VOLUME IV

### ELECTRICAL DISCOVERY AND INVENTION

**Early experiments.**—That amber when rubbed attracts light bodies was known in the earliest times. "It is the one single experiment in electricity which has come down to us from the remotest antiquity. . . . The power of certain fishes, notably what is known as the 'torpedo,' to produce electricity, was known at an early period, and was commented on by Pliny and Aristotle." Until the sixteenth century there was no scientific study of

master of Magdeburg, Otto von Guericke. The latter first noted the sound and light accompanying electrical excitation. These were afterwards independently discovered by Dr. Wall, an Englishman, who made the somewhat prophetic observation, "This light and crackling seems in some degree to represent thunder and lightning." Sir Isaac Newton made a few experiments in electricity, which he exhibited to the Royal Society. . . .

THE ORIGINAL ELECTRICAL MACHINE OF VON GUERICKE

A globe of sulphur was rotated on an axis, and electricity produced by the friction of the hands held against the globe

these phenomena. "Dr. Gilbert can justly be called the creator of the science of electricity and magnetism. His experiments were prodigious in number. . . . To him we are indebted for the name 'electricity,' which he bestowed upon the power or property which amber exhibited in attracting light bodies, borrowing the name from the substance itself, in order to define one of its attributes. . . . This application of experiment to the study of electricity, begun by Gilbert three hundred years ago, was industriously pursued by those who came after him, and the next two centuries witnessed a rapid development of science. Among the earlier students of this period were the English philosopher, Robert Boyle, and the celebrated burgo-

Francis Hawksbee was an active and useful contributor to experimental investigation, and he also called attention to the resemblance between the electric spark and lightning. The most ardent student of electricity in the early years of the eighteenth century was Stephen Gray. He performed a multitude of experiments, nearly all of which added something to the rapidly accumulating stock of knowledge, but doubtless his most important contribution was his discovery of the distinction between conductors and non-conductors. . . . Some of Gray's papers fell into the hands of Dufay, an officer of the French army, who, after several years' service, had resigned his post to devote himself to scientific pursuits. . . . His most

important discovery was the existence of two distinct species of electricity, which he named 'vitreous' and 'resinous.' . . . A very important advance was made in 1745 in the invention of the Leyden jar or phial. As has so many times happened in the history of scientific discovery, it seems tolerably certain that this interesting device was hit upon by at least three persons, working independently of each other. One Cuneus, a monk named Kleist, and Professor Muschenbroeck, of Leyden, are all accredited with the discovery. . . . Sir William Watson perfected it by adding the outside metallic coating, and was by its aid enabled to fire gunpowder and other inflammables."—T. C. Mendenhall, *Century of electricity*, ch. 1.

1745-1747.—Franklin's identification of electricity with lightning.—"In 1745 Mr. Peter Collinson of the Royal Society sent a [Leyden] jar to the Library Society of Philadelphia, with instructions how to use it. This fell into the hands of Benjamin Franklin, who at once began a series of electrical experiments. On March 28, 1747, Franklin began his famous letters to Collinson. . . . In these letters he propounded the single-fluid theory of electricity, and referred all electric phenomena to its accumulation in bodies in quantities more than their natural share, or to its being withdrawn from them so as to leave them minus their proper portion." Meantime, numerous experiments with the Leyden jar had convinced Franklin of the identity of lightning and electricity, and he set about the demonstration of the fact. "The account given by Dr. Stuber of Philadelphia, an intimate personal friend of Franklin, and published in one of the earliest editions of the works of the great philosopher, is as follows:—'The plan which he had originally proposed was to erect on some high tower, or other elevated place, a sentry-box, from which should rise a pointed iron rod, insulated by being fixed in a cake of resin. Electrified clouds passing over this would, he conceived, impart to it a portion of their electricity, which would be rendered evident to the senses by sparks being emitted when a key, a knuckle, or other conductor was presented to it. Philadelphia at this time offered no opportunity of trying an experiment of this kind. Whilst Franklin was waiting for the erection of a spire, it occurred to him that he might have more ready access to the region of clouds by means of a common kite. He prepared one by attaching two cross-sticks to a silk handkerchief, which would not suffer so much from the rain as paper. To his upright stick was fixed an iron point. The string was, as usual, of hemp, except the lower end, which was silk. Where the hempen string terminated, a key was fastened. With this apparatus, on the appearance of a thunder-gust approaching, he went into the common, accompanied by his son, to whom alone he communicated his intentions, well knowing the ridicule which, too generally for the interest of science, awaits unsuccessful experiments in philosophy. He placed himself under a shed to avoid the rain. His kite was raised. A thunder-cloud passed over it. No signs of electricity appeared. He almost despaired of success, when suddenly he observed the loose fibres of his string move toward an erect position. He now pressed his knuckle to the key, and received a strong spark. Repeated sparks were drawn from the key, a phial was charged, a shock given, and all the experiments made which are usually performed with electricity.' And thus the identity of lightning and electricity was proved. . . . Franklin's proposition to erect lightning rods which would convey the lightning to the ground, and so protect the buildings to

which they were attached, found abundant opponents. . . . Nevertheless, public opinion became settled . . . that they did protect buildings. . . . Then the philosophers raised a new controversy as to whether the conductors should be blunt or pointed; Franklin, Cavendish, and Watson advocating points, and Wilson blunt ends. . . . The logic of experiment, however, showed the advantage of pointed conductors; and people persisted then in preferring them, as they have done ever since."—P. Benjamin, *Age of electricity*, ch. 3.

1784-1800.—Discoveries of Coulomb Galvani and Volta.—In 1784 Coulomb devised the torsion balance, by means of which he was enabled to discover the law bearing his name; "the force exerted between two small electrified bodies varies inversely as the square of the distance between them." "The fundamental experiment which led to the discovery of dynamical electricity [1786] is due to Galvani, professor of anatomy in Bologna. Occupied with investigations on the influence of electricity on the nervous excitability of animals, and especially of the frog, he observed that when the lumbar nerves of a dead frog were connected with the crural muscles by a metallic circuit, the latter became briskly contracted. . . . Galvani had some time before observed that the electricity of machines produced in dead frogs analogous contractions, and he attributed the phenomena first described to an electricity inherent in the animal. He assumed that this electricity, which he called vital fluid, passed from the nerves to the muscles by the metallic arc, and was thus the cause of contraction. This theory met with great support, especially among physiologists, but it was not without opponents. The most considerable of these was Alexander Volta, professor of physics in Pavia. Galvani's attention had been exclusively devoted to the nerves and muscles of the frog; Volta's was directed upon the connecting metal. Resting on the observation, which Galvani had also made, that the contraction is more energetic when the connecting arc is composed of two metals than where there is only one, Volta attributed to the metals the active part in the phenomenon of contraction. He assumed that the disengagement of electricity was due to their contact, and that the animal parts only officiated as conductors, and at the same time as a very sensitive electroscope. By means of the then recently invented electroscope, Volta devised several modes of showing the disengagement of electricity on the contact of metals. . . . A memorable controversy arose between Galvani and Volta. The latter was led to give greater extension to his contact theory, and propounded the principle that when two heterogeneous substances are placed in contact, one of them always assumes the positive and the other the negative electrical condition. In this form Volta's theory obtained the assent of the principal philosophers of his time."—A. Ganot, *Elementary treatise on physics* (Tr. by Atkinson), bk. 10, ch. 1.—Volta's theory, however, though somewhat misleading, did not prevent his making what was probably the greatest step in the science up to this time, in the invention (about 1800) of the Voltaic pile, the first generator of electrical energy by chemical means, and the forerunner of the vast number of types of the modern "battery." Further means of generating electrical energy were discovered in the early part of the nineteenth century through the work of Oersted and Ampère. (See below: 1820-1825.)

1803-1905.—Storage cell.—"It is stated that Gautherot [in 1801] . . . found that platinum or silver electrodes would give a current of short

duration after the electrolysis of water. In 1803 Ritter noted the same thing (using gold wires), and constructed the first secondary battery, plates of gold and discs of cloth moistened with ammonia. Some knowledge of the subject was contributed by Volta himself, by Davy and by Marianini, and in 1837 Schoenbein used 'suboxide of lead.' Work with oxides of lead was done by Grove, Wheatstone, Siemens, and Faraday, and in 1842 Grove attracted attention to his 'gas battery' of fifty cells, which was powerful enough to produce an arc light. The commercial development of the storage cell dates from 1860 in the work of Planté who used the lead, lead oxide, sulphuric acid combination. Others have tried lead-copper, lead-zinc, and copper-iron (alkaline zincate solution), but the only important improvement in the lead cell since the time of Planté was that of 'pasting' (which now means shortening the time of 'forming' the plates by having pellets of lead salts forced into holes in the plates, sometimes by a hydraulic press). This was made a commercial success by Faure in 1870, but the process had been invented by Metzger previously. It was invented independently in this country, and the U. S. courts gave the decision for priority to Brush. The only radical change since then has been the development (about 1905) of the nickel-iron cell by Edison. (The solids are nickel oxide and iron, the liquid is a solution of caustic potash containing a little lithium hydrate.) Its advantages are that it is much lighter, will stand a high charging rate, and is not injured by lying idle when discharged."—A. L. Jordan, *Short stories of great inventions* (*School Science and Mathematics*, Apr., 1917).

1815-1921.—Electric furnaces.—Thermo-electric industries.—Reduction of aluminum.—Carborundum.—"Electric heating dates from the time of Volta and Davy, but the first experiment in electrometallurgy was the production of cementation steel [steel hardened in carbon packing under the influence of long continued heat] by William Pepys (Eng.) about 1815. It was not until 1853 that attempts at electric furnaces were made, one in England by J. H. Johnson, another in France by Pichou. These were commercial failures. The first furnace attracting public attention was that of William Siemens in 1878, where the molten metal formed one electrode. The Cowles Brothers (Eng.) in 1884 and 1885 finally succeeded in the production of aluminum alloys, and aluminum itself was made (by a combination of the electrolytic and heating effects) by Hall in America and Heroult in France, in 1886 or 1887. Elisha Thomson patented a resistance furnace in 1886, Borchers (Ger.) produced a successful one in 1891, and DeLaval made an attempt in 1892. In 1892 also, Moissan, using an arc furnace and employing the marvelous non-conducting properties of quick-lime, produced calcium carbide; while Acheson, using a resistance furnace, discovered the well-known abrasive carborundum. This was followed by the commercial production of calcium carbide (whence the making of acetylene gas) by Willson in 1895. A new type, the induction furnace, useful where iron free from carbon is desired, was invented by Ferranti in Italy and Colby in America in 1897. Work along similar lines was done by Stassano (It.), 1898; Kjellin (Swedish), 1900; Hjorth (Swedish), 1904; Frick (Eng.), 1904; and Girod (Fr.), about 1905."—A. L. Jordan, *Short stories of great inventions* (*School Science and Mathematics*, Apr., 1917).—"There are clustered at Niagara a number of unique industrial establishments, the importance of which will undoubtedly increase rapidly. In the carborundum factory we find huge furnaces heated

by the passage of electric current, and attaining temperatures far beyond those of the ordinary combustion of fuel. These electric furnaces produce carborundum, a new abrasive nearly as hard as the diamond, which is a combination of carbon and silicon, unknown before the electric furnace gave it birth. Sand and coke are the raw substances for its production, and these are acted upon by the excessively high heat necessary to form the new product, already in extensive use for grinding hard materials. The metal aluminum, which not many years ago cost \$2 an ounce, is . . . produced on a large scale . . . and sold at a price which makes it, bulk for bulk, cheaper than brass. Here, again, electricity is the agent; but in this case its power of electrolyzing or breaking up strong chemical unions is employed. . . . Works for the production of metallic sodium and other metals similarly depend upon the decompositions effected by the electric current. Solutions of ordinary salt or brine are electrolyzed on a large scale in extensive works established for the purpose. . . . The very high temperature which exists in an electric arc, or between the carbons of an arc lamp, has in recent years found application in the manufacture of another important compound, which was formerly but slightly known as a chemical difficult to prepare. Carbide of calcium is the compound referred to, and large works for its production exist at Niagara. Here again, as in the carborundum works, raw materials of the simplest and cheapest kind are acted upon in what may be termed an electric-arc furnace. Coke, or carbon, and lime are mixed and charged into a furnace in which an enormous electric arc is kept going. . . . The importance of carbide of calcium rests in the fact that, by contact with water, it produces acetylene gas. The illuminating power of this gas, when burned, is its remarkable property."—*Electrical advance in ten years* (*Forum*, Jan., 1898).—"At the intensely high temperature of the electric arc the nitrogen of the air can be made to burn, and from the gas so formed nitric acid can be made. To do this on a large scale a very special kind of arc is required. In one process, the Birckland Eyde, the arc is a great flat disk of flame about six feet across. In another, the Schönherr, the arc is produced in a tube, and is as much as twenty feet long. Nitric acid is used for making nearly all the explosives used in modern war; without it, armies would be of but little use."—C. Hall, *Triumphs of invention*, pp. 159, 181.—Since the beginning of the twentieth century electric furnaces have been used in an increasing degree, in the manufacture of steel. This is especially the case in the production of the hard steel alloys of, e.g., tungsten, chrome, nickel, vanadium steel, but also in making steel for rails. In 1921, J. A. Fleming, in "Fifty years of electricity," stated that at that time there were in existence electric furnaces which were capable of producing 200 tons of steel per day per furnace.

1820-1825.—Oersted, Ampère, and the discovery of the electro-magnet.—"There is little chance . . . that the discoverer of the magnet, or the discoverer and inventor of the magnetic needle, will ever be known by name, or that even the locality and date of the discovery will ever be determined. . . . The magnet and magnetism received their first scientific treatment at the hands of Dr. Gilbert. During the two centuries succeeding the publication of his work, the science of magnetism was much cultivated. . . . The development of the science went along parallel with that of the science of electricity . . . although the latter was more fruitful in novel discoveries and unex-

pected applications than the former. It is not to be imagined that the many close resemblances of the two classes of phenomena were allowed to pass unnoticed. . . . There was enough resemblance to suggest an intimate relation; and the connecting link was sought for by many eminent philosophers during the last years of the eighteenth and the earlier years of the present century."—T. C. Mendenhall, *Century of electricity*, ch. 3.—"The effect which an electric current, flowing in a wire, can exercise upon a neighbouring compass needle was discovered by Oersted in 1820. This first announcement of the possession of magnetic properties by an electric current was followed speedily by the researches of Ampère, Arago, Davy, and by the devices of several other experimenters, including De la Rive's floating battery and coil, Schweigger's multiplier, Cumming's galvanometer, Faraday's apparatus for rotation of a permanent magnet, Marsh's vibrating pendulum and Barlow's rotating star-wheel. But it was not until 1825 that the electromagnet was invented. Arago announced, on 25th September, 1820, that a copper wire uniting the poles of a voltaic cell, and consequently trav-

steel needles upon which he was experimenting, and had shown that the flow of electricity around the coil could confer magnetic power upon the steel needles. . . . The electromagnet, in the form which can first claim recognition . . . was devised by William Sturgeon, and is described by him in the paper which he contributed to the Society of Arts in 1825."—S. P. Thompson, *Electromagnet*, ch. 1.

1823-1921.—Dynamo-electrical machines.—"A dynamo-electrical machine is one which converts mechanical into electrical energy, or vice-versa, by means of the relative motion of a conductor carrying an electric current, and an interlinked magnetic field. When the conversion is from mechanical to electrical energy, the machine is called a generator; and when the conversion is from electrical to mechanical energy, the machine is called a motor."—F. B. Crocker, *Dynamo-electric machinery*, p. 1.—Induction was discovered in 1831 by Michael Faraday, who used for his later experiments an iron ring wound with copper wire, the forerunner of the great dynamos of our time. From this beginning he worked in to what he called a new electrical machine. "A disc of copper was mounted

FARADAY'S ANCHOR RING

With which he discovered the induction of electric current

FARADAY'S FIRST ELECTRIC GENERATOR,  
PRODUCING DIRECT CURRENTS

ersed by an electric current, could attract iron filings to itself laterally. In the same communication he described how he had succeeded in communicating permanent magnetism to steel needles laid at right angles to the copper wire, and how, on showing this experiment to Ampère, the latter had suggested that the magnetizing action would be more intense if for the straight copper wire there were substituted one wrapped in a helix, in the centre of which the steel needle might be placed. This suggestion was at once carried out by the two philosophers. 'A copper wire wound in a helix was terminated by two rectilinear portions which could be adapted, at will, to the opposite poles of a powerful horizontal voltaic pile; a steel needle wrapped up in paper was introduced into the helix.' 'Now, after some minutes' sojourn in the helix, the steel needle had received a sufficiently strong dose of magnetism.' Arago then wound upon a little glass tube some short helices, each about  $2\frac{1}{4}$  inches long, coiled alternately right-handedly and left-handedly, and found that on introducing into the glass tube a steel wire, he was able to produce 'consequent poles' at the places where the winding was reversed. Ampère, on October 23rd, 1820, read a memoir, claiming that these facts confirmed his theory of magnetic actions. Davy had, also, in 1820, surrounded with temporary coils of wire the

as shown in [the figure] . . . on a conducting axle and arranged to be turned between the poles of a strong horseshoe permanent magnet. The edge of the disc and a portion of the axle were carefully amalgamated and strips of lead adjusted to make sliding contact on the amalgamated surfaces. As the disc was turned, the successive radii connecting the axle with the point of the edge in contact with the outer lead strip or brush became virtually successive wires moved through the magnetic field, and a continuous flow of current in one direction resulted. If the direction of rotation reversed, the current direction also reversed. A new electric machine indeed! . . . Here was a true electric generator producing—in a very small amount, it is true, but nevertheless, producing—the same unidirectional flow of electricity which under the name *direct current* is supplying nearly all the electric care and many of the lights and motors of this electric age."—W. A. Durgin, *Electricity*, pp. 61-62.—This "discovery of induction by Faraday, in 1831, gave rise to the construction of magneto-electro machines. The first of such machines that was ever made was probably a machine that never came into practical use, the description of which was given in a letter, signed 'P. M.,' and directed to Faraday, published in the *Philosophical Magazine* of 2nd August, 1832. We learn from this description that

the essential parts of this machine were six horse-shoe magnets attached to a disc, which rotated in front of six coils of wire wound on bobbins." Sept. 3rd, 1832, Pixii constructed a machine in which a single horse-shoe magnet was made to rotate before two soft iron cores, wound with wire. In this machine he introduced the commutator, an essential element in all modern continuous current machines. "Almost at the same time, Ritchie, Saxton, and Clarke constructed similar machines. Clarke's is the best known, and is still popular in the small and portable 'medical' machines so commonly sold. . . . A larger machine [was] constructed by Stöhrer (1843), on the same plan as Clarke's, but with six coils instead of two, and three compound magnets instead of one. . . . The machines, constructed by Nollet (1849) and Shepard (1856) had still more magnets and coils. Shepard's machine was modified by Van Malderen, and was called the Alliance machine. . . . Dr. Werner Siemens, while considering how the inducing effect of the magnet can be most thoroughly utilised, and how to arrange the coils in the most efficient manner for this purpose, was led in 1857 to devise the cylindrical armature. . . . Sinsteden in 1851 pointed out that the current of the generator may itself be utilised to excite the magnetism of the field magnets. . . . Wilde [in 1863] carried out this suggestion by using a small steel permanent magnet and larger electro magnets. . . . The next great improvement of these machines arose from the discovery of what may be called the dynamo-electric principle. This principle may be stated as follows:—For the generation of currents by magneto-electric induction it is not necessary that the machine should be furnished with permanent magnets; the residual or temporary magnetism of soft iron quickly rotating is sufficient for the purpose. . . . In 1867 the principle was clearly enunciated and used simultaneously, but independently, by Siemens and by Wheatstone. . . . It was in February, 1867, that Dr. C. W. Siemens' classical paper on the conversion of dynamical into electrical energy without the aid of permanent magnetism was read before the Royal Society. Strangely enough, the discovery of the same principle was enunciated at the same meeting of the Society by Sir Charles Wheatstone. . . . The starting-point of a great improvement in dynamo-electric machines was the discovery by Pacinotti of the ring armature . . . in 1860. . . . Gramme, in 1871, modified the ring armature, and constructed the first machine, in which he made use of the Gramme ring and the dynamic principle. In 1872, Hefner-Alteneck, of the firm of Siemens and Halske, constructed a machine in which the Gramme ring is replaced by a drum armature, that is to say, by a cylinder round which wire is wound. . . . Either the Pacinotti-Gramme ring armature, or the Hefner-Alteneck drum armature, is now adopted by nearly all constructors of dynamo-electric machines, the parts varying of course in minor details."—A. R. von Urbanitzky, *Electricity in the service of man*, pp. 227-242.—"The motor historically precedes either the magneto or dynamo electric generator. Barlow's wheel of 1823, the first electric motor, was similar in construction to Faraday's disc of 1831, which was the original magneto electric generator. The Jacobi electric motor of 1838 was large enough to propel a boat carrying fourteen passengers at three miles an hour, and Page in 1851 constructed a car driven by a sixteen horse power electric motor at nineteen miles per hour, [whereas the dynamo-electric machine was not invented by C. W. Siemens and Wheatstone until 1867]. These as well as other electrical motors of those early times were far more

powerful and were regarded as more practical or more promising than the contemporaneous magneto-electric generators. The Pacinotti ring of 1861, the prototype of modern armatures, was primarily intended to be used as a motor, although the inventor suggested that it could also be used to generate electric currents. All of these early electric motors depended upon primary batteries for their supply of electrical energy, and it was found that the cost of operation was excessive for any considerable power. . . . The result was that the motor had to stand aside while the generator was being developed to commercial success, which development began about 1880 [after the production

EARLY EDISON "Z" GENERATOR BUILT IN 1883

of Edison's generator of 1870]. Even then the electrical energy produced was used entirely for arc and incandescent lighting. In fact, it was not until 1887 that central stations with their system of distribution had become sufficiently large and well enough regulated so that the use of electric motors was encouraged, or even permitted, except in a few cases. . . . Electric light having been practically introduced, and more or less generally established, inventors, manufacturers, also those who produced electrical energy, turned some attention to electrical power, which, from about 1888, has been a prominent part of electrical engineering, including railway as well as stationary motors. The former type, also the induction and synchronous alternating-current motors, began to be introduced . . . about that time or soon after. Since this compara-

tively recent epoch, the progress of electric power in all its branches has been at an extraordinarily rapid rate and with most far-reaching results, unequalled by any other art or industry, in anything like the same period of time."—F. B. Crocker, and M. Arendt, *Electric motors*, pp. 1-2.—"The compounding feature was set forth in theory by John Hopkinson (Eng.) in 1870, but the first commercial machine is said to have been built by Brush. The compound dynamo invention has been claimed for Sinsteden (1871), Varley (1876), Field, Edison, and Siemens, separately (during 1880), Swan (1882), Swinburne (1882), Shuckert (1883), and was patented by Crompton & Kapp in England. The advantages of lamination date from the work of Foucault on 'eddy currents' in 1850, but were pointed out in connection with dynamos by Gramme. A patent on laminated construction

gan to come into commercial use, it was discovered that any one of the modern machines designed as a generator of currents constituted a far more efficient electric motor than any of the previous forms which had been designed specially as motors. It required no new discovery of the law of reversibility to enable the electrician to understand this; but to convince the world required actual experiment."—A. Guillemin, *Electricity and magnetism*, pt. 2, ch. 10, sect. 3.—"The fact is that every dynamo can be made to run as a motor. Faraday's discovery (1831), that a conductor moved in a magnetic field has a current induced in it, was the reverse of his experiment (1821) where a magnet rotated about a wire carrying current; but Lenz (1838) seems to have been the first to recognize that fact. The real reversibility of an actual dynamo was shown by Jacobi in 1850. This did

© Publication Bureau

TWO-PHASE ALTERNATING DYNAMO, BUILT IN 1878 BY ELIHU THOMSON

was taken out in this country by Edward Weston in 1882. This long list may well close with mention of the work of Lord Kelvin, who assisted in developing the modern dynamo (1881); of Gordon, who built large two-phase machines in the same year; of Elihu Thomson, who patented the interpole or commutating-pole dynamo in 1885, this being a modern form of the 'slotted-pole' dynamo suggested by the late Silvanus P. Thompson several years before."—A. L. Jordan, *Short stories of great inventions (School Science and Mathematics, Mar., 1917)*.—"It has been known for . . . years that every form of electric motor which operated on the principle of mutual mechanical force between a magnet and a conducting wire or coil could also be made to act as a generator of induced currents by the reverse operation of producing the motion mechanically. And when, starting from the researches of Siemens, Wilde, Nollet, Holmes and Gramme, the modern forms of magneto-electric and dynamo-electric machines be-

not become generally known, and it was independently discovered by Pacinotti (1864) and by Rowland in America. Another story has it that it was stumbled upon at the Vienna Exposition of 1873 by a workman who connected two leads (not knowing them to be alive) to a dynamo, which at once ran as a motor. By some, the discovery is credited to Fontaine and Gramme [1870]."—A. L. Jordan, *Short stories of great inventions (School Science and Mathematics, Apr., 1917)*.—"Galileo Ferraris, in Italy, and Nikola Tesla, in the United States, brought out motors operating by systems of alternating currents displaced from one another in phase by definite amounts and producing what is known as the rotating magnetic field. The result of the introduction of polyphase systems has been the ability to transmit power economically for considerable distances, and, as this directly operated to make possible the utilization of water-power in remote places and the distribution of power over large areas, the immediate outcome of

the polyphase system was power transmission; and the outcome of power transmission almost surely will be the gradual supersession of coal and the harnessing of the waste forces of Nature to do useful work."—*Electrical Review*, Jan. 12, 1901.—The following is a description of Tesla's invention: "If the north and south poles of a small horseshoe magnet be suspended over a bar of soft iron free to revolve in a horizontal plane, or be placed over an ordinary compass-needle, the latter will be attracted at either end by the poles of the magnet and take up a position parallel to a straight line drawn between the two poles of the magnet. Now if the latter be revolved through any angle the soft iron or needle will follow, being dragged around by the magnet, and if the magnet be caused to revolve regularly the iron will also revolve, being pulled around by the full force of the magnet. It was not feasible, however, to cause the magnet to revolve in this way, and Tesla's invention consisted in obviating this trouble and, in fact, greatly simplifying the problem. He conceived the idea that if he took an iron ring and used two alternating currents, one of which had its maximum value at the instant that the other had a zero value—or, in other words, two currents whose periods were such that one waned as the other increased—he could produce in that iron ring by winding these circuits in alternate coils surfaces that without any mechanical movement of the parts would travel around that ring with a rapidity equal to the number of changes of direction of the currents employed. He thus had a ring, the north and south poles of which were rapidly revolving just as would the poles of the horseshoe magnet were it tied at its middle to a twisted string and allowed to revolve. A piece of iron pivoted at its middle placed concentric with this ring would therefore be dragged around by the changing poles of the ring. He had thus discovered what is somewhat awkwardly expressed by the expression 'the rotary magnetic field,' and also the use of what have been termed 'polyphased currents'—the one referring to the magnetism and the other to the combination of currents by which this changing magnetism was produced. This discovery is undoubtedly one of the most important that has ever been made within the domain of alternating currents."—N. W. Perry, *Engineering Magazine*, v. 7, p. 780.—See also AUTOMOBILES: 1858-1010; 1889-1005.

ALSO IN: S. P. Thompson, *Dynamo-electrical machines*.

1825-1921.—Development of the electro-magnet.—"Take an iron bar . . . and wind round it spiral coils of copper wire . . . spun over with silk or cotton to insulate the turns. Connect the ends of this wire to a battery . . . and the iron instantly becomes a powerful magnet. . . . Such an arrangement is called an *electro-magnet*, and it was first given to us by an English electrician, William Sturgeon, in 1825, who employed, however, a winding consisting of only a single layer of rather thick copper wire. Joseph Henry, . . . in the United States, bestowed on the electro-magnet additional powers by winding it with very many turns of fine silk-covered copper wire. J. P. Joule, a British engineer, invented divers forms of improved electro-magnets about 1840 remarkable for their great power of lifting other masses of iron. Large electro-magnets made on Joule's principles are now (1921) in common use in engineering works, and are used for lifting heavy masses of iron and materials such as scrap iron . . . [as well as in breaking up large masses of scrap metal by lifting heavy iron weights which, when the current is cut off from the magnet, drops with smashing force on

the material to be broken up.] The electro-magnet, in some form or another, is the basis of all modern electric telegraphy, of telephony, of machines for generating electric currents by mechanical power called dynamos, of electric motors, electric bells, induction coils, and countless other appliances used in 'everyday life.'—J. A. Fleming, *Fifty years of electricity*, pp. 1-2.—"They are used for drawing a bit of steel dust out of a man's eye [or a steel fragment from a wound] and for magnetic cranes which will hold up a weight of many tons. Edison invented a magnetic separator for sorting out iron ores. The broken ore has to pass through an apparatus containing electro-magnets. First comes a set of magnets just strong enough to pick out the richest kind of ore, known as magnetite; then a stronger set which separates . . . hematite, and the useless residue passes on and is got rid of."—C. Hall, *Triumphs of invention*, p. 150.

1831-1921.—Transformers.—Alternating current instruments.—"The transformer was really discovered by Faraday in 1831, but it did not become of industrial value until 1882, when Gaulard & Gibbs began to make transformers in England. In this long period, men had not been idle, however, work having been done by C. F. Varley, Jablochhoff, Ferranti, Zipernowsky, and others. The first transformer in the United States is claimed to have been that of William Stanley at Great Barrington, Mass., in 1885."—A. L. Jordan, *Short stories of great inventions (School Science and Mathematics, Apr., 1917)*.—In 1870, according to the *Scientific American* of May 29, J. B. Fuller invented and patented the first working transformer made in the United States. Stanley's model was a decided improvement and was the basis for later transformer construction in the United States. "About 1885, however, it became clear that transformers can be worked independently if the different primary circuits are arranged in parallel between two mains kept at constant high pressure, these primary circuits being joined across from one main to the other like the rungs of a ladder between the two side pieces, whilst the secondary circuits of each transformer are isolated. A system of parallel working of transformers was accordingly devised by three Hungarian inventors, Messrs. Zipernowsky, Deri and Blathy, of Budapest. . . . They constructed an alternator capable of supplying electric current at a pressure of 1,000 volts, and the transformers were designed to reduce this pressure to 100 volts on the secondary side. A number of these transformers had their primary circuits supplied with current at 1,000 volts, when arranged in parallel on the alternator. Incandescent lamps were then placed in parallel on the secondary circuit of each transformer . . . and it was found that lamps could be turned on or off on any one transformer without affecting those on any other. An experimental plant of this kind, brought to England in 1885 by Mr. Zipernowsky, of Budapest, was erected and tested at the Inventions Exhibition at South Kensington, London, by the author. Two transformers were used, each of 10 h. p. These were constructed to reduce electric pressure from 1,000 volts to 100 volts. They were, therefore, called *step-down transformers*. In process of time great advances were made in building alternating current transformers for very high voltages. In 1800 and 1801 Mr. Ferranti built transformers for reducing voltage from 10,000 to 2,000 volts, and later on as electric transmission of power developed, transformers were built in the United States for pressures as high as 100,000 volts."—A. J. Fleming, *Fifty years of electricity*, pp. 132-133, 137.

"In all cases of transmission of electricity over

long distances for lighting or power purposes the currents are 'alternating.' They flow first one way and then the other, reversing perhaps twenty times a second, or it may be two hundred, or even more times in that short period. Some electric railways are worked with alternating current, and it is used for lighting quite as much as direct current and is equally satisfactory. In wireless telegraphy it is essential. In that case, however, the reversals may take place millions of times per second. Consequently, to distinguish the comparatively slowly changing currents of a 'frequency' or 'periodicity' of a few hundreds per second from these much more rapid ones, the latter are more often spoken of as electrical oscillations. And these alternating and oscillating currents need to be measured just as the direct currents do. Yet in many cases the same instruments will not answer. There has therefore grown up a class of wonderful measuring instruments specially designed for this purpose, by which not only does the station engineer know what his alternating current dynamos are doing, but the wireless operator can tell what is happening in his apparatus, the investigator can probe the subtleties of the currents which he is working with. . . . One trouble in connection with measuring these alternating currents is that they are very reluctant to pass through a coil. One method by which this difficulty can be overcome [is by] . . . the heating of a wire through which current is passing. This is just the same whether the current be alternating or direct. One of the simplest instruments of this class has been appropriated by the Germans, who have named it the 'Reiss Electrical Thermometer,' although it was really invented [in the nineteenth century] nearly a century ago by Sir William Snow Harris. It consists of a glass bulb on one end of a glass tube. The current is passed through a fine wire inside this bulb, and as the wire becomes heated it expands the air inside the bulb. This expansion moves a little globule of mercury which lies in the tube, and which forms the pointer or indicator by which the instrument is read. . . . [While] thermogalvanometers . . . ascertain the strength of a current by the heat which it produces, the simple little contrivance of Sir William Snow Harris has more elaborate successors, of which perhaps the most interesting are those associated with the name of Mr. W. Duddell. . . . We have just noted the fact that electricity causes heat. Now we shall see the exact opposite, in which heat produces electrical pressure and current. And the feature of Mr. Duddell's instruments is the way in which these two things are combined. By a roundabout but very effective way he rectifies the current to be measured, for he first converts some of the alternating current into heat and then converts that heat into continuous current. If two pieces of dissimilar metals be connected together by their ends, so as to form a circuit, and one of the joints be heated, an electrical pressure will be generated which will cause a current to flow round the circuit. The direction in which it will flow will depend upon the metals employed. The amount of the pressure will also depend upon the metals used, combined with the temperature of the junctions. With any given pair of metals, however, the force, and therefore the volume of current, will vary as the temperature. Really it will be the difference in temperature between the hot junction and the cold junction, but if we so arrange things that the cold junction shall always remain about the same, the current which flows will vary as the temperature of the hot one. The volume of that current will therefore be a measure of the temperature. Such an arrangement is known as a thermo-

couple, and is becoming of great use in many manufacturing processes as a means of measuring temperatures. . . . Mr. Duddell has also perfected a wonderful instrument called an Oscillograph, for the strange purpose of making actual pictures of the rise and fall in volume of current in alternating circuits. To realise the almost miraculous delicacy of these wonderful instruments we need first of all to construct a mental picture of what takes place in a circuit through which alternating current is passing. The current begins to flow: it gradually increases in volume until it reaches its maximum: then it begins to die away until it becomes nil: then it begins to grow in the opposite direction, increases to its maximum and dies away once more. That cycle of events occurs over and over again at the rate it may be of hundreds of times per second. . . . As the current flowing [through two fibres in the instrument] increases or decreases, or changes in direction, the mirror [attached to the fibres] will be slewed round more or less in one direction or the other. The spot of light thrown by the mirror will then dance from side to side with every variation, and if it be made to fall upon a rapidly moving strip of photograph paper a wavy line will be drawn upon the paper which will faithfully represent the changes in the current. In its action, of course, it is not unlike an ordinary mirror galvanometer, but its special feature is in the mechanical arrangement of its parts which enable it to move with sufficient rapidity to follow the rapidly succeeding changes which need to be investigated. It is far less sensitive than, say, a Thomson Galvanometer, but the latter could not respond quickly enough for this particular purpose."—T. W. Corbin, *Marvels of scientific invention*, pp. 34-41.

1856-1889.—Electric welding.—"Electric welding, forging, etc., are very nearly related to work with furnaces. The first electric welding of which we have record is that of a bundle of iron wires by Joule in 1856. The use of the arc for cutting and welding (where the material is one electrode) dates back to 1881 when De Meretens did 'lead burning' with it. A more general use was made by the Russian Bernardos about 1901. The deflected-arc process began with Wederman in 1874, who used an air blast; the use of a magnet for deflecting the arc was by Zerener about 1881. A very novel and spectacular method is that of the 'water-pail forge,' introduced by LaGrange and Hoho (Belgians) in 1892. Lastly, one of the most important welding processes is that of Elihu Thomson (1889), employing the heat from the resistance (at the points of contact) to the heavy current from the secondary of a special step-down transformer."—A. L. Jordan, *Short stories of great inventions (School Science and Mathematics, Apr., 1917)*.

1879-1917.—Home devices.—Sewing machine.—Electric cooker.—Vacuum cleaner.—The electrical sewing machine came into use for manufacturing purposes long prior to its introduction as a household device. The first motor designed for use in a sewing machine was constructed at Menlo Park, for Thomas Edison in 1879. It was followed in 1889 by a motor made for the Singer Sewing Machine Company, by Philip Dhiel, who had applied for the patent in 1886, and made his first machine in 1887.—"Very soon after the discovery of the battery, it was found that a wire gets hot when a current is flowing through it. . . . The heating effect of a current in a wire depends on the resistance offered to the passage of the current; by doubling the resistance the rate at which heat is produced is also doubled. It also depends on the strength of the current; but when this is

doubled the rate of heat production becomes, not twice only, but four times as great; three times the current gives nine times the heat, and so on. The resistance of a long wire greater than that of a short one; of a thin wire greater than that of a thick one."—C. Hall, *Triumphs of invention*, p. 177.—"The first practical attempt at electric cookery was made in England in 1890. And the first effort to introduce electric cookery to the public was at the Crystal Palace Electrical Exhibition in London in 1891. In 1895 in the Cannon Street Hotel, London, the first electrically-cooked banquet was given in honor of the Lord Mayor and was a success both in the cookery and in creating general interest. The first activities in the United States took place about 1900 when a fireless cooker manufacturer in Toledo put an electric heating unit in his device. No progress worthy of mention occurred until 1905, when three electrical manufacturers began to experiment with a frail and undependable hot-plate. It was not until 1909 that a range which 'stood up' and cooked for any length of time was put on the market."—*Electric range handbook*, p. 48.—"The modern electric cooker or stove with its time and temperature control, apparently leaves nothing more to be done in the culinary line, unless, perhaps, some horticulturist invents self-cooking vegetables. The electric stove . . . consists of two heating chambers built as a unit upon the heat insulation principle. Built into the door of each chamber, is a thermometer controlling an adjustable electric switch which may be set to open at any desired temperature. This switch controls the current supply to the heating element of that chamber. In series with the chamber-controlling switches is a master switch under control of an alarm clock, which may be set to close the switches at any desired time. With this stove the preparation of a full dinner becomes a simple matter. The prepared vegetables are placed in one compartment, the thermometer being set to boiling temperature; the meat is placed in the other compartment, that temperature being set to roasting temperature. The house-wife then sets the clock to turn on the current at the proper time, and goes off to the matinee or spends the afternoon shopping with some friend. At the proper time the clock switches on the current, and the respective thermometers regulate the current, so as to supply just exactly the proper amount of heat to each compartment. Ten minutes before dinner time the compartments are opened and the food, which contains all the natural juices unaltered by gas or products of combustion, is placed upon the table. . . . There are a series of connecting sockets upon the top of the stove to which the electric broilers and coffee percolators may be attached."—H. H. Gordan, *Labor-saving devices for the home* (*Scientific American*, Oct. 12, 1912, p. 300).—"Perhaps one of the most efficient aids to domestic operations are the variety of carpet cleaners which . . . [were] placed upon the market [in the first decade of the century]. Especially vacuum cleaners present great advantages both in point of thoroughness and ease of operation. . . . The instrument consists of an electric motor driving a fan-blower, which latter creates the requisite blast of air to carry the dust from the floor or carpet through an outlet into a collecting bag. In the front portion of the sweeper, just over the suction opening, is located a rotary brush actuated by the same motor which also drives the fan. When the apparatus is in use for sweeping carpets the suction opening is raised somewhat from the level of the floor, and the force of the draft of air drives the carpet up against the suction opening, thus producing a vacant space be-

tween the carpet and the floor. . . . At the same time the brush is passed vigorously over the raised portion of the carpet, straightening the matted pile and dislodging the dirt. Owing to the pocket formed under the carpet, there is a rush of air right through the fabric, so that it is thoroughly purged of all dust. The use of such a sweeper brings with it a double gain. Not only is a perfect cleansing secured without effort in handling the instrument, but the tedious task of taking up the carpet and relaying it is either avoided entirely or at any rate occurs at much longer intervals. The action of the blower can be used for airing confined spaces, mattresses, bedding, etc., or for inflating pillows. The motor normally rotates at 3,400 revolutions per minute."—*Cleaning with electricity* (*Scientific American*, June 24, 1911, p. 626).—There are also in existence among labor- and fuel-saving devices, chief among which may be mentioned the electric washing machine, the electric flat-iron and roller, and electric dish washer.

### MEASURING INSTRUMENTS

1833-1921. — Ammeter. — Galvanometers. — Electrometers. — Dynamometers. — "Electrical measurements are generally made by means of the connection between electricity and magnetism. A current of electricity is a magnet. Whenever a current is flowing it is surrounded by a region in which magnetism can be felt. This region is called the magnetic field, and the strength of the field varies with the strength that is the number of amperes in the current. . . . The switchboard at a generating station is always supplied with instruments called *ammeters*, an abbreviation of amperemeters, for the purpose of measuring the current passing out from the dynamos. Each of these consists of a coil of wire through which the current passes. In some there is a piece of iron near by, which is attracted more or less as the current varies, the iron being pulled back by a spring and its movement against the tension of the spring being indicated by a pointer on a dial. In others the coil itself is free to swing in the neighbourhood of a powerful steel magnet, the interaction between the electro-magnet, or coil, and the permanent magnet being such that they approach each other or recede from each other as the current varies. A pointer on a dial records the movements as before. In yet another kind the permanent magnet gives way to a second coil, the current passing through both in succession, the result being very much the same, the two coils attracting each other more or less according to the current. Another kind of ammeter known as a thermo-ammeter works on quite a different principle. It consists of a piece of fine platinum wire which is arranged as a 'shunt'—that is to say, a certain small but definite proportion of the current to be measured passes through it. Now, being fine, the current has considerable difficulty in forcing its way through this wire and the energy so expended becomes turned into heat in the wire. . . . The wire, then, is heated by the current passing through it, and accordingly expands, the amount of expansion forming an indication of the current passing. The elongation of the wire is made to turn a pointer. A simple modification makes any of these instruments into a voltmeter. This instrument is intended to measure the force or pressure in the current as it leaves the dynamo. A short branch circuit is constructed, leading from the positive wire near the dynamo to the negative wire, or to the earth, where the pressure is zero. In this circuit is placed the instrument, together with a coil

made of a very long length of fine wire so that it has a very great resistance. . . . Instruments of the ammeter type can also be used as ohmmeters. In this case what is wanted is to test the resistance of a circuit, and it is done by applying a battery, the voltage of which is known, and seeing how much current flows."—T. W. Corbin, *Marvels of scientific invention*, pp. 25-27.—"The Wheatstone Bridge, the great fundamental measuring instrument for all ordinary resistances, was brought to public attention by Wheatstone in 1845, but this was, as Wheatstone himself states, invented by Christie in 1833. We are more or less familiar with its variations in construction (slide wire, 'Post Office,' dial decade, etc.), but some neglect the importance of a sensitive galvanometer and an accurate resistance box. The latter is the invention of Werner Siemens, but the 'rheostat' is credited to Wheatstone. The story of the search for a suitable resistance material (before manganin, platinoid, etc., were selected) is interesting, as is also that of the 'aging' of the wire, the difficulty of determining its exact temperature at the time of measurement, and other refinements, as the use of the ice bath or motor-stirred oil immersion. The names of Carey Foster, Lord Kelvin, and Varley should also be put down for their share in the development of the bridge."—A. L. Jordan, *Short stories of great inventions* (*School Science and Mathematics*, Apr., 1917).

The simplest form of the *galvanometer*, also a much used measuring instrument, "is a needle like that of a mariner's compass very delicately suspended by a thin fibre in the neighbourhood of a coil of wire. The magnetic field produced by the current flowing in the wire tends to turn the needle, which movement is resisted by its natural tendency to point north and south. Thus the current only turns the needle a certain distance, which distance will be in proportion to its strength. The deflection of the needle, therefore, gives us a measure of the strength of the current. But such an instrument is not delicate enough for the most refined experiments, and the improved form [the mirror galvanometer] generally used is due to . . . the late Lord Kelvin. He originally devised it [in 1858] it is interesting to note, not for laboratory experiments, but for practical use as a telegraph instrument in connection with the early Atlantic cables. . . . This wonderful instrument consisted of a magnet made of a small fragment of watch-spring, suspended in a horizontal position by means of a thread of fine silk, close to a coil of fine wire. . . . With a small current the movement of the magnet was too small to be observed by the unaided eye, so it was attached to a minute mirror. . . . The magnet was cemented to the back of this, yet both were so small that together their weight was supported by a single thread of cocoon silk. Light from a lamp was made to fall upon this mirror, thereby throwing a spot of light upon a distant screen. Thus the slightest movement of the magnet was magnified into a considerable movement of the spot of light. . . . The task of watching the rocking to and fro of the spot of light was found to be too nerve-racking for the telegraph operators, and so Lord Kelvin improved upon his galvanometer in two ways. He first of all managed to give it greater turning-power. . . . Then he utilised this added power to move a pen whereby the signals were recorded automatically upon a piece of paper. The new instrument is known as the Siphon Recorder. The added power was obtained by turning the instrument inside out, as it were, making the coil the moving part and the permanent magnet the fixed part. This enabled him to em-

ploy a very powerful permanent magnet in place of the minute one made of watch-spring. . . . So now we have two types of galvanometer, both due originally to the inventions of Lord Kelvin. For some purposes the Thomson type (his name was Sir William Thomson before he became Lord Kelvin) are still used, but in a slightly elaborated form. Its sensitiveness is such that a current of a thousandth of a micro-ampere will move the spot of light appreciably. . . . But there is . . . an instrument which can detect a millionth of a micro-ampere, or one millionth of a millionth of an ampere. It is not generally known that we are all possessors of an electric generator in the form of the human heart, but it is so, and Professor Einthoven, of Leyden, wishing to investigate these currents from the heart, found himself in need of a galvanometer exceeding in sensitiveness anything then known. . . . So the energetic Professor set about devising a new galvanometer which should answer his purpose. This is known as the 'String Galvanometer.' . . . [By the proper use of photographic plate or paper] a permanent record is made of the changes in the flowing current. An electric picture can thus be made of the working of a man's heart. He holds in his hands two metal handles or is in some other way connected to the two ends of the fibre by wires just as the handles of a shocking coil are connected to the ends of the coil. The faint currents caused by the beating of his heart are thus set down in the form of a wavy line. Such a diagram is called a 'cardiogram,' and it seems that each of us has a particular form of cardiogram peculiar to himself, so that a man could almost be recognised and distinguished from his fellows by the electrical action of his heart."—T. W. Corbin, *Marvels of scientific invention*, pp. 28-32.

"The galvanometer has a near relative, the *electrometer*, the astounding delicacy of which renders it equally interesting. It is particularly valuable in certain important investigations as to the nature and construction of atoms. The galvanometer, it will be remembered, measures minute currents; the electrometer measures minute pressures, particularly those of small electrically charged bodies. . . . In its simplest form the electrometer is called the 'electroscope.' Two strips of gold-leaf are suspended by their ends under a glass or metal shade. As they hang normally they are in close proximity. Their upper ends are, in fact, in contact and are attached to a small vertical conductor. A charge imparted to the small conductor will pass down into the leaves, and since it will charge them both they will repel each other so that their lower ends will swing apart. Such an instrument is very delicate, but because of the extreme thinness of the leaves it is very difficult to read accurately the amount of their movement and so to determine the charge which has been given to them."—T. W. Corbin, *Marvels of scientific invention*, pp. 32, 34.—"In a more recent improvement, . . . only one strip of gold-leaf is used, the place of the other being taken by a copper strip. The whole of the movement is thus in the single gold-leaf, as the copper strip is comparatively stiff, and it is possible to arrange for the movement of this one piece of gold-leaf to be measured by a microscope. The other principal kind of electrometer [the *quadrant electrometer*] we owe, as we do the galvanometers, to the wonderful ingenuity of Lord Kelvin. In this the moving part is a strip of thin aluminium. . . . A charge . . . passes down to the aluminium 'needle,' . . . [which swings] between two metal plates carefully insulated. Each plate is cut into four quadrants. . . . One set of quadrants is

charged positively, and one set negatively, by a battery, but these charges have no effect upon the needle until it is itself charged. As soon as that occurs, however, they pull it round, and the amount of its movement indicates the amount of the charge upon the needle, and therefore the pressure existing upon the charged body to which it is connected. The direction of its movement shows, moreover, whether the charge be positive or negative. A little mirror is attached to the needle, so that its slightest motion is revealed by the movement of a spot of light, as in the case of the mirror galvanometers."—*Ibid.*, pp. 34-35.—An ammeter was constructed by Sir William Thomson in 1881; an ammeter and voltmeter known as the Thomson-Rice was constructed in the early eighties. "Soon after 1882 many inventors endeavoured to supply simple portable instruments with scales divided to indicate, by the pointing of a needle, the value of a current in amperes, of a voltage in volts. The later Professors Ayrton and Perry were early in the field as inventors of such instruments, and Messrs. Crompton and Kapp designed others of a different type. . . . Another instrument called a portable dynamometer was devised about 1882, which depended on the fact that when a coil of wire which is suspended so as to be free to rotate, is placed near to another fixed coil, and the two coils are traversed by the same electric current, the movable coil tends to turn so as to place its axis in line with that of the other. This movement is resisted by the torsion of a spiral spring, and when the current passes, the top of this spring can be twisted so as to bring the coils back to their original position. . . . The instrument . . . has a scale of degrees by which to measure the twist given to the head of the torsion spring. . . . A large amount of invention was expended . . . between 1880 and 1890 in devising forms of electric quantity and energy-meters for use in houses and buildings . . . called *ampere-hour* and *watt-hour meters*."—J. A. Fleming, *Fifty years of electricity*, pp. 272, 283.

### ELECTRIC LIGHTING

1810-1876.—Davy's electric arc.—The Jablockoff candle.—"The earliest instance of applying Electricity to the production of light was in 1810, by Sir Humphrey Davy, who found that when the points of two carbon rods whose other ends were connected by wires with a powerful primary battery were brought into contact, and then drawn a little way apart, the Electric current still continued to jump across the gap, forming what is now termed an Electric Arc. . . . Various contrivances have been devised for automatically regulating the position of the two carbons. As early as 1847, a lamp was patented by Staité, in which the carbon rods were fed together by clockwork. . . . Similar devices were produced by Foucault and others, but the first really successful arc lamp was Serrin's, patented in 1857, which has not only itself survived until the present day, but has had its main features reproduced in many other lamps. . . . The Jablockoff Candle (1876), in which the arc was formed between the ends of a pair of carbon rods placed side by side, and separated by a layer of insulating material, which slowly consumed as the carbons burnt down, did good service in accustoming the public to the new illuminant."—J. B. Verity, *Electricity up to date for light, power, and traction*, ch. 3.—See also INVENTIONS: 10th century: Artificial light.

1841-1921.—Incandescent light.—The invention of incandescent lamps actually antedated the arc

lamps which were used before them. "The first strictly incandescent lamp was invented in 1841 by Frederick de Molyens of Cheltenham, England, and was constructed on the simple principle of the incandescence produced by the high resistance of a platinum wire to the passage of the electric current. In 1849 Péciré employed iridium for the same purpose, also alloys of iridium and platinum, and iridium and carbon. In 1845 J. W. Starr of Cincinnati first proposed the use of carbon, and associated with King, his English agent, produced, through the financial aid of the philanthropist Peabody, an incandescent lamp. . . . In all these early experiments, the battery was the source of electric supply; and the comparatively small current required for the incandescent light as compared with that required for the arc light, was an argument in favor of the former. . . . Still, no substantial progress was made with either system till the invention of the dynamo resulted in the practical development of both systems, that of the incandescent following that of the arc. Among the first to make incandescent lighting a practical success were Sawyer and Man of New York, and Edison. For a long time, Edison experimented with platinum, using fine platinum wire coiled into a spiral, so as to concentrate the heat, and produce incandescence; the same current producing only a red heat when the wire, whether of platinum or other metal, is stretched out. . . . Failing to obtain satisfactory results from platinum, Edison turned his attention to carbon, the superiority of which as an incandescent illuminant had already been demonstrated; but its rapid consumption, as shown by the Reynier and similar lamps, being unfavorable to its use as compared with the durability of platinum and iridium, the problem was, to secure the superior illumination of the carbon, and reduce or prevent its consumption. As this consumption was due chiefly to oxidation, it was questionable whether the superior illumination were not due to the same cause, and whether, if the carbon were enclosed in a glass globe, from which oxygen was eliminated, the same illumination could be obtained. Another difficulty of equal magnitude was to obtain a sufficiently perfect vacuum, and maintain it in a hermetically sealed globe inclosing the carbon, and at the same time maintain electric connection with the generator through the glass by a metal conductor, subject to expansion and contraction different from that of the glass, by the change of temperature due to the passage of the electric current. Sawyer and Man attempted to solve this problem by filling the globe with nitrogen, thus preventing combustion by eliminating the oxygen. . . . The results obtained by this method, which at one time attracted a great deal of attention, were not sufficiently satisfactory to become practical; and Edison and others gave their preference to the vacuum method, and sought to overcome the difficulties connected with it. The invention of the mercurial air pump, with its subsequent improvements, made it possible to obtain a sufficiently perfect vacuum, and the difficulty of introducing the current into the interior of the globe was overcome by imbedding a fine platinum wire in the glass, connecting the inclosed carbon with the external circuit; the expansion and contraction of the platinum not differing sufficiently from that of the glass, in so fine a wire, as to impair the vacuum. . . . The carbons made by Edison under his first patent in 1870, were obtained from brown paper or cardboard. . . . They were very fragile and shortlived, and consequently were soon abandoned. [In 1879 Edison's generator brought efficiency up to about 90 per cent. This with the division of electric cur-

rent, also an Edison invention, made domestic use of electric light economically possible.) In 1880 he patented the [carbon lamp] process which, with some modifications, he . . . [long adhered to]. In this process he . . . [used] filaments of bamboo, which . . . [were] taken from the interior, fibrous portion of the plant."—P. Atkinson, *Elements of electric lighting*, ch. 8.—In the meantime "Swan [an Englishman] was trying to discover a synthetic substance, which would be equal to the natural fibre. Here he achieved distinct success, because he was the first to evolve and to perfect the squirting process which is now used all over the world in connection with the preparation of the filament. This brought about the first commercial 'subdi-

REPLICA OF EDISON'S FIRST INCANDESCENT  
LAMP

vision of the electric light,' because thereby it was rendered possible to produce an artificial fibre, made from cellulose, which subsequently was proved to be the ideal material for the filament. Incidentally it may be mentioned that in consummating this great achievement for incandescent electric lighting Swan also laid the basis of another industry which to-day has reached enormous proportions—the manufacture of artificial silk. Swan's discovery sealed the commercial success of universal electric illumination, because his later improvements rendered it possible to produce a filament of exceeding fineness and uniformity. Thus a degree of economy which had never before been attainable was reached in the distribution of electricity, which led to the extension of the range of lighting from central supply stations. . . . In 1881

Edison, considering that the conditions were ripe for the exploitation of his discovery in Europe, planned the invasion of Paris and London. The Edison plant was placed near Holborn Viaduct, and the adjacent thoroughfares, together with the City Temple and part of the General Post Office, were electrically illuminated. In the furor which was created Swan appears to have been overlooked, the lamps which he had invented failing to claim pronounced attention. In Paris the Edison installation at the Exhibition created a wild excitement, the American inventor becoming the hero of the hour. . . . But the interests which had supported Mr. Swan were not disposed to tolerate the American march of triumph. The Edison interests received a severe shaking-up, when at the heyday of their sensational advance, by the intervention of litigation. . . . The fight over the claim for the invention of the incandescent electric light was fought stubbornly and bitterly. Thousands of pounds were sunk in trying to prove this and rebutting that. . . . The upshot of this spirited bout in the [British] Law Courts was somewhat unexpected, although perfectly logical under the unusual circumstances which prevailed at the time. Terms were arranged between the two antagonists, who decided to combine forces and thus be in a position to wage war against other claimants. In this manner was born, in 1883, the Edison and Swan United Electric Light Company, and the lamp placed upon the market was and is still known far and wide as the 'Ediswan,' a generic title formed by compounding the names of the British and American inventors."—F. A. Talbot, *Electrical discovery*, pp. 227-229.—"The next advance was initiated by Auer von Welsbach, who also invented the gas mantle. He suggested the use of the refractory metal osmium for filaments, but a still more valuable improvement was made in 1903, when W. von Bolton produced the tantalum lamp. He succeeded in preparing the highly infusible metal tantalum in the form of wire, and with it, owing to its very high melting point, he made an incandescent lamp which required a power of only 1.5 or 1.6 watts to yield one candlepower. With this material glow lamps were made of small candlepower to work at a voltage of 110 or less. The tantalum lamp . . . had a useful life of 600-800 hours, and an efficiency of 0.6 candle-power per watt expended in it. But this, in turn, was replaced by the tungsten lamp of Just, Hanaman and Kuzel. The difficulty at first was to produce this highly infusible metal in the form of wire. Originally, a process was employed which consisted in obtaining the metals in a colloidal condition in which extremely small metal particles are embedded in a gelatinous material. This is squirted into a filament and then dried and reduced to the condition of an aggregation of metallic particles welded together by passing an electric current through it. Later on methods were invented by Dr. W. D. Coolidge for fusing the metal in an electric furnace, and drawing it into fine wire. . . . In a 105-volt lamp of about 16 c.p., a length of some 24 inches of tungsten wire is employed. This wire is zig-zagged over a sort of frame composed of a central glass rod with small projecting pins of wire radiating at both ends. . . . Tungsten lamps are now obtainable for working on all the standard supply voltages, 100, 105, 110, 200, 210, 220 or 240, and of candlepower as low as 10 for the lower voltages, and 16 to 32 or more for the higher. . . . Although the high vacuum drawn-wire tungsten lamp is the most widely used of any type of incandescent lamp at present (1920) in domestic illumination, yet in the last year or two a gas-filled tungsten lamp has been introduced, having a still higher luminous

efficiency. In this lamp the glass bulb is not exhausted, but is filled at a reduced pressure with nitrogen, argon, or some inert gas, and its presence reduces the tendency of the tungsten to volatilise, and therefore it can be worked at a higher temperature. . . . The luminous efficiency varies from 1.8 to 2.0 c.p. per watt, with a useful life of about 1,000 hours. . . . These gas-filled lamps are called 'half-watt lamps,' because they emit one candle-power of light for every half-watt of electrical power expended in them. They are now made in very large sizes (2,000 c.p. or more) for street and open space illumination. . . . The half-watt lamp is more costly than the vacuum lamp, but its greater first cost is recovered in the diminished cost of electric energy by its greater efficiency after a certain number of hours' use. It has become a very formidable rival to both flame arc lamps and high pressure gas lamps in street lighting."—J. A. Fleming, *Fifty years of electricity*, pp. 164-167.—"While the electric light is extensively utilised for general and varied illuminating purposes, this by no means exhausts its spheres of usefulness. It is being widely employed for medical purposes, especially in the treatment of certain skin diseases such as tubercular lupus. The best known and most successful of these is that perfected by Dr. Finsen, who contrived a special lamp for the purpose [1893]. The light is very powerful, and is particularly rich in the ultra-violet rays, which are of distinct therapeutic value. The Crookes tube, which is employed in connection with X-ray photography, is another type of electric lamp designed to fulfill a specific duty. The electric light has also been discovered to possess first-class sterilising properties, the ultra-violet rays being fatal to microbic life. The lamps are of special design, so as to secure the maximum intensity of the necessary rays, and the water is passed before the light in a thin sheet or veil. The most deadly germs succumb instantly to the action of these rays, and the most heavily contaminated water can be speedily and cheaply sterilised by this process. Simple installations operating on this system are obtainable for use in the ordinary home, while it may be elaborated to meet the exacting and heavy demands of a densely populated town or city with equal success. Indeed, several plants have been laid down upon the Continent, upon which the citizens depend exclusively upon the germ-destroying properties of the ultra-violet rays in electric light, adapted to the purpose, for their pure drinking water."—F. A. Talbot, *All about inventions and discoveries*, pp. 227-236.—On January 23, 1913, Thomas Edison was awarded the Rathenau gold medal, by the American museum of safety for an electric safety lamp, for the use of miners. This lamp, it was said, represented the work of many years on the part of its inventor. About the same time F. Faerber, of Dortmund, Germany, was awarded a prize of \$30,000 offered by the British government for a satisfactory electric lamp for use by miners.

Also in: *Electrical World*, Jan. 25, 1913; Feb. 15, 1913.

1876.—Brush arc lamp.—"The reign of the Jablochhoff candle was summarily cut short, in the main, by the appearance of the arc lamp devised by Charles F. Brush, an American inventor. This was very similar in its general features to that in use to-day. . . . [With the perfection of the arc dynamo] the electric arc lamp [was brought] well within the realms of practical use, and as a result of vigorous campaigning and enterprise to initiate the public into the advantages of the new illumination, great headway was made throughout the world. Developments followed in such rapid suc-

cession, and the contributions of the men of science were so skilfully applied, that the invention became firmly planted among the community, especially as the light was so vastly superior to gas, no matter from what point of view it was considered. But as time passed the problem of electric illumination assumed a new significance. The arc-lamp's sphere of utility was somewhat limited, and the need for some other form of electric lighting became felt more and more acutely. The arc-lamp was excellent for the brilliant illumination of streets, open spaces, and interiors of spacious buildings, but was not adapted to the illumination of the average shop or the suburban home. Here gas reigned supreme, and at the time this form of consumption constituted an excellent sheet-anchor for the gas-producing interests. If electric lighting were to be rendered a menace to the supremacy of its rival in this field, a revolutionary development was essential. The light would need to be free from all complexity, of less candle-power, require no attention, dispense with the daily renewal of the carbons, and impose no more tax upon the intelligence of the user than the gas. Moreover, in order to be able to compete more effectively with the coal rival, electricity would have to be furnished upon a similar basis and at a comparative price, because in such matters the pocket governs the decision of the prospective customer. This demand precipitated what became known as the effort to 'subdivide the light,' and it was a problem which attracted many industrious scientists and investigators. One and all attacked the question contemporaneously and, for the most part, unknown to each other."—F. A. Talbot, *All about inventions and discoveries*, pp. 223-224.

#### ELECTRIC LOCOMOTIVES

1847-1899.—Early experiments and development.—"Owing to the high speed of early motors, the builders of the first locomotives were at a disadvantage. . . . [As early as 1847 Moses G. Farmer of Vermont experimented with such an engine, which he successfully demonstrated at his lectures.] Most early machines consisted merely of a wooden truck carrying an ordinary stationary motor from which power was transmitted to the axles either by chain and sprocket, or shafting and bevel gears. . . . [and were first used for mine haulage]. In the early days of motor building a motor of large output and comparatively small dimensions, with a safe heating-limit, was not produced, and for this reason the first mine locomotives were of the single-motor type. . . . The first electric mine haulage plant in America . . . was installed in July, 1887, in Lykens Valley Colliery, Pennsylvania. . . . The potential used was 400 volts. The power was transmitted by pinion and gear from the armature shaft . . . to a counter-shaft carried in the field frame of the motor and running at 400 revolutions. A chain and sprocket . . . connected this first counter-shaft to a second one between the forward and rear wheels. . . . A locomotive employed in one of the early American mine haulage plants, installed in 1880, at the Erie Colliery, near Scranton, Pa. . . . consisted of a 40 H.P., 220-volt motor surrounded by a heavy wooden frame-work carrying the wheels and gearing. The power was transmitted from the motor to one axle . . . and from the first set of drivers to the second by means of connecting rods. . . . The speed, under full load, was six miles per hour. . . . The machine installed at Forest City, Pa., U. S. A., in 1891 . . . showed a great improve-

ment over previous construction. Connecting rods were still used between the drivers, but the motor was hung between the wheels and ran at a speed requiring only double-reduction gearing. . . . The only important step between the Forest City machine and the . . . standard mine locomotive . . . was the substitution of two motors, operating the drivers independently, in place of the single-motor construction with connecting rods. The art of motor building soon reached a point where it was possible to build a motor of such dimensions and low speed that it could be hung between the wheels and connected to the driving axles by single-reduction gearing. The two-motor type of locomotive was then adopted, and experience has shown that the most efficient results can be secured by the independent application to the separate drivers of the total power required. . . . One motor is hung on each axle and drives it through single-reduction gearing. . . . The pioneer manufacturers of electric mine locomotives on a comprehensive scale were Messrs. Siemens & Halske, of Berlin. In 1882 they equipped the Royal Coal Mines at Zaukerode with a locomotive designed

the day they were first put in operation. The locomotive built by Siemens at Berlin in 1879 was the first machine to demonstrate the fact that great possibilities lay in the application of electric power to tractive service. In October, 1883, Leo Daft's locomotive *Ampère* was in operation on the Saratoga, Mt. McGregor and Lake George Railroad in New York State, U. S. A. . . . In 1885 the same inventor built a second locomotive, the *Ben Franklin*, and operated it for several weeks on the . . . Elevated Railway in New York City. This machine was rebuilt in 1888, and was then the most powerful electric locomotive in the world. It ran regularly, for nearly eight months between the frequent steam trains. . . . [See also NEW YORK CITY: 1689-1920.] Space forbids mention of many experimental locomotives built in America, Great Britain, Germany, France, Sweden and Switzerland, but the Heilmann Locomotive, built by the Electric Traction Society, of Paris, in 1895, demands notice, because of its unique character. A complete electric plant mounted on wheels was an idea probably never before conceived, nor has its materialisation since been attempted.

EARLIEST ELECTRIC ENGINE

to haul . . . an aggregate weight of about eight tons . . . at a speed of about  $4\frac{1}{2}$  miles an hour. This equipment was the first successful mine haulage plant in the world. The locomotive was of the single-motor type, and although the construction would to-day be considered crude, it hauled satisfactorily an average of 700 to 800 cars per day,—the work for which it was designed. . . . Swedish manufacturers were among the first in the field, and as early as 1890 the Allmänna Svenska Elektriska Aktiebolaget, of Vesteras, had two locomotives. . . . It is of interest to note that electric mine locomotives are in operation in almost every European country, and in China, Japan, Australia, the Sandwich Islands, South Africa, Chili and Mexico. . . . Contrary to the experience in the other branches of the application of electric energy, the development in this field has by no means been accomplished along gradually progressive lines. During a number of years experimental machines were built and operated in Germany, America, Great Britain and France, but none attained permanent commercial success. Meanwhile, the general art was rapidly advancing, and almost without warning . . . installations were made which have proved unreservedly successful from

The question of transmission was entirely eliminated, as a single truck carried boiler, engine, generator, and motors. . . . The close of the year 1890 marked the first permanent invasion of the field of steam-railroading by the electric locomotive. In December of that year the City and South London Railway . . . was opened to the public. The first sixteen locomotives furnished for this installation possessed many features which are characteristic of the best modern practice. . . . Each locomotive is equipped with two 50 H.P. motors of the gearless type, the axles forming the armature shafts. The axles also carry the lower end of the field frames, the upper ends being supported by a flexible link connection. . . . The installation made by the General Electric Company, of New York, in 1895 at Baltimore, U. S. A., for hauling the regular passenger trains of the Baltimore and Ohio Railway a distance of 14,500 feet through the city, involved the use of the largest electric locomotives . . . [which had at that time been] put in operation. The locomotive is mounted upon two four-wheeled trucks, and each truck is equipped with two motors. . . . The four motors are gearless, and the armature is carried on a sleeve. Spiders are shrunk on the ends of this sleeve, and the drivers are rotated by the spider-

arms which project between the spokes and are provided with double rubber cushions. Each motor has an output of 360 H.P., or a total of 1440 for each locomotive."—G. B. Mair, *Electric locomotive (Cassier's Magazine, Aug., 1899)*.—"The armatures in the locomotives [used by the City and South London] . . . are wound directly on the axles. . . . The two motors are permanently coupled in series and are controlled by a plain rheostat switch with twenty-six contacts; there is also a reversing switch for reversing the current in the armatures. . . . The rewinding of an armature, to the ordinary mind, or even to the average electrical engineer, is a serious matter; but when it is said that most of these armatures run 150,000 miles before rewinding becomes necessary, it will be seen that it is not such a heavy item. The average life of an armature is over 100,000 miles before rewinding. . . . Experience shows that in no case can the armature failures be traced to having the armature directly secured to the axle of the locomotive. . . . It was thought that the existing locomotives could be improved, and early in 1897 some experiments were made. . . . One of the locomotives was reconstructed as the result. The armature and magnets were removed for series-parallel working, and a new form of series-parallel switch, suitable for locomotive work, was developed. The switch is very similar to, and is operated in almost the same manner as, the ordinary rheostat switch. There is no magnetic blow-out or equivalent device, and in actual work this series-parallel controller has shown that it is eminently suitable for heavy locomotive work."—P. V. McMahon, *City and South London electric railway (Cassier's Magazine, Aug., 1899)*.—Later development in electric locomotives belongs to the history of railroads.—See also INVENTIONS: 20th century: Railroad brakes.

### ELECTRIC POWER

1896-1921.—Power from Niagara Falls.—"Perhaps . . . no better example of the varied application of electric energy exists than at Niagara. Certainly no grander exemplification of the way in which electric forces may be called into play, to replace other and unlike agencies, can be cited. Here at Niagara we may forcibly realize the importance of cheap and unailing power developed from water in its fall. We find the power of huge water wheels delivered to the massive dynamos for giving out electric energy."—*Electrical advance in ten years (Forum, Jan., 1898)*.—The following description of the engineering work by which Niagara was harnessed to turbines and dynamos, for an enormous development of electrical power, is taken from a paper read by Mr. Thomas Commerford Martin, of New York, at a meeting of the Royal Institution of Great Britain, June 10, 1896, and printed in the Proceedings of the Institution, Vol. 15; reprinted in the Annual Report of the Smithsonian Institution, 1896, p. 223: "Niagara is the point at which are discharged, through two narrowing precipitous channels only 3,800 feet wide and 160 feet high, the contents of 6,000 cubic miles of water, with a reservoir area of 90,000 square miles, draining 300,000 square miles of territory. The ordinary overspill of this Atlantic set on edge has been determined to be equal to about 75,000 cubic feet per second, and the quantity passing is estimated as high as 100,000,000 tons of water per hour. The drifting of a ship over the Horse Shoe Fall has proved it to have a thickness at the center of the crescent of over 16 feet. Between Lake Erie and Lake On-

tario there is a total difference of level of 300 feet, and the amount of power represented by the water at the falls has been estimated on different bases from 6,750,000 horsepower up to not less than 16,800,000 horsepower, the latter being a rough calculation of Sir William Siemens, who, in 1877, was the first to suggest the use of electricity as the modern and feasible agent of converting into useful power some of this majestic but squandered energy. . . . It was Mr. Thomas Evershed, an American civil engineer, who unfolded the plan of diverting part of the stream at a considerable distance above the falls, so that no natural beauty would be interfered with, while an enormous amount of power would be obtained with a very slight reduction in the volume of the stream at the crest of the falls. Essentially scientific and correct as the plan now shows itself to be, it found prompt criticism and condemnation, but not less quickly did it rally the able and influential support of Messrs. W. B. Rankine, Francis Lynde Stetson, Edward A. Wickes, and Edward D. Adams, who organized the corporate interests that, with an expenditure of £1,000,000 in five years, have carried out the present work. So many engineering problems arose early in the enterprise that after the survey of the property in 1800 an International Niagara Commission was established in London, with power to investigate the best existing methods of power development and transmission, and to select from among them, as well as to award prizes of an aggregate of £4,400. This body included men like Lord Kelvin, Mascart, Coleman Sellers, Turrettini, and Dr. Unwin, and its work was of the utmost value. Besides this the Niagara Company and the allied Cataract Construction Company enjoyed the direct aid of other experts, such as Prof. George Forbes, in a consultative capacity; while it was a necessary consequence that the manufacturers of the apparatus to be used threw upon their work the highest inventive and constructive talent at their command. The time-honored plan in water-power utilization has been to string factories along a canal of considerable length, with but a short tail race. At Niagara the plan now brought under notice is that of a short canal with a very long tail race. The use of electricity for distributing the power allows the factories to be placed away from the canal, and in any location that may appear specially desirable or advantageous. The perfected and concentrated Evershed scheme comprises a short surface canal 250 feet wide at its mouth, 1¼ miles above the falls, far beyond the outlying Three Sisters Islands, with an intake inclined obliquely to the Niagara River. This canal extends inwardly 1,700 feet, and has an average depth of some 12 feet, thus holding water adequate to the development of about 100,000 horsepower. The mouth of the canal is 600 feet from the shore line proper, and considerable work was necessary in its protection and excavation. The bed is now of clay, and the side walls are of solid masonry 17 feet high, 8 feet at the base, and 3 feet at the top. The northeastern side of the canal is occupied by a power house, and is pierced by ten inlets guarded by sentinel gates, each being the separate entrance to a wheel pit in the power house, where the water is used and the power is secured. The water as quickly as used is carried off by a tunnel to the Niagara River again. . . .

"The wheel pit, over which the power house is situated, is a long, deep, cavernous slot at one side, under the floor, cut in the rock, parallel with the canal outside. Here the water gets a fall of about 140 feet before it smites the turbines.

The arrangement of the dynamos generating the current up in the power house is such that each of them may be regarded as the screw at the end of a long shaft, just as we might see it if we stood an ocean steamer on its nose with its heel in the air. At the lower end of the dynamo shaft is the turbine in the wheel pit bottom, just as in the case of the steamer shaft we find attached to it the big triple or quadruple expansion marine steam engine. . . . The wheel pit which contains the turbines is 178 feet in depth, and connects by a lateral tunnel with the main tunnel running at right angles. This main tunnel is no less than 7,000 feet in length, with an average hydraulic slope of 6 feet in 1,000. It has a maximum height of 21 feet, and a width of 18 feet 10 inches, its net section being 386 square feet. The water rushes through it and out of its mouth of stone and iron at a velocity of 26½ feet per second, or nearly 20 miles an hour. More than 1,000 men were employed continuously for more than three years in the construction of this tunnel. . . . The first transmission of power from Niagara Falls to Buffalo was made at midnight, November 15-16, 1896, when 1,000 horsepower was sent over the wires to the power-house of the Buffalo Railway Company. The important event was signalled to the citizens by the firing of cannon, the ringing of bells and sounding of steam whistles."—*Electrical Review*, Jan. 12, 1901.

In 1913, "twenty-three years after the breaking of ground for the tunnel, the aggregate amount of power developed by The Niagara Falls Power Company and its allied interests, the Canadian Niagara Power Company, [was] about 175,000 h.p., with additional capacity in course of construction amounting to 50,000 h.p. . . . In the two Power Houses on the American side, the capacity of the turbines and generators [was] 5,500 h.p. each; in the Canadian Plant, 5 units of 10,000 h.p. and 2 units of 12,500 h.p. [were] installed. From the generators, the power, now in the form of electrical energy, is distributed through copper cables to the main copper bus bars located in a subway below the Power House floor, and from these bus bars [copper bars to which the electricity is delivered from the generating machines] is sent out over feeder cables run in ducts under ground to the different manufacturing establishments located nearby, or is sent to the step-up transformer stations for transmission at higher voltage to Buffalo, Lockport, the Tonawandas, Olcott, Bridgeburg and Fort Erie. . . . The Power House of the Canadian Niagara Power Company is located on the Canadian side of the river, a short distance above the Horseshoe Fall. . . . All three plants are inter-connected by heavy copper cables for the transmission of electrical energy so that power generated in any one plant can be sent out either direct . . . or can be transmitted through the inter-connecting cables to either of the other two plants for similar distribution. Thus the whole system is a single unit. . . . [On the company's lands] are located some thirty industries utilizing over 100,000 h.p. for manufacturing purposes. Except in the case of the more distant plants, the power for these industries is distributed at generator voltage, namely, 2,200 volts, 2-phase. For the more distant plants, the voltage is stepped up in transformers from 2,200 volts, 2-phase, to 11,000 volts, 3-phase. . . . On the Canadian side of the river the local distributing plant consists of one 3-phase, 2,200 volt and one 3-phase, 11,000 volt overhead circuit having an aggregate length of about ten miles. . . . For long-distance transmission, the electrical power de-

livered by the generators is stepped up to a higher voltage. . . . This is done by means of transformers located in transformer stations near the different Power Houses. The step-up transformer plant on the American side of the river contains 20 air-blast transformers of 1,250 h.p. each, . . . which change the generated current from 2,200-volt, two-phase, to 22,000-volt, three-phase, and 14 . . . transformers of 2,500 h.p. each, . . . which transform the generated current into three-phase current at either 11,000 volts, or 22,000 volts, as may be required. On the Canadian side of the river, the step-up transformer plant, . . . contains fifteen 1,675 h.p. transformers . . . and six 5,850 h.p. transformers, . . . which change the generated current from 11,000 volts, three-phase, to either 22,000, 33,000, 38,500 or 57,300 volts, three-phase, by slight changes in the connections. . . . From the step-up transformer plants overhead circuits distribute the electrical power at 22,000 volts to Buffalo, the Tonawandas, Lockport, Olcott and Fort Erie. . . . The total output of the three plants for the year ended February 28th, 1913, was 868,285,380 kilowatt-hours. To produce this output by steam would require the consumption of 1,800,000 tons of coal, or 5000 tons daily."—*Harnessing Niagara Falls (Pamphlet)*, pp. 5-8, 12-15.—In August, 1921, it was stated that the Provincial Hydroelectric Power Commission of Ontario serves about "250 municipalities, operates 13 distinct systems scattered over the province, and distributes 365,000 h.p. of hydroelectric energy [from Niagara]."—*Scientific American*, Aug. 6, 1921, p. 91.—"Enormous construction work was necessary to utilize the water power of Niagara. . . . [A dozen or more two-phase alternators generate the current at a pressure of 5,000 volts.] This voltage is raised to 11,000 for transmission to the City of Buffalo, . . . and the Cataract Co., which own the power station, supply thousands of horse-power to adjacent works for the manufacture of carborundum, aluminum, calcium carbide, alkali, and other electric products. . . . In addition they furnish currents for lighting, traction and heating to numerous towns and cities round. Altogether about 800,000 h.p. is now (1921) tapped from the Falls. At the present time there are four companies which draw and distribute power from Niagara Falls, three operating on the Canadian, and one on the American side. The former take 450,000 h.p. and the latter 350,000 h.p. from the Falls. There is, however, another great scheme on hand on the Canadian side, known as the Queenston-Chippewa Power Co., which has for its object to draw off another 500,000 h.p. [by deflecting the course of the Welland River, which now flows into the Niagara at Chippewa] and to utilise not merely the head of water of the Falls, but the full drop of level between Lakes Erie and Ontario, which is nearly double that of the Falls alone."—J. A. Fleming, *Fifty years of electricity*, pp. 239-241.

1921.—Other power plants.—Great and outstanding as it is, however, Niagara is but one of the many instances of the utilization of water power for the generation of electricity. "In about twenty years [written in 1921] the world has been covered with immense power houses converting the potential energy of coal by means of steam engines or else the potential energy of water at a high level into electric energy, which is transmitted to distant places [by means of wires and wire cables carried overhead on poles or towers, or, as in the case of cities and other populous places, through underground conduits]."—J. A. Fleming, *Fifty years of electricity*, p. 259.—The Shawingen

GREAT MEN IN THE FIELD OF ELECTRICITY

Falls in Quebec, upon which the asbestos industry is largely dependent, is a case in point. "The Caribou [Cal.] power plant transmits the power generated [at Caribou] . . . by aluminum cables, over an inch in diameter . . . to the San Francisco Bay distributing center. . . . The voltage is 165,000 . . . delivered across the bay by submarine cables. The power development . . . begins in Lake Almanor . . . and ends 75 miles distant, a drop of 4,000 feet. The waters . . . are used over and over again during this drop (seven times), for the generation of . . . power, [and are finally distributed] for irrigation. . . . The power thus developed . . . [furnishes] more than 300,000 . . . horse power for . . . agriculture business and industry."—*Scientific American*, Aug. 20, 1921, p. 143.—"Several power plants are now owned by the Compana Chilena de Electricidad

ing cities such as Zurich, Baden . . . and others" —J. A. Fleming, *Fifty years of electricity*, pp. 190, 191, 241.—"A unique position is occupied by the Victoria Falls and Transvaal Power Company, in South Africa. This has existed since and has reached an output of half a milliard (500,000) k.w. hours yearly. . . . The energy generated is used for various industrial purposes, but a large part is used to compress air for use in driving mining and other machinery, up to approximately 80,000 H.P. The total capacity of generators in commission amounts to 288,000 H.P., the compressed air plant alone having an output of 78,000 H.P., the transformer capacity is 473,000 k.w.a." —G. Klingenburg, *Large electric power stations*, ch. 6, p. 165.—It was proposed in 1922 to generate 220,000 volts on the Pit River, transmit the power to a station near Sacramento, and transform it

LONG LAKE STATION OF THE WASHINGTON (STATE) WATER POWER COMPANY

Ltd. in Santiago, Chile, which is to control the Chilean Tramway and Light Co. . . . and furnish electrification now under way of the first zone of the State Railways."—*United States Commerce Reports*, Jan. 2, 1922, p. 21.—"About 400,000 H.P. obtained from water power are employed in Norway, in producing nitric acid . . . yielding some 180,000 tons annually. . . . [The production of aluminum which we also owe to electricity is carried on at Neuhausen, Switzerland, and at Loch Leven in Scotland where the power is taken from the Falls of Foyers.] The manufacture of calcium carbide is conducted on a vast scale at Odda, Norway, using many thousands of electrical horse power, taken from lakes lying 1,300 feet above Odda. [This, a purely electro-thermal industry, is also carried on in Sweden, Germany, France, Japan, Canada.] One of the largest of [the] Swiss stations is at Beznau on the Aar, . . . in the north of Switzerland. In 1907 it distributed 20,000 H.P. over an area of 800 square miles, includ-

into 110,000 volts, so that it might be distributed to the cities and regions about San Francisco Bay. These are but a few, taken almost at random, of the great hydro-electric power stations which are steadily and economically producing the light, heat and power upon which modern industry depends in a great and increasing degree. Moreover numerous steam plants are used, where water power is not available, to generate the power needed for city lighting, to say nothing of the individual plants owned by industrial concerns which are out of economical reach of the large distributing plants. A very interesting development of electrical power, which may be compared to these individual plants, is its use on merchant ships and battleships, from lighting equipment and electrically controlled steering gear up to the electrical driving apparatus of such a vessel as U. S. S. "Tennessee."—See also EUROPE: Modern period: Mechanical revolution.

## TELEGRAPHY AND TELEPHONY

## Telegraph

1753-1874.—Early history.—Perfected telegraph.—“The first actual suggestion of an electric telegraph was made in an anonymous letter published in the Scots Magazine at Edinburgh, February 17th, 1753. The letter is initialed ‘C. M.,’ and many attempts have been made to discover the author’s identity. . . . The suggestions made in this letter were that a set of twenty-six wires should be stretched upon insulated supports between the two places which it was desired to put in connection, and at each end of every wire a metallic ball was to be suspended, having under it a letter of the alphabet inscribed upon a piece of paper. . . . The message was to be read off at the receiving station by observing the letters which were successively attracted by their corresponding balls, as soon as the wires attached to the latter received a charge from the distant conductor. In 1787 Monsieur Lomond, of Paris, made the very important step of reducing the twenty-six wires to one, and indicating the different letters by various combinations of simple movements of an indicator, consisting of a pith-ball suspended by means of a thread from a conductor in contact with the wire. . . . In the year 1790 Chappe, the inventor of the semaphore, or optico-mechanical telegraph, which was in practical use previous to the introduction of the electric telegraph, devised a means of communication, consisting of two clocks regulated so that the second hands moved in unison, and pointed at the same instant to the same figures. . . . In the early form of the apparatus, the exact moment at which the observer at the receiving station should read off the figure to which the hand pointed was indicated by means of a sound signal produced by the primitive method of striking a copper stewpan, but the inventor soon adopted the plan of giving electrical signals instead of sound signals. . . . In 1795 Don Francisco Salva . . . suggested . . . that instead of twenty-six wires being used, one for each letter, six or eight wires only should be employed, each charged by a Leyden jar, and that different letters should be formed by means of various combinations of signals from these. . . . Mr. (afterwards Sir Francis) Ronalds . . . took up the subject of telegraphy in the year 1816, and published an account of his experiments in 1823, [based on the same idea as that of Chappe]. Ronalds drew up a sort of telegraphic code by which words, and sometimes even complete sentences, could be transmitted by only three discharges. . . . Ronalds completely proved the practicability of his plan, not only on [a] short underground line, . . . but also upon an overhead line some eight miles in length, constructed by carrying a telegraph wire backwards and forwards over a wooden framework erected in his garden at Hammersmith. . . . The first attempt to employ voltaic electricity in telegraphy was made by Don Francisco Salva, whose frictional telegraph has already been referred to. On the 14th of May, 1800, Salva read a paper on ‘Galvanism and its application to Telegraphy’ before the Academy of Sciences at Barcelona, in which he described a number of experiments which he had made in telegraphing over a line some 310 metres in length. . . . A few years later he applied the then recent discovery of the Voltaic pile to the same purpose, the liberation of bubbles of gas by the decomposition of water at the receiving station being the method adopted for in-

dicating the passage of the signals. A telegraph of a very similar character was devised by Sömmering, and described in a paper communicated by the inventor to the Munich Academy of Sciences in 1809. Sömmering used a set of thirty-five wires corresponding to the twenty-five letters of the German alphabet and the ten numerals. . . . Oersted’s discovery of the action of the electric current upon a suspended magnetic needle provided a new and much more hopeful method of applying the electric current to telegraphy. The great French astronomer Laplace appears to have been the first to suggest this application of Oersted’s discovery, and he was followed shortly afterwards by Ampère, who in the year 1820 read a paper before the Paris Academy of Sciences.”—G. W. de Tunzelmann, *Electricity in modern life*, ch. 9.—“The European philosophers kept on groping. At the end of five years [after Oersted’s discovery], one of them reached an obstacle which he made up his mind was so entirely insurmountable, that it rendered the electric telegraph an impossibility for all future time. This was [1825] Mr. Peter Barlow, fellow of the Royal Society, who had encountered the question whether the lengthening of the conducting wire would produce any effect in diminishing the energy of the current transmitted, and had undertaken to resolve the problem. . . . ‘I found [he said] such a considerable diminution with only 200 feet of wire as at once to convince me of the impracticability of the scheme.’ . . . The year following the announcement of Barlow’s conclusions, a young graduate of the Albany (N. Y.) Academy—by name Joseph Henry—was appointed to the professorship of mathematics in that institution. Henry there began the series of scientific investigations which is now historic. . . . Up to that time, electro-magnets had been made with a single coil of naked wire wound spirally around the core, with large intervals between the strands. The core was insulated as a whole: the wire was not insulated at all. Professor Schweigger, who had previously invented the multiplying galvanometer, had covered his wires with silk. Henry followed this idea, and, instead of a single coil of wire, used several. . . . Barlow had said that the gentle current of the galvanic battery became so weakened, after traversing 200 feet of wire, that it was idle to consider the possibility of making it pass over even a mile of conductor and then affect a magnet. Henry’s reply was to point out that the trouble lay in the way Barlow’s magnet was made. . . . Make the magnet so that the diminished current will exercise its full effect. Instead of using one short coil, through which the current can easily slip, and do nothing, make a coil of many turns; that increases the magnetic field: make it of fine wire, and of higher resistance. And then, to prove the truth of his discovery, Henry put up the first electro-magnetic telegraph ever constructed. In the academy at Albany, in 1831, he suspended 1,060 feet of bell-wire, with a battery at one end and one of his magnets at the other; and he made the magnet attract and release its armature. The armature struck a bell, and so made the signals. Annihilating distance in this way was only one part of Henry’s discovery. He had also found, that, to obtain the greatest dynamic effect close at hand, the battery should be composed of a very few cells of large surface, combined with a coil or coils of short coarse wire around the magnet,—conditions just the reverse of those necessary when the magnet was to be worked at a distance. Now, he argued, suppose the magnet with the coarse short coil,

and the large-surface battery, be put at the receiving station; and the current coming over the line be used simply to make and break the circuit of that local battery. . . . This is the principle of the telegraphic 'relay.' In 1835 Henry worked a telegraph-line in that way at Princeton. And thus the electro-magnetic telegraph was completely invented and demonstrated. There was nothing left to do, but to put up the posts, string the lines, and attach the instruments."—P. Benjamin, *Age of electricity*, ch. 11.—"At last we leave the territory of theory and experiment and come to that of practice. 'The merit of inventing the modern telegraph, and applying it on a large scale for public use, is, beyond all question, due to Professor Morse of the United States.' So writes Sir David Brewster, and the best authorities on the question substantially agree with him. . . . Leaving for future consideration Morse's telegraph, which was not introduced until five years after the time when he was impressed with the notion of its feasibility, we may mention the telegraph of Gauss and Weber of Göttingen. In 1833, they erected a telegraphic wire between the Astronomical and Magnetical Observatory of Göttingen, and the Physical Cabinet of the University, for the purpose of carrying intelligence from the one locality to the other. To these great philosophers, however, rather the theory than the practice of Electric Telegraphy was indebted. Their apparatus was so improved as to be almost a new invention by Steinhilf of Munich, who, in 1837 . . . succeeded in sending a current from one end to the other of a wire 36,000 feet in length, the action of which caused two needles to vibrate from side to side, and strike a bell at each movement. To Steinhilf the honour is due of having discovered the important and extraordinary fact that the earth might be used as a part of the circuit of an electric current. The introduction of the Electric Telegraph into England dates from the same year as that in which Steinhilf's experiments took place. William Fothergill Cooke, a gentleman who held a commission in the Indian army, returned from India on leave of absence, and afterwards, because of his bad health, resigned his commission, and went to Heidelberg to study anatomy. In 1836, Professor Mönke, of Heidelberg, exhibited an electro-telegraphic experiment, 'in which electric currents, passing along a conducting wire, conveyed signals to a distant station by the deflexion of a magnetic needle enclosed in Schweigger's galvanometer or multiplier.' . . . Cooke was so struck with this experiment, that he immediately resolved to apply it to purposes of higher utility than the illustration of a lecture. . . . In a short time he produced two telegraphs of different construction. When his plans were completed, he came to England, and in February, 1837, having consulted Faraday and Dr. Roget on the construction of the electric-magnet employed in a part of his apparatus, the latter gentleman advised him to apply to Professor Wheatstone. . . . The result of the meeting of Cooke and Wheatstone was that they resolved to unite their several discoveries; and in the month of May, 1837, they took out their first patent 'for improvements in giving signals and sounding alarms in distant places by means of electric currents transmitted through metallic circuits.' . . . By-and-by, as might probably have been anticipated, difficulties arose between Cooke and Wheatstone, as to whom the main credit of introducing the Electric Telegraph into England was due. . . . Mr. Cooke accused Wheatstone (with a certain amount of justice, it should seem) of entirely

ignoring his claims; and in doing so Mr Cooke appears to have rather exaggerated his own services. Most will readily agree to the wise words of Mr. Sabine: 'It was once a popular fallacy in England that Messrs. Cooke and Wheatstone were the original inventors of the Electric Telegraph. The Electric Telegraph had, properly speaking, no inventor; it grew up as we have seen little by little.'—H. J. Nicoll, *Great movements*, pp. 424-429.—"In the latter part of the year 1832, Samuel F. B. Morse, an American artist, while on a voyage from France to the United States, conceived the idea of an electro-magnetic telegraph which should consist of the following parts, viz: A single circuit of conductors from some suitable generator of electricity; a system of signs, consisting of dots or points and spaces to represent numerals; a method of causing the electricity to mark or imprint these signs upon a strip or ribbon of paper by the mechanical action of an electro-magnet operating upon the paper by means of a lever, armed at one end with a pen or pencil; and a method of moving the paper ribbon at a uniform rate by means of clock-work to receive the characters. . . . In the autumn of the year 1835 he constructed the first rude working model of his invention. . . . The first public exhibition . . . was on the 2d of September, 1837, on which occasion the marking was successfully effected through one-third of a mile of wire. Immediately afterwards a recording instrument was constructed . . . which was subsequently employed upon the first experimental line between Washington and Baltimore. This line was constructed in 1843-44 under an appropriation by Congress, and was completed by May of the latter year. On the 27th of that month the first despatch was transmitted from Washington to Baltimore. . . . The experimental line was originally constructed with two wires, as Morse was not at that time acquainted with the discovery of Steinheil, that the earth might be used to complete the circuit. Accident, however, soon demonstrated this fact. . . . The following year (1845) telegraph lines began to be built over other routes. . . . In October, 1851, a convention of deputies from the German States of Austria, Prussia, Bavaria, Würtemberg and Saxony, met at Vienna, for the purpose of establishing a common and uniform telegraphic system, under the name of the German-Austrian Telegraph Union. The various systems of telegraphy then in use were subjected to the most thorough examination and discussion. The convention decided with great unanimity that the Morse system was practically far superior to all others, and it was accordingly adopted. Prof. Steinheil, although himself . . . the inventor of a telegraphic system, with a magnanimity that does him high honor, strongly urged upon the convention the adoption of the American system. [The first of the printing telegraphs was patented in the United States by Royal E. House, in 1846. The Hughes printing telegraph, a remarkable piece of mechanism, was patented by David E. Hughes, of Kentucky, in 1855. A system known as the automatic method, in which the signals representing letters are transmitted over the line through the instrumentality of mechanism, was originated by Alexander Bain of Edinburgh, whose first patents were taken out in 1846. An autographic telegraph, transmitting despatches in the reproduced hand-writing of the sender, was brought out in 1850, by F. C. Bakewell, of London. The same result was afterwards accomplished with variations of method by Chas. Cros, of Paris, Abbé Caseli, of Florence, and others.]

The possibility of making use of a single wire for the simultaneous transmission of two or more communications seems to have first suggested itself to Moses G. Farmer, of Boston, about the year 1852." The problem was first solved with partial success by Dr. Gintl, on the line between Prague and Vienna, in 1853, but more perfectly by Carl Frischen, of Hanover, in the following year. Other inventors followed in the same field, among them Thomas A. Edison, of New Jersey, who was led by his experiments finally, in 1874, to devise a system "which was destined to furnish the basis of the first practical solution of the curious and interesting problem of quadruplex telegraphy."—G. B. Prescott, *Electricity and the electric telegraph*, ch. 20-40.

1754-1866.—Submarine cables.—Their early history.—Laying the Atlantic cable.—"Among the applications of the telegraph which deserve special mention for magnitude and importance is the Atlantic Cable. For boldness of conception, tireless persistence in execution, and value of results, this engineering feat, though nearly a half century old, still challenges the admiration of the world, and marks the beginning of one of the great epochs of the Nineteenth Century. It was not so brilliant in substantive invention, as it added but little to the telegraph as already known, beyond the means for insulating the wires within a gutta percha cable, but it was one of the greatest of all engineering works."—E. W. Bryn, *Progress of invention in the nineteenth century*, p. 32.—"A submarine telegraph cable is merely a land-line completely isolated for its whole length, as water is so potent a conductor of electric force. A cable consists of three essential parts,—the core, or conductor, of copper, because that is the best conducting substance known; the skin, or insulator, of gutta-percha, because this is quite as effective in its resistance to the electric current; and the shield, or protector, of steel wire, to strengthen the cable in handling and submerging, and to protect it against the dangers of chafing on the bottom of the ocean, especially in shoal water; of injury by marine insects, and of damage from various other causes. . . . Cables are made in two-mile lengths and as each such section is completed, its electrical resistance is tested by a special machine and carefully noted. When a cable is made it is put on board the cable ship which is to submerge it. . . . The cable is stored in tanks in the ship's hold, and when she reaches the place where the laying process is to commence, she lands a 'shore-end,' a section bound with steel to the thickness of a man's arm to withstand the chafing of the surf, winds, and currents. This is taken to the cable house, usually a short distance above high-water and to which the cable is laid in a trench, and then the ship steams seaward, putting out the cable as she goes. The process is continued day and night, or from seven to ten knots an hour, as the weather warrants. An Atlantic cable is usually laid in little over a week. The last Atlantic cable [prior to 1915] was laid from Penzance, Cornwall, England, to Bay Roberts, Newfoundland, in thirteen days by the *Colonia*, the biggest cable-laying ship in the world."—P. T. McGrath, *Transatlantic cables and their control* (*American Review of Reviews*, May, 1915, pp. 591-592, 594-595).—"As early as 1811, Sömmerring insulated a wire with India rubber, and laid it across the Isar River near Munich for experimental purposes. In 1838 Pasley insulated a conductor by winding it with tarred rope and pitched yarn. He used this cable for sub-aqueous cable purposes in connection with a Cooke-

Wheatstone telegraph. In 1842 Morse laid in New York harbor a wire insulated with hemp saturated with pitch and tar, and coated with India rubber. In 1845, Cornell laid in the Hudson River twelve miles of duplex cable. . . . This cable gave excellent service until it was broken by ice."—*Modern land and submarine telegraphy* (*Encyclopedia of applied electricity*, v. 7, p. 272).—The feasibility of submarine cables was first suggested in 1795 by a Spaniard, Salva, before the Barcelona Academy of Sciences. In 1813 John Robert Sharpe, an Englishman, transmitted signals through seven miles of insulated wire in a pond. This was followed in 1838 by a practical demonstration of the transmission of signals, in actual experiment, by Colonel Pasley of the Royal Engineers, at Chatterton, England. In 1839, Dr. O'Shaughnessy, director of the East India Company's telegraph system, transmitted telegraphic signals through insulated wire laid under the Hugli River in India. An important step was taken in 1842, when Prof. Samuel F. B. Morse insulated a wire with hemp soaked with tar and pitch, surrounded with India rubber, laid it between Castle Garden and Governor's Island in New York harbor, and succeeded in transmitting electric currents and signals through it. In 1850, submarine telegraph lines, insulated with gutta percha, was laid across the English Channel connecting Dover and Calais. A few messages were exchanged, but it soon ceased to operate. The first successful line was established between Dover and Calais in 1851. A cable containing four copper wires was insulated with gutta percha, surrounded by tarred hemp and protected by 10 galvanized iron wires wound spirally about it. This was then laid across the English channel and opened for public telegraph business on November 13, 1851, and continued in constant use for many years. Its weight was 7 tons per mile, and it was 25 miles long. The success of the cross-channel cable "gave rise to numerous other cable enterprises around England and many experiments: Three attempts between Hollyhead, England, and Dublin, Ireland: First, no hemp between conductor and armor; second, no armor, and the cable broke many times while laying and was broken by strong currents soon after laying; no weight to hold it to the bottom; third attempt, a good cable was made, but an inadequate brake apparatus on the vessel laying it caused so much to run out that there was not enough to reach Ireland. But the success of the Dover-Calais cable across the Straits of Dover kept the spark of hope burning among the people. . . . [In 1853 the] Fourth attempt to reach Ireland was successful between Scotland and Ireland. These cables all had from four to six conductors. Only one year elapsed before there was another cable in demand between England and the continent, and it was laid in 1853 between Dover and Ostend and had six conductors. Within ten years, one-half dozen excellent cables ranging between 25 and 117 miles connected England with the continent, and cables were then laid for short distances in the Mediterranean Sea. [During] . . . 1855, a gutta percha insulated wire was laid in the Black Sea 300 miles; no armor except ten miles at each shore end. It was broken shortly after the taking of Sebastopol and was never repaired. Great trouble was experienced in laying this wire with no armor on which strain could be put. In order to prevent strain, much more wire was paid out than the distance required. 1857: Cables were laid from Sardinia to Malta and from Malta to Corfu, each 500 miles long. One cable only lasted a short time, being too light; . . . [the] bottom was uneven

and attempts to repair were unsuccessful. The other lasted about two years."—B. O. Lenoir, *History and uses of submarine cables* (Stone and Webster Public Service Journal, Dec., 1914, pp. 448-449).

