it was commercially possible for steel to be used, capital in substantial quantities was seeking investment in this new industry. It seemed at last as if the iron industry might develop into a big money-making enterprise after all. And so thought Andrew Carnegie, for in May, 1864, we find him buying from Thomas N. Miller for \$8920 a one-sixth interest in the Iron City Forge Company. . . . At about the same time Carnegie formed the Keystone Bridge Company, inducing J. Edgar Thomson, Colonel Scott, and other railroad officials to join him in financing the enterprise. It proved immediately successful, and in four years Carnegie had paid for his own stock out of the profits. The backing of the Pennsylvania Railroad, which Carnegie had shrewdly procured, was a gold mine to him. . . . After the Civil War, when prices fell, Carnegie's steel business suffered reverses, but the bad times were tided over. When business revived, Carnegie emerged in complete control of the enterprise, . . . and long before the panic of 1873 he was a millionaire several times over and one of the big ironmasters of America. . . . In England he soon heard of Bessemer steel and realized that perhaps after all the new process was a sound one that should be adopted. Investigation thoroughly converted him to the idea. He rushed back to Pittsburgh and to the astonishment of his partners talked nothing but steel, steel, steel. Immediately the firm of Carnegie, McCandless and Company was formed with a capital of seven hundred thousand dollars. Carnegie subscribed the bulk of the amount needed and steps were at once taken for the construction of a large plant. . . . About the time that Carnegie was getting his money ready to buy out the Iron City Forge Company, in 1864 a fourteen-year-old lad named Henry Clay Frick was working as errand boy in a village store at Mount Pleasant, about forty miles from Pittsburgh. He was the son of poor parents, whose ancestors had emigrated from Switzerland more than a century before, a quiet, thoughtful lad, self-contained and reticent. In those days a new industry was developing at Mount Pleasant, known as coke making. Coal was mined and baked in brick ovens until it turned into crisp gray lumps. These lumps were very valuable to iron makers, who used them in smelting the iron ore. It is not probable that young Frick fully realized what developments were ahead in the iron and steel business of the country or that he foresaw the age of steel in which coke making would become a giant industry. But the boy saw in coke making a lucrative opportunity and began to save his money with the hope that in time he would have capital enough to buy a small strip of coal land and go into the business himself. In four or five years he had saved enough to buy a little coal land, and he then induced his grandfather and uncle to buy some ovens which were offered for sale at a low price. But shortly afterwards the panic of 1873 set in, and the little enterprise was balked. . . . One day, after the smoke of the 1873 panic had disappeared and business was reviving, a Pittsburgh banker named Mellon received by mail a request for a loan of twenty thousand dollars from an unknown person by the name of H. C. Frick. No security was offered but big profits were promised if the money was advanced at once. The banker liked the tone of the letter and sent his partner to Mount Pleasant to investigate. . . .

"When in 1882 the tendency toward consolidation of interests had begun, it was natural enough that the coke making and the steel manufacturing businesses should be drawn together. Both Frick and Carnegie recognized the logic of the idea.

Consequently in this year Carnegie and his associates bought control of the H. C. Frick Coal and Coke Company. This change of ownership brought Henry C. Frick into the steel business. He acquired a substantial interest in the Carnegie Works and an influence which became more evident from year to year. His intelligence and masterful qualities were exactly what the Carnegie organization needed. A new chapter now opened in the affairs of the company. Having acquired control of one raw material by purchasing the coke business, the company was now to make a further advance and acquire ore beds. And, as the only ore deposits of value were far from Pittsburgh in the Lake Superior region, it became necessary for the company to go into the transportation business also, to establish steamship lines on the Great Lakes and to build railroads from the water to its works at Pittsburgh. The Mesaba ore fields, acquired by the Carnegie associates, had been first opened up by Louis Merritt, who had sold his holdings to John D. Rockefeller some years before. Rockefeller, knowing little at that time outside of the petroleum field, afterwards thought he had made a bad investment. But this was not the impression in Pittsburgh, where the possibilities of wealth in the mining of Lake Superior ore had now been fully recognized. A man named Harry Oliver, who had been in the steel business and had been a friend of Carnegie in his early days, realized the possibilities of the Mesaba Range and bought a large tract of land there for a small sum of money. Soon afterward Frick met Oliver on the street and suggested that the Carnegie company go into the Mesaba ore business with him. The terms suggested by Frick were that Oliver should surrender five-sixths of his stock, in return for which the Carnegie company would advance half a million dollars for the development of the mines. The bargain was made, and thus the Carnegie company acquired a property which in a few years was worth tens of millions of dollars. But this was only one step in the control of the ore supply. A few years later, Frick and Oliver joined forces with John D. Rockefeller in the Lake Superior ore business. This powerful alliance caused a great fall in the price of iron ore and forced many smaller producers to the wall. Their holdings were thereupon bought in by the Frick and Rockefeller combination. Thus from small beginnings the steel business had grown into a gigantic industry. Meanwhile railroads had spread over the continent and the petroleum business had become a monopoly under the control of the Rockefellers. The time was at hand when the big bankers of Wall Street, already busy in the railroad field, would take part also in petroleum, steel, and a multitude of other industrial enterprises and utilities which had so grown in size and value that they could no longer remain independent of vast banking interests. . . .

"About this time a young commission merchant in Cleveland, Ohio, named John D. Rockefeller had saved up about seven hundred dollars, nursing it from nothing, a few dollars at a time. In 1860 he took a chance with three other men in the venture of mining petroleum, putting in a portion of his seven hundred dollars. Within two years the three men had run their investment up to about four thousand dollars. They made a good burning oil, and their profits, like those of all refiners at the time, were amazingly large. During the next few years, tens of thousands of dollars were made annually by this concern. But instead of drawing these profits out, Rockefeller, who dominated the combination from the start, insisted that every cent possible be reinvested in the business. . . . Hence,

during the period when the business was getting well established, the decade from 1860 to 1870, John D. Rockefeller and his friends year by year added steadily and quietly to their cash, until by 1867 they were in no sense dependent on bankers or financiers, as were the railroads and other large industries of the country. They were their own bankers from the start and were in a position even in those early days to snap their fingers at Wall Street and Lombard Street. When the Standard Oil Company of Ohio was formed in 1870 with one million dollars cash capital, it was undoubtedly the one great business corporation of America which had no debts and no direct banking alliances or affiliations. There was, of course, a reason for this complete absence of banking or investing interest, aside from the announced policy of the Rockefeller group. From the beginning, such banking houses as the Morgans, the Drexels, and the foreign houses with American connections, had kept away from this new business, just as, until the twentieth century, conservative capital in Wall Street to a large extent kept away from precarious industries like copper mining, electrical enterprises, and so forth. The industry had not proved its permanence or stability and was therefore classed as a 'speculation' rather than a sure investment. . . . Not long after 1870 . . . hard times came, and refiners in all parts of the country went to the wall for want of cash. Bankers would not help them because of the newness and precarious nature of the business. Then the Standard Oil Company began to buy the weaker refineries at bargain prices and to establish a chain of plants across the country. This enabled it to organize production on a large scale and to reduce the cost of refining and distributing oil to a fraction of what it cost most of its competitors. The company then bought the pipes which connected the wells in all parts of the country and laid miles and miles of pipe lines of its own. This forced the railroads to come to terms, as they had been large shippers of oil; and they were obliged to accede to a policy of secret rebating in the interest of Standard Oil and at the expense of the independent refiners. Ultimately, nearly all the competition in the oil trade was eliminated by these methods, until, in 1879, the Standard Oil interests were the only bona-fide buyers, the only gatherers, and the only refiners of all but ten per cent of the petroleum of the country. One by one, all the plants in the business without sufficient cash capital had fallen into the hands of the one firm supplied with cash. During the decade in which this expansion of the Standard Oil Company took place, the policy was never abandoned of accumulating and retaining large cash resources. By 1875 the cash resources had risen from about one million in 1870 to over thirteen millions; half a dozen years later they reached forty-five millions; and during that decade the company and its subsidiaries had not only bought up most of their competitors with ready cash but in addition had paid out in dividends over eleven million dollars."—J. Moody, *Masters of capital*, pp. 1-3, 5, 7-18, 20-23, 37-39, 42-43, 45-47, 49-52, 54-57.—See also TRUSTS.

19th century.—Regulation of capitalism in the United States.—Effects of the Interstate Commerce Act.—Unifying influence of capital.—"That Congress should occupy itself with economic questions was made imperatively necessary, not only by the extraordinary growth of economic interests, but also by the portentous concentration of capital in the hands of corporations and of

small groups of capitalists. Both capital and labor were effecting their own organization independently and upon the grand scale. It was necessary to see to it in the interest of society that they should not be too far beforehand with the law. Some means of controlling them in the common interest became imperative to devise. On the one hand, not only trades unions, but also vast federations of unions, national associations of the trades, were forming; and, on the other hand, great combinations of capitalists, not only into corporations, which the law already undertook to control, but also into 'trusts' and 'combines,' for which the law had as yet devised no machinery of control. The invention of elaborate and costly machinery for all branches of manufacture was steadily increasing the amount of capital necessary for even the initial steps in establishing industries of all sorts, great and small; and for the maintenance of the greater sort associations of individuals were giving place to associations of companies. It was against these great combinations of capital that the laborers were themselves combining, to resist the attempts then already a-making, and sure to be made upon an even greater scale thereafter, to control rates of wages against the influence of competition for labor. For Congress the whole question was typified by the concentration under the management of a few companies of the great railway systems of the country. As the enormous growth of railways continued, and link after link was completed in the great systems of roads which were binding the country together in all its parts, the old order of separate lines of railway, under the management of separate companies, was rapidly giving place to joint management under monster corporations. The trade of the country was largely in their hands. They could discriminate as they pleased in both their passenger and their freight rates between individuals, and even between regions. They could make or ruin particular regions or persons or companies as their interest suggested. Congress had constitutional power to legislate concerning post roads and interstate commerce. The States had many of them sought to regulate the railways already; and in 1837 Congress passed an Interstate Commerce Act which forbade discrimination in rates, the 'pooling' of rates by competing lines of railway, or the division among them of earnings. A semi-judicial tribunal was constituted to enforce the provisions of the Act. This Interstate Commerce Commission speedily became one of the most important tribunals of the country, administering the provisions of the law with both firmness and discretion, to the fortunate correction of many abuses. . . . It was but twenty-four years since the close of the war between the States; but these twenty-four years of steam and electricity had done more than any previous century could have done to transform the nation into a new Union. The South had been changed, as if by a marvel, into likeness to the rest of the country. Freed from the incubus of slavery, she had sprung into a new life; already she promised to become one of the chief industrial regions of the Union. She had discovered resources of coal and iron beneath her rich soil of which she had never dreamed before. Manufactures sprang up on every hand. She lost her old leisure and her old-time culture, but began very fast to build the material foundations for a new leisure and a new intellectual life. In the presence of such changes the old alienation of feeling between the sections could not survive. Northern capital poured into the South; northern interests became identified

with southern interests, and the days of inevitable strife and permanent difference came to seem strangely remote."—W. Wilson, *Epochs of American history*, pp. 294-296, 298.

19th century.—Capitalistic ideals.—Relation of capitalism to finance.—"Early post-Waterloo enterprise was capitalistic rather than financial. The capitalist-entrepreneur class, largely composed of self-made men (felicitously described as a 'broad-bottomed oligarchy'), rose rapidly into a position of great influence in Parliament—a position which, to a large extent, especially as regards Lancashire and Yorkshire, they still maintain. Not a few of the manufacturers were reinforced from the yeomen classes. These could no longer combine agriculture with domestic manufacture, by the spinning-wheel and the hand-loom. The competition of the specialised capitalist manufacturer was too strong for them, and, where they hesitated to remain specialist farmers, they became specialist manufacturers themselves, providing the capital by the sale of their holdings. But they were mainly capitalist employers, as distinguished from financial organisers. Nathan Mayer Rothschild had been a Manchester cotton capitalist before he became a financier. Most of his contemporaries remained capitalists to the end, possessing no ability which was capable of transporting them into the more subtle atmosphere of finance. The influence of the early capitalist employers, unorganised and groping, was utilised to promote the interests of capital alone. They could not take the broader view of finance, for they did not know what finance was. 'Finance,' said Huskisson, in 1822, 'of all political subjects is that which requires the least comprehension or capacity; it is that which, in its own nature, is most on a level with the reach even of ordinary half-educated minds.' These were the views of the man who next year became President of the Board of Trade! Mr. Gisborne, in 1836, pleaded in the House of Commons that some allowance must be made, in the case of the new joint-stock banks, 'for the freakish dispositions incident to youth.' As if there were any room for freakishness in so serious and vital a thing as finance! Such men as Grenfell and Baring had to form financial and economic opinion at the most critical stage in modern British history. They stood almost alone in the possession of expert knowledge. . . . The consequence of this ignorance of the existence and capacities of financial science was to tinge all early nineteenth-century sentiment with the capitalist ideal. So it is that the virtues of capitalism become the darling protégés of early nineteenth-century sentiment. . . . In the age of the Reform Bill, and for thirty years onwards, the political aspirations of the capitalist order were mainly characterised by a desire to bring the 'upper class' down to its own level, while the 'lower classes' were simultaneously to be kept to their old place. Humanity, with all its resources and aspirations, had no interest for it except as sources of income. This is the reason why early nineteenth-century capitalism did so little, while late nineteenth-century finance attempted and achieved so much, for the æsthetic and intellectual interests of humanity. Perhaps it was also the reason why the great Sir Robert Peel said that he respected the aristocracy of birth and of intellect, but not the 'aristocracy of wealth.' Such men as Peel had in his mind's eye were awake to the end, but blind to the means. The central article of their creed was the necessity of giving absolute freedom of operation to the industrial entrepreneur. Early nineteenth-century capitalism was employed in determining, by means of internecine rivalry, who

should supply goods to the customer. Nineteenth-century finance is less concerned with that question than with a problem of much more profound social interest, namely, *what* goods shall be supplied, and whether their supply cannot be encouraged by extensive loans of money—of course, on approved security. Competition, as Arnold Toynbee told us, 'is neither good nor bad in itself; it is a force which has to be studied and controlled.' Early capitalism neither studied nor controlled; modern finance does both. The early nineteenth-century capitalists had not even glimpsed the system under which, in our day, there is an incessant accumulation of capitalist profits to feed finance, combined with a system of beneficial enterprise upon which finance exercises itself. They did not understand that unorganised and undisciplined capitalism is simply an illegitimate drain on the moral and physical forces of the nation, a species of enterprise which will wait long, perhaps, before it presents the bill; but when it comes will inexorably insist on a terrible payment."—E. T. Powell, *Evolution of the money market, 1385-1915*, pp. 255-258.

19th-20th centuries.—"Krupps."—"The Krupp establishment at Essen occupies about 1,000 acres, of which nearly 200 are under roof." Alfred Krupp, the real founder of the Krupp steel works was the son of Frederick Krupp, an iron worker of Essen, who between the years 1810 and 1815 discovered for himself the secret of making cast steel, which had for some time been known in England. He died at the age of thirty-nine, and left to his son Alfred, a boy of fourteen his secret formula for making cast steel, and a small, unsuccessful business. From this beginning Alfred Krupp built up the great steel works, known throughout the world as "Krupps" and the huge business in ordnance which gained for him and his son the title of "cannon king" and enabled Germany to arm herself against the world. "At the very beginning of his activity, he characteristically and eagerly endeavored to make everything required in the Works himself. In these gloomy years, he always deemed it an especially gratifying achievement, of which he at once gave due notice to his men, when he succeeded in enrolling any means to an end, were it even the least important tool, among the list of his products. The great scale upon which he carried out, in later years, the self-manufacturing system, is well-known. To-day there exist few branches of trade or manufacture which are not, in some way or other, represented in the establishment. Slowly but surely, the development of the Works went on. In the year 1832 Krupp stood in the midst of ten workmen. The financial backing of devoted relatives and friends enabled him gradually to get some good out of his inventions. His first and most important invention of this time was the cast-steel roller-die, for which he received patents in Germany, England and France. By the sale of his English patent, Krupp received the first reward worth mentioning for his continued labor, a reward that enabled him considerably to enlarge his Works. . . . From the 'forties' . . . date Krupp's endeavors to make cast-steel guns. In the year 1847, he sent a three-pounder muzzle-loading gun to Berlin, where it remained without notice until the Ordnance Board, in 1840, acknowledged the excellent quality of the metal. . . . After the unfortunate year 1848, all German industries were powerfully stimulated in competition with English and French products, and in the forefront of the patriotic combatants, who were striving with foreign opponents for recognition in the markets of the world, stood Alfred Krupp. . . . In 1852, Krupp invented a method of manufacturing weld-

less railroad tires, an ingenious and simple process, an invention whose extraordinary pecuniary success enabled him to utilize the experience he had gained, upon a grand scale, to establish great shops and to set up powerful machinery. . . . In 1858, ten hammers were in use, of a total weight of 370 hundred weight, even then insufficient for the work required. In the same year was erected a 60,000 lb. hammer, with 10 feet fall, and driven by a 66 horse-power engine. More hammers were shortly added, also other industrial improvements, a roll-train, &c. At this time, too, the giant stack, 230 feet high, 30 feet in diameter, which still towers above all the other chimneys of the Works, was built. . . . Until the 'sixties,' the Works were exclusively engaged in the fabrication of crucible steel; subsequently the later processes of Bessemer and Martin were introduced. . . . Since this period, Krupp, in accordance with his plan which he, as already stated, had formed at the very founding of the Works, that of being independent of other manufacturers and the daily fluctuations in raw material, acquired ore beds, coal mines, and blast furnaces. To-day the entire amount of ore and coal consumed is home supplied. The Firm owns . . . ore beds in Germany and in Spain (near Bilbao), eleven blast furnaces, some coal mines near Essen and Bochum, a number of smelting works on the Rhine and in the Westerwald, a series of stone quarries, clay and sand pits, and an extensive proving ground at Meppen, nearly ten miles long."—K. W. and O. E. Michaelis, *Alfred Krupp: A sketch of his life and work*, pp. 14, 15, 16, 19, 25, 32-33.

"The long reign of Alfred Krupp ended with his death in . . . 1887. . . . In the course of sixty-one years of clever guidance his works had grown into the national arsenal of Germany . . . a department in fact of the German state, whose ambassadors were proud to cater for orders for the monster establishment at Essen. . . . The cannon king's son . . . merely followed on the lines laid down by his father. . . . Friedrich Alfred died in 1902, and left the works to his eldest daughter Bertha. On July 1, 1903, the whole concern was floated as a company with a capital of £9,000,000 [about \$42,000,000], the shares being principally held by the Krupp family. The works were enlarged in 1907 with the aid of a loan of £2,500,000 from the Government." In 1896 Friedrich Alfred Krupp leased "the large ship-building yard [at Kiel] then owned by the Schiff and Maschinenbau Co. . . . and reconstruction began at once." "Just before the war the Krupp employees numbered 80,000 people; [during the] war, the number . . . increased to well over 100,000." There not only the guns for the army and navy were manufactured, but also the armor plate for the navy ships and submarines which were built in the company's shipyards on the Kiel canal.—H. Robertson Murray, *Krupps and the international armament ring*, pp. 79, 80, 81, 83, 138.—See also BELGIUM: 1914: Germany and Belgian neutrality; WARSHIPS: 1893-1914; WORLD WAR: Diplomatic background: 73, iii, vi.

20th century.—Japan.—"It has been the policy of the government to start new industries on a capital of taxes, to sell them at a very nominal figure or even to turn them over gratis into the hands of some capitalist high in government favor. Furthermore, very rich subsidies and bonuses are given to any capitalist enterprises without limitations. For instance, in order to build up a cotton industry in Japan, the government made the cotton free of import duty. This, of course, killed the home cotton growing industry, which until then

had clothed the entire population of thirty-five millions. The cotton industry is now one of the biggest industries in Japan, working 2,870,000 spindles, importing cotton valued at \$110,000,000 a year. The industry is controlled by big capitalists under the management of 161 companies. There are over 400,000 women workers in the cotton and other textile industries; these poor girls, mostly under 20, some of them 10 or 12 years of age, are mercilessly exploited in the factories. Female cotton spinners work 12 hours a day for 28 or 29 days every month. Half of them are employed at night, for, according to the new factory statutes it has become legal to employ children of 10 for 14 hours a day. These statutes are to be in force for the next fourteen years. . . . Every year some two hundred thousand girls are newly recruited to supply the factories; of these a few stay more than a year in the factory, eighty thousand return, the rest disappear. Upon such a brutal exploitation system the cotton masters have built up their industry in a short time, capitalized at nearly a hundred million dollars and producing some four hundred million dollars' worth of cotton yarn and goods a year. But the most extravagantly protected industry in Japan is the Formosan sugar industry. Japan took the island in 1898. Since then the government and its capitalists have decided to raise the sugar supply for the entire country in Formosa, and proceeded to establish sugar companies under very high protection. In the early stage of the industry the government supplied, freely, seeds, machines for cultivation and refinery, and many other aids. To keep up, or rather, to raise sugar prices the government put up very high protective customs duties on sugar and passed a sugar consumption tax to be used for the payment of direct bounties to the sugar companies. At one time 80 or 90 per cent. of the cost of production was paid to the sugar masters in Formosa either directly or indirectly. Furthermore, the government gives a direct bounty of 50c on every hundred pounds of sugar cane raised. The sugar industry in Formosa is capitalized on a gigantic scale. In a little while its valuation has reached forty-two million dollars and it produced 517,520,000 pounds in 1912 and 681,179,000 pounds in 1917."—S. Katayama, *Recent development of capitalism in Japan (Class Struggle, Sept.-Oct., 1917, pp. 75-76)*.

20th century.—Effect of the World War on capitalism.—Distribution of capital.—Capital in new industries.—"The world-convulsion . . . has brought in its train new trading and manufacturing situations which present problems never faced before. Commercial *ententes* between nations for the control of raw materials, control of production and distribution of some of the most important commodities by powerful combinations of private interests, huge agglomerations of capital in the hands of a few banking groups, the formation of gigantic capitalistic trading corporations—these are some of the economic outgrowths of the war. By common consent international competition for the trade of the globe will become a far more serious matter in the early future than at any previous period in history. Where before the war we witnessed competition among comparatively small groups, commercial giants are now preparing to measure their strength on the trade routes and in the markets of the world. It will constitute a problem for our statesmen to solve in how far the public interest will have to be protected by national legislation against dumping, by tariff laws, etc., or by international agreements for the protection of industrial property, etc. Un-

bridled competition of a kind threatened by the developments outlined in the foregoing pages is bound to develop into a source of friction and ill-feeling among the nations of the world in whom the long years of war have created a deep yearning for a lasting peace."—W. Notz, *Cartels during the war* (*Journal of political economy*, Jan., 1919, pp. 37-38).—See also INDUSTRIAL WORKERS OF THE WORLD: Recent tendencies.

"The demand for capital will be immense, not only in our own country, but throughout the civilized world. At first sight the problem of providing it appears quite insoluble, since the war has not only swallowed up all the capital available when it broke out, but has prevented the creation of fresh supplies through the normal processes of saving. Money, which in the ordinary course would have been reproductively employed, has been dissipated in the construction of engines and instruments of destruction. The products of the mine and the factory, which normally would have served to increase the world's wealth, have been applied only to its obliteration. To-day [1918] the world's supplies of liquid capital, meaning by that term capital that could be reproductively used in industrial enterprise, are locked up in War Loans, while of the profits being made by commercial undertakings a very high percentage is being absorbed by war taxation. Capital supplies have been practically exhausted, while there is no chance of replenishing them as long as the Government as borrower and tax-gatherer has a first claim upon the profits of commerce and industry. . . . The effect of the war upon the amount and the distribution of what we usually call wealth—the aggregate of private fortunes—is still obscure. It may, indeed, be years before we shall be able to obtain statistics enabling any precise estimates to be made. The British Government will perhaps have spent, before we get through all the necessary cost of demobilization, something like £100,000,000,000; and this is certainly more than half the aggregate total value of all the property, securities, and investments of all kinds owned in the United Kingdom just before the war. Does it follow that those who owned these fortunes have—to use the phrase of a Cabinet Minister—lost half their property? Will the amount drawn, irrespective of any contemporary service rendered, in the form of rent and interest be any less than before the war? Or will, on the contrary, the aggregate of private fortunes, and the tribute of rent and interest that we pay to our landlords and capitalists, be greater after the war? These are questions to which very definite answers can already be given. We know, not by any means exactly, but within a relatively small margin of error, what was the aggregate capital value at market prices of the privately owned wealth in the United Kingdom prior to the war. The calculations of various statisticians, based on the available official statistics—as summarized, for instance, in Dr. Stamp's very authoritative *British Incomes and Property*, and latterly in Mr. Pethick Lawrence's *Levy on Capital*—approximate in placing this total at somewhere about £12,500,000,000. About 88 per cent of this was owned by 12 per cent of the population (each family being 'worth' over £1,000); while 12 per cent of the total was shared among 88 per cent of the population, their average family fortune (including furniture and personal effects and all savings) being less than £40. We may go further and say that 2 per cent of the nation owned twice as much wealth as all the remaining 98 per cent! How will this stand after the war? There have, as we know, been great

changes. The Government (including the local authorities), which was, before the war, 'in debt,' in excess of the very extensive corporate assets, to the extent of perhaps £1,100,000,000 will now be 'in debt' to the extent of seven or eight times as much. On the other hand (after making full allowance for the depreciation in capital value) . . . it is confidently estimated that the post-war capital value of the aggregate of private fortunes in the United Kingdom—such as would be assessed, for instance, to the Death Duties—will have positively increased by at least 20 per cent; or from £12,500,000,000 to £15,000,000,000. So far as private fortunes are concerned, the small minority of us who are property owners, even to the modest extent of £1,000 capital, will certainly, in the aggregate, have increased our fortunes, taking all our possessions at the current market value, by at least £2,500,000,000. And the distribution of the aggregate private wealth will be even more unequal than it was before the war. The 2 per cent of the population, who formerly owned two thirds of the total wealth, now probably own three fourths of a greatly augmented total. Certainly, a vast number of individuals have taken up War Savings Certificates and War Bonds in small amounts. But the total amount of War Savings Certificates . . . is only a little over £200,000,000; and a further £300,000,000 would probably overstate the amount of War Loan and War Bonds held by small investors. It is the 12 per cent of the population who, before the war, owned 88 per cent of the total private wealth, who have been able to add substantially to their possessions, and who now own by far the greater proportion of the enlarged National Debt. The 88 per cent of the population, who before the war may have owned, on an average, £40 per head of wealth, have probably increased their little stocks of furniture and personal effects; to a comparatively small extent their holdings in Savings Banks, Coöperative Societies, Friendly and Building Societies, and Trade Unions; and perhaps even their holdings in houses and land. On the other hand, this class has suffered greatly in the extinction or depreciation of small businesses; while little hoards have in many cases been sadly drawn upon in order to live. It is doubtful, to say the least, whether, after the war, the aggregate private fortunes of the 88 per cent will amount to as much as 12 per cent of the augmented total. Measured in capital wealth, and subject to many individual exceptions, the rich will have become much richer and the poor hardly less poor in the course of the last five years. This, or worse, is, in fact, the invariable effect of war, food shortage, currency depreciation, and a general increase in the price of commodities. . . . Some interesting figures of 'War-time Wealth' were published in *The Observer*. The total number of super-taxes, *i. e.*, persons with incomes of £3,000 and over, was in 1914-1915, 30,211, and in 1917-18, 29,723, but the aggregate income had risen from £244,169,134, in 1914-15 to £247,257,124, in 1917-18. The very rich seem to grow richer, and the moderately rich to grow poorer. Thus the 90 persons who in the former year had incomes of £100,000 and over rose in the latter year to 95. But at the other end of the scale those with incomes between £3,000 and £5,000 fell from 15,524 to 14,463. The incomes of £20,000 to £25,000 rose in number from 537 to 606. The other incomes (the figures of course are of gross incomes) are very stationary. War always offers opportunities to the very rich to make more, *e. g.*, they participate in contracts, in six-penny syndicates, and they buy shares at rubbish prices, when the news is bad,

and everybody else wants to sell. The moral of these figures seems to us plain, and politically very significant. The incomes of the bloated capitalists, the idle rich, or whatever other term of abuse may soothe the ear of Socialism, have remained practically stationary. There is a slight increase at the top and a slight falling off at the bottom of the ladder, whether because the £3,000 to £5,000-a-yearers have gone up or down no one can say. But the great salient fact is that the £8,000,000,000 that have been spent on the war have gone, as to the greater part, not into the banks of the capitalists, but into the pockets of the working classes. Let the Socialists rejoice as much as they please, but let them admit the fact."—*War-time finance* (*Living Age*, Dec. 14, 1918, pp. 607, 700-701, 703.)—See also PROLETARIAN DICTATORSHIP.

"There is little evidence, . . . to suggest that the capital resources of [the United States] have been significantly impaired as a result of the war. Stocks of goods in warehouses and in retail stores may have been smaller at the signing of the armistice than prior to the entrance of the United States into war; statistics are not available for a reliable judgment. But such statistics as have come to the writer's notice indicate that for many raw materials and foodstuffs, including such important commodities as copper, cotton, tea, coffee, wheat, the stocks on hand at the cessation of hostilities were unprecedented in value. Buildings, railroads, highways, were not kept at their pre-war standards of maintenance and repair; extensions were undertaken at very much below the normal rate. But new capital in enormous quantities was turned into the construction and equipment of the greatly enlarged shipbuilding and shipping, chemical, dye, ordnance, and munition industries, was absorbed in the development of hitherto unexploited mineral and timber resources, and was used to purchase American securities held abroad, to make foreign loans, to build up a great reserve of gold obtained from abroad. Some of this new accumulation has proved to be of little value for peacetime purposes; the cases of conspicuous depreciation have received considerable publicity; but the bulk of it remains as a valuable addition to the working equipment of the United States."—J. Viner, *Who paid for the war* (*Journal of Political Economy*, Jan., 1920, p. 49).

20th century.—Re-establishing capitalism in Russia.—Nikolai Lenin, in a speech delivered in Moscow on October 19, 1921, "on Russia's new economic policy, declared: 'We must face the fact that we are re-establishing capitalism, and also the question of whether the peasantry will follow the capitalists or the communists. If the capitalists organize quicker and better they will send us communists to the devil. Our problem,' continued the Soviet Premier, 'is to make the future capitalism subject to the State and serve it. We are now surrounded by forces stronger than ourselves, and in order to gain victory we must use the last of our forces and convince the peasantry, and also the workers, of the necessity of our aims and of their advantages to the common good. The present return to capitalism is not the re-establishing of private ownership, but of personal communistic interests. In order to reorganize our economic life we must interest every specialist; and in this we have failed so far by direct attack. Now we must make a turning movement. If we again fail every one of us will go to the devil and be hanged, and will deserve it. I say to you: "Go into business. Work with the capitalist by your side, both Russian and foreign, who will get 100 per cent. out of you. Let him get rich. But learn from him, and only then

will the true communistic republic be created. It is hard, difficult, wrenching toil, but all of us must do it, as there is no other way out.'" The time for drawing political pictures of great aims is now past. We must put theories into practice. We must do much cultural work and also digest our political experience in order that our political coup d'état may be saved.'

"After a long rest in the country, Premier Lenin . . . returned to the political arena with an open admission of communism's defeat, according to an account of a speech he made recently before the Congress of Political Workers in Moscow, given out by the Rosta Agency, official Bolshevik news disseminator. 'Everybody sees,' he said, 'what a sharp turn the Soviet powers and the Communist Party have taken by adopting a new economic policy, which, in substance, contains more of the old régime than of our previous policy. The attitude of the Soviet toward economic questions during the first half of 1918, when the Brest-Litovsk peace treaty gave hope of peaceful reconstruction, was extraordinarily cautious. Then the necessity of considering the peasants was always pointed out, and the rôle of State capitalism in socialistic construction was considered. The civil war which broke out and the desperate position in which the republic found itself compelled us to change directly to communistic production and distribution. However, a not very long experience convinced us that, without having gone through a period of socialistic adjustment and investigation, it was not possible to reach even the lowest steps of communism. There can be no doubt that on the economic front, in the attempt to come over to communism toward the Spring of 1921, we suffered a defeat more serious than we had experienced before. This showed that our economic policies failed to have their feet on the ground and did not create that rising of productive powers which was recognized in the party program as fundamental and urgent.

"Acquisitions in villages and a direct communistic approach to construction problems in the cities retarded the elevation of our productive powers and were the cause of a deep economic and political crisis. We recognized defeat and retreated, and the retreat is continuing in many places even at present, amid very unnecessary disorders.'"—N. Y. *Times*, Oct. 22, 1921.

CAPITOLINE HILL AT ROME.—Capitol.—"In prehistoric times this hill was called the Mons Saturnius, see Varro, *Lin. Lat.*, v. 41; its name being connected with that legendary 'golden age' when Saturn himself reigned in Italy. . . . This hill, which, like the other hills of Rome, has had its contour much altered by cutting away and levelling, consists of a mass of tufa rock harder in structure than that of the Palatine hill. It appears once to have been surrounded by cliffs, very steep at most places, and had only approaches on one side—that towards the Forum. . . . The top of the hill is shaped into two peaks of about equal height, one of which was known as the Capitolium, and the other as the Arx, or Citadel. . . . The Capitolium was also in early

time known as the 'Mons Tarpeius,' so called from the familiar legend of the treachery of Tarpeia. . . . In later times the name 'rupes Tarpeia' was applied, not to the whole peak, but to a part of its cliff which faced towards the 'Vicus Jugarius' and the 'Forum Magnum.' The identification of that part of the Tarpeian rock, which was used for the execution of criminals, according to a very primitive custom, is now almost impossible. At one place the cliff of the Capitolium is quite perpendicular, and has been cut very carefully into an upright even surface; a deep groove, about a foot wide, runs up the face of this cutting, and there are many rock-cut chambers excavated in this part of the cliff, some openings into which appear in the face of the rock. This is popularly though erroneously known as the Tarpeian rock. . . . The perpendicular cliff was once very much higher than it is at present, as there is a great accumulation of rubbish at its foot. . . . That this cliff cannot be the Tarpeian rock where criminals were executed is shown by Dionysius (viii. 78. and vii. 35), who expressly says that this took place in the sight of people in the Forum Magnum, so that the popular Rupes Tarpeia is on the wrong side of the hill."—J. H. Middleton, *Ancient Rome* in 1885, ch. 7.—See also SEVEN HILLS OF ROME.

CAPITULARIES.—Capitularies "were the ordinances or constitutions issued by [the Frank] sovereigns, alone or, in certain cases, with the assent of the assembly of the people. The word capitulary came simply from the fact that the ordinances were divided into chapters—*capitula*. . . . Certain capitularies, and they are the most numerous, had for their object the organization of the empire, the administration, finances, justice, the relations of church and state, etc. They are the personal work of the prince, assisted by his counsellors. However, under Charlemagne the magnates [both lay and church] frequently participated in drawing up these capitularies, but they continued none the less to be considered as the personal work of the sovereign. Certain capitularies constituted a territorial law, and applied as such to all the empire. Another class composed the *capitula per se scribenda*, that is to say, capitularies destined to complete or modify a law (*lex*). These latter are sometimes distinguished by saying that they are special, whilst the others are general. But that formula is a little vague, also as they were not obligatory except for the people in whose presence they were made it was necessary that they should receive the assent of the people in order to become law. Finally there were capitularies which were simple instructions addressed to functionaries. . . . These are the *capitula missorum*. Properly speaking they do not form laws, in the large sense of the word. Also they were not promulgated and published by the system then used for all the other capitularies, and also for the *leges*. Publication [of the first two classes] was made by the despatch, in the name of the king, of certified copies, addressed to the officers charged with their execution. These brought the new capitularies to the knowledge of all by means of reading them aloud in the judicial assembly, *in mallo publico*. The authenticated copies were deposited in the archives, but as the archives were badly kept, it was often difficult to procure the text of a capitulary. The number of the royal ordinances appear to have been very limited under the Merovingians, and in fact few are in existence—nine in all. But the capitularies of the Carolingian epoch are very numerous, especially those of the reign of Charlemagne. Also from that time the necessity of collecting them

in order to facilitate research and application began to be understood. In the reign of Louis the Pious, Anségise abbot of Fonteville, made a collection. Twenty years later, before 858, a deacon of Mayence, named Benedictus Levita [Benoit the Levite or deacon] undertook a work on the capitularies. He stated in his preface that he proposed to reunite the capitularies which had escaped the researches of Anségise, and those which had been published since his death, and of adding to them some canonical pieces. In reality, however, his work is of quite a different nature and the capitularies disappear in a crowd of extracts of all sorts, often borrowed from the canon law or the Roman law. Some have concluded that Benoit had an obscure, confused mind, but the general opinion is that he proceeded with skill to obtain a hidden end; that he proposed to pass for capitularies, that is the laws of the state, doctrines borrowed from the Church, or even the Roman law, which would assure the privileges and the supremacy of the clergy. It is certain that at the same epoch there appeared another work written without doubt in that intention—the false decretals. But, some have discovered a certain relationship between the capitularium of Benoit and the false decretals. The false decretals have even been attributed to him though without serious proof on which to base that opinion. Some time after the composition of the Benoit collection Isaac, bishop of Langres, and Hérard archbishop of Tours, published, each in a single book, extracts from the Benoit collection containing only ordinances of a nature to interest the church. Finally there was composed an abridged collection towards the middle of the ninth century by order of the Emperor Lothaire for use in his Italian kingdom. These are the only collections which were made in the middle ages. In the XVII century, Baluze, Colbert's librarian, made his name illustrious by publishing a collection of capitularies."—E. Glasson in *La Grande Encyclopedie*.

ALSO IN: Glasson, *Histoire du droit et des institutions de la France*, v. 2, p. 199.—E. F. Henderson, *Select historical documents of the Middle Ages*, bk. 2.—Capitularies have come down also from the reigns of Louis the Pious and Charles the Bald. The best collections are those made by Walter, *Corpus juris germanici antiqui*, Berlin, 1824, 3 v.; Pertz, *Monumento Germaniae historica*, Hanover, 1826; Boretius, *Capitularia regum Francorum*, Hanover, 1883-1897.

CAPITULATION OF CHARLES V. See GERMANY: 1520-1521; also CAPITULATIONS.

CAPITULATIONS, a term used to designate treaties by which the nationals of one state are given extra-territorial privileges and rights within the boundaries of another. The name has probably come from the Latin *caput*, because of the heads or Chapters into which the treaties are divided. The custom of granting extra-territorial rights had its origin in ancient times when law was a personal; a man had no right to nor obligation under any law save that of his own nation, and was therefore practically an outlaw outside of his own country. But when numbers or wealth, or both, brought power to "strangers within the gate" it was found desirable to bring them within the jurisdiction of some law, and as in earlier times nations were slow to confer their citizenship, or freedom, upon aliens it was deemed advisable to give them the privilege of living under the jurisdiction of the laws of their own nation. The custom, however, is best known for its use between eastern and western nations. Thus, subjects of Charlemagne who traveled with

his consent, were granted privileges by Harun Al-Rashid. Some of the city republics of Italy obtained similar privileges from eastern potentates for their citizens. When the Byzantine empire fell before the Mahomedans, the Christian peoples were permitted to retain their personal rights, and a kind of semi-autonomy. Moreover the privileges which had been held by Genoese and Venetians, under the Greek emperors, were confirmed to them.

"The early Capitulations were in the form of a grant or charter of privileges accorded to foreigners by Sultans. The fact that these privileges were set forth under certain headings as statutes, or ordinances, gave rise to the vernacular use of the term Capitulations, which . . . meant nothing more than an . . . agreement to express in ordinary form the various stipulations agreed upon."—P. M. Brown, *Foreigners in Turkey, their juridical status*, p. 29, note.

The Capitulations "were a series of agreements by which foreigners resident in Turkey were placed under the jurisdiction of their own laws and their own officials. As it has worked out, this has become a valued privilege, securing to the foreigner immunity from the vexations of Turkish maladministration and even from the legitimate duties of citizenship. As such, we have come to think of the Capitulations as concessions extorted from decadent Turkey by the powerful nations of the West. Such they were when, in the later day, the system was imposed on China and Japan, and such they eventually became in Turkey. But nothing could be further from the truth as regards their origin. They date from a time when—can our imaginations picture it?—the two supreme powers in Europe were Portugal and Turkey. The first of these agreements was made between the most powerful of Turkish monarchs and a defeated Christian sovereign. Their real purport was this. The alien and the unbeliever had no standing in Moslem law. Its blessings were only for the faithful. Yet as Turkey possessed the shrines of the Christians and the most important highways of the world's commerce, thousands of aliens were at all times within the empire. These aliens were long outlaws, and got along only by the suffrance of their Turkish neighbours, but the need of regulating their status and conduct ultimately became manifest. Rome had had the same problem in her early history, and had just as unhesitatingly refused to aliens the benefit of her sacred law. She met their needs, however, by developing alongside her own code, a second code called the law of nature, or law of nations, a sort of codification of common sense and the supposed general practice, which, because of its less sacred character, proved infinitely more flexible. . . . The Turk, not being a lawgiver, and having an easier alternative, merely refused to bother with these outsiders, and said to the Christian powers in effect: 'Here, take care of your own people and see that they behave, and I won't interfere.' He was totally unconscious at the time that the task thus laid upon them might later be used to impair his authority. It was in pursuance of this same policy that he allowed the church, in the various countries which he conquered, to persist, and recognised its patriarchs as responsible leaders and administrators. It was out of the question to continue the temporal sovereigns of these countries. Moreover, it was perfectly congenial to Mohammedan ideas, that a religious functionary should administer law, for their own law is founded on the Koran and has been largely administered by

religious authorities. So each country got its patriarch, and thus was laid the foundation of that tenacious sectarianism which to-day is one of the chief obstacles to the unification and tranquillisation of the Balkans."—H. H. Powers, *Things men fight for*, pp. 124-126.

The earliest Capitulations with the Venetians "aimed particularly to determine the status of Venetians residing in Turkey. Among its many provisions were included one for the mutual rendition of criminals; another for the custody and settlement by the Venetian Consul of the estates of Venetians dying intestate or without heirs. . . . A provision calling for special mention is one fixing a duty of 2 per cent on all goods sold by Venetians in Turkish ports. . . . In the year 1528, Sultan Suliman II formally confirmed the privileges long enjoyed by the French and Catalan merchants established at Alexandria. . . . More definite, complete, and formal were the solemn treaty engagements of Sultan Suliman in 1535 with Francis I of France [which] . . . may be considered as the real commencement of the régime of the Capitulations. . . . Certainly all subsequent treaties were modelled on this treaty; and other nations have claimed as favorable treatment as therein accorded to France. Owing to the Turkish theory that a treaty could have force only during the life of the Sultan who signed it . . . the Capitulations of 1535 were subjected to numerous alterations of a sweeping character. . . . It was not until 1740 that these treaty rights were made perpetual. . . . Through tenacious insistence on the right to the same treatment accorded to the most favored nation, the other nations have successively obtained from Turkey for their own nationals, the same privileges granted to France. . . . England was the first in the year 1879; Holland also in the same year; Austria in 1615; Russia in 1711; Sweden in 1737; Denmark in 1756; Prussia in 1761; Spain in 1782; Sardinia in 1825; the United States in 1820; Portugal in 1843; Greece in 1854; Brazil in 1858. By these treaties all cases involving life and liberty of foreigners were removed "from the jurisdiction of Ottoman courts, and [submitted] to settlement through diplomatic negotiations with the Sublime Porte. This . . . method became in time most unsatisfactory, and early in the nineteenth century the consular courts assumed jurisdiction over their nationals charged with crimes against Ottoman subjects. After the . . . reforms of the year 1856, however, the rights of jurisdiction of Ottoman Courts in such cases were conceded by the powers with the important restriction requiring the presence of the Dragoman of the consulate of the accused, together with the virtual right of review of the decision by his consular or diplomatic representative."—P. M. Brown, *op. cit.*, pp. 36, 37, 41.—In 1673, France was given exclusive right to protect the subjects of nations which had received no capitulations. This gave increased prestige to France, but in 1675 England gained the right to protect such unrepresented nationals jointly with France, and in 1718 Austria obtained permission to protect the citizens of Genoa and Leghorn with her flag. As the different parts of the Turkish empire became independent, or fell under the rule of other powers, the capitulations became of no effect. Thus they became ineffective in Greece, Bosnia and Herzegovina, Cyprus, Serbia and Rumania after the Treaty of Berlin. In 1881 they were suppressed in Tunis, France having established a protectorate in that country. The use of the term "capitulation" is in modern times usually applied to the Turkish capitulations.

but treaties of the same nature have been made by most of the western powers with Japan, China, Siam and Persia, whose laws were contrary to western ideals. In 1890, however, they were abolished in Japan. "In countries where extra-territorial treaty rights exist, the nations which enjoy these rights also enjoy the right of jurisdiction over their own nationals. In order to exert this right consuls are given juridical powers, or special courts are set up. Thus there is a British Supreme Court, consular court in Constantinople, while in 1906" the United States court for China was established and given "exclusive jurisdiction in all cases and judicial proceedings whereof jurisdiction may now be exercised by the United States consuls and ministers of law and by consuls and ministers of law and by virtue of treaties between the United States and China."—*Cyclopedia of American Government: Extraterritoriality*.

In August, 1914, shortly after the outbreak of the World War, two German warships, *Goeben* and *Breslau*, fled into the Dardanelles. The Allies protested to the Turkish government; the latter, impotent to enforce its international obligations, abrogated the capitulations. The system, however, was restored by the peace treaty imposed by the Allies at Sèvres in 1920.—See also HAGUE CONFERENCES: 1890; Convention with respect to the laws and customs of war on land; WORLD WAR: Diplomatic background: 8.

CAPO D'ISTRIA, Giovanni Antonio, Count (1776-1831), Russian statesman, president of Greece, 1827-1831. He was born in Corfu. After holding an important position in the Republic of the Ionian Islands, entered the diplomatic service of Russia. In 1807, after the Treaty of Tilsit giving the Ionian Republic to Napoleon was signed, he was appointed attaché to the foreign office in Petrograd, and there became assistant minister of foreign affairs, and later counsel to the Tsar. In 1828, he was elected President of Greece. When he suspended the constitution and made himself dictator, he incurred ill-will in some factions and was assassinated, October 9, 1831.—See also GREECE: 1821-1829; 1830-1862.

CAPORETTO, village on the Isonzo river about 20 miles north of Gorizia and just east of the 1914 boundary of Italy. Here in 1917 the Italians suffered a crushing defeat by the Germans and Austrians. See WORLD WAR: 1917: IV. Austro-Italian front: d, d, 1-4; also ITALY: 1918: Conditions in Italy at the end of the World War.

CAPPADOCIA, in ancient geography, a vaguely-defined country of eastern Asia Minor, between the Black Sea, Cilicia, Armenia and Phrygia. In the fourth century B. C. it was a province of the Persian empire. It became a Roman province in A. D. 17. See BYZANTINE EMPIRE: 1057-1081; MITHRADATIC WARS; PERSIA: 226-627.

CAPPONI, Niccolo, gonfalonier of Florence. See FLORENCE: 1502-1569.

CAPRI, an island in southern Italy at the entrance of the Bay of Naples. In ancient times it was occupied by the Greeks; acquired by Neapolis and then granted to Augustus in exchange for Ænaria (Ischia). There are remains of twelve villas, said to have been built by Tiberius in honor of twelve deities. The island was captured by the English in 1806 and recaptured by the French two years later. In 1813 it was ceded to Ferdinand I, king of the two Sicilies.—See also ITALY (Southern): 1808-1809.

CAPRIVI DE CAPRARA DE MONTECUCCOLI, Georg Leo von (1831-1899), noted Ger-

man statesman. Became chief of the admiralty in 1883, commanding general of the 10th army corps in Hanover in 1888, and later general of infantry; succeeded Bismarck as imperial chancellor (see GERMANY: 1890-1894), president of the Prussian ministry and imperial minister of foreign affairs, in 1890 (see TARIFF: 1870-1000); resigned the presidency of the Prussian ministry in 1892; retired in 1894.—See also GERMANY: 1889-1890, 1890-1891, 1892-1894.

CAPRONI, Gianni, (1886-), Italian aviation engineer, builder of the Caproni aeroplanes. See AVIATION: Development of airplanes and air service: 1918-1921: Air service after World War.

CAPS, a political party in Sweden in favor of limiting the powers of the monarch. See SWEDEN: 1720-1792.

CAPTAINCY - GENERAL.—Office in the Spanish military system, corresponding to that of commander-in-chief. "As a strictly military office the grade of captain-general was . . . the highest in the whole military hierarchy and the military governors of the most important provinces in Spain took that title, by courtesy as it were, whatever their real rank may have been. The following Spanish provinces had captains-general in 1800: Aragon, Catalonia, Valencia, Majorca, Granada, Andalusia, Estremadura, Old Castile, and Galicia." In the colonies, this office was "perhaps . . . the most characteristic of all the positions of trust and profit in Spain's system of . . . administration. . . . From Chile and the extreme south to Mexico and Cuba on the north, the whole of Spanish America was divided, not into vice royalties or provinces, but captaincies-general, and the rulers of these districts had the all-important duty of maintaining the authority of the Spanish crown by the ultimate logic of military force."—D. E. Smith, *Viceroy of new Spain*, p. 193.—See also AUDIENCIAS; CHILE: 1540-1778; INTENDANTS IN SPANISH AMERICA; LATIN AMERICA: 1715-1810.

ALSO IN: *Des devises du Désert*, ii, pp. 133-134.

CAPTAL, title, derived from "capitalis," originally equivalent to count and anciently borne by several lords in Aquitaine. "Towards the 14th century there were no more than two captals acknowledged, that of Buch and that of Franc."—Froissart (Johnes), *Chronicles*, bk. 1, ch. 158, note.

CAPTIVITY, Prince of the. See JEWS: 200-400.

CAPTIVITY OF THE JEWS. See JEWS: B. C. 604-536.

CAPUA.—Capua, originally an Etruscan city, called Vulturnum, was taken by the Samnites, 424 B. C. and was afterwards a city in which Etruscan and neighboring Greek influences were mixed in their effect on a barbarous new population. "Capua became by its commerce and agriculture the second city in Italy in point of size—the first in point of wealth and luxury. The deep demoralization in which, according to the accounts of the ancients, that city surpassed all others in Italy, is especially reflected in the mercenary recruiting and in the gladiatorial sports, both of which pre-eminently flourished in Capua. Nowhere did recruiting officers find so numerous a concourse as in this metropolis of demoralized civilization. . . . The gladiatorial sports . . . if they did not originate, were at any rate carried to perfection in Capua. There, sets of gladiators made their appearance even during banquets."—T. Mommsen, *History of Rome*, bk. 2, ch. 5.

B. C. 216-211.—Welcome to Hannibal.—Siege and capture by the Romans.—City repeopled. See PUNIC WARS: Second.

B. C. 211.—Fall of. See ROME: Republic: B. C. 218-202.

800-1016.—Lombard principality. See ITALY (Southern): 800-1016.

1501.—Capture, sack and massacre by the French. See ITALY: 1501-1504.

CAPUCHINS.—The Capuchins were only a branch of the great Franciscan order, and their mode of life a modification of its Rule. Among the Franciscans the severity of their Rule had early become a subject of discussion, which finally led to a secession of some of the members, of whom Matteo de' Bassi, of the convent of Montefalcone was the leading spirit. These were the rigorists who desired to restore the primitive austerities of the Order. They began by a change of dress, adding to the usual monastic habit a 'cappuccio,' or pointed hood, which Matteo claimed was of the same pattern as that worn by St. Francis. By the bull 'Religionis zelus' (1528), Matteo obtained from Pope Clement VII, leave for himself and his companions to wear this peculiar dress; to allow their beards to grow; to live in hermitages, according to the rule of St. Francis, and to devote themselves chiefly to the reclaiming of great sinners. Paul III. afterwards gave them permission to settle wherever they liked. Consistently with the austerity of their professions, their churches were unadorned, and their convents built in the simplest style. They became very serviceable to the Church, and their fearlessness and assiduity in waiting upon the sick during the plague, which ravaged the whole of Italy, made them extremely popular.—J. Alzog, *Manual of universal church history*, v. 3, p. 455.—See also CHRISTIANITY: 16th century: Counter-Reformation; FRANCE: 1003.

CARACAS.—Geographical description.—Climate.—Area and population.—“The city of Caracas, the capital of Venezuela, as well as its metropolis, and according to geographies one of the most delightful places of residence in the world, lies in a narrow valley between two high ranges of mountains, which lift their heads nearly nine thousand feet on one side, and something over six thousand on the other. To one standing in the centre of the city it seems to be entirely surrounded by peaks, to lie in a pocket or deep depression; but from the top of 'Calvary,' a hill which used to be a cemetery but is now a park, one can see two roads that lead out, two passes through the mountains whence the river comes and whither it flows. The natural beauties of the place are very marked, and make it plain why Venezuelans are proud of their chief city.”—W. E. Curtis, *Capitals of Spanish America*, p. 265.—“Caracas stands on the north bank of the River Guaire, on the inner slope of the coastal cordillera. The northern part of the city is thus higher than the southern. . . . The minimum temperature recorded in an average year

may be as low as 48° F. (this, of course, at night), but, in general, days and nights are mild, and only in the middle of the year is the air uncomfortably warm at any time of the day. . . . It would be obviously unfair to institute a comparison between a city of this size and any of the better known capitals of the Spanish-American republics, but, considered purely on its own merits, the capital of Venezuela has much to commend it, and undoubtedly exerts a peculiar fascination over most of those who visit it.”—L. V. Dalton, *Venezuela*, pp. 138-139.—See also LATIN AMERICA: Map of South America.

Government.—“The city of Caracas is a Federal district, like the city of Washington, with a governor appointed by the President. His office is in a memorable room, corresponding to the Independence Hall in Philadelphia. It was formerly the chapel of an old convent, confiscated like the rest, and the remainder of the building is used for the police headquarters, the municipal court, and the other local authorities.”—W. E. Curtis, *Capitals of Spanish America*, p. 265.

1567.—Caracas founded by Diego de Losada.—“During the governorship of Don Diego Ponce de Leon, Diego de Losada, a native of Tucuyo, travelled across through Villa Rica (Nirgua) to the Llanos, where his efforts, in spite of the many battles with the Indians, were directed rather towards settlement than conquest. Returned to the Villa de San Francisco (of Faxardo), he founded there—presumably in the latter part of 1567, though, strangely enough, the exact date is not recorded—the city of Santiago de Leon de Caracas. As he had on his travels adopted San Sebastian as his patron and protector against the poisoned arrows of the Indians, that saint's day has been celebrated in a special manner in Caracas since its foundation.”—L. V. Dalton, *Venezuela*, p. 76.

ALSO IN: *Bulletin of Pan-American Union*, Nov., 1919, p. 497.

1595.—Capture of Caracas by Drake.—“Drake's capture of Caracas was considered the boldest of all his achievements. It was in 1595 that he stood in with his squadron at La Guayra, and the inhabitants, when they realized the presence of the man who had devastated the West Indies, abandoned their homes and fled to the mountains, carrying the news of the arrival of the terrible Englishman. The Alcaldes of Caracas assembled all the men in the country who could carry arms, from the ages of sixteen to seventy, and marched down the wagon-road along which the railway runs, to stay the invader. Half way down they prepared an ambush and lay in wait to annihilate him. Drake landed at La Guayra with seventy men, captured a fellow named Villalpando, who, by gifts of treasure, agreed to guide him up the old, dangerous, and abandoned Indian trail. So, while the gallant Alcaldes with all the men of Caracas were marching down one road Sir Francis was marching up another, which they thought he would not dare to climb. Neither met an enemy, and while the Spaniards were lying in ambush Sir Francis [and his men were] . . . hanging the traitorous Villalpando in what is now the Plaza Bolivar, drinking the wine from the Spanish cellars, ravishing the women, and plundering the houses of the citizens. But one old hidalgo, named Alonzo de Ledoema, who remained behind, denounced the invaders from the threshold of his plundered house . . . and dared the bravest of the Englishmen to meet him in single combat. Sir

Francis and his crew jeered at the brave old man, and told him to send for his fellow-citizens who had gone down the mountain-road; but he insisted on fighting them alone, and was accommodated. They killed him as tenderly as they could, set fire to the city, and then, laden with all the portable property of value in Caracas, marched down the ravine to La Guayra again, and sailed away with a million dollars' worth of treasure, captured without the loss of a single man."—W. E. Curtis, *Capitals of Spanish America*, p. 264.

1721.—Founding of the university of Carácas.—"The founding of the University of Carácas by Philip V. in 1721 seemed to promise development of the colony on sound lines, but three years later a monopoly of trade was granted to the Compañía Guipuzcoana, a step which probably did more than any other single act to bring about disaffection towards Spain."—L. V. Dalton, *Venezuela*, p. 80.

1810-1919.—Development of the city.—Revolution.—Recovery.—"The city began to prosper after the subjugation of the Indians in spite of the misfortunes which had fallen upon the province (among these, the invasion and pillage [in 1595] by the pirates of the famous filibuster, Preston), and before long it was made the headquarters of the captaincy general of Venezuela. The government of Caracas was organized according to the system which had been adopted for the Spanish colonies of America. The illusion of El Dorado no longer engaged the minds of the conquerors, they occupied themselves in founding towns in due form, providing them with municipal governments, consisting of a town corporation or city council, and dividing the lands and the Indians among the colonies according to their merits. The Indian population, which rapidly perished on account of privations and bad treatment, was in time replaced by slaves brought from Africa. In Caracas, as in all the other towns established in Spanish America, the same customs were followed. It has been said that the location of Caracas was chosen for the purpose of preventing Indian ambushes and attacks. The topography of the land does not seem to confirm this. It is easy to imagine into what the first Spanish camp would develop, converted little by little into a town, which grew gradually until it became a city. Soon after becoming the headquarters of the captaincy general it acquired a decided preponderance in the management of the public questions of the province, obtained certain relative advantages which gave it undoubted superiority over the other urban centers, and its inhabitants progressed in the study of science and of the arts, so that in 1810, when the revolution of April 10 broke out, Caracas was the center of the uprising and gave an example to the other towns of the real spirit of Spanish America. . . . The Caracas revolutionary forces took advantage of the opportunity to spring their long-matured plans, in the execution of which they relied upon the support of many important persons besides that of some of the troops. . . . While the country was being pacified, Caracas began to restore the destruction caused by the war. Her advantages as the capital permitted her to rapidly repair all damages, although the civil wars with which the country was afflicted for a number of years considerably retarded her progress. Thus, at the close of a long struggle, she maintained intact her appearance as a colonial town. It was during the administration of Guzman Blanco that her transformation began. That government, imbued with a spirit of material progress, gave to Caracas the first elements of modern life by con-

structing beautiful driveways, theaters, plazas, buildings, and, for that period, artistic monuments."—*Bulletin of Pan-American Union*, Nov., 1910, pp. 500, 503, 509.

1812.—Destruction by earthquake.—"The fine city, of fifty thousand people and handsome edifices, was razed, people were crushed to death at home, in churches, and in business buildings. One patriot company of eight hundred men was almost entirely destroyed. There were twelve thousand dead and the city was a waste and the people were in a frenzy of grief and fear. Then came the priests wailing and proclaiming that it was the punishment of God for the guilt of revolution. This operated upon patriotism as the earthquake had upon the city, as a disintegrating blast. The revolutionary leaders were looked upon as the authors of the trouble and they lost their influence."—C. S. Osborn, *Andean land*, pp. 240-241.—See also COLOMBIA: 1810-1819.

1904-1919.—Municipal growth and changes.—"It is within the last 15 years [written in 1919] that Caracas has rapidly changed. The old colonial city with its flat, ill-proportioned houses, with their broad eaves and shady courts or patios, with its dusty, miry, and badly paved streets, slept through its sestas with the same apathy and unconcern as did its priests of the eighteenth century. It has now been transformed into a modern city full of the noise of traffic and enterprise, with paved streets, suitable for the use of automobiles, fine buildings, and beautiful driveways. To-day the city has a pleasing aspect and is growing more and more attractive. Its streets are still too narrow for the volume of traffic, especially in the business sections. The municipality embraces a large area, and it has not been necessary to build high buildings so that there are not many houses of two stories and fewer still of three."—*Bulletin of Pan-American Union*, Nov., 1919, p. 510.

CARACAS. See CARRACKS.

CARACTACUS, Tribentine prince captured by the Romans. See BRITAIN: 43-53.

CARAFFA, Antonio (d. 1693), a general in Austrian service. See HUNGARY: 1683-1687.

CARAONNE, Battle of (1814). See FRANCE: 1814 (January-March).

CARAS, or Carans, aboriginal tribe. See ECUADOR: Aboriginal kingdom of Quito.

CARAUSIUS, Marcus Aurelius Valerius (d. A. D. 293), Roman insurgent revolts against Romans. See BRITAIN: 288-297.

CARAVANS: Routes in medieval times. See COMMERCE: Medieval: 12th-16th centuries.

CARAVELS, GALLEONS, etc.—"The term caravel was originally given to ships navigated wholly by sails as distinguished from the galley propelled by oars. It has been applied to a great variety of vessels of different size and construction. The caravels of the New World discoverers may be generally described as long narrow boats of from 20 to 100 tons burden, with three or four masts of about equal height carrying sometimes square and sometimes lateen sails, the fourth mast set at the heel of the bow-sprit carrying square sails. They were usually half-decked, and adorned with the lofty forecastle and loftier poop of the day. The latter constituted over that part of the vessel a double or treble deck, which was pierced for cannon. . . . The galera was a vessel of low bulwarks, navigated by sails and oars, usually

twenty or thirty oars on either side, four or five oarsmen to a bench. . . . The galeaza was the largest class of galera, or craft propelled wholly or in part by oars. . . . A galeota was a small galera, having only 16 or 20 oarsmen on a side, and two masts. The galeon was a large armed merchant vessel with high bulwarks, three or four decks, with two or three masts, square rigged, spreading courses and top-sails, and sometimes top-gallant sails. . . . Those which plied between Acapulco and Manila were from 1,200 to 2,000 tons burden.

A CARAVEL, 17TH CENTURY

A galeoncillo was a small galeon. The carac was a large carrying vessel, the one intended for Columbus' second voyage being 1,250 toneles or 1,500 tons. A nao, or navio, was a large ship with high bulwarks and three masts. A nave was a vessel with deck and sails, the former distinguishing it from the barca, and the absence of oars from a galera. The bergantin, or brig, had low bulwarks. . . . The name brigantine was applied in America also to an open flat-bottomed boat, which usually carried one sail and from 8 to 16 men."—H. H. Bancroft, *History of the Pacific States*, v. 1, p. 187, foot-note.—See also AMERICA: 1402.

CARBERRY HILL, in Scotland near Edinburgh where Mary Stuart surrendered to the barons who rose against her. See SCOTLAND: 1561-1568.

CARBON COMPOUNDS. See CHEMISTRY: Organic; Defined.

CARBONARI.—"The most famous and widespread [of the Italian secret societies] was the Carbonari or society of charcoal-burners, which would appear to have been organized during the reign of Murat [king of Naples] about the year 1811. This association, which may be taken as most typical and influential of all the Italian societies, represents both the undercurrents of popular agitation, and, in its higher and most worthy aspect, the influence of the revolutionary ideas and principles that had been evolved out of the events of the preceding twenty years. Italy had been shaken to her very foundation, and it was impossible that the national elements should rearrange themselves as they had been before. Therefore Carbonarism is for the student of Italian history not a great political movement, not even a great organized revolt, but a widespread political symptom indicating the spirit of the newer life that was everywhere dominating the mind of the people of western Europe. Carbonarism was not limited to Italy; it included the popular elements in neighbouring countries, in France . . . in Swit-

zerland, and Spain, and established its branches wherever it could find a following. . . . In France it protested against the Restoration, in Spain against the wretched government of Ferdinand VII., while in Italy it opposed Austria and everything for which that state stood. It took as its cardinal principles individual liberty, constitutional government and national independence; and for its instruments of action, agitation and revolution. Its chief defects were the character of its organization, the method that it employed, and the aim that it placed before itself; for each was vague, insufficient, and unsatisfactory. In organization it was secret, cosmopolitan, and ceremonious. . . . In form the system was a republic, but the facts did not always bear out the theory. The territory of activity was divided into provinces, in each of which were one or more lodges whose numbers were increased as rapidly as possible. The members were also divided into 'tribes,' and there was a senate and a house of representatives that were supposed to make the laws for each 'tribe.' In point of fact, however, the Constitution of the Carbonari was never very rigorously followed, and in practical working the system became rather oligarchic than republican. Instead of unity and free intercourse there was little or no communication between the lodges. Initiated members did not know their leaders. Instead of common co-operation in the making of laws, obedience was demanded to rules the origin of which was kept a secret, and power was concentrated in the hands of a few men, to whose councils few were admitted and whose identity was in the majority of cases a secret. . . . Then, too, it was cosmopolitan, and not Italian. It believed in the propagation of its doctrines throughout Europe, and did not concentrate its efforts upon the redemption of Italy alone. It was, therefore, a part of the general European liberal movement with its centre in Italy, a connection that weakened its strength, and prevented its holding a secure place in the hearts of those who desired Italy's salvation, and who were willing to sacrifice themselves for her cause but not for the Cause of Europe."—C. M. Andrews, *Historical development of modern Europe*, v. 1 (1815-1850), pp. 193-195.—See also ITALY (SOUTHERN): 1808-1809; PORTUGAL: 1911-1914.

CARDROSS, Henry Erskine, 3d baron (1650-1693), Scottish nobleman, founder of Stuart's Town. See **SOUTH CAROLINA**: 1680.

CARDUCCI, Giosuè (1835-1907), Italian poet and critic, one of the founders of the modern school of Italian poetry, into which he infused life and spirit. He began to publish in 1865 and thenceforth produced a large number of poems. His best work was done in 1880 to 1900 when the "Ode barbare" and "Rime e ritmi" were written. His critical work, notably "Conversazioni critiche," and "Storia filosofica della letteratura Italiana," belongs to his later period. The year before his death he was awarded the Nobel prize for literature. See **ITALIAN LITERATURE**: 1830-1912; 1860-1914; **NOBEL PRIZES**: Literature: 1906.

CARDUCHI.—"South of the lake [Lake Van, in Asia Minor] lay the Carduchi, whom the later Greeks call the Gordyæans and Gordyenes; but among the Armenians they were known as Kordu, among the Syrians as Kardu. These are the ancestors of the modern Kurds, a nation also of the Aryan stock."—M. Duncker *History of antiquity*, bk. 2, ch. 12.—See also **GORDYENE**.—Under Saladin and the Ayonbite dynasty the Kurds played an important part in medieval history.

CARENCY, town in France near Arras, lost in the German drive of 1914, retaken by French in 1915, during World War. See **WORLD WAR**: 1915: II. Western front: a, 6.

CAREY, George Glas Sandeman (1867-), British army officer. During the World War, he improvised an army of engineers and laborers, and for six days held the Germans before Amiens, which they were unable to capture. See **WORLD WAR**: 1918: II. Western front: c, 21.

CAREY, Henry (c. 1692-1743), English musician and poet. He is remembered as the author "God Save the King," and of "Sally in Our Alley." He was also the composer of a number of cantatas and other compositions. See **MUSIC**: Modern: 1750-1870.

CAREY, Henry Charles (1793-1879), American economist. He was the author of a number of works on economics, notably *Principles of Political Economy* (1837-1840).

CAREY, William (1761-1834), English missionary and Orientalist. See **MISSIONS**, **CHRISTIAN**: Mission fields: India; Y. M. C. A.: 1625-1844.

CAREY ACT (1804), aided reclamation in the United States. See **CONSERVATION OF NATURAL RESOURCES**: United States: 1847-1901.

CARGILLITES, Presbyterian group of insurgents, followers of Donald Cargill, a Covenanting preacher, opposed to the religious policy of England. See **SCOTLAND**: 1681-1680.

CARHAM, Battle of (1018), fought and won by an army of Scots, under King Malcolm, invading the then English earldom of Bernicia, 1018, and securing the annexation of Lothian to the Scottish kingdom. The battlefield was near that on which Flodden was afterwards fought.—E. A. Freeman, *Norman conquest*, ch. 6, sect. 2.

CARIANS.—"The Carians may be called the doubles of the Leleges. They are termed the 'speakers of a barbarous tongue,' and yet, on the other hand, Apollo is said to have spoken Carian. As a people of pirates clad in bronze they once

upon a time had their day in the Archipelago, and, like the Normans of the Middle Ages, swooped down from the sea to desolate the coasts; but their real home was in Asia Minor, where their settlements lay between those of Phrygians and Pisidians, and community of religion united them with the Lydians and Mysians."—E. Curtius, *History of Greece*, bk. 1, ch. 2.—The country of the Carians was the mountainous district in the southwestern angle of Asia Minor, the coast of which is indented with gulfs and frayed with long-projecting rocky promontories. The island of Rhodes lies close to it on the south. The Carians were subjugated by the Lydian king, Cræsus, and afterwards passed under the Persian yoke. The Persians permitted the establishment of a vassal kingdom, under a dynasty which fixed its capital at Halicarnassus, and made that city one of the splendid Asiatic outposts of Greek art and civilization, though always faithfully Persian in its politics [see also **GREECE**: B. C. 500-493]. It was to the memory of one of the Carian kings at Halicarnassus, Mausolus, that the famous sepulchral monument, which gave its name to all similar edifices, and which the ancients counted among the seven wonders of the world, was erected by his widow. Halicarnassus offered an obstinate resistance to Alexander the Great and was destroyed by that ruthless conqueror after it had succumbed to his siege. Subsequently rebuilt, it never gained importance again. The Turkish town of Budrum now occupies the site.—C. T. Newton, *Travels and discoveries in the Levant*, v. 2.—See also **HAMITES**; **DORIANS AND IONIANS**; **MILETUS**.

CARIAY, Indian tribe. See **GUCK OR COCO GROUP**.

CARIBBEAN NATIONS, Central and South American states which border on the Caribbean sea.

United States relations with. See **DOLLAR DIPLOMACY**.

CARIBBEE ISLANDS. See **AMERICA**: 1493-1496; **WEST INDIES**.

CARIBS.—"Their kindred,—The warlike and unyielding character of these people, so different from that of the pusillanimous nations around them, and the wide scope of their enterprises and wanderings, like those of the nomad tribes of the Old World, entitle them to distinguished attention. . . . The traditional accounts of their origin, though of course extremely vague, are yet capable of being verified to a great degree by geographical facts, and open one of the rich veins of curious inquiry and speculation which abound in the New World. They are said to have migrated from the remote valleys embosomed in the Apalachian mountains. The earliest accounts we have of them represent with weapons in their hands, continually engaged in wars, winning their way and shifting their abode, until, in the course of time, they found themselves at the extremity of Florida. Here, abandoning the northern continent, they passed over to the Lucayos [Bahamas], and thence gradually, in the process of years, from island to island of that vast verdant chain, which links, as it were, the end of Florida to the coast of Paria, on the southern continent. The archipelago extending from Porto Rico to Tobago was their stronghold, and the island of Guadalupe in a manner their citadel. Hence they made their expeditions, and spread the terror of their name through all the surrounding countries. Swarms of them landed upon the southern continent, and overran some parts of terra firma. Traces of them have been discovered far in the interior of that vast country through which flows the Oroon-

oko. The Dutch found colonies of them on the banks of the Ikouteka, which empties into the Surinam; along the Esquibi, the Maroni, and other rivers of Guayana; and in the country watered by the windings of the Cayenne."—W. Irving, *Life and voyages of Columbus*, v. 1, bk. 6, ch. 3.—"To this account [substantially as given above] of the origin of the Insular Charaibes, the generality of historians have given their assent; but there are doubts attending it that are not easily solved. If they migrated from Florida, the imperfect state and natural course of their navigation induce a belief that traces of them would have been found on those islands which are near to the Florida shore; yet the natives of the Bahamas, when discovered by Columbus, were evidently a similar people to those of Hispaniola. Besides, it is sufficiently known that there existed anciently many numerous and powerful tribes of Charaibes on the southern peninsula, extending from the river Oronoko to Essequibe, and throughout the whole province of Surinam, even to Brazil, some of which still maintain their independency. . . . I incline therefore to the opinion of Martyr, and conclude that the islanders were rather a colony from the Charaibes of South America, than from any nation of the North. Roehofort admits that their own traditions referred constantly to Guiana."—B. Edwards, *History of British colonies in the W. Indies*, bk. 1, ch. 2.—"The Carabisee, Carabeesi, Charaibes, Caribs, or Galibis, originally occupied [in Guiana] the principal rivers, but as the Dutch encroached upon their possessions they retired inland, and are now daily dwindling away. According to Mr. Hillhouse, they could formerly muster nearly 1,000 fighting men, but are now [1855] scarcely able to raise a tenth part of that number. . . . The smaller islands of the Caribbean Sea were formerly thickly populated by this tribe, but now not a trace of them remains."—H. G. Dalton, *History of British Guiana*, v. 1, ch. 1.—E. F. im Thurn, *Among the Indians of Guiana*, ch. 6.—"Recent researches have shown that the original home of the stock was south of the Amazon, and probably in the highlands at the head of the Tapajoz river. A tribe, the Bakairi, is still resident there, whose language is a pure and archaic form of the Carib tongue."—D. G. Brinton, *Races and peoples*, p. 268.—"Related to the Caribs stand a long list of small tribes . . . all inhabitants of the great primeval forest in and near Guiana. They may have characteristic differences, but none worthy of mention are known. In bodily appearance, according to all accounts, these relatives of the Caribs are beautiful. In Georgetown the Arauacas [or Arawaks] are celebrated for their beauty. They are slender and graceful, and their features handsome and regular, the face having a Grecian profile, and the skin being of a reddish cast. A little farther inland we find the Macushi [or Maecis], with a lighter complexion and a Roman nose. These two types are repeated in other tribes, except in the Tarumi, who are decidedly ugly. In mental characteristics great similarity prevails."—*Standard natural history* (J. S. Kingsley, ed.), p. 237.—"The Arawaks occupied on the continent the area of the modern Guiana, between the Corentyn and the Pomeroun rivers, and at one time all the West Indian Islands. From some of them they were early driven by the Caribs, and within 40 years of the date of Columbus' first voyage the Spanish had exterminated nearly all on the islands. Their course of migration had been from the interior of Brazil northward; their distant relations are still to be found between the headwaters of the Paraguay

and Schingu rivers."—D. G. Brinton, *Races and peoples*, p. 268-269.—"The Kāpohn (Acawoios, Waikas, &c.) claim kindred with the Caribs. . . . The Acawoios, though resolute and determined, are less hasty and impetuous than the Caribs. . . . According to their tradition, one of their hordes removed [to the Upper Demerera] . . . from the Masaruni. The Parawianas, who originally dwelt on the Demerera, having been exterminated by the continual incursions of the Caribs, the Waika-Acawoios occupied their vacant territory. . . . The Macusis . . . are supposed by some to have formerly inhabited the banks of the Orinoco. . . . As they are industrious and unwarlike, they have been the prey of every savage tribe around them. The Wapisianas are supposed to have driven them northward and taken possession of their country. The Brazilians, as well as the Caribs, Acawoios, &c., have long been in the habit of enslaving them. . . . The Arecunas have been accustomed to descend from the higher lands and attack the Macusis. . . . This tribe is said to have formerly dwelt on the banks of the Uaupes or Ucayari, a tributary of the Rio Negro. . . . The Waraus appear to have been the most ancient inhabitants of the land. Very little, however, can be gleaned from them respecting their early history. . . . The Tivitivas, mentioned by Raleigh, were probably a branch of the Waraus, whom he calls Quarawetes."—W. H. Brett, *Indian tribes of Guiana*, pt. 2, ch. 13.—See also APALACHES.

CARILLON, French name of Fort Ticonderoga. See CANADA: 1758; TICONDEROGA.

CARINTHIA, one of the seven provinces of the Republic of Austria, northeast of Italy and southeast of Salzburg. In 1920 it had a population of 369,401 to an area of 3,678 square miles.

CARINUS (d. 285), Roman emperor, 283-284.

CARIPUNA, Indian tribe. See GUCK OR COCO GROUP.

CARISBROOKE CASTLE, situated in the Isle of Wight, England, wherein Charles I took refuge and was held in captivity for fourteen months, 1647-1648. See ENGLAND: 1647 (August-December).

CARISSIMI, Giacomo (c. 1604-1674), famous Italian composer. A master at Assisi, he removed to Rome 1628 and became master of S. Apollinaris. Noteworthy work in sacred cantatas and chamber-music. Teacher of Alessandro Scarlatti. Manuscripts of his works are in British Museum, National Library and the Conservatory, Paris; Christ Church, Oxford, and in the Lateran. See MUSIC: Modern: 1607-1734.

CARIZMIANS, people of an ancient Asiatic tribe. See JERUSALEM: 1244; KHUAREZM: 12th century.

CARLETON, Sir Guy. See DORCHESTER, GUY CARLETON, 1ST BARON.

CARLINGS, Carlovingians, or Carolingians, a dynasty of Frankish kings. See FRANKS: 768-814.

CARLISLE, John Griffin (1835-1910), American lawyer and politician. He served as member of the House of Representatives, senator, speaker of the House and secretary of the treasury under Cleveland. See CONGRESS OF THE UNITED STATES:

House: Speaker and the committee system. U. S. A.: 1900-1901.

CARLISLE, parliamentary and municipal borough of England. Capital of the county of Cumberland. Originally a Roman military post by the name of *Luguvallium* (see *LUGUVALIUM*). Overrun by the Picts and Scots, and destroyed by the Danes in 875. During the Civil War it sided with the monarchy, and in 1745 it was captured by the Pretender. It is an episcopal city, having a fine cathedral founded by William Rufus.

CARLISLE INDIAN SCHOOL. Through the influence of Capt. R. H. Pratt an industrial training school for Indians was founded in 1879 at Carlisle, Pennsylvania. See *INDIANS, AMERICAN*: 1910.

CARLISTS, supporters of Don Carlos, the Spanish pretender; adherents of Spanish legitimacy and Catholic orthodoxy. When Don Jaime succeeded his father Don Carlos in 1909, he stated his determination to avoid civil war, to keep the peace. See *SPAIN*: 1833-1846; 1873-1874; 1874-1875; 1900-1900; 1921: Political outlook.

CARLO ALBERTO, Italian battleship loaned to Marconi in 1902 in order to assist him in transmitting messages across the Atlantic.

CARLOMAN (d. 754), son of Charles Martel. He shared the kingdom with Pippin the Short; but abdicated and became a monk.

Carloman (751-771), son of Pippin, King of the Franks. See *CHRISTIANITY*: 496-800.

Carloman (828-880), king of Bavaria and Italy, eldest son of Louis the German.

Carloman (d. 884), king of West Franks, son of Louis the Stammerer.

CARLOPAGO, seaport town of Jugo-Slavia, on the Adriatic. In 1915 it was promised to be incorporated in the territory of Croatia, Serbia and Montenegro, by the Treaty of London. See *LONDON, TREATY OR PACT OF*.

CARLOS. See *CHARLES*.

CARLOS I (1863-1908), king of Portugal. See *PORTUGAL*: 1906-1909.

ment of Carlyle's work and influence see *ENGLISH LITERATURE*: 1832-1880; *ECONOMICS*: 19th-20th centuries: Influence of Carlyle, Ruskin, Tolstoi; *HISTORY*: 4, 27, 33.

CARMACK, Edward Ward (1858-1908). American journalist and politician. Member of Tennessee state legislature, 1884; United States House of Representatives and Senate, 1897-1907. See *TENNESSEE*: 1887-1908.

CARMAGNOLA, Francesco Bussone, Count of (1390-1432), Italian general. See *ITALY*: 1412-1447.

CARMAGNOLE, French revolutionary song and dance. See *FRANCE*: 1793 (February-April).

CARMANIA, converted Cunard steamship which on September 14, 1914, off the coast of Brazil, sank the German raider *Cap Trafalgar*, during the World War.

CARMANIANS.—"The Germanians of Herodotus are the Carmanians of the later Greeks, who also passed with them as a separate nation, though closely allied to the Persians and Medes. They wandered to and fro to the east of Persia in the district now called Kirman."—M. Duncker, *History of antiquity*, v. 5, bk. 8, ch. 3.

CARMATHIANS.—"In the 277th year of the Hegira [A. D. 800], and in the neighbourhood of Cufa, an Arabian preacher of the name of Carmath assumed the lofty and incomprehensible style of the Guide, the Director, the Demonstration, the Word, the Holy Ghost, the Camel, the Herald of the Messiah, who had conversed with him in a human shape, and the representative of Mohammed the son of Ali, of St. John the Baptist, and of the Angel Gabriel." Carmath was one of the eastern proselytes of the sect of the Ishmailians or Ishmailites—the same from which sprang the terrible secret order of the Assassins. He founded another branch of the Ishmailians, which, taking his name, were called the Carmathians. The sect made rapid gains among the Bedouins and were soon a formidable and uncontrollable body. "After a bloody conflict they prevailed in the province of Bahrein, along the Persian Gulf. Far and wide the tribes of the desert were subject to the sceptre, or rather to the sword, of Abu Said and his son Abu Taher; and these rebellious imams could muster in the field 107,000 fanatics. . . . The cities of Racca and Baalbec, of Cufa and Bassorah, were taken and pillaged; Bagdad was filled with consternation; and the caliph trembled behind the veils of his palace. . . . The rapine of the Carmathians was sanctified by their aversion to the worship of Mecca. They robbed a caravan of pilgrims, and 20,000 devout Moslems were abandoned on the burning sands to a death of hunger and thirst. Another year [929] they suffered the pilgrims to proceed without interruption; but, in the festival of devotion, Abu Taher stormed the holy city and trampled on the most venerable relics of the Mahometan faith. Thirty thousand citizens and strangers were put to the sword; the sacred precincts were polluted by the burial of 3,000 dead bodies; the well of Zemzen overflowed with blood; the golden spout was forced from its place; the veil of the Caaba was divided among these impious sectaries; and the black stone, the first monument of the nation, was borne away in triumph to their capital. After this deed of sacrilege and cruelty they continued to infest the confines of Irak, Syria and Egypt; but the vital principle of enthusiasm had withered at the root. . . . It is needless to enquire into what factions they were broken, or by whose swords they were finally extirpated. The sect of the Carmathians may be considered as the second vis-

ible cause of the decline and fall of the empire of the caliphs."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 52, and note by W. Smith.

CARMELITE FRIARS.—"About the middle of the [twelfth] century, one Berthold, a Calabrian with a few companions, migrated to Mount Carmel [see CHRISTIANITY: Map of Palestine in the time of Christ], and in the place where the prophet Elias of old is said to have hid himself, built a humble cottage with a chapel, in which he and his associates led a laborious and solitary life. As others continued to unite themselves with these residents on Mount Carmel, Albert the patriarch of Jerusalem, near the commencement of the next century, prescribed for them a rule of life; which the pontiffs afterwards sanctioned by their authority, and also changed in various respects, and when it was found too rigorous and burdensome, mitigated considerably. Such was the origin of the celebrated order of Carmelites, or as it is commonly called the order of St. Mary of Mount Carmel [and known in England as the White Friars]; which subsequently passed from Syria into Europe, and became one of the principal mendicant orders. The Carmelites themselves reject with disdain this account of their origin, and most strenuously contend that the holy prophet Elias of the Old Testament, was the parent and founder of their society. But they were able to persuade very few (or rather none out of their society), that their origin was so ancient and illustrious."—J. L. von Mosheim, *Institutes of ecclesiastical history*, bk. 3, century 12, pt. 2, ch. 2, sect. 21.

ALSO IN: G. Waddington, *History of the church*, ch. 19, sect. 5.—J. Alzog, *Manual of universal church history*, v. 2, sect. 244.—E. L. Cutts, *Scenes and characters of the middle ages*, ch. 5.

CARMEN SYLVA, pen name of Elizabeth of Rumania. Pauline Elizabeth Ottilie Louise (1843-1916) was born in Germany, a princess of Wied, and married to Prince Charles (Carol) of Rumania in 1869. She was crowned queen in 1881 when Rumania became a kingdom. She published some twenty volumes of verses, mostly in German; some in Rumanian, and one in English, "The Bard of the Dimbovitza," besides many novelettes and dramas.

CARMONA, a city in the province of Seville, Spain. See SPAIN: 711-713.

CARNABII, or *Cornabii*. See BRITAIN: Celtic tribes.

CARNAC.—"The celebrated monument of Carnac, in Brittany, consists of eleven rows of unhewn stones, which differ greatly both in size and height, the largest being 22 feet above ground, while some are quite small. It appears that the avenues originally extended for several miles, but at present they are very imperfect, the stones having been cleared away in places for agricultural improvements. At present, therefore, there are several detached portions, which, however, have the same general direction, and appear to have been connected together. . . . Most of the great tumuli in Brittany probably belong to the Stone Age, and I am therefore disposed to regard Carnac as having been erected during the same period."—J. Lubbock, *Prehistoric times*, ch. 5.

CARNARVON, British cruiser in the battle of the Falkland islands (December, 1914) during the World War.

CARNARVONSHIRE, a county in North Wales. Carnarvon, the county town, is historically noted as the birthplace of Edward II, who in his infancy was created Prince of Wales by his father.

CARNAVALET, Musée, also called Musée Historique de la Ville, Paris. It is designed to illustrate the history of Paris and the revolution. Begun in 1544, the building was originally the Hôtel des Ligneris and then de Kernevenoy. In 1866 it was turned into a museum. Its collections comprise prehistoric monuments, Roman antiquities, monuments of the Merovingian period, bas-reliefs of scenes from the history of Paris, memorials of Paris, and numerous portraits of men prominent in the Revolution.

CARNEGIE, Andrew (1835-1919), American manufacturer and philanthropist. Superintendent of military railroads and government telegraph lines in the East during the Civil War; founder of Carnegie Steel Company (see CAPITALISM; 19th century: United States; and U. S. A.: 1897); gave liberally to public libraries and educational institutions.—See also CARNEGIE HERO FUNDS; CARNEGIE INSTITUTION, WASHINGTON; FOUNDATIONS, EDUCATIONAL AND PHILANTHROPIC, UNITED STATES; Carnegie Foundations; INSTITUTION; LIBRARIES: Modern: Carnegie library gifts; PEACE MOVEMENT: Peace organizations.

Central American court of justice. See CENTRAL AMERICA: 1908.

Pan-American building at Washington. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1906-1908.

Dunfermline, Scotland, gift to. See RECREATION: 1914.

CARNEGIE FOUNDATION. See FOUNDATIONS, EDUCATIONAL AND PHILANTHROPIC, UNITED STATES: Carnegie Foundations.

CARNEGIE HERO FUNDS.—April 15, 1904, a letter from Andrew Carnegie was made public announcing that he had set apart a fund of \$5,000,000 to be known as "The Hero Fund." In this letter Mr. Carnegie said: "We live in an heroic age. Not seldom are we thrilled by deeds of heroism where men or women are injured or lose their lives in attempting to preserve or rescue their fellows; such are the heroes of civilization. The heroes of barbarism maimed or killed. I have long felt that the heroes and those dependent upon them should be freed from pecuniary cares resulting from their heroism and as a fund for this purpose I have transferred to a commission \$5,000,000 of collateral 5 per cent bonds of the United States Steel Corporation." Only such as follow peaceful vocations on sea or land in the United States or Canada are eligible to receive money or medals for heroic deeds. The commission which has charge of the fund has its headquarters in Pittsburg, Pa. A similar fund in Great Britain was created soon afterward by Mr. Carnegie, and in May, 1909, he placed, for the same purpose, \$1,000,000 of the bonds of the United States Steel Corporation in the hands of trustees in France, under the sanction of the French government.—See also U. S. A.: 1909 (May 25).

CARNEGIE INSTITUTE, Pittsburgh.—The Carnegie Institute of Pittsburgh was founded in 1895 by Andrew Carnegie, who in 1890 offered \$1,000,000 to the city for the erection of buildings to house a museum, art gallery, library, and library branches. The city obtained legislative permission to accept the gift and the first building—the main library—was opened in 1895. From time to time the founder added large sums, to his generous donation, for the erection of additional buildings and for endowments. In 1907 the Institute was re-dedicated and is now one of the finest educational centers in the United States. "The Carnegie Institute, of Pittsburgh, comprises a group of cultural and educational departments embracing Fine

Arts, Museum, Music Hall, Library School and Institute of Technology. All of these departments, excepting the Technical Schools, are housed in a building which stands among the world's great pieces of architecture, and the Technical Schools are located in a group of commodious buildings on a large tract of land adjoining the Carnegie Institute. . . . In addition to the departments named there is the great Carnegie Library system, with the main library established in the same building with the Carnegie Institute, and eight branches placed at convenient locations throughout the city of Pittsburgh. . . . The Music Hall, which was originally under the direction of the Library Trustees . . . was, on January 1, 1916, transferred from the Carnegie Library control to the control of the Board of Trustees of the Carnegie Institute. . . . The Carnegie Library School is the outgrowth of a class of five students formed in October, 1900, to train young women for the staff of the Children's Department of the Carnegie Library of Pittsburgh. . . . On April 1, 1915, it became a department of the Carnegie Institute, and its name was officially changed to the Carnegie Library School. . . . In the Carnegie Music Hall . . . two public recitals are offered each week during nine months of the year, or approximately seventy-five recitals each season. . . . [The Museum and Art Gallery are very important sections of the Institute, and have a decided influence on American art. The donor desired that the directors should encourage American artists. Therefore the constitution provides that] within one year from the said appointment and in like manner within each succeeding year thereafter, the Fine Arts Committee shall submit to the Board of Trustees [for purchase if authorized by a two-thirds vote] not less than two pictures painted by American artists . . . completed within the year for which said committee shall be appointed."—*Manual of the Public Benefactions of Andrew Carnegie*, pp. 1, 8, 9, 25, 43.—The pictures are required to be exhibited for the public, in the Art Gallery, a provision which has created a significant annual exhibition.—See also COLLEGES AND UNIVERSITIES.

CARNEGIE INSTITUTION, Washington.—The following information relative to the founding, the plan and the work of the Carnegie Institution of Washington, is derived from the authorities of the Institution:

The Institution was founded by Mr. Andrew Carnegie, January 28, 1902, when he gave to a board of trustees \$10,000,000 in registered bonds, yielding five per cent annual interest. To this endowment fund an addition of \$2,000,000 was made by Mr. Carnegie on December 10, 1907. The Institution was originally organized under the laws of the District of Columbia as the Carnegie Institution. Subsequently, however, it was incorporated by an act of Congress, approved April 28, 1904, under the title of the Carnegie Institution of Washington. The articles of incorporation declare, in general, "that the objects of the corporation shall be to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." By the act of incorporation the Institution was placed under the control of a board of twenty-four trustees, all of whom had been members of the original board referred to above.

Since the object of the Institution is the promotion of investigation "in the broadest and most liberal manner," many projects in widely different fields of inquiry have been considered, or are

under consideration, by the Executive Committee. These projects are chiefly of three classes, namely:

First, large projects or departments of work whose execution requires continuous research by a corps of investigators during a series of years. Ten such departments have been established by the Institution. . . .

Second, minor projects which may be carried out by individual experts in a limited period of time. Many grants in aid of this class of projects have been made.

Third, research associates and assistants. Under this head aid has been given to a considerable number of investigators possessing exceptional abilities and opportunities for research work.

An annual appropriation is made for the purpose of publishing the results of investigations made under the auspices of the Institution, and for certain works which would not otherwise be readily printed. Its publications are not distributed gratis, except to a limited list of the greater libraries of the world. Other copies are offered for sale at prices only sufficient to cover the cost of publication and transportation to purchasers. Lists are furnished on application.

George Iles, in his "Inventors at Work," describes and characterizes the aims and guiding principles of the Institution as follows: "In its grants for widely varied purposes the policy of the Institution is clear: only those inquiries are aided which give promise of fruit, and in every case the grantee requires to be a man of proved ability, care being taken not to duplicate work already in hand elsewhere, or to essay tasks of an industrial character. Experience has already shown it better to confine research to a few large projects rather than to aid many minor investigations with grants comparatively small.

"One branch of work reminds us of Mr. Carnegie's method in establishing public libraries—the supplementing of local public spirit by a generous gift. In many cases a university or an observatory launches an inquiry which soon broadens out beyond the range of its own small funds; then it is that aid from the Carnegie Institution brings to port a ship that otherwise might remain at sea indefinitely. Let a few typical examples of this kind be mentioned:—Dudley Observatory, Albany, New York, and Lick Observatory, California, have received aid toward their observations and computations; Yerkes Observatory, Wisconsin, has been helped in measuring the distance of fixed stars. Among other investigations promoted have been the study of the rare earths and the heat-treatment of some high-carbon steels. The adjacent field of engineering has not been neglected; funds have been granted for experiments on ship resistance and propulsion, for determining the value of high pressure steam in locomotive service. In geology an investigation of fundamental principles has been furthered, as also the specific problem of the flow of rocks under severe pressure. In his remarkable inquiry into the economy of foods, Professor W. O. Atwater, of Wesleyan University, Middletown, Connecticut, has had liberal help. In the allied science of preventive medicine a grant is advancing the study of snake venoms and defeating inoculations.

"At a later day the Institution may possibly adopt plans recommended by eminent advisers of the rank of Professor Simon Newcomb, who points out that analysis and generalization are to-day much more needed than further observations of a routine kind. He has also had a weighty word to say regarding the desirability of bringing together

for mutual attrition and discussion men in contiguous fields of work, who take the bearings of a great problem from different points of view."—G. Iles, *Inventors at work*, p. 276.

"The different departments of research have been supplied . . . quarters of their own to enhance the efficiency of their work. The department of botanical research has established a laboratory at Tucson, Arizona, equipped for the special work of botanical research in desert areas. The plant consists of two laboratories, two shops, and two stone reservoirs located in a land reservation of about eight hundred acres. There is also a laboratory at Carmel, California. There are various reservations of land for plantations in the mountains of Arizona and in the desert areas of the southwestern states and adjacent areas of Mexico. The department of experimental evolution has a tract of land of about thirty acres at Cold Spring Harbor, Long Island, with an equipment of fourteen buildings, besides a naphtha launch for marine collecting. In addition, the department has recently secured a small island in Long Island Sound, where it conducts investigations of plants and animals in a state of isolation. The department of geophysics has a beautiful laboratory in the city of Washington on a site of five acres. The department of marine biology has a plant at Loggerhead Key, Dry Tortugas, Florida, in a region remarkable for its abundance of marine life. . . . For the purposes of studies in meridian astrometry it was decided in 1903 to establish an observatory in the southern hemisphere. The project was carried out with the approval of the government of Argentina, and the observatory located in 1909 on national land at San Luis, Argentine Republic. . . . The equipment of the solar observatory consists of two separate but closely-related parts. These are an observatory with telescopic equipment and physical laboratory on Mount Wilson, California, and an office, shops, and physical laboratory in Pasadena, twelve miles away. . . . A novel feature of the equipment of the observatory consists of a tower telescope sixty feet in height. An additional tower telescope one hundred and fifty feet high is now [1910] in the course of construction. In 1907 work was begun on the nutrition laboratory, which is situated near the Harvard Medical School in Boston. Through the courtesy of the authorities of Harvard College, heat, light, power, compressed air, vacuum and refrigeration are obtained from the near-by plant of the Harvard Medical School. The last of the departments having special equipment is that of terrestrial magnetism, which is conducting a general magnetic survey of the earth. To aid in this work the brigantine *Galilee* of San Francisco was chartered from 1904 until 1908. In the latter part of 1908 the construction of the non-magnetic ship *Carnegie* was begun, and she was launched in June, 1900, beginning her first voyage in August of the same year. Her novel equipment and freedom from magnetism permit making precise magnetic observations at sea, a feat which heretofore has been attended with the greatest difficulty."—L. P. Ayres, *Seven great foundations*, pp. 34-37.—See also FOUNDATIONS: Carnegie Institution.

CARNEIAN FESTIVAL, a Spartan festival, said to have been instituted 676 B. C. "The Carneian festival fell in the Spartan month Carneius, the Athenian Metageitnon, corresponding nearly to our August. It was held in honour of Apollo Carneius, a deity worshipped from very ancient times in the Peloponnese, especially at Amyclæ. . . . It was of a warlike character, like the Athe-

nian Boedrömia."—G. Rawlinson, *Note to Herodotus*, bk. 7.

ALSO IN: E. Curtius, *History of Greece*, bk. 2, ch. 1.

CARNIANS, Alpine tribe. See RHÆTIA.

CARNIFEX FERRY, Battle of. See U. S. A.: 1861 (August-December: West Virginia).

CARNIOLA, formerly a crown-land of Austria, north-east of Trieste and Istria. During the Roman empire, it was a part of Noricum and Pannonia, and was colonized by the Slovenes at the end of the sixth century. After 1282 it belonged to the house of Hapsburg (see AUSTRIA: 1240-1282; Map showing Hapsburg possessions), except during the period (1809-1813) when it formed part of the Illyrian provinces under Napoleon (see GERMANY: 1809; July-September). By the Treaty of St. Germain Austria was obliged to relinquish this territory, whose population is predominantly Slovene, and it now forms a part of Jugo-Slavia.—See also BALKAN STATES: Map showing distribution of nationalities; AUSTRIA-HUNGARY: 1918.

CARNOT, Lazare Nicholas Marguerite (1753-1823), French statesman, strategist and geometer. In 1791 deputy to the legislative assembly; 1792 deputy to the Convention, voting for the execution of Louis XVI; 1793 member of the committee of public safety; 1793-1795, in charge of the organization and direction of the armies, called the "organizer of victory"; 1795, president of the Convention; 1795, member of the directory and twice its president. On account of the *coup d'état* of Fructidor, 1797, fled to Switzerland, then to Germany; 1800-1801, minister of war; 1802-1807, tribune. Too ardent a republican to fight in the Napoleonic wars of aggression, he won distinction in the defense of Antwerp, 1814; Napoleon's minister of interior during the Hundred Days; proscribed by Louis XVIII, he lived in Magdeburg. He was author of treatises on mathematics and military strategy.—See also FRANCE: 1793 (June-October); 1793 (July-December); 1793 (October): Battle of Wattignies; 1794 (March-July); 1794 (June-July): French victory at Fleurus; 1794-1795 (July-April); 1795 (June-December); 1795 (October-December); 1797 (September); MILITARY ORGANIZATION: 26.

CARNOT, Marie François Sadi (1837-1894), fourth president of the third French republic. In 1871, member of National Assembly; 1876, member of Chamber of Deputies; 1878, secretary to minister of public works; 1880, minister of public works; 1883-1884, vice-president of the chamber; 1885, minister of finance; following the resignation of Jules Grévy, became president for seven critical years, 1887-1894; assassinated at Lyons by Santo Césario, an Italian anarchist. See ANARCHISM: 1894 (June 24); FRANCE: 1875-1889; 1894-1895.

CARNOT DOCK. See CALAIS: 1875-1911.

CARNUTES, a tribe who occupied a region supposed to be the center of Gaul. The modern city of Chartres stands in the midst of it.—G. Long, *Decline of the Roman republic*, v. 3, ch. 22.—See also VENETI of WESTERN GAUL.

CAROL I, king of Rumania. See CHARLES I, king of Rumania.

Carol, crown prince of Rumania. See CHARLES, crown prince of Rumania.

CAROLINA, Founding of. See U. S. A.: 1607-1752.

1669-1693.—Government.—Fundamental constitutions. See NORTH CAROLINA: 1660-1693.

Grants. See AMERICA: 1629; NORTH CAROLINA: 1663-1670.

CAROLINAS. See NORTH CAROLINA; SOUTH CAROLINA.

CAROLINE, Amelia Elizabeth (1768-1821), queen of George IV of England. Her trial and death. See ENGLAND: 1820-1827.

CAROLINE, a small American vessel destroyed by the Canadians in December, 1837, off Grand Island, almost causing serious trouble between Great Britain and the United States. See CANADA: 1837-1838; 1840-1841.

CAROLINE, Fort: Captured by the Spaniards. See FLORIDA: 1565.

CAROLINE BOOKS, a work put forth by Charlemagne against image-worship.

CAROLINE ISLANDS, an extensive group of small islands in the Pacific, lying southeastwardly from the Philippines, were first called the New Philippines, but afterwards named the Carolines, in honor of Charles II of Spain. The islets are some 500 in number, but their total population is only 20,000 or 30,000, mostly contained in the three larger islands, Ruk, or Rouk, Ponape, and Yap, or Guap. That some of them were once inhabited by a race capable of great works is shown by the existence of ruins, constructed of enormous basalt blocks. The existing natives are Polynesian. The Carolines were discovered by the Portuguese, in 1527. Their possession was long in dispute between Spain and Germany, but settled, by papal arbitration, in favor of the former, in 1885.—See also BRITISH EMPIRE: Map of the World.

1899-1920.—Sale by Spain to Germany.—By a treaty concluded in February, 1890, the Caroline Islands, the Western Carolines or Pelew Islands, and the Marianne or Ladrone Islands (excepting Guam), were sold by Spain to Germany for 25,000,000 pesetas—the peseta being equivalent to a fraction less than twenty cents. Spain reserved the right to establish and maintain naval and mercantile stations in the islands, and to retain them in case of war. Spanish trade and privileges for the Spanish religious orders are guaranteed against interference. As a result of the World War these groups of islands were placed under the control of Japan as "mandatory."—See also WORLD WAR: 1914; VII. German Pacific islands; YAP.

CAROLINGIANS, or Carolingians, dynasty of Frankish kings. See FRANCE: 9th century, and 877-987; FRANKS: 768-814; GERMANY: 481-768; SWITZERLAND: 536-843.

CARP, Petrahe (1837-), Rumanian statesman. Took part in the overthrow of Cuza; after ascent of Prince Charles, entered diplomatic service; 1870-1876, minister of foreign affairs; 1892-1895, minister of commerce, agriculture, and domains; 1900-1901, premier and minister of finance; 1911-1912, premier. See WORLD WAR: 1916: V. Balkan theater: c, 3.

CARPATHIANS, a great mountain mass, in Central Europe. "Though they curve far away round the Hungarian plain, the Carpathians return to the river [Danube] again, below its final turn eastwards."—H. B. George, *Relations of history and geography*, p. 251.—The mountains and their passes have had a strong influence on European history. "The wall of the Carpathians, bulwark of the Central Europe, split the westward moving Slav hordes in the 6th century, diverting one southward up the Danube Valley to the Eastern Alps, and turning one northward along the German lowlands."—E. C. Semple, *Influences of geographic environment*, p. 532.—In the last years of the ninth century the Magyars made their way through the Vereczka pass into the country drained by the Upper Theiss, and founded the kingdom of

Hungary. In 1914 the Russian armies invaded Hungary through the Carpathian passes. Those in the eastern Carpathians leading from Galicia and Bukovina, such as the Dukia, Rostoki, Uszok, Jablonitza, Borgo and other passes were seized and temporarily held by the Russians in the World War. The Rumanians invading Transylvania used the passes farther south, such as the Roterturm. The Germans, in turn, attacking Rumania, used the Vulcan, Roterturm and other passes.—See also WORLD WAR: 1915: III. Eastern front: a, 1; c, e.

CARPENTER, Alfred Francis Blakeney, British captain, commander on cruiser *Vindictive* in attack on Zeebrugge. See WORLD WAR: 1918: IX. Naval operations: a, 1.

CARPENTER, Daniel (1815-1866), American police inspector, active in New York draft riots. See NEW YORK CITY: 1863.

CARPET-BAGGERS, term applied to those northerners who went to exploit the South after the Civil War, particularly political adventurers who used the Negro vote for personal gain. See BLACK AND TAN CONVENTION; KU KLUX KLAN; LOUISIANA: 1865-1867; 1874-1877; SUFFRAGE, MANHOOD: United States: 1864-1921.

CARPINI, Giovanni Piano (c. 1200), Franciscan monk. See HUNGARY: Origin of Hungarians.

CARPOCRATIANS, a sect combining Platonic principles with Christian ideals; founded by Carpocrates, an Alexandrian Gnostic in the second century.

ALSO IN: *New Schaff-Herzog religious encyclopedia*, v. 2, p. 423.

CARR, Sir Robert (d. 1667), commissioner sent from England to settle disputes in America. See DELAWARE: 1664.

CARR DIKE, a Roman work in Britain, formed for the draining of the Lincolnshire Fens, and used, also, as a road.—H. M. Scarth, *Roman Britain*, ch. 16.

CARRACKS, or Caracs, "a large species of merchant vessel, principally used in coasting trade," among the Spaniards of the fifteenth and sixteenth centuries.—W. Irving, *Life and voyages of Christopher Columbus*, v. 1, bk. 6, ch. 1, foot-note.—See also CARAVELS.

CARRANZA, Venustiano (1850-1920), Mexican revolutionist and president. Took part in a local revolt in Coahuila in 1893; served as member of state legislature, federal senator, and governor of state; supported the Madero revolution; secretary of war in Madero's provisional cabinet; after the death of the latter in 1913 became the leader of the Constitutionalists; in 1915 his government was recognized as the *de facto* government of Mexico; his election as president took place in 1917; he was treacherously murdered in 1920, by followers of General Herrera, while in flight from Mexico City.—See also MEXICO: 1913-1914; 1914-1915; 1916-1917; 1918; 1920 (April-May); 1920 (May); U. CARREL, Alexis (1873-), American surgeon. In 1905 came from France and at once attracted attention by his research work; in 1909 became attached to the Rockefeller Institution; in 1912 received Nobel prize for medicine; wrote many works on the details of advanced surgery, especially that of blood vessels and the transplantation of organs and tissues (see MEDICAL

SCIENCE: Modern: 20th century: Advance in surgical method); accomplished remarkable feats in treating wounded in the World War.—See also NOBEL PRIZES: Medicine: 1912.

CARREL-DAKIN TREATMENT OF WOUNDS. See SCIENCE: 20th century: Medicine; MEDICAL SCIENCE: Modern: 1914-1918: War medicine and surgery.

CARRERA, Martin, Mexican general elected acting president August 15, 1855. See MEXICO: 1848-1861.

CARRERA, Rafael (1815-1865), Guatemalan revolutionist. Joined revolt against Federal party of Central America (1837); became commander of Guatemalan insurgents; president of Guatemala, 1844-1848, and 1852; made president for life and practically dictator (1854-1865).—See also CENTRAL AMERICA: 1821-1871.

CARRHÆ, town in Mesopotamia. See HARAN. B. C. 53.—Battle of. See ROME: B. C. 57-52.

CARRICK'S FORD, Battle of. See U. S. A. 1861 (June-July).

CARRIER, Jean Baptiste (1756-1794), a leader in the French Revolution, one of the most noted of the terrorists; in 1792, elected to the National Convention; sent into Flanders as a commissioner. The next year he became a member of the Revolutionary Tribunal, which he was influential in establishing, and was one of the judges who voted for the death of Louis XVI, and of the Duke of Orleans, "Philippe Egalité." In 1793, after the overthrow of the Girondins, in which he was especially active, was sent to Nantes where he established the Reign of Terror, and made himself notorious by resort to "fusillades" and "noyades," to clear the prisons. It is not known how many died by these means. In 1794 he was arrested by order of the Revolutionary Tribunal in Paris, and sent to the Guillotine.

CARRIZO INDIANS. See INDIANS, AMERICAN: Cultural areas in North America; Southeastern area.

CARROCCIO.—"The militia of every city [in Lombardy, or northern Italy, eleventh and twelfth centuries] was divided into separate bodies, according to local partitions, each led by a Gonfaloniere, or standard-bearer. They fought on foot, and assembled round the carroccio, a heavy car drawn by oxen, and covered with the flags and armorial bearings of the city. A high pole rose in the middle of this car, bearing the colours and a Christ, which seemed to bless the army, with both arms extended. A priest said daily mass at an altar placed in the front of the car. The trumpeters of the community, seated on the back part, sounded the charge and the retreat. It was Heribert, archbishop of Milan, contemporary of Conrad the Salic, who invented this car in imitation of the ark of alliance, and caused it to be adopted at Milan. All the free cities of Italy followed the example: this sacred car, intrusted to the guardianship of the militia, gave them weight and confidence."—J. C. L. de Sismondi, *History of the Italian republics*, ch. 1.

CARROLL, Charles, of Carrollton, (1737-1832), American patriot. Member of Colonial Commis-

sion to persuade Canadians to join in war against England 1776; member of Congress 1776; signed Declaration of Independence August 2, 1776; member of commission which drafted Maryland constitution 1776; member of state senate 1777-1800; returned to Congress 1777; United States senator 1789-1792; member of Maryland-Virginia boundary commission 1799; last survivor of the fifty-six signers of the Declaration of Independence.—See also U. S. A.: 1776 (July): Text of Declaration of Independence.

CARSO or Karst plateau, a large mountainous formation near the head of the Adriatic sea; the scene of an offensive which the Italians started in May, 1917, but which was stemmed by the superior Austro-German drive of October, 1917.—See WORLD WAR: 1916; IV. Austro-Italian front: c; 1917: IV. Austro-Italian front: a, 3; a, 4.

CARSON, Christopher, known as "Kit Carson" (1809-1868), American hunter, trapper, and scout. In 1826-1830, took part in hunting and trapping expeditions to New Mexico, California, and the Rocky Mountains; 1832-1840, hunter for garrison at Fort Bent; 1842-1844, 1846-1847; accompanied Fremont on western expeditions; 1854, appointed Indian agent at Taos, New Mexico; 1861-1865, served the government in the Civil War, especially against the Confederates in Texas and the Navajo Indians (see INDIANS: AMERICAN: 1860-1865); 1865, brevetted brigadier general.

CARSON, Edward Henry, 1st Baron (b. 1854), British statesman, Ulster leader. In 1892 he was solicitor-general for Ireland; 1900-1906, solicitor-general for England; active in parliament on the side of the crown during the land troubles; 1912-1913, leader of Ulster resistance to the home rule bill for Ireland; 1913, head of executive committee of the provisional government for Ulster; 1915, attorney-general; 1917, first lord of the admiralty; 1917-1918, member of war cabinet without portfolio. See IRELAND: 1918 (March 6).

CARSTENS, Asmus (1754-1798), German painter and engraver. See PAINTING: Europe: 19th century.

CART WAR (1857). See TEXAS: 1850-1861: Troubles with Indians and Mexicans.

CARTAGENA, Carthage or New Carthage, city of southeastern Spain, province of Murcia. Cartagena was a prosperous city under the Romans, who made it a colony and called it Colonia Viatrix Julia Nova Carthago. "It stands about half-way down the coast of Iberia in a gulf which faces south-west, running about twenty stades [stade, or furlong, equals about 220 yards] inland, and about 10 stades broad at its entrance. The whole gulf is made a harbour by the fact that an island lies at its mouth and thus makes the entrance channels on each side of it exceedingly narrow. . . . In the recess of the gulf a mountain juts out in the form of a chersonese [peninsula], and it is on this mountain that the city stands, surrounded by the sea on the east and south, and on the west by a lagoon extending so far northward that the remaining space to the sea on the other side, to connect it with the continent, is not more than two stades. The city itself has a deep depression in its centre, presenting on its south side a level approach from the sea; while the rest of it is hemmed in by hills, two of them mountainous and rough, three others much lower, but rocky and difficult of ascent; the largest of which lies on the east of the town running out into the sea, on which stands a temple of Asclepius. Exactly opposite this lies the western mountain in a closely corresponding position, on which a palace had been erected at great cost,

which it is said was built by Hasdrubal when he was aiming at establishing royal power. . . . The lagoon has been connected with the adjoining sea artificially for the sake of the maritime folk; and over the channel thus cut between it and the coast a bridge has been built, for beasts of burden and carts to bring in provisions from the country."—*Histories of Polybius, bk. x, ch. 10.*

Commercial and naval importance.—Population.—"The naval port of Cartagena owes its importance primarily to its splendid harbour, but recently mining has added to its prosperity."—H. R. Mill, *International geography, p. 377.*—"The discovery of the rich lead and silver mines near the town contributed much towards its prosperity. Successive Spanish governments have attempted to restore to Cartagena its ancient strategical importance. They have constructed docks and arsenals, and erected impregnable fortifications, but, in spite of this, the population of the town is hardly a third of what it was in the middle of the eighteenth century. The character of its commerce is almost local, notwithstanding its excellent post, and esparto grass, mats, fruits, and ore constitute the leading articles of export."—E. Reclus, *Universal geography, v. 1, p. 422.*—Cartagena's population was stated by the 1910 census to be 102,542. It has a fortress, repair docks and works, and a wireless telegraphic station.

B. C. 299-221.—Founding of the city by the Carthaginians.—"Hasdrubal, son-in-law and successor of Hamilcar Barca in Spain, founded New Carthage—modern Cartagena—sometime between 299 and 221 B. C. to be the capital of the Carthaginian dominion in the Spanish peninsula."—R. B. Smith, *Carthage and the Carthaginians, ch. 9.*

Also IX: U. R. Burke, *History of Spain, v. 1, p. 10.*

B. C.—210.—City stormed and taken by Publius Scipio.—Roman rule.—"The Romans, meanwhile, renewed the war in Spain where the youthful Publius Cornelius Scipio . . . had been placed in command. By reckless daring and good fortune rather than by military skill, Scipio won several battles and captured the great city of Cartagena."—C. E. Chapman, *History of Spain, p. 13.*—See also PUNIC WARS: Second.

Also IX: U. R. Burke, *History of Spain, v. 1, pp. 12-13.*—*Histories of Polybius, bk. x, ch. 11-15.*

409-713.—Taken by the Vandals and Alans.—Occupation of the Visigoths.—"In the opening years of the fifth century the Vandals, who had been in more or less hostile contact with the Romans during more than two centuries, left their homes within modern Hungary. . . . With them went the Alans, and a little later a group of the Suevians joined them. They invaded the region of what is now France, and after devastating it for several years, passed into Spain in the year 400. There seems to have been no effective resistance, whereupon the conquerors divided the land giving the southern country from Portugal to Cartagena to the Alans and another group of Vandals."—C. E. Chapman, *History of Spain, pp. 26-27.*—The Visigoths of later invasions conquered the Alans and so reduced the power of the Vandals that they migrated anew in 420. See SPAIN: 409-414.

711-1276.—Captured by the Saracens.—Became an independent kingdom.—Destroyed by Ferdinand II of Castile.—Returned to the Moors.—Conquered by James I of Aragon.—Early in the eighth century Cartagena was taken by the Saracens, under whom it became an independent principality. It was destroyed by Ferdi-

nand II of Castile (1243) and restored to the Moors, who retained it until 1276 when it was finally conquered by James I of Aragon.

1873-1874.—Cartagena proclaimed an independent cantonal government.—Besieged and taken by the Spanish.—In the political struggles of the nineteenth century Cartagena played an unimportant part until 1873 when it proclaimed an independent cantonal government. "Cartagena, one of the most violent, proved the most stubborn of the revolting cities. The soldiers fraternized with the mob; a deputy and a general, Contreras, led them. The forts and artillery depôt fell into their hands, with several hundred cannon. The armour-clad squadron joined them, increasing their power for harm and making them safe on the seaside. Closely watched by British ships of war, the ironclads, manned by undisciplined desperadoes, steamed up and down the coast spreading the doctrines of the Revolution. . . . When Castelar took office (Sept. 8, 1873), the history of the Republic was already a long and bloody one. . . . In Cartagena the powers of disorder had run a wilder riot even than in Málaga [Málaga and Cartagena were the two chief centres of agitation.] The convicts released by the mob were more reckless and fiercer than their liberators. Their resistance, too, was more determined, for to them defeat meant exile or return to gaol. Before Castelar became President, their means of doing harm had been curtailed by the loss of the greater part of the squadron. After terrorizing the neighbouring coast towns, bombarding and levying blackmail under the eyes of the commanders of the foreign squadrons, the Federal ships had been declared pirates by the Republican government. Thereupon the British fleet, acting as police of the seas, took possession of them and brought them to Gibraltar after turning their crews of desperadoes ashore. Still Cartagena remained obstinate, trusting to the great strength of her fortifications and the abundance of cannon and warlike stores. Contreras, general of the canton, actually ventured as far as the bridge of Chinchilla and defeated the feeble force sent against him by Pi y Margall. Salmeron sent General Martinez Campos, who early in August had delivered Valencia from the mob. But with only two thousand troops and a few mortars he was unable to undertake anything more than preliminary siege works. These had no effect, for the rebels had the open sea behind them and still retained some frigates. Castelar collected a stronger body of troops, properly equipped and provided with cannon. General Lopez Dominquez, its commander, was greatly favoured by chance. The rebel ship *Tetuan* was accidentally burned; the artillery posts blew up; the ironclads restored by the British Government took part in the blockade; and Cartagena surrendered (Jan. 13, 1874) after a tremendous bombardment."—H. B. Clarke, *Modern Spain (1815-1808), pp. 342, 347, 348.*

CARTAGENA, South America, the capital of Bolivar, Colombia, founded by Pedro de Heredia in 1533. Eleven years later the town suffered severely from an attack by pirates, and in 1585 it was forced to pay a large ransom to Sir Francis Drake.

1697.—Taken and sacked by the French.—One of the last enterprises of the French in the war which was closed by the Peace of Ryswick—undertaken, in fact, while the negotiations at Ryswick were in progress—was the storming and sacking of Cartagena by a privateer squadron, from Brest, commanded by Rear Admiral Pointis, April, 1697. "The inhabitants were allowed to carry

away their effects; but all the gold, silver, and precious stones were the prey of the conqueror. Pointis . . . reëntered Brest safe and sound, bringing back to his ship-owners more than ten millions. The officers of the squadron and the privateers had well provided for themselves besides, and the Spaniards had probably lost more than twenty millions."—H. Martin, *History of France: Age of Louis XIV.* (tr. by M. L. Booth), v. 2, ch. 2.

CARTAGO, a town about fourteen miles southeast of San José, in Costa Rica, Central America. Its estimated population in 1918 was 48,080.

Institution of the Central American court of justice.—Gift of a building by Andrew Carnegie. See CENTRAL AMERICA: 1908.

CARTELS.—"German captains of industry did not build up trusts in the American sense, but by a system of 'cartels' and syndicates nearly the whole of German industry was organized for the purpose of fixing prices, limiting production, dividing the field of sale and distributing goods, so that the results were practically the same as if the capital of the various concerns were pooled. Especially in coal and iron mining and in the steel industry the process of syndicating went to the point where the trade was absolutely controlled and the middle-man practically eliminated. The great generation of organizers who built up this system of cartels and syndicates is still in the saddle. The history of German industry is as yet too brief for the first group of creative spirits to have passed away,—the men who to a considerable extent resemble in energy and will power and executive ability the generation of Americans who after the war between the states laid the foundation of our steel and iron industries and built the railways from coast to coast. More and more industrial power became centered in the hands of a small group of men.

"At the beginning of the new century three banks had become practically supreme in German financial affairs. It was estimated in 1906 by conservative economists that the threads of the big business of the entire empire passed through the fingers of not more than fifty men. The whole Rhine-Westphalian system of collieries by 1907 was under the control of six capitalists. It is perfectly patent that even a government in which the monarchical principle plays so large a part could not escape the influence of business men like these. Business and politics find themselves as necessarily allied in Germany as in other lands. . . . The influence of such men [self-made capitalists] on politics has been exerted independently of party. Large capitalists organize political influence, not political parties; and big business in Germany as in America has found it possible to remain on good terms with nearly all the political factions. Indeed its direct influence on government has made it to a certain extent independent of the political game. Its restraining hand has not been used with the brutal openness with which the feudal agrarian interests are accustomed to exert pressure, but it has made itself felt sharply enough. The results of this restraint on government have shown themselves in many ways: in the repeated refusal of the Prussian ministry to bring in a measure fixing a ten-hour day of labor on government work, although on certain kinds of public works an eight-hour day was already in operation; in the refusal of the imperial ministry to lower the age limit for invalidity in the revision of the old age pen-

sion bill in 1911, and a similar refusal to extend the period of enforced rest for lying-in women.

"In these and similar cases the ministers recognize the justice of the demands of labor, but as Count Posadowsky, the able Prussian Minister of the Interior, declared in 1906, they were 'unwilling to add to the burdens of industry.' There is no doubt that the gifted Silesian aristocrat spoke in perfectly good faith, for he more fully perhaps than any of his colleagues understood the demands of labor; nevertheless, it may safely be said that the need which the government felt of the full support of the great industrialists in the struggle against the Social Democracy was the chief reason why it did not find it expedient to grant these reasonable demands."—R. H. Fife, Jr., *German Empire between two wars*, pp. 162-164.—See also CAPITALISM: 19th-20th centuries; GERMANY: 1919-1920; Question of socialization of industries.

CARTERET, John, Earl Granville. See GRANVILLE, JOHN CARTERET.

CARTHAGE, Founding of.—Ethbaal, or Ithobaal, a priest of Astarte, acquired possession of the throne of Tyre 917 B. C., deposing and putting to death the legitimate prince, a descendant of Hiram, Solomon's ally and friend. The Jezebel of Jewish history, who married Ahab, king of Israel, was the daughter of this king Ethbaal. "Ethbaal was succeeded by his son Balezor (885-877 B. C.). After eight years Balezor left two sons, Mutton and Sicharbaal, both under age. . . . Mutton died in the year 853 B. C. and again left a son nine years old, Pygmalion, and a daughter, Elissa, a few years older, whom he had married to his brother Sicharbaal, the priest of the temple of Melkarth. Mutton had intended that Elissa and Pygmalion should reign together, and thus the power really passed into the hands of Sicharbaal, the husband of Elissa. When Pygmalion reached his sixteenth year the people transferred to him the sovereignty of Tyre, and he put Sicharbaal, his uncle, to death . . . (846 B. C.). Elissa [or Dido, as she was also called] fled from Tyre before her brother, as we are told, with others who would not submit to the tyranny of Pygmalion. The exiles . . . are said . . . to have landed on the coast of Africa, in the neighbourhood of Ityke, the old colony of the Phenicians, and there to have bought as much land of the Libyans as could be covered by the skin of an ox. By dividing this into very thin strips they obtained a piece of land sufficient to enable them to build a fortress. This new dwelling-place, or the city which grew up round this fortress, the wanderers called, in reference to their old home, Karthada (Karta badasha), i. e., 'the new city,' the Karchedon of the Greeks, the Carthage of the Romans. The legend of the purchase of the soil may have arisen from the fact that the settlers for a long time paid tribute to the ancient population, the Maxyans, for their soil."—M. Duncker, *History of antiquity*, bk. 3, ch. 11.

ALSO IN: J. Kenrick, *Phoenicia: History*, ch. 1.

Divisions, size and population.—"The city proper, at the time at which it is best known to us, the period of the Punic wars, consisted of the Byrsa or Citadel quarter, a Greek word corrupted from the Canaanitish Bozra, or Bostra, that is, a fort, and of the Cothon or harbour quarter, so important in the history of the final siege. To the north and west of these, and occupying all

the vast space between them and the isthmus behind, were the Megara (Hebrew, Magurim), that is, the suburbs and gardens of Carthage, which, with the city proper, covered an area of 23 miles in circumference. Its population must have been fully proportioned to its size. Just before the third Punic war, when its strength had been drained . . . it contained 700,000 inhabitants."—R. B. Smith. *Carthage and the Carthaginians*, ch. 1.—See also TUNIS.

Industries and resources. See COMMERCE: Ancient: Phoenicians and Carthaginians.

Dominions.—"All our positive information, scanty as it is, about Carthage and her institutions, relates to the fourth, third, or second centuries B. C.; yet it may be held to justify presumptive conclusions as to the fifth century B. C., especially in reference to the general system pursued. The maximum of her power was attained before her first war with Rome, which began in 264 B. C.; the first and second Punic wars both of them greatly reduced her strength and dominion. Yet in spite of such reduction we learn that about 150 B. C. shortly before the third Punic war, which ended in the capture and depopulation of the city, not less than 700,000 souls were computed in it, as occupants of a fortified circumference of above twenty miles, covering a peninsula with its isthmus. Upon this isthmus its citadel Byrsa was situated, surrounded by a triple wall of its own, and crowned at its summit by a magnificent temple of Æsculapius. The numerous population is the more remarkable, since Utica (a considerable city, colonized from Phœnicia more anciently than even Carthage itself, and always independent of the Carthaginians, though in the condition of an inferior and discontented ally) was within the distance of seven miles from Carthage on the one side, and Tunis seemingly not much further off on the other. Even at that time, too, the Carthaginians are said to have possessed 300 tributary cities in Libya. [See COLONIZATION: Greek, Roman and Phœnician.] Yet this was but a small fraction of the prodigious empire which had belonged to them certainly in the fourth century B. C. and in all probability also between 480-410 B. C. That empire extended eastward as far as the Altars of the Philæni, near the Great Syrtis,—westward, all along the coast to the Pillars of Herakles and the western coast of Morocco. The line of coast southeast of Carthage, as far as the bay called the Lesser Syrtis, was proverbial (under the name of Byzacium and the Emporia) for its fertility. Along this extensive line were distributed indigenous Libyan tribes, living by agriculture; and a mixed population called Liby-Phœnician. . . . Of the Liby-Phœnician towns the number is not known to us, but it must have been prodigiously great. . . . A few of the towns along the coast,—Hippo, Utica, Adrumetum, Thapsus, Leptis, &c.—were colonies from Tyre, like Carthage itself. . . . Yet the Carthaginians contrived in time to render every town tributary, with the exception of Utica. . . . At one time, immediately after the first Punic war, they took from the rural cultivators as much as one-half of their produce, and doubled at one stroke the tribute levied upon the towns. . . . The native Carthaginians, though encouraged by honorary marks to undertake . . . military service were generally averse to it, and sparingly employed. . . . A chosen division of 2,500 citizens, men of wealth and family, formed what was called the Sacred Band of Carthage distinguished for their bravery in the field as well as for the splendour of their arms, and the gold and silver plate which formed part of their baggage.

We shall find these citizen troops occasionally employed on service in Sicily: but most part of the Carthaginian army consists of Gauls, Iberians, Libyans, &c., a mingled host got together for the occasion, discordant in language as well as in customs."—G. Grote, *History of Greece*, pt. 2, ch. 81.—See also AFRICA: Ancient and medieval civilization: Carthaginian empire, Roman occupation; COMMERCE: Ancient: B. C. 1000-600.

B. C. 241-238.—Revolt of the mercenaries.—"At the close of the First Punic War, the veteran army of mercenaries with which Hamilcar Barca had maintained himself so long in Sicily—a motley gathering of Greeks, Ligurians, Gauls, Iberians, Libyans and others—was sent over to Carthage for the long arrears of pay due them and for their discharge. The party in power in Carthage, being both incapable and mean, and being also embarrassed by an empty treasury, exasperated this dangerous body of men by delays and by attempts at bargaining with them for a reduction of their claims, until a general mutiny was provoked. The mercenaries, 20,000 strong, with Spendius, a runaway Campanian slave, Matho, an African, and Autaritus, a Gaul, for their leaders, marched from the town of Sicca, where they were quartered, and camped near Tunis, threatening Carthage. The government became panic-stricken and took no measures which did not embolden the mutineers and increase their demands. All the oppressed African peoples in the Carthaginian domain rose to join the revolt, and poured into the hands of the mercenaries the tribute money which Carthage would have wrung from them. The latter was soon brought to a state of sore distress, without an army, without ships, and with its supplies of food mostly cut off. The neighboring cities of Utica and Hippo Zarytus were besieged. At length the Carthaginian government, controlled by a party hostile to Hamilcar, was obliged to call him to the command, but associated with him Hanno, his bitterest personal enemy and the most incompetent leader of the ruling faction. Hamilcar succeeded, after a desperate and long struggle, in destroying the mutineers to almost the last man, and in saving Carthage. But the war, which lasted more than three years (241-238 B. C.), was merciless and horrible beyond description. It was known to the ancients as the "Truceless War" and the "Inexpiable War." The scenes and circumstances of it have been extraordinarily pictured in Flaubert's "Salamambo," which is one of the most revolting but most powerful of historical romances.—R. B. Smith, *Carthage and the Carthaginians*, ch. 8.

B. C. 149-146.—Siege of Carthage. See ROME: Republic: B. C. 149-146.

B. C. 146.—Destruction by Scipio.—“Carthage existed by Roman sufferance for fifty years after the ending of the Second Punic War, and even recovered some considerable prosperity in trade, though Rome took care that her chances for recovery should be slight. When Hannibal gave signs of being able to reform the government of the city and to distinguish himself in statesmanship as he had immortalized himself in war, Rome demanded him, and he escaped her chains only by flight. When, even without Hannibal, Carthage slowly repaired the broken fortunes of her mer-

ons, or engines or ships, until they made them anew, they shut their gates and kept the Roman armies out for more than two years. It was another Scipio, adopted grandson and namesake of the conqueror of Hannibal, who finally entered Carthage (146 B. C.), fought his way to its citadel, street by street, and, against his own wish, by command of the implacable senate at Rome, levelled its last building to the earth, after sending the inhabitants who survived to be sold as slaves.”—R. B. Smith, *Carthage and the Carthaginians*, ch. 20.

ALSO IN: H. G. Liddell, *History of Rome*, ch. 46

B. C. 44.—Restoration by Cæsar.—“A settlement named Junonia, had been made at Carthage by C. Gracchus [which furnished his enemies one of their weapons against him, because, they said, he had drawn on himself the curse of Scipio] and it appears that the city of Gracchus still existed. Cæsar restored the old name, and, as Strabo says, rebuilt the place: many Romans who preferred Carthage to Rome were sent there, and some sol-

CISTERN OF CARTHAGE

chants, there was an enemy at her door always ready, at the bidding of Rome, to plunder them afresh. This was Massinissa, the Numidian prince, client and obedient servant of the Roman state. Again and again the helpless Carthaginians appealed to Rome to protect them from his depredations, and finally they ventured to attempt the protection of themselves. Then the patient perfidy of Roman statecraft grasped its reward. It had waited many years for the provocations of Massinissa to work their effect; the maddened Carthaginians had broken, at last, the hard letter of the treaty of 201 by assailing the friend and ally of Rome. The pretext sufficed for a new declaration of war, with the fixed purpose of pressing it to the last extreme. Old Cato, who had been crying in the ears of the senate, ‘Carthago delenda est,’ should have his will. The doomed Carthaginians were kept in ignorance of the fate decreed, until they had been foully tricked into the surrender of their arms and the whole armament of their city. But when they knew the dreadful truth, they threw off all cowardice and rose to such a majesty of spirit as had never been exhibited in their history before. Without weap-

diars; and it is now, adds Strabo [reign of Augustus] more populous than any town in Libya.”—G. Long, *Decline of the Roman republic*, v. 5, ch. 32.

A. D. 2d-4th centuries.—Christian church. See CHRISTIANITY: 100-300: Church in Carthage.

439.—Taken by the Vandals.—Carthage was surprised and captured by the Vandals on October 9, 439,—nine years after the conquest and destruction of the African provinces by Genseric began;—585 years after the ancient Carthage was destroyed by Scipio. “A new city had risen from its ruins, with the title of a colony; and though Carthage might yield to the royal prerogatives of Constantinople, and perhaps to the trade of Alexandria or the splendour of Antioch, she still maintained the second rank in the West—as the Rome (if we may use the style of contemporaries) of the African world. . . . The buildings of Carthage were uniform and magnificent. A shady grove was planted in the midst of the capital; the new port, a secure and capacious harbour, was subservient to the commercial industry of citizens and strangers; and the splendid games of the circus and theatre were exhibited almost in the presence

of the barbarians. The reputation of the Carthaginians was not equal to that of their country, and the reproach of Punic faith still adhered to their subtle and faithless character. The habits of trade and the abuse of luxury had corrupted their manners. . . . The King of the Vandals severely reformed the vices of a voluptuous people. . . . The lands of the proconsular province, which formed the immediate district of Carthage, were accurately measured and divided among the barbarians."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 33.—See also VANDALS: 429-439.

533.—Taken by Belisarius. See VANDALS, 533-534.

534-558.—Province of Africa after Justinian's conquest.—"Successive inroads [of the Moorish tribes] had reduced the province of Africa to one-third of the measure of Italy; yet the Roman emperors continued to reign above a century over Carthage and the fruitful coast of the Mediterranean. But the victories and the losses of Justinian were alike pernicious to mankind; and such was the desolation of Africa that a stranger might wander whole days without meeting the face either of a friend or an enemy. The nation of the Vandals had disappeared. . . . Their numbers were infinitely surpassed by the number of the Moorish families extirpated in a relentless war; and the same destruction was retaliated on the Romans and their allies, who perished by the climate, their mutual quarrels, and the rage of the barbarians. When Procopius first landed [with Belisarius, 533] he admired the populousness of the cities and country, strenuously exercised in the labours of commerce and agriculture. In less than twenty years that busy scene was converted into a silent solitude; the wealthy citizens escaped to Sicily and Constantinople; and the secret historian has confidently affirmed that five millions of Africans were consumed by the wars and government of the Emperor Justinian."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 43.

698.—Destruction by the Arabs.—"In the 77th year of the Hegira [698] . . . Abd'almalec [the caliph] sent Hossan Ibn Anno'man, at the head of 40,000 choice troops, to carry out the scheme of African conquest [which had languished for some years, during the civil wars among the Moslems]. That general pressed forward at once with his troops against the city of Carthage, which, though declined from its ancient might and glory, was still an important seaport, fortified with lofty walls, haughty towers and powerful bulwarks, and had a numerous garrison of Greeks and other Christians. Hossan proceeded according to the old Arab mode; beleaguering and reducing it by a long siege; he then assailed it by storm, scaled its lofty walls with ladders, and made himself master of the place. Many of the inhabitants fell by the edge of the sword; many escaped by sea to Sicily and Spain. The walls were then demolished; the city was given up to be plundered by the soldiery, the meanest of whom was enriched by booty. . . . The triumph of the Moslem host was suddenly interrupted. While they were reveling in the ravaged palaces of Carthage, a fleet appeared before the port; snapped the strong chain which guarded the entrance, and sailed into the harbor. It was a combined force of ships and troops from Constantinople and Sicily; reinforced by Goths from Spain; all under the command of the prefect John, a patrician general of great valor and experience. Hossan felt himself unable to cope with such a force; he withdrew, however, in good order, and conducted his troops

laden with spoils to Tripoli and Caerwan, and, having strongly posted them, he awaited reinforcements from the Caliph. These arrived in course of time by sea and land. Hossan again took the field; encountered the prefect John, not far from Utica, defeated him in a pitched battle and drove him to embark the wrecks of his army and make all sail for Constantinople. Carthage was again assailed by the victors, and now its desolation was complete, for the vengeance of the Moslems gave that majestic city to the flames. A heap of ruins and the remains of a noble aqueduct are all the relics of a metropolis that once valiantly contended for dominion with Rome."—W. Irving, *Mahomet and his successors*, v. 2, ch. 54.—See also CALIPHATE: 647-709.

CARTHAGENA (New Carthage). See CARTAGENA.

CARTHUSIAN ORDER: La Grande Chartreuse.—"St. Bruno, once a canon of St. Cuthbert's, at Cologne, and afterward chancellor of the metropolitan church of Rheims, followed by six companions, founded a monastery near Grenoble, amid the bleak and rugged mountains of the desert of Chartreuse (A.D. 1084). The rule given by St. Bruno to his disciples was founded upon that of St. Benedict, but with such modifications as almost to make of it a new and particular one. The Carthusians were very nearly akin to the monks of Vallis-Umbrosa and Camaldoli; they led the same kind of life—the cremital joined to the cenobitic. Each religious had his own cell, where he spent the week in solitude, and met the community only on Sunday. . . . Never, perhaps, had the monastic life surrounded itself with such rigors and holy austerities. . . . The religious were bound to a life-long silence, having renounced the world to hold converse with Heaven alone. Like the solitaries of Thebais they never eat meat, and their dress, as an additional penance, consisted only of a sack-cloth garment. Manual labors, broken only by the exercise of common prayer; a board on the bare earth for a couch; a narrow cell, where the religious twice a day receives his slight allowance of boiled herbs;—such is the life of pious austerities of which the world knows not the heavenly sweetness. For 800 years has this order continued to edify and to serve the Church by the practice of the most sublime virtue; and its very rigor seems to hold out a mysterious attraction to pious souls. A congregation of women has embraced the primitive rule."—J. E. Darras, *History of the Catholic church*, v. 3, ch. 4, par. 26, and ch. 10, par. 11.—From the account of a visit to the Grande Chartreuse, the parent monastery, near Grenoble, made in 1667, by Dom Claude Lancelot, of Port Royal, the following is taken: "All I had heard of this astonishing seclusion falls infinitely short of the reality. No adequate description can be given of the awful magnificence of this dreary solitude. . . . The desert of the Chartreuse is wholly inaccessible but by one exceedingly narrow defile. This pass, which is only a few feet wide, is indeed truly tremendous. It winds between stupendous granite rocks, which overhang above. . . . The monastery itself is as striking as the approach. . . . On the west . . . there is a little space which . . . is occupied by a dark grove of pine trees; on every other side the rocks, which are as steep as so many walls, are not more than ten yards from the convent. By this means a dim and gloomy twilight perpetually reigns within."—M. A.

CARTOUCHE.—"It is impossible to travel in Upper Egypt without knowing what is meant by a cartouche. A cartouche is that elongated oval terminated by a straight line which is to be seen on every wall of the Egyptian temples, and of which other monuments also afford us numerous examples. The cartouche always contains the name of a king or of a queen, or in some cases the names of royal princesses. To designate a king there are most frequently two cartouches side by side. The first is called the prænomen, the second the nomen."—A. Mariette-Bey, *Monuments of upper Egypt*, p. 43.

CARTWRIGHT, Edmund (1743-1823), English inventor of the power loom. See **COTTON**, INTRODUCTION OF; U. S. A.: 1793; Whitney's cotton gin.

CARTWRIGHT, Peter (1785-1872), American Methodist preacher and circuit-rider. He began to preach in 1804, and, as circuit rider and presiding elder, became known as a powerful and original preacher and a fearless pioneer. He was a member of the Illinois legislature, and an opponent of Lincoln in the Congressional election of 1846.

CARTWRIGHT, Sir Richard John (1835-1912), Canadian statesman. Originally a Conservative, in 1873 he became a Liberal, and a strong opponent of protection. He did much in behalf of improved commercial relations between the United States and Canada.

CARTWRIGHT, Thomas (c. 1535-1603), English divine, who strongly upheld Puritan doctrines, and did much to systematize the Puritan tenets.—See also **DISCIPLINARIANS**.

CASA DE CONTRATACION DE LAS INDIAS or Council of Seville, an office established at Seville for the regulation of commerce with the Indies. The strict monopoly of American commerce maintained by it was one of the principal causes of complaint in the colonies. "By an ordinance dated at Alcalá, January 20th, 1503, it was provided that a board should be established, consisting of three functionaries, with the titles of treasurer, factor and comptroller. Their permanent residence was assigned in the old alcazar of Seville, where they were to meet every day for the despatch of business. The board was expected to make itself thoroughly acquainted with whatever concerned the colonies, and to afford the government all information that could be obtained affecting their interests and commercial prosperity. It was empowered to grant licenses under the regular conditions, to provide for the equipment of fleets, to determine their destination, and to furnish them with instructions on

sailing. All merchandise for exportation was to be deposited in the alcazar, where the return cargoes were to be received and contracts made for their sale. Similar authority was given to it over the trade with the Barbary coast and the Canary Islands. Its supervision was to extend in like manner over all vessels which might take their departure from the port of Cadiz, as well as from Seville. With these powers were combined others of a purely judicial character, authorizing it to take cognizance of questions arising out of particular voyages, and of the colonial trade in general. In this latter capacity it was to be assisted by the advice of two jurists, maintained by a regular salary from the government. Such were the extensive powers intrusted to the famous *Casa de Contratación*, or House of Trade, on this its first definite organization; and, although its authority was subsequently somewhat circumscribed by the appellate jurisdiction of the Council of the Indies, it has always continued the great organ by which the commercial transactions with the colonies have been conducted and controlled."—W. H. Prescott, *History of the reign of Ferdinand and Isabella*, v. 2, pp. 490-491.—"The school of nautical science of the *Casa de Contratación* of Seville merits special attention. Among the manifold functions of the *Casa* in its relation to the Americas was that of the pursuit of scientific studies to facilitate over-seas communication, and this was carried out to such an extent that the *Casa* was a veritable maritime university. Mathematics, cosmography, geography, cartography, navigation, the construction and use of nautical instruments, and military science (in so far as it related to artillery) were taught at the *Casa*, and in nearly all of these respects that institution not only outranked the others in Spain but was able also to add materially to the sum total of world knowledge."—C. CASEMENT, Sir Roger (1864-1916), Irish revolutionist leader. He was engaged in the British consular service from 1895 until 1913, when he was placed on the retired list, pensioned, and rewarded with a knighthood for meritorious service. He exposed the cruel treatment of the natives in the Congo State (see **BELGIAN CONGO**: 1903-1905)

and, as British consul at Rio de Janeiro, the Putumayo rubber atrocities in Peru (see PERU: 1912-1913). In April, 1916, he was captured in Ireland shortly after landing from a German submarine; charged with treason, he was found guilty, deprived of his honors and hanged.—See also IRELAND: 1913-1916; 1916; 1916 (June-August).

CASEY, James P., San Francisco politician who murdered James King. See CALIFORNIA: 1856.

CASH COINAGE, China. See MONEY AND BANKING: 20th century: China.

CASHEL, a city of Tipperary County, Ireland, southwest of Dublin. It is exceedingly unpretentious, and lies at the base of the Rock of Cashel, which is the chief object of interest. It is "a kind of natural citadel in the first place, commanding one of the richest districts in Ireland. Picture a rock, some three hundred feet high, with a couple of acres of surface on its flat top approached by the steepest ascents; and this rock dropped down among the pastures at the north of the Golden Vale. As soon as men conceived the ideal of fortification at all, it was inevitable that the strongest of them should possess themselves of this vantage-ground and secure their possession by encircling the summit with a girdle of roughly piled wall. Any fort so enclosed was a cashel; but this was the Cashel *par excellence*, and as early as we have any history, kings of Munster ruled here."—S. Gwynn, *Fair hills of Ireland*, p. 367.—But in 1101 the kingly power gave Cashel to the church for a religious center; there were archbishops of Cashel until 1839, when it was reduced to a bishopric. Here in 1172 Henry II received the homage of the Irish princes, including O'Brien, and called a synod. (See IRELAND: 1169-1175.) Cashel was stormed in the wars of 1647; it returned one member to parliament until 1870, when it was disfranchised for corrupt practices.

CASKET LETTERS, a series of eight letters and a number of sonnets said to have been written by Mary Queen of Scots to the Earl of Bothwell. See SCOTLAND: 1561-1568.

CASPIAN GATES, or *Pylæ Caspiæ*, an important pass in the Elburz mountains, so called by the Greeks. It is identified with the pass known to the modern Persians as the Girduni Surdurrah, some fifty miles or more eastward, or northeastward, from Teheran. "Through this pass alone can armies proceed from Armenia, Media, or Persia eastward, or from Turkestan, Khorasan and Afghanistan into the more western parts of Asia. The position is therefore one of primary importance. It was to guard it that Rhages was built so near to the eastern end of its territory."—G. Rawlinson, *Sixth great oriental monarchy*, ch. 4.

ALSO IN: G. Rawlinson, *Five great monarchies: Media*, ch. 1.

CASPIAN REPUBLIC: Established 1918. See WORLD WAR: 1918: VI. Turkish theater: b. 1.

CASPIAN SEA, the largest inland salt sea in the world, on the boundary between Europe and Asia. From north to south its length is about 680 miles; its breadth varies between 130 and 270 miles; total estimated area, 170,000 square miles. While the Caspian has no tides, it is frequently the scene of very violent storms. It is very shallow in the north—only 14 feet at a distance of ten miles from the shore, and 72 feet at a distance of 130 miles from the mouth of the Volga. Its greatest depth is, in the northern basin, where it reaches 2526 feet, and in the southern region it attains to over 3000 feet. The sea receives the waters of the Volga, Ural, Emba, Terek, Kura and Atrek. In ancient times the Oxus (Amu Daria) also flowed into it. Though salty, the water is by no means as briny as the ocean, and it contains a mass of fresh water (river) fish, principally the sturgeon and salmon, besides seals and tortoises. The Caspian is connected with the Baltic and White Sea by canals uniting the upper tributaries of the Volga with those of Lake Ladoga and the Duna. The chief towns on its shores are Astrakhan, Derbend, Baku and Krasnovodsk, besides Astrabad in Persia. The surrounding shores are nearly all within Russian territory, while the southern is Persian. Strabo refers to it as the "Hyrcanian Sea, which we also call the Caspian Sea." According to the same authority, "Eratosthenes says that the navigation of this sea was known to the [ancient] Greeks." "From the lower course of the Don to the Lake of Aral, all these low steppes that lie on both sides of the Volga and the Ural River form a peculiar region, the dried up bed of an ancient sea, of which the shores are quite distinguishable, and of which the vast salt lakes known as the Caspian and Aral Seas are the remnants. By a hydrographical freak which has exercised a considerable influence on the destinies of the Russian people, it is into one of these locked-up seas, decidedly Asiatic as they are, that the great artery of Russia, the Volga, debouches, after turning her back on Europe nearly from her very source."—A. Leroy-Beaulieu, *Empire of the tsars and the Russians*, v. 1, pp. 8-9.—The Caspian was first surveyed by order of Peter the Great. In 1715 he sent Artemius Volynsky as envoy to Persia, with special instructions to investigate from what quarters rivers ran into the Caspian, and whether there was not some river falling into it which came from India. Peter also began the canal system referred to above; about twenty miles were cut before his death; the rest was not completed till early in the nineteenth century, making a total length of communicating canals of only 455 miles. In 1711 it took Peter a week to sail the 200 miles from Astrakhan to the little bay of Agrakhan.

CASQUETS, a group of rocks in the English Channel. See CHANNEL ISLANDS.

CASS, Lewis (1782-1866), American statesman. Served in the War of 1812, rising to rank of brigadier-general; governor of Michigan territory 1813-1831; secretary of war 1831-1836, sided with Jackson in the nullification controversy with South Carolina, objected to the removal of the government deposits from the United States bank; minister to France 1836-1842; member of the United States Senate 1845-1848, 1849-1857, opposed the Wilmot Proviso, favored the Compromise of 1850, believed in "popular sovereignty" for slave territories; secretary of state 1857-1860; nominated for president, 1848, defeated by Zachary Taylor.

CASSANDER (c. B. C. 354-297), king of Macedonia. See GREECE: B. C. 321-312; MACEDONIA: B. C. 297-280.

CASSANDRA, a mythical personage, said to be the daughter of Hecuba and Priam, king of Troy. She obtained the spirit of prophecy from Apollo, but, on her refusal to carry out her promise to give herself to him, he made her power of no effect by discrediting her predictions. Therefore, her prophecy that Troy would fall was not believed and she, herself, was involved in its ruin. After the capture of the city, she fell to the lot of Agamemnon, and was murdered by Clytemnestra, his wife.

CASSIAN ROAD, one of the great Roman roads of antiquity, which ran from Rome, by way of Sutrium and Clusium to Arretium and Florentia.—T. Mommsen, *History of Rome*, bk. 4, ch. 11.

CASSII, a tribe of ancient Britons whose territory was near the Thames. See BRITAIN: Celtic tribes.

CASSIN, United States destroyer torpedoed by a German submarine. See WORLD WAR: 1917: IX. Naval operations: c, 1.

CASSINI CONVENTION, alleged secret agreement between Russia and China, negotiated (1805) by Arthur Pavlovitch Cassini (1835-), a Russian diplomat, minister at Peking. It granted to Russia railway privileges and other rights in Manchuria. See CHINA: 1805.

CASSIODORUS, Flavius Magnus Aurelius (c. 490-585), Latin statesman and historian. See HISTORY: 19.

CASSITERIDES, the "tin islands," from which the Phœnicians and Carthaginians obtained their supply of tin. Some archæologists identify them with the British islands, some with the Scilly islands, and some with the islands in Vigo bay, on the coast of Spain.—C. Elton, *Origins of English history*.

ALSO IN: J. Rhys, *Celtic Britain*.

CASSIUS LONGINUS, Gaius (d. B. C. 42), Roman soldier and politician, a leader in the conspiracy against Cæsar. After Cæsar's assassination he left Italy for Syria and there raised an army of considerable size. In an engagement near Philippi he was defeated by Mark Antony.—See also ROME: Republic: B. C. 44: Assassination of Cæsar; B. C. 44-42.

CASSIVELAUNUS (c. B. C. 50), king in Britain.

B. C. 54.—Submits to Cæsar. See BRITAIN: B. C. 55-54.

CASTANOS, Francisco Xavier de (d. 1852), Spanish general. See SPAIN: 1808 (May-September).

CASTALIAN SPRING, a spring which issued from between two peaks or cliffs of Mount Parnassus and flowed downward in a cool stream past the temple of Apollo at Delphi.

CASTE SYSTEM: India.—"The institution of caste, to which the world cannot offer any close parallel, was of slow growth. The word is Portuguese; the thing is so peculiarly Indian that it separates India from the rest of the globe by a barrier far more impassable than deserts, seas, or mountains. More than two hundred millions of Hindus are now broken up into thousands of distinct communities, each of which is kept apart from its neighbours by strict rules regulating marriage, diet, and every detail of life. Nothing like this state of things exists, or is known ever to have existed elsewhere. The Rîgveda refers to the system only in one of the latest hymns, the *Parushasukta* . . . ; and even at the time of the rise of Buddhism, in the fifth century B. C., caste was 'still in the making.' But in the fourth century B. C. the Greek accounts show that the existing system was already established in parts of Northern India, although for many centuries afterwards inter-marriages between different castes were permitted which could not be thought of in these days. . . . The later Vedic literature and the Hindu law-books composed by Brahman authors teach that there are only four 'pure' castes: (1) Brahmans, the guardians and teachers of the sacred traditions; (2) Kshatriyas, the fighting and ruling classes; (3) Vaisyas, tradespeople and agriculturists; and (4) Sudras, all the common folk, who were not recognized as Aryans. The Brahmans are supposed to proceed from the mouth, the Kshatriyas from the arms, the Vaisyas from the thighs, and the Sudras from the feet of Brahma. [See RELIGION: B. C. 1000.] All castes which would not fit into this framework were described as 'mixed,' fanciful origins being assigned to them. This theoretical scheme certainly does not apply to the complex facts of caste at the present day, and apparently never agreed with the reality of things at any time. . . . The ascetic orders, whether orthodox Hindu, Jain, or Buddhist, usually have been and still are willing to admit to membership persons of almost any caste, and to ignore distinctions of birth among the brethren. Some writers erroneously have supposed Buddhism to have been a revolt against caste, but as a matter of fact the lay Buddhist retained his caste, just as the Jain layman does now. It is, however, true that the free offer of the way of salvation, made to all comers by both Buddhism and Jainism, clashed with the Brahman doctrine that the teaching of the highest truths should be reserved for the highest castes, and so far diminished the importance of caste distinctions. The origin of this peculiar Indian institution, so beneficial in some respects and so hurtful in others, has given rise to much discussion. The result of all the writing is not satisfactory, and Sir Herbert Risley, a leading authority on the subject, confesses that he finds the question an 'insoluble problem.'—V. A. Smith, *Oxford student's history of India*, pp. 34-36.—"The caste of each individual was determined by his birth; and he could not, during his lifetime, by any means whatever rise into one higher than the one into which he was born. For a Sudra to represent himself as of a higher caste was a mortal sin, meriting capital punishment. The legal status of each caste was absolutely different in every circumstance of life. The laws were indeed mainly framed for the protection of the three upper castes. The fourth caste and the out-castes appear to be considered only in so far as they contribute to the advantage of the superior castes; and the gulf which divided the legal status of the Brahmin from that of the Sudra was prodigious and monstrous. The life,

person, property, and women of the Brahmin were protected by the severest laws in this world, and the most tremendous denunciations for the next. He was exempt from corporal or capital punishment, even for the most enormous crimes. Indeed, if a Brahmin fulfilled his proper functions and was learned in the Veda, or assiduous in muttering to himself those sacred syllables whose mystical value equalled that of the whole of the Veda, he might commit any crime, even murder, with complete impunity. He was exempt from all taxation, and it was incumbent on all classes to maintain and enrich him, by large and liberal gifts on those ceremonial and sacrificial occasions which were of daily occurrence. The Sudra, on the other hand, was completely at the mercy of the higher castes. A mere shadow of legal protection, it is true, was afforded him so long as he remained virtuous; but as he lost every claim to virtue the moment that anything in or about him excited the anger, greed, or lust of a Brahmin, the protection was very ephemeral. He could amass no wealth, even if he had the power, lest he should become proud and give pain to Brahmins; and whatever he had could be taken from him by fraud or force on certain occasions. He was compelled to serve the upper castes without payment or reward. . . . But this prodigious inequality in the legal status of the castes was not all. I have said that a Brahmin might commit any crime against humanity, in his relations with Sudras, with impunity. But there were certain things he could *not* do to them without being very severely punished. He could not treat a Sudra as his equal; he could not do him any kindness or service—this is repeated and emphasized in several passages in the sacred books—even though the service were not menial in character; he could not tend or succour him if he were lying by the wayside sick or wounded unto death; he could not in any way interfere with the operation of caste law, and mitigate the evil which it might inflict on him; he could not sacrifice for him, or initiate him in the way of expiating offences, or teach him the sacred Vedas which absolved other men from their sins, and assured them happiness in the next world. All these acts of common humanity were the greatest crimes that the Brahmin could commit; and the punishment they entailed was the greatest that could be inflicted on him. If he behaved to a Sudra in this humane manner, or made him some return for his services by performing on his behalf those offices which were his own peculiar function in the economy of Hindoo society, he lost his caste in the present life, and was sent to hell in the next.”—E. N. Reichardt, *Significance of ancient religions*, pp. 51-54.—“The caste system of India is not based upon an exclusive descent as involving a difference of rank and culture, but upon an exclusive descent as involving purity of blood. In the old materialistic religion which prevailed so largely in the ancient world, and was closely associated with sexual ideas, the maintenance of purity of blood was regarded as a sacred duty. The individual had no existence independent of the family. Male or female, the individual was but a ‘ink in the life of the family; and any intermixture would be followed by the separation of the impure branch from the parent stem. In a word, caste was the religion of the sexes, and as such exists in India to this day. . . . The three first castes of priests, soldiers, and merchants, are distinguished from the fourth caste of Sudras by the thread, or paita, which is worn depending from the left shoulder and resting on the right side below the loins. The

investiture usually takes place between the eighth and twelfth year, and is known as the second birth, and those who are invested are termed the ‘twice born.’ It is difficult to say whether the thread indicates a separation between the conquerors and the conquered; or whether it originated in a religious investiture from which the Sudras were excluded.”—J. T. Wheeler, *History of India*, v. 3, pp. 114, 64.—“Among the delusions about modern India which it seems impossible to kill, the belief still survives that, although there have been many changes in the system of caste, it remains true that the Hindu population is divided into the four great classes described by Manu: Brahmans, Kshatriyas, Vaisyas, and Sudras. In India itself this notion is fostered by the more learned among the Brahmans, who love to make themselves and others believe in the continuous existence of a divinely constituted organization. To what extent the religious and social systems shadowed forth in the ancient Brahmanical literature had an actual existence it is difficult to say, but it is certain that little remains of them now. The Brahmans maintain their exceptional position; but no one can discern the other great castes which Manu described. Excluding the Brahmans, caste means for the most part hereditary occupation, but it also often signifies a common origin of tribe or race. India, in the words of Sir Henry Maine, is divided into a vast number of independent, self-acting, organised social groups—trading, manufacturing, cultivating. ‘In the enormous majority of instances, caste is only the name for a number of practices which are followed by each one of a multitude of groups of men, whether such a group be ancient and natural or modern and artificial. As a rule, every trade, every profession, every guild, every tribe, every class, is also a caste; and the members of a caste not only have their special objects of worship, selected from the Hindu Pantheon, or adopted into it, but they exclusively eat together, and exclusively intermarry.’ Mr. Kitts, in his interesting ‘Compendium of the Castes and Tribes of India,’ compiled from the Indian Census reports of 1881, enumerates 1929, different castes. Forty-seven of these have each more than 1,000,000 members; twenty-one have 2,000,000 and upwards. The Brahmans, Kunbis (agriculturists), and Chumars (workers in leather), are the only three castes each of which has more than 10,000,000; nearly 15 per cent. of the inhabitants of India are included in these three castes. The distinctions and subdivisions of caste are innumerable, and even the Brahmans, who have this in common, that they are revered by the members of all other castes, are as much divided among themselves as the rest. There are nearly 14,000,000 Brahmans; according to Mr. Sherring, in his work on ‘Hindu Tribes and Castes,’ there are more than 1,800 Brahmanical subdivisions; and it constantly happens that to a Brahman of some particular class or district the pollution of eating with other Brahmans would be ruinous. . . . The Brahmans have become so numerous that only a small proportion can be employed in sacerdotal functions, and the charity which it is a duty to bestow upon them could not, however profuse, be sufficient for their support. They are found in almost every occupation. They are soldiers, cultivators, traders, and servants; they were very numerous in the old Sepoy army, and the name of one of their subdivisions, Pande, became the generic term by which the mutineers of 1857 were commonly known by the English in India. . . . Mr. Ibbetson, in his report on the census in the Punjab, shows how completely it is true that caste is a

social and not a religious institution. Conversion to Mobammedanism, for instance, does not necessarily affect the caste of the convert."—J. CASTEL, a town on the Rhine, opposite Mainz and linked with it by a magnificent bridge of five arches. See MOGONTIACUM.

CASTELAR Y RIPOLL, Emilio (1832-1890), Spanish statesman. Arrested for participating in revolutionary activity, tried and condemned to be hanged, but escaped to France (1866); returned to Spain and became republican leader (1868); on establishment of republic (1873) became minister of state; president of the executive (1873-1874); elected to Cortes (1876); finally became reconciled to monarchical form of government.—See also SPAIN: 1873-1874.

CASTELFIDARDO, Battle of (1860). See ITALY: 1850-1861.

CASTELLANO. See SPANISH COINS.

CASTELLORIZZO, an islet east of Rhodes and close to the shore of Asia Minor. With Rhodes it was assigned to Italy after the World War. See SEVRES, TREATY OF (1920): Part III: Political clauses: Libya.

CASTELNAU, Edouard de Curières de (1851-), French general. Invaded German Lorraine August 18, 1914, but was soon driven out; later defended Nancy and took the offensive in the battle of the Marne; commanded the 2d (see WORLD WAR: 1914: I. Western front: g, 1) and then the 7th army in the period following; attended war council of March 27-28, 1916; a prominent leader in the World War.—See also WORLD WAR: 1914: I. Western front: 8, 4; 1916: II. Western front: b, 13.

CASTIGLIONE, Battle of. See FRANCE: 1796 (April-October).

CASTILE, formerly a kingdom of Spain, situated in the central part of the Iberian peninsula and divided into Old and New Castile. Old Castile occupying the northern part of the kingdom was early freed from Moorish rule and divided into eight provinces: Ávila, Burgos, Logroño, Palencia, Santander, Segovia, Soria and Valladolid. New Castile embraces the provinces of Ciudad Real, Cuenca, Guadalajara, Madrid and Toledo. The history of Castile runs parallel with the struggle to reconquer the Iberian peninsula from the Mohammedans.

CASTLE GOVERNMENT, the name given to the administration of Ireland, having its seat at Dublin castle; regarded by the Sinn Féin as an oppressive bureaucracy of Bourbon character.

CASTLE PINCKNEY, Fort. See U. S. A.: 1860 (December): Major Anderson at Fort Sumter.

CASTLE ST. ANGELO.—The mausoleum of Hadrian, begun by the emperor Hadrian, 135, and probably completed by Antoninus Pius, "owes its preservation entirely to the peculiar fitness of its site and shape for the purposes of a fortress, which it has served since the time of Belisarius. . . . After the burial of Marcus Aurelius, the tomb was closed until the sack of Rome by Alaric in 410, when his barbarian soldiers probably broke it open in search of treasure, and scattered the ashes of the Antonines to the winds. From this time, for a hundred years, the tomb was turned into a fortress, the possession of which became the object of many struggles in the wars of the Goths under Vitiges (537) and Totilas (killed 552). From the end of the sixth century, when Gregory the Great saw on its summit a vision of St. Michael sheathing his sword, in token that the prayers of the Romans for preservation from the plague were heard, the Mausoleum of Hadrian was considered as a consecrated building, under the name of 'S. Angelus inter Nubes,' 'Usque ad Cælos,' or 'Inter Cælos,' until it was seized in 923 by Alberic, Count of Tusculum, and the infamous Marozia, and again became the scene of the fierce struggles between Popes, Emperors, and reckless adventurers which marked those miserable times. The last injuries appear to have been inflicted upon the building in the contest between the French Pope Clemens VII. and the Italian Pope Urban VIII. [see PAPACY: 1377-1417]. The exterior was then finally dismantled and stripped. Partial additions and restorations soon began to take place. Boniface IX., in the beginning of the fifteenth century, erected new battlements and fortifications on and around the building; and since his time it has remained in the possession of the Papal government. The strange medley of Papal reception rooms, dungeons and military

magazines which now encumbers the top, was chiefly built by Paul III. The corridor connecting it with the Vatican dates from the time of Alexander Borgia (1494), and the bronze statue of St. Michael on the summit, which replaced an older marble statue, from the reign of Benedict XIV.—R. Burn, *Rome and the Campagna*, ch. 11.

CASTLEREAGH, Viscount. See LONDON-DERRY, ROBERT STEWART, 2ND MARQUESS OF.

CASTOR WARE.—"Durobrivian or Castor ware, as it is variously called, is the production of the extensive Romano-British potteries on the River Nen in Northamptonshire and Huntingdonshire, which, with settlements [see DUROBRIVÆ], are computed to have covered a district of some twenty square miles in extent. . . . There are several varieties. . . . and two especially have been remarked; the first, blue, or slate-coloured, the other reddish-brown, or of a dark copper colour."—L. Jewett, *Grave mounds*, p. 152.

CASTRÀ, Roman.—"When a Roman army was in the field it never halted, even for a single night, without throwing up an entrenchment capable of containing the whole of the troops and their baggage. This field-work was termed *Castra*. . . . The form of the camp was a square, each side of which was 2,017 Roman feet in length. The defences consisted of a ditch (*fossa*), the earth dug out, being thrown inwards so as to form a rampart (*agger*), upon the summit of which a palisade (*vallum*) was erected of wooden stakes (*valli*—*sudes*), a certain number of which were carried by each soldier, along with his entrenching tools."—W. Ramsay, *Manual of Roman antiquities*, ch. 12.

CASTRICUM, Battle of. See FRANCE: 1799 (September-October).

CASTRICOT, George (1403-1467), Albanian chieftain and popular national hero. Better known as Scanderbeg or Iskander Bey, the name given him by the Turks on account of his valor, in complimentary reference to Alexander the Great.—See also ALBANIA: 1443-1467.

CASTRO, Cipriano (1861-), Venezuelan military leader. Became prominent in politics at an early age, largely through military methods; was forced to withdraw to Colombia, by Crespo's successful revolt in 1802; in 1899 began the revolt which resulted in his election as president (1902). During his presidency Castro involved Venezuela in quarrels with European nations, with Colombia, and in 1904 with the United States through the confiscation of the New York and Bermuda Company's property. In December, 1908, he went to Europe for his health. A revolution against him broke out in 1900, which made Juan Vicente Gómez president. The latter adjusted the Venezuelan troubles with the United States and other countries. Castro continued to live in Spain and France, being excluded from his own country, but in 1916 came to the United States.—See also COLUMBIA: 1808-1902; VENEZUELA: 1898-1900, 1905-1906, 1907-1908.

CATABAPTISTS, opposing baptism, especially of infants. See BAPTISMS: Origin of name.

CATACOMBS OF ROME.—"The Roman Catacombs—a name consecrated by long usage, but having no etymological meaning, and not a very determinate geographical one—are a vast labyrinth of galleries excavated in the bowels of the earth in the hills around the Eternal City; not in the hills on which the city itself was built, but in those beyond the walls. Their extent is enormous, not as to the amount of superficial soil which they underlie, for they rarely, if ever, pass beyond the third milestone from the city, but in the actual length of their galleries; for these are often excavated on various levels, or *piani*, three, four, or even five, one above the other, and they cross and recross one another, some times at short intervals, on each of these levels; so that, on the whole, there are certainly not less than 350 miles of them; that is to say, if stretched out in one continuous line, they would extend the whole length of Italy itself. The galleries are from two to four feet in width, and vary in height according to the nature of the rock in which they are dug. The walls on both sides are pierced with horizontal niches, like shelves in a book-case, or berths in a steamer, and every niche once contained one or more dead bodies. At various intervals this succession of shelves is interrupted for a moment, that room may be made for a doorway opening into a small chamber; and the walls of these chambers are generally pierced with graves in the same way as the galleries. These vast excavations once formed the ancient Christian cemeteries of Rome; they were begun in apostolic times, and continued to be used as burial-places of the faithful until the capture of the city by Alaric in the year 410. In the third century, the Roman Church numbered twenty-five or twenty-six of them, corresponding to the number of her titles or parishes within the city; and besides these, there are about twenty others, of smaller dimensions, isolated monuments of special martyrs, or belonging to this or that private family. Originally they all belonged to private families or individuals, the villas or gardens in which they were dug being the property of wealthy citizens who had embraced the faith of Christ, and devoted of their substance to His service. Hence their most ancient titles were taken merely from the names of their lawful owners, many of which still survive. . . . It has always been agreed among men of learning who have had an opportunity of examining these excavations, that they were used exclusively by the Christians as places of burial and of holding religious assemblies. Modern research has placed it beyond a doubt, that they were also originally designed for this purpose and for no other."—J. S. Northcote and W. R. Brownlow, *Roma sotterranea*, bk. 1, ch. 1.—See also CHRISTIANITY: 100-300: Church in Carthage.

CATALAN GRAND COMPANY.—The Catalan Grand Company was a formidable body of

CATACOMBS, ROME

military adventurers—mercenary soldiers—formed in Sicily during the twenty years of war that followed the Sicilian Vespers. "High pay and great license drew the best sinews in Catalonia and Aragon into the mercenary battalions of Sicily and induced them to submit to the severest discipline." The conclusion of peace in 1302 threw this trained army out of employment, and the greater part of its members were enlisted in the service of Andronicus I, of the restored Greek empire at Constantinople. They were under the command of one Roger de Flor, who had been a Templar, degraded from his knighthood for desertion, and afterwards a pirate; but whose military talents were undoubted. The Grand Company soon quarrelled with the Greek emperor; its leader was assassinated, and open war declared. The Greek army was terribly defeated in a battle at Apros, 1307, and the Catalans plundered Thrace for two years without resistance. Gallipoli, their headquarters, to which they brought their captives, became one of the great slave marts of Europe. In 1310 they marched into the heart of Greece, and were engaged in the service of Walter de Brienne, duke of Athens. He, too, found them dangerous servants. Quarrels were followed by war; the duke perished in a battle (1311) with his Catalan mercenaries on the banks of the Cephissus; his dukedom, embracing Attica and Bœotia, was the prize of their victory. The widows and daughters of the Greek nobles who had fallen were forced to marry the officers of the Catalans, who thus settled themselves in family as well as estate. They elected a duke of Athens; but proceeded afterwards to make the duchy an appanage of the house of Aragon. The title was held by sons of the Aragonese kings of Sicily until 1377, when it passed to Alphonso V, king of Aragon, and was retained by the kings of Spain after the union of the crowns of Aragon and Castile. The titular dukes were represented at Athens by regents. "During the period the duchy of Athens was possessed by the Sicilian branch of the house of Aragon, the Catalans were incessantly engaged in wars with all their neighbours." But, gradually, their military vigor and discipline were lost, and their name and power in Greece disappeared about 1386, when Athens and most of the territory of its duchy was conquered by Nero Acciainoli, a rich and powerful Florentine, who had become governor of Corinth, but acted as an independent prince, and who founded a new ducal family.—G. Finlay, *History of the Byzantine and Greek empires*, bk. 4, ch. 2, sect. 2.

CATALOG OF ERRORS OF PIUS IX. See PAPACY: 1864.

CATALONIA: Geographical and racial description.—Catalonia (in Spanish Cataluña), a captaincy-general of the Spanish kingdom, "occupies the extreme north-east corner of the peninsula. It is a mountainous region, being built up of the outlying spurs of the eastern Pyrenees which are disposed generally parallel to the coast that is from north-east to south-west."—*Stanford's compendium of geography and travel, Europe (Chisholm) v. 1, p. 308.*—The principal rivers are the Ebro, the Ter, and the Llobregat, all of which flow into the Mediterranean and none of which is navigable. "Catalonia . . . possesses an admirable seacoast. Its natural wealth, joined to favourable geographical position, has developed commerce with neighboring countries, and more

especially with Roussillon and Languedoc. Indeed, seven or eight centuries ago, the Catalans were Provençals rather than Spaniards, and in their language and customs they were closely related to the people to the north of the Pyrenees."—*Universal geography*, VI., *Southern Europe*, p. 429.—"In remote centuries Phœnician, Carthaginian and Greek colonies contributed to the peopling of the littoral, while Iberian tribes [among them the Suesetanos, Sedetanos, Cosetanos, Ceretanos, Rus-sinos, Indigentes, Lacetanos, Laletanos, Acetanos, Ausetanos, Ilergentes and Ilercanos] occupied the interior; but the present province and its inhabitants derive their names from the invaders of the fifth century—first the Alani, who early in the century joined the Vandals in disturbing the long repose which Spain enjoyed under Roman rule [Catalonia was one of the first of the Roman possessions in Spain, and formed the northeastern portion of Hispania Tarraconensis] and afterwards the western Goths. Hence arose the name of Gothallonia or Gotholunia, from which the modern Catalonia, in Spanish Cataluña, is formed."—*Stanford's compendium of geography and travel, Europe (Chisholm) v. 1, p. 309.*

Character of the Catalans.—"Of all the peninsular peoples the Catalans were—and are—most unlike the Castilians. A population of almost pure Romance origin, sharing with their neighbors in the south of France the language, traditions, and literature of their race—a series of accidents rather than obvious fate had brought them under the rule of a Castilian King, instead of their forming the nucleus of the great Romance empire projected by James the Conqueror, their sovereign in the thirteenth century. [See SPAIN: 1035-1258.] Their character is rough and independent; they are tenacious, industrious, and thrifty, without any of the Portuguese peasant's servility or the Castilian's haughty contempt of manual labour; fully conscious of their superiority over their neighbours in many respects, they repay their disdain with disdain still deeper."—M. Hume, *Spain*, 1470-1788, p. 256.

712-1196.—Earlier history.—"Catalonia had been overrun by the Moslems when they entered Spain [712], but between 785 and 811 the Frankish kings were able to reconquer that region, establishing a province there which they called the Spanish Mark. This section was at first ruled by a number of counts, independent of each other, but subject to the kings of the Franks. Catalan submission to the latter did not endure through the ninth century. Wilfredo, count of Barcelona, is believed to have established his independence as early as 874, although that event is doubtful; at any rate the separation from the Frankish kingdom was not much longer delayed. Each count was lord unto himself, although in the entire breadth of northern Spain each unit labored for its own selfish ends. Christians fought Moslems, but also fought other Christians. Owing to the disorder of the Moslem realm, however, the Catalan counts, like the other Christian rulers, were able to make some territorial gains."—C. E. Chapman, *History of Spain*, p. 56.—"The little county . . . of Catalonia, which came into existence . . . after the victories of Louis of Aquitaine in the early years of the ninth century, has no history, certain, or worthy of our attention, until the days of Ramon Berenguer I, *el riego* (1035-1076), whose victories over the Arabs were even less remarkable than the vigour and success of his domestic policy. The first undisputed master of all Catalonia, he introduced a modified form of the feudal system among the barons and knights

and as a supplement or complement to the old Gothic laws of the *Fuero Juzgo* he formulated the celebrated *Usages* of Catalonia, which were promulgated at the Council of Gerona, and confirmed, in 1068, by the *Cortes* of Barcelona, one of the earliest Councils at which no bishop was present, and which was a true popular and political assembly. This Ramon Berenguer acquired, moreover, by marriage and treaty, considerable possessions beyond the Pyrenees, and, at the instance of Pope Alexander II., he restored or rebuilt the cathedral at Barcelona. The wisdom of Ramon Berenguer the elder was not perpetuated in his children, nor did he himself display it in the disposition of his dominions at his death; for he divided his kingdom between his two sons, Ramon Berenguer II., . . . and his younger brother Berenguer Ramon; and the succession was only settled, after five years of domestic strife, by the assassination of the elder of those princes by the younger in 1081. The fratricide found no favour with the Catalons, and after a brief period of sovereignty he fled to the Holy Land, and was succeeded by his infant nephew, . . . who ruled for nearly fifty years as Ramon Berenguer III (1082-1131). By his marriage with Douce, Countess of Provence, by treaty, and by inheritance, this prudent sovereign extended his dominions on either side of the Pyrenees, and making head against the Arabs on his southern frontier, he actually carried his victorious arms across the Sea to Majorca, which was taken and occupied by the Catalons in 1100. This Ramon Berenguer III is known in history by the honourable title of the *Consolidator of the Realm*. He reigned over both Barcelona and Aragon with infinite advantage to the Commonwealth; and was succeeded by his son, Ramon Berenguer IV.—U. R. Burke, *History of Spain*, v. 1, pp. 201-202.—“Ramon Berenguer IV (1131-1162) inherited only the Spanish portions of his father's domain, but extended his authority over Tortosa, Lerida, and other Moslem regions, being a notable warrior. In 1150 he married the daughter of the king of Aragon, and in 1164 his son by this marriage [Ramon, who assumed, in 1161, the name of Alfonso—surnamed the *Chaste*] united Aragon [see ARAGON] and Catalonia under a single rule.”—C. E. Chapman, *History of Spain*, p. 78.—Alfonso, “dying in 1106, was succeeded by his son Peter, who played a more conspicuous part, not only in Aragon and in Southern Spain, but in Languedoc, and even in Italy.”—U. R. Burke, *History of Spain*, v. 1, p. 202. See SPAIN: 1035-1258.

1461-1472.—Long but unsuccessful revolt against John II of Aragon. See SPAIN: 1368-1470.

1639-1652.—Causes of disaffection.—Revolt.—Renunciation of allegiance to the Spanish crown.—Annexation to France offered and accepted.—Resubjection to Spain. See SPAIN: 1637-1640; 1640-1642; 1644-1646; 1648-1652.

1705.—Adhesion to Allies in the War of Spanish Succession.—Capture of Barcelona. See SPAIN: 1705.

1713-1714.—Betrayed and deserted by the Allies.—Barcelona besieged and captured.—“Alone among the Spaniards the Catalans had real reason to regret the peace. They had clung to the cause of Charles with a desperate fidelity, and the Peace of Utrecht rang the death-knell of provincial liberties to which they were passion-

ately attached. From the beginning of 1705 they had been steady and faithful allies of England; they had again and again done eminent service in her cause; they had again and again received from her ministers and generals the most solemn assurances that they would never be abandoned. When England first opened a separate negotiation for peace she might easily have secured the Catalonian liberties by making their recognition an indispensable preliminary of peace; but, instead of this, the English ministers began by recognizing the title of Philip, and contented themselves with a simple prayer that a general amnesty might be granted. When the Convention was signed for the evacuation of Catalonia by the Imperial troops, the question of the provincial liberties were referred to the definite peace, the Queen and the French King promising at that time to interpose their good offices to secure them. The Emperor, who was bound to the Catalans by the strongest ties of gratitude and honour, could have easily obtained a guarantee of their *fueros* at the price of an acknowledgment of the title of Philip; but he was too proud and too selfish for such a sacrifice. The English, it is true, repeatedly urged the Spanish King to guarantee these privileges, . . . but these were mere representations, supported by no action, and were therefore peremptorily refused. The English peace with Spain contained a clause granting the Catalans a general armistice, and also a promise that they should be placed in the same position as the Castilians, which gave them the right of holding employments and carrying on a direct trade with the Indies, but it made no mention of their provincial privileges. The Peace of Rastadt was equally silent, for the dignity of the Emperor would not suffer him to enter into any negotiations with Philip. The unhappy people, abandoned by those whom they had so faithfully served, refused to accept the position offered them by treaty, and, much to the indignation of the English Government, they still continued in arms, struggling with a desperate courage against overwhelming odds. The King of Spain then called upon the Queen, as a guarantee of the treaty of evacuation, ‘to order a squadron of her ships to reduce her subjects to their obedience, and thereby complete the tranquillity of Spain and of the Mediterranean commerce.’ A fleet was actually dispatched, which would probably have been employed against Barcelona, but for an urgent address of the House of Lords, and the whole moral weight of England was thrown into the scale against the insurgents. The conduct of the French was more decided. Though the French King had engaged himself with the Queen by the treaty of evacuation to use his good offices in the most effectual manner in favour of the Catalan liberties, he now sent an army to hasten the capture of Barcelona. The blockade . . . lasted more than a year. The insurgents hung up over the high altar the Queen's solemn declaration to protect them. They continued the hopeless struggle till 14,000 bombs had been thrown into the city; till a great part of it had been reduced to ashes; till seven breaches had been made; till 10,000 of the besieging army had been killed or wounded; and till famine had been added to the horrors of war. At last, on September 11, 1714, Barcelona was taken by storm. A frightful massacre took place in the streets. Many of the inhabitants were afterwards imprisoned or transported, and the old privileges of Catalonia were finally abolished.”—W. E. H. Lecky, *History of England, 18th century*, ch. i, v. 7.—See also SPAIN: 1713-1714.

1808-1809.—Part played in the Peninsular war. See SPAIN: 1808-1809 (August-January); 1809 (February-July).

1833-1846.—Carlist strongholds. See SPAIN: 1833-1846.

1900-1909.—Home rule agitation.—Catalonia has never become reconciled to her place as a dependency under the government at Madrid, and her spirit of fierce local patriotism has never died out. In 1900 the arrogance of the military party stirred afresh the desire of the Catalonians for separation, or at least for self-government. This half-rebellious state continued to harass the Spanish authorities during the early years of the twentieth century, and was one of the causes in 1905 for the downfall of the Rios ministry which was in office scarcely a month. Bomb explosions and anarchist outrages continued to increase despite the efforts of the various ministries who attempted to cope with the situation.—See also SPAIN: 1900-1909; 1909.

1909-1921.—Labor agitation.—Economic conditions.—Radicalism. See SPAIN: 1909; 1919-1920; 1921; BARCELONA: 1903-1919; 1915-1919.

1917-1919.—Attempts to gain self-government.—During 1917 the Catalanian desire for independence found expression in various forms of restlessness and hostility toward the government at Madrid. The demand of the Catalanian representatives that the Chambers be called together as a constituent assembly was refused by the government July 3, 1917. In December, 1918, a Catalanian delegation presented to the government at Madrid a fourfold demand for local autonomy, calling for the organization of a local government with two chambers. The Catalanian nationalists were, however, opposed by the army and in 1919 the movement for independence was overshadowed by the contest between the employing classes and the trade unions. The fear of a commercial boycott by the rest of Spain also aided in weakening Catalanian nationalist activities.

CATERANS.—"In 1384 an act was passed [by the Scottish parliament] for the suppression of masterful plunderers, who get in the statute their Highland name of 'cateran.' . . . This is the first of a long succession of penal and denunciatory laws against the Highlanders."—J. H. Burton, *History of Scotland, v. 3, ch. 27.*

CATERPILLAR TRACTOR: Origin of tank in warfare. See TANKS: Invention.

CATHARI, Catharists, or Patarenes.—"Among all the sects of the Middle Ages, very far the most important in numbers and in radical antagonism to the Church, were the Cathari, or the Pure, as with characteristic sectarian assumption they styled themselves. Albigenes they were called in Languedoc; Paterenes in North Italy; Good Men by themselves. Stretching through central Europe to Thrace and Bulgaria, they joined hands with the Paulicians of the East and shared their errors. Whether these Cathari stood in lineal historical descent from the old Manichæans, or had generated a dualistic scheme of their own, is a question hard to answer, and which has been answered in very different ways. This much, however, is certain, that in all essentials they agreed with them."—R. C. Trench, *Lectures of mediæval church history, lecture 15.*—"In Italy, men supposed to hold the same belief [as that of the Paulicians, Albigenes, etc.] went by the name of the Paterini, a word of uncertain derivation, perhaps arising from their willingness meekly to submit to all sufferings for Christ's sake (pati), perhaps from a quarter in the city of Milan named 'Pataria'; and more lately by that of Cathari (the Pure, Puritans), which was soon corrupted into Gazari, whence the German 'Ketzer,' the general word for a heretic."—L. Mariotti, *Frà Dolcino and his times, ch. 1.*—See also PAULICIANS; ALBIGENSES; CHRISTIANITY: 11th-16th centuries.

CATHAY, the name applied to China by Marco Polo and subsequently by mediæval Europe. It was later regarded as a rich country north of China, and as such was the great object with which Columbus set out on his westward journey, which resulted in the discovery of the New World. The name is derived from Khitai, the kingdom of a race which invaded and conquered northern China about 907. It is still common in poetry. See CHINA: Names of the country.

CATHEDRA. See EX CATHEDRA.

CATHEDRAL, "the chief church in every diocese, so called because it contains the cathedra or chair, the seat or throne of the bishop. The cathedral church is the parish church of the whole diocese. . . . It was not called the cathedral church till the tenth century, before which the term *ecclesia matrix*, to distinguish it from the ordinary churches, or *ecclesie diocesanae*, was used. In cathedrals the bishop is formally enthroned, and in them he holds his ordinations and visitations."—J. S. Bumpus, *Dictionary of ecclesiastical terms, p. 57.*—"The cathedral itself is not necessarily large nor splendid, nor is there any architectural style or character which can be said to belong to it in a peculiar sense. . . . The cathedral of that part of Venetia in which is situated the city of Venice was for many years a small

and unimportant church, S. Pietro in Castello, situated on a remote island, and the church of S. Marco, built and used as the chapel of the Doge, was made the cathedral after the destruction of the Venetian Republic. . . . The largest church in Christendom, S. Peter's, at Rome, is not a cathedral; the cathedral of the Bishop of Rome is the ancient Lateran Basilica. . . . There is, however, a cause for the rapid building of cathedrals in the twelfth and thirteenth centuries, and of the great size and splendor given especially to these churches. . . . It is the communal or social character of the movement which united people of the towns with their bishop, and which resulted in the free using of large parts of the cathedrals, when finished, as places of popular resort."—R. Sturgis, *Dictionary of architecture and building*, v. 1, p. 475.—Early Christian churches were modelled after the Roman basilicas in which the first meetings were held after Christianity was accepted in the Empire. "The basilica plan became gradually modified. The nave and aisles were retained, but the chancel, with or without an apse, was carried farther back and the length of the transepts prolonged, so that in time the cruciform plan prevailed and acquired a symbolic significance. A special feature, gradually introduced, was the *chevet* which formed an *ambulatory* around the sides of the choir and the semicircle of the apse, and could be divided up into chapels dedicated to individual saints."—C. H. Caffin, *How to study architecture*, pp. 241-242.

Historical importance.—Chief architectural features.—"The construction of these buildings, many of which were founded in the eleventh and twelfth centuries, was carried on from generation to generation. The place in the national life which the mediæval cathedrals occupied was an important one, and must be realized in order to understand how they were regarded. Cathedrals were erected and decorated partly as a means of popular education, and they were the history books of the period, taking the place in the social state since occupied, to a large extent, by such modern institutions as the Board School, Free Library, Museum, Picture Gallery and Concert Hall. The sculpture and the painted glass reflected the incidents of Bible History from the creation to the redemption of mankind, the sculptured forms and brilliant coloring being easily understood by the people. The virtues and vices, with their symbols, were there displayed, either in glass or statuary, along with their reward or punishment; saints and angels told of the better life, and the various handicrafts, both of peace and war, were mirrored in imperishable stone or colored glass. Architecture then as now was also the grand chronicle of secular history, past and present, in which Kings, Nobles and Knights were represented. The plans in all parts of Europe, as may be seen on referring to those of England, France, Belgium, Germany, and Italy, are generally in the form of a Latin cross, the short arms, north and south, forming the transepts. The cruciform ground plan is considered by some as a development from the early Christian basilicas, such as Old S. Peter, Rome, and by others, as evolved from the cruciform buildings erected for sepulchral purposes as early as the period of Constantine. A tower, sometimes crowned with a spire, was generally erected over the crossing or at the west end. As a rule the nave is the portion to the westward, and the choir, containing the bishop and clergy, is that to the eastward of the crossing. Each of these divisions is further di-

vided into a central nave and side aisles, separated by columns or piers. The principal entrance, often richly ornamented, is at the west end, or by a porch on the south or north sides. The columns or piers support arches (the nave arcade), which carry the main walls, rising above the aisle roof. Above this arcade are a series of small arches, opening into a dark space caused by the height of the sloping roof of the aisle; this is called the *triforium*, or 'blind story.' Above the triforium is a range of windows in the main wall, admitting light into the upper part of the nave; this division is called the *clerestory*, or 'clear story,' probably derived from the French word *clair*, light being admitted by the windows in this portion of the nave wall. The head of these windows is generally the level of the ridge of the stone vault of the nave, which is covered by a high pitched wooden roof. The east ends or choirs, usually square-ended in England, are generally richer than the remainder of the church, and the floor is raised above the nave level by steps. The east ends of Norwich, Gloucester, Peterborough, Lichfield, and Canterbury, all of Norman origin, were circular, while Westminster Abbey has a ring of chapels or *chevet*. The lady-chapel is placed beyond the choir at the extreme east end, as at Norwich, Peterborough, and Salisbury, or on one side, as at Ely. The cloisters attached to so many of the English cathedrals, forming part of the original monastic buildings, were probably derived from the atrium of the Early Christian period. They are generally, but not invariably, south and west of the transept, in the warmest and most sheltered position, forming the centre of the secular affairs of the monastery, and a means of communication between different parts of the Abbey. Such is the general distribution of the parts of a cathedral or large church, from which, naturally, there are many deviations, such as, for instance, the position and number of transepts. Great length, and central towers, are features of English cathedrals; western towers also occur in many examples, as at Lichfield (with spires), Durham, Canterbury, York, Wells, Lincoln and Ripon. Compared with such long, low, and highly grouped examples, Continental cathedrals seem short, high, and often shapeless, owing to the intricacy and profusion of their buttressing. In churches, a single western tower is an English characteristic."—B. Fletcher and B. F. Fletcher, *History of architecture*, pp. 273, 275-276.

English, Scottish, and Irish cathedrals.—"The English Cathedrals, as a general rule, owe much of their beauty to the fact that they are generally placed in a large open space called the Close, as at Canterbury, Lincoln and Salisbury, . . . or are situated picturesquely on the banks of a river, as at Worcester, or Durham. . . . The French Cathedrals, on the other hand, are often completely surrounded by houses and shops, which in many cases were actually built against the wall of the church itself. . . . The constitution and foundation of English Cathedrals is important and is largely responsible for their monastic character and general arrangement. They may be divided into three classes:—(a) Cathedrals of the Old Foundation. (b) Cathedrals of the Monastic Foundation. (c) Cathedrals of the New Foundation. (a) The Cathedrals of the old foundation are those which, being served by *secular* clergy, were not affected by the reforms of Henry VIII. The following is a list:—The Cathedrals of York, Lichfield, Wells, Exeter, Salisbury, Chichester, Lincoln, Hereford, S. Paul, London, and the Welsh Cathedrals of Llandaff, Bangor S. David's, and

S. Asaph. (b) The Cathedrals of the monastic foundation are those which were originally served by *regular* clergy or *monks*, and which were reconstituted at the dissolution of the monasteries as chapters of secular canons. The following is a list:—The Cathedrals of Canterbury, Durham, Rochester, Winchester, Worcester, Norwich, Ely, Carlisle, Peterborough, Gloucester, Chester, Oxford, and Bristol. Westminster Abbey was a Cathedral Church from A. D. 1540-1545. When the change in these monastic establishments was made the abbot became the bishop, the prior the dean, and the monks became canons and choristers; the *personnel* generally remaining the same. (c) The Cathedrals of the new foundation are those to which bishops have been appointed, viz., Ripon and Southwell, which are old Collegiate Churches, and the following Parochial Churches:—S. Albans, Newcastle, Wakefield, Manchester, and Truro. Diversity of style in each building was caused by the fact that with the single exception of Salisbury many were erected in all periods, thus presenting a complete history of the evolution of Gothic Architecture. Most of the English Cathedrals were founded or remodelled after the Conquest, including many which formerly served as churches of the great monastic institutions of the period. The character which each Cathedral possesses generally indicates its original purpose. Monastic Cathedrals are almost peculiar to England and Germany. In these countries a large proportion of the Cathedral Churches formed part of monastic establishments in which are found cloisters, refectories, dormitories, chapter houses, scriptorium, library, guest hall, infirmary, prison, wine cellars, mills, workshops and gardens. Cloisters were required in monastic establishments from necessity, as they formed a covered way for the use of monks, round which the various buildings enumerated above were grouped. They were also frequently planned as an ornamental adjunct to cathedrals of the old foundation which were not part of monastic establishments, but were served by secular clergy, as at Salisbury and Wells. The Collegiate Churches of Lichfield, Ripon, Southwell, York and Manchester, and the Irish, Scotch and Welsh Cathedrals (S. David's excepted) have no cloisters. . . . Architecture in Scotland followed on much the same lines as in England, until the middle of the fifteenth century, when it took a more national turn. . . . The most important Cathedrals are those of Edinburgh (S. Giles), Glasgow (having no transepts but a famous crypt), S. Andrew, Kirkwall, Dunblane, Aberdeen and Elgin, and the Abbeys of Kelso, Melrose, Dunfermline, Holyrood and Dryburgh are the best known. In these the lancet window, either singly or in groups, was used long after it had been discontinued in England, while in the later period the Flamboyant tracery of French Gothic was followed in preference to the Perpendicular style of English Gothic. . . . Within the English domain the influence of Continental art was felt during the Middle Ages, but few monuments of importance were erected. The Cathedrals of Dublin, Kildare and Cashel, were the most important, but the absence of parish churches is remarkable."—*Ibid.*, pp. 276, 294, 298, 359, 360.

Continental cathedrals.—"The development and consolidation of the French kingdom . . . corresponds with the great cathedral-building epoch of the thirteenth century. . . . All the great cathedrals, numbering about 150, were erected in the first half of the thirteenth century, principally by funds provided by the laity, and not as parts of monastic establishments, and in consequence vary

considerably in plan and arrangement from English cathedrals. The French cathedrals, in situation and surroundings, are also in marked contrast with English examples. . . . The churches are especially noticeable externally for (a) the flatness of the roofs; (b) the tendency to mask the aisle roofs by a mere screen wall forming the west façade, without reference to the slope of the roofs behind; (c) the great central circular window in the west front lighting the nave; (d) the flatness and comparative unimportance of the mouldings, their place being more than taken by the beautiful colored marbles with which the façades were faced, and the broad surfaces covered with fresco decorations. . . . [The general plan of the great cathedrals of western Germany, namely, Cologne, Strassburg, Freiburg, Ratisbon, Ulm, etc., were borrowed directly from France.] Milan Cathedral [Italy] (A. D. 1385-1418), erected by the first Duke of Milan, is the most important work [in Italy] of this period, and there is a marked German influence, both in character and details. It is the largest mediæval cathedral, with the exception of Seville, and is built entirely of white marble. . . . [In Spain] the Gothic style was best developed in Catalonia, where, though on French lines, as in most parts of Spain, it has a special character, owing to the grand scale of the single-span vaulted interiors. Leon Cathedral goes beyond its French original at Amiens, in the expanse of window opening and tenuity of its supports. The exteriors usually are flat in appearance, owing to the space between buttresses being utilized internally for chapels, and generally, it may be said that a liking for excessive ornamentation without any regard to its constructive character is apparent. Contrary to Northern Gothic, broad wall surfaces and horizontal lines are special features of the style. The cloisters of many of the cathedrals, as Barcelona, Toledo, and Lérida, are characteristic. . . . Seville Cathedral (1401-1520), erected on the site of a mosque of the same size, is the largest mediæval cathedral in any country. It bears a considerable resemblance to Milan Cathedral, but is less fanciful in detail, or, as some would prefer to say, of a purer Gothic style. . . . It is typically Spanish in having a rectangular outline, but it differs from most of the great Continental churches in having a square east end, and small apse. As showing the extraordinary size of this cathedral it may be pointed out that each of the four side aisles of Seville is practically equal both in height and width to the nave of Westminster Abbey, while the nave arcades have twice the span, although the total length of Seville is little more than that of the Abbey. Thus one aisle of Seville represents the size of the nave and choir of the abbey, and is repeated four times; in addition to which there is the great nave, 55 feet wide from centre to centre of piers, and 130 feet high surrounding the church, and of the same depth as the aisles, are the chapels. From these comparisons an idea can be obtained of the immense size of this Spanish cathedral."—*Ibid.*, pp. 363, 368, 405, 407, 408, 426, 430.

Among the more important cathedrals and churches are the following:

Austria.—S. Stephen's (Vienna); Prague (Bohemia).

Belgium.—Antwerp; Brussels; Ghent, Louvain; Malines; Tournai.

England.—Canterbury; Durham; Ely; Exeter; Gloucester; Lichfield; Lincoln; Norwich; Peterborough; S. Albans; Salisbury; Wells; Westminster Abbey; York; S. Paul (London); Rochester; Winchester.

France.—Amiens; Chartres; Metz; Notre Dame (Paris); Rheims; Rouen; Strassburg; Tours; Laon; Beauvais; Noyon; Bourges; Orléans.

Germany.—Cologne; Freiburg; Mainz; Ratisbon; Spire; Ulm; Trèves.

Italy.—Florence; Milan; Monreale; Pisa; Siena; S. Mark's (Venice); S. John Lateran (Rome); S. Peter's; S. Miniato; S. Croce, Florence; Orvieto; Lucca; Bologna; Bari; Piacenza; Palermo.

Mexico.—Mexico City; Puebla; Valladolid.

Russia.—S. Isaac of Dalmatia; S. Peter; S. Paul (Petrograd); Kremlin (Moscow).

Spain.—Burgos; Barcelona; Salamanca; Seville; Santiago de Compostella; Toledo; Granada; Tarragona; Segovia; Leon; Oviedo.

United States.—S. Patrick (New York); S. John the Divine (New York); St. Louis (Missouri).

CATHOLIC APOSTOLIC CHURCH.—"In 1830 and 1831 several Presbyterians in Scotland and London prayed for a restoration of the 'gifts of the Spirit.' . . . In response, gifts of 'tongues and prophesyings' came, it is said, upon a number of people . . . and in 1832, after the 'reality of the prophetic gift had been fully established by the experience of almost three years' the office of apostle was revived, a layman of the Church of England being the first person designated by the Holy Ghost to fill it. Others were designated from time to time until the number was completed and there were twelve. Several congregations were organized and in time the movement extended to other countries."—H. K. Carroll, *Religious forces of the United States*, pp. 84-85.—"The first church in the United States was organized at Potsdam, N. Y., and the second in New York City in 1851. In England the adherents of this communion are frequently called 'Irvingites' from the fact that the celebrated preacher Edward Irving

was prominent in the movement which resulted in its formation. . . . As the work of the church has been directed exclusively toward the awakening of the Christian Church to the hope of the Lord's coming and preparation therefor, it has included no foreign missionary, educational, or so-called institutional work, although the different churches care for the poor in their respective localities."—United States Census, *Religious bodies* 1916, pt. 2, p. 187.—Statistics available January 1, 1920, reported thirteen churches and 2,768 members of the denomination in the United States.—Federal council of the churches of Christ in America, *Year book of the churches* 1920, p. 198.—There are above eighty churches in the British Isles.—*Whitaker's almanack*, 1920, p. 260.—"Probably more numerous are the followers of the German and Dutch branch, which has increased in strength, though its separation from the English body has favored a tendency to fanatical extravagance and to the abandonment of the likeness to Roman Catholicism in externals."—*New Schaff-Herzog religious encyclopedia*, v. 2, p. 450.

CATTANI, VASSALI, MASNADA, SERVI.—The feudal barons of northern Italy were called Cattani. In the Florentine territory, "many of these Cattani, after having been subdued and made citizens of Florence, still maintained their feudal following, and were usually attended by troops of retainers, half slaves, half freedmen, called 'Uomini di Masnada,' who held certain possessions of them by the tenure of military service, took oaths of fidelity, and appear to have included every rank of person in the different Italian states according to the quality of the chief; but without any degradation of character being attached to such employment. . . . Some slight, perhaps unnecessary distinction is made between the 'Vassi,' who are supposed to have been vassals of the crown, and the 'Vassali,' who were the vassals of great lords. The 'Vavasours' were the vassals of great vassals. . . . Besides these military Villains, who were also called 'Fedeli,' there were two other kinds of slaves amongst the early Italians, namely prisoners of war and the labourers attached to the soil, who were considered as cattle in every respect except that of their superior utility and value. The former species of slavery disappeared much earlier than the latter."—H. E. Napier, *Florentine history*, v. 1, p. 624.

CATTARAUGUS RESERVATION. See **IROQUOIS CONFEDERACY**: Iroquoian family.

CATTARO (Serb, Kotor), the chief town and seaport of Dalmatia situated on a narrow strip between the Montenegro mountains and the Bocche di Cattaro. It is first mentioned under its ancient name, Ascrivium, about 168 B. C. After being held by Serbia, it passed to the possession of Venice in 1420. In 1797 it was given to Austria by the Treaty of Campo-Formio; in 1805 was given to Italy and in 1810 to France; restored to Austria at the Congress of Vienna (1814). In 1914 was used by the Austrians as a base in their Montenegrin campaign; ceded to Jugo-Slavia in 1919. See **LONDON, TREATY OR PACT OF**; **WORLD WAR**: 1917: IX. Naval operations: b.

CAUCASUS: Territory.—**Physical features**.—Mountaineers.—"Russia's far south-eastern province of Caucasia may be said roughly to occupy all the territory between the Black and Caspian Seas. Its northern boundaries are the Sea of Azof and the provinces of the Don and Astrakhan, its southern Persia and Turkey. It is separated by the Russians, and most effectively also by nature, into two parts, Ciscaucasia or European Caucasia and Trans- or Asiatic Caucasia. The natural separation is a strip of elevated country. . . . Beginning at each end in hills of moderate elevation, the height of the land soon rises as we progress towards the centre."—*Scottish Geographical Magazine*, May, 1917.—"The Caucasus is essentially a mountain country; its inhabitants, with the exception of the Christian population occupying the river valleys of the Rion and Koura, essentially mountaineers; for, just as, thanks to its mass and elevation, the great central range has largely influenced all other physical features, so together with them has it been the determining factor in the matter of population. The people of the Caucasus owe to it not only their salient characteristics, but their only existence. It may be said without exaggeration that the mountains made the men."—J. F. Baddeley, *Russian conquest of the Caucasus*, p. 1.—The estimated population in 1915 was 13,229,100 to an area of 181,173 English square miles.—See also **RUSSIA**: Map of Russia and the new border states.

Ethnology.—"One of the most remarkable characteristics of the Caucasus is that, while it has acted as a barrier between the north and the south, stopping and turning aside the movements of population, it has also preserved within its sheltered recesses fragments of the different peoples who from time to time have passed by it, or who have been driven by conquest into it from the lower country. Thus it is a kind of ethnological museum, where specimens may be found of countless races and languages, some of which probably belong to the early ages of the world; races that seem to have little affinity with their present neighbours, and of whose history we know nothing except what comparative philology can reveal. Even before the Christian era it was famous for the variety of its peoples. . . . No more inappropriate ethnological name was ever propounded than that of Caucasian for a fancied division of the human family, the cream of mankind, from which the civilized peoples of Europe are supposed to have sprung. For the Caucasus is to-day, as it was in Strabo's time, full of races differing in religion, language, aspect, manners, character."—J. Bryce, *Transcaucasia and Ararat*, ch. 2.

