BY

LOVELL AUGUSTUS REEVE, F.L.S., F.G.S.,

RESPONDING MEMBER OF THE NATURAL HISTORY SOCIETY OF WÜRTEMBERG, AND OF THE LYCEUM OF NATURAL HISTORY OF NEW YORK.

"And never, since the middle summer's spring,  
Met we on hill, in dale, forest, or mead,  
By paved fountain, or by rushy brook,  
Or on the beached margin of the sea,  
To dance our ringlets to the whistling wind,  
But with thy brawls thou hast disturbed our sport."

*Shakespeare.*

LONDON:

LOVELL REEVE, HENRIETTA STREET, COVENT GARDEN.

1858.

MONOGRAPH  
OF THE GENUS  
AMPULLARIA.

"He looks abroad into the varied field  
Of Nature, and though poor perhaps, compared  
With those whose mansions glitter in his sight,  
Calls the delightful sev'ry all his own,—  
His own the mountains, and the valleys his,  
And the resplendent rivers."—*Couper*.

*Ampullaria, Pl. I.*

# AMPULLARIA.

## PLATE I.

### *Genus AMPULLARIA, Lamarck.*

*Tegula globosa vel ovata, plus minus umbilicata, raro imperforata, epidermide crassiuscula oliveacea induta, spirae suturæ modo simplici, modo canaliculata, anfractibus plus minus ventricosis, levigatis; apertura subampullata, labro simplici. Operculum nunc cornutum nunc calcareum, aperturam claudens.*

Siclit globose or ovate, more or less umbilicated, rarely im-porfated, covered with a rather thick olive epidermis, suture of the spire sometimes simple, sometimes channeled, whorls more or less ventricose, smooth; aperture rather large, lip simple. Operculum sometimes horny, sometimes calcareous, closing the aperture.

The sonabre hue and obvious similarity of form, desti-tute of any indication of sculpture, of the shells of *Amphullaria*, have led to this genus being very much neglected by the collector; and their unattractive range of habitation, in swampy marshes, ponds, and rivers, has not been very inviting to the traveller. A few recent naturalists, including among the foremost M. D'Orbigny and Mr. Bridges on the banks of the great rivers of Bolivia, Dr. Spix in Brazil, M. Caillaud in Africa, Mr. Yates and Mr. Wallace at the rivers Marañon and Amazon, MM. Salki and Ghiesbrecht in Mexico, Mr. Dyson in Honduras, Mr. Benson in India, and Mr. Layard and Mr. Templeman in Ceylon, have directed their energies since Lamarck's time to *Amphullaria*-hunting; and the result is the following ample series of a hundred and thirty species, nearly two-thirds of which are new to science, and of which scarcely a dozen were known to the author of the 'Histoire des Animaux sans Vertèbres.' A monograph of the genus was published by Dr. Philippi in 1851, in M. Kuster's edition of the 'Conchylien Cabinet' of Chemnitz, but it is founded on very imperfect materials.

The species of *Amphullaria* are exceedingly well-defined, though bearing great general resemblance, and what is not usual with molluscs affecting such habitats, many of them are stained at the aperture with brilliant colour. The animal, as is now sufficiently well known, is of an amphibious nature, possessing a double system of respiration, which adapts it to breathe either air or water, according to the requirements of the place of its habitation, which may be at one time flooded and at another dry. This peculiarity, observed originally by Mr. Guilding at the Caribbee Islands, was noticed first in detail by M.

Caillaud on his return from his expedition to the Nile. On placing some of his *Amphullaria* in a basin of water M. Caillaud unexpectedly found many of his specimens come to life, and M. D'Orbigny discovered the existence of a distinct pulmonary apparatus.

So many new species of *Amphullaria* have been collected by recent travellers in comparatively few localities, that it is more than probable the genus abounds to a much larger extent than we have at present any idea of. It does not, however, exist in the great rivers of North America or of North-temperate Europe, and is peculiar to warm and tropical latitudes.

---

### Species 1. (Mus. Cuming.)

**AMPULLARIA CUPRINA.** *Amp. testa subquadrato-globosa, tenuicollis, profundè angulato-umbilicata, spiræ oblongæ exsertæ, anfractibus superiori latè planatis, ad angulos rotundatis, deinde plano-concisis; lutescente, nigro-fusco tintæ et fasciatæ; apertura oœata, labro semiplaci.*

**THE COPPER AMPULLARIA.** Shell somewhat squatly globose, rather thin, deeply angularly umbilicated, spire obtusely exserted, whorls broadly flattened round the upper part, rounded at the angle, then flatly convex; yellowish, stained and banded with red-brown; aperture ovate, lip simple.

*Hab.* — 2

A light, somewhat inflated species, with the whorls broadly rotundately angled round the upper part.

---

### Species 2. (Mus. Cuming.)

**AMPULLARIA SPIXII.** *Amp. testa globoso-turbanata, sub-ampulite umbilicata, spiræ subobtusa, anfractibus rotundatis, levibus, subangustis, superiori deciribus lutescente, fusciis intus castaneis cingulata; apertura circulari-ovata, labro simplici.*

**SPIX'S AMPULLARIA.** Shell globosely turbinated, rather largely umbilicated, spire rather obtuse, whorls rounded, smooth, rather narrow, slanting round the upper part; yellowish, encircled with dark chestnut bands; aperture circular-ovate, lip simple.

D'ORBIGNY, Voy. dans l'Amér. Mérid. p. 376. pl. 52. f.

7. 8.

*Hab.* River Parana, South America.

A fine turbinated species, of *Cyclostoma*-like growth, conspicuously banded and linedated with dark chestnut upon a yellowish ground.

Species 3. (Mus. Cuming.)

**AMPULLARIA GIGAS.** *Amp. testā ventricoso-globosā, maximā, angustè umbilicatā, spirā brevissimā, immersā, suturā angustā profunda canaliculatā, anfractiōnē convexis; virescente-olivaceis, fasciis angustis pallidis olivaceis cingulatā; aperturā oblongo-ovatā, fance aurantio-lutescente, carulescente fasciatā, labro simplici, intus nigro-maculatā.*

**THE GIANT AMPULLARIA.** Shell ventricosely globose, very large, narrowly umbilicated, spire very short, immersed, suture narrowly deeply channelled, whorls convex; greenish olive, encircled with narrow faint olive bands; aperture oblong-ovate, interior orange-yellow, blue-banded, lip simple, black spotted within.  
SPIX, *Testacea Fluvialia Brasilensia*, p. 1. pl. 1. f. 1.  
*Hab.* Solomon's River, Brazil.

This truly fine species is quite remarkable for its bold ventrieose growth and immersed channelled spire.

Species 4. (Mus. Cuming.)

**AMPULLARIA CORNUCOPIA.** *Amp. testā oblongo-ovatā, obliquā productā, angustè umbilicatā, spirā brevi, sub-acuminatā, anfractibus rotundatis, levibus, nitentibus, superne declivibus; livido-fuscenscente, lineis fasciisque rugis angustis cingulatā; aperturā ovatā, subampullā, effusa.*

**THE CORNUCOPIA AMPULLARIA.** Shell oblong-ovate, obliquely produced, narrowly umbilicated, spire short, rather acuminated, whorls rounded, smooth, shining, slanting round the upper part; livid-brown, encircled with narrow red bands and lines; aperture ovate, rather large, effused.

*Hab.* Columbia.

Of light substance, elegantly obliquely convoluted, with the aperture boldly effused.

Species 5. (Mus. Cuming.)

**AMPULLARIA CRASSA.** *Amp. testā subquadrato-globosā, crassa, imperforatā, spirā brevissimā, obtusa, anfractibus convexis, levibus, superne declivibus; sordidè lutescente, fasciis lineisque rastaneis subdistans cingulatā; aperturā ovatā, labro columellarī callosō, appresso, albo.*

**THE THICK AMPULLARIA.** Shell somewhat squarely globose, thick, imperforated, spire rather short, obtuse, whorls convex, smooth, slanting round the upper part; dull yellowish, encircled with rather distant chestnut bands and lines; aperture ovate, columellar lip callous, appressed, white.

SWAINSON, Zool. Illus. (First Series), vol. iii. pl. 101.

*Helix crassa*, Spix.

*Ampullaria Olivieri*, Deshayes.

*Helicina exumbilicata*, Spix.

*Ampullaria Brownii*, Jay.

*Hab.* Brazil.

Chiefly distinguished by its white, callous columellar lip, which is appressed over the place of the umbilicus.

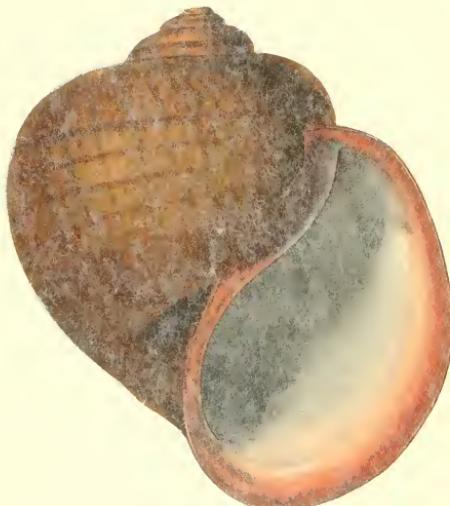

6.

7.

8.

9.

10.

# AMPULLARIA.

## PLATE II.

### Species 6. (Mus. Cuming.)

AMPULLARIA FIGULINA. *Amp. testā ovalā, tenuiculā, spirā brevi, anfractibus convexis, ad suturam subdepressis, laceribus; umbilicus amplio; aperturā ovalā; pallide olivaceo-cineratā, lineis fasciisque rufis cingulata.*

THE CLAY AMPULLARIA. Shell ovate, rather thin, spire short, whorls convex, rather depressed at the suture, smooth; umbilicus large; aperture ovate; pale olive-ash, encircled with red lines and bands.

SPIX. Test. Fluv. Brasil. pl. 4. f. 4.  
*Ampullaria lineata*, var., Spix.

Hab. Brazil.

Spix appears to have figured this species under the above name, and to have regarded it afterwards as a variety of his *A. lineata*. It is well distinguished by its light texture, largely umbilicated growth, and red-banded colouring upon a pale olive-ash ground.

### Species 7. (Mus. Cuming.)

AMPULLARIA KUPLINEATA. *Amp. testā ovalā, spirā subproculata, anfractibus superiorē subdepressis, deinde cavaoris, laceribus; umbilicus oblecto; aperturā ovalā, latèrè columellarī reflexo; albā, falso-spadiceā, lineis rufis varie cingulata.*

THE RED-LINED AMPULLARIA. Shell ovate, spire rather prominent, whorls rather depressed at the upper part, then convex, smooth; umbilicus covered; aperture ovate, columellar lip reflected; white, fulvous-fawn, variously encircled with red lines.

HAB. —?

Conspicuously encircled with red lines upon a fulvous-fawn ground, as in the preceding species, but distinguished by the absence of a visible umbilicus and by the more prominent convolution of the spire.

### Species 8. (Mus. Cuming.)

AMPULLARIA NODILIS. *Amp. testā subpyriformi-globosā, spirā depressa-ovalā, anfractibus superiorē ventricosis, laceribus; umbilicus subprofundo; aperturā pyriformi-ovalā, permepla; intus olivatā, extre. cornatā, obscurā nigro fasciatā, latro intus astutissimo-rufa.*

THE NOBLE AMPULLARIA. Shell somewhat pyriformly globose, spire rather depressed, whorls ventricose round the upper part, smooth; umbilicus rather deep; aperture pyriformly ovate, very large; dark olive, externally horny, obscurely black-banded, lip deep burnt red.

Hab. River Marañon; Mr. Yates.

This fine species, of a pyriformly globose shape, with a dark olive horny exterior, is painted within the lip with a peculiar deep-toned burnt red.

### Species 9. (Mus. Cuming.)

AMPULLARIA PALUDINOIDES. *Amp. testā globosā, spirā mediori, anfractibus rotundatis, ad suturam subdepressis, laceribus; umbilicus suboblecto; sordidè olivacea, labro flaveantia.*

THE PALUDINA-LIKE AMPULLARIA. Shell globose, spire middling, whorls rounded, a little depressed at the suture, smooth; umbilicus nearly covered; dull olive, lip yellowish.

CHRISTOFORI and JAN, Mus. Berolin. Philippi in Küster, Conch. Cab. *Amp.* p. 27. pl. 7. f. 4.

Hab. —?

Distinguished by its plump, rounded form and dark olive colour, the lip being coloured in a characteristic manner, with pale yellow.

### Species 10. (Mus. Cuming.)

AMPULLARIA CONICA. *Amp. testā subglobosa, spirā subprominula, anfractibus convexis, laceribus, nitensibus; umbilicus oblecto; aperturā ventrī, latro vix reflexo; falso-olivacea, labro albicans.*

THE CONICAL AMPULLARIA. Shell subglobose, spire rather prominent, whorls convex, smooth, shining; umbilicus covered; aperture ovate, lip scarcely reflected; fulvous olive, lip whitish.

Wood,

Hab. —?

The spire has a more prominently convoluted aspect than in the preceding species, from the last whorl rather more than usually descending next the aperture. In colour the shell is of a lighter fulvous olive.

11

12

13

14

# AMPULLARIA.

## PLATE III.

### Species 11. (Mus. Cuming.)

**AMPULLARIA BUSTA.** *Amp. testā globoso-turbanatā, spirā mīldissim, suturā canaliculatā, aufractilis rotundatis, levigatis; umbilico subamplo; aperturā ovatā; intescente-cirridi, fasciis naturalē olivaceis uniformib; ligato.*

THE ADUST AMPULLARIA. Shell globosely turbinated, spire middling, suture channelled, whorls rounded, smooth; umbilicus rather large; aperture ovate; yellowish-green, encircled throughout with dark olive bands.

*Hab.* —?

A rich dark-handed species, with channelled suture, of globose form, probably from Borneo.

### Species 12. (Mus. Cuming.)

**AMPULLARIA PILULA.** *Amp. testā globosā, spirā brevis, subi amersā, aufractilis contextis, tumidis, superne depresso rotundatis, levigatis; umbilico parvissimo; aperturā ovatā; intescente-ciridi, olivaceo fasciata et subrotundata.*

THE BALL AMPULLARIA. Shell globose, spire short, rather immersed whorls convex, swollen, depresso rounded at the upper part, smooth; umbilicus rather small; aperture ovate; yellowish-green, banded and clouded with olive.

*Hab.* Borneo.

Of the same typical character as the preceding species, rounder, with the spire shorter and slightly immersed.

### Species 13. (Mus. Cuming.)

**AMPULLARIA MEGASTOMA.** *Amp. testā globosa-centrifera, Naticiforme, spirā y am-immersa, aufractilis concava, tumida, spiratilis obscurè fuscoviridis, rugosa; umbilicus oblongus; aperturā perangulis, tumato-rotundata; intus fuscoviridis, intus purpureofasciata, levida.*

THE LARGE-MOUTHED AMPULLARIA. Shell globosely ventricose, Natica-shaped, spire flatly immersed, whorls convex, swollen, spirally obscurely corded, rugose; umbilicus covered over; aperture very large,

lunar-ovate; dark brown-olive, anterior part pale-livid.

SOWERBY, Tankerville Catalogue, App. p. 10.

*Ampullaria Neritoides*, D'Orbigny.

*Hab.* Mouth of the Rio Uruguay; D'Orbigny

Distinguished from all other species of the genus by its remarkably expansive Natica-shaped growth and vivid purple-brown interior.

### Species 14. (Mus. Cuming.)

**AMPULLARIA SORDIDA.** *Amp. testā globosa tenuiserrata, spirā subprotrusa, suturā canaliculata, aufractilis rotundatis, superne impressis, levigatis; umbilico profundo; aperturā ovatā, labro vix reflexo; rufo-olivacea, labro castaneo.*

THE DULL AMPULLARIA. Shell globosely turbinated, spire rather prominent, suture channelled, whorls rounded, impressed at the upper part, smooth; umbilicus deep; aperture ovate, lip scarcely reflected; reddish-olive, lip chestnut.

SWINZON, Zoological Illustrations, vol. iii. pl. 143.

*Hab.* Rio de la Plata.

Of regular rotundately turbinated growth, smooth, and chestnut-rust-coloured.

### Species 15. (Mus. Cuming.)

**AMPULLARIA HONDURASENSIS.** *Amp. testā oratō, ventricosa, spirā brevissimul, acuta, aufractilis superne plano-declinibus, deinde convexis, basis versus subattenuata, corrugatæ-striatis; umbilico angusto; aperturā pyriforme-ovata, labro subrepanso; cuero-olivacea, nictante, fasciis linearibus obscurè picta.*

THE HONDURAS AMPULLARIA. Shell ovate, ventricose, spire rather short, sharp, whorls flatly slanting round the upper part, then convex, rather attenuated towards the base, wrinkle-striated; umbilicus narrow; aperture pyriformly ovate, lip rather expanded; ash-olive, shining, obscurely painted with linear bands.

*Hab.* Honduras; Dyson.

A neatly convoluted species of a peculiar shining livid ash-olive colour, obscurely painted with linear bands.

16.

17.

19.

20.

# A M P U L L A R I A.

## PLATE IV.

### Species 16. (Mus. Cumig.)

**AMPULLARIA AUTUMNALIS.** *Amp. testā turbinatā, spirō subpropinulā, anfractibus rotundatis, ad suturam depresso-suturalis, obscurè spiraliatē faniculatis, faniculis irregularibus, intersticiis malleatis et striatis; umbilico subamplo; apertura rotundato-ovatā, labro expanso; olivaceā, cuncteō-ryfo tinctā.*

**THE AUTUMNAL AMPULLARIA.** Shell turbinate, spine rather prominent, whorls rounded, rather depressed at the suture, obscurely spirally corded, cords irregular, with the interstices malleated and striated; umbilicus rather large; aperture rotundately ovate, lip rather expanded; olive, stained with chestnut-red.

*Hab.* —?

The whorls of this species are somewhat more than usually rounded, while they are concentrically sculptured with obscure cords, irregular and wrinkle-like in parts, with the interstices malleated and striated. The outer surface is partially covered on the olive ground with a deciduous chestnut-red coating.

---

### Species 17. (Mus. Cuming.)

**AMPULLARIA VENETUS.** *Amp. testā globosā, subcentrica, spirā brevissimulā, acutā, anfractibus superne declinib; deinde convexis, undique malleatis et minuti crenulato-striatis; umbilico mediocri; apertura lato-pyramidalis, parvissimulā, labro expanso; interiore virente, versus apicem pallidior, labro latente.*

**THE SEA-GREEN AMPULLARIA.** Shell globose, subven-tricose, spine rather short, sharp, whorls slanting round the upper part, then convex, everywhere malleated and minutely crenulately striated; umbilicus middling; aperture lato-pyramidal, rather small, lip expanded; yellowish-green, paler towards the apex, lip yellowish.

*Hab.* —?

A pale sea-green species, with the surface rather largely clefted throughout and minutely crenulately striated, the lip and columella being of a rather conspicuous pale yellow tone.

---

### Species 18. (Mus. Cuming.)

**AMPULLARIA URCEUS.** *Amp. testā globoso-turbinatā, solitūsculā, spirā brevi, plerisque plus minus erosi, anfractibus compressè rotundatis, ad suturam depresso-suturalis, irregulariter corrugato-liratis, et rugoso-reticulatis; umbilico ampio, profundū; apertura pyramidalis, lobio columellarī reflexa; lutescente-albā, epidermis crassā carnē olivaceā inductā.*

**THE PITCHER AMPULLARIA.** Shell grossly turbinate, rather solid, spine short, generally more or less

eroded, whorls compressly rounded, a little depressed at the suture, irregularly wrinkle-ridged and rugosely reticulated; umbilicus large and deep; aperture pyriform, columellar lip reflected; yellowish-white, covered with a thick horny olive epidermis.

*Nerita urceus.* Müller, Hist. Verui, p. 174.

*Amphullaria urceus.* Deshayes.

*Amphullaria regosa.* Lamarck.

An endemic. *Amphullaria dolium.* Philippi.

An testa junior. *Amphullaria leucostoma.* Swainson.  
*Hab.* Trinidat; Cuttler.

This well-known species is at once recognized by its compressly rounded form and stout wrinkle-ridged horny epidermis, mostly eroded at the apex.

---

### Species 19. (Mus. Cuming.)

**AMPULLARIA PUNCTICULATA.** *Amp. testā subpyriforme-ovatā, ventricosā, spirā mediocri, anfractibus supornē tamidis, versus basim attenuatis, levigatis, sub tente punctulatis; umbilico angusto; apertura oblongo-ovatā, labro columellarī reflexo; olivaceo-virescente, fasciis angustis viridibus obscurè pictā, labro aurantiō-roso.*

**THE PUNCTURED AMPULLARIA.** Shell somewhat pyriformly ovate, ventricose, spine middling, whorls swollen round the upper part, attenuated towards the base, smooth, finely punctured beneath the lens; umbilicus narrow; aperture oblong-ovate, columellar lip reflexed; olive-green, obscurely painted with narrow green bands, lip orange-red.

*Swainson, Zoological Illustrations, vol. iii. p. 143.*  
*Hab.* —?

Of a very characteristic pear-like ovate form, with a warm orange-red lip.

---

### Species 20. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA VEXILLUM.** *Amp. testā ovatā, tenaculā, ventricosā, anfractibus convexis, superne subplanulatis, levigatis, sub tente punctulatis; umbilico angusto; apertura pyriforme-ovata, expansa, labro columellarī reflexo; olivaceo-virescente, fasciis saturatè viridibus cingulatā, labro rufescens.*

**THE FLAG AMPULLARIA.** Shell ovate, rather thin, ventricose, whorls convex, rather flattened at the upper part, smooth, finely punctured beneath the lens; umbilicus narrow; aperture pyriformly ovate, expanded, columellar lip reflexed; olive-green, encircled with dark green bands, lip tinged with red.

*Hab.* —?

Very closely allied to the preceding species, but of a less pear-shaped form, with the whorls more flattened round the upper part.

# AMPULLARIA.

## PLATE V.

### Species 21. (Mus. Cuming.)

**AMPULLARIA LIVESCENS.** *Amp. testā globosā, subcentri-*  
*cōsūdā, spīrā brevi, anfractūs tūmidae decibris, deinde*  
*cōvezis, lēvibus, nitentibus; umbilico profundo, sub-*  
*contracto; aperturā pyriforme-ovalē; lēido-cinereā,*  
*juxta suturā fulvescente, fasciis olivaceo-viridibus*  
*cīngulatā.*

**THE LIVID AMPULLARIA.** Shell globose, somewhat ventricose, spire short, whorls timidly slanting round the upper part, then convex, smooth, shining; umbilicus deep, rather contracted; aperture pyriformly ovate; livid ash, fulvous next the suture, encircled with narrow olive-green bands.

*Hab.* —?

A rather tumid species, with the whorls full and slanting round the upper part, of a fulvous livid colour, encircled with narrow greenish bands. In substance rather thin, with a smooth shining surface.

### Species 22. (Mus. Cuming.)

**AMPULLARIA LATTEA.** *Amp. testā glōbusā, solidinsculptā,*  
*spīrā hērēnsculptā, anfractūs rotundatā, lēvibus;*  
*umbilico profundo, sub- contracto; sordide fulōs, fas-*  
*cis pallide olivaceo-viridibus cīngulatā; aperturā*  
*ovalē, labro subreflexo.*

**LATRE'S AMPULLARIA.** Shell globose, rather solid, spire rather short, whorls rounded, smooth; umbilicus deep, rather contracted; dull fulvous, encircled with pale olive green bands; aperture ovate, lip slightly reflexed.

*Hab.* Coban, Guatemala; Latre.

Of a less tumid form than the preceding species, and of thicker substance, not shining exteriorly.

### Species 23. (Mus. Cuming.)

**AMPULLARIA HAUSTRUM.** *Amp. testā compressē ovalē,*  
*ventricosissimā, vix umbilicatā, spīrā pareā, subin-*  
*versā, anfractūs ad suturān impresō canaliculatis,*  
*deinde cōvezis; sordide olivaceā, striatā et malleatā,*  
*fasciis angustis pallide vircentibus cīngulatā; aper-*  
*turā pyriforme-oblongā, peramplyā; fauce lēido-pur-*  
*poreā.*

**THE SCOOP AMPULLARIA.** Shell compressly ovate, very ventricose, scarcely umbilicated, spire small, rather

immersed, whorls impressly channelled at the suture, then convex; dull olive, striated and mottled, encircled with narrow faint green bands; aperture pyriformly oblong, very large; livid purple in the interior.

*Hab.* River Marañon, Brazil.

This fine species belongs to the same type as *A. insularum*, D'Orbigny, from La Plata. Its chief points of difference consist in being less distinctly umbilicated, and in having a much larger and more expanded aperture.

### Species 24. (Mus. Cuming.)

**AMPULLARIA MELANOCHIELA.** *Amp. testā globoso-tur-*  
*binatā, spīrā mediocri, anfractūs superē planitā,*  
*deinde cōvezis; umbilico amplio, profundō; apertura*  
*ovatā; olivaceo-vircente, fasciis angustis pallide ru-*  
*fescente-fasciis cīngulatā, labro nigro.*

**THE BLACK-LIPPED AMPULLARIA.** Shell globosely turbinate, spire middling, whorls flattened round the upper part, then convex; umbilicus large, deep; aperture ovate, olive-green, encircled with narrow faint reddish-brown bands, lip black.

*Hab.* —?

A very characteristic species, rather depressedly flattened next the suture, with the lip conspicuously black-stained within the aperture.

### Species 25. (Mus. Cuming.)

**AMPULLARIA COLUMBIENSIS.** *Amp. testā globosā, tenui-*  
*cūlā, centricōsā, spīrā subplanulatā, anfractūs con-*  
*vezis, lēvibus, nitentibus; umbilico parvo, contracto;*  
*apertura ovalē, subamplyā; fulvescente-cinerā, fasciis*  
*pallide olivaceo-viridibus cīngulatā.*

**THE COLUMBIA AMPULLARIA.** Shell globose, rather thin, ventricose, spire rather flat, whorls convex, smooth, shining; umbilicus small, contracted; aperture ovate, rather large; fulvous ash, encircled with faint olive-green bands.

*SOWERBY, MS.* Mus. Cuming.

*Hab.* Chiriqui, Veragua.

Of light globe structure, with only a small umbilicus, fulvous in tone of colour, encircled with faint olive-green bands.

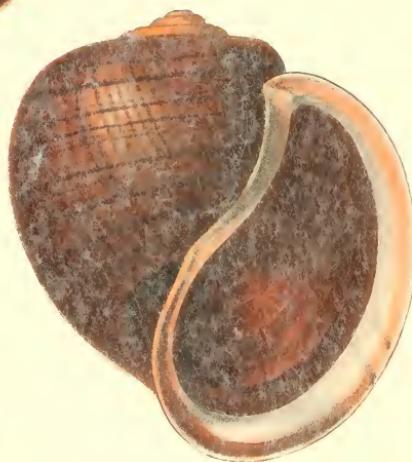

26.

27.

28.

29.

30.

# AMPULLARIA.

## PLATE VI.

### Species 26. (Mus. Cuming.)

**AMPULLARIA LUZONICA.** *Amp. testă globosă, tumidissimula, tenui, anfractibus superne planō-impressis, deinde rotundatis, levibus, longitudinālitter obsoletē sulcatis; umbilico parvo; aperturā ovatā, subampullā; fulvescente-olivaceā, obscurè fasciatā.*

THE LUZON AMPULLARIA. Shell globose, rather swollen, thin, whorls flatly impressed round the upper part, then rounded, smooth, longitudinally absolutely grooved; umbilicus small; aperture ovate, rather large; fulvous-olive, obscurely banded.

*Hab.* Calanang, Island of Luzon, Philippines; Cuming.

A light globosely turbinate shell, rather impressed next the suture, obscurely longitudinally grooved on the penultimate whorl.

---

### Species 27. (Mus. Cuming.)

**AMPULLARIA LAYARDI.** *Amp. testă subconpressa globosă, anfractibus superne angustè planō-impressis, deinde rotundatis, levibus, nitentibus; umbilico parvo, contracto; aperturā ovatā; albida, epidermine cornēa olivacea indutā.*

LAYARD'S AMPULLARIA. Shell rather compressly globose, whorls narrowly flatly impressed round the upper part, then rounded, smooth, shining; umbilicus small, contracted; aperture ovate; whitish, covered with an olive horny epidermis.

*Hab.* Colombo, Ceylon; Layard, Templeman.

Of a more compressly globose form than the preceding species, with a conspicuous horny epidermis.

---

### Species 28. (Mus. Cuming.)

**AMPULLARIA YATESII.** *Amp. testă globosă, spirā brevi, parum exserta, anfractibus superne subimpressis, deinde planō-convexis, longitudinālitter irregulariter striatis; umbilico subangusto, profundo; aperturā pyriforme, levata, peronoplă, labro reflexo; fulvo-castaneo, lineis*

*uirgris inaequidistantibus cingulatā, tubo intus rufo-aurantio lincto.*

YATES'S AMPULLARIA. Shell globose, spire short, but little exserted, whorls rather impressed round the upper part, then flatly convex, longitudinally irregularly striated; umbilicus rather narrow, deep; aperture pyriformly ovate, very large, lip reflected; fulvous-chestnut, encircled at unequal distances with black lines, lip tinged within with reddish-orange.

*Hab.* River Marañon; Yates.

This interesting species is of a peculiar fulvous-chestnut colour, encircled at unequal distances with black lines. The aperture is unusually large, tinged next the lip with a warm reddish-orange.

---

### Fig. 29. (Mus. Cuming.)

The specimen here figured is the Ceylon form of *A. Luzonica*, represented above it at Fig. 26, from the Philippine Islands. It is rather more flatly impressed round the upper part of the whorls.

---

### Species 30. (Mus. Cuming.)

**AMPULLARIA PORPHYROSTOMA.** *Amp. testă oblongo-globosă, spirid sub prominulă, anfractibus superne declivibus, deinde convexis, levibus, nitentibus; umbilico subangusto, profundo; aperturā ovatā, subfusil; cinereo-olivaceā, obscurè multifasciatā, aperturā nigritante.*

THE PURPLE-MOUTH AMPULLARIA. Shell oblong-globose, spire rather prominent, whorls slanting round the upper part, then convex, smooth, shining; umbilicus rather narrow, deep; aperture ovate, rather effused; ash-olive, faintly many-banded, aperture rather blackish.

*Hab.* —?

Of a rather oblong turbinate form, and shining ash-olive hue, the whorls being gently slanted next the suture.

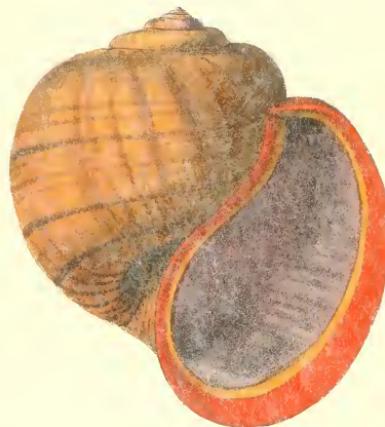

311.

312.

## PLATE VII.

### Species 31. (Mus. Cuming.)

**AMPHULLARIA PLATILIS.** *Amp. testā vix umbilicatā, globosā, obtusa, spirā breviusculā, anfractibus convexis, longitudinaliter striato-sculptis; virescentia angustæ fasciatā; apertura pyriforme-ovata, labio subfuscōlari subreflexa, flavescens.*

**BLOWN AMPULLARIA.** Shell scarcely umbilicated, globose, junid, spire rather short, whorls convex, smooth, longitudinally striately scratched; greenish olive, narrowly banded; aperture pyriformly ovate, columellar lip slightly reflexed, yellowish.

*Hab.* Tabasco, Mexico.

Allied to *A. virescens*, but obviously distinct in form, more rounded, with the spire less exserted, and more constricted at the umbilicus.

### Species 32. (Mus. Cuming.)

**AMPHULLARIA MALLEATA.** *Amp. testā globosā, tumida, vix umbilicata, spirā subacuminatā, anfractibus convexis, rufisque conspicue malleatis; livido-olivaceā; apertura pyriforme-ovata, labo subfusco, tulus flavescens.*

**THE HAMMERED AMPULLARIA.** Shell globose, tumid, scarcely umbilicated, spire rather acuminate, whorls convex, everywhere conspicuously malleated; vivid olive; aperture pyriformly ovate, lip rather effused, yellowish within.

*OSAS, Moll. Beitr. p. 22, pl. 10, f. 11.*

*Amphullaria reflexa, var.,* Philippi  
*Hab.* Mexico.

This species is clearly not a variety of *A. reflexa*. Although the malleated surface predominates in a manner to render it a distinguishing character, the shell is distinguished otherwise by peculiarities of form.

### Species 33. (Mus. Cuming.)

**AMPHULLARIA SPECIOSA.** *Amp. testā globosā, profunde umbilicata, spirā breviusculā, subimversā, anfractibus acutioribus convolutissimata, deinde convexis; glauca, lineato-fasciatā, epidermide olivacea cincta induta; apertura pyriforme-oblonga, perampliata, labo intus intenſe sanguinosa.*

**THE HANDSOME AMPULLARIA.** Shell globose, deeply umbilicated, spire rather short, somewhat immersed,

whorls channelled at the suture, then convex, glaucous, banded with lines, covered with an olive-horny epidermis; aperture pyriformly oblong, very large, lip deep vermilion within.

**PHILIPPI.** Zeitschrift für Malac. 1849, p. 18. Kuster. Conch. Cab. *Amp.* p. 40, pl. 11, f. 2.

*Hab.* Zamíbar.

A fine glaucous species, covered with a rather thin olive-horny epidermis, deep vermilion-stained within the lip, convoluted early on a vertical plane.

### Species 34. (Mus. Cuming.)

**AMPHULLARIA HEMASTOMA.** *Amp. testā globosā, subdisculā, profundè umbilicata, spirā brevi, obtusa, anfractibus superne planulatis, deinde convexis, unicolor peculiariter corrugato-malleatis; lividè livido-nigræ; apertura lento-oblonga, labo intus intenſe sanguinosa.*

**THE BLOOD-MOUTHED AMPULLARIA.** Shell globose, rather solid, rather deeply umbilicated, spire short, obtuse, whorls rather flat at the upper part, then convex, everywhere peculiarly wrinkle-malleated; vivid olive-black; aperture lunar-oblong, lip deep blood-red within.

*Hab.* Peru.

Of an intense dark livid colour, almost black, with the surface peculiarly wrinkle-malleated, and the lip stained within with deep blood-red.

### Species 35. (Mus. Cuming.)

**AMPHULLARIA POLITA.** *Amp. testā oblongo-globosā, subglauciformis, subimperforata, spirā vix acuminatā, anfractibus convexis, peculiariter nitentibus, olivaceo-virante, apertura pyriformi, subangustata.*

**THE POLISHED AMPULLARIA.** Shell oblong-globose, somewhat acorn-shaped, almost imperforated, spire slightly acuminated, whorls convex, peculiarly shining; olive-green; aperture pyriform, rather narrow.

**DESHAYES.** Encyclopédie Méthodique, Vers, vol. ii. p. 31. Eadem. *Amphullaria virescens*, Deshayes.

*Hab.* Port Jackson, Australia.

Of an oblong-globose glandiform shape, with a peculiar dark, shining, olive-green surface.

36.

37.

38.

39.

40.

# A M P U L L A R I A.

## PLATE VIII.

Fig. 36. (Mus. Cuming.)

The shell long figured proves to be a variety, of finer growth, of *A. fischeri*, represented at Pl. III. Fig. 12.

Species 37. (Mus. Cuming.)

**AMPULLARIA TURBINOIDES.** *Amp. testā oblongo-turbinatā, solidiscutulā, subauperforatā, spirā exsertā, anfractibus concisis, laevis; oliveo-virente, obscurè fasciata; aperturā ovatā, parencutulā, labro columellarī reflexo.*

**THE TURBO-LIKE AMPULLARIA.** Shell oblong-turbinate, rather solid, almost imperforated, spire exserted, whorls convex, smooth; olive-green, obscurely banded; aperture ovate, rather small. columellar lip reflected.

*Hab.* Australia.

A dull smooth olive-green species, faintly banded, of a *Turbo*-like growth.

Species 38 (Mus. Cuming.)

**AMPULLARIA OLIVACEA.** *Amp. testā suboblongo-globosā, ex umbilicata; spirā mediocri, anfractibus ad salarum caudicinatis, deinde convexis, longitudinā der corrugato-stratis; virente-olivacea; aperturā latō-oblongā, subangulā, labro intus aurantio-rufa.*

**THE OLIVI AMPULLARIA.** Shell somewhat oblong-globose, scarcely umbilicated, spire moderate, whorls slightly channelled at the suture, then convex, longitudinally corrugately striated; greenish-olive; aper-

ture lunar-oblong, rather large, lip tinged with orange-red without.

SPIX, Test. Fluv. Brasiliensia, pl. 3. f. 1.

*Hab.* ——?

Allied to *A. urceus*, but less roughly wrinkled, and of a lighter olive-horn colour, tinged in the mouth with a warm orange-red.

Species 39. (Mus. Cuming.)

**AMPULLARIA LYMNEAE-FORMIS.** *Amp. testā compressē rotundatā, subulus excavatā, subauplites umbilicatā, spirā subinversā, anfractibus supernē planulatis, deinde plano-concisis; sordide glandulā, fasciis quatuor fuscis distantibus angustis cingulatā; aperturā ovatā, latē expandida.*

**THE LYMNEA-SHAPED AMPULLARIA.** Shell compressly ovate, hollowed beneath, rather largely umbilicated, spire slightly immersed, whorls flattened round the top, then flatly convex; dull glaucous, encircled with four distant narrow brown bands; aperture ovate, largely expanded.

*Hab.* River Marañon.

This fine species is distinguished by its elegantly compressed *Lymnaea*-like form, and largely expanded aperture

Fig. 40. (Mus. Cuming.)

This shell, though differing so much in appearance from *A. Leyardi*, represented at Pl. VI. Fig. 27, is identical with it, and illustrates an example of the same species with the surface mottled.

*Ampullaria, Pl. II.*

# AMPULLARIA.

## PLATE IX.

### Species 41. (Mus. Cuming.)

**AMPULLARIA FASCIATA.** *Amp. testā ovato-globosā, tenui, inflatā, umbilicatā, spirā parvissimā, subimmersa, anfractibus ad suturam impressè canaliculatis, deinde rotundatis, malleatis, nitentibus; livido-glaucā, fasciis angustis rufescente-glaucis clavigata;* aperturā ovatā, subovatā.

**THE BANDED AMPULLARIA.** Shell ovately globose, thin, inflated, umbilicated, spire rather small, slightly immersed, whorls impressly channelled at the suture, then rounded, malleated, shining; livid glaucous, encircled with narrow reddish-glaucous bands; aperture ovate, rather large.

*Hab.* ——?

A very characteristic elegantly convoluted species, deeply impressed at the suture and conspicuously umbilicated, of light texture and pale glaucous colour, encircled with darker reddish-glaucous bands.

We select this out of the many that have been described and figured by authors under the name of *A. fasciata*, trusting it may henceforth be regarded as the fixed type of that species.

---

### Species 42. (Fig. 42 and 43, Mus. Cuming.)

**AMPULLARIA INSULARUM.** *Amp. testā ovato-globosā, tenuiculā, inflatā, angustè profundi umbilicatā, spirā breviissimā, immersa, anfractibus ad suturam impressè canaliculatis, deinde convexis, undique densè reticulato-striatis; olivaceo-virente, pallide fasciatā; aperturā circulari-ovatā, labro integro, intus rufo-aureantio tincto.*

**THE ISLAND AMPULLARIA.** Shell ovately globose, rather thin, inflated, narrowly deeply umbilicated, spire very

short, immersed, whorls impressly channelled at the suture, then convex, everywhere closely reticulately striated; olive-green, faintly banded; aperture circular-ovate, lip entire, tinged with reddish-orange.

D'ORBIGNY, Voy dans l'Amér. Mérid. Moll. p. 374, pl. 51, f. 1, 2.

*Hab.* Isles of Parana; D'Orbigny. Rio Grande, Bolivia: Bridges.

The shells represented at Fig. 42 and 43 illustrate two different states of this species; one in which the surface is finely indented striated, the other in which it is also ridged and malleated. The suture is deeply impressed and the aperture nearly circular and warmly tinged with orange. M. D'Orbigny describes having found specimens among the water-plants in the lakes and brooks of the Isles of Parana, La Plata, which he kept alive for a twelve-month afterwards without water.

---

### Species 44. (Mus. Cuming.)

**AMPULLARIA PAPYRACEA.** *Amp. testā globoso-turbinatā, tenuissimā, imperforatā, spirā exsertā, obsolete spiriter livatā, anfractibus convexis, levibus, nitentibus, undique intensè rufo-nigrā; aperturā pyriformi-oblongā, labro columellarī tenui reflexo.*

**THE PAPER AMPULLARIA.** Shell globosey turbinated, very thin, imperforated, spire exerted, obsoletely spirally ridged, whorls convex, smooth, shining, everywhere intense red-black; aperture pyriformly oblong, columellar lip thinly reflected.

SPIX, Test. Flv. Brasilensis, p. 3, pl. 4, f. 1, 2.  
*Hab.* Meobamba, Western Brazil.

Chiefly distinguished by its peculiarly light horny texture, and very dark shining ebony colour.

# AMPULLARIA.

## PLATE X.

### Species 45. (Mus. Cuming.)

**AMPULLARIA ORONOCENSIS.** *Amp. testa globosa, ampliter perspectice umbilicata, spirae breviuscula, anfractibus superne impresso-planis, deinde rotundatis; intensè olivaceo-virente, fasciis angustis nigris cingulata; apertura pyriforme-ovata, labro intus intensè aurantio-sanguinea.*

**THE ORONOCO AMPULLARIA.** Shell globose, largely perspective umbilicated, spire rather short, whorls impressly flattened at the upper part, then rounded; dark olive-green, encircled with narrow black bands; aperture pyriformly ovate; lip deep orange, blood-red within.

ZIEGLER, Mus. Cuming.  
*Hab.* River Oronoco.

Of very characteristic helicoid growth, forming a large perspective umbilicus, distinguished by its vivid colouring. The outer surface of the shell is painted with narrow black bands upon a rich olive-green ground, whilst the aperture is stained with blood-red passing into orange.

### Species 46. (Fig. 46 and 47, Mus. Cuming.)

**AMPULLARIA GLOBOSEA.** *Amp. testa rotundato-globosa, angustè profundi umbilicata, spiræ brevi, obtusa, interdum subexserta, anfractibus rotundatis, levibus, nitentibus, plus minus malleatis; lutescente-olivaceæ, viz. fasciata; apertura lunato-oblonga, ampliæ, labro intus rotundato, flavescente.*

**THE GLOBOSE AMPULLARIA.** Shell rotundately globose, narrowly deeply umbilicated, spire short, obtuse, sometimes a little exserted, whorls rounded, smooth, shining, more or less malleated; yellowish olive, scarcely banded; aperture lunar oblong, large, lip thickened, yellowish.

SWAINSON, Zool. Illus. First Series, Pl. 119.  
Eadem var. *Ampullaria corrugata*, Swainson.

### *Ampullaria pachystoma*, Benson.

*Hab.* Calcutta (in the Botanic Gardens); Benson.

Peculiarly distinguished by its shining olive, malleated, globular form and thickened peristome. The specimens being more or less smooth or wrinkled, with Fig. 46 and 47, represent the extreme states of the species, the spire more or less acuminate and the umbilicus larger or smaller.

---

**Species 48. (Mus. Cuming.)**  
**AMPULLARIA AMPULLACEA.** *Amp. testa pyriforme-globosa, basin versus attenuata, angustè compressæ umbilicata, spiræ brevi, obtusa, anfractibus superne declivibus, deinde plano-convexis, levibus; castaneo-olivaceæ, fasciæ angustis numerosis cingulataæ; apertura pyriforme-oblonga, ampliæ, labro intus aurantio-rufo plus minus tincto.*

**THE JUG AMPULLARIA.** Shell pyriformly globose, attenuated towards the base, narrowly compressly umbilicated, spire short, obtuse, whorls slanting round the upper part, then slightly convex, smooth; chestnut-olive, encircled with numerous narrow bands; aperture pyriformly oblong, large, lip more or less tinged within with orange-red.

*Helix ampullacea*, Linneus, Syst. Nat. p. 1244.

*Nerita ampullacea*, Müller.

*Ampullaria fasciata*, Lamarek.

*Bulinus ampullaceus*, Bruguière.

*Ampullaria ampullacea*, Féussac.

*Ampullaria magnifica*, Dunker.

*Ampullaria Swatrensis*, Philippi.

*Ampullaria Celebensis*, Quoy and Gaimard.

*Hab.* Borneo.

This appears to be the old Linnean type of the genus so far as it is possible to determine it. The shell is chiefly distinguished by a characteristic globosely pear-shaped form.

50.

51.

52.

53.

# AMPULLARIA.

## PLATE XI.

Species 49 (Mus. Cuming.)

AMPULLARIA DYSONI. *Amp. testá globosá, profundiè umbilicatá, spirá acuminatá, anfractibus superne declivibus, deinde tenuido-roundatis, conspicuè malleatis; livido-griseá, ferruginea tinctá; aperturá pyriformi-oblongá, fauce livido-purpureá.*

DYSON'S AMPULLARIA. Shell globose, deeply umbilicated, spire acuminated, whorls slanting at the upper part, then timidly rounded, conspicuously malleated; livid grey, tinged with rust: aperture pyriformly oblong, livid purple within.

HANLEY, Couch. Miscellany, No. 1. Pl. 2. Fig. 7.

Hab. Honduras; Dyson.

This species scarcely differs from *A. malleata*, except in being more umbilicated and more globosely acuminated towards the spire.

Species 50. (Fig. 50 and 51, Mus. Cuming.)

AMPULLARIA BRIDGESII. *Amp. testá oblongá, tenui, subprofundiè unoïlicatá, spirá turrilá, anfractibus superne latè plane-angulatis, deinde concezis, lœvibus, submalleatis, virente-olivaceá, interdum sordidè olivaceo-brunneá, fascis angustis numerosis cingulatá; aperturá orato-oblongá, labro effuso.*

BRIDGES'S AMPULLARIA Shell oblong, thin, rather

deeply umbilicated, spire turreted, whorls broadly flatly angled at the upper part, then convex, smooth, faintly malleated; greenish-olive, sometimes dusky olive-brown, encircled with numerous narrow bands: aperture ovately oblong, lip effused.

Hab. Rio Grande, Bolivia; Bridges.

This fine species, collected in the interior of Bolivia by Mr. Bridges, is remarkably distinguished by the broad spiral shelf which is formed by the angular structure of the upper part of the whorls next the suture.

Species 52. (Mus. Cuming.)

AMPULLARIA IMMERSA. *Amp. testá ovatá, tenui, ventricosá, spirá brevi, peculiariter immersá, anfractibus ad suturam profundiè canaliculatis, deinde convexis, levibus; virescete-olivaceá, versus spiram pallidá, fascis angustis cingulatá; aperturá ovatá, labro subeffuso.*

THE IMMERSED AMPULLARIA. Shell ovate, thin, ventricose, spire short, peculiarly immersed, whorls deeply channelled at the suture, then convex, smooth; greenish-olive, pale towards the spire, encircled with narrow bands; aperture ovate, lip rather effused.

Hab. Rio Grande, Bolivia; Bridges.

A light ventricose species, deeply channelled at the suture, with the spire peculiarly rudely immersed.

August, 1856.

53.

55.

56.

57.

# A M P U L L A R I A.

## PLATE XII.

### Species 53. (Mus. Cuming.)

AMPHULLARIA ZONATA. *Amp. testā subquadrato-ovalē, tenuis, inflatā, angustē profunde umbilicatā, spira brevis, conoidā, anfractibus superē latē rotundatis, subbasī basin versus attenuato; latero-olivaceā, lineis nigris, virginalibus, et viridiis promiscue cingulatā; apertura octā, ampliter effusa, fauce aurantio-lutea.*

THE ZONED AMPULLARIA. Shell somewhat squarely ovate, rather thin, inflated, narrowly deeply umbilicated, spire short, conuminate, whorls broadly rounded at the upper part, the last whorl attenuated towards the base; yellowish-olive, promiscuously shaded with red, black, and green lines; aperture ovate, largely effused, interior orange-yellow.

*SPEC. Test. Fluv. Brasilensis, p. 1. pl. 2. f. 1, 2.  
Hab. Colombia.*

The shell here figured, the only specimen we have been able to refer to *A. zonata*, corresponds with the variety figured by Dr. Spix with the name *A. Archimedes*.

### Species 54. (Mus. Cuming.)

AMPHULLARIA VERMIFORMIS. *Amp. testā globo-turbidatā, subampuller umbilicatā, spira mediocri, anfractibus ad suturam impressō canaliculatus, deinde rotundatā, subradē striatis; latero-olivaceā, fasciis virescibus angustis cingulatā; apertura circulari-ovalē, fauce aurantio tinctā.*

THE VERMIFORM AMPULLARIA. Shell globosely turbidated, rather largely umbilicated, spire middling, whorls impressly channelled at the suture, then rounded, rather roughly striated; yellowish-olive, encircled with narrow faint green bands; aperture circular-ovate, interior tinged with orange.

*Hab. Paraguay.*

Distinguished from *A. insularum*, to which it is closely allied, by its more spirally turbinated growth, larger umbilicus, and painting of narrow green bands.

### Species 55. (Mus. Cuming.)

AMPHULLARIA AMAZONICA. *Amp. testā oblongo-ovatā subangustē profunde umbilicatā, spira exsertā, anfractibus ad suturam impressā, deinde convexis, longitudinaliter striatis; virgente-olivaceā, obscurē fasciatā; apertura pyriformi-oblongā, fauce aurantio tinctā.*

THE AMAZON AMPULLARIA. Shell oblong-ovate, rather narrowly deeply umbilicated, spire exerted, whorls impressed at the suture, then convex, longitudinally striated; greenish-olive, obscurely banded; aperture pyriformly oblong, interior tinged with orange.

*Hab. River Amazon.*

Closely resembling Mr. Swainson's drawing of *A. reflexa*, but of larger size and differently coloured in the mouth.

### Species 56. (Mus. Cuming.)

AMPHULLARIA CASSIDIIFORMI. *Amp. testā oblongā, ver-sus basī attenuatā, subangustē profunde umbilicatā, spira breviusculā, conoidā, anfractibus superē tu-mido-declivibus, deinde plano-concexis; latero-te-riridi, nigricante obscurē fasciatā; apertura pyri-formi-oblongā, fauce livido-purpureā, labro columel-lari interdum sanguineo tincto.*

THE CASSIS-SHAPED AMPULLARIA. Shell oblong, attenuated towards the base, rather narrowly deeply umbilicated, spire rather short, conoid, whorls tu-midly slanting at the upper part, then flatly convex; yellowish-green, obscurely banded with blackish-brown; aperture pyriformly oblong, interior livid purple, columellar lip sometimes tinged with blood-red.

*Hab. Lake of Maracaibo, Venezuela.*

A fine species from Venezuela, distinguished by its oblong Cassis-like form.

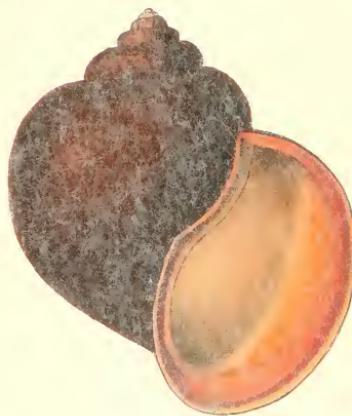

35.

36.

37.

38.

39.

# AMPULLARIA.

## PLATE XIII.

### Species 57. (Mus. Cuming.)

AMPULLARIA MACRA. *Amp. testa globosa, angustè umbilicata, spiræ brevissimæ, exfractibus ad suturas planatus, deinde rotundatis, levibus; saturæ olivaceæ; aperturæ ovatae, labo intus purpuro-nigro tincto.*

THE MOOR AMPULLARIA. Shell globose, narrowly umbilicated, spire rather short, whorls a little flattened at the sutures, then rounded, smooth; dark olive; aperture ovate, lip stained within with purple-black.  
*Hab.* —?

Of a particularly globose form, the lip being characteristically stained within with purple or chestnut-black.

### Species 58. (Mus. Cuming.)

AMPULLARIA CARINATA. *Amp. testa globosa, crassæ, angustè umbilicata, spiræ subobsoletæ, anfractibus superne planis-angulatis, deinde convertis; intense-olivaceæ; spiræ rotunda, labo incrassato, late tueto.*

THE KILLED AMPULLARIA. Shell globose, thick, narrowly umbilicated, spire rather obtuse, whorls flatly angled at the upper part, then convex; yellowish-green; aperture ovate, lip thickened, tinged with yellow.

SWAINSON (not of Lamarck), Zoological Illustrations.  
*Hab.* Indiæ.

A round shell of solid growth, with the whorls abruptly angled near the upper part so as to present a narrow shelf, not impressed as in the *t. caminatula*, which Lamarck further characterizes as having a pointed apex.

### Species 59. (Mus. Cuming.)

AMPULLARIA ERYTHROSTOMA. *Amp. testa globoso-rotundata, profunde umbilicata, spiræ acuminato-obtusa, anfractibus rotundatis, longitudinaliter corrugato-striatis; intensè olivaceo-castaneæ; aperturæ ovaliæ, subangustæ, labo intus coloris sanguiorum.*

THE RED-MOUTHED AMPULLARIA. Shell globosely turbinated, deeply umbilicated, spire acuminately exerted, whorls rounded, longitudinally wrinkle-striated;

ated; dark olive-chestnut; aperture ovate, rather large, lip deep blood-red within.

*Hab.* Zanzibar; Mr. T. Thorn.

This fine dark species, with blood-red-stained mouth, is perfectly distinct from any hitherto described.

### Species 60. (Mus. Cuming.)

AMPULLARIA HOPETONENSIS. *Amp. testa subtriangularis-globosa, tumidissimæ, mediorictre umbilicata, anfractibus superne impreso-declicibus, deinde concavæ, levibus; virescente-olivaceæ; versus spiram pallidore, fasciæ angustæ saturatioribus cingulata; aperturæ ovaliæ fuscæ nigricante-parpurae.*

THE HOPETOWN AMPULLARIA. Shell somewhat triangularly globose, rather swollen, moderately umbilicated, whorls impressly slanting round the upper part, then convex, smooth; greenish-olive, paler towards the spire, encircled with narrow darker bands; aperture ovate, interior blackish-purple.

LEA, Trans. Amer. Phil. Soc. vol. v. pl. 19. f. 84.

*Hab.* Darien, Georgia.

A tumid globose shell, inclined somewhat angularly towards the base

### Species 61. (Mus. Cuming.)

AMPULLARIA LUBRICA. *Amp. testa globoso-ovaliæ, angustissimæ umbilicata, spiræ subversata, apice obtusa, anfractibus convexis, longitudinatiter rugoso-striatis, rotundibus quasi lobatis; levido-olivaceæ, atra-quinæ; aperturæ ovaliæ, basi subflusæ.*

THE GLAZED AMPULLARIA. Shell globosely ovate, very narrowly umbilicated, spire rather exerted, obtuse at the apex, whorls convex, longitudinally rugosely striated, shining as if glazed; livid olive, black-smeared; aperture ovate, rather effused at the base.  
*Hab.* —?

Of a peculiar glazed livid black-smeared olive-colour, with a narrow scarcely perceptible umbilicus, the aperture being a little effused at the base.

# AMPULLARIA.

## PLATE XIV.

### Species 62. (Mus. Cuming.)

**AMPULLARIA COMPACTA.** *Amp. testa subgloboso-ovata, cix umbilicata, spirâ breviusculâ, anfractibus convexis, levibus; fulvescente-olivaceâ, fasciis virgineis cingulata; aperturâ oblongo-ovata, ad marginem marginata.*

**THE COMPACT AMPULLARIA.** Shell somewhat globosely ovate, scarcely umbilicated, spire rather short, whorls convex, smooth; fulvous-olive, encircled with greenish bands; aperture oblong-ovate, marbled at the edge.

*Hab.* Malacca.

A smooth dark olive species, scarcely umbilicated, with either a contracted aperture, the interior being purple-brown, with a thickened rim of opaque blue-white near the edge.

### Species 63. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA NOTABILIS.** *Amp. testa subquadrato-ovata, tenui, inflata, umbilicata, spirâ breviusculâ, anfractibus rotundato-productis, levibus, malefatis; fulvo-spatulâ, fasciis angulis, interrupitis, subsoletis cingulata; aperturâ ampliâ, fauce conspicue fasciata.*

**THE REMARKABLE AMPULLARIA.** Shell somewhat squarely ovate, thin, inflated, umbilicated, spire very short, whorls rotundately produced round the upper part, smooth, malefated; fulvous-fawn, encircled with faint narrow interrupted bands; aperture large, with the bands conspicuously marked in the interior.

*Hab.* —?

A light inflated species, having the upper part of the whorls almost on a plane with the spire.

### Species 64. (Mus. Cuming.)

**AMPULLARIA OVATA.** *Amp. testa ovata, tenuidiusculâ, subangustâ umbilicata, spirâ exsertâ, anfractibus concisis, undato-striatis; virgescute-olivaceâ, aperturâ ovata, litorâ columellarâ subcrevosa.*

**THE OVATE AMPULLARIA.** Shell ovate, rather swollen, rather narrowly umbilicated, spire exserted, whorls

convex, wave-striped; greenish-olive; aperture ovate, columellar lip slightly recurved.

**OLIVIER.** Voy. dans l'Empire Ottoman, l'Egypte et la Perse, vol. ii. p. 39. pl. 31. f. 1.  
*Hab.* Egypt.

Of a regularly tumid ovate form, characterized with longitudinally waved striae.

### Species 65. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA NUBILA.** *Amp. testa conico-ovata, Turbiniformis, solida, vix umbilicata, spirâ acuminato-exsertâ, anfractibus rotundatis, levibus, hic ille caricosus; latenteante, olivaceo-viridi interrupte fasciatis et nebulatis; aperturâ parvissimâ, subcirculari, obliquè effusa.*

**THE CLOUDY AMPULLARIA.** Shell conically ovate, Turbo-shaped, solid, scarcely umbilicated, spire acuminately exserted, whorls rounded, smooth, here and there varicose; yellowish, interruptedly banded and clouded with olive-green; aperture rather small, nearly circular, obliquely effused.

*Hab.* River Salomons; Mr. Yates.

A solid Turbo-like species, unusually acuminately convoluted, clouded with olive-green upon a dull fulvous-yellow ground.

### Species 66. (Mus. Cuming.)

**AMPULLARIA TROCHULUS.** *Amp. testa globosa, subampliata umbilicata, spirâ breviusculâ, acute acuminata, anfractibus superiore declivibus, deinde convexis; fulvo-olivaceâ, fasciis angulis crescentibus numerosa cingulata; aperturâ oblongâ, subangusta, fauce conspicue fasciata.*

**THE TOP AMPULLARIA.** Shell globose, rather largely umbilicated, spire rather short, sharply acuminated, whorls slanting round the upper part, then convex; fulvous-olive, encircled with numerous narrow green bands; aperture oblong, rather narrow, bands conspicuous in the interior.

*Hab.* —?

A globose many-banded shell, with a characteristic sharply acuminated spire.

# AMPULLARIA.

## PLATE XV.

*Species* 67. (Mus. Cuming.)

**AMPUllARIA MALABARICA.** *Amp. testa orata, angustè umbilicata; fulvo-olivacea, spirâ suberectâ, anfractibus superiorē decoloratis et minutiâ rugosis, deinde convexis, levibus, nitenibus, vix malleatis; aperturâ peccata, labro tenui, intus incrassato.*

**THE MALABAR AMPULLARIA.** Shell ovate, narrowly umbilicated; fulvous-olive, spire somewhat exerted, whorls slanting at the upper part and minutely wrinkled, then convex, smooth, shining, faintly malleated; aperture ovate, lip thin, thickened within.

**PHILIPPI,** Kuster, Conch. Cah. *Ampullaria*, p. 29. pl. 7. f. 8.

*Hab.* Malabar.

The outer surface of this species is shining fulvous-olive, with the umbilicus almost obsolete.

*Species* 68. (Fig. a, b, Mus. Cuming.)

**AMPUllARIA PRODUCTA.** *Amp. testa oblongo-orata, ad basin protracta, angustè umbilicata, umbilicus fratre obsoletus, spirâ subobtusa, anfractibus superiorē decoloratis et tenue rugosis, deinde plano-convezis: olivacea, rufocastanea fasciata; aperturâ oblonga, ad basin effusa, ad marginem mucosata.*

**THE PRODUCED AMPULLARIA.** Shell oblong-oval, produced at the base, narrowly umbilicated, umbilicus almost obsolete, spire rather obtuse, whorls slanting, and finely wrinkled at the upper part, then flatly convex; olive, banded with reddish-chestnut; aperture oblong, effused at the base, spotted at the edge.

*Hab.* —?

This species is chiefly characterized by its oblong-oval form, produced and effused at the base.

*Species* 69. (Mus. Cuming.)

**AMPUllARIA REFLEXA.** *Amp. testa globosa, subprofunda umbilicata, spirâ brevi, anfractibus ad suturam subimpressis, deinde rotundatis, levibus, nitenibus, obscurè*

*corrugatis et malleatis; virente-olivacea, vires fasciisque angustis nigricantibus cingulata; aperturâ ovalâ, intus nigricante-purpureâ, labro intus nigrescente.*

**THE REFLECTED AMPULLARIA.** Shell globose, rather deeply umbilicated, spire short, whorls somewhat impressed at the suture, then rounded, smooth, shining, obscurely wrinkled and malleated; greenish-olive encircled with dark lines and narrow bands; aperture oval, interior blackish-purple, lip black within.

**SWAINSON,** Zoological Illustrations, vol. iii. pl. 172  
*Hab.* —?

A globose shell, very symmetrically convoluted, chiefly distinguished by its blackish-purple interior, the lip being stained within darker.

*Species* 70. (Fig. a, b, Mus. Cuming.)

**AMPUllARIA OBLONGA.** *Amp. testa subtrigono-oblonga, solidinscula, angustè umbilicata, spirâ subpyramidalis, anfractibus ad suturam plano-impresso, deinde rotundato-angulatis; albida, epidermide fulvo-indata, apice carneâ; aperturâ angustè oblonga, labro columellaris reflexo*

**THE OBLONG AMPULLARIA.** Shell somewhat triangularly oblong, rather solid, narrowly umbilicated, spire subpyramidal, whorls flatly impressed at the suture, then rotundately angled; whitish, covered with a fulvous epidermis, flesh-tinged at the apex; aperture narrowly oblong, columellar lip reflected.

**SWAINSON,** Zoological Illustrations, vol. iii. pl. 136.  
*Hab.* —?

An interesting species, distinguished by its peculiarly oblong form, and light fulvous external colouring.

*Fig. 71. (Mus. Cuming.)*

The shell here figured is a variety of *A. conspecta*, represented in the preceding Plate, of which there are several, all distinguished by a peculiar narrow contracted umbilicus.

# AMPULLARIA.

## PLATE XVI.

Fig. 72. (Mus. Cuming.)

An interesting banded variety of *A. sordida*, represented by Pl. III. Fig. 14, presenting a link with *A. melanocheila*, Sp. 24.

Species 73. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA SCALARIS.** *Amp. testā pyriformi-ovatā, crassissimā, umbilicatā, spirā declivi-pyramidalē, acutā, angustisuperē latē planō-angulatā, deinde convexis, ultimā anticē descendente; purpuro-fusca, ad angulum lido-albicans; aperturā ovali, fance albida.*

**THE LADDER AMPULLARIA.** Shell pyriformly ovate, rather thick, umbilicated, spire slantingly pyramidal, sharp, whorls broadly latly angled at the upper part, then convex, last whorl descending in front; purple-brown, livid whitish at the angle; aperture oval, interior whitish.

D'ORBIGNY, Voy. dans l'Amérique Mérid. Moll. p. 374. pl. 50. f. 1-3.

*Hab.* Bolivia; D'Orbigny. Bridges.

Singularly distinguished from all other species of the genus by its broad angularly turbinated spire.

Species 74. (Mus. Cuming.)

**AMPULLARIA LABIOSA.** *Amp. testā obliquē globosā, sub-angustē umbilicata, spirā exsertinata, acutā, angustisubtibus convexis, niteatibus, longitudinaliter striatis et malleatis; fulvo-straminea; aperturā oblongo-ovatā, expansā, labro columellarī reflexo, fance ad marginem fulvo-aureatā.*

**THE LIPPED AMPULLARIA.** Shell obliquely globose, rather narrowly umbilicated, spire somewhat exserted, sharp, whorls convex, shining, longitudinally striated and malleated; fulvous straw-colour; aperture oblong-ovate, expanded, columellar lip reflected, interior fulvous-orange at the edge.

KOCH. Philippi, in Käster, Conch. Cab. *Ampullaria*, p. 58. pl. 18. f. 5.

*Hab.* India.

Of a peculiar obliquely expanded globose form, with a characteristic shining fulvous straw-coloured exterior, the aperture being edged within with fulvous-orange.

Species 75. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA DOLOIDES.** *Amp. testā ovatā, tenui, ventricosa, angustē umbilicata, spirā brevi, acutā, angustisubtibus convexis, niteatibus, ad suturas impressis, ultimo ampliata (nudata et expansa; cincta-olivacea, obscurè rufa-fasciata, fascis linearibus, irregularibus; aperturā perampulata, aperta, labro columellarī reflexo.*

**THE DOLUM-LIKE AMPULLARIA.** Shell ovate, thin, ventricose, narrowly umbilicated, spire short, sharp, whorls convex, shining, impressed at the sutures, last whorl largely swollen and expanded; ashi-olive, obscurely red-banded, bands linear, irregular; aperture very large, open, columellar lip reflected.

*Hab.* Bombay.

An elegantly convoluted species, of light semitransparent substance, the last whorl being unusually larger than the rest, and openly expanded.

Species 76. (Mus. Cuming.)

**AMPULLARIA ENCAUSTICA.** *Amp. testā globosā, basius versus obtusā attenuatā, via umbilicata, tenui, pellicidā, spirā brevi, obtusa, angustisubtibus convexis, levibus, nitentibus; virescent-olivacea; aperturā oblongo-ovatā, labro breviter reflexo, carneola-aureantia.*

**THE ENAMELLED AMPULLARIA.** Shell globose, obtusely attenuated towards the base, scarcely umbilicated, thin, transparent, spire short, obtuse, whorls convex, smooth, shining; greenish-olive; aperture oblong-ovate, lip shortly reflected, carnelion-orange.

*Hab.* —?

An apparently solid globular species, but, in reality, thin and semitransparent. The colour is a shining smooth greenish-olive, with the lip bright carnelion-orange.

78a.

77

78b.

79

80a.

# AMPULLARIA.

## PLATE XVII.

Species 77. (Mus. Cuming.)

**AMPULLARIA HEPATARIA.** *Amp. testa subglobosa, tenui, subangustâ, anguste umbilicata, spirâ brevissimâ, acutâ, aufractibus superne decliebus, deinde concavis, subrotatis, longitudinaliter striatis; livido-spadicis, cerasis opaco-pellucido-cornatis; apertura ovata, labro ciliato, lori tenue reflexo.*

THE LIVER AMPULLARIA. Shell subglobose, thin, rather inflated, narrowly umbilicated, spire rather short, pointed, whorls slanting round the upper part, then convex, shining, longitudinally striated; livid fawn-colour, transparent flesh towards the apex; aperture ovate, columellar lip thinly reflected.

Hub. —?

Of light inflated growth, thin in substance, characterized by a peculiar livid-fawn or liver-colour, changing towards the apex into a transparent flesh tint.

Species 78. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA VITTATA.** *Amp. testa globoso-turbinata, subangustâ umbilicata, spirâ exsertâ, aufractibus rotundatis, tardas, superne tenuissimâ plicato-striatis; fuligineo-olivaceâ, fasciis brunneis angustis numerosis cingulatis; apertura ovata, fauce livido-purpurascente, ad marginam maculata.*

THE FILLETED AMPULLARIA. Shell globose turbinated, rather narrowly umbilicated, spire exserted, whorls rounded, smooth, very finely plicated at the upper part; fulvous-olive, encircled with numerous narrow brown bands; aperture ovate, interior livid-purple, blottedched at the edge.

Hub. Philippine Islands; Cuming.

This species, which Mr. Cuming possesses in several states, is characterized throughout by a uniform fulvous-olive ground, encircled with narrow brown bands more than usually numerous.

Species 79. (Mus. Cuming.)

**AMPULLARIA CANALICULATA.** *Amp. testa globosa, subcylindrica, subangustâ umbilicata, spirâ brevi, acutâ, aufractibus concavis, longitudinaliter striatis, superne convexo-convoluculatis; pallide cinereâ, satureâ fasciatâ, sub epidermis tenui olivacea; aperturâ pyriforme-nudâ, coruscante, prope columellanâ aurantio-rufâ.*

THE CHANNELLED AMPULLARIA. Shell globose, somewhat ventricose, rather narrowly umbilicated, pine short, sharp, whorls convex, longitudinally striated, concavely channelled at the upper part; pale ash, dark banded beneath a thin olive epidermis; aperture pyriformly ovate, bluish, orange-red next the columella.

LAMARCK, Anim. sans vert. vol. viii. p. 534.  
Hub. Cashmere; Baron Hügel.

Chiefly distinguished from *A. immerse* and other channeled species of the genus by its sharp-pointed, though short, spire, a character specially noted by Lamarck.

Species 80. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA VITREA.** *Amp. testa ovato-turbinata, tenuisimâ, cornatâ, inflata, parum umbilicata, spirâ exsertâ, aufractibus primis quatuor angulatis, ad angulum indistincte carinatis, aufracta ultimâ superne declivi, angulo exornata, deinde concava; pellucido-brunnea, flaminis opaco-albitoë longitudinaliter irregulariter strigata; apertura ovata, labro columellaris tenui reflexo, nitente-atro.*

THE GLASSY AMPULLARIA. Shell ovately turbinated, very thin, horny, inflated, but slightly umbilicated, spire exserted, first four whorls angled, indistinctly keeled at the angle, last whorl slanting round the upper part, the angle gradually disappearing, then rounded; transparent brown, longitudinally irregularly streaked with opaque-whitish flames; aperture ovate, columellar lip thinly reflected, shining black.

*Helix vitrea*, Born, Test. Mus. Vindobonensis, pl. 15. f. 15, 16. Chemn. Conch. vol. xi. p. 282. pl. 210. f. 2072, 2073.

*Bulinus vitreus*, Bruguière, Deshayes.

Hub. —?

This extremely rare and curious shell, of transparent light horny texture, variegated with opaque epidermis-like flakes, hitherto referred to the genus *Bulinus*, appears to belong rather to *Amphallaria*.

Species 81. (Mus. Cuming.)

**AMPULLARIA CUMINGII.** *Amp. testa subglobosa-ovata, solidinclusa, profunda umbilicata, spirâ brevi, aufractibus superne planinclusis, deinde concavis, subdiscoideis; fulvo-cinereâ, fasciis angustis et lineis paucis refuscatis cingulata; apertura ovata, effusa, labro columellaris subincrustata.*

CUMING'S AMPULLARIA. Shell subglobosely ovate, rather solid, deeply umbilicated, spire short, whorls rather flat at the upper part, then convex, somewhat discoid; fulvous-ash, encircled with a few reddish narrow bands and lines; aperture ovate, effused, columellar lip rather thickened.

KING, Zoological Journal, vol. v. p. 344.

Hub. Island of Taboga, Panama.

A solid shell, of somewhat discoid growth, with the aperture thickened and much effused.

# AMPULLARIA.

## PLATE XVIII.

### Species 82. (Mus. Cuming.)

**AMPULLARIA PRUNULUM.** *Amp. testá globosá, subdiscoidális, prostratula umbilicata, spirá breviscula, acuminatá, superfície superne impreso-planis, deinde concavis; bandas cingulatá, lineis fuscescente obscurè cingulatá; aperturá rotundá, labro columellarí subeffuso, fave palbalia aurantia.*

**THE LITTLE PLUM AMPULLARIA.** Shell globose, subdiscoid, deeply umbilicated, spire rather short, acuminated, whorls impressly flattened round the upper part, then convex; lивid olive, obscurely encircled with a faint brown line; aperture ovate, columellar lip rather effused, interior pale orange.

*Hab.* New Granada.

Of the same typical outline as *A. luteostoma*, but less closed, and having a narrower umbilicus, with little external painting except a faint line or two.

### Species 83. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA CUBENSIS.** *Amp. testá anglobosá, subprostata, rotundatá, spirá exserta, aufretillos rotundatis, rosaceis; fimbriæ exsertæ, fasciæ angustis rufis regulariter cingulatæ; aperturá octed, subexpansa.*

**THE CUBA AMPULLARIA.** Shell subglobose, rather deeply umbilicated, spire exserted, whorls rounded, smooth; lивid ash, regularly encircled with narrow red bands; aperture ovate, rather expanded.

*Hab.* Cuba.

The regularity of the red bands with which this species is striped, is rather a characteristic feature.

### Species 84. (Mus. Cuming.)

**AMPULLARIA LUTEOSTOMA.** *Amp. testá orbiculato-ventricosa, subdiscoidá, perampitier umbilicata, spirá breviscula, acuminatá, anfractibus superne subimpressis, deinde rotundatis; favecenti-fusca, lineis brunneis duabus vel tribus distantibus cingulatá; aperturá ovata, labro subeffuso, fave aurantia.*

**THE YELLOW-MOUTH AMPULLARIA.** Shell orbicularily ventricose, somewhat discoid, very largely umbilicated, spire rather short, acuminated, whorls rather

impressed round the upper part, then rounded, yellowish-brown, encircled with two or three distant brown lines; aperture ovate, lip somewhat effused interior orange.