"Cyrus Field . . . established a company in America (in 1854), which . . . obtained the right of landing cables in Newfoundland for fifty years. Soundings were made in 1856 between Ireland and Newfoundland, showing a maximum depth of 4,400 metres. Having succeeded after several attempts in laying a cable between Nova Scotia and Newfoundland, Field founded the Atlantic Telegraph Company in England. . . . The length of the . . . cable [used] was 4,000 kilometres, and was carried by the two ships Agamemnon and Niagara. The distance between the two stations on the coasts was 2,640 kilometres. The laying of the cable commenced on the 7th of August, 1857, at Valentia (Ireland); on the third day the cable broke at a depth of 3,660 metres, and the expedition had to return. A second expedition was sent in 1858; the two ships met each other half-way, the ends of the cable were joined, and the lowering of it commenced in both directions; 140 kilometres were thus lowered, when a fault in the cable was discovered. It had, therefore, to be brought on board again, and was broken during the process. After it had been repaired, and when 476 kilometres had been already laid, another fault was discovered, which caused another breakage; this time it was impossible to repair it, and the expedition was again unsuccessful, and had to return. In spite of the repeated failures, two ships were again sent out in the same year, and this time one end of the cable was landed in Ireland, and the other at Newfoundland. The length of the sunk cable was 3,745 kilometres. Field's first telegram was sent on the 7th of August, from America to Ireland. The insulation of the cable, however, became more defective every day, and failed altogether on the 1st of September. From the experience obtained, it was concluded that it was possible to lay a trans-Atlantic cable, and the company, after consulting a number of professional men, again set to work. . . . The Great Eastern was employed in laying this cable. This ship, which . . . [was] 211 metres long, 25 metres broad, and 16 metres in height, carried a crew of 500 men, of which 120 were electricians and engineers, 179 mechanics and stokers, and 115 sailors. The management of all affairs relating to the laying of the cable was entrusted to Canning. The coast cable was laid on the 21st of July, and the end of it was connected with the Atlantic cable on the 23rd. After 1,326 kilometres had been laid, a fault was discovered, an iron wire was found stuck right across the cable, and Canning considered the mischief to have been done with a malevolent purpose. On the 2nd of August 2,196 kilometres of cable were sunk, when another fault was discovered. While the cable was being repaired it broke, and attempts to recover it at the time were all unsuccessful; in consequence of this the Great Eastern had to return without having completed the task. A new company, the Anglo-American Telegraph Company, was formed in 1866, and at once entrusted Messrs. Glass, Elliott and Company with the construction of a new cable of 3,000 kilometres. Different arrangements were made for the outer envelope of the cable, and the Great Eastern was once more equipped to give effect to the experiments which had just been made. The new expedition was not only to lay a new cable, but also to

take up the end of the old one, and join it to a new piece, and thus obtain a second telegraph line. The sinking again commenced in Ireland on the 13th of July, 1866, and it was finished on the 27th. On the 4th of August, 1866, the Trans-Atlantic Telegraph Line was declared open."—A. R. von Urbanitzky, *Electricity in the service of man*, pp. 767-768.

1855-1917.—Printer system.—Cables.—The first practical telegraph type-printing machine was devised by D. E. Hughes, an Englishman, in 1855. The system has been greatly improved and "the printing telegraphs of to-day produce their messages by the direct operation of typewriting machines or mechanisms operating substantially in the same manner as the ordinary typewriting machine. The methods by which the electrical impulses coming over the line are transformed into mechanical operation of the typewriter keys, or what corresponds to the typewriter keys, vary. It would be difficult to describe how this function is performed without entering upon much detail of a highly technical character. Suffice it to say that means have been devised by which each combination of electrical impulses coming over the line wire causes a channel to be opened for the motor operation of the typewriting key-bar operating the corresponding letter upon the typewriter apparatus. These machines write the messages with proper arrangement of the date line, address, text, and signature, operating not only the type, but also the carriage shift and the line spacing as required. A further step in advance has been made by feeding the blanks into the receiving typewriter from a continuous roll, an attendant tearing the messages off as they are completed. The entire operation is automatic from beginning to end and capable of considerable speed. There remained the problem of devising some means by which a number of automatic units could be operated over the same line at the same time. This is not by any means a new proposition. Here again various solutions have been offered by the scientists both of Europe and of this country, and different systems designed to accomplish the desired object have been placed in operation. One of the most recent and we believe the most efficient so far developed, is the so-called multiplex printer system, devised by the engineers of the Western Union Telegraph Company and now being extensively used by that company. Perhaps the best picture of what is accomplished by this system can be given by an illustration. Let us assume a single wire between New York and Chicago. At the New York end there are connected with this wire four combined perforators and transmitters, and four receiving machines operating on the typewriter principle. At the Chicago end the wire is connected with a like number of sending and receiving machines. All these machines are in simultaneous operation; that is to say, four messages are being sent from New York to Chicago and four messages are being sent Chicago to New York, all at the same time and over a single wire, and the entire process is automatic. The method by which eight messages can be sent over a single wire at the same time without interfering with one another cannot readily be described in simple terms. It may give some comprehension of the underlying principle to say that the heart of the mechanism is in two disks at each end of the line which are divided into groups of segments insulated from each other, each group being connected to one of the sending or receiving machines, respectively. A rotating contact brush connected to the line wire passes over the disk,

so that, as it comes into contact with each segment, the line wire is connected in turn with the channel leading to the corresponding operating unit. The brushes revolve in absolute unison of time and position. To use the same illustration as before, the brush on the Chicago disk and the brush on the New York disk not only move at exactly the same speed, but at any given moment the two brushes are in exactly the same position with regard to the respective group of segments of both disks. If we now conceive of these brushes passing over the successive segments of the disks at a very great rate of speed, it may be understood that the effect is that the electrical impulses are distributed, each receiving machine receiving only those produced by the corresponding sending machine at the other end. In other words, each of the sets of receiving and sending apparatus really gets the use of the line for a fraction of the time during each revolution of the brushes of the distributor or disk mechanism. The multiplex automatic circuits are being extended all over the country and are proving extremely valuable in handling the constantly growing volume of telegraph traffic. What has thus been achieved in developing the technical side of telegraph operation must be attributed in part to that impulse toward improvement which is constantly at work everywhere and is the most potent factor in the progress of all industries, but in large measure it is the reflex of the growing—and recently very rapidly growing—demands which are made upon the telegraph service. Emphasis is placed on the larger ratio of growth in this demand in recent years because it is peculiarly symptomatic of a noticeably wider realization of the advantages which the telegraph offers as an effective medium for business and social correspondence than has heretofore been in evidence. It means that we have graduated from that state of mind which saw in the telegraph something to be resorted to only under the stress of emergency, which caused many good people to associate a telegram with trouble and bad news and sudden calamity. . . . That is but one of the conditions which accounts for the growing use of the telegraph. Another is to be found in the recognition of the convenience of the night letter and day letter. This has brought about a considerable increase in the volume of family and social correspondence by telegraph, which will grow to very much greater proportions as experience demonstrates its value. In business life the night letter and day letter have likewise established a distinct place for themselves. Here also the present development of this traffic can be regarded as only rudimentary in comparison with the possibilities of its future development, indications of which are already apparent. It has been discovered that the telegram, on account of its peculiar attention-compelling quality, is an effective medium not only for the individual appeal, but for placing business propositions before a number of people at once, the night letters and day letters being particularly adapted to this purpose by reason of the greater scope of expression which they offer. Again, business men are developing the habit of using the telegram in keeping in touch with their field forces and their salesmen and encouraging their activities, in cultivating closer contact with their customers, in placing their orders, in replenishing their stocks, and in any number of other ways calculated to further the profitable conduct of their enterprises.”—W. K. Towers, *Masters of space*, pp. 272-280.—“Duplex operating of land telephone lines was introduced commercially in

1858, and the same year William Thomson patented a duplex method of operating submarine cable; this, however, was not immediately applied to commercial operations. . . . In 1862 Varley patented an artificial cable . . . with which a better balance was obtainable, but it was not until Muirhead patented an artificial line that the problem was so satisfactorily solved as to make duplex cable operation commercially successful.”—*Encyclopedia of applied electricity*, v. 7, p. 73.—“Probably the most important of the inventions relating to submarine telegraphs is the siphon recorder, invented by Sir William Thomson, now Lord Kelvin (U. S. Pat. No. 156,807, Nov. 17, 1874). It is called a siphon recorder because the record is made by a little glass siphon down which a flow of ink is maintained like a fountain pen. This siphon is vibrated by the electric impulses to produce on the paper strip a zigzag line, whose varying contour is made to represent letters.”—E. W. Bryn, *Progress of invention in the nineteenth century*, p. 32.

Also in: C. De F. Chandler, *Submarine telegraph cables* (*Scientific American*, Aug., 1922).

In 1915 there were “seventeen working cables across the Atlantic, distributed as follows: Four ‘Anglo-American’ cables between the British Isles and America, via Heart’s Content, Newfoundland. Three ‘Western Union’ cables,—two between the British Isles and America, via Bay Roberts, Newfoundland, and one via Canso, Nova Scotia. One ‘Direct U. S.’ cable between the British Isles and America, via Harbor Grace, Newfoundland. Five ‘Commercial’ cables,—two between the British Isles and America, via St. John’s, Newfoundland; two via Canso, and one via Horta, Azores. Two French cables,—one between Brest and New York, via St. Pierre, Miquelon, and one via Cape Cod. Two German cables between Borkum and New York, via the Azores. The Anglo-American Cable Company enjoyed a fifty-year monopoly in Newfoundland which made it impossible for any other cable company to effect a landing there until 1904, but as soon as this prohibition was removed all the other cable companies at once began to seek terms of entry. . . . Early in 1912 all the British telegraph cables in the North Atlantic, those of the Anglo-American Telegraph Company, were secured by the Western Union Telegraph Company of New York, under a 99-year lease, the one cable owned by the Direct United States Cable Company being also secured on similar terms. The result of this was that the control of every cable submerged in this section of the ocean, except the two French cables and the two German cables, passed under American control, and even the German cables may be virtually said to be so controlled also as to their western ends, because the Commercial Cable Company has an alliance with them. . . . [This made] American capitalists . . . absolute masters of this whole system of intercommunication across the Atlantic, with all the advantages appertaining thereto.”—P. T. McGrath, *Transatlantic cables and their control* (*American Review of Reviews*, May, 1915, pp. 591-594).

1915-1922.—Confiscation of German cables.—All British line.—United States cable law.—Cables in 1922.—During the Great War, the German cables were confiscated by Great Britain and France. In 1919, the Western Union Cable Co. abrogated its lease of the “Direct U. S. Cable,” giving as its reason the fact that the line was frequently out of operation, and thereupon the British government entered into negotiation for the purchase of the line, with a view to making

it a link in a line of "All British" telegraphic communication between England and Australia. In 1921, the United States government passed an Act "to prevent unauthorized cable landings in the United States, or any part of its possessions." This Act, up to the latter part of 1922, had prevented the landing at Miami of a cable laid for the Western Union Co., which it was said would connect with a British cable line from Brazil to the Barbadoes, and give color to a claim by the British company to a monopoly of cable communication between the United States and Brazil. In 1922, the importance of cable communication was again brought home when a body of armed men, in rebellion against the Irish Free State, took possession of Western Union cable stations in the southwest of Ireland. In 1922 "the submarine telegraph cables of the world number 530, with a total mileage of about 242,195; a sufficient length to encircle the earth at the equator about ten times. The longest section of submarine cable is part of the British Pacific cable between Vancouver and Fanning Island. This very long section has the remarkable record of uninterrupted service from natural causes since the original laying 19 years ago; except that during the recent war, the German cruiser 'Nürnberg' cut this cable as an act of hostility."—C. De F. Chandler, *Submarine telegraph cables* (*Scientific American*, Aug., 1922).

### Telephone

1875-1893.—**Invention and early use.**—"The first and simplest of all magnetic telephones is the Bell Telephone." In "the first form of this instrument, constructed by . . . Graham Bell, in 1876 . . . a harp of steel rods was attached to the poles of a permanent magnet. . . . When we sing into a piano, certain of the strings of the instrument are set in vibration sympathetically by the action of the voice with different degrees of amplitude, and a sound, which is an approximation to the vowel uttered, is produced from the piano. Theory shows that, had the piano a much larger number of strings to the octave, the vowel sounds would be perfectly reproduced. It was upon this principle that Bell constructed his first telephone. The expense of constructing such an apparatus, however, deterred Bell from making the attempt, and he sought to simplify the apparatus before proceeding further in this direction. After many experiments with more or less unsatisfactory results, he constructed the instrument . . . which he exhibited at Philadelphia in 1876. In this apparatus, the transmitter was formed by an electromagnet, through which a current flowed, and a membrane, made of gold-beater's skin, on which was placed as a sort of armature, a piece of soft iron, which thus vibrated in front of the electromagnet when the membrane was thrown into sonorous vibration. . . . It is quite clear that when we speak into a Bell transmitter only a small fraction of the energy of the sonorous vibrations of the voice can be converted into electric currents, and that these currents must be extremely weak. Edison applied himself to discover some means by which he could increase the strength of these currents. Elisha Gray had proposed to use the variation of resistance of a fine platinum wire attached to a diaphragm dipping into water, and hoped that the variation of extent of surface in contact would so vary the strength of current as to reproduce sonorous vibrations; but there is no record of this experiment having been tried. Edison proposed to utilize the fact that the resistance of carbon varied under pressure. He had in-

dependently discovered this peculiarity of carbon, but it had been previously described by Du Moncel. . . . The first carbon transmitter was constructed in 1878 by Edison."—W. H. Preece, and J. Maier, *Telephony*, ch. 3-4.—In a pamphlet distributed at the Columbian exposition, Chicago, 1893, entitled "Exhibit of the American Bell Telephone Co.," the following statements are made: "At the Centennial Exposition, in Philadelphia, in 1876, was given the first general public exhibition of the telephone by its inventor, Alexander Graham Bell. Seventeen years later, more than half a million instruments were in daily use in the United States alone, six hundred million talks by telephone are held every year, and the human voice is carried over a distance of twelve hundred miles without loss of sound or syllable. The first use of the telephone for business purposes was over a single wire connecting only two telephones. At once the need of general intercommunication made itself felt. In the cities and larger towns exchanges were established and all the subscribers to any one exchange were enabled to talk to one another through a central office. Means were then devised to connect two or more exchanges by trunk lines, thus affording means of communication between all the subscribers of all the exchanges so connected. This work has been pushed forward until now have been gathered into what may be termed one great exchange all the important cities from Augusta on the east to Milwaukee on the west, and from Burlington and Buffalo on the north to Washington on the south, bringing more than one half the people of this country and a much larger proportion of the business interests, within talking distance of one another. . . . The lines which connect Chicago with Boston, via New York, are of copper wire of extra size. It is about one sixth of an inch in diameter, and weighs 435 pounds to the mile. Hence each circuit contains 1,044,000 pounds of copper."

1900.—**Dr. Pupin's revolutionary improvement in long-distance telephony.**—The most important advance in telephonic science that has been made since the invention of the Bell instrument was announced at about the beginning of the new century (1900), as the result of studies pursued by Dr. Michael I. Pupin, of Columbia University, New York. Mathematical and experimental investigations which Dr. Pupin had been carrying on, for several years, led him to a determination of the precise intervals at which, if inductance coils are inserted in a long conductor, an electric current in traversing it may be made to travel far without much loss of force. He is said to have taken a hint from seeing how waves of vibration in a cord are strengthened by lightly "loading" it at certain exact points, determined by the wave lengths. It is probably correct to describe his invention as being a scientific ascertainment of the points in a long telephonic circuit at which to load the electric current in it, and the precise loading to be applied. In a paper published in the "Western Electrician," describing his investigations mathematically, Dr. Pupin wrote: "If an increase in efficiency of wave transmission over a cord thus loaded is to be obtained, it is evident that the load must be properly subdivided and the fractional parts of the total load must be placed at proper distances apart along the cord, otherwise the detrimental effects due to reflections resulting from the discontinuities thus introduced will more than neutralize the beneficial effects derived from the increased mass. . . . The insertion of inductance coils at periodically recurring points along the wave conductor produces the same effect

upon electrical wave transmission as the distribution of the small loads along the stretched cord . . . produces upon mechanical wave transmission along the cord."

The result is that conversation by telephone over a distance of 3,000 miles is made not only practicable but easy, and that it is as practicable through submarine cables as through overland wires. Dr. Pupin's invention was sold to the Bell Telephone Company for a very large sum. Similar results in long distance communication were attained for wireless telephony by DeForest's audion.—See also below: Wireless, or radio: 1915-1921.

**1915-1917. — Transcontinental line. — Increase in business.**—"The first practical telephone line [built between 1876 and 1878] was a copy of the best telegraph line of the day. A line wire was strung on the poles and housetops, using the ground for the return circuit. Electrical disturbances, coming from no one knows where, were picked up by this line. Frequently the disturbances were so loud in the telephone as to destroy conversation. When a second telephone line was strung alongside the first, even though perfectly insulated, another surprise awaited the telephone pioneer. Conversation carried on over one of these wires could plainly be heard on the other. Another strange thing was discovered. Iron wire was not so good a conductor for the telephone current as it was for the telegraph current. The talking distance, therefore, was limited by the imperfect carrying power of the conductor and by the confusing effect of all sorts of disturbing currents from the atmosphere and from neighboring telephone and telegraph wires. These and a multitude of other difficulties, constituting problems of the most intricate nature, impeded the progress of the telephone art, but American engineers, by persistent study, incessant experimentation, and the expenditure of immense sums of money, . . . [overcame] these difficulties. They . . . created a new art, inventing, developing, and perfecting, making improvements great and small in telephone, transmitter, line, cable, switchboard, and every other piece of apparatus and plant required for the transmission of speech. As the result of nearly forty years of this unceasing, organized effort, on the 25th of January, 1915, there was dedicated to the service of the American public a transcontinental telephone line, 3,600 miles long, joining the Atlantic and the Pacific, and carrying the human voice instantly and distinctly between San Francisco and New York and Philadelphia and Boston. On that day over this line Doctor Bell again talked to Mr. Watson, who was now 3,400 miles away. It was a day of romantic triumph for these two men and for their associates and their thousands of successors who have built up the great American telephone art. The 11th of February following was another day of triumph for the telephone art as a product of American institutions, for, in the presence of dignitaries of the city and State here at Philadelphia and at San Francisco, the sound of the Liberty Bell, which had not been heard since it tolled for the death of Chief-Justice Marshall, was transmitted by telephone over the transcontinental line to San Francisco, where it was plainly heard by all those there assembled. Immediately after this the stirring tones of the 'Star-spangled Banner' played on the bugle at San Francisco were sent like lightning back across the continent to salute the old bell in Philadelphia. It had often been pointed out that the words of the tenth verse of the twenty-fifth chapter of Leviticus, added

when the bell was recast in 1753, were peculiarly applicable to the part played by the old bell in 1776. But the words were still more prophetic. The old bell had been silent for nearly eighty years, and it was thought forever, but by the use of the telephone a gentle tap, which could be heard through the air only a few feet away, was enough to transmit the tones of the historic relic all the way across the continent from the Atlantic to the Pacific. Thus, by the aid of the telephone art, the Liberty Bell was enabled literally to fulfil its destiny and 'Proclaim liberty throughout all the land, unto all the inhabitants thereof.' The two telephone instruments of 1876 had become many millions by 1916, and the first telephone line, a hundred feet long, had grown to one of more than three thousand miles in length. This line is but part of the American telephone system of twenty-one million miles of wire, connecting more than nine million telephone stations located everywhere throughout the United States, and giving telephone service to one hundred million people. Universal telephone service throughout the length and breadth of our land, that grand objective of Theodore N. Vail, has been attained."—W. K. Towers, *Masters of space*, pp. 289-294.—"There were 54,319 telephones reported at the census of 1880. This had increased to 11,716,520. . . . In 1917 there were 113 telephones to each 1,000 population."—Department of Commerce, Bureau of Census, *Census of Electrical Industries, 1917, Telephones*, p. 221.—"The number of calls made during the year [1917 was] estimated at 21,842,000,000, an average of over 200 for every [individual member of the community]."—*Official U. S. Bulletin*, May 18, 1919, p. 16.

**1920-1921. — Amplifiers. — Projecting apparatus. — Loud speakers.**—"The attenuation of current in a thousand mile cable is something almost unbelievable. . . . But with thirty amplifiers, ordinary telephone currents produce ordinary speech at the end of such a line."—C. Claudy, *Scientific American*, May 15, 1920.—A spectacular demonstration of the power of such instruments brought their use to the attention of the general public. "On Armistice Day [Nov. 11, 1921] when the body of an unknown soldier was laid at rest in Arlington cemetery, President Harding's address and the prayers and the songs at Arlington were heard as clearly and with as much feeling by 30,000 persons in New York City and 20,000 in San Francisco as though . . . these audiences had been . . . within the Arlington Amphitheater. In addition to this at least 100,000 persons scattered on the hillsides outside the Amphitheater also heard the entire ceremony with little difficulty. . . . The electrical equipment used on Armistice Day divides itself into two distinct sets of apparatus. First, the apparatus for increasing the volume of speech at Washington, New York and San Francisco; secondly, the apparatus for projecting it out to the large audiences, loud-speakers of the type developed by the Bell Telephone System being installed for the purpose. These loud-speakers were joined by a single telephone circuit which extended across the continent. . . . This circuit is likewise a development . . . [which had recently] been perfected and installed. . . . In many respects the principles underlying the operation of the loud-speaker and those underlying a long-distance telephone circuit (e.g., the transcontinental circuit used on Armistice Day) are similar. Each usually comprises a transmitter containing loosely packed granules of carbon whose agitation by the air waves created by the voice gives rise to variations of the electric cur-

rent flowing through them, these variations being an exact copy of these waves; a receiver of the electromagnetic type which converts the variations of the telephone current back into sound waves; and an amplifier for increasing the energy of the telephone current as it comes from the transmitter. Now in flowing through a long circuit such as the transcontinental line, the telephone current grows steadily weaker. . . . Long-distance telephony, therefore, demands some form of amplifier to restore the voice current to its original value. In circuits more than a few hundred miles long, the restoring or amplifying is, for practical reasons, done at regular intervals along the line. These amplifiers are known as telephone repeaters. . . . In connection with the loud-speaker we employ amplifiers, not to restore an attenuated telephone current as it traverses a long circuit, but to magnify the original current as it comes from the transmitter to the order of thousands or even millions of times, and then to reconvert it into very intense sound waves by means of large and powerful receivers. The amplifier of the loud-speaker may receive the small telephone current which it is to magnify directly from a transmitter, as was the case at Arlington, or from a telephone line, as in New York and San Francisco. . . . The intense sounds generated by the receivers were directed to each audience by clusters of large wooden horns or 'projectors' shaped very much like megaphones. . . . Calculations show that the loud-speaker at Arlington was capable of stepping up the energy of the telephone current coming from its transmitter considerably over one billion fold. . . . The total amplification within the transcontinental line was over one hundred million million fold. Combining this amplification of the line with that imparted to the telephone current before reaching the line in Arlington and after leaving it at San Francisco, gives the total amplification as about ten trillion trillion fold. . . . And it should be borne in mind that this trillion trillion fold amplification was so accurately controlled and applied that the audience at San Francisco heard the speeches and songs as realistically as though they were standing but a few feet from the speaker's stand at Arlington. The amplifiers of both the loud-speaker and the telephone repeater make use of the three-electrode vacuum tube which, . . . reduced to its simplest terms, is simply an electric valve so extremely sensitive that by its means one electric current (can control with absolute accuracy the flow of another current) which may be as much as a million times larger. To bring out this control action of the amplifier more clearly, consider the course of events in the transcontinental circuit. . . . A small undulatory current is generated by the transmitter on the speaker's stand at Washington whenever sound waves strike it. This small current flows only as far as the first amplifier where it brings about the liberation of a much larger undulatory current from a battery associated with this amplifier. . . . The new and larger current flows to the first repeater station at Newtown Square, in reaching which it has become much smaller than it was originally. At this repeater it liberates from a Newtown Square battery a third current—about as large as that which previously started from Arlington—which flows to New York, where the process is again repeated, and so on through the remainder of the fifteen repeater stations extending across the country. The final stage of amplification occurs in the amplifier of the San Francisco loud-speaker, in which the current coming from the telephone

line causes the liberation of a relatively very large current from the power plant of the loud-speaker. This final current operates the battery of loud-speaking receivers directly. While a minute or more may be required to read about the progress of the telephone current across the country . . . in reality . . . it is known that in the improved type of transcontinental circuit the telephone currents travel across the country with practically the speed of light, so that a given event in Washington and its reproduction 3500 miles away are virtually simultaneous."—*Scientific American*, Feb., 1922, pp. 120-121.

#### Wireless, or radio

1864-1903. — Maxwell. — Hertz. — Marconi. — First use of the discovery.—"In 1864, Maxwell observed that electricity and light have the same velocity, 186,400 miles a second, and he formulated the theory that electricity propagates itself in waves which differ from those of light only in being longer. This was proved to be true by Hertz, in 1888, who showed that where alternating currents of very high frequency were set up in an open circuit, the energy might be conveyed entirely away from the circuit into the surrounding space as electric waves. . . . He demonstrated that electric waves move with the speed of light, and that they can be reflected and refracted precisely as if they formed a visible beam. At a certain intensity of strain the air insulation broke down, and the air became a conductor. This phenomenon of passing quite suddenly from a non-conductive to a conductive state is . . . also to be noted when air or other gases are exposed to the X ray. Now for the effect of electric waves such as Hertz produced, when they impinge upon substances reduced to powder or filings. Conductors, such as the metals, are of inestimable service to the electrician; of equal value are non-conductors, such as glass and gutta-percha, as they strictly fence in an electric stream. A third and remarkable vista opens to experiment when it deals with substances which, in their normal state, are non-conductive, but which, agitated by an electric wave, instantly become conductive in a high degree. As long ago as 1866 Mr. S. A. Varley noticed that black lead, reduced to a loose dust, effectually intercepted a current from fifty Daniell cells, although the battery poles were very near each other. When he increased the electric tension four- to sixfold, the black-lead particles at once compacted themselves so as to form a bridge of excellent conductivity. On this principle he invented a lightning-protector for electrical instruments, the incoming flash causing a tiny heap of carbon dust to provide it with a path through which it could safely pass to the earth. Professor Temistocle Calzecchi Onesti of Fermo, in 1885, in an independent series of researches, discovered that a mass of powdered copper is a non-conductor until an electric wave beats upon it; then, in an instant, the mass resolves itself into a conductor almost as efficient as if it were a stout, unbroken wire. Professor Edouard Branly of Paris, in 1891, on this principle devised a coherer, which passed from resistance to invitation when subjected to an electric impulse from afar. He enhanced the value of his device by the vital discovery that the conductivity bestowed upon filings by electric discharges could be destroyed by simply shaking or tapping them apart. . . . The coherer, as improved by Marconi, is a glass tube about  $1\frac{1}{2}$  inches long and about  $\frac{1}{2}$  of an inch in internal diameter. The electrodes are inserted in this tube

so as almost to touch; between them is about  $\frac{1}{30}$  of an inch filled with a pinch of the responsive mixture which forms the pivot of the whole contrivance. This mixture is 90 per cent. nickel filings, 10 per cent. hard silver filings, and a mere trace of mercury; the tube is exhausted of air to within  $\frac{1}{10000}$  part. . . . The coherer, when unexcited, forms a link which obstructs the flow of a current eager to leap across. The instant that an electric wave from the sending-station impinges upon the coherer it becomes conductive; the current instantly glides through it, and at the same time a current, by means of a relay, is sent through [a] powerful voltaic battery, so as to announce the signal through an ordinary telegraphic receiver. An electric impulse, almost too attenuated for computation, is here able to effect such a change in a pinch of dust that it becomes a free avenue instead of a barricade. Through that avenue a powerful blow from a local store of energy makes itself heard and felt. No device of the trigger class is comparable with this in delicacy. An instant after a signal has taken its way through the coherer a small hammer strikes the tiny tube, jarring its particles asunder, so that they resume their normal state of high resistance. We may well be astonished at the sensitiveness of the metallic filings to an electric wave originating many miles away, but let us remember how clearly the eye can see a bright lamp at the same distance as it sheds a sister beam. . . . An essential feature of this method of etheric telegraphy, due to Marconi himself, is the suspension of a perpendicular wire at each terminus, its length twenty feet for stations a mile apart, forty feet for four miles, and so on, the telegraphic distance increasing as the square of the length of suspended wire. In the Kingstown regatta, July, 1898, Marconi sent from a yacht under full steam a report to the shore without the loss of a moment from start to finish. This feat was repeated during the protracted contest between the 'Columbia' and the 'Shamrock' yachts in New York Bay, October, 1899. On March 28, 1899, Marconi signals put Wimereux, two miles north of Boulogne, in communication with the South Foreland Lighthouse, thirty-two miles off. In August, 1899, during the manoeuvres of the British navy, similar messages were sent as far as eighty miles. . . .

"A weak point in the first Marconi apparatus was that anybody within the working radius of the sending-instrument could read its message. To modify this objection secret codes were at times employed, as in commerce and diplomacy."—G. Iles, *Flame, electricity and camera*, ch. 16.

"Shall we not," said Professor John Trowbridge, in an article published in the *New York Tribune*, January 6, 1901, "in the next hundred years dispense with the limitations of wires and speak boldly through space, reaching some expectant human ear hundreds of miles away with the same ease that we now converse in a room? It is already possible to send messages by dots and dashes sixty to seventy miles without the use of wires. In the early days of the telephone this was the practical limit of that instrument, and we are all familiar with the immense extension which has taken place. Shall we not see a similar extension in the field of wireless telegraphy? Some late experiments which I have made lead me to be optimistic in regard to a possible great extension of the methods of wireless telegraphy.

"In the first place, I believe that these experiments prove that wireless telegraphy is not necessarily or merely accomplished through the air,

but, on the contrary, that the earth plays the controlling part, and that the message flows, so to speak, through the earth or over its surface rather than through the air. The most striking experiment was as follows: The poles of a storage battery of twenty thousand cells were connected with the ground at the Jefferson Laboratory, and I was enabled to receive the message in a room three quarters of a mile from the laboratory without the use of masts or wires of any sort. The earth was the medium of communication, and it seems possible, by arranging the sending and receiving apparatus suitably in connection with the electrical capacity of the earth, that we may dispense with lofty masts and overcome in this way the curvature of the earth." On March 12th, 1901, the chief of the Weather Bureau, Professor Moore, gave to the Press the following statement as to experiments in progress along the Virginia and North Carolina coast: "The most efficient method of long distance transmission has been found to be from wire cylinders. The new coast stations are being equipped with cylinders of sixteen wires each and 140 feet in length. From these cylinders it is expected to cover a magnetic field of not less than five hundred miles. The stations now in operation are at Hatteras and at Roanoke Island, in Pamlico Sound, North Carolina. Workmen are beginning the construction of a station at Cape Henry, which will be the third station. When this is finished the two remote stations will be 127 miles apart."

"Up to the commencement of 1902 the only receivers that could be practically employed for the purposes of wireless telegraphy were based on what may be called the coherer principle—that is, the detector, the principle of which is based on the discoveries and observations made by S. A. Varley, Professor Hughes, Calsecchi Onesti, and Professor Branly. Early in that year the author was fortunate enough to succeed in constructing a practical receiver of electric waves, based on a principle different from that of the coherer. . . . The action of this receiver is in the author's opinion based upon the decrease of magnetic hysteresis, which takes place in iron when under certain conditions this metal is exposed to high frequency oscillations of Hertzian waves. . . .

"This detector is and has been successfully employed for both long and short distance work. It is used on the ships of the Royal Navy and on all trans-Atlantic liners which are carrying on a long-distance news service. It has also been used to a large extent in the tests across the Atlantic Ocean. . . . The adoption of this magnetic receiver was the means of bringing about a great improvement in the practical working conditions of wireless telegraphy by making it possible to do away with the troublesome adjustments necessary when using coherers, and also by considerably increasing the speed at which it is possible to receive, the speed depending solely on the ability of the individual operators. Thus a speed of over 30 words a minute has been easily attained. . . .

"In the spring of 1903 the transmission of news messages from America to the *London Times* was attempted, and the first messages were correctly received and published in that newspaper. A breakdown in the insulation of the apparatus at Cape Breton made it necessary, however, to suspend the service, and, unfortunately, further accidents made the transmission of messages unreliable, especially during the spring and summer. In consequence of this, the author's company decided not to attempt the transmission of any more public messages until such time as a reliable and

continuous service could be maintained and guaranteed under all ordinary conditions. . . . In October, 1903, it was found possible to supply the Cunard steamship *Lucania* during her entire crossing from New York to Liverpool with news transmitted direct to that ship from Poldhu and Cape Breton."—G. Marconi, *Recent advances in wireless telegraphy* (Annual Report Smithsonian Institution, 1905-6, pp. 137-142).

1899.—First sea equipment.—"Although an installation was carried on the *St. Paul* for one trip in 1899, the credit of being the pioneers in the use of wireless telegraphy on the ocean belongs to the North-German Lloyd and Cunard Companies. The first vessel fitted was the *Kaiser Wilhelm der Grosse*, and the lead of the Germans was immediately followed by the English company. Both vessels were fitted by the Marconi Company, which has the distinction of being the first company to equip vessels on a commercial basis."—*Correspondence of the London Times*, July 2, 1909.

1903.—Tuning devices.—"It is well to remember that the year 1903 is the earliest date at which radio-telegraphy could be regarded as really workable, and of material practical utility. Previous to then, 'wireless' working was very uncertain, but in that year tuning devices were introduced, the principle of which was originally due to Sir Oliver Lodge; and it is these that have made so much difference in the application of Hertzian waves for the purposes of telegraphy. Practical success in radio-telegraphy should not, in fact, be judged from the point of view of the distance at which signals can be sent—or received—but rather from the standpoint of non-interference and secrecy. The essential element in wireless telegraphy—above all others—is, indeed, a discriminating or selective method. For the main purposes of radio-telegraphy, immunity from interference by syntony is essential. Thus a selective system in time of war would be invaluable; a non-selective system almost worse than useless. Syntonic wireless telegraphy entails in the first place, a similar rate of oscillation, or tune—i.e., a similar wave length—at the sending and receiving ends. Indeed, the real problem in wireless telegraphy is to arrange the receiving apparatus so that it is alive to notes of one definite frequency, or pitch, but deaf to any other notes, even though of but slightly different pitch. This is effected by the proper adjustment of inductance and capacity, as first shown by Sir Oliver Lodge. . . . It is, however, at present, impossible to secure really complete secrecy from any method of open wave radiation. A radio-telegraphist, with the right apparatus and a knowledge of the tune, could upset any system of Hertzian wave telegraphy. It should, therefore, be clearly understood that there are, as yet, definite limits to the practical results of tuning for securing absolute selectivity and secrecy."—C. Bright, *Useful sphere for radio-telegraphy* (*Westminster Review*, Apr., 1908).

1907.—Inauguration of Transatlantic service.—"The Transatlantic wireless service was inaugurated in October, 1907, between Ireland and Canada, the charges being reduced from 1s. per word for business and private messages and 5d. per word for Press messages to 5d. and 2½d. respectively, these charges not including the land line charges on both sides of the Atlantic. . . . The first wireless messages across the Atlantic were sent from the Canadian station at Table Head, in Cape Breton, in 1902. This station was afterwards removed to its present site, five miles inland, and there greatly enlarged. Ever since 1902 Mr. Marconi has been conducting experiments and mak-

ing new discoveries and improvements until, at the present day, wireless telegraphy across the Atlantic, over a distance of 2000 miles, is an assured success. . . . Press traffic . . . was started on October 17, 1907. On February 3, 1908, the service was extended to private and business telegrams between Montreal and London."—*Correspondence of the London Times*, June 25, 1909.

1909.—Singular unexplained phenomena.—Speaking at Stockholm, Sweden, on the occasion of his receiving the Nobel Prize, in December, 1909, Mr. Marconi gave the following account of some unexplained phenomena that are experienced in the working of radio-telegraphy. He said that "a result of scientific interest which he first noticed during the tests on the steamship *Philadelphia* and which was a most important factor in long distance radio-telegraphy was the very marked and detrimental effect of daylight on the propagation of electric waves at great distances, the range by night being usually more than double that attainable during daytime. He did not think that this effect had yet been satisfactorily investigated or explained. . . . He was now inclined to believe that the absorption of electric waves during the daytime was due to the ionization of the gaseous molecules of the air effected by ultra-violet light, and as the ultra-violet rays which emanated from the sun were largely absorbed in the upper atmosphere of the earth, it was probable that the portion of the earth's atmosphere which was facing the sun would contain more ions or electrons than that portion which was in darkness, and therefore, as Sir J. J. Thomson had shown, this illuminated and ionized air would absorb some of the energy of the electric waves. Apparently the length of wave and amplitude of the electrical oscillations had much to do with this interesting phenomenon, long waves and small amplitudes being subject to the effect of daylight to a much smaller degree than short waves and large amplitudes. . . . For comparatively short waves, such as were used for ship communication, clear sunlight and blue skies, though transparent to light, acted as a kind of fog to these waves. . . . It often occurred that a ship failed to communicate with a near-by station, but could correspond with perfect ease with a distant one. . . . Although high power stations were now used for communicating across the Atlantic, and messages could be sent by day as well as by night, there still existed short periods of daily occurrence during which transmission from England to America, or *vice versa*, was difficult."

1909-1912.—Rescues at sea.—Legislation.—The importance of the use of wireless telegraphy at sea was dramatically demonstrated on January 23, 1909, when, in a dense fog, the steamship *Republic*, of the White Star Line, was struck amidships by the Italian liner the *Florida*, twenty-six miles off the island of Nantucket. Both ships were badly damaged; but the *Republic* had a wireless equipment, by means of which the operator, Jack Binns, called the *Baltic*, which was similarly equipped, to their aid. The passengers were taken off, and the *Florida* was salvaged, but the *Republic* sank. Following upon this accident "in February [1909] the United States House of Representatives passed a Bill providing that 'every ocean passenger steamer certified to carry 50 passengers or more, before being granted a clearance for a foreign or domestic port 100 miles or more distant from the port of her departure from the United States, shall be equipped with an efficient radio-telegraph installation, and shall have in her employ and on board an efficient

radio-telegrapher.' . . . [This bill was approved in 1910.] Following the example of the United States Congress a Bill has been introduced in the Canadian House of Commons. An Italian Royal Decree dated March 14 provides that all vessels of whatever nationality clearing from Italian ports with emigrants shall carry a wireless installation."—*Correspondence of the London Times, July 2, 1909.*—In April, 1912, the *Titanic* struck an iceberg and went down in midocean, and 1517 of her passengers and crew were lost, 706 being rescued from boats by the *Caronia* which came up in response to calls from the wireless telegraph. Following this second catastrophe, and a third International Conference, which opened in London on June 4, the United States government passed a law which enacts that auxiliary power must be provided for the radio telegraph, and that in passenger ships which carry over a certain number of passengers, two skilled operators must be employed. The provisions of this act also cover cargo vessels, but in case of boats which carry less than 100 men one operator only is required to be certificated, and may be relieved by a sailor who is competent to send and receive signals.

1914-1918.—*Developments during the World War.*—It was in the period of the World War, however, that wireless telegraphy became an all-important factor in the life of the various nations, and hence received the greatest impetus. "During the war [World War] and since, messages have been sent direct from Washington to all parts of the world. . . . Long messages are copied off on a machine something like a type-writer, which, however, does not make type impression, but cuts perforations in a long sheet of paper. The paper is then run through a transmitter at a high speed and the message is sent out at a rate of as much as twelve hundred words a minute. At the receiving-station, the message is received photographically on a strip of paper. . . . In this way a perfect record is made of the message in dots and dashes, which are translated into the corresponding letters of the alphabet. . . . [The wireless compass] is another radio invention which . . . [the United States] contributed during the war, that proved of utmost service in thwarting German spies. . . . It was a simple matter to obtain the necessary apparatus, because there was plenty of it to be had everywhere. . . . It was highly important that these concealed stations be located. . . . The audion had made it possible to receive radio signals on a very small aerial. In place of the ordinary stationary aerial a frame five feet square was set up so that it could be turned to any point of the compass. A few turns of copper-bronze wire were wound round it. This was called the 'wireless compass.' It was set up on the roof of the radio station and concealed within a cupola. The shaft on which it was mounted extended down into the operating-room and carried a wheel by which it could be turned. On the shaft was a circular band of aluminum engraved with the 360 degrees of the circle, and a couple of fixed pointers indicated true north and south. Now when a signal was received by the aerial, . . . the compass [was] . . . turned until the loudest sound [was] . . . heard in the receiver and then the compass dial [showed] . . . from what direction the signals [were] . . . coming. At the same time, another line on the signals [would] . . . be found by a second station with another compass. These directions [were] . . . traced on a map; and where they [met], . . . the sending-station must be located. With this apparatus it was possible to locate the direction of the station within a de-

gree. After the station had been located as closely as possible in this way, a motor-truck was sent out in which there was a concealed radio compass. The truck would patrol the region located by the fixed compasses, and with it the position of the concealed station could be determined with perfect accuracy. . . . Even receiving-sets were discovered with the portable compass, but to find them was a far more difficult task. . . . [Since the close of the war] a number of radio-compass stations have been located around the entrance and approach to New York Harbor. Similar stations have been, or soon will be, established at other ports. As soon as a ship arrives within fifty or a hundred miles of port she is required to call for her bearings. The operator of the control station instructs the ship to send her call letters for thirty seconds, and at the same time notifies each compass station to get a bearing on the ship. This each does, reporting back to the control station. The bearings are plotted on a chart and inside of two minutes from the time the ship gives her call letters, her bearing is flashed to her by radio from the control station. The chart on which the plotting is done is covered with a sheet of glass. Holes are pierced through the glass at the location of each compass station. On the chart, around each station, there is a dial marked off in the 360 degrees of the circle. A thread passes through the chart and the hole in the glass at each station. These threads are attached to weights under the chart. When a compass station reports a bearing, the thread of that station is pulled out and extended across the corresponding degree on the dial. The same is done as each station reports and where the threads cross, the ship must be located."—A. R. Bond, *Inventions of the Great War, pp. 198-200, 202-205, 206, 208.*

"As soon as there seemed to be a possibility that . . . [the United States] might be drawn into the war, the Secretary of the Navy asked for the design of apparatus that would make it possible for ships to converse with one another and with shore stations. . . . A special equipment was designed for battleships and on test it was found that ships could easily converse with one another over a distance of thirty-five miles and to shore stations from a distance of a hundred and seventy-five miles. The apparatus was so improved that nine conversations could be carried on at the same time without any interference of one by the others. When it became certain that we should have to enter the war, there came a call for radiotelephone apparatus for submarine-chasers, and work was started on small compact outfits for these little vessels."—*Ibid., pp. 191-193.*

RADIOTELEPHONES FOR AIRPLANES.—"Then there was a demand for radiotelephone apparatus to be used on airplanes. . . . The first task was to make the apparatus noiseproof. A special sound-proof room was constructed in which a noise was produced exactly imitating that of the engine exhaust of an airplane engine. In this room, various helmets were tried in order to see whether they would be proof against the noise, and finally a very suitable helmet was designed, in which the telephone receiver and transmitter were installed. By . . . [the summer of 1917] the work had proceeded so far that an airplane equipped with transmitting-apparatus could send spoken messages to an operator on the ground from a distance of two miles. The antenna of the airplane consisted of a wire with a weight on the lower end, which hung down about one hundred yards from the body of the machine. But a trailing antenna was

a nuisance in airplane manœuvres, and it was also found that the helmet which was so satisfactory in the laboratory was not just the thing for actual service in an airplane. It had to fit very tightly around the ears and the mouth, and as the airplane went to high altitudes where the air-pressure was much lower than at the ground level, painful pressures were produced in the ears which were most annoying. Aside from that, in actual warfare airplanes have to operate at extreme heights, where the air is so rare that oxygen must be supplied to the aviators, and it was difficult to provide this supply of oxygen with the radio helmet tightly strapped to the head of the operator. But after considerable experiment, this difficulty was overcome and also that of the varying pressures on the ears. Another great difficulty was to obtain a steady supply of power on the airplane to operate the transmitting-apparatus. It has been the practice to supply current on airplanes for wireless-telegraph apparatus by means of a small electric generator which is revolved by a little propeller. The propeller in turn is revolved by the rush of air as it is carried along by the plane. But the speed of the airplane varies considerably. At times, it may be traveling at only forty miles per hour, and at other times as high as one hundred and sixty miles per hour, so that the little generator is subjected to great variations of speed and consequent variations of voltage. This made it impossible to produce the steady oscillations that are required in wireless telephony. After considerable experiment, a generator was produced with two windings, one of which operated through a vacuum tube, somewhat like an audion, and to resist the increase of voltage produced by the other winding. Then another trouble developed. The sparks produced by the magneto in the airplane motor set up electro-magnetic waves which seriously affected the receiving-instrument. There was no way of getting rid of the magneto, but the wires leading from it to the engine were incased in metal tubes which were grounded at frequent intervals, and in that way the trouble was overcome to a large extent. The magnetos themselves were also incased in such a way that electro-magnetic waves would not be radiated from them. Instead of using trailing wires which were liable to become entangled in the propeller, the antenna was extended from the upper plane to the tail of the machine, and later it was found that by using two short trailing antennæ one from each tip of the wings, the very best results could be obtained. Still another development was to embed the antenna wires in the wings of the plane. It was considered necessary, if the apparatus was to be practicable, to be able to use it over a distance of two thousand yards, but in experiments conducted in October, 1917, a couple of airplanes were able to talk to each other when twenty-three miles apart, and conversations were carried on with the ground from a distance of forty-five miles. The conditions under which these distances were attained were unusual, and a distance of three miles was accepted as a standard for communication between airplanes. The apparatus weighed only fifty-eight pounds and it was connected with both the pilot and the observer so that they could carry on conversations with each other and could both hear the conversation with other airplanes or the ground. As a matter of fact, airplanes with standard apparatus are able to talk clearly to a distance of five miles and even to a distance of ten miles when conditions are favorable, and they can receive messages from the ground over almost any dis-

tance. A similar apparatus was constructed for submarine-chasers with a standard range of conversation of over five miles. . . . This was particularly . . . [valuable] in the case of submarine detection, when it was possible for a seaplane or a balloon to report its findings at once to submarine-chasers and destroyers, and to guide them in pursuit of submarines. The improved audion holds out a wonderful future for radiotelephony. For receiving, at least, no elaborate aerial will be needed, and with a small loop of wire, an audion or two and simple tuning-apparatus any one can hear the radio gossip of the whole world."—*Ibid.*, pp. 193-198.

1915-1921.—Use of De Forest's audion.—Wireless telephony from Montauk Point to Wilmington, Del.—Transcontinental and transoceanic speech.—"Before the war, an aviator when on the wing was both deaf and dumb. He could communicate with other airplanes or with the ground only by signal or, for short distances, by radiotelegraphy, but he could not even carry on conversation with a fellow passenger in the machine without a speaking-tube fitted to mouth and ears so as to cut out the terrific roar of his own engine. Now the range of his voice has been so extended that he can chat with fellow aviators miles away. This remarkable achievement and many others in the field of radio-communication hinge upon a delicate electrical device invented by DeForest in 1906 and known as the 'audion.' For years this instrument was used by radio-telegraphers without a real appreciation of its marvelous possibilities, and, as a matter of fact, in its earlier crude form it was not capable of performing the wonders it has achieved since it was taken over and developed by the engineers of the Bell Telephone System."—A. R. Bond, *Inventions of the Great War*, pp. 184-185.—"The audion is a small glass bulb from which the air is exhausted to a high degree of vacuum [in other words a vacuum tube]. The bulb contains three elements. One is a tiny filament which is heated to incandescence by a battery, so that it emits negatively charged electrons. The filament is at one side of the bulb and at the opposite side there is a metal plate. When the plate and the filament are connected with opposite poles of a battery, there is a flow of current between them, but because only negative electrons are emitted by the filament, the current will flow only in one direction—that is, from the plate to the filament. If the audion be placed in the circuit of an alternating-current generator, it will let through only the current running in one direction. Thus it will 'rectify' the current or convert alternating current into direct current. But the most important part of the audion, the part for which DeForest is responsible, is the third element, which is a grid or flat coil of platinum wire placed between the filament and the plate. This grid furnishes a very delicate control of the strength of the electric current between plate and filament. . . . The range of wire telephony was greatly increased by the use of certain coils invented by Pupin [see above: Telephone: 1900], which were placed in the line at intervals. . . . Used as a relay, the improved audion made it possible to pick up very faint wireless-telegraph messages and in that way increased the range of radio outfits. Messages could be received from great distances without any extensive or elaborate aërials, and the audion could be used at the sending-station to magnify the signals transmitted and send them with far greater power. Having improved the audion and used it successfully for long-distance telephone conversation over

wires, the telephone company began to experiment with wireless telephony."—*Ibid.*, pp. 185-188.—"Attempts at long-distance talking without wires were made from Montauk Point, on the tip of Long Island, to Wilmington, Delaware, and they were successful. This was in 1915. The apparatus was still further improved and then the experiment was tried of talking from the big Arlington station near Washington to Darien, on the Isthmus of Panama. This was a distance of twenty-one hundred miles, and speech was actually transmitted through space over that great distance. That having proved successful, the next attempt was to talk from Arlington to Mare Island and San Diego, on the Pacific Coast, a distance of over twenty-five hundred miles. This proved a success, too, and it was found possible even to talk as far as Honolulu. The engineers now felt confident that they could talk across the Atlantic to Europe, and so in October of 1915 arrangements were made to conduct experiments between Arlington and the Eiffel Tower in Paris. . . . The Eiffel Tower could be used only for short periods of time, and there was much interference from other high-powered stations. Nevertheless, the experiment proved perfectly successful, and conversation was carried on between . . . [Washington and Paris], a distance of thirty-six hundred miles. At the same time, an operator in Honolulu, forty-five hundred miles away, heard the messages, and so the voice at Arlington carried virtually one third of the way around the globe."—A. R. Bond, *Inventions of the Great War*, pp. 191-192.

1918-1920.—Alexanderson alternator.—"For a number of years the design of radio frequency alternators has occupied the attention of Mr. E. F. W. Alexanderson and his staff. Starting with the development of several experimental types of alternators, they have steadily progressed towards the design of more powerful machines, which are now available for commercial use. Standardized alternator sets for transmission, at wave lengths between 6,000 and 10,000 meters, and between 10,500 and 25,000 meters are now [1921] under construction. . . . In September 1918 a 200 kilowatt alternator set was installed at the New Brunswick station of the Radio Corporation."—Abstract of paper by E. E. Bucher, *Scientific American Supplement*, Oct. 20, 1921.—"Instead of utilizing oscillations generated by vacuum tubes as has been the practice, the oscillations are now produced by a high-frequency alternator. . . . This does not mean that the vacuum tube has been discarded, for a limited number of these tubes are necessary to regulate the oscillations produced by the alternator and to superimpose the telephonic signals upon the continuous wave emitted by the machine. Perhaps the greatest advantage of this new machine is that the wave length transmitted may be varied simply by changing the speed of the machine. As a result of this invention, the patents of which are held here in the United States, the whole business of radio communication has undergone a transfer of control that means much to the future of this country in a political and commercial way. . . . In the days prior to the invention of the Alexanderson alternator the radio stations were sending out irregular waves, which like a drunken driver covered all the available street by their zigzagging. The new apparatus has done away with this. . . . Seven messages can now be made to keep their own path and travel on the same right of way formerly occupied by a single message. Another great advance in radio has come from the development of the so-called barrage re-

ceiver, which allows simultaneous sending and receiving. . . . Through the use of this invention a receiving station may be located close to a sending station which transmits on the same wave length, and yet the receiving station will be insensitive to the signals transmitted by that station, though it can receive messages from the other side of the ocean. Just after we got into the war the powerful German wireless station at Nauen was used to drown . . . messages from the United States [to France and England]. . . . This muddled the American communications beyond understanding and caused Alexanderson and his associates to start investigations of remedial measures that led to the perfecting of the barrage receiver, which effectively shut out the German signals. . . . Before this wireless talking was a one-way business. One person could listen, but could not answer back until the speaker had finished and both had thrown a switch simultaneously to reverse the process. A final wonderful radio development is the practice of photographic receiving of wireless messages. The instrument employed for this work is also a United States invention, having been discovered by an electrical engineer named C. A. Hoxie. This instrument permits the eye to replace the ear in reading a wireless communication. It enables greater speed in receiving, greater accuracy and a permanent record. It will decipher messages that operators were unable to get by ear. In practice the machine has already recorded at the rate of 400 words a minute, which is as fast as a machine gun shoots. . . . The mechanism of this new receiving device is comparatively simple. The tape on which the message is recorded is propelled by an electric motor. Automatically this tape enters a developing fluid; then a hypo fixing bath; next it is washed in running water and dried by electric heat assisted by forced draft. All of this process is invisible, as it is effected inside of the little machine. The message pours out of the wonderful device into a basket and contains an average of the word for every inch of tape. The time to record, develop, fix, wash and dry the tape is from two to four minutes. The rolls of tape are 1000 feet long and a continuous message of 10,000 words can be recorded without reloading the machine."—F. W. Parsons, *New day in communication* (*Saturday Evening Post*, Feb. 7, 1920, pp. 30, 32).

1919.—Long distance radio.—"Loud speakers."—Amplifiers.—Repeaters and projectors.—The use of vacuum tube amplifiers, and other highly scientific devices brought about an increasingly rapid development of long distance telephony, both by wire and radio, and a surprising adaptation of its use to public speaking. In 1919 it was stated that "wonders have been wrought in public speaking within the last few weeks, thanks to the intensive application of the vacuum tube amplifiers, and the loud speaking telephone. . . . Public speeches have been transmitted by means of the wireless telephone through many miles of space to an expectant audience."—*Scientific American*, May 10, 1919.

1921.—The radio link.—"The radio telephone has become part and parcel of our wire telephone system and is fast becoming as practical as the latter. The American Telephone and Telegraph Co. (in 1921) conducted experiments with radio links and the Transcontinental [telephone] line. The telephonic communication in this case was established between the steamship "Gloucester" . . . off Deal Beach, N. J., and Santa Catalina Island, situated some thirty miles off the coast

of California . . . from the Gloucester to Deal Beach via radio; from Deal Beach to New York, via telephone line; from New York to San Francisco via transcontinental Telephone line, from San Francisco to Los Angeles . . . [and] from Los Angeles to Long Beach via telephone line; and from Long Beach by radio to . . . Catalina Island. The first commercial radio and connecting land toll line is the Santa Catalina and California radio link which was set in operation . . . [in 1920]. The Avalon-Los Angeles circuit . . . [consists] of a little more than one mile of wire line from Avalon [Catalina Islands] . . . to Pebble Beach a 31½ mile radio link to Long Beach, and 25 miles additional wire circuit to Los Angeles."—*Scientific American*, Nov., 1921, p. 40.

### Survey of late inventions

For the most part new discoveries are worked out in laboratories, where scientists are employed by the great corporations to guide and improve the works and where they have all the complicated and delicate instruments and machinery needed to carry out experiments, at their command. It is difficult to estimate the great results which have flowed from the small beginnings of a hundred years ago; but a short account of a day spent by Thomas Edison at the plant of one of these great corporations is of interest, as giving some idea in non-technical terms, to the general reader, of the power which has been gained through the science of electricity.

"Thomas A. Edison, who has dealt in marvels all his life, was amazed at some of the things he saw today in the General Electric Company laboratories. . . . He saw a mercury boiler so much more efficient than steam that when it is perfected it will mean a saving of one-third in coal used to produce power. He saw a machine for registering the voice by light on a moving picture film that has unlimited possibilities of development—including talking-movies. And he saw vacuum tubes that have in them the germ of greater things than the world has yet known in electrical science. The day was in all ways a tribute to Edison, for although the application of electron energy, as demonstrated to him, is the beginning of a new science, the future of which is so vast that physicists dare not predict what may be found in it, they traced it all to his invention forty-three years ago of the incandescent bulb, the study of which has produced the vacuum tube which E. W. Rice, Jr., said, 'is destined to revolutionize our present methods of generation, transmission and utilization of electricity.' So they called him 'Master' and showed him things of which he had not dreamed when he blazed the path. Steinmetz juggled his lightning bolts for him, splintered wood and dissipated metal in a flash of fire. . . . Langmuir showed him tubes that Edison thought might mean much in long-distance transmission of power until 'you can't tell where it will end'; and he held a 100,000 candle power incandescent lamp which made his own first bulb seem like the glow of a firefly, a bulb which he did not believe could have been built. It was a great day for Edison and a great day for the physicists of the company, for it marked the achievements of forty years.

"He went to the room where in a heat of 5,500 degrees Fahrenheit, the greatest heat produced by man, he saw bars of tungsten run through a furnace and drawn out into wires. From there he went to the room where Dr. Irving Langmuir, inventor of the vacuum tubes, which the other day

took the place of enormous alternators in sending wireless messages across the Atlantic, showed him some of the big lamps he and his assistants have been working on. . . . The evolution by which they were changed from air-cooled to water-cooled tubes, so that they could be built larger and larger to carry more and more power, was explained. . . . The pallo photo phone, the machine which registers sound on a moving picture film so that voices and music may be reproduced in ordinary wireless loud-speaking phones and may be developed into talking movies in which the picture and sound would be perfectly synchronized, was demonstrated to Edison by the inventor, C. A. Hoxie. . . . This machine, while still in the experimental stage, has had great things predicted for it. The record is made by causing the sound waves to produce vibrations on a minute mirror. A beam of light reflected by the mirror strikes a photographic film kept in motion and which, when developed, shows a band of white with delicate markings on the edges which correspond to the sound reproduced. On account of the small mirror, its low inertia, and other factors, it is possible to produce a sound record which includes the very delicate overtones which give quality to music and speech and which, it was said, had not been so successfully accomplished by any other method of recording sound waves. The reproduction of the sound from the film is accomplished by moving the film in front of a delicate electrical device which produces an electromotive force that varies with the amount of light falling upon it. By a combination of vacuum or electron tubes an apparatus has been produced which responds to variation in the light falling on it with a speed so high that it can only be compared with that of light itself, or with the speed of the propagation of wireless waves in space. Therefore when this film is moved continuously in front of such a device, the device produces an electric current corresponding very accurately to the original sound wave. This electric current may be used to operate a telephone or loud speaker, and has been used to operate the radio transmitting station WGY of the General Electric Company. A method of taking the last bit of gas out of a vacuum tube was demonstrated by Dr. Langmuir. It was a small induction coil, which was set down over the tube, or electric bulb. The current penetrated the glass without heating it, and made the filament in the bulb glow, so as to burn up the gas. Dr. Langmuir put a small file inside the coil, and it turned red, and then told Mr. Edison to put his finger in the coil. He did so and laughed, as his finger did not even warm. He had seen induction coils before, but not this application of them. . . . Dr. [Charles] Steinmetz took him in charge then and went over to the big electrical laboratory where he is sole ruler. He has reproduced the phenomena of lightning in making experiments [first brought to public notice in 1921] to test lightning arresters and insulation.

"There were 120,000 volts in the big plates up near the ceiling. From them a wire led to a large electrode. About five inches below it was another electrode, from which a wire led to a piece of elm limb about five inches long and three thick. When Dr. Steinmetz gave the signal electricity began to gather in the plates, corresponding to storm clouds, until it reached 120,000 volts, when it exploded like a rifle shot across the gap and the piece of wood fell to pieces. Some of the bark fell twenty feet away. Another bit of elm was blown apart, and then an insulator, pro-

ected by Dr. Steinmetz's lightning arrester, was placed on the table. The cells exploded, and the insulator stood up. On the next test with the arrester removed the insulator was cracked open. Mr. Edison suggested that two insulators be used, and Dr. Steinmetz had them placed. . . . Nothing happened; the insulators stood up.

"Now we will convert some tungsten into helium," said Dr. Steinmetz. "Some people claim that they can change one metal into another by high electric currents. We have never been able to do that here."

"But when the tungsten was put on the table and the lightning hit it, it vanished. Helium gas it was supposed to turn into, although Dr. Steinmetz said they had never tested the gas to make sure. Dr. Steinmetz has a way of discharging 250,000 volts, and is now working on one to throw 500,000 volts.

"Several other buildings were visited and then Mr. Edison was taken to the turbine shop, where the turbines for driving battleships and electric generators are made. One was there of 40,000 horsepower that would light 2,000,000 sixteen-candle power Edison lamps, enough for a city of 200,000 persons. . . . In one of the turbine shops the new mercury boiler was shown him by the inventor, W. L. R. Emmet, engineer in charge of turbine work. This boiler was built to utilize the heat efficiency which is lost in steam boilers. The mercury is vaporized at a heat of 1,000 degrees and the vapor goes at a relatively low pressure into a turbine. From there it passes into a condenser, where it condenses at a temperature so much higher than is necessary to heat water that the condenser acts as a heater for a steam boiler, the steam from which goes to a steam turbine. Then the condensed mercury, still at high temperature, goes back to its own boiler. The mercury boiler it was explained, increases the output of kilowatt energy per unit of coal some 30 per cent., and saves that amount of coal. If 1,000 pounds of coal were used in a steam boiler, only 700 pounds would be used in the mercury boiler, a great increase in efficiency."—*New York Times*, Oct. 19, 1922.

"A 1,000,000-watt vacuum tube has been developed in the General Electric Research Laboratory here by J. H. Payne, Jr. The huge capacity tube is a magnetron, involving the principle of magneto control as developed by Dr. Albert W. Hull of the Laboratory. The tube is expected to be of much importance, both in radio work and long distance power transmission. Its output is about 40 amperes at 25,000 volts, and serves as a rectifier to change alternating to direct current, and also to change direct to alternating current of any frequency or to convert low frequency alternating current to high frequency. It is thought that one tube will be sufficient to carry radio telephone signals across the Atlantic. This tube consists essentially of a water-cooled cylindrical anode 30 inches long and 1¾ inches in diameter. In the axis of the anode is a tungsten filament four-tenths of an inch in diameter and 22 inches long. This filament is excited by current of 1,800 amperes at 10,000 cycles, the filament excitation requiring about 20 kilowatts. The magneto field produced by this large heating current is sufficient to "cut off" the electrical current from the cathode to the anode during a portion of each half cycle of the current passing through the cathode, this action taking the place of that of the grid in the three electrode tube. The electron current to the cathode is thus interrupted 20,000 times per second. By the use of properly tuned

circuits this can be used for the production of high frequency power radio or any other purpose."—*Toronto Mail and Empire*, Oct. 25, 1922.

**ELEUSINIAN MYSTERIES.**—"For many centuries Greece had been the home of certain cults distinguished alike from the domestic worship of the private citizen and the public ceremonies of the State. They were reserved for those who had been specially admitted after due preparation. The person of the candidate must be purified; he must be pledged to secrecy concerning the holy sights and sacred words; disclosure might involve the penalty of death. Such rituals of a ruder kind are now known to be wide-spread among the peoples of the lower culture, and certain elements in Greek practice which had acquired the sanctity of ancient custom may have been derived from an earlier and cruder stage of thought and life. Two great religious ideas emerge out of the obscurity in which these mysteries still remain in spite of all the labours of recent students for their elucidation. They were believed to open a way to direct communion with the Deity, and—perhaps as a natural consequence—to secure for the believer the promise of a happy immortality. Most famous of all were the mysteries of Eleusis. The town stood on a low rocky height guarding a bay upon the coast of Attica, opposite the island of Salamis. Across the hills and the fertile plain which separated it from Athens ran the Sacred Way, twelve miles in length, adorned in the course of many generations with temples and monuments. Along this road as early as the seventh century (perhaps earlier still) passed the processions year by year in the month of September, to and fro, bearing the 'holy things,' or escorting the 'fair young god' Iacchos. There were lustrations as the candidates for initiation (*mystae*) bathed in the sea; and they were required to be sexually pure, and to have abstained from certain forbidden foods. There was something in the nature of a religious

drama or passion-play, in which Demeter and the Maid (Kore, her daughter) and Aidoneus, lord of the under-world, took part. There was a display of consecrated objects, and the *mystæ* partook of some sacred food. There was a discourse by the presiding officer or hierophant. It probably explained the meaning of what was offered to the wondering gaze of the beholders. The fame of the Mysteries, the solemnity of the previous preparations, the concentration of thought and expectation on great themes, the contagion of numbers, the sympathy of a vast crowd from distant lands, all intensified the impression. The result was, as Aristotle phrased it, that they felt certain emotions, and were put into a certain frame of mind. Writing in the time of Julian in the fourth century A. D., Themistius compared the experiences of the initiated with those of the soul at the point of death; there were glooms and terrors, and then a wondrous light; the initiate was received into pure regions with holy dance and song; he joined in the divine communion and companied with the blessed, while those outside were huddled together in filth and fog. From the days of the Homeric Hymn to Demeter which practically threw the mysteries open to all Greece, it had been believed that they secured for the initiated a better lot in the world beyond the grave. Women, and even slaves, were admitted, and finally all limits of nationality were transcended, and the entry was made as wide as Roman citizenship. The homicide was rejected, and Nero suffered the ignominy of exclusion. The professor of unhallowed rites might not enter, and the door was closed against Apollonius or Tyana as a wandering magician. Otherwise there seem to have been no definite moral demands upon the candidates. They were not redeemed from any sinful ways. No pattern of conduct was held up before them; nor was the nature of the future life made clear. But they were inspired with faith in a happy immortality; and the sense of belonging to a vast community who had marched together along the Sacred Way, added to the conviction of a consecrated destiny, may well have given to many devout spirits an elevation of sentiment which dignified and strengthened their whole character. A decree of the Amphictyonic Council in the second century B. C. declared it to be 'the tradition of the mysteries that the greatest of human blessings is fellowship and mutual trust.' The epitaph on a certain hierophant, who passed on to the immortals in the tenth year of his office, affirmed that he found death not an evil but a blessing. The Eleusinian faith spread far and wide, and doubtless prompted many a prayer like that inscribed on Alexandrian grave-reliefs that the departed 'might reach the region of the holy ones.'—J. E. Carpenter, *Phases of early Christianity*, pp. 215-216.—'The Eleusinian mysteries continued to be celebrated during the whole of the second half of the fourth century, till they were put an end to by the destruction of the temple at Eleusis, and by the devastation of Greece in the invasion of the Goths under Alaric in 395.'—W. Smith, in *Gibbon's History of the decline and fall of the Roman empire*, ch. 25 (note).—See also ELEUSIS.

ELEUSIS.—Eleusis was originally one of the twelve confederate townships into which Attica was said to have been divided before the time of Theseus. In 700 B. C. it was annexed to Athens.

(See ATHENS: B. C. 700-565.) It "was advantageously situated [about fourteen miles northwest of Athens] on a height, at a small distance from the shore of an extensive bay, to which there is access only through narrow channels, at the two extremities of the island of Salamis [see GREECE: Map of ancient Greece]; its position was important, as commanding the shortest and most level route by land from Athens to the Isthmus by the pass which leads at the foot of Mount Cerata along the shore to Megara. . . . Eleusis was built at the eastern end of a low rocky hill, which lies parallel to the sea-shore. . . . The eastern extremity of the hill was levelled artificially for the reception of the Hierum of Ceres and the other sacred buildings. Above these are the traces of an Acropolis. A triangular space of about 500 yards each side, lying between the hill and the shore, was occupied by the town of Eleusis. . . . To those who approached Eleusis from Athens, the sacred buildings standing on the eastern extremity of the height concealed the greater part of the town, and on a nearer approach presented a succession of magnificent objects, well calculated to heighten the solemn grandeur of the ceremonies and the awe and reverence of the *Mystæ* in their initiation. . . . In the plurality of enclosures, in the magnificence of the pylæ or gateways, in the absence of any general symmetry of plan, in the small auxiliary temples, we recognize a great resemblance between the sacred buildings of Eleusis and the Egyptian Hiera of Thebes and Philæ. And this resemblance is the more remarkable, as the Demeter of Attica was the Isis of Egypt. We cannot suppose, however, that the plan of all these buildings was even thought of when the worship of Ceres was established at Eleusis. They were the progressive creation of successive ages. . . . Under the Roman Empire . . . it was fashionable among the higher order of Romans to pass some time at Athens in the study of philosophy and to be initiated in the Eleusinian mysteries. Hence Eleusis became at that time one of the most frequented places in Greece; and perhaps it was never so populous as under the emperors of the first two centuries of our æra. During the two following centuries, its mysteries were the chief support of declining polytheism, and almost the only remaining bond of national union among the Greeks; but at length the destructive visit of the Goths in the year 396, the extinction of paganism and the ruin of maritime commerce, left Eleusis deprived of every source of prosperity, except those which are inseparable from its fertile plain, its noble bay, and its position on the road from Attica to the Isthmus. . . . The village still preserves the ancient name, no further altered than is customary in Roman conversions."—W. M. Leake, *Topography of Athens*, v. 2: *The demi*, sect. 5.—See also ELEUSINIAN MYSTERIES; GOTHs: 395.

ELEVATED RAILWAYS, New York. See NEW YORK CITY: 1869-1920.

EL FASHER, town of Africa, capital of Darfur, occupied by British during World War. See SUDAN: 1914-1920.

ELGAR, Sir Edward William (1857- ), English composer; conductor of the Worcester Instrumental Society, 1882; organist at St. George's, 1885; established his European reputation with the beautiful oratorio, "The Dream of Gerontius." See MUSIC: Modern: 1842-1921; Modern English composers.

ELGIN, James Bruce, Earl of (1811-1863), British statesman and colonial ruler; 1842, governor of Jamaica; 1846, governor-general of Canada, where he succeeded Lord Durham, and engaged

in the important work of putting into effect his predecessor's policy; 1856, special envoy to China; 1858, negotiated treaty of Tientsin, and Treaty of Yeddo; 1860, concluded convention with Chinese government; appointed viceroy and governor-general of India, where he died.—See also CANADA: 1843-1849; CHINA: 1856-1860.

**ELGIN, Thomas Bruce, 7th Earl of** (1766-1841), British diplomat and art collector, donor of marbles to British museum. See BRITISH MUSEUM: Explorations and accessions; PARTHENON: 1801.

**ELGIN, Victor Alexander Bruce, 9th Earl of** (1849-1917), British statesman; 1886, commissioner of works; 1894-1899, governor-general and viceroy of India; 1900, chairman of Royal Commission on South African War; 1905, secretary of state for colonies; 1907, president at imperial conference.—See also BRITISH EMPIRE: Colonial and imperial conferences: 1907; RACE PROBLEMS: 1903-1908.

**ELGIN MARBLES.** See BRITISH MUSEUM: Explorations and accessions; PARTHENON: 1801.

**EL HADHR.** See HATRA.

**ELIJAH**, Hebrew prophet. See JEWS: Religion and the prophets.

**ELIOT, Charles William** (1834- ), American educator. Professor of chemistry at Harvard, 1858-1863, and at Massachusetts Institute of Technology, 1865-1869; president of Harvard University, 1869-1909; president emeritus since 1909.

**ELIOT, George** (1819-1850), pen name of Mrs. Mary Ann Evans Cross, English author. See ENGLISH LITERATURE: 1832-1880.

**ELIOT, John** (1604-1690), clergyman and missionary of early colonial times, known as the "Apostle to the Indians," and famed for his labors among them. He wrote a catechism, the first book printed in the Indian language. This was followed by a primer, and a translation of the Bible, which was printed in 1663, the first Bible printed in America. To separate the converted Indians from their tribes he made a settlement at Nonantum in 1646, and in 1651 moved it to Natick, Mass., where a church was built in 1660; John Eliot arrived in Boston in 1631, and in 1632 settled in Roxbury, where he lived for the rest of his long life.

**ELIOT, Sir John** (1592-1632), English statesman whose career is associated with the parliamentary struggle with the crown in the last years of James I and early years of Charles I. Member of Parliament irregularly between 1614 to 1629. Prominent in the impeachment of the duke of Buckingham in 1625 and in the formulation and enactment of the Petition of Right. He died in the Tower of London. See ENGLAND: 1629.

**ELIS.**—Elis was an ancient Greek state, occupying the country on the western coast of Peloponnesus, adjoining Arcadia, and between Messenia at the south and Achæa on the north. It was noted for the fertility of its soil and the rich yield of its fisheries. But Elis owed greater importance to the inclusion within its territory of the sacred ground of Olympia, where the celebration of the most famous festival of Zeus came to be established at an early time. The Elians had acquired Olympia by conquest of the city and territory of Pisa, to which it originally belonged, and the presidency of the Olympic games was always disputed with them by the latter. Elis was the close ally of Sparta down to the year 421 B. C., when a bitter quarrel arose between them, and Elis allied herself with Athens. (See

ATHENS: B. C. 419-416.) Elis suffered heavily in the wars which ensued. It was afterwards at war with the Arcadians, and joined the Ætolian league against the Achæan league. The city of Elis was one of the most splendid in Greece; but little now remains, even of ruins, to indicate its departed glories.—See also OLYMPIC GAMES.

1909.—Earthquake. See GREECE: 1909 (July).

**ELISHA**, Hebrew prophet. See JEWS: Religion and the prophets.

**ELISII**, tribe in ancient time, in Polish lands. See LYGIANS.

**ELISSA**, or Dido, legendary founder of Carthage. See CARTHAGE: Founding of.

**ELIZABETH** (1553-1603), queen of England from 1558 until 1603. Daughter of Henry VIII and Anne Boleyn; educated a Protestant, and studied under Roger Ascham; repealed the Catholic laws of the previous reign and completely established the Anglican Church (see CHURCH OF ENGLAND: 1534-1563); 1564, concluded the Treaty of Troyes with France, renouncing English claims to Calais; 1587, signed the death warrant of Mary, Queen of Scots, who had been guilty of plotting against her; 1588, her navy under Admiral Howard defeated the Spanish Armada and prevented an invasion of England. Her reign was one of great commercial enterprise and intellectual activity.—See also ENGLAND: 1558-1603; IRELAND: 1558-1560; NETHERLANDS: 1581-1584; 1585-1586.

**ELIZABETH**, industrial city on the Elizabeth river in New Jersey, first settled in 1665. See NEW JERSEY: 1664-1667.

**ELIZABETH AMÉLIE EUGÉNIE** (1837-1898), empress-queen of Austria-Hungary and wife of Francis Joseph; assassinated in 1898. See AUSTRIA-HUNGARY: 1898 (September).

**ELIZABETH FARNESE** (1602-1766), queen of Spain. She was a princess of Parma; married Philip V of Spain. See ITALY: 1715-1735; SPAIN: 1713-1725; 1726-1731.

**ELIZABETH PETROVNA** (1700-1762), empress of Russia, 1741-1762, daughter of Peter the Great. Was placed on the throne after a short revolution; took part in the War of the Austrian Succession, and later in the Seven Years' War against Frederick the Great; allowed herself to be ruled by favorites. See RUSSIA: 1740-1762.

**ELIZABETH STUART** (1596-1662), queen of Bohemia; daughter of James VI of Scotland (James I of England), and wife of Frederick V, elector palatine of the Rhine and king of Bohemia. See GERMANY: 1618-1620; 1621-1623.

**ELIZABETHAN AGE:** Drama. See DRAMA: 1558-1592; 1592-1648.

**Economic progress.** See ENGLAND: 1558-1603. Literature. See ENGLAND: 1558-1603: Literature; ENGLISH LITERATURE: 1530-1660.

**Parliament.** See ENGLAND: 1558-1603: Parliament.

**EL KEFR**, town in Palestine, taken by British in 1918. See WORLD WAR: 1918: VI. Turkish theater: c, 8.

**ELKESAITES**, "the name of a section of syncretistic Jewish Christianity. . . . Elxai is probably not the name of a person but the name of a book which was the chief authority for this sect. . . . As origin reports, this book was believed to have fallen from heaven. . . . The work itself contains a large element of natural religion mingled with Judaistic and Christian ideas. . . . Ritschi regards the Elkesaites as the antipodes of the Montanists, and asserts as their chief peculiarity the setting forth of a new theory of remission of sins by a new baptism. Giessler has wrongly identified them with the Ebionites. . . . The Elkesaites were not a distinct sect but rather

a school scattered among all parties of the Judeo-Christian Church. This syncretistic-gnostic Judaism contributed to the origin of Islam."—*New Schaff-Herzog religious encyclopedia*, v. 4, pp. 112-113.

**ELK HORN**, or Pea Ridge, Battle of. See U. S. A.: 1862 (January-March: Missouri-Arkansas).

**ELKINS**, Stephen Benton (1841-1911), American capitalist and politician. Delegate to Congress from Territory of New Mexico, 1873-1877; vice president of the West Virginia Central and Pittsburg railway; secretary of war, 1890-1893; United States senator, 1894-1911; prominent in connection with railway legislation. See COMMODITY CLAUSE OF THE HEPBURN ACT; RAILROADS: 1887-1906; 1908-1909; U. S. A.: 1910 (March-June).

**EL KUBEIBEH**, town in Palestine, southeast of Joppa, held by Turks in 1917. See WORLD WAR: 1917: VI. Turkish theater: c, 2, iv.

**EL KUNEITRA**, town in Syria, east of the Jordan, scene of battle in 1908. See WORLD WAR: 1918: VI. Turkish theater: c, 21.

**ELKUS**, Abram I. (1867- ), American lawyer and diplomat. Ambassador to Turkey, 1916-1917; made judge of court of appeals of New York, 1919.

**ELKWATER**, Battle of. See U. S. A.: 1861.

**ELLA** (d. c. 514), king of the South Saxons; founded the kingdom of Sussex by defeating the Britons and capturing the Roman city of Anderida.

**ELLANDUM**, Battle of (823), decisive victory of Egberht, the West Saxon king, over the Mercians.

**ELLEBRI**. See IRELAND: Tribes of early Celtic inhabitants.

**EL LEJJUN**, town in Palestine, scene of battle in 1918. See WORLD WAR: 1918: VI. Turkish theater: c, 16.

**ELLENBOROUGH**, Edward Law, Earl of (1790-1871), British statesman; 1828 lord privy seal; 1841, governor-general and viceroy of India, during the Indian mutiny and the conquest of Sind; 1844, was recalled by the directors of the East India Company, but received the thanks of Parliament and the title of earl; 1846, first lord of admiralty; 1858, president board of control. See INDIA: 1836-1845.

**ELLERY**, William (1727-1820), American statesman and a signer of the Declaration of Independence. See U. S. A.: 1776 (July): Text of Declaration of Independence.

**ELLESMERE**, Baron. See BRACKLEY, THOMAS EGERTON.

**ELLICE ISLANDS**, archipelago in the Pacific ocean, under British protection, situated half-way between Piji and Golbert. See PACIFIC OCEAN: 1800-1914.

**ELLCOTT**, Joseph (1760-1826), American civil engineer, founder of the city of Buffalo. See BUFFALO: 1799.

**ELLIOTT**, Howard (1860- ), American railway president, on executive committee of railroads. See RAILROADS: 1916-1920.

**ELLIOTT**, Jesse Duncan (1782-1845), American naval officer, in War of 1812. See U. S. A.: 1812 (September-November).

**ELLIS**, John Willis (1820-1861), governor of North Carolina. See NORTH CAROLINA: 1861 (January-May); U. S. A.: 1860-1861 (December-February); 1861; President Lincoln's call to arms.

**ELLIS**, William Hodgson (1845- ), Canadian chemist. See FERTILIZERS: Chemistry applied to soil cultivation.

**ELLIS ISLAND**, small island in upper New York bay, one mile southwest from the Battery. It was bought by the United States from New York state in 1808. It was used as a powder magazine until 1891, when it was made an immigrant station. The present buildings were erected in 1897.

**ELLSWORTH**, Ephraim Elmer (1837-1861), American lawyer and soldier. In 1861 he organized Zouave regiment in New York, of which he became colonel. See U. S. A.: 1861 (May: Virginia).

**ELLSWORTH**, Oliver (1745-1807), American statesman and jurist. Member Connecticut Assembly 1773-1775; member Continental Congress, 1778-1783; member of Governor's Council in Connecticut 1780-1785, 1803-1807; judge of State Superior Court, 1785-1789; member of Constitutional Convention, 1787; United States senator, 1789-1796; chief justice of the United States Supreme Court, 1796-1799; diplomatic commissioner to France, 1799-1800. See U. S. A.: 1787.

**ELMACIN**, El-Makin or Elmacinus, George (c. 1223-1274), Christian historian of Arabia. See HISTORY: 21.

**EL MENDUR**, in Palestine, seven miles south of Gaza, occupied by British in 1917. See WORLD WAR: 1917: VI. Turkish theater: c, 1, ii.

**ELMET**, small kingdom of the Britons which was swallowed up in the English kingdom of Northumbria early in the seventh century. It answered, roughly speaking, to the present West-Riding of Yorkshire. Leeds "preserves the name of Loidis, by which Elmet seems also to have been known."—J. R. Green, *Making of England*, p. 254.

**EL MEZEIREH**, in Syria, taken by British in 1918. See WORLD WAR: 1918: VI. Turkish theater: c, 4.

**ELMIRA**, industrial city of New York, situated on the Chemung river. In 1779 it was the scene of a battle (see U. S. A.: 1779 [August-September]); 1815, incorporated as village of Newton; 1828, named Elmira; 1836, became a county seat; and in 1864 it was chartered as a city. It is noted for its railroad car shops, bridge works, and radiator works. It is the site of a famous reformatory. See PRISON REFORM: England.

**EL MIRR**, in Syria, taken by the British in 1918. See WORLD WAR: 1918: VI. Turkish theater: c, 4.

**EL MUGHEIR**, in Palestine, southeast of Joppa, captured by British in 1918. See WORLD WAR: 1918: VI. Turkish theater: c, 12.

**EL MUNTAR**, in Palestine, near Jericho, taken by British in 1918. See WORLD WAR: 1918: VI. Turkish theater: c, 1.

**ELOHIST RECORD**: First and second, term applied by modern scholars to certain biblical works. See HISTORY: 14.

**ELPHINSTONE**, Mountstuart (1779-1859), Anglo-Indian statesman, lieutenant-governor of Bombay, 1819-1827. Served as commander in Indian wars. See INDIA: 1816-1819.

**EL PARDO**, Pact of (1885). See SPAIN: 1885-1896.

**EL PASO**, city in Texas on Mexican border, scene of Mexican bandit riots in 1919. See MEXICO: 1919 (June-December).

**ELSTER**, Battle of (1080). See PAPACY: 1056-1122.

**ELTEKEH**, victory won by the Assyrian, Sennacherib, over the Egyptians, before the disaster befell his army which is related in II. Kings 19:35. Sennacherib's own account of the battle has been

found among the Assyrian records.—A. H. Sayce, *Fresh light from the ancient monuments*, ch. 6.

**ELUSATES**, tribe of Aquitaine. See AQUITAINE: Ancient tribes.

**ELVIRA**, Battle of (1319). See SPAIN: 1273-1460.

**ELVIRA**, Synod of (306). See IDOLATRY AND IMAGE WORSHIP: Image worship in Christianity.

**ELXAL**. See ELKESAITES.

**ELY**, city in Cambridgeshire, England, famous for its cathedral. See ENGLAND: 1069-1071.

**ELYMAIS**, ancient Greek name of southern portion of Elam. See ELAM.

**ELYMEIA**, southernmost portion of Macedonia. See MACEDONIA.

**ELYMIANS**, ancient people. See SICILY: Early inhabitants.

**ELYOT**, Sir Thomas (c. 1400-1546), English educational writer. See ENGLISH LITERATURE: 1530-1660.

**ELYSIAN FIELDS**, in Greek belief the abodes of the righteous after death, the "Isles of the Blest." "In the year 81 B. C. [Sertorius] . . . happened to meet . . . with some seamen who had recently visited the 'Atlantic Islands.' These they described as being two in number, separated by a very narrow channel, and lying in the open sea at a distance of ten thousand stadia (1000 geographical miles) from the African coast. The climate of the islands they reported to be delightfully temperate, exempt from cold and violent winds and from excessive rain, with a soft and moist air, which not only rendered the soil fertile for cultivation, but produced self sown fruits in great abundance. The account thus given took such hold on the imagination of Sertorius that he was seized with a strong desire to betake himself to this spot . . . but he was forced to desist from this project by the unwillingness of the Cilician pirates, who formed the crews of his ship, to accompany him. As was natural, these islands were identified with the 'Islands of the Blessed' which had been celebrated from early days in Greek poetry—'where there is no snow nor yet great storm, nor any rain', . . . indeed, we are told that the barbarians themselves believed that in them were to be found the Elysian plains and the Abodes of the Happy, of which Homer had sung. Though the distance from the continent which is attributed to these islands must in any case have been a great exaggeration, yet it seems impossible to regard the Canaries, lying as they do within easy reach of the African coast, as corresponding to them; and the circumstance that they are spoken of as two only, suggests that Madeira and the neighboring Porto Santo were meant. . . . At a later period, however, there is no doubt that the islands which were known as *Fortunatae Insuloe* were the Canaries."—H. F. Tozer, *History of ancient geography*, pp. 225-226.—See also CANARY ISLANDS.

**ELZEVIRS**, family name of famous Dutch printers. See PRINTING AND THE PRESS: 1583-1680.

**EMAIN MACHA**, famous hill of ancient Ireland. See ARMAGH.

**EMANCIPATION**, Brazil: Of slaves. See BRAZIL: 1871-1888.

**EMANCIPATION**, Irish: Of Catholics. See IRELAND: 1811-1820.

Lincoln's proclamation. See U. S. A.: 1863 (January).

Of families of colored soldiers. See U. S. A.: 1865 (March): Emancipation of families of colored soldiers.

Of slaves in Missouri. See MISSOURI: 1862-1865.

**EMANIA**, famous palace of ancient Ireland. See IRELAND: Tribes of early Celtic inhabitants.

**EMANUEL I** (1469-1521), king of Portugal, 1495-1521. His reign is noteworthy for the continuance of Portuguese discoveries and the extension of their trading posts.

"**EMBALMED BEEF**", popular term for the inferior quality of canned beef served to American soldiers in Spanish-American War. See U. S. A.: 1898-1899.

**EMBARGO**: Definition.—Pacific or hostile.—"Embargo pure and simple is nothing more than the detention of ships in port; and it may be put in force for good reason by a state against its own vessels, as was done by the United States in 1807, when to avoid the violent action of both French and English cruisers neutral American merchantmen were for a time prevented from leaving American ports by the act of their own Government. A detention of this kind is called Pacific Embargo, and it has no necessary connection with any attempt to obtain redress for injuries received. When merchant vessels of the offending state are detained in the ports of the state which deems itself aggrieved, we have an instance of such an attempt, and it is called Hostile Embargo. Some writers regard it as a kind of Reprisal; but there is a distinction between the two in that the former consists of seizures in the waters of the offended state, and the latter of seizures on the high seas and in the ports of the state which gives the provocation. The legal effects of Hostile Embargo were stated by Lord Stowell in a luminous judgment in the cases of the *Boedes Lust*, which arose in 1803. After the rupture of the Peace of Amiens, Great Britain had good reason to believe that Holland was only waiting for an opportunity in order to join France against her. An Embargo was, therefore, laid upon all Dutch vessels in British ports with the object of inducing Holland to give up her alliance with Napoleon. Its effect was just the contrary. War broke out, and the question of the legal effect of the original seizure of the Dutch vessels came before a Prize Court. Lord Stowell laid down that Hostile Embargo was at first equivocal in its legal aspects and its real character was determined by the events that followed it. If war broke out, its commencement had a retroactive effect and made the seizure belligerent capture from the first. If satisfaction was given and friendship restored between the two states, the original seizure amounted to nothing more than civil detention and worked no disturbance of proprietary rights. Up to and during the last century Hostile Embargo was often resorted to in contemplation of hostilities. If a state found in its ports a considerable number of vessels belonging to a probable adversary, it was apt to seize the opportunity and lay hands upon them before the actual outbreak of war. The growth of commercial interests, and possibly a quickened sense of justice, have caused the practice to be discontinued; and in modern times the merchant vessels of the enemy found in port at the commencement of hostilities are generally allowed a fixed period in which to depart without molestation."—T. J.

Lawrence, *Principles of international law*, pp. 295-297.—The so-called pacific embargo is theoretically a domestic matter, and may be laid to avoid friction or to conserve supplies. An embargo on arms and munitions is occasionally used as a measure of very strict neutrality. The pacific embargo is capable, however, of use as a war measure, and may in some cases be more effective than blockade. The term has been extended to include other methods of transportation than by ship, just as has the doctrine of continuous voyage.

**First American embargoes.**—The United States laid her first embargo on March 26, 1794, in retaliation for the British orders in council. It remained in effect for sixty days. Later, during the wars between France and England, the United States was driven to pass first, a non-importation act in April, 1806, and then in December, 1807, a strict embargo act. This latter act prevented American vessels from engaging in any foreign commerce. It naturally met with much opposition in the New England States, the commercial center of the Union, where influential interests were almost entirely Federalist, and ready to oppose any measure of the Democratic-Republicans, who were then in power. (The opposition was so intense that in many sections secession was advocated.) Although smuggling was carried on to no small degree, the nation's exports fell from \$108,000,000 in 1807 to \$22,000,000 in 1808. As a means of bringing England and France to terms, the embargo was a failure. The United States suffered far more than either of the belligerents. This was realized by Congress in February, 1809, when a repeal bill was passed. Another embargo was laid in December, 1813, to remain in force until January 1, 1815. It was repealed, however, in April, 1814, for the same reasons which caused the repeal of the Embargo of 1807. "New England could not be coerced into subscription to national loans, but she might be prevented from trading with the enemy. Accordingly, a new and rigid embargo was enacted in December, 1813. Hardly was it on the statute-book when it had to be modified to prevent the people of the island of Nantucket from starving, because of the rigid enforcement of the prohibition of intercourse with the mainland. A fortnight after the passage of this embargo came the news of the overwhelming defeat of Napoleon at Leipzig, which meant that all the continent of Europe was now open to British commerce. . . . By April the futility of the embargo was clear: it was not serviceable either abroad or at home, and on Madison's recommendation it was repealed, April 14."—K. C. Baheock, *Rise of American nationality*, 1811-1819 (*American Nation: A history*, v. 13, pp. 158-159).—See also TARIFF: 1808-1824; U. S. A.: 1804-1809; 1808-1810; 1813-1814; 1912-1916.

**During the World War.**—"On March 1, 1915, the British Government informed the principal neutral powers that, in view of German violation of international law, it and the French Government would 'hold themselves free to detain and take into port ships carrying goods of presumed enemy destination, ownership, or origin,' and added that it was 'not intended to confiscate such vessels or cargoes unless they would otherwise be liable to condemnation.' Ten days later an Order in Council put this program into effect. Originally, the 'embargo,' as it came to be called, was defended simply as a retaliatory measure. Very soon however, the foreign office began to characterize it as a 'blockade,' although it is clearly a new application of the blockade principle, especially as it interferes with commerce through neutral ports.

The question of the effect of the embargo on the war has been much discussed. Without doubt it . . . contributed to make Germany's task much more difficult, and especially in the matter of the manufacture of high explosives. . . . [Later] developments, especially the entry of the United States into the war . . . strengthened the embargo."—*War cyclopedia*, p. 85.

"The President [of the United States] acting under authority given him by an Act of Congress, . . . forbade the export of a long list of articles to any of the fifty-six countries and their dependencies, save under licenses obtained from the bureau of Foreign and Domestic Commerce. The purpose of the Government, he said, was to better the food conditions which had risen and were likely to arise before the crops were harvested. In liberating any surplus over and above our own needs, the wants of nations fighting against Germany and her Allies would be first considered. 'Neutrals would not be unduly hampered; but the Government must be assured that they were husbanding their own resources, and that our own supplies did not directly or indirectly go to feed the enemy. Not only was the shipment of food and fodder to be restricted, but such essentials as pig iron, steel, bullets, arms, ammunition and explosives. The ban was to go into effect on July 15 [1917]. . . . A comparison of our exports during the nine months ending with March, 1917, with those for a like period ending with March, 1913, the year before the war, showed that those to Denmark had nearly trebled, those to Norway had increased ninefold, those to Sweden four-fold and those to Switzerland twenty-five fold. This did not mean that everything brought from our country was sent by these neutrals into Germany. Much of it was, and the rest went to make up the depletion of their own products caused by shipments to Germany. Sweden in times of peace was a large exporter of iron ore, but she was now selling to Germany each year more than she had ever before sold to all the world, and to replace her depleted stock was importing ore from the United States. Assurances from these neutrals that they would not send to Germany wheat, grain, copper, war supplies of any kind, bought from us, meant little if what they bought was merely to replace their own products sold to our enemy. This was the source of supply our duty to our Allies and ourselves required we should stop. A Danish journal did not believe that the contest for liberty and democracy would be fought with weapons which would mortally wound small nations. Before the war President Wilson had again and again upheld the right to neutrals to carry on trade with one of the belligerents. Before the war American goods in large quantities went through Denmark to Germany. Indeed, it was to defend the neutral commercial rights of America that the United States declared war. A German journal called the embargo a brutal assault against little neutrals. In France the embargo was hailed as one of the decisive acts of the war. The Allies, despite the vigilance of their navies, had failed to make the blockade tight. A new measure was needed. This the United States had furnished by forbidding indirect aid to the enemy. From Norway came a special commission, headed by the Arctic explorer Nansen, to remonstrate. Norway, he said, was dependent on the United States for supplies. In times of peace she bought from Germany sugar, grain and fats; but now she must get them from America. She was in great need of iron and grain. The harvest would be poor and little could be expected from the crop. When the

new minister from Switzerland arrived there accompanied him a commission to present the needs of that country as to food. She raised but twenty per cent. of her food supply, and besides her own population must feed thousands of interned people from neighboring countries. After some negotiation with Norway an agreement was reached by which she promised, if allowed to buy forty-seven thousand tons of cereals, to give up thirty-six thousand tons of wheat and rye for the benefit of Belgium. The rest, eleven thousand tons of barley, she was to keep. Germany had sunk seventeen of twenty-three Belgium Relief Commission ships, and it was to replace this loss that the thirty-six thousand tons were to be given up at cost and taken to Belgium in vessels Norway had chartered to carry foodstuffs home. A like agreement was tentatively made with Holland for the loading of some thirty of her ships, provided the larger part of their cargoes was given to Belgium. But the Exports Council would not consent, and it was soon announced that no ships with American wheat would be allowed to sail to the ports of any northern neutrals before the first of December. The Netherlands, despite its protest, it was said, had wheat and grain enough for her population until that time.—J. B. McMaster, *United States in the World War*, pp. 370-372.—See also **TARIFF**: 1919.