"In the middle ages the Caucasus was the route by which the wild Asiatic hordes, the Goths, Kharsars, Huns, Avars, Mongols, Tartars, and Arabs crossed from Asia into Europe; and consequently its secluded valleys contain a population composed of more different and distinct races than any other district in the world."—H. M. Chester, *Russia*, ch. 18.—"Taking Caucasia as a whole, numerically the most important element is the Russian, but the Russians are of course very much intermingled with native elements. . . . The most important nation included within the Caucasian limits is that of the Georgians. [See **GEORGIA**,

REPUBLIC OF: Geographical position.] . . . The third most numerous element is provided by the Armenian."—*Scottish Geographical Magazine*, May, 1917.—Among the other innumerable tribes, septa and clans of the Caucasus mountains are the Ossiets, the Imeritians, the Suans, the Tauli (Mountain Turks), and other Turkish tribes.

Culture.—Languages.—Public education.—"A well-known passage in Strabo states that Dioscurias, on or near the site of the present Soukhoun-Kalé, was frequented by people speaking seventy different languages. Pliny quotes Timosthenes to the effect that the number was 300, and says 'afterwards we Romans conducted our affairs there with the aid of 130 interpreters.' And Al-Azizi called the eastern Caucasus 'the Mountain of Languages' (Djebel-el Alsini) because, according to him, the people inhabiting it spoke 300 different tongues. Allowance must be made for Oriental exuberance of imagination, but even quite recently the number was given by sober Europeans as not less than forty for Daghestan alone, and it was supposed that many if not most of these were totally unconnected one with another. But recent researches have thrown quite a new light on this branch of comparative philology, and, according to F. Müller, the greater part of the languages of the Caucasus form one independent family consisting of three groups, namely, the Kartvel, the western and the eastern Caucasian, all originating in one parent language, and differentiated from it in the course of time in much the same way as the languages of the Hamite-Semitic family from a like common original."—J. F. Baddeley, *Russian conquest of the Caucasus*, p. xxiv.—Up to the time of the Russian conquest none of these mountain languages had ever been written, but the early introduction of Arabic supplied to some extent this deficiency. Following the conquest the Russian philologist, General Usler, invented alphabets and compiled grammars for several of the more important Caucasian languages, and these are now taught in the government schools which have been established under the auspices of the mountain administration at Vladikavkaz, Timour Khan Shoura, and Groznoi. [See also PHILLOGY: 23.]

"Public education was in the hands of the State, or was directly controlled by it. The number of persons able to read or write in the Caucasus in 1912 was only 17 per cent., and the percentage of schools to the population was very low. Some progress was made in the provision of instruction during 1912 and 1913, but the outbreak of war hindered the completion of the various schemes put forward. . . . Movable summer schools for the education of the nomad tribes were attempted for the first time in 1913 in the Governments of Erivan and Kutais. The industrial schools included . . . secondary and lower-grade technical schools, . . . trade schools, . . . lower-grade trade schools, and . . . charitable trade schools."—*Caucasia, Handbook No. 54*, pp. 33-34.

Lack of sanitation.—"The science of hygiene is unknown in Caucasian villages, and medical aid is absent or inaccessible in country districts. Malaria is the characteristic disease of Caucasia, but small-pox, scarlet fever, measles, dysentery, typhus, and pneumonia are prevalent and cause many deaths. . . . Goitre and epilepsy are common among the natives of Svanetia. Leprosy occurs among the poorer classes of the Persian population. Elisavetopol is notorious for the so-called Sartin sickness, a kind of skin eruption. . . . Only in the fashionable health resorts, such as Kislovodsk, Jeliznovodsk and Pyatigorsk, there are

very up-to-date sanatoria established on the latest German lines, to which people come from all parts of Russia to take the waters and the cure."—*Caucasia, Handbook No. 54*, pp. 8, 17.

Natural wealth.—Economic resources.—Industries.—Agriculture.—Land tenure.—River electricity.—Financial conditions.—Railways.—"The Caucasus is one of the richest regions of the globe. The land to which Jason and the Argonauts came in search of the Golden Fleece has proved a modern El Dorado. The Fountains of Eternal Fire that the Zoroastrians used to worship have been the making of the Moslem millionaire. A single tract ten miles square at Baku produced for some years half the world's supply of petroleum and even yet keeps Russia next to the United States in output."—E. E. Slosson, *From Baluchistan to Baku (Independent, Aug. 31, 1918)*.—"The fact remains that Caucasia contains great natural wealth, little exploited as yet. There are openings for development in the use of its forests and water power; in the exploitation of minerals and mineral springs; in the cultivation of fruit, vines, tea, and with the help of scientific irrigation of cotton; and in the production of silk. . . . The total area of forest land in Caucasia cannot be stated with certainty; the extent of the forests under the control of the Ministry of Forests was . . . more than half of its cultivated area. . . . Ciscaucasia and Transcaucasia have each their own characteristic industries, which, in the former case, are those proper to a region predominantly agricultural, and in the latter are dependent on the output of the oil-fields. Agriculture forms the occupation of the majority of the inhabitants of the Caucasus, though in many cases it is pursued in combination with other activities. . . . Ciscaucasia is far in advance of Transcaucasia in respect of agricultural methods, a fact due in part to the more enterprising character of the Cossack population and in part to the less isolated geographical position of the northern provinces. In both divisions of the country, however, there has in recent years been a notable advance in agricultural science, evidenced by the rapid development of co-operation. . . . The Caucasus as a whole has no fixed system of land tenure, nor are any of the characteristic Russian features of land-holding found there. The various kinds of landowner may be divided into six classes: the old nobility of Georgia; Tatar and Armenian peasant holders; nomad pastoral tribes, who occupy large areas of steppe land, especially in Stavropol Province; Russian settlers, placed on land vacated after the conquest; the Russian State, which owned large areas, mainly forest; and the Imperial family, which had acquired valuable appanages in the Caucasus. No figures are available to show the proportions in which the land is held by these various owners. . . . Moreover, recent events have to a great extent obliterated the old divisions, and new claims to ownership of much valuable land will have to be settled in the course of time."—*Caucasia, Handbook No. 54*.—"The water-power offered by the rapid streams of the Caucasus has hitherto been almost entirely neglected, but in 1914 an important scheme was set on foot for the erection of two large power-stations, one on the Terek . . . and the other at Elenoffka, in Erivan, utilizing the waters of Lake Gokoba. . . . Electric power was steadily replacing steampower on the oil-fields in 1914."—*Ibid.*, pp. 48-91.—"The paper money and coinage current in Caucasia is that of the Russian Empire, but certain silver coins of the old Georgian currency are still in circulation."—*Ibid.*, p. 89.—"The practical devaluation of this

paper, and the lack of any manufacturing or immediately available resources in the country affected all forms of commerce until trade became a mere matter of petty bartering. The peasants were swamped with more money than they could use, until they refused to exchange their crops for it. Due to arrangements with the Government, a certain amount of manufactured goods was imported, but, in spite of the enormous per capita figures in rubles, toward the end of the year practically all imports ceased, owing to the small purchasing power of the population. . . . The three republics composing . . . the Caucasus are practically stripped of all manufactured articles. Five years of war . . . have depleted the country and forced 75 per cent of the reputable firms to close their doors."—*Supplement to commerce reports, Nov. 10, 1920*.—"The banks operating in the Caucasus are with few exceptions branches of Moscow or Petrograd establishments long ago nationalized and looted."—*Ibid.*—"Road communication between the Caucasus and Russia are very few, the only ones of importance being the road along the Caspian littoral and one from Stavropol to Rostov-on-Don."—*Caucasia, Handbook No. 54*.—"The Transcaucasia Railway before the Russian revolution was a single system comprising a direct line from Batum, on the Black Sea, to Baku, the port of the Caspian Sea, and a branch extending from Tiflis southward through Alexandropol to Kars and Erivan, but it has since been split up among the three Caucasian States. At the time of the dissolution of the Transcaucasian cabinet each new government seized such rolling stock and railway materials as were within its borders and claimed them for its own."—*Commerce reports, Nov. 10, 1920, p. 4*.

Historical tradition.—"The Caucasus has always possessed a certain fascination not for the Russians only, but also for western nations, and is peculiarly rich in historical traditions, and in memories of ancient times and ancient nations. Here, to the rocks of Elbruz, Prometheus lay chained; and to Colchis, where the Phasis flowed towards the sea, through ever green woods, came the Argonauts. The present Kutais is the old capital of King Æetes, near which, in the sacred grove of Ares, hung the golden fleece. The gold mines which the Russians discovered in 1864 were apparently known to the Greeks, whose colony, Dioscurias, was an assemblage of 300 diverse nationalities. . . . Here on the coasts of the stormy and dangerous Black Sea arose the famous Pontine kingdom which in spite of its valiant resistance under Mithridates, fell a victim to Roman aggression. Along the rivers Kura and Rion ran the old commercial road from Europe to Asia, which enriched the Venetians and the Genoese in the middle ages. Up to recent times this trade consisted not only of all sorts of other merchandise, but of slaves; numberless girls and women were conveyed to Turkish harems and there exercised an important influence on the character of the Tartar and Mongol races."—H. M. Chester, *Russia, ch. 18*.

B. C. 323-A. D. 371.—Conquest by Alexander.—**First conflict with Persia.**—"To attempt to write the history of the Caucasus would not only be very difficult, but hardly profitable. Until the Russian occupation the Caucasus had no unity. Geographically it is divided into two distinct parts by the great range. Ethnographically it is but a collection of miscellaneous samples. Historically it has always been split up between a number of different foreign States, and more or less independent principalities and tribes. . . . Russia is the first Power which has succeeded in uniting these

scattered fragments."—L. Villari, *Fire and sword in the Caucasus, p. 26*.—"Recognized history begins with the conquest of the country by Alexander the Great in 323 B. C., and the subsequent expulsion of the Macedonian governors by Pharnawaz, son of a prince of the original dynasty and a Persian mother. The chronicles of the period that follows make constant mention of the Abkhassians, who held the Black Sea coast and range from the Phasis northwestwards; of the Asses or Ossets (Ossetes), a Median tribe whose territory lay in the hills from Mount Elbruz to the Dariel Pass; and of the incursions of Mongol Khazars and Alans from the steppes of the Caspian Sea, to meet which the fortress of Dariel was built at the northern end of the defile in 140 B. C. Persia, in war and peace, was the predominant factor, though her hold on the allegiance of Caucasia was insecure. At a later period the introduction of Christianity, about 318, reopened the conflict with Persia. Shapur II ravaged the country in 371, and the general left by him to hold the conquered lands built a fortress on the site of the present city of Tiflis."—*Caucasia, Handbook No. 54, p. 20*.

1080-1393.—Creation of greater Georgia.—Conflicts with Turks and Greeks.—Invasions of the Mongols.—"The only part of the Caucasus which had a more or less consecutive national history was the kingdom of Georgia. . . . David III. (1080), the Renovator, at last succeeded in expelling the Mohammedans and creating a new and greater Georgian kingdom, extending from the Black Sea to the Caspian, and from the Caucasus to Kars. He reorganized the country, suppressed brigandage and heresy, built churches, opened schools, and made Georgia a centre of culture and civilization. In 1184 the celebrated Queen Tamara came to the throne—a name still venerated as a glorious if half-legendary tradition wherever the Georgian tongue is spoken. Almost every church and every castle is attributed to her, and a whole host of legends has gathered about her personality. She does seem to have been a great woman, and to have raised her country to a high place among nations. She waged war successfully against both the Turks and the Greeks, and after the fall of the Byzantine Empire at the hands of the Crusaders she helped to form the Empire of Trebizond. But at her death in 1212 the edifice, laboriously raised, crumbled once more. Her incapable successors were unable to resist the ever-recurring onslaughts of the Moslems from the south and the highlanders from the north. First Genghis Khan's Mongol hordes, then the Persians, then again in 1236, the Mongols raided Georgia and made themselves for a time masters of the country. For the next three hundred years it is a prey to invasion, civil war, and Mongol oppression. In 1387 and 1393 it suffered at the hands of Timur the Tartar, who desolated the land with fire and sword."—L. Villari, *Fire and sword in the Caucasus, p. 28*.

1400-1737.—Turkish and Persian domination.—Russian relations established.—Both the Turks and the Persians at different periods held the nominal sovereignty of the entire Caucasus, but so far as the mountaineers were concerned it was only nominal. Army after army was sent out against them, only to return broken and defeated. In Georgia "the XV. and XVI. centuries are one long record of Turkish and Persian invasions and occupations, as a result of which several of the native princes became Moslems, and Oriental customs penetrated into the country. Massacre, bloodshed, treachery, and cruelty are the staple elements of Georgian history during this period, lit up at rare

intervals by flashes of heroism and sublime patriotism. The Persians were now the real rulers of Georgia, but they usually delegated their authority to native kings of proven fidelity. Some of these honestly tried to better the conditions of the people, and aspired to ultimate independence. One of them, Vakhtang VI. (1675-1737), although outwardly professing Islam—to which fact he owed his nomination as King of Georgia by the Persians—managed to re-establish a measure of order in the land, to unite the scattered provinces, and to promote an intellectual revival. It was in his reign that relations with Russia were first established, for with the help of the Muscovite Tsars he hoped to shake himself free of Persia and obtain protection from his various dangerous neighbours. The Moslem Powers, by their perpetual incursions and their savage oppression, threw the Christians of the Caucasus into the arms of Russia and led to their own eventual downfall.”—*Ibid.*, p. 28.

1736-1799.—Temporary friendship of Persia.—Tragic reign of Irakli.—Negotiation of Russo-Georgian treaty.—“In 1736 Nadir Shah had succeeded to the Persian throne, and was friendly to the Georgians. He freed the country from the Turks, and eventually placed Irakli II. on the throne. Irakli (1744-1798) was one of the most remarkable men of his time, and excited the admiration of all Europe; under him Georgia revived and prospered, and became for the last time a powerful and independent State. Culture and civilization spread, order and unity were achieved, and the neighbouring Tartar khanates reduced to vassalage; Imeretia, however, remained a separate kingdom under King Solomon. On the death of Nadir Shah Persia fell into a state of anarchy and civil war, and Irakli declared himself independent. But the Turkish danger became menacing once more, and the two Georgian missions to Joseph II. of Austria, asking for help against the Sultan, having failed, Irakli was persuaded to ally himself with Russia in 1769, as that Power was meditating a new Turkish campaign in which Austria promised to take part. War was declared, and the Russo-Georgian armies met the Turks near Akhaltzykh, but Irakli, like Vakhtang, was left in the lurch by his treacherous allies, who retired from the field of battle. By a superhuman effort he succeeded in defeating the Turks single-handed; but they soon returned in greater force, and Persian hordes, under the ferocious Aga Mohammed Khan, also poured into the unhappy land. Again Georgia was fearfully devastated, and in 1795 the capital Tiflis was burnt and captured by the Persians. Irakli managed to recapture the city a short time afterwards and expel the Persians from the country, but he was weakened and broken, and in 1798 he died. His son and successor, George XIII., entered into negotiations with Persia, but the Tzar Paul outbid the Shah, and in 1799 a Russo-Georgian treaty was concluded and confirmed in the following year.”—*Ibid.*, pp. 30-31.

1801-1877.—Russian conquest.—Capture of ShamyI.—Subjugation of the Circassians.—Penetration into Armezia.—“At the time of the Russian conquest Western Transcaucasia was divided into the kingdoms of Georgia, Imeretia, and Mingrelia, which had at an earlier period formed a single State. The Eastern provinces (Baku, Elizavetpol, and Erivan) were under Persian supremacy; Batum and Kars belonged to Turkey, who also had a nominal suzerainty over the Circassians. The mountain ranges were divided among a number of practically independent clans. This state of things had existed in a more or less modi-

fied form for several centuries, and in the wildly chaotic conditions of the country frontiers were uncertain and sovereign rights but vain things.”—*Ibid.*, pp. 26-27.—“So early as 1492 the king of Kakhelia had sought Russian assistance against the Turks and Persians. . . . Mingrelia in 1638, and Imeretia in 1650, swore allegiance to Russia in return for help against the Porte, which the Tsars were not able to furnish. . . . Giorgi XIII was utterly unable to cope with the situation, and, in their extremity, the Georgian nobles offered the country to the Tzar. The deed of surrender was signed by the king in 1799 and in 1801 Georgia, Mingrelia, Guria, and Imeretia were declared by the Tzar Alexander I to be Russian provinces.”—*Caucasia, Handbook No. 54, pp. 22-23.*

“But it was not till 1859 that the defeat and capture of the famous SchamyI brought about the final subjugation of the country. . . . In 1785 the mountaineers had been incited to take arms by a so-called prophet Scheick Mansur, but he was seized and banished to Solovetsk, on the White Sea. In 1820 a Mollah, Kasi by name, made his appearance in Daghestan, and began to preach the ‘Kasawat,’ that is, holy war against the Russians. To him succeeded another equally fanatical adventurer, Hamset Beg. The work which they had begun was carried on by SchamyI, who far surpassed his predecessors in all the qualities which make up a successful guerilla chief, and who maintained the unequal conflict against the enemies of his country for 25 years with singular good fortune, undaunted courage, untiring energy, and conspicuous ability. . . . The capture of the mountain fastness of Achulgo in 1839 seemed to be the death-blow of SchamyI’s cause, for it brought about the loss of the whole of Daghestan, the very focus of the Murides’ activity. SchamyI barely escaped being made a prisoner, and was forced to yield up his son, Djammel-Edden, only nine years of age as a hostage. . . . In 1840 the Tchetchens, who had previously been pacified, rose in arms once more, and Daghestan and other parts of the country followed their example. . . . At last, by means of a great concentration of troops on all the threatened points, by fortifying the chief central stations, and by forming broad military roads throughout the district, the Russians succeeded in breaking down SchamyI’s resistance. He now suffered one reverse after another. His chief fastnesses, Dargo, Weden, and Guni, were successively stormed and destroyed. . . . In 1864 the pacification of the whole country was accomplished, and a few years later the abolition of serfdom was proclaimed at Tiflis. After the subjugation of the various mountain tribes, the Circassians had the choice given them by the Government of settling on the low country along the Kuban, or of emigrating to Turkey. The latter course was chosen by the bulk of the nation, urged, thereto, in great measure, by envoys from Turkey. As many as 400,000 are said to have come to the ports, where the Sultan had promised to send vessels to receive them; but delays took place, and a large number died of want and disease. Those who reached Turkey were settled on the west coasts of the Black Sea, in Bulgaria and near Varna, and proved themselves most troublesome and unruly subjects. Most of those who at first remained in Circassia followed their fellow-countrymen in 1874.”—H. M. Chester, *Russia, ch. 18.*—“In the period preceding the Russo-Turkish war of 1877, Russia had been engaged in consolidating the position in the Transcaucasus, which she had acquired by her voluntary union with the ancient kingdom of Georgia. This had given her a hold over the lowlands lying

immediately South of the main range of the Caucasus, and had established her upon the first step of the ladder leading on to the Central Asian plateau. But after 1877, by the occupation of Kars, Russia acquired a footing upon the next step of the ladder in Greater Armenia."—M. P. Price, *War and revolution in Asiatic Russia*, p. 51.

ALSO IN: F. Mayne, *Life of Nicholas I.*, pt. 1, ch. 11 and 14.—S. M. Schmucker, *Life and reign of Nicholas I.*, ch. 21.—J. F. Braddeley, *Russian conquest of the Caucasus*.

1801-1917.—Changes in administration after the Russian conquest.—Reaction under Nicholas I.—Report of the Viceroy in 1913.—The Caucasians acknowledged no general ruler before the Russian conquest, as each tribe or community had its own system of government according to its needs or desires, ranging from the absolute monarchies to simple republics. "By its provisions [the treaty of 1799 between Georgia and Russia] King George, the magnates, the clergy, and the people of Georgia declared that they wished to become Russian subjects; but the crown was to be vested in George and his heirs, who were to retain the chief authority in the country but without legislative powers; the people were to enjoy immunity from taxation for twelve years; the number of Russian troops in Georgia was not to exceed 6,000, and military service for the Georgians was to take the form of a national militia; the Georgian Church was to be independent; and Georgian was to remain the official and educational language. This is how the treaty was observed. On the death of George his son, Prince David, succeeded, and was waiting to be confirmed; but in the spring of 1802 General Knorring entered Tiflis with a Russian army. On May 8th he summoned the nobles to hear the Tzar's manifesto read in the Sion Cathedral. Every one expected merely that the treaty of 1800 would be confirmed; but the manifesto declared instead that the Russian administration was to be introduced 'for the good of the country,' and that an oath of allegiance was expected of the Georgian magnates. This they indignantly refused, and they were about to return to their homes when they found themselves surrounded by troops outside the church. A great uproar followed, and some rioting; David was deposed, and a number of prominent Georgians were arrested. The Russians treated Georgia like a conquered country, the officials and officers beat and ill-used the natives, and outraged their women.

"The result was that risings broke out in various districts, the people refused to pay taxes, and David was approached by a deputation of Georgians and Armenians who offered to organize a general revolution; but he refused, from fear of the Russians, and was eventually sent to live in Russia. The state of the country, however, became so alarming that the Government decided on a more conciliatory policy. Prince Tsitsiani, a Georgian noble of high rank related to the Royal house, was appointed Governor-General, and commissioned to introduce an aristocratic constitution on a national basis. This was done, and for some years Georgia enjoyed a more or less native and moderately liberal government. Freed from the danger of Mohammedan and highland raids, the people developed, commerce prospered, and literature and culture revived. It seemed as though the country would become one of the most loyal and peaceful as well as one of the most progressive provinces of the Empire. But under Nicholas I. reaction set in, the censorship became more severe, and the Government tended to curtail the

privileges of the people. This produced discontent, and led to the conspiracy of 1832, which was discovered before it had time to achieve anything, and numbers of Georgians of the best families were imprisoned or exiled. Gradually every vestige of constitutional government was suppressed, even the Church was placed under the control of the Russian Holy Synod and a Russian appointed Exarch, and the country reduced to the status of a conquered province once more. Universal military service was introduced, and although it was never applied in its full rigour throughout the Caucasus, Georgians were sent to serve in Russian regiments in Europe and Siberia, while Russian army corps were quartered in Georgia. Russian became the official language, everything was done to expel the Georgian tongue from the schools, and an attempt made to Russify the country still further by settling Russian colonies in Transcaucasia. To-day [1906] the Caucasus forms a Viceroyalty divided into twelve provinces (seven *gubernii*, or governments, and five *oblasti*, or military territories) governed like any other part of the Russian Empire, with the same type of administration and the same bureaucratic machinery. But as in certain other frontier regions, the Governor-General or Viceroy has authority over the provincial governors, and even wider powers than those of ordinary Russian governors, and the *zemstva*, or elective provincial councils, have not been introduced, although there are elective municipal councils. A further difference is that the personnel of the bureaucracy is even worse than that of European Russia. According to a secret document of the police department, which was shown to me, during the period 1894-1898 the following officials were convicted of robbery, peculation, murder, and other crimes, and punished: 10 district governors (*Uyezdneye Nachalniki*), 9 assistant governors, 83 *pristavi* (police commissioners), and two town chiefs of police! If these were actually punished one may be quite sure that a far larger number committed crimes which remained unpunished."—L. Villari *Fire and sword in the Caucasus*, pp. 32-34.—"The title and power of Viceroy of the Caucasus were revived in 1905; the Viceroyalty had been abolished in 1882 in favour of a Governor-Generalship, directed and controlled by a Caucasian Committee at Petersburg. . . . When the Revolution occurred in 1917, the Viceroy was recalled."—*Caucasia, Handbook No. 54*, pp. 32-33.—"The Viceroy of the Caucasus, Prince Vorontsov-Dashkov, published a report . . . August [1913] upon the general condition of the province (which appeared in a *Times* supplement on Russia). He claims that the many racial and religious differences which exist do not prevent the populations from living and working harmoniously together, as Russian citizens. The Viceroy's own liberal and large-minded policy is to be credited with this happy result. Russian rule may not be so impartial as British rule in India, but on other scores it is superior. As Mr. James Bryce pointed out more than thirty years ago, Russian officials have none of that coldness and hauteur towards 'natives' such as our civil servants are inclined to show to the races under their rule. Partly apathy and partly good-nature in the Russian enables him to mix with his Asiatic subjects on terms of social equality. (See Bryce, 'Transcaucasia and Ararat,' p. 110.) Taking the whole province, the Moslem population is numerically preponderant, and is the more liable to fanaticism owing to the vicinity of the great Moslem states of the Sultan and the Shah. Yet in spite of these facts, the preaching of Pan-Islamism

nas been of no avail—Tartars, Persians, and the rest, all remain contented as subjects of Russia.”—R. H. Buxton, *Russian rule in the Caucasus* (*World's Work*, Jan., 1914).

1902-1917.—Independence movement.—Transcaucasian republic.—Union of the independent states of the mountaineers.—“For nearly a century this region, inhabited by small nationalities of pronounced racial feelings and varied religions, has been welded together by the constraining force of a single dominant power. The Mohammedan hill-tribes, conquered by superior force, unprogressive, brave, and violent by nature, valued their lost independence more than the peace which Russia's strong hand and impartial justice secured. The Christians, on the other hand, at first grateful for the protection afforded them, began, with increased education and a higher standard of living, to resent the effects of autocratic government and the cramping economic conditions. . . . It was among these elements (Armenians and Tartars) that trouble first broke out (1902-5) in the terrible riots at Baku at the time of general unrest in Russia which followed the war with Japan [see Russia: 1905 (April-November)]. Political agitation had its effect on the Western Georgians, awaking dreams of autonomy which the ill-judged government of the last few years had put them in a state to welcome. The disturbances of 1902-5, though they were sternly repressed, left seeds of unrest behind them; and the provinces were probably on the road to a serious effort to secure autonomy, when the European War, and later the Russian Revolution, shattered the existing system.”—*Ibid.*, pp. 29-35.—“Yet after a century of Russian rule, with more or less strongly accentuated Russifying tendencies, in spite of the spread of the Russian tongue and of Russian ideas and customs, and the supremacy of Russian bureaucratic methods, the Caucasus, or at least Transcaucasia, has certainly not become Russian. The Georgians, the Armenians, the Tartars, and many of the minor nationalities, civilized or barbarous, Christian or Mohammedan, peaceful or warlike, have preserved their languages and their racial characteristics intact, and in many cases are imbued with strong nationalist feelings. There is no hatred of the Russians such as there is in Poland, or such as there was in Italy against Austria, but there is a grim resolution to preserve language, nationality, and religion against all attacks, and at all events among the more civilized elements, a determination to put an end once and for all to Muscovite autocracy and bureaucracy.”—L. Villari, *Fire and sword in the Caucasus*, pp. 36.—“When the Revolution occurred in 1917, the various nationalities in the Caucasus arranged representative National Assemblies; but, as chaos in the Empire increased, relations were broken off with the Central Government. A separate Transcaucasian Republic was formed, in the Government of which Armenians, Tartars, and Georgians were equally represented.”—*Caucasia, Handbook No. 54*, p. 33.—“The news of the fall of Bagdad reached Tiflis on March 12th, [1917] and created scarcely any interest whatever. People were thinking of other things. The Duma had just been dismissed, and news of disorders in Petrograd was secretly coming through. For the next two days there was the most intense suppressed excitement in the city. The Grand Duke Nicholas kept back all the telegrams from Petrograd, refusing to allow any to get out. Nevertheless the news was public property. One of the telegraph clerks knew the ciphers, and kept all the revolutionary societies informed. The revolutionary leaders of course decided to take the

signal from Petrograd, but it was too early to move in the Caucasus until it was certain that the revolution was secure in the capital. If it should fail, the Caucasus by itself could do nothing. On the night of the 14th, Kutchubiesky ordered the arrest of all the members of the Armenian Dashnaktsutun and of the Georgian Socialist-Revolutionary societies. But the gendarmes, instead of being able to effect the arrest, found on the morning of the 15th that they themselves were arrested by armed bodies of these same revolutionaries and locked up in their own quarters. On the same day came the news that Nicolas the Second had abdicated; and then the flood was let loose. On the 16th and 17th the whole fabric of the Russian imperial authority was in process of dissolution. First the police vanished off the streets; then the Government offices closed down; then bands of revolutionaries and students arrested the chief and his wife. . . . An executive committee was formed of the revolutionary societies, of the garrison, which had gone over wholesale to the Revolution, and of the principal middle-class members of the City Council. Sunday March 18th was the great day in the Caucasus. The Revolution was then known to be secure in the Asiatic provinces; the old government had collapsed, and the hour for rejoicing had arrived. On the morning of that day . . . the streets were full of silent and serious people walking in the same direction. They were all going to a great mass meeting of the Caucasian people on the Nahalofsky square to welcome this great day in the history of Russia. In a large open space six raised platforms had been built, and round them was assembled a vast multitude composed of almost every element in the multi-racial population of the Caucasus. There were wild mountain tribesmen, Lesgians, Avars, Cechens and Swanetians in their long black cloaks and sheepskin caps. . . . The scene was indeed a memorable one. First upon the platforms mounted the Social-Democrat leaders, who until now had held their meetings in secret places. They called upon the people to preserve order and to proceed immediately to elect deputies for the Council of Workers and Soldiers.”—M. P. Price, *War and revolution in Asiatic Russia*, pp. 279-282.—“The Mohammedan mountaineers at the outbreak of the revolution united with the Kuban Cossacks to the north in the formation of a joint republic, but the two parties soon quarreled over the land question and have been fighting ever since. The Mohammedans in December, 1917, set up a separate republic called the ‘Union of the Independent States of the Mountaineers of the Caucasus’ with Vladikavkas as its capital and Colonel Tchernoev, a liberal minded Lesgian, as its president. . . . The Kuban Cossacks, who also claim the territory north of the Caucasian range, have set up a republic with General Krasnov as its head and Ekaterinodar as its capital. Still farther north are the Don Cossacks with a capital at Rostov. Both the Don and Kuban Cossacks have called in German aid to maintain their ‘independence’ against Great Russia and the Ukraine.”—E. E. Slosson, *From Baluchistan to Baku* (*Independent*, Aug. 31, 1918).

1915.—Events in World War.—Turkish massacre of Armenians. See WORLD WAR: 1915: VI. Turkey: d.

1916.—Caucasus front. See WORLD WAR: 1916: VI. Turkish theater: d, 1.

1917-1919.—War with Turkey.—British occupation.—By the Brest-Litovsk treaty Russia returned to Turkey not only the territory taken during the World War, which extended to Erzerum

and Trebizond, but also the districts of Batum, Ardahan and Kars, taken by it in the war of 1878. The Armenians and the Georgians, the main inhabitants of these regions, however, joined in an effort to prevent Turkey from annexing this territory, and in the resultant war Turkey succeeded not only in defending its acquisitions, but also in extending its possessions to the foot of the Caucasus mountains. Its further advances were halted by the British, who occupied the Caspian port Enzeli, and the Germans, who were reported to have occupied Poti, just north of Batum, and Tiflis. "At the beginning of 1919 the Caucasus was still occupied by British troops, with headquarters at Tiflis, a considerable force at Baku, and detachments at the larger points along the railway. The occupation lasted until August 15, 1919."—*Supplement to commerce reports, Nov. 10, 1920.*—See also WORLD WAR: 1918: VI. Turkish theater: b; b, 1, 3.

1918-1920.—Formation of the three independent republics.—Azerbaijan, the Tatar republic.—"Since May 26, 1918, when the Transcaucasian Diet proclaimed its own dissolution, there have existed three independent republics in what used to be Russian Caucasia—the Armenian Republic, the Georgian Republic, and a Tatar Republic in the eastern Caucasus."—*Caucasia, Handbook No. 54, p. 35.*—"Georgia is Christian, and its Iberian population are in the majority; Azerbaijan is Tartar and Moslem; Armenia is made up of the former Provinces that composed Russian Armenia, less the part that went to Azerbaijan in the split, and the majority of its people are the blood brothers of the Armenians of Turkey in Asia."—*International conciliation, June, 1920, p. 288.*—Azerbaijan, the Tatar republic with Baku as its capital, "extends along the lower part of the western Caspian coast from the Caucasus range to the Persian province of Azerbaijan. Azerbaijan forms a state of about 30,000 square miles, including the Russian provinces of Baku, Elizavetpol and Daghestan, and some Persian territory to the south, with a population of more than 3,000,000. . . . Because the Transcaucasian Tartars first invaded the Persian province of Azerbaijan and later moved northward to their present location, they are described as Azerbaijan Tartars, and hence the name of their Republic. . . . The Tartars of the latter territory . . . represent a mixture of races and tribes, with Turkish blood predominating in their veins. . . . The Turks and Tartars occupied these regions in comparatively recent times. The Persians . . . were there before Ghengiz Khan. They still have there a considerable minority in the population. There are in fact nearly two hundred thousand people in Azerbaijan, in the province of Baku, who are of Iranian stock. These are the Tates, who speak a Persian dialect. But in religion they are one with the Tartars, being Shiah Mohammedans. Besides, they have identified themselves with Tartar nationalism, adopting even the latter's language and traditions.—I. D. Levine, *Resurrected nations, pp. 303-304.*—Azerbaijan was recognized by the Allies in December, 1919. Following a clash between its government and Soviet Russia, the Mussavat cabinet fell, and the Military Revolutionary Committee took over the control of the new republic. Apprehending the interference of the Allies, the committee appealed to Soviet Russia for assistance, and on April 28, 1920, Baku was occupied by Bolshevik forces. Soviets are reported to have been established in Zaku, on June 20, and in Karabagh and Zangezuron, the territory claimed both by the Tatars and Armenians, on July 20. The Azerbaijan mili-

tia has been disbanded and replaced by Russian workmen, and all property has been nationalized and requisitioned.

CAUCASUS, Indian.—"The real Caucasus was the most lofty range of mountains known to the Greeks before [Alexander's conquests], and they were generally regarded as the highest mountains in the world. Hence when the army of Alexander came in sight of the vast mountain barrier [of the Hindu-Kush] that rose before them as they advanced northward from Arachosia, they seem to have at once concluded that this could be no other than the Caucasus." Hence the name Caucasus given by the Greeks to those mountains; "for the name of Hindoo Koosh, by which they are still known, is nothing more than a corruption of the Indian Caucasus."—E. H. Bunbury, *History of ancient geography, ch. 12, note q.*

CAUCI. See IRELAND: Tribes of early Celtic inhabitants.

CAUCUS: Origin.—In 1634—the fourth year of the colony of Massachusetts Bay—the freemen of the colony chose Dudley instead of Winthrop for governor. The next year they "followed up the doctrine of rotation in office by choosing Haynes as governor, a choice agreed upon by deputies from the towns, who came together for that purpose previously to the meeting of the court—the first instance of 'the caucus system' on record."—R. Hildreth, *History of the United States, v. 1, p. 224.*—"Gordon, writing in 1774, says: 'More than fifty years ago Mr. Samuel Adams' father and twenty others, one or two from the north end of the town where all the ship business is carried on, used to meet, make a caucus, and lay their plan for introducing certain persons into places of trust and power. When they had settled it they separated, and each used their particular influence within his own circle. He and his friends would furnish themselves with ballots, including the names of the parties fixed upon, which they distributed on the days of election. By acting in concert, together with a careful and extensive distribution of ballots, they generally carried their elections to their own mind. In like manner it was that Mr. Samuel Adams first became a representative for Boston.' (History of the American Revolution, vol. 1., p. 365.) February, 1763, Adams writes in his diary: 'This day I learned that the caucus club meets at certain times in the garret of Tom Dawes, the adjutant of the Boston regiment. He has a large house and he has a movable partition in his garret which he takes down and the whole club meets in one room. There they smoke tobacco till you can not see from one end of the room to the other. There they drink flip, I suppose, and there they choose a moderator who puts questions to the vote regularly; and selectmen, assessors, collectors, wardens, fire wards and representatives are regularly chosen before they are chosen in the town. Uncle Fairfield, Story, Ruddock, Adams, Cooper, and a *rudis indigestoque melle* of others are members. They send committees to wait on the merchants' club, and to propose in the choice of men and measures. Captain Cunningham says, they have often solicited him to go to these caucuses; they have assured him benefit in his business, etc.' (Adams' Works, vol. ii., p. 144.) Under the title Caucus should be considered the congressional nominating caucus; the caucuses of legislative assemblies; primary elections, still known outside the larger cities as caucuses."—F. W. Whitridge, *Caucus system (Economic tracts, No. viii, No. 4 of series of 1882, pp. 5-6).*

Applications of term.—"The word caucus has . . . a variety of applications. It is often used as

a synonym for primary. . . . In States where the regular nominations are made by direct primary election, a much larger field is left for preliminary conference within the party with reference to the selection of candidates for nomination. To such a conference the name caucus is given. Strictly speaking, indeed, the caucus is a secret meeting of a few party members to discuss questions of political policy, to determine in what manner the more open and public assembly of the primary shall be guided in its action, and to select the candidates to be brought before it. This was an original use of the term in colonial days, and there was early associated with the caucus the idea of underhand political intrigue and secret machination for securing political control. For the sake of clearness it is well to distinguish by name the free, open course of action by party voters for setting the forces of government in motion and nominating candidates for office, from the secret conclave of a few party organizers who meet to lay plans for manipulating the party agencies in order to accomplish personal ends. The first is more properly called the primary, the second the caucus. The primary is never secret. If it is ever made so, it is no longer in any true sense a primary, but becomes a caucus in the evil sense of that term."—J. Macy, *Party organization and machinery*, pp. 59-60.—See also ELECTIONS, PRESIDENTIAL: United States: Nomination by Congressional caucus.—"This expression [primary elections] is rapidly supplanting the use of the word caucus to designate the meetings of voters, for the direct nomination of candidates, or for the election of delegates to nominating conventions. In the country districts generally, and particularly in New England, the word caucus is still used. In the cities the increase of the safeguards which have been found necessary for the ascertainment of the results of a caucus have surrounded it with so many formalities that it is properly becoming known as a primary, or preliminary, election."—F. W. Whitridge, *Caucus System*, (*Economic Tracts*, No. viii, No. 4, of series of 1882, p. 13).—See also PRIMARIES IN THE UNITED STATES.—"There is, however, another use of the word caucus which is applied to a perfectly legitimate assembly of the party members of a legislative body. It is customary for the members of a party in each house of a state legislature to meet 'in caucus' to determine the course of party action in the house, to choose candidates for the offices to be filled by the house, or to agree upon the attitude which the party shall hold toward specific measures before the legislature. The state assembly has also its joint caucus of each party for the two houses taken together, and its most important business is perhaps the nomination of United States senators when party exigencies seem to demand it. In like manner, the party members in the House of the Federal legislature meet in caucus for similar purposes. Certain historical applications of the term caucus should also be mentioned. In the somewhat chaotic condition of political organization in early party history the legislative caucus, which was made up of the party members of the two houses of a state assembly, sometimes assumed the right to nominate candidates for state and even for Federal offices. The congressional caucus composed of the party members of the two Houses of Congress exercised for almost the whole of the first quarter of the last century the function of choosing presidential candidates. These secret gatherings, arrogating to themselves the guidance of party conduct, were never acceptable to the people, and in course of time gave place to the more popular

party agent, the nominating convention."—J. Macy, *Party organization and machinery*, pp. 60-61.—"Aspirants for . . . positions [chosen by the Caucuses of the state legislatures] not unfrequently attend at the place of meeting of the legislature in time to receive the members as they arrive, and to make personal supplication for their votes in caucus. Every sort of influence is brought to bear to obtain such votes, candidates often opening 'headquarters,' a sort of a club-room with free entertainment for all comers, and in one flagrant case a candidate for the senate was accompanied to the state capital by his wife, and his nomination and election were alleged to have been entirely due to the success of her personal appeals to members of the legislature for their votes in the party caucus. The whole of these influences are brought to bear to secure, not the votes of members in the legislature, but only the caucus nomination."—F. W. Whitridge, *Caucus system (Economic tracts, No. viii, No. 4, of series of 1882, p. 12)*.

United States: 1776-1800.—Growth.—Rise of congressional nominating caucus.—"Writers often, in referring to the caucus, quote John Adams as follows: 'Our revolution was effected by caucuses. The federal constitution was formed by caucuses, and the federal administrations, for twenty years, have been supported or subverted by caucuses. There is little more of the kind now than there was twenty years ago. Alexander Hamilton was the greatest organist that ever played upon this instrument.' After having recalled the intrigues to which Hamilton lent himself against him (Adams) and the cabals which took place over the presidential elections, he adds: 'This detail sufficiently shows that caucuses have been from the beginning. There is, no doubt, some regard to public good in the prosecution of these measures. They are considered as necessary. There is also ambition, avarice, envy, jealousy and revenge. As these causes, good and bad, have hitherto produced such combinations, and as these causes will continue to the end of the world, we may presume the combinations will continue too. . . . You cannot prevent them any more than you can prevent gentlemen from conversing at their lodgings.' These lines, written in 1808, when the nominating caucus was not yet fully developed, have, as a matter of fact, no bearing upon and no connection with it. Adams was only speaking of the secret understandings, the political meetings, often tainted with intrigue, the cabals. Used in this sense the caucus indeed presents nothing either novel or specific. . . . With the development of parties during Washington's administration, the system of formal nominations of the candidates of parties for elective offices also developed, but the integration, from within the parties, of permanent organizations which should serve as regular nominating bodies was somewhat slow. . . . In the first two presidential elections the choice of candidates was, one may say, a foregone conclusion. The contest did not begin until the retirement of Washington. Elected in 1706, in spite of some intrigues within the ranks of the Federalists themselves, John Adams saw, as the election of 1800 approached, a stronger opposition raise itself against him. The lack of unanimity within the Federalist camp, aggravated by the confusion which was caused by the death of Washington, seriously compromised the chances of the Federalist party. The imminent danger of the success of Jefferson and the triumph of radicalism in the government appeared to the Federalists of the Congress to demand their intervention in the presidential election, from which the Constitution had carefully banished them. For

some time past the Federalist members of the Congress, and the Senators in the first place, had been in the habit of holding semi-official meetings, to which the familiar name of caucus was applied, to settle their line of conduct beforehand on the most important questions coming before Congress. . . . In this way there grew up at an early stage, at the very seat of Congress, an extra-constitutional institution which prejudged and anticipated its acts. It was now about to reach out still further and lay hold of a matter which was entirely beyond the competence of Congress. It appears that this was done at the instigation of Hamilton, who, being anxious to push Adams on one side and to prevent the election of Jefferson, wanted to get the electoral manœuvre which he had hit upon for this purpose sanctioned by a formal decision of the members of the party in Congress. The latter took the decision, nominated in consequence the candidates for the presidency and vice-presidency of the Union, and agreed to try and get them accepted by the electors. This nomination became the precedent for a practice which completely destroyed the whole scheme of the provisions of the constitution for the election of the President."—M. Ostrogorski, *Rise and fall of the nominating caucus* (*American Historical Review*, Jan., 1900, pp. 253-254, 255, 259, 260-261).

United States: 1804-1828.—Fall of "King Caucus"—"At the next presidential election, in 1804, the Congressional Caucus reappeared, but on this occasion it no longer observed secrecy. The Republican members of Congress met publicly and settled the candidatures with all the formalities of deliberative assemblies, as if they were acting in pursuance of their mandate. The Federalists, who were almost annihilated as a party since Jefferson's victory in 1801, gave up holding caucuses altogether. Henceforth there met only a Republican congressional caucus, which appeared on the scene every four years at the approach of the presidential election. . . . Sometimes the state caucuses intervened in the nomination of candidates for the presidency of the republic; they proposed names, but in any event the Congressional Caucus always had the last word. . . . By way of meeting the reproaches which were levelled at the caucus of being a 'Jacobinical conclave,' its organizers decided that it should be held in public. It took place on the 14th of February 1824 in the hall of Congress. Directly the doors were opened an enormous crowd thronged into the galleries, but on the floor of the brilliantly lighted chamber the seats of the members of the caucus remained almost empty. At last it was ascertained that of two hundred and sixteen members summoned sixty-six had responded to the appeal."—*Ibid.*, pp. 261-262, 274.—"This uprising [against the congressional nominating caucus] came with the democratic movement that carried Jackson into the presidential office. The last congressional caucus was held in 1824, when a few friends of William H. Crawford gathered in the chamber of the House of Representatives and selected him as their candidate for the presidency. The subsequent election showed that Jackson was by far the most popular candidate, although his support in Congress was almost negligible. Jackson's friends, therefore, turned fiercely upon the caucus. The legislature of Jackson's state, Tennessee, had already sharply denounced it, and several other states followed this example. In the presidential election of 1828, no attempt was made to hold a congressional caucus. [The first nominating convention was called in 1832.] Jackson was nominated by 'spontaneous' legislative caucuses and conventions held by his fol-

lowers in the various states, and thus, to use a phrase then current, 'King Caucus met his death.'"—C. Beard, *American government and politics*, p. 130.—As in the case of the Congressional nominating caucus, the legislative nominating caucuses rapidly disappeared, Pennsylvania first, and the other states following suit. The collapse of the congressional nominating caucus meant the collapse of the whole system of nominations for elective offices by caucus. While the legislative caucus was declining the nominating convention was rising.

United States: 1881.—Senate deadlock.—"In 1881 the caucus nominees of one party for officers of the senate were generally alleged to be of worthless character. The opposite party, as a result of caucus deliberation, declined to permit these caucus nominations to be ratified by the election of the nominees. There ensued, in consequence of the unyielding adherence of senators to these caucus decisions, one of the most persistent 'dead-locks' on record, in the course of which, members of each party produced the most gory speeches about the 'revolutionary' tendencies of their opponents; and the members of the senate, by what was felt to be their obdurate fidelity to their respective caucuses, in a petty matter, brought their body for a time into public contempt."—F. W. Whitridge, *Caucus system* (*Economic tracts*, No. viii, No. 4, of series of 1882, pp. 11-12).

United States: 1895-1910.—Weakness of the Democratic caucus from 1895-1903.—Its usefulness.—"In the seven years from 1895 to 1903 an internal dispute or schism in the Democratic minority destroyed its ability to caucus in either House or Senate; as a consequence the party fell rapidly to such a position of weakness and helplessness that it lost all control over its own members and became a negligible quantity in national legislation. Meanwhile, the majority by its strict enforcement of caucus rules was enabled to run the government as it pleased. When in 1910 the Democrats secured a majority in the House they became a constructive party and were obliged to make frequent use of the caucus, aided by the President's active influence. The caucus is the simplest means of preserving party unanimity and discipline in favor of a positive program of legislation. A new bill comes before the House in the early part of a session and before the discussion progresses to any length it becomes apparent that large numbers of the people are interested in the measure and desire either its passage or its defeat or amendment. If the individual members of the majority party are left to themselves some will advocate it, some oppose and some insist on essential changes in the bill, and since the weight of inertia is against legislation, the bill must apparently fail for want of agreement. At this point the caucus machinery of each party is set in motion. The majority meets and perhaps decides that the bill should be made a party measure. This means that every member who attended the caucus must vote for the bill on its passage through the House. He may express what views he pleases in the caucus, he may use all his influence against the measure within the conference room but once the caucus has acted, he must support the common policy by his vote in the House. 'Must' means that if he refuses he is outlawed from his party, the measures in which he is interested are marked for an early grave, he may be denounced to the party executive committee in his State to be defeated in the next election and his usefulness to his constituents as a legislator is at an end until he repents, is forgiven and becomes once more an obedient member of the caucus. Severe as is this discipline it is impossible to see

how a party could otherwise secure the passage of legislation for which the country holds it responsible. Meanwhile the minority party may also hold its caucus and decide on an equally binding policy for its members. Formerly the minority would simply oppose the measure, but since the essential differences in principle between the parties have disappeared and they are now competing with each other on the same ground, the minority is apt to advocate either a more radical or a more conservative substitute for the measure endorsed by its rival. From this description it will be clear that the caucus is another influence towards the weakening of the individual member for the benefit of the party. It also strengthens greatly the position of the party leaders. By securing the adoption of a bill as a caucus measure they can crush out all effective opposition among the rank and file of the House membership. But we must also remember that it enables a scant majority of the majority to control the action of the entire House, although forming but a fraction of its membership. . . . The House may lose its head often, but the leader must never do so. It is this steadiness and breadth of view which offers the chief protection against abuses of the caucus system and of the party discipline. Those who criticize so harshly the emphasis placed on party organization and the practical elimination of the individual at times, must remember that the House has reached an almost unmanageable size and that although it cannot deliberate with 435 members, yet it must enact into law the principles to which the majority party is pledged. It is admitted that in so doing the free prerogatives and privileges of individual members are often limited to an undesirable, almost intolerable extent but this is necessary if the lower house is to be an acting rather than a mere debating body. The mass of bills and resolutions is so great that complete freedom of debate would be impossible and would block action on necessary measures, thereby placing the majority party at the mercy of the minority."—J. T. Young, *New American government and its work*, pp. 57-59.

United States: 1910-1915.—Methods employed in Congress.—"The caucus system used in the 62d and 63d congresses was adopted by the Democrats, upon their accession to control of the house in 1910, to replace Cannonism, which had become of ill repute among the voters, and which had been partly overthrown at the preceding session. The unwieldy size of the house, as well as the exigencies of party, required some extra-legal machinery to coordinate and direct the action of the members; the substitute chosen by the Democratic leaders was an adaptation of the senate caucus, formerly known as Aldrichism. The essence of Cannonism had been the control of the house by the speaker through his power of appointment of committees and his domination of the rules committee, backed by the power of the majority party caucus; the essence of the new system is direct control of legislative action by the caucus itself. As at present constituted, the Democratic caucus is composed of all members of the majority party in the house. For the election of caucus officers and for the nomination of candidates for house officers, a majority of those voting binds the entire caucus; on questions of policy Rule 7 of the Democratic caucus rules reads: 'In deciding upon action in the house involving party policy or principle, a two-thirds vote of those present and voting at a caucus meeting shall bind all members of the caucus; provided, the said two-thirds vote is a majority of the full Democratic membership of the house, and provided further, that no member

shall be bound upon questions involving a construction of the Constitution of the United States or upon which he made contrary pledges to his constituents prior to his election or received contrary instructions by resolution or platform from his nominating authority.' If a member decides not to be bound by the caucus on any question, he must notify the caucus in advance. . . . Among the actual instruments which the caucus uses to control the legislative action of the house the basis is of course the 'binding resolution,' through which a majority of two-thirds of those voting at the caucus binds the whole body of Democrats (except for Rule 7), and they in turn control the entire house. The control of the open voting of the house is, however, less important than the determination of what legislative material shall come before the house at all, for its consideration. The caucus controls the subjects upon which the house may legislate, in the first place, by controlling the house committees, and it controls the committees by controlling the selection of the majority members of the committees. As a matter of practice, the Democratic committee-assignments are really determined by a few leaders; since 1911 the nominations by the committee on committees have never been rejected by the caucus. This power of selection of the Democratic committee-majorities is of importance, first, because the majority members of committees may hold a miniature caucus in which a conclusion is reached which all are bound to support in the open committee. . . . As a matter of fact, however, the action of the committees in the house is often controlled by the caucus itself, in one of three ways. First, bills are often introduced into the house; their reference to a committee is then a mere formality. Second, the caucus may adopt a resolution forbidding reports on other than specified subjects, or by other than specified committees, without its express consent. And third, the house procedure is intentionally so inefficient that a special rule issued by the rules committee, under instructions from the caucus, is necessary to secure consideration for any bill not reported by one of the three privileged committees."—W. H. Haines, *Congressional caucus of today* (*American Political Science Review*, Nov., 1915, pp. 696-697, 697-698, 699).—See also CONGRESS OF THE UNITED STATES: Activities of the House and Senate: Caucus.

England: Development of caucus.—Birmingham "Four Hundred" under Chamberlain and Schnadhorst.—"An innovation carried through [the English parliament] in 1867 by those fearful of the approaching rule of numbers, was the so-called minority provision. In the three-member constituencies each elector was to have only two votes, so that by careful organization a two-fifths minority might gain one seat. . . . But the effect of the minority clause, as had been expected, was generally to provide a seat for the party hitherto unrepresented. The large Liberal minority in Liverpool was able to return a member, as did the Conservative minority in Manchester. But the most important result of the provision is to be found in the new electoral organizations which it forced. The Liberals of Birmingham realized that if they were to retain the third seat, their votes

must be divided economically between the three candidates. To prevent waste of votes, an organization must be built up which could control absolutely the choice of the elector; and each elector must vote invariably as he was told. The success of the Birmingham organization, which soon became known as the Caucus, was unbroken and no Conservative candidate was returned. It was copied in many other constituencies and inaugurated a new era in the development of party electoral machinery, the effect of which upon the representative system has been profound. . . . Ostrogorski, *Democracy and Parties*, i. 161-163. 'The Liberal committee selected candidates for all three seats in view of the impending general election (in 1868). But as each elector could only vote for two candidates, owing to the minority clause, the committee hit upon the following device: By a preliminary canvass the central committee ascertained the exact number of Liberal electors in each ward and the minimum of votes necessary to obtain the majority at the poll, then distributed the three candidates by twos among the electors of the ward, in such fashion that each candidate would only receive the number of votes strictly necessary to obtain the majority at the poll, and the votes over and above this would be given to one of the other two candidates so that each of them should eventually have a majority. . . . Vote as you are told, was the password . . . the immense majority of the electors voted as they were told, and the three Liberal candidates were elected in spite of the restricted voting clause passed for the benefit of minorities."—C. Seymour, *Electoral reform in England and Wales*, pp. 341, 342-343.—"To provide the machinery needed, Mr. William Harris, the Secretary of the Birmingham Liberal Association, a self-constituted election committee of the familiar type, proposed to transform that body into a representative party organisation; which was forthwith done in October, 1867. . . . It was officially called the general committee, but was commonly known from the approximate number of its members as 'The Four Hundred.' It was to have control of the policy of the association, and to nominate the three Liberal candidates for Parliament in the borough. The number of Liberal voters in each of the several wards was then carefully ascertained; and those in one ward were directed to vote for A and B; those of another for A and C; those of a third for B and C; and so on, in such a way that the total votes cast for each of the three candidates should be as nearly as possible the same. Protests were, of course, made against voting by dictation. It offended the sense of personal independence; but the great mass of Liberals voted as they were told, and all three of the candidates were elected. . . . In 1873 the association was revived for the purpose of getting control of the municipal government of the town, and introducing a more progressive policy in its administration. Two names are especially associated with the new departure, that of Mr. Schnadhorst, the secretary of the association, who had a genius for organising, and that of Mr. Chamberlain, who was the leading spirit of the movement, and became the mayor of the borough in the following autumn. These men proceeded to reconstruct the association on a slightly different and apparently even more democratic, plan. Taking the wards as the sole basis of the fabric, an annual meeting was held in each ward, at which any Liberals residing there might take part. . . . The general committee of the association was composed, as before, of the whole executive committee, together with the thirty representatives from each

ward; and, as there were sixteen wards, it numbered by 1877 five hundred and ninety-four members; and was known as the 'Six Hundred' of Birmingham. It had power to determine the policy of the association, and to nominate the candidates for Parliament and the school board. The members of the town council, on the other hand, being elected by wards, were nominated by the ward committees; but the whole association was bound to support them. Such was the new organisation of the Liberal Association. Its efficiency as an engine for controlling elections is proved by the fact that during the four years from 1873 to 1876, inclusive, it carried all three seats in Parliament in spite of the provision for minority representation. . . . Throughout the many vicissitudes of his long career, from his early years of advanced radicalism, through his breach with Mr. Gladstone over the Home Rule Bill, his subsequent junction with the Conservatives, and finally his advocacy of a wholly new policy about preferential tariffs, Mr. Chamberlain has never failed to carry every one of the parliamentary seats in Birmingham for his own adherents."—A. L. Lowell, *Government of England*, v. 1, pp. 470, 470-471, 471, 472, 473.—"After they had secured control of the city government, Mr. Chamberlain and his friends undertook an elaborate system of public works, the object of which was to increase the beauty and healthfulness of Birmingham. Their proceedings resembled those of Haussmann, the celebrated prefect of Paris under Napoleon III. The new municipality of Birmingham opened and graded streets; swept away the wretched buildings that disfigured the centre of the city, and erected magnificent edifices; provided a system of sewers, of sanitary inspection and of pavement for the street; built public libraries, baths, hospitals, squares; made the city proprietor of the gas and water works. The cost of this transformation was large, but its results were beneficial. In the prosecution of this work Mr. Chamberlain and his friends were supported in the town council by a compact and faithful majority. This was secured through the organization of the Liberal Party, which had been brought to a high degree of perfection by the efforts of Mr. Schnadhorst, a born organizer and a master of the art of wire-pulling. . . . The association performed well the services which the Liberals expected from it. Its candidates carried the Parliamentary elections with a high hand. Mr. Chamberlain himself was nominated in 1876. The discipline of the electoral body was perfect. 'The forces at the disposal of the Liberal Association,' as its chiefs declared with satisfaction, 'were not hordes of wayward free lances—they were armies of disciplined men, well accustomed to stand side by side and to move in unbroken battalions.' But it did not seem right that Birmingham should be the only place to profit by the use of this highly perfected instrument. Its advantages ought to be extended to the entire country, for the more complete triumph of the Liberal cause. For this purpose a propagandist campaign was opened by the Birmingham men. . . . Mr. Chamberlain and Mr. Schnadhorst in particular visited in succession the leading cities of the kingdom in order to propose the 'Birmingham plan.' After holding little private gatherings of the most influential (or most pushing) men of the place, they expounded the plan in public meetings. The agitation was carried on with much activity. . . . Since the 'plan' had been adopted in a sufficient number of localities, Mr. Schnadhorst believed that the time had come to establish a permanent connection between the local associations and secure unity of action by

means of a central organization. A circular from the Birmingham association invited all the Liberal organizations formed on the representative basis to send delegates for the purpose of discussing a plan of federation, which should be established 'in order to facilitate the public discussion of political questions, and to more effectually promote the adoption of Liberal principles in the government of the country.' Nearly a hundred associations responded, and on the 31st of May, 1877, the conference began at Birmingham under the presidency of Mr. Joseph Chamberlain. . . . In the polemics to which the new organization gave rise in the press and on the platform, it was given the name of the Caucus, after the organizations of the American parties, with which it was unkindly compared. Under this name it entered English history, there to play a part which could not fail to become important."—M. Ostrogorski, *Caucus in England* (*Political Science Quarterly*, v. 8, No. 2, June, 1893, pp. 294-295, 300-301, 302, 304-305, 316).

CAVE DWELLERS.—"We find a hunting and fishing race of cave-dwellers, in the remote pleistocene age, in possession of France, Belgium, Germany, and Britain, probably of the same stock as the Eskimos, living and forming part of a fauna in which northern and southern, living and extinct, species are strangely mingled with those now living in Europe. In the neolithic age caves were inhabited, and used for tombs, by men of the Iberian or Basque race, which is still represented by the small dark-haired peoples of Europe."—W. B. Dawkins, *Cave hunting*, p. 430.—In the new world also are found evidences of a prehistoric race of men who dwelt in caves. The greatest number of these dwellings are located in the southwestern part of the United States. "The most typical and noteworthy examples of cave dwellings or cavate lodges in the southwestern United States are those in the soft volcanic formation in the narrow canyons in the eastern slopes of the Valles of the great Cochiti Plateau in New Mexico and those in the sandstone ledges along the Rio Verde in Arizona. There are, however, a few examples in the San Juan district—a small group on the lower Mancos, and another, much weathered, on the San Juan itself, a few miles above the mouth of the Mancos."—T. M. Prudden, *Prehistoric ruins of the San Juan watershed* (*American Anthropologist*, 1903, pp. 245-246).—"The ruins in the San Juan watershed [traversing Utah, Arizona, Colorado and New Mexico] vary greatly in size, form, and situation. Thus some of them are so large as to contain several hundred rooms; others consist of a single enclosed chamber or of a simple tower. Some stand upon commanding summits; some at the edges of the great mesas, or in the sheltered valleys at their feet; others, again, are built in caves or along sheltered ledges on the faces of the cliffs. While it is sometimes convenient to speak of valley dwellings, mesa dwellings, cliff dwellings, and cave dwellings, there appears to be no reason for believing that these distinctions are of deeper significance than marks of an adaptation to their

environment of a house-building people lingering in the higher stages of savagery."—*Ibid.*, p. 231.

"Up to the present time only a few caves situated in Calaveras county [California] and in Shasta county have been examined. Many other occurrences are known, but limitations of time have made it impossible to visit these localities. One would hardly be justified in stating that as yet more than a beginning has been made on the possible cave investigations of California. It is to be hoped that in time these studies, in connection with the other phases of this work, may give us some definite information regarding the date of man's appearance in the Pacific Coast region. [Among the important caves located in California are the following: Potter Creek cave, Samwel cave, Mercer cave and Stone Man cave.] The faunas of both the Potter Creek and the Samwel cave indicate Quaternary age. As far as is now known, the fauna of Samwel cave contains the larger percentage of recent species and is probably the younger. In addition to this evidence, the situation of the two caverns gives considerable information regarding their relative ages. . . . From the evidence at hand it seems that both Mercer's cave and Stone Man cave were in existence in Quaternary time, and in all probability some of the deposits in both caverns were formed in that period."—J. C. Merriam, *Recent cave exploration in California (Congrès internationale des Americanistes, 1907, pp. 140, 145-146)*.—Cave dwellings have also been found in the Catherina Archipelago and on the Aleutian Islands, as well as in Japan.

CAVE OF ADULLAM. See ADULLAM, CAVE OF.

CAVELL, Edith (1872-1915), English nurse, from 1907 matron of the École Belge des Infirmières Diplômées, a nurses' training college in Brussels. Arrested by the Germans, August 5, 1915, charged with harboring British, Belgian and French soldiers and assisting them to escape from Belgium. Condemned to death October 11 and executed October 12. The daughter of a Church of England clergyman, Edith Cavell was in her Norfolk home on a visit to her mother at the time the war broke out. She immediately returned to Brussels and resumed her duties. "When the German Army entered the gates of Brussels, she called upon Governor von Lüttwitz and placed her staff of nurses at the services of the wounded under whatever flag they had fought. The services which she and her staff of nurses rendered many a wounded and dying German should have earned for her the generous consideration of the invader. But early in these ministrations of mercy she was obliged by the noblest of humanitarian motives to antagonize the German invaders. Governor von Lüttwitz demanded of her that all nurses should give formal undertakings, when treating wounded French or Belgian soldiers, to act as gaolers to their patients, but Miss Cavell [refused]. . . . When one of her associates, Miss Mary Boyle O'Reilly, was expelled from Belgium, she begged Miss Cavell to take the opportunity, while it presented itself, to leave that land of horror, and Miss Cavell, with characteristic bravery, replied: 'Impossible, my friend, my duty is here.' It was probably in connection with this humanitarian work that she violated the German military law by giving refuge to fugitive French and Belgian soldiers until such time as they could escape across the frontier to Holland. For this she suffered the penalty of death. . . . The history of war, at least in modern times, can be searched in vain for any instance in which any one, especially a woman, has been condemned to death for yielding

to the humanitarian impulse of giving temporary refuge to a fugitive soldier. Such an act is neither espionage nor treason, as those terms have been ordinarily understood in civilized countries. . . . I am assuming that Miss Cavell did give such protection to her compatriots, for all accessible information supports this view, and if so, however commendable her motive and heroic her conduct, she was guilty of an infraction of military law, which justified some punishment and possibly her forcible detention during the period of the war. The arrest was evidently a secret one, for it is obvious that for a time Miss Cavell's friends knew nothing of her whereabouts. Even the American Legation, which had assumed the care of British citizens in Belgium, apparently knew nothing of Miss Cavell's arrest until it learned after a second inquiry the fact and the place of her imprisonment from the German Civil Governor of Belgium on Sept. 12, 1915. Evidently some information had reached the British Foreign Office as to Miss Cavell's disappearance, for on Aug. 26th, Sir Edward Grey requested the American Ambassador in London to ascertain through the American Legation in Brussels whether it was true that Miss Cavell had been arrested. . . . So secret was Miss Cavell's arrest and so sinister the means whereby her end was compassed that the American Minister in Belgium was obliged to write on August 31st, to Baron von der Lancken as the representative in diplomatic matters of von Bissing, the German civil governor of Belgium, and asked whether it was true that she was under arrest. . . . Not hearing from Baron von der Lancken, our Minister on September 10th again wrote to him and again asked for a reply. Mr. Whitlock asked for the opportunity 'to take up the defence of Miss Cavell with the least possible delay.' To this, Baron von der Lancken replied by an *ex parte* statement that Miss Cavell had admitted having concealed in her house various English and French soldiers, as well as Belgians of military age, all anxious to proceed to the front. She also acknowledged having supplied these soldiers with the funds necessary to proceed to the front and having facilitated their departure from Belgium by finding guides to assist them in clandestinely crossing the frontier.

The Baron further answered that her defence had been intrusted to an advocate by the name of Braun, 'who is already in touch with the proper German authorities,' and added: 'In view of the fact that the Department of the Governor General as a matter of principle does not allow accused persons to have any interviews whatever, I must regret my inability to procure for M. de Leval permission to visit Miss Cavell, as long as she is in solitary confinement.' M. de Leval was a Belgian lawyer and the official legal adviser of the American Legation. His attempt to save Miss Cavell, as will hereafter appear, was worthy of all praise. The counsel in question was a M. Braun, a Belgian advocate of recognized standing, but for some reason, which does not appear, he was unable or declined to act for Miss Cavell and he secured for her defence another Belgian lawyer, whose name was Kirschen. According to credible information, Kirschen was a Roumanian by birth, although a naturalized Belgian subject and a member of the Brussels bar, but it will hereafter appear that the steps which he took to keep the American Legation—the one possible salvation for Miss Cavell—advised as to the progress of events, was to say the least peculiar. It is said that he had been a legal adviser of the German Legation in Brussels before the war. Except the explanations made by the German Civil Government, we

know very little as to what defence, if any, Miss Cavell made. From one of the inspired sources comes the statement that she freely admitted her guilt, and from her last interview with the English clergyman it would appear that she probably did admit some infraction of military law."—J. M. Beck, *The War and humanity*, pp. 115-130.—"She admitted all the charges against her. Often she helped her prosecutors by detailed statements on points that had not occurred to them. She made no concealment, and was glad to confess what she had done for young men caught whole and living in the trap of war, as others had been caught and mangled in the wards where she tended them—Germans as well as British."—Philip Gibbs.—According to Brand Whitlock's story, Edith Cavell was asked if she had helped twenty English soldiers, to which she replied, "Yes, more than twenty; two hundred . . . French and Belgians, too." There was no doubt "that the offence was one punishable with death under the German military code; but the execution of the sentence led to an outburst of indignation and horror throughout the civilized world."—*Annual Register*, 1915, p. 260.—The following is extracted from the report (transmitted to the British foreign office on Oct. 18, 1915) of Hugh Gibson, secretary of the American Legation in Brussels.—The persons referred to as "we" in the report were Hugh Gibson, M. de Leval, legal counsellor to the Legation, and the Marquis de Villalobar, the Spanish Minister in Brussels. The report was addressed to Mr. Brand Whitlock, American Minister to Belgium, who was lying sick at the time: ". . . Baron von der Lancken and all the members of his staff were absent for the evening [Oct. 11]. We sent a messenger to ask that he return at once to see us in regard to a matter of utmost urgency. A little after 10 o'clock he arrived, followed shortly after by Count Harrach and Herr von Falkenhausen, members of his staff. The circumstances of the case were explained to him and your [Brand Whitlock's, who was sick at the time] note presented, and he read it aloud in our presence. He expressed disbelief in the report that sentence had actually been passed, and manifested some surprise that we should give credence to any report not emanating from official sources. . . . We urged him to ascertain the facts immediately, and this, after some hesitancy, he agreed to do. He telephoned to the presiding Judge of the court-martial, and returned in a short time to say that the facts were as we had represented them and that it was intended to carry out the sentence before morning. We then presented as earnestly as possible your plea for delay. . . . The Spanish Minister forcibly supported all our representations and made an earnest plea for clemency. Baron von der Lancken stated that the Military Governor was the supreme authority (*Gerichtsherr*) in matters of this sort; that appeal from his decision could be carried only to the Emperor, the Governor General having no authority to intervene in such cases. He added that under the provisions of German martial law the Military Governor had discretionary powers to accept or to refuse acceptance of an appeal for clemency. After some discussion he agreed to call the Military Governor on the telephone and learn whether he had already ratified the sentence and whether there was any chance for clemency. He returned in about a half hour and stated that he had been to confer personally with the Military Governor, who said that he had acted in the case of Miss Cavell only after mature deliberation; that the circumstances in her case were of such a character that he considered the infliction of the death penalty

imperative, and that in view of the circumstances of this case he must decline to accept your plea for clemency or any representation in regard to the matter."—On the day this report was written, Oct. 12, 1915, Brand Whitlock telegraphed to the American Ambassador in London: ". . . Miss Cavell sentenced yesterday and executed at 2 o'clock this morning despite our best efforts continued until the last moment . . ." Writing the same day, M. de Leval reports: "This morning Mr. Gahan, the English clergyman, called to see me and told me that he had seen Miss Cavell in her cell yesterday night at 10 o'clock, that he had given her the holy communion and had found her admirably strong and calm. I asked Mr. Gahan whether she had made any remarks about anything concerning the legal side of her case and whether the confession which she made before the trial and in court was, in his opinion, perfectly free and sincere. Mr. Gahan says that she told him she perfectly well knew what she had done, that according to the law of course she was guilty and had admitted her guilt, but that she was happy to die for her country."

A German vindication.—"Moved by foreign denunciations of the execution of Miss Edith Cavell, out of which he said Germany's enemies were making capital, Dr. Alfred F. M. Zimmermann, Under Secretary for Foreign Affairs, on October 24, 1915, made the authorized statement to the staff correspondent of the *New York Times* in Berlin: 'It was a pity that Miss Cavell had to be executed, but it was necessary. She was judged justly. We hope it will not be necessary to have any more executions. I see from the England and American press that the shooting of an Englishwoman and the condemnation of several other women in Brussels for treason has caused a sensation, and capital against us is being made out of the fact. It is undoubtedly a terrible thing that the woman has been executed; but consider what would happen to a State, particularly in war, if it left crimes aimed at the safety of its armies to go unpunished because committed by women. No criminal code in the world—least of all the laws of war—makes such a distinction; and the feminine sex has but one preference according to legal usages, namely that women in a delicate condition may not be executed. Otherwise, man and woman are equal before the law, and only the degree of guilt makes a difference in the sentence for the crime and its consequences. I have before me the court's verdict in the Cavell case, and can assure you that it was gone into with the utmost thoroughness, and was investigated and cleared up to the smallest details. The result was so convincing, and the circumstances were so clear, that no war court in the world could have given any other verdict, for it was not concerned with a single emotional deed of one person, but a well-thought-out plot, with many far-reaching ramifications, which for nine months succeeded in doing valuable service to our enemies to the great detriment of our armies. Countless Belgian, French, and English soldiers are again fighting in the ranks of the Allies who owe their escape to the activities of the hand now found guilty, whose head was the Cavell woman. Only the utmost sternness could do away with such activities under the very nose of our authorities, and a Government which in such case does not resort to the sternest measures sins against its most elementary duties toward the safety of its own army.'"—J. M. Beck, *War and humanity*, pp. 295-298.—See also BRUSSELS: 1914-1918.

M. Clemenceau spoke the tribute of the people

of France. "The profound truth is that she honored her country by dying for what is finest in the human soul—that grandeur of which all of us dream but only the rare elect have the chance of attaining. Since the day of Joan of Arc, to whose memory I know that our Allies will one day seek to erect a statue, England has owed us this return. She has nobly given it."—J. Buchan, *Nelson's history of the war*, v. xi, p. 66.—An interesting sequel to the execution developed three years later. At the end of December, 1918, it was announced from Paris that "French soldiers who have been captives in Germany had formally accused Georges Gaston Quien, alias Luc, recently arrested on a charge of espionage, as having been the man who denounced Miss Edith Cavell, the English nurse, who was put to death by the Germans." After the armistice the British military authorities made diligent search for the body. The burial place was located and the remains were recovered. On May 15, 1919, the coffin was borne through London on a gun carriage, draped with the Union Jack. After an impressive service in Westminster Abbey, the remains of Edith Cavell were buried in her native city of Norwich.

CAVENDISH, Lord Frederick (1836-1882), English statesman; entered Parliament in 1865; private secretary to Gladstone 1872-1873; financial secretary of the treasury department 1880-1882; appointed chief secretary for Ireland, in 1882. The day he took office, May 6, 1882, he was assassinated in Phoenix Park, Dublin, while walking with Thomas Henry Burke, under secretary, who was killed at the same time. See IRELAND: 1882.

CAVENDISH, Henry (1731-1810), English chemist, discoverer of hydrogen. See CHEMISTRY: General: Phlogiston period.

CAVENDISH, Sir William (c. 1505-1557), English statesman, founder of the noble house of Cavendish; 1530, member of the commission for visiting monasteries from whose spoils he acquired considerable property; 1546, treasurer of the king's chamber, created a knight, member of the privy council; continued in favor under Edward VI and Mary.

CELEBES.—The extraordinary conformation of the island of Celebes (situated east of Borneo) gives it a coast line of no less than 3,500 miles, though its area is but 75,000 square miles. In other words, "although little over one-third the size of France, it has a seaboard equal in extent to that of France and the Iberian Peninsula taken together. . . . Were it as densely peopled as Java, it would have a population of some thirty millions, whereas, according to the approximate estimates, the actual population is little over three-quarters of a million. But, although nominally under the Dutch rule, most of the interior is still occupied by Alfarus, that is, wild tribes for the most part living in isolated and hostile groups. Nor was the Dutch occupation effected without many sanguinary struggles, not always to the advantage of the invaders. The Europeans appeared first as guests, and the early conflicts were connected with questions of trade rights. Then the Dutch presented themselves as rivals of the Portuguese in 1660, when they seized the fort of Macassar, long their only possession on the coast. Later they concluded a treaty of alliance and a protectorate with several petty states in the south-western peninsula, and since that time they have omitted no occasion of strengthening their position in the island. Yet in most of the inland states they are still unrepresented by any officials, and even the coast districts are visited only at long intervals. Celebes has not yet [written about 1800] been completely explored, and some parts are known only in a general way. . . . The native populations are usually classed as Malays and Alfarus, the inland wild tribes . . . [being] indiscriminately grouped as Alfarus."—E. Reclus, *Earth and its inhabitants: Oceanica*, ch. 3.—See also **BRITISH EMPIRE**: Map of the world; **MALAY ARCHIPELAGO**: Land.

1859.—**Insurrection**.—The Boni insurrection was quelled in 1859, but the country was still restless.

1905-1906.—**Revolts**.—In these years various chiefs revolted and were subdued only after much fighting, which, however, brought all of the island under Dutch authority.

1916-1919.—**Exploration**.—The expedition sent out to Borneo and Celebes by the Smithsonian Institute brought back much zoological and ethnological material.

CELTIBERIANS.—"The appellation Celtiberians indicates that in the north-eastern part of the peninsula [Spain] there was a mixture of Celts and Iberians."—W. Ihne, *History of Rome*, bk. 5, ch. 6. note.—See **FRANCE**: The people; **NUMANTIAN WAR**; **SPAIN**: Aboriginal peoples.

CELTIC CHURCH.—"By the Celtic Church in Britain and Ireland is meant the Christian Church which existed in parts of Great Britain and Ireland before the mission of Augustine (597) and which for some time thereafter maintained its independence by the side of the new Anglo-Roman Church. It comprises two branches, one in Roman Britain and a continuation of it in Wales, the other in Ireland and Alba (Scotland)."—H. Zimmer (*New Schaff-Herzog religious encyclopedia*, v. 2, p. 468).

176-597.—**Before Augustine's mission**.—"Christianity was probably brought into Britain between the years 176 and 208; for Irenæus, writing in 176 of the number of Christian lands, does not mention Britain, while Tertullian, writing about 208, says, somewhat rhetorically, that the Gospel had found its way into parts of Britain which were closed to the Romans. It doubtless came hither from Gaul . . . for there are many traces of a close connection between the Churches of Gaul and Britain. . . . The Church was orthodox, and accepted the creed and canons of the Council of Nicaea (325) where an arrangement was made settling the date of Easter for the Catholic Church. . . . In the fourth century, then, the British Church in no way differed from the Catholic Church either in faith or practice. . . . In 410 the Roman dominion in Britain came to an end, and before very long wars within the island, invasions, and conquest by the Saxons and Angles, cut it off from communication with Rome. . . . Some years later there is evidence that the Church still followed the directions of Rome, for in 455 it received and obeyed a command of Leo the Great as to the right date of Easter. At that time Teutonic invasions of Britain were in progress, and soon cut the Church off from communication with Rome. With one part of Gaul a close connection was maintained. . . . But in 502 the Franks claimed dominion over Armorica (Brittany), and the British churchmen there, indignant at this second Teutonic invasion, withdrew their obedience from Tours, and adopted a policy of isolation. Gildas gives us a picture of the Church in Britain about a century after it was cut off from Rome. He wrote a little before 550, when the Teutonic conquest had made much progress. . . . He shows us a Church with a diocesan episcopate, with bishops who were then rich and powerful, and claimed succession from St. Peter and the other apostles, and with a clergy of the two other sacred orders. The Church was governed by Synods, but discipline was lax and simony was rife. There were monks living under a vow and observing monastic decrees; indeed, we know that there were many British monasteries which were abodes of learning . . . and there were virgins and

widows vowed to chastity. Clerical marriage seems to have been common, though, as in all lands where monasticism flourished, there was a feeling against it. . . . The only differences noted by Gildas between the Roman and the British Churches are that in ordination the Britons used a lectionary of their own, and that they anointed the hands of those to be ordained. Their Church was certainly not at that time in conscious schism from Rome. When, however, in 602 the British Church was again brought into communication with Rome in the person of Augustine, other differences are discerned. . . . The differences concerning the date of Easter and the form of the tonsure were of great importance during the early days of the English Church."—W. Hunt, *English church from its foundation to the Norman conquest*, pp. 1-5, 7.—See also CHRISTIANITY: 100-300: British or Celtic church; 5th-9th centuries.

597-817.—Struggle for independence.—"This unhappy miscalculation about Easter proved a grievous cause of weakness in the Celtic Church, for those of her saints who travelled to Gaul or Italy were forced to admit that their native Church was in error and returning home formed a party which laboured for the abandonment of the old computation. . . . At the bottom of all the differences lay the independence of the Celtic Churches, which owed no allegiance to the Papal chair. . . . They were ready to acknowledge a certain primacy in the Roman see, as S. Columbanus said, later, 'next to Jerusalem,' but such a half admission would not satisfy those who were before all things, missionaries to extend Papal authority. Every sort of false accusation . . . was offered to the ancient British Church. Its orders were ignored, its ministrations flouted, the orthodoxy of its prelates disputed. . . . Pope Vitalian in 667, wrote to King Oswy to choose an archbishop for Canterbury who should root out the tares from the whole island, alluding thereby to the clergy of the National Church. The peculiarity in the observance of Easter was abandoned by the Church in the South of Ireland in 634, by the Northumbrian Church in 664; the Britons of Strathelyde submitted in 668, the northern Scots in Ireland in 697; in 704 a Roman party was formed in Iona itself. The British of the eastern portion of the West Welsh in Devon and Cornwall accepted the Roman computation in 710. The change took place in Wales between 768 and 777. Llandewennec, in Brittany, retained the Celtic tonsure till 817. . . . Thus ended the struggle for independence, after it had continued for more than a century and a half. Wales, at the beginning, was the head of a great and powerful Celtic confederacy; at the end it was almost alone. A party in Hy (Iona), and, perhaps, also the Breton clergy, remained faithful to the last to the cause of Celtic independence, but Wales had no other allies. The Church of Ireland had so entirely turned against it that by its canons it had put restrictions upon the ministrations of such clergy as came from Britain, and had condemned their churches for separating from the Roman customs and from the unity of Christendom. The prolongation of the struggle only completed the isolation of Wales; and though by its submission to Rome it again entered nominally into fellowship with the rest of Western Christendom, it was long separated in feeling from the English Church and the churches of the Continent, and it never quite regained the old connexion with its Celtic brethren." (Newell, *History of the Welsh church*, p. 133.) . . . It was the misfortune of the Celt everywhere—in Gaul, in Britain, in Ireland—never to be allowed to work

out his own ideas, to develop his own institutions logically to a constituted government on firm basis. Nor was he suffered to mould his Church as most convenient to himself. . . . The revolt against the Latin Church in Scotland, in Wales, and in England, as well as that of the Huguenots in France, was to a large extent due to the Latin organization being opposed to Celtic ideals. . . . It is certainly a most hopeful sign, that since the disestablishment of the Irish Church it has reshaped itself on . . . constitutional lines which are in complete accord with the Celtic spirit. . . . Had the Latin Church not trodden out independent Celtic Christianity it is not improbable that in Celtic lands the Church would be found alive, vigorous, one with its past, different in many particulars from the Latin and the Anglican Churches yet one in faith and one in devolution of authority from Christ, through the Apostles. . . . We may well suspect that in that event there would have been no Calvinism in Scotland and no Nonconformity in Wales."—S. Baring-Gould, *Lives of the saints*, v. 16, pp. 44-47, 55, 84-86.—See also CHRISTIANITY: 100-310: British or Celtic church; 597-800.

CELTS.—"The Celts form a branch of the great family of nations which has been variously called Aryan, Indo-European, Indo-Germanic, Indo-Celtic and Japhetic. . . . The Celts of antiquity who appeared first and oftenest in history were those of Gallia, which, having been made by the French into Gaule, we term Gaul. . . . The Celtic family; so far back as we can trace it into the darkness of antiquity, consisted of two groups or branches, with linguistic features of their own which marked them off from one another. To the one belonged the ancestors of the people who speak Gaelic in Ireland, the Isle of Man and the Highlands of the North. [See also IRELAND: Tribes of early Celtic inhabitants; and 13th-14th centuries.] . . . The national name which the members of this group have always given themselves, so far as one knows, is that of Gaidhel, pronounced and spelt in English Gael, but formerly written by themselves Goidel. . . . The other group is represented in point of speech by the people of Wales and the Bretons. . . . The national name of those speaking these dialects was that of Briton; but, since that word has now no precise meaning, we take the Welsh form of it, which is Brython, and call this group Brythons and Brythonic, whenever it is needful to be exact. The ancient Gauls must also be classified with them."—J. Rhys, *Celtic Britain*, ch. 1.—See also AMBACTI; ARYANS; and SPAIN: Aboriginal peoples.

Origin and meaning of the name.—"Probably the earliest mention of the word *Celt* with which most readers are familiar occurs in that classic phrase where, in the introduction of his 'Commentaries on the Gallic War,' Caesar, speaking of the division of all Gaul into three parts, says that

the native name of the group of peoples who occupied the centre of Gaul between the Seine, the Marne and the Garonne is a Celtic word. The word is found long before Caesar's time, however. In fact, as early as the end of the sixth century, B. C., we find, for the first time in history, the word in a derived form, in the Greek writer Hecataeus of Miletus, who uses it in a geographic sense. In his 'Voyage around the World,' of which only fragments have been preserved, he says, speaking of Marseilles, that it is near Celtica, and he also says that Nyra, wherever that may have been, is a Celtic city. The word *Celt*, itself, is found first in Herodotus, in a passage dating from the middle of the fifth century B. C., or, more precisely, between the years 445 and 443, where he informs us that the Celts, live at the sources of the Danube, that is, in the southwest corner of Germany in the present Grand Duchy of Baden, and in Spain and on the coast of the Atlantic. The Latin *Celta*, with which we are familiar in Caesar, is the plural of a masculine stem and, on it, the later Greek historians and geographers built the form *κελται*, as a variant of the older *κελτοι*. There are two very different applications of the word *Celt* in the ancient writers; as the name of a tribe in Gaul, and as the general name for all the Celts of the Continent. Apparently, the ancients never applied the name to the inhabitants of the British Isles. Since each tribe had its own name, it is probable that the word *Celt* was originally nothing more than the name of one of these tribes, but, just why it was given to that particular group of people that Caesar speaks of, we have no way of knowing. On the other hand, the Greeks, up to the third century B. C., not only had no other than this for all the Continental Celts, but the confusion is heightened by their sometimes including under that denomination, the Germans. . . . The word *Celt* has had a checkered career. It has grown from the name of a single tribe, so as to include (in the extra-Celtic use of the word) in a vague way, all the members of the family, so that now it has come to mean anyone who speaks, or is descended from one who speaks, any Celtic language. This is a quite modern use of the word, and there is nothing to show that the Celts themselves ever employed it, or that it is employed properly to-day, in this wider meaning, in any of the neo-Celtic languages. It is doubtful if the Celts of antiquity ever felt or acted as a united people, except to a certain extent, under Vercingetorix's lead at the siege of Alesia."—J. Dunn, *Word Celt* (*Catholic University Bulletin*, v. 13, 1907, pp. 94-95).

Early history.—Principal migrations.—"By the time that these Celtic peoples tread the threshold of history, they are beset by many enemies. On the east, the nomad Scythians drove the 'Cimmerian' section of them off the grassland altogether, in a flood of desperate fugitives, which broke through into Asia Minor in the seventh century, wrecked the nascent kingdom of the Lydians about 650, and swept on, like the new lords of Armenia before them, till they laid the last straw on the tottering back of Assyria. A century later, Etruscan conquests detached the whole Cisalpine province, and another century after that, a central European section of them, closely akin but of ruder manners, and standing in much the same relation to what Roman writers called the 'older or Umbrian' Celts, as the Sabellians to the older Italic peoples, broke loose somewhere in the north, and rapidly made themselves master of large parts of the Danube valley. About 400 B. C., these 'Gallic' tribes flooded out southward to create a

'Cisalpine Gaul' on the ruins of Etruscan rule; maiming Etruria itself, sacking Rome in 300, and threatening Tarentum, as we have seen. Next, in the following century, another horde of them penetrated far into Greece (reaching a Delphi in 279) and then across the Hellespont into a new 'Galatia' on the plateau of Asia Minor. The inrush of the dreaded Gaesatae into Cisalpine Gaul, about 235, which precipitated the intervention of Rome beyond the Apennines, was probably a backwash of this Galatian wave. Northwestward, similar conquests are rather later, and the chronology of them is obscure; but the Belgic movement was still in progress north of the Seine [see also BELGIUM: Ancient and medieval history] in the first century B. C., when the intervention of Julius Caesar brought all the country between the Rhine and the Atlantic under the domination of Rome, and replaced by a Roman sea-police the naval and commercial enterprises of the Breton Veneti, whom he found engaged in trade with both Celts and aborigines in Britain."—J. L. Myres, *Dawn of history*, pp. 245-246.—"The Britons of historic times were Celts who came to the island from Gaul at two periods. The first invasion was very early, and the invaders were Celts of the Goidelic (Gadhelic) or northern branch. From the testimony of sepulchral monuments it is conjectured that the Celts found two races in Britain: a small, dark-haired race, perhaps of Iberian stock, and a large light-haired race of Scandinavian origin. The Goidelic Celts conquered without exterminating the previous inhabitants, and held the land many centuries, until a new invasion of continental Celts occurred. This time it was the Brythonic or Cymric Celts of the southern stock, who crossed the channel, probably not very long before the expedition of Caesar, and dispossessed their kinsmen of the southern and eastern portion of the island."—C. Ploetz, *Epitome of ancient, mediæval and modern history*, pp. 35-37.—See also AMORITES; ENGLAND: Area; EUROPE: Introduction to the historic period: Migrations.

Social and political organization.—Trade and industry.—"These old Celts were a rude, hardy folk, but hospitable and kind in their crude, boisterous way. Their serious occupation was war and their diversion rough games and immoderate eating and drinking. In the earliest times we find them tattooing or painting their bodies, a practice which long survived among the northern peoples, the Scots and the Caledonians or Picts. At first their only form of social and political organization was the family, who chose their ablest male to lead them in war and to represent them in peace. As time went on, these families were united into tribes from which the most capable male member was selected as king. Their legal system was very primitive. They had no courts, as we understand the term, and their judges were merely umpires or arbitrators, who had no power to compel the acceptance of their decrees. In their earliest intercourse the Celts used cattle and bars of iron and tin for standards of value; but as early as 200 B. C. they seem, in the southeast, to have had gold coins fashioned on Greek models. In the absence of roads they made use of rivers and the tops of ridges as trade routes. The Thames and the Severn were especially important. Their greatest trade was in tin which they carried from Cornwall overland to the southeast coast, thence in ships to the shores of Gaul. Besides tin they came to export cattle, hides, grain, and also slaves and huge dogs, the latter used by the Gauls in war and by the Romans for hunting. Their imports were chiefly manufactured articles of iron and

bronze, cloth, and salt. But this does not mean that they did not manufacture, to some extent, themselves. They were fond of bright colors, and we are told that they wore clothes of various hues, getting the dyestuff from the bark of trees. They excelled in enamel work and made many of the gold ornaments which they wore, as well as the weapons and chariots which they used in war."—A. L. Cross, *Shorter history of England and Greater Britain*, pp. 11-12.

Religion.—"They worshipped the forces of nature as gods; they created lesser divinities for particular localities, identifying each grove, stream, or spring with its appropriate guardian spirit, and peopled the land with fairies, dwarfs, and elves. Living in wild and unfriendly surroundings, in the midst of dense gloomy forests and treacherous, inaccessible fens, exposed to storm, thunder and lightning, their attitude was naturally one of wonder mingled with fear. Much of their worship which included human sacrifices, was designed to placate the ferocious or malicious powers to which they were exposed. They believed in wishing wells and cursing stones; and the mistletoe, which still figures in our Christmas celebrations, they venerated for its miraculous properties. Very probably they borrowed from the stone men their priestly system and ceremonialism known as Druidism. The Druids were a highly privileged body who ranked with the nobles and were exempt from all public burdens, who conducted the sacrifices, practiced magic, foretold the future, acted as judges, and were the custodians of learning, human and divine."—*Ibid.* pp. 10-11.—See also MYTHOLOGY: Celtic mythology: Pre-Roman period; and Roman period; also MYTHOLOGY: Germanic: Sources of knowledge of Germanic mythology.

Celtic clans. See CLANS: Highland.

Celtic language.—"There is a certain family of languages called Celtic (a word of uncertain etymology and significance), belonging to the Indo-European stock, and forming a family distinguished by certain features of construction from other families of the same stock. These need not here be enumerated in full; it will suffice to mention the best-known. The letter has been lost by the Celtic languages from all words of the old Indo-European parent language. Thus, the word for 'grandson,' *pavi-*, which in Greek became *pavis* and ultimately *παῖς* became in the old Celtic avios, and this through intermediate forms *ave, ua*, degenerates into *o*; written in modern surnames with the mark of prolongation turned into an apostrophe after, as in 'O'Connor.' These languages again, are subdivided into two groups, the one, the *Goidelic* group (Irish, Scotch Gaelic, Manx) retaining the guttural part of the old Indo-European composite sound *qu* (= *kw*), which they express by *c*; the other, the *Brythonic* group (Welsh, Breton, and the extinct Cornish) retaining the labial part of the same sound, which they turn into *p*. Thus *quennos*, 'head,' becomes in Goidelic *Cenn*, in Brythonic *pen*. On the Continent the Celtic languages have now disappeared. . . .

"Celtic inscriptions are scattered widely over the Continent; but they are very obscure, very short, and for the greater part very fragmentary. . . . Celtic place-names are found over almost the whole Continent. From *Noviodunum*, the New Fortress, in Roumania to *Nertobriga*, the Strong Hill, in Spain, the map of Europe is strewn with Celtic wreckage. Where did these languages arise? The answer to this question has been sought with the aid of a very ingenious and reasonable argument.

In all countries the oldest place-names are the names of rivers. . . . From this it will follow that if we find a region in Europe where the river-names are notably Celtic, we may assume, at least as a working hypothesis, that in that region was the cradle of the Celtic languages. Such a place has been found by D'Arbois de Jubainville, in the region between the head waters of the Rhine and those of Danube—both of which great rivers bear Celtic names. Somewhere in what is now Bavaria and Wurtemberg is this indicated as the place where the Celtic speech became discriminated from the rest of the Indo-European languages. It is not to be understood that the speakers of the Celtic languages were at all times a single people, racially united. That is a fundamental mistake. . . . Probably the Celtic family of languages originated among the broad-headed people of Central Europe, the 'Alpine Race' of Ethnologists, and on that account it may be legitimate to call the Alpine Race 'the Celtic Race,' as some authorities do; but it is undesirable. The Celtic languages early spread beyond the limits of the Alpine people; and it was not an Alpine, but a Teutonic stock which brought the Celtic tongue to Ireland.

"The word 'Celtic' should be used as a linguistic designation only; to call a man a 'Celt' is in strict propriety as illogical as it would be to call a native of India a 'Sanskrit.' But it is a convenient term for those who speak the Celtic languages, and by extension for the civilisation which they enjoyed in common; so that there is no serious objection, if we understand clearly what we mean, to speaking of the Celtic peoples, Celtic religions, Celtic arts, and so on. But the expression 'Celtic Race,' even in the sense above mentioned, is apt to be misleading; notably so in Ireland, where the 'Celtic' racial element in the population is insignificant—we may almost say practically non-existent. . . .

"The Celtic language gradually, step by step, yielded to the tongue of the Anglo-Norman invaders, though after 700 years it still lives. There is evidence that the Pre-Celtic speech was also alive, 700 years after the coming of the Celts; though unfortunately it never occurred to its speakers to found a 'Pictish League' for its preservation—a fact which can never sufficiently deplore. The few tiny scraps which are all that survive of this tongue are just enough to make us long for more; but it is gone beyond recall."—R. A. S. Macalister, *Celtic Ireland (Irish Monthly, Nov., 1918, pp. 606-618.*—See also PHILOLOGY: 9; 11; 17.

Ancient Irish sagas.—"There has at last come about a popular revival of interest in the wealth of poems and tales to be found in the ancient Celtic, and especially in the ancient Erse, manuscripts—the whole forming a body of prose and poetry of great and well-nigh unique interest from every standpoint, which in some respects can be matched only by the Norse sagas, and which has some striking beauties the like of which are not to be found even in these Norse sagas. . . . It is difficult to speak with anything like exactness of the relative ages of these primitive literatures. Doubtless in each case the earliest manuscripts that have come down to us are themselves based upon far earlier ones which have been destroyed, and doubtless, when they were first written down, the tales had themselves been recited, and during the course of countless recitations had been changed and added to and built upon, for a period of centuries. . . . The Irish sagas were produced, or at least were in healthy life, at about the time when 'Beowulf' was a live saga, and two or three centuries or thereabouts we would recognize as virtually

akin to that they now have. In these tales, which in so many points are necessarily like the similar tales that have come down from the immemorial past of the peoples of kindred race, there are also striking peculiarities that hedge them apart. The tales are found in many versions, which for the most part have been enlarged by pedantic scribes of aftertime, who often made them prolix and tedious, and added grotesque and fantastic exaggerations of their own to the barbaric exaggerations already in them, doing much what Saxo Grammaticus did for the Scandinavian tales. They might have been woven into some great epic, or at least have taken far more definite and connected shape, if the history of Ireland had developed along lines similar to those of the other nations of west Europe. But her history was broken by terrible national tragedies and calamities. These Celtic sagas are conveniently, though somewhat artificially, arranged in cycles. In some ways the most interesting of these is the Cuchulain cycle, although until very recently it was far less known than the Ossianic cycle—the cycle which tells of the deeds of Finn and the Fianna. The poems which tell of the mighty feats of Cuchulain, and of the heroes whose life-threads were interwoven with his, date back to a purely pagan Ireland—an Ireland cut off from all connection with the splendid and slowly dying civilization of Rome, an Ireland in which still obtained ancient customs that had elsewhere vanished even from the memory of man. Thus the heroes of the Cuchulain sagas still fought in chariots driven each by a charioteer who was also the stanch friend and retainer of the hero. The customs of the heroes and people of the Erin of Cuchulain's time were as archaic as the chariots in which they rode to battle. The sagas contain a wealth of material for the historian. They show us a land where the men were herdsmen, tillers of the soil, hunters, hárds, seers, but, above all, warriors. Erin was a world to herself. Her people at times encountered the peoples of Britain or of Continental Europe, whether in trade or in piracy; but her chief interest, her overwhelming interest, lay in what went on within her own borders. The Erse tales differ markedly from the early Norse and Teutonic stories in more than one particular. A vein of the supernatural and a vein of the romantic run through them and relieve their grimness and harshness in a way very different from anything to be found in the Teutonic. Of course the supernatural element often takes as grim a form in early Irish as in early Norse or German; the Goddess with red eyebrows who on stricken fields wooed the Erse heroes from life did not differ essentially from the Valkyrie; and there were land and water demons in Ireland as terrible as those against which Beowulf warred. But, in addition, there is in the Irish tales, an unearthliness free from all that is monstrous and horrible, and their unearthly creatures could become in aftertime the fairies of the moonlight and the greenwood, so different from the trolls and gnomes and misshapen giants bequeathed to later generations by the Norse mythology. Still more striking is the difference between the women in the Irish sagas and those, for instance, of the Norse sagas. Their heirs of the spirit are the Arthurian heroines, and the heroines of the romances of the Middle Ages. . . . The Erse tales have suffered from many causes. Taken as a mass, they did not develop as the sagas and the epics of certain other nations developed; but they possess extraordinary variety and beauty, and in their mysticism, their devotion to and appreciation of natural beauty, their exaltation of the glo-

rious courage of men and of the charm and devotion of women, in all the touches that tell of a long-vanished life, they possess a curious attraction of their own. They deserve the research which can be given only by the lifelong effort of trained scholars; they should be studied for their poetry, as countless scholars have studied those early literatures; moreover, they should be studied as Victor Bérard has studied the 'Odyssey,' for reasons apart from their poetical worth; and finally they deserve to be translated and adapted so as to become a familiar household part of that literature which all the English-speaking peoples possess in common."—T. Roosevelt, *Ancient Irish sagas (History as literature, and other essays, pp. 278-300)*.—See also BRITANNY: Modern; ENGLISH LITERATURE: Formation; 3rd century; 1880-1020.

CELTS.—A name given among archaeologists to certain prehistoric implements, both stone and bronze, of the wedge, chisel, and axe kind. It has evidently no connection with the word Celt used ethnologically.

CELTS AND IBERIANS IN SPAIN. See CELTIBERIANS.

CELYDDON, Forest of, or Coed Celydon. See BRITAIN: Celtic tribes.

CENABUM. See GENABUM.

CENNINI, Cennino, (fl. 15th century). Italian art teacher and author of the *Trattato*. See EDUCATION, ART: Medieval and Renaissance.

CENOMANIANS. See INSUBRIANS.

CENSOR, rank or grade in Jesuit school. See EDUCATION: Modern; 16th-17th centuries: Jesuit teaching.

CENSORS, Council of Vermont. See VERMONT: 1777-1778.

CENSORS, Roman.—The original business of the Roman censors was to register the citizens and their property. They "made out the returns of the free population; but they did more; they divided it according to its civil distinctions, and drew up a list of the senators, a list of the equites, a list of the members of the several tribes, or of those citizens who enjoyed the right of voting, and a list of the ærarians, consisting of those freedmen, naturalized strangers, and others, who, being enrolled in no tribe, possessed no vote in the comitia, but still enjoyed all the private rights of Roman citizens. Now the lists thus drawn up by the censors were regarded as legal evidence of a man's condition. . . . From thence the transition was easy, according to Roman notions, to the decision of questions of right; such as whether a citizen was really worthy of retaining his rank. . . . If a man behaved tyrannically to his wife or children, if he was guilty of excessive cruelty even to his slaves, if he neglected his land, if he indulged in habits of extravagant expense, or followed any calling which was regarded as degrading, the offence was justly noted by the censors, and the offender was struck off from the list of senators, if his rank was so high; or, if he were an ordinary citizen, he was expelled from his tribe, and reduced to the class of the ærarians."—T. Arnold, *History of Rome, ch. 17*.—See also LUSTRUM.

CENSORSHIP: Press and speech.—Censorship, in the modern sense, began with the invention of the printing press, although as early as the Emperor Augustus, according to Tacitus, an attempt was made to punish libellous or scandalous books and in 150 we find the council of Ephesus condemning and prohibiting the "Acta Pauli," an unauthorized life of St. Paul. During the following centuries similar edicts were issued by ecclesiastical bodies or individuals. "The revolution in the methods of the production and dis-

tribution of literature brought about by the invention of printing in the middle of the 15th century, had, as an immediate result, an enormous increase in the influence upon the shaping of popular opinion of the written, or rather of the printed word, that is, of thought in the form of literature. The work of the printers was at first welcomed by the rulers of the Church. They convinced themselves that the Lord had placed at their disposal a valuable instrument for the spread of sound doctrine and for the enlightenment of believers, and with this conviction, they found funds for the support of a number of the early printers and kept their presses employed in the production of works of approved theological instruction. It was in fact not until nearly three-fourths of a century after Gutenberg, when the leaders of the Reformation were utilising the printing-presses of Wittenberg for the spread of the Protestant heresies, that the ecclesiastics became aroused to the perils that the new art was bringing upon the true faith and upon the authority of the Church. If the people were to be protected against the insidious influence of the new heresies, it was absolutely essential that some system should be instituted under which the productions of the printing-press could be supervised and controlled. . . . The requirement was met by the institution of a system planned to permit no books to reach the public that had not been passed upon and approved by ecclesiastical examiners appointed for the purpose. To this end, the production and the circulation of any literature not so approved were stamped as constituting a misdemeanor of the most serious character, one that might, under certain circumstances, become the final sin against the light, the offence against the Holy Ghost. In 1550, the responsibility for the censorship of literature was first assumed directly by the papal authority through the publication of the *Index Auctorum et Librorum Prohibitorum*, of Paul IV, the first of a long series of papal Indexes, aggregating, up to 1890, forty-two in all [see also BOOKS: Books in Medieval times; and PRINTING AND THE PRESS: 1564-1581]. The present methods of Roman censorship are more complicated than they were in 1550.—“The pope retains for himself, the official headship of the Congregation of the Index on the ground that the work of this Congregation has to do directly with matters of doctrine. The working body of the Congregation of the Index comprises ten to twelve members with votes, including always a group of cardinals. In addition to these voting members, there is a varying number of *consultores* (advisers) who are called in as experts in different divisions of knowledge, but who have no votes in the decisions arrived at.”—G. H. Putnam, *Censorship of the Church of Rome*, v. 1, pp. 3 and 427.

Austria.—“Metternich reigned [following the Napoleonic overthrow] as undisputed master and infallible guide. Through his influence a system of intellectual repression was instituted which became notorious as the ‘Metternich system.’ A harsh censorship was established over journals, books, plays, and schools. Spies were introduced into the university classrooms, who took notes at the lectures delivered by the professors and reported any utterances unfavorable to the Government. Librarians had to report the kind of books borrowed by liberal minded persons. The sale of books expressing liberal views, even of the most moderate kind, was forbidden. Most of the schools were placed under the control of the Catholic clergy, and students were compelled to go to mass on pain of dismissal. Prevention was the sum total

of the ‘Metternich system, which lay like a dead weight on the people for an entire generation.’—J. S. Schapiro, *Modern and contemporary European history*, p. 123.—See also AUSTRIA: 1905-1911.

Belgium.—Censorship laws. See BELGIUM, CONSTITUTION OF: Title II.

England.—“The Stationers’ Company received its charter by royal decree in 1566. . . . It constituted an organization of the publishing and printing trades of London which assumed to represent the publishing interests of the country. It seems probable that the purpose of the institution of the Company was not so much the furthering of the business of book-production, as the organization of this business in such shape that it could be reached effectively and promptly by the censorship authorities of the Crown. No question appears to have arisen in England in regard to any conflicting authority on the part of the Church to control such censorship. The Crown utilised the services of bishops and of other ecclesiastics for the examination of works in the division of theology which came under the suspicions of heresy. The selection of the examiners and the decision concerning the disposition of the books so examined was reserved, however, for the direct action of the Crown or of the representatives of the Crown. Such censorship as came into action in England proved to be more important in connection with political literature than with works on religion or theology. In 1644, the Long Parliament enacted certain regulations for the control of printing which provided that ‘No book, pamphlet, or paper shall be henceforth printed unless the same be first approved and licensed by censors that shall be thereto appointed.’ Milton had been a persistent opponent of the policy of censorship and of licensing, and one result of the enactment was the publication of the famous *Areopagitica*, an oration in the form of a pamphlet, which presented with fierce eloquence a protest against the whole theory of the exercise by Government licensers of a supervision and control of literature, or of the delegation of such control to a commercial company (the Stationers’ Company) which was the creation of Government.”—*Ibid.*, v. 2, pp. 368-369.—“As good almost kill a Man as kill a good Booke,” wrote Milton in the *Areopagitica*. “Who destroys a good Booke, kills Reason itself, kills the image of God as it were in the eye.”—See also PRINTING AND THE PRESS: 1637; 1647; and 1695.

In Great Britain the office of “Examiner of State Plays” was created under the Licensing Act of 1737 and confirmed by the Theatre Regulation Act 1842. This measure brought all London theatres under the control of the Lord Chamberlain’s office, to which the one or two examiners are attached. These officials are generally chosen from the ranks of well-known literary men; the jurisdiction of their censorship extends to the cities of London and Westminster, and certain other parts of the metropolis, as well as to those places within which the sovereign may occasionally reside. Within these limits no play can be produced without the Lord Chamberlain’s sanction.—See also ENGLAND: 1762-1764; 1771; 1816-1820.

France.—The French Revolution was in part a protest against censorship of speech and press. Opposition to the government of France, if openly expressed, was likely to land the writer in the frightful dungeons of the Bastille. Even philosophical discussion was hampered by the government. When Voltaire returned from England “he had to wait long and use many arts and suffer

harassing persecution, before he could publish what he had to say on Newton and Locke, and in other less important respects had to suppress much of what he had most at heart to say."—J. Morley, *Voltaire*, v. 1, p. 64.—In 1727 the first real encyclopedia was published in England and Denis Diderot was chosen to bring out a French edition. Employing most of the literary men of France to help him, Diderot published the first volume of the work in 1751 and the second in 1752. "A month later the work was suppressed by the Council as dangerous to royal authority and religion. None the less, the publication was continued, until in 1757 the work had reached the end of the letter G. Then, because of a most radical book of Helvetius, one of the leading Encyclopedists, the storm broke out again, and it was not until 1755 that the remaining volumes were delivered to subscribers."—S. Mathews, *French Revolution*, p. 62.—"Whatever may have been the real attitude of the parliaments, the makers of political history, toward the current political theories, they were dependent upon public opinion for support in their struggle with the monarchy. The government naturally endeavored to deprive them of this support and its attempts to suppress discussion and to prevent the expression of public opinion form one of the most interesting features of this remarkably interesting period. Throughout the century, it strove to maintain a strict censorship over the press, but its success was not flattering. The re-appearance, from time to time, of edicts upon the press was proof in itself of the inability of the government to deal successfully with the problem. . . . Presses were seized or destroyed; authors were immured in the Bastille; printers and colporteurs were placed in the stocks or sent to the galleys, while books and pamphlets were confiscated and many of them burned by the hangman. All these efforts were useless. The whole nation was in a conspiracy against the government. . . . Mirabeau, like the men of his generation, hoped all things from the growth of intelligence as the result of education, but his book ['Essay upon Despotism'] contains no definite counsels as to how that education could be accomplished. He would instruct the despot, but he confessed that 'the first arms of despots . . .' are 'the obstacles placed in the way of instruction, the prohibitions that hamper the press and the publication of public writings.' Despotism deprived him of the very means by which he would overcome despotism."—F. M. Fling, *Mirabeau and the French Revolution*, pp. 16, 17, 464.—"The whole trade in books was a sort of contraband, and was carried on with the stealth, subterfuge, daring, and knavery that are demanded in contraband dealings. . . . No work of merit could appear without more or less of slavish mutilation, and no amount of slavish mutilation could make the writer secure against the accidental grudge of people who had influence in high quarters. . . . Holland was now the great printing press of France, and when we are counting up the contributions of Protestantism to the enfranchisement of Europe, it is just to remember the indispensable services rendered by the freedom of the press in Holland to the dissemination of French thought in the eighteenth century. . . . The French government was anxious enough on all grounds to secure for France the production of the books of which France was the great consumer, but the severity of its censorship prevented this. The introduction of the books, when printed, was tolerated or connived at, because the country would hardly have endured to be deprived of the enjoyment of its own literature. C. G. de Lamoig-

non de Malesherbes, son of the chancellor . . . was Directeur de la Librairie from 1750-1763. The process was this: a book was submitted to him; he named a censor for it; on the censor's report the director gave or refused permission to print, or required alterations. Even after these formalities were complied with, the book was liable to a decree of the royal council, a decree of the parliament, or else a *lettre-de-cachet* might send the author to the Bastille."—J. Morley, *Rousseau*, v. 2, pp. 56-60 and footnote on p. 61.—With the revolution came a sudden change. Freedom of speech and of the press was assured by the "Declaration of the Rights of Man." Pamphlets on all subjects appeared; thousands of small newspapers and brochures came into existence. Freedom of speech increased to such an extent that every market place was filled with orators, discussing the condition of the nation. Restrictions on the press were again imposed in 1791 and 1810. Modern freedom of the press in France began with the law of 1831 asserting the liberty of the press and of bookselling which existed up to the outbreak of the World War. Political censorship was abolished in 1916. See FRANCE: 1830-1840; 1849-1851; 1916 (December).

Germany.—From 1529 to 1848 a rigid censorship existed in Germany. Nominally, liberty of discussion was established in 1848. The imperial constitution, however, gave to the Empire the power to regulate the press and the right of association. The press law of 1874 affirmed the liberty of the press, specifically stating, however, that this law was not to affect regulations made in time of war or internal disturbance. Section XIII, article 74, of the imperial constitution reads:—"Every attempt against the existence, the integrity, the security or the Constitution of the German Empire; finally, any affront offered to the *Bundesrat*, the *Reichstag*, a member of the *Bundesrat* or *Reichstag*, an authority or a public official of the Empire, while in the exercise of their calling . . . by word, writing, print . . . or other representation, shall be adjudged and punished in the several States of the *Bund* according to the laws therein existing, or which shall hereafter go into effect, by which a similar act committed against the individual State . . . is adjudged."—B. E. Howard, *German empire*, pp. 433-434.—See also GERMANY: 1900 (October 9).

Hungary.—Censorship of the press. See HUNGARY: 1825-1844.

Poland.—Censorship laws. See POLAND, CONSTITUTION OF.

United States: 1734.—Trial of John Peter Zenger. See NEW YORK: 1720-1734.

United States: 1789-1917.—As originally adopted the constitution contained no guarantee of liberty of the press or of speech. The framers of the document did not consider this necessary. Hamilton wrote: "For why declare that things shall not be done which there is no power to do? Why, for instance, should it be said that the liberty of the press shall not be restrained, when no power is given by which restrictions may be imposed? I will not contend that such a provision would confer a regulating power; but it is evident that it would furnish, to men disposed to usurp, a plausible pretense for claiming that power. They might urge with a semblance of reason that the Constitution ought not to be charged with the absurdity of providing against the abuse of an authority which was not given, and that the provision against restraining the liberty of the press afforded a clear implication that a power to prescribe proper regulations concerning it was intended to be vested

in the national government. . . . In the subject of the liberty of the press, as much as has been said, I cannot forbear adding a remark or two: in the first place, I observe that there is not a syllable concerning it in the constitution of this State [New York]; in the next, I contend that whatever has been said about it in that of any other State amounts to nothing. What signifies a declaration that 'the liberty of the press shall be inviolably preserved'? What is the liberty of the press? Who can give it any definition which would not leave the utmost latitude for evasion? I hold it to be impracticable; and from this I infer that its security, whatever fine declarations may be inserted in any constitution respecting it, must altogether depend on public opinion, and on the general spirit of the people and of the government."—A. Hamilton, *Federalist* (P. L. Ford, ed.), pp. 574-575.—*The first amendment to the constitution of the United States declares that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances."* The Sedition Act, 1798, "was intended to deal with citizens or aliens who too severely criticised the government. In its original form it was made illegal to justify the present attitude of France, or to imply that the administration acted contrary to the Constitution or to the liberties and happiness of the people. In its final shape it was made a high misdemeanor 'unlawfully to combine and conspire' in order to oppose the legal measures of the government, or in order to prevent a federal officer from executing his office, or with such purpose 'to commit, advise, or attempt to procure any insurrection, riot, or unlawful assembly, or combination.' The penalty was to be a fine not exceeding five thousand dollars and imprisonment not exceeding five years. To publish a false or malicious writing against the government of the United States, the president, or Congress with the purpose of stirring up hatred or resistance against them, or to incite any foreign nation to war against the United States, was made a misdemeanor punishable by fine of not more than two thousand dollars and imprisonment not longer than two years. . . . The Republicans held that the sedition law was unconstitutional because the federal courts had jurisdiction over those crimes only which were mentioned in the Constitution; they declared that these courts had by the Constitution no common-law jurisdiction, and they thought that this attempt to assume one was a dangerous advance in consolidating the federal government [see also U. S. A.: 1798.] The point was not settled at the time, but in 1882, after much uncertainty had existed for some time, the supreme court held that the federal courts have no common law jurisdiction in criminal cases."—J. S. Bassett, *Federalist system 1789-1801*, pp., 259, 260, 261.

In 1836 what is known as the *Gag resolution* was introduced into the House of Representatives providing for the appointment of a special committee, "under the chairmanship of Pinckney, of South Carolina, which accused the abolitionists of dangerous agitation tending to break up the Union, and recommended a resolution: 'That all petitions, memorials, resolutions, propositions or papers relating in any way or to any extent whatever to the subject of slavery or the abolition of slavery shall, without being either printed or referred, be laid upon the table and that no further action whatever shall be had thereon.' This so-called 'gag resolution' was duly adopted, May 26,

by a vote of 117 to 68; and the principle was thus laid down that no petitions on slavery should be brought to the attention of the House [see U. S. A.: 1836: Atherton gag]. When the name of John Quincy Adams was called, he cried: 'I hold the resolution to be a direct violation of the Constitution of the United States, of the rules of this House, and of the rights of my constituents.' . . . Under the practice of the House at that time the rules expired at the end of every session, but the gag resolution was easily renewed in January, 1837, by a vote of 129 to 69. When the new Congress assembled in December, 1837, resolutions of the Vermont legislature were presented asking their representatives and senators to use their influence to abolish slavery in the District of Columbia. By the doctrine of state sovereignty such resolutions had a different footing in Congress from the memorials of individuals; nevertheless, most of the southern members thereupon withdrew from the House to concert measures against further discussion of slavery in Congress. To this so-called 'Memorable Secession' Rhett, of South Carolina, proposed a special committee to report on the best way of peaceably dissolving the Union; but it finally agreed upon a more stringent gag resolution, which was passed next day by a vote of 122 to 74."—A. B. Hart, *Slavery and abolition, 1831-1841*, pp. 250-261.—The last gag resolution was abandoned in 1844.

"Whether it was possible for a person in one state to commit a crime of which other states could take cognizance, without the alleged criminal leaving his own domicile, was a question raised when abolition newspapers and other controversial material was sent to people in the southern states. These papers contained rude wood-cuts illustrating the cruel treatment of slaves, and many allusions to the injustice and illegality of slavery. In several southern cities such papers were seized in July, 1835, by self-constituted guardians of the peace, and burned before thousands of spectators. The postmaster of Charleston appealed to the postmaster of New York, to stop sending such matter; and he asked the anti-slavery societies to discontinue their use of the mails—a request which they refused to consider. The post-master-general, Amos Kendall, himself a slaveholder, declined to issue any official order to exclude matter duly mailed, but added the significant hint: 'We owe an obligation to the laws, but a higher one to the communities in which we live.' With this statement, which bears a singular kinship to 'higher law' principle of the abolitionists, the postmaster was well enough contented, and no more abolition mail was delivered in Charleston. [See also U. S. A.: 1835.] In this virtual approval of a search and censorship of the mail, Kendall was supported by President Jackson, who, in his annual message of 1835, suggested action by Congress. Calhoun introduced a Senate bill in 1836 providing that any mail matter (other than letters) touching the subject of slavery should not be delivered in any state prohibiting the circulation of such matter; and he got nineteen votes in favor of his proposal against twenty-five. Congress was held back by constitutional objections: it was to enact in advance laws not yet made by the states, and also to make as many different kinds of federal law as there were varieties of state legislation on the subject."—*Ibid.*, pp. 286, 287, 288.—"The Press was essentially free at the North, [during the Civil War] entirely so at the South, where no journals were suppressed as some had been in the Union. As the Southern papers had little news-gathering enterprise and borrowed a large part of their news

from the Northern press, they did not offend the Confederate generals as the Union generals were offended by the publications of estimates of the strength of armies or shrewd guesses of projected movements. Sometimes the Richmond journals, upon request of General Lee or the Secretary of War, refrained from publishing intelligence that might benefit the enemy, but no compulsion was employed. The right of public meeting was fully exercised in both sections, but the gatherings for free discussion were much more common at the North."—J. F. Rhodes, *History of the Civil War, 1861-1865*, p. 394.—See also PRINTING AND THE PRESS: 1861-1865.—During the Civil War the center of Copperhead agitation was in Ohio. The term "*Copperhead*," used to describe Northerners who opposed the war, originated in the fact that at a mass-meeting on May 1, 1863, the head of the Goddess of Liberty, cut out from a copper cent, was worn as a badge by many in the audience. For a violent speech delivered upon this occasion Clement L. Vallandigham was arrested and court-martialed upon orders by General Burnside. "No part of American liberty has been more jealously regarded than freedom of speech; had it come to such a pass in America that a man could no longer say what he chose? And if called to account, was it proper that the orator delivering his criticism in a part of the country not the seat of war should be seized by soldiers and tried by a court-martial? Justification for Burnside's proceeding might be sought in Lincoln's proclamation of September 24, 1862, which declared that 'During the existing insurrection, and as a necessary measure to suppressing the same, all rebels and insurgents, their aiders and abettors, within the United States, and all persons discouraging voluntary enlistments, resisting militia drafts, or guilty of any disloyal practice affording aid and comfort to rebels against the authority of the United States, shall be subject to martial law, and liable to trial and punishment by courts martial, or military commissions. This was certainly very definite; but the president's right to issue such a proclamation was gravely questioned, in particular by B. R. Curtis, who had been superseded by an act of Congress of March 3, 1863, signed by the president, according to which the proceeding of Burnside was quite too summary. Conceding that the arrest of Vallandigham was permissible (certainly in the arbitrary arrests which had taken place there was abundant precedent), the statute of March 3, 1863, made it necessary that the secretary of war should report the arrest to the Federal judge of that district; and if the grand jury found no indictment against him as giving aid and comfort to the enemy, the discharge of the prisoner was proper. In fact, the act of Burnside was an overstepping of his powers, which the administration should have discountenanced [see also U. S. A.: 1863 (May-June)]. In this crisis Lincoln showed vacillation. When, a few weeks later, Burnside suppressed the *Chicago Times*, for an offence similar to that of Vallandigham's, the president, under the pressure of such good friends of his as Lyman Trumbull and Isaac N. Arnold, and others, discountenanced the proceeding.—J. K. Hosmer, *Outcome of the Civil War, 1863-1865 (American Nation, v. 21, pp. 5-6)*.—"The clerk of the House of Representatives in 1864 writes of the suppression of newspapers as follows:

"August 16, 1861.—In the United States Circuit Court of New York the grand jury presented the *Journal of Commerce*, the *Daily News*,

the *Freeman's Journal*, and the *Brooklyn Eagle* as aiders and abettors of treason, in terms following:

" "To the Circuit Court of the United States, for the Southern District of New York:

" "The Grand Inquest of the United States of America for the Southern District of New York beg leave to present the following facts to the Court and ask its advice thereon:

" "There are certain newspapers within this district which are in the frequent practice of encouraging the rebels now in arms against the Federal Government by expressing sympathy and agreement with them, the duty of acceding to their demands, and dissatisfaction with the employment of force to overcome them. These papers are the *New York Daily* and weekly *Journal of Commerce*, the daily and weekly *News*, the daily and weekly *Day-Book*, the *Freeman's Journal*, all published in the city of New York, and the daily and weekly *Eagle*, published in the city of Brooklyn. The first named of these has just published a list of newspapers in the free States opposed to what it calls '*the present unholy war*'—a war in the defence of our country and its institutions, and our most sacred rights, and carried on solely for the restoration of the authority of the Government.

" "The Grand Jury are aware that free Governments allow liberty of speech and of the press to their utmost limit, but there is nevertheless a limit. If a person in a fortress or an army were to preach to the soldiers submission to the enemy he would be treated as an offender. Would he be more culpable than the citizen who, in the midst of the most formidable conspiracy and rebellion tells the conspirators and rebels that they are right, encourages them to persevere in resistance, and condemns the effort of loyal citizens to overcome and punish them as an 'unholy war' . . .

" "The conduct of these disloyal presses is of course condemned and abhorred by all loyal men; but the Grand Jury will be glad to learn from the Court that it is also subject to indictment and condign punishment.

" "CHARLES GOULD, Foreman.

" "New York, August 16, 1861."

(Signed by all the Grand Jurors.)

"Order of the Postmaster General

" "POST OFFICE DEPARTMENT.

" "August 22, 1861.

" "Sir: The Postmaster General directs that from and after your receipt of this letter none of the newspapers published in New York city which were lately presented by the grand jury as dangerous, from their disloyalty, shall be forwarded in the mails.

" "I am, respectfully, your obedient servant,

" "T. B. TROTT, Chief Clerk.

" "TO THE POSTMASTER, NEW YORK CITY."

"*Philadelphia, August 22*.—On the arrival of the New York train this morning Marshal Millward, and his officers, examined all the bundles of papers and seized every copy of the *New York Daily News*. The sale of this paper is totally suppressed in this city. . . .

"1864, May 19.—By order of the Secretary of War, the offices of the *Journal of Commerce*

and the *World*—in which papers had appeared a forged proclamation of the President for 400,000 troops—were seized by the military authorities and held for several days. This led to these proceedings:

“Gov. Seymour’s Letter to the District Attorney

““STATE OF NEW YORK,
““EXECUTIVE DEPARTMENT,
““ALBANY, MAY 23, 1864.

““TO A. OAKLEY HALL, ESQ.,

““District Attorney of the County of New York:

““Sir: I am advised that on the 10th inst., the office of *The Journal of Commerce* and that of *The New York World* were entered by armed men, the property of the owners seized, and the premises held by force for several days. It is charged that these acts of violence were done without due legal process, and without the sanction of state or national laws.

““If this be true the offenders must be punished.

““In the month of July last, when New York was a scene of violence, I gave warning that ‘the laws of the State must be enforced, its peace and order maintained and the property of its citizens protected at every hazard.’ . . . The declaration I then made was not intended merely for that occasion or against any class of men. It is one of an enduring character, to be asserted at all times and against all condition of citizens, without favor or distinction. . . .

““Unless all are made secure in their rights of person and property, none can be protected. If the owners of the above-named journals have violated State or national laws, they must be proceeded against and punished by those laws. Any action against them outside of legal procedures is criminal. At this time of civil war and disorder, the majesty of the law must be upheld or society will sink into anarchy. Our soldiers in the field will battle in vain for constitutional liberty if persons or property, or opinions, are trampled upon at home. We must not give up home freedom, and thus disgrace the American character while our citizens in the army are pouring out their blood to maintain the national honor. They must not find when they come back that their personal and fire-side rights have been despoiled.

““Very respectfully yours, etc.,

““HORATIO SEYMOUR.””

—E. McPherson, *Political history of the United States of America, during the great rebellion*, pp. 188, 192.

Since the Civil War the government has assumed the power to censor in certain limited ways; “the federal government excludes from the mails matter which the post-office authorities deem dangerous to morals, such as obscene literature and lottery mail.”—A. B. Hart, *Slavery and abolition*, p. 288. —On the whole, however, up to the entrance of the United States into the World War, freedom of speech and of the press had not been interfered with to any great extent by the government. James Bryce speaks of “unbounded freedom of discussion. Every view, every line of policy, has its fair chance before the people. . . No one can say that audience has been denied him, and comfort himself with the hope that, when he is heard, the world will come round to him. Under a repressive government, the sense of grievance and in-

justice feeds the flame of resistance in a persecuted minority. But in a country like this, where the freedom of the press, the right of public meeting, and the right of association and agitation have been legally extended and are daily exerted more widely than anywhere else in the world, there is nothing to awaken that sense. He whom the multitude condemns or ignores has no further court of appeal to look to. Rome has spoken. His cause has been heard and judgment has gone against him.”—J. Bryce, *American commonwealth*, p. 353.

World War: England.—France.—Germany.—New Zealand.—United States.—On August 8, 1914, the British House of Commons passed the Defense of the Realm act. “Orders in council have been made under this act which prohibit, in the widest possible terms, any attempt on the part either of aliens or of British subjects to communicate any information which ‘is calculated to be or might be directly or indirectly useful to an enemy’; and any person offending against this prohibition is liable to be tried by court-martial and sentenced to penal servitude for life.”—British Home Office, *Communication of Oct. 9, 1914*.—See ENGLAND: 1914-1918: Defense of the Realm Acts.—News censorship in France was strictly enforced (see FRANCE: 1914-1915). The papers contained little but records of events and daily progress of campaigns, partly owing to the censorship, partly due to the fact that most of the journalists and writers were in the army, and paper was scarce. In Germany, according to the provisions of its constitution, the imperial press law of 1874 was suspended. In time of war the kaiser, being commander-in-chief of the imperial forces, had the power to declare martial law, and under such martial law, the press laws and all acts concerning the right of assembly and association could be disregarded. Censorship was abolished by the German revolution. The new constitution of August, 1919, provides that “the secrecy of letter and other post, telegraph, and telephone services will remain inviolate. . . . Exceptions may be permitted only by national law. . . . Every German has a right within the limits of the general laws to express his opinions freely by word, in writing, in print, by picture, or in any other way. No relationship arising out of his employment may hinder him in the exercise of this right, and no one may discriminate against him if he makes use of this right. There is no censorship, although exceptional provisions may be made by law in the case of moving pictures. . . . All Germans have the right of meeting peaceably and unarmed without notice or special permission. Previous notice may be required by national law for meetings in the open, and such meetings may be forbidden in case of immediate danger to the public safety. . . . Every German has the right to petition or to complain in writing to the appropriate authorities or to the representatives of the People.”—*Constitution of the German Commonwealth, Articles 34, 117, 118, 123, 126*, translated by W. B. Munro and A. N. Holcombe in v. 2, No. 6 of the *World peace foundation’s pamphlets*, pp. 362, 383, 385.

“The leader of the Labor Party has drawn an important statement from the Attorney-General, Sir Francis Bell, on the policy of the New Zealand Government in respect to sedition and free speech. There has been some uneasiness, even among people who do not belong to the Labor Party, over the censorship established on books by the government; certain books which can be bought in the ordinary way in England and Australia, are banned in New Zealand. One of these is ‘Red Europe,’ a book by Frank Anstey, a well-known Socialist

member of Parliament in Australia. It has been feared that this censorship oversteps the bounds of traditional British freedom in the matter of free speech. Matters were brought to a head, so far as the Labor Party is concerned, by the recent conviction of a Socialist in Wellington for having sold copies of The Communist Program and other pamphlets. In convicting this man the magistrate pointed out that the literature in question plainly advocated the use of violence by workers to gain their ends. The leader of the Labor Party protested to the Attorney-General, contending that the conviction was an infringement of the right of free thinking, and asking whether the government proposed to prosecute men who read and circulated such books. Sir Francis Bell's reply is an important definition of the government's attitude. He agrees entirely with the contention that there should be full freedom to read every view point; but accuses the leader of the Labor Party of evading the real issue, which is the unlawful advocacy of violence.

"Each of the documents which the offender was found to have distributed advocated in the plainest manner bloodshed and violence as the method by which its propaganda was to be carried into effect. . . . I do not suggest that you are one of those who instigated and affirmed the distribution and circulation of literature advocating such methods. But your words can only mean that it is not criminal to advocate murder as a method of attaining social and political conditions or constitutional change. That is the issue between the government of a civilized country and offenders of the class for whom you ask that the prerogative of pardon should be exercised." Sir Francis Bell points out that all war restrictions in freedom of speech have been repealed, save the law prohibiting advocacy of violence or lawlessness. "So long as men refrain in print or language from inciting to violence or lawlessness, they are absolutely free to hold and express any opinions, and to advocate any change, however revolutionary, in the Constitution, or in the form of government. 'Advocacy of Communism, Socialism or a republic is not an offense.'"—*Christian Science Monitor*, July 5, 1921.

In the United States the government attitude toward the press and free speech in war time found expression in the Espionage act. "Almost immediately on the entrance of the United States into the war, it became apparent that special provision should be made, on the one hand, to control the giving of information to the public regarding matters of military import, and, on the other, to make known in an authoritative manner such information as it was desirable that the public should have. On April 13, 1917, the Secretaries of State, War, and the Navy addressed a joint letter to the President calling this matter to his attention and suggesting that there be created a body to be known as the Committee on Public Information which should have these two functions of censorship and publicity in charge. Acting on this recommendation, the President, by executive order issued April 14, 1917, provided for the creation of this Committee, specifying that it should consist of the Secretary of State, the Secretary of War, the Secretary of the Navy, and a civilian who should act as the executive head of the Committee. George Creel was named as the civilian member. In describing the work of this Committee it is well to distinguish between its two functions as a censorship board and as an organ of publicity. In respect to the first it should be noted that the functions of the Committee related wholly to the control of publications inside the United States.

It had no duty in respect to the censoring of communications passing between the United States and other countries, the control of such communications being vested in a Censorship Board which will be hereafter described. The situation as regards the control of the domestic press at the outbreak of the war was one in which the Government not only had little or no positive powers to control such publications, but was loath to seek enlarged powers because of the strong adherence of the American people to the principle of the freedom of the press. The Government therefore decided that such measures of control as it would seek to exercise should be in the way of making an appeal to the press of the country voluntarily to refrain from the publication of information that might be of value to the enemy or embarrass the Government in its operations at home. To the committee on Public Information was entrusted the duty of making this appeal to the press and of taking such steps as were in its power to see that its appeal was met. The Committee accordingly prepared and issued to the press a carefully drafted statement setting forth the character of the information that the Government desired should not be given publicity, and the rules that should be observed by the press in giving information of a military nature or in commenting upon such news. In this statement it was carefully set forth that the regulations thus formulated were not of a legally binding character, but were requests which it was hoped that the press would voluntarily observe. The statement thus said: "The Committee on Public Information is without legal authority or moral right to bring any form of pressure on publications to enforce observance of these requests. These paragraphs embody what the military and naval experts of our country hold to be the minimum that can be asked at this time for the protection of our soldiers and sailors and the success of our military plans. For their observance the Government relies implicitly upon the loyalty and judgment of the individual writer and publisher. . . . These requests go to the press without larger authority than the necessities of the war-making branches. Their enforcement is a matter for the press itself." The Committee, or its Chairman, also participated in other branches of the work of controlling the imparting of information that might be of use to the enemy through the fact that the Chairman of the Committee was a member of the Censorship Board to be hereafter described, and that the Committee was made the agency or clearing house to relate the activities of the military and naval classes to the other departments of the Government, and to the public. . . .

"All Governments in time of war have to take steps to prevent the disclosure to the enemy of information regarding their military plans and operations. They have also to take precautions against the spreading of misinformation, seditious utterances, the publication of seditious matter, or any action having for its purpose or effect to lend aid and comfort to the enemy, or to embarrass the Government in its plans, or to lead the people to do other than give a full and hearty support to the Government and to the enforcement of all laws enacted by it. In no war in which we have ever been engaged has action of this kind been more necessary than in the case of the Great War. This was due to a combination of circumstances. We had in our midst, in the first place, millions of persons who had been born in the countries with which we were at war or were children of parents who had been born there and

who had a natural sympathy for those countries. Many of these persons had never foresworn allegiance to those countries and were thus aliens. Many also were unable to read and write the English language and had thus been unable to fully enter into the life and aims of their new country. There was a large and influential press published in the enemy's language. There were also in the country a certain number of persons adhering to the tenets of socialism and pacifism who could not be counted upon to support the Government with loyalty even if they did not seek positively to embarrass it in its war measures. Most important of all, however, was the fact that the enemy, even before our entrance into the war, had organized a spy service in this country on a most elaborate scale, had taken steps through his accredited diplomatic and consular representatives for the destruction of ammunition plants, the promotion of labor disturbances, and interference in every way possible in our industrial life, and had in full force a propaganda having for its purpose to promote his interests and do damage to our own."—W. F. Willoughby, *Government organization in war time and after*, pp. 33-35, 39, 40.—"The chief law under which freedom of speech and of the press was restricted during the war was the *Espionage Act of June 15, 1917*. The main provisions which relate to the subject under discussion are as follows: 'Whoever, when the United States is at war, shall willfully make or convey false reports or false statements with intent to interfere with the operation or success of the military or naval forces of the United States or to promote the success of its enemies and whoever, when the United States is at war, shall willfully cause or attempt to cause insubordination, disloyalty, mutiny, or refusal of duty, in the military or naval forces of the United States, or shall willfully obstruct the recruiting or enlistment service of the United States, to the injury of the service or of the United States, shall be punished by a fine of not more than \$10,000 or imprisonment for not more than twenty years, or both. . . . Whoever harbors or conceals any person who he knows, or has reasonable grounds to believe or suspect, has committed, or is about to commit, an offense under this title shall be punished by a fine of not more than \$10,000 or by imprisonment for not more than two years, or both. . . . Whoever, in relation to any dispute or controversy between a foreign government and the United States, shall willfully and knowingly make any untrue statement, whether orally or in writing, under oath before any person authorized and empowered to administer oaths, which the affiant has knowledge or reason to believe will, or may be used to influence the measures or conduct of any foreign government, or of any officer or agent of any foreign government, to the injury of the United States, or with a view or intent to influence any measure of or action by the Government of the United States or any branch thereof, to the injury of the United States, shall be fined not more than \$5,000 or imprisoned not more than five years, or both.'"—*American Journal of International Law, Supplement, 1917, v. 2, pp. 189-190*.—In an executive order of October 12, 1917, President Wilson designated the postmaster-general as the official to censor the foreign languages press. "I Hereby vest in the Postmaster General the executive administration of all its provisions (except the penal provisions) of Section 19 of the Trading with the Enemy Act relating to the printing, publishing, or circulation in any foreign language of any news item, editorial, or other printed matter respecting

the government of the United States, or of any nation engaged in the present war, its policies, international relations, the state or conduct of the war or any matter relating thereto, and the filing with the Postmaster at the place of publication, in the form of an affidavit of a true and complete translation of the entire article containing such matter proposed to be published in such print, newspaper or publication, and the issuance of permits for the printing, publication and distribution thereof free from said restriction. And the Postmaster General is authorized and empowered to issue such permits upon such terms and conditions as are not inconsistent with law and to refuse, withhold or revoke the same."

"It should be noted in connection with the above that the censoring of communications and the control of the press as thus provided for relate only to foreign communications and to the printing, publication, and distribution of matter in a foreign language. No provision was made for the censoring of internal communications, and the control over the press in the English language remained in the voluntary basis as administered by the Committee on Public Information, subject, however, to the right of the Postmaster-General to refuse the right to the use of the mails to publications not complying with the provisions of the law."—W. F. Willoughby, *Government organization in war time and after*, pp. 47, 48.—See also ESPIONAGE ACT; SUPREME COURT: 1917-1921; and U. S. A.: 1917-1919; Effect on the United States, of the war.—Mails, cables and other means of communication were restricted as well as the press, by governments. "Great Britain at the outset of the war established a most efficient mail censorship which not only stopped all mail destined for, or coming from, enemy countries, but also examined mail of neutral origin and destination. The latter action caused many protests, notably from Sweden and the United States. When the United States entered the war, the government assumed control over all means of communication—radio, telegraph, telephone, cable and mail. The censorship of cables was under the Secretary of the Navy. The Espionage Act contained the following provision: 'Section 1. Every letter, writing, circular, postal card, picture, print, engraving, photograph, newspaper, pamphlet, book or other publication, matter or thing, of any kind, in violation of any of the provisions of this Act is hereby declared to be non-mailable matter and shall not be conveyed in the mails or delivered from any post office or by any letter carrier: *Provided*, that nothing in this act shall be so construed as to authorize any person other than an employee of the Dead Letter Office, duly authorized thereto, or other person upon a search warrant authorized by law, to open any letter not addressed to himself. Sec. 2. Every letter, writing, circular, postal card, picture, print, engraving, photograph, newspaper, pamphlet, book, or other publication, matter or thing of any kind, containing any matter advocating or urging treason, insurrection, or forcible, resistance to any law of the United States, is hereby declared to be non-mailable. Sec. 3. Whoever shall use or attempt to use the mails or Postals Service of the United States for the transmission of any matter declared by this title to be non-mailable, shall be fined not more than \$5,000 or imprisoned not more than five years, or both. Any person violating any provision of this title may be tried and punished either in the district in which the unlawful matter or publication was mailed, or to which it was carried by mail or delivery according to the direction thereon, or in which it was caused

to be delivered by mail to the person to whom it was addressed.'—*American Journal of International Law, Supplement*, 1917, v. 2, p. 197.—The Trading-with-the-Enemy act of October 6, 1917, "among other things, prohibits any person—not duly authorized so to do, 'to send or take out of, or bring into, or attempt to send, or take out, or bring into the United States any letter or other writing or tangible form of communication, except in the regular course of the mail,' or 'to send, take or transmit, or attempt to send, take, or transmit out of the United States, any letter or other writing, book, map, plan or any paper, picture, or any telegrams, cablegrams or wireless message, or other form of communication intended for or to be delivered directly or indirectly to an enemy or ally of enemy,' except as such communication had been authorized by the President or such officer as the President might direct. It further conferred upon the President complete power to censor all communications of every sort passing between this country and any foreign country. . . . By executive order dated October 12, 1917, the President designated the various agencies which should have charge of the administration of the several features of the Trading-with-the-Enemy Act. For the censoring of news coming from or going to foreign countries this order created a body known as the Censorship Board, to be composed of representatives of the Secretary of War, the Secretary of the Navy, the Postmaster-General, the War Trade Board and the Chairman of the Committee on Public Information. . . . Following is a copy of the provisions of this order: 'XIV. I hereby establish a Censorship Board to be composed of representatives respectively of the Secretary of War, the Secretary of the Navy, the Postmaster General, the War Trade Board and the Chairman of the Committee on Public Information. XV. And I hereby vest in said Censorship Board the executive administration of the rules, regulations and proclamations from time to time established by the President under sub-section (d) of section 3, of the Trading-with-the-Enemy Act, for the censorship of communications by mail, cable, radio or other means of transmission passing between the United States and any foreign country from time to time specified by the President, or carried by any vessel, or other means of transportation touching at any port, place or territory of the United States and bound to or from any foreign country. XVI. The said Censorship Board is hereby authorized to take all such measures as may be necessary or expedient to administer the powers hereby conferred.'—W. F. Willoughby, *Government organization in war time and after*, pp. 45-47.—Within a few weeks of the passage of this act the executive postal censorship committee started its work in New York City. Beginning with fifty or sixty censors, the organization at its height contained over 700 clerks and translators. Absolute secrecy prevailed. Valuable information was obtained from the mail examined and many plots of enemy agents were frustrated. The committee worked in cooperation with the army and navy intelligence sections, the war trade board, the post office, and the cable censorship.—See also U. S. A.: 1917 (Oct.): Trading with the enemy act.—"The continuance of the censorship of foreign mails and cable and wireless communications after the signing of the armistice gave rise to widespread protests. Although the censorship of cables by the United States was in time discontinued, the fact that foreign Governments still censor communications at the other end has prevented this means of communication from being

freely used as in normal times."—W. F. Willoughby, *Government organization in war time and after*, p. 49.—See also WORLD WAR: Miscellaneous auxiliary services: III. Press reports and censorship.

In the United States, news, cable, postal, and telegraph censorship over press communications was officially removed, November, 1918. The censorship of marine news was modified during the same month, while ship news was still banned. In April of the following year, England turned over the censorship of north European mail to the United States authorities and lifted her own censorship in June of the same year. Italy removed her censorship, July, 1919. The French news censorship was ended by presidential decree, October, 1919.

CENSORSHIP BOARD, United States. See CENSORSHIP: United States.

CENSUS, periodical enumeration of the inhabitants of a country; sometimes including resources and industries. In ancient times the term was applied to the enumeration of properties of all kinds mainly for purposes of taxation and warfare.

Ancient.—**Biblical.**—**Greek.**—**Roman.**—At the time of the Exodus all males over twenty among the children of Israel were counted to discover the fighting strength of the nation. Censuses were taken by David and by Solomon, and later during the Babylonian captivity a record of the population was kept. The Greek census was given form by the laws of Solon. "He established a constitution and made laws besides. . . . He divided the population into four census classes just as it had been divided, into pentacosimedimni, knights (hippeis), zengitae, and thetes. He assigned the offices to be filled from the pentacosimedimni, knights and zengitae, namely the (9) archons, the treasurers, the commissioners of contracts, the eleven, and the colacretae, distributing them among the several classes according to their property ratings. To the thetic class he granted a share in the assembly and the popular courts only. A pentacosimedimnus was one who produced from his own estate five hundred measures, wet and dry together, a knight three hundred measures, but as some say, one who could support a horse. . . . The zengitae were those who produced two hundred measures of both kinds, and the rest were thetes who had no right to any magistracy. Hence even now when the question is asked of one who is to be taken by lot for any office, what census class he belongs to, no one answers, the thetic."—Aristotle, *Constitution of the Athenians*, quoted in G. W. Botsford and E. G. Sihler, *Hellenic civilization*, pp. 143-144.—When Rome conquered Greece "the local municipal administration of the sep-

arate cities was allowed to exist, but, in order to enforce submission more readily, their constitutions were modified by fixing a census which restricted the franchise in the democratic commonwealths."—G. Finlay, *History of Greece*, v. 1, pp. 21-22.—"In ancient Rome there was a Registration Department for taking the Census. The Census at Rome was a numbering of the Roman people and also a valuation of their property. It was held in the Campus Martius after the year B.C. 432. Every Roman citizen was obliged, upon oath, to give in a statement of his own name and age, and of the name and age of his wife, children, slaves, and freedmen, if he had any. The punishment for a false return was, that the individual's property should be confiscated, and he himself scourged and sold for a slave. Taxation depended on the results of the Census, and was, in fact, its main object; many kinds of property were excepted, while, on the other hand, some sorts of property were assessed at several times their value. Constant changes were made by successive Censors in the valuation of taxable property. It appears from a passage in Livy (vi, 27) that the Census also showed the amount of a man's debts and the names of his creditors. The Census was held at first by the Kings, afterwards by the Consuls, and from B.C. 442 by two magistrates called Censors (Censores), who were appointed every five years. The Census was not taken with strict regularity. The usual interval, commonly called a lustrum (lustrum), was five years. . . . From the foregoing it will be seen that the Census was a regular Roman institution, one of the principal duties of the Censor being to enumerate the citizens (not including the proletariat) every five years (Cicero, 'De Leg.' book iii, c. 3). The Roman enumeration was not of persons only, but also of property. In this way, the Census of Rome was a quinquennial register prepared partly for purposes of assessment, and classification graded accordingly."—G. J. Bisset-Smith, *Census*, pp. 3-5.—Under the empire the Roman census reached its perfection. "The census was so perfect, that throughout the wide extent of the Roman empire every private estate was surveyed. Maps were constructed, indicating not only every locality possessing a name, but so detailed that every field was measured. And in the register connected with the map, even the number of the fruit-trees in the gardens, the olive-trees in the groves, and the vines in the vineyards, was set down, the cattle were counted, and the inhabitants, both slaves and free, were individually inscribed in this register. Not only every Roman province, and especially every Roman colony, but even every municipality, was surveyed with this extreme accuracy. A plan of the district was engraved on brass, and deposited in the imperial register-office; while copies were placed in the hands of the local administrations and in the provincial archives. The fact that these plans were engraved on plates of brass is mentioned by Hyginus, and the practice of multiplying copies of these brazen plates on linen is incidentally recorded in the Theodosian code. Such were the principles on which the Roman census was constructed, and these principles were first applied to Judaea in the time of Augustus. St. Luke gives us some interesting information concerning the manner of framing the personal registers of the census. He shows us the minute attention paid by the Roman administration to all statistical details, and supplies us with the means of contrasting the personal importance of each citizen in ancient political communities with the utter insignificance of the social position of a private in-

dividual in modern states. The words of the Evangelist are: 'And it came to pass in those days, that there went out a decree from Caesar Augustus, that all the world should be taxed. (And this taxing was first made when Cyrenius was governor of Syria.) And all went to be taxed, every one into his own city. And Joseph also went up from Galilee, out of the city of Nazareth, into Judaea, unto the city of David, which is called Bethlehem (because he was of the house and lineage of David), to be taxed.' The Pandects also afford evidence that the inspection over every portion of property was as exact and minute as the control which was exercised over each individual citizen. And Livy informs us that this administrative organization was a portion of the Roman constitution, and had been applied in all its details to the allied cities, and among the Latins, as early as the year B.C. 173. The mass of statistical information collected by the great census of Augustus was of such importance, that the Emperor himself was induced to prepare an abstract of its results, which was presented to the Senate by his successor Tiberius, and regarded as one of the most valuable monuments of his government. The registers of the census were still farther improved in the reigns of Diocletian and Constantine; and the revision of taxation based on these registers was established every fifteenth year, as fundamental law of the empire, and formed the cycle of indictions. The importance of the general survey and registration of property over the whole Roman empire has not been sufficiently appreciated by modern historians. nor has its effect on the events of Roman history been fully developed. It is not one of the least of the merits of the sagacious Niebuhr that he was the first to point out the great importance of the Agrimensores, or corps of civil engineers; and the necessity of studying their duties in order to enlarge our knowledge of the Roman administration. The business of the Agrimensores was to measure lands and maintain boundaries, and a map of their survey was deposited in the imperial archives, while a copy was placed in those of each colony. During the decline of the empire, and consequently in the time of Constantine, they formed a numerous and respectable class. Many of them were men both of rank and science. The name of the Surveyor-general of Augustus, Balbus, has been preserved by history. Frontinus, who mentions it, gives us some notices concerning the survey. The limits of the provinces and the boundaries of the municipalities and cities were determined and recorded in the books of Augustus and Nero; and Balbus, in the time of Augustus, compiled a commentary on the forms and admeasurements of the census, in which the condition of landed property throughout the empire was registered and explained. The exactitude of the details in this early survey was so great, that they were applicable to fixing questions relating to private property; and excited the admiration of posterity as late as the time of Cassiodorus, who cites its minuteness as enabling each proprietor to know his own rights with certainty, about the middle of the sixth century."—G. Finlay, *History of Greece*, pp. 470-472.—See also *COMITIA CENTURIATA*; *STATISTICS*: Early records and census taking.

Medieval.—Censuses of the middle ages were few and far-between, and on the whole can scarcely be dignified by that name. Charlemagne's Breviary and the Domesday Book of William the Conqueror stand practically alone as systematic efforts to enumerate the resources of those respective kingdoms. "The old haphazard method of rating which

had been in vogue since Ethelbred's day was abandoned, and by a careful survey of the kingdom a businesslike attempt was made to get at the actual wealth and resources of each region. This important work, the famous Domesday Survey, was begun in 1085. Commissioners were sent forth into every share of the kingdom to collect information on oath as to the number of Manors or townships, the whole number of hides, the names of those who held lands, their value, the population free and unfree, and the number of cattle, sheep, and swine upon each estate. Englishmen cried out against the unheard-of inquest. 'It was a shame,' they said, 'to pry into each man's matters.'—B. Terry, *History of England*, p. 171.—See also ENGLAND: 1085-1086.

Modern European.—Origin.—Sweden.—In England.—In Russia.—In other continental countries.—The census in Sweden grew out of the careful keeping of the church records and may be definitely dated from the law of 1686. "The keeping of church records began comparatively late in Sweden. The first episcopal ordinance on the subject was issued in 1608, for the archiepiscopal diocese, and merely prescribes the keeping of baptismal and marriage registers. The keeping of church records seem to have received an impulse in Europe with the Reformation; as in Sweden, at the beginning of the seventeenth century, the chief importance was attached to the baptismal registers—which were intended, as we are especially told, as a protection against the Anabaptists. . . . Specially valuable is the information given as regards causes of death (epidemics, etc.) in some of these older church registers (before 1686). As those who fell in war are usually missing in the burial registers, however, the figures relating to mortality in the years of war are seriously incomplete. It is all the better, therefore, that from about 1630, these records can generally be supplemented from the *rolls of the killed* recorded by parishes in the *Military Archives*, which also give information regarding the date and the battle—thus forming what is assuredly a perfectly unique source of information. Unfortunately, the corresponding series in the Naval Archives are not of the same value. After the Ecclesiastical Law of 1686 established in a statutory form for the whole kingdom—still valid in essentials—a system of ecclesiastical record-keeping which was found locally here and there somewhat earlier, we have a tolerably uniform set of demographical statistics for the whole country. . . . The official system of statistics in Sweden can trace its origin so far back as 1749, when there was established the so-called Tables Archive (*Tabellverket*) which intended the collection, from all the parishes in the kingdom, of information concerning births, marriages, deaths and the causes of death, and also concerning the number of the inhabitants of the country, the increase or decrease of the population, and its classification according to sex, age, civil status, occupation, etc. At the same time, the diocesan authorities were enjoined, in accordance with the Ecclesiastical Law, to see to it that the clergy kept correct registers referring to catechetical meetings, both children and adults, with the specification of age, and that those who were baptised or who married, died or moved elsewhere should immediately be entered in their respective columns so that the incumbent should be able in some few hours to make out the prescribed tables. . . . The Tables Archive of 1749 came into existence with the interested co-operation of the Academy of Sciences—which, ever since its establishment just ten years previously, seems to have

had its attention directed on the demographical statistical material accumulated in the church registers. . . . In 1756, the compilation of an abstract of the tables was entrusted to a special Tables Archive Commission, which should seem to be justly described as the *oldest statistical office in the world*: it continued to work for more than a hundred years. . . . The general population table of 1749 should seem to merit the name of the *oldest census in the world*. Information as to the number of the population was rendered yearly until 1751 (inclusive), every three years between 1751 and 1775, and from 1775 to 1860 every five years. Even though not a few errors have crept both into the parish-tables and into the tabular abstracts (in particular into the oldest ones), yet these population tables are to be regarded as perfectly unique, not only for their own time but for much later times, in respect both to reliability and wealth of detail; this holds good in particular about the information regarding ages. They form an epoch in the population statistics not only of Sweden but of the whole world."—*Official Statistics (Sweden Historical and Statistical Handbook, pt. 1, pp. 219, 220, 221)*.—Population records began definitely in England with the mortality bills of 1592. On them Sir William Petty based his work on economics in 1672. In 1753 a bill introducing the census into England was defeated in Parliament. The growth of economic thought during the latter half of the Eighteenth century gradually dissipated the prejudice against the census. "The Bill 'for taking account of the population of Great Britain, and of the increase or diminution thereof,' introduced into the House of Commons on 20th November, 1800, received the Royal Assent on 31st December. Overseers of the poor (or substantial householders) in every parish; township, or place were required by the Act of 1800 to take an account of the actual number of people present therein on the Census day in 1801. It is not necessary to do more than allude to the strong objections raised to the first Census Bill. Probably much of the antipathy could be traced to the feeling that the Census might be connected with increased taxation, the Roman Census being followed by the levying of taxes, and the practical British mind not yet understanding the administrative, legislative, and social uses of the national numbering authorised by the first Census Act. . . . At the Census of 1821 the vital question of Age was tentatively and guardedly introduced. Possibly, however, because the returns were incomplete by some 10 per cent. in 1821, the inquiry as to ages was omitted in 1831. But there was considerable amplification in the question relating to Occupation. Otherwise, the Census of 1831 did not differ materially from its predecessors in the particulars required and in the machinery for collection. . . . From 1841 onwards the Census Schedule has been utilised; and at the same time the question as to Age was re-introduced, and there was also added a new query, namely, 'Where Born?' Like the query as to Age, this question links up the Census with the Registers of Births, which answer both queries in every case since the introduction of Compulsory Registration, which came into force in England in 1837 and in Scotland in 1855. . . . Large undertakings cannot well secure arithmetical exactness. But the Census of 1851 aimed at exactitude. . . . Statistics of Parishes and Parliamentary and Municipal Burghs were exhibited at previous Censuses; but in 1851 details were given also of other large towns in England and Scotland, and of all the ecclesiastical districts and new ecclesiastical parishes which had

during the previous forty years been created in England and Wales. The Registrar-General enjoined on all concerned the necessity for exactitude in replies; and the Census Report of 1851 is written in a literary style superior to what is found in older official publications. . . . Ireland has always had a separate Act. Up to 1860 Scotland was included with England. But a Registrar-General was appointed for Scotland in 1855; and in 1860 separate Acts were passed for England and Wales and for Scotland; although in later Censuses there has been a reversion to the practice of including Great Britain in one Act, with a view to common consultation and possible uniformity in the particulars collected and their tabulation. . . . The value and the importance of the Age and the Occupation Tables were fully realised at the eighth Census. It had been seen in 1861 that collation and comparison were possible with the Death Registers in determining Occupational Mortality; the Occupations combined with Ages appearing in the Census Reports. . . . The Census Schedule continued with its eight or nine columns much the same until 1901. . . . At the Census of 1901, new subjects were introduced [see also ENGLAND: 1901]. But publication of the results was speeded up by the issuing of the results in Counties; this separate County publication was adopted in Scotland in 1917. . . . The fresh feature in the Census of 1911 was an inquiry into the fertility of marriage. Duration of marriage and number of children born were stated in the Schedule, and the number of those who had died. In 1921 there is asked simply the number and ages of all living children under sixteen years of age. . . . The British Census has never yet attempted anything in the direction of a record of possessions or what a man 'may be worth'; although the more enterprising officials of Australia and the United States, as examples, endeavour to obtain information in detail as to the property and possessions of the persons enumerated. . . . Fresh features in the measure passed on 16th August, 1920, give permanence to the Census Office, and power to ask for a Census every five years. Among the excellent effects of these improvements should be a more general utilisation of the Census information and a closer co-ordination of Census *data* with the relative information obtained from other Government Departments, such as Agriculture, Trade, Labour, and Fisheries, and with the vital statistics issued (like the Census Reports), from the office of the Registrar-General. . . . This act has been made perpetual. Henceforth, by section 1 of the Statute, it shall be lawful for his Majesty, by Order-in-Council, from time to time to direct that a Census shall be taken for Great Britain, or for any part of Great Britain. . . . An Imperial Census of the whole Empire has, however, been carefully planned and projected. An attempt in this direction made in 1871 had only moderate success. But more recent efforts, as in 1891, were less incomplete; and the Imperial Census of 1921 anticipated to be a very marked advance upon all its predecessors, the subject having received very thorough consideration in 1920 at the Imperial Statistical Conference held in London.—G. T. Bisset-Smith, *Census*, pp. 48-49, 68-76, 3-5.—In Russia counts of males were made at irregular intervals in very early days. In 1722 a ukase of Peter the Great ordered a census every twenty years, and in 1796 a central census bureau was established. "All male peasants in every part of the empire are inscribed on census lists, which form the basis of direct taxation. These lists are revised at irregular intervals and all males alive at the time of revision from the new-born babe

to the centenarian are duly inscribed. Each commune has a list of this kind, and pays to the Government an annual sum proportionate to the number of names which the list contains or in popular language, according to the number of 'revision souls.' During the intervals between the revisions the financial authorities take no notice of the births and deaths. A commune which has a hundred male members at the time of the revision may have in a few years considerably more or considerably less than that number, but it has to pay taxes for a hundred members all the same until a new revision is made of the whole Empire. . . . The census-list determines how much land each family will enjoy and the existing tenures are disturbed only by the revisions which take place at irregular intervals. Since 1719 eleven revisions have been made, the last in 1897. The intervals varied from six to forty-one years."—D. M. Wallace, *Russia*, pp. 111-113.—In France the census began after the Revolution although Colbert compiled one in 1670. The first census in Prussia was taken in 1805. In Austria a bureau was established in 1828 though rough counts had been taken earlier for military purposes. Belgium took her first census in 1833, while the United States was independent of all these origins.—See also STATISTICS: Early records and census taking.

United States.—"The United States census traces its lineage back to the Constitution. It is this fact which awakened the admiration of that French economist who, writing in the first half of the nineteenth century, declared that the United States presented in its history a phenomenon which had no parallel, namely, that of a people who instituted the statistics of their country on the very day when they founded their Government, and who regulated in the same instrument the census of the citizens, their civil and political rights, and the destinies of the nation. This enthusiastic tribute to the wisdom of the fathers was not altogether appropriate. There were some eminent statisticians among the framers of the Constitution, but they were not thinking of statistics or of the interests of statistical, historical, or sociological science when they introduced in that instrument a provision that there should be an enumeration of the population of the United States within three years after the first meeting of Congress and every ten years thereafter. The connection makes it perfectly clear that the purpose of this provision was purely political. A count of population was an essential feature of the form of government which was established, since population was to be the basis of the apportionment of representatives and direct taxes among the several States composing the Union. . . . From the standpoint of statistics, the fathers, when they adopted the constitutional provision for a census, builded better than they knew. Even the First Census, taken in 1790, went somewhat beyond the mere constitutional requirements and introduced a certain amount of detail not essential to the apportionment [see U. S. A.: 1790: First Census]. The distinction that was made between slaves and free persons, of course, was essential, the slaves being those 'other persons' of whom only three-fifths were to be counted in determining the apportionment. But going beyond this, the Congress which enacted the law for the First Census introduced the distinction of sex and color in the enumeration of the free population, and having in view, probably, the importance of determining the military strength of the newly created nation, introduced an age distinction—under 16, and 16 and over—in the enumeration of the free white male population. At

the next census, that of 1800, the age classification was given in more detail, comprising five age classes . . . and this classification was applied to free white females as well as free white males [see U. S. A.: 1800]. The census of 1810 conformed exactly to that of 1800 [see U. S. A.: 1810]. But in 1820 [see U. S. A.: 1920 Census] another advance was made in direction of a more complete and scientific census. An age and sex classification was introduced for the slave and free colored population which had hitherto been enumerated without distinction of either age or sex. This census asked also for the number of unnaturalized foreigners, an indication that the subject of immigration was already beginning to attract attention. It included, furthermore, the rudiments of an occupation census, enumerating the number of persons engaged in agriculture, in manufactures, and in trade and commerce. The occupation question was not repeated at the census of 1830. [See U. S. A.: 1830: Fifth census.] The age classification was given in greater detail than before, and questions were introduced regarding the number of deaf and dumb and blind. At the census of 1840 the occupation question reappeared with greater detail. It asked for the number of persons engaged in mining, agriculture, commerce, manufactures and trade, navigation of the ocean, navigation of canals, lakes, and rivers, and learned professions and engineering. The question as to the number of unnaturalized foreigners which had been included in the two preceding censuses was not repeated. To the defective classes previously enumerated, viz. the deaf, dumb, and blind, there was now added the insane. Questions were introduced in regard to the number of colleges and schools of different grades and number of scholars. This census also marks the first introduction of an illiteracy question, by asking for the number of white persons over 20 years of age in each family who could not read and write [see U. S. A.: 1840]. . . . The census of 1850 [see U. S. A.: 1850], marks the introduction of the present method of recording the facts for each individual separately [instead of having the family as the unit]. From that time until the present the population schedules of each successive census contain the name of every individual in the United States from that of the newly christened infant to that of the aged grandfather, and opposite the name, the age, sex, and other data. The central office then classifies, correlates, and tabulates the data in any way that may be deemed of sufficient value and significance to justify the labor involved. In 1850 the personal data recorded on the schedule for each individual enumerated included name, sex, age, color, profession, occupation or trade, value of real estate owned, place of birth, whether married within the year, whether attending school, whether unable to read and write (for persons over 20), and whether deaf, dumb, blind, insane, idiotic, pauper, or convict. The changes since 1850 in the scope of the population census have consisted simply in the addition or rejection of detail, and may be briefly summarized. The questions regarding the estate owned were repeated with some modification in 1860 [see U. S. A.: 1860: Eighth census] and 1870 [see U. S. A.: 1870: Ninth census], but not in any later census. The question whether married within the year was continued up to and including the census of 1890 [see U. S. A.: 1890], and was superseded in 1900 [see U. S. A.: 1900 (May-October)], by a question asking for the number of years married. To the birthplace question has been added a question asking for the birthplace of each parent. This was introduced in

1880, although the census of 1870 inquired whether either parent was of foreign birth. The question regarding conjugal condition—whether single, married, widowed, or divorced—now recognized as one of the fundamental questions in a population census, first appeared in 1880, but the data obtained at that time have never been tabulated. In 1890 and 1900 the question was repeated and the returns were tabulated and published as they doubtless will be in all future censuses. The census of 1880, which was the most comprehensive census we have ever undertaken, attempted to enumerate not only the blind, deaf, dumb, insane, idiotic, maimed, and crippled, but also those persons who are sick or temporarily disabled on the census day so as to be unable to attend to their ordinary business or duties, and asked for the nature of their sickness or disability. At the following census, that of 1890, the question was restricted to those suffering from acute or chronic diseases, with name of the disease and length of time afflicted. These attempts to secure statistics of morbidity through the instrumentality of the census were complete failures and will, it is safe to say, never be repeated. Under the subject of occupation the census of 1880 introduced the question as to unemployment, or number of months unemployed during the census year. This question has been repeated in each subsequent year, although the data obtained are not believed to be very reliable or significant. The census of 1890 introduced a group of questions applicable to immigrants, asking for the year of immigration to the United States, whether naturalized, and whether able to speak English. These questions were repeated in 1900.—J. A. Hill, *Historical value of the census records (Annual Report of the American Historical Association, 1908, pp. 199-203)*.—See also U. S. A.: 1901 (January).—“The census of 1910 was a notable one [see U. S. A.: 1910]. It was the first to be taken by the permanent Census Bureau, which had been established in 1902; and it differed from its predecessors in two other important features: First, in the method by which appointments of temporary clerks were made; and, second, in the manner in which the information obtained by it was compiled and presented to the public. At prior censuses clerical positions had been filled upon the recommendations of Senators and Representatives, and at the more recent censuses the appointments of the candidates named had been contingent upon their passing noncompetitive examinations [see CIVIL SERVICE REFORM: United States: 1909]. At the Thirteenth Census, however, positions on the temporary clerical force were filled through open competitive civil-service examinations held throughout the country by the United States Civil Service Commission. The method of presenting the results of the Thirteenth Census constituted a new and in some respects a radical departure from former practice. The most important change was with respect to the Abstract. At prior censuses this had been a small octavo volume issued after the publication of the complete reports and containing no text discussion and very few percentages, averages, or comparative statistics for earlier censuses. The Abstract of the Thirteenth Census is a quarto volume of 569 pages, issued in 53 editions, one without supplement and each of the others containing a supplement for some one State or for the District of Columbia, Alaska, Hawaii, or Porto-Rico. It presents the principal statistics gathered at the census of 1910, covering the subjects of population, agriculture, manufactures, and mining.”—United States Bureau of the Census, *Story of*

the census, 1790-1915, p. 16.—"The United States has never before approached a federal census under the exceptional conditions that have prevailed during the past year. Up to within sixty days the nation has been steadily concentrating its man power, money and material resources upon the prosecution of a great war 3,000 miles away, and so great was the strain that many, even though in peace times believers in census activities, began to doubt whether the time had not arrived to temporarily curtail the decennial federal census. . . . With the sudden collapse of the enemies of the United States and the certainty of our early return to a peace basis, questions as to policy, raised by the fact that the United States was at war, were naturally swept away. It was no longer a question of the wisdom or unwisdom of taking a census, but entirely a question of methods and policies in connection with a census certain to be taken. The act which authorized the Thirteenth Census . . . was made to apply to the 'Thirteenth and Subsequent Censuses,' because previous experience had shown the costly unwisdom of securing the passage of an individual census act. At the early hearings upon the bill . . . the director of the census submitted a statement which pointed out the differences between the act now before Congress and that which is upon the statute books. The changes in reality are very simple and are merely those required, first, to bring the act up to date; second, to correct inaccuracies or defects which occurred in the practical application of the existing law. The important changes which are introduced, adjust the personnel and properly increase salaries, restate census inquiries, change the date of the census from April 15 to January 1 preceding, and strengthen somewhat the penalty clauses. The House of Representatives inserted from the floor a requirement for a census of forestry and forest products. The Senate has retained this inquiry so that the usual main inquiries relating to population, agriculture, manufactures and mines and quarries are limited in the current act only with relation to dependent classes, and are expanded by the addition of biennial manufacturers' reports and a census of forestry and forest products."—W. S. Rossiter, *Federal census (American Statistical Association, 1919, pp. 286-288)*.—The census of 1920, in its population inquiry, divided population into urban and rural. For the first time in the history of the country the former class outnumbered the latter.—See also U. S. A.: 1921: First results of the 1920 census; and U. S. A.: 1921: Urban population.

Oriental.—"Among Oriental countries, Japan deserves first consideration for advanced and scientific interest in statistical inquiry. This extraordinary nation, which has shown such a surprising capacity for appropriating the ideas of western civilization, annually collects statistics of population with distinction of sex, age, and conjugal condition, and also statistics of agriculture and industry, under the direction of a well-organized central office. . . . In India census-taking is a colossal task accomplished decennially, with noteworthy success, by the British government. Even among those who find descriptions of census methods dry reading at best, interest must be awakened by the difficulties surmounted in that land of splendor and squalor, vast population, and innumerable races, languages, and religion. . . . In this immensely populous and remarkable empire

the census schedule is framed to meet a wide variety of local and racial conditions. It is printed in no less than seventeen different languages, and includes, in addition to the ordinary inquiries, questions concerning religion and caste. . . . In some districts in Hyderabad and the Central Provinces, enthusiastic and devout enumerators have returned the village shrines and temples as 'occupied houses,' the occupant being the idol, whose occupation was stated as 'granting boons and blessings,' or 'subsistence on contributions from the tenants.' However, this is by no means the only strange calling returned on the Indian census schedules. It is difficult to imagine a more remarkable variety. Among them may be mentioned collectors of edible birds' nests, receivers of stolen goods, witches, wizards, and cow-poisoners. In other Oriental countries the characteristics of Mohammedanism hinder statistical inquiry. In Persia and Turkey the only practical value of an enumeration of inhabitants would be to increase taxes and conscriptions, and consequently an accurate census would not be possible under existing conditions. In one of Greg's essays on 'British and Foreign Characteristics' there is a letter from a Turk which vividly illustrates the Oriental point of view. A European traveler, having returned to his home after a visit to the Orient, wrote to his Turkish host for facts concerning the city and province in which the latter resided. This was the reply: My illustrious friend and joy of my liver! The thing you ask of me is both difficult and useless. Although I have passed all my days in this place, I have neither counted the houses nor have I inquired into the number of inhabitants; and as to what one person loads on his mules and another stows away in the bottom of his ship, that is no business of mine. But above all, as to the previous history of this city, God only knows the amount of dirt and confusion the infidels may have eaten before the coming of the sword of Islam. It were unprofitable for us to inquire into it."—W. R. Merriam, *Census in foreign countries (Century Magazine, v. 66, No. 6, October, 1903, pp. 884-885)*.

CENSUS BILL. See CIVIL SERVICE REFORM: 1909.

CENSUS BUREAU.—"The Bureau of the Census, of the Department of Commerce, now the greatest statistical office in the world, represents the outgrowth and development of a century and a quarter of periodical, and in recent years continuous, statistical inquiry on the part of the Federal Government. . . . Prior to 1900 the Census Office established for the taking of each decennial census and the compilation and publication of its results had been a temporary institution, going practically out of existence at the conclusion of its work. On July 1, 1902, under authority of an act of Congress passed in March of the same year [see U. S. A.: 1902 (March)], the Census Office became a permanent branch of the Department of the Interior, under the name Bureau of the Census. A year later it was transferred to the newly created Department of Commerce and Labor, and since March 4, 1913, it has been a bureau of the Department of Commerce. While one of the reasons for the creation of the permanent Census Bureau was the need of a nucleus of trained employees around which to organize the large force necessary for the taking of a decennial census, this need was not the only justification—nor, for that matter, the leading one—for the existence of a permanent bureau. The establishment of the office on a permanent footing was the achievement of more than half a century of agitation, beginning in 1844,

when a select committee of the House of Representatives, which had had under consideration a memorial on the errors of the census of 1840, presented by a committee of the American Statistical Association, reported that it knew of no way of avoiding such errors in future censuses so easy and practicable as by the establishment of a Bureau of Statistics.' In the decades following various committees, of officials, superintendents of the census, and statistical organizations repeatedly urged upon Congress the advisability of making the office permanent. Improvement of the decennial census was the motive chiefly in evidence in all this agitation, and even at the present time is commonly thought of as constituting the chief advantage to be gained through the existence of a permanent bureau. From the first, however, those advocating the establishment of such a bureau have had other considerations in mind as well. In fact, the House committee already referred to recommended, in its reports for 1844 and 1845, the establishment of a bureau which not only should take the decennial census, but should coordinate the statistical work of all the departments of the Federal Government, and whose publications should include statistics relating to foreign countries. These efforts on the part of statisticians, administrative officials, and legislators finally resulted in the passage, in March, 1902, of the permanent census act, under the terms of which the Census Bureau was made a permanent instead of a temporary office."—*United States Bureau of the Census, Story of the census, 1790-1915*, pp. 23-25.—See also STATISTICS.

CENTENNIAL OF 1876.—"What could be more fitting than that the hundredth anniversary of the world's greatest republic should be kept by a monster celebration? Such a question was publicly raised in 1870 by an association of Philadelphia citizens, and it set the entire nation thinking. At first only a United States celebration was proposed, but reflection developed the idea of a mammoth fair where the arts and industries of the whole world should be represented. Congress took up the design in 1871-2. In 1873 President Grant formally proclaimed the Exposition, and in 1874 foreign governments were invited to participate in it. Thirty-three cordially responded, including all the civilized nations except Greece, a larger number than had ever before taken part in an event like this. Philadelphia was naturally chosen as the seat of the Exposition. Here the nation was born, a fact of which much remained to testify. . . . In Fairmount Park, beyond the Schuylkill, a level plat of over 200 acres was inclosed, and appropriate buildings erected. Five enormous structures, the Main Building, with Machinery, Agricultural, Horticultural, and Memorial Halls, towered above all the rest. Several foreign governments built structures of their own. Twenty-six States did the same. Thirty or more buildings were put up by private enterprise in order the better to present industrial processes and products. In all more than two hundred edifices stood within the inclosure. The Exposition opened on May 10th, with public exercises, a hundred thousand people being present. Wagner had composed a march for the occasion. . . . Further simple but impressive ceremonies were held on July 4th, in the public square at the rear of Independence Hall. In the Main Building, erected in a year, at a cost of \$1,700,000, manufactures were exhibited, also products of the mine, along with innumerable other evidences of scientific and educational progress. More than a third of the space was reserved for the United States, the rest being divided among foreign coun-

tries. The products of all climates, tribes, and times were here. Great Britain, France, and Germany exhibited the work of their myriad roaring looms side by side with the wares of the Hawaiian Islands and the little Orange Free State. Here were the furs of Russia, with other articles from the frozen North; there the flashing diamonds of Brazil, and the rich shawls and waving plumes of India. At a step one passed from old Egypt to the latest born South American republic. Chinese conservatism and Yankee enterprise confronted each other across the aisle. From the novelty of the foreign display the American visitor turned proudly to the handiwork of his own land. Textiles, arms, tools, musical instruments, watches, carriages, cutlery, books, furniture—a bewildering display of all things useful and ornamental—made him realize as never before the wealth, intelligence, and enterprise of his native country, and the proud station to which she had risen among the nations of the earth. Three-fourths of the space in Machinery Hall was taken up with American machinery. Memorial Hall, a beautiful permanent building of granite, erected by Pennsylvania and Philadelphia at a cost of \$1,500,000, was given up to art. This was the poorest feature of the Exposition, though the collection was the largest and most notable ever till then seen this side of the Atlantic. America had few art works of the first order to show, while foreign nations, with the exception of England, which contributed a noble lot of paintings, including works of Gainsborough and Reynolds, feared to send their choicest products across the sea. All through the summer and early autumn, in spite of the unusual heat that year, thousands of pilgrims from all parts of the country and the world filled the fair grounds and the city. Amid the crowds of visitors Philadelphians became strangers in their own streets. On September 28th, Pennsylvania day, 275,000 persons passed the gates. During October the visitors numbered over two and a half millions. From May 10th to November 10th, the closing day, the total admissions were 9,000,000."—E. B. Andrews, *United States in our own time*, pp. 106-200.

CENTRAL AFRICA PROTECTORATE, British. See NYASALAND PROTECTORATE.

CENTRAL AMERICA: Geographic description.—"The region collectively known as Central America is one of the most interesting portions of Latin America, and embodies six independent republics and the British Colony of Honduras. Geographically it is taken as extending from Panama, to Tehuantepec in Mexico, but politically the southern boundary of Mexico is the limit of the region. These six Central American republics have much in common as regards their physical formation and inhabitants; although each is stamped with its own individuality, and jealous of its rights. Guatemala, Honduras, and Nicaragua cover respectively areas of 48,000, 46,000, and 49,000 square miles, and the smaller republics of Salvador, Costa Rica, and Panama cover 7,200, 23,000 and 32,000 square miles respectively. British Honduras covers 7,562 square miles. Central America, physically, may be regarded as a transitional zone of territory connecting the continents of North and South America, rather than being part of either. It is a region of mountains and lowlands; the mountains having many high plateaus of limited extent, and containing many volcanoes, which form

some of the highest summits and are among the most destructive on the earth's surface. Among the principal of these volcanoes six are in Guatemala, two in Salvador, four in Nicaragua and four in Costa Rica. Guatemala and Salvador are countries possessing more volcanoes than almost any other, and throughout the whole history of Central America, up to the present time, these countries have suffered greatly from eruption and earthquake, with repeated overwhelming of cities and destruction of plantations. The geological formation of the Central American region has been greatly influenced by volcanic disturbances in past ages. It forms, as it were, a joint in the earth's crust, a weak point subject to the outburst of the forces within. In earlier geological times, it has been shown, the Atlantic and Pacific oceans were connected by various straits across what now are the narrow necks of land of Central America, the region having constituted a great insular system which has been consolidated in later times. Thus the cutting of the Panama Canal may be regarded, in a sense, as reverting to earlier hydrographic conditions. . . . The geographical position of Central America is one of extreme importance, and the whole region, including the Antilles and West India Islands, may in the future become the centre of an increased maritime and commercial movement; Central America forming, as it were, a bridge between the two great oceans, the Pacific and the Atlantic, and the two American continents: midway between Asia and Europe. The Cordillera, or mountain chain, traverses the whole territory of Central America from end to end, except that it is broken by the great lake-basin of Nicaragua. The mountains lie, as in South America, much closer to the Pacific than the Atlantic, except that in Costa Rica and Panama they occupy the centre of those narrower territories. The eastern side of the region consists in broad plains and highlands, watered by numerous rivers. Central America comprises some of the most fertile land on the earth's surface; and the landscape and scenery are among the most noteworthy, and the natural resources of the soil the most prolific of the whole of Latin America [see LATIN AMERICA: Agriculture]. The topography of the region gives rise to the vertical climatic conditions of *Tierra caliente*, *Tierra templada* and *Tierra fria*, or hot, temperate, and cold lands, a range of temperature from tropical to temperate which ensures the production of plant life of all kinds. The climate generally is healthy except in certain places on the coast, where lack of sanitary improvements and neglect and common hygienic conditions give rise to malarial fevers and worse disorders. In some zones, as at Panama formerly, and other ports on both shores of Central America, yellow fever was a terrible scourge, and malarious disorders rendered life for the foreigner unsafe. The improvements brought about at Panama, under the control of the United States, have shown that these tropical scourges are not inevitable conditions of Central American environment."—C. R. Enock, *Republics of Central and South America*, pp. 441-444.

Population.—Culture.—Variety of races.—Mestizos or "ladinos."—"The total population of the Central American republics numbers [1913] somewhat more than 5,000,000, distributed approximately as to 2,000,000 in Guatemala, 553,000 in Honduras, 600,000 in Nicaragua, 1,700,000 in Salvador, 388,000 in Costa Rica, and 336,000 in Panama. The estimates of population are very approximate. Accurate statistics cannot be obtained partly by reason of the

ignorance of the masses of Indians in certain regions, and largely by reason of fear of military conscription, or taxation, especially in Nicaragua and Honduras, both of which matters the inhabitants have good cause to avoid. In Guatemala 60 per cent. of the population are pure Indians; the remainder mestizos [mixed blood], with small class of whites. The Indian tribes are more diverse than in any part of Central America, and belong principally to the Maya and Quiché stocks, who in olden times were the builders of the famous Central American temples. There are about 15,000 foreigners in the country: and several important German coffee-growing settlements. In Honduras the mestizos are the most numerous, and the white element is small. There are many Indian tribes, a portion of which are Christianised, but a number, of about 90,000, still retain their aboriginal mode of tribe life, living in the mountains and cultivating the soil. These Indians are good and industrious laborers. On the north coast the vigorous Carib race is found, forming the principal source of labor for mahogany-cutting. There is a considerable but disappearing number of zambos and negroes. In Nicaragua the population is largely of a composite character, formed by the union of the original Indians, Spaniards, and negro slaves. Inter-marriage of immigrants of all nations, including Dutch, French and British, has produced a half-cast type with blue eyes and fair hair, an uncommon type for a Latin-American country. Indians of pure race are few, as they were almost exterminated in earlier times by the Spanish buccaners and colonists. Salvador is the most thickly populated of the Central American republics. The mestizos or 'ladinos,' as the mixed race is commonly termed in Central America, form more than half the total; the Indians 40 per cent., and the whites and foreigners 10 per cent.; the pure whites of Spanish race not being more than 2½ per cent. There is a small proportion of negroes. In Costa Rica the proportion of Spanish blood is greater than in any of the six republics, but the mestizos form the larger proportion of the inhabitants. The native Indians, who number about 4,000, are of a quiet, docile nature, dwelling in stockaded encampments, in a still savage and un-Christianised State. There are about 8,000 Europeans in the country. In Panama the population is extremely mixed, due to the labor of various nationalities brought in for the building of the canal. Negroes from Jamaica predominate, and Spanish, Italian and Greeks are plentiful. These, however, are not permanent elements. The population upon the canal zone numbered in 1912, 50,000; and there were 36,000 native Indians throughout the country."—C. R. Enock, *Republics of Central and South America*, pp. 444-445.—In 1922 the estimated civil population of the Canal Zone was 23,757, this is including Americans. The populations of the various Central American countries estimated in 1922 vary only slightly from those already cited. Salvador is estimated at 1,000,000, instead of 1,700,000.

Aborigines.—"The Central American civilization was sandwiched in between the empire of the Mexicans to the north and that of the Chibchas to the south. The habits and customs of the Guatemalans, however, resembled far more closely those of the Mexicans than those of the Chibchas. With these latter, indeed, they do not seem to have come in contact. This strengthens the theory that the inhabitants of the central empire of the Americas came into their country originally by way of Mexico. Nearly all of the accounts that exist of the advent of the Guatemalans are legendary, al-

though there is no reason to suppose that a certain amount of the tradition is not based on solid historical fact. Seeing that nothing else exists, these early tales may as well be rapidly reviewed here. It is said that the pioneers of the aboriginal civilization of Central America came from somewhere out of the dim and mysterious north, and landed in Tabasco, in Mexico. Led by a chief of the name of Votan, these newcomers soon subdued the savage tribes that existed in Mexico at the time, and founded an empire known as Xibalba or Xibalbay—which was really the first home of the Quichés or Maya-Quichés in these parts. It is Votan, who is supposed to have founded the city of Palenque, the remarkable ruins of which still exist. After a time a new and powerful people came upon the scene to dispute the supremacy of the men of Xibalba. These were the Nahuas, whose chief, Quetzalcohuhtl, was known to the Gutemalans by the name of Cucumatz. It was from the Nahuas that the Aztecs subsequently sprung. Warfare broke out between the Nahuas and the Xibalbans, and, after a fierce struggle, the latter were defeated. They were scattered, and forced to emigrate from the former centres of their rule. Some, under the guidance of the chief Huitziton, went north and founded the empire of Toltecas. Others marched, to the south-east and settled in Yucatan, while yet others proceeded in a more southerly direction and established their communities of Toltec civilization in Guatemala. In the course of time, it has been said, the Toltecs of the north became powerful, and, joined by other tribes, marched to the south again, and, overcoming the descendants of the Nihuas who had originally conquered them, came down to join their brethren who had settled in Guatemala. But this, to say the least of it, is a theory of very doubtful weight. Three kingdoms were now established in Guatemala. That of the Quichés was the most noteworthy of the three. These people established themselves in the region extending from the Sierra Madre to the coast of Suchitepequez, and founded the city of Utatlan, which to-day is known as Santa Cruz del Quiché. The other kingdoms were those of the Zutuhiles, who established themselves to the south of Lake Atitlan, and the Cackchiqueles, who occupied the territories to the north and east of the same lake. These, in common with some lesser States, appear to have been subservient up to a certain point to the powerful Quiché nation, which to all intents and purposes may be regarded as ruling Central America, though not to the same extent that the Aztecs ruled Mexico and that the Incas governed Bolivia and Peru. For the descendants of the Nahuas established themselves firmly in some of the territories adjoining the Pacific Coast, and constituted a continual menace to the Maya-Quiché empire. This latter empire, it may be said, did not only comprise the majority of the lands which at present go to make up Central America, but such parts of Mexico as the province of Chiapas and other districts which are to be met with in the south of the modern Republic. The Quiché empire is supposed to have been governed by a succession of twelve kings up to the time of the advent of the Spaniards. The dynasties and the names of the various rulers, as well as the events of their reigns, are given with much detail by several Central American writers; but the exact nature of many of these happenings is inclined to be hazy. It is certain, however, that civil war was frequent. It is, indeed, a most curious thing that in this respect Alvarado, who was the first Spaniard to enter Guatemala, met

with almost exactly the same train of circumstances as had so greatly assisted Pizarro in Peru and Cortes in Mexico."—W. H. Koebel, *Central America*, pp. 28-30.—See also INDIANS, AMERICAN: Cultural areas in Mexico and Central America.

1821-1871.—Separation from Spain, and independence.—Attempted federation and its failures.—Wars and revolutions of the five republics.—“The central part of the American continent, extending from the southern boundary of Mexico to the Isthmus of Panama, consisted in the old colonial times of several Intendancies, all of which were united in the Captaincy-General of Guatemala. Like the West Indian Islands, it was a neglected part of the Spanish Empire. . . . It was not until the success of the Revolution [against Spain] had become certain on both sides of them, both in Mexico and New Granada, that the Intendancies which made up the Captaincy-General of Guatemala declared themselves also independent of Spain. The cry of liberty had indeed been raised in Costa Rica in 1813, and in Nicaragua in 1815; but the Revolution was postponed for six years longer. Guatemala, the seat of government, published its declaration in September, 1821, and its example was speedily followed by San Salvador and Honduras. Nicaragua, on proclaiming its independence, together with one of the departments of Guatemala, declared its adherence to what was known in Mexico as the plan of Iguala [see MEXICO: 1820-1826]. As there were no Spanish troops in Central America, the recusant Spanish official party could make no resistance to the popular movement; and many of them crossed the sea to Cuba or returned to Spain. . . . The Revolution of Central America thus stands alone in the history of independence, as having been accomplished without the shedding of blood. [During the brief empire of Iturbide in Mexico (see as above) the Central American states were annexed to it, though with strong resistance on the part of all except Guatemala.] On the proclamation of the Federal Republic in Mexico [1824], the whole of Central America, except the district of Chiapas, withdrew from the alliance, and drove out the Mexican officials as only a year before they had driven out the Spanish officials. The people now had to face the task of forming a government for themselves: and . . . they now resolved on combining in a federation, in imitation of the great United States of North America. Perhaps no states were ever less suited to form a federal union. The petty territories of Central America lie on two oceans, are divided by lofty mountains, and have scarcely any communication with each other; and the citizens of each have scarcely any common interest. A Central American federation, however, was an imposing idea, and the people clung to it with great pertinacity. The first effort for federation was made under the direction of General Filisola. All the Intendancies combined in one sovereign state; first under the name of the ‘United Provinces,’ afterwards (November 22, 1823) under that of the ‘Federal Republic’ of Central America. . . . [See also COSTA RICA: 1821-1848.] A constitution of the most liberal kind was voted. This constitution is remarkable for having been the first which abolished slavery at once and absolutely and declared the slave trade to be piracy. . . . The cleri-

cal and oligarchic party [this conservative party made up of the Spanish bureaucracy and opposed to centralization was strongest in Guatemala while the federalist element was strongest in Honduras] set their faces stubbornly against the execution of the constitution, and began the revolt at Leon in Nicaragua. The union broke down in 1826, and though Morazán [of Honduras] reconstituted it in 1829, its history is a record of continual rebellion and reaction on the part of the Guatemaltec oligarchy. Of all South American conservative parties this oligarchy was perhaps the most despicable. They sank to their lowest when they raised the Spanish flag in 1832. But in doing this they went too far. Morazán's successes date from this time, and having beaten the Guatemaltecs, he transferred the Federal government in 1834 to San Salvador. But the Federal Republic of Central America dragged on a precarious existence until 1838, when it was overthrown by the revolt of Carrera in Guatemala. From the first the influence of the Federalists in the capital began to decay, and it was soon apparent that they had little power except in Honduras, San Salvador and Nicaragua. The Costa Ricans, a thriving commercial community, but of no great political importance, and separated by mountainous wastes from all the rest, soon ceased to take any part in public business. A second Federal Republic, excluding Costa Rica, was agreed to in 1842 [and dissolved in 1845]; but it fared no better than the first. The chief representative of the Federalist principle in Central America was Morazán, of Honduras, from whose government Carrera had revolted in 1838. On the failure of the Federation Morazán had fled to Chile, and on his return to Costa Rica he was shot at San José by the Carrerists. This was a great blow to the Liberals, and it was not until 1847 that a third Federation, consisting of Honduras, San Salvador, and Nicaragua, was organized. For some years Honduras, at the head of these states, carried on a war against Guatemala to compel it to join the union. Guatemala was far more than their match: San Salvador and Nicaragua soon failed in the struggle, and left Honduras to carry on the war alone. Under General Carrera Guatemala completely defeated its rival; and to his successes are due the revival of the Conservative or Clerical party all over Central America. . . . The government of each state became weaker and weaker: revolutions were everywhere frequent: and ultimately . . . the whole country was near falling into the hands of a North American adventurer."—E. J. Payne, *History of European colonies*, ch. 21.—"About this time an American adventurer by the name of William Walker got control of Nicaragua. He had gone to California in 1850 in the gold rush, and in 1853 had attempted a filibustering expedition into Mexico, which, however, was a failure. On his return to the East he conceived the idea of conducting a similar expedition into Nicaragua. He landed in 1855 with seventy men, and soon succeeded, through the aid of the American consul, in securing for himself the appointment as commander-in-chief of the army. From this post he soon advanced to the presidency, and for two years maintained himself in Nicaragua as president. His original plans had been to form a military government and proceed to the conquest of all Spanish America. At this time the slave holders in the South were planning the extension of slavery and the adding of slave states to the Union by seizing Cuba and other states to the south. Walker, however, on having secured power, attempted to keep it for himself, and this proved his undoing.

He was deserted by his friends in the United States when they learned of his purpose, and he was driven out by an insurrection in Nicaragua in 1857. He made two other attempts to regain his power in the country, but was captured in 1860 and put to death as a pirate."—W. W. Sweet, *History of Latin America*, p. 212.—See also NICARAGUA: 1855-1860.—"In former times the English government had maintained some connection with the country [originating with the buccaneers and made important by the mahogany-cutting] through the independent Indians of the Mosquito coast, over whom, for the purposes of their trade with Jamaica, it had maintained a protectorate [since 1665] and even a small English commercial colony, called Greytown, had been founded on this coast at the mouth of the river San Juan. Towards the close of Carrera's ascendancy this coast was resigned to Nicaragua [1860], and the Bay Islands, which lie off the coast, to Honduras: and England thus retained nothing in the country but the old settlement of British Honduras, with its capital, Belize. After Carrera's death in 1865, the Liberal party began to reassert itself: and in 1871 there was a Liberal revolution in Guatemala itself."—E. J. Payne, *History of European colonies*, ch. 21. 1826.—First Pan-American Congress at Panama. See COLOMBIA: 1826.

1850.—Protected under Clayton-Bulwer treaty. See NICARAGUA: 1850.

1871-1885.—Ascendancy of Barrios in Guatemala.—Expulsion of the Jesuits.—Efforts to re-establish a Central American Union.—The revolution of 1871, in Guatemala, established a government under the control of the Liberals, with Miguel García Granados as provisional president. "The new administration had hardly initiated reforms when an insurrection broke out in Santa Rosa, promoted by the priests and their aristocratic allies. It does not appear that García Granados had at first intended open hostility to the religious orders. . . . The priests would not rest contented with the loss of their former high standing. . . . The new régime now resolved to cut loose [from] the ecclesiastical incubus, and to establish the supremacy of the civil authority in the state on a firm basis. Its first step was to carry out a decree . . . to expel the Society of Jesus forever from the republic. This was not effected without some scandal and disturbance from the zealous partisans of the order. Seventy-three Jesuits, most of whom were foreigners, were sent away on an American steamship, bound for Panama." The expelled Jesuits were allowed to land in Nicaragua, where they remained until 1881. They were then accused of instigating an insurrection, and were driven from that state. In Guatemala, the expulsion of the Jesuits was followed, in 1872-1873, by the suppression of tithes, the extinction of religious communities of men, and the decreeing of freedom of worship, with toleration for all religious sects. The provisional president was succeeded in June, 1873, by Justo Rufino Barrios, elected by popular vote. Barrios, who had been the leading spirit of the revolution, was a resolute and energetic man. His government was vigorously, often violently, maintained, during a presidency of twelve years. Among his early acts was one which finished the dissolution of the religious houses, by opening the convents of women, and making a public allowance of money to the departing nuns. The chief aim of Barrios, throughout his career, was to bring about the long-sought union of Central American states. To that end, he seems to have assiduously interfered in the politics of the neighboring republics. By force of

arms, he established a government in Salvador that was favorable to his views, and he accomplished the same in Honduras by promoting a revolution. In Nicaragua and Costa Rica he had less success. In 1879 a new constitution was adopted in Guatemala, and Barrios was elected under it, in 1880, for a further term of six years. The country enjoyed a time of great prosperity, and Barrios, after visiting Europe and the United States, proposed, in 1882, to resign. He was persuaded, however, to remain in office, and his efforts for the union of states were resumed. They encountered so much opposition that he lost patience, and rashly undertook, in 1885, to accomplish the unification of Central America by force. By a decree issued on February 28 in that year, he proclaimed the consolidation of the five states into one republic. The government of Honduras assented; the other three states formed an alliance to resist. Barrios marched an army into Salvador, and lost his life in the fighting that ensued.—H. H. Bancroft, *History of the Pacific states*, v. 3, ch. 20-21.

1884-1900.—Interoceanic canal measures of later years. See PANAMA CANAL.

1886-1894.—Continued struggling for Union, and continued revolutionary conflicts.—Not long after the fall of Barrios, the government of Salvador itself proposed a congress to arrange terms of union; but the proposition failed. Nicaragua, always looking forward to the probable construction of an isthmian canal within her border, and ambitious to enjoy the great possession alone, continued aloof. Costa Rica, having some share in the same ambition, did likewise. Yet the unionists, who seem to have been always numerous, kept the project alive, and were able, in April, 1887, to bring about a preliminary treaty between the five republics, "to establish an intimate relationship between them, and, by making the continuance of peace certain, to provide for their future final fusion in one country." In the next year, President Soto, of Costa Rica, urged the assembling of a diet, to establish the union, pending which Costa Rican citizenship was extended to the citizens of the other republics. The diet met in September of that year, but the desired union was not achieved. In November, 1889, the three states of Honduras, Guatemala, and Salvador took another step, joining in a treaty which contemplated a provisional confederation for ten years, after which, if it proved satisfactory, a more perfect and permanent union should be formed; but Nicaragua and Costa Rica would not take part. In Salvador, moreover, the anti-unionists rallied, and a conflict occurred (1890) in which the government was overthrown, the president killed, and the opponents of union established a provisional government, with Gen. Ezeta at its head. Then the president of Guatemala, Manuel Barillas, who had succeeded Barrios, interfered, and Guatemala and Salvador went fiercely to war. The Salvadorians had the best of it in most of the fighting, and Barillas was hard pressed by revolutionists at home; but he kept his power in Guatemala, though he did not succeed in suppressing Ezeta and his party in Salvador. One incident connected with these events caused excitement and controversy in the United States. A Guatemalan exile, Barrundia, took passage from Mexico, on a Pacific Mail steamer, for Salvador, to enlist in the war. The steamer touched at a port in Guatemala, where the authorities undertook to arrest him. The captain refused to give his passenger up; but neither the United States minister nor naval officers present in the port could find authority to sustain the captain's refusal, and the latter was forced to

yield. Barrundia resisted the arrest, and was shot. While the opponents of union triumphed in Salvador, they failed in a desperate attempt at revolution in Honduras. President Bogran, in that state, maintained his authority, and was succeeded at the close of his constitutional term, in 1892, by General Leiva. In 1894, the government of Leiva was overthrown by insurgent Liberals, and Policarpo Bonilla made president, under a new constitution. Meantime, affairs in Nicaragua and Salvador were equally tempestuous. President Sacaza, in the former, was compelled to resign, in 1893. In Salvador, Ezeta was driven from the presidency in 1894, and a provisional government set up. In Costa Rica, during 1892-1893, there were conflicts between the president and the legislature, but no revolution occurred. In Guatemala, President Barillas was succeeded in 1892 by Gen. José Barrios, son of the former president.

1889-1890.—First use and origin of term Pan-Americanism. See PAN-AMERICANISM.

1890.—First International American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1890.

1895-1902.—Attempts at union of Central America.—Greater republic of Central America (1895).—Called United States of Central America (1898).—Withdrawal of Salvador from the union.—Ascendency of Salvador under General Regalado.—Failure of his attempt to form a new union.—"On June 20, 1895, the three states, Honduras, Nicaragua, and Salvador, which had always been most loyal to the Federal idea, actually accomplished a partial union. The new republic was called by the Treaty of Amapala, "La Republic Mayor de Centro-America." Ratifications were exchanged September 15, 1895, and a single political organization for the exercise of their external sovereignty was formed. The first three articles of the treaty of Federation reveal the spirit of union embodying itself in a tangible form: Article I. The republics of Salvador, Nicaragua, and Honduras shall hereafter form a single political entity for the exercise of the sovereignty as regards their intercourse with foreign nations, to be known as the Greater Republic of Central America. This name shall continue in use until the republics of Guatemala and Costa Rica shall voluntarily accept the president treaty in which case it shall be called the 'Republic of Central America.' Article II. The signatory governments do not by the present treaty, renounce their autonomy and independence as regards the direction of their internal affairs, and the constitution and laws of each state shall remain in force so far as they are not inconsistent with the stipulation hereof. Article III. For the execution of the provisions contained in Article I, there shall be a diet, composed of one member and one substitute, elected by each of the Congresses of the signatory republics for a term of three years. . . .

"The text of the treaty of Amapala was sent to Costa Rica and Guatemala, and their adherence invited. For a time they held entirely aloof, but a treaty of June 15, 1897, supplementary to that of June 20, 1895, provided for the acceptance by Guatemala and Costa Rica. . . . In the supplementary treaty it is stated in Article I, that the governments of Guatemala and Costa Rica and the Greater Republic of Central America 'shall henceforth form a free and independent nation.' . . . The treaty was never ratified, and Guatemala and Costa Rica never became actual members of the Greater Republic. In 1898, the Confederation was put on a better basis. A definitive constitution was adopted by a constituent assembly meeting at

Managua [Nicaragua], August 27, 1898, and the steps taken forecast in the original compact. By the constitution a Federal Republic was established under the name 'Estados Unidos de Centro-America.' The constitution was not to be submitted to popular vote, but a commission was appointed to exercise the functions of government for a time, and to provide for the election of a President during the following December. It was expected that the President would be inaugurated in March, 1899. The Executive Federal Council was installed at Amapala, November 1, 1898, and put into force the political constitution of the United States of Central America. This provisional council was to last until a president should be elected by the people. . . . The federation failed within a month of its inauguration. Revolutionary movements arose, demanding unity of action on the part of the military power of the Federal States to suppress them. It was the test of the Federation. The new union weakened under the strain, and utterly collapsed. About the middle of November, General Tomaso Regalado was one of the candidates for the presidency of Salvador. By gaining control of affairs, he succeeded in fomenting a separatist movement in the state of Salvador. . . . Regalado issued a proclamation declaring that Salvador was no longer a member of the Confederation. . . . The fact of union evidently had not obtained the sanction of the Salvadorean people, who regarded it as a violation of the political constitution of Salvador. . . . The executive Federal Council tried to suffocate the rebellion, but was obliged to recognize its impotence to execute the pact of union. Many military commanders in the service of the Federation failed in their duty so that the prompt and timely action of the Council was weakened. The state of Salvador remained separated from the republic, and under painful necessity the council declared the union at an end, November 29, 1898, twenty-eight days after its inauguration. Nicaragua and Honduras soon abandoned the joint compact, each resuming its independent sovereignty. The nineteenth century was not to close until another effort had resulted in failure. Regalado was not opposed to union. On the contrary, after the United States of Central America was destroyed through his effort, he was very much in favor of Federation. He was far-sighted enough to see that the largest state, Guatemala, must be included or else serve as a pretext for new revolutions and wars, which he knew by successful experience would overthrow a federal state. . . . The diplomacy connected with the intrigues of Regalado is decidedly complex. There is sufficient evidence that he was depending upon the help of Mexico. In 1880, Zaldivar who had not ceased his efforts for Federation with his failure in 1885, acted as the agent of Regalado in Mexico, where a secret pact was made March 2, whereby the attention of the Guatemalan army was to be divided, making the victory of the revolutionists easy. . . . On the 3d of August, Regalado wrote to President Diaz of Mexico in regard to his plans. He realized the necessity of establishing the superiority of Salvador among the people of the isthmus. . . . The climax came during the closing months of 1902. On November 21, Riviera wrote to Regalado that the conditions in Salvador were favorable for this unionist enterprise. The government of Honduras [he continued] favored the restoration of the 'Mando,' February 1, 1903, and would not refuse taking part in an undertaking which was in accord with its political creed. Nicaragua was menaced by revolution and external war, and Guatemala which constituted the

greatest obstacle to union was 'Abased below all conception.' On the other hand, the Salvadorean army was powerfully organized and well-equipped, and Riviera concludes, 'other internal and external circumstances which I omit, and which are known to you, make of these moments, the most favorable for the unionist enterprise.' The movement never materialized. The time was not sufficient for the hatching of the plot. The elections were held in Salvador in 1903, and Regalado was ineligible for reelection."—W. F. Slade (*Journal of Race Development*, Oct., 1917, pp. 210-218).