*SWAINSON*, Zoological Illustrations, vol. iii. pl. 157.

*Amphullaria pachystoma* and *bulleata*, *Philippi*.

*Hab.* Venezuela.

Readily distinguished from the preceding species by its larger size and rougher epidermis-clad texture, the columellar lip being less broadly reflected back.

### Species 85. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA GLAUCA.** *Amp. testá orbiculato-ceentricos, subdiscoidé, ampliiter umbilicata, spirá brevis, anfractibus superne planulatis, deinde plano-concavis; fuscescente, fasciæ lineisque glauco-costaneis densè cingulatæ, aperturá ovatæ, ampliæ, labro columellarí latè effuso, fave aurantia.*

**THE GLAUCEOUS AMPULLARIA.** Shell orbicularily ventricose somewhat discoid, largely umbilicated, spire short, whorls flattened round the upper part, then flatly convex; pale brown, closely circled with glaucous-chestnut lines and bands; aperture ovate, large, columellar lip broadly effused, interior orange.

*Helix glauca*, Linnaeus, Mus. Urie. p. 667.

*Nerita effusa*, Müller.

*Helix oculus communis*, Gmelin.

*Helix neritina*, Gmelin.

*Bulinus effusus*, Bruguière.

*Amphullaria effusa*, Swainson.

*Amphullaria Gyrenensis*, Guérin.

*Hab.* — ?

A very characteristic species, distinguished by its shining porcelain-like aspect and broadly effused reflection of the columellar lip, which, with the interior, is enamelled orange, the external surface of the shell being closely lined and banded with glaucous-chestnut.

### Fig. 86. (Mus. Cuming.)

A variety of *A. Paludinoides*, represented at Pl. II. Fig. 9, in which the whorls are more globosely convoluted.

88a.

88b.

89.

90a.

90b.

91.

## AMPULLARIA.

### PLATE XIX.

Fig. 81. (Mus. Cuming.)

A variety of *A. compacta*, represented at Pl. XIV.  
Fig. 82

Species 88. (Fig. a, b, Mus. Cumming.)

AMPULLARIA FILOSA. *Amp. testa ovala, imperforata, spirâ brevi, apice plus minus erosa, aufretilibus superne plano-e galutis, striis elevatis undique filosis; fulvo-ventre-castaneo, fasciis angustis rotis numerosis cingulata; aperturâ oblongâ, basi effusa, labro columellaris albo, plicato-reflexo.*

TYPE THREADED AMPULLARIA. Shell ovate, imperforated, spine short, more or less eroded at the apex, whorls slightly angled at the upper part, encircled throughout with thread-like raised striae, fulvous-chestnut, encircled with numerous narrow red bands: aperture oblong, effused at the base, columellar lip white, faintly reflected.

Hab. — ?  
Madagascar.

This species is distinguished by a typical character of its own, represented most conspicuously in the surface being sculptured throughout with thread-like raised striae

Species 89. (Mus. Cumming.)

AMPULLARIA COMPLICATA. *Amp. testa oblongo-turbinalis, subimperforata, spirâ exsertâ, anfractibus concisis, subangulis, rotundatis, fluorescente-olivaceo, liseris rufo-fusco, numerosis, irregularibus; apertura ovala, parva, labro columellaris albo, reflexo*

THE CONTRACTED AMPULLARIA. Shell oblong (reflected), almost imperforated, spire exerted, whorls convex, rather narrow, rounded; yellowish-olive, encircled with numerous irregular red-brown lines: aperture ovate, small, columellar lip white, reflected.

Hab. — ?

A species well distinguished by its oblong turbinate form, and contracted aperture. The irregular linear painting is also a characteristic feature.

Species 90. (Fig. 90 a, b, and 91, Mus. Cuming.)

AMPULLARIA APERTA *Amp. testa conoideo-ovalis, angustè umbilicata, spirâ breviscula, acuminata, aufretilibus convexis, levibus; pallidè cinerea, lineis rufescens, cingulata, epidermide olivacea subornata induta, apertura subcirculata, subampula, conspicue obliquè effusa, labro reflexo.*

THE OPEN AMPULLARIA. Shell conoidly ovate, narrowly umbilicated, spine rather short, acuminated, whorls convex, smooth; pale ash, encircled with red lines and covered with an olive subhorny epidermis: aperture nearly circular, rather large, conspicuously obliquely effused, lip reflected.

PHILIPPI, Zeitschrift für Malac. 1849, p. 18.

Hab. — ?

Characterized by a peculiarly expanded aperture, and a light ash, red-lined colouring, covered by a thin shining horny epidermis.

# AMPULLARIA.

## PLATE XX

Species 92. (Mus. Cuming.)

**AMPULLARIA MUESTA.** *Amp. testá ovoato-globosá, angusté umbilicatá, spira subexsertá, anfractibus superne subrotundatis, deinde rotundato-angularis, tenuibus; sordidè olivaceo-fasciatis; angusta saturatioribus cingulatá; aperturá obsoori-ovatá, labro intus lutescere-allo.*

**THE MORNING AMPULLARIA.** Shell ovately globose, narrowly umbilicated, spire rather exserted, whorls slightly flattened at the upper part, then rounded, smooth; dull olive, encircled with narrow darker bands; aperture luar-ovate, lip yellowish-white within.

*Hab.* Ceylon; F. Layard.

A dull greenish-olive species, of globose form, narrowly compressly umbilicated, encircled with numerous faint bands, irregular in width, but mostly linear.

Species 93. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA GOSSEI.** *Amp. testá ovoato-globosá, solidiservatá, compressè umbilicatá, spira subexsertá, anfractibus superne rotundato-angularis, deinde convexis, obsoletè liratus et malleatus; castaneo-fuscá, obscurè fasciatis; aperturá ovalá, fuscá rufescente-aurantia, labro columellarí incrassato, reflexo.*

**GOSSE'S AMPULLARIA.** Shell ovately globose, rather solid, compressly umbilicated, spire rather exserted, whorls rotundately angled round the upper part, then convex, obsoletely ridged and malleated; chestnut-brown, obscurely banded; aperture ovate, interior reddish-orange, columellar lip thickened, reflected.

*Hab.* Jamaica; Gosse.

Allied to *A. decussata*, but of more solid growth, with the spire more exserted, and the columellar lip more thickened.

Species 94. (Mus. Cuming.)

**AMPULLARIA CINEREA.** *Amp. testá globosa, tenui, subangustá, angustè umbilicatá, spira brevi, anfractibus rotundatis, tenuibus, ultimo anticè descendente; pallidè cinerea, fuscis linearibus rufescente-fasciis tribus ad quatuor cingulatæ; aperturá pyriforme-ovalá, labro columellarí tenui reflexo.*

**THE ASH-COLOURED AMPULLARIA.** Shell globose, thin, rather inflated, narrowly umbilicated, spire short, whorls rounded, smooth, the last ascending in front pale brown, encircled with three to four linear reddish-brown bands; aperture pyriformly ovate, columellar lip thinly reflected.

*Hab.* Ceylon.

A peculiarly rounded species, thin and somewhat inflated, of a light ash-colour, encircled with faint bands, which, towards the apex, are like red-brown lines, of which only the uppermost one is visible.

Species 95. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA ELECTRINA.** *Amp. testá ovalá, tenuissimá, inflatá, profundiè umbilicatá, spira brevi, acuminatá, anfractibus ad suturam angustè impressis, deinde concavis, undique malleatis, nictentibus; rufescente-spatulatæ, obscurè multifasciatæ; aperturá ovalá, subampliata, labro columellarí tenui reflexo.*

**THE AMBER AMPULLARIA.** Shell ovate, very thin, inflated, deeply umbilicated, spire short, acuminated, whorls narrowly impressed at the suture, then convex, everywhere malleated, shining; reddish-fawn colour, obscurely many-banded; aperture ovate, rather large, columellar lip thinly reflected.

*Hab.* —?

A very light inflated species, of a pale amber-tinted reddish-fawn colour.

Species 96. (Mus. Cuming.)

**AMPULLARIA JAVANICA.** *Amp. testá conico-oblonga, eix umbilicatá, spira exserta, anfractibus concavis, subangustis, levibus; intus olivacea; aperturá ovalá, parviuscula, labro tenui.*

**THE JAVA AMPULLARIA.** Shell conically oblong, scarcely umbilicated, spire exserted, whorls convex, rather narrow, smooth; dark olive; aperture ovate, rather small, lip thin.

*Hab.* Java.

A smooth olive species, scarcely umbilicated, chiefly distinguished by its conically oblong form.

# AMPULLARIA.

## PLATE XXI

### Species 97. (Mus. Cuming.)

**AMPULLARIA TERES.** *Amp. testa subglobosa, subumbilicata, spiræ brevi, anfractibus superius subplanatis, deinde convexis, herbicis; olivacea, fasciis angustis vel angustioribus cingulatâ; aperturâ ovaliâ, labro columellarí subreflexo curvato lato.*

**THE TAPERING AMPULLARIA.** Shell subglobose, rather largely umbilicated, spire short, whorls somewhat flattened at the upper part, then convex, smooth; olive, encircled with four or five reddish bands; aperture ovate, columnellar lip slightly reflected, orange-tinted.

PHILIPPI, Zeitschrift für Malac., 1849, p. 19. Kuster,

Monog. p. 38, pl. 10, f. 4.

Hab. —?

This is the nearest allied species to *A. effusa*, which it much resembles, but is uniformly of smaller size, with the columnellar lip less broadly expanded.

### Species 98. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA SIMPLEX.** *Amp. testa oralâ, viz umbilicata, spirâ brevi, anfractibus convexis, levibus, ultimo sub-expanso; olivacea, fasciis angustis lineisque numerosis nigricante-rufis cingulatâ; aperturâ ovalâ, labro columellarí tenui reflexo.*

**THE SIMPLE AMPULLARIA.** Shell ovate, scarcely umbilicated, spire short, whorls convex, smooth, the last rather expanded; olive, encircled with numerous blackish-red lines and narrow bands; aperture ovate, columnellar lip thinly reflected.

Hab. —?

A thin, somewhat expanded shell, scarcely umbilicated against the thinly reflected columnellar lip, encircled with numerous blackish-red pencil lines and narrow bands.

### Species 99. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA CERASUM.** *Amp. testa subglobosa, minutiâ umbilicata, spirâ porrecteovalâ, acuta, anfractibus convexis, longitudinaliter plicato-striatis; olivaceo-cinerâ, pallidissimâ fasciatâ; aperturâ rotundato-ovalâ, labro reflexo, virende minato.*

**THE CHERRY AMPULLARIA.** Shell subglobose, minutely umbilicated, spire rather small, sharp, whorls convex, longitudinally plicately striated; ash-olive, very faintly banded; aperture rotundately ovate, lip reflected, bright scarlet.

HANLEY, Conch. Miscellany.

Hab. Mexico.

Of an obscure ash-olive colour, with a striking, bright cherry-coloured lip.

### Species 100. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA PATULA.** *Amp. testa suborbiculari, imperforata, tenâ, spirâ brevisimâ, oblonga, anfractibus oblique declivi-planulatis, deinde convexis, ultimo latissime expanso; virgescere-olivacea, lineis angulis rufis et rufis cingulata; aperturâ ampliâ, expansa.*

**THE OPEN-MOUTHED AMPULLARIA.** Shell suborbicular, imperfectly perforated, thin, spire very short, obtuse, whorls slantingly flattened round the upper part, then convex, the last very widely expanded; greenish-olive, encircled with irregular black lines; aperture large, expanded.

Hab. —?

A thin open-mouthed species, belonging to the same peculiar type of the genus as the large *A. Neritoidea*.

### Species 101. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA INTROPICTA.** *Amp. testa obliquè globosa, subdepressa, angustè umbilicata, spirâ brevi, obtusa, plus minus erosa, anfractibus angustis, superne planatis, longitudinaliter striatis; rufescere-aureatu, fasciis angustis olivaceis cingulatâ; aperturâ ferè circulari, expansa, fauce viridi colorata, labro rotundateli tenui reflexo.*

**THE INNER PAINTED AMPULLARIA.** Shell obliquely globose, rather depressed, narrowly umbilicated, spire short, obtuse, more or less eroded, whorls narrow, flattened at the upper part, longitudinally striated; reddish-orange, encircled with narrow olive bands; aperture nearly circular, expanded, vividly coloured within, columnellar lip thinly reflected.

Hab. —?

A very distinct and beautiful species, of an obliquely expanded depressed form, of a warm orange-colour, encircled with narrow olive bands, the colouring being particularly warm and bright in the interior of the shell.

### Species 102. (Mus. Cuming.)

**AMPULLARIA OLEA.** *Amp. testa subglobosa, viz umbilicata, spirâ brevisimâ, anfractibus rotundatis, longitudinaliter striatis; nitente-olivacea, fasciis dubiis angustis nigricante-rufis distantiis cingulatâ; aperturâ pyriforme-ovata.*

**THE OLIVE AMPULLARIA.** Shell subglobose, scarcely umbilicated, spire rather short, whorls rounded, longitudinally striated; shining olive, encircled with two distant narrow blackish-red bands; aperture pyriformly ovate.

Hab. —?

Of a peculiar compact subglobose form, with a shining olive surface, encircled with two distant linear bands

# AMPULLARIA.

## PLATE XXII.

Species 103. (Mus. Cuming.)

**AMPULLARIA PERNAMBUCENSIS.** *Amp. testa obliqua orbiculari, imperforata, lateraliiter compressa, spiræ pareæ, anfractibus convezis, ultimo peramplo, expansa; olivacea, lineis nigricantibus cingulata; aperturæ profunda, fauce nitente castaneæ, labro tenui reflexo.*

**THE PERNAMBUCO AMPULLARIA.** Shell obliquely orbicular, imperforated, laterally compressed, spire small, whorls convex, the last very large and expanded; olive-ash, encircled with faint blackish lines; aperture wide open, interior shining chestnut, lip thinly reflected.

*Hab.* Pernambuco.

A laterally compressed expanded shell, of light texture, richly coloured with dark chestnut in the interior.

Species 104. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA BULLA.** *Amp. testa subglobosa, angustæ umbilicata, spiræ subobtusa, anfractibus rotundatis, terribus; fulvo-olivaceæ, lineis refuscens ins. cingulata; aperturæ rotundato-ovata, labro tenui reflexo.*

**THE BUBBLE AMPULLARIA.** Shell subglobose, narrowly umbilicated, spire rather obtuse, whorls rounded, smooth; fulvous-olive, encircled with red lines; aperture roundately ovate, lip thinly reflected.

*Hab.* — ?

Of simple character, encircled upon a fulvous-olive ground with red lines, which are seen more conspicuously in the interior.

Species 105. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA ROISSYI.** *Amp. testa oblongo-conica, solidiuscula, angustæ profundæ umbilicata, spiræ obtusa, anfractibus rotundatis, superne decubitus, exiliissime densusim striatus; fulvo-olivæ, fasciæ angustæ olivaceo-nigricantibus cingulata; aperturæ pyriforme-ovata, labro columellarí subrotulso, subreflexo.*

**ROISSY'S AMPULLARIA.** Shell oblong-conical, rather solid, narrowly deeply umbilicated, spire rather obtuse, whorls rounded, slanting at the upper part, very finely densusately striated; fulvous-white, encircled with narrow olive-black bands; aperture pyriformly ovate, columellar lip rather callous, slightly reflected.

D'ORBIGNY, Moll. Voy. dans l'Amér. Merid., p. 377, pl. 52.  
f. 1-3.

*Hab.* Rio Parana, La Plata; D'Orbigny.

The substance of this shell is rather more callous than usual, typical of a distinct section of the genus.

Fig. 106. (Mus. Cuming.)

The shell here represented proves to be an oblong convoluted variety of *A. crassa*, described at Pl. I, Fig. 5.

Species 107. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA PHYSOIDES.** *Amp. testa semiglobosa, tenuissima, eis umbilicata, spiræ pareæ, anfractibus convezis, longitudinalliter eleganter impressæ undato-striatis, ultimo periglotta; pallidæ fulræ, carne tinctæ, fasciæ parvis rufis obscuris cingulata; aperturæ ampliæ, labro tenui reflexo.*

**THE PHYSA-LIKE AMPULLARIA.** Shell semiglobose, very thin, scarcely umbilicated, spire small, whorls convex, longitudinally elegantly impressively wave-striated, last whorl much inflated; light fulvous, flesh-tinted, encircled with a few obscure linear red bands; aperture large, lip thinly reflected.

*Hab.* Pernambuco.

Of the same typical form as *A. Pernambucensis*, but thinner and more inflated, and of a pale flesh-tinted fulvous colour.

Species 108. (Mus. Cuming.)

**AMPULLARIA SAXEA.** *Amp. testa oblongo-ovata, solidiuscula, angustæ obdeceatæ umbilicata, spiræ subobtusa, anfractibus superne subdepressis, obsolete angulatis, deinde rotundatis; olivacea; aperturæ pyriformis, oblonga, labro columellarí tenui reflexo.*

**THE STONY AMPULLARIA.** Shell oblong-ovate, rather solid, with a narrow covered umbilicus, spire rather obtuse, whorls a little depressed round the upper part, obsoletely angled, then rounded; olive; aperture pyriformly oblong, columellar lip thinly reflected.

*Hab.* — ?

An oblong-ovate shell, of rather solid texture, characterized by a faint depression round the upper whorls, causing a scarcely perceptible angle.

# AMPULLARIA.

## PLATE XXIII.

Species 109. (Mus. Hanley.)

**AMPULLARIA LARGILLIERI.** *Amp. testā orato-globosā, angustē umbilicatā, tenuiculā, spirā obtusā, anfractibus rotundatis, concentricā plicato-striatis; olivaceo-viridi; fasciis linearibus nigricantibus cingulatā; aperturā ovatā, subeffusa.*

**LARGILLIERI'S AMPULLARIA.** Shell ovately globose, narrowly umbilicated, rather thin, spine obtuse, whorls rounded, concentrically plicately striated; olive-green, encircled with blackish linear bands; aperture ovate, somewhat effused.

PHILIPPI, Zeitschrift für Malac., 1848, p. 192.

Hab. Madagascar; Largillier.

This shell, which we take to be Dr. Philippi's *A. Largillieri*, is the nearest allied to *A. Layardi* from Ceylon.

Species 110. (Fig. a, b, Mus. Metcalfe.)

**AMPULLARIA BILINEATA.** *Amp. testā globosā, tenū, subinflatā, vix umbilicatā, spirā brevi, obtusā, anfractibus convexis, tenuibus, nitentibus; livido-folescente; fasciis bilineoribus rufis duebus distansibus cingulatis; aperturā ovatā, labro subeffuso.*

**THE TWO-LINED AMPULLARIA.** Shell globose, thin, rather inflated, scarcely umbilicated, spine short, obtuse, whorls convex, smooth, shining; livid-fulvous, encircled with two distant red bi-linear bands; aperture ovate, lip slightly effused.

Hab. —?

An interesting species from the collection of Mr. Metcalfe, light and globose, with a smooth, shining, lividfulvous surface, encircled round the centre with a band of two reddish lines, and the same at the base.

Species 41. (Fig. b, Mus. Hanley.)

A fine characteristic specimen of the shell which we ventured to determine at Pl. IX. Sp. 41. to represent *A. fasciata*.

Species 111. (Mus. Hanley.)

**AMPULLARIA DEPRESSA.** *Amp. testā ovalā, subcentricosā, imperforatā, spirā breviusculā, anfractibus convexis, supernā subplanulatis; lateo-olivaceā, lineis viridibus cingulatā; aperturā oblongo-ovatā, ad basin subsinuata.*

**THE DEPRESSED AMPULLARIA.** Shell ovate, subventricose, imperforated, spire rather short, whorls convex, rather flattened at the upper part; yellowish-olive, encircled with green lines; aperture oblong-ovate, somewhat sinuated at the base.

SAY, Exped. S. Peters, vol. ii. p. 264.

Hab. —?

This species differs from *S. paludosa* of the same author, in being of a lighter and more inflated structure, rather attenuated towards the base; it is of a yellow-tinted olive colour, encircled with green lines.

Species 112. (Mus. Hanley.)

**AMPULLARIA BUSEA.** *Amp. testā ovalā, subcentricosā, ad basim attenuatā et effusa, imperforatā, spirā breviusculā, anfractibus supernē subdecurrentibus, deinde planocoverzis; fuscescente-fulida, lineis numerosis rufo-olivaceis cingulatā; aperturā oblongo-ovatā.*

**THE BOX AMPULLARIA.** Shell ovate, subventricose, attenuated and effused at the base, imperforated, spire rather short, whorls rather slanting at the upper part, then flatly convex; brownish-fulvous, encircled with numerous reddish-olive lines; aperture oblong-ovate.

Hab. —?

Resembling the former species in the contour of the aperture and absence of umbilicus, but more slanting and inclined to angularity next the suture.

Species 113. (Mus. Hanley.)

**AMPULLARIA HANLEYI.** *Amp. testā turbinatā, tenū, pellucidā, angustē umbilicatā, spirā ampliter exsertā, anfractibus rotundatis, subangulis, tenuibus; livido-folida, lineis rufoscenti-fuscis cingulatā; aperturā parviusculā, subcirculari, labro columellarī reflexo.*

**HANLEY'S AMPULLARIA.** Shell turbinated, thin, transparent, narrowly umbilicated, spine largely exerted, whorls rounded, rather narrow, smooth; livid-fulvous, encircled with red-brown lines; aperture rather small, nearly circular, columellar lip reflexed.

Hab. —?

A semi-transparent turbinated species, quite distinct from any that has preceded it.

## AMPULLARIA.

### PLATE XXIV.

Species 114. (Mus. Hanley.)

AMPULLARIA TESTUDINEA. *Amp. testa ovoato-ventricosa, tenui, angulis umbilicata, spiræ mediocri, anfractibus convexis, levibus, nitentibus; fulvescente-cinereâ, fusca luteo-purpureo-fuscâ, cinctâ cingulata; apertura ovalis, lobis simplici.*

THE TORTOISE-SHELL AMPULLARIA. Shell ovately ventricose, thin, narrowly umbilicated, spire moderate, whorls convex, smooth, shining; fulvous-ash, encircled with rust-brown bands and lines; aperture ovate, lip simple.

Hab. —?

A shell of light substance, much painted with light rust-brown bands and lines.

Species 115. (Fig. a, b, Mus. Hanley.)

AMPULLARIA LINNEI. *Amp. testa subovato-turbinate, ventricosa, subangulis umbilicata, spiræ exserta, anfractibus rotundatis, levibus, nitentibus, ad suturam rufè impressa; livido-glaucâ, fasciis angustis roseo-viridâ, cingulata; apertura ovalis, lobis subfusca.*

ITINERUS'S AMPULLARIA. Shell ovately turbinate, ventricose, rather narrowly umbilicated, spire exerted, whorls rounded, smooth, shining, somewhat rudely impressed at the suture; livid-glaucous, encircled with pinkish narrow bands; aperture ovate, lip slightly effused.

PHILIPPI, Kuster Conch. Cab. *Ampullaria*, p. 62, pl. 20. f. 6.

Hab. —?

Of a livid-glaucous colour, smooth and shining, encircled with pale-pink linear bands.

Species 116. (Fig. a, b, Mus. Hanley.)

AMPULLARIA CITREUM. *Amp. testa oblongo-globosa, sub-ampiliter umbilicata, spiræ mediocri, anfractibus ad suturam impressa, deinde convexa, obscurè malleata, circa umbilicum obtuse angulata; pallidi fulvi antivirescent, interdum olivaceo fasciata; apertura pyriforme-oblonga, intus aurantiio-rufa.*

THE CITRON AMPULLARIA. Shell oblong-globose, rather largely umbilicated, spire moderate, whorls impressed at the suture, then convex, obscurely malleated, obtusely angled round the umbilicus; pale-fulvous, or greenish, sometimes banded with olive; aperture pyriformly oblong, orange-red within.

Hab. —?

A fine species, of very distinct character, peculiarly obtusely angled round the umbilicus.

Species 117. (Fig. a, b, Mus. Cuming.)

AMPULLARIA PICTA. *Amp. testa oblongo-ventricosa, ampliter profundi umbilicata, spiræ mediocri, anfractibus ad suturam planulatis, deinde plano-convexa, circa umbilicum obtuse angulata; vivente, fasciis luteisque elevatis numerosis cingulata; apertura oblongo-ovalis, intus aurantiio-minuta.*

THE PAINTED AMPULLARIA. Shell oblong-ventricose, largely deeply umbilicated, spire moderate, whorls rather flattened at the suture, then flatly convex, obtusely angled round the umbilicus; greenish, encircled with numerous olive bands and lines; aperture oblong-ovate, orange-vermilion within.

Hab. —?

Closely allied to the preceding species, especially in the peculiar obtusely angled structure of the whorl around the umbilicus, but uniformly distinct in all its stages of growth in general contour.

## A M P U L L A R I A.

### PLATE XXV.

Species 118. (Mus. Metcalfe.)

AMPULLARIA CALIGINOSA. *Amp. testā globosā, subprofundi umbilicatā, spirā mediocri, anfractibus superne plano-declinibus, medio gibbosusculis, tenue plicato-striatis et malleatis; nigricante-olivaceō, prope suturam fulvescente; aperturā ovatā, labro viz reflexo.*

THE GLOOMY AMPULLARIA. Shell globose, rather deeply umbilicated, spire moderate, whorls flatly slanting round the upper part, somewhat gibbous in the middle, finely plicately striated and malleated; dark olive, yellowish next the suture; aperture ovate, lip scarcely reflected.

Hab. —?

The most characteristic feature of this species is the gibbous expansion of the whorls, after flatly sloping from the suture.

Species 119. (Fig. a, b, Mus. Metcalfe.)

AMPULLARIA METCALFII. *Amp. testō compressē ovatā, subtus excavatā, viz umbilicatā, spirā parvā, acuminatā, anfractibus superne obtuse angulatis, deinde plano-concavis, longitudinaliter striatis; fulvescente-olivaceā, nigro irregulariter fuscata; aperturā ampliata expansā, labro columellarī recurvo, aurantio-distincto.*

METCALFE'S AMPULLARIA. Shell compressly ovate, excavated beneath, scarcely umbilicated, spire small, acuminate, whorls obtusely angled round the upper part, then flatly convex, longitudinally striated; yellowish-olive, irregularly banded with black; aperture

largely expanded, columellar lip recurved, orange-tinted.

Hab. —?

The only species similar to this in form is the *A. Lymanæa-formis*, which differs, among other essential characters, in being largely umbilicated.

Figs. 11 b, and 121. (Mus. Metcalfe.)

The shells here figured, and which should have been numbered 12 b and 12 c, are fine characteristic examples of Sp. 12, *A. pilula*, a species described at Pl. III. from an obscure specimen in an immature stage of growth.

Species 120. (Fig. a, b, Mus. Cuming.)

AMPULLARIA MILTOCHEILUS. *Amp. testā globosā, solidā, subanguliter profundi umbilicatā, spirā parvissimā, anfractibus rotundatis, spiraliiter corrugatis et malleatis, ad suturam declinibus; olivaceā, ferrugineo hic illic tinctā et vittatā; aperturā ocatā, labro solidè reflexo, intensè aurantio-miniatō.*

THE RED-LIPPED AMPULLARIA. Shell globose, solid, rather largely deeply umbilicated, spire rather small, whorls rounded, spirally wrinkled and malleated, slanting at the suture; olive, here and there stained and filled with rust; aperture ovate, lip solidly reflected, deep orange-vermilion.

Hab. Province of Chiapas, Mexico; Ghiesbrecht.

A fine solid rust-stained olive shell, with a characteristic orange-vermilion lip.

## PLATE XXVI.

Species 132. (Fig. *a, b, c*, Mus. Cuming.)

**AMPULLARIA ELEGANS.** *Amp. testā turbinatā, solidī, vix umbilicatā, spirā subexsertā, anfractibus convexis, subangustis, prope suturam planatis, lœvibus; latentes-alba, fasciis tineisque rubido-fuscis cingulatā; apertura rotundato-ovatā, porosa, vela, fave alba.*

**THE ELEGANT AMPULLARIA.** Shell turbinated, solid, scarcely umbilicated, spire rather exserted, whorls convex, rather narrow, flattened next the suture, smooth; yellowish-white, encircled with red-brown bands and lines; aperture rotundately ovate, rather small, interior white.

D'ORBIGNY, Mag. de Zool. 1835, p. 33. Moll. Voy. dans l'Amér. Mérid. p. 378. pl. 52. f. 4 to 6.

*Hab.* Rio Madeira, Tributary of the Amazon, Bolivia : D'Orbigny

This species chiefly differs from *A. Roissyi*, to which it is nearest allied, by its broader form of convolution, and in the more depressed growth of the whorls next the suture.

Species 123. (Mus. Cuming.)

**AMPULLARIA GHIESBRECHTI.** *Amp. testā globosā, solida, profunde umbilicatā, spirā parvinsculā, depresso, apice acutā, anfractibus rotundatis, undique decussatim malleatis; intensè olivaceā; apertura pyriforme-ovatā, labro effuso, viciis rubido-minutis.*

**GHIESBRECHT'S AMPULLARIA.** Shell globose, rather solid, deeply umbilicated, spire rather small, depressed, sharp at the apex, whorls rounded, everywhere depressedly malleated; dark olive; aperture pyriformly ovate, lip effused, deep ruddy vermilion.

*Hab.* Province of Chiapas, Mexico ; Ghiesbrecht.

A remarkably fine species, of solid globose form, cha-

racteristically malleated throughout, and having a conspicuously deep red aperture.

Species 124. (Fig. *a, b*, Mus. Cuming.)

**AMPULLARIA FUMATA.** *Amp. testā semiglobosā, obliquè effusa, angustè umbilicatā, spirā pareā, acutā, anfractibus convexis, lœvibus, ultimo multò maximo; olivacea, ad suturam fulvescente, lineis nigricantibus cingulatā; apertura ampliā, labro plano-expanso, fave fumosa, fuso tinctā et lineatā.*

**THE SMOKED AMPULLARIA.** Shell semiglobose, obliquely effused, narrowly umbilicated, spire small, sharp, whorls convex, smooth, the last one much the largest; olive, fulvous at the suture, encircled with dark lines; aperture large, lip flatly expanded, interior stained and lined with smoky brown.

*Hab.* Province of Chiapas, Mexico ; Ghiesbrecht.

Peculiarly distinguished by the flat expanded formation of the lip, and the painting of the interior, which is stained with shining smoky brown lines and tint.

Species 125. (Mus. Cuming.)

**AMPULLARIA DIRA.** *Amp. testā subglobosā, minutè angustè umbilicatā, anfractibus rotundatis, ad suturam planulatis, rudo striatis; olivaceo-nigricante; apertura ovata, labro simplici.*

**THE DISMAL AMPULLARIA.** Shell subglobose, minutely narrowly umbilicated, whorls rounded, rather flattened at the suture, rudely striated: olive-black; aperture ovate, lip simple.

*Hab.* — ?

A dull rudely striated blackish-olive species, of the simplest form.

*Ampullaria*, Pl. III.

# AMPULLARIA.

## PLATE XXVII.

Species 126. (Mus. Hanley.)

*AMPULLARIA PLANORBULA*. *Amp. testa discoidea, ampliata umbilicata, spirae brevi, subimmersa, anfractibus angustis, convexis, levioribus, ad suturam depresso; lutescere atque fascia lineisque castanea cingulata; apertura luna-circulari, labro simplici.*

*THE LITTLE PLANORBIS AMPULLARIA*. Shell discoid, largely umbilicated, spire short, subimmersed, whorls narrow, convex, smooth, depressed at the suture; yellowish-white, encircled with chestnut bands and lines; aperture luna-circular, lip simple.

PHILIPPI, Kuster, Conch. Cab. *Amp.* p. 26, pl. 7. f. 3.  
Hab. —?

A small species, distinguished from all others of the genus by its discoid *Planorbis*-like growth.

Species 127. (Fig. a, b, Mus. Cuming.)

*AMPULLARIA DECUSSETA*. *Amp. testa subglobosa, angustè profunde umbilicata, spiræ obtusa, erosa, anfractibus angustis, convexis, striis tenui decussatis, ad suturam lati planis; livido-caerulea, lineæ fulvescentibus cingulata, ad suturam fulvescente; apertura ovalis, parvissima, labro simplici.*

*DECUSSETA AMPULLARIA*. Shell subglobose, narrowly deeply umbilicated, spire obtuse, eroded, whorls narrow, convex, finely decussated with striae, broadly flattened at the suture; livid-chestnut, encircled with fulvous lines, fulvous at the suture; aperture ovate, rather small, lip simple.

MERICAND, Mem. Soc. Phys. de Genève, vol. vii. p. 445.  
pl. 2. f. 26, 27.

Hab. Brazil.

A rather narrowly convoluted shell, decussated throughout with fine striae, especially characterized by a broad flattened development of the whorls next the suture.

Species 128. (Mus. Hanley.)

*AMPULLARIA SWAINSONI*. *Amp. testa oblongo-ovalis, angustè profunde umbilicata, spiræ subezwartæ, anfractibus convexis, undique minime punctatis; lutescere olivacea, fasciæ numerosa angustis viridibus cingulata; apertura pyriformis-ovalis, labro effuso, fauce allicante.*

*SWAINSON'S AMPULLARIA*. Shell oblong-ovate, narrowly deeply umbilicated, spire rather exserted, whorls convex, minutely punctured throughout; yellowish-olive, encircled with numerous narrow green bands; aperture pyriformly ovate, lip effused, interior whitish.

*AMPULLARIA FASCIATA*, Swainson, Zool. Illus. Second Series, vol. ii. pl. 64.

*AMPULLARIA SWAINSONI*, Philippi.

Hab. —?

Distinguished from its congeners by its bold oblong-ovate form of convolution and continuous encircling of narrow bands.

Species 129. (Fig. a, b, Mus. Hanley.)

*AMPULLARIA BALANOIDEA*. *Amp. testa ovalis, solidâ, obteles umbilicata, spiræ subezwartæ, obtusa, anfractibus rotundatis, subangustis, tenuissime granoso-striatis, ad suturam plano-declinatis; nigrificate-castanea; apertura parviuscula, ovalis, labro effusa, columellâ callosoreflexa, auratio tincta.*

*THE ACORN-LIKE AMPULLARIA*. Shell ovate, solid with a covered umbilicus, spire rather exserted, obtuse, whorls rounded, rather narrow, very finely granoso-striated, flatly slanting at the suture; blackish-chestnut; aperture rather small, ovate, lip effused, columella callously reflexed, orange-tinted.

GOULD, MS., Mus. Hanley. *i. 51*   
Hab. Liberia, West Africa.

Very closely allied to *A. Platæ* which follows, but of a more obliquely effused form, with a more exserted spire.

Species 130. (Mus. Cuming.)

*AMPULLARIA PLATE*. *Amp. testa ovalis, solidiuscula, imperforata, spiræ obtusa exserta, anfractibus subangustis, convexis, minime granoso-striatis, ad suturam obtuse planis; lutescere-castanea, fasciæ angustis fasciæ cingulata; apertura ovalis, labro simplici, columellâ callosoreflexa, auratio-tincta.*

*THE PLATE AMPULLARIA*. Shell ovate, rather solid, im-perforated, spire obtusely exserted, whorls rather narrow, convex, minutely granoso-striated, obtusely flattened at the suture; yellowish-chestnut, encircled with narrow brown bands; aperture ovate, lip simple, columella callously reflexed, orange-tinted.

*HELIX PLATE*, Maton, Trans. Linn. Soc. 1809, vol. x. pl. 24. f. 16. 17.

*AMPULLARIA PLATE*, D'Orbigny.

*AMPULLARIA NATICOIDES*, D'Orbigny.

*AMPULLARIA CYCLOSTOMA*, Spix.

Hab. River Plate.

Distinguished from the preceding species, from Liberia, to which it is singularly closely allied, by its narrower form of convolution and banded painting.

*Ampullaria*, Pl. XXVIII.

# A M P U L L A R I A.

## PLATE XXVIII.

Species 131. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA AUROSTOMIA.** *Amp. testā globoso-turbinalā, vis umbilicatā, spirā subexsertā, anfractibus rotundatis, rugoso-striatis; nigrigante-castaneā; aperturā ovalā, labro vivide aurantio-rufo.*

**THE GOLDEN-NOUTH AMPULLARIA.** Shell globosely turbinated, scarcely umbilicated, spire somewhat exserted, whorls rounded, roughly striated; blackish-chestnut; aperture ovate, lip bright orange-red.

LEA, MS., Mus. Cuming. 

A globosely turbinated shell of solid structure and dark chestnut colour, with a pretty bright orange-red lip.

Species 132. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA NUX.** *Amp. testā oblongo-conoidā, solidā, vis umbilicatā, spirā obtusē exsertā, anfractibus convexis, ad subiram declivibus et obsoletē plicato-corrugatis; fulvo-castaneā; aperturā ovalā, parviusculā, labro columellarī callosō-reflexo.*

**THE NUT AMPULLARIA.** Shell oblong-conoid, solid, scarcely umbilicated, spire obtusely exserted, whorls convex, slanting and obsoletely plicately wrinkled at the suture; fulvous-chestnut; aperture ovate, rather small, columellar lip callously reflected.

Hab. Bombay.

A solid fulvous-chestnut shell of an oblong conoid form, with the columellar lip rather unusually callously reflected.

Species 133. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA AURIFORMIS.** *Amp. testā compressē ovalā, obliquā contortā, Lyonnaeformi, tenui, profundiē umbilicatā, spirā pareā, anfractibus convexis, striatis et walleatis, superiē obsoletē obtusā angulis, anfractu ultimo conspicuē effuso; intensē olivaceā; aperturā trigono-ovalā, basi rotundato-expansā, carulescente.*

**THE EAR-SHAPED AMPULLARIA.** Shell compressly ovate, obliquely twisted, Lyonnae-shaped, thin, deeply umbilicated, spire small, whorls convex, striated and malleated, obsoletely and obtusely angled round the upper part, last whorl conspicuously effused; dark olive; aperture triangularly ovate, rotundately expanded at the base, bluish.

Hab. Honduras.

The form of this species is quite peculiar, the last whorl being unusually obliquely effused, more particularly towards the base.

Species 134. (Fig. a, b, Mus. Cuming.)

**AMPULLARIA SPRUCEI.** *Amp. testā oblongo-conoidā, solidā, imperforatā, spirā plus minus erosā, anfractibus declivi-concrecis, levibus, hanc nitentibus; fulvo-olivaceā, prope aperturam obscurē rufo-fasciatā; aperturā ovalā, parviusculā, labro effuso, columellā dense callosā.*

**SPRUCE'S AMPULLARIA.** Shell oblong-conoid, solid, imperforated, spire more or less eroded, whorls slantingly convex, smooth, not shining; fulvous-olive, faintly red-banded near the aperture; aperture ovate, rather small, lip effused, columella thickly callous.

Hab. Tarapoto, east side of the Andes; Spruce.

This species has a peculiar solid *Littorina*-like aspect, with the columellar lip callously reflected over the place of the umbilicus.

Fig. 135. (Mus. De Burgh.)

This interesting shell has been selected from the collection of Mrs. De Burgh, for the sake of giving a more characteristic illustration of *A. zonata* of Spix than that represented at Pl. XII.

MONOGRAPH  
OF THE GENUS  
CANCELLARIA.

There is a pleasure in the pathless woods—  
There is a rapture in the lonely shore—  
There is society, where none intrudes,  
By the deep Sea, and music in its roar;  
I love not Man the less, but Nature more! —*Byron*.

# CANCELLARIA.

## PLATE I.

### Genus CANCELLARIA, Lamarck.

*Trochaea sen fusiformis*, interdum levigata, sappines densæ columellata, interdum imperforata, plerisque ampliter perforatae umbilicata, spiræ solvæ plerisque plus unius latè angustato-excavata; columella bi-tri-plicata, ploris plerisque valvatis, versus basim unicoloribus, basi non uniforme posticè recurvæ; aperturæ ovatæ, fauce plus minus valvæ lirata, labo interdum serrato. Operculum nullum.

Shell ovate or fusiform, sometimes smooth, mostly elaborately reticulated, sometimes imperforated, generally largely deeply umbilicated, suture of the spire generally more or less broadly angularly excavated; columella two-three-plaited, plaits mostly strong, smaller towards the base, base sometimes recurved posteriorly; aperture ovate, interior more or less strongly ridged, lip sometimes serrated. No operculum.

This very beautiful genus, which has risen greatly in the estimation of connoisseurs during the last few years, owing to the comparative rarity of the species and to their very elegant varieties of convolution and sculpture, and our acquaintance with which is chiefly due to the researches of Mr. Cuming and Sir Edward Belcher, and to the beautiful monograph in the 'Thesaurus Conchyliorum' of Mr. Sowerby, occupies a somewhat anomalous position in the system. The shells of the *Cancellaria*, with all the characteristics of those of a carnivorous race of molluscs, such as solid testaceous substance, enamelled apertures, and elaborately latticed sculpture, allied, too, in general aspect to the more voracious of the class, are nevertheless, according to the observations of M. Deshayes upon one of the most typical of the genus, the *C. cancellata* of the Mediterranean, a tribe of vegetable feeders unprovided with any operculum.

Apart from the main generic character of the group, namely, the plaits on the columella, the species are singularly unlike in generic aspect. In *C. balboana* and *pyramis*, for example, we have a heavy subglobular shell without any sculpture at all, while in *C. crenifera*, *laevigata*, and others we have sculpture of the most elaborate kind; and whilst in the forms of these the whorls are so closely convoluted as to leave the columella, or axial pillar, imperforated, in the latter, and especially in that marvellous species the *C. trigonostoma*, the pillar is formed round an umbilicus which penetrates inwardly nearly to the apex.

Little more than half-a-dozen species were known to Lamarck. It is to the deep-sea dredgings of Mr. Cuming, reaching from seven to forty fathoms off the shores of Central America and the Philippine Islands, that we are chiefly indebted to the magnificent series figured in this monograph, forming the pride of his collection, and there appears small probability of their being much added to.

#### Species 1. (Fig. a, b, Mus. Cuming.)

CANCELLARIA CUMINGIANA. Cau. testæ oblongo-ovatæ, ad basia attenuatæ, subumbilicata, spiræ brevissimæ, obtusa, rude oblique convoluta, anfractibus ad sulcæ canaliculatis, deinde rotundatis, undique angustè sulcatæ et liratis; spadicæ-fasciæ; aperturæ ovatæ, ploris tribus, infimæ ferræ obsolete.

CUMING'S CANCELLARIA. Shell oblong-ovate, attenuated at the base, slightly umbilicated, spire rather short, obtuse, rudely obliquely convoluted, whorls channelled at the suture, then rounded, everywhere narrowly grooved and ridged; fawn-brown; aperture ovate, plaits three, the lowest almost obsolete.

PETIT, Guérin's Mag. de Zool.

Hab. —?

This remarkable species is chiefly distinguished by its obtuse form and rude oblique plan of convolution; the surface is moreover sculptured throughout with narrow excavated grooves, the intermediate ridges being equally narrow, and sometimes faintly linearly grooved in the centre.

#### Species 2. (Fig. a, b, Mus. Cuming.)

CANCELLARIA SOLIDA. Cau. testæ ovato-globosæ, crassæ, solidæ, ad basia concavo-canaliculata, imperforata, spiræ brevissimæ, suturæ impressæ, anfractibus proprie apicea decussatim liratis, deinde levibus; aperturæ subangustæ, fauce lirata, ploris duobus, superiori angustæ, prominenti; auratio-spaticæ, iatus altæ.

THE SOLID CANCELLARIA. Shell ovately globose, thick, solid, concavely channelled at the base, imperforated, spire very short, suture impressed, whorls decussately ridged near the apex, then smooth; aperture rather narrow, interior ridged, plaits two, the upper narrow, prominent; orange-fawn, interior white.

SOWERBY, Pro. Zool. Soc. 1832, p. 52.  
*Hab.* Real Llejos, Central America; Cuming.

A very solid globose shell, concavely channelled round the columella on a level with the upper plait, without any indication of external sculpture except near the apex.

Species 3. (Mus. Cuming.)

CANCELLARIA RETICULATA. *Can. testā oblongo-turbinatā, imperforatā, solida, spirā exsertā, anfractibus canexis, undique obtuse reticulatā; albida, rufofusco fasciatā, variegatā; aperturā subangustā oratā, fance valde liratā, plīcis dubiis, valde prouinciatibus.*

THE RETICULATED CANCELLARIA. Shell oblong-turbinate, imperforated, solid, spire exerted, whorls convex, everywhere obtusely reticulated; whitish, banded and variegated with red-brown; aperture rather narrowly ovate, interior strongly ridged, plaits two, very prominent.

*Voluta reticulata*, Linnaeus, Syst. Nat. (12th edit.) p. 1190.

*Cancellaria reticulata*, Lamarek.  
*Hab.* West Indies.

This fine old Linnean species may be reeognized as the original type of the genus.

Species 4. (Fig. a, b, Mus. Cuming.)

CANCELLARIA ACUMINATA. *Can. testā oblongo-œatalā, solidā, imperforatā, spirā exsertā, acutissimā, anfractibus obsoletē planulatis, prope apicem decussatim costatis; albida, rufofusco fasciatā et nebulatā; aperturā angustā oblongā, fance valde liratā, plīcis tribus, supremā distante, prominente.*

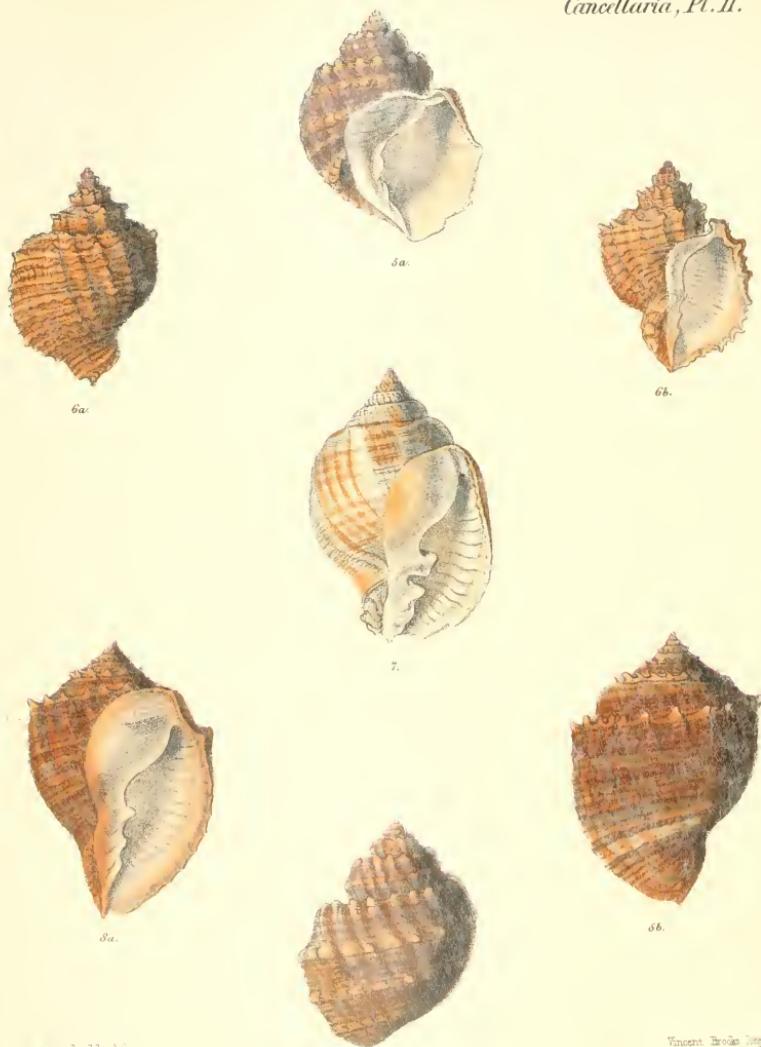

THE POINTED CANCELLARIA. Shell oblong-ovate, solid, imperforated, spire exerted, very sharp-pointed, whorls convex, obsoletely flatly ridged, decussately ribbed near the apex; whitish, banded and clouded with red-brown; aperture narrowly oblong, interior strongly ridged, plaits three, the uppermost distant, prominent.

SOWERBY, Pro. Zool. Soc. 1832, p. 53.

*Hab.* Guaemayo, Central America (dredged in sandy mud at a depth of twelve fathoms); Cuming.

Distinguished from the preceding species by its more compact oblong form and acuminate spire, encircled with flattened ridges which are almost obsolete.

# CANCELLARIA.

## PLATE II.

Species 6. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA BULLATA.* *Can. testā orato-conoidā, tenui-*  
*inflatā, ampliā profunde umbilicata, spira exsertā,*  
*turritā, aufrectius superē latē impresso-canaliculatis,*  
*ad angulārum rūle obliquā nodulatis, deinde concavis,*  
*obtuse rugoso-liratis et striatis; sordide fulcē; aper-*  
*tūrū trigono-ovatā, basi sinuatā, labro columellarī latē*  
*rflexo, plicis duabus, paries.*

THE BUBBLE-LIKE CANCELLARIA. Shell ovately conoid, thin, inflated, largely deeply umbilicated, spire exserted, turreted, whorls broadly impressly channelled round the upper part, rudely obliquely nodulated at the angle, then convex, obtusely wrinkle-ridged and striated; dirty fulvous; aperture triangular-ovate, sinuated at the base, columellar lip broadly reflexed, plaita two, small.

SOWERBY, Pro. Zool. Soc. 1832, p. 51.

*Hab.* Gulf of Nicoya, Central America (from a muddy bottom in twelve fathoms); Cuming.

Distinguished chiefly by its light inflated growth and large excavated umbilicus.

Species 7. (Mus. Cuming.)

*CANCELLARIA NODULIFERA.* *Can. testā orato-ventricosā,*  
*subpyriformi, imperforatā, basi costato-recurva, spirā*  
*turritā, aufrectiō superē excavato-canaliculatis,*  
*deinde concavis, longitudinaliter obliquā costatis, liris*  
*angustis nodulatis confertim spiraliō decussatis;*  
*luteo-fulvescentia, fasciā angustā albida versus basin*  
*cingulatā; aperiturā pyriformi-ovatā, plicis duabus,*  
*sinuatis.*

THE NODULED CANCELLARIA. Shell ovately ventricose, somewhat pear-shaped, imperforated, twistedly recurved at the base, spire turreted, whorls excavately channelled at the upper part, then convex, longitudinally obliquely ribbed, closely spirally decussated with narrow noduled ridges; yellowish-brown, encircled with a narrow whitish band towards the base; aperture pyriformly ovate, plaita two, very small.

SOWERBY, Tankerville Catalogue, Appendix, p. 15.  
*Cancellaria imperialis*, Michelin.

*Hab.* Japan.

The whorls of this species are rather broadly excavately channelled as in the preceding, but at the base they are closely convoluted into a twisted recurved extremity, leaving no trace of an umbilicus.

Species 7. (Mus. Cuming.)

*CANCELLARIA OBESA.* *Can. testā ovatā, crassā, ponderosā,*  
*imperforatā, spirā brevissimā, acuminatā, aufrectibus*  
*convexis, superē decollatis, levibus, obscurē spiraliter*  
*striatis versus apicem, minutē reticulatis; albida;*  
*aurantio-fusco pallide nebulata; aperiturā oblongā, sub-*  
*angustā, superē sinuatā, fance validissimā liratā, pli-*  
*cis duabus, crassissimis, prominentibus.*

THE STOUT CANCELLARIA. Shell ovate, thick, ponderous, imperforated, spire rather short, acuminate, whorls convex, slanting at the upper part, smooth, obscurely spirally striated toward the apex, minutely reticulated; whitish, faintly clouded with orange-brown; aperture oblong, rather narrow, situated at the upper part, interior very strongly ridged, plaita two, very thick, prominent.

SOWERBY, Pro. Zool. Soc. 1832, p. 52.

*Hab.* Gulf of Dulce, Central America (dredged from the depth of fifteen fathoms); Cuming.

This fine species, of which two specimens in a young state were brought to Mr. Cuming from Puerto Potrero, is distinguished by its obtuse growth and prominently developed columellar plaita, the surface of the last whorl being smooth, whilst the earlier whorls are finely reticulated.

Species 8. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA CASSIDIFORMIS.* *Can. testā ovalo-ventri-*  
*cosā, pyriformi, imperforatā, spirā brevi, acuminatā,*  
*aufrectiō spiraliter rugoso-striatis, ad satum pro-*  
*fundē angustē canaliculatis, deinde concavis et nodoso-*  
*angulatis, nodis subnervatis; aurantio-fusca; aper-*  
*tūrū oblongo-ovatā, subapicalē, labro columellarī re-*  
*curvo, latē expanso, plicis duabus, acutis.*

THE CASSIS-SHAPED CANCELLARIA. Shell ovately ventricose, pear-shaped, imperforated, spire short, acuminate, whorls spirally wrinkle-ridged, deeply narrowly channelled at the suture, then concave and nodosely angled, nodules rather prickly: orange-fulvous; aperture oblong, rather large, columellar lip recurved, widely spread, plaita two, sharp.

SOWERBY, Pro. Zool. Soc. 1832, p. 53.

*Hab.* Panama (young specimens dredged from a sandy muddy bottom, at the depth of sixteen fathoms); Cuming.

Allied to *C. nodulifera*, but differing by its more bulbous inflated proportions, less twistedly recurved base, and less exserted spire.

*Cancellaria, Pl. III.*

# CANCELLARIA.

## PLATE III.

Species 9. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA CUNNINGI.* *Can. testa subangusta turrata, impunctata; perline arcuata annularia, infrafusca spiralis; conoconica; angustodentata costata, opercularis planior, cordis ad angulum subnotulatis; fusiformis, rotundata, aperturam rotundata; apertura parva, plios dubius multibas.*

THE WANTED CANCELLARIA. Shell rather narrowly turreted, imperforated, spire sharply constricted, whorls spirally linearly grooved, longitudinally ribbed, rather flattened at the upper part, ribs faintly nodulated at the angle; fulvous-fawn, obscurely banded; aperture small, plaited two, very small.

SOWERBY, Pro. Zool. Soc. 1848, p. 136.  
Hab. Tasmania.

Of an erect sharply turreted form, ribbed throughout, the ribs being somewhat distant and slightly obliquely waved.

Species 10. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA SIMILARIS.* *Can. testa compressa rotunda, rotundata, basi contracta, spirale brevissimata, arcuata, infrafusca subplanata-concava, hic illuc rotundata, oblique nodulata-costata, spiralis spirabilibus leviter contracta; operculum rotundata, rotundata, fuscum, variegatum; apertura parva, fovea rotunda, rotundata, plios tricuspidata.*

THE SIMILAR CANCELLARIA. Shell compresly ovate, minutely undulated, twisted at the base, spire short, acuminated, whorls rather flatly convex, here and there varieose, obliquely wave-ribbed, elegantly cancellated with spiral cords; bluish-white, banded with reddish-brown; aperture small, interior strongly ridged, plaited three sheep.

SOWERBY, Conchological Illustrations, No. 41, f. 38.  
Hab. Seine.

Of precisely the same typical character as *C. cancellata*, from which species it differs specifically by its uniformly smaller size and finer sculpture.

Species 11. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA SPENGLERIANA.* *Can. testa fusiforme, turrata, impunctata, spirale arcuata exserta, rotundata, fusiformis, rotundata, oblique costata, spiralis lineata, subnotulata, superciliata dentata-angulata, costis ad angulum subnotulis; fusa, rotundata; apertura parvissima, plios tricuspidata.*

SPENGLER'S CANCELLARIA. Shell fusiformly turreted, imperforated, spire sharply exserted, whorls longitudinally obliquely ribbed, spirally linearly grooved,

slantingly angled at the upper part, ribs nodulated at the angle; fulvous, banded with red; aperture rather small, plaited three, moderate.

DESHAYES, Encyclopédie Méthodique, L'Or, Vol. II, p. 185  
*Cancellaria Tritonis*, Sowerby.

Hab. Cagayan, Island of Mindanao, Philippines.

A fine solid angularly ribbed species, of bright fulvous colour, splashed with red

Species 12. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA ELEGANS.* *Can. testa fusiforme, rotunda, crassata, impunctata, spirale conoides-acuminata, infrafusca plano-concava, undique eleganter granosa-reticulata, ad saturam angusti angulata; albida, rufopunctata, fuscata et variegata; apertura parvissima, plios tricuspidata, mediterranea.*

THE ELEGANT CANCELLARIA. Shell fusiformly ovate, thick, imperforated, spire conoidly acuminate, whorls flatly convex, everywhere elegantly granosely reticulated, narrowly angled at the suture; whitish, banded and variegated with reddish-fawn; aperture rather small, plaited three, moderate.

SOWERBY, Genera of Shells, f. 3.  
Hab. Island of Tico, Philippines (dredged from sandy mud, at the depth of six fathoms); Cuming.

This fine species differs from the *C. asperula*, to which M. Deshayes refers it, in being of a more adequately fusiform growth, more elegantly sculptured, and in not being excavately channelled at the suture.

Species 13. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA CANCELLATA.* *Can. testa conica rotunda, subfusiformis, impunctata, hic illuc variegata, basi contracta, spirale brevissimata, acuta, infrafusca, plano-concava, obliqua costata, levigata, operculis spirabilibus contracta, costis ad angulum subnotulis; albida, fuscata, variegata, fascia distans costarum levigata; apertura parva, fovea valde rotunda, plios tricuspidata.*

THE CANCELLED CANCELLARIA. Shell impressly ovate, somewhat fusiform, imperforated, here and there varieose, twisted at the base, spire rather short, sharp, whorls convex, obliquely ribbed, cancellated with narrow spiral ridges; whitish, variegated with brown, encircled with two chestnut bands; aperture small, interior strongly ridged, plaited three, prominent.

*Voluto cancellata*, Linnaeus, Syst. Nat. (12th edit.) p. 1191.  
*Cancellaria cancellata*, Lamarck.

Hab. Mouth of the Gambia, West Africa.

This well-known species partakes largely of the character of certain species of *Triton*.

# CANCELLARIA.

## PLATE IV.

Spec. 14. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA PYRUM.* *Obs. testá uniuspiriformi, solidá, impéforata, spira exserta, convexa, validó canálibus, ex parte rotundata oblonga, leví, ad basim striatissima, falso fasciculata, aperturam oblongam, angustam, contractam superam latè ovalis, ad basim granoso-corru-ctam plena, latus, exparsa, acutæ, prominentiæ.*

*THE PEAR CANCELLARIA.* Shell ovately pyriform, solid, imperforated, spire very short, slightly immersed, strongly emarginated, last whorl rounded, smooth, striated at the base; fulvous-brown; aperture oblique, narrow, columella broadly callous at the upper part, granularly wrinkled at the base, plait three, the apertural sharp and prominent.

ADAMS and ROEVE, Zool. Voy. Samarang, Moll. p. 42.  
pl. 10, T. 16.

*Hab.* China Sea.

A solid pear-shaped bulb-like species, closely allied to *C. bivalvis*, but of a distinct general form.

Species 15. (Fig. 15 a, and 16 a, b, Mus. Cuming.)

*CANCELLARIA BUCCINOIDES.* *Cau. testá fusiformi-oblonga, imperforata, spirá acutæ turrata, aufractionibus rotundatis, obscurè angustæ angulatis, costis longitudinaleibus nubiosis obliquis triviso latè spiralibus nudigè raro decussatis; lobioides carnis ast. fuscæ, obscurè fuscæ; aperturæ acutæ, sphaeræ sinuata, ploris duabus, nodosæ, rotundata.*

*THE BUCINUM-LIKE CANCELLARIA.* Shell fusiformy oblong, imperforated, spire sharply turreted, whorls convex, narrowly angled at the upper part, rudely decussated throughout with oblique longitudinal node-ribs, and broad spiral ridges; livid flesh-colour or brown, obscurely banded; aperture ovate, sinuated at the upper part, plait two, moderate.

SOWERBY, Pro. Zool. Soc. 1832, p. 54.

*Hab.* Real Líojos, Iquique, Callao, Puerto Potrero, Central America (dredged from a sandy muddy bottom, in from seven to fifteen fathoms); Cuming.

This species varies considerably in colour, but is always distinguished by the same characteristic rudely decussated sculpture.

Species 17. (Fig. 9, Mus. Cuming.)

*CANCELLARIA ASPERELLA.* *Cau. testá oblongo-ovata, im- perforata, spirá exserta, aufractionibus rotundatis, ad inter- turam angustè excavatis, liris striisque subtiliæ, crudelissimæ; rufescens-fuscæ, obscurè fasciata, aperturæ ovata, columella arcuata, ploris tripliæ, fortissi- malis.*

*THE RASP CANCELLARIA.* Shell oblong-ovate, imperforated, spire exerted, whorls convex, narrowly excavated at the suture, rudely decussated with rough ridges and striae; reddish-brown, obscurely banded; aperture ovate, columella arched, plait three, rather strong.

LA MARCK, Ann. sans. vert. vol. ix. p. 402.

*Hab.* Bactayon, Island of Bohol, Philippines (dredged from the depth of seventeen fathoms); Cuming.

In external aspect this species reminds one of the *Pur- pura lapillus*, so far as regards its general form. The surface is peculiarly fretted with seaborous striae.

Species 18. (Fig. o, b, Mus. Cuming.)

*CANCELLARIA OVATA.* *Cau. testá subglobosa-ovata, solidá, ponderosa, imperforata, spirá brevissimâ, acutâ acuminatâ, aufractionibus plono-convezis, spiraliter linear- scutatis, superæ subcornutatis, versus apicem reticula- tis; rufescens-fuscæ; aperturæ subangusta, fave- colida turrata, ploris duabus, prominuntibus.*

*THE OVATE CANCELLARIA.* Shell subglobosely ovate, solid, heavy, imperforated, spire very short, sharply acuminate, whorls flatly convex, spirally linearly grooved, somewhat wrinkled at the upper part, re-ticulated towards the apex; red-brown; aperture rather narrow, interior strongly ridged, plait two, prominent.

SOWERBY, Pro. Zool. Soc. 1832, p. 53.

*Hab.* St. Elena, West Columbia (dredged from a sandy bottom, in eight to ten fathoms); Cuming.

Allied to *C. reticulata* and *acuminata*, but fully distinguished by its more solid obese form and smooth exterior.

# CANCELLARIA.

## PLATE V.

Species 19. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA SCALATA.** *Can. testā subpyramidalē, mīnute umbilicatā, spīrā exsertā, anfractūs ad suturem impresso-crevatis, antīque dense concentricē costatis, costis subtiliter nodulatis; roseo-pudicā, nodulis albidis aperturā parvī, plīcis trībus, parvis.*

**THE STAIRCASE CANCELLARIA.** Shell subpyramidal, minutely umbilicated, spire exerted, whorls impressively excavated at the suture, closely concentrically ribbed throughout, ribs finely nodulated; rose-fawn, nodules whitish; aperture small, plait three, small.

SOWERBY, Conch. Illus. f. 27. Thesaurus Conch. vol. ii p. 455. pl. 93, f. 26.  
Hab. Ceylon: Dr. Siebold.

Sculptured throughout with delicate close-set ribs, finely nodulated at distant intervals, the shell being of a subtranslucent pinkish-fawn colour, inclining more to rose towards the apex.

Species 20. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA GRANOSA.** *Can. testā subpyramidalē, obtecte umbilicata, spīrā acuminato-territā, anfractūs superne angusti planitis, deinde longitudinaliter costatā, liris obtuse granatis spiralerū decussatis; flavescenti-pudicā, rufa sparsim maculatā; aperturā pericostatā, plīcis trībus, parvis.*

**THE GRAINED CANCELLARIA.** Shell subpyramidal, with a convex umbilicus, spire acuminately turreted, whorls narrowly flattened round the upper part, then longitudinally ribbed, spirally decussated with obtusely grained ridges; yellowish-fawn, sparingly blotched with red; aperture rather small, plait three, small.

SOWERBY, Conch. Illus. f. 16, 17.  
Hab. Peru.

The surface of this species is but indistinctly obtusely grained, of a yellowish-fawn colour, sparsely blotched round the angle of the whorls with red.

Species 21. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA EBURNIFORMIS.** *Can. testā oblongā, imperforatā, spīrā acuminalē exsertā, anfractūs superne leviter concavo-impressi, deinde convexi, strīs impressis undique decussatis; albidā, ferrugineo-rufa tintiā et fasciatā; aperturā subangustatā, fave valide lirata, plīcis duabus, tenuiſt, prominentibus.*

**THE EBURNA-SHAPED CANCELLARIA.** Shell oblong, imperforated, spire acuminately exerted, whorls slightly concavely impressed round the upper part, then con-

vex, decussated throughout with longitudinal stripes; whitish, banded and stained with rust-red; aperture rather narrow, interior strongly ridged, plait two, thin, prominent.

Hab. —?

This species partakes of the characters of *C. reticulata* and *acuminata*, but is distinctly characterized by the more acuminated convolution of the spire, and more globose form of the body-whorl.

Species 22. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA DECUSSETA.** *Can. testā globo-fusiformi, obtecte umbilicata, spīrā brevissimata, acutā, anfractūs ad suturem subangustissimi, liris finiculatis undique cancellatis; faleſcenti; aperturā subangustatā, plīcis tribus, evadōribas.*

**THE DECUSSET CANCELLARIA.** Shell globosely fusiform, with a covered umbilicus, spire rather short, sharp, whorls slightly impressed at the suture, cancellated throughout with corded ridges; fulvous; aperture rather narrow, plait three, moderate.

SOWERBY, Pro. Zool. Soc. 1832, p. 55.

Hab. Panama (dredged from a sandy bottom, in ten to thirteen fathoms); Cuming.

Of a somewhat Triton-like form, openly reticulated throughout with rather distant narrow raised cords.

Species 23. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA URCEOLATA.** *Can. testā sulciformi-turritā, solidiuscula, imperforatā, spīrā exsertā, anfractūs superne angusti obtusa angulatis, deinde planocovertes, obliqui longitudinaliter corrugato-liratis, salis spirali lineariā decussatis; faleſcenti-stranieri; aperturā parvissimata, plīcis duabus, angustiā, subprominentibus.*

**THE URCEOLATE CANCELLARIA.** Shell somewhat fusiformly turreted, rather solid, imperforated, spire exerted, whorls narrowly obtusely angled, then flatly convex, obliquely longitudinally wrinkle-ridged, decussated with spiral linear grooves; fulvous straw-colour; aperture rather small, plait two, narrow, rather prominent.

HINDS, Zool. Voy. Sulphur, Moll. p. 41. pl. 12. f. 7, s.  
Hab. Gulf of Papagayo and San Blas (in seven to fourteen fathoms); Islands.

Of a solid fusiformly turreted growth, superficially cancellated with oblique longitudinal waved ridges and spiral linear grooves.

## PLATE VI.

Species 24. (Fig. 3, 4, Mus. Cuming.)

**CANCELLARIA TUBIFERA.** *Can. testa subpyramidalis, profundi umbilicata, spiræ acuminata, anfractibus ad suturam impresso-excavatis, deinde obliquè costatis, costis et angulis unicolora-uncinatis, spiraliter crenato-ligatis; fuscospadicea, liris albidis; aperturæ parvæ, luteo-irrossata, ploris tribus, mediocribus.*

**THE UMBILICATED CANCELLARIA** Shell subpyramidal, deeply umbilicated, spire acuminated, whorls flatly excavated at the suture, then obliquely ribbed, the ribs prickly hooked at the angle, spirally crenately ridged; livid fawn, ridges white; aperture small, thickened in the interior, plait three, moderate.

*Sowerby, Conch. Illus. f. 29. Thesaurus Conch. vol. ii. p. 153. pl. 96. f. 84 to 86.*

*Dev. de Manil (in sandy mud at the depth of five fathoms); Cuming*

This elegantly formed species is peculiarly characterized by the prickly-hooked termination of the ribs, which are crenulated throughout with white cross-ridges.

Species 25. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA SCALARINA** *Can. testa pyramidalis, cix umbilicata, spiræ acuminato-turrata, anfractibus ad suturam ampliter excavatis, acutè angulatis, obliquè costatis, costis angustis, distantiis, ad angulum elevatis; fulvo-spadicea, albo-fasciata; aperturæ parvæ, ploris tribus, parvæ.*

**THE LADDER CANCELLARIA.** Shell pyramidal, scarcely umbilicated, spire acuminately turreted, whorls largely excavated at the suture, sharply angled, obliquely ribbed, ribs narrow, distant, raised at the angle; fulvous-fawn, banded with white; aperture small, plait three, small.

*LAMARCK, Anim. sans vert. vol. iv. p. 403.*

*Hab. West Indies.*

It is not possible to determine, satisfactorily, which species is the Lamarckian *C. scalarina*. The shell here figured is that assigned to it by Mr. Sowerby.

Species 26. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA MELANOSTOMA.** *Can. testa ocellata, subtrivialis, imperforata, spiræ brevirostrata, conica, anfractibus concavis, liris subtilibus undique dense decussatis; fulvescens-alba, rufo-fusco tintata et fasciata; aperturæ ovalis, columellæ subexcavata, laevis excavata, puerureo-fusca, ploris tribus, mediocribus.*

**THE BLACK-MOUTH CANCELLARIA.** Shell ovate, somewhat

ventricose, imperforated, spire rather short, acuminated, whorls convex, closely decussated throughout, with fine ridges; fulvous-white, stained and banded, with red-brown; aperture ovate, columella somewhat excavated, broadly enamelled, purplish-brown, plait three, moderate.

*Sowerby, Pro. Zool. Soc. 1845, p. 137.*

*Hab. —?*

Chiefly distinguished by its wide-spread enamelled lamina around the columella, of a dark purple-brown colour

Species 27. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA BIFASCIATA.** *Can. testa fusiformi-oblonga, ad basin attenuata, imperforata, spiræ exserta, anfractibus plano-concavis, liris parvis confertis undique densè decussatis; rufescens-spadicea, fasciis duabus pallidis cingulata; aperturæ oblongo-ovata, columellæ arcuata, triplicata.*

**THE TWO-BANDED CANCELLARIA.** Shell fusiformly oblong, attenuated at the base, imperforated, spire exserted, whorls flatly convex, densely decussated without with small close-set ridges; reddish-fawn, encircled with two faint bands; aperture oblong-oval, columella arched, three-plaited.

*Deshayes, Enc. Méth. Fers, vol. ii. p. 181.*

*Cancellaria oblonga, Kiener.*

*Hab. Straits of Macassar (in coarse sand); Hinds.*

The short description of *C. oblonga* in the Appendix to the Tankerville Catalogue does not agree with this fusiform Mitre-like species.

Species 28. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA TEXTILIS.** *Can. testa subpyramidalis, subumbilicata, spiræ acuminato-turrata, anfractibus ad suturam impresso-excavatis, deinde obliquè longitudinaliter costatis, liris spiralibus subobcuris decussatis; rufo-costatus, super costas hic illuc albipunctata; aperturæ parvæ, ploris tribus, mediocribus.*

**THE TEXTILE CANCELLARIA.** Shell subpyramidal, slightly umbilicated, spire acuminately turreted, whorls impressively excavated at the suture, then obliquely longitudinally ribbed, decussated with faint spiral ridges; reddish-chestnut, here and there white-dotted on the ribs; aperture small, plait three, moderate.

*Kiener, Coquilles Vivantes, Cancellaria, p. 10. pl. 7. f. 1.*  
*Hab. Moluccas.*

An elegant species, conspicuously distinguished by its chestnut-red colour, sparsely dotted on the ribs with white.

# CANCELLARIA.

## PLATE VII.

Species 29. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA BICOLOR.** *Can. testa ovato-ventricosa, latè profundè umbilicata, spirà brevissimula, turrīta, anfractibus ad suturem lata excavatis, acute angulatis, longitudinaliter remoto costatis, testa spiraliiter liratæ; rufo-maculata, versus apicem albâ; aperturâ trigonocetera, base sinuata, plicis tribus, subproniventibus.*

**THE TWO-COLOURED CANCELLARIA.** Shell ovately ventricose, broadly deeply umbilicated, spire rather short, turreted, whorls broadly excavated at the suture, sharply angled, longitudinally distantly ribbed, faintly spirally ridged; reddish-chestnut, white towards the apex; aperture triangularly ovate, situated at the base, plait three, rather prominent.

**HINDS,** Zool. Voy. Sulphur, Moll. p. 43. pl. 12. f. 13. 14.  
**Hab.** Island of Samar, Philippines; Cuming.

A sharply angled broadly turreted shell, with the longitudinal ribs rather distant from each other.

Species 30. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA ILMASTOMA.** *Can. testa pyramidalis-ovalata, solidi, subangustè umbilicata, spirâ obtuse turrīta, anfractibus superne rudo angulatis, longitudinaliter crassioratis, solcis linearibus spiraliibus decussatis; lutescentia-alba, rufo-fusco maculata et fasciata; aperturâ parec, fovea lirata et corrugata, viciâ sanguinea, plicis tribus, angustis.*

**THE RED-MOUTHED CANCELLARIA.** Shell pyramidal-oval, solid, rather narrowly umbilicated, spire obtusely turreted, whorls rudely angled round the upper part, longitudinally thickly ribbed, decussated with spiral linear grooves; yellowish-white, blotched and banded with red-brown; aperture small, interior ridged and wrinkled, bright red, plait three, narrow.