**EMINENT DOMAIN**: Definition and explanation.—Constitutional limitations.—"It is a necessary attribute of every government that it shall have the right to acquire for public purposes the ownership or control of private property even without the consent of the owner. Such property is essential to the carrying on of governmental functions; it is needed for forts, navy-yards, post-offices, custom-houses, prisons, highways, and so on. The *domain* or property-taking right of the government must therefore be *eminent* or paramount, that is, superior to the property-holding right of any individual. This is a well-recognized doctrine of both jurisprudence and political science, so well recognized, in fact, that it is now never disputed. In the absence of constitutional limitations, therefore, the nation and the several states might each take, at their own will and pleasure, any private property for any purpose and under such terms of payment as their legislatures might provide or even without any payment at all. In England, parliament has that unfettered authority, although it does not practise the tyranny of taking property without paying for it. But in America the constitution contains express limitations upon the power of eminent domain. The nation is restricted by the terms of the Fifth Amendment and the states are limited, for the most part in the same words, by the terms of their own respective constitutions. The limitations in both cases are twofold; the taking of property must be for a public purpose, and just compensation to the owner must be given. But what is a public purpose? The courts have been liberal in their interpretation of this term. They have upheld the taking of land for post-offices and other buildings, for parks, and for all other purposes related to the functions of government. Not only may the government itself exercise this right of taking private property for public purposes, moreover, but it may confer the same right by franchise-grant upon railroads and other corporations engaged in public or quasi-public enterprises. It is with reference to these public service corporations, indeed, that the chief difficulty is found in determining the constitutional limitations upon the right of eminent domain. It may be generally stated, however, that such power as the government itself possesses in the matter of condemning private property it may delegate to any public utility corporation. On the other hand, whatever limitations apply to the original authority of the government in this field also apply when the

power is delegated to a subordinate corporation."—W. B. Munro, *Government of the United States*, pp. 294-295.

**Meaning of "public use."—Exclusion of apartment houses from residence districts by eminent domain.**—The cases, *State v. Houghton* (Minnesota, October 24, 1919, 174 N.W. 885; same, Minnesota, January 23, 1920, 176 N.W. 159), "present an interesting judicial debate upon the question whether by use of the power of eminent domain and the payment of compensation apartment houses may lawfully be excluded from residence districts in cities. By an act of 1915 the legislature of Minnesota authorized cities of the first class to establish residence districts upon the petition of fifty per cent of the property owners in the district sought to be affected, and to exclude from such residence districts a long and varied list of industrial and mercantile establishments together with 'apartment houses, tenement houses, flat buildings.' The cities were authorized to effect the exclusion of these undesirable buildings or establishments by means of eminent domain and the payment of compensation. The compensation was to be paid out of assessments upon the property of the residents of the districts thus benefited. In this case a mandamus was asked to compel the building inspector of Minneapolis to issue a permit for an apartment in one of these restricted districts. On the original hearing the court held that this statute and the ordinance of the city council of Minneapolis passed in pursuance of it provided for an unconstitutional use of the power of eminent domain. The majority opinion, written by Judge Dibell, narrowed the issue of the case to the question whether the condemnation of property rights provided for was for a 'public use' or not, inasmuch as it is well established that private property may be taken only for a public use. It was pointed out that the property condemned under these enactments, property in the nature of an easement, or restricted use, was not property of which the public could make any actual use. The public gained by such condemnation no right to enter upon or use the property affected. The 'use' acquired was merely negative in character. The court further declared that the 'public use' for which the property was being taken was public only in the sense that it worked to the advantage and benefit of the surrounding property owners who desired protection from the erection of ugly or inappropriate structures. If the desire or need for protection of this kind is to be regarded as constituting a 'public use' for which private property may be taken by right of eminent domain the limits of the doctrine are hard to fix and much injustice may result. 'When the humble home is threatened by legislation upon aesthetic grounds, or at the instance of a particular class of citizens who would rid themselves of its presence as not suited in architecture or in other respects to their own more elaborate structures, a step will have been taken inevitably to cause discontent with the government as one controlled by class distinction, rather than in the interests and for the equal protection of all.' There is, of course, no question of the police power raised in this case. In fact the supreme court of Minnesota had in an earlier decision held that apartment houses could not be excluded from residence districts by a mere exercise of the police power since there was nothing in their character to justify the conclusion that they could properly be classed as nuisances (*State v. Houghton*, 134 Minn. 226, 158 N. W. 1017). Two justices dissented from the decision of the

majority in this case and filed a brief opinion in which they laid emphasis upon the undesirable results of allowing apartment houses to invade residence districts without restraint and expressed the view that 'it is about time that courts recognize the aesthetic as a factor in the affairs of life,' and that aesthetic protection is a proper field of legislative control. On a rehearing of the case the dissenting justices won a majority of the court to their point of view, the decision just discussed was reversed, and the statute and ordinance in question were held constitutional. The opinion of Judge Holt admitted that the public received no actual, physical use of the property taken by eminent domain, and that only a portion of the public could reasonably be said to be benefited by the taking. His opinion is in effect a vigorous protest against a narrow and inflexible definition of the term 'public use' in the law of eminent domain. The meaning of 'public use' must expand with time and the needs of society and purposes which are intimately connected with the welfare of the community or a substantial portion of it may legitimately be furthered by the condemnation of private property rights. Apartment houses are a menace to the welfare of the people living in residence districts. They destroy the beauty of the neighborhood and bring about depreciation in the value of surrounding property. This results in loss to the owners of the property affected and loss to the city in the form of diminished taxable values. 'Giving the people a means to secure for that portion of a city wherein they establish their homes, fit and harmonious surroundings, promotes contentment, induces further efforts to enhance the appearance and value of the home, fosters civic pride, and thus tends to produce a better type of citizens.' It is the conclusion of the court that property condemned for such purposes is condemned for a public use. It will be observed that the clash of opinion in these two cases presents an issue by no means new. There have long been two distinct interpretations applied to the term 'public use' in the law of eminent domain. One of these would make 'public use' synonymous with 'use by the public' and thereby limit the taking of private property to the cases in which the public actually acquires title and possession. The opinion of the majority in the first case examined approximates this point of view. This doctrine has the very obvious advantage of providing an explicit and unvarying test by which courts may determine whether or not the use for which property is being condemned is public or private. It is doubtless this definiteness which has commended it to the approval of an overwhelming majority of courts and commentators (Lewis, *Eminent Domain*, Secs. 257-258). The opposing view is that 'public use' in eminent domain should be construed to mean 'public welfare' and that any taking of private property which can be justified upon this broad ground may be sustained. It is this doctrine upon which Judge Holt bases his opinion in the second case. While it commands the adherence of only a small minority of the courts which have passed upon it, strong pressure is being exerted in its behalf. The adoption of this more liberal doctrine of public use seems necessary if the condemnation of various types of easements, or excess condemnation, are to be employed in the working out of city planning programs and it seems probable that its acceptance will tend to spread in spite of the dangers which are undoubtedly connected with it."—R. E. Cushman, *American Political Science Review*, Aug., 1920, pp. 462-464.—"United States v.

North American Transportation and Trading Company (253 U. S. 330) establishes that when the government appropriates private property for public use under legislative sanction but without instituting condemnation proceedings, it impliedly promises to pay therefor and may be sued on its promise in the Courts of Claims."—E. S. Corwin, *Constitutional law in 1919-1920* (*American Political Science Review*, Feb., 1921, p. 60).

ENCOMIENDA.—"Social inequality increased in this period [Moslem period, 711-1035], due to a decline in wealth and to an accentuation of the hazards of life. The higher nobility attained to vast privileges and authority, although less than in other parts of Christian Europe. They were often, but not always, allowed to conquer lands for themselves, rule their own estates with almost absolute authority, leave the king's service for that of another monarch, and be free from taxation. The social prestige of the nobles was weakened, however, through the king's right to grant titles of nobility. The king might also deprive a noble created by himself of his titles and lands. Most of the nobility of the lower grades were in fact retainers of the greater nobles or of the king, usually rendering military service in return for protection. This state of dependence was called *encomienda* (commendation),—a term used centuries later to cover the virtual enslavement of the American Indians."—C. E. Chapman, *History of Spain*, p. 60.—See also CHILE: 1540-1778; COLONIZATION: Modern: Spanish; EMINENT DOMAIN: Meaning of "public use"; REPARTIEMENTOS; SLAVERY: 1493-1542.

ENCRATITES, name given to the first ascetics in the early Christian church. They arose in Rome at the end of the second century and spread throughout Asia Minor. They seemed to have disappeared by the end of the fourth century. "The characteristic of the Encratites was their insistence upon asceticism as essential to Christian living. They were therefore associated, and with abundant historical justification, with Gnosticism. . . . Many offshoots of numerous heresies have already been formed from those heresies which we have described. . . . By way of example, let us say there are those springing from Saturninus and Marcion, who are called Encratites [i. e. self controlled], who preached the unmarried state, thus setting aside the original creation of God, and indirectly condemning Him who made male and female for the propagation of the human race. Some of those reckoned as belonging to them have also introduced abstinence from animal food, being ungrateful to God who created all things. They deny, also, the salvation of him who was first created. It is but recently that this opinion has been discovered among them, since a certain man named Tatian first introduced the blasphemy. He had been a hearer of Justin's and as long as he continued with him he expressed no such views; but after his martyrdom [circa 165] he separated from the Church, and having become excited and puffed up by the thought of being a teacher, as if he were superior to others, he composed his own peculiar type of doctrine. He invented a system of certain invisible Eons, like the followers of Valentinus; and like Marcion and Saturninus, he declared that marriage was nothing else than corruption and fornication. But this denial of Adam's salvation was an opinion due

entirely to himself.' (Irenaeus, *Adv. Haer.*, I, 28)."

**ENCYCLOPEDIISTS**, group of brilliant French writers and thinkers of the eighteenth century who received their name from their work on the encyclopedia. "French literature had never been so brilliant as in the second half of the 18th century. Buffon, Diderot, D'Alembert, Rousseau, Duclos, Condillac, Helvetius, Holbach, Raynal, Condorcet, Mably, and many others adorned it, and the 'Encyclopædia,' which was begun in 1751 under the direction of Diderot, became the focus of an intellectual influence which has rarely been equalled. The name and idea were taken from a work published by Ephraim Chambers in Dublin, in 1728. A noble preliminary discourse was written by D'Alembert; and all the best pens in France were enlisted in the enterprise, which was constantly encouraged and largely assisted by Voltaire. Twice it was suppressed by authority, but the interdiction was again raised. Popular favour now ran with an irresistible force in favour of the philosophers, and the work was brought to its conclusion in 1771."—W. E. H. Lecky, *History of England in the 18th century*, v. 5, ch. 20.—See also ATHEISM; BIOLOGY: History; FRANCE: 1789; Survey of France on the eve of revolution: Literary forerunners; FRENCH LITERATURE: 1750-1785.

## ENGLAND

**Area.**—Climate.—Effect of geographical position on history.—Population.—Industrial geography.—Mining resources.—Occupations.—The area of England alone, that is the southern part of the island of Great Britain, not including the principality of Wales, except the county of Monmouth, is 50,874 square miles, or about the area of the Dominion of Newfoundland. Of this area something less than one-fourth is rated as arable land, and a somewhat larger area as permanent pasture. Including Wales, the area is 58,340 square miles. "The history of the British islands has been affected to an exceptional extent by geography—1, (chief in importance) by their position on the globe—2, by their physical struc-

ture—3, (in modern times only) by their mineral products. Foremost among their geographical advantages is the benefit derived from the Gulf Stream. Thanks to it, the British Islands enjoy a climate far milder and more equable than most countries in the same latitude. London is in the same isothermal line with New York, which is 10° further south, and with Peking, which is 12° further. Liverpool is almost in the same latitude with Danzig, and Glasgow with Riga. Where would be the trade of a country destined by position to be maritime, if the surrounding seas were icebound during half the year? England lies at the north-western corner of Europe, its south-eastern angle within a few miles of the Continent,

the distance widening along the south coast, and still more along the east coast, and the broad Atlantic lying outside the islands to the north and west. The straits of Dover were formed late in geological time; and there is evidence that Britain was inhabited by men while it was still joined to the Continent. . . . At the time of Caesar's first invasion the island was already fairly well peopled by tribes mainly, if not entirely, Celtic, though not all of the same branch of that race—that is to say akin to their nearest neighbours on the continent of Europe, and carrying on some little intercourse with them. No sort of national unity existed: the coalitions of tribes to resist Roman conquest were but partial and temporary. . . . During several centuries after the withdrawal of the Romans, Britain was almost as much exposed to invasions and raids as if there had been no protecting sea. The Angles and Saxons met with little effectual resistance. The Northmen, who ravaged all coasts alike, insular and continental, made a permanent settlement on the east side of the island. The Norman invasion succeeded, partly at least because England was not really united, in spite of having been long under a single king. . . . The physical structure of Britain is of most importance in the second stage of its history, the period of the Anglo-Saxon conquest. If a line be drawn from the mouth of the Tees to the mouth of the Severn, and thence continued to the south coast, it will be found that it roughly divides the island into plain and hill regions. The country to the south and east of such a line is fairly level and almost everywhere fertile, exception being made for the fens and forests, which remained in primitive wildness till long after the Saxon conquest had been completed. On the other side of the line the country is mainly hilly, with a large proportion of land unfit for cultivation, at any rate until the growth of population rendered it worth while to utilize comparatively poor soil. Moreover, the greater the distance from the straits of Dover, the more uniformly hilly does the country become. Hence when the Angles and Saxons effected a lodgement in Britain, they gradually expelled the Celts from all the south and east; but the hill regions of the west and north formed a refuge for the Celts, all the more effective because it was less attractive to the invaders, as well as more difficult to penetrate in face of resistance. Unless the testimony of language is to be ignored, the same thing must have happened before, at the time of the Celtic immigration. If, as is at least possible, the islands were previously peopled by the Iberian race, they must have been driven by the Celts into the western regions, for it is there only that traces of them are believed to be recognizable. Moreover, the same process is more clearly discernible as between different sections of the Celts. . . . The Teutonic immigration was in itself largely governed by the geographical conditions. The first lodgement was made by the Jutes in Kent, the portion of the island nearest to the Continent. Successive swarms followed, of Saxons along the south coast, of Angles on the east coast northwards from the Thames; and geographical conditions may almost be said to have determined the fate of them all."—H. G. George, *Relations of geography and history*, pp. 132, 133, 134, 137, 138.—Ethnologically the main part of the population is descended from a mixture of Teuton, Celtic, Scandinavian and Norman French. "Islanders are always coast dwellers with a limited hinterland. Hence their stock may be differentiated from the mainland race in part for the same reason that all coasted folk in regions of maritime develop-

ment are differentiated from the people of the back country, namely because contact with the sea allows an intermittent influx of various foreign strains, which are gradually assimilated. The English today represent a mixture of Celts, with various distinct Teutonic elements, which had already diverged from one another in their separate habitats, Jutes, Angles, Saxons, Danes, Norse and Norman French. . . . England received the numerically dominant element of its population from across . . . the North Sea, from the bare but seaman-breeding coasts of Germany, Denmark, Norway rather than from the nearer shores of Gaul. . . . The subsequent detachment of these immigrant stocks . . . by the English Channel and the North Sea from their home people, and their arrival in necessarily small bands, enabled them to be readily assimilated. . . . The uniformity in cranial type prevailing all over the British Isles is amazing. The dominant Anglo-Saxon population . . . was a solvent for the Norman French. The whole southern and eastern coast population of England, from Cornwall to The Wash received during Elizabeth's reign valuable accessions of industrious Flemings and Huguenots."—E. C. Semple, *Influences of geographic environment*, pp. 184, 421, 422.—The population of Wales is almost purely Celtic, and has kept its native tongue for home use.

"In relief England, west and north-west of a line from Exeter via Nottingham to Newcastle, resembles generally the Scottish highlands, though the relief is rather gentler and the climate rather more favourable; but in resources it is more like the Scottish lowlands, being very rich in minerals, especially coal, in Cumberland, Lancashire, Glamorganshire, &c. It contains (1) the home of the cotton industry on the ring of rain-washed hills that overlook the Wigan coal-field, circle round Manchester, and have access to the sea at Liverpool; (2) the great iron and steel industry that rose on the coal and coke of Northumberland and Durham, and that has access to the sea by Tyne and Tees and Wear; (3) the great iron and steel industry that rose on the coal-fields of the Black Country—round Birmingham; and (4) the woollen industry of West Yorkshire. Of course there are numerous other developments, including the chemical industry of the Cheshire salt-field and the tweed industry of the Bristol coal-field. The south-eastern region is lower in relief, more extreme in climate, and richer in soil, and is naturally a farming country, sheep farming as well on the chalk and limestone 'downs' that cross it as wheat farms on the rich, stiff soils of the Ouse, Thames, and Hampshire basins."—A. R. H. Moncrieff, *New world of today*, v. 1, p. 250.—The earliest known mines of England were the tin mines of Cornwall, the product of which was exploited by the Phoenicians, and probably influenced Julius Cæsar in his determination to invade the country. Cornwall still produces tin, and also copper ores and galena (lead ores). Lead is also found in Derbyshire, lead and zinc in the northern countries, especially Yorkshire. Manganese, copper, zinc, galena and also carbonate of lead occur in the Welsh mountains. Iron and coal, however, have had a greater influence in the history of England than any other mineral.—See also INDUSTRIAL REVOLUTION: England; Mining inventions.

The population of England in 1921 was 35,678,530; of Wales 2,206,712, or a total of 37,885,242. "The classification of the population according to occupation shows that fully a quarter are engaged in various industries, this word in the census being used to exclude agriculture and fishing, but to

include all other 'industries'; and the numbers engaged in agriculture and fishing—about two and a quarter millions—is less, by nearly a quarter of a million, than the numbers engaged in commerce. Industrial and commercial occupations, therefore, engage . . . nearly one-third of . . . the total population. . . . The textile trade is much the most important part of it. The expansion of it has been most remarkable. A century ago the total value of our textile products was not much over £20,000,000, and in those days the wool industry was far the most important—with an annual output valued at about £17,000,000. To-day . . . cotton accounts for £120,000,000, wool coming second with £55,000,000. . . . About one-third of our total exports (in value) consists of textiles."—A. R. H. Moncrieff, *New world of to-day*, v. 1, p. 252.—See also CANALS: Principal European canals; British Isles.

**Before Teutonic Conquest.**—Celtic and Roman periods. See BRITAIN.

**A. D. 449-547.**—**First invasion.**—**Saxons, Angles and Jutes.**—**Naming of the country.**—"It was by . . . three tribes [from Northwestern Germany], the Saxons, the Angles, and the Jutes, that southern Britain was conquered and colonized in the fifth and sixth centuries, according to the most ancient testimony. . . . Of the three, the Angli almost if not altogether pass away into the migration: the Jutes and the Saxons, although migrating in great numbers, had yet a great part to play in their own homes and in other regions besides Britain; the former at a later period in the train and under the name of the Danes; the latter in German history from the eighth century to the present day."—W. Stubbs, *Constitutional history of England*, v. 1, ch. 3.—"Among the Teutonic settlers in Britain some tribes stand out conspicuously; Angles, Saxons, and Jutes stand out conspicuously above all. The Jutes led the way; from the Angles the land and the united nation took their name; the Saxons gave us the name by which our Celtic neighbours have ever known us. But there is no reason to confine the area from which our forefathers came to the space which we should mark on the map as the land of the continental Angles, Saxons, and Jutes. So great a migration is always likely to be swollen by some who are quite alien to the leading tribe; it is always certain to be swollen by many who are of stocks akin to the leading tribe, but who do not actually belong to it. As we in Britain are those who stayed behind at the time of the second great migration of our people [to America], so I venture to look on all our Low-Dutch kinsfolk on the continent of Europe as those who stayed behind at the time of the first great migration of our people. Our special hearth and cradle is doubtless to be found in the immediate marchland of Germany and Denmark, but the great common home of our people is to be looked on as stretching along the whole of that long coast where various dialects of the Low-Dutch tongue are spoken. If Angles and Saxons came, we know that Frisians came also, and with Frisians as an element among us, it is hardly too bold to claim the whole Netherlands as in the widest sense Old England, as the land of one part

of the kinsfolk who stayed behind. Through that whole region, from the special Anglian corner far into what is now northern France, the true tongue of the people, sometimes overshadowed by other tongues, is some dialect or other of that branch of the great Teutonic family which is essentially the same as our own speech. From Flanders to Sleswick the natural tongue is one which differs from English only as the historical events of fourteen hundred years of separation have inevitably made the two tongues—two dialects, I should rather say, of the same tongue—to differ. From these lands we came as a people. That was our first historical migration. Our remote forefathers must have made endless earlier migrations as parts of the great Aryan body, as parts of the smaller Teutonic body. But our voyage from the Low-Dutch mainland to the isle of Britain was our first migration as a people. . . . Among the Teutonic tribes which settled in Britain, two, the Angles and the Saxons, stood out foremost. These two between them occupied by far the greater part of the land that was occupied at all. Each of these two gave its name to the united nation, but each gave it on different lips. The Saxons were the earlier invaders; they had more to do with the Celtic remnant which abode in the land. On the lips then of the Celtic inhabitants of Britain, the whole of the Teutonic inhabitants of Britain were known from the beginning, and are known still, as Saxons. But, as the various Teutonic settlements drew together, as they began to have common national feelings and to feel the need of a common national name, the name which they chose was not the same as that by which their Celtic neighbours called them. They did not call themselves Saxons and their land Saxony; they called themselves English and their land England. I used the word Saxony in all seriousness; it is a real name for the Teutonic part of Britain, and it is an older name than the name England. But it is a name used only from the outside by Celtic neighbours and enemies; it was not used from the inside by the Teutonic people themselves. In their mouths, as soon as they took to themselves a common name, that name was English; as soon as they gave their land a common name, that name was England. . . . And this is the more remarkable, because the age when English was fully established as the name of the people, and England as the name of the land, was an age of Saxon supremacy, an age when a Saxon state held the headship of England and of Britain, when Saxon kings grew step by step to be kings of the English and lords of the whole British island. In common use then, the men of the tenth and eleventh centuries knew themselves by no name but English."—E. A. Freeman, *English people in its three homes (Lectures to American Audiences, pp. 30-31, 45-47)*.—See also ANGLES; BARBARIAN INVASIONS: 5th-6th centuries; SAXONS.

**449-473.**—**Landing of Jutes at Ebbsfleet.**—**Conquest of Kent by the Jutes.**—"In or about 449 a band of Jutish sea-rovers landed at Ebbsfleet, in the Isle of Thanet. According to tradition their leaders were Hengist and Horsa, names signifying the horse and the mare, which were not very likely to have been borne by real warriors. Whatever may have been the names of the chiefs, Vortigern took them into his service against the Picts, giving them the Isle of Thanet as a dwelling-place for themselves. With their help he defeated the Picts, but afterwards found himself unable to defend himself against his fierce auxiliaries. Thanet, was still cut off from the mainland by an arm of the sea, and the Jutes were strong enough to hold

it against all assailants. Their numbers rapidly increased as shiploads of their fellows landed, and they crossed the strait to win fresh lands from the Britons on the mainland of Kent. In several battles Vortigern was overpowered. His rival and successor, Ambrosius Aurelianus, whose name makes it probable that he was an upholder of the old Roman discipline, drove back the Jutes in turn. He did not long keep the upper hand, and in 465 he was routed utterly. The defeat of the British army was followed by an attack upon the great fortresses which had been erected along the Saxon Shore in the Roman times. The Jutes had no means of carrying them by assault, but they starved them out one by one, and some twenty-three years after their first landing, the whole of the coast of Kent was in their hands."—S. R. Gardiner, *Student's history of England*, p. 27.—"A final victory of the Jutes in 473 may mark the moment when they reached the rich pastures which the Roman engineers had reclaimed from Romney Marsh. . . . With this advance to the mouth of the Weald the work of Hengest's men came to an end; nor did the Jutes from this time play any important part in the attack on the island, for their after-gains were limited to the Isle of Wight and a few districts on the Southampton Water."—J. R. Green, *Making of England*, ch. 1.—See also BARBARIAN INVASIONS: 5th-6th centuries.

ALSO IN: J. M. Lappenberg, *History of England under the Anglo-Saxon kings*, v. 1, pp. 67-101.

477-527.—Conquests of the Saxons.—Founding of the kingdoms of Sussex, Wessex and Essex.—"Whilst the Jutes were conquering Kent, their kindred took part in the war. Ship after ship sailed from the North Sea, filled with eager warriors. The Saxons now arrived—Ella and his three sons landed in the ancient territory of the Regni (A. D. 477-491). The Britons were defeated with great slaughter, and driven into the forest of Andreade, whose extent is faintly indicated by the wastes and commons of the Weald. A general confederacy of the Kings and 'Tyrants' of the Britons was formed against the invaders. . . . From this period the kingdom of the South Saxons was established in the person of Ella; and though ruling only over the narrow boundary of modern Sussex, he was accepted as the first of the Saxon Bretwaldas, or Emperors of the Isle of Britain. Encouraged, perhaps, by the good tidings received from Ella, another band of Saxons, commanded by Cerdic and his son Cynric, landed on the neighbouring shore, in the modern Hampshire (A. D. 404). . . . Under Cynric and his son Ceaulin, the Saxons slowly, yet steadily, gained ground. The utmost extent of their dominions toward the North cannot be ascertained; but they had conquered the town of Bedford; and it was probably in consequence of their geographical position (571) with respect to the countries of the Middle and East Saxons, that the name of the West Saxons was given to this colony."—J. R. Green, *Making of England*, ch. 3.—"Whilst the coast line from the inlet of the sea now filled by Romney Marsh to the western edge of Hampshire had thus been mastered by Saxons, others of the same stock, known as East Saxons, seized upon the low coast to the north of the Thames. From them the land was called Essex. Neither Saxons nor Jutes, however, were as yet able to penetrate far up the valley of the Thames, as the Roman settlement of London, surrounded by marshes, still blocked the way."—S. R. Gardiner, *Student's history of England*, v. 1, p. 28.—"The greatness of Sussex did not last beyond the days of its founder

Ælle, the first Bretwalda. Whatever importance Essex, or its offshoot, Middlesex, could claim as containing the great city of London was of no long duration. We soon find London fluctuating between the condition of an independent commonwealth, and that of a dependency of the Mercian Kings. Very different was the destiny of the third Saxon Kingdom. Wessex has grown into England, England into Great Britain, Great Britain into the United Kingdom, the United Kingdom into the British Empire. Every prince who has ruled England before and since the eleventh century [the interval of the Danish kings, Harold, son of Godwine, and William the Conqueror, who were not of the West Saxon house] has had the blood of Cerdic the West Saxon in his veins. At the close of the sixth century Wessex had risen to high importance among the English Kingdoms, though the days of its permanent supremacy were still far distant."—E. A. Freeman, *History of the Norman conquest of England*, ch. 2, sect. 1.—See also BARBARIAN INVASIONS: 5th-6th centuries.

547-633.—Conquests of the Angles.—Founding of their kingdoms.—"Northwards of the East Saxons was established the kingdom of the East Angles, in which a northern and a southern people (Northfole and Suthfole) were distinguished. It is probable that, even during the last period of the Roman sway, Germans were settled in this part of Britain; a supposition that gains probability from several old Saxon sagas, which have reference to East Anglia at a period anterior to the coming of Hengest and Horsa. The land of the Gyrwas, containing 1,200 hides . . . comprised the neighbouring marsh districts of Ely and Huntingdonshire, almost as far as Lincoln. . . . The neighbouring states of Mercia originated in the marsh districts of the Lindisware, or inhabitants of Lindsey (Lindesig), the northern part of Lincolnshire. With these were united the Middle Angles. This kingdom, divided by the Trent into a northern and a southern portion, gradually extended itself to the borders of Wales. Among the states which it comprised was the little kingdom of the Hwiccas, conterminous with the later diocese of Worcester, or the counties of Gloucester, Worcester, and a part of Warwick. This state [Hwicce], together with that of the Hecanas, bore the common Germanic appellation of the land of the Magesætas. . . . The country to the north of the Humber had suffered the most severely from the inroads of the Picts and Scots. It became at an early period separated into two British states, the names of which were retained for some centuries, viz.: Deifyr (Deora rice), afterwards Latinized into Deira, extending from the Humber to the Tyne, and Berneich (Beorna rice), afterwards Bernicia, from the Tyne to the Clyde. Here also the settlements of the German races appear anterior to the date given in the common accounts of the first Anglian kings of those territories, in the middle of the sixth century."—J. M. Lappenberg, *History of England under the Anglo-Saxon kings*, v. 1, pp. 112-117.—The three Anglian kingdoms of Northumberland, Mercia and East Anglia, "are altogether much larger than the Saxon and Jutish Kingdoms, so you see very well why the land was called 'England' and not 'Saxony.' . . . 'Saxonia' does occur now and then, and it was really an older name than 'Anglia,' but it soon went quite out of use. . . . You must fully understand that in the old times Northumberland meant the whole land north of the Humber, reaching as far as the Firth of Forth. It thus takes in part of what is now Scotland, including the city of Edinburgh, that is Eadwinesburh, the

town of the great Northumbrian King Eadwine, or Edwin [Edwin of Deira, 617-633]. . . . You must not forget that Lothian and all that part of Scotland was part of Northumberland, and that the people there are really English, and still speak a tongue which has changed less from the Old-English than the tongue of any other part of England. And the real Scots, the Gael in the Highlands, call the Lowland Scots 'Saxons,' just as much as they do the people of England itself. This Northumbrian Kingdom was one of the greatest Kingdoms in England, but it was often divided into two, Beornicia [or Bernicia] and Deira, the latter of which answered pretty nearly to Yorkshire. The chief city was the old Roman town of Eboracum, which in Old-English is Eborwic, and which we cut short into York. York was for a long time the greatest town in the North of England. . . . The great Anglian Kingdom of the Mercians, that is the Marchmen, the people on the march or frontier, seems to have been the youngest of all, and to have grown up gradually by joining together several small states, including all the land which the West Saxons had held north of the Thames. Such little tribes or states were the Lindesfaras and the Gainas in Lincolnshire, the Magesetas in Herefordshire, the Hwiccas in Gloucester, Worcester, and part of Warwick, and several others. . . . When Mercia was fully joined under one King, it made one of the greatest states in England, and some of the Mercian Kings were very powerful princes. It was chiefly an Anglian Kingdom, and the Kings were of an Anglian stock, but among the Hwiccas and in some of the other shires in southern and western Mercia, most of the people must really have been Saxons."—E. A. Freeman, *Old English history for children*, ch. 5.—See also BARBARIAN INVASIONS: 5th-6th centuries.

560.—Ethelbert becomes king of Kent.

593.—Ethelfrith becomes king of Northumbria.

597-685.—Conversion of the English.—"It happened that certain Saxon children were to be sold for slaves at the market-place at Rome; when Divine Providence, the great clock-keeper of time, ordering not only hours, but even instants (Luke ii. 38), to his own honour, so disposed it, that Gregory, afterwards first bishop of Rome of that name, was present to behold them. It grieved the good man to see the disproportion betwixt the faces and fortunes, the complexions and conditions, of these children, condemned to a servile estate, though carrying liberal looks, so legible was ingenuity in their faces. It added more to his sorrow, when he conceived that those youths were twice vassals, bought by their masters, and 'sold under sin' (Rom. vii. 14), servants in their bodies, and slaves in their souls to Satan."—T. Fuller, *Church history of Britain*, bk. 2, sect. 1.—"In 500 the good Gregory became Bishop of Rome, or Pope, and six years later, still retaining the interest awakened in him by the captive English youth, he dispatched a band of missionary monks to Britain, with their prior, Augustine, at their head. Once they turned back, affrighted by what they heard of the ferocity of the new heathen possessors of the once-Christian island of Britain; but Gregory laid his commands upon them again, and in the spring of 507 they crossed the channel from Gaul, landing at Ebbsfleet, in the Isle of Thanet, where the Jutish invaders had made their first landing, a century and a half before. They found Ethelbert of Kent, the most powerful of the English kings at that time, already prepared to receive them with tolerance, if not with favor,

through the influence of a Christian wife—queen Bertha, of the royal family of the Frank. The conversion and baptism of the Kentish king and court, and the acceptance of the new faith by great numbers of the people followed quickly. In November of the same year, 507, Augustine returned to Gaul to receive his consecration as 'Archbishop of the English,' establishing the See of Canterbury, with the primacy which has remained in it to the present day. The East Saxons were the next to bow to the cross and in 604 a bishop, Mellitus, was sent to London. This ended Augustine's work—and Gregory's—for both died that year. Then followed an interval of little progress in the work of the mission, and, afterwards, a reaction towards idolatry which threatened to destroy it altogether. But just at this time of discouragement in the south, a great triumph of Christianity was brought about in Northumberland, and due, there, as in Kent, to the influence of a Christian queen. Edwin, the king, with many of his nobles and his people, were baptised on Easter Eve, A. D. 627, and a new center of missionary work was established at York. There, too, an appalling reverse occurred, when Northumberland was overrun, in 633, by Penda, the heathen king of Mercia; but the kingdom rallied, and the Christian Church was reestablished, not wholly, as before, under the patronage and rule of Rome, but partly by a mission from the ancient Celtic Church, which did not acknowledge the supremacy of Rome. In the end, however, the Roman forms of Christianity prevailed, throughout Britain, as elsewhere in western Europe. Before the end of the 7th century the religion of the Cross was established firmly in all parts of the island, the South Saxons being the latest to receive it. In the 8th century English missionaries were laboring zealously for the conversion of their Saxon and Frisian brethren on the continent."—G. F. Maclear, *Conversion of the West: The English*.

"The Roman tongue became again one of the tongues of Britain, the language of its worship, its correspondence, its literature. But more than the tongue of Rome returned with Augustine. Practically his landing renewed the union with the western world which the landing of Hengest had all but destroyed. The new England was admitted into the older commonwealth of nations. The civilization, arts, letters, which had fled before the sword of the English conquest, returned with the Christian faith. The fabric of the Roman law indeed never took root in England, but it is impossible not to recognize the result of the influence of the Roman missionaries in the fact that the codes of customary English law began to be put into writing soon after their arrival."—J. R. Green, *Short history of the English people*, p. 19.—See also CHRISTIANITY: 507-800; and Map.

End of the 6th century.—Extent, limits and character of the Teutonic conquest.—"Before the end of the 6th century the Teutonic dominion stretched from the German ocean to the Severn, and from the English Channel to the Firth of Forth. The northern part of the island was still held by Picts and Scots, Celtic tribes, whose exact ethnical relation to each other hardly concerns us. And the whole west side of the island, including not only modern Wales, but the great Kingdom of Strathclyde, stretching from Dumbarton to Chester, and the great peninsula containing Cornwall, Devon and part of Somerset, was still in the hands of independent Britons. The struggle had

been a long and severe one, and the natives often retained possession of a defensible district long after the surrounding country had been occupied by the invaders. . . . But by the end of the 6th century even these exceptions must have been few. The work of the Conquest, as a whole, was accomplished. The Teutonic settlers had occupied by far the greater part of the territory which they ever were, in the strictest sense, to occupy. The complete supremacy of the island was yet to be won; but that was to be won, when it was won, by quite another process. The English Conquest of Britain differed in several important respects from even other settlement of a Teutonic people within the limits of the Roman Empire. . . . Though the literal extirpation of a nation is an impossibility, there is every reason to believe that the Celtic inhabitants of those parts of Britain which had become English at the 6th century had been as nearly extirpated as a nation can be. The women would doubtless be largely spared, but as far as the male sex is concerned, we may feel sure that death, emigration or personal slavery were the only alternatives which the vanquished found at the hands of our fathers. The nature of the small Celtic element in our language would of itself prove the fact. Nearly every Welsh word which has found its way into English expresses some small domestic matter, such as women and slaves would be concerned with."—E. A. Freeman, *History of the Norman conquest of England*, ch. 2, sect. 1.—"A glance at the map shows that the mass of the local nomenclature of England begins with the Teutonic conquest, while the mass of the local nomenclature of France is older than the Teutonic conquest. And, if we turn from the names on the map to the living speech of men, there is the most obvious, but the most important, of all facts, the fact that Englishmen speak English and that Frenchmen speak French. . . . The obvious inference is that, while in Gaul the Teutonic conquest led to no general displacement of the inhabitants, in England it did lead to such a general displacement. In Gaul the Franks simply settled among a subject people, among whom they themselves were gradually merged; in Britain the Angles and Saxons slew or drove out the people whom they found in the land, and settled it again as a new people."—E. A. Freeman, *English people in its three homes (Lectures to American Audiences, pp. 114-115)*.—"When the new-comers planted themselves on British soil, each group of families united by kinship fixed its home in a separate village or township, to which was given the name of the kindred followed by 'ham' or 'tun,' the first word meaning the home or dwelling, the second the earthen mound which formed the defence of the community. Thus Wokingham is the home of the Wokings, and Wellington the 'tun' of the Weltings. Each man had a homestead of his own, with a strip or strips of arable land in an open field. Beyond the arable land was pasture and wood, common to the whole township, every villager being entitled to drive his cattle or pigs into them according to rules laid down by the whole township. The population was divided into Eorls and Ceorls. The Eorl was hereditarily distinguished by birth, and the Ceorl was a simple freeman without any such distinction. . . . Below the Ceorls were slaves taken in war or condemned to slavery as criminals. There were also men known as Gesiths, a word which means 'followers,' who were the followers of the chiefs or Ealdormen who led the conquerors. The Gesiths formed the war-band of the chief. . . . This war-

band of Gesiths was composed of young men who attached themselves to the chief by a tie of personal devotion. It was the highest glory of the Gesith to die to save his chief's life. [See also *COMITATUS*.] . . . The bulk of the population on the eastern and southern coasts was undoubtedly English. English institutions and English language took firm root. The conquerors looked on the Britons with the utmost contempt, naming them Welsh, a name which no Briton thought of giving to himself, but which Germans had been in the habit of applying somewhat contemptuously to the Celts on the Continent. So far as British words have entered into the English language at all, they have been words such as gown or curd, which are likely to have been used by women, or words such as cart or pony, which are likely to have been used by agricultural labourers and the evidence of language may therefore be adduced in favour of the view that many women and many agricultural labourers were spared by the conquerors. The smallest political community of the new settlers was the village, or, as it is commonly called, the township (q. v.), which is still represented by the parish, the parish being merely a township in which ecclesiastical institutions have been maintained whilst political institutions have ceased to exist. The freemen of the township met to settle small questions between themselves, under the presidency of their reeve or headman. More important cases were brought before the hundred-moot, or meeting of the hundred, a district which had been inhabited, or was supposed to have been inhabited, either by a hundred kindred groups of the original settlers or by the families of a hundred warriors. This hundred-moot was held once a month, and was attended by four men and the reeve from every township, and also by the Eorls and Thegns living in the hundred. It not only settled disputes about property, but gave judgment in criminal cases as well."—S. R. Gardiner, *Student's history of England*, v. 1, pp. 29-32.

7th century.—The so-called "Heptarchy."—"The old notion of an Heptarchy, of a regular system of seven Kingdoms, united under the regular supremacy of a single over-lord, is a dream which has passed away before the light of historic criticism. The English Kingdoms in Britain were ever fluctuating, alike in their number and in their relations to one another. The number of perfectly independent states was sometimes greater and sometimes less than the mystical seven, and, till the beginning of the ninth century, the whole nation did not admit the regular supremacy of any fixed and permanent over-lord. Yet it is no less certain that, among the mass of smaller and more obscure principalities, seven Kingdoms do stand out in a marked way, seven Kingdoms of which it is possible to recover something like a continuous history, seven Kingdoms which alone supplied candidates for the dominion of the whole island." These seven kingdoms were Kent, Sussex, Essex, Wessex, East Anglia, Northumberland and Mercia.—E. A. Freeman, *History of the Norman conquest of England*, ch. 2.—"After the territorial boundaries had become more settled, there appeared at the commencement of the seventh century seven or eight greater and smaller kingdoms. . . . Historians have described this condition of things as the Heptarchy, disregarding the early disappearance of Sussex, and the existence of still smaller kingdoms. But this grouping was neither based upon equality, nor destined to last for any length of time. It was the common interest of these smaller states to withstand the sudden and often dangerous invasions of their western and

northern neighbours; and, accordingly, whichever king was capable of successfully combating the common foe, acquired for the time a certain superior rank, which some historians denote by the title of Bretwalda. By this name can only be understood an actual and recognized temporary superiority; first ascribed to Ælla of Sussex, and later passing to Northumbria, until Wessex finally attains a real and lasting supremacy. It was geographical position which determined these relations of superiority. The small kingdoms in the west were shielded by the greater ones of Northumberland, Mercia and Wessex, as though by crescent-shaped forelands—which in their struggles with the Welsh kingdoms, with Strathclyde and Cumbria, with Picts and Scots, were continually in a state of martial activity. And so the smaller western kingdoms followed the three warlike ones; and round these Anglo-Saxon history revolves for two whole centuries, until in Wessex we find a combination of most of the conditions which are necessary to the existence of a great State.”—R. Gneist, *History of the English constitution*, ch. 3.

617.—Edwin becomes king of Northumbria.

634.—Oswald becomes king of Northumbria.

655.—Oswi becomes king of Northumbria.

670.—Egfrith becomes king of Northumbria.

688.—Ini becomes king of the West Saxons.

716.—Ethelbald becomes king of Mercia.

758.—Offa becomes king of Mercia.

794.—Cenwulf becomes king of Mercia.

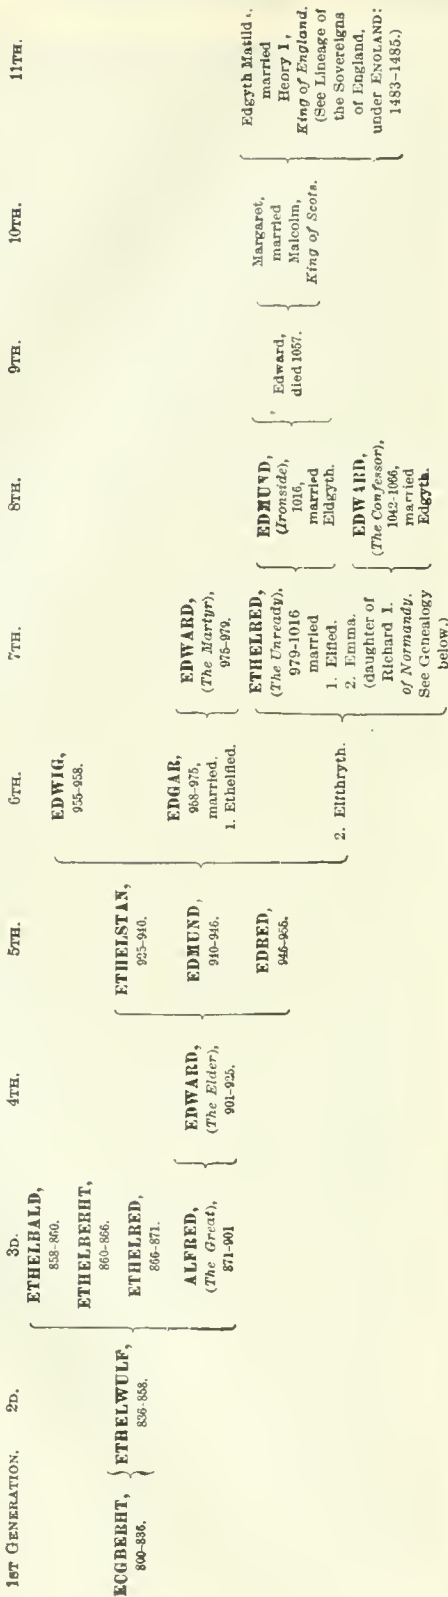

802-839.—Supremacy of Wessex.—Reign of Egbert.—“In 802, the young Egbert, of the royal house of Wessex, returned from the court of Charles the Great, whither he had been driven by the persecutions of Offa. Thirteen years he spent in rallying the shattered forces of his kingdom. Then he began a series of operations which culminated in 825 in the overthrow of the Mercians at Ellandun. When, in 829, he made a royal progress through Mercia, it was virtually his, as much as Wessex. . . . By the end of 830, with the exception of Celtic Strathclyde, all the lands south of the line of the Forth and the Clyde had submitted to Egbert. Through all this magnificent region, the princes, whether Celt or Teuton, acknowledged the overlordship of the southern king. The vague recognition of this overlordship, however, did not constitute these vassal states into a kingdom or an empire, still less into a national state. Egbert had, after all, only brought together such another confederacy as that which once obeyed Penda or Offa; only larger in extent, and, for the moment, confronted by no possible rival north or south.”—B. S. Terry, *History of England*, pp. 16-17.—See also SCANDINAVIAN STATES: 8th-9th centuries.

836.—Accession of the West Saxon king Ethelwulf.

855-880.—Conquests and settlements of the Danes.—Heroic struggle of Alfred the Great.—“Peace of Wedmore” and the “Danelaw.”—King Alfred’s character and reign.—“The Danish invasions of England . . . fall naturally into three periods, each of which finds its parallel in the course of the English Conquest of Britain. . . . We first find a period in which the object of the invaders seems to be simple plunder. They land, they harry the country, they fight, if need be, to secure their booty, but whether defeated or victorious, they equally return to their ships, and sail away with what they have gathered. This period includes the time from the first recorded invasion [787] till the latter half of the ninth century. Next comes a time in which the object of the Northmen is clearly no longer mere plunder, but

settlement. . . . In the reign of Æthelwulf the son of Egberht [Egbert] it is recorded that the heathen men wintered for the first time in the Isle of Sheppey [855]. This marks the transition from the first to the second period of their invasions. . . . It was not however till about eleven years from this time that the settlement actually began. Meanwhile the sceptre of the West-Saxons passed from one hand to another. . . . Four sons of Æthelwulf reigned in succession, and the reigns of the first three among them [Ethelbald, 858, Ethelberht, 860, Ethelred, 866-871] make up together only thirteen years. In the reign of the third of these princes, Æthelred I, the second period of the invasions fairly begins. Five years were spent by the Northmen in ravaging and conquering the tributary Kingdoms. Northumberland, still disputed between rival Kings, fell an easy prey [867-869], and one or two puppet princes did not scruple to receive a tributary crown at the hands of the heathen invaders. They next entered Mercia [868], they seized Nottingham, and the West-Saxon King hastening to the relief of his vassals, was unable to dislodge them from that stronghold. East Anglia was completely conquered [866-870] and its King Eadmund died a martyr. At last the full storm of invasion burst upon Wessex itself [871]. King Æthelred, the first of a long line of West-Saxon hero-Kings, supported by his greater brother Ælfred [Alfred the Great] met the invaders in battle after battle with varied success. He died and Ælfred succeeded, in the thick of the struggle. In this year [871], the last of Æthelred and the first of Ælfred, nine pitched battles, besides smaller engagements, were fought with the heathens on West-Saxon ground. At last peace was made; the Northmen retreated to London, within the Mercian frontier; Wessex was for the moment delivered, but the supremacy won by Egberht was lost. For a few years Wessex was subjected to nothing more than temporary incursions, but Northumberland and part of Mercia were systematically occupied by the Northmen, and the land was divided among them. . . . At last the Northmen, now settled in a large part of the island, made a second attempt to add Wessex itself to their possessions [878]. For a moment the land seemed conquered; Ælfred himself lay hid in the marshes of Somersetshire; men might well deem that the Empire of Egberht and the Kingdom of Cerdic itself, had vanished for ever. But the strong heart of the most renowned of Englishmen, the saint, the scholar, the hero, and the lawgiver, carried his people safely through this most terrible of dangers. Within the same year the Dragon of Wessex was again victorious [at the battle of Ethandun, or Edington], and the Northmen were driven to conclude a peace which Englishmen, fifty years sooner, would have deemed the lowest depth of degradation, but which might now be fairly looked upon as honourable and even as triumphant. [See NORMANS: 787-880; SCANDINAVIAN STATES: 8th-9th centuries.] By the terms of the Peace of Wedmore the Northmen were to evacuate Wessex and the part of Mercia south-west of Watling-Street; they, or at least their chiefs, were to submit to baptism, and they were to receive the whole land beyond Watling-Street as vassals of the West-Saxon King. . . . See ‘Ælfred and Guthrum’s Peace,’ Thorpe’s ‘Laws and Institutes,’ i. 152. This frontier gives London to the English; but it seems that Ælfred did not obtain full possession of London till 886.” The territory thus conceded to the Danes, which included all northeastern England from the Thames to the Tyne, was thence-

# LINEAGE OF THE WEST SAXON KINGS OF ENGLAND.

# LINEAGE OF THE DUKES OF NORMANDY TO THE CONQUEST OF ENGLAND.

forth known by the name of the Danelagh or Danelaw, signifying the country subject to the law of the Danes. The Peace of Wedmore ended the second period of the Danish invasions. The third period, which was not opened until a full century later, embraced the actual conquest of the whole of England by a Danish king and its temporary annexation to the dominions of the Danish crown.—E. A. Freeman, *History of the Norman conquest of England*, ch. 2, with foot-note.—“Now that peace was restored, and the Danes driven out of his domains, it remained to be seen whether Alfred was as good a ruler as he was a soldier. . . . What did he see? The towns, even London itself, pillaged, ruined, or burnt down; the monasteries destroyed; the people wild and lawless; ignorance, roughness, insecurity everywhere. It is almost incredible with what a brave heart he set himself to repair all this; how his great and noble aims were still before him; how hard he strove, and how much he achieved. First of all he seems to have sought for helpers. Like most clever men, he was good at reading characters. He soon saw who would be true, brave, wise friends, and he collected these around him. Some of them he fetched from over the sea, from France and Germany; our friend Asser from Wales, or, as he calls his country, ‘Western Britain,’ while England, he calls ‘Saxony.’ He says he first saw Alfred ‘in a royal vill, which is called Dene’ in Sussex. ‘He received me with kindness, and asked me eagerly to devote myself to his service, and become his friend; to leave everything which I possessed on the left or western bank of the Severn, and promised that he would give more than an equivalent for it in his own dominions. I replied that I could not rashly and incautiously promise such things; for it seemed to be unjust that I should leave those sacred places in which I had been bred, educated, crowned, and ordained for the sake of any earthly honour and power, unless upon compulsion. Upon this he said, “If you cannot accede to this, at least let me have your service in part; spend six months of the year with me here, and the other six months in Britain.”’ And to this after a time Asser consented. What were the principal things he turned his mind to after providing for the defence of his kingdom, and collecting his friends and counsellors about him? Law—justice—religion—education. He collected and studied the old laws of his nation; what he thought good he kept, what he disapproved he left out. He added others, especially the ten commandments and some other parts of the law of Moses. Then he laid them all before his Witan, or wise men, and with their approval published them. . . . The state of justice in England was dreadful at this time. . . . Alfred’s way of curing this was by inquiring into all cases, as far as he possibly could, himself; and Asser says he did this ‘especially for the sake of the poor, to whose interest, day and night, he ever was wonderfully attentive; for in the whole kingdom the poor, besides him, had few or no protectors.’ . . . When he found that the judges had made mistakes through ignorance, he rebuked them, and told them they must either grow wiser or give up their posts; and soon the old earls and other judges, who had been unlearned from their cradles, began to study diligently. . . . For reviving and spreading religion among his people he used the best means that he knew of; that is, he founded new monasteries and restored old ones, and did his utmost to get good bishops and clergymen. For his own part, he strove to practise in all ways what he taught to others. . . . Education was in

a still worse condition than everything else. . . . All the schools had been broken up. Alfred says that when he began to reign there were very few clergymen south of the Humber who could even understand the Prayer-book. (That was still in Latin, as the Roman missionaries had brought it.) And south of the Thames he could not remember one. His first care was to get better-educated clergy and bishops. And next to get the laymen taught also.”—T. Hughes, *Alfred the Great*, ch. 24.

“Alfred grasped the importance of national history as an instrument of education, and sought to leave to the people, in a language which the simplest of them could understand, a record of their kings and of their own achievements. This record, compiled under Alfred’s direction, partly from current traditions and partly from the Ecclesiastical History of Bede, was the beginning of the famous Chronicle, which was destined to be continued for three hundred years, forming a sort of semi-official national diary of the greatest

ALFRED THE GREAT

value in recovering the later history of Old English kings. For the benefit of his unlearned countrymen also Alfred caused to be put in an English dress such works, standard in his day, as Bede’s history and the general history of the world of Orosius. The king’s interest in literature, however, was by no means confined to history. He caused translations to be made of standard philosophical and theological works as well, of which the most important were the Consolations of Philosophy of the unfortunate Boetius [which Alfred himself translated from Latin into Anglo-Saxon], and the Pastoral Care of Pope Gregory I. He also made a collection of the ancient epic songs of the English. But of these, with the exception of the epic of Beowulf, only a few fragments have survived. In Beowulf, however, we have a priceless treasure. It is not only the earliest of English poems, antedating the era of migration; it is also a striking picture of life and manners, far more than the dry annals of the Chronicle, revealing the temper of the ancient English folk. . . . Like Charles the Great, he ransacked his dominions for men who were apt to teach. . . . Even foreign countries also were invited to contribute of their

wealth to enrich his schools. . . . Under the inspiration of such men, there began a genuine renaissance. The long struggle with the Danes had dealt severely with the English kingdoms; the old schools had been destroyed, their teachers and pupils scattered, and the people had lapsed into barbaric ignorance. When Alfred began his reign it was said that there was not a man in Wessex who could read understandingly. When Alfred closed his reign, English prose had been born, and the English mind had received an inspiration which it was not to lose, until it emerged into the full day of the modern era. The same order which Alfred introduced into the administration of his kingdom, he introduced also into his own private life. He had no clock to warn him of the flight of the hours; but, by burning a series of tapers, he contrived to divide his day with some accuracy. When he noticed that the draughts caused his candles to burn unevenly at times, he protected them with a lantern made with sides of horn. The well-ordered household, the value put upon education, the sobriety and patient industry of the king, and the quiet seriousness with which he took the duties of his high office, created an influence which affected all who came in contact with him, and from the court extended outward and downward to the people."—B. S. Terry, *History of England*, pp. 813-814.—See also EDUCATION: Medieval: 871-000; IRELAND: 7th-8th centuries.

901.—Accession of the West Saxon king Edward, called The Elder.

925.—Accession of the West Saxon king Ethelstan.

938.—Battle of Brunnaburgh.—Alfred the Great, dying in 901, was succeeded by his son, Edward, and Edward, in turn, was followed, 925, by his son Athelstane, or Æthelstan. In the reign of Athelstane a great league was formed against him by the Northumbrian Danes with the Scots, with the Danes of Dublin and with the Britons of Strathclyde and Cumbria. Athelstane defeated the confederates in a mighty battle, celebrated in one of the finest of Old-English war-songs and also in one of the Sagas of the Norse tongue, as the Battle of Brunnaburgh or Brunanburh, but the site of which is unknown. "The victory was so decisive that, during the remainder of the reign of Athelstane, no enemy dared to rise up against him; his supremacy was acknowledged without contest, and his glory extended to distant realms."—F. Palgrave, *History of the Anglo-Saxons*, ch. 10.—It would seem that the battle of Brunnaburgh was fought at Aldborough, near York.—W. F. Skene, *Celtic Scotland*, v. 1, p. 357.

940.—Accession of the West Saxon king, Edmund.

946.—Accession of the West Saxon king, Edred.

955.—Accession of the West Saxon king, Edwig.

958.—Accession of the West Saxon king, Edgar.

958.—Completed union of the realm.—Increase of kingly authority.—Approach towards feudalism.—Rise of the Witenagemot.—Decline of the Freeman.—"Before Alfred's son Edward died, the whole of Mercia was incorporated with his immediate dominions. The way in which the thing was done was more remarkable than the thing itself. Like the Romans, he made the fortified towns the means of upholding his power. But unlike the Romans, he did not garrison them with colonists from amongst his own immediate de-

pendents. He filled them, as Henry the Fowler did afterwards in Saxony, with free townsmen, whose hearts were at one with their fellow countrymen around. Before he died in 924, the Danish chiefs in the land beyond the Humber had acknowledged his overlordship, and even the Celts of Wales and Scotland had given in their submission in some form from which they were not likely to interpret too strictly. His son and his two grandsons, Athelstan, Edmund, and Edred completed the work, and when after the short and troubled interval of Edwy's rule in Wessex, Edgar united the undivided realm under his sway in 958, he had no internal enemies to suppress. He allowed the Celtic Scottish King who had succeeded to the inheritance of the Pictish race to possess the old Northumbrian land north of the Tweed, where they and their descendants learned the habits and speech of Englishmen. But he treated him and the other Celtic kings distinctly as his inferiors, though it was perhaps well for him that he did not attempt to impose upon any very tangible tokens of his supremacy."—S. R. Gardiner, *Student's history of England*, v. 1, p. 30.—See also FEUDALISM: Organization.

959-975.—Edgar and Dunstan.—Changes in English institutions.—Growth of the king's power.—Conversion of freemen into serfs.—The Towns.—Shire-moot.—Ealdormen and the Witenagemot.—"Eadgar was known as the Peaceful King. He had the advantage, which Eadwig had not, of having the Church on his side. He maintained order, with the help of Dunstan as his principal adviser. Not long after his accession Dunstan became Archbishop of Canterbury. His policy was that of a man who knows that he cannot do everything and is content to do what he can. The Danes were to keep their own laws, and not to have English laws forced upon them. The great ealdormen were to be conciliated, not to be repressed. Everything was to be done to raise the standard of morality and knowledge. Foreign teachers were brought in to set up schools. . . . His title of Peaceful shows that at least he lived on good terms with his neighbours. . . . It is of more importance that a Celtic king ruled thenceforward over an English people as well as over his own Celtic Scots, and that ultimately his descendants became more English than Celtic in character, through the attraction exercised upon them by their English subjects. The long struggle with the Danes could not fail to leave its mark upon English society. The history of the changes which took place is difficult to trace; in the first place because our information is scanty, in the second because things happened in one part of the country which did not happen in another. Yet there were two changes which were widely felt: the growth of the king's authority, and the acceleration of the process which was reducing to bondage the ceorl, or simple freeman. In the early days of the English conquest the kings and other great men had around them their war-bands, composed of gesiths or thegns, personally attached to themselves, and ready, if need were, to die on their lord's behalf. Very early these thegns were rewarded by grants of land on condition of continuing military service. Every extension of the king's power over fresh territory made their services more important. . . . The kings therefore had to rely more and more upon their thegns, who in turn had thegns of their own whom they could bring with them; and thus was formed an army ready for military service in any part of the kingdom. A king who could command such an army was even more powerful than one who could

command the whole of the forces of a smaller territory. It is impossible to give a certain account of the changes which passed over the English freemen, but there can be little doubt that a process had been for some time going on which converted them into bondmen, and that this process was greatly accelerated by the Danish wars. When a district was being plundered the peasant holders of the strips of village land suffered most, and needed the protection of the neighbouring thegn, who was better skilled in war than themselves, and this protection they could only obtain on condition of becoming bondmen themselves—that is to say, of giving certain days in the week to work on the special estate of the lord. A bondman differed both from a slave and from a modern farmer. Though he was bound to the soil and could not go away if he wished to do so, yet he could not be sold as though he were a slave; nor, on the other hand, could he, like a farmer, be turned out of his holding so long as he fulfilled his obligation of cultivating his lord's demesne. The lord was almost invariably a thegn, either of the king or of some superior thegn, and there thus arose in England, as there arose about the same time on the Continent, a chain of personal relationships. The king was no longer merely the head of the whole people. He was the personal lord of his own thegns, and they again were the lords of other thegns. The serfs cultivated their lands, and thereby set them free to fight for the king on behalf of the whole nation. It seems at first sight as if the English people had fallen into a worse condition. An organisation, partly military and partly servile, was substituted for an organisation of free men. Yet only in this way could the whole of England be amalgamated. [See also SERFDOM: 11th-17th centuries.] The nation gained in unity what it lost in freedom. The towns had grown up in various ways. . . . The inhabitants met to consult about their own affairs, sometimes in dependence on a lord. Where there was no lord they held a court which was composed in the same way as the hundred-moots outside. The townsmen had the right of holding a market. Every sale had to take place in the presence of witnesses who could prove, if called upon to do so, that the sale had really taken place, and markets were therefore usually to be found in towns, because it was there that witnesses could most easily be found. . . . Whilst the hundred-moot decayed, the folk-moot continued to flourish under a new name, as the shire-moot. This moot was still attended by the freemen of the shire though the thegns were more numerous and the simple freemen less numerous than they had once been. Still the continued existence of the shire-moot kept up the custom of self-government more than anything else in England. The ordeals were witnessed, the were-gild [or wer-gild, compensation by the murderer or his family to the relatives of a murdered man] inflicted, and rights to land adjudged, not by an officer of the king, but by the landowners of the shire assembled for the purpose. These meetings were ordinarily presided over by the ealdorman, who appeared as the military commander and the official head of the shire, and by the bishop, who represented the Church. Another most important personage was the sheriff, or shire-reeve, whose business it was to see that the king had all his rights, to preside over the shire-moot when it sat as a judicial court, and to take care that its sentences were put in execution. During the long fight with the Danes commanders were needed who could lead the forces of more than a single

shire. Before the end of Eadred's reign there were ealdormen who ruled over many shires. One of them for instance, Aethelstan, Ealdorman of East Anglia, and of the shires immediately to the west of East Anglia, was so powerful that he was popularly known as the flaf-King. Such ealdormen had great influence in their own districts, and they also were very powerful about the king. The king could not perform any important act without the consent of the Witenagemot, which was made up of three classes—the Ealdormen, the Bishops, and the greater Thegns. When a king died the Witenagemot chose his successor out of the kingly family; its members appeared as witnesses whenever the king 'booked' land to any one; and it even, on rare occasions, deposed a king who was unfit for his post. In the days of a great warrior king like Eadward or Eadmund, members of the Witenagemot were but instruments in his hands, but if a weak king came upon the throne, each member usually took his own way and pursued his own interest rather than that of the king and kingdom."—S. R. Gardiner, *Student's history of England*, v. 1, pp. 67-75.—See also COMITATUS.

975.—Accession of the West Saxon king, Edward, called The Martyr.

979.—Accession of the West Saxon king, Ethelred, called The Unready.

10th-11th centuries.—Early differentiation and relation to Scotland. See SCOTLAND: 10th-11th centuries.

979-1016. — Danish conquest.—"Then [A. D. 979] commenced one of the longest and most disastrous reigns of the Saxon kings, with the accession of Ethelred II., justly styled Ethelred the Unready. The Northmen now renewed their plundering and conquering expeditions against England; while England had a worthless waverer for her ruler, and many of her chief men turned traitors to their king and country. Always a laggart in open war, Ethelred tried in root the cowardly and foolish policy of buying off the enemies whom he dared not encounter. The tax called Dane-geld was then levied to provide 'a tribute for the Danish men on account of the great terror which they caused.' To pay money thus was in effect to hire the enemy to renew the war. In 1002 Ethelred tried the still more weak and wicked measure of ridding himself of his enemies by treacherous massacre. Great numbers of Danes were now living in England, intermixed with the Anglo-Saxon population. Ethelred resolved to relieve himself from all real or supposed danger of these Scandinavian settlers taking part with their invading kinsmen, by sending secret orders throughout his dominions for the putting to death of every Dane, man, woman, and child, on St. Brice's Day, Nov. 13. . . . The news of the massacre of St. Brice soon spread over the Continent, exciting the deepest indignation against the English and their king. Sweyn [the Danish king] collected in Denmark a larger fleet and army than the north had ever before sent forth, and solemnly vowed to conquer England or perish in the attempt. He landed on the south coast of Devon, obtained possession of Exeter by the treachery of its governor, and then marched through western and southern England, marking every shire with fire, famine and slaughter; but he was unable to take London, which was defended against the repeated attacks of the Danes with strong courage and patriotism, such as seemed to have died out in the rest of Saxon England. In 1013, the wretched king Ethelred fled the realm and sought shelter in Normandy. Sweyn was

acknowledged king in all the northern and western shires, but he died in 1014, while his vow of conquest was only partly accomplished. The English now sent for Ethelred back from Normandy, promising loyalty to him as their lawful king, 'provided he would rule over them more justly than he had done before.' Ethelred willingly promised amendment, and returned to reign amidst strife and misery for two years more. His implacable enemy, Sweyn, was indeed dead; but the Danish host which Sweyn had led thither was still in England, under the command of Sweyn's son, Canute [or Cnut], a prince equal in military prowess to his father, and far superior to him and to all other princes of the time in statesmanship and general ability. Ethelred died in 1016, while the war with Canute was yet raging. Ethelred's son, Edmund, surnamed Ironside, was chosen king by the great council then assembled in London, but great numbers of the Saxons made this submission to Canute. The remarkable personal valour of Edmund, strongly aided by the bravery of his faithful Londoners, maintained the war for

CANUTE

nearly a year, when Canute agreed to a compromise, by which he and Edmund divided the land between them. But within a few months after this, the royal Ironside died by the hand of an assassin, and Canute obtained the whole realm of the English race. A Danish dynasty was now [1016] established in England for three reigns."—E. S. Creasy, *History of England*, v. 1, ch. 5.—See also BARBARIAN INVASIONS: 5th-10th centuries; MALDEN AND ASSANDUN, BATTLES OF.

1016.—Accession and death of King Edmund Ironside.

1016-1042.—The reign of the Danish kings.—"Canut's rule was not as terrible as might have been feared. He was perfectly unscrupulous in striking down the treacherous and mischievous chieftains who had made a trade of Ethelred's weakness and the country's divisions. But he was wise and strong enough to rule, not by increasing but by allaying those divisions. . . . To bring England itself into unity was beyond his power. The device which he hit upon was operative only in hands as strong as his own. There were to be four great earls, deriving their name from the

Danish word jarl, centralizing the forces of government in Wessex, in Mercia, in East Anglia, and in Northumberland. With Cnut the four were officials of the highest class. They were there because he placed them there. They would cease to be there if he so willed it. But it could hardly be that it would always be so. Some day or another, unless a great catastrophe swept away Cnut and his creation, the earldoms would pass into territorial sovereignties and the divisions of England would be made evident openly."—S. R. Gardiner and J. B. Mullinger, *Introduction to the study of English history*, ch. 2, sect. 25.—"He [Canute] ruled nominally at least, a larger European dominion than any English sovereign has ever done; and perhaps also a more homogeneous one. No potentate of the time came near him except the king of Germany, the emperor, with whom he was allied as an equal. The king of the Norwegians, the Danes, and a great part of the Swedes, was in a position to found a Scandinavian empire with Britain annexed. Canute's division of his dominions on his death-bed, showed that he saw this to be impossible; Norway, for a century and a half after his strong hand was removed, was broken up amongst an anarchical crew of piratic and blood-thirsty princes, nor could Denmark be regarded as likely to continue united with England. The English nation was too much divided and demoralised to retain hold on Scandinavia, even if the condition of the latter had allowed it. Hence Canute determined that during his life, as after his death, the nations should be governed on their own principles. . . . The four nations of the English, Northumbrians, East Angles, Mercians and West Saxons, might, each under their own national leader, obey a sovereign who was strong enough to enforce peace amongst them. The great earldoms of Canute's reign were perhaps a nearer approach to a feudal division of England than anything which followed the Norman Conquest. . . . And the extent to which this creation of the four earldoms affected the history of the next half-century cannot be exaggerated. The certain tendency of such an arrangement to become hereditary, and the certain tendency of the hereditary occupation of great fiefs ultimately to overwhelm the royal power, are well exemplified. . . . The Norman Conquest restored national unity at a tremendous temporary sacrifice, just as the Danish Conquest in other ways, and by a reverse process, had helped to create it."—W. Stubbs, *Constitutional history of England*, ch. 7, sect. 77.—Canute died in 1035. He was succeeded by his two sons, Harold Harefoot (1035-1040) and Harthacnut or Hardicanute (1040-1042), after which the Saxon line of kings was momentarily restored.—E. A. Freeman, *History of the Norman conquest of England*, ch. 6.—See also BARBARIAN INVASIONS: 5th-10th centuries.

1035.—Accession of Harold, son of Cnut.

1040.—Accession of Harthacnut, or Hardicanute.

1042.—Accession of Edward the Confessor.

1042-1066.—Last of the Saxon kings.—"The love which Canute had inspired by his wise and conciliatory rule was dissipated by the bad government of his sons, Harold and Harthacnut, who ruled in turn. After seven years of misgovernment, or rather anarchy, England, freed from the hated rule of Harthacnut by his death, returned to its old line of kings, and 'all folk chose Edward [surnamed The Confessor, son of Ethelred the Unready] to king,' as was his right by birth. . . . Brought up under Norman influence, Edward had contracted the ideas and sympathies of his adopted

home. On his election to the English throne the French tongue became the language of the court, Norman favourites followed in his train, to be foisted into important offices of State and Church, and thus inaugurate that Normanizing policy which was to draw on the Norman Conquest. Had it not been for this, William would never have had any claim on England." The Normanizing policy of king Edward roused the opposition of a strong English party, headed by the great West-Saxon Earl Godwine, who had been lifted from an obscure origin to vast power in England by the favor of Canute, and whose son Harold held the earldom of East Anglia. "Edward, raised to the throne chiefly through the influence of Godwine, shortly married his daughter, and at first ruled England leaning on the assistance, and almost overshadowed by the power, of the great earl." But Edward was Norman at heart and Godwine was thoroughly English; whence quarrels were not long in arising. They came to the crisis in 1051, by reason of a bloody tumult at Dover, provoked by insolent conduct on the part of a train of French visitors returning home from Edward's Court. Godwine was commanded to punish the townsmen of Dover and refused, whereupon the king obtained a sentence of outlawry, not only against the earl, but against his sons. "Godwine, obliged to bow before the united power of his enemies, was forced to fly the land. He went to Flanders with his son Sweegen, while Harold and Leofwine went to Ireland, to be well received by Dermot king of Leinster. Many Englishmen seem to have followed him in his exile: for a year the foreign party was triumphant, and the first stage of the Norman Conquest complete. It was at this important crisis that William [Duke of Normandy], secure at home, visited his cousin Edward. . . . Friendly relations we may be sure had existed between the two cousins, and if, as is not improbable, William had begun to hope that he might some day succeed to the English throne, what more favourable opportunity for a visit could have been found? Edward had lost all hopes of ever having any children. . . . William came, and it would seem, gained all that he desired. For this most probably was the date of some promise on Edward's part that William should succeed him on his death. The whole question is beset with difficulties. The Norman chroniclers alone mention it, and give no dates. Edward had no right to will away his crown, the disposition of which lay with King and Witenagemot (or assembly of Wise Men, the grandees of the country), and his last act was to reverse the promise, if ever given, in favour of Harold, Godwine's son. But were it not for some such promise, it is hard to see how William could have subsequently made the Normans and the world believe in the sacredness of his claim. . . . William returned to Normandy; but next year Edward was forced to change his policy." Godwine and his sons returned to England, with a fleet at their backs; London declared for them, and the king submitted himself to a reconciliation. "The party of Godwine once more ruled supreme, and no mention was made of the gift of the crown to William. Godwine, indeed, did not long survive his restoration, but dying the year after, 1053, left his son Harold Earl of the West-Saxons and the most important man in England." King Edward the Confessor lived yet thirteen years after this time, during which period Earl Harold grew continually in influence and conspicuous headship of the English party. In 1062 it was Harold's misfortune to be shipwrecked on the coast of

France, and he was made captive. Duke William of Normandy intervened in his behalf and obtained his release; and "then, as the price of his assistance, extorted an oath from Harold, soon to be used against him. Harold, it is said, became his man, promised to marry William's daughter Adela, to place Dover at once in William's hands, and support his claim to the English throne on Edward's death. By a stratagem of William's the oath was unwittingly taken on holy relics, hidden by the duke under the table on which Harold laid hands to swear, whereby, according to the notions of those days, the oath was rendered more binding." But two years later, when Edward the Confessor died, the English Witenagemot chose Harold to be king, disregarding Edward's promise and Harold's oath to the Duke of Normandy.—A. H. Johnson, *Normans in Europe*, ch. 10 and 12.—See also ENGLISH LITERATURE: 11th-14th centuries.

EDWARD THE CONFESSOR

*man conquest of England*, ch. 7-10.—J. R. Green, *Conquest of England*, ch. 10.

1066.—Election and coronation of Harold.

1066 (Spring and Summer).—Preparations of Duke William to enforce his claim to the English crown.—On receiving news of Edward's death and of Harold's acceptance of the crown, Duke William of Normandy lost no time in demanding from Harold the performance of the engagements to which he had pledged himself by his oath. Harold answered that the oath had no binding effect, by reason of the compulsion under which it was given; that the crown of England was not his to bestow, and that, being the chosen king, he could not marry without consent of the Witenagemot. When the Duke had this reply he proceeded with vigor to secure from his own knights and barons the support he would need for the enforcing of his rights, as he deemed them, to the sovereignty of the English realm. A great parliament of the Norman barons was held at Lillebonne, for the consideration of the matter. . . . William did not confine himself to his own subjects. All the adventurers and adventurous spirits

of the neighbouring states were invited to join his standard. . . . To all, such promises were made as should best incite them to the enterprise—lands,—liveries,—money,—according to their rank and degree; and the port of St. Pierre-sur-Dive was appointed as the place where all the forces should assemble. William had discovered four most valid reasons for the prosecution of his offensive warfare against a neighbouring people:—the bequest made by his cousin;—the perjury of Harold;—the expulsion of the Normans, at the instigation, as he alleged, of Godwin;—and, lastly, the massacre of the Danes by Ethelred on St. Brice's Day. The alleged perjury of Harold enabled William to obtain the sanction of the Papal See. Alexander, the Roman Pontiff, allowed, nay, even urged him to punish the crime, provided England, when conquered, should be held as the fief of St. Peter.—F. Palgrave, *History of Normandy and England*, v. 3, pp. 300-303.—“William convinced, or seemed to convince, all men out of England and Scandinavia that his claim to the English crown was just and holy, and that it was a good work to help him to assert it in arms. . . . William himself doubtless thought his own claim the better; he deluded himself as he deluded others. But we are more concerned with William as a statesman; and if it be statesmanship to adapt means to ends, whatever the ends may be, if it be statesmanship to make men believe the worse cause is the better, then no man ever showed higher statesmanship than William showed in his great pleading before all Western Christendom. . . . Others had claimed crowns; none had taken such pains to convince all mankind that the claim was a good one. . . . Such an appeal to public opinion marks on one side a great advance.”—E. A. Freeman, *William the Conqueror*, ch. 6.

1066.—Norman invasion.—Defeat at Stamford Bridge (September).—Battle of Hastings (October).—“All through the summer Harold was watching for his rival's coming. . . . Harold had his house-earls, the constant guard of picked troops which had been instituted by Cnut, and his thegns, who, like the Norman barons, were bound to serve their lord in war. The greater part of his force, however, was composed of the peasants of the fyrd [national militia], and when September came they must needs be sent home to attend to their harvest, which seems to have been late this year. Scarcely were they gone when Harold received news that his brother Tostig, angry with him for having consented to his deposition from the Northumbrian earldom, had allied himself to Harold Hardrada, the fierce sea-rover, who was king of Norway, and that the two, with a mighty host, after wasting the Yorkshire coast, had sailed up the Humber. The two Northern Earls, Eadwine and Morkere, were hard pressed. Harold had not long before married their sister, and, whatever might be the risk, he was bound as the king of all England to aid them. Marching swiftly northwards with his house-earls, and the thegns who joined him on the way, he hastened to their succour. On the way worse tidings reached him. The Earls had been defeated and York had agreed to submit to the Norsemen. Harold hurried on the faster, and came upon the invaders unawares as they lay heedlessly on both sides of the Derwent at Stamford Bridge [in Yorkshire]. Those on the western side, unprepared as they were, were soon overpowered. One brave Norseman, like Horatius and his comrades in the Roman legend, kept the narrow bridge against the army, till an Englishman crept under it and stabbed him from below through a gap in the woodwork. The battle

rolled across the Derwent, and when evening came Harold Hardrada, and Tostig himself, with the bulk of the invaders, had been slain. For the last time an English king overthrew a foreign host in battle on English soil. As Harold was feasting at York in celebration of his victory, a messenger told him of the landing of the Norman host at Pevensey. . . . He had to hurry back to defend Sussex without a single man from the north or the Midlands, except those whom he collected on his line of march. . . . England was a kingdom divided against itself. Harold, as soon as he reached the point of danger, drew up his army on the long hill of Senlac on which Battle Abbey now stands. On October 14 William marched forth to attack him. . . . The English were brave enough, but William was a more intelligent leader than Harold, and his men were better under control. Twice after the battle had begun the Norman horsemen charged up the hill only to be driven back. . . . Slowly and steadily the Normans pressed on, till they reached the spot where Harold, surrounded by his house-earls, fought beneath his standard. There all their attacks were in vain, till William, calling for his bowmen, bade them shoot their arrows into the air. Down came the arrows in showers upon the heads of the English warriors, and one of them pierced Harold's eye, stretching him lifeless on the ground.”—S. R. Gardiner, *Student's history of England*, v. 1, pp. 93-98.

1066-1071.—Completion of the Norman Conquest.—Consolidation of Norman rule.—“It must be well understood that this great victory [of Hastings, or Senlac] did not make Duke William King nor put him in possession of the whole land. He still held only part of Sussex, and the people of the rest of the kingdom showed as yet no mind to submit to him. . . . William did not call himself King till he was regularly crowned more than two months later, and even then he had real possession only of about a third of the kingdom. It was more than three years before he had full possession of all. Still the great fight on Senlac none the less settled the fate of England. For after that fight William never met with any general resistance. . . . During the year 1067 William made no further conquests; all western and northern England remained unsubdued; but, except in Kent and Herefordshire, there was no fighting in any part of the land which had really submitted. The next two years were the time in which all England was really conquered. The former part of 1068 gave him the West. The latter part of that year gave him central and northern England as far as Yorkshire, the extreme north and northwest being still unsubdued. The attempt to win Durham in the beginning of 1069 led to two revolts at York. Later in the year all the north and west was again in arms, and the Danish fleet [of King Swegen, in league with the English patriots] came. But the revolts were put down one by one, and the great winter campaign of 1069-1070 conquered the still unsubdued parts, ending with the taking of Chester. Early in 1070 the whole land was for the first time in William's possession; there was no more fighting, and he was able to give his mind to the more peaceful part of his schemes, what we may call the conquest of the native Church by the appointment of foreign bishops. But in the summer of 1070 be-

gan the revolt of the Fenland, and the defence of Ely, which lasted till the autumn of 1071. After that William was full King everywhere without dispute. There was no more national resistance; there was no revolt of any large part of the country. . . . The conquest of the land, as far as fighting goes, was now finished."—E. A. Freeman, *Short history of the Norman conquest of England*, ch. 8, sect. 9; ch. 10, sect. 16.—"William had the instinct of government. . . . The Duke 'could never love a robber,' be he baron or knave. The sternness of his temper stamped itself throughout upon his rule. 'Stark he was to men that withstood him,' says the Chronicler of his English system of government; 'so harsh and cruel was he that none dared withstand his will. . . . If a man would live and hold his lands, need it were he followed the King's will.' Stern as such a rule was, its sternness gave rest to the land. Even amidst the sufferings which necessarily sprang from the circumstances of the Conquest itself . . . Englishmen were unable to forget 'the good peace he made in the land, so that a man might fare over his realm with a bosom full of gold.' . . . One of the strongest traits in his character was an aversion to shed blood by process of law; he formally abolished the punishment of death, and only a single execution stains the annals of his reign. An edict yet more honourable to his humanity put an end to the slave-trade which had till then been carried on at the port of Bristol. . . . But the greatness of the Conqueror was seen in more than the order and peace which he imposed upon the land. Fortune had given him one of the greatest opportunities ever offered to a king of stamping his own genius on the destinies of a people; and it is the way in which he seized on this opportunity which has set William among the foremost statesmen of the world. The struggle which ended in the fens of Ely had wholly changed his position. He no longer held the land merely as its national and elected King. To his elective right he added the right of conquest. It is the way in which William grasped and employed this double power that marks the originality of his political genius, for the system of government which he devised was in fact the result of this double origin of his rule. It represented neither the purely feudal system of the Continent nor the system of the older English royalty: more truly perhaps it may be said to have represented both. . . . The meanest Norman rose to wealth and power in this new dominion of his lord. Great or small, each manor thus granted was granted on condition of its holder's service at the King's call; a whole army was by this means encamped upon the soil; and William's summons could at any hour gather an overwhelming force around his standard. Such a force however, effective as it was against the conquered English, was hardly less formidable to the Crown itself. When once it was established, William found himself fronted in his new realm by a feudal baronage. . . . The political genius of the Conqueror was shown in his appreciation of this danger and in the skill with which he met it. Large as the estates he granted were, they were scattered over the country in such a way as to render union between the great landowners or the hereditary attachment of great areas of population to any one separate lord equally impossible. A yet wiser measure struck at the very root of feudalism. When the larger holdings were divided by their owners into smaller subtenancies, the under-tenants were bound by the same conditions of service to their lord as he to the Crown. 'Hear, my lord,' swore the vassal,

. . . 'I become liege man of yours' for life and limb and earthly regard; and I will keep faith and loyalty to you for life and death, God help me!' Then the kiss of his lord invested him with land as a 'fief' to descend to him and his heirs for ever. In other countries such a vassal owed fealty to his lord against all foes, be they king or no. By the usage however which William enacted in England each sub-tenant, in addition to his oath of fealty to his lord, swore fealty directly to the Crown, and loyalty to the King was thus established as the supreme and universal duty of all Englishmen. But the Conqueror's skill was shown not so much in these inner checks upon feudalism as in the counterbalancing forces which he provided without it. He was not only the head of the great garrison that held England down, he was legal and elected King of the English people. If as Conqueror he covered the country with a new military organization, as the successor of Eadward he maintained the judicial and administrative organization of the old English realm. At the danger of a severance of the land between the greater nobles he struck a final blow by the abolition of the four great earldoms. The shire became the largest unit of local government, and in each shire the royal nomination of sheriffs for its administration concentrated the whole executive power in the King's hands. The old legal constitution of the country gave him the whole judicial power, and William was jealous to retain and heighten this. While he preserved the local courts of the hundred and the shire he strengthened the jurisdiction of the King's Court, which seems even in the Confessor's day to have become more and more a court of highest appeal with a right to call up all cases from any lower jurisdiction to its bar. The control over the national revenue which had rested even in the most troubled times in the hands of the King was turned into a great financial power by the Conqueror's system. Over the whole face of the land a large part of the manors were burthened with special dues to the Crown; and it was for the purpose of ascertaining and recording these that William sent into each country the commissioners whose enquiries are recorded in his Domesday Book."—J. R. Green, *History of the English people*, v. 1, pp. 126-131.—See also BAYEUX TAPESTRY; ENGLISH LITERATURE: 11th-14th centuries; ARCHITECTURE: Medieval; French and Norman.

1085-1086.—Domesday Book.—Salisbury Oath.—Results of Norman conquest.—"If William gave his people good laws, he was determined they should pay for them; one of the most frequently reiterated complaints of the reign is that of heavy taxation. An important item of revenue was the Danegeld of two shillings a hide [about thirty acres of land], which was revived in 1084. In order to estimate the resources of the country for purposes of taxation we find him having 'much thought and deep speech' with his Witan at Gloucester in 1085, over the state of the country and its population. In consequence, he determined on a great survey or official inquiry, the results of which were embodied in a report known as the Domesday Book. Many guesses have been made as to the meaning of the name, the most generally accepted being that it arose from the belief that, like the great Day of Judgment, the survey would spare none. The Chronicle records in 1085 that the King: 'Sent his men over all England, into every shire, and caused them to ascertain how many hundred hides of land it contained, and what lands the King possessed therein, what cattle there were in the several counties, and how much

revenue he ought to receive from each. He also caused them to write down how much land belonged to his archbishops, to his bishops, his abbots, and his earls, and, that I may be brief, what property every inhabitant of all England possessed in land or in cattle, and how much money this was worth. So very narrowly did he cause the survey to be made, that there was not a single hide nor a rood of land, nor—it is shameful to relate that which he thought no shame to do—was there an ox, or a cow, or a pig passed by.' The methods employed by the royal commissioners were to visit not only the shires, but every hundred in the shire and to take testimony on oath from those best qualified to give it, the landowners, the priests, the bailiffs and six villeins from each township or manor. The four counties of Lancashire, Cumberland, Westmoreland, and Northumberland were not included. Besides getting the information he sought, the Conqueror has left to posterity, in the Domesday Book, 'a great rate book or tax roll, a land register, a military register, a census of population, and topographical dictionary.' But it must be said that, suggestive as it is for the economic and political conditions of the time, it raises fully as many questions as it answers. [See also CENSUS: Medieval; SERFDOM: 11th-17th centuries.] The importance of the great gemot [meeting, assembly] which William held on Salisbury Plain in the following year [1086] has doubtless been much exaggerated. We are told that 'there came to him his Witan and all the landsittende (land owning), men of substance that were all over England, whosoever men they were and all bowed down to him, and became his men, and swore oaths of fealty to him that they would be faithful to him against all men.' This has often been cited as one of the sources of strength of the Norman kings: that in this assembly the landowners were all bound by a direct oath to William. But no innovation was introduced, for, doubtless, such oaths had been exacted all through the reign; moreover, it is quite unlikely that all the landowners in England could be brought together at this single assembly. The Norman Conquest was deep and far-reaching in its results. In the first place, it brought in a new line of foreign kings who were, for three successive reigns, men of vigor and energy, and who were supported by an armed force bound to them by close and special ties. Thus fortified, they not only crushed out the local differences which had marked the earlier period; but, preserving whatever was best in the old system, they paved the way for the combination of central unity and local independence which survives to-day as the most characteristic feature of the English government. Although their aim was primarily to strengthen their own position, the peace and order which they preserved made for progress. Moreover, the infusion of a new racial element, combining the vigor of the primitive Northmen and the alertness of the latinized Frenchmen, tended to vivify and broaden the sluggish and narrow national character. Finally, by bringing remote England into closer connection with the Continent it opened the way for the intellectual and cultivating influences of the centers of older and higher civilization."—A. L. Cross, *History of England and Great Britain*, pp. 81, 82, 84.

1087-1135.—Sons of the Conqueror and their reigns.—William the Conqueror, when he died, left his Normandy and Maine [of French provinces] to his elder son Robert, the English crown to his stronger son, William, called Rufus, or the Red, and only a legacy of £5,000 to his third son, Henry, called Beauclerc, or the Scholar. The Conqueror's half-brother, Odo, soon began to persuade the Norman barons in England to displace William Rufus and plant Robert on the English throne. "The claim of Robert to succeed his father in England, was supported by the respected rights of primogeniture. But the Anglo-Saxon crown had always been elective. . . . Primogeniture . . . gave at that time no right to the crown of England, independent of the election of its parliamentary assembly. Having secured this title, the power of Rufus rested on the foundation most congenial with the feelings and institutions of the nation, and from their partiality received a popular support, which was soon experienced to be impregnable. The danger compelled the king to court his people by promises to diminish their grievances; which drew 30,000 knights spontaneously to his banners, happy to have got a sovereign distinct from hated Normandy. The invasion of Robert, thus resisted by the English people, effected nothing but some temporary devastations. . . . The state of Normandy, under Robert's administration, for some time furnished an ample field for his ambitious uncle's activity. It continued to exhibit a negligent government in its most vicious form. . . . Odo's politics only facilitated the reannexation of Normandy to England. But this event was not completed in William's reign. When he retorted to the attempt of Robert, by an invasion of Normandy, the great barons of both countries found themselves endangered by the conflict, and combined their interest to persuade their respective sovereigns to a fraternal pacification. The most important article of their reconciliation provided, that if either should die without issue, the survivor should inherit his dominions. Hostilities were then abandoned; mutual courtesies ensued; and Robert visited England as his brother's guest. The mind of William the Red King, was cast in no common mould. It had all the greatness and the defects of the chivalric character, in its strong but rude state. Impetuous, daring, original, magnanimous, and munificent; it was also harsh, tyrannical, and selfish; conceited of its own powers, loose in its moral principles, and disdainful consequences. . . . While Lanfranc [archbishop of Canterbury] lived, William had a counsellor whom he respected, and whose good opinion he was careful to preserve. . . . The death of Lanfranc removed the only man whose wisdom and influence could have meliorated the king's ardent, but undisciplined temper. It was his misfortune, on this event, to choose for his favourite minister, an able, but an unprincipled man. . . . The minister advised the king, on the death of every prelate, to seize all his temporal possessions. . . . The great revenues obtained from this violent innovation, tempted both the king and his minister to increase its productiveness, by deferring the nomination of every new prelate for an indefinite period. Thus he kept many bishoprics, and among them the see of Canterbury, vacant for some years; till a severe illness alarming his conscience, he suddenly appointed Anselm to the dignity. . . . His disagreement with Anselm soon began. The prelate injudiciously began the battle by asking the king to restore, not only the possessions of his see, which were enjoyed by Lanfranc—a fair request—but

HAROLD'S LAST STAND AGAINST WILLIAM THE CONQUEROR AT THE BATTLE OF HASTINGS

(From a painting by R. Caton Woodville)

also the lands which had before that time belonged to it; a demand that, after so many years' alteration of property, could not be complied with without great disturbance of other persons. . . . Anselm, seeing the churches and abbeys oppressed in their property, by the royal orders, resolved to visit Rome, and to concert with the pope the measures most adapted to overawe the king. . . . William threatened, that if he did go to Rome, he would seize all the possessions of the archbishopric. . . . The king immediately executed his threat, and sequestered all his lands and property. This was about three years before the end of the reign. . . . Anselm continued in Italy till William's death. The possession of Normandy was a leading object of William's ambition, and he gradually attained a preponderance in it. His first invasion compelled Robert to make some cessions; these were increased on his next attack; and when Robert determined to join the Crusaders, he mortgaged the whole of Normandy to William for three years, for 10,000 marks. He obtained the usual success of a powerful invasion in Wales. . . . The government of William appears to have been beneficial, both to England and Normandy. To the church it was oppressive. . . . He had scarcely reigned twelve years, when he fell by a violent death. [He was hunting with a few attendants in the New Forest.]

"It happened that, his friends dispersing in pursuit of game, he was left alone, as some authorities intimate, with Walter Tyrrel, a noble knight, who discharged an arrow [at a stag]. . . . At this precise juncture, a shaft struck the king, and buried itself in his breast. . . . He expired on the spot. It seems to be a questionable point, whether Walter Tyrrel actually shot the king. That opinion was certainly the most prevalent at the time, both here and in France. . . . None of the authorities intimate a belief of a purposed assassination; and, therefore, it would be unjust now to impute it to any one. . . . Henry [his younger brother] was hunting in a different part of the New Forest when [William] Rufus fell. . . . He left the body to the casual charity of the passing rustic, and rode precipitately to Winchester, to seize the royal treasure. . . . He obtained the treasure, and proceeding hastily to London, was on the following Sunday, the third day after William's death, elected king, and crowned. . . . He began his reign by removing the unpopular agents of his unfortunate brother. He recalled Anselm, and conciliated the clergy. He gratified the nation, by abolishing the oppressive exactions of the previous reign. He assured many benefits to the barons, and by a charter, signed on the day of his coronation, restored to the people their Anglo-Saxon laws and privileges, as amended by his father; a measure which ended the pecuniary oppressions of his brother, and which favoured the growing liberties of the nation. The Conqueror had noticed Henry's expanding intellect very early; had given him the best education which the age could supply. . . . He became the most learned monarch of his day, and acquired and deserved the surname of Beauclerc, or fine scholar. No wars, no cares of state, could afterwards deprive him of his love of literature. The nation soon felt the impulse and the benefit of their sovereign's intellectual taste. He acceded at the age of 32, and gratified the nation by marrying and crowning Mathilda, daughter of the sister of Edgar Etheling by Malcolm the king of Scotland, who had been waylaid and killed."—S. Turner, *History of England during the Middle Ages*, v. 1, ch. 5-6.—The Norman lords, hating the "English ways" of Henry, were

soon in rebellion, undertaking to put Robert of Normandy (who had returned from the Crusade) in his place. The quarrel went on till the battle of Tinchebray, 1106, in which Robert was defeated and taken prisoner. He was imprisoned for life. The duchy and the kingdom were again united. The war in Normandy led to a war with Louis, king of France, who had espoused Robert's cause. It was ended by the battle of Brémule, 1110, where the French suffered a bad defeat. In Henry's reign all south Wales was conquered; but the north Welsh princes held out. Another expedition against them was preparing, when, in 1135, Henry fell ill at the Castle of Lions in Normandy, and died.—E. A. Freeman, *Reign of William Rufus and accession of Henry I.*

1100-1135.—Reign of Henry I.—Rule of law.—Question of the succession of Matilda.—"The great merit of his English government was that he forsook his brother's evil ways of violence, and maintained peace by erecting a regular administrative system, which kept down the outrages of the barons."—S. R. Gardiner, *Student's history of England*, v. 1, p. 131.—Henry kept on good terms with the church by compromising with the pope and Anselm (archbishop of Canterbury) on the investiture question. The church conferred the ring and staff, while the king received homage for his land. Thus the king really retained control since he could block an appointment by holding back the land. He developed an orderly judicial and financial administrative machinery on whose foundations the greatest of his successors built. He appointed Roger (created Bishop of Salisbury) Chancellor, and later Justiciar. "The law-book, which bears . . . [the name of Henry I] and was in fact compiled by a clerk of his Curia Regis, seems to reflect the spirit of his government in the large concessions which it makes to feudalism. To judge from this book we should say that the Curia was inclined to tolerate all feudal rights, however indirectly dangerous to the prerogative, unless they had been expressly abolished by the royal authority. The author states, for example, that archbishops, bishops, earls and other officials have *la haute justice* over the lands pertaining to their dignity; and although the generalisation is too sweeping we know from Henry's charters to the sees of Bath and York that he did not hesitate to confer the widest powers of jurisdiction on some favoured vassals. . . . The King was satisfied with such restrictions as would make rebellion hopeless. He forbade the custom of private war; no castle might be built, no dwelling fortified, without his licence and he insisted that every under-tenant should regard the King as his chief lord. . . . The rule of law is the key-note to the inner history of the reign. Henry's Curia Regis was a different tribunal from that of Rufus, of which Eadmer said, with as much justice as severity, that all its judgments depended on the King's pleasure. In his law-courts, as in all other departments of the administration, Henry relied on men whom he had selected from the ranks of the inferior baronage. . . . But the King asked of

his judges no more than strict adherence to law and precedent. It was their boast that in their keeping the law remained unalterable *semper et ubique*; and the boast was true so far as it signified that the law was declared without respect of persons. The law of the King's court was a strange medley of scraps from the code of Saxon Kings, of feudal custom borrowed from the practice of the Norman courts, of maxims from the civil law and the decretals. But it gained steadily in bulk and consistency through the accumulation of new precedents. The judgments of the court were carefully enrolled, and from the law as laid down in that record there was no appeal. . . . There was no class too humble to be protected by the Curia Regis. The *Leges Henrici* deny, for instance, that the lord may do what he pleases with his vassal. 'If a lord slay his vassal blameless let him pay the were to the kindred; for the man was a serf to serve and not to be slain.' Wergilds, compurgation, the ordeal, and many such relics of archaic procedure were perforce tolerated by the Curia Regis. But the inclination of the judges was towards more enlightened forms of proof and more drastic penalties. . . . In 1120 an unforeseen catastrophe wrecked the king's plan, and left the future of his dominions in uncertainty. On November 25th . . . [his son William, called the Atheling, was] wrecked and drowned through the folly of a drunken pilot, [and] Henry . . . was left without a son to succeed him. His only daughter, Matilda, had been married to the Emperor Henry V. in the year 1114, and it was out of the question that her husband should be allowed to inherit England in her right. . . . But the death of the Emperor Henry V. (May 23, 1125) made it possible to designate Matilda as her father's successor. The Great Council of England did homage to her on Christmas Day, 1126, in the presence of Henry and her uncle David of Scotland. The latter took the oath in the character of an English earl; and the next to swear was Stephen, Count of Mortain and Boulogne, the Conqueror's grandson [son of his daughter Adele], himself a possible claimant to the Anglo-Norman heritage. There were many, no doubt, who preferred Stephen to Matilda; for no woman had yet ruled in Normandy or England. But the Council were overawed and accepted Henry's scheme without discussion. . . . [In 1120 Henry married his daughter to Geoffrey, son of the Count of Anjou] and in 1133 the birth of [her son] the future Henry II. appeared to place the succession beyond all dispute. . . . On the death of Henry I. there was hardly a man in his dominions who desired the accession of the Empress. Her sex, the arrogance of her temper, above all her Angevin marriage, were objections which in most minds overrode all scruples as to oaths and pledges. Henry, her eldest son, might have been more favourably regarded if his youth had not made it certain that the regency would remain for many years to come in the hands of his mother. But Henry's hereditary claim was hardly stronger than that of Theobald of Blois and Stephen of Boulogne, the grandsons of the Conqueror in the female line; the minds of Englishmen and Normans instinctively turned towards these brothers. . . . [Theobald, however, released his pretensions in favor of his brother], negotiated a six months' truce with the Count of Anjou, and offered his influence at Rome to procure the recognition of Stephen's title from the Pope. This recognition was speedily obtained, in spite of energetic protests from the envoys of the Empress."—H. W. C. Davis, *England under the Normans and Angevins*,

1066-1272 (*History of England*, v. 2, pp. 134, 137, 149, 151, 152, 154, 155).