1897.—Settlement of boundary dispute between Nicaragua and Costa Rica.—A dispute between Nicaragua and Costa Rica, as to the eastern extremity of their boundary line, was decided by General Alexander, a referee accepted by the two republics. The boundary had not been well defined in a treaty negotiated for its settlement in 1858. According to the terms of the treaty, the line was to start from the Atlantic at the mouth of the San Juan river; but changes of current and accumulation of river drift, etc., gave ground for dispute as to where the river actually made its exit. President Cleveland in 1888, acting as arbitrator at the request of the two countries, decided that the treaty of 1858 was valid, but was not clear as to which outlet of the delta was the boundary. Finally, in 1896, an agreement was reached for a final survey and marking of the boundary line, and President Cleveland, on request, appointed General Alexander as arbitrator in any case of disagreement between the surveying commissions. The decision gives to Nicaragua the territory upon which Greytown is situated, and practical control of the mouth of the canal.

1901-1902.—Second International American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1901-1902.

1903.—Secession of Panama from Colombia.—Independence recognized.—Treaty with United States for building of Panama canal. See PANAMA CANAL.

1904.—Nicaragua, Honduras, Salvador, and Guatemala: Peace conference.—A despatch, August 31, 1904, from the American minister at San José, Costa Rica, to the state department at Washington, was as follows: "I have the honor to advise that on the 21st instant, at Corinto, Nicaragua, the Presidents of Nicaragua, Honduras, and El Salvador, and a special delegate representing the President of Guatemala, held a conference ostensibly for the purpose of securing the peace of Central America. . . . The parties holding the conference have issued a lengthy manifesto, which indicates nothing of interest to our Government except that the four governments represented are controlled by parties who will aid each other by military force, if necessary, in maintaining the status quo, and that the peace of Central America is thus reasonably assured by making revolutionary efforts more difficult and less liable to achieve success."

1904.—Nicaragua and Honduras: Agreement to arbitrate boundary dispute.—In October, 1904, the United States government was informed that Nicaragua and Honduras had agreed to submit a boundary dispute to the king of Spain.

1904-1916.—Policy of United States in regard to affairs in Nicaragua. See DOLLAR DIPLOMACY.

1906.—Honduras, Guatemala, and Salvador: War, ended by mediation of United States and Mexico.—Neither the Convention of Peace and Compulsory Arbitration signed at Corinto in 1902 by the presidents of all five of the Central Ameri-

can republics, nor the peace agreement between four of them two years later, sufficed to prevent an outbreak of war in 1906 which involved the three states of Honduras, Guatemala, and Salvador. President Roosevelt, in his annual message to Congress that year, referred to the war as having arisen from "trouble which had existed for some time"; but does not indicate the nature of the "trouble"; nor is any light thrown on it in a long diplomatic correspondence between the parties to it and the governments of the United States and Mexico, which appears in the American report of foreign relations for 1906. Probably nobody outside of the belligerents ever learned definitely why they felt called upon to fight, or what they had to settle when peace was made.

Seemingly Honduras was the aggressor. Its chief importance is in the successful mediation that was undertaken jointly by the governments of the United States and Mexico, of which President Roosevelt made report in the message referred to above:

"The thoroughly good understanding which exists between the United States and Mexico," said the president, "enabled this Government and that of Mexico to unite in effective mediation between the warring Republics; which mediation resulted, not without long-continued and patient effort, in bringing about a meeting of the representatives of the hostile powers on board a United States warship as neutral territory, and peace was there concluded; a peace which resulted in the saving of thousands of lives and in the prevention of an incalculable amount of misery and the destruction of property and of the means of livelihood. The Rio Conference passed the following resolution in reference to this action:

"That the Third International American Conference shall address to the Presidents of the United States of America and of the United States of Mexico a note in which the conference which is being held at Rio expresses its satisfaction at the happy results of their mediation for the celebration of peace between the Republics of Guatemala, Honduras, and Salvador."

"This affords an excellent example of one way in which the influence of the United States can properly be exercised for the benefit of the peoples of the Western Hemisphere; that is, by action taken in concert with other American republics and therefore free from those suspicions and prejudices which might attach if the action were taken by one alone."

The resulting "General Treaty of Peace and Amity, Commerce, etc., between the Republics of Costa Rica, Salvador, Guatemala, and Honduras," signed September 25, 1906, involved solemn engagements. Notwithstanding their grave pledges to each other, three of the parties to this treaty were at war the next year. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1906.

1907.—Nicaragua, Honduras, and Salvador: War.—Mexican and American mediation.—Washington Peace Conference.—General treaty of peace and amity.—Central American Court of Justice.—In February, 1907, a fresh outbreak of Central American war occurred, originally between Nicaragua and Honduras, but involving Salvador, presently, in alliance with Honduras. The arbitration convention of 1904 had not accomplished a specific settlement of the boundary disputes between Honduras and Nicaragua, and President Zelaya, of the latter republic, accused the former of encroachments. Mexico and the United States had endeavored to pacify the disputants before hostilities began, but without success. The quarrel

was fought out, and a complete victory won by Nicaragua, whose forces captured the Honduran capital and drove President Bonilla from the country. A provisional government was established in Honduras and terms of peace arranged, April 24. Then the good offices of President Roosevelt and President Diaz were employed again, with the result which the former communicated to Congress in his message of December 3, 1907, as follows:

"The effort to compose this new difficulty has resulted in the acceptance of the joint suggestion of the Presidents of Mexico and of the United States for a general peace conference between all the countries of Central America. On the 17th day of September last a protocol was signed between the representatives of the five Central American countries accredited to this Government agreeing upon a conference to be held in the City of Washington 'in order to devise the means of preserving the good relations among said Republics and bringing about permanent peace in those countries.' The protocol includes the expression of a wish that the Presidents of the United States and Mexico should appoint representatives to lend their good and impartial offices in a purely friendly way toward the realization of the objects of the conference. The conference is now in session and will have our best wishes and, where it is practicable, our friendly assistance."

The first regular session of the conference was held on November 14, the place of meeting being the building of the International Bureau of the American Republics. In addition to the delegates present from the states of Costa Rica, Salvador, Guatemala, Honduras, and Nicaragua, the republic of Mexico designated Señor Don Enrique C. Creel, ambassador extraordinary and plenipotentiary to the United States, and the United States designated Hon. William I. Buchanan, as representatives from Mexico and the United States at the conference. The Hon. Elihu Root, secretary of state of the United States, was present, also, at the first session, over which he presided until the organization of the conference had been effected. His opening address to the conference included these wise and impressive remarks:

"It would ill become me to attempt to propose or suggest the steps which you should take, but I will venture to observe that the all-important thing for you to accomplish is that while you enter into agreements which will, I am sure, be framed in consonance with the most peaceful aspirations and the most rigid sense of justice, you shall devise also some practical methods under which it will be possible to secure the performance of those agreements. . . . To find practical definite methods by which you shall make it somebody's duty to see that the great principles you declare are not violated, by which if an attempt be made to violate them the responsibility may be fixed upon the guilty individual—those, in my judgment, are the problems to which you should specifically and most earnestly address yourselves."

The address of Secretary Root was followed by one of excellent counsel from the Mexican ambassador, and a reply to both was made, on behalf of the conference by Señor Don Luis Anderson, minister of foreign affairs of Costa Rica who was chosen president of the conference.

Fourteen sessions were held between November 14 and December 20, resulting from which eight conventions were agreed to and signed on the latter date. These conventions are: General treaty of peace and amity; additional convention to the general treaty; establishing a Central American

under direction of the editors and publishers.

court of justice; extradition; on future conferences (montetary); on communications; establishing an international Central American bureau; and establishing a pedagogical institute.—See also COSTA RICA: 1907.

1908.—Inauguration of the Central American Court of Justice.—Gift of a building for its use by Andrew Carnegie.—The Central American court of justice, contemplated in the treaty of 1907, was formally instituted, at Cartago, Costa Rica, with appropriate ceremony, in the last week of May, 1908. The Hon. William I. Buchanan, in attendance as commissioner from the United States, added interest to the occasion by announcing the proffer of a gift of \$100,000 by Andrew Carnegie, for the erection of a building to be dedicated to the exclusive use of the court.

1909-1916.—Conferences for economic uniformity in Central America.—“On 20 Jan., 1909, a meeting at Tegucigalpa, Honduras, was attended by delegates of the five nations and an agreement was framed to secure the unification of the monetary systems, customs duties, weights and measures, fiscal laws and consular service. . . . In January, 1914, another conference took place, which carried even farther the recommendations of the conference of 1909 and added plans for agreements as to international highways, postal and telegraph regulations, and coasting trade, as well as the founding of a central pedagogic institute, and a central mission of foreign relations. Although no united action had, up to February 1917, been taken to put in operation the plans of these Conferences, good influences were at work making for a better understanding of the essential community of interests and responsibilities and bringing nearer to realization the desired stabilization of financial and political conditions. Thus, the convention between the United States and Nicaragua, proclaimed 24 June, 1916, served to call attention to the need of increasing eventually the solidarity of four of the states—Nicaragua, Honduras, El Salvador, and Costa Rica—while the establishment of banks in Central America, with the aid of capitalists in the United States, has proved the power of such organizations to aid regular and orderly development throughout all that region, wherever transportation routes can be maintained with reasonable economy.”—M. Wilcox, *Encyclopedia of Latin America*, pp. 53-532.

1911.—Political situation in Nicaragua, Salvador, Honduras and Costa Rica.—“In Nicaragua the year opened with the election of General Estrada as President for a term of two years. He began by proclaiming an amnesty for political exiles. A series of unaccountable explosives led to the proclamation of martial law, and thereafter President Estrada and his family removed to the American Consulate. In May he resigned the Presidency in favour of the Vice-President Señor Diaz. . . . A Treaty with the United States was signed in July for a loan to be used in re-organizing the finances and secured on the Customs duties; the Nicaraguan Government agreed not to alter these without the consent of the United States, and to appoint a Collector-General to administer to the Customs from a list of names presented by the fiscal agent of the loan and approved by the President of the United States. The Customs revenues, however, were already pledged to the service of the British and French loan of 1909, and the Nicaraguan Government subsequently defaulted on this loan. . . . In Salvador Dr. Manuel Enrique Araujo succeeded General Figueroa as President, and delivered this inaugural address on March 1. The foreign trade was considerably developed by

a steamship service established by the Salvador Railway Company. President Dávila of Honduras made a Treaty with the United States in January under which the Republic was to be financed, the conditions being similar to those of the Nicaraguan Treaty mentioned above. The Treaty was signed only through fear of the revolutionary forces headed by General Bonilla, who were popularly believed in Honduras to be encouraged from Washington. The Honduran Congress, however, rejected the treaty on the grounds that it alienated the national sovereignty of the State revenues, and that the President had exceeded his powers in signing it, and its supporters in Congress were roughly treated by the populace of the capital. The affair illustrates the Central American fear of the United States. In view of the victory of General Manuel Bonilla at Ceiba (Jan. 25) the United States government intervened at the request of President Dávila, and after a conference on a United States warship, presided over by a representative from Washington, President Dávila resigned. An interim Government followed, and General Manuel Bonilla was elected President. Costa Rica at last settled with its foreign creditors. The seat of the Central American Arbitration Court was transferred from Cartago, where the Courthouse had been wrecked by an earthquake in 1910, to San José, Mr. Carnegie offering another \$100,000 for a new building.”—*Annual Register*, 1911.

1916.—Inhabitants.—Causes of lack of union.—“Central American problems present elements of unusual complexity. Geographical and racial divisions make more difficult the questions usually arising in tropical countries. Though the states are comparatively small, they have not the elements of unity usually present in such communities. With the exception of Salvador, all the republics face both the Atlantic and Pacific. Communications between the sections marked off by the Continental divide is difficult, and railways are just beginning to bring a feeling of political unity between regions which, though under the same flag, have heretofore been highly contrasted in race-feeling and economic interests. The low-lying swamp east coast of Nicaragua, for example, has little in common with the comparatively high Pacific region. The inhabitants of the east coast are largely Indian; those of the west coast, to a greater degree, are Spanish. The characteristic industry of one section is the growing of bananas, the prosperity of the other depends upon the coffee trade. The economic bonds of the east coast are chiefly with the United States, from which also almost all the capital for internal development has come; the west coast is connected markedly with Europe. Similar contrasts can be drawn in the case of Guatemala and Honduras. Racially, the republics are in striking contrast to each other. The predominantly Spanish civilization of Costa Rica bears little resemblance to the seven-eighths-Indians Nicaragua. The boundaries of the states do not coincide with natural barriers which cross the region—a circumstance which has helped to foster plans of conquest on the part of factional leaders. In the long perspective of years, there is no reason for a group of states in Central America; it is a region of political divisions where there should be a political unity. That the various attempts at confederation have failed is an excellent example of the way in which particularistic sentiment, based on local patriotism, may establish standards inconsistent with the plain dictates of logic. Geographical, racial and political divisions all have contributed to keep Central America a boiling pot for the Century of its independence.”—

1921.—Plans for the formation of a Central American confederation.—“Very little have the papers of this country [United States] said in regard to the Central American Congress which has just ended its labors in San José, Costa Rica.

“We do not wish to entertain in our minds the idea that this public holds in little regard what has taken place in that memorable congress, for in that congress the destiny of a nation, friendly in all respects to this country, was shaped out. For many years the trend of opinion in the Central American republics—Guatemala, El Salvador, Honduras, Nicaragua and Costa Rica—has been very strong towards the reconstruction of the federal republic that was founded at the time of the segregation of these countries from Spain in 1821. The Federal Republic of Central America did not survive for many years. The causes are various, and we do not wish to dwell upon them. As a consequence of the destruction of the federation, the five independent republics came into existence—practically, since 1840. But here, again, we have an example where political frontiers cannot keep apart nations which are united by nature, in customs, traditions, history, race, language and material interest.

“As a consequence of this, the frontiers between these countries have served only for political purposes. In the hearts of the people there have never existed any frontiers between one and another. A citizen of Guatemala, for instance, is considered a Honduran citizen in Honduras, and enjoys all privileges as such. The Constitution of each republic is framed upon these lines. . . . The Congress of Costa Rica is the natural outcome of the strong sentiment in favor of the federation of those five republics. In former years, the chief, and we may say that only, obstacle to the Federation has been having five Presidents. Today the presidents are convinced that there is no use of dodging the issue. Destiny points out clearly the future of these countries, and this future will be found in the federation. The congress which we have so often mentioned was attended by delegates appointed by the five Presidents. They drew up an agreement to which the delegates of Guatemala, El Salvador, Honduras and Costa Rica subscribed. This agreement, which has already been approved by the Congress of Honduras, states that the republics are united in a perpetual and indissoluble union and will constitute a sovereign and independent nation named Federation of Central America. Upon the approval given to the covenant by the congress of each republic, each congress, while notifying the International Bureau of Central America (Oficina Internacional Centro Americana) of this approval, and this in turn notifying each republic, will elect two Provisional Delegates and fifteen Deputies. The approval of three republics will be sufficient to start the functioning of the new republic. Immediately after the notification given of this by the International Bureau of Central America, the Provisional Delegates will meet at Tegucigalpa, Honduras. The scope of their power will be that of the executive power. They will call the legislative body, formed of the fifteen Deputies of each State. This body will frame the final Constitution. The Provisional Delegates will also call the people to elect Delegates, Deputies and Senators, and swear them in,

thus ending their functions. As it may be seen, this is a novel plan of government in America. The Central Americans are willing to try it, it realizes our aspirations of federation. Nicaragua, alone, proved to be unwilling to join; nevertheless, we are all hopeful that the Government of that republic will soon see that it is to its interest to join.”—Julio Cesar Valle, Representing Honduras in the Comite Unionista Centro Americano de N. Y., *New York Times*, Feb. 24, 1921.

“The pact creating the union of Central American republics was signed by the delegates of Costa Rica, Guatemala, Honduras and Salvador at San José, the Costa Rican capital, on Jan. 22. The Nicaraguan delegates, instructed by their Government, refused to sign and withdrew from the conference. All five delegations had previously come to an agreement on the disputed article regarding treaties. Nicaragua did not wish to surrender treaty-making rights in view of her pact with the United States regarding a possible Nicaragua canal. A provision was inserted in the compact to permit her admission at any time, and Nicaragua on Feb. 8 announced that she was about to send a diplomatic mission to the other countries with a view to clearing up the disputed points.”—*New York Times Current History*, Mar., 1921, p. 541.

“Costa Rica, Salvador, Honduras and Guatemala have formed a confederation based upon the same kind of Government as that of Switzerland. [The new state would be more than ten times the size of Switzerland and the population about one-third larger.] The most important feature of the new political organization is to have the executive power in the hands of a council instead of a single personality. The President of this council will be the President of the confederation. But what is still more transcendent, from the point of view of our political failings, is the circumstance that the President of the council can only act one year in that capacity, and, after his term is over, he cannot be re-elected for the subsequent term. This is a powerful cure against the enthroning of despotic rulers, which, in Latin America, are always ushered in with much jingle and jangle, as patriotic servants of the people, but after a while are transformed, through the endemic hero-worship of the nationals, into insufferable little tyrants. The new confederation will give us a practical example of the advantages of placing the executive power in the hands of a group instead of a person, whereby the authority of each is curtailed.”—R. Munoz Tebar (*New York Times*, Feb. 8, 1921).—Guatemala has already abolished trade restrictions with the other republics.

1921 (October).—New Central American republic formed.—“On October 10, a new nation having an approximate area of 100,000 miles and a population of 4,000,000 came into existence . . . when the governments of Honduras, Guatemala and Salvador ceased to function and the Provisional Federal Council of the Central American Federation, composed of those countries, took charge. The government of the new nation will become operative on February 10, 1922, the Provisional Council operating until that time. Elections of federal councilors who will function in the government of the Central American Federation will be held in each of the three countries which will form a part of the new federation. Policarpo Bonilla, former President of Honduras, is being urged to become a candidate for the council. The new Republic lies between Mexico and Nicaragua, with Tegucigalpa as its capital. The pact for the union was signed early in January of this year at San José, Costa Rica, by the three-

mentioned states and Costa Rica, whose National Assembly rejected it later by a vote of 20 to 19.

"Nicaragua refused to sign the pact on account of differences with its neighbor states about the interpretation of the Bryan-Chamorro Treaty, which gave to the United States special right for the construction of a new interoceanic canal through its territory. Similar considerations apparently prevailed in Costa Rica, but in both countries the public opinion is divided and a Unionist party is endeavoring to bring about, some time, the union of Nicaragua and Costa Rica to the federation. If this comes to a fulfillment, the population of the new nation would be increased by 1,000,000 inhabitants and would extend its boundary to Panama. The union of these sister republics has been a national aspiration since 80 years ago when political troubles destroyed the Federal Republic of Central America, which, as a whole, liberated itself from the Spanish power in 1821 and maintained its unity until the forties. They speak the same language (Spanish), have the same religion (Roman Catholic), and are of the same race (predominantly Indian, except in Costa Rica, where the white race prevails). Since the Spanish conquest they have had identical legislation and the same culture. The treaty of union provides for a government modeled on the lines of the Constitution of the United States, with three separate branches—the executive, legislative and judicial; although the executive is modeled more on the Swiss system. A constitution embodying these provisions was finally approved by the Constituent Assembly which met in September at Tegucigalpa. In so far as it does not infringe on the federal Constitution, each state retains its autonomy and independence in the management and direction of its internal affairs and will carry on the governmental functions not specifically delegated to the federation."—*Christian Science Monitor*, Oct. 12, 1921.

1921 (December).—**Revolution in Guatemala.—Central American Union threatened.**—A revolution suddenly broke out in the morning of December 5, by which President Herrera of Guatemala was overthrown. Fighting occurred in the streets of the capital, resulting in the death of 25 persons, many being wounded. The President and his cabinet were made prisoners and a provisional government formed under General José María Lima, General Orellana and Miguel Larrave. It foreshadowed that the Union of October would be broken up. The Guatemalan Congress met on December 8, nullified all the legislation of the Herrera administration, and ratified the choice of Orellana as provisional president.

1922 (January-February).—**Collapse of the Union.**—An election of senators was held on January 7, in Guatemala; Orellana took the oath of provisional president and formed a new cabinet. The United States government addressed a note to Salvador and Honduras expressing a hope that those states would abide by their treaties with Guatemala. The Central American Federation collapsed on January 20, the Provisional Federal Council sitting at Tegucigalpa, Honduras, dissolving voluntarily. The Union flag was hauled down in Guatemala City and the Orellana government repudiated the federal plan. A quarrel ensued between Guatemalan rival representatives in New York, with the result that two separate agencies were set up in that city. On February 11, Honduras resumed its status as a sovereign republic. On the 15th, General Orellana was elected constitutional president of Guatemala, the elections being carried out with some disturbance.

1922 (March-August).—**Railroad extension.—Recognition of Orellana by United States.—Renewal of treaty of peace and amity of 1907.**—A new link in the International Railway of Central America was opened on March 17, when the first train from Zacatecoluca arrived at San Salvador, a distance of 45 miles. The railroad is intended to unite the Central American republics, and later to form part of the Pan-American Railway, completing an all-rail route between New York and Buenos Aires. President Orellana of Guatemala was recognized by the United States government on April 15. "An unusual event occurred on board the United States cruiser *Tacoma* Sunday night [August 20], three miles off shore in the neutral waters of the Gulf of Fonseca, when the Presidents of the Republics of Nicaragua, Honduras and Salvador, with the members of their cabinets and in the presence of the American Ministers to those republics, signed a treaty in which the three republics renewed and extended the general treaty of peace and friendship made in Washington in 1907 [see *ante*, 1907], the validity of which had until now been open to dispute. The treaty was signed by the three Presidents with their respective Ministers of Foreign Affairs, and the American Ministers signed as witnesses. The treaty is to remain in force, in so far as it affects relations between the republics, until it is revised. The Presidents promise that they will not permit political emigrants from any one of the republics to organize or foment armed invasion of any other, or tolerate any act which will disturb or threaten peace. Each republic undertakes to guard its frontiers and vigorously enforce the former agreement made at Washington. It is also provided that leaders of agitation, political emigrants or their agents shall not be permitted to live near frontiers. Such leaders living near frontiers will be placed under immediate surveillance and removed if this is thought necessary. In case of an invasion, the Government in whose territory it was organized is obligated to send forces to capture and disarm the guilty parties, who will be taken to the capital of that Government and punished in accordance with law. The Presidents also agree to call a conference to discuss economic matters, closer commercial relations, free exchange of products, and the unification of money, customs, tariffs and ways of communication, which may eventually result in a union of Central America. The Presidents agreed, in order that all Central America might enjoy the beneficial results of the treaty, that the Presidents of Guatemala and Costa Rica be invited to adhere to this agreement. A simple notification from either or both of these republics will be sufficient to make them subscribers to the treaty."—*New York Times*, August 23, 1922.—See also GUATEMALA; HONDURAS; NICARAGUA; LATIN AMERICA.

CENTRAL AMERICA, Constitution of.—

ARTICLE 1.—The Republics of Guatemala, Salvador, Honduras, and Costa Rica join in a perpetual and indissoluble union, and will henceforth constitute a sovereign and independent nation whose name shall be Federation of Central America.

It will be the right and duty of the federal power to maintain the union, and, in accordance with the federal constitution, internal order in the States.

ARTICLE 2.—The four States will convene

through deputies in a Constituent National Assembly, and here and now accept as the supreme law the constitution that may be framed by the said assembly in accordance with the stipulations of this treaty.

ARTICLE 3.—In so far as it may be consistent with the federal constitution, each State will preserve its autonomy and independence in the handling and direction of its domestic affairs, and likewise all the powers that are not vested in the Federation by the federal constitution. The constitutions of the States will remain in force in so far as they do not conflict with the provisions of the federal constitution.

ARTICLE 4.—So long as the Federal Government, through diplomatic action, shall not have obtained the modification, derogation, or substitution of the treaties in force between the States of the Federation and foreign nations, each State shall respect and continue faithfully to observe the treaties that bind it to any one or more foreign nations to the full extent implied in the existing agreements.

ARTICLE 5.—The Constituent National Assembly, in framing the federal constitution, will respect the following bases:—

(A) There shall be a federal district under the direct rule of the Federal Government. The Assembly will designate and mark out the territory that is constituted, and within that area will designate the town or place that is to be the political capital of the Federation. The State or States from which territory is taken to constitute the federal district here and now convey it gratuitously to the Federation.

(B) The Government of the Federation will be republican, popular, representative, and responsible. Sovereignty will reside in the nation. The public powers shall be limited, and must be exercised in accordance with the constitution. There will be three powers: The Executive, Legislative, and Judiciary.

(C) The executive power shall be exercised by a Federal Council composed of delegates elected by the people. Each State will elect a principal and an alternate of forty years of age or more, and native citizens of the State which elect them. The term of the Council will be five years.

The delegates and their alternates shall reside in the federal capital. The alternates will attend the meetings of the Council without a vote, but they shall cast their vote whenever the meeting is not attended by their principals.

In order to impart validity to the action of the Council, it is necessary that all the States be represented therein. The decisions are arrived at by a plurality vote except in cases where the constitution may call for a greater majority. In case of a tie the President will cast two votes.

The Council will elect from among the delegates a President and a Vice-President, whose term of office will be one year. The President of the Council cannot be re-elected for the year immediately following.

The President of the Council will be regarded as President of the Federation, but he will always act in the name and by a resolution or direction of the Federal Council.

The Council will apportion among its members in the manner it may deem most appropriate the handling of public affairs, and may put any one or more of the alternates in charge of any department which it may deem expedient. The constitution will determine the form in which foreign relations are to be conducted, and will complete the organization of the executive power.

(D) The legislative power will be vested in two houses: the Senate and the Chamber of Deputies. The Senate will consist of three Senators from each State, elected by the Congress thereof. The Senators shall be forty years of age or more, and citizens of any one of the States. Their term will be six years, and they will be renewed every other year in thirds. The Chamber of Deputies will consist of representatives elected by the people, one deputy for every 100,000 inhabitants or fraction of more than 50,000. The Constituent Assembly will determine the number of deputies to be elected by each State until a general census of the Federation is taken.

Senators and Deputies may be re-elected indefinitely. In each house three-fourths of the whole number of members will form the quorum.

No law will be valid unless it has been approved in the separate houses by a plurality of votes in the Chamber of Deputies, and by two-thirds of the votes of the Senators, and unless it has been sanctioned by the executive as the federal constitution may provide.

(E) The judicial power shall be exercised by a Supreme Court of Justice and by the lower courts that may be established by law. The Senate, from a list of twenty-one names submitted by the federal executive, will elect seven incumbent magistrates, who will constitute the court, and three alternates to fill the temporary absence of the incumbents. Vacancies will be filled by new elections of incumbents or alternates. The magistrates shall not be removed from office unless the removal be authorized by a judicial sentence.

The Supreme Court will have jurisdiction in disputes to which the Federation is a party; the legal controversies that may arise between two or more States; the conflicts that may occur between the powers of any one State or of the Federation as to the constitutionality of their acts, and of all other matters which may be referred to it by the federal constitution or the organic law.

The States having pending questions among themselves as to boundaries or the validity or execution of judgments or awards made before the date of this treaty will be at liberty to refer them to arbitration. The federal court may take cognizance of such questions in the capacity of arbitrator, if the States concerned should refer to its decision.

(F) The Federation guarantees to every inhabitant freedom of thought and conscience. There shall be no legislation on religious subjects. In all the States toleration of cults that are not against morals or public policy shall be an obligatory principle.

(G) The Federation recognizes the principle that human life is inviolable as to political and like offences, and guarantees all men equality before the law and the protection that the States must grant to destitute classes as also to the proletariat.

(H) The Federation guarantees the freedom of teaching.

Primary instruction shall be compulsory, and that which is given in public schools shall be free, under the direction and at the expense of the States.

Colleges of secondary instruction may be founded and supported by the Federation, the States, municipal governments, and private persons.

The Federation will create as soon as possible a national university and will give preference, with regard to their early establishment, to the sections of agriculture, industry, commerce, and mathematical sciences.

(I) The Federation likewise guarantees in every State the respect of individual rights as also the freedom of suffrage and the rotation in power.

(J) The army is an institution intended for national defence, and the maintenance of peace and public order; it is essentially a passive body, and may not engage in debates.

Soldiers on active duty shall have no right to vote.

The army will be exclusively under the orders of the Federal Council. The States shall not maintain any force other than of police for the maintenance of public order.

The garrisons which may be kept permanently or temporarily by the Federation in any State will be under the command of national chiefs that the Council shall freely appoint and remove; but if in any State there should occur a subversive movement or serious grounds may exist to apprehend a grave disturbance, those forces shall place themselves at the command of the government of the State. If those forces should be insufficient to suppress the rebellion, the government of the State will ask for, and the Council will supply, adequate reinforcements.

The Council shall have the free disposal of the armament and war material that may now exist in the States after those States shall have been supplied with the amount needed for the police force.

The States acknowledge it to be necessary and expedient that the Federation should reduce armaments and armies to a minimum in order that the excessive number of men employed upon them may be restored to agriculture and industry to the common good.

(L) The Federal Government will administer the national public finances, which will be different from those of the States.

The law will create federal revenues and taxes.

(M) The States will continue the service of their present domestic and foreign debts. It will be the duty of the Federal Government to see that the service is faithfully performed, and that the revenues pledged for that purpose be applied thereto.

Henceforward none of the States shall contract for or issue foreign loans without being authorized by a law of the State ratified by a federal law, nor shall it enter into contracts that may in any way compromise its sovereignty or independence or the integrity of its territory.

(N) The Federation shall not contract for or issue foreign loans without being authorized to do so by law approved by two-thirds of the votes in the Chamber of Deputies, and three-fourths of the votes in the Senate.

(O) The constitution may set a term after which the ability to read and write may be set up as an essential requisite for the exercise of the right of suffrage in the elections of federal authorities.

(P) The constitution will lay down the course through which amendments of its dispositions may be ordered. However, if the reform should make any change in any one of the bases set forth in this Article, it will be absolutely necessary, in addition to the other general requirements of the constitution, that the legislatures of all the States shall give their consent.

(Q) The constitution will determine and specify the subject that shall be an exclusive matter for federal legislation.

The Constituent National Assembly, in framing the constitution, will complete the plan and purpose of the said constitution, developing the foregoing bases, but in no way conflicting with them.

Immediately after the enactment of the constitution the Assembly will pass the complementary laws concerning the freedom of the press, habeas corpus, state of siege, which shall be held as part of the federal constitution.

ARTICLE 18.—It will be sufficient that three of the contracting States ratify this treaty to have it considered as final and binding among them, and to have it carried into effect. A State that does not ratify the covenant may, however, join the Federation at any time it applies therefor; and the Federation will admit it without any other formality than the presenting of a law approving this treaty, the federal constitution, and constituent laws. In that event the Federal Council and the two legislative houses will be enlarged in the proper degree.

ARTICLE 19.—The contracting States are sincerely sorry that the sister Republic of Nicaragua does not desire to join the Federation of Central America. If the said Republic should later decide to join the union, the Federation will extend the greatest facilities for its joining in the treaty that may be made for that purpose.

In any event the Federation will continue to consider and treat her as a part of the Central American family just as it will any State that for some reason or other should not ratify this covenant."—*Central American Republic (Contemporary Review, Literary Supplement, Oct., 1921, pp. 695-699).*

CENTRAL ASSEMBLY OF RESISTANCE TO OPPRESSION. See FRANCE: 1793 (June).

CENTRAL PARK, New York. See NEW YORK CITY: 1851-1920.

CENTRAL POWERS, name applied to the group of countries allied with Germany, during the World War. They included Germany, Austria-Hungary, Bulgaria and Turkey and controlled central Europe from the North Sea to Constantinople.—See also BAGDAD RAILWAY; BOSPORUS: 1878-1914; PAN-GERMANISM; TRIPLE ALLIANCE; WORLD WAR.

CENTRALIA RIOTS (Washington).—On November 11, 1919, a parade of veterans of the World War, marching through Centralia, Wash., was fired upon from a hall belonging to the Industrial Workers of the World, which some of the marchers are said to have tried to "rush." Three of the soldiers were killed and three wounded. A riot followed. Members of the I. W. W. were held responsible and put in jail. A party of citizens later attacked the jail and lynched one of the prisoners. In March, 1920, seven of the men were convicted of complicity in the murders and imprisoned in the county jail at Montesano, Washington.

CENTREVILLE, town in Virginia which was evacuated by the Southern troops in the early part of the Civil War. See U. S. A.: 1861-1862 (December-March; Virginia).

CENTRUM, Catholic political party in Germany. See GERMANY: 1900-1909; RIGHT, LEFT AND CENTER.

"CENTURIES OF SILENCE," term for the interval between the Old and New Testaments. See JEWS: B. C. 433-332.

CENTURIES, Roman, division of the army. See COMITIA CENTURIATA; EQUESTRIAN ORDER.

CENTURION, the officer commanding one of the fifty-five centuries or companies in a Roman legion of the empire. See LEGION, ROMAN.

CENTURY CLUB, New York. See CLUBS: 19th-20th centuries; New York.

CEORL, a common freeman, as distinguished from a privileged freeman (eorl), in the Anglo-Saxon social order. See ÆTHEL; ENGLAND: End of 6th century; EORL.

CEPEDA Y AHUMADA, Teresade (1515-1582), Spanish poetess. See SPANISH LITERATURE: 1500-1600.

CEPHISSUS, Battle of (1311). See CATALAN GRAND COMPANY.

CERAMICUS OF ATHENS.—The Ceramicus was originally the most important of the suburban districts of Athens and derived its name from the potters. "It is probable that about the time of Pisistratus the market of the ancient suburb called the Ceramicus (for every Attic district possessed its own market) was constituted the central market of the city. . . . They [the Pisistratidæ] connected Athens in all directions by roadways with the country districts: these roads were accurately measured, and all met on the Ceramicus, in the centre of which an altar was erected to the Twelve Gods. From this centre of town and country were calculated the distances to the different country districts, to the ports, and to the most important sanctuaries of the common fatherland. . . . [In the next century—in the age of Pericles—the population had extended to the north and west and] part of the ancient potters' district or Ceramicus had long become a quarter of the city [the Inner Ceramicus]; the other part remained suburb [the Outer Ceramicus]. Between the two lay the double gate or Dipylum, the broadest and most splendid gate of the city. . . . Here the broad carriage-road which, avoiding all heights, ascended from the market-place of Hippodamus directly to the city-market of the Ceramicus, entered the city; from here straight to the west led the road to Eleusis, the sacred course of the festive processions. . . . From this road again, immediately outside the gate, branched off that which led to the Academy. . . . The high roads in the vicinity of the city gates were everywhere bordered with numerous and handsome sepulchral monuments, in particular the road leading through the outer Ceramicus. Here lay the public burial-ground for the citizens who had fallen in war; the vast space was divided into fields, corresponding to the different battle-fields at home and abroad."—E. Curtius, *History of Greece*, bk. 2, ch. 2, and bk. 3, ch. 3.

ALSO IN: W. M. Leake, *Topography of Athens*, sect. 3.

CERAMIO, Battle of (1080). See ITALY (Southern): 1000-1000.

CERCHI, family in Florence which was the origin of the Bianchi political party. See FLORENCE: 1205-1300.

CERDIC, or Cedric (d. 534), founder of West Saxon kingdom. See ENGLAND: 477-527.

CERDONIANS, a sect of Gnostics which took its name from Cerdon, a Syrian who held that there were two first causes, one good, one evil. The evil principle was the Creator of the world; the good principle was the unknown Father of Jesus Christ. Later followers of the heresy gave the Creator an intermediate position between the good and evil first causes. Cerdon and his adherents rejected the entire Old Testament, the Acts of the Apostles, the Apocalypse, and all of the gospels (excepting a part of St. Luke. Parts of some of St. Paul's epistles were accepted. The name Cerdonians early gave way to that of Marcionites, so called from their leader Marcion, a pupil of Cerdon.

ALSO IN: J. C. Ayer, Jr., *Source book for ancient church history*, p. 103.

CEREMONIAL, one of the eleven Sacred Congregations of the Roman Catholic Church. See VATICAN: Present-day papal administration.

CERESTES, or Kerestes, Battle of (1596). See HUNGARY: 1595-1606.

CERIGNOLA, Battle of (1503). See ITALY: 1501-1504.

CERINTHIAN.—"One of the earliest of the judaizing Gnostics was Cerinthus, supposed to be a native of Alexandria, who is described as a contemporary and opposer of the Apostle John at Ephesus. His system contained a large admixture of Ebionitism. Yet he distinguished the maker of the world from God and the earthly Jesus from the heavenly Christ, who was connected with him in a temporary union."—G. P. Fisher, *History of the Christian church*, p. 76.—See also EBIONISM; GNOSTICS.

CERISOLES, Battle of (1544). See FRANCE: 1532-1547.

CERNAVODA, a city on the right bank of the Danube, in the Dobrudja, Rumania. It is on the railroad from Bucharest to Constanza; was taken by the Bulgar-Germans in 1910. See WORLD WAR: 1916: V. Balkan Theater: c, 6, ii.

CERRO GORDO, Battle of (1847). See MEXICO: 1847 (March-September).

CERVANTES SAAVEDRA, Miguel de (1547-1616), Spanish novelist and dramatist. His plays and interludes are many in number, but his genius was not essentially dramatic. His great and lasting work is "Don Quixote" (published about 1605), which contributes one of the great comic figures of the world's literature, and is the epitaph of medieval chivalry, as well as a minutely detailed picture of sixteenth century life. See SPANISH LITERATURE: 1500-1680.

CERVERA Y TOPETE, Pascual, conde de Jerez, marqués de Santa Anna (1839-1909), Spanish admiral and statesman. Placed in command of the squadron sent to America at the outbreak of the Spanish-American war; defeated in battle of Santiago harbor. See U. S. A.: 1898 (April-June); 1898 (July 3).

CERVIGNANO, town in the Austrian Alps, southwest of Gorizia, taken by the Italians in 1918. See WORLD WAR: 1918: IV. Austro-Italian theater: d.

CESARINI, one of the powerful families of Rome. See ROME: Modern city: 1600-1656.

CESCHI, Fra Giovanni, grand master of Order of St. John. See HOSPITALIERS OF ST. JOHN OF JERUSALEM: 1879.

CESENA, city in the province of Forli, Italy, scene of a massacre in 1372 by Hawkwood and the White Company; taken by the Venetians in 1503. See ITALY: 1343-1393; VENICE: 1494-1503.

CESEPDES Y BORGES, Carlos Manuel de (1810-1874), Cuban insurgent. In 1868 he was chosen president of the newly-proclaimed republic; but in 1874 was killed in a skirmish with the Spaniards. See CUBA: 1868-1878.

CESS, a word corrupted from "assess," signifying a rate, or tax; used especially in Scotland.

CESTI, Marc' Antonio (c. 1620-1660), Italian composer. A pupil of Carissimi. Chapel master in Florence 1646, in papal choir 1660, and vice chapel master in Vienna 1666-1669. Composer of opera and influenced its development in Italy. Manuscripts preserved in libraries at Rome; Paris and Oxford. See MUSIC: Modern: 1607-1734.

CETTE, a French Mediterranean port, about 100 miles west of Marseilles, to which as a port it ranks second on the south coast. It has a large wine trade.

CETTINJE, a small town of Jugo-Slavia, formerly capital of Montenegro; taken by the Austrians, January 13, 1916. Population, about 6,000. See BALKAN STATES: Map.

CEUTA, seaport in Morocco and military and convict station of Spain. It occupies the site of

an old Roman city called "Ad Septem Fratres." Later the city was captured by the Vandals, then by the Byzantines under Justinian, by the Goths, and finally (711), by the Arabs. In 1415 it was taken by the Portuguese under Prince Henry the Navigator, but yielded to Spain in 1580. See AFRICA: Ancient and Medieval civilization: Arab occupation; PORTUGAL: 1415-1460.

CEVENNES MOUNTAINS, France, the region of the Camisard (French protestant) uprising against Catholic oppression. See FRANCE: 1702-1710.

CEYLON: Location and size.—"Ceylon is situated between 5° 56' and 9° 50' north latitude, and between 80° and 82° east longitude; and, from the shape and position of the island, it has, with no less beauty than truth, been compared to a pearl-drop on the brow of the Indian continent. Its length is about 276 miles, its breadth about 103, and its circumference is about 900. The superficial area is nearly 24,000 square miles." The estimated population at the end of 1919 was 4,757,596. "The island is bounded on the north-[west] by the Gulf of Mannar, by which it is separated from the main land [southern India], and the Indian Ocean bounds its other shores."—H. C. Sirr, *Ceylon and the Cingalese*, pp. 218-219. See BRITISH EMPIRE: Extent; INDIA: Map.

Earliest history (B. C. 600-A. D. 1796).—First settlers.—Reign of Tissa.—Introduction of Buddhism.—Tamil wars.—Portuguese and Dutch conquests.—"About 600 B. C. the ancestors of the Sinhalese race swarmed into Ceylon from Bengal, and speedily made it their own. Of earlier inhabitants whom they supplanted, a few fast-disappearing remnants linger in the wilds, and are called Veddahs. The Sinhalese settled the country, founded towns, and made great tanks and irrigation works. They had large buildings profusely adorned with carved stone, at a time when the inhabitants of Britain knew no grander habitations than huts of wattle and mud."—L. B. Clarence, *Ceylon (British Empire series, v. 1, p. 434.)*—"In Asoka's time the ruler of Ceylon was Tissa, who began to reign about 251 B. C. It is reported that there existed a friendship between these two, since Tissa, without ever having seen the King of Magadha, had conceived an ardent admiration for him, owing to a description of his person and deeds. Directly after his accession to the throne, Tissa sent, therefore, an embassy to Asoka, and an embassy was sent to him in return. The latter is said to have come with the object of communicating to Tissa Asoka's Buddhist creed. In any case, it was from Asoka's kingdom that Buddhism was introduced into Ceylon. . . . At the beginning of the third century A. D., a tooth of the Buddha was brought as a relic from India to Ceylon, and a magnificent place was built for its reception. The holy tooth was removed later on to Pollunaruwa, which became the capital in the eighth century A. D.; and finally it was sent to Candy, where a spurious one (for the original tooth was destroyed) is venerated to the present day. In all important respects Buddhism remained unchanged in Ceylon from the early days, and its history is mainly that of changing circumstances (of which there were many), for it was closely bound up with the history of the Sinhalese rulers and their kingdom. . . . A fall in the political power of its patron meant invariably a corresponding fall in the position of Buddhism; whereas a more powerful and prosperous ruler added new lustre to religion. After a rapid declension, a great revival took place during the reign of the mighty ruler Parakrama-Bahu (in the twelfth century). But after the

Portuguese had laid a heavy hand on the island in the sixteenth century—to be displaced and robbed of their plunder later on by the Dutch, from whose hands Ceylon passed yet again to the British in 1796—Buddhism lost more and more of its ancient splendour. It still remained an important factor in the intellectual life of the island within its natural limits."—H. Hackmann, *Buddhism as a religion*, pp. 64-70.—"The Sinhalese were not long undisturbed in the island. After them there came in some Tamil invaders from Southern India, and between these two races there was much fighting. At last, in the sixth century A. D., the Sinhalese power waned rapidly; the Tamils overran the land, and the Sinhalese capital fell into their hands. Once, in the twelfth century, a strong Sinhalese king arose, who beat the Tamils back, and for a while restored the old Sinhalese power. He repaired their ancient buildings, added great works of his own, and even made successful foreign expeditions. . . . When he did there was no one strong enough to take his place, and the glory of the Sinhalese nation departed, never to return. At last the Sinhalese retreated into the southerly parts of the island, and the Tamils settled in the north, and so the two races dwelt apart when in 1505 a European invader first appeared. This was the Portuguese, who appeared on the west coast, attracted by the prospect of obtaining spice, especially cinnamon. They, with much bloodshed and savage cruelty, succeeded in establishing a string of forts and settlements all round the coast, especially on the west and south-west. They worked for two objects—to get spice, and to propagate their own religion. . . . They held these coast settlements, with pretty constant fighting, for about 150 years, but never got any permanent footing inland, and, commercially, the settlements cost them far more than they brought in. . . . The Portuguese were about 150 years in the island, and then, the Dutch turned them out. The Dutch held the settlements for about another 150 years, and then, in 1796, we [the British] turned them out. They, also, never gained any footing away from the coast. They strove hard to make a profitable trade in spice; and did all they could to efface all traces of the Portuguese and their religion, for they detested both with a hatred not to be wondered at in men whose forefathers had gone through blood and fire in the days of Philip the Second and the Inquisition. Their fortifications and churches and canals still remain, and they introduced into their settlements their own Roman-Dutch law."—L. B. Clarence, *Ceylon (British Empire series, v. 1), pp. 435, 436.*

1796-1848.—British rule.—In 1796 we [the British] succeeded to these coast settlements, but the interior was still unsubdued. . . . At first our new possession was placed under the East India Company; but that arrangement, though certainly the most natural, did not work smoothly. The Company's Civil Service was not then what it afterwards became. The officers entrusted with the administration of the Ceylon settlements were neither honest nor discreet. The Sinhalese rose in revolt, and when the revolt had been subdued the settlements were withdrawn from the Company's government, and made into a Crown colony under the Colonial office. Nearly twenty years afterwards, in 1815, we obtained possession of the rest of the country. . . . Until 1833 the interior and the coast settlements were separately administered, but then the whole island was placed on one footing. The form of government is in theory much the same as that of the Indian Presidencies. . . . Soon after the annexation of the interior a determined

revolt took place among the Kandyan Sinhalese. . . . The revolt was suppressed, but with difficulty, and at the expense of laying waste a great deal of country. After this task the opening up the country with roads and bridges was undertaken with great vigour; . . . roads soon overspread the island. There are now something like 4,000 miles of roads, and very good roads they are. In the wake of the roads followed public works of all sorts, and finally railways. There are now 300 miles of railway, and more in contemplation. The last attempt at native revolt was in 1848, and now that the country has become thoroughly opened up, revolt grows more and more unlikely. Even when India was shaken by the Mutiny, Ceylon remained tranquil."—*Ibid.*, pp. 437-441.—See also BRITISH EMPIRE: Treaties promoting expansion: 1815.

1915.—Serious riots.—Explanation by a native.—"Ceylon had up to [1915] . . . been very free from the type of political unrest which had long prevailed over a large part of India, but in June serious riots occurred, which were at least partly political in character. The riots broke out in Kandy, but spread to Colombo and other towns, and martial law had to be proclaimed in five provinces of the island. The rioting, which was almost exclusively confined to the Singalese—the Tamil coolies and Indian residents taking no part in the outbreak—was partly religious in its origin; the disturbances commenced on Buddha's birthday and the rioters attacked and looted the shops of the Indian Moslems. The fact that the riots broke out simultaneously in more than one place and that the natives attempted to interrupt railway communications pointed, however, to a definite plan for a concerted rising. The districts affected were kept under martial law for three months, and many of the Mohammedan shopkeepers returned in disgust to India."—*Annual Register*, 1915, pp. 294-296.—"The intolerance and aggressiveness of a small section of the Muhammadans known to the Sinhalese as 'Hambayas' (boatmen), and their insistence on the religious processions of the Sinhalese Buddhists passing in silence before their mosques in Gampola and Kandy, were the earliest of the causes of the recent riots in Ceylon, which began on the 29th May and ended on the 5th of June, 1915. . . . To understand still better the true dimensions of the riots, we have to remember that the present population of Ceylon is 4,220,000, and that, if as many as 20,000 rioters be said to have roused fear in 200,000 persons, the remaining four millions were passive spectators from a safe distance. It should also be borne in mind, in order to realise the intentions of the rioters, that even the very wicked among them did not raise a finger against Government Officers or other Europeans, or their property, and that they were not bent on killing anyone. Disloyalty and treason were not in their hearts. The rioters had no guns or ammunition to fight the forces of the Government, as the house-to-house search made by the military in towns and villages proved; and they had neither the means nor the sympathy of the respectable and well-to-do people to molest the Moors beyond a few minutes in each of the disturbed places."—P. Ramanathan, *Riots and martial law in Ceylon*, 1915, pp. 1, 52, 53.

ALSO IN: E. Tennants, *History of Ceylon*.—H. W. Cave, *Book of Ceylon*.—A. Clark, *Ceylon*.

1916-1922.—Results of riots.—Arrests and damage.—Constitutional changes.—[Ceylon] "passed through a quiet year, and there was no fresh outbreak of the fighting between the Moslem and non-Moslem elements of the population

which had been so serious in the previous year. Over 100 persons were killed in these riots, thirty-nine being murdered by the Singalese rioters, and sixty-three being killed by the police and troops during the suppression of the rising. Nearly 9,000 persons were arrested during the period of martial law, and 4,855 were convicted. The damage done to property amounted to 6,000,000 rupees [\$2,000,000]."—*Annual Register*, 1916, pp. 305-306. On Oct. 1, 1920, the Imperial Government issued the provisions for amendments to be introduced into the constitution, under which the legislative council was to be reformed to include a majority of unofficial members instead of a majority of official members, as was hitherto the case. As regards the executive council, the governor was instructed to appoint three additional unofficial members, while the modifications in the legislative council involved a considerable extension of the principle of popular election and gave the unofficial members a substantial majority over the official vote. Exclusive of the governor, who presides at the deliberations, the new legislative council numbers thirty-seven members—fourteen official and twenty-three unofficial, nineteen of the latter to be elected by various constituencies, and four nominated. Special powers are reserved to the governor to be exercised in certain emergencies, including authority to appoint not more than three unofficial members to represent interests inadequately provided for. The governor is to have both an original and a casting vote, to be used at his discretion; in the event of a deadlock the governor may declare the passing of any measure to be of paramount importance to the community, in which case the measure may be carried by the votes of the official members alone. There was some opposition to the scheme, particularly on the part of the Ceylon National Congress, which resolved to boycott the measure.

1919-1920.—New educational system.—A board of education was established in 1919 under a new ordinance, which also stipulated that new regulations must be laid before the legislative council for approval before being confirmed by the governor in executive council. The Board is to consist of from 16 to 20 members nominated by the governor and to hold office for three years. The department is under the control of a director, assistant-director, and a staff of inspectors. The vernacular schools operating in 1920 were—895 government schools, 1,868 aided schools, 1,350 unaided schools, besides 278 English and Anglo-vernacular schools. In vernacular schools education is free, while fees are charged in English schools. There are also eighty-four industrial schools. The government gives three scholarships with fares to England. Plans were put forward in 1919 to affiliate Ceylon University College to Oxford University. The construction of a new Royal College was begun in 1920. In the same year there were 446 pupils attending the technical schools of the island.

1921.—British reforms. See BRITISH EMPIRE: Colonial and imperial conferences: 1921: India's representative, etc.

1921-1922.—Decennial census.—The decennial census of Ceylon was taken on March 18, 1921. According to the provisional figures published in 1922, the population showed an increase of 0.5 per cent since the census of 1911, and revealed a total of 4,504,283, exclusive of the military and shipping personnel. These latter two classes were returned as numbering 6,684. The European residents numbered 8,421; Singalese, 3,016,423; Tamils, 1,120,478; Moors, or non-Malay Mohammedans, 284,704; Burghers, 28,923; Malays, 13,745; Veddahs, 4,402, and 20,500 of other races. The popu-

lation of the principal towns was: Colombo, 244,100; Galle, 39,000; Jaffna, 42,400, and Kandy, 32,000. The provisional statistics regarding adherents of the principal religions state that there were 2,770,000 Buddhists, 982,000 Hindus, 302,000 Mohammedans and 444,000 Christians.

CEZANNE, Paul, French Post-Impressionist. See PAINTING: Europe (10th century).

CHACABUCO, Battle of (1817). See CHILE: 1810-1818.

CHACO, stretch of territory in northeast Argentina, extending also into Paraguay and Bolivia. See PARAGUAY: Name.

CHAD, or Tchad, Lake, a large shallow lake in the Sudan, Africa. It is surrounded by French and British territory. The lake is largely choked with vegetation and is yearly decreasing in area. See AFRICA: Modern European occupation: 19th century; CAMEROONS: Exploration of the interior.

CHÆRONEA, Battles of. See GREECE: B. C. 357-336; MITHRADATIC WARS.

CHAFFARINAS, Zaffarines or Zafarin islands (the *Tres Insulæ* of the Romans, *Zafran* of the Arabs), a group of three small islands lying close to the northeastern coast of Morocco. They were occupied by the Spanish in 1848 just a few days before a French expedition arrived to annex them to Algeria. The central island, Isabella II, is fortified, and the Spanish government is uniting it by breakwaters with the nearby island of El Rey, thus forming an excellent harbor for deep-water vessels.

CHAGAN, identified with the word khan. See KHAN.

CHA'HTA INDIANS. See MUSKHOGEAN or MASKOKI FAMILY.

CHAIT SINGH, raja of Benares, who revolted against Warren Hastings' rule in India. See INDIA: 1773-1785.

CHAKK, tribe of ancient warriors in Kashmir. See KASHMIR.

CHAKRABERTY, Chandra Kanta, Indian doctor in charge of German revolutionary propaganda against the Allies who was tried and convicted in the United States. See U. S. A.: 1914-1917.

CHALCEDON, an ancient Greek city, founded by the Megarians on the Asiatic side of the Bosphorus, nearly opposite to Byzantium. It was besieged by the Persians in 616. See PERSIA: 226-627.

Council of (451). See ABYSSINIAN CHURCH; CHRISTIANITY: 312-337.

CHALCIDICE, in ancient geography the most important peninsula of Macedonia, jutting out into the Ægean sea. It was settled about the seventh century B. C. by the Euboeans, and its chief cities were Olynthus and Potidea. One of the three projecting peninsulas, in which Chalcidice ends, is the famous Athos, with its huge mountain rising directly from the water's edge to a height of 6,349 feet, where there has been a community of monks since the Middle Ages. See GREECE: Map of ancient Greece.

In Peloponnesian War. See GREECE: B. C. 424-421.

CHALCIDICE LEAGUE, union of cities on the Chalcidice peninsula of ancient Greece, of which Olynthus was an important member. The league arose about 421 B. C. but became more prominent after the Peloponnesian War. See GREECE: B. C. 4th century.

CHALCIS AND ERETRIA.—"The most dangerous rivals of Ionia were the towns of Eubœa, among which, in the first instance, Cyme, situated in an excellent bay of the east coast, in a district

abounding in wine, and afterwards the two sister-towns on the Euripus, Chalcis and Eretria, distinguished themselves by larger measures of colonization. While Eretria, the 'city of rowers,' rose to prosperity especially by means of purple-fisheries and a ferry-navigation conducted on a constantly increasing scale, Chalcis, the 'bronze city,' on the double sea of the Bœotian sound, contrived to raise and employ for herself the most important of the many treasures of the island—its copper. . . . Chalcis became the . . . Greek Sidon. Next to Cyprus there were no richer stores of copper in the Greek world than on Eubœa."—E. Curtius, *History of Greece*, bk. 2, ch. 3.—The Chalcidians were enterprising colonists, particularly in Thrace, in the Macedonian peninsula and in southern Italy and Sicily. It was the abundant wealth of Thrace in metallic ores which drew the Chalcidians to it. About 700 B. C. a border feud between Chalcis and Eretria, concerning certain 'Lelantian fields' which lay between them, grew to such proportions and so many other states came to take part in it, that, "according to Thucydides no war of more universal importance for the whole nation was fought between the fall of Troja and the Persian war."—*Ibid.*, v. 1, bk. 2, ch. 1.—Chalcis was subdued by the Athenians in B. C. 506. See ATHENS: B. C. 509-506; EUBŒA.

CHALDEA, CHALDEANS.—"The origin of the Chaldeans is obscure, but some facts concerning them may be considered as fairly well known. They invaded Babylonia from the south, coming from the neighborhood of the Persian Gulf. [See BABYLONIA: Earliest inhabitants.] Whence they had come into the Sea Lands at that point is nearly as well known by a process of elimination. They could not have come from Elam, and they must therefore be settlers from Arabia. From what part of that old home land of Semites they had come is not known. It is, however, clear that they were Semites. They bore Semitic names, as far as any of their names are known to us, and they readily adapted themselves to Semitic customs, whether of religion, government, or social life. [See SEMITES: Primitive Babylonia.] Their appearance in Babylonia was at an early date, and they had gradually spread in scattered communities over a considerable portion of the country, both north and south. In this they form a close parallel to the Aramæans, who belonged, indeed, to the same general wave of migration as themselves, and had early proved dangerous neighbors to the Assyrians."—R. W. Rogers, *History of Babylonia and Assyria*, v. 2, pp. 301-305.—Although the date of their earliest appearance is not known, some of the dynasties of the eleventh century B. C. were probably Chaldean. In 803 B. C. Adadnari III was receiving tribute from Chaldean princes and between 812-783 B. C. the term "Mat-Kaldu" was applied to all Babylonia.—See also BABYLONIA: Early (Chaldean) monarchy.

"The chief stronghold of the Chaldeans was the territory known as the Sea Lands. This country was somewhat larger than the alluvial lands about the mouths of the rivers, as it apparently included a strip of territory of unknown extent along the Arabian coast of the Persian Gulf. It had a government and a history of its own, running back through the centuries, of which, however, only fragments are known to us. That part of its history which is known is little more than a story of a half-nomad, half-agricultural and pastoral people who kept up a running fire of efforts to possess themselves of the rich lands and wealthy cities of their more fortunate Babylonian neighbors. The other Chaldean communities have left

even less mark of their individuality upon history. They formed, indeed, principalities, which the boastfulness of Assyrian kings has elevated into large kingdoms and endowed with great armies, and with forces which could only be overcome by the might of the great god Asshur. Like their more numerous fellows in the Sea Lands, these also were anxious chiefly to find a leader who could give into their hands the possessions of the Babylonians. Any prince of one of these small states or communities who could win battles over the native Babylonians was sure of a following of Chaldeans generally, and not merely of the men of his own community. This was the surest way of coming out of the limitations of a petty principedom in Bit-Yakin, or in the Sea Lands, and of becoming the king of Kaldi Land. A man who could gain the title of king of Babylon or of king of Sumer and Accad would stand so much above his fellow-princes among the Chaldeans that he might well be called by the lesser title of king of Kaldi. This fact goes far to explain the constant attempts of Chaldean princes upon Babylon. They were not moved by a sentimental appreciation of the glories of Babylon and its ancient royal titles, as were Tiglathpileser III and Sargon. They thirsted for power over the Babylonians because it brought wealth and ease, and with these headship among their own Chaldean peoples. This leadership among the Chaldeans had, however, more than once wrecked their hopes, when by contact with Babylonians they had learned more of the beauty and dignity of Babylonian civilization and come to recognize in the title an expression not so much of wealth as of honor, a headship in civilization. From such ideas they were dragged down by the Chaldean population, who thirsted after the wealth and demanded that they should receive the well-cultivated lands and the city property. These demands had been measurably granted by Merodach-baladan, and as a direct consequence of this compliance his new rule was promptly shattered by the Assyrians, and Chaldean supremacy was postponed."—*Ibid.*—Merodach-baladan, prince of Bit-Yakin, the ancient capital of the Sea Lands, took Babylon in 721 B. C. and held the title of king of Babylon until 709 B. C. He made a second attempt to take the city in 702 B. C., but was driven out by the powerful Assyrian, Sennacherib.—"As we have already said, however, the Chaldeans had not disappeared during the period of the Assyrian supremacy over Babylonia. They existed in great numbers in Babylonia, and were only awaiting the day when they should be able to produce the man strong enough to seize or to create a favorable opportunity, as Merodach-baladan had done, by which they might again rule. Of the Chaldean communities which had not been absorbed by the Babylonians the kingdom or principality of the Sea Lands was at this time still the largest and strongest. North of it were a number of Chaldean tribes, among which Bit-Silani, Bit-Sa'alli, and Bit-Sala had long been the most prominent, for their names find mention in the inscriptions of Tiglathpileser III. Indeed, were it not for his records and the Annals of the later Assyrian kings, we should know even less than we do of the Chaldeans. The Babylonian inscriptions, devoted to temples, palaces, and canals, ignore their very existence, and when they came to dominion themselves they acted in all things as Babylonians. Above these tribes going northward were the communities of Bit-Amukkani, out of which came Ukin-zer, and of Bit-Adini, which lay just south of the city of Babylon. Even here the line of Chaldean communities did not cease, for the tribe

of the Bit-Dakkuri was established north of the great capital city. These Chaldean communities, though they were Semites, were, nevertheless, alien communities. They did not, as a rule, intermingle readily with the Babylonians, or they would all long since have been absorbed. Though settled in a land which had been tilled for many centuries, they still remained half-nomads. The land was not overpopulated, and if they had desired to settle down as quiet and peaceable agriculturists, there would have been plenty of room for them. They did not accept this opportunity, but over and over again had been disturbers of the peace, eager to gain the complete control, and desirous not of making a destiny for themselves, but wishing to rob the Babylonians of that which the industry of ages had accumulated by slow and painful steps. In the attainment of this purpose they had been defeated before the Assyrians. There was now a larger hope, for Assyrian vitality was gone and the whole vast empire was falling to pieces. . . . Babylonian vitality was also at the lowest ebb, and could offer no effectual resistance to any sharp blow delivered by a strong arm. But, though the Chaldeans must have known of the evident decay of Assyria, they were too wily to rise again in rebellion in an inopportune time. They could not be sure that Asshurbanapal [668-c. 626 B. C.] did not possess resources which might be directed against them with crushing force, and they well knew that no movement of his was tempered with mercy."—R. W. Rogers, *History of Babylonia and Assyria*, v. 2, pp. 301-305.—"But as so often before, so it was now, change of rulers gave opportunity to a Chaldean to grasp the throne of Babylon. From 625 the lists designate NABU-APLU-UISUR, 625, or, as the name has come down to us through the Greeks somewhat distorted, as other names and facts delivered to us from the same source, Nabopolassar. He was a Chaldean, but we do not know which was his native state. He is the first of the last dynasty of Babylon, which raised her again to the leading power of Western Asia and extended her dominion once more as far as the Mediterranean. In the uninterrupted struggle between Assyria and the Chaldeans over Babylon the latter were eventually victors, after their efforts were repeatedly thwarted for a couple of centuries. Babylonia was not Chaldean. The Chaldean migration had reached its goal and therewith also its end. . . . But this result was not won through an awakening of the power of the Babylonian people. Babylon was, as she had been for centuries, in the hands of conquerors who sought historical eclat for their power through the ancient renown of this home of culture. In the centuries of conflict between Assyrians and Chaldeans the oft defeated but undeterred intruder won in the end. Nebuchadnezzar [son of Nabopolassar], before whom Palestine now trembled, was a Chaldean. The Old Testament, also, in its contemporary records, designates these representatives of the last Babylonian dynasty as Chaldeans."—H. Winckler, *History of Babylonia and Assyria*, pp. 125, 126; 315.—See also BABYLONIA: Later empire.

Wise men of the East.—Skill in astrology.—Discoveries in mathematics and astronomy.—"The Chaldeans were devout believers in astrology, a form of superstition into which an astronomical religion like Sabeism is very apt to degenerate. For once it is taken for granted that the stars are divine beings, possessed of intelligence, and will, and power, what more natural than to imagine that they can rule and shape the destinies of men by a mysterious influence? This influence was supposed to depend

on their movements, their position in the sky, their ever changing combinations and relations to each other; under this supposition every movement of a star—its rising, its setting, or crossing the path of another—every slightest change in the aspect of the heavens every unusual phenomenon—an eclipse, for instance—must be possessed of some weighty sense, boding good or evil to men, whose destiny must constantly be as clearly written in the blue sky as in a book. If only one could learn the language, read the characters! Such knowledge was thought to be within the reach of men, but only to be acquired by the exceptionally gifted and learned few, and those whom they might think worthy of having it imparted to them. That these few must be priests was self-evident. They were themselves fervent believers in astrology, which they considered quite as much a real science as astronomy, and to which they devoted themselves as assiduously. They thus became the acknowledged interpreters of the divine will, partakers, so to speak, of the secret councils of heaven. Of course such a position added greatly to their power, and that they should never abuse it to strengthen their hold on the public mind and to favor their own ambitious views, was not in human nature. Moreover, being the clever and learned ones of the nation, they really were at the time the fittest to rule it—and rule it they did. . . . The three great branches of religious science—astrology, incantation and divination—were represented by three corresponding classes of 'wise men,' all belonging, in different degrees, to the priesthood: the star-gazers or astrologers, the magicians or sorcerers, and the soothsayers or fortune-tellers. . . . When the Babylonian empire ceased to exist and the Chaldeans were no longer a nation, these secret arts continued to be practised by them, and the name 'Chaldean' became a by-word, a synonym for 'a wise man of the East,'—astrologer, magician or soothsayer. They dispersed all over the world, carrying their delusive science with them, practising and teaching it, welcomed everywhere by the credulous and superstitious, often highly honored and always richly paid. Thus it is from the Chaldeans and their predecessors the Shumiro-Accads that the belief in astrology, witchcraft and every kind of fortune-telling has been handed down to the nations of Europe, together with the practices belonging thereto, many of which we find lingering even to our day among the less educated classes. The very words "magic" and 'magician' are probably an inheritance of that remotest of antiquities. One of the words for 'priest' in the old Turanian tongue of Shumir was *imga*, which, in the later Semitic language, became *mag*. The *Rabmag*—'great priest,' or perhaps 'chief conjurer,' was a high functionary at the court of the Assyrian kings. Hence 'magus,' 'magic,' 'magician,' in all the European languages, from Latin downward. [See PRIESTHOOD: In Semitic religions (non-Jewish).] There can be no doubt that we have little reason to be grateful for such an heirloom as this mass of superstitions, which have produced so much evil in the world and still occasionally do mischief enough. But we must not forget to set off against it the many excellent things, most important discoveries in the province of astronomy and mathematics which have come to us from the same distant source. To the ancient Chaldeo-Babylonians we owe not only our division of time, but the invention of the sundial, and the week of seven days, dedicated in succession to the Sun, the Moon, and the five planets—an arrangement which is still maintained, the names of our days being merely that; there were days set apart and kept holy, as

days of rest, as far back as the time of Sargon of Agadê; it was from the Semites of Babylonia—perhaps the Chaldeans of Ur—that both the name and the observance passed to the Hebrew branch of the race, the tribe of Abraham. George Smith found an Assyrian calendar where the day called *Sabattu* or *Sabattuv* is explained to mean 'completion of work, a day of rest for the soul.'—Z. A. Ragozin, *Chaldaea*, pp. 233-236.—See also ASTRONOMY: Early History.

Monetary system. See MONEY AND BANKING: Ancient Egypt and Babylonia.

CHALDIRAN, Battle of (1514). See BAGDAD: 1303-1638; TURKEY.

CHALLENGER, corvette sent out by the British government in 1872-1876 for oceanic exploration. See ANTARCTIC EXPLORATION: Map of Antarctic regions.

CHALLONER, Richard (1601-1781), English Catholic prelate, author of numerous devotional works including a revision of the Douai Bible. See BIBLE, ENGLISH: Bible used in Roman Catholic churches.

CHALON-SUR-SAONE, an ancient city of east-central France, eighty miles north of Lyons. In the sixth century was the capital of Burgundy; in 1814 offered stout resistance to the Austrians.

CHALONS-SUR-MARNE, a city of north-eastern France, about twenty-five miles south-east of Rheims. In 451 Attila was defeated between Châlons and Troyes; in the thirteenth and fifteenth centuries the town was the scene of conflict; in 1856 Napoleon III established a large camp nearby; in 1870 Marshal MacMahon formed here the army of Châlons which later capitulated at Sedan; in 1914 the Germans captured the city and held it until the battle of the Marne.

Battle of (271). Among the pretenders who aspired to the Roman imperial throne—"the thirty tyrants," as they were called—of the distracted reign of Gallienus, was Tetricus, who had been governor of Aquitaine. The dangerous honor was forced upon him, by a demoralized army, and he reigned against his will for several years over Gaul, Spain and Britain. At length, when the iron-banded Aurelian had taken the reins of government at Rome, Tetricus secretly plotted with him for deliverance from his own uncoveted greatness. Aurelian invaded Gaul and Tetricus led an army against him, only to betray it, in a great battle at Chalons (271), where the rebels were cut to pieces.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 11.

Battle of (451). See BARBARIAN INVASIONS: 423-455; HUNS: 451.

CHALUKYA, Indian dynasty which ruled in the Deccan. See INDIA: B. C. 240-A. D. 1200.

CHALUS, a castle near Limoges in south-central France. In 1199, while besieging it, Richard I of England was mortally wounded by a bolt from a cross-bow.

CHALYBES.—The Chalybes, or Chalybians, were an ancient people in Asia Minor, on the coast of the Euxine, probably east of the Halys, who were noted as workers of iron.—E. H. Bunbury, *History of ancient geography*, ch. 22, note A.

CHAMAVI, Germanic tribe. See BRUCTERI.

CHAMBALA, a town of (former) German East Africa, occupied by the British in 1916. See WORLD WAR: 1916: VII. African theater: a, 13.

CHAMBERLAIN, Austen (1863-), English statesman, son of Joseph Chamberlain; 1895-1900, civil lord of admiralty; 1902-1908, postmaster-gen-

eral; 1903-1905, chancellor of the exchequer; 1915-1916, secretary of state for India; 1918, member of war cabinet; 1919, again became chancellor of the exchequer.

CHAMBERLAIN, Daniel Henry (1835-1907), governor of South Carolina, 1874-1876; succeeded in checking political corruption during his administration. See **SOUTH CAROLINA**: 1873-1877.

CHAMBERLAIN, Joseph (1836-1914), English statesman. Thrice mayor of Birmingham; 1880-1885, president of board of trade; 1886, president of local government board; 1895-1903, secretary of state for colonies, during which time he presided over the colonial conferences of premiers. His main aims were to develop the resources of the colonies and to bring them into closer relation with the mother country. He advocated colonial preference, resigning his office in 1903 to promote tariff reform.—See also **ENGLAND**: 1804-1895 (March-September); 1900 (November-December).

CHAMBERS OF COMMERCE, Congress of (1909), meeting of members from the British empire at New South Wales. See **BRITISH EMPIRE**: Colonial and imperial conferences: 1909 (September).

CHAMBERSBURG, borough and county seat of Franklin county, Pennsylvania. During the Civil War it was burned by the Confederates, July 30, 1864, upon the citizens' refusal to pay ransom. See **U. S. A.**: 1864 (July: Virginia-Maryland).

CHAMBORD, Henri Charles Ferdinand Marie Dieudonné d'Artois, comte de (1820-1883), duc de Bordeaux, French prince, grandson of Charles X, called "Henry V." In 1873, a monarchist majority of the National Assembly offered him the throne as Bourbon Legitimist. He agreed to certain of the conditions but refused to accept the tricolor flag in place of the white standard of the Bourbons, symbol of absolutism and divine right.

CHAMERY, village of France southwest of Rheims, occupied by the Allies in 1918. See **WORLD WAR**: 1918: II. Western front: h.

CHAMICOCO, South American Indian tribe. See **GUCK OR COCO GROUP**.

CHAMORRO, Salvador, president of the Nicaraguan Chamber of Deputies; representative at the Peace Conference. See **VERSAILLES, TREATY OF**: Conditions of peace.

CHAMORRO-BRYAN TREATY, a treaty between Nicaragua and United States concerning the canal route. See **NICARAGUA**: 1913-1916.

CHAMPAGNE (Latin, *Campania*), country of the plains, a large district in the north of France. In the middle years of the revolt that dethroned the Carolingians and raised the Capetians to a throne which they made the throne of a kingdom of France, Count Herbert of Vermandois allied

himself with the party of the latter, and began operations for the expanding of his domain. "The Campaign of Rheims, the 'Campania Remensis'—a most appropriate descriptive denomination of the region—an extension of the plains of Flanders—but not yet employed politically as designating a province—was protected against Count Herbert on the Vermandois border by the *Castrum Theodorici*—Château Thierry. . . Herbert's profuse promises induced the commander to betray his duty. . . Herbert, through this occupation of Château Thierry, obtained the city of Troyes and all the 'Campania Remensis,' which, under his potent sway, was speedily developed into the magnificent County of Champagne. Herbert and his lineage held Champagne during three generations, until some time after the accession of the Capets, when the Grand Fief passed from the House of Vermandois to the House of Blois."—Sir F. Palgrave, *History of Normandy and England*, v. 2, p. 192.—See also **FRANCE**: Maps of medieval period: 1154-1360.—The province ceased to be independent in 1314 when Count Louis Hutin, eldest son of Philip the Fair and Joan of Navarre (who was heiress of Champagne), became Louis X of France. The modern departments of Ardennes, Aube and Haute-Marne, Marne, part of Aisne, Seine-et-Marne, Yonne and Meuse have been formed from the old province. The country is drained and watered by the Aisne. The Oise, the Marne and the Seine. The wine known as champagne is chiefly produced in Aube, Ardennes, Haute-Marne and Marne.

1911.—Revolt of wine growers. See **FRANCE**: 1911.

1909.—Tercentenary celebration of the discovery. See **NEW YORK**: 1909.

CHAMPLAIN CANAL. See **BARGE CANAL, New York State**.

CHAMPOLLION, Jean François (1700-1832), French Egyptologist; 1821, first deciphered Egyptian hieroglyphics; 1824, sent by the French government to study the museums of Italy and appointed director of the Egyptian museum at the

Louvre; 1828, conducted a scientific expedition to Egypt and upon his return became professor of Egyptology at the Collège de France. See ALPHABET: Deciphering the hieroglyphics; HIEROGLYPHICS, EGYPTIAN; PHILOLOGY: 12.

CHAMPS DE MARS, or **Champs de Mai**.—When the Merovingian kings of the Franks summoned their captains to gather for the planning and preparing of campaigns, the assemblies were called at first the Champs de Mars, because the meeting was in earliest spring—in March. "But as the Franks, from serving on foot, became cavaliers under the second [the Carolingian] race, the time was changed to May, for the sake of forage, and the assemblies were called Champs de Mai."—E. E. Crowe, *History of France*, ch. 1.—See also FRANCE: 1791 (July-September); PARLIAMENT OF PARIS.

CHAMPS ELYSEES, the fashionable promenade of Paris. It extends about 1 1/3 miles, from the Place de la Concorde to the Arc de Triomphe de l'Etoile. It was laid out by Marie de Medici in 1616.

CHANAK, a fort on the east shore of the Narrows of the Dardanelles. In 1915 it was unsuccessfully bombarded by the Allied fleet in an attempt to force the passage of the strait.

CHANCAS, South American Indian tribe. See PERU: Paternal despotism of the Incas.

CHANCELLOR, Richard (d. 1556), an English navigator and explorer. In 1553 he was pilot-general of Sir Hugh Willoughby's expedition of several ships to find a northeast passage to China. Chancellor was the only one to bring his ship through (the crews of the others all perished); he continued the voyage to the White Sea, entered the northern Dvina, and travelled thence overland to Moscow, where he obtained trade concessions from the tsar, Ivan the Terrible. Chancellor was drowned on a second voyage to that region.

CHANCELLOR: British.—"The name [chancellor], derived probably from the cancelli or screen behind which the secretarial work of the royal household was carried on, claims a considerable antiquity; and the offices which it denotes are various in proportion. The chancellor of the Karolingian sovereigns, succeeding to the place of the more ancient referendarius, is simply the royal notary; the archi-cancellarius is the chief of a large body of such officers associated under the name of the chancery, and is the keeper of the royal seal. It is from this minister that the English chancellor derives his name and function. Edward the Confessor, the first of our sovereigns who had a seal, is also the first who had a chancellor; from the reign of the Conqueror the office has descended in regular succession. It seems to have been to a comparatively late period, generally if not always, at least in England, held by an ecclesiastic who was a member of the royal household and on a footing with the great dignitaries. The chancellor was the most dignified of the royal chaplains, if not the head of that body. The whole secretarial work of the household and court fell on the chancellor and the chaplains. . . . The chancellor was, in a manner, the secretary of state for all departments."—W. Stubbs, *Constitutional history of England*, ch. 11, sect. 121.—"In the reign of Edward I. we begin to perceive signs of the rise of the extraordinary or equitable jurisdiction of the Chancellor. The numerous petitions addressed to the King and his Council, seeking the interposition of the royal grace and favour either to mitigate the harshness of the Common Law or supply its deficiencies, had been in the

special care of the Chancellor, who examined and reported upon them to the King. . . . At length, in 1348, by a writ or ordinance of the 22d year of Edward III, all such matters as were 'of Grace' were directed to be dispatched by the Chancellor or by the Keeper of the Privy Seal. This was a great step in the recognition of the equitable jurisdiction of the Court of Chancery, as distinct from the legal jurisdiction of the Chancellor and of the Courts of Common Law; although it was not until the following reign that it can be said to have been permanently established."—T. P. Taswell-Langmead, *English constitutional history*, pp. 173-174.—"The Lord Chancellor is a Privy Councillor by his office; a Cabinet Minister; and, according to Lord Chancellor Ellesmere, prolocutor [chairman, or Speaker] of the House of Lords by prescription."—A. C. Ewald, *Crown and its advisers*, lecture 2.

ALSO IN: E. Fischel, *English constitution*, bk. 5, ch. 7.

"The Lord High Chancellor of England corresponds to the Chief Justice of the United States Supreme Court in some respects, and to our Vice-President in others. He is the highest judicial officer of the realm, as well as the presiding officer of the House of Lords. The Lord Chancellor, however, has other important functions which the American officials do not possess. He is always a member of the Cabinet, and usually, though not of necessity, a member of the House of Lords. It is customary to elevate a commoner to the peerage when appointed to this office. The post is one of great dignity and carries with it important patronage."—T. F. Moran, *English government*, p. 75.—"The judges of the county courts are appointed, and may be dismissed by the Lord Chancellor, who may, with the rule Committee of the judges make rules for their procedure."—W. R. Anson, *Law and custom of the constitution (Crown, v. 1, p. 270)*.—"The Chancery Division [of the High Court of Justice] consists of the Lord Chancellor, who presides, and five judges. . . . All the judges of the High Court (twenty-one in all) are appointed by letters patent under the Great Seal, on the advice of the Chancellor."—*Ibid.*, p. 268.—"He is responsible for the appointment of the judges of the High Court, for the placing of the names on the Commission of the Peace, and for their removal in case of need. . . . Besides his duties as a judge, and his responsibility for many judicial and some ecclesiastical appointments, the Chancellor is the head of the office in which his first duties began. . . . It is in the Crown Office in Chancery that the Great Seal is for most purposes affixed. . . . [See EQUITY LAW: 1461-1483: Jurisdiction of chancery.] The Chancellor is directly responsible in all cases for the use of the Great Seal [see EQUITY LAW: 506]. The ultimate expression of the will of the sovereign. . . . He is, however, only Chancellor for Great Britain. . . . There is a Lord Chancellor for Ireland."—*Ibid.*, v. 2, pp. 154, 155.—See also EQUITY LAW: 1066-1154, 1272-1307 and 1348.

Of the Exchequer.—In England in the reign of Henry III (1216-1272), "was created the office of Chancellor of the Exchequer, to whom the Exchequer seal was entrusted, and who with the Treasurer took part in the equitable jurisdiction of the Exchequer, although not in the common law jurisdiction of the barons, which extended itself as the legal fictions of pleading brought common pleas into this court."—W. Stubbs, *Constitutional history of England*, ch. 15, sect. 237.—"The Chancellor of the Exchequer is the responsible head of the Treasury Department. He corresponds,

in a general way, to our Secretary of the Treasury, but performs some duties which in the United States fall to the Committee on Ways and Means in the House of Representatives [but now the Bureau of the Budget]. He must provide for the necessary expenditure of the government, and must control the details of that expenditure. He must first make an estimate of the amount of money necessary to carry on the government for the year, and must then devise methods for raising the required sum. This is the preparation of the famous 'Budget.' . . . The Chancellor of the Exchequer is always a member of the House of Commons, since money bills must originate in that chamber. The holder of the office is, of necessity, one of the most influential members of the Cabinet. The leadership of the House of Commons was often associated with this office, especially before the press of business became so great as to make such a combination burdensome."—T. F. Moran, *English government*, pp. 72-75.

German imperial.—"Within the domain of Imperial government the place filled in other political systems by a ministry or cabinet [was, under the imperial government], occupied by a single official known as the *Reichskanzler*, or Chancellor. When the constitution of 1867 was framed Bismarck sought to secure for the new federal government a high degree of administrative unity, and at the same time to provide for himself a place of becoming dignity and power, by giving the Chancellor no colleagues, and by making him responsible solely to the Bundespräsident. The plan tended, of course, toward a thoroughgoing centralization in Imperial affairs and an utter negation of anything in the nature of cabinet government. The subject was reopened for discussion in 1871, and the liberal elements in the constituent Reichstag forced a modification, of such a sort that when the constitution assumed final form it contained not merely the stipulation, 'The Imperial Chancellor, to be appointed by the Emperor, shall preside in the Bundesrath and supervise the conduct of its business,' but also the following provision: 'The decrees and ordinances of the Emperor shall be issued in the name of the Empire, and shall require for their validity the countersignature of the Imperial Chancellor, who thereby assumes the responsibility for them.' Speaking broadly, the functions of the Chancellor [were] twofold. The first [arose] from his position within the Bundesrath. Not only [did] he represent in that body, as . . . his Prussian colleagues, the king of Prussia; he [was] vested with the chairmanship of it and with the supervision of its business. He fixed the dates of its sessions. Through his hands passed all communications, and proposals, from the states as well as from the Reichstag, addressed to it, and he [was] its representative in all of its external relations. In the name of the Emperor he lay before the Reichstag all measures enacted by the Bundesrath; and as a member of the Bundesrath, although not as Imperial Chancellor, he appeared on the floor of the Reichstag to advocate and explain proposed legislation. Measures . . . enacted into law [became] binding only after they [had] been proclaimed by the Chancellor, in the name of the Emperor, such proclamation being made regularly through the official organ known as the *Reichsgesetzblatt*."

The Imperial Chancellor was, in addition, the principal administrative official of the empire. The entire administrative authority was centralized and gathered in his hands. The various departments of marine, foreign affairs, telegraphs, etc., had a

status totally unlike that of corresponding branches of other governments. They were merely bureaus of the imperial chancellery, and their heads formed in no sense a collegiate ministry or cabinet. Each official in charge of a department was directly responsible to the chancellor. There has been a mass of incoherent controversy regarding the nature of the responsibility which the imperial chancellor assumed when he countersigned decrees and ordinances of the emperor.

"The truth is that most of the discussion merely befogs a situation which to the unbiased observer is perfectly clear. . . . In the sense in which the ministers of England and France are responsible, the German Chancellor [was] not responsible at all. He [was] answerable in all matters to his Imperial master, who [could] instruct, admonish, censure, or remove him at any moment. But, whatever theories may be spun upon the subject, other responsibility, in practice, he had none. The Imperial government has always been able to do business without for a moment admitting the right of the Reichstag to unseat the Chancellor or any of his subordinates by an adverse vote. The Chancellor, may of course, be criticized, and the proposals which he introduces may be defeated; expediency may even require his removal by his Imperial master; but he has never felt obliged to retire merely by reason of lack of support in the legislative chamber, as would a British or a French minister similarly situated. This does not mean that the blocking of a government program may not tend to produce the practical effect of a parliamentary vote of 'want of confidence.' It means simply that the Chancellor, in such a case, is under no admitted obligation to resign. The retirement of Chancellor von Bülow in 1909 was more nearly involuntary than that of any of his three predecessors; but persons most conversant with the circumstances agree that it was intended to involve no acknowledgment of responsibility to the nation's elected representatives. The situation was simply one in which legislation had become impossible because the Chancellor was unwilling to enter into a compromise with the Conservative-Clerical majority in the Reichstag on his proposed taxation of inheritances and other financial reforms."—F. A. Ogg, *National governments and the World War*, pp. 461-465.—See also GERMANY: 1910 (March).—From the foundation of the empire to its fall there have been eight chancellors (1) Prince Bismarck, 1871-1890; (2) Count Caprivi, 1890-1894; (3) Prince Hohenlohe, 1894-1904; (4) Prince von Bülow, 1904-1909; (5) Dr. von Bethmann-Hollweg, 1909-1917; (6) Dr. Georg Michaelis, July 14-November 2, 1917; (7) Count Georg von Hertling, November 3, 1917-September 30, 1918; (8) Prince Maximilian of Baden, September 30, 1918-November 9, 1918.

German national.—By the Republican constitution adopted July 31, 1919, by the National Assembly at Weimar it was provided that: "Art. 52.—The administration of the Government shall consist of the National Chancellor and the Government Ministers. Art. 53.—The Chancellor, and at his suggestion the Ministers of the Government, shall be appointed and dismissed by the President of the Republic. Art. 54.—The Chancellor and the Government Ministers shall require the confidence of the Reichstag for the fulfillment of their office. Any of them must withdraw in the event that the Reichstag by explicit resolution withholds its confidence. Art. 55.—The Chancellor shall reside in the Government Administration and shall conduct its affairs in accordance with an order of business,

which shall be determined by the Administration and approved by the President of the Republic." On March 28, 1920, Herman Müller was appointed the first national chancellor.

CHANNEL ISLANDS, group of islands situated in the English channel and belonging to Great Britain. Their combined area is about seventy-five square miles with a population of 96,899 in 1920. They lie from ten to thirty miles west of the peninsula of Cotentin. The shortest distance between the islands and the English coast is fifty miles. The principal individual islands are Alderney, Guernsey, Sark and Jersey and around these four the smaller islands are grouped. The northern group includes Alderney, Burhou and the angry Casquets where William, son of Henry I was supposed to have perished. To the southwest of these lies the group about Guernsey, to the east of Guernsey lies Sark with Herm and Jethou, and to the southeast of Sark is Jersey. "As regards the export trade of the Channel Islands, it has been summarized as consisting of 'Granite, for paving purposes; fruit and vegetables; fish and crustaceans; cows and heifers.' The stone is chiefly from St. Sampson, Guernsey; early potatoes mainly from Jersey, tomatoes grown under glass from Guernsey, grapes and pears from both islands. . . . Owing to their early connection with Normandy these islands alike in language, literature, laws, and customs have retained much that affords opportunity of interesting study to the ethnologist, philologist, the lawyer, and the student of history."—P. E. Amy, *Channel Islands*, pp. 21, 27.

Early history.—Abundant proof of a prehistoric race is extant in the form of megalithic monu-

ments, cromlechs, menhirs and mounds, but very little has been left of the Roman invasion. Christianity was introduced in the middle of the fifth century. "The Northmen made frequent incursions in the ninth century; and in 912 Charles the Simple, who then ruled France, weakly ceded the Province of Neustria and Dukedom of Normandy to Rollo who left his mark in more ways than one."—*Ibid*, p. 34.—"For the reign of the Conqueror and the three which succeeded it . . . the allegiance of the Islands alternated, being English under William the First, Norman under Rufus, English under Henry the First and Norman again under Stephen. . . . With Henry II the allegiance reverted to its original course . . . and sovereign of the Islands was as the successor of William I and Henry I, King of England and Duke of Normandy. . . . With John a new era begins." He gave a constitution to Guernsey which was "to insular Normandy . . . what the Magna Carta is in England. . . . Under Henry III, the islands were still part of the dowry of Henry II held by England. With Edward III a better state of things began." By definite orders "from the reign of Edward III till the reign of William III, the Channel Islands were one and all free from foreign aggression. . . . The transfer of 1688 was not only from Normandy to England but from the reign of Catholicism to the region of Protestantism."—D. Austed and R. Latham, *Channel Islands*, pp. 353-359, 365.—In the reign of "George III, two more attempts were made upon Jersey by the French. . . . The French Revolution did not affect the islands except that many refugees were there hospitably received. . . . During the last thirty years of the eighteenth century many forms of dissent were introduced and developed. John Wesley visiting the islands in 1787, whilst the English Independents had a Chapel in Guernsey as early as 1706. . . . Printing was introduced in 1784, and several newspapers were founded."—P. E. Amy, *Channel Islands*, pp. 37-38.

More recent history.—"Since the peace of 1814 the history of the Channel Islands has been that of a thriving and progressive population sufficiently isolated to be free from the political storms which visited England, and sufficiently in contact with both England and France to partake of the movement by which the civilization of the present (nineteenth) century is distinguished. Its details, however, connect themselves with the history of particular institutions, and the biography of particular individuals rather than that of the Islands in general."—D. Austed and R. Latham, *Channel Islands*, p. 407.—The Channel Islands are administered according to their own laws and customs and are an interesting example of home rule. They include the two bailiwicks of Jersey and Guernsey with adjacent islands. Jersey has a separate legal existence. The islands are governed by a lieutenant-governor appointed by the crown and a "bailliff" or native chief magistrate also appointed by the crown. These two executives are assisted by the "states" or legislative assembly composed of "jurats." The lieutenant-governor has the right of veto but no vote in the assembly. Judicial affairs are managed by a royal court composed of the bailiff and jurats. In 1905 a law was passed for the island of Guernsey making it necessary for aliens to have the approval of the lieutenant-governor and of the royal court in order to acquire, lease or occupy immovable property.—See also **Jersey and Guernsey**.

CHANNEL PORTS, a term applied to three of the French seaports on the English channel, namely Dunkirk, Calais and Boulogne. During the

World War they were objects of German ambition (see *WORLD WAR: 1914: I. Western front: u, 1*), the purpose being to hamper and harass the British; but the coast of France and the channel ports were never reached by the German armies. See *BREST: 1914-1918; CALAIS: 1875-1911; WORLD WAR: 1918: II. Western front: d*.

CHANNEL TUNNEL.—The proposal to construct a tunnel under the bed of the English channel between Great Britain and France is more than a century old. From time to time careful investigations as to the geology and continuity of the strata have been carried out, in the course of which about 7,000 borings and soundings were taken under the guidance of experts. It has been established that the strata on both sides of the channel are identical, and that at one time an isthmus had existed, which had been cut through by a river from the North sea, thus forming the English channel. It had also been found that under the grey chalk was gault, a series of lower cretaceous beds of clay and marl, a clay very similar to the London clay, which could easily be tunneled. "Geographically a tunnel under the Strait of Dover will be unimportant by comparison with the Panama and Suez canals; commercially no great new avenues in the relations of whole continents will be opened up; and even politically the results will hardly be commensurate with either the hopes or the alarms which friends and foes of the scheme have in past years expressed on the subject. Nevertheless, the boring of a Channel tunnel will still mark a new and important stage of world progress; and from an engineering point of view it will of course rank high among the feats accomplished by human skill and labor. As in the case of many other schemes which appeal to the imagination, the conception of a Channel tunnel is French. It was suggested to the First Napoleon by a French engineer named Mathieu, and shortly after the Peace of Amiens the Emperor proposed it to the then British Ambassador in Paris, saying: 'This is one of the great things we should do together?' The Ambassador's reply is not on record; but it has taken England more than a hundred years to look upon the proposal with favor. And even yet it is not altogether certain that British public opinion is quite satisfied that the 'Charing Cross to Bagdad' of the advocates of the tunnel is so alluring a phrase as the 'splendid isolation' which so long stood the opponents of the scheme in good stead. . . . Horatio Bottomley . . . put a question to the House to which Bonar Law gave the offhand reply that he was in communication with the Prime Minister on the subject of approaching the French Government with a view to beginning immediately the construction of the tunnel in order to find work for discharged soldiers. . . . During the war, opinion in favor of the tunnel grew under the stimulating influence of arguments that had it existed in 1914 the British Expeditionary Force could have reached the front many precious days earlier; had it existed between then and 1919 the whole problem of supporting, supplying, and reinforcing Britain's western armies would have been incalculably lightened, and the German submarine campaign would have lost a serious part of its sting. Even now, however, it is rather pertinently pointed out that, had the Channel tunnel been in existence in 1914, German military strategy would undoubtedly have been different, and instead of making Paris their first objective the Kaiser's armies would have been directed to securing the territory in which the Channel tunnel had its French exit. If the argument is pursued, it will become evident that a rather good case can

be made out against the tunnel on the very same premises as those upon which a case is made out for it."—London correspondent, Mar. 25 (*New York Times*, Apr. 13, 1919).

1875.—Beginning of organization for work.—"This long debated project has at length emerged from the region of speculation, and is entering the stage of actual experiment. On this side of the Channel a company has been formed to carry out the work, and on the other side the French Minister of Public Works has presented to the Assembly a bill authorizing a French Company to cooperate with the English engineers. The course which, as at present fixed, will be taken by the proposed tunnel lies between the two points which are nearest each other on the two coasts, and to which the railway systems of England and the Continent respectively converged."—*Annual Register*, 1875.—The English company received parliamentary sanction to undertake certain preliminary works at St. Margaret's bay.

1876.—First actual work on the tunnel.—The preliminary work commenced at Sangatte, near Calais, about May. "Shafts were sunk to a depth of 40 meters, and the work was rapidly carried out by day and night. . . . The tunnel has definitely been commenced."

1880.—Concession renewed.—The concession for the preliminary works of the Channel tunnel, originally granted for five years in 1875, was renewed by the French government for three years. The English company on the other side of the Channel, was wound up.

1883.—The question of the Channel tunnel referred to a committee of both Houses of Parliament, which reported adversely on the scheme.

1884-1887.—Bills rejected.—Channel tunnel bills of 1884, 1885, and 1887 were defeated in the House of Commons.

1913.—Channel tunnel proposal revived.—Premier Asquith informed a deputation that the matter had been referred to the Committee of Imperial Defence and was under consideration in other government departments.

1914 (May).—French support and construction.—British opinion.—"The French and English engineers have meanwhile perfected their plans: they estimate that it will take seven years to complete the Tunnel, which will be a double one of two tubes each of 20 feet diameter driven parallel and about 20 feet apart, and that a further tunnel for motor traffic will follow. The French government support the enterprise whole-heartedly, and the French railway, which is one of the wealthiest and most powerful in the world, will construct their half and find one-half of the cost. The total cost will be £16,000,000, and the half to be found by England will be £8,000,000 spread over seven years. . . . The railways propose to run a half-hourly service of specially built trains to Paris with special services to Switzerland and the Riviera; and the great European expresses to Berlin, Vienna, Rome, and Madrid will in time start from London, which will then be truly the metropolis of Europe."—A. Fell, *Position of the channel tunnel question in May, 1914*, pp. 4-6.

"That the stupendous folly of connecting Great Britain with the Continent of Europe may never be undertaken is the prayer of the oldest admiral in the British Navy."—Admiral A. De Horsey, *National defence vs. channel tunnel, 1914*.—"It is not generally known that the two chief objections of Lord Wolseley have been met already. He said the Tunnel entrance at Dover would require two forts with garrisons to command it. These forts have been already erected by the government, and

have a garrison of two thousand men for the defence of the Admiralty Harbour at Dover, and they command the proposed tunnel entrance. The second objection was that the British fleet, although in full command of the channel, would have no power to destroy the tunnel, and the French troops, after capturing Dover and the forts, without the tunnel being destroyed, could pass through the tunnel in safety under the keels of our ironclads, which would be unable to interfere with their passage. Plans revised to meet this point provide for the tunnel to emerge from the cliffs on the French shore, and for the line to traverse a viaduct on the seashore and then plunge again into the cliffs. This exposed viaduct would be open to destruction by the guns of the fleet, and could not be repaired under months. The question of an open viaduct is the one which is now [May, 1914] being debated in military circles. . . . In any case, Lord Wolseley's point is completely met. His other objections are largely sentimental. . . . In Lord Wolseley's day France was our only possible invader; now she is our best friend, and we are her best customer. The present grouping of the powers was not anticipated by him. Whilst this grouping continues the tunnel must be, it is allowed, both in peace and in war, a strategic and commercial blessing to both countries. If the grouping should change, whatever the changes may be, the tunnel will always be an advantage to us, unless France should join the group opposed to us, and in that case in time of war the tunnel would be closed as well as the channel steamship service."—A. Fell, *Channel tunnel in 1914*, pp. 11-18.

1919.—**Military opposition withdrawn.**—"The completion of the oft proposed Channel Tunnel connecting England and France is being seriously contemplated, as was revealed in a recent statement made in the British House of Commons, and the matter is even now under discussion between the British and French authorities in Paris. . . . If the project is at last carried through, it will be to the great satisfaction of Sir Arthur Fell, M. P., chairman of the House of Commons Channel Tunnel Committee, who has watched over the interests of the project for many years now. In a recent interview with a representative of The Christian Science Monitor, Sir Arthur stated that the military opposition which had held up the undertaking for such a long time has now been withdrawn, and that there is every prospect that the scheme will go forward. . . . All the data which had been compiled previous to the outbreak of war with regard to the tunnel, still holds good, with the exception of that relating to the cost. It is now estimated that between £20,000,000 and £25,000,000 will be required, in place of a previous estimate of £15,000,000 to £18,000,000. . . . Five years is the period named for purposes of construction of the tunnel, and its construction will absorb a great amount of the labor that is now being freed from the army. It is proposed that the excavation shall be performed by revolving cutters, fixed in Greathead shields, the debris being removed from the face of the chalk by high-speed endless belts, so arranged as to deliver their loads direct into wagons without the necessity of any further manual labor. More workmen will be employed outside the tunnel, in the construction of accommodation for the workers, in the building of supply lines, on the necessary power station, and in making alterations to the existing railways."—*Christian Science Monitor*, May 2, 1919.

CHANNING, William Ellery (1780-1842),

American Unitarian preacher and author. In 1819 he forsook the Calvinistic theology and espoused the Unitarian doctrine with such vigor and ability that he was termed "the apostle of Unitarianism." He was the author of a number of books and treatises.

CHARITIES

Definition and points of interest.—The term "charities" is commonly used to denote the activities, organizations and institutions by means of, or through which relief is given to the needy. In studying the various forms of relief, four definitions may well be kept in mind: public relief is that which depends upon taxation for its funds, while private relief depends upon voluntary contributions; indoor relief is administered within the walls of institutions, where the recipients must live, while outdoor relief is given outside of institutions, and leaves the recipients free. One should also distinguish between poverty, which is simply the state of being in need, and pauperism, which is the state of depending for the relief of need upon charity, particularly upon the funds of benevolent associations or the public poor fund. The following survey shows the development of charities in a number of countries and from early times. In reading it the student will be especially interested in noting the modern method of educating children out of the ways of poverty, and of keeping up the self-respect of those to whom relief is given.

AUSTRALASIA

1897-1905.—Private charities.—Destitute asylums.—"Australasia has a liberal amount of private charities. New South Wales had in 1900 40 metropolitan and 49 country benevolent associations recorded, with a combined expense of £37,138, which furnished outdoor and other relief to 33,553 persons out of a population of one and one-third millions. The Government aided 65 of these societies to the amount of £24,979. South Australia has one in ten of the population of Friendly societies, Victoria, one in fifteen. There were in 1897 in Australasia 3,306 branches of friendly societies with 276,772 members, or 6.24 per cent. of the population with a revenue of £1,012,608. Of these Victoria had 1,088; New South Wales, 817; Queensland, 328; South Australia, 487; Western Australia, 68; Tasmania, 130; New Zealand, 388. These societies and associations generally have their own independent boards, yet cooperate by exchanging reports and information frequently. . . . Movements toward establishment of 'clearing-houses' are also noted. The Melbourne Charity Organization Society promoted recently a conference which represented 26 charitable societies, which formed an agreement to establish a common register of those helped 'for mutual protection against imposition.' . . . Australasia is well supplied with institutions for indoor relief. In the Commonwealth of Australasia 11,614 were cared for in Destitute Asylums in one year; (including New Zealand), 12,794, at a cost of £308,315. All large centers have institutions for the destitute managed on a practically uniform plan. The government of the colony generally grants half the cost, remainder comes from local sources. Adelaide Asylum (for destitute) answers for the whole colony and the state (South Australia) contributes the entire expense. The cost per inmate is annually about £15. Official salaries take but a small proportion of the income. The condition of admission is a *bona fide* inability to earn a livelihood. 'There is no social stigma attached to the inmates of these institutions. . . . The work of providing a shelter free from the idea of shame for people thus circumstanced is consid-

ered in a high spirit of public duty, and not as an act of municipal or state obligation. [The Australians] are careful not to sap the dignity of manhood and womanhood in their methods of ministering to the needs of those who become destitute. They have not copied the professional charity of the old world in dealing with their unfortunate fellows.' Western Australia had three charitable institutions, two in Perth, one at Fremantle, supported by public funds, with 659 inmates (December 31, 1902). New Zealand has nineteen benevolent asylums for indigent persons, with 1,167 inmates."—C. R. Henderson, *Modern methods of charity*, pp. 308-310.

1920.—New Zealand hospitals.—"New Zealand hospitals, though controlled by local Hospital boards, are liberally subsidized by the Central Government. Partly in consequence of this, and partly because persons of independent property are infrequent, it is very difficult to obtain voluntary support. Large donations are uncommon. According to the Journal of Public Health the Dominion is 'one of the few countries where people are gradually tending to a form of state socialism, and where a resident can easily forget all social responsibility.' With a few exceptions, the voluntarily supported hospital does not exist."—*Charity Organization Review*, Sept., 1920, p. 80.

AUSTRIA

1716-1764.—Relief principles of Charles VI and Maria Theresa.—"A patent of the 17th January, 1724, contains a clear and systematic account of the principles which Charles VI. followed on this subject. (1) Throughout the whole country 'below the Enns' general and particular inspections were to be had several times a year, with a view to abolishing begging. Beggars arrested should be examined, those who did not belong to the place sent home and referred to the local authority, whose duty it was to find work on the roads or elsewhere at moderate wages for those who could do it, and provide maintenance for the infirm. (2) Workhouses were to be set up both in Vienna and in the country, where orphans and other poor of both sexes, in separate places, were to be taught to read, write, and cipher, as well as to do some kind of useful handiwork, such as spinning, knitting, making cloth, or caps, for a small sum. (3) and (4) There was to be a special house for old soldiers, and another for persons afflicted with incurable diseases. (5) Periodical collections were to be made in churches and houses, and the proceeds to be partly distributed among the deserving poor, partly employed in building a new hospital. Future receipts by way of fines should serve to form a permanent fund for the poor.

"Similar provisions are met with in numberless ordinances of the times. In 1716 it was ordered that no marriages should be celebrated, except where the parties could produce from their local authorities a certificate of sufficient means; and if married couples fell into poverty where such a certificate had been issued, that the issuer should find them maintenance and suffer severe additional punishment. In addition, the same authorities were forbidden to erect small houses to be rented by the poor. We next come to a law of Maria Theresa, of the 22nd November, 1754. In this the poor are divided into three classes: (1) Those

persons who have settled in an hereditary territory, and have regularly acquired citizenship, or as inhabitants without residence have followed their trade or profession, and thus helped to bear their public burden till their distress began. (a) It is laid down as to those persons, that the citizens, in case they fall into poverty, shall be cared for in their place of abode at the expense of the city or place, or in hospitals, wherever such are to be found. (b) The mere inhabitants resident in one place for ten or more years, are to be provided for in the same way as actual citizens; but, if they have not remained in one place for ten years, they are to be sent to their birthplace. (2) Those who have been in service to a commune, or a private person, in one place for ten years. These are to be provided for by the local commune, or, if during the whole time they served the lord of the place, by the lord for the time being without assistance from the commune. (3) Those who have been away from their birth-place for ten years, or more, but have in the meantime lived in different places, are to be sent to their birth-place.

"Earlier enactments against begging, and as to the removal of beggars to their homes, were renewed. The patent of the 28th of March, 1750, ordered the erection and endowment of houses for invalid soldiers after the plan of that already built in Pesth, and the Empress by the patent of the 24th March, 1764, had in view the establishment of a foundling hospital. The prohibition to marry, by the Emperor Charles VI., in the case of persons without means, was renewed by Maria Theresa, in the patent of July the 1st, 1764, with the addition that in case of disobedience both husbands and wives should be punished, and the men fit for service sent to the army."—J. F. Kleinwächter, *Austria, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 133-135.

1783-1909.—Provincial laws of domicile.—Principles of poor relief.—Funds available.—Elberfeld system.—"The first attempt at systematic and uniform relief of the poor was instituted in 1783 by parochial relief. Under this scheme poor relief was administered by the priest of each parish, assisted by the elected guardians, and all the accounts had to be published. By a law made in 1789 it was enacted that any person who had resided in a parish for ten years should be entitled to support there, while others should be sent back to the place of their birth. The originally wide scope of parochial poor relief was thus narrowed down to that of a purely local institution. No further legislative change of any importance took place till the law of domicile was passed in 1863. By a series of provincial laws passed between 1869 and 1883 the parochial system of poor relief was entirely abolished in Upper and Lower Austria, Carinthia, Carniola, and Silesia. Special laws in various provinces regulate the nature of the provision to be made, while the law of domicile lays down the general principles of poor relief. Thus, any person who cannot obtain the necessary means of subsistence, either from the members of their family or from any unions, guilds, or benefit funds, upon which they may have a claim, are entitled to assistance, in the first instance, from the commune; secondly, from the district; thirdly, from the province to which they belong. Every person desirous of receiving poor relief must apply for it in person. If the applicant has not a settlement in the commune, the authorities are bound to undertake his immediate relief and ascertain in which commune he has a settlement, from which said commune compensation for his maintenance may be obtained. In the

case of persons having a settlement in the commune *Gemeinde*, it is necessary to prove that their families are unable to support them, and that they have no legal claim on anyone else. The assistance must consist of board and lodging, and, in case of sickness, medical attendance and medicines also. In the case of the mentally afflicted, they must be maintained in a public institution; orphans must be maintained and educated. Persons who die in a state of destitution must be buried at the expense of the commune. The funds available for poor relief are derived from voluntary contributions, and such sources as the poor's third of the property left by intestate secular priests, and certain percentages on the proceeds of voluntary sales. These funds are variously augmented in the different provinces—for example, by the proceeds of theatre taxes and game licenses. Should these sources be exhausted, the commune of origin must make provision. By the erection of houses for forwarding vagrants to their proper communes, a great step was taken towards the suppression of begging. Besides poorhouses and poor relief, there exists in many provinces, by custom or constitutional rule, the practice of assigning the poor, in respect of board and lodging, to each of the resident householders in fixed succession. The Elberfeld system, which is the prevailing type of poor law administration in Germany, was first introduced into Austria in 1889, in which year it was adopted by the town of Trautenuau, in North Bohemia. . . . The success of the Elberfeld system was repeated at Trautenuau. The attention of the Government was drawn to the experiment, and in 1890 the Minister of the Interior published an official account of the system for the information of local authorities. Although the subject was eagerly taken up for a time, it did not receive a wide extension, owing to the difficulty of carrying on the Elberfeld system without clashing with the law of domicile. Nevertheless, each year saw it adopted by some town of importance: for instance, Salzburg (1893), Linz (1899), Innsbruck (1897), Graz (1899)—in every case with satisfactory results."—G. Drage, *Austria-Hungary*, pp. 147-149.—Under a system called the Pharrarmen-institute, Austrian private charitable funds are administered by public officials. According to Mr. C. R. Henderson, there were in 1898, 951 endowments in Vienna, which were officially administered, and in addition 136 private societies whose members devoted large sums to the aid of the poor. In addition the Katholische Lands-Wohlthätigkeits-Komitee in lower Austria, founded in 1900, bent its energies toward unifying Catholic charitable relief and educational agencies, and introducing economy and efficiency in their administration.

1921.—"Poor relief in Austria is based on the home law of 1863. . . . [It] consists of the grant of the necessities of life, including the costs of sickness, nursing and burial, and of education of the poor under age. Claims of the poor to any special kind of provision are not acknowledged. The poor relief comes into force only when no other kind of aid is administered. In the relief of the poor numerous persons are engaged as volunteers. . . . Pecuniary aid is the last to be rendered, nevertheless it has in the course of time become one of the principal forms of help in . . . outdoor relief. The existing institutions for indoor relief which provides homes for the poor and aged, are not numerous enough to receive all those needing them. . . . A person may receive aid in a community other than that to which his parents belonged only after a ten years' residence. . . . The public poor relief finds its complement in in-

stitutions and societies of voluntary poor relief."—R. Bartsch, *Government organization for social aid in Austria* (*Annals of American Academy of Political and Social Science*, November, 1921, supplement, pp. 64, 65).

BELGIUM

1650-1793.—Private benevolence.—French Revolutionary reforms.—“The principles of the Belgian Poor Laws have been much changed in the course of time. Until nearly the middle of the sixteenth century the care of the poor was left entirely to private benevolence; neither State nor commune took any concern in erecting or administering charitable foundations, which were governed by irresponsible bodies appointed by the founders.

The [French] Constituent Assembly [whose decrees affected Belgium after the latter had been conquered by France], by the decrees of the 4th August, 1789, and 13th and 10th February, 20th and 22nd April, 1790, abolished tithes, suppressed the monasteries, confiscated church property, but did not immediately do away with the hospitals and charitable institutions, or with those religious orders who devoted themselves to the care of the sick. These were retained provisionally, but the management of the institutions was placed in the hands of lay officers, under the superintendence of the civil power. Private persons might still, however, contribute to the endowment of these charities; but before long, a committee, appointed by the Constituent Assembly to draw up a plan for more lasting arrangements, laid down the following maxims: (1) The Government is not bound to supply all the unemployed with regular work; its task is to make opportunities for work more frequent and more attainable, for it is quite difficult enough to find able-bodied men an opportunity of working. (2) The nation is bound to assist those who, through age or infirmity, are unable to gain the necessities of life. (3) Begging must be suppressed with the utmost energy.

“The work begun by the Constituent Assembly was continued by the Legislative Assembly. A committee was again appointed to decide on the principles which should govern the organization of public poor-relief. Its members, influenced by the tendencies prevalent at that time, embodied in their report of the 13th June, 1792, far more radical opinions than the last, *i.e.*: (1) Every person must maintain himself by labour if he is capable of working; everyone has a right to relief if he is incapable of working. (2) No one can demand more than the absolute necessities of life. (3) As society cannot exist without the labour of its members, idleness and begging ought to be severely punished; but such punishment is not justified if the nation does not offer work to those who have no other opportunity of obtaining it. (4) The support of the poor is a national burden, for the pauper belongs to the whole nation, and not to solitary individuals. This was giving the pauper a legal claim either for work or relief, and at the same time making the duty of providing work or relief compulsory on the nation. The Legislative Assembly was dissolved before there was time to put this new theory into practice; but on the 18th of August, 1792, a decree had been passed suppressing all religious confraternities, even those which were exclusively occupied with the management of hospitals. It was therefore left to the Convention to carry on the work of the Legislative Assembly, and the following vote was passed on the 24th of June, 1793: Public relief of the poor is a sacred duty; society is bound to care for the

existence of its members in misfortune; work must be provided for those capable of it, and the necessities of life for those who are incapable.”—A. Emminghaus, *Belgium, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 240-243.

1792-1910.—Influence of French Revolution.—Bureaus.—Orphanages.—Asylums.—Labor Colonies.—“The local responsibility created in 1790 continues to the present day, and rests with about three thousand local bodies, which act practically without central control. The committees for the relief of poverty are of two kinds, both nominated by the communal councils. By far the more important are the *Bureaux de Bienfaisance*, of which, with very few exceptions, one is found in each of the 2627 communes into which Belgium is divided. The work of these is supplemented by the *Commissions des Hospices*, of which there are only 334. With unimportant exceptions, they confine their attention to indoor relief, and their responsibility for this is limited by the capacity of the buildings which they administer. All other poor-relief falls upon the shoulders of the *Bureaux de Bienfaisance*. In the great majority of communes, where there is no *Commission des Hospices*, the *Bureau de Bienfaisance* undertakes the administration of all poor-relief, both indoor and outdoor. The history of poor-law legislation during the last century has been little more than a melancholy record of attempts made by those responsible for defraying the cost of caring for the poor to transfer the burden to other bodies. There has been but slight progress in developing such scientific treatment of the difficult problems calling for solution as would lead towards the reduction of pauperism. As a result of the efforts made to transfer financial responsibilities there are now no less than six different bodies which share the cost of poor-law relief. Mention has been made of the *Commissions des Hospices* and the *Bureaux de Bienfaisance*. If these have not funds sufficient, the deficiency must be met from the exchequer of the commune itself.

In order to distribute the burden fairly among rich and poor communes, a Common Fund has been established in each province, to which all its communes must contribute sums varying according to their population and income. The Common Fund constitutes the fourth source from which funds for the relief of the poor are drawn. The fifth and sixth are respectively the Province and the State. The exact proportion which each of these six bodies is called upon to pay depends upon the character of the relief to be given; whether, for example, it is for pauper-lunatics, for the aged and infirm, or for foundlings. . . . The granting or refusal of relief is left absolutely and without appeal to the local administrators of public charity; but in practice no destitute person can be refused admission at least to the quasi-penal labour colonies at Hoogstraeten and Merxplas. The cost of maintenance of those admitted is charged to the communes to which they belong.

One of three different systems [of administration of relief] is generally adopted. Under the first of these the *Commissions des Hospices* themselves conduct, through a secretary, all business matters connected with the *hospices* under their authority. They also appoint all lay members of the staff, but the direct care of the inmates is handed over to a religious order, whose members receive from the *Commission* a fixed salary, usually from £8 to £12 a year. Under the second system the financial management, as well as the personal care of the inmates, is largely handed over to a religious congregation, which furnishes the *Commissions des Hospices* with monthly ac-

counts of the expenditure incurred. The third system, which is universally practised in the case of communes where there is no *Commission des Hospices* (i.e., in seven-eighths of the communes of Belgium), as well as in some where there is one, is to send those persons who require indoor relief to be cared for in convents or in *hospices* situated in other communes, where places are vacant. Many convents in Belgium are willing to undertake work of this kind at fixed rates, which are so low as to render competition from public authorities practically impossible. . . . 'Why,' it may be asked, 'should the Church be willing to undertake this responsibility upon such low terms?' The answer is that the administration of charity is regarded by Catholics as a sacred duty. They consider that charity should be administered by the Church, and that the atmosphere of the institutions in which indoor relief is given should be religious. In order to create this atmosphere hundreds of devoted women consecrate their lives to superintending the *hospices* for scarcely any payment beyond the bare cost of very simple living.

"Orphanages are usually attached to a convent. There, again, remarkably low charges are made. The convent of Heule in West Flanders offers to receive orphans at £3 a year. Other orphanages will accept them at prices ranging from £6 a year upwards. If, however, those who send the orphans to the institutions undertake that they shall remain till they reach their majority, the charges are considerably lower. Some orphanages take the children for nothing, others at fees varying from £4 to £6 per annum. These figures refer to the Flemish provinces. The number of orphanages is much smaller in the Walloon provinces, and the charges made are higher, as in the case of the *hospices*. The low charges are, however, largely accounted for by the great amount of work performed by the inmates. Every convent is a busy centre of industry, sewing, corset-making, glove-making, lace-making, and laundry work being the chief occupations. Much of what has been said about orphanages applies also to lunatic asylums, the control of which has passed almost entirely into the hands of the *Frères de la Charité*, who are willing to undertake the care of the insane at fees which defy competition. For many years a large proportion of the insane in Belgium have been boarded out among the peasants in Gheel, in the province of Antwerp, and Lierneux, in the province of Liège. They live as members of the family, giving such help as they can in field work. . . .

But the practice of boarding out the insane in this manner tends to decline, for the Catholics now receive them into asylums at very low fees. . . . A word must be said with reference to the large labour colonies at Merxplas and Hoogstraeten. These are not under the control either of the *Bureaux de Bienfaisance* or of the *Commissions des Hospices*, but are managed directly by the State. . . . In Belgium vagrancy and mendicity are penal offences, and all persons found homeless or begging and without visible means of support, may be arrested and sentenced by a police court to detention at either Hoogstraeten or Merxplas. [for terms of from two to seven years]. When these institutions were inaugurated nearly a century ago, and also when their organization was remodelled in 1891, it was hoped that they would lead to the gradual reclamation of the vagrant class. This hope has not been fulfilled. So far from being reduced, the number of entries is increasing year by year. . . . During their term of confinement at Merxplas the inmates have the opportunity of earning a small wage, part of

which may be spent in little luxuries purchasable at the canteen, and the rest saved until they go out. . . . An institution such as Merxplas, harbouring over five thousand men—men describable only as human wreckage, governed by military discipline and patrolled by soldiers carrying loaded muskets—is not the place in which an atmosphere favourable to moral reform can be created, no matter how earnest may be the efforts of the officials. These State institutions, in an ever-increasing degree, are developing into permanent asylums for those ruined by drink, for the indolent, the incapable, and the old. . . . So far we have dealt only with poor-relief paid for from public funds. There is, however, in Belgium as in other countries, an enormous amount of charitable relief other than that granted by public bodies. In view of the fact that the various poor-relief authorities administering public funds make use of private institutions in which to board out the paupers for whom they are responsible, it is impossible in Belgium to draw [a] sharp line between public and private charity. Paupers maintained from the public Exchequer frequently occupy the same institutions as people cared for at the cost of the Church or of private benefactors, or even paying for their own board and lodging."—B. S. Bowntree, *Land and labour: Lessons from Belgium*, pp. 467-469, 482-483, 486-490.

1921.—Child welfare.—"In Belgium the preservation of child life is engaging the attention of her statesmen. The organizations existing for this purpose before the war were discouraged by the Germans, but nevertheless in the occupied territory the *Comité National du Secours* quickly grouped them together into the *Oeuvre Nationale de l'Enfance*, and started in addition *consultations du nourrissons* and *gouttes de lait* (baby dispensaries and milk stations) for 90,000 children below the age of three and *continues* for supplying refreshment to 22,000 mothers. . . . Attention is drawn to the lamentable influence which the conditions arising out of the German occupation . . . had on the youth of Belgium. 'These long years of oppression say M. Vandervelde and his colleagues, lived in misery, idleness and deception and of excessive gains easily acquired through equivocal trafficking, have left their mark on juvenile mentality. Side by side with the material restoration of the country there is the more arduous and more essential task of the restoration of conscience.' The *Oeuvre Nationale de l'Enfance* has been established on a permanent legal basis by an act of Parliament."—*Charity Organization Review*, June, 1921; p. 249.

CHINA

B. C. 1122.-A. D. 1912.—Beginnings of institutional charity and social legislation.—Poor laws.—Scope and character of Chinese philanthropy.—"During the Chow dynasty (1122-255 B. C.), the state periodically gave relief to orphans in spring and summer, and during the Han dynasty (206 B. C.-25 A. D.), an emperor ordered state support of neglected children and children of poor families with supply from the public granaries. During the Sung dynasty (960-1260 A. D.) public lands were devoted to the cultivation of grains, which went to fill public granaries established in all districts; buildings were erected for the reception and care of cast-away children. An emperor of the Yuan dynasty (1260-1368 A. D.) in 1271 ordered alms-houses to be built for the shelter of the poor. In 1659, Emperor Sun-chi issued an edict in which desertion or destruction

of infants was severely condemned. He observed therein that it seemed strange to him that while the beasts of the field and the fowls of the air cherished their young, rational beings should want to destroy their daughters; that the destruction of infant life was a blacker crime than robbery, for all creatures were ordained of Heaven to live. In 1711, Emperor Kang Hsi ordered the establishment of founding hospitals throughout the empire. A private hospital that was established two years after this date at Shanghai survives to this day. In 1724, a government alms-house was opened at Canton; and in 1739, Emperor Kien Lung ordered it to feed 4,676 destitute persons. In 1783, the same Emperor reprinted the edict of 1659, condemning persons committing infanticide to be punished with 100 blows and exile for a year and a half. In 1805 (9th year of Kia King), a private charities society, at Shanghai, the Hall of United Benevolence, was formed; since then, it has had an unbroken career. In 1873, a proclamation encouraging care and preservation of infant life was issued by the provincial authorities of Hupeh. The above account of the beginnings of institutional charities and social legislation is far from being a complete statement of what took place during the years mentioned; it is intended only to serve as an indication of the development of practical philanthropy in China. The [modern] law of China recognizes the right to relief of those dependent persons, who may be classed as the 'worthy poor.' . . . In illustration of the activities of central charities societies . . . we may cite those of the Hall of Benevolence of Chefoo: The seventeen forms of activities are (1) Non-interest loans to the poor; (2) Burial facilities for the poor; (3) Waste-paper collection; (4) Assisting shipwrecked persons; (5) Fire protection; (6) Aid to widows; (7) Reception of deserted infants; (8) Free supply of books to the poor who are desirous of reading; (9) Free education for poor children; (10) Orphanage; (11) Industrial school for poor girls; (12) Refuge for the cure of opium-habit; (13) Refuge for the homeless sick; (14) Hospital work; (15) Refuge for the poor in winter; (16) Free kitchen; (17) Vaccination. Chinese philanthropy may be divided into three general groups: I. Charity, in the strict sense of the word, meaning disinterested aid to the poor; II. Mutual Benefit, or the method of relief and protection by reciprocal efforts; III. Civic Betterment, or the promotion of public welfare through voluntary co-operation on the part of the inhabitants. There are other activities which are benevolent in nature, such as the humane treatment of animals, which cannot be included in the above division. But as far as the human content is concerned, Charity, Mutual Benefit and Civic Betterment succinctly describe the character and scope of Chinese Philanthropy."—Yu-Yue Tsu, *Spirit of Chinese philanthropy*, pp. 24-26, 29, 30.

CZECHO-SLOVAKIA

1916-1921.—Charities in Prague.—Care of children.—"Cooperation between different agencies and between private and public agencies was lacking in effectiveness and also in joint action to prevent causes of misery so far as individual cases were concerned. . . .

"Protective care for mothers and infants had since 1916 been organized for the whole city by a benevolent association with broad vision and persistent effort. It maintained infant clinics, mostly in school rooms and in one branch had developed health service for mothers and children. . . .

Institutional care for dependent children . . . varied in value. . . . Children were grouped without sufficient regard to age, mental and physical condition or need for material aid. Responsibility for public care was divided between federal government, province and city; a municipal bureau for the welfare of dependent children was administered in too bureaucratic a spirit. The allowance made for children boarded out in foster homes varied in the communes composing Greater Prague. Correctional institutions for juvenile delinquents were in many cases too far removed from the capital to make possible a very close administrative cooperation. The training they provided was too uniform and insufficiently related to the individual talents of the children committed to them. On the whole, these institutions compared favorably with those in other countries. . . .

"Social medical agencies in Prague were especially lacking in cooperation. . . . Prague suffered from a 'startling' lack of nurses, and both hospitals and ambulatoria were very inadequate. For the physically handicapped, all except war invalids, the responsibility assumed by the government was very slight. In practice neither the city nor provincial governments lived up even to the relatively meager duties placed on them in this respect under the old Austrian law."—M. E. Hurlbutt, *Social care for individuals (Survey, June 11, 1921, p. 344)*.—"The Child Relief, for which there was appropriated in the budget of 1920 the sum of 12,000,000 Czech crowns, is one of the best organized social welfare agencies in the republic. The problem to be faced in this work is how to bring about the best cooperation between public relief and the relief work of various private organizations that have been established for many years and are in most cases doing splendid work. Some of the voluntary organizations have selected special fields of activity. The Ceskoslovenska Péce o dite (the Czecho-Slovak child relief) was organized by the American Relief Administration through the initiative of Herbert Hoover with the object of securing immediate help for children suffering from malnutrition, and has been feeding more than half a million Czecho-Slovak children for eighteen months [prior to November, 1921] and providing warm clothing for 100,000 of the neediest children, and quantities of cod liver oil for tuberculous children. It has established 2,700 kitchens in all parts of the republic and will continue feeding at least 200,000 of the children until the harvest of 1921. The Czecho-Slovak Society for the Protection of Mothers and Nurslings is giving milk and medical attention to babies until their second year, and advice and support to nursing mothers and pregnant women. The society, with the help of the American Red Cross and the American Relief Administration, has established several model milk stations. The Bohemian Land Commission for Child Relief in Prague and Brno, and the German Land Commission with its headquarters in Liberec, Brno and Opava, with their district commissions (in Moravia with the aid of societies for the protection of orphans), pay special attention to neglected, destitute and abnormal children and give necessary care in their institutions. In Moravia and Carpatho-Russia, the sections of the Czecho-Slovakian Red Cross for Child Relief do the same work. . . .

"There is still great need of modern institutions for children but funds are lacking. Of about 15,000 tuberculous and scrofular children in the republic, only 1,512 are cared for in hospitals and sanatoria. There are about 4,000 crippled children in the republic and only two institutions for them. One of

these, the institute of Dr. Jedlicka for crippled children, has done wonders in the short time of its existence. The care of imbecile children is at its very beginning. A central organization will be created in a short time. Great need of an institution is particularly felt in Carpatho-Russia, where 'Grandmother' Babushka is developing great activity to secure an asylum for imbecile children. Some existing institutions for the blind, and deaf and dumb children in Czecho-Slovakia, owing to the lack of funds, cannot meet their demands. A central organization for the blind and a central organization for the deaf and dumb in Czecho-Slovakia will soon resume their functions. There are five institutions in the republic for those children whose moral educations have been neglected. . . .

"Attached to the Ministry of Social Welfare is a central organization for the care of children in the summer months which, in cooperation with various voluntary societies, is sending children from large towns to the country, either to individual families, or to fresh air camps."—B. Stepanek, *Social and economic problems (Czecho-Slovakia)*, Survey, June 11, 1921, p. 352.

DENMARK

1683-1905.—State obligation admitted.—Law of settlement.—Old-age relief.—Poor fund.—"The fundamental principle of the Danish Poor Law is that every destitute person has a right to relief. In no other country is this right expressly affirmed, although in England it is tacitly admitted, as providing for those who are unable to provide for themselves is declared to be the duty of the State. Nor is it only in recent days that this right has been recognized in Denmark. According to tradition, it was conceded in very early times; and it was certainly affirmed, with all due solemnity, in 1683. 'He who cannot maintain himself or those dependent on him'—so runs the law passed in that year—has the right to relief at the cost of the community, providing there be no other person responsible for his maintenance.' The community must grant relief to all applicants who require it; they have not the power to refuse to support those who cannot support themselves. This is a point on which every Poor Law ever passed in Denmark is quite explicit. But although they must grant relief, the law allows them to attach conditions to what they grant. 'In order that the Poor Law authorities may secure the right spending of the relief given, that they may compel paupers to be industrious, and prevent their committing offences and indulging in vices which would defeat the object for which the relief is granted, the said authorities are vested with special rights of surveillance and control over all who receive poor relief.' Further, 'in order that the burden entailed by the universal right to support shall not become altogether too heavy to be borne, the law secures to them'—*i.e.*, to the Poor Law authorities—"the right to exercise very great power over all who receive support.' By the law of 1801, on which the present relief system is founded, it is expressly enacted that 'he who receives relief must submit to the restraints'—"to the hemmings in of his personal liberty,' would be a more exact rendering of the term—"which the law imposes.' And the framers of the law have taken good care to make these restraints, restraints of a kind to which no man submits willingly. So ingeniously indeed, have they done their work, that, when the recipient belongs to the worthless class, what they give with one hand they, in a measure

at least, take away with the other. Under the new system the old right is left intact. Every Dane has still the right in case of need to be supported by the community, if he cannot, or will not, support himself. Only, if he avails himself of this right, he forfeits at one fell swoop many other rights; for, assuming he is not qualified to be a pensioner, he becomes a pauper, and in his part of the world a pauper is a bondsman. And this is only just; for in Denmark it very rarely happens that any one is a pauper except by his own fault. One of the most interesting features of the Danish relief system is the infinite trouble that is taken to prevent any person who deserves a better fate from becoming a pauper owing to misfortune, temporary distress, illness, or accident."—E. Sellers, *Danish poor relief system*, pp. 7-9.

"Every town or commune is primarily responsible for its own poor, but for its own poor alone. If, therefore, a destitute person applies to the authorities for relief, the first question that arises is whether he has, or has not, a right of settlement in their district. This can easily be decided, as the Danish law of settlement is very simple. Every child has a right of settlement in the place where, at the time of his birth, his father—or, if illegitimate, his mother—had a right of settlement; and this he keeps until he has acquired another. Until he has completed his eighteenth year, he acquires a settlement wherever his father—or, if illegitimate, his mother—acquires a settlement; and after that age wherever he himself resides uninterruptedly for five years, providing that during these years he does not receive poor relief. Once the settlement question decided, the authorities have to find out whether the applicant has not some relative bound to support him. Here again their task is no difficult one, for by Danish law the cases in which persons can be compelled to support others are limited. A man is responsible for the maintenance of his wife, and for that of his children, grandchildren, step-children, and adopted children until they are eighteen. He is also responsible for half the cost of the maintenance of his own illegitimate children; and, oddly enough, for half the cost of the maintenance of any illegitimate children his wife may have. On the other hand, he is not responsible for the maintenance of his parents or grandparents, and he cannot be compelled to contribute one penny towards their support. A woman is responsible for the maintenance of her children, grandchildren, stepchildren, and adopted children until they are eighteen; and also for that of her husband. A husband, however, cannot himself claim maintenance from his wife; it must be claimed for him by the Poor Law authorities. Thus no one, unless a married woman, a married man, or a child, can legally have a claim for support on any one but the authorities."—*Ibid.*, 15-17.—"According to the wording of the law, in order to obtain old-age relief an applicant must be 'without the means of providing himself or those dependent on him with the necessaries of life, or with proper treatment in case of illness'; and this, certain jurists argued, when it first came into force, meant that he must be destitute; that he must, in fact, if he had any little savings, spend them before relief could be given to him. Had this interpretation of the law been allowed to stand, the result would of course, have been disastrous, as, instead of any encouragement being offered to thrift, a premium would have been placed on unthrift. The Minister of the Interior, however, being a practical man, made short work of it, promptly decreeing that this was not what the law meant, whatever it might

say. But even when the destitution test was set aside, the Act was still open to the approach of offering no direct encouragement to thrift, as it requires that the relief granted 'must always be sufficient for the support of the person relieved.' Thus the more a man had the less was given to him. In some districts, indeed, the authorities, in fixing the amount of the old-age relief any applicant was to receive, simply deducted from the relief he would have received, had he been penniless, the income derived from his savings. Even in Copenhagen one-half of the income was deducted. In 1902, however, there was added to the law a new and most valuable clause, which effectually put an end to this unsatisfactory state of things by enacting that, in fixing the amount of the relief to be granted to an applicant for old-age relief, the local authorities 'must leave out of consideration any income or house accommodation he may possess from private sources up to the value of 100 kroner (£5 11s. 1d.) [about twenty-five dollars] a year; also that the said authorities may, should they in the circumstances deem it advisable, also leave out of consideration any income which he may have from an annuity, a legacy, a pension, or any dwelling accommodation which he may possess, provided their value, in addition to the support he may obtain from private sources, does not exceed 100 kroner.' Thus the law as it now stands does offer a direct inducement to save, at least until a capital large enough to yield a yearly income of £5 11s. 1d. has been obtained. An indirect inducement it has always offered, it must be remembered; as, unless a man has something to fall back upon, it is not probable that he will be able to get through the perilous years between fifty and sixty without receiving pauper relief. And if he has received pauper relief, even though it be only one penny, during the ten years that precede his application for old-age relief, this relief cannot be granted to him."—*Ibid.*, 67-69.

"Before dealing with the question as to what expenditure is entailed on Denmark by her poor under the new system, some explanation must be given of the sources from which she obtains the money wherewith she defrays it. There is no one rate levied exclusively for the poor in Denmark; indeed, it is only when the money obtained from other sources proves insufficient, that recourse is had to the rates. Every town or commune has a Poor Fund, the money of which is derived from whatever sources the local authorities fix upon, supplemented when necessary by grants out of the rates. In Copenhagen the Poor Fund consists of the yield of a tax on theatrical representations—5 per cent. on the gross receipts if the company is Danish, and 10 per cent. if it is foreign; of a tax of ¼ per cent. on the value of all real property sold in the city; of certain fines imposed by the city courts; and of the income from certain old endowments and bequests. As Copenhagen ranks both as a town and a county, all that it spends on its poor it must provide for itself, out of the Poor Fund and the rates; and it is the same in the case of the 'trading towns.' In other towns, however, as well as in rural communes, there are, in addition to the ordinary poor funds, two other funds, the County Poor Fund and the County 'Repartition' Fund, from which, in certain circumstances, money is obtained for Poor Law purposes. The 'Repartition' Funds owe their existence to an arrangement by which, about a hundred years ago, local authorities commuted their claim on certain grants out of the royal purse for the right to levy a local land tax. The control

of the Repartition Fund, as well as of the County Fund, is in the hands of the County Council. These funds now derive their income from the local land tax, which is assessed according to the yield per acre; from a tax of ¼ per cent. on the yield of all the public auctions held within the county; from certain fines imposed by criminal courts, as well as from registration fees for forming companies, dissolving partnerships, etc., and the interest on certain invested funds, supplemented by yearly grants out of the communal funds. The county funds are devoted to defraying the cost of the relief of the poor in so far as it affects the county as a whole; and also to making grants in aid to communes and towns which have more than their fair share of pauperism to contend against. They supply the money for building and maintaining penal workhouses, hospitals, and other county Poor Law institutions, as well as for the expenses entailed by the precautions taken to prevent the spread of infectious diseases. In Denmark the State pays the salaries of all medical officers, and also defrays half the cost of the inmates of lunatic and idiot asylums. The Free Funds of which mention has already been made, obtain their income from gifts, bequests, the money from the church boxes, and the price paid for licences to give public balls and other entertainments. They are reserved for helping the respectable poor in temporary distress, and can never be used for Poor Law purposes. As old-age relief has nothing whatever to do with pauper relief, the cost of it cannot be defrayed out of the Poor Funds. By the law of 1891 it was enacted that one-half the expense incurred by the communes in connection with old-age relief should be paid by the State out of the yield of the beer tax; but that the amount of the State grant should not exceed 2,000,000 kroner (£111,110). Since then, however, this limit has been removed, and the State now pays one-half the cost of the relief, no matter what the amount may be. The local authorities defray the other half out of the local rates."—*Ibid.*, pp. 83-86.

1891-1914.—Loss of privileges incurred by receipt of Poor relief.—Private charities.—"A number of persons receiving 'poor-help' live . . . in their own homes, and others are put out on board, as are also many children whose parents are not at the same time receiving 'poor-help.' [Under the law of 1891] persons receiving 'poor-help' forfeit, temporarily at least, various privileges; they lose their Parliamentary and municipal suffrage; they are not allowed to marry . . . without special permission; and they are subjected to supervision and restrictions of other kinds. . . . The loss of the various rights need not be continuous; for if five years elapse after the receipt of any 'poor-help,' the privileges can be restored. Moreover, support given under certain circumstances and for certain purposes does not carry this odium at all; this is the case, for instance, with help towards medical and funeral expenses, and help given to seriously afflicted persons, imbeciles, the blind and deaf, people suffering from tuberculosis and lupus, and other serious diseases. In the streets of Copenhagen one often sees gangs of men in dark uniform, the inmates of the Ladegaard, a municipal workhouse, who keep the streets of Copenhagen clean. . . . The individuals receiving 'poor-help' are circumspcctly sifted, so that respectable old and infirm people are not troubled, when it is possibly avoidable, with the presence of drunkards and disorderly

persons. Private charity often takes the shape of independent funds or legacies, the revenues from which go either to some institution or to a distinct class or group of supplicants, confined either to a certain locality, vocation, or family. Some of the legacies are very important and comprehensive in their scope, others almost touching in the sentiment of which they are the outcome. There are thousands and thousands of these *Legater*, with a capital ranging from several hundred thousand to a few pounds, and their number is being increased almost every week. There is also a continuous growth in the number of charitable societies, which in innumerable ways help those in need, and amongst the many good features of these societies is the cheapness of their working and administration. As regards hospitals, homes for the blind, deaf, and dumb, and for imbeciles, lunatic asylums, and special homes and institutions for men and women in want of temporary help and care, Denmark yields to no country."—J. Brochner, *Danish life in town and country*, pp. 215-217. —The mothers' pensions law which went into effect January 1, 1914, "provides that aid can be given to mothers whose income is below a certain amount, but graduated according to the number of dependent children, the highest amount being given on account of children under two years of age. It provides also that in certain circumstances the allowance may be given on account of children up to 18 years of age. This law also provides certain minimum requirements as to the fitness of the mother and home conditions. The continuance of the aid is conditional upon the mother not receiving poor relief. Half of the amount of aid is borne by the state and the other half by the commune in which the mother has a permanent residence."—J. L. Gillin, *Poverty and dependency*, p. 376.

1921.—Care of cripples.—"In Denmark there is a centralized society which is concerned with the care of all educable cripples. This society maintains an active orthopedic hospital, an ordinary school and a trade school. The three together form an ideal cripple institution. The State contributes towards both treatment and education."—*Survey (Graphic) Nov. 26, 1921*, pp. 311, 312.

ENGLAND

827-1553.—Anglo-Saxon poor relief.—Part played by the monasteries.—Act of 1536.—Restraint of vagabondage.—"It is a characteristic fact in English history, that although after the union of the seven kingdoms [the heptarchy], the care of the poor was for centuries left in the hands of the Church, the duty was, nevertheless, imposed by the State. The bishop was obliged by a law of King Egbert, A. D. 827, to provide, so far as his means allowed, food and clothing for the poor and infirm who were not able to earn it by their own labour; and we here find for the first time that the title to relief is made to depend upon specific conditions. Again, though in France the Church of its own accord devoted a portion of the tithe to poor relief, in England the same course was made obligatory (law VI. of King Ethelred, A. D. 1014) on the bishop by the civil power. We are not, however, to suppose that the Church ceased to be the voluntary medium of good works, or to stimulate the endowment of foundations for the poor, or gave up the administration of the property of charities."—A. Emminghaus, *England, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 6-7.

"It has been often said and often denied that

the monasteries supplied the want which the poor law, two generations after the dissolution of these bodies, enforced. That the monasteries were renowned for their almsgiving is certain. The duty of aiding the needy was universal. Themselves the creatures of charity, they could not deny to others that on which they subsisted. . . . It is possible that these institutions created the mendicancy which they relieved, but it cannot be doubted that they assisted much which needed their help. The guilds which existed in the towns were also found in the country villages. . . . They were convenient instruments for charity before the establishment of a poor law, and they employed no inconsiderable part of their revenues, collected from subscriptions and from lands and tenements, in relieving the indigent and treating poor strangers hospitably. . . . Before the dissolution of the monasteries, but when this issue was fairly in view, in 1536, an attempt was made to secure some legal provision for destitution. The Act of this year provides that the authorities in the cities and boroughs should collect alms on Sundays and holy days, that the ministers should on all occasions, public and private, stir up the people to contribute to a common fund, that the custom of giving doles by private persons should be forbidden under penalty, and that the churchwardens should distribute the alms when collected. The Act, however, is strictly limited to free gifts, and the obligations of monasteries, almshouses, hospitals, and brotherhoods are expressly maintained. . . . There was a considerable party in England which was willing enough to see the monasteries destroyed, root and branch, and one of the most obvious means by which this result could be attained would be to allege that all which could be needed for the relief of destitution would be derived from the voluntary offerings of those who contributed so handsomely to the maintenance of indolent and dissolute friars. The public was reconciled to the Dissolution by the promise made that the monastic estates should not be converted to the king's private use, but be devoted towards the maintenance of a military force, and that therefore no more demands should be made on the nation for subsidies and aids. Similarly when the guild lands and chantry lands were confiscated at the beginning of Edward's reign, a promise was made that the estates of these foundations should be devoted to good and proper uses, for erecting grammar schools, for the further augmentation of the universities, and the better provision for the poor and needy. They were swept into the hands of Seymour and Somerset, of the Dudleys and Cecils, and the rest of the crew who surrounded the throne of Edward. It cannot, therefore, I think, be doubted that this violent change of ownership, apart from any considerations of previous practice in these several institutions, must have aggravated whatever evils already existed. . . . The guardians of Edward attempted, in a savage statute passed in the first year of his reign, to restrain pauperism and vagabondage by reducing the landless and destitute poor to slavery, by branding them, and making them work in chains. The Act, however, only endured for two years. In the last year of Edward's reign [1553] two collectors were to be appointed in every parish, who were to wait on every person of substance and inquire what sums he will give weekly to the relief of the poor. The promises are to be entered in a book, and the collectors were authorized to employ the poor in such work as they could perform, paying them from the fund. Those who refused to aid were to be first ex-

horted by the ministers and church wardens, and if they continued obstinate were to be denounced to the bishop, who is to remonstrate with such uncharitable folk."—J. E. Thorold Rogers, *Six centuries of work and wages*, v. 2, ch. 15.

1553-1601.—**Local poor rate.**—The church boxes were filled by voluntary contributions. But a policy of compulsion was by degrees introduced, until at last under Elizabeth (1572) a local poor rate was established. This compulsion is not the logical result of a want of means for supporting the helpless poor; but is attributable to the fact that those able to work were so numerous that their case could not be efficaciously dealt with by the repressive policy employed to meet it, and recourse was had on their account also to the church boxes. The object was to keep their numbers down. Warning and punishment of all kinds were employed with this view. Branding, bond-service, death itself were the penalties for refusing to work. . . . The third stage in which the care of the poor is regulated in a systematic manner, and made the business of civic society, was reached in England much sooner than elsewhere, perhaps because a check was sooner put in that country to the indiscriminate method employed by the Church."—A. Emminghaus, *England, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 6-10.

"There are a few bequests for the sick in various places, as at Dartmouth in 1505 to provide the poor with meat, fire, and candles in their sickness, and after their death with shrouds; there are some small money bequests for the bedridden; a few lazarus houses also. Thus, in 1538, John Gilbert left a house for lepers at Newton Bushell, because great numbers were then infected with that disease. A lazarus house may have served almost as a general hospital since leprosy was a common name for several distinct diseases."—B. K. Gray, *History of English philanthropy*, p. 27.

"In the beginning of Elizabeth's reign (5, cap. 3) the unwilling giver, after being exhorted by the bishop, is to be bound to appear before the justices, in quarter sessions, where, if he be still obdurate to exhortation, the justices are empowered to tax him in a weekly sum, and commit him to prison till he pays. . . . There was only a step from the process under which a reluctant subscriber to the poor law was assessed by the justices and imprisoned on refusal, to the assessment of all property under the celebrated Act of 43 Elizabeth [1601], cap. 3. The law had provided for the regular appointment of assessors for the levy of rates, for supplying work to the able-bodied, for giving relief to the infirm and old, and for binding apprentices. It now consolidates the experience of the whole reign, defines the kind of property on which the rate is to be levied, prescribes the manner in which the assessors shall be appointed, and inflicts penalties on parties who infringe its provisions. It is singular that the Act was only temporary. It was, by the last clause, only to continue to the end of the next session of parliament. [See also EQUITY LAW: 1601; ENGLAND: 1558-1603.] It was, however, renewed, and finally made perpetual by 16 Car. I., cap. 4. The economical history of labour in England is henceforward intimately associated with this remarkable Act. . . . The Act was to be tentative, indeed, but in its general principles it lasted till 1835. . . . The effect of poor law relief on the wages of labour was to keep them hopelessly low, to hinder a rise even under the most urgent circumstances."—J. E. Thorold Rogers, *Six centuries of work and wages*, v. 2, ch. 15.

1683-1747. — **Jewish charities.** — **Doles.** — "Scarcely had the Jews begun to settle in England before they took up that part of the responsibility of a civilized community, which consists in provision for its unfortunate members. Jewish names take their place in the lists of charitable donors. Abraham Jacobs (d. 1683), Benjamin Isaacs, Abraham Lopez Pereira, are a few of the many who, having prospered in their life, did not forget to leave some bequest for the poor after their death. But there are more important monuments. The first synagogue was opened in London in 1662; two years later a Spanish and Portuguese Jews' School was founded, and this was followed by an Orphanage, also for the Jews from the Iberian Peninsula, in 1703; a charity for defraying the costs of circumcising the poor, and a hospital for the aged and sick and for lying-in women in 1747. In the first instance these foreign immigrants were dependent on English hospitality, but they quickly began to organise their own charities for their own poor. Their efforts, which attracted the attention and received the support of native philanthropists, exercised in their turn a reciprocal influence through the stimulus they gave to the imitative faculty, and established the first model of one special form of hospital which was to play a considerable part in the social economy of the poor."—B. K. Gray, *History of English philanthropy*, pp. 156-157.

"By far the most numerous charities are those that provide small gifts of money, food, clothes, fuel, or some other commodity. How numerous they were, not only in the sixteenth century, but throughout our history, is suggested by the heavy and largely unsuccessful efforts of the Charity Commissioners to divert them to less mischievous uses. Some specimens may not be without interest as suggesting the social manners of the period. There were three little table boards at Exeter, which were to be covered with linen cloths and the loaves to be set out before the church service for distribution at its close. One, John Peter, left 20s. a year for the poor of each of twenty parishes in Devon. Another gift is to twelve poor women, for frocks of frieze, meat for their bodies, and smocks of new linen cloth. Gifts of fuel, 'sea cole' as it was known, are also frequent. There is a grim feeling in a bequest of shrouds for prisoners who should suffer at Ryngswill at Exeter. An Exmouth charity, of which I have come across no other instance, is that of Th. Browne, mariner, who left £4 for the purchase of two milch kine for the poor of the parish. The gifts are to be bestowed, at Christmas, midsummer, mid-lent, some anniversary or saint's day, frequently on All Souls', and there is an occasional clause withholding the benefit from tipplers and haunters of taverns."—*Ibid.*, pp. 21-22.

1774-1784.—**Society of Universal Good Will.—Relief of foreigners.**—"The Society of Universal Good Will, which in the magnificence of its aim recalls the 'All men free and equal' of the American Declaration, or the 'Liberty, Equality, and Fraternity' of the French Revolution, had nevertheless a very humble origin. The Scots who resided in and near Norwich were in the habit of celebrating the festival of St. Andrew 'with some degree of cheerfulness and merriment.' In the year 1774 it was found that, after paying all expenses, there remained a balance of 3s. 6d. The company being 'in good humour,' supplemented this by a collection of 10s., the money to be kept for helping any distressed Scot in the course of the year. This modest fund was the beginning of the Scots Society, and the Scots Society, founded

in 1776, became in 1784 the Society of Universal Good Will. It had several imitators. The aim of the Norwich fraternity embraced all such poor people in distress as were not entitled to parochial relief. Scots first, then foreigners from other parts of England, then natives of the world. A Turk was relieved in 1781, wanderers from Barbary and Denmark in 1783; and in the course of ten years above a thousand people from no less than eighteen countries. On one occasion a number of Lascars left destitute in England served to punctuate the need for this universalising of schemes of charity. A new want, a new method of relief, a fresh opportunity of imposture, such is the monotonous repetition of history. The president of the Scots Society, it is true, made a popular point when he affirmed that people would not come here from abroad merely to avoid starvation in a foreign land. He carried his audience with him, but the reports of the society are sufficient evidence that what would not happen sometimes did happen; or at least, that if people did not seek in emigration relief from starvation at home they did find by emigration the means of livelihood in England from those who had no opportunity of checking a plausible tale of distress."—*Ibid.*, pp. 160-170.

1782.—Charities for the sick.—"As early as 1782, the Rev. Mr. Dolling, vicar of Alderham, was concerned with the perils of maternity in a parish that had no midwife. He raised a subscription in order to send a woman for three months to a lying-in hospital at Store Street, in London. On her return she attended the labourers' wives at a charge of 2s. 6d., never had an accident, and saved the poor rate. This method of assistance was adopted in numerous other villages, and the services of the nurse were supplemented in some instances by the provision of maternity bags. The garments were made by the children at the schools for the poor. We have already seen how charity needlework acted as a mischievous competition to force down women's wages. Here we have rather to note how the new supply was in response to or created a new demand. Its remote effect on the labour market may have been bad, but in the first place this work was not for sale, and it was largely in addition to the previous manufactures of the village. We meet also with sick clubs for women, in which, for a payment of 1½d. a week, sick pay was given—3s. a week for three months and then 1s. The Rev. William Herringham's plan at Ongar was different. He provided for the use of the sick bed-linen, wrapping gowns, 'a large easy wicker chair with a head to it,' and a candlestick with a pannikin attached for heating liquid in."—*Ibid.*, p. 236.

1782-1834.—Gilbert's act.—Disastrous changes in Poor Law.—Views of Malthus.—Influence of Bentham.—Frugality banks, forerunners of savings bank system.—"It was not until 1782 . . . that the first step in the wrong direction was made, by an Act of Parliament (generally called from its framer Gilbert's Act), which allowed the guardians of the poor in each parish to find work near his house for any person out of employment, and to add to his wages from the parish funds if he had not quite sufficient to maintain himself. This was followed fourteen years later by a far more disastrous piece of misplaced philanthropy. In the early days of the great French war distress was rife everywhere, and one of the methods taken to alleviate it was to establish a system of giving a regular system of 'grants in aid of wages' for all poor laborers."—C. W. Oman, *England in the nineteenth century*, pp. 84-85.—Malthus, the great

economist, "showed himself an uncompromising opponent of the English Poor Law as it then existed [1798]. Speaking of the famous 43rd of Elizabeth [see above] he declares that one of its clauses is 'as arrogant and as absurd as if it had enacted that two ears of wheat should in future grow where one only had grown before. Canute, when he commanded the waves not to wet his princely foot, did not in reality assume a greater power over the laws of nature.' Since public assistance cannot create wealth, it cannot either keep alive a single pauper. 'It may at first appear strange, but I believe it is true, that I cannot by means of money raise the condition of a poor man . . . without proportionately depressing others in the same class.' . . . Not only does he condemn charity in the way of almsgiving, but also the practice of giving work for charity's sake. He admits an exception in the case of education, of which everybody can partake without making anyone else the poorer. . . . He demands the gradual abolition of the Poor Laws and of every kind of systematic assistance which offers to the poor any kind of help upon which they can always reckon. . . . Though he failed to remove the Poor Laws, the effect of his teaching is clearly seen in the Poor Law Amendment Act of 1834."—C. Gide and C. Rist, *History of economic doctrines* (tr. by R. Richards), pp. 135-136, footnotes.—Jeremy Bentham had a tremendous influence upon the change in the Poor Laws. He mocked at the whole system of poor relief. He introduced into English thought a new philosophy—the pain and pleasure theory and the utilitarian principle of "the greatest happiness of the greatest number." These views of Bentham's naturally conflicted with the existing attitude toward poverty. Among the "reforms advocated by Bentham . . . was the reformation of the Poor Laws, on the guiding principle of utilizing the able-bodied pauper and suppressing the mendicant or 'sturdy beggar.' In this relation, he was the first to sketch a system of education for pauper children, and to suggest the institution of 'Frugality Banks,' which has developed into the 'Savings Bank' system of to-day. . . . Pauper children . . . seemed to him to claim the attention of the State in a very special degree. . . . He wished to raise these unfortunates out of the grade of outcasts, to which they had been hitherto condemned, and to fit them for being good and profitable subjects of the King. For this purpose he urged the necessity, first of all, of laying in them the foundation of good habits, which could not be done apart from moral teaching. It was . . . a matter of personal character. . . . There next was needed training in other ways suitable to the circumstances. As being indigent children destined to make their living by some kind of manual labour, it was necessary to instruct them in a trade as means of livelihood."—W. L. Davidson, *Political thought in England from Bentham to John Stuart Mill*, pp. 82, 86-87.

ALSO IN: T. F. Fowle, (*English*) *Poor law*.

1796.—Society for improving the condition of the poor.—"In 1796, Sir Thomas Bernard founded The Society for Bettering the Conditions and Increasing the Comforts of the Poor. The original meeting of the society was at Mr. Wilberforce's Old Palace Yard, and its scope was declared to be 'everything that concerns the happiness of the poor.' The method adopted was to search and 'disseminate useful and practical knowledge with regard to the poor,' and to co-operate in all plans for their improvement. Reports were solicited from correspondents in various parts of the

country; they were to contain first-hand information only, and to be brief and clear. In the general plan of these reports they consist of two sections, one giving information, followed by another containing remarks. Let us, writes Bernard in another place, make 'inquiry into all that concerns the poor, and the promotion of their happiness, a science—let us investigate practically and upon system.' In addition to the work of Bernard and some others in the matters more especially of institutional charity, important contributions to a science of poverty, and consequently of poor relief, had been made by several inquirers, and above all by Eden, in his 'State of the Poor.' The mention of Eden's great work suggests rather the larger science, sociology, than the more restricted matter of philanthropy. We must confine ourselves to the narrower ground, and even in it other interesting suggestions crop up to which we must turn our attention before finally seeking to gather up the result and meaning of this epoch of reflection."—B. K. Gray, *History of English philanthropy*, pp. 278-279.

1818-1919.—Private charities.—Charity commissioners.—Care of children.—Religious institutions.—"The most important private charities in England are endowed charities. These include not only foundations for educational and religious purposes, but also for private alms-houses, for pensions for the aged poor, for relief of the sick, for fuel, food, and clothing, and for gifts in money, or doles. Many of these endowments are very ancient, having been created in the sixteenth and seventeenth centuries, and even earlier. Thus most of the endowments for private almshouses, which are very numerous, were created in the sixteenth and seventeenth centuries during the incipience of the Poor Law, when the Government encouraged such gifts to supplement public relief. . . . In 1818 a commission was appointed to investigate endowed charities, which finally completed its report in 1837. This report enumerated 28,820 charitable endowments, whose gross aggregate income was over £2,000,000 annually and which held in possession over 523,000 acres of land. Since then the number and extent of charitable foundations have increased enormously. It is, indeed, probable that the endowments of the nineteenth century exceed in extent those of all the previous centuries combined. . . . Judicial and administrative control over endowments has in recent years become an important public question. It has been a difficult matter to harmonize many of the ancient endowments with the conditions of modern life. . . . To meet these conditions a Board of Charity Commissioners was established in 1853, and has since then had its powers considerably enlarged. This is primarily a board with inspective and supervisory powers, rather than a board of control. Through a staff of inspectors the commissioners inspect the bulk of charitable endowment annually. The light thus thrown on the working of endowments has of itself done much to effect their improvement. The charity commissioners have the further important power of remodeling arrangements for the administration of a charitable endowment in certain cases. . . . The secularization of the relief system which followed the Reformation did not destroy the charitable activities of the Church. . . . Many of the endowed charities are, in effect, church charities, since the controlling trustees are church authorities—church wardens, vicars, bishops, or other church officials. Some of the ancient endowments were confiscated or secularized during the reign of Henry VIII, but many more remained in-

tact under practical church control. . . . The more recently established charities of the English Church, . . . partake of the broad and enlightened humanitarianism of the nineteenth century, and cover almost every object of philanthropic endeavor. Thus in the field of the care of the sick the Church maintains seventy-four cottage hospitals and eight special hospitals; thirty-four convalescent homes for men and women, twenty-three for women and children, twelve for children only, and eight for gentlewomen—all of these institutions being conducted on a charitable basis. Besides, to care for the sick poor in their own homes the Church has twenty-six institutions which train and send out visiting nurses. . . .

"Among the most successful and extensive charities of the Church of England are those which are included in the 'Reformatory and Refuge Union.' Such is the Children's Aid Society which had aided, up to 1895, over 11,000 dependent and neglected children. Such also is the Church of England Society for Providing Homes for Waifs and Strays. This society has eighty-five homes, all of small size, the largest having a capacity of not more than forty. In 1895 these homes contained 2,250 children, besides which 540 were boarded out in families, 165 placed in service, and twenty-four assisted to emigrate. Finally, the Reformatory and Refuge Union includes the twenty-six reformatory and industrial schools for boys and the nineteen similar institutions for girls maintained by the Church of England. All of these schools are certified by the local Government Board as fit to receive children committed by magistrates. . . . Closely allied to this work is that of the Church Penitentiary Association . . . [which] maintains forty-four 'penitentiaries' or homes for penitent fallen women. In these days they are kept from three months to three years and fitted to return to normal social life. . . . Next after the Church of England, the greatest development of charitable activities among English religious denominations is to be found in the Roman Catholic Church. . . . In the field of general relief work, the most extensive and important organization is the St. Vincent de Paul Society. This society adopts wholly modern methods in its relief work. It investigates carefully all cases applying for aid, it keeps a record of these cases, it co-operates with other relief societies, and it sends visitors to the homes of the poor. The society has branches in all large cities, and in the larger cities many local branches. In London alone there are, for example, twenty-nine of these local branches, or 'committees,' of the St. Vincent de Paul Society. There are several other societies for the relief of the aged poor, like the Benevolent Society for the Relief of the Aged and Infirm Poor, . . . [which] grants pensions to poor Catholic persons above the age of sixty. The Little Sisters of the Poor have as their special object the care of the aged poor in institutions. They are by far the most important organization engaged in this special branch of philanthropic work. They have twenty-eight houses in England, many of them being large institutions. . . . In the field of the care of the sick poor the Catholic Church has in England eighteen hospitals and convalescent homes conducted on a charitable basis. It maintains also eleven societies for nursing the sick poor in their own homes, and a number of homes for incurables. The various sisterhoods devote themselves largely to the nursing of the sick and the education of poor children. . . . The Church maintains in England eleven Poor Law Schools for boys and twenty-five for girls which have been certified by

the Local Government Board as fit to receive dependent children committed to them by the boards of guardians. It has also five certified reformatories for boys and two for girls for the reception of delinquent children between twelve and sixteen, guilty of serious offenses. For delinquent children under fourteen, guilty of minor offenses, the Church maintains twenty-seven certified industrial schools, fifteen for boys and twelve for girls. In England dependent, neglected, and delinquent children of Catholic parentage must by law be committed to these certified Catholic schools. In addition to such schools, the Catholic Church in England has about forty other schools, orphanages, or homes, for boys or girls.

"Among the newer religious denominations in England, none have attempted more extensive philanthropic work than the Salvation Army.

In 1890 General Booth published his book, 'In Darkest England and the Way Out,' in which, after picturing the condition of the poorer classes of London, he proposed his plan of removing the more wretched of them to the country and rendering them self-supporting through agriculture. He estimated that he could make this plan a success if £1,000,000 were donated. The money was soon forthcoming, and this formed the nucleus for the now extensive charities of the Army. According to the report of the English division of the Salvation Army for the year 1900, the Army had in England twelve farm colonies, comprising 25,562 acres, with 650 colonists. These colonies were connected with similar farm colonies in English countries across the sea for the purpose of assisting emigration.

In addition to this strictly industrial work, the Army has many other charities. It has 188 shelters and food depots, providing sleeping accommodations for 14,041 homeless men and women.

Again, the Army has 132 slum posts, and maintains ninety-four rescue homes for fallen women. The children's homes and day nurseries supported by the Army number seventeen.

It has eleven homes for ex-convicts through which 1,626 discharged prisoners passed in 1900 with satisfactory results in 1,393 cases [see also Salvation Army]. The scope of this article will not permit any attempt at description of this vast network of private secular charities. An illustration or two will suffice to indicate their character. An example of such a charity founded by private initiative is the 'National Incorporated Waifs' Association,' or 'Dr. Barnardo's Homes,' as it is popularly called. This organization exists for the rescue and care of neglected and dependent children. It has connected with it some forty different institutions in England which care for over 3,000 children, besides three emigration depots in Canada. Its chief method of child-saving is through placing out dependent children in homes, especially in Canada, and since its founding by Dr. T. J. Barnardo, it has thus placed out over 10,000 children."—*Public relief and private charity in England (University of Missouri Studies, v. 2, no. 2, Dec., 1903, pp. 67-75, 78).*

1834.—Report of the commission on the Poor Law.—Parliament passes bill amending the Poor Law.—A commission was appointed in 1833 to report upon the ways in which the old system might be reformed. The influence of Bentham is clearly shown in the argument of the report. "All men seek pleasure and avoid pain. Society ought to secure that pain attaches to anti-social, and pleasure to social conduct. This may be done by making every man's livelihood and that of his children normally dependent upon his own exertions, by separating those destitute persons who cannot do

work useful to the community from those who can, and by presenting these last with the alternative of voluntary effort or painful restriction."—G. Wallas, *Human nature in politics*, p. 156.—"In February, 1834, was published perhaps the most remarkable and startling document to be found in the whole range of English, perhaps, indeed, of all social history. It was the Report upon the administration and practical operation of the Poor Laws by the Commissioners who had been appointed to investigate the subject. . . . It was their rare good fortune not only to lay bare the existence of abuses and trace them to their roots, but also to propound and enforce the remedies by which they might be cured."—T. W. Fowle, *Poor law, ch. 4.*—"The poor-rate had become public spoil. The ignorant believed it an inexhaustible fund which belonged to them. To obtain their share, the brutal bullied the administrators, the profligate exhibited their bastards which must be fed, the idle folded their arms and waited till they got it; ignorant boys and girls married upon it; poachers, thieves, and prostitutes extorted it by intimidation; country justices lavished it for popularity, and guardians for convenience. This was the way the fund went. As for whence it arose—it came, more and more every year, out of the capital of the shopkeeper and the farmer, and the diminishing resources of the country gentleman. . . . Instead of the proper number of labourers to till his lands—labourers paid by himself—the farmer was compelled to take double the number, whose wages were paid partly out of the rates; and these men, being employed by compulsion on him, were beyond his control—worked or not as they chose—let down the quality of his land, and disabled him from employing the better men who would have toiled hard for independence. These better men sank down among the worse; the rate-paying cottager, after a vain struggle, went to the pay-table to seek relief; the modest girl might starve, while her bolder neighbour received rs. 6d. per week for every illegitimate child. Industry, probity, purity, prudence—all heart and spirit—the whole soul of goodness—were melting down into depravity and social ruin, like snow under the foul internal fires which precede the earthquake. There were clergymen in the commission, as well as politicians and economists; and they took these things to heart, and laboured diligently to frame suggestions for a measure which should heal and recreate the moral spirit as well as the economical condition of society in England. To thoughtful observers it is clear that the . . . grave aristocratic error . . . of confounding in one all ranks below a certain level of wealth was at the bottom of much poor-law abuse, as it has been of the opposition to its amendment. . . . Except the distinction between sovereign and subject, there is no social difference in England so wide as that between the independent labourer and the pauper; and it is equally ignorant, immoral, and impolitic to confound the two. This truth was so apparent to the commissioners, and they conveyed it so fully to the framers of the new poor-law, that it forms the very foundation of the measure. . . . Enlightened by a prodigious accumulation of evidence, the commissioners offered their suggestions to government; and a bill to amend the poor-law was prepared and proposed to the consideration of parliament early in 1834. . . . If one main object of the reform was to encourage industry, it was clearly desirable to remove the impediments to the circulation of labour. Settlement by hiring and service was to exist no longer; labour could freely enter any parish where it was wanted, and leave it for another parish which might, in its turn, want

hands. In observance of the great principle that the independent labourer was not to be sacrificed to the pauper, all administration of relief to the able-bodied at their own homes was to be discontinued as soon as possible; and the allowance system was put an end to entirely. . . . Henceforth, the indigent must come into the workhouse for relief, if he must have it. . . . The able-bodied should work—should do a certain amount of work for every meal. They might go out after the expiration of twenty-four hours; but while in the house they must work. The men, women, and children must be separated; and the able-bodied and infirm. . . . In order to a complete and economical classification in the workhouses, and for other obvious reasons, the new act provided for unions of parishes. . . . To afford the necessary control over such a system . . . a central board was indispensable, by whose orders, and through whose assistant-commissioners, everything was to be arranged, and to whom all appeals were to be directed. . . . Of the changes proposed by the new law, none was more important to morals than that which threw the charge of the maintenance of illegitimate children upon the mother. . . . The decrease of illegitimate births was what many called wonderful, but only what the framers of the law had anticipated from the removal of direct pecuniary inducement to profligacy, and from the awakening of proper care in parents of daughters, and of reflection in the women themselves. . . . On the 14th of August, 1834, the royal assent was given to the Poor-law Amendment Act, amidst prognostications of utter failure from the timid, and some misgivings among those who were most confident of the absolute necessity of the measure. . . . Before two years were out, wages were rising and rates were falling in the whole series of country parishes; farmers were employing more labourers; surplus labour was absorbed; bullying paupers were transformed into steady working-men; the decrease of illegitimate births, chargeable to the parish, throughout England, was nearly 10,000, or nearly 13 per cent.; . . . and, finally, the rates, which had risen nearly a million in their annual amount during the five years before the poor-law commission was issued, sank down, in the course of the five years after it, from being upwards of seven millions to very little above four.”—H. Martineau, *History of the Thirty Years Peace*, v. 2, bk. 4, ch. 7.—See also ENGLAND: 1834-1839.—In 1838 the Act was extended to Ireland, and in 1845 to Scotland.—T. W. Fowle, *Poor Law*, ch. 4.—“The new Poor Law was passed by Parliament in 1834; and the oversight of its administration was placed in the hands of a special board of commissioners, then known as the Central Poor Law Board. This board, which was not represented in Parliament, was continued until 1847. In that year it was reconstructed and placed under the presidency of a minister with a seat in the House of Commons—a reconstruction putting it on a political level with the Home Office and the other important Government Departments at Whitehall. The Department was henceforward known as the Poor Law Board, and continued to be so named until 1871, when there was another reconstruction. This time the Poor Law Board took over from the Home Office various duties in respect of municipal government and public health, and from the Privy Council the oversight of the administration of the vaccination laws and other powers, and its title was changed to that of the Local Government Board. Since then hardly a session of Parliament has passed in which its duties and responsibilities have not been added to, until at the present time the

Local Government Board is more directly in touch with the people of England and Wales than any other Government Department. There is not a village in the land which its inspectors do not visit or to which the official communications of the Board are not addressed.”—E. Porritt, *Englishman at home*, ch. 2.

1869.—Establishment of the Charity Organization Society.—“A second system of charity, characteristic of modern methods and forming a distinct contrast to the relief methods of antiquity and medieval times, is the Charity Organization Society, a private charity. The reform movement in public charitable administration, initiated by the successful Hamburg-Elberfeld system, spread to England where, in 1860, the Charity Organization Society of London was formed. This society aimed at organizing the existing charities of the city, public and private, in order that the work of relief might be carried on in a spirit of harmonious coöperation. It tried to check the evil of overlapping relief, and to repress and prevent pauperism by means of investigation, follow-up work, and restoration of the destitute to independence by self-help. [See also EDUCATION: Modern developments: 20th century: Education for the deaf, blind and feeble-minded: Feeble-minded.] Since 1877, when Buffalo established the first Charity Organization Society in the United States, the system has spread to the chief cities of this country. The first step towards the organization of private relief was the establishment of Relief Societies to take the place of indiscriminate almsgiving by individuals. Then came the period of Associations for Improving the Condition of the Poor. These associations attempted the permanent elevation of those in need, but failing to keep in view this desirable end, degenerated into the practice of giving indiscriminate relief. They were not educational, provided no adequate safeguards against deception, and neglected the supervision of recipients of aid. Finally, comes the Charity Organization Movement.”—F. S. Chapin, *Historical introduction to social economy*, pp. 286-287.

1896-1909.—Report of royal commission.—Increasing pauperism.—In December, 1905, a royal commission, composed of nineteen men and women of distinguished ability and of special qualifications for the service, was appointed in Great Britain, “to inquire—(1) Into the working of the laws relating to the relief of poor persons in the United Kingdom; (2) into the various means which have been adopted outside of the Poor Laws for meeting distress arising from want of employment, particularly during periods of severe industrial depression; and to consider and report whether any, and, if so, what modification of the Poor Laws or changes in their administration or fresh legislation for dealing with distress are advisable.”

After three years of laborious investigation, making “more than 800 personal visits to unions, meetings of boards of guardians, and institutions in England, Scotland, and Ireland,” as well as examining over 1,300 witnesses, the commission submitted an elaborate report in February, 1909. Its findings as to the present working of the poor-laws and the relief-systems of the United King-

dom, and its recommendations for reform, cannot be summarized with any clearness in such space as can be given to the subject here; but there is a startling significance in what it shows of the increase of pauperism and of the public cost of poor relief in late years. It appears from the returns of the local government board that the mean number of paupers in 1906, 1907 and 1908, was at a higher level than it had been for 31 previous years. Excluding, however, these three especially bad years, it is found that throughout the period 1896-1906 there were 24,000 more paupers than in the period 1888-1896, and 7,000 more than in the period 1880-1888. In discussing the report the London *Times* remarks: "Further examination even diminishes the meagre consolation these figures afford as to the results of a generation of effort at reducing pauperism. Comparing the period 1896-1906 with 1871-80, there has been a decrease of 3.9 per cent. in the total number of paupers, but this decrease has been accompanied by a large increase of male pauperism and is due entirely to the large decrease in the number of children, whose numbers have decreased by 18 per cent., and a small reduction in the number of women, whose numbers have decreased by 2 per cent. The decrease in these two classes so affects the total as entirely to conceal an absolute increase of 18 per cent. in the number of male paupers. Even in regard to the children, at any rate during the last 15 years, the decrease has been almost wholly in rural unions, and in the children of widows, and there has been a general increase in the number of children of able-bodied men.

"Further, so far as figures are available, they show a greater proportionate increase in the number of paupers during the working years of life than in the very young or the very old. Taking only the able-bodied in health, we find that in the period 1896-1906 in metropolitan unions the indoor paupers have increased by 38 per cent. and the outdoor by 137 per cent.; in urban unions the indoor by 24 per cent. and the outdoor by 133 per cent.; and in the whole of England and Wales the indoor by 21 per cent. and the outdoor by 49 per cent. In London alone 15,800 more paupers are being maintained than in the eighties, and the rate per 1,000 of the population, which used to be below that for England and Wales, has risen above it."

As for expenditure, it was some £8,000,000 in the year 1871-72, and £14,000,000 in the year 1905-06. Summing up the general situation with regard to this expenditure, the commission says: "We find that, whilst the expenditure per inhabitant has increased from 7s. 0¼d. to 8s. 2¾d. since 1871-72, and is only 7¼d. less than it was in 1834, the expenditure per pauper has increased from £7 12s. 1d. to £15 12s. 6d. in the same period. The country is maintaining a multitude of paupers not far short of the numbers maintained in 1871-72, and is spending more than double the amount upon each individual. The increased expenditure has done little towards diminishing the extent of pauperism. Such advance as the nation has made has been accomplished at an enormous cost, and absorbs an annual amount which is now equivalent to nearly one-half of the present expenditure upon the Army. It may be urged that the rate of pauperism has diminished from 31.2 per 1,000 in 1871-79 to 22.2 per 1,000 in 1896-1905, and this is certainly a matter for congratulation, but it has been the result of the large increase in the population rather than of any considerable reduction in the number of paupers."

This discouraging result has occurred notwithstanding the fact that the nation is spending £20,-

000,000 more in education than in 1831, and £13,000,000 more in sanitation and the prevention of disease than in 1841; notwithstanding the fact "that money wages in the nineties were 10 per cent. above those of the eighties, and 30 per cent. above those of the sixties," and notwithstanding the fact that "there has been a considerable flow of the working classes from the lower paid occupations to the higher paid industries."

The recommendations of the commission include a scheme for a permanent system of public assistance for the able-bodied, which contemplates the establishment in every district of four coöperating organizations: (a) An organization for insurance against unemployment, to develop and secure (with contributions from public funds) the greatest possible benefits to the workmen from coöperative insurance against unemployment; (b) a labor exchange established and maintained by the Board of Trade to provide efficient machinery for putting those requiring work and those requiring workers into prompt communication; (c) a voluntary aid committee to give advice and aid out of voluntary funds especially to the better class of workmen reduced to want through unemployment; (d) a public assistance authority representing the county or county borough and acting locally through a public assistance committee to assist necessitous workmen under specified conditions at the public expense. The report adds that it must be a fundamental principle of the system of public assistance that the responsibility for the due and effective assistance of all necessitous persons at the public expense shall be in the hands of one, and only one, authority in each county and county borough—viz., the public assistance authority. The report of the minority members of the commission—four out of the seventeen—is almost as long as the majority report. It recommends a radical change in the whole system of poor relief. It does not approve the institution of new officials in place of the guardians. The minority consider, however, that "registrars of public assistance" should be appointed by the county councils. Among their duties should be the recording of all assistance given to the poor. As for the problem of unemployment the minority believe that one of the chief functions of a labor exchange as recommended by the majority, should be to dovetail seasonal occupations so that employment would be continuous. Mothers of young children should receive public assistance so that they shall not have to work in order to support their families. Public works should be so arranged by the government as to employ more labor in times of trade depression, and less labor when private business and trade are flourishing. The minority do not approve compulsory government insurance against unemployment, but recommend government subsidies of trade unions which provide for such insurance.

1898-1922.—King Edward's Hospital Fund.—This fund, originally known as the Prince of Wales's Hospital Fund, which is used to assist in the upkeep of the London hospitals, dates from the Diamond Jubilee of Queen Victoria (Sixtieth anniversary of her reign). In order to create a fund for the hospitals of London, King Edward VII, then Prince of Wales, proposed to the general public that in commemoration of the Diamond Jubilee of a long reign, a sum should be raised, which could be used for this purpose. He called especially for new contributors, and desired that the new fund should not interfere with the raising of two other important funds, the Metropolitan Hospital Sunday Fund (the name of which shows its origin), and the Hospital Saturday Fund, raised

by contributions of one shilling each from shop workers. The response to the appeal was generous beyond expectation. The Prince hoped that from £100,000 to £150,000 might be raised yearly, but the first year £227,000 was subscribed and of this £56,800 was carried to a reserve fund for lean years. By 1907 the reserve and contributions had reached a point where permanent organization was necessary, and on the advice of the then president of the fund, King George V, incorporation was applied for and obtained. Under the constitution, the governing body consists of a general council and a president, who must be a brother, son or grandson of the reigning sovereign. It is now [1922] under the presidency of Edward, Prince of Wales, who succeeded his father, King George. The fund is managed on the best business principles. An annual distribution is made on the recommendation of the Distribution and Convalescent Homes Committees, and is used for very definite objects, such as maintenance, reduction of debts, removal of hospitals to better or more suitable sites, amalgamations, equipment, the opening of additional beds, and aid to country convalescent Homes and Sanatoria for tuberculosis patients, who take in London sick. The invested funds [known as the King's Fund] had grown to such an extent by 1920 that £250,000 were applied during that year to tide the hospitals over the economic crisis which had seriously affected their annual returns from contributions. This amount was added to the yearly distribution of £200,000 which is ordinarily made.

1907.—Small Holdings Act. See ENGLAND: 1907-1908.

1919-1921.—Proportion of population in receipt of relief.—Child welfare.—Treatment of tuberculosis.—Relief of the blind.—Health visitors and district nurses.—“The practice of making a census of the persons in receipt of poor law relief which had been interrupted during the war years was resumed in 1920. “The following particulars are derived from that census. . . . The total number of persons in receipt of relief on the night of the 1st January, 1920, was 576,418. This number is 1.5 per cent. of the estimated population. . . . 80.7 per cent. of the men in receipt of relief, 74.9 per cent. of the women, and 10.2 per cent. of the children were suffering from sickness, accident, or bodily or mental infirmity. A further 2.1 per cent. of the men and 0.5 per cent. of the women were relieved on account of the ill-health of a dependent. . . . 311,656 (54.1 per cent.) of the total number of men, women and children in receipt of relief were suffering from sickness, accident, or bodily or mental infirmity. 177,589 (68 per cent.) of the persons in receipt of relief who are classified as ‘Other persons’ *i.e.*, persons *not* suffering from sickness, accident, or bodily or mental infirmity) were children. Widows and other husbandless women having dependent children form a large proportion of the adult ‘Other persons’ who are in receipt of relief. . . . 82,666 (41.5 per cent.) of the 199,086 persons suffering from sickness, accident, or bodily infirmity were relieved in institutions, and 116,420 (58.5 per cent.) were relieved in their own homes. Of the 112,570 persons suffering from lunacy or some other form of mental infirmity, 107,920 (95.9 per cent.) were relieved in institutions, and 4,650 (4.1 per cent.) were in receipt of relief in their own homes. Of the persons *not* suffering from sickness, accident, or bodily or mental infirmity, 79,983 (30.2 per

cent. of the total of 264,762) were relieved in institutions, and 184,779 (69.8 per cent.) were in receipt of relief in their own homes.”—*First Annual Report of the Ministry of Health, 1919-1920, p. 3, pp. 7-9.*—“Considerable progress [has been] made in the work undertaken by local authorities and voluntary agencies for the physical welfare of expectant and nursing mothers and young children. Peace conditions have rendered possible a certain amount of adaptation of premises, if not of actual building, for the purpose of maternity homes and centers and similar institutions. Local authorities have taken advantage of these improved circumstances and of their powers under the Maternity and Child Welfare Act of 1918 to develop the provision which they began to make before and during the war for attending to the health of mothers and young children. . . . The powers and duties of the Board of Education with regard to children under 5 years of age were transferred to the Ministry of Health as from 1st October, 1919. This order had the effect of placing under the jurisdiction of the Ministry a large number of Centres originally known as Schools for Mothers. . . . The great majority of these Centres now receive children up to the age of 5, and most of them are open to expectant and nursing mothers as well as to children. . . . In one or two towns there are consultation centres opened one afternoon a week and attended by an Assistant Medical Officer, who refers any ailing women and children discovered at these Centres to a central clinic, opened each morning, and dealing with school children as well as with children under five and expectant and nursing mothers. . . . The accommodations for the in-patient treatment of children under five in general and special hospitals supported by voluntary contributions has been supplemented in the course of the development of Maternity and Child Welfare schemes in various ways. In Maternity and Child Welfare Centres which receive a large number of children the Medical Officer examines some who for some cause which is not immediately apparent are not making satisfactory progress. About 12 Centres have provided observation beds in which these children can be kept until the reason why they are not thriving is ascertained and a remedy for their condition can be applied. . . . The problem of dealing with children whose parents cannot make a satisfactory home for them, and who have not become chargeable to the Poor Law, presents many difficulties. To a large extent they are looked after by charitable agencies, who provide homes for them or board them out with foster-mothers, and it is well known that a great deal of excellent work is done by these agencies. To an increasing extent, however, such children are coming under the care of local authorities in connection with Maternity and Child Welfare work, and while the main provision for them, apart from the Poor Law, is still made by voluntary societies, local authorities have not only in some cases themselves undertaken the arrangements for securing to them healthy conditions of life, but have also in still more instances made contributions to voluntary bodies in respect of their maintenance.”—*First Annual Report of the Ministry of Health, 1919-1920, pt. 1, pp. 44, 49, 50, 51, 53.*—“The provision of treatment for tuberculosis as a benefit under the National Health Insurance Acts . . . [has been changed]. Insured persons . . . will continue to receive domiciliary treatment from their insurance practitioners, but the responsibility for provision of residential treatment for insured, as well as for non-insured, persons now rests with County

and County Borough Councils and not with Insurance Committees. . . . The number of Centres rose during the year [1920-1921] by 183 to a total of 1,780, 1,068 provided by Local Authorities and 712 by voluntary agencies; the Health Visitors at work increased from 3,000 to 3,215, the time devoted by them to these functions being approximately equivalent to the whole time of 1,617; a somewhat larger proportion of births in London and in County Boroughs was attended (during 1910) by registered midwives; and their assistance is now estimated to be available to 68 per cent. of the rural population. . . . Under the Blind Persons Act, 1920, persons so blind as to be unable to perform any work for which eyesight is essential become eligible for old age pensions at the age of 50; County and County Borough Councils are required to frame schemes by August, 1921, for the promotion of the welfare of blind persons in their areas; and a measure of supervision is extended to charities of which a principal purpose is to secure assistance for the blind. . . . The number of Health Visitors at work was increased during the year . . . and the total number of women so acting on the 31st March, 1921, was 3,215. Of these 1,021 were also School Nurses, or held some similar office under the Local Authority, and 1,302 others did not give their whole time to the Local Authority, of whom 937 are district nurses engaged in health visiting in rural districts. Approximately the equivalent of the whole time of 1,617 women is devoted to health visiting. . . . During the year new courses of training in the curriculum prescribed by the Board of Education for the training of Health Visitors were started at King's College for Women, Bedford College for Women, Battersea Polytechnic, Liverpool School of Hygiene, and in Wales, University College of South Wales and Monmouthshire, Cardiff. The qualifications possessed by the Health Visitors now at work are those of a trained nurse (about 74 per cent.), a midwife (about 83 per cent.), a Sanitary Inspector's Certificate (about 18 per cent.), and the special certificate for Health Visitors of an examining body approved by the Department (about 24 per cent.). Most of the present Health Visitors possess more than one certificate, and it is now the practice of the Department to require in the case of new applicants the possession of more than one such qualification, pending the supply of women who have obtained certificates under the new regulations of the Board of Education. The duties of a Health Visitor are not yet of a stereotyped nature. They are mainly concerned with the care of children under five not living in institutions. . . . During the year further efforts have been made to secure universal compliance with Article IV of the Poor Law Institutions Order, 1913, which requires the removal of healthy children over the age of three from workhouses. A few backward Boards of Guardians have still, however, failed to fulfil their obligation in this respect."—*Second Annual Report of the Ministry of Health, 1920-1921, pp. 5, 6, 22-23, 134.*

FRANCE

511-1553.—Medieval relief.—Royal assistance.—Shift of responsibility from clergy to laity.—“In early times the bishops and clergy were the only dispensers of alms to the poor. The first council of Orleans, held during the reign of Clovis, in the year 511, ordained that the whole income of the church should be devoted to the maintenance of public worship, the support of the

clergy and the poor, and the ransom of captives. A later council, held in the same city in 549, ordained that criminals should be visited in the prisons every Sunday, by the archdeacon and provost, who should supply their wants at the expense of the church, and further, that the bishops should take particular care of the lepers. The council of Tours, held in 566, denounces as murderers of the poor, all who shall appropriate to their own use the property of the church; and if they persist in their evil courses, ‘after three warnings, we will all assemble, and in concert with our bishops, priests, and clergy, since we have no other arms, we will proclaim from the choir of the church, against such murderers, the 108th Psalm, to draw upon them the malediction of Judas, that they may die not only excommunicated, but accursed.’ The second council of Macon, held in 585, ordained that ‘The bishops should recommend to all the virtue of hospitality; and to enable them better to practice it themselves, they should harbor no dogs in their houses, lest access thereto should be less free to the poor.’ The synod of Auxerre soon afterwards recommended to the faithful, in order that their devotions should be more acceptable, that they should make gifts to those poor persons whose names should be registered in the church records. In the year 540, the council of Orleans confirmed the establishment of a hospital at Lyons, founded by Childebert and his queen. Before the end of the same century, Paris had established the Hospital of St. Julien Le Pauvre, and Reims and Auterre each possessed a similar institution. Before the close of the next century nearly every considerable town had its hospital, while Paris possessed several. As early as the reign of Charlemagne they were classified for the reception of five kinds of inmates,—the poor, the sick, the orphans, the aged, and children. To meet the large expenditures required for the relief of the poor, the ransom of captives, and the support of hospitals, the clergy received vast benefices. Following the example of Constantine and his successors, the Merovingian kings were most liberal in their grants to the clergy. Clovis, for instance, gave to the church at Reims as much land as St. Remy could ride around during the royal nap at noon, and this grant was made in accordance with the prayer of the inhabitants, who preferred to be vassals to the church rather than to the king. Childebert and his Queen Uthugoth, as before stated, built and endowed the hospital at Lyons, and their example was followed by their subjects, who conferred large sums in public charity. From the reign of Pepin in 752, the first of the second or Carolingian race of kings, the clergy ceased to be the exclusive almoners to the poor. Under Charlemagne, in 809, the following became the law of the kingdom: ‘The counts must take care of the poor; each must feed his own poor. Let no one despoil the poor of the little which remains to him. The widow, the orphan, and the helpless, are placed under the protection of the king, as they are under God. They should enjoy legal peace, and the cause in which they are interested should be judged with especial care and diligence. Advocates should be given to the poor to prevent oppression and deception by the rich. To insure the execution of these charitable measures, *missi dominici*, charged with full powers, will go forth, and visit all parts of this vast empire.’

“Notwithstanding these enactments, the church continued to be the source from whence flowed the streams of public charity, and Charlemagne himself was prodigal in his gifts. During

the wars and confusion which followed the death of that monarch, all organized institutions for the relief of the poor had nearly disappeared. On the approach of the year 1000, which in the popular mind was fixed upon as heralding the end of the world, and to be preceded by wars, famine, and the prevalence of the *feu sacré* or St. Anthony's fire, large sums were bestowed in public charity, while wills and deeds in favor of hospitals and other charitable institutions were headed by the inscription, '*Adventante mundi vespero.*' With the crusaders came the diseases incident to large armies thrown upon a foreign shore without commissariat or discipline, and exposed to the vicissitudes of climate, and the pangs of hunger and thirst. The principal diseases thus brought were the leprosy and scurvy, and scarcely a town or village was without some kind of hospital or refuge for patients afflicted with the disorder first named. In the twelfth century, according to official statements, no less than nineteen thousand hospitals and retreats were opened in Europe for lepers. With the increase of these establishments came abuses in the administration of funds, and consequent edicts in favor of reform from the councils of Paris held in 1212, and from those of Arles and Ravenna held during the same century. Upon the complaint of Durant, Bishop of Mende, the council of Vienne, held in 1312, appointed laymen to aid in managing the hospitals and public establishments, called Clementine, in honor of Clement V., who presided over the council. It does not appear that the poor gained by the change of organization, as frequent edicts to check flagrant abuses are found during the following centuries. In a royal edict dated at Fontainebleau, December 15, 1543, we read: 'As we have been informed of the great disorders which exist in the lazarettoes and leproseries founded during past ages in our realm by our predecessors, kings, dukes, counts, and other seigneurs, as well as by many other devoted and faithful Christians, cities, chapters, and religious communities, of which the funds have been perverted, the title-deeds and charters lost or stolen by the administrators and governors of the same, who persecute and strangle the sick poor and lepers, and otherwise treat them so cruelly that they are compelled to quit the place and beg through the surrounding towns and villages, and besides do in other ways misapply the revenues, goods, and inheritances of the said hospitals, bequeathing them to their children, relatives, and friends, and other enormous abuses; now, therefore, I give to the bailiffs, seneschals, and judges, the supervision of the said hospitals and lazarettoes, with power to remove the said administrators.' These measures having been found insufficient, Francis I. in 1544 established the '*Bureau Generale des Pauvres,*' which was charged with the duty of levying an annual tax, called '*tax d'aumone,*' or poor-tax, on all princes, lords, towns, and landholders. An edict of Henry II., dated in 1547, ordains that 'Each inhabitant of Paris shall pay a special tax to meet the wants of the poor. But the weekly collections and gifts received in each parish for the relief of the poor, almost innumerable in Paris, are so much diminished, and come in most part from persons in easy circumstances, burghers, and inhabitants of our now cold-hearted city, and it being inconvenient and impossible to continue longer the distribution of alms to the said poor, which have hitherto been weekly distributed,—a matter which causes us great regret and displeasure,—Parliament shall appoint commissioners who shall receive the alms and gifts which all liberally-disposed persons shall be in-

clined to give.' By an edict dated in 1553, the general supervision of all the hospitals in the kingdom was given to the grand almoner of France. A few years later Charles IX. authorized the appointment of a joint commission of the clergy and laity to administer the public funds. The gradually increasing influence of the laity in the administration of public affairs, as will be seen by reference to past legislation, is strikingly shown by the act of Henry III., in which it was provided, 'That none shall hereafter be commissioned as administrator for the government of the goods and revenues of the lazarettoes and hospitals, other than simple burghers, tradesmen, and laborers, and not ecclesiastics, gentlemen, archers, public officials, their followers, or persons by them introduced.'—W. R. Lawrence, *Charities of France in 1866*, pp. 14-18.

1532-1873.—Grand Bureau des pauvres.—Bureau of Charity.—'The Grand Bureau des pauvres was the name of the Charitable state institution which corresponded in the capital at the close of the *ancien regime* to our *Assistance publique* today. The origin of the institution is unknown to us and the men of the eighteenth century were no better taught, upon this subject. We find in a memoir, of which the author is perhaps M. U. Tillière, substitute procureur général, who was specially charged towards 1750 with the direction of the charitable establishments, that the Grand Bureau owed its establishment to the necessity which was found at the commencement of the century to take some measures for the relief of a considerable multitude of the poor who begged. In fact, we find an order of the parliament published April 22, 1532, by which the court in forbidding healthy mendicants to beg, ordered that all the mendicants should be arrested that the healthy should be employed in the public works, that the sick and the healthy should be put in different hospitals, that to furnish food and maintenance for both, there should be made a public collection of which the proceeds should be placed in the hands of those who were deputed to take care of the said poor. Charity under the *ancien regime* was always considered as an affair of the police. The occupation of the government was to assure public order, and not to relieve individual miseries. The procureur général had in his department the surveillance and direction of the charitable establishments, notably of the Grand Bureau of the poor, which comprehended three establishments, each of which responded to a distinct end, which possessed a sufficiently large autonomy, but which were under the authority of a common chief, the Procureur Général of the Parlement of Paris, which had a common house, an administration in common, officers in common. . . . These are, the Grand Bureau, properly so-called, which distributed regular resources to the unfortunate, the hospice of the Petites Maisons which received aged indigents and the insane; the hospice of the Trinity which gathered the children, orphans without father or mother, or both, and taught them an occupation. Relief in the course of the seventeenth century could not exceed 5 sous a week for children and 8 sous for adults. In the eighteenth century these last were made the objects of a generous measure; the weekly allocation that they might receive was raised to 10 sous. But that was a maximum that all the poor could not obtain. The relief afforded by the Grand Bureau was insufficient and precarious and if one thinks how little effect would be produced to-day by five or ten francs distributed by the bureau of charity one will understand that the official bureau was not able to struggle against the contemporaneous misery and that there were con-

stituted a certain number of private and local organizations, the parochial companies for example. Mediocre though the alms was, however, many poor, many unfortunates sought for it. The Grand Bureau could not satisfy all the demands—the budget, and still more the regulations forbade. Each parish received an annuity (yearly allowance) which it could use as it would. The number of the poor was estimated in advance, probably each year, by the Procureur Général of each quarter (of the city), figured on the list with a pre-determined contingent. Be the misery more or less, that was of little import. The postulants, whatever their distress, whatever their merit, were reduced to wait for relief until a vacancy occurred. They waited by seniority, if they could not secure favour, and the correspondence shows that favour played as great a part at the end of the eighteenth century as in our day. The number of the inscribed poor was 2,000 at the end of the seventeenth century, in 1690 it was reduced by half. In 1717 it was 1,181, in 1731 it was about the same. The figures are derisory if one thinks of the population of Paris at that time.”—Translated from L. Cahon, *Grand bureau des pauvres*, pp. 12, 18-19.

Under the authority of the Procureur Général and dependent on the Grand Bureau were also the Petites Maisons. The Petites Maisons were designed for the care of the sick poor, the very aged poor, and the insane. They apparently were not well managed, and many abuses crept in. The Trinity was a hospice for orphans where 100 boys and thirty girls were received, and kept until they had learned a trade. This refuge is described as partly convent, partly prison, partly a place of apprenticeship, more singular and more defective than even the Petites Maisons. The Bureaux de Bienfaisance (Bureaus of Charity), establishments, charged with relief at the domicile were created as to cantons, by the law of the year V, and as to communes by that of the year VIII. The law of May 21, 1873, regulates the rights and duties of the administrative commission which governs them; the functions of the members are gratuitous. The resources of the bureaus consist in gifts, collections, legacies, subscriptions, taxes on spectacles, balls and concerts. The poor may receive temporary or annual relief. The injured, the ill, mothers in childbirth and nursing mothers, orphans, have the right to the first only; the second is reserved to the blind, the infirm, the aged of both sexes over 65 years; fathers overcharged with families of small children. These last must prove that they send their children to school, and that they have had them vaccinated. Outside of the allowance of bread, meat, soup and so on, of fire wood, bedding and clothing and small sums of money that the bureaus distribute to the poor, they also look for work for those who are healthy, they furnish to those who are ill, and who prefer home treatment to that of the hospitals, a doctor and medicines. Finally they give outdoor relief to the aged who desire to conserve their family life. As for the composition of the commissions of the hospitals and of the bureaus of charity since the law of 1873 the oldest curé of the commune is a member by right, by the law of August 5, 1870, the presence of ministers of religion in these commissions ceased to be obligatory, although they may be elected or nominated. In virtue of that law the administrative commissions of hospices, hospitals and bureaus of charity are composed of the mayor and of six members. Two members of each commission are elected by the municipal council. The four other members are named by the prefect. In Paris there are twenty bureaus, that is to say one

for each arrondissement. . . . From January 1, 1876, to December 31, 1873, gifts made to the bureaus were valued at 65,293,985 francs and 2,516,977 francs of income.—From *La Grande Encyclopédie*, v. 2, pp. 16, 17.

1796-1851.—Effect of the Revolution.—Treatment of begging.—“Even in the second year [1793-1794] of the Republic some advance was made by deciding where a poor man might ask for relief, and by imposing the duty of giving it on that commune in which the needy person was settled. Then came the laws of the year V., which gave back the property of the charitable institutions, and re-established the ‘Bureaux de Bienfaisance’; finally the law of the 7th Frimaire, V. [November 27, 1796], which, in connection with the royal orders of the 31st October, 1821, and the 6th of June, 1830, and, lastly, with the law of August 7, 1851, forms the foundation of the whole arrangements of the present time. For Paris itself there is an especial legislation. . . . Begging is forbidden, and has been so for centuries. According to resolutions of the Parliament of Paris, of the 29th August and 24th October, 1596, hanging or strangling, without any form of trial, was the punishment for beggars who were caught in Paris after 24 hours. Orders from 1764 to 1777 threatened beggars with the galleys. At last, in 1808, a decree of July 5th ordered that every department should have a ‘dépôt de mendicité’ which, however, has never been completely carried out. Sometimes one of these dépôts, or workhouses, is appointed for several departments, and they have been already established for 59 departments. In 14 more, measures have been taken for establishing them.”—M. Block, *France, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 204-211.

1908.—Lack of public charity.—Private charity.—Assistance Publique.—Bureau de bienfaisance.—Semi-official status of pawnshops.—“The French have this constant incentive to charity: their poor are always with them. There are no Boards of Guardians to look after them, and no workhouses into which they can be put out of sight. There are a few almshouses, or *hospices*, like those at Bicêtre and Nanterre, near Paris, among charitable public institutions, but what are such drops of dew to the thirst of the desert? To the penniless multitude who cannot, or will not, work, there is nothing but private charity or the prison. The blind, the paralysed, the armless and legless plead for alms at church doors and in the public places. Mendicity in public is officially forbidden and is punishable, but it is officially recognized that the cheapest way of dealing with the problem of pauperism is to leave private charity to deal with it. The State cannot afford to be generous with its prison accommodation, which is very inadequate. The tramp who steals something, or breaks a window, in order to get food and a roof over his head in winter, is regarded as an inconvenient humorist. Life in common, which is the rule of French prisons in the case of petty offenders, makes the treatment much the same as that of an English workhouse—possibly more genial; but the honest beggar cannot, by merely wishing it, get himself arrested and admitted as a guest in a State hotel, where there is nothing to pay. He must in some way make himself a public nuisance in order to enforce his claim. To the honour of the French be it said that they have a large stock of private charity for daily use. They are easily moved by the appeals of misery that come before their eyes, and there is a strong sentiment throughout the country against driving a beggar from the door, who only asks for bread.

Such a thing as a poor-rate would be bitterly resented by the public, who would never believe that the money so raised would find its way to those in greatest need of it. They would suspect the official machine of oiling its wheels too freely. . . .

"In the way of official charity there is the permanent organization of Public Assistance under State direction. This keeps up hospitals, takes charge of foundlings and abandoned children, most of whom are placed with peasants and are brought up to agricultural work, buries the pauper, and in other ways performs those unavoidable offices of charity which every State is bound to accept. If the *Assistance Publique* depended upon voluntary gifts, it would not get much; therefore, in addition to what the Budget allows it, it takes a good deal with or without leave. A rather heavy toll, amounting to nine per cent., is levied upon the gross receipts of all theatres (subventioned or not) and other places of amusement. The money that changes hands at racecourses, under the legalized system of betting known as '*Le pari mutuel*,' is also laid under contribution by the Public Assistance, and in this way bad habits are made to serve philanthropic purposes. Religion has always been in France the principal driving force of charitable work. It formed habits of private charity among the people by its influence in the course of ages, and many of those who now repudiate all religious doctrine are faithful to transmitted habits which were a gradual deposit of religion upon the sentiment of generations. The religious orders that devote their efforts mainly to practical charity, such as Les Filles de Saint-Vincent de Paul (popularly known as Sisters of Charity) and the Little Sisters of the Poor, have done a vast work in the past to relieve human suffering and wretchedness, and this is still continued on a reduced scale, and within the narrow limits now tolerated. The series of measures directed against religious orders of late years, inspired in the main by the motive of political reprisals, has had, among other effects, that of increasing the sufferings of the poor, who, victims of evil chance or of their own mistakes, flaws, and vices, have no hope left but in human charity. In all churches collections are regularly made for the poor, the distribution of the money thus obtained being left to the discretion of the *curé*, and in most of the communes throughout the country there is a lay organization called a *Bureau de bienfaisance*, under the superintendence of the mayor, for the alleviation of local distress. In Paris there is one in every *arrondissement*. Strange as it may seem, the pawning system in France is in a general sense one of the branches of Public Assistance, although under the direct control of local authorities. The pawnbroker, strictly speaking, does not exist in the country. If he tried to ply his trade in the English manner, he would be prosecuted as a usurer. The Mont de Piété, the establishment where money is advanced on pledges under official control, is in theory a philanthropic one and a continuation of the charitable banks which, under the name of *Monti di pietà*, appeared in Italy in the fifteenth century. In every town of importance there is a Mont de Piété, the capital needed for making advances on pledges being derived from loans, donations, and occasionally subventions. The rate of interest charged throughout the country is not uniform. In Paris it is nearly eight per cent., whereas at Rouen it is more than nine, and at Angers only $1\frac{1}{4}$ per cent. When the interest is so low as in the last case, it is obvious that the working expenses are charitably provided for. The theory is that the charges should never exceed the interest on money borrowed and what is sufficient

to cover working expenses. Should there be a margin to the good, the poor must benefit by it. The system reduces the evils inseparable from pawning facilities to a minimum, and is incomparably better than the English one, which is an abusive traffic upon distress and providence. Not that the French system is free from abuses. The rule of the Mont de Piété is never to advance more than two-thirds of the realizable value of the articles pledged, and as the corporation of official valuers (*commissaires-prieurs*) connected with the Mont de Piété are liable for the consequences of their errors, their appraisal of the value is usually so low that outside speculators whose business is to buy pawntickets have long been in existence. They undertake to sell the tickets again to the owners of the pledges after a stipulated lapse of time, but the interest they charge for the accommodation is very different from that of the Mont de Piété. In point of fact, those who have recourse to these traffickers rarely redem."—E. H. Barker, *France of the French*, pp. 244^a247.

1920.—Ministry of assistance, thrift and hygiene.—Mutual agreement with Italy for the care of the poor.—Education of dependent children.—"By a decree of January 20, the departments of public Assistance, health and thrift were grouped together to form a new ministry [the Ministry of Assistance, Thrift and Hygiene], in the same year an agreement has been arrived at between France and Italy which places subjects of either country sojourning in the other's territory on the same footing as to relief as the natives themselves, and provides for the adjustment of points in dispute and for the reimbursement of pecuniary outlay."—*Charity Organization Review*, June, 1920, p. 161.—"In France the actual surgical treatment for crippled children is provided for much in the same way as in the United States and England, but we may note the open-air hospitals on the seacoast at Berck near Boulogne."—*Charity Organization Review*, January, 1921, pp. 56, 57, 58.—"*Enfants assistés*, ordinary children of the rate are placed with the peasantry . . . on the other hand the *pupilles de la nation*, orphans of men fallen in the war, are given opportunities of being apprenticed to trades or sent to technical schools and so have a wider choice. . . . Experience gained during the war and reinforced by American medical opinion, through the Red Cross agencies . . . has given a fresh impetus to the crusade against tuberculosis. Provision for the establishment of dispensaries was made by law in 1916 and supplemented by another in 1920 which requires each department, within an interval of five years, either to erect a sanatorium for tuberculosis cases, or to provide for their admission into private sanatoria."—*Charity Organization Review*, July, 1920, p. 22-23.

