## MECHANICAL TESTS

MADE WITH THE

## U. S. TESTING MACHINE,

(CAPACITY, 800,000 POUNDS,)

WATERTOWN ARSENAL, MASS.,

NOVEMBER 5, 1883,

BY THE
U. S. ORDNANCE DEPARTMENT,

AT THE REQUEST OF THE
fommissioners for the frection of the frublie fifuildings,
IN THE

CITY OF PHIIADELPHIA, PA.

TESTS BY COMPRESSION, TWELVE BRICK PIERS.
-140 be artative arint rax $\square \cdot$
$\qquad$
$\qquad$ $x_{2}$
$\qquad$

The Piers were tested between flat compression platforms.
The covering plates of cast iron at the ends of the piers were allowed to remain in position, removing the tie-bolts during the tests.

The compression measurements and sets. were determined by a micrometer, secured at either end to the compression platforms of the Testing Machine; thus indicating the total amount of compression which occurred as each increment of load was applied to the piers. Upon the removal of the loads to the initial 5000 lbs ., the amount of permanent set was found.

Plates of Cast Iron, enclosing brick piers, planed true on both sides, and made perfectly parallel by means of the swivel tie-bolts.

Style of Piers.

Mariss on Pier.
No. 3255.
A. 1. Dobbins, Lime. August 14, 1882.

Length, $12^{\prime \prime} .75$.
Sectional area, $12^{\prime \prime} .75 \times 13^{\prime \prime} .00=165.75$.
Weight, 147 lbs.

## N O T E.

Upon examination, it was found that the mortar in most of the piers did not cover the ends completely, so that the covering plates only took bearing over part of the surface. In such cases, plaster, of paris was used to fill the spaces and give even bearings ; allowing the plaster to set at least twenty-four hours before testing.

Correct.
J. E. Howard.

F. H. Parker,<br>Major of Ordnance Commanding.