1135-1154.—Miserable reign of Stephen.—Civil war, anarchy and wretchedness in England.—Transition to hereditary monarchy.—As soon as Henry's death was known, Stephen secured the royal treasure and persuaded a council of peers to elect him king. A most grievous civil war ensued, which lasted for nineteen terrible years, during which long period there was anarchy and great wretchedness in England. "Fortune favoured the Angevin cause. The energy and valour of Stephen availed him little; he had neither the foresight nor the decision of character which might have turned these qualities to good account. Nervously alive to the difficulties of his position he stood on the defensive, and even for purposes of defence rarely ventured far afield; when the princes of South Wales, according to their usual practice, inaugurated the new reign with fire and sword, he scarcely attempted to assist his English subjects and allowed the marches of the Wye to relapse into a state of anarchy. Yet with all his caution he rarely detected a conspiracy until it culminated in rebellion. The treacherous matured their preparations undisturbed, and chose their own time to defy him. When it came to open war he carried himself in knightly fashion. But his knightliness was that of the reckless jousting. He attacked the nearest enemy as though it were a point of honour to answer the first challenge; he never paused to reflect in what quarter he should strike to inflict a paralyzing blow."—H. W. C. Davis, *England under the Normans and Angevins*, 1066-1272 (*History of England*, v. 2, p. 157).—"The land was filled with castles, and the castles with armed banditti, who seem to have carried on their extortions under colour of the military commands bestowed by Stephen on every petty castellan. Often the very bellies of churches were fortified. On the poor lay the burden of building these strongholds; the rich suffered in their donjons. Many were starved to death, and these were the happiest. Others were flung into cellars filled with reptiles, or hung up by the thumbs till they told where their treasures were concealed, or crippled in frames which did not suffer them to move, or held just resting on the ground by sharp iron collars round the neck. The Earl of Essex used to send out spies who begged from door to door, and then reported in what houses wealth was still left; the alms-givers were presently seized and imprisoned. The towns that could no longer pay the blackmail demanded from them were burned. . . . Sometimes the peasants, maddened by misery, crowded to the roads that led from a field of battle, and smote down the fugitives without any distinction of sides. The bishops cursed vainly, when the very churches were burned and monks robbed. 'To till the ground was to plough the sea; the earth bare no corn, for the land was all laid waste by such deeds, and men said openly that Christ slept, and his saints. Such things, and more than we can say, suffered we nineteen winters for our sins' (A. S. Chronicle). . . . Many soldiers, sickened with the unnatural war, put on the white cross and sailed for a nobler battle-field in the East." As Matilda's son Henry—afterwards Henry II—grew to manhood, the feeling in his favor gained strength and his party made head against the weak and incompetent Stephen. Finally in 1153 (after the death of Stephen's son Eustace) peace was brought about under an agreement "that Stephen should wear the crown till his death, and Henry receive the homage of the lords and towns of the realm

as heir apparent [Treaty of Wallingford]." Stephen died the next year and Henry came to the throne with little further dispute.—C. H. Pearson, *History of England during the Early and Middle Ages*, ch. 28.—"Stephen, as a king, was an admitted failure. . . . His weakness throughout his reign . . . was due to two causes, each supplementing the other. These were—(1) the essentially unsatisfactory character of his position, as resting, virtually, on a compact that he should be king so long only as he gave satisfaction to those who had placed him on the throne; (2) the existence of a rival claim, hanging over him from the first, like the sword of Damocles, and affording a lever by which the malcontents could compel him to adhere to the original understanding, or even to submit to further demands. . . . Passing . . . the existence of a rival claim, we approach a subject of great interest, the theory of the succession to the English Crown at what may be termed the crisis of transition from the principle of election (within the royal house) to that of hereditary right according to feudal rules. For the right view on this subject, we turn, as ever, to Dr. Stubbs, who, with his usual sound judgment, writes thus of the Norman period:—"The crown then continued to be elective. . . . But whilst the elective principle was maintained in its fulness where it was necessary or possible to maintain it, it is quite certain that the right of inheritance, and inheritance as primogeniture, was recognized as co-ordinate. . . . The measures taken by Henry I. for securing the crown to his own children, whilst they prove the acceptance of the hereditary principle, prove also the importance of strengthening it by the recognition of the elective theory." Mr. Freeman, though writing with a strong bias in favour of the elective theory, is fully justified in his main argument, namely, that Stephen 'was no usurper in the sense in which the word is vulgarly used.' He urges, apparently with perfect truth, that Stephen's offence, in the eyes of his contemporaries, lay in his breaking his solemn oath, and not in his supplanting a rightful heir. And he aptly suggests that the wretchedness of his reign may have hastened the growth of that new belief in the divine right of the heir to the throne, which first appears under Henry II., and in the pages of William of Newburgh. . . . Broadly speaking, to sum up the evidence here collected, it tends to the belief that the obsolescence of the right of election to the English crown presents considerable analogy to that of canonical election in the case of English bishoprics. In both cases a free election degenerated into a mere assent to a choice already made. We see the process of change already in full operation when Henry I. endeavours to extort beforehand from the magnates their assent to his daughter's succession, and when they subsequently complain of this attempt to dictate to them on the subject. We catch sight of it again when his daughter bases her claim to the crown, not on any free election, but on her rights as her father's heir, confirmed by the above assent. We see it, lastly, when Stephen, though owing his crown to election, claims to rule by Divine right ('*Dei gratia*'), and attempts to reduce that election to nothing more than a national 'assent' to his succession. Obviously, the whole question turned on whether the election was to be held first, or was to be a mere ratification of a choice already made. . . . In comparing Stephen with his successor the difference between their circumstances has been insufficiently allowed for. At Stephen's accession, thirty years of legal and financial oppression had rendered unpopular the

power of the Crown, and had led to an impatience of official restraint which opened the path to a feudal reaction: at the accession of Henry, on the contrary, the evils of an enfeebled administration and of feudalism run mad had made all men eager for the advent of a strong king, and had prepared them to welcome the introduction of his centralizing administrative reforms. He anticipated the position of the house of Tudor at the close of the Wars of the Roses, and combined with it the advantages which Charles II. derived from the Puritan tyranny. Again, Stephen was hampered from the first by his weak position as a king on sufferance, whereas Henry came to his work unhampered by compact or concession. Lastly, Stephen was confronted throughout by a rival claimant, who formed a splendid rallying-point for all the discontent in his realm. But Henry reigned for as long as Stephen without a rival to trouble him; and when he found at length a rival in his own son, a claim far weaker than that which had threatened his predecessor seemed likely for a time to break his power as effectually as the followers of the Empress had broken that of Stephen. He may only, indeed, have owed his escape to that efficient administration which years of strength and safety had given him the time to construct. It in no way follows from these considerations that Henry was not superior to Stephen; but it does, surely, suggest itself that Stephen's disadvantages were great, and that had he enjoyed better fortune, we might have heard less of his defects."—J. H. Round, *Geoffrey de Mandeville*, ch. 1.

1138.—Battle of the Standard. See STANDARD, BATTLE OF THE.

1154-1189.—Henry II., first of the Angevin kings (Plantagenets), and his possessions.—Henry II., who came to the English throne on Stephen's death, was already, by the death of his father, Geoffrey, count of Anjou, the head of the great house of Anjou, in France. From his father he inherited Anjou, Touraine and Maine; through his mother, Matilda, daughter of Henry I, he received the dukedom of Normandy as well as the kingdom of England; by marriage with Eleanor, of Aquitaine, or Guienne, he added to his possessions the princely domain which included Gascony, Poitou, Saintonge, Perigord, Limousin, Angoumois, with claims of suzerainty over Auvergne and Toulouse. "Henry found himself at twenty-one ruler of dominions such as no king before him had ever dreamed of uniting. He was master of both sides of the English Channel, and by his alliance with his uncle, the Count of Flanders, he had command of the French coast from the Scheldt to the Pyrenees, while his claims on Toulouse would carry him to the shores of the Mediterranean. His subjects told with pride how 'his empire reached from the Arctic Ocean to the Pyrenees'; there was no monarch save the [Holy Roman] Emperor himself who ruled over such vast domains. . . . His aim [a few years later] seems to have been to rival in some sort the Empire of the West [Holy Roman empire], and to reign as an over-king, with sub-kings of his various provinces, and England as one of them, around him. He was connected with all the great ruling houses. . . . England was forced out of her old isolation; her interest in the world without was suddenly awakened. English scholars thronged the foreign universities; English chroniclers questioned travellers, scholars, ambassadors, as to what was passing abroad. The influence of English learn-

ing and English statecraft made itself felt all over Europe. Never, perhaps, in all the history of England was there a time when Englishmen played so great a part abroad." The king who gathered this wide, incongruous domain under his sceptre, by mere circumstances of birth and marriage, proved strangely equal, in many respects, to its greatness. "He was a foreign king who never spoke the English tongue, who lived and moved for the most part in a foreign camp, surrounded with a motley host of Brabançons and hirelings. . . . It was under the rule of a foreigner such as this, however, that the races of conquerors and conquered in England first learnt to feel that they were one. It was by his power that England, Scotland and Ireland were brought to some vague acknowledgement of a common suzerain lord, and the foundations laid of the United Kingdom of Great Britain and Ireland. [See AQUITAINE: 1137-1152; IRELAND: 1169-1200; SCOTLAND: 1174-1189;

HENRY II

ULSTER: 1171-1186; and DUBLIN: 12th-14th centuries.] It was he who abolished feudalism as a system of government, and left it little more than a system of land tenure. It was he who defined the relations established between Church and State, and decreed that in England churchman as well as baron was to be held under the Common Law. . . . It was by his genius for government that the servants of the royal household became transformed into Ministers of State. It was he who gave England a foreign policy which decided our continental relations for seven hundred years. The impress which the personality of Henry II. left upon his time meets us wherever we turn."—Mrs. J. R. Green, *Henry the Second*, ch. 1-2.—Henry II and his two sons, Richard I (Cœur de Lion), and John, are distinguished, sometimes, as the Angevin kings, or kings of the house of Anjou, and sometimes as the Plantagenets (this line of kings continued in unbroken succession for 245 years), the latter name being derived from a boyish habit ascribed to Henry's father, Count Geoffrey, of "adorning his cap with a sprig of 'plantagenista,' the broom which in early summer

makes the open country of Anjou and Maine a blaze of living gold." Richard retained and ruled the great realm of his father; but John lost most of his foreign inheritance, including Normandy, and became the unwilling benefactor of England by stripping her kings of alien interests and alien powers and bending their necks to Magna Charta.—K. Norgate, *England under the Angevin kings*.

ALSO IN: W. Stubbs, *Early Plantagenets*.

1162-1170.—Conflict of king and church.—Constitutions of Clarendon.—Murder of Archbishop Becket.—"Archbishop Theobald was at first the King's [Henry II] chief favourite and adviser, but his health and his influence declining, Becket [the archdeacon of Canterbury] was found apt for business as well as amusement, and gradually became intrusted with the exercise of all the powers of the crown. . . . Becket continued Chancellor till the year 1162, without any abatement in his favour with the King, or in the power which he possessed, or in the energy he displayed, or in the splendour of his career. . . . In April, 1161, Archbishop Theobald died. Henry declared that Becket should succeed,—no doubt counting upon his co-operation in carrying on the policy hitherto pursued in checking the encroachments of the clergy and of the see of Rome. . . . The universal expectation was, that Becket would now attempt the part so successfully played by Cardinal Wolsey in a succeeding age; that, Chancellor and Archbishop, he would continue the minister and personal friend of the King; that he would study to support and extend all the prerogatives of the Crown, which he himself was to exercise; and that in the palaces of which he was now master he would live with increased magnificence and luxury. . . . Never was there so wonderful a transformation. Whether from a predetermined purpose, or from a sudden change of inclination, he immediately became in every respect an altered man. Instead of the stately and fastidious courtier, was seen the humble and squalid penitent. Next his skin he wore hair-cloth, populous with vermin; he lived upon roots, and his drink was water, rendered nauseous by an infusion of fennel. By way of further penance and mortification, he frequently inflicted stripes on his naked back. . . . He sent the Great Seal to Henry, in Normandy, with this short message, 'I desire that you will provide yourself with another Chancellor, as I find myself hardly sufficient for the duties of one office, and much less of two.' The fond patron, who had been so eager for his elevation, was now grievously disappointed and alarmed. . . . He at once saw that he had been deceived in his choice. . . . The grand struggle which the Church was then making was, that all churchmen should be entirely exempted from the jurisdiction of the secular courts, whatever crime they might have committed. . . . Henry, thinking that he had a favourable opportunity for bringing the dispute to a crisis, summoned an assembly of all the prelates at Westminster, and himself put to them this plain question: 'Whether they were willing to submit to the ancient laws and customs of the kingdom?' Their reply, framed by Becket, was: 'We are willing, saving our own order.' . . . The King, seeing what was comprehended in the reservation, retired with evident marks of displeasure, deprived Becket of the government of Eye and Berkhamstead, and all the appointments which he held at the pleasure of the Crown, and uttered threats as to seizing the temporalities of all the bishops, since they would not acknowledge their allegiance to him as the head of the state. The legate of Pope Alexander, dreading a breach with so powerful a prince as so

unseasonable a juncture, advised Becket to submit for the moment; and he with his brethren, retracting the saving clause, absolutely promised 'to observe the laws and customs of the kingdom.' To avoid all future dispute, Henry resolved to follow up his victory by having these laws and customs, as far as the Church was concerned, reduced into a code, to be sanctioned by the legislature, and to be specifically acknowledged by all the bishops. This was the origin of the famous 'Constitutions of Clarendon.' [They not only provided that criminous clergy must be tried in the king's courts, but that many cases involving church property and large court fees must come before royal tribunals.] Becket [repudiated the Constitutions and] left the kingdom (1164). Several years later he made peace with Henry and returned to Canterbury; but soon he again displeased the King, who cried in a rage, 'Who will rid me of this turbulent priest?' Four knights who were present immediately went to Canterbury, where they slew the Archbishop in the cathedral (December 29, 1170). The government tried to justify or palliate the murder. The Archbishop of York likened Thomas à Becket to Pharaoh, who died by the Divine vengeance, as a punishment for his hardness of heart; and a proclamation was issued, forbidding any one to speak of Thomas of Canterbury as a martyr: but the feelings of men were too strong to be checked by authority; pieces of linen which had been dipped in his blood were preserved as relics; from the time of his death it was believed that miracles were worked at his tomb; thither flocked hundreds of thousands, in spite of the most violent threats of punishment; at the end of two years he was canonised at Rome; and, till the breaking out of the Reformation, St. Thomas of Canterbury, for pilgrimages and prayers, was the most distinguished Saint in England."—Lord Campbell, *Lives of the lord chancellors*, ch. 3.—"Public opinion held Henry accountable for the base deed for which he was only indirectly responsible, so that he was obliged to seek reconciliation with the Pope at the expense of humiliating concessions. . . . Henry crossed to Normandy, and at Avranches came to terms with the papal legates and received absolution. He swore that he had not instigated the murder of Becket, that he would support Alexander III, and, without mentioning the Constitutions of Clarendon, agreed to do away with any customs introduced against the Church in his time. As a matter of fact, his courts continued to claim control over most of the property cases in which the Church was involved, though clergymen accused of criminal offenses claimed exemption from the lay courts—'benefit of clergy' (q.v.) it was called—for centuries."—A. L. Cross, *Shorter history of England and Greater Britain*, pp. 74-75.—The Assize of Clarendon, sometimes confused with the Constitutions of Clarendon, was an important decree approved two years later. It laid down the principles on which the administration of justice was to be carried out, in twenty-two articles drawn up for the use of the judges.—Mrs. J. R. Green, *Henry the Second*, ch. 5-6.—"It may not be without instruction to remember that the Constitutions of Clarendon, which Becket spent his life in opposing, and of which his death procured the suspension, are now incorporated in the English law, and are regarded, without a dissentient voice, as among the wisest and most necessary of English institutions."—A. P. Stanley, *Historical memorials of Canterbury*, p. 124.—See also BENEFIT OF THE CLERGY; CONSTITUTIONS OF CLARENDON; JURY, TRIAL BY.

1169-1200.—Conquest of Ireland. See IRELAND: 1169-1200; ULSTER: 1171-1186; DUBLIN: 12th-14th centuries.

1170-1189.—Constitutional and legal reforms.—Origin of the jury.—"It is a relief to turn to a survey of those aspects of Henry's work which have given him deservedly a place among England's greater Kings. In the field of domestic legislation and preëminently in legal reform he marked an epoch in progress. . . . Henry II did not originate this work, but he contributed so much toward the process of development that his reign was truly 'a critical period in the history of English law.' The legal and constitutional edifice begun by William I and Henry I was demolished during the anarchy of Stephen's reign, and Henry II had to rebuild practically from the foundation. . . . His foremost aim was political, to strengthen the royal powers at the expense of the Church and the barons. . . . As a result, before the close of his reign the King's courts and judges, instead of being exceptional resorts for great men and great causes, had come to exercise, as a matter of course, a vast and steadily increasing jurisdiction. When Henry and his judges began their work, law and procedure were as yet confused, conflicting, and disorganized. Anglo-Saxon law was still administered in the hundred and county courts; aside from private and inadequate compilations, the law was practically unwritten; the Anglo-Norman officials who administered it, even though they might be willing to respect local customs, understood them imperfectly at best. [See also COMMON LAW: 440-1066 to 1154-1189.] . . . In the thirteenth century the Roman civil law secured a permanent foothold in France; . . . it never obtained any considerable hold in England. It is due to the work of Henry II that it did not, for, while in other countries no single system existed able to dispute the superior claims of the intrusive guest, Henry II so simplified and unified divergent practices that by the time the Roman law was in a position to make itself felt in the Island, the common law was too widespread and too firmly founded to be supplanted by an alien rival. . . . He brought into general use juries for accusing criminals and for deciding disputed points at law—the parents of our modern grand and petty juries. . . . At first allowed for privileged subjects as an exceptional favor, Henry extended it to all. By the presentment jury, consisting usually of twelve men from each hundred, criminals were brought to account by men sworn to voice the common report of their vicinage. Inquisition or recognition juries, or assizes (the word 'assize' has many meanings: a royal enactment, a form of trial, an early form of jury, a judicial session), enabled men to determine their rights of possession against an intruder by forms of procedure juster and more summary than they had ever before dreamed of. . . . Aside from the introduction of the jury into general use there were many other instances of Henry's legal and administrative activity. He restored the Curia Regis (q.v.) and Exchequer (q.v.) founded by Henry I. In 1178, he selected from the former body two clerks and three laymen to hear certain important cases, thus creating the parent of the latter courts of King's Bench and Common Pleas. Then he marked England anew into circuits and sent out itinerant justices to represent him in the courts of the hundred and shire. [See also COURTS: Early Teutonic.] In 1181, by his famous Assize of Arms, he took steps to reorganize the military forces in a more serviceable way by providing that every free subject of the realm should arm himself

according to his property, and it is interesting to notice that, in determining each man's liability, he made use of the sworn testimony of neighbors."—A. L. Cross, *Shorter history of England and Greater Britain*, pp. 74-78.—See also COMMON LAW: 1154-1189, to 1164-1176; CRIMINAL LAW: 1066-1272.

1189-1199.—Reign of Richard I (called Cœur de Lion).—Crusades and campaigns in France.—Richard I acceded to the throne in 1189, but, except for a few months in 1189 and 1194, he was out of England during the entire ten years of his reign. "Henry II's son and successor, Richard I. (1189-1199), was, like all his family, an able man. He was a poet and a musician. But he had none of his father's statesmanship. He was, first and foremost, a superb fighting man, the strongest and most daring knight-errant of his age, and an excellent leader in war. His supreme delight was in battle; and this carried him away to Palestine, to do wonderful deeds of valour in the struggle with the Saracens for the Holy Sepulchre, which is known as the Third Crusade. To pay the expenses of this expedition, he used the vast power which he had inherited from his father to bleed England of money; and one important result of this was, that he sold to the King of Scotland the right of exemption from the feudal supremacy which Henry II. had imposed upon him. On his way home Richard was taken captive and held a prisoner by the Emperor Henry VI. of Germany, and in order to release their very expensive king the English had to be bled once more for a vast ransom. When he did at length return, it was only to spend his last years in hard and skilful warfare against the French king. Picturesque as they were, Richard's romantic adventures form no part of the history of the English people. But there were three ways in which Richard's short and costly reign was useful in the development of the English people. In the first place, their king's crusade, even though few of them took part in it, gave them some knowledge of remote countries, with which in the distant future they were to have more intimate contact. In the second place, the prolonged absences of the king showed how solidly and well the work of Henry II. had been done, for the government went on quite well, and there were even some improvements made; rebellions, even though led by the king's brother, John, were easily put down; and the huge sums required for the king's ransom were raised with surprising ease. Nothing could show more clearly how completely the government now controlled the country. Finally, during the king's absence, and because of it, the Great Council of barons took a larger share in discussing and criticising the government. Their share did not as yet amount to very much. But at least it was something that an organised and recognised body of leading men was asserting the right to criticise the powerful system of government which Henry II. had set up. And this was to have greater importance in the next reign."—R. Muir, *Short history of the British commonwealth*, v. 1, pp. 61-62.—Richard left England in 1194 to revenge himself on Philip II of France. He was killed in 1199 in one of his

many wars in France. During his absence his ministers carried on the government and continued the policy of Henry II. The most noted of these was Hubert Walter, archbishop of Canterbury and justiciar, and later chancellor. "The Third Crusade [see CRUSADES: 1188-1192], undertaken for the deliverance of Palestine from the disasters brought upon the Crusaders' Kingdom by Saladin, was the first to be popular in England. . . . Richard joined the Crusade in the very first year of his reign, and every portion of his subsequent career was concerned with its consequences. Neither in the time of William Rufus nor of Stephen had the First or Second Crusades found England sufficiently settled for such expeditions. . . . But the patronage of the Crusades was a hereditary distinction in the Angevin family now reigning in England: they had founded the kingdom of Palestine; Henry II. himself had often prepared to set out; and Richard was confidently expected by the great body of his subjects to redeem the family pledge. [See also JEWS: England: 1189.] . . . Wholly inferior in statesmanlike qualities to his father as he was, the generosity, munificence, and easy confidence of his character made him an almost perfect representative of the chivalry of that age. He was scarcely at all in England, but his fine exploits both by land and sea have made him deservedly a favourite. . . . A King who leaves behind him such an example of apparently reckless, but really prudent valour, of patience under jealous ill-treatment, and perseverance in the face of extreme difficulties, . . . leaves a heritage of example as well as glory, and incites posterity to noble deeds."—M. Burrows, *Commentaries on the history of England*, bk. 1, ch. 18.—Richard "was a bad king; his great exploits, his military skill, his splendour and extravagance, his poetical tastes, his adventurous spirit, do not serve to cloak his entire want of sympathy, or even consideration for his people. He was no Englishman. . . . His ambition was that of a mere warrior."—W. Stubbs, *Constitutional history of England*, v. 1, sect. 150.—See also CYPRUS: 1191.

1199.—Accession of King John.

1199-1202.—Beginning of King John's reign.—Marriage with Isabella of Angoulême.—"The death of Richard on 6th April, 1199 [and the accession of John, his youngest brother, to the exclusion of his nephew, Arthur, duke of Brittany, the son of Geoffrey, fourth son of Henry II] brought with it at least one important change; England was no longer to be governed by an absentee. John, as impatient of control as he was incompetent, endeavoured to shake himself free from the restraints of powerful ministers, and determined to conduct the work of government in his own way. The result was an abrupt end to the progress made in the previous reign towards ministerial responsibility. The odium formerly exhausting itself on the justiciars of Richard was now expended on John. While, previously, men had sought redress in a change of minister, such vain expectations could no longer deceive. A new element of bitterness was added to injuries long resented, and the nobles who felt the pinch of heavy taxation were compelled to seek redress in an entirely new direction. All the forces of discontent played openly around the throne. As is usual at the opening of a new reign, the discontented hoped that a change of sovereign would bring some relief. The excessive taxation of the late reign had been the result of exceptional circumstances. It

was expected that the new King would revert to the less burdensome scale of his father's financial measures. Such hopes were quickly disappointed. John's needs proved as great as Richard's and the money he obtained was used for purposes that appealed to no one but himself. The excessive exactions demanded both in money and in service, coupled with the unpopular uses to which these were put, form the keynote of the whole reign. They form also the background of Magna Carta."—W. S. McKechnie, *Magna Carta*, pp. 26, 27.—The first serious trouble of his reign, however, arose outside of England, although it was caused by his second marriage, made with Isabella of Angoulême, who had already been betrothed to Hugh de Lusignan, a member of a powerful noble family of Poitou. The whole Lusignan family were much incensed at the marriage, and in order to prevent possible action on their part, John seized some of their strongholds and accused their adherents of treason. This marriage had an important influence on the political history of England, as it led to the loss of a large part of the king's French dominions.

1199-1260.—Continued resistance of Ulster against Normans.—Norman victory in battle at Downpatrick. See ULSTER: 1199-1260.

1205.—Loss of Normandy, Anjou, Touraine and Poitou.—Effects.—In 1202 Philip Augustus, king of France, summoned John of England, as duke of Normandy (therefore the feudal vassal of the French crown) to appear for trial on certain grave charges before the august court of the peers of France. John refused to obey the summons; his French fiefs were declared forfeited, and the armies of the French king took possession of them. This proved to be a lasting separation of Normandy from England,—except as it was recovered momentarily long afterwards in the conquests of Henry V. John "neither came [at the summons of Philip] nor properly excused himself, though he tried to avoid the difficulty. . . . He said that the king of England could not submit to such a trial, and was answered that the king of France could not lose his rights over a vassal because he happened to have acquired another dignity. Finally, John's legal rights of delay and excuse being exhausted, the court decreed that he should be deprived of all the fiefs which he held of France on the ground of failure of service. All the steps of this action from its beginning to its ending seem to have been perfectly regular, John being tried, of course, not on the appeal of the barons of Poitou which had led to the king's action, but for his refusal to obey the summons, and the severe sentence with which it closed was that which the law provided, though it was not often enforced in its extreme form, and probably would not have been in this case if John had been willing to submit. The sentence of his court Philip gladly accepted, and invaded Normandy about June 1, capturing place after place with almost no opposition from John. . . . [John, however, captured his nephew Arthur, who had taken the field in Poitou, and had him murdered to remove him from his path. Some say he murdered him with his own hand.] The listless conduct of John during the loss of Normandy is not easy to explain. The only suggestion of explanation in the contemporary historians is that of the general prevalence of treason in the duchy, which made it impossible for the king to know whom to trust and difficult to organize a sufficient defence to the advance of Philip, and undoubtedly this factor in the case should receive more emphasis than it has usually been given. . . . By the end of August Philip was

ready for the siege of the Château-Gaillard, Richard's great fortress, the key to Rouen and so to the duchy. . . . John, seeing the hopelessness of defending Normandy with the resources left him there, and even, it is said, fearing treasonable designs against his person, had quitted the duchy in what proved to be a final abandonment and crossed to England on December 5. . . . With the loss of Normandy nothing remained to John but his mother's inheritance, and against this Philip next turned. Queen Eleanor, eighty-two years of age, had closed her marvellous career on April 1, and no question of her rights stood in the way of the absorption of all Aquitaine in France. The conquest of Touraine and Poitou was almost as easy as that of Normandy, except the castles of Chinon and Loches which held out for a year, and the cities of Niort, Thouars, and La Rochelle. But beyond the bounds of the county of Poitou Philip made no progress. . . . The great duchy founded three hundred years before on the colonization of the Northmen, always one of the mightiest of the feudal states of France, all the dominions which the counts of Anjou had struggled to bring together through so many generations, the disputed claims on Maine [including Anjou] and Brittany recognized now for a long time as going with Normandy, a part even of the splendid possessions of the dukes of Aquitaine;—all these in little more than two years Philip had transferred from the possession of the king of England to his own, and all except Brittany to the royal domain."—G. B. Adams, *Political history of England*, 1066-1216, v. 2, pp. 390, 400, 402-406.—"Almost immediately Normandy settles down into a quiet province of France. . . . For England the result of the separation was more important still. Even within the reign of John it became clear that the release of the barons from their connexion with the continent was all that was wanted to make them Englishmen. With the last vestiges of the Norman inheritances vanished the last idea of making England a feudal kingdom. The Great Charter was won by men who were maintaining, not the cause of a class, as had been the case in every civil war since 1070, but the cause of a nation. From the year 1203 the king stood before the English people face to face."—W. Stubbs, *Constitutional history of England*, ch. 12, sect. 152.—See also FRANCE: 1180-1224.

ALSO IN: F. M. Powicke, *Loss of Normandy*.

1205-1213.—King John's quarrel with the pope and the church.—On the death, in 1205, of Archbishop Hubert, of Canterbury, who had long been chief minister of the crown, a complicated quarrel over the appointment to the vacant see arose between the monks of the cathedral, the suffragan bishops of the province, King John, and the powerful pope Innocent III. Pope Innocent put forward as his candidate the afterwards famous Stephen Langton, secured his election in a somewhat irregular way (1207), and consecrated him with his own hands. King John, bent on filling the primacy with a creature of his own, resisted the papal action with more fury than discretion, and proceeded to open war with the whole church. "The death of Archbishop Hubert Walter . . . deprived King John of the services of the most experienced statesman in England. It did more, for it marked the termination of the long friendship between the English Crown and the National Church. Its immediate effect was to create a vacancy, the filling of which led to a bitter quarrel with Rome. John failed, as usual, to recognize the merits of abler men, and saw in the death of his great Justiciar and Archbishop

only the removal of an unwelcome restraint, and the opening to the Crown of a desirable piece of patronage. He prepared to strain to the utmost his rights in the election of a successor to the See of Canterbury, in favour of one of his own creatures, a certain John de Grey, already by royal influence Bishop of Norwich. Unexpected opposition to his will was offered by the canons of the Cathedral Church, who determined on a bold policy, namely, to turn their nominal right of canonical election into a reality, and to appoint their own nominee, without waiting either for the King's approval or the co-operation of the suffragan bishops of the Province, who, during the last three vacancies, had put forth a claim to participate in the election, and had invariably used their influence on behalf of the King's nominee. Reginald, the sub-prior, was secretly elected by the monks, and hurried abroad to obtain confirmation at Rome before the appointment was made public. Reginald's vanity prevented his keeping his pledge of secrecy, and a rumour reached the ear of John, who brought pressure to bear on the monks, now frightened at their own temerity, and secured de Grey's appointment in a second election. The bishop of Norwich was actually enthroned at Canterbury, and invested by the King with the temporalities of the See. All parties now sent representatives to Rome. This somewhat petty squabble benefited none of the original disputants; for the astute Innocent III. was quick to see an opportunity for papal aggrandisement. Both elections were set aside by decree of the Papal Curia, and the emissaries of the various parties were coerced or persuaded to appoint there and then in the Pope's presence the Pope's own nominee, a certain Cardinal, English-born, but hitherto little known in England, Stephen Langton by name, destined to play an important part in the future history of the land of his birth. John refused to view this triumph of papal arrogance in the light of a compromise—the view diplomatically suggested by Innocent. The King, with the hot blood common to his race, and the bad judgment peculiar to himself, rushed headlong into a quarrel with Rome which he was incapable of carrying to a successful issue.—W. S. McKeechie, *Magna Carta*, pp. 27-28.—He refused to admit the pope's appointee, who in punishment for this obduracy placed the kingdom under an interdict and excommunicated the king.—“The monks of Canterbury were driven from their monastery, [1207] and when, in the following year, an interdict which the Pope had intrusted to the Bishops of London, Ely and Worcester, was published, his hostility to the Church became so extreme that almost all the bishops fled; the Bishops of Winchester, Durham, and Norwich, two of whom belonged to the ministerial body, being the only prelates left in England. The interdict was of the severest form; all services of the Church, with the exception of baptism and extreme unction, being forbidden, while the burial of the dead was allowed only in unconsecrated ground; its effect was however weakened by the conduct of some of the monastic orders, who claimed exemption from its operation, and continued their services. The king's anger knew no bounds. The clergy were put beyond the protection of the law; orders were issued to drive them from their benefices, and lawless acts committed at their expense met with no punishment. . . . Though acting thus violently, John showed the weakness of his character by continued communication with the Pope, and occasional fitful acts of favour to the Church; so much so, that, in the

following year, Langton prepared to come over to England, and, upon the continued obstinacy of the king, Innocent, feeling sure of his final victory, did not shrink from issuing his threatened excommunication. John had hoped to be able to exclude the knowledge of this step from the island; . . . but the rumour of it soon got abroad, and its effect was great. . . . In a state of nervous excitement, and mistrusting his nobles, the king himself perpetually moved to and fro in his kingdom, seldom staying more than a few days in one place. None the less did he continue his old line of policy. . . . In 1211 a league of excommunicated leaders was formed, including all the princes of the North of Europe; Ferrand of Flanders, the Duke of Brabant, John, and Otho [John's Guelphic Saxon nephew, who was one of two contestants for the imperial crown in Germany], were all members of it, and it was chiefly organized by the activity of Reinald of Dammartin, Count of Boulogne. The chief enemy of these confederates was Philip of France; and John thought he saw in this league the means of revenge against his old enemy. To complete the line of demarcation between the two parties, Innocent, who was greatly moved by the description of the disorders and persecutions in England, declared John's crown forfeited, and intrusted the carrying out of the sentence to Philip. In 1213 armies were collected on both sides. Philip was already on the Channel, and John had assembled a large army on Barhamdown, not far from Canterbury.” But, at the last moment, when the French king was on the eve of embarking his forces for the invasion of England, John submitted himself abjectly to Pandulf, the legate of the pope. He not only surrendered too all that he had contended against, but went further, to the most shameful extreme. “On the 15th of May, at Dover, he formally resigned the crowns of England and Ireland into the hands of Pandulf, and received them again as the Pope's feudatory.”—J. F. Bright, *History of England*, v. 1, pp. 130-134.

1214.—Battle of Bouvines. See BOUVINES, BATTLE OF; FRANCE: 1214.

1215.—Magna Carta.—“It is to the victory of Bouvines [1214] that England owes her Great Charter. . . . John sailed for Poitou with the dream of a great victory which should lay Philip [of France] and the barons alike at his feet. He returned from his defeat to find the nobles no longer banded together in secret conspiracies, but openly united in a definite claim of liberty and law. The author of this great change was the new Archbishop [Langton] whom Innocent had set on the throne of Canterbury. . . . In a private meeting of the barons at St. Paul's, he produced the Charter of Henry I [see above: 1087-1135], and the enthusiasm with which it was welcomed showed the sagacity with which the Primate had chosen his ground for the coming struggle. All hope, however, hung on the fortunes of the French campaign; it was the victory at Bouvines that broke the spell of terror and within a few days of the king's landing the barons again met at St. Ed-

KING JOHN PLACING HIS SEAL ON THE MAGNA CARTA

To the left of the king stands Stephen Langton, Archbishop of Canterbury

(From a painting by R. Caton Woodville)

mundsbury. . . . At Christmas they presented themselves in arms before the king and preferred their claim. The few months that followed showed John that he stood alone in the land. . . . At Easter the barons again gathered in arms at Brackley and renewed their claim. 'Why do they not ask for my kingdom?' cried John in a burst of passion; but the whole country rose as one man at his refusal. London threw open her gates to the army of the barons, now organized under Robert Fitz-Walter, 'the marshal of the army of God and the holy Church.' The example of the capital was at once followed by Exeter and Lincoln; promises of aid came from Scotland and Wales; the northern nobles marched hastily to join their comrades in London. With seven horsemen in his train John found himself face to face with a nation in arms. . . . Nursing wrath in his heart the tyrant bowed to necessity, and summoned the barons to a conference at Runnymede. An island in the Thames between Staines and Windsor had been chosen as the place of conference: the king encamped on one bank, while the barons covered the marshy flat, still known by the name of Runnymede, on the other. Their delegates met in the island between them. . . . The Great Charter was discussed, agreed to, and signed in a single day [June 15, 1215]. One copy of it still remains in the British Museum, injured by age and fire, but with the royal seal still hanging from the brown, shriveled parchment."—J. R. Green, *Short history of the English people*, ch. 3, sect. 2-3.—For text, see MAGNA CARTA.

"As this was the first effort towards a legal government, so is it beyond comparison the most important event in our history, except that Revolution without which its benefits would have been rapidly annihilated. The constitution of England has indeed no single date from which its duration is to be reckoned. The institutions of positive law, the far more important changes which time has wrought in the order of society, during six hundred years subsequent to the Great Charter, have undoubtedly lessened its direct application to our present circumstances. But it is still the key-stone of English liberty. All that has since been obtained is little more than as confirmation or commentary. . . . The essential clauses of Magna Charta are those which protect the personal liberty and property of all freemen, by giving security from arbitrary imprisonment and arbitrary spoliation. 'No freeman (says the 29th chapter of Henry III.'s charter, which, as the existing law, I quote in preference to that of John, the variations not being very material) shall be taken or imprisoned, or be disseised of his freehold, or liberties, or free customs, or be outlawed, or exiled, or any otherwise destroyed; nor will we pass upon him, nor send upon, but by lawful judgment of his peers, or by the law of the land. We will sell to no man, we will not deny or delay to any man, justice or right.' [See also LAND TITLES: 1215.] It is obvious that these words, interpreted by any honest court of law, convey an ample security for the two main rights of civil society."—H. Hallam, *Middle Ages*, ch. 8, pt. 2.—"The Great Charter, although drawn up in the form of a royal grant, was really a treaty between the king and his subjects. . . . It is the collective people who really form the other high contracting party in the great capitulation,—the three estates of the realm, not, it is true, arranged in order according to their profession or rank, but not the less certainly combined in one national purpose, and securing by one bond the interests and rights of each other, severally and all

together. . . . The barons maintain and secure the right of the whole people as against themselves as well as against their master. Clause by clause the rights of the commons are provided for as well as the rights of the nobles. . . . The knight is protected against the compulsory exaction of his services, and the horse and cart of the freeman against the irregular requisition even of the sheriff. . . . The Great Charter is the first great public act of the nation, after it has realised its own identity. . . . The whole of the constitutional history of England is little more than a commentary on Magna Carta."—W. Stubbs, *Constitutional history of England*, ch. 12, sect. 155.—"The reforms demanded by the barons and granted by this Charter were just and moderate. The avoidance of all extremes tended towards a permanent settlement, since moderation both gains and keeps adherents. Its aims were practical as well as moderate; the language in which they were framed, clear and straightforward. A high authority has described the Charter as 'an intensely practical document.' . . . Closely connected with this feature is another—the essentially *legal* nature of the whole. As Magna Carta was rarely absent from the minds of subsequent opponents of despotism, a practical and legal direction was thus given to the efforts of Englishmen in many ages. . . . The Charter . . . made definite what had been vague before. Definition is a valuable protection for the weak against the strong; whereas vagueness increases the powers of the tyrant who can interpret while he enforces the law. Misty rights were now reduced to a tangible form, and could no longer be broken with so great impunity. Magna Carta contained no crude innovations, and confirmed many principles whose value was enhanced by their antiquity. . . . Further, the nature of the provisions bears witness to the broad basis on which the settlement was intended to be built. The Charter, notwithstanding the prominence given to redress of feudal grievances, redressed other grievances as well. In this, the influence of the Church and notably of its Primate, can be traced. Some little attention was given to the rights of the under-tenants also, and even to those of the merchants, while the villein and the alien were not left entirely unprotected. Thus the settlement contained in the Charter had a broad basis in the affection of all classes . . . [and] henceforward it was more difficult for the king to invade the rights of others. Where previously the vagueness of the law lent itself to evasion, its clear re-statement and ratification in 1215 pinned down the king to a definite issue. He could no longer plead that he sinned in ignorance; he must either keep the law, or openly defy it—no middle course was possible. . . . It is no disparagement to Magna Carta . . . to confess that part of its power has been read into it by later generations, and lies in the halo, almost of romance, which has gradually gathered round it in the course of centuries. It became a battle cry for future ages, a banner, a rallying point, a stimulus to the imagination. For a king, thereafter, openly to infringe the promises contained in the Great Charter, was to challenge the bitterness of public opinion—to put himself palpably in the wrong. . . . It has been often repeated, and with truth, that the Great Charter marks also a stage in the growth of national unity or nationality. Here, however, it is necessary to guard against exaggeration. It is really one movement in a process, rather than a final achievement. We must somewhat discount, while still agreeing in the main with, statements which declare the Charter to be 'the first documentary proof

of the existence of a united English nation'; or with the often-quoted words of Dr. Stubbs, that 'The Great Charter is the first great public act of the nation, after it has realised its own identity.' . . . Magna Carta undoubtedly marked one step, an important step, in the process by which England became a nation; but that step was neither the first nor yet the final one."—W. S. McKechnie, *Magna Carta*, pp. 144-147, 149, 150.

1216.—Strategic importance of Cambridge. See CAMBRIDGE: Early history.

1216-1272.—Character and reign of Henry III. —Barons' War.—Simon de Montfort and the evolution of the English Parliament.—King John died October 17, 1216. "His legitimate successor was a child of nine years of age. For the first time since the Conquest the personal government was in the hands of a minor. In that stormy time the great Earl of Pembroke undertook the government, as Protector. . . . At the Council of Bristol, with general approbation and even with that of the papal legate, Magna Charta was confirmed, though with the omission of certain articles. . . . After some degree of tranquillity had been restored, a second confirmation of the Great Charter took place in the autumn of 1217, with the omission of the clauses referring to the estates, but with the grant of a new charta de foresta, introducing a vigorous administration of the forest laws. In 9 Henry III [the ninth year of his reign] Magna Charta was again confirmed, and this is the form in which it afterwards took its place among the statutes of the realm."—R. Gneist, *History of the English constitution*, v. 1, pp. 313. —"The importance of the omissions is considerably minimized . . . by two considerations. . . . Many of the original provisions were merely declaratory, and their omission in 1216 by no means implied that they were then abolished. The common law remained what it had been previously, although it was not considered necessary to specify those particular parts of it in black and white. In particular, throughout the entire reign of Henry, the *Commune Concilium* frequently met, and was always, in practice, consulted before a levy was made of any scutage or aid. The issue of the new Charter was not immediately successful in bringing the civil war to an end; but a stream of waverers flowed from Louis to Henry, influenced partly by the success of the national faction in the field and partly by the moderate policy of the government typified by the re-issue of the Charter. On 19th May, 1217, the royalists gained a decisive victory at the battle known as the 'Fair of Lincoln'; and, on 24th August following, Hubert de Burgh, the Justiciar, destroyed the fleet on which Louis depended. The French prince was compelled to sue for peace. Although negotiations were somewhat protracted, the resulting Treaty of Lambeth bears date the 11th September, 1217, the day on which they opened. Several interviews took place at Lambeth between 11th and 13th September, and these were followed by a general conference at Merton, commencing on the 23rd, at which Gualo, Louis, the Regent, and many English nobles were present. Some difference of opinion exists as to the exact stages of these negotiations, and it seems best to treat as one whole the settlement ultimately arranged. 'The treaty of Lambeth is, in practical importance, scarcely inferior to the charter itself.' It marked the final acceptance by the advisers of the Crown of the substance of Magna Carta as the permanent basis of government for England in time of peace, not merely as a provisional expedient in time of war. Its terms were equally honourable to both parties:

to the Regent and his supporters, because of the moderation they displaced; and to Louis who, while renouncing all claim to the English Crown, did so only on condition of a full pardon to his allies, combined with the guarantee of their cause, so far at least as that was embodied in the Charter. Ten thousand marks were paid to Louis, nominally as indemnity for his expenses; but he had in return to restore the Exchequer Rolls, the charters of the Jews (that is the rolls on which copies of their starrs or mortgages had been registered), the Charters of Liberties granted by John at Runnymede, and all other national archives in his possession. . . . On 14th May, 1210, England lost a trusted ruler through the death of the aged Regent, whose loyalty, firmness, and moderation had contributed so much to repair the breaches made in the body politic by John's evil deeds, and the consequent civil war. After the good Earl of Pembroke's death, the Bishop of Winchester and Hubert de Burgh contended for the chief place in Henry de Burgh's councils, with alternating success. . . . A few years later, the young King seems to have grown impatient under the restraints of a minority, and the Roman Curia was ready to bid for his good will by humouring him. In 1223 Honorius III., by letter dated 13th April, declared Henry (then only in his sixteenth year) to be of full age as regarded most of the duties of a king."—W. S. McKechnie, *Magna Carta*, pp. 168, 170, 171, 180.—"Henry III. personally assumes the reins of government at the Parliament of Oxford (1227), and begins his rule without confirming the two charters. At first the tutorial government still continues, which had meanwhile, even after the death of the great Earl of Pembroke (1210), remained in a fairly orderly condition. The first epoch of sixteen years of this reign must therefore be regarded purely as a government by the nobility under the name of Henry III. The regency had succeeded in removing the dominant influence of the Roman Curia by the recall of the papal legate, Pandulf, to Rome (1221), and in getting rid of the dangerous foreign mercenary soldiery (1224). . . . With the disgraceful dismissal of the chief justiciary, Hubert de Burgh [who among other charges, with slight or no foundation, was accused of embezzlement], there begins a second epoch of a personal rule of Henry III. (1232-1252), which for twenty continuous years, presents the picture of a confused and undecided struggle between the king and his foreign favourites and personal adherents on the one side, and the great barons, and with them soon the prelates, on the other. . . . In 21 Henry III. [1225] the King finds himself, in consequence of pressing money embarrassments, again compelled to make a solemn confirmation of the charter, in which once more the clauses relating to the estates are omitted. Shortly afterwards, as had happened just one hundred years previously in France, the name 'parliamentum' occurs for the first time (Chron. Dunst., 1244; Matth. Paris, 1246), and curiously enough, Henry III. himself, in a writ addressed to the Sheriff of Northampton, designates with this term the assembly which originated the Magna Charta. . . . The name 'parliament,' now occurs more frequently, but does not supplant the more definite terms concilium, colloquium, etc. In the meanwhile the relations with the Continent became complicated, in consequence of the family connections of the mother [Isabella of Angoulême] and the wife [Eleanor of Provence] of the King, and the greed of the papal envoys. . . . From the year 1244 onwards, neither a chief justice nor a chancellor, nor even a

treasurer, is appointed, but the administration of the country is conducted at the Court by the clerks of the offices."—R. Gneist, *History of the English constitution*, v. 1, pp. 313-321.—"Nothing is so hard to realise as chaos; and nothing nearer to chaos can be conceived than the government of Henry III. Henry was, like all the Plantagenets, clever; like very few of them, he was devout; and if the power of conceiving a great policy would constitute a great King, he would certainly have been one. . . . He aimed at making the Crown virtually independent of the barons. . . . His connexion with Louis IX., whose brother-in-law he became, was certainly a misfortune to him. In France the royal power had during the last fifty years been steadily on the advance; in England it had as steadily receded; and Henry was ever hearing from the other side of the Channel maxims of government and ideas of royal authority which were utterly inapplicable to the actual state of his own kingdom. . . . Henry had imbibed from the events and the tutors of his early childhood two maxims of state, and two alone: to trust Rome, and to distrust the barons of England. . . . He filled the places of trust and power about himself with aliens, to whom the maintenance of Papal influence was like an instinct of self-preservation. Thus were definitely formed the two great parties out of whose antagonism the War of the Barons arose, under whose influence the relations between the crown and people of England were remodelled, and out of whose enduring conflict rose, indirectly, the political principles which contributed so largely to bring about the Reformation of the English Church. The few years which followed the fall of Hubert de Burgh were the heyday of Papal triumph. And no triumph could have been worse used. . . . Thus was the whole country lying a prey to the ecclesiastical aliens maintained by the Pope, and to the lay aliens maintained by the king, . . . when Simon de Montfort [earl of Leicester] became . . . inseparably intermixed with the course of our history. . . . In the year 1258 opened the first act of the great drama which has made the name of Simon de Montfort immortal. . . . The Barons of England, at Leicester's suggestion, had leagued for the defence of their rights. They appeared armed at the Great Council. . . . They required as the condition of their assistance that the general reformation of the realm should be entrusted to a Commission of twenty-four members, half to be chosen by the crown, and half by themselves. For the election of this body, primarily, and for a more explicit statement of grievances, the Great Council was to meet again at Oxford on the 11th of June, 1258. [This meeting of the Great Council is known as the "Mad Parliament." See PARLIAMENT, ENGLISH: 1258.] When the Barons came, they appeared at the head of their retainers. The invasion of the Welsh was the plea; but the real danger was nearer home. They seized on the Cinque Ports; the unrenewed truce with France was the excuse; they remembered too vividly King John and his foreign mercenaries. They then presented their petition. This was directed to the redress of various abuses. . . . To each and every clause the King gave his inevitable assent. One more remarkable encroachment was made upon the royal prerogative; the election in Parliament of a chief justiciar. . . . The chief justiciar was the first officer of the Crown. He was not a mere chief justice, after the fashion of the present day, but the representative of the Crown in its high character of the fountain of justice. . . . But the point upon which the barons laid the greatest

stress, from the beginning to the end of their struggle, was the question of the employment of aliens. That the strongest castles and the fairest lands of England should be in the hands of foreigners, was an insult to the national spirit which no free people could fail to resent. . . . England for the English, the great war cry of the barons, went home to the heart of the humblest. . . . The great question of the constitution of Parliament was not heard at Oxford; it emerged into importance when the struggle grew fiercer, and the barons found it necessary to gather allies round them. . . . One other measure completed the programme of the barons; namely, the appointment, already referred to, of a committee of twenty-four. . . . It amounted to placing the crown under the control of a temporary Council of Regency. [See OXFORD, PROVISIONS OF; and COMMON LAW: 1258] . . . Part of the barons' work was simple enough. The justiciar was named, and the committee of twenty-four. To expel the foreigners was less easy. Simon de Montfort, himself an alien by birth [Norman], resigned the two castles which he held, and called upon the rest to follow. They simply refused. . . . But the barons were in arms, and prepared to use them. The aliens, with their few English supporters, fled to Winchester, where the castle was in the hands of the foreign bishop Aymer. They were besieged, brought to terms, and exiled. The barons were now masters of the situation. . . . Among the prerogatives of the crown which passed to the Oxford Commission not the least valuable, for the hold which it gave on the general government of the country, was the right to nominate the sheriffs. In 1261 the King, who had procured a Papal bull to abrogate the Provisions of Oxford, and an army of mercenaries to give the bull effect, proceeded to expel the sheriffs who had been placed in office by the barons. The reply of the barons was most memorable; it was a direct appeal to the order below their own. They summoned three knights elected from each county in England to meet them at St. Albans to discuss the state of the realm. It was clear that the day of the House of Commons could not be far distant, when at such a crisis an appeal to the knights of the shire could be made, and evidently made with success. For a moment, in this great move, the whole strength of the barons was united; but differences soon returned, and against divided counsels the crown steadily prevailed. In June, 1262, we find peace restored. The more moderate of the barons had acquiesced in the terms offered by Henry; Montfort, who refused them, was abroad in voluntary exile. . . . Suddenly, in July, the Earl of Gloucester died, and the sole leadership of the barons passed into the hands of Montfort. With this critical event opens the last act in the career of the great Earl. In October he returns privately to England. The whole winter is passed in the patient reorganising of the party, and the preparation for a decisive struggle. Montfort, fervent, eloquent, and devoted, swayed with despotic influence the hearts of the younger nobles (and few in those days lived to be grey), and taught them to feel that the Provisions of Oxford were to them what the Great Charter had been to their fathers. They were drawn together with an unanimity unknown before. . . . They demanded the restoration of the Great Provisions. The King refused, and in May, 1263, the barons appealed to arms. . . . Henry, with a reluctant hand, subscribed once more to the Provisions of Oxford, with a saving clause, however, that they should be revised in the coming Parliament. On

the 9th of September, accordingly, Parliament was assembled. . . . The King and the barons agreed to submit their differences to the arbitration of Louis of France. . . . Louis IX. had done more than any one king of France to enlarge the royal prerogative; and Louis was the brother-in-law of Henry. His award, given at Amiens on the 23d of January, 1264, was, as we should have expected, absolutely in favour of the king. [This award was called the "Mise of Amiens" and the wars that followed are called by some historians, the "Barons' Wars." Others date the wars from 1258-1265.] The whole Provisions of Oxford were, in his view, an invasion of the royal power. . . . The barons were astounded. . . . They at once said that the question of the employment of aliens was never meant to be included. . . . The appeal was made once again to the sword. Success for a moment inclined to the royal side, but it was only for a moment; and on the memorable field of Lewes [May 14, 1264] the genius of Leicester prevailed. . . . With the two kings of England and of the Roman prisoners in his hands, Montfort dictated the terms of the so-called Mise of Lewes. [For election of Richard of Cornwall, Henry's brother, as king of the Romans, see GERMANY: 1250-1272.] . . . Subject to the approval of Parliament, all differences were to be submitted once more to French arbitration. . . . On the 23d of June the Parliament met. It was no longer a Great Council, after the fashion of previous assemblies; it included four knights, elected by each English county. This Parliament gave such sanction as it was able to the exceptional authority of Montfort, and ordered that until the proposed arbitration could be carried out, the King's council should consist of nine persons, to be named by the Bishop of Chichester, and the Earls of Gloucester and Leicester. The effect was to give Simon for the time despotic power. . . . It was at length agreed that all questions whatever, the employment of aliens alone excepted, should be referred to the Bishop of London, the justiciar Hugh le Despenser, Charles of Anjou, and the Abbot of Bec. If on any point they could not agree, the Archbishop of Rouen was to act as referee. . . . It was . . . not simply the expedient of a revolutionary chief in difficulties, but the expression of a settled and matured policy, when, in December, 1264, [Montfort] issued in the King's name the ever-memorable writs which summoned the first complete Parliament which ever met in England.—*Simon de Montfort* (*Quarterly Review*, Jan., 1866).—"The reappearance of Knights of the Shire—country gentlemen—in Parliament invites comment. Henry had called for them in 1254 in the hope of obtaining money. The Oxford Provisions of 1258, so far from extending the action of Parliament, had proposed to supersede its sittings by those of a standing committee. But in 1261 de Montfort had summoned country representatives to meet him at St. Albans. The change from the measures of 1258 to those of 1261 and 1264 indicates a rapid development of policy on his part."—J. H. Ramsay, *Dawn of the constitution*, A.D. 1216-1307, p. 228.—"Important as this assembly [the Parliament of 1265] is in the history of the constitution, it was not primarily and essentially a constitutional assembly. It was not a general convention of the tenants in chief or of the three estates, but a parliamentary assembly of the supporters of the existing government."—W. Stubbs, *Constitutional history of England*, v. 2, ch. 14, sect. 177.—"The earls, barons, and bishops received their summons as a matter of course; and with them the deans of cathedral churches, an unprecedented number

of abbots and priors, two knights from every shire, and two citizens or burgesses from every city or borough in England. Of their proceedings [they sat from January to March, 1265] we know but little; but they appear to have appointed Simon de Montfort to the office of Justiciar of England, and to have thus made him in rank, what he had before been in power, the first subject in the realm. . . . Montfort . . . had now gone so far, he had exercised such extraordinary powers, he had done so many things which could never really be pardoned, that perhaps his only chance of safety lay in the possession of some such office as this. It is certain, moreover, that something which passed in this Parliament, or almost exactly at the time of its meeting, did cause deep offense to a considerable section of the barons. . . . Difficulties were visibly gathering thicker around him, and he was evidently conscious that disaffection was spreading fast. [He was accused of violating the Mise of Lewes, of tyranny, and of aiming at the crown.] . . . Negotiations went forward, not very smoothly, for the release of Prince Edward. They were terminated in May [1265] by his escape. It was the signal for a royalist rising. Edward took the command of the Welsh border; before the middle of June he had made the border his own. On the 29th Gloucester opened its gates to him. He had many secret friends. He pushed fearlessly eastward, and surprised the garrison of Kenilworth, commanded by Simon, the Earl's second son. The Earl himself lay at Evesham, awaiting the troops which his son was to bring up from Kenilworth. . . . On the fatal field of Evesham [August 4, 1265], fighting side by side to the last, fell the Earl himself, his eldest son Henry, Despenser the late Justiciar, Lord Basset of Drayton, one of his firmest friends, and a host of minor names. With them, to all appearance, fell the cause for which they had fought."—*Simon de Montfort* (*Quarterly Review*, Jan., 1866).—See also PARLIAMENT, ENGLISH: Early stages of its evolution; SUFFRAGE, MANHOOD: British empire: 500-1295.

1275-1295.—Development of parliamentary representation under Edward I.—His work as administrative organizer and lawgiver.—"Happily, Earl Simon [de Montfort] found a successor, and more than a successor, in the king's [Henry III's] son. . . . Edward I. stood on the vantage ground of the throne. . . . He could do that easily and without effort which Simon could only do laboriously, and with the certainty of rousing opposition. Especially was this the case with the encouragement given by the two men to the growing aspirations after parliamentary representation. Earl Simon's assemblies were instruments of warfare. Edward's assemblies were invitations to peace. . . . Barons and prelates, knights and townsmen, came together only to support a king who took the initiative so wisely, and who, knowing what was best for all, sought the good of his kingdom without thought of his own ease. Yet even so, Edward was too prudent at once to gather together such a body as that which

Earl Simon had planned. He summoned, indeed, all the constituent parts of Simon's parliament, but he seldom summoned them to meet in one place or at one time. Sometimes the barons and prelates met apart from the townsmen or the knights, sometimes one or the other class met entirely alone. . . . In this way, during the first twenty years of Edward's reign, the nation rapidly grew in that consciousness of national unity which would one day transfer the function of regulation from the crown to the representatives of the people."—S. R. Gardiner and J. B. Mullinger, *Introduction to the study of English history*, ch. 4, sect. 17.—"In 1264 Simon de Montfort had called up from both shires and boroughs representatives to aid him in the new work of government. That part of Earl Simon's work had not been lasting. The task was left for Edward I. to be advanced by gradual safe steps, but to be thoroughly completed, as a part of a definite and orderly arrangement, according to which the English parliament was to be the perfect representation of the Three Estates of the Realm, assembled for purposes of taxation, legislation and united political action. . . . Edward's first parliament, in 1275, enabled him to pass a great statute of legal reform, called the Statute of Westminster the First [passed to correct abuses practised by royal officials, to strengthen the king's power and prevent extortion], and to exact the new custom on wool; another assembly, the same year, granted him a fifteenth. [See also COMMON LAW: 1275.] . . . There is no evidence that the commons of either town or county were represented. . . . In 1282, when the expenses of the Welsh war were becoming heavy, Edward again tried the plan of obtaining money from the towns and counties by separate negotiation; but as that did not provide him with funds sufficient for his purpose, he called together, early in 1283, two great assemblies, one at York and another at Northampton, in which four knights from each shire and four members from each city and borough were ordered to attend; the cathedral and conventual clergy also of the two provinces were represented at the same places by their elected proctors. At these assemblies there was no attendance of the barons; they were with the king in Wales; but the commons made a grant of one-thirtieth on the understanding that the lords should do the same. Another assembly was held at Shrewsbury the same year, 1283, to witness the trial of David of Wales; to this the bishops and clergy were not called, but twenty towns and all the counties were ordered to send representatives. Another step was taken in 1290: knights of the shire were again summoned; but still much remained to be done before a perfect parliament was constituted. Counsel was wanted for legislation, consent was wanted for taxation. The lords were summoned in May, and did their work in June and July, granting a feudal aid and passing the statute 'Quia Emptores' [called the third statute of Westminster. It was passed to prevent too great a sub-infeudation of land whereby services due to the overlord became so complicated and divided that no track could be kept of them]; but the knights only came to vote or to promise a tax, after a law had been passed; and the towns were again taxed by special commissions. In 1294, . . . under the alarm of war with France, an alarm which led Edward into several breaches of constitutional law, he went still further, assembling the clergy by their representatives in August, and the shires by their representative knights in October. The next year, 1295, witnessed the first summons of a perfect and model parliament; the

clergy represented by their bishops, deans, archdeacons, and elected proctors; the barons summoned severally in person by the king's special writ, and the commons summoned by writs addressed to the sheriffs, directing them to send up two elected knights from each shire, two elected citizens from each city, and two elected burghers from each borough. The writ by which the prelates were called to this parliament contained a famous sentence taken from the Roman law, 'That which touches all should be approved by all,' a maxim which might serve as a motto for Edward's constitutional scheme, however slowly it grew upon him, now permanently and consistently completed."—W. Stubbs, *Early Plantagenets*, ch. 10.—Both the second statute of Westminster (see COMMON LAW: 1286; DE DONIS CONDITIONALIBUS) and the statute of Winchester were passed in 1285. The former provided for entailed estates (an estate that cannot be divided among heirs or in payment of debt) and the latter sought to reorganize institutions of national police and defense. "Comparing the history of the following ages

EDWARD I

with that of the past, we can scarcely doubt that Edward had a definite idea of government before his eyes, or that that idea was successful because it approved itself to the genius and grew out of the habits of the people. Edward saw, in fact, what the nation was capable of, and adapted his constitutional reforms to that capacity. But although we may not refuse him the credit of design, it may still be questioned whether the design was altogether voluntary, whether it was not forced upon him by circumstances and developed by a series of careful experiments. . . . The design, as interpreted by the result, was the creation of a national parliament, composed of the three estates. . . . This design was perfected in 1295. It was not the result of compulsion, but the consummation of a growing policy. . . . But the close union of 1295 [known as the Model Parliament] was followed by the compulsion of 1297: out of the organic completeness of the constitution sprang the power of resistance, and out of the resistance the victory of the principles, which Edward might guide, but which he failed to coerce."—Idem.

*Constitutional history of England, ch. 15, sect. 244 and ch. 14, sect. 180-182.*—Idem, *Select charters, pt. 7.*—See also SUFFRAGE, MANHOOD: British empire: 1205-1832.

"The 13th century was above all things the age of the lawyer and the legislator. The revived study of Roman law had been one of the greatest results of the intellectual renaissance of the twelfth century. The enormous growth of the universities in the early part of the thirteenth century was in no small measure due to the zeal, ardour and success of their legal faculties. From Bologna there flowed all over Europe a great impulse towards the systematic and scientific study of the Civil Law of Rome. . . . The northern lawyers were inspired by their emulation of the civilians and canonists to look at the rude chaos of feudal custom with more critical eyes. They sought to give it more system and method, to elicit its leading principles, and to co-ordinate its clashing rules into a harmonious body of doctrine worthy to be put side by side with the more pretentious edifices of the Civil and Canon Law. In this spirit Henry de Bracton wrote the first systematic exposition of English law in the reign of Henry III. The judges and lawyers of the reign of Edward sought to put the principles of Bracton into practice. [See also COMMON LAW: 1216-1272.] Edward himself strove with no small success to carry on the same great work by new legislation. . . . His well-known title of the 'English Justinian' is not so absurd as it appears at first sight. He did not merely resemble Justinian in being a great legislator. Like the famous codifier of the Roman law, Edward stood at the end of a long period of legal development, and sought to arrange and systematise what had gone before him. Some of his great laws are almost in form attempts at the systematic codification of various branches of feudal custom. . . . Edward was greedy for power, and a constant object of his legislation was the exaltation of the royal prerogative. But he nearly always took a broad and comprehensive view of his authority, and thoroughly grasped the truth that the best interests of king and kingdom were identical. He wished to rule the state, but was willing to take his subjects into partnership with him, if they in return recognised his royal rights. . . . The same principles which influenced Edward as a lawgiver stand out clearly in his relations to every class of his subjects. . . . It was the greatest work of Edward's life to make a permanent and ordinary part of the machinery of English government, what in his father's time had been but the temporary expedient of a needy taxgatherer or the last despairing effort of a revolutionary partisan. Edward I. is—so much as one man can be—the creator of the historical English constitution. It is true that the materials were ready to his hand. But before he came to the throne the parts of the constitution, though already roughly worked out, were ill-defined and ill-understood. Before his death the national council was no longer regarded as complete unless it contained a systematic representation of the three estates. All over Europe the thirteenth century saw the establishment of a system of estates. The various classes of the community, which had a separate social status and a common political interest, became organised communities, and sent their representatives to swell the council of the nation. By Edward's time there had already grown up in England some rough anticipation of the three estates of later history. . . . It was with no intention of diminishing his power, but rather with the object of enlarging it, that Edward called the

nation into some sort of partnership with him. The special clue to this aspect of his policy is his constant financial embarrassment. He found that he could get larger and more cheerful subsidies if he laid his financial condition before the representatives of his people. . . . The really important thing was that Edward, like Montfort, brought shire and borough representatives together in a single estate, and so taught the country gentry, the lesser landowners, who, in a time when direct participation in politics was impossible for a lower class, were the real constituencies of the shire members, to look upon their interests as more in common with the traders of lower social status than with the greater landlords with whom in most continental countries the lesser gentry were forced to associate their lot. The result strengthened the union of classes, prevented the growth of the abnormally numerous privileged nobility of most foreign countries, and broadened and deepened the main current of the national life."—T. F. Tout, *Edward the First, ch. 7-8.*—"There was nothing in England which answered to the 'third estate' in France—a class, that is to say, both isolated and close, composed exclusively of townspeople, enjoying no commerce with the rural population (except such as consisted in the reception of fugitives), and at once detesting and dreading the nobility by whom it was surrounded. In England the contrary was the case. The townsfolk and the other classes in each county were thrown together upon numberless occasions; a long period of common activity created a cordial understanding between the burghers on the one hand and their neighbours the knights and landowners on the other, and finally prepared the way for the fusion of the two classes."—E. Boutmy, *English constitution, ch. 3.*

1279.—Statute of Mortmain.—"For many years past, the great danger to the balance of power appeared to come from the regular clergy, who, favoured by the success of the mendicant orders, were adding house to house and field to field. [They had acquired one third of the land of England.] Never dying out like families, and rarely losing by forfeitures, the monasteries might well nigh calculate the time, when all the soil of England should be their own. . . . Accordingly, one of the first acts of the barons under Henry III had been to enact, that no fees should be alienated to religious persons or corporations. Edward re-enacted and strengthened this by various provisions in the famous Statute of Mortmain. The fee illegally alienated was now to be forfeited to the chief lord under the King; and if, by collusion or neglect, the lord omitted to claim his right, the crown might enter upon it. Never was statute more unpopular with the class at whom it was aimed, more ceaselessly eluded, or more effectual."—C. H. Pearson, *History of England during the Early and Middle Ages, v. 2, ch. 9.*—Church holdings were exempt from most military obligations and from various taxes and fees connected with wardship, marriage and reliefs. Consequently it had become the custom for those who wished to evade these obligations to grant their lands to the church in return for part of the income.

1297.—Confirmatio Cartarum of Edward I.—“It was long before the King would surrender the right of taking talliages [revival of the Danegeld; land tax extorted by Norman kings on towns and demesne lands] without a parliamentary grant. In order to carry on his extensive wars he was in constant need of large sums of money, which he raised by arbitrary exactions from all classes of his subjects, lay and clerical.” The disputes and the resistance to which these exactions gave rise grew violent in 1297, and Edward was at length persuaded to assent to what was called the “Confirmatio Cartarum”—confirmation of the Great Charter and the Charter of Forests. “The Confirmatio Cartarum, which, although a statute, is drawn up in the form of a charter, was passed on the 10th of October, 1297, in a Parliament at which knights of the shire attended as representatives of the Commons, as well as the lay and clerical baronage. . . . The Confirmatio Cartarum was not merely a re-issue of Magna Charta and the Charter of the Forest, . . . but the enactment of a series of new provisions. . . . By the 5th section of this statute the King expressly renounced as precedents the aids, tasks, and prises before taken. . . . The exclusive right of Parliament to impose taxation, though often infringed by the illegal exercise of prerogative, became from this time an axiom of the Constitution.”—T. P. Taswell-Langmead, *English constitutional history*, ch. 7.

1306-1393.—Resistance to the pope.—“For one hundred and fifty years succeeding the Conquest, the right of nominating the archbishops, bishops, and mitred abbots had been claimed and exercised by the king. This right had been specially confirmed by the Constitutions of Clarendon [q. v.], which also provided that the revenues of vacant sees should belong to the Crown. But John admitted all the Papal claims, surrendering even his kingdom to the Pope, and receiving it back as a fief of the Holy See. By the Great Charter the Church recovered its liberties; the right of free election being specially conceded to the cathedral chapters and the religious houses. Every election was, however, subject to the approval of the Pope, who also claimed a right of veto on institutions to the smaller church benefices. . . . Under Henry III. the power thus vested in the Pope and foreign superiors of the monastic orders was greatly abused, and soon degenerated into a mere channel for draining money into the Roman exchequer. Edward I. firmly withstood the exactions of the Pope, and reasserted the independence of both Church and Crown. . . . In the reign of the great Edward began a series of statutes passed to check the aggressions of the Pope and restore the independence of the national church. The first of the series was passed in 1306-7. . . . This statute was confirmed under Edward III. in the

4th, and again in the 5th year of his reign; and in the 25th of his reign [1351], roused ‘by the grievous complaints of all the commons of his realm,’ the King and Parliament passed the famous Statute of Provisors, aimed directly at the Pope, and emphatically forbidding his nominations to English benefices. [The English were especially opposed to the pope at this period because he seemed to favor the French with whom the English were at war.] . . . Three years afterwards it was found necessary to pass a statute forbidding citations to the court of Rome [Statute of Præmunire]. . . . In 1389, there was an expectation that the Pope was about to attempt to enforce his claims, by excommunicating those who rejected them. . . . The Parliament at once passed a highly penal statute. . . . Matters were shortly afterwards brought to a crisis by Boniface IX., who after declaring the statutes enacted by the English Parliament null and void, granted to an Italian cardinal a prebendal stall at Wells. . . . Cross suits were at once instituted by the two claimants in the Papal and English courts. A decision was given by the latter, in favour of the king’s nominee, and the bishops, having agreed to support the Crown, were forthwith excommunicated by the Pope. The Commons were now roused to the highest pitch of indignation,”—and the final great Statute of Præmunire was passed, 1393. “The firm and resolute attitude assumed by the country caused Boniface to yield; ‘and for the moment,’ observes Mr. Froude, ‘and indeed for ever under this especial form, the wave of papal encroachment was rolled back.’”—T. P. Taswell-Langmead, *English constitutional history*, ch. 11.—“The great Statute of Provisors, passed in 1351, was a very solemn expression of the National determination not to give way to the pope’s usurpation of patronage. . . . All persons procuring or accepting papal promotions were to be arrested. . . . In 1352 the purchasers of Provisions were declared outlaws; in 1365 another act repeated the prohibitions and penalties; and in 1390 the parliament of Richard II. rehearsed and confirmed the statute. By this act, forfeiture and banishment were decreed against future transgressors.” The Statute of Præmunire as enacted finally in 1393, provided that “all persons procuring in the court of Rome or elsewhere such translations, processes, sentences of excommunication, bulls, instruments or other things which touch the king, his crown, regality or realm, should suffer the penalties of præmunire”—which included imprisonment and forfeiture of goods. “The name præmunire which marks this form of legislation is taken from the opening word of the writ by which the sheriff is charged to summon the delinquent.”—W. Stubbs, *Constitutional history of England*, ch. 19, sect. 715-716.—See also PAPACY: 1204-1348.

1307.—Accession of King Edward II.

1310-1311.—Ordnainers.—Edward of Carnarvon, though well trained by his father, Edward I, had no aptitude for statecraft and was the tool of his favorites. His extravagance and misgovernment brought matters to a crisis in 1310. “At the parliament which met in March, 1310 [reign of Edward II.] a new scheme of reform was promulgated, which was framed on the model of that of 1258 and the Provisions of Oxford. It was determined that the task of regulating the affairs of the realm and of the king’s household should be committed to an elected body of twenty-one members, or Ordnainers, the chief of whom was Archbishop Winchelsey. . . . The Ordnainers were empowered to remain in office until Michaelmas,

1311, and to make ordinances for the good of the realm, agreeable to the tenour of the king's coronation oath. The whole administration of the kingdom thus passed into their hands. . . . The Ordainers immediately on their appointment issued six articles directing the observance of the charters, the careful collection of the customs, and the arrest of the foreign merchants; but the great body of the ordinances was reserved for the parliament which met in August, 1311. The famous document or statute known as the Ordinances of 1311 contained forty-one clauses, all aimed at existing abuses."—W. Stubbs, *Early Plantagenets*, ch. 12.

1332-1370.—Wars of Edward III with Scotland. See SCOTLAND: 1332-1333; 1333-1370.

1333-1380.—Effects of the war with France.—"A period of great wars is generally favourable to the growth of a nobility. Men who equipped large bodies of troops for the Scotch or French wars, or who had served with distinction in them, naturally had a claim for reward at the hands of their sovereign. . . . The 13th century had broken up estates all over England and multiplied families of the upper class; the 14th century was consolidating properties again, and establishing a broad division between a few powerful nobles and the mass of the community. But if the gentry, as an order, lost a little in relative importance by the formation of a class of great nobles, more distinct than had existed before, the middle classes of England, its merchants and yeoman, gained very much in importance by the war. [See also YEOMEN.] Under the firm rule of the 'King of the Sea,' as his subjects lovingly called Edward III., our commerce expanded. Englishmen rose to an equality with the merchants of the Hanse Towns, the Genoese, or the Lombards, and England for a time overflowed with treasure. The first period of war, ending with the capture of Calais [see CALAIS: 1346-1347], secured our coasts; the second, terminated by the peace of Brétigny, [see BRÉTIGNY, TREATY OF (1360)] brought the plunder of half France into the English markets; and even when Edward's reign had closed on defeat and bankruptcy, and our own shores were ravaged by hostile fleets, it was still possible for private adventurers to retaliate invasion upon the enemy. . . . The romance of foreign conquest, of fortunes lightly gained and lightly lost, influenced English enterprise for many years to come. . . . The change to the lower orders during the reign arose rather from the frequent pestilences, which reduced the number of working men and made labour valuable, than from any immediate participation in the war. In fact, English serfs, as a rule, did not serve in Edward's armies. They

could not be men-at-arms or archers for want of training and equipment; and for the work of light-armed troops and foragers, the Irish and Welsh seem to have been preferred. The opportunity of the serfs came with the Black Death, while districts were depopulated, and everywhere there was a want of hands to till the fields and get in the crops. The immediate effect was unfortunate. . . . The indifference of late years, when men were careless if their villains stayed on the property or emigrated, was succeeded by a sharp inquisition after fugitive serfs, and constant legislation to bring them back to their masters. . . . The leading idea of the legislator was that the labourer, whose work had doubled or trebled in value, was to receive the same wages as in years past; and it was enacted that he might be paid in kind, and, at last, that in all cases of contumacy he should be imprisoned without the option of a fine. . . . The French war contributed in many ways to heighten the feeling of English nationality. Our trade, our language and our Church received a new and powerful influence. In the early years of Edward III.'s reign, Italian merchants were the great financiers of England, farming the taxes and advancing loans to the Crown. Gradually the instinct of race, the influence of the Pope, and geographical position, contributed, with the mistakes of Edward's policy, to make France the head, as it were, of a confederation of Latin nations. Genoese ships served in the French fleet, Genoese bowmen fought at Crécy [August 26, 1346], and English privateers retorted on Genoese commerce throughout the course of the reign. In 1376 the Commons petitioned that all Lombards might be expelled the kingdom, bringing amongst other charges against them that they were French spies. The Florentines do not seem to have been equally odious, but the failure of the great firm of the Bardi in 1345, chiefly through its English engagements, obliged Edward to seek assistance elsewhere; and he transferred the privilege of lending to the crown to the merchants of the rising Hanse Towns."—C. H. Pearson, *English history in the fourteenth century*, ch. 9.—"We may trace the destructive nature of the war with France in the notices of adjoining parishes thrown into one for want of sufficient inhabitants, 'of people impoverished by frequent taxation of our lord the king,' until they had fled, of churches allowed to fall into ruin because there were none to worship within their walls, and of religious houses extinguished because the monks and nuns had died, and none had been found to supply their places. . . . To the poverty of the country and the consequent inability of the nation to maintain the costly wars of Edward III., are attributed the enactments of sumptuary laws, which were passed because men who spent much on their table and dress were unable 'to help their liege lord' in the battle field."—W. Denton, *England in the 15th century*, introd., pt. 2.

1342.—Occupation of Brest. See BREST: 1342-1397.

1348-1349.—Black Death and its effects.—"The plague of 1349 . . . produced in every country some marked social changes. . . . In England the effects of the plague are historically prominent chiefly among the lower classes of society. The population was diminished to an extent to which it is impossible now even to approximate, but which bewildered and appalled the writers of the time; whole districts were thrown out of cultivation, whole parishes depopulated, the number of labourers was so much diminished that on the one hand the survivors demanded an extravagant rate

Maps prepared specially for the **NEW LARNED**  
 under direction of the editors and publishers.

of wages, and even combined to enforce it, whilst on the other hand the landowners had to resort to every antiquated claim of service to get their estates cultivated at all; the whole system of farming was changed in consequence, the great landlords and the monastic corporations ceased to manage their estates by farming stewards, and after a short interval, during which the lands with the stock on them were let to the cultivator on short leases, the modern system of letting was introduced, and the permanent distinction between the farmer and the labourer established."—W. Stubbs, *Constitutional history of England*, ch. 16, sect. 259.—See also AGRICULTURE: Medieval: 14th-17th centuries.—"On the first of August, 1348, the disease appeared in the seaport towns of Dorsetshire, and travelled slowly westwards and northwards, through Devonshire and Somersetshire to Bristol. In order, if possible, to arrest its progress, all intercourse with the citizens of Bristol was prohibited by the authorities of the county of Gloucester. These precautions were however taken in vain; the Plague continued to Oxford, and, travelling slowly in the same measured way, reached London by the first of November. It appeared in Norwich on the first of January, and thence spread northwards. . . . The mortality was enormous. Perhaps from one-third to one-half the population fell victims to the disease. Adam of Monmouth says that only a tenth of the population survived. Similar amplifications are found in all the chroniclers. We are told that 60,000 persons perished in Norwich between January and July, 1340. No doubt Norwich was at that time the second city in the kingdom, but the number is impossible. . . . It is stated that in England the weight of the calamity fell on the poor, and that the higher classes were less severely affected. But Edward's daughter Joan fell a victim to it and three archbishops of Canterbury perished in the same year. . . . All contemporary writers inform us that the immediate consequence of the Plague was a dearth of labour, and excessive enhancement of wages, and thereupon a serious loss to the landowners. To meet this scarcity the king issued a proclamation directed to the sheriffs of the several counties, which forbade the payment of higher than the customary wages, under the penalties of amercement. But the king's mandate was everywhere disobeyed. . . . Many of the labourers were thrown into prison; many to avoid punishment fled to the forests, but were occasionally captured and fined; and all were constrained to disavow under oath that they would take higher than customary wages for the future."—J. E. T. Rogers, *History of agriculture and prices in England*, v. 1, ch. 15.—See also BLACK DEATH.

1350-1400.—Chaucer and his relations to English language and literature.—"At the time when the conflict between church and state was most violent, and when Wyclif was beginning to draw upon himself the eyes of patriots, there was considerable talk at the English court about a young man named Geoffrey Chaucer, who belonged to the king's household, and who both by his personality and his connections enjoyed the favor of the royal family. . . . The young poet belonged to a well-to-do middle-class family who had many far-reaching connections, and even some influence with the court. . . . Even as a boy he may have heard his father, John Chaucer, the vintner of Thames Street, London, telling of the marvelous voyage he had made to Antwerp and Cologne in

the brilliant suite of Edward III in 1338. When a youth of sixteen or seventeen, Geoffrey served as a page or squire to Elizabeth, duchess of Ulster, first wife of Lionel, duke of Clarence, and daughter-in-law of the king. He bore arms when about nineteen years of age, and went to France in 1359, in the army commanded by Edward III. . . . This epoch formed a sort of 'Indian summer' to the age of chivalry, and its spirit found expression in great deeds of war as well as in the festivals and manners of the court. The ideal which men strove to realize did not quite correspond to the spirit of the former age. On the whole, people had become more worldly and practical, and were generally anxious to protect the real interests of life from the unwarranted interference of romantic aspirations. The spirit of chivalry no longer formed a fundamental element, but only an ornament of life—an ornament, indeed, which was made much of, and which was looked upon with a sentiment partaking of enthusiasm. . . . In the midst of this outside world of motley pomp and throbbing life Geoffrey could observe the doings of high and low in various situations. He was early initiated into court intrigues, and even into many political secrets, and found opportunities of studying the human type in numerous individuals and according to the varieties developed by rank in life, education, age, and sex. . . . Nothing has been preserved from his early writings. . . . The fact is very remarkable that from the first, or at least from a very early period, Chaucer wrote in the English language—however natural this may seem to succeeding ages in 'The Father of English Poetry.' The court of Edward III. favored the language as well as the literature of France; a considerable number of French poets and 'menestrels' were in the service and pay of the English king. Queen Philippa, in particular, showing herself in this a true daughter of her native Hainault, formed the centre of a society cultivating the French language and poetry. . . . But Chaucer did not let himself be led astray by examples such as these. It is possible that he would have found writing in French no easy task, even if he had attempted it. At any rate his bourgeois origin, and the seriousness of his vocation as poet, threw a determining weight into the scale and secured his fidelity to the English language with a commendable consistency."—B. Ten Brink, *History of English literature*, v. 2, pt. 1, bk. 4, ch. 4.—See also ENGLISH LITERATURE: 14th century.

1360.—Extent of possessions in France. See FRANCE: Maps of medieval period: 1154-1360.

1360-1414.—Lollards.—"The Lollards were the earliest 'Protestants' of England. They were the followers of John Wyclif, but before his time the nickname of Lollard had been known on the continent. A little brotherhood of pious people had sprung up in Holland, about the year 1300, who lived in a half-monastic fashion and devoted themselves to helping the poor in the burial of their dead; and, from the low chants they sang at the funerals—lollen being the old word for such singing—they were called Lollards. The priests and friars hated them and accused them of heresy, and a Walter Lollard, probably one of them, was burnt in 1322 at Cologne as a heretic, and gradually the name became a nickname for such people. So when Wyclif's 'simple priests' were preaching the new doctrines, the name already familiar in Holland and Germany, was given to them, and gradually became the name for that whole movement of religious reformation which grew up from the seed Wyclif sowed."—B. Herford, *Story of religion in England*, ch. 16.—"A turning point ar-

rived in the history of the reforming party at the accession of the house of Lancaster [1399]. King Henry the Fourth was not only a devoted son of the Church, but he owed his success in no slight measure to the assistance of the Churchmen, and above all to that of Archbishop Arundel. It was felt that the new dynasty and the hierarchy stood or fell together. A mixture of religious and political motives led to the passing of the well-known statute 'De hæretico comburendo' [q. v.] in 1401 and thenceforward Lollardy was a capital offence."—R. L. Poole, *Wycliffe and movements for reforms*, ch. 8.—"The abortive insurrection of the Lollards at the commencement of Henry V.'s reign [1413] under the leadership of Sir John Oldcastle, had the effect of adding to the penal laws already in existence against the sect." This gave to Lollardy a political character and made the Lollards enemies against the State, as is evident from the king's proclamation in which it was asserted "that the insurgents intended to 'destroy him, his brothers and several of the spiritual and temporal lords, to confiscate the possessions of the Church, to secularize the religious orders, to divide the realm into confederate districts, and to appoint Sir John Oldcastle president of the commonwealth.'"—T. P. Taswell-Langmead, *English constitutional history*, ch. 11.—"The early life of Wycliffe is obscure. . . . He emerges into distinct notice in 1360, ten years subsequent to the passing of the first Statute of Provisors, having then acquired a great Oxford reputation as a lecturer in divinity. . . . He was a man of most simple life; austere in appearance, with bare feet and russet mantle. As a soldier of Christ, he saw in his Great Master and his Apostles the patterns whom he was bound to imitate. By the contagion of example he gathered about him other men who thought as he did; and gradually, under his captaincy, these 'poor priests' as they were called—vowed to poverty because Christ was poor—vowed to accept no benefice' . . . spread out over the country as an army of missionaries, to preach the faith which they found in the Bible—to preach, not of relics and of indulgences, but of repentance and of the grace of God. They carried with them copies of the Bible which Wycliffe had translated, . . . and they refused to recognize the authority of the bishops, or their right to silence them. If this had been all, and perhaps if Edward III. had been succeeded by a prince less miserably incapable than his grandson Richard, Wycliffe might have made good his ground; the movement of the parliament against the pope might have united in a common stream with the spiritual move against the church at home, and the Reformation have been antedated by a century. He was summoned to answer for himself before the Archbishop of Canterbury in 1377. He appeared in court supported by the presence of John of Gaunt, Duke of Lancaster, the eldest of Edward's surviving sons, and the authorities were unable to strike him behind so powerful a shield. But the 'poor priests' had other doctrines. . . . His [Wycliffe's] theory of property, and his study of the character of Christ, had led him to the near confines of Anabaptism." The rebellion of Wat Tyler, which occurred in 1381, cast odium upon all such opinions. "So long as Wycliffe lived [he died in 1384], his own lofty character was a guarantee for the conduct of his immediate disciples; and although his favour had far declined, a party in the state remained attached to him, with sufficient influence to prevent the adoption of extreme measures against the 'poor priests.' . . . They were left unmolested for the next twenty years. . . . On the settlement of the

country under Henry IV. they fell under the general ban which struck down all parties who had shared in the late disturbances."—J. A. Froude, *History of England*, ch. 6.—"Wycliffe's translation of the Bible itself created a new era, and gave birth to what may be said never to have existed till then—a popular theology. . . . It is difficult in our day to imagine the impression such a book must have produced in an age which had scarcely anything in the way of popular literature, and which had been accustomed to regard the Scriptures as the special property of the learned. It was welcomed with an enthusiasm which could not be restrained, and read with avidity both by priests and laymen. . . . The homely wisdom, blended with eternal truth, which has long since enriched our vernacular speech with a multitude of proverbs, could not thenceforth be restrained in its circulation by mere pious awe or time-honoured prejudice. Divinity was discussed in ale-houses. Popular preachers made war upon old prejudices, and did much to shock that sense of reverence which belonged to an earlier generation. A new school had arisen with a theology of its own, warning the people against the delusive preaching of the friars, and asserting loudly its own claims to be true and evangelical, on the ground that it possessed the gospel in the English tongue. Appealing to such an authority in their favour, the eloquence of the new teachers made a marvellous impression. Their followers increased with extraordinary rapidity. By the estimate of an opponent they soon numbered half the population and you could hardly see two persons in the street but one of them was a Wycliffite. . . . They were supported by the powerful influence of John of Gaunt, who shielded not only Wycliffe himself, but even the most violent of the fanatics. And, certainly, whatever might have been Wycliffe's own view, doctrines were promulgated by his reputed followers that were distinctly subversive of authority. John Ball fomented the insurrection of Wat Tyler, by preaching the natural equality of men. . . . But the popularity of Lollardy was short-lived. The extravagance to which it led soon alienated the sympathies of the people, and the sect fell off in numbers almost as rapidly as it had risen."—J. Gairdner, *Studies in English history*, 1-2.—"Wyclif . . . was not without numerous followers, and the Lollardism which sprang out of his teaching was a living force in England for some time to come. But it was weak through its connection with subversive social doctrines. He himself stood aloof from such doctrines, but he could not prevent his followers from mingling in the social fray. It was perhaps their merit that they did so. The established constitutional order was but another name for oppression and wrong to the lower classes. But as yet the lower classes were not sufficiently advanced in moral and political training to make it safe to entrust them with the task of righting their own wrongs as they would have attempted to right them if they had gained the mastery. It had nevertheless become impossible to leave the peasants to be once more goaded by suffering into rebellion. The attempt, if it had been made, to enforce absolute labour-rents was tacitly abandoned, and gradually during the next century the mass of the villeins passed into the position of freemen. For the moment, nobles and prelates, landowners and clergy, banded themselves together to form one great party of resistance. The church came to be but an outwork of the baronage."—S. R. Gardiner and J. B. Mullinger, *Introduction to the study of English history*, pt. 1, ch. 5, sect. 14-15.

1377.—Accession of King Richard II.

1377-1399.—Character and reign of Richard II. —"Richard II. was a far superior man to many of the weaker kings of England; but being self-willed and unwarlike, he was unfitted for the work which the times required. Yet, on a closer inspection than the traditional view of the reign has generally encouraged, we cannot but observe that the finer qualities which came out in certain crises of his reign appear to have frequently influenced his conduct: His brilliant behaviour in the insurrection of 1381 indicated much more than mere possession of the Plantagenet courage and presence of mind. He showed a real sympathy with the villeins who had undeniable grievances. . . . His instincts were undoubtedly for freedom and forgiveness, and there is no proof, nor even probability, that he intended to use the villeins against his enemies. His early and happy marriage with Anne of Bohemia ought, one might think, to have saved him from the vice of favouritism; but he was at least more fortunate than Edward II. in not being cast under the spell of a Gaveston. [Piers Gaveston, the favorite of Edward II who was tried and beheaded by the barons in 1312.] When we consider the effect of such a galling government as that of his uncle Gloucester, and his cousin Derby, afterwards Henry IV., who seems to have been pushing Gloucester on from the first, we can hardly be surprised that he should require some friend to lean upon. The reign is, in short, from one, and perhaps the truest, point of view, a long duel between the son of the Black Prince and the son of John of Gaunt. [The Black Prince and John of Gaunt were sons of Edward III, Richard II was the son of the Black Prince, and Henry IV of Lancaster the son of John of Gaunt.] One or other of them must inevitably perish. A handsome and cultivated youth, who showed himself at fifteen every inch a king, who was married at sixteen, and led his own army to Scotland at eighteen, required a different treatment from that which he received. He was a man, and should have been dealt with as such. His lavish and reprehensible grants to his favourites were made the excuse for Gloucester's violent interference in 1386, but there is good ground for believing that the movement was encouraged by the anti-Wickliffite party, which had taken alarm at the sympathy with the Reformers shown at this time by Richard and Anne."—M. Burrows, *Commentaries on the history of England*, bk. 2, ch. 5.

1381.—Peasants' revolt.—"The peasants had other grievances besides the weight of taxation thrown on them by a Parliament in which they had no representatives. The landlords, finding it impossible to compel the acceptance of the low wages provided for by the Statute of Labourers,

had attempted to help themselves in another way. Before the Black Death the bodily service of villeins had been frequently commuted into a payment of money which had been its fair equivalent, but which, since the rise of wages consequent upon the Black Death, could not command anything like the amount of labour surrendered. The landlords in many places now declared the bargains to have been unfair, and compelled the villeins to render once more the old bodily service. The discontent which prevailed everywhere was fanned not merely by the attacks made by Wycliffe's poor priests upon the idle and inefficient clergy, but by itinerant preachers unconnected with Wycliffe, who denounced the propertied classes in general. One of these, John Ball, a notorious assailant of the gentry, had been thrown into prison. . . . From one end of England to another the revolt spread. The parks of the gentry were broken into, the deer killed, the fish-ponds emptied. The court-rolls which testified to the villeins' services were burnt, and lawyers and all others connected with the courts were put to death without mercy. From Kent and Essex 100,000 enraged peasants, headed by Wat Tyler and Jack Straw, released John Ball from gaol and poured along the roads to London. They hoped to place the young Richard at their head against their enemies the gentry. . . . The peasants had sympathisers in London itself, who allowed them to break into the city. Lancaster's palace of the Savoy and the houses of lawyers and officials were sacked and burnt. All the lawyers who could be found were murdered, and others who were not lawyers shared their fate. The mob broke into the Tower, and beheaded Simon of Sudbury, Archbishop of Canterbury, who had, as Chancellor, proposed the obnoxious taxes to Parliament. The boy-king met the mob at Mile-End, and promised to abolish villeinage in England. Charters of manumission were drawn out and sealed, and a great part of the insurgents returned contentedly home. About 30,000, however, remained behind. When Richard came amongst them at Smithfield, Wat Tyler threatened him, and Walworth, the Mayor of London, slew Wat Tyler with his dagger. A shout for vengeance was raised. With astonishing presence of mind Richard rode forward. 'I am your king,' he said; 'I will be your leader.' His boldness inspired the insurgents with confidence, and caused them to desist from their threats and to return to their homes. In the country the gentry, encouraged by the failure of the insurgents in London, recovered their courage. The insurrection was everywhere vigorously suppressed. Richard ordered the payment of all services due, and revoked the charters he had granted. The judges on their circuits hanged the ringleaders without mercy. When Parliament met it directed that the charters of manumission should be cancelled. Lords and Commons alike stood up for the rich against the poor, and the boy-king was powerless to resist them, and it is possible that he did not wish to do so. The villeinage into which the peasants had been thrust back could not, indeed, endure long, because service unwillingly rendered is too expensive to be maintained. Men were, however, no longer in a mood to listen to reformers. Great noblemen, whose right to the services of their villeins had been denied, now made common cause with the great churchmen. The propertied classes, lay and clerical, instinctively saw that they must hang together."—S. R. Gardiner, *Students' history of England*, pp. 268-269.

1399.—Accession of King Henry IV.

1399-1471.—House of Lancaster.—This name is given in English history to the family which became royal in the person of Henry of Bolingbroke, duke of Lancaster, who deposed his cousin, Richard II, or forced him to abdicate the throne, and who was crowned king (Henry IV), October 11, 1399, with what seemed to be the consent of the nation. He not only claimed to be the next in succession to Richard, but he put forward a claim of descent through his mother, more direct than Richard's had been, from Henry III. "In point of fact Henry was not the next in succession. His father, John of Gaunt [or John of Ghent, in which city he was born], was the fourth son of Edward III., and there were descendants of that king's third son, Lionel Duke of Clarence, living. . . . At one time Richard himself had designated as his successor the nobleman who really stood next to him in the line of descent. This was Roger Mortimer, Earl of March, the same who was killed by the rebels in Ireland. This Roger had left a son Edmund to inherit his title, but Edmund was a mere child, and the inconvenience of another minority could not have been endured."—J. Gairdner, *Houses of Lancaster and York*, ch. 2.—As for Henry's pretensions through his mother, they were founded upon what Mr. Gairdner calls an "idle story," that "the eldest son of Henry III, was not king Edward, but his brother Edmund Crouchback, Earl of Lancaster, who was commonly reputed the second son; and that this Edmund had been purposely set aside on account of his personal deformity. The plain fact of the matter was that Edmund Crouchback was six years younger than his brother Edward I.; and that his surname Crouchback had not the smallest reference to personal deformity, but only implied that he wore the cross upon his back as a crusader." Mr. Wylie ("History of England under Henry IV," v. 1, ch. 1) represents that this latter claim was put forward under the advice of the leading jurists of the time, to give the appearance of a legitimate succession; whereas Henry took his real title from the will and assent of the nation. Nevertheless his position was insecure, and harassed by factions, he became cruel and calculating whereas by nature he was temperate and merciful, with statesmanlike qualities. Henry IV was succeeded by his vigorous son, Henry V and he in turn by a feeble son, Henry VI, during whose reign England was torn by intrigues and factions, ending in the lamentable civil wars known as the "Wars of the Roses," the deposition of Henry VI and the acquisition of the throne by the "House of York," in the persons of Edward IV and Richard III. It was a branch of the house of Lancaster that reappeared, after the death of Richard III, in the royal family better known as the Tudors.

1413.—Accession of King Henry V.

1413-1422.—Parliamentary gains under Henry V.—"What the sword had won the sword should keep, said Henry V. on his accession; but what was meant by the saying has its comment in the fact that, in the year which witnessed his victory at Agincourt [1415], he yielded to the House of Commons the most liberal measure of legislation which until then it had obtained. The dazzling splendour of his conquests in France had for the time cast into the shade every doubt or question of his title, but the very extent of those gains upon the French soil established more decisively the worse than uselessness of such acquisitions to the English throne. The distinction of Henry's reign in constitutional history will always be, that from it dates that power, indispensable to a free and limited monarchy, called Privilege of Parliament; the shield and buckler under which all the battles of liberty and good government were fought in the after time. Not only were its leading safeguards now obtained, but at once so firmly established, that against the shock of incessant resistance in later years they stood perfectly unmoved. Of the awful right of impeachment, too, the same is to be said. It was won in the same reign, and was never afterwards lost."—J. Forster, *Historical and biographical essays*, v. 1, p. 207.—Parliament made strides during the entire Lancastrian period. In Henry IV's reign "they forced the king to agree that he would do nothing without the consent of a continual Council of their own choosing. Had this scheme remained permanent the present cabinet system would have been anticipated by many centuries. . . . [and] they [parliament] secured recognition of the important principle that money grants should originate in the Commons."—A. L. Cross, *Shorter history of England and Greater Britain*, p. 163.

1415-1422.—Conquests of Henry V in France. See FRANCE: 1415; 1417-1422.

1422.—Accession of King Henry VI.

1422-1455.—Opening years of reign of Henry VI.—Henry VI was not a year old when his father died. Henry V had appointed his brother John (duke of Bedford) regent of France and his younger brother Humphrey (duke of Gloucester) regent of England, but Parliament, suspicious of Gloucester, who was of a quarrelsome disposition, set aside the king's will and made Bedford protector of the realm. Gloucester soon became embroiled with his uncle Cardinal Beaufort, bishop of Winchester, and, in 1425, the dispute between them was prevented from becoming open warfare only by the restraint of Beaufort, whom Gloucester had accused of disloyalty, and by the conciliatory powers of Bedford, who hurried over from France to patch up the quarrel. Gloucester, however, could not be kept quiet, and in order to reduce his power of mischief the king was crowned in 1429 and the protectorate ended. But he still had great influence which he continued to use to thwart the plans of Beaufort, and later of Suffolk. From the first, therefore, the reign of Henry VI was disturbed, and the political events of his reign were largely composed of the struggles between

powerful families, who imposed their wills on Parliament and the Council. Bedford died in 1435, worn out by his efforts to win the war in France, and keep the domestic peace which was constantly being broken by the activities of Gloucester. After Bedford's death, Beaufort took the helm, and undertook the king's education in government. But he was an old man, and the direction of affairs fell into the hands of his nephew Edmund Beaufort whose military incapacity caused the loss of Guienne and Normandy, and of the duke of Suffolk, who arranged the marriage of the king with Margaret of Anjou, in 1445. The price of this marriage was the cession of Maine and Anjou and to add to the unpopularity which, for this reason, awaited her in England, the queen attached herself to the faction headed by Beaufort and Suffolk, and brought them into strong favor with the weak king.