**SOWERBY,** Pro. Zool. Soc. 1832, p. 54.  
**Hab.** Galapagos Islands (dredged from a sandy bottom, at a depth of ten or sixteen fathoms); Cuming.

A solid rudely sculptured shell, with a characteristic bright-red aperture.

Species 31. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA CHRYSOSTOMA.** *Can. testa subglobosa, vix umbilicata, spirâ subpyramidalis, superne parum angulatis, costis crassis et liris rudo decussatis; carnis celeste-alba, castaneo sparsis lineolatis et punctatâ; aperturâ rotundato-expansa, fovea lirata et corrugata, viciâ aurantio-sanguinea, plicis tribus, prominentibus.*

**THE GOLDEN-MOUTH CANCELLARIA.** Shell subglobose, scarcely umbilicated, spire subpyramidal, whorls but little angled at the upper part, rudely decussated with thick ribs and ridges; bluish-white, sparingly

dotted and lined with chitonal; aperture rotundately expanded, interior ridged and wrinkled, bright orange-red, plait three, prominent.

**SOWERBY,** Pro. Zool. Soc. 1832, p. 54.

**Hab.** Panama and St. Elena (dredged from a sandy bottom, at the depth of from eight to ten fathoms); Cuming.

Obscurely rudely decussated with ribs and ridges, and with a more expanded aperture than the preceding species.

Species 32. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA GONIOSTOMA.** *Can. testa subglobosa, ampliè profunde umbilicata, spirâ turrīta, anfractibus superne latissimè excavato-angulatis, longitudinaliter costatis, costis distansibus, liris spiraliibus clathratis; purpurascens-alba, castaneo-fusco hic illic lineatâ; aperturâ porosa, trigona, plicis duabus, subsoletis.*

**THE ANGLE-MOUTH CANCELLARIA.** Shell subglobose, largely deeply umbilicated, spire turreted, whorls very broadly excavately angled at the upper part, longitudinally ribbed, ribs distant, latticed with spiral ridges; purple-white, here and there lined with chestnut-brown; aperture small, triangular, plait two, rather obsolete.

**SOWERBY,** Pro. Zool. Soc. 1832, p. 51.

**Hab.** Conchagua and St. Salvador, Central America (dredged from a sandy bottom, at a depth of about eight fathoms); Cuming.

This fine species is characterized by its broadly angled turreted growth and bold latticed sculpture.

Species 33. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA RIGIDA.** *Can. testa ovata, subangustiter profunde umbilicata, spirâ turrīta, anfractibus superne late excavato-angulatis, obliquè costatis, costis tenuibus, subdistansibus, liris subtilibus spiraliibus decussatis; lateo-spadicidæ, ad angulum purpureo-fusco maculata; aperturâ trigona, ad basim sinuata, triplicata.*

**THE RIGID CANCELLARIA.** Shell ovate, rather largely deeply umbilicated, spire turreted, whorls broadly excavately angled at the upper part, obliquely ribbed, ribs thin, rather distant, decussated with fine spiral ridges; yellowish-fawn, spotted at the angle with purple-brown; aperture triangular, situated at the base, plait three.

**SOWERBY,** Pro. Zool. Soc. 1832, p. 53.

*Cancellaria costata,* Sowerby, Jun.

**Hab.** Puerto Portero, Central America (from a sandy bottom, at the depth of thirteen fathoms); Cuming.

This species comes near to *C. gonostoma* in form, but is at once distinguished by its more delicate ribs.

# CANCELLARIA.

## PLATE VIII.

Species 34. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA TESTICOSTATA.* *Can. testa ovalis, imperforata,* spirae brevissimae, exsertae, anfractibus superne angustè oblique angustatis, ad angulum obsoletè plicato-nodulatis, deinde levigatis; ultimæ, curvo-fasciente obscure testis et ad angulum nuculatæ: aperturæ ovalis, favea clausa levata, plus tribus, prominentibus.

THE SMOOTH CANCELLARIA. Shell ovate, imperforated, spire rather short, exserted, whorls narrowly obtusely angled at the upper part, obsoletely plicately noduled at the angle, then smooth; white, obscurely tinged with flesh-brown and blotched at the angle; aperture ovate, closely ridged within, plait three, prominent.

SOWERBY, Pro. Zool. Soc. 1832, p. 51.

Hab. New South Wales.

A smooth species, partaking, like *C. spirata*, of the typical form of the little *Elbora australis*.

Species 35. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA SINENSIS.* *Can. testa subfusiforme-ovata,* i specie perforata, spiræ exsertæ, subobtusa, anfractibus superne concretae-decussatis, liris subtilibus granosis undique decussatis; ultimæ, rufo-fusco tinctæ et fasciatæ; aperturæ ovalis, favea valde levata, columella arcuata, plicias dubias, mediorubris.

THE CHINESE CANCELLARIA. Shell somewhat fusiformly ovate, imperforated, spire exserted, somewhat obtuse, whorls convexly slanting at the upper part, every where decussated with fine granose ridges; whitish, stained and banded with red-brown; aperture ovate, interior strongly ridged, columella arched, plait two, moderate.

Hab. China.

A simply convoluted fusiformly oblong shell, with the surface closely decussated throughout with fine granose linear ridges.

Species 36. (Fig. c, d, Mus. Cuming.)

*CANCELLARIA TUBERCULOSA.* *Can. testa subglobosa, profunde umbilicata, spiræ brevi, subinversa, anfractibus superne concavae-angustatis, in regulam serrato-lunatae, deinde concaevae, striatis et levigatae; candidæ;* aperturæ subampullæ, trigono-ovalis, labro columellari latè reflexo, plicias dubias, mediorubris, obliquas.

THE TUBERCLED CANCELLARIA. Shell subglobose, deeply umbilicated, spire short, somewhat immersed, whorls concavely angled round the upper part, serrately la-

minated in the angle, then convex, striated and tubercled; white; aperture wider longer triangular oval, columellar lip broadly reflexed, plait two, moderate, oblique.

SOWERBY, Pro. Zool. Soc. 1832, p. 51.

Hab. Iquiqui, Peru (dredged from a sandy bottom, at the depth of seven fathoms); Cuming.

Of a peculiar chalk-white aspect allied to *C. bulbulus*.

Species 37. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA OBTUSA.* *Can. testa globosa, minutè umbilicata, spiræ brevissimæ, obtusa, sutura subimpressa, anfractibus rotundatis, longitudinaliter subobsoletè pliatis, spiraler regulariter sulcatis; late-apicidæ;* aperturæ ovalis, subampullæ, columella arcuata, plicias dubias, parvis.

THE OBTUSE CANCELLARIA. Shell globose, minutely umbilicated, spire very short, obtuse, suture slightly impressed, whorls rounded, longitudinally somewhat obsoletely plicated, spirally regularly grooved; yellowish-fawn; aperture ovate, rather large, columella arched, plait two, small.

DESISTES, Enc. Méth. Terc, vol. ii, p. 187. Cuv. Règne Animal, nov. édit. Moll. pl. 52, f. 6.

Hab. —?

This shell, formerly in the collection of M. Deshayes, and the only example of the species known, is remarkably distinguished by its very obtuse growth.

Species 38. (Fig. a, b, Mus. Cuming.)

*CANCELLARIA PULCHRA.* *Can. testa orato-globosa, vis umbilicata, spiræ aculeæ conoidæ, anfractibus concisis, superne subangustatis, costis obliquis longitudinalibus turgide spiralis spinosis undique clathratis; albida, castaneo-fusco fasciatæ et levatae; aperturæ parvæ;* ovalis, favea valde levata, plicias tribus, mediorubris.

THE BEAUTIFUL CANCELLARIA. Shell ovately globose, scarcely umbilicated, spire sharply conoid, whorls convex, slightly angled at the upper part, latticed throughout with oblique longitudinal ribs and spiral ridges; whitish, banded and lined with chestnut-brown; aperture rather small, strongly ridged within, plait three, moderate.

SOWERBY, Pro. Zool. Soc. 1832, p. 50.

Hab. St. Elena, West Columbia (from a sandy bottom, at a depth of from eight to ten fathoms); Cuming.

Closely allied to *C. similis*, but conspicuously distinguished by the spiny processes upon the ribs.

# CANCELLARIA.

## PLATE IX.

Species 35. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA AFFINITA.** *Can. testa fusiforme ovata, minime umbilicata, spiræ mediocri, infrafractibus superne angulato-crevicolis, deinde planitatis, liris obliquis et spirabilibus undique clathratis, fida, liris rufescensibus; apertura subangustâ, plieis tribus, mediocribas.*

**THE ALLIED CANCELLARIA.** Shell uniformly ovate, minutely umbilicated, spire middling, whorls angularly slanting round the upper part, then rather flat, latticed throughout with oblique and spiral ridges; fulvous, ridge reddish; aperture rather narrow, plait three, moderate.

*Cancellaria indentata, var., Sowerby.*

*Hab. ——?*

Of a characteristic fusiformly oblong form, neatly latitudinal throughout without any depression at the suture. It differs from *C. indentata* in form and in not being indented at the lip, while the cancellular-plaits are finer.

Species 40. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA BREVIS.** *Can. testa subglobosa, subunguifera umbilicata, spiræ abbreviato-turrata, infrafractibus superne late excavato-angulatis, longitudinaliter obliquè eride costatis, spirabilis absoluè tenuirubris; albida, circa angulum castaneo-nuculatam; apertura trigonocaudata, parva, plieis duabus, precis.*

**THE SHORT CANCELLARIA.** Shell subglobose, rather largely umbilicated, spire shortly turreted, whorls broadly excavated angled round the upper part, longitudinally obliquely rudely ribbed, spirally obscurely finely ridged; whitish, blotched with chestnut-brown about the angle; aperture triangularly ovate, small, plait two, small.

*SOWERBY, Pro. Zool. Soc. 1832, p. 52.*

*Hab. Puerto Principe and St. Elena; Cuming.*

Closely allied to *C. gonostoma*, of which it has the appearance of being a small worn specimen.

Species 41. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA INDENTATA.** *Can. testa subquadrato-oblonga, viz. umbilicata, spiræ brevi, acuminata, infrafractibus superne decorticatis, obscurè angulatis, deinde planitatis, liris longitudinalibus et spirabilibus undique clathratis; rufescens-fuscæ; apertura angulus obtusus, iates rauide levata, labio versus basin indentata, plieis et abso. radibus, protracta.*

**THE SPURTED CANCELLARIA.** Shell somewhat squarely oblong, scarcely umbilicated spire short, acuminated, whorls slanting round the upper part, obscurely angled, then flatly convex, latticed throughout with

longitudinal and spiral ridges, reddish-brown, spire narrow oblong, interior strongly ridged, lip indented towards the base, plait two, rude, prominent.

*SOWERBY, Pro. Zool. Soc. 1832, p. 54.*

*Hab. Panama.*

Distinguished by its oblong-square form, closely latitudinal sculpture, and indented lip.

Species 42. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA CONTABULATA.** *Can. testa ovata, angustè umbilicata, spiræ turrata, infrafractibus superne latè excavato-angulatis, deinde convezis, longitudinaliter tenue corrugato-costatis, costis subtiliter nodulatis, striis spirabilibus decussatis; pallidè straminea, aurantio-rubo ad myrosum sparsim maculata; apertura trigono-ovata, plieis tribus, parvis.*

**THE BARRED CANCELLARIA.** Shell ovate, narrowly umbilicated, spire turreted, whorls broadly excavated angled at the upper part, then convex, longitudinally finely wrinkle-ribbed, ribs finely nodulated, decussated with spiral striae; pale straw-colour, sparingly blotched at the angle with orange-red; aperture triangularly ovate, plait three, small.

*SOWERBY, Conch. Illus. f. 23. Thesaurus Conch. vol. ii. p. 455. pl. 93. f. 19, 23.*

*Cancellaria pusilla, Sowerby.*

*Hab. Ceylon (on the sands); Dr. Sibbald.*

Of elegant form, delicately sculptured and coloured.

Species 43. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA CRISPATA.** *Can. testa ovata, imperforata, spiræ acute exserta, infrafractibus superne angulis angulatis, obliquè longitudinaliter costatis, costis crassis, ad angulum moricato-nuculatis, striis spirabilibus decussatis; albida, lineis fasciisque castaneo-fuscis cingulata; apertura ovata, parva, fauce tenuidirata, plieis tribus, parvis.*

**THE CRISP CANCELLARIA.** Shell ovate, imperforated, spiræ sharply exserted, whorls narrowly angled round the upper part, obliquely longitudinally ribbed, ribs thick, prickly hooked at the angle, decussated with spiral striae; whitish, encircled with chestnut-brown bands and lines; aperture ovate, small, interior finely ridged, plait three, small.

*SOWERBY, Conch. Illus. f. 20. Thesaurus Conch. vol. ii. p. 452. pl. 96. f. 89.*

*Hab. Island of Negros, Philippines (dredged in fine sand, at the depth of five fathoms); Cuming.*

Allied to *C. crenifera*, from which species it is chiefly distinguished by its very thick ribs.

*Cancellaria*, Pl. X.

# CANCELLARIA.

## PLATE X.

Species 44. (Fig. a, b, Mus. Cuming.)

CANCELLARIA AUSTRALIS. *Can. testā ovatā, imperforatā, spirō acuminatā, suturā impressā, anfractibus rotundatis, liris longitudinalibus obliquis confertis lirisque tenibus spiralibus; candidā; aperturā parieculata, columellā arcuata, plicis tribus, mediocribus.*

THE SOUTHERN CANCELLARIA. Shell ovate, imperforated, spire acuminated, suture impressed, whorls rounded, decussated with close-set oblique longitudinal ribs, and fine spiral ridges; white; aperture rather small, columella arched, plait three, moderate.

SOWERBY, Conch. Illus. sp. 24, f. 23. Thesaurus Conch. vol. ii. p. 442, pl. 95. f. 72, 73.

Hab. New South Wales.

Of an ordinary *Buccinum*-like form, strongly decussated throughout with close-set ribs and ridges.

Species 45. (Fig. a, b, Mus. Cuming.)

CANCELLARIA ALBIDA. *Can. testā subfusiformi-oblongā, solidā, imperforatā, basi contortā, spirā acuminatā, anfractibus plano-concavis, ad suturam angusti plancatis, deinde declivis-angulis, liris fusciculatis undique eleganter reticulatis; candidā; aperturā parvā, angusta, plicis duabus, sub prominatibus.*

THE WHITISH CANCELLARIA. Shell somewhat fusiformly oblong, solid, imperforated, twisted at the base, spire acuminated, whorls flatly convex, narrowly puckered at the suture, then slantingly angled, elegantly reticulated throughout with corded ridges; white; aperture small, narrow, plait two, rather prominent.

HINDS, Pro. Zool. Soc. 1843, p. 47.

Hab. Bay of Guayaquil, Panama, and Veragua (at a depth of from seven to twenty-three fathoms); Cuming.

This elegantly fusiform species, collected by Mr. Hinds in the voyage of the 'Sulphur,' is most exquisitely latticed throughout with equidistant raised cord-like ridges.

Species 46. (Fig. a, b, Mus. Cuming.)

CANCELLARIA CANDIDA. *Can. testā subfusiformi-ovatā, ventricosā, basi contortā, imperforatā, spirā acutē acuminatā, anfractibus rotundatis, ad suturam parum planatis, undique dense nodoso-reticulatis; candidā; aperturā subangustā, fince valde liratā, plicis duabus, fortibus, vnde prominatibus.*

THE WHITE CANCELLARIA. Shell somewhat fusiformly ovate, swollen, imperforated, twisted at the base,

spire sharply acuminated, whorls rounded, but little flattened at the suture, densely nodosely reticulated throughout; white; aperture rather narrow, strongly ridged within, plait two, strong, very prominent.

SOWERBY, Conch. Illus. sp. 2. f. 1.

Hab. Polynesia.

This species very closely resembles *C. australis*, but it may be at once recognized by its stronger sculpture, and more prominent columellar plait.

Species 47. (Fig. a, b, Mus. Cuming.)

CANCELLARIA VENTRICOSA. *Can. testā fusiformi-oblongā, ventricosā, imperforatā, spirā acutē acuminatā, anfractibus superne plano-concavis, deinde rotundatis, liris longitudinalibus et spiralibus undique decussatis; rufo-fusco; plicis trīnis, angustis.*

THE VENTRICOSE CANCELLARIA. Shell fusiformly oblong, ventricose, imperforated, spire sharply acuminated, whorls flatly convex at the upper part, then rounded, decussated throughout with longitudinal and spiral ridges; red-brown; plait three, narrow.

HINDS, Pro. Zool. Soc. 1843, p. 47.

Hab. Realejo, Central America (at a depth of from sixty to seventy fathoms), and Gulf of Magdalena, California (in sandy mud at seven fathoms); Hinds.

Not much unlike *C. albida*, but of a peculiar red-brown colour, carved with a distinct pattern of sculpture.

Species 48. (Fig. a, b, Mus. Cuming.)

CANCELLARIA GEMMULATA. *Can. testā globoso-ovatā, solidā, imperforatā, spirā brevi, acutā, anfractibus superne vix angulis, plano-concavis, costis nodulatis lirisque deinceps decussatis; alba; aperturā subexpansa, plicis tribus, mediocribus.*

THE GEMMED CANCELLARIA. Shell globosely ovate, solid, imperforated, spire short, sharp, whorls scarcely angled at the upper part, flatly convex, closely prominently decussated with noduled ridges; white; aperture rather expanded, plait three, moderate.

SOWERBY, Pro. Zool. Soc. 1832, p. 55.

Hab. Bay of Nicoya, Central America (from a sandy muddy bottom); Cuming.

Distinguished from the preceding species chiefly by its more contracted subglobose form and roughly noduled sculpture.

# CANCELLARIA.

## PLATE XI.

Species 49. (Fig. a, b, c. Mus. Cuming.)

**CANCELLARIA MITRIFORMIS.** *Can. testâ fusiformi-elongatâ, imperforatâ, ad basin attenuato-recurreâ, spirâ turritâ, anfractibus superne decolor-angulatis et concavis, lîris nodulatis undique densâ decussatis, lîris spiralibus ad labrum elevatis et serratis; rufo-fusca vel nigricante; aperturâ subangustâ, columellâ uniplaêta.*

**THE MITRE-SHAPED CANCELLARIA.** Shell fusiformly elongated, imperforated, attenuately recurved at the base, spire turreted, whorls slantingly angulated and concave at the upper part, closely decussated throughout with noduled ridges, the spiral ridges raised and serrated at the lip; red-brown or blackish; aperture rather narrow, columella one-plaited.

SOWERBY, Pro. Zool. Soc. 1832, p. 51.

*Cancellaria uniplicata*, Sowerby.

*Hab.* Panama (dredged in sandy mud); Cuming.

Distinguished from all other species of the genus by its elongated Mitra-like form and serrated lip.

Species 50. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA MACROSPIRA.** *Can. testâ acuminato-turritâ, semipellucida, minutiâ umbilicata, spirâ elongatâ, hic illie varicosâ, anfractibus ad suturam angustâ planâ-excavatis, deinde convexis, lîris subtilibus crenulatis decussatis; pellucidâ-alba; aperturâ minuta, labro varicosâ incrassato, labro columellari expanso, pliis tribus, tenuibus.*

**THE LARGE SPIRE CANCELLARIA.** Shell acuminately turreted, semipellucid, minutely umbilicated, spire elongated, here and there varicose, whorls narrowly flatly excavated at the suture, then convex, decussated with fine crenulated ridges; transparent white; aperture very small, lip varicosely thickened, columellar lip expanded, plait three, thin.

ADAMS and REEVE, Moll. Voy. Samarang, p. 41, pl. 10, f. 2.

*Hab.* Coast of Borneo, China Sea; Belcher.

An extremely delicate transparent white shell, remarkable for its narrow elongated form of convolution.

Species 51. (Fig. a, b. Mus. Cuming.)

**CANCELLARIA TRIGONOSTOMA.** *Can. testâ elongata pyramidaliter-turbinate, scalariformi, perangustata perspectivè umbilicata, spirâ prætenuâ, anfractibus acutè trigonis, spirâliter obsoletè liratis, ad angulum exteriore spinosis; roseo-alba; aperturâ parva, trigona, columellâ biplicata, pliis tenuibus.*

**THE TRIANGULAR-MOUTH CANCELLARIA.** Shell elegantly pyramidalily turbinate, Scalaria-shaped, very largely perspectively umbilicated, spire much attenuated, whorls sharply triangular, spirally obsoletely ridged, spined along the outer angle; pink-white; aperture small, triangular, columella two-plaited, plaits three. *Delphinula trigonostoma*, Lamarck, Anim. sans vert. vol. ix p. 88.

*Cancellaria trigonostoma*, Deshayes.

*Le Bordstrappe*, Favanne.

*Hab.* Ceylon; Kicker.

This very remarkable species is convoluted with one side of each triangular whorl so attached to that of the preceding as to form a cone enclosing a large deep perspective umbilicus.

Species 52. (Fig. a, b, c, Mus. Cuming.)

**CANCELLARIA CLAVATULA.** *Can. testâ elongato-turritâ, ad basin recurreâ, imperforatâ, spirâ acutâ, hic illie valvâ irregulariter varicosâ, anfractibus plano-convexis, obtuso longitudinaliter costatis, spirâliter striatis; rufo-fusca, albo maculata et fasciata; aperturâ parva, columella biplicata.*

**THE CLUB CANCELLARIA.** Shell elongately turreted, re-curved at the base, imperforated, spire sharp, bare and there strongly irregularly varicose, whorls flatly convex, obtusely longitudinally ribbed, spirally striated; red-brown, blotched and banded with white; aperture small, columella two-plaited.

SOWERBY, Pro. Zool. Soc. 1832, p. 52.

*Hab.* Panama (dredged from a sandy muddy bottom, at seven fathoms); Cuming.

Chiefly distinguished, amongst other peculiarities, by its strong irregular deposit of varices.

*Cancellaria. Pl. III.*

# CANCELLARIA.

## PLATE XII.

Species 53. (Fig. *a, b*, Mus. Cuming.)

**CANCELLARIA EXCAVATA.** *Can. testă oblongo-ovată, tenui-culd, minotissimè umbilicată, spiră turrită, acută, anfractibus ad suturam latè profunde excavatis, ad angulum cornutus, deinde planitatis, levitatis, utentibus; pallido-ashă; apertură subquadrate-ovată, fance tenuirată, columellă arcuată, triplicata.*

**THE EXCAVATED CANCELLARIA.** Shell oblong-ovate, rather thin, very minutely umbilicated, spire turned, sharp, whorls broadly deeply excavated at the suture, keeled at the angle, then flattened, smooth, shining; transparent white; aperture somewhat squarely ovate, finely ridged within, columella arched, three-plaited.

SOWERBY, Pro. Zool. Soc. 1848, p. 137.

Hab. South Australia.

This very delicate transparent white *Eburnea*-like species is remarkably characterized by its very broad and deeply excavated sutural chaunel.

Species 54. (Fig. *a, b*, Mus. Cuming.)

**CANCELLARIA ARTICULARIS.** *Con. testă ovoato-conoideă, angustă profundiè umbilicată, spiră acută exsertă, anfractibus ad suturam angustă subprofundiè excavatis, deinde concavis, oblique longitudinaliter subtiliter costatis, spiraliiter obscurè liratis, costis minute nodulatis, nodulis ad angulum prominenteribus; livido-carnea, nodulis albidis; apertură trigono-ovată, subexpansa, fance valde lirată, columellă triplicata.*

**THE ARTICULATED CANCELLARIA.** Shell ovately conoid, narrowly deeply umbilicated, spire sharply exserted, whorls narrowly rather deeply excavated at the suture, then convex, obliquely longitudinally finely ribbed, spirally faintly ridged, ribs minutely noduled, nodules more prominent at the angle; vivid flesh-colour, nodules whitish; aperture triangularly ovate, rather expanded, interior strongly ridged, columella three-plaited.

SOWERBY, Conch. Illust. sp. 34. f. 32.

Hab. Ceylon; Dr. Sibbald.

A most elegantly sculptured species, with somewhat of the general aspect of a *Nassa*.

Species 55. (Fig. *a, b*, Mus. Cuming.)

**CANCELLARIA PISCATORIA.** *Can. testă ovată, tenui-culd, umbilicată, ad basin subconforță, spiră attenuată, anfractibus superne excavato-angulatia, ad angulum muricato-nodulatis, deinde convexis, liris muricatis, decussatis; cinereo-albă, livido-olivaceo lirată et nebularată, columellă arcuată, obscurè uniplicată.*

**THE FISHERMAN'S CANCELLARIA.** Shell ovate, with a covered umbilicus, somewhat twisted at the base, spire sharply attenuated, whorls excavately angled at the upper part, prickly noduled at the angle, then convex, decussated with prickly ridges; ash-white, stained and clouded with livid olive, columella arched, obscurely one-plaited.

*Buccinum piscatorium*, Gmelin, Syst. Nat. p. 3496. no. 116.

*Cancellaria piscatoria*, Deshayes.

*Cancellaria nodulosa*, Lamarck.

*Nassa nodosa*, Martini.

*Le Solat*, Adanson.

Hab. Mouth of the Gambia, West Africa.

A somewhat abnormal form of the genus, with only a single indistinct plait on the columella.

Species 56. (Fig. *a, b*, Mus. Cuming.)

**CANCELLARIA SPIRATA.** *Can. testă ovată, minutiè superficialiter umbilicată, spiră brevissimă, acută, anfractibus plano-concavis, ad suturam profundè excavatis, prope apicem longitudinaliter costatis, ad basin spiraliiter striatis; albida, carneo-livacea, ad angulum muriculă aurantio-rufă cingulată; apertură ovată, fance valde lirată, columellă arcuată, triplicata.*

**THE SPIRAL CANCELLARIA.** Shell ovate, minutely superficially umbilicated, spire rather short, sharp, whorls flatly convex, deeply excavated at the suture, longitudinally ribbed near the apex, spirally striated at the base; white, flesh-tinged, encircled with orange-red spots at the angle; aperture ovate, strongly ridged within, columella arched, three-plaited.

LAMARCK, Anim. sans vert. vol. ix. p. 408.

Hab. Garden Island, Swan River.

This shell so nearly resembles the *Eburnea australis* that, as we have shown in speaking of that species, it has been confounded with it by very high authorities. The pre-

sence of the columellar plait in the shell assigned to *Cancellaria* is decisive.

Species 24. (Fig. *a, b*, Mus. Cuming.)

**CANCELLARIA COSTIFERA.** *Can. testis ovalis, talè superficialiter umbilicata, spirè turrita, a frictibus superpolatè excavato-angulatis, obliquè longitudinaliter costatis, spiraliter substritatis; leido-purpureo, lineis rufis interrumpitis cingulata, angulo costisque hic illuc albis; apertura trigono-ovata, columella arcuata, tricuspidata.*

THE RIBBED CANCELLARIA. Shell ovate, broadly super-

ficialy umbilicated, spire turreted, whorls broadly excavately angled at the upper part, obliquely longitudinally ribbed, spirally faintly striated; livid-purple, encircled with interrupted red lines, angle and ribs here and there white; aperture triangularly ovate, columella arched, three-plaited.

SOWERBY, Conch. Illus. sp. 33. f. 31.

Hab. Island of Burias, Philippines (in coarse sand at the depth of nine fathoms); Cuming.

The most striking peculiarity of this species is its painting of interrupted red lines upon a dull livid-purple ground.

# CANCELLARIA.

## PLATE XIII.

Species 58. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA SEMI-DISJUNCTA.** *Can. testā ovatā, latissimē apertū umbilicatā, spirā larvā exsertā, anfractibus ad suturam latissimē excavatā angulatis, angulo obtuso, spirāliter liratis et excavatā sulcatis, liris suteisque impresso-striatis; spadicā, aurunto-fusco tinctā et maculatā; aperturā trigonā, columellā biplicatā.*

**THE HALF-DISJOINED CANCELLARIA.** Shell ovate, very broadly openly umbilicated, spire loosely exerted, whorls very broadly excavately angled at the suture, angle obtuse, spirally ridged and excavately grooved, ridges and grooves impressively striated; fawn-colour, tinged and spotted with orange-brown; aperture triangular, columella two-plaited.

SOWERBY, Pro. Zool. Soc. 1848, p. 137.

*Hab.* Cagayan, Island of Mindanao, Philippines (from sandy mud at the depth of twenty-five fathoms); Cuming.

Readily distinguished by its loose manner of convolution, the last whorl being nearly disjoined from the preceding.

Species 59. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA VERREAUXII.** *Can. testā ovatā, minutiū umbilicatā, spirā breviusculā, acutā, anfractibus convexis, ad suturam angustè obtusè excavatis, longitudinaliter obliquè costatis, striis elevatis spiraliter decussatis; castaneo-rufā; aperturā ovatā, fauce liratā, ploris tricus parvis.*

**VERREAUX'S CANCELLARIA.** Shell ovate, minutely umbilicated, spire rather short, sharp, whorls convex, narrowly obtusely excavated at the suture, longitudinally obliquely ribbed, decussated with spiral raised striae; chestnut-red; aperture ovate, interior ridged, plates three, small.

KIENER, Coquilles Vivantes, p. 17. pl. 8. f. 3.

*Hab.* ——?

Allied, both in respect of form and colour, to *C. Littoralis*, but more prominently sculptured.

Species 60. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA RUGOSA.** *Can. testā subgloboſā, solidā, imperforata, anfractibus rotundatis, superne obtusè angulatis, obliquè rudi tuberculato-costatis, spiraliter sulcatis; pallidè strawinō, ad angulum aurunto-rufo tinctā; aperturā ovatā, subexpansā, fauce valde liratā, columellā triplicatā.*

**THE WRINKLED CANCELLARIA.** Shell subglobose, solid, imperforated, whorls round, obtusely angled round the upper part, obliquely roughly tubercularly ribbed, spirally grooved; pale straw-colour, tinged with

orange-red at the angle; aperture ovate, rather expanded, interior strongly ridged, columella three-plaited.

LAMARCK, Anim. sans vert. vol. ix. p. 408.

*Hab.* China.

The form of this species is nearly globose, the shell being expanded, so to speak, by its rude swollen tuberculated ridges.

Species 61. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA OBLIQUATA.** *Can. testā obliquā globoſā, ventricoso-expansā, anguste profundiū umbilicatā, spirā parvā, acutā, anfractibus ad suturam sublatè excavatis, deinde rotundatis, obliquè tenuicostatis, spiraliter elevato-strigatis, striis super costas nitidè nodulatis, costis ad angulum subnucicatis; fulvescente-alba, rufo-fuscōcrescente tinctā et sparsim punctatā; aperturā expansa, fauce liratā, fabro columellarī tensè reflexa, plieis tribus.*

**THE OBLIQUE CANCELLARIA.** Shell obliquely globose, ventricosely expanded, narrowly deeply umbilicated, spire small, sharp, whorls rather broadly excavated at the suture, then rounded, obliquely thinly ribbed, spirally elevately striated, striae neatly noduled on the ribs, ribs slightly prickled at the angle; fulvous-white, stained and sparingly dotted with red-brown; aperture expanded, interior ridged, columellar lip thinly reflected, plaits three.

LAMARCK, Anim. sans vert. vol. ix. p. 408.

*Hab.* Bay of Manila (in sandy mud at the depth of eight fathoms); Cuming.

A most elegantly formed neatly sculptured species, of a delicate, shining, fulvous-white colour, sparingly tinged and dotted with reddish-brown.

Species 62. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA LITTORINÆFORMIS.** *Can. testā ovatā, profundiū umbilicatā, tenuiculā, anfractibus superne angustè angulatis, deinde declivè-convergis, undique decussatim striatis; rufocerete-castaneā; aperturā subangustè ovatā, columellā triplicatā.*

**THE LITTORINA-LIKE CANCELLARIA.** Shell ovate, deeply umbilicated, rather thin, whorls narrowly angled at the upper part, then slantingly convex, decussately striated throughout; reddish-chestnut; aperture rather narrowly ovate, columella three-plaited.

SOWERBY, Conch. Illus. f. 14.

*Hab.* Ceylon.

Of precisely the typical form of *Littorina*, faintly sculptured throughout with decussating striae.

# CANCELLARIA.

## PLATE XIV.

Species 63. (Fig. a, b. Mus. Cuming.)

CANCELLARIA SERRATA. *Can. testā ovalā, angustē umbilicatā, spirā acutē turrītā, anfractibus superne sublatē excavato-angulatis, tenuē longitudinaliter costatis, costis acutē fimbriato-serratis; albida, livido-olivaceo fuscō, nudit̄ albifasciata; aperturā trigono-ovatā, fance liratā, columellā triplicatā.*

THE SERRATED CANCELLARIA. Shell ovate, narrowly umbilicated, spire sharply turreted, whorls rather broadly excavated at the upper part, thinly longitudinally ribbed, ribs sharply fimbriately serrated; whitish, stained with livid olive, white-banded in the middle; aperture triangularly ovate, ridged within, columella three-plaited.

*Hab.* —?

An elegantly sculptured species, the ribs being unusually thin, erect, and sharply fimbriately striated.

Species 64. (Fig. a, b. Mus. Cuming.)

CANCELLARIA CORROSA. *Can. testā subgloboso-ovatā, crassissimula, minutiē umbilicatā, spirā acutā, anfractibus rotundatis, ad suturam parvū angulatis, liris folientalis undique nitide elatioribus; fulvescente; aperturā parricula, plieis tribus, fortibus.*

THE FRETLED CANCELLARIA. Shell subglobosely ovate, rather thick, minutely umbilicated, spire sharp, whorls rounded, but little angled at the suture, everywhere neatly latticed with corded ridges; light fulvous; aperture rather small, plait three, strong.

*Canicularia ciathrata*, Adams (not of Lamarek).

*Hab.* —?

A solid shell, peculiarly neatly latticed throughout with cord-like ridges.

Species 65. (Fig. a, b. Mus. Cuming.)

CANCELLARIA LAMELLOSA. *Can. testā ovoatā, sublatē profundi umbilicatā, spirā acutē acuminatā, anfractibus superne angustē excavatis, obligatē longitudinaliter costatis, costis paleberriaribz serratis et lamellatis, ad angustissima muricato-uncinalis; albida, ad angustum ruf-*

*fuso maculatō; aperturā trigono-ovatā, fance liratā, columellā triplicatā.*

THE LAMELLOSE CANCELLARIA. Shell ovate, rather broadly deeply umbilicated, spire sharply acuminate, whorls narrowly excavated on the upper part, obliquely longitudinally ribbed, ribs beautifully serrated and lamellated, prickly-hooked at the angle; whitish, spotted with red-brown at the angle; aperture triangularly ovate, ridged within, columella three-plaited.

HINDS, Zool. Voy. Sulphur, Moll. p. 43. pl. 12. f. 15. 16.  
*Hab.* Indian Archipelago.

A beautifully sculptured species, the ribs being elegantly produced along the edge into lamelle.

Fig. 66. (Mus. Cuming.)

The shell here represented is in a very immature stage of growth, and may be the young of *C. Spengleriana*. It however has a finer pattern of sculpture than is usual with that species.

Species 67. (Fig. a, b. Mus. Cuming.)

CANCELLARIA HYSTRIX. *Can. testā globo-ovatā, imperforatā, spirā breviscula, acutē acuminate, anfractibus ad suturam angustē angulatis, obligatē longitudinaliter dense costatis, costis erectis, angustis, undique pulcherrimè muricato-serratis; albida, livido-fuscescente pallide tintatā; aperturā ovalā, fance refilinetatā, columellā arcuatā, plieis tribus, irregularibus.*

THE HEDGEHOG CANCELLARIA. Shell globosely ovate, imperforated, spire rather short, sharply acuminate, whorls narrowly angled at the suture, obliquely longitudinally closely ribbed, ribs erect, narrow, beautifully prickly serrated throughout; whitish, faintly tinged with livid brown; aperture ovate, interior marked with red lines, columella arched, plait three, irregular.

*Hab.* Mauritius.

This is one of the most beautifully sculptured species of the genus. The ribs are peculiarly serrated throughout at the edge into short obtuse prickles.

# CANCELLARIA.

## PLATE XV.

Species 68. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA FUNICULATA.** *Can. testa acuminato-turrita, exalatata, spirâ gracili, aufractibus ad suturem protracte impressis, obtuse angulatis, longitudinaliter costatis, costis elevatis, convexis, distantibus, tisis exaltis transversi striatis, linea elevata intercavente; peristola alba, antricula pallidè tincta; aperturâ trigono-orata, labio expanso, columella triplicata.*

**THE CORDED CANCELLARIA.** Shell acuminate turritate, umbilicated, spire slender, whorls deeply impressed at the suture, obtusely angled, longitudinally ribbed, ribs raised, compressed, distant, sculptured with delicate transverse ridges, with a raised line intervening; transparent white, faintly tinged with orange; aperture triangularly ovate, lip expanded, columella three-plaited.

HINDS, Moll. Voy. Sulphur, p. 43, pl. 12, f. 5, 6.

*Cancellaria Igrata*, Adams and Reeve.

*Hab.* Gulf of Magdalena, California (in sandy mud, at seven fathoms); Hinds.

Characterized by its exquisitely sculptured distant ribs, which give the shell a *Sclerioidea*-like aspect. Although the locality given by Sir Edward Belcher to *C. testa* of the Voyage of the Samarang is China Sea, the species are evidently the same.

Species 69. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA MANGELLOIDES.** *Can. testa nonnudata, imperforata, spirâ acute, aufrestra superior angulis, longitudinaliter costatis, costis convexis, distantes, transversi striatis; cunctis; aperturâ trigono-orata, labio subexpanso, columella triplicata.*

**THE MANGELIA-LIKE CANCELLARIA.** Shell acuminate turbinate, imperforated, spire sharp, whorls angled round the upper part, longitudinally ribbed, ribs compressed, distant, transversely striated; white; aperture triangularly ovate, lip rather expanded, columella three-plaited.

*Hab. —?*

Resembling the preceding species in some respects, but more compactly convoluted, and more obtusely angled round the upper part of the whorls.

Species 70. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA TESSELLATA.** *Can. testa cylindrica oblonga, solidiora sita, imperforata, spirâ brevi, conica, setosa parva impressa aufractibus plano-convexis, granulosa-decessatis; albidâ, parvocostata, conjuncta levigata et intercostis tessellata; aperturâ oratâ oblonga, linea levata, columella calida biplicata, lata excavata.*

**THE TESSELLATED CANCELLARIA.** Shell cylindrically oblong, rather solid, imperforated, spire short, coni-

cal, suture but little impressed, whorls flatly convex, granosely decussated; whitish, banded and sometimes tessellated with purple-rust; aperture narrowly oblong, ridged within, columella strongly two-plaited, broadly enamelled.

SOWERBY, Pro. Zool. Soc. 1832, p. 51.

*Hab.* Bay of Caracas, St. Elena, and Xipixapi, Central America (dredged from a sandy muddy bottom, at a depth of from seven to ten fathoms); Cuming.

Quite unlike any other species of the genus in its general typical form, as is sufficiently apparent in the figure.

Species 71. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA FOVEOLATA.** *Can. testa pyramidalis-ovata, rugosae umbilicata, spirâ exserta, aufractibus ad suturem profundi declivi-excaratis, ad angulum obtuse carinatis, deinde plano-convergis, levibus; cornice fulva, lineis pallide fasciatis cingulata; auriculae fascia ad angulum cingulata; aperturâ trigono-orata, labio crassâ carico, columella arcuata, triplicata.*

**THE TRENCHED CANCELLARIA.** Shell pyramidal ovate, narrowly umbilicated, spire exserted, whorls deeply slantingly excavated at the suture, obtusely keeled at the angle, then flatly convex, smooth; flesh-fulvous, encircled with faint brownish lines, blotched with orange-brown at the angles; aperture triangularly ovate, lip thickly varicose, columella arched, three-plaited.

SOWERBY, Pro. Zool. Soc. 1848, p. 137.

*Hab.* Algoa Bay.

The excavated grooving of this species slants inward in a peculiar manner, whilst the shell is characterized by a faint linear pattern.

Species 72. (Fig. a, b, Mus. Cuming.)

**CANCELLARIA CORUGATA.** *Can. testa oblonga-pyriformis, imperforata, spirâ rotunda, solidiora, aufractibus declivi-convergis, longitudinaliter obsoletè corrugatis, tenuis impressis decessatis; fulvo-olivaceo; aperturâ rugosa oblonga, fundo levata, columella subattenuata, hippocata.*

**THE WRINKLED CANCELLARIA.** Shell oblong pears-shaped, imperforated, spire exserted, rather obtuse, whorl slantingly convex, longitudinally obsoletely wrinkled, decussated with impressed lines; fulvous-olive; aperture narrowly oblong, ridged within, columella rather attenuated, two-plated.

HINDS, Pro. Zool. Soc. 1843, p. 48.

*Hab.* Bay of Guayaquil (in mud, at the depth of seven fathoms); Hinds.

Of a very distinct typical form, peculiarly attenuated towards the base, and having no excavated indenture at the suture.

*Cancellaria*. Pl. III.

## PLATE XVI.

Species 73. (Fig. *a, b, c, d*, Mus. Cuming.)

**CANCELLARIA SEMIPELLUCIDA.** *Can. testā ovato-ventriculā, testā, umbilicā, suturā profundiā impressā, anfractibus superficialiā rotundatā, longitudinaliter oblique plicato-costatis, transversim tenuilatris; falecente, subpellucida; aperturā ovatā, ad basin attenuatā, columellā triplicata.*

**THE SEMITRANSPARENT CANCELLARIA.** Shell ovately ventricose, rather thin, very minutely umbilicated, spire rather short, sharp, suture deeply impressed, whorls rounded at the upper part, longitudinally obliquely plicately ribbed, transversely finely ridged; fulvous, subpellucid; aperture ovate, attenuated at the base, columella three-plaited.

ADAMS and REEVE, Moll. Voy. Samarang, p. 42, pl. 10.  
f. 3 and 3 *a*.

Hab. Sooloo Sea.

A light inflated shell, with the suture deeply impressed, peculiarly attenuated at the base.

Species 74. (Fig. *a, b*, Mus. Cuming.)

**CANCELLARIA ANTIQUATA.** *Can. testā ovatā, pernuplīper et profundiā umbilicatā, spirā turrīta, anfractibus ad suturā latē declivē-excavatis, ad angulum carinatis et emarginatis, deinde oculū plicato-costatis, levigatis; alba; aperturā parvā, trigonā, columellā subobsoletē biplicata.*

**THE ANTRICATED CANCELLARIA.** Shell ovate, very largely and deeply umbilicated, spire turreted, whorls broadly slantingly excavated at the suture, keeled and prickled at the angle, then sharply plicately ribbed, smooth; white; aperture small, triangular, columella rather obsoletely two-plaited.

HINDS, Moll. Voy. Sulphur, p. 43, pl. 12, f. 17, 18.

Hab. New Guinea (dredged from coarse sand, at the depth of twenty-two fathoms); Hinds.

This elegant little species has the largest umbilicus next

to the remarkable *C. trispinosus*, the whorls being convoluted in the same peculiar manner.

Species 75. (Fig. *a, b*, Mus. Cuming.)

**CANCELLARIA TENUIS.** *Can. testā ovatā, tenueplāta, angustā profundiā umbilicatā, spirā subpyramidalis, anfractibus ad suturā angustā declivē-excarinis, longitudinaliter laminato-costatis, transversim tenuilatris; falecente; aperturā ovatā, ad basin attenuatā, columellā triplicata.*

**THE THIN CANCELLARIA.** Shell ovate, rather thin, narrowly deeply umbilicated, spire subpyramidal, whorls narrowly slantingly excavated at the suture, longitudinally lamellately ribbed, transversely finely ridged; fulvous; aperture ovate, attenuated at the base, columella three-plaited.

ADAMS, MS., Mus. Cuming.

Hab. —?

A light semitransparent fulvous shell, chiefly distinguished by the thin laminar structure of the ribs.

Species 76. (Fig. *a, b*, Mus. Cuming.)

**CANCELLARIA PURPURIFORMIS.** *Can. testā oblongo-ovatā, imperforatā, spirā exsertā, subobtusa, anfractibus plano-concisis, longitudinaliter obsoletē plicatis, transversim linearē-sulcatis, fuscocincta-alba; aperturā ovatā, columellā arcuata, triplicata.*

**THE PURPURA-SHAPED CANCELLARIA.** Shell oblong-ovate, imperforated, spire exserted, rather obtuse, whorls slightly convex, longitudinally obsoletely plicated, transversely linearly grooved; brownish-white; aperture ovate, columella arched, three-plaited.

VALENCIENNES, Kiener, Coquilles vivantes, *Cancellaria*, No. 27.

Hab. —?

A simple oblong-ovate shell, without umbilicus or any depression at the suture.

# CANCELLARIA.

## PLATE XVII.

Species 77. (Fig. 6.) Mus. Cuming.

CANCELLARIA MINIMA. *Can. testā subfusiformi, imperforatā, spirā subelongatā, austroribis rotundatis, oblique costatis, costis superne obtuse nodosis, interstitiis nūtis cancellatis; albo, intersticis fuscosecundis; columellā obsoletā biplicatā.*

THE VERY SMALL CANCELLARIA. Shell subfuscous, impunctated, spire rather elongated, whorls rounded, obliquely ribbed, ribs obtusely noduled at the upper part, interstices neatly cancellated; white, sometimes brownish; columella obsoletely two-plaited.

*Hab.* —?

A minute species, obliquely ribbed, with the interstices neatly latticed with fine transverse ridges.

Species 78. (Fig. a, b, Mus. Cuming.)

CANCELLARIA NITIDA. *Can. testā ovato-turrīta, superficie umbilicata, spirā levitatis, austroribis ad suturam angustè angulatis, costatis, costis compressis, valde prominentibus, acutis, interstitiis lecigatis; albo, carneo-creveti; apertura subquadrate-ovalis, fauce brāta, columellā conspicue biplicatā.*

THE NEAT CANCELLARIA. Shell ovately turreted, superficially umbilicated, spire sharp, whorls narrowly angled at the suture, ribbed, ribs compressed and very prominent, sharp, with the interstices smooth; white, flesh-tinged; aperture somewhat squarely ovate, ridged within, columella conspicuously three-plaited.

ADAMS, MS. Mus. Cuming.

*Hab.* —?

Distinguished by its sharply developed ribs, which resemble those of *Scularia* more than in any other species.

Species 79. (Fig. a, b, Mus. Cuming.)

CANCELLARIA COCTILIS. *Can. testā ovato-globosā, an-*

*gusō profunde undulatā, spirā levitatis, austroribis tumidis, superne obtuse angularis, valde nodoso-costatis, transversis litatis; refuscante; apertura subquadrate-ovalis, ad basim attenuata, columellā triplicatā.*

THE BAKED CANCELLARIA. Shell ovately globose, narrowly deeply undulated, spire rather short, sharp; whorls tumid, obtusely angled at the upper part, rudely nodosely ribbed, transversely ridged; reddish; aperture somewhat squarely ovate, attenuated at the base, columella three-plaited.

*Hab.* —?

A shell of rather tumid growth, decussated with blunt noduled ribs and ridges, of a peculiar reddish colour.

Fig. 80. (Mus. Cuming.)

The shell here figured proves to be a variety of *C. piscatoria* described at Pl. XII. Sp. 55.

Species 81. (Fig. a, b, Mus. Cuming.)

CANCELLARIA TENUITA. *Can. testā subfusiformi-turrīta, imperforatā, spirā subgracili, austroribis superne planis-angularis, longitudinaliter angustè costatis, subobsoletè decussatis litatis; fulvo-refuscente, fuso levitatis; columellā biplicatā.*

THE FILLETED CANCELLARIA. Shell somewhat fusiformly turreted, imperforated, spire rather slender, whorls flatly angled round the upper part, longitudinally narrowly ribbed, faintly decussately ridged; fulvous-red, filleted with brown; columella two-plaited.

SOWERBY, PTO. Zool. Soc. 1848, p. 137.

*Hab.* —?

A slender turreted species, neatly filleted with narrow brown bands upon a fulvous-red ground.

## PLATE XVIII.

Species 82. (Fig. Thesaurus Conch.)

**CANCELLARIA LACTEA.** *Cau. testā oblongo-ovatā, tenui, gelūsūbū, imperforatā, spirā subrotundā, anfractibus superne declici-cavexis, levigatis; lacteā; aperturā rotundā, fave levatā, columellā rotundā triplicatā.*

THE CREAM-COLOURED CANCELLARIA. Shell oblong-ovate, thin, transparent, imperforated, spire rather obtuse, whorls slantingly convex round the upper part, smooth; cream-coloured; aperture oval, interior ridged, columella strongly three-plaited.

**L. H. LAYEN.** Encyclopédie Méthodique, p. 180. Sowerby, Thesaurus Conch. vol. ii. p. 448. pl. 96. f. 105.

Hab. —?

This species is unknown to me. The accompanying figure is from Mr. Sowerby's 'Thesaurus Conchyliorum.'

Species 83. (Fig. Moll. Voy. Sulphur.)

**CANCELLARIA ELATA.** *Cau. testā ovatā, elongatā, acuminate, anfractibus costatis, suprē angulatis, lineis elevatis decussatis, suturā profunda; aperturā ovali, peritreme superne disjuncta, labro intus salcato, columellā triplicata, plici inferiorē maximā, nubilā, parco, subocculta, canali infero.*

THE RAISED CANCELLARIA. Shell ovate, elongated, acuminate, whorls ribbed, angulated at the upper part, decussated with raised lines, suture deep; aperture oval, peritreme disjoined at the upper part, lip grooved within, columella three-plaited, lower plait the largest, umbilicus small, somewhat concealed, canal inflected.

**M. J. Moī. Voy. Sulphur,** p. 42, pl. 12, f. 3, 4.

Hab. Panama (at the depth of thirty fathoms); Hinds.

This species is also unknown to me. The description and figure are Mr. Hinds' in the Mollusca of the Voyage of the Sulphur.

Fig. 15 c, d, e. (Mus. Cuming.)

The specimens here represented are varieties, which it seems desirable to figure, of *C. Buccinoides*, described at Plate IV.

Species 84. (Fig. a, b. Mus. Cuming.)

**CANCELLARIA BULBULUS.** *Cau. testā oblongo-pyriformi, subcentricosid, solidā, imperforatā, basi angustē attenuata, spirā parē, valvula decussativa plicatā, suturā rotula impressā, anfractu ultimo superne declici, levata;*

*gato; faixa: aperturā rotundā, columellā triplicata, plici supraedita subfasciatā.*

THE LITTLE BULB CANCELLARIA. Shell oblong-pyramidal, subventricose, solid, imperforated, narrowly attenuated at the base, spire small, strongly decussately plicated, suture rudely impressed, last whorl slanting round the upper part, smooth; fulvous; aperture narrowly oblong, columella three-plaited, uppermost plait very strong.

**SOWERBY.** Pro. Zool. Soc. 1832, p. 55.

Hab. Real Ejecos, Central America.

Very closely allied to *C. pyrena*, from which it differs in being of a more attenuately oblong form.

Species 85. (Fig. Thesaurus Conch.)

**CANCELLARIA VIRIDULA.** *Cau. testā oblongā, longitudinālier obscurē costatā, spirālier costatā, spirā acuminatā, anfractibus rotundatis, suturā rotundā; aperturā brevi, tenui, columellā obsoletē plicatā; colore aucta, epidermide pallide virescante.*

THE GREENISH CANCELLARIA. Shell oblong, longitudinally obscurely ribbed, spirally ribbed, spire acuminated, whorls rounded, suture strong; aperture short, smooth, columella obsoletely plicated; colour none, with a pale green epidermis.

**Adula viridula.** Gould. Sowerby, Thesaurus Conch. vol. ii. p. 449. pl. 96. f. 102.

Hab. —?

Unknown to me. Description and figure copied from Mr. Sowerby's 'Thesaurus Conchyliorum.'

Species 86. (Fig. Gould Invert. Mass.)

**CANCELLARIA COUTHOUYI.** *Cau. testā ovato-conicā, alt. incis rotulibꝫ spirābus et concentricis decorsa, columellā triplicata.*

COUTHOUY'S CANCELLARIA. Shell ovately conical; white, reticulated with coarse revolving lines, and lines of growth, columella three-plaited.

**JAY.** Catalogue, 1839.

**Cancellaria Buccinoides.** Couthouy. Boston Journ. Nat. Hist. vol. ii. p. 105. pl. 3. f. 3.

Hab. Massachusetts Bay, United States (found in fishes): Gould.

This little shell Dr. Gould describes in his Report of the Invertebrata of Massachusetts, as being somewhat abundant, and usually occupied by a hermit crab.

# MONOGRAPH

OF THE GENUS

# L I T T O R I N A.

It sees the ocean to its bosom clasp  
The rocks and sea-sand with the kiss of peace;  
It sees the wild winds lift it in their grasp,  
And hold it up, and shake it like a fleece.

The startled waves leap over it; the storm  
Smites it with all the scourges of the rain,  
And steadily against its solid form  
Press the great shoulders of the hurricane."

# LITTORINA.

## PLATE I.

### Genus LITTORINA, Féussac.

*Trochus turbinata, conico-ovata, vel subglobosa, plerunque solida, raro umbilicata; spiræ sepiissime breviusculæ, acutæ; anfractibus aut levibus aut linearis-sulcatis, inferne interdum tenuicarinatis; aperturæ subcirculari, columella saepe plus minus late excavata. Operculum cornutum, pyriforme-circulare.*

Shell turbinate, conically ovate, or subglobose, generally solid, rarely umbilicate, spine generally rather short, sharp; whorls either smooth or linear-grooved, sometimes thinly keeled at the lower part; aperture nearly circular, columella often more or less broadly excavated. Operculum horny, pyriformly circular.

The *Littorina* or Periwinkles are a group of turbinate shells, mostly small, inhabiting the sea-shore in all parts of the world between tide-marks, or living on the branches of trees within range of the spray. The few species known to Lamarck were referred to his genera *Turbo*, *Monodonta*, and *Phasianella*. De Féussac first collected them into a genus, taking the old Linnaean *Turbo littoreus*, or common edible Periwinkle of our shores, as the type; and Deshayes described it in detail in his notes to the new edition of the 'Animaux sans Vertèbres.' In 1845 Dr. Philippi examined the *Littorina* in Mr. Cuming's collection, describing twenty-one new species in the 'Proceedings of the Zoological Society,' and published subsequently a monograph of the group in his 'Abbildungen,' in which a hundred and twelve species are enumerated; more however are set down there as species than we feel justified in adopting.

Of the genera into which the group has been further subdivided, the most natural is that section named *Tectarius*, of which the Linnaean *Turbo pagodus* is the type. But we have the authority of Deshayes and M.M. Quoy and Gaimard for stating that its animal and horny operculum are similar in all respects to the typical *L. littorea*.

It would be vain to attempt to show any speciality of geographical range in the *Littorina*. From Sitka in the north to New Zealand and Valparaiso in the south they are distributed along the shores both of the eastern and western intermediate continents and islands. In their natural habitats they generally represent tidal zones on the rocks, and in Borneo and such swampy localities they live commonly on the branches of the Mangrove-trees.

### Species 1. (Fig. a, b, c, d, Mus. Cuming.)

**LITTORINA BUELATA.** *Litt. testæ obliquæ conicæ, trochiformi, crassæ, imperforatæ, aurantio-lacteæ, fasciæ fasciæ striatæ, et papillosæ, papilliæ nunc oblongi et plus siccæ obsoletæ, nunc echinatæ, prominentib; et numerosæ.*

**THE BUBBLED LITTORINA.** Shell obliquely conical, trochus-shaped, thick, imperforated, orange-cream-colour, sometimes encircled with brown or blackish-grey bands, transversely roughly striated and papillose, papilliæ sometimes oblong, and more or less obsolete, sometimes prickly, prominent, and numerous.

*Trochus bullatus*, Martyn, Universal Conchologist, pl. 38.  
— *Trochus granulatus*, Chemnitz.

*Monodonta papillosa*, Lamarck.

*Littorina papillosa*, Deshayes.

*Tectarius papillosa*, Adams.

*Hab.* Zanzibar, North Australia, and New Zealand.

The varieties of this extremely variable species are distinguished by Philippi in his 'Abbildung' as vars. *eligans*, *quadriserrata*, *rustica*, *subinervata*, and *vera*. The division is but an artificial one, though characteristic of as many typical states of the species. The differences consist mainly in the development of the papillæ-like nodules of the shell, which may be observed in all gradations, from prickly protuberances, to oblong, more or less obsolete, compressed tubercles.

### Species 2. (Mus. Cuming.)

**LITTORINA CORONARIA.** *Litt. testæ pyramidalis-conicæ, crassæ, imperforatæ, lacteæ, anfractibus superne concavo-decorticatis, subangulatis, striatis et carinatis, carinae nudique muricato-nudulatis, columellæ subconicae, basi erosa.*

**THE GARLAND LITTORINA.** Shell pyramidalis-conical, thick, imperforated, cream-coloured, whorls concavely slanting at the upper part, slightly angled, striated and keeled, keels everywhere prickly noduled, columella somewhat twisted, notched at the base.

*Monodonta coronaria*, Lamarck, Anim. sans vert. vol. ix. p. 174. Enc. Méth. pl. 447. f. 6.

*Littorina coronaria*, Philippi.

*Echinella coronaria*, Adams.

*Hab.* Philippine Islands; Cuming.

## LITTORINA.—PLATE I.

This species may be readily distinguished from all varieties of the preceding by its more pyramidal form, smaller, prickly sculpture, and more concave growth at the suture.

## Species 3. (Mus. Cuming.)

LITTORINA TECTUM-PERSICUM. *Litt. testū obliquē conicā, crassā, imperforatā, lacteā, fuscō lineatā et lineatā, transversā striatā, et tuberculatā, tuberculis rudiōnis, prominentibus, declivibus, plus minus irregularibus, columellā basi crenulatā.*

THE PERSIAN-ROOF LITTORINA. Shell obliquely conical, thick, imperforated, cream-coloured, stained and lined with brown, transversely striated and tubercled, tubercles rude, prominent, slanting, more or less irregular, columella slightly notched at the base.

*Turbo tectum-Persicum*, Linnaeus, Syst. Nat. p. 1234.

*Monodonta tectum-Persicum*, Lamarck.

*Littorina tectum-Persicum*, Deshayes.

Hab. —?

Intermediate in its characters, between *L. bullata* and *pagodus*, and subject apparently to limited variation.

## Species 4. (Mus. Cuming.)

LITTORINA PAGODUS. *Litt. testū obliquē conicā, acutā, crassā, solidā, imperforatā, fuscōcemente-lacteā, fuso lineatā et lineatā, angustiōnis rugoso-striatā, et compressā nodulatā, suprē declivibus, rudiō subuplicatā, angustatā ultimo conspicuā bituberculatā.*

THE PAGODA LITTORINA. Shell obliquely conical, sharp, thick, solid, imperforated, brownish cream-colour, stained and lined with brown, whorls roughly striated and compressly nodulated, slanting round the upper part, rudely subuplicat, last whorl conspicuously bitubercled.

*Turbo pagodus*, Linnaeus, Syst. Nat. p. 1234.

*Trochus pagodus*, Chemnitz.

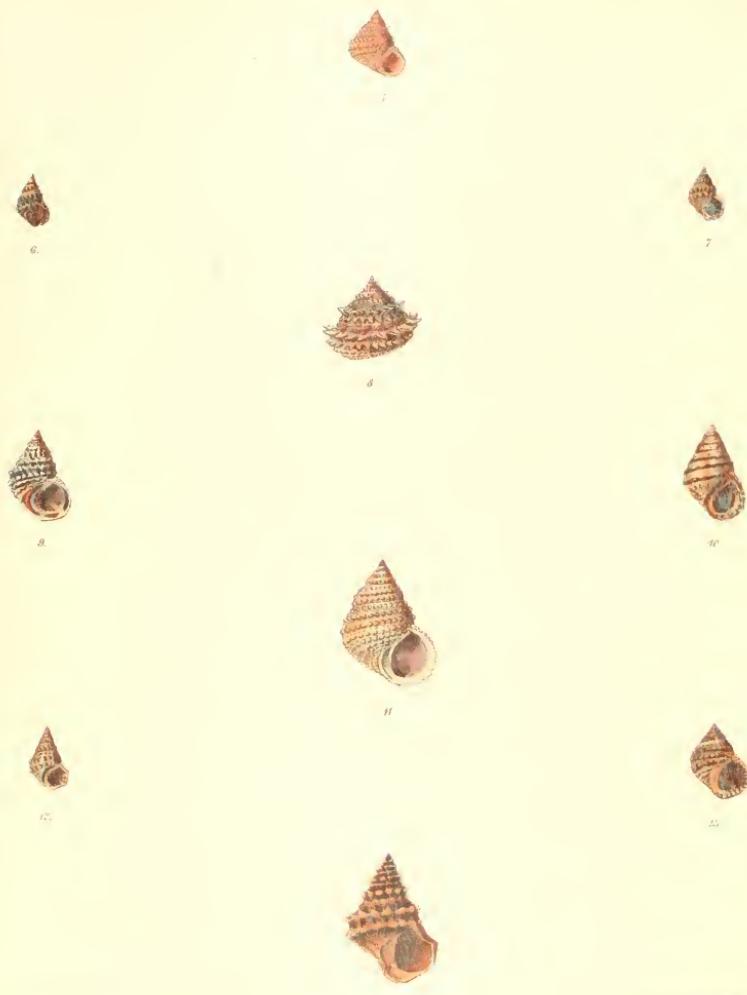

*Monodonta pagodus*, Lamarck.

*Littorina pagodus*, Deshayes.

*Tectarius pagodus*, Guerin.

This well-known species is chiefly remarkable for its uniformly large size and more angular sharp growth, the entire surface being more or less plicately striated and tubercled, the tubercles on the last whorl being developed in a prominent double row.

# LITTORINA.

## PLATE II.

### Species 5. (Mus. Cuming.)

**LITTORINA SPINULOSA.** *Litt. testā conicā, acutā, angustō profunde umbilicatā, umbilico interdū oblecto, rufō carnē, anfractibus rugoso-striatis, declivi-angulatis, seriatim nūculis nodulatis.*

**THE SPINED LITTORINA.** Shell broadly conical, sharp, narrowly deeply umbilicated, umbilicus sometimes covered, reddish flesh-colour, whorls roughly striated, slantingly angled, sculptured with rows of small nodules.

PHILIPPI, Abbild. und Besch. Conch. vol. iii. p. 17. pl. 6. f. 24.

Hab. Singapore; Cuming.

The reddish flesh-colouring of this species, as compared with the uniform livid-grey that prevails in the group, is not among the least characteristic of its peculiarities.

### Species 6. (Mus. Cuming.)

**LITTORINA LEMNISCATA.** *Litt. testā angustō conicā, imperforatā, nigra, striis transversis et gravioribus scribus tribus, basi obscurè albifasciata, columellā concavō-öffnati.*

**THE FILETED LITTORINA.** Shell narrowly conical, imperforated, black, sculptured with transverse striae and three rows of granules, base obscurely white-banded, columella concavely effused.

PHILIPPI, Pro. Zool. Soc. 1845. p. 139.

Hab. Cuba?

A small pyramidal conical shell, sculptured with raised transverse lines and granules.

### Species 7. (Mus. Cuming.)

**LITTORINA MALACCANA.** *Litt. testā sublate conicā, acutā, nigricante-griseā, anfractibus superne declivibus, transversum striatis, granulis albicans biseriatim cingulatis.*

**THE MALACCA LITTORINA.** Shell somewhat broadly conical, sharp, blackish-grey whorls slanting at the upper part, transversely striated, encircled with two rows of whitish granules.

PHILIPPI, Abbild. und Besch. Conch. vol. iii. p. 15. pl. 6. f. 17.

Hab. Pulo Penang, Malacca.

More tumid in the lower whorl than the preceding species, with the granules whitish.

### Species 8. (Mus. Cuming.)

**LITTORINA CUMINGI.** *Litt. testā abbreviato-conicā, profunde umbilicatā, acuta, carneo-griseā, anfractibus superne planō-declivibus, munita squamulato-striatis, squamis muricatis prominentibus biseriatim cingulatis, basi multi-squamata.*

**CUMING'S LITTORINA.** Shell shortly conical, deeply umbilicated, sharp, flesh-tinged ash-colour, whorls flatly slanting at the upper part, minutely squamuolately striated, encircled with two rows of prominent prickly scales, base many-scaled.

PHILIPPI, Abbild. und Besch. Conch. vol. iii. p. 17. pl. 6. f. 23.

*Echicella Cumingii.* Adams.

Hab. Island of Guimaras, Philippines.

This very beautiful species is prominently distinguished by its winding periphery of prickly scales and deep umbilicus.

### Species 9. (Mus. Cuming.)

**LITTORINA DILATATA.** *Litt. testā subpyramidalē-conicā, erosisusculā, imperforatā, tenui-griseā, nodulis albis cingulatā, anfractibus superne declivibus, columellā late concavo-ditata, purpurascente-fusca.*

**THE DILATED LITTORINA.** Shell subpyramidally conical, rather thick, imperforated, livid-grey, encircled with white nodules, whorls slanting at the upper part, columella broadly concavely dilated, purplish-brown.

D'ORBIGNY, Moll. Cuba, p. 297. pl. 14. f. 20-23.

Hab. Cuba.

Chiefly remarkable for the broadly excavated purple-brown columella, and conspicuous white nodules upon a livid-grey ground.

### Species 10. (Mus. Cuming.)

**LITTORINA SUBNODOSA.** *Litt. testā ovato-conicā, solidā, imperforatā, griseā, purpureo-fusco tessellatā, transversum triliratā, tiris distantibus tenue nodulatis; aperturā pareiusculā, purpureo-fusca.*

## LITTORINA.—PLATE II.

**THE SUBNODOSE LITTORINA.** Shell ovately conical, solid, imperforated, grey, tessellated with purple-brown, transversely three-ridged, ridges distant, finely noduled; aperture rather small, purple-brown.

PHILIPPI, Abbild. und Besch. Conch. vol. ii. p. 19, pl. 3.  
f. 8 and 9.

*Hab.* Red Sea.

A solid, rather tumid species, encircled with three rather distant, finely noduled ridges, tessellated with rich purple-brown, and having the columella and interior deeply stained with the same colour.

## Species 11. (Mus. Cuming.)

**LITTORINA MURICATA.** *Litt. testā ovalo-conicā, acutā, angustē excavato-umbilicatā, violaceente-cinerē, anfractibus rotundatis, ad suturam subimpresso, striatis, nodulis granularibus undique seriatim sculptis.*

**THE PRICKLY LITTORINA.** Shell ovately conical, sharp, narrowly excavately umbilicated, violet-ash, whorls rounded, rather impressed at the suture, striated, encircled throughout with rows of granulated nodules.

*Turbo muricatus*, Linneus, Syst. Nat. 12th edit. p. 1232.  
*Le Bonon*, Adamson.

*Littorina muricata*, Deshayes.  
*Hab.* West Afric., Cuba, Honduras.

In this species the whorls are more rounded and the suture more impressed than in its congeners, and the granulated sculpture is more defined.

## Species 12. (Mus. Cuming.)

**LITTORINA VILIS.** *Litt. testā pyramidalis-conicā, acutā, imperforatā, transversim elevato-striatā, virideente-griseā, anfractibus superū planō-declivibus, nodulis albidis medio biserialiter cinctis, aperturā purpureo-fuscā.*

**THE WORTHLESS LITTORINA.** Shell pyramidalis conical, sharp, imperforated, transversely elevated striated, greenish-grey, whorls flatly slanting round the upper part, encircled round the middle with two rows of white nodules, aperture purple-brown.

MENKE, Philippi, Abbild. und Besch. Conch. vol. ii. p. 15.  
pl. 2, f. 21.

*Hab.* New Zealand.

Distinguished from the allied species by its more slender, sharply pyramidal form.

## Species 13. (Mus. Cuming.)

**LITTORINA NODOSA.** *Litt. testā obovata, tumidiusculā, im-perforatā, spirā brevi, acutā, anfractibus superū de-clivibus, deinde concexis, liris linearibus et nodulis te-nuisis muricatis cingulatis, fuso-griseā, rufo inctā, columellā int̄ excavatā, apertura fauce fusa.*

**THE NODOSO LITTORINA.** Shell broadly ovate, rather swollen, imperforated, spire short, sharp, whorls slanting round the upper part, then convex, encircled with linear ridges and fine prickly nodules, fuscous-grey, stained with red, columella broadly excavated, interior of aperture brown.

GRAY, Zoology of Beechey's Voyage, p. 139.

*Hab.* North coast of Australia.

A shortly conoid swollen species, with a somewhat *Pur-pura*-like aspect, sculptured with fine granose nodules.

## Species 14. (Mus. Cuming.)

**LITTORINA PYRAMIDALIS.** *Litt. testā pyramidalis-ovatā, imperforatā, spirā turrīlā, anfractibus superū concavo-declivibus, deinde angulatis, et tuberculorum seriebus duabus conspicue cingulatis, purpureo-edistā, aperturā parvā, columellā latissimē excavatā, purpurascente, basi subproductā.*

**THE PYRAMIDAL LITTORINA.** Shell pyramidalis ovate, imperforated, spire turreted, whorls concavely slanting at the upper part, then angled, and conspicuously encircled with two rows of tubercles, purple-brown, aperture small, columella very broadly excavated, purplish, rather produced at the base.

QUOY and GAIMARD, Voy. de l'Astrolabe, vol. ii. pl. 33. f. 12-15.

*Hab.* New Zealand.

A rather abnormal form of the genus, quite peculiar in its characters.

15a.

15b.

15c.

16a.

17a.

17b.

16b.

## LITTORINA.

### PLATE III.

Species 15. (Fig. b, c. Mus. Cuming.)

LITTORINA AHNEA. *Litt. testā ovato-turbinatā, imperforatā, spirā acutā, suturā impressā, anfractibus convexis, densē seutoroso-striatis; albida vel lutecente, cinereo-fusco et cornilio varia obliquè striatā seu levigatā.*

THE BRONZED LITTORINA. Shell ovately turbinated, imperforated, spire sharp, suture impressed, whorls convex, densely seaborously striated; whitish or yellowish, variously obliquely streaked or freckled with ash-brown and blue.

Hab. Senegal.

The two shells here represented, from Mr. Cuming's collection, were figured by Dr. Philippi in his "Abbildung," pl. 5, fig. 13 and 14, as varieties of *L. angulifera*, Lamarck. They appear to me, on further examination and comparison, to belong to different species. Fig. 15 a I take to be a variety of *L. scabra*, described at Pl. 5, Sp. 21, while the shell Fig. 15 b and 15 c appears not to have been described.

Species 16. (Fig. a, b. Mus. Cuming.)

LITTORINA GRANDIS. *Litt. testā obliquè turbinatā, crassā, solidā, imperforatā, anfractibus superne concavisculis levibus vel obsoletē carinatis, versus apicem striatis; cornilecente-griseā, carinis interruptō nigricante-fuscis, columellā taliē callosā, albā, tubo fuso maculata.*

THE LARGE LITTORINA. Shell obliquely turbinated,

thick, solid, imperforated, whorls slightly concave round the upper part, smooth or obsoletely keeled, striated towards the apex; bluish-grey, keels interruptedly blackish-brown, columella broadly callous, white, lip spotted with brown.

MIDDLENDORF, Beitr. Maare. Rossica, part 2, p. 57.

Hab. Island of Schantar, Sea of Ochotsk; Middlendorf.

A fine species of solid massive growth, of a bluish-grey colour, encircled with narrow interrupted black-brown bands, indicating keels that with age have become obsolete.

Species 17. (Fig. a, b. Mus. Cuming.)

LITTORINA PULCHRA. *Litt. testā ovato-turgida, imperforatā, apice acutā, anfractibus densē lirato-striatis, superne concavo-declinib; aurantio-rufescente, flammulis atralis obliquis striatā, columellā taliē excavata.*

THE BEAUTIFUL LITTORINA. Shell ovately turgid, imperforated, apex sharp, whorls densely ridge-striated, concavely slanting at the upper part; orange-red, streaked with oblique black flames, columella broadly excavated.

SOWERBY, Genera of Shells, *Littorina*, f. 2, 3.

Hab. Panama.

Another fine species, better known to collectors than the preceding, distinguished by its conspicuous pattern of obliquely waved stripes upon a rich orange-red ground.

13a.

13a.

13a.

13b.

13c.

13d.

20

## LITTORINA.

### PLATE IV.

Species 18. (Fig. a, b, c, d, Mus. Cuming.)

LITTORINA LITTOREA. *Litt. testá ovalo-turbanatá, imperforatá, crassá, levigatá vel spiratiter elevato-striatá, anfractibus interdum superne concavo-impressis; olivaceo, aut cinereo, ad rufá, nigricante interdum fuscata et lineata; columellá latè callosa, subexcavatá, albá.*

THE SHORE LITTORINA. Shell ovately turbinated, im-  
perforated, thick, smooth or spirally elevately stri-  
ated, whorls sometimes concavely impressed round  
the upper part; olive, or ash, or red, sometimes  
banded and lineated with black; columella broadly  
callous, slightly excavated, white.

*Turbo littoreus*, Linnaeus, Syst. Nat. p. 1232.

*Turbo ustulatus*, Lamarck.

*Littorina vulgaris*, Sowerby.

*Littorina littorea*, Johnston.

Hab. Atlantic shores of Europe.

Of this species, the well-known eatable Periwinkle of  
our market, we have selected four varieties, differing in  
colour and even in form, so far as regards the angular  
depression of the upper portion of the whorls.

Species 19. (Fig. a, b, Mus. Cuming.)