1921.—National institutions.—Coöperation of public and private relief.—Functions of bureaux de bienfaisance.—"Ten Charitable institutions in France are termed national because . . . they are under the Ministry of Assistance, Thrift and Hygiene. Two are for the blind, three for the deaf and dumb, one for the non-pauper insane, two for convalescents, one for the aged, and one for workmen injured in accidents. Thus, with one exception, all have their function in providing for classes which require special treatment. . . . The bonus which raised the allowance of the aged and of large families from five francs to fifteen francs was continued for a year. . . . A study . . . made for the Société pour l'Etude de l'assistance by M. Charles Voigt states that in most of the

social legislation . . . beginning with the law of 1893 instituting free medical relief, a place has been found for co-operation between private and public relief, and that in 1911 a model by-law was drawn up to facilitate such co-operation. . . . The creation of new branches of the Assistance Publique . . . has gradually reduced the functions of the Bureaux de Bienfaisance to dispensing relief at home and administering legacies bequeathed to the poor. For though they are a branch of the Assistance Publique, nine-tenths of their resources are derived from private sources."—*Charity Organization Review, August, 1921, p. 106.*

GERMANY

9th-10th centuries.—Early laws.—"At a council held at Mainz in A. D. 847 it was decreed that the tithe, which every Christian should pay to his parish church must be divided into four parts, of which one part must be devoted to the relief of the poor. To the bishop was committed the task of the oversight of the administration of relief throughout his diocese; upon him was the responsibility of a firm control laid. Laymen who were guilty of usurpation of the Church's property were to be excommunicated. Also the king was petitioned to interpose against the oppression of poor freemen, and to defend the churches and their possessions as his own property. At a parliament held at Mainz in A. D. 851 these decrees of the council were promulgated as laws of the realm. . . . In the tenth century, under the firm rule of the Saxon Kings, the true founders of the German Empire, we find a greatly improved condition of the Church. At this time many of the bishops were men not only of great influence in affairs of State, but also men of real piety, who cared to the utmost of their ability for the poor, saw to their needs, and frequently fed them at their table and maintained them in their own houses. What the bishops did in the large towns they directed the clergy to do in their various parishes. From their income, derived from tithes and oblations, they must support the poor and those unable to work; they must supply the needs of widows and orphans; they must also provide food and shelter for wayfarers. Though the proportion of the income of the Church to be devoted to the poor is not stated, it was probably that ordered by Charlemagne. A survey of this period gives the impression that the bestowal of charity was becoming more and more a matter of personal feeling—indeed, of personal piety—and that, consequently, it was in practice less and less governed by any regulations."—W. E. Chadwick, *The Church, the state, and the poor*, pp. 38-30.

1497-1616.—Early Bavarian legislation.—"In Bavaria, as in other parts of Germany, the legislation . . . in force [in 1873] on the subject of the poor may be traced to the laws of the German Empire, more especially to a resolution of the Diet at Lindau in 1497, and the police regulation of the Diet at Lindau in 1497, and the police regulations of the following century. By the resolution of the Diet none were allowed to beg except poor and feeble persons, and children of beggars were to enter a craft or service of some kind, as soon as they were capable of earning their bread. The Governmental police regulations above mentioned enact that every commune should maintain its own poor, which, however, was understood to mean that the different communes were to allow such of their own poor as were incapable of work to collect alms within their limits, and were also to admit them to the local asylums. Overburdened districts

might grant certificates to such poor as they were unable to support, giving them leave to solicit alms elsewhere; but with this exception strange beggars were not tolerated. The code of 1616 for Upper and Lower Bavaria embodied these provisions with some additional enactments. In the first place, the settlement of the poor was regulated by reference to birth or residence; moreover the certificate system was so modified that begging might be authorized over the whole judicial district, but the authorities were instructed not to give certificates without careful inquiry, and to review all the cases every year. Almsgiving was not made compulsory; but collections in churches were to be set on foot, and the duty of charitable works was to be enforced from the pulpit. It was furthermore ordered that the authorities should exercise a diligent supervision of the administration of relief in asylums and elsewhere, and should revise accounts. Lastly, the common people were required to keep their children employed in learning, labour, or service, or in case of difficulty to inform the authorities, who were thereupon to provide the requisite assistance. It was in general terms the duty of those in authority to make sure that young unmarried persons hired themselves out, and that older persons, idle and without means of support, were kept to work."—Makowiczka, *Bavaria, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 118-119.

1684-1748.—Edicts of Frederick the Elector and Frederick the Great in Prussia.—National code.—"An ordinance of Nov. 18th, 1684, only laid down in general terms that every commune should, as far as possible, provide for its own poor. This was followed on the 10th of April, 1696, by an edict of the Elector, Frederick III., the chief purport of which was to secure unconditional admission to refugees from France and the Palatinate, and to all those whom war or religious persecution had driven from their homes, while gipsies and beggars were not allowed to cross the frontiers; but which at the same time ordered that the judicial authorities of each district should provide for beggars born within their limits. Should this be a greater burden than the locality could bear, unions were ordered to be formed, so that different districts should be obliged to provide for their poor in common. Ordinances issued on the 18th March, 1701, and the 10th of September, 1708, enlarge and define the obligation of relief and the procedure to be followed. The able-bodied poor were to be set at work, alms were to be given to those only partially able to support themselves, while such as were absolutely incapable of work were to be provided with lodging and general relief in poor-houses, orphan asylums, and hospitals. The rule was laid down for the benefit of these last institutions in particular, that in case of need different independent places and districts should combine. In towns the acquisition of civic rights, admission into a guild, or residence for ten years, gave a claim to support. If voluntary donations were insufficient for the purposes of relief, the law went so far as to invest the magistrates with the right, subject to certain conditions and regulations, of assessing and levying contributions in proportion to the means of the contributors. Under Frederick the Great a more detailed system of public relief was introduced. An edict of the 28th of April, 1748, declaring how the real poor should be provided for, and wilful beggars punished and kept at work, while in general no beggars should be tolerated, ordered that funds for the poor should be everywhere established, increased the severity to be used towards idlers and vagabonds, and laid down

that foreign beggars should be banished from the country, natural subjects being sent to their own district, that is, to the locality in which they were born, or had resided, or maintained themselves for the last three years. . . . The most important regulations as to public relief, the so-called principles of the National Code, occur in Title 19, Part 6, and are as follows: Sec. 1. It is the business of the State to take measures for the maintenance and care of those citizens who are not able to procure their own subsistence, nor to obtain it from such other private persons as especial laws oblige to afford it. Sec. 2. Those who only want means and opportunity to earn subsistence for themselves and their families, shall have such work given them as is suited to their strength and capacity. Sec. 3. Those who are unwilling to employ the means of earning their own subsistence, from laziness, love of loitering, or other irregular habits, shall be held to useful labour under the requisite supervision by force and punishments. Sec. 4. Foreign beggars shall not be allowed to enter or remain in the country, and if they find their way in in spite of this prohibition, they shall be immediately expelled. Sec. 5. Native poor shall be equally forbidden to beg, but shall be removed to the place to which they belong, and in which, according to the regulations of this Title, provision is to be made for them. Sec. 6. It is the right and duty of the State to take measures to prevent its citizens being in a state of destitution, and to stop excessive extravagance. Sec. 7. The State shall not tolerate practices which give encouragement to mischievous loitering, especially among the lower classes, or which interfere with the growth of industrious habits. Sec. 8. If any foundations exist with the object of promoting and encouraging mischievous inclinations of the kind in question, it is the right of the State to put an end to them, and to apply their revenues for the good of the poor. Sec. 10. Town and village communes are under the obligation of maintaining such of their members and inhabitants as have fallen into a state of poverty. Sec. 14. It is the duty of heads of corporations and communes to inquire into the reason why their members have sunk into poverty, and to give timely information of the same to the authorities with a view to their relief. Sec. 15. All poor and destitute persons whose subsistence cannot be procured in any other way are to be taken care of by the public authorities of the particular district, irrespective of rank or general judicial status."—E. Bruch, *Prussia, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 34-38.

1693-1699.—First public relief in Berlin.—"The first attempts at organizing poor-relief in Berlin on the part of the State, as far as our means of information reach, occur in the reign of the elector, Frederick III. (afterwards King Frederick I.). It was in his time that a foundation was laid for the formation of a Poor fund, and for the appointment of a special department for superintending the whole subject and conducting the business of relief. The enactments of preceding rulers, concerning as they did the poor of the Kurmark, and more particularly of the residential city Berlin itself, were chiefly aimed at the extinction of begging on highways, or from door to door, and its attendant mischiefs, this practice having then assumed a very bold front; and, further, at giving a legal form to the duty of relief incumbent on the communes. The management of relief in towns and villages generally was referred by the elector to the local authorities, magistrates, and lords of manors, but the Poor Law of Berlin was separated from that of the kingdom in general, and treated

independently. The elector first of all nominated by an order of the 10th of August, 1693, a commission of superior officers, secular and spiritual, for inquiring into the condition of the Berlin Poor establishments. This commission, which appears to have conducted all Poor Law matters provisionally until the year 1699, made an order on the 16th of August, 1695, that all poor and distressed persons should meet twice a week in the Town Hall, in order that everyone might receive assistance according to his need. Begging on highways and in houses was to be forbidden. To defray expenses, the commission ordered that a special collecting box should go round once a week (it was afterwards altered to once a month), and this is the origin of the main Poor Fund still existing. This fund was further augmented by Church offerings and State appropriations of different kinds, by taxes and fines, to some extent by the acquisition of landed property, and before long by private donations and legacies. As early as the year 1699 the creation of this main Poor fund was followed by the foundation of free schools for the poor. These schools have remained under the management and supervision of the Poor Law authorities down to the present day, having been in the meantime considerably augmented and extended."—H. Schwabe, *City of Berlin, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 71-72.

1852-1921.—The Hamburg-Elberfeld system of poor relief.—"One of the earliest constructive efforts at dealing with paupers and poverty-stricken people was made in Hamburg at the close of the eighteenth century. The system consisted of a central bureau, with the city divided into districts under the direction of overseers. Almsgiving at the door was prohibited, work was supplied the unemployed so that the helpless might learn to help themselves, an industrial school was provided for the children, and there were hospitals for the sick. So complete was the provision for all classes in need of assistance or discipline, that the system worked a revolution in Hamburg. Beggars, who had formerly lined the streets to the annoyance of the passerby, were either put at work or driven out. Destitute children, who had heretofore begun the struggle of life under a terrible handicap, were relieved and educated to industry and self-support. The poverty-stricken sick were cared for, or restored to health. The Elberfeld system of public relief, adopted in 1852 as a modification of the Hamburg system, represents one of the most remarkable of the earlier experiments in constructive charity. Its fundamental principles are a thorough examination of each individual dependent, continued careful guardianship during the period of dependence, and a constant effort to help him regain economic independence. In practice, a large number of unpaid citizens are relied upon to carry on this work. For purposes of administration, the city is divided into 564 precincts, each of which contain from four to six poor families out of a population of three hundred. A citizen visitor, or *Armenpfleger*, is placed in charge of each precinct. Appointed for three years of compulsory service on pain of loss of franchise and increased taxes, the *Armenpfleger* is a responsible person whose services the city may count upon. The office is not limited to the wealthy classes; indeed, a special effort is made to secure tradesmen and mechanics. Considerable prestige attaches to the office, which is considered the first round on the ladder of municipal honor offices. Applications for aid come directly to the *Armenpfleger*, whose duty it is to inquire carefully into all the circumstances of the case. When he is convinced that the family is

really in need, he gives the relief himself. At least once every two weeks he visits each poor family, and keeps himself informed of any change in their circumstances. The law sets a minimum amount for relief, and any income received by the family is deducted from this minimum. . . . As an adviser, or a 'friendly visitor,' the *Armenpfleger* assists any persons or families whose circumstances indicate the possibility of future dependence. Thus he finds work for the unemployed, provides medical aid for the sick, advises the improvident, and reports the incorrigible for prosecution and discipline. Fourteen precincts are grouped into a district organization. The reports of the *Armenpfleger* are made to the overseer of the district at regular fortnightly meetings where all cases are thoroughly discussed and a minute book prepared for the central committee. This committee meets fortnightly, following the district meetings. It has control over the work of the district workers, reviews the district decisions in regard to amount, kind, and duration of relief in particular cases, and prepares measures of a general nature. While relief to the poor in their own homes is administered and decided by the district meetings of visitors, subject to supervision and review by the central committee, it is the latter authority alone, acting upon recommendation of the visitors, which has the power to order relief in an institution. The success of the system is indicated by the fact that although Elberfeld increased from fifty thousand in 1852 to one hundred and sixty-two thousand in 1904, the proportion of the population in receipt of temporary or permanent relief diminished by over forty per cent.; that is, from 8 to 4.7 per cent. The per capita cost also diminished. The secret of its success seems to be found in the efficient service secured by the personal and intimate touch resulting from first-hand contact. When each relief agent has but four or six cases to look after, it is possible to individualize them, and to show true neighborliness. . . . With modifications, this Elberfeld system has spread to many other German cities. In 1802, the Hamburg system was reorganized by adapting some of the principles of the Elberfeld system to the special needs of a city of six hundred thousand. The original relief system of the city had broken down under the strain put upon it by increased population. It was obviously impossible for a visitor to look after the welfare of from twenty to eighty cases in a thorough manner. . . . In the absence of records kept at a central office, there was no means provided for preventing an indigent pauper from receiving support the year round. As reorganized, the system was arranged with superintendents at the head of each district. Applications for aid were made to these officials, who in turn assigned cases to the visitors best fitted to deal with them. . . . Another reform consisted of an extension of the period for which relief was granted. Under the Elberfeld system, aid was given for two weeks. Under the new system, dependents were divided into several classes. The aged, sick, and disabled were granted an allowance for six months, younger persons, like widows with dependent children, received aid for not more than three months, and all other cases were granted relief from one session of the council to another, usually for a month at a time. Another distinguishing mark of the reorganized Hamburg plan was the insertion of circuit councils, composed of district superintendents, between the district and the central administrative board. The circuit council discusses matters of interest to all districts, hears complaints against district decisions, and grants hospital and

institutional relief. The central board is the court of last appeal for complaints. It fixes the rules of administration, and determines upon more general remedial measures and agencies. Finally, the business management is the agency which centralizes and organizes the work by providing a registry of information of all cases from all districts, thus making it easy to detect duplication of relief. The active corps of this admirable relief system consists of twenty members of the central board, over one hundred district chairmen, about sixteen hundred helpers, and nearly one hundred clerks."—F. S. Chapin, *Historical introduction to social economy*, pp. 281-285.

1872-1914.—Private charitable societies.—**Founding of Bethel.**—Care of epileptics and weak-minded.—**Self support of institution.**—"In most German towns there are private societies for almost every kind of charity, from the care of the babies with working mothers to the care of mothers themselves. In one instance, at least, individual energies have created and supported an institution which I believe is unique in the world of charitable organization. I refer to Bethel, the city for the unfortunates. It was founded in the year 1872 by some enterprising clergy, and extended to its present proportions by the magnificent work of Pastor von Bodelschwingh. In the beginning no more than a peasant's farm, it is now a town of over five thousand inhabitants. Strange inhabitants—all the world's cripples and cast-offs, epileptic children, epileptic men and women, the weak-minded of every sex and age, beggars and vagrants, confirmed drunkards, debased and lost souls from every rank of society—of such is the population. And yet no town is more orderly, busier, happier. Out of suffering has been formed content, out of waste utility. Each of the buildings has its name and its special section of inhabitants. There is Bethsaida for the girls, Nazareth for the boys, Gilgal for the locksmiths, Bethabara for the laundry-women, Helven for the farm-hands. Every trade, every profession has its own quarters, its own work. The children, rescued from homes where their terrible afflictions made them unwanted scapegoats, are brought up to do work within the scope of their weak powers. The care with which they are surrounded saves them from their worst misery, and at no moment are they brought to face any brutal contrast or the fact that they are useless burdens to the community. They are in their own world. They grow up in it, and they die in it. It may not be a big world, but it is their very own, almost, indeed, the work of their own hands. For no one is idle. Bethel supports itself. Though it is inevitable that it should require financial help, it works no less for its own maintenance. It is not conscious in any way of being a charity. It has its own farms, its own manufactories, its workshops, its telegraph offices, its hospitals, its schools, its bakeries. And nearly all the workers are the derelicts who in the outer world would be either a danger or a burden. Each establishment has its 'pastor,' or father, as he is called, and under him are the sisters and brothers—men and women who have given up their lives to the care of the unfortunate. The whole town is like one big family, of which, when he was alive, Pastor von Bodelschwingh was the loved head."—I. A. B. Wylie, *Eight years in Germany*, pp. 151-152.

1914.—Out-door relief.—Relief which does not incur deprivation of civil rights.—Public institutions for casual relief.—Work colonies.—Night shelters.—Care of orphans.—Food for poor children.—Medical aid.—Dispensaries.—Houses of Correction.—"The problem of the poor, al-

though in some degree made easier in Germany by the compulsory insurance system, is still a very difficult and costly one. Poor-houses, such as exist in Great Britain, are unknown in Germany. Outdoor relief with supervision is the principle in general adopted, the underlying idea being that in this way the poor are helped to help themselves without becoming pauperised. In the administration of the Poor Law no insuperable difficulty is found in dealing with the aged, the totally infirm, the sick and the orphans. Support *has* to be given to them and the public does its duty. The real difficulty begins with the willing healthy unemployed workmen for whom no place is available. Then there are the lazy and weak-minded, but otherwise healthy people. Finally, come the semi-invalids and bodily weak, whom no one will employ. It has been suggested that the municipalities should start factories in which these classes of the poor should be employed, in the same way as in the country colonies for the workless. Proposals have been made that the poor should be engaged in making paper, ink and pens for the Administration, simple appliances for cripples and for the hospitals and lunatic asylums, and toys for the amusement of the orphans in the schools. The poor people would not be boarded or lodged in the factories, and would only be called on to do just what they were capable of doing, and at any time be allowed to go and seek other work if a definite chance was open. The method of caring for the deserving poor in Germany has often been described, but will bear brief recapitulation. The Elberfeld system of poor relief, which has been widely adopted by the city municipalities and country parishes of Germany, has obtained a world-wide renown. The fundamental ideas of the system are individualisation and decentralisation. . . . In some cities slight modifications have been introduced into the system, whereby the district committee may, on its own initiative, extend the duration of the assistance given. In some cases, paid officials are appointed to superintend the relief of permanent paupers. The guardian is in all cases empowered to give immediate relief when he finds it necessary, but not for longer than fourteen days. He remains in constant touch with the needy and gives them advice as to where to seek work if unemployed. This advice is not offered as a rule in a bureaucratic spirit, but in a kindly, helpful way.

"Women have hitherto not been permitted to participate largely in the work of poor relief, but a change has recently come about in some districts, and 4,000 women are now members of guardians' committees. In some cases, such as Berlin, Hamburg and other big cities, it has been found advisable to appoint boards of guardians. The needy have then to apply to the chairman, who appoints one of the guardians to investigate. This system has been found to work well. The guardians, as a rule, pursue their investigations with the utmost tact, and very often the neighbours do not know that a needy family is in receipt of public assistance. The help given to the poor consists in money, food, clothing, free medicines, and on the parish doctor's advice good nourishment, while in the case of the unemployed destitute, tools, sewing machines, mangles, or railway fares to places where work is offered are provided. In many instances, the assistance is given in the shape of a loan, and thus those receiving aid avoid the loss of civil rights which is incurred by persons entirely dependent on public support. Sick relief, the admission of a member of a family free of cost into an asylum or other institution, help given to an orphan in learning a trade, and temporary relief

in general are not regarded as poor law aid incurring the deprivation of civil rights. In the rural unions a somewhat similar system to that of the cities is adopted. The effort is made to distribute the burden of poverty as widely as possible and not drive the poor into the towns and industrial centres. Each municipality or union must, whether the person affected is domiciled in the locality or not provide for the deserving needy who apply.

"In addition to the general system of assisting the resident poor, there are also public institutions spread all over the country wherein men wandering from one place to another in search of work may obtain food and lodging on condition that they fulfil a modest task before continuing on their way. These may, in many respects, be compared to casual wards. The men have to be provided with an official certificate, in which the route is indicated which they are to follow, and this must be stamped at each halting place. When the men, who are usually honest workers looking for employment, are worn out with fruitless wandering, they may apply and be admitted to one of the work colonies in the country districts. There are thirty-four of these colonies, capable of accommodating 5,000 persons. The original founder of the colonies, which are mostly private enterprises subsidised by the State and the municipalities, was the Emperor Frederick, when he was Crown Prince. He gave them a considerable endowment, which has, however, proved insufficient for their entire maintenance. Entry is entirely voluntary, and both men and women are eligible. Every applicant must produce his or her last rent receipt, a police registration form, a reference from the last situation and a stamped certificate entitling the holder to wander over the country in search of work. Over 200,000 of the poor unemployed of both sexes have utilised these colonies, but it is found that the skilled artisan objects to give up his trade and settle down to the entirely new occupation of an agricultural laborer, although opportunities are offered him to acquire his own piece of land from his own savings out of his earnings in the colony. In some instances, these colonies form entirely new villages and every effort is made to improve the economic conditions of the colonists and increase their capacity to earn money. The governors are really foremen, who teach the colonists various kinds of agricultural work. The average duration of the colonists' stay is three months. An inmate who shirks the work is promptly ejected and handed over to the police as a vagabond. Anyone who is weak and unfit for hard work is given light tasks and may stay as long as he or she cares to. Before the institution of these colonies the houses of correction for tramps and vagrants contained over 30,000 tramps. Now their inmates number only 5,000 in the whole Empire [1914] (of whom 1,400 are in the vicinity of Berlin). Some of the houses of correction have consequently recently been closed.

"Night shelters are also provided in several large towns, many of them being the result of the efforts of private societies. There the users do not need to legitimise themselves. Everyone is welcome and receives a bath, has his clothing disinfected and may sleep and take a free breakfast before leaving. In the municipal night shelters in Berlin, where 4,000 homeless men take refuge every night in winter, the system has recently been introduced of enforcing inmates to do two or three hours' work in return for their lodging and bowl of soup with bread. This has had the effect of driving large numbers of confirmed tramps to seek other refuges either in private night shelters or wherever they

can find a place to creep into. Despite this the Berlin municipal night shelters, during the . . . financial year, from April 1, 1908, to March 31, 1909 admitted 866,300 persons, or an average right through the year of 2,373 homeless people nightly.

"Orphans and foundlings are well looked after, both the system of institution and distribution among families being in vogue. The latter is more general, a small amount being paid by the authorities for their keep. The persons in charge are kept under control, so that the children are not ill-treated or exploited, women taking a great part in the control. The group, or family, system has also been adopted—a workman and his wife being given a free house in the country on condition that they bring up from 6-12 orphans, the boys to learn the man's trade, the girls household work. A small amount per head is also paid. This has the advantage of giving the children the benefit of family life. Among other institutions for the assistance of the poor are the popular kitchens, where food is provided to both children and grown-ups. Where the latter can pay, they are asked for a small sum. Tramway workers, scavengers and other labourers may often be seen taking a meal in these kitchens. They are under the control of private societies, in the same way as the breakfasts to hungry school children, but the municipalities subsidise them. Poores' doctors are appointed in most districts. They are given a small salary by the municipality on condition that they set aside certain hours when poor sick people visit them. They have also to visit the poor in their houses when necessary. In country districts several parishes join together and pay for one doctor between them. Accident stations exist in every town, where first help is rendered to victims of accidents, who are then taken to hospital or sent home. Dispensaries for the poor are also erected at the municipal expense. In university cities these serve as instructional centres for students. The hospitals are all controlled by the municipalities, and a charge, which is graduated according to the circumstances of the individual patient, is made for attendance. Poor persons unable to pay are admitted and receive medicine and surgical attendance at the charge of the municipality. Any person, however, is entitled to admittance to the hospital of the district in which he resides on payment of a minimum sum of 3s. [about 70 cents] per day, which includes medical attention, board and lodging. Two thousand two hundred and eighty-six people on an average are in the Berlin hospitals at the city's expense. The number of beds available is over 3,000. The yearly cost to the city is £56,600. Whereas formerly natives of one German State when resident in another were considered for the purposes of the Poor Law as foreigners and immediately expelled on becoming paupers, the law now says that every German, from whatever State of the Empire he comes, must be considered a native wherever he is in the Empire and be given assistance, which must afterwards be recovered from the authorities of his fixed domicile. Germany suffers just as other lands do in having most of the poor in great cities and industrial centres, many of them drawn thither by the indiscriminate charity of well-meaning but foolish people.

"Professional paupers certainly exist, but they are restricted to a very small class by means of the excellent regulation compelling private charitable institutions to submit all applications for assistance to the central body having charge of the distribution of official poor relief in each district. An applicant for assistance who endeavours to obtain pecuniary or other aid from a number of institu-

tions in the same district is soon found out and, as his or her name is also communicated to other districts by the authorities, it is very rare that he or she succeeds in living systematically on the gifts of well-disposed people. Of course, the most ingenious of these pests of modern society manage by confining their operations to private persons, instead of applying to societies, to prey for a length of time on charity, but they are usually found out in the long run. The race of 'nevers,' who will not work without compulsion, receives little encouragement. Woe be to them if they fall into the hands of the authorities, for they are first punished by a term of imprisonment and then relegated to the houses of correction, or *work* houses, as they are called in Germany, and detained for a period of two to five years. The regime in these 'work houses' is very strict. They are virtually prisons, as the inmates may not take their discharge. Even when allowed to leave after a long term of detention, they may be sent back to their place of domicile and forbidden to leave under pain of relegation. Professional beggars, drunkards and prostitutes, as well as persons who, owing to vice, place those dependent on them in such a position as to become a burden to the community, are all liable to this form of detention. In some cases, the deserving poor and homeless are admitted, but are under no compulsion to remain if they receive an offer of employment. Foreigners who become destitute are expelled from the country. It must be confessed that the accommodation and nourishment in both workers' colonies and work houses is very poor, and a movement is proceeding to introduce improvements in these respects. Complete statistics dealing with the entire outlay for poor relief throughout Germany have not been issued for twenty years. The labour of compiling the returns from the great rural districts is enormous, and the central department is overburdened with so much administrative work that officials cannot be spared for the task. A fairly accurate official estimate of the outlay on the poor, the sick and the orphans in urban and rural districts containing over 10,000 inhabitants in the course of the year 1905 showed that £7,535,505 had been disbursed for these purposes. This total leaves entirely out of account the many hundreds of districts comprising fewer than 10,000 inhabitants. The principles of the operation of the German poor law may be summed up as follows: 1. Very poor districts are carefully watched and the State comes to their assistance in case of necessity. 2. Poor law officials, most of whom are voluntary, are, with the resources placed at their disposal, kept under close control. 3. The arrangement by law of the right to settle in a district, thus preventing the flow of the poor towards any one point. 4. Official superintendence of private charities. 5. Organisation of a system of loan institutions, which, by advancing monetary assistance to those struggling against their downfall, help the poor to re-establish themselves in independent positions and at the same time protect them against usurers."—R. M. Berry, *Germany of the Germans*, pp. 115-122, 124.

1920-1921.—Care of cripples.—"In Germany in 1905 was formed a Central Association for aid to Young, with a special section dealing with cripples. In 1909 . . . there existed twenty-three institutions for cripples with accommodation for 12,000 patients. Perhaps one of the best known of these is [1920] the institution in Berlin provided by the municipality. . . . There are also well-known special orthopedic hospitals such as those in Munich and Heidelberg."—*Charity Organization Review*, Jan., 1921, p. 58.—"The principles and technique

of care for crippled children, which . . . was regulated [in 1920] by national legislation is further being developed by a new national society of teachers for cripples. One of the matters on which some of the foremost of these teachers insist is a better psychological training, because the adjustment of the handicapped to a normal vocational and home life is largely a question of mental attitude."—*Survey*, Oct. 8, 1921, p. 60.

GREAT BRITAIN

1909-1919.—Old Age Pensions.—Establishment of Ministry of Health.—Despite the close political union between England and Scotland, these countries are distinct from each other, and it has been necessary to treat their charities under separate headings. The old age pension act, however, applies to both countries alike, and as both countries also come within the competence of the ministry of health, it is equally necessary, when speaking of these late acts to treat the two kingdoms as a unit. The old age pension act of Great Britain of 1909 provided for a pension of 5 shillings per week for persons having reached the age of 70 and who gave evidence of need. No one who has an income of more than 3 pounds and 10 shillings is eligible. . . . As [the law was] originally passed . . . no one received a pension who had been in receipt of poor relief within the previous five years. In 1911 that condition was removed [and numbers of the poor houses were practically emptied]! In 1910 the maximum pension was increased from 5 shillings to 10 per week."—J. L. Gillin, *Property and dependency*, p. 376.—See also SOCIAL INSURANCE: Details for various countries: Great Britain: 1833-1911.

The poor relief Act of 1910 created a new department, the Ministry of Health, to take over the whole public administration of charity. The reasons and need for so doing are clearly stated in the following article, written in 1919: "The whole poor law organization which is still costing for the United Kingdom somewhere about seventeen million pounds per annum, has become redundant. During the past half century there has gradually grown up another way of dealing, out of public money, for every one of the various classes of persons whom the community has to help.

The town council now provides for maternity and infancy; for the education and even the maintenance and medical treatment of children of school age; for everything required by various large classes of the sick of all ages; for the lunatics, mentally defective, and feeble-minded; for the pensionable aged, and for the able-bodied unemployed. But these are all the classes that the board of guardians provides for! The overlapping has become universal. We cannot go on with the waste involved in maintaining in every town duplicate staffs and duplicate institutions, at the expense of the rates and taxes, for all the several classes for which we provide help; one set for those who are technically destitute and who are stigmatized as paupers, and another set for those who are not so stigmatized and are welcomed as citizens—especially when it is often a matter of chance which are dealt with in one way and which in the other. . . . Observe what is in question is a merging of services, a union of staffs and institutions, not merely a transfer of this or that work from the board of guardians to the town council. . . . It is not a question of merely substituting one directly-elected body for another, or one committee for another. It is merging the poor law medical staff and the poor law infirmary

in the larger and more comprehensive public health service of the municipality, which will have its series of properly classified hospitals, maternity clinics and infant nurseries, dispensaries, sanatoria, convalescent homes and homes of refuge for the chronic invalids and the infirm aged. It is a merging of the separate poor law schools or cottage homes, and all the boarding-out, in the wider and more specialized educational system which the council maintains for all the children and young persons. It is a merging of the all-too-scanty poor law provision for the feeble-minded in the more extensive and more expert provision that the council makes for the mentally defective of all grades. With regard to the able-bodied the idea is a definite rejection of all the ways in which the poor law deals with the man physically and mentally able to work, who is destitute through inability to obtain employment, and the commission to the council, by the agency of a new committee on which organized labor must be specially represented, of the whole problem of how best to prevent unemployment.

"There is a decisive reason why no continuance of any particular board of guardians is possible. . . . The union of all the separate poor law services with those of the municipality in itself necessarily involves the repeal of all the poor law statutes, and the dropping of all the existing poor law orders, which will cease to be applicable. . . . The town council will take over the services of the guardians and administer them under the town council's existing powers, the public health, education, lunacy, unemployment and other acts, which will need only slight amendment to enable this to be done. . . . No town council would consent for a moment to come under the terribly out-of-date poor law statutes and poor law orders, with their stigma and odium, and with the subjection that they involve to the meticulous supervision and peremptory commands of the local Government Board. Every town council will naturally deal with the sick under the public health acts, and with the children under the education acts. When the transfer of the poor law services is made, the poor law will cease to exist."—S. Webb, *Coming revolution in local government* (*Survey*, June 28, 1919, p. 480).—See also ENGLAND: 1919-1921.

GREECE

1919-1921.—Infant welfare work.—"Infant Welfare Work in Greece was begun in 1919 by the American Red Cross in Athens [where sanitary arrangements for the poor are non-existent and infant mortality is very high]. In July of 1910 the Red Cross turned its clinic over to the Patriotic League of Greece. . . . The volunteers are expected to give at least one-half day a week to home visiting and attend the conference once a week. . . . The volunteers who visit the homes are instructed to make enquiries concerning living conditions to give instructions concerning the baby, and to see that all children of school age are attending school. . . . In June, 1921, the station was transferred from the Patriotic League to the Ministry of Public Assistance. . . . The Minister now (October, 1921) has a bill before Parliament which he believes will pass without any doubt, and which will enable him to create a child welfare department."—W. R. Brooks, *Infant welfare work in Greece* (*Survey*, Oct. 8, 1921).

1922.—General philanthropic work.—Departments of public charities in each municipality have existed for some years. Women's associations all over the country minister to the destitute; orphan

asylums, supported by private gifts and endowments, homes for the poor and aged, and medical dispensaries have been established in large cities; public kitchens are a feature in the lives of the poor in such cities as Athens, Patras, and Salonica. Lodgings for working girls in Athens are also an interesting philanthropic institution.

HOLLAND

1413-1908.—Government responsibility.—“During the fifteenth century, the relief of the poor by the civil power is a principle of most of the orders issued in the northern provinces, even in the episcopal town of Utrecht, in 1413; the edict of Charles V. met therefore with much less opposition in the northern than in the southern Netherlands. This principle was fully sanctioned by the edict of the States of Holland of the 2nd of March, 1575, and it entirely harmonised with the principles of the Reformation which had meanwhile taken root in the land. But, in the beginning of the seventeenth century, a new system of ecclesiastical poor-relief by the deacons of the church arose side by side with the secular system ordered by the civil power. We must, however, conclude that the whole state of poor-relief in the seventeenth century was defective, judging from the accounts of the great mortality in different years from 1600 to 1666; from the existence of a great many hospitals for the sick, and for those attacked by the plague; from the frequent complaints about beggars and vagabonds; and from the increase in the number of foundlings. Towards the end of the seventeenth and in the first half of the eighteenth century, the state of things improved. It was then that many of the ‘God’s Houses’ were erected and enlarged, and richly endowed by gifts and legacies. . . . Towards the end of the eighteenth century another advance was made in the development of poor-relief, by the larger share taken in it by the Government. According to the Constitution of 1798, the management of the poor throughout the Republic was to be carried out on a uniform plan. The representatives of the people required a report concerning all foundations specially intended for the poor, their endowments, and administration. A general law regulating relief was drawn up, and even published, July 15th, 1800, but it never came into operation. . . . By the fundamental law of 1815, Art. 220, it became the duty of the Government to take charge of the charitable institutions and the education of the poor, and to give an annual report to the States General. These Reports have been printed since 1816, and in a very copious form since 1847. The law of November 28th, 1818, which remained in force in Belgium until the introduction of the law of February, 1845, and in the Netherlands until June, 1854, was limited to deciding upon the place where the needy might claim relief. This law granted a settlement by birthplace, but, at the same time, decided that such a settlement might be forfeited by four years’ unbroken residence in some other place, and in the case of women, by marriage.”—M. M. Von Baumhauer, *Holland, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 257-259.—In 1008 “the municipalities had under them 1,060 institutions of a general character. There were also under public direction 1,109 relief centers or distributing offices. Those in connection with the different churches were most numerous of all viz.: 4,052; institutions under private direction totalled 819. Many of these societies or guilds only distributed food in winter, but hospitals, homes for the poor, and lying-in hospitals are in-

cluded in all the totals.”—D. C. Boulger, *Holland of the Dutch*.

HUNGARY

1909.—State League for the protection of children.—Labor bureau.—Old age pensions.—Housing of agricultural laborers.—“The Hungarian State League for the Protection of Children. . . . It is by far the most valuable charitable institution in the country, and its sphere of activity extends over the length and breadth of the land. Indeed, the Government has recognised its importance as one of the State’s auxiliary forces in the work of Child Protection, and, as such, has invested it with an official character. . . . The operations of the League include all phases and branches of Child Protection, from earliest infancy up to latest youth, and its activity is limited only in cases where the League’s assistance would clash with that of the State. . . . Children who are sick, deaf, dumb, blind, epileptic, scrofulous, phthisical, deformed or crippled, are sent by the League to medical institutions and watering-places. Arrangements are also made to send children to health-resorts during vacation time while children endowed with special talents are afforded opportunities for higher education; and in this respect no exception is made with regard to children of foreign nationality. The League provides for the children under its charge to be placed either in its institutions or in private families living on its settlements. In the latter case the children are under the supervision of a physician belonging to the asylums. On the other hand, such children as have been exposed to immoral influences (or have lived in an immoral atmosphere), or who have already shown vicious tendencies, are put into the League’s own institutions under strict observation. . . . Each institution is staffed by a director and the necessary number of teachers. The children are instructed in various branches of domestic knowledge and usefulness.”—P. Alden, *Hungary of to-day*, pp. 328-329.—The “Labour Bureau . . . has its local branches in the parishes, its headquarters in the county halls, and a very efficient central office at Budapest. . . . An act was passed to provide for organising a system of old age pensions for farm servants, by which, in return for a small yearly contribution from the labourer (the tax being one penny [two cents] a week), and a compulsory contribution from the employer, the labourer is insured against sickness, accidents, and old age at sixty-five years old. The Exchequer is directly responsible for any obligations of this fund. By another Act passed only last year, a grant of a yearly sum of £12,500, for a period of thirty years, was made for the building of houses for agricultural labourers; with the co-operation of the local authority this Act makes possible the erection of about 20,000 dwelling-houses, and its working has a direct and encouraging effect upon private enterprise. These dwelling-houses, generally speaking, are in a very miserable condition throughout the country, and even on the larger estates are far from what they should be.”—A. György, *The state and agriculture (Hungary of to-day*, p. 269).

IRELAND

1703-1838.—Public poor relief.—Houses of industry and foundling hospitals.—Early work-houses.—Infirmaries.—Support of fever hospitals.—“Although there was, previous to 1838, no

general poor law in Ireland, several acts of the Irish and the United Parliaments had made provision for the relief of particular classes of poor. Apart from certain penal acts directed against vagrancy and begging, the first enactment of the Irish Parliament dealing with the poor was passed in 1703, providing for the erection of a workhouse and for the maintenance and apprenticing out of foundling children in the city of Dublin. The expenses of these objects were to be defrayed out of a tax on hackney coaches and sedan chairs, and a rate of threepence in the pound on every house within the city and liberties. This act is important as it marks the earliest recognition by the Irish Parliament of the principle that the poor should be supported by compulsory taxation. In 1735 a similar act was passed applying to the city of Cork. In 1715 an act was passed which applied to the whole of Ireland, giving power to ministers and churchwardens, with the consent of a justice of the peace, to apprentice out helpless children to 'any honest and respectable protestant housekeeper.' Many years later provision was made for the care of foundling and deserted children in cities by means of a rate assessed on the inhabitants, and shortly afterwards the provisions of this act were extended to country districts. About the same time the workhouse and foundling branches of the Dublin institution were separated. An important act was passed in 1771 making provision for the establishment of a house of industry in each county.

The following is Nicholls' summary of the poor relief legislation of the Irish Parliament: 'Houses of industry and foundling hospitals, supported partly by public rates and partly by voluntary contributions, were established at Dublin and Cork, for the reception and bringing up of exposed and deserted children, and the confinement of vagrants; parishes were required to support the children exposed and deserted within their limits, and vestries were organized and overseers appointed to attend to this duty; hospitals, houses of industry, or workhouses were to be provided in every county and city; severe punishments were enacted against idle vagabonds and vagrants; while the deserving poor were to be lodged or licensed to beg, or if infirm and helpless were to be maintained in the hospitals or houses of industry, for the building and upholding of which reliance was chiefly placed on the charitable aid of the humane and affluent, assessments for the purpose being limited to £400 in counties at large and to £200 in counties of cities or towns.' No statute of the United Parliament dealing with the relief of the able-bodied poor was passed before 1838, though various acts were passed making provision for the sick and lunatic poor. An act of 1805 provided that, in counties where the county infirmary was unavailable to the poor of any district on account of distance, the grand jury might raise a sum by presentment equal to the amount already raised by private subscription to establish local dispensaries. In the following year the amounts which the grand juries were authorized to present for the erection of houses of industry were slightly increased. In 1814 an act was passed providing that, when any fever hospital had been established in a county, the grand jury might raise a sum not exceeding £250 for its support; and four years later [1818] a further act provided for the creation in every county of a corporation, charged with the duty of erecting fever hospitals and authorizing grand juries to present sums for their support not exceeding double the amount raised by voluntary subscrip-

tion. In the following year provision was made for the appointment of officers of health to supervise the carrying into effect of the last mentioned act. An act of 1817 empowered the Lord Lieutenant to direct the erection of lunatic asylums in districts where they were needed, the cost to be defrayed by grand jury presentments. In 1825 the provision for deserted children was slightly extended."—G. O'Brien, *Economic history of Ireland from the union to the famine*, pp. 162-165.—The provisions of these acts were not carried out effectively, and in fact were scarcely enforced except in the counties of Cork, Waterford and Limerick. The house of industry in Dublin was opened to the poor from every part of Ireland, and this institution alone received grants from the public funds.

1765-1921.—Dispensary system.—Hospitals—"Few if any countries . . . have a more complete system of free treatment for the poor than has Ireland. For the seventy years since the passing of the Medical Charities Act, which established what is known as the 'dispensary' system, it has been possible for any poor person to secure free medical attendance and medicine for himself or any member of his family. His wife may secure the free assistance of a doctor and a midwife in her confinement. Hospital treatment is available for medical or surgical cases in the county or union infirmary and for cases of infectious diseases in a fever hospital. The population of Ireland is about four and a quarter millions, of whom perhaps two millions are eligible for this free treatment. The country is divided into 740 dispensary districts with over 800 medical officers in charge, some districts in the large towns having more than one medical officer. There are 146 union infirmaries and 138 infectious diseases hospitals (containing in all about 17,000 beds) available for the treatment of sickness. In addition there is a county infirmary in each county for the treatment of the more serious medical and surgical cases and these infirmaries are also available for poor persons without payment. The cities are provided with well staffed and well equipped hospitals, which gave to the poor specialist and operative treatment in no respect inferior to that available for the wealthy. . . . The same excellent conditions unfortunately do not hold in the smaller towns and in the country. Of the only hospital accommodation is in the union infirmary, or in the county infirmary, too often handicapped by lack of funds, and subject to conditions and limitations imposed by an Act of Parliament passed in 1765. Neither in the rural districts nor in the majority of the smaller towns are those who are in the greatest need of the highest medical or surgical skill or of prolonged institutional treatment—radium, X-ray, etc.—cared for as their condition demands. In a few towns there are successful cottage hospitals which serve a purpose analogous to that of the large voluntary hospitals in the cities. Sanatoria for the treatment of tuberculosis have been established within the past few years, and these now [1921] number thirteen, with accommodation for 1,382 patients. A system of special dispensaries has been established in the majority of the counties and county boroughs. Half the cost of these schemes is defrayed from government funds and the other half falls on the county rates. Asylums for the detention and treatment of lunatics and the feeble-minded exist and are in many respects superior to the union infirmaries where the sick are treated. Practically every district in Ireland is also provided with a trained maternity

nurse. There are a number of voluntary societies which have for their object the provision of nurses for home nursing. Their 200 nurses have by their skill and devotion won the respect, esteem and affection of the poor in every district to which they have been appointed. A number of schemes for the diagnosis and treatment of venereal diseases are in operation. The government pays to local authorities 75 per cent. of the cost of these schemes.

"It must be confessed that as regards preventive medicine Ireland lags behind most civilized countries. The Public Health Act of 1878 and the subsequent acts are chiefly concerned with the correction of sanitary defects, the provision of water supplies and sewage systems, and the isolation and treatment of infectious disease. The acts dealing with notification and prevention are permissive and many of the local authorities have not adopted them. During the last few years at least seven acts of parliament have been passed with the primary object of preventing rather than treating sickness. Of these, the Notification of Births Act of 1915 gives very wide powers to local authorities for attending to the health of mothers and children and the government defrays half the cost of the approved arrangements. There are also great hopes that the Medical Inspection and Treatment of School Children Act of 1919, when it is put into operation, will accomplish much in preventing permanent ill health and disability.

"The first and most obvious defects of the system as it exists to-day is that the various health activities are controlled (except for the six county boroughs) by three different bodies: the county councils, the urban and rural district councils and the boards of guardians, each of which is an elected body. The fact that the boundaries of the three do not coincide makes the situation still worse. The union, for example, may be partly in two counties, or even in three, and may include two or three rural or urban districts within its boundaries. There are in Ireland 30 county and county borough councils, 154 unions, and over 300 urban and rural districts. The dispensary medical service and the union infirmaries and fever hospitals are controlled by the boards of guardians, the primary function of which is the administration of the poor laws and the management of the workhouses. This fact gives to the whole an unmerited taint of pauperism. A further sting is inflicted on the sick poor in that, before admission to the union infirmary, a patient must, in theory, be first admitted to the workhouse. No one who has not lived in Ireland can know with what horror the 'house' is regarded by the thousands who are always poor but never paupers. As regards the service itself, some harsh things have been said. The controlling body of the service is very local and parochial in its views. Further, the salaries of the medical officers are small and the chance of promotion almost nil. In addition there is no provision for post-graduate work or study leave. It is probably chiefly from motives of patriotism that such a high percentage of skilful and capable doctors is to be found in the dispensary service, who could have done much better in other countries. As to the institutions, there are brilliant exceptions, but the dispensary buildings, the infirmaries, the fever hospitals, are for the most part old and ill suited for their purposes. The hospitals and county infirmaries are frequently gloomy, badly equipped and unsuitable for modern surgery. Progress in preventive medicine is hampered by the fact that it is controlled

by a small local body whose chief aim appears to be an overweening desire to keep down the rates to the lowest possible level. These criticisms have been directed toward the local health work; but what of the central controlling bodies? Most of the local authorities are, to a greater or lesser extent, under the central control of the local government board. The insurance commissioners control health insurance; there is another body responsible for asylums and certain other medical functions are directed by other bodies.

"The Irish Public Health Council, appointed in 1919, made its first report in 1920. The present system of health administration in Ireland has been put together piecemeal. It may be compared to a patchwork quilt made by an astigmatic and color-blind person. . . .

"There is just one further point: Ireland has many health problems remaining to be solved, some common to many countries, some more or less peculiar to herself, but medical research is being done to-day in Ireland by only a handful of keen workers in the universities. These workers are starved by the colleges which they serve (more through necessity, be it said, than by desire) and utterly ignored both by the state and by local authorities. . . . Perhaps the state or the local authorities may some day realize their duty to these men, who continue only for love of the work, but we hope for the munificence of some Rockefeller or Carnegie who will assist them and who will found a great school of public health where the young practitioner will be equipped to battle against disease."—E. C. Bigger, *New health for old* (Survey, Graphic Number, Nov. 26, 1921, pp. 311-312).

1830-1836.—Spring Rice committee.—Infirmaries.—Dispensaries.—Houses of industry.—Dublin Mendicity Institution.—Poor Inquiry Commissioners.—"A committee known as The Spring Rice Committee, appointed in 1830, found that there were at that time thirty-one county infirmaries in Ireland, maintained at a total cost of £54,000 a year, that, with the exception of some minor amendments, 'the county infirmaries of Ireland may be considered as adequate to the purposes for which they were intended.' The committee next devoted its attention to fever hospitals, which it found had been established in most parts of Ireland. 'No county is said to be without one in Munster, and the county of Cork has four and Tipperary eight; but many counties in the province of Ulster and Connaught have omitted to provide fever hospitals.' The committee further found that nearly 400 dispensaries had been established, affording relief annually to upwards of half a million of persons. . . . The provision for lunatics was found to be sufficient and satisfactory; 'as regards one of the most painful afflictions to which humanity is exposed, there has been provided within a few years a system of relief for the Irish poor as extensive as can be wished, and as perfect and effectual as is to be found in any country.' The committee recommended that curable and incurable cases should be segregated. The committee then proceeded to deal with the houses of industry, and reported that the number of those institutions in Ireland did not exceed twelve, 'including the great establishment bearing that name in Dublin, which is supported exclusively by votes of parliament.' There were eight houses of industry in Munster, three in Leinster, but none in Ulster or Connaught. . . . Attention was also drawn to the great volume of private charity in Ireland, of which the foremost example was the Dublin Mendicity

Institution. Dublin has always been remarkable for the extent of its charities supported by voluntary contributions. In 1815 they numbered about fifty, including dispensaries, hospitals, schools, asylums, penitentiaries, infirmaries and loan societies. About 16,000 pounds was said to be raised annually by charity sermons alone. Two years later the Mendicity Institution was founded. The famine of 1817 had flooded the streets of the city with more than the usual number of beggars, for whose assistance subscriptions were raised; the committee appointed for this purpose led processions of beggars through the streets, and taught them to howl outside the doors of those who would not subscribe to the fund; as a result of which campaign about £19,000 was collected, and the Mendicity Institution founded. Among the charitable associations which the committee of 1830 observed in Dublin may be mentioned, 'schools, hospitals, Magdalen asylums, houses of refuge, orphan establishments, lying-in hospitals, societies for relief of the sick and indigent, mendicity associations, and charitable loans.' The second report of the Poor Inquiry Commissioners, published in 1836, was devoted to the existing establishments for the relief of distress in Ireland. It was stated that there were in existence 31 county and 5 city and town infirmaries, 452 independent dispensaries, and 42 more united with fever hospitals, and 28 fever hospitals. The total cost of the upkeep of these institutions in the year 1833 was calculated to amount to £100,054, of which £55,065 was furnished by grand jury presentments, £37,563 by subscriptions, £6,661 by parliamentary grants, and £9,766 by petty sessions fees and miscellaneous funds. With regard to these institutions the commissioners remarked: 'The medical relief at present afforded throughout Ireland is very unequally distributed. In the county of Dublin, containing exclusive of the city about 176,000 inhabitants, and about 375 square miles, there are 19 dispensaries, or one for every 9,306 inhabitants. In the County of Mayo, containing 311,328 inhabitants, and about 2,100 square miles, there is only one dispensary supported at the public expense.' In spite of these inequalities of distribution, however, the sick poor of Ireland would seem to have been reasonably well provided for: 'the sick poor of Ireland are better attended than even the sick poor of England.' While however the existing system was sound in principle, it was vitiated by many practical abuses, amongst others, (1) the total omission of an efficient superintendence and control exercised by properly qualified persons, whether over the working of the whole system or its subordinate machinery, (2) the authorizing of a sort of partnership in charity between the public purse and private individuals, thereby placing it within the power of designing persons to impose a permanent tax upon the community for their own or their friends' private advantage, (3) the leaving it discretionary with grand juries to diminish or extinguish the funds of a charity capable of much usefulness, and (4) the dispensary acts requiring no specific medical qualifications of any kind. Passing from medical charities to the institutions for the general relief of the poor, the commission found that there were in existence nine houses of industry, and two large foundling hospitals, one in Dublin, the other in Cork, and a small one in Galway. These institutions, according to the commissioners, were utterly indefensible, in view of the large cost of their upkeep. In addition to these institutions there were also eleven lunatic asylums in Ireland. The total cost of these in-

stitutions in 1833 was £204,806. Of this sum upwards of £50,000 was furnished by parliamentary grants, the remainder being derived from grand jury presentments, voluntary contributions, and other local sources. . . . Let us next inquire into the nature and source of the demand for the extension to Ireland of some system corresponding to the English poor law. For many years previous to the setting up of the Poor Inquiry Commission in 1833, constant complaints had been made in England of the ruinous effects of the increasing immigration of Irish labourers. . . . The committee of 1828 reported that the number of these paupers was growing annually, and the expense of their removal was assuming large proportions. . . . Five years later the question was considered by another committee, which reported that the evil of Irish vagrancy had greatly increased.'—G. O'Brien, *Economic history of Ireland from the union to the famine* (1921), pp. 166-71.

1838-1849.—**Poor law act and amendments.**—In spite of the great amount of poverty, and its attendant evils, the majority report of the Poor Inquiry commission opposed the adoption of a poor law. Nevertheless, in 1838, acting on the advice of Mr. George Nicholls, one of the English poor law commissioners, an act was passed, on July 31, 1838, which still remains the foundation of the Irish poor law. The main provisions "were as follows:—(1) The division of the country into unions. . . . (2) The formation of a board of guardians for each union—the board consisting of elected and ex-officio guardians. (3) The establishment of a central authority, viz., the Poor Law Commissioners for England and Wales. (4) A compulsory rate for the relief of the poor. (5) The relief to be at the discretion of the guardians, and accordingly no poor person, however, destitute, to be held to have a statutory right to relief. A preference to be given to the aged, the infirm, the defective, and the children. . . . (6) The relief to be limited to relief in the workhouse. (7) The relief to be subject to the 'direction and control' of the Poor Law Commissioners, who, however, were prohibited from interfering in individual cases for the purpose of ordering relief. The Commissioners to make orders for the guidance and control of guardians, wardens, officers, the auditing of accounts, and for carrying the act into execution in all other respects as they might think proper."—*Ibid.*, pp. 186-187.—In 1838 the law was amended so as to permit local unions to give aid to emigrants, a power which was further enlarged by the amendments of 1843, 1847 and 1849. Little advantage was taken of these amendments, however, and it is doubtful if many of the poor knew of the existence of such provisions. In 1847 an Irish Poor Law Commission was established and the following year provision was made for out-door relief in certain cases.

1845-1852.—**Famine relief.**—"The entire amount advanced by the government towards the relief of the Irish people during the famine was £7,132,268, of which £3,754,739 was to be repaid within ten years, and the remaining £3,377,529 was a free grant. Of the sums lent, a large part was remitted between 1847 and 1852, when a select committee of the House of Lords recommended the remission of the whole amount, and in 1853 the total loans made to meet the famine were remitted by Gladstone, in consideration of Ireland's assuming the burden of the income tax."—*Ibid.*, p. 257.—See also IRELAND: 1845-1847.

1908-1921.—**Pension Act.**—Ireland came under the Pension Act, which was passed in 1908 for

the United Kingdom, and the amendments of 1911 and 1919. The provisions of the Act were carried out by the local Government Boards.—See also above, GREAT BRITAIN.

ITALY

Lack of poor laws.—Endowed charities.—Bequests.—Hospitals.—Charities of the Renaissance.—Technical schools for girls.—"There is no legal right of the poor to maintenance in Italy, as in England. There is no public provision for able-bodied paupers, except that the police may send them at the public expense to their native place. The infirm poor have to be placed in an infirmary or hospital, and pauper children under nine years in a charity school, the expense falling on the charities of the place, where a pauper has his settlement, or, if these are insufficient, on the communal rates, or, in the last resort, on the State. If the authorities fail to do this, the pauper is permitted to beg; but begging is strictly forbidden to the able-bodied, though in spite of the numerous prosecutions for begging . . . the law is much honoured in the breach. Relatives in better circumstances may be compelled to contribute to the maintenance of the infirm and children. There is a better provision for the sick poor. Every commune is bound by law to pay a resident doctor and midwife to attend the poor free of charge; in some he is paid to attend all inhabitants. Sometimes the communes give free medicine to the poor. But the law is often indifferently observed, and in many rural districts, at all events, it is nearly or quite a dead-letter. The Provincial Councils are bound to maintain pauper lunatics and (conjointly with the communes) foundlings. And both provinces and communes have large optional powers to make grants to infirmaries, hospitals, orphanages, in fact to any kind of charity. These optional grants amounted in 1897 to £560,000, and are steadily increasing. The total cost to local authorities in poor relief and charity is £2,600,000.

"The lack of public provision for the poor is to a certain extent compensated by the magnificent public charities. Italy has always led the way in charity among the nations of Western Europe. Its hospitals date from the early middle-ages, its *Monti di Pietà* were installed by the Franciscans in the fifteenth and sixteenth centuries. The great medieval hospitals and orphanages still exist. The principal hospital at Florence, that of Santa Maria Nuova, was founded by the father of Dante's Beatrice. The orphanage of the Bigallo owes itself to St. Peter Martyr. The Foundling and Children's Hospital of the Innocenti, that Brunelleschi designed and Andrea Della Robbia adorned, gained the highest honour at the Paris Exhibition last year.—B. King and T. Okey, *Italy to-day*, pp. 220-221.—"In more modern times the *Scuole Leopoldine*, founded by the reforming Grand Duke Leopold at Florence in the last century, are perhaps the earliest technical schools for girls. The Florentines claim that the first Infant School was that started by the Jews of their city in 1735."—*Ibid.*, p. 220.

1880-1909.—Value of charitable endowments.—Council of charity.—Outdoor relief.—Private charities.—Industrial homes.—Farm schools for children.—Care of sick.—"The charities have a magnitude worthy of their history. The property of endowed charities (exclusive of those of religious and educational endowments) was valued

in 1880 . . . at more than £68,000,000. Of this, the hospitals had £25,000,000; orphanages, £14,000,000; charities for the relief of the poor, £11,000,000; infirmaries, nearly £5,000,000. The gross income for charitable purposes was then about £3,500,000, but taxes, estate expenses, and expenses of management absorbed 43 per cent., and the net available income was under £1,800,000. When the contributions of local authorities and private subscriptions and casual receipts are added, the total net revenue was about £3,400,000. And this amount has rapidly increased since then. In spite of the efforts of the clergy to divert generosity into ecclesiastical channels, the value of bequests to public charities in the eighteen years from 1881 to 1898 has been nearly £12,000,000.

"The control of charitable endowments is regulated by a law passed in 1890, . . . which established a Council of Charity (*Congregazione di carità*) in every commune; the Council is appointed by the Communal Council; any elector, except officials and clergy in the cure of souls, may serve, and women are eligible. The Council controls the public charities of the commune, but not, as a rule, those with an income exceeding £200, or the larger hospitals and lunatic asylums, or founding hospitals, educational foundations, and reformatories. They often manage the local *Monte di Pietà*. It has been their duty to reorganize the charities of the commune, and though they are often tied by the terms of the old deeds, and the reform of the dowry charities has been incomplete, yet they have redeemed a great number of charities from obsolete and pauperizing purposes. In some towns general schemes have been drawn up, apportioning the small endowments between the Council and the independent foundations. At Bologna the Council takes the income of 243 old charities, worth £41,000. The councils spend their funds chiefly on infirmaries, poor-houses, out-door relief, relief of the *poveri vergognosi* (the 'shame-faced poor,' who have come down from better circumstances), maternity cases, and dowries. . . . An essential part of the work of the Councils lies in the poor-houses and infirmaries, which take the place of work-houses. . . . They are infirmaries for men and women who are entirely or in part incapable of regular work, where the partially infirm are employed on light work and take one-third or two-thirds of the profits, while those who are employed in the domestic service of the house are paid a small wage. Beggars may be compelled to enter *ricovero* (sometimes there is a separate *ricovero di mendicizia*), but otherwise there is no compulsion or (apart from the loss of their vote) any taint of pauperism, and with the pleasant business of work, that is graduated to the strength of each, contrasts with the dreariness of our own workhouses. Each inmate costs about 8d. a day, and the *ricoveri* are largely subsidized by local authorities. In 1885 there were 671 *ricoveri*, with 37,000 inmates; now [1000] there are probably more. Outside the endowed charities, there is an immense amount of private charity, lay and ecclesiastical, Catholic and Protestant and unsectarian. Charity, like everything else in Italian life, has shared in the revival of late years, and the very keen interest shown in economic questions has taken shape in a multitude of agencies for the relief of the destitute and the sick. It is only possible here to refer to some of the more prominent branches of this activity. There are some excellent industrial homes for boys and girls. The *Conversini Home* at Pistoia was founded in 1880 with an endowment of £44,000

for poor boys, who are not orphans; it has two branches, industrial and agricultural, and the boys are credited with one-third of the profits of their work, their respective shares being invested in a Savings Bank, from which, as a rule, they cannot be withdrawn till they have attained their majority. There is a similar institution for 150 girls at Piacenza. Near Rome there is an excellent agricultural school for boys (*Colonia agraria fuori Porta del Popolo*), where waifs and strays are removed from city influences, and learn farm work under the charge of a cultured, earnest young priest. The Florentine Protestants have a farm-school for poor children at Trebbiolo. At Volterra orphans are boarded out with foster-parents till they are seventeen, under the supervision of doctor, priest, and committee of ladies. With characteristic Italian thoughtfulness, the children are dressed in the ordinary style of the district to which they are sent, so as to avoid the orphanage stamp. A home at Padua looks after boys from very poor or bad homes during the day, feeding them and sending the elder ones to work, the younger ones to school. The homes for abandoned children, founded by Don Bosco and the 'Coöperators of St. Francis de Sales,' give an industrial and commercial training, or in the case of the cleverer boys a classical education, which trains them to be school teachers or priests. . . . Care for the sick has been especially directed of late years towards combating consumption, which is a more than usually fatal scourge in Italy. There is a National League for the cure of consumption. A fund is being [1909] raised at Florence to found a sanatorium for children in early stages of the disease, where they will be treated on the lines of the French and German sanatoriums."—*Ibid.*, pp. 221-226.

1909-1921.—Free meals for school children.—Savings bank prizes.—Vacations.—Summary of principal charities.—"The most active philanthropic movement of the last few years has been in the provision of free meals for school children. Even at Milan there are a great many absentees from school owing to sheer poverty, and want of clothes and food is perhaps the chief reason everywhere why the law of compulsory attendance is so largely a dead letter. A little seems to have been done at Milan privately for a quarter of a century past, and in several towns (first at San Remo) the movement for municipal support began in 1896, but in the great majority of cases it dates from an appeal of the Minister of Education in the following year. The *Comitati di Patronato*, who organize it, have semi-official recognition; they generally receive grants from the State and Provincial Councils and to a larger extent from the communes, hampered though these are by the small margin of revenue that is available. At Rome the Commune grants annually £2,000, at Turin £800, at Cremona £720; at Pavia it has given £400 for the plant of the kitchen. At Milan the Municipal Council has recently taken the organization into its own hands, and proposes to find £4,000 out of a total expenditure of £5,760. The Committees supply one free meal a day to necessitous children for longer or shorter periods, sometimes for a few weeks only, sometimes for the whole winter, at Milan for ten months. At Pavia food is also sold to those who can afford to pay. Each meal costs about 1d. [2 cents]. The proportion of children, who receive free meals, varies very much; at Milan it is 16 per cent., at Pavia 28, in the villages round Perugia 68. Some Committees supply clothes in addition, some give books, copy-books, and

pencils, some give prizes for regular attendance by starting Savings Bank accounts. . . . But the work is much hampered by want of funds; sometimes suburban schools, where the need is greatest, go uncared for; and as the Milanese have recognized, the matter requires to be organized by the Municipal Councils, before it can be thoroughly carried out. In some of the larger towns the movement has expanded into an organization for taking care of children between six and ten years out of school hours in the holidays (*educatori*). Kindergarten games, cooking classes, gymnastics, and singing are held in the school buildings till the hour when the parents return from work. Every child has to wash itself daily, and on fixed days has a bath. In the vacations and on the weekly holiday on Thursdays the *educatori* are open all day, and two free meals are given. At Milan they are maintained in forty schools, at Rome, where the commune spends £3,200 on them, in fifteen. In several cities kindred societies send children to the sea or hills in the hot weather. The Florentine 'summer school' at Montepiano, which has grants from Government and the local authorities takes in sixty delicate children every summer, and teaches them during their stay. A summary of the principal charities of a few towns will show how thick is the net-work of public and private charity. Florence boasts its hospital of Santa Maria Nuova with 1,200 beds, another general and an ophthalmic hospital; the orphanage of the Bigallo, which maintains 800 abandoned or neglected children, and three other orphanages; the Foundling Hospital of the Innocenti, which takes in 700 illegitimate and 250 legitimate children every year; the *Pia Casa di Lavoro*, which shelters the infirm and educates poor children; a lunatic asylum with room for 700 inmates; a charity which spends £4,500 a year in clothes and bedding and milk for the poor; the ancient Fraternity of the Misericordia, which takes the sick and dead to hospital or burial, grants money to the sick and watches by their beds; an old charity for helping the *poveri vergognosi*; five homes for girls who have fallen or are in danger; a society to look after semi-abandoned boys who have left school; another to send scrofulous children to sea baths; a charity that gives bonuses to the savings of school children; and cheap kitchens.

. . . . Or again, the town of Piacenza, with 35,000 inhabitants, has a hospital with 400 beds, an orphanage, a home for incurables, a *Casa di Ricovero*, industrial schools for boys and girls, four infant schools, a charity to assist poor lads to an art training, a retreat for ancient priests, cheap kitchens, and several charities for doles and dowries. Cremona, with a population of 37,000, has its *Ospedale Maggiore*, dating from the fifteenth century, another general hospital, a children's hospital, a foundling hospital, a charity for sending scrofulous persons to sea baths; it has its home for the aged, which shelters 200 men and women over seventy years, its infirmary for 160 infirm paupers, a home for babies whose mothers cannot nourish them, a charity for sending delicate children to the hills, a discharged prisoners' society, and lay and ecclesiastical societies for helping the poor; an orphanage, a school for poor girls, a home for the fallen, a boys' refuge, and infant schools. The little country town of Lucignano, in the Val di Chiana, boasts its ancient hospital, its three ancient charities, now under the Council of Charity, which spends £160 a year on out-relief and maternity cases, its *confraternità di misericordia*, which helps and nurses the sick, assists at fires, and carries the dead to burial, its

infant schools, and school to teach linen-weaving."—*Ibid.*, pp. 226-230.—"Rome, where it is estimated about a quarter of the population is in the indigent class, possesses a sanitary [health] service which attends the sick poor in their own homes as well as Sanitary Stations."—*Charity Organization Review*, Jan., 1921, p. 58.—In Bologna and Milan there are respectively two famous orthopedic hospitals.

JUGO-SLAVIA

1921.—Relief of children.—Before the Peace of Neuilly, Croatia and Slavonia came under Austrian laws. While in Serbia, though the standard of living was low, there was enough to supply the simple needs of all. Great misery was caused by the long years of war, however, and it has been found necessary to provide means especially for the care and relief of children. "The Child's Bureau is a part of the Ministry of Social Welfare. It has the following purposes: to assure proper physical and mental training for the children; to collect statistics and other information relating to children and to take a census of the needy children, particularly war orphans; to investigate morbidity and mortality of children and to take the necessary preventive measures to reduce them; to work for the amendment of the present laws and regulations for the purpose of improving the situation of the children; to secure rational distribution of the government appropriations for child welfare, to supervise all government agencies concerned with child welfare; to cooperate with all other government departments and private societies interested in child welfare, and to aid them financially when necessary and supervise their activities."—*Survey*, Oct. 22, 1921, p. 122.

NORWAY

1845-1866.—Public charity organized.—"It was only in 1845 that a law was passed organising public poor-relief. This law gave to every person, in case of destitution, a legal claim to relief by the commune or district of the place where he was born, or where he had lived for at least three years between his 15th and 63d birthday; the question of dwelling-place being thus treated in much the same way as by the Prussian law of 1842. Begging was forbidden. The care of the poor was placed in the hands of commissioners who, in conjunction with the local Poor Law officials, were allowed finally to impose a tax in money and kind from year to year. In the country the old institution of the 'Laegd' was also retained, i.e., boarding the poor at a certain number of farms by turns. The law also gave the commissioners power to place able-bodied persons claiming relief, in work-houses (this idea was borrowed from England), but the power was only given at first in the case of some of the more considerable towns. . . . One peculiar part of the system was the *Skole* (school) *Laegd*; it consisted in boarding orphans, or the children of destitute parents, by turns, with the schoolmaster, when this latter had no fixed abode, but himself received board and lodging at different farms, giving instructions, in return, to the children in the neighborhood. The law of 1845, by giving the poor a legal claim to relief, and making it consequently the duty of the wealthier classes to pay regular imposts, increased the burden of the latter, whilst the motives to self-dependence in the former were weakened. But this mischievous effect of a step which was in itself necessary in

order to bring together under similar rules the chaotic elements of poor-relief, for some years escaped notice. . . . In the year 1866 the Storting went a little further by granting money to found a chief Poor Law Office under the Ministry of Improvement and Education, by which the statistics should be published annually instead of only once in five years, as hitherto. Eilert Sundt was appointed, and the first volume for 1866 . . . will be found instructive, especially through the information collected by the chairmen of the Poor Commissions, who are in general clergymen. During 15 years the whole population had only increased one-fifth, whilst the number of poor had increased one-third, and the total amount expended, reckoning relief in kind with that in money, had nearly doubled."—A. Lammers, *Sweden and Norway, in Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 195-199.

1863-1908.—Guardians of the poor.—Relief of children.—Compulsory labor establishments.—In Norway "the legal definition of the class entitled to receive help under the Poor Law is as follows: 'Those who lack the means of supporting themselves, or of providing needful attendance in case of sickness, and who are unable to earn such means and have no one who is bound to provide for them, shall be entitled to receive the necessary assistance from the poor relief fund, to such an extent and in such a manner as the guardians of the poor shall consider advisable.' Further: 'The relief which a destitute person (over fifteen years of age) has received for himself, wife, or son, the Poor Law can demand to be refunded.' The way in which the relief of the poor is organized is as follows: Every commune, *herred*, or country district and market town, has its own system of poor law administration. For the carrying out of the law relating to poor relief there is a body called the *Fattigstyre*, a term which may perhaps best be translated 'board of guardians of the poor.' This consists of (1) the parish priest, but if there should be several in the district, one of them, nominated by the bishop; (2) in towns, one of the magistrates, or the chief of the police or other police official; (3) so many men or women as the town or country council shall determine. These bodies have under them a number of paid officials, inspectors, etc., for the carrying out of their work. Those who are selected as members of the *Fattigstyre* are obliged to serve if they are under sixty years of age, and they must also attend to the duties of the board, a failure to be present at a meeting without reasonable excuse rendering the member liable to a fine of 5 kroner. The indigent are cared for either in public or private homes, or in their own houses, or the workhouse, or hospital, according to the nature of the case. When the *Fattigstyre* are deciding what form the relief is to take, they are obliged carefully to consider the various circumstances, and especially to see if the person applying is able to do anything to help himself or herself. In the case of children, where it is found that they cannot be provided for along with their parents, they are boarded out or sent to homes, and every effort is made to place them in a family or home, where they will have opportunities of learning some trade or occupation, which will enable them to maintain themselves later. . . . Closely connected with the question of the relief of the poor, and forming a part of the Poor Law system, are the various compulsory labour establishments (*Tvangsarbeidsanstalter*), which have been doing excellent work for a considerable time. These are

to be found in the principal towns of Norway, including Christiania, Bergen, and Trondhjem. They are intended to deal with a variety of cases in which men fail to support their families or children, and with the vagrant classes who prefer to wander over the country begging, and possibly stealing, instead of doing regular work. These institutions were originally founded under a law passed in 1803, but more recent legislation, that of 1802, has extended their scope."—T. B. Willson, *Norway at home*, pp. 172-175.

RUSSIA

1901-1918.—Old Russian views of charity.—Public charities controlled by officials.—"Institutions of Empress Marie."—Peasant care of orphan children.—Work of Zemstvos.—"The old Russian benefactor," a Moscow professor says, 'did not so much intend to raise by his good work the standard of the general social welfare as to attain in a higher degree to his own moral perfection. Hence pauperism was not dealt with in ancient Russia as an economical evil, as a plague of the social order, but rather as a practical institution for moral education.' In short, charity did not exist because there were poor and downtrodden people; but the poor and downtrodden people existed in order that charity might be practiced. It was a part of the divine order of things; therefore pauperism was not to be destroyed or even alleviated, but simply to be used for the soul's salvation."—P. Milyoukov, *Russia and its crisis*, p. 71.

In 1901, Frederick Palmer, in a study of Russian life, speaking on this subject, said: "The question of charities in Russia leads up to another phase in the moral character of the people, to which I must allude. . . . In Russia, where all is under bureaucratic direction, the public charities are entirely controlled by officials, and mainly supported by grants from the Government, though gifts and legacies from private persons are also made upon a liberal scale. A large proportion of these charities, existing in all parts of the Empire, are grouped together under the name of the 'Institutions of the Empress Marie,' and are governed by the board of directors, officials of ministerial rank, appointed by the Emperor personally. These 'institutions' comprise asylums, schools, and hospitals of almost every kind, from boarding-schools in which the orphan daughters of officials of high rank, but in reduced fortunes, are educated, to asylums for the aged poor and foundlings. Official charities, the functionaries of which are responsible to their hierarchical superiors alone, are rarely satisfactory, and it must be admitted that this rule applies to most of the State-supported charities in Russia. Fortunately, as I have already mentioned, the natural character of the Russian people themselves supplies many of the deficiencies in charities supported by the State. Among the very poorest peasants and working classes, nothing is more common than to find one or more orphan children, perhaps left by complete strangers, adopted as a matter of course; and only as a last resort would the foster-parents appeal for help in maintaining them, when in dire distress themselves."—F. H. E. Palmer, *Russian life in town and country*, pp. 300-311.

Three years later [1904] C. R. Henderson described the functioning of charitable work under the Zemstvos: "Most of the work of public assistance rests with local administrative bodies, under the jurisdiction of the

Minister of the Interior. There is, however, no central organization, no uniformity of regulations, no system of general reports. To understand the situation it is necessary to have in mind the general forms of local government in European Russia. The country is divided into 50 'governments' or provinces, each with a governor at its head, and these provinces are divided into from 5 to 15 districts. Each district and province has its Zemstvo, or popular assembly. That of the district, presided over by the marshal of the nobility, is elected by the property owners of the district and in turn elects the provincial Zemstvo. The cities have somewhat similar councils presided over by the mayor. The rural units of government are the volosts or cantons, composed of communes, and the mirs, or communes, which number some 30 to 35 families. Both volosts and mirs have their assemblies. They have charge of the aged, orphans and cripples and of such endowed institutions as exist. These are few in number. Most peasant charity takes the form of almsgiving or family care of an unfortunate neighbor. Upon the Zemstvos and city councils rests the care of schools, hospitals, charitable institutions, public granaries and sanitary service. They appoint special committees of charity administration which work in connection with the heads of institutions. In the provinces which have no Zemstvos, the old bureaus of charity continue to act, less efficiently than the Zemstvos."—C. R. Henderson, *Modern methods of charity*, p. 634.—When the soviet form of government was established in 1918, all previous forms of charities were abolished. The Soviet constitution bound the state to provide for all those who are unable to work.

SCOTLAND

1908-1911.—Care of children.—Free lodging houses.—Free meals in Edinburgh.—"Under the new Education Act for Scotland of 1908, large powers are given for feeding and clothing destitute children under certain conditions, and in Edinburgh action is already being taken by the Board to give effect to the various clauses. . . . One hundred and fifty charities show an annual income of £255,070. . . . Let us look a little closer and discover how this vast sum is distributed. In the report by the special commissioners of the Royal Commission, we find that in Edinburgh there are ten different lodging-houses, or shelters, for destitute men, women, and children. These lodging-houses provide in all 500 beds, at a cost of over £6000, where a free night's lodging can be had, and a meal night and morning. 'On Sundays large numbers who have had their porridge and milk in the morning at the Night Asylum, secure the breakfast given by the Sabbath Free Breakfast Mission. If they choose they can obtain later on in the morning a bun and some coffee at another mission, and return to the Asylum for a dinner of soup and bread. Free teas are also given on other days of the week by some of the missions, and, altogether, there seem to be many opportunities of obtaining free meals in Edinburgh.' . . . Perhaps the most interesting of the charities at the present moment are those for supplying food and clothes to children attending the board schools. . . . In Edinburgh, there are nine funds or associations for providing food and clothing for necessitous school children. They can provide 145,000 meals during the year, and they claim to have assisted 6000 children. Their joint income varies,

but appears to be considerably over £2000 a year. It is difficult to get any figures as to the percentage of underfed children in the schools.

. . . An experienced officer of the Edinburgh School Board makes a guess of 5 per cent. If this is anywhere near the truth, it would give 2039 children in Edinburgh who have to be dealt with and considered. All that public sentiment at present demands is that the child should have one hot meal each school day for six winter months. This can be given at the cost of 16s. per child. It would thus seem that our voluntary charities were able to meet the need, and that all that was wanted was that they should work together, and make sure that they are reaching the right children, and that their service is in every way sufficient and good. There are also two societies which give country holidays to children, and between them they send away about 3000 children in the year. . . . Edinburgh is very rich in pension charities. Their gross yearly income amounts to £42,374, and appears to be distributed, by thirty agencies, among a selected class of 2281 persons."—Mrs. G. Kerr, *Path of social progress*, pp. 78, 112, 114, 117, 124-125.

1909-1919.—Old age pensions.—Ministry of health. See above, Great Britain.

SWEDEN

1571-1873.—Ecclesiastical relief.—State regulation of local relief.—"The first State law which laid the foundation of public poor-relief, was the Church ordinance of 1571. This fact is very characteristic of Sweden, which, even to the present day [1873] has kept up a closer connection between Church and State than any other Protestant country, such as among Catholic countries perhaps Spain only has maintained. No one ventured, as yet, to forbid begging altogether. It was, however, partly attempted to restrain it from without, since it was linked with a kind of public credentials, a 'beggars pass' prepared by the bishop; and this only could be required to be read by the clergyman from the pulpit, that is to say, made known publicly and recommended to notice; the pulpit is so used, even to this day, within certain districts of Scandinavia. In part, too, an attack was made on mendicancy from within, by making regular collections on all festive occasions, the proceeds of which went to a special poor-fund, as well as by instituting special places of refuge for the helpless poor. Near every cathedral a hospital was to be erected, and maintained in such a way that it might contain at least 30 persons; and in every parish there were to be one or more rooms capable of containing from four to six poor sick persons. . . .

As to the relief of the poor in general, or as the task was then chiefly understood, the suppression of begging, the necessary (legislative) measures were taken on an average once in a generation. The Beggar's Order of 1642 fixed the duty of support on the parish, which, in the Ecclesiastical Order of 1571 had been merely hinted at for the first time; urged the duty of providing more rooms for the sick; and, on the other hand, restricted and further modified the beggar passes. The old rule of the provincial laws, that any property left by a person receiving relief in a hospital should go to the hospital, was revived. Poor-relief was also the subject of the Ecclesiastical Law of 1686. This law confined the right of begging strictly to the parish more strenuously, and required, from every person of means, a

yearly gift for the support 'of his needy fellow-Christians.' If any parish was overburdened with poor, the neighbouring parishes were to render assistance.

"The Beggar's Order of 1698 granted the requisite legal machinery, and in order to strengthen the Ecclesiastical Law of 1686, forbade all begging beyond the beggar's own parish. At the same time, the poor-funds were augmented by certain dues from weddings, baptisms, and burials, from the sale of houses, inheritance, etc. Every ship which sailed upon the West Sea, that is to say, the ocean beyond the Kattegat, was bound to take out every four years a poor lad as ship's boy, and so on. A law of 1734 defined more exactly the duty of building rooms or houses for the poor. In the course of the eighteenth century, a time as is well known, when philanthropy was practised in many cases despotically by the higher classes, the State began to interfere more minutely with local poor-relief, without, however, any special success. Broomé tells us, for instance, that within three years it prescribed the model of an economical plan for a poor-house in each parish, and again it let it drop. The Royal Orders of 1788 and 1811 at length conclusively laid down the main principles which had up to this time been worked out by practice, and by the law handed down, on the subject. They made it tolerably clear on the one hand, that every parishioner, not himself in receipt of relief, must help to bear the burden of the poor. On the other hand, they disposed of the question of settlement less satisfactorily. The districts were no longer to be able to send back persons fully capable of work, in order to free themselves from the burden of their eventual maintenance; hence arose not only great uncertainty as to the limits of this idea, and great variety in its actual definition, but even a regular so-called 'war of parishes,' one parish seeking to shift on another the burden springing from the necessary relief of the migratory poor."—A. Lammers, *Sweden and Norway*, in *Poor relief in different parts of Europe* (A. Emminghaus, ed.), pp. 186-190.

1809-1914.—Provisions of poor law of 1847.—Law of 1871.—Workhouses and infirmaries.—Children of the poor.—Boarding out.—Poor law farm.—Charitable homes.—"The founders of the constitution of 1809 [drew] attention to the necessity of investigating all conditions pertaining to poor relief and of promulgating regulations for the whole kingdom based on that investigation. However, the first general poor law for Sweden did not appear before 1847. Certain principles were then established for the giving of poor relief, but the various communities were left free to regulate the details according to local conditions; yet *begging had to be prevented*. Up to then it had been regularly permitted, though under strict control, as being the right way for the destitute to obtain the necessities of life. The poor relief ordinance now in force, issued June 9th, 1871, are mainly founded on those of 1847, with partial alterations and additions made before 1871 and since. They ordain that every able-bodied man shall, without burdening the poor law union, provide for himself and his children under age, *i.e.*, under 15 years; the same shall apply to the support of his wife, it being understood that parents and children are bound to support each other, in proportion as the one part needs it and the other can bestow it. Servants and other working dependents, together with their wives and children under age who are at home, shall be supported by their master so long as the

contract for work runs. Necessary relief *shall* be provided for minors, and for those who are, by reason of age, sickness, disablement, or other defect, incapable of supporting themselves and lack means of maintenance or other relief. In other cases, support *may* be given after investigation by the Board of Guardians. Every town and parish in the country forms a *community for poor relief*. Application for support shall be made in the parish where the necessitous person is living, but the cost of the support enjoined by law shall be met by the parish where he has his settlement. . . . The Poor Law Guardians are bound, on receipt of application for relief, to inquire carefully into the applicant's position and needs, and into how far such relief should be afforded; to see that necessitous children not only receive maintenance, but also a fixed abode and Christian education; to take note that support given is properly applied, and, with that object, to divide the community into districts, each under the inspection of a special Guardian; and to superintend special districts and private Unions for poor relief, where they exist. . . . Everyone who solicits alms by word or gesture, from any other than the person appointed by the community to receive application for poor relief, is considered to have been *begging*. Within every poor law parish, there shall exist a competent number of overseers, whose duty it is to stop beggars and institute an examination of them. If the detained man is in a necessitous condition, he receives relief; otherwise he is warned and may in more serious cases be sentenced to compulsory labour. The same consequences threaten any who permits a child under age to beg, whether it is his own or under his guardianship. . . .

"Indoor relief is afforded in institutions or homes to various classes of the poor. In larger towns are to be found work-houses and infirmaries for the destitute—with departments for chronic cases of sickness, either physical or mental—homes for the aged and for children, asylums for the homeless and for women in confinement and for nursing mothers, night refuges, etc. Pauper children are likewise *boarded out* in simple but good private homes; this is in rural parts the usual means of provision with respect to pauper children, and is also resorted to for elder people. In those parishes where no parochial institutions are to be found, or such as do exist are inadequate, outdoor relief is frequently given. In 1912, over the whole kingdom, outdoor relief was given to 60.8% of all in receipt of relief. The danger of abuse in this system is, nevertheless, great, and at the same time aversion to seeking this form of relief is so slight as to create a temptation to apply for help without necessity. A well managed *poor law farm*, with work on the land, has proved to be remunerative for parish and inmates alike; the weakly ones obtain needful care, while those who have more or less working capacity there get farm-work after their ability, and are strictly kept to its performance. . . . During the centuries which elapsed after the reformation, before a definite poor law for the whole country was set up, a number of institutions were developed, which may be indicated as transitional forms between public and private enterprise. In the 16th and 17th centuries, the State, or the reigning sovereign and his family, without the co-operation of the parishes, erected homes for the aged and the sick and for the care and education of children, and these establishments were maintained by the founder and private benefactors

together. Among such places there are still in operation a great number. . . .

"During the first half of the 19th century, very few institutions of the afore-mentioned character were founded. On the other hand, associations for the purpose of giving assistance in one way or another are beginning to appear. . . . In the latter half of the same century, active organization of every kind of institution prevailed, and associations were formed to assist those who, in various ways, were in need. At last, in the last decades of the century, it became a clearly necessary task to systematise the confusion of activities and to establish co-operation among them, and between them and the poor law. At the same time, it became clear that the prevention of distress was more urgent than the attempt to mitigate it, and that to prevent distress was the only way to be able at some future time to get rid of it altogether. . . . Homes of different kinds have also been organized for the misguided, fallen, and unfortunate in mind or body. Attempts have been made to supply work to the unemployed; cheap dwellings have been provided for people with very little ability to pay rent, and the homeless have obtained temporary refuge in night-lodgings and shelters. . . . Following an example set in London, the *Charity Organization Society* (Föreningen för Vålgörenhetens Ordande, commonly called F. V. O.), was founded in Stockholm in 1880. Its mission is to secure in the capital collaboration, irrespective of differences of religious or political opinions, between benevolent private persons, institutions, or associations, and the poor law boards; and, consequently, while striving to check mendicity, it strives so to concentrate and regulate all available strength as to permanently improve, with a united and systematic action, the condition of those who are in need of help. . . . Associations with a similar purpose as F. V. O., though under different names, have been started in several Swedish towns and have—like the one in Stockholm—been of great value, not least of all by checking begging."—A. Montelius, *Poor relief (Sweden, Historical and Statistical Handbook, 2nd ed., pp. 293-301)*.

1912-1921.—Care of Cripples.—"In Sweden the State has appointed a Committee consisting of individuals with special knowledge of all aspects of the care of cripples, and since 1912 it has been held as a principle that the State should contribute one half of all expenses involved in the scheme. Three large institutions for cripples already exist in Stockholm, Gothen and Helsingborg. Each institution includes an orthopedic hospital, a general education school, and a trade school. Originally they were founded by the Central Society for cripples, and they are maintained by the contributions of the State by local contributions from the various districts, and by ordinary voluntary contributions."—*Survey (Graphic), Nov. 26, 1921, pp. 311-312*.

SWITZERLAND

Early difficulties.—"Mediaeval relief in Switzerland . . . was administrated by the church, through parish and monastic agencies, and by indiscriminate and impulsive almsgiving. The plague of beggars spread through the valleys of Switzerland. . . . The same causes everywhere produced similar results; the breaking up of serfdom and feudal control of the habit of wandering, the vicious customs of almsgiving without consideration of effects on character, and the inadequacy of ecclesiastical machinery to deal with sturdy

mendicant rogues, all increased the swarm of parasites. The evil was aggravated in this land by the custom of sending out mercenary soldiers to earn their living in foreign armies. Military life demoralized young men; the long absence of husbands broke up homes; and of those who returned many were without skill and habits of regular industry. The ordinary agencies of relief could not manage this dangerous and aggressive element of the population, and it was found to be necessary to invoke the police power of the governments to give security to life, property and order. The first intervention of government was therefore repressive, punitive, deterrent; and the cantons enacted strict regulations against begging and vagabondage. Since the principle of local responsibility for local dependents had long been accepted, the cantonal authorities required those who sought assistance to make their appeal to their neighbors in their own commune."—C. R. Henderson, *Modern methods of charity*, pp. 138-139.

1844-1921.—Variety of laws due to communal system.—Society of Public Utility.—It is difficult to give a clear account of Swiss charities owing to the fact that different laws maintain in the different cantons, to the peculiar communal system of local government which exists, and to the fact that some of the communes still possess fairly adequate public resources in common lands, while others are not so well endowed. For instance, Bern passed a law in 1857, under which voluntary contributions are eked out by a communal subsidy; under the law of 1897 Basel has a bureau of alms through which orphans are provided for and also the aged over sixty years. These latter, however, must have resided in the canton for twenty-five years, including five full years of unbroken residence immediately preceding the appeal for aid. Later laws passed in Basel (in 1885 and 1891) provide for burial funds and for care of the sick. Aid is given to the transient poor under certain circumstances; but only after a residence of two years in the canton, and even then their home authorities are called upon for assistance. It is impossible to draw a definite line between public and private charities. The outstanding ideas are that every citizen who falls into evil days is entitled to help, and every child to shelter, clothing and education. The care of the poor is . . . left largely to the Communes. When a commune possesses insufficient funds, or no funds at all for the poor, the latter are relieved by voluntary contributions, and this matter is in such circumstances left as much as possible to charitable associations, the establishment of which the communal authorities must endeavor to promote. The communal councils can also institute special committees for charitable purposes."—G. Lloyd, *Sovereign people*, p. 106.—"Every inhabitant of a commune must be inscribed at the police office, and be prepared to show at all times that he is a member of the commune. . . . This regulation is strictly enforced especially where the party is in any danger of becoming a public burden. Every commune is absolutely protected against being compelled to support the vagrants or beggars of other communes. The idea that it is the duty of the commune to take care of its poor, the unfortunate and incapable, is firmly planted in the mind and breast of every member. They will try to prevent an hereditary or professional pauper from acquiring a domicile in the commune, and to return to their own communes shiftless persons that are likely to need aid, but are ready to relieve every case of destitution

which fairly belongs to the commune."—H. Waterson, *Swiss republic*, p. 188.—The commune of Grindelwald may be cited as an example of communal relief. There "the poor are relieved in three different ways. For the regular paupers there is a cantonal official who comes up from Interlaken, makes his inspection and pays for their maintenance out of cantonal funds; other less necessitous persons and poor people passing through the commune are relieved by one special committee, while yet another provides for the 'wants of the sick poor.'"—F. O. Adams and C. D. Cunningham, *Swiss Confederation*, pp. 111-112.

"Nothing could give a better idea of the practical philanthropy everywhere at work in Switzerland than a brief survey of some of the ways in which this Society of Public Utility expends its efforts. Every canton has its branch of the society except Schwyz and Valais. But besides the cantonal sections, there are thirty-one district sub-sections, of which ten are in Aargau, eleven in Zurich, five in Soleure, four in Berne, and one in St. Gall. . . . The world over, there are never wanting objects for commiseration and timely succour; but such cases appear to be more than usually common in Switzerland, where, what with flood, avalanches, fires (often caused by lightning), to say nothing of the common accidents of everyday life, there is an ever-active call upon the goodwill of the willing. . . . It may be noted that, in view of the frequency of such catastrophes, arising from the untamable forces of nature, several cantons, among them being Berne, St. Gall, Thurgau, and the Grisons, have established special funds for the benefit of those who suffer from disasters of the kind, and every year a special collection is made for the replenishment of the treasury. . . . One of the most striking features of Swiss beneficence is the thought and care which it has always devoted to the young. Its principle of actions seems to be, 'Start the plant right, and it will grow strong.' Cantonal governments vie with private charity in their generous efforts on behalf of the young. Rural asylums and country colonies, together with societies of every description for the protection of children, multiply themselves on every hand. . . . It would be impossible to refer to a tithe of these various agencies; but I may mention, among others, the agricultural and industrial colony of Serix in the canton of Vaud, founded in 1863; the colony of Sonnenberg, near Lucerne, established in 1859 by the Society of Public Utility, above referred to; the *Solidarité*, a Vaudois society for the protection of unfortunate children; and the Geneva committee for the care of abandoned children, dating from 1892. . . . So I might mention the Bernese establishments of the Gotthelf society, the first of which was opened [about 1880], . . . the Zurich society for the succour of abandoned children, dating from 1865; and the asylum for children at Mendrisio, in the canton of Tessin, to which a noble Tessinese, Giovanni Bernasconi, . . . left a large part of his fortune. Besides *crèches* innumerable in the larger towns, and *Cuisines scolaires*, founded so that school children who have to go long distances from home may have good warm dinners in the cold and wet season, the philanthropy which focusses itself chiefly upon the young has also thought of the children who, cooped up in the narrow streets of towns and cities, would seldom get a breath of the pure air of the country or of the mountains were it not for the 'vacation colonies' which have been provided for that purpose. Pastor Bion, of

Zurich, was the original promoter of these holiday colonies, which are now to be found in most parts of Switzerland. The Genevese, always a little in advance, have pushed their solicitude for the welfare of the young even beyond the vacation colonies amid the hills and among the lakes of the home land, and have a committee at work which every year sends a number of children and young people suffering from scrofula and other similar complaints to Cettes, Cannes, and Sestri-Levante (Liguria) for the benefit of the sea-air and the bathing. . . . I do not know whether Switzerland produces, in proportion to its population, a larger number of deaf-mutes, blind, idiots, or children suffering from epilepsy, than other countries. It certainly has its share, and they constitute a by no means light burden for those who are blessed with the altruistic spirit. Fortunately there is no lack of that spirit in this land of democracy, and so for the care of those who come into the world deficient in respect to sight, hearing, or intelligence, there are throughout the Confederation no fewer than thirty-one institutions, most of them supported by public or private beneficence. One of these establishments, that of Zurich, is for the blind as well as for the deaf and dumb. Two others, one at Könitz, near Berne, and the other at Lausanne, receive only the blind. The latter, among other things, makes a feature of teaching its inmates basket and wicker-chair making, etc. It was founded by the philanthropist Haldimand, and dates from 1844. Fifteen of these institutions are for deaf-mutes, and are distributed through the cantons of Aargau, Basel, Berne, Freiburg, Geneva, the Grisons, Lucerne, St. Gall, Tessin, Vaud, Valais, and Zurich. Thirteen establishments are devoted to the care and education of children intellectually deficient. Two of these—one at Bagensberg, Zurich (founded in 1863), and the other at Weinfelden, in Thurgau (dating from 1805)—were established by that Society of Public Utility which puts its hand to so many good works. . . . Next to infancy and youth, old age lays claim to the attention of Swiss philanthropy. Nor does it ask in vain, as is proved by the long list of charitable institutions specially reserved for the aged which are to be found in every canton of the Confederation. The canton of Basel alone possesses six asylums for the aged, infirm, and incurable, besides a general fund for widows and orphans, which is one of the oldest philanthropic organisations in Switzerland. The canton of Geneva, never behind in these matters, has two such institutions for the aged, one at Anières, with one hundred and fifty pensioners averaging seventy years of age, and another, supported by the State, at Petit-Saconnex. . . . The canton of Vaud is equally thoughtful of its aged poor, but it manages matters in a different way. The Government supports an organisation for the care of those of its old people who are infirm, or suffering from incurable disease, and there is, besides, a 'society for the succour of poor persons hopelessly afflicted,' with about one hundred and fifty persons always on its books. But both these organisations, instead of maintaining special establishments, place their patients out in private families. There is, however, at Chailly, near Lausanne, an asylum of the general type for old people of both sexes, *pauvre et mal-heureux*. Other institutions of the kind . . . abound in all the cantons, to the number, in all, of eighty-one, some private, others State-supported, some connected with religious organisations, others not.

. . . I refer to the sanatoria conducted specially for the benefit of persons suffering from tuberculosis. . . . The poor, unaided, cannot afford to go to such places, and so philanthropy in Switzerland has stepped in and opened a number of sanatoria. . . . The sanatorium at Heiligenschwendli, in the canton of Berne, is said to be the first establishment of its kind on the Continent of Europe. . . . [There is also] one at Leysin (canton of Vaud); . . . one at Davos . . . and a third at Braunwald in the canton of Glarus. . . . Zurich also supports a sanatorium at Wald, and Neuchâtel one at Malvilliers."—A. T. Story, *Swiss life in town and country*, pp. 79-81, 83-86, 89-91.—To the vacation colonies are sent feeble children those who are sickly, or badly nourished, from large families of the poor. The physician indicates the children who shall be sent, but the members of the Directors Committees have also an important task to fill, that of making an exact enquiry into the families of the children. The Colonies are designed to contribute not only to the physical well-being of the children, but also to exercise an enduring moral influence. These children who often come from unsympathetic, and sometimes corrupt surroundings, learn to know the joys and benediction of a well-ordered family. They are habituated to cleanliness, good manners, order. They are taught also to play with good nature and in general all things good and noble, and something of the impression will endure. The cost of the colonies is covered by special societies . . . from funds provided by subscriptions, legacies, gifts, interest on capital, charitable performances, contributions by the State, Communes, societies, savings banks, banks, and parents of children.—From C. A. Schmid, *L'assistance légale des indigents en Suisse*, pp. 208, 209.

UNITED STATES

1642-1779.—Poor relief in colonial days.—Law of settlement.—Apprenticeship of pauper children.—Overseers.—Almshouses.—"The town records of New England amply show that the early settlers were determined that wilful poverty should find no lodgment in the new England. The poor would be helped, but it must be proved that they could no longer help themselves and had no kin who owed them support. Vagrancy . . . had become a scourge in old England. In the new land the bread that fed the tramp must come from the scanty store of the laboring man, depriving his little ones. If these factors of Old-World experience, of present poverty, of necessity for great individual exertion, are given due weight in our consideration of the chill and unsympathetic annals of these first American overseers of the poor, a flood of understanding will attend our study of the upgrowth of our present-day system of poor relief with its complicated law of settlement and its long continuance of the town as the primary agent in public charity. . . . As early as 1642 Plymouth Colony placed upon each town the obligation to support its own poor. This was no more than a revoicing of the practice already established. By the English law, to which the minds of the colonists were schooled, the support of the poor was a local burden for which the parish or hamlet was responsible. It was, therefore, an ingrained part of the theory of New England village life that the town was liable for the support of those persons who, through sickness,

misfortune, or old age, were unable to help themselves. . . . Hence the question disturbing the selectmen of the towns was not whether the town owed the duty of support for its own poor; it was the truly perplexing question of identification; Who were the town's poor? . . . [Stringent measures were taken to prevent poor persons from outside sections from becoming inhabitants, and by degrees the Settlement Law was evolved.] New England town government is effected through a committee known as the selectmen. These officials had in the first decades the duty of aiding the poor. In later times the English pattern was followed by electing overseers of the poor. Boston created such a separate body for the first time in 1691. Plymouth selected two overseers in 1779. . . . Though the older settlements resorted early to the expedient of housing their poor under a single roof, it may be taken as a general statement that almshouse care was not common till after 1700. Thus, for nearly a century, it was usual to deal with each case individually as it arose. . . . There was no compunction in winding up a household, placing the children with various parties by indenture, and even putting the parents out to service, in order to prevent a public expense. . . . When public relief did become necessary, the chief aim was to avoid as much of the burden as possible. . . . 'Going on the town' was rated a catastrophe of the first order, a refinement of poverty exceeded only by the inevitable hunger and exposure which must otherwise ensue. Much more fortunate were they who, though in need of some assistance were nevertheless possessed of such means as would save them from going completely upon the town. Partial measures were much more humane. It was common to aid poor inhabitants who were near to dependency by granting them an abatement of taxes, by increasing their rights in the common lands, or even by contributing toward the building of a house for them. With the exception of votes of money or other relief to widows, this form of partial help toward self-support is by far the most frequent in the first few decades. . . . As the towns grew older there was no escape from a steady increase in the number of those who for various reasons, including their own vicious courses, must be given food and shelter. . . . The aim was to dispose of the poor as cheaply as possible. To search out the best conditions for the individual pauper by some modern system of case work or home finding was not practicable as the machinery for such investigation did not exist. It was quite natural, therefore, that the towns fell into the habit of allowing the public to offer terms. It became the custom, universal among our Massachusetts communities, to bid off the support of the town's poor at public auction. . . . For decades in the history of our almshouse system the jail was the only other institution where individuals were housed; and it was natural enough, therefore, to gather together under this single roof for the poor all manner of persons of what condition soever, who were either unable or unwilling to do for themselves. Of the worthy poor, there were the widow who was beyond self-support; the little child left orphan or sired by the incompetent; the idiot who was the grinning butt of public ridicule; the maniac; the lame; the halt; and the blind. They were gathered together in the same enclosure, sometimes, but not always, with separate sleeping quarters. It was common to provide a separate room for the furiously mad, as their ravings

made life intolerable for the rest. . . . By 1712 the almshouse had become a Bridewell and house of correction where all manner of vicious persons were congregated to the great detriment of the worthy poor. . . . In 1713 a vote passed the town meeting directing the overseers of the poor 'to receive no person into the Alms House . . . other than such as are proper objects of the charity of this town.' . . . The lack of regular employment in the Boston house was the cause, no doubt, of the proposal that a work-house be set up for the able-bodied. This proposal was not adopted until 1735. . . . The story of almshouse care in Boston is, with due allowance for the complication due to her location as the chief port of the region, the story of almshouse care in other places. Almshouses were shelters where all classes of dependents were housed, fed, and clothed. Unclassified grouping tended to level the best down to the grade of the worst."—R. W. Kelso, *History of public poor relief in Massachusetts, 1620-1920*, pp. 33, 48-49, 93, 95-97, 103, 107, 113-114, 117.

1853-1908.—Outdoor relief.—Private societies.—Charities endorsement committee.—"Outdoor relief in the United States is given [written in 1908] by county and township officials; and from its nature the bookkeeping is likely to be faulty, especially as to the number of persons aided. In most Western States, as, for instance, in California, there is no State official to whom the county and township authorities are called upon to report. They publish no annual accounts, except such as may be found in the local papers annually or semi-annually; and those who have undertaken to study the problem of outdoor relief in these States have had to get their facts by personal visits or correspondence with the local officials. In twenty-four States, relief of the poor in their homes is legally authorized, and several others may authorize it at discretion; only a few Southern States give outdoor relief. . . . Under the law of 1853 in Indiana, poor relief was given by the trustees of more than 1000 townships; the amount was left to their judgment, and they might in their own discretion send the applicants for relief to the county poor asylum or grant them relief in their homes or transportation to the next township. The Boards of County Commissioners were also permitted to give annual allowances and medical aid. Under this system, very serious abuses grew up. The township trustee, elected by popular vote, was inexperienced, poorly paid, and subject to political pressure and the demands of friends; the County Commissioners often gave when the trustees refused. Under this system, the average amount paid in outdoor relief between 1890 and 1895 was \$550,000 annually. The first step toward reform was a law secured by the State Board of Charities in 1894, requiring accurate statistics of the relief given to be reported to a State officer. The information obtained was startling: one in every 31 of the State's inhabitants was receiving relief, the proportion in different counties varying from 1 in 13 to 1 in 208; in some of the richest counties the number aided was 1 in 16 to 1 in 20. As a result of agitation on the basis of this information, a law was passed in 1899, which is said to be the first application of charity organization principles to an entire State. The law provided for the investigation of each case by the overseer of the poor; for securing the help of the friends and relatives of the applicant; for compelling the able-bodied members of the family to work; for refusing transporta-

tion to all except the sick, aged, injured, or crippled, and them only in the direction of their legal residences; for coöperation with private relief societies; for limiting the relief power of the County Commissioners, and the amount of temporary aid.

"The Catholic Order of the Little Sisters of the Poor maintains, in various large cities, homes for the aged, to which persons are admitted without regard to creed or character, if only they are amenable to the rules of the house after admission. These homes are supported entirely by the Sisters, who beg from door to door, and from office to office, and go at the close of business to the markets and stores to collect the refuse, or whatever may be given by the owners; and who further collect from hotels, restaurants, and private dwellings the broken victuals and other material that can be used. These homes are models of order, and the Sisters, most of whom come from France, where is the mother house of the order, have good control of the very querulous and often exacting inmates, whom they speak of as 'the children.' The United Hebrew Charities throughout the country, whose charitable methods might serve as models for the benevolent work of other religious bodies, endeavor to take care of all their own poor, but do not exclude other poor from the benefits of many of their institutions. At the same time their individual members are often most liberal contributors to every sort of constructive work undertaken by persons of other religious views.

In San Francisco, a method has been devised to induce the public, and especially business men, to give only to such institutions and charities as are endorsed by an expert committee. The Charities Endorsement Committee is made up of representatives from the Merchants' Association, the Associated Charities, and the Charities at Large, and its secretary is the secretary of the Associated Charities. The Committee investigates all charitable enterprises applying to it for endorsement, and issues an official card to those doing honest and efficient work. The members of the Merchants' Association, representing a majority of the moneyed men of the city, refused to give unendorsed charities, and the general public is being slowly educated to do likewise. The plan, while rousing the resentment of all fraudulent charities and of many that were far behind the demands of modern philanthropy in their standards, has proved successful in driving the former from the city, and in inducing many of the latter to make an effort to meet the requirements."—A. G. Warner, *American charities*, pp. 226-232, 380-384.

1863-1908.—State boards of charity.—"The demand for State regulation of private charities is rapidly strengthening, and at the present time [1908] about one-half the States require supervision by some board, generally the Board of Charities, with various degrees of power by inspection, license, and control. . . . Soon after the conclusion of the Civil War, there was a movement in some of the older and wealthier States to establish public supervisory agencies known as State Boards of Charities. This was part of the general tendency to amplify and improve the administrative machinery of our State governments of the creation of boards or commissions for the care of the public health, and for the collection of statistics regarding labor. The first board for the supervision of charities was established in Massachusetts in 1863, and Ohio and New York followed with similar boards

in 1867. Illinois, Pennsylvania, and Rhode Island established boards in 1869. In 1907 there were 21 supervisory boards of charities and correction, and 12 boards of administrative control, in the United States. In the main, these State Boards are of two general types, one having powers of supervision and report only, and the other having powers of control over the charitable institutions of the State. Typical boards of control are now found in Rhode Island, Kansas, Iowa, Wisconsin, and other States. They are usually made up of salaried members, limited in number,—usually not more than six,—who are the trustees of the public charitable institutions and who have extensive executive power. They are charged with the maintenance, government, and direct supervision of State institutions, appoint their superintendents or wardens, and generally purchase all staple supplies."—*Ibid.*, pp. 388, 425-426.

1872-1908.—Voluntary supervision of private institutions.—New York Association.—"In several States there have grown up associations for the voluntary unofficial supervision of public charitable institutions in coöperation with the official boards. Of these the most important is the State Charities Aid Association of New York, organized in 1872, with the object of bringing about reforms in the poorhouses, the almshouses, and the State charitable institutions of New York, through the active interest of an organized body of voluntary visitors, acting in coöperation with and as an aid to the local administration of these institutions and the official State boards of supervision. Upon the nomination of the State Charities Aid Association, through its board of managers, district supreme courts are authorized to grant to the visitors of the Association orders enabling them to visit, inspect, and examine on behalf of the Association any of the public charitable institutions owned by the State, county, township, or city, the poorhouses and almshouses within the State of New York, such visitors, to be responsible to the counties from which these institutions receive their inmates. The Association reports annually to the State Board of Charities and the State Commission of Lunacy upon matters relative to the institutions subject respectively to the inspection and control of these two official bodies. The New York Association has a central board of managers, largely of New York City, and visiting committees in 43 counties with a total of more than 1000 volunteer visitors to country, city, and town almshouses, State Hospitals for the Insane, County Homes for Children, City Hospitals, and other public charities. The Association is supported entirely through voluntary contributions, refusing to receive money from public sources in order to remain free from outside influences. It maintains a salaried secretary and assistant secretary, prints a valuable annual report, and occasionally pamphlets on subjects of special interest connected with relief, at a total cost of about \$30,000 per year. Such an agency as this would manifestly be a nuisance unless wisely managed, and would result in legalized meddling. But actually the Association has secured very large results through its voluntary inspection of public institutions. Chiefly through its exertions a higher standard of care has been introduced into every almshouse in the State; a training school for nurses was established at Bellevue Hospital in 1873, and in 1874 a hospital book and newspaper society to provide reading matter for the inmates; the farming out of the poor has been abolished; a

society for instruction in First Aid to the Injured, training schools for nurses for the insane and municipal lodging houses were established, and the removal of the insane from almshouses has been secured."—*Ibid.*, pp. 433-434.

1874-1902.—Establishment and influence of American National Conference of Charities and Corrections.—Indoor relief.—Outdoor relief.—Care and education of defectives.—Oversight of neglected children.—General care of children.—Salvation Army.—“The American National Conference of Charities and Correction [originated in] the autumn of 1873, [when] at the suggestion of F. B. Sanborn, then secretary of the American Social Science Association, several men came together who recognized the need of an annual conference on relief problems. . . . The first conference was held in New York in 1874, which had representatives from four boards and written communications from four others. Not many more than one hundred persons took part in that conference, and its report filled less than fifty pages. During the succeeding years this organization has been greatly developed and has become one of the most significant factors in American charity. . . . The influence of the conference on the development of American poor relief is undeniable; it enjoys today great respect, and has actually become the focus of all efforts which belong to this field. Directly or indirectly through its agency there have been organized conferences in the several states. . . . On the whole, one receives from the poor relief and charity of the United States the impression of a living interest in the revival of personal care for the poor; more than in other lands is the social importance of a sound method emphasized. . . . In general there is a strong tendency to take away from cities and counties the care of two classes of dependents, children and the insane. Several states have introduced an exclusively state system for unprotected children, and require that the insane be placed in state institutions. . . . The public poor relief, like that of England, rests upon the more or less exclusive application of the system of indoor relief. The poorhouses or almshouses are, as Warner calls them, ‘the charitable catch-all for the community.’ The laws exclude public outdoor relief partly in cases of permanent dependence and entirely for able-bodied persons, so that only the sick, defective, and similar persons may be relieved temporarily by the outdoor method. Outdoor relief, for example, is abolished in many of the great cities, as New York, Brooklyn, Baltimore. The new law of Indiana for 1899 greatly restricts outdoor relief. In the report the figures for 1895 and 1900 are compared. While in the former year \$630,189 were expended for outdoor relief, the expenditures for 1900, including medical relief, were only \$209,956, with a parallel decrease in the population of poorhouses. This attitude of state relief is only intelligible when one considers that a richly developed private charity precisely in the field of outdoor relief comes to the aid of public relief, and that the effort to keep the care of children, the feeble-minded, the sick, and the defectives separate from other public poor relief is constantly gaining ground. . . . To the care of defectives, especially of children and youths, great attention and large means are devoted. In almost all states exist institutions for the instruction of deaf-mute and of blind children. These are either state institutions or private institutions, which are paid by the state for the care of children sent to them. This, for example, is the method for

both deaf-mutes and blind children in Massachusetts, Connecticut, New Hampshire, Pennsylvania and for the deaf-mutes in Oklahoma and New York. Generally the institutions are designed for children of school age. The residence varies in duration and is between two and six years, the former in Texas and Oregon, the latter in Alabama. In sixteen states a distinction is made between dependents and those who pay, but usually board and education are gratuitous. In addition to these special institutions there are also, in some of the larger cities, provision for the instruction of deaf-mute and blind children in the public schools, as, for example, in Pennsylvania, where school districts which have eight or more deaf-mutes among twenty thousand children must provide suitable instruction for them. In Wisconsin the state appropriates \$100 for each child of this class. . . . America has given special attention to the education and care of deaf-mutes. At present more than ten thousand deaf-mute children are sheltered in schools and homes, although by no means all such children enjoy this benefit. The Illinois report states that the great institution at Jacksonville, has received during the last few years between 500 and 550 children, but that more deaf-mute children are growing up without any instruction than those who are taught. In the institutions themselves the best educational methods are employed, and a domestic life with work, entertainment, and recreative plays is provided.”—E. Münsterberg, *Poor relief in the United States (American Journal of Sociology, January, 1902, pp. 504, 506, 519, 522-523, 532-533)*.

“It is as true of America as of England that the care of children belongs to the most promising field of relief effort. . . . It is interesting to note that in the beginning of the previous century, as appears from a report of the secretary of the state of New York, Yates, it was thought best to use the poorhouses for children, since at that time this measure seemed progress. . . . The hopes which were set upon the poorhouses, however, as would appear self-evident to our present thought, were not fulfilled. . . . Efforts to remove them from the poorhouses . . . have gained during the last decennium in extent and earnestness. . . . It is only a question of time when this removal will be complete. By law the retention of children in the poorhouse is forbidden in one-third of the states. . . . The experiences which led to the introduction of state boards repeat themselves in the care of children and lead to the demand for the subjection of this branch of relief, whether by public or private benevolence, to the supervision of general boards or special bodies appointed for the oversight of children. Such oversight has been introduced in recent years in various forms. In 1807 [in Indiana] this duty was assigned to the board of state charities, and extended to all public poor relief on behalf of children. It has succeeded admirably in helping to place children in families. . . . In every county of the state a board of children’s guardians, consisting of three married men and three married women, is established. The members of the board are chosen by the county court and serve voluntarily for honor. Each member is chosen for three years. The board is charged with the duty of supervising and caring for neglected and dependent children under fifteen years of age. It is authorized to take under its oversight: all abandoned and neglected children, or those mistreated by their parents; children who beg upon the streets; children of

drunkards or of vicious parents, and of those incapable of educating children; children who are found in vicious and immoral surroundings; children who are to be described as morally imperiled; vagrants and youthful criminals. The board is authorized by the county court to place such children in orphanages or to apprentice them or otherwise to control them, without needing the consent of the parents. As soon as it comes to the knowledge of the board that a child under fifteen years of age is forsaken, purposely neglected, or habitually mistreated by his parents or his legal guardians, or by their knowledge or consent goes out to beg, or that the parents of the child are frequently intoxicated; then is it authorized to step in and transfer the child, by legal process, to an institution or family care. Parents or guardians of the child are obliged to bear the costs when they are able, and if they refuse may be compelled by legal process. The board of county commissioners is to erect and maintain a house for the temporary reception of children who are under the supervision of the board of guardians. It has to pay for the necessary assistance and for maintenance, with the exception of the cost of food and clothing, which is borne by the guardians under a contract. The boards of guardians are to give reports to the board of state charities, as desired, for which purpose the required forms and means are furnished. . . .

"[In general] the arrangements for children correspond to those in other lands: institutional care in great orphanages, of which America possesses some of the first rank (institutional system); or in small homes (home system); family care (boarding and placing out); and the union of both the latter systems by reception of the children at first in a central place, and their transfer hence to family care, the so-called state public-school system, or the Michigan system, because it was first applied in Michigan, and now enjoys a great reputation in America. Along with the exclusively public and exclusively private care of children exists the system of subsidies from public means to private institutions. More and more the system of family care gains in importance, although at first it was hindered in the attempt to remove children from poorhouses by the tendency to replace poorhouses with special institutions for children. . . . In America . . . there is much discussion of the advantages of institutional relief as compared with family care. . . . In the reports of the state boards and in the National Conference the subject is more or less fully discussed. Theoretically the victory may be said to belong to family care; its advantages are thoroughly discussed by Mathews: Life in a family, especially in a well-ordered rural family, prepares the child for life far more satisfactorily than is possible in an institution. In an institution the children are taught rather too much of heavenly and too little of earthly things. The atmosphere is only too well adapted to train them in dependence. Shelter is provided; food is always ready; clothing, good beds, warm rooms are at their disposal, without the least thought or care on the part of the children. Altogether different is family care. It is said in a report of Illinois in 1899: In a real domestic household all members of a family are bound together by reciprocal ties. In the nature of family life, persons help each other and make sacrifices in turn. There is the great world in small, and the relations of the members to each other correspond to those which the child will find in later years in society. It

is a workplace, a school of labor, where daily practice in household duties prepares the child for further duties. Family life alone can teach the children self-control, submission to the conditions of practical life, and capacity for independent action. From the standpoint of poor relief, we mention also the advantage that family care is essentially cheaper than that of the institution. If there is a reasonably general agreement that family care is theoretically the best form, this does not imply that institutions in a certain measure may not be accepted, and least of all requires us to shut our eyes to the dangers of inadequate family care. Institutions are most of all necessary for the reception of children, to observe them and to select for them suitable homes. There are many children who, on account of their character, or on account of physical or psychical defects, are not adapted to home life, or proper families cannot be found in which to place them. By the extension of the group system in the larger institutions, and by the erection of homes, the danger which attends institutional care is materially diminished.

"As in England, though not to the same extent, the work of the Salvation Army has been developed in America, and has found even more favorable conditions. . . . In all there are 160 organizations of the Salvation Army, among which are children's asylums, homes for women and girls, lying-in homes, public kitchens, employment bureaus, homes for discharged prisoners, nursing, workmen's colonies, and winter relief; and everywhere the tendency is not to support, but to aid, to call forth all the powers and capacity of the person who is in want and assist him to regain his independence. The principle is held that all help offered must be paid for, so far as possible, in money or work. Noteworthy are the three agricultural colonies established in Colorado, California, and Ohio, on which thirty buildings have been erected, and where about two hundred men and women have been settled, and of whom the greater number have obtained independent homes. . . . A singular enterprise is the sending of poor families, who otherwise could never breathe pure air, to the country. In this division of the army work outings by water or land are provided, and frequently street-car companies furnish free transportation."—E. Münsterberg, *Poor relief in the United States* (*American Journal of Sociology*, March, 1902, pp. 659-663, 683-684).—See also SALVATION ARMY.

1877-1903.—Charity organization societies.—"The movement for charity organization which originated in London in 1868 was introduced into this country about ten years later, being copied directly at a number of independent points. After the trial of a society with similar purposes at Germantown, Pennsylvania, and certain tentative and unsatisfactory experiments in clearing-house registration of relief work in New York and Boston, the first real Charity Organization Society was established in Buffalo, in December, 1877. The Rev. S. H. Gurteen, an English clergyman, who had been active in the London society, was the moving force in the inauguration of this enterprise. Boston, Philadelphia, and New Haven established similar societies in 1878, and Cincinnati, Brooklyn, and Indianapolis followed in 1879. The society in New York was not organized until 1882, when the initiative in the matter was taken by the State Board of Charities, which adopted the following resolutions: 'Whereas, There are in the City of New York a large number of independent societies engaged in teaching and reliev-

ing the poor of the city in their own homes, and *Whereas*, Without some such system it is impossible that much of their effort should not be wasted, and even do harm by encouraging pauperism and imposture, therefore, *Resolved*, That, the Commissioners of New York City are hereby appointed a committee to take such steps as they may deem wise, to inaugurate a system of mutual help and cooperation between such societies.'

... Taking up *seriatim* the objects and methods of the Charity Organization Societies of the United States, it may be seen that the fundamental thought is the cooperation of all charitable agencies of a given locality, and the best coordination of their efforts. In order to secure this, the cooperating societies, as far as practicable, furnish records of the relief-work done by each to the central office, so that accounts may be compared and the overlapping of relief prevented. The Charity Organization Society maintains at this central office an alphabetical list of all cases that have received relief from any reporting agency whatever, or that have been investigated by itself; and this confidential catalogue of cases treated as a treasure-house of facts for the guidance of those engaged in benevolent work. The New York society had in 1907 nearly 100,000 records (not including those withdrawn or destroyed), some of them covering 25 years and containing 40,000 to 50,000 words. While this is the largest consolidated list in the country yet the central office catalogues of Boston, Philadelphia, and many other cities contain a very large number of cases. These are so arranged that any case can be referred to at once, and the person charitably interested in that case can get a reply regarding it from the society by return mail. This clearing-house function of the Charity Organization Society is the first and perhaps most fundamental one, and the one most clearly stated in the name which the societies adopted. . . . The third function of a Charity Organization Society is to find prompt and adequate relief for all that should have it. The society is an animated directory of charities of the locality in which it works. No one is turned away from the office of the society with the statement, 'Your need is none of our business;' for the society makes it its business to see that each need is brought to the attention of the proper agency.

"The fourth function of the Charity Organization Society is to establish relations of personal interest and sympathy between the poor and the well-to-do. This is accomplished through what is technically known as 'friendly visiting,' volunteer visitors being secured who are willing to go to the poor as friends, and not as almsgivers. Preferably each friendly visitor has only one, or at most two, cases, and the relation is made as permanent as possible. There are many instances where for years the same visitor has gone to the same family, and genuine personal attachments have been formed. Visitors should never be almsgivers; for in that case the poor look upon them as persons from whom something is to be gotten, and, on the other hand, if empowered to give relief, the visitor fails to invent methods of rendering the better service that is needed in order to cure poverty. The work of friendly visiting is declared by the most advanced societies to be the heart of the work. The motto 'Not alms but a friend,' first adopted in Boston, has come to be the motto of many of the societies.

... The seventh function of the Charity Organization Society has been enumerated as the prevention of pauperism. This is sought to be

accomplished by all the means employed for the furtherance of the other specific purposes of the society. From the beginning of the charity organization movement, many societies have established undertakings to assail pauperism in its causes: the creche, or day nursery at which working mothers may leave their children during the day; kindergartens in connection with the public schools, cooking schools, sewing schools, trade schools; the encouragement of thrift by different varieties of savings-funds, such as the Penny Provident, which receives deposits of one cent and upward; fuel funds, by means of which summer savings can secure winter delivery of coal at summer prices; these and hundreds of other educative and preventive measures have been inspired and initiated by them. In recent years the Charity Organization Societies have been leaders in municipal and legislative reform, sharing and organizing independent movements for the prevention of tuberculosis and unsanitary housing, for the establishment of municipal lodging houses and the control of charity transportation. The eighth and last function of the Charity Organization Society is the diffusion of knowledge on all subjects connected with the administration of charities and the prevention of dependence."—A. G. Warner, *American charities*, pp. 442-444, 446, 449, 452, 455-456.

1914-1921.—*Mothers' pensions*.—Care of crippled children.—*Rehabilitation of civilian cripples*.—"During 1913, 13 states in the Union passed new or amended old laws on the subject [of mothers' pensions]. By January 1, 1921, 40 of the 48 states had adopted some form of mothers' pension. . . . In all the states, except Colorado and Florida, Minnesota and Wisconsin, the law applies only to mothers. In Florida it applies to a mother or a female relative who is guardian of the child; in Minnesota to a mother, step-mother or grandmother; in Wisconsin the aid is given . . . to a person having custody of the child. In some states it is given to any mother with dependent children. In other states it is confined to a widow. In still others it is given [also] to mothers whose husbands are prisoners. In others it is granted to mothers whose husbands are in state asylums [and so on]. . . . The conditions governing the grant also vary in the different states, as does also the age of the child. [The amount of the grant varies from] an amount sufficient to care properly for the child in Colorado, Hawaii, Maine, Massachusetts to the cost of caring for the child in an institution. . . . The highest amount is given in Arizona and Illinois where \$60 a month may be given. . . . In 1917 there were 11 states who had provided for the care and education of crippled children. . . . In some of the states only indigent children are received, in others all crippled or deformed, and in Nebraska those children who are suffering from diseases from which they are liable to be deformed or crippled. . . . A number of the states, and finally the Federal Government [have undertaken] the rehabilitation of the man and woman disabled in civil life. Seven of these states notice only those injured in industry, or who came under the provisions of the state compensation laws. The rest provide for any handicapped person. . . . Perhaps the law passed by New Jersey is the most liberal and far-visioned. It provides that the board it sets up shall seek to train and qualify every disabled person, whether his disability is due to accident, disease or congenital defect. . . . Maintenance is supplied by the State if

necessary for 20 weeks at not over \$10 per week. The act does not compel any person to take the training. [By the Federal Act of 1920] vocational rehabilitation is contemplated for all persons disabled in any way whatever, whose disability interferes with remunerative occupation. . . . It includes both men and women. . . . The act provides for a subsidy to those states who accept by legislative enactment the dollar for dollar coöperation plan. That is, each state must provide as much money as will come from the Federal government on the basis of population."—J. L. Gillin, *Poverty and dependency*, pp. 377, 378, 434.

1921.—Some factors in poverty.—"Boarding out" of children in Ohio.—"Social agencies do not exist for the purpose of relieving the distress due to the incidence of unemployment. The Montreal Council of Social Agencies, in commenting upon the decision of the Family Welfare Association of its city some months ago to give no more relief from the funds of the society to unemployed men even though they were married men with families, hits the nub of this situation with the statement that much unemployment is not inevitable, 'but would yield to a better organization of industry; and much of the suffering due to the unemployment that is inevitable would yield itself to a better community provision for such misfortune.' John B. Dawson, former general secretary of the Charity Organization Society of Montreal, carries this a step farther. 'I protest,' he says, 'against the idea that is so prevalent in many quarters that the inevitable results of a needless maladjustment in industry should be shuffled off onto the shoulders of the charitable agencies of the community.' The replies from the organizations indicate, however, that unemployment is simply one of the complex causal factors in poverty. This is summed up in the statement of the Associated Charities of Cleveland that 'the one thing we are sure of, regarding the causes of poverty, is that there is not any one cause and that in each family we deal with there is usually such a combination of reasons for their unfortunate plight that it takes considerable study upon our part to get at the root of the difficulty.'

"An analysis of the cases handled by the organizations for a year shows that in their experience sickness was beyond question the predisposing factor in poverty. In Cleveland, 53 per cent of the families cared for by the Associated Charities came to the organization through sickness, death or some physical or mental disability. [See also CLEVELAND: 1917-1921: Public welfare.] In Philadelphia, sickness and various forms of disability are the outstanding factors, with tuberculosis and venereal disease predominant. Although the Charity Organization Society of New York City does not keep account of the number of persons who are affected by the various factors of dependency, a table showing the amount of money spent for relief during the last three fiscal years of the society shows a steady increase in the amount spent on relief for persons whose dependency was immediately due to death, sickness or desertion. In 1918, this was 86 per cent of the total amount spent on relief; in 1919, it was 89 per cent and in 1920 it rose to slightly over 91 per cent. Anna G. Williams, general secretary of the Social Service Bureau of Denver, writes that 'there is no question in our mind that the problem is sickness.' Of 1,007 families handled by the Charity Organization Society of New Orleans sickness is cited as a

contributing cause of distress in 443 cases. Physical disability characterized 1,182 of the 1,706 problems presented to the Social Service Bureau of Houston, Tex., during 1920. A study of the first thousand families under the care of the Associated Charities of Washington shows that some form of illness or old age affected 15 per cent of these families. Some other physical disability, however, affected 616 of the same families, or 61 per cent. In Washington, it was found that tuberculosis was the immediate factor in dependency for 10 per cent of the families under the care of the Associated Charities; in New Orleans, for 192 out of 1,007; in Memphis, for 72 families out of 480 in which there was some physical disability.

"Further analysis of the cases indicates that serious contributing factors in poverty, in addition to sickness, other physical disabilities and unemployment, are desertion and non-support, and widowhood. Trailing these are old age, mental disabilities, marital difficulties and industrial adjustments. Other casual factors given in sporadic instances are moral behavior, intemperance, lack of education and the assimilation of the foreign-born. The work of the Associated Charities of Minneapolis centers about two problems—the non-support and the desertion group, and the illness group. Widowhood, acute illness and desertion are the chief factors for a condition 'below the subsistence level' in the United Charities of Chicago. The Associated Charities of Cleveland lists sixteen primal reasons for application for help, the principal ones of which are widowhood, 40.1 per cent; sickness, 26.5 per cent; desertion and non-support, 14.6 per cent; and mental disorder, 7.5 per cent. Unemployment, sickness and various forms of mental disability, and desertion and non-support were by far the outstanding problems handled by the Philadelphia Society for Organizing Charity. The little stress placed at the present time upon intemperance as a contributing factor in poverty is one of the interesting points brought out by replies to the questionnaire. Stockton Raymond, general secretary of the Family Welfare Society of Boston, states that 'one fact stands out above all others. Intemperance, under prohibition, has been a decreasing factor in the work of the Family Welfare Society.' It has thus been possible for the organization 'to undertake a great amount of constructive and preventive work instead of wasting time in trying to alleviate suffering which could not fail to exist under such an evil as licensed liquor selling.'

"One of the most marked developments among family welfare agencies has been an increase in the amount given for relief. Although the increase in cost prices has played a part in this, fundamentally it seems to be due to a better conception of adequacy in relief giving. The relief given by the Associated Charities of Minneapolis has shown a rising crescendo of \$26,424.19 in 1918, \$41,080.28 in 1919, and \$54,566.13 in 1920. Lawson Purdy states that in New York City 'there had been with us as elsewhere a very great increase in the amount of relief given.' Amelia N. Sears of the United Charities of Chicago writes that the increase in relief given by that organization is a result of the increased cost of living, the establishment of a higher standard of family care and the burden of caring for widows on the waiting list for mothers' pensions and widows receiving inadequate mothers' pensions. This last group cost the society \$100,000 in two years. It is the experience of the Charity Organization Society of New Orleans that their phenom-

enal rise in relief work during the last few years has been the result, not only of increased prices, but of the 'growing opinion that adequate nourishment is apt to prevent sickness, and our society, as well as other relief agencies, has been giving material relief more abundantly and freely than before.' Although the Family Welfare Society of Boston is not primarily a relief agency, Stockton Raymond states that it has been compelled during the last few years to secure large sums for relief, accounted for both by the increase in prices and 'a tendency toward more adequate relief.'—P. L. Benjamin, *Family welfare (Survey, Oct. 15, 1921)*.—See also MUNICIPAL GOVERNMENT: Municipal charities in the United States.

Following an experiment in boarding out made in Hancock County, Ohio passed a law, in September, 1921, "which makes it possible for Counties which have children's homes to abandon them. It also authorizes the county child welfare boards whose duty it shall be to devise other means of caring for the dependent children of the county. This latter section legalizes the repetition of the Hancock county experiment in counties that have no children's homes. For years the State Division of Charities had at intervals suggested that the dependency problem might be solved in some other way than an institutional home in Hancock county [where the children's home had fallen into ruinous condition, was condemned and was ordered to be vacated]. To meet the emergency the boarding out plan was adopted. Boarding out homes were selected by a trained visitor, licensed under the law of 1919, and the children placed in them. The plan was an immediate success. In August, 1920, when the nurse from the Institution Inspection Bureau assisted the local physician in making physical examinations of the children, it was found that 48 per cent were of normal weight. In July following, 72 per cent were of normal weight. The food under the old regime was wholesome and the change in nutrition is due not so much to food as to better living conditions and individual care and attention."—M. I. Atkinson, *Survey, Nov. 19, 1921, p. 278*.

CHARLEMAGNE, or Charles I, the Great (742-814), Roman emperor and king of the Franks. Succeeded his father, Pepin the Short, as king of Neustria, 768; upon his brother Carloman's death, 771, became king of all the Franks (see FRANKS: 768-814); 772, began war against the Saxons which resulted, in 804, in their submission and Christianization (see SAXONS: 772-804); 773, fought the Lombards and in 774 incorporated Lombardy with the kingdom of the Franks (see LOMBARDS: 754-774); 778, led an expedition against the Arabs in Spain, during which Roland was killed and the Frankish rearguard annihilated at Roncesvalles (see SPAIN: 778); 788, subdued Bavaria; 791-796, and again in 804, subdued the Avars (see AVARS: 791-805); December 25, 800, received from Pope Leo III the crown of the Roman empire (see GERMANY: 800); 808-810, repulsed the Danish invaders. He organized his kingdom in margravates, instituted *missi dominici*, increased the ecclesiastical power and was a patron of learning, founding the School of the Palace under Alcuin. See SCHOOL OF THE PALACE; ANNALS: French, German, Italian and Spanish; BARBARIAN INVASIONS: 5th-10th centuries; BELGIUM: Ancient and medieval history; CAPITULARIES; EDUCATION: Medieval: 742-814; EUROPE: Middle Ages: Rise of the Frankish kingdom; GERMANY: 687-800, 768-814; HEERBAN; HISTORY: 20; ITALY: 568-800, 843-951; PAPACY: 755-774; VENICE: 697-810.

CHARLEROI (Carolus Rex), town in Belgium between Namur and Mons, in the province of Hainaut.

1667.—Taken by the French. See BELGIUM: 1667.

1668.—Ceded to France. See NETHERLANDS: 1668.

1679.—Restored to Spain. See NIMEGUEN, PEACE OF (1678-1679).

1693.—Siege and capture by the French. See FRANCE: 1693 (July).

1697.—Restored to Spain. See FRANCE: 1697.

1713.—Ceded to Holland. See UTRECHT: 1712-1714.

1794.—Captured by French.—After the town was taken from Holland in 1794 it was dismantled.

1816-1859.—Fortified by Wellington.—After the fall of Napoleon, Wellington fortified it, but a half century later it was again dismantled.

1914-1918.—During the World War.—The town was taken by the Germans in their initial drive, and was the scene of the first engagement with French troops in Belgium. See WORLD WAR: 1914: I: Western front; i; 1916: German rule in northern France and Belgium: b; Miscellaneous auxiliary services: X; Alleged atrocities and violations of international law: a, 5.

CHARLES I, the Great. See CHARLEMAGNE.

Charles II, the Bald (823-877), Roman emperor and king of the West Franks; invaded Italy and was crowned emperor. During his reign France, including Paris, was ravaged by the Normans.—See also ALSACE-LORRAINE: 842-1477; FRANCE: 843, 861; FRANKS: 768-814; PARIS: 857-861.

Charles III, the Fat (832-888), Roman emperor and king of the West Franks; deposed after his humiliating treaty with the Normans who had

besieged Paris. See FRANCE: 877-987; FRANKS: 768-814; GERMANY: 814-843; ITALY: 843-951; PAPAS: 885-886.

Charles IV (1316-1378), Roman emperor and king of Bohemia; elected German king in 1347; issued the *Golden Bull* in 1356 to regulate the election of the king. See AUSTRIA: 1330-1364; BOHEMIA: 1310-1410; GERMANY: 1347-1493.

Charles V (1500-1558), Roman emperor, German king, 1510-1558; duke of Burgundy, 1506-1555; and (as Charles I) king of Spain and of the Sicilies, 1516-1556. In spite of internal dissensions, the enmity of France and England, and the pressure of the Turks in the East, he consolidated and even added to his vast domain; but worn with his too active life, and especially with his bitter struggle against Protestantism, he resigned his powers and spent the last two years of his life in retirement. See also AUSTRIA: 1496-1526; 1510-1555; BARBARY STATES: 1516-1535; 1541; EUROPE: Renaissance and Reformation: Political situation in Luther's time; FRANCE: 1520-1523; 1525-1526; 1532-1547; GERMANY: 1517-1523; 1510; 1520-1521; 1546-1552; 1552-1561; GHEENT: 1530-1540; ITALY: 1523-1527; 1527-1520; NETHERLANDS: 1494-1519; 1521-1555; 1547; 1555; PAPACY: 1530-1531; SPAIN: 1518-1522.

Charles VI (1685-1740), Roman emperor; issued his Pragmatic Sanction in 1713, to secure the throne for his daughter, Maria Theresa. See AUSTRIA: 1711; 1718-1738.

Charles VII (1697-1745), Roman emperor, and (as Charles Albert) elector of Bavaria and king of Bohemia; opposed Maria Theresa in the War of the Spanish Succession. See AUSTRIA: 1743.

Charles I (1887-1922), emperor of Austria-Hungary, king of Hungary, 1916-1918; succeeded his great-uncle, Emperor Francis Joseph; was the nephew of Archduke Francis Ferdinand, heir to the throne, whose murder at Serajevo on June 28, 1914, contributed toward the outbreak of the World War; abdicated when the Austro-Hungarian empire began to disintegrate toward the close of 1918. In April, 1921, he made an unsuccessful attempt to regain the throne of Hungary, but was forced to return to exile in Switzerland. He made another attempt, this time with an army of monarchist troops, in October, 1921. He was defeated in two engagements by loyal troops under Admiral Horthy. Charles and Queen Zita were both taken prisoner on October 24, and banished to Madeira, where Charles died on April 1, 1922.—See also AUSTRIA-HUNGARY: 1916-1917; 1918; HUNGARY: 1920-1921; WORLD WAR: 1917: XI. Efforts toward peace: j; XII. Political conditions in the belligerent countries: g.

Charles I (1600-1640), king of Great Britain and Ireland; governed without Parliament from 1629 to 1640. His religious policies caused a rebellion in Scotland which forced him to summon Parliament; this Parliament proceeded to abrogate Charles' whole system of government and the king in retaliation tried to arrest five members; civil war resulted and in 1640 he was tried for treason and executed.—See also ENGLAND: 1625-1628; 1629-1640; 1642 (January-August); 1643 (June-September); 1645 (June-December); 1646-1647; 1647 (April-August); 1647 (August-December); 1640 (January); PRESBYTERIAN CHURCHES: 1557-1646; SCOTLAND: 1644-1645.

Charles II (1630-1685), king of Great Britain and Ireland; commanded the Royalist forces during the civil war and made several attempts to regain the throne; proclaimed king upon the death of Cromwell. See ENGLAND: 1658-1660, 1661; 1662;

1668; 1670; 1681-1683; IRELAND: 1660-1665; MILITARY ORGANIZATION: 31; SCOTLAND: 1650 (March-July); 1651 (August); 1660-1666; VIRGINIA: 1650-1660.

Charles I, king of France. See CHARLES II, Roman emperor.

Charles II, king of France. See CHARLES III, Roman emperor.

CHARLES EDWARD, the Young Pretender (1720-1788), English prince of the house of Stuart, attempted an invasion of England with the aid of Scotland. See SCOTLAND: 1745-1746.

CHARLES EMMANUEL I (1562-1630), duke of Savoy, 1580-1630. See GENEVA: 1602-1603; FRANCE: 1599-1610.

Charles Emmanuel II (d. 1675), duke of Savoy, 1638-1675.

Charles Emmanuel III (1701-1773), duke of Savoy and king of Sardinia, 1730-1773.

Charles Emmanuel IV (d. 1819), duke of Savoy and king of Sardinia, 1796-1802.

CHARLES FELIX (d. 1831), duke of Savoy and king of Sardinia, 1821-1831. See ITALY: 1820-1821.

CHARLES MARTEL (c. 688-741), Frankish ruler; established order in Gaul, checked the Arab invasions of Europe and subdued the Germanic tribes. See CALIPHATE: 715-732; EUROPE: Middle Ages: Rise of the Frankish kingdom; FRANKS: 511-572; GAUL: 5th-8th centuries; GERMANY: 481-768.

CHARLES OF BOURBON. See CHARLES III, king of Spain.

CHARLES WILLIAM FERDINAND, Duke of Brunswick. See BRUNSWICK, CHARLES WILLIAM FERDINAND, duke of.

CHARLESTON, the largest city and chief com-

mercial center of South Carolina, a south Atlantic seaport, situated between the Ashley and Cooper rivers. Its estimated population in 1920 was 67,957.

1680.—Founding of the city. See SOUTH CAROLINA: 1670-1696; NORTH CAROLINA: 1663-1670.

1706.—Unsuccessful attack by the French. See SOUTH CAROLINA: 1700-1706.

1772-1776.—Revolutionary proceedings. See SOUTH CAROLINA: 1775 and 1776; U. S. A.: 1772-1773.

1776.—Sir Henry Clinton's attack and repulse. See U. S. A.: 1776 (June): British repulsed at Charleston.

1780.—Siege by the British.—Surrender of the city. See SOUTH CAROLINA: 1670-1783; U. S. A.: 1780 (February-August); 1780-1781.

1860.—Splitting of the National Democratic convention. See U. S. A.: 1860 (April-November).

1860.—Adoption of the Ordinance of Secession. See U. S. A.: 1860 (November-December).

1860.—Major Anderson at Fort Sumter. See U. S. A.: 1860 (December): Major Anderson at Fort Sumter.

1861 (April).—Beginning of war.—Bombardment of Fort Sumter. See U. S. A.: 1861 (March-April).

1863 (April).—Attack and repulse of the Monitor fleet. See U. S. A.: 1863 (April: South Carolina).

1863 (July).—Union troops on Morris island. See U. S. A.: 1863 (July: South Carolina).

1863 (August-December).—Bombardment. See U. S. A.: 1863 (August-December: South Carolina).

1865 (February).—Evacuation by the Confederates.—Federal Occupation. See U. S. A.: 1865 (February: South Carolina); 1865 (February-March: The Carolinas).

1886.—Earthquake.—A severe earthquake, Aug. 31, 1886, destroyed much of the city and many lives. See SOUTH CAROLINA: 1886-1911.

1901.—South Carolina and Interstate and West Indian Exposition.—Under this name, a very beautiful and successful exhibit of the progress of Southern industry and art, and of the possibilities of West Indian and Spanish-American trade, was opened at Charleston, S. C., on December 1, 1901. The site of the exposition was a tract of one hundred and sixty acres of ground, only two and a half miles from the business section of the city, embracing the famous old Lowndes estate, with its historic mansion which the owner permitted to be used as the Women's Building of the occasion. Fine taste and a high public spirit entered into the making of this very interesting fair.

CHARLESTOWN, originally a city of Middlesex county, Massachusetts; incorporated with Boston in 1874.

1623.—First settlement. See MASSACHUSETTS: 1620-1630.

1775.—Battle of. See U. S. A.: 1775: (April-May).

CHARLEVILLE, a city 150 miles northeast of Paris on the Meuse opposite Mézières; on the final allied line, November 11, 1918.

CHARLOTTE (Marie Charlotte Amélie Auguste Victoire Clémentine Leopoldine) (b. 1840), empress of Mexico; married Maximilian, archduke of Austria, 1857; accompanied him to Mexico on his acceptance of the imperial crown, 1864; was sent to Napoleon III and Pius IX to secure assistance against the republicans, 1866; failing in her mission, became hopelessly insane and was confined after 1879 near Brussels.

CHARLOTTE (1896-), grand-duchess of Luxemburg, succeeded on the abdication of her sister Marie-Adelaide, 1919. See LUXEMBURG: 1919-1921.

CHARLOTTESVILLE, small city of north-western Virginia occupied by Federal troops in 1865, during the Civil War. See U. S. A.: 1865 (February-March: Virginia).

CHARMIS, Roman physician. See MEDICAL SCIENCE: Ancient: 1st century.

CHARNISE, Charles de Menou, Seigneur D'Aulnay (c. 1605-1650), French proprietor in Acadia. See NOVA SCOTIA: 1621-1668.

CHAROON, Prince, Siamese representative at the Peace Conference. See VERSAILLES, TREATY OF: Conditions of peace.

CHARPENTIER, Gustave (1860-), French opera composer. See MUSIC: Modern: 1830-1921.

CHARRUA, South American Indian tribe. See URUGUAY: Aborigines.

CHARTER OAK, of Hartford in which Connecticut's charter was hidden in 1687. See CONNECTICUT: 1685-1687.

CHARTER OF PRIVILEGES, granted by William Penn to the settlers of Pennsylvania in 1701. See PENNSYLVANIA: 1701-1718.

CHARTER SCHOOLS, Ireland. See EDUCATION: Modern: 18th century: Ireland.

CHARTERHOUSE, or *Chartreuse*, a famous building of London, formerly a Carthusian monastery. See CARTHUSIAN ORDER.

CHARTISTS, **CHARTISM**, movement for political reform in England. See ENGLAND: 1838-1842; 1848; also BIRMINGHAM: 1839.

CHARTRES, French city fifty-five miles southwest of Paris. Was the scene of conflict in medieval wars; on October 21, 1870, was taken by the Germans, who used it as a base of operations.

CHARTREUSE, La Grande, mother house of the Carthusians in Isère, France. See CARTHUSIAN ORDER.

CHASAURI, ancient tribe. See DULGIBINI AND CHASAURI.

CHASE, Salmon Portland (1808-1873), American jurist. United States senator, 1840-1855, 1861; governor of Ohio, 1856-1860; secretary of the treasury, 1861-1864; chief justice of the United States Supreme Court, 1864-1873. See LEGAL TENDER CASES; MONEY AND BANKING: Modern: 1861-1864; SUPREME COURT: 1866-1873; 1867-1884; U. S. A.: 1864 (May-November); 1865 (May-July); 1869-1872.

CHASE, Samuel (1741-1811), American jurist; signer of the Declaration of Independence; associate justice of the United States Supreme Court, 1706-1811; impeached in 1804 and acquitted the following year. See U. S. A.: 1774 (September); 1776 (July): Text of Declaration of Independence; 1804-1805.

CHASIDIM, or Chasidees, or Assideans, a name, signifying the godly or pious, assumed by a party among the Jews, in the second century B. C., who resisted the Grecianizing tendencies of the time under the influence of the Græco-Syrian domination, and who were the nucleus of the Maccabean revolt. The later school of the Pharisees is represented by Ewald (*History of Israel*, bk. 5, sect. 2) to have been the product of a narrowing transformation of the school of the Chasidim; while the Essenes, in his view, were a purer residue of the Chasidim "who strove after piety, yet would not join the Pharisees"; who abandoned "society as worldly and incurably corrupt," and in whom "the conscience of the nation, as it were, withdrew into the wilderness."—A modern sect, borrowing the name, founded by Israel Baal

Schem, who first appeared in Podolia, in 1740, is said to embrace most of the Jews in Galicia, Hungary, Southern Russia, and Wallachia.—H. C. Adams, *History of the Jews*, p. 333.

ALSO IN: H. Graetz, *History of the Jews*, v. 5, ch. 9.

CHASTELER, Jean Gabriel Joseph Albert, Marquis du (1763-1825), Austrian general against the French. See GERMANY: 1809-1810 (April-February).

CHASUARI, Germanic tribe. See FRANKS: Origin, etc.

CHATALJA, a village some twenty miles west of Constantinople. It gives its name to the main line of defense of that city, a position of great natural strength and elaborately fortified from sea to sea across the peninsula. Here the Turks made their final stand in 1912 in the first Balkan War. In 1920 it was made the boundary of Turkey in Europe. See BALKAN STATES: 1912-1913; SÈVRES, TREATY OF: 1920: Part II.

CHATEAU GAILLARD.—This was the name given to a famous castle, built by Richard Cœur de Lion in Normandy, and designed to be the key to the defenses of that important duchy. "As a monument of warlike skill, his 'Saucy Castle,' Château Gaillard, stands first among the fortresses of the Middle Ages. Richard fixed its site where the Seine bends suddenly at Gaillon in a great semicircle to the north, and where the Valley of Les Andelys breaks the line of the chalk cliffs along its bank. The castle formed part of an intrenched camp which Richard designed to cover his Norman capital. . . . The easy reduction of Normandy on the fall of Château Gaillard at a later time [when it was taken by Philip Augustus, of France] proved Richard's foresight."—J. R. Green, *Short history of the English people*, ch. 2, sect. 9.

CHATEAUBRIAND, François René, Vicomte de (1768-1848), French statesman and author. Served in the army before and during the Revolution; later emigrated to England; published his celebrated "Essai historique, politique et moral sur les révolutions anciennes et modernes, etc.," in 1797; in France in 1800; turned from Atheism to the Roman Catholic Church of which he became a redoubtable champion; had visited America in 1791-1792; was ambassador in London in 1822. See FRENCH LITERATURE: 1789-1820.

CHATEAU-THIERRY, a city on the Marne, France, fifty-eight miles east of Paris. In 1918, the Americans halted the on-rushing Germans at this point in their last offensive of the World War, and from here started the offensive on July 18 which led to final Allied victory. See WORLD WAR: 1918: II. Western front: a, 4; d, 19; g, 2; g, 4, i; g, 6.

CHATHAM, John Pitt (1756-1835), British military commander, son of William Pitt, 1st earl of Chatham. See ENGLAND: 1809 (July-December).

CHATHAM, William Pitt, 1st earl of (1708-1778), English statesman; entered Parliament in 1735; secretary of state, 1756-1757; assumed full control of foreign and military affairs during the Seven Years' War; prime minister, 1766-1768; vigorously opposed the policy of the government toward the American colonists. See ENGLAND: 1745; 1757-1760; 1760-1763; 1765-1768; 1770; U. S. A.: 1766; Repeal of Stamp Act; 1775 (January-March).

CHATILLON, Battles of. See FRANCE: 1793 (July-December).

CHATILLON-SUR-SEINE, Congress of. See FRANCE: 1814 (January-March).

CHATTANOOGA, city and county seat of Hamilton county, Tennessee, on the Tennessee river, strategic point in the Civil War.

Name. See U. S. A.: 1863 (August-September: TENNESSEE).

1862.—Secured by the Confederates. See U. S. A.: 1862 (June-October: Tennessee-Kentucky).

1863 (August).—Evacuation by the Confederates. See U. S. A.: 1863 (August-September: Tennessee).

1863 (October-November).—Siege.—Battle on Lookout mountain.—Assault of Missionary Ridge.—Routing of Bragg's army. See U. S. A.: 1863 (October-November: Tennessee).

1907.—Retains charter and evades prohibition law. See TENNESSEE: 1887-1908.

CHATTERTON'S HILL, Battle of. See U. S. A.: 1776 (September-November).

CHATTI, or **Catti**.—"Beyond [the Mattiac] are the Chatti, whose settlements begin at the Hercynian forest, where the country is not so open and marshy as in the other cantons into which Germany stretches. They are found where there are hills, and with them grow less frequent, for the Hercynian forest keeps close till it has seen the last of its native Chatti. Hardy frames, close-knit limbs, fierce countenances, and a peculiarly vigorous courage, mark the tribe. For Germans, they have much intelligence and sagacity. . . . Other tribes you see going to battle, the Chatti to a campaign."—"The settlements of the Chatti, one of the chief German tribes, apparently coincide with portions of Westphalia, Nassau, Hesse-Darmstadt and Hesse-Cassel. Dr. Latham assumes the Chatti of Tacitus to be the Suevi of Cæsar. The fact that the name Chatti does not occur in Cæsar renders this hypothesis by no means improbable."—Tacitus, *Germany*, trans. by Church and Brodrigg, and note.—See also ALĒMANNI or ALAMANNI: 213; SUEVI.

CHAUCER, Geoffrey (c. 1340-1400), English poet. By 1368 he had become one of the king's squires; throughout his life served in a number of official capacities; frequently sent on commissions to Italy and France; first important poet to use the English language as his medium and is looked upon as the "father of English literature"; best-known work is the "Canterbury Tales"; other poems include "Troilus and Cryseyde", "The House of Fame", "Boke of the Duchesse", "Assembly of Fowles", "Legende of Good Women"; and numerous minor poems and translations.—See also ENGLAND: 1350-1400; ENGLISH LITERATURE: 14th century.

CHAUCI, **CHERUSCI**.—"The tribe of the Chauci . . . beginning at the Frisian settlements and occupying a part of the coast, stretches along the frontier of all the tribes which I have enumerated, till it reaches with a bend as far as the Chatti. This vast extent of country is not merely possessed but densely peopled by the Chauci, the noblest of the German races, a nation who would maintain their greatness by righteous dealing. Without ambition, without lawless violence, . . . the crowning proof of their valour and their strength is, that they keep up their superiority without harm to others. . . . Dwelling on one side of the Chauci and Chatti, the Cherusci long cherished, unassailed, an excessive and enervating love of peace. This was more pleasant than safe, . . . and so the Cherusci, ever reputed good and just, are now called cowards and fools, while in the case of the victorious Chatti success has been identified with prudence. The downfall of the Cherusci brought with it also

that of the Fosi, a neighbouring tribe."—"The settlements of the Chauci . . . must have included almost the entire country between the Ems and the Weser—that is, Oldenburg and part of Hanover—and have taken in portions of Westphalia about Munster and Paderborn. The Cherusci . . . appear to have occupied Brunsvick and the south part of Hanover. Arminius who destroyed the Roman army under Varus, was a Cheruscan chief. . . . The Fosi . . . must have occupied part of Hanover."—Tacitus, *Minor Works*, trans. by Church and Brodrigg: *Germany, with geographical notes*.—Bishop Stubbs conjectures that the Chauci, Cherusci and some other tribes may have been afterwards comprehended under the general name "Saxon." See SAXONS.

CHAUDFONTAINE, one of the forts around Liège, Belgium, captured by Germans in August, 1914. See WORLD WAR: 1914: I. Western front: b.

CHAULIAC, Guy de (fl. 1348), French surgeon. See MEDICAL SCIENCE: Ancient: 10th century.

CHAUMETTE, Pierre Gaspard (1763-1794), French revolutionist; elected president of the Commune in 1792; guillotined in 1794. See FRANCE: 1793 (November); 1793-1794 (November-June).

CHAUMONT, a town in eastern France, department of Haute-Marne; used, 1917-1919, by General Pershing as general headquarters of the American Expeditionary Forces.

CHAUMONT, Treaty of (1814), an agreement concluded at Chaumont, eastern France, by Great Britain, Austria, Russia and Prussia. They severally bound themselves not to make a separate peace with Napoleon, and to continue fighting until France should be reduced to her boundaries of 1792. See FRANCE: 1814 (January-March).

CHAUMONT-EN-VEXIN, a small town in France about sixty miles north of Paris. There the American First Division detrained when called to the Montdidier sector by the great German advance of the spring of 1918.

CHAUNCEY, Isaac (1772-1840), American naval officer; during the War of 1812 he had command on the Great Lakes, participating in the capture of York (now Toronto) and Fort George. See U. S. A.: 1813 (April-July).

CHAUNY, a town about twenty miles south of St. Quentin, north-eastern France. Was the scene of much fighting in the Hundred Years' War; in the World War it also changed hands several times. See WORLD WAR: Miscellaneous auxiliary services: XI. Devastation: c; 1918: II. Western front: c. 17; d; b, 2.

CHAUTAUQUA, name adopted from a lake and county in southwestern New York and applied to a system of popular education. See EDUCATION: Modern developments: 20th century: Chautauqua.

CHAUVEL, Sir Henry George (1865-), British lieutenant-general who commanded the Desert Mounted Corps, Egyptian Expeditionary Force, in the World War. See WORLD WAR: 1916: VI. Turkish theater: b, 2, iii; b, 2, iv; 1917: VI. Turkish theater: c, 1, ii; c, 1, iii.

CHAUVINISM, "originally a French term (*chauvinisme*), derived from Nicholas Chauvin, a soldier in the army of Napoleon, who was ridiculed by his comrades for his demonstrative and unreasoning patriotism. After the fall of Napoleon the term '*chauvinisme*' was applied in ridicule to the old soldiers who still professed an idolatrous admiration for the emperor. In Cognard's play, '*La cocarde tricolore*' (1831), one of the characters, *Chauvin*, exaggerated the character of the

original Chauvin; and from this time the term chauvinisme came to be commonly applied to any one exhibiting a blind and unreasoning patriotism or an excessive enthusiasm for national ascendancy. The English equivalent of the word is 'jingoism.' But the French term '*chauvinisme*' has been anglicized into '*chauvinism*,' and it now has a somewhat broader meaning than 'jingoism.' It is sometimes applied to one who exhibits an unreasoning loyalty to any cause or any leader."—*War Cyclopaedia*, p. 54.

CHAVEZ-DARTNELL, Jorge (d. 1910), Peruvian aviator who made a trans-Alpine flight in 1910. See AVIATION: Important flights since 1900: 1910.

CHAZAN, officer in the Jewish synagogue. See BIBLE, ENGLISH: Sources.

CHAZARS. See KHAZARS.

CHEAT SUMMIT, Battle of. See U. S. A.: 1861 (August-December: WEST VIRGINIA).

CHEBUCTO, original name of the harbor of Halifax.

CHEIROTONIA, a vote by show of hands, among the ancient Greeks.

CHEKHOV, Anton Pavlovich (1860-1904), Russian novelist and master of the short story. See RUSSIAN LITERATURE: 1883-1905.

CHELLEAN MAN. See EUROPE: Prehistoric period: Earliest remains, and Stone Age.

CHELMSFORD, Frederic Thesiger, 1st baron (1704-1878), lord chancellor of England.

CHELMSFORD, Frederic Augustus, 2d baron (1827-1905), English general, fought in Zulu War, 1879.

CHELMSFORD, Frederic John Napier Thesiger, 3d baron (1868-), governor of Queensland, 1905-1909; governor of New South Wales 1909-1913; viceroy of India 1916-1920.

CHEMI, ancient name for Egypt. See EGYPT: Names.

CHEMIN DES DAMES, a road along a crest of hills overlooking the valley of the Ailette river in northern France. Here the Germans retained a foothold after the battle of the Aisne. The French offensive north of Rheims in the summer of 1917 included attacks on the town of Craonne and the Chemin des Dames. The French success at the Chemin des Dames in June furnished some of the most desperate fighting of the war. The German counter attacks against the ridge in July rivaled their attacks at Verdun. The capture of this position by the Germans May 27, 1918, was the last conspicuous success in their last great offensive.—See also WORLD WAR: 1914: I. Western front: s, 1; s, 2; s, 3; s, 5; 1917: II. Western front: b, 1; b, 2, iv; c, 16; 1918: II. Western front: a, 3; f, 1; g, 1; g, 6.

CHEMISTRY

Definition.—Use.—Chemistry is the science that treats of the various substances that are capable of existence, of their composition and their relations to one another, and of the transformations they undergo.—"It studies the different kinds of substances found in the world, whether in the living animal and vegetable organisms, or in the non-living mineral matter of the universe. Chemistry investigates the composition of these substances, the methods of their preparation and their behaviour not only in relation to what are called physical forces but also in relation to other substances; and it endeavours to 'manipulate' the different substances so as to obtain from them new materials, either useful or ornamental. Through a knowledge of chemistry one may learn how to prepare, artificially, substances which are normally the products of the vital activity of animal and vegetable organisms, or how to prepare substitutes for these naturally occurring substances. Chemistry, further, occupies itself with the question of how things already manufactured, can be manufactured more economically, or be replaced by more suitable materials; and it helps us to understand how the natural and, it may be, irreplaceable resources of the world, can be economised. On the science of chemistry, indeed, more than on any other branch of organised knowledge, depend the material well-being and comfort of man."—A. Findlay, *Chemistry in the service of man*, pp. 1-2.

GENERAL

Origin of the science and its name.—"There are various indications that some knowledge of the practical applications of chemistry existed long before the era of Western civilization. The Chinese, for instance, possessed means of manufacturing articles which in some cases cannot be made with the same degree of elegance at the present day; this implies a considerable acquaintance with some sort of technical chemistry. At a less indefinite date, which is still too remote to be fixed with any certainty, we find the Phœnicians and Egyp-

tians well acquainted with the manufacture of glass and pottery; some of the simpler metallurgical processes were already practised, including the mechanical separation of gold, the smelting of iron, the preparation of mercury from cinnabar, and the separation of lead and silver. The arts of dyeing and embalming were also largely engaged in by the Egyptians. The Jews, too, in the reign of Solomon (and probably for some time prior to that period) recognized at least six distinct metals: gold, silver, iron, copper, tin and lead. Metallurgy at this early date was carried on chiefly in the northern part of Egypt; deposits of ores were fairly abundant in that region, and, in addition, the seaport of Alexandria afforded means for the import of ores from the various lands washed by the Mediterranean. . . . It is convenient to summarize at this point the chemical knowledge of the ancients:

"(1) *Practical.*—In China and India (?), in Phœnicia and Egypt: metallurgy, dyeing, glass, earthenware.

"(2) *Theoretical.*—In Greece (500-200 B. C.) and Rome (100 B. C.-A. D. 150); vague, general observations on nature.

"(3) *Experimental* (according to the modern meaning of the word).—Practically none.

"With regard to the origin of the word 'chemistry,' there is a choice of about six very plausible 'derivations,' such as from the North Egyptian word 'chemi' = Egypt: from *χημεία* = Egyptian art; from *χημεία* = black, etc. As these cannot all be correct, let us be content merely to say that the first use of the word 'chemia' appears in an astrological treatise compiled by Julius Firmicus, a writer of the fourth century of the Christian era."—T. P. Hilditch, *Concise history of chemistry*, pp. 3, 5, 6.—See also SCIENCE: Ancient: Arabian; also MEDICAL SCIENCE: Ancient: 7th-11th centuries: Medical Art of the Arabs.

Alchemists.—Roger Bacon.—However, to find the real beginnings of the science of chemistry, we must revert back to the art of alchemy, "com-

monly supposed to be occupied with the search for the philosopher's stone and the elixir of life [but which] was in reality the rudimentary stage of the science of chemistry. The most ancient alchemists, Turanian, Chaldean, or Egyptians, exercised their skill in practical operations. They studied the metallurgy of the metals known to them, practised the arts of preparing drugs (and perhaps poisons), of making, tinting and working glass, of dyeing, painting and staining fabrics, and of making soap, and developed the use of antiseptics and the hydrocarbon industries. The quackery and mysticism which discredited alchemy in its later periods were merely accidental accretions, the product of an ignorant and superstitious age—often, indeed the result of inability to read and understand the ancient manuscripts. The early alchemists, groping in the dark, making many mistakes and following many blind alleys, discovered principles and processes, which have been handed down to modern chemists, and form part of the heritage of modern chemistry. No student of the history of the science can afford to overlook the debt which chemistry owes to these men, who may be said to have laid its foundations, and who were the first to grasp the conception that beneath its varied and complex phenomena lay certain elementary principles, which might be discovered by patient research."—J. C. Brown, *History of chemistry*, pp. 25-26.—If we but reflect a bit upon the alchemist's conception of the philosopher's stone, "and consider the philosophy and aims of the alchemists, we perceive how foolish it would be to attempt to sum them up in a single epithet. The men belonged to distinct classes. There were mystical or religious alchemists who made use of terms of art merely as parables, and alchemical processes as allegories. Their real subject was the human soul; their true object the guidance of mankind to salvation. But these were few. There were philosophical alchemists, steeped in the doctrines of Aristotle, who sought by the transmutation of base metals into gold to prove their great thesis—the unity of all things. There were scientific alchemists, whose desire was to discover the properties and combinations of metals, and the best methods for their manipulation. And there were mercenary alchemists, who hoped to find in the philosopher's stone the key to a store of unlimited riches. Unless we keep these distinct classes in mind, and differentiate clearly between them, we shall never understand all that is implied in the title 'alchemist.'"—*Ibid.*, pp. 190-191.—See also **ALCHEMY**.

"Roger Bacon (1214-1284) . . . denied the theory of transmutation of metals, although he is alleged to have said that with a certain amount of the philosopher's stone he could transmute a million times as much base metal into gold. To save his life, however, he had to recant his opinions. Having picked up some information from the Arabs during his travels in the East, he described in an obscure way the composition of gunpowder, which was first used in war by the English in 1327, forty years after his death. That air is the food of fire he proved by placing a lighted lamp in a closed vessel, showing that under these conditions the flame was extinguished. . . . What gives Bacon supreme importance in the history of his times is the fact that he was no mere schoolman with his mind cramped and fettered by logical quibbles and the tales of deductive philosophy, but a thinker of the modern type with a wonderfully just and clear conception of the principles of science. In his experimental method we see the beginnings of the inductive philosophy associated

with his greater namesake, Francis Bacon, which is the only foundation upon which the natural sciences can be built. In his own day he was overshadowed by more popular names, but his reputation as a scientist is now receiving more adequate recognition."—*Ibid.*, pp. 96-97.—See also **SCIENCE: Middle Ages and the Renaissance**.—While it is quite obvious that the alchemists were working along mistaken lines, we must however, credit them with having obtained a considerable knowledge of those metals and substances which they used. Besides, through them, we have handed down such chemical apparatus as was at their disposal combined with their skill in its manipulation. This, then, formed the basic foundation upon which the science of modern chemistry was to grow up and expand into its many fields of research.

Iatro- or medical chemistry.—"While the philosopher's mind was fixed on one theme—gold manufacture—his experiments were naturally concerned only with metallic derivatives, so that few of the new facts discovered related to any but this class of compounds. When the Renaissance of learning and the Reformation led to a wider intellectual outlook the scope of chemists' views also appeared to broaden, and a larger field of use for chemistry was opened up. . . . Basil Valentine and a few other workers of the first alchemical period here and there applied isolated metallic preparations as medicinal remedies, but Paracelsus (sixteenth century) was the first to emphasize the close interdependence and alliance of chemistry and medicine. He assumed that the three 'principles,' sulphur, salt, and mercury, which were held to constitute the different metals, also composed the human body, and that illness was the result of deficiency or excess of one or more of these in the organism. [See also **MEDICAL SCIENCE: Medieval: 16th century: Paracelsus**]. . . . The 'medicine of the third order,' the Philosopher's Stone, which should bring perfection to weak and erring metals, was naturally supposed to perform the same function for mortals, endowing them with an indefinite span of life and resistance to all physical decay. This fusion of medicine and chemistry was of advantage to both, but particularly to the latter, which then attracted men of wider culture than previously; it led to the discovery, too, of further new facts and compounds, especially in the domain of what is now 'organic' chemistry, and unintentionally paved the way for the emancipation of chemistry from a gold-making art to a truth-seeking science. . . . One of the first to apply the 'inductive' method to chemistry was Roger Bacon (thirteenth century); then, towards the end of the seventeenth century, the necessity of putting aside the subsidiary aims which chemistry might serve seems to have been more widely felt, and the efforts of chemists were directed along new lines, notably by the work of Boyle and Kunkel."—T. P. Hilditch, *Concise history of chemistry*, pp. 9-11.

Phlogiston period.—Theory of combustion.—Work of Boyle.—Experiments of Black, Priestley, Cavendish and Scheele in field of pneumatic chemistry.—"Of the four 'Aristotelian elements' it may be said that, while chemists always have been and will be concerned with the constituents of earth, the nature of fire, air, and water was practically cleared up in the course of a century, or, more precisely, during the phlogistic period. . . . It is easy to see why 'fire' was given a position

equal to the other three elements, for while the gaseous, liquid, and solid states could be represented fundamentally by air, water, and earth, the equally patent state of 'flame' was supposed to be the manifestation of the principle of 'fire.' The earlier alchemists did not turn their attention very seriously to the problem of combustion, but in the iatro-chemical era, Sylvius (*circa* 1650) suggested that sulphur (the alchemical 'principle') was the principle of fire, and also drew attention to the analogy between burning and breathing. This suggestion was accepted by other alchemists, such as Homberg and Kunkel; Boyle, who, to use the title of one of his works, was more of a 'sceptical chymist,' regarded it as possible, but not proved, and preferred merely to call the fire principle a 'combustible earth.' In the meantime Mayow (1668-9) showed that there was a substance in air which took part both in the calcination of metals and in respiration, but did not seemingly pursue the subject far enough to give a complete explanation. . . . Unfortunately, as has frequently happened, preconceived assumption met with more notice than precise observation (due in this case to Mayow), and Stahl, one of Becher's pupils, elaborated Becher's idea into the famous phlogiston theory. Stahl assumed that all combustible or calcinable matter contained a substance 'phlogiston' which was evolved during the process of burning; the more readily and completely combustible the substance, then, the greater was the amount of phlogiston it contained. Coal was supposed to be particularly rich in phlogiston, for on heating it is almost entirely burnt away, while by heating it with many metal oxides the metal is reformed. On the other hand, the metals, etc., were supposed to be the products of union of phlogiston with the metal calces. . . . When a calx or sulphuric or phosphoric acid is heated with matter rich in phlogiston (coal), the metal or sulphur or phosphorus is 'revived.' This idea is a direct inversion, so to speak, of our modern view of combustion, for we hold that addition of oxygen takes place in combustion, and elimination of oxygen in reduction. In order to make the relation of phlogistic to modern views quite clear, we may add that: Elimination of phlogiston = oxidation (combustion). Addition of phlogiston = reduction (elimination of oxygen). Stahl suggested that a similar explanation, based on phlogiston, could be found for respiration, which would thus consist of an exhalation of phlogiston. This theory gave a concise explanation of a large number of miscellaneous facts, and it was exceedingly simple. Unfortunately, it was also hopelessly impossible; the 'elimination of phlogiston' was invariably accompanied by gain in weight, and conversely."—T. P. Hilditch, *Concise history of chemistry*, pp. 14-16.—The creative genius of the 17th century was Robert Boyle (1627-1601), who shook off the trammels of Aristotle and Paracelsus and opened a new era in the field of chemistry. One of Boyle's most important contributions to science lies in his proclamation that chemistry be studied for its own sake, and not because it may possibly be of aid to the alchemist or the physician. Due to his work in determining the composition of substances, Boyle has frequently been regarded as the father of analytical chemistry. While he knew that metals gained weight upon being heated in air, he could not explain the cause, and therefore remained a staunch phlogistonist. "Pure substances, as Boyle pointed out, can be divided into two classes. In the one class are those which have, so far, resisted all attempts to decompose them, or to break them down into substances simpler than

themselves. These substances, according to Boyle, are the true *elements*, and this definition of an element is still retained. The definition, it should be noted, does not postulate the impossibility of decomposition, but insists merely on the fact that the possibility, if it exists, has not so far been realized. In the second class of pure substances are placed those which, by one means or another, can be resolved into simpler substances. These more complex substances are called *compounds*. Thus, for example, if we heat in a glass tube the red substance known as red precipitate or oxide of mercury, we find that a gas is given off which has the property that it will cause a glowing splint of wood to re-ignite; and, at the same time, metallic mercury is deposited in shining droplets on the cooler portions of the tube. We have thus decomposed the red substance into metallic mercury and a gaseous substance, to which the name of oxygen has been given. This red substance, therefore, is a compound, a compound of mercury and oxygen. In spite of most laborious and prolonged efforts, chemists have not succeeded in reducing the number of the elements to less than about eighty. Of these eighty odd elements . . . all the substances in the known universe are built up."—A. Findlay, *Chemistry in the service of man*, pp. 5-6.—"That the phlogistic theory was in no wise a worthless attempt at an explanation of combustion is proved by the number of useful discoveries made in all departments of chemistry in the eighteenth century and by the men whose allegiance to it did not prevent them from being brilliant chemists (Black, Cavendish, Priestley, Scheele, Bergman, etc.). The nature of air and water, indeed was finally elucidated during this epoch, and it will be most convenient to deal with these before proceeding to give a description of the advent of Lavoisier and the decline of phlogiston."—T. P. Hilditch, *Concise history of chemistry*, p. 16.

"Since the time of Boyle no English chemist had produced any work of first importance. But now with the second half of the eighteenth century came Black, Priestley, and Cavendish, men whose epoch-marking work was to make the name of England honoured throughout the whole scientific world. With them chemistry at once entered on a new phase. The exact quantitative spirit of Black and Cavendish and the pioneering genius of Priestley found powerful collaboration in the work of the Swedes Bergman and Scheele. . . . Joseph Black was born in 1728; he was of Scotch parentage, and subsequently became professor of chemistry in Edinburgh. He began his scientific career a convinced phlogistonist, but in his latter days was a convert to the Lavoisierian school. Black's most memorable achievement was his discovery of the composition of the mild and caustic alkalis. . . . Black was the first to insist on the fact that a gas can enter into chemical combination. He may be regarded as the discoverer of carbonic acid gas, his 'fixed air,' which he showed to be no other than choke damp. . . . Carbonic acid was the first gas to be definitely recognized as differing from ordinary air, and the field of *pneumatic chemistry* [chemistry of gases] was practically virgin soil when Priestley and Scheele almost simultaneously set about its exploitation. Joseph Priestley was born in 1733, in the neighbourhood of Leeds. A Nonconformist minister by profession, he took up chemical research merely as a pastime. . . . In August, 1774, by means of a burning glass he concentrated the solar rays on some red oxide of mercury, and obtained a gas which, to his amazement, sustained the flame of a candle with vastly increased brilliancy. At

TABLE OF THE CHEMICAL ELEMENTS

Name	Symbol	Discoverer	Year	Atomic Weight	Principal Valence	Specific Gravity	Fusing or Melting Point	Most Common Occurrence
Aluminum.....	Al	Wohler	1828	27.1	3	2.58	658° C.	In rocks.
Antimony (<i>Stibium</i>)...	Sb	Basil Valentine	1580	120.2	3 or 5	6.7	630° C.	As sulphide in metallic ores.
Argon.....	A	Ramsey and Rayleigh	1894	39.9	0	1.5	-188° C.	In atmosphere.
Arsenic.....	As	Schroeder	1733	74.96	3 or 5	5.71	815° C.	Native and as sulphide.
Barium.....	Ba	Davy	1808	137.37	2	3.75	850° C.	In barite and with-erite.
Bismuth.....	Bi	Agricola	1529	208.0	3 or 5	9.8	271° C.	Native and as sulphide.
Boron.....	B	Davy	1808	11.0	3	2.6	2200° C.	In borax and minerals.
Bromine.....	Br	Balard	1826	79.02	1	3.10	-7.4° C.	In sea water.
Cadmium.....	Cd	Stromeyer	1818	112.40	2	8.65	320.0° C.	In zinc ores.
Cæsium.....	Cs	Bunsen	1860	132.81	1	1.88	28.5° C.	In lepidolite and pol-lucite.
Calcium.....	Ca	Davy	1808	40.07	2	1.6-1.8	803° C.	In limestone.
Carbon.....	C	Ancients	12.005	2 or 4	3.52	3600° C.	All organic matter.
Cerium.....	Ce	Berzelius	1803	140.25	4 or 3	6.7	623° C.	In cerite.
Chlorine.....	Cl	Scheele	1774	35.46	1	1.33	-103.6° C.	In common salt.
Chromium.....	Cr	Vanquelin	1797	52.0	2, 3 or 6	7.3	1550° C.	In chrome-iron ores.
Cobalt.....	Co	Brandt	1733	58.97	2 or 3	8.06	1478° C.	In many metallic ores.
Columbium (<i>niobium</i>)...	Cb	Hatchette	1801	93.1	3 or 5	Above 7	In columbite.
Copper.....	Cu	Ancients	63.57	1 or 2	8.9	1083° C.	Native and in many ores.
Dysprosium.....	Dy	Boisbaudron	1886	162.5	3	In gadolinite.
Erbium.....	Er	Mosander	1843	167.7	3	In gadolinite.
Europium.....	Eu	152.0	3	In monazite sand.
Fluorine.....	F	Davy	1810	19.0	1	In fluo-rite.
Gadolinium.....	Gd	Boisbaudron	1875	157.3	3	In gadolinite.
Gallium.....	Ga	Boisbaudron	1875	70.1	3	5.95	13.5° C.	In zinc-blendes.
Germanium.....	Ge	Winkler	1886	72.5	4	5.47	900° C.	In argyrodite.
Glincium (<i>beryllium</i>)...	Gl	Wohler	1828	9.1	2	1.85	Above Redness	In beryl.
Gold (<i>aurum</i>).....	Au	Ancients	197.2	1 or 3	19.3	1062° C.	Generally free.
Helium.....	He	Janssen	1868	4.00	0	In cleveite.
Holmium.....	Ho	Cleve	163.5	3
Hydrogen.....	H	Cavendish	1776	1.008	1	0.025	-250° C.	Mainly in water.
Indium.....	In	Reich and Reichter	1863	114.8	3	7.4	155° C.	Certain zinc ores.
Iodine.....	I	Courtois	1812	126.92	1	4.05	113.5° C.	Ashes of sea weeds.
Iridium.....	Ir	Tennant	1803	193.1	3 or 4	22.4	2290° C.	In iridosmin.
Iron (<i>ferrum</i>).....	Fe	Ancients	55.84	2 or 3	8	1530° C.	As oxide or sulphide in rocks.
Krypton.....	Kr	Ramsey and Travers	1898	82.02	0	-160° C.	In atmosphere.
Lanthanum.....	La	Mosander	1838	139.0	3	6.1	810° C.	In cerite.
Lead (<i>plumbum</i>).....	Pb	Ancients	207.2	2 or 4	11.36	327.4° C.	In galena.
Lithium.....	Li	Arfvedson	1817	6.94	1	0.585	180° C.	In lepidolite and spodumene.
Lutecium.....	Lu	Urbain	1907	175.0	3	In samarskite.
Magnesium.....	Mg	Bussy	1829	24.32	2	1.75	350° C.	Sea water and mag-nesite.
Manganese.....	Mn	Gahn	1774	54.93	2, 4, 6 or 7	7.2	1260° C.	In pyrolusite.
Mercury (<i>hydrargyrum</i>)	Hg	Ancients	200.0	1 or 2	13.506	-38.0° C.	Native and in cin-nabar.
Molybdenum.....	Mo	Hjelm	1782	96.0	3, 4 or 6	8.6	2535° C.	Mainly in molyb-denite.
Neodymium.....	Nd	Von Welsbach	1885	144.3	3	Above 6.5	In cerite.
Neon.....	Ne	Ramsey	1898	20.2	0
Nickel.....	Ni	Cronstedt	1751	58.68	2 or 3	8.9	1452° C.	Many metallic ores.
Nitron (<i>Ra emanation</i>)...	Nt	Dorn	1900	222.4	In radium and pitch-blende.
Nitrogen.....	N	Rutherford	1772	14.008	3 or 5	0.38	-210.5° C.	Atmosphere and or-ganic matter.
Osmium.....	Os	Tennant	1803	190.9	2, 3, 4 or 8	22.48	2200° C.	In iridosmin and na-tive platinum.
Oxygen.....	O	Priestley	1774	16.0	2	1.11	-235° C.	Free in air.
Palladium.....	Pd	Wollaston	1803	106.7	2 or 4	12.1	1540° C.	Native and with gold
Phosphorus.....	P	Brandt	1669	31.04	3 or 5	1.84	44.0° C.	In bones and apatite.
Platinum.....	Pt	Wood	1741	195.2	2 or 4	21.5	1755° C.	Native platinum.
Potassium (<i>kalium</i>)...	K	Davy	1807	39.10	1	0.86	63.5° C.	In wood ashes.
Praseodymium.....	Pr	Von Welsbach	1885	140.0	3	Above 6.5	In cerite.
Radium.....	Ra	Curie	1898	226.0	2	In pitch-blende.
Rhodium.....	Rh	Wollaston	1804	102.0	3	12.1	1907° C.	With platinum and iridosmin.
Rubidium.....	Rb	Bunsen	1860	85.45	1	1.52	39.0° C.	In lepidolite.
Ruthenium.....	Ru	Claus	1840	101.7	3, 4, 6 or 8	12.26	1900° C.(?)	With platinum and iridosmin.
Samarium.....	Sa	Boisbaudron	1879	150.4	3	In samarskite and cerite.
Scandium.....	Sc	Nilsson	1879	44.1	3	In gadolinite.
Selenium.....	Se	Berzelius	1817	79.2	2, 4 or 6	4.5	217° C.	Mainly in sulphur.
Silicon.....	Si	Berzelius	1810	28.3	4	2.48	1414° C.	In quartz.
Silver (<i>argentum</i>).....	Ag	Ancients	107.88	1	10.5	961° C.	Native in ores.
Sodium (<i>natrium</i>).....	Na	Davy	1807	23.00	1	0.97	97.9° C.	In common salt.
Strontium.....	Sr	Davy	1808	87.63	2	2.5	900° C.	In celestite and strontianite.
Sulphur.....	S	Ancients	32.06	2, 4 or 6	2.07	110.2° C.	Native and in sul-phides.
Tantalum.....	Ta	Ekeberg	1802	181.5	5	Above 10	2850° C.	In tantalite.
Tellurium.....	Te	Klaproth	1798	127.5	2, 4 or 6	6.23	451° C.	In rare minerals.

TABLE OF THE CHEMICAL ELEMENTS — *Continued*

Name	Symbol	Discoverer	Year	Atomic Weight	Principal Valence	Specific Gravity	Fusing or Melting Point	Most Common Occurrence
Terbium	Tb	Mosander	1843	159.2	3	In gadolinite.
Thallium	Tl	Crookes	1862	204.0	1 or 3	11.19	302° C.	In pyrites.
Thorium	Th	Berzelius	1828	232.15	4	11.23	1600° C.	In thorite.
Thulium	Tm	Urban	1900	168.5	3	Rare minerals (gadolinite).
Tin (<i>stannum</i>)	Sn	Ancients	118.7	2 or 4	7.25	231.8° C.	Mainly in cassiterite.
Titanium	Ti	Gregor	1780	48.1	3 or 4	1795° C.	In rocks and clays.
Tungsten (<i>wolframium</i>)	W	De Luyert	1783	184.0	6	19.26	3207° C.	In wolframite.
Uranium	U	Klaproth	1780	238.2	4 or 6	18.69	Very high	In pitch-blende.
Vanadium	V	Sefstrom	1830	51.0	3 or 5	5.87	1720° C.	In vanadinite.
Xenon	Xe	Ramsay and Travers	1898	130.2	0	-140° C.	In atmosphere.
Ytterbium	Yb	Mariqnac	1878	173.5	3	In gadolinite.
Yttrium	Yt	Gadolin	1794	89.33	3	In gadolinite.
Zinc	Zn	Paracelsus	65.37	2	7.12	419° C.	In ores as oxide, etc.
Zirconium	Zr	Berzelius	1824	90.0	4	4.15	1300° C. (?)	In zircon.

first he thought this might be the same nitrous air he had obtained two years before by the action of nitric acid on copper; but the fact that its powers of supporting combustion were not exhausted by the prolonged burning of a candle, and that it did not give brown fumes with air, persuaded him that here, indeed, was something new. It was not, however, till the March of 1775 that he became fully convinced of the importance of his discovery. Finding that his new gas underwent diminution in volume when mixed with nitrous air (our nitric oxide) over water, he tried its effect on a mouse, and found that it supported life even better than ordinary air. To this gas, so eminently suited for supporting combustion, so free from phlogiston in the parlance of the period, he gave the name 'dephlogisticated air.' . . . While Priestley was performing his random experiments, as he called them, and enriching chemical science with a wealth of new gases, a countryman of his was equally hard at work; and it would be hard to decide to which of the two, Priestley or [Henry] Cavendish, posterity owes the greater debt. Priestley discovered, Cavendish investigated: the former restlessly turned his hand first to one substance, then to another; the latter concentrated his whole energy on one point, and did not leave it till it was comprehended in its entirety. To the random experiments of the one we owe our first knowledge of oxygen; to the scientific method of the other the discovery of the composition of water and nitric acid. Their outward circumstances were as diverse as their inner consciousness. Priestley was the son of a mechanic, Cavendish the grandson of a duke. Cavendish was born at Nice in 1731, two years before Priestley; but, notwithstanding his brilliant circumstances, he lived the life of a recluse, devoting himself entirely to the furtherance of his beloved science. He died in 1810. . . . To Cavendish also we owe the first accurate analysis of air. He adopted the method of Priestley and demonstrated the constant composition of the atmosphere. . . . Carl Wilhelm Scheele was born at Stralsund, in North Germany, in 1742, and died at the comparatively early age of forty-four. . . . While Priestley discovered oxygen in the August of 1774. Scheele's laboratory notes would show that the latter had already, more than a year previously, obtained the same gas from mercuric oxide, nitre, and various other substances. . . . Scheele's paper on manganese dioxide appeared in 1774, and gave information of three discoveries, those of the gas chlorine, the metal manganese, which, however, was not isolated, and the earth baryta. . . . Other discoveries of Scheele were those of hydrochloric acid and am-

monia,—these quite independently of Priestley—of molybdic acid and tungstic acid, of arsenic and prussic acids. Before Scheele organic chemistry had been almost entirely neglected. Though the chemists of the iatro period based all their claims on a supposed knowledge of the working of the digestive system, their views had scarcely extended beyond general conceptions of acidity and alkalinity. . . . He isolated, for the first time, tartaric, malic, citric, and gallic acids, and was able to identify the acid of sorrel with that produced by the action of nitric acid on sugar. All these acids he examined rigorously, and showed how they might be differentiated, and how detected in their parent plant. . . . That which Scheele did for organic chemistry another Swede, Torbern Bergman, did for analytical chemistry, giving to the whole system of quantitative and qualitative analysis a sound foundation."—F. P. Armitage, *History of chemistry*, pp. 36-41, 43-45.—While it is true that chemistry advanced during the phlogiston period, its gain had little to do with the erroneous phlogiston hypothesis. We should rather attribute the cause to a more correct appreciation of the aims of chemical science. The great lesson of the period was set forth by the phlogistonists in their endeavour to arrive at the truth. From the chaotic sciences of alchemists and iatrochemists, the phlogistonists produced ordered, well arranged facts. They began to apply the doctrine set forth by Francis Bacon in his "Novum Organum": "True experience begins with an ordered, not chaotic, knowledge of facts, deduces axioms from these, and from the axioms again designs new experiments. Equipped with such axioms, chemistry might enroll itself amongst the exact sciences." The phlogistonists were wrong in their theory, but not in their practice. They obtained by their experiments an ordered knowledge of facts, deduced axioms from these facts, and from these axioms designed new experiments. Chemistry was, in fact, at length in the way of becoming an exact science.—See also MEDICAL SCIENCE: Modern: 17th century: closing of humoral pathology.

Modern period: Lavoisier's theories of combustion and the indestructibility of matter.—Atomic theory.—Further discoveries.—Electrochemistry.—Periodic law.—"The later chemists of the Phlogiston Period began to get approxi-

mately quantitative observations, which were gradually seen to be inconsistent with this hypothesis. Scheele was inclined to the opinion that combustion consists not only in a *decomposition*, but also in a *formation of a compound*. In France the way began to be cleared for a new theory of chemistry as early as 1775, but in England, Sweden, and Germany the phlogiston theory held its place longer. The consequence was that from 1780 till 1790 both the phlogiston and antiphlogiston theories had a following. That man wrought a complete revolution in chemistry, who proved, amongst other things, that when metals are burned and their weight increases, a portion of air equal to their increase in weight is absorbed, and that burning, rusting, and calcination are not processes of decomposition. He thereby established a theory entirely opposed to the older one to which we have alluded, and introduced into the methods of chemical investigation the same precision, and into chemical generalisations and principles the same accuracy and deductive reasoning, as are found in other branches of science. The history of the life and work of such a man reveals . . . the foundations of modern chemistry. . . . His name was **Antoine Laurent Lavoisier** (1743-1794). . . . Priestley came to Paris about the end of 1774, and as we said before, explained to Lavoisier the method of preparing dephlogisticated air from the red calx (or oxide) of mercury. This supplied the clue to the meaning of the experiments and to the nature of combustion. Lavoisier prosecuted experiments with oxygen for twelve years in a very precise way, and disproved the phlogiston theory, demonstrating the behaviour of the gas towards divers kinds of substances. [To this gas he gave the name of 'oxygen,' meaning *acid-former*, supposedly the essential constituent of all acids.] Berthollet in 1785 declared his adherence to the views of Lavoisier, and was soon followed by De Morveau and Fourcroy, while in 1792 the new doctrines received recognition at Berlin. . . . We shall now try to sum up the principal services which this epoch-making man rendered to chemistry. His success in this respect was mainly due to his having made the balance the *ultima ratio* of the laboratory. The following seven propositions were deduced from the experiments of Lavoisier:—

"1. That however long water is heated it cannot be converted into earth.

"2. That when metals, sulphur, phosphorus, carbon, and similar substances, are burned in air, they increase in weight to an extent exactly equal to the volume of oxygen which they derive from the atmosphere; and, on the other hand, when calces are reduced by means of charcoal, the resulting metal weighs less than the calx to an extent exactly equal to the volume of oxygen which has combined with the carbon and escaped in the form of carbon dioxide.

"3. That the diamond is pure carbon, and is converted by combustion into a gas, which he named carbonic acid (carbon dioxide).

"4. That sulphuric acid differs from sulphurous gas by containing a larger proportion of oxygen; and likewise nitric acid from the nitrous gas discovered by Scheele.

"5. That metallic salts are formed (firstly) by the disengagement of oxygen from the acid, which unites with the metal, forming an oxide, and (secondly) by the union of the acid with the oxide thus produced.

"6. That by burning alcohol, oil, wax, or similar organic substances in a known volume of oxygen, the quantity of carbon, hydrogen or oxygen present

in the organic body burned, can be calculated from the weight of water and carbon dioxide produced during combustion.

"7. That there are three states of aggregation of matter—solid, liquid, and gaseous—depending upon the amount of fire-matter with which the ponderable substances are interpenetrated and combined. Lavoisier anticipated that gases could be reduced to liquids and solids by the influence of cold and pressure. He also clearly enunciated the first scientific proof of the indestructibility of matter.

"The opinion of Lavoisier on these subjects has been modified by the results of modern research; but on the whole these propositions still form portions of chemical philosophy, and are accepted by modern chemists. . . . Of all the men whom we have as yet mentioned in this history, Paracelsus alone can be ranked with Lavoisier as a fundamental reformer of the science. . . . Although Lavoisier was the leader of the reformation of chemistry, in the latter portion of the eighteenth century, the work of his followers was of great importance. His views were adopted by the principal chemists of France and Germany, and rapidly spread over the continent of Europe. The great English chemists held back for a time, but in the end they too became adherents of the new doctrines, and carried these to a higher development."—J. C. Brown, *History of chemistry*, pp. 293-295, 300-301, 303.

"The nineteenth century was opened with a series of important and far-reaching discoveries in the nature of the composition of compounds. In 1802, Dalton (1776-1844) announced his *atomic theory*, based upon his study of gases and their composition. He believed that an element is made up of small particles called atoms exactly alike in their properties, but differing from the atoms of any other element. Further, according to Dalton, a compound is formed by the coming together or combination of atoms of different kinds; and since the nature of the compound will necessarily depend on the number and kind of the atoms present, *the composition of the compound must be definite*. This is the first fundamental law of chemistry, the law of constant or definite proportions. And still further. Since the fundamental assumption of the atomic theory is that atoms are indivisible, that they cannot be broken up into anything smaller, it follows that if one particular element A combines with another element B to form compounds containing different proportions of A and B, the higher proportions of the elements must be *whole* multiples of the lowest proportion. That is to say, we can have the compounds AB, A₂B, 2AB, 2A₃B, etc., where A and B represent atoms of the elements A and B. Here, then, we have the explanation of the second fundamental law of chemistry, the law of multiple proportions."—A. Findlay, *Chemistry in the service of man*, p. 10.

"The conception of atoms was at once accepted by the leading chemists, but most of these (e. g. Davy, Gay-Lussac, Wollaston) perceived that the actual relative weights determined according to Dalton's principles were merely the combining weights, and that no light was thereby thrown on the relative weights of the atoms themselves."

—T. P. Hilditch, *Concise history of chemistry*, p. 35.—Dalton did not distinguish between the smallest particle of an element or the smallest particle of a compound, which caused much confusion since the atom of a compound could still be split up into the atoms of the component elements. In 1811, Avogadro (1776-1856), an Italian chemist, solved the difficulty by calling

the smallest particle of a compound a molecule, which consisted fundamentally of the atoms of the component elements. The atom, then, is the smallest particle of an element which enters into the composition of a molecule, or which can participate in chemical reaction. Ampère, in 1814, by independent research made a similar exposition of the atoms and molecule. "The conception of an Atomic Theory, based upon equivalent weights, and the determination of the fundamental laws of chemical combination, not only added precision to chemical philosophy, but facilitated the labours of the student of chemical principles, the laboratory worker, and the manufacturer. . . . The Laws of Chemical Combination are founded upon the conception that all the simple atoms in an elementary body are alike, and that a compound atom or molecule can only be altered by the addition or subtraction of one or more complete atoms, hence the proportional relation which always subsists between the elements in their several combinations. It is possible that the Daltonian Atomic Theory may share the fate of other hypotheses which have preceded it. As research extends, it may have to be abandoned, and may give place to some other doctrine, which will be more consistent with later discoveries. But that time has not yet arrived. The Theory and the Laws of Chemical Combination have been, and are still being, modified in parts, but no modern discovery has discredited the possibility of atoms, although it seems probable that they are neither so imperishable, nor so indivisible, as Dalton conceived. The laws, therefore, are still received by chemists as being founded upon fact, and the atomic theory is still accepted as a useful working hypothesis."—J. C. Brown, *History of chemistry*, pp. 333-334.

"Returning to the previous point, viz., the difference between equivalent weight and atomic weight, we might fill a chapter with a description of the uncertainty and confusion which prevailed in the first half of last century with respect to these two terms. Some, like Davy or Gay-Lussac, held that the determination of the relative weights of atoms themselves was impossible; others, and of these Berzelius was foremost, adopted the opposite conclusion. Berzelius himself attacked the problem with amazing thoroughness, and in the course of ten years had made fairly reliable analyses of compounds of practically all the known elements. . . . This first atomic weight table of Berzelius was complete about 1817. . . . His second atomic weight table (1826) was rendered necessary because he found reasons for halving many of the values he had previously selected."—T. P. Hilditch, *Concise history of chemistry*, pp. 36, 37.—"Jöns Jacob Berzelius was born 20th Aug. 1779. . . . He early occupied himself with the effects of the Voltaic pile, and in 1803 published, jointly with Hisinger, a paper on electrolysis. He spent much time in determining the proportion of oxygen present in many oxides, and showed the connection between the quantity of oxygen in the base and the amount of acid required to form with it a neutral salt. . . . Berzelius introduced the symbols which since his time have been used to represent atoms, namely, the initial letters of the Latin names of the respective elements. His electro-chemical theory of affinity has been considerably modified, but Berzelius was the first to show experimentally that in organic compounds the elements are united, as in inorganic compounds, in definite atomic proportions. . . . He died at Stockholm, 7th Aug. 1848.—W. A. Tilden, *Progress of scientific*

chemistry in our own times, p. 18.—"The years which witnessed the rise of electro-chemistry also witnessed an extraordinary advance in chemical knowledge. The ten years before and twenty years after the beginning of the nineteenth century formed one of the most fruitful periods in the history of chemistry. Never were a greater number of distinguished chemists at work in different countries at the same time seeking to discover the mysteries of the science, and never were their labours more liberally rewarded. The isolation of potassium, sodium, calcium, magnesium, strontium, barium, selenium, iridium, osmium, palladium and other rare metals; the recognition of the elemental character of chlorine, iodine, fluorine, and bromine; the adoption of platinum apparatus; the improvement of blowpipe manipulation; and the introduction of more accurate methods of analysis—had all tended to effect an entire change in the state of chemical knowledge. Chemists were now taking an enlarged view of the number and variety of chemical elements and their possible compounds. Not only oxides and sulphides, but phosphides, chlorides, iodides, fluorides and bromides had to be studied. Much had still to be learned regarding salts; the oxygen-acid theory had been overturned, but the hydrogen-acid theory was yet in its infancy. Although inorganic chemistry had been developed to a great extent, the vast field of organic chemistry and the carbon compounds was almost untouched; it was for a later group of chemists to open up that immense subject of research. But a firm base of operations had been secured, from which further advance was rendered easier and more certain."—J. C. Brown, *History of chemistry*, pp. 251-252.

Among the noteworthy contemporaries of Berzelius is Sir Humphrey Davy (1778-1829) who, in 1807, isolated the alkali metals, sodium and potassium, by means of electrolysis. About four years later he established chlorine as an element, and not an oxide as was formerly believed, thus overthrowing Lavoisier's theory that oxygen was the characteristic component of all acids. In America there was Robert Hare (1781-1858) and Benjamin Silliman (1779-1864). Hare invented the compound blowpipe, making possible new excursions into the field of blowpipe analysis. "Hare also invented a galvanic battery which he called a 'deflagrator,' consisting of a large number of single cells in series. With this, using carbon electrodes, he was able to obtain a higher temperature than with his oxy-hydrogen blowpipe. He was the first to apply galvanic ignition to blasting, and he first carried out electrolysis with the use of mercury as the cathode. In this way he prepared metallic calcium and other metals from solutions of their chlorides, while the principle employed by him has in recent times been used as the basis of a very important process for manufacturing caustic potash and soda."—H. L. Wells and H. W. Foote, *Century of science in America*, p. 280.

Also in: E. F. Smith, *Life of Robert Hare*.

Silliman, by means of Hare's deflagrator, showed that carbon could be volatilized at the temperature produced in the electric arc. He also was the pioneer in the production of hydrofluoric acid in America, and discovered the presence of bromine in one of our natural brines. The two distinguished German chemists, Justus Liebig (1803-1873) and Friedrich Wöhler (1800-1882) must also be mentioned here. Liebig, pioneer in the fields of physiological and agricultural chemistry, was also the first to give systematic laboratory instruction. Wöhler in 1828 announced one of the most epoch making discoveries in the history of science. By

PIONEERS IN CHEMISTRY

his artificial preparation of an organic compound, he destroyed the belief that the production of such compounds were dependent upon a "vital force" and thus opened up the great and important field of modern synthetic chemistry. "The electrochemical views which were put forward and developed by Davy, Berzelius, Gay-Lussac, and Thénard received their full development at the hands of Faraday [1791-1867], to whose work we owe our knowledge of the principal facts and laws of electrical science. Besides being an electrician *par excellence*, Faraday was a distinguished chemist, and published many purely chemical researches, but his chief influence on chemistry has arisen from his physical and electrical researches. . . . The bulk of his work lies outside the scope of our history, the only portion of Faraday's electrical researches which bears on chemistry being his work in relation to electrolysis. . . . From these observations he deduced what is called Faraday's Law (*Experimental Researches*, 505); 'For a constant quantity of electricity, whatever the decomposing conductor may be, whether water, saline solutions, acids, fused bodies or the like, the amount of electro-chemical action is also a constant quantity.' This law, which implies that the same quantity of electricity will produce the same amount of chemical effect, is the basis of all electro-chemical work. . . ."—J. C. Brown, *History of chemistry*, pp. 353-355, 361.—Faraday extracted the first coal tar product, benzene, and was thus the forerunner of a mighty modern industry. One of the great French chemists of the first half of the nineteenth century was Jean Baptiste Andre Dumas (1800-1884) whose contributions to theoretical and analytical chemistry were prolific. Dumas was followed by Louis Pasteur (1822-1895) whose work in biological chemistry has made his name immortal. His contributions were of the most far-reaching importance to almost every branch of natural and physical science, but those on the chemistry of fermentation and its allied subject, contagious diseases, were perhaps the most valuable. In 1854 the spectroscope was perfected by Robert Bunsen (1811-1899) and Kirchhoff (1824-1887). This gave the chemist his most delicate instrument for detecting elements. About the middle of the nineteenth century more attention began to be given to the physical properties of substances—their boiling points, melting points, specific gravities, and their optical properties. It was discovered that many substances had the power of turning the plane of polarization of a ray of polarized light to the right, but in 1848 Pasteur made the astonishing observation that substances having the same composition rotated the plane equally to the left. If the atoms of such a pair of compounds be conceived as being arranged in a particular order, then the atoms of the other must be arranged in the same order, but inversely. Twenty years later (in 1874), Van't Hoff (1852-1911), a Dutch chemist, and Le Bel, a French chemist, set forth a theory that "all compounds of carbon which in the liquid state rotate a polarised ray, or when crystallised produce hemihedral forms which are mirror images of each other, are found to contain at least one atom of carbon which is united directly to four dissimilar atoms or groups of atoms and which is therefore said to be asymmetric." This principle forms the basis of modern "stereo-chemistry." Kekulé (1829-1896) was another chemist of this period who advanced new theories on the constitution of carbon compounds, and his work together with that of Van't Hoff revolutionized the domain of organic chemistry. The science of physical chemistry has been tremendously furthered

by the distinguished Swede, Arrhenius (1859-), who succeeded in establishing the theory of electrolytic dissociation.

With all this advance in the realm of general chemistry, no fundamental law governing the relationship of elements and compounds had yet been discovered. Many important isolated facts relating to their atomic weights were known, but no one had welded this information into a coherent system. "By 1860, however, data had become available for fixing these numbers, and their mutual relationships attracted more and more attention. . . . At about the same time Newlands in England was publishing a series of papers dealing with atomic classification. . . . He called his generalization the Law of Octaves and . . . pointed out more clearly than any previous chemist the periodic recurrence of similar properties among the elements. His system, however, showed no gaps and therefore left no room for new elements unless some entire octave should be discovered. This judicious sense of where the gaps must be, characterize the more complete systems of Lothar Meyer and Mendelejeff. . . . There was for a time a good deal of feeling between the friends of Lothar Meyer [1830-1895] and those of Mendelejeff [1834-1907] upon the question of priority in the discovery of the periodic law. Such questions, however, need not detain us here. The fundamental idea, that the properties of the elements are a periodic function of their atomic weights, had been a slow growth, to which these two men independently gave the permanent form of expression. In 1882 the Royal Society conferred the Davy medal upon both in recognition of this fact, and we can well follow the spirit of their compromise. . . . In 1854 Kirchoff came to Heidelberg as professor of physics and he soon began to work with Bunsen upon problems connected with optics. . . . The result was the spectroscope, an instrument which has added constantly to human knowledge from that day to this."—F. J. Moore, *History of chemistry*, pp. 178, 182-185, 196, 198.

ANALYTICAL

This branch concerns itself primarily with the determination of the constituents of a chemical compound. The two great subdivisions of analytical chemistry are *qualitative* analysis which is interested only in the detection of the constituents, and *quantitative* analysis which ascertains the amount of the constituent present. In chemistry, the methods of analysis are generally classified according to types of reactions it undergoes. Thus, *dry* or *blowpipe* analysis consists of the examination of the dry substance, quantitative work being termed "dry assaying"; wet analysis is the treatment of a solution of the substance with different reagents to produce known reactions. In quantitative analysis two methods of examination are practiced: (1) Gravimetric in which the constituent is precipitated as an insoluble compound by reagents or by the passage of an electric current; (2) Volumetric by means of which the strength of the unknown is compared with the known strength by means of standardized solutions. Robert Boyle may well be considered the founder of analytical chemistry, although inklings are to be found in the writings of chemists of the iatrochemical period.