1450.—Cade's rebellion.—A formidable rebellion broke out in Kent, under the leadership of one Jack Cade, 1450. Overtaxation, the bad management of the council, the extortion of the subordinate officers, the injustice of the king's bench, the abuse of the right of purveyance (system of obtaining supplies for the king's household, at a valuation fixed by the purveyors), the "enquestes" and ameracements, and the illegitimate control of elections were the chief causes of the rising of 1450. "The rising was mainly political, only one complaint was economical, not a single one was religious. We find not a single demand for new legislation. . . . The movement was by no means of a distinctly plebeian or disorderly character, but was a general and organized rising of the people at large. It was a political upheaval. We find no trace of socialism or of democracy. . . . The commons in 1450 arose against Lancaster and in favor of York. Their rising was the first great struggle in the Wars of the Roses."—Kriehn, *Rising in 1450*, ch. 4, 7.—Cade and his rebels took possession of London; but they were beaten in a battle and forced to quit the city. Cade and some followers continued to be turbulent and soon afterwards he was killed.—J. Gairdner, *Houses of Lancaster and York*, ch. 7, sect. 6.

1455.—Demoralized state of the nation.—Effects of the wars in France.—"The whole picture of the times is very depressing on the moral if not on the material side. There are few more pitiful episodes in history than the whole tale of the reign of Henry VI, the most unselfish and well-intentioned king that ever sat upon the English throne—a man of whom not even his enemies and oppressors could find an evil word to say; the troubles came, as they confessed, 'all because of his false lords, and never of him.' We feel that there must have been something wrong with the heart of a nation that could see unmoved the meek and holy king torn from wife and child, sent to wander in disguise up and down the kingdom for which he had done his poor best, and finally doomed to pine for five years a prisoner in the fortress where he had so long held his royal Court. Nor is our first impression concerning the demoralisation of England wrong. Every line that we read bears home to us mofe and more

the fact that the nation had fallen on evil times. First and foremost among the causes of its moral deterioration was the wretched French War, a war begun in the pure spirit of greed and ambition,—there was not even the poor excuse that had existed in the time of Edward III—carried on by the aid of hordes of debauched foreign mercenaries . . . and persisted in long after it had become hopeless, partly from misplaced national pride, partly because of the personal interests of the ruling classes. Thirty-five years of a war that was as unjust as it was unfortunate had both soured and demoralised the nation. . . . When the final catastrophe came and the fights of Formigny [or Fourmigny] and Chatillon [Castillon] ended the chapter of our disasters [1449-1453], the nation began to cast about for a scapegoat on whom to lay the burden of its failures. At first the unfortunate Suffolk and Somerset had the responsibility laid upon them [for the disasters at home and abroad]; a little later the outcry became more bold and fixed upon the Lancastrian dynasty itself as being to blame not only for disaster abroad, but for want of governance at home. If King Henry had understood the charge, and possessed the wit to answer it, he might fairly have replied that his subjects must fit the burden upon their own backs, not upon his. The war had been weakly conducted, it was true; but weakly because the men and money for it were grudged. . . . At home, the bulwarks of social order seemed crumbling away. Private wars, riot, open highway robbery, murder, abduction, armed resistance to the law, prevailed on a scale that had been unknown since the troublous times of Edward II.—we might almost say since the evil days of Stephen. But it was not the Crown alone that should have been blamed for the state of the realm. The nation had chosen to impose over-stringent constitutional checks on the kingly power before it was ripe for self-government, and the Lancastrian house sat on the throne because it had agreed to submit to those checks. If the result of the experiment was disastrous, both parties to the contract had to bear their share of the responsibility. But a nation seldom allows that it has been wrong; and Henry of Windsor had to serve as a scapegoat for all the misfortunes of the realm, because Henry of Bolingbroke [Henry IV] had committed his descendants to the unhappy compact. Want of a strong central government was undoubtedly the complaint under which England was labouring in the middle of the 15th century, and all the grievances against which outcry was made were but symptoms of one latent disease. . . . All these public troubles would have been of comparatively small importance if the heart of the nation had been sound. The phenomenon which makes the time so depressing is the terrible decay in private morals since the previous century. . . . There is no class or caste in England which comes well out of the scrutiny. The Church, which had served as the conscience of the nation in better times, had become dead to spiritual things. It no longer produced either men of saintly life or learned theologians or patriotic statesmen. . . . The baronage of England had often been unruly, but it had never before developed the two vices which distinguished it in the times of the Two Roses—a taste for indiscriminate bloodshed and a turn for political apostasy. . . . Twenty years spent in contact with French factions, and in command of the godless mercenaries who formed the bulk of the English armies, had taught our nobles lessons of cruelty and faithlessness such as they had not before imbibed. . . . The knights and squires showed on a

smaller scale all the vices of the nobility. Instead of holding together and maintaining a united loyalty to the Crown, they bound themselves by solemn sealed bonds and the reception of 'liveries' each to the baron whom he preferred. This fatal system, by which the smaller landholder agreed on behalf of himself and his tenants to follow his greater neighbour in peace and war, had ruined

turn, when they had ascertained that their own persons and property were not endangered by so doing. A town, it has been remarked, seldom or never stood a siege during the Wars of the Roses, for no town ever refused to open its gates to any commander with an adequate force who asked for entrance."—C. W. Oman, *Warwick the king-maker*, ch. 1.

ENGLAND AND WALES DURING THE WARS OF THE ROSES

the military system of England, and was quite as dangerous as the ancient feudalism. . . . If the gentry constituted themselves the voluntary followers of the baronage, and aided their employers to keep England unhappy, the class of citizens and burgesses took a very different line of conduct. If not actively mischievous, they were solidly inert. They refused to entangle themselves in politics at all. They submitted impassively to each ruler in

1455-1471.—Wars of the Roses.—“The close of the Hundred Years' War was followed in England by the Wars of the Roses, between the rival houses which were struggling for the crown. The badge of the house of Lancaster to which Henry VI belonged was a red rose, and that of the duke of York [on his mother's side Richard, duke of York, was more directly descended from Edward III than was Henry VI] who proposed to push him

off the throne, was a white one."—J. H. Robinson, *History of Western Europe*, p. 296.—"As early as the time of John of Ghent, the rose was used as an heraldic emblem, and when he married Blanche, the daughter of the Duke of Lancaster, he used the red rose for a device. Edmund of Langley, his brother, the fifth son of Edward III., adopted the white rose in opposition to him. . . . There is, however, no authentic account of the precise period when these badges were first adopted."—Mrs. Hookham, *Life and times of Margaret of Anjou*, v. 2, ch. 1.—"The name [Wars of the Roses] is not strictly correct, however, for while the white rose was the symbol of the Yorkists, the red rose was not a Lancastrian symbol. It was first used by Henry Tudor at Bosworth in 1485."—A. L. Cross, *Shorter history of England and Greater Britain*, p. 171.—"Each party was supported by a group of the wealthy and powerful nobles whose rivalries, conspiracies, treasons, murders, and executions fill the annals of England during the period which we have been discussing. Vast estates had come into the hands of the higher nobility by inheritance, and marriages with wealthy heiresses. Many of the dukes and earls were related to the royal family and consequently were inevitably drawn into the dynastic struggles. The nobles no longer owed their power to vassals who were bound to follow them to war. Like the king, they relied upon hired soldiers. It was easy to find plenty of restless fellows who were willing to become the retainers of a nobleman if he would agree to clothe them with his livery and keep open house, where they might eat and drink their fill. Their master was to help them when they got into trouble, and they on their part were expected to intimidate, misuse, and even murder at need those who opposed the interests of their chief. When the French war was over, the unruly elements of society poured back across the Channel and, as retainers of the rival lords, became the terror of the country. They bullied judges and juries, and helped the nobles to control the selection of those who were sent to Parliament."—J. H. Robinson, *History of Western Europe*, p. 296.—Beginning with a battle fought at St. Albans on May 23, 1455, England was kept in a pitiable state of civil war, with short intervals of troubled peace, during thirty years. The immediate cause of trouble was in the feebleness of King Henry VI, . . . whose mind, never strong, gave way under the trials of his position when he came to manhood. The control of the government, thus weakly commanded, became a subject of strife between successive factions. The final leaders in such contests were Queen Margaret of Anjou, the energetic consort of the helpless king (with the king himself sometimes in a condition of mind to cooperate with her), on one side, and, on the other side, the duke of York, . . . who had strong claims to the throne if Henry should leave no heir. The battle at St. Albans was a victory for the Yorkists and placed them in power for the next two years, the duke of York being named Protector. In 1456 the king recovered so far as to resume the reins of government, and in 1459 there was a new rupture between the factions. The queen's adherents were beaten in the battle of Bloreheath, September 23 of that year; but defections in the ranks of the Yorkists soon obliged the latter to disperse and their leaders, York, Warwick and Salisbury, fled to Ireland and to Calais. In June, 1460, the earls of Warwick, Salisbury and March (the latter being the eldest son of the duke of York) returned to England and gathered an army speedily, the city of London opening its gates to them. The

king's forces were defeated at Northampton (July 10) and the king taken prisoner. A Parliament was summoned and assembled in October. Then the duke of York came over from Ireland, took possession of the royal palace and laid before Parliament a solemn claim to the crown. After much discussion a compromise was agreed upon, under which Henry VI should reign undisturbed during his life and the duke of York should be his undisputed successor. This was embodied in an act of Parliament and received the assent of the king; but Queen Margaret who had retired into the north, refused to surrender the rights of her infant son, and a strong party sustained her. The duke of York attacked these Lancastrian forces rashly, at Wakefield, December 30, 1460 [see WAKEFIELD, BATTLE OF] and was slain on the field of a disastrous defeat. The queen's army, then, marching towards London, defeated the earl of Warwick at St. Albans, February 17, 1461 (the second battle of the war at that place), and recovered possession of the person of the king. But Edward, earl of March (now become duke of York, by the death of his father), who had just routed a Lancastrian force at Mortimer's Cross, in Wales, joined his forces with those of Warwick and succeeded in occupying London, which steadily favored his cause. Calling together a council of lords, Edward persuaded them to declare King Henry deposed, on the ground that he had broken the agreement made with the late duke of York. (Henry, and the two preceding Lancastrian kings were declared usurpers.) The next step was to elect Edward king, and he assumed the royal title and state at once. The new king lost no time in marching northwards against the army of the deposed sovereign, which lay near York. On March 27 the advanced division of the Lancastrians was defeated at Ferrybridge, and, two days later, their main body was almost destroyed in the fearful battle of Towton,—said to have been the bloodiest encounter that ever took place on English soil. (See TOWTON, BATTLE OF.) King Henry took refuge in Scotland and Queen Margaret repaired to France. In 1464 Henry reappeared in the north with a body of Scots and refugees and there were risings in his favor in Northumberland, which the Yorkists crushed in the successive battles of Hedgeley Moor and Hexham. The Yorkist king (Edward IV) now reigned without much disturbance until 1470, when he quarreled with the powerful earl of Warwick—"the king-maker," whose strong hand had placed him on the throne. Warwick then passed to the other side, offering his services to Queen Margaret and leading an expedition which sailed from Harfleur in September, convoyed by a French fleet. Edward found himself unprepared to resist the Yorkist risings which, deserting him, welcomed Warwick, and he fled to Holland, seeking aid from his brother-in-law, the duke of Burgundy. For nearly six months, the kingdom was in the hands of Warwick and the Lancastrians; the unfortunate Henry VI, released from captivity in the Tower, was once more seated on the throne. But on March 14, 1471, Edward reappeared in England, landing at Ravenspur, professing that he came only to recover his dukedom of York. As he moved southwards he gathered a large force of supporters and soon reassumed the royal title and pretensions. London opened its gates to him, and, on April 14—exactly one month after his landing—he defeated his opponents at Barnet, where Warwick, "the king-maker"—the last of the great feudal barons—was slain. (See BARNET, BATTLE OF.) Henry, again a captive, was sent back to the Tower. But Henry's dauntless

queen, who landed at Weymouth with a body of French allies on the very day of the disastrous *Barnet* fight, refused to submit. Cornwall and Devon were true to her cause and gave her an army with which she fought the last battle of the war at *Tewksbury* on May 4. (See *TEWKSBURY, BATTLE OF*.) Defeated and taken prisoner, her young son slain—whether in the battle or after it is unknown—the long contention of *Margaret of Anjou* ended on that bloody field. A few days later, when the triumphant Yorkist King *Edward* entered London, his poor, demented Lancastrian rival died suddenly and suspiciously in the Tower.—Based on Mrs. Hookham, *Life and times of Margaret of Anjou*, v. 2, ch. 1.

1461.—Accession of King *Edward IV*.

1461-1485.—House of York.—The house of York, which triumphed in the Wars of the Roses, attaining the throne in the person of *Edward IV* (1461), derived its claim to the crown through descent, in the female line, from *Lionel*, duke of *Clarence*, the third son of *Edward III* (the second son who lived to manhood and left children); while the house of Lancaster traced its lineage to *John of Gaunt*, a younger son of the same king *Edward III*, but the line of Lancastrian succession was through males. "Had the crown followed the course of hereditary succession, it would have devolved on the posterity of *Lionel*. . . . By the decease of that prince without male issue, his possessions and pretensions fell to his daughter *Philippa*, who by a singular combination of circumstances had married *Roger Mortimer*, earl of *March*, the male representative of the powerful baron who was attainted and executed for the murder of *Edward II*., the grandfather of the duke of *Clarence*. The son of that potent delinquent had been restored to his honours and estates at an advanced period in the reign of *Edward III*. . . . *Edmund*, his grandson, had espoused *Philippa* of *Clarence*. *Roger Mortimer*, the fourth in descent from the regicide, was lord lieutenant of *Ireland* and was considered, or, according to some writers, declared to be heir of the crown in the early part of *Richard's* reign. *Edmund Mortimer*, earl of *March*, in whom the hereditary claim to the crown was vested at the deposition of *Richard*, was then only an infant of ten years of age. . . . Dying without issue, the pretensions to the crown, which he inherited through the duke of *Clarence*, devolved on his sister *Anne Mortimer*, who espoused *Richard of York*, earl of *Cambridge*, the grandson of *Edward III*, by his fourth [fifth] son *Edmund of Langley*, duke of *York*. [*Edward IV* was the grandson of this *Anne Mortimer* and *Richard of York*.]—*J. Mackintosh, History of England*, v. 1, pp. 338-339.—The house of York occupied the throne but twenty-four years. On the death of *Edward IV*, in 1483, the crown was secured by his brother, *Richard*, duke of *Gloucester*, who caused *Edward's* two sons to be murdered in the Tower. The elder of these murdered princes is named in the list of English kings as *Edward V*; but he cannot be said to have reigned. *Richard III* was overthrown and slain on *Bosworth* field in 1485.

1471-1485.—New monarchy.—Rise of Absolutism and the decline of parliamentary government.—"If we use the name of the New Monarchy to express the character of the English sovereignty from the time of *Edward IV*. to the time of *Elizabeth*, it is because the character of the monarchy during this period was something wholly new in our history. There is no kind of similarity between the kinship of the Old English, of the Norman, the Angevin, or the Plantagenet sovereigns, and the kinship of the Tudors. . . .

What the Great Rebellion in its final result actually did was to wipe away every trace of the New Monarchy, and to take up again the thread of our political development just where it had been snapped by the Wars of the Roses. . . . The founder of the New Monarchy was *Edward IV*. . . . While jesting with aldermen, or dallying with his mistresses, or idling over the new pages from the printing press [*Caxton's*] at Westminster, *Edward* was silently laying the foundations of an absolute rule which *Henry VII*. did little more than develop and consolidate. The almost total discontinuance of Parliamentary life was in itself a revolution. Up to this moment the two Houses had played a part which became more and more prominent in the government of the realm. . . . Under *Henry VI*. an important step in constitutional progress had been made by abandoning the old form of presenting the requests of the Parliament in the form of petitions which were subsequently moulded into statutes by the Royal Councils; the statute itself, in its final form, was now presented for the royal assent, and the Crown was deprived of its former privilege of modifying it. Not only does this progress cease, but the legislative activity of Parliament itself comes abruptly to an end. . . . The necessity for summoning the two Houses had, in fact, been removed by the enormous tide of wealth which the confiscation of the civil war poured into the royal treasury. . . . It was said that nearly a fifth of the land had passed into the royal possession at one period or another of the civil war. *Edward* added to his resources by trading on a vast scale. . . . The enterprises he had planned against France . . . enabled *Edward* not only to increase his hoard, but to deal a deadly blow at liberty. Setting aside the usage of loans sanctioned by the authority of Parliament, *Edward* called before him the merchants of the city and requested from each a present or benevolence in proportion to the need. Their compliance with his prayer was probably aided by his popularity with the merchant class; but the system of benevolence was soon to be developed into the forced loans of *Wolsey* and the ship-money of *Charles I*."—*J. R. Green, Short history of the English people*, ch. 6, sect. 3.

1482.—*Edward IV* supports *Alexander*, duke of *Albany* in his claim to the Scottish throne. See SCOTLAND: 1482-1488.

1483-1485.—Murder of the young king, *Edward V*.—Accession of *Richard III*.—Battle of *Bosworth* and the fall of the House of York.—On the death of *Edward IV*, in 1483, his crafty and unscrupulous brother, *Richard*, duke of *Gloucester*, gathered quickly into his hands the reins of power, proceeding with consummate audacity and ruthlessness to sweep every strong rival out of his path. Contenting himself for a few weeks, only, with the title of Protector, he soon disputed the validity of his brother *Edward's* marriage. [*Edward* married *Elizabeth*, a widowed daughter of *Richard Woodville*, a family of Lancastrian connection] caused an obsequious Parliament to set aside the young sons whom the latter had left, declaring them to be illegitimate, and placed the crown on his own head. The little princes (*King Edward V*, and *Richard*, duke of *York*), immured in the Tower, were murdered presently at their uncle's command, and *Richard*

III appeared, for the time, to have triumphed in his ambitious villainy. But, popular as he made himself in many cunning ways, his deeds excited a horror which united Lancastrians with the party of York in a common detestation. Friends of Henry, earl of Richmond, then in exile, were not slow to take advantage of this feeling. Henry could claim descent from the same John of Gaunt, son of Edward III, to whom the house of Lancaster traced its lineage; but his family—the Beauforts—sprang from the mistress, not the wife, of the great duke of Lancaster, and had only been legitimated by act of Parliament. The Lancastrians, however, were satisfied with the royalty of his blood, and the Yorkists were made content by his promise to marry a daughter of Edward IV. On this understanding being arranged, Henry came over from Brittany to England, landing at Milford Haven on August 7 or 8, 1485, and advancing through Wales, being joined by great numbers as he moved. Richard, who had no lack of courage, marched quickly to meet him, and the two forces joined battle on Bosworth Field, in Leicestershire, on Sunday, August 21. At the outset of the fighting Richard was deserted by a large division of his army and saw that his fate was sealed. He plunged, with despairing rage, into the thickest of the struggle and was slain. His crowned helmet, which he had worn, was found by Sir Reginald Bray, battered and broken, under a hawthorn bush, and placed on the head of his rival, who soon attained a more solemn coronation, as Henry VII.—C. M. Yonge, *Cameos from English history, 3d Series, c. 19-20*.—"As king he [Richard III] seems really to have studied his country's welfare, passed good laws, endeavoured to put an end to extortion, declined the free gifts offered to him by several towns, and declared he would rather have the hearts of his subjects than their money. His munificence was especially shown in religious foundations. . . . His hypocrisy was not of the vulgar kind which seeks to screen habitual baseness of motive by habitual affection of virtue. His best and his worst deeds were alike too well known to be either concealed or magnified; at least, soon after he became king, all doubt upon the subject must have been removed. . . . His ingratiating manners, together with the liberality of his disposition, seem really to have mitigated to a considerable extent the alarms created by his fitful deeds of violence. The reader will not require to be reminded of Shakespeare's portrait of a murderer who could cajole the woman whom he had most exasperated and made a widow into marrying himself. That Richard's ingenuity was equal to this extraordinary feat we do not venture to assert; but that he had a wonderful power of reassuring those whom he had most intimidated and deceiving those who knew him best there can be very little doubt. . . . His taste in building was magnificent and princely. . . . With such a one did the long reign of the Plantagenets terminate. The fierce spirit and the valour of the race never showed more strongly than at the close. The Middle Ages, too, as far as England was concerned, may be said to have passed away with Richard III."—J. Gairdner, *History of the life and reign of Richard the Third, introd. and ch. 6*.

1485.—Effects of the Wars of the Roses.—"It is astonishing to observe the rapidity with which it [the English nation] had settled down to order in the reign of Henry VII. after so many years of civil dissension. It would lead us to infer that

those wars were the wars of a class, and not of the nation; and that the effects of them have been greatly exaggerated. With the single exception of Cade's rebellion, they had nothing in common with the revolutions of later or earlier times. They were not wars against classes, against forms of government, against the order or the institutions of the nation. It was the rivalry of two aristocratic factions struggling for superiority, neither of them hoping or desiring, whichever obtained the upper hand, to introduce momentous changes in the State or its administration. The main body of the people took little interest in the struggle; in the towns at least there was no intermission of employment. The war passed over the nation, ruffling the surface, toppling down high cliffs here and there, washing away ancient landmarks, attracting the imagination of the spectator by the mightiness of its waves, and the noise of its thunders; but the great body below the surface remained unmoved. No famines, no plagues, consequent on the intermittance of labour caused by civil war, are recorded; even the prices of land and provisions scarcely varied more than they have been known to do in times of profoundest peace. But the indirect and silent operation of these conflicts was much more remarkable. It reft into fragments the confederated ranks of a powerful territorial aristocracy which had hitherto bid defiance to the King, however popular, however energetic. Henceforth the position of the Sovereign in the time of the Tudors, in relation to all classes of the people, became very different from what it had been: the royal supremacy was no longer a theory, but a fact. Another class had sprung up on the decay of the ancient nobility. The great towns had enjoyed uninterrupted tranquillity, and even flourished, under the storm that was scourging the aristocracy and the rural districts. Their population had increased by numbers whom fear or the horrors of war had induced to find shelter behind stone walls. The diminution of agricultural labourers converted into soldiers by the folly of their lords had turned corn-lands into pasture, requiring less skill, less capital, and less labour."—J. S. Brewer, *Reign of Henry VIII, v. 1, ch. 2*.—"Those who would estimate the condition of England aright should remember that the War of the Roses was only a repetition on a large scale of those private wars which distracted almost every county, and, indeed, by taking away all sense of security, disturbed almost every manor and every class of society during the same century. . . . The lawless condition of English society in the 15th century resembled that of Ireland in as recent a date as the beginning of the 19th century. . . . In both countries women were . . . violated. . . . Children were seized and thrown into a dungeon until ransomed by their parents."—W. Denton, *England in the 15th century, ch. 3*.—"The Wars of the Roses which filled the second half of the 15th century furnished the barons with an arena in which their instincts of violence had freer play than ever; it was they who, under the pretext of dynastic interests which had ceased to exist, of their own free choice prolonged the struggle. Altogether unlike the Italian condottieri, the English barons showed no mercy to their own order; they massacred and exterminated each other freely, while they were careful to spare the commonalty. Whole families were extinguished or submerged in the nameless mass of the nation, and their estates by confiscation or escheat helped to swell the royal domain. When Henry VII. had stifled the last movements of rebellion and had punished, through the Star Chamber, those nobles who were still sus-

pected of maintaining armed bands, the baronage was reduced to a very low ebb; not more than twenty-nine lay peers were summoned by the king to his first Parliament. The old Norman feudal nobility existed no longer; the heroic barons of the great charter barely survived in the persons of a few doubtful descendants; their estates were split up or had been forfeited to the Crown. A new class came forward to fill the gap, that rural middle class which was formed . . . by the fusion of the knights with the free landowners. It had already taken the lead in the House of Commons, and it was from its ranks that Henry VII. chose nearly all the new peers. A peerage renewed almost throughout, ignorant of the habits and traditions of the earlier nobility, created in large batches, closely dependent on the monarch who had raised it from little or nothing and who had endowed it with his bounty—this is the phenomenon which confronts us at the end of the fifteenth century."

—E. Boutmy, *English constitution*, ch. 5.

1485.—Accession of King Henry VII.

1485-1509.—Character and reign of Henry VII.—Yorkist uprisings.—Star chamber.—Increase in the royal treasury.—Foreign alliances.—Tudor inheritance of the royal power made legal.—"Henry VII, first of the Tudor line, came to the throne well fitted for the task before him. His youth had been spent in prison or in exile, and discipline had taught him self-control and moderation. To stern resolution he united great patience and the tact that marked the greatest of his house. His tastes were literary and artistic, and the learned men of his time were his friends. Henry had little chance to indulge the gentler sides of his character, for his reign was one continuous struggle to make secure the throne which treachery had given him. On Bosworth Field Lord Stanley placed the crown of England on Henry's head, but it took twenty years of ceaseless effort to make good the title. . . . During the first fifteen years of Henry's reign, several attempts were made by the Yorkist party to overthrow him. Two of these plots were especially significant of the lawless and reckless conditions that had so long prevailed. In 1487 a youth presented himself in Ireland as Edward, Earl of Warwick. In reality, the fellow's name was Lambert Simnel. . . . With a force of Irish and German, Simnel invaded Lancashire, but the people did not rise, and he was easily defeated at the battle of Stoke. . . . Henry, with contemptuous moderation, spared his life, but made him turnspit in the royal kitchen. Five years later a similar attempt was made to usurp the throne. This time it was a roving trader of Tournay, Perkin Warbeck by name, who landed in Cork, and was believed by the discontented and impressionable Irish to be Richard, the younger of the two princes, popularly supposed to have been murdered in the Tower by Richard III. . . . James IV of Scotland recognized his claims, and Flanders and France gave him aid. But, as before, England refused to rise, and an attempt to invade Cornwall (1497) ended in Warbeck's capture and imprisonment.

"The easy suppression of the Yorkist risings was largely the result of Henry's wise policy. In many ways his reign may be looked upon as a continuation of that of Edward IV. The first Tudor, like the last York, strove to establish firm government, and to make himself independent of Parliament. To secure his realm from attack from abroad was the object that controlled his foreign relations. . . . In severe measures toward the nobility Henry was sure of popular support. . . . Henry began at once to reduce their power. . . . To remedy the

weakness of the ordinary courts in dealing with great offenders, Henry established in 1487 a new tribunal, that could neither be bribed nor bullied. The Court of the Star Chamber, as the new court was called, was made up of certain members of the Privy Council and two judges, and was the first of the great councils through which Henry and his successors governed the kingdom. Henry also diminished the political power of the nobles by placing the administration largely in the hands of churchmen or of men whom he himself had raised to eminence. While thus weakening the power of the barons, Henry strove to gain the support of the lower classes, by encouraging trade and commerce. He was quick to see the advantage to himself and to the country in the presence of powerful industrial interests, which would balance the influence of the noble class and would increase the national wealth. He therefore fostered the resources of the kingdom and strove to remedy any causes for decline. Henry realized that the weakness of the crown in the fifteenth century was due in great measure to the poverty of the treasury, and throughout his reign he strove to make good the lack. As representative of the united Lancastrian and Yorkist lines he inherited the possessions of both. He was careful, almost parsimonious, in his expenditures. The few wars in which he engaged were made to pay for themselves. . . . An important source of the royal revenue was the judicial fines which were imposed for infractions of the law. In the latter part of Henry's reign, two of his ministers, Empson and Dudley, made themselves detested by their extortions in such matters. Taxation, regular and irregular, steadily increased. Henry contrived to raise large sums of money in unusual ways, through feudal dues, loans, and benevolences. . . . As a result of careful management Henry was able to dispense with Parliament during the last years of his reign, and yet to leave behind him a treasure of nearly 1,800,000 pounds, probably equal to eighteen millions to-day. Henry's dealings with foreign powers were characteristic not merely of his preference for peaceful methods, but also of the tendency of the time to substitute diplomacy for war. He was active in continental affairs, constantly on the brink of war, and yet never seriously fighting. The truth was, he did not feel himself sufficiently secure on his throne to risk a war. To secure England against attack, and to strengthen his position abroad, Henry built up a system of alliances. He continued the traditional policy of friendly relations with Spain by marrying his son and heir, Arthur, to Catherine of Aragon, daughter of Ferdinand and Isabella of Spain. To secure the northern border against the Scots, he married his eldest daughter, Margaret, to James IV of Scotland. With Burgundy he established closer commercial relations. By this threefold alliance, as the king himself boasted, England was surrounded with a wall of brass."—K. Coman and E. K. Kendall, *History of England*, pp. 214-220.—Henry further strengthened his position by obtaining an act from Parliament in 1485 securing the royal inheritance to himself and his heirs, which was recognized by the Pope in a bull the following year. In 1495 he forced Parliament to pass an act making it no treason to obey a "de facto" king. "As Henry VII united the dynastic claims of the two Houses so he combined their policies. Observing the forms of constitutional liberty accepted by the Lancastrians, he ruled with a strong hand like the Yorkists. What the country wanted most was peace and prosperity under rulers who could keep order. The line

of Henry VII gave them that. It erected a new absolutism, but an absolutism based on popularity. This new absolutism prevailed until the country had recovered from exhaustion, emancipated itself from the bonds of the Middle Ages, and was prepared to make use of the liberty which it had at an earlier time prematurely acquired. It has been said that the result of the struggle between Lancaster and York was to arrest the progress of English freedom for more than a century. At its beginning Parliament had established freedom from arbitrary taxation, legislation, and imprisonment, and the responsibility of even the highest servants of the Crown to itself and the law. From the time of Edward IV parliamentary life was checked, suspended, or turned into a mere form. The legislative powers were usurped by the royal Council, parliamentary taxation gave way to forced loans and benevolences, personal liberty was encroached on by a searching spy system and arbitrary imprisonment, justice was degraded by bills of attainder, by the extension of the powers of the Council, by the subservience of judges and the coercion of juries. It took a revolution in the seventeenth century to recover from the Crown what had been recognized and observed in the early part of the fifteenth."—A. L. Cross, *History of England and Greater Britain*, p. 276.

1485-1603.—Tudors.—The Tudor family, which occupied the English throne from the accession of Henry VII, 1485, until the death of Elizabeth, 1603, took its name, but not its royal lineage, from Sir Owen Tudor, a handsome Welsh chieftain, who won the heart and the hand of the young widow of Henry V, Catherine of France. The eldest son of that marriage, made earl of Richmond, married in his turn Margaret Beaufort, great-granddaughter to John of Gaunt, or Ghent, who was one of the sons of Edward III. From this latter union came Henry of Richmond, as he was known, who disputed the crown with Richard III and made his claim good on Bosworth Field, where the hated Richard was killed. Henry of Richmond strengthened his hold upon the crown, though not his title to it, by marrying Elizabeth, daughter of Edward IV, thus joining the white rose to the red. He ascended the throne as Henry VII, 1485; was succeeded by his son, Henry VIII, in 1509, and the latter by his three children, in order as follows: Edward VI, 1547; Mary, 1553; Elizabeth, 1558. The Tudor family became extinct on the death of Queen Elizabeth, in 1603. "They [the Tudors] reigned in England, without a successful rising against them, for upwards of a hundred years; but not more by a studied avoidance of what might so provoke the country, than by the most resolute repression of every effort, on the part of what remained of the peerage and great families, to make head against the throne. They gave free indulgence to their tyranny only within the circle of the court, while they unceasingly watched and conciliated the temper of the people. The work they had to do, and which by more scrupulous means was not possible to be done, was one of paramount necessity; the dynasty uninterruptedly endured for only so long as was requisite to its thorough completion; and to each individual sovereign the particular task might seem to have been specially assigned."—J. Forster, *Historical and biographical essays*, pp. 221-222.

15th century.—Dawn of the renaissance.—Period of transition in English literature. See ENGLISH LITERATURE: 15th century.

15th-16th centuries.—Renaissance.—Life in "Merry England."—Preludes to the Elizabethan Age of literature.—"Toward the close of the fifteenth century . . . commerce and the woollen trade made a sudden advance, and such an enormous one that corn-fields were changed into pasture-lands, 'whereby the inhabitants of the said town (Manchester) have gotten and come into riches and wealthy livings,' so that in 1553, 40,000 pieces of cloth were exported in English ships. It was already the England which we see to-day, a land of meadows, green, intersected by hedgerows, crowded with cattle, abounding in ships, a manufacturing, opulent land, with a people of beef-eating toilers, who enrich it while they enrich themselves. They improved agriculture to such an extent, that in half a century the produce of an acre was doubled. They grew so rich, that at the beginning of the reign of Charles I. the Commons represented three times the wealth of the Upper House. The ruin of Antwerp by the Duke of Parma sent to England 'the third part of the merchants and manufacturers, who made silk, damask, stockings, taffetas and serges.' The defeat of the Armada and the decadence of Spain opened the seas to their merchants. The toiling hive, who would dare, attempt, explore, act in unison, and always with profit, was about to reap its advantages and set out on its voyages, buzzing over the universe. At the base and on the summit of society, in all ranks of life, in all grades of human condition, this new welfare became visible. . . . It is not when all is good, but when all is better, that they see the bright side of life, and are tempted to make a holiday of it. This is why at this period they make a holiday of it, a splendid show, so like a picture that it fostered painting in Italy, so like a representation, that it produced the drama in England. Now that the battle-axe and sword of the civil wars had beaten down the independent nobility, and the abolition of the law of maintenance had destroyed the petty royalty of each great feudal baron, the lords quitted their sombre castles, battlemented fortresses, surrounded by stagnant water, pierced with narrow windows, a sort of stone breastplates of no use but to preserve the life of their masters. They flock into new palaces, with vaulted roofs and turrets, covered with fantastic and manifold ornaments, adorned with terraces and vast staircases, with gardens, fountains, statues, such as were the palaces of Henry VIII. and Elizabeth, half Gothic and half Italian, whose convenience, grandeur, and beauty announced already habits of society and the taste for pleasure. They came to court and abandoned their old manners; the four meals which scarcely sufficed their former voracity were reduced to two; gentlemen soon became refined, placing their glory in the elegance and singularity of their amusements and their clothes. . . . To vent the feelings, to satisfy the heart and eyes, to set free boldly on all the roads of existence the pack of appetites and instincts, this was the craving which the manners of the time betrayed. It was 'merry England,' as

they called it then. It was not yet stern and constricted. It expanded widely, freely, and rejoiced to find itself so expanded. No longer at court only was the drama found, but in the village. Strolling companies betook themselves thither, and the country folk supplied any deficiencies when necessary. Shakspeare saw, before he depicted them, stupid fellows, carpenters, joiners, bellows-menders, play Pyramus and Thisbe, represent the lion roaring as gently as possible, and the wall, by stretching out their hands. Every holiday was a pageant, in which townspeople, workmen, and children bore their parts. . . . A few sectarians, chiefly in the towns and of the people, clung gloomily to the Bible. But the court and the men of the world sought their teachers and their heroes from pagan Greece and Rome. About 1490 they began to read the classics; one after the other they translated them; it was soon the fashion to read them in the original. Elizabeth, Jane Grey, the Duchess of Norfolk, the Countess of Arundel, many other ladies, were conversant with Plato, Xenophon, and Cicero in the original, and appreciated them. Gradually, by an insensible change, men were raised to the level of the great and healthy minds who had freely handled ideas of all kinds fifteen centuries ago. They comprehended not only their language, but their thought; they did not repeat lessons from, but held conversations with them; they were their equals, and found in them intellects as manly as their own. . . . Across the train of hooded schoolmen and sordid cavillers the two adult and thinking ages were united, and the moderns, silencing the infantine or snuffling voices of the middle-age, condescended only to converse with the noble ancients. They accepted their gods, at least they understand them, and keep them by their side. In poems, festivals, tapestries, almost all ceremonies they appear, not restored by pedantry merely, but kept alive by sympathy, and glorified by the arts of an age as flourishing and almost as profound as that of their earliest birth. After the terrible night of the middle-age, and the dolorous legends of spirits and the damned, it was a delight to see again Olympus shining upon us from Greece; its heroic and beautiful deities once more ravishing the heart of men, they raised and instructed this young world by speaking to it the language of passion and genius; and the age of strong deeds, free sensuality, bold invention, had only to follow its own bent, in order to discover in them the eternal promoters of liberty and beauty. Nearer still was another paganism, that of Italy; the more seductive because more modern, and because it circulates fresh sap in an ancient stock; the more attractive, because more sensuous and present, with its worship of force and genius, of pleasure and voluptuousness. . . . At that time Italy clearly led in everything, and civilisation was to be drawn thence as from its spring. What is this civilisation which is thus imposed on the whole of Europe, whence every science and every elegance comes, whose laws are obeyed in every court, in which Surrey, Sidney, Spenser, Shakspeare sought their models and their materials? It was pagan in its elements and its birth; in its language, which is but slightly different from Latin; in its Latin traditions and recollections, which no gap has come to interrupt; in its constitution, whose old municipal life first led and absorbed the feudal life; in the genius of its race, in which energy and enjoyment always abounded." —H. A. Taine, *History of English literature*, v. 1, bk. 2, ch. 1.—See also COMMERCE: Medieval: 14th-16th centuries; CAPITALISM: 15th-16th centuries; SERFDOM: 11th-17th centuries; AGRICULTURE: Me-

1513-1529.—Ministry of Cardinal Wolsey.—From 1513 to 1529, Thomas Wolsey, who became archbishop of York in 1514, and cardinal in 1515, was the minister who guided the policy of Henry VIII, so far as that headstrong and absolute monarch could be guided at all. "England was going through a crisis politically, socially, and intellectually, when Wolsey undertook the management of affairs. . . . We must regret that he put foreign policy in the first place, and reserved his constructive measures for domestic affairs. . . . Yet even here we may doubt if the measures of the English Reformation would have been possible if Wolsey's mind had not inspired the king and the nation with a heightened consciousness of England's power and dignity. Wolsey's diplomacy at least tore away all illusions about Pope and Emperor, and the opinion of Europe, and taught Henry VIII, the measure of his own strength. It was impossible that Wolsey's powerful hand should not leave its impression upon everything which it touched. If Henry VIII. inherited a strong monarchy, Wolsey made the basis of monarchical power still stronger. . . . Wolsey saw in the royal power the only possible means of holding England together and guiding it through the dangers of impending change. . . . Wolsey was in no sense a constitutional minister, nor did he pay much heed to constitutional forms. Parliament was only summoned once during the time that he was in office, and then he tried to browbeat Parliament and set aside its privileges. In his view the only function of Parliament was to grant money for the king's needs. The king should say how much he needed, and Parliament ought only to advise how this sum might be most conveniently raised. . . . He was trawise in his attempt to force the king's will upon Parliament as an unchangeable law of its action. Henry VIII. looked and learned from Wolsey's failure, and when he took the management of Parliament into his own hands he showed himself a consummate master of that craft. . . . He was so skilful that Parliament at last gave him even the power over the purse, and Henry, without raising a murmur, imposed taxes which Wolsey would not have dared to suggest. . . . Where Wolsey would have made the Crown independent of Parliament, Henry VIII. reduced Parliament to be a willing instrument of the royal will. . . . Henry . . . clothed his despotism with the appear-

ance of paternal solicitude. He made the people think that he lived for them, and that their interests were his, whereas Wolsey endeavoured to convince the people that the king alone could guard their interests, and that their only course was to put entire confidence in him. Henry saw that men were easier to cajole than to convince. . . . In spite of the disadvantage of a royal education, Henry was a more thorough Englishman than Wolsey, though Wolsey sprang from the people. It was Wolsey's teaching, however, that prepared Henry for his task. The king who could use a minister like Wolsey and then throw him away when he was no longer useful, felt that there was no limitation to his self-sufficiency. . . . For politics in the largest sense, comprising all the relations of the nation at home and abroad, Wolsey had a capacity which amounted to genius, and it is doubtful if this can be said of any other Englishman. . . . Taking England as he found her, he aimed at developing all her latent possibilities, and leading Europe to follow in her train. . . . He made England for a time the centre of European politics, and gave her an influence far higher than she could claim on material grounds. . . . He was indeed a political artist, who worked with a free hand and a certain touch. . . . He was, though he knew it not, fitted to serve England, but not to serve the English king. He had the aims of a national statesman, not of a royal servant. Wolsey's misfortune was that his lot was cast on days when the career of a statesman was not distinct from that of a royal servant."—M. Creighton, *Cardinal Wolsey*, ch. 8 and 11.—"Henry had munificently rewarded Wolsey's services to the Crown. He had been promoted to the See of Lincoln and thence to the Archbishopric of York. Henry procured his elevation to the rank of Cardinal, and raised him to the post of Chancellor. The revenues of two sees whose tenants were foreigners fell into his hands; he held the bishopric of Winchester and the abbacy of St. Albans; he was in receipt of pensions from France and Spain, while his official emoluments were enormous. His pomp was almost royal. A train of prelates and nobles followed him wherever he moved; his household was composed of five hundred persons of noble birth, and its chief posts were held by knights and barons of the realm. He spent his vast wealth with princely ostentation. . . . Nor was this magnificence a mere show of power. The whole direction of home and foreign affairs rested with Wolsey alone; as Chancellor he stood at the head of public justice; his elevation to the office of Legate rendered him supreme in the Church. Enormous as was the mass of work which he undertook, it was thoroughly done; his administration of the royal treasury was economical; the number of his despatches is hardly less remarkable than the care bestowed upon each; even More, an avowed enemy, confesses that as Chancellor he surpassed all men's expectations. The court of Chancery, indeed, became so crowded through the character for expedition and justice which it gained under his rule that subordinate courts had to be created for its relief. It was this concentration of all secular and ecclesiastical power in a single hand which accustomed England to the personal government which began with Henry the Eighth; and it was, above all, Wolsey's long tenure of the whole Papal authority within the realm, and the consequent suspension of appeals to Rome, that led men to acquiesce at a later time in Henry's claim of religious supremacy. For proud as was Wolsey's bearing and high as were his natural powers he stood before England as the

mere creature of the King. Greatness, wealth, authority he held, and owned he held, simply at the royal will. In raising his low-born favourite to the head of Church and State Henry was gathering all religious as well as all civil authority into his personal grasp. The nation which trembled before Wolsey learned to tremble before the King who could destroy Wolsey by a breath. Through the twenty years of his reign Henry had known nothing of opposition to his will. His imperious temper had chafed at the weary negotiations, the subterfuges and perfidies of the Pope. His wrath fell at once on Wolsey, who had dissuaded him from acting at the first independently, from conducting the cause in his own courts and acting on the sentence of his own judges; who had counselled him to seek a divorce from Rome and promised him success in his suit. He was at once prosecuted [1529] for receiving bulls from Rome in violation of the Statute of Praemunire. A few days later he was deprived of the seals. Wolsey was prostrated by the blow. He offered to give up everything that he possessed if the King would

CARDINAL WOLSEY

but cease from his displeasure. 'His face,' wrote the French ambassador, 'is dwindled to half its natural size. In truth his misery is such that his enemies, Englishmen as they are, cannot help pitying him.' Pardon was granted him on surrender of his vast possessions to the Crown, and he was permitted to withdraw to his diocese of York, the one dignity he had been suffered to retain. But hardly a year had passed before the jealousy of his political rivals was roused by the King's regrets, and on the eve of his installation feast he was arrested on a charge of high treason, and conducted by the Lieutenant of the Tower towards London. Already broken by his enormous labours, by internal disease, and the sense of his fall, Wolsey accepted the arrest as a sentence of death. An attack of dysentery forced him to rest at the abbey of Leicester, and as he reached the gate he said feebly to the brethren who met him, 'I am come to lay my bones among you.'—J. R. HENRY VIII

—“Prior to the second decade of the sixteenth century, Englishmen had looked upon the bishops of Rome as the center of Catholic unity. At this time, however, there arose in England a feeling of hostility toward the Catholic church similar in most respects to that on the Continent. In the first place the teachings of Lutheranism were finding their way across the Channel and were already persuading a considerable number of people that Catholic doctrines were fundamentally wrong. Others believed that the clergy—particularly the bishops and abbots—needed a moral overhauling. The chief objections, however, were on political and economic grounds. At this time England was no longer a loose federation of feudal states in perpetual turmoil. Outside the church her great barons had been subdued and brought completely under the sway of the king, who established a real despotism under the cloak of constitutional government. This policy had the moral support of the powerful middle class, who, tired of civil war, wanted peace, which for them meant prosperity.

The church was the sole obstacle to the supremacy of the king. Its vast wealth was almost wholly exempt from taxation, while a large part of its revenues constantly flowed into the coffers of a foreigner, the pope. Its officials could not be tried and punished in the ordinary courts of the realm, nor did the king have control over the bishops and abbots, the sole remaining feudal lords. It was even a worse grievance that, on pretext of regulating the morals of king and people, the pope could interfere almost at will in domestic politics. Briefly, a clash between the international policy of the church and the national policy of the state was inevitable.”—G. W. Botsford, *Brief history of the world*, pp. 327-328.—“It is difficult [however] to see how the Anglican Church would have immediately broken away from Catholic unity had it not been for the peculiar marital troubles of Henry VIII. The king had been married eighteen years to Catherine of Aragon, and had been presented by her with six children (of whom only one daughter, the Princess Mary, had survived), when one day he informed her that they had been living all those years in mortal sin and that their union was not true marriage. The queen could hardly be expected to agree with such a definition, and there ensued a legal suit between the royal pair. To Henry VIII the matter was really quite simple. Henry was tired of Catherine and wanted to get rid of her; he believed the queen could bear him no more children and yet he ardently desired a male heir; rumor reported that the susceptible king had recently been smitten by the brilliant black eyes of a certain Anne Boleyn, a maid-in-waiting at the court. The purpose of Henry was obvious; so was the means, he thought. For it had occurred to him that Catherine was his elder brother's widow, and, therefore, had no right, by church law, to marry him. To be sure, a papal dispensation had been obtained from Pope Julius II authorizing the marriage, but why not now obtain a revocation of that dispensation from the reigning Pope Clement VII? Thus the marriage with Catherine could be declared null and void, and Henry would be a bachelor, thirty-six years of age, free to wed some princess, or haply Anne Boleyn. There was no doubt that Clement VII would like to do a favor for his great English champion, but two difficulties at once presented themselves. It would be a most dangerous precedent for the pope to reverse the decision of one of his predecessors. Worse still, the Emperor Charles V, the nephew of Queen Catherine, took up cudgels in his aunt's behalf and threatened Clement with dire penalties if he nullified the marriage. The pope complained truthfully that he was between the anvil and the hammer. There was little for him to do except to temporize and to delay decision as long as possible. The protracted delay was very irritating to the impulsive English king, who was now really in love with Anne Boleyn. Gradually Henry's former effusive loyalty to the Roman See gave way to a settled conviction of the tyranny of the papal power, and there rushed to his mind the recollection of efforts of earlier English rulers to restrict that power. A few salutary enactments against the Church might compel a favorable decision from the pope. Henry VIII seriously opened his campaign against the Roman Church in 1531, when he frightened the English clergy into paying a fine of over half a million dollars for violating an obsolete statute that had forbidden reception of papal legates without royal sanction, and in the same year he forced the clergy to recognize himself as supreme head of the Church as far as that is permitted by

the law of Christ.' His subservient Parliament then empowered him to stop the payment of annates [first year's income, paid by ecclesiastics to the Pope] and to appoint the bishops without recourse to the papacy. Without waiting longer for the papal decision, he had Cranmer, one of his own creatures, whom he had just named' archbishop of Canterbury, declare his marriage with Catherine null and void and his union with Anne Boleyn canonical and legal. Pope Clement VII thereupon handed down [in 1534] his long-delayed decision favorable to Queen Catherine, and excommunicated Henry VIII for adultery."—C. J. H. Hayes, *Modern Europe*, pp. 151-152.—"The papal decree deposing him from the throne, and absolving his subjects from their allegiance, did not follow until 1538, and was issued by Paul III. Clement's bull [of excommunication] was sent forth on the 23d of March. On the 23d of November [1534] Parliament passed the Act of Supremacy [see also SUPREMACY, ACTS OF], without the qualifying clause which the clergy had attached to their vote. The king was, moreover, clothed with full power and authority to repress and amend all such errors, heresies, and abuses as 'by any manner of spiritual authority or jurisdiction ought or may lawfully be reformed.' Thus a visitatorial function of vast extent was recognized as belonging to him. In 1532 convocation was driven to engage not 'to enact or promulge or put in execution' any measures without the royal license, and to promise to change or to abrogate any of the 'provincial constitutions' which he should judge inconsistent with his prerogative. The clergy were thus stripped of all power to make laws. A mixed commission, which Parliament ordained for the revision of the whole canon law, was not appointed in this reign. The dissolution of the king's marriage thus dissolved the union of England with the papacy."—G. P. Fisher, *History of the Christian church*, period 8, ch. 6.—See also CHURCH OF ENGLAND: 1534-1563.

1529-1535.—Act of Succession.—Execution of More and Fisher.—"When Henry's antagonism to the pope became manifest, Sir Thomas More, who had been in the service of the crown for many years and had become lord chancellor on Wolsey's downfall, resigned in 1532." In 1534 Parliament passed the Act of Succession which provided that the heirs of Henry and Anne Boleyn should succeed to the throne after Henry's death. All subjects were required to take an oath upholding this statute and the Act of Supremacy. "When More was asked to take this oath he refused, on grounds of conscience; and Fisher, the aged bishop of Rochester, another old friend of Henry, did the same. They were both brought to trial and beheaded as traitors, to the astonishment and disapproval of all Europe. Many others, including a number of prominent ecclesiastics, were executed for treason on the same grounds in the year 1535. The pope in retaliation excommunicated Henry and declared him deposed from the throne. Such a sentence, which three hundred years before had humbled King John, had now but little meaning in England, and there was no serious probability of any regard being paid to it."—E. P. Cheney, *Short history of England*, p. 303.—"By a tyrannical edict, miscalled a law, in the same session of 1533-4, it was made high treason, after the 1st of

May, 1534, by writing, print, deed, or act, to do or to procure, or cause to be done or procured, anything to the prejudice, slander, disturbance, or derogation of the king's lawful matrimony with queen Anne. If the same offences were committed by words, they were only misprision. The same act enjoined all persons to take an oath to maintain the whole contents of the statute, and an obstinate refusal to make such oath was subjected to the penalties of misprision. . . . Sir T. More was summoned to appear before these commissioners at Lambeth, on Monday the 13th of April, 1534. . . . After having read the statute and the form of the oath, he declared his readiness to swear that he would maintain and defend the order of succession to the crown as established by parliament. He disclaimed all censure of those who had imposed, or on those who had taken, the oath, but declared it to be impossible that he should swear to the whole contents of it, without offending against his own conscience. . . . He never more returned to his house, being committed to the custody of the abbot of Westminster, in which he continued four days; and at the end of that time he was conveyed to the Tower on Friday the 17th of April, 1534. . . . On the 6th of May, 1535, almost immediately after the defeat of every attempt to practise on his firmness, More was brought to trial at Westminster, and it will scarcely be doubted, that no such culprit stood at any European bar for a thousand years. . . . It is lamentable that the records of the proceedings against such a man should be scanty. We do not certainly know the specific offence of which he was convicted. . . . On Tuesday, the 6th of July (St. Thomas's eve), 1535, Sir Thomas More, 'his singular good friend,' came to him early with a message from the king and council, to say that he should die before nine o'clock of the same morning. . . . The lieutenant brought him to the scaffold, which was so weak that it was ready to fall, on which he said, merrily, 'Master lieutenant, I pray you see me safe up, and for my coming down let me shift for myself' When he laid his head on the block he desired the executioner to wait till he had removed his beard, for that had never offended his highness."—J. Mackintosh, *Sir Thomas More (Cabinet Cyclopaedia: Eminent British statesmen*, v. 1).

1531-1563.—Genesis of the Church of England.—"Henry VIII. attempted to constitute an Anglican Church differing from the Roman Catholic Church on the point of the supremacy, and on that point alone. His success in this attempt was extraordinary. The force of his character, the singularly favorable situation in which he stood with respect to foreign powers, the immense wealth which the spoliation of the abbeys placed at his disposal, and the support of that class which still halted between two opinions, enabled him to bid defiance to both the extreme parties, to burn as heretics those who avowed the tenets of the Reformers, and to bang as traitors those who owned the authority of the Pope."—Lord Macaulay, *History of England*, ch. 1.—"The Reformation in England was singular amongst the great religious movements of the sixteenth century. It was the least heroic of them all—the least swayed by religious passion, or moulded and governed by spiritual and theological necessities. From a general point of view, it looks at first little more than

a great political change. The exigencies of royal passion, and the dubious impulses of statecraft, seem its moving and really powerful springs. But, regarded more closely, we recognise a significant train both of religious and critical forces at work. The lust and avarice of Henry, the policy of Cromwell, and the vacillations of the leading clergy, attract prominent notice; but there may be traced beneath the surface a widespread evangelical fervour amongst the people, and, above all, a genuine spiritual earnestness and excitement of thought at the universities. These higher influences preside at the first birth of the movement. They are seen in active operation long before the reforming task was taken up by the Court and the bishops."—J. Tulloch, *Rational theology and Christian philosophy in England in the 17th century*, v. 1, ch. 2.—"Popular feeling and political considerations combined to hurry the government along. In 1530 the Council, by the king's command, had issued a declaration against Luther's writings, but in 1536, convocation, acting at Henry's bidding, drew up the Ten Articles, a statement of doctrine which showed a decided advance toward Lutheranism. A complete English translation of the Bible had been made by Coverdale, under the auspices of the king, and it was ordered (1538) that a copy of this, open to all, should be placed in every church. Portions of the service, also, were translated into the vernacular [see also BIBLE, ENGLISH]. The destruction of the monasteries was accompanied by an attack upon relics, the object of popular worship. Here the religious zeal of the reformer was reinforced by the greed of the spoilsman since some of the shrines were rich in gold and jewels."—K. Co-man and E. K. Kendall, *History of England*, p. 232.—See also CHURCH OF ENGLAND: 1534-1563.

1535-1539.—**Suppression of the monasteries.**—"Two years later Henry ordered that the monasteries be dissolved. To a certain extent their day of usefulness had passed away. At that time many of the monks were wealthy landowners, and cared more for increasing their revenues than for their religious duties. Many friars, too, had lost both their religious devotion and their love of learning, and were now mere beggars. Then, too, these classes had firmly opposed Henry's break with Rome, and still refused to recognize the Act of Supremacy. Henry's chief motive, however, was his need of funds to pay for the gayeties of court life. His orders to destroy the monasteries were carried out ruthlessly. Many conscientious monks and nuns were deprived of shelter and livelihood. The estates were confiscated by the Crown, which divided a large part of it among favorite courtiers. The lead, stone, and glass, together with the roofs and walls, were sold as building materials. The gold, silver, and precious metals were taken to the royal treasury."—G. W. Botsford, *Brief history of the world*, p. 328.—"A revenue of about £131,607 is computed to have thus come to the Crown, while the movables are valued at £400,000. How was this vast sum of money expended? (1) By the Act for the suppression of the greater monasteries the King was empowered to erect six new sees, with their deans and chapters, namely, Westminster, Oxford, Chester, Gloucester, Bristol and Peterborough. . . . (2) Some monasteries were turned into collegiate churches, and many of the abbey churches . . . were assigned as parish churches. (3) Some grammar schools were erected. (4) A considerable sum is said to have been spent in making roads and in fortifying the coasts of the Channel. (5) But by far the greater part of the monastic property passed into the hands of the nobility and gentry, either by purchase at very

easy rates, or by direct gift from the Crown. . . . The monks and nuns ejected from the monasteries had small pensions assigned to them which are said to have been regularly paid; but to many of them the sudden return into a world with which they had become utterly unacquainted, and in which they had no part to play, was a terrible hardship, . . . greatly increased by the Six Article Law, [See below: 1539] which made the marriage of the secularized 'religious' illegal under heavy penalties." G. G. Perry, *History of the Reformation in England*, ch. 4.—"The religious bodies, instead of uniting in their common defence, seem to have awaited singly their fate with the apathy of despair. A few houses only, through the agency of their friends, sought to purchase the royal favour with offers of money and lands; but the rapacity of the king refused to accept a part when the whole was at his mercy."—J. Lingard, *History of England*, v. 6, ch. 4.—Some of the social results of the suppression "may be summed up in a few words. The creation of a large class of poor to whose poverty was attached the stigma of crime; the division of class from class, the rich mounting up to place and power, the poor sinking to lower depths; destruction of custom as a check upon the exactions of the landlords; the loss by the poor of those foundations at schools and universities intended for their children, and the passing away of ecclesiastical tithes into the hands of lay owners."—F. A. Gasquet, *Henry VIII and the English monasteries*, v. 2, p. 523.

1535-1553.—**Policy in Ireland.** See IRELAND: 1535-1553.

1536-1543.—**Trial and execution of Anne Boleyn.**—Her successors, the later wives of Henry VIII.—Anne Boleyn had been secretly married to the king in January, 1533, and had been crowned on Whitsunday of that year. Within three years the fickle king had fastened his affections on Jane Seymour, a young lady then of the queen's bed-chamber. Charges were brought against the unfortunate queen, and the commission appointed to inquire into her alleged misdeeds found her guilty of high treason. Condemnation duly followed, and the unhappy queen was executed May 19, 1536. The king lost little time in wedding Jane Seymour. "She died in childhood of Edward VI. on the 13th of October, 1537. The next choice made by or for Henry, who remained a widower for the period of more than two years," was the "princess Anne, sister of the duke of Cleves, a considerable prince on the lower Rhine. . . . Holbein was employed to paint this lady for the king, who, pleased by the execution, gave the flattering artist credit for a faithful likeness. He met her at Dover, and almost immediately betrayed his disappointment. Without descending into . . . particulars, it is necessary to state that, though the marriage was solemnised, the king treated the princess of Cleves as a friend." At length, by common action of an obsequious parliament and a more obsequious convocation of the church, the marriage was declared to be annulled, for reasons not specified. The consent of the repudiated wife was "insured by a liberal income of £3,000 a year, and she lived for 16 years in England with the title of princess Anne of Cleves. . . . This annulment once more displayed the triumph of an English lady over a foreign princess." The lady who now captivated the . . . monarch was Lady Catherine Howard, niece to the duke of Norfolk, who became queen on August 8, 1540. In the following November, the king received such information of Lady Catherine's dissolute life before marriage "as im-

mediately caused a rigid inquiry into her behaviour. . . . The confessions of Catherine and of lady Rochford, upon which they were attainted in parliament, and executed in the Tower on the 14th of February, are not said to have been at any time questioned. . . . On the 10th of July, 1543, Henry wedded Catherine Parr, the widow of Lord Latimer, a lady of mature age," who survived him.—J. Mackintosh, *History of England* (L. C. C.), v. 2, ch. 7-8.

1539.—Reformation checked.—Six Articles.—"Yielding to the pressure of circumstances, he [Henry VIII] had allowed the Reformers to go further than he really approved. The separation from the Church of Rome, the absorption by the Crown of the powers of the Papacy, the unity of authority over both Church and State centred in himself, had been his objects. In doctrinal matters he clung to the Church of which he had once been the champion. He had gained his objects because he had the feeling of the nation with him. In his eagerness he had even countenanced some steps of doctrinal reform. But circumstances had changed. . . . Without detriment to his position he could follow his natural inclinations. He listened, therefore, to the advice of the reactionary party of which Norfolk was the head. They were full of bitterness against the upstart Cromwell, and longed to overthrow him as they had overthrown Wolsey. The first step in their triumph was the bill of the Six Articles, carried in the Parliament of 1539. These laid down and fenced round with extraordinary severity the chief points of the Catholic religion at that time questioned by the Protestants. The bill enacted, first, 'that the natural body and blood of Jesus Christ were present in the Blessed Sacrament,' and that 'after consecration there remained no substances of bread and wine, nor any other but the substance of Christ' [transubstantiation]; whoever, by word or writing, denied this article was a heretic, and to be burned. Secondly, the Communion in both kinds was not necessary, both body and blood being present in each element; thirdly, priests might not marry; fourthly, vows of chastity by man or woman ought to be observed; fifthly, private masses ought to be continued; sixthly, auricular confession must be retained. Whoever wrote or spoke against these . . . Articles, on the first offence his property was forfeited; on the second offence he was a felon, and was put to death. Under this 'whip with six strings' the kingdom continued for the rest of the reign. The Bishops at first made wild work with it. Five hundred persons are said to have been arrested in a fortnight; the king had twice to interfere and grant pardons. It is believed that only twenty-eight persons actually suffered death under it.—J. F. Bright, *History of England*, v. 2, p. 411.

1547.—Accession of King Edward VI.—Edward VI was only nine when Henry VIII died. During his brief reign (he died at sixteen) the kingdom was in the hands first of Hertford who became duke of Somerset, then of Warwick, a brilliant but unscrupulous soldier who had himself created duke of Northumberland.

1547-1553.—Protestantizing the church of England under Edward VI.—"The Church of England, separated from the papacy under Henry VIII, became Protestant under Edward VI (1547-1553). The young king's guardian tolerated all manner of reforming propaganda, and Calvinists as well as Lutherans preached their doctrines freely. Official articles of religion, which were drawn up for the Anglican Church, showed unmistakably Protestant influence. The Latin service books of the Catholic Church were translated into English, under Cranmer's auspices, and the edition of the Book of Common Prayer, published in 1552, made clear that the Eucharist was no longer to be regarded as a propitiatory sacrifice; the names 'Holy Communion' and 'Lord's Supper' were substituted for 'Mass,' while the word 'altar' was replaced by 'table.' The old places of Catholic worship were changed to suit a new order: altars and images were taken down, the former service books destroyed, and stained-glass windows broken. Several peasant uprisings [the most famous of these was Kett's Rebellion (1549)] signified that the nation was not completely united upon a policy of religious change, but the reformers had their way, and Protestantism advanced."—C. J. H. Hayes, *History of modern Europe*, p. 154.

1547-1555.—Troubles in Ireland.—Plantation scheme. See IRELAND: 1541-1555.

1553.—Right of succession to the throne, on the death of Edward VI.—"If Henry VII. be considered as the stock of a new dynasty, it is clear that on mere principles of hereditary right, the crown would descend, first, to the issue of Henry VIII.; secondly, to those of [his elder sister] Margaret Tudor, queen of Scots; thirdly, to those of [his younger sister] Mary Tudor, queen of France. The title of Edward was on all principles equally undisputed; but Mary and Elizabeth might be considered as excluded by the sentence of nullity, which had been pronounced in the case of Catharine and in that of Anne Boleyn, both which sentences had been confirmed in parliament. They had been expressly pronounced to be illegitimate children. Their hereditary right of succession seemed thus to be taken away, and their pretensions rested solely on the conditional settlement of the crown on them, made by their father's will, in pursuance of authority granted to him by act of parliament. After Elizabeth, Henry had placed the descendants of Mary, queen of France, passing by the progeny of his eldest sister Margaret. Mary of France, by her second marriage with Charles Brandon, duke of Suffolk, had two daughters,—lady Frances, who wedded Henry Grey, marquis of Dorset, created duke of Suffolk; and lady Elinor, who espoused Henry Clifford, earl of Cumberland. Henry afterwards settled the crown by his will on the heirs of these two ladies successively, passing over his nieces themselves in silence. Northumberland obtained

the hand of lady Jane Grey, the oldest daughter of Grey, duke of Suffolk, by lady Frances Brandon, for lord Guilford Dudley, the admiral's son. The marriage was solemnised in May, 1553, and the fatal right of succession claimed by the house of Suffolk devolved on the excellent and unfortunate lady Jane."—J. Mackintosh, *History of England*, v. 2, ch. 9.

1553.—Accession of Queen Mary.

1553.—Status of Protestantism and Roman Catholicism.—"Great as was the number of those whom conviction or self interest enlisted under the Protestant banner, it appears plain that the Reformation moved on with too precipitate a step for the majority. The new doctrines prevailed in London, in many large towns, and in the eastern counties. But in the north and west of England, the body of the people were strictly Catholics. The clergy, though not very scrupulous about conforming to the innovations, were generally averse to most of them. And, in spite of the church lands, I imagine that most of the nobility, if not the gentry, inclined to the same persuasion. . . . An historian, whose bias was certainly not unfavourable to Protestantism [Burnet, iii. 190, 196] confesses that all endeavours were too weak to overcome the aversion of the people towards reformation, and even intimates that German troops were sent for from Calais on account of the bigotry with which the bulk of the nation adhered to the old superstition. This is somewhat a humiliating admission, that the Protestant faith was imposed upon our ancestors by a foreign army. . . . It is certain that the re-establishment of popery on Mary's accession must have been acceptable to a large part, or perhaps to the majority, of the nation."—H. Hallam, *Constitutional history of England*, v. 1, ch. 2.—"Eight weeks and upwards passed between the proclaiming of Mary queen and the Parliament by her assembled; during which time two religions were together set on foot, Protestantism and Popery; the former hoping to be continued, the latter labouring to be restored. . . . No small jostling was there betwixt the zealous promoters of these contrary religions. The Protestants had possession on their side, and the protection of the laws lately made by King Edward, and still standing in free and full force unrepealed. . . . The Papists put their ceremonies in execution, presuming on the queen's private practice and public countenance."—T. Fuller, *Church history of Britain*, bk. 8, sect. 1, ¶ 5.

ALSO IN: J. H. Blunt, *Reformation of the Church of England*, v. 1, ch. 8-9.

1554.—Wyat's insurrection.—Queen Mary's marriage with Philip of Spain was opposed with great bitterness of popular feeling, especially in London and its neighborhood. Risings were undertaken in Kent, Devonshire, and the midland counties, intended for the frustration of the marriage scheme; but they were ill planned and soon suppressed. That in Kent, led by Sir Thomas Wyatt, threatened to be formidable at first, and the queen's troops retreated before it. Wyatt, however, lost his opportunity for securing London, by delays, and his followers dispersed. He was taken prisoner and executed. "Four hundred persons are said to have suffered for this rebellion."—D. Hume, *History of England*, ch. 36.

1555-1558.—Temporary Roman Catholic revival under Mary Tudor.—"An attempt was made, by authority of King Edward's will, to set aside both his sisters from the succession, and raise Lady Jane Grey to the throne, who had lately been married to one of Northumberland's sons. This was Northumberland's doing; he was actu-

ated by ambition, and the other members of the government assented to it, believing, like the late young King, that it was necessary for the preservation of the Protestant faith. Cranmer opposed the measure, but yielded. . . . But the principles of succession were in fact well ascertained at that time, and, what was of more consequence, they were established in public opinion. Nor could the intended change be supported on the ground of religion, for popular feeling was decidedly against the Reformation. Queen Mary obtained possession of her rightful throne without the loss of a single life, so completely did the nation acknowledge her claim; and an after insurrection, rashly planned and worse conducted, served only to hasten the destruction of the Lady Jane and her husband. . . . If any person may be excused for hating the Reformation, it was Mary. She regarded it as having arisen in this country from her mother's wrongs, and enabled the King to complete an iniquitous and cruel divorce. It had exposed her to inconvenience, and even danger, under her father's reign, to vexation and restraint under her brother; and after having been bastardized in consequence of it, . . . an attempt had been made to deprive her of the inheritance, because she continued to profess the Roman Catholic faith. . . . Had the religion of the country been settled, she might have proved a good and beneficent, as well as conscientious, queen. But she delivered her conscience to the direction of cruel men; and . . . boasted that she was a virgin sent by God to ride and tame the people of England. . . . The people did not wait till the laws of King Edward were repealed; the Romish doctrines were preached, and in some places the Romish Clergy took possession of the churches, turned out the incumbents, and performed mass in jubilant anticipation of their approaching triumph. What course the new Queen would pursue had never been doubtful; and as one of her first acts had been to make Gardiner Chancellor, it was evident that a fiery persecution was at hand. Many who were obnoxious withdrew in time, some into Scotland, and more into Switzerland and the Protestant parts of Germany. Cranmer advised others to fly; but when his friends entreated him to preserve himself by the like precaution, he replied, that it was not fitting for him to desert his post. . . . The Protestant Bishops were soon dispossessed of their sees; the marriages which the Clergy and Religioners had contracted were declared unlawful, and their children bastardized. The heads of the reformed Clergy, having been brought forth to hold disputations, for the purpose rather of intimidating than of convincing them, had been committed to different prisons, and after these preparatories the fiery process began."—R. Southey, *Book of the church*, ch. 14.—"The total number of those who suffered in this persecution, from the martyrdom of Rogers, in February, 1555, to September, 1558, when its last ravages were felt, is variously related, in a manner sufficiently different to assure us that the relaters were independent witnesses, who did not borrow from each other, and yet sufficiently near to attest the general accuracy of their distinct statements. By Cooper they are estimated at about 290. According to Burnet they were 284. Speed calculates them at 274. The most accurate account is probably that of Lord Burleigh, who, in his treatise called 'The Execution of Justice in England,' reckons the number of those who died in that reign by imprisonment, torments, famine and fire, to be near 400, of which those who were burnt alive amounted to 290. From Burnet's Tables of the separate years, it is

apparent that the persecution reached its full force in its earliest year."—J. Mackintosh, *History of England*, v. 2, ch. 11.—Hugh Latimer, bishop of Worcester, who more than any other had been responsible for the success of the Reformation in England, and Nicholas Ridley, Bishop of Rochester, were burned at the stake at Oxford, on October 15, 1555. "Be of good comfort, Master Ridley, and play the man," said Latimer to Ridley as they were being led to death. "We shall this day light a candle in England which (I trust) shall never be put out." "Though Pole [Archbishop of Canterbury after Cranmer] and Mary could have laid their hands on earl and baron, knight and gentleman, whose heresy was notorious, although, in the queen's own guard, there were many who never listened to a mass, they durst not strike where there was danger that they would be struck in return. . . . They took the weaver from his loom, the carpenter from his workshop, the husbandman from his plough; they laid hands on maidens and boys 'who had never heard of any other religion than that which they were called on to abjure'; old men tottering into the grave, and children whose lips could but just lisp the articles of their creed; and of these they made their burnt-offerings; with these they crowded their prisons, and when filth and famine killed them, they flung them out to rot."—J. A. Froude, *History of England*, ch. 24.—Queen Mary's marriage with Philip of Spain and his arbitrary disposition, "while it thoroughly alienated the kingdom from Mary, created a prejudice against the religion which the Spanish court so steadily favoured. . . . Many are said to have become Protestants under Mary who, at her coming to the throne, had retained the contrary persuasion."—H. Hallam, *Constitutional history of England*, v. 1, ch. 2.

1558.—Accession of Queen Elizabeth.

1558-1566.—Puritanism taking form.—First naming of the Puritans.—"The Church of England was a latitudinarian experiment, a contrivance to enable men of opposing creeds to live together without shedding each others' blood. It was not intended, and it was not possible, that Catholics or Protestants should find in its formulas all that they required. The services were deliberately made elastic; comprehending in the form of positive statement only what all Christians agreed in believing, while opportunities were left open by the rubric to vary the ceremonial according to the taste of the congregations. The management lay with the local authorities in town or parish; where the people were Catholics the Catholic aspect could be made prominent; where Popery was a bugbear, the people were not disturbed by the obtusion of doctrines which they had outgrown. In itself it pleased no party or section. To the heated controversialist its chief merit was its chief defect. . . . Where the tendencies to Rome were strongest, there the extreme Reformers considered themselves bound to exhibit in the most marked contrast the unloveliness of the purer creed. It was they who furnished the noble element in the Church of England. It was they who had been its martyrs; they who, in their scorn of the world, in their passionate desire to consociate

themselves in life and death to the Almighty, were able to rival in self-devotion the Catholic Saints. But they had not the wisdom of the serpent, and certainly not the harmlessness of the dove. Had they been let alone—had they been unharassed by perpetual threats of revolution and a return of the persecutions—they, too, were not disinclined to reason and good sense. A remarkable specimen survives, in an account of the Church of Northampton, of what English Protestantism could become under favouring conditions. . . . The fury of the times unhappily forbade the maintenance of this wise and prudent spirit. As the power of evil gathered to destroy the Church of England, a fiercer temper was required to combat with them, and Protestantism became impatient, like David, of the uniform in which it was sent to the battle. It would have fared ill with England had there been no hotter blood there than filtered in the sluggish veins of the officials of the Establishment. There needed an enthusiasm fiercer far to encounter the revival of Catholic fanaticism; and if the young Puritans, in the heat and glow of their convictions, snapped their traces and flung off their harness, it was they, after all, who saved the Church which attempted to disown them, and with the Church saved also the stolid mediocrity to which the fates then and ever committed and commit the government of it."—J. A. Froude, *History of England*, v. 10, ch. 20.—"The English bishops, conceiving themselves empowered by their canons, began to show their authority in urging the clergy of their dioceses to subscribe to the Liturgy, ceremonies and discipline of the Church; and such as refused the same were branded with the odious name of Puritans. A name which in this notion first began in this year [1564]; and the grief had not been great if it had ended in the same."—T. Fuller, *Church history of Britain*, bk. 9, sect. 1.—Members of the various Protestant sects were termed "dissenters" or "non-conformists" while the Roman Catholics were generally called "Papists"

1558-1588.—Age of Elizabeth: Definite fashioning of Anglicanism.—English dissent from Anglicanism.—"The education of Elizabeth, as well as her interest, led her to favour the reformation; and she remained not long in suspense with regard to the party which she should embrace. But though determined in her own mind, she resolved to proceed by gradual and secure steps, and not to imitate the example of Mary, in encouraging the bigots of her party to make immediately a violent invasion on the established religion. She thought it requisite, however, to discover such symptoms of her intentions as might give encouragement to the Protestants, so much depressed by the late violent persecutions. She immediately recalled all the exiles, and gave liberty to the prisoners who were confined an account of religion."—D. Hume, *History of England*, v. 3, ch. 38, pp. 375-380.—"Elizabeth ascended the throne much more in the character of a Protestant champion than her own convictions and inclinations would have dictated. She was, indeed, the daughter of Anne Boleyn, whom by this time the Protestants were beginning to regard as a martyr of the faith; but she was also the child of Henry VIII., and the heiress of his imperious will. Soon, however, she found herself Protestant almost in her own despite. The Papacy, in the first pride of successful reaction, offered her only the alternative of submission or excommunication, and she did not for a moment hesitate to choose the latter. . . . Then, too, the shadow of Spanish supremacy began to cast itself broadly over Eu-

rope: the unequal struggle with Holland was still prolonged: it was known that Philip's dearest wish was to recover to his empire and the Church the island kingdom which had once unwillingly accepted his rule. It was thus the instinct of self-defence which placed Elizabeth at the head of the Protestant interest in Europe: she sent Philip Sidney to die at Zutphen: her sailor buccaneers, whether there were peace at home or not, bit and tore at everything Spanish upon the southern main: till at last, 1588, Philip gathered up all his naval strength and hurled the Armada at our shores. 'Afflavit Deus, et dissipati sunt.' The valour of England did much; the storms of heaven the rest. Mary of Scotland had gone to her death the year before, and her son had been trained to hate his mother's faith. There could be no question any more of the fixed Protestantism of the English people."—C. Beard, *Hibbert lectures*, 1883: *Reformation*, lect. 9.—In the reign of Elizabeth the church took definite form and acquired those

sea. . . . A great majority both of clergy and laity yielded to the times; and of these temporizing conformists it cannot be doubted that many lost by degrees all thought of returning to their ancient fold. But others, while they complied with exterior ceremonies, retained in their private devotions their accustomed mode of worship."—H. Hallam, *Constitutional history of England*, ch. 3.

ALSO IN: J. Tulloch, *English Puritanism and its leaders*, introd.—D. Neal, *History of the Puritans*, v. 1, ch. 4.—D. Campbell, *Puritan in Holland, England, and America*, v. 3, ch. 8-10.

1558-1598.—Age of Elizabeth: Queen's chief councilors.—"Sir William Cecil, afterwards Lord Burleigh, although officially experienced during three reigns, though still young, was the queen's chief adviser from first to last—that is to say, till he died in 1598. Philip II., who also died in that year, was thus his exact contemporary; for he mounted the Spanish throne just when Elizabeth and her minister began their work together. He was not long in discovering that there was one man, possessed of the most balanced judgment ever brought to the head of English affairs, who was capable of unwinding all his most secret intrigues; and, in fact, the two arch-enemies, the one in London and the other in Madrid, were pitted against each other for forty years. Elizabeth had also the good sense to select the wisest and most learned ecclesiastic of his day, Matthew Parker, for her Primate and chief adviser in Church affairs. It should be noted that both of these sages, as well as the queen herself, had been Conformists to the Papal obedience under Mary—a position far from heroic, but not for a moment to be confused with that of men whose philosophical indifference to the questions which exercised all the highest minds enabled them to join in the persecution of Romanists and Anglicans at different times with a sublime impartiality. . . . It was under the advice of Cecil and Parker that Elizabeth, on coming to the throne, made her famous settlement or Establishment of religion."—M. Burrows, *Commentaries on the history of England*, bk. 2, ch. 17.

1558-1603.—Age of Elizabeth: Parliament.—"The house of Commons, upon a review of Elizabeth's reign, was very far, on the one hand, from exercising those constitutional rights which have long since belonged to it, or even those which by ancient precedent they might have claimed as their own; yet, on the other hand, was not quite so servile and submissive an assembly as an artful historian has represented it. If many of its members were but creatures of power, . . . there was still a considerable party, sometimes carrying the house along with them, who with patient resolution and inflexible aim recurred in every session to the assertion of that one great privilege which their sovereign contested, the right of parliament to inquire into and suggest a remedy for every public mischief or danger. It may be remarked that the ministers, such as Knollys, Hatton, and Robert Cecil, not only sat among the commons, but took a very leading part in their discussions; a proof that the influence of argument could no more be dispensed with than that of power. This, as I conceive, will never be the case in any kingdom where the assembly of the estates is quite subservient to the crown. Nor should we put out of consideration the manner in which the commons were composed. Sixty-two members were added at different times by Elizabeth to the representation; as well from places which had in earlier times discontinued their franchise, as from those to which it was first granted; a very large proportion

QUEEN ELIZABETH

characteristics which we associate with the word "Anglican." A series of Acts reestablished the sovereignty of England as head of the church, adopted the Thirty-nine Articles and the Book of Common Prayer. A uniform doctrine and form of worship were to be used throughout the kingdom. Thus the English church which can claim unbroken continuity from the days of St. Augustine to the present was in reality changed from Catholic to Protestant between 1558 and 1603. The majority of the nation accepted the Anglican church, but there were numerous objectors who were vigorously persecuted. "Camden and many others have asserted that by systematic connivance the Roman Catholics enjoyed a pretty free use of their religion for the first fourteen years of Elizabeth's reign. But this is not reconcilable to many passages in Strype's collections. We find abundance of persons harassed for recusancy, that is, for not attending the protestant church, and driven to insincere promises of conformity. Others were dragged before ecclesiastical commissions [forming a Protestant inquisition] for harbouring priests, or for sending money to those who had fled beyond

of them petty boroughs, evidently under the influence of the crown or peerage. The ministry took much pains with elections, of which many proofs remain. The house accordingly was filled with placemen, civilians, and common lawyers grasping at preferment. The slavish tone of these persons, as we collect from the minutes of D'Ewes, is strikingly contrasted by the manliness of independent gentlemen. And as the house was by no means very fully attended, the divisions, a few of which are recorded, running from 200 to 250 in the aggregate, it may be perceived that the court, whose followers were at hand, would maintain a formidable influence. But this influence, however pernicious to the integrity of parliament, is distinguishable from that exertion of almost absolute prerogative which Hume has assumed as the sole spring of Elizabeth's government, and would never be employed till some deficiency of strength was experienced in the other."—H. Hallam, *Constitutional history of England*, ch. 5.

1558-1603.—Age of Elizabeth: Literature.—“The age of Elizabeth was distinguished beyond, perhaps, any other in our history by a number of great men, famous in different ways, and whose names have come down to us with unblemished honours: statesmen, warriors, divines, scholars, poets, and philosophers; Raleigh, Drake, Coke, Hooker, and—high and more sounding still, and still more frequent in our mouths—Shakespeare, Spenser, Sidney, Bacon, Jonson, Beaumont, and Fletcher, men whom fame has eternised in her long and lasting scroll, and who, by their words and acts, were benefactors of their country, and ornaments of human nature.”—W. Hazlitt, *Lectures on the literature of the Age of Elizabeth*, lect. 1.—“Elizabethan literature was fresh and native, because it was the utterance of a youthful race, aroused to vigorous self-consciousness under conditions which did not depress or exhaust its energies. The English opened frank eyes upon the discovery of the world and man, which had been effected by the Renaissance. They were not wearied with collecting, collating, correcting, transmitting to the press. All the hard work of assimilating the humanities had been done for them. They had only to survey and to enjoy, to feel and to express, to lay themselves open to delightful influences, to con the noble lessons of the past, to thrill beneath the beauty and the awe of an authentic revelation. Criticism had not laid its cold, dry finger on the blossoms of the fancy. The new learning was still young enough to be a thing of wonder and entrancing joy.”—J. A. Symonds, *Comparison of Elizabethan with Victorian poetry* (*Fortnightly Review*, v. 45, p. 56).—See also ENGLISH LITERATURE: 1530-1660; DRAMA: 1558-1592.

1558-1603.—Age of Elizabeth: Industrial regulations.—Statute of laborers.—Poverty and the poor laws (1601).—Reform of the currency.—Economic progress.—“Elizabeth was a conscientious sovereign who wished all her subjects to be prosperous and happy. This condition she thought might be brought about by government regulation. For the benefit of small farmers, she proclaimed the Corn Laws, which forbade the importation of grain and thereby enabled the farmer to grow grain and sell it at a profit. Minute laws were passed, too, for the regulation of industries. ‘No person using the feat or mystery of cloth-making shall keep or have in his house any more than one woollen loom at a time on pain of a fine of twenty shillings.’ Those who wished to manufacture on a larger scale applied to the Crown for a charter; and for this privilege they paid a substantial fee. Merchants, such as haberdashers, saddlers, cur-

riers, and shoe-dealers, were forced to do the same thing. In like manner the Crown attempted to restrict certain manufactures to certain towns. Business men began to resent strongly this interference. The result was that they transferred their business to the country regions. In a certain town the citizens, who had previously built up a rope-making industry, complained that their town ‘was like to be utterly decayed owing to the competition of people in the adjacent parts.’ Because of the enclosures many laborers had lost their little gardens and were now dependent on wages alone; but they received so little for their work that in many cases they failed to make a living. Elizabeth and her legislators showed a deep interest in their welfare. The Statute of Laborers admitted that wages ‘are in divers places too small and not answerable to this time, respecting the advancement of prices of all things belonging to the said servants and laborers.’ This measure provided that in the future wages were to be fixed

SIR WALTER RALEIGH  
(Painted by Zuccherò)

by the justices of the peace. These officers had to take into consideration ‘the price of food and other circumstances necessary to be considered,’ and to make the scheme ‘yield the hired person, both in the time of need and time of plenty, a convenient proportion of wages.’ In many instances this plan worked well. It must be remembered, however, that the judges then were not so independent and so fair as they are to-day. A majority were either employers or their friends. While they were often good-hearted, it was to their interest to keep wages as low as possible. Too often their pocketbooks got the better of their generosity. In many instances therefore this plan caused a decline in wages. Laborers without land or means of travel were forced to accept work from the nearest employer, however low the pay. Furthermore the workers were not permitted to join together in self-defence. It was a conspiracy, a legal offence, for them to enter into any association to raise the rate of wages. In the case of such unions members were induced to turn traitor and betray their fellows. . . . While the nobility and gentry became constantly richer, a majority of the laborers were in fair condition. The breach

was gradually widening between rich and poor, however, for there was growing up a class of paupers. Among them, it is true, there were many undeserving beggars who became a nuisance to society and good order. They bore a hatred to all and were always ready to join in any riot or disorder. In times of peace they formed gangs of marauders who terrorized the countryside. Property and life were insecure. The innocent traveller on a country road was constantly in danger of being stripped of his valuables by one or more of these sturdy beggars. At the same time wages tended to drop and prices to rise. As a result poverty became more common. Humanity demanded that the deserving poor be assisted, while there was an equally strong feeling that rogues and vagabonds be punished. The Poor Laws of Elizabeth resulted from these sentiments. Giving to the poor was no longer an act of Christian charity; it became a compulsory tax upon the people of the realm. Each parish now had its poor rate for which property owners were assessed. These laws ordained further that 'work was to be provided for those who could work, and relief for those who could not; poor children were to be trained to some craft; and the idle were to be punished.' In spite of its defects this group of laws was an admirable attempt to lessen a great social evil. They remained in force until early in the nineteenth century; [See also CHARITIES: England; 1553-1601]. When Elizabeth ascended the throne, her country was in an unsound financial condition. Her predecessors had been in the habit of filling their empty coffers by using more and more alloy in their coinage. For example, the shilling of 1551 weighed as much as that of 1527 but contained only one seventh as much silver. Necessarily business men understood that some coins were worth less than others. Hence they charge different prices for their goods according to the coins that were offered them. Foreigners, too, looked askance at the bad coins. The general public naturally felt confused by the irregularity. Those who had good coins saved them or melted them down. The debasement of the currency was detrimental to the laborer, for prices rose by leaps and bounds, and clothes and food became very dear. In 1560 the Queen asked her people to bring her their impure money. Their response was hearty and loyal, for they were willing to bear their share of the loss. The government undertook the cost of refining and recoinage. In this way Elizabeth averted a national disaster. There was a great increase in wealth during the reign of Elizabeth, due in large part to the intelligence and activity of her people, rich and poor alike. Manufacturers, capitalist farmers, merchants, and adventurers were especially energetic. England, too, was at peace; she took little part in the religious conflicts then raging on the Continent. National expenditures were kept down. The debasement of the coinage came to an end. The government could now be trusted to pay its debts promptly, and therefore found it easy to borrow money at low rates of interest. Elizabeth aimed further to make England a power in world affairs. She saw, however, that it would be foolish for her country to continue its ancient struggle with France, for supremacy on the Continent would profit little. Because England was surrounded by water, Elizabeth reasoned that its strength should be on the sea. She therefore encouraged the construction of merchant ships which, if necessary, could be armed and used for fighting. In this way a powerful navy was built up. Fishing, too, was encouraged. People were forced by law to eat fish on Friday 'so

that the fishers should be set to work.' Shippers also were aided in every possible way; English ships alone should be used in foreign trade, both going and coming. Piers were built, harbors repaired, and channels marked out with buoys."—G. W. Botsford, *Brief history of the world*, pp. 330-334.

1559.—Act of Supremacy, Act of Uniformity, and Court of High Commission.—"When Elizabeth's first Parliament met in January, 1559, Convocation, of course, met too. It at once claimed that the clergy alone had authority in matters of faith, and proceeded to pass resolutions in favour of Transubstantiation, the Mass, and the Papal Supremacy. The bishops and the Universities signed a formal agreement to this effect. That in the constitution of the English Church, Convocation, as Convocation, has no such power as this, was proved by the steps now taken. The Crown, advised by the Council and Parliament, took the matter in hand. As every element, except the Roman, had been excluded from the clerical bodies, a consultation was ordered between the representatives of both sides, and all preaching was suspended till a settlement had been arrived at between the queen and the Three Estates of the realm. The consultation broke up on the refusal of the Romanist champions to keep to the terms agreed upon; but even before it took place Parliament restored the Royal Supremacy, repealed the laws of Mary affecting religion, and gave the queen by her own desire, not the title of 'Supreme Head,' but 'Supreme Governor,' of the Church of England."—M. Burrows, *Commentaries on the history of England*, bk. 2, ch. 17.—This first Parliament of Elizabeth passed two memorable acts of great importance in English history,—the Act of Supremacy and the Act of Uniformity of Common Prayer. "The former is entitled 'An act for restoring to the crown the antient jurisdiction over the State Ecclesiastical and Spiritual; and for abolishing foreign power.' It is the same for substance with the 25th of Henry VIII [See above: 1527-1534] . . . but the commons incorporated several other bills into it; for besides the title of 'Supreme Governor in all causes Ecclesiastical and Temporal,' which is restored to the Queen, the act revives those laws of King Henry VIII, and King Edward VI. which had been repealed in the late reign. It forbids all appeals to Rome, and exonerates the subjects from all exactions and impositions heretofore paid to that court; and as it revives King Edward's laws, it repeals a severe act made in the late reign for punishing heresy. . . . 'Moreover, all persons in any public employes, whether civil or ecclesiastical, are obliged to take an oath in recognition of the Queen's right to the crown, and of her supremacy in all causes ecclesiastical and civil, on penalty of forfeiting all their promotions in the church, and of being declared incapable of holding any public office.' . . . Further, 'The act forbids all writing, printing, teaching, or preaching, and all other deeds or acts whereby any foreign jurisdiction over these realms is defended, upon pain that they and their abettors, being thereof convicted, shall for the first offence forfeit their goods and chattels; . . . spiritual persons shall lose their benefices, and all ecclesiastical preferments; for the second offence they shall incur the penalties of a præmunire; and the third offence shall be deemed high treason.' There is a remarkable clause in this act, which gave rise to a new court, called 'The Court of High Commission.' The words are these, 'The Queen and her successors shall have power, by their letters patent under the great seal, to assign, name, and authorize, as

often as they shall think meet. and for as long a time as they shall please, persons being natural-born subjects, to use, occupy, and exercise, under her and them, all manner of jurisdiction, privileges, and pre-eminences, touching any spiritual or ecclesiastical jurisdiction within the realms of England and Ireland, &c., to visit, reform, redress, order, correct and amend all errors, heresies, schisms, abuses, contempts, offences and enormities whatsoever. Provided, that they have no power to determine anything to be heresy, but what has been adjudged to be so by the authority of the canonical scripture, or by the first four general councils, or any of them; or by any other general council wherein the same was declared heresy by the express and plain words of canonical scripture; or such as shall hereafter be declared to be heresy by the high court of parliament, with the assent of the clergy in convocation.' Upon the authority of this clause the Queen appointed a certain number of 'Commissioners' for ecclesiastical causes, who exercised the same power that had been lodged in the hands of one vicegerent in the reign of King Henry VIII. And how sadly they abused their power in this and the two next reigns will appear in the sequel of this history. They did not trouble themselves much with the express words of scripture, or the four first general councils, but entangled their prisoners with oaths ex-officio, and the inextricable mazes of the popish canon law. . . . The papists being vanquished, the next point was to unite the reformed among themselves. . . . Though all the reformers were of one faith, yet they were far from agreeing about discipline and ceremonies, each party being for settling the church according to their own model. . . . The Queen . . . therefore appointed a committee of divines to review King Edward's liturgy, and to see if in any particular it was fit to be changed; their names were Dr. Parker, Grindal, Cox, Pilkington, May, Bill, Whitehead, and Sir Thomas Smith, doctor of the civil law. Their instructions were, to strike out all offensive passages against the pope, and to make people easy about the belief of the corporal presence of Christ in the sacraments; but not a word in favour of the stricter protestants. Her Majesty was afraid of reforming too far; she was desirous to retain images in churches, crucifixes and crosses, vocal and instrumental music, with all the old popish garments; it is not therefore to be wondered, that in reviewing the liturgy of King Edward, no alterations were made in favour of those who now began to be called Puritans, from their attempting a purer form of worship and discipline than had yet been established. . . . The book was presented to the two houses and passed into a law [June 24, 1559]. . . . The title of the act is 'An act for the Uniformity of Common Prayer and Service in the Church, and administration of the Sacraments.'

1585-1587.—Mary Queen of Scots and the Catholic conspiracies.—Her trial and execution.—'Maddened by persecution, by the hopelessness of rebellion within or deliverance from without, the fiercer Catholics listened to schemes of assassination, to which the murder of William of Orange lent at the moment a terrible significance. The detection of Somerville, a fanatic who had received the host before setting out for London, 'to shoot the Queen with his dagger,' was followed by measures of natural severity, by the flight and arrest of Catholic gentry, by a vigorous purification of the Inns of Court, where a few Catholics lingered, and by the dispatch of fresh batches of priests to the block. The trial and death of Parry, a member of the House of Commons who had served in the Queen's household, on a similar charge, brought the Parliament together in a transport of horror and loyalty. All Jesuits and seminary priests were banished from the realm on pain of death. A bill for the security of the Queen disqualified any claimant of the succession who had instigated subjects to rebellion or hurt to the Queen's person from ever succeeding to the crown. The threat was aimed at Mary Stuart. Weary of her long restraint, of her failure to rouse Philip or Scotland to aid her, of the baffled revolt of the English Catholics and the baffled intrigues of the Jesuits, she bent for a moment to submission. 'Let me go,' she wrote to Elizabeth; 'let me retire from this island to some solitude where I may prepare my soul to die. Grant this and I will sign away every right which either I or mine can claim.' But the cry was useless, and her despair found a new and more terrible hope in the plots against Elizabeth's life. She knew and approved the vow of Anthony Babington and a band of young Catholics, for the most part connected with the royal household, to kill the Queen; but plot and approval alike passed through Walsingham's hands, and the seizure of Mary's correspondence revealed her guilt. In spite of her protests, a commission of peers sat as her judges at Fotheringay Castle; and their verdict of 'guilty' annihilated, under the provisions of the recent statute, her claim to the crown. The streets of London blazed with bonfires, and peals rang out from steeple to steeple, at the news of her condemnation; but, in spite of the prayer of Parliament for her execution, and the pressure of the Council, Elizabeth shrank from her death. The force of public opinion, however, was now carrying all before it, and the unanimous demand of her people wrested at last a sullen consent from the Queen. She flung the warrant signed upon the floor, and the Council took on themselves the re-

sponsibility of executing it. Mary died [Feb. 8, 1587] on a scaffold which was erected in the castle hall at Forthingay, as dauntlessly as she had lived. 'Do not weep,' she said to her ladies, 'I have given my word for you.' 'Tell my friends,' she charged Melville, 'that I die a good Catholic.'—J. R. Green, *Short history of the English people*, ch. 7, sect. 6.—'Who now doubts,' writes an eloquent modern writer, 'that it would have been wiser in Elizabeth to spare her life?' Rather, the political wisdom of a critical and difficult act has never in the world's history been more signally justified. It cut away the only interest on which the Scotch and English Catholics could possibly have combined. It determined Philip upon the undisguised pursuit of the English throne, and it enlisted against him and his projects the passionate patriotism of the English nobility."—J. A. Froude, *History of England*, v. 12, ch. 34.

1587-1588.—Wrath of Catholic Europe.—Spanish vengeance and ambition astir.—"The death of Mary [Queen of Scots] may have preserved England from the religious struggle which would have ensued upon her accession to the throne, but it delivered Elizabeth from only one, and that the weakest of her enemies; and it exposed her to a charge of injustice and cruelty, which, being itself well founded, obtained belief for any other accusation, however extravagantly false. It was not Philip [of Spain] alone who prepared for making war upon her with a feeling of personal hatred: throughout Romish Christendom she was represented as a monster of iniquity; that representation was assiduously set forth, not in ephemeral libels, but in histories, in dramas, in poems, and in hawkers' pamphlets; and when the king of Spain equipped an armament for the invasion of England, volunteers entered it with a passionate persuasion that they were about to bear a part in a holy war against the wickedest and most inhuman of tyrants. The Pope exhorted Philip to engage in this great enterprize for the sake of the Roman Catholic and apostolic church, which could not be more effectually nor more meritoriously extended than by the conquest of England. . . . And he promised, as soon as his troops should have set foot in that island, to supply him with a million of crowns of gold towards the expenses of the expedition. . . . Such exhortations accorded with the ambition, the passions, and the rooted principles of the king of Spain. The undertaking was resolved."—R. Southey, *Lives of the British admirals*, v. 2, p. 310.—"The succors which Elizabeth had from time to time afforded to the insurgents of the Netherlands was not the only cause of Philip's resentment and of his desire for revenge. She had fomented the disturbances in Portugal, . . . and her captains, among whom Sir Francis Drake was the most active, had for many years committed unjustifiable depredations on the Spanish possessions of South America, and more than once on the coasts of the Peninsula itself. . . . By Spanish historians, these hostilities are represented as unprovoked."—S. A. Dunham, *History of Spain and Portugal*, bk. 4, sect. 1, ch. 1.—When the intentions of the Spaniard were known, Drake's activity increased. In the spring of 1587, he sailed into the harbor of Cadiz, and destroyed fifty or sixty ships, which is said to have delayed the ex-

pedition for a year. This he called "singeing the king of Spain's beard."—See also CADIZ: 1587.