LITTORINA VARIA. *Litt. testá acuminato-ovalis, imper-  
foratá, crassiusculá, densè irregulariter carinatá, prope  
suturam canaliculatá; lutescente-albá, lineis nigris*

*undique tessellato-lextigiosa; columellá sublate exca-  
vata, margine nigro-lineata.*

THE VARIED LITTORINA. Shell acuminate ovate, im-  
perforated, rather thick, densely irregularly keeled,  
somewhat channelled next the suture; yellowish-  
white, everywhere tessellately freckled with black  
lines; columella rather broadly excavated, margin  
black-lined.

SOWERBY, Genera of Shells, No. 37.

Hab. Panama.

A prettily marked species, densely irregularly keeled  
throughout.

Species 20. (Mus. Cuming.)

LITTORINA FASCIATA. *Litt. testá ovo-turbanatá, sub-  
ventricosá, imperforatá, levigatá; albida, fasciis li-  
neisque fusco-griseis oblique undatá; aperturá subcon-  
tracta, columellá late excavatá, margine fusco-lineata.*

THE BANDED LITTORINA. Shell ovately turbinated,  
somewhat ventricose, imperforated, smooth; whitish,  
obliquely waved with brownish-grey bands and lines;  
aperture somewhat contracted, columella broadly ex-  
cavated, margin brown-lined.

GRAY, Zool. Beechey's Voyage, p. 139.

Hab. Tumbes, Peru; Cuming.

A fine bold species, lineated and obliquely banded, char-  
acterized by a dark blotch upon the columellar area, which  
is more than usually twisted.

## LITTORINA.

### PLATE V.

Species 21. (Fig. a, b, Mus. Cuming.)

**LITTORINA SCABRA.** *Litt. testa acuminato-ovata, tenui-culta, anfractibus declivi-concavis, spiraliiter dense liratis, striâ elevatâ sepe inter liras decurrente, infernâ obsoletâ unicoloratis; latescere ant roseâ, nunc obliquâ fuscâ strigata et pî netata, nunc inmaculata; aperturâ subcontractâ, columellâ excavato-appressâ.*

**THE SCABROUS LITTORINA.** Shell acuminate-ovate, rather thin, whorls slantingly convex, spirally densely ridged, with a raised stria often running between the ridges, obsoletely keeled towards the lower part; yellowish or rose, sometimes obliquely streaked and dotted with brown, sometimes unspotted; aperture rather contracted, columella excavately appressed.

*Helix scabra*, Linnaeus, Syst. Nat. p. 1243.

*Phasianella angelifera*, Lamarek.

*Littorina scabra*, Philippi.

*Hab.* Philippine Islands; Cuming.

Mostly characterized by a painting of oblique interrupted dark-brown streaks, though it has varieties of yellow or rose-colour entirely without marking.

Species 22. (Fig. a, b, Mus. Cuming.)

**LITTORINA PHILIPPINA.** *Litt. testa acuminato-ovata, tenui, anfractibus declivi-concavis, spiraliiter regulariter filoso-liratis, intersitis oblique longitudinallis striatis, infernâ obsoletâ carinatis; purpurascente-spicato, obscurè punctata, versus apicem rufa; aperturâ subcontractâ, columellâ appressâ, purpurascens.*

**PHILIPPI'S LITTORINA.** Shell acuminate-ovate, thin, whorls slantingly convex, spirally regularly thread-ridged, interstices obliquely longitudinally striated, obsoletely keeled at the lower part; purple-fawn, obscurely dotted, red towards the apex; aperture rather contracted, columella appressed, purplish.

*Hab.* Philippine Islands; Cuming.

This species very closely resembles the *L. Sieboldii*, which immediately follows, but the spiral ridges are of a

finer thread-like character, and there is more transparency in the substance of the shell.

Species 23. (Fig. a, b, Mus. Cuming.)

**LITTORINA SIEBOLDII.** *Litt. testa acuminato-ovata, tenui-culta, anfractibus declivi-concavis, spiraliiter cari-nato-liratis, striâ elevatâ inter liras decurrente; latescente-spicato, obscurè punctata; aperturâ subcon-tractâ, columellâ excavato-appressâ.*

**SIEBOLD'S LITTORINA.** Shell acuminate-ovate, rather thin, whorls slantingly convex, spirally keel-ridged, with a raised stria running between the ridges; yellowish-fawn, obscurely dotted; aperture rather contracted, columella excavately appressed.

**PHILIPPI.** Pro. Zool. Soc. 1845, p. 142. Abbild. und Besch. Conch. pl. 6. f. 3.

*Hab.* Japan.

A fine acuminate species, of rather solid growth, spirally keel-ridged throughout with great regularity.

Species 24. (Fig. a, b, c, Mus. Cuming.)

**LITTORINA FILOSA.** *Litt. testa acuminato-ovata, tenui, subventricosa, anfractibus convexis, spiraliiter filoso-liratis, liris regularibus, subdistansibus, striâ elevatâ inter liras raro decurrente; caeruleo-griseâ aut roseâ, fuscâ sepe prouisivâ punctata, aperturâ subrotundata, columellâ tenui contortâ.*

**THE THREAD-BOUND LITTORINA.** Shell acuminate-ovate, thin, somewhat ventricose, whorls convex, spirally thread-ridged, ridges regular, rather distant, with rarely a raised stria running between the ridges; ash-grey or rose, often promiseously dotted with brown; aperture nearly round, columella thinly twisted.

**SOWERBY,** Genera of Shells, *Littorina*, f. 5.

*Hab.* Island of Zebu, Philippine Islands (on the rocks at half-tide); Cuming.

Of light substance, with the thread-like ridges more than usually distant, while the columella is peculiar in being thinly contorted.

# LITTORINA.

## PLATE VI.

### Species 25. (Mus. Cuming.)

**LITTORINA CINGULATA.** *Litt. testa conico-ovata, solidiuscula, aenfracibus convexis, spiraliiter filoso-costatis, interstitiis dense elevato-striatis; cinereo-rafia, costis pallidis, obscurè maculatis; apertura parviuscula, columellâ subcallosâ, alba.*

**THE BELTED LITTORINA.** Shell conically ovate, rather solid, whorls convex, spirally thread-ribbed, interstices densely elevatedly striated; ash-red, ribs pale, obscurely spotted; aperture rather small, columella rather callous, white.

PHILIPPI, Pro. Zool. Soc. 1845, p. 142.

*Hab.* North coast of New Holland; Dring.

Distinguished by its strong spiral ridges, the interstices between which are prominently excavated and of darker colour.

---

### Species 26. (Fig. a, b, Mus. Cuming.)

**LITTORINA CASTANEA.** *Litt. testa subgloboso-ovata, solidiuscula, spirâ brevi, aenfracibus superne depresso-convexus, deinde rotundatus et spiraliiter carinatus, carias rugosus, subdistansibus; intus rufo-castaneus; apertura circulata, columellâ latè callosâ.*

**THE CHESTNUT LITTORINA.** Shell somewhat globosely ovate, rather solid, spire short, whorls somewhat depressed at the upper part, then rounded and spirally keeled, keels regular, rather distant; deep reddish-chestnut; aperture circular, columella broadly callous.

ADAMS and REEVE, Moll. Voy. Samarang, p. 49, pl. 11.  
f. 8.

*Hab.* Eastern Seas; Becher.

Of a dark reddish-chestnut colour, encircled throughout with strong, rather distant keels.

---

### Species 27. (Fig. a, b, Mus. Cuming.)

**LITTORINA ARBORICOLA.** *Litt. testa acuminato-ovata, tenuevata, aenfracibus declivi-concisis, spiraliiter filoso-liratis, liris sèpè alternatis majoribus, interstitiis striatis; fulvâ, purpureo ad suturam maculatâ et interlum obliquâ strigata; apertura subcontracta, columellâ excauto-appressa, interdum purpureo tinctâ.*

**THREE-TRAIL LITTORINA.** Shell acuminate ovate, rather thin, whorls slantingly convex, spirally thread-ridged, ridges often alternately larger, interstices striated; fulvous, spotted at the suture and sometimes obliquely streaked with purple; aperture rather contracted, columella excavately appressed, sometimes stained with purple.

*Hab.* Singapore (on the branches of the Mangrove-tree); Cuming.

Of a peculiar opaque fulvous east, spotted beneath the suture with purple, which is occasionally prolonged into oblique streaks.

---

### Species 28. (Fig. a, b, Mus. Cuming.)

**LITTORINA NEWCOMBI.** *Litt. testa pyramidalis-ovata, solidiuscula, aenfracibus ad suturam rudit marginatis, decipi-convervis, infernè obtusè angulatis, undique dense irregulariter linear-sulcatis; carinante, fulvo-rufa prouinciatè tessellata; apertura parviuscula, columella excauto-appressa, intus purpurea.*

**NEWCOMBE'S LITTORINA.** Shell pyramidalis ovate, rather solid, whorls rudely marginated at the suture, slantingly convex, obtusely angled at the lower part, densely irregularly linear-grooved throughout, bluish, promiscuously tessellated with fulvous-red; aperture rather small, columella excavately appressed, deep purple.

*Hab.* Sandwich Islands.

A very characteristic species, rather solid, inclined to be angular at the base, closely linearly incised throughout. The ground-colour is grey-blue, promiscuously tessellated throughout with fulvous-red.

---

### Species 29. (Fig. a, b, Mus. Cuming.)

**LITTORINA CARINIFERA.** *Litt. testa pyramidalis-conica, versus basin angulato-ventricosa, solidiuscula, aenfracibus piano-declinibus, parum convexis, spiraliiter carinato-costatis, costis distantiis, lirâ obtusâ inter costas decurrente; griseo-cerulea, rafio-fusco punctata et lentiginosa; columellâ latè appressâ, fulvâ aut intense vio-lacea.*

**THE KEELLED LITTORINA.** Shell pyramidalis conical, angularly ventricose towards the base, rather solid, whorls flatly slanting, but little convex, spirally keel-ribbed, ribs distant, with an obtuse ridge running between the ribs; grey-blue, dotted and freckled with red-brown; columella broadly appressed, fulvous or deep violet.

*Phasianella carinifera*, Menke, Synopsis, 2nd edit. p. 51.

*Littorina perdx*, King.

*Littorina carinifera*, Philippi.

*Hab.* Java, Philippine Islands, China, Borneo.

This species has a wide range in the Eastern Seas, and varies materially in general form.

# LITTORINA.

## PLATE VII.

### Species 30. (Mus. Cuming.)

**LITTORINA TENEBROSA.** *Litt. testā conico-oratā, obtectā perforatā, anfractibus subangustis, rotundatis, nunc levibus, nunc spiraliter liratis; rufo-fusca, vel fulva, fusco reticulata; aperturā circulari, columellā dilatato-sinuata.*

**THE DINGY LITTORINA.** Shell conically ovate, with a covered umbilicus, whorls rather narrow, rounded, sometimes smooth, sometimes spirally ridged; reddish-brown, or fulvous reticulated with brown; aperture circular, columella dilately sinuated.

*Turbo tenebrosa*, Montagu, Test. Brit. vol. ii. p. 303.  
Supp. pl. 20. f. 4.

*Turbo vestitus*, Say.

*Littorina tenebrosa*, Forbes.

*Hab.* Britain and United States.

Of this little species there are two very distinct varieties; one smooth and the other ridged. It is said to run into *L. rufa*; but it requires a considerable stretch of the imagination to trace this specific relationship.

### Species 31. (Fig. a, b, Mus. Cuming.)

**LITTORINA PALLIATA.** *Litt. testā subglobo-ovatā, solidū, imperforatā, spirā vix exsertā, anfractibus convexis, minutissimā granuloso-striatis, versus apertura expansae; coruleo-fuscā, purpurō-fasciatā, aut fuligineo-striatō; aperturā semicirculari, columellā latē callōsa, interdum rufo-purpurea.*

**THE CLOTHED LITTORINA.** Shell somewhat globose-ovate, rather solid, imperforated, spire scarcely exserted, whorls convex, very minutely granularly striated, expanded towards the aperture; ash-brown, banded with purple, or fulvous-olive; aperture semi-circular, columella broadly callous, sometimes reddish-purple.

*Turbo palliatus*, Say, Journ. Acad. Nat. Sci. Philadelphia, vol. ii. p. 240.

*Littorina palliata*, Gould.

*Hab.* United States.

Although included in the British fauna, the existence of this species upon our coast has not been satisfactorily determined. It is abundant on the shores of the United States.

### Species 32. (Fig. a, b, Mus. Cuming.)

**LITTORINA RUGOSA.** *Litt. testā ovalo-globosā, solidā, imperforatā, spirā parvā, acutā, anfractibus tumido-convexis, longitudinaliter rude corrugatis, spiraliter linearī-sulcatis; opaco-albā, carneo-fusco-roseante, obscurè pallidissimā (nactā); columellā latissimā excavatā, carneo-fusco-roseante maculata.*

**THE WRINKLED LITTORINA.** Shell ovately globose, solid, imperforated, spire small, sharp, whorls timidly convex, longitudinally rudely wrinkled, spirally linearly grooved; opaque-white, very faintly obscurely tinged with flesh-purple, columella very broadly excavated, spotted with flesh-purple.

*MENKE*, Specim. Moll. New Holland, p. 9.

*Hab.* Mouth of the Swan River, New Holland.

A very solid opaque-white globose shell, encircled with linear grooves, curiously rudely wrinkled longitudinally, and remarkably broadly excavated upon the columella.

### Species 33. (Fig. a, b, c, Mus. Cuming.)

**LITTORINA RUDIS.** *Litt. testā ovalo-globosā, interdum obtecte umbilicata, solidissimā, spirā brevi, acutā, anfractibus convexis, levibus aut spiraliter linearī-sulcatis; albida, carneo-fusco fasciatā, aut tutea, interdum nigro-lineatā; aperturā parvā, contracta, circulari, columellā callosa.*

**THE RUDE LITTORINA.** Shell ovately globose, sometimes with a covered umbilicus, very solid, spire short, sharp, whorls convex, smooth or spirally linearly grooved; whitish, banded with flesh-brown, or yellow, sometimes black in the linear grooves; aperture small, contracted, circular, columella callous.

*Turbo rufus*, Donovan, Brit. Shells, vol. i. p. 33. f. 3.

*Turbo littoreus*, Merton and Rackett.

*Littorina rufa*, Johnston.

*Littorina zosaria*, Bean.

*Littorina nigrolineata*, Gray.

*Hab.* Britain and United States.

The specimens figured in the accompanying Plate represent the most characteristic varieties of this well-known species, the last, Fig. 33 c, being the *L. nigrolineata* of Gray.

LITTORINA.—PLATE VII.

Species 34. (Fig. *a*, *b*, Mus. Cuming.)

LITTORINA LITTORALIS. *Litt. testá semiglobosá, solidissimá, spirá plano-depressá, anfractibus obliquu convexis, levibus aut obscurissime striatis; luteá, interdum latè fuscofasciatá; aperturá circulari, valdè contractá, columellá latè excavatá.*

THE LITTORAL LITTORINA. Shell semiglobose, very solid, spire flatly depressed, whorls obliquely convex, smooth, or very obscurely striated; yellow, sometimes broadly brown-banded; aperture circular, very much contracted, columella broadly excavated.

*Nerita littoralis*, Linnaeus, Syst. Nat. p. 1253.

*Turbo retusus* and *obtusatus*, Lamarck.

*Turbo undulatus*, De Blainville.

*Littorina obtusata*, Menke.

Hab. Britain and North European shores.

Well distinguished by its oblique obtuse growth and depressed spire, varying in colour from yellow, more or less banded, to freckled brown.

# LITTORINA.

## PLATE VIII.

Species 35. (Mus. Cuming.)

**LITTORINA TENUIS.** *Litt. testā ovato-oblongā, acutā, imperforatā, anfractibus decolori-covezis, concentricō te-nū linearē-sulcatis; caraco-albidā, opaco-albo obscurē lentiginosā; aperturā parvissimul, labro columellarī tenuē reflexo.*

**THE THIN LITTORINA.** Shell ovately oblong, sharp, imperforated, whorls slantingly convex, concentrically finely linear-grooved; flesh-white, obscurely freckled with opake-white; aperture rather small, columellar lip thinly reflected.

PHILIPPI, Abbild. und Besch. Conch. p. 18. pl. 6. f. 8.  
*Hab.* Island of Ticao, Philippine Islands.

A light-drift freckled shell, having more the appearance of a *Bolinus* than of a *Littorina*.

Species 36. (Fig. a, b, Mus. Cuming.)

**LITTORINA CONICA.** *Litt. testā subpyramidalē-conicā, tenuicūndā, imperforatā, anfractibus plano-declivibus, parva covezis, spiraliter linearē-sulcatis, infernē angulatis, ad angulum tenaciorinatis; pelticeido-griseā, fuscescens vittata et lentiginosā; interdum stramineā; aperturā parvissimul, columellā appressā, subvatā, labro tenuē reflexo, violacea.*

**THE CONICAL LITTORINA.** Shell somewhat pyramidal conical, rather thin, imperforated, whorls flatly slanting, but little convex, spirally linear-grooved, angled round the lower part, finely keeled at the angle; transparent-grey, filleted and freckled with light-brown, sometimes straw-colour; aperture rather small, columella appressed, grooved, lip thinly reflected, violet.

PHILIPPI, Pro. Zool. Soc. 1845, p. 141.  
*Hab.* Japan.

An extremely graceful and characteristic species, of a pyramidal conical form, semitransparent, either yellow or freckled with a neat filleted pattern, the columellar lip being of a violet hue.

Species 37. (Fig. a, b, Mus. Cuming.)

**LITTORINA AFRICANA.** *Litt. testā ovato-conicā, subventri-cosā, solidissimul, imperforatā, anfractibus covezis,*

*lævibus, spiraliter linearē-sulcatis, infernē angulatis, tenuicarinatis; caraco-albā; columellā latè excavatā, cum aperturā fauce intenſe purpuro-castanā.*

**THE AFRICAN LITTORINA.** Shell ovately conical, somewhat ventricose, rather solid, imperforated, whorls convex, smooth, spirally linear-grooved, angled and finely keeled round the lower part; bluish-white; columella broadly excavated, with the interior of the aperture deep purple-chestnut.

PHILIPPI, Abbild. und Besch. Conch. p. 31. pl. 4. f. 10.  
*Hab.* Algoa Bay ; Krauss.

A solid, opake, blue-white shell, faintly linear-grooved, neatly angled round the lower part, having the columella and interior of the aperture richly stained with dark purple-chestnut.

Species 38. (Fig. a, b, Mus. Cuming.)

**LITTORINA PLANAXIS.** *Litt. testā subglobosa-conicā, pen-tricōsa, imperforatā, anfractibus levibus, supernē sub-impressis, deinde convexis; olivaceo-fusca, abo floccata; columellā latissimū excavatā.*

**THE PLANAXIS LITTORINA.** Shell somewhat globosely conical, ventricose, imperforated, whorls smooth, slightly impressed round the upper part, then convex; olive-brown, flaked with white; columella very broadly excavated.

NUTTALL, Philippi, Abbild. und Besch. Conch. p. 33. pl. 4. f. 16.

*Hab.* Upper California.

Of rather globose form, remarkably broadly excavated at the columella against the body-whorl. Rusty olive-brown in colour, flaked with white.

Species 39. (Fig. a, b, Mus. Cuming.)

**LITTORINA SULCULOSA.** *Litt. testā subarcuētē conicā, testū-culā, solidā, anfractibus plano-declivibus, regulariter latē sulcatis et obtusē costatis, infernē angulatis; spadicei, costis interdum livido-purpurascentibus, nitentibus; aperturā subconcreta.*

**THE GROOVED LITTORINA.** Shell rather sharply conical, rather thin, solid, whorls flatly slanting, regularly grooved and obtusely ribbed, angled at the

LITTORINA.—PLATE VIII.

lower part; fawn-colour, ribs sometimes stained with livid-purple, shining; aperture rather contracted.

PHILLIPPI, Pro. Zool. Soc. 1845, p. 142.  
*Hab.* North coast of New Holland.

Characterized very distinctly by its broad, shining, flattened ribs, which are sometimes of a purplish-livid hue, and intervening grooves.

---

Species 40. (Mus. Cuming.)

LITTORINA STRIATA. *Litt. testā abbreviato-conicā, ventri-  
caū, imperforatā, acentrā, aufractibus declivi-concisis,*

*obesia, spiralliter sulcatis et liratis, sordide cinereo-  
nigricante; columellā latissimè excavatā, fuso tinctā.*

THE STRIATED LITTORINA. Shell shortly conical, ventricose, imperforated, sharp, whorls slantingly convex, stout, spirally grooved and ridged; ash-black; columella very broadly excavated, stained with brown.

KING, Zool. Journ. vol. v. p. 345.

*Littorina Caucasiensis*, D'Orbigy.

*Littorina arenica*, Nuttall.

*Hab.* West Africa, Azores, and Canary Islands.

A stout, strongly linear-grooved, adust shell, with the columella against the body-whorl very broadly excavated.

# LITTORINA.

## PLATE IX.

Species 41. (Mus. Cuming.)

**LITTORINA CRESA.** *Litt. testa orato-conoida; solida, adobosa, aufractibus decoloratae-concreta, tenuissime spiraliiter linearis-suturatis, inferior obtuse angulatis; roseo-spadios; apertura subconcreta, fave aurantia, columella callous, violacea.*

THE STOUT LITTORINA. Shell ovately conoid, solid, rather stout, whorls slantingly convex, very finely spirally linearly grooved, obtusely angled at the lower part; pinkish fawn-colour; aperture rather contracted, orange in the interior, columella callous, violet.

SOWERBY, Genera of Shells, f. 6.  
Hab. Society and Philippine Islands.

A smooth, stout species, of solid growth, flesh-tinged without, orange within, having the spiral linear grooves rather distant.

Species 42. (Fig. a, b, Mus. Cuming.)

**LITTORINA FORTUNEL.** *Litt. testa subelongato-turbinate, angusta, tenuicula, aufractibus concrescens, audique spiraliiter linearis-suturatis; pallide spadios, rufo-fusco oblique striatâ; apertura parvâ, circinata, columella tenui reflecta.*

FORTUNE'S LITTORINA. Shell somewhat elongately turbinated, narrow, rather thin, whorls convex, spirally linearly grooved throughout; light fawn-colour, obliquely streaked with red-brown; aperture small, circular, columella thinly reflected.

Hab. China.

A slender acuminate shell, with a small aperture, having more the appearance of a *Turritella* than a *Littorina*.

Species 43. (Mus. Cuming.)

**LITTORINA PALLESSENS.** *Litt. testa ovato-turbinata, spirâ acuta, aufractibus rotundatis, spiraliiter filos-costatis, ad suturam impressis; opaco-alba; apertura subcirculari, latro expanso, albo.*

THE PALE LITTORINA. Shell ovately turbinated, spire sharp, whorls rounded, spirally thread-ribbed, impressed at the suture; opake-white; aperture nearly circular, lip expanded, white.

PHILIPPI, Pro. Zool. Soc. 1845, p. 142

Hab. Cagayan, Island of Mindanao, Philippines. Cuman.

An opake-white shell, of solid, elegantly convoluted growth, encircled throughout with strongly defined thread-like keels.

Species 44. (Fig. a, b, Mus. Cuming.)

**LITTORINA ALBICANS.** *Litt. testa ovoavata-ovata, tenues semipellucida, spirâ acuta, aufractibus rotundatis, spiraliiter linearis-suturatis, ad suturam obtuse carinatis, ultimo plicato-varicoso; calcareo-alba, versus apicem livido-purpurascens, ad carinam rufo-fusco vittata, aperta subcirculari, labore tenui reflexo.*

THE WHITISH LITTORINA. Shell acuminately ovate, thin, semi-transparent, spire sharp, whorls rounded, spirally linearly grooved, obtusely keeled at the suture, last whorl plicately variose; chalk-white, livid-purple towards the apex, flecked with red-brown at the keel; aperture nearly circular, lip thinly reflected.

METCALFE, Pro. Zool. Soc. 1852.

Hab. Sarawak, Borneo; Sir James Brooke.

A peculiarly delicate semi-transparent chalk-white shell, irregularly variose on the last whorl after the manner of a *Scalaria*.

Species 45. (Fig. a, b, Mus. Cuming.)

**LITTORINA MELANOSTOMA.** *Litt. testa pyramidalis-oblonga, solidiuscula, spirâ acutâ, aufractibus planos-decorticatis, oblique rudo striatis, spiraliiter linearis-suturatis; straminea, purpureo-fusco interdum oblique striata; apertura trigono-oculata, basi expansa, columella callous, intus nigricante-ciolacea.*

THE BLACK-MOUTH LITTORINA. Shell pyramidal oblong, rather solid, spire sharp, whorls flatly slanting, obliquely roughly striated, spirally linearly grooved; straw-colour, sometimes obliquely streaked with purple-brown; aperture triangularly ovate, expanded at the base, columella callous, deep black-sh-violet.

GRAY, Zoology of Beechey's Voyage, p. 140.

Hab. Singapore and Borneo.

An interesting species, distinguished from all others of

the genus by its oblong pyramidal form and deep purple-violet columella.

Species 46. (Fig. *a, b*, Mus. Cuming.)

LITTORINA FLAMMEA. *Litt. testā elongato-ovalā, angustā, tenui, subventricosā, spirā acutā, anfractibus declivi-concavis, valide et confertim spiraliter linearisulcatis; ferrugineo-spadiceā, rufo-fusco obliquè striatā; aperturā parviusculā, basi dilatatā, columellā tenuē reflexā.*

THE FLAMED LITTORINA. Shell elongately ovate, narrow, thin, slightly ventricose, spire sharp, whorls slantingly convex, strongly and closely spirally lined, nearly grooved; rust-fawn-colour, obliquely streaked with red-brown; aperture rather small, dilated at the base, columella reflected at the base.

PHILIPPI, Abbild. und Besch. Conch. pl. 6. f. 21.

Hab. Shanghai, China; Fortune.

A slight, elongated species, closely spirally grooved throughout, and peculiarly marked with oblique flames.

*Litterina*, Pl. X.

# LITTORINA.

## PLATE X.

### Species 47. (Mus. Cuming.)

**LITTORINA FRASERI.** Litt. testa acuminate-ovalis, angustioribus decicci-cocreas, subventricosus, validè crebriliratus; livido-purpurascens, nito-te, undique rugosus; apertura semicirculari, columella latè excavata.

**Fraser's LITTORINA.** Shell acuminate-oval, whorls slightly convex, subventricose, strongly closely ridged; livid-purple, shining, everywhere red-dotted; aperture semicircular, columella broadly excavated.

*Hab.* Lagos, West Africa; Fraser.

A thin but solid shell, deeply closely grooved, the intermediate ridges being tessellated with dark purple-red.

### Species 48. (Fig. a, b, Mus. Cuming.)

**LITTORINA TESSELLATA.** Litt. testa ovo-acuminate-ovalis, angustioribus ad suturam impresius, deinde ventricosus, infirmè obtusè angustus, undique levius linearis-sulcatus; virescent-albus, punctis purpureo-rufis undique densè tessellatus; columella latè excavata.

**THE TESSELLATED LITTORINA.** Shell acuminate-oval, whorls impressed at the suture, then ventricose, obtusely angled at the lower part, everywhere finely linearly grooved; greenish-white, densely tessellated throughout with dark purple-red dots; columella broadly excavated.

PHILIPPI, Abbild. und Besch. Conch. pl. 5. f. 26.

*Littorina undulata*, D'Orbigny.  
*Hab.* West Indies.

Neatly tessellated throughout with dark purple-red, the dots mostly forming oblique waved streaks.

### Species 49. (Mus. Cuming.)

**LITTORINA SITCHANA.** Litt. testa semiglobosa, inflata, spiræ parvæ, obtusa, angustioribus concavæ, nunc levibus, nunc spirali ter ratæ; nigra, virescente medio et ad suturam fasciatæ; apertura circulari, labro excavato-dilatato.

**THE SITKA LITTORINA.** Shell semiglobose, inflated, spire small, obtuse, whorls convex, sometimes smooth, sometimes spirally ridged; black, banded in the middle and at the suture with greenish-white; aperture circular, lip excavately dilated.

PHILIPPI, Pro. Zool. Soc. 1845, p. 140.

*Hab.* Sitka.

A very characteristic semiglobose inflated shell, of solid growth, more or less strongly keeled,

### Species 50. (Fig. a, b, Mus. Cuming.)

**LITTORINA CARINATA.** Litt. testa pyramidalis-conoidæ,

angustioribus planis-decicatis, spiræ latè rotundate, inferior convexus, infra subconicus, albido, interiore planior-circulis fasciatis, purpureo-rufis rufo-viliostrigata; apertura parva, columella latè excavata.

**THE KEELLED LITTORINA.** Shell pyriformis-conoidæ keeled at the lower part, slightly convex beneath whitish, banded with deep leaden blue, obliquely wave-streaked with purple-red; aperture small, columella broadly excavated.

D'ORBIGNY, Moll. de Cuba, p. 209, pl. 15, f. 1-4.  
*Hab.* Cuba.

A solid shell, of very characteristic form and pattern of colouring.

### Species 51. (Fig. a, b, Mus. Cuming.)

**LITTORINA BREVICULA.** Litt. testa globo-turbinata, solidiscolla, spiræ brevi, acuta, angustioribus derecta, angustata, callo spirali ter carinata, carina distans; basi, interstitiis striatis; albido, nigro virescente, rufo et cirri mandibulari; apertura circulari, columella latè excavata et dilatata.

**THE SHORT LITTORINA.** Shell globose-turbinate, rather solid, spire short, sharp, whorls slightly angled, strongly spirally keeled, keels distant, interstices striated; whitish, stained with black, blotched with red and green; aperture circular, columella broadly excavated and dilated.

*Turbo breviculus*, Philippi, Zeitschrift für Malac. 1844, p. 166.

*Hab.* North coast of China.

Of broad Turbo-like form, encircled with three strong keels, and prettily variegated with colour upon a dark ground.

### Species 52. (Mus. Cuming.)

**LITTORINA GREENLANDICA.** Litt. testa ovalo-cratricosa, tonitrua, angustioribus convexis, spirali ter obsoletè liratis; livido-castanea; columella dilatata.

**THE GREENLAND LITTORINA.** Shell ovately ventricosus, rather thin, whorls convex, spirally obsoletely ridged, livid-chestnut; columella broadly dilated.

MENKE, Synt. Moll. 1830, p. 45.

*Littorina solida*, Menke.

*Littorina castanea*, Deshayes.

*Nerita litoralis*, Fabricius.

*Hab.* Greenland.

Of rather light structure, sometimes banded, with the columellar lip conspicuously excavately dilated.

# LITTORINA.

## PLATE XI.

### Species 53. (Mus. Cuming.)

**LITTORINA CINCTA.** Litt. testā acuminato-ovatā, anfractūs declivi-concavis, spiraliter linearis-sulcatis, infernē oblique carinatis, infra liratis; purparascente-fusca, ferruginea tincta, inter liras basales alba; apertura parva, columellā excavata, callous, livido-purpurea.

**THE ENCIRCLED LITTORINA.** Shell acuminate ovate, whorls slantingly convex, spirally linearly grooved, obtusely keeled at the lower part, ridged beneath; purplish-brown, rust-tinged, white between the basal ridges; aperture small, columella excavated, callous, livid-purple.

QUOY and GAIMARD, Voy. de l'Astrolabe, vol. ii. p. 481. pl. 33. f. 20-21.

Hab. New Zealand.

A dark ash-brown shell, simply linearly grooved, the grooves being wider at the base beneath the angle.

### Species 54. (Fig. a, b, Mus. Cuming.)

**LITTORINA PINTADO.** Litt. testā acuminato-ovatā, spirā peracutā, anfractibus concavis, deinceps spiraliter linearis-sulcatis; cerascente-alba, nudique minute rufo-punctata; apertura parvissima, fauce purpureo-violacea, columellā tenuissimè excavata.

**THE PINTADO LITTORINA.** Shell acuminate ovate, spire very sharp, whorls convex, closely spirally linearly grooved; bluish-white, everywhere minutely red-dotted; aperture rather small, interior purple-violet, columella very broadly excavated.

*Turbo Pintado*, Wood, Index Test. Supp. pl. 6. f. 34.  
*Littorina Pintado*, Philippi.

Hab. 4. Saulwich Islands.

Of a very characteristic aspect, bluish-grey, covered with minute purple-red dots.

### Species 55. (Fig. a, b, Mus. Cuming.)

**LITTORINA NEBULOSA.** Litt. testā acuminato-ovatā, testicula, ventricosa, anfractibus declivi-concavis, densè impresso-striatis; albida, rufescente-fusca obliquè flammata; columellā tenuè reflexa.

**THE CLOUDED LITTORINA.** Shell acuminate ovate, rather thin, ventricose, whorls slantingly convex, densely impressively striated; whitish, obliquely flamed with reddish-brown; columella thinly reflected.

*Phasianella nebulosa*, Lamarck, Anim. sicc. vert. vol. ix. p. 244

Hab. Honduras.

Allied to *L. nudulata*, but of less solid growth, more

ventricose, and wanting the characteristic violet columella of that species.

### Species 56. (Fig. a, b, Mus. Cuming.)

**LITTORINA IRROBATA.** Litt. testā acuminato-ovatā, soliduscula, anfractibus superne subimpresis, deinde rotundatis, vnde valde spiraliter liratis, liris confertis, interstitiis profunde excavatis; livido-plumbea ant nigrivire, liris carnea-albidis, rufa punctatis; operatur subcontracta, fauce nigro-purpurea, columellā excavato-dilatata.

**THE BEDEWED LITTORINA.** Shell acuminate ovate, rather solid, whorls slightly impressed round the upper part, then rounded, everywhere strongly spirally ridged, ridges close-set, interstices deeply excavated; livid lead-colour or blackish, ridges bluish-white, dotted with red; aperture rather contracted, interior blackish-purple, columella excavately dilated. *Turbo irroratus*, Say, Journ. Acad. Nat. Sci. Philadelphia, vol. ii. p. 239.

*Littorina irrorata*, Gray.

*Phasianella sulcata*, Lamarck.

Hab. Sitska.

Strongly ridged, of a grey colour, the ridges being roughened with red granules.

### Species 57. (Fig. a, b, Mus. Cuming.)

**LITTORINA ZICZAC.** Litt. testā acuminato-ovatā, anfractibus declivi-concavis, tenuissimè linearis-sulcatis, infernē obsolete angulatis; luteo-ante-alba, pallide cinereo-cerascente, lineis rugis nudatis obliquè striata; apertura subcontracta, fauce purpureo-fasciata, columellā subcollata.

**THE ZIGZAG LITTORINA.** Shell acuminate ovate, whorls slantingly convex, very finely linearly grooved, obliquely angled at the lower part; yellowish-white, banded with pale ash-blue, obliquely streaked with waved red lines; aperture rather contracted, interior purple-banded, columella slightly callous.

*Trochus ziczac*, Chemnitz, Conch. Cab. vol. v. p. 69. pl. 166. f. 1599.

Hab. Monte Christi, West Columbia. Kangaroo Island, South Australia.

Notwithstanding the discrepancy in the above-quoted localities, the specimens bearing them, on good authority, are certainly the same species, agreeing precisely with the figure cited from Chemnitz.

### Fig. 58. (Mus. Cuming.)

The shell here represented, *L. tenebrosa* of Nuttall, proves, on examination, to be merely a worn *L. Pintado*.

# LITTORINA.

## PLATE XII.

### Species 59. (Mus. Cuming.)

LITTORINA ABERRANS. *Litt. testā acuminato-turritā, tenui, gracili, anfractibus rotundatis, spiraliiter subtilliter liratis et striatis, striis longitudinalibus irregulariter decussatis striatis; carneo-albicente, liris opacis; aperturā parvā, circulari, labro et columellā tenue reflexis, roseo-purpureis.*

THE ABERRANT LITTORINA. Shell acuminate turreted, thin, slender, whorls rounded, spirally finely ridged and striated, irregularly plicately decussated with longitudinal striae; flesh-white, ridges opaque; aperture small, circular, lip and columella thinly reflected, rose-purple.

PHILIPPI, Pro. Zool. Soc. 1845, p. 142.

Hab. Panama.

A slender acuminate shell, of light growth, having very much the appearance of a *Bulinus*.

---

### Fig. 60. (Mus. Cuming.)

A variety of *L. Fraseri*, of more attenuated form, from Fernando Po.

---

### Species 61. (Fig. a, b, Mus. Cuming.)

LITTORINA ZEBRA. *Litt. testā acuminato-ovalā, spirā acuta, crassiscutulā, anfractibus convexis, toribus; aigrigante-purpureā, flavus et albus latis undato-striigatā; columellā latē excavatā, aperturē fave nigrinante-purpureā.*

THE ZEBRA LITTORINA. Shell acuminate ovate, spire sharp, rather thick, whorls convex, smooth; blackish-chestnut, streaked with broad waved white flames; columella broadly excavated, interior of aperture blackish-purple.

*Turbo zebra*, Woosl, Index Test. Supp. pl. 6. f. 33.

*Littorina zebra*, Philippi.

*Phasianella Peruviana*, Lamarck.

Hab. Peru, Chili.

A solid, conspicuously white-flamed shell, stained with deep-purple in the aperture.

---

### Species 62. (Fig. a, b, Mus. Cuming.)

LITTORINA GLANS. *Litt. testā ovato-conoidā, crassū,*

*apice acutā, anfractibus declivis, rinde planis corrugatis et tuberculato-granulis; atrā, ad suturen refescente; aperturā parvā, columellā callosā.*

THE ACORN LITTORINA. Shell ovately conoid, thick, sharp at the apex, whorls slantingly convex, rudely plicately wrinkled, and tubercularly grained; black, reddish at the suture; aperture small, columella callous.

Hab. ——?

An obtusely conoid solid shell, cinder-black, rust-tinted at the suture, largely grained throughout.

---

### Species 63. (Fig. a, b, Mus. Cuming.)

LITTORINA SIMPLEX. *Litt. testā ovato-turbinate, tenuicula, anfractibus rotundatis, obsolete spiraliiter liratis; sordidè fluorescente-aureantia; aperturā subcirculari, columellā excavato-expansā.*

THE SIMPLE LITTORINA. Shell ovately turbinated, rather thin, whorls rounded, obsoletely spirally ridged; dirty brownish-orange; aperture nearly circular, columella excavately expanded.

Hab. St. Vincent, Cape de Verds.

Of simple form, the representative apparently of our common *L. vulgaris*.

---

### Species 64. (Mus. Cuming.)

LITTORINA AMBIGUA. *Litt. testā acuminato-ovatā, crassiscutulā, anfractibus superne decollati-impressis, deinde convexis, spiraliiter liratis, liris angustis, interdum subobsoletis; fluorescente, purpureo-castaneo tessellata ant promiscue maculata; columellā latē excavatā, callosā.*

THE DOUBTFUL LITTORINA. Shell acuminate ovate, rather thick, whorls slantingly impressed round the upper part, then convex, spirally ridged, ridges narrow, sometimes nearly obsolete; brownish, tessellated or promiscuously blotched with purple-chestnut; columella broadly excavated, callous.

NUTTALL, MSS., Mus. Cuming.

Hab. Sandwich Islands.

A shell of rather solid growth, tessellated in a somewhat irregular blotched manner.

66d.

69.

# LITTORINA.

## PLATE XIII.

Species 65. (Mus. Cuming.)

LITTORINA LUCUTOSA. *Litt. testā acuminato-ovatā, imporforatā, anfractibus dehinc-convexis, longitudinaliter plicato-striatis, infernā spiraliter subcatis; livido-fusca; aperturā parvissimā, columellā purpurascens.*

THE SAW LITTORINA. Shell acuminately ovate, imperforated, whorls slantingly convex, longitudinally pliately striated, spirally grooved towards the lower part; livid-brown; aperture rather small, columella purplish.

Hab. New Zealand.

A rather light acuminate species, of a bluish livid-brown colour, chestnut in the aperture.

Species 66. (Fig. a, b, Mus. Cuming.)

LITTORINA PUNCTATA. *Litt. testā ovato-ventricosā, spirā brevisculptā, acutā, anfractibus convexis, regulariter lineari-salicotis; oliveo-fusca, punctis albis quadratis nudigae tessellata; aperturā subpatulā, columellā late appressā.*

THE DOTTED LITTORINA. Shell ovately ventricose, spire rather short, sharp, whorls convex, regularly linearly grooved; olive-brown, tessellated throughout with square white dots; aperture rather open, columella broadly appressed.

*Turbo punctata*, Gmelin, Syst. Nat. p. 3597.

*Le Marval*, Adanson.

Hab. Senegal.

Mostly of ventricose growth, thickly tessellated with small square white dots upon a dark-olive ground.

Species 67. (Fig. a, b, c, d, Mus. Cuming.)

LITTORINA UNDULATA. *Litt. testā ovato-conoidā, imperforatā, solidisculptā, anfractibus superne subconcavo-impressis, deinde convexis, nunc levibus, nunc subcatis et liratis; latissimante-albā, rufo-fusco sepiè fasciatā set flammatā; aperturā subcontractā, columellā callos-appressā, intense violacea.*

THE WAVED LITTORINA. Shell ovately conoid, imperforated, rather solid, whorls slightly concavely im-

pressed round the upper part, then convex, sometimes smooth, sometimes grooved and ridged; yellowish white, frequently banded or flamed with reddish-brown; aperture rather contracted, columella callously appressed, deep violet.

GRAY, Zool. Beechey's Voyage, p. 140.

Hab. Society and Philippine Islands.

This is the most variable of all *Littorinae*. Some specimens are smooth and marbled with chestnut-brown, others pale and spirally ridge-striated; but all are characterized by a deep-violet enamelled columella.

Species 68. (Fig. a, b, Mus. Cuming.)

LITTORINA GRANULARIS. *Litt. testā ovato-ventricosā, spirā parvā, acutā, anfractibus convexis, densē irregulariter granulos-liratis; fulcō, caruleo tinctā; columellā late excavatā et dilatatā, carneo-fuscescente.*

THE GRAINED LITTORINA. Shell ovately ventricose, spire small, sharp, whorls convex, closely irregularly granosely ridged; fulvous, tinged with blue; columella broadly excavated and dilated, flesh-brown.

GRAY, Zool. Beechey's Voyage, p. 140.

Hab. — ?

The grained ridges are on the middle and upper portion of the whorls; on the lower part the ridges are smooth, and more numerous and close-set.

Species 69. (Mus. Cuming.)

LITTORINA ARCTICA. *Litt. testā subglobosā, spirā brevisculptā, anfractibus rotundatis, plus minus erosis, sordidē fusca; aperturā subcirculari, columellā subcallosā.*

THE ARCTIC LITTORINA. Shell subglobose, spire rather short, obtuse, whorls rounded, more or less eroded; dirty-brown; aperture nearly circular, columella somewhat callous.

MÖLLER, Fauna Grönlaudica, p. 9.

Hab. Kamtschatka, Nova Zembla.

A globose, rather light inflated species, of a dingy hue, generally more or less eroded.

## PLATE XIV.

Species 70. (Mus. Cuming.)

**LITTORINA DEBILIS.** *Litt. testā subpyramidali-conoideā, solidiusculā, anfractibus plano-convergīs, infernē abrupū angulatis, levigatā, nitente, tenuissimē linearisulcata; cornulessente-albā, linea carnis nodulatis pallidissimis longitudinaliter pictā; aperturā parvissimā, columellā callosā, violaceo-fuscōscente.*

THE FAINT LITTORINA. Shell somewhat pyramidaly conoid, rather solid, whorls flatly convex, abruptly angled at the lower part; smooth, shining, very finely linearly grooved; bluish-white, painted longitudinally with faint zigzag flesh-lines; aperture rather small, columella callous, violet-brown.

PHILIPPI, Pro. Zool. Soc. 1845, p. 140.

Hab. —?

A solid subpyramidal shell, of a smooth, bluish aspect, marked with faint zigzag flesh-lines.

Species 71. (Fig. a, b, Mus. Cuming.)

**LITTORINA BALTEATA.** *Litt. testā globoso-turbanatā, spirā brevi, acuta, anfractibus supernē declivibus, deinde ventricosā, spiraliter fortiter carinatā, carnis subdiscontinibus obsoletē granosis; līcido-plumbatā; aperturā parvā, columellā latā excavatā et dilatata.*

THE BELTED LITTORINA. Shell globosely turbinated, spire short, sharp, whorls slanting round the upper part, then ventricose, spirally strongly keeled, keels rather distant, obsoletely grained; livid lead-colour; aperture small, columella broadly excavated and dilated.

Hab. China; Fortune.

Allied in form to *L. brevicula*, but of thinner substance, with the ribs sharper and more distant.

Species 72. (Mus. Cuming.)

**LITTORINA NERITOIDES.** *Litt. testā orato-conoideā, spirā breviscula, anfractibus lacūbus, supernē subiapressis, declivibus, deinde obesia, solidis; albida, līcido-rufescēte fasciatā; aperturā parvā, columellā subcallosā, rufā.*

THE NERITOID LITTORINA. Shell ovately conoid, spire rather short, whorls smooth, slightly impressed round

the upper part, slanting, then strongly solid; whitish, banded with a livid-red; aperture small, columella somewhat callous, red.

*Turbo Neritooides*, Linnaeus, Syst. Nat. p. 1232.

*Herlia petrea*, Montagu.

*Turbo petraea*, Maton and Rackett.

*Turbo cornuta*, Lamarck.

*Littorina Basteroli*, Payraudeau.

*Rissoa elegans*, Risso.

*Paludina glabra*, Ziegler.

*Littorina cervaea*, Costa.

*Littorina petrea*, Gray.

*Littorina Neritooides*, Philippi.

Hab. Mediterranean and other seas of Europe.

To Dr. Philippi is due the merit of having recognized in this species the true Linnaean *Turbo Neritooides*.

Fig. 73. (Mus. Cuming.)

This shell, *L. Canariensis* of D'Orbigny, is identical with *L. striata*, King.

Species 74. (Mus. Cuming.)

**LITTORINA NOVÆ-ZEALANDIÆ.** *Litt. testā subgloboso-turbanatā, spirā breviscula, acutissimā, anfractibus rotundatis, spiraliter irregulariter linearē-sulcatis; opaco-albā, obscurā pallidissimā rufo-flammeatā; aperturā subcirculari, fance castaneo-fusco, columellā latissimā excavatā, livido-castanea.*

THE NEW ZEALAND LITTORINA. Shell somewhat globosely turbinated, spire rather short, very sharp, whorls rounded, spirally irregularly linearly grooved; opake-white, obscurely very faintly red-flamed; aperture nearly rounded, chestnut-brown in the interior, columella very broadly excavated, livid-chestnut.

Hab. New Zealand.

Curiously resembling *L. Africana* in colour and marking, but of lighter and rounder form.

Species 75. (Fig. a, b, Mus. Cuming.)

**LITTORINA KNYSNAENSIS.** *Litt. testā subgloboso-turbanatā, leuciculā, ventricosā, anfractibus declivi-convergīs, dense spiraliter elevato-striatis; alba, ferrugineo-fusco*

LITTORINA.—PLATE XIV.

*lentiginosā, infernē livido-nigricante tauriā; apertura  
fauce nigricante-castaneā, columellā callosā, rufā, sub-  
excavatā.*

THE KNYSNA LITTORINA. Shell somewhat globosely turbinated, rather thin, ventriose, whorls slantingly convex, densely spirally elevately striated; whitish, freckled with rust-brown, tinged with livid-black towards the lower part; interior of the aperture blackish-chestnut, columella callous, red, slightly excavated.

KRAUSS, Philippi, Abbild. und Besch. Conch. pl. 4. f. 4.

Hab. Mouth of the Knysna, Cape of Good Hope

There is a peculiarity in the freckled marking of this species which renders it easily recognizable.

Species 76. (Mus. Cuming.)

LITTORINA GUTTATA. *Litt. testā subpyramidalati-conoideā,  
solidā, aurociblis plano-convexis, infernē abrupte an-  
gulatis, levigatis; oliveaceo-griseā, punctis albī lenti-  
ginosā et tessellatā; apertura parvissimā, columellā  
callosā, rufescente.*

THE SPOTTED LITTORINA. Shell somewhat pyramidalily conoid, solid, whorls flatly convex, abruptly angled at the lower part, smooth; olive-grey, freckled and tessellated with white dots; aperture rather small, columella callous, reddish.

PHILIPPI, Abbild. und Besch. Conch. pl. 4. f. 7.

*Phasianello punctata*, Pfeiffer.

Hab. St. Vincent, Cape de Verds.

Of rather solid acuminated growth, freckled throughout with whitish dots upon an olive-grey ground.

## PLATE XV.

### Species 77. (Mus. Cuming.)

**LITTORINA MESPLUM.** *Litt. testá obtusè conoidea, subumbilicata, solidivestita, anfractibus convexis, levibus; fuscescente-rufa; apertura subcirculari, columella callosa.*

THE MEDIAL LITTORINA. Shell obtusely conoid, slightly umbilicated, rather solid, whorls convex, smooth; brownish-red; aperture nearly circular, columella callous.

*Helix mesplum,* Mühlfeldt, Verh. Berl. Ges. Nat. vol. i. p. 219, pl. S. f. 8.

*Littorina fusca,* Pfeiffer.

*Littorina mesplum,* Philippi.

*Littorina Naticoides,* D'Orbigny.

*Hab.* Jamaica.

A small solid shell, of a characteristic brownish-red or drab colour.

### Species 78. (Fig. a, b, Mus. Cuming.)

**LITTORINA THERSITES.** *Litt. testá obtusè ovala, solidiuscula, spirá brevi, acutá, anfractibus tenuè linearisulcatis, plano-convexis, infernè subangulatis; albida, cirescente-ceruleo fasciata; columella appresso-excavata; apertura fauce purpureo-fusca.*

THE THERSITES LITTORINA. Shell obtusely ovate, rather solid, spire short, sharp, whorls finely linearly grooved, flatly convex, slightly angled at the lower part; whitish, banded with greenish-blue; columella appressly excavated; interior of aperture purple-brown.

*Hab.* Valparaiso.

A small, solid, humped shell, conspicuously linearly grooved, of a pale ash-colour, banded with grey-blue.

### Species 79. (Mus. Cuming.)

**LITTORINA GRANO-COSTATA.** *Litt. testá subglobosa, spirá brevi, acutá, anfractibus convexis, subventricosis, spiraller linearisulcatis, longitudinaliter granosco-costatis; cerulescente-alba; columella appresso-excavata; apertura fauce purpureo-fusca.*

THE GRAIN-RIBBED LITTORINA. Shell sub-globose, spire short, sharp, whorls convex, sub-ventricose, spirally linearly grooved, longitudinally granosely ribbed; bluish-white; columella appressly excavated; interior of the aperture purple-brown.

*Hab.* Brisbane Water, Australia; Strange.

A pretty little opaque blue-white shell, latticed with

grained ribs, which, in specimens of more mature growth, become somewhat obsolete.

### Species 80. (Fig. 80 a, b, and 81, Mus. Cuming.)

**LITTORINA PICTA.** *Litt. testá ovato-turbinata, anfractibus convexis vel obsoletè linearisulcatis, interdum granulatis; olivaceo-nigricante, maculis grandibus amplis irregulariter marmorata; columella excavata, apertura fauce intensè purparea.*

THE PAINTED LITTORINA. Shell ovately turbinated, whorls convex or obsoletely linearly grooved, sometimes granulated; olive-black, irregularly marbled with large white spots; columella excavated, interior of the aperture deep-purple.

*PHILIPPI,* Abbild. und Besch. Conch. pl. 3. f. 26.

*Hab.* Sandwich Islands.

The specimen of *L. picta* here represented is Dr. Philippi's var. *marmorata*.

### Species 82. (Fig. a, b, Mus. Cuming.)

**LITTORINA FEJEENSIS.** *Litt. testá ovato-conoidea, tenuicula, spirá brevi, acutá, anfractibus ventricosis, planulatis, infernè angulatis, undique irregulariter granosolitatis; nigricante, granulis pallidis; columella excavata, apertura fauce purpureo-fusca.*

THE FEJEE LITTORINA. Shell ovately conoid, rather thin, spire short, sharp, whorls ventricose, rather flat, angled at the lower part, everywhere irregularly granosely ridged; blackish, granules pale; columella excavated, interior of the aperture purple-brown.

*Hab.* Fejee Islands; Maegillivray.

A dull, angularly convoluted shell, encircled with small chains of whitish grains.

### Species 83. (Mus. Cuming.)

**LITTORINA PICEA.** *Litt. testá obtusè conoidea, anfractibus plano-convexis, obliquè striatis et interdum granulatis, infernè angulatis, intenè piceo-nigrâ; apertura parva, columella excavata, purpurea.*

THE PITCHY LITTORINA. Shell obtusely conoid, whorls flatly convex, obliquely striated, sometimes granulated, angled at the lower part; dark pitch-black; aperture small, columella excavated, purplish.

*Hab.* —?

A solid, pitch-dark, berry-like shell, of a distinct typical form from any other of the genus.

## PLATE XVI.

Species 84. (Mus. Cuming.)

*Littorina Paludinella.* *Litt. testā subglobosā, tenui, cornēd, spira parōd, acutā, anfractibus ad suturam subimpresso, rotundatā, levibus; oliveo-castaneō; aperturā subcirculari, columellā excavatā, callous.*

THE LITTLE PALUDINA LITTORINA. Shell subglobose, thin, horny, spire small, sharp, whorls rather impressed at the suture, rounded, smooth; olive-chestnut; aperture nearly circular, columella excavated, callous.

Hab. Tasmania.

A minute, dark-brown, horny-like shell, with the whorls narrow and more than usually rounded.

Species 85. (Fig. a, b, Mus. Cuming.)

*Littorina Adamsii.* *Litt. testā ovato-turbinatā, subturrilā, anfractibus linearē-sulcatis, supernē et inferne angustatis; lutescente-albā, punctis fasciā vitatā, punctis ad angulum infernum majoribus; aperturā subcirculari.*

ADAMS'S LITTORINA. Shell ovately turbinated, somewhat turreted, whorls linearly grooved, angled above and below; yellowish-white, filled with brown dots, dots larger at the lower angle; aperture nearly circular.

*Littorina pulchella,* C. B. Adams, MS., Mus. Cuming.

Hab. Jamaica.

A minute yellowish shell, of a peculiar turreted form, filled with brown dots.

Species 86. (Mus. Cuming.)

*Littorina Minima.* *Litt. testā ovoē, Naticiformi, subumbilicatā, spira parōd, acutā, anfractibus convexis, ultimo subexpanso, carnellescente-albā, punctis purpureo-fusci regulariter seriatim aspersa; columellā planō-callosā, aperturā fauce violaceo-purpureā.*

THE VERY SMALL LITTORINA. Shell ovate, Natic-shaped, slightly umbilicated, spire small, sharp, whorls convex, the last somewhat expanded; bluish-white, sprinkled with regular rows of purple-brown dots; columella flatly callous, interior of the aperture violet-purple.

*Turbo miximus,* Wood, Index Test. Supp. pl. 6. f. 29.

Hab. —?

Distinguished by a very characteristic clear pattern of small, distinct red dots upon a blue-white ground.

Species 87. (Mus. Cuming.)

*Littorina Rufa.* *Litt. testā orato-turbanatā, solidivulcū, minutē umbilicatā, anfractibus declici-convexis levibus, politis; rufo-fuscescente; aperturā parat, fauce callosā.*

THE RED LITTORINA. Shell ovately turbinated, rather solid, minutely umbilicated, whorls slantingly convex, smooth, polished; red-brown; aperture small, inferior callous.

RECLUS, MS., Mus. Cuming.

Hab. —?

A minute, solid, bright red-brown shell, with a bright polished surface.

Species 88. (Mus. Cuming.)

*Littorina Araucana.* *Litt. testā oblongo-ovatā, spira elevatā, anfractibus declici-convexis, leavigatis; purpureo-castaneā; aperturā ovatā, pareiusculā, columellā subexcavatā, ad extremitatem dilatatā, apertura fauce nigricante-purpureā.*

THE SLENDER LITTORINA. Shell oblong-ovate, spire raised, whorls slantingly convex, smooth; purple-chestnut; aperture ovate, rather small, columella slightly excavated, dilated at the extremity, interior of the aperture blackish-purple.

D'ORBIGNY, Voy. dans l'Amér. Mérid. p. 393. pl. 53. f. 3, 4.

A dark, shining, chestnut shell, faintly banded, of a slender attenuated form.

Species 89. (Mus. Cuming.)

*Littorina Porcata.* *Litt. testā globoso-ovoē, subeuvriscosā, profundiē umbilicatā, spira pareā, anfractibus declici-convexis, infernē expansis, undique spiralis costatis; carnellescente-albā; columellā excavatā, apertura fauce violaceo-purpureā.*

THE RIBBED LITTORINA. Shell globosely ovate, subeuvriscose, deeply umbilicated, spire small, whorls slantingly convex, expanded towards the lower part, spi-

rally ribbed throughout; bluish-white; columella excavated, interior of the aperture violet-purple.

PHILIPPI, Pro. Zool. Soc. 1845, p. 139.

Hab. Galapagos Islands (found on high exposed rocks); Cuming.

A small, open, bluish-white shell, spirally ribbed, violet-purple in the interior.

Species 90. (Fig. a, b, Mus. Cuming.)

LITTORINA FABALIS. *Litt. testā globosā, tenui, spirā brevissimā, minulā, aurofractibus angustis, ultimo expanso; castaneo-rufā, lineis obscurè reticulatā; aperturā amplā, columellā excavatā.*

THE LITTLE BEAN LITTORINA. Shell globose, thin, spire very short, minute, whorls narrow, the last expanded; chestnut-red, obscurely reticulated with lines; aperture large, columella excavated.

*Turbo fabalis*, Zoological Journal, vol. ii. p. 366. pl. 13. f. 10.

*Littorina Beanii*, Macgillivray.

*Littorina jubatis*, Thorpe.  
Hab. Northern shores of England.

It is somewhat doubtful whether this little species is not an extreme variety of *L. littoralis*.

Species 91. (Mus. Cuming.)

LITTORINA SAXATILIS. *Litt. testā ovato-turbinatā, spirā acutā, anfractibus rotundatis, spiraliter tenuissimē linearī-sulcatis; olivaceo-fuscā, nitente; aperturā circulari, columellā tenuē callosā.*

THE ROCK-INHABITING LITTORINA. Shell ovately turbinated, spire sharp, whorls rounded, spirally very finely linearly grooved; olive-brown, shining; aperture circular, columella thinly callous.

JOHNSTON, Berwick Club, vol. i. p. 268.

*Littorina neglecta*, Bean.

Hab. Northern shores of England.

This also is referred by some authors to a typical British species, *L. rufus*.

# LITTORINA.

## PLATE XVII.

Species 92. (Mus. Cuming.)

**LITTORINA DECOLLATA.** Litt. testā ovatā, apice obtusā, erosā, levissimā, albida, fasciā latā carvolecente cingulatā; anfractibus parum convexis, ultimo vix angulato; aperturā ovatā, nigro-fusca, zonis duabus albis, columellā excavato-depressā, nigro-fusca.

**THE DECOLLED LITTORINA.** Shell ovate, obtuse and eroded at the apex, very smooth, whitish, encircled with a broad blue band; whorls but little convex, the last slightly angled; aperture ovate, blackish-brown, with two white zones, columella excavately depressed, blackish-brown.

KRAUSS, Philippi, Abbild. und Besch. Conch. vol. ii. p. 197, pl. 4. f. 3.

Hab. Natal.

A small patulate species, of a peculiar blue colour, white at the sutures, with aperture and columella dark chestnut-brown.

Species 93. (Mus. Cuming.)

**LITTORINA VENTRICOSA.** Litt. testā ovatā, ventricosā, basi rotundatā, transversim sulcata, sulcis nonnunquam granulatis; albida, striis nudulis rufis pictā; anfractibus convexis; aperturā semiorbiculari, patulā, carnēa, columellā excavato-depressā, subcallosā, carnēa.

**THE VENTRICOSA LITTORINA.** Shell ovate, ventricose, rounded at the base, transversely grooved, grooves sometimes granulated; whitish, painted with waved red streaks; whorls convex; aperture semiobicular, patulate, flesh-colour, columella excavately depressed, rather callosa, flesh-colour.

PHILIPPI, Abbild. und Besch. Conch. vol. iii. p. 15. pl. 6. f. 19.

Hab. Pulo-Penang.

A linearly grooved inflated shell, faintly red-streaked, with the aperture and columella of a characteristic flesh-colour.

Species 94. (Mus. Cuming.)

**LITTORINA DIEMENENSIS.** Litt. testā ovato-oblongā, basi subangulatā, transversim tenuissimè striatā, albido-carneolente; anfractibus planisculis, ultimo medio carneolente vittato; aperturā ovatā, parviusculā, carneo-fusca.

**THE DIEMEN LITTORINA.** Shell ovately oblong, slightly angled at the base, transversely very finely striated, whitish-blue; whorls rather flat, the last blue-banded

round the middle; aperture ovate, rather small, chestnut-brown.

QUOY and GAIMARD, Voy. de l'Astrolabe, vol. ii. p. 479. pl. 33. f. 8-11.

Hab. New Zealand.

A rather solid oblong species, conspicuously blue-banded, shining chestnut-brown in the aperture.

Species 95. (Mus. Cuming.)

**LITTORINA LEVIS.** Litt. testā ovato-oblongā, acutā, albida, cincero marmoratā, interdum carvolecente, anfractibus parum convexis, laevis, sub lente spiralierte striatis, ultimo basi angulatā; aperturā ovatā, fusco-violacea, columellā excavato-depressā, fusco-violacea.

**THE SMOOTH LITTORINA.** Shell ovately oblong, sharp-whitish, marbled with ash, sometimes blue-banded; whorls but little convex, smooth, beneath the lens spirally striated, last whorl angled at the base; aperture ovate, brownish-violet, columella excavately depressed, brownish-violet.

PHILIPPI, Pro. Zool. Soc. 1845, p. 140.

Hab. —?

A shell of rather solid growth, angled towards the base, blue-banded or mottled, while the aperture and columella are deep brownish-violet.

Species 96. (Fig. a, b, Mus. Cuming.)

**LITTORINA SAYI.** Litt. testā ovatā, acutā, subcentricosā, transversim multiseriatā, albā, punctis pallidè rufis ornatā; spira violascente, anfractibus convexisculis, superne declivibus; aperturā ovato-orbiculari, columellā rufā.

SAY'S LITTORINA. Shell ovate, sharp, rather ventricose, transversely many-grooved, white, ornamented with pale red dots; spire violet, whorls rather convex, slanting round the upper part; aperture ovate-orbicular, columella red.

PHILIPPI, Pro. Zool. Soc. 1845, p. 140.

Hab. Florida.

Of rather solid, ventricose growth, closely spirally grooved throughout, with the columella characteristically stained with red.

## LITTORINA.—PLATE XVII.

Species 97. (Mus. Cuming.)

LITTORINA COLUMELLARIS. *Litt. testá ovato-conicá, acutá, subventricosá, densé striatá, albida, interdum punctis luteis ferrugineis sepe in strigis confluentibus picta; anfractibus convexis, suturis excavatis; aperturá semi-orbiculari, columellá excavato-depressa, fusco-violacea tincta.*

THE PILLARED LITTORINA. Shell ovately conical, sharp, rather ventricose, densely striated, whitish, sometimes painted with yellow or rust spots, often running into streaks; whorls convex, sutures excavated; aperture semi-orbicular; columella excavately depressed, stained with brownish-violet.

D'ORBIGNY, Voy. dans l'Amer. Mérid. n. 284.

Hab. Pernambuco.

It is not without some doubt as to its correctness, that I adopt this shell as M. D'Orbigny's *L. columellaris*, from Pernambuco. It belongs, rather, to the eastern type of the genus, represented by *L. undulata*, and approaches closely to some colourless varieties of that species.

Species 98. (Mus. Cuming.)

LITTORINA OBLIGATA. *Litt. testá globo-turbinatá, tenui, ventricosá, spiraliter densé elevato-striatá, olivaceá vel rufo-castaná, fasciis luteolis intermixtis interdum cingulatá; anfractibus rotundatis; aperturá orbiculari.*

THE TIED LITTORINA. Shell globosely turbinated, thin, ventricose, spirally densely elevatedly striated, olive or reddish-chestnut, sometimes encircled with interrupted yellowish bands; whorls rounded; aperture orbicular.

*Turbo obligatus*, Say, Journ. Acad. Nat. Sci. Philadelphia, vol. ii. p. 241.

*Littorina rufa*, Gould.

Hab. Maine, United States.

A light, turbinated shell, mostly of a bright reddish-chestnut colour, more or less freckled with yellowish interrupted bands.

Species 99. (Mus. Cuming.)

LITTORINA MILLEGRANA. *Litt. testá ovato-conoidea, ventricosá, acutá, albida; anfractibus convexis, spiraliter densé grano-liratis; aperturá suborbiculari, carneo-fusco-violacea tincta.*

THE THOUSAND-GRAINED LITTORINA. Shell ovately conoid, ventricose, sharp, whitish; whorls convex, spirally densely grain-ridged; aperture nearly orbicular, flesh-brown.

PHILIPPI, Abbild. und Besch. Conch. vol. iii. p. 65. pl. 7. f. 15.

Hab. Red Sea.

Allied to the group figured in Plate II., of which *L. dilatata* is the type.

Species 100. (Mus. Cuming.)

LITTORINA MAURITIANA. *Litt. testá ovato-conicá, solidá, carulescente-albá, transversim tenuissime striatá; anfractibus parum convexis, ultimo subangulato; aperturá purpureo-fusca, fasciá solitariá albá basali.*

THE MAURITIUS LITTORINA. Shell ovately conical, solid, bluish-white, transversely very finely striated; whorls but little convex, the last slightly angled; aperture purple-brown, with a solitary white band at the base.

*Phasianella Mauritiana*, Lamarck, Anim. sans vert. vol. ii. p. 244.

*Littorina unifasciata*, Gray.

Hab. Mauritius. New Holland.

Distinguished by its solid, sharply conical form, and peculiarity of colouring.

# LITTORINA.

## PLATE XVIII.

### Species 101. (Mus. Brit.)

**LITTORINA INTERMEDIA.** *Litt. testā oblongo-conicā, basi ventricosā, tenui, colore viridi, lineis impressis exarata; spirā acutā, anfractibus convexiusculis, ultimo rotundata; columellā albā vel violacea.*

**THE INTERMEDIATE LITTORINA.** Shell oblong, conical, ventricose at the base, thin, various in colour, grooved with impressed lines, spire sharp, whorls convex, the last rounded; columella white or violet.

PHILIPPI, Pro. Zool. Soc. 1845, p. 141.

*Hab.* Red Sea, Natal, New Holland, Philippine Islands, Tahiti.

Closely allied to *L. scabra*, of which there are many forms not always readily definable.

### Species 102. (Mus. Brit.)

**LITTORINA NATALENSIS.** *Litt. testā parvā, orato-conicā, acutā, cinereā, transversa striatā, tuberculato-nodosa; aperturā ovali, columellā nigra, planinscula, inferne proiecta et dilatata.*

**THE NATAL LITTORINA.** Shell small, ovately conical, sharp, ash-coloured, transversely striated and tubercularly nodose; aperture oval, columella black, rather flat, produced and dilated at the lower part.

KRAUSS, Philippi, Abbild. und Besch. Conch. vol. ii. p. 160. pl. 3. f. 4.

*Hab.* Natal.

A small, solid species, belonging to that characteristic group of the genus represented most conspicuously by *L. dilatata*.

### Fig. 103. (Mus. Brit.)

Having figured a transversely banded example of *Littorina fuscata*, Gray, at Plate IV, fig. 20, which is not very typical of its general character, a specimen is here represented with longitudinally waved bands.

### Species 104. (Mus. Brit.)

**LITTORINA GLABRATA.** *Litt. testā ovato-oblongā, acutā, albidō-cornē, striis pallidē fasciis obliquis pictā; anfractibus parum convexis, levibus, ultimo basi angulato; aperturā ovali, rufescente, columellā depressā, violacea.*

**THE SMOOTH LITTORINA.** Shell ovately oblong, sharp, whitish-flesh-colour, painted with oblique pale-brown streaks; whorls but little convex, smooth, the last angled; aperture ovate, reddish, columella depressed, violet.

PHILIPPI, Pro. Zool. Soc. 1845, p. 140.

*Hab.* Payta, Peru; Cuming.

Of a rather solid narrowly conical form, smooth, painted in a characteristic manner with oblique brown hair-streaks.

### Species 105. (Mus. Cuming.)

**LITTORINA TROCHOIDES.** *Litt. testā elongato-conicā, subpyramidalis, sordide griseā; anfractibus convexis, valde tuberculato-nodosis, ad saturam impressis; aperturā parvā, subquadrate-orbiculari, columellā excavato-depressā, nigrescente.*

**THE TROCHOID LITTORINA.** Shell elongately conical, somewhat pyramidal, dull grey; whorls convex, strongly tubercularly nodose, impressed at the surface; aperture small, somewhat squarely orbicular, columella excavately depressed, blackish.

GRAY, Zoology of Beechey's Voyage, p. 140.

*Hab.* — ?

Chiefly distinguished from its congeners by a more contracted and pyramidal growth.

### Species 106. (Mus. Cuming.)

**LITTORINA GRANOSA.** *Litt. testā ovato-ventricosā, crassā, granoso-tuberculata, sordide griseā; aperturā parvā, columellā arcuato-depressā, subcallosā.*

**THE GRAINED LITTORINA.** Shell ovately ventricose, thick, granosely tubercled, dull grey; aperture small, columella arcuately depressed, rather callous.

PHILIPPI, Abbild. und Besch. Conch. vol. iii. p. 65. pl. 7. f. 14.

*Hab.* Guinea, Liberia.

The growth of this species is quite the opposite to the preceding, being broad and obese though belonging to the same type.

### Species 107. (Mus. Brit.)

**LITTORINA MODESTA.** *Litt. testā ovato-oblongā, albida,*

LITTORINA.—PLATE XVIII.

*rarius obsoletè rufo-punctatâ, transversia profundâ  
suicatâ; anfractibus convexiusculis; operaturâ semi-  
orbiculari, columellâ latissimâ excavato-depressâ, au-  
rautio-fuscâ, supernâ purpureo-maculatâ.*

THE MODEST LITTORINA. Shell ovately oblong, whitish,  
rarely obsoletely dotted with red, transversely deeply  
grooved; whorls rather convex; aperture semi-orbi-  
cular, columella very broadly excavately depressed,

orange-brown, blotched with purple at the upper  
part.

PHILIPPI, Pro. Zool. Soc. 1845, p. 141.

Hab. Sitka.

A dull-white shell, sometimes speckled with red, chiefly  
distinguished by the regularity with which it is spirally  
grooved.

# SOLETELLINA.

## PLATE I.

Genus SOLETELLINA, *De Blainvill.*

*Testa oblongo-transversa vel ovata, compressa, plerumque angustioribus, subaequilateralis, levigata vel concentricè striata, plerumque purpurea, posticè sepe iradiata, epidermide cornea induta, latere antico rotundato, positivo vario, unco brevi, truncato, unco acuminato, umbonibus parvis. Cardo dente unico parvo erecto in callo sinistro, duobus in callo sinistrâ interdum bifurcatis. Ligamentum subampulum, exterratum, subcallositate oblongo-conspicua interdum positum. Impressio muscularis pallia ampliter sinuata.*

Shell oblong-transverse or ovate, compressed, generally equivalent, nearly equilateral, smooth or concentrically striated, generally purple and mostly two-rayed posteriorly, covered with a horny epidermis, anterior side rounded, posterior various, sometimes shortly truncated, sometimes acuminate, umboes small. Hinge with a single small erect tooth in the left valve, two teeth in the right valve, sometimes bifurcated. Ligament rather large, external, placed upon a conspicuous oblong internal callousity. Muscular impression of the mantle largely sinuous.

The genus *Soletellina* was founded by Dr. Blainville in his "Manuel de Malacologie" for the purpose of grouping together "four or five species of *Solen* of Lamarck." He does not particularize the species, but takes Lamarck's *Solen rostratus* (*Solen diphys*, Linneus) as the type. The genus, as lately arranged and named by M. Deshayes in Mr. Cuming's cabinet, includes but this one Lamarckian species. It includes also the *Solen orbicularis* of Wood, Index Test. Supplement, typified of another section; and, agreeing with these two very well-defined types, we introduce a series of twenty-one characteristic species.

The species of large size allied to *S. diphys* are from the Moluccas or Philippine Islands. Of the other division of the genus the finest and most characteristic example is *S. Nuttallii*, from California, and an allied species, *S. Japonica*, which inhabits a nearly similar latitude in the opposite hemisphere. An intermediate, represented by *A. nitida*, appears in New Zealand.

---

Species 1. (Mus. Cuming.)

SOLETELLINA CONSOBrina. *Sol. testâ ovato-transversâ, flexuoso-architâ, subaequilaterali, rugoso-striatâ, pur-*

*purascens-cerviculâ, epidermide cornea olivacea indutâ, latere antico subangustè rotundato, postico obliquè truncato, compressè rostrato.*

THE ALLIED SOLETELLINA. Shell ovately transverse, flexuously arched, nearly equilateral, roughly striated, purple-blue, covered with an olive horny epidermis, anterior side rather narrowly rounded, posterior obliquely truncated, compressly beaked.

DESHAYES, MS., Mus. Cuming.  
Hab. Philippine Islands; Cuming.

Distinguished by a compressed beak-like flexure on the posterior side.

---

Species 2. (Mus. Cuming.)