He first realized that certain substances give certain precipitates with various solutions, and introduced vegetable indicators to detect bases and acids, a discovery which laid the foundation of all chemical analysis. It remained for Bergman, however, to lay the foundations of a systematic qualitative analysis. He is responsible for the systematic separation of the metals into groups according to their behaviour with reagents, a division which is of fundamental importance in determining the constituents of minerals. For the introduction of blowpipe analysis we must credit Axel Fredrik Cranstedt while the systematization is due to Berzelius, Hausmann, and in recent times K. F. Plattner. Flame coloration due to the presence of certain metals was first observed by Marggraf and Schiele, but it remained for Bunsen and Merz to perfect this new branch of chemical analysis with the introduction of the spectroscope. Until the advent of Lavoisier, quantitative chemistry can hardly be thought of as having existed. He may properly be said to be its founder, for it was his research which first opened the eyes of the scientific world to the importance of this branch. Praust, Dalton, and Berzelius in their exposition of the different phases of atomic action contributed enormously to the development of the field. In 1865 O. Wolcott Gibbs applied the principle of electrical precipitation of metals to analytical chemistry, working out the electrolytic separation of copper. This phase was more extensively studied by Alexander Classen, who published his results in his "Qualitative Chemical Analysis by Electricity" in 1903.

PHYSICAL

Laws of gases.—Crystallography.—Solutions.—Colloids.—"At the outset we should note that the basis of the whole science rests on two 'laws'—the conservation of mass and the conservation of energy. . . . The first of these was proved by Lavoisier when he showed that in chemical reactions matter is never either created or destroyed, but quite recently (1893-1908) elaborate experiments have been carried out by H. Landolt in order to test how far the law is an accurate expression of fact, the final result being that it is rigidly correct to within the limits of one part in ten million. The accompanying doctrine of the conservation of energy is due more to Mayer and to Joule (1842) than to any other physicists, though not a few workers dealt with the subject in the earlier part of the nineteenth century. The first to realize the varying chemical nature of different gases were van Helmont (who introduced the term 'gas' about 1620) and Rey (who showed that air possessed weight, in 1630). The relation of the volume of gases to external pressure was discovered by Boyle (1660) and Mariotte (1670), while the effect of temperature was quantitatively investigated by Charles (1785) and Gay-Lussac (1808). Dalton (1807) showed that, in any mixture of gases, each exercised its own 'partial pressure' independently of the rest. Again, in 1808, Gay-Lussac found that the volumes of reacting gases always bore a simple ratio to each other and to the volume of the products (if gaseous), and this served in certain cases to contradict Dalton's atomic hypothesis until in 1811 Avogadro put forward the hypothesis that equal volumes of gases contained equal numbers of molecules (Ampère attempted to extend the same hypothesis to solids, with indifferent success, a few years later). In the meantime, from a purely physical standpoint, others were developing the kinetic theory of gases. The idea that gas particles are

in motion was expressed by Bernoulli (1738) and Herapath, but a physical estimation of their mean velocities was first made by Joule in 1851. The modern kinetic theory of gases was practically stated by Waterson (1845) in an unpublished paper which was only brought to light in 1892 by Lord Rayleigh, and consequently the fame of evolving the theory rests with Clausius (1857) and Maxwell (1860). From this in 1881 van der Waals constructed a modified form of the 'gas-equation' $PV=RT$ (Horstmann), which should express the deviations from Boyle's and Gay-Lussac's laws shown by readily liquefiable gases, and also to a smaller extent (Amagat, 1880) by the then-called permanent gases (nitrogen, hydrogen, oxygen). This equation,

$$\left(p + \frac{a}{v^2}\right) (v - b) = RT$$

(where a and b are specific constants), is so accurate an expression of fact that by its means, on the one hand, Guye and Friedrich were able in 1900 to deduce practically coincident values for the 'gas-constant' R from measurements of different gases, and, on the other, Daniel Berthelot (1899) has theoretically calculated the atomic weights of various elements from the densities of their compounds (or of the elements themselves) determined by Regnault (1845), Lord Rayleigh (1888), and others. The values so obtained agreed excellently with those from chemical data. The *liquefaction of gases* was a subject of careful study by Northmore (1805), who liquefied chlorine, and by Michael Faraday (1823), who condensed ammonia, sulphur dioxide, and other gases by the combined application of considerable pressure and a freezing mixture.

"His principle was improved by later workers, such as R. Pictet (1877), Cailletet (1877), Wroblewski and Olzsczewski (1883), and, finally Dewar (1884), by increasing the pressure and the degree of cold, so that all the known gases (even the so-called permanent ones), with the exception of hydrogen and helium (discovered later), had been liquefied by 1885. Dewar succeeded in liquefying hydrogen in 1898, and in the meantime a new principle (Hampson-Linde, 1895, the intense cooling of a gas by its own expansion when already cooled under great pressure) led to the cheapening of liquefaction processes. Finally, H. Kammerlingh Onnes condensed helium in 1908 to a colourless liquid boiling at 4.5° Abs., and has also obtained it in the solid state. In 1821 Cagniard de la Tour noticed that many gases could not be liquefied above a certain temperature by any pressure, and in 1869 Andrews minutely studied the phenomenon and found that for each gas there existed a temperature above which no amount of pressure would condense it; he called this the *critical temperature* and the pressure necessary to produce liquefaction at that temperature the *critical pressure*, while the specific volume of the liquid formed was the *critical volume*. Much important theoretical work has since been carried out on the critical data, notably by Mendelejew (1884) and by Ham-say and Young (1894). Finally the decomposition of some gases by heat and their reformation on cooling was studied by Deville in 1857 and named '*dissociation*.' About the same time Kopp and Kekulé observed the effect and set it down to partial decomposition. Gaseous dissociation has been studied quantitatively by methods of effusion (sal ammoniac, Pebal, 1862), colorimetry (phosphorus pentachloride, Deville; nitric peroxide, Salet, 1868), and specific heat (nitrogen peroxide, acetic acid vapour, Berthelot and Ogier, 1882).

"This sub-science [crystallography], so important for mineralogy, was given a definite shape by Romé de L'Isle, Haüy, and Werner, who in the early years of the nineteenth century classified crystals according to physical form and assumed that difference in form entailed difference in chemical composition. This was overthrown later by Mitscherlich's discovery of *polymorphism* (1821). Later crystal-systems, by means of which all crystal-forms were finally divided into thirty-two geometrical classes, are due to Hessel (1830), Gadolin (1867) and P. Curie (1884). In 1888 Beinitzer noticed that cholesteryl benzoate, before melting to a clear liquid, passed through a turbid or milky phase, and in 1890 other instances were observed by Gattermann. Lehmann (1890) found that the turbid liquid rotates the plane of polarized light, and must therefore be doubly-refracting and possess crystalline structure. Such substances are said to be *liquid crystals*, and although Tammann (1901) disputed the crystalline structure, the previous explanation is usually adopted at the present time. The relation of crystalline form to chemical composition has naturally been the subject of much study. In 1846 Buys-Ballot stated that the elements and simpler compounds tended to crystallize in the simplest forms (regular and hexagonal) and more recently Retgers has statistically demonstrated the truth of the proposition (1892). Before this, however, Mitscherlich discovered *isomorphism* (1819), following on Gay-Lussac's and Bendant's observations on the growth of potash alum in ammonia alum, and of ferrous sulphate in copper sulphate solutions respectively. Mitscherlich based his views of isomorphism on phosphoric and arsenic acid salts, selenic and sulphuric acid salts, and the alums and oxides of iron, chromium, and aluminium, and, with Berzelius, held that isomorphous bodies contained similar atomic structures—a point utilized by Berzelius to assist in determining atomic weights. Fuchs, similarly, discussed the constitution of isomorphous minerals (1872). Finally, reference must be made to Mitscherlich's further discoveries of *dimorphism* and *polymorphism* (1821), and to Scherer's use of the term *polymeric isomorphism* (when atoms had been replaced by an atomic group to form an isomorph). Kopp's work on the specific volumes of isomorphs is noteworthy. Other interesting points are the phenomenon of *isogonism* or *hemi-hedry* observed by Pasteur in 1861, wherein the slightest change of constitution (change of asymmetric configuration) causes a similar change in the position of the crystal facets, and that of *morphotropy*, studied by Groth (1876)—the definite alteration of form caused by definite substituents in organic compounds, especially in the aromatic series. In conclusion, we have to describe the comprehensive theory recently elaborated by Barlow and Pope (1906), who 'regard the whole of the volume occupied by a crystalline structure as partitioned out into polyhedra, which lie packed together in such a manner as to fill the whole of that volume without interstices. The polyhedra . . . are termed the spheres of atomic influence of the constituent atoms.' The crystalline forms of many of the elements and simpler compounds,

at all events, agree with the postulates of this theory, which is also capable of furnishing a steric formula for benzene expressing, according to the authors, all the necessary chemical facts."—*Ibid.*, pp. 175-176.

Further progress was made in the laws of solutions. "The osmotic pressure of solutions is a field opened up by the work of Pfeffer (1877) who made use of Traube's 'semi-permeable membranes' (1867). Pfeffer found that substances in solutions obeyed definite laws with reference to their osmotic pressure, etc., but it was van't Hoff who first perceived that dilute solutions are amenable to the same laws as gases, and that hence, among other corollaries, it follows that the molecular weight of a dissolved substance is related to the vapour pressure of the solution. This led to the determination of molecular weights by lowering the vapour pressure of a solvent (Raoult, 1887) or, what amounts to the same, lowering of freezing-point or elevation of boiling-point; it then appeared that solutions of electrolytes in water gave abnormal values for the molecular weight, and this found an explanation in Arrhenius' ionic theory (1886), which assumed that ions exist ready formed in dilute solution, the electric current exerting simply a directive effect. This does not, however, afford an absolutely perfect explanation, and it seems likely that the final theory of solutions will be a combination of Mendelejew and Arrhenius' theory of hydration of ions and molecules (1888) for concentrated solutions, with the ionic theory for dilute solutions and electrolysis. The electrical conductivity of solutions has been the subject of experiment ever since Hittorf (1853-9) determined the 'transport numbers' for the migration of the ions and Kohlrausch (1870) discovered, first, the relation of the 'transport number' to conductivity (1870) and then the law of the 'independent migration of the ions' (1885), whereby the total conductivity of a solution was shown to depend upon the sum of the two ionic velocities. The conductivity of acids (organic, Ostwald, 1878-87; Walden, 1891; very weak acids, Walker, 1900) has been shown to be a measure of their 'relative affinity,' . . . while that of pure water has been concordantly determined by the E.M.F. of an acidalkali cell (Oswald, 1893), the hydrolysis of salts (Arrhenius, 1893), and the rate of hydrolysis of methyl acetate in pure water (van't Hoff and Wiis, 1893), and finally, by direct measurement (Kohlrausch and Heydwiller, 1894). *Ampho-teric electrolytes* (both acid and basic, such as methyl orange, sulphanilic acid, glycocoll, zinc hydroxide and other feebly acidic metal oxides) have been studied by Küster (1892), Winkelhlech (1901), J. Walker (1904), and many others; similar fields have been opened by Hantzsch in the case of *pseudo-acids and bases* (1896), and Noyes and Whitney on *complex ions* ('double salts') in 1894. *Conductivity* in solvents other than water has been investigated by Tessori (1896, formic acid), Carrara (1896, acetone) and especially by Jones (1902-6) and by Walden (1901-6, tetra ethylammonium iodide in liquid sulphur dioxide, sulphur oxychloride, ether, etc., etc.), while Kahlenberg (1902-3) has proved that the dissociating power of a solvent depends directly upon the magnitude of its dielectric constant. Finally, Nernst has recently given theoretical explanations of 'Volta's pile' and of the ordinary galvanic cells by means of a diffusion theory based upon van't Hoff's theory of solutions.

"The solutes we have so far dealt with are all crystalline substances, but we must now refer to another branch of soluble bodies, the *colloidal sub-*

stances. The purification of these has been rendered possible by the process of *dialysis*, discovered by Graham in his researches on *diffusion*. The phenomenon of diffusion seems to have been first noticed by Parrot in 1815, and a mathematical treatment of the subject appeared by Ficks in 1855. In the meantime the different rates of diffusion and effusion of gases had been studied by Graham in 1851, and later the same chemist extended his observations to the diffusion of dissolved bodies through animal membranes. He found that these were permeable to one set of substances (crystalloids) and impermeable to others such as dextrin, silicic acid, tannin, which he termed *colloids* (1862). Work on osmosis by Jolly, Brücke, and Pfeffer (1877) proved that the osmotic pressure of such bodies was very small, and consequently their molecular weight should be enormously large, that of many being greater than 10,000 (Linebarger found by osmotic pressure measurements in 1892 that tungstic acid, one of the simpler colloids, possessed a molecular weight of 1700-1720: $(\text{H}_2\text{WO}_4)_n = 1750$. Much work has been done of late years on this subject (especially by Bredig, 1903, and Biltzer, 1903).—T. P. Hilditch, *Concise history of chemistry*, pp. 175-179.—Through the work of P. P. von Weimarn, especially, it was discovered that Graham's classification of substances into colloidal and crystalloidal worlds was wrong. He mathematically calculated the main formulae governing the appearance of a substance in either the colloidal or crystalloidal state and introduced general methods for making colloids. Von Weimarn himself produced over 400 substances in the colloidal state. Zsigmondy will be remembered not only for his work in the production of new colloids but also for his invention of the ultra-microscope, which has more than any other factors combined contributed to advance this new and increasingly important branch of chemistry.

ALSO IN: W. Ostwald, *Handbook of colloid chemistry*.—P. Rohland, *Die Kolloidstoffe in den Tonen*.—E. Hatschek, *Introduction to the physics and chemistry of colloids*.

Due to the work of Bredig, "colloidal suspensions of the metals were found to have very remarkable properties. They were found to be excellent catalyzers, and to effect many of the same reactions that are brought about by the organic enzymes. Thus, finely divided platinum will oxidize alcohol to acetic acid in the presence of the oxygen of the air, just as the ferment *mycoderma aceti* will do. Oxalic acid is broken down by finely divided metals, just as it is by yeast. These finely divided metals invert cane sugar just like the organic ferments. The reaction which was studied most thoroughly from the standpoint of the analogy between the action of colloidal suspensions of the metals and organic enzymes, was the decomposition of hydrogen dioxide. This substance is decomposed by all of the finely divided metals, and also by all of the organic ferments. It is an especially good reaction to study from this standpoint, because the velocity of the decomposition can be so readily measured. That the metals decompose this substance catalytically is shown by the fact that the reaction is, as we say, of the first order; that is, the metal does not enter into the reaction at all, only the mass of the hydrogen dioxide present undergoing change. The analogy between the action of the finely divided metals and the organic enzymes is strikingly illustrated by the behavior of poisons on the two. The same substances which poison the ferments and which retard the rate at which they decompose hydrogen

dioxide, also 'poison' the platinum and retard the rate at which it effects the same decomposition. Thus, mercuric chloride and hydrocyanic acid, in the merest traces, poison the organic enzymes. The same quantities produce almost exactly the same effect on the finely divided metals, with respect to their power to decompose hydrogen dioxide."—H. C. Jones, *New era in chemistry*, pp. 243-244.—More recently, within the period of the World War, colloidal gold solutions have been used to test spinal fluids. This work was developed chiefly at the Bellevue Hospital where Dr. Getter succeeded in obtaining a suitable colloidal gold solution which served as an extremely delicate test for spinal fluids of paretics, luetics, or meningetics. The condition is determined by examining the color changes caused by the precipitation of the colloidal gold in a series of succeeding tubes with degrees of diluted spinal fluid. The whole test is based on the fact that colloids are protective in nature, two explanations of the action being given: First, that here is something in abnormal spinal fluids which will precipitate colloidal gold, the degree of concentration exerting an influence on the precipitation; second, that the colloidal gold is protected by something which exists in normal spinal fluid, but which has been destroyed in abnormal conditions, thus causing precipitation.

ORGANIC

Defined.—Use of term "radicle."—Synthesis of organic compounds.—Laws of substitution and types.—Further discoveries.—"Organic chemistry is the chemistry of the carbon compounds; the study of the hydrocarbons and their derivatives. So early as at the close of the seventeenth century mineral substances were classed apart from vegetable and animal, the three being treated separately in text-books of chemistry. . . . This division was in accordance with the classification of natural substances according to the three 'kingdoms of nature,' which was even then in vogue. It was from this empirical standpoint that the chemistry of organic compounds developed itself, after Lavoisier had proved qualitatively that the main constituents of these were carbon, hydrogen, oxygen and sometimes nitrogen, occasionally together with sulphur and phosphorus. . . . While Lavoisier and other chemists after him remained true to the old classification of substances, Bergman began about the year 1780 to distinguish organic from inorganic bodies. But, in spite of the simplicity which this proposal had to recommend it, the line which remained drawn between vegetable and animal substances was only gradually removed as the knowledge increased that the same chemical compounds occurred both in vegetables and animals, as proved, e. g., in the case of several fats, formic acid, benzoic acid, etc. Still it was generally felt to be necessary to strictly separate organic from inorganic bodies, it being represented as an infallible distinction that the former could not be prepared directly from their elements. But even this barrier was destined to

fall before very long, and both classes of compounds to be regarded henceforth from the same standpoints."—E. von Meyer, *History of chemistry*, pp. 246-248.—"Liebig [1803-1873] defined organic chemistry as the chemistry of compound radicles. The term 'radicle' was first mentioned in 1787 by Guyton de Morveau; but the idea of radicals, as we now conceive them, arose in the time of Lavoisier, who applied the term to that part of a compound which united with oxygen. Berzelius adopted the idea, and said in 1817 that the difference between inorganic and organic compounds lies in the circumstance that in inorganic compounds all the oxidised substances have a *simple* radicle, while all organic substances have *compound* radicles. Gay-Lussac had already, in 1815, discovered cyanogen, and demonstrated that it is the radicle of the prussiates, while Ampère and Berzelius had worked out the constitution of the ammonium salts on the theory that ammonium (NH_4) is a radicle. Starting with a knowledge of these views of his seniors, Liebig first worked on organic compounds containing the radicle cyanogen (CN). Then, in 1832, working with Wöhler, he showed that benzoyl ($\text{C}_6\text{H}_5\text{O}$) is the radicle of a series of bodies. This demonstration was followed by the long controversy on the constitution of alcohol and ether. Gay-Lussac had in 1815 suggested that these substances were compounds of olefiant gas. Dumas and Boullay in 1828 developed this suggestion, and termed olefiant gas (C_2H_4) the radicle of all the ethers, as ammonium (NH_4) is the radicle of all the ammonium compounds. Thus, sugar would be ($\text{C}_2\text{H}_4\text{CO}_2\text{H}_2\text{O}$), and might be called the bicarbonate of this radicle, just as the principal ingredient of smelling salts is called the bicarbonate of ammonium ($\text{NH}_2\text{CO}_2\text{H}_2\text{O}$). Berzelius, after opposing, accepted this etherin theory. Liebig in 1833 argued that just as sal ammoniac is regarded as NH_4Cl , not NH_3HCl , so muriatic ether should be regarded as $\text{C}_2\text{H}_5\text{Cl}$, not $\text{C}_2\text{H}_5\text{HCl}$, because, he said, contrary to the opinion of Dumas, alcohol contains combined water, which ether does not. Thus, alcohol ($\text{C}_2\text{H}_5\text{OH}$) contains oxidised hydrogen, as water is oxidised hydrogen, while, on the other hand, ether is (C_2H_5) $_2\text{O}$. Regnault explained this constitution on the basis of the radicle aldehydene (C_2H_3), and Liebig compared this with NH_3 . In short, Liebig borrowed his radicle theory from Berzelius, but carried it out from a more practical point of view, further, and more consistently.

"The first . . . synthesis of a truly organic compound [was made by Wöhler in 1828]. By this experiment, which depended on the molecular transformation of ammonium cyanate, of purely inorganic origin, into urea, an eminently characteristic animal product, he broke down the idea that organic compounds are the result of a vital action, which is independent of ordinary chemical laws, and which often brings about changes in defiance of them. A new era began from this discovery—an era which has already been marked by the synthetical production of innumerable carbon compounds, resembling in character, and often identical with, those produced in the organs of plants and animals. Wöhler also worked on urine, and on the physiological secretion through it of matter from the body. In 1830 he published, in collaboration with Liebig, papers on mellitic and cyanic acids. . . . A new era in chemistry, as Berzelius said, was created in 1832 by the publication of Liebig and Wöhler's researches on the radicle of benzoic acid (*Annalen der Chemie und Pharmacie*, Vol. III, p. 249). They demonstrated that that radicle, which they termed ben-

zoyl ($\text{C}_7\text{H}_5\text{O}$), might be regarded as a compound element entering into a host of combinations. The idea of a radicle containing oxygen was then quite a new suggestion. In 1837 Dumas was converted by Liebig to his views, and they jointly published a paper, in which they asserted that numerous organic compounds are formed from a small number of simple substances, which first combine to form radicles, some of which resemble chlorine and oxygen, and others resemble metals. These radicles are the elements of organic chemistry, and they cannot be decomposed into their simple elements without annihilating their organic nature. The dualistic theory of the constitution of chemical compounds thus included organic bodies, but the electro-chemical theory also held its place. The next great advance took place about 1834, when Dumas evolved his Law of Substitution from a number of discoveries—Gay-Lussac's chloride of cyanogen (1815), Faraday's series (1821) from ethylene dichloride ($\text{C}_2\text{H}_4\text{Cl}_2$) to carbon sesqui-chloride (C_2Cl_6), Liebig and Wöhler's chloride of benzoyl, the formation of chloral, and his own substitution compounds of turpentine. This law and the facts upon which it was based interfered with the electro-chemical view of Berzelius, and led Laurent in 1836 to propose his Nucleus Theory. According to this theory, every organic compound contains a group of atoms called 'kernel' or 'nucleus' (Fr. *noyau*; Ger. *Kern*). Primary nuclei are hydrocarbons, of which the hydrogen may be replaced by chlorine, or another element, without altering the shape of the nucleus. There are also secondary nuclei, of which the compounds are substitution products of the corresponding compounds of the primary nuclei. Laurent's views are noticeable, inasmuch as he doubled the old formulæ, as indeed we do now. The nucleus theory was the basis of classification in Leopold Gmelin's large *Handbook of Chemistry* . . . but was not much further recognised. The Substitution Theory led Dumas himself to his Theory of Types [1839]. According to it, all bodies which are derived from each other by simple substitution belong to the same type; for example, acetic acid and its chlor-derivatives: chloroform, bromoform, and iodoform; aldehyde and chloral. He further recognised with Regnault mechanical types [1840]—that is to say, bodies containing the same number of equivalents but having different properties, as alcohol and acetic acid. A fierce contest now ensued between Berzelius, with his electro-chemical dualistic theories, and Dumas with his substitutions, which ended in the victory of the Substitution Theory and the Type Theory in improved form. These prevailed because they were in the main founded upon ascertained facts; while Berzelius had to meet these facts by endless modification and complication of formulæ, in order to make the new bodies, discovered in great numbers at this period, appear to conform to his theoretical views. . . . Liebig argued against the views of Berzelius because they were founded upon supposition, rejected Laurent's nucleus theory as being unscientific and useless, and said that Dumas went too far with his Substitution Theory, especially in saying that even carbon could be replaced by other elements or groups. The continually increasing number of new substitution compounds firmly established the Law of Substitution in the form in which we now have it. Great support was rendered to it by Melsens in 1842, when he showed that the original compound can be reproduced by inverse substitution; for example, that by the action of potassium amalgam on trichloroacetic acid one again obtains acetic acid.

Hoffman in 1845 discovered the chlorinated anilines, whereupon Liebig enunciated the doctrine that the nature of a compound depends not on the nature of the elements composing it, but on their position in the compound. This admission of chlorine into radicles subsequently led to the recognition that oxygen might exist in a radicle. At first it was not conceived that it might be possible to isolate radicles, any more than the nuclei of Laurent; both were deemed hypothetical bodies. But this idea of radicles was gradually modified, until their isolability was held to be possible, and became an object of research. Then followed Bunsen's work on the cacodyl compounds, which resulted in his isolation of cacodyl (C_6H_6As)₂, a radicle that enters into numerous combinations, in which it plays the part of a metal. . . .—J. C. Brown, *History of chemistry*, pp. 374, 375, 379-380, 408-411.—“Gerhardt, in 1839, regarded substitution as a particular case of the copulation of two residues or radicles. Thus when chlorine acted on oil of bitter almonds, the former lost a chlorine and the latter a hydrogen atom in the form of hydrogen chloride, and the product was formed by the union of the two residues,

In this way the idea of substitution could be extended to include the products obtained by the action of sulphuric acid and nitric acid on benzene, of acetic acid on alcohol, of ammonia on benzoyl chloride, etc. Gerhardt regarded his residues, not as real substances, but as expressions of the changes which a compound could undergo; he therefore distinguished between the radicles H and Cl and the gases H₂ and Cl₂. He also halved the formulæ of nearly all organic compounds and used simple formulæ based on Avogadro's hypothesis.”—T. M. Lowry, *Historical introduction to chemistry*, p. 445.

“After Liebig and Dumas, Wurtz is most conspicuous as one of the founders of organic chemistry. . . . In 1845 he discovered sulphophosphoric acid and potassium oxychloride, and three years later cyanic and cyanuric ethers, thus opening out a new field of research in organic chemistry, and discovering a method of forming primary amines from cyanic ethers. In 1840 he discovered methylamine, the simplest organic derivative of ammonia, and also the compound ammonias, which he regarded as conjugated compounds of olefines and ammonia (C_2H_4, NH_3), until Hoffmann reproduced them by another process, and thus disclosed their true nature. His study of the compound ureas followed in 1851. Wurtz then interpreted Berthollet's glycerine and its derivative on the ‘condensed type’ theory, and discovered in 1856 the first diatomic alcohol, named glycol. This he formed by combining olefiant gas with bromine and replacing the bromine by the radicle ‘hydroxyl’ (OH). By the action of hydrochloric acid on glycol he produced ethene chlorhydrate, which by oxidation yields chloracetic acid, and by ammonia chloracetamide. A controversy ensued between Frankland and Kolbe, on the one hand, who maintained that the radicles isolated from the alcohols remained free, and Laurent, Gerhardt and Hoffmann, on the other, who asserted that they combined with themselves, as, for example, $C_2H_5.C_2H_5$. Wurtz entered into this discussion, and produced evidence in favour of the latter view by treating a mixture of iodides of two different alcohol radicles with sodium, and so forming a mixed radicle. But a more important branch of his research was his work on lactic acid, by which he contributed to the development of the doctrine of the atomicity, as distinguished from the basicity, of an acid.

Lactic acid was first isolated from sour milk by Scheele; Berzelius obtained it from other sources; Liebig and Mitscherlich determined its composition; and Strecker produced it synthetically. Wurtz formed it by the oxidation of propyl-glycol. . . . In 1867 he produced neurine by synthesis, and in 1872 discovered aldol, which possesses the double character of an alcohol and an aldehyde, hence its name. He also conducted an investigation into vapour densities, discovered phosphorus oxychloride, and worked upon the saturation capacity of the nitrogen atom. Of great importance also was the discovery of phenol, which was first observed by Wurtz and Kekulé by fusing benzene-sulphonic acid with potash. The next chemist whom we have to mention is Antoine Jerome Balard (1802-1876). . . . In addition to the discovery of bromine, Balard discovered hypochlorous acid and studied the bleaching compounds of chlorine. In organic chemistry he did valuable work. He discovered oxamic acid, and investigated amylic alcohol, the decomposition of ammonium oxalate, the cyanides, and the difference between nitric and sulphuric ethers. . . . “Friedrich August Kekulé (1829-1896) is intimately associated with the doctrine of the linkage of atoms. . . . After Frankland [1825-1899] had enunciated the theory of atomicity, Kekulé declared carbon to be tetravalent, and then set forth his doctrine of the linkage of atoms. He said that in a substance containing several carbon atoms it must be assumed that some of the affinities of each carbon atom are bound by the affinities of the atoms of other elements in the substance, and some by an equal number of the affinities of the other carbon atoms. But he engaged in other research of great moment. His theory of the constitution of benzene founded on the linkage of atoms has been called ‘the most brilliant piece of prediction to be found in the whole range of organic chemistry.’ It has led to the elucidation of the constitution of the aromatic compounds, and to new methods which amongst other things have conduced to the development of the coal-tar colours, and to the preparation of artificial and synthetic medicines.”—J. C. Brown, *History of chemistry*, pp. 424-426, 429, 437-438.

PRACTICAL APPLICATION

The progress which the organic chemist has made during the past few decades has been most astonishing. To-day he produces drugs to allay fever, to dispel pain, to calm the nerves, and to stimulate the heart; he manufactures dyes for wool, silk, and cotton, dyes of evanescent beauty of shade, or of such ruggedness as to resist all harsh treatment; fibers of the glossy beauty of silk or of the coarseness of horse-hair. He produces explosives, for use in war and in peace; cosmetics and perfumes; disinfectants and foods. In short, in every walk of life we detect the product of the organic chemist's ingenuity, from the moving picture and medicine to the Panama Canal. The dye industry is as closely related to the manufacture of high explosives as the manufacture of steel for rails is to

that of making cannon and battleships. In times of war, it is a simple matter to shift from the manufacture of the dyes to that of explosives, by the rearrangement of the molecules, as is shown by a study of the formulas of the different substances.

Drugs: Early synthetic processes.—**Chloroform; iodoform; chloral; veronal; adrenaline; antifebrin; phenacetin; aspirin; salvarsan; strychnine; morphine; atropine; coniine; formaldehyde; saccharin.**—"A systematic study of synthetic processes was first undertaken by Berthelot the famous French chemist [1827-1907]. He showed how, by starting from the elements and from mineral substances, carbon can be combined step by step with hydrogen, then with oxygen, and again with nitrogen, producing thereby organic compounds, some identical with certain products of nature, others only analogous thereto, but at the same time serving as starting points for the formation of natural organic compounds. A single example taken from Berthelot's work will suffice by way of illustration. By heating carbon (coke or charcoal) in the electric arc surrounded by an atmosphere of hydrogen, acetylene, C_2H_2 , is formed. By an easy process acetylene can be made to combine with more hydrogen so as to produce ethylene, C_2H_4 . Ethylene dissolves in concentrated sulphuric acid, and the compound thus formed when mixed with water unites with the elements of water and, distilled, yields *alcohol*, C_2H_5O . The alcohol thus formed is identical in every respect with alcohol produced by fermentation of sugar. The synthetic process is so practicable that a company was at one time actually formed with the object of manufacturing alcohol from common coal-gas, of which ethylene is a constituent. This was fifty years ago, but the development of the same idea as that which was the basis of Berthelot's experiments has led in later times to the building up of numberless chemical compounds previously known only as limited products of animal or vegetable life. Before proceeding to describe the origin of some of the most modern of chemical drugs the reader may be reminded that previous generations have already enjoyed the use of some of the agents originating in the chemical laboratory. The most familiar of anæsthetics, 'the gas' used by every modern dentist, was breathed for the first time by Sir Humphry Davy so long ago as 1798, and in the earliest of his works he describes his 'Researches Chemical and Philosophical chiefly concerning Nitrous Oxide and its Respiration' (1800). Ether has been known from the times of the alchemists and from its being produced by the action of strong sulphuric acid on alcohol, it was called in those days *oleum vitrioli dulce*. Its use as an anæsthetic belongs exclusively to quite modern practice; it is generally associated with chloroform."—W. A. Tilden, *Chemical discovery and invention in the twentieth century*, pp. 334-336.—"The earliest of these synthetic products dates from 1832, when Liebig prepared the anæsthetic **chloroform**, by the action of bleaching powder on alcohol. Who will dare to compute the sum of misery and suffering from which this one discovery has freed mankind, or place a money value on the service it has rendered?"

But the discovery of chloroform has been followed by the discovery of other anæsthetics; general anæsthetics like ether and ethyl chloride (also, like chloroform, produced from alcohol); and local anæsthetics like novocaine (a derivative of coal tar benzene), used as a substitute for the vegetable alkaloid cocaine."—A. Findlay, *Chemistry in the service of man*, pp. 240-241.—"The alkaloids of opium and those of cinchona bark and many other vegetable principles had also been introduced into regular medical practice long ago. The characteristic of our own time in respect to medicine arises from the great advances which have been made in the knowledge of physiology and theoretical chemistry, and recognition of the interdependence the one on the other. . . ."—W. A. Tilden, *Chemical discovery and invention in the twentieth century*, p. 336.—"Side by side with chloroform we may place the closely related compound **iodoform**, a yellow crystalline compound largely used as an antiseptic. Following closely on the discovery of chloroform came the discovery of **chloral**, the first hypnotic to be produced commercially. But the dangers attending the use of chloral led to the search for and discovery of other hypnotics which are free from the bad qualities of chloral; and at the present day quite a number of synthetic hypnotics are known, of which perhaps the most familiar are **veronal**, and the inter-related compounds, **sulphonal**, **trional**, and **tetralon**. If the introduction of the anæsthetic chloroform marked a new era in surgery, a similar claim may perhaps also be made in connection with the substance **adrenaline**, the active principle of the supra-renal glands. This substance when injected subcutaneously even in *excessively minute amounts*, produces so violent a contraction of the arteries that the blood is driven away from the injected tissues and 'bloodless' surgery becomes a possibility. Adrenaline was isolated for the first time in 1901, from the supra-renal glands of sheep and oxen, close on 11,000 lbs. of tissue (the glands from 20,000 oxen) being required to yield 1 lb. of adrenaline. It was not long, however, before the nature of the substance had been determined, and a process for preparing it synthetically on an industrial scale had been devised. It is now placed on the market under the name *suprarenine*. . . ."

"The great development which has taken place in recent times in the industrial production of the synthetic drugs is due mainly to the discovery in 1887 of **antifebrin**, the first of a series of synthetic antipyretics which have entered into competition with the natural alkaloid quinine. Strangely enough, the discovery of the antipyretic properties of antifebrin, a compound derived from acetic acid and aniline, and known in chemistry as *acetanilide*, was due to a mistake on the part of a laboratory boy who supplied this substance in mistake for naphthalene. During a pharmacological investigation of the substance, its strongly antifebrile action was detected, and from a chemical analysis, it was learned what the substance really was. The success of the first synthetic antipyretic soon led to the preparation and systematic study of the physiological action of a large number of other substances, but although hundreds, indeed thousands, of these have been found to have certain medicinal value, only a few have, by their special properties or effectiveness, obtained a place in actual practice. Among synthetic drugs, however, there exists a ceaseless competition, and antifebrin has been largely superseded by newer and better drugs. Antifebrin, as we have seen, is derived from aniline, and is liable to undergo decomposition in the body, giving rise again to

aniline which exerts a toxic action; and the continued use of the drug is therefore dangerous. By slightly modifying the composition of antifebrin, however, another compound, the well-known phenacetin is obtained, a substance which possesses the valuable antipyretic properties of antifebrin, but is much less toxic. One other synthetic drug of which special mention may be made is the anti-rheumatic, aspirin, a derivative of salicylic acid, which is itself a therapeutic agent of value, and is prepared from the coal-tar product, phenol or carbolic acid. Owing, however, to the large amounts of phenol used in different departments of synthetic chemistry, the amount obtained from coal tar is quite insufficient to supply the demand, so that phenol itself is now largely manufactured from coal-tar benzene."—A. Findlay, *Chemistry in the service of man*, pp. 241-243.—Phenol is also the starting point in the manufacture of salicylic acid, discovered by Kolbe in 1874.

"The discovery of new remedies depends more and more on a combination of chemical and physiological knowledge. No better illustration of this principle could be adduced than the case of the remarkable compound 'salvarsan,' or '606,' the use of which was introduced into medicine by Professor Ehrlich. Salvarsan is an artificial chemical compound containing the element arsenic in such a condition that it does not produce the ordinary effects of arsenical poisoning. It possesses the property of seeking out and destroying the specific organism of syphilis, the *Spirochata pallida*. Salvarsan does not represent the first attempt to use arsenical compounds for medical purposes. Common white arsenic, the arsenious oxide As_2O_3 , has long been recognised as a valuable alterative and tonic medicine when given in minute doses. It is also known to act as a dangerous poison in quantities exceeding a small fraction of a grain. Some fifty years ago cacodylic acid (dimethylarsinic acid $[(CH_3)_2 As O.OH]$) was tried in cases of tuberculosis, and arsenic acid itself was reported to have some value. Later a number of arsenical organic compounds were prepared by the French chemist Béchamp and others. Among the rest a substance named 'atoxyl' was introduced into medicine. Its constitution was, however, unknown and misrepresented till, in 1907, Ehrlich, in conjunction with A. Berthelm, proved that atoxyl is the sodium salt of para-amino phenyl-arsenic acid,

The use of atoxyl has been practically abandoned in favour of the more complicated dioxidiamino-arsenobenzene,

the hydrochloride of which is *salvarsan*. The rapid rise into notoriety of this remarkable substance is known to all the world, but it appears to be still doubtful whether it is effectual in all cases, and its action occasionally becomes poisonous. This is probably partly due to the fact that on exposure to the air it readily undergoes oxidation yielding a more poisonous compound. . . .

"Time alone can show whether these expectations are justified. Several of the natural drugs provided by the vegetable kingdom were mentioned. Of these the most important by far are those which are familiarly known as 'alkaloids,' inasmuch as the majority of them possess very powerful physiological action, and in many cases act as violent poisons when introduced into the animal economy either by the mouth or by hypodermic injection into the circulatory system. It is only necessary to mention strychnine, morphine, and atropine, all of which are used in medicine. These and many other substances of the same class have

been known for a long time, approaching a century. But beyond the fact that they contain beside carbon, hydrogen, and commonly also oxygen, together with nitrogen, little was known until recent times as to their chemical constitution. They agree in possessing the power of uniting with acids forming definite and usually crystalline salts. This property is connected with the nitrogen they contain, and down to about forty years ago they were assumed to be derivatives of ammonia, and the name *alkaloid* applied to them all had reference to the basic or alkaline character exhibited more or less strongly by every one. A considerable number of basic substances have been discovered in animal tissues or in products of decomposition and in a few cases these are identical with alkaloids derived from vegetable substances. Adenine, for example, is a base of comparatively simple composition with the formula $C_8 H_8 N_6$, which occurs not only in the pancreas but in small quantity in tea, beetroot, and shoots of bamboo. Its constitution is perfectly well known, not only from a study of its products of decomposition, but from the fact that it has been produced synthetically in the laboratory. Another case of a natural alkaloid which has been produced by artificial processes is *coniine*, the poisonous principle of hemlock (*Conium maculatum*). This is a colourless, oily substance, having the formula $C_8 H_{17} N$, which is obtainable from the hemlock plant or fruits by distillation with a solution of sodium carbonate. It rotates the plane of polarisation to the right. The artificial product is optionally inactive as it consists of equal quantities of two stereo-isomeric bases, the one rotating to the right, the other to an equal extent to the left. These were separated from each other by Ladenburg [1842-1911] by fractionally crystallising the tartrates, and the artificial right-handed base was found to be identical with the natural."—W. A. Tilden, *Chemical discovery and invention in the twentieth century*, pp. 330-341.

"One of the most remarkable compounds which has come into use during recent years is formaldehyde. This is obtained on a large scale by bringing the vapour of methyl alcohol (wood spirit) mixed with air into contact with heated platinum or copper. The formaldehyde produced is a gas, but dissolves readily in water, and a solution containing nearly 40 per cent is sold under the name of 'formalin.' This is used as a disinfectant and antiseptic. A very minute quantity of it added to milk, for example, will prevent change for many days. It has also the remarkable property of rendering gelatine in any form, such as glue, insoluble in water, whence many applications of this property to technical purposes. When brought into contact with ammonia it is converted into a solid crystalline substance, hexmethylene tetramine $(CH_2)_6 N_4$, used in medicine under the name *hexamine*, urotropin or formin.

"Among the many synthetic products which have become familiar in our own time is *saccharin*, a compound which is reputed to have a sweetening power four to five hundred times the sweetness of cane sugar. Saccharin, or *gluside* as it is called in the *British Pharmacopœia*, is orthosulphamido benzoic anhydride. $C_6 H_4 \left\langle \begin{array}{c} C \\ SO_2 \end{array} \right\rangle NH$.

It is produced by a series of operations which have for starting point the hydrocarbon toluene obtained from coal-tar. It is used as a substitute for sugar in the diet of patients suffering from diabetes and other disorders."—*Ibid.*, p. 337.

Essential oils and perfumes: *Early syntheses of coumarin, vanillin, and compound ethers.*—

"If the synthesis of colouring matters and of drugs constitutes an achievement of the greatest importance, the significance of which is all too little realised, scarcely less notable are the successes of the chemist in the synthesis of those natural spices and perfumes, which have been valued by man from the earliest days. For thousands of years the volatile substances to which the different flowers and plants owe their odours have been prepared by distillation or by extraction by means of solvents. But in the past thirty or forty years the secrets of nature have been largely unravelled, and the chemical laboratory has become as odorous as a garden, and filled with the perfumes of violet and rose, heliotrope, lilac, hyacinth, and orange blossom; and from the stills of the chemists there also flow liquids whose flavours imitate those of the apple, pear, pineapple, and other fruits, and which, in consequence, find application as artificial fruit essences. Although in a number of cases these perfumes and flavouring essences merely imitate the products of nature, in other cases the chemist has succeeded in preparing the identical substances to which the flavour of the natural fruit or the perfume of the growing flower is due. . . .

The synthetic production of sweet-smelling substances, often at only a fraction of the cost of the natural product has led to a great extension in the use of such substances, more especially for the perfuming of soaps, creams, and other toilet materials."—A. Findlay, *Chemistry in the service of man*, pp. 244-245.—"It was among these things that one of the earliest triumphs of synthetical chemistry was celebrated when Perkin, the discoverer of the first coal-tar dye, contrived a process by which salicylic aldehyde could be transformed into coumarin. This was in 1868, and since a method was found in 1876 by which salicylic aldehyde could be produced from phenol, the synthesis may be regarded as complete, for, if necessary, phenol can be made from benzene, and benzene from acetylene, and the last can be formed by uniting carbon and hydrogen. Coumarin is the fragrant substance to which the perfume of the Tonquin bean, of woodruff, and some other plants is due, and artificial coumarin is now an article of manufacture without the aid of the plant. It was not long before a second step of the same kind was taken, for in 1876 a method was discovered for the synthesis of vanillin, the sweet-smelling constituent of the vanilla pod, so long used in confectionery. Here again it would be possible to proceed from the elements carbon, hydrogen, and oxygen. This, however, would necessitate several roundabout processes, and fortunately nature provides, in the substance called *eugenol*, a convenient and not too expensive material. Eugenol is the chief constituent of oil of cloves, and by acting on it with oxidising agents vanillin is produced. . . . Many years before such achievements could be placed on record the chemist had already learned that some of the fragrant essences so lavishly provided in fruit and flower and leaf could be reproduced by purely laboratory operations. As soon as organic chemistry began to be seriously studied nearly a century ago, among the earliest results was the production of what used to be called **compound ethers**, by the action of various acids on common alcohol, on the alcohol from wood spirit, and on the alcohol from fusel oil separated in the rectification of whiskey. Among these products were speedily recognised such odours and flavours as those of the pineapple, the jargonelle pear, and others. Pineapple owes its fragrance to ethyl butyrate, the pear to amyl acetate, wintergreen

(largely used in the United States) to methyl salicylate, while the strawberry and raspberry contain mixtures of several such ethereal compounds. These are now common articles of commerce. These, however, were not alone, for already in those early days the odour developed when bitter almonds are crushed with water was found to be due to the formation of another kind of substance . . . namely, benzaldehyde. Similarly the flowers of the meadowsweet contain salicylic aldehyde, the barks of cinnamon and cassia yield cinnamic aldehyde, the hawthorn and many garden flowers secrete other characteristic aldehydes. Nor were the older chemists altogether ignorant of the constitution of the essences to which the pungency of mustard, garlic, onions, and horse-radish are due. There are also ethereal salts or compound ethers which are characterised by the presence in them of sulphur associated with a radicle called *allyl* in reference to their frequent presence in plants of the genus *Allium*, belonging to the onion tribe."—W. A. Tilden, *Chemical discovery and invention in the twentieth century*, pp. 342-343.

Composition and Extraction of Essential Oils.—"There is perhaps no department of applied organic chemistry which has attracted during the last thirty years a larger number of workers, nor one in which a larger amount of definite progress has been achieved, for although the preparation of perfumes from plants is an industry which dates back many centuries, any knowledge of the composition of the 'essential oils' has been derived almost wholly from chemical researches conducted within living memory. Before proceeding to the most recent advances it will be in the interest of those who are quite unacquainted with the technology of the subject to explain briefly what is understood by an essential oil. An oil is usually understood to be a liquid fat which is practically insoluble in water and which floats on that liquid. When boiled with an alkaline liquid, such as solution of caustic soda, it slowly dissolves, forming a solution of soap. And if a drop of oil is placed on paper it forms a translucent spot which is permanent, for common oil does not evaporate away when exposed to the air. An essential oil is distinguished from the fatty oils first by a strong and characteristic odour; it usually floats on water, but it is slightly soluble, for the odour is commonly communicated to the water, as in such instances as the familiar rose-water or orange-flower water. An essential oil is usually changed by contact with caustic alkali, but it does not produce a soap. And lastly if a drop of essential oil is placed on paper the translucent stain disappears gradually as the oil evaporates away. Most commonly, though not invariably, an essential oil is a mixture of two chief ingredients. One of these is a terpene—a compound of carbon and hydrogen only—the other is usually a compound of carbon and hydrogen with oxygen, and consists of an aldehyde, a ketone, a compound ether or 'ester' or something else. To the latter ingredient the characteristic odour of the oil is mainly due. . . . The extraction of essential oils from the plants which contain them is accomplished in most cases by a process of distillation with water. The essential oil usually boils at a much higher temperature than water, but the vapour rises with the steam and both are condensed together, the oil then floating to the surface of the water from which it may be separated. . . . There are, however, other essential oils which cannot be extracted from the flowers or fruit containing them by a process of distillation without injury to their delicacy. In such cases as

the violet, for example, the flowers are macerated in hot lard, which is afterwards pressed out, retaining the perfume. . . . According to another plan, the scent may be extracted by immersing the flowers in light petroleum spirit, which can afterwards be separated and distilled off, leaving the essence behind. . . .

"The use of perfumes is a form of luxury which in ancient times was probably limited to the rich, but in our own day they are used more or less unconsciously by everybody. For while nearly all women delight in perfumes, few men deliberately scent their persons or their clothes, but they cannot escape the use of soap, which in the form of toilet soap invariably contains some kind of essential oil. . . . The consumption of essential oils is, however, not the greatest in the form of perfume. Immense quantities are used in making drinks like lemonade and alcoholic liqueurs of all kinds, also in confectionery and cookery. There is also an enormous demand for certain oils as medicinal agents, some for external use, others to be administered by the mouth, and many of them are included in all the pharmacopeias. . . . This synthetic industry is a development which follows naturally on the pursuit of knowledge in pure scientific chemistry without regard to possible applications. And much of the knowledge thus accumulated during the last forty years or more was no doubt regarded by the 'practical' man in years gone by as useless. . . . Though many of the discoveries were originally made in German laboratories, the later developments have gone forward elsewhere, and many of the leading French perfumery houses are devoting attention and capital to the subject."—*Ibid.*, pp. 344-346, 348-349, 351.

Synthesis of Perfumes (aromatics): Lilac; lily of the valley; violet; hawthorn; rose; hyacinth; orange blossom; camphor.—"The methods by which coumarin and vanillin have been produced were described. . . . To these we may now add, two other examples which on account of their scientific interest as well as their commercial importance cannot be overlooked. The first of these is the substance known as terpineol, a crystalline solid of which there are two varieties having a pleasant odour. It is the basis of the lilac and lily of the valley artificial perfumes, and is now manufactured by the ton. . . . The chemical structure of terpineol, which is a kind of alcohol, has been the subject of many researches, but it is now fully understood, as it has been produced synthetically from compounds of known constitution by Professor W. H. Perkin in 1904. The perfume of the violet was the subject of research by Tiemann and Kruger so long ago as 1893. They found it impossible to obtain sufficient material for their work from the flowers, but as this characteristic fragrance is possessed by the dried root of iris (orris), the latter was used by these chemists as the source of the fragrant oil on which their experiments were made. To this substance when purified they gave the name irone. It belongs to the class of compounds, called in chemical language ketones. . . . Protracted study of this compound led to the synthetical production of another substance to which the name ionone is given. This has the same ultimate composition . . . and closely similar properties, including especially the fragrant odour of the violet. No time was lost in applying these facts to the manufacture of artificial essence of violet. Ionone is made from citral, an aldehyde existing in considerable proportion in essences of lemon, and citron, and in lemon grass oil, to which the characteristic lemon odour of these materials is due. Ethyl and amyl salicylates are made and

used in perfumery, but they are not known to be contained in any natural essential oils. The odour of the heliotrope is said to be due to piperonal [C₈H₆O₂] which has long been known. The only important compound not referred to so far is camphor. This substance has been known from very early times, and before the sixth century was brought to Europe by the Arabians. In China and the East generally it has always been regarded as a valuable medicine, and is familiar enough in modern use both as a medicinal agent and antiseptic, as well as for other purposes, for example in the manufacture of celluloid. The greater part of the camphor of European commerce is obtained from the island of Formosa, and is distinguished as Japanese or Chinese camphor to distinguish it from borneol camphor, which is obtained from the *Laurus camphora*, the latter from *Dryobalanops camphora*, both large trees. . . . Camphor has always been procured by the crude and wasteful method of cutting up the wood, in which the camphor exists in crystals, and distilling it with water in stills of very primitive construction. It is purified by resublimation and is obtained in large hemispherical masses called bells, or being obtained in crystalline powder is then compressed into cakes. Common camphor is a natural constituent of several essential oils, especially those of lavender, rosemary, and sage. Borneo camphor does not come into European commerce, but it is preferred in Eastern Asia, where it commands a high price, and is used chiefly for making incense and generally for ceremonial purposes. . . . Camphor has been the subject of very protracted investigations, as its constitution was for many years somewhat mysterious. These difficulties have now been cleared away, and the knowledge now existing of the relation of camphor to the terpenes has enabled chemists to contrive a process by which it can be made from oil of turpentine. . . . The artificial camphor is identical in every respect with natural camphor, except that it is optically inactive, while all the natural products rotate the polarised ray. The manufacture of camphor has been the subject of several patents, and for a time synthetic camphor was found in the European markets, but has disappeared again in consequence of a reduction of price in the Japanese product."—*Ibid.*, pp. 351-352, 354-356.

Dyes.—*Ancient sources*.—*Aniline derived from coal tar* (1834-1854).—*Mauve produced by Perkin* (1856).—*Magenta by Medlock and Nicholson* (1862).—"From time immemorial, men, denied by nature the more varied and gorgeous colourings of the animals, have delighted in staining their bodies or dyeing their garments by means of the various colouring matters with which the animal and vegetable creation supplied them—the colouring matter of logwood; the animal dye carmine or cochineal which was used in this country [England] to dye the scarlet tunics of our soldiers; the blue dye, indigo or woad, one of the oldest of dyes; the red dye, alizarin, obtained from the root of the madder plant and employed in the production of Turkey red; and the costliest and most famous dye of the ancient world, Tyrian purple, obtained from a shell-fish found on the eastern shores of the Mediterranean. Until the

middle of the nineteenth century these and some other dyes, mainly of animal or vegetable origin, were practically the only dyes with which man was acquainted. But in 1856 a new chapter, and one of the highest importance in the history of dyes, commenced with the discovery of the once favourite synthetic dye, mauve, which found its last use for colouring the postage stamps of the late Victorian era. This dye was prepared from crude aniline, which was in turn produced from the benzole derived from coal tar, and it was the first of a long list of synthetic dyes prepared by chemists from the constituents of coal tar. Starting from benzene, toluene, phenol, naphthalene, anthracene, and a few other constituents of the thick black liquid, coal tar, which less than a hundred years ago was a useless waste material and a nuisance to the gas manufacturer, synthetic dyes, to the estimated value of nearly £20,000,000, are now manufactured annually, more than two-thirds of this amount being produced, in 1913, in Germany. These dyes have, by reason of their almost infinite variety and applicability, their range of colour and delicacy of tone, ousted the natural dyes to a very large extent from the dye-works. It is, of course, now universally known that these numerous coal-tar dyes are not present as such in the coal tar, but that they are obtained from the constituents of coal tar by a more or less complex series of chemical reactions. Thus, from some eight or nine primary constituents of coal tar (benzene, toluene, xylene, phenol, cresol, naphthalene, anthracene, etc.), there are produced, by the action of various chemical reagents—nitric acid, sulphuric acid, chlorine, caustic soda, etc.—some two hundred and ninety 'intermediate' compounds, and from these 'intermediates,' by their mutual combinations and interactions, the finished dyes are prepared, of which upwards of nine hundred actually find application at the present time. The production of a dye, therefore, is by no means a simple operation, except in a very few cases, and is, in most cases, a very complex process involving, it may be, fifteen or twenty distinct and separate chemical reactions. That the industry of dye-manufacture is a very intricate one will, therefore, be readily understood, and if success is to be attained, each step in the process of manufacture must be scientifically controlled and carried out with the highest degree of efficiency. But a further very serious complication is introduced owing to the fact that in the preparation of many of the intermediates, 'by-products' are produced in varying amounts, and for these by-products a remunerative outlet must be obtained. Even when all the products formed in the manufacture of a given intermediate can be used up in the manufacture of dye-stuffs, the demand for the dye-stuffs thus obtained may differ very greatly, and by no means always in the same direction or in the same measure as the intermediates. The problem of working up, completely and remuneratively, without waste and without over-production, all the by-products formed in the manufacture of the intermediates, is one of the utmost importance for the success of the industry. Owing to the enormous development of her organic chemical industry, embracing the manufacture of dyes, drugs, perfumes, and 'fine' (organic) chemicals generally, the solution of this problem has become more easy for Germany than for any other country.

"In the year 1815, largely owing to the efforts of the Prince Consort [Albert] and of the Queen's physician, Sir James Clark, there was founded the Royal College of Chemistry in London, and A. W. Hofmann, a young German chemist, who had been

trained under the renowned Justus von Liebig at Giessen, was appointed Professor of Chemistry. For some time chemists had been interesting themselves in the nature and composition of coal tar, and Hofmann and his students engaged energetically in the work of investigation. One of the earliest results to be obtained was the isolation from coal tar of the hydrocarbon benzene, a compound which was first discovered by Michael Faraday in 1825; and after the work of [Charles B.] Mansfield [1810-1855] coal tar became the chief source of the compound. As early as 1834 Mitscherlich had shown that when benzene is treated with concentrated nitric acid, it is converted into an oily liquid, nitro-benzene, $C_6H_5NO_2$, which, even before the introduction of the coal-tar dyes, was manufactured in small quantities and used under the name of Essence of Mirbane, for scenting soap. Nitrobenzene, in its turn, as was found by Béchamp in 1854, could be converted into aniline, $C_6H_5NH_2$, by acting on it with a mixture of acetic acid and finely divided iron. We see, then, that coal tar became not only a convenient source of supply of benzene, but also, through the chemical transformation of this substance, of the compound aniline. Entering into this heritage of knowledge, W. H. Perkin, who had, as one of Hofmann's students, been trained in an atmosphere of purely scientific investigation, made his important discovery of the first coal-tar dye. It was in 1856, while engaged in an attempt to produce the naturally-occurring alkaloid quinine from simpler substances, that Perkin treated a solution of aniline in dilute sulphuric acid with potassium dichromate. As a result, there separated out from the liquid a dark-coloured, resinous mass, and from this unpromising material Perkin separated the first-known aniline dye, which he somewhat later manufactured and sold under the name of 'aniline purple,' or 'Tyrian Purple' or 'mauve,' the name given to it by the French dyers to whom, as we learn, the industrial application of this dye was largely due. . . . The success which attended the introduction of mauve, the vogue of which among the women of 1859 became so 'epidemic' that *Punch* referred to it as 'The Mauve Measles,' naturally led chemists to try the action on aniline of other oxidising agents (substances capable of giving up oxygen to other substances) than the potassium dichromate used by Perkin; and although they did not succeed in displacing the latter for the preparation of mauve, their efforts led to the discovery of a new dye, aniline red, magenta, or fuchsine. The formation of this red dye had been observed by several chemists, even as early as 1856, and although it was manufactured in small quantity in France in 1858-59, by a process due to Verguin, the greatest success in its manufacture was achieved, in 1860, by two English chemists, Medlock and Nicholson, former pupils of Hofmann, who prepared it by the action of arsenic acid on commercial aniline. "The manufacture of this important dye was carried out by Messrs. Simpson, Maule and Nicholson, and the 'crown' of magenta crystals prepared by this firm was one of the most notable exhibits of the International Exhibition of 1862. . . . Just as aniline formed the basis of manufacture of mauve and of magenta, so magenta became, in its turn, the starting-point for the preparation of a series of new dyes, the number of which now began rapidly to increase. In 1861 Girard and de Laire prepared aniline blue or Lyons blue by heating magenta with aniline in presence of benzoic acid; and by treating this dye with concentrated sulphuric acid, E. C. Nicholson, in 1862, produced the more valuable Nicholson's blue or water blue,

which possessed the great advantage of being soluble in water and in solutions of alkalis, and was better adapted for dyeing wool than the dyes previously prepared. Hofmann, also, prepared brilliant but not very stable violet dyes, Hofmann violets, by acting on magenta with methyl iodide and ethyl iodide."—A. Findlay, *Treasures of coal tar*, pp. 48-50, 52-58.

Theoretical investigation.—Chromophores and their action.—Azo-dyes, 1860, 1876, 1884.—"But although the preparation of new dyes and the perfecting of their industrial production were carried on with much vigour along the lines opened up by W. H. Perkin, chemists were not unmindful of the need of more theoretical investigations for the purpose of determining the composition and unravelling the constitution of these important new substances. Without such knowledge the dye industry could not be placed on a secure scientific basis and its further development ensured. In this work of investigation Hofmann took a leading part and in 1862 he showed that the dye magenta was the salt of a base which he called rosaniline. Moreover, in 1864 he confirmed what had already been discovered by Nicholson, that magenta cannot be obtained by the oxidation of pure aniline but only of commercial aniline which contained the two isomeric substances, ortho- and para-toluidine, as impurities. . . . From the study of a large number of substances the conclusion has been reached that colour is associated with the presence of certain groups or arrangements of atoms in the molecule—such groups being known as 'chromophors' or colour-bearing groups. When a chromophor is present in a compound the latter is said to be a 'chromogen,' and may or may not be coloured. To convert the latter into a coloured substance, it is necessary to introduce certain groups (especially OH and NH₂), called 'auxochromes.' In the dyes the colour is believed to be due to a modification of one of the benzene rings. But although the character of a dye-stuff is derived from its chromophor, the actual colour and shade may be very distinctly altered by the introduction of different groups into the molecule. Thus, if we write down the different primary colours, namely: Greenish-yellow → yellow → orange → red → purple → violet → indigo → cyanide-blue → bluish-green, it is found that the introduction of methyl and ethyl groups, and still more the introduction of phenyl, benzyl, and other groups derived from benzene, produces a change of colour in the direction shown by the . . . [arrows]. By introducing three methyl or ethyl groups into the molecule of magenta (red), Hofmann obtained violet dyes. Moreover, by increasing the number of such groups the violet shade becomes bluer, as is shown in the case of methyl violet and crystal violet, which contain five or six methyl groups. . . . Some years after the epoch-making discovery of mauve an observation was made which led in time to the development of an entirely new class of compounds which, in number and importance, now occupy a foremost place among coal-tar dyes. In 1860 it was found by Dr. Peter Griess, chemist in the brewery of Messrs. Allsopp & Sons, Burton-on-Trent, that when nitrous acid acts on aniline, or on any other derivative of benzene containing the amino-group (NH₂), an unstable compound—a so-called diazo-compound—is produced. The diazo-compounds which were thus obtained possessed the very important property of combining or 'coupling' with aromatic amines (compounds containing the NH₂ group), or with phenols (compounds containing the OH-group). In this way were produced the so-

called azo-dyes, which have found their special application as wool-dyes, and which owe their colour to the presence of the chromophoric azo-group or pair of linked nitrogen atoms,—N:N—. Even in 1863, although its constitution was not then known, an azo-dye, aniline yellow, had been prepared and put on the market, with only a limited success; but it was not till 1876, and after the constitution of the compounds had been elucidated, that the production of azo-dyes began to undergo a rapid development. Many hundreds, even thousands, of azo-dyes have now been prepared, and a very considerable number have been found suitable for use as dyes. Not only can one produce azo-dyes from aniline, toluidine, phenol, etc., and from their derivatives, but one may also use similar compounds derived from other hydrocarbons. In this connection the coal-tar hydrocarbon naphthalene has been found of especial value, and very many dyes have now been produced from the amino- and hydroxyl-derivatives of this compound. By thus drawing naphthalene within the sphere of the dye industry, an important outlet was secured for this coal-tar product—otherwise but little used—and at the same time a large number of valuable new dyes were obtained. . . . Although most of the dyes to which reference has been made, dye silk and wool directly, vegetable fibres, e.g., linen and cotton, must first be mordanted before they will take up the dye from the bath. It was therefore an event of the first importance when, in 1884, the German chemist Böttinger discovered a new group of azo-dyes which were able to dye cotton and linen directly without requiring a mordant. . . . There is a very complex dye primuline, discovered by Professor A. G. Green in 1887, which will dye cotton directly of a yellow shade. This dye is somewhat fugitive, and is, consequently, of comparatively little value in itself. If, however, a piece of calico, dyed with primuline, is passed through a cold, dilute solution of nitrous acid, the primuline (which contains an amino-group), is diazotised; and if the fabric is then passed through a solution of an amine or phenol, a dye is produced or 'developed' on the fibre. Thus, with beta-naphthol, primuline red; with resorcinol, primuline orange; with metaphenylene-diamine, primuline brown; and with salicylic acid, oriole yellow is obtained. To these colours developed on the fibre the name of 'ingrain dyes' is given; or, since the solution of the diazo-compound has, on account of its instability, to be kept cool by means of ice, the name 'ice colours' is also sometimes applied to this group of dyes. Another pigment dye . . . which carries us back again to the substance, aniline, from which the first artificial colouring matter was prepared, is the very important black dye, aniline black. This dye, which has a very complex structure, and is not an azo-dye, is obtained by a modification of the process first used by Perkin in the production of mauve, the dye being formed, however, directly on the fibre. Thus, if a piece of cotton is first steeped in a solution of aniline in hydrochloric acid and afterwards immersed in a cold solution of sodium bichromate, a fast black colour is developed on the fibre. Various improvements have more recently been introduced for the purpose both of cheapening the dye and of obtaining more readily a black which will not turn green; and it has been found by Professor A. G. Green that in the presence of certain substances the oxidation of the aniline may even be effected by atmospheric oxygen."—*Ibid.*, pp. 58-59, 65-66, 70-71, 74, 78-79.

Synthesis of Natural Color: Madder; indigo; Tyrian purple.—"The technique of dye manufacture has become so perfected, and our knowledge of the variation of colour with the constitution of the compound has become so well established, that the synthetic production of new shades is no longer a haphazard process, but one of which the conditions of success are clearly known. But it is, perhaps, in the artificial production of Nature's own colouring matters, more especially of alizarin and indigo, that organic chemistry has achieved its most striking successes. . . . Forty or fifty years ago, over the whole of Southern Europe, and eastwards to Asia Minor, great tracts of land were devoted to the growing of the madder plant; in France alone, 50,000 acres were devoted to its culture. When the roots of this plant were allowed to ferment, a substance alizarin, so called from the name given by the Arabs to the madder root, was formed, which was capable of dyeing cotton of a bright red colour—the so-called Turkey red, one of the oldest of dyes and most largely used in the dyeing of cotton goods. But these madder fields have now all disappeared; for when the composition and nature of this dye-stuff had once been ascertained, it was not long before chemists discovered a method by which the dye could be manufactured from what was then practically a waste material, anthracene, one of the constituents of coal tar. . . . In this way the madder dye can be manufactured much more cheaply than nature can produce it, and instead of the 750 tons of alizarin extracted from madder roots in 1870, over 2,000 tons are now manufactured annually in chemical works. The fate of the madder threatens also to be the fate of another dye-producing plant (*Isatis tinctoria*), from which the much prized dye-stuff, indigo, has for thousands of years been obtained. Even as late as the seventeenth century, the wood was cultivated in Europe, but with the opening up of trade with the East, the European dye could not hold its own with the cheaper indigo obtained from the Indian plantations, and these, until recently, controlled the markets of the world. But even they have not been able to stand against the march of science, and, in the production of synthetic indigo, the conquest of Nature by the chemist and manufacturer constitutes one of the most striking features of the nineteenth century. . . . As far back as 1880, the artificial production of indigo was first achieved by the German chemist, Adolph von Baeyer, using as raw material the substance toluene, which is one of the constituents of coal tar. But although this laboratory production of indigo constituted an achievement of the highest scientific importance, the chemical manufacturer strove in vain to use this discovery in his struggle to oust the natural product. Indigo certainly could be manufactured, and manufactured in quantity, but—and this is the whole essence of the matter—the artificial indigo cost more than the natural, and the raw material, toluene, was not procurable in sufficient amount to make the displacement of the natural indigo possible. For seventeen years the struggle went on, the chemist assisting with his brains and experience, the manufacturer assisting with his money, until at last, in October, 1897, after many attempts and many failures, and the expenditure of close on £1,000,000, synthetic indigo (indigo, that is prepared by the skill of man from simpler substances), was placed on the market in competition with the natural product from the Indian plantations. And what, to-day, is the result of this competition? Hear how eloquently the following figures speak. In 1896 India ex-

ported indigo to the annual value of over £3,500,000; in 1913 her exports of this dye were worth about £60,000, while the German export was valued at about £2,000,000. Moreover, in the above period, the price of indigo fell from about 8s. to about 3s. 6d. per lb. Since the production of indigo involves a considerable number of different processes, and requires the use of a number of different substances, of which sulphuric acid, ammonia, chlorine, and acetic acid are the chief, the success of the synthesis as a whole, depends upon the success with which each step of the process can be carried out, and on the cost of the substances employed. . . .

"Closely related, chemically, with indigo, is that other ancient dye, Tyrian purple. Some years ago the nature of this dye was investigated by a German chemist, who extracted it from the glands of two species of marine snail, the *Murex brandaris* and *Murex trunculus*, and ascertained that this 'dye of dyes whereof one drop worked miracles,' was a compound of indigo with bromine, a compound which can be prepared synthetically with comparative ease. The costliness of this natural dye was almost proverbial, and the reason for this is not far to seek; for the colouring matter obtained by the German chemist from the glands of 12,000 shell-fish, amounted to only about 23 grains, and the estimated cost of the dye was nearly £60 an ounce."—A. Findlay, *Chemistry in the service of man*, pp. 234-239.

Explosives.—If we examine closely a history of civilization, we should undoubtedly find it to be to a great extent, the history of man's endeavor to utilize and control energy. Progress is determined by the quantity of energy which mankind has been able to turn to useful account and by the degree to which it has been able to concentrate energy. With this in consideration, we can the more realize the value of explosives, representing as they do, highly concentrated forms of potential energy capable of being released for work almost at will. While their use in war has played an all-important rôle in our history, we must not overlook the fact that explosives have had powerful influences in the peaceful progress of civilization. We have but to note some of our great modern engineering feats, and we realize the prominent part taken by these sources of energy. "An explosive may be defined as a substance or mixture, solid or liquid, capable of undergoing extremely rapid combustion or decomposition, with production of gaseous substances which occupy a volume which may be ten or twelve thousand times as great as that of the explosive itself. In the case of gunpowder, cordite, and other propellants (low explosives), there is a rapid combustion of the explosive, but in the case of high explosives—to which class all the coal-tar explosives belong—the molecules of the compound are in a somewhat unstable condition, and, when subjected to a suitable shock, undergo decomposition into more stable substances. This decomposition is generally initiated by means of a 'detonator,' or substance which is, comparatively, very sensitive to shock, and the 'explosive wave' which is set up is transmitted with a very great velocity—amounting in some cases to more than four miles per second—and so causes an almost instantaneous decomposition of the explosive."—A. Findlay, *Treasures of coal tar*, p. 123.

Gunpowder and early use of explosives.—The origin of *gunpowder*, the only explosive known until the middle of the nineteenth century, is uncertain. Greek Fire, extensively used in the defense of Constantinople in the seventh century, is generally regarded as a form of gunpowder, but the theory is also advanced that it was merely an incendiary mixture to which nitre had been added to make it burn more fiercely. There is evidence that the Chinese used gunpowder in warfare about 1232, and the writings of Roger Bacon also leave no doubt but that he was fully acquainted with the explosive properties of sulphur, charcoal, and nitre mixtures. There are indications that the Arabs, too, at this period, possessed a knowledge of these properties. The early usages of gunpowder were confined chiefly to warfare, in the form of hand grenades. While it is officially recorded that the English used cannon at the battle of Crecy in 1346, they seem to have been used a few years prior in the Hispano-Moorish wars. "The manufacture of gunpowder was originally carried out by the very crude method of pounding the ingredients together by hand in mortars, but edge runners were introduced towards the end of the sixteenth century. The original mixtures were of very fine grain, were deliquescent, and the ingredients separated very easily when the powder suffered vibration as in transport. In the fourteenth century attempts were made to avoid this latter defect by the addition of camphor, sal-ammoniac and gum, and in the sixteenth century the process of 'corning' or 'granulating' was introduced. This was done by moistening the powder during the latter stages of mixing, so as to obtain a cake which was subsequently broken up and sifted. *Fuzed shells* were first introduced in 1588, but the fuzes were naturally of a very crude nature. More accurate fuzes were employed by the British at the siege of Gibraltar in 1779, and *shrapnel shell* was introduced a few years later. Berthollet, as a result of his researches on *chlorates*, in 1788 suggested substituting potassium chlorate for nitre, and obtained a more powerful explosive by this means, but it was too dangerous to make or use. A chlorate powder, however, was adopted in 1805 by Forsyth as a priming charge. *Fulminate caps* seem to have come into use first about 1815, and in 1831 Bickford first introduced *safety fuze*."—E. DeB. Barnett, *Explosives*, pp. 1-6.

Black gunpowder.—"Up to about 1886 black gunpowder had been used, but as it had been found that with increased length of the gun the pressure on the breech became injurious to the gun without giving the desired velocity to the projectile, many modifications were tried in the size of the grain, and in the cubes, prisms or perforated slabs in which form the powder was used. The old powder, however, had one insuperable defect, namely, the large quantity of smoke produced in firing. This arises from the fact that black gunpowder is composed of nitre, charcoal, and sulphur in the proportions on the average of 75:15:10 per cent., respectively. Hence when burnt the potassium of the nitre is converted into a mixture of potassium carbonate, potassium sulphate, with a small quantity of potassium sulphide, all of which are solids, and being dispersed in fine powder give rise to clouds of smoke. . . . Changes in the guns then demanded changes in the rate of combustion of the powder used in them, while the conditions of modern warfare required a propellant which should be practically smokeless. It seemed useless to construct quick-firing guns and machine guns capable of delivering a shower of bullets if after the first discharge or two all view

of the enemy in front of the guns became impossible. Gun-cotton [see below], which is the essential basis of all modern propellants, differs from the old powder in yielding only gaseous products in its explosion, without any solid and hence without smoke. There is also an important difference between the two, in the fact that the old powder is merely a mechanical mixture of solid ingredients, the particles of which, under a microscope, can be seen lying side by side but quite distinct from one another, while gun-cotton is a chemical compound."—W. A. Tilden, *Chemical discovery and invention in the twentieth century*, pp. 375-377.

Gun-cotton.—"The discovery of *gun-cotton* by Schönbein in 1845, and of nitroglycerine by Sobrero in 1846, opened up new fields, although the accidents attendant on the manufacture of these substances at first greatly delayed their general introduction. Schönbein sold the British rights of his patent to John Hall & Sons, of Faversham, who manufactured *gun-cotton* for a few months, but abandoned it in 1847, after a disastrous explosion. Six years later the Austrian Government took up the matter, and General von Lenk constructed some batteries in which *gun-cotton* was used both as a propellant and as a bursting charge for the shell. These were not an unmitigated success, and after two disastrous explosions in 1865, they were abandoned. In the meantime the British Government had taken up the subject, and Frederick Abel [1827-1902] carried out investigations on their behalf. He quickly realized that the instability of *gun-cotton* was due to the difficulty in washing it, and in 1865 introduced the pulping process. Simple as it may seem, this must be regarded as an epoch-making discovery, as it at once changed a very dangerous process into one of the safest known in an explosive works. Also the wet pulp could be compressed into blocks which were convenient for transport and use. The usefulness of these blocks was greatly enhanced by the discovery by Braun in 1868 that dry *gun-cotton* could be fired by a fulminate detonator, and that wet *gun-cotton* could be fired in the same way if a small primer of dry *gun-cotton* was used. The value of this discovery will be realized when it is remembered that wet *gun-cotton* is non-inflammable and insensitive to shock. These slabs of wet *gun-cotton* have for many years been the standard explosive for military demolitions and for signal maroons, and until quite recently have been the invariable charge for torpedoes."—E. DeB. Barnett, *Explosives*, pp. 1-6.

Sprengel explosives.—*Smokeless powder.*—*Picric acid.*—T. N. T.—A new class of explosive was introduced by Sprengel in 1871. He found that mixtures of suitable organic matter, such as nitrobenzole, and strong or fuming nitric acid or liquid nitrogen tetroxide, could be detonated. These had the advantage that the ingredients were kept separate and only mixed just before the shot was fired, and although nitric acid is an inconvenient liquid to transport, *Sprengel explosives* enjoyed some vogue. A more rational explosive of the Sprengel class was introduced by Devine in 1880. This consisted in a cartridge of potassium chlorate which immediately before use was dipped into an organic liquid such as nitrobenzole. *Rack-a-rock* was an explosive of this nature, and was used in 1885 for blasting Hell Gate Rock in New York harbour. The first ammonium nitrate explosive was introduced by Favier in 1885, but attracted scant attention at the time on account of its objectionable hygroscopic properties. Finally, in recent years proposals have been made to employ mixtures of liquid air or oxygen in conjunction with organic

matter, and although a good deal of the blasting in connection with the Simplon tunnel was carried out with explosives of this class, they suffer from obvious disadvantages and are never likely to come into general use. They have been used, however, for general blasting purposes in Germany during the war [1914-1918]. . . . Berthollet in 1788 was the first to propose the use of *chlorates*, but was compelled to abandon the scheme on account of the great sensitiveness of his mixtures. This danger was remedied by Street in 1897, who prepared safe chlorate mixtures from potassium chlorate and castor oil thickened with a nitrohydrocarbon. These have met with considerable success under the name of *Cheddite*. The first *smokeless powder* after von Lenk's nitrocotton batteries was introduced by Schultze in 1865. It consisted of pellets of wood which were nitrated and then impregnated with barium nitrate or potassium nitrate. A great stride was made by Volkmann five years later, who partly gelatinized nitrated wood by treatment with a mixture of alcohol and ether. This must be regarded as having laid the foundation of the modern smokeless powder industry. A similar powder, E. C. powder, was introduced in 1882 by the Explosives Company of Stowmarket. It consisted of partly gelatinized nitrocotton impregnated with a mixture of barium and potassium nitrates, and found immediate favour among sportsmen. The first smokeless military powder was Poudre B, introduced by Vielle, in 1886, and adopted by the French Government. It was made by forming a dough of nitrocellulose with alcohol and ether, which was then rolled out into sheets, cut up into strips, and dried. . . . Sprengel in 1871 drew attention to the fact that *picric acid* could be detonated, but no use was made of this discovery until Turpin proposed its use in 1886 as a bursting charge for shells. For this purpose it found wide application under the names of *Melinite*, *Lyddite*, etc., but has now been largely replaced by the cheaper and safer *trinitrotoluol*.—E. DeB. Barnett, *Explosives*, pp. 1-6.—“Trinitrotoluene, which was later to become known as such an excellent explosive, was prepared in 1863 by Wilbrand, and in 1869 by Beilstein and Kuhlberg. Paul Hepp, in 1880, produced particularly pure trinitrotoluene from p- and o-nitrotoluene. . . . Toluene itself is recovered almost exclusively from the coal-tar of gas works and coke ovens, and after all the necessary separations, purifications, and distillations of the tar have been carried out and the final rectification undertaken. . . . In the explosive industry the raw material used for the manufacture of trinitrotoluene is either pure toluene, mononitrotoluene, which is manufactured for other purposes than explosives, as, for instance, for the dyeing industry, or finally from ‘dinitro oil.’ . . . In order to discover the effect of friction on trinitrotoluene, a sample of the material was taken first alone and then mixed with sand and thoroughly ground in an iron mortar without any extraordinary phenomena being observed. By striking a sample of the material upon an anvil, it was only possible to cause a slight decomposition which was accompanied by the development of a small quantity of smoke. . . . Further experiments proved that trinitrotoluene could not be made to explode either by heating in an open flame or by simply heating in air in open vessels. . . . Only by the rapid heating of large quantities in closed vessels was it possible to cause a moderate detonation, which was, moreover, only accompanied by very small effects. . . . This behaviour of trinitrotoluene to blows, friction, and high tem-

peratures was amply confirmed in a research undertaken at the Technischen Hochschule of Hanover in April, 1903. . . . It has been proved to be one of the most insensitive and safe compounds which has been used up to the present time. The insensitivity of mixtures of trinitrotoluene and ammonium nitrate is so great that much research was necessary to find thoroughly satisfactory means for their ignition when used as fillings for high-explosive shell. . . . Whilst trinitrotoluene having a melting point of 72° to 76° C. practically finds its sole use in combination with substances rich in oxygen, pure trinitrotoluene having a melting point of 80.6 is most advantageously used alone as a filling for bombs, mines, shells, or torpedoes, and for this purpose is rapidly displacing picric acid, which was believed to be unique in this respect. On account of the acknowledged excellence of picric acid as an explosive, it will not be without interest to enumerate a few of the reasons why it is being replaced by trinitrotoluene, which is a somewhat less powerful explosive, but which nevertheless possesses many distinct advantages. The unpleasant bitter taste of the dust and fumes of picric acid are known to every chemist, but only experts and those who come into contact with it know of the baneful action that picric acid dust has on health, leading as it does to heart disease and disturbances of the digestive organs. These so-called poisonous vapours are concerned not only with the manufacture of the explosive, but also with its use as a filling for shells when the picric acid is being melted and when it is used as a dry powder. In addition to these properties, which can have such an injurious effect on the health of the workers, the chemical properties of picric acid, in so far that it acts as a strong acid, must be taken into consideration, since highly-explosive picrates are readily formed which make the manipulation of the explosive extremely dangerous. It will therefore be readily understood that a material so chemically stable, so insensitive, and so completely durable as trinitrotoluene, and one which neither during its manufacture nor its subsequent manipulation, provided the necessary precautions are taken, causes such a deleterious or injurious effect upon the health of the workers, should have taken the place of picric acid as an explosive. . . . For military purposes only crystallised, commercially pure, so-called 81/82 trinitrotoluene is used. . . . Attempts were next made to compress the crystallised trinitrotoluene. . . . [The] insensitivity of pressed trinitrotoluene, however, caused great difficulty when it was used for artillery purposes. . . . In modern practice trinitrotoluene is both pressed and cast on a large scale.”—E. de W. S. Colver, *High explosives*, pp. 18, 172, 174, 222-223, 242-244.
Nitroglycerine.—Dynamite.—Blasting gelatine.—Cordite.—Nitroglycerine, a compound similar in constitution to nitrocellulose, both being nitrates, was discovered by Sobrero, an Italian chemist, in 1847. Though its explosive properties were known it was regarded as dangerous, and was not generally used as a blasting agent till after 1867 when Alfred Nobel discovered a method of rendering it portable and less dangerous by incorporating the liquid with a sufficient quantity of a fine silicious earth, called kieselguhr. The product is *dynamite*, which is familiar enough by name to the public. Nitroglycerine is produced very simply by the interaction of a mixture of nitric and sulphuric acid with pure glycerine. Glycerine is the secondary product obtained in boiling fat or oil with caustic alkali for the purpose of producing soap. But a large quantity is also produced by

distilling fats in super-heated steam, when the fatty acid and glycerine are obtained, and it is only necessary to evaporate the watery part of the distillate to obtain the glycerine. Glycerine, or glycerol as it is called in systematic chemical language, is a familiar colourless syrupy liquid, with a sweet taste. It mixes with water in all proportions, and when mixed with nitric acid it is converted into the nitrate, or nitroglycerine, at the same time that water is produced. While formerly only small quantities at one time of glycerine were acted on by the acids, a charge of 1400 lbs. of glycerine may be now used in one operation in the apparatus called a nitrator-separator. In the modern practice a mixture of strong nitric acid with sulphuric acid is used, to which is added a certain amount of anhydrous sulphuric acid in the form of what is called oleum, which combines with a larger proportion of water, with the result that the yield of nitroglycerine is not far short of the theoretically possible amount. From the formulæ 100 parts of glycerine should yield 246.7 parts of nitrate, while in practice upwards of 230 parts are obtained. . . . In 1875 it was discovered by Alfred Nobel that when a low grade of guncotton and nitroglycerine are mixed together the cotton loses its fibrous or cellular structure and becomes gelatinised. In the product each constituent has its explosive properties modified, and the mass becomes better suited to blasting purposes than either ingredient separately. This substance has been largely used under the name 'blasting gelatine,' and it is otherwise interesting as the forerunner of the various mixtures which have been the subject of experiment and which have resulted in the production of the chief military propellant *cordite*. It was discovered that not only could the lower nitro-celluloses be gelatinised by nitroglycerine, but that the most highly nitrated cotton could be blended with nitroglycerine if the mixture was treated with a common solvent such as acetone."—W. A. Tilden, *Chemical discovery and invention in the twentieth century*, pp. 382-385.

Interrelation between dyes, drugs, perfumes, and explosives.—One of the most fascinating studies for the chemist—and also for the layman—is that of the interrelation between the different branches of organic chemistry. The many substances, with totally different physical as well as chemical properties, produced by the slightest rearrangement of the atomic structure present only one of the interesting phases. Thus, from alcohol, C_2H_5OH , we can obtain substances such as mustard gas, $(C_2H_5)_2SCl_2$, so frequently used during the World War and dyes as pontamine yellow; from toluene, $C_6H_5.CH_3$, easily obtained as a coal-tar distillate, are produced substances such as saccharine,

synthetic oil of bitter almonds, C_6H_5COH , the high explosive T.N.T., $C_6H_2(NO_2)_3CH_3$, as well as various important and essential dyes and intermediate dye products. The industries manufacturing dyes, drugs, and explosives are in most cases closely interwoven, and three products usually being simultaneously manufactured in the same plant, due to their intimate chemical relationship. It is a matter of but a moment's notice, and the dye plant has been turned, as if by magic, into one manufacturing the modern high explosives; and the return can be accomplished in as short a time.

This interrelation is now (1922) playing an important rôle in the commercial policies of the

great powers of the world, for in all these countries, the lessons of the recent war have been vividly brought home to them in the form of German preparedness for conflict. It is urged that protective measures be passed to insure the comparatively new home industries against being wiped out by the competition offered by German dye manufacturers, thus saving an industry which can be made to play an important part in any scheme of military preparedness.

RADIO-ACTIVITY

"The phenomena of radio-activity revive interest in the prophetic views of Michael Faraday. In 1816, when he was but twenty-four years of age, he delivered a lecture at the Royal Institution in London on Radiant Matter. In the course of his remarks there occurs this passage:—"If we now conceive a change as far beyond vaporization as that is above fluidity, and then take into account the proportional increased extent of alteration as the changes arise, we shall perhaps, if we can form any conception at all, not fall short of radiant matter; and as in the last conversion many qualities were lost, so here also many more would disappear. It was the opinion of Newton, and of many other distinguished philosophers, that this conversion was possible, and continually going on in the processes of nature, and they found that the idea would bear without injury the applications of mathematical reasoning—as regards heat, for instance. If assumed, we must also assume the simplicity of matter; for it would follow that all the variety of substances with which we are acquainted could be converted into one of three kinds of radiant matter; which again may differ from each other only in the size of their particles or their form. The properties of known bodies would then be supposed to arise from the varied

arrangements of their ultimate atoms, and belong to substances only as long as their compound nature existed; and thus variety of matter and variety of properties would be found co-essential.”

—G. Iles, *Inventors at work*, pp. 204-205.

Electric discharges in attenuated gases.—“If a first step towards understanding the relations between aether and ponderable matter is to be made, it seems to me that the most hopeful foundation for it is knowledge derived from experiments on electricity in high vacuum.”—Lord Kelvin (1893). The study of the phenomena attending the passage of electricity through gases has led to astounding developments . . . and abundantly justified Lord Kelvin’s prognostication. Under ordinary conditions, gases are such poor conductors of electricity that they are classed as good insulators. In order to get electricity to pass through air at ordinary atmospheric pressures, an electrical pressure approaching 30,000 volts per cm. is required; and as the pressure of the air is diminished the voltage required to produce a discharge diminishes in almost exactly the same proportion. If a glass tube, about 30 cm. long, be connected with a mercurial air pump and the aluminium electrodes—disc and point—be connected with an ordinary induction coil and battery, either no spark, or thin zig-zag sparks will pass through the tube; all depends on the distance of the electrodes apart, and on the electric pressure produced by the coil. If the pump be started, the spark passes more and more readily as exhaustion proceeds; first, forked brush-like bluish sparks begin to leap from electrode to electrode. . . . As exhaustion continues, the striæ diminish in number and size; and they appear to be paler in colour. . . . The pressure is then about 0.03 mm. of mercury. With further exhaustion the tube looks as if it were empty, but the glass still glows brightly, particularly about the cathode. With still further exhaustions, the current from the induction coil is unable to pass through the vacuum tube. The fact that the tube when highly evacuated is non-conducting shows that the electric current must somehow be carried from one electrode to the other by something. W. Hittorf (1860) showed that if a solid body—say, a Maltese cross—made of mica be placed between the anode and cathode, a true shadow appears on the glass; the shape of the cross shows that something must travel from the neighbourhood of the cathode in straight lines. This ‘something’ which causes the phosphorescence of glass was called by E. Goldstein (1876) cathode rays. His conclusions were: ‘(1) the cathode rays travel in straight lines normal to the surface of the cathode; and they will cast a well-defined shadow if a solid object be placed between the cathode and the wall of the vacuum tube . . . (2) cathode rays can exert mechanical pressure . . . (3) many minerals become phosphorescent when exposed to the cathode rays . . . (4) the cathode rays raise the temperature of bodies on which they fall . . . (5) the cathode rays can produce chemical or physical changes . . . (6) the cathode rays are negatively electrified while the other contents of the tube are positively electrified . . . (7) the cathode rays can be deflected from their normal course by means of a magnet . . . (8) the cathode rays can penetrate and pass through thin sheets of metal, but not through thick sheets.’ At first, the cathode rays were thought to be a stream of negatively electrified atoms or molecules of the residual gas in the evacuated tube; C. Varly (1871), or rather W. Crookes (1879), suggested that they were particles or molecules of a

fourth state of matter—an ultragaseous state which was called radiant matter—in which the free paths of the molecules were so long that collisions could be disregarded. Owing to their high penetrative power (Lenard rays), and the fact that no difference in the properties of electrons can be detected by changing the kind of gas in the evacuated tube, nor by changing the electrodes, it follows that (9) the cathode rays are independent of the kind of matter present; and if the particles be matter at all, the matter is the same in kind from whatever source it is derived. E. Wiechart (Jan., 1897) and J. J. Thomson (Apr., 1897) suggested the startling hypothesis that what Crookes called ‘radiant matter’ or the cathode rays, is a stream of negatively charged particles or corpuscles which have been formed by the disintegration of atoms of the gas in the vacuum tube. The term electron was applied by G. J. Stoney (1881) to designate the unit or atomic charge of electricity, and it is now almost universally applied to the sub-atomic particles supposed to stream from the negative electrode when a discharge is passing through an attenuated gas. No difference can be detected in the corpuscles derived from different gases, and hence it is inferred that the electrons are common constituents of all gases. If a stream of electrons be directed into an atmosphere of moist air, each electron serves as a nucleus about which moisture collects, and each electron becomes the centre of a visible drop of water. Hence (10), a stream of electrons, when directed into moist air, forms a cloud. The cloud or mist is an aggregate of minute falling raindrops; and it is assumed that, like a particle of dust in moist air an electron in moist air can serve as a nucleus for the condensation of the water vapour.”—J. W. Mellor, *Modern inorganic chemistry*, pp. 826-830.

Cathode ray theory.—“According to hypothesis, the electric discharge in attenuated gases splits the atoms of the gas into positively and negatively charged electrons. The cathode rays are a stream of negatively charged electrons sent from the cathode with a high velocity. It is inferred that ordinary atoms are probably made of nothing but aggregates of sub-atomic particles—positively and negatively charged. Under ordinary conditions, the charges counteract one another and the atom is electrically neutral. By the action of an electrical discharge, negative electrons are supposed to be detached from the atom, leaving a residue with a positive charge, and called a positive electron or positive ion. If a negative electron attaches itself to a neutral atom, the latter will acquire a negative charge. In reviewing the evidence derived from the properties of cathode rays J. J. Thomson (1897) said: ‘The explanation which seems to me to account for the facts in the most simple and straightforward way is founded on the view of the constitution of the chemical elements which has been favourably entertained by many chemists.’ The view is that the atoms of the different chemical elements contain different aggregations of particles of the same kind; otherwise expressed, that a part at least of all atoms consists of electrons. . . . Compared with the atom, the electron has quite a microscopic size. The electrons can travel with a velocity ranging as much as 90,000 miles per second. Their speed is dependent upon the intensity of the electrical force passing through the vacuum tube. A cathode particle travelling at this speed could go nearly twice round the earth in a second. The idea that the electrical condition of matter and its chemical activity depend upon the addition or

removal of electrons from atoms or molecules has been incorporated with the ionic hypothesis."—*Ibid.*, pp. 830-831.

Röntgen or X-rays.—"When the exhaustion of a vacuum tube is such that the tube is on the verge of becoming electrically non-conducting, and the glass opposite the cathode is brilliantly fluorescent, rays proceed from the fluorescent glass, outside the tube; these rays—called X-rays or Röntgen rays—have quite different properties from the cathode or Lenard rays, because they will pass through glass, and they are not deflected by a magnet. Like rays of light, Röntgen rays can be reflected, refracted, and polarized; and they are not appreciably affected by the most powerful electric or magnetic fields as charged particles would be. It is supposed that Röntgen rays—like rays of light, radiant heat, and electro-magnetic waves—are due to pulses or waves set up in the aether by the impact of electrons on matter. . . . The discoverer of the X-rays, W. C. Röntgen (1895), found that they can excite fluorescence on a paper screen coated with barium platinocyanide, BaPtCy, or calcium tungstate, CaWO; they can fog a photographic plate; and make the air through which they pass a conductor of electricity. They have a remarkable power of penetrating substances opaque to ordinary light. Röntgen rays are produced by the destruction of the cathode rays and are formed when the cathode rays impinge on solid objects. Every substance when bombarded by electrons emits Röntgen rays—the glass walls of a vacuum tube, heavy metals like platinum or uranium, etc."—*Ibid.*, p. 831.—"Provided with a Röntgen bulb, the photographer passes from the exterior to the interior of an object, almost as if he were a sorcerer with power to transmute all things to glass. Equipped with a simple X-ray apparatus, dislocations and fractures are detected by the surgeon, diseases of bones are studied, and shot, needles, and bits of glass or corroding wire within the muscles of a patient are located with exactitude. . . . The same means of exploration offers equal aid to medicine; it demonstrates the calcification of arteries, and aneurisms of the heart or of the first part of the aorta; . . . Dr. C. M. Mouillin, addressing the Röntgen Society of London as its president, states that the fluorescent screen has now reached such a degree of perfection that the minutest movement of the heart and lungs, and the least change in the action of the diaphragm, can be watched and studied at leisure in the living subject. . . .

"Manifestly, the unseen universe which enfolds us is steadily being brought to the light of day. The investigations of Hertz established that the light-waves which affect the eye are but one octave in a gamut which sweeps indefinitely far both above and below them. In his hands, as in those of Joseph Henry long before, electric waves found their way through the walls and floors of a house; in the Marconi telegraph these waves pass through the earth or a fog, a mist or a rain-storm, with little or no hindrance. What does all this mean? Nothing less than that, given its accordant ray, any substance whatever is permeable, and that, therefore, to communicate between any two places in the universe is simply a question of providing the right means."—G. Hes, *Flame, electricity and the camera*, ch. 24.

Positive or canal rays.—"When a perforated cathode is employed in the vacuum tube for producing cathode rays, E. Goldstein (1866) first noticed that streams of violet light passed through the perforations or canals and emerged behind

the cathode on the side remote from the anode, and hence he called these streams Kanalstrahlen (Canal rays). . . . The canal rays have been investigated by methods similar to those employed for the cathode rays. The results indicate that the canal rays are streams of particles the majority of which are positively electrified—hence, the term positive rays replacing the older term, canal rays. The streaming particles travel in straight lines and produce a phosphorescence (usually violet) when they impinge upon glass, etc. The speed of the positive electrons is usually much less than that of the negative electrons; and they are not so sensitive to magnetic influences. . . . It is probable that when a gas is ionized, one or more negatively electrified particles—electrons—are expelled from the atom, and the corresponding positively charged nucleus remains."—J. W. Mellor, *Modern inorganic chemistry*, pp. 833-834.

Becquerel rays.—"About the time Röntgen (1895) discovered the peculiar X-rays, radiating from phosphorescing Crookes' tubes, H. Becquerel (1866) repeated some experiments of Niepce de St. Victor (1867) in order to find 'if the property of emitting very penetrative rays is intimately connected with phosphorescence.' In other words, does the principle of reversibility apply? If Röntgen rays make a fluorescent substance shine in the dark, will a fluorescing substance emit invisible penetrative rays?"—*Ibid.*, p. 836.—"The efforts of Becquerel were crowned with success in an unexpected direction. He exposed a uranium salt to the light, and then placing it in a dark room on a photographic plate covered with opaque paper he demonstrated the action of these rays on the plate through the paper, thin sheets of metal, etc. But the supposed and sought-for relation of the rays to the previous fluorescence was not evident, for Becquerel obtained precisely the same results with preparations of uranium which had not only not been previously exposed directly to the light, but had purposely been kept some time in darkness and could therefore display no stored-up luminescence. He had, however, discovered the uranium or Becquerel rays."—F. Himstedt, *Radioactivity (Annual Report, Smithsonian Institution, 1905-6, pp. 117-118)*.

Radium: discovery and properties.—"At Becquerel's suggestion, Madame Curie undertook a systematic investigation of all the chemical elements and established the fact that with none of them, excepting uranium and thorium, could an appreciable effect indicating rays be obtained with her apparatus. On the other hand, she found that many of the minerals investigated showed noticeable action in this direction. The fact that a few of them, the uranium pitchblende, for example, from Joachimsthal, Bohemia, emitted rays three or four times stronger than those of pure uranium, and which could not therefore be announced as uranium rays, led her to suppose that in the pitchblende itself, apart from the uranium, there must exist a still more powerful radioactive substance. It is a matter of record how, in this research, which might serve as a model for such work, she and her husband, so soon afterwards to lose his life by a deplorable accident, succeeded in tracing this supposed substance more and more accurately, and finally in obtaining it pure. Madame Curie thus became the discoverer of radium, a new element possessed of wonderful, of fabulous qualities."—*Ibid.*—It was these results "that determined the attribution in 1903 of the Nobel Prize to Monsieur Becquerel

and Monsieur and Madame Curie jointly and severally for their researches in phenomena of spontaneous radiation. A new science had sprung up—a science of the deepest importance: the science of radio-active phenomena. . . . In 1912 [Madame Curie] was occupied in establishing an international standard of radium—*i. e.*, making the comparison of different specimens of radium from wherever they might have been obtained. . . . It should be noted that the last miracle of the series—*i. e.*, the 'isolation' of radium, and therefore the existence of pure radium—was only accomplished by Madame Curie many years after the first discovery. . . . She first made out a list methodically of every common and uncommon element, every combination possible, . . . and never rested till she had gone through the lot. 'Madame Curie experimented with some very rare elements' (Rutherford). 'It seems she broke up the bromide by electrical methods—and there in her tiny crystal retort was the minute film of bright metal.' 'She also determined correctly the atomic weight of radium (pure) hitherto unknown.' For these further discoveries she was again awarded the Nobel Prize, this time alone."—M. Cunningham, *Madame Curie and the story of radium*, pp. 29, 33, 34.—"The Becquerel rays evolved from radium chloride closely resemble those from uranum and they produce similar effects, but over a million times more intense. The Becquerel rays from radium chloride or radium bromide incite phosphorescence in diamonds, rubies, fluorspar, calcium sulphide, zinc sulphide, barium platinocyanide, etc. If the eyes be closed, and a tube of radium bromide be held near the forehead, the retina of the eye becomes phosphorescent, and light will be seen though the eyes are closed. A tube containing a little radium bromide when held near the skin for a few hours produces painful sores. Caterpillars and other small animals are said to be killed if shut up in a box with a minute fragment of radium. The radiations coagulate proteid matter—*e. g.*, globulin. It is also claimed that the exposure of malignant skin diseases, superficial cancer nodules, etc., has proved beneficial in many cases although the testimony of medical experts is not unanimous. . . . It has been estimated that a gram of radium will continue radioactive for about 2500 years, and it therefore follows that a gram of radium gives energy equivalent to that obtained by burning 9/10ths of a ton of coal during the period of radioactive change. Otherwise expressed, radium furnishes 250,000 times as much energy as is given by burning an equal weight of coal. Obviously, too, a relatively large amount of energy is needed for the continuous decomposition of water by radium salts in aqueous solutions. Hence radium is continually doing work at an undiminishing speed without any external supply of energy; otherwise expressed, the reaction is exothermal."—J. W. Mellor, *Modern inorganic chemistry*, pp. 840-841.

Rutherford's work on thorium.—Theory of atomic disintegration.—Formation of helium from radium.—"The subject of radioactivity entered upon a new stage when, in 1900, Sir Ernest Rutherford, then professor in Montreal, began an intensive study of the radio-activity of thorium, the only previously well-known element except uranium which had thus far shown the property. Acting upon the observation of Owens that some of the effects produced by radioactive products were modified by currents of air, Rutherford found that air which had been passed over an active thorium preparation had itself acquired activity,

but that this activity decayed rapidly with the time in accordance with the equation

$$\frac{I_t}{I_0} = e^{-\lambda t}$$

where I_0 represents the initial intensity, I_t that at the time t , e the base of natural logarithms, and λ a constant characteristic of the substance. It has since been found that all radioactive materials follow this law of gradual decay and it is perhaps the most important single generalization in the subject of radioactivity. The experiments showed that thorium was continually producing an extremely attenuated but highly radioactive gas, and to this Rutherford applied the name of the thorium emanation. He found that when the gas is retained for some time in any vessel the walls of the latter become coated with active material. This he called the *radioactive deposit*. It exhibited some remarkable properties. If a negatively charged wire was suspended in a vessel containing the emanation, all the deposit was concentrated upon the wire. The quantity of material was so small that it could be recognized only by its activity, but that it was a solid adhering to the wire seemed amply proved by the fact that it could be driven off by heat, or removed by rubbing with sandpaper. Still another substance, therefore, had been formed by the decomposition of the emanation, whose activity and period of decay were different from the latter. In 1902 Rutherford and Soddy pointed out another decomposition of thorium compounds of a somewhat analogous character. When a solution of thorium nitrate, for example, is precipitated by ammonia, the hydroxide thrown down, when filtered and dried, is found to be almost inactive. If the filtrate, however, be evaporated to dryness and the ammonia nitrate expelled by heat, an extremely small residue is left which possesses practically the whole activity of the original preparation. At the end of about a month, however, this has been practically lost, while that of the precipitated thoria has by this time regained practically all its original value. Subsequent investigation has shown that the changes just mentioned are in reality a good deal more complex, but these experiments sufficed to prove that radioactivity is accompanied by the formation of new material. Any single process, therefore, cannot be of infinite duration.

"On the strength of this evidence Rutherford and Soddy in 1902 advanced their theory of atomic disintegration, which thus far has accounted for all observed phenomena and is the present working hypothesis of the subject. Its fundamental principles may be stated as follows: The chemical atom is not to be regarded as an impenetrable and indivisible point, but as an extremely complex structure, and the forces which determine the relations of its component parts are incomparably greater than any which obtain in chemical combination between the atoms. The atoms of a substance which we call radioactive are unstable, and manifest this instability in the peculiar manner that certain ones (determined solely by the total number present) decompose explosively every instant, throwing off with great velocity the material composing the various kinds of rays above described, and leaving behind a new chemical element with properties of its own, which may or may not include radioactivity.

"Since radium occurs only in minerals containing uranium, this theory made it probable that radium is a product of the latter, and since most active minerals such as monazite sand contain helium,

this might be looked upon as one of the products of such activity. The latter point was established beyond question in 1903 when Ramsay and Soddy undertook a thorough study of the radium emanation. This material is a true gas obeying Boyle's law. It can be separated from other gases, condensed to a liquid, and frozen. Its atomic weight as determined from its density by Ramsay is 222. He classified it in the argon group and named it *niton*. The most striking observation made by Ramsay and Soddy was that when this gas has been kept for some days it disappears and helium appears in its place. This discovery, which represented the first known production of one element from another, seemed a realization of the dreams of the alchemists, and aroused a popular interest almost equal to that excited by the discovery of the X-rays. The experiment was soon successfully repeated in several laboratories. In the same year Rutherford pointed out that helium could not well be the only decomposition product of radium, as indeed was improbable, because the radium emanation like that of thorium also yielded an *active deposit*, which probably represents the greater portion of the products of decomposition. Rutherford suggested that the α rays emitted by the emanation, as well as other radioactive substances might really consist of electrically charged atoms of helium. In 1909 he was able to prove this by an extremely ingenious experiment. Some of the radium emanation was sealed into a tube of glass so extremely thin that α rays could penetrate it with considerable ease. This tube was then placed inside another which was attached to a spectrum tube. The outer tube was then evacuated. After two days its contents showed the principal lines in the spectrum of helium and after six the spectrum was complete.

"As a control a similar experiment was tried in which the inner tube was filled with helium instead of the emanation. None of this, however, penetrated to the outer tube. Meantime it had been shown that many other radioactive changes take place with evolution of α rays, and it follows from this, that the production of helium is not a particular property of the radium emanation but is a frequent accompaniment of perhaps the majority of such changes.

"From the chemical standpoint there is greater interest in certain researches carried on simultaneously with those described above, and which had for their object the discovery of new kinds of radioactive material. These for the most part had to be sought in the transformations of elements already known. Here it was soon found that many products at first deemed homogeneous like the *active deposit* really represented mixtures of several substances passing consecutively into each other. The relationships involved seemed at first sight hopelessly complex, but by applying the law of decay it became possible to recognize the activities of different elements even when they were superposed. In this way elements were discovered whose 'period of average life' had sometimes to be reckoned in seconds. This constant varies widely. For radium it is 2,440 years, for the emanation 5.55 days, and for uranium it is millions of years. In all about thirty radioactive elements have been discovered, each of which belongs to one of three series or families. The first comprises the products of disintegration of uranium and contains radium and polonium. The second series is formed by the decomposition of thorium, and the third is derived in the same way from actinium, a natural radioactive element allied to lanthanum, which was discovered by

Debiere in 1800. There is some reason to suppose that all three of these series end in ordinary lead, but this has not yet been proved."—F. J. Moore, *History of chemistry*, pp. 254-257, 261.

"H. S. Sheldon (1913) has emphasized the fact that the indifference of radioactive changes to temperature and other physical conditions must be a relative phenomenon, and a consequence of the limited range of our resources. The highest temperatures of our laboratories—3000°—are feeble when contrasted with those ten times hotter, which prevail in the colossal furnaces revealed by stellar spectra of the hotter stars. Consequently, the indifference of radioactive changes to external conditions cannot be accepted as absolute. Suppose, he adds, that electricity were unknown and it was only possible to attain variations of temperatures of a few degrees in our laboratories, then a large number of so-called compounds would be classed as elements, and the slow decomposition of many substances with the evolution of heat would appear as marvellous sources of energy, as unaccountable as radioactive changes are today."—J. W. Mellor, *Modern organic chemistry*, p. 853.—See also SCIENCE: Modern: 20th century: Chemistry.

CHEMISTRY, Agricultural.—Agricultural chemistry is that branch of chemical science which deals mainly with the problem of the soil, the nutrition of plants, and the composition of their products. "The rise of agricultural chemistry was necessarily contemporaneous with the rise of scientific agriculture. As there was really no science of agriculture until the latter part of the eighteenth century, it follows that the discussion of chemistry applicable to the cultivation of the soil has had a short history." Although the cultivation of the soil had been in progress for many centuries, "it cannot be said that the scientific side of agriculture received adequate consideration until after the Union of the Crowns in 1603. It is true that Tusser, who may be termed the father of modern agriculture, the author of the 'Hundred Points of Husbandry,' lived in the preceding reign of Elizabeth, but the admirable advice which he gave to farmers received little attention in his own day." With the growth in population in the eighteenth century, came the necessity for an improved system of agriculture. "Regular rotation of crops was introduced, turnips were sown in drills or rows, instead of broadcast." In 1790, the University of Edinburgh established a chair of agriculture. Twelve years later (1802), the first attempt to bring together the teachings of chemistry as applied to agriculture was made by Sir Humphry Davy who was invited by the British Board of Agriculture to deliver a series of lectures on agricultural chemistry. "The recognition of a distinct branch of chemistry, dealing with plants and soils, may be said to date from this period."

"Sir Humphry described the simplest method known of analysing soils to ascertain the constituents and chemical ingredients which appear to be connected with fertility. In the previous century it was supposed that minute earthly particles supplied the whole nourishment of the vegetable world, and that manures acted in no other way than in ameliorating the texture of the soil. Their agency was thought to be mechanical. But after the time of Cavendish, it was shown by Saussure and Hassenfratz's experiments that animal and vegetable matters deposited in soil are absorbed by plants, and that neither water, nor air, nor earth supplies the whole of the food of plants, although they all operate in the process of vege-

tation. Water acts as a solvent, vegetables decompose the carbonic acid gas of the atmosphere in the sunshine, and saline manures furnish a part of the true food of plants. The use of gypsum, particularly in the growth of clover, was recognised; slaked lime had been used by the Romans for manuring the ground in which fruit trees were grown; and marl had been employed by the British and the Gauls from the earliest times as a 'top-dressing.' Davy's experiments favoured the opinion that soluble matters pass unaltered into the roots of plants, and in consequence that water is essential to vegetable growth; the action of the roots is not selective, poisons being absorbed as well as useful substances. The great object in the application of manure, therefore, should be to make it afford as much soluble matter as possible to the roots of the plants. At the period when Sir Humphry Davy was lecturing on agricultural chemistry, it was popularly believed, although not universally accepted, that plants under the influence of sunlight absorb carbonic acid gas (carbon dioxide), decompose it, and exhale oxygen, while the reverse process takes place in the dark. It is now known that this is only a very rough, and not invariably correct, generalisation. Thirty years later, in Liebig's time, great importance was attached to humus, as the principal food of plants, absorbed from the soil by the roots. Experiments and calculations, however, have shown: (1) that the largest conceivable proportion of humus absorbed could not introduce more than a very small proportion of the carbon actually produced in vegetation; and (2) that humus in the form in which it exists in the soil is not absorbed, and does not yield the smallest degree of nourishment to plants. The mistake arose through the crude observation that dark soils rich in humus are always very fertile. Saussure's investigations established the belief that the carbonaceous material of plants is derived from carbonic acid gas, although it was not known in what way the change took place. The rotation of carbon and other elements between plants and animals was clearly established before 1845. The carbonic acid gas is mainly derived from the air, but a small quantity in solution is constantly absorbed by the roots. During the night carbonic acid gas is accumulated in all parts of plant structure, and decomposition begins when the rays of the sun strike the growing plants. It has to be observed, however, that humus exposed to the air by tilling and loosening supplied an atmosphere of carbonic acid gas. Next to Davy, no one has done more for agricultural chemistry than Baron von Liebig. His most important influence on agriculture was his recognition of the necessity of a sufficient, though small, supply of mineral matter as part of the essential food of plants and his observation that most soils contain very small proportions of these soluble mineral constituents, which are soon expended by continual cropping and removal of the crop, while, on the other hand, carbonic acid gas is furnished spontaneously by Nature. He made analyses of the ashes of plants, and introduced the practice of applying to the land manures containing potash salts, lime, and phosphates. The action of light was not well understood in Liebig's time. The conversion of starch into sugar was recognised as a hydrolytic action, but the chemists of that period had no conception of the way in which carbonic acid is transformed either into starch, or sugar, or any other vegetable matter. The synthesis of sugar by Fischer, and the formation of formaldehyde from

carbonic acid, have rendered it easy in modern times to conceive that carbonic acid gas may be reduced to formaldehyde, and then polymerised to formose, from which all other plant constituents may conceivably be produced. The only thing remaining to be determined at the present day [1912] is by what agency light falling upon the green parts of plants reduces carbonic acid to formaldehyde. Such conjectures are very easily formed, but very difficult to verify by experiment. From Liebig's time onwards the supplying of artificial manures has been an important industry, and has resulted in greatly increasing the yield of food crops by most soils. Opinion has varied from time to time as to the source of plant nitrogen. The investigations of Liebig naturally led to the belief that it is mainly derived from ammonia or nitrates, through the roots of the plants. . . . On the other hand, however, it has more recently been established, without leaving much room for doubt, that leaves have the power, in some plants at any rate, of absorbing nitrogen from the air."—J. C. Brown, *History of chemistry*, pp. 451-455.—The observations of Baron von Liebig concerning the mineral constituents of plants have been studied in recent times by Gabriel Bertrand. In a lecture on the "Chemical Infinitesimal in Agriculture" before the Eighth International Chemical Congress of Applied Science of September, 1912, he brought out the relations of metals and metalloids to the yield of crop. He proved "that some metalloids and metals, which are present in the plant in the most minute proportions may nevertheless be physiological factors, as necessary for the general metabolism of plants as carbon or nitrogen." Among these are manganese, baron, iodine, bromine, fluorine, arsenic, lithium, strontium, barium, zinc, copper, and cobalt. By a study of the composition of the plants, he found that he could increase the crop per acre by the addition of the soluble salt of the metal with the fertilizer. In an experiment with corn, he increased his weight of crop 61 per cent. by using as additional fertilizer 50 lbs. of boric acid, and 56 per cent. by using 25 lbs. as compared with the yield when no boric acid was added. Experiments with beets also showed marked increase in yields. Recent studies in the field of colloidal chemistry have brought out interesting and useful information for the agriculturist.

"One of the chief sources of usefulness of agricultural chemistry to the farmer, has been its poisons for the dreaded insects which have destroyed so many millions of dollars of crops. Insects may be divided into two classes, biting and sucking, while a third class is retained for the injurious fungi. Biting insects are destroyed by spraying the plants eaten with poisonous material that will be taken in by the insect with its food. The materials used are usually those compounds of arsenic having decided toxic effects and along with the other insect poisons are called insecticides. Among the more important ones for biting insects are, Paris Green first used for the Colorado Beetle (potato bug) in the United States; Bordeaux Mixture, first used in 1890 by Gillette; London Purple, imported from England in 1878 by Bessey as a substitute for Paris Green in the destruction of the potato beetle; calcium arsenite first used by Kilgare; lead arsenite, which was put on the market in 1892 as a caterpillar poison, and hellebore. To kill the sucking insects, it is necessary to close their pores. The surrounding atmosphere is therefore filled with poisonous fumes.

The more important of these poisons are lime-sulphur mixtures, used in California as a sheep dip in 1886, kerosene emulsions, soaps, nicotine sulphate solution, and carbon disulphide. The fungicides are most effectively destroyed by Bordeaux mixtures (made from milk of lime and copper sulphate), used since 1883 when Millardet used it against downy mildew of grape; lime-sulphur; sodium thiosulphate, used since 1885 against leaf blight; ammoniacal copper carbonate; and formaldehyde solution. It is thus apparent in the brief history of agricultural chemistry, as in the longer history of the science in general, that there has been much diversity of opinion in regard to matters of principle. But if there has been much diversity of opinion as to theory, there has been still more as to practice. While the judicious application of suitable chemical manures in appropriate quantities has a beneficial influence upon crops, it is quite possible to overdo such application. The commercial zeal of rival manufacturers has in many cases forced the use of chemical manures without sufficient regard to measure or propriety, with the result that serious injury has been done to the soil. The right understanding of the relation between soils and manures is a matter of study. With the extension of technical classes and laboratories, excessive use of chemical applications will be restrained, and mistakes will be avoided. Agricultural chemistry will then be esteemed one of the most important branches of the science."—J. C. Brown, *History of chemistry*, p. 455-456.—See also BIOLOGY: Applications.

CHEROKEES.—"The Cherokee tribe has long been a puzzling factor to students of ethnology and North American languages. Whether to be considered an abnormal offshoot from one of the well-known Indian stocks or families of North America, or the remnant of some undetermined or almost extinct family which has merged into another, appear to be questions yet unsettled."—C. Thomas, *Burial mounds of the Northern sections of the U. S.*, (*Fifth Annual Report of the Bureau of Ethnology*, 1883-4).—Facts which tend to identify the Cherokees with the ancient "mound-builders" of the Ohio Valley—the Alleghans or Talligewi of Indian tradition—are set forth by Prof. Thomas in a later paper, on the "Problem of the Ohio Mounds," published by the Bureau of Ethnology in 1880 [see ALLEGHANS] and in a little book published in 1890, entitled "The Cherokees in Pre-Columbian Times."—"The Cherokee nation has probably occupied a more prominent place in the affairs and history of what is now the United States of America, since the date of the early European settlements, than any other tribe, nation, or confederacy of Indians, unless it be possible

to except the powerful and warlike league of the Iroquois or Six Nations of New York. It is almost certain that they were visited at a very early period [1540] following the discovery of the American continent by that daring and enthusiastic Spaniard, Fernando de Soto. . . . At the time of the English settlement of the Carolinas the Cherokees occupied a diversified and well-watered region of country of large extent upon the waters of the Catawba, Broad, Saluda, Keowee, Tugaloo, Savannah, and Coosa rivers on the east and south, and several tributaries of the Tennessee on the north and west. . . . In subsequent years, through frequent and long continued conflicts with the ever advancing white settlements, and the successive treaties whereby the Cherokees gradually yielded portions of their domain, the location and names of their towns were continually changing until the final removal of the nation [1836-1839] west of the Mississippi. . . . This removal turned the Cherokees back in the calendar of progress and civilization at least a quarter of a century. The hardships and exposures of the journey, coupled with the fevers and malaria of a radically different climate, cost the lives of perhaps 10 per cent. of their total population. The animosities and turbulence born of the treaty of 1835 not only occasioned the loss of many lives, but rendered property insecure, and in consequence diminished the zeal and industry of the entire community in its accumulation. A brief period of comparative quiet, however, was again characterized by an advance toward a higher civilization. Five years after their removal we find from the report of their agent that they are again on the increase in population. . . . With the exception of occasional drawbacks—the result of civil feuds—the progress of the nation in education, industry and civilization continued until the outbreak of the rebellion. At this period, from the best attainable information, the Cherokees numbered 21,000 souls. The events of the war brought to them more of desolation and ruin than perhaps to any other community. Raided and sacked alternately, not only by the Confederates and Union forces, but by the vindictive ferocity and hate of their own factional divisions, their country became a blackened and desolate waste. . . . The war over, and the work of reconstruction commenced, found them numbering 14,000 impoverished, heart-broken, and revengeful people. . . . To-day their country is more prosperous than ever. They number 22,000, a greater population than they have had at any previous period, except perhaps just prior to the date of the treaty of 1835, when those east added to those west of the Mississippi are stated to have aggregated nearly 25,000 people. To-day they have 2,300 scholars attending 75 schools, established and supported by themselves at an annual expense to the nation of nearly \$100,000. To-day, 13,000 of their people can read and 18,000 can speak the English language. To-day, 5,000 brick, frame and log-houses are occupied by them, and they have 64 churches with a membership of several thousand. They cultivate 100,000 acres of land and have an additional 150,000 fenced. . . . They have a constitutional form of government predicated upon that of the United States. As a rule their laws are wise and beneficent and are enforced with strictness and justice. . . . The present Cherokee population is of a composite character. Remnants of other nations or tribes [Delawares, Shawnees, Creeks, Natchez] have from time to time been absorbed and admitted to full participation in the benefits of Cherokee citizenship."—C. C.

Royce, *Cherokee nation of Indians (Fifth Annual Report of the Bureau of Ethnology, 1883-84)*.—This elaborate paper by Mr. Royce is a narrative in detail of the official relations of the Cherokees with the colonial and federal governments, from their first treaty with South Carolina, in 1721, down to the treaty of April 27, 1868.—“As early as 1798 Barton compared the Cherokee language with that of the Iroquois and stated his belief that there was a connection between them. . . . Mr. Hale was the first to give formal expression to his belief in the affinity of the Cherokee to Iroquois. Recently extensive Cherokee vocabularies have come into possession of the Bureau of Ethnology, and a careful comparison of them with ample Iroquois material has been made by Mr. Hewitt. The result is convincing proof of the relationship of the two languages.”—J. W. Powell, *Seventh Annual Report of the Bureau of Ethnology, p. 77*.—See also INDIANS, AMERICAN: Cultural areas in North America: Southeastern area; 1893-1899; 1920: Facts on Oklahoma Indians; MUSKIOGEAN OR MASKOKI FAMILY; ALABAMA: 1835-1838; GEORGIA: 1825-1838; OKLAHOMA: 1824-1837; 1830-1844; 1860-1865; 1891-1901; SOUTH CAROLINA: 1750-1761.

CHERSON.—“A thousand years after the rest of the Greek nation was sunk in irremediable slavery, Cherson remained free. Such a phenomenon as the existence of manly feeling in one city, when mankind everywhere else slept contented in a state of political degradation, deserved attentive consideration. . . . Cherson retained its position as an independent State until the reign of Theophilus [Byzantine emperor, 829-842], who compelled it to receive a governor from Constantinople; but, even under the Byzantine government, it continued to defend its municipal institutions, and, instead of slavishly soliciting the imperial favour, and adopting Byzantine manners, it boasted of its constitution and self government. But it gradually lost its former wealth and extensive trade, and when Vladimir, the sovereign of Russia, attacked it in 988, it was betrayed into his hands by a priest, who informed him how to cut off the water. . . . Vladimir obtained the hand of Anne, the sister of the emperors Basil II. and Constantine VIII., and was baptised and married in the church of the Panaghia at Cherson. To soothe the vanity of the Empire, he pretended to retain possession of his conquest as the dowry of his wife. Many of the priests who converted the Russians to Christianity, and many of the artists who adorned the earliest Russian churches with paintings and mosaics, were natives of Cherson.”—G. Finlay, *History of the Byzantine empire from 716 to 1057*.—See also BOSPORUS, CIMMERIAN: 565-574.

CHESS, Origin of the game of.—“If we wished to know, for instance, who has taught us the game of chess, the name of chess would tell us better than anything else that it came to the West from Persia. In spite of all that has been written to the contrary, chess was originally the game of Kings, the game of Shabs. This word Shah became in Old French *eschac*, It. *scacco*, Germ. *Schach*; while the Old French *eschecs* was further corrupted into *chess*. The more original form *chec* has likewise been preserved, though we little think of it when we draw a cheque, or when we suffer a check, or when we speak of the Chancellor of the Exchequer. The great object of the chess-player is to protect the king, and when the king is in danger, the opponent is obliged to say ‘check,’ i. e., Shah, the king. . . . After this the various meanings of check, cheque, or exchequer become easily intelligible, though it is quite true that if similar changes of meaning, which in our case we can watch by the light of history, had taken place in the dimness of prehistoric ages, it would be difficult to convince the sceptic that exchequer, or scaccarium, the name of the chess-board was afterwards used for the checkered cloth on which accounts were calculated by means of counters, and that a checkered career was a life with many cross-lines.”—F. M. Müller, *Biography of words, ch. 4*.

CHIBCHA INDIANS.—The most northerly group of the tribes of the Andes "are the Cundinamarca of the table lands of Bogotá. At the time of the conquest the watershed of the Magdalena was occupied by the Chibcha, or, as they were called by the Spaniards, Muyscas. At that time the Chibcha were the most powerful of all the autochthonous tribes, had a long history behind them, were well advanced toward civilization, to which numerous antiquities bear witness. The Chibcha of to-day no longer speak the well-developed and musical language of their forefathers. It became extinct about 1730, and it can now only be inferred from existing dialects of it; these are the languages of the Turiero, a tribe dwelling north of Bogotá, and of the Itoco Indians who live in the neighborhood of the celebrated Emerald mines of Muzo."—J. S. Kingsley, ed., *Standard natural history*, v. 6, p. 215.—"As potters and goldsmiths they [the Chibcha] ranked among the finest on the continent."—D. G. Brinton, *Races and peoples*, p. 272.—See also **COLOMBIA: Inhabitants; INDIANS, AMERICAN: Cultural areas in South America: Chibcha area.**

CHIBKAT INDIANS. See **INDIANS, AMERICAN: Cultural areas in North America: North Pacific coast area.**

CHICAGO: Geographical position.—Area.—Population.—"Chicago, Cook County, Illinois, is situated on the south-western shore of Lake Michigan, at the head of lake navigation. . . . The spot now covered with stately blocks of buildings, and alive in every direction with a busy and eager multitude . . . was [about 1832] . . . a low and marshy plain."—*Chicago directory*, 1839 (*Fergus' historical series*, No. 2, pp. 53-54).—Chicago, in 1920, had an area of 123,142.6 acres, or about 192.4 miles, with a population of 2,701,705.

Also in: E. Atkinson, *Story of Chicago and national development*.—J. S. Currey, *Chicago; its history and its builders*.—H. C. Chatfield-Taylor, *Chicago*.

Industries.—"In 1916 Chicago manufactories numbered ten thousand; their finished products were valued at two billions; and furnished work for three hundred thousand wage earners who were paid two hundred million dollars. . . . [It is] the world's first city in live stock, in cement . . . and in food production. These and like statistics are self-evident facts."—W. D. Moody, *What of the City?* pp. 154, 155.—The great meat packing industry, is centered at the Union Stock Yards on the south side, together with the industries provided by its by-products, such as butter substi-

tutes, lard, soap, toilet articles, animal and poultry foods, glue, fertilisers, all manufactured from the waste of the meat packing industry. "Chicago is located in the center of the richest agricultural region of the world. . . . It is the great railroad center—great meat packing industries are located here—the receipts and shipments of grain at this point perhaps exceed those of any other city; and manufactured articles of all kinds carry the name 'Chicago' to the uttermost ends of the world—but the chief contribution to Chicago's greatness is the agricultural wealth of the great states contiguous to the city. Let us consider the great manufacturing plants where agricultural machines and implements are made. . . . Among the plants devoted to the manufacture of farm machines, wagons and implements, the largest are the McCormick, Deering, Weber, and Plano, known as the International Harvester Company. . . . The buildings of the various plants cover more than 700 acres of ground. The output includes grain binders, reapers, headers, header-binders, rice binders, mowers, corn binders, huskers and shredders, hay rakes, hay tedders, sweep rakes, hay stackers, hay presses, knife grinders, binder twine, wagons, cream separators, gasoline engines, auto-buggies, manure spreaders, and feed grinders, together with duplicate parts of all machines and implements. [Other great industries are the Illinois Steel Company, Portland cement, furniture in wood and steel, clothing, shoes, mining machinery, aeroplanes. The largest manufacturing plant of the Western Electric Company is just outside the city limits.] . . . Chicago has a favorable location. Being situated in a broad and fertile valley, she is able to command abundant supplies of food for her great population, as well as raw materials for the various lines of industry carried on in her manufactories, foundries, and shops. Her position at the head of Lake Michigan gives her control of the commerce of the lakes, and invites to her door the products of the varied industry of the North and East during the season of lake navigation. This control of the lakes and her easy access to the productive prairies west and south have naturally made Chicago the terminus of many lines of railroads and these railroads have proved important factors in her phenomenal development."—Editorial staff Little Chronicle Company, *Industries of a great city*, pp. 68, 128.—"Twenty-seven railways, making thirty-two main trunk lines have terminals in Chicago. None of the systems run trains through the city. All of them stop there. In addition seventeen steamship lines provide water transport, and, to supply them with proper dockage, four new harbor sites were established by ordinance in 1911."—W. D. Moody, *What of the City?*, pp. 154-155.

Also in: L. R. Wells, *Industrial history of the United States*.

1673-1804.—Foundation.—Early history.—"In regard to its earlier history . . . very little can be affirmed with any degree of certainty. The original proprietors and first inhabitants of the region were, of course, the aborigines. The description of the first appearance of the vicinity by some of its earliest explorers, leads to the belief that they were here from a very early period, that this was then, and from time immemorial had been, the site of an Indian village."—*Chicago directory*, 1830 (*Fergus' historical series*, No. 2, p. 54).—"The earliest record that has come down to us of the coming of white men to Chicago is that of Joliet and Marquette's visit in the summer of 1673, while returning from their famous voyage of exploration of the Mississippi River."—M. M.

Quaife, *Development of Chicago, 1674-1914*, p. 1.—“On the 3d of August, 1795, at the treaty held by General Wayne, with the Pottawatomies and other tribes at Greenville, the title to six miles square of territory, at the mouth of Chikajo River, as it is expressed in the treaty, was obtained by the United States. From the language of this treaty, it appears that a fort had formerly stood on the land thus ceded, which renders it pretty certain, that the French, who alone could have required anything of the sort, had made a settlement here, many years before. In 1804, Fort Chicago was built on the site of the [later] . . . Fort. About the same time, the American Fur Company, having been organized shortly before, established a trading station, under the protection of the garrison. The little colony thus planted here, some forty years ago [written in 1839], for military and trading purposes, may be regarded as the first attempt to effect a permanent settlement of Chicago.”—*Chicago directory, 1839 (Fergus' historical series, No. 2, p. 50)*.

1812-1837.—Evacuation in the war with England.—Fort Dearborn.—City's incorporation (Mar. 4, 1837).—“The regular and monotonous life

Indians, from whom they were descended—and their log or bark houses as low, filthy, and disgusting, displaying not the least trace of comfort, and as a place of business, affording no inducements to the settler—the whole amount of trade on the Lake, not exceeding the cargoes of five or six schooners, even at the time when the garrison received its supplies from Mackinaw.’ This picture, though perhaps too highly colored, presents, in the main, a correct view of Chicago, in 1832. . . . The year 1832 may then be regarded as the period from which to date the commencement of the city. . . . In 1837, Chicago became an incorporated city, the Act of the Legislature conferring its charter being granted and approved March 4th, of that year.”—*Chicago directory, 1839 (Fergus' historical series, No. 2, pp. 56-59)*.

1848-1852.—First railroads.—Connection with the east.—The Galena and Chicago Union railway was completed in 1848. In 1852 the Michigan Southern and the Michigan Central, the first roads connecting the city with the east, extended their lines to Chicago. Railroad development from that time on was remarkably rapid.

FORT DEARBORN IN 1853

led by the community, for the first eight years, afforded few incidents worthy of particular notice. In 1812, however, the war broke out with England, the consequences of which were peculiarly disastrous to all the Western settlements, exposed as they were, especially those in Illinois, to the hostility of neighboring tribes of Indians. . . . Chicago being then an extreme frontier post in this direction, and the country in every direction around it, full of Indians, with a force inadequate to its defence, was considered so much endangered as to require its evacuation. . . . This evacuation, on account of the fatal consequences which followed it (the massacre of most of the retreating garrison), . . . may be considered a memorable event in the annals of Chicago.” The fort was burned down by the Indians, but was rebuilt in 1817 and renamed Fort Dearborn. “Until 1832, and even so late as 1833, little or nothing was done towards making a commencement of the City. . . . In 1832, its appearance and condition was much the same as in 1823, when Major Long, who visited the place that year, describes it ‘as presenting no cheering prospects, and containing but few huts, inhabited by a miserable race of men, scarcely equal to the

1857.—Academy of Sciences.—The Academy of Sciences was opened in 1857.

1860.—Republican National Convention.—Chicago was the meeting place of the Republican National Convention which nominated Lincoln for president. See U. S. A.: 1860 (April-November).

1864.—Democratic National Convention. See U. S. A.: 1864 (May-November).

1865.—Union stockyards.—In 1865 the Union Stockyards, now the largest in the world, were established on the South Side, and contributed much to the city's subsequent development.

1865.—Growth of factories. See ILLINOIS: 1865.

1866.—Art Institute.—The Art Institute, known until 1882 as the Chicago Academy of Design, was opened in 1866. See ART INSTITUTE, Chicago.

1867.—Academy of Design founded. See EDUCATION, ART: Modern Period: United States.

1869-1922.—City park system.—The year 1869 marks the beginning of the city park system. To-day the main parks are Lincoln Park, the site of what is perhaps the finest of the many Lincoln statues, Jackson Park and Washington Park, while around the city stretches a vast semi-circle of park land comprising 35,000 acres of hills and valleys, meadow land and forest. The various parks are

linked together into one great system by wide boulevards, and the north shore is skirted by a beautiful driveway, known as the lake shore drive. With this driveway, the city has set a much-needed example in the beautifying of water fronts. Even on the south side shore, by which railways enter the city, the tracks have been lowered to permit of improvements being made. In addition to the large parks, there are within the city a number of neighborhood parks, which are used as playgrounds and neighborhood centers.

1870.—Increase of population.—Commercial importance of the city.—In 1870 the population of the city was 306,605, as compared to only 4,479 in 1840. In the thirty years, that is, 302,126 inhabitants had been added to the city. By 1870 Chicago had become one of the most important commercial centers of the country.

1871.—Great fire.—"The greatest event in the history of Chicago was the Great Fire, as it is termed, which broke out on the evening of Oct. 8, 1871. Chicago was at that time [except in the business center] a city of wood. For a long time prior to the evening referred to there had been blowing a hot wind from the southwest, which had dried everything to the inflammability of tinder, and it was upon a mass of sun and wind-dried wooden structures that the fire began its work. It is supposed to have originated from the accidental upsetting of a kerosene lamp in a cow barn [Mrs. O'Leary's] on De Koven Street, near the corner of Jefferson, on the west side of the river. This region was composed largely of shanties, and the fire spread rapidly, very soon crossing the river to the South Side, and fastening on that portion of the city which contained nearly all the leading business houses, and which was built up very largely with stone and brick. But it seemed to enkindle as if it were tinder. Some buildings were blown up with gunpowder, which, in connection with the strong southwest gale, prevented the extension of the flames to the south. The fire swept on Monday steadily to the north, including everything from the lake to the South Branch, and then crossed to the North Side, and, taking in everything from the lake to the North Branch, it burned northward for a distance of three miles, where it died out at the city limits, when there was nothing more to burn. . . .

[The amount of the total property loss was estimated at \$200,000,000.] Of this vast sum, nearly one-half was covered by insurance, but under the tremendous losses many of the insurance companies were forced to the wall, and went into liquidation, and the victims of the conflagration recovered only about one-fifth of their aggregate losses. Among the buildings which were burned were the court-house, custom-house and post office, chamber of commerce, three railway depots, nine daily newspaper offices, thirty-two hotels, ten theatres and halls, eight public schools and some branch school buildings, forty-one churches, five elevators, and all the national banks. If the Great Fire was an event without parallel in its dimensions and the magnitude of its dire results, the charity which followed it was equally unrivalled in its extent. . . . All the civilized world appeared to instantly appreciate the calamity. Food, clothing, supplies of every kind, money, messages of affection, sympathy, etc., began pouring in at once in a stream that appeared endless and bottomless. In all, the amount contributed reached over \$7,000,000. . . . It was believed by many that the fire had forever blotted out Chicago from the list of great American cities, but the spirit of her people was undaunted by calamity, and, en-

couraged by the generous sympathy and help from all quarters, they set to work at once to repair their almost ruined fortunes. . . . Rebuilding was at once commenced, and, within a year after the fire, more than \$40,000,000 were expended in improvements. The city came up from its ruins far more palatial, splendid, strong and imperishable than before. In one sense the fire was a benefit. Its consequence was a class of structures far better, in every essential respect, than before the conflagration. Fire-proof buildings became the rule, the limits of wood were carefully restricted, and the value of the reconstructed portion immeasurably exceeded that of the city which had been destroyed."—*Marquis' handbook of Chicago*, p. 22.—"Thousands of people on the North Side fled far out on the prairie, but other thousands, less fortunate, were hemmed in before they could reach the country, and were driven to the Sands, a group of beach-hillocks fronting on Lake Michigan. These had been covered with rescued merchandise and furniture. The flames fell fiercely upon the heaps of goods, and the miserable refugees were driven into the black waves, where they stood neck-deep in chilling water, scourged by sheets of sparks and blowing sand. A great number of horses had been collected here, and they too dashed into the sea, where scores of them were drowned. Toward evening the Mayor sent a fleet of tow-boats which took off the fugitives at the Sands. When the next day [Tuesday, October 10] dawned, the prairie was covered with the calcined ruins of more than 17,000 buildings. . . . This was the greatest and most disastrous conflagration on record. The burning of Moscow, in 1812, caused a loss amounting to £30,000,000; but the loss at Chicago was in excess of this amount. The Great Fire of London, in 1666, devastated a tract of 436 acres, and destroyed 13,000 buildings; but that of Chicago swept over 1,900 acres, and burned more than 17,000 buildings."—M. F. Sweetser, *Chicago (Cities of the World, v. 1)*.—The following is the statement of area burned over, and of property destroyed, made by the Chicago Relief and Aid Society, and which is probably authoritative: "The total area burned over in the city, including streets, was 2,124 acres, or nearly three and one-third square miles. This area contained about 73 miles of streets, 18,000 buildings, and the homes of 100,000 people."—A. T. Andreas, *History of Chicago*, v. 2, p. 760.

1879-1887.—Carter Henry Harrison mayor.—For four successive terms Carter Henry Harrison, Democrat, was mayor of Chicago. He was not candidate again until 1891.

1886-1887.—Haymarket tragedy.—"The whole story . . . must begin with the strikes that at intervals for many years had shaken the city; strikes of seamen, dock laborers, stockyard workers, street railroad workers; we must go back to these and to John Bonfield, Captain first and then Inspector of Police. A large, powerful, resolute, ruthless man, Bonfield has pressed his way to the front chiefly by reason of his physical prowess and unshakable courage, for of understanding he had little. He went to peace by a way old enough in history, but rather new in American communities; he cracked all heads in sight until no man was left upright, and then announced that quiet was restored and the strike broken. . . . Men that worked with their hands became convinced that the police were tyrannical, cruel, arbitrary, the professional and gratuitous enemies of the workers and the devoted champions of the

employing class. On the other hand, another part of the community got the notion that in the city was a large element of desperate men, foes to society and order, ripe for violence, and only held in check by the constant vigilance of the police. . . . On the top of this smoldering heap was now laid, by the hands of Fate, the eight-hour movement of 1886. . . . It was bitterly resented by employers. . . . It was seen that the demand for eight hours was limited chiefly to factories in which was much foreign-born labor, and the fact increased the common foreboding. . . . The most important factory involved in the eight-hour strikes was the great McCormick harvester and reaper works on the far west side. Close by, to the east, were teeming foreign quarters, mostly of Poles and Bohemians. The McCormick Company attempted to fill the places of the strikers, and riot after riot ensued."—C. E. Russell, *These shifting scenes*, pp. 81-83.—"On May 4, 1886, this discontent culminated in a terrible tragedy at the city of Chicago. An open-air meeting was held by the discontented party at the old Haymarket, on the West Side of the city. As the attitude of these men had been threatening for several weeks, a company of policemen were sent to preserve order. Their presence and their demeanor inflamed the wrath of some madman in the crowd, and a dynamite bomb was thrown into their midst, killing one policeman immediately and wounding sixty-seven others. The bomb was probably thrown by a German named Schnaubelt. This man fled, and was never captured. Seven policemen in all died, from the results of the riot. The city was seriously alarmed. There were rumors of a great conspiracy. It was whispered that a plot existed to burn the city to the ground. A raid was made on the office of the *Arbeiter Zeitung*, the organ of the Anarchists. Here dynamite bombs and infernal machines were found, as well as a large number of circulars on which there was an appeal to the workmen to arm themselves. It is said by the friends of the Anarchists that these circulars were not intended for distribution. They maintained that some ill-advised person had put that appeal upon the circulars without the knowledge of the men who were to speak at the Haymarket meeting which the circulars announced. It is said that Albert Parsons, one of the best known of the Anarchist leaders, refused to speak at the meeting unless other circulars were printed which did not contain that seditious injunction. These milder circulars had been printed and circulated, and those left in the office, it is said, were to be destroyed. But even when this point is conceded, it does not explain the presence of dynamite. . . . Eight leaders of the Anarchists were arrested on charge of conspiracy and murder. They were August Spies, Albert R. Parsons, Samuel Fielden, Oscar Neebe, George Engel, Louis Ling, Michael Schwab and Adolph Fischer."—E. W. Peattie, *Story of America*, pp. 670, 673.—The trial began July 14, 1886. The evidence closed on August 10, the argument of counsel consumed more than a week, and on August 20, the jury brought in a verdict which condemned Neebe to imprisonment for fifteen years, and all the other prisoners to death. Ling committed suicide in prison; the sentences of Schwab and Fielden were commuted by the governor to imprisonment for life; the remaining four were hanged on November 11, 1887.—Judge Gary, *Chicago anarchists of 1886* (*Century Magazine*, April, 1893).—In 1893 Governor J. P. Altgeld of Illinois pardoned Fielden, Neebe and Schwab on the ground that the presiding judge was prejudiced, that the jury was "packed" and there-

fore incompetent, and that no evidence connected the prisoners with the crime.

1890-1892.—Chicago University founded and opened. See UNIVERSITIES AND COLLEGES: 1890-1892.

1892-1893.—World's Fair. See WORLD'S COLUMBIAN EXPOSITION.

1893.—Re-election of Carter Henry Harrison as mayor.—His assassination.—The closing days of the exposition were marked by the assassination of Mayor Harrison. He had been a prominent and much discussed figure in municipal politics for many years, and served for four consecutive terms before he was defeated in 1886. In spite of strong opposition, had been again elected in 1893.

1894.—Destruction of the Columbian exposition buildings.—By a succession of fires, January 9, February 14, most of the buildings of the exposition, with valuable exhibits not yet removed, were destroyed.

1894.—Pullman strike. See U. S. A.: 1894: Strike at Pullman.

1896.—Democratic National Convention. See U. S. A.: 1896: Party platforms and nominations: Democratic.

1897-1899.—Carter Henry Harrison, Jr., Mayor of Chicago.

1899.—Significance of the municipal election.—The municipal election of April 4, 1899, resulted in the reelection of Mayor Carter H. Harrison, Democrat, by 149,000 votes, against 107,000 cast for Zina R. Carter, Republican, and 46,000 for ex-Governor Altgeld, radical Democrat, running independently. In the opinion of a correspondent of the *Review of Reviews*, "The campaign disclosed three interesting results—namely: (1) the growth of independence and of attention to local issue; (2) the dominance of the street-railroad issue; and (3) the growth of sentiment in favor of municipal ownership. Nearly two-thirds of all the votes cast were against the Republican candidate, and our correspondent regards this as largely due to the belief that he, more than any of the others, represented the interests of the street-railroad corporations." This writer held that "in all probability any practical proposition for municipal ownership and operation of the street-railroads would to-day [1899] be approved by a popular vote in Chicago."

1899.—Origin of Children's Court. See CHILD WELFARE LEGISLATION: 1899-1921.

1900.—Experiment in teaching blind in public schools. See EDUCATION: Modern developments: 20th century: Education for the deaf, blind and feeble-minded: Blind.

1900.—Opening of the drainage canal.—An extraordinary public work was brought into use early in the year, by the opening of what is known as the Chicago drainage canal. This was constructed for the purpose of turning the natural flow of water in Chicago river backward, away from Lake Michigan, its natural embouchure, into the small Des Plaines river, which runs to the Illinois, and the Illinois to the Mississippi,—the object being to carry the sewage of Chicago away from the lake, where it contaminated the water supply of the city. Part of the city sewage was already being sent in that direction by a pumping system which carried it over the divide; the purpose of the canal was to take the whole. The work was begun in September, 1892, and practically finished, so far as concerned the canal, in little more than seven years, at a cost of about \$34,500,000. Changes in the city sewage system, to fully utilize the object of the canal, were still to be completed. It was estimated that, with full use, there would

be provision in the canal for a maximum discharge of 600,000 cubic feet of water per minute. Some anticipated that such an outflow would seriously lower the level of the lakes; but there were no signs of that effect in the season of 1900. Nor did it seem to appear that the sewage then passing by river flow westward was doing harm to towns on the Illinois and Mississippi, as they had apprehended; but the discharge was then far short of what it was intended to be. It is possible that ultimately the Chicago drainage canal may become part of a navigable water-way from the lakes to the Mississippi, realizing an old project of water transportation in that direction to compete with the rails. The canal has been constructed upon a scale to suffice for that use; but the river-improvement called for is one of formidable cost.

1903.—**Burning of the Iroquois Theater.**—On the afternoon of December 30, 1903, 588 people perished in the burning of the Iroquois theater. The audience was made up principally of women and children, many of whom belonged to prominent families. The whole city was plunged in grief, and the whole world shared in the sorrow and manifested its sympathy. The theater was a new one, and was regarded as the best of any in the city in its method of construction. But inquiry soon proved that it was defective in its provisions for safety. Further examination, moreover, showed a similar condition in other places of assembly, with the result that all the theaters, with many churches and halls in Chicago, were closed by order of the mayor, pending their compliance with certain provisions of the law.

1903-1907.—**Transit problems.**—With the rapid growth of the city as shown by the increase of population from 503,185 in 1880 to 1,698,575 in 1900, transport facilities became very inadequate. In consequence much hardship was felt; increasing discontent became apparent, and a clamor for public ownership arose. In 1903, an Act, known as the Mueller law, was passed by the legislature to provide for public ownership and operation, contingent upon a simple majority on referendum, for municipal ownership, and a two-thirds majority for operation. In 1905, both political parties pledged themselves to city ownership. The democratic candidate, Edward F. Dunne, was elected on a promise for immediate relief; but opposition within the council curtailed his policy. The companies, whose franchises were on the verge of expiration, had no desire to sink money in improvements, and as a result the service, already bad, became worse. In 1907, matters came to a head, and finally a new agreement was arrived at, by which the city's receipts from the transit companies were fixed at 55 per cent of the net receipts from operation, the city reserved the right to purchase at six months' notice, and the companies agreed to, and carried out extensive improvements.

1905.—**Convention of I. W. W.** See INDUSTRIAL WORKERS OF THE WORLD.

1909.—**Chicago Plan.**—**Systematizing the future development.**—"Early in 1906 the Merchants' Club, comprising a group of the younger business and professional men of the city, arranged for the preparation of a complete project for the future development of Chicago. The next year the Merchants' Club was merged with the Commercial Club under the name of the latter organization, and the city-planning work was continued under the auspices of that body." The resulting "Plan of Chicago" was reported in the course of the summer of 1909. "The report represents about thirty months' work by men whose thoughts for

years have dwelt upon the subject of city building and beautification. The work was in charge of Daniel H. Burnham, chief architect and director of works of the World's Columbian Exposition of 1893, who gave his services to his city without compensation for the purpose of this report. Even so, the expense of preparing and publishing the report has approximated \$75,000, all raised by voluntary subscriptions from the business men of Chicago."—G. C. Sikes, *New Chicago (Outlook, Aug. 28, 1909)*.—See also CITY PLANNING: United States: Progress in city planning.

1910-1911.—**Garment makers' strike.** See LABOR STRIKES AND BOYCOTTS: 1877-1911.

1910.—**Bureau of public efficiency.**—To supersede the Chicago commission on city expenditure, whose function it was to investigate city disbursements, a Chicago bureau of public efficiency was organized in 1910.

1911.—**Housing regulations.**—By certain provisions added to the Chicago housing code in 1911, all new buildings were to be inspected by the sanitary department prior to their occupancy; in constructing buildings, the defined minimum as to the size of rooms and the height of basement rooms had to be observed, and courts, free space and width of alleys had to comply with the regular measure.

1911.—**Billboard regulations.** See BILLBOARDS: Court decisions.

1911-1915.—**Carter Henry Harrison, Jr., Mayor.**

1912.—**Republican and Progressive conventions.** See U. S. A.: 1911-1912 (June); 1912: Formation of Progressive party; 1912: Election of 1912.

1913.—**City Club housing exhibition.**—**Art Institute.**—In connection with the city's studies of the housing problem, Chicago's City Club held a competitive exhibition at which some forty plans for a proposed new section in an outlying district of the city were presented. By the will of B. F. Ferguson the Art Institute of Chicago received a fund of over \$1,000,000, the income of which was to be devoted to the erection in parks and boulevards of monuments commemorating events and individuals. The *Fountain of the Lakes*, by Lorado Taft, dedicated on September 9, was the first production constructed from this fund.

1913.—**Police department reconstruction.**—By an ordinance, passed on December 30, 1912, the police department of Chicago was divided into two distinct bureaus, both subordinate to the general superintendent of police. One of these bureaus, the so-called active bureau, is under the supervision of the first deputy superintendent of police, who is a member of the police force, and has charge of the enforcement of laws and ordinances, the prevention of crime and apprehension of criminals, the assignments and distribution of the police force, and the regulation of street traffic. The second bureau, which is the clerical, mechanical and inspection division, is under the supervision of the second deputy superintendent of police, who is not a member of the police force, and is entrusted with the general care, custody and inspection of the property and records of the department, the instruction of members of the police force, the ascertaining and recording of their relative efficiency, the receiving of all complaints of citizens regarding the uniformed force, the censoring of moving pictures and other performances, and the supervision and enforcing of ordinances pertaining to all matters effecting public morals.

1914-1918.—**City Improvements**—**City telephone bureau.**—**Public markets.**—**Wilson Avenue water tunnel.**—In 1914, Chicago organized a

city telephone bureau to adjust complaints regarding rates, poor service, or prepayment requirements. In the same year, the first municipal markets, in charge of agents appointed by the markets commission, were opened in the congested districts of the city. Circulars, printed in English and foreign languages, informed the public of their location and advantages, and notified the truck farmers within a radius of twenty-five miles of the city that they could have a place reserved upon application. The work of constructing the Wilson avenue water-tunnel, begun in 1914, was completed on May 1, 1918. It extends for three miles under Lake Michigan and connects with a large concrete intake crib. This improvement increased the city's water supply by 300,000,000 gallons a day.

1915.—Thompson elected mayor.—In 1915 William Hale Thompson was elected mayor of the city, on the Republican ticket, with a plurality of 13,726.

1916.—University medical department.—Provisions were made for the establishment of a medical department at the University of Chicago with an endowment fund of almost \$8,000,000, appropriated partly by the General Education Board and the Rockefeller Foundation, and partly by the university itself. In the same year the university funds were increased by over a million dollars in benefactions.

1916 (June).—Republican and Progressive National conventions.—Platforms. See U. S. A.: 1916 (February-November).

1916-1917.—Recruiting for negro labor. See RACE PROBLEMS: 1909-1921.

1917-1919.—Limitation of home rule.—By a decision of the Illinois Supreme Court of 1917, granting to the state Public Utility Commission the power of regulating municipal utilities, Chicago's home rule was considerably impaired.

1917.—Chicago's new city council.—"In April Chicago held an important municipal election. Thirty-six aldermen were elected, or one more than half of the total number serving. There were several issues involved, but only one was 'city wide' and fundamental—this issue being 'Thompsonism vs. an independent and non-spoils city council.' On this issue the mayor, 'Big Bill' Thompson, suffered a decisive defeat. The new council is unmistakably anti-Thompson by a large majority. The city hall machine fought the best men in the council and sought to defeat them at the primaries or at the election. . . . Every fit alderman in the council is formally pledged to treat his office as non-partisan, and the fit constitute a majority. When the matter of organization—of committee assignments and the distribution of important chairmanships—came up, immediately after the election, a serious effort was made by the . . . mayor and his . . . henchmen to defeat the principle of non-partisan organization and put through a 'slate' satisfactory to the spoilsmen of both parties. The effort failed signally, . . . and the municipal voters' league won another notable victory for the established principle that the aldermanic office is wholly non-partisan."—V. S. Yarros, *Chicago's new city council* (*National Municipal Review*, v. 6, July, 1917, p. 514).

1918.—Trial of I. W. W. See INDUSTRIAL WORKERS OF THE WORLD: Recent tendencies.

1918-1919.—Crime Commission.—"To curb crimes of violence in the city of Chicago the Association Committee on Prevalence and Prevention of Crime recommended (1918) the formation of a body to be incorporated under the laws of the

State of Illinois, to be known as the Chicago Crime Commission. The commission to aid the present machinery of the law so to function that crimes of violence may be reduced to a minimum. This commission [under the guidance of the Association of Commerce, and serving without pay] has now been organized and incorporated [1919, with Edward W. Sims, former U. S. District Attorney, as president]. The commission employs investigators who ascertain the facts relating to major crimes within the city, and these facts are from time to time put into the hands of the Chief of Police, the Mayor of the city and other officials. But the activities of the organization are not confined to such work as this. It aims to do a constructive work for the city. . . . The following from the Commission's Bulletin No. 2, March 31, 1919, sets forth the first constructive enterprise of the organization: 'It is impossible to determine with accuracy the number of law violators, the charges under which they were arrested and convicted and the sentences imposed. It is this lack of records and proper identification which permits habitual and professional criminals to be placed on probation and parole, thereby contributing largely to the present disgraceful situation. With an adequate bureau engaged in the collection and collation of criminal records, with a record of the activities of police, prosecutors and judges available, it would be comparatively easy to cause the proper functioning of the machinery already created to combat crime and prevent miscarriages of justice through collusion, indifference or political intrigue. With this as the ultimate object, the Chicago Crime Commission has caused an exhaustive investigation and study to be made as to the provisions by statutes and ordinances touching reports and records of crimes and criminals. Having found such provisions inadequate, it has caused a bill to be prepared which is being presented to the General Assembly of Illinois [1919]'—R. H. Gault, *Chicago crime commission* (*Journal of American Institute of Criminal Law and Criminology*, v. 10, May, 1919, pp. 9-10).—The bill to create a Bureau of Criminal Records, "when presented to the Fifty-first General Assembly of Illinois carried with it the approval of Governor Lowden and the Director of the Department of Public Welfare, Charles H. Thorne. . . . the bill passed the Senate and went to a third reading in the House, where it met with bitter opposition. . . . and died on the calendar."—H. B. Chamberlain, *Chicago Crime Commission* (*Journal of the American Institute of Crime and Criminology*, Nov., 1920, p. 388).

ALSO IN: W. L. Chenery, *Politics in Chicago* (*New Republic*, March 15, 1919).

1918-1919.—Municipal reconstruction plans.—"The war has intensified rather than dimmed the necessity for public improvements in Chicago. . . . The public health, ample means for helpful recreation, convenience of traffic in the streets, relief of the congested districts, and facilitation of railway terminal and food handling, which were of fundamental importance before the war, now became matters of absolute necessity. . . . Chicago is fortunate indeed in having a scientifically worked out plan that exactly fits the present emergency, and which will inure immeasurably to the health, happiness and financial prosperity of all the people."—*Reconstruction platform of the Chicago plan commission* (*American City*, Jan., 1919).—This plan was set forth in the "Reconstruction Platform" of the Chicago Plan commission, of December 6, 1918. It recommended railway terminal reconstruction, the extending, widen-

ing, and rebuilding of important roads, highways, and streets, utilization of the lake front for dumping grounds, bathing beaches, park lands, picnic grounds, and other recreation centers, and called for coöperation in the bridge program, the traction and housing question, the development of the drainage canal boulevards, and in the securing of a new city charter with wider powers.

1919.—Organization of Labor party. See LABOR PARTIES: 1918-1920.

1919.—Municipal reform measures.—“For several years Chicago's financial affairs have steadily grown worse. Conditions existing in December, 1917, prompted the city council to petition Governor Lowden to call a special session of the legislature to provide a remedy, to which the governor responded that he would do so when the council obtained the approval of some definite plan for legislation by the city's civic organizations. As an outgrowth of this suggestion, various civic bodies of Chicago did undertake to function in coöperation with the city council, not only with respect to revenue matters, but also in the formulation of a constructive program of legislative needs. The leading organizations participating in a joint conference were the association of commerce, the bureau of public efficiency, the Chicago real estate board, the civic federation, the city club, the citizens' association, and the woman's city club. Other organizations coöperating later in the movement included the Western Society of Engineers, the Chicago woman's club, the Cook County and estate board, the political equality league, the Chicago woman's aid, and the committee of one hundred. The study which these organizations made of the conditions developed the conclusion that political changes as well as changes of policy were required to correct the situation, and that in fact the former were fundamental. The conference committee of civic organizations therefore formulated and approved in principle the features of a legislative program for Chicago. A committee representing the conference acted with a special committee of the city council in putting the principal points of this program into the form of bills for presentation to the legislature. The result was four bills, of which the essential feature were as follows: (1) Non-partisan elections for aldermen, mayor, city clerk and city treasurer, so long as they shall remain elective by popular vote. (2) Reorganization of the council by reducing the number of aldermen from 70 to 35, one from each ward, all elected at the same time, for four-year terms, subject to a limited popular recall, thus reducing the number of elections (each city election eliminated means a saving of about \$700,000); this bill made the city clerk and city treasurer appointive by the city council; it also contained provisions calculated to insure that the city be immediately redistricted into wards of equal population. (3) Provision for a limited popular recall for mayor, after one year in office, on the same terms as for aldermen. (4) A manager form of government, the mayor to be chosen by the city council, and to hold office at its pleasure. While there was general agreement on these bills, some reservations were made. The association of commerce, speaking through its executive committee, withheld indorsement of the city manager plan and the recall. The civic federation conceded the recall (on condition that it be limited in nature) only in deference to the view of many other organizations that approval of a four-year term for aldermen could not be secured without such a provision, and through a desire not to hamper the general program. The city council, on the other

hand, indorsed only three of the bills, going on record as being opposed to the manager plan. It also recommended 50 wards instead of 35. In spite of the lack of complete unanimity upon the manager plan and the recall, the conference committee of civic organizations favored the passage of all four bills, because even if approved by the legislature they required approval by a city referendum, and the committee advocated the giving of an opportunity to the people of Chicago to express themselves on the issues involved. The bills, however, were subjected to considerable modification by the legislature. The non-partisan election bill was made applicable only to aldermen. The number of wards was increased to 50, and the number of aldermen reduced to that figure, providing for one from each ward. The recall and the manager plan failed of passage. The net gain of the program, therefore, is a council, reduced from 70 to 50 members, to be elected on a non-partisan ballot; but the bills embodying these provisions, as already stated, require ratification by a popular referendum. A subsidiary referendum is provided by which the voters may indicate whether they wish the aldermen elected for two or four years. A bill was also passed discontinuing all legal holidays now allowed on account of elections, except the holidays falling upon the biennial general state election day.”—*National Municipal Review*, v. 8, Aug., 1919, pp. 455-456.

1919 (April).—Thompson re-elected.—“William Hale Thompson was re-elected mayor of Chicago on April 1 with a plurality of 18,000. . . . It is surprising enough that Mayor Thompson should have gotten more votes than his opponents for the Republican nomination, Judge Olson and Capt. Charles E. Merriman together, at the primaries.”—*National Municipal Review*, May, 1919, p. 265.—“Judge Olson's . . . candidacy was doomed from its inception. Two arguments were advanced in his favor. One was that he was acceptable to the political machines. That sufficed to convince the dominant morning and afternoon papers which supported him energetically. The second argument was that somebody must defeat Mayor Thompson, who had ‘disgraced Chicago.’ [He refused to invite Joffre and the Allied mission to the metropolis of the Middle West, giving as his reason that Chicago was the ‘sixth German city.’] Neither argument was persuasive to the great mass of voters except that the indirect result was achieved of making Captain Merriman's success, without machine or newspaper support, seem improbable. To both the bosses and to the utility autocrats that was undoubtedly the most important issue. . . . The fact is that Mayor Thompson was renominated by his enemies. To their honor, it should be recorded, the press of all shades of opinion were against Mayor Thompson. But they were for Judge Olson on the sole ground that he was acceptable to the political leaders and they were for Robert M. Sweitzer, the successful Democratic nominee, who happens to be the brother-in-law of Roger C. Sullivan, utility magnate and long recognized as the dominant figure in the so-called Democratic party of Illinois. The fact that the newspapers were supporting candidates who made no pretense of their friendliness to utility companies which were seeking to raise fares and rates aided Mayor Thompson mightily. He was able to conceal his fealty to corporation control in a cloak of adroit demagoguery. But even more potent than this was the popular antagonism to the press due to wrongs of other years. On this dormant hostility Thomp-

son played with skill. The largest morning paper and the largest afternoon paper in Chicago have long term leases on school lands. These leases do not require revaluations from time to time as do other school leases. Consequently they have long been sources of criticism against the papers which benefit from the school lands. The episodes are, however, two decades old and they have no more relevance to the issues of the present mayor-ally campaign than would have the kidnapping of Charlie Ross. Nevertheless, Mayor Thompson made the school land question his chief issue. He convinced the people that the papers were against him because he was against the school land deal. Never did demagogue make a more irrelevant plea. But it won, and it will continue to win until these ancient issues are cleared up."—W. L. Chenery, *Politics in Chicago* (*New Republic*, March 15, 1919, pp. 213-214).

1919 (July).—Chicago Race Riots.—"On July 27, race rioting broke out in Chicago, starting at South Side bathing beaches and spreading into the heart of the so-called Black Belt [an area of over eight square miles, with a population of 125,000]. The trouble started with negroes wandering over the dividing line to the white section of the beach; the whites stoned them, and a general fight was precipitated. . . . A small army of policemen momentarily quelled the conflict, but both whites and blacks swarmed through the South Side Black Belt, and rioting spread through the district. . . . The South Side was terrorized. There were many street battles at night, begun by roving bands of blacks and whites, the negroes stormed an armory in an effort to obtain weapons and ammunition. On July 28 five negroes and nine whites were killed in a fierce fight. For more than five hours the battle raged between the two races, and between the policemen and the blacks, who fired from windows, roofs, and other points of vantage. The next day the fighting continued with unabated fury; a total of 28 killed and 500 injured was reported. Almost 5,000 troops under arms and the entire police force strove to check the fighters. . . . On July 30, five more deaths were reported. . . . The renewal of the outbreak caused Mayor Thompson to consent to martial law. The negroes had secured arms and barricaded themselves within their homes, while crowds of whites besieged the Black Belt. . . . On July 31 sporadic outbreaks continued, though 3,000 soldiers had the situation practically in hand.

Thirty-six incendiary fires were started, but the police forestalled a conspiracy to burn the whole Black Belt. . . . By Aug. 1 order had been restored by a military force of 6,000 men."—*Race riots in Washington and Chicago* (*New York Times Current History*, Sept., 1919, pp. 453-454).

1919 (November).—Aldermanic election law ratified.—Main features.—"The law provides for nomination by petition, a non-partisan ballot and majority elections, with certain incidental improvements in election technique. It is the hope of the framers of the law that it will not only simplify and improve election methods and reduce election costs, but in some measure also untie the city government from the leading strings of partisan organizations and factions. The new election law was passed only after many years of effort, during which a considerable body of voters had been won over to the principle of non-partisanship in local elections. Since 1806 the Municipal Voters League has been impartially reviewing the records of candidates for the City Council, has been making non-partisan endorsements, and by persistent effort along these lines has helped to promote among the

electorate the habit of voting for fit candidates, irrespective of national party allegiance. The League also brought about and has been able to maintain, year after year, in the face of political opposition, a non-partisan organization of the City Council and its committees. There have also been in Chicago sporadic, and occasionally successful, citizens' movements to elect aldermanic candidates, running without party support on a 'non-partisan' platform. The idea of non-partisanship in voting at local elections is therefore not new to Chicago voters. The aldermanic election law ratified last November [1919], however, is the first recognition of this principle in law in Chicago. It provides a definite method of election without the aid of party machinery and without party designations upon the ballot. The outstanding features of the new election law are as follows: 1. It applies only to aldermen. The Mayor, the City Clerk and the City Treasurer were exempted from its provisions by a compromise which was made to insure the passage of the bill. It is hoped that a successful demonstration of the law in aldermanic elections will result in subsequent legislation bringing these officials under the new system. 2. It provides for nomination by petition instead of by party primaries as heretofore. Petitions must contain the names of not less than 2 per cent. and of not more than 5 per cent. of the voters of the ward voting at the last aldermanic election. 3. Candidates receiving a majority vote at the election are declared elected. If no candidate should receive a majority vote, however, the two candidates receiving the greatest number of votes, respectively, stand for a supplementary election. Majority elections are therefore insured, and at the same time worthwhile economies will undoubtedly be effected in many wards by the elimination of one election. 4. There will be no party columns, circles or other designations on the ballot. The names of candidates are to be rotated by precincts so that each name will appear at the top of the ballot in an equal number of precincts. It was no small accomplishment for the framers of this legislation to break through the adverse psychology of a State Legislature elected on partisan lines, and to obtain the passage of the bill, for similar bills had received scant consideration at previous sessions of the Legislature."—D. L. Akers, *Chicago moves toward non-partisanship* (*The American City*, v. 22, no. 2, Feb., 1920, p. 119).

1919-1920.—Conventions of American Labor party. See LABOR PARTIES: 1918-1920.

1920.—Cheap transportation. See MUNICIPAL GOVERNMENT: Transportation and health.

1920 (February).—Election on non-partisan basis.—"Chicago's first non-partisan election was held (Feb. 24) . . . twenty-six aldermen were elected outright. In nine wards supplementary elections are required on April 6th, with two high men in each ward at to-day's voting the candidates. The majorities registered for the twenty winning candidates mean a net saving to the city of more than \$100,000 because of the elimination of the supplementary elections in the twenty-six wards. . . . Twenty of the twenty-six aldermanic winners carried the indorsement of the Municipal Voters League . . . only two who won were opposed by the league. The first tryout of the non-partisan law seems to have been satisfactory to citizens."—*New York Times*, Feb. 25, 1920.

1920-1921.—Poor relief. See CHARITIES: United States: 1921.

1920 (September).—1922 (February).—Libel suit brought against Chicago Tribune by the

city.—“The suit, filed in Circuit Court in September, 1920, after the bitter Illinois Republican primary campaign of that year, asks damages of \$10,000,000, alleging that published charges against the financial part of Mayor William Hale Thompson's administration had impaired the city's credit and hampered the conduct of municipal business. A similar suit has been filed against the Chicago *Daily News*. In each instance the city sued in its corporate capacity.”—*New York Times*, Sept. 15, 1921.—One of the chief issues in the case of the City vs. *The Chicago Tribune* called for hearing Sept. 22, 1921, is whether a city or other municipal corporation may sue a newspaper for libel, alleging damages approximating the value of the entire establishment of the latter. Up to February, 1922, no decision had been rendered.

1922.—Law Enforcement Commissioner appointed.—“The Rev. John H. Williamson, pastor of a Methodist Episcopal Church, became Law Enforcement Commissioner of Chicago to-night, with supreme powers in caring for the city's moral welfare. His appointment to the post, especially created by Mayor William Hale Thompson at the request of reform and religious organizations, was announced to-day [Feb. 9] by the Mayor, and Mr. Williamson resigned as pastor of his church and formally accepted the new position.”—*New York Times*, Feb. 10, 1922.

CHILD, Sir Josiah (1603-1699), English economist and merchant, shareholder and subsequently director, deputy-governor and governor of the East India Company. His “Brief Observations Concerning Trade and the Interest of Money” and “A New Discourse of Trade” are important contributions to the literature of economics. He adhered to the doctrine of the balance of trade, making the reservation that a people cannot always sell to foreigners without buying from them, and denying the detrimental effects of the export of metals.

CHILD LABOR. See CHILD WELFARE LEGISLATION.

CHILD WELFARE LEGISLATION

Introduction.—“From the ‘Statute of Labourers’ of Edward III to the Keating-Owens act there may be traced the relatively steady development of an ideal. It seems a far stretch from the act of Henry IV. in the year 1405, providing that attendance at school may exempt a child from the penalties of the law requiring all children of the non-landholding classes to be regularly employed, to the modern provisions that all children must remain under educational influences until physical maturity is reached. But the way is

marked very definitely by the great statutes of Henry and Elizabeth, by the Massachusetts law of 1642, by the early attempts of the states to control the labor of children, and by the epoch-making battles of the nineteenth century in support of free schools with compulsory attendance thereon. In this period the conception of government has changed utterly among English speaking people; ideals as to the child's relations to industry and to education have almost exactly reversed themselves; yet there remains constant

the principle that the welfare of the state demands a citizenship with established habits of industry and thrift; that it is the duty of the state to require the formation of such habits; and that to secure these ends a certain degree of public control of young children in regard to their labor and training is essential."—F. C. Ensign, *Compulsory school attendance and child labor*, p. 258.—See also CHARITIES.

14th-16th Century.—Beginning of child labor legislation in England.—The first realization of the need for child welfare legislation was in England, where a law which might come under this head was passed even before the close of the Middle Ages. In fact, "the fundamental conceptions of government forming the basis of our modern laws of child control are very old, reaching back . . . to customs and laws prevailing in England in the fourteenth century [when], as now, labor was being drawn from the country to the town, tempted by the higher wages commanded by the skilled craftsmen. The ranks of labor were greatly depleted at this time by the plague which swept away a considerable portion of the working population. As a check to the movement cityward, the landed gentry secured the passage of a law designed to control young children, requiring: 'That he or she, which use to labour at the Plough and Cart or other Labour or Service of Husbandry till they be of the Age of twelve years, that from thenceforth they shall abide at the same Labour, without being put to any Mystery or Handicraft.' It appears that about this time the schools, now abundant throughout England, were drawing an appreciable number of boys of the working classes away from the farms. The landholders were deeply concerned at this further depletion of the ranks of their toilers, and the Commons, in 1391, petitioned the king to require that 'for the safety and honor of the freemen of this realm,' no child of the villein class should be permitted to attend school. King Richard, happily, did not grant this request. The grievance persisted, however, and the matter came before his successor, Henry IV. Henry was unwilling to exclude children of humble parentage from school, yet he recognized the claims of the landholders and evidently shared the apprehensions of the Commons as to the movement to the towns. He therefore confirmed the legislation in control of children, requiring further that no parent not possessed of land or rent to the value of twenty shillings should apprentice his child to any craft or other labor within any city or borough in the realm, but should set him at some other employment. But to this severe regulation the far-sighted king or his advisers added a most significant alternative: 'Provided always, That every Man or Woman, of what Estate or Condition that he be, shall be free to set their Son or Daughter to take learning at any manner of School that pleaseth them within the Realm.'

"The significance of the closing paragraph of this statute is apparent. Compulsory employment of children, so characteristic of New England two and a half centuries later, was already clearly established. Now for the first time appears legal recognition of the right of the child, even of most humble birth, to such education as may be available. Further, attendance at school was made a legal alternative for the regular employment required by the older law. In the fifteenth and sixteenth centuries, the laws intended to prevent vagabondage and to stabilize industry were further elaborated. The great statutes of Henry VIII, especially, must have been given careful consideration by the most expert lawyers of the time. Affecting

children specifically, was a provision giving local authorities power to take up all between the ages of five and thirteen years who might be found begging or in idleness, and to apprentice them to masters in husbandry or crafts, that they might be taught to gain their own livelihood when they should become of age."—F. C. Ensign, *Compulsory School Attendance and Child Labor*, pp. 7, 9, 11.

1597-1642.—Elizabethan legislation.—Early compulsory education law.—Effect of English legislation in colonies.—"In 1597 and 1601 the final steps were taken in the development of the poor law to the state in which it is found when compulsory education laws appear in the Massachusetts records. In these laws of Elizabeth still more definite provision was made for the compulsory support of the worthy poor, for the industrial training of children, and for apprenticing those whose parents were not able to maintain them. . . . The following year, 1642, marks the first great advance over English legislation in the control and instruction of children. The law of that year is one of the most famous bits of educational legislation in history. It sums up the English procedure regarding instruction of the children of the poor in productive industry, but, going further, extends the requirements to include all children; it enjoins upon the towns the duty of holding children steadily to their tasks; gives directions for dealing with delinquents; and for the first time in English history provides for the literary instruction of every child. This is strictly a compulsory education and child labor law. Its provisions concerning the labor of children were, of course, almost exactly the reverse of the modern conception of what such a law should be; it made no schooling requirements and provided no schools, but it made provisions for enforcement which were equalled by few if any of the schooling and labor laws prior to the twentieth century, and anticipated some of the principles of modern industrial education. To what extent the law of 1642 was enforced in those early years the records do not reveal. It is certain, however, that its machinery was capable of operation, and that in Massachusetts and later in Connecticut individuals were prosecuted for its violation."—*Ibid.*, pp. 13, 20-21.—See also EDUCATION: Modern: 17th century: United States.

1771-1838.—Legislation for poor and deserted children in Ireland. See CHARITIES: Ireland: 1703-1838.

1791-1872.—French penal code.—House of Correction.—"Colonies Pénitenciaires."—"The beginning of legislation in France with relation to children dates back to the Penal Code of 1791, "in which the question of understanding in relation to criminal offences is expressly noted. Having regard to the fact that the Roman law is the basis of the Code, the old Law of France was inclined to follow the Civil Law in this matter, and attempted to mark out in sections a young person's life according to the degree of intelligence expected at various ages to a much finer extent than in English law. . . . The Penal Code of 1810 closely followed that of 1791, but unfortunately the 'house of correction' did not exist, and in order to comply with the law the departmental prison was called a house of correction for this purpose, and the result was that those who had and those who had no discernment were in the same building and slept in the same rooms, but the former were in prison and the latter in a 'house of correction.' The next movement was made by the law of the 5th of August, 1850, which had in view the reclaiming of the juvenile criminal and the making of a

useful citizen. 'Colonies pénitenciers' were founded often in the country where the child found a trade to his hands, and where he was out of contact with other criminals. From time to time changes have taken place. An inquiry into 'pénitenciers' was made in 1872 and improvements followed."—R. W. Holland, *Law relating to the child*, pp. xi, xii.

1802-1847.—Child labor legislation in England.—"As early as 1802, an act was passed in the British Parliament 'for the preservation of the health and morals of apprentices and others employed in cotton and other mills.' When the elder Sir Robert Peel, worthy pioneer of labor legislation, had secured the passage of the act of 1802 ameliorating in a limited sense the condition of child labor in cotton and woolen mills, the most pernicious features of the system disappeared for a time. The hours of work were by the requirements of this bill reduced to only twelve per day. They had been fifteen or sixteen. Public sentiment was so deeply stirred that the degrading custom of apprenticing the parish poor, half-witted children, and other incapables, to the mill owners, had also to be discontinued. . . . Gibbins who has faithfully chronicled that period, speaks also of the disastrous effects upon the women and grown-up girls, and goes on to write as follows of the deplorable system: 'A curious inversion of the proper order of things was seen in the domestic economy of the victims of this cheap labor system; for women and girls were superseding men in manufacturing labor, and in consequence, their husbands had often to attend, in a shiftless, slovenly fashion, to those household duties which mothers and daughters, hard at work in the factories, were unable to fulfill. Worse still, mothers and fathers in some cases lived upon the killing labor of their little children, by letting them out to hire to manufacturers, who found them cheaper than their parents.' . . . Champion after champion appeared before Parliament praying that the children of the State be defended. The manufacturers, panoplied in greed and gold, constituted a host difficult to gain ground from; but the righteous cause pressed on step by step. In 1815 Sir Robert Peel again urged the matter with such overwhelming arguments that Parliament was constrained to the appointment of a 'Committee of Inquiry' to investigate conditions and make honorable and fair report before the body. The issue of this investigation was the enactment, in 1819, of a law forbidding the employment of children under nine years of age in factories and limiting the hours of labor of those under sixteen to twelve a day, with one hour and a half taken from this for meals. In 1825 Sir John Cam Hobhouse secured the passage of a measure that went a step further, and, among other provisions, contained a requirement for abridging the hours of labor on Saturdays. The act of 1831 prohibited night work to all between the ages of nine and twenty-one—a most important point gained; moreover, it limited the hours of labor of all persons under eighteen years to twelve a day except on Saturdays, when the limit was nine hours. [See ENGLAND: 1832-1833.] But it was not until 1833, when Lord Ashley, afterward Earl of Shaftesbury, came to the front as the advocate of protective legislation for the working classes, that sufficiently stringent measures were taken to prevent the decay of England. [See LABOR LEGISLATION: 1801-1878.] During his long career, one statutory enactment after another was fought through Parliament, each bringing about some urgently needed modification as regards hours, conditions, and age of factory

operatives. . . . Since 1847 [and the Ten Hours Bill] no child under thirteen years of age has been allowed to work exceeding five to seven hours a day in English mills, and no person under eighteen exceeding ten hours."—L. B. Ellis, *Movement to restrict child labor* (Arena, Oct., 1902).

1813-1871.—Early school laws and labor legislation in the United States.—"To a surprising extent the American public school system, free everywhere and almost universally compulsory, rests upon the early laws to regulate the labor of poor children and to secure for them the elements of learning. In the later years of the eighteenth century, England discovered a new use for the children of this class. Those hitherto regarded as a burden upon society or upon their parents were found to have an appreciable money value as operators in the textile mills, where only dexterity and constant watchfulness were required. The story of England's shame in the exploitation of young children in her mills and factories is familiar. Not so well known is her splendid battle, first, for the relief and elementary education of her poor, then, for the gradual development of an educational plan, now rapidly rounding out into an adequate national system fairly well adapted to the needs of every child, free, and compulsory. . . . There was nothing new in the English system of apprenticing the children of the poor; it had been going on for four hundred years. The 'laudable custom' had been well established throughout the colonies. It was the new industrial condition which led to its serious abuse, and only time could reveal these evils. . . . Factories similar to those of England were being established in America. In the latter part of the eighteenth century, plans were under way in several states to utilize the labor of children. . . . With the restrictions upon imports arising from interrupted trade relations with England and ending with the close of the war of 1812, there came a rapid increase in the textile as well as other manufacturing industries [in which the labor of children was in demand]. Active boys and girls from eight to twelve years of age seem to have been especially sought after, though there is evidence that children even younger were employed. . . . It was clear that to avoid the lapse of a large portion of society into gross ignorance, working children must be schooled. Connecticut led in the legislative program, by enacting a law looking to the welfare of factory children and requiring that they be given instruction in the common branches. Col. David Humphreys, a philanthropic manufacturer . . . was the moving spirit in securing the law of 1813. . . . The chief requirements of the law are: (1) The management of factories to cause all children in their employ to be instructed in reading, writing, and arithmetic. (2) Attention to be given to morals; regular attendance upon public worship required. (3) The selectmen of the town, or a committee appointed by them, required once a year 'carefully to examine, and to ascertain whether the requisitions of this act which relate to the instruction and the preservation of the morals of children employed as aforesaid, be duly observed.' (4) Penalty for violation on the part of the mill management, either discharge of the indentures in case of apprenticed children or a fine of not to exceed one hundred dollars, at the option of the Court. There seems to be no evidence that any attempt was made to enforce this law. It may be regarded merely as the registration of the wish of some of the more philanthropic manufacturers expressed in legislation. There is little reason to believe that there was, as yet, anything

like a general recognition of the dangers of employing young children during the time when society now agrees that the school should be given right of way. The law was permitted to remain upon the statute books until 1842, but its failure to provide either for schools or for adequate means of enforcement insured its ineffectiveness. Toward the close of the first quarter of the nineteenth century . . . Massachusetts was becoming aware that an industrial-educational problem had arisen. . . . The Assembly authorized an investigation; a committee was appointed which, after a partial investigation, evidently conducted by means of a questionnaire sent to the manufacturers themselves, submitted a report on June 16, 1825. The committee found that in some cases two or three months a year were allowed for schooling. This apparently was not usual, however, the report stating: 'It appears that the time of employment is generally twelve or thirteen hours each day, excepting the Sabbath, which leaves little opportunity for daily instruction.' The investigators did not believe their findings warranted action. . . . Apparently the committee was not impressed by the fact that young children were working for twelve and thirteen hours a day, nor did it discuss the effect that this early and prolonged labor might have on their health or on the health of future generations, though it did seem mildly concerned as to the intellectual status of those who might in their turn become proprietors of factories. In 1836 Massachusetts passed her first law designed both to limit the labor of young children and to provide for their education."—F. C. Ensign, *Compulsory school attendance and child labor*, pp. 30, 31, 33-37.—"But it was not until 1866 that this strong commonwealth was able to enact the first really effective measure, nor until 1894 that she could write upon her statute-books the law prohibiting children under thirteen years of age from being regularly employed in textile factories. Excellent limitations as to hours and provision for education are now embodied in her code, and today the Bay State stands a fair pattern for others in the Union in regard to this most important phase of protective legislation. Connecticut followed Massachusetts closely in throwing the State's protective arm around her children, New York and Pennsylvania pressing behind Connecticut, and others falling gradually into line."—F. Kelly, *American Journal of Sociology*, Nov., 1904, p. 16.—"In Rhode Island . . . in 1838 a bill was introduced requiring that no child under twelve years of age be permitted to work in any factory unless he had attended school for three months during the preceding year. After successful blocking for two years by the manufacturing interests, the bill became a law in January, 1840, but as no adequate provision was made for its enforcement, it was disregarded by all concerned. . . . In New York, as in Pennsylvania and Massachusetts, working men began to organize in the second and third decades of the century, and to demand better working conditions and shorter hours for their children. . . . Meanwhile education lagged and relatively large numbers of children were found to be growing up in ignorance. There was grave danger of an ignorant, debased factory class when once the neglected children of the mills came into maturity. . . . Two new forces [however] were developing which, . . . were to lead to state systems of free public schools; a growing democracy was expressing itself in a rapid extension of the suffrage; working men, newly enfranchised and learning to use their power, were demanding a measure of leisure for them-

selves and better educational opportunities for their children. These forces, guided and supported by men like James G. Carter, Horace Mann, Henry Barnard, Horace Greeley, and a host of others, were able to put under way a shadowy kind of compulsory schooling for those young children whom necessity drove to the factories. . . . The school and labor laws enacted in Connecticut, Massachusetts and Rhode Island, weak, unenforceable, purposely shorn of features which might embarrass the employer, were forerunners of genuine compulsory education, adapted to the needs of all. . . . Since the time of James Carter and Horace Mann there has been constant agitation for legislation intended to restrain children from severe labor and to provide for their schooling. Many causes have contributed to delay adequate legislation. Some of them have already been indicated. Selfishness of employers and poverty of parents, unwilling to sacrifice their real or fancied interests to the social good, were for years relatively constant factors. Social inertia long rendered adequate laws impossible. A few men with vested interests could easily prevent legislation, could usually divert attention from the real issues. Progress was delayed, also, by the early enactment of spineless laws, which were widely copied in various states. The Michigan attendance law of 1871, copied without substantial change in half a dozen other states, and the Massachusetts act of 1852, the first general attendance law in America, are good examples. . . . In the earlier attendance laws liberal provision was made for exemption from the fixed penalties."—F. C. Ensign, *Compulsory school attendance and child labor*, pp. 41, 43-45, 235, 236.—See also EDUCATION: Modern: 18th century: United States, 19th century: United States: Evolution of public school system.

1866-1890.—Enforcement of child labor laws in the United States.—Organization of child labor bureaus.—Discouraging reports.—"In the inauguration of state enforcement of child labor laws leadership again falls to Massachusetts. The law of 1866 authorized the governor to prevent the illegal employment of children through the state constabulary. General H. K. Oliver, first charged with this duty, was able to accomplish little, yet his reports locate some of the problems of child labor, and his work and that of his successors throughout the state prepared the way for factory inspection inaugurated in 1877. Connecticut was a close second to Massachusetts in beginning a program of state enforcement. Her child labor law of 1869 directed the state board of education to carry out the provisions of the act. . . . Gradually the duties of the board of education have been increased and its powers extended until state control of young children in school and in employment is more complete in Connecticut than elsewhere in the United States. Of the other states included in this study [the states studied are Massachusetts, Connecticut, New York, Pennsylvania and Wisconsin], Pennsylvania enacted her first child labor law in 1848, providing for state enforcing officers forty-one years later; Wisconsin, enacting her first measure to restrict the employment of children in 1877, provided in a limited way for state enforcement in 1885; New York secured her first protective legislation in 1886, at once establishing a system of factory inspection with statewide jurisdiction."—*Ibid.*, pp. 243, 244.—"The following are the states which have organized labor bureaus, with the dates of their organization: (1) Massachusetts, 1869; (2) Pennsylvania, 1872; (3) Ohio, 1877; (4) New Jersey, 1878; (5) Illinois, 1879; (6) New York, 1883; (7) Michigan,

1883; (8) Wisconsin, 1883; (9) Iowa, 1884; (10) Connecticut, 1885; (11) Indiana, 1879; (12) Missouri, 1883; (13) California, 1883; (14) Maryland, 1884; (15) Kansas, 1885; (16) Rhode Island, 1887; (17) Maine, 1887; (18) Colorado, 1887; (19) Minnesota, 1887; (20) North Carolina, 1887; (21) Nebraska, 1887. . . . Owing to the especial advantages possessed by the United States as a labor market, and the better condition of the laboring population in general, children were not employed in any considerable numbers until within comparatively recent years. As population has multiplied, and the crowding together of people in large cities has gone on, the employment of young children has largely increased. To trace this growth is, however, a much more difficult task than that offered in the case of England. There, the regulation of factories and labor was the single duty of the central government, while here it falls to the different State legislatures. As a consequence, while throughout England the laws are uniform, and but one set of statutes and reports, those of Parliament, which are easily accessible, have to be studied; here no two States have the same laws; only a comparatively few have any at all; and information must be obtained through the various bureaus of labor or the reports of their inspectors of factories and workshops. Many of these reports are difficult to obtain, as the small editions are soon exhausted, and only a few libraries possess complete sets of them. When found, they are often unsatisfactory and are confessedly unreliable. Each department is conducted in its own way. Some, with adequate means, are well organized, and their reports are of the greatest value, while others, with very limited resources, can do but feeble work. The law creating them has, in most cases, been inadequate and too timid. Almost all the reports complain that factory owners refuse with impunity to answer questions, fill up blanks or afford information of any kind, and that there is no law which can compel them to do so. This has been especially so in regard to Child-labor. . . . There thus remains but one available source for information in regard to the number of children employed prior to 1880, and their tendency to increase, viz., the United States censuses. Although not given in sufficient detail, yet they are by far the most available collections of statistics that can be obtained. . . . The Second Annual Report of the New York Labor Bureau, devoted entirely to an investigation of child-labor, was summed up as follows: 'My conclusions are, (1) The system of child-labor exists in the State in its worst form. (2) The compulsory education law is a dead letter. (3) The condition of laborers is of a low standard.' The Commissioner of Labor for Ohio in his report for 1887, page 9, says: 'My attention has been frequently called to the alarming growth of women and child-labor in gainful occupations. Children are crowded into workshops at twelve years of age; when they reach manhood, they are thrown out of work and their places filled with other boys.' The Inspector of Factories for New Jersey says, Second Annual Report, page 19: 'Our examination shows that there are thousands of children in the State who know no change but from the workshop to the bed and from the bed to the workshop.' . . . The legislation regulating the employment of children has been exceedingly various in the different States. Most of it is of comparatively recent date. Some few States have early seen the importance of regulating the employment of this class of labor, but the great majority of them have allowed it to go on uncontrolled. . . . From this slight sketch

it can be seen that the laws regulating the employment of young children are far from complete and satisfactory. What has been done, has been in the right direction, but in no single case have we approached the complete and well-working law of England. The greater number of the States have no laws regulating the employment of children (so far as I have been able to discover), except, possibly, some provision of a compulsory education law, which is practically a dead letter, so far as preventing the employment of children is concerned. Only eleven States forbid the employment of children under a certain age in all industries. Of these, three place the limit at the low age of ten, three at twelve, and five at thirteen years of age. Seven others forbid the employment of those under a certain age in mines. The provisions in regard to schooling and hours of labor vary widely. The really effective portions of these acts are those which unqualifiedly prohibit the employment of children under a certain age. It is evident that the other provisions are difficult of rigid enforcement, and evasions can easily be made, through the false statements of the employers and parents. Indeed, of these States with laws on their statute book, the great many, as admitted by their own labor reports, are largely inoperative. . . . A chief inspector should always be appointed, with a sufficient corps of assistants, and with large powers to enforce the execution of the law. It has been the universal experience of both England and this country that, where this has not been done, the law has proven useless [written in 1890]. . . . But eight States, Massachusetts, New York, New Jersey, Ohio, Wisconsin, Connecticut, Maine, and Rhode Island, possess inspectors of factories."—Wm. F. Willoughby, *Child labor*, v. 5, no. 2, Mar., 1890, pp. 25-27, 35, 38-40.

1873-1921.—Laws relating to regulation of child labor in agriculture in European countries, United States and Canada.—"In Europe, as in the western hemisphere, there are but few examples of direct legislation bearing on the labour of children in agriculture, either with respect to the age of admission to agricultural work, or in relation to other means of protection. The reason is not far to seek. . . . Since the main purpose of labour legislation in Europe is to protect the workers in industry, prohibition or limitation of the employment of children, as of adults, is usually related to special trades or processes; where a schedule of such trades exists, agriculture is automatically excluded. There are, however, labour laws which specifically exclude agriculture from the protection accorded to other industries. The Netherlands Labour Act of 1 November, 1919, for the regulation of hours is such a law. 'Agriculture, horticulture, forestry, and cattle-keeping' are excepted in Section 1 (1) from the occupations in which the hours of labour are regulated, and consequently the clause prohibiting all work to a child under 14 years of age who is attending school does not apply to children in agriculture. The specific inclusion, on the other hand, of the control of children's agricultural work in general labour laws calls for some consideration. The conditions governing child labour in agriculture are laid down in certain countries; the relevant sections are here summarised. . . .

"[In] Esthonia, [under the] Agricultural Labour Law, 13 May, 1921, (a) Children under 12 can only be employed on their parents' farms. (b) Children from 12 to 16 may only be employed on easy work or on herding cattle. (c) School chil-

dren cannot be employed except during the holidays.

"[In] Italy, [under the] Act regulating the Cultivation of Rice, 16 June, 1907. (a) Children under 14 may not be employed in the weeding (*mondatura*) of rice-fields. (b) Boys under 16 cannot be employed in weeding rice, except on presentation of a birth certificate. . . .

"[In] Switzerland, [Canton of Basel, under the] Basel City Act Respecting Hours of Work, 8 April, 1920. Children may not be employed under the age of 12 in any agricultural undertaking other than that of their parents; a limit of six hours' work a day during the whole period of compulsory school attendance and of two hours in the school term is imposed.

"Taking an example from this group of laws, we find that the protection of children engaged in farm-labour appears in a modified form as compared with the age-limit, control of hours, and safety regulations imposed for children in other occupations. In the Danish law . . . children who have not completed their compulsory school attendance are altogether prohibited from work in occupations subject to inspection; the Danish school law fixes that age at 14. The child in agriculture is permitted to work with machinery and without the safeguard of inspection four years earlier. This may be considered typical of the differentiation commonly practised between agricultural and industrial employment in Europe. . . . Austria, by the Child Labour Act of 19 December, 1918, and Czecho-Slovakia, by a very similar Act (17 July, 1919), prohibit the general employment of children under 12 years old. In both Acts this prohibition is modified in the case of agriculture, employment in 'light work in agriculture' being permitted from the age of 10. On Sundays and religious festivals children may not be employed save only for 'urgent agricultural operations necessary to save the crops, or for regular (agricultural) operations which cannot be postponed.' Only six hours' work may be required of the agricultural child on holidays; this may be contrasted with the restriction to four hours' employment of a child engaged in other occupations. . . . In Czecho-Slovakia, as in Austria, children may not work more than three hours on school-days. Agricultural employment for children is prohibited 'in general' for the two hours immediately preceding school, and an hour's leisure after school is compulsory. In Great Britain and Ireland, apart from the school attendance provisions in the Education Acts, the labour of children in agriculture is already controlled by legislation. In the Agricultural Gangs Act of 1867 it was laid down that the distance to which children might travel for work should be specified on every gang-master's licence; and it established 8 years as a statutory minimum age for children in agricultural gangs. The Agricultural Children's Act of 1873 (dealing generally with the education of agricultural children) raised the minimum age for employment in gangs to 10. In 1876 the Agricultural Children's Act was itself repealed by the Education Act, and the age of 10 was fixed as a general minimum age for employment. . . . The English law of school attendance has been amended and consolidated in the Education Act of 8 August, 1918, commonly known as the 'Fisher Act,' and the Education (Consolidation) Act of 21 August, 1921. (See EDUCATION: Modern developments: 20th century: General Education: England: Fisher act.) The main lines of the policy of the Fisher Act are reproduced in the Education (Scotland) Act of

21 November, 1918. . . . It is laid down that no local education authority shall retain power to make by-laws for the exemption of children under 14 (the age-limit for compulsory school attendance). . . . Section 16 of the Norwegian education code embodied some restrictions applicable to the employment of children of school age. . . . No child of school age may be employed during school hours nor at such a time as would prevent his arriving 'sufficiently rested' in time for school. Neither may any child be employed in such a way as to prejudice his school preparation work. There is a remarkable variation in the maximum period fixed for exemptions allowed for agricultural work in different parts of Europe. Comparing eleven countries, which exempt specifically for employment in agriculture, the same limit appears twice only. The following limits are fixed in the legislation of these countries and are embodied in the exemptions which can be studied in table II summarising their education laws. The amount of employment in agriculture is more difficult to gauge in countries in which exemption from school attendance is not specifically granted for agricultural work, and it is difficult to see how there can be effective control of the employment of children in such work, so long as the school attendance period can be curtailed without a specific reason. An instance is provided in the case of Sweden, where no specific exemption for agricultural work can be granted."—*Agriculture (International Labour Review, Nov., 1921, pp. 402-407, 409-410).*

"The administration of a child labour law which regulates the employment of children in agriculture presents serious difficulties. . . . The natural result is that, for the most part, direct legislation regarding the agricultural employment of children has been avoided and reliance for their protection has been placed on the indirect application of other laws. Such direct legislation, however, is not entirely unknown, and may be cited, for example, in certain of the States of America. In twenty-seven of the forty-eight States the employment of children in any gainful occupation is definitely forbidden during school hours. . . . Also—a fact of primary importance and one which is typical of the advantage in protection which is given to children of urban, as compared with those of rural, districts—in eighteen States (including nine of those legislating against gainful employment in general as above) modifications are made in the child labour Acts such that, in their application to agriculture, the employment of children at farm labour is wholly or partially exempted from the prohibition. . . . One other way in which the control of children in agriculture may be effected by direct legislation is in the regulation of hours. But while always an outstanding feature of factory legislation, this method of regulating child labour on farms has to a perhaps surprising extent been disregarded, whilst in some States we find a definite exemption for child farm workers from the legal limitations as to hours of other occupations. . . . An example of a State where the hours of the employment of children in agriculture are legally regulated in a direct way is Nebraska. This State, while it does not prohibit children under the minimum age from working in agriculture, regulates the hours of employment for persons under 16 years of age in sugar-beet fields as follows: 'No person under the age of sixteen years shall be employed or suffered or permitted to work in any . . . beet field . . . more than forty-eight hours in any one week, nor

more than eight hours in any one day, nor before the hours of six o'clock in the morning, nor after the hour of eight o'clock in the evening.' Arkansas is the only State which includes agriculture in its child labour law restrictions on the same basis as industrial or commercial employment. It provides that no child under 14 may be employed in any remunerative occupation. . . .

"In Canada, as in the United States of America, the legal regulation of working conditions rests largely with the Provincial Governments, as distinct from the Federal. In eight out of the nine Canadian Provinces, the minimum age of employment in factories and certain other branches of industry is fixed. In Alberta no child under 15 years may be employed in a factory. In British Columbia the limitation applies to boys under 14 and girls under 15 years (an exception is made here in the case of employment in canning fish, packing fruit, and work incidental thereto, but only during the time of fish runs and in fruit seasons). In Manitoba, New Brunswick, Ontario, Quebec, Saskatchewan, and Nova Scotia the minimum age of industrial employment is 14 years; in Nova Scotia an exception is made in the gathering and preparation . . . of fruits and vegetables for canning; in such case . . . hours are limited to eight in one day and four on Saturday. The Industrial Establishments Act of Quebec requires that no child under 16 years of age may be employed in any industry, trade, or business, if he is unable to read and write readily. Quebec, Manitoba, and Saskatchewan require a certificate of age in the case of children under 16 years employed in industrial occupations, and in Ontario a home permit or employment certificate must be held by any child under 16 years of age who is employed by any person during the hours between 8 a.m. and 5 p.m. This provision of the Adolescent School Attendance Act applies to any employment and evidently includes agriculture. These are the Canadian laws which protect children in their employment, but, excepting in Ontario, they exercise no direct control in the case of agriculture. In Ontario the Factory, Shop, and Office Building Act as amended in 1919 makes some approach to the problem, in that it provides for the maintenance of certain standards in farm camps in which women and girls are employed. Such camps may be open only between the first of May and the first of November; women and girls may be employed not more than ten hours in one day, unless a different arrangement is made for the sole purpose of giving a shorter day's work on one day of the week; no women or girls may be employed for more than sixty hours in any one week."—*Ibid.*, Sept., 1921, pp. 154, 382, 383, 385, 389.

1874-1905.—Child labor laws in England.—Protection of children in Spain.—When the English Ten Hours bill of 1847 was followed by the Minimum Age bill of 1874, and "the excellent amendments of these in 1878 and 1891, the necessary bulwarks against national decadence might at last be called complete. . . . In 1874, the age for a full day's work was raised to fourteen years and stringent provisions made for the attendance at school between work periods. The measure of 1878 consolidated and amended all existing laws for the regulation of child labor and provided adequate means for their enforcement. By this measure the employment of children under ten years was totally prohibited, a limit that was in 1891 raised to eleven years. Greatly improved sanitation was also provided for in the 1878 enactment, and adequate safeguards against

accidents were set up. Periodic medical certificates were required from all operatives under sixteen years; employees were compelled to obtain weekly certificates proving the necessary school attendance, and a sufficient number of inspectors was demanded, to execute the provisions of this comprehensive act."—L. B. Ellis, *Movement to restrict child labor* (Arena, Oct., 1902.)

"Spain, often spoken of as one of the most backward of the civilised countries of Europe, has as long ago as 1878 made provision for the protection of child life, but the object of such provision is clearly seen when the fact is noticed that the Minister of War is in most cases the person responsible for the promulgation of regulations and the carrying out of the law in this respect. Many of the laws of Spain are equal and in some respects superior to the English law in relation to the employment of children. It is only recently in England that the age of sixteen has been laid down as the minimum age at which persons are allowed in subterranean workings; but this has been the law in Spain since 1900. There is in Spain, however, provision made for cases where the law cannot be observed, whilst in England the law must be observed. The excellence of the Spanish laws, so far as they go, cannot be disputed, but in their administration they are extremely doubtful, as it is often found necessary, after the promulgation of the law, to issue further decrees from time to time, setting out the same specific enactments, with or without further explanation. Thus the law of the 13th March, 1900, which contains many of the provisions relating to the employment of children, is practically repeated in the decree of the Minister of War in March, 1902. . . . The minimum working age under the law of 13th March, 1900, is ten years, except where permission is granted for work to commence one year earlier by reason that the particular child is proficient in reading and writing. Between the ages of ten and fourteen the hours of labour are limited. In factories and purely industrial occupations six hours is the limit for the day's work, whilst the eight hours day is the maximum in offices and commercial life. Here again the *juntas* may allow an extension of these times where, through drought, water mills have been stopped and overtime is necessary, and in the case of factories having steam power any forced stoppage can be made up by increasing the hours of labour. . . . By the law of March, 1900, all children between the ages of ten and fourteen must be allowed two hours daily for primary and religious instruction. They must attend school for this purpose if there is a recognised school within a distance of two kilometres. Where there is no such school, any establishment in which more than twenty children are employed must provide its own school. If failure is made in this respect the Minister of War may, under a decree of 1902, establish such school. . . . By regulations issued in May, 1900, it is provided that the master is to concede one hour daily for primary education to all his work-people under eighteen years of age. If there is no properly equipped school within two kilometres, any establishment employing more than 150 persons must equip in such establishment a school under a competent master. In such school, reading, writing, the elements of Spanish grammar, the first four rules of arithmetic, and Christian doctrine must be taught. Groups of factories can join in providing schools and all schools are under the local authorities—Municipal and Provincial *Juntas*—who appoint local inspectors. The

inspectors report to the local authority; the local authority to the Governor of the Province; the Governor to the Rector of the University in the district, and this latter official compiles statistics for use of the Government. . . . No night work is allowed for children under the age of fourteen, and only in certain industries will persons between fourteen and eighteen be allowed to work at night. . . . The total amount of night work allowed per week by the law of March, 1900, is forty-eight hours, but this appears to have been increased to sixty-six by a decree of 1902. . . . Working in mines is restricted to persons over sixteen. 'Mines' includes mines, tunnels, and surface works where ordinary operations similar to those of mining are carried on. . . . Similar provision is made against persons under sixteen working at employments where inflammable or insubrious materials are used, and against such persons being engaged in cleaning machinery whilst in motion. . . . The moral protection of persons under sixteen and women under age is the provision that such persons shall not be engaged in printing works where books, pictures, or documents, not coming within the penal law and yet likely to injure the morals, are produced. . . .

"The first important laws for protection of children in Spain were promulgated on the 26th July, 1878, and the punishments for infractions of the law are there laid down. In addition, fines have been fixed for breaches of Factory laws. . . . By a decree of the Minister of War in March, 1902, a workman is defined as a person who works with pay or without, outside his own home. By the same decree rules for admission of minors to business are laid down. (1) Permission of the father, or in default, the mother, or where the child is brought up in a home, the permission of the director of the establishment in which the child had been *asilado* must be obtained. (2) His age must be proved by entry on the civil register (*i.e.*, by certificate of birth). (3) Proof must be forthcoming that the class of work to which the minor is going is not above his strength. (4) and that the person is free from any infectious or contagious disease. This is proved by a medical certificate. This brief *résumé* of the Laws of Spain as they affect children illustrates the position in the southern countries of Europe."—R. W. Holland, *Law relating to the child*, pp. vi-viii.

1874-1918.—**Employment of children under Swiss Factory Act.**—"One of the most valuable of the new constitutional articles introduced at the revision of 1874 was that conferring upon the federation power to enact uniform laws with regard to the employment of children in factories, the length of the working day of adults therein, and the protection of laborers engaged in unsanitary and dangerous manufactures. . . . Under the authority of Article 34, a comprehensive factory act was passed early in 1877, and ratified by a small majority of the popular vote at the referendum held October 21 of that year. So important are its provisions regarding the labor of women and children, the length of the working day, night work, Sunday work, etc., that this law justly deserves to be called 'the Swiss factory worker's Magna Charta.' . . . Women and children under eighteen may not be used for night or Sunday work. . . . In all cases, even where two shifts of workers are employed, women and children under eighteen must be given a night's rest of at least eleven continuous hours. . . . Children under fourteen may not be employed in factories, nor may those above that age who are legally obligated to attend school daily. In the

case of children under sixteen the time spent in school, in receiving religious instruction, and in the factory, all combined, shall not exceed ten hours per day."—R. C. Brooks, *Government and politics of Switzerland*, pp. 236-238.