1588.—Spanish Armada.—"The queen still clung to the hope of extricating herself from the danger of invasion. It was in vain that Leicester and Walsingham represented the attempt as calculated to paralyze the efforts of her subjects and to give courage to her enemies; supported by the opinion of Burghley, she named as commissioners the earl of Derby, Lord Cobham, Sir James Croft, and Dale and Rogers, doctors of civil law. They landed at Ostend, and after some preliminary forms, met at Bourbourg, near Calais, the Spanish commissioners, the count of Aremberg, Perenotte, Richardot, De Mas, and Garnier. The English opened the conferences with the demand of an armistice; it was granted by the Spaniards, but only for the four cautionary towns possessed by the queen in the Netherlands. They then brought forward three propositions; that the ancient league between England and the house of Burgundy should be renewed; that Philip should withdraw his foreign troops from the Low Countries, and that freedom of worship should be allowed to all the inhabitants for the space of at least two years. It was replied that, to the renewal of the league the king of Spain could have no objection; but that it would be imprudent in him to withdraw his forces as long as England and France continued in arms; and that the queen could not be serious in soliciting liberty of conscience for the Protestants of Belgium, as long as she refused it to the Catholics of England. The Spanish commissioners then demanded the restoration of the towns mortgaged to Elizabeth by the States; their opponents required, in return, the repayment of the money which she had advanced. Neither would yield; expedients were suggested and refused; and the conferences continued till the Armada had arrived in the mouth of the Channel. It was the general opinion that each party negotiated for the sole purpose of overreaching the other; but, if we may believe the private letters of the ministers, Elizabeth anxiously sought the restoration of peace. During five years, procrastination had marked the counsels of Philip; on a sudden his caution was exchanged for temerity. The marquess of Santa Cruz had objected to the danger of navigating a narrow and tempestuous sea without the possession of a single harbour capable of sheltering the fleet; the duke of Parma had solicited permission to reduce the port of Flushing previously to the departure of the expedition; and Sir William Stanley had advised the occupation of Ireland, as a measure necessary to secure the conquest of England. But the king would admit of no delay. He had understood from the pontiff that on his part everything was ready; that the money had been collected, the bull of deposition signed, and the appointment of the legate made out; but that he was resolved not to commit himself by any public act, till he should be assured that the Spanish forces had obtained a footing in England. Philip immediately issued peremptory orders to the admiral that he should put to sea without further delay; to Farnese that he should hold the army in readiness to embark on the first appearance of the fleet near the coast of Flanders. But Santa Cruz was already dead,—the victim of his anxiety to satisfy the impatience of his sovereign; and his place was inadequately supplied by the duke of Medina Sidonia, who, like the lord admiral of England, was totally unacquainted with the naval service. Under this new leader the

Armada sailed from the Tagus."—J. Lingard and H. Belloc, *History of England*, v. 6, pp. 506-508.

"At last, on the 28th, 29th and 30th May, 1588, the fleet, which had been waiting at Lisbon more than a month for favourable weather, set sail from that port. . . . The galleons, of which there were about 60, were huge round-stemmed clumsy vessels, . . . built up at stem and stern, like castles. The galleasses . . . were rowed each by 300 galley-slaves. They consisted of an enormous towering fortress at the stern, a castellated structure almost equally massive in front, with seats for the rowers amidships. At stem and stern and between each of the slaves' benches were heavy cannon. These galleasses were floating edifices, very wonderful to contemplate. They were gorgeously decorated. . . . To take part in an ostentatious pageant, nothing could be better devised. To fulfil the great objects of a war-vessel—to sail and to fight—they were the worst machines ever launched upon the ocean. . . . All the ships of the fleet—galleasses, galleys, galleons, and hulks—were so encumbered with top-hamper, so over-weighted in proportion to their draught of water, that they could bear but little canvas, even with smooth seas and light and favourable winds. . . . Such was the machinery which Philip had at last set afloat, for the purpose of dethroning Elizabeth and establishing the inquisition in England. . . . Medina Sidonia [the captain-general of the Armada] was to proceed straight from Lisbon to Calais roads; there he was to wait for the Duke of Parma [Spanish commander in the Netherlands] . . . to assume the chief command of the whole expedition. They were then to cross the channel to Dover . . . [and] march at once upon London. Medina Sidonia was to seize and fortify the Isle of Wight, guard the entrance of the harbours against any interference from the Dutch and English fleets, and—so soon as the conquest of England had been effected—he was to proceed to Ireland. . . . A strange omission had however been made in the plan from first to last. The commander of the whole expedition was the Duke of Parma: on his head was the whole responsibility. Not a gun was to be fired—if it could be avoided—until he had come forth with his veterans to make his junction with the Invincible Armada off Calais. . . . With as much sluggishness as might have been expected from their clumsy architecture, the ships of the Armada consumed nearly three weeks in sailing from Lisbon to the neighbourhood of Cape Finisterre. Here they were overtaken by a tempest. . . . [and] ultimately reassembled at Coruña; . . . they remained a month, repairing damages and recruiting; and on the 22d of July (N. S.) the Armada set sail."—J. L. Motley, *History of the United Netherlands*, ch. 10.

1588.—Destruction of Armada.—"The great number of the English, the whole able-bodied population being drilled, counterbalanced the advantages possessed, from their universal use of firearms, by the invaders. . . . Every hamlet was on the alert for the beacon-signal. Some 15,000 men were already under arms in London; the compact Tilbury Fort was full, and a bridge of boats from Tilbury to Gravesend blocked the Thames."—H. R. Clinton, *From Crecy to Assye*, ch. 7.—"Howard . . . with Drake and Hawkins and the major part of the English fleet was lying in Plymouth, getting stores aboard as fast as might be, while

Seymour and Sir William Wynter with their squadron were lying at the East end of the Channel, when on July 10th the news came that the Armada had been sighted off the Lizard, coming up with a favouring wind. There was nothing for it but to work out of Plymouth Sound in the teeth of the wind. When the Spaniards came in view on the 20th (Saturday) the move had been accomplished. In the night, the English passed out to sea, across the Spanish front, and so in the morning found themselves to windward and attacked—as it would seem, for the first time in naval warfare, in 'line-ahead' formation, pouring successive broadsides into the enemy's 'weathermost' ship. This action lasted little more than two hours. Not many of the Spaniards were actually engaged, but the working effect of the new tactics was tested, Admiral Recalde's ship was crippled, some others had suffered from a very severe fire very inadequately returned; incidentally too, one great galleon had been almost blown to pieces by an accident, and the ship of Valdez was disabled through collision. The Duke of Medina Sidonia left her to her fate, and she surrendered to Drake early next morning, the two fleets in the meantime having proceeded up Channel. Drake ought to have led the pursuit during the night, and by not doing so caused some confusion and delay—also, it would seem, much indignation on the part especially of Frobisher; but his conduct is capable of legitimate if not complete justification. In consequence however, the English were unable to form for attack . . . till late on the next day, when they were foiled by the falling of a calm. When the breeze got up again on Tuesday, the Spaniards were to windward, off Portland, and challenged an engagement. In manœuvring to recover the weather-gauge, Frobisher, with some other vessels, was for a time cut off, and fought a very valiant fight, till a change in the wind enabled them to extricate themselves, and there was more sharp fighting in which the Spaniards suffered most. . . . It was supposed to be the intention of the Armada to secure the station at the Isle of Wight and Portsmouth; and it was to frustrate this object that the third battle was fought on Thursday. In the interval, Howard had only worried the enemy, being in need of fresh supplies of ammunition which were not arriving. . . . The brunt of the resulting engagement was borne by Frobisher and Howard, who occupied the enemy and were very thoroughly occupied themselves; until the Armada, which had not in appearance been getting the worst of it, went about and sailed off up Channel in good order. The explanation would appear to be that the Spaniard found himself suddenly threatened with a crushing flank attack by the combined squadrons of Drake and Hawkins, which would have driven him upon the banks known as the 'Owers'; and to escape destruction, he had no alternative but to give up the design on Portsmouth, if he had ever entertained it, and continue his unimpeded course up Channel. . . . Although strategically a great point was secured by this third engagement, the ostensible strength of the Spanish fleet remained virtually unaltered, and the English captains were evidently disappointed at having achieved no more marked results. Of course, on the theory that the odds were, professionally speaking, all in favour of the Armada, they had done exceedingly well; but they were fighting under the perfectly correct impression that the odds were in their own favour, and yet they had done no signal injury. In fact however they had accomplished a good deal more than appears on the surface. Their

losses were far short of 100 men all told; their ships were intact; the spirit of the fleet had been tested; and they had already learnt and remedied the defect in their organisation at the start. On the other hand, the Armada had lost three ships, several more had suffered so severely as to be useless for further action, its ammunition was running short, some hundreds of men had been killed or wounded, and the whole fleet had realised that in manœuvring capacity it was completely outclassed, so that its *morale* was failing. . . . On Saturday evening, without any further fighting, the Armada anchored in Calais Roads. The same evening, Howard was joined by Seymour's squadron, and for the first time his fleet was at its full strength. It now became his great object to force the decisive engagement before Medina Sidonia and Parma at Dunkirk could effect a junction. To this end it was needful to dislodge the Armada from its anchorage. Wind and tide both favouring, on Sunday night eight fire-ships were sent drifting on to the Spanish fleet. A panic arose; the Spaniards cut their cables and made for the open, to escape the danger. . . . For the Duke, the first thing to do was to recover his formation; for the English, to prevent his doing so. Howard should have led the attack, but turned aside to make sure of a crippled galleon. Drake, followed by Hawkins, Frobisher, and Seymour, sailed down on the Spaniards, and the last decisive engagement began. Medina Sidonia was never able to bring more than half his ships into action. He gained some time, by Howard's aberration, but in the course of the day the entire English fleet was engaging him. The ships and the captains, however, who were able to rejoin him, were the best in the Armada, and they made a magnificent and desperate struggle. Raked with broadside after broadside they fought on, drifting into ever more dangerous proximity to the shoals, their hulls riddled, their decks charnel-houses; resolved to sink rather than strike; while the English poured in a ceaseless storm of shot at close range, but always evaded the one danger, of being grappled and boarded, the sole condition under which the Spaniard could fight at an advantage. At last the English drew off; partly because their ammunition, like the Spaniards', was all but exhausted, except in Howard's squadron, the expenditure having been quite unparalleled; partly because a fierce squall for a time provided them with a new enemy which it took all their energies to meet. That squall was the salvation of the Spaniards; when it cleared, they were already in full flight to the North East. . . . But for the English shortage of ammunition, which made it impossible to provoke another general engagement, half the Armada might very well have fallen a prey to the pursuers; for it was a fleet that knew itself hopelessly beaten; its *morale* was gone, its ammunition was exhausted, its best crews were much more than decimated, many of its vessels were hopelessly crippled. As it was, the English were content to follow and watch while the Spaniards drove Northwards before a stiff gale; giving up the chase on August 2nd, by which time it was evident that the enemy had no course open to them but to attempt the passage round the North of Scotland, and so to make for home by the Irish coast as best they might; though later, the wind changing to the North created a passing fear that they might return with it to Denmark, to refit. In the whole series of actions, the English lost only about a hundred men and one ship. Out of that great Armada which had sailed with the Papal blessing to lower the insolent

pride of heretic England, not more than half the ships found their way back to Spain. Of the sixty or more that were lost, nine only are definitely recorded as wrecked on the Scottish or Irish coast: there must have been many more. Of their crews, those whom the winds and the waves spared, the Irish slew; and those who escaped the Irish, the English soldiery slew. Of the fate of the remainder, one-fourth of the entire fleet, nothing is known."—A. D. Innes, *History of England*, v. 4.—*England under the Tudors*, pp. 363-367.

1588-1590.—Effects of the Armada.—Philip's policy.—War with Spain.—Invasion of Portugal.—The defeat of the Spanish Armada marks the beginning and not the end of the Spanish war, which outlasted Elizabeth's reign. Philip was as slow to acknowledge defeat as he had been to engage in war; and he stubbornly set to work to recreate on a sounder basis his shattered naval power, and to reconstruct on saner principles his plans for Elizabeth's humiliation. The conquest of England at one great stroke was seen to be impracticable, and the war was reduced to the more normal level of hostilities between nations not unevenly matched, seeking to cripple rather than to annex their rivals. Philip would at any time have probably been content to abandon the pose of champion of the Roman catholic church and avenger of Mary Stuart, which was forced on him by catholic public opinion, in return for Elizabeth's desertion of the Dutch and abstention from attacks on the New World. He can have hoped for nothing better after 1588, and his designs on England were limited to attempts to seize some English port as a basis of operations. For his energies, which had momentarily been concentrated on England in 1588, were for the rest of his reign once more divided between England, France and the Netherlands; and the war became a European, rather than a national, struggle against Spain. This change hinged upon developments in France, where Henry III. was ground to powder between the upper and nether millstones of the Guises and the Huguenots, and national independence was far more precarious than in England. . . . Meanwhile English sailors had been impressed by the limitations rather than by the magnitude of their success. The capacity for resistance possessed by a close pack of Spanish ships had exceeded their expectations, and they had no desire to see another Armada in the Channel. The government set itself to the task of devising preventive measures. These were of three kinds: to cut the root, which nourished Spain's ambition, by intercepting its treasure-fleets from the Indies; to destroy the shipping in Spanish ports before it could sail; or, as Cobham had written in 1579, to make another Netherlands of Portugal. This last design was mooted in September, 1588, before the Armada had left British waters. Its success depended upon the accuracy of the reports which Don Antonio and other Portuguese exiles poured into Elizabeth's ears. Probably there was little hope of Antonio's establishment on the throne of Portugal; but it would be enough for England's purpose if his country were plunged in civil war, or even if a few places could be strengthened to defy the Spanish king; . . . [but] the expedition, which sailed in April, 1589, under the military command of Norris and the naval command of Drake, lit no national revolt in patient Portugal, although it carried a force stronger by thousands than any Elizabeth had sent to the Netherlands. Cupidity also marred its purpose: it was fitted out as a joint-stock enterprise, partly designed to recoup

the adventurers for their expense in defeating the Spanish Armada; and its first act was an attempt to plunder Coruña. 'We left there,' wrote Don Antonio, 'and disembarked at Peniche, where the strong wines of the country increased the sickness of the men; and when we arrived before Lisbon, there were not enough men fit to attack a boat. . . . We were short of powder and fire-match, and we had no artillery battery. Drake's fleet remained at Cascaes, and refrained from entering the river.' Lisbon was vigorously defended by the Cardinal Archduke Albert, who, said Henry IV., was a good general though nobody would believe it; and the expedition returned with hardly one-sixth of its men efficient. An inquiry was held on the conduct of the commanders; and Drake remained under a cloud for nearly six years, while his ambitious plans of naval warfare were exchanged for the more cautious policy of preying on Spanish treasure-ships. The Earl of Cumberland had, indeed, with one great ship, the *Victory*, and a few privateers, done more to please Elizabeth than had Drake's elaborate force. He seized Fayal in the Azores and held it to ransom; captured a number of prizes at sea and cut others out from under the Spanish guns; and maintained his position all the summer, narrowly missing the East and West Indian treasure. But Hawkins and Frobisher, who were sent out in 1590 to repeat and improve on the earl's exploits, achieved comparatively little; and the immunity of Philip's harbours from attack during the years which followed the Armada enabled him to build a navy of fighting ships. When in 1591 Lord Thomas Howard and Sir Richard Grenville again sought the Azores, a powerful fleet was sent to meet them. Howard escaped without great difficulty; but Grenville in the *Revenge* was too proud to obey orders to retreat, and fought for fifteen hours against fifteen Spanish men-of-war, refusing to surrender, and dying himself of his wounds a few hours after his capture. . . . His splendid bravery resulted in the loss of the only English warship taken in Elizabeth's reign. . . . For the next five years Elizabeth pursued a cautious policy. Leicester had died on September 5, 1588, Sir Amias Paulet three weeks later, Sir Walter Mildmay in 1589, and Walsingham on April 6, 1590. All had favoured aggression, and had championed Drake against the more conservative school of politicians represented by Burghley. Only two members were admitted to the privy council in their places, Sir John Fortescue as chancellor of the exchequer in 1589, and Sir Robert Cecil as secretary on August 2, 1591. The result was to give the cautious party complete control of the government; but it is misleading to represent the issue as one between war and peace. The alternatives were rather a naval colonial and a continental military war; and this divergence continued to divide opinion for more than a generation. Nor can we be sure that Burghley and the queen were wrong; it was more essential for England that France and the Netherlands should be saved from Spanish control than that England should burden herself with a colonial empire, the weight of which she was not yet strong enough to bear. Elizabeth liked to help those who helped themselves, and both the Dutch and the Huguenots showed remarkable efficiency at this time. . . . Peregrine Bertie, Lord Willoughby de Eresby, had been left in command of the English contingent when Leicester withdrew in 1587, and he with his lieutenants, . . . saved Bergen-op-Zoom against which Parma had turned on the dispersal of the Armada. But many of the English officers and men were required in Septem-

ber, 1589, to make up the 4,000 troops which Elizabeth was sending under Willoughby to the assistance of Henry IV. They landed at Dieppe, and after accompanying the king to his futile attempt on Paris, assisted in the reduction of Le Mans, Alençon, Falaise, and Honfleur. They returned home early in 1590, too soon to participate in Henry's victory at Ivry on March 14; and only Williams and a handful of English were present at the siege of Paris which was raised by Parma in September."—A. F. Pollard, *History of England*, pp. 408-412.

1603.—Accession of King James I.—Stuart family.—On the death of Queen Elizabeth, in 1603, James VI of Scotland became also the accepted king of England (under the title of James I), by virtue of his descent from that daughter of Henry VII and sister of Henry VIII, Margaret, Tudor, who married James IV, king of Scots. His grandfather was James V; his mother was Marie Stuart, or Mary Queen of Scots, born, of her marriage with Lord Darnley. He was the ninth in the line of the Scottish dynasty of the Stuarts, or Stewarts, for an account of the origin of which see SCOTLAND: 1370. He had been carefully alienated from the religion of his mother and reared in Protestantism, to make him an acceptable heir to the English throne. He came to it at a time when the autocratic spirit of the Tudors, making use of the

peculiar circumstances of their time, had raised the royal power and prerogative to their most exalted pitch; and he united the two kingdoms of Scotland and England under one sovereignty. "The noble inheritance fell to a race who, comprehending not one of the conditions by which alone it was possible to be retained, profligately misused until they lost it utterly. The calamity was in no respect foreseen by the statesman, Cecil, to whose exertion it was mainly due that James was seated on the throne: yet in regard to it he cannot be held blameless. He was doubtless right in the course he took, in so far as he thereby satisfied a national desire, and brought under one crown two kingdoms that with advantage to either could not separately exist; but it remains a reproach to his name that he let slip the occasion of obtaining for the people some ascertained and settled guarantees which could not then have been refused, and which might have saved half a century of bloodshed. None such were proposed to James. He was allowed to seize a prerogative, which for upwards of fifty years had been strained to a higher pitch than at any previous period of the English history; and his clumsy grasp closed on it without a sign of question or remonstrance from the leading statesmen of England. 'Do I mak the judges? Do I mak the bishops?' he exclaimed, as the powers of his new dominion dawned on his delighted sense: 'Then, God's wauns! I mak what likes me, law and gospel!' It was even so. And this license to make gospel and law was given, with other far more questionable powers, to a man whose personal appearance and qualities were as suggestive of contempt, as his public acts were provocative of rebellion. It is necessary to dwell upon this part of the subject; for it is only just to his not more culpable but far less fortunate successor to say, that in it lies the source and explanation of not a little for which the penalty was paid by him. What is called the Great Rebellion [1642-1660] can have no comment so pregnant as that which is suggested by the character and previous career of the first of the Stuart kings."—J. Forster, *History and biology, essays*, p. 227.—In 1603 when James was on his way to London what was called a Millenary Petition was presented to him. It was signed by 825 of the clergy who asked for greater freedom in matters of worship.

1603-1619.—Religious controversy of the Netherlands. See NETHERLANDS: 1603-1619.

1604.—The Hampton Court conference.—James I "was not long seated on the English throne, when a conference was held at Hampton Court, to hear the complaints of the puritans, as those good men were called who scrupled to conform to the ceremonies and sought a reformation of the abuses of the church of England. On this occasion surrounded with his deans, bishops, and archbishops, who breathed into his ears the music of flattery, and worshipped him as an oracle, James, like king Solomon, to whom he was fond of being compared, appeared in all his glory, giving his judgment on every question, and displaying before the astonished prelates, who kneeled every time they addressed him, his polemic powers and theological learning. . . . After long conferences, during which the king gave the most extraordinary exhibitions of his learning, drollery, and profaneness, he was completely thrown off his guard by the word presbytery, which Dr. Reynolds, a representative of the puritans, had unfortunately employed. Thinking that he aimed at a 'Scotch presbytery,' James rose into a towering passion, declaring that presbytery agreed as well with monarchy as God and the devil. 'Then,' said he, 'Jack and Tom, and

Will and Dick, shall meet, and at their pleasures censure me and my council, and all our proceedings.' . . . Then, putting his hand to his hat, 'My lords the bishops,' said his majesty, 'I may thank you that these men plead for my supremacy; they think they can't make their party good against you, but by appealing unto it. But if once you are out, and they in place, I know what would become of my supremacy; for no bishop, no king, as I said before.' Then rising from his chair, he concluded the conference with, 'If this be all they have to say, I'll make them conform, or I'll harry them out of this land, or else do worse.' The English lords and prelates were so filled with admiration at the quickness of apprehension and dexterity in controversy shown by the king, that, as Dr. Barlow informs us, 'one of them said his majesty spoke by the instinct of the Spirit of God.' . . . In these circumstances, buoyed up with flattery by his English clergy, and placed beyond the reach of the faithful admonitions of the Scottish ministry, we need not wonder to find James prosecuting, with redoubled ardour, his scheme of reducing the church of Scotland to the English model."—T. McCrie, *Sketches of Scottish church history*, ch. 5.—The king had the opportunity at this conference of drawing together the extreme parties in the religious controversy, but he chose to ally himself with one small party, and all clergymen who did not fully agree with the Anglican form of worship were driven from their offices.

1605.—Gunpowder plot.—"The Roman Catholics had expected great favour and indulgence on the accession of James, both as he was descended from Mary, whose life they believed to have been sacrificed to their cause, and as he himself, in his early youth, was imagined to have shown some partiality towards them. . . . Very soon they discovered their mistake; and were at once surprised and enraged to find James, on all occasions, express his intention of strictly executing the laws enacted against them, and of persevering in all the rigorous measures of Elizabeth. Catesby, a gentleman of good parts and of an ancient family, first thought of a most extraordinary method of revenge; and he opened his intention to Piercy, a descendant of the illustrious house of Northumberland. In vain, said he, would you put an end to the king's life: he has children. . . . To serve any good purpose, we must destroy, at one blow, the king, the royal family, the Lords, the Commons, and bury all our enemies in one common ruin. Happily, they are all assembled on the first meeting of Parliament, and afford us the opportunity of glorious and useful vengeance. Great preparations will not be requisite. A few of us, combining, may run a mine below the hall in which they meet, and choosing the very moment when the king harangues both Houses, consign over to destruction those determined foes to all piety and religion. . . . Piercy was charmed with this project of Catesby; and they agreed to communicate the matter to a few more, and among the rest to Thomas Winter, whom they sent over to Flanders, in quest of Fawkes, an officer in the Spanish service, with whose zeal and courage they were all thoroughly acquainted. . . . All this passed in the spring and summer of the year 1604; when the conspirators also hired a house in Piercy's name, adjoining to that in which the Parliament was to assemble. Towards the end of that year

they began their operations. . . . They soon pierced the wall, though three yards in thickness; but on approaching the other side they were somewhat startled at hearing a noise which they knew not how to account for. Upon inquiry, they found that it came from the vault below the House of Lords; that a magazine of coals had been kept there; and that, as the coals were selling off, the vault would be let to the highest bidder. The opportunity was immediately seized; the place hired by Piercy; thirty-six barrels of powder lodged in it; the whole covered up with faggots and billets; the doors of the cellar boldly flung open, and everybody admitted, as if it contained nothing dangerous. . . . The day [November 5, 1605], so long wished for, now approached, on which the Parliament was appointed to assemble. The dreadful secret, though communicated to above twenty persons, had been religiously kept, during the space of near a year and a half. No remorse, no pity, no fear of punishment, no hope of reward, had as yet induced any one conspirator, either to abandon the enterprise or make a discovery of it." But the betrayal was unwittingly made, after all, by one in the plot, who tried to deter Lord Monteagle from attending the opening session of Parliament, by sending him a mysterious message of warning. Lord Monteagle showed the letter to Lord Salisbury, secretary of state, who attached little importance to it, but who laid it before the king. The Scottish Solomon read it with more anxiety and was shrewdly led by some expressions in the missive to order an inspection of the vaults underneath the parliamentary houses. The gunpowder was discovered and Guy Fawkes was found in the place, with matches for the firing of it on his person. Being put to the rack he disclosed the names of his accomplices. They were seized, tried and executed, or killed while resisting arrest.—D. Hume, *History of England*, v. 4, ch. 46.

1625.—Gains of Parliament in the reign of James I.—Impeachment of Bacon.—"The commons had now been engaged [at the end of the reign of James I], for more than twenty years, in a struggle to restore and to fortify their own and their fellow subjects' liberties. They had obtained in this period but one legislative measure of importance, the late declaratory act against monop-

olies. But they had rescued from disuse their ancient right of impeachment. They had placed on record a protestation of their claim to debate all matters of public concern. They had remonstrated against the usurped prerogatives of binding the subject by proclamation, and of levying customs at the out-ports. They had secured beyond controversy their exclusive privilege of determining contested elections of their members. They had maintained, and carried indeed to an unwarrantable extent, their power of judging and inflicting punishment, even for offences not committed against their house. Of these advantages some were evidently incomplete; and it would require the most vigorous exertions of future parliaments to realize them. But such exertions the increased energy of the nation gave abundant cause to anticipate. A deep and lasting love of freedom had taken hold of every class except perhaps the clergy; from which, when viewed together with the rash pride of the court, and the uncertainty of constitutional principles and precedents, collected through our long and various history, a calm by-stander might presage that the ensuing reign would not pass without disturbance, nor perhaps end without confusion."—H. Hallam, *Constitutional history of England*, ch. 6.—In the first session of Parliament (1604) James quarrelled over the matter of parliamentary privilege. The session closed with the famous apology in which the house declared that free and lawful election of its members, freedom from arrest, and freedom of speech were its inalienable rights. In 1610 James dissolved Parliament when it demanded certain concessions be yielded by the king in return for an annual grant of £200,000 (Great Contract). The "added parliament" of 1614 discussed subjects prohibited by the king and was dissolved after two months (see PARLIAMENT, ENGLISH: 1614), and James tried to rule without parliament from 1614-1620. In the sessions of 1621 and 1622 the quarrel over privileges reached a climax. The king finally tore up the protestation of parliament that "their liberties and privileges were the inherited birthright of the subjects of England; the State, the defense of the realm, the laws and grievances were proper matters for them to debate; the members have liberty of speech, and freedom from all imprisonment for speaking on matters touching Parliamentary business"; and dissolved parliament. When it met again in 1624 James was willing to advise with them. An important act was passed doing away with monopolies (with certain exceptions), and foreign matters were discussed, particularly plans for war with Spain. "A parliamentary right which had slept ever since the reign of Henry VI., the right of the Lower House to impeach great offenders at the bar of the Lords, was revived against the monopolists; and James was driven by the general indignation to leave hem to their fate. But the practice of monopolies was only one sign of the corruption of the court. Sales of peerages and offices of state had raised a general disgust; and this disgust showed itself in the impeachment of the highest among the officers of State, the Chancellor, Francis Bacon, the most distinguished man of his time for learning and ability. . . . He had attached himself to the rising fortunes of Buckingham, and the favour of Buckingham made him Lord Chancellor. . . . The years during which he held the Chancellorship were the most disgraceful years of a disgraceful reign. They saw the execution of Raleigh, the sacrifice of the Palatinate, the exaction of benevolences, the multiplication of monopolies, the supremacy of Buckingham. Against none of the acts of folly and

wickedness which distinguished James's government did Bacon do more than protest. . . . To ordinary eyes the Chancellor was at the summit of human success . . . when the storm burst. The Commons charged Bacon with corruption in the exercise of his office. It had been customary among Chancellors to receive gifts from successful suitors after their suit was ended. Bacon, it is certain, had taken such gifts from men whose suits were still unsettled; and though his judgment may have been unaffected by them, the fact of their reception left him with no valid defense. . . . The heavy fine imposed on him was remitted by the Crown; but the Great Seal was taken from him, and he was declared incapable of holding office in the State or of sitting in Parliament."—J. R. Green,

such a force without money. He could not legally raise money without the consent of Parliament. It followed, therefore, that he either must administer the government in conformity with the sense of the House of Commons, or must venture on such a violation of the fundamental laws of the land as had been unknown during several centuries. . . . Just at this conjuncture James died [March 27, 1625]. Charles I. succeeded to the throne. He had received from nature a far better understanding, a far stronger will, and a far keener and firmer temper than his father's. He had inherited his father's political theories, and was much more disposed than his father to carry them into practice. . . . His taste in literature and art was excellent, his manner dignified though not gracious, his do-

CHARLES I IN THE GUARD-ROOM

*Short history of the English people*, pp. 490-491.

1625.—Marriage of Charles with Henrietta Maria of France. See FRANCE: 1624-1626.

1625-1628.—Accession of Charles I.—Beginning of the struggle of king and Parliament.—“The political and religious schism which had originated in the 16th century was, during the first quarter of the 17th century, constantly widening. Theories tending to Turkish despotism were in fashion at Whitcomb. Theories tending to republicanism were in favour with a large portion of the House of Commons. . . . While the minds of men were in this state, the country, after a peace of many years, at length engaged in a war [with Spain, and with Austria and the Emperor in the Palatinate] which required strenuous exertions. This war hastened the approach of the great constitutional crisis. It was necessary that the king should have a large military force. He could not have

mestic life without blemish. Faithlessness was the chief cause of his disasters, and is the chief stain on his memory. He was, in truth, impelled by an incurable propensity to dark and crooked ways. . . . He seems to have learned from the theologians whom he most esteemed that between him and his subjects there could be nothing of the nature of mutual contract; that he could not, even if he would, divest himself of his despotic authority; and that, in every promise which he made, there was an implied reservation that such promise might be broken in case of necessity, and that of the necessity he was the sole judge. And now began that hazardous game on which were staked the destinies of the English people. It was played on the side of the House of Commons with keenness, but with admirable dexterity, coolness and perseverance. Great statesmen who looked far behind them and far before them were at the head of that

assembly. They were resolved to place the king in such a situation that he must either conduct the administration in conformity with the wishes of his Parliament, or make outrageous attacks on the most sacred principles of the constitution. They accordingly doled out supplies to him very sparingly. He found that he must govern either in harmony with the House of Commons, or in defiance of all law. His choice was soon made. He dissolved his first Parliament, and levied taxes by his own authority."—Lord Macaulay, *History of England*, ch. 1.—Parliament had refused him sufficient funds to carry on the war with Spain, had demanded that the laws against Roman Catholics be strictly enforced, and had made objections to the king's councillors, the chief of these being George Villiers, created duke of Buckingham in 1623. The king and his favorite struggled on without Parliament for some months, but the disastrous result of the expedition to Cadiz made it necessary for him to convoke a second Parliament in 1626 which he found more intractable than the first. Under the able leadership of John Eliot, the Commons discussed their grievances and demanded the impeachment of Buckingham. Charles "again resorted to the expedient of dissolution, raised fresh taxes without any show of legal right, and threw the chiefs of the opposition into prison. [Five knights thus treated, brought the matter to court by suing out writs of habeas corpus, but the judges decided in the King's favor.] At the same time a new grievance, which the peculiar feelings and habits of the English nation made insupportably painful, and which seemed to all discerning men to be of fearful augury, excited general discontent and alarm. Companies of soldiers were billeted on the people; and martial law was, in some places, substituted for the ancient jurisprudence of the realm. The King called a third Parliament [1628], and soon perceived that the opposition was stronger and fiercer than ever. He now determined on a change of tactics. Instead of opposing an inflexible resistance to the demands of the commons, he, after much altercation and many evasions, agreed to a compromise which, if he had faithfully adhered to it, would have averted a long series of calamities. The Parliament granted an ample supply. The King ratified, in the most solemn manner, that celebrated law which is known by the name of the Petition of Rights, and which is the second Great Charter of the liberties of England."—Lord Macaulay, *History of England*, ch. 1.

1627-1628.—Buckingham's war with France and expedition to La Rochelle. See FRANCE: 1627-1628.

1628.—Petition of Right.—"Charles had recourse to many subterfuges in hopes to elude the passing of this law; rather perhaps through wounded pride, as we may judge from his subsequent conduct, than much apprehension that it would create a serious impediment to his despotic schemes. He tried to persuade them to acquiesce in his royal promise not to arrest any one without just cause, or in a simple confirmation of the Great Charter and other statutes in favour of liberty. The peers, too pliant in this instance to his wishes, and half receding from the patriot banner they had lately joined, lent him their aid by proposing amendments (insidious in those who suggested them, though not in the body of the house) which the commons firmly rejected. Even when the bill was tendered to him for that

assent which it had been necessary, for the last two centuries, that the king should grant or refuse in a word, he returned a long and equivocal answer, from which it could only be collected that he did not intend to remit any portion of what he had claimed as his prerogative. But on an address from both houses for a more explicit answer, he thought fit to consent to the bill in the usual form. The commons, of whose harshness towards Charles his advocates have said so much, immediately passed a bill for granting five subsidies, about £350,000; a sum not too great for the wealth of the kingdom or for his exigencies, but considerable according to the precedents of former times, to which men naturally look. . . . The Petition of Right, . . . this statute is still called, from its not being drawn in the common form of an act of parliament." Although the king had been defeated in his attempt to qualify his assent to the Petition of Right, and had been forced to accede to it unequivocally, yet "he had the absurd and audacious insincerity (for we can use no milder epithets), to circulate 1,500 copies of it through the country, after the prorogation, with his first answer annexed; an attempt to deceive without the possibility of success. But instances of such ill-faith, accumulated as they are through the life of Charles, render the assertion of his sincerity a proof either of historical ignorance or of a want of moral delicacy."—H. Hallam, *Constitutional history of England*, v. 1, ch. 7.—For the text, see PETITION OF RIGHT.

1628.—Assassination of Buckingham.—"While the struggle [over the Petition of Right] was going on, the popular hatred of Buckingham showed itself in a brutal manner. In the streets of London, the Duke's physician, Dr. Lambè, was set upon by the mob, . . . [and] beaten to death. . . . The fleet was at Portsmouth, and Buckingham went down . . . to take the command. . . . As he rose [from the breakfast table] he received letters which made him believe that Rochelle had been relieved. He said he must tell the King instantly, but Soubise and the other refugees did not believe a word of it, and there was a good deal of disputing and gesticulation between them. He crossed a lobby, followed by the eager Frenchmen, and halted to take leave of an officer, Sir Thomas Fryar. Over the shoulder of this gentleman, as he bowed, a knife was thrust into Buckingham's breast. There was an effort to withdraw it; a cry 'The Villain!' and the great Duke, at 30 years old, was dead. The attendants at first thought the blow came from one of the noisy Frenchmen, and were falling on them." But a servant had seen the deed committed, and ran after the assassin, who was arrested and proved to be one John Felton, a soldier and a man of good family. He had suffered wrongs which apparently unhinged his mind.—C. M. Yonge, *Cameos from English history*, 6th series, c. 17.

ALSO IN: S. R. Gardiner, *History of England*, 1603-1642, ch. 45.

1629.—Religious and political conditions.—Ecclesiastical policy of Parliament.—Tonnage and poundage.—Tumult in Parliament.—Three Resolutions.—Dissolution.—"At the opening of the seventeenth century, [several features] differentiated England from the other countries of Europe. Owing to these characteristics, it was still possible that, if our island could for a while remain isolated from continental affairs, we might evolve some new kind of state, more free but not less highly organised than the military and bureaucratic despotism, which otherwise bade fair to become the one type of civilised government. For

England was a land of local government, local armaments, local feeling, where the life of the shire, the parish and the city was vigorous, yet where no feud existed between the country and town; where ranks were for ever mingling; where the gentry intermarried with the middle class, and shared with them the commercial and professional careers. Bureaucrats and soldiers were almost unknown; the King depended for the execution of his mandates on an unpaid magistracy, and for his defence on the loyalty of his subjects. The religion which most inspired the best and ablest men, did not depend, like the Protestantism of Germany or the Catholicism of France, on a State Church or a Church State, but referred the individual to his own intellect and his own conscience, and inspired him to defend his spiritual liberties. And this country, when Elizabeth died, was entering on a period of peace and isolation favourable to internal activities, while the nations on the continent again embarked on a series of gigantic wars. Whether in such a land, liberty had still a chance of survival; or whether the universal tide of monarchy in Europe would not after all prove irresistible even in England, now that feudal traditions were lost and no republican ideals had taken their place, was soon to be decided by the hazard of events, and by the prejudice and passion of men whom fortune would raise above their fellows, not to guide the world whither they themselves would, but blindly to impel it down courses which neither themselves nor any other had desired. . . . James had upheld the ecclesiastical polity of the High Churchmen; Charles took under his protection their doctrinal system. About the time of his accession, the Anglicans, whose defence of English insularity was based upon a profound study of the early fathers, adopted the theories of a contemporary Dutchman. The doctrine of Free Will promulgated by Arminius was encouraged by Laud, Charles and Buckingham, because to reject Predestination was to ruin Calvin's whole logical structure. The excitement produced seems now almost incredible. A generation that was theological as well as religious supposed that all their deepest beliefs and feelings depended on the dispute. The problem which in every age baffles or divides the acutest metaphysicians, supplied the catchwords of the two parties in Church and State. Prentices hooted down the street after the Arminian rogues; courtiers damned the Predestinate crew. Our ancestors might understand even less of what they were disputing than did the mobs who massacred one another for the doctrine of the Homoousion in the cities of the Eastern Empire; yet much that every Englishman could appreciate was for the time involved in the fate of the rival dogmas. The victory of Free Will would establish a coercive and despotic government; a sacramental and priestly religion; while Predestination implied privilege of Parliament, liberty of person, Protestant ascendancy, and the agreeable doctrine of exclusive salvation. So long as Parliament was continually meeting, it was impossible to begin a vigorous persecution of Puritanism, but every preparation for such an attempt was being made at Court. Manwaring and Montague, the clergymen whom the Commons had attacked by name for their Arminian and absolutist utterances, were rewarded, the one with a rich living, the other with a Bishopric. Laud, perpetually closeted with King and favourite, drew up at their request a list of the leading clergy, marking each name 'P' or 'O' (Puritan or Orthodox), as a guide to the exercise of royal patronage. The Commons were rightly convinced that the High Churchmen were striving

to acquire not a share but a monopoly. Indeed, neither side contemplated either a comprehension within, or a toleration without the Church. If the sovereign power of the Crown remained untouched for another generation, the Puritans would have to leave England; if Parliament became sovereign, the High Anglicans would no less certainly be crushed out. Thus the desire for liberty of conscience, then hopelessly involved with the right to persecute, drove Laud to become Erastian, and changed the gentlemen of the House of Commons into unconscious revolutionists. In the brief session of 1629, after the Duke's murder, the members attempted to dictate an ecclesiastical policy for the kingdom, and thereby proposed in effect, thought not yet in name, the sovereignty of Parliament—a doctrine as strange to the Constitution as the prerogative theories of Charles."—G. M. Trevelyan, *England under the Stuarts (Political history of England, v. 5, pp. 71-72, 153-154)*.—"There needed to be a Committee of Religion. The House resolved itself into a Grand Committee of Religion; and did not want for matter. Bishop Neile of Winchester, Bishop Laud now of London, were a frightfully ceremonial pair of Bishops; the fountain they of innumerable tendencies to Papistry and the old clothes of Babylon. It was in this Committee of Religion, on the 11th day of February, 1628-9, that Mr. Cromwell, Member for Huntingdon, stood up and made his first speech, a fragment of which has found its way into History. . . . A new Remonstrance behoves to be resolved upon; Bishops Neile and Laud are even to be 'named' there. Whereupon, before they could get well 'named' . . . the King hastily interfered."—T. Carlyle, *Introduction to Oliver Cromwell's letters and speeches, ch. 4*.—"Tonnage and Poundage were closely connected in their minds with Predestination and Free Will. If the King was not to have his way in Church and State, he must depend for supply upon the Houses. He was already prevented from waging war without their consent, for the Petition of Right forbade him to levy direct taxation—'any gift, loan, benevolence, tax or such like charge without common consent by Act of Parliament.' They now proposed, by granting him Tonnage and Poundage for one year only, to make him dependent on them for indirect taxation also; he would then be unable to carry on prerogative government even in time of peace. But Charles refused to accept the grant unless it was given him for life, as it had been given to his father. Meanwhile he continued to levy the duties, relying on the decision which the Judges had made in Bate's case, that indirect taxation was within the power of the Crown. The House of Commons fell back upon the doubtful argument that indirect taxation was covered by the terms of the Petition of Right."—G. M. Trevelyan, *England under the Stuarts (Political history of England, v. 5, p. 155)*.—See also TONNAGE and POUNDAGE.—"This Parliament, in a fortnight more, was dissolved; and that under circumstances of the most unparalleled sort. For Speaker Finch, as we have seen, was a Courtier, in constant communication with the King; one day, while these high matters were astir, Speaker Finch refused to 'put the question' when ordered by the House! He said he had orders to the contrary; persisted in that;—and at last took to weeping. What was the House to do? Adjourn for two days, and consider what to do! On the second day, which was Wednesday, Speaker Finch signified that by his Majesty's command they were again adjourned till Monday next. On Monday next Speaker Finch, still recusant, would not put the former nor indeed any question, having the

King's order to adjourn again instantly. He refused; was reprimanded, menaced; once more took to weeping; then started up to go his ways. But young Mr. Holles, Denzil Holles, the Earl of Clare's second son, he and certain other honourable members were prepared for that movement: they seized Speaker Finch, set him down in his chair, and by main force held him there! A scene of such agitation as was never seen in Parliament before. 'The House was much troubled,' 'Let him go,' cried certain Privy Councillors, Majesty's Ministers as we should now call them, who in those days sat in front of the Speaker, 'Let Mr. Speaker go!' cried they imploringly. 'No!' answered Holles; 'God's wounds, he shall sit there till it pleases the House to rise!' The House in a decisive though almost distracted manner, with their Speaker thus belted down for them, locked their doors; redacted Three emphatic Resolutions, their Protest against Arminianism, Papastry, and illegal Tonnage and Poundage; and passed the same by acclamation; letting no man out, refusing to let even the King's Usher in."—T. Carlyle, *Introduction to Oliver Cromwell's letters and speeches*, ch. 4.—"The business of the session of January to March, 1629, can be read in the famous Three Resolutions:—[1] Whosoever shall bring in innovation in religion, or by favour seek to extend or introduce Popery or Arminianism, or other opinions disagreeing from the true and orthodox Church, shall be reputed a capital enemy to this kingdom and the commonwealth. [2] Whosoever shall counsel or advise the taking and levying of the subsidies of tonnage and poundage not being granted by Parliament, or shall be an actor or instrument therein, shall he likewise be reputed an innovator in the government, and a capital enemy to this kingdom and commonwealth. [3] If any merchant or other person whatsoever shall voluntarily yield or pay the said subsidies of tonnage and poundage, not being granted by Parliament, he shall likewise be reputed a betrayer of the liberty of England, and an enemy to the same. Such were the Three Resolutions of the last and greatest day of Eliot's Parliamentary career, passed by the shouts of the angry members, thronging and swaying round the chair into which they had forced back the frightened Speaker [Finch], whilst the blows of the King's officers without resounded on the fastened door. When they had so voted, they flung all open and poured out flushed into the cold air of heaven, freemen still and already almost rebels."—G. M. Trevelyan, *England under the Stuarts (Political history of England, v. 5. p. 155)*.—"For which surprising procedure, vindicated by Necessity the mother of Invention, and supreme of Lawgivers, certain honourable gentlemen, Denzil Holles, Sir John Eliot, William Strode, John Selden, and others less known to us, suffered fine, imprisonment, and much legal tribulation: nay Sir John Eliot, refusing to submit, was kept in the Tower till he died. This scene fell out on Monday, 2d of March, 1629."—T. Carlyle, *Introduction to Oliver Cromwell's letters and speeches*, ch. 4.

1629-1640.—Personal rule of Charles.—Ship-money.—"The aspect of public affairs grew darker and darker. . . . All the promises of the king were violated without scruple or shame. The Petition of Right, to which he had, in consideration of moneys duly numbered, given a solemn assent, was set at naught. Taxes were raised by the royal authority. Patents of monopoly were granted. The old usages of feudal times were made pretexts for harassing the people with exactions unknown during many years."—Lord Macaulay, *Nugent's*

*memorials of Hampden (Critical and miscellaneous essays, v. 2)*.—After the death of Buckingham "Charles set eagerly to work to rule the kingdom by himself. To the Puritan dogma of enforced unity of religious belief—utterly mischievous, and just as much fraught with slavery to the soul in one sect as another—he sought, through Laud, to oppose the only less mischievous, because silly, doctrine of enforced uniformity in the externals of public worship. Laud was a small and narrow man, hating Puritanism in every form, and persecuting bitterly every clergyman or layman who deviated in any way from what he regarded as proper ecclesiastical custom. His tyranny was of that fussy kind which, without striking terror, often irritates nearly to madness. He was Charles's instrument in the effort to secure ecclesiastical absolutism. The instrument through which the King sought to establish the royal prerogative in political affairs was of far more formidable temper. Immediately after the dissolution of Parliament, Wentworth had obtained his price from the King, and was appointed to be his right-hand man in administering the kingdom. A man of great shrewdness and insight, he seems to have struggled to govern well, according to his lights; but he despised law and acted upon the belief that the people should be slaves, unpermitted, as they are unfit, to take any share in governing themselves. After awhile Laud was made archbishop; and Wentworth was later made Lord Strafford. Wentworth and Laud, with their associates, when they tried to govern on such terms, were continually clashing with the people. A government thus carried on naturally aroused resistance, which often itself took unjustifiable forms; and this resistance was, in its turn, punished with revolting brutality. Criticism of Laudian methods, or existing social habits, might take scurrilous shape; and then the critic's ears were hacked off as he stood in the pillory, or he was imprisoned for life. The great fight was made, not on a religious, but on a purely political question—that of Ship Money. The king wished to go to war with the Dutch, and to raise his fleet he issued writs, first to the maritime counties, and then to every shire [a step which had never been taken before] in England. He consulted his judges, who stated that his action was legal: as well they might, for when a judge disagreed with him on any important point, he was promptly dismissed from office. But there was one man in the kingdom who thought differently, John Hampden, a Buckinghamshire 'squire,' who had already once sat as a silent member in Parliament, together with another equally silent member of the same social standing, his [Hampden's] nephew, Oliver Cromwell. Hampden was assessed at twenty shillings. The amount was of no more importance than the value of the tea which a century and a half later was thrown into Boston Harbor; but in each case a vital principle—the same vital principle—was involved. If the King could take twenty shillings from Hampden without authority from the representatives of the people in Parliament assembled, then his rule was absolute: he could do what he pleased. On the other hand, if the House of Commons could do as it wished in granting money only for whatever need it chose to recognize in the kingdom, then the House of Commons was supreme. In Hampden's view but one course was possible—he was for the Parliament and the nation against the King; and he refused to pay the sum, facing without a murmur the punishment for his contumacy. The King and his ministers did not flinch from proceeding to any length against either

political or religious opponents. Charles heartily upheld Laud and Wentworth in carrying out their policy of 'thorough'; Laud in England; Wentworth, after 1633, in Ireland. 'Thorough,' in their sense of the word, meant making the State, which was the King, paramount in every ecclesiastical and political matter, and putting his interests above the interests, the principles, and the prejudices of all classes and all parties; paying heed to nothing but to what seemed right in the eyes of the sovereign and the sovereign's chosen advisers. Under Wentworth's strong hand a certain amount of material prosperity followed in Ireland, although chiefly among the English settlers. There was no such material prosperity in England; 1630, for instance, was a famine year. The net effect of the policy would in the long run have been to bring down a freedom-loving people to a lower grade of political and social development. There was, of course, no oppression in England in any way resembling such oppression as that which flogged the Dutch to revolt against the Spaniards. . . . Eliot, Hampden, and Pym, stood for the principles that were championed by Washington, Patrick Henry, and the Adamses."—T. Roosevelt, *Oliver Cromwell*, pp. 33-36.—"Hampden, after consulting the most eminent constitutional lawyers of the time, refused to pay the few shillings at which he was assessed; and determined to incur all the certain expense and the probable danger of bringing to a solemn hearing this great controversy between the people and the crown. . . . Towards the close of the year 1637, this great cause came on in the Exchequer Chamber before all the judges of England. The leading counsel against the writ was the celebrated Oliver St. John; a man whose temper was melancholy, whose manners were reserved, and who was as yet little known in Westminster Hall; but whose great talents had not escaped the penetrating eye of Hampden. The arguments of the counsel occupied many days; and the Exchequer Chamber took a considerable time for deliberation. The opinion of the bench was divided. So clearly was the law in favour of Hampden, that though the judges held their situations only during the royal pleasure, the majority against him was the least possible. Four of the twelve pronounced decidedly in his favour; a fifth took a middle course. The remaining seven gave their voices in favour of the writ. The only effect of this decision was to make the public indignation stronger and deeper. 'The judgment,' says Clarendon, 'proved of more advantage and credit to the gentleman condemned than to the king's service.' The courage which Hampden had shown on this occasion, as the same historian tells us, 'raised his reputation to a great height generally throughout the kingdom.'"—Lord Macaulay, *Nugent's memorials of Hampden (Critical and miscellaneous essays, v. 2)*.—See also IRELAND: 1633-1639.

1633-1640.—Ecclesiastical despotism of Laud.—"When Charles, having quarrelled with his parliament, stood alone in the midst of his kingdom, seeking on all sides the means of governing, the Anglican clergy believed this day [for establishing the independent and uncontrolled power of their church] was come. They had again got immense

wealth, and enjoyed it without dispute. The papists no longer inspired them with alarm. The primate of the church, Laud, possessed the entire confidence of the king and alone directed all ecclesiastical affairs. Among the other ministers, none professed, like lord Burleigh under Elizabeth, to fear and struggle against the encroachments of the clergy. The courtiers were indifferent, or secret papists. Learned men threw lustre over the church. The universities, that of Oxford more especially, were devoted to her maxims. Only one adversary remained—the people, each day more discontented with uncompleted reform, and more eager fully to accomplish it. But this adversary was also the adversary of the throne; it claimed at the same time, the one to secure the other, evangelical faith and civil liberty. The same peril threatened the sovereignty of the crown and of episcopacy. The king, sincerely pious, seemed disposed to believe that he was not the only one who held his authority from God, and that the power of the bishops was neither of less high origin, nor of less sacred character. Never had so many favourable circumstances seemed combined to enable the clergy to achieve independence of the crown, dominion over the people. Laud set himself to work with his accustomed vehemence. First, it was essential that all dissensions in the bosom of the church itself should cease, and that the strictest uniformity should infuse strength into its doctrines, its discipline, its worship. He applied himself to this task with the most unhesitating and unscrupulous resolution. [Archbishop Laud possessed great influence in the Privy Council and practically controlled the courts of High Commission and the Star Chamber]. Power was exclusively concentrated into the hands of the bishops. The court of high commission, where they took cognizance of and decided everything relating to religious matters, became day by day more arbitrary, more harsh in its jurisdiction, its forms and its penalties. The complete adoption of the Anglican canons, the minute observance of the liturgy, and the rites enforced in cathedrals, were rigorously exacted on the part of the whole ecclesiastical body. A great many livings were in the hands of nonconformists; they were withdrawn from them. The people crowded to their sermons; they were forbidden to preach. . . . Persecution followed and reached them everywhere. . . . On the part of the nonconformists, every innovation, the least derogation from the canons or the liturgy, was punished as a crime; yet Laud innovated without consulting anybody, looking to nothing beyond the king's consent, and sometimes acting entirely upon his own authority. . . . And all these changes had, if not the aim, at all events the result, of rendering the Anglican church more and more like that of Rome. . . . Books were published to prove that the doctrine of the English bishops might very well adapt itself to that of Rome; and these books, though not regularly licensed, were dedicated to the king or to Laud, and openly tolerated. . . . The splendour and exclusive dominion of episcopacy thus established, at least so he flattered himself, Laud proceeded to secure its independence. . . . The divine right of bishops became, in a short time, the official doctrine, not only of the upper clergy, but of the king himself. . . . By the time things had come to this pass, the people were not alone in their anger. The high nobility, part of them at least, took the alarm. They saw in the progress of the church far more than mere tyranny; it was a regular revolution, which, not satisfied with crushing popular reforms, disfigured and endangered the first reformation; that which

kings had made and the aristocracy adopted."—F. P. Guizot, *History of the English revolution of 1640*, bk. 2.—See also PRINTING AND THE PRESS: 1637.

1638-1640.—Presbyterianism of the Puritan party.—Rise of the Independents.—"It is the artifice of the favourers of the Catholic and of the prelatical party to call all who are sticklers for the constitution in church or state, or would square their actions by any rule, human or divine, Puritans."—J. Rushworth, *Historical collections*, v. 2, 1355.—"These men [the Puritan Party], at the commencement of the civil war, were presbyterians: and such had at that time been the great majority of the serious, the sober, and the conscientious people of England. There was a sort of imputation of laxness of principles, and of a tendency to immorality of conduct, upon the adherents of the establishment, which was infinitely injurious to the episcopal church. But these persons, whose hearts were in entire opposition to the hierarchy, had for the most part no difference of opinion among themselves, and therefore no thought of toleration for difference of opinion in others. Their desire was to abolish episcopacy and set up presbytery. They thought and talked much of the unity of the church of God, and of the cordial consent and agreement of its members, and considered all sects and varieties of sentiment as a blemish and scandal upon their holy religion. They would put down popery and episcopacy with the strong hand of the law, and were disposed to employ the same instrument to suppress all who should venture to think the presbyterian church itself not yet sufficiently spiritual and pure. Against this party, which lorded it for a time almost without contradiction, gradually arose the party of the independents. . . . Before the end of the civil war they became almost as strong as the party of the presbyterians, and greatly surpassed them in abilities, intellectual, military and civil."—W. Godwin, *History of the commonwealth*, v. 2, bk. 2, ch. 1.—See also INDEPENDENTS; ENGLAND: 1643 (July); (July-September); 1646 (March); 1647 (April-August); 1648 (November-December).

1639.—First Bishops' War in Scotland. See SCOTLAND: 1638-1640.

1640.—Short Parliament and the Second Bishops' War.—Scots army in England.—"His Majesty having burnt Scotch paper Declarations 'by the hands of the common hangman,' and almost cut the Scotch Chancellor Loudon's head off, and being again resolute to chastise the rebel Scots with an Army, decides on summoning a Parliament for that end, there being no money attainable otherwise. To the great and glad astonishment of England; which, at one time, thought never to have seen another Parliament! Oliver Cromwell sat in this Parliament for Cambridge; recommended by Hampden, say some; not needing any recommendation in those Fen-countries, think others. Oliver's Colleague was a Thomas Meautys, Esq. This Parliament met, 13th April, 1640: it was by no means prompt enough with supplies against the rebel Scots; the king dismissed it in a huff, 5th May; after a Session of three weeks: Historians called it the Short Parliament. His Majesty decides on raising money and an Army 'by other methods': to which end Wentworth, now Earl Strafford and Lord-Lieutenant of Ireland, who had advised that course in the Council, did himself subscribe £20,000. Archbishop Laud had long ago

seen 'a cloud rising' against the Four surplices at Allhallowtide; and now it is covering the whole sky in a most dismal and really thundery-looking manner. His Majesty by 'other methods,' commission of array, benevolence, forced loan, or how he could, got a kind of Army on foot, and set it marching out of the several Counties in the South towards the Scotch Border; but it was a most hopeless Army. The soldiers called the affair a Bishops' War; they mutinied against their officers, shot some of their officers: in various Towns on their march, if the Clergyman were reputed Puritan, they went and gave him three cheers; if of Surplice-tendency, they sometimes threw his furniture out of the window. No fighting against poor Scotch Gospellers was to be hoped for from these men. Meanwhile the Scots, not to be behindhand, had raised a good Army of their own; and decided on going into England with it, this time, 'to present their grievances to the King's Majesty.' On the 20th of August, 1640, they cross the Tweed at Coldstream; Montrose wading in the van of them all. They wore uniform of hodden gray, with blue caps; and each man had a moderate haversack of oatmeal on his back. August 28th, the Scots force their way across the Tyne, at Newburn, some miles above Newcastle; the King's Army making small fight, most of them no fight; hurrying from Newcastle, and all town and country quarters, towards York again, where his Majesty and Strafford were. The Bishops' War was at an end. The Scots, striving to be gentle as doves in their behaviour, and publishing boundless brotherly Declarations to all the brethren that loved Christ's Gospel and God's Justice in England,—took possession of Newcastle next day; took possession gradually of all Northumberland and Durham,—and stayed there, in various towns and villages, about a year. The whole body of English Puritans looked upon them as their saviours. . . . His Majesty and Strafford, in a fine frenzy at the turn of affairs, found no refuge, except to summon a 'Council of Peers,' to enter upon a 'Treaty' with the Scots; and alas, at last, summon a New Parliament. Not to be helped in any way. . . . A Parliament was appointed for the 3d of November next;—whereupon London cheerfully lent £200,000; and the Treaty with the Scots at Ripon, 1st October, 1640, by and by transferred to London, went peaceably on at a very leisurely pace. The Scotch Army lay quartered at Newcastle, and over Northumberland and Durham, on an allowance of £850 a day; an Army indispensable for Puritan objects; no haste in finishing its Treaty. The English army lay across in Yorkshire; without allowance except from the casualties of the King's Exchequer; in a dissatisfied manner, and occasionally getting into 'Army-Plots.' This Parliament, which met on the 3d of November, 1640, has become very celebrated in History by the name of the 'Long Parliament.'—T. Carlyle, *Cromwell's letters and speeches*, pt. 1: 1640.—"A point may be reached where the people have to assert their rights, be the peril what it may; and in Great Britain this point was passed under Charles I. The first break came, not in England, but in Scotland. . . . In Scotland the spirit of Puritanism was uppermost, and was already exhibiting both its strength and its weakness; its sincerity and its lack of breadth; its stern morality and its failure to discriminate between essentials and non-essentials; its loftiness of aim and its tendency to condemn liberality of thought in religion, art, literature, and science, alike as irreligious; its insistence on purity of life, and yet its unconscious tendency to promote hypocrisy and

to drive out one form of religious tyranny merely to erect another. A man of any insight would not have striven to force an alien system of ecclesiastical government upon a people so stubborn and self-reliant, who were wedded to their own system of religious thought. But this was what Laud attempted, with the full approval of Charles. In 1637 he made a last effort to introduce the ceremonies of the English Church at Edinburgh. No sooner was the reading of the Prayer-Book begun than the congregation burst into wild uproar, execrating it as no better than celebrating mass. It was essentially a popular revolt. . . . The whole nation responded to the cry, and hurried to sign a national Covenant, engaging to defend the Reformed religion, and to do away with all 'innovations,' that is, with everything in which Episcopacy differed from Puritanism and inclined toward the Church of Rome. In England and Scotland alike the Church of Rome was still accepted by the people at large as the most dangerous of enemies. The wonderful career of Gustavus Adolphus had just closed. The Thirty Years' War—the last great religious struggle—was still at its height. If, in France, the Massacre of St. Bartholomew stood far in the past, the Revolution of the Edict of Nantes yet lay in the future. The after-glow of the fires of Smithfield still gleamed with lurid light in each sombre Puritan heart. The men who, in England, were most earnest about their religion held to their Calvinistic creed with the utmost sincerity, high purpose, and self-devotion: but with no little harshness. There was a lofty creed, but one which, in the revolt against levity and viciousness, set up a standard of gloom; and, though ready to fight to the death for liberty for themselves, they had as yet little idea of tolerating liberty in others. Naturally, such men sympathized with one another, and the action of the Scotch was heartily, though secretly, applauded by the stoutest Presbyterians of England. Moreover, while menaced by the common oppressor, the Puritan independents, who afterward split off from the Presbyterians, made common cause with them, the irreconcilable differences between the two bodies not yet being evident. Soon the Scotch held a general assembly of the Church, composed of both clerical and lay members, and formally abolished Episcopacy, in spite of the angry protests of the King. Their action amounted in effect to establishing a theocracy. They repudiated the unlimited power of the King and the bishops, as men would do nowadays in like case; but they declared against liberty of thought and conduct in religious matters, basing their action on practically the same line of reasoning that influenced the very men they most denounced, hated, and feared. The King took up the glove which the Scotch had thrown down. He raised an army and undertook the first of what were derisively known as the 'Bishops' Wars.' But his people sympathized with the Scotch rather than with him. He got an army together on the Border, but it would not fight, and he was forced reluctantly to treat for peace. Then Strafford came back from Ireland and requested Charles to summon a Parliament so that he could get funds. In April, 1640, the Short Parliament came together, but the English spirit was now almost as high as the Scotch in hostility to the King, and Parliament would not grant anything to the King until the grievances of the people were redressed. To this demand Charles would not listen, and the Parliament was promptly dissolved. Then, being heartened by Laud, and especially by Strafford, Charles renewed the war, only to see his army driven in headlong panic before the Scotch

at Newburn. The result was that he had to try to patch up a peace under the direction of Strafford. But the Scotch would not leave the kingdom until they were paid the expenses of the war. There was no money to pay them, and Charles had to summon Parliament once more. On November 3, 1640, the Long Parliament met at Westminster."—T. Roosevelt, *Oliver Cromwell*, pp. 38, 39, 40, 41.

ALSO IN: J. Forster, *Statesmen of the Commonwealth: Strafford*.—S. R. Gardiner, *History of England, 1603-1642*, ch. 91-94.—J. H. Burton, *History of Scotland*, v. 7, ch. 72-73.

1640-1641.—Long Parliament and the beginning of its work.—Impeachment and execution of Strafford.—"The game of tyranny was now up. Charles had risked and lost his last stake. It is impossible to trace the mortifications and humiliations which this bad man now had to endure without a feeling of vindictive pleasure. His army was mutinous; his treasury was empty; his people clamoured for a Parliament; addresses and petitions against the government were presented. Strafford was for shooting those who presented them by martial law, but the king could not trust the soldiers. A great council of Peers was called at York, but the king would not trust even the Peers. He struggled, he evaded, he hesitated, he tried every shift rather than again face the representatives of his injured people. At length no shift was left. He made a truce with the Scots, and summoned a Parliament. . . . On the 3rd of November, 1640—a day to be long remembered—met that great Parliament, destined to every extreme of fortune—to empire and to servitude, to glory and to contempt;—at one time the sovereign of its sovereign, at another time the servant of its servants, and the tool of its tools. From the first day of its meeting the attendance was great, and the aspect of the members was that of men not disposed to do the work negligently. The dissolution of the late Parliament had convinced most of them that half measures would no longer suffice. Clarendon tells us that 'the same men who, six months before, were observed to be of very moderate tempers, and to wish that gentle remedies might be applied, talked now in another dialect both of kings and persons; and said that they must now be of another temper than they were the last Parliament.' The debt of vengeance was swollen by all the usury which had been accumulating during many years; and payment was made to the full. This memorable crisis called forth parliamentary abilities, such as England had never before seen. Among the most distinguished members of the House of Commons were Falkland, Hyde, Digby, Young, Harry Vane, Oliver St. John, Denzil Hollis, Nathaniel Fiennes. But two men exercised a paramount influence over the legislature and the country—Pym and Hampden; and by the universal consent of friends and enemies, the first place belonged to Hampden."—Lord Macaulay, *Nugent's memorials of Hampden (Critical and Miscellaneous Essays, v. 2)*.—"The resolute looks of the members as they gathered at Westminster contrasted with the hesitating words of the king, and each brought from borough or county a petition of grievances. Fresh petitions were brought every day by bands of citizens or farmers. Forty committees were appointed to examine and report on them, and their reports formed the grounds on which the Commons acted. One by one the illegal acts of the Tyranny were annulled. Prynne [William Prynne, a barrister, imprisoned by Laud for his attacks on the Episcopacy] and his fellow 'martyrs' recalled from

their prisons, entered London in triumph, amid the shouts of a great multitude who strewed laurel in their path. The civil and criminal jurisdiction of the Privy Council, the Star Chamber, the Court of High Commission, the irregular jurisdictions of the Council of the North, of the Duchy of Lancaster, the County of Chester, and a crowd of lesser tribunals, were summarily abolished. Ship-money was declared illegal, and the judgment in Hampden's case annulled. A statute declaring 'the ancient right of the subjects of this kingdom that no subsidy, custom, impost, or any charge whatsoever, ought or may be laid or imposed upon any merchandize exported or imported by subjects, denizens or allies, without common consent of Parliament,' put an end forever to all pretensions

'that grand apostate to the Commonwealth who,' in the terrible words which closed Lord Digby's invective, 'must not expect to be pardoned in this world till he be dispatched to the other.' He was conscious of his danger, but Charles forced him to attend the Court." He came to London with the solemn assurance of his master that, "while there was a king in England, not a hair of Strafford's head should be touched by the Parliament." Immediately impeached for high treason by the Commons, and sent to the Tower, he received from the king a second and more solemn pledge, by letter, that, "upon the word of a king, you shall not suffer in life, honour or fortune." But the "word of a king" likes Charles Stuart, had neither honor nor gratitude, nor a decent self respect behind it.

THE EARL OF STRAFFORD GOING TO EXECUTION, MAY 12, 1641

Being blessed by the Archbishop Laud

(Painted by Paul Delaroché)

to a right of arbitrary taxation on the part of the crown. A Triennial Bill enforced the Assembly of the Houses every three years, and bound the sheriff and citizens to proceed to election if the Royal writ failed to summon them. Charles protested, but gave way. He was forced to look helplessly on at the wreck of his Tyranny, for the Scotch army was still encamped in the north. . . . Meanwhile the Commons were dealing roughly with the agents of the Royal system. . . . Windebank, the Secretary of State, with the Chancellor, Finch, fled in terror over sea. Laud himself was flung into prison. . . . But even Laud, hateful as he was to all but the poor neighbors whose prayers his alms had won, was not the centre of so great and universal a hatred as the Earl of Strafford. Strafford's guilt was more than the guilt of a servile instrument of tyranny—it was the guilt of

He could be false to a friend as easily as to an enemy. When the Commons, fearing failure on the trial of their impeachment, resorted to a bill of attainder, Charles signed it with a little resistance, and Strafford went bravely and manfully to the block. "As the axe fell, the silence of the great multitude was broken by a universal shout of joy. The streets blazed with bonfires. The bells clashed out from every steeple."—J. R. Green, *Short history of England*, ch. 8, sect. 6.—Laud met his death at the same place, Jan. 10, 1644.

1641 (March-May).—Root and Branch Bill.—"A bill was brought in [March, 1641], known as the Restraining Bill, to deprive Bishops of their rights of voting in the House of Lords. The opposition it encountered in that House induced the Commons to follow it up [May 27] with a more vehement measure, 'for the utter abolition of Arch-

bishops, Bishops, Deans, Archdeacons, Prebendaries and Canons,' a measure known by the title of the Root and Branch Bill. By the skill of the royal partisans, this bill was long delayed in Committee."—J. F. Bright, *History of England*, v. 2, period 2, p. 650.

ALSO IN: D. Masson, *Life of John Milton*, v. 2, bk. 2, ch. 3.

1641 (October).—Roundheads and Cavaliers.—Birth of English parties.—"After ten months of assiduous toil, the Houses, in September, 1641, adjourned for a short vacation and the king visited Scotland. He with difficulty pacified that kingdom, by consenting not only to relinquish his plans of ecclesiastical reform, but even to pass, with a very bad grace, an act declaring that episcopacy was contrary to the word of God. The recess of the English Parliament lasted six weeks. The day on which the houses met again is one of the most remarkable epochs in our history. From that day dates the corporate existence of the two great parties which have ever since alternately governed the country. . . . During the first months of the Long Parliament, the indignation excited by many years of lawless oppression was so strong and general that the House of Commons acted as one man. Abuse after abuse disappeared without a struggle. If a small minority of the representative body wished to retain the Star Chamber and the High Commission, that minority, overawed by the enthusiasm and by the numerical superiority of the reformers, contented itself with secretly regretting institutions which could not, with any hope of success, be openly defended. At a later period the Royalists found it convenient to antedate the separation between themselves and their opponents, and to attribute the Act which restrained the king from dissolving or proroguing the Parliament, the Triennial Act, the impeachment of the ministers, and the attainder of Strafford, to the faction which afterwards made war on the king. But no artifice could be more disingenuous. Every one of those strong measures was actively promoted by the men who were afterwards foremost among the Cavaliers. No republican spoke of the long mis-government of Charles more severely than Colepepper [John, first Lord Colepepper; chancellor of the exchequer, 1642]. The most remarkable speech in favour of the Triennial Bill was made by Digby. [Sir Kenelm Digby, brought up a Roman Catholic; chancellor to Queen Henrietta Maria (wife of Charles I) after 1643]. The impeachment of the Lord Keeper was moved by Falkland [Lucius Cary, Viscount Falkland, secretary of state 1641; went over to the royalists, 1642]. The demand that the Lord Lieutenant should be kept close prisoner was made at the bar of the Lords by Hyde. Not till the law attaining Strafford was proposed did the signs of serious disunion become visible. Even against that law, a law which nothing but extreme necessity could justify, only about sixty members of the House of Commons voted. It is certain that Hyde was not in the minority, and that Falkland not only voted with the majority, but spoke strongly for the bill. Even the few who entertained a scruple about inflicting death by a retrospective enactment thought it necessary to express the utmost abhorrence of Strafford's character and administration. But under this apparent concord a great schism was latent; and when, in October 1641, the Parliament reassembled after a short recess, two hostile parties, essentially the same with those which, under different names, have ever since contended, and are still contending, for the direction of public affairs, appeared confronting

each other. During some years they were designated as Cavaliers and Roundheads. They were subsequently called Tories and Whigs; nor does it seem that these appellations are likely soon to become obsolete."—Lord Macaulay, *History of England*, ch. 1.—It was not until some months later, however, that the name of Roundheads was applied to the defenders of popular rights by their royalist adversaries.—See also ROUNDHEADS.

1641 (November).—Grand Remonstrance.—Early in November, 1641, the king being in Scotland, and news of the insurrection in Ireland [Ulster Rebellion. See IRELAND: 1641] having just reached London, the party of Pym, Hampden, and Cromwell "resolved on a great pitched battle between them and the opposition, which should try their relative strengths before the king's return; and they chose to fight this battle over a vast document, which they entitled 'A Declaration and Remonstrance of the State of the Kingdom,' but which has come to be known since as 'The Grand Remonstrance. . . . The notion of a great general document which, under the name of 'A Remonstrance,' should present to the king in one view a survey of the principal evils that had crept into the kingdom in his own and preceding reigns, with a detection of their causes, and a specification of the remedies, had more than once been before the Commons. It had been first mooted by Lord Digby while the Parliament was not a week old. Again and again set aside for more immediate work, it had recurred to the leaders of the Movement party, just before the king's departure for Scotland, as likely to afford the broad battleground with the opposition then becoming desirable. 'A Remonstrance to be made, how we found the Kingdom and the Church, and how the state of it now stands,' such was the description of the then intended document (Aug. 7). The document had doubtless been in rehearsal through the Recess, for on the 8th of November the rough draft of it was presented to the House and read at the clerk's table. When we say that the document in its final form occupies thirteen folio pages of rather close print in Rushworth, and consists of a preamble followed by 206 articles or paragraphs duly numbered, one can conceive what a task the reading of even the first draft of it must have been, and through what a storm of successive debates over proposed amendments and additions it reached completeness. There had been no such debates yet in the Parliament."—D. Masson, *Life of John Milton*, v. 2, bk. 2, ch. 6.—"It [the Grand Remonstrance] embodies the case of the Parliament against the Ministers of the king. It is the most authentic statement ever put forth of the wrongs endured by all classes of the English people, during the first fifteen years of the reign of Charles I.; and, for that reason, the most complete justification upon record of the Great Rebellion."—J. Forster, *Debates on the Grand Remonstrance (Historical and biographical essays*, v. 1).—"In this (document) all of Charles' errors were enumerated and a demand was made that the king's ministers should thereafter be responsible to Parliament. This document Parliament ordered to be printed and circulated throughout the country."—J. H. Robinson, *History of western Europe*, p. 484.—For text of this document, see GRAND REMONSTRANCE.

1642 (January).—King's attempt against the Five Members.—On the 3d of January, "the king was betrayed into . . . an indiscretion. . . . This

was the impeachment of Lord Kimbolton and the five members. . . . Herbert, attorney-general, appeared in the House of Peers, and, in his majesty's name, entered an accusation of high treason against Lord Kimbolton and five commoners, Hollis, Sir Arthur Hazlerig, Hambden, Pym, and Strode. The articles were: That they had traitorously endeavoured to subvert the fundamental laws and government of the kingdom, to deprive the king of his regal power, and to impose on his subjects an arbitrary and tyrannical authority; that they had endeavoured, by many foul aspersions on his majesty and his government, to alienate the affections of his people, and make him odious to them; that they had attempted to draw his late army to disobedience of his royal commands, and to side with them in their traitorous designs; that they had invited and encouraged a foreign power to invade the kingdom; that they had aimed at subverting the rights and very being of Parliament; that, in order to complete their traitorous designs, they had endeavoured, as far as in them lay, by force and terror, to compel the Parliament to join with them, and to that end had actually raised and countenanced tumults against the king and Parliament; and that they had traitorously conspired to levy, and actually had levied, war against the king. The whole world stood amazed at this important accusation, so suddenly entered upon, without concert, deliberation or reflection. . . . A sergeant at arms, in the king's name, demanded of the House the five members, and was sent back without any positive answer. Messengers were employed to search for them and arrest them. Their trunks, chambers, and studies, were sealed and locked. The House voted all these acts of violence to be breaches of privilege, and commanded every one to defend the liberty of the members. The king, irritated by all this opposition, resolved next day to come in person to the House, with an intention to demand, perhaps seize, in their presence, the persons whom he had accused. This resolution was discovered; . . . and they [the five members] had time to withdraw, a moment before the king entered. He was accompanied by his ordinary retinue, to the number of above two hundred. . . . The king left them at the door and he himself advanced alone through the hall, while all the members rose to receive him. The speaker withdrew from his chair, and the king took possession of it. . . . When the king was looking around for the accused members, he asked the speaker, who stood below, whether any of these persons were in the House? The speaker, falling on his knee, prudently replied: 'I have, sir, neither eyes to see, nor tongue to speak, in this place, but as the House is pleased to direct me, whose servant I am. And I humbly ask pardon, that I cannot give any other answer to what your majesty is pleased to demand of me.' The Commons were in the utmost disorder; . . . the House immediately adjourned till next day. That evening the accused members, to show the greater apprehension, removed into the city, which was their fortress. The citizens were the whole night in arms. When the people . . . were wrought up to a sufficient degree of rage and terror, it was thought proper, that the accused members should, with a triumphant and military procession, take their seats in the House. The river was covered with boats, and other vessels, laden with small pieces of ordnance, and prepared for fight. Skippon, whom the Parliament had appointed, by their own authority, major-general of the city militia, conducted the members, at the head of this tumultuary army, to Westminster-

hall. And when the populace, by land and by water, passed Whitehall, they still asked, with insulting shouts, What has become of the king and his cavaliers? And whither are they fled? The king, apprehensive of danger from the enraged multitude, had retired to Hampton-court, deserted by all the world, and overwhelmed with grief, shame, and remorse for the fatal measures into which he had been hurried."—D. Hume, *History of England*, v. 5, ch. 55, pp. 85-01.

1642 (January-August).—Preparations for war.—Marshalling of forces.—Raising of the king's standard.—"January 10th. The King with his Courts quits Whitehall; the Five Members and Parliament proposing to return tomorrow, with the whole City in arms round them. He left Whitehall; never saw it again till he came to lay down his head there. March 9th. The King has sent away his Queen from Dover, "to be in a place of safety,"—and also to pawn the Crown-jewels in Holland, and get him arms. He returns Northward again, avoiding London. Many messages between the Houses of Parliament and him: 'Will your Majesty grant us Power of the Militia; accept this list of Lord-Lieutenants?' On the 9th of March, still advancing Northward without affirmative response, he has got to Newmarket; where another Message overtakes him, earnestly urges itself upon him: 'Could not your Majesty please to grant us Power of the Militia for a limited time?' 'No, by God!' answers his Majesty, 'not for an hour.'—On the 10th of March he is at York, [his headquarters] where his Hull Magazine, gathered for service against the Scots, is lying near; where a great Earl of Newcastle, and other Northern potentates, will help him; where at least London and its Puritanism, now grown so fierce, is far off. There we will leave him; attempting Hull Magazine, in vain; exchanging messages with his Parliament; messages, missives, printed and written Papers without limit: Law-pleadings of both parties before the great tribunal of the English Nation, each party striving to prove itself right and within the verge of Law: preserved still in acres of typography, once thrillingly alive in every fibre of them; now a mere torpor, readable by few creatures, not rememberable by any."—T. Carlyle, *Oliver Cromwell's letters and speeches*, pt. 2, preliminary.—"As early as June 2 a ship had arrived on the North-English coast, bringing the King arms and ammunition from Holland, purchased by the sale of the crown-jewels which the Queen had taken abroad. On the 22d day of the same month more than forty of the nobles and others in attendance on the King at York had put down their names for the numbers of armed horse they would furnish respectively for his service. Requisitions in the King's name were also out for supplies of money; and the two Universities, and the Colleges in each, were invited to send in their plate. On the other hand, the Parliament had not been more negligent. [Between June and August Parliament had chosen a committee of safety for the kingdom, voted an army and made the Earl of Essex commander-in-chief.] There had been contributions or promises from all the chief Parliamentary nobles and others; there was a large loan from the city; and hundreds of thousands, on a smaller scale, were willing to subscribe. And already, through all the shires, the two opposed

powers were grappling and jostling with each other in raising levies. Despite all these preparations, however, it was probably not till August had begun that the certainty of Civil War was universally acknowledged. It was on the 6th of that month that the King issued his proclamation 'for suppressing the present Rebellion under the command of Robert, Earl of Essex,' offering pardon to him and others if within six days they made their submission. The Parliamentary answer to this was on the 11th; on which day the Commons resolved, each man separately rising in his place and giving his word, that they would stand by the Earl of Essex with their lives and fortunes to the end. Still, even after that, there were trembling souls here and there who hoped for a reconciliation. Monday the 22d of August put an end to all such fluttering:—On that day, the King, who had meanwhile left York, and come about a hundred miles farther south, into the very heart of England, . . . made a backward movement as far as the town of Nottingham, where preparations had been made for the great scene that was to follow. . . . This consisted in bringing out the royal standard and setting it up in due form. It was about six o'clock in the evening when it was done. . . . A herald read a proclamation, declaring the cause why the standard had been set up, and summoning all the lieges to assist his Majesty. Those who were present cheered and threw up their hats, and, with a beating of drums and a sounding of trumpets, the ceremony ended. . . . From that evening of the 22d of August, 1642, the Civil War had begun."—D. Masson, *Life of John Milton*, v. 2, bk. 2, ch. 8.

1642 (August-September).—Nation choosing sides.—"In wealth, in numbers, and in cohesion the Parliament was stronger than the king. To him there had rallied most of the greater nobles, many of the lesser gentry, some proportion of the richer citizens, the townsmen of the west, and the rural population generally of the west and north of England. For the Parliament stood a strong section of the peers and greater gentry, the great bulk of the lesser gentry, the townsmen of the richer parts of England, the whole eastern and home counties, and lastly, the city of London. But as the Civil War did not sharply divide classes, so neither did it geographically bisect England. Roughly speaking, aristocracy and peasantry, the Church, universities, the world of culture, fashion, and pleasure were loyal: the gentry, the yeomanry, trade, commerce, morality, and law inclined to the Parliament. Broadly divided, the north and west went for the king; the south and east for the Houses; but the lines of demarcation were never exact: cities, castles, and manor-houses long held out in an enemy's county. There is only one permanent limitation. Draw a line from the Wash to the Solent. East of that line the country never yielded to the king; from first to last it never failed the Parliament. Within it are enclosed Norfolk, Suffolk, Essex, Cambridge, Huntingdon, Bedford, Bucks, Herts, Middlesex, Surrey, Kent, Sussex. This was the wealthiest, the most populous, and the most advanced portion of England. With Gloucester, Reading, Bristol, Leicester, and Northampton, it formed the natural home of Puritanism."—F. Harrison, *Oliver Cromwell*, ch. 4.

1642 (October-December).—Edgehill. — The opening battle of the war.—Eastern Association.

—Immediately after the raising of his standard at Nottingham, the king, "aware at last that he could not rely on the inhabitants of Yorkshire, moved to Shrewsbury, at once to collect the Catholic gentry at Lancashire and Cheshire, to receive the Royalist levies of Wales, and to secure the valley of the Severn. The movement was successful. In a few days his little army was increased fourfold, and he felt himself strong enough to make a direct march towards the capital. Essex had garrisoned Northampton, Coventry and Warwick, and lay himself at Worcester; but the King, waiting for no sieges, left the garrisoned towns unmolested and passed on towards London, and Essex received peremptory orders to pursue and interpose if possible between the King and London. On the 22nd of October he was close upon the King's rear at Keynton, between Stratford and Banbury. But his army was by no means at its full strength; some regiments had been left to garrison the West, others, under Hampden had not yet joined him. But delay was impossible, and the first battle of the war was fought on the plain at the foot of the north-west slope of Edgehill, over which the royal army descended, turning back on its course to meet Essex. Both parties claimed the victory. In fact it was with the King. The Parliamentary cavalry found themselves wholly unable to withstand the charge of Rupert's cavaliers. [Rupert was the nephew of the king and the son of Frederick, Elector Palatine. He began the war as commander of the cavalry and later became commander-in-chief of the royal forces.] Whole regiments turned and fled without striking a blow; but, as usual, want of discipline ruined the royal cause. Rupert's men fell to plundering the Parliamentary baggage, and returned to the field only in time to find that the infantry, under the personal leading of Essex, had reestablished the fight. Night closed the battle [which is sometimes named from Edgehill and sometimes from Keynton]. The King's army withdrew to the vantage-ground of the hills, and Essex, reinforced by Hampden, passed the night upon the field. But the Royalist army was neither beaten nor checked in its advance, while the rottenness of the Parliamentary troops had been disclosed." Some attempts at peace-making followed this doubtful first collision; but their only effect was to embitter the passions on both sides. The King advanced, threatening London, but the citizens of the capital turned out valiantly to oppose him, and he "fell back upon Oxford, which henceforward became the centre of their operations. . . . War was again the only resource, and speedily became universal. . . . There was local fighting over the whole of England. . . . The headquarters of the King were constantly at Oxford, from which, as from a centre, Rupert would suddenly make rapid raids, now in one direction, now in another."—J. F. Bright, *History of England, period 2*, p. 659.—"This winter there arise among certain Counties 'Associations' for mutual defence, against Royalism and plunderous Rupertism; a measure cherished by the Parliament, condemned as treasonable by the King. Of which 'Associations,' countable to the number of five or six, we name only one, that of Norfolk, Suffolk, Essex, Cambridge, Herts; with Lord Gray of Wark for Commander; where and under whom Oliver was now serving. This 'Eastern Association' is alone worth naming. All the other Associations, no man of emphasis being in the midst of them, fell in a few months to pieces; only this of Cromwell subsisted, enlarged itself, grew famous;—and kept its own borders clear of invasion during the whole course of the War."—

1643 (May).—Cromwell's Ironsides.—“It was

trusts to greater; from my first being Captain of a Troop of Horse. . . . I had a very worthy friend then; and he was a very noble person, and I know his memory was very grateful to all,—Mr. John Hampden. At my first going out into this engagement, I saw our men were beaten at every hand. . . . Your troops, said I, are most of them old decayed serving-men, and tapsters, and such

ENGLAND AND WALES DURING THE CIVIL WARS OF THE 17TH CENTURY

. . . probably, a little before Edgehill, that there took place between Cromwell and Hampden the memorable conversation which fifteen years afterwards the Protector related in a speech to his second Parliament. It is a piece of autobiography so instructive and pathetic that it must be set forth in full in the words of Cromwell himself:—“I was a person who, from my first employment, was suddenly preferred and lifted up from lesser

kind of fellows; and, said I, their troops are gentlemen's sons, younger sons and persons of quality; do you think that the spirits of such base mean fellows will ever be able to encounter gentlemen, that have honour and courage and resolution in them? Truly I did represent to him in this manner conscientiously; and truly I did tell him: You must get men of a spirit; and take it not ill what I say.—I know you will not,—of a spirit

that is likely to go on as far as gentlemen will go; or else you will be beaten still. I told him so; I did truly. He was a wise and worthy person; and he did think that I talked a good notion, but an impracticable one. . . . I raised such men as had the fear of God before them, as made some conscience of what they did; and from that day forward, I must say to you, they were never beaten, and wherever they were engaged against the enemy they beat continually.' . . . The issue of the whole war lay in that word. It lay with 'such men as had some conscience in what they did.' 'From that day forward they were never beaten.' . . . 'As for Colonel Cromwell,' writes a newsletter of May, 1643, 'he hath 2,000 brave men, well disciplined; no man swears but he pays his twelve-pence; if he be drunk, he is set in the stocks, or worse; if one calls the other roundhead he is cashiered: insomuch that the countries where they come leap for joy of them, and come in and join with them. How happy were it if all the forces were thus disciplined!' These were the men who ultimately decided the war, and established the Commonwealth. On the field of Marston, Rupert gave Cromwell the name of Ironside, and from thence this famous name passed to his troopers. There are two features in their history which we need to note. They were indeed 'such men as had some conscience in their work'; but they were also much more. They were disciplined and trained soldiers. They were the only body of 'regulars' on either side. The instinctive genius of Cromwell from the very first created the strong nucleus of a regular army, which at last in discipline, in skill, in valour, reached the highest perfection ever attained by soldiers either in ancient or modern times. The fervour of Cromwell is continually pressing towards the extension of this 'regular' force. Through all the early disasters, this body of Ironsides kept the cause alive: at Marston [1644] it overwhelmed the king: as soon as, by the New Model, this system was extended to the whole army, the Civil War was at an end." F. Harrison, *Oliver Cromwell*, ch. 4.—See also MILITARY ORGANIZATION: 30.

1643 (June-September).—**King calls in the Irish.**—"To balance the accession of power which the alliance with Scotland [Solemn League and Covenant (1643)] brought to the Parliament, Charles was so unwise, men then said so guilty, as to conclude a peace with the Irish rebels, with the intent that thus those of his forces which had been employed against them, might be set free to join his army in England. No act of the King, not the levying of ship-money, not the crowd of monopolies which enriched the court and impoverished the people, neither the extravagance of Buckingham, the tyranny of Strafford nor the prelacy of Laud, not even the attempted arrest of the five members, raised such a storm of indignation and hatred throughout the kingdom, as did this determination of the King to withdraw (as men said), for the purpose of subduing his subjects, the force which had been raised to avenge the blood of 100,000 Protestant martyrs. . . . To the England of the time this act was nauseous, was exasperating to the highest degree, while to the cause of the King it was fatal; for, from this moment, the condition of the Parliamentary party began to mend."—N. L. Walford, *Parliamentary generals of the Great Civil War*, ch. 2.—"None of the king's schemes proved so fatal to his cause as these. On their discovery, officer after officer in his own army flung down their commissions,

the peers who had fled to Oxford fled back again to London, and the Royalist reaction in the Parliament itself came utterly to an end."—J. R. Green, *Short history of England*, ch. 8, sect. 7.

ALSO IN: S. R. Gardiner, *History of the Great Civil War*, v. 1, ch. 11.

1643 (July).—**Meeting of the Westminster Assembly of divines.**—At the beginning of July, 1643, "London was astir with a new event of great consequence in the course of the national revolution. This was the meeting of the famous Westminster Assembly. The necessity of an ecclesiastical Synod or Convocation, to cooperate with the Parliament, had been long felt. Among the articles of the Grand Remonstrance of Dec. 1641 had been one desiring a convention of 'a General Synod of the most grave, pious, learned, and judicious divines of this island, assisted by some from foreign parts,' to consider of all things relating to the Church and report thereon to Parliament. . . . Notwithstanding a Royal Proclamation from Oxford, dated June 22, forbidding the Assembly and threatening consequences, the first meeting duly took place on the day appointed—Saturday, July 1, 1643; and from that day till the 22 of February, 1648-9, or for more than five years and a half, the Westminster Assembly is to be borne in mind as a power or institution in the English realm, existing side by side with the Long Parliament, and in constant conference and cooperation with it. The number of its sittings during these five years and a half was 1,163 in all; which is at the rate of about four sittings every week for the whole time. The earliest years of the Assembly were the most important."—D. Masson, *Life of John Milton*, v. 2, bk. 3, ch. 3.—See also INDEPENDENTS; WESTMINSTER ASSEMBLY.

ALSO IN: A. F. Mitchell, *Westminster Assembly*, lect. 4-5.—D. Neal, *History of the Puritans*, v. 3, ch. 2 and 4.

1643 (July-September).—**Solemn League and Covenant with the Scottish nation.**—"Scotland had been hitherto kept aloof from the English quarrel. . . . Up to this time the pride and delicacy of the English patriots withheld them, for obvious reasons, from claiming her assistance. Had it been possible, they would still have desired to engage no distant party in this great domestic struggle; but when the present unexpected crisis arrived . . . these considerations were laid aside, and the chief leaders of the Parliament resolved upon an embassy to the North, to bring the Scottish nation into the field. The conduct of this embassy was a matter of the highest difficulty and danger. The Scots were known to be bigoted to their own persuasions of narrow and exclusive church government, while the greatest men of the English Parliament had proclaimed the sacred maxim that every man who worshipped God according to the dictates of his conscience was entitled to the protection of the State. But these men, Vane, Cromwell, Marten and St. John, though the difficulties of the common cause had brought them into the acknowledged position of leaders and directors of affairs, were in a minority in the House of Commons, and the party who were their superiors in numbers were as bigoted to the most exclusive principles of Presbyterianism as the Scots themselves. Denzil Holles stood at the head of this inferior class of patriots. . . . The most eminent of the Parliamentary nobility, particularly Northumberland, Essex and Manchester belonged also to this body; while the London clergy, and the metropolis itself, were almost entirely Presbyterian. These things considered, there was indeed great reason to apprehend that this party, backed by the Scots,

and supported with a Scottish army, would be strong enough to overpower the advocates of free conscience, and 'set up a tyranny not less to be deplored than that of Laud and his hierarchy, which had proved one of the main occasions of bringing on the war.' Yet, opposing to all this danger only their own high purposes and dauntless courage, the smaller party of more consummate statesmen were the first to propose the embassy to Scotland. . . . On the 20th of July, 1643, the commissioners set out from London. They were four; and the man principally confided in among them was Vane [Sir Henry, the younger]. He, indeed, was the individual best qualified to succeed Hampden as a counsellor in the arduous struggle in which the nation was at this time engaged. . . . Immediately on his arrival in Edinburgh the negotiation commenced, and what Vane seems to have anticipated at once occurred. The Scots offered their assistance heartily on the sole condition of an adhesion to the Scottish religious system on the part of England. After many long and very warm debates, in which Vane held to one firm policy from the first, a solemn covenant was proposed, which Vane insisted should be named a solemn league and covenant, while certain words were inserted in it on his subsequent motion, to which he also adhered with immovable constancy, and which had the effect of leaving open to the great party in England, to whose interests he was devoted, that last liberty of conscience which man should never surrender. . . . The famous article respecting religion ran in these words: 'That we shall sincerely, really, and constantly, through the grace of God, endeavour, in our several places and callings, the preservation of the Reformed religion in the Church of Scotland, in doctrine, worship, discipline and government, against our common enemies; the reformation of religion in the kingdoms of England and Ireland, in doctrine, worship, discipline, and government, according to the Word of God, and the example of the best Reformed churches; and we shall endeavour to bring the churches of God in the three kingdoms to the nearest conjunction and uniformity in religion, confessing of faith, form of church government directory for worship and catechizing; that we and our posterity after us, may as brethren live in faith and love, and the Lord may delight to dwell in the midst of us. That we shall in like manner, without respect of persons, endeavour the extirpation of popery, prelacy (that is, church government by archbishops, bishops, their chancellors and commissaries, deans, deans and chapters, archdeacons, and all other ecclesiastical officers depending on that hierarchy).' Vane, by this introduction of 'according to the Word of God,' left the interpretation of that word to the free conscience of every man. On the 17th of August, the solemn league and covenant was voted by the Legislature and the Assembly of the Church at Edinburgh. The king in desperate alarm, sent his commands to the Scotch people not to take such a covenant. In reply, they 'humbly advised his majesty to take the covenant himself.' The surpassing service rendered by Vane on this great occasion to the Parliamentary cause, exposed him to a more violent hatred from the Royalists than he had yet experienced, and Clarendon has used every artifice to depreciate his motives and his sincerity. . . . The solemn league and covenant remained to be adopted in England. The Scottish form of giving it authority was followed as far as possible. It was referred by the two Houses to the Assembly of Divines, which had commenced its sittings on the 1st of the preceding July, being called to-

gether to be consulted with by the Parliament for the purpose of settling the government and form of worship of the Church of England. This assembly already referred to, consisted of 121 of the clergy; and a number of lay assessors were joined with them, consisting of ten peers, and twenty members of the House of Commons. All these persons were named by the ordinance of the two Houses of Parliament which gave birth to the assembly. The public taking of the Covenant was solemnized on the 25th of September, each member of either House attesting his adherence by oath first, and then by subscribing his name. The name of Vane, subscribed immediately on his return, appears upon the list next to that of Cromwell."—J. Forster, *Statesmen of the Commonwealth: Vane*.—For text of the Solemn League and Covenant, see SOLEMN LEAGUE AND COVENANT.

1643 (August-September).—Siege of Gloucester and first battle of Newbury.—"When the war had lasted a year, the advantage was decidedly with the Royalists. . . . In August, 1643, he [Charles] sat down before the city of Gloucester. That city was defended by the inhabitants and by the garrison, with a determination such as had not, since the commencement of the war, been shown by the adherents of the Parliament. The emulation of London was excited. The trainbands of the City volunteered to march wherever their services might be required. A great force was speedily collected, and began to move westward. The siege of Gloucester was raised. The Royalists in every part of the kingdom were disheartened; the spirit of the parliamentary party revived; and the apostate Lords, who had lately fled from Westminster to Oxford, hastened back from Oxford to Westminster."—Lord Macaulay, *History of England*, ch. 1.—"In Gloucester the Puritan minority, having overawed their less zealous fellow-townsmen, were valiantly conducting an almost desperate defence. The end was only delayed because Charles was hampered at this crisis of his fate by want of munitions and engines of war, the result of want of money and of sea communication. When it was known that the apprentices were coming to the relief of Gloucester, the infantry and guns were left in the trenches to press the siege, and Rupert was sent with the cavalry to prevent the passage of the Cotswold Hills. The Royalist horse swept that upland cloth district of its thousand flocks, as they had already on less occasion swept many other sheep runs in the West, winning for the King's cause the hostility of loyal populations. The citizen soldiers had therefore to advance without provisions over an open plateau, where the agricultural land was 'all champion,' that is, unenclosed by hedges, and where consequently they were subject to fierce attacks from Rupert's cavalry. But Essex had troops of all arms, including on this occasion an infantry, who were not rascals gathered by the press-gang, but 'citizens of good account.' They arrived at last on the steep edge of the Cotswolds above Cheltenham, they saw across the plain the roofs and towers of Gloucester in the morning light, and the long columns of besiegers winding away from their burning camp. The object of the great march had been achieved, but it remained for Essex to bring the citizen army home. The Cavaliers, in full force, blocked his retreat at Newbury. Already short of food, he must cut his way through,

or surrender in a few days. As the fields round this town were much enclosed, a fierce soldiers'-battle was fought in the lanes and ditches at push of pike all day long, until the enemy could be detected only by the flash of his musket through the darkened hedge. Then both sides flung themselves down to sleep among the slain, each regiment in the ground it held. Not to have conquered meant destruction for the Roundheads. Their generals waited uneasily for dawn. But if Essex was short of bread, Charles was short of powder. At dawn the royal army had disappeared. On the 25th of September, scarcely five weeks after they had marched out, the prentices returned . . . in triumphant array."—G. M. Trevelyan, *England under the Stuarts* (*Political history of England*, v. 5, pp. 254-255).—After accomplishing the relief of Gloucester, the Parliamentary army, marching back to London, was intercepted at Newbury by the army of king, and forced to fight a battle, September 20, 1643, in which both parties, as at Edgehill, claimed the victory. The Royalists, however, failed to bar the road to London, as they had undertaken to do, and Essex resumed his march on the following morning.—"In this unhappy battle was slain the lord viscount Falkland; a person of such prodigious parts of learning and knowledge, of that inimitable sweetness and delight in conversation, of so flowing and obliging a humanity and goodness to mankind, and of that primitive sincerity and integrity of life, that if there were no other brand upon this odious and accursed war than that single loss, it must be most infamous and execrable to all posterity."—Earl of Clarendon, *History of the rebellion*, bk. 7, sect. 217.—This lamented death on the royal side nearly evened, so to speak, the great, unmeasured calamity which had befallen the better cause three months before, when the high-souled patriot Hampden was slain in a paltry skirmish with Rupert's horse, at Chalgrove Field, not far from the borders of Oxfordshire. Soon after the fight at Newbury, Charles, having occupied Reading, withdrew his army to Oxford and went into winter quarters.—N. L. Walford, *Parliamentary generals of the Great Civil War*, ch. 2.—"In the end of 1643 the tide was at the turn. Of the leaders on the royalist side Falkland had fallen, on the parliamentary side Pym 'the greatest leader of them all' and Hampden were both gone. With these two the giants of the first generation fell. The crisis had undergone once more a change of phase. The clouds hung heavier, the storm was darker, the ship labored in the trough. A little group of men next stood in the front line, honorable in character and patriotic in intention, but mediocre in their capacity for war. . . . For them too the hour had struck. Essex, Manchester, Warwick, were slow in motion without being firm in conclusion; just and candid, but . . . unwilling to see that Thorough must be met by Thorough; and of that Fabian type whom the quick call for action, instead of inspiring, irritates. . . . Cromwell had truer impressions and better nerve. The one essential was that Charles should not come out master in the military struggle. Cromwell saw that at this stage nothing else mattered; he saw that the Parliamentary liberties of the country could have no safety, until the king's weapon had been finally struck from his hand. At least one other actor in that scene was as keenly alive to this as Cromwell, and that was Charles himself. It is a mistake to suppose that the patriots and their comrades had now at their back a nation at red heat. The flame kindled by the attempted arrest of the five members, and by the tyranny of the Star Chamber or of the bishops,

had a little sunk. Divisions had arisen, and that fatal and familiar stage had come when men on the same side hate one another more bitterly than they hate the common foe. New circumstances evolved new motives. Some who had been most forward against the king at first had early fainted by the way and were now thinking of pardon and royal favor. Others were men of a neutral spirit, willing to have a peace on any terms. Others had got estates by serving the Parliament and now wished to secure them by serving the king. . . . Cromwell in his place warned the House of the discouragement that was stealing upon the public mind. Unless, he said, we have a more vigorous prosecution of the war, we shall make the kingdom weary of us and hate the name of a Parliament. Even many that had at the beginning been their friends, were now saying that Lords and Commons had got great places and commands and the power of the sword into their hands, and would prolong the war in order to perpetuate their own grandeur, just as soldiers of fortune across the seas spun out campaigns in order to keep their own employments. If the army were not put upon another footing and the war more vigorously followed, the people could bear the war no longer, but would insist upon peace, even rather a dishonorable peace than none. Almost the same reproaches were brought on the other side. This is the moment when Clarendon says that it seemed as if the whole stock of affection, loyalty, and courage that had at first animated the friends of the king were now quite spent, and had been followed up by negligence, laziness, inadvertency, and base dejection of spirit. Mere folly produced as much mischief to the king's cause as deliberate villainy could have done. Charles's own counsels according to Clarendon were as irresolute and unsteady as his advisers were ill-humored and factious. They were all blind to what ought to have been evident, and full of trepidation about things that were never likely to happen. One day they wasted time in deliberating without coming to a decision, another day they decided without deliberating. Worst of all, decision was never followed by vigorous execution. . . . All through the summer of 1643 the tide of victory flowed strong for the king. . . . [After the fall of Bristol] it seemed as if nothing could prevent the triumph of a great combined operation by which the king should lead his main army down the valley of the Thames, while Newcastle should bring his northern force through the eastern counties and unite with the king in overpowering London. But the moment was lost, and the tide turned. For good reasons or bad, the king stopped to lay siege to Gloucester, and so gave time to Essex to recover. This was one of the critical events of the war, as it was Essex's one marked success."—J. Morley, *Oliver Cromwell*, pp. 131-135.