SOLETELLINA NYMPHALIS. *Sol. testâ ovato-transversâ, superne trigonâ, pleno-compressâ, viz. æquilaterali, levigata, fulvoente-carnea, nitente, versus umbones roseo-tinctâ, epidermide intescentia cornea prope marginem indutâ, latere antico latè rotundato, postico brevirostre, subattenuato-rostrato.*

THE WATER SOLETELLINA. Shell ovately transverse, triangular at the upper part, flatly compressed, scarcely equilateral, smooth, fulvous-flesh, shining, stained with rose towards the umboes, covered near the margin with a yellowish horny epidermis, anterior side broadly rounded, posterior shorter, somewhat attenuately beaked.

DESHAYES, MS., Mus. Cuming.  
Hab. Australia.

An Australian species, of a distinct typical character from the preceding, flat and smooth, sloping triangularly on each side from the umboes.

---

Species 3. (Mus. Cuming.)

SOLETELLINA EPIDERMIA. *Sol. testâ ovato-transversâ, convexiscaudâ, viz. æquilaterali, rufè plicato-striatâ, sordidè calcareo-albi, versus umbones carneo-tinctâ, epidermide cornea foliâ nitente indutâ, latere antico latè rotundato, postico brevirostre subattenuato-rostrato.*

THE EPIDERMID SOLETELLINA. Shell ovately transverse, rather convex, scarcely equilateral, rudely plicately striated, dull chalk-white, flesh-tinted towards the umboes, covered with a fulvous shining horny epi-

SOLETELLINA.—PLATE I.

dermis, anterior side broadly rounded, posterior side shorter, somewhat attenuately beaked.

DESHAYES, MS., Mus. Cuming.

Hab. Port Adelaide, Australia.

More convex than the preceding species, and differing also in being roughly plicately striated, covered with a peculiarly glittering transparent deciduous horny epidermis.

Species 4. (Mus. Cuming.)

SOLETELLINA CUMINGIANA. *Sol. testā oblongo-transversā, compressissimulā, æquilaterali, rugoso-striatā, purpurascente-ceruleā, posticè biradiatā, epidermide olivacea*

*indutā, laterioris supernē subæqualiter rectis, antico late rotundato, postico obliquè rotundato, subflexuoso-impresso.*

CUMING'S SOLETELLINA. Shell oblong-transverse, rather compressed, equilateral, roughly striated, purple-blue, posteriorly two-rayed, covered with an olive epidermis, sides almost equally straight at the upper part, anterior broadly rounded, posterior obliquely rounded, slightly flexuously impressed.

DESHAYES, MS., Mus. Cuming.

Hab. Island of Negros, Philippines; Cuming.

The form of this elegant species is simply oblong-ovate, the anterior side being the broader, whilst the posterior is but slightly flexuously impressed.

*Seletellina*, Pl. II.

## SOLETELLINA.

### PLATE II.

#### Species 5. (Mus. Cuming.)

SOLETELLINA ADAMSII. *Sol. testa elongato-transversa, convexiuscula, inaequilateralis, carneo-purpurea, postice biradiata, epidermide olivacea nitente indutâ, latere antico rotundata, postico paulo longiore, oblique compresso-truncata.*

ADAMS'S SOLETELLINA. Shell elongately transverse, rather convex, inequilateral, bluish-purple, posteriorly two-rayed, covered with a shining olive epidermis, anterior side round, posterior a little the longer, obliquely compressly truncated.

DESHAYES, MS., Mus. Cuming.  
*Hab.* Island of Negros, Philippines.

Chiefly distinguished by the posterior end being slightly obliquely truncated, and rather compressed.

#### Species 6. (Mus. Cuming.)

SOLETELLINA NITIDA. *Sol. testa oblongo-ovalata, compressa, subaequilateralis, purpuravantea-alba, epidermide cornea laevi transducida nitente indutâ, latere antico rotundata, postico breve, declivi-acuminata, et concretrice rugosâ.*

THE SHINING SOLETELLINA. Shell rather compressed, nearly equilateral, purplish-white, covered with a smooth, shining, transparent, horny epidermis, anterior side rounded, posterior shorter, slopingly acuminate, and concentrically wrinkled.

GRAY, MS., Mus. Brit.  
*Hab.* New Zealand; Strange.

Of an extremely delicate purple-white substance, covered with a peculiarly clear, glittering, horny epidermis.

#### Species 7. (Mus. Cuming.)

SOLETELLINA BIRADIATA. *Sol. testa ovalo-transversa, convexo-planata, aequilateralis, levigata, purpureo vel*

*griseo transversine strigata, postice biradiata, lateribus superne arcuato-declinibas, deinde salattenuato-rostratis.*

THE BIRADIATE SOLETELLINA. Shell ovately transverse, convexly flattened, equilateral, smooth, transversely streaked with purple and grey, posteriorly two-rayed, sides arcuately sloped at the upper part, then somewhat attenuately rounded.

*Soles biradiatus*, Wood, Gen. Conch. pl. 33. f. 1, Index Test. pl. 3. f. 26.

*Hab.* Port Adelaide, Australia.

Characterized on the posterior side with two conspicuous narrow purple rays, on a fulvous halo-like ground, breaking through the transverse blue and purple streaks.

#### Species 8. (Mus. Cuming.)

SOLETELLINA DIPLOS. *Sol. testa elongato-transversa, sub-compressa, subaequilateralis, purparea, postice biradiata, epidermide cornea olivacea indutâ, latere antico rotundata, postico flexuosa subacuminata-rostrata.*

THE TWO-RAYED SOLETELLINA. Shell elongately transverse, rather compressed, nearly equilateral, purple, posteriorly two-rayed, covered with an olive horny epidermis, anterior side rounded, posterior flexuously sub-acuminately beaked.

*Soles diplos*, Linneus, Mantissa, p. 554. Chemnitz, Conch. Cab. vol. vi. p. 68. pl. 7. f. 53, 54.

*Soles rostratus*, Lamarck.

*Psmamobia rostrata*, Deshayes.

*Solellina radiata*, De Blainville.

*Hab.* Malacca.

Distinguished from its allied species by the flexuous acuminately beaked form of the posterior extremity.

9.

10.

11.

12.

13.

14.

15.

## SOLETELLINA.

### PLATE III.

Species 9. (Mus. Cuming.)

SOLETELLINA TRUNCATA. *Sol. testa ovato-transversa, penicillariter obliquè contortæ, subequaliterali, inaequivalve, valvæ sinistræ convexæ, dextræ planæ, nigricundine-purpureæ, epidermide olivacea indutæ, latere antico rotundato, postice brevi, latissimè truncata.*

THE TRUNCATED SOLETELLINA. Shell ovately transverse, peculiarly obliquely contorted, nearly equilateral, inequivalue, left valve convex, right flattened, blackish-purple, covered with an olive epidermis, anterior side rounded, posterior short, very broadly truncated.

Hab. Moluccas.

An interesting species, distinguished from all others by the flattened growth of the right valve, and by its general oblique contortion.

Species 10. (Mus. Cuming.)

SOLETELLINA SILIQUA. *Sol. testa angustæ transversa, tenui, equaliterali, levæ, carneo-alba, epidermide cornea olivacea transversè nitens indutæ, postice pallide biradiatæ, latere antico rotundato, postice obliquè acuminato-rotundato.*

THE POD SOLETELLINA. Shell narrowly transverse, thin, equilateral, smooth, flesh-white, covered with a shining transparent olive horny epidermis, faintly tworayed on the posterior side, anterior side rounded, posterior obliquely acuminate rounded.

Hab. New Zealand; Hart.

A delicate flesh-tinted shell, covered with a thin transparent shining horny epidermis, exhibiting the two posterior rays so frequently characteristic of this genus.

Species 11. (Mus. Cuming.)

SOLETELLINA DONACIOIDES. *Sol. testa oblongo-transversa, tenui, inaequaliterali, levigata, latè castaneo-radiatæ, epidermide crassa cornæ transversæ indutæ, latérans apud laterem rotundatis, postice multo brevioræ.*

THE DONAX-LIKE SOLETELLINA. Shell oblong-transverse, thin, inaequalateral, smooth, broadly chestnut-rayed, covered with a thick, transparent, horny epidermis, sides equally rounded, posterior much the shorter.

Hab. Port Adelaide, Australia.

This little species does not present the usual inequality in the form of the lateral extremities, and it is enveloped in an unusually thick transparent horny epidermis, resembling that of *Solemya*.

Species 12. (Mus. Cuming.)

SOLETELLINA ACUMINATA. *Sol. testa elongato-transversa, inaequaliterali, cerascente-purpurea, epidermide nigricante-oliveacea indutæ, ad umbrae erosæ, latere antico rotundato, postice obliquè flexuoso-acuminato, angulum obliquum rugosum formante.*

THE ACUMINATED SOLETELLINA. Shell elongately transverse, inaequalateral, bluish-purple, covered with a blackish-olive epidermis, eroded at the umbrae, anterior side rounded, posterior obliquely flexuously acuminate, forming an obtuse wrinkled angle.

DESHAYES, MS., Mus. Cuming.

Hab. Philippina Islands.

Of rather more rough and solid structure than its allies, with a darker epidermis, and conspicuous above all in having the posterior extremity obliquely acuminate.

Species 13. (Mus. Cuming.)

SOLETELLINA INCERTA. *Sol. testa oblongo-transversa, postice latiore, tenui, inaequaliterali, levæ, epidermide tenui cornæ olivacea indutæ, postice obscurè biradiatæ, latere antico rotundato, postice obliquè truncato.*

THE DOUBTFUL SOLETELLINA. Shell oblong-transverse, broader posteriorly, thin, inaequalateral, smooth, covered with a thin horny epidermis, obscurely tworayed posteriorly, anterior side rounded, posterior obliquely truncated.

DESHAYES, MS., Mus. Cuming.

Hab. New Zealand; Strange.

Of simple form, with the posterior side only very slightly compressly truncated.

Species 14. (Mus. Cuming.)

SOLETELLINA ATRATA. *Sol. testa ovato-transversa, postice latiore, tenui, concentricè striatæ, atro-purpurea, epidermide cornæ olivacea indutæ, postice biradiatæ, latere antico rotundato, postice tumidulo, rotundato-truncato.*

THE DARK SOLETELLINA. Shell ovately transverse, broader posteriorly, thin, concentrically striated, dark purple, covered with a horny olive epidermis, two-rayed posteriorly, anterior side rounded, posterior rather swollen, rotundately truncated.

DESHAYES, MS., Mus. Cuming.  
*Hab.* Catanauan, Island of Luzon, Philippines; Cuming.

Closely allied to the preceding species, but of a more *Jouaz*-like form, and darker-coloured.

Species 15. (Mus. Cuming.)

SOLETELLINA PLANULATA. *Sol. testá oblongo-transversa.*

*pomo-couverta, subequaliter ali, atro-purpurea, epider-  
mide olivaceo-fuscá indutâ, latere antico rotundato,  
postico oblique rotundato-truncato.*

THE FLAT SOLETELLINA. Shell oblong-transverse, flatly convex, nearly equilateral, dark purple, covered with an olive-brown epidermis, anterior side rounded, posterior obliquely rotundately truncated  
*Hab.* Moluccas.

Chiefly distinguished from the larger typical species of the genus by its less elongately transverse growth and darker colour.

# SOLETELLINA.

## PLATE IV

### Species 16. (Mus. Cuming.)

**SOLETELLINA JAPONICA.** *Sol. testa orbiculari-transversa, plano-convexa, inaequilaterali, levigata, purpuraceo-fulva, eximia radiata, epidermis cornea falso-olivacea transversitate induta, latere antico latè rotundata, postico brevi, obliquè subacuminato-truncata.*

**THE JAPAN SOLETELLINA.** Shell orbicularly transverse, flatly convex, inequilateral, smooth, purple-white, delicately rayed, covered with a transparent, fulvous-olive, horny epidermis, anterior side broadly rounded, posterior short, obliquely subacuminately truncated.

DESHayES, MS., Mus. Cuming.  
*Hab.* Japan; Dr. Siebold.

Delicately purple-rayed upon a white ground, beneath a characteristic, transparent, shining, fulvous-olive epidermis.

### Species 17. (Mus. Cuming.)

**SOLETELLINA REVERSA.** *Sol. testa obliquè orbiculari, tenui, pelucida, valde inaequilaterali, levigata, cornescente-alba, epidermis tenui cornea transversa floscante-cornea induta, latere antico brevissimo, postico obliquè latè expanso, umbobus rotundata.*

**THE REVERSED SOLETELLINA.** Shell obliquely orbicular, thin, transparent, very inequilateral, smooth, bluish-white, covered with a thin, transparent, yellowish-horny epidermis, anterior side very short, posterior obliquely broadly expanded, both rounded.

*Hab.* Malacca; Dr. Traill.

In this and the following species, both very thin and horny, the sides are, as it were, reversed, the posterior being much more broadly and more largely developed than the anterior.

### Species 18. (Mus. Cuming.)

**SOLETELLINA ORBICULATA.** *Sol. testa obliquè orbiculari, tenui, semipellucida, valde inaequilaterali, levigata, niente, cornescente, epidermis cornea transversa floscante-cornea induta, latere antico brevissimo, postico latè subobliquè expanso, umbobus rotundata.*

**THE ORBICULAR SOLETELLINA.** Shell obliquely orbicular, thin, semitransparent, very inequilateral, smooth, shining, bluish-white, covered with a yellowish-olive, transparent, horny epidermis, anterior side very short, posterior side broad, rather obliquely expanded, both rounded.

*Solen orbicularis*, Wood, Index Testacologiens, Supp. p. 3.  
Pl. i. f. 4.

*Hab.* Sumatra; Captain Adolphe Martin.

This species scarcely differs from the preceding, yet it is scarcely so obliquely expanded, and the difference, though slight, is characteristic.

### Species 19. (Mus. Cuming.)

**SOLETELLINA NUTTALLII.** *Sol. testa obliquè ovata, subaequilaterali, inaequivale, valre dextræ planore, levigata, ad marginem posticam densè striatâ, obliquè, purpureo-crenata tenui, posticè hirsutata, epidermis cornea falso-olivacea pellucidamente induta, latere antico rotundata, postico brevi, obliquè subacuminato-truncata.*

**NUTTALL'S SOLETELLINA.** Shell obliquely ovate, nearly equilateral, inaequivale, right valve the flatter, smooth, densely striated at the posterior margin, white, delicately tinged with purple, two-rayed posteriorly, covered with a transparent, shining, fulvous-olive, horny epidermis, anterior side rounded, posterior short, obliquely truncated.

CONRAD, Journ. Acad. Nat. Sci. Phil.  
*Hab.* San Diego, California; Nuttall.

This very beautiful species is highly distinguished by its remarkably transparent and richly coloured horny epidermis.

### Species 20. (Fig. a, b, Mus. Cuming.)

**SOLETELLINA TUMENS.** *Sol. testa ovalo-transversa, tenui, inaequilaterali, tenui, irregulariter rugosè-striata, alto-purpurea, posticè hirsutata, epidermis olivacea tenui decidua induta, latere antico rotundata, postico brevi, obliquè subacuminato-truncata.*

**THE SWOLLEN SOLETELLINA.** Shell ovately transverse, swollen, inequilateral, thin, irregularly roughly striated, dark purple, posteriorly two-rayed, covered with a thin, deciduous, olive epidermis, anterior side rounded, posterior short, obliquely sub-acuminately truncated.

DESHayES, MS., Mus. Cuming.  
*Hab.* Island of Negros, Philippines; Cuming.

Of light tumid growth, still characterized by the two light posterior rays.

### Species 21. (Mus. Cuming.)

**SOLETELLINA OBSCURATA.** *Sol. testa trigono-orbiculari subobliqua, subaequilaterali, inaequivale, valre dextræ planiore, levigata, posticè corrugata, purpureo-grisea, hic illuc satratè fasciatâ, latere antico rotundata, postico breviro, obliquè truncata.*

**THE DARKENED SOLETELLINA.** Shell triangularly orbicular, rather oblique, nearly equilateral, inaequivale, right valve the flatter, smooth, wrinkled posteriorly, purple-grey, here and there darker-banded, anterior side rounded, posterior shorter, obliquely truncated.

DESHayES, MS., Mus. Cuming.  
*Hab.* ——?

A very characteristic species, belonging to the same peculiar type of the genus as *S. Japonica* and *Nuttallii*, but quite distinct specifically from either.

## PLATE I.

### Genus CAPSA, Bruguire.

*Testa oblongo-transversa, subquadrate, ventricosa, ad latera paululum hians, inaequilateralis, latere postico longiore, Cardo, in utrâque valvâ dentibus duos brevibus centralibus, quorun, in valvâ dextrâ, postico majore, subrecurrens, in valvâ sinistrali, antico mejore, trigono, solidio, obtuse bifido. Ligamentum subomplum, externum. Impressio pallii sinus magno, lato.*

Shell oblong-transverse, somewhat square, a little gaping at the sides, inequilateral, posterior side the longer. Hinge with two central teeth in each valve, of which, in the right valve, the posterior is the larger, a little recurred, in the left valve the anterior is the larger, triangular, solid, and obtusely bifid. Ligament rather large, external. Impression of the mantle showing a large broad sinus.

On reference to the 'Encyclopédie Méthodique,' Pl. 231, it will be seen that the very characteristic bivalve shell represented in the accompanying Plate, the old *Venus deflorata* of Linneaus (*Sanguinolaria rugosa*, Lamarck, *Psammobia rugosa*, Sowerby) is there figured by Bruguire under the generic title of *Capa*. Nearly twenty years afterwards the name was appropriated by Lamarck to distinguish two bivalves (*C. beeziata* and *Brasiliensis*) which belong more properly to the genus *Dowaz*. This misappropriation of the term *Capa* obtained a wide circulation; it is now restored to the typical *Venus deflorata* of Linneaus, inhabiting a wide range of latitude over the Eastern seas, and to a closely allied species from Tahiti.

### Species 1. (Fig. a to f, Mus. Cuming.)

CAPSÆ DEFLORATA. *Cap. testâ oblongo-transversâ, ventricosa, radiatione densissimâ rugosa-striatâ et liratâ, tiris modo levibus, modo evanilloribus, posticè semper valvidibus et plus minus nodoso-crenatis; abdilâ, aut carneorosacâ, aut intensâ lirido-violacea, obscure zonata et radiatâ, intus sepiissimâ lutescente, posticè intensâ purpureo-violacea tintâ.*

THE DEFLOWERED CAPSA. Shell oblong-transverse, ventricose, radiately very densely roughly striated and ridged, ridges sometimes thin, sometimes stronger, posteriorly always strong, and more or less nodosely crenated; whitish, or flesh-rose, or dark livid-violet, obscurely zoned and rayed, interior often yellowish, stained posteriorly with very deep purple-violet.

*Venus deflorata*, Linneus, Syst. Nat. (12th edit.), p. 1133  
*Capa deflorata*, Bruguire, Deshayes.

*Venus versicolor*, Gmelin.

*Venus purpurea*, Gmelin.

*Sanguinolaria rugosa*, Lamarck.

*Psammocula rugosa*, De Blainville.

*Psammobia rugosa*, Sowerby.

Hab. Eastern Seas.

The figures 1 a to 1<sup>f</sup> in the accompanying Plate represent this well-known species in all its varieties of sculpture and colour, in different stages of growth.

---

### Species 2. (Mus. Cuming.)

CAPSÆ TAHITENSIS. *Cap. testâ orato-transversâ, tenuicosta, subventricosa, conformatissimâ rugosa-liratâ, tiris posticis tenuibus, elevatis, subauricato-squamatis; albâ, latore antico rotundato, postivo, suboblique quadrato, latisculo, versus marginem compresso.*

THE TAHITI CAPSA. Shell ovately transverse, rather thin, somewhat ventricose, very closely roughly ridged, posterior ridges thin, raised, rather prickly-scaled; white, anterior side rounded, posterior somewhat obliquely square, rather broad, compressed towards the margin.

BERNARDI, MS. in Mus. Cuming.

Hab. Tahiti.

Of lighter structure than the preceding species, more delicately prickly sculptured on the posterior side, which is broader and more squarely compressed.

MONOGRAPH

## CAPSELLA.

### PLATE I.

#### Genus CAPSELLA, Deshayes.

*Testa subelongato-transversa, plerumque equilateralis, levigata vel concentrica striata, epidermide sepsissimè corrugata vel olivacea indutæ, latere antico rotundato, postico paulo angulato-truncato, angulo obtusissimo, interdum vix nullo. Cardo dentis unicus in ventre sinistra, duobus in valvæ destræ, bifurcatis. Ligamentum exter-*

*num, subampulum, sub callositate oblongâ internâ positiun. Impressio muscularis pallii asperiter sinuosa.*

Shell rather elongately transverse, generally equilateral, smooth or concentrically striated, covered with an olive epidermis, which is mostly horny, anterior side rounded, posterior slightly angularly truncated, angle very obtuse, sometimes scarcely any. Hinge with one tooth in the left valve, two teeth in the right valve, bifurcated. Ligament external, rather large, placed upon an internal oblong callosity. Muscular impression of the mantle largely sinuous.

While lately arranging the Lamarcian family *Nuculaceæ* in the collection of Mr. Cuming, M. Deshayes set apart a characteristic series of thirteen species of shells collected in the Eastern Seas, the only one of which hitherto described was included by Lamarek in his genus *Pssammonia* (*P. elongata*). The remaining twelve M. Deshayes described in the 'Proceedings of the Zoological Society' for 1854, under the title of *Capsella*, taken subgenerically as a section of the Lamarcian *Capsa*. To this genus, better known to conchologists as *Iphigenia* of Schumacher, the shells under consideration have less affinity than to *Solellina*. They partake materially of the characters of the latter genus. The hinge scarcely differs except in the teeth being more distinct and in the posterior oblong callosity being less prominently developed, but there is a very natural assimilation of external characters. They are all of a uniform oblong-transverse growth, with the posterior side uniformly simply truncated into a faintly obtuse angle.

Twelve of the species are from the Philippine Islands. The remainder are from China, Ceylon, and the Moluccas.

#### Species 1. (Mus. Cuming.)

CAPSELLA CHINENSIS. *Caps. testa elongato-transversa, versus marginem compressa, epidermide ciliatè lateo-castaneâ indutæ, inaequilaterali, latere antico longiori, rotundato, postico decivisi-compresso, parum truncato.*

THE CHINESE CAPSELLA. Shell elongately transverse, compressed towards the margin, covered with a bright yellowish-chestnut epidermis, inaequilateral, anterior side the longer, rounded, posterior slantingly compressed, but little truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 345.

Hab. China Seas.

Of an oblong-triangular form, compressed towards the margin, and bright yellowish-chestnut colour.

#### Species 2. (Mus. Cuming.)

CAPSELLA DIFFICILIS. *Caps. testa elongato-transversa, tumidula, tenui, equilaterali, tenimstriata, epidermide lutescente-viridi indutâ, latere antico obtuso, superne recto, postico obliquè truncato, angulum obtusissimum fornicata.*

THE RUGGED CAPSELLA. Shell elongately transverse, rather swollen, thin, equilateral, finely striated, covered with a yellowish-green epidermis, anterior side obtuse, straight at the upper part, posterior obliquely truncated, forming a very obtuse angle.

DESHAYES, Pro. Zool. Soc. 1854, p. 347.

Hab. Philippine Islands; Cuming.

Of rugged growth, covered with a little dull yellowish-green epidermis, partially eroded about the umboes.

#### Species 3. (Mus. Cuming.)

CAPSELLA RUF'A. *Caps. testa elongato-transversa, tenui, compressiunculâ, subaequilaterali, arcuata, rugosostriata, epidermide castaneo-rufâ indutâ, versus umbones erod., intus roseo-purpurascente, latere antico subattenuato-rotundato, postico obliquè flexuoso-truncato.*

THE RED CAPSELLA. Shell elongately transverse, thin, rather compressed, nearly equilateral, arched, roughly striated, covered with a chestnut-red epidermis, eroded towards the umboes, interior rose-purple, anterior side rather attenuately rounded, posterior obliquely flexuously truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 347.

Hab. Bay of Manila; Cuming.

Distinguished by a somewhat arched growth, clothed

## CAPSELLA.—PLATE I.

with a light chestnut-red epidermis, not shining, as in *C. Chinensis*.

## Species 4. (Mus. Cuming.)

CAPSELLA ELONGATA. *Caps. testā oblongo-transversā, compresso-concavā, subequilaterali, irregulariter rugoso-striatā, fulvescente-albā, carneo tactā, violaceo radiatā, latere antico declivi-rotundato, postico latē truncato, angulum subobtusum formante.*

THE ELONGATED CAPSELLA. Shell oblong-transverse, compressly convex, nearly equilateral, irregularly roughly striated, fulvous-white, flesh-tinged, rayed with violet, anterior side slantingly rounded, posterior broadly truncated, forming a somewhat obtuse angle.

*Psammobia elongata*, Lamarck, Anim. sans vert. vol. vi. p. 176.

Hab. Philippine Islands; Cuming.

This Lamarckian species of *Psammobia* may be regarded as the type of the genus under consideration, all the species of which, it will be seen, are well distinguished from the true *Psammobia*.

## Species 5. (Mus. Cuming.)

CAPSELLA SOLIDA. *Caps. testā elongato-transversā, versus marginem compressā, crassiusculā, irregulariter rugoso-striatā, subequilaterali, sordidè albā, ad umbones fulvo-purpureoscente, epidermide fibrosā prope marginem induitā, latere antico rotundato, postico latē truncato, angulum obtusum formante.*

THE SOLID CAPSELLA. Shell elongately transverse, compressed towards the margin, rather thick, irregularly roughly striated, nearly equilateral, dull white, fulvous-purple at the umboes, covered near the margin with a fibrous epidermis, anterior side rounded, posterior broadly truncated, forming an obtuse angle.

Hab. Malacca.

Of solid roughly striated growth and compressly oblong-square form, tinged with fulvous-purple.

## Species 6. (Mus. Cuming.)

CAPSELLA VIOLENCEA. *Caps. testā elongato-transversā, gibbosiusculā, inaequilaterali, tenuistriatā, intensè purpuro-violacea, epidermide fibrosā prope marginem induitā, latere antico breviore, subattenuato-rotundato, postico latē obliquè truncato, angulum obtusissimum formante.*

THE VIOLET CAPSELLA. Shell elongately transverse, rather gibbous, inequilateral, finely striated, deep purple-violet, covered with a fibrous epidermis near the margin, anterior side the shorter, rather attenuately rounded, posterior broadly obliquely truncated, forming a very obtuse angle.

Hab. Bay of Manila; Cuming.

A rather solid gibbous shell, of a characteristic deep purple-violet colour, covered near the margin with a very decided fibrous epidermis.

## Species 7. (Mus. Cuming.)

CAPSELLA RADIATA. *Caps. testā elongato-transversā, subangustā, posticè gibbosā, subaequilaterali, tenui, subtilissimè striatā, flavescente-roseā, translucidā, umbonibus vide roseis, latere antico attenuato-rotundato, postico subampliter obliquè truncato.*

THE RAYED CAPSELLA. Shell elongately transverse, rather narrow, gibbous posteriorly, nearly equilateral, thin, very finely striated, yellowish-rose, translucent, umboes deep rose, anterior side attenuately rounded, posterior side rather largely obliquely truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 348.

Hab. Orion, Bay of Manila; Cuming.

An extremely delicate semi-transparent rose-tinted shell, much more largely angularly developed on the posterior than on the anterior side.

### PLATE II.

Species 8. (Fig. 3, 4. Mus. Cuming.)

CAPSELLA CRASSULA. *Caps. testa orato-transversa, subtriangulari, aequilaterali, transversim inaequilateris striato-sulcata, epidermide olivacea-fusca induta, ad umbrae erasit, latera antica obtusa, semielliptico, postico latè truncata, flexurā obliquā bipartita.*

THE THICK CAPSELLA. Shell ovately transverse, subtriangular, equilateral, transversely unequally striately grooved, covered with an olive-brown epidermis, eroded at the umboes, anterior side obtuse, semielliptic, posterior broadly truncated, divided by an oblique flexure.

DESHAYES, Pro. Zool. Soc. 1854, p. 349.  
Hub. Philippine Islands.

Of an oblong subtriangular form, covered with a dark olive-brown epidermis, which is much eroded about the umboes.

Species 9. (Mus. Cuming.)

CAPSELLA MINOR. *Caps. testa orato-transversa, compressa, tenui, subaequilaterali, irregulariter striato-sulcata, epidermide florente vestita, violacea, obscurè radiata, latera antica obtusa, parva attenuata, superne concrevissimata, declivi, postice angustiora, attenuata, subtruncata, flexurā rix manifesta bipartita.*

THE LESSER CAPSELLA. Shell ovately transverse, compressed, thin, nearly equilateral, irregularly striately grooved, clothed with a yellowish epidermis, violet, obscurely rayed, anterior side obtuse, but little attenuated, rather convex and slanting at the upper part, posterior side narrower, attenuated, slightly truncated, divided by a scarcely perceptible flexure

DESHAYES, Pro. Zool. Soc. 1854, p. 347.  
Hub. Bay of Manila; Cuming.

A compressed violet-tinted species, somewhat flexuously attenuated on the posterior side.

Species 10. (Mus. Cuming.)

CAPSELLA VIRESSENS. *Caps. testa elongato-transversa, tenui, subaequilaterali, levigata, albida, versus umbrae rosacea, nigro radiatione striata et trigono-maculata, epidermide nitidate olivacea-viridi induta, lateribus rotundatis, postico subflexuoso-truncata.*

THE GREEN CAPSELLA. Shell elongately transverse, thin,

nearly equilateral, smooth, whitish, rose-tinted towards the umboes, radiately streaked and triangularly marked with black, covered with a shining olive-green epidermis, sides rounded, posterior slightly flexuously truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 349.  
Hub. ——

A rather thin shell, of a light watery olive-green colour, tinged with rose towards the umboes, and obscurely marked with triangular black marks and rays.

Species 11. (Mus. Cuming.)

CAPSELLA SOLENELLA. *Caps. testa elongato-transversa, elliptica, tenuis, subaequilaterali, tenuistrigata, epidermide olivacea induta, versus umbrae purpurea, latera antica attenuata-rotundata, postico quadrato-truncata, gibbosa, angulum oblongum oblongum formante.*

THE LITTLE SOLEN CAPSELLA. Shell elongately transverse, elliptic, rather swollen, nearly equilateral, finely striated, covered with an olive epidermis, purple towards the umboes, anterior side attenuately rounded, posterior side quadrately truncated, gibbous, forming an obtuse angle.

DESHAYES, Pro. Zool. Soc. 1854, p. 350.  
Hub. Bay of Manila; Cuming.

Chiefly distinguished by the more gibbous proportions of the posterior end, which forms an obtuse angle.

Species 12. (Mus. Cuming.)

CAPSELLA LUNULATA. *Caps. testa elongato-transversa, subtrigonoida, aequilaterali, tenui, translucida, laxe, epidermide nitente olivacea-cornuta induta, griseo-nigricante obscurè radiata, margini superiore utroque latere aequaliter declivi, latera antica rotundata, superne anguste lunulata, postico obliquè obtusa truncata, angustata.*

THE LUNULED CAPSELLA. Shell elongately transverse, somewhat triangular, equilateral, thin, translucent, smooth, covered with a shining olive horny epidermis, obscurely rayed with greyish-black, upper margin on each side equally slanting, anterior side rounded, narrowly lunuled above, posterior obliquely and obliquely truncated and narrowed.

DESHAYES, Pro. Zool. Soc. 1854, p. 349.

## CAPSELLA.—PLATE II.

Hab. Philippine Islands; Cuming.

Of a delicate transparent horny aspect, though solid, faintly rayed, distinguished by a narrow lunule, which in other species of the genus is either wanting or but slightly indicated.

## Species 13. (Mus. Cuming.)

CAPSSELLA CANDIDA. *Caps. testá longato-transversá, solidá, gibbosá, subaziphiavali, deoù striatíssimá, abhí epidermide tenui fibrosa versus marginem indutá, laterè antico rotundata, postico pao's longiora, subquadrate-truncata, angul in odosum formatae.*

THE WHITE CAPSELLA. Shell elongately transverse, rather solid, gibbous, nearly equilateral, densely finely striated, white, covered towards the margins with a slight fibrous epidermis, anterior side rounded, posterior rather the longer, subquadrately truncated, forming an obtuse angle.

Hab. Philippine Islands; Cuming.

A white squarely elongated species, of solid gibbous growth, covered towards the margin with a slight decurrent fibrous epidermis.

## Species 14. (Mus. Cuming.)

CAPSSELLA TENUIS. *Caps. testá elongato-transversá, convexisculá, subequilaterali, tenui, striato-sulcatá, epidermide corné nitente olivaceo-corné indutá, obsoletè purparo radiatá, lateribus obtuse rotundatis, ob umbothes declic'bas.*

THE THIN CAPSELLA. Shell elongately transverse, rather convex, nearly equilateral, thin, striately grooved, covered with a shining horny epidermis, slightly eroded at the umboes, sides rounded, the posterior rather compressed.

DESHAYES, Pro. Zool. Soc. 1854, p. 349.

Hab. Philippine Islands; Cuming.

Of a rather simple elongated form, with the sides almost equally rounded.

## Species 15. (Mus. Cuming.)

CAPSSELLA ROSACEA. *Caps. testá elongato-transversá, depresso-ovalá, tenui, subequilaterali, levigatiorá, epidermide rosaceo-stramineá indutá, violaceo pavimentalá, laterè antico rotundata, postico sublongiore, oblique compresso-truncata.*

THE ROSE-TINTED CAPSELLA. Shell elongately transverse, rather depressed, thin, nearly equilateral, finely striated, covered with a rose-tinted straw-coloured epidermis, with a few violet rays, anterior side rounded, posterior rather the longer, obliquely compressly truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 348.

Hab. Philippine Islands.

Chiefly distinguished by its light rose-tinted straw-colour, sparingly rayed with violet.

## Species 16. (Mus. Cuming.)

CAPSSELLA LAYARDI. *Caps. testá ovalo-transversá, tenui, fragili, convergensculá, subequilaterali, irregulariter striato-sulcatá, epidermide nitente olivaceo-corné indutá, obscurè purparo radiatá, lateribus obtuse rotundatis, ob umbothes declic'bas.*

LAYARD'S CAPSELLA. Shell ovately transverse, thin, fragile, rather convex, nearly equilateral, irregularly striately grooved, covered with a shining olive-horny epidermis, faintly purple-rayed, sides obtusely rounded, sloping from the umboes.

DESHAYES, Pro. Zool. Soc. 1854, p. 148.

Hab. Ceylon; E. F. Layard.

A shell of very light structure, covered with a shining horny epidermis, rayed with purple, which is best seen in the interior.

MONOGRAPH  
OF THE GENUS  
SANGUINOLARIA.

In hollow of the tide-worn reef,  
Left at low water glittering in the sun,  
Pell-mell pools, and rocks in miniature,  
With their small fry of fishes, crusted shells,  
Rich mosses, tree-like seaweed, sparkling pebbles  
Enchant the eyes, and tempt the eager hand  
To violate the fairy paradise."—*Montgomery*

# SANGUINOLARIA.

## PLATE I.

### GENUS SANGUINOLARIA, Lamarck.

*Testa orato-transversa, convezinosa, sapè pellucida, inaequilateralis, transversim concentrica striata, plerisque plus minus sanguineo-rosea, latere antico rotundato, postico plus minus attenuato-produculo, impressio flexuosa ab umbonibus ad marginem recinante. Cardo dentatus duobus parvis erectis subbifidis approximatis in utræque valle. Impressio muscularis pallii siantrigoso latè centrale.*

Shell ovately transverse, rather convex, mostly transparent, inequilateral, very finely concentrically striated, generally more or less blood-rose, anterior side rounded, posterior more or less attenuately produced, with a flexuous impression radiating from the umbos to the margin. Hinge with two small erect sub-bifid teeth, approximating, in each valve. Muscular impression of the mantle with a broadly ventral triangular sinus.

Of the two species which Lamarck included under this generic head only one, *Sanguinolaria rosea* (*Solea sanguinolentus*, Gmelin), remains. To this are added in the accompanying Plate four other species of characteristic typical resemblance, one described by Mr. Arthur Adams in the 'Proceedings of the Zoological Society' for 1849, two described by M. Deshayes in the same journal for 1854, and one which is apparently new. They differ little from each other in form or texture; and the colouring, where any exists, though of a different intensity in each species, is of the same uniform tone. The anterior side of the shell in each species is regularly rounded, and the posterior more or less attenuated or beaked, and characterized by a faint depression radiating across the posterior area from the umbo on each side to the margin.

The habitats of the species, so far as they are known, are Ceylon, Central America, and California.

#### Species 1. (Mus. Cuming.)

**SANGUINOLARIA VITREA.** *Sang. testa oculo-transversa, convezinosa, inaequilaterali, tenui, candida, vitrea, tenuissime et irregulariter striata, latere antico latiore, circulari, postice superne recto, riz devici, extremitate angustata, margine inferiore validè concavo.*

THE GLASSY SANGUINOLARIA. Shell ovately transverse, rather convex, inequilateral, thin, white, glassy, very finely and irregularly striated, anterior side shorter,

circular, posterior straight at the upper part, a little sloping, narrowed at the extremity, lower margin very convex.

DESHAYES, PRO. ZOOL. SOC. 1854, p. 325.

Hab. —?

This shell is of rather firm texture, though perfectly transparent, without any tinge of the delicate sanguineous rose-colour which characterizes the other species of the genus.

#### Species 2. (Mus. Cuming.)

**SANGUINOLARIA OVALIS.** *Sang. testa oculo-transversa, convezinosa, subaequilaterali, tenui, minutissime decussatim striata, albida, purpureo-roseo dilute lineata, later antico latè rotundato, postico subbottusè attenuato, margine inferiori convexo.*

THE OVAL SANGUINOLARIA. Shell ovately transverse, rather convex, nearly equilateral, thin, very minutely decussately striated, whitish, dilutely tinged with purple-rose, anterior side broadly rounded, posterior side rather obtusely attenuated, lower margin convex

Hab. Central America.

This little species is chiefly distinguished by its convex swollen growth about the umbones.

#### Species 3. (Mus. Cuming.)

**SANGUINOLARIA TELLINOIDES.** *Sang. testa subangustè transversa, inaequilaterali, tenuicula, mihi decussatim striata, intus pellucido-rosea, latere antico latiore, rotundato, postice ab umbonibus flexuoso-impresso, ad extremitatem attenuato-rostrato.*

THE TELLINA-LIKE SANGUINOLARIA. Shell rather narrowly transverse, inequilateral, rather thin, minutely decussately striated, deep transparent rose, anterior side broader, rounded, posterior flexuously impressed from the umbones, attenuately beaked at the extremity.

ADAMS, PRO. ZOOL. SOC. 1849, p. 170, pl. 6, f. 6.

Hab. Gulf of California.

A pretty transparent rose-coloured species, with a flexuous depression sloping from the umbo to the margin of the posterior side, which is somewhat attenuately beaked at the extremity.

SANGUINOLARIA.—PLATE I.

Species 4. (Mus. Cuming.)

**SANGUINOLARIA SANGUINOLENTA.** *Sang. testá ovato-transversá, solidiusculá, inaequilaterali, convexiusculá, decussatim striatá, albá, circa umbones rosacá, latere antico rotundato, acuminato-producto, ab umboibus flexuoso-impresso.*

THE BLOOD-STAINED SANGUINOLARIA. Shell ovately transverse, rather solid, inequilateral, rather convex, decussately striated, white, tinged with rose around the umbones, anterior side rounded, posterior side acuminately produced, flexuously impressed from the umboes.

GMELIN, Syst. Nat. 13th edit. p. 3227.

*Solen sanguinolentus*, Dillwyn.

*Sanguinolaria sanguinolenta*, Deshayes.

*Tellina rosea*, Gmelin.

*Sanguinolaria rosea*, Sowerby.

*Pseudomria rosea*, Deshayes.

Hab. Ceylon.

This fine species, the original type of the genus, well figured by Lister and Chemnitz, is of a rather solid clear

opaque-white texture, merely tinged with rose around the umboes.

Species 5. (Mus. Cuming.)

**SANGUINOLARIA PURPUREA.** *Sang. testá ovato-transversá, transversim densé striatá, intus intenè nitente sanguineo-purpureá, latere antico rotundato, postico regulariter attenuato-rotundato.*

THE PURPLE SANGUINOLARIA. Shell ovately transverse, thin, fragile, transparent, flatly convex, inequilateral, transversely closely striated, interior deep shining blood-purple, anterior side rounded, posterior regularly attenuately rounded.

DESHAYES, Proc. Zool. Soc. 1854, p. 346.

Hab. —?

The form of this species is very similar to that of the preceding, but it is of semitransparent texture, mostly deeply coloured from the interior throughout with shining blood-purple.

# P S A M M O B I A .

## PLATE I.

### Genus PSAMMOBIA, Lamarck.

*Testa transversa, oblonga vel elongato-ovata, ad latera paulo hians, levigata vel concentrica striata, serpissime inaequilateralis, latere antico rotundato, postico plus minus flexuoso-angulato et truncato, interdum pulcherius sculpto; colore virio, interdum cum epidermide olivacea. Carolo in valle altera dentibus duobus, plerumque bifidis, in altera unico, ligamento externo. Impressio muscularis palli sicut maximo.*

Shell transverse, oblong or elongately ovate, a little gaping at the sides, smooth or concentrically striated, mostly inequilateral, the anterior side rounded, the posterior more or less flexuously angled and truncated, sometimes very beautifully sculptured; colour various, sometimes with an olive epidermis. Hinge in one valve with two teeth, generally bifid, in the other with one tooth, the ligament being external. Muscular impression of the mantle with a very large sinus.

In a recent investigation of the genera ranging in the system between *Solen* and *Tellina*, M. Deshayes referred to the Lamarckian genus *Psammodia*, a beautiful series of undescribed species in the collection of Mr. Cuming that had not hitherto found a resting-place, and displaced one or two, as, for example, the *Capsa rugosa*, that had been referred to this genus in error. By far the most characteristic forms of the group are those which were so described, and are here for the first time figured. They present a strong generic peculiarity in the flexuous angular development of the posterior angle, which in most species is elaborately sculptured with wrinkled ridges, and are remarkable for their display of delicate colours, generally of a rosy hue.

The *Psammodiae* are, with one or two abnormal exceptions, confined to the Eastern Hemisphere, the genus being well represented on our own shores by the common *P. Ferreensis*, and ranging as far south as Tasmania.

---

### Species 1. (Mus. Cuming.)

*PSAMMOBIA ORIENS. Psam. testa ovato-transversa, subquadrata, solidula, inaequilaterali, transversim substriatâ, in latere postico inaequilateri sulcata; carneorosâ, radiis et lineis angulatis roseo-purpurascensibus rotatâ, latere antico breviore, latè obtuso, postico obliquè truncato.*

---

June, 1857.

**THE RISING-SUN PSAMMOBIA.** Shell ovately transverse, somewhat square, rather solid, inequilateral, transversely finely striated, unequally grooved on the posterior side; flesh-rose, marked with rose-purple rays and angular lines, anterior side shorter, broadly obtuse, posterior obliquely truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 318.  
Hab. Japan.

Of the same typical character as *P. maxima*, more equivalve and square-built, delicately rayed, and elegantly mottled with violet triangular marks.

---

### Species 2. (Mus. Cuming.)

*PSAMMOBIA PUELLA. Psam. testa elongato-transversa, tenui, depressâ, inaequilaterali, transversim striatâ, striis in latere postico rugaformibus; nitente-albâ, aurantio-rubo pallide radiatâ, umbonibus nitente-violaceis; latere antico longiore, rotundato, postico brevi, obtuse angulato.*

**THE TENDER PSAMMOBIA.** Shell elongately transverse, thin, depressed, inequilateral, transversely striated, stria on the posterior side wrinkle-like; shining white, faintly rayed with orange-red, umbones shining violet; anterior side the longer, rounded, posterior short, obtusely angled.

DESHAYES, Pro. Zool. Soc. 1854, p. 320.  
Hab. Australia.

Bluish-white, shining, faintly rayed with orange-red, neatly sculptured on each side with raised striae.

---

### Species 3. (Mus. Cuming.)

*PSAMMOBIA MODESTA. Psam. testa elongato-transversâ, convexiscuta, subaequilaterali, medio substriatâ; albida, pallide rufescente sparsim radiatâ; latere antico rotundato, postico subangulato.*

**THE MODEST PSAMMOBIA.** Shell elongately transverse, rather convex, nearly equilateral, faintly striated in the middle; whitish, sparsely rayed with faint red; anterior side rounded, posterior slightly angulated.

DESHAYES, Pro. Zool. Soc. 1854, p. 319.  
Hab. Australia.

More convex and less angularly formed than the preceding species.

---

## PSAMMOBIA.—PLATE I.

## Species 4. (Mus. Cuming.)

**PSAMMOBIA MAXIMA.** *Psam. testā orato-transversā, compressissimā, solidā, valde inaequilaterali, ruditē concentricē tiratē et striatā, liris posticē subundulatis; tutescente-olivā, radiis carneo-roseis lineisque angularibus notatā; lateribus rotundatis, postico subobliquè truncato.*

**THE VERY LARGE PSAMMOBIA.** Shell ovately transverse, rather compressed, solid, very inequilateral, rudely concentrically ridged and striated, ridges slightly waved on the posterior side; yellowish-white, marked with faint flesh-rose rays and angular lines, sides rounded, the posterior somewhat obliquely truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 317.  
Hab. Panama.

A very solid roughly-formed shell, of brownish chalk substance, mottled throughout with faint red triangular marks.

## Species 5. (Mus. Cuming.)

**PSAMMOBIA ANOMALA.** *Psam. testā elongato-transversā, tenui, fragili, tumidulā, subaequilaterali, transversim obliquè minutē striatā, striae ad latera evanidis; tutescente-carnēa, prope umbonem aurantio tinctā; latere antico paulo attenuato, postico sublate angulato.*

**THE ANOMALOUS PSAMMOBIA.** Shell elongately transverse, thin, fragile, rather swollen, nearly equilateral, transversely obliquely minutely striated, striae disappearing at the sides; yellowish flesh-colour, tinged with orange near the umbo; anterior side a little attenuated, posterior rather broadly angled.

DESHAYES, Pro. Zool. Soc. 1854, p. 320.  
Hab. Brisbane Water, east coast of New Holland; Strange.

A delicate orange-tinted shell, having the posterior angle rather concavely impressed.

## Species 6. (Mus. Cuming.)

**PSAMMOBIA TELLINELLA.** *Psam. testā elongato-transversā, subaequilaterali, levigatā; sordidē carneo-olivā, rufō tinctā et interruptē radiatā, umbonibus vivide rufō biradiatē.*

**THE LITTLE TELLEN PSAMMOBIA.** Shell elongately transverse, nearly equilateral, smooth; dull flesh-white, tinged and interruptedly rayed with red, umbones two-rayed with deep scarlet.

LAMARCK, Anim. sans vert. vol. vi. p. 177.  
*Psammodia florida*, Turton.

Hab. Britain.

A pretty orange-tinted simply convex shell, with two small bright pink rays darting from the umbones.

## Species 7. (Mus. Cuming.)

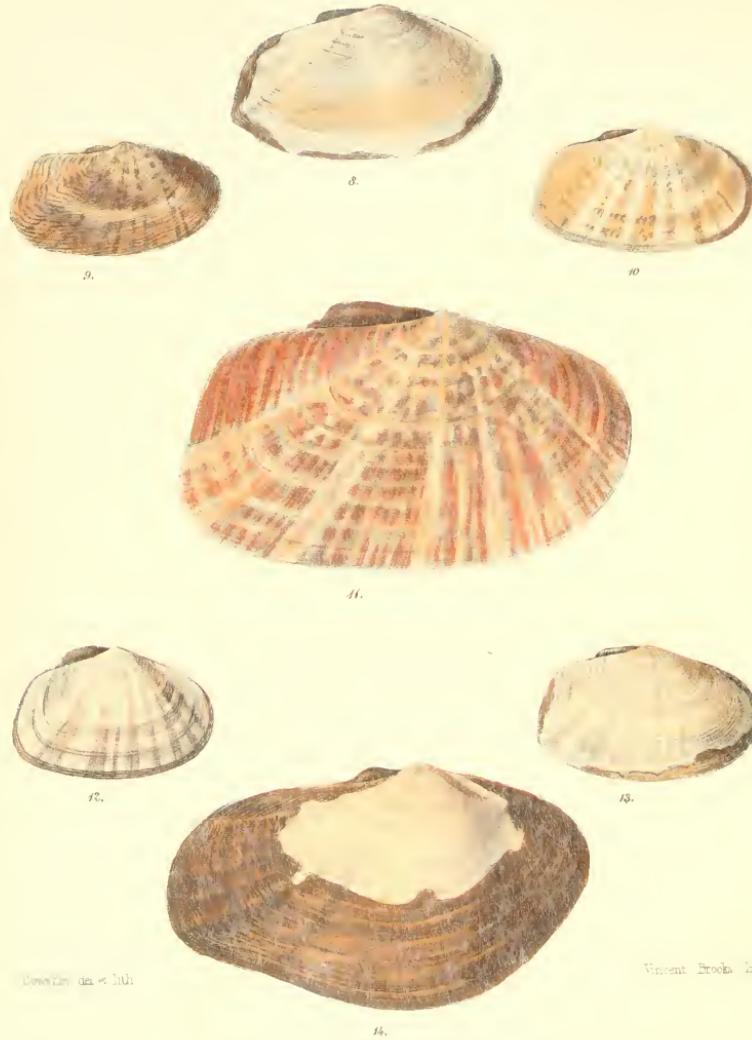

**PSAMMOBIA LATA.** *Psam. testā orato-transversā, latā, depresso, solidā, inaequilaterali, inaequaliter transversim striatā; purpuriscente, epidermae tutescente-olivaceo indutā; interius subtruncato-rotundatis.*

**THE BROAD PSAMMOBIA.** Shell ovately transverse, broad, depressed, solid, inequilateral, unequally transversely striated; purplish, covered with a yellowish-olive epidermis; sides somewhat truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 318.  
Hab. St. Elena, West Columbia; Cuming.

A broad square shell, almost entirely enveloped in a skin-like yellowish-olive epidermis.

# PSAMMOBIA.

## PLATE II.

### Species 8. (Mus. Cuming.)

**PSAMMOBIA LUMBOSE.** *Psam. testā oblongo-transversā, ovato-concavā, rubro-violaceo, albo irregulatim irregulatim minutē striatā, aperte elongata, duplo decussatū, lenticulo-cerulea, ferruginea fuscata, ultime, latere antico subattenuatè rotundata, postice subtruncata, ab umbro concava-angustata.*

**LUMBOSE'S PSAMMOBIA.** Shell oblong-transverse, rather depressed, radiately irregularly minutely striated, decussated with oblique raised striae, livid-blue, rust-tinted, shining, anterior side somewhat attenuately rounded, posterior slightly truncated, concavely angled from the umbra.

DE BLAINVILLE. Deshayes, MS., in Mus. Cuming.

*Hab.* Island of Samar, Philippines; Cuming.

A compressed shell, characterized by a concave angular slope on the posterior side, the entire surface of the shell being of a bright livid rust-tinted blue, rayed with hair-lines, crossed obliquely with raised striae.

### Species 9. (Mus. Cuming.)

**PSAMMOBIA CORRUGATA.** *Psam. testā ovalo-transversā, cōrruxiōculā, ināgulatōrati; rubro-violaceo, albo irregulatim maculatā, et rubro-violacea saturatōre subradiatā, transversim obliquē dense striatā, in latere postico latē et irregulatim rugosā, rugis cum strīs continuatis, latere antico breviori, latē rotundato, postice parum dilatato, superne recto.*

**THE WRINKLED PSAMMOBIA.** Shell ovately transverse, rather convex, inequilateral; reddish-violet, irregularly spotted with white, and faintly rayed with darker reddish-violet, transversely obliquely densely striated, broadly and irregularly wrinkled on the posterior side, wrinkles continuous with the striae, anterior side the shorter, broadly rounded, posterior a little dilated, straight at the upper part.

DESHAYES, PRO. ZOOL. SOC. 1854, p. 324.

*Hab.* Island of Zebu, Philippines; Cuming.

A delicate reddish-violet mottled shell, with waved striae passing obliquely across the valve to the posterior side, where they enlarge into ripple-like wrinkles.

### Species 10. (Mus. Cuming.)

**PSAMMOBIA GRATA.** *Psam. testā ovalo-transversā, sub-*

*quilaterali, solidata, ovalata, aperte obtusa, brunnore, postice subtruncata, transversim obliquē striatā; albō pallidē violacea saturatōre, rediis albo maculatis, lineolis longitudinali irregulariter rotatis, intus albō.*

**THE COMELY PSAMMOBIA.** Shell ovately transverse, nearly equilateral, rather solid, rather swollen, anteriorly obtuse, shorter, posteriorly slightly truncated, transversely obsoletely striated; white, many-rayed with pale violet, rays spotted with white, and marked with irregular longitudinal lines, interior white.

DESHAYES, PRO. ZOOL. SOC. 1854, p. 318.

*Hab.* Amboyna.

Of smooth, rather swollen aspect, delicately rayed on a bluish-white ground, with interrupted violet-red pencilled rays.

### Species 11. (Mus. Cuming.)

**PSAMMOBIA OCCIDENTIS.** *Psam. testā oblongo-transversā, subellipticā, densē concentricā striatā, livido-rosea albo-rosea radiatā et maculatā, latere postico longiore, obliquē latē truncatā, subcompressa, antico rotundata.*

**THE SUN-SET PSAMMOBIA.** Shell oblong-transverse, sub-elliptic, densely concentrically striated, rayed and spotted with vivid rose and white, posterior side the longer, obliquely broadly truncated, rather compressed, anterior rounded.

*Solen occidentis*, Chemnitz, Conch. Cab. vol. vi. p. 74 pl. 7. f. 61.

*Sanguinolaria occidentis*, De Blainville.

*Psammodia occidens*, Deshayes.

*Hab.* Ceylon.

This beautifully painted and well-known species differs materially in generic character from the type of the genus *Sanguinolaria*, *S. rosea*, and is referred by M. Deshayes to the genus under consideration.

### Species 12. (Mus. Cuming.)

**PSAMMOBIA STANGERI.** *Psam. testā ovalo-transversā, solidatā, subequalaterali, albida, pallidē violacea multiradiatā, lateralibus superne subdeclinibus, deinde rotundatis, postice breviori, vix truncata.*

**STANGER'S PSAMMOBIA.** Shell ovately transverse, rather

## PSAMMOBIA. —PLATE II.

solid, nearly equilateral, whitish, many-rayed with pale violet, sides gently slanting at the upper part, then rounded, posterior side the shorter, scarcely truncated.

GRAY. Dieffenbach's Travels in New Zealand; Fauna, p. 253.

Hob. New Zealand; Strange.

A rather solid shell, with the sides gently sloping from the umboes, and nearly equally rounded. The painting appears in faint violet rays throughout upon a dull stone-white ground.

Species 13. (Mus. Cuming.)

PSAMMOBIA TRISTIS. *Psam. testā ovato-transversā, de-  
pressiusculā, solidulā, subaequilaterali, transversim in-  
aequaliter substriatā, albo-griseā, obscurè violaceo ra-  
diatā, intus pallidō violacea, latere antico paulo lon-  
giore, lateribus superiorē decibiūs, antico latē obtuso,  
postico latē obtuso truncato, subangulato.*

THE SAD PSAMMOBIA. Shell ovately transverse, rather depressed, rather solid, nearly equilateral, transversely unequally finely striated, whitish-grey, obscurely violet-rayed, pale violet within, anterior side a little the longer, sides slanting at the upper part, anterior broadly obtuse, posterior broadly obtusely truncated, slightly angled.

DESHAYES, Pro. Zool. Soc. 1854, p. 318.

*Hab.* Amboyna.

Painted with very obscure violet rays, with a thin deciduous epidermis more or less remaining along the margin of the shell.

Species 14. (Mus. Cuming.)

PSAMMOBIA TOGATA. *Psam. testā ovato-transversā, tu-  
nidulā, inaequilaterali, extremitatibus sensim attenuata,  
attamen antīcē rotundatā et breviore, posticē oblique  
truncatā, epidermide fuscō-circante, margines superante,  
vestitā, ad umboes deciduā vel erosā, calcis intus ex-  
tusque albis.*

THE CLOTHED PSAMMOBIA. Shell ovately transverse, rather swollen, inequilateral, gradually attenuated at the extremities, but rounded and shorter anteriorly, and obliquely truncated posteriorly, clothed with a brownish-green epidermis passing over the margins, deciduous or eroded at the umboes, valves within and without white.

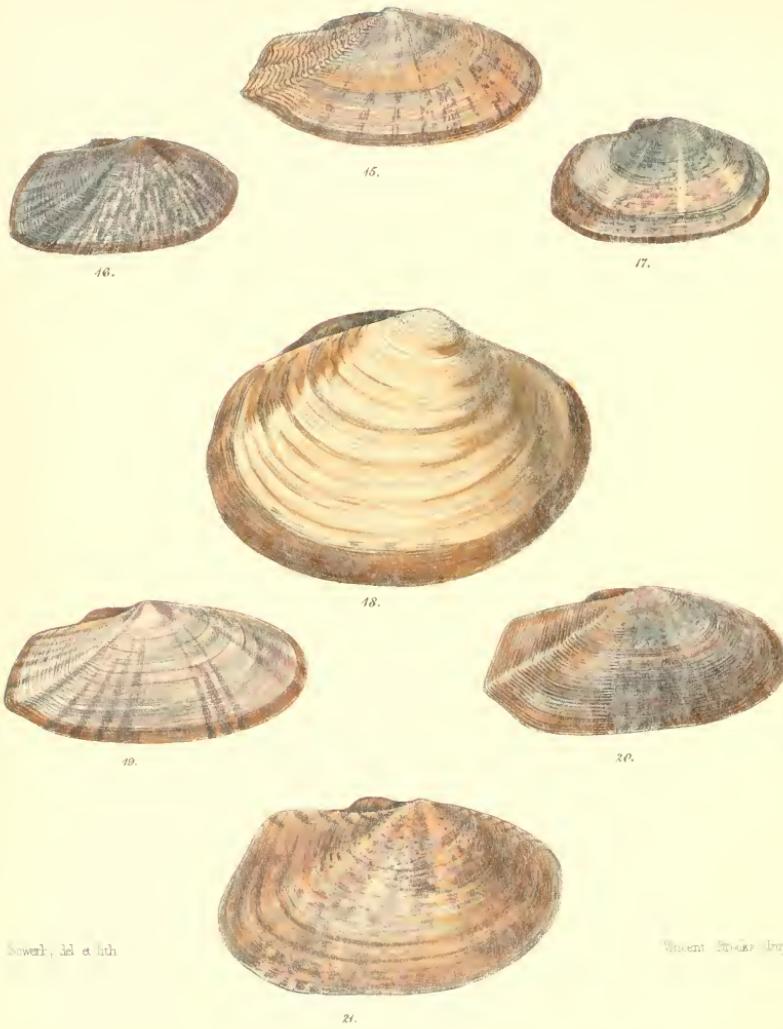

DESHAYES, Pro. Zool. Soc. 1854, p. 318.

*Hab.* Port Essington, Australia; Jukes. Bay of Manilla, Philippines; Cuming.

Of quite a different typical character from any of the preceding species, the shell being of a rough opaque texture, attenuated towards the extremities, covered with a thick fibrous epidermis.

*Psammodia*, Pl. III

Brewer, Ed. & lith.

Wm. H. Brewster, Jr.

# P S A M M O B I A .

## PLATE III.

### Species 15. (Mus. Cuming.)

**PSAMMOBIA INSPIRELLA.** *Psm.*, testă elongata-transversă, comprăsă, subæquilaterală, solidusculă, violaceo-rubescență, răbă-purpuro-violetă pânci-radiată, radii nuculii irregulat rupti, transversim tenue sublati-striată, strie ad undas tenue, versus marginis crassiорibus et profundiорibus, latere antico semi-elliptică, obtuse, superne infernăcăe aequaliter concava, latere postico superne recto, pastulim declină, angulo superiore bipartito.

THE REMARKABLE PSAMMOBIA. Shell elongately transverse, compressed, nearly equilateral, rather solid, violet-red, sparsely rayed with reddish-purple, ray interrupted with regular spots, transversely finely groove-striated, stria fine at the umbones, thicker and deeper towards the margins, anterior side semi-elliptic, obtuse, equally convex above and below, posterior side straight at the upper part, a little slanting, with a bipartite concave angle.

DESHAYES, Pro. Zool. Soc. 1854, p. 322.  
Hab. Moluccas.

Rather elongate in form with the posterior end produced into a bipartite concavely angled beak, with the striae raised upon it in concentric wrinkles.

### Species 16. (Mus. Cuming.)

**PSAMMOBIA PRESTANS.** *Psm.*, testă elongata-transversă, convexo-cuboidală, tenuă, inæquilaterală, intensă violaceo, albo-întidă flocculă, transversim et obliquè minutiș regu-sacriter striată, ad latus posteriorum strigis subito interrupția, latere antico brevioră, superne conveξișcuso, almo, latere postico loliore, angulo obtuso obliquo.

THE SURPASSING PSAMMOBIA. Shell elongately transverse, rather convex, thin, inæquilateral, deep violet, neatly flaked with white, transversely and obliquely minutely regularly striated, stria suddenly interrupted on the posterior side, anterior side shorter, rather convex and obtuse at the upper part, posterior side broader, with an obtuse oblique angle.

DESHAYES, Pro. Zool. Soc. 1854, p. 322.  
Hab. Moluccas.

Very characteristic in its style of colouring, which varies from rose-purple to very deep violet, prettily flaked with white.

### Species 17. (Mus. Cuming.)

**PSAMMOBIA VESPERTINA.** *Psm.*, testă ovato-transversă, tumidusculă, subæquilaterală, lăvă, nitente, transversim striato-sculptă, striis ad latus posteriorum confertioribus, refuscate et carmine-purpără, abo flocculă et triradiată, extremităbilis rotundată.

THE EVENING PSAMMOBIA. Shell ovately transversely slightly swollen, nearly equilateral, smooth, shining, transversely striately grooved, striae on the posterior side closer, reddish and blue-purple, flaked and three-rayed with white, extremities rounded.

*Solea vespertina*, Gmelin, Syst. Nat. p. 3228.

*Laz vespertina*, Chemnitz.

*Tellina depressa*, Pennant.

*Tellina variabilis*, Pulteney.

*Tellina albida*, Dillwyn.

*Psammodia vespertina*, Lamarck.

*Psammodia florida*, Lamarck.

*Sanguinolaria vespertina*, Fleming.

*Psammodia vespertinalis*, De Blainville.

Hab. Mediterraneum.

This well-known species is mostly flaked and three-rayed with white upon a deep purple-blue rust-tinged ground.

### Species 18. (Mus. Cuming.)

**PSAMMOBIA SOLIDA.** *Psm.*, testă lată orato-transversa gibbosă, inæquilaterală, lateribus ad undas deciliatim, extremităbilis rotundată; sordidă alba, concentrica, rugosă-striată, prope margines epidermide vestita.

THE SOLID PSAMMOBIA. Shell broadly ovately transverse, gibbose, inæquilateral, sides sloping from the umbones, rounded at the extremities; dead-white, concentrically roughly striated, covered near the margins with an epidermis.

GRAY, MS., Ivit. Mus.

Hab. Chili; Cuming.

A roughly-striated gibbose dead-white *Mya*-like species, covered towards the margins with a brown fibrous epidermis.

### (Species 19. Mus. Cuming.)

**PSAMMOBIA AMETHYSTUS.** *Psm.*, testă elongata-transversă, comprăsă, subæquilaterală, densă levistrinată

PSAMMORIA.—PLATE III.

*striis ad tatus posticum subobliquis, elevatis : livido-purpureo-roseo pallide radiata, latere antico rotundato, postico obliquè angulato et truncato.*

THE AMETHYST PSAMMORIA. Shell elongately transverse, compressed, nearly equilateral, densely finely striated, striae on the posterior side rather oblique and raised; livid-purple, faintly rayed with purple rose, interior side rounded, posterior obliquely angled and truncated.

Hab. Ceylon; E. L. Layard.

Of a delicate livid-purple colour, rayed at rather distant intervals with faint purple-rose.

Species 20. (Mus. Cumug.)

PSAMMORIA TRIPARTITA. *Psam. testa elongato-transversa, ellipsoidea, compressa, aequilaterali, muculis minimis aliis conuentibus irregulariter sparsis notata sed obscurè albo radiata, transversim striata, striis anticis latis et planis, in medio bipartitis et duplo numerosioribus, in latere subito lamellosis, imbrevis, acutis, latere antico semi-elliptico, obtuso, latere postico paulo latiore, obliquè truncato, angulo acutiusculo inferne terminato, angulo obtuso obsoleto ab umbone decurrente.*

THE TRIPARTITE PSAMMORIA. Shell elongately transverse, ellipsoid, compressed, equilateral, violet, marked with irregularly sprinkled confluent minute white spots or obscurely white-rayed, transversely striated, stria anteriorly broad and flat, bipartite and twice as numerous in the middle, on the posterior side

suddenly lamellose, nubricated, and sharp, anterior side semi-elliptic, obtuse, posterior side rather broader, obliquely truncated, terminated at the lower part by a rather sharp angle, an obsolete obtuse angle running from the umbo.

DESHAYES, Pro. Zool. Soc. 1854, p. 301.

Hab. Sau Nicolas, Island of Zebu, Philippines. Cuming.

This interesting species may be readily recognized, by its surface being curiously separated into three distinct patterns of sculpture.

Species 21. (Mus. Cumug.)

PSAMMORIA NIVOSA. *Psam. testa oraliter-transversa, solidula, compressivulsula, utroque latere hiante, inaequilaterali, transversim substriata, roseo-purpureo, maculis sparsis niveis irrorata, latere antico breviore, late rotundato, postico latiore, superne recto, non elevati, horizontali, latè obtusè truncato.*

THE SNOWY PSAMMORIA. Shell ovately transverse, rather solid, somewhat compressed, gaping on both sides, inequilateral, transversely faintly striated, rose-purple, bedewed with scattered snowy spots, anterior side shorter, broadly rounded, posterior side broader, straight at the upper part, not sloping, horizontal, broadly obtusely truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 317.

Hab. Dumaguete, Island of Negros, Philippines; Cuming

Closely allied to *P. occidentis*, but uniformly distinguished by the various characters detailed in the foregoing description.

22.

23.

24.

25.

26a.

26b.

27.

# PSAMMOBIA.

## PLATE IV.

Species 22. (Mus. Cuming.)

PSAMMOBIA AFFINIS. *Pson. testa orato-transversa, equilaterali, transversis rufè striatæ, striis in medio subobsoletis, anticè distinctis, posticè subplicatis; lutescens-albidæ, carneo-roseo versus marginis promiscue radiata, lateribus rotundatis, postico parvo truncata.*

THE ALLIED PSAMMOBIA. Shell ovately transverse, equilateral, transversely rudely striated, striae almost obsolete in the middle, distinct anteriorly, slightly plicated posteriorly; yellowish-white, promiscuously rayed towards the margins with flesh-rose, sides rounded, the posterior but little truncated.

Hab. New Zealand and the Philippine Islands.

A species intermediate in its character between *A. grata* and *vespertina*.

Species 23. (Mus. Cuming.)

PSAMMOBIA PULCHELLA. *Pson. testa subangustè transversè compressa, inaequilaterali, obliquè nitidè elevato-striata, striis ad marginem area postice abruptè terminatis; verdeo-purpureæ, ferrugineo tinctæ, albo pallido-striata, latere antico rotundata, postico decliciata, areæ sublevigata, ab umbone superficialiter rugosa.*

THE PINKY PSAMMOBIA. Shell rather narrowly transverse, compressed, inequilateral, obliquely neatly elevated-striated, striae abruptly terminated at the edge of the posterior area; blue-purple, tinged with rust, easily rayed with white, anterior side rounded, posterior slopingly truncated, impressed superficially with a nearly smooth area from the umbo.

Hab. Anini, sans vert, vol. vi. p. 177.

Hab. Bay of Manila, Philippines; Cuming.

The sculpture of this species consists of numerous oblique raised striae, which terminate suddenly along the edge of a superficially impressed area sloping posteriorly from the umbo.

Species 24. (Mus. Cuming.)

PSAMMOBIA COMPA. *Pson. testa elongato-transversa, equilaterali, compressa, tenuicostata, levigata et promiscue sulcato-striata, striis posticè plicatis; lenticulari crenulante, purpureo-roseo radiata, latere antico*

*rotundata, postico decolorato-truncata, areæ subangustæ ab umbone formante.*

THE NEAT PSAMMOBIA. Shell elongately equilateral, compressed, rather thin, smooth or promiscuously groove-striated, striae posteriorly *lenticulari*, livid-blue, rayed with purple violet, anterior side rounded, posterior slopingly truncated, forming a concave area from the umbo.

DESHAYES, PRO. ZOOL. SOC. 1854, p. 321.

Hab. Catbalonga, Island of Samar, Philippines; Cuming.

The striae are almost obsolete in the centre of the valves the surface of that part being smooth, crossed by interrupted linear grooves.

Species 25. (Mus. Cuming.)

PSAMMOBIA INTERMEDIA. *Pson. testa orato-transversa, coeruleo-roseæ, solidæ, aquilaterali, albido, roseo transversè radiata, epidermide totæ partim indutæ, transversè rugosæ, rugis radibus, solidusculis, promiscue rotundatis, posticè crassioribus, valde irregularibus, latere antico rotundata, postico subattenuata, compressa, decolorata-truncata.*

THE INTERMEDIATE PSAMMOBIA. Shell ovately transverse, rather convex, solid, equilateral, whitish, finely rayed with rose, partially covered with a yellow epidermis, transversely wrinkled, wrinkles rude *solidus*, solid, promiscuously wavy, posterior thicker and very irregular, anterior side rounded, posterior rather attenuated and compressed, slopingly truncated.

DESHAYES, PRO. ZOOL. SOC. 1854, p. 319.

Hab. Faro, coast of Portugal; M'Andrew.

A fine species, chiefly distinguished by the boldness and irregular waved development of its wrinkled sculpture.

Species 26. (Fig. a, b, Mus. Cuming.)

PSAMMOBIA ORNATA. *Pson. testa orato-transversa, coeruleo-roseæ, subaequilaterali, latescens-albidæ, porporaceæ castaneo et rufo-violaceo promiscue maculata et obscurè radiata, obliquè striato-rugosæ, rugis posticè irregulariter undato-plicatis, latere antico rotundata, postico transverso-rotundata, ab apice corvæo-impresso.*

THE ORNATE PSAMMOBIA. Shell ovately transverse, subventricose, nearly equilateral, yellowish-white.

promiscuously blotched and obscurely rayed with purple-chestnut and reddish-violet, obliquely striately wrinkled, wrinkles posteriorly irregularly wave-plated, anterior side rounded, posterior truncatedly rounded, convexly impressed from the umbo.

DESHAYES, Pro. Zool. Soc. 1854, p. 323.

Hab. Island of Ticao, Philippines; Cuming.

The most obvious characteristic of this species is its peculiarity of painting, the surface being more or less ornamented with promiscuous blotches of purple-chestnut and reddish-violet inclining towards the margins in rays.

Species 27. (Mus. Cuming.)

PSAMMOBIA MARMOREA. *Psam. testá ovato-transversá, compressissimulá, solidulá, subequilaterali, obliquu striato-rugosá, rugis posticé flexuoso-plicatis, lutescente-albá, ad umbones lutescente-violaceá, purpuro-cas-*

*taneo interrupte radiatá, latere antico rotundato, politico compressè truncato, ab umbone obtuse superficia-liter angulato.*

THE MARBLED PSAMMOBIA. Shell ovate transverse, rather compressed, rather solid, nearly equilateral, transversely obliquely striately wrinkled, wrinkles flexuously plicated, yellowish-white, yellowish-violet at the umbones, interruptedly rayed with purple-chestnut, anterior side rounded, posterior compressly truncated, obtusely superficially angled from the umbo.

DESHAYES, Pro. Zool. Soc. 1854, p. 324.

Hab. Moluccas and New Holland.

The painting of this species resembles that of the last in colour, but it is differently disposed, whilst the sculptured wrinkles are more obliquely pronounced, though nearly obsolete in the middle.

# PSAMMOBIA.

## PLATE V.

Species 28. (Fig. 28 and 59, Mus. Cuming.)

PSAMMOBIA BICARINATA. *Psam. testa elongato-transversa, angustâ, depresso, solidâ, subequilaterali, atroriolatâ, obsolete saturiore radiatâ, transversia salcata, sulca versus marginem obliquâ pliculis, latere antico rotundato, postico obliquâ truncato et rostrato, ab umbone bicarinato.*

THE TWO-KEELED PSAMMOBIA. Shell elongately transverse, narrow, depressed, rather solid, equilateral, dark-violet, obsolete darker rayed, transversely grooved, grooves obliquely plicated towards the margin, anterior side rounded, posterior obliquely truncated and beaked, two-keeled from the umbo.

DESHAYES, Pro. Zool. Soc. 1854, p. 322.

Hab. Zambar; T. Thorne.

A dark purple shell, sometimes white, stained with rose, as in Fig. 30, sculptured with obliquely sloping folds near the margin, the posterior extremity being beaked, with two-keeled angles running down from the umbo.

Species 29. (Mus. Cuming.)

PSAMMOBIA ZONALIS. *Psam. testa angustâ transversâ, compressâ, subequilaterali, tenuissimâ striatâ, nitente, albida, zonis transversis livido-rosis, latere antico rotundato, postico ab umbone subangulato, truncato.*

THE ZONED PSAMMOBIA. Shell narrowly transverse, compressed, nearly equilateral, very finely striated, shining, whitish, with transverse livid-rose zones, anterior side rounded, posterior slightly angled from the umbo, and truncated.