1876-1909.—**Legislation in Hungary.—Infant protection.—Infant homes.**—"In 1876, the [Hungarian] State itself began to undertake the maintenance of Homes for Infant Children. . . . From this time forward the State provided for infant protection with increased activity. A great influence was exerted on the legislative settlement of this cause by the Infant Homes Exhibition arranged in 1889 at Budapest, the variety of which convinced everybody of the success hitherto attained by the cause of infant protection, and at the same time of its importance for the whole country. . . . Under such circumstances neither the State nor the Legislature could delay any longer the legislative settlement of infant protection. Count Albin Csáky, at that time Minister of Public Instruction, prepared the Bill which, as Act XV of 1890 on Infant Protection, received sanction on April 28, 1891. . . .

"According to the Act of 1890, the object of infant protection is to nurse and take care of children from three to six years old, to perfect the fundamental work of education, to develop their physical skill, intellect and temperament suitably with their age, and to help forward thereby their physical, mental, and moral development. There is no place in Infant Homes for the tuition assigned to the elementary schools; but, on the other hand, it is a work of first importance to facilitate the task of Hungarian-speaking schools existing in provinces where other idioms are spoken in appropriating the Hungarian tongue, and to help on their general culture by these means. . . . There are for this purpose—(1) Infant Homes under the management of qualified mistresses or masters. (2) Permanent Infant Asylums under the management of qualified persons. (3) So-called Summer Asylums for Infants. Where any of the above-named institutions exist, every parent is obliged to send his or her children from the ages of three to six, of whom proper care cannot be taken at home, to the existing Infant Home, under penalty of a small fine. The conditions as to what may be understood by proper care are defined in the regulations for carrying out the Act. . . . The obligation to establish Infant Homes . . . [is imposed upon] (1) *a.* Every municipality with autonomous rights. *b.* Every county town regardless of the taxes paid, and every community in which contribution to the revenue exceeds 30,000 crowns; and if in such community there is no Infant Home; or if the number of children uncared for is above 40 for whom there is no accommodation in an existing Home. (2) Permanent Infant Homes must be established in communities in which the tax is between 20,000 and 30,000 crowns, and if there are not less than 40 children uncared for. (3) Summer Infant Asylums must be established in every community, finally, whose tax does not exceed 20,000 crowns, and where there are not more than 15 children uncared for, if for this purpose the resources of the community are not adequate, it is allowed to impose a supplementary tax of 3 per cent. on the State tax. The State may employ for the maintenance of its own Infant Homes this tax of 3 per cent. in so far as it has not been already taken up for Infant Homes by the community. Furthermore the law provides that where there is no other Infant Home, infants must be received into sectarian,

association, or private homes without regard to religion or language. The Infant Home work usually lasts for three hours in the morning and two hours in the afternoon. It is a rule that the children should not be all together except in the round games. Occupations for the development of the intellect must, as a rule, be taken at the beginning of the day's work. To form the mind and character (temperament) the games and conversation, fairy tales, stories, learning poetry, singing, and, further, manual occupations, are important. Instructions in relation to these differ from the Froebel system, in so far as they do not excessively hinder the exercise of the child's will, do not overcharge the child's mind by forcing all its capacities, but leave a wider scope for the child's freedom, while protecting him from excessive demands upon his physical and mental powers.

"Infant Homes are usually established by the State, (a) where the work of larger State elementary schools requires to be facilitated by Infant Homes, chiefly in respect of the acquisition of the Hungarian language, or (b) where Infant Protection, or the reinforcement of the national power is required, chiefly with regard to economic circumstances; (c) finally, where the arrangement or neglected condition of the whole of the national education makes it absolutely necessary for the State to take into its own hands the management of the Infant Homes, or to give them a national direction."—P. A. Alden, *Hungary of today*, pp. 314-319.

1879-1921.—Advance in Child Labor restrictive legislation in the United States.—Lack of enforcement in many states.—"Between the years 1879 and 1909 the number of States regulating the employment of children in manufacturing industries jumped from 14 to 44. The figures for dangerous occupations were approximately the same. The more recent restrictions are in the fields of street trades and office, hotel, and theater employment. At first mining legislation developed almost as rapidly as manufacturing, but in the period from 1905 to 1910, the rate slackened, due perhaps to the fact that mines are geographically more limited than factories. For this reason, too, it was not necessary for all States to legislate on employment in mines. Up to 1889 only one State had any legal regulation of the employment of children in mercantile establishments. Since 1900, however, such legislation has developed rapidly.

Legislation governing the dangerous occupations has been steadily increasing in recent years. Of the many employments falling in this class, the most commonly legislated against has been the employment of children in street exhibitions for mendicant purposes. The prohibition of child labor in places where liquor is sold has not been as general as one would imagine. Such legislation would be superfluous now. One general observation is that once a State regulates the employment of children in a given occupation, it rarely recedes. A law apparently excellent can be all but choked to death by exemptions, and another law, apparently inferior but unhampered by a multitude of exemptions, can live a far more useful life. The chief exemptions are the following: Vacation times; outside of school hours; during specified seasons; orphans, children of widowed mothers or disabled parents; farm and domestic labor; labor on perishable goods; to make repairs; to shorten one day of the week; to make up for lost time; by special permit; physical condition; certain counties and cities of certain sizes. Throughout the statutes we con-

stantly come in contact with such exemptions as these, and it is well to consider their debilitating influence before judging the efficacy of the law. The age limits—the ages under which children may not work in certain occupations—have been raised gradually but steadily. During the years 1879 to 1889, the typical minimum age for legal employment in manufacturing industries was 10. During the next decade it was 12, and for the last two decades it has stood at 14, although recent legislative efforts have been made to raise it to 16. Before 1894, 12 was the typical age minimum in most occupations other than dangerous occupations, and since then 14. In dangerous occupations, as in some few others, the age limits frequently differ for boys and girls, and, as might naturally be expected, they have been higher than others, rising to 16, 18, and 21. Concerning hours, 10 a day and 60 a week seems to have been the average maximum in the early child-labor laws. From 1895 on, however, there can be noted a decided decrease. In 1909, 9 a day and 54 a week was the average. Since then there has been a strong and successful tendency to establish the 8-hour day and the 48-hour week—the general maximum of the present day [1921]."—M. E. Loughram, *Historical development of child labor legislation in the United States*, pp. 6-7.—Measured by the legislative advances by which child labor has been restricted and controlled in the various States, "an outline of the progress the American people are making in the protection of young children against injurious employments may be seen at a glance by the following schedules: (1) during eight [written in 1912] years six States passed their first law upon this subject: Arizona, Delaware, Florida, Georgia, Mississippi, Oklahoma, and the District of Columbia. (2) The eight-hour day has been established in Arizona, Ohio, Illinois, California, Indiana, Nebraska, New York, Wisconsin, Colorado, Mississippi, Oklahoma, North Dakota, Kansas, Missouri, District of Columbia, and Washington (for females in most occupations). (3) Night work under sixteen years has been made illegal in Alabama, Arizona, California, Colorado, Delaware, Idaho, Indiana, Iowa, Kansas, Kentucky, Louisiana, Mississippi, Missouri, Nebraska, New Jersey, North Dakota, Oklahoma, Rhode Island, South Carolina, Vermont, Washington, and the District of Columbia. (4) A fourteen-year age limit as the minimum for employment in industry has been established in the following States: Arizona, California, Colorado, Delaware, Idaho, Iowa, Kentucky, Louisiana, Maine, Missouri, Maryland, Nebraska, Pennsylvania, North Dakota, New Jersey, Tennessee, West Virginia, Rhode Island, Kansas, and the District of Columbia. (5) Departments of factory inspection have been established in Alabama, Colorado, Delaware, Kansas, Louisiana, Maryland, North Dakota, Oklahoma, South Carolina, Texas, Tennessee, Virginia, and the District of Columbia. (6) Methods of proving the age of children seeking employment have been provided in Arizona, California, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Michigan, Missouri, Nebraska, North Dakota, Oklahoma, Oregon, Pennsylvania, Rhode Island, Washington, Wisconsin, and the District of Columbia. Meantime, compulsory education laws have been enacted or improved in a large number of States. In order that no one may think this work is nearing its completion and that the public can reasonably rest, we must also consider a few principal defects. There are still five States which have not reached the fourteen-year age limit even for employment in factories. These States are

North Carolina, Alabama, Georgia, Mississippi, South Carolina, Alabama, Florida, Maryland, North Carolina, North Dakota, South Carolina, and Virginia permit the employment of boys of twelve years in mines. Children under sixteen are still permitted to work at night in Arizona, Connecticut, Maine, Maryland, Montana, Nevada, New Hampshire, South Dakota, West Virginia, and Wyoming. There are thirty-four States in the Union in which children under sixteen years of age may work more than eight hours a day.

. . . In ten States there is no method of determining how old children are who seek work in our industries. Our agents have frequently found eight, nine, and ten-year-old boys applying for work in glass-factories or coal mines, upon affidavits certifying them to be fourteen or sixteen years of age. We must keep in mind the honor and dignity of our social institutions, and nothing is more fatal to the integrity of the American people than contempt for its own laws. . . . The States in which we do not require a proof of the child's age, or at least any proof worthy the name, are: Florida, Mississippi, Nevada, South Dakota, New Mexico, Texas, Utah, Vermont, Virginia, Wyoming. It is necessary that the laws to which we have referred shall be enforced by public officials clothed with adequate authority. At present Arkansas, Florida, Nevada, North Carolina, Arizona, New Mexico, Mississippi, South Dakota, Virginia, Vermont, Idaho, North Dakota, and Wyoming have no department entrusted with this duty. The commissioner of labor in West Virginia says it is not his duty to enforce the law; while the factory inspector in Missouri has jurisdiction only in the large cities; in Louisiana, only in the parish of New Orleans; in Alabama, he is also required to visit jails and almshouses; and the governor of South Carolina last year [written in 1912] vetoed the appropriation made by the legislature for the two factory inspectors who, during two years, have assisted the commissioner of labor in laying the foundations of this branch of public service."—O. R. Lovejoy, *Child labor, Social service series*, pp. 24-29.

"Four standards already quite generally recognized by the individual states: (1) an age limit of fourteen years for employment in mills, canneries, workshops and factories; (2) a minimum work day of eight hours for children between fourteen and sixteen in such establishments; (3) the prohibition of work at night in such places on the part of children between these ages; and (4) an age limit of sixteen years for employment in mines and quarries. The power of Congress to regulate commerce among the states is invoked with the object of imposing these standards upon manufacturers and mine operators who ship their products from state to state—a provision virtually all-inclusive. For those who refuse to meet these requirements, suitable penalties in the form of fines or imprisonment are provided. At present twenty-seven of the states have the first standard already written in their laws without weakening exemptions, while seventeen others have adopted it in principle but permit a lower standard under certain conditions. Eighteen states rigidly require the second standard, while four others make exceptions. The third standard is widely recognized, as no fewer than thirty-three states insist upon this elementary provision for the protection of working children, and five others have adopted it with exemptions. The fourth standard affects only those states with mining or quarrying industries, and has been incorporated in the laws of twenty-two, three of these, however, authorizing depart-

ures from its observance. . . . The child labor laws of the several states may be things of beauty as they repose on the statute books, but they are certainly not joys forever because they are not enforced. A few years ago a model child labor law was drafted by the National Committee and endorsed by the United States Commissioners on Uniform Laws; in the exuberance of its new statehood Arizona actually swallowed it whole, but omitted to provide any means for its enforcement, and to this day the act is merely ornamental. An older commonwealth, indeed, North Carolina, one of the thirteen original states, still denies to its Commissioner of Labor the authority to compel obedience to even its wretchedly inadequate law. And these are only instances of widespread indifference. . . . Officers charged with child labor law enforcement in the most enlightened communities commonly complain that in many of the courts it is almost impossible to secure convictions for violation and that, when convicted, the defendant is either fined the minimum sum fixed by law or released under suspended sentence."—E. N. Clopper, *Enforcement of child labor laws (Annals of the American Academy of Political and Social Science, Jan., 1916, pp. 272, 274, 275)*.—In Massachusetts, Connecticut, New York, Pennsylvania, and Wisconsin "elaborate systems of state of child labor regulations are now [1921] in operation and, compared with the enforcement of the school attendance laws, fairly satisfactory results are obtained."—F. C. Ensign, *Compulsory school attendance and child labor laws*, p. 244.

1889-1900.—Child protection laws in France.—Italian law of 1890.—Child welfare in Norway.—"Although the legal status of the child has always been an important matter in France, yet the law which gave birth to the series of laws having for their object the protection of the child was the law of the 24th of July, 1889, 'sur la protection des enfants maltraités et moralement abandonnés.' Side by side with this law are others falling into three groups governing the labour and education, the protection from harm, and the reclaiming of the juvenile criminal. The law of the 7th December, 1874, relative to the protection of children employed in 'les professions ambulantes' was followed by the law of 2nd November, 1892, modified and completed by the law of 30th March, 1900, governing the working of infants, young girls and women in industrial establishments. These laws have been followed by another regulating the night work of children. . . . As in England private enterprise of the charitably inclined has accompanied and sometimes anticipated legislation. The law often works hand in hand with private initiative; thus the law of the 19th April, 1898, recognises private charitable institutions by authorising the juge d'instruction on the Tribunal de l'Enfant to remand a child, guilty under this law 'pour la répression des violences' of acts of cruelty, violence, or assault, or against whom such acts are committed, to charitable institutions."—R. W. Holland, *Law relating to the child*, pp. x-xi.

"The following is an epitome of the Italian law (of 1890) concerning minors: *Section 21*.—When a minor has been sentenced to one month's imprisonment, the judge may order him to expiate the sentence in his own house. *Section 53*.—He who, when he committed a crime, was still under nine years of age, shall not be proceeded against. . . . *Section 54*.—He who, when he committed the crime, was more than nine but less than fourteen years old, is not liable to prosecution, unless his discernment be proved. . . . *Section 391*.

—Whoever maltreats a member of his family or a child under twelve years of age is punished with hard labour for not less than three days nor more than thirty months. If the person maltreated be a son or a daughter, the penalty is from one to five years' hard labour. . . . *Section 386.*—Whoever abandons a child under twelve years of age . . . is liable to the punishment of hard labour from three to thirty months. . . . *Section 389.*—Whoever, having found a child under seven years of age forsaken or lost . . . omits to inform the Authorities or their officials at once, is liable to a fine from 5 to 100 lire. *Section 390.*—Whoever, abusing the means of correction or discipline, causes damage or danger to the health of a person under his authority, or entrusted to his care for the sake of education, treatment, or supervision, or for apprenticeship in a trade or profession, is liable to a punishment of from three days' to eighteen months' imprisonment."—R. W. Holland, *Laws relating to the child*, pp. xv-xvi.—See also CHARITIES: Italy: 1880-1900.

"Since the eighties of last century many bills have been introduced [in Norway] with the purpose in view, of improving the lot of [illegitimate] children, but the movement did not result in changes in existing laws until 1892, when the economic responsibility of the father was accentuated and the right of the child to inheritance from the mother was established. A proposal put forth at the same time regarding inheritance from the father was not then taken under consideration. In 1896, Norway established by law a council for the welfare of children, which aims at helping all neglected and mistreated children, those who are born outside of as well as those born in marriage. In 1905 the law was made more severe."—*Survey*, Oct. 9, 1920.

1889-1921.—**Factory inspection, and medical inspection of school children in the United States.**—**School certificates.**—**Working papers.**—**School age.**—"Under the theory that the parent was entitled to the economic service of his child, compulsory school attendance laws were long resisted. In many states the enactment of the first legislation of this character was possible only by including the provision that in case the labor of a child was necessary for the support of his parents he would be exempt from the penalties of the law. . . . [However,] as early as 1889 Massachusetts, in revising her attendance laws, omitted poverty as cause for exemption from their operation. . . . In enacting the first compulsory education law in America the General Court of Massachusetts Bay clearly had in mind the moral as well as the intellectual and economic welfare of children. Two hundred years later, when the descendants of these Puritan law-makers were fighting for compulsory school attendance and child labor laws in Massachusetts and Connecticut, their strongest argument was that children were growing up without proper opportunity to develop their moral natures and under conditions prejudicial to health. Relatively early, the more progressive states began to exclude children from occupations regarded as physically or morally dangerous. Later, factory inspectors were given authority to remove children from such employment as seemed unsuited to their strength; and, finally, the modern state provided that no minor should enter upon dangerous employment and that no child under sixteen should leave school to engage in any sort of labor exclusive of home duties and farming, without first submitting to a thorough medical examination and securing a physician's written assurance of physical fitness for

the specific tasks proposed. Several states have now provided for medical inspection of school children, usually authorizing school boards to establish such inspection at public expense and to require all children under their control to submit to periodic examinations. Massachusetts has taken the logical step in developing her system of free and compulsory education by requiring medical inspection in all public schools throughout the state. . . . The history of the development of the employment certificate is the history of effective child labor legislation. . . . The simple statement of school attendance, signed by a teacher and sworn to before a justice of the peace, as provided for in Massachusetts in 1848, was not intended to insure to the child the elements of an education, nor to keep him out of the factory. . . . Provisions for school attendance certificates little more effective than those of 1838 in Massachusetts were made by other states in the early stages of child labor legislation, as in Connecticut in 1842 and in New York in 1874. In Pennsylvania, not even this crude form was provided until 1889. . . . It is commonly agreed that under ideal conditions the certificate of employment should never be placed in the hands of the child but should be sent by mail directly to the employer from the office of issue; then, on termination of employment, it should be returned in the same manner to the office of issue. The experience of many years was required to develop this standard; that of Massachusetts may be regarded as typical. In this state it was found that employers were preserving age and schooling certificates after children presenting them had left their service. These papers were then assigned to other children who applied for work but who had no certificates. In 1890 a law was enacted making the certificate the property of the child and requiring that on leaving service it be returned to him. This did not prove satisfactory. . . . The next step, taken in Massachusetts in 1913, in some states earlier, was to require the employer to return the certificate, not to the child, but to the authorities issuing it. . . . Under ideal conditions the applicant for working papers must present a definite written promise of employment in which the character of the work proposed is stated. Here again Massachusetts led. As early as 1888 she required an employment ticket. This was nearly a quarter of a century before the practice became common. . . . There remains considerable variation in the educational requirements for working papers. The early laws merely provided that the child applying for employment, if under a certain age, must give evidence of having attended school for a minimum number of months, usually three, of the preceding twelve. As compulsory attendance laws developed, steadily advancing the minimum period of schooling the labor laws were kept in harmony with them, until in most of the northern states all children under fourteen years of age, under sixteen if not employed and if the elementary school course or its equivalent has not been completed, are required to attend school for the full session each year. In certain states, New York and Pennsylvania, for example, an examination as to ability to read and write was required in addition to the school attendance record, the former state still adhering to the plan. In Massachusetts, where the importance of the school record has been stressed, the minimum attainment in school is such knowledge of reading, spelling, and writing as is required for the completion of the sixth grade in the local public schools. In New York, where the examination

is stressed, the school record of the applicant for working papers must show that, if under fifteen, he has completed the elementary course of eight grades or its equivalent. Pennsylvania, long exceedingly lax in educational standards for working papers, now requires that the applicant, if under sixteen, must have completed the work of the sixth grade. In Wisconsin the applicant, if under seventeen, must have completed the sixth grade. In all the states here considered the young worker who has not finished the equivalent of the eighth grade of the elementary school passes automatically into the continuation school, except in Connecticut, where he must attend evening school, if one is established."—F. C. Ensign, *Compulsory school attendance and child labor*, pp. 236-241.

1899-1921.—**Juvenile courts in Europe and the United States.**—"Countries which have established juvenile courts [are]: England, Germany, Poland, Czechoslovakia, Austria, Russia, Hungary, France, Belgium, Holland, Denmark and, finally, Switzerland. This movement had its inception in the United States where the first juvenile court in the world was established in 1899. Since that time practically every state in this country [United States] has established similar courts. . . . The laws of Belgium and Hungary make some provision for physical and mental tests of children, . . . as does also the bill for a children's code in Italy. In Munich the juvenile court has changed its name to the Child Welfare Court, and men and women representing the trade unions and other labor organizations have been added to the advisory committee of the court. The university has lent its assistants to conduct physical and mental examinations. The juvenile court judges are delivering lectures on the legal aspects of their work before parents' associations, teachers' meetings, labor organizations and other gatherings as a means of educating the people as to the importance of child welfare work and to bring about a greater degree of confidence and cooperation between the courts and the general masses. . . . Juvenile courts are to be established in Spain in those capitals of the provinces and main cities of the districts where there are institutions for the care of neglected and delinquent children, according to word received by the federal Children's Bureau. These courts consist of a judge, who is not necessarily a member of the bench, two advisory members appointed by the Committee for the Protection of Children, and a judge who acts as secretary of the court. The court has jurisdiction over all children under fifteen years of age. Its sessions must be held in a place and at a time different from the regular court sessions. Only probation officers and persons with special permits are allowed to attend sessions of the juvenile court, and newspapers are prohibited from publishing any information concerning cases of delinquency. In the Spanish courts no mental or physical tests are given, but considerable interest in this matter has been shown by the persons influential in securing the passage of the law, and a report on the methods in use in the best American courts has been made by Señor E. C. Calon."—*Child welfare* (*Survey*, v. 45, Nov. 13, 1920, pp. 250, 252).

A collection of reports on "Children's Courts in the United States," prepared for the International Prison Commission and edited by Samuel J. Barrows, Commissioner for the United States, was published in 1904 as House Document No. 701 of the 58th Congress, 2d Session. The following account of the origin of the now widely

established juvenile courts and of their development in the United States during the first four years of their existence, is derived from those reports. Commissioner Barrows opens his introduction to the collected reports with the following remarks: "If the question be asked, 'What is the most notable development in judicial principles and methods in the United States within the last five years?' the answer may unhesitatingly be, 'The introduction and establishment of juvenile courts.' Never perhaps has any judicial reform made such rapid progress. . . . This progress has been made not merely by changes in procedure or legal technique, nor by the introduction of a new method; it is most of all by the introduction of a new spirit and a new aim. . . . It must not be supposed that the juvenile court is only a smaller court for smaller offenders or simply a court holding separate sessions for such offenders; it represents an altogether different principle. The juvenile court is a life-saving institute in society. It is scarcely necessary to say that child-saving methods, institutions, and organizations have long flourished in the United States. The Northern States have regarded juvenile reformatories as a part of their correctional equipment, and the courts have served as vestibules for such institutions; but they have only been incidentally a part of the process. We have not before realized what the court might be and do before resorting to institutions. The children's court still maintains relations with the reform school, but it represents in itself active and vital forces and invokes a whole range of influence and motives which are personal and formative. It appeals to the reform school not as the first, but only as the last resort. The juvenile court has discovered that the child is a child, and, as judge Hurley says, 'The child should be treated as a child. Instead of reformation, the thought and idea in the judge's mind should always be formation. No child should be punished for the purpose of making an example of him.' . . . The methods of children's courts, or juvenile courts, as they are termed in some States, differ in different places. In some States the judge is detailed from some other court; in some courts but one judge is assigned to this work. In New York several judges from the court of special sessions act successively in turn as judges of the children's court. In Maryland and Indiana the judges of the children's courts exercise this function only, and it is claimed that it is better than the method of rotation, since the judge who confines himself to juvenile court cases becomes a specialist in this work. In Colorado Judge Lindsey is not only judge of the juvenile court, but also of the county court. He finds advantage in the fact that in his first capacity he can protect the child, while as judge of the county court he can also sentence the guardian or parent who is responsible for the child's delinquency. An essential feature of every juvenile court is the probation system and probation officers. Their duty is to investigate the case before trial, and, if the child is placed on probation, to exercise watchcare over them until the period of probation is closed. It is in this way that the parental care of the State is exerted."

The precise time and place of the origin of the juvenile court movement has for some time been a disputed point. It has been claimed that the city of Chicago and the legislature of Illinois have the honors of the origination of the Children's Court as a distinct creation of law. The Visitation and Aid Society of Chicago had been laboring since 1801 to secure various measures of advanced legislation bearing on child-saving, with-

out much success, until, as related in a report of that society, the Bar Association of Chicago took the matter in hand, in 1899, and appointed a committee to press it. This committee drafted what was perhaps the first juvenile court law ever planned distinctly to that end and secured its enactment by the legislature of the state. The law went into force on July 1, 1899. The court was soon opened, and Judge Tuthill, of the Circuit Court of Illinois, who presided in it from the first, has stated the principles of its constitution and action in these following words: "The basic principle of the law is this: That no child under 16 years of age shall be considered or be treated as a criminal; that a child under that age shall not be arrested, indicted, convicted, imprisoned, or punished as a criminal. It of course recognizes the fact that such children may do acts which in an older person would be crimes and be properly punishable by the state therefor, but it provides that a child under the age mentioned shall not be branded in the opening years of its life with an indelible stain of criminality, or be brought, even temporarily, into the companionship of men and women whose lives are low, vicious, and criminal. The law divides children into two classes, the 'dependent' and the 'delinquent.' A dependent child, in the language of the law, is a child—who for any reason is destitute or homeless or abandoned, or has not proper parental care or guardianship, or who habitually begs or receives alms, or who is found living in any house of ill fame or with any vicious or disreputable person, or whose home, by reason of neglect, cruelty, or depravity on the part of the parents, guardian, or other person in whose care it may be, is an unfit place for such a child." A "delinquent child" is defined to be—"any child under the age of 16 who violates any law of this State or any city or village ordinance, or who is incorrigible, or who knowingly associates with thieves, vicious, or immoral persons, or who is growing up in idleness or crime, or who knowingly frequents a house of ill fame, or who knowingly patronizes any policy shop or place where any gaming device is or shall be operated." The law places its enforcement upon the judges of the circuit court, who are required to select one of their number to perform these duties as a part of the judicial work of such judge. . . . The circuit court is a court of original and unlimited jurisdiction, the highest in the State, and the duty of holding the juvenile court was placed in the circuit court (which for convenience is designated the "juvenile court") as an indication by the legislature of the importance to the State of the work to be done. The case of each child brought into court, whether dependent or delinquent, becomes of record, and every step taken in the case is shown upon the court record." Interest in the Illinois law was awakened quickly in many parts of the country, and requests for copies of it, says Mr. Hurley in his historical sketch, "began to pour in from all directions. These requests were promptly answered and copies of the Juvenile Court Record, published by the Visitation and Aid Society, containing the necessary information, were sent to applicants. Agitation began in other States for a law similar to the one passed in Illinois, and those who helped to form the Illinois law were invited to visit other States to explain the measure and the method of administering the law in Cook County. The Illinois law proved so satisfactory that many judges throughout the country, not wishing to await the action of a legislature, established branches in their several courts for children cases only, and in the treat-

ment of the cases applied the probate and chancery powers of the court."

Colorado's claim to the honor of having originated the juvenile court movement is given in the following statement of Judge Ben B. Lindsey in his reply (dated November 22, 1920) to a query on the mooted point: "Briefly the history of the juvenile court is this: one of the first two laws passed, under which these courts were established, was the law of April 12, 1899, known as the Colorado school law, providing for the care of disorderly, immoral or criminal children. It was under this law of April 12, 1899, that I established the juvenile court here in Denver. Of course I added some 44 items of law to our code since that time, for the Juvenile Court is a growth. The other court is the Chicago Juvenile Court which was established under the law that went into effect on the first of June, 1899, with Judge Tuthill as the Judge. But Judge Tuthill had nothing to do with the drafting of a simple little law defining delinquency, under which the court was established. This law provided that for convenience the Circuit Court, in which children were tried for offenses, might be called the Juvenile Court. It was not, therefore, the establishment of a new court. Mrs. Lucy Flower and several other women of the Woman's Club of Chicago, who had been concerned about the great number of boys in the jails of Chicago, went to Judge Harvey Hurd, a distinguished lawyer of Chicago, and asked him if he could draw a bill that would take these children out of the criminal courts and provide for a somewhat different procedure for their trial. Judge Hurd thereupon drew up the delinquency law referred to that became effective in June, 1899, in Chicago. This, in brief, is the history of the beginnings of the first two juvenile courts in America—Denver and Chicago."

"Roughly speaking, the years up to 1904 may be called the pioneer stage. Personal factors were prominent. Miss Lathrop and the group in Chicago; Judge Lindsey of Denver; Judge Stubbs of Indianapolis; Mr. Bernard Flexner of Louisville; Mr. Homer Folks, Mr. and Mrs. Samuel June Barrows, Judge Deuel, and Father Kincaid of New York, and others stand out as dominating figures in this period. Juvenile courts were being started or advocated in many places, often hastily or on a wave of sentiment. The court was journalistically exploited as a panacea for childhood's ills, and children were dumped wholesale on the courts. In spite of the steady, strong growth of the Chicago court, Judge Lindsey set his seal upon this period. His lectures were of a character to stimulate the sort of interest which was back of the early courts. The reform of gangs, the honor system, 'snitching bees,' and recreation features, though not the real heart and secret of the success of the Denver court, were made prominent in the public eye because of their possibilities of picturesque; and such things, rather than sober considerations of social economy, influenced the early ideals of some courts. Thinking people have grown somewhat tired of this sort of exploitation. All credit is due to Judge Lindsey, however, for really valuable service in spreading ideas of the court faster than any one else did, and for his real accomplishment in Colorado."—T. D. Eliot, *Juvenile court and the community*, pp. 1-2.

"Juvenile-court laws have been enacted [up to 1921] throughout the United States with the exception of Connecticut, Maine, and Wyoming, and these three States have passed laws dealing with some of the problems usually included in the juvenile-court law itself. Connecticut provides for

detention homes, probation, juvenile reformatories, and separate hearings for first offenses of children, and further provides that in cities of 20,000 or more juvenile courts may be established by ordinance, to be held by a judge of the police or city court, provided such ordinance does not extend beyond the selection of a suitable court room; Maine makes special provisions for the probation of children under 16 and has established industrial schools; Wyoming defines delinquent, dependent, and neglected children and provides for State supervision of their care. . . . In a few States a special juvenile court is created for the larger cities or counties. This is the case in Alabama [see ALABAMA: 1886-1907: Child labor legislation], Colorado, Delaware, Georgia, Indiana, Louisiana, Massachusetts, New York, Tennessee, and Virginia. A special court is established in the District of Columbia, and in Utah one is provided for each judicial district. In other districts of these States, and in all other States jurisdiction is vested in courts already existing, usually with the provision that such court may be called the juvenile court when acting under the juvenile-court law. Exclusive jurisdiction over juvenile cases is given to the special courts thus created and to designated courts in [thirty-four States]. . . . The qualifications of the judges for this special task are of such importance in attaining the purpose of the juvenile-court law that it is essential to give jurisdiction to a court in which high character and training are required for the judges. This can seldom be attained by vesting jurisdiction in police judges or justices of the peace, as is done in Connecticut, Delaware, Florida, Maine, New Hampshire, and Vermont, and in certain jurisdictions of Maryland, Massachusetts, Nebraska, New York, Pennsylvania, and Virginia. Other States definitely provide that such courts shall not have jurisdiction and require the immediate transfer of juvenile cases that happen to be brought before them. . . . The juvenile court has likewise jurisdiction over cases of desertion and nonsupport in Alabama, the District of Columbia, Louisiana, New Jersey, West Virginia, and part of New York. In California, Maryland, Ohio, and Tennessee the court has jurisdiction in cases of abandonment or failure to provide for a child. In cities of 50,000 in Virginia, where a special juvenile and domestic relations court is established, this court has jurisdiction over cases of desertion and nonsupport. The juvenile court has jurisdiction over persons accused of offenses against children in Colorado, the district of Columbia, and Virginia. The juvenile court administers the 'mothers' aid' law in Arkansas, Colorado, Illinois, Iowa, Maryland, Michigan, Minnesota, Missouri, Montana, New Jersey, Ohio, Oklahoma, Oregon, South Dakota, Tennessee, Utah, Washington, and Wisconsin. The juvenile court has jurisdiction over the case of an adult violating the child-labor law in Delaware, the District of Columbia, Utah, and certain counties in New York; over the failure of a parent to comply with the compulsory school-attendance law in Idaho, Indiana, Kansas, Montana, and New Jersey; and in cases brought for the purpose of providing support and maintenance of children born out of wedlock in the District of Columbia. The judge of the juvenile court in Oregon has power to make a compromise with the putative father of an illegitimate child relative to the support of the child. Cases concerning the concealment of the birth of a child may be brought to the juvenile court in certain counties in New York. In Ohio the judge may give consent to the marriage of persons under legal age who are without

parents or legal guardians. Adults aiding the escape of a child from an institution in Delaware, or furnishing a minor in an institution with tobacco in certain counties in New York, are subject to the jurisdiction of the juvenile court. . . . Special detention homes, rooms, or schools are required for all counties in five States only—Arizona, California, Michigan, Missouri, and Pennsylvania—and for the larger cities or counties in nine others—Alabama, Colorado, Kentucky, Montana, Nevada, New York, Utah, Washington, and West Virginia. The law permits their establishment in all counties of Florida, Georgia, Illinois, Nebraska, New Jersey, North Carolina, Rhode Island, South Carolina, Texas, Washington, and West Virginia, and in certain counties of Kansas, New York, Oregon, and South Dakota. In Florida and Utah the small counties may combine in the use of a detention home. The commissioners of the District of Columbia are required to provide a 'suitable place of detention.' In Idaho a 'suitable room in the county building or courthouse must be provided wherein the sheriff may safely keep such child.' In other States it is left to the discretion of the sheriff, police, or probation officer to place the child in a suitable place provided by the city or county authorities. . . . The public may be excluded from trials in the juvenile court in Alabama, California, Delaware, Georgia, Indiana, Iowa, Kentucky, Massachusetts, Michigan, Minnesota, Mississippi, Montana, New Jersey, New Mexico, New York, North Carolina, Oregon, Rhode Island, Utah, and Washington. The law prohibits any publication of the case in the newspapers in Arkansas, Colorado, Nevada, New Hampshire, North Dakota, South Dakota, and West Virginia. It is unlawful in Colorado to take the photograph or to make a sketch of any child in court. The court record may be withheld from the public in Alabama, Georgia, Minnesota, New Jersey, New York, Rhode Island, Virginia, and Washington. The name of the child must not be given in the annual reports of the court in Arkansas, Colorado, Delaware, Idaho, Kentucky, Montana, Oklahoma, Washington, and West Virginia. . . . California and New Mexico are the only States that specifically provide by law for the appointment of a woman to hear cases of girls brought before the court. Colorado, Georgia, Mississippi, North Dakota, and Chautauqua County, N. Y., make provision for the appointment by the judge of other persons to hear cases. Rhode Island requires that a woman probation officer shall be present at all hearings of petitions concerning girls. The laws of Alabama, Idaho, Minnesota, Ohio, Virginia, and Chautauqua County, N. Y., provide that the court may require the child to be examined mentally and physically by a competent physician. In Illinois and New York a mental examination may be given; and in South Dakota there is provision for a physical examination. . . . The cases of both delinquent and dependent children may be disposed of by (1) dismissing; (2) continuing from time to time; (3) placing the child on probation, that is, leaving him in his home subject to the visitation of the probation officer; (4) appointing a guardian; (5) committing to an institution, agency, or organization. In the case of delinquent children, as has been pointed out, punishment may still be resorted to in a number of States. One State, namely Alabama, still allows a child to be bound out as an apprentice. These provisions will be summarized, first, with reference to delinquent, and second, with reference to dependent, children. . . . All States with the exception of Wyoming provide for the probation of juvenile

delinquents. The child may be allowed to remain at home or may be placed in a suitable family under the supervision of a probation officer. . . . Thirty-five States have provided for liberal construction of the juvenile-court law. In Alabama 'all proceedings shall be upon the theory that the child is a ward of the State and subject to the discipline and entitled to the protection which the court should give under the conditions disclosed.' [See ALABAMA: History of child labor.] A similar statement is contained in the Georgia statute and in the laws applying to Monroe, Ontario, and Chautauqua Counties, N. Y. In Mississippi the act shall be liberally construed, and wide discretion given all officers in carrying out its objects, with proper regard to the welfare of the child and to the public interest. In Illinois the act 'shall be liberally construed to the end that the care, custody, and discipline of the child may approximate that which should be given by its parents.' The provision is substantially the same in 31 other States.—*Children's Bureau of the United States Department of Labor (Legal series no. 5, 1920)*.—"The Massachusetts juvenile court [established in 1907] situation is very different from that which holds in most of the other states that have given thought to the development of good social work for children. There is but one juvenile court in the whole state of Massachusetts. This is the Boston Juvenile Court, created under special act and having jurisdiction over that section corresponding to the old city proper."—*Child welfare (Survey, Nov. 13, 1920)*.—See also PRISON REFORM: George Junior republic.

1901-1918.—**Protective legislation in Australia.**—"For the protection of child life, strict measures have been taken to prevent adulteration of foods, and to reduce the great waste of child life through infantile mortality. Of the latter measures, the chief are those which aim to secure a pure, clean milk supply. In all States special laws and regulations have been passed for the supervision of dairy farms and dairies, for the notification of infectious diseases among either the employees or the herd of the dairyman, and for the prevention of the sale of milk which is not fresh or wholesome, or which has been watered, adulterated, reduced, or changed in any respect by the addition of any substance or by the removal of cream. . . . These measures have been very successful in effecting their aim. The infant mortality rate for the Commonwealth has been reduced from 103 per 1,000 in 1901 to 68 per 1,000 in 1911. Within the metropolitan area of Sydney the rate has been reduced from 119 per 1,000 in 1902 to 73 per 1,000 in 1915, while it fell as low as 71 in 1911. . . . Care of the child is carried on into school life by a system of medical inspection. In the various States, medical officers, oculists, dentists and trained nurses are engaged, as officers of the respective education departments, in this task. Parents are informed of defects which are likely to prove detrimental to the physical and mental development of the children. . . . Each parent is notified of the child's condition and is urged, by circular or through public meetings, to have the defect remedied. The public interest does not cease with notification. Nurses are sent to the houses to second the doctor's words. Nor is the inability of the parent to meet his child's needs allowed to be an insuperable obstacle to the child's development. In New South Wales eye-glasses are sup-

plied by the State at a minimum quotation, dentists are sent to fill defective teeth, and in the more remote regions, where medical attention is difficult to procure, a traveling school hospital has been established. Better conditions in regard to the lighting and ventilation of schools are being provided in every State, and the whole policy secures the almost unanimous endorsement of the parents. . . . The care for child life, manifested in regard for health and in an extensive and co-ordinated educational curriculum, extends to dependent and delinquent children. No more interesting experiment in social reform has ever been attempted in Australia than the endeavor to take the orphans, the waifs and strays, and convert them into decent, useful citizens. Every state in the Commonwealth has made more or less provision for the care of neglected children or those who, because of their parentage or domestic disabilities, are in danger of becoming neglected and delinquent. This work is not carried out in state-controlled institutions alone. Widows and deserted wives are subsidized by the State to rear their own destitute children under the protection of the home, advice and assistance being rendered and efficiency guaranteed by the frequent visits of government inspectors and other men and women who have voluntarily and gratuitously undertaken this task. Motherly women, too, whose capacity and suitability are tested beforehand, are paid to act as foster-mothers, and perform their duty with rare fidelity and true motherly tenderness."—C. H. Northcott, *Australian social development*, pp. 172-175, 194.—See also AUSTRALIA: 1912; CHARITIES: Australasia.

1902-1920.—**Children under the law in Italy.**—**Act of 1902 on work of women and children.**—**Law of 1913.**—"An act on the work of women and children (1902) [provides that]: Children under twelve years cannot be employed in any factory (Sec. 1). For work underground, as in mines, galleries, quarries, etc., boys under thirteen years and women of any age cannot be employed (Sec. 1). For dangerous and unwholesome work, boys under fifteen and girls under age cannot be employed. A medical certificate certifying the good health and fitness for work is necessary in order that a child may be admitted to work. Children must have a 'service book' stating their name, age, profession, and when they have been vaccinated. Work by night is forbidden to boys under fifteen and girls under age (Sec. 5). Children of either sex up to fifteen years cannot be employed for more than eleven hours out of the twenty-four (Sec. 7). Work of children cannot last for more than six hours uninterruptedly, but must be interrupted for a rest of one or two hours (Sec. 8). Offenders are liable to a fine from 50 to 5,000 lire, and the proceeds of these fines shall be added to the fund for old age and invalidity.

"In a Regulation attached to the Act, and in two Schedules, all the unwholesome and dangerous professions are enumerated, and other provisions are given as to the application of the Act. . . . The problem of the criminality of minors has attracted the notice of many sociologists, especially because this phenomenon has lately had a decided tendency towards increasing: in fact, the juvenile offenders sentenced in Italy in the year 1890 were 30,000, and now they are more than 50,000 per annum. . . . [The law on these points is covered by the Code of Criminal Proceedings (1913)]: *Section 373.*—The trial shall always take place with closed doors whenever a minor under eighteen years stands accused. *Section 372.*—Any person apparently under eighteen years of age shall be

prevented from entering a Criminal Court. *Section 423.*—When a minor under eighteen years of age is sentenced for the first time to no more than one year's imprisonment, the judge may order the execution of the sentence to be stayed for the period of five years, subject to the offender's behaving well during that time—in which case he shall be pardoned."—R. W. Holland, *Law relating to the child*, pp. xvi-xvii.—See also CHARITIES: Italy: 1909-1921.

1903-1914.—Protective laws in Germany.—"The chief provisions of the law in Germany are to be found in the Trade Regulations and in the Law for the Protection of Children of the 30th March, 1903. . . . The school-leaving age of fourteen is the same as in England, and certain circumstances are laid down under which a child of thirteen may be released from school. In such cases he may not be employed in a factory for more than six hours per day. The daily period is raised, however, to ten hours for children between fourteen and sixteen years of age. Just as [the English] . . . Mines Regulations Act, 1911, provides for the keeping of an employment register in respect of juvenile employees, so the German law provides for such a book being kept by all employers employing persons under age. This book is open to the inspection of the civil authority, but it does not affect domestic servants and children employed in the home. By the law of 30th March, 1903, the hours of labour and the intervals for rest and refreshment are laid down. Further provision is made for cases of industries (as in Spain) where persons under age should not be employed for moral or hygienic reasons. . . . German law is rather deficient in the fact that penalties are not exacted from persons who endanger the development of the body, intellect or morality of persons under age. . . . The Criminal Code of Germany does provide against the offence of 'ejection' or abandonment or exposure of children. The punishment is three months' imprisonment for the 'ejection' of youthful persons or invalids by strangers, but six months is the minimum if the parent is responsible for the offence."—*Ibid.*, pp. ix-x.

1903-1920.—Child labor regulation in Great Britain.—Act regulating employment of children (1903).—Children Act (1908).—Provisions for juvenile courts.—Mines Regulation Act (1911).—Provision of Meals Act.—Problem of juvenile delinquency after the war.—An act "to make better provision for regulating the employment of children," became law in August, 1903. Most of the responsibility for a proper protective regulation of child labor was imposed by this enactment on the local authorities of the kingdom. Among its provisions were the following: "1. Any local authority may make byelaws—(i) prescribing for all children, or for boys and girls separately, and with respect to all occupations or to any specified occupation,—(a) the age below which employment is illegal; and (b) the hours between which employment is illegal; and (c) the number of daily and weekly hours beyond which employment is illegal; (ii) prohibiting absolutely or permitting, subject to conditions, the employment of children in any specified occupation.

"2. Any local authority may make byelaws with respect to street trading by persons under the age of sixteen. . . .

"3.—(i) A child shall not be employed between the hours of nine in the evening and six in the morning: Provided that any local authority may, by byelaw, vary these hours either generally or for any specified occupation. (ii) A child under

the age of eleven years shall not be employed in street trading. (iii) No child who is employed half-time under the Factory and Workshop Act, 1901, shall be employed in any other occupation. (iv) A child shall not be employed to lift, carry, or move anything so heavy as to be likely to cause injury to the child. (v) A child shall not be employed in any occupation likely to be injurious to his life, limb, health or education, regard being had to his physical condition. . . .

"4.—(i) A byelaw made under this Act shall not have any effect until confirmed by the Secretary of State, and shall not be so confirmed until at least thirty days after the local authority have published it in such manner as the Secretary of State may by general or special order direct. . . .

"13. In this Act—The expression 'child' means a person under the age of fourteen years: The expression 'guardian' used in reference to a child, includes any person who is liable to maintain or has the actual custody of the child: The expression 'employ' and 'employment,' used in reference to a child, include employment in any labour exercised by way of trade or for the purposes of gain, whether the trade be to the child or to any other person: . . . The expression 'street trading' includes the hawking of newspapers, matches, flowers, and other articles, playing, singing, or performing for profit, shoe-blacking, and any other like occupation carried on in streets or public places."

An Act entitled the Children Act, passed by the Parliament of the United Kingdom in December, 1908, and which came into effect April 1, 1909, had such importance that it was described as "The Children's Charter." According to its full title it was "An Act to consolidate and amend the Law relating to the Protection of Children and Young Persons, Reformatory and Industrial Schools and Juvenile Offenders and otherwise to amend the Law with respect to Children and Young Persons." It gathered into one great enactment nearly everything in which the guardianship of law could be specially extended to them, except the matters of education and child labor, which are subjects of distinct legislation. It repealed wholly twenty-one previous enactments and amended more or less seventeen more. It contained 134 sections and filled a so-called Parliamentary "White Book" of 93 pages. As used in the Act, the word "child" means a person under 14 years; the expression "young person" means one above that age, but under sixteen. The Act is divided into six parts, which are concerned with the following main subjects: (1) Infant life protection. (2) The prevention of cruelty to children and young persons. (3) Juvenile smoking. (4) Reformatory and industrial schools. (5) Juvenile offenders. (6) Miscellaneous and general. The provisions for "infant life protection" have to do mainly with the supervision of "baby-farming." Foster parents are forbidden to insure the life of a nurse-child and insurance companies are forbidden to accept any such insurance. Juvenile smoking is dealt with very drastically, the penalties for selling cigarettes or the material for making them to persons under sixteen years of age being severe, and both policemen and park-keepers in uniform being empowered to take such materials from the persons of juvenile smokers. The part of the Act which relates to reformatory and industrial schools enables the courts to deal effectively with youthful offenders without subjecting them to the prison taint. Boys or girls between the ages of 12 and 16 who are convicted of offences punishable in the case of adults with penal servitude or imprisonment may be sent to

a certified reformatory school. In certain defined cases, children may be taken from depraved or drunken parents and consigned to a certified industrial school. In these cases the child may be brought before the court by any person in order that the provisions of the Act may be set in force. Parents who are unable to control their children may themselves take advantage of the Act, and in these cases the court may place the children under the supervision of a probation officer instead of sending them to an industrial school. In all cases of children who are liable to be consigned to an industrial school, there is given to the courts the alternative power of committing them to the care of relatives or other fit persons with or without the supervision of the probation officer. The most important part of the Act, perhaps, is that relating to juvenile offenders. It allows no young person under sixteen years of age to be sentenced to death. "Sentence of death," says this law, "shall not be pronounced on or recorded against a child or young person, but in lieu thereof the court shall sentence the child or young person to be detained during his Majesty's pleasure." Under it no child may be sentenced to imprisonment or penal servitude for any offence, or committed to prison in default of payment of a fine, damages, or costs. No young person may be sentenced to penal servitude for any offence, nor may he be sentenced to imprisonment or committed to prison in default of payment of a fine or costs, unless the court certifies that he is of so unruly a character or so depraved that it is not desirable to send him to a "place of detention" provided under the Act. These provisions relating to the substitution of "detention" for imprisonment did not come into force until January 1, 1910. This part of the Act makes elaborate arrangements for the treatment of youthful criminals, both before and after trial. Special "places of detention" were to be opened in all petty sessional divisions. Here children would be placed on arrest (if for some special reason they could not be released on a recognizance), or after being remanded or committed for trial. Here they may be kept in custody instead of being lodged in gaol if they are sentenced to terms of imprisonment of less than one month. Persons under 16 years of age must also be tried in special "juvenile courts," unless they are charged jointly with adult offenders. A "juvenile court" must sit "either in a different building or room from that in which the ordinary sittings of the court are held, or on different days or at different times from those at which the ordinary sittings are held." Only the court officials, those directly interested in the case, and the representatives of the press may be admitted to these courts, unless the special leave of the magistrate is obtained. Every effort is to be made, both before and after trial, to prevent the association of children with adult criminals. Finally, parents and guardians are to be required to attend the hearing of charges against their children or wards, and may be ordered to pay any fines, damages, or costs imposed. The miscellaneous provisions of the Act include a number of importance, to prevent the giving of intoxicating liquors to children, to exclude them from drinking places, to safeguard them at entertainments, and to make the Act applicable to Scotland and Ireland.

The Mines Regulation Act of 1911 provides for the keeping of an employment register of all juvenile employees. It also forbids the employment of children under sixteen years of age in any of the mines.

An order from the English local government

board on the subject of providing food for underfed school children was published on April 29, 1905. It applied only to children under sixteen who were neither blind, deaf or dumb, and who were living with a father not in receipt of relief. Application in each case must be made by school managers, or by a teacher empowered by the managers, or by an officer empowered by the education authorities. The relief might be granted in the ordinary way or as a loan, the father being allowed the opportunity of making the needful provision himself. If he failed to do so, the poor-law guardians were empowered to make it and to recover the cost as if it were a loan. In no case could the relief be given in money, or continued on a single application for more than a month. Where possible, arrangements should be made with local charitable organizations for the issue of tickets for meals. The above mentioned tentative order was followed, in the next year, by the passage of an act which authorizes any "local education authority" in England and Wales to "take such steps as they think fit for the provision of meals for children" at any public elementary school, and for that purpose to "associate with themselves any committee on which the authority are represented, who will undertake to provide food for those children." Such education authority may aid the committee by furnishing necessary land, buildings, furniture and apparatus, and necessary officers and servants; but, "save as hereinafter provided, the authority shall not incur any expense in respect to the purchase of food to be supplied at such meals."

"The Children's Act [1908], the Education Act [1918] and other recent measures added to the Statute Book have pointed the way to more scientific methods for dealing with children and youths manifesting criminal tendencies or lapsing into delinquency, and yet we are slow to advance. We have promise of an extension of Children's Courts with presence thereof of expert magistrates for dealing with cases brought before these courts, and much may be expected from such action. But the whole spirit and purpose of our system stand in need of revision."—*Child*, July, 1920.—See also LABOR ORGANIZATION: 1899-1918.

1904-1916.—Federal care for children in the United States.—Organization of the National Child Labor committee.—Establishment of the Children's Bureau.—"The National Child Labor Committee was organized April 15, 1904, and incorporated by Act of Congress, February 21, 1907. It owes its origin to the coming together of several men and women who, in different parts of the country, had been aroused by what they had seen of child labor in some of its worst forms, and to the publication of census figures showing the great extent of the evil. . . . The object of the Committee is to safeguard American childhood as affected by industrial and agricultural conditions. The enactment and enforcement of progressive legislation and the development of enlightened public opinion are essential features of the Committee's policy. The Committee's effort goes beyond legislation—it goes beyond prohibition to all practicable means and methods of prevention, some of which require legislation and some of which do not. The Committee is vitally interested in the whole problem of premature school-leaving. It is interested, as well, in the establishment of the substitutes for child labor, particularly suitable schooling, suitable play and suitable work—and in this both as a method and as a goal of child labor reform. Not an unoccupied but a well occupied childhood is its aim. . . . The legislative pro-

gram of the Committee is chiefly concerned with child labor laws, compulsory education laws, mothers' pension laws, and so-called Children's Codes. Items in the program may be listed as follows: Better child labor laws, better enforced; better school attendance laws, better enforced; better schools with stronger holding power of their own; vocational training, guidance, and placement; health supervision of the child in school and at work; physical examination of applicants for working papers; provision of public recreation facilities for children; children's scholarships, mothers' pensions, and other means of relieving and preventing poverty; all children under 16 in school on full time; all children between 16 and 18 in part-time or continuation schools if not attending school on full time. Throughout its existence the Committee has emphasized the necessity of efficient administration. In the last few years it has devoted much attention to the Children's Code, which represents the attempt, in a given state, to standardize and coordinate the laws and administrative agencies having to do with children and to supply laws and agencies covering aspects of child welfare that have been neglected in the statutes. The National Child Labor Committee from its inception has based its work on first hand knowledge gained through investigation of the particular phase of child labor under discussion. Such investigations were at first, of necessity, on a small scale, and devoted to a special issue. To-day the Committee has a large staff, at the service of any community desirous of discovering the truth about itself as regards child welfare in all its numerous . . . aspects. Several states have taken advantage of this service, and in cooperation with both public and private agencies, the Committee has made a number of state-wide child welfare studies. These surveys cover such subjects as Public Health, Education, Dependency, Juvenile delinquency, Institutions, Recreation, Child Labor, Agriculture, Rural Life, and Law and Administration."—*Report of National Child Labor Committee (American Child, Feb., 1921)*.

The Children's bureau was authorized by act of the Sixty-second Congress and approved April 9, 1912. It began operation August 23, 1912, when its appropriation of \$25,640 became available. The Act is as follows:

An Act "to establish in the department of labor a bureau to be known as the Children's Bureau: *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That there shall be established in the Department of Labor a bureau to be known as the Children's Bureau. . . . Sec. 2. That the said bureau shall be under the direction of a chief, to be appointed by the President, by and with the advice and consent of the Senate, and who shall receive an annual compensation of five thousand dollars. The said bureau shall investigate and report to said department upon all matters pertaining to the welfare of children and child life among all classes of our people, and shall especially investigate the questions of infant mortality, the birth rate, orphanage, juvenile courts, desertion, dangerous occupations, accidents and diseases of children, employment, legislation affecting children in the several States and Territories." This bureau is the result of the belief, on the part of many individuals and associations interested in the protection and betterment of children, that the Federal Government should aid in that service, just as the various bureaus of the Department of Agriculture. The field of the Children's Bureau is now defined as "all matters pertaining to the wel-

fare of children and child life." It is obvious that the bureau is to be a center of information useful to all the children of America, to ascertain and to popularize just standards for their life and development. The act establishing the bureau gives no definition of the age at which childhood ends, nor have the states a uniform definition. For some purposes the age of tutelage continues until twenty-one, but taking the ordinary view of childhood there are in continental United States, according to the census of 1910, 31,220,361 children under sixteen years of age, or about one-third of the total population. This number may be divided into: (1) 12,666,762 under 6 years of age, of whom 2,217,342 were under 1 year; (2) 14,984,252 over 6 and under 14 years of age; and (3) 3,569,347 over 14 and under 16 years of age. The vast majority of these are children of average health and opportunity, but there is an unknown percentage of exceptional children, who suffer from handicaps of various kinds. Generally speaking, these may be divided into dependent, delinquent, and deficient children, and children working during the early years when the majority are protected in their right to education. While it is evidently the final purpose of the bureau to serve all children, to try to work out the standards of care and protection which shall give to every child his fair chance in the world, this purpose, in the minds of those who drafted the law, by no means overshadowed the needs of those unfortunate and handicapped children whose lack of adequate protection is indicated by the enumeration of subjects in the statute—infant mortality, orphanage, juvenile courts, desertion, etc. It is a matter of common experience that the greatest service to the health and education of normal children has been gained through efforts to aid those who were abnormal or sub-normal or suffering from physical or mental ills. For example, some of the greatest gains to educational method have been bestowed by teachers of defective children, whose work has had the direct result of furnishing many ingenious practical methods for quickening the minds of normal children; and the care of tuberculous children has made fresh air a recognized educational factor. Thus all service to the handicapped children of the community—an immediate service properly demanded by the popular conscience—also serves to aid in laying the foundations for the best service to all the children of the commonwealth. The work of the bureau is defined by law as that of investigating and reporting upon all matters pertaining to the welfare of children and child life. After serious consideration of the most useful point at which to begin the work, the subject of infant mortality was chosen, with its closely allied interests of child welfare in the home and in the community.—*Abstract of the fourth annual report of the chief of the Children's Bureau (1916)*.

1908-1914.—Progress in France—Compulsory education.—Children's courts.—Penal majority age.—"Mr. W. L. George, writing in 1908 of France in the twentieth century, says of the Frenchman—From childhood upwards he is overworked, and thrives under the burden; long hours and short holidays are willingly accepted by the people for their children. The law fixes 9½ hours (now 8 since 1912) as the legal working day in factories, a high limit. . . . Moreover the average is counted over six days, for the half-day has not yet entered into national customs. Indeed, up to four or five years ago no child had more than one half-holiday in every week. This is now changed, and the position of the child is becoming stronger. Up to the age of thirteen, education in

France is compulsory, and has reached the masses without any great difficulty. A problem that has always interested the French lawyer, who is naturally a student of philosophy and sociology, is the problem of juvenile criminality. The history of legislation in France on this aspect of law is the history of the whole law as to infancy, and it has culminated in the law of the 22d July, 1912, which came into force on the 4th March, 1914.

. . . The law of the 11th April, 1906, raised the 'penal majority' to eighteen years, and finally the erection of special Tribunaux has been brought about for children under thirteen and for those between thirteen and eighteen. . . . The main points are that children of either sex under thirteen years of age are not subject to punitive but rather to correctional jurisdiction. They are not tried before a criminal court, but the jurisdiction is civil in its nature, and the decisions of the Court are not inscribed 'au casier judiciaire.' The law of the 22d July, 1912 [contains the following provisions]: Article I.—When found guilty they may be placed in charge of a guardian, in an educational establishment, in a charitable institute of recognized public utility, or in a public institution, as best meets the case. Article II.—Trials are held in private, the only persons admitted being 'membres des comités de défense des enfants traduits en justice,' such members of charitable institutions taking charge of children as may be admitted by the court, and any person specially admitted.

. . . Article VI.—Special provision is also made for minors between thirteen and eighteen years of age who are guilty of infractions of the law. Such persons cannot be directly cited before the ordinary criminal courts, but may only be committed to such courts by an examining magistrate."—R. W. Holland, *Law relating to the child*, pp. xi-xiii.

1910.—Care of orphans in Belgium. See BELGIUM: 1792-1910.

1911-1919.—First steps at regulation of women's and children's labor in Japan and China.—Japanese factory law.—Preventive laws in Hong Kong.—The first factory law passed in 1911 [Japan] provides that "factory owners must not employ children below the age of twelve, but the administration authorities may allow children above ten years of age to work in factories for lighter kinds of work. Children below the age of fifteen and women must not be worked more than twelve hours a day. The minister of agriculture and commerce, however, may allow the extension of the hours to fourteen in certain industries for fifteen years following the enactment of this law. Again children below the age of fifteen and women shall not be employed in factories between 10 p. m. and 4 a. m., but this does not apply in the following cases: in industries whose nature necessitates immediate work; in industries which require night work as a necessity; in industries which require continuous operation. [When this law was passed, the manufacturers begged for a period of five years in which to adjust themselves to these reforms; in 1916, when the law was due to take effect, they again asked for a postponement. They were overruled, however, and the law went into effect June 1, 1916.]

The movement is spreading. "For the first time in the history of Hong-Kong, China, and that part of the far east generally, some attempt to regulate the employment of women and children and to prevent overcrowding in factories is being made.

. . . In a general way the regulations as to child labor presented for enactment as an ordinance by the legislative council of the colony—which un-

questionably will enact them—are far behind those obtaining in Great Britain or the United States. The proposed law merely provides that no child under 14 years of age shall be employed more than 10 hours, excluding meal times, in any one day except by special permit of the sanitary board; and prohibits the employment of children under 13 years of age in any factories or workshops likely to be injurious to life, limb, or health—regard being had to the individual physical condition of child so employed. Since only two holidays per lunar month are allowed, and no half-holidays are observed in Hong Kong, the weekly hours thus fixed are nearer to seventy than to the fifty-five which such a regulation would secure in Great Britain. In the matter of overcrowding, section 3 (1) of the factory and workshop act of the United Kingdom (1901) was adopted by the board. This provides that there shall be not less than 250 cubic feet of space in each room or subdivision of any factory or workshop for each person employed therein, and not less than 400 cubic feet for each person employed after 6 p. m. Under the regulation adopted the board will post a notice in English and Chinese in every factory and workshop, indicating the number of persons who may be employed in each room or subdivision. Practically all shops employing women and children in Hong Kong are already within the provisions of the new regulations, whose purpose is preventive rather than corrective."—U. S. Department of Commerce, *Report*, Aug. 15, 1919.

1914.—Legislation in force in Sweden.—Removal of restrictions in Germany.—"The chief laws and ordinances providing for the protection of children are the Care of Foster Children Act, the Education of Depraved and Morally Neglected Children Act, and the Poor Relief ordinance. From lack of space, only an abbreviated and compressed account can be given of the various forms assumed by the protection of children in Sweden. The following categories of children are contemplated by the above Acts: (1) parentless children, or those who lack relatives; (2) those whose parents are unknown; (3) those whose relatives cannot, or will not contribute to the protection or care of them; (4) those who in consequence of mental deficiency need some other attention than can be provided by individuals, homes, or schools; (5) and finally, children so morally degenerate as to require care at institutions specially adapted for them.

"The management of the work is undertaken by institutions that receive public encouragement and support from the State or commune, by associations wholly or partially privately financed, or thirdly by private persons who from philanthropic or other motives, devote their efforts to the work of protecting children."—J. Guinchard, ed., *Sweden, historical and statistical handbook*, pt. 1, *Land and People*, p. 771.

"Upon the outbreak of the war the [German] Government enacted the 'war emergency law' of August 4, 1914, which authorized the granting of exemptions from many provisions of the labor laws, including those restricting the employment of children under 16 years of age in establishments subject to factory inspection. This opened the way for the suspension of the most important safeguards for the protection of children in industry. During the early part of the war such exemptions were granted to a limited extent only, but as the demands of the war industries increased, they became more and more frequent. According to law, they were to be permitted only upon investigation of each case and a showing that adult

workers were not available, and it was the announced policy of the factory inspection authorities to comply strictly with this provision. But judging from the frequent complaints of the shortage of inspectors made by the inspection officials themselves, it seems hardly probable that the investigations were at all thorough or even that they were made in every instance. Perhaps the most frequent requests were for the suspension of the legal rest periods, which were, for children under 14, a half-hour in a six-hour day, and, for children between 14 and 16, two hours a day—one hour at noon, a half-hour in the forenoon, and another half hour in the afternoon. The employers claimed that the greater frequency of the children's rest periods interfered with the output of the adults, with whom they worked side by side; consequently in order to raise production to the highest limit their intermissions were either shortened or, when the pressure of war work was greatest, often entirely eliminated. Overtime work was also very common. Reports from almost every district state that children under 14, for whom the law prescribed a six-hour day, were frequently allowed to work up to 10 hours daily. The working day of children between 14 and 16, normally 10 hours, was often extended to 11 and 12 hours. This was particularly frequent in the machine-manufacturing, woodworking, and metal industries. Employment of children under 16 on Sunday, prohibited by law, was permitted in a number of districts; in others, of less industrial importance, it was consistently refused. Night work was even more prevalent than overtime work. In normal times children under 16 could not be employed between 8 p. m. and 6 a. m.; but during the war many of them were permitted to work until late in the evening or in the early morning, and a very large number were employed on the regular night shifts, which often lasted 12 hours, including rest periods."—A. Kalet, *Effect of the war on working children in Germany (Monthly Labor Review, July, 1921, Bureau of Labor Statistics, United States Department of Labor, p. 2)*.

1915-1920.—Children's laws in Norway.—Protection for illegitimate children.—Placing of responsibility.—Care of mothers.—Juvenile advisory boards in South Africa.—"The laws adopted in Norway, in April, 1915, and popularly termed the children's laws, are the result of a movement which has of late gained great force in all civilized countries, and which has, as its aim, the protection of children, especially during the first years of life. All the laws mentioned above undoubtedly resulted in the better protection of childhood, but the further step of legally establishing closer ties between father and child, was not accomplished until the enactment of the so-called children's laws—laws concerning children whose parents have not married. It was reserved for the then head of the Ministry of Social Affairs, Minister Johan Castberg, to propose those laws which went into effect January 1, 1916, and, as regards certain paragraphs, January 1, 1917. According to these laws, illegitimate children now have right of inheritance from the father; right of name as regards the family name of mother or father; right to better arranged economic support; and the mother is assured economic support and satisfactory attention both before and after childbirth. There is a very satisfactory mothers' insurance for women in industries. It was only natural that the new children's laws should awaken a storm of protest as regards the right of name and of inheritance. Meetings of protest, discus-

sion in the press and otherwise and lists containing thousands of signatures both for and against the laws were produced. The laws were publicly discussed for a long time. The future was pictured darkly, such a prediction being usual, as that unmarried mothers, with one or more children would suddenly appear in peaceful homes to demand inheritance, name and a home for their children. Now that the law has been in force for almost three years there has been very little rumor of these dire consequences. The public officials who administer the law generally state, that the whole matter proceeds surprisingly smoothly and satisfactorily. The fathers have willingly paid their contributions—at least the number of the unwilling, is no larger now than before the law came into force."—*Survey, Oct. 9, 1920.*

"The idea of Juvenile Advisory Boards started in Durban: the first board was appointed in Durban. The idea was that increased difficulty was being found in the way in which boys leaving school at 14 were going into undesirable employment, and a number of citizens in various places took an interest in the matter and thought that some systematic method of getting hold of these juveniles after they leave school and trying to assist them to get into proper occupations was very much needed. After that the first board was created. The board assisted juveniles in that particular town to try and get better employment and not to get into blind-alley occupations. That was soon followed by others. A section of the report of last year says, 'during the latter part of the year 1920 new Juvenile Advisory Boards were appointed at Port Elizabeth, Germiston, Benoni and Krugersdorp, and for coloured juveniles a special board was formed to operate at Durban (1915), the Cape Peninsula (1916), Johannesburg (1917), Bloemfontein (1918) and Pretoria (1918).' . . . The boards have been working voluntarily so far. There was a conference last year at which the question of incorporation by Act of Parliament was discussed. . . . You can see the extreme importance of the three bills being linked up together: the Juvenile Bill dealing with the child as he leaves school, the Apprenticeship Bill which carries him on to a trade, and the Wages Regulation Bill."—*Minutes of evidence (Union of South Africa, First-Third Reports of the Select Committee on Subject-Matter of Apprenticeship Bill and Regulation of Wages Bill, June, 1921, pp. 1-4)*.

1916-1922.—Federal Child labor laws.—Influence of labor organizations.—Keating-Owen law declared unconstitutional.—Effects of adverse decision.—New law passed in 1919.—Declared unconstitutional by supreme court.—"Organized labor is the agency to which, more than to any other, credit must be given for stimulating national interest in the fight against child labor. In its first constitution the American Federation of Labor declared itself in favor of the complete abolition of the employment of children under fourteen years of age. . . . Coöperating with organized labor, often guiding its forces, always affording the benefit of scientific foundation, has been a considerable group of students of practical philanthropy and social economics. . . . Tangible evidence of the effectiveness of this volunteer work is seen, also, in the Federal Children's Bureau, established as a bureau in the Department of Labor in 1912, and since then an effective official agency in the campaign in behalf of children and women. . . . The first serious consideration given child labor in the United States Congress was in 1907, when the Beveridge-Parsons bill was under

discussion. This bill was not permitted to come to a vote in either House, owing to a widespread conviction that it was unconstitutional. In 1915 a bill similar in character passed the House of Representatives, but did not reach a vote in the Senate. The following year this measure, then known as the Keating-Owen Bill, passed both Houses by large majorities, and went into effect September 1, 1917. This law was permitted to operate for only nine months, but during that time its effectiveness was demonstrated in widely separated sections of the country. It was declared unconstitutional in the Federal Court of the Western District of North Carolina, Judge Boyd presiding, and on June 3, 1918, the decision was affirmed by the United States Supreme Court, four of the nine justices dissenting."—F. C. Ensign, *Compulsory school attendance and child labor*, pp. 246-248.—The setting aside by the supreme court, in June, 1918, of the federal Child Labor law (see U. S. A.: 1917-1919: Taxation and expenditures) on the ground of its unconstitutionality was promptly followed by the restoration of the longer working hours for children which a number of state laws sanctioned; while the demand for child labor, joined to abnormally high wages under war conditions, caused even the state laws to be extensively violated. In one state 47 out of 53 factories were found to be violating the law by employing children under 12 years of age; in another, where the minimum age for employment in canneries was 14 years, 721 children under that age, including fifty who were less than ten years old, were working in canning establishments in the summer of 1918. Some check to the evil was given when the War Labor Policies board made compliance with the standards set by the federal Child Labor law a condition in government war contracts made after the date of the supreme court decision. An investigation of the shipbuilding plants on the Atlantic Coast, the Gulf of Mexico and the Great Lakes, however, undertaken in the winter and spring of 1919 in cooperation with the Emergency Fleet Corporation, showed numerous violations by important establishments of both state and federal standards. In five states which the Children's Bureau investigated 19,606 children between fourteen and sixteen years of age were found to whom work certificates had been issued. Of that number, more than one-fourth could not write their name legibly; nearly ten per cent had not gone further than the first grade; more than half were in the fourth or some lower grade when they left school; only about three per cent had reached the eighth grade, and only about one per cent had gone as far as the high school. Of the 19,606 children, only twenty-four were foreign-born.—From *Report issued by Children's bureau of federal Department of Labor*, Jan., 1920.—The National Child Labor Committee called attention to the fact that in spite of increasing adult unemployment, more children left school to go to work in 1920 in many industrial centers than in 1919. Fourteen states reported an increase in child labor during the first six or eight months of 1920. In New York city 5,283 more children applied for work permits in the first six months of 1920 than in the same period of the preceding year, but in the last three months there was a decrease in applications so that the total increase was only 2,353. In Baltimore County, Md., there were 4,064 more applications for work permits up to October 31, 1920, than in 1919, while during the summer the Chicago authorities reported an increase of 13,000 in that city, and in Minnesota there had been an increase of 193 per cent since 1915.—"The Keating-Owen

law was based upon the power of Congress to regulate commerce and prohibited interstate commerce in articles in the production of which the labor of children had entered. A new law, based upon the power of Congress to tax, was enacted, going into operation on April 25, 1919. On August 19 of that year, this measure was declared unconstitutional in the same court that passed upon its predecessor."—F. C. Ensign, *Compulsory school attendance and child labor*, p. 258.—This same court again declared the act invalid in December, 1921. The case was carried to the Supreme Court, which in May, 1922, declared against the constitutionality of the law as an infringement upon the sovereign rights of the States.—See also U. S. A.: 1916 (August); 1916-1917: Opposition to Keating-Owen-Child Labor Law; 1917-1919: Taxation and expenditures.

"Although the Federal law accomplished an enormous amount of good, it was distinctly limited in scope. Though it affected 300,000 children by its age, hour, and night-work provisions, it applied only to industries and occupations in which according to the census of 1910, but 15 per cent. of the total number of child laborers were engaged. The only standards of the Federal law were the 14-year age-limit for children employed in factories, mills, workshops and canneries; a 16-year age-limit for children employed in mines and quarries, and an eight-hour day, with night work prohibited, for children between 14 and 16 in factories, mills, workshops and canneries. The Federal law provided no protection whatever for child labor in agriculture, in tenement homework, street trades, domestic service, restaurants, hotels, moving pictures and a list of other industries which might be extended indefinitely. It was in these occupations combined, according to the Census of 1910, that 85 per cent. of America's 2,000,000 child laborers were engaged. The Federal law set no educational qualifications for children leaving school to go to work, and made no requirement as to physical fitness."—*New York Times Current History*, July, 1922, p. 617.

1918-1920.—Steps for child welfare taken by new governments of Europe.—Child labor laws in Austria and Czecho-Slovakia.—Special provisions for children in the labor laws of Soviet Russia.—Poland.—"Austria, by the Child Labour Act of 19 December, 1918, prohibits the general employment of children under 12 years old. . . . This prohibition is modified in the case of agriculture, employment in 'light work in agriculture' being permitted from the age of 10. Under the 'general limitations clause' of the Austrian Act 'children shall only be employed or otherwise occupied in so far as the carrying out of their compulsory school attendance is not prevented.' This applies to 'the employers' own children and all other children in work of any kind for which remuneration is paid or which is carried on regularly even if it is not specially remunerated.'"—*International Labor Review*, Sept., 1921, p. 193.—"On July 17, 1919, the National Assembly of the Czecho-Slovakian republic passed a child labor law which was promulgated on July 28, 1919, and became effective three months after its promulgation. The law defines as children all boys and girls who have not completed their fourteenth year of age. Child labor within the meaning of the law is the regular employment of children at whatever labor for or without compensation. The performance of work by children for purposes of training or instruction, as well as the employment of children at casual jobs, and the employment of own children at light, although regular, household work, is not to be

considered child labor. Own children within the meaning of the law are children living in common household with the employer, who are related to him by blood or marriage up to the third degree, or live with him as foster children or wards. The employment of children at manual labor or other occupations is permissible only in so far as it does not endanger their health, their physical and mental development, or their morals, and in so far as it does not interfere with their attendance at school. The employment of children who have not completed their twelfth year of age is prohibited. Children over 10 years of age may, however, be employed at light agricultural or household work. On school days children may not be employed at labor in excess of two hours. Their employment at labor before the morning session of school and during the two hours preceding the afternoon session is prohibited. With respect to agricultural and household work this prohibition is limited by the law to two hours preceding the school session. A period of recreation of one hour is to be granted after school hours. On school holidays children may not be employed at labor in excess of four hours, except that in agricultural and household work employment may not exceed six hours. The employment of children at labor on Sundays and church holidays is prohibited. Children employed in agriculture and at household work must be allowed an uninterrupted night rest of 10 hours from 8 p. m. to 6 a. m. In all other fields of child labor the employment of children between 8 p. m. and 7 a. m. is prohibited. . . . If an employer employs other than his own children for compensation in money he may deduct from their wages only lodging, board, clothing and school supplies furnished by him and the price charged therefor may not exceed the actual cost. . . . Whoever employs other children than his own must without delay report their employment to the communal authorities of his place of residence, indicating the nature of his establishment and of the employment of the children. . . . Anybody intending to employ other children than his own must previously apply to the communal authorities for a work card for each child. The cards are to be issued for one year and must be renewed on their expiration. They are to be issued free of charge by the communal authorities of the place of residence of the child after a hearing of the legal representative of the child and of the competent school authorities. . . . The issuance of a work card must be refused if in the opinion of the physician or the school authorities the labor in question would endanger the morals or the physical or mental development of the child. . . . Contraventions of the law, if not subject to severer penalties in accordance with other laws, are punishable with fines up to 1,000 crowns or imprisonment up to three months. . . . Persons convicted of a contravention of the law may temporarily or permanently be enjoined by the political authorities from employing children. The law authorizes the Minister of Social Welfare to conclude agreements with foreign countries for assuring the application abroad of the principles of the present law."—*Monthly Labor Review, Apr., 1920.*

"The labor laws of Soviet Russia provide that children under sixteen years of age shall not be permitted to work. In special cases children of fourteen and over may get the permission of the labor department but only when there is acute need and it is impossible to place the children in schools, homes and other state institutions. They

must not work longer than four hours a day, those between sixteen and eighteen must not work longer than six hours a day, those under eighteen are forbidden overtime, night work and underground work. The guiding idea of the Soviet Republic is to give the children a preference in everything, from food and clothing to less tangible goods. . . . In practice, the Soviet Republic can realize its ideal program only on a limited scale. It lacks teachers, buildings and material, even if the mass of Russian parents were content to allow their children to be educated in colonies or boarding schools up to the age of sixteen. . . . The most picturesque of them [schools] are the 'colonies,' planted as a rule in forests which begin a few miles beyond the suburban area. I saw two of these, in the Sokolniki Park outside Moscow, and in the Tsarskoe Selo, the Russian Windsor, now known as Dyetskoe Selo (children's village), outside Petrograd. . . . Many of the villas were assigned to ailing or tuberculous children, and these later, sleeping more or less in the open even in the winter, make wonderfully rapid cures. Others, however, were inhabited by normal children of all ages and both sexes up to the age of sixteen. Boys and girls live together, and co-education is, indeed the universal rule in all Russian schools. . . . The villas were clean and tidy, though simply, even barely furnished, and the children were learning to be personally clean, a lesson they would never have learned at home. Their gardens and vegetable plots were well kept and they did most of the housework themselves. I took a meal with the children. The food was good and I should say sufficient, though the milk was only condensed. . . . Every villa had its piano. The children evidently revelled in drawing and painting, and were encouraged to exercise their creative fancy. Some of their portraits, and even more their interpretations of Russian fairy tales, showed unusual talent. They vied with each other moreover in writing verses. Each little colony had its 'Soviet,' in which the children, with the aid of a teacher, learned to discuss their own affairs. . . . Even in remote Vladimir, there were some of these colonies, especially a permanent one for tuberculous children, and a big camp in charge of an enthusiastic young doctor, in which several hundred children of all ages spent the summer under canvas, dividing their time between sports and helpful farm work to assist the peasants. Not the least interesting of the new developments is a Children's Court, composed of a doctor, a teacher and a legal member, which deals with juvenile criminals (chiefly thieves) and has also the right to send children living in bad moral environment to one of these school homes. It works with a volunteer organization, composed mainly of young people, called 'The Brothers and Sisters of Social Aid,' which devotes itself to aiding or reclaiming neglected children. Ten of its members from Vladimir are taking a course of instruction in Moscow. The Communists are justly proud of their whole organization for the 'protection' (Ochrana) of children—a conception which includes moral welfare, education and recreation as well as the provision of food and hygiene. Several playing fields for the children have been opened in Vladimir, and there was also a so-called Children's 'club,' in which I saw them doing carpentering, painting and theatricals, voluntarily but with some help from teachers out of school hours. In the long summer vacation the children were organized to do such pleasant and useful work as the collection of medicinal herbs, and the gather-

ing of fir cones in the forest for fuel. All this, needless to say, is not only new but unprecedented in Russia."—H. N. Brailsford, *Russian impressions* (New Republic, Dec., 1920).—See also INTERNATIONAL RELIEF: European relief council.—For Poland, see POLAND, CONSTITUTION OF.

1918-1921.—Effect of Fisher Act on Child Labor in England and Wales.—"The Fisher Education Act represents the government's effort permanently to improve the condition of young workers. This law requires school attendance of every child under fourteen. Gainful employment outside school hours is absolutely forbidden, except a very limited amount by children between twelve and fourteen. Working boys and girls are required to go to continuation school eight hours a week until eighteen years of age, when the law goes into full effect, and the time of attendance must be taken out of working hours. It is unfortunate that the children who in some ways most need the help of the act, namely those who went to work during the war, are expressly exempted from its provision. . . . The chief forces in bringing about this diminution of child labor were, naturally, the laws forbidding child labor and requiring compulsory schooling. Children were required to attend school until they were fourteen unless they were thirteen and could secure a certificate of 'proficiency' or of regular attendance. They might not work in factories until they had completed their school attendance, except that 'half timers,' girls and boys of twelve, might work not more than thirty-three hours a week and were compelled to go to school half the time. Most of the 'half timers' were found in the Lancashire cotton mills. Children under eleven might not sell articles on the street, boys under fourteen might not work in coal mines, and the local authorities might forbid all work by children under fourteen, though unfortunately the power had been but slightly exercised. The health and safety regulations affecting 'young persons' under eighteen were similar to those for women, but somewhat more stringent. The lead processes which were forbidden women were also forbidden girls and boys under eighteen, together with a few other very unhealthy trades. In others where women might be employed, boys and girls under sixteen were forbidden to work. Children under fourteen might not be employed 'in a manner likely to be dangerous to their health or education.' . . . In addition the hours of boys under sixteen employed in mines were limited, and a maximum of seventy-four hours a week was fixed for shop assistants under eighteen. The minimum rates set by the trade boards for boys and girls under eighteen generally rose year by year according to age from about 4s. weekly at fourteen (66 cents) to 10s. (\$2.40) or 12s. (\$2.88) at seventeen. Girls with the necessary experience in the trade received the full minimum rate for women at eighteen years of age, but the boys, who sometimes began at a higher rate than the girls, did not reach the full men's rate till they were twenty-one or more. Almost all these working conditions—the principal kinds of work women and children were doing, the rate of increase in their numbers, their wages and the legal regulations protecting them—were changed during three years of the world war."—I. O. Andrews and M. A. Hobbs, *Economic effects of the world war upon women and children in Great Britain*, pp. 12, 18-10.—"The Factory Acts still permit night work for boys and girls in glass works, iron and steel mills, letter press and printing works, paper mills, and blast furnaces. In these occupations no intelligent work is offered to the great majority of

young persons. Yet a boy of fourteen may be kept at labour amid the dirt and heat for as much as fourteen hours on a night shift and for sixty hours in any week."—*Juvenile labour: A problem in industry* (Contemporary Review, Feb., 1921.)

1919.—Legislation in the United States during the year.—Comparative study of working age throughout the world.—According to the report of the National Child Labor Committee, made by A. R. Lovejoy in 1920, "the most encouraging child welfare legislative achievements [during 1919] have been in Kentucky and Alabama. In the latter state following the establishment of the Child Welfare Department, organized by the staff of the National Child Labor Committee, a bill was passed at a special session of the legislature increasing the annual appropriation from \$12,500 to \$30,000, thus enabling the department to develop the agencies for child welfare still further. In Kentucky the governor appointed a Children's Code Commission which is now at work; the total appropriation for state health work was more than doubled; a Board of Charities and Corrections was created; the child labor and compulsory education laws were improved and a Domestic Relations' Court for Louisville was created. Favorable legislation was enacted in the following states: Louisiana, provision for mothers' pensions; Massachusetts, prohibiting the operation, cleaning or repairing of freight elevators by children under sixteen years; Mississippi, compulsory school attendance made state-wide, permitting, however, districts to exempt themselves by their own vote; New York, the creation of a Children's Code Commission to revise and standardize the laws of the state which relate to children and report back to the legislature, and the extension of medical inspection provisions to include children employed in mercantile establishments; Virginia, provision for an eight-hour day for children under sixteen years in canneries, factories and mercantile establishments. Unfavorable legislative action resulted in the following states: Delaware, the new school code was weakened at a special session of the legislature reducing the required school attendance from 180 days to 120 a year; Maryland, permitting non-resident minors to appear in theatrical performances with travelling companies in Baltimore, and amending the work permit provisions to allow mentally retarded boys over fourteen years of age to obtain temporary work permits; in Virginia, permitting children of twelve years of age to work in canneries when schools are not in session, and to work at errand and delivery service."—*Child welfare* (The Survey, Dec. 18, 1920, p. 427).—"As we go over the laws of the various States we feel without particular examination that we have fairly good laws, that we have various safeguards thrown around the children at the ages they are permitted to work. As we go down the list of States we find the maximum working hours for children under sixteen years in nineteen States and the District of Columbia to be eight hours a day and forty-eight hours a week, and in eleven additional states the same hours but with certain exemptions; in ten states a maximum working day of nine to ten hours but not more than fifty-eight hours a week; and in seven states ten hours or more a day, with sixty hours a week. After the age of sixteen, children are permitted in many states to work ten hours, in some states even longer. In Indiana, which is one of our important industrial States, there is no regulation for the hours for women. Thus after children reach the age of sixteen—and girls of sixteen are children—they can work twelve, fourteen, in fact any num-

ber of hours that the employer may choose. Our safeguards are left off at a very tender age."—A. Nestor, *Hours (United States Department of Labor, Children's Bureau, publication No. 60, 1919)*.—See also CALIFORNIA: 1919.

"Fourteen is the age for admission to employment in industry in the following countries: The United States of America, Belgium, Great Britain, Bulgaria, Czecho-Slovakia, Denmark, Greece, Norway, Serbia, Sweden (girls only), Switzerland; five Australian States: New South Wales, Victoria (girls, 15), Queensland, Western Australia, Tasmania; seven provinces of Canada: Ontario, Quebec, Manitoba (girls, 15), Nova Scotia, New Brunswick, British Columbia, Saskatchewan; and New Zealand. Thirteen is the minimum age fixed in France, Germany, the Netherlands, Sweden (boys only) and South Australia; twelve in the Argentine Republic, Brazil, Italy, Japan, Mexico, and Portugal; eleven in Rumania; ten in Spain; and nine in India. A few instances of a higher minimum limit are found in seven states of America: California, Maine, Michigan, Montana, Ohio, South Dakota and Texas; in one province of Canada, Alberta; and for girls in two other Canadian provinces: British Columbia and Manitoba; and the State of Victoria in Australia, where the minimum age is fifteen. It is sixteen in one American State: Montana. In five countries (Czecho-Slovakia, Greece, the Netherlands, Norway, Sweden) and in thirty-six American States, children who have not passed an educational standard are excluded from industrial employment after reaching the age fixed for absolute exclusion. In countries where the general age limit is fixed at fourteen there are cases in which a lower limit is allowed. This may include, as in Great Britain and Germany, children employed elsewhere than in factories and mines; or in special work connected with seasonal trades and in street trading, as in several of the provinces of Canada, where the age limit is twelve (ten in one case); or again, as in New Zealand, in special cases authorized by the inspector if the child has an educational certificate (age limit thirteen), or with educational and medical certificates, as in France (where the age limit is twelve). Moreover, in certain States permits are given for employment at ten in light agricultural and domestic work (Czecho-Slovakia, Japan) and with a school-leaving certificate at ten in Portugal. It has been remarked that in general the age for employment in mines—employment being usually restricted to boys—is higher than that for employment in factories and workshops. There are, however, some exceptions to this rule, the age for employment in mines in British Columbia (metalliferous mines only), Nicaragua, Nova Scotia, and the Yukon Territory, and in Portugal being twelve only. In France the minimum age for trimmers is thirteen, for assistants, or apprentices at the face, fourteen, while for all other underground work a boy must have attained the age of fifteen. Fourteen is the usual minimum age in Europe, but instances of a higher age of entry are not wanting. The minimum is fifteen in two provinces of Canada (British Columbia and Quebec), Greece (underground work), and Sweden. In America the Tax on Employment of Child Labour Act in effect prohibits the employment of children under sixteen in any mine or quarry. [This Act was declared unconstitutional in 1922.] This is the statutory age in one province of Canada (Alberta, underground), South Africa (underground) and Spain, where also the minimum age for employment in extraction of minerals or work carried on by means of explosives is eighteen; seventeen in the parts

of Poland formerly ruled by Russia and in the State of Texas; eighteen in the State of Arizona (underground), in Bulgaria and in the State of Wisconsin. . . . The replies received to the questionnaire issued by the Committee to the different governments show that fifteen countries (including two of the British Dominions and five Australian States) have already adopted the age (16) recommended by the Berne Conference of 1913, as the general minimum for employment during the night in industrial work and in a number of cases (nine) have adopted a still higher age. Sixteen has also been adopted as the age limit in Germany. In Brazil (São Paulo), Great Britain, Denmark, France, Norway, Sweden, Switzerland, and three American States, the minimum age is 18; in the Netherlands, and the parts of Poland formerly under Russian rule, 17; in the United States of America, the Argentine, Belgium, Germany, five Australian States, New Zealand, in the parts of Poland formerly under Austrian and German rule, in South Africa, and in Spain, 16; in Italy, Japan, and Rumania it is 15. There is also conformity in all these States (except France) with the proposal in Article 1 of the Berne Draft Convention that the prohibition of night work is to be absolute in all cases and no exceptions are to be permitted from the general rule until 14 years of age. In France, the age at present is 13. Belgium, Great Britain, Germany, Italy, Japan, the Netherlands, parts of Poland formerly under German and Austrian rule, Spain and Switzerland allow certain exceptions at 14; Denmark (for purposes of industrial training only), and the parts of Poland formerly under Russian rule at 15; and Norway and Sweden at 16. In most cases exception is allowed only for continuous industries; for trades dealing with perishable materials; and for newspaper printing works. . . .

"The protection of young persons from injury to health in especially injurious trades and processes takes the form either of hygienic regulations or of the total exclusion of young workers. . . . The age limits for exclusion vary greatly. In Belgium, Italy and Spain, where adult women are not excluded at all, the employment of female young persons is prohibited up to 21 years of age, while the corresponding prohibition of boys' work extends only up to the age of 16 (15 in Italy). Male as well as female young persons up to the age of 21 are debarred from certain lead processes in the State of Pennsylvania. Both sexes are excluded from certain injurious work up to the age of 18 in Great Britain, France, Germany, the Netherlands and part of Poland. The States of Maryland, Massachusetts, New York, Ohio and Wisconsin in America provide examples of the exclusion of boys as well as girls up to 18 from unhealthy processes. Cases where the age limit for exclusion is 18 for girls and 16 for boys are found in Greece, and the Canadian Province of Quebec; 17 is the age limit for lads in certain trades in the Netherlands. The most common standard is that which admits boys to unhealthy processes after the age of 16, whether coupled with a higher limit for girls (as in the cases mentioned above, where young women up to 21 years of age are excluded), or with the same rule applying to both girls and boys (as in the case of a long list of trades in Belgium, of a few specially regulated industries in Great Britain, and a small part of the schedules of injurious trades in France, and in practically every case where young workers are debarred from injurious work in the United States of America). A lower age limit for boys is found in Italy, where 15 is the age generally fixed

for the purposes here considered. In Japan and parts of Poland exclusion of young persons from unhealthy trades affects both girls and boys up to 15 only. In a few countries (Belgium, France, Great Britain, Germany) children under 14 are specifically excluded from certain unhealthy occupations. But provisions to that effect will become obsolete as the age limit for general admission to industrial work is raised. For example, in Great Britain, the few instances of exclusion from unhealthy work under 14 will become meaningless when, on Section 14 of the Education Act of 1918 coming into operation, children under that age are no longer admitted at all to employment in factories and workshops."—*League of Nations, Report III, Employment of women and children, International Labour Conference, Washington, 1919, pp. 45-47, 51-52, 56-57.*

CHILE.—Geographic description.—Resources. "The Republic of Chile, beginning at latitude seventeen degrees, and extending to the farthest southern limits of South America, forms a narrow longitudinal strip of territory twenty-four hundred miles long, and not exceeding 200 miles in width in the extreme. It has an area of 462,000 square miles. . . . [See LATIN AMERICA: Map]. Nature has been prodigal in the bestowal of her varied gifts upon Chile. Its geographical formation represents a huge serpent with its sinewy form stretched along the west coast of the continent, its head resting in the arid coast of the continent, its tail coiled about the wood-crowned hills and ice-bound islands of Tierra del Fuego. Upon one side looms the Andes Mountains, . . . upon the other stretches the vast expanse of the Pacific. Bordered as it is by the ocean on one side, and including within its limits a range of mountains reaching in some places an altitude of 24,000 feet, Chile presents a variety of geological, geographical and climatic conditions possessed by few countries in the world. Being isolated by great national barriers, it faces away from all the centres of population and ancient homes of civilization, and of all the countries of South America, it occupies the most unfavorable position geographically, and is the most inaccessible from Europe, North America and the Far East. But with all its isolation, its long struggle to gain a place among civilized nations, its history of cruel and uncivilized warfare, Chile possesses natural resources and attractions which intervening years have made known."—R. E. Mansfield, *Progressive Chile, pp. 11, 12*.—"Looked on from the agricultural and economical standpoint as well as regarding the distribution of its natural products, Chile may be divided into three large zones. The Northern zone extends about as far as the 30 deg. and shows for the most part the characteristics of a desert. In this thinly populated zone the chief mineral treasures of the country are to be found. A European savant, who explored this part of the country being appointed by the Chilean government, compared them to a huge chemical laboratory because they are stocked with almost every kind of ore. They contain immeasurable quantities of saltpetre and borax and also numerous silver and copper mines, especially the latter. The central zone, about as far as the 38 deg., reaching up to the boundaries of the province of Valdivia, is the best cultivated and watered. It is crossed by numerous railways and roads, and on the whole it is fairly well populated. This is the agricultural zone, and in it thrive wine, olives and corn to a great extent. The southern zone is mainly remarkable for its woods. There is in some places good coal, and gold dust has been found in some of the rivers, but the main wealth of this still sparsely populated zone are the woods and products of the sea. However, cattle raising is developing and the different branches of industry . . . are increasing to a great extent."—*Short description of the Republic of Chile, p. 2, according to official data (F. A. Brockhaus, ed.)*.—See also LATIN AMERICA: Agriculture: 1918-1921: Effect of Natural resources; and below 1900-1910: Mineral wealth and progress.

Population.—"In Chile the growth of population has been very slow indeed, far too much so for

the economic development of the country. On the other hand, chiefly owing to the difficulties of access to the country in the past, it has been, on the whole and as compared with other South American Countries, a fairly homogeneous growth. . . . According to historians the Spaniards in Chile numbered little more than 2,000 at the beginning of the eighteenth century. By the middle of the eighteenth century they had increased to 80,000, and at the Declaration of Independence (1810) the population was about 500,000. It had rather more than doubled by 1835. In 1907, at the last census, the population was found to be 3,249,279. It is probable that at the present time (1914) the number of Chile's population approaches 5,000,000. There is practically no admixture of Asiatic or African blood. The people are of mainly European descent, and very largely Spanish. Among the governing classes many English and Irish names are to be met with, and a few French are found, the bearers of these being descendants of old colonists who made their mark in politics, the army and navy, and in consequence, have now become thoroughly identified with the country. Since these early days there has been a thin infiltration of foreign emigrants, perhaps the most prominent elements being the German colonists who came to Valdivia and its neighbourhood about 1850, and the Anglo-Saxon sheep and cattle ranchers and miners. Other attempts at importation of foreign colonists on a fairly large scale have been made, but the grand total was not at all overwhelming. For instance, in 1910 only 2,543 emigrants registered. Meanwhile the natural growth of population is quite inadequate to the needs of the country, partly owing to the heavy death rate, the mortality among children being exceptionally high. In 1910 the excess of births over deaths was less than 25,000. Population is most dense in the Central Provinces. At the last census [written in 1914] the population of Santiago was 332,723, of Valparaiso 162,447, whilst Concepcion (which could claim 55,330) and ten other towns accounted for another 306,965. Thus, about a fourth of the population was concentrated in twelve towns of 15,000 inhabitants and upwards. There is quite a notable foreign element in the seaport towns, but it must be remembered that in such northern ports as Iquique, Antofagasta, and Talca, the foreigners are largely mere birds of passage, attracted by the nitrate and mineral industries."—G. J. Mills, *Chile*, pp. 40-42.—The 1920 census shows a population of 3,754,723. In December, 1921, the estimated population was 3,792,241.

Origin of the name.—"The name of Chile is of doubtful origin. During the Inca epoch it was called Tilli, that being the name of a powerful and popular Araucanian Chief. It was pronounced 'tele,' which translated means enemy. From changes in the pronunciation, the word was finally converted into Chile. Some authorities say that the name is derived from the Indian word Tchile or Techile, which signifies cold, having direct reference to the snows of the Cordilleras, or the glaciers of the far south."—R. E. Mansfield, *Progressive Chile*, p. 11.—See also LATIN AMERICA.

ALSO IN: Stanford's *Compendium of travel and geography*, v. 1, p. 269.

Aborigines.—"It is estimated that at the Conquest there were about half a million Indians in the country. . . . They consisted of the Changos in the North, to the extremity of Atacama,

a branch of the Aymara Indians, who had submitted to the influence of the Incas, then came the sturdy and patriotic Araucanians in the centre provinces and down south to Llanquihue, the Fuegians in the cold regions of the Archipelago. All these made war with the Spanish invaders, and the Araucanians kept up active hostility until well into the first half of the nineteenth century. The Fuegians, on the other hand, came into conflict with colonists through a not altogether unnatural inability to distinguish sheep and cattle from the wild guanaco of their mountains. Consequently the native races have been worn down to a tithe. But the Araucanians have shown themselves a fine race."—G. J. Mills, *Chile*, pp. 40-41.—"Chili from 30° south latitude, was and is still in part occupied by several tribes who speak the same language. They form the fourth and most southern group of the Andes people, and are called Araucanians. Like almost all American tribal names, the term Araucanian is indefinite; sometimes it is restricted to a single band, and sometimes so extended as to embrace a group of tribes. Some regard them as a separate family, calling them Chilians, while others, whom we follow, regard them as the southern members of the Andes group, and still others class them with the Pampas Indians. The name Araucanian is an improper one, introduced by the Spaniards, but it is so firmly fixed that it cannot be changed. The native names are Moluche (warriors) and Alapuche (natives). Originally they extended from Coquimbo to the Chonos Archipelago and from ocean to ocean, and even now they extend, though not very far, to the east of the Cordilleras. They are divided into four (or, if we include the Picunche, five) tribes, the names of which all end in 'tche' or 'che,' the word for man. Other minor divisions exist. The entire number of the Araucanians is computed at about 30,000 souls, but it is decreasing by sickness as well as by vice. They are owners of their land and have cattle in abundance, pay no taxes, and even their labor in the construction of highways is only light. They are warlike, brave, and still enjoy some of the blessings of the Inca civilization; only the real, western Araucanians in Chili have attained to a sedentary life. Long before the arrival of the Spaniards the government of the Araucanians offered a striking resemblance to the military aristocracy of the old world. All the rest that has been written of their high stage of culture has proved to be an empty picture of fancy. They followed agriculture, built fixed houses, and made at least an attempt at a form of government, but they still remain, as a whole, cruel, plundering savages."—*The standard natural history* (J. S. Kingsley, ed.), v. 6, pp. 232-234.—"The Araucanians inhabit the delightful region between the Andes and the sea, and between the rivers Bio-bio and Valdivia. They derive the appellation of Araucanians from the province of Arauco. . . . The political division of the Araucanian state is regulated with much intelligence. It is divided from north to south into four governments. . . . Each government is divided into five provinces, and each province into nine counties. The state consists of three orders of nobility, each being subordinate to the other, and all having their respective vassals. They are the Toquis, the Apo-Ulmenes, and the Ulmenes. The Toquis, or governors, are four in number. They are independent of each other, but confederated for the public welfare. The Arch-Ulmenes govern the provinces under their respective Toquis. The Ulmenes govern the counties. The upper ranks, generally, are likewise comprehended under

the term *Ulmenes*."—R. G. Watson, *Spanish and Portuguese South America*, v. 1, ch. 12.

ALSO IN: R. E. Mansfield, *Progressive Chile*, pp. 25-26.—G. F. S. Elliot, *Chile*, pp. 1-13.—J. I. Molina, *Geography, Natural and civil history of Chili*, v. 2, bk. 2.

1450-1535.—Invasion and conquest of northern Chile by Yupanqui, Inca of Peru.—"In the year 1450 the Peruvian Inca, Yupanqui, desirous of extending his dominions towards the south, stationed himself with a powerful army at Atacama. Thence he dispatched a force of 10,000 men to Chili, under the command of Chinchiruca, who, overcoming almost incredible obstacles, marched through a sandy desert as far as Copiapo, a distance of 80 leagues. The Copiapins flew to arms, and prepared to resist this invasion. But Chinchiruca, true to the policy which the Incas always observed, stood upon the defensive, trusting to persuasion rather than to force for the accomplishment of his designs. . . . While he proffered peace, he warned them of the consequences of resisting the 'Children of the Sun.' After wavering for a time, the Copiapins submitted themselves to the rule of the Incas. "The adjoining province of Coquimbo was easily subjugated, and steadily advancing, the Peruvians, some six years after their first entering the country, firmly established themselves in the valley of Chili, at a distance of more than 200 leagues from the frontier of Atacama. The 'Children of the Sun' had met thus far with little resistance, and, encouraged by success, they marched their victorious armies against the Purumancians, a warlike people living beyond the river Rapel." Here they were desperately resisted, in a battle which lasted three days, and from which both armies withdrew, undefeated and unvictorious. On learning this result, the Inca Yupanqui ordered his generals to relinquish all attempts at further conquest, and to "seek, by the introduction of wise laws, and by instructing the people in agriculture and the arts, to establish themselves more firmly in the territory already acquired. To what extent the Peruvians were successful in the endeavor to ingraft their civilization, religion, and customs upon the Chilians, it is at this distant day impossible to determine, since the earliest historians differ widely on the subject. Certain it is, that on the arrival of the Spaniards the Incas, at least nominally, ruled the country, and received an annual tribute of gold from the people."—E. R. Smith, *Araucanians*, ch. 11-14.

ALSO IN: R. E. Mansfield, *Progressive Chile*, pp. 27-28.

1535-1724.—Spanish conquest.—Araucanian War of Independence.—"In the year 1535, after the death of the unfortunate Inca Atahualpa, Diego Almagro, fired by the love of glory and the thirst for gold, yielded to the solicitations of Francisco Pizarro, the conqueror of Peru, and set out for the subjection of Chili, which, as yet, had not been visited by any European. His army consisted of 570 Spaniards, well equipped, and 15,000 Peruvian auxiliaries. Regardless of difficulties and dangers this impetuous soldier selected the near route that lay along the summits of the Andes, in preference to the more circuitous road passing through the desert of Atacama. Upon the horrors of this march, of which so thrilling an account is given by Prescott in the 'Conquest of Peru,' it is unnecessary for us to dwell; suffice it to state that, on reaching Copiapo no less than one-fourth of his Spanish troops, and two-thirds of his Indian auxiliaries, had perished from the effects of cold, fatigue and starvation. . . .

Everywhere the Spaniards met with a friendly reception from the natives, who regarded them as a superior race of beings, and the after conquest of the country would probably have been attended with no difficulty had a conciliatory policy been adopted; but this naturally inoffensive people, aroused by acts of the most barbarous cruelty, soon flew to arms. Despite the opposition of the natives, who were now rising in every direction to oppose his march, Almagro kept on, overcoming every obstacle, until he reached the river Cacha-pual, the northern boundary of the Purumancian territory." Here he met with so stubborn and effective a resistance that he abandoned his expedition and returned to Peru, where, soon after, he lost his life (see PERU: 1533-1548) in a contest with the Pizarros. "Pizarro, ever desirous of conquering Chili, in 1540 dispatched Pedro Valdivia for that purpose, with some 200 Spanish soldiers and a large body of Peruvians." The invasion of Valdivia was opposed from the moment he entered the country; but he pushed on until he reached the river Mapoclio, and "encamped upon the site of the present capital of Chili. Valdivia, finding the location pleasant, and the surrounding plain fertile, here founded a city on the 24th of February, 1541. To this first European settlement in Chili he gave the name of Santiago, in honor of the patron saint of Spain. He laid out the town in Spanish style; and as a place of refuge in case of attack, erected a fort upon a steep rocky hill, rising some 200 feet above the plain." The Mapochins soon attacked the infant town, drove its people to the fort and burned their settlement; but were finally repulsed with dreadful slaughter. "On the arrival of a second army from Peru, Valdivia, whose ambition had always been to conquer the southern provinces of Chili, advanced into the country of the Purumancians. Here history is probably defective, as we have no account of any battles fought with these brave people. . . . We simply learn that the Spanish leader eventually gained their good-will, and established with them an alliance both offensive and defensive. . . . In the following year (1546) the Spanish forces crossed the river Maulé, the southern boundary of the Purumancians, and advanced toward the Itata. While encamped near the latter river, they were attacked at dead of night by a body of Araucanians. So unexpected was the approach of this new enemy, that many of the horses were captured, and the army with difficulty escaped total destruction. After this terrible defeat, Valdivia finding himself unable to proceed, returned to Santiago." Soon afterwards he went to Peru for reinforcements and was absent two years; but came back, at the end of that time, with a large band of followers, and marched to the south. "Reaching the bay of Talcahuano without having met with any opposition, on the 5th of October, 1550, he founded the city of Concepcion on a site at present known as Penco." The Araucanians, advancing boldly upon the Spaniards at Concepcion, were defeated in a furious battle which cost the invaders many lives. Three years later, in December, 1553, the Araucanians had their revenge, routing the Spaniards utterly and pursuing them so furiously that only two of their whole army escaped. Valdivia was among the prisoners taken and was slain. Again and again, under the lead of a youthful hero, Lautaro, and a vigorous *toqui*, or chief, named Caupolican, the Araucanians assailed the invaders of their country with success; but the latter increased in numbers and gained ground, at last, for a time, building towns and extending settlements in the Araucanian territory.

The indomitable people were not broken in spirit, however; and in 1598, by an universal and simultaneous rising, they expelled the Spaniards from almost every settlement they had made. "In 1602 . . . of the numerous Spanish forts and settlements south of the Bio-Bio, Nacimiento and Arauco only had not fallen. Valdivia and Osorno were afterward rebuilt. About the same time a fort was erected at Boroa. This fort was soon after abandoned. Valdivia, Osorno, Nacimiento, and Arauco still remain. But of all the 'cities of the plain' lying within the boundaries of the haughty Araucanians, not one ever rose from its ashes; their names exist only in history; and the sites where they once flourished are now marked by ill-defined and grass-grown ruins. From the period of their fall dates the independence of the Araucanian nation; for though a hundred years more were wasted in the vain attempt to reconquer the heroic people . . . the Spaniards, weary of constant war, and disheartened by the loss of so much blood and treasure, were finally compelled to sue for peace; and in 1724 a treaty was ratified, acknowledging their freedom, and establishing the limits of their territory."—E. R. Smith, *Araucanians*, ch. 11-14.

1540-1778.—Institutions of the Spaniards.—"The Spanish *conquistadores* based their power on the royal charters which allocated the lands that should accrue to the crown, and the conquered regions at once became fiefs or seignories in accordance with the Spanish political system. Valdivia distributed the territory of Chile amongst his chief captains, allotting to each a proportion of the native inhabitants in conformity with the system of *encomiendas* then in vogue in the New World. The institution of the *encomiendas* was merely a means of gaining possession of the territory and of subduing the native population. It enabled Valdivia and his successors to acquire the labour indispensable to the building of cities and forts, the working of mines and placers, and particularly the cultivation of the soil. The Spanish soldiery, constantly occupied in warfare with the Indians, had no time to found important cities, and lived primitively enough in camps and villages of mud huts, though later on they built a few wretched little hamlets. But the vitality and activity of the colony increased in proportion as the affairs of war permitted of the development of agriculture, and, thanks to the system of *encomiendas*, of the utilization of native labour. Thus gradually were formed the farms and estates of the colony, which gave the Spaniards definite possession of the great longitudinal valley as far as the banks of the Bio-Bio, where by force of arms they held in check the warlike Araucanian tribes. On these estates, as in the cities, Spanish and native blood began to intermingle, and soon a new and vigorous race was born, the race of the *mestizo*, which to-day forms a great majority of the inhabitants of the Republic. The upper classes maintained more or less the purity of their European blood, and their descendants enjoyed an advantageous pre-eminence in society, while some of them received the further consideration due to the administrative functions which they discharged. Owing to the wars with the Araucanos, ship-loads of European soldiery were arriving in the colony, and while the population was augmented by their numbers the *encomiendas* benefited by the additional native labour which they forced into their

service. The creole Spanish, that is to say the white race without admixture of Indian blood, occupied second place in the social hierarchy, but formed, by virtue of their industry and intelligence and their attachment to the country of their birth, the patrician class which secured the independence of the colony and organized the most prosperous Republic of South America. The third social element was constituted by the *mestizos*, born of the intermingling of Spanish and Indian blood, to which class we have already referred. . . . The native, regarded by the law as an individual who needed protection and segregation, was in reality, during the colonial period, a member of a vanquished race, and as such was subjected to forced labour. His wages were heavily taxed, and in addition to the constant toil which was exacted from him he had to suffer the cruel treatment of his masters. The consequence was the gradual extinction of the Indian inhabitants. The excesses and abuses committed against the natives towards the end of the eighteenth century aroused the humanitarian sentiments of the Governor of Chile, Don Ambrosio O'Higgins, who represented to the monarch the necessity of suppressing the *encomiendas* then in existence, showing how the abolition of forced labour must bring as an immediate consequence the industrial and agricultural prosperity of the country. A royal Act of 1791 ordered the incorporation to the crown of all the *encomiendas* of Chile. By this time the number and importance of the Indian allotments had dwindled considerably, while the free and independent working-class had increased in extraordinary fashion. The fulfilment of the royal wishes, however, encountered some opposition from the usufructuaries of the system and contributed to the alienation of a part of the population from the maintenance of Spanish rule. As to the natives themselves, their ignorance prevented them from understanding that the king had given them their liberty, and they continued to slave for their masters under the designation of *inquilinos* ('tenants'), a name which is still accepted, without protest, by the free labourers who settle on a farm or estate to work for the proprietor. The reforms accomplished during this period mark the dawn of a new era in Chilean history. The colony now relied upon the original institutions for the formation of a people capable of self-government. For nearly three centuries the absolute authority of the Spanish monarchs had prevailed without let or hindrance; the king was arbiter and sovereign lord of the country, dictating his commands under the sanction of his own laws and wielding unrestricted power. All appointments were held from the crown, and were conferred as a rule upon Spanish-born subjects who had friends at court. Seldom were they obtained by the *criollos* of the colony. The fear of usurpation of power or of the exercise of undue influence, says an author, was the general cause of the insecurity of public offices or appointments. Not a single functionary, whether of the administrative, military, or even the judicial order, could feel his position assured, since all the appointments were for a limited period, terminable at will. Purchase by auction was the system by which nine-tenths of the public posts were obtained. . . . The government of the country was invariably entrusted to a personage of high military rank, who assumed the title of Captain-General, Governor, and President of the Kingdom of Chile. His residence was in the city of Santiago, and he exercised his function subject to no authority but that of the monarch, save in the event of war, when he was obliged to consult

with the Viceroy of Perú. In his quality of Captain-General he had under his command all the military forces and the heads of the garrisons of Chiloé, Valdivia, Valparaíso, and Juan Fernandez. As President he controlled the highest tribunal of Justice, the Royal Audience, or Chancery. The provinces were governed by *Intendentes*, in theory appointed by the king, but, in view of the distance from Madrid, usually nominated by the governor. In the province capitals a municipal corporation known as the *Cabildo*, composed of *alcaldes*, *regidores*, and other magistrates, administered local affairs. In respect of the ecclesiastical government, the territory was divided into two vast dioceses, that of Santiago and that of Concepcion, in the charge of suffragan bishops of the Archbishopric of Lima. The system of taxation in vogue in the American Colonies followed no theoretical principle, and was designed solely to secure the greatest possible profit to the crown, without regard for the injury that the imposts might occasion to the prosperity of the country and the welfare of its inhabitants. The principal revenues of the Treasury consisted of the customs house duties, the *diezmos* or tithes, the taxes on mining and agriculture, and the product of the sale of public offices and of Papal bulls. It is probable that these revenues would have sufficed for the ordinary expenditure, but they failed to cover the heavy cost of the wars against the Araucanos. Chile, at the period of the Independence, was in reality a military colony, which contributed no surplus to the Royal Treasury, and which, for its own support, had need of the endowment of 220,000 ducats which was voted by the 'Laws of India' and annually received from Lima. . . . The Spanish monopoly of exports, together with this system of restrictions and prohibitions, sufficiently explained the backward state of Chilean agriculture at the Independence period. Mining, on the other hand, had developed without obstruction for the reason that it was immensely to the interest of Spain that her colonies should furnish the greatest possible quantity of precious metals. Chile was thus able to occupy fourth place amongst all the countries of the world in respect of her production of gold, for the coining of which a mint was installed in Santiago towards the middle of the seventeenth century. This obviated the necessity of sending the metal to Lima, as was formerly prescribed by laws designed to favour the Lima merchants and the Lima mint. . . . As to the commerce of the interior, the sale of merchandise was subject to taxation in respect of the quality and price in each locality of the goods on sale, which also paid the excise duty. Intercolonial commerce, when not prohibited altogether, was subject to important export duties, though in Chile the export of wheat and flour was free. Commerce with Spain could not be effected direct from Chile, but was carried on through the medium of Peru, and, as regards commerce with foreign countries, this was prohibited absolutely, under pain of confiscation and death. These excessive restrictions underwent a remarkable transformation with the advent of the edict of free trade issued by Carlos III in 1778, but freights was so high that Chile profited very little by the change. Such was the political, economical, and social condition of Chile when events in Spain, consequent upon the Napoleonic invasion, affected a notable alteration in the situation of the colony."

—J. P. Canto, *Chile*, pp. 147-155.

1568.—Audiençia established.—"In 1567 (or 1568) the royal audiençia was established, with Don Melchor de Bravo as president, civil

governor, and military commander. This system of government, however, lasted only to 1575, when a special commissioner was appointed to reorganize the government under a captain general."—W. W. Sweet, *History of Latin America*, p. 136. See AUDIENCIAS.

1810-1818.—Achievement of independence.—San Martín, the Liberator.—"Chili first threw off the Spanish yoke in September, 1810 [on the pretext of fidelity to the Bourbon king dethroned by Napoleon], but the national independence was not fully established till April, 1818. [See LATIN AMERICA: 1778-1824.] During the intermediate period, the dissensions of the different parties; their disputes as to the form of government and the law of election; with other distracting causes, arising out of the ambition of turbulent individuals, and the inexperience of the whole nation in political affairs; so materially retarded the union of the country, that the Spaniards, by sending expeditions from Peru, were enabled, in 1814, to regain their lost authority in Chili. Meanwhile the Government of Buenos Ayres, the independence of which had been established in 1810 [see ARGENTINA: 1806-1820], naturally dreaded that the Spaniards would not long be confined to the western side of the Andes; but would speedily make a descent upon the provinces of the River Plate, of which Buenos Ayres is the capital. In order to guard against this formidable danger, they bravely resolved themselves to become the invaders, and by great exertions equipped an army of 4,000 men. The command of this force was given to General Don José de San Martín, a native of the town of Yapeyu in Paraguay; a man greatly beloved by all ranks, and held in such high estimation by the people, that to his personal exertions the formation of this army is chiefly due. With these troops San Martín entered Chili by a pass over the Andes heretofore deemed inaccessible, and on the 12th of February, 1817, attacked and completely defeated the royal army at Chacabuco. The Chilians, thus freed from the immediate presence of the enemy, elected General O'Higgins [see PERU: 1550-1816] as Director; and he, in 1818, offered the Chilians a constitution, and nominated five senators to administer the affairs of the country. This meritorious officer, an Irishman by descent, though born in Chili, has ever since [1825] remained at the head of the government. It was originally proposed to elect General San Martín as Director; but this he steadily refused, proposing his companion in arms, O'Higgins, in his stead. The remnant of the Spanish army took refuge in Talcahuana, a fortified sea-port near Concepcion, on the southern frontier of Chili. Vigorous measures were taken to reduce this place, but, in the beginning of 1818, the Viceroy of Peru, by draining that province of its best troops, sent off a body of 5,000 men under General Osorio, who succeeded in joining the Spaniards shut up in Talcahuana. Thus reinforced, the Royal army, amounting in all to 8,000, drove back the Chilians, marched on the capital, and gained other considerable advantages; particularly in a night attack at Talca, on the 10th of March, 1818, where the Royalists almost entirely dispersed the Patriot forces. San Martín, however, who, after the battle of Chacabuco, had been named Commander-in-chief of the united armies of Chili and Buenos Ayres," rallied his army and equipped it anew so quickly that, "on the 5th of April, only 17 days after his defeat, he engaged, and, after an obstinate and sanguinary conflict, completely routed the Spanish army on the plains of Maypo. From that day Chili may date her complete inde-

pendence; for although a small portion of the Spanish troops endeavoured to make a stand at Concepcion, they were soon driven out and the country left in the free possession of the Patriots. Having now time to breathe, the Chilean Government, aided by that of Buenos Ayres, determined to attack the Royalists in their turn, by sending an armament against Peru—a great and bold measure, originating with San Martín.”—Capt. B. Hall *Extracts from a journal*, v. 1, ch. 1.

1833-1884.—Successful oligarchy and its constitution.—War with Peru and Bolivia.—“After the perfection of its national independence, the Chilean government soon passed into the permanent control of civilians, ‘while the other governments of the west coast remained prizes for military chieftains.’ Its present constitution was framed in 1833, and though it is only half a century old ‘it is the oldest written national constitution in force in all the world except our own, unless the Magna Charta of England be included in the category.’ The political history of Chile during the fifty years of its life has been that of a well ordered commonwealth, but one of a most unusual and interesting sort. Its government has never been forcibly overthrown, and only one serious attempt at revolution has been made. Chile is in name and in an important sense a republic, and yet its government is an oligarchy. Suffrage is restricted to those male citizens who are registered, who are twenty-five years old if unmarried and twenty-one if married, and who can read and write; and there is also a stringent property qualification. The consequence is that the privilege of voting is confined to an aristocracy: in 1876, the total number of ballots thrown for president was only 46,114 in a population of about two and a quarter millions. The president of Chile has immense powers of nomination and appointment, and when he is a man of vigorous will he tyrannically sways public policy, and can almost always dictate the name of his successor. The government has thus become practically vested in a comparatively small number of leading Chilean families. There is no such thing as ‘public opinion’ in the sense in which we use the phrase, and the newspapers, though ably conducted, do not attempt, as they do not desire, to change the existing order of things. ‘History,’ says Mr. Browne, ‘does not furnish an example of a more powerful political “machine” under the title of republic; nor, I am bound to say, one which has been more ably directed so far as concerns the aggrandizement of the country, or more honestly administered so far as concerns pecuniary corruption.’ The population of Chile doubled between 1843 and 1875; the quantity of land brought under tillage was quadrupled; . . . more than 1,000 miles of railroad were built; a foreign export trade of \$31,695,039 was reported in 1878; and two powerful iron-clads, which were destined to pay a most important part in Chilean affairs, were built in England. Meanwhile, the constitution was officially interpreted so as to guarantee religious toleration, and the political power of the Roman Catholic priesthood diminished. Almost everything good, except home manufactures and popular education, flourished. The development

of the nation in these years was on a wonderful scale for a South American state, and the contrast between Chile and Peru was peculiarly striking. . . . Early in 1879 began the great series of events which were to make the fortune of Chile. We use the word ‘great,’ in its low, superficial sense, and without the attribution of any moral significance to the adjective. The aggressor in the war between Chile and Peru was inspired by the most purely selfish motives, and it remains to be seen whether the just gods will not win in the long run, even though the game of their antagonists be played with heavily plated ironclads. . . . At the date last mentioned Chile was suffering, like many other nations, from a general depression in business pursuits. Its people were in no serious trouble, but as a government it was in a bad way. . . . The means to keep up a sinking fund for the foreign debt had failed, and the Chilean five per cents were quoted in London at sixty-four. ‘A political cloud also was darkening again in the north, in the renewal of something like a confederation between Peru and Bolivia.’ In this state of things the governing oligarchy of Chile decided, rather suddenly, Mr. Browne thinks, upon a scheme which was sure to result either in splendid prosperity or absolute ruin, and which contemplated nothing less than a war of conquest against Peru and Bolivia, with a view to seizing the most valuable territory of the former country. There is a certain strip of land bordering upon the Pacific and about 400 miles long, of which the northern three quarters belonged to Peru and Bolivia, the remaining one quarter to Chile. Upon this land a heavy rain never falls, and often years pass in which the soil does not feel a shower. . . . Its money value is immense. ‘From this region the world derives almost its whole supply of nitrates—chiefly saltpetre—and of iodine’; its mountains, also, are rich in metals, and great deposits of guano are found in the highlands bordering the sea. The nitrate-bearing country is a plain, from fifty to eighty miles wide, the nitrate lying in layers just below a thin sheet of impacted stones, gravel, and sand. The export of saltpetre from this region was valued in 1882 at nearly \$30,000,000, and the worth of the Peruvian section, which is much the largest and most productive, is estimated, for government purposes, at a capital of \$600,000,000. Chile was, naturally, well aware of the wealth which lay so close to her own doors, and to possess herself thereof, and thus to rehabilitate her national fortunes, she addressed herself to war. The occasion for war was easily found. Bolivia was first attacked, a difficulty which arose at her port of Antofagasta, with respect to her enforcement of a tax upon some nitrate works carried on by a Chilean company, affording a good pretext; and when Peru attempted intervention her envoy was confronted with Chile’s knowledge of a secret treaty between Peru and Bolivia, and war was formally declared by Chile upon Peru, April 5, 1879. This war lasted, with some breathing spaces, for almost exactly five years. At the outset the two belligerent powers—Bolivia being soon practically out of the contest—seemed to be about equal in ships, soldiers, and resources; but the supremacy which Chile soon gained upon the seas substantially determined the war in her favor. Each nation owned two powerful iron-clads, and six months were employed in settling the question of naval superiority. . . . On the 21st of May, 1879, the Peruvian fleet attacked and almost destroyed the Chilean wooden frigates which were blockading Iquique; but in chasing a Chilean corvette the larger Peruvian iron-clad—the Inde-

pendencia—ran too near the shore, and was fatally wrecked. 'So Peru lost one of her knights. The game she played with the other—the Huascar—was admirable, but a losing one'; and on the 8th of October of the same year the Huascar was attacked by the Chilean fleet, which included two iron-clads, and was finally captured 'after a desperate resistance.' . . . From this moment the Peruvian coast was at Chile's mercy: the Chilean arms prevailed in every pitched battle, at San Francisco [November 16, 1870], at Tacna [May 26, 1880], at Arica [June 7, 1880]; and finally, on the 17th of January, 1881, after a series of actions which resembled in some of their details the engagements that preceded our capture of the city of Mexico [ending in what is known as the battle of Miraflores], the victorious army of Chile took possession of Lima, the capital of Peru. . . . The results of the war have thus far exceeded the wildest hopes of Chile. She has taken absolute possession of the whole nitrate region, has cut Bolivia off from the sea, and achieved the permanent dissolution of the Peru-Bolivian confederation. As a consequence, her foreign trade has doubled, the revenue of her government has been trebled, and the public debt greatly reduced. The Chilean bonds, which were sold at 64 in London in January, 1870, and fell to 60 in March of that year, at the announcement of the war, were quoted at 95 in January, 1884."—*Growing power of the republic of Chile* (*Atlantic Monthly*, July, 1884).—See also PERU: 1826-1876.

1885-1891.—Presidency and dictatorship of Balmaceda.—His conflict with the Congress.—Civil war.—"Save in the one struggle in which the parties resorted to arms, the political development of Chili was free from civil disturbances, and the ruling class was distinguished among the Spanish-American nations not only for wealth and education, but for its talent for government and love of constitutional liberty. The republic was called 'the England of South America,' and it was a common boast that in Chili a pronunciamiento or a revolution was impossible. The spirit of modern Liberalism became more prevalent. . . . As the Liberal party became all-powerful it split into factions, divided by questions of principle and by struggles for leadership and office. . . . The patronage of the Chilian President is enormous, embracing not only the general civil service, but local officials, except in the municipalities, and all appointments in the army and navy and in the telegraph and railroad services and the giving out of contracts. The President has always been able to select his successor, and has exercised this power, usually in harmony with the wishes of influential statesmen, sometimes calling a conference of party chiefs to decide on a candidate. In the course of time the more advanced wing of the Liberals grew more numerous than the Moderates. The most radical section had its nucleus in a Reform Club in Santiago, composed of young university men, of whom Balmaceda was the finest orator. Entering Congress in 1868, he took a leading part in debates. . . . In 1885 he was the most popular man in the country; but his claim to the presidential suc-

cession was contested by various other aspirants—older politicians and leaders of factions striving for supremacy in Congress. He was elected by an overwhelming majority, and as President enjoyed an unexampled degree of popularity. For two or three years the politicians who had been his party associates worked in harmony with his ideas. . . . At the flood of the democratic tide he was the most popular man in South America. But when the old territorial families saw the seats in Congress and the posts in the civil service that had been their prerogative filled by new men, and fortunes made by upstarts where all chances had been at their disposal, then a reaction set in, corruption was scented, and Moderate Liberals, joining hands with the Nationalists and the reviving Conservative party, formed an opposition of respectable strength. In the earlier part of his administration Balmaceda had the co-operation of the Nationalists, who were represented in the Cabinet. In the last two years of his term, when the time drew near for selecting his successor, defection and revolt and the rivalries of aspirants for the succession threw the party into disorder and angered its hitherto unquestioned leader. . . . In January, 1890, the Opposition were strong enough to place their candidate in the chair when the House of Representatives organized. The ministry resigned, and a conflict between the executive and legislative branches of the Government was openly begun when the President appointed a Cabinet of his own selection. . . . This ministry had to face an overwhelming majority against the President, which treated him as a dictator and began to pass hostile laws and resolutions that were vetoed, and refused to consider the measures that he recommended. The ministers were cited before the Chambers and questioned about the manner of their appointment. They either declined to answer, or answered in a way that increased the animosity of Congress, which finally passed a vote of censure, in obedience to which, as was usual, the Cabinet resigned. Then Balmaceda appointed a ministry in open defiance of Congress, with Sanfuentes at its head, the man who was already spoken of as his selected candidate for the presidency. He prepared for the struggle that he invited by removing the chiefs of the administration of the departments and replacing them with men devoted to himself and his policy, and making changes in the police, the militia, and, to some extent, in the army and navy commands. The press denounced him as a dictator, and indignation meetings were held in every town. Balmaceda and his supporters pretended to be not only the champions of the people against the aristocracy, but of the principle of Chili for the Chilians."—*Appleton's annual cyclopaedia*, 1891, pp. 123-124.—"The conflict between President Balmaceda and Congress ripened into revolution. On January 1, 1891, the Opposition members of the Senate and House of Deputies met, and signed an Act declaring that the President was unworthy of his post, and that he was no longer head of the State nor President of the Republic, as he had violated the Constitution. On January 7 the navy declared in favour of the Legislature, and against Balmaceda. The President announced the navy as traitors, abolished all the laws of the country, declared himself Dictator, and proclaimed martial law. It was a reign of terror. The Opposition recruited an army in the Island of Santa Maria under General Urrutia and Commander Canto. On February 14 a severe fight took place with the Government troops in Iquique, and the Congressional army took possession of Pisagua.

In April, President Balmaceda . . . delivered a long message, denouncing the navy. . . . The contest continued, and April 7, Arica, in the province of Tarapaca, was taken by the revolutionists. Some naval fights occurred later, and the iron-clad Blanco Encalada was blown up by the Dictator's torpedo cruisers. Finally, on August 21, General Canto landed at Concon, ten miles north of Valparaiso. Balmaceda's forces attacked immediately and were routed, losing 3,500 killed and wounded. The Congress army lost 600. On the 28th a decisive battle was fought at Placilla, near Valparaiso. The Dictator had 12,000 troops, and the opposing army 10,000. Balmaceda's forces were completely routed after five hours' hard fighting, with a loss of 1,500 men. Santiago formally surrendered, and the triumph of the Congress party was complete. A Junta, headed by Señor Jorge Montt, took charge of affairs at Valparaiso August 30. Balmaceda, who had taken refuge at the Argentine Legation in Santiago, was not able to make his escape, and to avoid capture, trial, and punishment committed suicide, September 20, by shooting himself. On the 10th November Admiral Jorge Montt was chosen by the Electoral College, at Santiago, President of Chile, and on December 26 he was installed with great ceremony and general rejoicings."—*Annual Register*, 1891, p. 420.

1887.—**Trans-Andean railway.** See RAILROADS: 1872-1912.

1890.—**First Pan-American congress at Washington.** See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1890.

1891-1892.—**Difficulty with the United States.** —**Threatened war.**—During the civil war which terminated, as told above, in the overthrow and suicide of the dictatorial usurper, Balmaceda, the triumph of the Congress party, and the election to the presidency of Admiral Jorge Montt, the representative of the United States, Minister Patrick Egan, showed marked favor to Balmaceda and his party, which irritated the Chileans, and produced among them a hostile feeling towards Americans and the American government. This was increased by the action of Egan, after the defeat of the Balmacedists, in sheltering a large number of refugees of that party within the walls of the American legation. The same was done by other foreign representatives, but to no such extent, except in the case of the Spanish legation. A telegram sent by Egan on October 8 to the state department at Washington stated: "80 persons sought refuge in his legation after the overthrow of the Balmaceda government; about the same number in the Spanish legation, 8 in the Brazilian, 5 in the French, several in the Uruguayan, 2 in the German, and 1 in the English. Balmaceda sought refuge in the Argentine. All these have gone out except 15 in his own legation, 1 in the German and 5 in the Spanish." Not venturing to violate the privileges of the American minister's residence, the Chilean authorities placed it under police surveillance, and arrested a number of persons entering the premises. The minister complained, and was supported in his complaints at Washington, causing further irritation in Chile. This was again greatly increased by his claiming the right not only to shelter the refugees in his residence, but to protect them in their departure from the country. In that, too, he was sustained by his government, and the refugees were safely sent away. Meantime a more serious cause of quarrel between the two countries had arisen. A party of sailors on shore at Valparaiso, from the United States ship *Baltimore*, had been assailed

by a mob, October 16, and two were killed, while eighteen were wounded. The United States demanded satisfaction, and much angry correspondence ensued, made particularly offensive on the Chilean side by an insulting circular which Señor Matta, the Chilean foreign minister, issued December 13, and which he caused to be published in the Chilean newspapers. "The note was to the last degree insulting, and would have justified a withdrawal of our minister and a severance of diplomatic relations. The attempt was made later to set up the claim that it was a 'domestic communication' which could not be the subject of diplomatic complaint. Mr. Blaine declined to accept the view that a nation is to take no notice of an insult not directly communicated, and refused to receive as a sufficient apology a statement that the Chilean government would strike out the offensive words. . . . In the elaborate review of the difficulty made in his message of January 25, 1892, President Harrison says: 'The Communications of the Chilean government . . . have not at any time taken the form of a manly and satisfactory expression of regret, much less of apology.' This statement is accurate as to the attitude of Chile up to the end of Matta's administration. . . . When, in January, the Chilean foreign department passed into the hands of Señor Percira, a change is instantly visible; on January 4th Señor Montt at Washington officially mentioned the occurrence which 'Chile has lamented and does so sincerely lament.' Four days later he announced that he had received special instructions to state 'that the Government of Chile has felt very sincere regret for the unfortunate events which occurred in Valparaiso on the 16th of October;' and he added that his Government 'sincerely deploras the aforesaid disturbance.' Minister Montt had already suggested arbitration as a means of settling the dispute. . . . On January 16th the Chilean authorities notified Mr. Egan that they would withdraw any offensive passages in the Matta circular, and had instructed their Minister in Washington to express regret. The apology, thus expressed both in Washington and Santiago, was stiff and ungraceful, perhaps inadequate; but it was made in good faith. On January 20th, evidently feeling that all was now serene, the Chileans ventured, acting on a hint of Mr. Blaine's, to ask for Egan's withdrawal as a 'persona non grata.' What, therefore, must have been the dismay of the Chileans, on January 23d, to receive an official notice, which the newspapers dubbed an 'ultimatum,' containing the statement that the United States Government was not satisfied with the result of the judicial investigation at Valparaiso and still asked 'for a suitable apology;' that for the Matta note there must be still another 'suitable apology,' without which the United States would terminate diplomatic relations; and that the request for Mr. Egan's withdrawal could not at that time be considered. It was a bitter draught for any government; but threats of war were resounding through the United States; American naval vessels were hurriedly being made ready; coal and supplies were going into the Pacific. There was power behind the note, and Chile prepared to bend to the storm. The 'ultimatum' appears to have reached the Chileans on Saturday, January 23d. On Monday, January 25th, they sent an answer which could not possibly be read as anything but a complete and abject apology on all the three points." But on the same day on which this answer was being forwarded, the President of the United States sent a warlike message to Congress. "It rehearsed the whole con-

trovery at great length, submitted copious correspondence, and ended with the significant phrase: 'In my opinion I ought not to delay longer to bring these matters to the attention of Congress for such action as may be deemed appropriate.'

. . . It is an unprofitable controversy as to whether the authorities in Washington knew that an answer was on its way, if they had read the correspondence they knew that an answer must come, and that the Chilean Ministry must have sent a peaceful answer. It is therefore difficult to understand the purpose of the President's message. . . . The effect . . . was to inflict an unnecessary humiliation on Chile. Spanish-Americans have good memories. Mexico still cherishes resentment for the war begun against her forty-five years ago; and forty-five years hence the Chileans are likely to remember the Balmaceda affair as Americans remembered the impressment of American seamen by Great Britain. We have the apology, but with it we have the ill-will."—A. B. Hart, *Practical essays on American government, Essay 5*.—See also U. S. A.: 1891: Trouble with Chile; EXTERRITORIALITY: Application to diplomatic agents.

1894-1900.—Dispute with Bolivia and Peru concerning Atacama, Tacna and Arica.—Of the treaties which closed the war of 1879-1884 between Chile, Bolivia and Peru, that between Chile and Bolivia contained the following curious provision, of "indefinite truce," as it has been called: "Until the opportunity presents itself of celebrating a definite treaty of peace between the Republics of Chile and Bolivia, both countries duly represented by . . . have agreed to adjust a treaty of truce in accordance with the following bases: First, the Republics of Chile and Bolivia agree to celebrate an indefinite truce; and, in consequence, declare at the end the state of war, which will not be renewed unless one of the contracting parties should inform the other, with at least a year's notification, of its intention to recommence hostilities. In this case the notification will be made directly, or through the diplomatic representative of a friendly nation. Second, the Republic of Chile, while this truce is in force, shall continue to rule, in accordance with the political and administrative system established by Chilean law, the territories situated between parallel 238 and the mouth of the Loa in the Pacific, such territories having for their eastern boundary a straight line." Under this agreement Chile has held ever since the territory in question (which is the province of Atacama) and has claimed that her possession of it should be made conclusive and permanent by such a "definite treaty" as the "treaty of truce" in 1884 contemplated. In her view it was taken in lieu of a war indemnity. Bolivia has disputed this view, maintaining that a permanent cession of the province, which was her only seaboard, and without which she has no port, was not intended. The Bolivian government has continually urged claims to the restoration of a seaport for Bolivian trade, which Chile has refused. At the same time when Atacama was taken from Bolivia, the provinces of Tacna and Arica were taken by Chile from Peru, with a stipulation in the peace treaty of Ancon (1884) that she should hold them for ten years, pending the payment by Peru of a war indemnity, and that the inhabitants should then decide by vote to which country they would belong. The Chilean government, however, would not allow the vote to be taken. In September, 1900, the dispute, as between Chile and Bolivia, was brought to what seemed to be an ultimate stage by an incisive note from the Chilean to the Bolivian

government, proposing to grant to the latter "in exchange for a final cancelling of all claims to the littoral, three compensations, viz.: First, to pay all obligations contracted by the Bolivian Government with the mining enterprises at Huachaca, Corocoro and Oruro, and the balance of the Bolivian loan contracted in Chile in 1867; second, an amount of money, to be fixed by mutual agreement, for the construction of a railroad connecting any port on the Chilean coast with the interior of Bolivia, or else to extend the present Oruro Railway; and, third, to grant free transit for all products and merchandise passing into and out of Bolivia through the port referred to."

1896.—Presidential election.—An excited but orderly presidential election held in June, 1896, without government interference, resulted in the choice of Señor Errazuriz, to succeed Admiral Jorge Montt, who had been at the head of the government since the overthrow and death of Balmaceda in 1891.

1898.—Settlement of boundary dispute with Argentina. See ARGENTINA: 1898.

1900.—Adoption of compulsory military service.—The *Diario Oficial* of Chile of September 5, 1900, published a decree of the Chilean government establishing compulsory military service in Chile. By the decree all Chileans will be liable to military service from their twentieth to their forty-fifth year. Every man on completing his twentieth year will be liable to be chosen by lot to serve one year with the colors, after which, if so chosen, he will pass into the first reserve, where he will remain for nine years. Those not chosen by lot to serve one year with the colors will pass directly into the first reserve. The second reserve will consist of men of from thirty to forty-five years of age. Among those who will be exempt from compulsory military service are the members of the government, members of Congress, state and municipal councillors, judges, the clergy, including all those who wear the tonsure, or belong to any religious order, the directors and teachers of public schools and colleges, and the police. The last, however, will be liable to military duty if called upon by the president. Various civil servants and every only son, or every one of two only sons of a family which he assists to maintain, may be excused service under certain conditions.

1900.—Vote against compulsory arbitration at Spanish-American congress. See SPAIN: 1900 (November).

1901.—Death of President Errazuriz.—General German Riesco chosen to succeed him.—"The Republic had the misfortune to lose by death the services of President Errazuriz. In July General German Riesco was elected by an overwhelming majority, and the significance of the choice of him was regarded as lying in the unification of all shades of Liberals. His programme was that of financial reform."—*Annual Register*, 1901, p. 441.

1901-1902.—Participation in second international conference of American republics held at the city of Mexico.—"A matter that aroused some interest was the attitude of Chile in the Pan-American Congress held late in the year in Mexico. Chile accepted the invitation to the gathering only on the condition that resolutions should not be of a retroactive character, or include subjects, present or past, in which Chile had an interest. The object of this restriction was to exclude Chile from decisions of the Congress in questions such as that of International Arbitration, thus leaving her a free hand in regard to her frontier controversies with Argentina, Bolivia and Peru."—

Annual Register, 1901, pp. 441-442.—See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1901-1902.

1902.—Treaties with Argentina for obligatory arbitration. See ARGENTINA: 1902.

1903.—Sale of war vessels to Great Britain.—Pursuant to her convention with Argentina, for the reduction of armaments, Chile, in this year, sold two newly built war vessels to Great Britain.

1904.—Treaty with Bolivia over seaport question. See below 1909-1912; BOLIVIA: 1920-1921.

1906.—Participation in third international conference of American republics at Rio de Janeiro. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1906.

1906.—Installation of President Montt.—Don Pedro Montt, elected president of Chile in June,

pedo boat destroyers, and two submarines at an expenditure of \$14,000,000."—See also WAR, PREPARATION FOR: 1909: Chilian navy building.

1909-1910.—Completion of Trans-Andean railway tunnel and Trans-Andean railway via Uspallata pass.—"The first step in the progressive policy of railway building in which Chile has been engaged in recent years, was the Construction of the Transandine Railway via Uspallata Pass. This important line, connecting the Atlantic with the Pacific, and giving to the Republic rail connections with countries to the east of the Andean range, brought the importance of better interior transportation facilities more closely to the minds of the people, and the result has been a period of railway building surpassing the expectation of the most radical advocates of an aggressive indus-

Monument erected to commemorate the treaty (1902) which insured permanent peace between Chile and Argentine

1906, was installed in office on September 10 following—the anniversary of Chilean independence.

1906.—Earthquake at Valparaiso. See VALPARAISO: 1906.

1907.—Diplomatic relations with Peru re-established.—Diplomatic relations with Peru were re-established in 1907; but the old sore question between the two countries, concerning the interpretation of the peace treaty of Ancon (1884), relative to the provinces of Tacna and Arica, which Chile took from Peru in the preceding war remained open. (See above 1894-1900.)

1909 (October.)—Naval plans.—It was reported from Santiago de Chile to the English press, October 21, 1909, that "the government has decided upon a naval expenditure of £4,000,000 which includes a 20,000-ton battleship, two ocean-going destroyers, and several submarines. Instructions for tenders have been sent to the commission in London." A later message to the American press, November 12, stated that "the naval program decided upon by the Chilian government, provides for the construction of one battleship, four tor-

trial policy. . . . On May 25, 1910, the first train was run through the tunnel and an all-rail route opened between Valparaiso and Buenos Ayres, a distance of 888 miles,—the first railroad across the South American continent. Thus after thirty-seven years of work and planning, vicissitudes and discouragements, the hopes of the promoters were realized and the Transandine Railway an accomplished fact."—R. E. Mansfield, *Progressive Chile*, pp. 212-214.

1909-1910.—Mineral wealth and progress.—"Copper and nitrate are the two mineral products which have made the name of Chile universally known. The exploitation of copper began early in the seventeenth century, and the ore extracted from the mines of Coquimbo was sufficient to satisfy the needs of local consumption and to supply the demand of the vice-royalty of Perú, where it was principally used in the casting of ordnance. In the eighteenth century copper-mining spread to the provinces of Atacama and Aconcagua, and at the beginning of the nineteenth century

so many mines were in operation that the Chilean Industry became the most important in the world. . . . Until the end of 1882 this country occupied first place amongst copper-producing countries, but from that date the United States and other countries began to produce on a large scale, surpassing the Chilean yield. . . . The most detailed statistics available with respect to the production of copper from the commencement of the working of this mineral to the end of 1909 gave a total of 2,207,908 tons with a value of £135,324,092. . . . Nitrate constitutes the most important of Chile's mineral products. From the time when the Tarapacá and Antofagasta territories passed into the possession of Chile the nitrate industry made great strides; the output, which in 1879 was approximately 60,000 tons, increased ten years later to 950,000 and now reaches 2,350,000, with a customs house value of £17,675,006. But this enormous development has only been attained within the last ten years, during which time an intelligently conducted propaganda has succeeded in making known, in a scientific and practical form, the advantages accruing from the use of nitrate as a nitrogenous fertilizer in agriculture. Nitrate, as is well known, is extracted from the saline deposits which exist in immense abundance in the province of Tarapacá and Antofagasta, where they form layers of varying thickness. It occurs as a rule mixed with other salts, from which it has to be separated. The raw material, known as *claiiche*, is treated in large establishments by means of a solution-and-evaporation process. . . . In 1910 there were in operation 108 *ofcinas* (or factories), which employed 25,000 hands. . . . Iodine [iodine], in restricted quantities, is extracted from the liquid solution of the nitrate deposits. . . . The total production of nitrate in Chile from 1878 to 1909 was 33,060,182 tons, of which the value is estimated at £235,433,071. The total output of iodine in the same period was 8,975 tons, worth £9,511,713. In addition to nitrate and iodine many other mineral substances are exploited, among which coal, natural borates, guano, sulphur, and common salt are worthy of mention. Coal mining is assured of a great future in Chile, which possesses a very extensive carboniferous zone, but up to the present it is a source of wealth which has not been exploited on a very large scale. The present output amounts to about 1,000,000 tons a year, and it is computed that from 1840 to 1909 the production was 26,617,574 tons, with a value of £22,402,910. The mining statistics for 1909 give the following *résumé*, which demonstrates the importance of this branch of national production:

	Output	Value
Copper	42,726 tons	£ 1,985,814
Gold	40,695 ounces	88,168
Silver	1,420,735 "	77,932
Coal	808,971 tons	876,497
Nitrate	2,101,512 "	13,135,253
Iodine	474 "	417,889
Borate	32,218 "	342,790
Sulphur	4,507 "	40,569
Guano	10,692 "	31,879

The total value of the mineral production in Chile in 1909 is calculated at £19,583,912. As may be seen, nitrate, with the iodine derived from it, is easily first in importance, far surpassing other sources of Chilean mineral wealth. Nitrate and iodine contribute to the State, in the shape of export duties, a sum which in 1910 amounted to £6,029,533, of which only £55,381 was paid on

export of iodine. In addition to copper, silver, gold and lead are mined in Chile, and of late the iron ores of exceptional quality which occur in great abundance in the country have been exploited. . . . Broadly speaking, the production of silver, or rather the working of the silver mines, is a decadent industry. Important mines are, however, carried on in Tarapacá and other provinces, the principal centre of production being for the present the department of Taltal. Seeing that the majority of the silver mines are situated amongst calcareous rocks it is remarkable that the calcination process is not adopted for smelting with copper ores to produce argentiferous regulus, which would be easily marketable in Europe. . . . Gold-mining, in the last few years, has declined considerably, for the fine gold produced in 1909 amounted only to 1,603 ounces, as against 12,952 ounces six years previously, that is in 1903. There are many gold mines which are not worked because the treatment of the ores requires special plants, according to their nature, and also would necessitate the investment of capital which is used to better advantage and with less risk in other industries. This state of affairs has effected a stoppage of numerous plants. However, the recent discovery in the Constitución district may, if report speaks true, do much to revive the industry. It is said that . . . a *peon*, having purchased the foundations of an old house, found amongst the fallen masonry a stone which contained a considerable quantity of gold. Learning that the stones originally came from a neighbouring hill he investigated the site, with the result that, within a week, gold to the value of £15,000 was extracted from the soft quartz matrix in which it occurs. A company has been formed to exploit the deposit, and at the time of writing the find has created a species of 'gold rush.' . . . In 1910 was started the exploitation of the rich iron mine *El Tofo*, in Coquimbo, which belongs to the French iron prospecting company that established blast furnaces at Corral, Valdivia, for the smelting of ingots. The exportation to England of 65 per cent. ferruginous ores free from undesirable substances has also been commenced. Chile's wealth in iron ores is fabulous, and when it is better known it will attract much attention in the metallurgical centres of Europe."—J. P. Canto, *Chile: an account of its wealth and progress*, pp. 227-230.

Also in: G. J. Mills, *Chile*, pp. 142-156.
 1909-1911.—Arbitration of the Alsop claim of the United States.—"Many years ago diplomatic intervention became necessary to the protection of the interests in the American claim of Alsop and Company against the government of Chili. The government of Chili had frequently admitted obligation in the case, and had promised this government to settle it. There had been two abortive attempts to do so through arbitral commissions, which failed through lack of jurisdiction. Now, happily, as the result of the recent diplomatic negotiations, the governments of the United States and Chili, actuated by the sincere desire to free from any strain those cordial and friendly relations upon which both set such store, have agreed by a protocol to submit the controversy to definitive settlement by his Britannic Majesty, Edward VII."—*Message to Congress of President Taft*, Dec., 1909.

The claim referred to is that of "the Alsop Company of New York and Connecticut" which advanced large sums of money to the Bolivian government in exchange for the right to valuable guano deposits in that country and other concessions. The government contracted further to return

a part of the loan from the receipts of customs at the port of Arica. Before her contract could be fulfilled Bolivia lost Arica and the adjoining districts to Chili in war. In 1885, following representations by the American State Department, Chili agreed to assume the obligations of Bolivia to the Alsop Company. The settlement of the Alsop claim was finally made on July 5, 1911, King George V acting as *aimable compositeur*. The amount offered by Chile was \$450,000, but the arbitrator finally decided that Chile was to pay to the claimants through the United States the sum of \$935,000.

1909-1912.—Contract given for the Arica-La Paz railway.—Railway completed.—“An important division of the State railways is the line extending from Arica to La Paz. This road, constructed in accordance with stipulations in the treaty celebrated between Chile and Bolivia, October, 1904, was built at the expense of the Chilean government at a cost of \$11,900,000 United States currency. The treaty agreement providing for this road caused a vigorous protest from the Peruvian government, as the route lies through the province of Arica which, previous to the war of 1879, was Peruvian territory, and which is still involved in the Tacna and Arica question.”—R. E. Mansfield, *Progressive Chile*, pp. 215-216.—The contract for the construction was awarded in 1909 and the road was completed in 1912. See RAILROADS: 1872-1912.

1910.—Presidential election.—President Pedro Montt died at Bremen on August 16 and Vice-President Elias Fernández Albano who had been acting as chief executive in the absence of the president continued in that capacity. He died on September 6 while the campaign for the election of president was going on. Ramón Barros Luco was chosen president.

1910.—Fourth Pan-American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1910.

1913.—Opening of Arica-La Paz railway.—Protocol with Bolivia. See BOLIVIA: 1913 (May).

1914.—A B C conference at Niagara Falls. See A B C CONFERENCE; U. S. A.: 1914 (April).

1914.—Declaration of neutrality.—Chilean government adopts conditions of second peace conference of The Hague.—“Chile was so far removed from the scene of the war in Europe and had so few ships engaged in European trade that her government did not have the same provocation that others had. Furthermore, German propaganda had made great headway in Chile and the Chilean army, trained by German officers, was strongly pro-German. In the navy, on the other hand, sentiment was strongly in favor of the Allies. This was a matter of tradition, for since the days of Lord Cochrane the Chilean navy has followed English ideals. Under these circumstances Chile remained neutral, though before the end of the war public sentiment had shifted to the side of the Allies.”—J. H. Latané, *United States and Latin America*, p. 316. (See LATIN AMERICA, 1914.)—“The first official notification of the breaking out of War that the [Chilean] Government received was the following:

“IMPERIAL GERMAN LEGATION,
“SANTIAGO, 3RD AUGUST, 1914.

“SIR, By order of my Government, I have the honour to inform you that the German Empire is at war with Russia from the first of August of this year. I avail myself of this opportunity to

reiterate to Your Excellency the assurance of my highest consideration.

(Signed) “VON ECKERT.

“TO MINISTER OF FOREIGN AFFAIRS.’

“The Minister answered in accordance with diplomatic usage:

“SANTIAGO, 3RD AUGUST, 1914.

“SIR, I have the honour to acknowledge receipt of Your Excellency's note of the 3rd inst. in which you, by order of your Government, graciously bring to the knowledge of this Department, that the German Empire is at war with Russia since the first of August of this year. I take due note of this State of War, and manifest to Your Excellency that the Government of Chile will maintain the strictest neutrality in the actual conflict. I offer very sincere prayers for the speedy reestablishment of Peace, and reiterate to Your Excellency the assurance of my most distinguished consideration.

(Signed) “E. VILLEGAS E.

“TO HIS EXCELLENCY VON ECKERT, Envoy Extraordinary and Minister Plenipotentiary of Germany.’

“The later notifications of a State of War, made by other countries, received analogous replies, and thus the attitude of the Republic was outlined with precision. The countries which were not directly affected by the hostilities declared, or which were not leagued with the belligerent nations by Treaties of Alliance, replied in the same manner. Very few days after the 7th of August, the Minister of Foreign Affairs, addressed himself to the Department of Home Affairs, of War, and of the Army and Navy, impressing on them the line of conduct to which the Government had determined to adjust itself, to make the neutrality adopted, as effective as possible. The communication of the Ministry of Foreign Affairs stated that ‘The Government of Chile which subscribed the Convention of the second Peace Conference of the Hague in 1907 relative to the rights and duties of the Powers and neutral persons in case of war, accepted the conditions of that Convention, which are inspired by the principles of International Law universally recognised, and consequently, although the Convention has not been ratified, the principles laid down therein constitute the only authorised norms to which the conduct of the Authorities and habitants of the Republic should be adjusted, in regard to the maintaining of neutrality. In conformity with this criterion, I shall be obliged to you, Sir, if you will be good enough to impart to the Intendants and Governors, the instructions necessary to enable them to make known, to the habitants of the national territory, the neutrality declared by the Government of the Republic, as also the conduct which should be observed towards the belligerents, in conformity with the beforenamed Hague Convention, of which I herewith transmit an authorised copy for you, Sir.’ The Minister of Foreign Affairs made no delay in addressing the Naval Department, so as to determine what rules should be observed on the coasts, in the ports and territorial waters in respect to the navigation of neutral ships, the supervision of all ships, and the provisioning and movements of them, which might signify a breach of neutrality.”—E. Rocuant, *Neutrality of Chile*, pp. 21-23.

1914.—Neutrality violated by von Spee at Valparaiso. See WORLD WAR: 1914: IX. Naval operations: f, 2.

1914.—Percentage of railroads controlled by government. See RAILROADS: 1917-1919.

1914-1915.—Effect of the World War on commerce and industry.—“Although the effects of the general world-wide depression were felt in Chile throughout the year 1913 and during the six months of 1914 immediately preceding the outbreak of the European War, the acuteness of the depression was not so marked as in the other leading countries of South America, notably the Argentine, Brazil, and Peru. The main reason for the more favorable situation of Chile” was that “the local situation was not aggravated by a reaction against a long period of speculative inflation, such as characterized Argentine and Brazilian commercial conditions during the years 1910 to 1913, inclusive. While it is true that world conditions were not favorable either to the nitrate or to the copper market—the two great products of Chile—the depression was not sufficient to lead to any serious curtailment of production. In fact, during the months of May, June, and July, 1914, there were marked indications of a healthy renewal of business. It was generally expected that the year would end with a record of real improvement over 1913. The war came as a blight to all these prospects. The fact that Chile is essentially a ‘one-product country’ and that not only the general prosperity of the country but also the stability of government finances are dependent on the conditions of the nitrate market, means that any influence that seriously affects the demand for nitrate immediately reacts throughout the entire country. The European War, at one blow, practically destroyed the nitrate market for the time being. Up to the outbreak of the war Europe was the market for this product. . . . The uncertainties of transportation due to the presence of belligerent fleets in the Pacific completely paralyzed shipping and thus made it impossible to meet even the reduced demands of Europe. The importance of nitrate as a factor in the international trade of Chile is seen from the fact that in 1913 it represented \$111,454,397 out of a total export of \$142,801,576. . . . The nitrate producers found themselves facing a situation which threatened ruin. During the first six months of 1914 the production of nitrate was 32,748,900 quintals of 101.4 pounds as compared with 30,002,777 quintals during the first six months of 1913. Exportation during the first six months of 1914 was 24,144,211 quintals as compared with 26,922,030 for the same period of 1913.”—L. S. Rowe, *Early effects of the European war on the finance, commerce and industry of Chile*, pp. 25-26.

1915 (March).—Diplomatic controversy with Great Britain.—“Chile had a slight diplomatic controversy with Great Britain in March, owing to the British cruiser *Glasgow* sinking the German cruiser *Dresden* in Chilean territorial water, off the Juan Fernandez Islands on March 14. On March 26th the Chilean Minister in London sent a note to Sir Edward Grey making complaints relative to this incident. . . . Sir Edward Grey replied that the British Government made a full apology to the Chilean Government for the incident.”—*Annual Register*, 1915, pp. 350-351.

1915.—Presidential election.—“In the summer the presidential elections were held, the successful candidate being Señor Don Juan Luis Sanfuentes. In a manifesto to the country, the new President declared that the financial difficulties arising out of the war had been overcome and that a prosperous period might be expected. In spite of that optimistic declaration, the Budget of 1915 showed a very serious estimated deficit. . . . The new

President, in accordance with the usual custom, did not actually assume office until December.”—*Annual Register*, 1915, p. 351.

1915.—Formation of A B C alliance.—Reasons. See LATIN AMERICA: 1912-1915.

1915.—Pan-American conference. See U. S. A.: 1915 (August-October).

1916-1917. — Dispute with Argentina over Straits of Magellan. See ARGENTINA: 1916-1917.

1919.—Status of education.—“The most advanced republics (of Latin America) from the educational standpoint are Argentina, Chile and Uruguay. . . . Chile maintains over 2,500 primary schools, some 75 secondary schools, 16 training colleges, as well as 6 agricultural colleges, 10 commercial schools, 3 mining schools, and 29 technical schools for women, where all kinds of practical work are taught, also a school of art, music, and drama. Chile owes much of her educational advance to the work of Balmaceda [see above 1885-1891]. There are two Chilean universities, a National University and a Catholic University.”—W. W. Sweet, *History of Latin America*, p. 230.—See also EDUCATION: Modern developments: 20th century: General education: Latin America.

1920.—Organization of permanent board for conciliation and arbitration of labor disputes.—“A permanent board has been organized in Chile for the conciliation and arbitration of labor disputes. The board is composed of seven members, two representing industrial establishments and two representing labor, the remaining three members being designated by the Government. When the board is in session each of the interested parties, employers and laborers, shall designate, respectively, three representatives. After receiving the petitions of the parties in controversy, and duly considering industrial conditions and the possible effects on labor and capital in granting these petitions, the board shall render a decision, such decision to be accompanied by the supporting reasons. In any particular case the discussion may continue five days, during which the cessation of labor operations is prohibited. Arbitration is subject to the consent of both parties.”—*Monthly Labor Review*, Sept., 1920, pp. 197-198.

1920.—Increase in navy.—In 1920 Chile purchased ten naval vessels, mainly gunboats and armored cruisers.

1920 (June).—Presidential election.—Political tendencies. — Parties. — Platforms. — Method of electing the president.—“By a majority of one, the electoral vote finally standing 177 to 176, Arturo Alessandri, the Liberal Alliance candidate, has been declared President of Chile. When the popular election was held the vote for presidential electors stood 179 for Alessandri and 175 for Barros Borgoño, the candidate of the National Union, but the final decision as to who should be the next president lay with a Court of Honor formed with the consent of both parties to pass on the qualifications of the electors. This Court decided in favor of Alessandri by a vote of five to two, and the Chilean Congress has accordingly proclaimed him president, and has ended an election which was the greatest and most significant that ever took place in Chile. In the Constitution of 1833, the fundamental document of Chile, there is the following statement: ‘There is no privileged class in Chile.’ Justice requires one to say that there has been a steady and notable social advance in Chilean affairs since that sentence was written, but candor compels one to add that it never was and is not yet representative of the truth. There has always been a more or less dominant aristocracy in Chile, made up largely

of the great land-owners and the church. For many years they were the directing force in all branches of Chilean life. The first great break from traditional influences came during the presidency of Balmaceda, toward the close of the nineteenth century. Meeting with tremendous opposition in his efforts for reform, Balmaceda illegally assumed dictatorial powers. There followed the revolution of 1891, in which Balmaceda was defeated, committing suicide rather than surrender to his opponents. Balmaceda's reforms, many of which were aimed against the church, have since his death in great part been attained, but it is not precisely on their account that he stands out as a great figure in Chilean history. Rather it is because he is looked upon as the martyr in the fight on behalf of the masses. Their cause has made great strides since 1891. The Conservatives, the traditionalist party in Chilean politics, are no longer dominant, though they have heretofore held the balance of power—and may yet. The Liberals are now the most numerous element, but they have split into four groups: Liberals proper (*Doctrinarios*); Liberal Democrats (or Balmacedists); Nationals; and Nationalists. The Liberals, however, are no longer the chosen prophets of the people. Two new parties have appeared, one of which, the Radical, has pushed forward so rapidly that it is now the most numerous single group in Chilean politics. The Radicals represent what was until recent years a new element in Chilean society. They contain the bulk of the fast-growing, educated 'middle class.' They are the party of the youth of Chile, standing for social and political reforms which are not at all 'radical,' as that word is understood in the United States, but more in line with what North Americans would term 'progressive.' They are bitter enemies of the traditionalist elements, and are greatly feared by the church. A second party, the Democrats, is made up mainly of laborers, whose radicalism is more extreme than that of the Radicals. They had not heretofore attained to any considerable power, but the importance of their rôle in the recent election cannot be denied. There are also some other insignificant groups—Socialists, for example. Straight through and across these groups there is another line of cleavage, made necessary by the cabinet system and the election of a president both of which demand a majority. Thus there has sprung into being what amounts to two parties, the National Union and the Liberal Alliance. Both have their origin in the Liberal party. Strangely enough, some members of a single group may belong to the Alliance and others to the Union. Most of the Liberals, however, lined up with the Union. The real strength of the Alliance was the Radical party. The Democrats and Socialists were also enthusiastic supporters of the Alliance. On the other hand, the Conservatives threw their weight to the Union. Both candidates for the presidency—Señor Alessandri and Barros Borgoño—were not only Liberals, but also *Doctrinarios*, belonging, that is, to the same group, but the real battle was between the Radicals and Conservatives, as personified in the opposing candidates.

"A natural query on the part of North Americans would be: What were the issues in the recent campaign? A study of the two platforms would lead one to believe that there were none, for both proclaimed the same things, differing only in phraseology and in degree. Thus, both came out strongly for educational reform, emphasizing the same needs; both stood for the protection of national products; and both called for legislation

on behalf of the workingman. And yet there is a profound difference between the two parties, though it is mainly psychological and exists to a great extent in the minds of each with respect to the other. The Union holds that its members are the 'true Chileans,' not opposed to reforms, but wishing to advance toward them at a safe and sure pace. The Alliance considers the Unionists reactionaries, opposed to any and all reform, lest it injure their selfish interests, and its own members to be progressives, standing for a hastening of internal reforms. The Union regards them as dangerous innovators, ready to ruin the country to vent their spite on the church and the aristocracy. These feelings found perfect expression in the two candidates. Barros is the type of man who would appeal to certain elements of the better educated classes. Member of an old Chilean family which has produced one of the greatest historians in Hispanic-American historiography (Barros Arana), he, too, has won distinction as historian and man of letters; for years he was a professor in the University of Chile; his political achievements have been more than usually notable, especially in his capacity of Minister of Foreign Affairs; and to round out a long, varied, and successful career, he is at present one of the leading figures in the most powerful banking institution in the country. Nor can it be claimed that he is an out-and-out reactionary. Indeed, his nomination displeased the Conservatives, because in the past he has advocated reforms that were unwelcome to the church; before they would join the Union they exacted certain pledges from him. Barros is therefore a figure that commands respect. But he does not possess the divine fire that wins the multitude. Alessandri is just the opposite kind of man. He is a new man, of Italian descent, a self-made man, and a young man for a Hispanic-American presidential candidate, for he is only in the forties. For some twenty years he has been well-known as a lawyer and politician. As Deputy, Senator, and Cabinet Minister, he has won a reputation for fearlessness and for moving oratory, such that he is known popularly as 'the Lion of Tarapacá' (the province he represents). He is distinctly a man for the attack. . . . No man in Chile has been more severely maligned. Every other person one meets will tell you of 'crooked deals' that Alessandri has been mixed up in, but the masses either do not believe these charges or do not care about them. Never have I known a man to be so enthusiastically accepted as the prophet of the people. On June 25 the election was held. In Santiago there were mounted carbineers and lancers everywhere; policemen and soldiers, be it said in passing, do not possess the vote. The day was more like the occasion of a glad picnic, however, than a riot, for the manifest Alessandri sentiment was overwhelming, almost to the complete exclusion of any in favor of Barros. On ensuing days news items were given out proclaiming—what seemed incredible—that Barros was winning, or at least making it clear that Alessandri could win by only a narrow margin. Then indeed there was a little trouble. Business houses closed (with shutters down), street cars stopped running, crowds of ragged commoners filled the center, and soldiers were at all strategic corners. Now and then there were mild clashes, serious only in that they might have become worse. Alessandri himself saved the situation, calling upon the people to return to work. The prophet had spoken, and all became again serene. Chile has long been a country of two principal and widely separated classes, the aristocracy and the *rotos* (literally, the 'broken'), as the common people are

usually called. The lot of the *roto* has indeed improved, and many have emerged therefrom into the comparatively new middle class, but the majority of Chileans are still utterly poor, illiterate, and almost without hope. Leading politicians can refer to them as 'canaille' or 'rag-bags' (*chusma*) without fear of damage to their career; indeed, that happened during the recent campaign. To be sure, great numbers of the *rotos* do not possess the vote, since the law disfranchises those who cannot read and write, but there are many who do vote. They certainly do! For in Chile vote-buying has not been frowned down by public opinion. In past elections the *roto* got five or ten pesos (\$1 or \$2). This time it was different. The Alliance organized a League Against Vote-buying, which their opponents styled a 'League to Monopolize Vote-buying for the Alliance,' and the *rotos* resolved to stand by Alessandri. Unquestionably many votes were bought, and by both parties, even though the price went up to fifty, a hundred, and as much as two hundred pesos. Many took these sums from Union supporters, but voted for Alessandri just the same. But the real heroes, of whom one hears on every side—I have even heard men of opposite party refer to them with a certain amount of pride—were the thousands in all parts of Chile who refused even the semblance of being bought. In some cases they took the money, and tore it to shreds before the eyes of their would-be corrupters. This, to my mind, is the most admirable and by all odds most hopeful, sign in Chilean politics in recent years. It gives one confidence in the future of Chile. Here there is the making of a real democracy!

"Outwardly the Chilean method of electing a president is quite like our own. The people vote for electors, who a month later cast ballots for the president. One important difference in the Chilean system is that electoral districts are separate. Thus the vote of each province (state) and even of each department (county) does not go as a unit, but may, and usually does, split. Speaking generally, northern Chile, the mining district, went for Alessandri. The Union displayed most strength in central Chile, an agricultural section of vast estates and the nucleus of the country. The far south, the new and coming Chile, a land of great variety (though mainly agricultural), leaned toward the Alliance. Santiago, though in the center, seemed to be all for Alessandri, but on the official return he carried the department by twenty to nineteen, and lost the province twenty-nine to twenty-two. Great numbers of those who cheered, sang, and paraded in his honor must have been non-voting illiterates. It was five days before the vote of Santiago was declared. Three days more, and the full count for the country was announced as 179 for Alessandri to 175 for Barros Borgoño. Not until the last day was the former assured of his majority. Late in July the electors cast their ballots. One month afterward Congress was to pass judgment on the legitimacy of the electoral vote, but at the suggestion of Eduardo Juarez Mujica, former Chilean Ambassador to the United States, the Court of Honor was formed instead, and both parties agreed to abide by its decision. In addition to the political factors already indicated for which this election is significant—the rise of a new democracy and the installation in the presidency of the first candidate of the people in Chilean history—there are two others worthy of note. One is that the presidency is returning to its one-time prestige. Formerly the president was the principal element in the Government, even going so far as virtually to chose his successor. The

revolution against Balmaceda ended that. Then Chile went to the opposite extreme, making Congress the arbiter. In imitation of the English system, the cabinet, representing the majority in Congress, took charge of the executive branch. The president was merely to 'preside,' as the king of England 'reigns,' but was not to 'rule.' This system has, however, proved something of a failure, because of the instability of Congressional majorities. The average life of a cabinet has been about three months; during four months recently there were four cabinets. Inevitably, therefore, the president has been recovering prestige and power, even though legally he is still a figurehead. The importance which all classes attach to the present election is proof enough that the presidency is no longer what the victors of 1891 intended it to be. At the least it amounts to an active party leadership. It seems inevitable that some change in the method of choosing the president will be made. The Unionist papers are advocating the French system, of election by Congress. There are two preliminary questions that ought first to be solved, it would seem. Is it possible, or advisable, to have that system when the president is not in fact an innocuous abstraction like the president of France? Is it advisable, or possible, to have it until such time as a thoroughgoing reform shall have removed Congress from even the suspicion of the venality and graft from which few Chileans of the present day absolve it? The basic question, after all, is not one of constitutional systems, but rather the development of a civic righteousness which will insist upon clean politics—whatever the system—and will then abide by the result. Such a spirit, I believe, has made its appearance (at least in one of its aspects) in the present election. This is a new force, of which it is to be hoped, for the good of Chile, that the leaders of both parties will avail themselves."—C. E. Chapman, *Chilean elections* (*Nation*, Oct. 20, 1920, pp. 445-446).

1920-1921.—Dispute with Bolivia over sea-ports. See BOLIVIA: 1920-1921.

1921-1922.—Invitation to Chile and Peru by President of United States for a conference at Washington to settle the Tacna-Arica quarrel.—Bolivia excluded.—"On Dec. 23, 1921, President Alessandri addressed a note to the Peruvian Government, asking that representatives of both countries be appointed to negotiate the settlement of the unfulfilled clauses of the Ancón Treaty [1884]. After an exchange of views, negotiations were dropped owing to the impossibility of attaining a similar point of view, Peru's intentness on demanding that the whole treaty be declared null and void, and the settlement of the whole territorial dispute, including the Province of Tarapacá, be referred to arbitration. On Jan. 17, President Harding sent notes to the Governments of Peru and Chile inviting them to meet at Washington, 'on neutral and friendly soil,' to negotiate directly an accord upon 'the unfulfilled clauses of the Treaty of Peace,' or else to find their way toward arbitration of the controversy, now more than thirty years old. Later, Bolivia presented its claims before the White House, asking to be represented in the negotiations. President Harding, however, on Feb. 28, declined to interfere, leaving the matter entirely to a mutual agreement between Chile and Peru."—*New York Times Current History*, May, 1922, p. 340.

The conference opened on May 15, 1922, attended by two "official observers" sent by Bolivia. Secretary of State Hughes emphatically declared to the meeting that the success of the conference

would be left entirely in the hands of the countries therein represented, which statement definitely allayed any suspicion that the United States government would play a part in the proceedings. The Tacna-Arica controversy was the principal point of discussion, both sides firmly insisting on the exclusion of Bolivia from the deliberations. The conference progressed slowly owing to the fact that the delegates were invested with limited powers, all important decisions having to be referred to their respective governments. After two months of discussion it was announced on July 14 that a provisional protocol of an agreement for the arbitration of the unfulfilled clauses of the Ancon Treaty would be signed shortly. [A] "deadlock which the conference faced at the beginning of June had been broken with the Chilean proposal that the United States be invited to arbitrate the conditions under which the Tacna-Arica plebiscite should be held. The Peruvian Government answered that, the plebiscite having been postponed for so many years, changed conditions had altered the terms of the problem. It insisted, therefore, that all three demands stipulated in its proposal should be considered as interlocked. They were: (1) To submit to arbitration whether in the present circumstances the plebiscite should be held or not. (2) If a plebiscite should not be held, the arbitrator to decide to which country shall be given the final dominion over Tacna and Arica, and under what conditions. (3) If a plebiscite should be held, the arbitrator to decide on the conditions to the plebiscite. . . . [Following an appeal to Mr. Hughes, the latter proposed a middle course to the effect that] in the event of an affirmative decision by the arbitrator, the conditions of the plebiscite will be fixed by him, but if the decision is against the plebiscite the Chilean and Peruvian governments will call another conference for the purpose of deciding how article 3 of the Treaty of Ancon shall be fulfilled. . . . By the second week in July it was evident that the results of the conference depended mainly on the skill and directness of Secretary Hughes's action. Minor questions, such as the scope of the arbitration in the fixation of the conditions of the plebiscite, were discussed in the meanwhile. Also a rectification of the boundaries of the province of Tacna, with reference to the disputed districts of Tarata on the north and Chilcaya on the south . . . was under consideration. . . . The second week in July the protocol began to be drafted. With the substitution of the term 'good offices' for the arbitration demanded by Peru in case the plebiscite were declared void by the United States, Chile met practically every one of the demands presented by Peru. . . . The signing of the protocol marked the end of the first act of the negotiations. After its ratification by both governments, special commissions must come again to Washington to present the case for each country and plead their claims to the territory of Tacna and Arica. . . . Thus, at last, there is concrete ground to expect a lasting settlement of the conflicting claims which sprang out of the faulty wording of clause 3 of the Ancon Treaty subscribed between Peru and Chile at the close of the war fought by Peru and Bolivia against Chile from 1879 to 1883."—*Current History*, August, 1922, p. 910.

CHILE, Constitution of: Abstract and text.—"By the constitution of the 25th May, 1833, still in force, though repeatedly amended, the republican

form of government was confirmed and declared to consist of the Legislative, Executive and Judicial branches. Although important in details, the amendments of 1888 and 1890 and 1892 did not materially modify the original provision, the centralised form of administration being retained. Legislative Power rests in the National Congress, composed of a Senate and a Chamber of Deputies. Senators are elected as representatives of provinces by direct cumulative vote, for a period of six years. There is one senator for every three deputies, and one-third of the Senate is renewed every two years. Senators must not be less than 36 years of age and have a fixed income. Deputies are elected by direct cumulative vote by the departments and sit for three years. There is a deputy for every 30,000 inhabitants, or fraction of that number not falling below 15,000. Deputies must not be less than 36 years of age, and like Senators they must be possessed of a fixed income, and also serve without a salary. Every married male Chilean of 21, or every unmarried man of 25, not civilly disqualified by Judicial act, is an elector; but he must know how to read and write and possess landed or movable property. The literary test practically disenfranchises three-fifths of the possible electorate, for although primary education is gratuitous, it is not compulsory. . . . The President of the republic, who must be a native Chilean of not less than 30 years of age, is Chief of the Executive. He is elected by representatives who are themselves sent to a special congress for the purpose of a direct vote of the whole electorate. [See also ELECTIONS, PRESIDENTIAL: South American republics.] He holds office for a period of five years and cannot serve two successive terms. Moreover, he must not leave the country either during his term of office, or for one year after its termination, without sanction of Congress. The President receives the quite moderate salary of \$5,000 per annum. . . . He is assisted by a Council of State, consisting of eleven members, five of whom he appoints, the other six being appointed by the Senate. The Council of Ministers consists of the holders of the following portfolios: Interior, Foreign Affairs, Justice and Public Instruction, Treasury, War and Marine, Industry and Public Works. In the event of the President's death or abdication, the Minister of the Interior becomes Vice-President and Chief of the Executive. The country is divided into twenty-three provinces, and one national territory. The provinces are divided into departments of which there are seventy-four, and these are divided into 865 sub-delegations, further subdivided into 3,068 districts. . . . The Judicial Administration comprises Supreme Court of Justice, Courts of Appeal, Courts of First Instance, Courts of Justice and Peace, and Courts of the Alcaldes and Higher Police Officers."—G. J. Mills, *Chile*, pp. 74-77.

The following is the text of the constitution, taken from J. I. Rodriguez, *American constitutions*, v. 2 (1902):

CONSTITUTION

(As promulgated May 25, 1833, and amended up to June 26, 1893.)

In the name of Almighty God, the Creator and Supreme Law of the Universe.

The Great Convention of Chile called upon by the law of October first, eighteen hundred and thirty-one, to amend the Political Constitution of

the Nation, promulgated on the eighth of August, eighteen hundred and twenty-eight, after having examined that code, adopted those of its provisions believed to be conducive to the prosperity and good government of the State, modified and suppressed other provisions, and added some new ones deemed especially suitable to promote the same important end, decrees that all previous constitutions are repealed and that the following shall be the political Constitution of the Republic of Chile:

Chapter I. The Form of Government

ARTICLE 1. The Government of Chile is popular and representative.

ART. 2. The Republic of Chile is one and indivisible.

ART. 3. The sovereignty is vested essentially in the Nation, which delegates its exercise to the authorities established by this Constitution.

Chapter II. Religion

[See below Annex No. 1.]

Chapter III. Chileans

ART. 5. The following are Chileans:

1. Those born within the territory of Chile.
2. The children of Chilean father or mother born in foreign territory, by the sole fact of becoming domiciled in Chile. The children of Chileans born in foreign territory, while the father is in the actual service of the Republic, are Chileans for all intents and purposes, even those for which the fundamental laws, or any others, require nativity in Chilean territory.
3. Foreigners who, having resided one year in the Republic, declare before the municipal authorities of the district in which they reside their desire to become domiciled in Chile, and ask for papers of naturalization.
4. Those who have obtained an especial grant of naturalization by an act of Congress.

ART. 6. The power to declare that persons who have not been born in Chile are entitled to naturalization under clause 3 of the preceding article, belongs to the municipality of the department of their residence. Upon the favorable declaration of the municipality the President of the Republic shall issue the proper naturalization papers.

ART. 7. No one shall be a Chilean citizen entitled to vote, who has not reached the age of twenty-one years, can not read and write, and has not been duly inscribed in the electoral register of the department.

ART. 8. Active citizenship with the right of suffrage shall be suspended for the following causes:

1. Physical or moral incapacity interfering with the free and reasonable use of the mental faculties.
2. The condition of domestic service.
3. Prosecution for a crime which merits corporal or infamous punishment.

ART. 9. Citizenship is lost for the following causes:

1. Condemnation to corporal or infamous punishment.
2. Fraudulent bankruptcy.
3. Naturalization in a foreign country.
4. Acceptance of employment, office, or salary from a foreign government, without special permission of Congress.

Those who from any one of the causes enumerated in this article have suffered the loss of citizenship, may apply to the Senate for rehabilitation.

Chapter IV. Public Law of Chile

ART. 10. The Constitution guarantees to all inhabitants of the Republic

1. Equality before the law. In Chile no class privileges exist.

2. Admission to all public employments and offices without other conditions than those prescribed by law.

3. The equal distribution of imposts and taxes in proportion to property and the equal distribution of all other public charges. A special law shall determine the method of recruiting and enrolling substitutes for the land and naval forces.

4. The liberty of sojourn in any part of the Republic, of removal to any other part, and of departure from its territory, respecting, however, the regulations of police and always without injury to the rights of third parties. No person shall be arrested, detained, or exiled except according to the forms prescribed by law.

5. The inviolability of property of all kinds, whether belonging to individuals or corporations. No one shall be deprived of his property or of any part thereof, however small, or of any right therein, except by virtue of a judicial decision, or when the interest of the State, declared by law, requires the use of or condemnation thereof; but in this case proper indemnification to be determined either by agreement with the owner or by valuation made by a jury of competent men shall be previously made.

6. The right to assemble without previous permission and without arms. . . .

The right to form associations without previous permission.

The right to present petitions to the properly constituted authorities on any subject of public or private interest has no other restriction than that of using respectful and proper language.

The liberty of teaching.

7. The liberty of publishing through the press, without previous censorship, their own opinions; and no one shall be condemned for abuse of this liberty except upon trial and conviction by a jury according to law.

Chapter V. The National Congress

ART. 11. The legislative power is vested in the National Congress, composed of two chambers, one of deputies, the other of senators.

ART. 12. The deputies and senators are inviolable for the opinions expressed and the votes cast by them in the discharge of their duties.

ART. 13. From the day of his election no senator or deputy shall be accused, prosecuted, or arrested, except when taken *in flagrante delicto*, unless the chamber of which he is a member has previously authorized the prosecution.

ART. 14. From the day of his election no deputy or senator shall be accused except before the chamber of which he is a member, or before the permanent committee, if the chamber is not in session. If the prosecution is authorized, the accused shall be suspended from his legislative functions, and subjected to the proper tribunal.

ART. 15. Deputies or senators arrested *in flagrante delicto*, shall be placed immediately at the disposal of their respective chamber, or of the permanent committee. . . .

The Chamber of Deputies

ART. 16. The Chamber of Deputies shall be composed of members elected from the departments by direct vote in the manner determined by the electoral laws.

ART. 17. One deputy shall be elected for each thirty thousand inhabitants and for each fraction not below fifteen thousand.

If a deputy dies or ceases for any cause whatever to belong to the chamber during the first two years of his term, a new election shall be held to choose his successor in the manner and time prescribed by law.

A deputy who loses his representative character by resignation or by accepting an incompatible office shall not be reeligible at the next renewal of the chamber.

ART. 18. The Chamber of Deputies shall be totally renewed every three years.

ART. 19. The qualifications for eligibility to the office of deputy are:

1. Possession of the rights of a citizen elector.
2. An annual income of at least five hundred dollars.

ART. 20. Deputies are reeligible indefinitely.

ART. 21. The following persons are ineligible to the office of deputy:

1. Members of the religious orders, curates and vice-curates.
2. Judges of the superior courts and of the courts of first instance, and prosecuting attorneys.
3. Intendants of provinces and governors of places or departments.
4. Contractors of public works, or other government services, and their bondsmen.
5. Chileans mentioned in Clause 3 of Article 5, unless they have been in possession of their naturalization papers at least five years prior to their election.

The office of deputy is gratuitous and is incompatible with that of member of the municipal council, and with any remunerative public employment, function, or commission. Persons elected for the position of deputy shall choose between said position and the employment, function, or commission which they are serving, the choice to be made within fifteen days if they are within the territory of the Republic, or within one hundred days if they are absent. The time must be reckoned from the date of the approval of the election. Upon failure to make the choice within the required period the elected deputy forfeits his seat.

No deputy from the moment of his election until six months after the termination of his office shall be appointed to any remunerative public function, commission or employment.

This provision is not binding in case of foreign war, nor does it apply to the offices of President of the Republic, cabinet minister, or diplomatic agent; but no other offices than those bestowed during the state of war and the positions of cabinet minister shall be compatible with the functions of deputy. . . .

The Senate

ART. 22. The Senate shall be composed of members elected by direct vote from the provinces, each of which shall choose one senator for every three deputies or fraction of two deputies.

ART. 23. The senators shall serve for six years and are reeligible indefinitely.

ART. 24. The senators shall be renewed every three years in the following manner:

The Provinces which elect an even number of senators shall renew half of them at the triennial election.

The Provinces which elect an odd number shall renew an even number in the first triennial election and leave for the next one the renewal of the odd senator not touched at the preceding election.

The provinces which elect only one senator shall make the renewal every six years.

ART. 25. If a senator dies or for any cause whatever ceases to be a member of the chamber, before the last year of his term, the vacancy shall be filled for the unexpired term by a new election in the manner and time prescribed by law.

A senator who loses his seat by discharging or accepting an incompatible employment shall not be reeligible before the next triennial election.

ART. 26. The qualifications for eligibility to the office of senator are:

1. Citizenship in exercise.
2. To be over 36 years of age.
3. Never having been condemned for a crime.
4. An annual income of at least two thousand dollars.

The provisions of article 21 relating to deputies apply likewise to senators.

Powers of Congress and Special Functions of Each Chamber

ART. 27. The exclusive powers of Congress are:

1. To approve or disapprove the annual account of disbursements made to defray the expenses of the public administration, which must be presented by the Government.
2. To approve or disapprove the declaration of war, recommended by the President of the Republic.
3. To declare, in case the President of the Republic tenders his resignation, whether the causes set forth by him render him unable to discharge the duties of his office, and consequently to accept or refuse his resignation.
4. To declare, when any doubt should arise in the case specified in Articles 65 and 69, whether the impediment which deprives the President from the exercise of his office is of such a nature as to demand the holding of a new election.
5. To count the votes and verify the election of the President of the Republic in conformity with Articles 58, 59, 60, 61, 62, 63, and 64.
6. To pass exceptional and temporary laws, for a period not longer than one year, restricting personal liberty and the liberty of the press, and suspending or restricting the liberty of reunion, when so demanded by imperious necessity for the defense of the state, or the preservation of the constitutional system or of internal peace.

If such laws establish penalties, the application thereof shall always be made by the established courts. . . .

ART. 28. Only by virtue of a law shall it be permissible:

1. To impose taxes of any kind or nature whatsoever, to abolish those existing, and to determine in case of necessity their apportionment among the Provinces or Departments.
2. To fix annually the expenditures of the public administration.
3. To determine likewise in each year the strength of the land and naval forces in time of peace or war.

Taxes shall be levied for the period of eighteen months only; and the strength of the land and sea forces shall be determined for like period.

4. To contract debts, ratify those already incurred, and provide funds for their payment.

5. To create new provinces or departments, fix their boundaries, create ports of entry, and establish custom-houses.

6. To fix the weight, fineness, value, form, and denomination of the coins, and to regulate the system of weights and measures.

7. To permit the introduction of foreign troops into the territory of the Republic, and determine the length of their stay therein.

8. To permit troops to be quartered in the place where the sessions of Congress are held, or within ten leagues around it.

9. To permit the departure of the national troops from the territory of the Republic, and fix the time of their return.

10. To create or abolish public offices. [See below Annex No. 2.] . . .

11. To grant general pardons or amnesties.

12. To fix the place of residence of the National Executive and of Congress.

ART. 29. The exclusive powers of the Chamber of Deputies are:

1. To be the judge of the election of its own members, and pass upon charges of nullity made against the same; and to accept the resignation of its members if the causes assigned therefor are of such a nature as to make it physically or morally impossible for them to perform their duties. To pass upon these causes there must be a concurrence of three-fourths of the deputies present.

2. To impeach before the Senate whenever it shall be found proper any of the following officers:

Cabinet ministers and councilors of state in the manner and for the offenses set forth in Articles 83, 84, 85, 86, 87, 88 and 98.

Generals of the army or navy for having seriously endangered the security and honor of the Nation, the proceedings to be in the same form as that provided for cabinet ministers and councilors of state.

Members of the permanent committee for grave omissions in the discharge of the duty imposed upon them by Clause 2, Article 49.

Intendants of provinces for the crimes of treason, sedition, violation of the constitution, misappropriation of public funds, and official corruption.

Magistrates of the superior courts of justice for notable malfeasance in office.

In the last three cases the Chamber of Deputies shall first declare whether or not there is good ground for considering the proposition to impeach; and six days thereafter, upon consideration of the reports of a committee of five chosen by lot from among its own members, whether or not impeachment proceedings should be instituted. If the decision is in the affirmative two deputies shall be chosen to formulate the articles, and prosecute the case before the Senate.

ART. 30. The exclusive powers of the Chamber of Senators are:

1. To be the judge of the election of its own members, and pass upon the charges of nullity made against the same; and to accept the resignation of the senators, if the causes assigned therefor are of such a nature as to make it physically or morally impossible for them to perform their duties. To pass upon these causes there must be a concurrence of three-fourths of the senators present.

2. To try according to the provisions of Articles 29 and 89 the case of the functionaries impeached by the Chamber of Deputies.

3. To approve the nominations to be made by the President for archbishops and bishops in the Republic.

4. To give or refuse its consent to the acts of the government, when such consent is required by the Constitution.

The Making of the Laws

ART. 31. Laws may be originated in the Senate or in the Chamber of Deputies upon the motion

of any member or by a message from the President of the Republic. Laws concerning taxation of all kinds and recruiting shall be originated in the Chamber of Deputies. Laws relating to amnesties shall be originated in the Senate.

ART. 32. Upon the approval of a bill in the chamber where it was introduced it shall be referred immediately to the other chamber for debate and approval within the period of that session.

ART. 33. A bill rejected in the chamber of origin shall not be reintroduced in that chamber until the session of the following year.

ART. 34. Upon the approval of a bill by both chambers it shall be sent to the President of the Republic, who, if he approves it, shall promulgate it as a law.

ART. 35. If the President of the Republic disapproves the bill, he shall return it to the chamber where it originated within fifteen days with such objection thereto as he may deem proper.

ART. 36. If the two chambers accept the objections of the President of the Republic, the bill as amended shall become a law and shall be sent to the President for its promulgation. [See below Annex No. 3.] . . .

Arts. 37, 38, and 39 were stricken out, by law of June 26, 1893.

ART. 40. If the President of the Republic does not return the bill within fifteen days after it shall have been forwarded to him, it shall be considered approved and shall be promulgated as law. If the chambers adjourn before the expiration of the fifteen days within which the bill must be returned, the President of the Republic shall return it within the first six days of the regular session of the following year.

ART. 41. A bill passed by one chamber and rejected absolutely by the other shall be returned to the chamber of origin where it shall be considered anew, and if passed by a two-thirds majority of the members present it shall be again sent to the chamber which rejected it; and it shall not be considered that the latter chamber again rejects it unless it does so by a majority of two-thirds of the members present.

ART. 42. All bills amended by the revising chamber shall be returned to the chamber of origin; and if the latter approves the amendments by an absolute majority of the members present, the bill shall be sent to the President of the Republic.

But if the amendments are rejected, the bill shall be sent a second time to the revising chamber; if the amendments are there passed again by a two-thirds majority of the members present the bill shall be returned to the other chamber, and the said amendments shall not be considered rejected by the latter unless it does so by a majority of two-thirds of the members present.

Sessions of Congress

ART. 43. The regular sessions of Congress shall commence on the first day of June of each year and shall end on the first day of September.

ART. 44. When convened in extraordinary session, Congress shall consider the business for which it was called to convene to the exclusion of all other matters.

ART. 45. The Chamber of Senators shall not do business without a quorum of one-third of its members. The quorum for the Chamber of Deputies shall be one-fourth.

ART. 46. If on the day fixed by the Constitution for the opening of the regular sessions, Congress is sitting in extraordinary session, the latter shall be closed, and the business for which it was called

shall continue to be considered in the regular session.

ART. 47. The Senate and Chamber of Deputies shall open and close their regular and extraordinary sessions at the same time. The Senate, nevertheless, may convene without the presence of the Chamber of Deputies for the exercise of the judicial functions belonging to it under Clause 2 of Article 30.

The Chamber of Deputies shall continue its sessions without the presence of the Senate, if at the close of a regular session any charges against the officers designated in Clause 2 of Article 29 are left pending; but the continuation shall be only for the exclusive purpose of declaring whether or not there is good ground for an impeachment.

The Permanent Committee

ART. 48. Before the close of the regular sessions of Congress, each chamber shall elect seven of its members, who shall together constitute a single body called the permanent committee, and whose functions shall expire *de facto* on the thirty-first day of the following May. [See below Annex No. 4.]

ART. 49. The permanent committee as the representative of Congress shall exercise the supervision pertaining to that body over all branches of the public administration. It is therefore its duty:

1. To watch over the observance of the Constitution and the laws and to afford protection to the individual guaranties.

2. To address to the President of the Republic representations conducing to those ends, and reiterate them if those already made have not proved sufficient.

When such representations are based upon abuses or wrongs committed by the authorities depending upon the President of the Republic and he does not adopt the measures within his power to put an end to them, and punish the guilty officials, it shall be understood that the President of the Republic and the minister of the respective department accept the responsibility for the acts of the subordinate authority, as if they had been done by their order and with their consent.

3. To give or refuse its consent to such acts of the President of the Republic as, according to the provisions of the Constitution, require for their validity the ratification of the permanent committee.

4. To call Congress to meet in extraordinary session, whenever in its judgment such action is necessary, or when a majority of both chambers has asked for it in writing.

5. To render an account to Congress at its first meeting of the measures taken by it in the discharge of its duties.

The committee is responsible to Congress for any omission in the fulfillment of the duties imposed upon it by the preceding sections.

Chapter VI. The President of the Republic

ART. 50. A citizen with the title of President of the Republic of Chile administers the government of the State and is the supreme chief of the Nation.

ART. 51. The qualifications for eligibility to the office of President of the Republic are:

1. To have been born in the territory of Chile.

2. To be eligible to membership in the Chamber of Deputies.

3. To be at least thirty years old.

ART. 52. The President of the Republic shall ful-

fill his duties for the term of five years and shall not be eligible for the succeeding term.

ART. 53. To be eligible for a second or more terms the period of one term shall always have intervened.

ART. 54. The President of the Republic shall be elected by electors chosen by direct popular vote. The number of electors shall be three times the total number of deputies corresponding to each Department.

ART. 55. The electors shall be chosen by departments on the twenty-fifth of June of the year in which the presidential term ends. The qualifications of the electors shall be the same as those of the deputies.

ART. 56. The electors shall meet on the twenty-fifth day of July of the year in which the presidential term ends and proceed to the election of the President in conformity to the general law of elections.

ART. 57. The electoral boards shall make two lists of all the individuals elected, and the said lists, after having been signed by all the electors, shall be transmitted in sealed envelopes, one to the municipal council of the capital of the province, in whose archives it shall be kept on file, and the other to the Senate, where it shall be kept in the same manner until the thirtieth day of August.

ART. 58. On that day the said lists shall be opened and read in a public session of both chambers assembled in the hall of the Senate, the president of the Senate presiding, and the counting of the votes, and if necessary the revision of the election, shall take place. [See below Annex No. 5.]

ART. 59. The one who has received an absolute majority of the votes shall be proclaimed President of the Republic.

ART. 60. If none has an absolute majority, the Congress shall choose between the two who have received the greatest number of votes.

ART. 61. If more than two have received a majority Congress shall choose from among all of them.

ART. 62. If the highest number of votes is given to one person alone, and two or more persons obtain the second highest number, Congress shall choose from among all the persons receiving such highest and second highest numbers.

ART. 63. This election shall be made by absolute plurality of votes and by secret ballot. If there is not an absolute majority on the first ballot a second ballot shall be taken, the voting being limited to the two persons who, upon the first ballot, shall have received the greatest number of votes. In case of a tie another ballot shall be taken, and if a tie again occurs the president of the Senate shall cast the deciding vote.

ART. 64. No counting or verification of the election returns shall be held unless an absolute majority of the members of each chamber is present.

ART. 65. When the President of the Republic is in personal command of the armed forces of the Republic, or when by reason of sickness, absence from the territory of the Republic, or other grave reason, he has become unable to discharge the duties of his office, the minister of the interior shall take his place under the title of *Vice-President of the Republic*. If the disability of the President is temporary the said minister shall continue to take his place until the President shall be able to resume his duties. In case of death of the President, acceptance of his resignation, or other cause of absolute disability, or of disability which can not be removed before the termination of his five years of office, the minister Vice-President shall order, within ten days after assuming the office, a

new presidential election to be held in the manner prescribed by this Constitution.

ART. 66. If there is no minister of the interior, the senior member of the cabinet shall take the place of the President; and if there are not cabinet members, the office shall be filled by the senior member of the council of state, who is not an ecclesiastic.

ART. 67. The President of the Republic shall not leave the territory of the State during the term of his office, or within one year after the expiration of the same, without the consent of Congress.

ART. 68. The President of the Republic shall cease to hold office on the day on which his five-year term expires, and he shall be succeeded by the newly elected President.

ART. 69. If the newly elected President is temporarily prevented from entering upon the discharge of the duties of his office, the senior member of the council of state shall take his place for the time being; but if the disability of the President-elect is absolute, or likely to continue indefinitely, or for a period longer than the presidential term, then a new election shall be held in the manner prescribed by this Constitution, the office in the meantime being filled by the senior councillor of state, who is not an ecclesiastic.

ART. 70. When in the cases mentioned in Articles 65 and 69 an election of the President of the Republic is to be held at a time different from the one prescribed by the Constitution, the order for the election upon the same day of presidential electors shall be given, and the same intervals and the same forms shall be observed for such an election of President, and for the counting and verification of the returns, as are prescribed by Articles 56 to 65, inclusive.

ART. 71. The President-elect, upon entering upon the discharge of the duties of his office, shall take the following oath administered by the president of the Senate in the hall of the Senate before the two chambers therein assembled:

"I, ———, swear by God, our Lord, and by these holy gospels that I shall faithfully discharge the duties of the office of President of the Republic; observe and protect the Roman Catholic Apostolic Religion; preserve the integrity and independence of the Republic; and comply and cause others to comply with the Constitution and the laws. If I do so, may God help and defend me. If not, may He demand it of me."

ART. 72. The President of the Republic is entrusted with the administration of the government of the State; and his authority extends to everything that has for its object the preservation of public order at home and the security of the Republic from external danger, observing and causing others to observe the Constitution and the laws.

ART. 73. The special powers of the President are:

1. To concur in making the laws in conformity with the provisions of the Constitution; and sanction and promulgate them.

2. To issue such decrees, regulations, and instructions as he may deem necessary for the execution of the laws.

3. To watch over the official conduct of the judges and other judicial officers; and to this end he may require the prosecuting attorneys to cause the competent tribunal to take proper disciplinary measures, or if there be sufficient grounds to file a formal accusation.

4. To extend the time of the regular sessions of Congress, at the most, fifty days.

5. To call with the advice and consent of the council of state an extra session of Congress.

6. To appoint and remove at will cabinet ministers, department officers, councilors of state of his own choosing, diplomatic ministers, consuls, and other foreign agents, intendants of Provinces and governors of Departments.

The appointment of diplomatic ministers shall require approval by the Senate, or by the permanent committee if the Senate happens to be in recess.

7. To appoint upon nomination by the council of state in conformity with Clause 2 of Article 95 the justices of the superior courts and the judges of first instance.

8. To nominate archbishops, bishops, canons, and prebendaries of the cathedrals, the names to be selected by him out of lists of three candidates submitted by the council of state. The person selected by the President for archbishop or bishop must also receive the confirmation of the Senate.

9. To appoint all other civil and military officers; but the consent and advice of the Senate, or, if the latter is in recess, that of the permanent committee shall be required for the appointment of colonels, naval captains, and other superior officers of the army and navy. Upon the field of battle he may make these appointments without consulting the Senate.

10. To dismiss public employes for incompetency or for any other cause which injuriously affects the public service; but the consent of the Senate, or, during its recess, of the permanent committee, shall be required to remove chiefs of bureaus or other high officers. Subaltern officers shall not be removed without a report from their respective chief.

11. To grant leaves of absence, and pensions of all kinds in conformity with the laws.

12. To watch over the collection and disbursement of the public revenues in conformity with the laws.

13. To exercise the right of patronage in regard to churches, benefices, and ecclesiastical persons in conformity with the laws.

14. To grant or refuse, with the consent of the council of state, passage to the decrees of councils, papal bulls, briefs and rescripts; but if they contain general provisions their passage shall only be granted or refused by means of a law.

15. To grant, with the consent of the council of state, individual pardons. Cabinet ministers, councilors of state, members of the executive committee, generals in chief, and intendants of Provinces, indicated by the Chamber of Deputies and condemned by the Senate, shall only be pardoned by Congress.

16. To dispose of the land and naval forces, and organize and distribute them, as he shall judge proper.

17. To command in person, with the consent of the Senate, or, during its recess, with that of the permanent committee, the land and naval forces of the Republic. In such a case the President of the Republic may reside in any part of the territory occupied by the Chilean armies.

18. To declare war with the previous approval of Congress, and to grant letters of marque and reprisal.

19. To maintain political relations with foreign powers, receive ministers, admit consuls, conduct negotiations, make preliminary stipulations, conclude and sign all treaties of peace, alliance, truce, neutrality, commerce, concordats, and other conventions. Treaties, before their ratification, shall be submitted to Congress for approval. Discussions and deliberations upon these subjects shall

be secret, if the President of the Republic demands it.

20. To declare, in case of a foreign attack, one or various points in the Republic to be in a state of siege; but this is to be done with the consent of the council of state and for a specified period.

In case of domestic disturbance the declaration of a state of siege at one or more points belongs to Congress; but if that body is not in session, the President may make it, with the consent of the council of state, and for a specified period. If, upon the reassembling of Congress, the time specified has not expired, the declaration made by the President of the Republic shall be considered as a bill or *proposition of law*.

21. All matters pertaining to police and public establishments shall be under the supreme supervision of the President of the Republic in accordance with the particular ordinances which govern them.

ART. 74. The President of the Republic can be accused during the year immediately succeeding the end of his term of office, and not at a later date, for any act of his administration by which the honor and safety of the State have been gravely compromised or the Constitution openly violated. The forms for the accusation of the President shall be those set forth in Articles 84 to 91, inclusive.

Cabinet Ministers

ART. 75. The number of ministers and their respective departments shall be determined by law.

ART. 76. To be a minister the following shall be required:

1. To have been born within the territory of the Republic.

2. To have the qualifications required to be a member of the Chamber of Deputies.

ART. 77. All the orders of the President of the Republic shall be signed by the minister of the respective department, and shall not be obeyed when lacking that essential requisite.

ART. 78. Each minister is personally responsible for the acts signed by him, and jointly and severally for those subscribed to or agreed upon with the other ministers.

ART. 79. At the opening of the sessions of Congress each minister shall submit to it a report on the state of the Nation, in so far as the business of his own department is concerned.

ART. 80. They shall likewise present to that body the annual estimates of the expenditures required by their respective departments, and an account of the expenses of the previous year.

ART. 81. The office of cabinet minister is not incompatible with those of senator or deputy.

ART. 82. The ministers, even if not members of the Senate or Chamber of Deputies, may attend the sessions of those bodies and take part in the debate, but shall have no vote.

ART. 83. The cabinet ministers may be impeached by the Chamber of Deputies for treason, corruption in office, misappropriation of public funds, bribery, violation of the Constitution, disobedience to the laws, failure to execute the same, and having gravely endangered the safety or honor of the Nation.

ART. 84. Upon the introduction of the impeachment resolution, one of the eight succeeding days shall be set apart to hear the accused minister in reply to charges brought against him, and the question shall then be decided whether or not the proceedings are to be discontinued.

ART. 85. If it be decided to proceed with the examination of the charges, a committee of nine shall be chosen by lot from among the deputies present, whose duty it shall be to report within five days whether or not there exist sufficient grounds for a formal impeachment.

ART. 86. On the presentation of the report of the committee, the chamber shall proceed to discuss it, giving a hearing to the members of the committee, to the authors of the impeachment resolution, to the minister or ministers accused, and to all the deputies who may desire to take part in the debate.

ART. 87. If at the end of the discussion the chamber decides to admit the accusation, it shall appoint from among its members three managers who shall represent it in formulating and prosecuting the said accusation before the Senate.

ART. 88. Immediately upon the decision of the chamber to bring the accusation before the Senate, or upon its declaration that there are grounds for prosecution, the accused minister shall be suspended from his official functions.

Such suspension, however, shall terminate if the Senate does not render its decision within six months following the date on which the Chamber of Deputies decided to begin the prosecution.

ART. 89. The Senate, acting as a jury, shall try the minister, confining itself, however, to declare whether or not he is guilty of the crime or abuse of power of which he is charged.

The verdict of guilty must be rendered by two-thirds of the number of Senators present at the session. By virtue of such verdict the minister is removed from the office.