1644 (January-July).—Defeat of Irish loyalists.—Scots in England.—Battle of Marston Moor.—The Irish army brought over by King Charles and landed in Flintshire, in November, 1643, under the command of Lord Byron, invaded Cheshire and laid siege to Nantwich, which was the headquarters of the Parliamentary cause in that region. Young Sir Thomas Fairfax was ordered to collect forces and relieve the town. With great difficulty he succeeded, near the end of January, 1644, in leading 2,500 foot-soldiers and twenty-eight troops of horse, against the besieging army, which numbered 3,000 foot and 1,800 horse.

On the 28th of January he attacked and routed the Irish royalists completely. "On the 19th of January, 1644, the Scottish army entered England. Lesley, now earl of Leven, commanded them. . . . In the meantime, the parliament at Westminster formed a council under the title of 'The Committee of the Two Kingdoms,' consisting of seven Lords, fourteen members of the Commons, and four Scottish Commissioners. Whatever belongs to the executive power as distinguished from the legislative devolved upon this Committee. In the spring of 1644 the parliament had five armies in the field, paid by general or local taxation, and by voluntary contributions. Including the Scottish army there were altogether 56,000 men under arms; the English forces [Parliamentary] being commanded, as separate armies, by Essex, Waller, Manchester, and Fairfax. Essex and Waller advanced to blockade Oxford. The queen went to Exeter in April, and never saw Charles again. The blockading forces around Oxford had become so strong that resistance appeared to be hopeless. On the night of the 3d of June the king secretly left the city and passed safely between the two hostile armies. There had again been jealousies and disagreements between Essex and Waller. Essex, supported by the council of war, but in opposition to the committee of the two kingdoms, had marched to the west. Waller, meanwhile, went in pursuit of the king into Worcestershire. Charles suddenly returned to Oxford; and then at Copredy Bridge, near Banbury, defeated Waller, who had hastened back to encounter him. Essex was before the walls of Exeter, in which city the queen had given birth to a princess. The king hastened to the west. He was strong enough to meet either of the parliamentary armies thus separated. Meanwhile the combined English and Scottish armies were besieging York. Rupert had just accomplished the relief of Lathom House, which had been defended by the heroic countess of Derby for eighteen weeks, against a detachment of the army of Fairfax. He then marched towards York with 20,000 men. The allied English and Scots retired from Hesse Moor, near York, to Tadcaster. Rupert entered York with 2,000 cavalry. The Earl of Newcastle was in command there. He counselled a prudent delay. The impetuous Rupert said he had the orders of the king for his guidance, and he was resolved to fight. On the 2nd of July, having rested two days in and near York, and enabled the city to be newly provisioned, the royalist army went forth to engage. They met their enemy on Marston Moor."—C. Knight, *Crown history of England*, ch. 25.—"For some five hours (July 21) the two hosts with colors flying and match burning, looked each other in the face. It was a showery summer afternoon. The Parliamentarians in the standing corn, hungry and wet, beguiled the time in singing hymns. 'You cannot imagine,' says an eye-witness, 'the courage, spirit, and resolution that was taken up on both sides; for we looked, and no doubt they also, upon this fight as the losing or gaining the garland.' . . . At seven o'clock the flame of battle leaped forth, the low hum of the two armed hosts in an instant charged into fierce uproar, and before many minutes the moor and the slope of the hill were covered with bloodshed and disorder. Who gave the sign for the general engagement we do not know, and it is even likely that no sign as the result of deliberate and concerted plan was ever given at all. . . . Cromwell, on the Parliamentary left, charged Rupert with the greatest resolution that ever was seen. It was the first time that these two great leaders of horse had ever met in direct shock, and

it was here that Rupert gave to Oliver the brave nickname of Ironside. As it happened, this was also one of the rare occasions when Oliver's cavalry suffered a check. David Leslie with his Scotch troopers was luckily at hand, and charging forward together they fell upon Rupert's right flank. This diversion enabled Oliver, who had been wounded in the neck, to order his retreating men to face about. Such a manœuver, say the soldiers, is one of the nicest in the whole range of tactics, and bears witness to the discipline and flexibility of Cromwell's force, like a delicate-mouthed charger with a consummate rider. With Leslie's aid they put Rupert and his cavalry to rout. . . . It was admitted by Cromwell's partizan that Leslie's chase of the broken forces of Rupert, making a rally impossible, was what left Cromwell free to hold his men compact and ready for another charge. The key to most of his victories was his care that his horse when they had broken the enemy should not scatter in pursuit. The secret a masterful coolness and the flash of military perception in the leader, along with iron discipline in the men. . . . In the center. . . the Parliamentary force was completely broken, though the Scotch infantry on the right continued stubbornly to hold their ground. This was the crisis of the fight, and the Parliamentary battle seemed to be irretrievably lost. It was saved in a second act by the manful stoutness of a remnant of the Scots in the center, and still more by the genius and energy of Cromwell and the endurance of his troopers. . . . Before ten o'clock all was over, and the Royalists beaten from the field were in full retreat. In what is sometimes too lightly called the vulgar courage of the soldier, neither side was wanting. Cromwell's was the only manœuver of the day that showed the talent of the soldier's eye or the power of swift initiative."—J. Morley, *Oliver Cromwell*, pp. 138, 139, 140, 141.—See also SCOTLAND: 1644-1645.

1644 (August-September).—Essex's surrender.—Second battle of Newbury.—"The great success at Marston, which had given the north to the Parliament, was all undone in the south and west through feebleness and jealousies in the leaders and the wretched policy that directed the war. Detached armies, consisting of a local militia, were aimlessly ordered about by a committee of civilians in London. Disaster follow on disaster. Essex, Waller, and Manchester would neither agree amongst themselves nor obey orders. Essex and Waller had parted before Marston was fought; Manchester had returned from York to protect his own eastern counties. Waller, after his defeat at Copredy, did nothing, and naturally found his army melting away. Essex, perversely advancing into the west, was outmanœuvred by Charles, and ended a campaign of blunders by the surrender of all his infantry [at Fowey, in Cornwall, Sept. 2, 1644]. By September, 1644, throughout the whole south-west the Parliament had not an army in the field. But the Committee of the Houses still toiled on with honourable spirit, and at last brought together near Newbury a united army nearly double the strength of the King's. On Sunday, the 20th of October, was fought the second battle of Newbury, as usual in these ill-ordered campaigns, late in the afternoon. An arduous day ended without victory, in spite of the greater numbers of the Parliament's army, though the

men fought well, and their officers led them with skill and energy. At night the King was suffered to withdraw his army without loss, and later to carry off his guns and train. The urgent appeals of Cromwell and his officers could not infuse into Manchester energy to win the day, or spirit to pursue the retreating foe."—F. Harrison, *Oliver Cromwell*, ch. 5.

1644-1645.—Self-denying Ordinance.—"Cromwell had shown his capacity for organization in the creation of the Ironsides; his military genius had displayed itself at Marston Moor. Newbury first raised him into a political leader. 'Without a more speedy, vigorous and effective prosecution of the war,' he said to the Commons after his quarrel with Manchester, 'casting off all lingering proceedings, like those of soldiers of fortune beyond sea to spin out a war, we shall make the kingdom weary of us, and hate the name of a Parliament.' But under the leaders who at present conducted it a vigorous conduct of the war was hopeless. They were, in Cromwell's plain words, 'afraid to conquer.' They desired not to crush Charles, but to force him back, with as much of his old strength remaining as might be, to the position of a constitutional King. . . . The army, too, as he long ago urged at Edgehill, was not an army to conquer with. Now, as then, he urged that till the whole force was new modeled, and placed under a stricter discipline, 'they must not expect any notable success in anything they went about.' But the first step in such a reorganization must be a change of officers. The army was led and officered by members of the two Houses, and the Self-renouncing [or Self-denying] Ordinance, which was introduced by Cromwell and Vane, declared the tenure of civil or military offices incompatible with a seat in either. In spite of a long and bitter resistance, which was justified at a later time by the political results which followed this rupture of the tie which had hitherto bound the army to the Parliament, the drift of public opinion was too strong to be withstood. The passage of the Ordinance brought about the retirement of Essex, Manchester, and Waller; and the new organization of the army went rapidly on under a new commander-in-chief, Sir Thomas Fairfax, the hero of the long contest in Yorkshire, and who had been raised into fame by his victory at Nantwich and his bravery at Marston Moor."—J. 1645.—Storm and destruction of Basing House by Cromwell. See BASING HOUSE.

1645 (January-February).—Attempted treaty of Uxbridge.—A futile negotiation between the king and Parliament was opened at Uxbridge in January, 1645. "But neither the king nor his advisers entered on it with minds sincerely bent on peace; they, on the one hand, resolute not to swerve from the utmost rigour of a conqueror's terms, without having conquered; and he though more secretly, cherishing illusive hopes of a more triumphant restoration to power than any treaty could be expected to effect. The three leading topics of discussion among the negotiators at Uxbridge were, the church, the militia, and the state of Ireland. Bound by their unhappy covenant, and watched by their Scots colleagues, the English com-

missioners on the parliament's side demanded the complete establishment of a presbyterian polity, and the substitution of what was called the directory for the Anglican liturgy. Upon this head there was little prospect of a union."—H. Hallam, *Constitutional history of England*, ch. 10, pt. 1.

ALSO IN: Earl of Clarendon, *History of the rebellion*, v. 3, bk. 8, sect. 209-252.

1645 (January-April).—New model of the army.—The passage of the Self-denying Ordinance was followed, or accompanied, by the adoption of the scheme for the so-called new model of the army. "All officers were to be nominated by Sir Thomas Fairfax, the new General, and (as was insisted upon by the Lords, with the object of excluding the more fanatical Independents) every officer was to sign the covenant within twenty days of his appointment. . . . Sir Thomas Fairfax having been appointed Commander-in-Chief by a vote of both Houses on the 1st of April [1645], Essex, Manchester and others of the Lords resigned their commissions on the 2nd. . . . The name of Cromwell was of course, with those of other members of the Commons, omitted from the original list of the New Model army; but with a significance which could not have escaped remark, the appointment of lieutenant-general was left vacant, while none doubted by whom that vacancy would be filled."—N. L. Walford, *Parliamentary generals of the Great Civil War*, ch. 4.—The cavalry was greatly improved in this new organization and the energy and enthusiasm of Fairfax and Cromwell finally succeeded in welding together a powerful force.

1645 (June).—Battle of Naseby.—"Early in April, Fairfax with his new army advanced westward to raise the siege of Taunton. . . . [Later he] received orders to proceed in pursuit of the royal forces, which, having left Worcester, were marching apparently against the Eastern Association, and had just taken Leicester on their way. He came up with the king in the neighbourhood of Harborough. Charles turned back to meet him, and just by the village of Naseby the great battle known by that name was fought. Cromwell had joined the army, amid the rejoicing shouts of the troops, two days before, with the Association horse. Again the victory seems to have been chiefly due to his skill. In detail it is almost a repetition of the battle of Marston Moor."—J. F. Bright, *History of England, period 2*, p. 675.—"It was on this high moor-ground, in the centre of England, that King Charles, on the 14th of June, 1645, fought his last battle; dashed fiercely against the New-Model Army which he had despised till then; and saw himself shivered utterly to ruin thereby. 'Prince Rupert, on the King's right wing, charged up the hill, and carried all before him'; but Lieutenant-General Cromwell charged downhill on the other wing, likewise carrying all before him,—and did not gallop off the field to plunder, he. Cromwell, ordered thither by the Parliament, had arrived from the Association two days before, 'amid shouts from the whole Army': he had the ordering of the Horse this morning. Prince Rupert, on returning from his plunder, finds the King's Infantry a ruin; prepares to charge again with the rallied Cavalry; but the Cavalry too, when it came to the point, 'broke all asunder,'—never to reassemble more. . . . There were taken here a good few 'ladies of quality in carriages';—and above a hundred Irish ladies not of quality, tatterey camp-followers 'with long skean-knives about a foot in length,' which they well knew how

to use; upon whom I fear the Ordinance against Papists pressed hard this day. The King's Carriage was also taken, with a Cabinet and many Royal Autographs in it, which when printed made a sad impression against his Majesty,—gave in fact a most melancholy view of the veracity of his Majesty, 'On the word of a King.' All was lost!"—T. Carlyle, *Oliver Cromwell's letters and speeches*, pt. 2, letter 20.—Although Charles held out for nearly a year before he gave himself up to the Scots his cause was doomed.

1645 (June-December).—Intrigues of Charles.—Glamorgan's commission.—Charles attempted to wring victory from defeat by playing off the fanatical Presbyterian Parliament against the army, being as he said, "not without hope that I shall be able to draw Presbyterians or Independents to side with me for extirpating one another, that I shall really be king again." Consequently the next two years were so filled with the intrigues of Charles that no party would put any trust in him. "At the battle of Naseby, copies of some letters to the queen, chiefly written about the time of the treaty of Uxbridge, and strangely preserved, fell into the hands of the enemy and were instantly published. No other losses of that fatal day were more injurious to [the king's] cause. . . . He gave her [the queen] power to treat with the English catholics, promising to take away all penal laws against them as soon as God should enable him to do so, in consideration of such powerful assistance as might deserve so great a favour, and enable him to affect it. . . . Suspicions were much aggravated by a second discovery that took place soon afterwards, of a secret treaty between the earl of Glamorgan and the confederate Irish catholics, not merely promising the repeal of the penal laws, but the establishment of their religion in far the greater part of Ireland. . . . The king, informed of this, disavowed Glamorgan."—H. Hallam, *Constitutional history of England*, v. 2, ch. 10.

1646 (March).—Adoption of Presbyterianism by Parliament.—"For the last three years the Assembly of Divines had been sitting almost daily in the Jerusalem Chamber of Westminster Abbey. . . . They were preparing a new Prayer-book, a form of Church Government, a Confession of Faith, and a Catechism; but the real questions at issue were the establishment of the Presbyterian Church and the toleration of sectarians. The Presbyterians, as we know, desired to establish their own form of Church government by assemblies and synods, without any toleration for non-conformists, whether Catholics, Episcopalians, or sectarians. But though they formed a large majority in the Assembly, there was a well-organized opposition of Independents and Erastians, [see Erastianism] whose union made it no easy matter for the Presbyterians to carry every vote their own way. . . . After the Assembly had sat a year and a half, the Parliament passed an ordinance for putting a directory, prepared by the divines, into force, and taking away the Common Prayer-book (3rd Jan., 1645). The sign of the cross in baptism, the ring

in marriage, the wearing of vestments, the keeping of saints' days, were discontinued. The communion table was ordered to be set in the body of the church, about which the people were to stand or sit; the passages of Scripture to be read were left to the minister's choice; no forms of prayer were prescribed. The same year a new directory for ordination of ministers was passed into an ordinance. The Presbyterian assemblies, called presbyteries, were empowered to ordain, and none were allowed to enter the ministry without first taking the covenant (8th Nov., 1645). This was followed by a third ordinance for establishing the Presbyterian system of Church government in England by way of trial for three years. As originally introduced into the House, this ordinance met with great opposition, because it gave power to ministers of refusing the sacrament and turning men out of the Church for scandalous offences. Now, in what, argued the Erastians, did scandalous offences consist? . . . A modified ordinance accordingly was passed; scandalous offences, for which ministers might refuse the sacrament and excommunicate, were specified; assemblies were declared subject to Parliament, and leave was granted to those who thought themselves unjustly sentenced, to appeal right up from one Church assembly after another to the civil power—the Parliament (10th March, 1646). Presbyterians, both in England and Scotland, felt deeply mortified. After all these years' contending, then, just when they thought they were entering on the fruits of their labours, to see the Church still left under the power of the State—the disappointment was intense to a degree we cannot estimate. They looked on the Independents as the enemies of God; this 'lame Erastian Presbytery' as hardly worth the having. . . . The Assembly of Divines practically came to an end in 1649, when it was changed into a committee for examining candidates for the Presbyterian ministry. It finally broke up without any formal dismissal on the dispersion of the Rump Parliament in March, 1653."—B. M. Cordery and J. S. Phillpotts, *King and Commonwealth*, ch. 6.—See also INDEPENDENTS; WESTMINSTER ASSEMBLY.

1646-1647.—King in the hands of the Scots.—His duplicity and his intrigues.—Scots surrender him.—With his last field army conquered in 1645 and his forces dispersed, Charles took refuge with the Scots, riding into Newark May 5, 1646. In June Oxford surrendered. The Scots retreated to Newcastle where on July 17, 1646, proposals for peace from the Scots and Parliament were presented to Charles. The king was asked to support Presbyterians and to grant Parliament the control of the militia for twenty years. "The King had given no distinct answer. It was a suspicious circumstance that the Duke of Hamilton had gone into Scotland, especially as Cromwell learned that, in spite of an ostensible order from the King, Montrose's force had not been disbanded. . . . If the King had been a man to be trusted, and if he had frankly accepted the army programme of free religion, a free Parliament, and responsible advisers, there is little doubt that he might have kept his crown and his Anglican ritual—at least for his own worship—and might yet have concluded his reign prosperously as the first constitutional King of England. Instead of this, he angered the army by making their most sacred purposes mere cards in a game, to be played or held as he thought most to his own advantage in dealing with the

Presbyterian Parliament. . . . If the King would have taken the Covenant, and guaranteed to them their precious Presbyterian system, his Scottish subjects would have fought for him almost to the last man. The firmness of Charles in declining the Covenant for himself is, no doubt, the most creditable point in his resistance. But his obstinacy in disputing the right of two nations, in their political establishment of religion, to override his convictions by their own, illustrates his entire incapacity to comprehend the new light dawning on the relations of sovereign and people. The Scots did their best for him. They petitioned him, they knelt to him, they preached to him. . . . But to have carried with them an intractable man to form a wedge of division amongst themselves, at the same time that he brought against them the whole power of England, would have been sheer insanity. Accordingly, they made the best bargain they could both for him and themselves; and, taking their wages, they left him [Jan. 30, 1647] with his English subjects, who conducted him to Holdenby House, in Northamptonshire, on the 6th of February, 1647."—J. A. Picton, *Oliver Cromwell*, ch. 13.

Godwin, *History of the Commonwealth*, v. 2, bk. 1, ch. 24-27, and bk. 2, ch. 1-6.—Earl of Clarendon, *History of the rebellion*, v. 3, bk. 9, sect. 161-178, and bk. 10.

1647 (April-August).—Army assumes custody of king.—Parliament was now willing to lessen its demands for it was desirous of disbanding the army which it considered a menace. The army was the stronghold of Independency and religious liberty. "That day [April 30, 1647] it became known that there existed an organization, a sort of Parliament, in the Army, the officers forming an upper council and the representatives of the rank and file a lower council. Two such representatives stood in the lower council for each squadron or troop, known as 'Adjutors,' aiders, or 'Agitators.' This organization had taken upon itself to see that the Army had its rights. . . . At the end of a month, there was still greater occasion for astonishment. Seven hundred horse suddenly left the camp, and appearing without warning, June 2, at Holmby House, where Charles was kept, in charge of Parliamentary commissioners, proposed to assume the custody of the King."—J. K. Hosmer, *Life of young Sir Henry Vane*, ch. 12.

1647 (August-December).—Charles' "game" with Cromwell and the army, and his flight.—Increasing unrest.—"So bold a step as the seizure of the King made necessary other bold steps on the part of the Army. Scarcely a fortnight had passed, when a demand was made for the exclusion from Parliament of eleven Presbyterians, the men most conspicuous for extreme views. The Army meanwhile hovered, ever ominously, close at hand, to the north and east of the city, paying slight regard to the Parliamentary prohibition to remain at a distance. The eleven members withdrew. . . . But if Parliament was willing to yield, Presbyterian London and the country round about were not, and in July broke out into sheer rebellion. . . . The Speakers of the Lords and Commons, at the head of the strength of the Parliament, fourteen Peers and one hundred Commoners, betook themselves to Fairfax, and on August 2 they threw themselves into the protection of the Army at Hounslow Heath, ten miles distant. A grand review took place. The consummate soldier, Fairfax, had his troops in perfect condition, and they were drawn out 20,000 strong to receive the seced-

ing Parliament. The soldiers rent the air with shouts in their behalf, and all was made ready for a most impressive demonstration. On the 6th of August, Fairfax marched his troops in full array through the city, from Hammersmith to Westminster. Each man had in his hat a wreath of laurel. The Lords and Commons who had taken flight were escorted in the midst of the column; the city officials joined the train. At Westminster the Speakers were ceremoniously reinstated, and the Houses again put to work, the first business being to thank the General and the veterans who had reconstituted them. The next day, with Skippon in the centre and Cromwell in the rear, the Army marched through the city itself, a heavy tramp of battle-seasoned platoons, at the mere sound of which the warlike ardor of the turbulent youths of the workshops and the rough watermen was completely squelched. Yet the soldiers looked neither to the right nor left; by no act, word, or gesture was any offence given."—J. K. Hosmer, *Life of young Sir Henry Vane*, ch. 12.

After reinstating the Parliament at Westminster, "the army leaders resumed negotiations with the King. The indignation of the soldiers at his delays and intrigues made the task hourly more difficult; but Cromwell . . . clung to the hope of accommodation with a passionate tenacity. His mind, conservative by tradition, and above all practical in temper, saw the political difficulties which would follow on the abolition of Royalty, and in spite of the King's evasions, he persisted in negotiating with him. But Cromwell stood almost alone; the Parliament refused to accept Ireton's [General Ireton, Cromwell's son-in-law] proposals as a basis of peace, Charles still evaded, and the army then grew restless and suspicious. There were cries for a wide reform, for the abolition of the House of Peers, for a new House of Commons, and the Adjutors called on the Council of Officers to discuss the question of abolishing Royalty itself. Cromwell was never braver than when he faced the gathering storm, forbade the discussion, adjourned the Council, and sent the officers to their regiments. But the strain was too great to last long, and Charles was still resolute to 'play his game.' He was, in fact, so far from being in earnest in his negotiations with Cromwell and Ireton, that at the moment they were risking their lives for him he was conducting another and equally delusive negotiation with the Parliament. . . . In the midst of his hopes of an accommodation, Cromwell found with astonishment that he had been duped throughout, and that the King had fled [to the Isle of Wight, Nov. 11, 1647]. . . . Even Cromwell was powerless to break the spirit which now pervaded the soldiers, and the King's perfidy left him without resource. 'The King is a man of great parts and great understanding,' he said at last, 'but so great a dissembler and so false a man that he is not to be trusted.' By a strange error, Charles had made his way from Hampton Court to the Isle of Wight, perhaps with some hope from the sympathy of Colonel Hammond, the Governor of Carisbrooke Castle, and again found himself a prisoner. Foiled in his effort to put himself at the head of the new civil war, he set himself to organize it from his prison; and while again opening delusive negotiations with the Parliament, he signed a secret treaty with the Scots for the invasion of the realm. The rise of Inde-

pendency, and the practical suspension of the Covenant, had produced a violent reaction in his favour north of the Tweed. . . . In England the whole of the conservative party, with many of the most conspicuous members of the Long Parliament at its head, was drifting, in its horror of the religious and political changes which seemed impending, toward the King; and the news from Scotland gave the signal for fitful insurrections in almost every quarter."—J. R. Green, *Short history of England*, ch. 8, sect. 8.

1648 (April-August).—Second Civil War.—Defeat of the Scots at Preston.—"The Second Civil War broke out in April, and proved to be a short but formidable affair. The whole of Wales was speedily in insurrection; a strong force of cavaliers were mustering in the north of England; in Essex, Surrey, and the southern counties various outbreaks arose; Berwick, Carlisle, Chester, Pembroke, Colchester, were held for the king; the fleet revolted; and 40,000 men were ordered by the Parliament of Scotland to invade England. Lambert was sent to the north; Fairfax to take Colchester [see COLCHESTER: 1648]; and Cromwell into Wales, and thence to join Lambert and meet the Scotch. On the 24th of May Cromwell reached Pembroke, but being short of guns, he did not take it till 11th July. The rising in Wales crushed, Cromwell turned northwards, where the north-west was already in revolt, and 20,000 Scots, under the Duke of Hamilton, were advancing into the country. Want of supplies and shoes, and sickness, detained him with his army, some 7,000 strong, 'so extremely harassed with hard service and long marches, that they seemed rather fit for a hospital than a battle.' Having joined Lambert in Yorkshire he fought the battle of Preston on 17th of August. The battle of Preston was one of the most decisive and important victories ever gained by Cromwell, over the most numerous enemy he ever encountered, and the first in which he was in supreme command. . . . Early on the morning of the 17th August, Cromwell, with some 9,000 men, fell upon the army of the Duke of Hamilton unawares, as it proceeded southwards in a long, straggling, unprotected line. The invaders consisted of 17,000 Scots and 7,000 good men from northern counties. The long ill-ordered line was cut in half and rolled back northward and southward, before they even knew that Cromwell was upon them. The great host, cut into sections, fought with desperation from town to town. But for three days it was one long chase and carnage, which ended only with the exhaustion of the victors and their horses. Ten thousand prisoners were taken. 'We have killed we know not what,' writes Cromwell, 'but a very great number; having done execution upon them above thirty miles together, besides what we killed in the two great fights.' His own loss was small, and but one superior officer. . . . The Scottish invaders dispersed, Cromwell hastened to recover Berwick and Carlisle, and to restore the Presbyterian or Whig party in Scotland."—F. Harrison, *Oliver Cromwell*, ch. 1.

7, ch. 74.—Earl of Clarendon, *History of the rebellion*, v. 4, bk. 11.

1648 (September - November).—Treaty at Newport.—In spite of Cromwell's military success, public sentiment in favor of an honorable peace with the king brought into ascendancy the party for distinction's sake called presbyterian, but now rather to be termed constitutional. "This change in the counsels of parliament brought on the treaty of Newport. The treaty of Newport was set on foot and managed by those politicians of the house of lords, who, having long suspected no danger to themselves but from the power of the king, had discovered, somewhat of the latest, that the crown itself was at stake, and that their own privileges were set on the same cast. . . . They now grew anxious to see a treaty concluded with the king. Sensible that it was necessary to anticipate, if possible, the return of Cromwell from the north, they implored him to comply at once with all the propositions of parliament, or at least to yield in the first instance as far as he meant to go. They had not, however, mitigated in any degree the rigorous conditions so often proposed; nor did the king during this treaty obtain any reciprocal concession worth mentioning in return for his surrender of almost all that could be demanded."—H. Hallam, *Constitutional history of England*, ch. 10, pt. 2.—The utter faithlessness with which Charles carried on these negotiations, as on all former occasions, was shown at a later day when his correspondence came to light. . . . The parliament, though without any exact information, suspected all this perfidy; even the friends of peace, the men most affected by the king's condition, and most earnest to save him, replied but hesitatingly to the charges of the independents."—F. P. Guizot, *History of the English revolution of 1640*, bk. 8.

1648 (November-December).—Grand Army Remonstrance and Pride's Purge.—Long Parliament cut down to the Rump.—"By this time the army had lost all patience with the king. It was only too evident that he was merely seeking to gain time and the opportunity to escape to some friendly land to secure aid. The army saw that there could be no strong government in England so long as Charles was permitted to remain at large. By military authority he was removed on December 1 to the desolate Hurst Castle, where no help could reach him. On December 5th the House of Commons declared for a reconciliation with the king. On the 6th a body of soldiers, under the command of Colonel Pride, forced it to serve the purposes of the army by forcibly expelling all members who took the side of the king. This act of violence is commonly known as 'Pride's Purge.'"—S. R. Gardiner, *Student's history of England*, p. 557.—"The famous Pride's Purge was accomplished. By military force the Long Parliament was cut down to a fraction of its number, and the career begins of the mighty 'Rump,' so called in the coarse wit of the time because it was 'the sitting part.'"—J. K. Hosmer, *Life of young Sir Henry Vane*, ch. 13.—"This name [the Rump] was first given to them by Walker, the author of the History of Independency, by way of derision, in allusion to a fowl all devoured but the rump."—D. Neal, *History of the Puritans*, v. 4, ch. 1, footnote.

1649 (January).—Trial and execution of the king.—“During the month in which Charles had remained at Windsor [whither he had been brought from Hurst Castle on the 17th of December], there had been proceedings in Parliament of which he was imperfectly informed. On the day he arrived there, it was resolved by the Commons that he should be brought to trial. On the 2nd of January, 1649, it was voted that, in making war against the Parliament, he had been guilty of treason; and a High Court was appointed to try him. . . . [On January 10] the High Court of Justice was opened in Westminster-hall. . . . After the names of the members of the court had been called, 69 being present, Bradshaw, the president, ordered the serjeant to bring in the prisoner. Silently the King sat down in the chair prepared for him. He moved not his hat, as he looked sternly and contemptuously around. The sixty-nine rose not from their seats, and remained covered. . . . The clerk reads the charge, and when he is accused therein of being tyrant and traitor, he laughs in the face of the Court. ‘Though his tongue usually hesitated, yet it was very free at this time, for he was never discomposed in mind,’ writes Warwick. . . . Again and again contending against the authority of the Court, the King was removed, and the sitting was adjourned to the 22nd. On that day the same scene was renewed; and again on the 23rd. A growing sympathy for the monarch became apparent. The cries of ‘Justice, justice,’ which were heard at first, were now mingled with ‘God save the King.’ He had refused to plead; but the Court nevertheless employed the 24th and 25th of January in collecting evidence to prove the charge of his levying war against the Parliament. Coke, the solicitor-general, then demanded whether the Court would proceed to pronouncing sentence; and the members adjourned to the Painted Chamber. On the 27th the public sitting was resumed. . . . The Court, Bradshaw then stated, had agreed upon the sentence. Ludlow records that the King ‘desired to make one proposition before they proceeded to sentence; which he earnestly pressing, as that which he thought would lead to the reconciling of all parties, and to the peace of the three kingdoms, they permitted him to offer it: the effect of which was, that he might meet the two Houses in the Painted Chamber, to whom he doubted not to offer that which should satisfy and secure all interests.’ Ludlow goes on to say, ‘Designing, as I have since been informed, to propose his own resignation, and the admission of his son to the throne upon such terms as should have been agreed upon.’ The commissioners retired to deliberate, ‘and being satisfied, upon debate, that nothing but loss of time would be the consequence of it, they returned into the Court with a negative to his demand.’ Bradshaw then delivered a solemn speech to the King. . . . The clerk was lastly commanded to read the sentence, that his head should be severed from his body; ‘and the commissioners,’ says Ludlow, ‘testified their unanimous assent by standing up.’ The King attempted to speak; ‘but being accounted dead in law, was not permitted.’ On the 20th of January, the Court met to sign the sentence of execution, addressed to ‘colonel Francis Hacker, colonel Huncks, and lieutenant-colonel Phayr, and to every one of them.’ . . . There were some attempts to save him. The Dutch ambassador made vigorous efforts to procure a reprieve, whilst the French and Spanish ambassadors were inert.’ The ambassadors from the States nevertheless persevered; and early in the day of the 30th obtained some glimmering of hope from Fairfax. ‘But we found,’ they say in their despatch, ‘in front

of the house in which we had just spoken with the general, about 200 horsemen; and we learned, as well as on our way as on reaching home, that all the streets, passages, and squares of London were occupied by troops, so that no one could pass, and that the approaches of the city were covered with cavalry, so as to prevent any one from coming in or going out. . . . The same day [Jan. 30, 1649], between two and three o’clock, the King was taken to a scaffold covered with black, erected before Whitehall.’ To that scaffold before Whitehall, Charles walked, surrounded by soldiers, through the leafless avenues of St. James’s Park. It was a bitterly cold morning. . . . His purposed address to the people was delivered only to the hearing of those upon the scaffold, but its purport was that the people mistook the nature of government; ‘for people are free under a government, not by being sharers in it, but by due administration of the laws of it.’ His theory of government was a consistent one. He had the misfortune not to understand that the time had been fast passing away for its assertion. The beadsman did his office; and a deep groan went up from the surrounding multitude.”—C. Knight, *Popular history of England*, v. 4, ch. 7.—“In the death-warrant of 20th January, 1649, next after the President and Lord Grey, stands the name of Oliver Cromwell. He accepted the responsibility of it, justified, defended it to his dying day. No man in England was more entirely answerable for the deed than he. ‘I tell you,’ he said to Algernon Sidney, ‘we will cut off his head with the crown upon it.’ . . . Slowly he had come to know—not only that the man, Charles Stuart, was incurably treacherous, but that any settlement of Parliament with the old Feudal Monarchy was impossible. As the head of the king rolled on the scaffold the old Feudal Monarchy expired for ever. In January, 1649, a great mark was set in the course of the national life—the Old Rule behind it, the New Rule before it. Parliamentary government, the consent of the nation, equality of rights, and equity in the law—all date from this great New Departure. The Stuarts indeed returned for one generation, but with the sting of the Old Monarchy gone, and only to disappear almost without a blow. The Church of England returned; but not the Church of Laud or of Charles. The peers returned, but as a meek House of Lords, with their castles razed, their feudal rights and their political power extinct. It is said that the regicides killed Charles I. only to make Charles II. king. It is not so. They killed the Old Monarchy; and the restored monarch was by no means its heir, but a royal Stadtholder or Hereditary President.”—F. Harrison, *Oliver Cromwell*, ch. 7.—“The proper lesson taught by the act of the thirtieth of January, was that no person, however high in station, however protected by the prejudices of his contemporaries, must expect to be criminal against the welfare of the state and the community, without retribution and punishment. The event however sufficiently proved that the condemnation and execution of Charles did not answer the purposes intended by its authors. It did not conciliate the English nation to republican ideas. It shocked all those persons in the country who did not adhere to the ruling party. This was in some degree owing to the decency with which Charles met his fate. He had always been in manners, formal, sober and specious. . . . The notion was everywhere prevalent, that a sovereign could not be called to account, could not be arraigned at the bar of his subjects. And the violation of this prejudice, instead of breaking down the wall which separated him from others, gave to his person a sa-

credness which never before appertained to it. Among his own partisans the death of Charles was treated, and was spoken of, as a sort of decide. And it may be admitted for a universal rule, that the abrupt violation of a deep-rooted maxim and persuasion of the human mind, produces a reaction, and urges men to hug the maxim closer than ever. I am afraid, that the day that saw Charles perish on the scaffold, rendered the restoration of his family certain."—W. Godwin, *History of the Commonwealth of England to the Restoration of Charles II*, v. 2, bk. 2, ch. 26.—"In private life he [Charles] was the best of the Stuart kings, reaching about the average level of his subjects. In public life his treachery, mendacity, folly, and vindictiveness: his utter inability to learn by experience or to sympathize with any noble ambition of his country: his readiness to follow evil counsel, and his ingratitude toward any sincere friend, made him as unfit as either of his sons to sit on the English throne; and a greater condemnation than this it is not possible to award."—T. Roosevelt, *Oliver Cromwell*, pp. 25, 26.

The following is the text of the Act which arraigned the king and constituted the Court by which he was tried: "Whereas it is notorious that Charles Stuart, the now king of England, not content with many encroachments which his predecessors had made upon the people in their rights and freedom, hath had a wicked design totally to subvert the antient and fundamental laws and liberties of this nation, and in their place to introduce an arbitrary and tyrannical government; and that, besides all other evil ways and means to bring his design to pass, he hath prosecuted it with fire and sword, levied and maintained a civil war in the land, against the parliament and kingdom; whereby this country hath been miserably wasted, the public treasure exhausted, trade decayed, thousands of people murdered, and infinite other mischiefs committed; for all which high and treasonable offences the said Charles Stuart might long since have justly been brought to exemplary and condign punishment: whereas also the parliament, well hoping that the restraint and imprisonment of his person after it had pleased God to deliver him into their hands, would have quieted the distempers of the kingdom, did forbear to proceed judiciously against him; but found, by sad experience, that such their remissness served only to encourage him and his accomplices in the continuance of their evil practices and in raising new commotions, rebellions, and invasions: for prevention therefore of the like or greater inconveniences, and to the end no other chief officer or magistrate whatsoever may hereafter presume, traitorously and maliciously, to imagine or contrive the enslaving or destroying of the English nation, and to expect impunity for so doing; be it enacted and ordained by the [Lords] and commons in Parliament assembled, and it is hereby enacted and ordained by the authority thereof, That the earls of Kent, Nottingham, Pembroke, Denbigh, and Mulgrave; the lord Grey of Warke; lord chief justice Rolle of the king's bench, lord chief justice St. John of the common Pleas, and lord chief baron Wyldc; the lord Fairfax, lieutenant general Cromwell, &c. [in all about 150,] shall be, and are hereby appointed and required to be Commissioners and Judges, for the Hearing, Trying, and Judging of the said Charles Stuart; and the said Commissioners, or any 20 or more of them, shall be, and are hereby authorized and consti-

tuted an High Court of Justice, to meet and sit at such convenient times and place as by the said commissioners, or the major part, or 20 or more of them, under their hands and seals, shall be appointed and notified by public Proclamation in the Great Hall, or Palace Yard of Westminster; and to adjourn from time to time, and from place to place, as the said High Court, or the major part thereof, at meeting, shall hold fit; and to take order for the charging of him, the said Charles Stuart, with the Crimes and Treasons above-mentioned, and for receiving his personal Answer therunto, and for examination of witnesses upon oath. (which the court hath hereby authority to administer) or otherwise, and taking any other Evidence concerning the same; and thereupon, or in default of such Answer, to proceed to final Sentence according to justice and the merit of the cause; and such final Sentence to execute, or cause to be executed, speedily and impartially.—And the said court is hereby authorized and required to chuse and appoint all such officers, attendants, and other circumstances as they, or the major part of them, shall in any sort judge necessary or useful for the orderly and good managing of the premises; and Thomas lord Fairfax, the General, and all officers and soldiers, under his command, and all officers of justice, and other well-affected persons, are hereby authorized and required to be aiding and assisting unto the said court in the due execution of the trust hereby committed unto them; provided that this act, and the authority hereby granted, do continue in force for the space of one month from the date of the making hereof, and no longer."—*Cobbett's Parliamentary history of England*, v. 3, pp. 1254-1255.

1649 (February).—Commonwealth established.—"England was now a Republic. The change had been virtually made on Thursday, January 4, 1648-9, when the Commons passed their three great Resolutions, declaring (1) that the People of England were, under God, the original of all just power in the State, (2) that the Commons, in Parliament assembled, having been chosen by the People, and representing the People, possessed the supreme power in their name, and (3) that whatever the Commons enacted should have the force of a law, without needing the consent of either King or House of Peers. On Tuesday, the 30th of January, the theory of these Resolutions became more visibly a fact. On the afternoon of that day, while the crowd that had seen the execution in front of Whitehall were still lingering round the scaffold, the Commons passed an Act 'prohibiting the proclaiming of any person to be King of England or Ireland, or the dominions thereof.' It was thus declared that Kingship in England had died with Charles. But what of the House of Peers? It was significant that on the same fatal day the Commons revived their three theoretical resolutions of the 4th, and ordered them to be printed. The wretched little rag of a House might then have known its doom. But it took a week more to convince them." On the 6th of February it was resolved by the House of Commons, "That the House of Peers in Parliament is useless and dangerous, and ought to be abolished, and that an Act be brought in to that purpose. Next day, Feb. 7, after another long debate, it was further resolved 'That it hath been found by experience, and this House doth declare, that the office of a King in this realm, and to have the power thereof in any single person, is unnecessary, burdensome, and dangerous to the liberty, safety, and public interest of the People of this nation, and therefore ought to be abolished, and that an

Act be brought in to that purpose.' Not till after some weeks were these Acts deliberately passed after the customary three readings. [They were passed in March, 1649]. The delay, however, was matter of mere Parliamentary form. Theoretically a Republic since Jan. 4, 1648-9, and visibly a Republic from the day of Charles's death, England was a Republic absolutely and in every sense from Feb. 7, 1648-9." For the administration of the government of the republican commonwealth, the Commons resolved, on February 7, that a council of state be erected, to consist of not more than forty persons. On the 13th, instructions to the intended council of state were reported and agreed to, "these Instructions conferring almost plenary powers, but limiting the duration of the Council to one year." On February 14 and 15 forty-one persons were appointed to be members of the Council, Fairfax, Cromwell, Vane, St. John, Whitlocke, Henry Marten, and Colonels Hutchinson and Ludlow being in the number; nine to constitute a quorum, and no permanent president to be

OLIVER CROMWELL

chosen.—D. Masson, *Life of John Milton*, v. 4, bk. 1, ch. 1.

1651-1653.—Army and the Rump.—"Now that the King is dead and his son defeated,' Cromwell said gravely to the Parliament, 'I think it necessary to come to a settlement.' But the settlement which had been promised after Naseby was still as distant as ever after Worcester. The bill for

dissolving the present Parliament, though Cromwell pressed it in person, was only passed, after bitter opposition, by a majority of two; and even this success had been purchased by a compromise which permitted the House to sit for three years more. Internal affairs were simply at a dead lock. . . . The one remedy for all this was, as the army saw, the assembly of a new and complete Parliament in place of the mere 'rump' of the old; but this was the one measure which the House was resolute to avert. Vane spurred it to a new activity. . . . But it was necessary for Vane's purposes not only to show the energy of the Parliament, but to free it from the control of the army. His aim was to raise in the navy a force devoted to the House, and to eclipse the glories of Dunbar and Worcester by yet greater triumphs at sea. With this view the quarrel with Holland had been carefully nursed. . . . The army hardly needed the warning conveyed by the introduction of a bill for its disbanding to understand the new policy of the Parliament. . . . The army petitioned not only for reform in Church and State, but for an explicit declaration that the House would bring its proceedings to a close. The Petition forced the House to discuss a bill for 'a New Representative,' but the discussion soon brought out the resolve of the sitting members to continue as a part of the coming Parliament without re-election. The officers, irritated by such a claim, demanded in conference after conference an immediate dissolution, and the House as resolutely refused. In ominous words Cromwell supported the demands of the army. 'As for the members of this Parliament, the army begins to take them in disgust. I would it did so with less reason.' . . . Not only were the existing members to continue as members of the New Parliament, depriving the places they represented of their right of choosing representatives, but they were to constitute a Committee of Revision, to determine the validity of each election, and the fitness of the members returned. A conference took place [April 10, 1653] between the leaders of the Commons and the officers of the army. . . . The conference was adjourned till the next morning, on an understanding that no decisive step should be taken; but it had no sooner reassembled, than the absence of the leading members confirmed the news that Vane was fast pressing the bill for a new Representative through the House. 'It is contrary to common honesty,' Cromwell angrily broke out; and, quitting Whitehall, he summoned a company of musketeers to follow him as far as the door of the House of Commons."—J. R. Green, *Short history of England*, ch. 8, sect. 0.

1652-1654.—War with the Dutch republic.—"After the death of William, Prince of Orange, which was attended with the depression of his party and the triumph of the Dutch republicans [see NETHERLANDS: 1648-1650], the Parliament thought that the time was now favourable for cementing a closer confederacy with the states. St. John, chief justice, who was sent over to the Hague, had entertained the idea of forming a kind of coalition between the two republics, which would have rendered their interests totally inseparable; . . . but the states, who were unwilling to form a nearer confederacy with a government whose measures were so obnoxious, and whose situation seemed so precarious, offered only to renew the former alli-

ances with England; and the haughty St. John, disgusted with this disappointment, as well as incensed at many affronts which had been offered him, with impunity, by the retainers of the Palatine and Orange families, and indeed by the populace in general, returned into England and endeavoured to foment a quarrel between the republics. . . . There were several motives which at this time induced the English Parliament to embrace hostile measures. Many of the members thought that a foreign war would serve as a pretence for continuing the same Parliament, and delaying the new model for a representative, with which the nation had so long been flattered. Others hoped that the war would furnish a reason for maintaining, some time longer, that numerous standing army which was so much complained of. On the other hand, some, who dreaded the increasing power of Cromwell, expected that the great expense of naval armaments would prove a motive for diminishing the military establishment. To divert the attention of the public from domestic quarrels towards foreign transactions, seemed, in the present disposition of men's minds, to be good policy. . . . All these views, enforced by the violent spirit of St. John, who had great influence over Cromwell, determined the Parliament to change the purposed alliance into a furious war against the United Provinces. To cover these hostile intentions, the Parliament, under pretence of providing for the interests of commerce, embraced such measures as they knew would give disgust to the states. They framed the famous act of navigation, which prohibited all nations from importing into England in their bottoms any commodity which was not the growth and manufacture of their own country. . . . The minds of men in both states were every day more irritated against each other; and it was not long before these humours broke forth into action."—D. Hume, *History of England*, v. 5, ch. 60.—"The negotiations . . . were still pending when Blake, meeting Van Tromp's fleet in the Downs, in vain summoned the Dutch Admiral to lower his flag. A battle was the consequence, which led to a declaration of war on the 8th of July (1652). The maritime success of England was chiefly due to the genius of Blake, who having hitherto served upon shore, now turned his whole attention to the navy. A series of bloody fights took place between the two nations. For some time the fortunes of the war seemed undecided. Van Tromp, defeated by Blake, had to yield the command to De Ruyter. De Ruyter in his turn was displaced to give way again to his greater rival. Van Tromp was reinstated in command. A victory over Blake off the Naze (Nov. 28) enabled him to cruise in the Channel with a broom at his mast-head, implying that he had swept the English from the seas. But the year 1653 again saw Blake able to fight a drawn battle of two days' duration between Portland and La Hogue; while at length, on the 2d and 3d of June, a decisive engagement was fought off the North Foreland, in which Monk and Deane, supported by Blake, completely defeated the Dutch Admiral, who, as a last resource, tried in vain to blow up his own ship, and then retreated to the Dutch coast, leaving eleven ships in the hands of the English. In the next month, another victory on the part of Blake, accompanied by the death of the great Dutch Admiral, completed the ruin of the naval power of Holland. The States were driven to treat. In 1654 the treaty was signed, in which Denmark, the Hanseatic towns, and the Swiss provinces were included. . . . The Dutch acknowledged the supremacy of the English flag in the British

seas; they consented to the Navigation Act"—J. F. Bright, *History of England*, period 2, p. 701.—See also NAVIGATION LAWS: 1651.

1653 (April-December).—Cromwell's expulsion of the Long or Rump Parliament.—So-called Barbone's little or nominated parliament.—"The House was passing its bill in the form which he [Cromwell] disliked. Going to the House, when the last vote on the bill was about to be taken he rose to speak. Parliament, he said, had done well in its care for the public good, but it had been stained with 'injustice, delays of justice, self-interest.' Being interrupted by a member, he blazed up into anger. 'Come, come,' he cried; 'we have had enough of this. I will put an end to this. It is not fit you should sit here any longer.' He called in his soldiers, and bade them clear the House, following the members with words of obloquy as they passed out. 'What shall we do with this bauble?' he asked, taking up the mace. 'Take it away.' 'It is you,' he said to such of the members as still lingered, 'that have forced me to do this. I have sought the Lord night and day, that He would rather slay me than put me upon the doing of this work.' Cromwell and the officers shrank from summoning an elected Parliament. They gathered an assembly of their own nominees, to which men gave, in derision, the title of the Barbone's Parliament, because a certain Praise-God Barbone sat in it. In a speech at its opening, on July 4, Cromwell told them that England ought to be governed by godly men, and that they had been selected to govern it because they were godly. Unfortunately, many of these godly men were crotchety and unpractical. A large number of them wanted to abolish the Court of Chancery without providing a substitute, and a majority resolved to abolish tithes without providing any other means for the support of the clergy. At the same time, enthusiasts outside Parliament—the Fifth Monarchy men, as they were called—declared that the time had arrived for the reign of the saints, and that they were themselves the saints. All who had anything to lose were terrified, and turned to Cromwell for support, as it was known that no man in England had stronger common sense, or was less likely to be carried away by such dreamers. In the Parliament itself there was a strong minority which thought it desirable that, if tithes were abolished, support should be provided for the clergy in some other way. These men [the more moderate members], on December 11, got up early in the morning, and, before their opponents knew what they were about, declared Parliament to be dissolved, and placed supreme authority in the hands of Cromwell."—S. R. Gardiner, *Student's history of England*, pp. 550-568.—The "assembly of godly persons" proved, however, to be quite an unmanageable body, containing so large a number of erratic and impracticable reformers that everything substantial among English institutions was threatened with overthrow at their hands. After five months of busy session, Cromwell was happily able to bring about a dissolution of his parliament, by the action of a majority, surrendering back their powers into his hands,—which was done on the 10th of December,

1653 (December).—Establishment and constitution of the Protectorate.—Instrument of Government.—“What followed the dissolution of the Little Parliament is soon told. The Council of Officers having been summoned by Cromwell as the only power de facto, there were dialogues and deliberations, ending in the clear conclusion that the method of headship in a ‘Single Person’ for his whole life must now be tried in the Government of the Commonwealth, and that Cromwell must be that ‘Single Person.’ The title of King was actually proposed; but, as there were objections to that, Protector was chosen as a title familiar in English History and of venerable associations. Accordingly, Cromwell having consented, and all

and religious, which had been the visible drift at last of the Barebones or Daft Little Parliament. . . . The powers and duties of the Protectorate had been defined, rather elaborately, in a Constitutional Instrument of forty-two Articles, called ‘The Government of the Commonwealth’ [more commonly known as The Instrument of Government] to which Cromwell had sworn fidelity at his installation.”—D. Masson, *Life of John Milton*, v. 4, bk. 4, ch. 1 and 3.—It is an interesting fact that this document was the first written constitution of modern times. Cromwell was to govern as “Lord Protector” in conjunction with a council of state. Parliament was to meet at least every three years to make laws and levy taxes. Puritanism was to be the state religion. The nature of this Parliament is of interest for several reasons. In the first place it consisted of only one house; secondly it

OLIVER CROMWELL DICTATING TO YOUNG JOHN MILTON, WHO WAS HIS SECRETARY  
(Painted by Newenham)

preparations having been made, he was, on Friday, Dec. 16, in a great assembly of civic, judicial and military dignities, solemnly sworn and installed in the Chancery Court, Westminster Hall, as Lord Protector of the Commonwealth of England, Scotland and Ireland. There were some of his adherents hitherto who did not like this new elevation of their hero, and forsook him in consequence, regarding any experiment of the Single Person method in Government as a treason to true Republicanism, and Cromwell's assent to it as unworthy of him. Among these was Harrison Lambert, on the other hand, had been the main agent in the change, and took a conspicuous part in the installation-ceremony. In fact, pretty generally throughout the country and even among the Presbyterians, the elevation of Cromwell to some kind of sovereignty had come to be regarded as an inevitable necessity of the time, the only possible salvation of the Commonwealth from the anarchy, or wild and experimental idealism, in matters civil

represented both Great Britain and Ireland; in the third place its members were elected on the basis of equitable representation.—For the text of this document, see INSTRUMENT OF GOVERNMENT.

1654 (April).—Incorporation of Scotland with the Commonwealth. See SCOTLAND: 1654.

1654-1658.—The Protector, his Parliaments and his major-generals.—Humble Petition and Advice.—“The House proceeded with their measure on the new footing, and on June 26th [1654] Oliver was solemnly installed as Lord Protector under the new law. Though the royal title was in abeyance, the scene marked the conversion of what had first been a military dictatorship, and then the Protectorate of a Republic, into a constitutional monarchy.”—J. Morley, *Oliver Cromwell*, p. 423.—“Oliver addressed his first Protectorate Parliament on Sunday, the 3d of September. . . . Immediately, under the leadership of old Parliamentarians, Haslerig, Scott, Bradshaw, and many other republicans, the House proceeded to debate the

Instrument of Government, the constitutional basis of the existing system. By five votes, it decided to discuss 'whether the House should approve of government by a Single Person and a Parliament.' This was of course to set up the principle of making the Executive dependent on the House; a principle, in Oliver's mind, fatal to settlement and order. He acted at once. Calling on the Lord Mayor to secure the city, and disposing his own guard round Westminster Hall, he summoned the House again on the 9th day. . . . Members were called on to sign a declaration, 'not to alter the government as settled in a Single Person and a Parliament.' Some 300 signed; the minority—about a fourth—refused and retired. . . . The Parliament, in spite of the declaration, set itself from the first to discuss the constitution, to punish heretics, suppress blasphemy, revise the Ordinances of the Council; and they deliberately withheld all supplies for the services and the government. At last they passed an Act for revising the constitution *de novo*. Not a single bill had been sent up to the Protector for his assent. Oliver, as usual, acted at once. On the expiration of their five lunar months, 22d January, 1655, he summoned the House and dissolved it, with a speech full of reproaches."—F. Harrison, *Oliver Cromwell*, ch. 11.—"In 1656, the Protector called a second Parliament. By excluding from it about a hundred members whom he judged to be hostile to his government, he found himself on amicable terms with the new assembly. It presented to him a Humble Petition and Advice, asking that certain changes of the Constitution might be agreed to by mutual consent, and that he should assume the title of King. This title he rejected, and the Humble Petition and Advice was passed in an amended form on May 25, 1657, and at once received the assent of the Protector. On June 26, it was modified in some details by the Additional Petition and Advice. Taking the two together, the result was to enlarge the power of Parliament and to diminish that of the Council. The Protector, in turn, received the right of appointing his successor, and to name the life-members of 'the other House,' which was now to take the place of the House of Lords. . . . In accordance with the Additional Petition and Advice, the Protector summoned 'certain persons to sit in the other House.' A quarrel between the two Houses broke out, and the Protector [Feb. 4, 1658] dissolved the Parliament in anger."—S. R. Gardiner, *Constitutional doctrines of the Puritan revolution*, pp. 63-64, and 334-350.—"The Protectorate has sometimes been treated as a new and original settlement of the crucial question of Parliamentary sovereignty. On the contrary, the history of the Protectorate in its two phases, under the two Instruments of 1653 and 1657 by which it was constituted, seems rather to mark a progressive return to an old system than the creation of a new one. The 'Agreement of the People' (1649) was the embodiment of the idea of the absolute supremacy of a single elective House. The 'Instrument of Government' (1653) went a certain way toward mitigating this supremacy by entrusting executive power to a single person, subject to the assent and coöperation of a council itself the creation, at first direct and afterward indirect, of the single House. The 'Humble Petition and Advice' (1657) in effect restored the principle of monarchy, and took away from Parliament the right in future to choose the monarch. The oath prescribed for a privy council was an oath of allegiance to the person and authority of the Lord Protector and his successors, and he was clothed with the more than regal right of deciding who the successor should be. On him was conferred the

further power of naming the members of the new Second House. On the other hand, the council or cabinet by whose advice the Lord Protector was bound to govern, was to be approved by both Houses, and to be irremovable without the consent of Parliament. The Protectorate then was finally established, so far as constitutional documents go and in rudimentary forms, on the same principles of Parliamentary supremacy over the executive and of ministerial responsibility that have developed our modern system of government by Parliamentary cabinet."—J. Morley, *Oliver Cromwell*, pp. 424, 425.

ALSO IN: J. Forster, *Statesmen of the Commonwealth: Cromwell*.—L. von Ranke, *History of England, 17th century*, v. 3, bk. 12, ch. 1.—S. R. Gardiner, *Constitutional doctrines of the Puritan revolution*, introd., sect. 4 and pp. 314-324.—Cobbett's *Parliamentary history of England*, v. 3, pp. 1417-1426.

The merits of Cromwell's rule have been the subject of much controversy, but on the whole modern historians are inclined to agree with J. R. Green when he says, "if pardon, indeed, could ever be won for a tyranny, the wisdom and grandeur with which he used the power he usurped would win pardon for the Protector." His measures were often harsh, and fell heavily on the royalists, especially in matters of taxation. Anglican worship was forbidden, but private meetings did not seem to be interfered with. The Jews who had not been permitted to enter England from the time of Edward I were readmitted (see JEWS: England: 1655), and Catholics were given partial protection. Scores of ordinances regulating matters concerning the police, public amusements, finances, roads, the conditions of prisons, and particularly the Court of Chancery showed Cromwell's passion for a well-organized and just government. Peace and order were of paramount importance to the life of the protectorate, and revolts were put down with severity. (See LEVELLERS.) After the dissolution of Parliament in 1654 and the royalist uprisings in Devon, Dorset and the Welsh Marches, Cromwell divided the country into ten military provinces, each with a major-general at its head, armed with a certain degree of autocratic power. "His [Cromwell's] wish seems to have been to govern constitutionally, and to substitute the empire of the laws for that of the sword. But he soon found that, hated as he was, both by Royalists and Presbyterians, he could be safe only by being absolute. . . . Those soldiers who would not suffer him to assume the kingly title, stood by him when he ventured on acts of power as high as any English king has ever attempted. The government, therefore, though in form a republic, was in truth a despotism, moderated only by the wisdom, the sobriety and the magnanimity of the despot."—Lord Macaulay, *History of England*, ch. 1.—"I cannot . . . agree in the praises which have been showered upon Cromwell for the just administration of the laws under his dominion. That, between party and party, the ordinary civil rights of men were fairly dealt with, is no extraordinary praise; and it may be admitted that he filled the benches of justice with able lawyers, though not so considerable as those of the reign of Charles II.; but it is manifest that, so far as his own authority was concerned, no hereditary despot, proud in the crimes of a hundred ancestors, could more have spurned at every limitation than this soldier of a commonwealth."—H. Hallam, *Constitutional history of England*, ch. 10, pt. 2.—See also PRINTING AND THE PRESS: 1654-1664.—"Cromwell had that mark of greatness in a ruler that he was well served. No

prince had ever abler or more faithful agents in arms, diplomacy, administration. Blake, Monk, Lockhart, Thurloe are conspicuous names in a list that might easily be made longer. Familiars Cromwell had none. The sage and indefatigable Thurloe, who more closely than any of the others resembled the deep-browed counselors that stood around the throne of Elizabeth, came nearest to the heart of the Protector's deliberations. . . . Oliver was not of the evil Napoleonic build. He was liable to bursts of passion, he had his moods, he was unwisely and fatally impatient of Parliamentary discussion; but nobody knew better the value of consultation in good faith, of serious conference among men sincerely bent on common aims, of the arts of honest persuasion as distinguished from cajolery. Of that pettish egotism which regards a step taken on advice as humiliation, he had not a trace; he was a man."—J. Morley, *Oliver Cromwell*, pp. 431, 432.

1655.—Cromwell's intervention in behalf of Waldenses. See WALDENSES: 1655.

1655-1658.—War with Spain, alliance with France.—Acquisition of Dunkirk.—"Though the German war [the Thirty Years' War,] concluded in 1648 by the Treaty of Westphalia] was over, the struggle between France and Spain was continued with great animosity, each country striving to crush her rival and become the first power in Europe. Both Louis XIV. and Philip IV. of Spain were bidding for the protector's support. Spain offered the possession of Calais, when taken from France; France the possession of Dunkirk when taken from Spain (1655). Cromwell determined to ally himself with France against Spain. . . . It was in the West Indies that the obstructive policy of Spain came most into collision with the interests of England. Her kings based their claims to the possession of two continents on the bull of Pope Alexander VI., who in 1493 had granted them all lands they should discover from pole to pole, at the distance of 100 leagues west from the Azores and Cape Verd Islands. On the strength of this bull they held that the discovery of an island gave them the right to the group, the discovery of a headland the right to a continent. Though this monstrous claim had quite broken down as far as the North American continent was concerned, the Spaniards, still recognizing 'no peace beyond the line,' endeavoured to shut all Europeans but themselves out of any share in the trade or colonization of at least the southern half of the New World. . . . While war was now proclaimed with Spain, a treaty of peace was signed between France and England, Louis XIV. agreeing to banish Charles Stuart and his brothers from French territory (Oct. 24, 1655). This treaty was afterwards changed into a league, offensive and defensive (March 23, 1657), Cromwell undertaking to assist Louis with 6,000 men in besieging Gravelines, Mardyke, and Dunkirk, on condition of receiving the two latter towns when reduced by the allied armies. By the occupation of these towns Cromwell intended to control the trade of the Channel, to hold the Dutch in check, who were then but unwilling friends, and to lessen the danger of invasion from any union of Royalists and Spaniards. The war opened in the year 1657 [Jamaica, however, had already been taken from the Spaniards and St. Domingo attacked], with another triumph by sea." This was Blake's last exploit. He attacked and destroyed the Spanish hullion fleet, from Mexico, in the harbor of Santa Cruz, island of Teneriffe, and silenced the forts which guarded it. The great sea-captain died on his voyage home, after striking this blow. The next

spring "the siege of Dunkirk was commenced (May, 1658). The Spaniards tried to relieve the town, but were completely defeated in an engagement called the Battle of the Dunes from the sand hills among which it was fought; the defeat was mainly owing to the courage and discipline of Oliver's troops, who won for themselves the name of 'the Immortal Six Thousand.' . . . Ten days after the battle Dunkirk surrendered, and the French had no choice but to give over to the English ambassador the keys of a town they thought 'un si bon morceau' (June 25)."—B. M. 1658-1660.—Fall of the Protectorate and restoration of the Stuarts.—King Charles II and the Declaration of Breda.—When Oliver Cromwell died, on September 3, 1658—the anniversary of his victories at Dunbar, and at Worcester—his eldest son Richard, whom he had nominated, it was said, on his death-bed, was proclaimed Protector, and succeeded him "as quietly as any King had ever been succeeded by any Prince of Wales. During five months, the administration of Richard Cromwell went on so tranquilly and regularly that all Europe believed him to be firmly established on the chair of state." But Richard had none of his father's genius or personal power, and the discontents and jealousies which the former had rigorously suppressed soon tossed the latter from his unstable throne by their fierce upheaval. He summoned a new Parliament (January 27, 1659), which recognized and confirmed his authority, though containing a powerful opposition, of uncompromising republicans and secret royalists. But the army, which the great Protector had tamed to submissive obedience, was now stirred into mischievous action once more as a political power in the state, subservient to the ambition of Fleetwood and other commanders. Richard Cromwell could not make himself the master of his father's battalions. "He was used by the army as an instrument for the purpose of dissolving the Parliament [April 22], and was then contemptuously thrown aside. The officers gratified their republican allies by declaring that the expulsion of the Rump had been illegal, and by inviting that assembly to resume its functions. The old Speaker and a quorum of the old members came together [May 9] and were proclaimed, amidst the scarcely stifled derision and execration of the whole nation, the supreme power in the Commonwealth. It was at the same time expressly declared that there should be no first magistrate and no House of Lords. But this state of things could not last. On the day on which the Long Parliament revived, revived also its old quarrel with the army. Again the Rump forgot that it owed its existence to the pleasure of the soldiers, and began to treat them as subjects. Again the doors of the House of Commons were closed by military violence [October 13]; and a provisional government, named by the officers, assumed the direction of affairs." The troops stationed in Scotland, under Monk (George Monk, duke of Alhmarle), had not been consulted, however, in these transactions, and were evidently out of sympathy with their comrades in England. Monk, who had never meddled with politics before, was now in-

duced to interfere. He refused to acknowledge the military provisional government, declared himself the champion of the civil power, and marched into England at the head of his 7,000 veterans. His movement was everywhere welcomed and encouraged by popular demonstrations of delight. The army in England lost courage and lost unity, awed and paralyzed by the public feeling at last set free. Monk reached London without opposition, and was the recognized master of the realm. Nobody knew his intentions—himself, perhaps, as little as any—and it was not until after a period of protracted suspense that he declared himself for the convening of a new and free Parliament in the place of the Rump—which had again resumed its sittings—for the settlement of the state. Monk allowed the members who had been excluded by Pride's Purge to be readmitted and thus restored the Long Parliament, which dissolved itself March 26, 1660 after an intermittent term of nearly twenty years. "The result of the elections was such as might have been expected from the temper of the nation. The new House of Commons consisted, with few exceptions, of persons friendly to the royal family. The Presbyterians formed the majority. . . . The new Parliament, which, having been called without the royal writ, is more accurately described as a Convention, met at Westminster [April 26, 1660]. The Lords repaired to the hall, from which they had, during more than eleven years, been excluded by force. Both Houses instantly invited the King to return to his country. He was proclaimed with pomp never before known. A gallant fleet convoyed him from Holland to the coast of Kent. When he landed [May 25, 1660], the cliffs of Dover were covered by thousands of gazers, among whom scarcely one could be found who was not weeping with delight. The journey to London was a continued triumph."—Lord Macaulay, *History of England*, ch. 1.—The only guarantee with which the careless nation took back their ejected kings of the faithless race of Stuarts was embodied in a declaration which Charles sent over from "Our Court at Breda" in April, and which was read in Parliament with an effusive display of respect and thankfulness. In this declaration from Breda, "a general amnesty and liberty of conscience were promised, with such exceptions and limitations only as the Parliament should think fit to make. [By a compromise between Lords and Commons only thirteen regicides were executed and twenty-five were imprisoned for life. Among those sentenced to death was Sir Harry Vane (executed 1662), whose case is a glaring example of the political intolerance of the time. He was imprisoned under the Cromwellian regime for an attack on the protectorate, and was executed under the Restoration as a regicide, although he had had no part in putting Charles I to death.] All delicate questions, among others the proprietorship of confiscated estates, were in like manner referred to the decision of Parliament, thus leaving the King his liberty while diminishing his responsibility; and though fully asserting the ancient rights of the Crown, he announced his intention to associate the two Houses with himself in all great affairs of State."—F. 1661.—Savoy conference.—"The Restoration had been the joint work of Episcopalian and Presbyterian; would it be possible to reconcile them on this question too [i. e., of the settlement of Church government]? The Presbyterian indeed was willing enough for a compromise, for he had an uneasy feeling that the ground was slipping from beneath his feet. Of Charles's intentions he was still in doubt; but he knew that Clarendon [Edward Hyde, earl of Clarendon, a supporter of Charles I, was successively chancellor of the exchequer and lord chancellor after the Restoration,] was the sworn friend of the Church. The Churchman on the other hand was eagerly expecting the approaching hour of triumph. It soon appeared that as King and Parliament, so King and Church were inseparable in the English mind; that indeed the return of the King was the restoration of the Church even more than it was the restoration of Parliament. In the face of the present Presbyterian majority however it was necessary to temporise. The former incumbents of Church livings were restored, and the Commons took the Communion according to the rites of the Church; but in other respects the Presbyterians were carefully kept in play; Charles taking his part in the elaborate farce by appointing ten of their leading ministers royal chaplains, and even attending their sermons." In October, 1660, Charles "took the matter more completely into his own hands by issuing a Declaration. Refusing, on the ground of constraint, to admit the validity of the oaths imposed upon him in Scotland, by which he was bound to uphold the Covenant, and not concealing his preference for the Anglican Church as 'the best fence God hath yet raised against popery in the world,' he asserted that nevertheless, to his own knowledge, the Presbyterians were not enemies to Episcopacy or a set liturgy, and were opposed to the alienation of Church revenues. The Declaration then went on to limit the power of bishops and archdeacons in a degree sufficient to satisfy many of the leading Presbyterians, one of whom, Reynolds, accepted a bishopric. Charles then proposed to choose an equal number of learned divines of both persuasions to discuss alterations in the liturgy; meanwhile no one was to be troubled regarding differences of practice. The majority in the Commons at first welcomed the Declaration, . . . and a bill was accordingly introduced by Sir Matthew Hale to turn the Declaration into a law. But Clarendon at any rate had no intention of thus hauling the Church of her revenge. Anticipating Hale's action, he had in the interval been busy in securing a majority against any compromise. The Declaration had done its work in gaining time, and when the bill was brought in it was rejected by 183 to 157 votes. Parliament was at once (December 24) dissolved. The way was now open for the riot of the Anglican triumph. Even before the new House met the mask was thrown off by the issuing of an order to the justices to restore the full liturgy. The conference indeed took place in the Savoy Palace. It failed, like the Hampton Court Conference of James I., because it was intended to fail. Upon the two important points, the authority of bishops and the liturgy, the Anglicans would not give way an inch. Both parties informed the King that, anxious as they were for agreement, they saw no chance of it. This last attempt at union having fallen through, the Government had their hands free; and their intentions were speedily made

plain."—O. Airy, *English Restoration and Louis XIV*, ch. 7.

1662.—Sale of Dunkirk.—"Unable to confine himself within the narrow limits of his civil list, with his favorites and mistresses, he [Charles II] would have sought even in the infernal regions the gold which his subjects measured out to him with too parsimonious a hand. . . . [He] proposed to sell to France Dunkirk and its dependencies, which, he said, cost him too much to keep up. He asked twelve millions francs; he fell at last to five millions, and the treaty was signed Oct. 27, 1662. It was time; the Lord Mayor and Aldermen of London, informed of the negotiation, had determined to offer Charles II. whatever he wished in behalf of their city not to alienate Dunkirk. Charles dared not retract his word, which would have been, as D'Estrades told him, to break forever with Louis XIV., and on the 2d of December Louis joyfully made his entry into his good city, reconquered by gold instead of the sword."—H. Martin, *History of France: Age of Louis XIV* (translated by M. L. Booth), v. 1, ch. 4.

1662-1665.—Act of Uniformity and persecution of the Nonconformists.—The failure of the Savoy Conference "was the conclusion which had been expected and desired. Charles had already summoned the Convocation, and to that assembly was assigned the task which had failed in the hands of the commissioners at the Savoy. . . . The act of uniformity followed [May 19, 1662], by which it was enacted that the revised Book of Common Prayer, and of Ordination of Ministers, and no other, should be used in all places of public worship; and that all beneficed clergymen should read the service from it within a given time, and, at the close, profess in a set form of words, their 'unfeigned assent and consent to everything contained and prescribed in it.' . . . The act of uniformity may have been necessary for the restoration of the church to its former discipline and doctrine; but if such was the intention of those who framed the declaration from Breda, they were guilty of infidelity to the king and of fraud to the people, by putting into his mouth language which, with the aid of equivocation, they might explain away, and by raising in them expectations which it was never meant to fulfil."—J. Lingard, *History of England*, v. 11, ch. 4.—"This rigorous act when it passed, gave the ministers, who could not conform, no longer time than till Bartholomew-day, August 24th, 1662, when they were all cast out. . . . This was an action without a precedent: The like to this the Reformed church, nay the Christian world, never saw before. Historians relate, with tragical exclamations, that between three and four score bishops were driven at once into the island of Sardinia by the African vandals; that 200 ministers were banished by Ferdinand, king of Bohemia; and that great havock was, a few years after, made among the ministers of Germany by the Imperial Interim. But these all together fell short of the number ejected by the act of uniformity, which was not less than 2,000. The succeeding hardships of the latter were also by far the greatest. They were not only silenced, but had no room left for any sort of usefulness, and were in a manner buried alive. Far greater tenderness was used towards the Popish clergy ejected at the Reformation. They were suffered to live quietly; but these were oppressed to the utmost, and that even by their brethren who professed the same faith themselves: not only excluded preferments,

but turned out into the wide world without any visible way of subsistence. Not so much as a poor vicarage, not an obscure chapel, not a school was left them. Nay, though they offered, as some of them did, to preach gratis, it must not be allowed them. . . . The ejected ministers continued for ten years in a state of silence and obscurity. . . . The act of uniformity took place August the 24th, 1662. On the 26th of December following, the king published a Declaration, expressing his purpose to grant some indulgence or liberty in religion. Some of the Nonconformists were hereupon much encouraged, and waiting privately on the king, had their hopes confirmed, and would have persuaded their brethren to have thanked him for his declaration; but they refused, lest they should make way for the toleration of the Papists, whom they understood the king intended to include in it. . . . Instead of indulgence or comprehension, on the 30th of June, an act against private meetings, called the Conventicle Act, passed the House of Commons, and soon after was made a law, viz.: 'That every person above sixteen years of age, present at any meeting, under pretence of any exercise of religion, in other manner than is the practice of the church of England, where there are five persons more than the household, shall for the first offence, by a justice of peace be recorded, and sent to gaol three months, till he pay £5, and for the second offence six months, till he pay £10, and the third time being convicted by a jury, shall be banished to some of the American plantations, excepting New England or Virginia.' . . . In the year 1665 the plague broke out"—and the ejected ministers boldly took possession for the time of the deserted London pulpits. "While God was consuming the people by this judgment, and the Nonconformists were labouring to save their souls, the parliament, which sat at Oxford, was busy in making an act [called the Five Mile Act] to render their case incomparably harder than it was before, by putting upon them a certain oath ['that it is not lawful, upon any pretence whatsoever, to take arms against the king,' &c.], which, if they refused, they must not come (unless upon the road) within five miles of any city or corporation, any place that sent burgesses to parliament, any place where they had been ministers, or had preached after the act of oblivion. . . . When this act came out, those ministers who had any maintenance of their own, found out some place of residence in obscure villages, or market-towns, that were not corporations."—E. Calamy, *Nonconformist's memorial*, introd., sect. 4-6.—In December, 1661, the Corporation Act was passed prohibiting any man from holding office in a corporate town unless he renounced the covenant, declared it unlawful to bear arms against the king, and was willing to take the sacrament according to the Church of England. This Act, the Act of Uniformity, Conventicle Act and Five Mile Act were called the "Clarendon Code."

1668-1670.—Secret Catholicism and the perfidy of the king—Begging of bribes from Louis XIV.—Betrayal of Holland.—Breaking of the Triple

**Alliance.**—In 1668, the royal treasury being greatly embarrassed by the king's extravagances, an attempt was made "to reduce the annual expenditure below the amount of the royal income. . . . But this plan of economy accorded not with the royal disposition, nor did it offer any prospect of extinguishing the debt. Charles remembered the promise of pecuniary assistance from France in the beginning of his reign; and, though his previous efforts to cultivate the friendship of Louis had been defeated by an unpropitious course of events, he resolved to renew the experiment. Immediately after the peace of Aix-la-Chapelle, [1668] Buckingham [George Villiers, second duke of Buckingham] opened a negotiation with the duchess of Orleans, the king's sister, in France, and Charles, in his conversations with the French resident, apologised for his conduct in forming the triple alliance, and openly expressed his wish to enter into a closer union, a more intimate friendship, with Louis. . . . About the end of the year the communications between the two princes became more open and confidential; French money, or the promise of French money, was received by the English ministers; the negotiation began to assume a more regular form, and the most solemn assurances of secrecy were given, that their real object might be withheld from the knowledge, or even the suspicion, of the States. In this stage of the proceedings Charles received an important communication from his brother James. Hitherto that prince had been an obedient and zealous son of the Church of England; but Dr. Heylin's History of the Reformation had shaken his religious credulity, and the result of the inquiry was a conviction that it became his duty to reconcile himself with the Church of Rome. He was not blind to the dangers to which such a change would expose him; and he therefore purposed to continue outwardly in communion with the established church, while he attended at the Catholic service in private. But, to his surprise, he learned from Symonds, a Jesuit missionary, that no dispensation could authorise such duplicity of conduct: a similar answer was returned to the same question from the pope; and James immediately took his resolution. He communicated to the king in private that he was determined to embrace the Catholic faith; and Charles without hesitation replied that he was of the same mind, and would consult with the duke on the subject in the presence of lord Arundell, lord Arlington, and Arlington's confidential friend, sir Thomas Clifford. . . . The meeting was held in the duke's closet. Charles, with tears in his eyes, lamented the hardship of being compelled to profess a religion which he did not approve, declared his determination to emancipate himself from this restraint, and requested the opinion of those present, as to the most eligible means of effecting his purpose with safety and success. They advised him to communicate his intention to Louis, and to solicit the powerful aid of that monarch. Here occurs a very interesting question,—was Charles sincere or not? . . . He was the most accomplished dissembler in his dominions; nor will it be any injustice to his character to suspect that his real object was to deceive both his brother and the king of France. . . . Now, however, the secret negotiation proceeded with greater activity; and lord Arundell, accompanied by Sir Richard Bellings, hastened to the French court. He solicited from Louis the present of a considerable sum, to enable the king to suppress any insurrection which might be provoked by his intended conversion, and offered the co-operation of England in the projected invasion of Holland, on the condition of an annual subsidy during the continuation of hostilities." On

the advice of Louis, Charles postponed, for the time being, his intention to enter publicly the Romish church and thus provoke a national revolt; but his proposals were otherwise accepted, and a secret treaty was concluded at Dover, on May 22, 1670, through the agency of Charles' sister, Henrietta, the duchess of Orleans, who came over for that purpose. "Of this treaty, . . . though much was afterwards said, little was certainly known. All the parties concerned, both the sovereigns and the negotiators, observed an impenetrable secrecy. What became of the copy transmitted to France is unknown; its counterpart was confided to the custody of sir Thomas Clifford. . . . The principal articles were: 1. That the king of England should publicly profess himself a Catholic at such time as should appear to him most expedient, and subsequently to that profession should join with Louis in a war against the Dutch republic at such time as the most Christian king should judge proper. 2. That to enable the king of England to suppress any insurrection which might be occasioned by his conversion, the king of France should grant him an aid of 2,000,000 of livres, by two payments, one at the expiration of three months, the other of six months, after the ratification of the treaty, and should also assist him with an armed force of 6,000 men, if . . . necessary. . . . 4. That if, eventually, any new rights on the Spanish monarchy should accrue to the king of France, the king of England should aid him with all his power in the acquisition of those rights. 5. That both princes should make war on the united provinces, and that neither should conclude peace or truce with them without the advice and consent of his ally."—J. Lingard, *History of England*, v. 11, ch. 6.

1671-1673.—**The Cabal.**—In 1667 Clarendon was impeached by Parliament and fled to the Continent. Charles now attempted to establish himself as absolute monarch and until 1673 (Test Act) he ruled with a group of intimate advisors known as the "Cabal." "It was remarked that the committee of council, established for foreign affairs, was entirely changed; and that Prince Rupert, the Duke of Ormond, Secretary Trevor, and Lord-keeper Bridgeman, men in whose honour the nation had great confidence, were never called to any deliberations. The whole secret was intrusted to five persons, Clifford, Ashley [afterwards earl of Shaftesbury], Buckingham, Arlington and Lauderdale. These men were known by the appellation of the Cabal, a word which the initial letters of their names happened to compose. Never was there a more dangerous ministry in England, nor one more noted for pernicious counsels."—D. Hume, *History of England*, v. 6, ch. 65.—See also CABINET: English: Origin of term.

1672-1673.—**Declaration of Indulgence and the Test Act.**—"It would have been impossible to obtain the consent of the party in the Royal council which represented the old Presbyterians, of Ashley or Lauderdale or the Duke of Buckingham, to the Treaty of Dover. But it was possible to trick them into approval of a war with Holland by playing on their desire for a toleration of the Nonconformists. The announcement of the King's Catholicism was therefore deferred. . . . His ministers outwitted, it only remained for Charles to outwit his Parliament. A large subsidy was demanded for the fleet, under the pretext of upholding the Triple Alliance, and the subsidy was no sooner granted than the two

Houses were adjourned. Fresh supplies were obtained by closing the Exchequer, and suspending—under Clifford's advice—the payment of either principal or interest on loans advanced to the public treasury. The measure spread bankruptcy among half the goldsmiths of London; but it was followed in 1672 by one yet more startling—the Declaration of Indulgence. By virtue of his ecclesiastical powers, the King ordered 'that all manner of penal laws on matters ecclesiastical against whatever sort of Nonconformists or recusants should be from that day suspended,' and gave liberty of public worship to all dissidents save Catholics, who were allowed to practice their religion only in private houses. . . . The Declaration of Indulgence was at once followed by a declaration of war against the Dutch on the part of both England and France. . . . It was necessary in 1673 to appeal to the Commons [for war supplies], but the Commons met in a mood of angry distrust. . . . There was a general suspicion that a plot was on foot for the establishment of Catholicism and despotism, and that the war and the Indulgence were parts of the plot. The change of temper in the Commons was marked by the appearance of what was from that time called the Country party, with Lords Russell and Cavendish and Sir William Coventry at its head—a party which sympathized with the Non-conformists, but looked on it as its first duty to guard against the designs of the Court. As to the Declaration of Indulgence, however, all parties in the House were at one. The Commons resolved 'that penal statutes in matters ecclesiastical cannot be suspended but by consent of Parliament,' and refused supplies till the Declaration was recalled. The King yielded; but the Declaration was no sooner recalled than a Test Act, was passed through both Houses without opposition, which required from every one in the civil and military employment of the State the oaths of allegiance and supremacy, a declaration against transubstantiation, and a reception of the sacrament according to the rites of the Church of England. Clifford at once counseled resistance, and Buckingham talked flightily about bringing the army to London, but Arlington saw that all hope of carrying the 'great plan' through was at an end, and pressed Charles to yield. . . . Charles sullenly gave way. No measure has ever brought about more startling results. The Duke of York owned himself a Catholic, and resigned his office as Lord High Admiral. . . . Clifford, too, . . . owned to being a Catholic, and . . . laid down his staff of office. Their resignation was followed by that of hundreds of others in the army and the civil service of the Crown. . . . The resignations were held to have proved the existence of the dangers which the Test Act had been passed to meet. From this moment all trust in Charles was at an end."—J. R. Green, *Short history of England*, ch. 9, sect. 3.—"It is very true that the [Test Act] pointed only at Catholics, that it really proposed an anti-Popish test, yet the construction of it, although it did not exclude from office such Dissenters as could occasionally conform, did effectually exclude all who scrupled to do so. Aimed at the Romanists, it struck the Presbyterians. It is clear that, had the Nonconformists and the Catholics joined their forces with those of the Court, in opposing the measure, they might have defeated it; but the first of these classes for the present submitted to the inconvenience, from the horror which they entertained of Popery, hoping, at the same time, that some relief would be afforded for this personal sacrifice in the cause of a common Protestantism. Thus the passing of an Act, which, until a late period, inflicted a social wrong upon

two large sections of the community, is to be attributed to the course pursued by the very parties whose successors became the sufferers."—J. Stoughton, *History of religion in England*, v. 3, ch. 11.

1672-1674.—Alliance with Louis XIV of France in war with Holland. See NETHERLANDS: 1672-1674.

1674.—Peace with the Dutch.—Treaty of Westminster. See NETHERLANDS: 1674.

1678-1679.—So-called Popish Plot.—The English people were rapidly becoming dissatisfied with the conduct of their king, and began to fear that French arms might be called in to overwhelm their newly-won liberties. At this critical juncture it was asserted that the Roman Catholics had leagued together to murder the king, to place the duke of York, who was an uncompromising Catholic, on the throne, and to suppress Protestantism. The originator of this falsehood was Titus Oates, a degraded character, once an Anglican clergyman, who had studied for a time at the Jesuit colleges at Valladolid, Spain, and St. Omer's, France, but was expelled from both institutions for his scandalous conduct. With the Gunpowder plot fresh in memory, however, people took this story seriously. Men went about armed, and there was increasing excitement. A new Test Act was passed whereby Catholics were excluded from both houses of Parliament. That body next proceeded to impeach Danby (Sir Thomas Osborne, Lord Treasurer, 1673, created earl of Danby, 1674), the king's minister, on the grounds of treasonable intercourse with France. To save both himself and his minister, Charles dissolved the Cavalier Parliament, which had sat for seventeen years (1661-1678). The new Parliament, however, showed a decided gain for the opposition. At this time Charles tried an interesting experiment in government. A new privy council was appointed of which fifteen members mere ministers to the crown, and the other fifteen influential lords and commoners; as this body was too large for matters requiring secrecy small committees were formed for the transaction of all important business.

1679 (May).—Habeas Corpus Act.—The foundation of freedom from arbitrary imprisonment laid by the Great Charter was renewed and strengthened during the reigns of the Stuarts. "The right of an English subject to a writ of habeas corpus, and to a release from imprisonment unless sufficient cause be shown for his detention, was fully canvassed in the first years of the reign of Charles I. . . . The parliament endeavoured to prevent such arbitrary imprisonment by passing the 'Petition of Right,' which enacted that no freeman, in any such manner . . . should be imprisoned or detained. Even this act was found unavailing against the malevolent interpretations put by the judges; hence the 16 Charles I., c. 10, was passed, which enacts, that when any person is restrained of his liberty by the king in person, or by the Privy Council, or any member thereof, he shall, on demand of his counsel, have a writ of habeas corpus, and, three days after the writ, shall be brought before the court to determine whether there is ground for further imprisonment, for bail, or for his release. Notwithstanding these provisions, the immunity of English subjects from arbitrary detention was not ultimately established in full practical efficiency until the passing of the statute of Charles II., commonly called the 'Habeas Corpus Act.'"—E. Fischel, *English constitution*, bk. 1, ch. 9.—This act was largely due to the efforts of Shaftesbury after whom it is some-

times called, and although it added no new right to the Petition of 1628 it improved the means of executing that right. Great delays had been used by jailors in making returns of writs of habeas corpus, prisoners had been shifted about from one place to another, and it was not clear what division of the King's Court could issue writs or whether more than one judge was required. In spite of the advance made by the Act of 1679, it contained obvious defects which went unremedied until 1816.—For the text of this document, see HABEAS CORPUS.

1679-1681.—Exclusion Bill.—“Though the duke of York [James, brother of Charles II] was not charged with participation in the darkest schemes of the popish conspirators, it was evident that his succession was the great aim of their endeavours, and evident also that he had been engaged in the more real and undeniable intrigues of Coleman [Secretary of the duke of York]. His accession to the throne, long viewed with just apprehension, now seemed to threaten such perils to every part of the constitution as ought not supinely to be waited for, if any means could be devised to obviate them. This gave rise to the bold measure of the exclusion bill, too bold, indeed, for the spirit of the country, and the rock on which English liberty was nearly shipwrecked. In the long parliament, full as it was of pensioners and creatures of court influence, nothing so vigorous would have been successful. . . . But the zeal they showed against Danby induced the king to put an end [January 24, 1679] to this parliament of seventeen years' duration; an event long ardently desired by the popular party, who foresaw their ascendancy in the new elections. The next house of commons accordingly came together with an ardour not yet quenched by corruption; and after reviving the impeachments commenced by their predecessors, and carrying a measure long in agitation, a test which shut the catholic peers out of parliament, went upon the exclusion bill [the second reading of which was carried, May 21, 1679, by 207 to 128]. Their dissolution put a stop to this; and in the next parliament the lords rejected it [after the commons had passed the bill, without a division, October, 1680]. . . . The bill of exclusion . . . provided that the imperial crown of England should descend to and be enjoyed by such person or persons successively during the life of the duke of York as would have inherited or enjoyed the same in case he were naturally dead. . . . But a large part of the opposition had unfortunately other objects in view.” Under the contaminating influence of the earl of Shaftesbury, “they broke away more and more from the line of national opinion, till a fatal reaction involved themselves in ruin, and exposed the cause of public liberty to its most imminent peril. The countenance and support of Shaftesbury brought forward that unconstitutional and most impolitic scheme of the duke of Monmouth's succession. [James, duke of Monmouth, was the acknowledged natural son of king Charles, by Lucy Walters, his mistress while in exile at The Hague.] There could hardly be a greater insult to a nation used to respect its hereditary line of kings, than to set up the bastard of a prostitute, without the least pretence of personal excellence or public services, against a princess [Mary, daughter of James by Anne Hyde his first wife] of known virtue and attachment to the protestant religion. And the effrontery of this attempt was aggravated by the libels eagerly circulated to dupe the credulous populace into a belief of Monmouth's legitimacy.”

—H. Hallam, *Constitutional history of England*, ch. 12.

1680.—Whigs and Tories acquire their respective names.—Out of this tempest over the Exclusion bill two great political parties were formed. Many members of Parliament dreading a renewal of civil war were ready to accept a Roman Catholic monarch. The conservative temper of their minds made them dislike the Puritans as much as they did the “papists,” and they saw no way to safeguard Church and State except through a hereditary monarchy. On the other hand several of the great nobles, among them Shaftesbury, were distrustful of the royal power and violent in their hatred of Roman Catholicism. Others belonged to the wealthy merchant class who supported Parliament for the preservation of their economic interests. These latter became known as “Whigs” while their conservative opponents acquired the title of “Tories.” “Factions indeed were at this time [1680] extremely animated against each other. The very names by which each party denominated its antagonist discover the virulence and rancour which prevailed. For besides petitioner and abhorrer, appellations which were soon forgotten, this year is remarkable for being the epoch of the well-known epithets of Whig and Tory, by which, and sometimes without any material difference, this island has been so long divided. The court party reproached their antagonists with their affinity to the fanatical conventiclers in Scotland, who were known by the name of Whigs: the country party found a resemblance between the courtiers and the popish banditti in Ireland, to whom the appellation of Tory was affixed: and after this manner these foolish terms of reproach came into public and general use.”—D. Hume, *History of England*, v. 6, ch. 68.—“The definition of the nickname Tory, as it originally arose, is given in ‘A New Ballad’ (Narcissus Luttrell's Collection):—

The word Tory's of Irish Extraction,  
'Tis a Legacy that they have left here  
They came here in their brogues,  
And have acted like Rogues,  
In endeavouring to learn us to swear.”

—J. Grego, *History of parliamentary elections*, p. 36.—For the origin of the name of the Whig party, see WHIGS; RAPPAREES.

ALSO IN: G. W. Cooke, *History of party*, v. 1, ch. 2.—Lord Macaulay, *History of England*, ch. 2.

1681-1683.—Tory reaction and the downfall of the Whigs.—Rye-house plot.—“Shaftesbury's course rested wholly on the belief that the penury of the Treasury left Charles at his mercy, and that a refusal of supplies must wring from the King his assent to the exclusion. But the gold of France had freed the King from his thralldom. He had used the Parliament [of 1681] simply to exhibit himself as a sovereign whose patience and conciliatory temper was rewarded with insult and violence; and now that he saw his end accomplished, he suddenly dissolved the Houses in April, and appealed in a Royal declaration to the justice of the nation at large. The appeal was met by an almost universal burst of loyalty. The Church rallied to the King; his declaration was read from every pulpit; and the Universities solemnly decided that ‘no religion, no law, no fault, no forfeiture’ could avail to bar the sacred right of hereditary succes-

sion. . . . The Duke of York returned in triumph to St. James's. . . . Monmouth, who had resumed his progresses through the country as a means of checking the tide of reaction, was at once arrested. . . . Shaftesbury, alive to the new danger, plunged desperately into conspiracies with a handful of adventurers as desperate as himself, hid himself in the City, where he boasted that ten thousand 'brisk boys' were ready to appear at his call, and urged his friends to rise in arms. But their delays drove him to flight. . . . The flight of Shaftesbury proclaimed the triumph of the King. His wonderful sagacity had told him when the struggle was over and further resistance useless. But the Whig leaders, who had delayed to answer the Earl's call, still nursed projects of rising in arms, and the more desperate spirits who had clustered around him as he lay hidden in the City took refuge in plots of assassination, and in a plan for murdering Charles and his brother as they passed the Rye-house [a Hertfordshire farm house, so-called] on their road from London to Newmarket. Both the conspiracies were betrayed, and, though they were wholly distinct from one another, the cruel ingenuity of the Crown lawyers blended them into one. Lord Essex, the last of an ill-fated race, saved himself from a traitor's death by suicide in the Tower. Lord Russell, convicted on a charge of sharing in the Rye-house Plot, was beheaded in Lincoln Inn Fields. The same fate awaited Algernon Sidney. Monmouth fled in terror over sea, and his flight was followed by a series of prosecutions for sedition directed against his followers. In 1683 the Constitutional opposition which had held Charles so long in check lay crushed at his feet. . . . On the very day when the crowd around Russell's scaffold were dipping their handkerchiefs in his blood, as in the blood of a martyr, the University of Oxford solemnly declared that the doctrine of passive obedience, even to the worst of rulers, was a part of religion." During the brief remainder of his reign Charles was a prudently absolute monarch, governing without a Parliament, coolly ignoring the Triennial Act, and treating on occasions the Test Act, as well as other laws obnoxious to him, with contempt. He died unexpectedly, early in February, 1685, and his brother, the duke of York, succeeded to the throne, as James II, with no resistance, but with much feeling opposed to him.—J. R. Green, *Short history of England*, ch. 9, sect. 5-6.

ALSO IN: G. Roberts, *Life of Monmouth*, v. 1, ch. 8-10.—D. Hume, *History of England*, v. 6, ch. 68-69.—G. W. Cooke, *History of party*, v. 1, ch. 6-11.

#### 1685.—Accession of James II.

1685 (February).—New king proclaims his religion.—"The King [James II] early put the loyalty of his Protestant friends to the proof. While he was a subject, he had been in the habit of hearing mass with closed doors in a small oratory which had been fitted up for his wife [Mary of Modena, his second wife]. He now ordered the doors to be thrown open, in order that all who came to pay their duty to him might see the ceremony. When the host was elevated there was a strange confusion in the antechamber. The Roman Catholics fell on their knees: the Protestants hurried out of the room. Soon a new pulpit was erected in the palace, and, during Lent, a series of sermons was preached there by Popish divines."—Lord Macaulay, *History of England*, v. 2, ch. 4.