*Psammonotæ zonalis*, Lamarck, Anim. sans vert. vol. vi. p. 182.

Hab. Tasmania; R. C. Gunn.

A smooth compressed species, very finely striated towards the margin and extremities, painted with delicate livid-rose zones.

Species 31. (Mus. Cuming.)

PSAMMOBIA TELLINÆFORMIS. *Psam. testa angustâ transversâ, compressâ, subequilaterali, densè tenuistriatâ, nitente, striis ad latus posticum plicato-elevatis; albida, livido-carne pallide radiatâ, latere antico rotundato, postico rotundato-truncato, ab umbone superficialiter angulato.*

THE TELLINA-SHAPED PSAMMOBIA. Shell narrowly transverse, compressed, nearly equilateral, closely finely striated, shining, striae plicately raised on the posterior side; whitish, faintly rayed with livid-flesh, anterior side rounded, posterior rotundately truncated, superficially angled from the umbo.

DESHAYES, MS., Mus. Cuming.

Hab. —?

Unusually compressed, with the posterior angular cavity only superficially developed, the surface being faintly rayed with a thin livid-flesh tint.

Species 32. (Mus. Cuming.)

PSAMMOBIA CASTRENsis. *Psam. testa ovato-transversâ, tenui, pellucidâ, subequilaterali, nitente, vix striatâ, purpurascente-alba, maculis hieroglyphicis purpurascens pictâ, epineurâ tenui cornæ prope margines indutâ, latrunculus rotundatâ, postico tumidulo.*

THE CAMP-MARKED PSAMMOBIA. Shell ovately transverse, thin, pellucid, nearly equilateral, shining, scarcely striated, purplish-white, painted with obscure hieroglyphic purplish spots, covered with a thin horny epidermis near the margins, sides rounded, posterior slightly swollen.

HANLEY, Species of Shells, p. 59.

*Solen castrensis*, Chemnitz.

Hab. Sorsogon, Island of Luzon, Philippines; Cuming.

A semipellucid smooth shell, covered towards the margin with a thin horny epidermis, not unlike a *Solen* in general aspect.

Species 33. (Mus. Cuming.)

PSAMMOBIA FERROENSIS. *Psam. testa angustâ transversâ, subcompressâ, subequilaterali, striatâ, striis ad latus posticum subplicatis, ad angulum striis radiatibus decussatis; albida, rosâ radiatâ, ad margines epidermide vestita, latere antico rotundato, postico attenuato-truncato ab umbone angulato.*

THE FERROE PSAMMOBIA. Shell narrowly transverse, rather compressed, nearly equilateral, striated, striae subplicated on the posterior side, decussated on the angle with radiating striae; whitish, rayed with pink, clothed with an epidermis at the margins, anterior

shell rounded, posterior attenuately truncated, angled from the umbo.

*Tellina Ferroensis*, Chemnitz, Conch. Cab. vol. vi. p. 99. pl. 10. f. 91.

*Tellina incarnata*, Pennant.

*Tellina radiata*, Da Costa.

*Tellina trifasciata*, Donovan.

*Tellina trivecta*, Spengler.

*Psammobia Ferroensis*, Lamarek.

Hab. Ferroe and other Northern Isles, British Isles, and throughout the European Seas.

There is not much variation in this widely distributed species, the rose rays more or less predominating on a stone-white ground.

Fig. 34. (Mus. De Burgh.)

*Psammobia rubicunda*. *Psam. testa ovo-transversa, gibbosâ, utroque laterè parvulum hante, subæquilaterali, obliquè striatâ, striis posticè plicatis et abruptè interrumpit, deinde superne continuis, vixidè sanguineo-roseâ, albo floccatâ, lateribus rotundatis superficialiter ab umbone impresso.*

THE BRIGHT RED PSAMMOMIA. Shell ovately transverse, gibbosus, a little gaping at both ends, nearly equilateral, obliquely striated, striae posteriorly plicated and abruptly interrupted, then continuous towards the upper part, bright scarlet-rose flaked with white, sides rounded, posterior superficially impressed from the umbo.

DESHAYES, Pro. Zool. Soc. 1854, p. 324.

Hab. Island of Ticao, Philippines; Cuming.

This beautifully painted species is remarkable for the brightness and delicacy of its colour, the entire surface being a deep transparent blood-rose, flaked here and there with white. The specimen here figured is from the choice collection of Mrs. De Burgh. Mr. Cuming also possesses a fine and equally brilliantly painted specimen.

Species 35. (Fig. a, b, Mus. Cuming.)

*Psammomia elegans*. *Psam. testâ elongato-transversa, angustâ, compressâ, æquilaterali, transversim rugosoplicatâ, plicis subundulatis, latere antico rotundato, postico attenuato-rostrato, et ab umbone bicarinato, fusco-roseâ, fusco-purpureo promiscue radiatâ.*

THE ELEGANT PSAMMOMIA. Shell elongately transverse, narrow, compressed, equilateral, transversely rugosely plicated, slightly waved, anterior side rounded, posterior attenuately beaked, and two-keeled from the umbo, brownish-white, promiscuously rayed with brown-purple.

DESHAYES, Pro. Zool. Soc. 1854, p. 322.

Hab. Philippine Islands.

The posterior side of this species is developed in a manner very similar to that of the *P. bicarinata*.

Species 36. (Mus. Cuming.)

*Psammobia amena*. *Psam. testâ elongato-transversâ, depressâ, tenui, semipellucido, æquilaterali, deuse transversi striatâ, striis antico latioribus, in medio furcatis, striis posticis in valva dextra subobsoletis, in valva sinistra continuis; albâ, rufo-violaceo pallidissime maculatâ et radiatâ, nitente, latere antico rotundato, postico obliquè truncato, ab umbone superficialiter angulato-impressâ.*

THE DELICATE PSAMMOMIA. Shell elongately transverse, depressed, thin, semipellucid, equilateral, densely transversely striated, striae broader anteriorly, forked in the middle, posterior striae nearly obsolete in the right valve, in the left valve continuous, white, faintly rayed and spotted with reddish-violet, shining, anterior side rounded, posterior obliquely truncated, faintly angularly impressed from the umbo.

DESHAYES, Pro. Zool. Soc. 1854, p. 323.

Hab. —?

An extremely delicate shining species, with a characteristic difference, as above noted, in the sculpture of the two valves.

# PSAMMOBIA.

## PLATE VI.

Species 37. (Fig. a, b, Mus. Cuming.)

PSAMMOBIA TENUIS. *Psam. testa elongato-transversa, convexicula, tenui, hyalina, inaequilaterali, albida, interdum roseo radiata, obliquè tenissimè striata, striis ad latum posticum abruptè terminatis, latere antico subattenuato, postico breviore, late truncata.*

THE THIN PSAMMOBIA. Shell elongately transverse, rather convex, thin, hyaline, inequilateral, whitish, sometimes rayed with rose, obliquely very finely striated, striae abruptly terminated on the posterior side, anterior side slightly attenuated, posterior shorter, broadly truncated.

DESHAYES, Pro. Zool. Soc. 1854, p. 320.

Hab. Philippine Islands; Cuming.

The posterior side of this delicate hyaline species is compressly truncated and more angularly sloped in some specimens than in others.

Species 38. (Mus. Cuming.)

PSAMMOBIA COSTULATA. *Psam. testa elongato-transversa, tenuicula, inaequilaterali, concentricè salcato-striata, albida, intenè roseo pauciradiata, latere antico attenuato-rotundato, postico breviore, rotundato, radiatim tenui-costata.*

THE FINELY RIBBED PSAMMOBIA. Shell elongately transverse, rather thin, inequilateral, concentrically grooved, whitish, marked with a few deep rose rays, anterior side attenuately rounded, posterior shorter, rounded, radiately finely ribbed.

TURTON, Dithyra Brit. p. 87, pl. 6. f. 8.

*Psammobia discors*, Philippi.

Hab. Porto Santo, Madeiras, Sicily, British Isles.

A small elongately transverse species, sculptured in a characteristic manner on the posterior side with fine radiating ribs.

Species 39. (Mus. Cuming.)

PSAMMOBIA ABRUPTA. *Psam. testa elongato-transversa, tenui, pellucida, aequilaterali, compressa, albida, transversim costata, costis obtusis, subobliquis, postice abruptè interrupta, latere postico compresso, costis talis radiatibus sculpto, supernè recto, ad extremitatem rotundato-truncata.*

THE ABRUPT PSAMMOBIA. Shell elongately transverse, thin, pellucid, equilateral, compressed, whitish transversely ribbed, ribs obtuse, rather oblique, posteriorly abruptly interrupted, posterior side compressed, sculptured with broad radiating ribs, straight at the upper part, roundately truncated at the extremity.

DESHAYES, Pro. Zool. Soc. 1854, p. 324.

Hab. Philippine Islands; Cuming.

The ribbed sculpture of this delicate little transparent shell is very conspicuous.

Species 40. (Mus. Cuming.)

PSAMMOBIA EBURNEA. *Psam. testa oblongo-transversa, valde compressa, levigata, nitente, albâ, inaequilaterali, latere antico late rotundata, postico brevissimata, ad marginem superam angustè angulato-impresso, ad extremitatem rotundata.*

THE IVORY PSAMMOBIA. Shell oblong-transverse, very compressed, smooth, shining, white, inequilateral, anterior side broadly rounded, posterior rather short, narrowly angularly impressed along the upper margin, rounded at the extremity.

Hab. Malacea.

A thin compressed smooth ivory-like shell, with a simple narrowly impressed slope along the upper posterior edge.

Species 41. (Mus. Cuming.)

PSAMMOBIA CANDIDULA. *Psam. testa oblongo-transversa, tumida, crassissimâ, subaequilaterali, levigata, irregulariter incremento interrupta, flavescente-albâ, lateribus rotundatis, ab umbonem declivibus, latere postico parvulum breviora, obtuse angulata.*

THE WHITE PSAMMOBIA. Shell oblong-transverse, rather swollen, somewhat thick, nearly equilateral, smooth, irregularly interrupted with lines of growth, yellowish-white, sides rounded, slanting from the umbo, posterior side rather the shorter, obtusely angled.

DESHAYES, Pro. Zool. Soc. 1854, p. 319.

Hab. Philippine Islands; Cuming.

Of a solid dead-white aspect, smooth throughout, with only the faintest indication of an angle on the posterior side.

PSAMMOBIA.—PLATE VI.

Species 42. (Mus. Cuming.)

PSAMMOBIA MALACCANA. *Psam. testā ovato-transversā, subcōpressā, tenui, æquilaterali, niteat-albi, nitidē obliquē sulcato-striatā, striis posticis abrupte interrup-  
tis latere antico rotundato, postico latiore, subangu-  
lato-truncato et concentrici striato.*

THE MALACCA PSAMMOBIA. Shell ovalately transverse, somewhat compressed, thin, equilateral, shining white, neatly obliquely groove-striated, stria abruptly interrupted on the posterior side, anterior side rounded, posterior broader, slightly angularly truncated and concentrically striated.

*Hab.* Malacca.

A delicate shining white shell, neatly sculptured with oblique grooved striae, which suddenly terminate on the posterior side.

Species 43. (Mus. Cuming.)

PSAMMOBIA MENKEANA. *Psam. testā elongato-transversā, angustā, æquilaterali, liris plicatis subirregularibus concentricis sculptā, flavescente-alba, pallidissimè vio-  
laceo rauatā, latere antico late rotundato, postico ob-  
tuse truncato obtusissimè angulata.*

MENKE'S PSAMMOBIA. Shell elongately transverse, narrow, equilateral, concentrically sculptured with irregular plicated ridges yellowish-white, very faintly violet-rayed, interior side broadly rounded, posterior obtusely truncated, very obtusely angled.

*Hab.* East coast of Australia.

A narrow species, sculptured concentrically with somewhat irregular plicated ridges.

Species 44. (Mus. Cuming.)

PSAMMOBIA ANGUSTA. *Psam. testā elongato-transversā,*

*subæquilaterali, tenui, fragili, transversim inæqualiter plicato-striatā, striis posticis anguste elevatis, flaves-  
cente-alba, lateribus rotundatis, postico obscurè obtusè  
angulata.*

THE NARROW PSAMMOBIA. Shell elongately transverse, nearly equilateral, thin, fragile, transversely somewhat plicately striated, stria posteriorly narrowly raised, yellowish-white, sides rounded, posterior obscurely obtusely angled.

DESHAYES, Pro. Zool. Soc. 1854, p. 320.

*Hab.* Senegal.

The striae in this as in the preceding species incline to be obliquely plicated, but are developed on the posterior side in narrow ridges.

Species 45. (Mus. Cuming.)

PSAMMOBIA LAYARDI. *Psam. testā elongato-transversā,  
depressā, æquilaterali, obliquè minuti sulcato-striatā,  
striae ad latas posticam abrupte terminantur, latere pos-  
ticō striis concentricis et radiantibus fortiter decussato,  
sublate obtuse angulata, rotundato-truncata : flaves-  
cente, albo et violaceo-fusco marmorata.*

LAYARD'S PSAMMOBIA. Shell elongately transverse, depressed, equilateral, obliquely minutely groove-striated, stria abruptly terminated on the posterior side, posterior side strongly decussated with concentric and radiating striae, rather broadly obtusely angled, rotundately truncated; yellowish, mottled with white and violet-brown.

DESHAYES, Pro. Zool. Soc. 1854, p. 323.

*Hab.* Philippine Islands; Cuming.

Elegantly sculptured and mottled throughout with violet-brown and white.

*Psammebia*, Pl. VII.

# PSAMMOBIA.

## PLATE VII.

### Species 46. (Mus. Cuming.)

PSAMMOBIA PULCHERRIMA. *Psam. testa elongato-transversa, compressa, tenui, subaequilaterali, violaceo-rosea, obsoletè albo-radiata, inter rosso-purpurascente, obliquè transversim costata, costis simplicibus, depresso, superè acutangulis, ad latas posticam subito sub-crepitis, latere posico paulo hincate, costulis radiatis seborosis, ad marginem denticulatis.*

THE VERY BEAUTIFUL PSAMMOBIA. Shell elongately transverse, compressed, thin, nearly equilateral, violet-rose, obsoletely white-rayed, interior rose-purple, obliquely transversely ribbed, ribs simple, depressed, rather sharp at the upper part, suddenly interrupted at the posterior side, posterior side a little gaping, with small scarous radiating ribs, denticulated at the edge.

DESHAYES, Pro. Zool. Soc. 1854, p. 325.  
Hab. —?

This beautiful little species is remarkable for its strongly marked and strongly contrasted sculpture, the posterior radiating ribs being obtusely prickly scaled.

### Species 47. (Mus. Cuming.)

PSAMMOBIA PALMULA. *Psam. testa oblongo-transversa, arcuata, tenui, fragili, inaequilaterali, obliquè costulata, costulis ante subtilibus, subundulatis postice crenatis et radiatis, lateante-albid, sanguinis perponcis pallide rufescensibus dispersa, latere antico attenuato-rotundato, posico obliquè truncato et paulum hincate.*

THE LITTLE OAR PSAMMOBIA. Shell oblong-transverse, arched, thin, fragile, inaequilateral, obliquely finely ribbed, ribs anteriorly fine, slightly waved, posteriorly continuous and radiating, yellowish-white, sprinkled with a few faint red spots, anterior side attenuately rounded, posterior obliquely truncated and a little gaping.

DESHAYES, Pro. Zool. Soc. 1854, p. 325.  
Hab. Sydney, New Holland.

The obliquely sloping ribs in this species are not interrupted on the posterior side, but become gradually open and rayed.

### Species 48. (Mus. Cuming.)

PSAMMOBIA DISPAR. *Psam. testa ovato-transversa, tenui, inaequilaterali, laterale-albid, rosso-marmorata, obliquè litato-strigata, striis ad latas posticam interrupitis, latere antico latissimo, attenuato-rotundato, posico brevi, subrostrato, paulo hincate, conspicue radiata costata.*

THE UNEQUAL PSAMMOBIA. Shell ovately transverse, thin, inaequilateral, yellowish-white, rose-mottled, obliquely ridge-striated, striae interrupted at the posterior side, anterior side rather broad, attenuately rounded, posterior short, somewhat beaked, a little gaping, conspicuously radiately ribbed.

DESHAYES, Pro. Zool. Soc. 1854, p. 325.

Hab. Philippines; Cuming.

Chiefly distinguished by the posterior side being somewhat beaked and conspicuously cross-ribbed, in contrast with the obliquely sloping striae.

### Species 49. (Mus. Cuming.)

PSAMMOBIA DENTICULATA. *Psam. testa elongato-transversa, arcuata, tenui, subaequilaterali, albida, ad umbones rosso lineata, obliquè undulato-lirata, postice radiata costata, costis seborosis, latere posico obliquè truncata, hincate, ad marginem denticulata.*

THE TOOTHED PSAMMOBIA. Shell elongately transverse, arched, thin, nearly equilateral, whitish, tinged with rose at the umbo, obliquely wave-ridged, posteriorly radiately ribbed, ribs scarous, posterior side obliquely truncated, gaping, denticulated at the edge.

ADAMS and REEVE, Moll. Voy. Samarang, p. 80. pl. 24. f. 2.

Hab. China Sea.

The ribs on the posterior side are prickly-scaled, radiating openly, so as to show the interstices deeply grooved.

### Species 50. (Fig. a, b, Mus. Cuming.)

PSAMMOBIA SQUAMOSA. *Psam. testa oblongo-transversa, arcuata, tenui, subaequilaterali, obliquè undulato-lirata, postice radiata costata, costis prominentibus, squamosis, subdistantibus, corallaceo-violacea, interdina albidà, rosso marmorata, latere antico rotundato, posico obliquè truncata et hincate.*

PSAMMOBIA.—PLATE VII.

THE SCALED PSAMMOBIA. Shell oblong-transverse, arched, thin, nearly equilateral, obliquely wave-ridged, posteriorly radiately ribbed, ribs prominent, scaled, rather distant, blue-violet, sometimes whitish, mottled with rose, anterior side rounded, posterior obliquely truncated and gaping.

LAMARCK, Ainsi, sans vert. vol. vi. p. 176.

Hab. Island of Masbate, Philippines; Cuming.

A delicate and beautifully sculptured species, chiefly distinguished by the prominent openly spread development of the posterior ribs and gaping extremity.

---

Species 51. (Mus. Cuming.)

PSAMMOBIA RUGULOSA. *Psam. testa elongato-transversa, subarcuata, tenui, inaequilaterali, obliquè rugulosatà, posticè radiatim costata, costis scabrosis, laterè cincte-albo, latere antico attenuato-rotundato, postico attenuato-rostrato et obliquè truncata.*

THE WRINKLED PSAMMOBIA. Shell elongately transverse, slightly arched, thin, inequilateral, obliquely wrinkle-ridged, posteriorly radiately ribbed, ribs seaceous, yellowish-white, anterior side attenuately rounded, posterior attenuately beaked and obliquely truncated.

ADAMS AND REEVE, Moll. Voy. Samarang, p. 81. pl. 24. f. 4.

Hab. China Sea.

The posterior side of this species is more attenuately beaked than in other examples of the genus.

---

(Species 52. Mus. Cuming.)

PSAMMOBIA PENNATA. *Psam. testa orato-transversa, inaequilaterali, utrinque hianta, albo-grisea, albo et rubescente irregulariter minute maculata, oblique tenuissimo striata, striis ad latus posticum abruptè interrupitis, latere postico depresso-depressinculo, vix truncato, bipartito, divaricatis corrugato-costato.*

THE WINGED PSAMMOBIA. Shell ovately transverse, inequilateral, gaping at each side, whitish-grey, irregularly minutely spotted with white and pale red, obliquely very finely striated, striae abruptly inter-

rupted at the posterior side, posterior side rather depressed, scarcely truncated, bipartite, divaricately wrinkle-ribbed.

DESHAYES, Pro. Zool. Soc. 1854, p. 325.

Hab. Philippine Islands; Cuming.

The posterior side of this species is less distinguished in form from the anterior than usual, and both sides gape at the extremity.

---

Species 53. (Mus. Cuming.)

PSAMMOBIA PETALINA. *Psam. testa oblongo-transversa, tenuissima, pellucida, valde inaequilaterali pallide violaceo, violaceo quinqueradiata, nitente, latere antico elongato, postico brevi, ambobus rotundatis.*

THE LITTLE PETAL PSAMMOBIA. Shell oblong-transverse, very thin, transparent, very inequilateral, pale-violet, five-rayed with darker violet, shining, anterior side elongated, posterior side short, both rounded.

DESHAYES, Pro. Zool. Soc. 1854, p. 320.

Hab. China Sea.

An extremely delicate, transparent, violet-rayed shell, without any indication of the peculiar sloping sculpture which is chiefly characteristic of this genus.

---

Species 54. (Mus. Cuming.)

PSAMMOBIA SUFFUSA. *Psam. testa oblongo-transversa, tenui, subcompressa, subaequilaterali, obliquè lirato-striata, striis ad latus posticum subito interruptis, purpurascente-violacea, albo tenuiradiata, latere antico rotundato, postico latiore, levigata, subangulato-truncato.*

THE BLUSHING PSAMMOBIA. Shell oblong-transverse, thin, rather compressed, nearly equilateral, obliquely ridge-striated, striae suddenly interrupted on the posterior side, purple-violet, finely rayed with white, anterior side rounded, posterior broader, smooth, somewhat angularly truncated.

Hab. Malacca.

A thin, purple-violet shell, delicately rayed with white, conspicuously sculptured with obliquely sloping ridges.

## PLATE VIII.

### Species 55. (Mus. Hanley.)

**PSAMMOBIA CASTA.** *Psam. testā oblongo-ovatā, planō-convēxa, petūciō-albā, pallidē rosacē, posticē flexuoso-angulatā, sulcīs linearīs tenuissimis obliquē scriptā, ad angulū posicūa interruptis.*

**THE CHASTE PSAMMOBIA.** Shell oblong-ovate, flatly convex, transparent white, faintly rose-tinted, posteriorly flexuously angled, obliquely sculptured with very fine minute linear grooves, which are interrupted at the posterior angle.

*Hab.* Guatemala.

A very delicate semitransparent shell, sculpture obscurely with very fine linear grooves, which terminate some little distance before reaching the posterior flexibility.

### Species 56. (Mus. Cuming.)

**PSAMMOBIA PARVULA.** *Psam. testā oblongā, planiusculā, posticē impresso-flexuosa, tenuissimē decussatim striatā, nitente-albā, versus umbonem carno tinctā.*

**THE SMALL PSAMMOBIA.** Shell oblong, rather flat, posteriorly impressly flexuous, finely decussately striated, shining-white, flesh-tinted towards the umbo.

*Hab.* —?

Of very simple form, but distinct from any hitherto described species.

### Species 57. (Mus. Cuming.)

**PSAMMOBIA YAGINOIDES.** *Psam. testā oblongo-ovatā, convexiusculā, aequaliterā, laterib⁹ rotundatā, tenuissimē decussatim striatā, sordidē albā, versus umbonem rosacea, epidermide stramineā ad marginem induitā.*

**THE SHEATH-LIKE PSAMMOBIA.** Shell oblong-ovate, rather convex, equilateral, sides rounded, very finely decussately striated; dull white, pink towards the umbo, covered at the margin with a straw-coloured epidermis.

*Hab.* —?

Equilateral, with the sides uniformly rounded, pink-tinted about the umbo, with a pale straw-coloured epidermis at the margin.

### Species 58. (Mus. Cuming.)

**PSAMMOBIA LINEOLATA.** *Psam. testā oblongā, ad latera subacutinatā, planā, posticē subangulato-flexuosa; carnēo-roscatē, lineis opaco-albis concentricē fasciatā.*

**THE LINEOLATED PSAMMOBIA.** Shell oblong, somewhat acuminated at the sides, flat, posteriorly, slightly angularly flexuous; flesh-pink, banded with irregular, concentric, opaque white lines.

**GRAY, MS., Mus. Brit.**

*Hab.* New Zealand.

A rather flatly-compressed shell, of a deep flesh-pink colour, peculiarly marked with whitish concentric bands and lines.

### Species 59. (Fig. a, b, Mus. Cuming.)

**PSAMMOBIA CONVEXA.** *Psam. oblongo-ovatā, planō-convēxa, crassiusculā, laterib⁹ subaequalib⁹, lăvigatā, nitente; carnēo-albā, rosacea varie radiatā et minnissime marmoratā.*

**THE CONVEX PSAMMOBIA.** Shell oblong-ovate, flatly convex, rather thick, sides nearly equal, smooth, shining; flesh-white, variously rayed with pink, and very minutely mottled.

*Hab.* —?

Distinguished chiefly by its convex though flattened form.

### Fig. 60. (Mus. Cuming.)

**PSAMMOBIA CERULESCENS.** *Psam. testā subelongato-oblongā, depressā, posticē latē superficialiter flexuosa, subangulatā, striis elevatis obliquis scriptā, striis ad angulū posicūa interruptis; pallidē violaceo-cernescens, umbonibus purpureo-brindatis.*

**THE BLUSH PSAMMOBIA.** Shell somewhat elongately oblong, depressed, posteriorly broadly superficially flexuous, slightly angled, sculptured with oblique raised striae, stria interrupted at the posterior angle; pale violet-blue umboes, two-rayed with purple.

**LAMARCK, Anim. sans vert. vol. vi. p. 170.**

*Psammobia bipartita*, Philippi.

*Hab.* Ceylon.

Of a delicate violet-blue, with the sculpture suddenly interrupted at the edge of the posterior angle.

## PSAMMOTELLA.

### PLATE I.

Genus PSAMMOTELLA, Deshayes.

*Testa orato-transversa, convexisulca, subaequilateralis, utrinque hians, anticò rotundata, posticò longior, truncata vel subrostrata, concentrica striata, aut lutea aut violacea, epidermide tenui decidua cornea. Cardo dentibus parvo centralibus eructis in valva sinistra, in valva dextra unica, callositate oblonga in umbonibus. Ligamentum externum. Impressio muscularis pallii sini oblongo pernuptio.*

Shell ovately transverse, rather convex, nearly equilateral, gaping at both ends, anteriorly rounded, posteriorly longer, truncated or slightly beaked, concentrically striated, yellowish or violet, with a thin horny deciduous epidermis. Hinge with two small erect central teeth in the left valve, and one in the right, and an oblong callousness in both valves. Ligament external. Muscular impression of the mantle distinguished by a very large oblong sinus.

This genus, of which we have here represented seven species, was recently founded by M. Deshayes during an examination of the family to which they belong, lately made by that distinguished conchologist in the collection of Mr. Cuming. While engaged in arranging the *Psammobie* and their allies, M. Deshayes recognized a distinct generic type to which these were severally referable, none of which had hitherto been described. They are distinguished by a peculiarity of form, and they agree especially in substance and tone of coloring. With a convexly oblong nearly equilateral form, the posterior side being rather the longer, they are all densely concentrically striated, and either yellowish or deep violet, chiefly of the latter colour, with a thin deciduous epidermis.

So far as the localities are known, two are from the Philippine Islands, one from Malacca, one from Ceylon, and one from the Red Sea.

---

Species 1. (Mus. Cuming.)

PSAMMOTELLA PHILIPPINENSIS. *Psm. testa orato-transversa, convexisulca, subaequilaterali, concentrica irregulariter plicata-striata, albida, epidermide fulvo versus marginem insinata, lateribus superius declivibus, antico subangustè rotundata, postico oblique attenuata-truncata, margine inferiore semicirculari.*

THE PHILIPPINE PSAMMOTELLA. Shell ovately transverse, rather convex, nearly equilateral, concentrically

irregularly plicately striated, whitish, covered towards the margin with a fulvous epidermis, sides sloping at the upper part, anterior rather narrowly rounded, posterior obliquely attenuately truncated, lower margin semicircular.

DESHAYES, MS., Mus. Cuming.

Hab. San Nicolas, Island of Zebu, Philippines; Cuming.

Of light swollen structure, nearly equilateral, and ovately attenuated at each end.

---

Species 2. (Mus. Cuming.)

PSAMMOTELLA MALACCENSIS. *Psm. testa orato-transversa, tenui, æquilaterali, convexisulcata, levigata vel subtilissime striata, pellucido-alba, latere antico subangustè rotundata, postico subcompressa, truncato-rotundata.*

THE MALACCA PSAMMOTELLA. Shell ovately transverse, thin, equilateral, slightly convex, smooth or faintly striated, transparent white, anterior side rather narrowly rounded, posterior somewhat compressed, truncately rounded.

DESHAYES, MS., Mus. Cuming.  
Hab. Malacca.

A small species, of simple form and semitransparent substance, the posterior side being rather compressed.

---

Species 3. (Mus. Cuming.)

PSAMMOTELLA SKINNERI. *Psm. testa oblongo-transversa, minus impresso-striata, tenuissima, subelevata, lineis nigricantibus undatis, radiisque duabus, notata, epidermide cornea olivaceo nitente insuta, lateribus subattenuata, postico breviore, viz. truncata.*

SKINNER'S PSAMMOTELLA. Shell oblong transverse, minutely impressly striated, very thin, somewhat glassy, marked with black zigzag lines and two rays, covered with a shining olive horny epidermis, sides rather attenuated, posterior rather shorter, scarcely truncated.

Hab. Ceylon; Major Skinner.

Of very distinct character from the rest of the genus, the shell being exceedingly thin and transparent, marked with blackish zigzag lines, covered with a shining horny epidermis.

---

## PSAMMOTELLA.—PLATE I.

## Species 4. (Mus. Cuming.)

PSAMMOTELLA RUPPELLIANA. *Psam. testa elongato-transversa, solidiuscula, subobliqua contorta, inaequilateralis, deinceps irregulariter striata, albida, livido-violetacea fuscata, posticè pallide biradiata, epidermide tenui versus marginem indutâ, lateribus superne declivibus, antico subanguste rotundato, postico oblongo-truncato.*

RUPPELL'S PSAMMOTELLA. Shell elongately transverse, rather solid, rather obliquely twisted, incapsulated, densely irregularly striated, whitish, banded with livid violet, posteriorly faintly two-rayed, covered near the margin with a deciduous epidermis, anterior side rounded, posterior oblong-truncated.

Hab. Red Sea; Ruppell.

A rather solid species, of oblong transverse growth, rather contorted in the posterior direction.

## Species 5. (Mus. Cuming.)

PSAMMOTELLA AMBIGUA. *Psam. testa ovato-transversa, inaequilateralis, irregulariter rugoso-striata, sordidò violacea, lateribus superne declivibus, antico subanguste rotundato, postico subcompresso producto, deinde truncato-rotundato.*

THE DOUBTFUL PSAMMOTELLA. Shell ovately transverse, inequilateral, irregularly roughly striated, dull violet, sides sloping at the upper part, anterior rather narrowly rounded, posterior somewhat compressly reduced, then truncately rounded.

DESHAYES, MS., Mus. Cuming.

Hab. —?

Chiefly distinguished by the posterior side being conspicuously compressly produced.

## Species 6. (Mus. Cuming.)

PSAMMOTELLA SUBRADIANA. *Psam. testa westo-traversa, tenui, cuneoxuscula, irregulariter rugoso-striata, violaceente, pallidè alto-radiata, epidermide tenui versus marginem indutâ, lateribus superne declivibus, antico subanguste rotundato, postico subcompresso, truncato-rotundato.*

THE FAINTLY RAYED PSAMMOTELLA. Shell ovately transverse, thin, rather convex, irregularly roughly striated, pale violet, faintly white-rayed, covered with a thin epidermis, sides sloping at the upper part, anterior rather narrowly rounded, posterior a little compressed, truncately rounded.

DESHAYES, MS., Mus. Cuming.

Hab. San Nicolas, Island of Zebu, Philippines; Cuming.

Of lighter substance than the preceding species, with the posterior side shorter.

## Species 7. (Mus. Cuming.)

PSAMMOTELLA OBLONGA. *Psam. testa elongato-transversa, tenui, subaequilaterali, irregulariter rufè striata, purpurascente-violacea, epidermide tenui decidua prope marginem indutâ, lateribus subaequilateri rotundatis.*

THE OBLONG PSAMMOTELLA. Shell elongately transverse, thin, nearly equilateral, irregularly rudely striated, purplish-violet, covered towards the margin with a thin deciduous epidermis, sides nearly equally rounded.

DESHAYES, MS., Mus. Cuming.

Hab. —?

A light purple-violet shell, distinguished by its elongately oblong form, with the sides nearly equally rounded.

## MYTILUS.

### PLATE I.

#### *Cinclus MYTILUS, Linnaeus*

*Testa argenteo-purpurea, lingue flabelliformis, plus minus trigona, basi apice undulatis acutis, subrectis, terminalibus, leviter rotula sepe compressè expansa, postico saepe rotato; epidermide pterumque evanescit, interdum pilosa. Caro dentatus, interdum subcrenulatus, ligamentum marginatum, subinterior. Impressio muscularis composta, sublateralis.*

Shell equivalve, obliquely fan-shaped, more or less triangular, affixed by a byssus, umbones sharp, nearly straight, terminal; anterior side often compressly expanded, posterior somewhat contracted; epidermis generally horny, sometimes hairy. Hinge toothless, sometimes slightly crenulated, with the ligament marginal and partially internal. Muscular impression compound, sublateral.

The *Mytili* are chiefly characterized by an elongately fan-shaped growth, more or less beaked towards the umbones, having the interior side for the most part compressly expanded and the posterior areately contracted. Some species, distinguished by the presence of a thin shelf across the interior of the umbones, are arranged by authors as a separate genus under the name of *Septifer*; and others, characterized by a not unimportant difference in the animal, have been separated under the name of *Dreissena*. Neither of these forms have been however allowed to take rank of genera by Deshayes.

So much do the *Mytili* vary in appearance under different circumstances of habitation, as exemplified by the two figures of *M. Californianus* in the accompanying Plate, that it has been impossible to identify many of the species described by Continental conchologists. Sixty-one are

all that have been satisfactorily made out by procurable specimens; their range of habitation extends over the seas of both hemispheres.

Fig. 1. (Mus. Cuming.)

This delicately-formed and exquisitely-coloured shell is the *Mytilus flexu*s of Poli, now universally regarded as a variety of *M. edulis*, for description of which see Pl. VIII. Sp. 33.

Species 2. (Fig. 2 a, b, Mus. Cuming.)

*MYTILUS CALIFORNIANUS. Myt. testa pyriforme elongata, subarcuata, solidi, radiatim costata, sulcis intermedium conspicue excavatis, concentricè ruditè corrugata, areolæ posticæ levigatae; latero-olivaceæ, in estate nigricantæ, carnis.*

THE CALIFORNIA *MYTILUS*. Shell pyriformly elongated, slightly arched, solid, radiately ribbed, intermediate grooves conspicuously excavated, concentrically rudely wrinkled, posterior area smooth; yellowish-olive, blackish-blue with age.

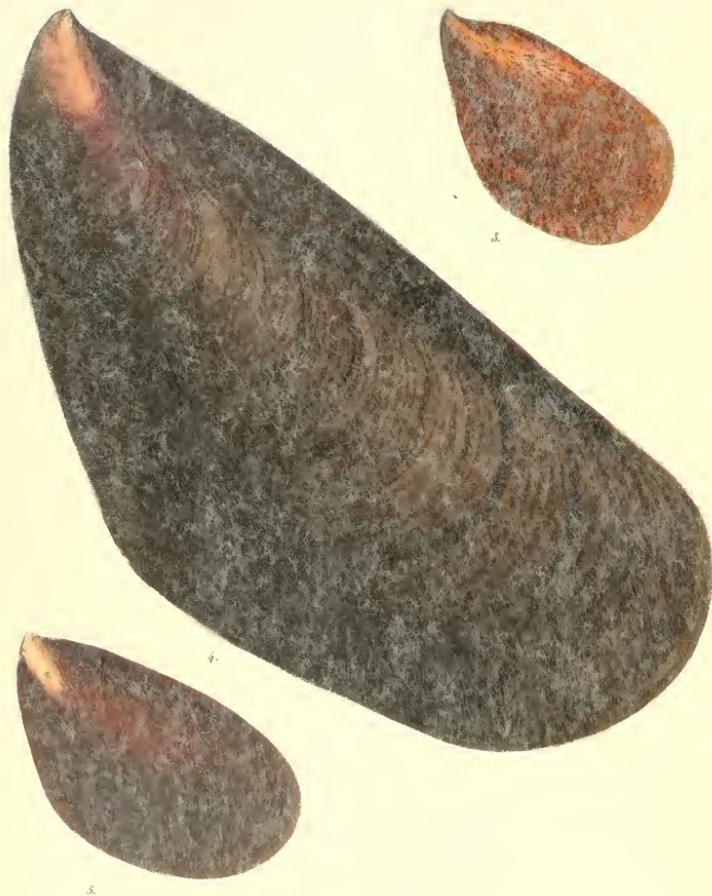

CONRAD, Journ. Acad. Nat. Sci. Philadelphia, vol. vii. p. 242.

*Hab.* California.

The examples here figured of this fine species represent its extreme states. Young specimens, as Fig. 2 b, are rayed with strongly excavated grooves, and the shell is of a rich yellowish-olive colour. In a more advanced state, the grooves become more and more obsolete, and the shell assumes a rough blackish-blue tone.

## MYTILUS.

### PLATE II.

Species 3. (Mus. Cuming.)

MYTILUS APER. *Myt. testā trigono-oblongā, posticē compressā, vix angulatā, concentricē irregulariter striatā, aurantio-fuscō, lineis saturatioribus acutis undatis levitiginosā, extremitate posticā viridi.*

THE AFRICAN MYTILUS. Shell triangularly oblong, posteriorly compressed, scarcely angled, concentrically irregularly striated; orange-brown, freckled with darker zigzag lines, green at the posterior extremity.

Gmelin, Syst. Nat. p. 3258.

*Mytilus Africanus*, Chemnitz.  
Hab. Algiers.

Readily distinguished by its orange-brown tone of colour, freckled with zigzag markings.

Species 4. (Mus. Cuming.)

MYTILUS UNGULATUS. *Myt. testā elongato-oblongā, crassiusculā, concentricē striatā, latere postico subangulato-compresso, anticē latiusculā, intense violaceo-nigrā.*

THE HOOKED MYTILUS. Shell elongately oblong, rather thick, concentrically striated, posterior side rather

angularly compressed, anteriorly rather broad; dark violet-black.

LINNEUS, Syst. Nat. (Gmel. edit.) No. 12.

*Mytilus latus, pars*; Lamarck.  
Hab. Conception, Chili; Cuming.

Of very large size, rather flat, straight on the posterior side, obtusely angled in front, covered with a rich glazed violet-black epidermis.

Species 5. (Mus. Cuming.)

MYTILUS COMPRESSUS. *Myt. testā oblongo-ovatā, compressā, concentricē irregulariter striatā, latere postico obtuse compressa angulata, intermē olivaceo-castaneā.*

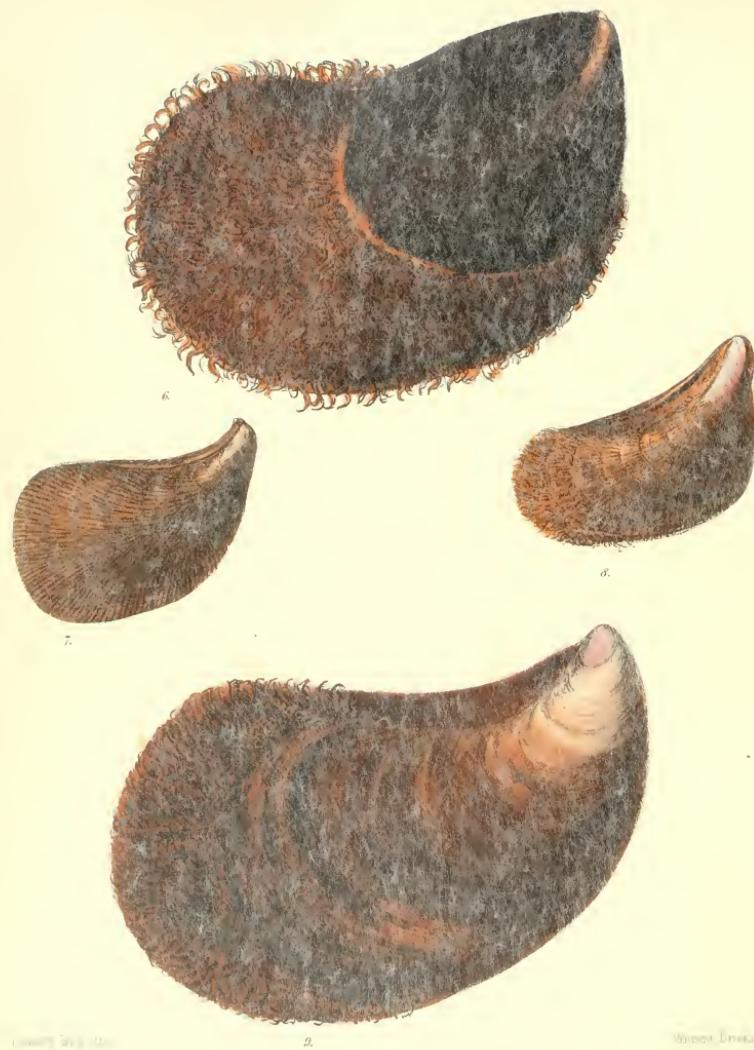

THE COMPRESSED MYTILUS. Shell oblong-ovate, compressed, concentrically irregularly striated, posterior side obtusely compressly angled; dark olive-chestnut.

PHILIPPI, MS., Mus. Cuming  
Hab. — ?

A simple compressed species, of a bright olive-chestnut, inclining at the margin to greenish-black.

## MYTILUS.

### PLATE III.

Species 6. (Mus. Cuming.)

**MYTILUS TORTUS.** *Myt. testa pyriformi-ovata, concentrica striata, striis peculiariter obliquè decussatis, latere posteriori late, peculiariter contorta; nitente-castanea, epidermide fibrosa barbata.*

**THE TWISTED MYTILUS.** Shell pyriformly ovate, concentrically striated, striae obliquely decussated, posterior side broad, peculiarly distorted : shining-chestnut, bearded with a fibrous epidermis.

DUNCKER, Pro. Zool. Soc., 1856. 2<sup>o</sup>  
Hab. Island of Mindanao, Philippines ; Cuming.

This fine species, with its handsome bearded epidermis, is peculiarly distinguished by its strangely twisted growth.

Species 7. (Mus. Cuming.)

**MYTILUS HAMATUS.** *Myt. testa arcuato-pyriformi, subquadrata, antice late impressa, striis elevatis divaricatis radiis sculpta; olivaceo-virente.*

**THE HOOKED MYTILUS.** Shell arcuately pyriform, somewhat square, anteriorly broadly impressed, strongly sculptured with divaricated raised striae ; olive-green. SAY, Journ. Acad. Nat. Sci. vol. ii. p. 263. American Conchology, pl. 50.  
*Mytilus striatus*, Barnes.

Hab. Gulf of Mexico.

A shell of stout substance, sculptured throughout with very strongly developed thick-set divaricating ridges.

Species 8. (Mus. Cuming.)

**MYTILUS HIRSUTUS.** *Myt. testa arcuato-oblonga, postice*

*breviter oblique angulata; apice latissimâ et gibbosa, medio hiscavata, longitudinaliter levè elevato-striata, nitente-castanea, epidermide fibrosa barbata.*

**THE HAIRY MYTILUS.** Shell arcuately oblong, posteriorly shortly obtusely angled, anteriorly very broad and gibbous, gaping in the middle, longitudinally densely elevately striated ; shining-chestnut, bearded with a fibrous epidermis.

LAMARCK, Ann. sans vert. vol. vii. p. 38.  
Hab. New Zealand.

Triangular, curved, and very gibbous on the posterior side, with the valves gaping rather largely for the passage of the byssus.

Species 9. (Mus. Cuming.)

**MYTILUS HORRIDUS.** *Myt. testa pyriformi-ovata, latero postico impresso-curvata, concentrica striata, striis obliquè decussatis; nitente-castanea, epidermide fibrosa barbata.*

**THE HORRID MYTILUS.** Shell pyriformly ovate, posterior side impressly curved, concentrically striated, striae obliquely decussated : bright-chestnut, bearded with a fibrous epidermis.

DUNCKER, Pro. Zool. Soc., 1856.

Hab. Cape Capricorn, North Australia ; Macgillivray.

Very closely allied to *M. tortus*, figured above it, but of a more truly pyriform curve, and destitute of any indication of the curious posterior distortion which is constant in that species.

*Mytilus*, Pl. IV.

*A.*

*B.*

*C.*

### Species 10. (Mus. Cuming.)

**MYTILUS EXUSTUS.** *Myt. testá oblongo-folbelliforme, ante-*  
*tice compressa, longitudinaliter sulcata et bifurcatim*  
*striatá, latere postico obtuse angulato: fasciæ, ochraceo*  
*sepè radiatæ.*

THE SCORCHED MYTILUS. Shell oblong fan-shaped, anteriorly compressed, longitudinally grooved and bifurcately striated, posterior side obtusely angled: brown, often rayed with ochre.

LAMARCK, *Anim. sans vert. vol. vii. p. 39.*  
Hab. West Indies.

A rather compressed, oblong fan-shaped species, strongly longitudinally striated, the striae being here and there bifurcated, and inclined to pass off in the anterior direction. In colour the shell is mostly of a swarthy-brown, tinged and often rayed with ochre.

### Species 11. (Mus. Cuming.)

**MYTILUS ATROPURPUREUS.** *Myt. testá oblongo-tenuicostata,*  
*posticè tumidæ, vix angulatæ, longitudinaliter tenui-*  
*striata, stria confertis, cumbundulatis; atro-purpurea.*

THE DARK-PURPLE MYTILUS. Shell oblong, rather thin, posteriorly swollen, scarcely angled, longitudinally finely striated, striae close-set, slightly waved: black-purple.

DUNKER, *MS. in Mus. Cuming.*   
Hab. Guinea, Dr. Tams.

Delicate in substance, very closely finely striated throughout, and of a rich dark-purple colour; collected by Dr. Tams at Guinea.

### Species 12. (Mus. Cuming.)

**MYTILUS LATUS.** *Myt. testá elongato-ovalis, concentrici*  
*irregulariter striatæ, olivacea, sub epidermide tenui-*  
*coronæ viridi ciliis decussatis in radiis; latere postico*  
*recto, obtuse decisis, antice arcuato, vix angulato.*

THE BROAD MYTILUS. Shell elongately ovate, concentrically irregularly striated, olive, decussated with rays of bright-green beneath a thin horny epidermis: posterior side straight, obtusely slanting, anterior arched, scarcely angled.

LAMARCK, *Anim. sans vert. vol. vii. p. 41.*  
Hab. New Zealand.

Of a peculiar straight oblong form, swollen and bluntly sloping on the posterior side, which is straight at the margin, whilst the margin on the anterior side is only slightly angularly curved.

### Species 13. (Mus. Cuming.)

**MYTILUS EXCUSIS.** *Myt. testá oblongo-ovata, soliduscula,*  
*curvata, callo gibbosæ, longitudinaliter sulcata et li-*  
*ratæ, liris confertis, crenulatis, hic illæ bifurcalim*  
*divergentibus, latere postico obtuse contracto, antico*  
*rotundato: albida, purpurascens-sordida tincta.*

THE ENGRAVED MYTILUS. Shell oblong-ovate, rather solid, curved, very gibbous, longitudinally grooved and ridged, ridges close-set, crenulated, here and there bifurcately diverging, posterior side obtusely contracted, anterior rounded; whitish, tinged with purple-fawn.

*Tichogonia excisa*, Wiegman, Archives, 1837.

*Mytilus fuscus*, Recluz.

Hab. Madagascar.

Of very gibbous solid growth, with the diverging striae enlarged into conspicuously crenulated ridges.

### Species 14. (Mus. Cuming.)

**MYTILUS OVALIS.** *Myt. testá oblongo-ovalis, plus minus*  
*gibbosæ, longitudinaliter lirata, liris parva crenulatis,*  
*undatus, subdistantibus, interstiliis versus marginem*  
*lira altera interveniente; umbobus tumidinaculis, in-*  
*cumbentibus; nigro-purpurea, costatae tincta.*

THE OVAL MYTILUS. Shell oblong-oval, more or less gibbous, longitudinally ridged, ridges but little crenulated, waved, rather distant, interstices towards the margin with another ridge intervening; umboes rather swollen, incumbent; blackish-purple, stained with chestnut.

In this species, as Lamarek describes, the umboes are compressly incumbent, presenting a link with the typical growth of the umboes in *Modiola*. The sculpture consists of slightly waved radiating ridges, with an alternate ridge appearing in the interstices as they widen out towards the margin. The colour is blackish-purple, passing beneath the umboes into chestnut.

## PLATE V.

### Species 15. (Mus. Cuming.)

**MYTILUS ROSTRATUS.** *Myt. testa subangusta, versus umbonem attenuata et rostrata, longitudinibus testae striis oblique, leviter levigatis, latere posteriori oblique incurvo, nubecula rotundata; purpureo-nigra.*

**THE BEAKED MYTILUS.** Shell rather elongated, attenuated towards the umboes and beaked, longitudinally finely striated, striae wavy, here and there obsolete, posterior side obscurely incurved, anterior rounded, purple-black.

*Descript.* MS. in Mus. Cuming. 

*Hab.* Tasmania.

Of rather elongated form, attenuated towards the umboes, which are produced into a sharp beak. The striae are very superficial. The colouring is very dark, only showing purple where bruised.

### Species 16. (Mus. Cuming.)

**MYTILUS SINUATUS.** *Myt. testa oblongo-flabelliformis, posterius arcuata, oblonga gibba, horizonte, antice angustata striata, versus postea multe incurva, nubecula rotundata; nigra-virens, iridis, nigra obscurè fuscata.*

**THE SINUATED MYTILUS.** Shell oblong fan-shaped, posteriorly arched, obscurely gibbous, smooth, anteriorly inconspicuously striated, posterior side much incurved, anterior sharply rounded; very dark green, obscurely freckled with black.

*Descript.* MS. in Mus. Cuming.

*Hab.* Philippine Islands; Cuming.

Distinguished by its peculiarly arched gibbous growth, and dark green freckled colouring.

### Species 17. (Mus. Cuming.)

**MYTILUS DUNKERI.** *Myt. testa trigono-flabelliformis, posterius plano-incurvata et gibbosata, antice declivis-compressa, versus umbonem subangustata rostrata, radiatim superciliata striata, striae concentricas decussatas, intercalatae.*

**DUNKER'S MYTILUS.** Shell triangularly fan-shaped, posteriorly flatly incurved and gibbous, anteriorly slightly compressed, towards the umboes rather narrowly beaked, radiately superficially striated, decussated with concentric striae; shining black.

### Hub. Philippine Islands.

I have the pleasure of naming this fine species after the intelligent naturalist of Cassel, who has worked with so much zeal on the specimens of *Mytilaceæ* in Mr. Cuming's cabinet. It is a shining black shell, of a conspicuous fan-shape, broadly gibbous and incurved on the posterior side, with the umboes contracted and beaked.

### Species 18. (Mus. Cuming.)

**MYTILUS CUNIFORMIS.** *Myt. testa elongato-oblonga, regulariter rotundata-trigonata, latere posteriori recessissima, versus umbonem punctulariter declivis-contorta, latere antice planum, compressa; levigata, et obsoletè decussata striata; extremitate orobata, inter se viridi, posterius latero-elevata.*

**THE WEDGE-SHAPED MYTILUS.** Shell elongately oblong, regularly rotundately triangular, posterior side very short, peculiarly slopingly twisted towards the umboes, anterior side very long, compressed; smooth, or obsoletely decussately striated; shining horny, very dark green, posteriorly yellowish-chestnut.

*Hab.* Bay of Guayaquil (on mud-banks); Cuming.

Of a dark shining horny-green, passing on the posterior side into chestnut, with the interior delicately purple-stained. The curious posteriorly contorted attenuation of this shell near the umboes renders it easily recognized.

### Species 19. (Mus. Cuming.)

**MYTILUS PALLIO-FUNCTATUM.** *Myt. testa elongato-flabelliformis, solidata, gibba, versus umbonem attenuato-rostrata, latere posterius late incurva; testae purpureo-nigra.*

**THE MANTLE-DOTTED MYTILUS.** Shell elongately fan-shaped, solid, gibbous, attenuately beaked towards the umboes, posterior side broadly incurved; deep purple-black.

*Dunker.* MS. in Mus. Cuming. 

*Hab.* California and Mazatlan.

This species is always so much eroded it is not possible to describe the sculpture. It appears however to be developed originally in fine radiating striae. Mr. Carpenter described it, in his Catalogue of the Reigen Collection in the British Museum, as being abundant at Mazatlan, and always similarly eroded.

# MYTILUS.

## PLATE VI.

### Species 20. (Mus. Cuming.)

**MYTILUS BOREALIS.** *Myt. testa oblonga, subconica, levigata, laevigata, levigata vel decessu striata, nivis subplacidae corrugata, umbonibus paucis diversatis; nitente olivaceo-nigrâ, ad umbones rugosâ.*

**THE NORTHERN MYTILUS.** Shell oblong-ovate, somewhat arched, thin, rather swollen, smooth or decessuately striated, faintly plicately wrinkled on the anterior side, umbones a little divaricated: shining olive-black, violet at the umboes.

LAMARCK, Anns. sans vert vol. viii. p. 46.  
Hab. Newfoundland.

A light, oval, swollen shell, of a dark shining olive-black colour, tinged with violet at the umboes, which are somewhat removed from each other.

### Species 21. (Mus. Cuming.)

**MYTILUS CHILOENSIS.** *Myt. testa oblonga, subglobiflava, levigata vel nivis decessu striata, latere postico recto, antico subdepresso, ad marginem rotundato-angulata; testa-alveolâ, versus marginem nitente-olivacea, et obscurè radiatum lineariter.*

**THE CHILOE MYTILUS.** Shell oblong, somewhat fan-shaped, smooth, or minutely decessuately striated, posterior side straight, anterior slightly depressed, roundly angled at the margin; yellowish-olive, towards the margin shining olive, and obscurely radiately lineated.

PHILIPPI, Dunker, MS. in Mus. Cuming.  
Hab. Island of Chiloe.

Of rather light substance, of a rich shining olive-colour, rayed with fine pencil lines.

### Species 22. (Mus. Cuming.)

**MYTILUS MAGELLANICUS.** *Myt. testa elongato-pyriformai,*

*compressuim, verset umbonis umbo attenuatus, longiora thanaxa subcarinata, costis costato-corrugatis et crenatis, intercostis proprie marginis obsoletis, intus violaceo-nigrâ.*

**THE MAGELLAN MYTILUS.** Shell elongately pear-shaped, rather compressed, arched and attenuated towards the umboes, longitudinally radiately ribbed, ribs wave-wrinkled and crenated, sometimes obsolete near the margin: deep violet-black.

CHEMNITZ, Conch. vol. viii. pl. 83 f. 7+2.  
Hab. Straits of Magellan.

A very characteristic flattened pear-shaped shell, of a violet-black colour, covered with waved, wrinkle-like, crenated ribs.

### Species 23. (Mus. Cuming.)

**MYTILUS PERTA.** *Myt. testa angusto-longata, crassiuscula, versus umbones gibba et posterius obtuse angulata, levigata vel decessu striata; violascens, versus marginem intus viridi.*

**THE PERTA MYTILUS.** Shell narrowly elongated, rather thick, gibbous and posteriorly obtusely angled towards the umboes, smooth or decessuately striated: violet, stained with dark green towards the margin.

*Mya Perna*, Linneaus, Syst. Nat. p. 1113.

*Mytilus elongatus*, Chemnitz.

Hab. Newfoundland.

Of a narrow elongated form and solid structure, gibbously obtusely angled towards the umboes on the posterior side.

### Fig. 24. (Mus. Cuming.)

A fine example in an early stage of growth of *Mytilus latus* represented at Pl. IV. Fig. 12. It is only in this state that a characteristic dark horny band descending posteriorly from the umboes is seen.

25.

37

28.

29

# M Y T I L U S.

## PLATE VII.

Species 25. (Mus. Cuming.)

**Mytilus crassus.** *Myt. testā elongato-flabelliformi, pos-  
ticē arenatā, latē gibbosō, undique radiatum undato-  
striatā, striis crenulatis; intensē rufo-purpureā.*

**THE THICK Mytilus.** Shell elongately fan-shaped, posteriorly arched, broadly gibbose, radiately wave-striated throughout, strie crenulated; deep reddish-purple.

*Septifer crassus*, Dunker.

*Hab.* —

A dark reddish-purple shell, wave-striated throughout, with a characteristic septum across the interior of the umbonal extremity of each valve, and which is regarded by authors as the type of a distinct genus, *Septifer*.

—  
Species 26. (Mus. Cuming.)

**Mytilus menkeanus.** *Myt. testā subtrigono-elongatā,  
solida, valde gibbosā, radiatum valdē corrugato-cos-  
tata, costis anticē divergentibus, areo posticē latā, de-  
pressā, creberriōne crenulato-liratā: nitente luteo-cas-  
tanā, intus intensē purpureā.*

**MENKE'S Mytilus.** Shell somewhat triangularly elongated, solid, very gibbose, radiately strongly wrinkle-ribbed, ribs diverging anteriorly, posterior area broad, depressed, very closely crenulately ridged; shining yellowish-ochreous, deep purple in the interior.

*Philippi*, Dunker, MS. in Mus. Cuming.

*Hab.* New Holland.

The sculpture is curiously developed, on the same plan, but in three different degrees. The posterior, anterior, and middle areas present a striking contrast.

Fig. 27. (Mus. Cuming.)

This shell, here figured and which Mr. Cuming possesses

as representing *Mytilus pictus*, Born, is identical with *M. Afer*, Gmelin, described at Plate II.

Species 28. (Mus. Cuming.)

**Mytilus smaragdinus.** *Myt. testā elongato-oblongā,  
convexā, margine anticō declivi-angulatā, levigatā enti-  
decurrentiā striatā, latere postico subrecto, medio leviter  
arcuato; nigro-olivaceā, versus marginem vireōe sma-  
ragdinae.*

**THE BRIGHT-GREEN Mytilus.** Shell elongately oblong, convex, slopingly angled at the anterior margin, smooth or decussately striated, posterior side nearly straight, slightly arched in the middle: very dark olive, bright-green towards the margin.

*Chennitz*, Conch. Cab. vol. viii. pl. 83. f. 745.

*Mytilus opalinus*, Lamarck.

*Hab.* Borneo.

This well-known species, in an advanced stage of growth, with the epidermis more or less worn off or eroded, shows a pearly structure, and is in this state the *M. opalinus* of Lamarck.

Species 29. (Mus. Cuming.)

**Mytilus grunerianus.** *Myt. testā elongato-flabelliformi,  
posticē latē gibbosā, subrectā, anticē ad marginem de-  
clivi-ornatalā, levigatā, nitente, concentricē corrugato-  
striatā; intescent-spadiceā, ad marginem purpureo-  
nigrā, intus ptumbeo-carnulatā.*

**GRUNER'S Mytilus.** Shell elongately fan-shaped, posteriorly broadly gibbose, nearly straight, anteriorly slopingly arched at the margin, smooth, shining, concentrically wrinkle-striated; yellowish-fawn, purple-black at the margin, lead-blue in the interior.

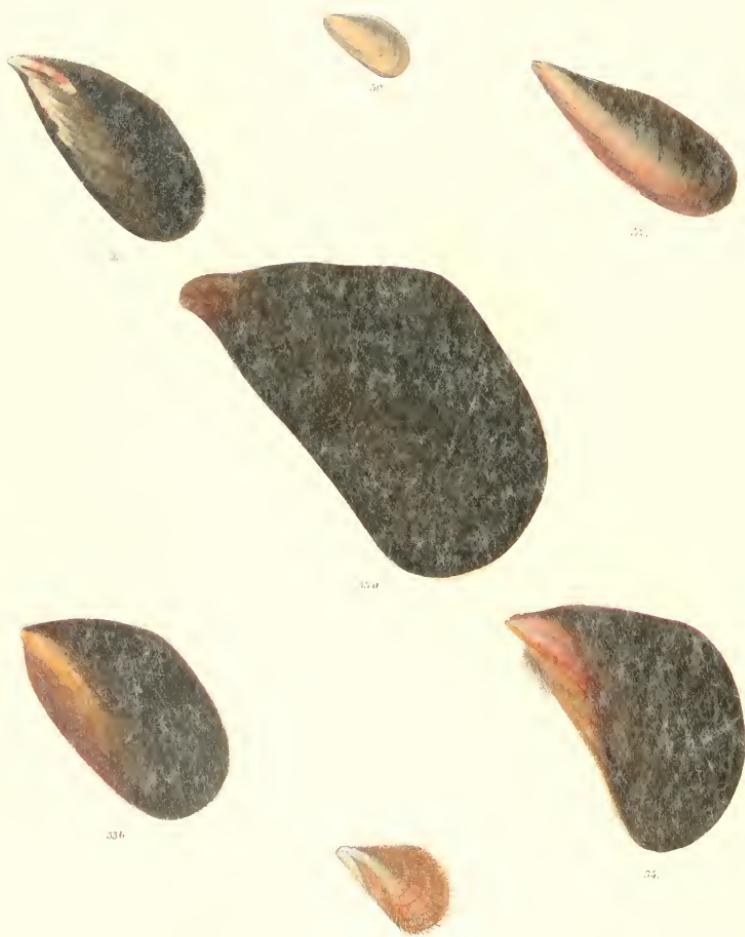

*Dunker*, MS. in Mus. Cuming.

*Hab.* Iceland.

A fine new species, of a peculiar yellowish-fawn-colour, richly coloured towards the margin with purple-black, while the interior is of a dull leaden-blue.

# M Y T I L U S.

## PLATE VIII.

Species 30. (Mus. Cuming.)

**MYTILUS OBSCURUS.** *Myt. testa subquadrato-oblonga, convexa, postice band impressa, concentricè striata; albida, sordida olivacea aut rufescens tincta.*

**THE OBSCURE MYTILUS.** Shell somewhat squarely oblong, convex, not impressed on the posterior side, concentrically striated; whitish, tinged with dull olive or green.

DUNKER, Pro. Zool. Soc. 1856, p. 360.

*Hab.* Sydney.

Distinguished by an even convex growth, not impressed, as is commonly the case in this genus, on the posterior side.

Species 31. (Mus. Cuming.)

**MYTILUS OBESUS.** *Myt. testa elongato-ovata, solidula, versus umbones subangulato-attenuata, rossostra, levigata, plus minus rufè erosa, obscurè divaricatum pliata; intus porporo-erat.*

**THE STOUT MYTILUS.** Shell elongately ovate, rather solid, somewhat angularly attenuated towards the umboes, beaked, smooth, more or less roughly eroded, obscurely divaricately plicated; deep purple-black.

DUNKER, MS. Mus. Cuming.

*Hab.* Van Diemen's Land; R. C. Gunn.

A shell of solid structure and rough purple-black surface obscurely divaricately waved with rude folds.

Species 32. (Mus. Cuming.)

**MYTILUS GRACILIS.** *Myt. testa angustè elongata, tenui, versus umbones attenuatae producta, postice vix impressa, concentrica densè striata; albida, epidermide cornuta olivacea et intus carunculo-viridi induta.*

**THE SLENDER MYTILUS.** Shell narrowly elongated, thin, attenuately produced towards the umboes, posteriorly but little impressed, concentrically densely striated; whitish, covered with an olive and dark blue-green epidermis.

*Hab.* Mexico.

Distinguished in a conspicuous degree by its narrowly elongated form.

Species 33. (Fig. a, b, Mus. Cuming.)

**MYTILUS EDULIS.** *Myt. testa obliquè trigonæ, concentrica striata, cordelevante-nigræ, vel olivaceæ nigro-radiatæ, postice subcompressæ, antice arcuatum impressæ.*

**THE EDIBLE MYTILUS.** Shell obliquely triangular, concentrically striated, blue-black or olive, rayed with black, rather compressed posteriorly, anteriorly arcuately impressed.

**LINNEUS.** Syst. Nat. (12th edit.) p. 1157.

*Mytilus pellucidus*, Pennant.

*Mytilus incurvatus*, Pennant.

*Mytilus vulgaris*, Da Costa.

*Mytilus flaves*, Poli.

*Mytilus sagittatus*, Poli.

*Mytilus abbreviatus*, Lamarck.

*Mytilus retusus*, Lamarck.

*Mytilus hesperianus*, Lamarck.

*Mytilus diabolus*, Gray.

*Mytilus subsazatilis*, Williamson.

*Hab.* North Atlantic shores.

The numerous synonyms annexed to this well-known species, evidence in a striking degree the many variations it assumes under different circumstances of habitation.

Fig. 34. (Mus. Cuming.)

This fine shell proves to be a dark full-grown variety of *M. lotus*, represented at Plate IV.

Species 35. (Mus. Cuming.)

**MYTILUS PILOSUS.** *Myt. testa latè trigonæ, versus umbones calde gibbosæ, postice concavo-impressæ, undique fortiter liratæ, liris granulato-serratis; lateo-olivaceæ, sparsim pilosæ.*

**THE HAIRY MYTILUS.** Shell broadly triangular, very gibbous towards the umboes, posteriorly concavely impressed, everywhere strongly ridged, ridges granularly serrated, yellowish-olive, sparingly hairy.

RECLUZ, MS. in Mus. Cuming.

*Hab.* —?

A broadly triangular shell, very gibbous and contracted towards the umboes, the surface being densely serrately ridged throughout, covered with a yellowish-olive horny epidermis, bearded with rather distant bristly hairs

# M Y T I L U S.

## PLATE IX.

### Species 36. (Mus. Cuming.)

**Mytilus angustanus.** *Myt. testā angustē oblongā, gibbosaustrā, umbobios subconcreta, transversis, margaritaceis, levibus, extremitate concentricè striatā, fulvo-fusca, rotundata.*

**THE NARROW Mytilus.** Shell narrowly oblong, rather gibbous, umboes somewhat contracted, swollen pearly, smooth, extremity concentrically striated, fulvous-brown, rounded.

*Hab.* Auim. sans vert. vol. vii. p. 46.  
*Hab.* Valparaiso.

Distinguished by its narrow prolonged growth, partaking somewhat of *M. edulis* in form.

### Species 37. (Mus. Cuming.)

**Mytilus tenuistriatus.** *Myt. testā trigono-oblongā, subcurvata, posticō gibbosā, antīcē compressē angulatā, radiatum densē striatā, striis medio plus minus obsoletis; olivaceo-fusca, circa umbones cibā, purpurascente linea.*

**THE PINELY-STRIATED Mytilus.** Shell triangularly oblong, rather curved, posteriorly gibbous, anteriorly compressly angled, radiately densely striated, striae more or less obsolete in the middle; olive-brown, white, tinged with purple around the umboes.

*DUNKER,* MS. Mus. Cuming.  
*Hab.* —

A shell of light substance, purple-brown in colour, closely rayed with striae, which commence on the umboes, and then become obsolete, reappearing more strongly developed at the margin.

### Species 38. (Mus. Cuming.)

**Mytilus Morrisii.** *Myt. testā angustē curvatā, versus umbones gibbosā, posticō peculiariter concavā, undique radiata sulcata, liris angustis, hic illuc bifurcatis; caruleo-nigrā.*

**MORRIS'S Mytilus.** Shell narrowly curved, gibbous towards the umboes, posteriorly peculiarly concave, everywhere radiately grooved, ridges narrow, here and there bifurcated; blue-black.

*DUNKER,* Pro. Zool. Soc. 1856, p. 360.  
*Hab.* Guinea.

A narrow, peculiarly curved shell, bifurcately grooved and ridged after the manner of *M. Nicobaricus*.

### Species 39. (Mus. Cuming.)

**Mytilus Gallo-Provincialis.** *Myt. testā oblongā, posticō subdepressā, gibbosā, antīcē compressē dilatata, undique lirē, caruleo-nigrā, nimbata.*

**THE PROVENCE Mytilus.** Shell oblong, posteriorly rather depressed, gibbous, anteriorly compressly dilated, everywhere smooth, shining, blue-black.

*LAMARCK,* Animal. sans vert. vol. vii. p. 46.  
*Hab.* Shores of Provence, Mediterranean.

This species may be nothing more than a local modification of *M. edulis*; it is, however, peculiarly compressly dilated on the anterior side.

### Fig. 40. (Mus. Cuming.)

The shell here represented, *Mytilus Kraussii*, Kuster, is a characteristic orange-red variety of *M. Nicobaricus*, of which species the dark bronze-green state, described and figured at Sp. 42, is the type.

### Species 41. (Mus. Cuming.)

**Mytilus bifurcatus.** *Myt. testā trigono-ovatā, posticē depresso, valdī gibbosā, undique latē conspicuā sulcata, sulcis hic illuc bifurcatis, liris obtuse granulatis; intēse caruleo-nigrā.*

**THE BIFURCATED Mytilus.** Shell triangularly ovate, posteriorly depressed, very gibbous, everywhere conspicuously grooved, grooves here and there bifurcated, ridges obtusely granulated; deep blue-black.

*CONRAD,* Journ. Acad. Nat. Sci. Philadelphia, vol. vii. pl. 241.

A very strongly grooved species, of a dark indigo blue-black colour.

### Species 42. (Mus. Cuming.)

**Mytilus Nicobaricus.** *Myt. testā subquadrato-oblongā, crassissimā, posticē latē concavo-depresso, calde gibbosā, ad umboes rostratā, antīcē flexuoso-compressā, undique densē sulcata, liris granulato-serratis, hic illuc bifurcatis; intēse caruleo-viridi.*

**THE NICOBAR Mytilus.** Shell somewhat squarely oblong, rather thick, posteriorly broadly concavely depressed, very gibbous, beaked at the umboes, anteriorly flexuously compressed, everywhere densely grooved, the ridges being granulately serrated, and here and there bifurcated; deep blue-green.

*CHEMINTZ,* Conch. Cab. vol. viii. p. 155-157. pl. 82. f. 736 a, b, and 737 nos. 2 and 3.

*Mytilus bicolorialis,* Lamarck.

*Tichogonia bilobularis,* Wiegman.

*Septif' r bicolorialis,* Dunker.

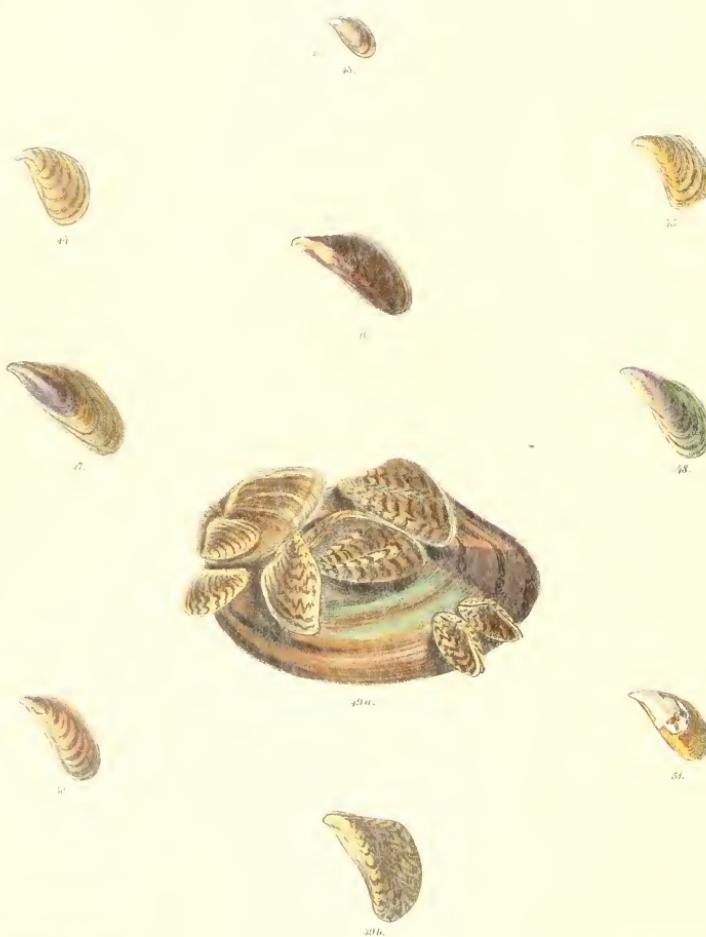

*Hab.* Eastern Archipelago,

A characteristic densely-grooved species, of dark bronze-green colour, charmed within the umboes.

*Mytilus*, Pl. I.

# M Y T I L U S.

## PLATE X.

### Species 13. (Mus. Cuming.)

**MYTILUS AFRICANUS.** *Myt. testa trigonoglobulata, dorsum concavum, concentrica striata; umbilicus rotundus.*  
**THE AMERICAN MYTILUS.** Shell triangularly acute, thin, convex, concentrically striated; white, somewhat silky.

*Dreissena Americana*, Recluz, Mus. in Mus. Cuming.  
*Hab.* Florida.

A delicate silvery olive shell of thin substance, rather convex.

### Species 14. (Mus. Cuming.)

**MYTILUS SALLEI.** *Myt. testa trigonoglobulata, operculo posterior impressa, umbilicus rotundus, marginis fuscescens, striatus nigritus, venae concentricae punctatae.*

**SALLE'S MYTILUS.** Shell triangularly fan-shaped, curved, posteriorly impressed, umbos sharply rounded; pale dirty-brown, concentrically painted with distant blackish streaks.