The minister declared guilty by the Senate shall be tried in accordance with the laws, by the ordinary court of competent jurisdiction, for the double purpose of imposing upon him the penalty provided by law for the crime committed and of enforcing his civil responsibility for damages caused to the state or to private individuals.

ART. 90. Cabinet ministers may be accused by any private individual, on account of losses unjustly sustained by him through any act of the minister. The complaint shall be addressed to the Senate, and that body shall decide whether or not it is well founded.

ART. 91. If the Senate declares that the complaint is well founded, the complainant shall sue the minister before the court of competent jurisdiction.

ART. 92. The Chamber of Deputies may impeach a minister during his term of office, and within six months subsequent to its termination. During these six months no minister shall absent himself from the Republic without permission of Congress, or of the executive committee, when Congress is in recess.

The Council of State

ART. 93. The council of state shall be composed of:

Three councilors chosen by the Senate and three by the Chamber of Deputies, at the first ordinary session after each renewal of the Congress, the retiring councilors being eligible for reelection. In case of death or disability of any councilor thus chosen, the respective chamber shall proceed to appoint a substitute, who shall fill the place until the next renewal.

A member of the superior courts of justice, residing in the city of Santiago.

A church dignitary.

A general in the army or navy.

A head of some office in the treasury department.

An individual who has filled the position of minister of state, diplomatic agent, intendant, governor, or chief of a municipality.

These five councilors last named shall be appointed by the President of the Republic.

The council shall be presided over by the President of the Republic, or in his absence by its own vice-president, who shall be elected annually from among its members, and may be reelected.

The vice-president of the council shall be considered the senior member thereof for the purposes contemplated in Articles 66 and 69 of this Constitution.

Cabinet ministers shall have no vote in the council, and if any councilor is appointed minister he shall thereby vacate his seat in the council.

ART. 94. The qualifications for councilor of state shall be the same as those for Senator.

ART. 95. The powers of the council of state are:

1. To render its opinion in all cases in which the President of the Republic may ask for it.

2. To suggest to the President in cases of vacancies in courts of first instance and superior courts the appointment of such persons as it shall deem suitable, to fill those positions, this to be done upon nomination by the superior court designated by law, and in the form provided by it.

3. To suggest three names for archbishops and bishops, dignitaries, canons, and prebendaries of the cathedrals of the Republic.

4. To take cognizance of all matters pertaining to ecclesiastical patronage and protection which may be subject to litigation, hearing in all cases the opinion of the superior court of justice, designated by law for that purpose.

5. To take cognizance of conflicts of jurisdiction between the administrative authorities with each other, and the administrative authorities with the courts of justice.

6. To declare whether or not there is ground for the prosecution on criminal charges of intendants, military governors, and governors of departments. The case in which the accusation against an intendant is instituted by the Chamber of Deputies is excepted from this provision.

7. To give its assent to the declaration of a state of siege in one or more provinces invaded or threatened in case of foreign war.

8. To recommend the dismissal of the cabinet ministers, intendants, governors, or other public officials who prove to be guilty of an offense, incompetent, or negligent.

ART. 96. The President of the Republic shall submit to the consideration of the council of state:

1. All bills which he intends to introduce in Congress.

2. All acts passed by the Senate and Chamber of Deputies sent to him for approval.

3. All matters in which the Constitution requires expressly that the council of state should be heard.

4. The annual budget of expenditures to be submitted to Congress.

5. All other matters concerning which the President may judge it advisable to hear the opinion of the council.

ART. 97. The opinion of the council of state is simply advisory, except in the particular cases in which the Constitution requires that the President shall act in accordance with it.

ART. 98. The councilors of state shall be responsible for the opinions rendered by them to the President contrary to the laws and manifestly with

evil intent; and they may be impeached and tried in the manner provided in Articles 84 to 89, inclusive.

Chapter VII. The Administration of Justice

ART. 99. The power of passing on civil and criminal causes belongs exclusively to the courts established by law. Neither Congress nor the President of the Republic shall in any case exercise judicial powers or assume jurisdiction in pending causes or revive causes terminated.

ART. 100. Only by virtue of a law can any change be made in the functions of the courts or in the number of their members.

ART. 101. The judges of the superior courts and those of the courts of first instance shall hold office during good behavior. Judges of commerce, mayors, and other inferior judges shall hold their respective offices for the time specified by law. . . .

ART. 102. The judges are personally responsible for bribery, failure to observe the laws of procedure, and in general for any wrong done by them in the administration of justice. The law shall determine the manner in which this responsibility shall be enforced.

ART. 103. The law shall determine the qualifications which judges shall respectively possess, and the number of years of legal practice which shall be required from lawyers to be appointed members of the superior courts, or judges learned in the law.

ART. 104. There shall be in the Republic one judicial authority entrusted with the directive, correctional, and economical superintendence of all the tribunals and courts of the nation, in accordance with the law determining its organization and attributes.

ART. 105. The organization and powers of the tribunals and courts that may be necessary for the prompt and complete administration of justice throughout the territory of the Republic shall be fixed by a special law.

Chapter VIII. Provincial Government

ART. 106. The territory of the Republic is divided into provinces, the provinces into departments, the departments into subdelegations, and the subdelegations into districts.

The Intendants

ART. 107. The superior government of each province in all branches of the administration is vested in an intendant, who shall exercise his powers in accordance with the laws, under the orders and instructions of the President of the Republic, whose natural and immediate agent he is. His term of office shall be three years, but he may be reappointed indefinitely.

ART. 108. The government of each department is vested in a governor, subordinate to the intendant of the province. His term of office shall be three years.

ART. 109. The governors are appointed by the President of the Republic, on the recommendation of the respective intendants, and are removable by the intendants with the approval of the President of the Republic.

ART. 110. The intendant of the province is also governor of the department of the capital in which he resides.

The Subdelegates

ART. 111. Each subdelegation is governed by a subdelegate, who is subordinate to the governor of the department, by whom he is appointed. The

subdelegates hold office for two years and are removable by the governor, but their removal and the grounds thereof shall be reported to the intendant. Subdelegates may be reappointed indefinitely.

The Inspectors

ART. 112. Each district is governed by an inspector, subordinate to the subdelegate, who may appoint or remove him, reporting thereon to the governor.

The Municipal Councils

ART. 113. There shall be a municipal council, in every capital of department, and in all other centers of population in which the President of the Republic, with the approval of the council of state, may think it proper to establish one.

ART. 114. The municipal councils shall be composed of as many mayors and aldermen as the law, taking into consideration the population of the department, or of the territory allotted to each, shall determine.

ART. 115. The election of aldermen shall be by direct popular vote, in the manner prescribed by the electoral law. Their term of office shall be three years.

ART. 116. The manner of election of the mayors and the length of their term of office shall be determined by law.

ART. 117. The qualifications for eligibility to the office of mayor or aldermen are:

1. Enjoyment in full of the rights of citizenship.
2. Residence in the territory of the municipality for five years at least.

ART. 118. The governor is the superior chief of all the municipal councils in his department, and the president of that one established in its capital. The subdelegate is president of the municipal council of his respective subdelegation.

ART. 119. The powers of the municipal councils in their respective territories are:

1. To attend to the public health, and all matters relating to the comfort, improvement, and recreation of the inhabitants.
2. To promote education, agriculture, industry, and commerce.
3. To supervise the primary schools and all other educational institutions supported by municipal funds.
4. To superintend the hospitals, asylums, homes for foundlings, jails, houses of correction, and all charitable institutions, in accordance with their respective regulations.
5. To attend to the construction and repair of the roads, bridges, and all other public works necessary, useful or ornamental, supported by municipal funds.
6. To manage and disburse the municipal funds in accordance with the rules established by law.
7. To make the apportionment of the amount of taxes and number of recruits and substitutes allotted to the municipality, provided that the law has not entrusted this duty to any other persons or authorities.
8. To address to Congress every year, through the intendants and the President of the Republic, such petitions as may be judged proper in relation to matters affecting the general welfare of the state, or of particular interest to the department, especially the levying of municipal taxes to meet extra expenses required for the construction of new works of public utility in the department or repairs of those in existence.
9. To propose to the general government or to that of the province or department such adminis-

trative measures as may conduce to the general welfare of the department.

10. To make municipal ordinances in regard to the aforesaid subjects and submit them, through the intendants, to the President of the Republic, for his approval, with the advice of the council of state.

ART. 120. No decision or resolution of a municipal council which is not passed in compliance with established rules shall be carried into effect without being brought to the attention of the governor, or of the subdelegate, as the case may be; said governor or subdelegate having the power to suspend its execution if he judges it to be prejudicial to the public order.

ART. 121. All municipal offices are public burdens, and no one shall be excused from serving them unless for cause specified by law.

ART. 122. A special law shall provide for the government of the provinces, designate the functions of those charged with the provincial administration and determine the manner in which such functions shall be exercised.

Chapter IX. Guarantees of Security and Property

ART. 123. In Chile there are no slaves, and the slave who should step on Chilean soil shall thereby become free. No Chilean shall engage in the slave trade, and no foreigner engaged in that trade shall be permitted to inhabit Chile or be naturalized in the Republic.

ART. 124. No one shall be condemned without legal trial and by virtue of a law promulgated before the act for which he is tried.

ART. 125. No one shall be tried by special commissions, or by any authority different from the court established by law for that purpose, and previously existing.

ART. 126. No warrant of arrest shall be executed if not issued by an authority having the right to make arrests, and if not served upon the person at the time of his apprehension.

ART. 127. Any person caught in *flagrante delicto* may be arrested without a warrant and by any person, but for the sole purpose of conducting him before a competent judge.

ART. 128. No one shall be kept imprisoned or detained, except in his own house, or in the public places destined for that purpose.

ART. 129. Wardens of jails shall not admit any prisoner without entering upon their register a copy of the warrant for the arrest issued by competent authority. They may, however, admit, as merely detained persons, all those brought there to be taken to the presence of the competent judge; but they must make the said judge acquainted with the fact, within twenty-four hours.

ART. 130. If the public authority should cause under certain circumstances any inhabitant of the Republic to be arrested, the officer who ordered the arrest shall give notice thereof to the proper judge within the next forty-eight hours, and place the arrested person at the disposal of said judge.

ART. 131. No order of solitary confinement shall prevent the magistrate in charge of the house of detention, where the prisoner is confined, from visiting him.

ART. 132. Such magistrate shall be bound, upon the request of the prisoner, to transmit to the proper judge the copy of the warrant of arrest served upon him, demand that such a copy be given him; or give him a certificate showing the fact of his imprisonment, if at the time of his

arrest no copy of the warrant was served upon him.

ART. 133. When sufficient bail has been given for the release of the prisoner, or the results of the action are properly secured by competent bond, in the manner prescribed by law for such cases, no one shall be kept in prison or under restraint, unless he is amenable to a severe or infamous penalty.

ART. 134. Any individual illegally imprisoned or detained in violation of the provisions of Articles 126, 128, 129, and 130, may have recourse, either by himself or by one acting in his name, to the magistrate designated by law, and demand that the legal forms be observed in his case. . . .

ART. 135. In criminal cases persons accused shall not be required to testify under oath as to their own acts, nor shall their descendants, husband or wife, or relatives to the third degree of consanguinity or to the second of affinity, inclusive, be compelled to do so.

ART. 136. No torture shall be inflicted, nor in any case shall confiscation of property be imposed. No infamous penalty shall extend beyond the person of the condemned.

ART. 137. The house of every inhabitant of the Chilean territory is an inviolable asylum, and shall not be invaded, except for some special reason determined by law and by virtue of an order of the proper authority.

ART. 138. Private correspondene is inviolable. No papers or documents can be seized, intercepted, or searched, except in cases expressly designated by law.

ART. 139. Congress alone has power to impose taxes, whether direct or indirect, and no authority of the State or individual shall, without its special authorization, impose them under any pretext whatsoever even if it were as a loan, voluntary or otherwise.

ART. 140. No personal service or burden of any kind shall be exacted, except by virtue of a decree issued by the proper authority based on a law authorizing the exaction, and such decree must be shown to the party concerned at the time of requiring the service, or imposing the burden.

ART. 141. No armed body shall make requisitions or exact any kind of assistance, except through the civil authorities and by their order.

ART. 142. No kind of labor or industry shall be prohibited, unless opposed to good morals or to public health or safety, or unless the prohibition is required by national interest, and a law so declares.

ART. 143. Every author or inventor shall have the exclusive ownership of his discovery or invention, for a time specified by law; and in case the law requires that said discovery or invention should be made public, suitable indemnification shall be paid to the inventor.

Chapter X. General Provisions

ART. 144. Public instruction shall preëminently demand the attention of the Government. Congress shall formulate a general plan of national education, and the minister of the respective department shall annually make a report on the condition of the same throughout the entire Republic.

ART. 145. There shall be a department of public instruction, which shall superintend and direct, under the authority of the Government, the national education.

ART. 146. No payment made in the treasury shall be approved unless it was made by virtue of a decree, in which the law or that part of the

budget, relating to it, approved by both chambers, authorizing the expenditure, is properly stated.

ART. 147. All Chileans able to bear arms shall be enrolled on the militia lists, unless specially exempted by law.

ART. 148. The public force is essentially obedient. No armed body shall deliberate.

ART. 149. Every measure taken by the President of the Republic, the Senate, or the Chamber of Deputies, in the presence of or under pressure of an army, or of a general at the head of an armed force, or of any assemblage of people, who, whether armed or unarmed, disobeys the civil authorities, is null in law and shall have no effect whatever.

ART. 150. No person or reunion of persons shall assume the title or representation of the people, arrogate to themselves its rights, or petition in its name. The violation of this article is sedition.

ART. 151. No magistrate, person, or reunion of persons shall assume, even under pretext of extraordinary circumstances, any authority or right not expressly conferred upon them by the laws. Every act in violation of this article is null and void.

ART. 152. When one or more places in the Republic are declared to be in a state of siege, in conformity with the provision of Clause 20 of Article 73, the following powers and no others shall be understood to be granted by virtue of said declaration to the President of the Republic:

1. To make arrests and keep the arrested persons in their own houses or in establishments which are not jails or prisons for common criminals.

2. To remove persons from one department to another, on the mainland and within the area comprised between the port of Caldera on the north and the Province of Llanquihue on the south. . . .

ART. 153. No entailment of property already made, or to be made in the future, shall impede the free alienation of the property affected by it; but the value of the property alienated shall be secured in favor of the beneficiaries under the terms of the entailment. A special law shall regulate the method of carrying this article into effect. [See below Annex No. 6.]

Chapter XI. Observance and Amendment of the Constitution

ART. 154. Every public functionary upon the assumption of his office shall take an oath to support this Constitution.

ART. 155. Congress alone shall have the power to settle, in conformity with Article 31 and the following of the Constitution, any doubts that may arise in regard to the interpretation of the provisions of the same.

ART. 156. An amendment to the Constitution may be proposed in either chamber in the manner and form provided in the first part of Article 31.

No vote shall be taken in either chamber upon the proposition of amendment without the presence of an absolute majority of the members thereof.

In approving a proposition of amendment the chambers shall adhere to the rules established in Articles 32, 41, and 42.

ART. 157. A proposition of amendment, approved by both chambers, which in conformity with Article 34 goes to the President of the Republic, may only be objected to by the latter, by proposing modifications or corrections to the amendments agreed upon by the Congress.

If the modifications proposed by the President of the Republic are approved in each chamber by a majority of two-thirds of the members present in conformity with the provision of the second paragraph of the preceding Article, the proposed

amendment shall be returned to the President of the Republic for its promulgation.

If the chambers approve only in part the modifications and corrections made by the President of the Republic, and do not insist by a two-thirds majority upon the amendment as agreed upon by Congress, the amendments upon which the President of the Republic and the chambers are in accord shall be considered approved, and the project in this form shall be returned for its promulgation.

When the chambers do not approve the modifications proposed by the President of the Republic and shall insist by a majority of two-thirds of those present in each chamber upon the amendment as agreed upon by them, the proposition of amendment in its original form shall be returned to the President of the Republic for its promulgation.

ART. 158. The amendments, approved and published, as established in the two preceding articles, shall be submitted to the ratification of the Congress to be elected or renewed after their publication.

The new Congress when taking up for the purpose of ratification the constitutional amendments submitted to it, shall consider them, exactly in the same terms in which they are formulated without making in them any alteration whatever.

The deliberation upon the acceptance and ratification shall begin in that chamber in which the proposition of amendment originated, and each chamber shall pass upon the question by an absolute majority of the number of members present, which number shall not be less than the absolute majority of the number of members of which each Chamber is composed.

Upon the ratification of the proposition of amendment by both chambers it shall be transmitted to the President of the Republic for its promulgation.

Upon the promulgation of the amendment, its provisions shall thereby become part of this Constitution, and shall be considered embodied in its text.

The amendments which are to be submitted to the ratification of the next succeeding Congress shall be published by the President of the Republic within six months previous to the renewal of Congress, and three months at least before the date for holding the elections. In making such publication the President of the Republic shall announce to the country that the Congress about to be elected shall be entrusted with the duty of accepting and ratifying the proposed amendments. When the Congress called upon to perform this duty permits its constitutional period to expire without having performed it, the amendment shall be considered as never proposed.

ART. 159. When Congress is called to meet in extraordinary session, either chamber may take up, discuss, and vote the proposed constitutional amendments to which Article 156 refers, even when such proposed amendments were not included in the call.

A Congress called upon to consider the ratification of proposed amendments may, if both chambers agree thereto by an absolute majority of votes, in sessions attended by an absolute majority of their members, continue its deliberations in extraordinary session for a period not exceeding ninety days without necessity of a call of the President of the Republic, and consider exclusively the question of ratification. In all cases the chambers shall have the power to deliberate upon the ratification of proposed amendments in the extraordinary ses-

sions held by them under the call of the President of the Republic, even if the subject is not mentioned in the said call.

Transient Provision

Substitutes of Senators and Deputies, elected in conformity with the constitutional provisions now in force, shall continue to hold their positions until the first renewal of the Chamber of Deputies.

If in the meantime a Senator or Deputy dies, his seat shall be given to the respective substitute.

If the substitute is already acting in place of a Senator or Deputy, or dies, or loses his position, said office shall be filled according to the provisions of the present Constitution.

AMENDMENTS AND EXPLANATIONS

Annex No. 1

Law of July 27, 1865

ARTICLE 1. It is hereby declared that under Article 4 of the Constitution those who do not profess the Roman Catholic Apostolic Religion are permitted to practice their religion inside private buildings belonging to them.

ART. 2. Non-Catholics shall be permitted to found and support schools for the instruction of their children in the doctrines of their respective religions.

Annex No. 2

Law of September 10, 1887

ARTICLE 1. Every one who wishes to obtain from the Government a pecuniary favor, whether in the form of a pension, grant, condonation of debt, or recognition of civil or military services shall before filing his petition to Congress, as provided in Clause 6, Article 12 of the Constitution, obtain from the secretaries of the two chambers, certificates showing that he has not filed during the five preceding years any petition relating to the same subject, and if such petition was filed, what was the result thereof.

ART. 2. If it should appear by any of the two certificates above named that the petitioner had filed before any chamber an application of analogous nature, within the five preceding years, which has not ended in any practical result, no action on the new petition shall be taken until the former one is disposed of; and if it is rejected, until one year thereafter, as provided by Article 42 of the Constitution.

ART. 3. No petition or resolution regarding the subjects referred to in Article 1 shall be acted upon without a report from the respective committee, which, if services rendered to the Nation by the interested party or his relatives are invoked, shall previously pass upon the question, whether the said services did or did not entitle the person who rendered them to national gratitude.

The committee shall set forth, particularly in its report, what are the facts or circumstances which in its opinion rendered the petitioners entitled to national gratitude.

ART. 4. The reports on petitions or resolutions for pecuniary favors of whatever nature shall be revised in each chamber by a special committee consisting of the members of the Board and the chairmen of the standing committees, and it shall decide whether the petitioners or their ancestors have or have not a claim upon the national gratitude.

CHILE, CONSTITUTION

ART. 5. Each chamber in passing upon these petitions or resolutions shall decide previously whether the alleged services merit national gratitude.

ART. 6. No resolution or petition of this kind shall be signed by more than two members of Congress.

ART. 7. The reports of the committees in these matters shall remain secret until actually submitted to the respective chamber.

ART. 8. All resolutions or applications of this nature shall be considered by Congress in the order in which they were introduced or filed, on special days set apart for this purpose, unless precedence has been granted to any one by secret vote by a majority of three-fourths of the members present.

ART. 9. Petitions withdrawn by the applicant but reported by a committee shall remain in the archives in the secretary's office. . . .

Annex No. 3

Law of July 4, 1878

ARTICLE 1. Whenever in accordance with the provisions of the Constitution or the laws, one-third, two-thirds, one-fourth, or three-fourths of the number of members of a corporation are required to act or resolve on any subject, and if the number of persons constituting the said corporation does not admit of exact division by three or four, respectively, the following rule shall be observed: The fraction resulting after the corresponding arithmetical operation to find the third or two-thirds, or the fourth or the three-fourths is made shall be considered as a whole number and taken as such in the computation if exceeding one-half; but if equal to, or less than one-half, it shall be ignored. For instance, the third of seven shall be two and the two-thirds, five; the fourth of eleven shall be three, and the three-fourths eight.

ART. 2. The same rule shall be applicable when the laws shall require some other proportional part of the members or of the votes in a corporation to give validity to its acts, and the number of members or votes does not admit of exact division by the figure serving as a basis for the proportion.

ART. 3. The law of October eight, eighteen hundred and sixty-two, is hereby repealed.

Annex No. 4

Law of September, 1884

SOLE ARTICLE. The election of the members of the Senate and of the Chamber of Deputies, who, according to Article 48 of the Constitution, should form the permanent committee, shall be made by accumulative vote.

Annex No. 5

Law of August 28, 1851

SOLE ARTICLE. The thirtieth day of August set apart by Article 57 of the Constitution for the counting of the votes for President of the Republic is not absolutely unchangeable. If for lack of a quorum in each chamber, or for any other unforeseen circumstances, the counting can not take place on that day, it shall be made on some other day, as soon as the difficulty or impediment which caused the postponement is removed.

The President of the Republic shall extend for

CHIN HILLS

this purpose the sessions of Congress or call an extra session.

Annex No. 7

Law of December 16, 1848

SOLE ARTICLE. The provision of Article 153 of the Constitution of 1833 does not revive the entailments quashed by the Constitution of 1828.

CHILIARCHS, captains of thousands, in the army of the Vandals.—T. Hodgkin, *Italy and her invaders*, bk. 3, ch. 2.

CHILLY, village of France southeast of Amiens, scene of fighting in 1916. See WORLD WAR: 1916: II. Western front: c, 3.

CHILPERIC I (d. 584), Frankish king of Neustria, 561-584.

Chilperic II (d. 720), Frankish king of Neustria, 715-720.

CHILTERN HUNDREDS, the three hundreds of Stoke, Desborough and Bodenham in Buckinghamshire, England. The stewardship of the chiltern hundreds was originally an office for the suppression of robbers in the district, but was later used for parliamentary purposes. A seat in the British House of Commons "cannot be resigned, nor can a man who has once formally taken his seat for one constituency throw it up and contest another. Either a disqualification must be incurred, or the House must declare the seat vacant." The necessary disqualification can be incurred by accepting an office of profit under the crown,—within certain official categories. "Certain old offices of nominal value in the gift of the Treasury are now granted, as of course, to members who wish to resign their seats in order to be quit of Parliamentary duties or to contest another constituency. These offices are the Stewardship of the Chiltern Hundreds, of the manors of East Hendred, Northstead, or Hempholme, and the escheatorship of Munster. The office is resigned as soon as it has operated to vacate the seat."—W. R. Anson, *Law and custom of the constitution*, v. 1, p. 84.

CHILTS, Indian tribe. See FLATHEADS (Salishan family).

CHIMAKUAN FAMILY.—"The Chimakum are said to have been formerly one of the largest and most powerful tribes of Puget Sound. Their warlike habits early tended to diminish their numbers, and when visited by Gibbs in 1854 they counted only about 70 individuals. This small remnant occupied some 15 small lodges on Port Townsend Bay."—J. W. Powell, *Seventh annual report, Bureau of ethnology*, p. 62.—See also INDIANS, AMERICAN: Cultural areas in North America: North Pacific coast area.

CHIMARIKAN FAMILY.—"According to Powers, this family was represented, so far as known, by two tribes in California, one the Chimal-a-kwe, living on New River, a branch of the Trinity, the other the Chimariko, residing upon the Trinity itself from Burnt Ranch up to the mouth of North Fork, California. The two tribes are said to have been as numerous formerly as the Hupa, by whom they were overcome and nearly exterminated. Upon the arrival of the Americans only 25 of the Chimalakwe were left."—J. W. Powell, *Seventh annual report, Bureau of ethnology*, p. 63.

CHIN HILLS, mountainous district of Burma. See BURMA: Geographical characteristics.

CHINA

Names of the country.—"That spacious seat of ancient civilization which we call China has loomed always so large to western eyes, . . . that, at eras far apart, we find it to have been distinguished by different appellations according as it was regarded as the terminus of a southern sea route coasting the great peninsulas and islands of Asia, or as that of a northern land route traversing the longitude of that continent. In the former aspect the name applied has nearly always been some form of the name Sin, Chin, Sinæ, China. In the latter point of view the region in question was known to the ancients as the land of the Seres; the middle ages as the Empire of Cathay. The name of China has been supposed, like many another word and name connected with trade and geography of the far east, to have come to us through the Malays, and to have been applied by them to the great eastern monarchy from the style of the dynasty of Thsin, which a little more than two centuries before our era enjoyed a brief but very vigorous existence. . . . There are reasons however for believing that the name of China must have been bestowed at a much earlier date, for it occurs in the laws of Manu, which assert the Chinas to have been degenerate Kshatryas, and in the Mahabharat, compositions many centuries older than the imperial dynasty of Thsin. . . . This name may have yet possibly been connected with the Thsin, or some monarchy of like dynastic title; for that dynasty had reigned locally in Shensi from the 6th century before our era; and when, at a still earlier date, the empire was partitioned into many small kingdoms, we find among them the dynasties of the Tcin and the Ching. . . . Some at least of the circumstances which have been collected . . . render it the less improbable that the Sinim of the prophet Isaiah . . . should be truly interpreted as indicating the Chinese. The name of China in this form was late in reaching the Greeks and Romans, and to them it probably came through people of Arabian speech, as the Arabs, being without the sound of 'ch,' made the China of the Hindus and Malays into Sin, and perhaps sometimes into Thin. Hence the Thin of the author of the Periplus of the Erythraean Sea, who appears to be the first extant author to employ the name in this form; hence also the Sinæ and Thinaæ of Ptolemy. . . . If we now turn to the Seres we find this name mentioned by classic authors much more frequently and at an earlier date by at least a century. The name is familiar enough to the Latin poets of the Augustan age, but always in a vague way. . . . The name of Seres is probably from its earliest use in the west identified with the name of the silkworm and its produce, and this association continued until the name ceased entirely to be used as a geographical expression. . . . It was in the days of the Mongols . . . that China first became really known to Europe, and that by a name which, though especially applied to the northern provinces, also came to bear a more general application, Cathay. This name, Khitai, is that by which China is styled to this day by all, or nearly all, the nations which know it from an inland point of view, including the Russians, the Persians, and the nations of Turkestan; and yet it originally belonged to a people who were not Chinese at all. The Khitans were a people of Manchu race, who inhabited for centuries a country to the north-east of China." During a period between the 10th

and 12th centuries, the Khitans acquired supremacy over their neighbours and established an empire which embraced Northern China and the adjoining regions of Tartary. "It must have been during this period, ending with the overthrow of the dynasty [called the Leao or Iron dynasty] in 1123, and whilst this northern monarchy was the face which the Celestial Empire turned to Inner Asia, that the name of Khitan, Khitat, or Khitai, became indissolubly associated with China."—H. Yule, *Cathay and the way thither: Preliminary essay.*—"The term 'China,' applied by Europeans to this region, is unknown to the natives, and the Tsin dynasty, whence probably the Hindu form China, has for nearly fifteen hundred years ceased to rule over the plains of the Hoang-ho and Yangtze-kiang. Nor do they recognize the epithet 'Celestial,' attributed to their empire. . . . In ordinary language the usual expression is Chung-kwó; that is, 'Middle Kingdom,' or 'Central Empire,' in reference either to the preponderance gradually acquired by the central plains over the surrounding states, or to the idea common to so many peoples, that China was really the centre of the world. To the usual four points of the compass the Chinese add a fifth—the centre; that is, China. Since the Manchu conquest the official designation is Tatsing-kwó; that is, the 'Great and Pure Empire,' or, perhaps, Ta Tsing-kwó, the 'Empire of Tsing, or Pure.' . . . The people themselves are the 'Children of Han,' or the 'Men of Tsang,' in allusion to two famous dynasties. They also call themselves Limin, an enigmatical term commonly rendered 'Black-haired Race.' But there is no precise natural term of general acceptance either for the country or the people."—E. Reclus, *Earth and its inhabitants*, v. 2, ch. 5.

Geography of China proper.—Article 3 of the Chinese constitution reads: "The territory of the Chung Hua Min Kuo continues the same as that of the former Empire." China has an estimated area of 1,532,420 square miles and a population of 302,110,000 (1911). It lies between 18° and 43° north latitude, and extends from 08° to 122° longitude east from Greenwich. Its boundaries are Mongolia on the north; Tibet on the west; Tongking and the Gulf of Tongking on the south; and the Eastern Sea on the east. (See also MONGOLIA and TIBET.) . . . "The massive and elevated table-land of Tibet forms the centre or backbone from which all the mountains of China branch off throughout the country. To the North, the Eastern K'uenlun throwing out numerous chains into Kansu, and splitting up towards the East into 3 principal systems: (1°) The Alashan (Holan-shan) range, running North-Eastwards through the Ordos plateau into the bend of the Hwang-ho, then continuing through the Shansi plateau, the In-shan mountains and Inner Hsingngan. . . . (2°) The Eastern K'uenlun properly so-called. This range separates the basin of the Hwang-ho from that of the Yangtze-kiang and takes successively, as it runs from West to East the names of the Sik'ing-shan, Ts'inlingshan, Funiu-shan and Hwaiyang-shan. . . . (3°) The Min-shan and Kiulung ranges. The former runs along the Northern limit of Szechw'an, the second separates the Han-ho from the Yangtze-kiang. . . . Besides the above systems, which cover nearly the whole of China, there are 2 other important ranges extending along the coast, one to the South, and the other to the North, forming the Shantung promontory. (1°) The Tayü-ling

covers a great part of Fokien and of Chêkiang. The range runs parallel with the coast, North-East and South-West, and forms the boundary line between these two Provinces. . . . (2°) The Shantung hills are formed by several groups, whose highest peak, the T'ai-shan, attains 5,060 feet in height. . . . Let us mention, before concluding the orography of China, its 5 Sacred Mountains (Wu Yoh), famous in the annals of the country. These are the following: the T'ai-shan, in Shantung; Hang-shan, in Shansi; Sung-shan, in Honan; Hwa-shan, in Shensi; Heng-shan, in Hunan. Several other mountains are also famous. The principal are: the 3 peaks of Dokerla near Atuntze, North-West of Yunnan; Ngomei-shan, in Western Szechwan; Wut'ai-shan, in the North of Shansi. . . . The Great Plain lies to the North-East of China, and occupies the greater part of Chihli, Honan, Nganhwei, Kiangsu and Shantung. It is slightly undulated and is of alluvial or loess

West the Szechwan plateau, and flows into the Tung-hai or Eastern Sea, a little to the North of Shanghai. Its length is 3,200 miles.—L. Richard, *Comprehensive geography of the Chinese empire and dependencies*, pp. 11-13, 15.—“Both rivers [the Hwang-ho and Yangtze-kiang] wash down large quantities of sedimentary matter, estimated in 1792 by Staunton at one-fiftieth of the whole volume for the united stream. . . . These deposits are one of the great sources of danger to the riverain populations. Natural embankments are thereby gradually formed along the course of the stream, whose bed is raised, and new channels formed during the floods, which often cause widespread ruin. Like the Nile, Po, and Mississippi, the Yellow River thus flows occasionally at a higher elevation than the surrounding plain, although not so high as has been represented by the terror-stricken fancy of the inhabitants. A vast system of embankments has been erected on

THE MARBLE CAMEL BRIDGE

Across an inlet of the Sacred Lotus Lake, in the Forbidden City, Peking

formation. Besides the Great Plain, there are others of lesser importance, the principal of which are: the Tung'ing Lake plain, that of Hank'ow and of the P'oyang Lake, all of which are situated in the Yantze valley. The plains of Hangchow Fu and of Canton are much less important. . . . No country in the world is so well watered as China. Her river system, like her mountain system, is intimately connected with Tibet. Her rivers rise there like her mountains and run in a West to Easterly direction. China possesses 3 great rivers. In the North, the Hwang-ho (Yellow River), which rises South of the Ku-ku Nor or Ts'ing-hai, takes an extensive Northerly sweep round the Ortos plateau, forms the Western boundary of the Shansi plateau, and flows into the Gulf of Chihli. Its total length is about 2,700 miles. In the Centre, the Yangtze-kiang (Yang Kingdom River), called also the Blue River. The Yangtze rises to the South of the Hwang-ho, and runs at first Southward, under the name of the Kinsha-kiang (Golden Sand River), then takes a North-Easterly direction, leaving to the North-

both sides to keep the stream within its bed during the rising of its waters. . . . But this very system itself, maintained by the constant labor of 60,000 hands, has the inevitable result of increasing the . . . difference in level between the river bed and the low-lying plains. . . . The higher the embankments are carried the more dangerous becomes the stream. In spite of all precautions, great disasters are occasionally caused by the bursting of the dykes, when the crops of whole provinces are swept away, and millions become a prey to famine and pestilence. For China the Hoang-ho still remains the Nih-ho or 'Rebellious River,' as it is called by the old chroniclers. The riverain populations are always at the mercy of invading hosts, or even of predatory bands strong enough to seize and open the sluices. . . . Apart from the highlands and alluvial plains, most of the Hoang-ho basin is covered with hoang-tu, or 'yellow-earth,' which prevails throughout Pechili, Shansi, Kansu, half of Shensi, the northern division of Honan, and extensive tracts in Shantung. This formation, comprising a region larger than the

whole of France, reaches in some places even to the banks of the Yang-tze, and stretches westwards to the Tibetan plateaux. In these regions everything is yellow—hills, fields, highways, houses, the very torrents and streams charged with alluvia. Even the vegetation is often covered with a yellow veil, while every puff of wind raises clouds of fine dust. From these lands the emperor himself [took] the title of Hoang-ti, or 'Yellow Lord,' equivalent to 'Master of the World.' According to Richthofen, the hoang-tu, regarded by him as a formation analogous to the loess of the Rhine and Danube basins, is nothing more than so much dust accumulated during the course of ages by the northern winds. . . . On the plateaux encircled by mountain barriers forming closed basins the yellow earth forms a uniform layer of unknown depth. But wherever the erosive action of running waters has had full play, enormous fissures with vertical walls have been opened in the argillaceous mass.

contain some of the richest coal beds in the world. Anthracite and other varieties are found in all the provinces watered by tributaries of the Hoang-ho. . . . The Yang-tze-kiang basin comprises three-eighths of China proper. . . . Although not originally founded here, the State drew from this region the chief elements of strength, which enabled it to develop into the paramount power of East Asia. Of the two great Chinese rivers, the Yang-tze is by far the largest, and is hence commonly spoken of simply as the Ta-kiang, or 'Great River.' . . . It is certainly one of the very largest in the world. In the length of its course and the extent of its basin it is no doubt surpassed by three others in Asia alone—the Ob, Yenisei, and Lena. But in volume it far exceeds those Siberian streams, and, according to the careful measurements of Blakiston and Guppy, it is surpassed in this respect by three only in the whole world—the Amazon, Congo, and La Plata. . . . The Yang-

MARBLE BOAT AND BRIDGE ON LOTUS LAKE OF THE SUMMER PALACE, PEKING

. . . The erosions reveal in some places a thickness of at least 2,000 feet, offering a prodigious quantity of fertilizing soil, constantly washed down, and maintaining the productiveness of the plains watered by the Hoang-ho. For this yellow earth is the richest soil in China, being far more fertile even than ordinary alluvium. It requires no manuring, and goes on producing heavy crops for ages. . . . Much ingenuity has been displayed in overcoming the difficulties offered to free communication by the perpendicular walls of the yellow lands [see also CONSERVATION OF NATURAL RESOURCES: China: B. C. 2297-A. D. 1915]. To pass from river basin to river basin advantage has been taken of every narrow fissure, deep cuttings have been made in many places, and fresh routes opened when these have been filled up by the landslips. Some of the most-frequented roads have been excavated to depths of from 40 to 100 feet and upwards, and the labor expended on all these works is at least equal to that lavished on the building of the Great Wall, or the construction of the Grand Canal. . . . The mountains whose lower slopes are covered by the yellow earth also

tze has never caused such widespread ruin as that which has attended the shiftings of the Hoang-ho, nor is any river in the world more useful for navigation. If it does not yet number as many steamers as the Mississippi, or even the Volga, it is none the less crowded with flotillas of junks and river craft of every description, while its floating population is numbered by hundreds of thousands. . . . The Yang-tze has received from the Mongolians the title of Dalai, or 'Sea,' and in the history of China it has played the same part as the ocean and great marine inlets elsewhere. It has afforded even greater facilities for travel, for the transport of goods, and for the mutual intercourse of the surrounding peoples. At the present day European influences are penetrating into the heart of the empire through the same channel, which for practical purposes may be regarded as a continuation of the seaboard, stretching some 2,400 miles inland. The total length of the navigable waters in its basin is equal to half the circumference of the globe. The head-streams of the Yang-tze are known to rise on the Tibetan plateaux far beyond the limits of China proper."—E. Reclus,

The earth and its inhabitants, v. 2, ch. 5.—"In the South, the Si-kiang (Western River), which rises in the Yünnan plateau, and empties itself near Canton into the South China Sea, after a course of 1,250 miles. Of the minor rivers, which water through themselves, or through their tributaries, the greater part of China, the most important are the 3 following: (1°) The Peh-ho (White river) rising in Mongolia, runs through the Chihli Province and flows into the Gulf of Chihli. (2°) The Hwei-ho which drains the Provinces of Honan and Nganhwei and flows into the Hungtseh lake. (3°) The Min-kiang, which flows through Fokien, and empties its waters into the China Sea, North of Formosa. The Mekong or Lants'ang-kiang and

overflow their banks. Between these 2 seasons are a short Spring and Autumn. The winds change their direction and the temperature is unsteady. Spring is generally ushered in by spells of increasing warmth; Autumn, on the contrary, is mild and agreeable, and lasts from the end of September till the middle of November. At T'ientsin the thermometer falls in Winter to -4° Fahrenheit, and rises in Summer to 100° F. At Shanghai it reaches in Winter $17^{\circ}.5$, and sometimes to 102° F. At Canton it rarely falls in Winter below 32° F., while in Summer the maximum varies from $96^{\circ}.8$ to $100^{\circ}.4$ F. Taken on the whole, China enjoys a rather dry climate, that is, it rains less there than in other climates lying within the same

A great part of the population of many Chinese cities situated on the river front live on these sampans, or river boats

the Salween or Lu-kiang, are also important streams, but they drain only the lower and less considerable part of Yünnan."—L. Richard, *Comprehensive geography of the Chinese empire and dependencies*, pp. 15-16.—See also ASIA: Influence of geography on the political problems; CANALS: Asiatic: China.

Climate.—"Speaking in general, it may be said that China enjoys two quite distinct seasons: (1°) That produced by the North winds. This becomes more rigorous as one advances Northwards. The weather is generally dry when dust-storms prevail over the plains of the North. It lasts from November to April. (2°) That resulting from the Southern winds. The chief features of this season are its excessive heat, which is moister and more unhealthy along the coasts, while in the interior, it is greater, but healthier and less depressing. Rain falls frequently during this season and rivers

limits of latitude. Szechw'an and the neighbouring regions: lower Yünnan, Kweichow, the South of Kansu and of Shensi are however exceptions, the climate of these Provinces being foggy and rainy. These features of the climate of China are especially due to its situation, on the South of the vast and lofty table-land of Mongolia. Hot air tends by its nature to ascend to the higher regions of the atmosphere, while cold air, on the contrary, tends to descend. In Winter, the high table-land of Mongolia, deprived of the warmth of the sun, pours its cold air upon the regions of China that are less elevated and whose air is warmer; there is then produced a current of air coming from the North. In Summer, on the contrary, the sands of Mongolia are heated by the sun. They are thus covered by a warmer layer of air than that of China, cooled by its rivers and the sea that bathes it. A current then sets in from

the South. As the sea changes its temperature more slowly than the land, the coasts of China undergo less variation in their climate than the interior. These two great movements bear also close relation to the variations of the atmospheric pressure, and belong in fact to the great phenomenon of the monsoons, to which the whole Asiatic continent is subject."—L. Richard, *Comprehensive geography of the Chinese empire and dependencies*, pp. 14-15.

Agriculture.—Natural resources.—Vast coal fields.—"China proper is eminently fitted by nature to be the home of a great civilization. For thousands of years its best sections have been subjected to nearly continuous farming, and, thanks partly to the skill of the cultivators and partly to its own original strength, it shows no signs of exhaustion. In the North is the loess, very fertile, in places hundreds of feet deep, and probably built up by the dust from the plains of Central Asia carried south and east by the winds of many millenniums. In the central and northeastern districts is the great alluvial plain formed of deposits laid down through the ages by the muddy waters of the Yangtze and Yellow rivers. In other sections there are numerous other plains and valleys. . . . Added to the fertility of the soil is a favorable climate. China lies almost entirely in the temperate zone, which with its marked seasonal changes seems to be favorable to the development of a vigorous race. . . . The heaviest rainfall comes as a rule in the late winter, spring and summer when it is of most use to the growing crops. Then China proper is well supplied with rivers. . . . These streams not only provide for irrigation where this is needed, but furnish easy and inexpensive means of transportation. . . . China is richly supplied with minerals. The precious metals are not plentiful, but the minerals used in industry are unusually abundant. Every-one of the eighteen provinces has workable deposits of coal, and in one province alone a German geologist has estimated that there is enough to last the entire world at the present rate of consumption for many centuries. There are extensive deposits of iron. Great fields of petroleum are known to exist. Antimony, tin and copper are found in quantities."—K. S. Latourette, *Development of China*, pp. 2-5.—"Since the food-supply of the Chinese population has always been supplied from within the Empire, agriculture has rightly been accorded first place among all branches of labour from time immemorial. According to legend, the Emperor Shenung (2737-2697 B. C.) established agriculture as a science. He examined the various kinds of soils and gave directions as to what should be cultivated in each. He taught the people how to make ploughs, and instructed them in the best methods of husbandry. Immediate results were seen in the improved conditions of the people, and succeeding generations have amply testified their gratitude to him. Under the title of 'Prince of Cereals' he has long since been deified, and is worshipped throughout the length and breadth of the land. . . . The Chinese nation is to a very large extent vegetarian, flesh being eaten only in small quantities except on festival occasions. Pork, chickens, ducks, and fish comprise the meat-diet, and of these the Chinese are excessively fond, but to the great majority they are luxuries, only to be indulged in on rare occasions. Rice is to them what wheat is to us, only more so. . . . Next to rice the more important food-stuffs are wheat, maize, pulse, and cabbage. The Chinese fry most of their vegetables, and for this purpose a vegetable oil is nearly always used. The

oils expressed from the seeds of members of the Cabbage (*Brassica*) family, the Soy Bean (*Glycine hispida*), and Sesamé (*Sesamum indicum*) being most in request. Whilst the Chinese cultivate a great variety of vegetables the quality of one and all, judged from our standard, is wretchedly inferior. With the exception of maize and sweet potatoes, it is safe to say that not a single Chinese vegetable would command attention in this country [England]. . . . In the cultivation of rice, the patience, ingenuity, and incredible industry of the Chinese are particularly well exemplified. The terraced fields, necessary to ensure a flow of water, whether it be on a seemingly flat plain or on a steep hillside, meet the eye of the traveller on all sides. It is little short of marvellous when one reflects on the skilful way in which the entire rice-belt in China is terraced, and the enormous amount of time and labour involved in the undertaking indicate what a hard task-master necessity has been. In matters of irrigation the Chinese are past masters. They have not yet succeeded in making water run uphill, but with their various contrivances they lift it bodily from streams and ditches and convey it long distances to wherever it is needed. The number of devices for irrigation purposes is almost legion, and though simple in principle and efficacious in results they are intricate in detail. Some are operated by hand, others by the foot, and many are automatically worked by the current of the streams."—E. H. Wilson, *Naturalist in western China*, v. 2, pp. 49-51.—"In passing from Japan to China, we pass from a country that has experienced perhaps the maximum of its local development to one whose material bases for future growth are so vast that we may fairly expect industrial development of very remarkable extent. This development will not necessarily require cheap labor, though in its earliest phases it will have very cheap labor to aid it. But its real strength will lie in the possession of great and easily worked coals, of very high grade. As regards the question of tonnage, we may note that China is credited with containing high-grade coal reserves amounting to about 1,000,000 millions of tons. This quantity is about half the American tonnage; but it is five times as much as still remains to the German Republic, and six times as much as is left in the British Isles. For other comparisons, the Chinese total is one hundred and fifty times as great as that of Japan, and about eight or ten times as large as that of the Russian Empire at the time of its greatest extent. As regards grade of coal, we may further note that only high-grade coals are included in these estimates, and that almost half the Chinese tonnage is supposed to be anthracite. A few words on the geographic distribution of the Chinese coals may serve to throw light on current political disputes. There are many coal areas in China, but the bulk of the tonnage occurs in one or two very large fields. One of these, in north China, embraces most of the province of Shansi, with portions of Chihli and Honan; and is credited with some 750,000 million tons, or three-fourths of the Chinese total. The other large field, in south China, covers much of the provinces of Yunnan, Kueichou, Szechuan, with adjoining areas, and contains over 200,000 million tons. The province of Shantung, in an isolated field, contains about as much coal as all of Japan, and incidentally furnishes one of the best routes in to the great Shansi coalfield. It also yields at present about ten per cent. of the total coal output of China, which for the years immediately before the war had risen to almost twenty million tons. During

the later days of the Empire, a steel works was built at Hanyang, supposedly at government expense as a government enterprise. It seems to have passed later into foreign, nominally private, control. Its output of iron was approximately 250,000 tons annually, somewhat greater than the total reported output of Japan. There seems to be some reason to believe that the Hanyang works could even now, if they had any surplus for export, lay down finished steel products in San Francisco more cheaply than could any American steel works. Under these conditions as to fuel supply, and the known existing status of the Chinese labor market, there seems to be no necessity for arguing at length that Chinese competition with American and European mills would be possible. That is clear enough without discussion. The matter of real interest is not as to the fact, but as to the date of its arrival; and in this we can have little to guide us. What we do know now, however, is that industrial development can take place very rapidly indeed, if natural resources and labor are available and if capital is supplied. There is no reason to expect the growth of the Chinese steel and other industries to be very slow, provided they are undertaken at all. There would be no physical or technical obstacle, capital being supplied, that would prevent China attaining sixth or seventh place among the iron and steel producing countries of the world within ten years after the development was started; and to reach a higher rank soon after that. Building up a modern industry is very quickly done in these days, if there are the materials to work on and the money to start the work. So that if the impetus to Chinese industrial development comes, from any source, we may expect very rapid growth to follow in the steel industry. With regard to such as the textile industries, it is probable that the growth could be even more rapid, for they do not require the extensive and relatively slow mine development that is necessary as a basis for iron and steel manufactures. We may therefore take it for granted that the chief industrial features of the next two or three decades may easily be the growth of Chinese industrialism; and that in the form which this growth takes, and the markets it affects, may lie the future of peace or war for the world. In so far as Chinese manufactures are marketed in China itself, and aid in the development of that country, there will be involved merely a somewhat narrower market for European and American goods. But if industries are built up in China chiefly for the export trade—and this might readily occur in an industrial development fostered or controlled from the outside, the consequences would be far more serious. In their worst form they would bear most heavily on Europe, whose coal and other raw material supplies are not excessive; but at some stage of the development American industries would feel the weight of Chinese competition.”—E. C. Eckel, *Coal, iron and war*, pp. 343-345.

Languages and dialects of the country.—“We remember, some thirty years or so ago, trying to elicit from a lecturer on languages and literature his idea of the position held by the Chinese language amongst that of others. After considerable humming and hawing, he said that it held one of its own, outside of the general scheme of languages as elaborated by philologists. This position is practically the same that it holds to this day amongst many of those who delight to classify language. As the Chinese have been outside the comity of nations, so their language has been relegated to a position of its own with no certain relationship to the other speeches of mankind; and

as the exclusiveness of the nation is being slowly broken down, so it is to be hoped that, before long, in response to the toil of not a few scholars, the affinity of Chinese with that of other languages in the world will be more clearly established and the wall or partition separating it from the others be a thing of the past. Most divergent views have been held on the subject and clearly proved to the satisfaction of those who held and advanced them, but not to the equal satisfaction of their readers. . . . Some people go so far as to say that Chinese has no grammar. If grammar only consisted of declension and inflection, such a statement might be true; but the Chinese most cleverly use the relative position of words to express what we, to a great extent, and some continental nations to a greater, and the dead languages of Europe to the greatest extent, show by case, mood, tense, number, and person: position is everything in the construction of Chinese sentences, and does away with those troubles of schoolboys, carried to such an excess in the classical languages. In addition to position, the use of auxiliary characters is employed, and, in the written language especially, a general symmetry of construction, and use of words in sentences and clauses, which are either in antithesis or juxtaposition to each other, assists materially in the correct development of ideas. Chinese is one of the simplest, while at the same time one of the most difficult, languages in the world; most simple from the almost entire absence of these inflectional forms; most difficult from the combination of different languages under the one heading of Chinese; such for instance as the book language in its two or three different forms, the Colloquial or spoken language in its different vernaculars, and in its tones, the bugbear and ruin of most European readers and speakers of it. . . .

“The language of China may be divided as follows: (1) The ancient style in which the classics are written: sententious, concise, vague, and often unintelligible without explanation. (2) The literary style: more diffuse, and consequently more intelligible; it might be described as poetry written in prose on account of a ‘*rhythmus*,’ as it has been termed, in which it is written, the ancient language having less of this—both forms having a number of particles either difficult or impossible of translation into English. The essays written by candidates at the literary examinations are composed in this style. (3) The business style which is plain enough to be intelligible; it is prose without, or with but little of, the poetry element, and few, if any, of the troublesome particles. It is in general use for commercial purposes, legal documents, official and business correspondence, and governmental, statistical, and legal works are written in it. (4) The Colloquial, or the spoken languages. They are divided into numerous dialects . . . but unfortunately they are despised—there is scarcely even one book written in them in the South of China, and yet it is impossible to speak in any other language; and to the great majority of the lower classes, no other is intelligible in its entirety. When we learn to speak a Western language, we nearly always learn consequently to read it; but a knowledge of Chinese, as spoken, only places one on the threshold of the Chinese of books. This has not inaptly been compared to a man who knows French fluently, but who, if he wishes to read Latin, has, after his knowledge of French, to apply himself to Latin; the French in this instance being the colloquial, and the Latin the language of the book. Again, let us suppose the ancient language, as compared with the busi-

Maps prepared specially for the NEW LARNED
 under direction of the editors and publishers.

style, to be that of the English of Chaucer as compared with that of the modern writer. The difference between the book style and the colloquial might be likened perhaps to the difference between a common English book and some highly scientific or technical work so bristling with scientific terms, or technical expressions, or mathematical formulæ, that it would be entirely, or nearly entirely, incomprehensible, except to one who had been specially educated for years, making such a subject a speciality. This way of putting the matter may throw some light on what seems such a mysterious matter to English-speaking people, and show how difficult of comprehension the book language is to all except those who have received a special and sufficient training. Writers on the Chinese have differed as to the richness, or otherwise, of the language. Putting aside all prejudiced statements, it may fairly be affirmed that in some respects its vocabulary is very full, where some of our languages are poor, and *vice versa*. The Chinese have no difficulty in expressing themselves so as to be understood by their own countrymen and others, though Europeans and Americans have not sometimes the patience to make the good listeners which the want of mood, tense, and all inflections occasionally requires in order to get at the meaning. On the other hand, the statements are often more concisely expressed than is the case in the general run of European languages. What strikes a foreigner as strange in the language, is the ease with which a word does duty as a noun, or verb, an adjective, adverb, or preposition. Marshman says: 'A Chinese character may in general be considered as conveying an idea without reference to any part of speech; and its being used as a substantive, an adjective, or a verb depends on circumstances.'"—J. D. Ball, *Things Chinese*, pp. 367-369, 374, 375.—See also JAPANESE LITERATURE: 794-1868.—"The language of the Republic is Chinese, but it is subdivided into so many dialects with widely differing pronunciations, often only intelligible locally, that the country can hardly be said to be possessed of a common tongue. . . . The one language that can claim to be in any way common to the Republic is known as *Mandarin*, which in its three varieties, Northern, Southern (Nanking) and Western, is spoken by two-thirds of the population of China. The dialects that most resemble Mandarin are the *Cantonese*, with the allied *Hakka*, the *Ningpo*, *Shanghai*, *Wenchow*, *Amoy*, *Swatow* and *Foochow* dialects. These dialects, however, would not be understood by an ordinary Mandarin-speaking Chinese belonging to another province. Interpreters are by no means unknown in official Chinese conclaves in Peking. The various tribes to which reference has already been made have their own dialects, and a different script." Of the *Manchu* language L. Richard writes: "In Manchuria Chinese is the most widely spoken language of the country. The Manchus, when speaking among themselves, employ their own dialect, which is very different from the Chinese and Mongol languages. It is of Tungusic origin, sonorous and easily learned. It is composed of dissyllabic roots, the meaning of which is modified (especially in verbs) by agglutinative suffixes. The alphabet is syllabic and of Syro-Uigur origin. The latest form has been borrowed, in the sixteenth century, from the Mongols. There are 6 to 8 vowels, 18 consonants and 10 diacritical marks. Like Chinese it is written in vertical columns, but from left to right." Of the *Mongol* language the same authority says: "The most widely diffused type of the Mongol language, spoken throughout the country, belongs to the

Ural-Altai family, as the Turkish and Manchu dialects. It abounds in dissyllabic roots, and is rich in words and forms. The alphabet is syllabic and of Syro-Uigur origin. It has 7 vowels, 17 consonants and 5 diphthongs. Gutturals and aspirates are largely used. The writing has undergone various transformations. Its latest form, which resembles knotted cords, dates from the thirteenth century. Mongol is written in vertical columns from top to bottom, but unlike Chinese, the lines proceed from left to right. The Mongol language has its conjugations and declinations. Sentences consist of a number of participial clauses with the principal verb at the end, and this gives them at times an indefinite length. In the spoken language the letter 'r' is frequent, but the consonant 'i' is non-existent."—*China year book*, 1910-1920, p. 38.—See also CHINESE LITERATURE: Origin of the language; JAPAN: Languages; PHILOLOGY: 7.—In 1918 phonetic writing was introduced into China. See below 1918 (November).

Religions of the people.—Primitive beliefs.—Ceremonial observances.—Ancestor worship.—Confucianism, Taoism, Buddhism.—"The religion of the old Chinese Empire, as it existed certainly from the twelfth century B. C., and probably at a much earlier period, is best described as a purified and organised worship of spirits, with a predominant fetishist tendency, combined into a system before it was possible for a regular mythology to develop out of it. [See MYTHOLOGY: Eastern Asia: Indian and Chinese influences.] The sole objects of worship are the spirits (*shin*), which are divided into heavenly, earthly, and human, and, as a rule, are still closely connected with the objects of nature. Heaven (*Thian*), who, when conceived as a personal being, is called the supreme emperor (*Shang-ti*), stands at the head, and in coöperation with the earth has produced everything. His will is fate, and he rewards and punishes. He is one; but he has five emperors beside him, and an innumerable multitude of spirits beneath him, among which those of the sun, moon, stars, and constellations are pre-eminent. The spirit of the earth (*Hou-thu*), though not sharply personified, is for the most part conceived as of female nature. The spirits of the mountains, streams, &c., belong to her realm. Besides these, the spirits are without number. They are perceived, but are neither heard nor seen, though they reside in visible objects, and for the most part assume the forms of animals. It may be regarded as a great advance that there is no mention of essentially evil spirits, that all spirits are exalted servants of Shang-ti, and in their intercourse with men esteem moral qualities above everything else. . . . The doctrine of continued existence after death among the Chinese entirely accords with that of the Nature-peoples. Man has two souls, one of which ascends after death to heaven, while the other descends into the earth, after vain attempts have been made to recall them both. Of the doctrine of retribution no certain traces are to be found, but we do find the idea that it is possible by sacrificing life to save a sick person. The souls of ancestors were worshipped with great pomp and earnestness, and were, it was supposed, present at the sacrifices. . . . The Chinese are remarkable for the complete absence of a priestly caste. Their worship, which was regulated down to its minute details, was entirely a civil function. It was placed under the control of one of the six ministers who directed all the officials connected with religion, including the musicians and dancers. To Thian, the spirit of heaven, only the emperor might sacrifice; to the

spirits of the earth and the fruits of the land, only the emperor and the feudal princes; to the five house spirits, only the high officials, and so on in

THE PORCELAIN PAGODA AT PEKING

strict order. Of the sacrifices, which originally included also human victims, that part was presented which was regarded as the seat of the soul or of life. The greater number of the temples

were consecrated to the dead, while the emperor himself performed his sacrifices under the open sky. Prayer, even when addressed to Thian, was permitted to all, but at the court, regular officials were appointed for the purpose. Even the magicians, soothsayers, and spirit-charmers, though numbered among the state functionaries, formed no priestly order. Great value, however, was attached to the oracles procured by their instrumentality, especially to those obtained by means of the plant *Shi*, and by the burning of furrows on a tortoiseshell (*pu*).”—C. P. Tiele, *Outlines of history of religion to spread of the universal religions*, pp. 27-30.

“The emperor was, until the establishment of the republic in 1912, the religious head of the nation. He could enlarge the pantheon by increasing the number of spirits that were to be venerated, or reduce its size. Upon the proper performance of his religious duties the prosperity of the whole empire was supposed to depend. It was his exclusive right to worship Heaven. The performance of such worship on the part of local governors was regarded as a declaration of rebellion. The local governors each in like manner worshiped the spirits of their respective provinces. The imperial sacrifices to Heaven were offered in the southern suburb of the capital; those to Earth, in the northern. The ceremonies varied in different dynasties. The *Li Ki* states that the offering to Heaven was made on the grand altar with a blazing fire of wood; that to Earth, by burying the victim in the great mound. In both cases the victim was red. By burying a sheep and a pig at the altar of Great Brightness they sacrificed to the seasons. With similar victims they sacrificed to the spirits of heat and cold, sun, moon, stars, winds, flood, rain, mountains, valleys, forests, streams, etc. The spirits worshiped were not all imaginary; many of them were ancestors of the sovereigns and princes. Thus according to the *Li Ki* kings and feudal princes erected temples to father, grandfather, great-grandfather, great-great-grandfather, and remote ancestors. Each temple had a raised altar surrounded by an open area. In all of these, sacrifices were offered every month. There were two other temples for more remote ancestors to which the tablets of the earlier princes of the line were gradually removed. At these only the seasonal sacrifices were offered.”—G. A. Barton, *Religions of the world*, pp. 206-207.—“The Chinese describe themselves as possessing three religions, or more accurately, three sects, namely Joo keaou, the sect of Scholars; Fue keaou, the sect of Buddha; and Taou keaou, the sect of Taou. Both as regards age and origin, the sect of Scholars, or, as it is generally called, Confucianism, represents pre-eminently the religion of China. It has its root in the worship of Shang-te, a deity which is associated with the earliest traditions of the Chinese race. Hwang-te (2607 B. C.) erected a temple to his honour, and succeeding emperors worshipped before his shrine. . . . During the troublous times which followed after the reign of the few first sovereigns of the Chow Dynasty, the belief in a personal deity grew indistinct and dim, until, when Confucius [born 551 B. C.] began his career, there appeared nothing strange in his atheistic doctrines. He never in any way denied the existence of Shang-te, but he ignored him. His concern was with man as a member of society, and the object of his teaching was to lead him into those paths of rectitude which might best contribute to his own happiness, and to the well-being of that community of which he formed part. Man, he held, was born good, and was endowed

with qualities which, when cultivated and improved by watchfulness and self-restraint, might enable him to acquire godlike wisdom and to become 'the equal of Heaven.' He divided mankind into four classes, viz., those who are born with the possession of knowledge; those who learn, and so readily get possession of knowledge; those who are dull and stupid, and yet succeed in learning; and, lastly, those who are dull and stupid, and yet do not learn. To all these, except those of the last class, the path to the climax reached by the 'Sage' is open. Man has only to watch, listen to, understand, and obey the moral sense implanted in him by Heaven, and the highest perfection is within

Eagerly he sought in the execution of his official duties to effect the regeneration of the empire, but beyond the circle of his personal disciples he found few followers, and as soon as princes and statesmen had satisfied their curiosity about him they turned their backs on his precepts and would have none of his reproofs. Succeeding ages, recognising the loftiness of his aims, eliminated all that was impracticable and unreal in his system, and held fast to that part of it that was true and good. They were content to accept the logic of events, and to throw overboard the ideal 'sage,' and to ignore the supposed potency of his influence; but they clung to the doctrines of filial

LAO-TSZE (Born 604 B.C.)

Chinese philosopher, founder of Táoism, contemporary of Confucius

his reach. . . . In this system there is no place for a personal God. The impersonal Heaven, according to Confucius, implants a pure nature in every being at his birth, but, having done this, there is no further supernatural interference with the thoughts and deeds of men. It is in the power of each one to perfect his nature, and there is no divine influence to restrain those who take the downward course. Man has his destiny in his own hands, to make or to mar. Neither had Confucius any inducement to offer to encourage men in the practice of virtue, except virtue's self. He was a matter-of-fact, unimaginative man, who was quite content to occupy himself with the study of his fellow-men, and was disinclined to grope into the future or to peer upwards. No wonder that his system, as he enunciated it, proved a failure.

piety, brotherly love, and virtuous living. It was admiration for the emphasis which he laid on these and other virtues which has drawn so many millions of men unto him; which has made his tomb at Keo-foo to be the Mecca of Confucianism, and has adorned every city of the empire with temples built in his honour. . . . Concurrently with the lapse of pure Confucianism, and the adoption of those principles which find their earliest expression in the pre-Confucian classics of China, there is observable a return to the worship of Shang-te. The most magnificent temple in the empire is the Temple of Heaven at Peking, where the highest object of Chinese worship is adored with the purest rites. . . . What is popularly known in Europe as Confucianism is, therefore, Confucianism with the distinctive opinions of Con-

fucius omitted. . . . But this worship of Shang-te is confined only to the emperor. The people have no lot or heritage in the sacred acts of worship at the Altar of Heaven. . . . Side by side with the revival of the Joo keaou, under the influence of Confucius, grew up a system of a totally different nature, and which, when divested of its esoteric doctrines, and reduced by the practically-minded Chinamen to a code of morals, was destined in future ages to become affiliated with the teachings of the Sage. This was Taoism, which was founded by Laou-tsze, who was a contemporary of Confucius. An air of mystery hangs over the history of Laou-tsze. Of his parentage we know nothing, and the historians, in their anxiety to conceal their ignorance of his earlier years, shelter themselves behind the legend that he was born an old man. . . . The primary meaning of Taou is 'The way,' 'The path,' but in Laou-tsze's philosophy it was more than the way, it was the way-goer as well. It was an eternal road; along it all beings and things walked; it was everything and nothing, and the cause and effect of all. All things originated from Taou, conformed to Taou, and to Taou at last returned. . . . 'If, then, we had to express the meaning of Taou, we should describe it as the Absolute; the totality of Being and Things; the phenomenal world and its order; and the ethical nature of the good man, and the principle of his action.' It was absorption into this 'Mother of all things' that Laou-tsze aimed at. And this end was to be attained to by self-emptiness, and by giving free scope to the uncontaminated nature which, like Confucius, he taught was given by Heaven to all men. . . . But these subtleties, like the more abstruse speculations of Confucius, were suited only to the taste of the schools. To the common people they were foolishness, and, before long, the philosophical doctrine of Laou-tsze of the identity of existence and non-existence, assumed in their eyes a warrant for the old Epicurean motto, 'Let us eat and drink, for to-morrow we die.' The pleasures of sense were substituted for the delights of virtue, and the next step was to desire prolongation of the time when those pleasures could be enjoyed. Legend said that Laou-tsze had secured to himself immunity from death by drinking the elixir of immortality, and to enjoy the same privilege became the all-absorbing object of his followers. The demand for elixirs and charms produced a supply, and Taoism quickly degenerated into a system of magic. . . . The teachings of Laou-tsze having familiarised the Chinese mind with philosophical doctrines, which, whatever were their direct source, bore a marked resemblance to the musings of Indian sages, served to prepare the way for the introduction of Buddhism. The exact date at which the Chinese first became acquainted with the doctrines of Buddha was, according to an author quoted in K'ang-he's Imperial Encyclopædia, the thirtieth year of the reign of She Hwanz-te, i. e., B. C. 216. The story this writer tells of the difficulties which the first missionaries encountered is curious, and singularly suggestive of the narrative of St. Peter's imprisonment."—R. K. Douglas, *China*, ch. 17.—"Buddhism . . . penetrated to China along the fixed route from India to that country, round the north-west corner of the Himalayas and across Eastern Turkestan. Already in the 2nd year B. C., an embassy, perhaps sent by Huvishka [who reigned in Kabul and Kashmere] took Buddhist books to the then Emperor of China, A-ili; and the Emperor Ming-ti, 62 A. D., guided by a dream, is said to have sent to Tartary and Central India

and brought Buddhist books to China. From this time Buddhism rapidly spread there. . . . In the fourth century Buddhism became the state religion."—T. W. Rhys Davids, *Buddhism*, ch. 9.

Domestic relations.—"In the social organization the emphasis has been laid on the family rather than on the individual. The family means not only the father and mother and the children, but the larger circle of blood relationship. Large sections of the family frequently live together, and in some districts whole villages are made up of one clan group. The immediate ancestors are represented by tablets in the home and the remote ancestors by tablets in the ancestral hall of the family clan. The sons marry early, usually before they are able to support households of their own. They bring their wives to the paternal home and stay there even after the children come, so that one will often find several generations living together under the same roof tree. Great emphasis has been placed on family solidarity. Of the 'five relationships' familiar to every schoolboy, within which are supposed to be summed up the duties of man to his fellows, three have to do with the family. These are the relationship between husband and wife, between younger brother and older brother, and between father and son. The basis of much of the national ethics has been duty to parents rather than duty to God. If a man indulges in dissipation, he sins, not because he has defiled the temple of God, but because he has injured the body transmitted to him by his ancestors. He is to serve his parents during their life, and after their death to sacrifice to their spirits. Ancestral worship thus becomes a part of his mental background and of his daily life. No crime is considered greater than to die without leaving sons to perpetuate the name of the ancestors and to honor their spirits. The family has acted as a unit far more than in the West. It usually centers around the ancestral hall, which is often endowed. It frequently provides for the education of its children, especially of the more promising. It looks after its indigent members and its aged, and often after the family graves. The state recognized family solidarity by holding the theory of joint responsibility. The penalty for murder was inflicted not only on the individual culprit, but on his relatives as well, with a severity nicely adjusted to the degree of relationship. Even distant cousins might be punished if the offense of the culprit was particularly heinous. The morals of the entire family must be imperfect, it was argued, if one of its members was guilty of crime. Given the family system, this was not an altogether unjust deduction. This family solidarity has many points of strength. It is a preventive of a too hurried departure from the past. It furnishes a motive for and makes possible the preservation of excellent moral standards and restraints and is an aid to government. . . . On the other hand, this family system has had certain grave defects. It has hindered initiative. It has been extremely hard for the individual to break away from the dead hand of the past. All the pressure of the traditional moral code and of the family group has tended to subordinate the will of one to the will of all, to discourage

departure from the ways of the fathers. That is perhaps one reason why China has found it so difficult to discover leaders in recent years. . . . Since individual initiative has been so difficult and the tendency has been to honor the past, it follows that conservatism has been encouraged and progress discouraged. When individuals or the nation as a whole finally break away from the past, as has been the case in recent years, extremes of radicalism are apt to follow. Unaccustomed to progress, the natural tendency when the break comes is to go to extremes. Too rapid change results and chaos follows. . . . The position of woman in the old China was midway between that of the modern Occident and of the older Orient. She has been more honored than in India or in Mohammedan lands. At times she has been educated, and there have been a few notable instances in which empresses or empress dowagers have governed. In every age many homes have been dominated by vigorous mothers or grandmothers. The husband and wife are ideally to hold each other in mutual regard and both are to be honored by their children. But in many respects the position of woman has not been the equal of that of her sister in the West. Concubinage has been allowed. Divorce has been freely permitted, usually at the instance of the husband and on a number of grounds, some of them trivial. Women, while more frequently educated than in most Asiatic countries, have not been as frequently educated as men. The widespread custom of foot-binding, enforced by the sanction of long practice, has been a physical hindrance. The girl has not been as much valued as the boy and with the advent of poverty has been the first to be sold into slavery." —K. S. Latourette, *Development of China*, pp. 131-137.—See also ETHICS: China.

Industrial development from the earliest period.—Guild system.—"Apparently, the Chinese were among the earliest peoples to discover the industrial advantages of a division of labor and of an exchange of products. In *The Chinese Classics*, edited by Confucius B. C. 551-478, the people are represented as divided into five classes: scholars, farmers, artisans, merchants, servants; and they ranked in honor in the order named. Soldiers were included under servants, and soldiers instead of servants are often named as the fifth, or lowest, class, though military conquerors as often in China as in other lands have reached the headship of the nation. Confucius refers this division of the people into classes to two thousand years before his time. . . . The five kinds of grain mentioned in *The Chinese Classics*, edited by Confucius, are referred to the mythological emperor, Shennung (2738-2698 B. C.). E. Bretschneider, M. D., says the grains designated were rice, wheat, barley, millet, and soy beans. Stuart says the grains were rice, wheat, two kinds of millet and soy beans—barley being identified with wheat. Undoubtedly, these five kinds of grain had been discovered and were in use long before the time of Confucius. The Pen-tsoo, or Chinese Herbal, says the use of tea was mentioned as early as B. C. 2700. Bretschneider says tea was used as a drink in the days of Confucius, but did not become the common beverage of the Chinese until the sixth and seventh centuries A. D. The first reference to the cultivation of the tea plant is found A. D. 350. Iron mines were opened in very early ages, iron was used for money and for tools, and the iron industry assumed a growing importance between B. C. 1122-221. Hand grain mills, and hand looms and hand embroidery, fishing with lines and nets, buckwheat for food

in addition to the grains already named, the use of indigo for dyeing and rearing of silk worms find early mention, while cows, sheep, swine, chickens, ducks, geese, and dogs were the domestic animals of the Chinese a thousand years before Christ. Spinning, weaving, dyeing, the rearing of silk worms and the wearing of silk are claimed by the Chinese as belonging to an even earlier date. Among industries mentioned in Confucius's edition of the Classics as existing long before his time are rope-making and carpentry. Among articles of diet in this early age, beef, mutton, dog, hare, fowls, grains, apricots and bamboo shoots are named. Fans, metal mirrors, flatirons, umbrellas, bamboo writing tablets, and hair pencils, the abacus for reckoning accounts, lamps, candles made from the oils of certain trees, chopsticks—all were in use a thousand years before the time of Christ. Between B. C. 221 and A. D. 221 porcelain, paper, some form of printing with an ink made of vermilion and oil, and a machine for sowing or planting grain, are mentioned; walls of buildings were constructed then, as now, by pounding clay between wooden frames. City and national walls were built by imperial levies of labor. Preexisting walls were joined together, thus forming one united Great Wall, by Shi-Hwang-Ti, B. C. 214-204, thought it was largely rebuilt in the fourteenth century; stone bridges, terraces and temples were erected; flails, forks, spades, sickles, needles and thread, beds, steamers for cooking food and stone rollers for leveling fields were in common use. Among foods, vermicelli, bean-curd, refined salt and condiments, sauces, vinegar, honey, sugar, and many fruits are mentioned. No slaves appear in the earliest recorded history of China: 'The elders employed the younger and the well-to-do the poor.' But the labor of all was at the disposal of the sovereign. No man could have an occupation different from his father, save by the order or consent of the sovereign. Trades were segregated in different streets. Men and horses and cattle—all were used in the earliest ages and all in some measure are yet used for drawing the plow. Slavery was introduced into China B. C. 204, through the sale of children, but we do not think it has been sufficiently general seriously to affect the industrial life of the people. It has consisted chiefly of the purchase of girls or women for domestic service and for concubines; its inevitable evils have appeared in the degradation of family life. For the past two thousand years there has been very little change in the articles of food, raiment [see COSTUME: India], or instruments of production, or in clothing, house-building or any other of the industrial arts, save that cotton-growing, introduced into China between A. D. 960 and A. D. 1280, caused a marked change in the clothing of the people. The fundamental human causes of production are physical vitality, industry, economy, intelligence, and power of combination. [See also ASIA: European influence on education, industry, medicine, etc.] . . . A careful study of the Chinese will show that there exists in their small 'hweis,' or unions, and in their guilds a far older and possibly a wiser method of coöperation than Western nations have reached through trusts and labor unions. Everyone in China is eager to organize a union, and every Chinese boy or girl aspires to enter such a union. A person wishing to provide for a marriage or to start in some simple business, may form a union. Each member agrees to furnish to the party forming the union a small sum of money to enable this person to provide for the opportunity or to enter upon the trade or industry contemplated. Often the money is ad

vanced without interest, the persons receiving the first advance of the money continuing in the union until each person in the union has received an equal benefit. Of course it is impossible to form such a union except among a group of persons who know and trust each other; and such unions in most cases are carried through in good faith. In this way not only is each one helped to enter upon some investment, impossible without the aid of others, but the resolution of each to deny himself and meet his engagements is greatly strengthened by the group spirit. These small voluntary unions are almost innumerable in China. Again, the laboring classes, whatever their employment, all band together on the slightest pretext. But a far larger and more important development of

official representative of the government, or, better still, a representative of the gild upon the one side and of the rights of the government upon the other—a striking illustration of the mediator of whom more will be said later. In almost all cases the secretary serves as the lawyers of the gild. Theoretically, all gild matters are brought before the whole body of discussion. Practically, a matter is usually brought before the leaders of the gild, discussed and modified, and if they think it has a reasonable prospect of passing, the measure is then presented to the entire body; otherwise it often dies in the committee stage. The democratic management of industrial and commercial affairs through the gilds, and the democratic origin of industrial and commercial law, furnish the

© E. M. Newman

THE GREAT WATER GATE AND THE CHIEN-MÊN GATE, SOUTHERN ENTRANCES
TO PEKING

the coöperative spirit is found in the Chinese gilds. All Chinese industries save farming are organized into gilds. There are the silk gild, the bankers' gild and the thieves' gild! In the United States the churches, schools, and courthouses are the most conspicuous buildings in town or city; in China the gild halls, thus showing that commerce and industry occupy the position of chief importance. Trading gilds were active B. C. 1122-221. Marco Polo's report about A. D. 1275 of the gilds of the city now called Hangchow shows that practically the entire population was organized into gilds, and probably members outside of the city were included, for the report shows over one and a half million members. Each gild has a president and an executive committee elected yearly and eligible to reelection, and a secretary who is a scholar with a degree from the government but without official government position. Hence he becomes a semi-

historic and economic basis for the democratic character of Chinese civilization. Indeed, so firmly is the authority of the gild established in settling commercial and industrial disputes that the government recognizes gild rules in all trials, giving them the rank of statute laws. Thus the gilds control not only the larger amount of industrial and commercial business in the nation, but shape and determine the commercial law of China; they settle quarrels between their members and usually controversies arising between themselves and neighboring gilds. In addition the gilds, in common, promulgate the dates for settling accounts, the rate of interest, the rate of exchange, etc. In some cities they have organized a fire department and a water service. In a word, in China the gilds or voluntary organizations, combined through their chief representatives, frequently discharge the functions of a Board of Trade, a City Council, a

Board of Charities, and a Board of Arbitration—all with the semi-official powers.”—J. W. Bashford, *China—an interpretation*, pp. 43-46; 63-66.—See also GULLDS, OR GILDS: Modern times.

Origin of the people and their early history.—“The best authorities are agreed that the ancient Chinese originally migrated from a point near the Caspian Sea across what is now arid desert to the upper reaches of the Yellow River. The date at which this exodus took place is so remote that all trace of it has been lost; and although the proofs of the Central Asian origin of the race are satisfying to scholars, they are of a nature which cannot be here adequately summarized. Excavations recently made in Honan province have, however, brought to light utensils and modellings in baked clay of the most primitive description, including Noah’s arks of almost Biblical exactitude. According to some experts, these are conclusive evidence not only of a settlement which may be counted at least six thousand years old, but point to a close cultural connection with very distant regions. It may be that systematic search will some day disclose new and remarkable facts concerning Chinese origins in the cradle of the human race. [See also BABYLONIA: Earliest inhabitants.] In any case it is quite certain that thirty centuries before the Christian era the Chinese had already occupied most of the territory comprised in the modern provinces of Kansu, Shensi, and Honan; that their route eastwards—toward the sea—was barred by forests may be assumed. It is interesting to record that their pictorial character for ‘East’ is a sun shining through trees, whilst the word ‘obstruction’ is compounded by placing the selfsame tree in a doorway. The remote ancestors of the race certainly cleared the land as they advanced, changing from a pastoral cultivator race, tilling the soil in small patches, into a purely agricultural nation at a time when classical Greece had not yet emerged out of the dim mists. The Chinese still venerate the name of the ruler who established tillage as the basic institution, and who rightly assumed that there is no increment so rich and so beneficial to mankind as the increment of the fields. Twenty-five hundred years ago, when Confucius and Laotzu flourished, China was already a very old country. Although the celebrated Stone Drums in the Confucian Temple in Peking, which are said to record the hunting adventures of an emperor of the Chou dynasty (B. C. 876), show the most ancient writing known, it is probable that the transition from tying knots on cords, as a means of conveying ideas, to cutting notches on wood and finally to writing pictorial and ideographic symbols, took place many centuries earlier. The conception of a central kingship was certainly well-fixed by the time of the first emperors of the Hsia dynasty (B. C. 2200); and Confucius, writing in the sixth century before Christ on the discontents of the age, constantly bewails the spacious days of the legendary rulers Yao and Shun, who ruled as shepherd kings anterior to the Hsia. Remembering how much older the human race is to-day admitted to be than was believed a generation ago, it is by no means improbable that the Chinese entered the Yellow River valley at least a hundred centuries ago. This ancient people of the pre-Christian era was a small, warring community of not more than a few million souls. Distributed along the [loess] soil of the broad, central valleys, their expansion during a very long period was hardly noticeable, wars and expeditions tending to monopolize their attention and breaking up the country into petty states in spite of the Imperial rule. The North China of to-day was then nothing

but an arid frontier-land, a glacia; and the present metropolitan province of Chihli as wild as much of Mongolia still is.”—B. L. P. Weale (B. L. Simpson), *Truth about China and Japan*, pp. 1-3.—“It would appear also that the Chinese came into China possessed of the resources of Western Asian culture. They brought with them a knowledge of writing and astronomy, as well as of the arts which primarily minister to the wants and comfort of mankind. The invention of these civilising influences is traditionally attributed to the Emperor Hwang-te, who is said to have reigned from B. C. 2697-2597. But the name of this sovereign leads us to suppose that he never sat on the throne in China. One of his names, we are told, was Nai, anciently Nak, and in the Chinese paleographical collection he is described by a character composed of a group of phonetics which read Nak-kon-ti. The resemblance between this name and that of Nak-hunte, who, according to the Susian texts, was the chief of the gods, is sufficiently striking, and many of the attributes belonging to him are such as to place him on an equality with the Susian deity. In exact accordance also with the system of Babylonian chronology he established a cycle of twelve years, and fixed the length of the year at 360 days composed of twelve months, with an intercalary month to balance the surplus time. He further, we are told, built a Ling tai, or observatory, reminding us of the Babylonian Zigguratu, or house of observation, ‘from which to watch the movements of the heavenly bodies.’ The primitive Chinese, like the Babylonians, recognised five planets besides the sun and moon, and, with one exception, knew them by the same names. . . . The various phases of these planets were carefully watched, and portents were derived from every real and imaginary change in their relative positions and colours. A comparison between the astrological tablets translated by Professor Sayce and the astrological chapter (27th) in the She ke, the earliest of the Dynastic Histories, shows a remarkable parallelism, not only in the general style of the forecasts, but in particular portents which are so contrary to Chinese prejudices, as a nation, and the train of thought of the people that they would be at once put down as of foreign origin, even if they were not found in the Babylonian records. . . . In the reign of Chwan Hu (2513-2435 B. C.), we find according to the Chinese records, that the year, as among the Chaldeans, began with the third month of the solar year, and a comparison between the ancient names of the months given in the *Urh ya*, the oldest Chinese dictionary, with the Accadian equivalents, shows, in some instances, an exact identity. . . . These parallelisms, together with a host of others which might be produced, all point to the existence of an early relationship between Chinese and Mesopotamian culture; and, armed with the advantages thus possessed, the Chinese entered into the empire over which they were ultimately to over-spread themselves. But they came among tribes who, though somewhat inferior to them in general civilisation, were by no means destitute of culture. . . . Among such people, and others of a lower civilisation, such as the Jungs of the west and the Teks, the ancestors of the Tekke Turcomans, in the north, the Chinese succeeded in establishing themselves. The Emperor Yaou (2356-2255 B. C.) divided his kingdom into twelve portions, presided over by as many Pastors, in exact imitation of the duodenary feudal system of Susa with their twelve Pastor Princes. To Yaou succeeded Shun, who carried on the work of his predecessor of consolidating the Chinese power with energy and

success. In his reign the first mention is made of religious worship. . . . In Shun's reign occurred the great flood which inundated most of the provinces of the existing empire. The waters, we are told, rose to so great a height, that the people had to betake themselves to the mountains to escape

OLD CHINESE BRONZE
(Shang Dynasty)

death. The disaster arose, as many similar disasters, though of a less magnitude, have since arisen, in consequence of the Yellow River bursting its bounds, and the 'Great Yu' was appointed to lead the waters back to their channel. With unremitting energy he set about his task, and in nine years succeeded in bringing the river under control. . . . [See also CONSERVATION OF NATURAL RESOURCES: China; B. C. 2207-A. D. 1915.] As a reward for the services he had rendered to the em-

BRONZE JAR
(Chou Dynasty)

pire, he was invested with the principality of Hea, and after having occupied the throne conjointly with Shun for some years, he succeeded that sovereign on his death, in 2208 B. C. With Yu began the dynasty of Hea, which gave place, in 1766 B. C., to the Shang Dynasty. The last sovereign

of the Hea line, Kieh kwei, is said to have been a monster of iniquity, and to have suffered the just punishment for his crimes at the hands of T'ang, the prince of the State of Shang, who took his throne from him. In like manner, 640 years later, Woo-wang, the prince of Chow, overthrew Chow Sin, the last of the Shang Dynasty, and established himself as the chief of the sovereign state of the empire. By empire it must not be supposed that the empire, as it exists at present, is meant. The China of the Chow Dynasty lay between the 33rd and 38th parallels of latitude, and the 106th and 110th of longitude only, and extended over no more than portions of the provinces of Pih chih-li, Shanse, Shense, Honan, Keang-se, and Shan-tung. This territory was rearranged by Woo-wang into the nine principalities established by Yu. . . . Woo is held up in Chinese history as one of the model monarchs of antiquity. . . . Under the next ruler, K'ang (B. C. 1078-1053), the empire was consolidated, and the feudal princes one and all acknowledged

CHINESE VESSEL
(Shang Dynasty)

their allegiance to the ruling house of Chow. . . . From all accounts there speedily occurred a marked degeneracy in the characters of the Chow kings. . . . Already a spirit of lawlessness was spreading far and wide among the princes and nobles, and wars and rumours of wars were creating misery and unrest throughout the country. . . . The hand of every man was against his neighbour, and a constant state of internecine war succeeded the peace and prosperity which had existed under the rule of Woo-wang. . . . As time went on and the disorder increased, supernatural signs added their testimony to the impending crisis. The brazen vessels upon which Yu had engraved the nine divisions of the empire were observed to shake and totter as though foreshadowing the approaching change in the political position. Meanwhile Ts'in on the northwest, Ts'oo on the south, and Tsin on the north, having vanquished all the other states, engaged in the final struggle for the mastery over the confederate prin-

cialities. The ultimate victory rested with the state of Ts'in, and in 255 B. C., Chaou-seang Wang became the acknowledged ruler over the 'black-haired' people. Only four years were given him to reign supreme, and at the end of that time he was succeeded by his son, Heaou-wan Wang, who died almost immediately on ascending the throne. To him succeeded Chwang-seang Wang, who was followed in 246 B. C. by Che Hwang-te, the first Emperor of China. The abolition of feudalism, which was the first act of Che Hwang-te raised much discontent among those to whom the feudal system had brought power and emoluments, and the countenance which had been given to the system by Confucius and Mencius made it desirable—so thought the emperor—to demolish once for all

vision, and though every endeavor was made to hasten its completion he died (209) leaving it unfinished. His death was the signal for an outbreak among the dispossessed feudal princes, who, however, after some years of disorder, were again reduced to the rank of citizens by a successful leader, who adopted the title of Kaou-te, and named his dynasty that of Han (206). From that day to . . . [the establishment of a republic in 1912], with occasional interregnums, the empire has been ruled on the lines laid down by Che Hwang-te. Dynasty has succeeded dynasty, but the political tradition has remained unchanged, and though Mongols and Manchoos have at different times wrested the throne from its legitimate heirs, they have been engulfed in

THE GREAT WALL OF CHINA

their testimony in favour of that condition of affairs, which he had decreed should be among the things of the past. With this object he ordered that the whole existing literature, with the exception of books on medicine, agriculture, and divination, should be burned. The decree was obeyed as faithfully as was possible in the case of so sweeping an ordinance, and for many years a night of ignorance rested on the country. The construction of one gigantic work—the Great Wall of China—has made the name of this monarch as famous as the destruction of the books has made it infamous. Finding the Heung-nu Tartars were making dangerous inroads into the empire, he determined with characteristic thoroughness to build a huge barrier which should protect the northern frontier of the empire through all time. In 214 B. C. the work was begun under his personal super-

vision, and though every endeavor was made to hasten its completion he died (209) leaving it unfinished. His death was the signal for an outbreak among the dispossessed feudal princes, who, however, after some years of disorder, were again reduced to the rank of citizens by a successful leader, who adopted the title of Kaou-te, and named his dynasty that of Han (206). From that day to . . . [the establishment of a republic in 1912], with occasional interregnums, the empire has been ruled on the lines laid down by Che Hwang-te. B. C. 206—A. D. 1280.—From the early Han dynasty to the Yuan dynasty of the Mongols.—“The Han dynasty was established B. C. 206 by Liu-pang, Prince of Han. It carried Chinese arms and civilisation south of the Yangtze (Kiangsi, Hunan, Kweichow, Kwangsi, and Kwangtung); following the lines through the Poyang and Tungting Lakes; and it also included Kansu in its dominion, and subjugated the northern part of

Korea. Through Kansu the Chinese thus came, by the trans-Asian trade routes, into communication with the West. This period is looked back to as the Golden Age of Chinese history; and 'Sons of Han' is the name given to themselves to this day by the Chinese, except the Cantonese, who call themselves 'Sons of Tang.' During this period, too, the incursions of the Tartar tribes became more troublesome, the most insistent being the Hiung-nu, to whom for many years the Han Emperors paid an annual subsidy of silks, rice, and wine. The Han dynasty came to an end A. D. 25, and a period of two centuries of confusion followed. In this were distinguished the three great traitors of Chinese history, Wang-mang, Tung-cho, and Tsao-tsao. This was followed by the romantic and chivalrous period of the 'Three Kingdoms' (A. D.

(557-589), and Sui (589-618)—each throne set up by a strong commander and lost by his degenerate successor. The Tang dynasty (618-907) is another glorious period of Chinese history. Its founder remodelled his army and was able to drive back the Tartar invaders, establishing his capital at Changan in Shensi; he reorganized the government and re-established order; he brought the Cantonese under more perfect control; and he encouraged the study of the Confucian classics, declaring that 'Confucian thought is to the Chinese what the water is to the fish.' The culminating point in this period was the domination of the Empress Wu-how, who first ruled jointly with her husband, the Emperor Kao-tsung (650-684) and then as Empress Dowager-Regent for her son Cbung-tsung, until in 705 she was forced by advancing age to abdi-

221-265)—the kingdom of Wei, comprising the central and northern parts of the Han Empire; Wu, bordering the Yangtze and comprising Hunan, Hupeh, Kiangsi, Anhwei, Kiangsu, and Chekiang; and Shu, including Szechwan and adjacent territory. These kingdoms waged incessant war with each other; but finally the kingdom of Wei was victorious and, absorbing the others, its ruler established the Western Tsin dynasty (A. D. 265-317). During the whole of this time the country was subject to the incursions of the Tartars, who seemed to consider the Great Wall as only an incitement to invasion, and to regard with scorn the weak pretensions of the 'man behind the wall.' Finally the Chinese rulers were driven from their capital at Kaifeng and pushed south of the Yangtze, the Tartars holding the country to the north; and in that southern territory, with the capital at Nanking, there was a succession of weak and short-lived dynasties—Eastern Tsin (317-420), Sung (420-479), Tsi (479-502), Liang (502-557), Chen

cate her power. Her ability has been recognised by the Chinese, but her memory has been execrated because of the impropriety of her conduct in presuming to govern the Empire. In fact, however, she was the last of the strong rulers of the dynasty, and for the remaining two centuries the throne was for the most part filled by men weak in character and of small capacity. Literature flourished and the arts advanced; but the country was disturbed by internal rebellions and Tartar incursions. Korea was fully conquered in 667 and reduced to a vassal state, remaining in that position until 1805; this secured the north-eastern frontier, but along the northern border for more than two centuries there was no peace. Nestorian priests, coming from Persia, brought the first teaching of Christianity into China during this period. They were favourably received; and by Imperial sanction a stone tablet recording the tenets of their Church was erected at Siangfu in Shensi. After the Tang dynasty followed the period of the Five

Dynasties (907-960)—Later Liang, Later Tang, Later Tsin, Later Han, and Later Chow—a period of military despotism. The Sung dynasty followed in 960. Peace was again restored and order established, and for a time one ruler governed the whole Empire. The incursions of the Tartar tribes were, however, soon resumed; and in 1125 the Kin or Nü-chen Tartars—'the Golden Horde'—gained the predominance and made serious inroads upon the Imperial domain. At an early date they seized the capital, Kaifeng, and required the Emperor to pay an annual tribute; and in no time they drove the Imperial forces south of the Yangtze, establishing their own dominion over the territory to

7th-9th centuries.—Trade with western Eu-

extended to the Empire of the Kin itself. In 1214 he ravaged their provinces to the Yellow River, and in the following year took Chungtu or Peking. In 1219 he turned his arms against Western Asia; . . . but a lieutenant whom he had left behind him in the East continued to prosecute the subjection of Northern China. Chinghiz himself on his return from his western conquests renewed his attack on Tangut, and died on that enterprise, 18th August. Okkodai, the son and successor of Chinghiz, followed up the subjugation of China, extinguished the Kin finally in 1234 and consolidated with his Empire all the provinces north of the Great Kiang. The Southern provinces remained for the present subject to the Chinese dynasty of the Sung, reigning now at Kingssé or Hangcheu. This kingdom was known to the Tartars as Nangkiass, and also by the quasi-Chinese title of Mangi

or Manzi, made so famous by Marco Polo and the travellers of the following age."—H. Yule, *Cathay and the way thither: Preliminary essay*, sect. 91-92.—See also MONGOLIA: 1153-1227; 1229-1294.

1259-1294.—Empire of Kublai Khan.—Kublai, or Khubilai Khan, one of the grandsons of Jenghiz Khan, who reigned as the great khan or supreme lord of the Mongols from 1259 until 1294, "was the sovereign of the largest empire that was ever controlled by one man. China, Corea, Thibet, Tung-King, Cochin China, a great portion of India beyond the Ganges, the Turkish and Siberian realms from the Eastern Sea to the Dnieper, obeyed his commands; and although the chief of the Hordes of Jagatai and Ogatai refused to acknowledge him, the Ilkhans of Persia . . . were his feudatories. . . . The Supreme Khan had immediate authority only in Mongolia and China. . . . The capital of the Khakan, after the accession of Khubilai, was a new city he built close to the ancient metropolis of the Liao and Kin dynasties."—H. H. Howorth, *History of the Mongols*, v. 1, pp. 216-282.—"Khan-Bâlig (Mong., 'The Khan's city'), the Cambalu of Marco, Peking . . . was captured by Chinghiz in 1215, and in 1264 Kublai made it his chief residence. In 1267 he built a new city, three 'li' to the north-east of the old one, to which was given the name of Ta-tu or 'Great Court,' called by the Mongols Daïdu, the Taydo of Odoric and Taidu of Polo, who gives a description of its dimensions, the number of its gates, etc., similar to that in the text. The Chinese accounts give only eleven gates. This city was abandoned as a royal residence on the expulsion of the Mongol dynasty in 1368, but re-occupied in 1421 by the third Ming Emperor, who built the walls as they now exist, reducing their extent and the number of the gates to nine. This is what is commonly called the 'Tartar city' of the present day (called also by the Chinese Lau-Chhing or 'Old Town'), which therefore represents the 'Taydo' of Odoric."—H. Yule, *Cathay and the way thither*, v. 1, p. 127, footnote.—See also MONGOLIA: 1206-1500; 1220-1294.

1294-1736.—Dissolution of the empire of Kublai Khan.—Ming dynasty and its fall.—Enthronement of the present Manchu Tatar dynasty, of the Tsings or Ch'ings.—Appearance of the Portuguese and the Jesuit missionaries.—"The immediate successors of Kublai, brought up in the luxuries of the imperial palace, the most gorgeous at that time in the world, relied upon the prestige with which the glory of the late emperor invested them, and never dreamed that change could touch a dominion so vast and so solid. Some devoted themselves to elegant literature and the improvement of the people; later princes to the mysteries of Buddhism, which became, in some degree, the state religion; and as the cycle went round, the dregs of the dynasty abandoned themselves, as usual, to priests, women, and eunuchs. . . . The distant provinces threw off their subjection; robbers ravaged the land, and pirates the sea; a minority and a famine came at the same moment; and in less than ninety years after its commencement, the fall of the dynasty was only illumined by some few flashes of dying heroism, and every armed Tartar, who could obtain a horse to aid his flight, spurred back to his native deserts. Some of them, of the royal race, turning to the west, took refuge with the Manchows, and

in process of time, marrying with the families of the chiefs, intermingled the blood of the two great tribes. The proximate cause of this catastrophe was a Chinese of low birth, who, in the midst of the troubles of the time, found means to raise himself by his genius from a servile station to the leadership of a body of the malcontents, and thence to step into the imperial throne. The new dynasty [the Ming] began their reign with great brilliance. The emperor carried the Tartar war into their own country, and at home made unrelenting war upon the abuses of his palace. He committed the mistake, however, of granting separate principalities to the members of his house, which in the next reign caused a civil war and the usurpation of the throne by an uncle of the then emperor. The usurper found it necessary to transfer the capital to Peking, as a post of defence against the eastern Tartars, who now made their appearance again on this eventful stage. He was successful, however, in his wars in the desert, and he added Tonquin and Cochin China to the Chinese dominions. After him the fortunes of the dynasty began to wane. The government became weaker, the Tartars stronger, some princes attached themselves to literature, some to Buddhism or Taoism; Cochin China revolted, and was lost to the empire, Japan ravaged the coasts with her privateers; famine came to add to the horrors of misrule."—L. Ritchie, *History of the Oriental nations*, v. 2, bk. 1, ch. 1.—"Never was there such marine activity in China as during the early reigns of the Ming dynasty (1368-1424). Chinese junks, under the command of a very distinguished eunuch, amply supplied with funds, ammunition, and fighting men, went as far as the Arabian and African coasts; the Red Sea was first vaguely heard of, and tribute was for some time regularly sent from Arabia, Ma'abar or Malabar, Ceylon, Sumatra, the Malay states, Siam, Java, Sulu, Loochoo, and Borneo, besides innumerable other petty island rulers too insignificant to enumerate here. Towards the end of the sixteenth century the armies of the great Japanese Napoleon, Hideyoshi, overran Corea, his ultimate aim being to conquer China. The Ming dynasty, though already decrepit, rendered signal aid to Corea in driving the Japanese out. During the two preceding centuries the Japanese pirates had actively harassed the Chinese coasts, and in 1600 they temporarily carried off China's tributary, the King of Loochoo. . . . Luzon (Manila) is first mentioned in 1410 as sending tribute to China [see PHILIPPINE ISLANDS: Previous to 1525]; but nothing more is heard of the place until 1576, when the sea-borne Franks (Fulangki) begin to attract serious attention. [See PHILIPPINE ISLANDS: 1574.] At first this term was applied indifferently to the Portuguese, Spaniards, and French; but the Dutch (Ho-lan), and afterwards the English, were specially known as 'Red-hairs.' Chinese influence had almost disappeared from the South Seas before Europeans put in an appearance, and after the settlement of Malacca by the Portuguese, the whole political field was practically abandoned; the Chinese traders there willingly submitted to the government of natives and Europeans without attempting to secure the protection of either the Ming or the Manchu power—in fact, the latter was always disposed to view trading emigrants in the light of pirates or traitors. . . . The Ming dynasty waged a long war with Burma and the Shan states under the latter's protection; on the whole successfully. It also maintained a preponderating influence in Annam, Siam, Ciampa, and Cambodia. Tribute was

occasionally sent from Arabia, Samarcand, the Pamir states, and various parts of Turkestan; but in the main Chinese influence in Tibet and all places west of it and of the Yellow River was fitful and feeble. In spite of the vigour of the founder of the Ming dynasty and of his warlike son, who in 1421 finally transferred the capital from Nanking to his own appanage, Peking, on the whole no impression of affection or respect has been left upon the Chinese mind by this ruling house, the emperors of which soon dropped into the hands of eunuchs and favourites; and it perhaps ended as pitifully and contemptibly as any Chinese dynasty ever did."—E. H. Parker, *China*, pp. 35-37.—See also MONGOLIA: 1206-1500.—"From without, the Mings were constantly harassed by the encroachments of the Tartars; from within, the ceaseless intriguing of the eunuchs

long list. . . . The overthrow of the Mings [1644] was brought about by a combination of events, of the utmost importance to those who would understand the present position of the Tartars as rulers of China. A sudden rebellion had resulted in the capture of Peking by the insurgents, and in the suicide of the Emperor who was fated to be the last of his line. The Imperial Commander-in-chief, Wu San-kuei, at that time away on the frontiers of Manchuria, engaged in resisting the incursions of the Manchu Tartars, now for a long time in a state of ferment, immediately hurried back to the capital, but was totally defeated by the insurgent leader, and once more made his way, this time as a fugitive and a suppliant, towards the Tartar camp. Here he obtained promises of assistance, chiefly on condition that he would shave his head and grow a tail in

DINNER PARTY AT A MANDARIN'S HOUSE

(Period, Ming Dynasty)

(resulting in one case in the temporary deposition of an Emperor) was a fertile cause of trouble. Towards the close of the 16th century the Portuguese appeared upon the scene, and from their 'concession' at Macao, for some time the residence of Camoens, opened commercial relations between China and the West. They brought the Chinese, among other things, opium, which had previously been imported overland from India. They possibly taught them how to make gunpowder, to the invention of which the Chinese do not seem, upon striking a balance of evidence, to possess an independent claim. About the same time [1580] Rome contributed the first instalment of those wonderful Jesuit fathers, whose names may truly be said to have filled the empire 'with sounds that echo still,' the memory of their scientific labours and the benefits they thus conferred upon China having long survived. . . . Of all these Jesuit missionaries, the name of Matteo Ricci [who died in 1610] stands by common consent first upon the

accordance with Manchu custom, and again set off with his new auxiliaries towards Peking, being reinforced on the way by a body of Mongol volunteers. As things turned out Wu San-kuei arrived at Peking in advance of these allies, and actually succeeded, with the remnant of his own scattered forces, in routing the troops of the rebel leader before the Tartars and the Mongols came up. He then started in pursuit of the flying foe. Meanwhile the Tartar contingent arrived; and on entering the capital, the young Manchu prince in command was invited by the people of Peking to ascend the vacant throne. So that by the time Wu San-kuei re-appeared he found a new dynasty [the Ta Ching Ch'ao dynasty, which fell in 1612] established, and his late Manchu ally at the head of affairs. His first intention had doubtless been to continue the Ming line of Emperors; but he seems to have readily fallen in with the arrangement already made, and to have tendered his formal allegiance on the four following conditions:

—(1.) That no Chinese woman should be taken into the Imperial seraglio. (2.) That the first place at the great triennial examination for the highest literary degrees should never be given to a Tartar. (3.) That the people should adopt the national costume of the Tartars in their everyday life; but that they should be allowed to bury their corpses in the dress of the late dynasty. (4.) That this condition of costume should not apply to the women of China, who were not to be compelled either to wear the hair in a tail before marriage (as the Tartar girls do) or to abandon the custom of compressing their feet. The great Ming dynasty was now at an end, though not destined wholly to pass away. A large part of it may be said to remain in the literary monuments which were executed during its three centuries of existence. . . . Under the third Manchu Emperor, Yung Cheng [1723-1736], began that violent persecution of the Catholics which has continued almost to the present day. The various sects—Jesuits, Dominicans, Franciscans—had been unable to agree about the Chinese equivalent for God, and the matter had been finally referred to the Pope. Another difficulty had arisen as to the toleration of ancestral worship by Chinese converts professing the Catholic faith. . . . As the Pope refused to permit the embodiment of this ancient custom with the ceremonies of the Catholic church, the new religion ceased to advance, and by-and-by fell into disrepute.”—H. A. Giles, *Historic China*, ch. 5-6.

1662-1838.—Manchu rule.—Early strength and later deterioration.—Imperial political system.—Early European and American relations with China.—“The first century and a half of Manchu rule was marked by vigor and efficiency. The period was nearly covered by two reigns, those of K'ang Hsi (1662-1723) and Ch'ien Lung (1736-1796), one sixty-one and the other sixty years in length. These two monarchs were among the strongest that the nation has had. During their time China was one of the best-governed lands on the earth and was second to none in population and to but two in area. These two men gave an impetus to the dynasty that was to carry it over the reigns of weaker rulers down into the twentieth century. . . . The period was marked by a vigorous home policy. Rebellions were put down with a heavy hand. The most serious of these broke out during the earlier years of K'ang Hsi, headed by the Chinese general, Wu San Kwei, who had allied himself with the Manchus when they had first marched on Peking and who greatly facilitated if not indeed made possible their success. This king-maker had been rewarded with the governorship of extensive domains in the Southwest, an almost semi-independent satrapy. From that vantage-point he declined the emperor's invitation to come to Peking, sent him apparently with the desire to curtail his dangerous power, and raised the standard of revolt. The rebellion

was subdued only after the greatest exertions. . . . Other rebellions were put down with an equally vigorous hand. Remnants of non-Chinese peoples still exist within the borders of the Eighteen Provinces, principally in the South and Southwest. These have to a large extent preserved their own tribal form of government and their own language. Their territories have been encroached upon by the Chinese only slowly. During this early Manchu period these native tribes were more firmly reduced to submission and were made to keep the peace. They were placed as far as possible under the direct rule of the central government, but complete amalgamation with the Chinese has never yet been effected. Both the great emperors were intelligent patrons of Chinese culture. Confucius had never been more generously honored than by these Manchus. The Sung dynasty philosophers—especially Chu Hsi—were revered and their commentaries on the Classics made the official interpretation of these ancient documents. Chinese scholarship was encouraged and thus bound by ties of loyalty to the foreign ruling house. Both K'ang Hsi and Ch'ien Lung were themselves authors of no mean ability and were masters of Chinese literature. Under imperial direction scholars compiled books on all the branches of learning known to the nation. Ancient works were sought out and were issued in imperial revised editions. Great encyclopedias were prepared, and a dictionary that still remains standard. It was not a period of creative genius. No important new schools of thought arose. It was, however, a time of great interest in all branches of culture. Art was encouraged, especially work in porcelain, in brass, and in lacquer. The china of these years is noteworthy and is still eagerly sought by collectors. . . . The period was marked as well by a vigorous foreign policy. The boundaries of the empire were carried farther than ever before. . . . Manchuria, as the home of the dynasty, was already a part of their domain. To the west of Manchuria lies the great semi-arid region known as Mongolia. The tribes of Inner Mongolia, the section contiguous to China, had nearly submitted to Manchu domination. [See MONGOLIA: 1206-1500.] Partly through voluntary submission, partly by an extensive war of conquest, Chinese rule was expanded into the section to the north, Outer Mongolia. The reduction of Mongolia brought China into conflict with Tibet. In the seventh century this region had been converted to a sect of Buddhism, and its priests had in the course of centuries become the temporal as well as the spiritual rulers of the land. In the fifteenth century this Buddhist sect was reformed by a vigorous character who made the priesthood celibate and established its rule over the country more firmly than ever, in a form that has endured until the present. The head of this Tibetan Buddhist Church is known as the Dalai Lama. He is held to be the incarnation of one of the Buddhist saints (or Bodhisattvas), and at the death of one Dalai Lama the spirit is believed to be immediately reincarnated in another, so that the succession is perpetual. Now the inhabitants of Mongolia were at this time adherents of this Lama sect of Buddhism, and although ruled directly by their own spiritual chief, the Dalai Lama was so closely connected with them that the subjugation of Tibet became a necessity if peace in Mongolia was to be assured. K'ang Hsi soon found in a disputed succession an opportunity for interfering in the internal affairs of Tibet, and in the interests of his candidate invaded the country, put him into power at Lhasa, and maintained him by a gar-

ri-son. Tibet thus became tributary to China and has remained so ever since. Probably as much from the dictates of state policy as from conviction K'ang Hsi and his successors became patrons of Lamaistic Buddhism and showed it great favors. Most of Mongolia and Tibet were now part of the Manchu Empire. [See MONGOLIA: 1697-1724.] It became necessary, however, to round out the frontier to its natural boundaries, the great divide that separates what is now the Chinese Empire from the Russian dominions in Western and Northern Asia. The principal territory still un-

occupy the northern borders of India. So thoroughly were they awed that they sent tribute to the court of Peking until brought under the growing British authority in India. In the south-west, where the mountain passes are low and invite intercourse, troubles arose with Burma. To settle them Burma was invaded and reduced to submission. In witness of Chinese suzerainty it sent tribute to Peking every ten years, a practice which continued until 1836, when it was ended by the new masters of Burma, the British. Annam was invaded, and that country, which had been

THRONE OF THE EMPEROR KIEN-LUNG (1736-1795)

It is of carved red lacquer, 4 feet high and 4 feet wide, and was made at a time when Chinese art was at its height.

occupied was that along the ancient overland caravan routes to the West, the section known to Western geographers as Chinese Turkestan and some districts north of it, Ili and Dzungaria. Trouble arose in Mongolia over the presence of independent, restless tribes on its boundaries, and the disturbance became at once the excuse and the occasion for the reduction of these territories. By a series of campaigns, largely under Ch'ien Lung, they were conquered and annexed, and were organized into the so-called 'New Territory' (Sin Kinagn). Except on the north the Chinese boundaries now stretched without interruption to the continental divide. Invasions into Tibet by the peoples of the Himalaya region led to the reduction of some of the hardy mountaineers that

part of the Ming domains, was compelled still further to recognize Chinese overlordship. These vigorous Manchu emperors, then, had not only ruled China proper well and with justice, but they had extended Chinese territory to its natural boundaries. . . . After Ch'ien Lung inferior men came to the throne. The Manchu race began to suffer from too many years of success, and its vigor declined. Outwardly the empire was as brilliant as ever, but inwardly unrest began to show itself. Secret political organizations were constituted in opposition to the dynasty. Rebellions sprang up, some of them difficult to reduce, and disorder arose on the distant frontiers. The Manchu power was manifestly waning. During this period began a more extensive growth of

European trade. European impact on the empire increased. The irresistible growth of the pressure of Western nations on China and the weakness and ignorance of the Chinese authorities led to a series of momentous events, some of which are still in progress."—K. S. Latourette, *Development of China*, pp. 71-83.

As to political system: "The political organization of China was highly developed. No other surviving one can show a so nearly continuous history stretching over so many centuries. In ideal it was primarily for the people. It existed to secure and to further their welfare. Its objects were primarily the well-being of the entire nation. The ruler existed for the people, not the people for the ruler. The military was supposedly used merely for defensive policing purposes. Although the army has always played an important part in Chinese history and although dynasties have invariably owed their foundation to successful generals, the soldier has not been exalted as highly as in Japan and the Occident. He has been regarded as a destroyer of life and property and has been ranked among the lowest classes of society. The producer and the creative thinker, the scholar, were ranked above him. The practical turn of the Chinese mind, with its emphasis upon physical well-being, is clearly seen throughout the political constitution. At the head was the emperor. One of his titles was 'Son of Heaven.' The theory, however, was far removed from that of the divine right of kings of Western absolutists. The decree of Heaven was supposed to be given primarily with the good of the people in mind, and if the emperor failed to rule them justly or if he neglected their prosperity and gave himself to selfish luxury, the theory regarded with complacency rebellion and the foundation of a new dynasty. It justified that succession of royal houses which is so characteristic of Chinese history. The authority of the emperor was absolute. He was the fountain of law, of justice, and of administration, and his word was final. The institution was paternalistic, and the emperor took in theory, and if an able ruler, in practice, an interest in every detail of national life. The emperor ruled, however, by means of a bureaucracy. One man could not hope, of course, to attend to all the details of government and his power was delegated to subordinates in a carefully worked-out, descending scale. At the top were the court officials; there was the council of state; there were central boards in charge of military affairs, the judiciary, public works, and various other branches of administrative, judicial, and legislative activity; there was a board of censors, charged to speak fearlessly its criticisms of the government; there were official historiographers whose duty it was to record impartially public events and the acts of the emperor. Below these central bodies the system ramified through the empire. There were viceroys, usually at the head of two provinces. In the province the central power was shared by the governor, the treasurer, the salt commissioner, the commissioner of education, and the provincial judge. These acted as checks on one another and so make sedition difficult. Underneath the provincial authorities were the officials of another series of divisions and sub-divisions, heads of circuits, of counties, of districts. All of these were appointed from the capital, and under the Manchus no official could hold office in his own province. Rebellion and the growth of independence and decentralization, always the danger of so large a state, were thus guarded against. This immense official class was recruited by a series of civil service examinations,

to which all but members of a few despised occupations were eligible, regardless of birth or station. In theory the emperor was to govern with the aid of the wisest and the ablest of the realm. Was not the government for the benefit of all, and should not the wisest and ablest be searched out to aid in it? These examinations, then, with their three successive grades and degrees, were for the purpose of selecting the best men in the empire. They were based primarily on the ancient Classics and had mostly to do with ethics, history, and statecraft. Too frequently they were stereotyped and encouraged literary style and memory at the expense of independent creative thinking. Too often corruption crept in, and literary degrees were sold to meet the necessities of the state and of dishonest officials. On the whole, however, they were fairly efficient and surprisingly democratic. They brought into competition for government positions and into official service most of the highly trained minds of the nation. Sons of the humblest might rise to the highest positions. On even rude farmhouses in out-of-the-way districts one might see displayed characters indicating that some relative of the occupant had won a degree. Thanks to this system China was largely freed from a ruling caste that owed its power to hereditary right. No other part of the constitution so contributed to the continuance and the efficiency of the government. Underneath the bureaucracy were the village elders and the heads of families, a humble but a no less important part of the government. The village was in many respects self-governing, and family control was universal and strong. Guilds exercised many of the powers of regulation over trade and industry which in most other countries have fallen to the government. The central government was a policing and tax-gathering agency. It gave coherence to the country and provided for the common defense, but in local, and especially in rural and village, administration, the nation was largely self-governing with a strong tendency to democracy. There was a carefully organized code of laws, reissued and amended by each dynasty, but representing the growth of ages of experience and legislation. Justice was too frequently bought and sold, many of the punishments seem to us inhuman, and torture, though illegal, was all too frequent. The theory of justice was there, however, and long-established precedent for reliance on and respect for law."—*Ibid.*, pp. 97-102.

As to trade: "In 1784 the Stars and Stripes floating from the *Empress of China*, an American trading vessel, first appeared in the Orient at Canton, the only Chinese port at which foreigners were permitted to trade. In 1786, President Washington, in the interests of a rapidly growing trade, appointed Samuel Shaw as consul at that port. It was over a half-century later that China first consented to make treaties regulating and extending commercial intercourse, and providing for the protection of the lives and property of American citizens on Chinese territory. From 1786 to 1844 the American consuls at Canton were merely merchants. During that time, however, our trade with China suffered only one temporary interruption—in 1821, when Terranora, a sailor on board of the American ship *Emily*, was judicially murdered by the Chinese magistrate, Pwany, and the American merchants at Whampoa protested without effect. For many years the powers of Western Europe had been able to secure a restricted trade. As early as 1537 the Portuguese temporarily established a trade at Macao. They were soon followed by the Spanish, who had established a

colony at Manila in 1543. In 1622 the Dutch attacked the Portuguese settlements at Macao and occupied the Pescadore (Pang-hu) Islands, and in 1625 they were induced to move to Formosa by Chinese promises of freedom of trade, but were driven to Java, a generation later, by the fleet of Koshinga, the pirate. In 1637 Captain Weddel, with an English squadron, anchored off Macao and compelled the opening of trade with the English. Soon after 1689 Russian caravans were permitted to go to Peking to trade. All attempts to secure commercial treaties or regular diplomatic intercourse, however, had ended in failure. Most ambassadors refused to make the nine prostrations required by the emperor as a preliminary to negotiation. In 1699 the English East India Company obtained permission to establish a factory and a consulate at Canton, where they desired to trade in tea, but trade was often interrupted by heavy duties and extortions. The Dutch finally secured the same privilege. No other port was open to commerce. For half a century after 1720 all business of Europeans was transacted through a single company of Chinese hong merchants, which was responsible to the Chinese Government for the customs and duties, and responsible to no one for its enormous profits. Though the co-hong was dissolved in 1771, the hong merchants, by making presents to the Canton magistrates, still contrived to maintain their monopoly and continued their exorbitant and extortionate prices, and in some cases refused to pay their debts. Suspecting that their complaints were never allowed to reach Peking, the British, in 1792, sent to the imperial city an ambassador (Lord Macartney) who secured the dismissal of the Canton viceroy who had encouraged the frauds. In 1816, they again complained of the manner of the Canton trade and asked for new ports more convenient to the principal tea district, but Lord Amherst, who was sent at the head of an embassy, was not received by the Chinese sovereign."—J. 1839-1842.—Opium War with England.—Treaty of Nanking.—Opening of the five ports.—"The first Chinese war [of England] was in one sense directly attributable to the altered position of the East India Company after 1833. [See INDIA: 1823-1833.] Up to that year trade between England and China had been conducted in both countries on principles of strict monopoly. The Chinese trade was secured to the East India Company, and the English trade was confined to a company of merchants specially nominated for the purpose by the Emperor. The change of thought which produced the destruction of monopolies in England did not penetrate to the conservative atmosphere of the Celestial Empire, and, while the trade in one country was thrown open to everyone, trade in the other was still exclusively confined to the merchants nominated by the Chinese Government. These merchants, hong merchants as they were called, traded separately, but were mutually liable for the dues to the Chinese Government and for their debts to the foreigners.

Such conditions neither promoted the growth of trade nor the solvency of the traders; and, out of the thirteen hong merchants in 1837, three or four were avowedly insolvent. (State Papers, v. 27, p. 1310.) Such were the general conditions on which the trade was conducted. The most important article of trade was opium. The importation of opium into China had, indeed, been illegal since 1796. But the Chinese Government had made no stringent efforts to prohibit the trade, and a Select Committee of the House of Commons had declared that it was inadvisable to abandon an important source of revenue to the East India Company. (State Papers, v. 29, p. 1020.) The opium trade consequently thrived, and grew from 4,100 chests in 1796 to 30,000 chests in 1837, and the Chinese connived at or ignored the growing trade. (Ibid., p. 1010)."—S. Walpole, *History of England from 1815*, note, v. 5, p. 287.—"The Emperor Taokwang took the opium question much to heart. The restriction on its import had in no way diminished the quantity; the ships under all the foreign flags (excepting only the ships of the English East India Company) continued to bring it, but, instead of coming into port, they remained outside port limits and delivered it there to Chinese buyers; and the officials continued to levy their tax on it, but it was for their own profit and not for the public fisc. In 1836, in order to combat the evils of a clandestine trade, the question was seriously debated at Peking whether it was not better to legalise the trade, but it was decided in the negative. In this decision the Emperor had against him practically all the tax-collecting mandarins, but in Lin Tse-sü he found a man after his own heart, prepared to over-ride all obstacles and so extirpate the curse. He was appointed High Commissioner for this purpose in 1839; and, on his arrival at Canton, put an embargo on the foreign trade, and placed the English Superintendent and the foreign merchants of all nationalities in close confinement in their houses, deprived of food, fuel, water, and servants, and demanded that the opium then in the 'outside waters' be brought in and surrendered to him. With the foreign residents held as hostages for the execution of this command, the English Superintendent, to secure their release, ordered all opium then in Chinese waters to be surrendered to him on behalf of the British Government, and he in turn surrendered it, to the amount of 20,291 chests, to the Chinese authorities, who destroyed it to the last ounce. Commissioner Lin then demanded that each foreign resident should sign a bond undertaking, for himself, his Government, and all foreign merchants, that there should be no more trade in opium. They were willing, in their state of duress, to sign for themselves individually; and, when the High Commissioner found he could obtain no more, he released the imprisoned foreigners and allowed them to take refuge on board their ships at Hongkong. In the war which followed the Chinese were uniformly beaten; Canton, Amoy, Ningpo, Chapu, Shanghai, and Chinkiang were taken by the British plenipotentiary, Sir Henry Pottinger, with Admiral Sir William Parker in command of the fleet; and on August 29th, 1842, was signed the treaty of Nanking, by which the Chinese conceded all that was demanded. To the Chinese opium appeared to have been the sole cause of the war, and they honestly could not understand that any other cause existed. To their expressed surprise, the opium question was not included in the English demands formulated at Nanking, and they were informed that they could regulate the trade according to their own laws, on condition that, in doing so, they

did not injuriously affect the persons or the other property of foreign merchants. The treaty settled the equal status of nations, and guaranteed security to the persons of their representatives and merchants; abolished the monopoly of trade, and permitted foreign representatives to communicate direct with the Chinese officials; designated five ports (Canton, Amoy, Foochow, Ningpo, and Shanghai) at which foreign merchants might erect residences and warehouses and conduct trade; provided for a uniform and published tariff of customs duties, in lieu of the previous exactions, unknown in amount and uncertain in their incidence; and exacted an indemnity of six million dollars for the expenses of the expedition and as compensation for the opium surrendered to obtain the release of the persons illegally detained. The provisions of this treaty, imposed at the cannon's

sent to the Senate and the House a message, prepared by Webster, referring to the importance of the Sandwich Islands and the China trade, and urging an appropriation for sending an official representative to China. A bill for a mission was called up by the Senate at midnight on the last day of the session of 1842-43. It met with much opposition. Benton, on the ground that we already had trade and could never have closer relations than that with a people so distant and peculiar, said there was no necessity for a treaty. The appropriation was voted, however, and Edward Everett was selected (March 3) as the first envoy. When the latter declined, Caleb Cushing was appointed. His instructions, signed by Webster, were designed to dispel the Chinese delusion that other nations were dependents, and their representatives tribute bearers. He was directed to announce to

TAO-KWANG REVIEWING GUARDS AT THE PALACE, PEKING

mouth, indicate clearly enough what were the motives which led the British Government to take up arms."—H. B. Morse, *Trade and administration of the Chinese empire*, pp. 18-20.—See also ASIA: European influence on education, industry, medicine, etc.; OPIUM PROBLEM: 1840; MILITARY ORGANIZATION: 25.

1839-1844.—Relations with the United States.—First mission and treaty.—"The United States was not slow to take advantage of the Chinese reformed methods of intercourse. In September, 1839, when the Chinese suspected that Americans were coöperating with the British, P. W. Snow, the American consul at Canton, had declined to conform to the troublesome Chinese literary conventionalities which the authorities asked him to insert in his reply to the edicts of the imperial commissioner. In December, 1842, President Tyler

the Chinese that the United States 'pays tribute to none and expects tribute from none,' but desires friendship and the protection of rights. Arriving at Macao on the *Brandywine* in February, 1844, he soon opened correspondence with the authorities near Canton, who kept him in diplomatic contention until the middle of May. Failing to induce the Oriental mind to allow him to go to Peking, he was finally persuaded to abandon that part of his plan. Pen and ink prevailed over thoughts of cannon and ammunition. On the arrival of an imperial commissioner, Cushing decided that it was best 'to dispose of all the commercial questions by treaty before venturing on Peking,' where the Chinese ceremonial required ambassadors to undergo a series of prostrations and bumping of the head on the ground before the footstool of the Chinese 'Son of Heaven.' On July 3, at Wang Hiya, near Macao, he concluded with Keying a treaty of peace, amity and commerce, opening the five ports to American commerce, establishing port regulations, allowing American citizens the privi-

leges of residence, cemeteries and hospitals, conceding the right of foreigners to be tried before their consuls; granting to the United States the privilege of direct correspondence with the Imperial Government (to be transmitted by designated port officers), and promising all the privileges and advantages which China might grant to other nations. The United States, by her peaceful but firm policy, with no desire for Chinese territory, secured greater prestige and concession than the British."—J. M. Callahan, *American relations in the Pacific and the Far East*, pp. 86-88.

1850-1864.—Taiping rebellion.—"The phrase 'Taiping Rebellion' is wholly of foreign manufacture; at Peking and everywhere among those loyal to the government the insurgents were styled, 'Chang-mao tseh,' or 'Long-haired rebels,' while on their side, by a whimsical resemblance to English slang, the imperialists were dubbed 'imps.' When the chiefs assumed to be aiming at independence in 1850, in order to identify their followers with their cause they took the term 'Ping Chao,' or 'Peace Dynasty,' as the style of their sway, to distinguish it from the 'Tsing Chao,' or 'Pure Dynasty' of the Manchus. Each of them prefixed the adjective 'Ta' (or 'Tai,' in Cantonese), 'Great,' as is the Chinese custom with regard to dynasties and nations: thus the name Tai-ping became known to foreigners."—S. W. Williams, *Middle kingdom*, v. 2, ch. 24.—"This remarkable movement, which at one time excited much interest in Western lands, originated with a man named Hung Sew-tseun [or Hung Siutseun], son of a humble peasant residing in a village near Canton. On the occasion of one of his visits to the provincial city, probably in the year 1833, he appears to have seen a foreign Protestant missionary addressing the populace in the streets, assisted by a native interpreter. Either then or on the following day he received from some tract-distributor a book entitled 'Good Words for Exhorting the Age,' which consisted of essays and sermons by Leang A-fah, a well-known convert and evangelist. Taking the volume home with him, he looked it over with some interest, but carelessly laid it aside in his book-case. A few years afterward he attended for the second time the competitive literary examination with high hopes of honor and distinction, having already passed with much credit the lower examination in the district city. His ambitious venture, however, met with severe disappointment, and he returned to his friends sick in mind and body. During this state of mental depression and physical infirmity, which continued for some forty days, he had certain strange visions, in which he received commands from heaven to destroy the idols. These fancied revelations seem to have produced a deep impression on his mind, and led to a certain gravity of demeanor after his recovery and return to his quiet occupation as a student and village schoolmaster. When the English war broke out, and foreigners swept up Canton River with their wonderful fire-ships, . . . it is not surprising that Hung should have had his attention again attracted to the Christian publication which had lain so long neglected in his library. . . . The writings of Leang A-fah contained chapters from the Old and New Testament Scriptures, which he found to correspond in a striking manner with the preternatural sights and voices of that memorable period in his history [during his sickness, six years before]; and this

strange coincidence convinced him of their truth, and of his being divinely appointed to restore the world, that is China, to the worship of the true God. Hung Sew-tseun accepted his mission and began the work of propagating the faith he had espoused. Among his first converts was one Fung Yun-san, who became a most ardent missionary and disinterested preacher. These two leaders of the movement traveled far and near through the country, teaching the people of all classes and forming a society of God-worshippers. All the converts renounced idolatry and gave up the worship of Confucius. Hung, at this time apparently a sincere and earnest seeker after truth, went to Canton and placed himself under the instructions of the Rev. Mr. Roberts, an American missionary, who for some cause fearing that his novitiate might be inspired by mercenary motives, denied him the rite of baptism. But, without being offended at this cold and suspicious treatment, he went home and taught his converts how to baptize themselves. The God-worshippers rapidly increased in numbers, and were known and feared as zealous iconoclasts. . . . For a year after Hung Sew-tseun had rejoined the God-worshippers that society retained its exclusively religious nature, but in the autumn of 1850 it was brought into direct collision with the civil magistrates, when the movement assumed a political character of the highest aims." It was soon a movement of declared rebellion, and allied with a rebel army of bandits and pirates which had taken arms against the government in south-eastern China."—L. N. Wheeler, *Foreigner in China*, ch. 13.—"The Hakka schoolmaster proclaimed his 'mission' in 1850. A vast horde gathered to him. He nominated five 'Wangs' or soldier sub-kings from out of his clan, and commenced his northward movement from Wooswen in January, 1851. Through the rich prosperous provinces his desultory march, interspersed with frequent halts, spread destruction and desolation. The peaceful fled shudderingly before this wave of fierce, stalwart ruffianhood, with its tattered malian tawdriness, its flaunting banners, its rusty naked weapons. Everywhere it gathered in the local scoundrelism. The pirates came from the coast; the robbers from the interior mountains rallied to an enterprise that promised so well for their trade. In the perturbed state of the Chinese population the horde grew like an avalanche as it rolled along. The Heavenly King [as Hung now styled himself] met with no opposition to speak of, and in 1853 his promenade ended under the shadow of the Porcelain Tower, in the city of Nanking, the second metropolis of the Chinese Empire, where, till the rebellion and his life ended simultaneously, he lived a life of licentiousness, darkened further by the grossest cruelties. The rebellion had lasted nearly ten years when the fates brought it into collision with the armed civilization of the West. The Imperialist forces had made sluggishly some head against it. Nanking had been invested after a fashion for years on end. 'The prospects of the Tai-pings,' says Commander Brine, 'in the early spring of 1860, had become very gloomy. The Imperialist generals had hemmed Tai-pingdom within certain limits in the lower valley of the Yantsze, and the movement languished further from its destructive and exhausting nature, which for continued vitality constantly required new districts of country to exhaust and destroy.' But in 1850 China and the West came into collision. . . . The rebellion had opportunity to recover lost ground. For the sixth time the 'Faithful King' relieved Nanking. The Imperialist generals fell back, and then the Tai-

pings took the offensive, and as the result of sundry victories, the rebellion regained an active and flourishing condition. . . . Shanghai, one of the treaty ports, was threatened."—A. Forbes, *Chinese Gordon*, ch. 2.—"Europe . . . has known evil days under the hands of fierce conquerors, plundering and destroying in religion's name; but its annals may be ransacked in vain, without finding any parallel to the miseries endured in those provinces of China over which 'The Heavenly King,' the Taiping prophet, extended his fell sway for ten sad years. Hung Sew-tsuen (better known in China by his assumed title, Tien Wang) . . . had read Christian tracts, had learnt from a Christian missionary; and when he announced publicly three years afterwards that part of his mission was to destroy the temples and images, and showed in the jargon of his pretended visions some traces of his New Testament study, the conclusion was instantly seized by the sanguine minds of a section set upon evangelizing the East, that their efforts had produced a true prophet, fit for the work. Wedded to this fancy, they rejected as the inventions of the enemies of missions the tales of Taiping cruelty which soon reached Europe: and long after the details of the impostor's life at Nankin, with its medley of visions, executions, edicts, and harem indulgence, became notorious to the world, prayers were offered for his success by devotees in Great Britain as bigoted to his cause as the bloodiest commander, or 'Wang,' whom he had raised from the ranks of his followers to carry out his 'exterminating decrees.' The Taiping cause was lost in China before it was wholly abandoned by these fanatics in England, and their belief in its excellence so powerfully reacted on our policy, that it might have preserved us from active intervention down to the present time, had not certain Imperialist successes elsewhere, the diminishing means of their wasted possessions, and the rashness of their own chiefs, brought the Taiping arms into direct collision with us. And with the occasion there was happily raised up the man whose prowess was to scatter their blood-cemented empire to pieces far more speedily than it had been built up."—C. C. Chesney, *Essays in military biography*, ch. 10.—"The Taiping rebellion was of so barbarous a nature that its suppression had become necessary in the interests of civilization. A force raised at the expense of the Shanghai merchants, and supported by the Chinese government, had been for some years struggling against its progress. This force, known as the 'Ever Victorious Army,' was commanded at first by Ward, an American, and, on his death, by Burevine, also an American, who was summarily dismissed; for a short time the command was held by Holland, an English marine officer, but he was defeated at Taitan, 22 Feb., 1863. Li Hung Chang, governor-general of the Kiang provinces, then applied to the British commander-in-chief for the services of an English officer, and Gordon [Charles George, subsequently known as 'Chinese Gordon'] was authorised to accept the command. He arrived at Sung-Kiong and entered on his new duties as a mandarin and lieutenant-colonel in the Chinese service on 24 March, 1863. His force was composed of some three to four thousand Chinese, officered by 150 Europeans of almost every nationality and often of doubtful character. By the indomitable will of its commander this heterogeneous body was moulded into a little army whose high-sounding title of 'ever-victorious' became a reality, and in less than two years, after 33 engagements, the power of the Taipings was completely broken, and

the rebellion stamped out. The theatre of operations was the district of Kiangsoo, lying between the Yang-tze-Kiang river in the north and the bay of Hang-chow in the south." Before the summer of 1863 was over, Gordon had raised the rebel siege of Chanzu, and taken from the Taipings the towns of Fushan, Taitan, Quinsan, Kahpoo, Wokong, Patachiaow, Leeku, Wanti, and Fusaiquan. Finally, in December, the great city of Soo-chow was surrendered to him. Gordon was always in front of all his storming parties, "carrying no other weapon than a little cane. His men called it his 'magic wand,' regarding it as a charm that protected his life and led them on to victory. When Soo-chow fell Gordon had stipulated with the Governor-general Li for the lives of the Wangs (rebel leaders). They were treacherously murdered by Li's orders. Indignant at this perfidy, Gordon refused to serve any longer with Governor Li, and when on 1 Jan. 1864 money and rewards were heaped upon him by the Emperor, declined them all. . . . After some [two] months of inaction it became evident that if Gordon did not again take the field the Taipings would regain the rescued country," and he was prevailed upon to resume his campaign, which, although badly wounded in one of the battles, he brought to an end in the following April (1864), by the capture of Chan-chu-fu. "This victory not only ended the campaign but completely destroyed the rebellion, and the Chinese regular forces were enabled to occupy Nankin in the July following. The large money present offered to Gordon by the emperor was again declined, although he had spent his pay in promoting the efficiency of his force, so that he wrote home: 'I shall leave China as poor as when I entered it.'"—Col. R. H. Veitch, *Charles George Gordon (Dictionary of National Biography)*.

1856-1860.—War with England and France.—Bombardment and capture of Canton.—Allies in Peking.—Destruction of the Summer Palace.—Terms of peace.—The speech from the throne at the opening of the English Parliament, on February 3, 1857, "stated that acts of violence, insults to the British flag, and infractions of treaty rights, committed by the local authorities at Canton, and a pertinacious refusal of redress, had rendered it necessary for her Majesty's officers in China to have recourse to measures of force to obtain satisfaction. The alleged offences of the Chinese authorities at Canton had for their single victim the lorcha *Arrow*. The lorcha *Arrow* was a small boat built on the European model. The word 'Lorcha' is taken from the Portuguese settlement at Macao, at the mouth of the Canton river. It often occurs in treaties with the Chinese authorities. On October 8, 1856, a party of Chinese in charge of an officer boarded the *Arrow*, in the Canton river. They took off twelve men on a charge of piracy, leaving two men in charge of the lorcha. The *Arrow* was declared by its owners to be a British vessel. Our consul at Canton, Mr. Parkes, demanded from Yeh, the Chinese Governor of Canton, the return of the men, basing his demand upon the Treaty of 1843, supplemental to the Treaty of 1842. This treaty did not give the Chinese authorities any right to seize Chinese offenders, or supposed offenders, on board an English vessel. It

merely gave them a right to require the surrender of the offenders at the hands of the English. The Chinese Governor, Yeh, contended, however, that the lorch was a Chinese pirate vessel, which had no right whatever to hoist the flag of England. It may be plainly stated at once that the *Arrow* was not an English vessel, but only a Chinese vessel which had obtained by false pretences the temporary possession of a British flag. Mr. Consul Parkes, however, was fussy, and he demanded the instant restoration of the captured men, and he sent off to our Plenipotentiary at Hong Kong Sir John Bowring, for authority and assistance in the business. Sir John Bowring . . . ordered the Chinese authorities to surrender all the men taken from the *Arrow*, and he insisted that an apology should be offered for their arrest, and a formal pledge given that no such act should ever be committed again. If this were not done within forty-eight hours, naval operations were to be begun against the Chinese. The Chinese Governor, Yeh, sent back all the men, and undertook to promise that for the future great care should be taken that no British ships should be visited improperly by Chinese officers. But he could not offer an apology for the particular case of the *Arrow*, for he still maintained, as was indeed the fact, that the *Arrow* was a Chinese vessel, and that the English had nothing to do with her. Accordingly Sir John Bowring carried out his threat, and had Canton bombarded by the fleet which Admiral Sir Michael Seymour commanded. From October 23 to November 13 naval and military operations were kept up continuously. Commissioner Yeh retaliated by foolishly offering a reward for the head of every Englishman. This news from China created a considerable sensation in England. On February 24, 1857, Lord Derby brought forward in the House of Lords a motion, comprehensively condemning the whole of the proceedings of the British authorities in China. The debate would have been memorable if only for the powerful speech in which the venerable Lord Lyndhurst supported the motion, and exposed the utter illegality of the course pursued by Sir John Bowring. The House of Lords rejected the motion of Lord Derby by a majority of 146 to 110. On February 26 Mr. Cobden brought forward a similar motion in the House of Commons. . . . Mr. Cobden had probably never dreamed of the amount or the nature of the support his motion was destined to receive. The vote of censure was carried by 263 votes against 247—a majority of 16. Lord Palmerston announced two or three days after that the Government had resolved on a dissolution and an appeal to the country. Lord Palmerston understood his countrymen." In the ensuing elections his victory was complete. "Cobden, Bright, Milner Gibson, W. J. Fox, Layard, and many other leading opponents of the Chinese policy, were left without seats. Lord Palmerston came back to power with renewed and redoubled strength." He "had the satisfaction before he left office [in 1858] of being able to announce the capture of Canton. The operations against China had been virtually suspended . . . when the Indian Mutiny broke out. England had now got the co-operation of France. France had a complaint of long standing against China on account of the murder of some missionaries, for which redress had been asked in vain. There was, therefore, an allied attack made upon Canton [December, 1857], and of course the city was easily captured. Commissioner Yeh himself was taken prisoner, not until he had been sought for and hunted out in most ignominious fashion. He was found at last hidden

away in some obscure part of a house. He was known by his enormous fatness. . . . He was put on board an English man-of-war, and afterwards sent to Calcutta, where he died early in the following year. Unless report greatly belied him he had been exceptionally cruel, even for a Chinese official. The English and French Envoys, Lord Elgin and Baron Gros, succeeded in making a treaty with China. By the conditions of the treaty, England and France were to have ministers at the Chinese Court, on certain special occasions at least, and China was to be represented in London and Paris; there was to be toleration of Christianity in China, and a certain freedom of access to Chinese rivers for English and French mercantile vessels, and to the interior of China for English and French subjects. China was to pay the expenses of the war. It was further agreed that the term 'barbarian' was no longer to be applied to Europeans in China. There was great congratulation in England over this treaty, and the prospect it afforded of a lasting peace with China. The peace thus procured lasted in fact exactly a year. . . . The treaty of Tientsin, which had been arranged by Lord Elgin and Baron Gros, contained a clause providing for the exchange of the ratifications at Peking within a year from the date of the signature, which took place in June 1858. Lord Elgin returned to England, and his brother, Mr. Frederick Bruce, was appointed in March 1859 Envoy Extraordinary and Minister Plenipotentiary to China. Mr. Bruce was directed to proceed by way of the Peiho to Tientsin and thence to Peking to exchange the ratifications of the treaty. Lord Malmesbury, who was then Foreign Secretary . . . impressed upon Mr. Bruce that he was not to be put off from going to the capital. Instructions were sent out from England at the same time to Admiral Hope, the Naval Commander-in-Chief in China, to provide a sufficient force to accompany Mr. Bruce to the mouth of the Peiho. The Peiho river flows from the highlands on the west into the Gulf of Pecheli, at the north-east corner of the Chinese dominions. The capital of the Empire is about 100 miles inland from the mouth of the Peiho. It does not stand on that river, which flows past it at some distance westward, but it is connected with the river by means of a canal. The town of Tientsin stands on the Peiho near its junction with one of the many rivers that flow into it, and about forty miles from the mouth. The entrance to the Peiho was defended by the Taku forts. On June 20, 1859, Mr. Bruce and the French Envoy reached the mouth of the Peiho with Admiral Hope's fleet, some nineteen vessels in all, to escort them. They found the forts defended; some negotiations and inter-communications took place, and a Chinese official from Tientsin came to Mr. Bruce and endeavoured to obtain some delay or compromise. Mr. Bruce became convinced that the condition of things predicted by Lord Malmesbury was coming about, and that the Chinese authorities were only trying to defeat his purpose. He called on Admiral Hope to clear a passage for the vessels. When the Admiral brought up his gunboats the forts opened fire. The Chinese artillerymen showed unexpected skill and precision. Four of the gunboats were almost immediately disabled. All the attacking vessels got aground. Admiral Hope attempted to storm the forts. The attempt was a complete failure. Admiral Hope himself was wounded; so was the commander of the French vessel which had contributed a contingent to the storming party. The attempt to force a passage of the river was given

up and the mission to Peking was over for the present. It seems only fair to say that the Chinese at the mouth of the Peiho cannot be accused of perfidy. They had mounted the forts and barricaded the river openly and even ostentatiously. . . . It will be easily imagined that the news created a deep sensation in England. People in general made up their minds at once that the matter could not be allowed to rest there, and that the mission to Peking must be enforced. . . . Before the whole question came to be discussed in Parliament the Conservatives had gone out and the Liberals had come in. The English and French Governments determined that the men who had made the treaty of Tien-tsin—Lord Elgin and Baron Gros—should be sent back to insist on its reinforcement. Sir Hope Grant was appointed to the military command of our land forces, and General Cousin de Montauban, afterwards Count Palikao, commanded the soldiers of France. The Chinese to do them justice, fought very bravely, but of course they had no chance whatever against such forces as those commanded by the English and French generals. The allies captured the Taku forts [August, 1860], occupied Tien-tsin, and marched on Peking. The Chinese Government endeavoured to negotiate for peace, and to interpose any manner of delay, diplomatic or otherwise, between the allies and their progress to the capital. Lord Elgin consented at last to enter into negotiations at Tungchow, a walled town ten or twelve miles nearer than Peking. Before the negotiations took place, Lord Elgin's secretaries, Mr. Parkes and Mr. Loch, some English officers, Mr. Bowlby, the correspondent of the *Times*, and some members of the staff of Baron Gros, were treacherously seized by the Chinese while under a flag of truce and dragged off to various prisons. Mr. Parkes and Mr. Loch, with eleven of their companions, were afterwards released, after having been treated with much cruelty and indignity, but thirteen of the prisoners died of the horrible ill-treatment they received. Lord Elgin refused to negotiate until the prisoners had been returned, and the allied armies were actually at one of the great gates of Peking, and had their guns in position to blow the gate in, when the Chinese acceded to their terms. The gate was surrendered, the allies entered the city, and the English and French flags were hoisted side by side on the walls of Peking. It was only after entering the city that Lord Elgin learned of the murder of the captives. He then determined that the Summer Palace should be burnt down as a means of impressing the mind of the Chinese authorities generally with some sense of the danger of treachery and foul play. Two days were occupied in the destruction of the palace. It covered an area of many miles. Gardens, temples, small lodges, and pagodas, groves, grottoes, lakes, bridges, terraces, artificial hills, diversified the vast space. All the artistic treasures, all the curiosities, archaeological and other, that Chinese wealth and Chinese taste, such as it was, could bring together, had been accumulated in this magnificent pleasure. The surrounding scenery was beautiful. The high mountains of Tartary ramparted one side of the enclosure. The buildings were set on fire; the whole place was given over to destruction. A monument was raised with an inscription in Chinese, setting forth that such was the reward of perfidy and cruelty. Very different opinions were held in England as to the destruction of the Imperial palace. To many it seemed an act of unintelligible and unpardonable vandalism. Lord Elgin explained, that if he did not demand the

surrender of the actual perpetrators, it was because he knew full well that no difficulty would have been made about giving him a seeming satisfaction. The Chinese Government would have selected for vicarious punishment, in all probability, a crowd of mean and unfortunate wretches who had nothing to do with the murders. . . . It is somewhat singular that so many persons should have been roused to indignation by the destruction of a building who took with perfect composure the unjust invasion of a country. The allied powers now of course had it all their own way. England established her right to have an envoy in Peking, whether the Chinese liked it or not. China had to pay a war indemnity, and a large sum of money as compensation to the families of the murdered prisoners and to those who had suffered injuries, and to make an apology for the attack by the garrison of the Taku forts. Perhaps the most important gain to Europe from the war was the knowledge that Peking was not by any means so large a city as we had all imagined it to be, and that it was on the whole rather a crumbling and tumbledown sort of place."—J. McCarthy, *Short history of our own time*, ch. 12, 15, 17 (v. 3, ch. 30 and 42, of larger work).

1857-1868.—Treaty with the United States.—Burlingame embassy and the Burlingame treaties.—“The government of the United States viewed with anxiety the new breaking out of hostilities between Great Britain, supported by France as an ally, and China, in the year 1856. President Buchanan sent thither the Hon. William B. Reed to watch the course of events, and to act the part of a mediator and peacemaker when opportunity should offer. In this he was sustained by the influence of Russia. Mr. Reed arrived in Hong-Kong, on the fine war steamer *Minnesota*, November 7, 1857. He at once set himself to remove the difficulties between the English and Chinese, and save if possible the future effusion of blood. He endeavored in vain to persuade the proud and obstinate governor Yeh to yield, and save Canton from bombardment. He proceeded to the north, and made on behalf of his government a treaty of peace with China which was signed June 18. The first article of the treaty contains a significant reference to the posture of the United States in relation to the war then in progress, as well as to any which might thereafter arise. The article says: ‘There shall be, as there have always been, peace and friendship between the United States of America and the Ta-Tsing Empire, and between their people respectively. They shall not insult or oppress each other for any trifling cause, so as to produce an estrangement between them; and if any other nation should act unjustly or oppressively, the United States will exert their good offices, on being informed of the case, to bring about an amicable arrangement of the question, thus showing their friendly feelings.’ A subsequent article of this treaty is to be interpreted by keeping in view the bitter root of the difficulties between Great Britain and China which led to the previous war of 1839 to ’42, and to this war. After stating the ports where Americans shall be permitted to reside and their vessels to trade, it continues in the following language: ‘But said vessels shall not carry on a clandestine and fraudulent trade at other ports of China not declared to be legal, or

along the coasts thereof; and any vessel under the American flag violating this provision shall, with her cargo, be subject to confiscation to the Chinese government; and any citizen of the United States who shall trade in any contraband article of merchandise shall be subject to be dealt with by the Chinese government, without being entitled to any countenance or protection from that of the United States; and the United States will take measures to prevent their flag from being abused by the subjects of other nations as a cover for the violation of the laws of the empire.' . . . The development of the foreign trade with China during the brief time which has passed [1870] since the last war has been very great. . . . The American government has been represented most of the time by the Hon. Anson Burlingame, who has taken the lead, with remarkable ability and success, in establishing the policy of peaceful co-operation between the chief treaty-powers, in encouraging the Chinese to adopt a more wise and progressive policy in their intercourse with foreign nations and in the introduction of the improvements of the age. . . . Mr. Burlingame, who had been in China six years, determined [in 1867] to resign his post and return to America. The news of it excited much regret among both Chinese and foreign diplomatists. The former endeavored in vain to dissuade him from his purpose. Failing to accomplish this, he was invited by Prince Kung to a farewell entertainment, at which were present many of the leading officers of the government. During it they expressed to him their gratitude for his offices to them as an intelligent and disinterested counselor and friend. And they seem to have conceived at this time the thought of putting the relations of the empire with foreign countries upon a more just and equal basis, by sending to them an imperial embassy of which he should be the head. They promptly consulted some of their more reliable friends among the foreign gentlemen at the capital, and in two days after they tendered to Mr. Burlingame, much to his surprise, the appointment of minister plenipotentiary of China to the Western powers. . . . Mr. Burlingame left the Chinese capital on the 25th of November, 1867. The embassy consisted, besides the principal, of Chih-kang and Sun Chia-ku, a Manchu and a Chinese officer, each wearing the red ball on his cap which indicates an official of a rank next to the highest in the empire; J. McLeary Brown, formerly of the British legation, and M. Deschamps, as secretaries; Teh Ming and Fung I as Chinese attachés, and several other persons in subordinate positions. . . . It went to Shanghai, thence to San Francisco, where it was most cordially welcomed by both the American and Chinese mercantile communities. It reached Washington in May, 1868. The embassy was treated with much distinction at the American capital. No American statesman was so capable and disposed to enter cordially into its objects as the Secretary of State at that time, the Hon. William H. Seward, whose mind had long apprehended the great features of the policy which American and foreign nations should pursue in relation to the Chinese empire. On the 16th of July the Senate of the United States ratified a treaty which he had made in behalf of this country with the representative of the Chinese government. The treaty defines and fixes the principles of the intercourse of Western nations with China. . . . It secures the territorial integrity of the empire, and concedes to China the rights which the civilized nations of the world accord to each other as to eminent domain over land and waters, and jurisdiction over

persons and property therein. It takes the first step toward the appointment of Chinese consuls in our seaports—a measure promotive of both Chinese and American interests. It secures exemption from all disability or persecution on account of religious faith in either country. It recognizes the right of voluntary emigration and makes penal the wrongs of the coolie traffic. [See RACE PROBLEMS: 1880-1906.] It pledges privileges as to travel or residence in either country such as are enjoyed by the most favored nation. It grants to the Chinese permission to attend our schools and colleges, and allows us to freely establish and maintain schools in China. And while it acknowledges the right of the Chinese government to control its own whole interior arrangements, as to railroads, telegraphs and other internal improvements, it suggests the willingness of our government to afford aid toward their construction by designating and authorizing suitable engineers to perform the work, at the expense of the Chinese government. The treaty expressly leaves the question of naturalization in either country an open one. . . . It is not necessary to follow in detail the progress of this first imperial Chinese embassy. In England it was received at first very coldly, and it was some months before proper attention could be secured from the government to its objects. At length, however, on November 20, it was presented to the queen at Windsor Castle."—W. Speer, *Oldest and the newest empire*, ch. 14.

1894-1895.—War with Japan.—Peace treaty of Shimonoseki.—Recognition of Korean independence.—Cession to Japan of Formosa and the Pescadores and other territory.—Protest by the powers and relinquishment by Japan of Port Arthur and Liao-tung peninsula.—Causes and effects of China's defeat.—"The ostensible starting-point of the trouble that resulted in hostilities was a local insurrection which broke out in May in one of the southern provinces of Corea. The cause of the insurrection was primarily the misrule of the authorities, with possibly some influence by the quarreling court factions at the capital. The Corean king applied at once to China as his suzerain for assistance in subduing the insurgents, and a Chinese force was sent. Japan, thereupon, claiming that Corea was an independent state and that China had no exclusive right to interfere, promptly began to pour large forces into Corea, to protect Japanese interests. By the middle of June a whole Japanese army corps was at Seoul, the Corean capital, and the Japanese minister soon formulated a radical scheme of administrative reforms which he demanded as indispensable to the permanent maintenance of order in the country. This scheme was rejected by the conservative faction which was in power at court, whereupon, on July 23, the Japanese forces attacked the palace, captured the king and held him as hostage for the carrying out of the reforms. The Chinese were meanwhile putting forth great efforts to make up for the advantage that their rivals had gained in the race for control of Corea, and to strengthen

their forces in that kingdom. On the 25th a Chinese fleet carrying troops to Corea became engaged in hostilities with some Japanese war vessels, and one of the transports was sunk. On August 1, the Emperor of Japan made a formal declaration of war on China, basing his action on the false claim of the latter to suzerainty over Corea, and on the course of China in opposing and thwarting the plan of reforms which were necessary to the progress of Corea and to the security of Japanese interests there. The counter-proclamation of the Chinese Emperor denounced the Japanese as wanton invaders of China's tributary state, and as aiming at the enslaving of Corea. On August 26 a treaty of offensive and defensive alliance against China was made between Japan and Corea. . . . A severe engagement at Ping-Yang, September 16, resulted in the rout of the Chinese and the loss of their last stronghold in Corea. A few days later the hostile fleets had a pitched battle off the mouth of the Yalu River, with the result that the Japanese were left in full control of the adjacent waters. On the 26th of October the Japanese land forces brushed aside with slight resistance the Chinese on the Yalu, which is the boundary between Corea and China, and began their advance through the Chinese province of Manchuria, apparently aiming at Peking."—(*Political Science Quarterly*, Dec., 1894).—On November 3, Port Arthur being then invested by the Japanese land and naval forces, while Marshal Yamagata, the Japanese commander, continued his victorious advance through Manchuria, Prince Kung made a formal appeal to the representatives of all the powers for their intervention, acknowledging the inability of China to cope with the Japanese. On November 21, Port Arthur, called the strongest fortress in China, was taken, after hard fighting from noon of the previous day. In retaliation for the murder and mutilation of some prisoners by the Chinese, the Japanese gave no quarter, and are accused of great atrocities. To the advance of the Japanese armies in the field, the Chinese opposed comparatively slight resistance, in several engagements of a minor character, until December 10, when a battle of decided obstinacy was fought at Kungwasai, near Hai-tcheng. The Japanese were again the victors. Overtures for peace made by the Chinese government proved unavailing; the Japanese authorities declined to receive the envoys sent, for the reason that they were not commissioned with adequate powers. Nothing came of an earlier proffer of the good offices of the government of the United States. In the first month of the new year the successes of the Japanese were renewed. Kaiphing was taken on January 10; a vigorous Chinese attack was repulsed, near Niuchuang, on January 16; a landing of 25,000 troops on the Shantung peninsula was effected on the 20th, and a combined attack by army and navy on the strong forts which protected the important harbor of Wei-hai-wei, and the Chinese fleet sheltered in it, was begun on the 30th of the month. The attack was ended on February 13, when the Chinese admiral Ting-Juchang gave up the remnant of his fleet and then killed himself. The Chinese general, Tai, had committed suicide in despair on the third night of the fighting. There was further fighting around Niuchuang and Yingkow during February and part of March, while overtures for peace were being made by the Chinese government [see also MILITARY ORGANIZATION: 25]. At length the famous viceroys, Li Hung-chang, was sent to Japan with full powers to conclude a treaty. Negotiations were interrupted at the outset by a foul attack

on the Chinese ambassador by a Japanese ruffian, who shot and seriously wounded him in the cheek. But the mikado ordered an armistice, and the Treaty of Shimonoseki was concluded and signed on April 17, 1895.

"The terms of the treaty come under three heads: the surrender of territory, the payment of an indemnity, and the concession of commercial facilities and rights, while the first article of all provided for the full and complete independence and autonomy of Corea. The surrender of territory was to comprise the islands of Formosa and the Pescadores and the southern part of the province of Shingking [Feng-tien], including the Leaoutung or Regent's Sword Peninsula and the important naval harbour and fortress of Port Arthur. As indemnity, China was to pay 200 million Kuping taels in eight instalments with interest at the rate of 5 per cent. on the unpaid instalments. The commercial concessions included the admission of ships under the Japanese flag to the different rivers and lakes of China, and the appointment of consuls. The terms of peace imposed on China were certainly onerous, but considering the completeness of the Japanese triumph they could not be termed excessive. If they had not seriously disturbed the balance of power in the Far East they would no doubt have been allowed to stand, as no Government was disposed to take up the cause of China from disinterested motives. The British Government, with the largest commercial stake in the question, was by no means inclined to fetter the Japanese when they placed freedom of trade at the head of their programme. It wished China to be opened to external and beneficial influences, and that was exactly what the Japanese proposed to do. Moreover, Japan had shown throughout the war every wish to consider British views, and to respect their interests. Shanghai, in the first place, and the Yangtse Valley afterwards, were ruled outside the sphere of military operations. The identity of interests between England and Japan was clear to the most ordinary intelligence, and certainly the British Government was not the one that would seek to fetter the legitimate and beneficial expansion of the bold islanders of the Far East. But other Powers did not regard the matter from the same point of view, and Russia saw in the appearance of the Japanese on the Pacific freeboard a spectre for the future. The Russian Government could not tolerate the presence of the Japanese on the mainland, and especially in a position which enabled them to command Peking. They therefore resorted to a diplomatic move unprecedented in the East, and which furnished evidence of how closely European affairs were reacting on Asia. The then unwritten alliance between France and Russia was turned into a formal arrangement for the achievement of definite ends, and the powerful co-operation of Germany was secured for the attainment of the same object, viz., the arrest of Japan in her hour of triumph. This movement was destined to produce the most pregnant consequences, some of which are not yet revealed, but for the moment it signified that a Triple Alliance had superseded Great Britain in the leading rôle she had filled in the Far East since the Treaty of Nankin. The ink was scarcely dry on the Treaty of Shimonoseki when Japan found herself confronted by the Three Powers, with a demand couched in polite language to waive that part of the Treaty which provided for the surrender of Port Arthur and the Leaoutung peninsula. The demand was clearly one that could not be rejected without war, and Japan could have no possible chance in coping with

an alliance so formidable on land and sea. Japan gave way with a good grace, and negotiations followed which resulted in the resignation of her claim to the Leaoutung peninsula in return for an increase in the indemnity by the sum of six millions sterling. Wei-Hai-Wei was to be retained as bail, pending the payment of the indemnity; and the final payment in May, 1898 . . . released all Chinese territory on the mainland from the hands of the victors in the war of 1894-5."—D. C. Boulger, *History of China*, v. 2, pp. 532-534. —For the text of the Treaty of Shimonoseki, see SHIMONOSEKI, TREATY OF.—"Of all China's foreign wars, the one with Japan had the most disastrous effect. It swept away her equipment as a military power; reduced her prestige to the lowest ebb; revealed her weakness to the world; and burdened her for the first time with a foreign debt of £50,000,000. When Admiral Ito wrote to Admiral Ting asking him to capitulate he was able to say, 'it is not the fault of one man.' Again he remarked in the same letter: 'The blame must rest upon the errors of a government that has long administered affairs. She selects her servants by competitive examination and literary attainments are the test. The result is that the officials through whom the government is administered are all literati, and literature is honored above everything.' Indeed, one might go a step further and say that the blame also rested upon the system of philosophy which taught every Chinese to love his family instead of his nation. For this teaching China has but the Sung philosophers and their adherents to blame."—Li Ung Bing, *Outlines of Chinese history*, pp. 591-592.

1894-1895 (March-July).—Cession of Kiang-Hung to France a violation of treaty agreement with Great Britain.—In March, 1894, the government of China entered into a treaty with that of Great Britain, for the settlement of boundaries of Burma, in which it agreed to make no cession of the district of Kiang-Hung, or any part of it, to any other power. Notwithstanding this agreement, the eastern part of Kiang-Hung was ceded to France in July, 1895; for which proceeding the British government promptly called China to account. See below 1897 (May-June).

1895.—Treaty with Russia, giving railway privileges and other rights in Manchuria.—"Apparently it is necessary to conclude that, in 1895, Germany adopted the programme of purchasing Russia's good will in the Occident by abetting her aggressions in the Orient; a not unnatural policy, since charity begins at home, but assuredly a policy somewhat disagreeable to contemplate from an Oriental point of view. However, having done China the apparently weighty service of rescuing southern Manchuria from the jaws of Japan, Russia was generally expected to claim a reward, as is her wont; and that general expectation crystallized, eighteen months later, into assured statements that a secret convention had been concluded in Peking, making various remarkable concessions on behalf of the Great Northern Power. This 'Cassini Convention,' as it was called—Count Cassini having been its alleged negotiator—may or may not have been a reality. It contained internal evidences which defied the most willing credulity; and perhaps all that can be said of it is, that it cleverly embodied the wishes which Russia might be supposed to entertain at that particular time. For it allowed her, in the first place, to carry her trans-Asian Railway across the north of Manchuria—which meant that the line would follow the

chord of an arc through flat country instead of creeping round the periphery of the arc through mountains; it allowed her, in the second place, to construct a branch from this main road due south through Manchuria to the Liaotung Peninsula; it allowed her, in the third place, to post troops for the protection of these roads—an arrangement virtually amounting to military occupation of Manchuria; and it allowed her, in the fourth place, to hold as military bases, in case of necessity, two ports in the Liaotung Peninsula (Port Arthur and Talian), and one port in the Shantung Peninsula (Kiaochow). Rumors of this Convention and the comments it evoked from foreign journals helped greatly to disturb the mind of the Chinese nation."—F. Brinkley, *China: its history, arts and literature*, v. 12, pp. 188-189.

1895 (August).—Massacre of missionaries at Hua Sang.—In the fall of 1894 the English and American missionaries at Ku Cheng, in the Chinese province of Fu Kien, of which Foochow is the capital, began to be threatened by a sect or party called the "Vegetarians" (Siah Chai), who were violently hostile to foreigners, and said to be revolutionary in their aims. The hostile demonstrations were repeated in the following April, and the missionary party started upon a retreat to Foochow, but were stopped on the way by news that the mandarin at Ku Cheng had pacified the Vegetarians and that they might safely return. They did so and were apparently secure for some months. In July they retired from the city to a mountain sanatorium, named Hua Sang, twelve miles from Ku Cheng, and there, on August 1, without warning, they were surrounded by a Vegetarian band of some eighty savage men, armed with swords and spears, who performed a rapid work of murder, killing eleven persons, including six women and two children, and then disappeared. "These men did not belong either to Hua Sang or Ku Cheng, but came from some villages at a considerable distance. . . . The city authorities at Ku Cheng had no hand in the outrage. It was evidently the work of a band of marauders, and the district magistrate seems to have done all that could be done under the circumstances."—D. M. Berry, *Sister martyrs of Ku Cheng*.—The British and American governments joined in sending a consular commission to investigate the crime, and with difficulty compelled the Chinese government to execute twenty of the ringleaders of the attack. At Fatshan, near Canton, there had been mob attacks on the missionary station, with destruction of buildings but no murders, during the same month in which the massacre at Hua Sang occurred.

1896.—Tour of Li Hung-chang in Europe and America.—"Li Hung Chang, the Chinese statesman, left Shanghai with a numerous suite, March 28, on board a French mail steamer for Europe, to represent the Emperor of China at the coronation of the Czar of Russia, and afterwards to visit other countries. He declared that his object was to see Europe for himself, in order to report to the Emperor as to feasible reforms for China. A great reception was offered to him at Hongkong, but he refused to land by the advice of the European physician of the embassy, who feared lest any member of the suite, by catching the plague, would render the party liable to quarantine elsewhere. Proceeding to Singapore, via Saigon, he visited the Governor of the Straits Settlements. At Colombo he was received on landing by a guard of honour. After the Russian coronation he visited Germany, Holland, Belgium and France, and arrived in London early in August.

Wherever he went he was lionised, and he lost no opportunity of asking questions and informing himself concerning the manufactures and armaments of the several countries he visited. He returned to China via New York and the Canadian Pacific Railway, sailing from Vancouver (September 14) for Yokohama and Tien-tsin, where he arrived October 3. Thence he proceeded to Peking (October 20), where he was received by the Emperor, and appointed a member of the Tsung-li-Yamen. At the same time for presuming to enter the precincts of the ruined Summer Palace while visiting the Empress Dowager, after his return home, his enemies took occasion of the slight trespass to insult him, and proposed that he should be stripped of all his titles and honours, with the exception of the earldom, which is confirmed to the Li family for twenty-nine generations. The case was referred to the Board of Civil Appointments, and the Controller-General, Chang-chih-wan, decided that 'according to precedent' the ex-Viceroy should be cashiered, but on account of his life-long and distinguished services to the imperial dynasty he should be recommended to the clemency of the Throne, which took the form of a loss of one year's salary. He took over his seals of office in the Tsung-li-Yamen on November 1, but none of his colleagues were present to welcome him."—*Annual Register*, 1896, pp. 349-50.

1897.—Chinese-Eastern Railway started. See TRANS-SIBERIAN RAILWAY.

1897 (May-June).—Cessions and concessions to England and France.—In May, the Chinese government sanctioned an extension of the British settlement at Tien-tsin from sixty-five acres to about 300. In the next month, it satisfied the complaints of Great Britain concerning the cession of Kiang-Hung to France (see above 1894-1895, MARCH-JULY), by ceding to that power the Shan district of Kokang, about 400 square miles in extent, and leasing to Great Britain in perpetuity a considerable tract at the south of the Namwan river. The same treaty opened new routes to trade across the frontier between Burma and China, and admitted British consuls and merchants to two new ports. At about the same time France secured mining privileges on the Tonquin frontier and rights for the extension of a railway into Chinese territory.

1897 (November).—Germany opened attack of European Powers on the integrity of the Chinese empire.—Seizure of the port of Kiao-Chau.—Concessions obtained as reparation for murder of German missionaries.—"Among the recent events that have attracted especial attention to China is the lease to foreign nations of important strategic or commercial ports on the coast of the Empire. While the Portuguese have controlled the island of Macao, near Canton, since 1537, and the English became owners of the island of Hongkong, in the same vicinity, by the treaty of 1842, no other nation had possessions on or near the coast of China until within a comparatively recent date. One result of the war between China and Japan was that Japan obtained the island of Formosa, lying 90 miles off the coast of central China. By this treaty Japan was also to have certain territory on the peninsula of Liaotung, which commands from the north the entrance to the Gulf of Pechili, the gateway to the capital of China; but on the urgent protest of Russia, France, and Germany this was abandoned, and the mainland of China up to that time thus remained intact. On November 4, 1897, however, the German Government seized the port of Kiao-

Chau, on the northeastern coast of China, asserting as the cause of its action the desire to obtain satisfaction for the murder of [two] German missionaries by Chinese on November 1 of that year. This port was held by a German war ship until the announcement of a treaty with China by which the port of Kiao-Chau and adjacent territory were leased to Germany for a term of ninety-nine years, the German Government being given the right to land troops, construct fortifications, and establish a coaling and naval station, while German subjects were to have the right to construct railways, open mines, and transact business in the rich mineral and agricultural province of Shantung, in which Kiao-Chau is located, Chinese vessels, however, to have the same privileges in the port of Kiao-Chau that the German Government might decide to give to other nations."—*U. S. Bureau of Statistics, Monthly summary of commerce and statistics, Mar., 1899*.—See also GERMANY: 1897 (November-December); U. S. A.: 1897.

In the treaty ceding Kiao-Chau "the Chinese Government undertake not to frame any Regulations within a zone of 50 kilometers round the bay without the consent of the German Government, and, in particular, to offer no resistance to any measures necessary for regulating the course of the rivers. The Chinese Government also grant to German troops the right of passage across the zone above described. With the object of avoiding every possibility of collision, the Chinese Government will exercise no rights of sovereignty within the leased territory during the period of the lease, but they cede these rights as well as those over the entire water-surface of the Bay of Kiao-Chau to the German Government. The German Government will erect sea-marks on the islands and shallows at the entrance to the bay. . . . In the event of the territory leased not proving to be adapted to the requirements of the German Government, the Government of China will cede to Germany a more suitable district, and will take back the Bay of Kiao-Chau, paying compensation for any improvements or constructions the Germans may have made there. . . . A more accurate delimitation of the boundaries of the district leased will take place in accordance with the local conditions, and will be carried out by Commissioners from both Governments." Early in 1898 the Chinese government was in need of money for the final payment of indemnity to Japan, and opened negotiations with the British government for the guarantee of a loan. Her majesty's ministers were quite ready to give the needed financial aid, for a consideration, requiring, in return, that Ta-lien-wan should be opened to trade as a treaty port. But Russia was then scheming to secure possession of Ta-lien-wan, and interfered with the British negotiation so vigorously that the Chinese were frightened into breaking it off, even after they had practically accepted the offered loan. Not daring, however, to take from Russia the financial guarantee which they rejected at British hands, they thought to balance themselves between these jealous rivals by borrowing without help from either. Both the powers were thus offended, England especially showing stern resentment on account of the slight with which she had been treated.—*Great Britain, Papers by command: China, No. 1, 1899, pp. 13-18*.

1898.—Exclusion from Hawaiian Islands. See HAWAIIAN ISLANDS: Discovery and early history.

1898 (February-December).—Battle of Concessions for railway building and mining.—By summer-time in 1898 the scramble among the

powers for footholds of territory on the Chinese coast seemed to be giving way to what Lord Salisbury described as "the battle of concessions," for the building of railways and the opening of mines. This newer battle gave his lordship much anxiety. On July 13 he cabled to Sir Claude MacDonald: "It does not seem that the battle of Concessions is going well for us, and that the mass of Chinese railways, if they are ever built, will be in foreign hands is a possibility that we must face. One evil of this is, that no orders for materials will come to this country. That we cannot help. The other evil is, that by differential rates and privileges the Managers of the railways may strangle our trade. This we ought to be able to prevent, by pressing that proper provisions for equal treatment be inserted in every Concession."

The British minister at Peking, in reply, dissented warmly from Lord Salisbury's opinion. "The battle of Concessions is not, in my opinion," he cabled on July 23, "going against us. . . . Up to the present, any concessions granted to other nationalities are far out-balanced in financial value by the Shansi and Honan mining and railway concession, with its possible extensions. I have consistently informed the Chinese government that, as to differential rates and privileges, we want none ourselves, and cannot admit that other nationalities have a claim to them." The outcome of the grand "battle" was communicated by Sir Claude MacDonald to Lord Charles Beresford, on November 23, in a full list of the concessions then granted to British subjects, compared with the grants to other nationalities. "We do not seem," wrote Sir Claude, with pardonable complacency, "to have come out second best. . . . Not a single bona fide or approximately practical scheme which has been brought to this Legation has failed to be put through." The summarized result in railway concessions was nine British (2,800 miles); three Russian (1,530 miles); two German (720 miles); three French (420 miles); one Belgian (650 miles); one American (300 miles).

1898 (March-July).—Russian acquisition of Port Arthur and Talienwan.—Ineffectual British opposition.—Consequent British demand for Wei-hai-Wei.—Its lease by China.—While the British minister at Peking was securing these assurances from the Tsung-li Yamèn, concerning the non-alienation of the Yang-tszé region and the opening of inland waters to steam navigation, the Russian minister was equally busy, extorting a cession or lease of Port Arthur and Talienwan, with privileges of railway construction through neighboring territory which gave immense value to those acquisitions. The probability of his success was soon known to the British authorities, who made no serious objection to the leasing of Talienwan, but were strongly opposed to a Russian occupation of Port Arthur. On March 29 the completion of the transaction by which China transferred Port Arthur and Talienwan to Russia was officially announced at St. Petersburg (Petrograd).

On April 3, Sir Claude MacDonald was able to announce by cable to Lord Salisbury: "Yamèn agreed yesterday to the following arrangement: China will lease Wei-hai-Wei to Great Britain on the same terms as Port Arthur has been leased to Russia, but Great Britain agrees not to take possession of the place until it has been given up by Japan. The lease will continue until Russia ceases to occupy Liaotung Peninsula. Details are left for subsequent adjustment." Negotiations relative to the terms of the lease of Wei-hai-Wei were protracted until the first of July, when the conven-

tion determining them was signed at Peking.—See also WEI-HAI-WEI.

1898 (April-July).—Charges of corruption against Li Hung-chang and the Tsung-li Yamèn.—"One of the censors of highest rank memorialised the Emperor early in April, accusing the whole Tsung-li Yamèn of being in Russian pay, and alleging that the sum of 10,000,000 taels was paid to them. He also stated that Li Hung-chang had secured from Russia 1,500,000 taels, and he prayed for a full inquiry and for the decapitation of Li Hung-chang if the accusation were proved, or if he were found guiltless, he himself should be decapitated. Li Hung-chang was dismissed on September 6, but afterwards in November was appointed an imperial commissioner to report on the inundations of the Yellow River, an unwelcome post. . . . A Black Flag rebellion in the southern province of Kwang-si, in which the secret society called The Triads was said to be concerned, was giving the Peking Government great anxiety in July. The rebels, numbering about 40,000, were for a time victorious and seemed determined to overthrow the dynasty."—*Annual Register*, 1898, pp. 333-4.

1898 (April-August).—France in the field with demands.—New demands from Great Britain.—France had now come forward to seize a place in the attacking line, preparatory to what seemed to be the impending partition of China. On April 12, Sir Claude MacDonald cabled to Lord Salisbury the following dispatch: "I had an interview with the Yamèn yesterday, at which they informed me that China had acceded to the following demands on the part of France:—1. Kwang-chow Wan [in the Lei-chau peninsula, on the southern coast, near Tonquin] to be leased as a coaling-station to France. 2. The right to construct a railway to Yünnan-fu from the Tonquin frontier. 3. The promise not to alienate any territory in the three provinces of Kwangtung, Kwangsi, and Yünnan, which border on the French frontier. 4. The Chinese Government agree that if ever they constitute a Postal Department independent of the maritime customs, and if a European is to be appointed as Director thereof, France shall have an equal right with that of other Powers to nominate a candidate for the post of Director. The Chinese Government are willing—1. To lease us as much additional territory on Kowloon promontory [opposite Hong Kong], exclusive of Kowloon city, as is required for military and naval purposes. 2. The Yamèn state that China is quite willing to allow the extension into Yünnan of the Burmah Railway."

On April 13, Mr. Balfour, in the absence of Lord Salisbury, cabled from London in reply: "Inform Yamèn that, although they have not followed our advice, we are anxious to maintain, as far as possible, integrity of China, and will, therefore, not make new territorial demands upon them. It is, however, absolutely necessary, if we are to pursue this policy, that they, on their side, should first immediately conclude negotiations—(a) for giving us all the land required for military defences of Hong Kong; (b) to fulfil their promise to make Nan-ning a Treaty port; (c) to give some railway concession; (d) an agreement as to the non-alienation of Kuangtung and Yünnan. In connection with condition (d), it is in the interests of the integrity of China, and is justified by the proximity of Yünnan to Burmah, and by our commercial preponderance in Kuangtung."

On the same day (April 13) the British minister at Paris telegraphed to the foreign office, London: "It is stated in to-night's papers that, at

the Cabinet Council held this morning, M. Hanotaux was able to announce to his colleagues that the French demands on China had been satisfactorily met. They are stated in the semi-official 'Temps' to be:—1. Concession of a lease of a bay on the south coast of China. 2. Concession of a railway connecting Tonquin with Yunnan-fu by the Red River. 3. Engagement on the part of China never to alienate the territories of the provinces contiguous to Tonquin. 4. Engagement never to cede to any other Power the Island of Hainan. 5. Arrangement in regard to the constitution of the postal service."

Thus, for the time being, France was satisfied, and England would be, before she gave rest to the Tsung-li Yamèn. Her present demands, as above specified by Mr. Balfour, were pressed without ceasing by the pertinacious Sir Claude. On June 9 he obtained from the Yamèn a lease for the British government of about 200 square miles of territory on the mainland opposite its island crown colony of Hong Kong, and surrounding the Chinese city of Kowloon, the latter, however, to remain under Chinese jurisdiction. The term of the lease was ninety-nine years. With regard to the opening of Nan-ning as a treaty port, he received an assurance from the Yamèn in August that it should be done so soon as the Kwang-si rebellion was crushed. On the other points he had equal success.—*Great Britain, Papers by command: China, No. 1, 1899, pp. 12, 19, 98-9, 178.*

1898 (May).—How the murder of a missionary was made the ground of French demands for a railway concession.—Extraterritoriality.—On May 17, 1898, the British minister at Peking cabled to Lord Salisbury: "Murder of missionary in Kuang-si. French demands for compensation. . . . The Yamèn . . . said they were not certain that the murdered missionary was not a Chinaman, and that the demands made by the French for compensation comprise a Concession for a railway to some point on the sea-coast not specified, a chapel to be built, and a pecuniary indemnity of 100,000 fr. to be paid. Up to the present they had refused all these demands." Later, the following particulars of the murder were received from the British consul at Canton: "The occurrence happened about a fortnight ago at Yun-gan-chou, in the P'ing-lo Prefecture. While walking through the streets the missionary noticed a placard directed against the Christian religion. Having discovered the author of the placard, the missionary, with two converts, proceeded to his house and attempted to arrest him. Out of this a disturbance arose in which the passers-by took part, and in the end the missionary and the two converts lost their lives."

On May 21, Sir Claude MacDonald reported to Lord Salisbury from Peking: "I am very reliably informed that the demands made at an interview with the Yamèn yesterday by M. Pichon, the French Minister, in connection with this case were:—1. A Concession to construct a railway from Pakhoi to Nan-ning; 2. Construction of a chapel at Pakhoi; 3. A pecuniary indemnity of 100,000 fr.; and 4. The responsible officials to be punished. In response to these demands, the Yamèn suggested that the Railway Concession should be granted in a document by itself, apart from the granting of the other demands, and that the chapel should be built at Yung-an-chou, the scene of the murder, instead of at Pakhoi, and the French Minister undertook to refer these modifications to his Government for their favourable consideration."—*Great Britain, Papers by command: China, No. 1, 1899, pp. 91, 146, 159.*—Alluding to this incident,

and to that which the German government made its pretext for seizing Kiao-Chau (see above 1897—November), a German writer has remarked: "Never before, perhaps, has so much material value been attached to ministers of the Gospel in foreign lands, and the manner in which, after their death, they are used to spread civilization is somewhat foreign to our older ideas of the functions of the bearers of spiritual blessings."

"From the standpoint of international law and diplomacy, the situation in China is complicated in the extreme. Probably nowhere else in the world is there such a mixture of territorial rights with foreign privileges and understandings, of purely political engagements with economic and financial concessions, of foreign interests conflicting with one another and with those of the nominally sovereign State. When a national government is wholly untrammelled with regard to the management of its own domestic affairs and has within its own hands the enforcement of law within its own territorial borders, its international rights and responsibilities are easily determined by a resort to well-established principles of public law. But when, as in the case of China, we have a Power which permits the exercise within its limits of all kinds of extraterritorial rights or privileges; when there exist within its territory spheres of interest, 'special interests,' war zones, leased territories, treaty ports, concessions, settlements, and legation quarters; when there are in force a multitude of special engagements to foreign Powers with reference to commercial and industrial rights, railways and mines, loans and currency; when two of its chief revenue services—the maritime customs and the salt tax—are under foreign overhead administrative control or direction; when the proceeds of these and other revenues are definitely pledged to meet fixed charges on foreign indebtedness; when, at various points within its borders, there are stationed considerable bodies of foreign troops under foreign command—when we have these and other phenomena all carrying with them limitations upon the free exercise by the central government of its ordinary administrative powers or its discretionary right to deal as it deems best with the individual nations with which it maintains treaty relations, we then have a condition of affairs which furnishes abundant material not only for theoretical or academic discussions by students of international jurisprudence, but for serious conflict and disputes between the nations concerned. Under any circumstances, it is practically impossible to make a complete statement of the engagements which have been entered into by China with foreign Powers or with their nationals. In the first place, there is the difficulty that presents itself when dealing with the diplomacy and international relations of any country, that none of the Foreign Offices of the world have been willing to publish in full the correspondence between themselves and their diplomatic representatives stationed abroad, and that even the portions of such correspondence as finally are made public often appear only years after the dates they bear. And, even as to the treaties themselves, as is well known, many agreements exist that are known only to the parties signatory to them or to their allies. Perhaps the time will come when all covenants will be open and openly arrived at, but as yet that era has not arrived. But in the case of China's international relations the peculiar difficulty confronts the student that there are many instances in which China has committed herself, in writings or even conversations of a most informal character, which have not been

recorded or made public, and which are only presented when the party claiming under them a beneficial interest deems the time opportune for doing so. Still further, that in many, if not most of these cases, the State of China has been held bound by promises which have been made, or are alleged to have been made, by individual Chinese officials upon their own personal responsibility. . . . Applying the principles stated in the extra-territorial provisions of the treaties which have been quoted, it is found that the situation is as follows: (1) As regards the controversies in which no foreigners are involved, the jurisdiction is wholly in the hands of the Chinese authorities, and the suits are adjudicated according to Chinese law and procedure. (2) As regards controversies between two or more nationals of the same Treaty Power, the jurisdiction is exclusively in the consular or other courts which that Power is permitted by China to establish and operate in China, and the law applied is that of the Power concerned. Chinese police officials may make arrests, in criminal cases, but the offenders must be brought as speedily as possible and without undue hardship before, and surrendered into the custody of, the authorities of the State of which the offenders are nationals. (3) Over controversies between nationals of different Treaty Powers, the Chinese authorities exercise no jurisdiction: they are determined by the authorities and the laws of the States concerned according to agreements thereunto appertaining entered into between these States. (4) As regards actions brought by nationals of non-treaty Powers against nationals of the Treaty Powers the jurisdiction is in the authorities of the Treaty Powers. As regards suits, civil or criminal, in which the non-Treaty Power nationals are defendants, jurisdiction is in the Chinese courts. As regards controversies to which all the parties are non-treaty power nationals, or in which they appear as plaintiffs or complainants against Chinese defendants, the jurisdiction is in the Chinese tribunals and the law applied is that of China. The Treaty Powers sometimes exercise their 'good offices' in behalf of non-treaty power nationals in such suits, but there does not exist in China the system, found [formerly] in Turkey and other countries of the Levant, according to which a Treaty Power is permitted to take under its protection and authority, as protégés, the nationals of other powers."—W. W. Willoughby, *Foreign rights and interests in China*, pp. 1-3, 23-24.

1898 (June-September).—Attempted reforms by the emperor.—Overthrow of the reformers and surrender of power to the empress-dowager.—"The agitations in the Empire had hitherto been largely in the hands of the secret societies and had had for their object little beyond the vague program, 'Destroy the Ts'ing; restore the Ming.' From this time onwards a new spirit was abroad in the land. It was the result of many co-operating causes. The success of Japan had been clearly due to the fact that the Island Empire had adopted Occidental methods. The infiltration of Western learning, through the labors of missionaries and others, was beginning to tell. Most effective of all, there were personalities at work with a very definite end in view. One of the most influential of these was the great viceroy of Hu peh, Chang Chih tung, whose book, known by its English title, '*China's Only Hope*,' is said by a competent authority to have 'made more history in a shorter time than any other modern piece of literature.' Advertised throughout China on yellow posters, introduced with a rescript from the Emperor him-

self, it 'astonished a kingdom, convulsed an empire and brought on a war.' It was by no means the work of a radical. Chang Chih tung was no advocate of Parliaments. 'There were too many fools,' he said naïvely. Nor was he too favorable to the introduction of foreign instructors. They seemed to him too lazy, and inclined to dribble out their knowledge to students in order to make their engagement last longer. But he was in some respects thoroughgoing. With regard to opium he said: 'Cast out the poison.' With regard to education: 'Abolish the eight-legged essay,' whilst he recommended that the temples of the two religions in which he did not believe should be turned into schools. Above all he urged loyalty to the throne, to the race and to Confucianism. . . . A character harder to estimate aright is that of 'China's modern sage,' Kang Yu wei, a Cantonese, whose studies on the restoration in Japan, the decadence of Turkey, the constitutional changes in England, and the life of Peter the Great, penetrated in 1897 into the royal palace. Kang Yu wei's friends have declared he was by no means so precipitate as the Emperor's later actions would imply and his friendship with Chang Chih tung would argue for a certain measure of conservatism. His influence, however, is unmistakable. As Secretary of the Tsungli Yamèn and as publisher of a periodical entitled *News for the Times* he had ample opportunity to reach and influence others. Almost before the argus-eyed Dowager was aware of what was going on in the palace precincts the Emperor was surrounded by persons and influences recommended by Kang Yu wei. For three months 'the modern Confucius' reigned supreme in the Emperor's counsels; then came the deluge. The result of such influences as have been described, aided by the natural intelligence of the Emperor and his interest in western toys and scientific experiments, was soon apparent in his acts. 'We do not lack,' he said, 'either men of intellect or brilliant talents, capable of learning and doing anything they please; but their movements have hitherto been hampered by old prejudices.' Kwang hsu was at least resolved that this should no longer be true of himself. In the early part of 1898 he is said to have bought a hundred and twenty-nine foreign books, a Bible, maps, globes and charts. Moreover, he was determined to make things move outside the palace and there is something pathetic in the eagerness with which he launched, one after another, those twenty-seven ill-fated Edicts of July, 1898. They provided, with the bewildering haste, and with little or no attention to the means for carrying them into execution, for every reform which his somewhat visionary instructors had suggested to his enthusiasm. There was to be a new university at Peking, universal reform in education, extensions of railways, developments of art, science and agriculture, together with the immediate abolition of all that had hitherto retarded the advance of the Empire. It was a beautiful dream, but the dreamer was destined to a very sudden and rude awakening. The Empress Dowager was, as we have seen, no novice at a *coup d'état*. It had become manifestly a case for instant action if she were to save herself and her friends from the consequences of the new movement. We may also give her credit for the sincere belief that the new craze for western materialism was likely to play into the hands of the greedy European powers ever on the alert for the partitioning of China. It is no reflection on her patriotism that she believed drastic measures were necessary for the Empire's salvation. Yuan Shih Kai has been blamed by some for warning the Empress

of what was taking place in the Royal Palace. He too may be credited with the belief that hot-headed, inexperienced young enthusiasts were not the real leaders the time necessitated. So the blow fell; Kang Yu wei escaped with difficulty to live henceforth with a price upon his head. Most of his associates were ruthlessly beheaded; the poor young Emperor was from this time forth practically deposed and a prisoner; and a new era was inaugurated by an Edict which commences as follows: 'Her Imperial Majesty the Empress Dowager, Tsz hsi, since the first years of the reign of the late Emperor Tung Chih down to our present reign, has twice ably filled the regency of the Empire, and never did her Majesty fail in happily bringing to a successful issue even the most difficult problems of government. In all things we have ever placed the interests of our Empire before those of others and looking back at her Majesty's successful handiwork, we are now led to beseech, for a third time, for the assistance from her Imperial Majesty, so that we may benefit from her wise and kindly advice in all matters of State. Having now obtained her Majesty's gracious consent, we truly consider this to be a great boon to ourselves as well as to the people of our Empire.'—H. H. Gowen, *Outline history of China*, pp. 158-163.

1898 (October-November).—Outbreaks of popular hostility to foreigners.—The palace revolution which overthrew the reforming party was followed quickly by outbreaks of popular hostility to foreigners.

1898-1899.—Rioting in Shanghai consequent on French desecration of a cemetery.—French demand for extension of settlement ground in Shanghai.—English and American protests.—On July 18, 1898, the following was reported by the British consul-general at Shanghai: "Serious rioting took place in the French settlement on the 16th and the morning of 17th instant, in the course of which some fifteen natives lost their lives. The disturbance was due to an attempt of the French authorities to take possession of certain temple land known as the Ningpo Joss-house Cemetery. The ground is full of graves, and it is also used for depositing coffins until a favourable opportunity presents itself for removing them to the native districts of the deceased. The cemetery is within the limits of the French Settlement; originally it was far removed from the inhabited portion of the Settlement, but by degrees new streets have been laid out, and houses have been built, until the cemetery is surrounded by dwellings." On August 23 it was announced by telegram from Shanghai that "the dispute arising out of the Ningpo Joss-house is about to be settled by French withdrawing their claims to remove the buildings in consideration for an extension of their concession as far as Si-ca Wei, an addition of 20 square miles." This raised protests from Great Britain and the United States, many of whose citizens owned property within the area thus proposed to be placed under French jurisdiction; and the distracted Tsung-li Yamèn was threatened and pulled about between the contending parties for months. The final outcome was an extension of the general foreign settlement at Shanghai (principally British and American) and a limited extension of that especially controlled by the French. The adjustment of the question was not reached until near the end of 1899.—*Great Britain, Papers by command: China*, No. 1, 1899, and No. 1, 1900.

1899.—Anti-missionary outbreaks, increasing

piracy, and other signs of growing disorder.—During 1899 there was a notable relaxation of the hard and ceaseless pressure upon China which governments, capitalists and speculators had been keeping up of late, in demands more or less peremptory for harbor leases, settlement grounds, railway franchises, mining privileges, and naval, military and commercial advantages of every possible sort. But the irritation of the country under the bullying and "nagging" of the treatment it had received from the European nations revealed itself in increasing outbreaks of popular hostility to foreigners; and these called out threats and demands, for indemnity and punishment, which were made, as a rule, in the truculent tone that had become habitual to western diplomacy in dealing with the people of the East. It was a tone which the Chinese provoked, by the childish evasions and treacherous deceptions with which their officials tried to baffle the demands made on them; but it gave no less offense, and is no less plainly to be counted among the causes of what afterwards occurred. On February 18 the British minister complained energetically to the Tsung-li Yamèn of the rapid increase in piracy on the Canton river. "Since November, 1898," he wrote, "that is in three months, no less than forty-seven cases of piracy in the Canton waters have been reported in the papers. In several of these cases life was taken, and it may almost be said that a reign of terror exists on the waterways of the Two Kuang. Cargo boats are afraid to travel at night, or to move about except in company, and trade is becoming to a certain extent paralysed. The Viceroy is always ailing, and it is difficult to obtain an interview with him. Her Majesty's Consul has repeatedly addressed him on the subject of these piracies in the strongest terms, but can only obtain the stereotyped reply that stringent instructions have been sent to the officials concerned."

On February 28 von Bülow, the German imperial secretary of state for foreign affairs, announced in the Reichstag, at Berlin, the reception of a telegram from Tientsin, reporting that several Germans had been attacked and insulted in that town on the 24th, and had been compelled to take refuge in the side streets and narrow alleys. The imperial government, he said, had been already aware for some weeks past that a considerable feeling of irritation had manifested itself against foreigners in China, especially in the southern portion of the province of Shantung. The Chinese government was thereupon warned of the necessity of maintaining order and securing public safety, and, upon the receipt of the telegram above referred to, the German minister at Peking was instructed to impress upon the Chinese government that, if such incidents were permitted to recur, or the perpetrators allowed to escape unpunished, the consequences for China would be very serious. In June there was an anti-missionary riot at Kienning, in the neighborhood of Foochow, excited by the murder of a boy, popular rumor ascribing the murder to foreigners. The missionaries succeeded in escaping from the mob; but one native convert was killed, and the mission hospital and other premises were looted. A settlement of the Kienning case was arranged locally between the British consul at Foochow, Mr. Playfair, and the viceroy of the province. In November the German government made public the substance of an official telegram received from Peking, reporting a serious state of disturbance in the German missionary districts of Shantung: "It appears from this communication that the followers

of the sects of the 'Red Fist' and the 'Great Knife' are in a state of revolt against the Administration and the people in that province, and are engaged in plunder and rapine in many places. The native Christians suffer no less than the rest of the population by this revolt. Money was usually extorted from them, and their dwellings were pillaged or destroyed. The Italian Mission, situated in the adjoining district, were faring no better, and their chapel had just been burned down. Owing, however, to the unremitting representations of the German Minister, the Chinese Government have caused several of the agitators to be arrested by the local authorities, and they are taking further steps in this direction, with the result that order is gradually being restored. At several places the native Christians, with their non-Christian fellow-countrymen, repulsed the rebels by force of arms. The Provincial Governor has promised the authorities of the Mission a full indemnity for the losses suffered by them and by the other Christians, and several payments have already been made." On December 4, the following despatch was sent to London from the British legation at Peking: "During the delimitation of French leased territory at Kwang-chou-wan on the 13th November, Chinese villagers seized two French officers and decapitated them. The execution of a dignitary—the Prefect concerned in the murder—has been demanded by the French Minister, as well as the dismissal of the Canton Viceroy, who is also implicated. The Chinese Commissioner engaged in the delimitation and the gunboat in which he travelled are held by the French as hostages."

1899 (March-April).—**Agreement between England and Russia concerning their railway interests in China.**—On April 28, 1899, the governments of Great Britain and Russia exchanged notes, embodying an agreement (practically arrived at in the previous month) concerning their respective railway interests in China, in the following terms: "Russia and Great Britain, animated by the sincere desire to avoid in China all cause of conflict on questions where their interests meet, and taking into consideration the economic and geographical gravitation of certain parts of that Empire, have agreed as follows: (1) Russia engages not to seek for her own account, or on behalf of Russian subjects or of others, any railway concessions in the basin of the Yang-tsze, and not to obstruct, directly or indirectly, applications for railway concessions in that region supported by the British Government. (2) Great Britain, on her part, engages not to seek for her own account, or on behalf of British subjects or of others, any railway concessions to the north of the Great Wall of China, and not to obstruct, directly or indirectly, applications for railway concessions in that region supported by the Russian Government. The two contracting parties, having nowise in view to infringe in any way the sovereign rights of China or of existing treaties, will not fail to communicate to the Chinese Government the present arrangement, which, by averting all cause of complication between them, is of a nature to consolidate peace in the far East, and to serve the primordial interests of China herself." *Second Note.* "In order to complete the notes exchanged this day respecting the partition of spheres for concessions for the construction and working of railways in China, it has been agreed to record in the present additional note the arrangement arrived at with regard to the line Shan-hai-kuan-Newchwang, for the construction of which a loan has been already contracted by the Chinese

Government with the Shanghai-Hongkong Bank, acting on behalf of the British and Chinese corporation. The general arrangement established by the above-mentioned notes is not to infringe in any way the rights acquired under the said loan contract, and the Chinese Government may appoint both an English engineer and a European accountant to supervise the construction of the line in question, and the expenditure of the money appropriated to it. But it remains understood that this fact can not be taken as constituting a right of property or foreign control, and that the line in question is to remain a Chinese line under the control of the Chinese Government, and can not be mortgaged or alienated to a non-Chinese company. As regards the branch line from Siaoheichan to Sinminting, in addition to the aforesaid restrictions, it has been agreed that it is to be constructed by China herself, which may permit European—not necessarily British—engineers to periodically inspect it, and to verify and certify that the work is being properly executed. The present special agreement is naturally not to interfere in any way with the right of the Russian Government to support, if it thinks fit, applications of Russian subjects or establishments for concessions for railways, which, starting from the main Manchurian line in a southwesterly direction, would traverse the region in which the Chinese line terminating at Sinminting and Newchwang is to be constructed."—*Great Britain, Papers by command, Treaty series, No. 11, 1899.*

1899 (May-July).—**Representation in the Peace Conference at The Hague.** See HAGUE CONFERENCE: 1899: Constitution.

1899 (August).—**Talienwan declared a free port.**—"The Emperor of Russia in a quaintly worded Imperial Order issued on Sunday last [August 13] and addressed to the Minister of Finance, has declared that after the completion of the railway Talienwan shall be a free port during the whole duration of the lease from China. In the course of the Order the Emperor says: 'Thanks to the wise decision of the Chinese Government, we shall through the railway lines in course of construction be united with China,—a result which gives to all nations the immeasurable gain of easy communication and lightens the operations of the world's trade.' The Emperor also speaks of 'a rapprochement between the peoples of the West and East' (brought about apparently by obtaining an outlet for the great Siberian railway) as 'our historic aim.'"—*Spectator, London, Aug. 19, 1899.*

1899 (December).—**Li Hung-chang appointed acting viceroy at Canton.**—On December 20 it was announced that the viceroy at Canton had been ordered to Peking and that Li Hung-chang had been appointed acting viceroy of Kwangtung and Kwangsi—the provinces of which Canton is the viceregal seat.

1899-1900 (September-February).—**Pledges of an "open-door" commercial policy in China obtained by the government of the United States from the governments of Great Britain, Russia, France, Germany, Italy and Japan.**—"In September and November, 1899, Secretary Hay sent to the diplomatic representatives of the United States at London, Paris, Berlin, St. Petersburg, Tokyo, and Rome, instructions to advise the governments to which they were respectively accredited of the hope that they would make 'formal declaration of an open door policy in the territories held by them in China.' An assurance was sought from each power that: first, it would 'in no way interfere with any treaty port or any

vested interest within any so-called "sphere of interest" or "leased territory" which it might have in China"; second, "the Chinese treaty tariff of the time being shall apply to all merchandise landed or shipped to all such ports as are within said 'sphere of interest' (unless they be free ports), no matter to what nationality it may belong, and . . . duties so leviable shall be collected by the Chinese government"; and, third, "it will levy no higher harbor dues on vessels of another nationality frequenting any port in such "sphere" than shall be levied on vessels of its own nationality, and no higher railroad charges over lines built, controlled, or operated within its "sphere" on merchandise belonging to citizens or subjects of other nationalities transported through such "sphere" than shall be levied on similar merchandise belonging to its own nationals transported over like distances." In due course favorable replies had been received from all the governments addressed, though one of the notes was decidedly equivocal in its wording, while several not unnaturally made the reservation that assent was given upon the condition that the proposals were accepted by all the other powers concerned. Having in hand and having compared the replies, Secretary Hay on March 20, 1900, sent instructions to each of the above-mentioned representatives to inform the government to which he was accredited that, inasmuch as it had accepted the declaration suggested by the United States and as like action had been taken by all the various powers concerned, the condition of common acceptance having been complied with, the United States government would consider the assent given as final and definite. In other words, Secretary Hay declared that in his opinion each of these six powers had entered into an agreement with the United States which amounted to a mutual pledge to preserve the commercial *status quo* and to refrain, each in what might be its sphere of interest, from measures calculated to destroy equality of opportunity."—S. K. Hornbeck, *Contemporary politics in the Far East*, pp. 233-235.—See also BOXER RISING AND THE "OPEN DOOR."

1900 (January).—Imperial decree relative to the succession to the throne.—The following is a translation of an imperial decree, "by the emperor's own pen," which appeared in the *Peking Gazette*, January 24, 1900: "When at a tender age we entered into the succession to the throne, Her Majesty the Empress-Dowager graciously undertook the rule of the country as Regent, taught and guided us with diligence, and managed all things, great and small, with unremitting care, until we ourselves assumed the government. Thereafter the times again became critical. We bent all our thoughts and energies to the task of ruling rightly, striving to requite Her Majesty's loving kindness, that so we might fulfil the weighty duties entrusted to us by the late Emperor Mu Tsung Yi (T'ung Chih). But since last year we have suffered from ill-health, affairs of State have increased in magnitude and perplexity, and we have lived in constant dread of going wrong. Reflecting on the supreme importance of the worship of our ancestors and of the spirits of the land, we therefore implored the Empress-Dowager to advise us in the government. This was more than a year ago, but we have never been restored to health, and we have not the strength to perform in person the great sacrifices at the altar of Heaven and in the temples of the spirits of the land. And now the times are full of difficulties. We see Her Gracious Majesty's anxious toil by day and by night, never laid aside for rest or leisure, and with

troubled mind we examine ourself, taking no comfort in sleep or food, but ever dwelling in thought on the labours of our ancestors in founding the dynasty, and ever fearful lest our strength be not equal to our task. Moreover, we call to mind how, when we first succeeded to the throne, we reverently received the Empress-Dowager's Decree that as soon as a Prince should be born to us he should become the heir by adoption to the late Emperor Mu Tsung Yi (T'ung Chih). This is known to all the officials and people throughout the Empire. But we suffer from an incurable disease, and it is impossible for us to beget a son, so that the Emperor Mu Tsung Yi has no posterity, and the consequences to the lines of succession are of the utmost gravity. Sorrowfully thinking on this, and feeling that there is no place to hide ourself for shame, how can we look forward to recovery from all our ailments? We have therefore humbly implored Her Sacred Majesty carefully to select from among the near branches of our family a good and worthy member, who should found a line of posterity for the Emperor Mu Tsung Yi (T'ung Chih), and to whom the Throne should revert hereafter. After repeated entreaties, Her Majesty has now deigned to grant her consent that P'u Chün, son of Tsai Yi, Prince Tuan, should be adopted as the son of the late Emperor Mu Tsung Yi (T'ung Chih). We have received Her Majesty's Decree with unspeakable joy, and in reverent obedience to her gracious instruction we appoint P'u Chün, son of Tsai Yi, as Prince Imperial, to carry on the dynastic succession. Let this Decree be made known to all men."—*Great Britain, Parliamentary publications (Papers by command: China, No. 3, 1900, pp. 15-16)*.