*Dreissena Sallei*, Recluz, Revue de Zool. 1849, p. 69;  
*Journ. de Conch.* vol. iii. p. 255, pl. 10, f. 9.  
*Hab.* Central America.

With a curiously curved fan-shape, impressively nipped behind the umboes in a manner to render them sharply beaked.

### Species 45. (Mus. Cuming.)

**MYTILUS ROSSMSSLERI.** *Myt. testa trigonoglobulata, subconcentrica solidi oscula, postice late impressa, gibbosa; alba, epidermide levius fuscescens concentrica florata.*

**ROSSMSSLER'S MYTILUS.** Shell triangularly fan-shaped, somewhat curved, rather solid, posteriorly broadly impressed, gibbous; whitish, concentrically flaked with a thin light-brown epidermis.

*Dreissena Rossmssleri*, Dunker, MS. in Mus. Cuming.  
*Hab.* United States.

Chiefly distinguished by its broadly impressed gibbous growth on the posterior side, and characteristic epidermis, which consists only of thin concentric flukes.

### Species 16. (Mus. Cuming.)

**MYTILUS VENERIFORMIS.** *Myt. testa elongata, rotundata, gibba, triseriata, postice impressa, operculo rotundato, concentrica striata; alba, concentrica striata; operculo nigritus, umbilicus rotundus.*

**THE DARK MYTILUS.** Shell elongated, posteriorly very gibbous, very broad, flatly impressed, sharp at the angle; bluish-white, concentrically streaked with black, covered with an olive-black fibrous epidermis.

*Dreissena Cumingiana* Recluz, MS. in Mus. Cuming.  
*Hab.* Mississippi.

Of elongated form, remarkably gibbous, and broadly flatly impressed on the posterior side.

### Species 17. (Mus. Cuming.)

**MYTILUS AFRICANUS.** *Myt. testa subelongata, postice obscurata, sordidus fuscus, epidermide florosa concentrica undulata.*

**TILL AFRICAN MYTILUS.** Shell rather elongated, posteriorly scarcely impressed; dirty-brown, concentrically invested with a fibrous epidermis.

*Dreissena Africana*, Vanbeneden, Ann. de Sci. Nat. 1835.  
*Hab.* Senegal.

The peculiarity of this species consists in its simple convexly elongated form, the posterior side showing scarcely any of the depression commonly typical of the *Dreissena* group.

### Species 48. (Mus. Cuming.)

**MYTILUS DOMINGENSIS.** *Myt. testa conata, sollempnata, versus aperturam attenuata et costata posteri; somma pressa; purpureofuscus, subrotundata concentrica striae.*

**THE DOMINGO MYTILUS.** Shell elongated, slightly curved, attenuated and beaked towards the umboes, faintly impressed posteriorly; purple-brown, somewhat rudely concentrically striated.

*Dreissena Domingensis*, Recluz, Journ. de Conch. vol. vii. p. 255, pl. 10, f. 8.

*Hab.* St. Domingo, Sal.

Characterized by a peculiar attenuately beaked configuration in the direction of the pubescence.

MYTILUS.—PLATE X.

Species 49. (Mus. Cuming.)

MYTILUS POLYMORPHUS. *Myt. testa trigono-trapezoidea*,  
posticè valde gibbosæ, latissimè concavo-impressa, ad  
angulum acutæ, concentricè striatæ; lateræ, striis  
acutæ undatis olivaceis concentricè variegatæ.

THE MANY-SHAPED MYTILUS. Shell triangularly trapezoid,  
posteriorly very gibbous, very broadly concavely  
impressed, sharp at the angle, concentrically striated;  
yellow, concentrically variegated with zigzag olive  
streaks.

PALLAS, IT. RUSS. VOL. I. p. 478; CHEM. CONCH. CAB.  
VOL. XI. p. 256. PL. 205, PL. 202S.

*Mytilus Hagenii*, De Baer.

*Mytilus area*, Kickx.

*Dreissena polymorpha*, Van Beneden.

Hab. Rivers of Northern Europe.

This well-known species is distinguished from all others  
of the *Dreissena* group by its extreme trapezoidal form  
and variegated painting.

Species 50. (Mus. Cuming.)

MYTILUS COCHLEATUS. *Myt. testa elongato-oblonga*, an-

ticè subangulatæ, posticè impressa, concentricè striatæ  
sordide fuscenscente, purpureo concentricè strigata.

THE SPOON-SHAPED MYTILUS. Shell elongately oblong,  
anteriorly slightly angled, posteriorly impressed, con-  
centrically striated; dirty light-brown, concentrically  
streaked with purple.

*Dreissena cochleata*, Kickx, Dunker, MS. in Mus. Cuming.  
Hab. ——?

Of a rather oblong-produced form, streaked with a  
characteristic pattern of concentric purple bands.

Species 51. (Mus. Cuming.)

MYTILUS MORCHIANUS. *Myt. testa trigonæ, subcurvatæ*,  
posticè subimpressa, umboñibus rostratis; eroso-albæ,  
epidermide intescente fibrosa pertim indutæ.

MORCHI'S MYTILUS. Shell triangular, slightly curved,  
posteriorly faintly impressed, umboes beaked; eroded  
white, partially covered with a yellowish fibrous epi-  
dermis.

*Dreissena Morchiana*, Dunker.

Hab. Island of St. Thomas, West Indies.

Of paler substance than usual in the *Dreissena* group,  
more or less invested with a yellowish fibrous epidermis

## PLATE XI.

### Species 52. (Mus. Cuming.)

**Mytilus Cumingsianus.** *Myt. testâ trigono-flabellatâ, valde gibbosâ, posticâ latè subconcavo-impressâ, undique radiatum densè granoso-liratâ, lîris versus marginem plus minus dichotomis; pellucido-lutescente, rufo et vivido virescent variegatâ.*

CUMING'S MYTILUS. Shell triangularly fan-shaped, very gibbose, posteriorly broadly somewhat concavely impressed, radiately densely granosely ridged throughout, ridges more or less dichotomous towards the margin; transparent-yellow, variegated with red and bright-green.

Hab. Panama.  
Hab. Panama.

A convex gibbously-compressed shell, prettily variegated with red or bright-green upon a light semitransparent ground.

### Species 53. (Mus. Cuming.)

**Mytilus curvatus.** *Myt. testâ subtrigoniâ, solidatâ, valde arcuâtâ, posticâ peculiariter impressâ, umboibus subrostratis; fuscocornéa, costulis dichotomis radiatâ.*

THE CURVED MYTILUS. Shell somewhat triangular, rather solid, very much arched, posteriorly peculiarly impressed, umboes rather beaked; brownish-horny, rayed with fine dichotomous ribs.

DUNKER, Pro. Zool. Soc. 1856.  
Hab. Island of Luzon, Philippines; Cuming.

A short curved shell, curiously compressed, or pinched, as it were, beneath the umboes in the vicinity of the byssal orifice.

### Species 54. (Mus. Cuming.)

**Mytilus Lavallleanus.** *Myt. testâ oblongâ, Modioliformis, valde gibbosâ et tumida, latere posticâ subtus impressâ, radiatum obsoletâ sulcato; castaneo-fusco.*

LAVALLE'S MYTILUS. Shell oblong, *Modiola*-shaped, very gibbose and swollen, posterior side impressed beneath, radiately obsoletely grooved: chestnut-brown.

D'ORRIGNY, Moll. de Cuba.  
Hab. Cuba.

A short, swollen, gibbose species, partaking very much of the character of *Modiola*.

### Species 55. (Mus. Cuming.)

**Mytilus Adamsianus.** *Myt. testâ ovoato-trigonâ, valde gibbosâ, posticâ plano-compressa, ad umbones attenuato-rostratâ, anticâ flabellatâ, undique nitide flexuoso-costellatâ, costellis granulato-serratis, versus marginem dichotomis; of vacâ, nigro tinctâ.*

ADAMS'S MYTILUS. Shell ovately triangular, very gibbose, posteriorly flatly compressed, attenuately beaked at the umboes, fan-shaped anteriorly, everywhere neatly flexuously ribbed, ribs granularly serrated dichotomous towards the margin; olive, tinged with black.

DUNKER, Pro. Zool. Soc. 1856, p. 360.  
Hab. Panama; Cuming.

A very pretty species, rayed throughout with finely serrated flexuous dichotomous ripples.

### Species 56. (Mus. Cuming.)

**Mytilus minimus.** *Myt. testâ trigono-oblongâ, posticâ gibbosâ et concavo-impressâ, utrinque subacute angulatâ, densè concentricâ striatâ; albidâ, fuscopurpureo tinctâ.*

THE VERY SMALL MYTILUS. Shell triangularly oblong, posteriorly gibbose and concavely impressed, rather sharply angled on each side, densely concentrically striated; whitish, stained with fuscous-purple.

POLI, Test. utr. Sicil. vol. ii. pl. 32, f. 1.  
Hab. Mediterranean.

An unusually sharply-angled species, densely concentrically striated, and darkly stained with fuscous-purple.

### Species 57. (Mus. Cuming.)

**Mytilus cubitus.** *Myt. testâ trigono-oblongâ, subcurvatâ, posticâ obtuse gibbosâ, impressâ, radiante granoso-liratâ; olivaceo-latae.*

THE COCCI MYTILUS. Shell triangularly oblong, somewhat curved, posteriorly obtusely gibbose, impressed, radiately granularly ridged; olive-yellow.

SAY, Journ. Acad. Nat. Sci. Philadelphia, vol. ii. p. 263.

*Hab.* — ♀

Of simple, rather gibbous form, granularly ridged throughout.

Species 58. (Mus. Cuming.)

**Mytilus Charpentieri.** *Myt. testā oblongā, posticē gibbosissimā, posticē concavo-impressā et oblongā undulatā, undique dense flexuoso-irata; fuscō-tinctā.*

**Charpentier's Mytilus.** Shell oblong, peculiarly very gibbous, posteriorly concavely impressed and obtusely angled, densely flexuously ridged throughout; fuscous-yellow.

DUNKEE, MS. in Mus. Cuming. 1855  
*Hab.* Guinea.

A densely-ridged fuscous-yellow species, remarkable for its extremely gibbous growth.

Species 59. (Mus. Cuming.)

**Mytilus ustulatus.** *Myt. testā angustē oblongā, gibbosā, posticē impressā, versus umbones subattenuatā, radiatum iratā, liris subdistantiis, flexuosis; albida; nigricante-fusco tinctā.*

**The scorched Mytilus.** Shell narrowly oblong, gibbous, posteriorly impressed, rather attenuated towards the umboes, radially ridged, ridges rather distant, flexuous; whitish, stained with blackish-brown.

LAMARCK, Añim. sans vert. vol. vii. p. 40.  
*Hab.* Borneo.

Of rather narrow constricted growth, rayed with flexuous edges, which are rather more than commonly distant.

Species 60. (Mus. Cuming.)

**Mytilus glomeratus.** *Myt. testā oblongo-oratā, subobliquā, concentricā rodē rugosā; intensē carneo-nigrā*

**The grouped Mytilus.** Shell oblong-ovate, rather oblique, concentrically rudely wrinkled; deep blue-black.

GOULD, MS. in Mus. Cuming. 1851  
*Hab.* — ♀

Named *glomeratus* from its habit of attaching itself in such dense clusters.

Species 61. (Mus. Cuming.)

**Mytilus granulatus.** *Myt. testā oblongā, gibbosissimā, posticē concavo-impressā, radiatum iratā, liris conspicue granulatis; olivaceo-tutea.*

**The granulated Mytilus.** Shell oblong, very gibbous, posteriorly concavely impressed, radially ridged, ridges conspicuously granulated; olive-yellow.

HANLEY, Recent Bivalve Shells, p. 246.  
*Hab.* South America.

This shell partakes so much of the form and colour of *M. Charpentieri*, that it would seem to be a variety of that species. It is however remarkable for its very defined granulated sculpture.

MONOGRAPH  
OF THE GENUS  
M O D I O L A.

"Fame is the spur that the clear spirit doth raise  
(That last infirmity of noble minds)  
To scorn delights, and live laborious days." — *Milton*

# M O D I O L A.

## PLATE I.

### Genus MODIOLA, Lamarck.

*Testa oblonga, aequivalvis, plus minus centrica, umbonibus paries, tumidinsculis, hand terminalibus, latere antico sepe expanso, postico arcuato contracto. Cordo linearis, ligamento marginali, subinterno. Impressio muscularis composita, sublateralis.*

Shell oblong, equivalve, more or less ventricose, with the umbones small, rather swollen, not terminal, anterior side often expanded, posterior arched, contracted. Hinge linear, with the ligament marginal and partially internal. Muscular impression compound, sublateral.

The typical distinction between *Mytilus* and *Modiola* consists in the latter having a lighter and more cylindrically oblong shell, with the umbones rounder and not terminal, in consequence of the posterior extremity of the shell protruding beyond them. This generic form is, however, subject to more decided variation than *Mytilus*, and excellent subdivisions have been established under the names *Modiolacea*, *Crenella* or *Lanistina*.

*Modiola* is somewhat more numerous in species than *Mytilus*, omitting even the *Litobdomi*, which form an extremely characteristic group, and they are often beautifully painted while less sculptured. Their range of habitation is equally widely spread.

### Species 1. (Mus. Cuming.)

*MODIOLA PHILIPPINAREM.* *Mod. testa oblongo-trapeziformi, ventricosa, anticè subexpansa, concentricè dense fibro-striata; pallide castanea, latero-radiata.*

THE PHILIPPINE MODIOLA. Shell oblong-trapeziform, ventricose, anteriorly somewhat expanded, concentrically densely thread-striated: light-chestnut, yellow-rayed.

HANLEY, Recent Bivalve Shells, p. 235.  
Hab. Philippine Islands.

This interesting species, from the Philippine Islands, has very much the typical form of the European *M. mo-*

*diolus*. It is ~~only~~ ornamented throughout with raised thread-like striae, but they exist apparently only in the epidermis.

### Species 2. (Mus. Cuming.)

*MODIOLA MODIOLUS.* *Mod. testa oblonga, subtrapeziformi, versus umbones ventricosa, laxigatia vel obsoletè corrugato-striata; intensè castanea.*

THE BUSHEL MODIOLA. Shell oblong, somewhat trapeziform, ventricose towards the umbones, smooth or obsoletely wrinkle-striated; dark-chestnut.

*Mytilus modiolus*, Linnaeus, Syst. Nat. p. 1158.

*Mytilus umbilicatus*, Pennant.

*Mytilus certus*, Pennant.

*Mytilus curvirostratus*, Da Costa.

*Modiola Papuana*, Lamarck.

*Modiola modiolus*, Turton.

*Modiola vulgaris*, Fleming.

Hab. North Atlantic shores of Europe and America.

This, the largest species of the genus, well known on our own shores, is common throughout the whole of Northern Europe and America.

### Species 3. (Mus. Cuming.)

*MODIOLA VAGINA.* *Mod. testa cylindraceo-oblonga, recta, levata, subdepresso, concentricè dense subtilissime striata; radiatum linearè-striata et obsoletè undato-corrugata; nitente-castanea.*

THE SHEATH MODIOLA. Shell cylindrically oblong, straight, thin, rather depressed, concentrically densely very finely striated, radiately linearly striated and obsoletely wave-wrinkled: shining-chestnut.

LAMARCK, Ann. sans. vert. vol. vii. p. 22.

*Mytilus arcarius*, Rumphius?

Hab. Philippine Islands; Cuming.

A peculiarly straight, cylindrically oblong species, of slight substance, with a delicate silky surface of a shining-chestnut colour.

7.

8.

6.

5.

## MODIOLA.

### PLATE II.

#### Species 4. (Mus. Cuming.)

MODIOLA ELONGATA. *Mod. testā elongato-trapeziformi, subangustā, tenui, latere postico subimpresso-arcuato, antico carinato-producto; nictante-castaneā, olivaceo-fusco tinctā, undique concentricā striatā.*

THE ELONGATED MODIOLA. Shell elongately trapeziform, rather narrow, thin, posterior side rather impressly arched, anterior produced into a compressed keel; shining chestnut, stained with olive-yellow, concentrically striated throughout.

SWAINSON, Exotic Conchology, Second Edition, p. 31, f. 8.  
Hab. Moluccas.

A delicate glossy fulvous-chestnut shell of light substance, elegantly produced in form.

---

#### Fig. 5. (Mus. Cuming.)

This fine shell proves on examination to be a specimen of very advanced growth of *M. tulipa*, described at Pl. IV.

---

#### Species 6. (Mus. Cuming.)

MODIOLA NITIDA. *Mod. testā elongato-oblongā, subcurvata, tenuicula, tenui, concentricā striatā, nictante-castaneā, fulvo tinctā, latere postico recto, antico versus extremitatem subfusiformi.*

THE SHINING MODIOLA. Shell elongately oblong, some-

what curved, rather thin, swollen, concentrically striated, shining-chestnut, fulvous-tinged, posterior side straight, anterior a little fan-shaped towards the extremity.

Hab. Port Essington, New Holland.

This pretty glossy species resembles *M. elongata*, but more foreshortened, with the anterior side less produced into a keel.

---

#### Species 7. (Mus. Cuming.)

MODIOLA ALBICOSTA. *Mod. testā subtrigono-oblongā, solidincola, valde tumida, latere postico subimpresso-arcuato, antico superne producto, quasi alato; intenso castaneā, obscurè fulvo-radiatā.*

THE WHITE-RIBBED MODIOLA. Shell somewhat triangularly oblong, rather solid, very much swollen, posterior side rather impressly arched, anterior side produced at the upper part, as if winged; dark-chestnut, obscurely fulvous-rayed.

LAMARCK, Anim. sans vert. vol. vii. p. 19.  
Hab. Tasmania.

We are indebted to the beautiful work of M. Delessert for being able to identify this species. The character which suggested to Lamarck the name "white-ribbed" arose apparently from the epidermis being worn off the prominent central ridge of the shell.

## M O D I O L A .

PLATE III.

**Species 8. (Mus. Cuming.)**

**MODIOLA PECTINATA.** *Mod. testā subtriangulo-oblongā, posticā impressā, antice longititudinē litoris producta, lobulatim dilatata, undique densè subcavata, liris, intercostulis subplanatis, castaneo-nigrā, olivaceo-intervallis.*

**THE PECTINATED MODIOLA.** Shell somewhat triangularly oblong, posteriorly impressively curved, anteriorly longitudinally produced and fan-like dilated, everywhere closely grooved, the intermediate ridges being rather low, chestnut-black, tinged with olive-yellow

JAMARK, Anim. sans vert. vol. vii. p. 22.

*Mytilus demissus*, Dillwyn.

*Mytilus plicatus*, Deshayes

U. S. N. M., United States.

An oblong gibbose species, closely sculptured throughout with flattened ridges, excavately grooved in the interridges.

**Species 9. (Fig. 9 and 10, Mus. Cuming.)**

**MODIOLA BARBATA.** *Mod. testā trigono-fibelliformi, subdepressā, concentricā nitide filo-striatā, niveo castanē, pilis setaceis versus marginem densè barbatā.*

**THE BEARDED MODIOLA.** Shell triangularly fan-shaped, rather compressed, concentrically neatly thread-striated, bright chestnut, densely bearded towards the margin with bristly hairs.

LAMARCK, ABBE, sans vert. vol. viii. p. 22

*Mytilus barbatus*, Liucanus.

*Mytilus modiolus*, Brooks.

*Hab.* Seas of Europe.

A fan-shaped compressed species, partaking very much of the character of *Mytilus*, densely covered with a stiffly bearded

**Species 11. (Mus. Cuming.)**

**MODIOLA CAPAX.** *Mod. testā oblongā, subarcuatā, posticā latè impressā, valde gibbosā, antice declici-compressā, margine superne obtuse angulato; intencē castanē, versus marginem pilis setaceis sparsim barbatā.*

**THE SPACIOUS MODIOLA.** Shell oblong, slightly arched, posteriorly broadly impressed, very gibbose, anteriorly slopingly compressed, margin obtusely angled towards the upper part; dark chestnut, sparingly bearded towards the margin with bristly hairs.

CONRAD, Journ. Acad. Nat. Sci. Philadelphia, vol. vii. p. 242.

*Hab.* Galapagos Islands, Cuming. California, Nuttall. Mazatlan, Carpenter.

This chiefly differs from the preceding species in having more the typical form of the genus, more oblong and gibbose, with the anterior margin more slopingly produced. It appears also to be less densely bearded.

17

21

22

23

Grönblad, 1880

# MODIOLA.

## PLATE IV.

### Species 12 (Mus. Cuming.)

**Modiola arata.** *Mod. testa cylindraceo-oblonga, subangustata, rotundato-gibbosa, tenuicula, fulvo-castanea, angue utile concentrica flo-striata, latere postico contracto, antico carinato-producto, ad extremitatem decolor-angulata.*

**The TERRIFIED MODIOLA.** Shell cylindrically oblong rather narrow, rotundately gibbous, rather thin, fulvous-chestnut, neatly concentrically thread-striated throughout, posterior side contracted, anterior produced into a keel which is slopingly angled at the extremity.

*Hab.* MS. in Mus. Cuming

*Hab.* North Australia.

This interesting species is characterized by the horny epidermis, forming a beautiful concentric series of raised stripes.

### Species 13. (Fig. 13 and 14, Mus. Cuming.)

**Modiola trailli.** *Mod. testa oblongo-flabelliformis, subcylindrica, rotundata, latero postico plano-impresso, latere subangusta, subnigra, antice decolor-compresso, interdum crenata, angulo-angulo-producta, viride castana.*

**TEAILL'S MODIOLA.** Shell oblong fan-shaped, rather roughly concentrically striated, posterior side flatly impressed, very gibbous, anterior side slopingly compressed, sometimes angularly produced at the margin; bright chestnut.

*Hab.* Malacca; Dr. Traill.

Remarkable for the very gibbous development of the posterior side of the shell.

### Species 15. (Mus. Cuming.)

**Modiola tulipa.** *Mod. testa longa, tenuicula, ventricosa, latero-postico subcontracta, antice decolor-producto, undique subtusissima concentrica striata; aurantio-lutea rufo-viridis; plus minus radiata.*

**THE TULIP MODIOLA.** Shell oblong, rather thin, ventricose, posterior side somewhat contracted, anterior slopingly produced, everywhere very finely concentrically striated; orange-yellow, more or less rayed with reddish-chestnut.

*LAMARCK, Anim. sans vert. vol. vii., p. 18.*

*Hab.* West Indies.

Generally distinguished by its prettily-rayed painting,

which, however, as in the specimen figured at Pl. II. Fig. 5, becomes more obscure with age.

### Species 16. (Fig. a b, Mus. Cuming.)

**Modiola metcalfei.** *Mod. testa subtriangularis-oblonga, angustata, ventricosa, levigata ant subtusissima striata, latero postico recto, paulo contracto, antice in alveo compressum angulato-producto; luteo-castanea, fascia carmineo-purpurascens ab umbone radiatim descendente; interdum epidermide pilosa versus marginem induta.*

**METCALFE'S MODIOLA.** Shell somewhat triangularly oblong, narrow, ventricose, smooth or very finely striated, posterior side straight, a little contracted, anterior angularly produced into a compressed wing; yellowish-chestnut, with a bluish-purple band, radiately descending from the umbo; sometimes covered towards the margin with a hairy epidermis.

*HANLEY, Pro. Zool. Soc., 1844; Cat. Recent Bivalve Shells, p. 235.*

*Hab.* Philippine Islands; Cuming.

The elegant keel-winged form of this shell is peculiar, but its chief characteristic is the presence of a conspicuous broad purple band, radiating from each umbo.

### Species 17. (Mus. Cuming.)

**Modiola brasiliensis.** *Mod. testa trigono-flabelliformis, latero postico subcontracta, levigata vel subtusissima striata, antice caruata, deinde late dilatata, et concentrica flo-striata; area postica fulvo-castanea, antice viride aergineo-viridi, punctis et lineis flexuosis minutis levigata.*

**THE BRAZILIAN MODIOLA.** Shell triangularly fan-shaped, posterior side somewhat contracted, smooth or very finely striated, anterior keeled, then broadly dilated, and concentrically thread-striated; posterior area fulvous-chestnut, anterior bright metallic-green, freckled with dots and minute flexuous lines.

*CHEMNITZ, Conch. Cab. vol. ii. pl. 205. f. 2020 and 2021.*  
*Modiola Guyanensis, Lamarck.*

*Modiola semifusca, Sowerby.*

*Hab.* Brazil.

This very pretty species may be readily distinguished by its striking contrast of colour, the posterior area being a glossy fulvous-chestnut, almost smooth, while the posterior is a bright pale metallic-green, with the striae raised in thread-like ridges.

18.

19.

20.

21.

22.

23.

24.

# M O D I O L A .

## PLATE V.

Species 18. (Mus. Cuming.)

**MODIOLA UNDULATA.** *Mod. testā oblongā, gibbosā, tenui,  
latere postico rotundato, antico subfibrilliformi, medio  
obtuse angulatū, ad angulum subobscenū plicato-corrugatū, latere ventrī fuscā, virentē.*

**THE WAVED MODIOLA.** Shell oblong, gibbose, thin, posterior side rounded, anterior somewhat fan-shaped, obtusely angled in the middle, rather obscurely pliately wrinkled; yellowish-brown, shining.

*Folsella undulata*, Dunker, Pro. Zool. Soc. 1856, p. 363.  
*Hab.* Moluccas.

A thin, shining, yellowish-brown shell, in which the angular ridge, descending from the umboes, is faintly swollen with waved folds.

Species 19. (Mus. Cuming.)

**MODIOLA ELEGANS.** *Mod. testā oblongā, tenui, levigatā,  
latere postico brevissimi, convexo, antico subfibrilliformi  
dilatato; pelticido-virescante, antice purpureo tinctū  
et transversim nodatā.*

**THE ELEGANT MODIOLA.** Shell oblong, thin, smooth, posterior side very short, convex, anterior somewhat fan-like dilated; transparent-greenish, stained and transversely waved anteriorly with purple.

**GRAY.** Spicilegia Zoologica, pl. 6, f. 14.  
*Modiola incostata*, Dunker.

*Hab.* Gambia, West Africa.

A delicate transparent green shell, rayed with irregular rose lines, crossed concentrically with purple-waved bands.

Species 20. (Mus. Cuming.)

**MODIOLA SETIGERA.** *Mod. testā oblongā, gibbosā, densè  
radiatio liratā, tirs ad latum posterius fasciā latā  
levigatā nitente interrupta; albida, epidermis olivacea  
co-located indutā, antice setigerā.*

**THE BRISTLY MODIOLA.** Shell oblong, gibbose, densely rayed with ridges, ridges interrupted on the posterior side with a broad, smooth, shining band; whitish, covered with an olive-yellow epidermis, bristled anteriorly.

*Folsella setigera*, Dunker, Pro. Zool. Soc. 1856, p. 364.  
*Hab.* ——?

Rayed throughout with close-set ridges and grooves, rather gibbose in form, finely bristled anteriorly.

Species 21. (Mus. Cuming.)

**MODIOLA AUSTRALIS.** *Mod. testā orato-fibrilliformi, la-  
tere postico brecissimo, antico latē dilatato, medio con-  
vexā, concretrice striatā; lateo-castaneā, ad marginem  
sparsim barbatā.*

**THE AUSTRALIAN MODIOLA.** Shell ovately fan-shaped, posterior side very short, anterior broadly dilated, convex in the middle, concentrically striated; yellowish-chestnut, sparingly bearded towards the margin.

**GRAY.** Appendix to King's Voyage.  
*Hab.* North Australia; Jukes.

Remarkable for the very short contracted growth of the posterior side, and convexly dilated form anteriorly.

Species 22. (Mus. Cuming.)

**MODIOLA SENHAUSI.** *Mod. testā suboblongo-fibrilliformi,  
levigatā, tenui, latere postico brevi, subattenuato, au-  
gustā compresi dilatato; albā, rosaceo radiale et trans-  
versio nodulatā sub epidermidē tenui lutescente pella-  
cida.*

**SENHAUS'S MODIOLA.** Shell somewhat oblong fan-shaped, smooth, thin, posterior side short, rather attenuated, anterior compressly dilated; white, rayed and transversely waved with pale rose beneath a thin yellowish transparent epidermis.

*Hab.* Chusan; Captain Benson.

As extremely delicate species, most beautifully sculptured and coloured.

Species 23. (Fig. 23 and 24, Mus. Cuming.)

**MODIOLA NITENS.** *Mod. testā elongato-trapeziforme, au-  
gustā, posticō attenuato-tumida, calide gibbosō-distorta,  
angulatā; intus virescante-olivacea, nitente.*

**THE SHINING MODIOLA.** Shell elongately trapeziform, narrow, attenuately tumid posteriorly, gibbously distorted, angled; dark greenish-olive, shining.

**CARPENTER.** Cat. Reisen Coll. in Brit. Mus.  
*Hab.* California.

A dark, greenish-olive, narrow, boat-shaped shell, with the posterior sides curiously gibbously distorted.

25.

26.

27.

28.

29.

30.

31.

# M O D I O L A .

## PLATE VI.

### Species 25. (Mus. Cuming.)

**MODIOLA PLICATA.** *Mod. testā oblongo-naviformi, tenuiculā, latere postico brevi, tumidiusculo, rotundato, liris brevibus subdistantibus rugato, antico compressè dilatato, margine angulato-producto; subpellucidā, epidermide tenai cornē olivaceo-aestuante intente indutā.*

**THE PLICATED MODIOLA.** Shell oblong-boat-shaped, rather thin, posterior side short, rather swollen, rounded, wrinkled with rather distant short ridges, anterior side compressly dilated, angularly produced at the margin; semitransparent, covered with a shining, olive-chestnut, horny epidermis.

LAMARCK, Anin. sans vert. vol. vii. p. 25.

*Mitilus plicatus*, Gmelin.

Hab. West Africa.

A very light, broad, rather compressed shell, delicately obliquely wrinkled.

### Species 26. (Mus. Cuming.)

**MODIOLA JAPONICA.** *Mod. testā cylindraceo-oblongā, angusta, tenui, lateribus rotundatis, postico brevissimo, attenuato; pellucido-virescente, roseo-purpureo concavis rotundatā.*

**THE JAPAN MODIOLA.** Shell cylindrically oblong, narrow, sides rounded, posterior very short, attenuated; transparent green, concentrically waved with rose-purple.

*Mitilus Japonica*, Dunker, Pro. Zool. Soc. 1856, p. 363.  
Hab. Japan.

A slender shell, very elegantly painted.

### Species 27. (Mus. Cuming.)

**MODIOLA ARCUATULA.** *Mod. testā arcuato-elongatā, subangustā, medio valde gibbosso-angulata, latere postico parvo, antico subfusillato; pellucido-corneā, purpureo irregulatāriter undulatā.*

**THE ARCHED MODIOLA.** Shell arcuately elongated, rather narrow, strongly gibbosously angled in the middle; posterior side small, anterior somewhat fan-shaped; transparent horny, irregularly waved with purple.

HANLEY, Pro. Zool. Soc. 1844.

*Modiola varicosa*, Gould.

Hab. Singapore and Philippine Islands.

Chiefly distinguished by its arched form and gibbosely angled growth. The painting consists of purple vein-like stains of irregular pattern, upon a semitransparent horny ground.

### Fig. 28. (Mus. Cuming.)

**MODIOLA RHOMBOIDEA.** *Mod. testā elongato-rhomboidēa, tenuiculā, latere postico brevi, rotundato, antico valde elongato, margine compressè angulato; nitente luteo-castanā, posticō obscurè saturatè fasciatā.*

**THE RHOMBOID MODIOLA.** Shell elongately rhomboid, rather thin, posterior side short, rounded, anterior very elongated, compressly angled at the margin; shining yellowish-chestnut, obscurely darker banded on the posterior side.

HANLEY, Species Recent Shells.

Hab. The Gambia, West Africa.

An elegantly-formed species of very simple character, beyond the concentric lines of growth inclining to become corrugated on the median angular ridge and beneath the umboes.

### Fig. 29. (Mus. Cuming.)

The specimen here figured is a fine characteristic example of *M. elegans*, represented in the preceding Plate.

### Species 30. (Mus. Cuming.)

**MODIOLA ARBORESCENS.** *Mod. testā subcylindraceo-oblongā, tenui, compressè convexā, levigatā, lateribus rotundatā; intescente-albā, ferrugineo-fuscā, antice lūcis tenuibus nigricantibus irregulatāriter densè divaricatis reticulatā.*

**THE ARBORESCENT MODIOLA.** Shell somewhat cylindrically oblong, thin, compressly convex, smooth, sides rounded; yellowish-white, stained with rust, anteriorly irregularly densely diversely netted with fine blackish lines.

*Mitilus arborecens*, Chemnitz, Conch. Cab. vol. ii. pl. 198. f. 2016-17.

*Modiola picta*, Lamarck.

Hab. West Indies.

Peculiarly distinguished by its arborescent pattern of network on the anterior side.

### Fig. 31. (Mus. Cuming.)

This dark-coloured shell, tinged on the anterior side with bronze-green, is the typical *M. Brasilensis* from Brazil. The light-coloured specimen represented at Pl. IV Fig. 17, is a variety from Guayaquil.

39.

# M O D I O L A.

## PLATE VII.

Species 32. (Mus. Cuming.)

**MODIOLA GUBERNACULUM.** *Mod. testā subquadrate-oblongā, arcuatā, latere postico brevissimā, subrostrato, antice latē flabelliformi, undique dense concentricē striatā; intesente, radiis linearibus fuscō-caeruleis pictā, versus marginem fuso tinctā.*

THE RUDDER MODIOLA. Shell somewhat squarely oblong, curved, posterior side very short, somewhat beaked, anterior broadly fan-shaped, densely concentrically striated throughout; yellowish, painted with livid-blue linear rays, stained with brown towards the margin.

*Volsella gubernaculum*, Dunker, Pro. Zool. Soc. 1856, p. 361.

Hab. —?

Partaking very much of the typical character of *Mytilus*, and especially distinguished by its painting of livid-blue linear rays upon a yellowish ground.

Species 33. (Mus. Cuming.)

**MODIOLA STRIGATA.** *Mod. testā subelongatā, tenui, gibbosā, posticē attenuatā, antice subangustē productā, levigatā, viridi eximū tinctā et variegatā.*

THE STREAKED MODIOLA. Shell somewhat elongated, thin, gibbose, posteriorly attenuated, anteriorly rather narrowly produced, smooth, prettily stained and variegated with green.

*Mytilus strigatus*, Hanley, Pro. Zool. Soc. 1844.  
Hal. Philippine Islands.

A thin shell, of rather narrow gibbose growth, prettily painted with rich green, which, on the anterior side, is disposed in oblique bands.

Species 34. (Mus. Cuming.)

**MODIOLA TRISTIS.** *Mod. testā sublongatā, tenui, posticē trigono-attenuatā, antice rectā, compressā, levigatā; fulvo-rastanea, nitente.*

THE SAD MODIOLA. Shell somewhat elongated, thin, posteriorly triangularly attenuated, anteriorly straight, compressed, smooth: fulvous-chestnut, shining.

*Volsella tristis*, Dunker, Pro. Zool. Soc. 1856, p. 362

Hab. Chusan; Capt. Benson.

A light shell, of semitransparent substance, remarkable for its straightly-produced *Volsella*-like growth anteriorly

Species 35. (Mus. Cuming.)

**MODIOLA SPECIOSA.** *Mod. testā longissimā, rectā, latere postico brevi, rotundato, parum gibbosā, antice elongato, graduatim latiore, medio obliqui obtuse angulo: pellucido-albā, epidermide cornēd deciduā, posticē fulrā, antice smorodinā indutā, intus margaritacea.*

THE BEAUTIFUL MODIOLA. Shell very long, straight, posterior side short, rounded, but little gibbose, anterior elongated, gradually broader, obliquely obtusely angled in the middle, covered with a deciduous horny epidermis, which is fulvous on the posterior area and bright green anteriorly, interior pearl grey.

*Volsella speciosa*, Dunker MS. in Mus. Cuming.

Hab. Tumbes, Peru; Cuming.

A very rare and beautiful species, remarkable for its elongated form and richly-coloured horny epidermis.

Fig. 36. (Mus. Cuming.)

This shell proves to be the young of *M. nitida*, represented at Plate II. The anterior slope of the shell is characterized by a peculiar rippled structure.

Species 37. (Mus. Cuming.)

**MODIOLA SPLENDENS.** *Mod. testā oblongo-oratā, tenui culā, utrinque rotundatā, latere postico gibbosā, undique levigatā, nitente, vel minutissimè decussatum striatā; fulcē et introrsē brunneā, partim iridescentē viridi.*

THE SPLENDID MODIOLA. Shell oblong-ovate, rather thin, rounded at both ends, posterior side gibbose, smooth throughout, shining, or very minutely decussately striated; fulvous and dark-brown, partially iridescent-green.

*Mytilus splendens*, Dunker, Pro. Zool. Soc. 1856, p. 358.  
Hab. Peru.

MODIOLA.—PLATE VII.

A shining, horny shell, the surface being elegantly clouded with brown and fulvous intermixed with iridescent green.

Species 33. (Mus. Cuming.)

MODIOLA RECTA. *Mod. testā elongatā, medio obliquè gibbosā-angulatā, latere postico peculiariter compressè producto, antico subaliformi; albida, epidermide cornicē fulvā vitente, antice sparsim pilosā induitā, postice late fuso-fasciatā.*

THE STRAIGHT MODIOLA. Shell elongated, obliquely

gibbously angled in the middle, posterior side peculiarly compressly produced, anterior somewhat wing-shaped; whitish, covered with a shining, horny epidermis, fulvous and sparsely hairy anteriorly, broadly brown-banded posteriorly.

CONRAD, JOURD. Acad. Nat. Sci. Philadelphia, vol. vii. p. 245. pl. 19. f. 1.  
Hab. ——?

Distinguished by a strict peculiarity of form, the posterior side being curiously compressly produced, whilst the anterior side is wing-shaped, like some of the *Aviculae*.

# MODIOLA.

## PLATE VIII.

### Species 39. (Mus. Cuming.)

MODIOLA OPIFEX. *Mod. testā oblongo-cuneiformi, gibbosā, radiatim sulcōsa, latere postico brevissimo, antico angulato-attenuato; castaneo-cornēa, nitente, versus extremitatem anticam ruditē setigera.*

THE ARTIFICER MODIOLA. Shell oblong wedge-shaped, gibbous, radially grooved, posterior side very short, anterior angularly attenuated; chestnut-horny, shining, rudely bristled towards the anterior extremity.  
Say, Journ. Acad. Nat. Sci. Philadelphia, vol. iv. p. 369.  
*Hab.* Rio Janeiro.

Unlike most *Modiolae*, this species is attenuated anteriorly, broadly gibbous, and roughly clothed at the extremity with an epidermis of bristly hairs.

### Species 40. (Mus. Cuming.)

MODIOLA VEXILLUM. *Mod. testā subtrigono-flabelliformi, tenui, pellucida, latere postico subgibboso, antico angulo-expanso; flavescente, olivaceo-viridi, nitide undulatim pīcta.*

THE FLAG MODIOLA. Shell somewhat triangularly fan-shaped, thin, transparent, posterior side rather gibbous, anterior angularly expanded; yellowish, neatly painted with waves of olive-green.

*Volsella picta*, Dunker (not *M. picta*, Lamarck).  
*Hab.* Australia.

Of thin, transparent substance, prettily variegated with concentric dark-green zigzag waves.

### Species 41. (Mus. Cuming.)

MODIOLA MAGELLANICA. *Mod. testā oblongo-trapezoidea, posticō gibbosā, anticō subexpansa, undique radiatim sulcatā; fulvescente.*

THE MAGELLAN MODIOLA. Shell oblong-trapezoid, posteriorly gibbous, anteriorly rather expanded, radially grooved throughout; light fulvous.

*Volsella Magellanica*, Dunker MS. in Mus. Cuming.  
*Hab.* Straits of Magellan.

Of a light fulvous colour, rayed throughout with close-set longitudinal grooves.

### Species 42. (Mus. Cuming.)

MODIOLA PERFRAGILIS. *Mod. testā elongatā, tenui, undique minutissime decussatim striatā, striae posticis longitudinalibus incisis, extremitate posticā parvō, rotundatā, anticā obliquā; pellucido-albā, nitente, virescente tinctā.*

THE VERY FRAGILE MODIOLA. Shell elongated, thin, very minutely decussately striated, posterior longitudinal striae engraved, posterior end small, rounded, anterior rather oblique; transparent-white, shining, tinged with pale-green.

*Volsella perfragilis*, Dunker, Pro. Zool. Soc. 1856, p. 332.

*Hab.* Moluccas.

In substance this shell is very thin, transparent-white, tinged with sea-green, and on examination with a lens, the surface will be found to be minutely decussately sculptured, the longitudinal striae being impressively engraved.

### Species 43. (Mus. Cuming.)

MODIOLA SUBRAMOSA. *Mod. testā subtrigono-oblonga, tenui, semipellucida, concentricā testā striatā, radiatim ramoso-liratā, liris obtusa, sufflexuosa, latere postico parvo, gibboso, antico trigono-flabelliformi; lutescente purpureo-rufo tinctā.*

THE BRANCHED MODIOLA. Shell somewhat triangularly oblong, thin, semitransparent, concentrically finely striated, radially branch-ridged, ridges somewhat flexuous, posterior side small, gibbous, anterior triangularly fan-shaped; yellowish, stained with purple-red.

HANLEY, Pro. Zool. Soc. 1844, p. 14.

*Hab.* Island of Mindanao, Philippines; Cuming.

A somewhat fragile shell, neatly rayed with obtuse ridges, which branch off in a flexuous manner, particularly in the anterior direction.

### Species 44. (Mus. Cuming.)

MODIOLA SUBPURPUREA. *Mod. testā elongatā, subarcuata, tenuiculā, gibbosā, levigatā, latere postico obtusè rotundato, anticō compressa producto; nitente olivacei, subpurpureā.*

THE PURPLISH MODIOLA. Shell elongated, somewhat

arched, rather thin, gibbous, smooth, posterior side obtusely rounded, anterior compressly produced : shining-olive, tinged with purple.

*Volsella subpurpurea*, Dunker, Pro. Zool. Soc. 1856, p. 362.

*Hab.* Seuegal.

Of a somewhat horny substance, and dark shining purplish-olive colour.

Fig. 45. (Mus. Cuming.)

A full-grown specimen of *M. arcuata*, described at Plate VI. Fig. 27.

Species 46. (Mus. Cuming.)

MODIOLA PETAGNE. *Mod. testa elongata, tenuissima, postice longitudinaliter striata, nitente-cornuta, antice concentricè striata, pulchre iridescente-argynosæ, lumen rufescensibus undique pallide reticulata*.

PETAGN'S MODIOLA. Shell elongated, very thin, posteriorly longitudinally striated, shining horny, anteriorly concentrically striated, beautifully iridescent-verdigris, faintly reticulated throughout with reddish lines.

SCACCHI, Phil. Enum. Moll. Sicil. vol. ii. p. 51.

*Hab.* Mediterranean, and Galveston, Texas.

A beautifully delicate transparent shell, having the posterior side horny and shining, while the anterior is of a delicate verdigris-colour and iridescent.

Species 47. (Mus. Cuming.)

MODIOLA SUBSULCATA. *Mod. testa oblonga, gibbosa, me-*

*dio contracta, undique densè sulcata, lateribus rotundatis, antice subangulata; fulvo-castaneæ, postice nitente-cornutæ, antice sparsim setigeræ.*

THE GROOVED MODIOLA. Shell oblong, gibbous, contracted in the middle, densely grooved throughout, sides rounded, anterior slightly angled ; fulvous-chestnut, posteriorly shining horny, anteriorly sparsely bristly.

*Volsella subsulcata*, Dunker, Pro. Zool. Soc. 1856, p. 364.

*Hab.* Bay of Manila ; Cuming.

The form of this species is rather gibbous throughout, the entire surface being closely finely grooved.

Species 48. (Mus. Cuming.)

MODIOLA GLABERRIMA. *Mod. testa subtrigono-elongata, tenui, levigata, nitente, latera postice parvo, attenuato, antico gradatim latiore, margine oblique rotundato; pallide olivaceo-cornuta, ærugineo-purpureamente radiatim lineata et concentricè striata*.

THE GLOSSY MODIOLA. Shell somewhat triangularly ovate, thin, smooth, shining, posterior side small, attenuated, anterior gradually broader, obliquely rounded at the margin ; pale olive-horny, radiately lineated and concentrically streaked with light bronze-purple.

*Volsella globerrima*, Pro. Zool. Soc. 1856, p. 363.

*Hab.* Sydney.

A very delicate horny shell, decussated with characteristic lines and bands of red-bronze purple.

# MODIOLA.

## PLATE IX.

Species 49. (Fig. 62, Mus. Cuming.)

**MODIOLA NIGRA.** *Mod. testā subquadrate-ovatā, compressio-ovalā, anticē densē testicostatā, medio levigatā, posticē ad extremitatem iratā; purpureo-nigrā.*

**THE BLACK MODIOLA.** Shell somewhat squarely ovate, rather compressed, anteriorly densely finely striated, smooth in the middle, posteriorly ridged at the extremity; purple-black.

**HANLEY,** Brit. Marine Conch., Recent Bivalve Shells, p. 242.

*Lawistina nigra*, Gray Conch. Syst. pl. 100. f. 3.  
*Hab.* Orsund Bay, Sweden.

A rather compressed species, of deep purple-black colour, belonging, together with the rest of the species in this Plate, to the genus *Modiolarea*, *Crenella*, and *Lawistina* of authors.

Species 50. (Fig. 63, a, b, Mus. Cuming.)

**MODIOLA CUMINGIANA.** *Mod. testā oblongo-cuneiformi, curvata, testiculata, anticē valde gibbosā, tumida, tenuistratā, obtuse angulatā, medio levigatā, posticē ad extremitatem obscurē iratā; fulvescere-cornēa, rufescere-fusco interdum rotundata.*

**CUMING'S MODIOLA.** Shell oblong wedge-shaped, curved, rather thin, very gibbous and swollen anteriorly, finely striated and obtusely angled, smooth in the middle, posteriorly obscurely ridged at the extremity; fulvous-horny, sometimes waved with reddish-brown.

**DUNKER,** MS. Mus. Cuming.  
*Hab.* Moreton Bay, Australia.

An extremely delicate species, of a characteristic swollen wedge-shape.

Species 51. (Fig. 64, Mus. Cuming.)

**MODIOLA IMPACTA.** *Mod. testā ovo-concaviformali, tumida, posticē et anticē radiatum iratā, liris angustis, subrenatis, utrinque excavatis, medio levigatā; intensē olivaceā, cornēa, nitente.*

**THE DRIVEN MODIOLA.** Shell ovately wedge-shaped, swollen, posteriorly and anteriorly ridged, ridges narrow, rather distant, excavated on both sides, smooth in the middle; dark-olive, horny, shining.

**HERMAN,** Naturforscher, vol. xvii. pl. 3. f. 5-8.

*Mytilus cor* Martyn.

*Mytilus discors*, Lamarck (not of Linnaeus).

*Hab.* New Zealand (in sponge).

This, the finest species in the group, is not, as shown by M. Deshayes, the Linnean *Mytilus discors*. It is larger and more gibbous, pearly and purple-rayed within.

Chemnitz gives a characteristic figure of the species 2 vol. viii. pl. 86. f. 76\*

Species 52. (Fig. 65, Mus. Cuming.)

**MODIOLA DISCORS.** *Mod. testā oblonga, subcuneiforme tumida, anticē radiatum iratā, liris tenuibus, subobsoecris, liris posticis fortioribus, remotis, medio levigatā; olivescēd, cornēd, nitente.*

**THE DIFFERING MODIOLA.** Shell oblong, somewhat wedge-shaped, swollen, anteriorly radiately ridged, ridges fine, rather obscure, posterior ridges stronger and more distant, middle smooth; olive, horny, shining.

*Mytilus discors*, Linnaeus, Syst. Nat. p. 1159.

*Mytilus discerpans*, Lamarck.

*Hab.* Massachusetts (found adhering to seaweed); Gould. The anterior striae in this species are fine and close-set.

Species 53. (Fig. 66, Mus. Cuming.)

**MODIOLA LEVIGATA.** *Mod. testā oblongo-ovatā, anticē latiore, subcompresso, nudique concentricē striatā, medio subcrevata, extremitate posticā obscurē sulcata; olivaceo-castaneā, cornēa, nitente.*

**THE SMOOTH MODIOLA.** Shell oblong-ovate, broader anteriorly, rather compressed, everywhere concentrically striated, slightly excavated in the middle, posterior extremity obscurely grooved; olive-chestnut, horny, shining.

*Lawistina levigata*, Gray.

*Hab.* Greenland.

The peculiarity of this species consists chiefly in the anterior area not being longitudinally ridged.

Species 54. (Fig. 67, Mus. Cuming.)

**MODIOLA NEXA.** *Mod. testā oblongo-ovatā, convexo-compresso, anticē parva latiore, nudique densē linearis-sulcata et liratis, liris medianis subtilissimis, fere oblongatis; castaneo-fusca, umbonibus plus minus erosis, marginibus.*

**THE TIED MODIOLA.** Shell oblong-ovate, convexly compressed, anteriorly but little broader, everywhere densely linearly grooved and ridged, middle ridges very fine, almost obsolete; chestnut-brown, umbos more or less eroded, pearl.

**GOULD,** Invert. Massachusetts.

*Hab.* Massachusetts Bay; United States.

A rather compressed red-brown species, in which the posterior and anterior portions are sculptured alike with densely-set striae.

# MODIOLA.

## PLATE X.

Species 55. (Fig. 68, Mus. Cuming.)

MODIOLA COSTULATA. *Mod. testā oratā, subexpansā, pellucido-cornicē, posticē et anticē munitā subobsoletā costulatā, umboibus porrō contractis.*

THE FINELY-RIBBED MODIOLA. Shell ovate, rather expanded, transparent horny, posteriorly and anteriorly minutely rather obsoletely finely ribbed, umboes small, contracted.

RISSE, Hist. Nat. d'Europe Mérid. vol. iv. p. 324. f. 163.  
*Crenula costulata*, Forbes and Hanley.

Hab. Southern Europe.

A small horny shell, with the umboes unusually contracted.

Species 56. (Fig. 69, Mus. Cuming.)

MODIOLA NANA. *Mod. testā munitā, obliquè ovatā, tenui, umboibus subrostratis; pellucido-cornicē, lineis rufescens variegatā.*

THE DWARF MODIOLA. Shell minute, obliquely ovate, thin umboes somewhat beaked : transparent horny, variegated with reddish lines.

*Modiolina nana*, Dunker, Pro. Zool. Soc. 1856, p. 365.  
Hab. Port Lincoln, Australia.

A very minute semitransparent bronze-horny shell, variegated with fine zigzag reddish lines.

Species 57. (Fig. 70, Mus. Cuming.)

MODIOLA SUBTOETA. *Mod. testā parvula, subtotā, oblongo-trapezoida, versus umboes attenuatā, concentricè rugosā, posticē albitā, anticē nigricante-fusca.*

THE TWISTED MODIOLA. Shell rather small, slightly twisted, oblong-trapezoid, attenuated towards the umboes, concentrically wrinkled, posteriorly whitish, anteriorly blackish-brown.

*Modiolarca subtoeta*, Dunker, Pro. Zool. Soc. 1856, p. 365.  
Hab. New Holland.

A narrow trapezoid shell, peculiarly slightly twisted.

Species 58. (Fig. 71, Mus. Cuming.)

MODIOLA LIGNEA. *Mod. testā oblonga, ventricosa, so-lidiuscula, nitente-castanea, concentrica rufa striata, medio angustè contracta, umboibus globoso-tumidis.*

THE WOOD MODIOLA. Shell oblong, ventricose, rather solid, shining chestnut, concentrically rudely striated, narrowly contracted in the middle, umboes globose swollen.

Hab. — ?

A rather solid ventricose shell, striated only concentrically with a smooth shining-chestnut epidermis.

Species 59. (Fig. 72, Mus. Cuming.)

MODIOLA STRIATULA. *Mod. testā elongato-trapezoida, subangustā, medio gibbosā, tenuicula, undique radiatia densè tenuiliratā; olivacea, nigro radiatim fasciatā.*

THE STRIATED MODIOLA. Shell elongately trapezoid, rather narrow, gibbous in the middle, rather thin, everywhere radiately densely finely ridged ; olive, radiately banded with black.

HANLEY, Recent Bivalve Shells, p. 241.

Hab. Philippine Islands.

Of a peculiarly elongated trapezoid form, densely finely ridged throughout, the ridges radiating off wider and rather more distinct on the anterior margin.

Species 60. (Fig. 73, Mus. Cuming.)

MODIOLA EMARGINATUS. *Mod. testā oblongo-trapezoida, anticē obliquè subflobellata, posticē contracta, subcanaliculata, radiatim tenuiliratā; nigricante-olivacea.*

THE EMARGINATED MODIOLA. Shell oblong-trapezoid, anteriorly obliquely somewhat fan-shaped, posteriorly contracted, rather channelled, radiately finely ridged ; blackish-olive.

BENSON, MS. in Mus. Cuming.

Hab. — ?

Of more solid structure and less elongated form than the preceding species, not so strongly and regularly ridged.

Species 61. (Fig. 74, Mus. Cuming.)

MODIOLA SULCATA. *Mod. testā elongatā, anticē flabellata, margine subangulata, compressa, radiatia densè flexuoso-lirata, medio gibbosā, umboibus prominentibus; virescente-olivacea, nigricante obscurè fasciata.*

THE GROOVED MODIOLA. Shell elongated, anteriorly fan-shaped, slightly angled and compressed at the

## MODIOLA. -PLATE X.

margina, radiately densely flexuously ridged, gibbous in the middle, umbones prominent; greenish-olive, obscurely dark-banded.

LAMARCK, Ann. sans. vert. vol. ix.

An elongately fan-shaped shell, agreeably coloured with a livid-olive hue tinged with shining chestnut, the whole surface being flexuously ridged.

Species 62. (Fig. 75, Mus. Cuming.)

MODIOLA FORTUNEL. *Mod. testā parenlā, ovo-to-oblongā, subtriangulā, utrinque obtusè carinatā, concentricè rugoso-striatā; supernē violacea, infernē albida, epidermē virente indutā.*

FORTUNE'S MODIOLA. Shell rather small, ovately oblong, somewhat triangular, obtusely keeled on both sides, concentrically roughly striated; violet at the upper part, whitish below, covered with a greenish epidermis.

*Volutula Fortunei*, Dunker, Pro. Zool. Soc. 1856, p. 361.  
Hab. China Sea; Fortune.

Of neat symmetrical form, richly coloured on the upper part, pale at the lower.

Species 63. (Fig. 76, Mus. Cuming.)

MODIOLA PHASEOLINA. *Mod. testū pyriformi-ovalā, tu-*

*midiusculā, cornicā, concentricè striatā, aperturā sub-spinosā indutā.*

THE PEASE MODIOLA. Shell pyriformly ovate, rather swollen, horny, concentrically striated, covered with a somewhat spinous epidermis.

PHILIPPI, Ennū. Mol. Sicil. vol. ii, p. 51. f. 14.  
Hab. West coast of Scotland; M'Andrew.

A spinously beaded horny shell, originally observed by Philippi in Sicily in a fossil state, and lately found living on the north-east and west coasts of Scotland.

Species 64. (Fig. 77, Mus. Cuming.)

MODIOLA FLAVIDA. *Mod. testā oblongā, tenui, inflatā, lineis concentricis tenuibus elevatis sculpta; flavida, linea ab umbonibus ad basin obliquè decurrente colore pallidiorē signatā; umbonibus tumidis, vārgine centrali postice sinuata.*

THE YELLOWISH MODIOLA. Shell oblong, thin, inflated, sculptured with fine raised concentric lines; yellowish, with a line running down obliquely from the umbones to the base marked with a paler colour, umbones swollen, ventral margin posteriorly sinuated.  
*Volutula flavida*, Dunker, Pro. Zool. Soc. 1856, p. 364.  
Hab. Bay of Manila: Cumiug.

A light inflated shell of yellowish-chestnut colour, dehincately sculptured with raised concentric lines.

*Mediola* PL. II.

## PLATE XI.

Species 65. (Fig. 78 and 80, Mus. Cuming.)

**MODIOLA CICERULA.** Mod. testa obliquè orbicularis, convexa, umbonibus parvis, decussatim striata, striis radiatibus subdicularatis; albida, lateo-fuscescente tincta.

**THE CHICK-PEA MODIOLA.** Shell obliquely orbicular, convex, umbos small, decussately striated, radiating striae rather divaricate; whitish, tinged with yellowish-brown.

MOLLER, Fauna Greenlandica  
*Mytilus decussatus*, Montagu.

*Crenella elliptica*, Brown.  
Hab. Greenland; Moller. Orkney; M'Andrew.

A small pea-like shell, with very much the aspect of a little *Cardium*.

Species 66. (Fig. 79, Mus. Cuming.)

**MODIOLA RHOMBEA.** Mod. testa obliquè quadrata, anticè latiore, subproducid, media rabil gibbosat, obtuse angulata, undique radialis levigata; rosaceo-a'la, subpellucida.

**THE RHOMBOID MODIOLA.** Shell obliquely quadrate, anteriorly broader and somewhat produced, very gibbose in the middle, obtusely angled, everywhere rayed with fine striae; pinkish-white, slightly transparent.

BERKELEY, Zool. Journ. vol. iii. p. 229. Supp. pl. 18. f. 1.  
Hab. Tunis; M'Andrew.

A rather solid, gibbose, rhomboid shell, of a pinkish hue.

Species 67. (Fig. 81, Mus. Cuming.)

**MODIOLA MARMORATA.** Mod. testa obliquè rhomboides, valde gibbosat, obtuse angulata, postice et anticè radialis levigata et subcavata, medio levigata; virescente-cinerata, rosacea tincta.

**THE MARBLED MODIOLA.** Shell obliquely rhomboid, very gibbose, obtusely angled, rayed posteriorly and anteriorly with grooves and ridges, smooth in the middle; greenish-ash, tinged with rose.

FORBES, Malacol. Monogr. p. 40  
*Modiola tenuida*, Hanley.  
*Modiola Poliana*, Philippi.

*Crenella marmorata*, Worrell and Hanley  
Hab. Britain.

An interesting small species, of the characteristic *Lanistina* group.

Species 69. (Fig. 82, Mus. Cuming.)

**MODIOLA GLANDULA.** Mod. testa subobliqua orbicularis, convexa, umbonibus parvis, decussatim striata, striis longitudinalibus fortioribus, subdicularatis; sordide albida, epidemide lateo indutæ.

**THE ACORN MODIOLA.** Shell somewhat obliquely orbicular, convex, umbos small, decussately striated, longitudinal striae the stronger, rather divaricate; dull white, covered with a yellow epidermis.

TOTTEN, Silliman's American Journal of Science, vol. xxvi. p. 367. f. 3.

A *Cardium*-shaped species, of the same typical form as *M. cicerula*.

Fig. 83. (Mus. Cuming.)

A young specimen of *M. strigata*, Hanley, described at Pl. VII. Fig. 33.

Species 69. (Fig. 84, Mus. Cuming.)

**MODIOLA PECTINULA.** Mod. testa obovata, ventricosa, anticè latiore, radialis costata, umbonibus subprominentibus; lateo-fuscescente.

**THE LITTLE PECTEN MODIOLA.** Shell obovate, ventricose, broader anteriorly, radiately ribbed, umbos rather prominent; yellowish-brown.

GOULD, Invertebrates of Massachusetts, p. 127. f. 55.  
Hab. St. George's Bank, Bay of Massachusetts, United States.

Of a rather solid obovate *Cardium*-like form.

Species 70. (Fig. 85, Mus. Cuming.)

**MODIOLA BULLA.** Mod. testa obliquè globosa, vitreosublata, levigata, sub tenui minutiissime radialis striatâ, gibbosissimâ, umbonibus parvis, incurvis.

**THE BUBBLE MODIOLA.** Shell obliquely globose, glassy-white, smooth, beneath the lens very minutely ra-

MODIOLA.—PLATE XI.

dately striated, very gibbous, umbones small, incurved.

*Crenella bulla*, Dunker, Pro. Zool. Soc. 1856, p. 366.  
Hab. Island of Luzon, Philippines; Cuming.

A delicate bubble-like glassy shell, of a very gibbous *Isocardia*-like form.

Species 71. (Fig. 86, Mus. Cuming.)

MODIOLA FABA. *Mod. testā obovata, obliquē compressā, radiatim tenuicostatā; livido-purpurascente, epidermide cornēa nitente-castaneā undulatā.*

THE BEAN MODIOLA. Shell obovate, obliquely com-

pressed, radiately finely ribbed; livid-purple, covered with a shining chestnut horny epidermis.

*Mytilus faha*, Fabricius, Gmelin, Syst. Nat. p. 3359.  
*Modiola arctica*, Leach.

Hab. Greenland.

Partaking very much of the character of Dr. Gould's *M. pectinula*, but uniformly smaller and more compressed, with a dark, shining, horny epidermis.

Fig. 87. (Mus. Cuming.)

The shell here figured proves to be a young transparent example of *M. marmorata*, Forbes, represented above in Fig. 41.

# LITHODOMUS.

## PLATE I.

### Genus LITHODOMUS, Cuvier.

*Testa transversa, cylindraceo-oblonga, squivalvis, epidermis rufa-castanea induta, calce interdum incrustata; extremitatis rotundata; latera postice brevissimo; umbonibus parvis, incurvis. Cardo linearis, ligamento marginali. Impressio muscularis composite, indistincta.*

Shell transverse, cylindrically oblong, equivalve, covered with a reddish-chestnut epidermis, sometimes incrusted with chalk; extremities rounded; posterior side very short; umbo small, incurved. Hinge linear, with the ligament marginal. Muscular impression compound, indistinct.

This very interesting genus, founded by Cuvier, is not alone distinguished from *Modiola* by the boring habits of its animal. The shell is always of a peculiarly oblong-cylindrical or wedge-shaped form, and of a peculiar substance. It is found imbedded in stone, chalk, coral, and in the valves of *Spondylus* shells, though often extremely delicate in structure. There is scarcely any species which is not beautifully striated, and there are several curiously sculptured with feathery wrinkles or furrows. Another peculiarity consists in the shell being frequently thickly incrusted with a deposit of chalky matter, which is sometimes sculptured, and in some few instances produced beyond the extremity. Among the small species, a few are bearded with bristles.

The geographical range of this genus is partial, but widely distributed. There are more species perhaps in the West Indies than in any other locality, but the genus is known to inhabit the Philippine Islands, New Zealand, Chili, the Galapagos Islands, and Mazatlan.

### Species 1. (Mus. Cuming.)

**LITHODOMUS CORRUGATUS.** *Lithod. testa subcylindracea, favidæ, per totam superficiem striis arcuatis postice divisoricatis corrugata, extremitate antice angustâ, postice dilatata, margine dorsali medio elevato, subangulato.*

**THE WRINKLED LITHODOMUS.** Shell somewhat cylindrical, yellowish, wrinkled over the entire surface with posteriorly divericated arched striae, anterior extremity narrow, posterior dilated, dorsal margin raised in the middle, slightly angled.

*Modiola corrugata*, Philippi, Abbild. und Besch. Conch. vol. ii. p. 147. pl. 1. f. 1.

Hab. Island of St. Vincent, West Indies.

A yellowish shell, rather depressed, with the surface diagonally crossed throughout with waved wrinkles.

### Species 2. (Mus. Cuming.)

**LITHODOMUS MALAYANUS.** *Lithod. testa subteretæ, castaneæ, striis perpendicularibus exarata, area dorsali levigata, margine subtriangulari-producto, umbonibus involuti, parte antica manifeste angustiore.*

**THE MALAY LITHODOMUS.** Shell somewhat slender, chestnut, furrowed with perpendicular striae, dorsal area smooth, margin rather angularly produced, umbo involute, anterior portion of the shell manifestly narrowed.

*Modiola Maliana*, Philippi, Abbild. und Besch. Conch. vol. iii. p. 21. pl. 2. f. 6.

Hab. Malay.

A short dark-chestnut shell, grooved perpendicularly over one-half of its surface, the dorsal margin being rather angularly produced in the middle.

### Species 3. (Mus. Cuming.)

**LITHODOMUS TRUNCATUS.** *Lithod. testa oblonga, ab umbo obtuse angulata, anteice attenuata, postice tumida, angulato-truncata, medio subcontracta; nigricante-castanea, concentrica rude striata.*

**THE TRUNCATED LITHODOMUS.** Shell oblong, obtusely angled from the umbo, attenuated anteriorly, posteriorly swollen and angularly truncated, a little contracted in the middle; dark chestnut, concentrically rudely striated.

GRAY, Appendix to Dieffenbach's 'New Zealand.'

Peculiarly distinguished from all other species of the genus by its truncated and angularly contracted form.

### Species 4. (Mus. Cuming.)

**LITHODOMUS GRACILIS.** *Lithod. testa elongato-cylindracea, rufa-castanea, in parte antica striis perpendicularibus exarata, extremitate postici sensim attenuata, anticanæ aequante, margine dorsali convexisculo, hanc angulato.*

**THE SLENDER LITHODOMUS.** Shell elongately cylindrical, reddish-chestnut, furrowed on the anterior portion with perpendicular striae, posterior extremity

## LITHODOMUS.—PLATE I

gradually attenuated, equal in the anterior, dorsal margin rather convex, not angled.

*Modiola gracilis*, Philippi, Zeitschrift für Malac. 1847; Abbildungen, pl. 2. f. 1.

*Hab.* China.

This fine species, the largest of the genus, is of a rich dark chestnut colour, with the furrowed sculpture of the anterior surface somewhat delicately indicated.

Species 5. (Fig. a, b, Mus. Cuming.)

LITHODOMUS CINNAMOMINUS. *Lithod. testa cylindraceo-cuneiformis, tumida, subarcuata, undique minutissime decussatim striata, castanea aut flavecente-castanea, nitente, quasi sericea, extremitate anticâ abrupte truncata, umbonibus nitide involuta, posticâ subcompresso.*  
THE CINNAMON LITHODOMUS. Shell cylindrically wedge-shaped, swollen, rather arched, everywhere very minutely decussately striated, chestnut or yellowish-chestnut, shining as though silky, anterior extremity abruptly truncated, with the umboes neatly involuted, posterior extremity rather compressed.

*Mytilus cinnamominus*, Chemnitz, Conch. Cab. vol. viii. p. 252. pl. 82. f. 731.

*Mytilus cinnamomeus*, Bruguière.

*Modiola cinnamomea*, Lamarck.

*Hab.* Philippine Islands, and Island of St. Thomas, West Indies.

This species is peculiarly distinguished by its swollen, wedge-shaped, *Modiola*-like form, and shining, silky appearance.

Species 6. (Mus. Cuming.)

LITHODOMUS OBESUS. *Lithod. testa oblonga, medio obesa, astringue fere æquilater rotundata, flavescente; loci ant concentrici striata, margine ventrali arcuato, dorsali declivi-angulato, angulo fere obsolete, extremitate anteriori subattenuata, umbonibus indistinctis.*

THE STOUT LITHODOMUS. Shell oblong, stout in the middle, almost equally rounded at both ends, yellowish, smooth or conceutrically striated, ventral margin arched, dorsal slopingly angled, with the angle nearly obsolete, anterior extremity rather attenuated, umboes distinct.

*Modiola obesa*, Philippi, Zeitschrift für Malac. 1847; Abbildungen, pl. 2. f. 2.

*Hab.* China.

Well distinguished by its stout, angular form, and absence of furrowed sculpture.

7

8a.

8b

9.

10a.

10b.

11.

# LITHODOMUS.

## PLATE II.

### Species 7. (Mus. Cuming.)

**LITHODOMUS ANTILLARUM.** *Lithod. testā cylindracē, gracili, intenſe castaneā, in parte posticā striis perpendicularibus fere omniō exarata, extremitate antica posticam aequante, margine ventrali fere rectilineo īa extremitate posticā ascendente, dorsali subangulato, umbonilis ierolutis, ultra extremitatem posticam prominolit.*

THE WEST INDIAN LITHODOMUS. Shell cylindrical, slender, dark chestnut, furrowed almost entirely on the posterior portion with perpendicular striae, anterior extremity equaling the posterior, dorsal slightly angled, umbones involuted, rather protruding beyond the posterior extremity.

*Modiola (Lithophagus) Antillarum*, Philippi, *Zeitschrift für Malac.* 1847.

*Hab.* West Indies.

Of a very dark chestnut colour, straight in form, gently angularly sloping about three-fifths of the way down.

### Species 8. (Fig. a, b, Mus. Cuming.)

**LITHODOMUS CUMINGIANUS.** *Lithod. testā elongatā, posicē subglobosā, anticē gradatim attenuatā, tenuicollis, concentricē striatā, striis hic illic subcorrugato-plicatis; flavescente-olivacea.*

THE CUMINGIAN LITHODOMUS. Shell elongated, posteriorly subglobose, anteriorly gradually attenuated, rather thin, concentrically striated, striae here and there somewhat wrinkle-plated; yellowish-olive.

DUNKEE, MS. in Mus. Cuming.

*Hab.* North Australia, Mazatlan.

A shell of light substance and pale yellowish-olive colour, globosely formed at the posterior end, and gradually attenuated towards the anterior.

### Species 9. (Mus. Cuming.)

**LITHODOMUS LITHOPHAGUS.** *Lithod. testā cylindracē, castaneā, in parte posticā obsoletē decussatim exarata, anticē concentricē rudi plicata, band attenuatā, rectilineā.*

THE STONE-BORING LITHODOMUS. Shell cylindrical,

chestnut, obsoletely decussately furrowed on the posterior part, anteriorly concentrically rudely plicated, not attenuated, rectilinear.

*Mytilus lithophagus*, Linneus, *Syst. Nat.* p. 1156.

*Modiola lithophaga*, Deshayes.

*Hab.* Malta

This is the well-known typical species of the genus, described by Linnaeus as a *Mytilus*, and by earlier naturalists, D'Argenville, Klein, Petiver, Rumphius, Lister, and Rondeletius, as a *Pholas*.

### Species 10. (Fig. a, b, Mus. Cuming.)

**LITHODOMUS NASUTUS.** *Lithod. testā subcylindracē, tenui, levigatā, anticē concentricē plicato-striatā, margine dorsali medio elevato, utrinque subequaliter declivi: flavescente-castaneā.*

THE NOSED LITHODOMUS. Shell nearly cylindrical, thin, smooth, anteriorly concentrically plicated striated, dorsal margin raised in the middle, nearly equally sloping on each side; yellowish-chestnut.

*Modiola nasuta*, Philippi, *Abbild. und Besch. Conch. vol. ii.* p. 149, pl. 1. f. 2.

*Hab.* Island of St. Thomas, West Indies.

A comparatively smooth shell, frequently incrusted, as in Fig. 10, b, with calcareous matter which on the anterior side becomes decussately furrowed.

### Species 11. (Mus. Cuming.)

**LITHODOMUS STRAMINEUS.** *Lithod. testā cylindracē, posicē gibbā, anticē latiore, rectilineā, parte posticā striis perpendicularibus, hic illic divaricatis, eximie exarata; stramineo-castaneā.*

THE STRAW-COLOURED LITHODOMUS. Shell cylindrical, posteriorly gibbous, anteriorly broader, rectilinear, posterior part delicately furrowed with perpendicular striae which are here and there divaricate; straw-coloured chestnut.

DUNKEE, MS. in Mus. Cuming.

*Hab.* West Indies.

There is little to distinguish this species from *L. lithophagus* except its paler tone of colour, which is a character insufficient from its variability.

SOURCE [15 & 16].

FIGURE THREE.

# LITHODOMUS.

## PLATE III.

### Species 12. (Mus. Cuming.)

**LITHODOMUS GRUNERI.** *Lithod. testā arcuato-elongatā, circa umbonē peculiariter angulato-gibbosā, anticē attenuatā, intus castaneā, undique obliquē flexuoso-exarata.*

**GRUNER'S LITHODOMUS.** Shell arcuately elongated, peculiarly angularly gibbous about the umbo, attenuated anteriorly; dark-chestnut, obliquely flexuously furrowed throughout.

**PHILIPPI,** MS. in Mus. Cuming.  
*Hab.* New Zealand.

This species, it will be seen, is distinguished by a very remarkable shape. In other respects the characters are much of the ordinary type.

### Species 13. (Mus. Cuming.)

**LITHODOMUS TERES.** *Lithod. testū subcylindraceā, parte posticā densē perpendiculatiter exarata, anticā levigatā; intus castaneā.*

**THE SLENDER LITHODOMUS.** Shell somewhat cylindrical, posterior part closely perpendicularly furrowed, anterior smooth; dark-chestnut.

**PHILIPPI,** Abbild. und Besch. Conch. vol. ii. p. 148. pl. 1. f. 3.

*Hab.* Mazatlau.

Of simple form and sculpture, uniformly of small size.

### Species 14. (Mus. Cuming.)

**LITHODOMUS COARCTATA.** *Lithod. testā oblongo-convergī, formis, undique perpendiculatiter exarata, posteri gibbosō-cordiformi, gibbosā, deinde anticē attenuato-coarctatā, versus extremitatem epidermide fibrosā barbatā.*

**THE CONTRACTED LITHODOMUS.** Shell oblong wedge-shaped, perpendicularly furrowed throughout, posteriorly globose heart-shaped, gibbous, then anteriorly attenuately contracted, bearded towards the extremity with a fibrous epidermis.

*Iolsella coarctata,* Dunker.

*Hab.* Galapagos Islands; Cuming.

Eminently distinguished by its wedge-shaped, *treu-like* form the posterior portion being prettily involuted like an

*Isocardia*, the anterior attenuated and bearded with a fibrous epidermis.