1900.—Origin of the Boxers.—Missionary interference in civil affairs.—Boxer outbreak.—Massacres of foreign and native Christians.—Siege of the legations.—Rescue by Allied troops.—Suppression of the movement.—Looting.—Terms of peace.—"Chinese state papers show that a society under the name of I Ho Ch'uan had existed in China since the days of Chia Ch'ing. Like other secret societies it had existed under the ban of the law; and, like most of them it had the province of Shantung for its cradle. Its members had to undergo an initiation which was supposed to make them invulnerable. At any rate, after the required period of initiation, they were little better than madmen; and, singing incantations as they made their attacks, were absolutely regardless of danger. It was their wont to perform their experiments before admiring and credulous crowds; and when any of their number failed to make good his claims to invulnerability, the usual excuse was that the man in question had been deserted by the spirits. They indulged in dances and prostrations to evoke this divine protection; and worshipped a variety of gods of Buddhist or Taoist origin. For weapons they used knives and spears. . . . Missionaries as a body suffered more than any other class of foreigners during the Boxer trouble; but even they were not entirely free from blame. Their principal fault lay in the fact that some of them assisted Chinese in their lawsuits in order to secure new converts. This was especially true of the Catholic priests. They had official rank conferred on them by the Emperor, and were permitted to communicate with the local officials either in person or by writing. A priest would often tell the officials that the converts could have done no wrong because they were Christians, or because he had investigated the case and knew

what he was talking about. He would then dictate to them what action to take; and, in case of refusal to comply, a threat to report them to their superior officials for their failure to protect Christians from persecution usually had the desired effect. The result was that the outside people in going to law with a 'convert' often got anything but justice; and murderers, thieves, and other criminals flocked into the church. After the Boxer trouble the British minister had more than one occasion to insist that American citizens had no treaty right to deal directly with Chinese officials. These facts alone are sufficient to show that the Protestant missionaries had also indulged in this illegal and harmful practice, although to a much less extent than the Roman Catholics. China owes much to missionaries for new ideas and knowledge; she also owes much to them for the Boxer Uprising. There were 2,218 missionaries in China at the time the uprising took place."—Li Ung Bing, *Outlines of Chinese history*, pp. 600, 613.—"Throughout the year 1899 sporadic outbreaks and outrages indicated the existence of widespread disturbance in Chihli and its two neighbouring provinces, Shantung and Shansi. Some of the troubles were connected with Catholic missions, some with Protestant, and some with causes independent of either. The most careful diagnosis could not get beyond the fact that the air was full of unrest. By and by, however, salient features began to detach themselves from the confusion. It was perceived that there existed, here and there, the elements of an organisation, called in some quarters the 'Fists of Public Harmony' (*I-ho-Chuan*), in others the 'Big Sword Society' (*Ta-tao-hui*). Under either name the associates were understood to be inspired by hostility to foreigners. Many analyses of this phenomenon have been published. All, with one exception, discuss the manifestations rather than the motives. That exception is Sir Robert Hart's account. Sir Robert says that the 'Boxers'—by which name the 'Fists of Public Harmony' ultimately came to be known, and will be forever known in Occidental history—were the outcome of a conviction which had forced itself on the mind of the Chinese Government that the only economical and effective method of protecting the empire against foreign aggression was to organise volunteer associations all over the country, which, in any moment of crisis, would rise and unite their strength to beat back the tide of invasion. The idea seemed to receive immediate confirmation from without in the stand a handful of burghers were making in the Transvaal; hence the Boxer Association, patriotic in origin, justifiable in its fundamental idea, and, in point of fact, the outcome of either foreign advice or the study of foreign methods. (Here follows a recapitulation of the factors of irritation caused by the operation of the treaties; by the fruits of missionary propagandism; by the privilege which the French Government demanded and obtained for Roman Catholic priests in 1899, the privilege of adopting the equipages and paraphernalia of secular rank and receiving the treatment due to high officials; by the Kiaochow affair, and by the cessions of territory at Port Arthur, Wei-hai-wei and Kwangchow Bay.) These doings, followed by the successful stand made against the Italian demand for a port on the coast of Chekiang, helped to force the Chinese Government to see that concession had gone far enough and that opposition to foreign encroachment might now and henceforth be the key-note of its policy. Li Ping-Hêng (cashiered in obedience to Germany's de-

mand) had taken up his private residence in the southeastern corner of Chihli, close to the Shantung frontier; and the Boxer movement, already started in a tentative way in the latter province, now received an immense impetus from the occurrences alluded to, and was carefully matured and fostered by that cashiered official—more respected than ever by his countrymen. Other high officials were known to be in sympathy with the new departure and to give it their strongest approval and support, such as Hsü Tung, Kang Yi, and men of the same stamp and standing; and their advice to the throne was to try conclusions with foreigners and yield no more to their demands. However mistaken may have been their reading of foreigners, and however wrong their manner of action, these men—eminent in their own country for their learning and services—were animated by patriotism, were enraged at foreign dictation, and had the courage of their convictions. Ranged on the same side was General Tung Fuh-hsiang, with his troops, a numerous body of soldiers raised in the north-western province of Kansu, and supposed to be at once fierce fighters and radically anti-foreign; while at the head of the whole organisation stood Prince Tuan, father of the now heir apparent. It will be observed that Sir Robert Hart's account attributes the origin of the Boxers solely to anti-foreign sentiment. But Chinese observers affirm that the organisation was directed also against the reform movement which Kang Yu-wei and his enlightened associates had done so much to foster. In short, the Boxers were intended to intimidate domestic reformers as much as to check foreign aggression. But, in the sequel, they threw their whole strength into a movement for the expulsion of foreigners from Chinese soil, and upon that rock they shattered themselves. What, then, was the immediate cause of this extraordinary attempt, which virtually amounted to throwing the gauntlet in the face of the world? Only one authority has attempted to explain the mad outbreak, and that is Wen Ching, author of 'The Chinese Crisis from Within.' Briefly stated, his analysis may be summed up thus:—At the head of all anti-foreign officials stood Kang Yi, Assistant Grand Secretary, a semi-educated, superstitious Manchu, around whom the alarmed members of the Manchu clique had rallied when the thunderbolts of the reforming Emperor were beginning to strike them from the seats of power. Allied with him, but less violent and more of an opportunist, was Yung Lu, Commander-in-chief of the Manchu army. These two men, conscious that their influence demanded the support and association of a member of the Imperial clan, gradually approached Prince Tuan, who stood next to the Emperor in the order of succession to the Throne. Ultimately a plan for the deposition of the Emperor and the nomination of Prince Tuan's son, Pu Chun, to be heir apparent, received the approval of the Empress Dowager. On January 24, 1900, an edict was issued, declaring that the Emperor had requested the Empress Dowager to appoint Pu Chun as his successor. This act, being considered preliminary to the Emperor's dethronement, threw China into a convulsion of excitement. Memorials reached the Throne from all quarters protesting against the deposition of the Emperor; and since it became evident that to persist in the project would dangerously alienate the Chinese section of the nation, the Empress Dowager and Yung Lu drew back. But Prince Tuan, a violent, headstrong man, could not brook the notion that, in deference to remonstrances from the subject

race, the publicly recognised claim of his son should be even temporarily set aside. He therefore espoused the cause of the Boxers more strenuously than ever, and took into his confidence General Tung Fuh-hsiang, already spoken of. The Boxers practised various religious rites which were supposed to render them invulnerable; and Prince Tuan, a thoroughly superstitious man, believed firmly in the efficacy of these rites. The Boxers, then, would constitute an instrument for punishing all the insolent Chinese who had shown their sympathy with the reforming Emperor as well as for checking foreign aggression. At this stage Prince Tuan, to placate his offended pride, was appointed a member of the *Tsung-li Yamên*. He immediately learned that the news of his appointment had excited the strongest possible condemnation in the Foreign Legations; and he determined to let loose the Boxer inundation, directing it against these contumacious foreigners, whose insolence and aggressions had roused him and others of his countrymen to fiery anger. Of the bloody traces left by the Boxer wave as it swept through the provinces towards Peking, a terribly graphic record may be found in a volume called 'The Martyred Missionaries of the China Inland Mission, and Perils and Sufferings of Some who Survived.' That Mission alone lost 33 ladies, 25 men, and 21 children; and the number of martyrs among eleven missionary societies represented in the four provinces which were the scene of the disaster—Shansi, Chihli, Chekiang, and Shantung—totalled 188, of whom 53 were children. Of Roman Catholics there fell 35 priests and 9 nuns in Manchuria, Shansi, Mongolia, Chihli, and Hunan. As to the number of native Christians done to death, records do not exist. There is no evidence that the crime of assassination was supplemented by any of the horrors commonly perpetrated when women fall into the hands of a mob. The mercy of a speedy death was accorded. . . . On the 13th of June the Boxers entered Peking. By that time the foreign community had assembled at the Legations with the exception of some Roman Catholic priests and their native converts who had taken refuge within the Peh-tang (Northern Cathedral). In the Legations were some six hundred Europeans and Americans—more than half of them fighting men—and three thousand Chinese, the latter consisting chiefly of native converts. A mixed force, under Vice Admiral Seymour of the British Navy, left Tientsin on the 10th of June for Peking; and had it reached the city, all the subsequent trouble would have been prevented. But the force spent too much time endeavouring to restore the line of communication by repairing the railway, instead of moving on at once to the capital, and thus the opportunity was lost. The Boxers made at first no attempt to attack the Legations. They confined themselves to killing native Christians, burning churches, and destroying everything that savoured of Occidental fashions, as well as much that had no such distinction. The city was almost completely given over to pillage and rapine, for many of the soldiers co-operated with the Boxers in this work. But the Legations did not appear to be in any serious danger. One of the occupations of the inmates was marching out to rescue native Christians from Cathedrals to which the torch had been applied, or from the swords of Boxers. Had not any extraneous influence been imported into the situation, there is no valid reason to conclude that the Legations would ever have been attacked by Chinese troops; though, on the other hand, it is equally impos-

sible to affirm that the party of Prince Tuan, Kang Yi, and General Tung would not have given effect to their policy of violence in spite of the more prudent views of the Empress Dowager and Yung Lu. Up to the evening of the 17th of June, Ministers of the *Tsung-li Yamên* called personally at the Legations. But in the meanwhile the officers commanding the allied fleets off the mouth of the Peiho had arrived at the conclusion that their communications with Peking were in danger and that the Chinese garrison of the Taku Forts contemplated laying torpedoes in the river. Meeting in council under the presidency of a Russian Admiral, they decided to demand the surrender of the forts within twelve hours. Of course that meant war. There could be no other issue. For the wires having been cut by the Boxers, who tore down telegraphs, tore up railways, and burned churches with equal diligence, the officer at the forts could not consult his senior within the given time, and it was obviously out of the question that he could surrender on his own discretion. He refused; and at daybreak on the following morning (17th June) the ships took up convenient positions, bombarded the Forts and then landed a party which carried them by escalade. This singular performance astonished the world. Evidently no alternative had been left to the Chinese. If it was not intended to force a fight, the natural course would have been to make war contingent on some specific act; to declare, for example, that any attempt to lay torpedoes or any attempt to re-enforce the garrison of the Forts would be regarded as hostile. But no such choice was given. What made the thing stranger was that Tientsin, forty miles distant, was thus left for at least two days at the mercy of large forces of Chinese troops then posted in its vicinity; that Admiral Seymour's relief expedition, harassed by Boxers between Tientsin and Peking, was placed in deadly peril, and that Peking was completely isolated. So patent to onlookers were all these dangerous consequences that the officer chiefly responsible for the attack fell under suspicion of having precipitated hostilities in the selfish interests of the only country that stood to gain anything by war. News of the capture of the Taku Forts having reached Peking on the 10th of July, the *Tsung-li Yamên* sent a note to the Foreign Ministers, requesting them to leave the city within twenty-four hours, as their security could not be guaranteed any longer. It is tolerably certain that this note represented the result of a compromise between the war party and the peace party. The former had agreed to give the Ministers a chance of escaping, their neglect of it to be the signal for attack. It was an illusory chance. If Admiral Seymour with a thousand men, all combatants, had not been able to make his way from Tientsin to Peking in nine days, before war had broken out, what hope offered that three hundred and fifty marines should safely escort over three thousand non-combatants from Peking to Tientsin after hostilities had commenced?"—F. Brinkley, *China: Its history, arts and literature*, v. 12, pp. 108-207.

"In the meantime affairs in the capital were in a most critical state. The Boxers burned and looted at will, and obtained complete control of the city. On June 11th, Mr. Sugiyama, Chancellor of the Japanese Legation, was killed in a barbarous manner. On June 20th, Baron von Ketteler, the German Ambassador, while making his way to the *Tsung-li Yamên*, was shot dead in the streets. After the attack on the Taku Forts

the ultimatum already referred to had been issued for the withdrawal of the foreign ministers within twenty-four hours. The Ambassadors refused to obey this order, as they feared that they would be instantly massacred should they attempt to pass through the streets of the city. Upon their refusal, the Imperialist troops immediately joined with the Boxers in an attack on the Legations, and all the foreign residents in Peking were forced to retreat to the British, American, and adjoining Legations for safety. A constant bombardment was kept up against these legations, and the foreigners were in imminent danger of being annihilated. There seemed, however, to be divided counsel among those directing the attack, and this probably alone saved the entire foreign community from extermination. Many of the Chinese officials foresaw what would be the consequence of such an outrage. Others perhaps waited until they could see what the fate of Tientsin was to be. If the Foreign Settlement of Tientsin had been taken by the Boxers, then probably the full fury of the mobs in Peking would have been turned against the Legations, and even those officials who still wished to avert the massacre would have been unable to do so. In the desire to take the Legations by storm, numerous buildings just outside the Legation walls were successively fired for the purpose of burning out the foreigners. In this way the celebrated Hanlin Academy, with its valuable collection of Chinese books, was destroyed. The American marines, by securing a portion of the wall around the Tartar city on one side of the American Legation, rendered the position of the besieged more tenable, and the holding of this was a great advantage throughout the siege. In the beginning of August the Allied force, consisting of 15,000 men, began the advance on Peking. It was composed principally of British, Japanese, Russian, American, and German troops. The British Commander was General Gaselee, and the American, General Chaffee. On the way some opposition was encountered at Peitsang and Yang-tsun. The expedition finally reached Peking on August 14th, and the city was taken on the following day. The Emperor and Empress Dowager fled from the city as the Allies entered, and, after suffering much hardship on the way, finally established the Court at Si-nan-fu in Shansi. Thus ended one of the most remarkable sieges in history, exceeding in importance the famous sieges of Lucknow and Cawnpore. On the part of the Chinese the greatest political blunder imaginable had been committed, and China had rendered herself liable to chastisement at the hands of the whole Western world. While in the North this desperate attempt was being made to throw off the yoke of foreign aggression, a large part of China remained peaceful and took no part in the outbreak. This was effected by the viceroys of the Eastern and Southern Provinces refusing to obey the secret edict calling upon them to rise and drive out the foreigners. They realized the rashness of such an attempt, knowing that China was not strong enough to throw down the gauntlet to all the Western Powers. An agreement was made by Chang Chih-tung, the Viceroy of Honan and Hupeh, Liu K'un-i, the Viceroy of Kiangsu, Anhui, and Kiangsi, Yüan Shih-kai, the Governor of Shantung, and Li Hung-chang, the viceroy of Kuangtung and Kuangsi, with the foreign consuls of the different Western Powers, by which the former promised to preserve peace in their jurisdictions provided that the foreign troops confined their military operations to the North. This

agreement was faithfully carried out on both sides, and was the means of saving China from universal anarchy. It showed very clearly that the history of the past had not been entirely without effect, and that some of the most influential officials realized that foreign intercourse need not necessarily harm their country, but might be the means of leading her to internal reform. After the taking of Peking it was occupied by the foreign forces. The capital and the adjoining country were completely under the control of the Allied army. Peking was looted in a way that threw much discredit upon Western civilization. The Russian and French troops treated the people with cruelty and barbarity, and the German forces, inspired with the spirit of revenge for the murder of their Ambassador, went about the country dispersing bands of Boxers, and working much needless devastation. Count von Waldersee was sent out from Germany, and was recognized as Commander-in-Chief by all the forces except the American."—F. L. H. Pott, *Sketch of Chinese history*, pp. 200-203.—"An unhappy incident of the relief of the Legations was the wanton and savage destruction with which the foreign troops avenged the savagery of their foes. It is useless now to bandy reproaches among the various nationalities concerned, but it may be said that order was first restored among the Japanese, then among Americans and British. Many Chinese, perfectly innocent of complicity with Boxerdom, had occasion to rue the entrance of the foreign forces into Peking and the object lesson which it was designed to give was to a large extent spoiled. Captain Brinkley writes: 'It sends a thrill of horror through every white man's bosom to learn that forty missionary women and twenty-five little children were butchered by the Boxers. But in Tung-chow alone, a city where the Chinese made no resistance and where there was no fighting, five hundred and seventy-three Chinese women of the upper classes committed suicide rather than survive the indignities they had suffered.' After this the looting of the treasures of *Yamens* and private houses and the carrying off by the Germans of the beautiful astronomical instruments given by Louis XIV to Kang hsi seem insignificant. Our civilization of which we boast so much is still something of a veneer."—H. H. Gowen, *Outline history of China*, p. 170.—"At first there were no Chinese Officials with whom terms of peace could be discussed, but after a time Li Hung-chang came up from the South, having received the appointment of Viceroy of Chihli, and he and Prince Ching were appointed Plenipotentiaries for negotiating terms of peace. After long conferences the following peace protocol was agreed to by the Chinese Peace Plenipotentiaries and the Ministers of Peace Commissioners of the Western Powers. (1) China was to erect a monument to the memory of Baron von Kettler on the site where he was murdered, and to send an Imperial Prince to Germany to convey the Emperor's apology for the sad occurrence. (2) China was to inflict the death penalty upon eleven princes and officials named by the foreign negotiators. (3) The provincial examinations were to be suspended for five years in the places where the outrages had occurred. (4) In future all officials who failed to prevent anti-foreign outrages within their jurisdictions were to be dismissed and punished. (5) An indemnity was to be paid to the states, corporations, and individuals who had suffered from the disturbance, and the Chinese Government was to be allowed to raise the tariff on imports to an effective five per cent. (6) The

Tsung-li Yamên was to be abolished, and its functions vested in a ministry of Foreign Affairs (Wai-wu-pu) which was to take rank before the other six ministries of state. (7) Rational intercourse was to be permitted with the Emperor as in other civilized nations. (8) The forts at Taku and the other forts on the coast of Chihli were to be razed to the ground, and the importation of arms and war material was to be prohibited. (9) Permanent guards of foreign soldiers were to be maintained in the Capital, and also at various stations in order to keep open the communication between Peking and the sea. (10) For two years, Imperial proclamations were to be posted throughout the Empire ordering the suppression of Boxers. (11) The indemnity was to include compensation for Chinese who suffered for being in the employ of the foreigners, but no compensation money was to be given to the native Christians. These terms were severe, but they were far better than many of the Chinese had expected, inasmuch as the integrity of China was preserved, and no further demands were made for portions of her territory. Most of the terms of the peace protocol have already been carried out. Prince Chun has accomplished a mission of apology to Germany, and the amount of the indemnity to be paid has been settled. China has to pay the large sum of 450 million taels, to be paid off in annual installments extending over 40 years."—F. L. H. Pott, *Sketch of Chinese history*, pp. 203-204.—See also **BOXER RISING AND THE "OPEN DOOR."**

1900-1908.—Awakening of China.—Rise of the reform movement.—"The Boxer Rebellion was the last protest of China against the inevitable, and, in the completeness of its failure, was the final lesson necessary in that series of international events ever since 1840 to teach China that, however excellent her civilization may be in some respects, it was inadequate when judged by the spirit and achievements of the XXth century. Through the agency of unparalleled national disasters, it was finally brought home to the intelligent classes and in a lesser degree to the entire people that, successfully to withstand European aggression, it was necessary to have recourse to Europe's ways, to adopt in the new scheme of things whatever heretofore had been lacking, whether for good or for evil. The awakening did not come all at once. For the ensuing two or three years China remained crushed by the succession of humiliations heaped upon her since 1895. It even fell to other nations, notably Japan, to save China from Russian ambitions, the result of which was the Russo-Japanese war, fought equally in Chinese interests, on Chinese territory, and with the violation of Chinese integrity and neutrality. This momentous conflict, in which an Oriental race triumphed over one of the greatest of European Powers, besides changing the course of history in the Far East, left an indelible impression upon the Chinese national consciousness, and from then on the awakening of China began in a truly nationalized form."—P. H. Clements, *Boxer rebellion*, pp. 204-205.—"As a result of these lessons the walls of Chinese conservatism broke down in rapid succession and the country entered feverishly on a campaign of reform. China at last was awake to the new age and attempted to fit herself to enter it by changes which startled the world. The empress dowager saw that unless the Manchus could place themselves at the head of the movement they would be swept aside. She received foreigners at court and endeavored to establish more cordial relations

with them. The building of railways was encouraged and no special hindrance was placed in the way of granting concessions to foreign capital. The new education was aided. . . . A post office had been started under the direction of the maritime customs service and now grew apace. Telegraph lines were built by the government to connect all the principal cities. By the end of 1908, two thousand five hundred miles of railway were open in China proper and one thousand seven hundred more were under construction. . . . Modern cotton mills and match factories were started, and new coal, iron and antimony mines

LI HUNG-CHANG (1823-1901)

Famous Chinese statesman

were opened. Chinese organized companies after Western methods to handle these and other enterprises. Attempts were made to stamp out foot-binding and to eradicate opium smoking. . . . Foreign commerce grew. . . . An attempt was made to introduce uniform coinage and to end the monetary chaos of the empire. There was a remarkable growth in national feeling. The Chinese had a racial coherence but they lacked national consciousness. Now the disgrace of China's helpless condition began to be keenly felt."—K. S. Latourette, *Development of China*, pp. 201-204.

1901-1902.—Russian grip on Manchuria.—Coercive negotiations with China.—Protests from other powers.—Manchurian treaty of 1902

and its impotence.—Early in December, 1901, the American minister to China, Edwin H. Conger, reported to Secretary Hay, at Washington, an impending treaty which Russia seemed likely to force on the Chinese government, which would practically secure to that aggressive power, through a prolonged agreement of China with the Russo-Chinese bank, exclusive railway and mining concessions in Manchuria, and which would protract the Russian evacuation of that country through three years. England and Japan were using all their influence at Peking to prevent the signing of the treaty, and Hay entered a vigorous protest on the part of the government of the United States, “animated now, as heretofore, by the sincere desire to insure to the whole world full and fair intercourse with China on equal footing.” The pressure from Russia on China was so potent, however, that Conger, on January 20, 1902, reported to Hay that Prince Ch'ing, who acted with authority from his government in the negotiation with Russia, had informed him “that the latter has done the best he could and has held out as long as possible, but that Russian possession of Manchuria has become intolerable, and that China must at once sign the convention or lose everything; that he has therefore agreed to sign the convention [modified in some particulars] and will also sign the separate agreement with the Russo-Chinese Bank, which practically gives exclusive privileges of industrial development in Manchuria.” Nevertheless the consummation of the Russian project of coercive diplomacy was delayed until April 8, and the terms of the treaty then signed were considerably moderated from the original design.—*Papers relating to the foreign relations of the United States, 1902, pp. 271-281.*—See also MANCHURIA: 1900-1901.—During the next two years Russia was accused from all sides of infidelity to the engagements of this treaty, and her conduct, which seemed especially menacing to Japan, gave rise to the Russo-Japanese War. See JAPAN: 1901-1904.

1901-1908.—Settlement of the indemnity to be paid to fourteen powers on account of the Boxer rising.—Remission of part by the United States.—In April, 1901, the Chinese government had promised satisfaction and indemnity to the fourteen powers whose subjects had suffered from the barbarous attack and whose forces had overcome it, and the measure of indemnity to be paid was then being discussed. The discussion and the reckonings involved were prolonged till September. The final protocol was signed September 7, but it was not until the 30th of that month that the formulated claims of the powers concerned were accepted by China, and the responsibility of payment assumed by an imperial decree. The total was 450,000,000 taels, equivalent to \$334,000,000, divided between Austria-Hungary, Belgium, Denmark, France, Germany, Great Britain, Italy, Japan, Netherlands, Portugal, Russia, Spain, Sweden, and the United States. The sum was not reckoned solely for the covering of losses and expenses, consequent on the Boxer outrages, but was intended to be, in some degree, a penalty imposed on the Chinese nation; and some of the claimant nations were said to be more exacting on this score than others were. The amount for which the United States stipulated was \$24,440,000, and the American government received an indemnity bond for that sum. But when the

expenses of the American relief expedition had been accurately ascertained, and all losses and destruction of property belonging to American claimants had been settled, it was found that they would be largely overpaid. It was possible, according to common practice in international dealings, to regard the excess as justly punitive; but a different view was dictated by the wish to show friendliness to China, and a return of the overpayment was proposed. Recommended by President Roosevelt, the necessary sanction was given by Congress, and on July 11, 1908, the American minister to China addressed the following communication to the prince of Ch'ing, president of the *wai-wu-pu*, or board of foreign affairs, at Peking:

“YOUR HIGHNESS:

“It is with great satisfaction that I have the honor to inform your Highness, under direction of the Secretary of State of the United States, that a bill has passed the Congress of the United States authorizing the President to modify the indemnity bond given the United States by China under the provisions of Article VI. of the final protocol of September 7, 1901, from twenty-four million, four hundred and forty thousand dollars (\$24,440,000), United States gold currency, to thirteen million, six hundred and fifty-five thousand, four hundred and ninety-two dollars and twenty-nine cents (\$13,655,492.29), with interest at four per cent (4%) per annum. Of this amount two million dollars (\$2,000,000) are held pending the result of hearings on private claims presented to the Court of Claims of the United States within one year. Any balance remaining after such adjudication is also to be returned to the Chinese Government, in such manner as the Secretary of State shall decide.

“The President is further authorized under the Bill to remit to China the remainder of the indemnity as an act of friendship, such payments and remissions to be made at such times and in such a manner as he may deem just.

“I am also directed by the Secretary of State to request the Imperial Government kindly to favor him with its views as to the time and manner of the remissions.

“Trusting that your Imperial Highness will favor me with an early reply to communicate to my Government, I avail myself of this occasion to renew to your Highness the assurance of my highest consideration—W. W. ROCKHILL.”

In his reply, after reciting the statements conveyed to him by Mr. Rockhill, the prince wrote (as translated) the following:

“On reading this despatch I was profoundly impressed with the justice and great friendliness of the American government, and wish to express our sincerest thanks.

“Concerning the time and manner of the return of the amounts to be remitted to China, the Imperial Government has no wishes to express in the matter. It relies implicitly on the friendly intentions of the United States Government, and is convinced that it will adopt such measures as are best calculated to attain the end it has in view.

“The Imperial Government, wishing to give expression to the high value it places on the friendship of the United States, finds in its present action a favorable opportunity for doing so. Mindful of the desire recently expressed by the President of the United States to promote the

coming of Chinese students to the United States to take courses in the schools and higher educational institutions of the country, and convinced by the happy results of past experience of the great value to China of education in American schools, the Imperial Government has the honor to state that it is its intention to send henceforth yearly to the United States a considerable number of students there to receive their education. The Board of Foreign Affairs will confer with the American Minister in Peking concerning the elaboration of plans for the carrying out of the intention of the Imperial Government.

"A necessary despatch.

"SEAL OF THE WAI-WU-PU."

Simultaneously with the note from Prince Ch'ing, the *wai-wu-pu* as a body addressed the following to Mr. Rockbill:

"To his Excellency W. W. Rockhill, American Minister, Peking:

"Referring to the despatch just sent to your Excellency regarding sending students to America, it has now been determined that from the year when the return of the indemnity begins, one hundred students shall be sent to America every year for four years, so that four hundred students may be in America by the fourth year. From the fifth year and throughout the period of the indemnity payments a minimum of fifty students will be sent each year.

"As the number of students will be very great, there will be difficulty in making suitable arrangements for them. Therefore, in the matter of choosing them, as well as in the matters of providing suitable homes for them in America and selecting the schools which they are to enter, we hope to have your advice and assistance. The details of our scheme will have to be elaborated later, but we take this occasion to state the general features of our plan, and ask you to inform the American Government of it. We sincerely hope that the American Government will render us assistance in the matter.

"Wishing you all prosperity,

(Signed)

"PRINCE OF CH'ING, YUAN-SHIH-K'AI,
"NA-TUNG LIEN-FANG
"LIANG-TUN-YEN."

The remission of somewhat more than \$10,000,000 of the indemnity did not involve a repayment of that sum of money to the Chinese government, for the reason that payments on the original indemnity bond were to be in annual instalments, running until 1940, certain revenues being pledged to secure them. The remission is effected, accordingly, by a readjustment of those payments hereafter.

A special ambassador from China, bearing a letter of thanks from the emperor, presented it to the president on December 2, 1908.

1902.—Return to Peking of the emperor, empress-dowager, and court.—Receptions to foreign representatives.—Withdrawals of foreign troops.—Recurrence of Boxer outbreaks.—The emperor, empress-dowager, and their suite re-entered Peking on January 7, 1902. On the 22d the foreign representatives were admitted to audience with the emperor; on the 28th the emperor and empress-dowager, together, gave a reception to the diplomatic body, the empress-dowager being throned on a higher seat than the emperor; on February 1, the empress-dowager entertained the ladies of the foreign legations at a banquet,

where presents of jewelry were made to all the guests. Sorrow for the misdoings from which the foreigners in China had suffered was expressed on all these occasions, and there seemed to be an earnest desire to make amends for them. Foreign troops were withdrawn from Tien-tsin on August 15, 1902, and the city delivered to the Chinese viceroy. Many improvements in streets, bridges, and public grounds had been made by the provisional government which the allies instituted in 1900. Shanghai was evacuated by the allied forces at the end of the year 1902. Some recurrence of Boxer movements and insurrections occurred in different parts of the empire during 1902. Several missionaries and a number of native converts were murdered, chapels were burned, and other outrages committed; but in general there was a restoration of order in the country, and considerable building of railways and forwarding of other enterprises went on.

1902.—Russo-Chinese treaty concerning Tibet. See TIBET: 1902.

1902 (January).—Agreement respecting China between Great Britain and Japan. See JAPAN: 1902-1905.

1903 (May-October).—Treaty with the United States.—Opening of two ports in Manchuria.—Rights and privileges enlarged.—"In the protocol of September 7, 1901, [see above 1901-1908] China had agreed to extend the scope of her commercial treaties with the powers. When the negotiation of a new treaty was begun by Consul-General Goodnow at Shanghai, the United States demanded that at least two new ports in Manchuria be opened to foreign trade and residence. The Chinese commissioners declined to discuss this subject, on the alleged ground that they had no instructions to do so. It was evident that there was secret opposition somewhere, and on May 7, 1903, Mr. Conger reported that it came from the Russian *chargé d'affaires*. Later he secured a written acknowledgment from the Chinese government that such was the case.

Mr. Hay then appealed with the utmost directness to the Russian government. . . . On July 14 a definite answer was at length received from Russia, in which she declared that it had never entered into her views to oppose the opening of certain cities in Manchuria to foreign commerce, but that this declaration did not apply to Harbin, one of the cities selected by the United States, which was situated within the railway zone, and therefore was not under the complete jurisdiction of China. A copy of this note was shown to the Chinese government; which finally agreed to insert in the treaty on October 8 (the date on which Russia had agreed to completely withdraw from Manchuria) a provision for the opening of two ports. The United States agreed to this arrangement, and on October 8 the treaty was signed, and Mukden and Antung named as the open ports."—J. H. Latané, *America as a world power*, ch. 6.—The further scope of the treaty was announced by President Roosevelt in his message to Congress, Dec. 7, 1903, as follows: "It provides not only for the ordinary rights and privileges of diplomatic and consular officers, but also for an important extension of our commerce by increased facility of access to Chinese ports, and for the relief of trade by the removal of some of the obstacles which have embarrassed it in the past. The Chinese Government engages, on fair and equitable conditions, which will probably be accepted by the principal commercial nations, to abandon the levy of 'liken' and other transit dues throughout the Empire, and to introduce other

desirable administrative reforms. Larger facilities are to be given to our citizens who desire to carry on mining enterprises in China. We have secured for our missionaries a valuable privilege, the recognition of their right to rent and lease in perpetuity such property as their religious societies may need in all parts of the Empire."

1904-1909.—Hankau Sze-chuen railway loan.—Question of American participation.—In 1904 the American minister at Peking concluded an agreement with the Chinese government to the effect that, when loans for the construction of a projected railway into the western province of Sze-chuen, from Hankau, should be negotiated, Americans should have an opportunity to subscribe to it. Nearly five years passed before arrangements for the loan were made, and then, in the spring of 1909, it was found that terms had been concluded with a group of British, German, and French bankers for the whole sum sought, of \$27,500,000, while American capitalists had not been given the promised opportunity. On behalf of the latter the government of the United States intervened, claiming fulfilment of the agreement of 1904. The matter was regarded as being both politically and financially important. "A precedent is what we want to establish," said Charles R. Crane, the newly appointed minister to China, in an interview on the subject at New York. "The task of this Government to maintain its position with the European Powers in the East will be less difficult. We are looking twenty years ahead." As the result of communications in July from Washington to Peking, in which President Taft took part personally, the loan arrangement was readjusted, and American capitalists became participant in it to the extent of one-fourth. According to a despatch from Peking, August 17, the matter was settled definitely that day, on the following terms: "The loan to be increased from \$27,500,000 to \$30,000,000, and of this latter amount American bankers to get one-quarter, the other three-quarters going to British, French, and German interests. Americans are to have equal opportunity with the other nations to supply material for both the Sze-chuen and the Canton lines and the branches; they will appoint subordinate engineers, and they will have also one-half of all future loans of the Sze-chuen Railroad and its branches with the corresponding advantages." Subsequently, however, some difficulty in the readjustment of business details in the matter arose, which delayed the final settlement.

1905.—Railway opening, from Peking south. See RAILROADS: 1905-1921.

1905.—Boycott of American goods.—"The best evidence of the birth of national feeling in China was the movement set on foot in 1905 to buy no American goods. This boycott was instituted to express their disapproval of the treatment they had been receiving from America. For years America had tried to exclude Chinese on the ground that Chinese laborers were robbing the white laborers of their bread. In legislation, and by unauthorized acts of their custom officers, the American had dealt harshly with Chinese laborers as well as other classes, and since their acquisition

of the Philippine Islands this policy had been extended to them. The Chinese in America were mostly from Canton, while those in the Philippine Islands were chiefly from Fukien; but the centre of the boycott was Shanghai. The day when Chinese of one province looked upon those of another with indifference was now past. A nation must rise or fall together, and the Chinese were beginning to realize this truth. The boycott gradually extended to other ports, although in the North, owing to the strong attitude of Yüan Shih k'ai, Viceroy of Chihli, it was less severe than in the South. It worked such havoc to American trade that it produced a feeling in the United States in favor of less objectionable laws. President Taft, then Secretary of War, visited China towards the end of the year. Unfortunately Chinese merchants also suffered considerably on account of the boycott; and the whole movement soon died out. The boycott is not a Chinese institution, but its use in this country is evidence of how rapidly the Chinese can adopt foreign ideas."—Li Ung Bing, *Outlines of Chinese history*, p. 617.

1905 (December).—Treaty with Japan relative to Manchuria.—By a treaty with Japan, concluded December, 1905, China consented to lease to Japan the Kwangtung peninsula, at the southern extremity of which are Port Arthur and Dalny, formerly held by Russia under lease from China, and concede to Japan the control of the railway on the peninsula northward as far as Changchün. China also conceded to Japan the right to build a railway from Antung on the Yalu river to Mukden, the ancient capital of Manchuria, provided, however, that at the end of a certain period the road may be purchased by China. More important is the fact that China agreed in the treaty to open to the world's commerce and trade sixteen principal ports and cities in Manchuria, including Harbin, or Kharbin, the modern Russian capital of the province and its most important railway center.

1905-1908.—Stir of new ideas.—Imperial commission to study representative systems of government.—Signs of fruit from it.—Reformatory movements.—Constitutional program set forth in August, 1908.—Nine years of approach to a promised constitution.—A significant token of the dawning in China of a changed state of mind respecting the western world of Europe and America, and its very different development of scientific knowledge and of social institutions, was afforded in the fall of 1905, when an imperial commission, headed by Prince Tsai Tse, was sent abroad to study representative systems of government. The commission returned in the following July, and in August a committee of high dignitaries, with Prince Ch'ing for its chairman, was appointed to consider the report it had submitted on administrative reforms. The outcome, soon afterwards, was an imperial edict which recognized a "lack of confidence between the highest and the lowest, between the throne and ministers and the masses," and went so far as to say that "foreign countries become wealthy and powerful by granting a constitution to the masses and allowing suffrage to all." While intimating that China must look forward to a similar admission of the masses to some voice in the government, the edict set forth the prior need of many reforms, in

the official system, in the laws, in education, in the finances, and in the army and police. To begin the undertaking of such reforms, Prince Tsai Tse was put at the head of a committee for dealing with the official system, and before the year closed there were several changes of importance introduced, tending towards more simplicity of methods in public business and more centering of responsibilities. Examinations in Western subjects of knowledge began to replace the old conventional examinations in classic Chinese literature, as tests for admission and promotion in official service, and eagerness was shown in the opening of schools and colleges that approached the European and American type. Simultaneously with these stirrings of a new consciousness and purpose in China, a great moral reform was taken in hand. This was no less than an attempt to rescue the nation from its opium curse. Some account of the opium edict issued in September, 1906, will be found elsewhere (see *OPIMUM PROBLEM: 1906*). That these reformative steps were actually taken with a view to the ultimate granting of "a constitution to the masses and allowing suffrage to all" was proved in the summer of 1908, when a program of gradual approach to constitutional government, by stages which extend through the next nine years, was promulgated at Peking on August 27.

1905-1909.—Disputes with Japan.—*Fa-ku-menn railway and the Antung-Mukden railway questions.*—Settlement of the latter by Japanese ultimatum.—It could hardly have been possible for cordially friendly relations to be maintained between China and Japan, in the circumstances which transferred to the latter the extensive rights and privileges in Southern Manchuria, which Russia had acquired in that Chinese province by treaty and lease. By a protocol of December, 1905, after the closing of the Russo-Japanese War, there was an attempt, between Peking and Tokyo, to define the effects of the treaty of Portsmouth, especially in the bearings of that article of the treaty which ceded to Japan, "with the consent of the Government of China, the lease of Port Arthur, of Talien, and of the adjacent territories and territorial waters, as well as the rights, privileges and concessions connected with this lease or forming part thereof," and likewise, of "all the public works and property within the territory over which the above lease extends"; but misunderstandings and differences of opinion were sure to arise. The main contention has related to the projected extension by China of a railway to *Fa-kun-menn* from the terminus of an existing line at *Hsin-min-tun*, west of *Mukden*. It was in the agreement of December, 1905, that no railways in competition with the South Manchurian line, which Japan took from Russia, should be built. The Japanese assert that they had in view this very *Fa-ku-menn* extension when that stipulation was inserted. The Chinese declare that the negotiation on their part had reference solely to the area east of the *Liao* river. Japan made two alternative proposals for the settlement of this question: "One that the Chinese should build a railway from *Fa-ku-menn* to the South Manchurian Railway instead of to *Hsin-min-tun*, or that the Japanese should build a railway from the South Manchurian line to *Fa-ku-menn* and thence to the North, in which case Japan would withdraw her objection to the *Fa-ku-menn-Hsin-min-tun* railway, provided that China undertook not to extend the line beyond *Fa-ku-menn* without a previous agreement with Japan." China is said to have declined discussion of these proposals, but

offered arbitration of the whole matter. Japan objected to arbitration without previous discussion of her new proposals. And so the dispute seemed deadlocked.

Another dispute turned on the interpretation of a clause in the agreement of December, 1905, which reads: "China agrees that Japan has the right to improve the Antung-Mukden Railway so as to make it fit for the conveyance of commercial and industrial goods of all nations." Japan undertook, as a necessary "improvement" of the road, to reconstruct it, with a change of gauge to connect it with the standard gauge of the South Manchuria and Korean roads. China denied that the agreement gave a right to reconstruction. At length on August 6, 1909, Japan brought discussion of the Antung-Mukden railway question to a summary ending, by a note to the Chinese government which announced that "the Imperial Government is now compelled to take independent action, and to proceed to carry out the necessary work of reconstruction and improvement according to treaty rights." Before taking this decisive step, the Japanese government is said to have consulted Great Britain and other powers, and to have had approval of her action from London, if not from elsewhere. China yielded to the ultimatum, and this leading cause of quarrel between the great nations of the East was removed on September 4 by the signing, at *Mukden*, of a memorandum of agreement, reported in substance as follows: China agrees, first, not to construct the *Hsin-min-tun-Fa-ku-menn* railroad without consulting Japan; second, that half the capital required to extend the *Kirin* railroad shall be borrowed in Japan; third, that Japan will be permitted to extend the *Yinkow* and improve and modernize the *Antung-Mukden* railroads, to which China was bitterly opposed; fourth, that Japan may work the mines in the *Fushun* and *Yentai* districts, and have joint exploitation of the mines reached by the *Antung* and *Manchurian* railroad lines. In the *Chientao* boundary dispute Japan agrees to recognize China's sovereignty, while China agrees to open four trade marts in the district.

1906.—Commission sent to America and Europe for the study of political and other institutions.—The new spirit beginning to stir in China was manifested in the early months of 1906 by the sending of a large commission of carefully chosen men to the United States and Europe, for observations that would be helpful toward reforms in their own country. It was headed by two high commissioners of distinction, *Tai Hung-chi* and *Tuan Fang*, and they were attended by thirty-five scholars and functionaries of note. They received much attention during their stay of five weeks in the United States, and were placed by the government under the special charge of Prof. J. W. Jenks. Writing subsequently of their mission Professor Jenks said: "The purpose of the commission is, primarily, to make such a study of the political institutions of the various countries visited that they will be able, on their return, to offer valuable suggestions for the improvement of their own. There is even serious talk among the high officials in China of some form of a constitution. In consequence, the commissioners are as eager to learn regarding the working of some of our institutions as regarding their form of organization. Inasmuch as political reform necessarily involves social reform, even as a condition precedent, the commission is devoting special attention to the study of education, in universities and schools, and to methods of social amelioration, in

TZE-HSI, DOWAGER EMPRESS OF CHINA

(Painted by Catherine Augusta Carl)

prisons and asylums for the insane and the poor. They, however, are not neglecting the study of our large manufacturing plants, and have clearly in mind, also, the improvement of the industrial conditions of China. It is a matter of peculiar interest that the Empress-Dowager charged them to inquire especially into the education of girls in the United States, since she hoped, on their return, to be able to found a school for the education of the daughters of the princes."

1906.—Sixty cities opened to foreign settlement.—A memorandum on the subject of the foreign settlements at the open ports of China, prepared by the Chinese secretary of the American legation at Peking, was transmitted to the state department at Washington in December, 1906. It conveyed the following information: "In China proper and in Manchuria 46 cities and towns have been thrown open already to foreign residence and international trade. This does not include Dalny, in Manchuria, leased to Japan; Wei-hai-wei, in Shantung, leased to Great Britain; Kiaochow, in Shantung, leased to Germany; Kowloon, in Kuangtung, leased to Great Britain; nor Kuang-chou-wan, in Kuangtung, leased to France. Besides the above, there are 3 cities in Tibet thrown open to trade, making 49 ports in the Empire. In addition to these already declared open, there are 13 cities whose opening in the immediate future is arranged for, and 3 others whose opening depends upon the acceptance by other treaty powers of the provisions of Article VIII. of the last commercial treaty between China and Great Britain. No account is taken of the cities of Turkestan, Mongolia, and the Amur region, in which Russian subjects have for many years enjoyed privileges of trade and consular jurisdiction. It will be seen, therefore, that in the immediate future foreigners will enjoy the right of residence for purposes of trade at more than 60 cities of the Chinese Empire."

1906.—Edict against the use of opium. See OPIUM PROBLEM: 1906.

1906-1907.—Flood and famine in the region traversed by the Grand Canal.—One of the frequent destructive floods in China which produce famine befell the region that is traversed by the grand canal in the summer of 1906. Heavy rains covered its vast plains with lakes of water, which drowned out the crops throughout an area estimated at 40,000 square miles. From ten to fifteen millions of people were reduced to famine, and could only be kept alive until the harvests of another year by the generosity of the outside world. It was not vainly appealed to; but the suffering and death in the afflicted country were appallingly great.

1908 (November).—Death of the emperor, Kuang-hsu, and of the empress-dowager, Tze-Hsi.—Accession of the child-emperor, Hsuan-Tung (Pu-Yi).—The circumstances of the death, almost simultaneously, of the late emperor, Kuang-hsu, and of the dowager-empress, Tze-Hsi, who had been the real ruler of the empire, are involved in considerable obscurity. The em-

peror is said to have died on November 14, 1908, and the empress on the following day. The announcement of their decease was preceded by the publication of two imperial edicts, one of which made Prince Chun, of the royal family, regent of the empire, while the other named Pu-Yi, the prince's son, three years old, as the heir presumptive to the throne. As communicated later to foreign governments, the regent was given, by another imperial rescript, full power over the civil and military departments of government, and the entire appointment and dismissal of officials. The promised creation of a parliament was anticipated in the prescription of his duties, among which were the following:

"When a Parliament has been established the Prince Regent shall attend the same in place of the Emperor, but he need not attend the ordinary sessions. When the Constitutional Commission meets, the Prince Regent shall likewise represent the Emperor there.

"The Prince Regent shall have full authority in negotiating treaties and in appointing representatives abroad.

"The Prince Regent shall enter and leave his chair at the Ch'ien Ch'ing gate. The yamens, according to their duty, shall draw up and report on regulations modelled on the precedent established by Prince Jui-Chung regarding the equipage, escort, and general preparations for movements of the Prince Regent outside the palace.

"Every year the Board of Finance shall transfer to the Department of the Imperial Household the sum of taels 150,000 for disbursement. When the Emperor comes of age, his studies being completed, and his marriage takes place, the official body shall unite in asking him to assume personal direction of the government."

On November 21 the members of the diplomatic corps at Peking were received in a body at the palace, to present the condolences of the governments they represented on the deaths of the emperor and empress. On December 2 the strict mourning observed at Peking was suspended briefly, to permit the ceremonies attending the ascension of the dragon throne by the child-emperor, Pu-Yi, who, as emperor, took the name of Hsuan-Tung.

1908 (December).—Decree reaffirming the constitutional program of the late empress-dowager.—An imperial edict reaffirming the determination of the new government of China to carry out in its entirety the constitutional program laid down by the late empress-dowager of China in August, 1908, was promulgated on December 4.

1909.—Progress in the opium reform.—International opium commission. See OPIUM PROBLEM: 1900; 1909 (February).

1909 (January).—Abrupt dismissal of Viceroy Yuan Shih-kai from his offices.—Much disturbance of feeling and apprehension of a troublesome reaction in Chinese policy was excited among the foreign representatives in China, on January 2, 1909, by the sudden dismissal of the able and powerful viceroy of Chih-li, Yuan Shih-kai, from all his offices. Yuan Shih-kai left Peking in haste, evidently in fear of his life, and it was expected that his whole following of friends and supporters would be swept out of their offices and employments. But no such result followed, and credit began to be given to the assurances of the imperial government that the dismissal of Yuan meant no reversal of policy or reaction whatever. He was distrusted, it was intimated, because he had been disloyal to the late emperor in 1893, when the latter attempted great reforms.

1909 (October).—Death of Chang Chih-Tung.—Chang Chih-Tung, grand counselor of the empire of China, died on October 4, 1909, and Tai Hung-tze, president of the board of justice, was appointed his successor in office.

1909 (October–November).—Election and opening of provincial assemblies.—Beginnings of the institution of constitutional and representative government.—The following, from the Peking reports to *The Times*, London, narrates the actual beginning of the series of proceedings planned and promised for the gradual institution of representative constitutional government. The first is of the date of October 14, 1909:

"To-day marks an era in the establishment of constitutional government in China. In obedience to the Imperial decrees of October 10, 1907, and of July 22, 1908, ordering the establishment, within one year of the latter date, in each of the 22 provinces of China proper and in Manchuria and the New Dominion of provincial deliberative assemblies, elections have been in progress for some time past, and the assemblies meet in accordance with the regulations for the first time to-day, the first day of the ninth moon. . . .

"The elections have taken place according to the regulations, and halls have been erected for the assemblies to sit wherever a Viceroy or a Governor has his seat. The number of members varies from 140 in Chih-li, 114 in Che-kiang, to 30 each in Kirin, Leblun-chiang, and Hsin-kiang. The incomplete returns which have been published show nearly 1,000 voters for each representative.

"For weeks past reports have been coming in from provincial authorities asking for instructions and information concerning this new departure. An edict issued last night renews the Imperial admonitions to members of the assemblies as to their deliberations, and to Viceroys and Governors as to their supervision of the deliberations, and exhorts all to display a loyal patriotism so that the country may attain strength and prosperity. The event may be one of great historical importance."

The next was sent from Peking on the following November 6:

"Already, in the opening debates of these Provincial Assemblies, one apprehends the coming chaos, one hears the first whispering of the approaching storm.

"The spirit which animates these Assemblies is evidently very similar to that which speaks through the vernacular Press; iconoclastic, patriotic—in the sense that it denounces everything foreign—but lacking, so far, in intelligent leadership and constructive policy. Their attitude towards the Central Government is generally one of scarcely veiled contempt. I cannot illustrate better its general tendency than in the words of a native journalist who, in a recent criticism of the Grand Council, congratulated these rulers of China on their remarkable longevity, but observed that 'there is little hope of longevity for an Empire that is governed by such incompetent survivals.'"

A few weeks later, after the forty days' session of the new Provincial Assemblies had ended, this writer had changed his view. Writing on the 22d of December, he said: "A study of the reports of the proceedings so far available of the first session of the Provincial Assemblies supports the contention that the Throne has been justified in granting the subjects of the Empire a limited right of speech through their chosen representatives. The programmes of debate have been strictly in accordance with the Imperial edict, and the proceedings have been marked with dignity and de-

corum. The net result justifies the declaration made by a high authority, who has been given special opportunity of forming a judgment, that the 'members have fulfilled their appointed task of working in harmony with the executive authorities in the interests of their respective provinces.'"

1911 (April–December).—Sun Yat-sen and the revolutionary movement.—Outbreak of anti-dynastic revolution.—Yuan Shi-kai's diplomacy.—Collapse of the Manchu government.—When the empress-dowager died in 1908, the Manchus lost their last great leader, and were themselves eventually swept aside by the reform movement which she had partially espoused. For some time a republican movement had been agitated, largely by the Cantonese and by Chinese abroad, and, despite the fact that the beginnings of representative government had been established, the spirit of unrest grew apace, until by the spring of 1911 it had assumed alarming proportions. The foremost leader of the extreme wing of the reform party was Sun Yat-sen. "Kuangtung, the province that once gave to China a great rebel leader in the person of Hung Hsiu-ch'uan, has since produced a great revolutionist. The man is Sun Wên, better known to the people outside of China as Dr. Sun Yat-sen. In his younger days Dr. Sun attended a missionary school in Hongkong, where he prepared himself for the medical profession under a certain Dr. Cantlie, an Englishman. After graduation, he practiced medicine for a short time at both Macao and Hongkong. He then gave up his professional labours, in order to take up revolutionary work. At an early age Dr. Sun was convinced that China must be reformed. With this end in view he organized at Canton the Hsing Chung Hui, or a Society for the Uplifting of China. He soon saw that under the Manchus no reform was possible, and did not hesitate to start a revolution, but it failed and many heads fell at the stroke of the executioner's axe. That was in 1895. To save his head, the young doctor had to flee. During the next fourteen or fifteen years, Dr. Sun travelled extensively, visiting all the Chinese centres around the world and always preaching revolution. The cause of revolution never looked so bright as when China sent one party of students after another to Japan. As a rule these students, after having come into contact with Dr. Sun in Japan, returned to China imbued with revolutionary ideas; and were watching quietly to carry out their avowed purpose. In Japan Dr. Sun also met Huang Hsing and many other influential members of the various Chinese secret societies. As a result of these meetings, the great Revolutionary League, or Tungmenghui, came into being. The Tungmenghui established newspapers to arouse the Chinese against the Manchus. While emissaries were busy in China working among the soldiery of the various provinces, others went from one Chinese colony to another, soliciting financial support. Thus was the revolutionary movement set on foot. . . . Betrayals, disappointments, cruel deaths, wholesale massacres,—these only tended to stimulate the patriots to renewed efforts. [In 1911 bitter opposition was aroused in the provinces when the Imperial government (Manchu

regency for the infant Hsuang-Tung) attempted to take over many of the provincially owned railroads and to complete them by means of foreign loans.] . . . On April 8th the Tartar General, Fu Ch'i, commanding the Manchu garrison of Canton, was assassinated. On the 27th of the same month a party of revolutionists attempted to destroy the Viceroy's Yamen with bombs; but this enterprise was ill-timed. The authorities in fact had information as to what was coming and were not at all unprepared for the emergency. The result was most pathetic. Scores of China's most promising sons were arrested and mercilessly executed. The Viceroy, Chang Ming-ch'i, was heartily commended by the Peking Government for his alertness and success in unearthing a revolutionary plot and in vanquishing his foes. The Government evidently thought that the cruelty of the Viceroy had dealt a severe blow to the movement; but nothing was farther from the truth. The revolutionists were temporarily suppressed; but they were not discouraged. They merely turned their attention from Canton to the Yangtze Valley."—Li Ung Bing, *Outlines of Chinese history*, pp. 632-634.—The key position of the central Yangtze valley is held by the great commercial city of Hankow. Here at Wuchang, directly opposite Hankow, the radical reformers commanded by General Li Yuan Hung took advantage of the ill-feeling existing against the central government and led a successful rebellion in the fall of 1911. "In the first place, it is to be observed that, even amongst Sun Yat-sen's advanced vanguard of Cantonese reformers, there had never been any generally declared intention of replacing the Manchus by a Republic until some five weeks after the outbreak of the successful (but evidently accidental) revolutionary movement at Wuchang in October [11], 1911. In 1895 when the 'Young China' party was definitely organised at Canton, its object was the establishment of Constitutional Government on lines similar to those of K'ang Yu-wei's reform movement of 1898. When, coincident with the outbreak of the rebellion at Wuchang, the Cantonese revolutionaries became active, there was still no question of a Chinese Republic. The movement then assumed a purely provincial form, self-government for Kuangtung being the order of the day. On October 28th, the flag of independence was hoisted over a section of the Native City, and the Manchu garrison came to an amicable arrangement with the 'reformers' pending consideration of the latter's proposals for a mutually satisfactory change in the form of government. As the utter helplessness of the Manchus and the general disorganisation of the Government became more apparent with every success of the Yangtze rebels, the programme of the Radical extremists, supported by the Americanised Chinese of the Pacific coast, became gradually bolder and more aggressive, but it was only at the beginning of November that the idea of a Chinese Republic found definite expression, supported by Li Yuan-hung (under compulsion), at Wuchang, and by influential bodies of disaffected mandarins at Nanking and Shanghai. Up to this time, all the activities of Young China had been steadily directed towards acceleration of the Government's programme of Constitutional Government and the convening of a National Parliament under the Monarchy. It was only when the terrorised Throne, on November 5th, issued a humiliating edict recognising the 'Ko Ming t'ang' Revolutionary Society as a regular political party, entitled to a voice in the government of the country, that the extreme Radicals realised, and promptly seized,

their opportunities of attaining supreme command of the situation. Sun Yat-sen's party in the south, and General Li Yuan-hung at Wuchang perceived that, thanks to the sympathetic attitude of the European communities at the Treaty Ports and the chaotic demoralisation of the Manchus, only a strong policy was needed to carry the day. The Manchus were clearly doomed, and the position was at the mercy of the first bold stroke. Up to this point, the National Assembly, recognised by the Throne as the elected representatives of the nation, though aggressively progressive, had adhered to the Constitutional programme. On November 5th, however, simultaneously with the passing of the native cities of Shanghai, Suchow, and Hangchow to the revolutionaries, the Assembly was denounced by the rebel leaders of several provinces for having failed to represent the true wishes of the nation. At the same time, a Republican Committee was definitely organised at Shanghai under the leadership of Wu Ting-fang, Wen Tsung-yao and Li Ping-shu, well-known men whose claims to distinction rested as much on their careers as mandarins as on their Liberal views."—J. O. P. Bland, *Recent events and present policies in China*, pp. 150-152.—As early as October 14 (three days after the revolution had broken out in Wuchang) the Manchu government in a panic called to their aid by imperial edict Yuan Shi-kai. "Yuan Shi K'ai had been prominent under the empress dowager, first as Chinese resident in Korea before the fateful war with Japan and later in the *coup d'état* of 1898 when he was accused of betraying the young emperor. As governor of Shantung during 1900 he showed his good judgment by opposing the Boxer madness. He was unpopular with the regency and had been dismissed from court after the death of the empress dowager. He was primarily a soldier, a leader of the new army, thoroughly convinced of the necessity of reorganizing China by adopting Western ideas; but being a Northerner he represented a more conservative type of reformer."—K. S. Latourette, *Development of China*, pp. 208-209.—"This . . . Imperial Edict . . . told to the world that the Court in Peking was *in extremis*, yet ever astute. There was one man who could deal with the situation, one man to whom the Northern Army would be *leal* in a conflict with the Army of the South [the revolutionary army]; that one man was the neglected Yuan Shih K'ai. At first Yuan refused the proffered honour, but afterwards General Yin Chang, who commanded the troops, interviewed him, and on the 18th Yuan formally accepted the appointment and proceeded south. It was a time fraught with great issues: Yuan the Reformer in close contact with Li the Revolutionary. In the battle of brains (as well as of bullets) who would prove to be the stronger man? . . . On November 10th Yuan Shih K'ai was recalled to Peking, and five days later accepted the position of Prime Minister, which carried with it the difficult task of trying to pacify the nation and institute a Reform Government which would be satisfactory to a majority of both factions. . . . Yuan's first move in Peking was an astute one, but it failed. His Cabinet that was to reconcile all parties practically resigned before it was ever constituted. Even the National Assembly found itself powerless to do other than pass resolutions. The Premier's first great triumph over the Manchus was in bringing about the resignation of the Prince Regent, who had so summarily dismissed Yuan a few years before. [From October to November there had been fierce fighting between the imperialists and the revolutionists. On December 4, a truce was

agreed to between these factions and on the 18th a peace conference met at Shanghai.] Yuan Shih K'ai's next problem was to so arrange matters that the Manchu Court should see fit to 'abdicate,' and at the same time temporise with the Republican party by means of the famous but fatuous Peace Conference. Here the master-hand revealed itself. For a time Yuan seemed trusted yet doubted alike by both sides. He succeeded in bringing actual hostilities to an end—and this may have been his objective."—E. J. Dingle, *China's revolution, 1911-1912*, pp. 228-232.—While Yuan Shi-kai was quieting the revolutionists for the time being, he maintained friendly relations with the imperial family which he finally persuaded to leave Peking for its safety on December 28.—See also MONGOLIA: 1911.

DR. SUN YAT-SEN

Chinese political reformer, first president of the republic

1912.—First provisional republic at Nanking.—Abdication of the emperor.—Plan of provisional government.—As yet no signs of abdication had been forthcoming and on January 1, the revolutionary party set up a provisional republic at Nanking. A provisional constitution was drawn up and Sun Yat-sen was elected first provisional president, until a regular republican government could be established by the people of the country. During the month of January Yuan Shi-kai had been counselling the empress dowager to sign an edict of abdication for the emperor. Various forms were drawn up, and finally on Feb. 12, the Abdication Edict was issued endorsing the establishment of a republic. "The following is a full text of the Edict which has become known as the Abdication Edict. As intimated in recent dispatches concerning the terms agreed upon, it became apparent that there was to be no complete abdication. The Emperor was simply to relinquish all political power, a new provisional Government was to take charge, which in turn was to be succeeded by a regular Government to be named by a National Convention. The Edict reads:—"Since the uprising in Wuchang the Throne has complied with the people's request and pro-

mulgated nineteen articles of constitution, vesting in the Ministers of State all administrative powers in which the subjects may take part, and that members of the Imperial family should not interfere in political affairs. Subsequently an edict was issued calling a national convention to decide publicly on the government system, thus to show our intention not to regard the Throne in a selfish spirit. The gentry and the people in the different provinces, however, opine that the situation is pressing, and that if the holding of a national convention is delayed, it is feared that disasters of war may be prolonged and the situation will not be saved. In addition, foreign troubles are threatening and new dangers appear daily, and in the present circumstances the nineteen articles of constitution are not entirely suited to conditions. The authority of the Premier especially is insufficient to rule the whole country from within, or to superintend foreign relations from without, and in order to adapt the government to exigencies, in which it is necessary to expect slight changes, the name of Premier is hereby abrogated, and a President is created. All political power shall be vested in control of the President, who is to be elected by the people. But with the exception of resignation of all political powers, the majesty of the Emperor shall not be much different from what is set forth in the nineteen articles formerly adopted. We have enquired this course of the Princes, nobles, officials and gentry in the provinces who are agreed in their views. And it is becoming to comply with their request and let it be carried out according. But rumours are widespread, and during our resignation from the political government, unless a united organ exists to control affairs it is feared that good order may not be maintained. We hereby specially command Yuan Shih K'ai to act in conjunction with the officials and gentry of the north and the south and temporarily to form a provisional and united government to destroy the seeds of trouble. Once the national convention has met and formally elected the President, the provisional government will be dissolved, so as to comply with public opinion and display full justice. All our soldiers and people should know that in taking this step our object is solely for the benefit of the State, the blessing of the people and to restore good order. All affairs will remain as of old, and they should not listen to rumours and create confusion and disturbances. It will thus be fortunate for the country as well as the general position.'

"Having agreed to abdication in favour of a Republic, the Empress Dowager [mother of the infant Emperor Hsuan-Tung] issued a secret edict commanding Yuan Shih K'ai to prepare for the formation of a provisional Government and the drawing up of a preliminary scheme to carry it into effect. During January Yuan Shih K'ai had several conferences, with the result that the following scheme was organized:—Article (1) deals with the necessity of a provisional and united government after the Emperor's resignation from government to assume all powers in preserving the *status quo* and to control foreign affairs, and it will be dissolved after the national convention has elected a President. (2) After resignation from power the Emperor shall remain in the Palace so as to preserve peace in the north. (3) The President's residence shall be built in Peking, or the newly completed Regent's Palace may be converted into a Presidential house. (4) Owing to the depletion of the treasuries of the present and also the Nanking government since the revolution, while means should be devised for the southern

provinces, provisions shall be made towards meeting administrative expenses in the northern provinces after the provisional government has been formed. (5) The northern and southern provinces should remove prejudices and assist the central united government and remit reasonable amounts of money to it to uphold the situation. Contributions from provinces which have suffered greatly may be deferred. (6) All official administrative officers in Peking shall remain in office, but owing to need of funds for the provisional government all salaries will be suspended for six months. (7) During a few months the pay of the northern and southern troops will be provided and the officers will remain in office. (8) When the provisional united government shall have been recognised by the foreign Powers, foreign relations shall be directly in charge of that government. (9) When the government system has been determined all foreign loans and indemnities shall be paid when due and the provinces should continue to send their usual contributions. (10) The Edict by which the Emperor surrenders the government shall be printed and copies promulgated throughout the country. An Edict will also be issued to the soldiery so as to acquaint them and prevent mutiny."—E. J. Dingle, *China's revolution, 1911-1912*, pp. 278-280.

1912.—Yuan Shi-kai elected president.—Disturbed situation of the country.—Growth of movement against Yuan Shi-kai.—"Here, then, was the unique spectacle of a disappearing despotism appointing its republican successor. In a comic opera or burlesque the sight of such a bit of topsy-turvydom would be received with smiles and laughter. China presented it in all seriousness, and though the world applauded, it did not laugh. It saw in the fact the only possible solution of an extraordinary problem, and it perceived in Yuan the only man, the man of destiny, fitted for the rôle of Protector of the Commonwealth. . . .

[Upon the publication of this edict, the provisional government at Nanking was willing to compromise with the government at Peking for the sake of a united China and the establishment of a permanent republican government. Sun Yat-sen recommended Yuan Shi-kai for president and announced his own willingness to resign.] As a result of Dr. Sun's recommendation, and the general consensus of opinion that what he had said was right, Yuan was appointed Provisional President by the unanimous vote of the Nanking delegates, representing no fewer than seventeen of the provinces. The new President was to come to Nanking to take the oath of office as soon as circumstances permitted, and it was decreed that the 15th February should be celebrated as a holiday in honour of the great event which had just been accomplished. There was little time for the nation as a whole to prepare for such a festival, but the eight men-of-war lying at the arsenal at Shanghai fired a salute of twenty-one guns at noon, and for the first time the new five-coloured flag was raised over the Custom House in the Shanghai Settlements."—G. Lanning, *Old forces in new China*, pp. 331-333.—"The revolution in China synchronized with a crisis of the nation's financial affairs. When the revolt started, negotiations were proceeding between the Peking Government and foreign financiers with a view to reforming generally the fiscal system of the Empire, and to provide funds for internal development. The proposed reforms included revision of the revenue system, currency, and loans for railway construction and various administrative requirements. The revolution involved the Government in further financial difficulties. One of

effects was an almost complete stoppage of revenues from the provinces to the central Government. The Government was unable to meet maturing foreign loans and interest. It needed funds to suppress the rebellion and to meet current administrative expenses. The lack of money on both sides was a strong influence in bringing a compromise, and in forcing the Throne to abdicate. Without money, neither faction could go on; and after the Republic was declared its most pressing problem was finance. The end of hostilities found several hundred thousand troops under arms. The compromise had included an undertaking by the new Government to assume obligations that had been incurred by the revolutionists, and to pay off the revolutionary troops. . . . If the troops were not paid they would mutiny and riot and loot, and perhaps kill their commanders. . . . The presence of bodies of armed men throughout the country, who had composed the revolutionary armies, was a grave danger. These soldiers had hardly any discipline, and they might at any time drift into banditry. Many of the revolutionary commanders were reluctant to disband their troops, for as long as each had an army they could dominate localities, and were political factors. These generals had to be placated by the new Government in some way, their armed followers disbanded, and the local administrations brought under the authority of Peking. Even Yuan Shih K'ai's army was unreliable. A slip anywhere, a misapprehension, a lack of tact, a dissatisfied or irreconcilable revolutionist general, might start a new revolt and throw the country into disorder again. A large faction of the revolutionists distrusted and feared Yuan Shih K'ai. Some of them had been Yuan's political antagonists in the past, and others were influenced by reports about him. In those circumstances outward harmony of all the principal popular leaders was absolutely essential. Li Yuan Hung was depended on to keep order in central China. Sun Yat Sen had enough popularity to control the situation in the Yangtze Delta. The Cantonese group had their local leaders, and relied on Tang Shao-yi and Wu Ting-fang, who were both from that section. In forming his first Cabinet Yuan Shih K'ai tried to bring together representatives of all factions. The revolutionists wanted the national capital moved from Peking to Nanking, and Tang Shao-yi made a promise to that effect on behalf of Yuan Shih K'ai. Yuan, however, temporized, and a delegation of southern republicans went to Peking to urge him to go to Nanking. While the delegates were at Peking, on February 29, a division of troops mutinied and looted part of the city. This demonstration of the instability of conditions in the North convinced the southerners that it was better not to move the capital at that time, so the question was dropped and never afterward seriously resumed. The northern army mutinies spread to Paotingfu, Tientsin, and other places, but the Government quickly got control. The whole country was a tinder-box—a spark might cause a blaze.

"Yuan Shih K'ai was inaugurated President at Peking on March 10, 1912. General Li Yuan Hung was elected Vice-President. The following day the National Council at Nanking ratified the election of Yuan and adopted a provisional constitution. Yuan issued a manifesto to the people, proclaimed an amnesty, and announced the remission of certain taxes. The selection of a Cabinet required adroit handling. Tang Shao-yi was made Premier, a selection which was satisfactory to the southern republicans. It is believed that both Sun Yat Sen and Wu Ting-fang were offered places

in the Cabinet, but they declined. The National Council was still at Nanking, and the Premier went there to confer with it about the Cabinet. The southern party wanted its partisans to have the ministries of war and finance, and Huang Hsing was their candidate for minister of war. Yuan Shih K'ai, however, would not have Huang, and a compromise was effected by making him Resident-General of Nanking. While Tang Shao-yi was at Nanking an agreement was made apportioning the principal offices among the important factions. General Tuan Chi-jui (a Yuan man) was made minister of war. Chen Chi-mei, a radical leader, was nominated minister of commerce and industry. He accepted the post, but did not assume the office. On April 2 the National Council voted to transfer its seat to Peking, thus concentrating all branches of the republican government there. For a while the Council insisted that it should be accompanied to Peking by a guard of southern troops, but it finally receded from that position. . . . Notwithstanding the opposition of the Council, and resignations in the Cabinet, Yuan Shih K'ai remained firm in the belief that the time had not come for a party Cabinet, and that the only practicable Government was by a Cabinet composed of the ablest men regardless of party. The President at times nominated members for the Cabinet, and the Council refused or delayed to confirm them. The President issued an appeal to the provincial assemblies, which also were in confusion, asking for harmony. Reorganization proceeded slowly. *Tutus* (military governors) governed the provinces in place of viceroys. Sporadic disorders continued. Plots to assassinate the President and the Vice-President, Li Yuan Hung, and to overthrow the Government, were frequent, and some plotters were apprehended and executed, in some cases in an arbitrary manner. The summary execution of General Chang Chen-wu, who was arrested after he attended a dinner at the Wagons-Lits Hotel in Peking, caused a crisis. The Council attempted to impeach the President, but could not carry it. Sun Yat Sen was induced to visit Peking, in an attempt to bring coöperation between the Council and the Executive, but the good effect was only temporary. Sun Yat Sen was received with cordiality by Yuan Shih K'ai, and was entertained profusely during his stay. Just before Sun's visit to Peking, the more important opposition parties were amalgamated into one named the Koumingtang. . . . For some months after the Republic was organized with Yuan Shih K'ai as President, the elements opposed to him had the idea that it was possible to eliminate him without resort to arms. They controlled the National Council. But as time passed, Yuan Shih K'ai more and more outfinessed the radicals in the struggle for power between the Executive and parliament. . . . It was realization of this fact that enabled demagogues to swing the Koumingtang toward rebellion. In this they were retarded by the attitude of Sun Yat Sen, who did not then approve any project to resort to arms against Yuan. Nevertheless, Huang Hsing, Chen Chi-mei, and their lieutenants continued secretly to plot rebellion, and to lay plans for a revolt. On September 29, a mandate was issued ordering the suppression of the secret societies that had come into existence in all parts of the country, and which were the centers of political intrigue against the government. . . . The agitation for a 'second revolution' began to assume definite form late in 1912, when the radical native press in central and south China openly presented it as a possible alternative to submitting to the alleged

autocracy of Yuan Shih K'ai. The National Council had fallen into lethargy, the center of Opposition having been transferred to the Koumingtang headquarters at Shanghai. The President succeeded in pushing a bill through the Council giving the Executive the power to establish martial law, 'in case of war or other extraordinary troubles arising, when it is necessary that either the whole or part of the country should be the scene of military operations.' A majority of members of the Council were away from Peking, electioneering for the new National Assembly."—T. F. Millard, *Our Eastern question*, pp. 47-50, 57-62.

1913.—Assassination of Revolutionary leader.—Increasing strength of the president.—Question of a foreign loan.—Outbreak and suppression of rebellion (second).—Yuan Shi-kai elected constitutional president.—Suppression of revolutionary society and coup d'état of November 4.—"An event of great significance was the assassination at Shanghai on March 21, 1913, of Sung Chiao-jen, a Koumingtang leader who was shot at the railway station when he was about to leave for Peking. A connection of Ying Kuisung, a secret agent of the Government, was established with the crime, which gave occasion for the Koumingtang press to accuse Yuan Shih K'ai of having instigated the murder. From that time the attitude of the Koumingtang was openly hostile toward the President. The new Assembly (parliament) met in April and it soon became evident that it would clash with the Government. The Koumingtang had almost as many seats as all other parties combined, but the Government was stronger than it had been in the previous Council. A number of important matters demanded attention from parliament, but the members found too many things to wrangle about to transact business. Several weeks were consumed before presiding officers could be elected, and the Koumingtang candidates won. The attack on the Government in parliament centered on the foreign loan policy. Everything proposed by the Government was strongly criticized. Many sessions were disorderly, and a few were riotous. It was evident that the stability of the Government depended on the outcome of the struggle between the Executive and the Assembly. Public opinion, which in the first months of the Republic had been with parliament, was veering toward the Executive. . . . In that situation, the radical Koumingtang leaders saw themselves and their party facing defeat. There is no doubt that after the assassination of Sung Chiao-jen a majority of the Koumingtang were secretly for revolution, and the radicals succeeded in getting control of the party. Secret preparations for rebellion, with Shanghai as headquarters, were actively carried on. Evidences of foreign intrigue in support of the anti-Government element were numerous. There were shipments of arms to various places, destined for the rebels. The Koumingtang accumulated a war fund. All the Koumingtang leaders were not in favor of revolution, but the extreme radicals, led by Huang Hsing and Chen Chi-mei, carried the party along. By the end of June it was evident that an outbreak was imminent."—T. F. Millard, *Our Eastern question*, pp. 63-64.—"The issue was joined chiefly over the question of a foreign loan. The new government was in dire need of funds and could not immediately obtain them in sufficient amounts from taxation. A com-

bination of foreign capitalists, representing Great Britain, France, Germany, the United States, Russia, and Japan, offered to make a loan. It was to be a large one and was to be secured by a lien on Chinese revenues, principally the income from the salt monopoly. It involved increased political as well as financial control and evidently compromised still further Chinese independence. So prominent was the political side that President Wilson refused to give official backing to the American capitalists, and these withdrew, leaving the loan to be made by the representatives of the five powers. The Southern radical party was opposed to the loan, and obstructed its ratification by the national assembly. Finally, in the spring of 1913, Yüan signed it on his own authority, without the sanction of the assembly. At once a rebellion broke out in the South, in an attempt to depose the president who, it was alleged, had sold his country to the foreigner."—K. S. Latourette, *Development of China*, p. 212.—On July 10, 1913, the second revolution began. "The campaign was short and inglorious. The South, ill-furnished with munitions and practically penniless, and always confronted by the same well-trained Northern Divisions who had proved themselves invincible only eighteen months before, fought hard for a while, but never became a serious menace to the Central Government owing to the lack of co-operation between the various Rebel forces in the field. . . . The turbulent city of Canton . . . also rose against the authority of Peking. . . . A border General, named Lung Chi-Kwang, with 20,000 semi-savage Kwangsi troops had been moved near the city and at once attacked and over-awed the garrison. Appointed Military Governor of the province in return for his service, this Lung Chi-kwang, who was an infamous brute, for three years ruled the South with heartless barbarity, until he was finally ejected by the great rising of 1916. Thoroughly disappointed in this and many other directions the Southern Party was now emasculated; for the moneyed classes had withheld their support to the end."—B. L. Putnam Weale, *Fight for the republic in China*, pp. 53-54.—"Yuan Shih K'ai outthought and outmaneuvered his opponents. Li Lieh-chun, former Tutuh of Kiangsi, led the rebel forces in the Kiukiang district. His troops occupied the forts at the entrance to the Po Yang lakes. Nanking went over to the rebels, but attacks on the arsenal at Shanghai failed, because of the spirited defense made by Admiral Tseng Ju-cheng. The government forces gradually got the upper hand, and by September the rebellion collapsed. Early in August Sun Yat Sen, Huang Hsing, and other prominent Koumingtang leaders fled to Japan. Li Lieh-chun also escaped to Japan, being conveyed down the Yang-tze by a Japanese gunboat. The outstanding features of the rebellion were: (a) Chinese opinion was with the Government and against reform by revolution; (b) a revulsion of sentiment among foreign residents in China, who had been sympathetic to the younger reformers, but who now perceived the dangers of radicalism, and that the political situation was a choice between Yuan Shih K'ai or chaos; (c) the revelation that Japan was intriguing in a disturbing way in China's internal politics. On October 6 Yuan Shih K'ai was formally elected by the National Assembly under the new constitution, and Li Yuan Hung was elected Vice-President. On November 4 a mandate dissolved the Koumingtang as a seditious organization. The immediate effect of this action was to unseat about half of the members of the Assembly, making a quorum impossible, and leav-

ing the Executive in substantial control of the central government."—T. F. Millard, *Our Eastern question*, p. 67.—Though a virtual dictator, the president by a series of political dictats during 1914 attempted to clothe his arbitrary acts with a semblance of constitutional form.

ALSO IN: B. L. Putnam Weale (B. L. Simpson), *Fight for the republic in China*, pp. 39-56.

1914.—Suspension of Parliament.—Strengthening of central executive power.—Establishment of constitutional council.—Publication of the "Constitutional Compact."—Enactment of new presidential election law.—"The year 1913 ended with the President's *coup d'état*, when the Kuomintang, the main Opposition party, was dissolved by Presidential mandate and its members suspended from exercising parliamentary functions. No formal dissolution of Parliament followed; but, in the absence of a quorum, it had ceased to be a parliament, and was indefinitely suspended on January 10, 1914. From this time on Yuan Shih-kai's efforts had to be directed to the strengthening and consolidation of the central executive power. His first step was to create the *Cheng Chih Hui I*, or Political Council, the members of which were appointed by himself. This body acted as an advisory council to the President, and it immediately recommended him to call into being an elected assembly, which, being representative of the nation, would give constitutional sanction to the acts of the President. Regulations for the establishment and election of such an assembly, to be known as *Yue Fa Hui I*, or Constitutional Council, were drawn up by the Political Council, were approved by the President and were promulgated by him on January 26, 1914. The Council was to consist of fifty-six members, distributing as follows: Four elected in Peking, two in each province, eight by Mongolia, Tibet, and Sinkiang, four by the Chambers of Commerce. Electors had to be thirty years of age or over, an official or with the rank of Chu-jen, or a graduate of a provincial high school or possessed of property of at least \$10,000 in value. The qualifications for membership were: Tenure of an official post for at least five years, a graduate of a law school, the holder of a degree higher than that of Chu-jen or possessor of education of an equivalent standard."—*China year book*, 1916, pp. 432-433.—Meanwhile wholesale executions were carried out in the provinces with monotonous regularity and all attempts at rising ruthlessly suppressed. In Peking the infamous Chih Fa Chu or Military Court—a sort of Chinese Star-Chamber—was continually engaged in summarily dispatching men suspected of conspiring against the Dictator. Even the printed word was looked upon as seditious, an unfortunate native editor being actually flogged to death in Hankow for telling the truth about conditions in the riverine districts. . . . Although he was increasingly pressed for ready money, Yuan Shih-kai, by the end of April, 1914, had the situation sufficiently in hand to bring out his supreme surprise,—a brand-new Constitution promulgated under the euphonious title of 'The Constitutional Compact.' . . . It placed all power directly in the hands of the President, giving him a single Secretary of State after the American model and reducing Cabinet Ministers to mere Department Chiefs who received their instructions from the State Department but had no real voice in the actual government. A new provincial system was likewise invented for the provinces, the Tutuhs or Governors of the Revolutionary period being turned into Chiang Chun or Military Officials on

the Manchu model and provincial control absolutely centralized in their hands, whilst the Provincial Assemblies established under the former dynasty were summarily abolished. . . . A brand-new ceremony, the worship of the two titular Military Gods, was ordered so as to inculcate military virtue."—B. L. Putnam Weale (B. L. Simpson), *Fight for the republic in China*, pp. 53-54, 62, 63.—At the end of the year on Dec. 20, 1914, a new Presidential election law and succession act was passed by which Yuan added another five years to his term of office and could succeed himself at the close of that term. "The following is a summary of the principal clauses: (1) Any Chinese who is forty years of age, who enjoys full public rights and has lived in the country for upwards of twenty years, will be eligible for election. (2) At each election the President, representing the people, shall nominate three candidates, their names to be written by the President on a gold plate, which is to be locked up in a casket and the keys kept by the President, the Secretary of State, and the Chairman of the Council of State. (3) A committee of ten is to be appointed to open the casket. (4) The names will be submitted by the President to an Electoral College consisting of fifty members of the Council of State and fifty members of the Lifayuan, and the candidate who secures two-thirds of the votes will be considered elected. (5) If the required two-thirds are not secured, then the names of the two candidates with the largest number of votes will again be submitted for ballot, and the one securing the majority will be elected. (6) The President himself is eligible for re-election and may be voted for at the same time as the three candidates nominated by him. (7) The term of the Presidential office shall be for ten years. (8) The Council of State may extend the term of office and thereby render an election unnecessary. (9) The President has also the right to nominate three candidates for the post of Vice-President, whose term of office will also be for ten years. The procedure of election will be the same as for the President. The oath taken by the President is in the following terms: 'I swear that I will honestly adhere to the Constitution and faithfully perform my duties as President of this Republic.'—*China Year Book*, 1916, pp. 434-435.—The government, however, continued to take on military form. Scores of officers were appointed in various departments, and a "palace of generals" was erected at Peking. Japan, watching throughout all these changes, was awaiting her opportunity to seize control in China. This came with the outbreak of the World War, when Japan forthwith marched her troops against the German Chinese territory of Kiao-Chau. Yuan Shi-kai had been in the midst of negotiations with Germany concerning the retrocession of this territory when the blow fell. The Japanese captured Kiao-Chau before the end of 1914 and served their demands on China at the beginning of the new year.—See also JAPAN: 1914-1918; WORLD WAR: 1914: V. Japan: d.

Also in: B. L. Putnam Weale (B. L. Simpson), *Fight for the republic in China*, pp. 60-70.

1915.—Japan's twenty-one demands.—Protests in China, in England and America.—Acceptance of demands after modification.—"In the history of nations, there has never been a document presented to a sovereign State by another such as the demands Japan presented to China on January 18, 1915. . . . The following, which is an officially verified translation of the identical note presented to the President of China by the Japa-

nese Minister on that date, will best show the reader just how far the dream of the domination of China is outlined by Japan.

"GROUP 1. The Japanese Government and the Chinese Government, being desirous of maintaining the peace of Eastern Asia and of further strengthening the friendly relations existing between the two neighboring nations, agree to the following Articles:—

"Article i. The Chinese Government agrees that when the Japanese Government hereafter approaches the German Government for the transfer of all rights and privileges of whatsoever nature enjoyed by Germany in the Province of Shantung, whether secured by Treaty or in any other manner, China shall give her full assent thereto.

"Article ii. The Chinese Government agrees that within the Province of Shantung and along its sea border no territory or island or land of any name or nature shall be ceded or leased to any third Power.

"Article iii. The Chinese Government consents to Japan building a railway from Chefoo or Lung-chau to join the Tsinan-Kiaochow Railway.

"Article iv. The Chinese Government agrees that for the sake of trade and for the residence of foreigners certain important places shall be speedily opened in the Province of Shantung as treaty ports, such necessary places to be jointly decided upon by the two Governments by separate agreement.

"GROUP II. The Japanese Government and the Chinese Government, since the Chinese Government has always acknowledged the specially favorable position enjoyed by Japan in South Manchuria and Eastern Inner Mongolia, agree to the following Articles:—

"Article i. The two contracting Powers mutually agree that the term or lease of Port Arthur and Dalny and the term of lease of the South Manchuria and Antung-Mukden Railways shall be extended to the period of ninety-nine years.

"Article ii. Japanese subjects in South Manchuria and Eastern Inner Mongolia in erecting buildings for the purpose of trade and manufacture or for farming shall have the right to lease or own land so required.

"Article iii. Japanese subjects shall be free to reside and travel in South Manchuria and Eastern Inner Mongolia and to engage in business and in manufacture of any kind whatsoever.

"Article iv. The Chinese Government agrees to grant Japanese subjects the right of opening all mines in South Manchuria and Eastern Inner Mongolia, such mining places to be jointly decided upon by the two Governments.

"Article v. The Chinese Government agrees that in respect of the two following subjects mentioned herein below the Japanese Government's consent shall be first obtained before action shall be taken:—(a) Whenever permission is granted to the subject of a third Power to build a railway or make a loan with a third Power for the purpose of building a railway in South Manchuria and Eastern Inner Mongolia. (b) Whenever a loan is to be made with a third Power pledging the local taxes of South Manchuria and Eastern Inner Mongolia as security.

"Article vi. The Chinese Government agrees that if the Chinese Government in South Manchuria or Eastern Inner Mongolia employs advisers or instructors for political, financial, or military purposes the Japanese shall first be consulted.

"Article vii. The Chinese Government agrees that the control and administration of the Kirin-

Changchou Railway shall be handed over to the Japanese Government to take effect on the signing of this agreement, the term to last for ninety-nine years.

"GROUP III. The Japanese Government and the Chinese Government, seeing that Japanese financiers and the Hanyehping Company have close relations with each other at present, and also desiring that the common interests of the two nations shall be advanced, agree to the following Articles:—

"Article i. The two contracting Powers mutually agree that when the opportune moment arrives the Hanyehping Company shall be made a joint concern of the two nations and they further agree that without the previous consent of Japan, China shall not by her own act dispose of the rights and property of whatsoever nature of the Hanyehping Company, nor cause the said Company to dispose freely of the same.

"Article ii. The Chinese Government agrees that all mines in the neighborhood of those owned by the Hanyehping Company shall not be permitted, without the consent of the said Company, to be worked by other persons outside of the said Company, and further agrees that if it is desired to carry out any undertaking which it is apprehended may directly or indirectly affect the interests of the said Company the consent of the said company shall first be obtained.

"GROUP IV. The Japanese Government and the Chinese Government with the object of effectively protecting the territorial integrity of China agree to the following special Article:—The Chinese Government agrees that no island, port, and harbor along the coast shall be ceded or leased to any third Power.

"GROUP V. Article i. The Chinese Central Government shall employ influential Japanese as advisers in political, financial, and military affairs.

"Article ii. In the interior of China, Japanese shall have the right to ownership of land for the building of Japanese hospitals, churches, and schools.

"Article iii. Since the Japanese Government and the Chinese Government have had many cases of dispute between the Japanese and Chinese police to settle, cases which cause no inconsiderable misunderstanding, it is for this reason necessary that the police departments of important places (in China) shall be jointly administered (by Japanese and Chinese) or that the (Chinese) police department of these places shall employ numerous Japanese for the purpose of organizing and improving the Chinese police service.

"Article iv. China shall purchase from Japan a fixed ratio of the quantity of munitions of war (say fifty per cent or more), or Japan shall establish in China a jointly worked arsenal, Japanese technical experts to be employed and Japanese material to be purchased.

"Article v. China agrees to grant to Japan the right of constructing a railway connecting Wuchang with Kiu-kiang and Nan-chang. Also a line between Nan-chang and Hang-chow, and a line between Nan-chang and Chao-chow.

"Article vi. China agrees that in the Province of Fu-kien Japan shall have the right to work mines and build railways and to construct harbor works (including dockyards), and in case of employing foreign capital Japan shall be first consulted.

"Article vii. China agrees that Japanese subjects shall have the right to propagate religious doctrines in China."—J. Jones, *Fall of Tsingtau*, pp. 182-189.

"In the course of the contest which ensued

and which was brought to a close—in some respects only—by the signing of treaties on May 25, the substance of Groups I and II of these demands underwent practically no changes. Certain modifications were made in Group III. Group IV was retained as it stood. And it was ultimately agreed that the discussion of Group V, with the exception of the provision regarding Fukien Province—which was retained—should be postponed. Several features stand out with simple and peculiar prominence. Four of the groups were introduced by special, cleverly constructed preambles. There was no introduction or explanation attached to Group V. Baron Kato later declared in the Japanese Diet that Group V had represented not 'demands' but an expression of Japan's 'wishes' with a view to ascertaining China's attitude upon the points involved. No such explanation had been vouchsafed the Chinese government; Group V had been included, with no indication of special character or reservation, in the original document presented to the President of China as a summary of Japan's demands. That they were thus included in the document as presented to China and were entirely omitted from the account given the powers is significant and, instead of minimizing, serves greatly to increase their importance. The concessions which Japan sought may be divided into three classes: in some cases she was asking for options; in others she was asking the right to exercise a veto power with regard to actions of the Chinese government; in the third class she was asking for herself a position of definite, immediate, direct, and important special privilege.

"GROUP I related to Shantung. It required not only that all German holdings be turned over to Japan, but, in addition, that China pledge—as she had not been required to do by Germany—that she would not lease to other countries any territory on the coast of Shantung. Still further, China was to grant Japan the right to construct a new railway in Shantung, a line from Tungchow—near Chefoo—to Weih sien. . . . The preamble to GROUP II stated that 'the Chinese government has acknowledged the special position enjoyed by Japan in South Manchuria and Eastern Inner Mongolia.' As a matter of fact, Japan never had a special position in either region until ten years ago; China has only step by step and reluctantly recognized the position which Japan has acquired in Manchuria; and on no basis except that of her own unauthorized forward movement, and with no recognition of right by any nation has Japan acquired a 'special position in Eastern Inner Mongolia.' The requirement that China extend the lease on 'Port Arthur and Dalny' had subsequently been interpreted by Japan to mean the 'Leased Territory.' This, together with the extension of the railway leases, is all but equivalent to the cession of South Manchuria to Japan. If there is any question upon that point, the remaining clauses in this group remove all doubt. If China seeks advisers upon affairs in these regions, Japan is to be the final authority as to their selection: if China wishes to build railways with foreign capital here or to take foreign loans on the security of the local taxes, Japan's consent must be obtained. Japanese subjects are to be free to travel, reside, engage in business and in manufacture of any sort, lease or own land and erect buildings, and to open mines throughout the region. These last mentioned provisions are the most novel and most far-reaching in what will be their immediate effect. It has not heretofore been legal for foreigners, with the exception of missionaries, to own land and build-

ings, reside, and carry on business at places other than the treaty ports. . . .

"GROUP III relates to the great Hanyehping Company whose interests included the Hanyang iron works, the Lingsiang coal mines, and the Tayeh iron mines. The Hanyehping iron and steel mills are located at Hankow, 'the Chicago of China,' seven hundred miles up the Yangtse, while the coal and iron mines are near at hand, all being in the very heart of the British sphere of influence. The company is Chinese. During recent years it has borrowed certain sums of money from Japanese sources. Now, in the form in which this demand was presented, Japan asked not only a partnership in the company, but what would amount to control; not that alone, but the right to prevent by Japanese veto the opening up, whether by other foreigners or by Chinese, of any mines in all the region round about; even more—the interdiction of any enterprise which would, in the opinion of the Japanese, be held likely 'directly or indirectly to affect the interests of the company.' . . . The demand which constituted GROUP IV, that China should engage 'not to cede or lease to any third power any harbor or bay or island along the coast,' carries with it a significant implication and should it be acceded to, two particular consequences, one negative and one positive. The implication is that China is responsible to Japan in the matter of disposing of her territories; that is, that a new limitation of China's sovereign rights, in favor of Japan, is to be recognized. The consequences would be that China would stand pledged on the one hand to refrain from giving territorial concessions to any *third* power, whence it would follow that no third power might obtain such concessions; while on the other hand as between China and Japan no such prohibition would be established. In GROUP V, concessions of the most unprecedented and wide-reaching nature were required. China was to employ Japanese advisers in political, financial, and military affairs; to admit Japanese to joint participation in the policing of 'important places'; to purchase from Japan 'say fifty per cent. or more' of her munitions of war, or allow the establishing of an arsenal in China under Japanese supervision; to grant Japan the right to construct important designated railway lines in the Yangtsé Valley some of which were already promised to British concessionaires; to specify that Japanese might carry on missionary propaganda and own lands for hospitals, churches, and schools in the interior; and to give Japan first option for the furnishing of capital for developments, 'including dock yards,' in Fukien Province. The reaction in China was quite different from what the Japanese government seems to have expected. Even the members of the Kwo-ming Tang, hitherto irreconcilably opposed to Yuan Shih-kai, laid aside internal political strife and rallied to the support of their government in opposition to Japan. Outside China there was a split in the Kwo-ming Party, but the principal leader, Huang Hsing, gave his support, and most of his party followed his lead. The Japanese Minister in Peking sought at the outset to get the Chinese officials to agree 'in principle' to all the demands. To this the Chinese refused to commit themselves. Long weeks of negotiation followed. . . . There were rumors that Japan was contemplating drastic action. Military and naval preparations were going forward in Japan, and vessels and additional troops were being dispatched to China. It was generally believed that Japan was waiting to hear what reply Sir Edward

Grey would make to the questions which were being asked in the British House of Commons. British interests had been bestirring themselves and the British government was at last being forced to recognize something of the importance and the seriousness of the Far Eastern situation. The facts had also at last gotten before the American public, and from the utterances of both the British and the American press it began to be apparent that, now that the real nature of the demands was understood, the sympathy of the world was with China. Vigorous publicity and the time element had come to China's assistance with unprecedented effectiveness. True, the Japanese government had won in the recent elections, but it now had to answer questions which were being raised insistently and pertinently both at home and from abroad. On April 23 it was announced by the Kokusai News Agency of Tokyo, officially inspired, that the Japanese government intended to change and modify some of its demands. On April 26 this announcement was made good by the presentation of a revision comprising twenty-four demands, the Japanese Minister announcing that this communication was final and that if China would consent to the whole group without revision Japan would restore Kiaochow to China at an opportune time and subject to certain conditions. . . . The Chinese people were by this time urging the government to resist Japan, if necessary by force of arms, but Yuan Shih-kai, knowing that such a course would be futile, authorized his ministers to make further concessions. Overtures to that effect were rejected by the Japanese, and the ultimatum was presented on May 7, giving China forty-eight hours in which to accede to the demands. War vessels had been dispatched, and additional troops were embarking at Japanese ports for service against China. At some time between May 1 and May 7 the Japanese government seems to have undergone a considerable change of mind, if not of heart, for the requirements embodied in the ultimatum represented a modification of what had been put forward in the document of April 26 as Japan's last and final demands. It has been suggested that counsels to restraint had been forthcoming, in the interval, from Japan's Occidental ally. The ultimatum was accompanied by an explanatory note in which it was indicated that five matters: namely, (a) the employment of advisers, (b) the establishing of schools and hospitals, (c) the railway concessions in South China, (d) the supply of arms and ammunition and the establishing of arsenals, and (e) the propagation of Buddhism, were to be postponed for later negotiations—thus making it a matter of record that these demands were not to be considered as definitely waived. 'If the Chinese Government accepts all the articles as demanded in the Ultimatum, the offer of the Japanese Government to restore Kiaochow . . . will still hold good.' The note also made specifications with regard to certain changes in phraseology which might be effected, and left the disposal of a few minor matters to the future. . . . Before daybreak on the morning of May 9 the Chinese government agreed to the terms laid down in the ultimatum. . . . It remained to draft the necessary treaties, agreements, exchanges of notes, and declarations. Several conferences were held before this work was completed, and at these the Japanese Minister brought up certain points which the Chinese claim went beyond the provisions of the ultimatum. Finally, on May 25, the arranging and phrasing of the documents having been completed, the signatures of the ministers were affixed;

and on June 8 the ratifications were exchanged, terminating the diplomatic contest which had lasted for five months."—S. K. Hornbeck, *Contemporary politics in the Far East*, pp. 311-332.—See also U. S. A.: 1907-1917.

1915-1916.—Attempted return to monarchy.—Yuan Shi-kai, emperor as result of nominal plebiscite.—Rebellion (third) starting in Yunnan.—Yuan Shi-kai's abandonment of monarchical idea.—Reinstatement of republican forms.—The two great anti-dynastic and anti-military parties of China were the Kuomintang and the Chinputang. The former was composed of extreme radicals and was the larger of the two. The latter was made up of the scholars of China and the older and more conservative progressives. Its most distinguished member was the Chinese scholar Liang Chi-Chao. "Immediately after the conclusion of negotiations with Japan in May, 1915, the leaders of the Chin-pu Tang, now the most influential of the political parties in China and the support of the government, memorialized the President, asking him to hasten the convening of the National Assembly. It was argued that the position of the government would be strengthened by the existence of this body. The President straightway, on May 25, issued orders that the census lists of voters qualified for the primary elections should be completed by September 13. In July the President issued a further mandate directing the bureau concerned with preparations for the election of representatives to the National (Constitutional) Convention to hasten its work. The Council of State had been instructed on July 1 to appoint the Committee of Ten for the drafting of a permanent constitution. The Council at once made its appointments and the President announced the membership. The Committee held its first meeting on July 31. It was announced that in all probability the draft of the constitution would be ready by the end of the year; and the Chinese press chose to believe that the existing provisional constitution and its supplementary laws would be made the basis of the work. The governors of the provinces were to be taken into consultation, and particular deference was to be paid to the views of Dr. Goodnow as Constitutional Adviser. It was reported early in August that the elections would be held in January and February and the convention be summoned in March, 1916. Thus far had the legal reconstruction gone when, suddenly—as far as the outside world is concerned—there began to come rumors that the Chinese were discussing the possibility and advisability of reverting to the monarchical form of government. The talk, however, went on, and the discussion finally came into the open with the organizing of a 'Peace Planning Society,' or 'Society for the Devising of Permanent Peace' [and the publication of pamphlets advocating an empire]. . . . The next move was made by the Council of State, an instrument of the President. The Council recommended early in September that the President call a convention to decide for or against the restoration, and if that be not possible, that he 'devise other proper and adequate means to consult the will of the people.' The Council reported that it had received eighty-two petitions from different bodies favoring a monarchy. On October 8, the Council passed a bill providing for the election of a convention of citizens to decide as to the future form of government, and the President at once promulgated the bill as law. The military elements were by this time urging that Yuan proclaim himself Emperor on October 10, the anniversary of the

beginning of the revolution, but the President refused to consider this, and, to prevent a demonstration, canceled the orders for a parade of the troops on that day. The President, next, on October 12, issued a mandate saying that he had received petitions from representative sources expressing the unanimous opinion that the republican form of government was unsuited to the needs of China and requesting him to adopt a constitutional monarchy, 'so that the peace be maintained.' But, according to the constitutional compact, sovereign rights are vested in the entire body of citizens, therefore he must leave the decision to the people. In the meantime, the balloting for the election of representatives to the colleges which were to decide the question had been going on. The vote was taken on the basis of the electoral census and lists prepared for the

YUAN SHI-KAI
President of China (1912-1916)

coming election of the National Assembly and the choosing of delegates to the National Convention. The election officials had given notice to qualified citizens in every district and every special electoral group that they were entitled to cast ballots to determine what form of government should be adopted. The persons so notified were required to register, and all who had registered were allowed to vote on the days set for their districts or groups. In each of the provincial constituencies the voters selected five men who in turn chose one as elector for the district. The electors proceeded to their respective provincial capitals and there cast their ballots either for the republic or for constitutional monarchy. The voting for the dependencies was done by citizens who happened to be in Peking. The canvass of the returns showed that all but fifty of the 2,043 electors had declared for constitutional monarchy. In many provinces the electors were asked to express themselves as to who should be Emperor—and the unanimous opinion, where sought, was for Yuan Shih-kai. The Council of State immediately sent Yuan a

petition asking him to accept the throne, and on December 11 it was announced that Yuan 'in deference to the will of the people' had consented to become Emperor."—*Ibid.*, pp. 87-96.

"Yuan's coronation was postponed, possibly because Japan and the Entente Powers had expressed apprehension lest the restoration of monarchy lead to internal disorders in China and a disturbance of the international equilibrium in the Far East. The justice of this apprehension soon appeared. To be sure, an attempt at mutiny on December 5, by a handful of insurgents on board the Chinese training-ship *Chao-ho* in the harbor of Shanghai, proved premature. But a formidable insurrection raised its head late in December, under the leadership of Tsai Ao, former military governor of Yunnan. Tsai Ao's declared purpose was the restoration of the parliamentary, constitutional republic. From Yunnan the republican rebellion spread to the neighboring provinces of Kweichau, Kiangsi, Hupeh, and Szechuan. Mutiny broke out at the very important city of Nanking and in Fukien and Hunan provinces. As the Republican insurrection made headway, Yuan Shih-kai faltered in his determination to assume the crown. On January 21 the formal coronation, tentatively scheduled for February 12, was postponed *sine die*. On March 22 Yuan proclaimed that he would abandon the monarchical scheme altogether and would revert to the republican form of government. The staunch republican Hsu Shih Chang, who had resigned as a protest against the monarchical restoration, now reentered the cabinet as secretary of state. A special session of the Council of State, March 27, repealed all monarchical legislation and legally restored the republican régime. Nevertheless, the republican insurgents in the southern provinces, thoroughly hostile to Yuan, pursued their military campaign. By the end of May all of the southern provinces, Yunnan, Kwangsi, Kwangtung, Fokien, Chikiang, Kiangsi, Hunan, and Kweichau, were dominated by the rebels; among the central provinces, Szechuan was in rebel hands and others were more or less disaffected; further north, Shensi and Shansi were said to have declared independence and Shantung was rapidly being conquered by revolutionaries, apparently with unofficial Japanese support. Meanwhile President Yuan Shih-kai made desperate efforts to retrieve his blunder. He agreed to surrender all civil authority to a responsible Republican cabinet, April 22, with Tuan Chi-jui, a conspicuous Republican leader, as premier and war minister. This concession was scorned, however, by 216 members of the National Assembly, who refused to be conciliated so long as Yuan remained president."—*Political Science Quarterly* (Supplement, Sept., 1916, pp. 68-69).

1916-1917.—Continuance of disorders.—Death of Yuan Shi-kai.—Diplomatic relations with Germany severed.—Attempted monarchist coup.—Speedy collapse.—"The situation had become truly appalling in Peking. It was even said that the neighbouring province of Shantung was to become a separate state under Japanese protection. Although the Peking administration was still nominally the Central Government of China, it was amply clear to observers on the spot that by a process of successive collapses all that was left of government was simply that pertaining to a city-state of the antique Greek type—a maladministration dominated by the enigmatic personality of Liang Shih-yi. The writ of the capital no longer ran more than ten miles beyond the city walls. The very Government Departments, disgusted with, and distrustful of, the many hid-

den influences at work, had virtually declared their independence and went their own way, demanding foreign dollars and foreign banknotes from the public, and refusing all Chinese money. The fine residuum of undisputed power left in the hands of the mal-administrator-in-chief, Liang Shih-yi, was the control of the copper cash market which he busily juggled with to the very end, netting a few last thousands for his own purse, and showing that men like water inevitably find their true level. In all China's tribulations nothing similar had ever been seen. Even in 1900, after the Boxer bubble had been pricked and the Court had sought safety in flight, there was a certain dignity and majesty left. Then an immense misfortune had fallen across the capital; but that misfortune was like a cloak which hid the nakedness of the victim; and there was at least no pretence at authority. In the summer of 1916, had it not been for the fact that an admirable police and gendarmerie system, comprising 16,000 men, secured the safety of the people, there can be little doubt that firing and looting would have daily taken place and no woman been safe. It was the last phase of political collapse with a vengeance; and small wonder if all Chinese officials, including even high police officers, sent their valuables either out of the city or into the Legation Quarter for safe custody. Extraordinary rumours circulated endlessly among the common people that there would be great trouble on the occasion of the Dragon Festival, the 5th June; and what actually took place was perhaps more than a coincidence. Early on the 6th June an electric thrill ran through Peking—Yuan Shih-kai was dead! At first the news was not believed, but by eleven o'clock it was definitely known in the Legation Quarter that he had died a few minutes after ten o'clock that morning from uræmia of the blood—the surgeon of the French Legation being in attendance almost to the last. A certificate issued later by this gentleman immediately quieted the rumours of suicide, though many still refused to believe that he was actually dead. 'I did not wish this end,' he is reported to have whispered hoarsely a few minutes before he expired, 'I did not wish to be Emperor. Those around me said that the people wanted a king and named me for the Throne. I believed and was misled.' And in this way his light flickered out."—B. L. Putnam Weale (B. L. Simpson), *Fight for the republic in China*, pp. 265-266.—"The perturbations of the Chinese republic were by no means ended with the death of Yuan Shih-kai. To be sure, Yuan's successor in the presidency, General Li Yuan-hung, a liberal from middle China, proved his sincere republicanism by reopening, on August 1 [1916], the republican parliament which Yuan had arbitrarily suspended in 1914, and by endeavoring to harmonize the discordant factions by forming a coalition cabinet. Against President Li, however, provincial military governors and generals, particularly in the northern provinces, were busily conspiring to revive the defunct Manchu empire. In the face of this menace the republicans themselves were disunited. The Conservative northern or militarist party, recruited chiefly from the old governing classes in North China, and led by Premier Tuan Chi-jui, was determined to dominate the republic in defiance of parliamentary Radicals. On the other hand, the Radical republicans (organized in party called Kwo-min-tang), representing the 'solid South' of Chinese democracy, uncompromisingly insisted that they should exercise the control of the government. Their candidate for the premiership, Tang Shao-yi, preferred to resign the port-

folio of foreign affairs, which had been assigned to him in the coalition cabinet, rather than to serve in a subordinate capacity under his rival, Premier Tuan Chi-jui. Moreover, the Radical majority in parliament so stubbornly opposed Tuan's attempts to replace republicans by Conservatives in the cabinet, that vexatious conflicts arose between parliament and premier, and seventeen military governors telegraphed to President Li Yuan-hung threatening insurrection if the premier were not given full authority over his own cabinet, without interference from parliament.—The feud was further embittered by disputes over foreign policy. Foreign Minister Wu Ting-fang, appointed in November, was accused of weakness in his dealings with Japan . . . as well as in his futile efforts to obtain satisfactory amends for the massacre of several hundred Chinese by Russian Cossacks at Kaahu (Sinkiang) and for the seizure by French troops of a square mile of Chinese territory adjoining the French concession at Tientsin. Furthermore, in the negotiations of foreign loans, a clique of pro-Japanese Conservatives favored Japan, whereas the Radicals inclined toward America and were gratified by the award of a very important contract (to build 700 miles of railway, with an option on 1,500 miles in addition, at \$50,000 a mile, and to rebuild the Grand Canal) to the American International Corporation. Most embarrassing of all was the question of intervention in the war. When the German government inaugurated its ruthless submarine Campaign and began to sink liners bearing Chinese coolies to France, Premier Tuan Chi-jui and his cabinet proposed action. The president opposed it. The premier resigned. But three days later President Li Yuan-hung yielded, and Tuan, returning to power, severed diplomatic relations with Germany on March 14 [1917]. After taking this step, the Chinese government formally requested the Entente Powers and the United States to sanction (a) the suspension of the Boxer indemnity payments, (b) an increase in import duties above the stipulated five per cent *ad valorem*, and (c) the posting of Chinese troops at Tientsin, along the Tientsin-Peking Railway, and in the legation quarter. In May, Premier Tuan Chi-jui asked parliament to authorize a declaration of war against Germany. The parliamentary majority, however, obstinately refused to precipitate China into the Great War as long as Tuan Chi-jui remained premier, for it was feared that he would use the war simply as an excuse for suspending constitutional liberties and intrinching the militarist Conservative party in power. President Li Yuan-hung, siding with parliament, openly defied the northern military party by dismissing Tuan from the premiership, May 23. Here was the opportunity for which the extreme reactionaries and monarchists had long been sighing."—*Political Science Quarterly* (Supplement, Sept., 1917, pp. 76-77).—Immediately the military governors of the northern provinces who had evidently been warned and organized by the Premier and his party, rose in opposition to the Kuomintang [and what is known as the fourth revolution broke out]. Foremost among them was the powerful Chang Hsun, a freebooter, who, with his private army of probably forty thousand men, ranks as an independent baron, over the important province of Anhwei, through which the railway runs from Peking to Shanghai. . . . Chang Hsun brought his troops up by rail to Tientsin [June 7, 1917], the Treaty Port nearest the capital, and the government troops, being controlled by Tuan's party, would not oppose them. He then demanded of

the President the dissolution of Parliament. . . . Then he [the president], in order to save the country from civil war, proceeded to find legality for his action and sought in vain to persuade his acting Premier, the well-known Wu Ting Fang, to countersign the mandate for dissolution. . . . At last the chief of police of the capital had to be created Premier in order to execute the President's decision, and meet the demands of General Chang Hsun."—F. Moore, *Counter-revolutions in China* (Asia, July, 1917).—On June 13, the mandate for dissolution was countersigned. "On June 15 Chang Hsun arrived in Peking with Li Ching-hsi. Eight of the provinces that week canceled their independence, stating that their desire for the dissolution of Parliament had been satisfied. The members of Parliament made their way, many of them in disguise, to Shanghai and there held meetings and sent out manifestoes. Affairs were apparently at a standstill with the country thus divided when the great coup d'état was carried out by Chang Hsun. Affairs thereupon moved swiftly. On June 30 Kang Yu-wei, a known advocate of the monarchy, arrived in Peking. He had traveled incognito from Shanghai. His first visit was to Chang Hsun. On July 1 at 4 A. M. Chang Hsun and his suite called on the Manchu boy Emperor and informed him of his restoration, and seated him on the throne. President Li Yuan-hung was requested to resign, but refused. He was then practically held prisoner. Numerous imperial edicts were issued, countersigned by 'Chang Hsun, member of the Privy Council.'

"On July 3 Feng Kuo-chang [the Vice-President] repudiated any connection with the restoration, his name having appeared in the edicts as one of the petitioners. The Military Governor of Canton issued proclamations that the Cantonese would fight to maintain the republic. Many similar messages were sent by other provinces. Japanese troops proceeded to the Forbidden City. . . . [President Li Yuan-hung escaped from the custody of Chang Hsun and took refuge in the Japanese Legation.] On July 4 the President issued a pledge to fight for the republic. On July 5 hostilities broke out at Lang Fang on the Peking-Tientsin railway. General Tsao Kun arrived at Liuliho with 10,000 troops en route to Peking. The diplomatic body notified the Peking authorities that the Protocol of 1901 providing for open railway communication between Shanghai and Peking must be observed. On July 5 trains out of Peking were packed to overflowing with Chinese fleeing to Tientsin. A special train with a foreign detachment was stopped at Lang Fang by a republican General, who requested the passengers to turn back, as Chang Hsun's troops had torn up the tracks a mile further on. By this time the entire country, with the exception of three provinces, had declared its opposition to the Manchu movement. Tuan Chi-jui came out of his retirement, offering to take command of the republican army. Liang Chi-chao, who was such a force against Yuan Shih-kai, denounced the whole movement. The republican troops advanced upon Peking, and on July 7 American, Japanese, and British soldiers arrived at the capital, after having been detained at Fengtai, where firing between the opposing Chinese forces was in progress; several bullets struck the train, and a Japanese postman was injured. An airplane later dropped a bomb over Fengtai station and wrecked the shed. Chang Hsun's troops at Poama Chang retired inside the capital without fighting and concentrated at the Temple of Heaven. Another airplane flew over

the Forbidden City and dropped bombs. Chang Hsun, on July 8, resigned, but the abdication of the Emperor was not published, his protector holding out for favorable terms. Vice President Feng Kuo-chang assumed the office of Acting President at Nanking, which was declared the capital of the Provincial Government. Dr. Wu Ting-fang arrived in Shanghai with the seal of the Ministry of Foreign Affairs, although on July 9 the Premier announced that he was dismissed from office. Several Ministers of the Manchu Cabinet on this day were captured while attempting to escape. Chang Hsun refusing to surrender and 50,000 republican troops having surrounded Peking, on July 12, at 4 A. M., the attack was begun in earnest. The battle continued nine hours. Several foreigners were wounded; fire broke out in the Forbidden City; Chang Hsun took refuge in the Dutch Legation, and the republican flag was raised over the Forbidden City. Several thousand of Chang Hsun's troops surrendered and were disarmed and sent back to Hsu-chowfu. On July 13 Chang Hsun's troops offered to surrender their arms upon payment of \$80,000. General Tuan Chi-jui accepted the offer by telegraph and arranged for a temporary loan from the Yokohama Special Bank to make the payment. Chang Hsun's internment came about by his visit to the Legation Quarter, which is neutral territory. He was trying to arrange for mediation. On July 14 Tuan Chi arrived in Peking. President Li left the Japanese Legation for his private residence. On July 15 Tuan Chi-jui assumed the office of Premier, though the southern provinces showed opposition to him. On July 16 Li Yuan-hung entered the Peking French Hospital. Dr. Sun Yat-sen and his party arrived in Canton from Swatow. In an interview he stated it was desirable that the southwestern provinces should be joined together for the restoration of the Provisional Constitution. On July 17 President Li, in a telegram to the provinces, refused to resume office. Mandates were issued appointing Wang Ta-hsieh Minister for Foreign Affairs, and Premier Tuan Chi-jui concurrently Minister of War. The Chin-Pu-Tang Party at Tientsin voted to support the Tuan Government. Acting President Feng Kuo-chang expressed his willingness to succeed Li Yuan-hung.—*New York Times Current History*, Nov., 1917, pp. 351-352.

1917.—Declaration of war against Germany and Austria-Hungary.—“On August 3 General Feng Kuo Chang, president of the Chinese Republic, declared war on Germany, and, on September 11, on Austria-Hungary. The problems of the newly re-established republic were many and vexed, and the step was taken, rumor has it, on the advice of the American minister, in the hope that the problems of facing a common enemy without might unify the factions at home and create for China the military strength and unity necessary to resist aggression. This was no longer feared from Europe, on the continental side, but Japan gave Chinese patriots constant anxiety. The cause of the republic had its most loyal champions in the return student bodies, but these were poorly organized and without any real community with the masses, whose mentality and outlook they did not understand and thus far could not modify. The numerous parties and provincial groups dividing the rest of that part of the Chinese population which was really awake to political issues were very weak in comparison with the provincial military governors who are gaining a mastery of the country. Between them civil war might break out at any time.”—*Political Science*

Quarterly (Supplement, Sept., 1918, p. 64).—Shortly after this the country was split in two and the revolutionary party of the south established its government at Canton. (See below, 1917-1918.)

1917 (November).—Lansing-Ishii agreement between the United States and Japan concerning China.—“On November 2, 1917, the Lansing-Ishii Agreement between America and Japan was signed at Washington. The agreement, embodied in an exchange of notes, defined the future attitude of these two countries toward China. Its important clauses were two in number: that the United States recognized Japan's ‘special interests’ in China; and that both the United States and Japan repledged themselves to observe the principle of the ‘open door’ and the territorial integrity of China. The agreement was the most important one which had been reached by America in relation to the Orient since the Hay proposal, in 1890, to uphold the principle of the ‘open door’; and its future bearing on international relations in the Orient will be large. The general affirmation of the ‘open door’ policy was the remedy proposed by America eighteen years before, to meet the dangerous situation fast developing in China. At that time the prospect of national disintegration and partition by the world powers seemed imminent. The history of China's relations with the other nations, with the single exception of the United States, was a long story of defeat and losses of Chinese territory and sovereign rights.”—W. R. Wheeler, *China and the World War*, pp. 102-103.—See also U. S. A.: 1907-1917.

1917-1918.—Election of President Hsu Shih-chang.—Two rival Parliaments.—Continued strife between northern militarists and southern constitutionalists.—Agreement for peace conference.—“The Republican Ministry under Tuan Chi-jui returned to power and Feng Kuo-chang remained acting President. The North, however, took no steps to conciliate the Southerners and the breach between the two parties widened. The accepted constitutional theory in Peking at this time was that, with the dissolution of Parliament, the situation reverted to the one which had existed in 1912, immediately after the promulgation of the Provisional Constitution and before the National Council had been replaced by a regular Parliament. Feng Kuo-chang accordingly convened a Council for the purpose of drafting new laws for the election of a new Parliament, and in accordance with the laws thus enacted (in February, 1918), which differed materially from the laws passed by the National Council in 1912, a new Parliament was elected. The opening session was held in August, 1918, and on September 4 the ex-premier, Hsu Shih-chang, was elected President of the Republic. Party faction prevented the election of a vice-president. The Peking reading of the situation did not satisfy Southern China or the members of the old Parliament, who had been a second time unseated. These were summoned to meet in Canton and to constitute the real representative body of the Republic. During the summer of 1918 a quorum of the old Parliament was obtained, and for the rest of the year China had two Parliaments—the one sitting at Peking, the other at Canton—each subscribing to the Provisional Constitution and claiming to be the sole legal legislative body of the Republic. The case of the Southerners or Constitutionalists was set forth in a manifesto (August, 1918), addressed ‘to the Foreign Powers,’ asking for ‘support of their righteous cause.’ . . . Throughout the whole of 1918 desultory fighting had been taking place between ‘North’

and 'South,' the chief provinces affected being Hunan, Szechuan, Kiangsi, Fukien, and Hupeh. The inability of the Northern party to make any headway in the campaign, the financial embarrassment of both sides, and the growing dissatisfaction with a state of affairs that promised to lead nowhere, were at last responsible for an attempt to find a *modus vivendi* for the two factions, and the President proclaimed an armistice when the news of the armistice in Europe reached China. Towards the end of 1918 it was agreed that a peace conference should be held. A controversy arose over the place of meeting, but eventually it was decided that the northern and southern delegates should deliberate in the native city of Shanghai (February, 1919).—*China Year Book*, 1919-1920, pp. 301-303.

1918.—Military agreement with Japan.—“The situation in Russia following the abdication of the Czar in March, 1917, was of special concern to the Allies. It was of vital importance to the two neighbouring Oriental supporters of the Allies, Japan and China. The northern boundaries of the Chinese Republics are contiguous for hundreds of miles with the boundaries of Siberia; any German penetration there would be felt at once in China. Japanese shipping, which included practically all of the vessels on the Pacific, would be menaced at once if the Germans should gain control of Vladivostok. Further, in its larger aspect of German control of Russia's resources and territory, presaging the establishment of a vast empire stretching from the North Sea to the Pacific, the Japanese saw a grave menace. The military danger of the German forces in Siberia seems to have been exaggerated, but there was every probability of economic control and domination. Japan could not take military measures to meet this situation unless it had the consent and support of its neighbour on the mainland, and consequently, soon after the revolution in Russia, negotiations were begun leading to a military agreement between China and Japan. The military agreement was signed May 16, 1918; the naval agreement, May 10th; the first public announcement was made in Tokio, May 30th. The whole affair was shrouded in much secrecy, and was the cause of endless comment and even suspicion in both countries, which was not wholly dispelled by the explanatory statement finally published. The first report concerning the proposed agreement became current in China in the Spring of 1917. Unfortunately it was associated in the minds of the Chinese with Group Five of the Twenty-one Demands made by Japan in January, 1915. These demands were forecasted by the secret statement of the Black Dragon Society, which spoke of a 'Defensive Military Alliance' between China and Japan as the ultimate goal of Japanese foreign policy. The fifth group of the Demands, it may be remembered, was the most severe, involving certain rights which, if granted to Japan, would infringe the sovereignty of China and make it practically a vassal nation. . . . Finally, on May 16th [1918], an official statement from both Peking and Tokyo was published, stating that an agreement had been reached. The fears of the Chinese were heightened by the fact that the officials would not publish the terms of the alliance. . . . Various versions have been published unofficially; a translation of one of

them which comes from semi-official sources, read as follows:

“ARTICLE 1. In view of the penetration of enemy influence into the eastern territory of Russia, and of the likelihood of the peace of the two contracting parties being disturbed thereby, China and Japan mutually agree actively to undertake the obligations of war-participation by measures designed jointly to guard against the action of the enemy.

“ARTICLE 2. The two countries shall mutually recognize and respect the equality of the other regarding position and interests in carrying out joint military measures.

“ARTICLE 3. When it is necessary to take action based on this agreement, orders will be issued by both China and Japan to their troops and people, calling on them to be frankly sincere in dealing with each other in the area of military operations; and the Chinese officials shall co-operate and assist the Japanese troops in the area involved so that there may be no hindrance to military movements. Japanese troops shall on their part respect Chinese sovereignty and shall not cause any inconvenience to the Chinese people by violating local customs and traditions.

“ARTICLE 4. Japanese troops in Chinese territory shall withdraw from China as soon as war is ended.

“ARTICLE 5. If it be found necessary to send troops outside of Chinese territory, troops will be jointly sent by the two countries.

“ARTICLE 6. The war area and war responsibilities shall be fixed by mutual arrangement of the military authorities of the two countries as and when occasion arises in accordance with their respective military resources.

“ARTICLE 7. In the interests of convenience, the military authorities of the two countries shall undertake the following affairs during the period necessary for the execution of joint measures: (1) The two countries shall mutually assist and facilitate each other in extending the means of communications (post and telegraph) in connection with military movements and transportation. (2) When necessary for war purposes construction operations may be carried on and the same shall be decided, when occasion arises, by mutual consent of the chief commanders of the two countries. The said construction-operation shall be removed when the war is ended. (3) The two countries shall mutually supply each other with military supplies and raw materials for the purpose of jointly guarding against the enemy. The quantity to be supplied shall be limited to the extent of not interfering with the necessary requirements of the country supplying the same. (4) Regarding questions of military sanitation in the war area the two countries shall render mutual assistance to each other. (5) Officers directly concerned with war operations shall mutually be sent by the two countries for co-operation. If one party should ask for the assistance of technical experts, the other shall supply the same. (6) For convenience, military maps of the area of war operations will be exchanged.

“ARTICLE 8. When the Chinese Eastern Railway is used for military transportation, the provisions of the original treaty relating to the management and protection of the said line shall be respected. The method of transportation shall be decided as occasion arises.

“ARTICLE 9. Details regarding the actual performance of this agreement shall be discussed by mutual agreement of the delegates appointed by

the Military Authorities of the two countries concerned.

"ARTICLE 10. Neither of the two countries shall disclose the contents of the agreement and its appendix, and the same shall be treated as military secrets.

"ARTICLE 11. The Agreement shall become valid when it is approved by both Governments after being signed by the Military representatives of the two countries. As to the proper moment for the beginning of war operations, the same shall be decided by the highest military organs of the two countries. The provisions of this agreement and the detailed steps arising therefrom shall become null and void on the day the joint war measures against the enemy end.

"ARTICLE 12. Two copies of the Chinese and of the Japanese text of this agreement shall be drawn; one of each shall be kept by China and Japan. The Chinese and Japanese texts shall be identical in meaning."—W. R. Wheeler, *China and the World War*, pp. 127-132; 138-142.

1918 (November).—Phonetic writing introduced.—"Something is happening in China which will undoubtedly leave its historical impression. Veteran traders and missionaries discuss the possibilities seriously and, if they have a love for the vast, unhappy nation, with great hope and joy. The immense republic, they say, may sweep into the forefront of modern civilization much sooner than the most sanguine had expected. The new simplified National Phonetic Writing, they report, is making most amazing progress. It is as easy for the Chinese to learn to read and write now as it is for the American boy. The graduate of a Chinese Governmental College is, after many years of study, supposed to know about 40,000 ideographs or thought characters; this as compared to about 4,000 words in the vocabulary of the usual American. F. W. Bible, a Presbyterian missionary from Hangchow, told me that the pupils in Christian schools mastered the new system in a month as compared with the five or six years needed for the old ideograph system. Some illiterates are taught to read in two weeks with lessons of two hours a day. . . . Of China's four hundred million or more inhabitants only about five per cent. can read at all, and no more than two per cent. are real masters of the written language. It is quite possible that 375,000,000 Chinese may learn to read and write within one generation, or even in the next ten years. Anyone who knows China realizes that the Chinese do not stand behind the men of any other race in intelligence. In literature alone the performances of the past would lead us to expect that a literate China would produce something of inestimable value to the whole world. . . . Chu Yin Tzu-Mu, as it is called, is not the first attempt to give China a rational writing. It had thirty or forty predecessors. The Christian missionaries have always been busy on the problem. Attempts at Romanization, or writing in characters similar to English, failed dismally. The system of Wang Chao, a Chinese scholar, had some success; but the Chinese as a whole did not show great interest. The new system is a decided improvement on Wang Chao's construction and all those that have gone before. To understand it, one must remember that Chinese is entirely made up of monosyllables. There are only 420 monosyllables in the Pekingese official dialect. The num-

ber of words in the Imperial Dictionary of K'ang Hai, two centuries old, but still the standard, is 44,449. Each monosyllable on the average has 105 meanings. These are distinguished in two ways; first, by the slight differences of pronunciation, and second, by the association of one word with the word next to it. It must be remembered that each of these 105 variations of the same monosyllable is an entirely distinct word to the Chinese, and each has an ideograph which bears no suggestion of the 104. It is easy to see why Romanization failed. In a little dictionary which the missionaries tried to use were 165 characters Romanized as 'chi' and 178 as 'i' (pronounced like English 'e'). Chu Yin Tzu-Mu uses thirty-nine symbols, twenty-four initials, twelve finals and three medials, or connecting sounds. These do not even remotely suggest Roman characters, but they represent all the sounds of what is to be the new national language. Because the Chinese themselves are pushing the system it is going through the country very fast. The previous systems were handicapped for the most part by being foreign. Chinese pride and conservatism smothered them. But it seems there has really come a change over the spirit of China. Repeated humiliations are getting deep underneath the skin. Her educated and intelligent thinkers have been pondering on what is wrong and realized gradually that they must have a national spirit and a national patriotism comparable to the Western nations. To accomplish this they decided China must have a national language and a method of reading and writing everywhere understood, so that there could be quick nation-wide dissemination of ideas. The new National Language was founded on the so-called Mandarin. This was already spoken in fifteen out of the eighteen provinces, for the southern coast provinces have a quite different speech. But the pronunciation of Mandarin varied so much that natives of different provinces often were unable to understand each other. To overcome this difficulty a standardized pronunciation was adopted. The pronunciation was fixed for about 800 words, and all the rest grouped themselves naturally around these. It is believed that in the course of time this will be the accepted tongue of China, except in the far isolated districts. Then in the fall of 1918 a special congress of representatives of all the provinces, called by the National Ministry of Education, officially adopted Chi Yin Tzu-Mu as the written language of China. A government decree to this effect, Order No. 75, was promulgated November 23, 1918.

"The method taken to spread the language was to teach it first in the government normal schools, then in the lower normal schools, and finally on down through the grades to the primary schools. Progress was very rapid. In the Province of Shansi the Governor appointed lecturers to go into even remote towns. Where he found the old conservatives hampering him he forced the merchants to attend the classes under threat of dire punishment. . . . One thing more the new writing has done—it has given China the typewriter. Chinese merchants indeed used a kind of typewriter for the old ideographs, but it had 8,000 characters, and its only function was to make carbon copies of letters of importance. Now several American typewriter companies are putting Chinese typewriters on the market and preparing to push them vigorously."—H. C. Reynolds (*Asia*, November, 1919, pp. 1143-1147).

1919.—Shantung controversy.—“In the absence of any recent formal declaration by the Japanese Government as to its intentions concerning Kiaochou and Shantung, one is forced to quote such statements as have been made since the opening of the war. In presenting an ultimatum to Germany on August 15, 1914, Japan made two demands, the second of which was:

“To deliver on a date not later than September 15 to the Imperial Japanese authorities, without condition or compensation, the entire leased territory of Kiaochou, with a view to the eventual restoration of the same to China.” . . .

“The clear, unmistakable meaning of the ultimatum is that Japan intended to restore eventually to China ‘the entire leased territory of Kiaochou,’ and yet when the ultimatum to China was presented, in May of the following year, it carried with it a forced consent to an exchange of notes ‘respecting the restoration of the leased territory of Kiaochou Bay,’ which materially changed for Japan’s benefit the original plain declaration. The notes which were finally exchanged, May 25, 1915, were as follows: When, after the termination of the present war, the leased territory of Kiaochou Bay is completely left to the free disposal of Japan, the Japanese Government will restore the said leased territory to China under the following conditions: (1) The whole of Kiaochou Bay to be opened as a commercial port. (2) A concession under the exclusive jurisdiction of Japan to be established at a place designated by the Japanese Government. (3) If the foreign Powers desire it, an international concession may be established. (4) As regards the disposal to be made of the buildings and properties of Germany and the conditions and procedure relating thereto, the Japanese Government and the Chinese Government shall arrange the matter by mutual agreement before the restoration.’ . . .

“China’s position in Shantung has been rendered most embarrassing and difficult by two experiences which seem to have been caused by the unnecessary aggressiveness of Japan in attaining her purpose of destroying German influence in the Far East. The first of these was in the landing of Japanese troops in 1914 at Lungkow instead of some place near Kiaochou or even within the Kiaochou zone. Lungkow is approximately 200 miles from Tsingtao, where the German fortifications were located. The Chinese Government, which could easily have sent troops to capture Kiaochou, if she had been allowed to undertake the job, desired to have it done with the least possible disturbance to the people of Shantung province and naturally objected to the Japanese proposal to land troops at such a distance from their goal. . . . The second grievance occurred in October, 1917, when the Japanese Government issued an official statement that the military administration of Tsingtao had been abolished and that a civil administration had been established in its place. It was said that this was designed to improve the administration of the territory in general and also of the railways and mines, as well as to promote the welfare of the inhabitants by bringing about more friendly relations with them. This establishment of civil government over the whole length of the railway was such a gross infraction of the sovereign rights of China that the Chinese Government promptly protested against it, but it has never been formally abolished. The whole problem of ousting Germany from Kiaochou

could have been such a simple one that its present complexity can only be accounted for on the supposition that it has been deliberately brought about. In 1914 Japan could have sought the co-operation of China in capturing Kiaochou and could then have earned the eternal gratitude of the Chinese people by promptly withdrawing and allowing China to re-establish her government. This would have placed Japan in a position even more enviable than that now occupied by the United States on account of the remission of a portion of the Boxer indemnity. Instead of having followed this straight and narrow path, which would have led to an honorable record for herself and have earned the hearty good-will of the Chinese people, she chose the tortuous road of compromising statements and conflicting actions, with the only goal in sight at present of an increasing hatred on the part of China and a widening suspicion of her motives by her allies.” —J. C. Ferguson, *Pan-Nipponism (Asia, Sept., 1919, pp. 892, 893)*.—See also U. S. A.: 1919-1921; VERSAILLES, TREATY OF: Part IV.: Section VIII.

1919.—Consortium agreement.—“A consortium or joint loan agreement for financing Chinese loans was effected at Paris, May 12, by American, French, British, and Japanese bankers. A reservation was made for later participation by Belgian bankers. Thomas W. Lamont of the United States (a member of J. P. Morgan & Co.) presided at the meeting. Others who attended were Sir Charles S. Addis of Great Britain, M. Simon of France, and Mr. Adagiri of Japan. The general agreement provided that, at the suggestion of the United States and with the sanction of the French, British, and Japanese governments, the banking groups will combine their interests to make joint financial administrative, and industrial loans to the Chinese Government.”—*New York Times Current History, June, 1919, p. 427*.

1919-1920. — Anti-Japanese boycott. — Fuchow incident.—Continued civil strife.—Changes in government.—Completion of consortium arrangement.—Peace with Germany proclaimed.—“In spite of the many utterances of Japanese publicists and statesmen, insisting that it was Japan’s irrevocable intention to restore Shantung in full sovereignty to China, intense resentment over the Shantung provisions of the Peace Treaty continued to find expression throughout the year. On September 14 Dr. Paul S. Reinsch tendered his resignation as United States Minister to China because of his opposition to the Shantung Settlement. Upon his return to the United States on October 9 he stated that the Chinese boycott of all things Japanese was being so efficiently maintained that Japanese interests were sustaining enormous losses. Evidence of this was indicated by the serious decline in the trade of Japanese steamship companies, which fell from 154 tons per trip in 1918 to an average of barely 71 tons per trip in 1919. The Japanese brought strong pressure to bear on the Peking government in an

effort to end the boycott, but it still (July 1, 1920) continues, threats and persuasions notwithstanding. A grave crisis was narrowly averted as a result of disorders at Fuchow on November 16 [1919], when a number of Chinese were killed or wounded by Japanese residents. In consequence the Chinese government on December 1 demanded that the Japanese consul at Fuchow be removed; that Japan pay an indemnity for all Chinese lives lost as a result of these attacks, as well as the cost of all medical expenses incurred by the wounded Chinese; that adequate punishment be meted out to the Japanese ringleaders; and that the Japanese consul at Fuchow apologize to the Chinese authorities of that city. Throughout China anti-Japanese feeling ran high, and it was intensified by the arrival of four Japanese warships at Fuchow. The situation, although relieved by a Japanese announcement on December 31 to the effect that the war vessels would be withdrawn, was not materially improved, as neither the boycott nor the Chinese attitude of hostility suffered any visible change. Relations were not improved by the refusal of China to open negotiations regarding territory ceded under the treaty. The disunity and disorganization resulting from inter-party strife and civil war between the two most important sections of the country have continued to prevail, and efforts toward reconciliation, although not infrequent, have thus far failed. In October the chieftains of Outer Mongolia announced their intention of cancelling the autonomy which Russia had induced them to proclaim in 1912; their request of November for reunion with China was granted.—Early in January [1920] the organization of a new cabinet under General Chin Yun-Peng, formerly acting President, was thought to mark the end of the bitter strife between the political groups in Peking as well as to open the way for the conclusion of civil war. In this cabinet General Chin Yun-Peng became Prime Minister and Minister of War; associated with him were Lu Tseng-Shiang, Foreign Affairs; T'ien Wen Lioh, Interior, Commerce and Agriculture; Li Hsu-Ho, Finance; Admiral Sah Cheng-Ping, Navy; Chu Slien, Justice; Tseng Yuchun, Communications. This government was constantly hampered by the Anfu or Conservatives, who favored opening negotiations with Japan. On February 19 the Minister of Foreign Affairs and Cheng-Lu, Vice-Foreign Minister, were forced out of office for opposing such negotiations; ten days later the Prime Minister resigned for the same reason, but subsequently reconsidered his resignation after a compromise agreement had been reached. Early in May, however, he again resigned, being succeeded by Admiral Sah Cheng-Ping.—It was officially announced on March 21 that the Chinese government had received expressions of goodwill from Soviet Russia. A proffer of peace has also been made, based on the renunciation of Russia's share of the Boxer indemnity, and on the transference to China of the right to control the Chinese Eastern Railway.—The details of the consortium agreement for financing China have finally been arranged. All loans by banking groups of the United States must have the approval of the State Department, and the same procedure is to be followed in other countries. Japan will have the right to object to loans for any project which in her opinion will jeopardize her national life or vitally affect her sovereignty.—Although China has steadfastly refused to sign the Treaty of Versailles, the Parliament on August 8 authorized the President to issue a mandate declaring an

end to the state of war with Germany. Ratification of the Treaty of St. Germain, entitling China to participation in the League of Nations, occurred on June 21.—*Political Science Quarterly* (Supplement, Sept., 1920, pp. 142-143).

1920.—Leading parties and personalities in the Civil War.—Anfu army under Tuan Chi-jui defeated by General Wu.—“Nominally, the war is a civil war between north and south. Really, one does not know what it is. [Some authorities consider it a war between reactionary militarists and progressive nationalists.] Instead of two parties facing each other, there are actually four factions checkmating each other in a fashion that reminds us strongly of Machiavelli. The four factions are: The Anfu Club, the Chih-li group, the Kuo-ming-ton and the Kwei group. Why did the north split into the Anfu and Chih-li groups? In the matter of political principle, there are two differences between them: the Anfu Club pursues a pro-Japanese policy and desires to suppress the South by force of arms—two things which the Chih-li group cannot accept. How sincere the two factions are in their belief of these principles one should not judge too off-handedly; one does know that personal motives have contributed largely to the split of the North. The Anfu Club is composed mostly of men from the province of Anhwei, with General Tuan as their leader. When President Yuan Shih-kai died, the leadership of the North fell to General Tuan. It is said that he favored Anhwei men in his appointments, a partiality greatly resented by the Chih-li men, who had also served valiantly under President Yuan. Among the Chih-li men was President Feng Kuo-chang, who became naturally their leader. President Feng and Premier Tuan intrigued against each other in all possible ways. When Premier Tuan ordered troops to fight the South, the three provinces of Kiangsu, Kiangsi and Hupeh, all occupying strategic positions along the Yangtze and controlled by the President's followers, not only would not help, but even made their neutrality friendly to the South. But the two factions never came to an open fight till July of this year [1920], under President Hsu Shih-chang. President Hsu has never openly identified himself with any faction. He is, however, in favor of peace with the South, and is opposed in that by the Anfu Club. He has favored Chih-li men in both Cabinet and Tuchun [military governor] appointments. The recent fighting around Peking illustrates clearly how the two factions intrigue against each other. Next to General Tuan in control of the Anfu Club is General Hsu Shu-tseng, commonly called 'little Hsu.' He was the Commissioner in Mongolia, and had under his command an enormous army. To the east of his post is Manchuria, controlled by General Chang Tso-lin, a Chih-li man, and to the south is the province of Chih-li, controlled by Tsao Kun, also a Chih-li man. These two men had three grievances against Anfu: They alleged that 'little Hsu' wanted to replace them, thus bringing the solid North under Anfu; they also charged that the Minister of Finance, an Anfu man, supplied funds to Anfu troops regularly, but not to their (Chih-li) troops; furthermore, they said that the resignation of Premier Ching Yun-pen was caused by the pressure of Anfu. President Hsu dismissed 'little Hsu' from his post in Mongolia; 'little Hsu' openly defied Presidential orders. Chang Tso-lin and Tsao Kun embraced the cause of the President and started to punish 'little Hsu.' General Tuan took up the cause of 'little Hsu' and was badly beaten [by Gen. Wu Pei-fu,

the military governor of South Central China]. . . . The dissension among leaders of the South is still more disappointing. Here, as in the North, personal motives count for a great deal. The southern government originally consisted of a part of the old Parliament and of an administration directorate of seven men, including Sun Yat-sen, Wu Ting-fang, Tang Shao-yi, Chen Chun-hsien and Lu Yuan-ting.

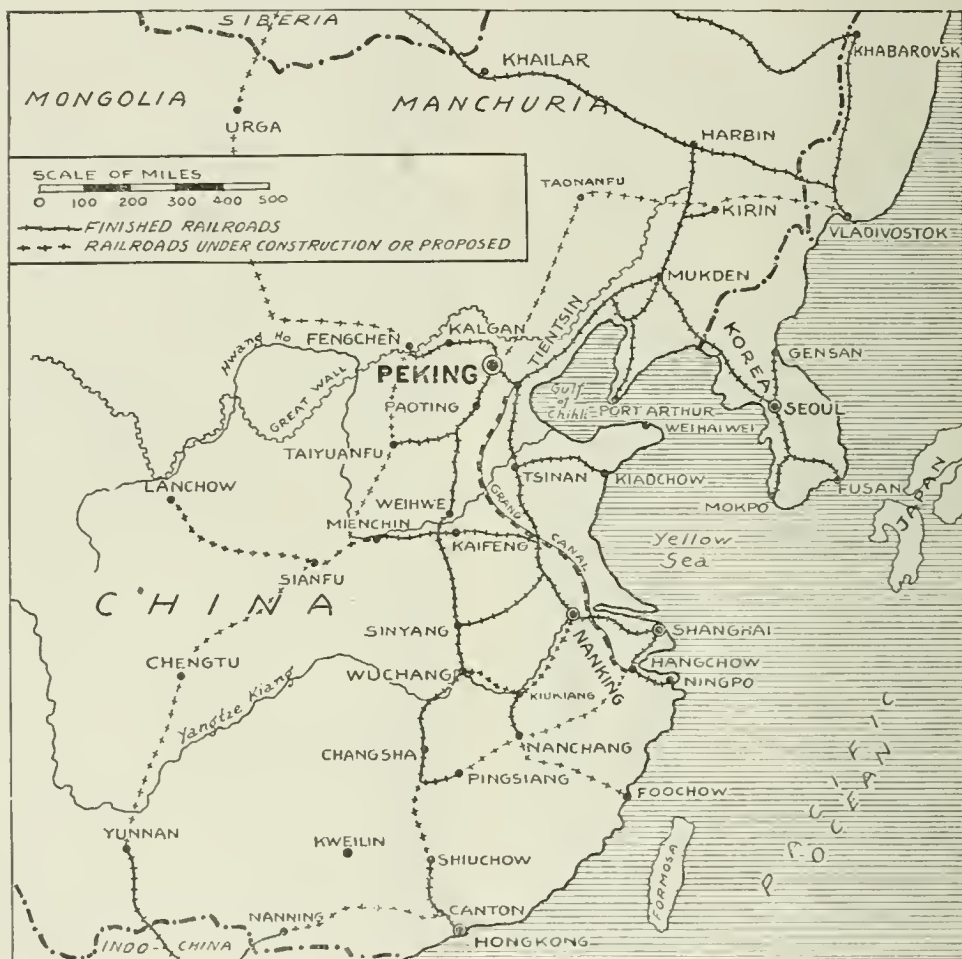

"In Government the four groups are more or less cohesive. Each province with its Tuchun is quite independent of the others. Between the groups the relation is not definite. There are constant public telegraphic consultations of one with the other. Nominally, they are at war with each other, actually they guard their own borders and fight only rarely. Besides the Tuchun or military governor, each province has a civil governor, who is overshadowed in many places by his military colleague and a provincial assembly. Each province attends to its own education and has its own troops. The Central Government at Peking is the only one recognized by foreign nations. It has a President, a Cabinet, a Parliament of two Houses and a Supreme Court. Although it will be long before these various organs will function properly, each in its own defined sphere, the general framework of government will stay. The Supreme Court has done good work. Chief Justice Yao Tseng has compiled a volume of decisions rendered by the court, which will serve as law in future cases. A Law Codification Commission has been at work systematizing the laws of the land. Thus the country is gradually emerging from custom law into positive written law. Prison reform is also being pushed [see PRISON REFORM: China], with a number of model prisons scattered over the country."—*New York Times Current History*, Sept., 1920, pp. 994-996.

1920.—Development of journalism.—"That journalism in China has taken remarkable strides forward in recent years goes without saying, notwithstanding that it was in the days of the Ming dynasty when the first newspaper—the *Kung Men Chao* or *The Imperial Court Gazette*, of Peking—was published in the Middle Kingdom. But it is interesting to note the various phases of such progress. We will not attempt to estimate the number of newspapers in actual existence throughout the Republic, since it is never easy to get at precise figures, but it is surprising that more and more foreign newspapers are also entering this interesting field to enlighten Chinese public opinion. For example, many so-called native papers are really Japanese owned, yet their 'we Chinese' and 'our country' are meant to lead the unwary astray. In addition the same nationals are also starting professedly Japanese organs in the English language in Peking, Tientsin, etc., so that Dai Nippon's aims and policies *vis-à-vis* the Chinese may not be misunderstood by Americans and Europeans. Finally there is also the interesting fact that not a few foreign dailies have begun to publish Chinese editions, notably the *Peking and Tientsin Times* and *Le Journal de Peking*. Until democracy as it is definitely understood in the West, is fairly enthroned in this country, it seems that the phenomenon of what the Chinese call 'political-parties-subsidized' papers will always exist, especially as the art of advertising is still an almost unknown aid to Chinese merchants. Even then within such circumscribed limits the enterprising among the Chinese journalists are endeavoring to live up to the ideals and traditions of their noble profession. Consequently, apart from taking sides where they are expected or constrained to do so,

these editors have a considerable field to explore in the way of enlightening public opinion. And this is especially true of their non-political news pages—the literary sheets—with the result that not only serial stories are regularly appearing but translations from foreign fiction—e.g., Carpenter's 'Love's Coming of Age'—are also becoming increasingly popular. A decade ago a favourite 'stunt' with the native newspapers in Shanghai—that holiest of holies of extra-territoriality—was to heap coals of satire and ridicule upon the heads of Chinese officialdom. . . . Nevertheless, patriotic Chinese will yet for many a long day have to do incessant spade work to cleanse the Augean stable of official corruption in this country. And until the hearts of Chinese officials are purged of all forms of uncleanness, it may be doubted if Democracy can be really enthroned on the pedestal of China's body politics. . . . But the predominant note which is being struck in the majority of Chinese journals is one of reconstruction. . . . The most effective method for this purpose is to bestir the wealth-producing elements and assist them in all possible directions. Those who can read the ordinary newspapers do not need much persuasion in this matter, and already they have done more than their level share to make themselves as well as their country prosperous. But the vast majority who are unable to wade through the journals written in classical Chinese style deserve all possible encouragement. . . . According to its advocates, notably Prof. Dr. Suh Hu, of the Peking Government University, the *pai hua* (plain language or vulgate Chinese) should be the new language for this country, because it is the spoken language and most truly represents the life and needs of the people. The old classical 'literary language' is dead, and no longer a sufficient medium for creative literary productions: 'Only a living language is fit for the production of a living literature.' What is most important, the old *wen-li* style is accessible only to the educated classes, whereas the new movement aims to open the literary riches of the world, etc., to the greatest number of people. . . . Hence more and more papers are being published in the *pai-hua* style. There are several scientific and philosophical works now published in the spoken language. Editors of several newspapers, such as the *Kuo Min K'un Pao* of Peking, and the *Shih Shih Hsin Pao*, of Shanghai, are now writing their editorials in it. Other periodicals, notably the *Weekly Review* of Peking, and the *Renaissance*, a new monthly edited by the students of the Peking Government University, are publishing vulgate articles and verses in their columns. Last but not least, Mr. Liang Chi-chao, whose writings have greatly influenced the Chinese for almost twenty years, is now writing his Sunday law-sermons in the spoken language. Notwithstanding the opposition of the classical or literary school, it seems that the *pai-hua* has come to stay. Hence many native newspapers have also their extra *pai-hua sheets*, either distinct from the main issues or complementary to them, exclusively for the less educated classes. . . . A recent number of 'Emancipation and Reconstruction' thus includes the following among its bill of fare:—woman suffrage, co-education, the fight for woman's economic independence, the abolition of prostitution and concubinage, etc. Feminists in China may or may not be sanguine over their rosy expectations, but there is no denying the fact that the movement in favor of woman's emancipation has more than begun. . . . [See WOMAN'S RIGHTS: 1900-1921.] The *Shun Pao*,

established in 1872, or during the reign of Tung-Chi of the Ching Dynasty, is the oldest newspaper in China. Its head office is a modern five-storied concrete building, built by the American Trading Company, at 24 Hankow Road, Shanghai. There are more than a hundred rooms in the building, certain of which are divided into three departments—business, editorial and printing. There is also a library, photo-engraving rooms, artists' quarters, and a staff club. The printing machinery is of the latest American type. Forty-eight pages can be printed at a time and 48,000 copies of 12 pages can be printed, folded, deliv-

Railway, of 2 ft. 6 in. gauge, which was built by foreign enterprise and was formally opened on June 30, 1876. It was subsequently 'redeemed' by the Chinese, and when the last instalment of the purchase money was paid in October, 1877, the rails were torn up and shipped to Formosa. Ten years later, however, a railway was in operation between Tongshan and Tientsin—the nucleus of the present Peking-Mukden Railway—and in 1897 the section from Peking to Tientsin was opened. China now possesses 6,835 miles of railway, with 2,000 miles more 'under construction.' An Imperial Edict of May 9, 1911, ordered that all trunk

RAILROAD LINES IN CHINA

ered and counted in an hour. . . . The library contains a complete set of old *Shun Pao* publications covering a period of 47 years. Owing to the old establishment of the paper it has a wide circulation which extends to every city in the interior of China, the South Sea Islands, Annam, Korea, Europe and America."—*Far Eastern Review*, March, 1920, pp. 201-203.

1920.—Missions committee on phonetic script. See MISSIONS, CHRISTIAN: China.

1920.—Exclusion of Chinese immigrants from Canada. See IMMIGRATION AND EMIGRATION: Canada: 1920.

1920.—Growth of the railway system.—"China's railway history began with the Woosung

lines, under construction or projected, were to be taken over by the Government, while branch railways were 'to be allowed to be undertaken by the people according to their ability.' This order, which contributed to the unrest that came to a head in the Revolution in October, 1911, had special reference to the Szechuan-Hupeh Railway and the Canton-Hankow Railway. Under the Republic steps have been taken to nationalize railway expansion in China. The movement for keeping railways in the hands of the provinces through which they ran has given place to an appreciation of the advantages of a national system. The present resources of China are not equal to providing the country with the network of railways

it requires; but the Government is able to build a certain number of lines and to arrange for the construction of others on terms that do not clash with China's sovereign rights, and are satisfactory to those who contribute the capital. Something in the nature of a railway programme has been agreed upon, and will be carried out as occasion and funds offer. At the same time a distinct effort has been made to unify railway accounts and statistics. A commission for this purpose was appointed in 1913, under the presidency of Yeh Kung-ch'ò and C. C. Wang, and the services of Dr. Henry C. Adams, of the United States Interstate Commerce Commission, as adviser were secured. As a result of its labours the various railway systems of whatever nationality have adopted a uniform system of accounts, and statistics of Government Railways in China for the two half-years in 1915 have been issued."—*China Year Book*, 1919-1920, p. 214.—See also RAILROADS: 1876-1921.

1920.—Failure of the victorious generals to unite China.—Signs of impending conflict between Chang Tso-lin and President Hsu.—“When, by force of arms, Tuan Chi-jui, Little Hsü, and other leaders of the so-called ‘Militarist’ faction had been driven from power, it was hoped that the victorious general, Wu Pei-fu, with Chang Tso-lin to support him, would be able to carry through his plan of convening a Citizens’ Convention, and thus put an end to the strife of rival Parliaments. Hopes were forcibly expressed by Young China’s organs at Shanghai and in the South that the downfall of Tuan’s party meant the end of Japanese ascendancy and a prospect of popular government in a united country. But what are the actual results of the struggle? No sooner had the Chihli party, headed by the President and the Tuchuns Chang Tso-lin and Tsao Kun, defeated their opponents, than new symptoms of strife became manifest in the camp of the victors. Some of them (notably the President) began to display unmistakable signs of sympathy for the defeated Anfu leaders who had sought refuge and protection as guests of the Japanese Minister. Tuan Chi-jui, allowed to retire, with the honours and profits of war, is living as a prosperous citizen in close proximity to the Presidential mansion. Little Hsü, for whose arrest a large reward was originally offered, has been allowed to escape from the Japanese Legation and is believed to have returned to his former stamping-grounds in Mongolia. The ‘two traitors,’ Tsao Ju-lin and Lu Tsung-ju, removed from office in disgrace as the result of the students’ violent agitation two years ago because of their financial dealings with Japan, are now [written in 1921] the President’s honoured guests and confidential advisers. General Wu Pei-fu has been relegated to the background by common consent of the scheming politicians, and with him the National Convention idea has been quietly shelved. . . . Hardly had they made an end of congratulations and rejoicings over the defeat of the Anfu faction, than Chang Tso-lin and Tsao Kun began insisting on their respective claims to any money that might be forthcoming, for payment of the expenses of their week’s campaign (the combined total of these claims, as stated by the native press, amounting to some \$40,000,000). At the same time, they began to compete with each other to secure the disbanded troops of the two Frontier Defence Corps, while the President, on his side, proceeded to strengthen his own hand by recruiting two new brigades of troops through his representative, Wang Huai-ching. So, while the shadow

of famine spread darkly over the Northern provinces, these leaders of the people continued to squander the public substance and to show new seeds of civil strife.”—J. O. P. Bland, *China, Japan and Korea*, pp. 107-109.

1920.—Severe famine.—Relief from the United States.—Famines in China are frequent and devastating. From earliest days the inhabitants of whole provinces have been decimated by this dread spectre, but due to the unusual density of its population the nation recovers and thrives. Among the various causes that operate to bring about these famines are the periodic floods, the dependence of the country on agriculture and the poor transportation system. The Hwang-ho and Yangtze-Kiang are extremely difficult to control (see above, Geography of China proper), and draining as they do vast territories, thickly peopled, they spread death and ruin when they burst their banks. Although it is most often the rivers that are responsible for famines, droughts and scales not infrequently destroy the crops, and since the Chinese are primarily a grain-eating race and fundamentally dependent on agriculture, the results are disastrous. To make matters worse, China has lacked an adequate transportation system and in times of dire want food cannot be carried in any quantity from one province where it is plentiful to another which is starving. Among the most terrible famines of recent years are those in 1878, 1888, 1906 and 1920. China, continually in difficulties with Japan, torn by civil war, burdened with debts and beset with difficulties from every side, is compelled, in addition, to face a national catastrophe in the terrible conditions of famine prevailing in four of its richest provinces. The South of Chihli, the whole of Honan north of the Yellow River, and the western part of Shantung, an area the population of which is normally from 30,000,000 to 40,000,000 people, were for many months without rain, with the result of an almost total failure of crops. By October thousands on thousands were reported to be dying of starvation; people were living on leaves and bark; desperate families were selling or drowning their children; famine refugees were trekking over the naked roads to points of relief. The stories told by eyewitnesses were pitiful in the extreme. Both the Peking Government and the foreign legations took active measures to relieve the famine sufferers. The Chinese Ministries of Finance, Agriculture and Interior appointed a commission to dispense a fund of \$1,000,000 to be raised by means of a short-term loan. Another fund of \$1,800,000 was undertaken by seven of the southern provinces at the instigation of Tang Shao-li, the Constitutionalist leader. Among other relief organizations was a committee created by the American Minister, Charles R. Crane. But, despite all efforts, Famine, the Third Horseman of the Apocalypse, pursued its inexorable course.”—*Famine and strife in China (New York Times Current History, December, 1920, pp. 458, 459.)*

1920 (December).—Plans for new government by Constitutionalist party.—Continued quarrel of the Tuchuns.—Chang Tso-lin’s ascendancy.—The military government which had been set up in 1918 at Canton by Sun Yat-sen’s party, disintegrated during 1920 and the southern provinces drifted apart from each other. Before the close of the year, however, plans were being made for a new “constitutionalist” government. “Peking, Dec. 24.—Sun Yat-sen, Dr. Wu Ting-fang, Tang Shao-yi and others, leaders of what is called the ‘Constitutionalist’ faction, until recently entrenched in Shanghai, have gone to Canton and are busy

with the organization of a new government to supersede or rejuvenate the defunct 'Canton Military government.' They propose, it is understood here, to call theirs an 'extraordinary' government, and its purpose is to call an 'extraordinary' parliament and elect an 'extraordinary' President in the person of Sun Yat-sen. After union with the north has been effected they propose to drop the term 'extraordinary' and become the government for all of China. Dr. Sun is said to have issued a call to each of the ninety-six districts in the Province of Kwantung to contribute \$30,000, to be employed in the organization of the new government and in the training of troops, including 30,000 for a special bodyguard. He is further alleged to have in mind a union of the southern and southwestern provinces into a 'constitution preserving league,' with the object of presenting a united front against the north. In the opinion of observers in Peking, however, this effort in the south is eclipsed by interest in the alleged three-cornered fight for domination between General Chang Tso-lin, in Mukden; General Tsao Kun, in Paotingfu, and the President in Peking. A great deal of jockeying has been going on between the two military factors, and it is even alleged that the Urga rebellion has been staged by Chang Tso-lin in order to furnish an excuse to send some of Tso Kun's troops there and thus weaken his position. The latter, though, seemingly is alive to the strategy in question, and has refused to send troops, arguing that it is General Chang's territory and the responsibility is his. There are persistent rumors, which are as persistently denied in official quarters, that a Cabinet reorganization is pending and that the next Cabinet will be more subservient to Chang Tso-lin.—*New York Tribune*, Jan. 23, 1921.

1921.—China and Monroe Doctrine in League of Nations Covenant.—On April 5 the Chinese government submitted an amendment to Article 21 of the League Covenant to the Amendment Committee of the League of Nations at Geneva. Article 21 of the Covenant reads:—"Nothing in this covenant shall be deemed to affect the validity of international agreements, such as treaties of arbitration or regional understandings like the Monroe Doctrine, for securing the maintenance of peace." The amendment proposed by China read:—"The Monroe Doctrine is recognized as not incompatible with any disposition of the present compact."

1921 (July).—Chino-German agreement.—"The general agreement between China and Germany which became effective on the first of the present month [July, 1921], must in many ways be regarded as a signal triumph for German diplomacy. It is true that, superficially viewed, the agreement amounts to no more than a full restoration, with certain necessary changes, of the status quo ante bellum. But when the nature of Germany's relations with China, especially in the matter of trade, before the war are understood, the significance of the present agreement is at once appreciated. Germany has evidently laid herself out to treat China with marked liberality. The attitude of a grudging, not to say truculent, submission to a force majeure, so evident in her dealings with the other Allies, is entirely absent in the case of

China. Germany shows herself all eagerness to repair wrongs, to meet expenditures, and to offer reparation on a liberal scale. Thus, in a note accompanying the agreement from the German representative to the Chinese Minister of Foreign Affairs, it is declared that, in addition to indemnifying China according to the terms set forth in the treaty of Versailles, Germany is also willing to refund to the Chinese authorities the internment expenses of German militarists in China. As to the war indemnity, this note declares that Germany agrees to pay in advance a portion thereof in a lump sum, equal to one-half of the proceeds from the liquidated German property and a half of the values of the sequestered, but not yet liquidated, German property. This lump sum will be paid, as to \$4,000,000, in cash, and as to the balance in Tsin-Pu and Hu-Kwang railway bonds. In return for these and other undertakings, China agrees that, immediately on ratification, China's Trading with the Enemy Act will cease to be effective, and all German trade-marks which had been recognized at the custom house will recover their validity, if again registered by the owner; that Germany may appoint her consuls and consular agents in China as before the rupture of diplomatic relations; and that, whilst China shall enjoy, as regards Germany, complete fiscal autonomy, she agrees that the German trader shall never be called upon to pay 'any imposts, taxes or contributions' higher than those paid by the Chinese themselves. The agreement is at all points entirely reciprocal, but, in view of the fact that the Chinese trader in Germany is quite a negligible quantity, whilst the German trader in China, in the days before the war, was the most important foreign trader in China, the exact value of this reciprocity is apparent. The fact is that the outbreak of the war, in 1914, interrupted in China one of the most astounding pieces of trade exploitation which Germany had ever undertaken. Germany was engaged in a tremendous effort to monopolize the Chinese market, and to this end nothing was spared. German subsidized goods literally flooded China, and the German merchant, by a persistent policy of underselling, was fast ousting all competitors and making giant strides toward securing the monopoly aimed at."—*Christian Science Monitor*, July 19, 1921.

1921-1922.—Position of the Tuchuns.—President Hsu forced by General Chang to accept a dictated cabinet.—Premier Liang Shi-yi forced to resign by General Wu.—"North and South, not to mention East and West, are still at war [1921], in the sense that five super-Tuchuns and seventeen lesser satraps maintain armed forces in the field, and even more on paper. But these forces are not seriously engaged in any systematic warfare for the assertion of clearly-defined political principles. The only real warfare now waged is the same old struggle for place and patronage and pelf which has gone on, grim and silent, for centuries around and about the seats of the mighty in Peking. Moreover, there is no longer any serious pretence of vital difference between North and South. . . . And the real question in China to-day is, how to limit the power and rapacity of these Tuchuns, how to bring under the authority of the Central Government those who, during the past six years, have had time not only to taste the sweets of independent power, but to perfect, each in his own province, the machinery of self-determination."—J. O. P. Bland, *China, Japan and Korea*, pp. 90-91.—After his victories at the close of 1920 "it was Chang who assumed the right to occupy Peking and to reform the Gov-

ernment. Chang, furthermore, won for himself the appointment of Inspector General of the three Manchurian provinces—Feng-tien, Kirin and Heilung-kiang. . . . Wu began a period of watchful waiting, to see what Chang would accomplish toward the calling of a new national convention to establish a Government on a democratic basis, and toward the ousting of Japanese influence at Peking. . . . He [Wu] was sent by the Peking Government to suppress a revolt in Hunan, engineered, it was said, by Canton. The Canton faction accuses him of ruthless cruelty and atrocity in quelling this uprising. However this may be, Wu clung to his rôle of super-patriot. After witnessing various attempts of Chang Tso-lin to reform the Peking régime, he came out in open opposition to Chang last December [1921], when the Mukden dictator went to the capital and forced President Hsu to accept a dictated Cabinet, headed by one Liang Shi-yi. It may safely be said that all China was indignant at the elevation to office of this notorious personage, who had worked hand in glove with Yuan Shih-kai in his attempts to make himself Emperor, and who had, incidentally, amassed a fortune. . . . Wu immediately assumed a threatening attitude. . . . Liang, in view of the public outcry against him, and terrorized by General Wu's threats, reluctantly retired to Tientsin, ostensibly on 'sick leave.' . . . Tsu Chu-chi took his place as acting Premier, with Dr. Yen as Foreign Minister. . . . Wu's action in ousting Liang, the puppet of Chang Tso-lin, was, of course, a direct challenge to the Manchurian dictator."—*New York Times Current History*, June, 1922, pp. 397-398.

1921-1922.—Invited to attend conference on limitation of armaments.—Progress at conference. See WASHINGTON CONFERENCE; U. S. A.: 1921 (July-August).

1922 (April-May).—Civil war between Generals Chang Tso-lin and Wu Pei-fu.—General Wu victorious.—"General Chang Tso-lin began dispatching troop trains southward from Mukden about the middle of April. Some 70,000 of his soldiers poured in through the Great Wall and were garrisoned in the vicinity of Peking. General Wu was mustering his army, estimated at 80,000 men, in Shantung and other points. Chang's troops occupied all the railroads leading from Tientsin, and established camps within eleven miles east, north and south of the foreign concessions. President Hsu had issued a general appeal for conciliation, and had sent a special plea to the Mukden war lord to avoid civil war, but Chang had refused to listen. . . . Wu's position was strengthened by the departure of General Tsao-kun, Military Governor of Chih-li, thus leaving Wu free to enter this province, and relieving Tsao-kun of responsibility. All southbound trains had been held up by Wu's forces. The situation became tense as the opposing armies drew closer. General Chang's troops took possession of Peking and Tientsin on April 21, replacing the local police force. The Peking-Pukow railway had been cut by Chang's men south of Tientsin. . . . The first active step of hostility occurred on April 23, when the Tientsin-Pukow railway was torn up at Machang by the Wu Pei-fu forces. Peking was isolated. . . . Tsu Chu-chi, the Acting Premier, telegraphed to the civil and military Governors of all the provinces saying that the existence of the republic was threatened, and asking each province to send a commissioner to Peking to devise means to rid China of her private armies, which had grown to such an extent that they made any Cen-

tral Government impossible. Undeterred by these appeals, Chang and Wu went on strengthening their positions in Chih-li. . . . Preliminary skirmishes occurred on April 26. The battle for supremacy between the two powerful Tuchuns began in earnest on Thursday evening, April 27. . . . An attack by the Wu forces on Machang, however, developed into a fiercely contested battle. . . . On Saturday morning, April 29, heavy fighting began at Changtsin-tien, only twelve miles southwest of Peking. The great guns on both sides were distinctly heard in Peking, which had closed its gates. Only the day before the foreign legations had sent a warning to the Peking Government that the fighting must not be extended to the capital, and intimated that serious consequences would follow

GENERAL WU PEI-FU

tral Government impossible. Undeterred by these appeals, Chang and Wu went on strengthening their positions in Chih-li. . . . Preliminary skirmishes occurred on April 26. The battle for supremacy between the two powerful Tuchuns began in earnest on Thursday evening, April 27. . . . An attack by the Wu forces on Machang, however, developed into a fiercely contested battle. . . . On Saturday morning, April 29, heavy fighting began at Changtsin-tien, only twelve miles southwest of Peking. The great guns on both sides were distinctly heard in Peking, which had closed its gates. Only the day before the foreign legations had sent a warning to the Peking Government that the fighting must not be extended to the capital, and intimated that serious consequences would follow

the bombardment of the city and the damaging of foreign property or the killing of any of their nationals. By April 30 the war front extended from Machang, on the Pukow Railroad, westward to Paoting-fu, on the Peking-Hankow Railroad, thence north to Changtsin-tien. The fighting at Changtsin-tien centred about the Marco Polo Bridge. Many people owning Summer homes on the hills outside Peking could follow the progress of the fighting at this point. Legation guards had been reinforced, and all foreigners were displaying their national flags. Thousands of Chinese in the outlying district came into the city, bearing all their money, valuables, and household goods. Wounded were brought in from the front the same day. Two warships of the Chinese Navy joined Wu, with whom they declared their sympathies, and were proceeding from Chefu to Shanhai-kwan with the purpose of shelling and destroying the Mukden Railway, thus cutting Chang's rear. The fighting continued unabated through Sunday at Changtsin-tien. By May 1 the tide of battle

was rolling ever nearer Peking. Hundreds had been killed upon each side. It became known that the fighting at Changtsin-tien was being conducted by General Feng Yu-Hsiang, the 'Christian General,' who was showing brilliant strategy. Already it was becoming evident that Wu's star was in the ascendant. The cannonading ceased on the morning of May 2. The bodies of 2,000 fallen soldiers lay on the battlefield. New battles south of the city had begun. Wu was bringing up heavy reinforcements. He took personal command at Machang on May 3. On May 4 it was definitely stated that Chang had suffered heavy reverses on all fronts, and his troops were driven headlong out of Changtsin-tien. Many of them boarded trains and sped to Fengtai, where they vainly strove to make a stand. . . . On May 5 Wu's victory was recognized by Peking. Chang's guard was disarmed inside the capital. Wu's control was recognized by President Hsu. The President on May 6 issued orders dismissing Chang as Inspector General of Manchuria, and calling for the arrest of Premier Liang, the Finance Minister and the Minister of Communications. General Wu was making no attempt to enter the capital and announced that his plans for reorganizing the Government had not changed. He intimated that the President would temporarily remain in office. . . . Wu still faced a danger of Chang's recovery, and also the possibility of an attack by Dr. Sun Yat-sen, who had remained strangely inactive in the South."—*New York Times Current History*, June, 1922, pp. 398-400.

1922 (June).—Resignation of President Hsu Shih-chang.—Li Yuan-hung, next president.—Convening of 1917 parliament.—"President Hsu Shih-chang tendered his resignation at an extraordinary session of the Cabinet held to-day [June 2]. He was urged to withhold it until the Parliament convenes at Peking. If a vacancy occurs before a new President takes office, Acting Premier Tsu Chu-chi will act. The old republican Parliament of China, which has the backing of General Wu Pei-fu, recent victor over Chang Tso-lin, convened at Tientsin to-day for the first time since it was dissolved in 1917, and adopted a program aimed at the unification of China. The President of the Senate and the Speaker of the House issued a statement in which they said the old Parliament planned to publish a manifesto, declaring President Hsu Shih-chang deposed. They then will offer the Presidency to Li Yuan-hung, who was President from June, 1916, to July 1, 1917, and who was forced out of office by the militarists. The Parliament which is in session at Tien-tsin plans to move to Peking when its preliminary program is completed and formally assume charge as the nation's legislative body. Members of the old Parliament who are at Canton and Shanghai have been urged to proceed to Peking without delay to take part in the deliberations. It was announced to-day that during the sessions at Peking the railroad between the capital and Tien-tsin will be under guard to prevent interference from possible obstructionists. . . . The text of President Hsu's offer to resign, which was presented to the Cabinet to-day, follows: 'I am much saddened at the difficulties under which the nation has been suffering. My whole aim has been for a peaceful solution to relieve the severe sufferings of the common people. I have read with interest the plan proposed whereby Dr. Sun Yat Sen and myself should both resign and a new President be elected by Parliament. This seems fair. I sympathize with any plan to relieve the country and am prepared to relinquish my duties and position as

President as soon as a successor can be determined upon.' The text has been communicated to Dr. Sun Yat Sen, head of the South China Government, with an invitation to follow the example of President Hsu, thus removing what the authors of the proposal declared is the only obstacle to reunification of China. Additional strength for the revived Republican parliament is found in the announcement that General Chen Chiung-ming, military power of South China, who a few days ago demanded Dr. Sun's resignation, has declared his intention to support the movement launched at Tien-tsin."—*New York Times*, June 3, 1922.

CHINA, Constitution of.—The struggle of the Chinese for constitutional government was one of sudden growth in the twentieth century, and was still unsettled in 1922. The importance of this movement dominated the history of China from 1908 to 1914, when the Constitutional Compact was accepted by the forces then in control of China. Since then, revolution has followed revolution, and a separate government has been set up at Canton for South China, leaving the status of the constitution more or less undetermined.—See also CHINA: 1905-1908; 1908 (December); 1909 (October-November); 1911 (April-December); 1912; 1914.

Constitution Compact of the CHUNG HUA MIN KUO, translated by SAO-KE ALFRED SZE, transla-

tion revised by FRANK J. GOODNOW AND N. ARIGA (advisers on constitutional law to the Chinese government):

CHAPTER 1.—THE NATION

ART. 1.—The Chung Hua Min Kuo is composed of the citizens of Chung Hua.

ART. 2.—The sovereignty of the Chung Hua Min Kuo originates in the whole body of the citizens.

ART. 3.—The territory of the Chung Hua Min Kuo continues the same as that of the former Empire.

CHAPTER 2.—THE CITIZENS

ART. 4.—Citizens of the Chung Hua Min Kuo shall be equal before the law, irrespective of race, rank or religion.

ART. 5.—Citizens shall enjoy the following rights: (a) No citizen shall be arrested, imprisoned, tried or punished, except in accordance with statute. (b) The habitation of any citizen shall not be forcibly entered into or searched, except in accordance with statute. (c) Within the limits of the statutes citizens shall have the right to own and enjoy property and to trade freely. (d) Within the limits of the statutes citizens shall have the rights of freedom of speech, of writing and publication, and of assembly and association. (e) Within the limits of the statutes citizens shall have the right of secrecy of correspondence. (f) Within the limits of the statutes citizens shall have the right of freedom of abode and of changing the same. (g) Within the limits of the statutes citizens shall have the right of freedom of religious belief.

ART. 6.—In accordance with the provisions of the statutes citizens shall have the right of petitioning the Legislature.

ART. 7.—In accordance with the provisions of the statutes citizens shall have the right to institute proceedings in the Courts of Law.

ART. 8.—In accordance with the provisions of the statutes citizens shall have the right of petitioning administrative officers and of lodging complaints with the Ping Cheng Yuan.

ART. 9.—In accordance with the provisions of law and ordinance citizens shall have the right to attend the examinations for the appointment of officers and to enter the public service.

ART. 10.—In accordance with the provisions of the statutes citizens shall have the right to elect and to be elected.

ART. 11.—In accordance with the provisions of the statutes citizens are subject to the duty of paying taxes.

ART. 12.—In accordance with the provisions of the statutes citizens are subject to the duty of performing military service.

ART. 13.—The provisions made in this Chapter, that are not in conflict with the law, ordinances and discipline of the Army and Navy, shall be applicable to persons belonging to the said services.

CHAPTER 3.—THE PRESIDENT

ART. 14.—The President is the head of the Nation and combines in himself all the powers of government.

ART. 15.—The President shall represent the Chung Hua Min Kuo.

ART. 16.—The President shall be responsible to the whole Nation.

ART. 17.—The President shall convoke the Legislature and open, prorogue and close its sessions.

The President, with the concurrence of the Council of State, may dissolve the Legislature; in the case of dissolution new members must be elected and the Legislature convoked within six months from the date of dissolution.

ART. 18.—The President may initiate legislation and shall lay the estimates before the Legislature.

ART. 19.—For the promotion of public welfare, for the execution of the statutes, or in pursuance of authority granted by statute, the President may issue or cause to be issued ordinances, but no ordinance shall alter any statute.

ART. 20.—In order to maintain peace and order, or to avert extraordinary calamities, at a time of urgent necessity when the Legislature cannot be convoked, the President, with the concurrence of the Council of State, may issue emergency ordinances having the force of law; but such ordinances shall be submitted to the Legislature for ratification at the beginning of its next session.

Should the said emergency ordinances be rejected by the Legislature, they shall, thereafter, be null and void.

ART. 21.—The President shall prescribe and determine the organization of all offices and shall issue the regulations fixing the duties of officials.

The President shall appoint and dismiss civil and military officers.

ART. 22.—The President shall declare war and conclude peace.

ART. 23.—The President is the Commander-in-chief of the Army and Navy, and leads the land and sea forces of the Nation. The President shall determine the organization and the strength of the Army and Navy.

ART. 24.—The President shall receive foreign ambassadors and ministers.

ART. 25.—The President makes treaties; but should articles therein provide for any change of territory, or increase the burdens of the citizens, the concurrence of the Legislature shall be required.

ART. 26.—The President may in accordance with the provisions of the statutes, declare a state of siege.

ART. 27.—The President may confer titles of nobility, rank, orders and other marks of honour.

ART. 28.—The President may grant general amnesty, special pardon, commutation of punishment and restoration of rights. In the case of general amnesty the concurrence of the Legislature shall be required.

ART. 29.—When the President, for any cause, vacates his office or is unable to exercise the powers and functions connected therewith, the Vice-President shall act in his stead.

CHAPTER 4.—LEGISLATURE

ART. 30.—Statutes shall be enacted by the Legislature composed of members elected by the people. The organization of the Legislature and the method of the election of its members shall be prescribed and determined by the Constitutional Compact Conference.

ART. 31.—The competence of the Legislature shall be as follows: (1) To discuss and pass bills. (2) To discuss and pass the estimates. (3) To discuss and pass or approve measures relating to the assumption of public debts, and to the contracting of other liabilities to the charge of the National Treasury. (4) To reply to enquiries addressed to it by the President. (5) To receive petitions from the people. (6) To initiate legislation. (7) To submit to the President suggestions and opinions relating to legislation and other mat-

ters. (8) To raise questions in regard to administration over which doubts have arisen and to request the President to reply thereon. But the President may refuse to reply should he deem it necessary for the matter to be kept in secret. (9) Should the President make an attempt against the state the Legislature may institute against him impeachment proceedings in the Supreme Court of Justice, if approved by a majority of three-fourths or over, of a quorum of four-fifths or over, of the total number of members of the Legislature. The exercise of the powers mentioned in Clauses 1 to 8 of this article, and Articles 20, 25, 28, 55 and 57 shall require the concurrence of a majority of the members present in the Legislature.

ART. 32.—The annual session of the Legislature shall not exceed four months in duration, but may be prolonged should the President consider it necessary. The President may call an extraordinary session during the recess.

ART. 33.—The deliberations of the Legislature shall be public, but the members may sit behind closed doors at the request of the President, or as a result of the decision of a majority of the members present.

ART. 34.—Bills which have passed the Legislature shall be promulgated and enforced by the President. But if the President shall disapprove a bill duly passed in the Legislature, he may return the bill to the Legislature for reconsideration, with a statement of the reasons of his disapproval. Even in case that the former decision of the Legislature be adhered to by a majority of two-thirds or over, of the members present, if the President still maintain that the bill would greatly endanger and harm, either the internal administration of the state, or its foreign relations, or that there are great and important obstacles in the way of its execution, in such a case the President may, with the concurrence of the Council of State, withhold promulgation.

ART. 35.—The Speaker and the Deputy Speaker of the Legislature shall be elected from and among the members by a majority of the votes cast.

ART. 36.—Members of the Legislature shall not be held responsible, outside of the House for their speeches, debates or for votes cast in the House.

ART. 37.—Except when discovered in the commission of a crime, or when involved in crimes connected with internal or external troubles, no member of the Legislature shall be arrested during the session without the permission of the House.

ART. 38.—The Legislature shall prescribe its own rules.

CHAPTER 5.—THE ADMINISTRATION

ART. 39.—The President is the chief of the Administration and shall be assisted by one Secretary of State.

ART. 40.—The affairs of Administration shall be separately conducted by the Departments of Foreign Affairs, Interior, Finance, War, the Navy, Justice, Education, Agriculture and Commerce and of Communications.

ART. 41.—The Heads of the Departments shall manage the Administration of their respective departments in accordance with laws and ordinances.

ART. 42.—The Secretary of State, the heads of the departments, and Special Delegates, representing the President, shall be entitled to sit and speak in the Legislature.

ART. 43.—The Secretary of State and the heads of the departments may be impeached by the Board

of Censors and judged by the Ping Cheng Yuen should they violate the law.

CHAPTER 6.—THE COURTS OF LAW

ART. 44.—The Courts of Law shall be composed of the law officers appointed by the President.

The organization of the Courts of Law and the qualifications of the law officers shall be determined by statute.

ART. 45.—The Courts of Law, in accordance with the provisions of the statutes, shall try and judge, independently, all civil and criminal cases. But administrative law proceedings and other special law proceedings, shall be tried and judged according to the law governing the same.

ART. 46.—The procedure of impeachment cases in the Supreme Court of Justice, as provided for under clause 9 of Article 31, shall be determined separately by statute.

ART. 47.—In the Courts of Law trials shall be conducted and judgment shall be rendered publicly. When, however, it is considered that publicity may be prejudicial to peace and order, or to public morality, secrecy may be observed.

ART. 48.—During his term of office no law officer shall be reduced in salary, nor be transferred to another office, nor shall he be deprived of his office, except as a consequence of punishment according to statute, or of disciplinary measures entailing dismissal. Regulations governing the discipline of law officers shall be determined by statute.

CHAPTER 7.—THE COUNCIL OF STATE

ART. 49.—The Council of State, when consulted by the President, shall deliberate upon important matters of state.

The organization of the Council of State shall be determined by the Constitutional Compact Conference.

CHAPTER 8.—FINANCE

ART. 50.—The imposition of new taxes and the modification of the rates of the existing taxes shall be made by statute. The taxes levied at present shall, unless changed by statute, be collected as in the past.

ART. 51.—The annual receipts and expenditures of the state shall be dealt with every year in accordance with the provisions of the estimates passed by the Legislature.

ART. 52.—In order to meet special requirements there may be included in the estimates appropriations extending over a certain number of years as a Continuing Expenditure Fund.

ART. 53.—In order to supply deficiencies in the estimates, or to meet requirements unprovided for in the same, a Reserve Fund shall be provided for in the estimates.

ART. 54.—Estimates for the objects of expenditure specified below shall not be rejected or reduced, except with the concurrence of the President: (1) Those appertaining to the legal obligations of the state. (2) Such necessary expenditures as may have arisen from the provisions of statute. (3) Expenditures necessary to carry out treaties. (4) Expenditures necessary for the organization of the Army and Navy.

ART. 55.—In case of international warfare or internal disturbance, or in extraordinary circumstances, when the Legislature cannot be convoked, the President, with the concurrence of the Council of State, may make urgent financial appropria-

tions. But he shall request the Legislature to ratify the same at the beginning of its next session.

ART. 56.—If the new estimates have not been acted upon the appropriations of the previous year shall continue in force. The same procedure shall be observed should the adoption of the estimates be delayed after the fiscal year has already begun.

ART. 57.—The final accounts of the receipts and expenditure of the state shall be audited every year by the Board of Audit, and shall be reported by the President to the Legislature for approval.

ART. 58.—The organization of the Board of Audit shall be determined by the Constitutional Compact Conference.

CHAPTER 9.—THE PROCEDURE FOR MAKING THE CONSTITUTION

ART. 59.—The Constitution of the Chung Hua Min Kuo shall be drafted by the Constitution Drafting Committee. This Committee shall be composed of persons not exceeding ten in number elected by the Council of State.

ART. 60.—The Draft of the Constitution of the Chung Hua Min Kuo shall be examined and passed by the Council of State.

ART. 61.—After the Constitution of the Chung Hua Min Kuo has been examined and passed by the Council of State it shall be submitted by the President to the National Convention for final adoption.

The organization of the National Convention shall be determined by the Constitutional Compact Conference.

ART. 62.—The National Convention shall be convoked and dissolved by the President.

ART. 63.—The Constitution of the Chung Hua Min Kuo shall be promulgated by the President.

CHAPTER 10.—SUPPLEMENTARY ARTICLES

ART. 64.—Until the Constitution of the Chung Hua Min Kuo comes into force the Constitutional Compact shall have the same force as the Constitution.

Laws and ordinances in force before the going into effect of the Constitutional Compact, so far as they do not come into conflict with the same, shall continue to be valid.

ART. 65.—The Articles proclaimed on the twelfth day of the second month of the first year of the Min Kuo, regarding the favourable treatment of the Ta Ching Emperor after his abdication of the Throne, and the special treatment of the Ching Imperial Clan, as well as the special treatment of the Manchus, Mongols, Mohammedans, and Thibetans shall never be modified. The statute on the treatment of the Mongols, which is co-related with the foregoing Articles, shall continue to be effective unless changed by statute.

ART. 66.—On the proposal of a majority of two-thirds or over of the members of the Legislature, or on the proposal of the President, in either case if approved by a majority of three-fourths or over, of a quorum of four-fifths or over, of the total number of members of the Legislature, the President shall convoke the Constitutional Compact Conference to amend the Constitutional Compact.

ART. 67.—Before the Legislature shall have been convoked, its powers and functions shall be assumed and discharged by the Council of State.

ART. 68.—The Constitutional Compact of the

Chung Hua Min Kuo shall take effect as from the date of promulgation, on which day the Provisional Constitution, proclaimed on the eleventh day of the third month of the first year of the Min Kuo, shall become null and void.

CHINESE LITERATURE: Origin of the language.—“In the sixth century B. C. the Chinese were also in possession of a written language, fully adequate to the most varied expression of human thought, and indeed almost identical with their present script, allowing, among other things, for certain modifications of form brought about by the substitution of paper and a camel's-hair brush for the bamboo tablet and stylus of old. The actual stages by which the point was reached are so far unknown to us. China has her Cadmus in the person of a prehistoric individual named Ts'ang Chieh, who is said to have had four eyes, and to have taken the idea of a written language from the markings of birds' claws upon the sand. Upon the achievement of his task the sky rained grain and evil spirits mourned by night. Previous to this mankind had no other system than rude methods of knotting cords and notching sticks for noting events or communicating with one another at a distance. As to the origin of the written language of China, invention is altogether out of the question. It seems probable that in prehistoric ages, the Chinese, like other peoples, began to make rude pictures of the sun, moon, and stars, of man himself, of trees, of fire, of rain, and they appear to have followed these up by ideograms of various kinds. How far they went in this direction we can only surmise. There are comparatively few obviously pictorial characters and ideograms to be found even in the script of two thousand years ago; but investigations carried on for many years by Mr. L. C. Hopkins, H. M. Consul, Chefoo, and now approaching completion, point more and more to the fact that the written language will some day be recognised as systematically developed from pictorial symbols. It is, at any rate, certain that at a very early date subsequent to the legendary period of 'knotted cords' and 'notches,' while the picture-symbols were still comparatively few,

some master-mind reached at a bound the phonetic principle, from which point the rapid development of a written language such as we now find would be an easy matter."—H. A. Giles, *History of Chinese literature*, pp. 5-6.

Confucius, the founder.—Nine classics.—“In B. C. 551 Confucius was born. He may be regarded as the founder of Chinese literature. During his years of office as a Government servant and his years of teaching and wandering as an exile, he found time to rescue for posterity certain valuable literary fragments of great antiquity, and to produce at least one original work of his own. It is impossible to assert that before his time there was anything in the sense of what we understand by the term general literature. The written language appears to have been used chiefly for purposes of administration. Many utterances, however, of early, not to say legendary, rulers had been committed to writing at one time or another, and such of these as were still extant were diligently collected and edited by Confucius, forming what is now known as the *Shu Ching*, or Book of History. The documents of which this work is composed are said to have been originally one hundred in all, and they cover a period extending from the twenty-fourth to the eighth century B. C. They give us glimpses of an age earlier than that of Confucius, if not actually so early as is claimed.”—*Ibid.*, p. 7.—“Of the nine classics . . . five relate to pre-Confucian times, that is, prior to the sixth century B. C. Four contain the personal teachings of Confucius and his disciples. Native Christians can hardly be blamed if they discover in these two collections a fanciful analogy to the Five Books of Moses and the Four Gospels, relating, as they do, to something like an earlier and a later dispensation. In contrast, however, with our Holy Scriptures, the religious element in them is so faint and feeble as to suggest the aurora borealis rather than the life-giving sunshine. They recognize, under the names of *Shangti* and *Tien*, a Supreme Power, who presides over the destinies of men and dispenses rewards and punishments; but they do not inculcate the worship of that august Being. He is consequently forgotten by the people, and his place is usurped by idols. Yet so pure are the moral teachings of these ancient writings that no nation, with one exception, ever received from antiquity a more precious heritage. While some of the Sacred Books of the Hindus are unfit for translation, in the Chinese canon there is nothing to offend the most delicate sense of propriety. Referring to the nine works *seriatim*, I may give a paragraph to each. (1) The ‘Book of History’ consists of fragments (more or less modified by redaction) treating of the first three dynasties; and, prior to the first (B. C. 2200), of a golden age, in which the throne was not strictly hereditary, but the prize of merit—good kings passing over their own offspring to adopt worthier successors. (2) The ‘Book of Changes,’ supposed to date from 2800 B. C., is esteemed an abyss of wisdom so profound that no foreigner (and, some would add, no Chinese) can hope to understand it. Without professing to understand it, I have no hesitation in saying that, under the guise of science, it is an absurd system of divination, and that it has done more than any other book to impose on the Chinese mind the fetters of obstructive superstition. It is to-day the text-book of fortune-tellers of every description, as it was four thousand years ago. (3) The ‘Book of Odes,’ an anthology of primitive poetry, which had its origin from 600 to 1100 B. C. Invaluable as a

picture of life and manners, there is little in it to suggest the fire and fancy of the Greek muse, and nothing resembling the sublime poetry of the Hebrews. ‘You should read the “Book of Odes,”’ said Confucius to his son, ‘and you will learn the names of many birds, beasts, and vegetables.’ (4) The ‘Animals of Lu,’ compiled by Confucius, and charmingly amplified by his disciple Tso. This work is the recognized model for historic composition. (5) The ‘Book of Rites,’ a collection of court etiquette, social usages, and religious ritual, which has had a great influence in moulding the manners of the Chinese people. It has made them the most ceremonious nation on earth. The later collection, called the *Four Books*, is the New Testament of China, though it resembles the Talmud rather than the Gospels. (1) The ‘Analects or Sayings of Confucius,’ which form the most important part of it, are so wise and good that many of them have passed into the current language in the form of proverbs. The Sage’s most remarkable utterance is a negative statement of the golden rule—answering exactly to that given in the Book of Tobit, iv. 16 [Apocrypha]. (2) The ‘Great Study’—instructions for rulers how to accomplish the renovation of their people. They are taught to begin by ‘renewing themselves’ after the example of a good emperor who inscribed on his wash-basin the words: ‘Daily renew thyself.’ With such precepts and such examples, is it not strange that social regeneration is the last thing desired by the Chinese? (3) The ‘Just Mean.’ This is a theory of virtue, as the mean between extremes of excess and defect—eloquently set forth by the Sage’s grandson, for whom the Sage himself serves as a perfect model. (4) ‘Discourses of Mencius,’ the St. Paul of the Confucian school, who, born a hundred and eighty years later than Confucius, revived his doctrines and gave them currency. He preached the principles of his master with the zeal of an apostle, and rebuked vice in high places with the courage of a Hebrew prophet.”—W. A. P. Martin, *Cycle of Cathay*, pp. 58-61.

Literature after B.C. 478.—“The poetry which is representative of the period between the death of Confucius and the 2nd century B. C. is a thing apart. There is nothing like it in the whole range of Chinese literature. It illumines many a native pronouncement on the poetic art, the drift of which would otherwise remain obscure. For poetry has been defined by the Chinese as ‘emotion expressed in words,’ a definition perhaps not more inadequate than Wordsworth ‘impassioned expression.’ ‘Poetry,’ they say, ‘knows no law.’ And again, ‘The men of old reckoned it the highest excellence in poetry that the meaning should lie beyond the words, and that the reader should have to think it out.’ Of these three canons only the last can be said to have survived to the present day. But in the fourth century B. C., Ch’ü Yüan and his school indulged in wild irregular metres which consorted well with their wild irregular thoughts. Their poetry was prose run mad. It was allusive and allegorical to a high degree, and now, but for the commentary, much of it would be quite unintelligible. . . . Never has the literature of any country been more closely bound up with the national history than was that of China at the beginning of the period upon which we are now about to enter. The feudal spirit had long since declined, and the bond between suzerain and vassal had grown weaker and weaker until at length it had ceased to exist. Then came the opportunity and the man. The ruler of the powerful State of Ch’in, after gradually vanquishing and absorbing such

of the other rival States as had not already been swallowed up by his own State, found himself in B. C. 221 master of the whole of China, and forthwith proclaimed himself its Emperor. The Chou dynasty, with its eight hundred years of sway, was a thing of the past. . . . So soon as the empire settled down to comparative peace, a mighty effort was made to undo at least some of the mischief sustained by the national literature. An extra impetus was given to this movement by the fact that under the First Emperor, if we can believe tradition, the materials of writing had undergone a radical change. A general, named Mêng T'ien, added to the triumphs of the sword the invention of the camel's-hair brush, which the Chinese use as a pen. The clumsy bamboo tablet and stylus were discarded, and strips of cloth or silk came into general use, and were so employed until the first century A. D., when paper was invented by Ts'ai Lun. Some say that brick dust and water did duty at first for ink. However that may be, the form of the written character underwent a corresponding change to suit the materials employed. Meanwhile, books were brought out of their hiding-places, and scholars like K'ung An-kuo, a descendant of Confucius in the twelfth degree, set to work to restore the lost classics. He deciphered the text of the Book of History, which had been discovered when pulling down the old house where Confucius once lived, and transcribed large portions of it from the ancient into the later script. He also wrote a commentary on the *Analecs* and another on the *Filial Piety Classic*. . . . The centuries which elapsed between A. D. 200 and 600 were not favourable to the development and growth of a national literature. During a great part of the time the empire was torn by civil wars; there was not much leisure for book-learning, and few patrons to encourage it. Still the work was carried on, and many great names have come down to us."—H. A. Giles, *History of Chinese literature*, pp. 50, 77-80, 110.—"Building on this fair foundation, the Chinese have, in the course of twenty-three centuries, erected a magnificent structure. Its leading sections are: (1) Histories vast in extent and containing an unparalleled wealth of recorded facts. India has nothing to compare with them. (2) Philosophers, acute and daring in speculation, but by no means scientific in method. (3) Poets, nearly all of the lyric order, some of whom may challenge comparison with those of Greece or Rome. (4) Novelists, who developed the modern novel a thousand years before its appearance in our horizon. Will not this colossal literature, in which is mirrored the life of one of the grandest divisions of the human race, some day claim a place in our seats of learning?"—W. A. P. Martin, *Cycle of Cathay*, p. 61.

CHISHOLM vs. GEORGIA, Case of (1793).—"When the Constitution was submitted to the people, a principal objection urged against it was that it exposed a State, although a sovereign commonwealth, to be sued by the individual citizens of some other State. . . . The power as well as the dignity of a State would be gone if it could be dragged into court by a private plaintiff. Hamilton . . . met the objection by arguing that the jurisdiction-giving clause of the Constitution ought not to be so construed but must be read as being subject to the general doctrine that a sovereign body cannot be sued by an individual without its own consent. . . . However, in 1793 the Supreme Court, in the famous case of *Chisholm vs. The State of Georgia*, construed the Constitution in the very sense which Hamilton had denied, holding that an action did lie against Georgia at the suit of a private plaintiff; and when Georgia protested and refused to appear, the court proceeded (in 1794) to give judgment against her by default in case she should not appear and plead before a day fixed. Her cries of rage filled the Union, and brought other States to her help. An amendment (the eleventh) to the Constitution, was passed by Congress and duly accepted by the requisite majority of the States, which declares that 'the judicial power of the United States shall not be construed to extend to any suit commenced or prosecuted against one of the United States by citizens of another State or by citizens of subjects of any foreign State.'"—J. Bryce, *American commonwealth* (1891), v. 1, pp. 231-232.—See also SUPREME COURT: 1789-1835; 1835-1864.

CHITON.—"The chiton [of the ancient Greeks] was an oblong piece of cloth arranged round the body so that the arm was put through a hole in the closed side, the two ends of the open side being fastened over the opposite shoulder by means of a button or clasp. On this latter side, therefore, the chiton was completely open, at least as far as the thigh, underneath of which the two ends might be either pinned or stitched together. Round the hips the chiton was fastened with a ribbon or girdle, and the lower part could be shortened as much as required by pulling it through this girdle. . . . Frequently sleeves, either shorter and covering only the upper arm, or continued to the wrist were added to the chiton. . . . The short-sleeved chiton is frequently worn by women and children on monuments. Of the sleeveless chiton, worn by men over both shoulders, it is stated that it was the sign of a free citizen. Slaves and artisans are said to have worn a chiton with one hole for the left arm, the right arm and half the chest remaining quite uncovered. . . . It appears clearly that the whole chiton consists of

one piece. Together with the open and half-open kinds of the chiton we also find the closed double chiton flowing down to the feet. It was a piece of cloth considerably longer than the human body, and closed on both sides, inside of which the person putting it on stood as in a cylinder."—E. Guhl and W. Koner, *Life of the Greeks and Romans*, pt. 1, sect. 41.—"The principal, or rather, the sole garment, of the Dorian maidens was the chiton, or himation made of woolen stuff, and without sleeves, but fastened on either shoulder by a large clasp, and gathered on the breast by a kind of brooch. This sleeveless robe, which seldom reached more than half way to the knee, was moreover left open up to a certain point on both sides, so that the skirts or wings, flying open as they walked, entirely exposed their limbs. . . . The married women, however, did not make their appearance in public 'en chemise,' but when going abroad donned a second garment which seems to have resembled pretty closely their husbands' himatia."—J. A. St. John, *The Hellenes*, bk. 3 ch. 6.

CHITRAL, a highland state in the northwest frontier province of British India, bordering on Kafiristan.

1895.—Defense and relief of. See INDIA: 1895 (March-September).

CHIUSAFORTE, a town of northeastern Italy, the scene of fighting on the Austro-Italian front, 1918. See WORLD WAR: 1918: IV. Austro-Italian theater: e, 14.

CHIVALRY.—"The primitive sense of this well-known word, derived from the French Chevalier, signifies merely cavalry, or a body of soldiers serving on horseback; and has been used in that general acceptance by the best of our poets, ancient and modern, from Milton to Thomas Campbell. But the present article respects the peculiar meaning given to the word in modern Europe, as applied to the order of knighthood, established in almost all her kingdoms during the middle ages, and the laws, rules, and customs, by which it was governed. Those laws and customs have long been antiquated, but their effects may still be traced in European manners; and, excepting only the change which flowed from the introduction of the Christian religion, we know no cause which has produced such general and permanent difference betwixt the ancients and moderns, as that which has arisen out of the institution of chivalry. . . . From the time that cavalry becomes used in war, the horseman who furnishes and supports a charger arises, in all countries, into a person of superior importance to the mere foot-soldier. . . . In various military nations, therefore, we find that horsemen are distinguished as an order in the state. . . . But, in the middle ages, the distinction ascribed to soldiers serving on horseback assumed a very peculiar and imposing character. They were not merely respected on account of their wealth or military skill, but were bound together by a union of a very peculiar character, which monarchs were ambitious to share with the poorest of their subjects, and governed by laws directed to enhance, into enthusiasm, the military spirit and the sense of personal honour associated with it [see also MILITARY ORGANIZATION: 13; 15]. The aspirants to this dignity were not permitted to assume the sacred character of knighthood until after a long and severe probation, during which they practised, as acolytes, the virtues necessary to the order of Chivalry. Knighthood was the goal to which the ambition of every noble youth turned; and to support its honours, which (in theory at least)

could only be conferred on the gallant, the modest, and the virtuous, it was necessary he should spend a certain time in a subordinate situation, attendant upon some knight of eminence, observing the conduct of his master, as what must in future be the model of his own, and practising the virtues of humility, modesty, and temperance, until called upon to display those of a higher order. . . . In the general and abstract definition of Chivalry, whether as comprising a body of men whose military service was on horseback, and who were invested with peculiar honours and privileges, or with reference to the mode and period in which these distinctions and privileges were conferred, there is nothing either original or exclusively proper to our Gothic ancestors. It was in the singular tenets of Chivalry,—in the exalted, enthusiastic, and almost sanctimonious, ideas connected with its duties,—in the singular balance which its institutions offered against the evils of the rude ages in which it arose, that we are to seek those peculiarities which render it so worthy of our attention. . . . The education of the future knight began at an early period. The care of the mother, after the first years of early youth were passed, was deemed too tender, and the indulgences of the paternal roof too effeminate, for the future aspirant to the honours of chivalry. . . . To counteract these habits of indulgence, the first step to the order of knighthood was the degree of Page. The young and noble stripling, generally about his twelfth year, was transferred from his father's house to that of some baron or gallant knight, sedulously chosen by the anxious parent as that which had the best reputation for good order and discipline. [See also EDUCATION: Medieval: 9th-15th centuries: Chivalry.] . . . When advancing age and experience in the use of arms had qualified the page for the hardships and dangers of actual war, he was removed, from the lowest to the second gradation of chivalry, and became an Escuyer, Esquire, or Squire. The derivation of this phrase has been much contested. It has been generally supposed to be derived from its becoming the official duty of the esquire to carry the shield (Escu) of the knight his master, until he was about to engage the enemy. Others have fetched the epithet (more remotely certainly) from Scuria, a stable, the charger of the knight being under the especial care of the squire. Others, again, ascribe the derivation of the word to the right which the squire himself had to carry a shield, and to blazon it with armorial bearings. This, in later times, became almost the exclusive meaning attached to the appellative esquire; and, accordingly, if the phrase now means anything, it means a gentleman having a right to carry arms. There is reason, however, to think this is a secondary meaning of the word, for we do not find the word Escuyer, applied as a title of rank, until so late as the Ordonnance of Blois, in 1579. . . . In actual war the page was not expected to render much service, but that of the squire was important and indispensable. Upon a march he bore the helmet and shield of the knight and led his horse of battle, a tall heavy animal fit to bear the weight of a man in armour, but which was led in hand in marching, while the knight rode an ambling hackney. The squire was also qualified to perform the part of an armourer, not only facing his master's helmet and buckling his cuirass, but also closing with a hammer the rivets by which the various pieces were united to each other. . . . In the actual shock of battle, the esquire attended closely on the banner of his master, or on his person if he were only a knight bachelor,

kept pace with him during the mêlée, and was at hand to remount him when his steed was slain, or relieve him when oppressed by numbers. If the knight made prisoners they were the charge of the esquire; if the esquire himself fortune to make one, the ransom belonged to his master. . . . A youth usually ceased to be a page at 14, or a little earlier, and could not regularly receive the honour of knighthood until he was one-and-twenty. . . . Knighthood was, in its origin, an order of a republican, or at least an oligarchic nature, arising . . . from the customs of the free tribes of Germany [see COMITATUS], and, in its essence, not requiring the sanction of a monarch. On the contrary, each knight could confer the order of knighthood upon whomsoever preparatory noviciate and probation had fitted to receive it. The highest potentates sought the accolade, or stroke which conferred the honour, at the hands of the worthiest knight whose achievements had dignified the period. . . . Though no positive regulation took place on the subject, ambition on the part of the aspirant, and pride and policy on that of the sovereign princes and nobles of high rank, gradually limited to the latter the power of conferring knighthood. . . . Knights were usually made either on the eve of battle, or when the victory had been obtained; or they were created during the pomp of some solemn warning or grand festival. . . . The spirit of chivalry sunk gradually under a combination of physical and moral causes; the first arising from the change gradually introduced into the art of war, and the last from the equally great alteration produced by time in the habits and modes of thinking in modern Europe. Chivalry began to dawn in the end of the 10th, and beginning of the 11th century. It blazed forth with high vigour during the crusades, which indeed may be considered as exploits of national knight-errantry, or general wars, undertaken on the very same principles which actuated the conduct of individual knights adventurers. But its most brilliant period was during the wars between France and England, and it was unquestionably in those kingdoms that the habit of constant and honourable opposition, unembittered by rancour or personal hatred, gave the fairest opportunity for the exercise of the virtues required from him whom Chaucer terms 'a very perfect gentle knight.' Froissart frequently makes allusions to the generosity exercised by the French and English to their prisoners, and contrasts it with the dungeons to which captives taken in war were consigned both in Spain and Germany. Yet both these countries, and indeed every kingdom in Europe, partook of the spirit of chivalry in a greater or less degree; and even the Moors of Spain caught the emulation, and had their orders of Knighthood as well as the Christians. But even during this splendid period, various causes were silently operating the future extinction of the flame, which blazed thus wide and brightly. An important discovery, the invention of gunpowder, had taken place, and was beginning to be used in war, even when chivalry was in its highest glory. . . . Another change, of vital importance, arose from the institution of the bands of gens-d'armes, or men at arms in France, constituted . . . expressly as a sort of standing army. . . . A more fatal cause had, however, been for some time operating in England, as well as France, for the destruction of the system we are treating of. The wars of York and Lancaster in England, and those of the Huguenots and of the League, were of a nature so bitter and rancorous, as was utterly inconsistent with the courtesy, fair

play, and gentleness, proper to chivalry. . . . The civil wars not only operated in debasing the spirit of chivalry, but in exhausting and destroying the particular class of society from which its votaries were drawn."—W. Scott, *Essay on chivalry*.

CHLAMYS.—"The chlamys [worn by the ancient Greeks and Romans] . . . was an oblong piece of cloth thrown over the left shoulder, the open ends being fastened across the right shoulder by means of a clasp; the corners hanging down were, as in the himation, kept straight by means of weights sewed into them. The chlamys was principally used by travellers and soldiers."—E. Guhl and W. Koner, *Life of the Greeks and Romans*, pt. 1, sect. 42.—See also **COSTUME: Rome**.

CHONTALS and POPOLOCAS.—"According to the census of 1880 there were 31,000 Indians in Mexico belonging to the Familia Chontal. No such family exists. The word 'chontalli' in the Nahuatl language means simply 'stranger,' and was applied by the Nahuas to any people other than their own. According to the Mexican statistics, the Chontals are found in the states of Mexico, Puebla, Oaxaca, Guerrero, Tabasco, Guatemala and Nicaragua. A similar term is 'popoloca,' which in Nahuatl means a coarse fellow, one speaking badly, that is, broken Nahuatl. The Popolocas have also been erected into an ethnic entity by some ethnographers, with as little justice as the Chontallis. They are stated to have lived in the provinces of Puebla, Oaxaca, Vera Cruz, Mechoacan and Guatemala."—D. G. Brinton, *American race*, pp. 146-153.