### Species 15. (Fig. a, b, Mus. Cuming.)

**LITHODOMUS ATTENUATUS.** *Lithod. testā cylindraceā, tenui, posticē globosā, tumiduscūla, deinde coarctatā et anticē gradatim attenuatā, undique levigatā vel obsoletē malleatā; flavescēte-olivaceā.*

**THE ATTENUED LITHODOMUS.** Shell cylindrical, thin, posteriorly globose, then contracted and anteriorly gradually attenuated, smooth or obsoletely malleated throughout; yellowish-olive.

*Modiola attenuata,* Deshayes, Ann. sans vert. vol. vii. p. 28.

*Hab.* Chili and Peru.

A very characteristic species, of a yellowish-olive colour, thin in substance, except when incrusted with calcareous matter, as in Fig. 15 a, with no indication on its surface of the perpendicularly furrows frequent in this genus.

### Species 16. (Mus. Cuming.)

**LITHODOMUS CAUDIGERUS.** *Lithod. testā cylindraceā, tenui, levigatā, extremitate anticē appendicibus calcareis angustatis subcaudatā; rufescēte-castaneā.*

**THE TAIL-BEARING LITHODOMUS.** Shell cylindrical, thin, smooth, anterior extremity tailed with narrow calcareous appendages; reddish-chestnut.

*LAMARCK,* Ann. sans vert. vol. vii. p. 27.

*Hab.* West Indies.

We need scarcely remark that the calcareous incrustation protruding beyond the anterior extremity of this shell is no specific characteristic.

### Species 17. (Mus. Cuming.)

**LITHODOMUS CASTANEUS.** *Lithod. testā cylindraceā, tenui, undique gibbosissimā et levigatā; castaneā.*

**THE CHESTNUT LITHODOMUS.** Shell cylindrical, thin, rather gibbous throughout and smooth; chestnut.

*DUNKER,* MS. in Mus. Cuming.

*Hab.* — ?

Of extremely simple character, without any appearance of furrowed sculpture.

13.

20.

21.

22a.

22b.

23.

24.

25.

26.

# LITHODOMUS.

## PLATE IV

### Species 18. (Mus. Cuming.)

**LITHODOMUS RUGIFERUS.** *Lithod. testā cylindracea, testā, convexā, extremitatibus sub-equaliter rotundatis; flavescente-castaneis, parte posticā crustā calcarea dense rugosifera.*

**THE WRINKLED LITHODOMUS.** Shell cylindrical, thin, convex, extremities nearly equally rounded; yellowish-chestnut, posterior part with the calcareous crust densely wrinkled.

DUNKER, MS. in Mus. Cuming.  
*Hab.* ——?

A shell of rather slight substance, incrusted with a wrinkle-roughened calcareous coating.

### Species 19. (Mus. Cuming.)

**LITHODOMUS HANLEYANUS.** *Lithod. testā parviusculā, rotundato-cylindracea, tenuissimā, anticē subexcavata et rugosōdī.*

**HANLEY'S LITHODOMUS.** Shell rather small, rotundately cylindrical, very thin, anteriorly slightly excavated and rugulose.

DUNKER, MS. in Mus. Cuming.  
*Hab.* Suez.

In this very slight species the wrinkled sculpture of the calcareous coating is at the anterior end.

### Species 20. (Mus. Cuming.)

**LITHODOMUS MALACCANUS.** *Lithod. testā parviusculā, tenui, angusti cylindracea, posticē rotundatā, anticē attenuatā et rugoso-exarata.*

**THE MALACCA LITHODOMUS.** Shell rather small, thin, narrowly cylindrical, posteriorly rounded, anteriorly attenuated and wrinkle-furrowed.

*Hab.* Malacca.

Of rather narrower cylindrical form than the preceding species, conspicuously attenuated and wrinkle-furrowed at the anterior end.

### Species 21. (Mus. Cuming.)

**LITHODOMUS APPENDICULATUS.** *Lithod. testā subcylindracea, levigata, posticē rotundatā, anticē attenuatā,*

*areā superiore pinguis excavatā, appendicibus mediocri-  
nis prominenti.*

**THE APPENDED LITHODOMUS.** Shell nearly cylindrical, smooth, posteriorly rounded, anteriorly attenuated, upper area excavated on both sides, the middle appendages being rather prominent.

*Modiola appendiculata*, Philippi, Abbild. und Besch. Conch. vol. ii. p. 150. pl. 1. f. 4.

*Hab.* Cuba.

Characterized by an excavation running on each side from the ligamentary area to the anterior extremity, which produces a raised wing-like prominence in the centre.

### Species 22. (Fig. a, b, Mus. Cuming.)

**LITHODOMUS BI-EXCAVATUS.** *Lithod. testā cylindracea,  
narrowi, posticē convexā, levigata, anticē biradiatim angulato-excavata, rugosō.*

**THE DOUBLY-EXCAVATED LITHODOMUS.** Shell cylindrical, boat-shaped, posteriorly convex, smooth, anteriorly biradiately angularly excavated, rough.

*Hab.* Island of St. Thomas, West Indies.

Very closely allied to the preceding species, but of rather different form, more decidedly excavated down each anterior slope, though the upper middle portion of the valves is less prominent.

### Species 23. (Mus. Cuming.)

**LITHODOMUS PLUMULA.** *Lithod. testā elongato-cylindracea, posticē rotundatā, levigata, anticē attenuatā, per-  
culatior rugoso-plumulata.*

**THE FEATHER LITHODOMUS.** Shell elongately cylindrical, posteriorly rounded, smooth, anteriorly attenuated, peculiarly roughly feathered.

HANLEY, Proc. Zool. Soc. 1844, p. 17.

*Hab.* Panama (Found imbedded in *Spondyli*); Cuming.

This species is especially curious in showing the feathery disposition of the incrustation on the anterior slope.

### Species 24. (Mus. Cuming.)

**LITHODOMUS PESSULATUS.** *Lithod. testā cylindracea, pos-  
ticē rotundatā, anticē decliri-attenuatā, parte posticā*

## LITHODOMUS.—PLATE IV.

*perpendiculare leviter convoluta, antice subexcavata et rugosa plumulata.*

THE BAKED LITHODOMUS. Shell cylindrical, posteriorly rounded, anteriorly slopingly attenuated, posterior part perpendicularly wrinkled, anterior slightly excavated and roughly feathered.

Hab. —?

This little species is sharply attenuated, whilst the incrustation is roughly wrinkled on the posterior as well as anterior side.

Species 25. (Mus. Cuming.)

LITHODOMUS CANALIFERUS. *Lithod. testa cylindracea, postice rotundata, antice bi-radiatum excavata et angustè multi-canaliculata.*

THE CHANNELLED LITHODOMUS. Shell cylindrical, posteriorly rounded, anteriorly biradiately excavated and narrowly many-channelled.

HANLEY, Pro. Zool. Soc. 1844, p. 16.  
Hob. Island of Zebu, Philippines; Cuming.

The calcareous crust in this species takes a very characteristic form, being rayed on the anterior slope in deep narrow channels.

Fig. 26. (Mus. Cuming.)

LITHODOMUS SUBULA. *Lithod. testa elongata, postice globosa, antice subacute attenuata, parte posticâ levigata, antice angustè canaliculata et rugoso-plumulata.*

THE AWL LITHODOMUS. Shell elongated, posteriorly globose, anteriorly rather sharply attenuated, posterior part smooth, anterior narrowly channelled and roughly feathered.

Hab. —?

Allied to *L. plumula*, but more sharply attenuated, and more narrowly channelled along the edge of the anterior slope.

# LITHODOMUS.

## PLATE V.

Species 27. (Mus. Cuming.)

**LITHODOMUS BARBATUM.** *Lith. testa elongata, oblonga, medio obtuso angulata, tenui, cornuta, minute granulato-striata, epidermide versus extremitates barbatâ induita.*

THE BEARDED LITHODOMUS. Shell obliquely oblong, obtusely angled down the middle, thin, horny, minutely granularly striated, covered with an epidermis which towards the extremity is bearded.

*Hab.* Sydney (in mud at the depth of six fathoms); Cuming.

The smallest species of the genus, of delicate horny substance, minutely grain-striated, covered towards the extremity with a bearded epidermis.

Species 28. (Fig. a, b, Mus. Cuming.)

**LITHODOMUS SEMIGRANULATUS.** *Lith. testa elongata, subirregulari, medio obtuso angulata, pellucido-cornata, posticè tergitata, antice granulato-striata, epidermide pilosa versus extremitatem induita*

THE HALF-GRAINED LITHODOMUS. Shell obliquely arched, rather irregular, obtusely angled down the middle, transparent-horny, smooth posteriorly, granularly striated anteriorly, covered towards the extremity with a hairy epidermis.

*Hab.* ——?

This differs from the preceding species in being of a more irregular arched growth, grain-striated only on the posterior area

Species 29. (Fig. 29 and 32, Mus. Cuming.)

**LITHODOMUS GOSSEI.** *Lith. testa clavata-cuneiformis, umbonibus abrupte angulato-compressa, area antice concava; latero-ventrali posticè crebristriata, antice radiis granulato-decussata.*

GOSSE'S LITHODOMUS. Shell elongately wedge-shaped, umbos abruptly angularly compressed, anterior area concave; yellowish, closely striated posteriorly, strongly granularly decussated anteriorly.

*Hab.* Jamaica; Gosse.

A very characteristic species, fretted with decussately-

grained sculpture on the hollow anterior area, while the posterior is finely striated.

Species 30. (Mus. Cuming.)

**LITHODOMUS LANIGER.** *Lith. testa elongata, solidula, antice acuminate-concordata, medio gibbosâ, obtuso angulata, conspicuâ striata, epidermide tenua, cornuta, antice dense pilosa.*

THE WOOLLY LITHODOMUS. Shell elongated, rather solid, anteriorly acuminate-twisted, gibbous in the middle, obtusely angled, conspicuously striated, with a thin horny epidermis, anteriorly densely hairy.

DUNKER MS. in Mus. Cuming.

*Hab.* Australia.

A narrow angularly distorted shell, curiously attenuated towards the anterior extremity, which is densely hairy.

Species 31. (Mus. Cuming.)

**LITHODOMUS SPLENDIDES.** *Lith. testa oblonga, naviformi, utrinque inflata, radiatum striata, margine dorsali arcuato subangulato, ventrali posticè sinuato; albidâ, epidermide nitente castanâ induita, antice subpilosa.*

THE SPLENDID LITHODOMUS. Shell oblong, boat-shaped, inflated on each side, radiately striated, dorsal margin arched, slightly angled, ventral posteriorly sinuated; whitish, covered with a shining-chestnut epidermis, rather hairy anteriorly.

*Volsella splendida*, Dunker, Pro. Zool. Soc. 1856, p. 365.  
*Hab.* Sydney.

Very broadly inflated, and covered with a beautiful shining-horny epidermis.

Species 33. (Mus. Cuming.)

**LITHODOMUS ARGENTEUS.** *Lith. testa trigono-cuneiformi, lateribus contractâ, pellucido-cornata, albante, posticè elongato-striata, antice radiatione striata.*

THE SILVERY LITHODOMUS. Shell triangularly wedge-shaped, contracted at the sides, transparent-horny; whitish, posteriorly elongately striated, anteriorly radiately striated.

LITHODOMUS.—PLATE V.

Hab. —

More contractedly angled than *no* of the preceding species, and sculptured with fine thread-like striae, extending over each side in different directions

—  
Species 34. (Mus. Cumag.)

LITHODOMUS DIVARICATUS. *Lith. testa elongato-angulo-  
zinā, antice attenuatā, margine dorsali concava, medio  
acutē angulata, ventrali subcanaliculata, superficie an-  
ticā concinna divaricatum tenuistriatā, posticā levigatā,  
corned.*

THE DIVARICATE LITHODOMUS. Shell elongately trapezoid, attenuated anteriorly, dorsal margins concave, then sharply angled, ventral faintly channelled, anterior surface neatly divaricately finely striated, posterior smooth, horny.

PHILIPPI, Zeitschrift für Malac. 1847, p. 115.  
Hab. West Indies.

Distinguished by a characteristic variation of sculpture, the anterior portion of the shell being beautifully divaricately striated, whilst the posterior is smooth and horny.

# MONOGRAPH

OF THE GENUS

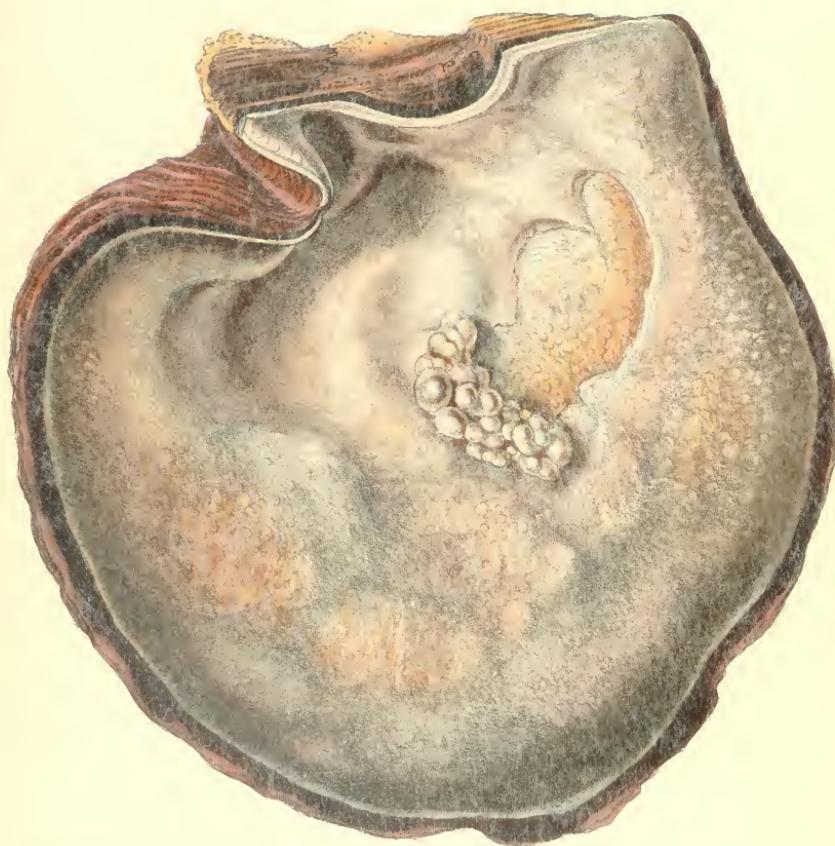

A V I C U L A.

The boy dreamt of his promised bride,  
Dressed in robes on her golden hair,  
And her cheek was glowing fresh and fair  
With the breath of morn and the soft sea-air.

*Loughfellar*

## AVICULA.

### PLATE I.

#### Genus AVICULA, Kletz.

*Testa irregularis, nunc orbicularis nunc obliquè trigona, latere antico plus minus elongato-alato, fibro-laminaris, inequivalvis, lacunæ pro byssu, intus plerumque margaritacea. Cardo edatulus, sed tuberculo oscureo in utrâque valvâ infra umbones plerumque instrutus. Ligamentum lineare, in medio plus minus dilatatum. Impressio muscularis centralis.*

Shell irregular, sometimes orbicular, sometimes obliquely triangular, with the anterior side more or less obscurely winged, fibro-lamellar, inequivalve, having an opening for the byssus, interior generally pearly. Hinge toothless, but mostly furnished in each valve beneath the umboes with an obscure tubercle. Ligament linear, more or less dilated in the middle. Muscular impression central.

Under this head are included the Lamarekian *Aeicula* represented by the characteristic *A. marginifera* and *hele-roptera*, and *Melagrina*, of which the Great Pearl Oyster, *A. margaritifera*, is the type. Though differing materially in shape, the animal is the same, and a close inspection of the shell will show that even the roundest form of *Melagrina* possesses the rudiment of a winged process. Like all shells that live attached to rocks by a byssus, the *Aeicula* vary greatly in general form, and the same species is often so variable in growth that it is not easy to identify it by description. In substance the *Aeicula* are fibro-lamellar like the *Pinnæ*, and many are remarkable for the beautifully furbelowed scales which they develop, and for the exquisitely festooned and serrated character of the epidermis. The external striae are often deposited like concentric silken ridges.

Many of the *Aeicula* secrete pearls in addition to the well-known *A. margaritifera*. Mr. Cuming possesses fine

pearls taken from the *A. macrophtera*, and some others peculiarly delicate warm hue produced by the *A. pica*.

The *Aeiculae* are abundant in the tropical and sub-tropical seas, and are handsomely represented on our own shores by the *A. Tarentina* of the Mediterranean. The smaller species, some of which are extremely fragile, attach themselves chiefly to bunches of Zoophytes.

#### Species 1. (Fig. 1 and 21, Mus. Cuming.)

AVICULA MARGARITIFERA. *Aeic. testa orbiculari, plana-concava, superè rectâ, posticè subincurvata, abique concentrica laminata, taminis versus marginem in series longitudinalibus squamularum protulita, squassis plus minus irregulariter contortis; griseo-oliveacea, prope umboem virescente.*

THE PEARLY AVICULA. Shell orbicular, flatly convex, straight at the upper part, slightly sinuated on the posterior side, everywhere concentrically laminated, lamina produced towards the margin into longitudinal rows of scales, scales more or less irregularly twisted; greyish-olive, green near the umbo.

*Myltilus marginiffer*, Linneus, Syst. Nat. p. 1153.

*Margarita Sinensis*, Leach.

*Aeicula marginififera*, De Roissy.

*Melagrina marginififra*, Lamarek.

*Aeicula melagrina*, De Blainville.

*Aeicula radiata*, Leach.

Hab. Tropical and sub-tropical seas in both hemispheres.

Of this colossal species, the well-known Pearl Oyster of the South Seas, we have figured a young specimen at Plate VIII., to show the nature of its sculpture in an early stage of growth. As the shell advances in age, and the valves thicken, the sculpture becomes obsolete.

## A V I C U L A.

### PLATE II.

Species ♀ (Mus. Cuming.)

AVICULA MACROPTERA. *Aev. testā longitūinaliter sub-quadrato-oblongā, obliquā, plus minus gibbosā, fascio-nigricante, solidē cornē, pallide radiatā, squamulis fuscis minutè cuspidatis versus marginem plus minus undulatā; superā densē inaequilaterali, extremitate angustiā in alam angustum longissimam productā.*

THE LONG-WINGED AVICULA. Shell longitudinally somewhat squarely oblong, oblique, more or less gibbose, brown-black, solidly horny, faintly rayed, more or less covered towards the margin with minutely cuspidate brown scales: very incipiently at the upper

part, anterior extremity produced into a very long narrow wing.

LAMARCK, Anim. sans vert vol. vii. p. 97.  
Hab. Moluccas.

This fine species, besides being distinguished by the long narrow winged prolongation of the anterior side, is peculiarly rayed with pale longitudinal bands, showing the places where minute cuspidate scales have been attached. In well-preserved specimens these minute scales, having the edges finely curled, cluster very densely about the margin and in the arched hollow between the body of the shell and the wing.

March, 1857.

# A V I C U L A.

## PLATE III.

Species 3. (Mus. Brit.)

**AVICULA LOTORIUM.** *Avic. testā longitudinaliter oblongā, obliquā, solidiusculā, ampliiter gibbose, margaritiferā, nacreo-nigra, extus fuso-nigrā, cornutā, decussatim striatā, superne obtuse rotundatā.*

**THE BATH AVICULA.** Shell longitudinally oblong, oblique rather solid, largely gibbose, pearly, coppery-red, externally brown-black, horny, decussately striated obtusely winged at the upper part

LAMARCK, Ann. sans vert. vol. vii. p. 97.

*Laccurvum cupreum*, Chemnitz

Hab. —?

M. Deshayes regards this species as a variety of *A. nigerocoptera*, with the anterior wing not produced. We entirely coincide with Lamarck's view, that it is distinct. The shell is of more solid growth, and more amply gibbose, while the pearly nacre, as remarked by Chemnitz, is of a peculiar deep coppery-red.

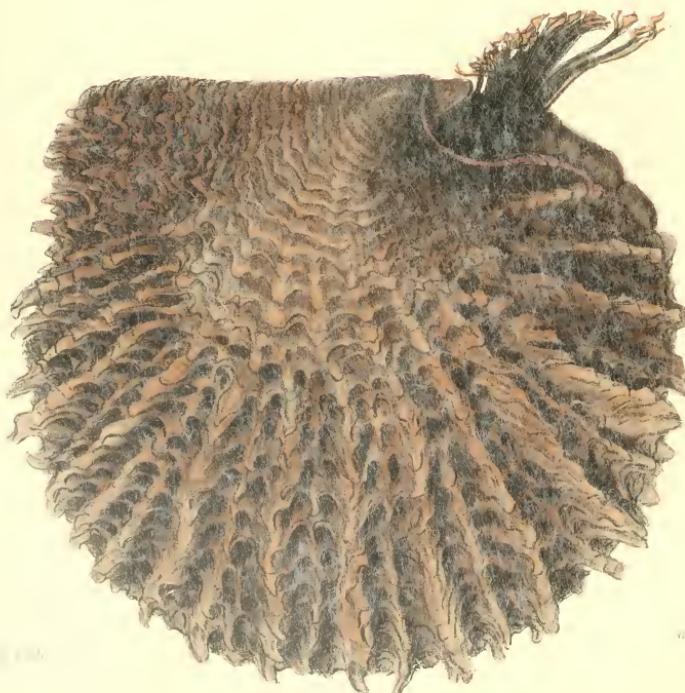

4.

5.

6.

## AVICULA.

### PLATE IV.

#### Species 4. (Mus. Cuming.)

AVICULA FLEXUOSA. *Avis. testā subquadratā, tenuiculā, compressā, subdistortā, valde inaequilaterali, supernā rectā, posticē vix alatā, longitudinaliter flexuō squamata, squamis parisi, planis, cuspidatis, hic illuc obsoletis, regulariter descendenter.*

THE FLEXUOUS AVICULA. Shell somewhat square, rather thin, compressed, somewhat distorted, very inequilateral, straight at the upper part, scarcely winged posteriorly, longitudinally flexuously scaled, scales small, flat, cuspid, here and there obsolete, descending regularly.

Hab. Cape Hillsborough, North Australia; Jukes.

A shell of somewhat square growth, having rather a distorted appearance, sculptured with small cuspid scales descending in comparatively distant flexuous rays.

#### Species 5. (Mus. Cuming.)

AVICULA LATA. *Avis. testā transversē oblongo-quadratā, subdistortā, valde inaequilaterali, posticē parum alatā, latē sinuata, concentrica deusū filo-striata, intensē rufocastanā, squamulis minutis, irregulariter curvatis, versus marginem concentricē indutā.*

THE BROAD AVICULA. Shell transversely oblong-square, rather distorted, very inequilateral, but little winged posteriorly, broadly sinuated, concentrically densely thread-striated, dark reddish-chestnut, covered to-

wards the margin with close-set irregularly festooned minute scales.

GRAY, M.S., Brit. Mus.

Hab. Port Essington and Raines' Island, Torres Straits, Australia; Lieutenant Inc.

An extremely characteristic species, of a peculiar reddish-chestnut colour, sculptured throughout with close-set thread-like concentric striae of growth, and covered towards the margin with minute irregularly festooned scales, which have the appearance of a dense pile.

#### Species 6. (Mus. Cuming.)

AVICULA CUMINGI. *Aeie. testā orbiculari, plena-concreta, supernā rectā, posticē vix sinuata, ubique concentrica et longitudinaliter squamatā, squavis longitudinalibus crispiato-spathulatis valde promiscuis, interius virescente-olivaceis, pallide radiatā.*

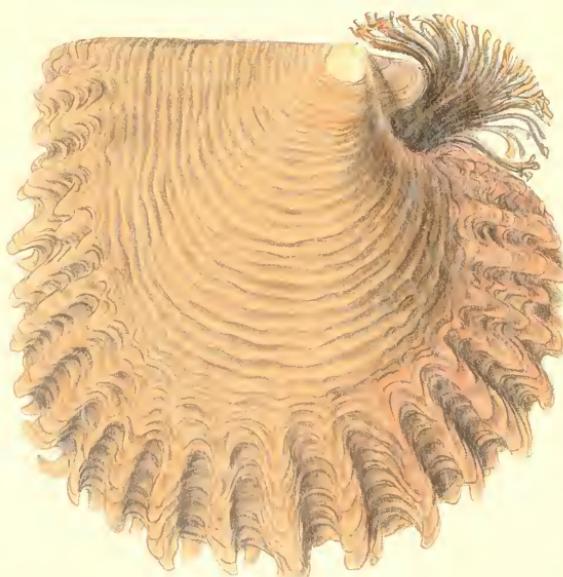

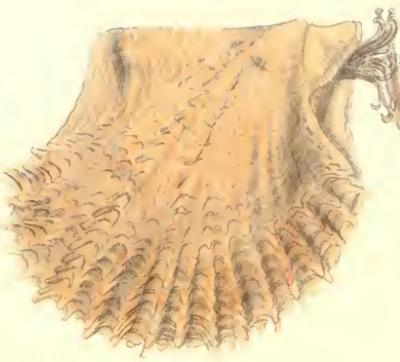

CUMING'S AVICULA. Shell orbicular, flatly convex, straight at the upper part, scarcely sinuated posteriorly, everywhere concentrically and longitudinally scaled, longitudinal scales crisplike spathulate, very promiscuous, dark greenish-olive, faintly rayed.

Hab. Lord Hood's Island, Pacific Ocean (attached to rocks, at the depth of ten fathoms); Cuming.

This fine species is quite remarkable for the dense forest of scales with which it is sculptured throughout, the scales being of an irregularly crisplike spathulate growth, developed in the most fantastic and promiscuous manner

## A V I C U L A.

### PLATE V.

Species 1 (Fig. 7 and 8, Mus. Cuming.)

**AVICULA FLABELLUM.** *Avic. testā obliquē suborbiculari,  
postvē latē subsinuatā, pellucido-cornēa, squavis lan-  
ceolatis fragilissimis concentricē longitudinaliter ra-  
diata, pallido olivacea, perjureo-nigricante irregula-  
riter radiatim lineata.*

**THE FLAN AVICULA.** Shell obliquely suborbicular, slightly broadly sinuated posteriorly, transparent horny, concentrically and longitudinally rayed with extremely fragile spear-like scales pale olive, irregularly radiately smeared with purple-black.

*Hab.* Venezuela

The characteristic sculpture of this species, which is of a comparatively fragile horny texture, consists of a mass of more fragile lanceolate scales, arranged for the most part with tolerable regularity. The shell is more or less radiately smeared with purple-black.

Species 2 (Mus. Cuming.)

**AVICULA BARBATA.** *Avic. testā orbiculari, supernē rectā,  
plano-convexē, olivaceo-flavicaute, concentricē lami-  
natā, versus marginem densē squamatis, squamis plano-  
cockleariformibus, regulariter sequentibus.*

**THE BEARDED AVICULA** Shell orbicular, straight at the upper part, flatly convex, olive-yellow, concentrically laminated, densely scaled towards the margin, scales flatly spoon-shaped, following regularly.

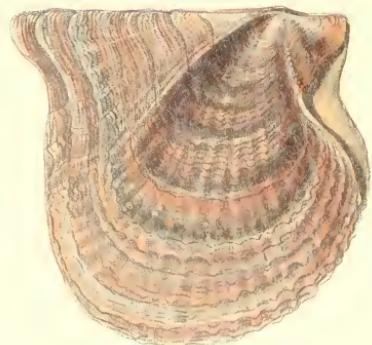

*Hab.* Panama (under stones at low water); Cuming.

Distinguished from *A. Cumingii* by the regular sequence of the scales, which, so far as we have observed, are only developed near the margin, and by its yellower tone of colour. The species is also from a different locality, and possesses a distinct uniformity of character throughout.

March, 1857.

## A V I C U L A.

### PLATE VI.

Species 10. (Mus. Cuming.)

**AVICULA ALA-PERDICIS.** *Avic. testā subquadrate-orbiculari, obliquē convexā, supernō rectā, posticē angulato-sinuatā, semipellucidō-corneā, purpureo-rufescente radiatā, undique dēsē squamulā, squamis trigono-lanceolatis, fragilibus, peculiariter marmoratā.*

**THE PARTRIDGE-WING AVICULA.** Shell somewhat squarely orbicular, obliquely convex, straight at the top, posteriorly angularly sinuated, semitransparent, horny, rayed with purple-red, densely scaled throughout, scales triangularly lanceolate, fragile, peculiarly mottled.

*Hab.* West Indies.

Of this horny species, delicately rayed with purple-red, the scales are prominently festooned in their mode of development, whilst in substance and appearance they are fragile and peculiarly mottled.

Species 11. (Mus. Cumiug.)

**AVICULA IMBRICATA.** *Avic. testā subquadratā, planiusculi, posticē angulo-productā, parvā sinuatā, oliveo-flavante, undique dēsē imbricato-squamulā, squamis cuspidatis, appressis, regularibus.*

**THE IMBRICATED AVICULA.** Shell somewhat square, rather flat, posteriorly angularly produced, but little sinuated, olive-yellow, everywhere densely imbricately scaled, scales cuspid, appressed, regular.

*Hab.* Philippine Islands; Cumiug.

The scales of this species are very numerous, flatly appressed, pointed, and of unusually regular growth.

Species 12. (Mus. Cuming.)

**AVICULA MURICATA.** *Avic. testā subobliquā quadratā, solidiusculā, leviter convexā, posticē arcuato-sinuatā, flavante, marmorato-nigro interrumpē strigatā, versus marginem dēsē squamulā, squamis angulato-lanceolatis, regularibus.*

**THE PRICKLY AVICULA.** Shell somewhat obliquely square, rather solid, slightly convex, posteriorly arcuately sinuated, pale yellow, interruptedly streaked with mottled black, densely scaled towards the margin, scales angularly lanceolate, regular.

*Hab.* Philippine Islands.

The colouring of this species is characteristic, the surface being of a yellowish cast, interruptedly rayed with marbled-black, and the scales are prominently pointed.

Species 13. (Mus. Cuming.)

**AVICULA LENTIGINOSA.** *Avic. testā subquadratā, posticē latē brevi-atalā, parvā sinuatā, planiusculā, spadiceo-flavescente, abo radiatim lentiginosā, irregulariter laminato-squamulā, squamis simplicibus, hic illuc obsoletis.*

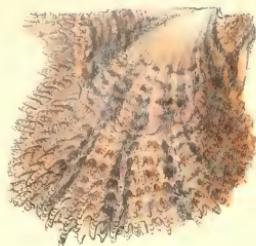

**THE FRECKLED AVICULA.** Shell somewhat square, posteriorly broadly short-winged, but little sinuated, rather flat, fawn-brown, radiately freckled with white, irregularly lamellately scaled, scales simple, here and there obsolete.

*Hab.* Moluccas.

In this species the scales are only obscurely developed with the irregular laminae of growth. The colour of the shell is a pale fawn-brown, distinguished by a characteristic pattern of mottled-white rays.

14.

15.

16.

17.

## A V I C U L A.

### PLATE VII.

Fig. 14. (Mus. Cuming.)

The shell here figured is intended to represent another state of the curiously mottled species *A. ola-perdicis*, described at Fig. 10 in the preceding Plate.

Species 15. (Mus. Cuming.)

*AVICULA PRETEXTA.* *Aovic. testa subquadrata, postice latè sinuata, levigata, livido-spadicea, maculis pallidis radiatis, maculis lineis opaco-albis corrugatis.*

THE LACED AVICULA. Shell somewhat square, posteriorly broadly sinuated, smooth, livid-fawn, rayed with pale blotches, blotches wrinkled with opaque-white lines.

*Hab.* Island of Corrigidor, Philippines; Cuming.

Of a peculiar livid-fawn colour, rayed with pale oblong blotches, which are curiously wrinkled across with opaque-white lines.

Fig. 16. (Mus. Cuming.)

A variety of *A. fibulatum*, represented at Pl. V. Fig. 7, which it is necessary to give in illustration of its exquisite variety of sculpture.

Species 17. (Mus. Cuming.)

*AVICULA TEGLULATA.* *Aovic. testa subquadrata, postice late alata, plana, tenui, subcornuta, spadicea, rufo-tincta, vel luteo-circrente, albo radiali, squamatata, squamis tenuissimas, planulas, subelongatis, distantibus.*

THE THATCHED AVICULA. Shell somewhat square, posteriorly broadly winged, flat, thin, sub-horny, fawn, tinged with red or yellowish-green, rayed with white, scaled, scales thin, flattened, rather elongated and distant.

*Hab.* Moreton Bay, Australia.

A thin broadly winged species, scarcely sinuated, of rather horny substance, of a reddish or yellowish-green hue, faintly white-rayed, armed in the rays with rather distant, prolonged, thin, flattened scales.

March, 1857.

22.

23.

24.

# AVICULA.

## PLATE VIII.

### Species 18. (Mus. Cuming.)

**AVICULA HYSTRIX.** *Avic. testā subglobosā, tenui, cornēa, virescēte, pallidē radiatā, spinis vittiformibus clavigatis, promiscuē careatis, et laminibus tunnibus projectis, indutā.*

**THE PORCUPINE AVICULA.** Shell subglobose, thin, horny, green, faintly rayed, covered with long ribbon-like spines, promiscuously curved, projected from fine laminae.

*Hab.* ——?

This little species of thin globular form is distinguished from all other species of the genus by its long promiscuously curved ribbon-like spines.

### Species 19. (Mus. Cuming.)

**AVICULA RUTILA.** *Avic. testā obliquē subquadratā, tenui, levigatā, pellucidā, oroco-rufescēte.*

**THE RUDDY AVICULA.** Shell obliquely subquadrate, thin, smooth, transparent, coppery-red.

*Hab.* Australia; Strange.

Of very simple structure, being of a thin transparent coppery-red substance, somewhat rudely developed, without any indication of scales or over-lapping laminae.

### Species 20. (Mus. Cuming.)

**AVICULA PERVIRIDIS.** *Avic. testā obliquē ovatā, convexiusculā, superē latē alatā, cornēa, perviridi, pallidē radiatā, squamis paucis exornatis mucronatis prope marginem.*

**THE GREEN AVICULA.** Shell obliquely ovate, rather convex, broadly winged at the upper part, horny, bright green, faintly rayed, with a few delicate pointed scales near the margin.

*Hab.* Australia; Strange.

Of an unusually bright-green horny substance, faintly rayed, with a few flattened pointed scales in the rays near the margin.

### Fig. 21. (Mus. Cuming.)

The young state of the large *Avicula margaritifera*, described and figured at Pl. I.

### Species 22. (Mus. Cuming.)

**AVICULA PULCHELLA.** *Avic. testā peroblique levigatā, aperturā angustiore, convexiusculā, tenissimā, permoderatā, flavonudis rufis angustis radiatā, maculis nigris lineis subtilibus opaco-albidis conspicuātis.*

**THE PRETTY AVICULA.** Shell very obliquely ovate, narrower at the upper part, rather convex, very thin, transparent horny, rayed with narrow red flames, intermixed with black blotches and fine opake-white lines.

*Hab.* Philippine Islands; Cuming.

An exceedingly transparent shell, curiously painted with interrupted rays of black spots, narrow red flames and fine opake-white lines. The shell is of very oblique growth, and broader at the base than at the upper part.

### Species 23. (Mus. Cuming.)

**AVICULA RADULA.** *Avic. testā subquadratā, planiusculā, irregulari, circa unibos levigatā, deinde squamuī auctis fibrivitis appressis armatā, aliōd, lateo-angustā.*

**THE RASP AVICULA.** Shell somewhat square, rather apressed, irregular, smooth around the unibos, then armed with flat pointed frilled scales, white, tinged with yellow.

*Hab.* ——?

A yellow-stained opake-white shell, of rude irregular growth, beset with appressed sharp-pointed frilled scales.

### Species 24. (Mus. Cuming.)

**AVICULA OCCA.** *Avic. testā obliquē oratā, convexiusculā, præseriatā valvā destratā, cornēa, solidinsculā, olivaceā, nigro interrupte radiatā, conspicue squamatā, squamis planis, crispatis, marmoratis.*

**THE HARROW AVICULA.** Shell obliquely ovate, rather convex, especially the right valve, horny, rather solid, olive, rayed with interrupted black, conspicuously scaled, scales flat, crisp, mottled.

*Hab.* Red Sea.

Allied to *A. ala-perdicis*, from which it differs chiefly in the scales being larger and more regularly festooned.

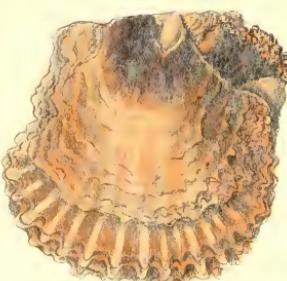

25.

26.

27.

28.

# A V I C U L A.

## PLATE IX.

### Species 24. (Mus. Cuming.)

**AVICULA FIMBRIATA.** *Aric. testā subquadrate-ovatā, superne rotundata, tenui, planisutile, levigata, irregulari, squamis laminaribus versus marginem latè fimbriata, pallide spadicata.*

**FURBLOWED AVICULA.** Shell somewhat squarely ovate, broad at the upper part, thin, rather flat, smooth, irregular, broadly furbelowed towards the margin with laminar scales, pale fawn-colour.

*Hab.* North-west coast of Australia (under pieces of coral at low water); J. E. Dring.

Of rather slight irregular structure, thin and flat, ornamented towards the margin with conspicuous rows of broadly frilled laminae.

### Species 26. (Mus. Cuming.)

**AVICULA ANOMIOIDES.** *Aric. testā subcirculari, sub-Pectiniformē, tenui, levigata, pellucido-alba, virescente pallidè radiotata, ad marginem obsoletè rugoso-laminata.*  
THE ANOMIA-LIKE AVICULA. Shell nearly circular, somewhat Pecten-shaped, thin, smooth, transparent-white, faintly rayed with pale green, obsoletely roughly laminated at the margin.

*Hab.* —?

A very characteristic species, of semitransparent white Anomia-like substance, rayed with pale green in a manner very unusual in this genus, the edge being rudely jagged with short broken laminae.

### Species 27. (Mus. Cuming.)

**AVICULA SUGILLATA.** *Aric. testō subquadrate-ovatā, irre-*

*gulari, levigata, pellucido-alba, purpureo-nigente, circa umbones lineata et radiata, fasciis opake-albis, prope marginem radiata, deinde laminis planis fimbriata.*

**THE BRUISED AVICULA.** Shell somewhat squarely ovate, irregular, smooth, transparent-white, rayed and stained about the umbones with purple-black, rayed near the margin with opake-white bands, then frilled with flat laminae.

*Hab.* Cape Hillsborough, North Australia; Jukes.

This shell is of the same transparent white Anomia-like substance as the preceding species, but differs materially in form, and is more or less stained with purple-black. Near the margin it is curiously marked with opake-white radiating bands, and at the edge is broadly flatly frilled.

### Species 28. (Mus. Cuming.)

**AVICULA CETHA.** *Aric. testō subquadratā, superne rotundata, levigata, orobrīdè spadicata, irregulariter obsoletè laminata, versus marginem dense radiatione squamata squamis minutis, planis, cuspidatis, subdistantibus, perculanter maravatis.*

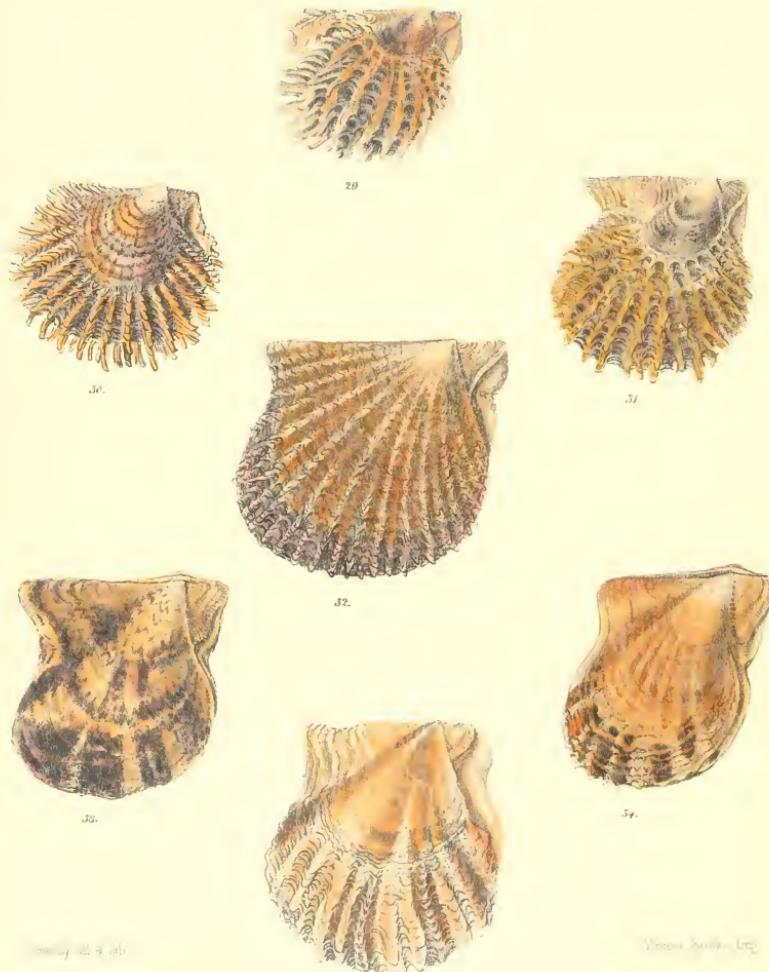

**THE SHIELD AVICULA.** Shell somewhat square, very broad at the upper part, smooth, dirty fawn-colour, irregularly obsoletely laminated, towards the margin densely radiately scaled, scales minute, flat, cuspid, rather distant, peculiarly mottled.

*Hab.* —?

The chief characteristic of this thin broadly square species is its sculpture of minute flat cuspid mottled scales, arranged in regular radiating rows.

# A V I C U L A.

## PLATE X.

Species 29. (Fig. 29 and 31, Mus. Cuming.)

**AVICULA LACUNATA.** *Avic. testa subquadrotro-ovalis, convexicula, tenui, lutescente-cornuta, conspicue dense laminita, laminae in spinis lacunatis fibulariis praecisis.*

**THE GUTTERED AVICULA.** Shell somewhat squarely ovate, rather convex, thin, yellowish-horny, conspicuously densely laminated, the laminae projecting into festooned guttered spines.

*Hab.* Australia.

The surface of this species is remarkable for its very elaborate system of horny laminae, projected into festooned guttered spines.

Species 30. (Mus. Cuming.)

**AVICULA IRRASA.** *Avic. testa subcirculari, tenuicula, cornuta, concentricè tonitudo-striata, deinde squamis angustis planis dense regulariter obsoleta, pallido spacio-rostrata.*

**THE UNSHORN AVICULA.** Shell nearly circular, rather thin, horny, concentrically laminitately striated, then densely regularly beset with flat narrow scales, light fawn-red.

*Hab.* —?

A light nearly circular species, of a delicate fawn-red colour, thickly rayed with close-set flattened narrow scales.

Species 32. (Mus. Cuming.)

**AVICULA ERATA.** *Avic. testa subquadrate, tenuicula, convexa, praeferentia valva dextra, postice substriata, aereo-lutescente, obsoletè laminitumidata, squamus tenuibus numerosis parvis planis marmoratis obsoleta.*

**THE BRONZE AVICULA.** Shell somewhat square, rather thin, convex, especially the right valve, posteriorly slightly situated, bronze-yellow, obsoletely finely

laminated, beset with numerous small thin flat mottled scales.

*Hab.* Australia.

Chiefly distinguished by its yellowish-bronze hue, thin in substance, and regularly beset with small flat mottled scales.

Species 33. (Fig. 33 and 34, Mus. Cuming.)

**AVICULA NEBULOSA.** *Avic. testa obliquè quadrata, convexicula, praeferentia valva dextra, solidiuscula, postice substriata, inter ciliis margaritacea, exter rugosa, matita, sordida alba, nigro profusa nebulosa.*

**THE CLOUDED AVICULA.** Shell obliquely square, rather convex, especially the right valve, rather solid, posteriorly slightly situated, richly pearly in the interior, externally rough, without sculpture, dull white, profusely clouded with black.

*CONRAD, Journ. Acad. Nat. Soc. Philadelphia, vol. vii.  
Hab.* Sandwich Islands.

A rather solid black clouded species, void of any external sculpture, remarkable for the rich delicate golden hue of its internal nacre.

Species 35. (Mus. Cuming.)

**AVICULA IRRADIANS.** *Avic. testa sub-Pectiniformi, irregulari, planicula, levigata vel obsoletè laminitata circa umbones, deinde rufè squamata, squamus crispati, valle irregolaribus; albida, rufo-rostrata.*

**THE RAYED AVICULA.** Shell somewhat Pecten-shaped, irregular, rather flat, smooth or obsoletely laminated around the umboes, then rudely scaled, scales crisp, very irregular; whitish, rayed with red.

*Hab.* Australia.

An irregularly formed species, of whitish hue, rayed in a characteristic manner with red.

# AVICULA.

## PLATE XI.

### Species 36. (Mus. Cuming.)

**AVICULA ZEBRA.** *Avic. testa obliquè trapezoïdeâ, superè latâ, rectâ, post è ria sinuata, medio elongato-rugosa, levigata, peltacoïdo-cornata, lineis nigricante-flavis distinctis promiscue rugata.*

**THE ZEBRA AVICULA.** Shell very obliquely trapezoid, broad and straight at the upper part, posteriorly scarcely sinuated, elongately convex in the middle, smooth, transparent horny, promiscuously striped with distant black-brown lines.

*Hab.* Moreton Bay, Australia.

This little *Avicula*, of which three specimens are exhibited in the accompanying figure, attached by their hyssus to a branch of *Sectularia*, is of a peculiarly oblique form and bright transparent horny substance, promiscuously striped with distant black-brown lines.

---

### Species 37. (Mus. Cuming.)

**AVICULA FLAMMATA.** *Avic. testa obliquè quadratâ, sub-depressa, superè angustâ, peltacoïdo-cornata, flavis refloccis, floridatim radiata.*

**THE FLAMED AVICULA.** Shell obliquely square, rather depressed, narrow at the upper part, transparent horny, rayed with bands of red-brown flames.

*Hab.* Philippine Islands; Cuming.

A small transparent horny species, of somewhat rude oblique growth, rayed with bands of red-brown flames, and having a delicate tortoise-shell aspect.

---

### Species 38. (Mus. Cuming.)

**AVICULA SCALPTA.** *Avic. testa obliquè quadratâ, superè angustissimâ, convexâ, pallide peltacoïdo-cornata, lineis capillaribus opaco-albis, promiscue divergentibus, radicatis.*

**THE SCRATCHED AVICULA.** Shell obliquely square, rather narrow at the upper part, convex; pale transparent horny, rayed with opaque-white hair-lines, promiscuously diverging.

*Hab.* Australia.

A rather convex shell, of a pale, horny texture, curiously marked with opaque-white hair-lines, promiscuously diverging off.

### Species 39. (Mus. Cuming.)

**AVICULA PERNOIDES.** *Avic. testa obliquè circulari, superè subangustâ, planâ, solidissimâ, rugosa, nubicâ, ad marginem irregulariter creatâ; laterante-albâ, purpureo-nigro radiatâ et conspicue marmorata.*

**THE PERNA-LIKE AVICULA.** Shell obliquely circular, rather narrow at the upper part, flat, rather solid, rough, without external sculpture, irregularly notched at the margin; yellowish-white, rayed and conspicuously mottled with purple-black.

*Hab.* —?

The most noticeable feature in this species is its bold, purple-black marbled paiting, which is particularly conspicuous in the marginal interior.

---

### Species 40. (Mus. Cuming.)

**AVICULA ASSULA.** *Avic. testa subquadrato-ovata, solidissimâ, posticè subsinuata, prope umbones obsolete laminata, deinde squamis lanceolatis fragilibus fimbriatis obtusa; subcornata, purpureo-rufo radiata et marmorata.*

**THE SLAB AVICULA.** Shell somewhat squarely ovate, rather solid, slightly sinuated posteriorly, obsoletely laminated near the umbones, then beset with festoons of fragile lanceolate scales; somewhat horny, rayed and mottled with purple-red.

*Hab.* West Indies.

A simple stout horny shell, rayed and mottled with purple-red, densely beset towards the margin with festoons of fragile lanceolate scales.

---

### Species 41. (Mus. Cuming.)

**AVICULA CHAMOIDES.** *Avic. testa subquadrato-circulari, tenui, cornata, concentricâ laminata, laminae plus minus ampliter rotundis; olivacea, undulo-nigra maculata.*

**THE CHAMA-LIKE AVICULA.** Shell somewhat squarely circular, thin, horny, concentrically laminated, laminae more or less largely branched; olive, blotched with wavy black.

*Hab.* —?

A pretty horny species, of which a cluster of four specimens is represented within a valve of *A. margaritifera*, remarkable for the bold Chama-like branching out of the concentric laminae.

# AVICULA.

## PLATE XII.

Species 42. (Mus. Cuming.)

**AVICULA PUNCTULATA.** *Avic.* testā obliquē ovalā, pos-  
tici subsinuatā, cornēa, solidiscutā, levigatā, vividē  
olivaceo-viridi, punctulis minutis opaco-albis radiatō.

**THE DOTTED AVICULA.** Shell obliquely ovate, slightly  
sinuated posteriorly, horny, rather stout, smooth,  
bright olive-green, rayed with minute opake-white  
dots.

*Hab.* — ?

A rather stout horny species, of a particularly bright  
olive-green colour, rayed throughout with minute opake-  
white dots.

Species 43. (Fig. a, b, Mus. Cuming.)

**AVICULA ELECTRINA.** *Avic.* testā oblongā, plus minus  
producat, convexiscutā, levigatā, virecē rufō-auran-  
tiā, pallidē radiatā, interdum punctulis opaco-albis as-  
persā, valvā dextrā prope umbonem plus minus nigro  
maculatā.

**THE AMBER AVICULA.** Shell obliquely oblong, more or  
less produced, rather convex, smooth, bright reddish-  
orange, faintly rayed, sometimes sprinkled with  
opake-white dots, right valve more or less blotched  
with black near the umbo.

*Hab.* Moluccas.

A species of characteristic oblique oblong growth, re-  
markable for its bright reddish-orange colour.

Species 44. (Fig. a, b, Mus. Cuming.)

**AVICULA ALA-CORVI.** *Avic.* testā obliquē oblongā, planā,  
lingulatā, levigatā, intenſe purpureo-nigro punctulis  
opaco-albis interdum aspersā, sepe albā prope umbones,  
purpureo-nigro maculatā.

**THE CROW'S-WING AVICULA.** Shell obliquely oblong,  
flat, lingulate, smooth, deep purple-black, sometimes  
sprinkled with opake-white dots, often white near  
the umboes, blotched with purple-black.

*Ala corvi*, Chemnitz, Conch. Cab. vol. viii. p. 144. pl. 81.  
f. 727.

*Arcula lingulata*, Deshayes.

*Hab.* Red Sea.

An obliquely oblong depressed lingulate form, of a char-  
acteristic deep purple-black colour, sometimes sprinkled  
with opake-white dots.

Species 45. (Mus. Cuming.)

**AVICULA SMARAGDINA.** *Avic.* testā elongato-oblongā, per-  
obliquā, irregulari, convexā, levigatā, intenſe smarag-  
dinā, valvā dextrā saturatā maculatā.

**THE EMERALD-GREEN AVICULA.** Shell elongately ob-  
long, very oblique, irregular, convex, smooth, dark  
emerald-green, right valve darker-blotted.

*Hab.* Moluccas?

This singular species is of a peculiar narrow oblique  
oblong form, of a conspicuous uniform dark green colour.

Species 46. (Mus. Cuming.)

**AVICULA MALLEOIDES.** *Avic.* testā perobliquē lingulatā,  
depresso-planā, levigatā, irregulari, virescente-alba.

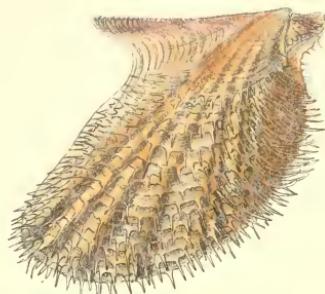

**THE MALLEUS-LIKE AVICULA.** Shell very obliquely lin-  
gulate, depresso flattened, smooth, irregular, green-  
ish-white.

*Hab.* Australia.

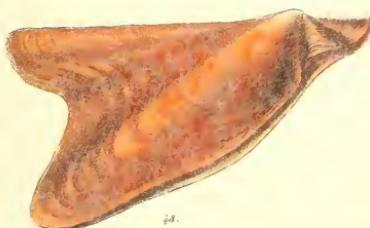

Very like a *Malleus* in form and want of colour, and  
also in being void of sculpture.

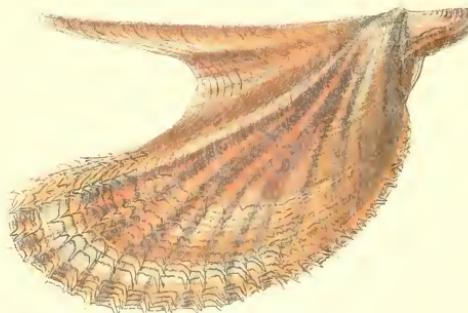

47a.

48.

49.

47b.

## A V I C U L A.

### PLATE XIII.

Species 47. (Fig. n. b, Mus. Cuming.)

AVICULA TARENTINA. *Avic. testā obliquē ovalā, posticē acutē alatā, levigatā vel obsoletē costatā, concentricē fibroso-laminatā, laminae spinis muricatis obsitā; sordidū olivaceū, purpurascens-fusco radiatā.*

THE TARENTUM AVICULA. Shell obliquely triangular, posteriorly sharply winged, smooth or obsoletely ribbed, concentrically fibrously laminated, laminae beset with prickly spines; dirty olive, rayed with purplish-brown. *Mytilus hirundo, pars, Linneus, Syst. Nat. 12th edit. p. 1159.*

*Avicula hirundo*, Turton.

*Avicula Tarentina*, Lanarek.

*Avicula filacea*, Lanarek.

*Avicula aculeata*, Sowerby.

*Avicula Anglica*, Brown.

*Avicula Atlantica*, Brown.

*Hab.* Mediterranean.

This well-known species, which is not uncommon in the Mediterranean, occurs with rarity on our own coast. The prickly spines are projected from its fibrous epidermis.

Species 48. (Mus. Cuming.)

AVICULA IRIDESCENTS. *Avic. testā obliquē trigonā, convexiscauda, posticē latē sinuatā, striis minutis undulatis*

*latis undique angustatis, versus marginem fibratissimā, auranto-roja, subiridescente.*

THE IRIDESCENT AVICULA. Shell obliquely triangular, rather convex, posteriorly broadly sinuate, sculptured throughout with fine waved striae, festooned towards the margin; orange-red, somewhat iridescent.

*Hab.* Moluccas.

Of very oblique growth, but not materially winged, of a bright orange-red colour, having a bronze or iridescent hue.

Species 49. (Mus. Cuming.)

AVICULA CASTANEA. *Avic. testā subangustā transversā, porobliquā, convexiscauda, posticē subproductā, munitā undato-striatā, striis versus marginem fibratissimā; intensē purpuro-castaneā.*

THE CHESTNUT AVICULA. Shell somewhat narrowly transverse, very oblique, rather convex, posteriorly somewhat produced, finely wave-striated, striae festooned towards the margin; dark purple-chestnut.

*Hab.* Island of Mindoro, Philippines; Cuming.

The form of this species is narrower transversely and more winged than the preceding species, and in colour it is of a very dark purple-chestnut. The sculpture is similar.

51.

51.

52.

53.

54.

55.

56.

# AVICULA.

## PLATE XIV.

### Species 50. (Mus. Cuming.)

AVICULA FIBROSA. *Avic. testā subovatā, posticē subproducatā, tenuiculā, convexā, castaneo-rufā, epidermide fibrosi densus fibrinatis, quasi squamulis, indutā.*

THE FIBROUS AVICULA. Shell somewhat ovate, posteriorly rather produced, rather thin, convex; chestnut-red, covered with a fibrous epidermis, elaborately festooned like scales.

Hab. Catanaau, Island of Luzon, Philippines; Cuming.

A species of elegant form, moderately winged, covered with a fibrous epidermis, developed in scale-like festoons.

---

### Species 51. (Mus. Cuming.)

AVICULA TROCHILUS. *Avic. testā elongato-trigonā, obliquā, conicusincolā, posticē acutē alatā, levigatā; vires aureo-rufā, superne aureo-lutescens.*

THE HUMMING-BIRD AVICULA. Shell elongately triangular, oblique, rather convex, posteriorly sharply winged, smooth; bright orange-red, golden-yellow towards the upper part.

Hab. Philippine Islands; Cuming.

This little winged species is remarkable for its bright orange-red colouring, passing towards the upper part into golden-yellow, distinct in tone from that of *A. crocea*.

---

### Species 52. (Mus. Cuming.)

AVICULA AQUATILIS. *Avic. testā elongato-transversā, intense purpureo-castaneā, posticē conspicue alatā, alatā longissimā, latā, fortiter plicato-indutā.*

THE RIPPLED AVICULA. Shell elongately transverse, deep purple-chestnut, posteriorly conspicuously winged, wings long, broad, strongly plicately waved.

Hab. Moluccas.

The wing of this little dark purple-chestnut species is much elongated and broad in proportion to the body of the shell, and strongly rippled in relief throughout.

---

### Species 53. (Mus. Cuming.)

AVICULA PERUVIANA. *Avic. testā ovatā, convexā, subglobosā, solidincolā, superne latā, posticē parum sinuatā; castaneā, pallidā radiatā, epidermide fibrosa fibrinata indutā.*

THE PERUVIAN AVICULA. Shell ovate, convex, sub-globose, rather solid, broad at the upper part, but little sinuated posteriorly; chestnut, faintly rayed, covered with a fibrous festooned epidermis.

Hab. Peru.

A large subglobose shell, of rather solid growth, broadly developed along the hinge-margin, and but little sinuated on the posterior side.

---

### Species 54. (Mus. Cuming.)

AVICULA SCABRIUSCULA. *Avic. testā elongato-transversā, perangustā, posticē conspicue alatā; sordidè albā, subpellucidō-cornēa, epidermide pulcherrimā eximie scabrosā indutā, ad alam undulata.*

THE ROUGH AVICULA. Shell elongately transverse, very narrow, posteriorly conspicuously winged; dull white, subtransparent horny, covered with a beautiful delicately scaled epidermis, rippled on the wing.

Hab. Australia.

A characteristic elongately winged species, of a pale sub-transparent texture, covered with a very peculiar scabrous epidermis.

---

### Species 55. (Mus. Cuming.)

AVICULA PRODUCTA. *Avic. testā subtriangularis, convexā, obliquē elongato-productā, perangustā, posticē acutē alatā, peculiariter profundē sinuatā; vires purpureo-castaneā, epidermide eximie fibrosā versus marginā indutā.*

THE PRODUCED AVICULA. Shell somewhat triangular, convex, obliquely elongately produced, very narrow, posteriorly sharply winged, peculiarly deeply sinuated; bright purple-chestnut, covered towards the margin with a fine fibrous epidermis.

Hab. Red Sea.

This interesting species is chiefly remarkable for its peculiarly narrow obliquely produced form, and sharp wing.

---

### Species 56. (Mus. Cuming.)

AVICULA SIGNATA. *Avic. testā subtriangularis, obliquē productā, posticē perangustā elongato-alatā, late sinuatā; nigricante-castaneā, epidermide densi fibrinata fibrosā indutā.*

THE REMARKABLE AVICULA. Shell somewhat triangularly square, obliquely produced, posteriorly very narrowly elongately winged, broadly sinuated; blackish-chestnut, covered with an elaborately festooned fibrous epidermis.

Hab. —?

A fine typical species of this winged section of the genus, of very dark chestnut-colour, covered with a very characteristic festooned fibrous epidermis.

57.

58.

59.

60.

## A V I C U L A.

### PLATE XV.

Species 57. (Mus. Cuming.)

AVICULA CROCEA. *Avic. testā subangustè obliquā, convexā, levigatā, striis simplicibus incrementi, alā longissimā, granili; vividè croco-miniatā, fasciis castaneis angustis radiatā.*

THE SAFFRON AVICULA. Shell rather narrowly oblique, convex, smooth, with simple striae of growth, wing very long and slender; bright saffron-red, rayed with narrow chestnut bands.

CHEMNITZ, Conch. Cab. vol. xi. pl. 205. f. 2025, 2026.  
*Avicula Chinensis*, Leach.

Hab. Island of Mindoro, Philippines; Cuming.

Conspicuously distinguished by its bright saffron-red colour and very long slender wing.

Species 58. (Mus. Cuming.)

AVICULA MARMORATA. *Avic. testā obliquè subquadratā, marginitacē, epidermide tenui deciduā indistinctā, concentricè striatā, purpureo-rufō undique undato-marmoratā, intensiore rufā versus marginem, obscurè pallidè radiatā, alā latineculā.*

THE MOTTLED AVICULA. Shell obliquely somewhat square, pearly, covered with a thin deciduous epidermis, concentrically striated, mottled throughout with waved purple-red, towards the margin darker red, obscurely light-rayed, wing rather broad.

Broadly winged, of a solid pearly texture, covered with

a rather thin epidermis, painted with a mottled character, which becomes more and more obsolete towards the margin.

Species 59. (Mus. Cuming.)

AVICULA SPECTRUM. *Avic. testā perobliquā, convexiusculā, subvargitacē, epidermide pallidè spadiceā, in striis concentricis serratis indutā, alā sviproducta.*

THE GHOST AVICULA. Shell very oblique, rather convex, somewhat pearly, covered with a light-drab epidermis, arranged in concentric striae, serrated at the edge, wing rather produced.

Hab. Island of Mindoro, Philippines; Cuming.

Very oblique in form, and of a pale, ghastly drab-colour.

Species 60. (Mus. Cuming.)

AVICULA FORMOSA. *Avic. testā oblongo-ovatā, convexā, solidineculā, levigatā, intensè rufā, livido-purpureo-tinctā, concentricè sulcato-striatā, alā latineculā, vix sinuatā.*

THE HANDSOME AVICULA. Shell oblong-ovate, convex, rather solid, smooth, dark-red, tinged with livid-purple, concentrically groove-striated, wing rather broad, scarcely sinuated.

Hab. —?

This fine species is allied to *A. heteroptera*, but the wing is less elongated, and it differs in form.

64

65.

66.

67.

68.

69.

70.

# AVICULA.

## PLATE XVI.

### Species 61. (Mus. Cuming.)

**AVICULA INQUINATA.** *Avic. testā angustē obliquā, convexiusculā, levigatā, viride castaneo-rufo inquinatā, epidernide liratā minutē serratā versus marginem indutā, alā latā superficialiter canaliculata.*

**THE DYED AVICULA.** Shell narrowly oblique, rather convex, smooth, stained with bright chestnut-red, covered towards the margin with a minutely-serrated ridged epidermis, wing broadly superficially channelled.

*Hab.* Singapore.

Very obliquely formed, with the wing unusually broadly superficially channelled.

### Species 62. (Mus. Cuming.)

**AVICULA EXIMIA.** *Avic. testā angustē elongatā, tenui, castaneo-rufa, iridescente, epidernide minutē serratā versus marginem undulatā, valvū dextrā eleganter marmoratā et radiatā.*

**THE DELICATE AVICULA.** Shell narrowly elongated, thin, iridescent, chestnut-red, covered towards the margin with a minutely-serrated epidermis, right valve elegantly mottled and rayed.

*Hab.* — ?

An extremely delicate elongately-winged shell, of a peculiar iridescent chestnut-colour.

### Species 63. (Mus. Cuming.)

**AVICULA GREGATA.** *Avic. testā obliquē rotundatā, convexa, alā longissimā, gracili; pellucido-purpureo-rufa; epidernide fibrosā foliatā minutē serratā indutā.*

**THE GREGARIOUS AVICULA.** Shell obliquely rounded, convex, with a wing very long and slender; transparent purple-red; covered with a minutely-serrated festooned fibrous epidermis.

*Hab.* Tutuilla, Samoa Islands.

A transparent purple-red shell, rather rounded and convex, with a slender elongated wing, covered with a beautifully-serrated, festooned, fibrous epidermis.

### Species 64. (Mus. Cuming.)

**AVICULA SEMI-SAGITA.** *Avic. testā obliquē subquadratā,*

*convexiusculā, cinereo-griseā vel nigricante, purpureo undatā, epidernide fibrosā minutē foliatā indutā in liris confertis concentricis.*

**THE HALF-ARROW AVICULA.** Shell obliquely subquadrate, rather convex; ash-grey or blackish, purple waved, covered with a minutely-festooned fibrous epidermis in close-set concentric ridges.

*LAMARCK, Anim. sans vert. vol. vii. p. 98.*

*Hab.* — ?

This is the nearest to agree with Lamarck's definition of *A. semi-sagitta*. The identification is necessarily doubtful.

### Species 65. (Mus. Cuming.)

**AVICULA ARGENTEA.** *Avic. testā suborbiculari, alā latā productā, solidesculā, argenteo-griseā, purpureo undatā, pallidē radiatā, epidernide vix nullā.*

**THE SILVERY AVICULA.** Shell suborbicular, with a broad produced wing, rather solid, silvery-grey, rippled with purple, faintly rayed, epidermis very slight.

*Hab.* — ?

Of a peculiar silvery hue, prettily rayed, with rippled purple, having white rays passing through it.

Fig. 66.

This shell has all the appearance of a distinct species, but it is entirely covered with a coating of coral.

### Species 67. (Mus. Cuming.)

**AVICULA HETEROPTERA.** *Avic. testā obliquē orbiculari, alā longissimā, convezā, levigatā, liratā, margaritacea, viride rufo-castanea, obscurè angustē radiatā, valvis inaequibus.*

**THE DISSIMILARLY-WINGED AVICULA.** Shell obliquely orbicular, with a very long wing, convex, smooth, pearly, bright reddish-chestnut, obscurely narrowly rayed, valves unequal.

*LAMARCK, Anim. sans vert. vol. vii. p. 98.*

*Avicula sterna, Gould.*

*Hab.* New Holland.

There can be little doubt of this being the true Lamarckian *A. heteroptera*.

68.

— 69 —

— 70 —

71.

— 72 —

— 73 —

74.

# A V I C U L A.

## PLATE XVII.

### Species 68. (Mus. Cuming.)

**AVICULA PLACUNOIDES.** *Avic. testā longitudinaliter ovatā, supernē subquadratā, tenui, semipellucidā, planā, sobernā, lutescente-albā, fasciis angustis opaco-albis undetis radiatā, nigricante-purpureis promiscue maculatā.*

**THE PLACUNA-LIKE AVICULA.** Shell longitudinally oval, somewhat square at the upper part, thin, semitransparent, flat, rather horny, yellowish-white, rayed with narrow waved opaque white bands, promiscuously blotched with blackish-purple.

*Hab.* Australia.

Remarkable for its thin *Placuna*-like structure, rayed irregularly with waved opaque bands, and promiscuously blotched with purple-black.

### Species 69. (Mus. Cuming.)

**AVICULA LIBELLA.** *Avic. testā obliquē orbiculari, valde convexā, alā gracili, elongatā; lutescente-cornuatā; epidermide serratā minutū foliata indutā.*

**THE DRAGON-FLY AVICULA.** Shell obliquely orbicular, very convex, with a long slender wing; yellowish-horny; covered with an elaborately festooned serrated epidermis.

*Hab.* China Seas.

A semitransparent, horny, elongately-winged shell, most elaborately festooned with a minutely-serrated epidermis.

### Species 70. (Mus. Cuming.)

**AVICULA VEXILLUM.** *Avic. testā obliquē quadratā, inquinata, pellucido-cornuatā, tenuissimā, strigis ampliis purpureo-rufis marmoratā.*

**THE FLAG AVICULA.** Shell obliquely square, inequivalve, transparent horny, very thin, marbled with large purple-red streaks.

*Hab.* Ceylon (in deep water). : Gardner.

A shell of very transparent substance, boldly marked with promiscuous dark stripes, destitute of any winged appendage.

### Species 71. (Mus. Cuming.)

**AVICULA PICA.** *Avic. testā trigono-ovatā, crassā, convexā, levigatā, virescente-albā, radis nigricante-purpureis irregularris marmoratā, margine laminari, intus conspicue picid.*

**THE PIED AVICULA.** Shell triangularly oval, thick, convex, smooth, greenish-white, marbled with irregular

blackish-purple rays, margin laminar, conspicuously pied within.

GOULD, Moll. U. S. Exploring Expedition, p. 443. pl. 39 f. 59.

*Avicula maculata.*, Gould.

*Hab.* Pitcairn's Island.

A species of solid structure, inlaid with an extremely delicate yellowish nacre, remarkable for its prolonged laminar margin being conspicuously pied.

### Species 72. (Mus. Cuming.)

**AVICULA MAURA.** *Avic. testā obliquē oblongā, tenui, levigatā, nitente-nigrā, alio sparsim marmoratā, epidermide decidua minutiè serratā, alā subproductā.*

**THE MOOR AVICULA.** Shell obliquely oblong, thin, smooth, shining-black, sparingly marbled with white, minutely-serrated deciduous epidermis, wing rather produced.

*Hab.* Sydney.

A thin, shining, jet-black shell, with a finely serrated thick-set epidermis on the ear.

### Species 73. (Mus. Cuming.)

**AVICULA CORNEA.** *Avic. testā obliquē oblongā, convexus-culā, olivaceo-cornuatā, levigatā, alā latiusculā.*

**THE HORNY AVICULA.** Shell obliquely oblong, rather convex, olive, horny, smooth, wing rather broad.

*Hab.* Jamaica; Gosse.

A plain, olive, horny shell, moderately winged, attaching itself to *Gorgia*.

### Species 74. (Mus. Cuming.)

**AVICULA PUCATA.** *Avic. testā longitudinaliter oblongā, subquadratā, convexā, tenuiculā, purpureo-rufa densè radiatā, laminis tenuibus planis concentricis ampliter serratis obsita.*

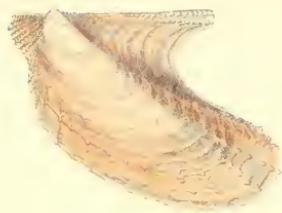

**THE STAINED AVICULA.** Shell longitudinally oblong, somewhat square, convex, rather thin, closely rayed with purple-red, beset with thin, largely serrated, flat, concentric laminae.

GOULD, Pro. Bost. Soc. Nat. Hist. vol. iii. p. 309; Moll. U. S. Exploring Expedition, p. 441. pl. 39. f. 551  
*Hab.* Japan.

Chiefly distinguished by its radiating pattern of red stains.

68.

69.

70.

71.

## AVICULA.

### PLATE XVIII.

Species 72. (Fig. 68, Mus. Brit.)

AVICULA VITREA. *Avic. testā obliquā curvātā, subspathulatā, alā latē sinuatā, tenui; pellucido-albā; parum convexā, piano-squamata, squamis ferè obsolete.*

THE GLASSY AVICULA. Shell obliquely curved, somewhat spatulate, with the wing broadly sinuated, thin; transparent-white but little convex, flatly scaled, scales almost obsolete.

Hab. West Indies.

Flat and transparent, of thin *Placuna*-like substance, obliquely spatulate, with a few scarcely-developed festooned scales.

Species 73 (Fig. 69, Mus. Brit.)

AVICULA ATLANTICA. *Avic. testā obliquā ovalē, solidusculd, convexā, alā sublatē sinuatā, levigatā; purpureofusca, fasciis angustis pallidis radiatā, fasciis maculis fusciis cuspidiatis vittatis.*

THE ATLANTIC AVICULA. Shell obliquely ovate, rather solid, convex, wing rather broadly sinuated, smooth; purple-brown, rayed with light narrow bands, bands filleted with brown arrow-headed spots.

LAMARCK, Ann. sans vert. vol. vii. p. 98.  
*Mytilus avicula seu kirundo* Chemnitz.

Hab. Australia. Jukes.

This species has doubtless a wide range of habitation. Its most distinguishing characteristic is the rayed pattern of narrow light bands, filleted with brown arrow-headed marks.

Species 74. (Fig. 70, Mus. Brit.)

AVICULA RETICULATA. *Avic. testā trigono-ovatā, alā latiusculā; intenso purpureo-costatā; tenui concentricē striatā, epidermide minutē reticulatā prope marginem indutā.*

THE RETICULATED AVICULA. Shell triangularly ovate, with the wing rather broad; dark rich purple-chestnut; finely concentrically striated, covered near the margin with minutely reticulated epidermis.

Hab. Australia.

Allied to *A. lata*, but rather different in form, and of darker colour. The epidermis presents a most exquisite example of finely tufted network.

Species 75. (Fig. 71, Mus. Brit.)

AVICULA SAVIGNYI. *Avic. testā obliquē oblongā, trigonā, alā late sinuata; intenso purpureo-nigrā, striis elevatis concentricis reticulatio indutā.*

SAVIGNY'S AVICULA. Shell obliquely oblong, triangular, with the wing broadly sinuated; dark purple-black, covered with a concentric network of raised striae.

DESHAYES, Ann. sans vert. vol. vii. p. 102.

*Avicula heteroptera*, Sowerby, in Genera of Shells.  
*Mytilus morio*; Dillwyn.

Hab. Pulo Condore; Mus. Brit.

A fine purple-black species, with a broad, expanded, not elongated, wing, beautifully sculptured with fine concentric striae.

June, 1857.