1685 (May-July).—Monmouth's rebellion.—"The Parliament which assembled . . . [in] May . . . was almost entirely Tory. The failure of the Rye-house Plot had produced a reaction, which for a time entirely annihilated the Whig influence. . . . The apparent triumph of the King and the Tory

party was completed by the disastrous failure of the insurrection planned by their adversaries. A knot of exiled malcontents, some Scotch, some English, had collected in Holland. Among them was Monmouth and the Earl of Argyle, son of that Marquis of Argyle who had taken so prominent a part on the Presbyterian side in the Scotch troubles of Charles I.'s reign. Monmouth had kept aloof from politics till, on the accession of James, he was induced to join the exiles at Amsterdam, whither Argyle, a strong Presbyterian, but a man of lofty and moderate views, also repaired. National jealousy prevented any union between the exiles, and two expeditions were determined on,—the one under Argyle, who hoped to find an army ready to his hand among his clansmen in the West of Scotland, the other under Monmouth in the West of England. Argyle's expedition set sail on the 2nd of May [1685]. . . . Argyle's invasion was ruined by the limited authority intrusted to him, and by the jealousy and insubordination of his fellow leaders. . . . His army disbanded. He was himself taken in Renfrewshire, and, after an exhibition of admirable constancy, was beheaded. . . . A week before the final dispersion of Argyle's troops, Monmouth had landed in England [at Lyme, June 11]. He was well received in the West. He had not been twenty-four hours in England before he found himself at the head of 1,500 men; but though popular among the common people, he received no support from the upper classes. Even the strongest Whigs disbelieved the story of his legitimacy, and thought his attempt ill-timed and fraught with danger. . . . Meanwhile Monmouth had advanced to Taunton, had been there received with enthusiasm, and, vainly thinking to attract the nobility, had assumed the title of King. Nor was his reception at Bridgewater less flattering. But difficulties already began to gather round him; he was in such want of arms, that, although rustic implements were converted into pikes, he was still obliged to send away many volunteers; the militia were closing in upon him in all directions; Bristol had been seized by the Duke of Beaufort, and the regular army under Feversham and Churchill were approaching." After feebly attempting several movements, against Bristol and into Wiltshire, Monmouth lost heart and fell back to Bridgewater. "The Royalist army was close behind him, and on the fifth of July encamped about three miles from Bridgewater, on the plain of Sedgemoor." Monmouth was advised to undertake a night surprise, and did so in the early morning of the 6th. "The night was not unfitting for such an enterprise, for the mist was so thick that at a few paces nothing could be seen. Three great ditches by which the moor was drained lay between the armies; of the third of these, strangely enough, Monmouth knew nothing." The unexpected discovery of this third ditch, known as "the Bussex Rhine," which his cavalry could not cross, and behind which the enemy rallied, was the ruin of the enterprise. "Monmouth saw that the day was lost, and with the love of life which was one of the characteristics of his soft nature, he turned and fled. Even after his flight the battle was kept up bravely. At length the arrival of the King's artillery put an end to any further struggle. The defeat was followed by all the terrible scenes which mark a suppressed insurrection. . . . Monmouth and Grey pursued their flight into the New Forest, and were there apprehended in the neighbourhood of Ringwood." Monmouth petitioned abjectly for his life, but in vain. He was executed on the 15th of July. "The failure of this insurrection was followed by the most terrible cruelties. Feversham returned to London, to be flattered by the

King and laughed at by the Court for his military exploits. He left Colonel Kirke in command at Bridgewater. This man had learned, as commander at Tangier, all the worst arts of cruel despotism. His soldiery in bitter pleasantries were called Kirke's 'Lambs,' from the emblem of their regiment. It is impossible to say how many suffered at the hands of this man and his brutal troops; 100 captives are said by some to have been put to death the week after the battle. But this military revenge did not satisfy the Court.—J. F. Bright, *History of England, period 2, pp. 764-768.*

ALSO IN: G. Roberts, *Life of Monmouth, v. 1-2, ch. 13-28.*

1685 (September).—Bloody Assizes.—“Large numbers of Monmouth's followers were hanged by the pursuing soldiers without form of law. Many were thrust into prison to await their trial. Jeffreys, the most insolent of the judges, was sent to hold, in the western counties, what will always be known as the Bloody Assizes. It is true that the law which he had to administer was cruel, but Jeffreys gained peculiar obliquely by delighting in its cruelty, and by sneering at its unhappy victims. At Winchester he condemned to death an old lady, Alice Lisle, who was guilty of hiding in her house two fugitives from vengeance. At Dorchester 74 persons were hanged. In Somersetshire no less than 233 were put to death. Jeffreys overwhelmed his victims with scornful mockery. One of them pleaded that he was a good Protestant: ‘Protestant?’ cried Jeffreys, ‘you mean Presbyterian; I’ll hold you a wager of it, I can smell a Presbyterian forty miles.’ Some one tried to move his compassion in favour of one of the accused. ‘My lord,’ he said, ‘this poor creature is on the parish.’ ‘Do not trouble yourselves,’ was the only answer given, ‘I will ease the parish of the burden,’ and he ordered the man to be hanged at once. The whole number of those who perished in the Bloody Assizes was 320, whilst 841 were transported to the West Indies to work as slaves under a broiling sun. James welcomed Jeffreys on his return, and made him Lord Chancellor as a reward for his achievements.”—S. R. Gardiner, *Student's history of England, pp. 637-638.*

1686.—Court of High Commission revived.—When Parliament met in November, 1685, James tried to force through three measures of importance to him in carrying out his arbitrary government: (1) the maintenance of a standing army of 20,000; (2) the repeal of the Test Act; (3) the repeal of the Habeas Corpus Act. The Houses stubbornly refused and the angry king prorogued them. Parliament did not meet again in his reign. “James conceived the design of employing his authority as head of the Church of England as a means of subjecting that church to his pleasure, if not of finally destroying it. It is hard to conceive how he could reconcile to his religion the exercise of supremacy in an heretical sect, and thus sanction by his example the usurpations of the Tudors on the rights of the Catholic Church. . . . He, indeed, considered the ecclesiastical supremacy as placed in his hands by Providence to enable him to betray the Protestant establishment. ‘God,’ said he to Barillon, ‘has permitted that all the laws made to

establish Protestantism now serve as a foundation for my measures to re-establish true religion, and give me a right to exercise a more extensive power than other Catholic princes possess in the ecclesiastical affairs of their dominions.’ He found legal advisers ready with paltry expedients for evading the two statutes of 1641 and 1660 [abolishing, and re-affirming the abolition of the Court of High Commission], under the futile pretext that they forbade only a court vested with such powers of corporal punishment as had been exercised by the old Court of High Commission; and in conformity to their pernicious counsel, he issued, in July, a commission to certain ministers, prelates, and judges, to act as a Court of Commissioners in Ecclesiastical Causes. The first purpose of this court was to enforce directions to preachers, issued by the King, enjoining them to abstain from preaching on controverted questions.”—J. Mackintosh, *History of the revolution in England, ch. 2.*

ALSO IN: D. Neal, *History of the Puritans, v. 5, ch. 3.*

1687.—Riddance of the Test Act by royal dispensing power.—“The abolition of the tests was a thing resolved upon in the catholic council, and for this a sanction of some kind or other was required, as they dared not yet proceed upon the royal will alone. Chance, or the machinations of the catholics, created an affair which brought the question of the tests under another form before the court of king's bench. This court had not the power to abolish the Test Act, but it might consider whether the king had the right of exempting particular subjects from the formalities. . . . The king . . . closeted himself with the judges one by one, dismissed some, and got those who replaced them, ‘ignorant men,’ says an historian, ‘and scandalously incompetent,’ to acknowledge his dispensing power. . . . The judges of the king's bench, after a trial, . . . declared, almost in the very language used by the crown counsel:—1. That the kings of England are sovereign princes; 2. That the laws of England are the king's laws; 3. That therefore it is an inseparable prerogative in the kings of England to dispense with penal laws in particular cases, and upon particular necessary reasons; 4. That of those reasons, and those necessities, the king himself is sole judge; and finally, which is consequent upon all, 5. That this is not a trust invested in, or granted to the king by the people, but the ancient remains of the sovereign power and prerogative of the kings of England, which never yet was taken from them, nor can be. The case thus decided, the king thought he might rely upon the respect always felt by the English people for the decisions of the higher courts, to exempt all his catholic subjects from the obligations of the test. And upon this, it became no longer a question merely of preserving in their commissions and offices those whose dismissal had been demanded by parliament. . . . To obtain or to retain certain employments, it was necessary to be of the same religion with the king. Papists replaced in the army and in the administration all those who had pronounced at all energetically for the maintenance of the tests. Abjurations, somewhat out of credit during the last session of parliament, again resumed favour.”—A. Carrel, *History of the counter-revolution in England, ch. 3.*

ALSO IN: J. Stoughton, *History of religion in England, v. 4, ch. 4.*

1687-1688.—Declarations of Indulgence.—Trial of the seven bishops.—“Under pretence of toleration for Dissenters, James endeavoured, under another form, to remove obstacles from Romanists. . . . He announced to the English Privy Council

his intention to prorogue Parliament, and to grant upon his own authority entire liberty of conscience to all his subjects. Accordingly on the 4th of April, [1687], he published his Indulgence, declaring his desire to see all his subjects become members of the Church of Rome, and his resolution (since that was impracticable) to protect them in the free exercise of their religion; also promising to protect the Established Church; then he annulled a number of Acts of Parliament, suspended all penal laws against Nonconformists, authorised Roman Catholics and Protestant Dissenters to perform worship publicly, and abrogated all Acts of Parliament imposing any religious test for civil or military offices. [So blind was James to the general discontent aroused by this act that he attempted to procure the election of a "packed" Parliament, but finding no one in town or county whom he could trust, he was forced to abandon his scheme, and rule without even the form of constitutional control.] . . . On the 27th of April, 1688, James issued a second Declaration of Indulgence for England . . . [and directed it] to be publicly read during divine service in all Churches and Chapels, by the officiating ministers, on two successive Sundays . . . and desired the Bishops to circulate this Declaration through their dioceses. Hitherto the Bishops and Clergy had held the doctrine of passive obedience to the sovereign, however bad in character or in his measures—now they were placed by the King himself in a dilemma. Here was a violation of existing law, and an intentional injury to their Church, if not a plan for the substitution of another. The Nonconformists, whom James pretended to serve, coincided with and supported the Church. A decided course must be taken. . . . A petition to the King was drawn up by the Archbishop of Canterbury in his own handwriting, disclaiming all disloyalty and all intolerance, . . . but stating that Parliament had decided that the King could not dispense with Statutes in matters ecclesiastical—that the Declaration was therefore illegal—and could not be solemnly published by the petitioners in the House of God and during divine service. This paper was signed by Sancroft, Archbishop of Canterbury, Lloyd, Bishop of St. Asaph, Turner of Ely, Lake of Chichester, Ken of Bath and Wells, White of Peterborough, and Trelawny of Bristol. On Friday evening the six Bishops who had signed were introduced by Sunderland to the King, who read the document and pronounced it libellous [and seditious and rebellious], and the Bishops retired. On Sunday, the 20th of May, the first day appointed, the Declaration was read in London only in four Churches out of one hundred. The Dissenters and Church Laymen sided with the Clergy. On the following Sunday the Declaration was treated in the same manner in London, and on Sunday, the 3d of June, was disregarded by Bishops and Clergy in all parts of England. James, by the advice of Jeffreys, ordered the Archbishop and Bishops to be indicted for a seditious libel. They were, on the 8th of June, conveyed to the Tower amidst the most enthusiastic demonstrations of respect and affection from all classes. The same night the Queen was said to have given birth to a son; but the national opinion was that some trick had been played. [This charge of trickery was baseless.] On the 20th of June the trial of the seven Bishops came on before the Court of King's Bench. . . . The Jury, who, after remaining together all night (one being stubborn) pronounced a verdict of not guilty on the morning of the 30th June, 1688."—W. H. Torriano, *William the Third*, ch. 2.—"The court met at nine o'clock. The nobility and gentry covered the benches, and an immense concourse of people filled the Hall, and

blocked up the adjoining streets. Sir Robert Langley, the foreman of the jury, being, according to established form, asked whether the accused were guilty or not guilty, pronounced the verdict, 'Not guilty.' No sooner were these words uttered than a loud huzza arose from the audience in the court. It was instantly echoed from without by a shout of joy, which sounded like a crack of the ancient and massy roof of Westminster Hall. It passed with electrical rapidity from voice to voice along the infinite multitude who waited in the streets. It reached the Temple in a few minutes. . . . 'The acclamations,' says Sir John Reresby, 'were a very rebellion in noise.' In no long time they ran to the camp at Hounslow, and were repeated with an ominous voice by the soldiers in the hearing of the King, who, on being told that they were for the acquittal of the bishops, said, with an ambiguity probably arising from confusion, 'So much the worse for them.'"—J. Mackintosh, *History of the revolution in England in 1688*, ch. 9.

1688 (July).—William of Orange and Mary the hope of the nation.—"The wiser among English statesmen had fixed their hopes steadily on the succession of Mary, the elder daughter and heiress of James. The tyranny of her father's reign made this succession the hope of the people at large. But to Europe the importance of the change, whenever it should come about, lay not so much in the succession of Mary as in the new power which such an event would give to her husband, William, Prince of Orange. We have come, in fact, to a moment when the struggle of England against the aggression of its King blends with the larger struggle of Europe against the aggression of Lewis XIV."—J. R. Green, *Short history of England*, ch. 9, sect. 7.—"William of Nassau, Prince of Orange, Stadtholder of the republic of the United Provinces, was, before the birth of the Prince of Wales, first prince of the blood royal of England [as son of Princess Mary, daughter of Charles I, and, therefore, nephew as well as son-in-law of James II]; and his consort, the Lady Mary, the eldest daughter of the King, was, at that period, presumptive heiress to the crown."—J. Mackintosh, *History of the revolution in England*, ch. 10.

1688 (July-November).—Invitation to William of Orange and his acceptance.—"In July, in almost exact coincidence of time with the Queen's accouchement, came the memorable trial of the Seven Bishops, which gave the first demonstration of the full force of that popular animosity which James's rule had provoked. Some months before, however, Edward Russell, nephew of the Earl of Bedford, and cousin of Algernon Sidney's fellow-victim, had sought the Hague with proposals to William [prince of Orange] to make an armed descent upon England, as vindicator of English liberties and the Protestant religion. William had cautiously required a signed invitation from at least a few representative statesmen before committing himself to such an enterprise, and on the day of the acquittal of the Seven Bishops a paper, signed in cipher by Lord Shrewsbury, Devonshire, Danby, and Lumley, by Compton, Bishop of Northampton, by Edward Russell, and by Henry Sidney, brother of Algernon [leaders of both parties], was conveyed by Admiral Herbert to the Hague. William was now furnished with the required security for English assistance in the projected undertaking, but the task before him was still one of extreme difficulty. . . . On the 10th of

October, matters now being ripe for such a step, William, in conjunction with some of his English advisers, put forth his famous declaration. Starting with a preamble to the effect that the observance of laws is necessary to the happiness of states, the instrument proceeds to enumerate fifteen particulars in which the laws of England had been set at naught. The most important of these were—(1) the exercise of the dispensing power; (2) the corruption, coercion, and packing of the judicial bench; (3) the violation of the test laws by the appointment of papists to offices (particularly judicial and military officers, and the administration of Ireland), and generally the arbitrary and illegal measures resorted to by James for the propagation of the Catholic religion; (4) the establishment and action of the Court of High Commission; (5) the infringement of some municipal charters, and the procuring of the surrender of others; (6) interference

as soon as the state of the nation should permit of it, send home his foreign forces. About a week after, on the 16th of October, all things being now in readiness, the Prince took solemn leave of the States-General. . . . On the 10th William and his armament set sail from Helvoetsluys, but was met on the following day by a violent storm which forced him to put back on the 21st. On the 1st of November the fleet put to sea a second time. . . . By noon of the 5th of November, the Prince's fleet was wafted safely into Torbay."—H. D. Traill, *William the Third*, ch. 3.—See also IRELAND: 1680.

1688 (November - December). — "Glorious

ARRIVAL OF WILLIAM OF ORANGE IN ENGLAND, NOVEMBER, 1688.

(After a contemporary copper plate by Romain de Hooghe)

with elections by turning out of all employment such as refused to vote as they were required; and (7) the grave suspicion which had arisen that the Prince of Wales was not born of the Queen, which as yet nothing had been done to remove. Having set forth these grievances, the Prince's manifesto went on to recite the close interest which he and his consort had in this matter as next in succession to the crown, and the earnest solicitations which had been made to him by many lords spiritual and temporal, and other English subjects of all ranks, to interpose, and concluded by affirming in a very distinct and solemn manner that the sole object of the expedition then preparing was to obtain the assembling of a free and lawful Parliament, to which the Prince pledged himself to refer all questions concerning the due execution of the laws, and the maintenance of the Protestant religion, and the conclusion of an agreement between the Church of England and the Dissenters, as also the inquiry into the birth of the 'pretended Prince of Wales'; and that this object being attained, the Prince would,

Revolution."—Ignominious flight of James.—When it was too late, James suddenly awoke to the dangers threatening him and tried to reverse his policy. He prepared to call Parliament, restored charters to towns, abolished the court of Ecclesiastical Commission and re-invested bishops and clergymen who had been forced out of their livings. But nothing could stop the slow shifting of the national allegiance to William. "Every day now brought with it new accessions to the standard of the prince, and tidings of movements in different parts of the kingdom in his favour; while James was as constantly reminded, by one desertion after another, that he lived in an atmosphere of treachery, with scarcely a man or woman about him to be trusted. The defection of the lords Churchill and Drumlaneric, and of the dukes of Grafton and Ormond, was followed by that of prince George and the princess Anne [daughter of James]. . . . So desperate had the affairs of James now become, that some of his advisers urged his leaving the kingdom, and negotiating with safety to his person

from a distance. . . . On the morning of the 9th of December, the queen and the infant prince of Wales were lodged on board a yacht at Gravesend, and commenced a safe voyage to Calais. . . . The arrest of the monarch at Feversham . . . was followed by an order of the privy council, commanding that his carriage and the royal guards should be sent to reconduct him to the capital. . . . After some consultation the king was informed that the public interests required his immediate withdrawal to some distance from Westminster, and Hampton Court was named. James expressed a preference for Rochester, and his wishes in that respect were complied with. The day on which the king withdrew to Rochester William took up his residence in St. James's. The king chose his retreat, deeming it probable that it might be expedient for him to make a second effort to reach the continent. . . . His guards left him so much at liberty, that no impediment to his departure was likely to arise; and on the last day of this memorable year—only a week after his removal from Whitehall, James embarked secretly at Rochester, and with a favourable breeze safely reached the French coast."—R. Vaughan, *History of England under the House of Stuart*, v. 2, pp. 914-918.—This deposition of James II and the seating of William and Mary on the throne of England by Act of Parliament is known as the "glorious revolution" of 1688.

1689 (January-February).—Settlement of the crown on William and Mary.—Declaration of Rights.—"The convention [called by William when he entered London] met on the 22nd of January. Their first care was to address the prince to take the administration of affairs and disposal of the revenue into his hands, in order to give a kind of parliamentary sanction to the power he already exercised. On the 28th of January the commons, after a debate in which the friends of the late king made but a faint opposition, came to their great vote: That king James II., having endeavoured to subvert the constitution of this kingdom, by breaking the original contract between king and people, and by the advice of Jesuits and other wicked persons having violated the fundamental laws, and having withdrawn himself out of the kingdom, has abdicated the government, and that the throne is thereby vacant. They resolved unanimously the next day, That it hath been found by experience inconsistent with the safety and welfare of this protestant kingdom to be governed by a popish prince. This vote was a remarkable triumph of the whig party, who had contended for the exclusion bill. . . . The lords agreed with equal unanimity to this vote; which, though it was expressed only as an abstract proposition, led by a practical inference to the whole change that the whigs had in view. But upon the former resolution several important divisions took place." The lords were unwilling to commit themselves to the two propositions, that James had "abdicated" the government by his desertion of it, and that the throne had thereby become "vacant." They yielded at length, however, and adopted the resolution as the commons had passed it. They "followed this up by a resolution, that the prince and princess of Orange shall be declared king and queen of England, and all the dominions thereunto belonging. But the commons, with a noble patriotism, delayed to concur in this hasty settlement of the crown, till they should have completed the declara-

tion of those fundamental rights and liberties for the sake of which alone they had gone forward with this great revolution. That declaration, being at once an exposition of the misgovernment which had compelled them to dethrone the late king, and of the conditions upon which they elected his successors, was incorporated in the final resolution to which both houses came on the 13th of February, extending the limitation of the crown as far as the state of affairs required: That William and Mary, prince and princess of Orange, he, and be declared, king and queen of England, France and Ireland, and the dominions thereunto belonging, to hold the crown and dignity of the said kingdoms and dominions to them, the said prince and princess, during their lives, and the life of the survivor of them; and that the sole and full exercise of the regal power be only in, and executed by, the said prince of Orange, in the names of the said prince and princess, during their joint lives; and after their decease the said crown and royal dignity of the said kingdoms and dominions to be to the heirs of the body of the said princess; for default of such issue, to the princess Anne of Denmark [younger daughter of James II], and the heirs of her body; and for default of such issue, to the heirs of the body of the said prince of Orange. . . . The Declaration of Rights presented to the prince of Orange by the marquis of Halifax, as speaker of the lords, in the presence of both houses, on the 18th of February, consists of three parts; a recital of the illegal and arbitrary acts committed by the late king, and of their consequent vote of abdication; a declaration, nearly following the words of the former part, that such enumerated acts are illegal; and a resolution, that the throne shall be filled by the prince and princess of Orange, according to the limitations mentioned. . . . This declaration was, some months afterwards [in October], confirmed by a regular act of the legislature in the bill of rights."—H. Hallam, *Constitutional history of England*, v. 3, ch. 14-15.

1689.—Mutiny Act. See MILITARY LAW: Mutiny Act.

1689 (April-August).—Church and the revolution.—Toleration Act.—Non-jurors.—"The men who had been most helpful in bringing about the late changes were not all of the same way of thinking in religion; many of them belonged to the Church of England; many were Dissenters. It seemed, therefore, a fitting time to grant the Dissenters some relief from the harsh laws passed against them in Charles II.'s reign. Protestant Dissenters, save those who denied the Trinity, were no longer forbidden to have places of worship and services of their own, if they would only swear to be loyal to the king, and that his power was as lawful in Church as in State matters. The law that gave them this is called the Toleration Act. Men's notions were still, however, very narrow; care was taken that the Roman Catholics should get no benefit from this law. Even a Protestant Dissenter might not yet lawfully be a member of either House of Parliament, or take a post in the king's service; for the Test Acts were left untouched. King William, who was a Presbyterian in his own land, wanted very much to see the Dissenters won back to the Church of England. To bring this about, he wished the Church to alter those things in the Prayer Book which kept Dissenters from joining with her. But most of the clergy would not have any change; and because these were the stronger party in Convocation—as the Parliament of the

Church is called—William could get nothing done. At the same time a rent, which at first seemed likely to be serious, was made in the Church itself. There was a strong feeling among the clergy in favour of the banished king. So a law was made by which every man who held a preferment in the Church, or either of the Universities, had to swear to be true to King William and Queen Mary, or had to give up his preferment. Most of the clergy were very unwilling to obey this law; but only 400 were found stout-hearted enough to give up their livings rather than do what they thought to be a wicked thing. These were called 'non-jurors,' or men who would not swear. Among them were five out of the seven Bishops who had withstood James II. only a year before. The sect of non-jurors, who looked upon themselves as the only true Churchmen, did not spread. But it did not die out altogether until seventy years ago [i.e., early in the nineteenth century]. It was at this time that the names High-Church and Low-Church first came into use.—J. Rowley, *Settlement of the constitution*, ch. 1.

1689 (May).—War declared against France.—Grand Alliance. See FRANCE: 1680-1690.

1689 (October).—Bill of Rights.—Question of revenue.—In its sitting of October, 1680, Parliament passed several measures of great importance. Among these was the Bill of Rights (For the text of this document, see BILL OF RIGHTS, ENGLISH) and the Toleration Act. The question of the revenue, the rock upon which the Stuarts had been wrecked, was settled in this Parliament and the following, by separating the royal expenditure (known as the "civil list") from the appropriations necessary for carrying on the government.

1689-1696.—War of the league of Augsburg (called in American history "King William's War"). See FRANCE: 1680-1690; 1689-1691; 1692; 1693 (July); 1694; 1695-1696; CANADA: 1680-1690; 1692-1697; NEWFOUNDLAND: 1694-1697; U. S. A.: 1690.

1690 (June).—Battle of Beachy Head.—Great peril of the kingdom.—"In June, 1690, whilst William was in Ireland, the French sent a fleet, under Tourville, to threaten England. He left Brest and entered the British Channel. Herbert (then Earl of Torrington) commanded the English fleet lying in the Downs, and sailed to Saint Helens, where he was joined by the Dutch fleet under Evertsen. On the 26th of June the English and French fleets were close to each other, and an important engagement was expected, when unexpectedly Torrington abandoned the Isle of Wight and retreated towards the Straits of Dover. . . . The Queen and her Council, receiving this intelligence, sent to Torrington peremptory orders to fight. Torrington received these orders on the 29th June. Next day he bore down on the French fleet in order of battle. He had less than 60 ships of the line, whilst the French had 80. He placed the Dutch in the van, and during the whole fight rendered them little or no assistance. He gave the signal to engage, which was immediately obeyed by Evertsen, who fought with the most splendid courage, but at length, being unsupported, his second in command and many other officers of high rank having fallen, and his ships being fearfully shattered, Evertsen was obliged to draw off his contingent from the unequal battle. Torrington destroyed some of these injured ships, took the remainder in tow, and sailed along the coast of Kent for the Thames. When in that river he pulled up all the buoys to prevent pursuit.

. . . Upon his return to London he was sent to the Tower, and in December was tried at Sheerness by court-martial, and on the third day was acquitted; but William refused to see him, and ordered him to be dismissed from the navy."—W. H. Torriano, *William the Third*, ch. 24.—"There has scarcely ever been so sad a day in London as that on which the news of the Battle of Beachy Head arrived. The shame was insupportable; the peril was imminent. . . . At any moment London might be appalled by news that 20,000 French veterans were in Kent. It was notorious that, in every part of the kingdom, the Jacobites had been, during some months, making preparations for a rising. All the regular troops who could be assembled for the defence of the island did not amount to more than 10,000 men. It may be doubted whether our country has ever passed through a more alarming crisis than that of the first week of July, 1690."—Lord Macaulay, *History of England*, v. 3, ch. 15.

ALSO IN: J. Campbell, *Naval history of Great Britain*, v. 2, ch. 18.

1691.—Toleration of Waldenses obtained by William of Orange. See WALDENSES: 1691.

1691.—Treaty of Limerick with Ireland. See IRELAND: 1691.

1692.—Attempted invasion from France.—Battle of La Hogue.—"The diversion in Ireland having failed, Louis [XIV] wished to make an effort to attack England without and within James II., who had turned to so little advantage the first aid granted by the King of France saw therefore in preparation a much more powerful assistance, and obtained what had been refused him after the days of the Boyne [July 1, 1690; see IRELAND: 1680] and Beachy-Head,—an army to invade England. . . . An army of 30,000 men, with 500 transports, was assembled on the coast of Normandy, the greater part at La Hogue and Cherbourg, the rest at Havre: this was composed of all the Irish troops, a number of Anglo-Scotch refugees, and a corps of French troops. Marshal de Bellefonds commanded under King James. Tourville was to set out from Brest in the middle of April with fifty ships of the line, enter the Channel, attack the English fleet before it could be reinforced by the Dutch, and thus secure the invasion. Express orders were sent to him to engage the enemy 'whatever might be his numbers.' It was believed that half of the English fleet would go over to the side of the allies of its king. . . . May 20, at daybreak, between the Capes of La Hogue and Barfleur, Tourville found himself in presence of the allied fleet, the most powerful that had ever appeared on the sea. He had been joined by seven ships from the squadron of Rochefort, and numbered 44 vessels against 00, 78 of which carried over 50 guns, and, for the most part, were much larger than a majority of the French. The English had 63 ships and [4,540] guns; the Dutch, 36 ships and 2,614 guns; in all, 7,154 guns; the French counted only 3,114. The allied fleet numbered nearly 42,000 men; the French fleet less than 20,000." Notwithstanding this great inferiority of numbers and strength, it was the French fleet which made the attack, bearing down under full sail "on the immense mass of the enemy." The attempt was almost hopeless; and yet, when night fell, after a day of tremendous battle, Tourville had not yet lost a ship; but his line of battle had been broken, and no chance of success remained. "May 30, at break of day, Tourville rallied around him 35 vessels. The other nine had strayed, five towards La Hogue, four towards the English coast, whence they regained Brest. If there had been a naval port at La Hogue or at Cherbourg, as Colbert and Vauban

had desired, the French fleet would have preserved its laurels! There was no place of retreat on all that coast. The fleet of the enemy advanced in full force. It was impossible to renew the prodigious effort of the day before." In this emergency, Tourville made a daring attempt to escape with his fleet through the dangerous channel called the race of Alderney, which separates the Channel Islands from the Normandy coast. Twenty-two vessels made the passage safely and found a place of refuge at St. Malo; thirteen were too late for the tide and failed. Most of these were destroyed, during the next few days, by the English and Dutch at Cherbourg and in the bay of La Hogue,—in the presence and under the guns of King James' army of invasion. "James II. had reason to say that 'his unlucky star' everywhere shed a malign influence around him; but this influence was only that of his blindness and incapacity. Such was that disaster of La Hogue, which has left among us such a fatal renown, and the name of which resounds in our history like another Agincourt or Cressy. Historians have gone so far as to ascribe to this the destruction of the French navy."—H. Martin, *History of France: Age of Louis XIV* (translated by M. L. Booth), v. 2, ch. 2.—This was the greatest naval battle since the Armada and gave the English and Dutch control of the channel.

1701.—Act of Settlement and the succession.—The history of Parliament at this time is the history of the rise of party government. In the early part of William's reign, the Whigs were in control, but towards the close the Tories obtained a majority. "The first work of the Tory Parliament was the Act of Settlement. By this Act the succession was settled, after Anne's death, on Sophia, Electress of Hanover, and her descendants.

She was the daughter of Elizabeth, queen of Bohemia and was thus the granddaughter of James I. The principle on which the selection rested was that she was the nearest Protestant heir, all the living descendants of Charles I, except William and Anne, being Roman Catholics. [Queen Mary had died in December, 1691.] The view that the nation had a right to fix the succession was now accepted by the Tories as fully as by the Whigs; but the Tories, seeing that William was inclined to trust their opponents more than themselves, now went beyond the Whigs in their desire to restrict the powers of the Crown. By the Tory Act of Settlement the future Hanoverian sovereign was (1) to join in the Communion of the Church of England; (2) not to declare war without consent of Parliament on behalf of territories possessed by him on the Continent, and (3) not to leave the three kingdoms without consent of Parliament—an article which was repealed in the first year of George I. A stipulation (4) that no pardon under the great seal was to be pleadable in bar of impeachment, was intended to prevent William or his successors from protecting ministers against Parliament, as Charles II had attempted to do in Danby's case. A further stipulation was (5) that after Anne's death no man, unless born in England or of English parents abroad, should sit in the Privy Council or in Parliament, or hold office or lands granted him by the Crown. These five articles all sprang from jealousy of a foreign sovereign. A sixth, enacting (6) that the judges should, henceforward, hold their places as long as they behaved well, but might be removed on an address from both Houses of Parliament, was an improvement in the constitution, irrespective of all personal considerations. It has prevented, ever since, the repetition of the scandal caused by James II, when he changed some of the judges for the purpose of getting a judgment in his own favour."—S. R. Gardiner, *Student's history of England*, pp. 672-673.—See also below: 1714.

1701-1702.—Rousing of the nation to war with France.—The king of Spain, Charles II, died without heirs, but the emperor, Leopold I, who had married one of his sisters, and Louis XIV, who had married another, had long planned to divide the Spanish possessions between them. Louis, however, procured and accepted for his grandson the bequest of the vast Spanish empire, thus overthrowing the Partition Treaty. Neither Leopold nor William of Orange could permit this unprecedented extension of French power. "William had the intolerable chagrin of discovering not only that he had been befooled, but that his English subjects had no sympathy with him or animosity against the royal swindler who had tricked him. 'The blindness of the people here,' he writes sadly to the Pensionary Heinsius, 'is incredible. For though the affair is not public, yet it was no sooner said that the King of Spain's will was in favour of the Duke of Anjou, than it was the general opinion that it was better for England that France should accept the will than fulfil the Treaty of Partition.' . . . William dreaded the idea of a Bourbon reigning at Madrid, but he saw no very grave objection, as the two treaties showed, to Naples and Sicily passing into French hands. With his English subjects the exact converse was the case. They strongly deprecated the assignment of the Mediterranean possessions of the Spaniard to the Dauphin; but they were undisturbed by the sight of the Duke of Anjou seating himself on the Spanish throne. . . . But just as, under a discharge from

an electric battery, two repugnant chemical compounds will sometimes rush into sudden combination, so at this juncture the King and the nation were instantaneously united by the shock of a gross affront. The hand that liberated the uniting fluid was that of the Christian king. On the 16th of September 1701 James II. breathed his last at St. Germain, and, obedient to one of those impulses, half-chivalrous, half-arrogant, which so often determined his policy, Louis XIV. declared his recognition of the Prince of Wales as de jure King of England. No more timely and effective assistance to the policy of its de facto king could possibly have been rendered. Its effect upon English public opinion was instantaneous; and when William returned from Holland on the 4th of November, he found the country in the temper in which he could most have wished it to be.

"Dissolving the Parliament in which his plans had long been factiously opposed, he summoned a new one, which met on the last day of the year 1701. Opposition in Parliament—in the country it was already inaudible—was completely silenced. The two Houses sent up addresses assuring the King of their firm resolve to defend the succession against the pretended Prince of Wales and all other pretenders whatsoever. . . . Nor did the goodwill of Parliament expend itself in words. The Commons accepted without a word of protest the four treaties constituting the new Grand Alliance. [The most important members were England, Holland and Austria.] . . . The votes of supply were passed unanimously." But scarcely had the nation and the king arrived at this agreement with one another than the latter was snatched from his labors. On February 21, 1702, William received an injury, through the stumbling of his horse, which his frail and diseased body could not bear. His death would not have been long delayed in any event, but it was hastened by this accident, and occurred on March 8 following. He was succeeded by Anne, the sister of his deceased queen, Mary, and second daughter of the deposed Stuart king, James II.—H. D. Traill, *William the Third*, ch. 14-15.—See also SPAIN: 1701-1702.

1703.—Aylesbury election case.—"Ashby, a burghess of Aylesbury, sued the returning officer for maliciously refusing his vote. Three judges of the King's Bench decided, against the opinion of Chief Justice Holt, that the verdict which a jury had given in favor of Ashby must be set aside, as the action was not maintainable. The plaintiff went to the House of Lords upon a writ of error, and there the judgment was reversed by a large majority of Peers. The Lower House maintained that 'the qualification of an elector is not cognizable elsewhere than before the Commons of England'; that Ashby was guilty of a breach of privilege; and that all persons who should in future commence such an action, and all attorneys and counsel conducting the same, are also guilty of a high breach of privilege. The Lords, led by Somers, then came to counter-resolutions. . . . The prorogation of Parliament put an end to the quarrel in that Session; but in the next it was renewed with increased violence. The judgment against the Returning Officer was followed up by Ashby levying his damages. Other Aylesbury men brought new actions. The Commons imprisoned the Aylesbury electors. The Lords took strong measures that affected, or appeared to affect, the privileges of the Commons. The Queen finally stopped the contest by a prorogation; and the quarrel expired when the Parliament expired under the Triennial Act. Lord Somers 'established the doctrine which has been acted on ever since, that an action lies against a Returning Officer for maliciously refusing the vote of an elector.'"—C. Knight, *Popular history of England*, v. 5, ch. 17.

1709.—Whig ministry.—Barrier Treaty with Holland.—From the first Marlborough had attempted to maintain a system of political balance between Whigs and Tories, and in the ministry of 1704 had succeeded in placing in the cabinet Tories of a moderate stamp. Robert Harley was made secretary of state, and Henry St. John (later Lord Bolingbroke) was made secretary of war. When the victory of Ramillies (1706) placed Marlborough at the height of his power, he forced Anne to give Sunderland (the bitterest of the Whig leaders) an office. By 1708, the hostility of the English to the continuance of the war and Anne's increasing distrust of Marlborough finally caused the duke to go over to the Whigs. The Tories, Harley and St. John, were put out of the ministry and the triumph of the Whigs was complete. Lord Somers was made president of the council, Wharton, lord lieutenant of Ireland, while the duke of Newcastle and Robert Walpole held lower offices. Their ascendancy was short-lived, however. "The influence of the Whig party in the affairs of government in England, always irksome to the Queen, had now begun visibly to decline; and the partiality she was suspected of entertaining for her brother, with her known dislike of the

house of Hanover, inspired them with alarm, lest the Tories might seek still further to propitiate her favour, by altering, in his favour, the line of succession, as at present established. They had, accordingly, made it one of the preliminaries of the proposed treaty of peace [to close the war of the Spanish Succession], that the Protestant succession, in England, should be secured by a general guarantee, and now sought to repair, as far as possible, the failure caused by the unsuccessful termination of the conferences, by entering into a treaty to that effect with the States [Netherlands]. The Marquis Townshend, accordingly, repaired for this purpose to the Hague, when the States consented to enter into an engagement to maintain the present succession to the crown, with their whole force, and to make the recognition of that succession, and the expulsion of the Pretender from France, an indispensable preliminary to any peace with that kingdom. In return for this important guarantee, England was to secure to the States a barrier, formed of the towns of Nieuport, Furnes and the fort of Knokke, Menin, Lille, Ryssel, Tournay, Condé, and Valenciennes, Maubeuge, Charleroi, Namur, Lier, Halle, and some forts, besides the citadels of Ghent and Dendermonde. It was afterwards asserted, in excuse for the dereliction from that treaty on the part of England, that Townshend had gone beyond his instructions; but it is quite certain that it was ratified without hesitation by the queen, whatever may have been her secret feelings regarding it."—C. M. Davies, *History of Holland*, v. 3, pt. 3, ch. 11.

1710-1712.—Opposition to the war.—Trial of Sacheverell.—Fall of the Whigs and Marlborough.—"A 'deluge of blood' such as that of Malplaquet [Ramillies, Oudenarde and Malplaquet were victories won in various parts of the Netherlands against the French] increased the growing weariness of the war, and the rejection of the French offers was unjustly attributed to a desire on the part of Marlborough of lengthening out a contest which brought him profit and power. The expulsion of Harley and St. John [Bolingbroke] from the Ministry had given the Tories leaders of a more vigorous stamp, and St. John brought into play a new engine of political attack whose powers soon made themselves felt. In the Examiner, and in a crowd of pamphlets and periodicals which followed in its train, the humor of Prior, the bitter irony of Swift, and St. John's own brilliant sophistry spent themselves on the abuse of the war and of its general. . . . A sudden storm of popular passion showed the way in which public opinion responded to these efforts. A High-Church divine, Dr. Sacheverell, maintained the doctrine of non-resistance [the doctrine, that is, of passive obedience and non-resistance to government, implying a condemnation of the revolution of 1688 and of the revolution settlement], in a sermon at St. Paul's, with a boldness which deserved prosecution; but in spite of the warning of Marlborough and of Somers the Whig Ministers resolved on his impeachment. His trial in 1710 at once widened into a great party struggle, and the popular enthusiasm in Sacheverell's favor showed the gathering hatred of the Whigs and the war. . . . A small majority of the peers found him guilty, but the light sentence they inflicted was in effect an acquittal, and bonfires and illuminations over the whole country welcomed it as a Tory triumph.

The turn of popular feeling freed Anne at once from the pressure beneath which she had bent; and the skill of Harley, whose cousin, Mrs. Masham, had succeeded the Duchess of Marlborough in the Queen's favor, was employed in bringing about the fall both of Marlborough and the Whig Ministers. [The new Tory ministry contained Harley and St. John at its head.] . . . The return of a Tory House of Commons sealed his [Marlborough's] fate. His wife was dismissed from court. A masterly plan for a march into the heart of France in the opening of 1711 was foiled by the withdrawal of a part of his forces, and the negotiations which had for some time been conducted between the French and English Ministers without his knowledge marched rapidly to a close. [This secret treaty negotiated by Lord Bolingbroke was in direct opposition to the terms of the Grand Alliance which stipulated that no separate peace was to be made by any of the contracting parties.] . . . At the opening of 1712 the Whig majority of the House of Lords was swamped by the creation of twelve Tory peers. Marlborough was dismissed from his command, charged with peculation, and condemned as guilty by a vote of the House of Commons. He at once withdrew from England, and with his withdrawal all opposition to the peace was at an end."—J. R. Green, *Short history of the English people*, sect. 9, ch. 9.—Added to other reasons for opposition to the war, the death of the Emperor Joseph I, which occurred in April, 1711, had entirely reversed the situation in Europe out of which the war proceeded. The Archduke Charles, whom the allies had been striving to place on the Spanish throne, was now certain to be elected emperor. He received the imperial crown, in fact, in December, 1711. By this change of fortune, therefore, he became a more objectionable claimant of the Spanish crown than Louis XIV's grandson had been. (See AUSTRIA: 1711.)—Lord Mahon, *History of England, reign of Anne*, ch. 12-15.—"Round the fall of Marlborough has gathered the interest attaching to the earliest political crisis at all resembling those of quite recent times. It is at this moment that Party Government in the modern sense actually commenced. William the Third with military instinct had always been reluctant to govern by means of a party. Bound as he was, closely, to the Whigs, he employed Tory Ministers. . . . The new idea of a homogeneous government was working itself into shape under the mild direction of Lord Somers; but the form finally taken under Sir Robert Walpole, which has continued to the present time, was as yet some way off. Marlborough's notions were those of the late King. Both abroad and at home he carried out the policy of William. He refused to rely wholly upon the Whigs, and the extreme Tories were not given employment. The Ministry of Godolphin [Sidney Godolphin, created earl of Godolphin 1706; held the office of lord treasurer; was a master of finance, serving under four sovereigns] was a composite administration, containing at one time, in 1705, Tories like Harley and St. John as well as Whigs such as Sunderland and Halifax. . . . Lord Somers was a type of statesman of a novel order at that time. . . . In the beginning of the eighteenth century it was rare to find a man attaining the highest political rank who was unconnected by birth or training or marriage with any of the great 'governing families,' as they have been called. Lord Somers was the son of a Worcester attorney. . . . It was fortunate for England that Lord Somers should have been the foremost man of the Whig

party at the time when constitutional government, as we now call it, was in course of construction. By his prudent counsel the Whigs were guided through the difficult years at the end of Queen Anne's reign; and from the ordeal of seeing their rivals in power they certainly managed, as a party, to emerge on the whole with credit. Although he was not nominally their leader, the paramount influence in the Tory party was Bolingbroke's; and that the Tories suffered from the defects of his great qualities, no unprejudiced critic can doubt. Between the two parties, and at the head of the Treasury through the earlier years of the reign, stood Godolphin, without whose masterly knowledge of finance and careful attention to the details of administration Marlborough's policy would have been baffled and his campaigns remained unfought. To Godolphin, more than to any other one man, is due the preponderance of the Treasury control in public affairs. It was his administration, during the absence of Marlborough on the Continent, which created for the office of Lord Treasurer its paramount importance, and paved the way for Sir Robert Walpole's government of England under the title of First Lord of the Treasury. . . . Marlborough saw and always admitted that his victories were due in large measure to the financial skill of Godolphin. To this statesman's lasting credit it must be remembered that in a venal age, when the standards of public honesty were so different from those which now prevail, Godolphin died a poor man. . . . Bolingbroke is interesting to us as the most striking figure among the originators of the new parliamentary system. With Marlborough disappeared the type of Tudor statesmen modified by contact with the Stuarts. He was the last of the Imperial Chancellors. Bolingbroke and his successor Walpole were the earlier types of constitutional statesmen among whom Mr. Pitt and, later, Mr. Gladstone stand pre-eminent. . . . He and his friends, opponents of Marlborough, and contributors to his fall, are interesting to us mainly as furnishing the first examples of 'Her Majesty's Opposition,' as the authors of party government and the prototypes of cabinet ministers of to-day. Their ways of thought, their style of speech and of writing, may be dissimilar to those now in vogue, but they show greater resemblance to those of modern politicians than to those of the Ministers of William or of the Stuarts. Bolingbroke may have appeared a strange product of the eighteenth century to his contemporaries, but he would not have appeared peculiarly misplaced among the colleagues of Lord Randolph Churchill or Mr. Chamberlain."—R. B. Brett, *Footprints of statesmen*, ch. 3.—See also NETHERLANDS: 1710-1712.

1711-1714.—Occasional Conformity Bill and the Schism Act.—"The Test Act, making the reception of the Anglican Sacrament a necessary qualification for becoming a member of corporations, and for the enjoyment of most civil offices, was very efficacious in excluding Catholics, but was altogether insufficient to exclude moderate Dissenters. . . . Such men, while habitually attending their own places of worship, had no scruple about occasionally entering an Anglican church, or receiving the sacrament from an Anglican clergyman. The Independents, it is true, and some of the Baptists, censured this practice, and Defoe wrote

vehemently against it, but it was very general, and was supported by a long list of imposing authorities. . . . In 1702, in 1703, and in 1704, measures for suppressing occasional conformity were carried through the Commons, but on each occasion they were defeated by the Whig preponderance in the Lords." In 1711, the Whigs formed a coalition with one section of the Tories to defeat the negotiations which led to the Peace of Utrecht (closing the war of the Spanish Succession); but, the Tories "made it the condition of alliance that the Occasional Conformity Bill should be accepted by the Whigs. The bargain was made; the Dissenters were abandoned, and, on the motion of Nottingham, a measure was carried providing that all persons in places of profit or trust, and all common councilmen in corporations, who, while holding office, were proved to have attended any Nonconformist place of worship, should forfeit the place, and should continue incapable of public employment till they should depose that for a whole year they had not attended a conventicle. The House of Commons added a fine of £40, which was to be paid to the informer, and with this addition the Bill became a law. Its effects during the few years it continued in force were very inconsiderable, for the great majority of conspicuous Dissenters remained in office, abstaining from public worship in conventicles, but having Dissenting ministers as private chaplains in their houses. . . . The object of the Occasional Conformity Bill was to exclude the Dissenters from all Government positions of power, dignity or profit. It was followed in 1714 by the Schism Act, which was intended to crush their seminaries and deprive them of the means of educating their children in their faith. . . . As carried through the House of Commons, it provided that no one, under pain of three months' imprisonment, should keep either a public or a private school, or should even act as tutor or usher, unless he had obtained a licence from the Bishop, had engaged to conform to the Anglican liturgy, and had received the sacrament in some Anglican church within the year. In order to prevent occasional conformity it was further provided that if a teacher so qualified were present at any other form of worship he should at once become liable to three months' imprisonment, and should be incapacitated for the rest of his life from acting as schoolmaster or tutor. . . . Some important clauses, however, were introduced by the Whig party qualifying its severity. They provided that Dissenters might have school-mistresses to teach their children to read; that the Act should not extend to any person instructing youth in reading, writing, or arithmetic, in any part of mathematics relating to navigation, or in any mechanical art only. . . . The facility with which this atrocious Act was carried, abundantly shows the danger in which religious liberty was placed in the latter years of the reign of Queen Anne."—W. E. H. Lecky, *History of England, 18th century*, ch. 1.—The Schism Act was repealed in 1719, during the administration of Lord Stanhope.—*Cobbett's parliamentary history*, v. 7, pp. 567-587.

1714.—End of the Stuart line and the beginning of the Hanoverians.—Queen Anne died, after a short illness, on the morning of August 1, 1714. The Tories, who had just gained control of the ministry, were wholly unprepared for this emergency. They assembled in privy council on July 29, when the probably fatal issue of the queen's illness became apparent, and "a strange scene is said to have occurred. Argyle and Somerset [dukes of] though they had contributed largely by their defection to the downfall of the Whig ministry of Godolphin, were now again in opposition to the Tories, and had recently been dismissed from their posts. Availing themselves of their rank of Privy Councillors, they appeared unsummoned in the council room, pleading the greatness of the emergency. Shrewsbury [president of the council in the Tory ministry of Queen Anne's reign, but a strong rival of Bolingbroke's], who had probably concocted the scene, rose and warmly thanked them for their offer of assistance; and these three men appear to have guided the course of events. . . . Shrewsbury, who was already Chamberlain and Lord Lieutenant of Ireland, became Lord Treasurer, and assumed the authority of Prime Minister. Summonses were at once sent to all Privy Councillors, irrespective of party, to attend; and Somers and several other of the Whig leaders were speedily at their posts. They had the great advantage of knowing clearly the policy they should pursue, and their measures were taken with admirable promptitude and energy. The guards of the Tower were at once doubled. Four regiments were ordered to march from the country to London, and all seamen to repair to their vessels. An embargo was laid on all shipping. The fleet was equipped, and speedy measures were taken to protect the seaports and to secure tranquility in Scotland and Ireland. At the same time despatches were sent to the Netherlands ordering seven of the ten British battalions to embark without delay; to Lord Strafford, the ambassador at the Hague, desiring the States-General to fulfil their guarantee of the Protestant succession in England; to the Elector, urging him to hasten to Holland, where, on the death of the Queen, he would be met by a British squadron, and escorted to his new kingdom." When the Queen's death occurred, "the new King was at once proclaimed, and it is a striking proof of the danger of the crisis that the funds, which had fallen on a false rumour of the Queen's recovery, rose at once when she died. Atterbury [Bishop Atterbury of Rochester who was banished by Parliament in 1722 for his Jacobite intrigues] is said to have urged Bolingbroke to proclaim James III. at Charing Cross, and to have offered to head the procession in his lawn sleeves, but the counsel was mere madness, and Bolingbroke saw clearly that any attempt to overthrow the Act of Settlement would be now worse than useless. . . . The more violent spirits among the Jacobites now looked eagerly for a French invasion, but the calmer members of the party perceived that such an invasion was impossible. . . . The Regency Act of 1705 came at once into operation. The Hanoverian minister produced the sealed list of the names of those to whom the Elector entrusted the government before his arrival, and it was found to consist of eighteen names taken from the leaders of the Whig party.

. . . Parliament, in accordance with the provisions of the Bill, was at once summoned, and it was soon evident that there was nothing to fear. The moment for a restoration was passed."—W. E. H. Lecky, *History of England, 18th century, v. 1, ch. 1*.—"George I., whom circumstances and the Act of Settlement had thus called to be King of Great Britain and Ireland, had been a sovereign prince for sixteen years, during which time he had been Elector of Brunswick-Lüneburg. The new royal house in England is sometimes called the House of Hanover, sometimes the House of Brunswick. It will be found that the latter name is more generally used in histories written during the last [eighteenth] century, the former in books written in the present day [nineteenth century]. If the names were equally applicable, the modern use is the more convenient, because there is another, and in some respects well known, branch of the House of Brunswick; but no other has a right to the name of Hanover. It is, however, quite certain that, whatever the English use may be, Hanover is properly the name of a town and of a duchy, but that the electorate was Brunswick-Lüneburg."—E. E. Morris, *Early Hanoverians, bk. 1, ch. 2*.—See also above: 1701.

Thackeray, *Four Georges, lect. 1*.—A. W. Ward, *Electress Sophia and the Hanoverian succession (English Historical Review, v. 1)*.

1714-1721.—First years of George I.—Rise of Walpole to power and the founding of Parliamentary government.—"The accession of the house of Hanover in the person of the great-grandson of James I. was once called by a Whig of this generation [1889] the greatest miracle in our history. It took place without domestic or foreign disturbance. . . . Within our own borders a short lull followed the sharp agitations of the last six months. The new king appointed an exclusively Whig Ministry. The office of Lord Treasurer was not revived, and the title disappears from political history. Lord Townshend was made principal Secretary of State [General Stanhope was raised to the peerage and made a fellow secretary], and assumed the part of first Minister. Mr. Walpole [Sir Robert] took the subaltern office of paymaster of the forces, holding along with it the paymastership of Chelsea Hospital. Although he had at first no seat in the inner Council or Cabinet, which seems to have consisted of eight members, only one of them a commoner, it is evident that from the outset his influence was hardly second to that of Townshend himself. In little more than a year (October, 1715) he had made himself so prominent and valuable in the House of Commons, that the opportunity of a vacancy was taken to appoint him to be First Commissioner of the Treasury and Chancellor of the Exchequer. . . . Besides excluding their opponents from power, the Whigs instantly took more positive measures. The new Parliament was strongly Whig. A secret committee was at once appointed to inquire into the negotiations for the Peace. Walpole was chairman, took the lead in its proceedings, and drew the report." On Walpole's report, the House "directed the impeachment of Oxford, Bolingbroke, and Ormond for high treason, and other high crimes and misdemeanours mainly relating to the Peace of Utrecht. . . . [Bolingbroke and the Duke of Ormond fled to the continent.] The proceedings against Oxford and Bolingbroke are the last instance in our history of a political impeachment. They are the last ministers

who were ever made personally responsible for giving bad advice and pursuing a discredited policy, and since then a political mistake has ceased to be a crime. . . . The affair came to an abortive end. . . . The opening years of the new reign mark one of the least attractive periods in political history. George I. . . . cared very little for his new kingdom, and knew very little about its people or its institutions. . . . His expeditions to Hanover threw the management of all domestic affairs almost without control into the hands of his English ministers. If the two first Hanoverian kings had been Englishmen instead of Germans, if they had been men of talent and ambition, or even men of strong and commanding will without much talent, Walpole would never have been able to lay the foundations of government by the House of Commons and by Cabinet so firmly that even the obdurate will of George III. was unable to overthrow it [see CABINET, ENGLISH]. Happily for the system now established, circumstances compelled the first two sovereigns of the Hanoverian line to strike a bargain with the English Whigs, and it was faithfully kept until the accession of the third George. The king was to manage the affairs of Hanover, and the Whigs were to govern England. It was an excellent bargain for England. Smooth as this operation may seem in historic description, Walpole found its early stages rough and thorny." The king was not easily brought to understand that England would not make war for Hanoverian objects, nor allow her foreign policy to be shaped by the ambitions of the Electorate. Differences arose which drove Townshend from the Cabinet, and divided the Whig party. Walpole retired from the government with Townshend, and was in opposition for three years, while Lord Stanhope and the earl of Sunderland controlled the administration. The Whig schism came to an end in 1720, and Townshend and Walpole rejoined the administration (in the contest over the Peage Bill, 1720). The latter as paymaster of the forces without a seat in the Cabinet. "His opposition was at an end, but he took no part in the active work of government. . . . Before many months had passed the country was overtaken by the memorable disasters of the South Sea Bubble [see SOUTH SEA BUBBLE]. . . . All eyes were turned to Walpole. Though he had privately dabbled in South Sea stock on his own account, his public predictions came back to men's minds; they remembered that he had been called the best man for figures in the House, and the disgrace of his most important colleagues only made his sagacity the more prominent. . . . He returned to his old posts, and once more became First Lord of the Treasury and Chancellor of the Exchequer (April, 1721), while Townshend was again Secretary of State. Walpole held his offices practically without a break for twenty-one years. The younger Pitt had an almost equal span of unbroken supremacy, but with that exception there is no parallel to Walpole's long tenure of power. To estimate aright the vast significance of this extraordinary stability, we must remember that the country had just passed through eighty years of revolution. A man of 80 in 1721 could recall the execution of Charles I., the protectorate of Oliver, the fall of Richard Cromwell, the restoration of Charles II., the exile of James II., the change of the order of succession to William of Orange, the reactionary ministry of Anne, and finally the second change to the House of Hanover. The interposition, after so long a series of violent perturbations as this, of twenty years of settled system and continuous order under one man, makes Walpole's government of capital and decisive importance in our history, and consti-

tutes not an artificial division like the reign of a king, but a true and definite period, with a beginning, an end, a significance, and a unity of its own." —J. Morley, *Walpole*, ch. 3-4.

1715.—**Jacobite rising.** See SCOTLAND: 1715.

1716.—**Septennial Act.**—The easy suppression of the Jacobite rebellion was far from putting an end to the fears of the loyal supporters of the Hanoverian dynasty. They regarded with especial anxiety the approaching Parliamentary elections. "As, by the existing statute of 6 William and Mary [the Triennial Act, of 1694], Parliament would be dissolved at the close of the year, and a new election held in the spring of 1717, there seemed great probability of a renewal of the contest, or at least of very serious riots during the election time. With this in view, the ministers proposed that the existing Parliament should be continued for a term of seven instead of three years. This, which was meant for a temporary measure has never been repealed, and is still the law under which Parliaments are held. [By the Parliament Act of 1911, the term of Parliament was changed from seven years to five.] It has been often objected to this action of Parliament, that it was acting arbitrarily in thus increasing its own duration. 'It was a direct usurpation,' it has been said, 'of the rights of the people, analogous to the act of the Long Parliament in declaring itself indestructible.' It has been regarded rather as a party measure than as a forward step in liberal government. We must seek its vindication in the peculiar conditions of the time. It was useless to look to the constituencies for the support of the popular liberty. The returns of members in the smaller boroughs was in the hands of corrupt or corruptible freemen; in the counties, of great landowners; in the larger towns, of small placeholders under Government. A general election in fact only gave fresh occasion for the exercise of the influence of the Crown and of the House of Lords—freedom and independence in the presence of these two permanent powers could be secured only by the greater permanence of the third element of the Legislature, the House of Commons. It was thus that, though no doubt in some degree a party measure for securing a more lengthened tenure of office to the Whigs, the Septennial Act received, upon good constitutional grounds, the support and approbation of the best statesmen of the time."—J. F. Bright, *History of England*, period 3, p. 938.

1727.—**Accession of King George II.**

1727-1741.—**Walpole's administration under George II.**—"The management of public affairs during the six years of George the First's reign in which Walpole was Prime Minister, was easy. . . . His political fortunes seemed to be ruined by George the First's death [1727]. That King's suc-

cessor had ransacked a very copious vocabulary of abuse, in order to stigmatise the minister and his associates. Rogue and rascal, scoundrel and fool, were his commonest utterances when Robert Walpole's name was mentioned. . . . Walpole bowed meekly to the coming storm," and an attempt was made to put Sir Spencer Compton in his place. But Compton himself, as well as the king and his sagacious queen, soon saw the futility of it, and the old ministry was retained. "At first, Walpole was associated with his brother-in-law, Townsend. But they soon disagreed and the rupture was total after the death of Walpole's sister, Townsend's wife. . . . After Townsend's dismissal, Walpole reigned alone, if, indeed, he could be said to exercise sole functions while Newcastle was tied to him. Long before he was betrayed by this person, of whom he justly said that his name was perfidy, he knew how dangerous was the association. But Newcastle was the largest proprietor of rotten boroughs in the kingdom, and, fool and knave as he was, he had wit enough to guess at his own importance, and knavery enough to make his market. Walpole's chief business lay in managing the King, the Queen, the Church, the House of Commons, and perhaps the people. I have already said, that before his accession George hated Walpole. But there are hatreds and hatreds, equal in fervency while they last, but different in duration. The King hated Walpole because he had served his father well. But one George was gone, and another George was in possession. Then came before the man in possession the clear vision of Walpole's consummate usefulness. The vision was made clearer by the sagacious hints of the Queen [Caroline of Anspach]. It became clear as noonday when Walpole contrived to add £115,000 to the civil list. . . . Besides, Walpole was sincerely determined to support the Hanoverian succession. He constantly insisted to George that the final settlement of his House on the throne would be fought out in England. . . . Hence he was able to check one of the King's ruling passions, a longing to engage in war. . . . It is generally understood that Walpole managed the House of Commons by bribery; that the secret service money was thus employed; and that this minister was the father of that corruption which was reported to have disgraced the House during the first half of the . . . [eighteenth] century. I suspect that these influences have been exaggerated. It is a stock story that Walpole said he knew every man's price. It might have been generally true, but the foundation of this apothegm is, in all likelihood, a recorded saying of his about certain members of the opposition. . . . Walpole has been designated, and with justice, as emphatically a peace minister. He held 'that the most pernicious circumstances in which this country can be, are those of war, as we must be great losers while the war lasts, and cannot be great gainers when it ends.' He kept George the Second at peace, as well as he could, by insisting on it that the safety of his dynasty lay in avoiding foreign embroilments. He strove in vain against the war which broke out in 1739 [War of 'Jenkins' Ear']. . . . I do not intend to disparage Walpole's administrative ability when I say that the country prospered independently of any financial policy which he adopted or carried out. . . . Walpole let matters take their course, for he understood that the highest merit of a minister consists in his doing no mischief. But Walpole's praise lies in the fact, that, with this evident growth of material prosperity, he steadily set his face against gambling with it. He resolved, as far as lay in his power, to keep the peace of Europe; and he was seconded in his efforts by Cardinal Fleury. He contrived to smooth away the

difficulties which arose in 1727; and on January 13, 1730, negotiated the treaty of Seville [see SPAIN: 1726-1731], the benefits of which lasted through ten years of peace, and under which he reduced the army to 5,000 men." But the opposition to Walpole's peace policy became a growing passion, which overcame him in 1741 and forced him to resign. On his resignation he was raised to the peerage, with the title of earl of Orford, and defeated, though with great difficulty, the determination of his enemies to impeach him.—J. E. T. Rogers, *Historical gleanings*, v. 1, ch. 2.—"It is impossible, I think, to consider his [Walpole's] career with adequate attention without recognising in him a great minister, although the merits of his administration were often rather negative than positive, and although it exhibits few of those dramatic incidents, and is but little susceptible of that rhetorical colouring, on which the reputation of statesmen largely depends. . . . He was eminently true to the character of his countrymen. He discerned with a rare sagacity the lines of policy most suited to their genius and to their needs, and he had a sufficient ascendancy in English politics to form its traditions, to give a character and a bias to its institutions. The Whig party, under his guidance, retained, though with diminished energy, its old love of civil and of religious liberty, but it lost its foreign sympathies, its tendency to extravagance, its military restlessness. The landed gentry, and in a great degree the Church, were reconciled to the new dynasty. The dangerous fissures which divided the English nation were filled up. Parliamentary government lost its old violence, it entered into a period of normal and pacific action, and the habits of compromise, of moderation, and of practical good sense, which are most essential to its success, were greatly strengthened. These were the great merits of Walpole. His faults were very manifest, and are to be attributed in part to his own character, but in a great degree to the moral atmosphere of his time. He was an honest man in the sense of desiring sincerely the welfare of his country and serving his sovereign with fidelity; but he was intensely wedded to power, exceedingly unscrupulous about the means of grasping or retaining it, and entirely destitute of that delicacy of honour which marks a high-minded man. . . . His estimate of political integrity was very similar to his estimate of female virtue. He governed by means of an assembly which was saturated with corruption, and he fully acquiesced in its conditions and resisted every attempt to improve it. . . . It is necessary to speak with much caution on this matter, remembering that no statesman can emancipate himself from the conditions of his time. . . . The systematic corruption of Members of Parliament is said to have begun under Charles II., in whose reign it was practised to the largest extent. It was continued under his successor, and the number of scandals rather increased than diminished after the Revolution. . . . And if corruption did not begin with Walpole, it is equally certain that it did not end with him. His expenditure of secret service money, large as it was, never equalled in an equal space of time the expenditure of Bute. [John Stuart, Earl of Bute; favorite of Frederick, Prince of Wales, and later of his son who ascended the throne as George III.; prime minister in 1761]. . . . The real charge against him is that in a period of profound peace, when he exercised an almost unexampled ascendancy in politics, and when public opinion was strongly in favour of the diminution of corrupt influence in Parliament, he steadily and successfully resisted every attempt at reform. . . . It was his settled policy to maintain his Parliamentary majority, not by attracting to his ministry

great orators, great writers, great financiers, or great statesmen, . . . but simply by engrossing borough influence and extending the patronage of the Crown."—W. E. H. Lecky, *History of England in the 18th century*, v. 1, ch. 3.—"But for Sir Robert Walpole, we should have had the Pretender back again. But for his obstinate love of peace, we should have had wars, which the nation was not strong enough nor united enough to endure. But for his resolute counsels and good-humoured resistance, we might have had German despots attempting a Hanoverian regimen over us: we should have had revolt, commotion, want, and tyrannous misrule, in place of a quarter of a century of peace, freedom and material prosperity, such as the country never enjoyed, until that corrupter of parliaments, that dissolute tipsy cynic, that courageous lover of peace and liberty, that great citizen, patriot and statesman governed it. . . . In private life the old pagan revelled in the lowest pleasures: he passed his Sundays tippling at Richmond; and his holidays bawling after dogs, or boozing at Houghton with Boors over beef and punch. He cared for letters no more than his master did: he judged human nature so meanly that one is ashamed to have to own that he was right, and that men could be corrupted by means so base. But, with his hiring House of Commons, he defended liberty for us; with his incredulity he kept Church-craft down. . . . He gave Englishmen no conquests, but he gave them peace, and ease, and freedom; the Three per Cents, nearly at par; and wheat at five and six and twenty shillings a quarter."—W. M. Thackeray, *Four Georges*, ch. 2.—It is interesting to note that Walpole brought prosperity to England through strict adherence to mercantilist principles, among which may be mentioned the removal of duties on imported raw material and on exported manufactures, as well as an aggressive colonial policy. Walpole, who was called "the best master of figures of any man of his time" also achieved economies through the application of business methods to public finance.

1739-1741.—War of Jenkins' Ear.—Assiento.—"In spite of Walpole's love of peace, and determined efforts to preserve it, in the year 1730 a war broke out with Spain, which is an illustration of the saying that the occasion of a war may be trifling, though its real cause be very serious. The war is often called the War of Jenkins' Ear. The story ran that eight year before (1731) a certain Captain Jenkins, skipper of the ship 'Rebecca,' of London, had been maltreated by the Spaniards. His ship was sailing from Jamaica, and hanging about the entrance of the Gulf of Florida, when it was boarded by the Spanish coastguard. The Spaniards could find no proof that Jenkins was smuggling, though they searched narrowly, and being angry at their ill-success they hanged him to the yardarm, lowering him just in time to save his life. At length they pulled off his ear and told him to take it to his king. . . . Seven years later Captain Jenkins was examined by the House of Commons. . . . 'No need of allies now,' said one politician; 'the

story of Jenkins will raise us volunteers.' The war arose out of a question of trade, in this as in so many other cases the English being prepared to fight in order to force an entrance for their trade, which the Spaniards wished to shut out from Spanish America. This question found a place amongst the other matters arranged by the treaty of Utrecht, when the English obtained almost as their sole return for their victories what was known as the Assiento. This is a Spanish word meaning contract, but its use had been for some time confined to the disgraceful privilege of providing Spanish America with negroes kidnapped from their homes in Africa. The Flemings, the Genoese, the Portuguese, and the French Guinea Company received in turn from Spanish kings the monopoly in this shameful traffic, which at the treaty of Utrecht was passed on for a period of thirty years to England, now becoming mistress of the seas, and with her numerous merchant ships better able than others to carry on the business. The English Government committed the contract to the South Sea Company, and the number of negroes to be supplied annually was no less than 4,800 'sound, healthy, merchantable negroes, two-thirds to be male, none under ten or over forty years old.' In the Assiento Treaty there was also a provision for the trading of one English ship each year with Spanish America; but in order to prevent too great advantage therefrom it was carefully stipulated that the ship should not exceed 600 tons burden. There is no doubt that this stipulation was regularly violated by the English sending a ship of the required number of tons, but with it numerous tenders and smaller craft. Moreover smuggling, being very profitable, became common; . . . Walpole, always anxious for peace, by argument, by negotiation, by delays, resisted the growing desire for war; at length he could resist no longer . . . [and] allowed himself to be forced into a declaration of war October 10, 1730. The news was received throughout England with a perfect frenzy of delight. . . . A year and a day after this declaration of war an event occurred—the death of the Emperor—which helped to swell the volume of this war until it was merged into the European war, called the War of the Austrian Succession, which includes within itself the First and Second Silesian Wars, between Austria and Frederick the Great of Prussia. The European war went on until the general pacification in the treaty of Aix-la-Chapelle, 1748. Within another ten years war broke out again on somewhat similar grounds, but on a much wider scale and with the combatants differently arranged, under the title 'Seven Years' War' The events of this year, whilst the war was only between Spain and England, were the attacks on Spanish settlements in America, the capture of Porto Bello, and the failure before Cartagena, which led to Anson's famous voyage."—E. E. Morris, *Early Hanoverians*, bk. 2, ch. 3.—Admiral Vernon, setting sail with the English fleet from Jamaica, captured Porto Bello, on the Isthmus of Darien, Dec. 1st—an exploit for which he received the thanks of both Houses of Parliament. His attempt on Cartagena, in the spring of 1741, proved, however, a complete failure. . . . A squadron, under Commodore Anson, despatched to the South Sea for the purpose of annoying the Spanish colonies of Peru and Chili, destroyed the Peruvian town of Paita, and made several prizes. . . . It was on this occasion that Anson circumnavigated the globe, having sailed from England in 1740 and returned to Spithead in 1744."—T. H. Dyer, *History of modern Europe*, bk. 6, ch. 3.—See also FRANCE: 1733; GEORGIA: 1738-1743.

1745.—Pitt's admission to the cabinet.—"From Walpole's death in 1745, when the star of the Stuarts set for ever among the clouds of Culloden, to 1754, when Henry Pelham [brother of the Duke of Newcastle and prime minister in 1743] followed his old chief, public life in England was singularly calm and languid. The temperate and peaceful disposition of the Minister seemed to pervade Parliament. At his death the King exclaimed: 'Now I shall have no more peace'; and the words proved to be prophetic. Both in Parliament and in the country, as well as beyond its shores, the elements of discord were swiftly at war. Out of conflicting ambitions and widely divergent interests a new type of statesman, very different from Walpole, or from Bolingbroke, or from Pelham, or from the 'hubble-bubble Newcastle,' was destined to arise. And along with the new statesman a new force, of which he was in part the representative, in part the creator, was to be introduced into political life. This new force was the unrepresented voice of the people. The new statesman was an ex-cornet of horse, William Pitt [who had long been the leader of a group of young men called 'Patriots' opposed to the ministry of Walpole], better known as Lord Chatham. The characteristics of William Pitt which mainly influenced his career were his ambition and his ill-health. Power, and that conspicuous form of egotism called personal glory, were the objects of his life. He pursued them with all the ardour of a strong-willed purpose; but the flesh was in his case painfully weak. Gout had declared itself his foe while he was still an Eton boy. His failures, and prolonged withdrawal at intervals from public affairs, were due to the inroads of this fatal enemy, from whom he was destined to receive his death-blow. Walpole had not been slow to recognize the quality of this 'terrible cornet of horse,' as he called him."—R. B. Brett, *Footprints of statesmen*, ch. 7.

1745-1747.—War of the Austrian Succession.—British incapacity.—Final successes at sea.—"The extraordinary incapacity of English commanders, both by land and sea, is one of the most striking facts in the war we are considering. . . . Mismanagement and languor were general. The battle of Dettingen [1743] was truly described as a happy escape rather than a great victory; the army

in Flanders can hardly be said to have exhibited any military quality except courage, and the British navy, though it gained some successes, added little to its reputation. The one brilliant exception was the expedition of Anson round Cape Horn, for the purpose of plundering the Spanish merchandise and settlements in the Pacific. . . . The overwhelming superiority of England upon the sea began, however, gradually to influence the war. The island of Cape Breton, which commanded the mouth of Gulf St. Lawrence, and protected the Newfoundland fisheries, was captured in the June of 1745. In 1747 a French squadron was destroyed by a very superior English fleet off Cape Finisterre. Another was defeated near Belleisle, and in the same year as many as 644 prizes were taken. The war on the part of the English, however, was most efficiently conducted by means of subsidies, which were enormously multiplied."—W. E. H. Lecky, *History of England*, 18th century, v. 1, ch. 3.

1754-1755.—Seven Years' War.—Causes and provocations.—"The seven years that succeeded the Peace of Aix-la-Chapelle [closing the War of the Austrian Succession, 1748] are described by Voltaire as among the happiest that Europe ever enjoyed. Commerce revived, the fine arts flourished, and the European nations resembled, it is said, one large family that had been reunited after its dissensions. Unfortunately, however, the peace had not exterminated all the elements of discord. Scarcely had Europe begun to breathe again when new disputes arose, and the seven years of peace and prosperity were succeeded by another seven of misery and war. The ancient rivalry between France and England, which had formerly vented itself in continental struggles, had, by the progress of maritime discovery and colonisation, been extended to all the quarters of the globe. The interests of the two nations came into collision in India, Africa and America, and a dispute about boundaries in this last quarter again plunged them into a war. By the 6th article of the Treaty of Aix-la-Chapelle, France and England were mutually to restore their conquests in such state as they were before the war. This clause became a copious source of quarrel. The principal dispute regarded the limits of Acadia, or Nova Scotia, which province had . . . been ceded to England. . . . Another dispute regarded the western limits of the British North American settlements. The English claimed the banks of the Ohio as belonging to Virginia, the French as forming part of Louisiana. . . . The question of boundaries was, however, undoubtedly the occasion, if not also the true cause, of the war. A series of desultory conflicts had taken place along the Ohio, and on the frontiers of Nova Scotia, in 1754, without being avowed by the mother countries. . . . Orders were now issued to the English fleet to attack French vessels wherever found. . . . It being known that a considerable French fleet was preparing to sail from Brest and Rochefort for America, Admiral Boscawen was despatched thither, and captured two French men-of-war off Cape Race in Newfoundland, June, 1755. [See CANADA: 1755 (June).] Hostilities were also transferred to the shores of Europe. . . . A naval war between England and France was now unavoidable; but, as in the case of the Austrian Succession, this was also to be mixed

up with a European war. The complicated relations of the European system again caused these two wars to run into one, though their origin had nothing in common. France and England, whose quarrel lay in the New World, appeared as the leading Powers in a European contest in which they had only a secondary interest, and decided the fate of Canada on the plains of Germany. The war in Europe, commonly called the Seven Years' War, was chiefly caused by the pride of one Empress [Maria Theresa], the vanity of another [Elizabeth of Russia], and the subserviency of a royal courtier [Madame Pompadour], who became the tool of these passions."—T. H. Dyer, *History of modern Europe*, v. 3, bk. 6, ch. 5.—"The Seven Years' War was in its origin not an European war at all; it was a war between England and France on Colonial questions with which the rest of Europe had nothing to do; but the alliances and enmities of England and France in Europe, joined with the fact that the King of England was also Elector of Hanover, made it almost certain that a war between England and France must spread to the Continent. I am far from charging on the English Government of the time—for it was they, and not the French, who forced on the war—as Macaulay might do, the blood of the Austrians who perished at Leuthen [1767], of the Russians sabred at Zorndorf [1758], and the Prussians mown down at Kunersdorf [1759]. The States of the Continent had many old enmities not either appeased or fought out to a result; and these would probably have given rise to a war some day, even if no black men, to adapt Macaulay again, had been previously fighting on the coast of Coromandel, nor red men scalping each other by the great lakes of North America. Still, it is to be remembered that it was the work of England that the war took place then and on those lines; and in view of the enormous suffering and slaughter of that war, and of the violent and arbitrary proceedings by which it was forced on, we may well question whether English writers have any right to reprobate Frederick's seizure of Silesia as something specially immoral in itself and disastrous to the world. If the Prussians were highway robbers, the English were pirates. . . . The origin of the war between England and France, if a struggle which had hardly been interrupted since the nominal peace could be said to have an origin, was the struggle for America."—A. R. Ropes, *Causes of the Seven Years' War* (Royal Historical Society, Transactions, new series, v. 4).—See also GERMANY: 1755-1756; CANADA: 1750-1753; OHIO: 1748-1754.

1757-1760.—Great administration of the Elder Pitt.—"In 1754 Henry Pelham died. The important consequence of his death was the fact that it gave Pitt at last an opportunity of coming to the front. The Duke of Newcastle, Henry Pelham's brother, became leader of the administration, with Henry Fox for Secretary at War, Pitt for Paymaster-general of the Forces, and Murray, afterwards to be famous as Lord Mansfield, for Attorney-general. There was some difficulty about the leadership of the House of Commons. Pitt was still too much disliked by the King to be available for the position. Fox for a while refused to accept it, and Murray was unwilling to do anything which might be likely to withdraw him from the professional path along

which he was to move to such distinction. An attempt was made to get on with a Sir Thomas Robinson, a man of no capacity for such a position, and the attempt was soon an evident failure. Then Fox consented to take the position on Newcastle's own terms, which were those of absolute submission to the dictates of Newcastle. Later still he was content to descend to a subordinate office which did not even give him a place in the Cabinet. Fox never recovered the damage which his reputation and his influence suffered by this amazing act. . . . The Duke of Newcastle's Ministry soon fell. Newcastle was not a man who had the slightest capacity for controlling or directing a policy of war; and the great struggle known as the Seven Years' War had now broken out. One lamentable event in the war has to be recorded, although it was but of minor importance. This was the capture of Minorca by the French under the romantic, gallant, and profligate Duc de Richelieu. The event is memorable chiefly, or only, because it was followed by the trial and execution [March 14, 1757] of the unfortunate Admiral Byng [see MINORCA: 1756]. . . . The Duke of Newcastle resigned office, and for a short time the Duke of Devonshire was at the head of a coalition Ministry which included Pitt. The King, however, did not stand this long, and one day suddenly turned them all out of office. Then a coalition of another kind was formed, which included Newcastle and Pitt, with Henry Fox in the subordinate position of paymaster. Pitt now for the first time had it all his own way. He ruled everything in the House of Commons. He flung himself with passionate and patriotic energy into the alliance with that great Frederick whose genius and daring were like his own."—J. McCarthy, *History of the four Georges*, v. 2, ch. 41.—"Newcastle took the Treasury. Pitt was Secretary of State, with the lead in the House of Commons, and with the supreme direction of the war and of foreign affairs. Fox, the only man who could have given much annoyance to the new Government, was silenced with the office of Paymaster, which, during the continuance of that war, was probably the most lucrative place in the whole Government. He was poor, and the situation was tempting. . . . The first acts of the new administration were characterized rather by vigour than by judgment. Expeditions were sent against different parts of the French coast with little success. . . . But soon conquests of a very different kind filled the kingdom with pride and rejoicing. A succession of victories undoubtedly brilliant, and, as it was thought, not barren, raised to the highest point the fame of the minister to whom the conduct of the war had been intrusted. In July, 1758, Louisburg fell. The whole island of Cape Breton was reduced. [See CANADA: 1758; CAPE BRETON ISLAND: 1758-1760.] The fleet to which the Court of Versailles had confided the defence of French America was destroyed. The captured standards were borne in triumph from Kensington Palace to the city, and were suspended in St. Paul's Church, amidst the roar of guns and kettle-drums, and the shouts of an immense multitude. Addresses of congratulation came in from all the great towns of England. Parliament met only to decree thanks and monuments, and to bestow, without one murmur, supplies more than double of those which had been given during the war of the Grand Alliance. The year 1750 opened with the conquest of Goree. Next fell Guadaloupe; then Ticonderoga; then Niagara. The Toulon squadron was completely defeated by Boscawen off Cape Lagos. But the greatest exploit of the year was the achievement of Wolfe on the heights of Abraham. The news of his glorious death and of

the fall of Quebec reached London in the very week in which the Houses met. [See CANADA: 1759 (July, August); 1759 (July-September).] All was joy and triumph. Envy and faction were forced to join in the general applause. Whigs and Tories vied with each other in extolling the genius and energy of Pitt. His colleagues were never talked of or thought of. The House of Commons, the nation, the colonies, our allies, our enemies, had their eyes fixed on him alone. Scarcely had Parliament voted a monument to Wolfe when another great event called for fresh rejoicings. The Brest fleet, under the command of Conflans, had put out to sea. It was overtaken by an English squadron under Hawke. Conflans attempted to take shelter close under the French coast. The shore was rocky: the night was black: the wind was furious: the waves of the Bay of Biscay ran high. But Pitt had infused into every branch of the service a spirit which had long been unknown. No British seaman was disposed to err on the same side with Byng. The pilot told Hawke that the attack could not be made without the greatest danger. 'You have done your duty in remonstrating,' answered Hawke; 'I will answer for everything. I command you to lay me alongside the French admiral.' Two French ships of the line struck. Four were destroyed. The rest hid themselves in the rivers of Brittany. [See below: 1759 (August-November).] The year 1760 came; and still triumph followed triumph. Montreal was taken; the whole Province of Canada was subjugated [see CANADA: 1759]; the French fleets underwent a succession of disasters in the seas of Europe and America. In the meantime conquests equalling in rapidity, and far surpassing in magnitude, those of Cortes and Pizarro, had been achieved in the East. In the space of three years the English had founded a mighty empire. The French had been defeated in every part of India. Chandernagore had surrendered to Clive, Pondicherry to Coote. Throughout Bengal, Bahar, Orissa, and the Carnatic, the authority of the East India Company was more absolute than that of Acbar or Aurungzebe had ever been. [See INDIA: 1757-1772; 1758-1761.] On the continent of Europe the odds were against England. We had but one important ally, the King of Prussia; and he was attacked, not only by France, but also by Russia and Austria. Yet even on the Continent, the energy of Pitt triumphed over all difficulties. Vehemently as he had condemned the practice of subsidising foreign princes, he now carried that practice farther than Carteret [John Carteret, Earl of Granville, in the cabinet of Lord Wilmington in 1742, unsuccessfully tried to form a ministry in 1746] himself would have ventured to do. The active and able Sovereign of Prussia [Frederick, the Great] received such pecuniary assistance as enabled him to maintain the conflict on equal terms against his powerful enemies. On no subject had Pitt ever spoken with so much eloquence and ardour as on the mischiefs of the Hanoverian connection. He now declared, not without much show of reason, that it would be unworthy of the English people to suffer their King to be deprived of his electoral dominions in an English quarrel. He assured his countrymen that they should be no losers, and that he would conquer America for them in Germany. By taking this line he conciliated the King, and lost no part of his influence with the nation. In Parliament, such was the ascendancy which his eloquence, his success, his high situation, his pride, and his intrepidity had obtained for him, that he took liberties with the House of which there had been no example, and which have never since been imitated. . . . The face of affairs was speedily

changed. The invaders [of Hanover] were driven out. . . . In the meantime, the nation exhibited all the signs of wealth and prosperity. . . . The success of our arms was perhaps owing less to the skill of his [Pitt's] dispositions than to the national resources and the national spirit. But that the national spirit rose to the emergency, that the national resources were contributed with unexampled cheerfulness, this was undoubtedly his work. The ardour of his soul had set the whole kingdom on fire. . . . The situation which Pitt occupied at the close of the reign of George the Second was the most enviable ever occupied by any public man in English history. He had conciliated the King; he domineered over the House of Commons; he was adored by the people; he was admired by all Europe. He was the first Englishman of his time; and he had made England the first country in the world. The Great Commoner, the name by which he was often designated, might look down with scorn on coronets and garters. The nation was drunk with joy and pride."—Lord Macaulay, *First essay on William Pitt, Earl of Chatham (Essays, v. 3)*.

1758 (June-August).—Seven Years' War.—Abortive expeditions against the coast of France.—Early in 1758 there was sent out "one of those joint military and naval expeditions which Pitt seems at first to have thought the proper means by which England should assist in a continental war. Like all such isolated expeditions, it was of little value. St. Malo, against which it was directed, was found too strong to be taken, but a large quantity of shipping and naval stores was destroyed. The fleet also approached Cherbourg, but although the troops were actually in their boats ready to land, they were ordered to re-embark, and the fleet came home. Another somewhat similar expedition was sent out later in the year. In July General Bligh and Commodore Howe took and destroyed Cherbourg, but on attempting a similar assault on St. Malo they found it too strong for them. The army had been landed in the Bay of St. Cast, and, while engaged in re-embarkation, it was attacked by some French troops which had been hastily collected and severely handled."—J. F. Bright, *History of England, period 3, p. 1027*.

1758-1759.—Seven Years' War in America. See CANADA: 1758; 1759; CAPE BRETON ISLAND: 1758-1760.

1759 (August-November).—British naval supremacy established.—Victories off Lagos and in Quiberon bay.—"Early in the year [1759] the French had begun to make preparations for an invasion of the British Isles on a large scale. Flat-bottomed boats were built at Havre and other places along the coasts of Normandy and Brittany, and large fleets were collected at Brest and Toulon, besides a small squadron at Dunkirk. . . . Had a landing been effected, the regular troops in the country, with the support of the newly created militia, would probably have been equal to the emergency; but a more effectual bulwark was found in the fleet, which watched the whole French coast, ready to engage the enemy as soon as he ventured out of his ports. The first attempt to break through the cordon was made by M. de la Clue from Toulon. The English Mediterranean fleet, under Admiral Boscawen, cruising before that port, was compelled early in July to retire to Gibraltar to take in water and provisions and to refit some of the ships. Hereupon M. de la Clue put to sea, and hugging the African coast, passed the

straits without molestation. Boscawen, however, though his ships were not yet refitted, at once gave chase, and came up with the enemy off [Lagos, on] the coast of Portugal, where an engagement took place [August 18], in which three French ships were taken and two driven on shore and burnt. The remainder took refuge in Cadiz, where they were blockaded till the winter, when, the English fleet being driven off the coast by a storm, they managed to get back to Toulon. The discomfiture of the Brest fleet, under M. de Conflans, was even more complete. On November 6 Admiral Sir Edward Hawke, who had blockaded Brest all the summer and autumn, was driven from his post by a violent gale, and on the 14th, Conflans put to sea with 21 sail of the line and 4 frigates. On the same day, Hawke, with 22 sail of the line, stood out from Torbay, where he had taken shelter, and made sail for Quibéron Bay, judging that Conflans would steer thither to liberate a fleet of transports which were blocked up in the river Morbihan, by a small squadron of frigates under Commodore Duff. On the morning of the 20th, he sighted the French fleet chasing Duff in Quibéron Bay. Conflans, when he discerned the English, recalled his chasing ships and prepared for action; but on their nearer approach changed his mind, and ran for shelter among the shoals and rocks of the coast. The sea was running mountains high and the coast was very dangerous and little known to the English, who had no pilots; but Hawke, whom no peril could daunt, never hesitated a moment, but crowded all sail after them. Without regard to lines of battle, every ship was directed to make the best of her way towards the enemy, the admiral telling his officers he was for the old way of fighting, to make down-right work with them. In consequence many of the English ships never got into action at all; but the short winter day was wearing away, and all haste was needed if the enemy were not to escape. . . . As long as daylight lasted the battle raged with great fury, so near the coast that '10,000 persons on the shore were the sad spectators of the white flag's disgrace.' . . . By nightfall two French ships, the *Thésée* 74, and *Superb* 70, were sunk, and two, the *Formidable* 80, and the *Héros* 74, had struck. The *Soleil Royal* afterwards went aground, but her crew escaped, as did that of the *Héros*, whose captain dishonourably ran her ashore in the night. Of the remainder, seven ships of the line and four frigates threw their guns overboard, and escaped up the river *Vilaine*, where most of them bumped their bottoms out in the shallow water; the rest got away and took shelter in the *Charente*, all but one, which was wrecked, but very few ever got out again. With two hours more of daylight Hawke thought he could have taken or destroyed all, as he was almost up with the French van when night overtook him. Two English ships, the *Essex* 64, and the *Resolution* 74, went ashore in the night and could not be got off, but the crews were saved, and the victory was won with the loss of 40 killed and 200 wounded. The great invasion scheme was completely wrecked. *Thurot* [Admiral *Thurot*, a celebrated French privateer] had succeeded in getting out from *Dunkirk*, and for some months was a terror to the northern coast-towns, but early in the following year an end was put to his career. For the rest of the war the French never ventured to meet the English in battle on the high seas, and could only look on helplessly while their colonies and commerce fell into the hands of their rivals. From the day of the fight in Quibéron Bay, the naval and commercial supremacy of England was assured."—F. W. Longman, *Frederick the Great and the Seven Years' War*, ch. 12, sect. 3.

1760-1763.—Accession of George III.—His ignorance and his despotic notions of kingship.—Retirement of the elder Pitt.—Rise and fall of Bute.—Grenville ministry.—"When George III. came to the throne, in 1760, England had been governed for more than half a century by the great Whig families which had been brought into the foreground by the revolution of 1688. . . . Under Walpole's wise and powerful sway, the first two Georges had possessed scarcely more than the shadow of sovereignty. It was the third George's ambition to become a real king, like the king of France or the king of Spain. From earliest babyhood, his mother had forever been impressing upon him the precept, 'George be king!' and this simple lesson had constituted pretty much the whole of his education. Popular tradition regards him as the most ignorant king that ever sat upon the English throne; and so far as general culture is concerned, this opinion is undoubtedly correct. . . . Nevertheless . . . George III. was not destitute of a certain kind of ability, which often gets highly rated in this not too clear-sighted world. He could see an immediate end very distinctly, and acquired considerable power from the dogged industry with which he pursued it. In an age where some of the noblest English statesmen drank their gallon of strong wine daily, or sat late at the gambling-table, or lived in scarcely hidden concubinage, George III. was decorous in personal habits and pure in domestic relations, and no banker's clerk in London applied himself to the details of business more industriously than he. He had a genuine talent for administration, and he devoted this talent most assiduously to selfish ends. Scantily endowed with human sympathy, and almost boorishly stiff in his ordinary unstudied manner, he could be smooth as oil whenever he liked. He was an adept in gaining men's confidence by a show of interest, and securing their aid by dint of fair promises; and when he found them of no further use, he could turn them adrift with wanton insult. Any one who dared to disagree with him upon even the slightest point of policy he straightway regarded as a natural enemy, and pursued him ever afterward with vindictive hatred. As a natural consequence, he surrounded himself with weak and short-sighted advisers, and toward all statesmen of broad views and independent character he nursed the bitterest rancour. . . . Such was the man who, on coming to the throne in 1760, had it for his first and chiefest thought to break down the growing system of cabinet government in England."—J. Fiske, *American Revolution*, v. 1, ch. 1.—"The dissolution of Parliament, shortly after his accession, afforded an opportunity of strengthening the parliamentary connection of the king's friends. Parliament was kept sitting while the king and Lord Bute were making out lists of the court candidates, and using every exertion to secure their return. The king not only wrested government boroughs from the ministers, in order to nominate his own friends, but even encouraged opposition to such ministers as he conceived not to be in his interest. . . . Lord Bute, the originator of the new policy, was not personally well qualified for its successful promotion. He was not connected with the great families who had acquired a preponderance of political influence; he was no parliamentary debater: his manners were unpopular: he was a courtier rather than a politician: his intimate relations with the Princess of

Wales [wife of Frederick, father of George III] were an object of scandal; and, above all, he was a Scotchman. . . . Immediately after the king's accession he had been made a privy councillor, and admitted into the cabinet. An arrangement was soon afterwards concerted, by which Lord Holderness retired from office with a pension, and Lord Bute succeeded him as Secretary of State. It was now the object of the court to break up the existing ministry, and to replace it with another, formed from among the king's friends. Had the ministry been united, and had the chiefs reposed confidence in one another, it would have been difficult to overthrow them. But there were already jealousies amongst them, which the court lost no opportunity of fomenting. A breach soon arose between Mr. Pitt, the most powerful and popular of the ministers, and his colleagues. He desired to strike a sudden blow against Spain, which had concluded a secret treaty of alliance with France, then at war with this country [see FRANCE: 1761 (August); SPAIN: 1761-1763]. Though war minister he was opposed by all his colleagues except Lord Temple. He bore himself haughtily at the council,—declared that he had been called to the ministry by the voice of the people, and that he could not be responsible for measures which he was no longer allowed to guide. Being met with equal loftiness in the cabinet, he was forced to tender his resignation. The king overpowered the retiring minister with kindness and condescension. He offered the barony of Chatham to his wife, and to himself an annuity of £3,000 a year for three lives. The minister had deserved these royal favours, and he accepted them, but at the cost of his popularity. . . . The same Gazette which announced his resignation, also trumpeted forth the peerage and the pension, and was the signal for clamours against the public favourite. On the retirement of Mr. Pitt, Lord Bute became the most influential of the ministers. He undertook the chief management of public affairs in the cabinet, and the sole direction of the House of Lords. . . . His ascendancy provoked the jealousy and resentment of the king's veteran minister, the Duke of Newcastle: who had hitherto distributed all the patronage of the Crown, but now was never consulted. . . . At length, in May, 1762, his grace, after frequent disagreements in the cabinet and numerous affronts, was obliged to resign. And now, the object of the court being at length attained, Lord Bute was immediately placed at the head of affairs, as First Lord of the Treasury. . . . The king and his minister were resolved to carry matters with a high hand, and their arbitrary attempts to coerce and intimidate opponents disclosed their imperious views of the prerogative. Preliminaries of a treaty of peace with France having been agreed upon, against which a strong popular feeling was aroused, the king's vengeance was directed against all who ventured to disapprove them. The Duke of Devonshire having declined to attend the council summoned to decide upon the peace, was insulted by the king, and forced to resign his office of Lord Chamberlain. A few days afterwards the king, with his own hand, struck his grace's name from the list of privy councillors. . . . No sooner had Lord Rockingham heard of the treatment of the Duke of Devonshire than he . . . resigned his place in the household. A more general proscription of the Whig nobles soon followed. The Dukes of Newcastle and Grafton, and the Marquess of Rockingham, having presumed, as peers of Parliament, to express their disapprobation of the peace, were dismissed from the lord-lieutenancies of their counties. . . . Nor was the vengeance of the court confined to the heads of the Whig party. All placemen,

who had voted against the preliminaries of peace, were dismissed. . . . The preliminaries of peace were approved by Parliament; and the Princess of Wales, exulting in the success of the court, exclaimed, 'Now my son is king of England.' But her exultation was premature. . . . These stretches of prerogative served to unite the Whigs into an organised opposition. . . . The fall of the king's favoured minister was even more sudden than his rise. . . . Afraid, as he confessed, 'not only of falling himself, but of involving his royal master in his ruin,' he resigned suddenly [April 7, 1763].—to the surprise of all parties, and even of the king himself,—before he had held office for eleven months. . . . He retreated to the interior cabinet, whence he could direct more securely the measures of the court; having previously negotiated the appointment of Mr. George Grenville as his successor, and arranged with him the nomination of the cabinet. The ministry of Mr. Grenville was constituted in a manner favourable to the king's personal views, and was expected to be under the control of himself and his favourite."—T. E. 1762-1764.—"North Briton," No. 45, and the prosecution of Wilkes.—"At first the king got on well with Grenville, as they were both inclined to take high-handed proceedings with those who criticised the Government. John Wilkes, a member of the House of Commons, blamed the king's speech in No. 45 of the *North Briton*. The king ordered the prosecution of all concerned in the article, and Lord Halifax, as Secretary of State, issued a warrant for the apprehension of its authors, printers, and publishers. Such a warrant was called a general warrant, because it did not specify the name of any particular person who was to be arrested. On this warrant Wilkes was arrested and sent to the Tower. On May 6, however, he was discharged by Pratt, the Chief Justice of the Common Pleas, on the ground that, by his privilege as a member of Parliament, he was protected from arrest, except for treason, felony, or breach of the peace. Not long afterwards Pratt declared general warrants to be illegal, though there had been several examples of their use. In November, 1763, the House of Commons, urged on by the king and Grenville, voted No. 45 of the *North Briton* to be a libel, whilst the House of Lords attacked Wilkes on the ground that in the notes of an indecent poem called *An Essay on Woman*, of which he was the author, he had assailed Bishop Warburton, a member of that House. Wilkes, indeed, had never published the poem, but its existence was betrayed by Lord Sandwich, one of the Bedford party, who had been a boon companion of Wilkes, and whose life was as profligate as Wilkes's own. On January 19, 1764, the House of Commons expelled Wilkes on account of No. 45, and on February 21, in the Court of King's Bench, a verdict was recorded against him both as a libeller and as the author of an obscene poem. Attempts having been made to get rid of him by challenging him to fight duels, he escaped to France and was outlawed by the Court."—S. R. Gardiner, *Student's history of England, pp. 260-270.*—The Bedford party was so-called after John

Russell, fourth duke of Bedford, who was a violent opponent of Pitt and had been one of the negotiators of peace at the end of the Seven Years' War. When he was ousted from the ministry with the fall of Bute, he headed the Bedford party or the "Bloomsbury Gang."

1765-1768.—Grenville dismissed.—Rockingham and Grafton-Chatham ministries.—Repeal of the Stamp Act.—Fresh trouble in the American colonies.—"Hitherto the Ministry had only excited the indignation of the people and the colonies. Not satisfied with the number of their enemies, they now proceeded to quarrel openly with the king. In 1765 the first signs of the illness, to which George afterwards fell a victim, appeared; and as soon as he recovered he proposed, with wonderful firmness, that a Regency Bill should be brought in, limiting the king's choice of a Regent to the members of the Royal Family. The Ministers, however, in alarm at the prospect of a new Bute Ministry, persuaded the king that there was no hope of the Princess's name being accepted, and that it had better be left out of the Bill. The king unwisely consented to this unparalleled insult on his parent, apparently through lack of consideration. Parliament, however, insisted on inserting the Princess's name by a large majority, and thus exposed the trick of his Ministers. This the king never forgave. They had been for some time obnoxious to him, and now he determined to get rid of them. With this view he induced the Duke of Cumberland to make overtures to Chatham [Pitt, not yet titled], offering almost any terms." But no arrangement was practicable, and the king was left quite at the mercy of the ministers he detested. "He was obliged to consent to dismiss Bute and all Bute's following. He was obliged to promise that he would use no underhand influence for the future. Life, in fact, became a burden to him under George Grenville's domination, and he determined to dismiss him, even at the cost of accepting the Whig Houses, whom he had pledged himself never to employ again. Pitt and Temple still proving obdurate, Cumberland opened negotiations with the Rockingham Whigs, and the Grenville Ministry was at an end [July, 1765]. . . . The new Ministry was composed as follows: Rockingham became First Lord of the Treasury; Dowdeswell, Chancellor of the Exchequer; Newcastle, Privy Seal; Northington, Lord Chancellor. . . . Their leader Rockingham was a man of sound sense, but no power of language or government. . . . He was totally free from any suspicion of corruption. In fact there was more honesty than talent in the Ministry altogether. . . . The back-bone of the party was removed by the refusal of Pitt to co-operate. Burke was undoubtedly the ablest man among them, but his time was not yet come. Such a Ministry, it was recognized even by its own members, could not last long. However, it had come in to effect certain necessary legislation, and it certainly so far accomplished the end of its being. It repealed the Stamp Act [see U. S. A.: 1766: Repeal of Stamp Act], which had caused so much indignation among the Americans; and at the same

time passed a law securing the dependence of the colonies. . . . The king, however, made no secret of his hostility to his Ministers. . . . The conduct of Pitt in refusing to join them was a decided mistake, and more. He was really at one with them on most points. Most of their acts were in accordance with his views. But he was determined not to join a purely party Ministry, though he could have done so practically on whatever terms he pleased. In 1766, however, he consented to form a coalition, in which were included men of the most opposite views—"King's Friends," Rockingham Whigs, and the few personal followers of Pitt. Rockingham refused to take any office, and retired to the more congenial occupation of following the hounds. The nominal Prime Minister of this Cabinet was the Duke of Grafton, for Pitt refused the leadership, and retired to the House of Lords as Lord Chatham. Charles Townshend became Chancellor of the Exchequer, and Lord North, the leader of the 'King's Friends,' was Pay-master. The Ministry included Shelburne, Barré, Conway, Northington, Barrington, Camden, Granby—all men of the most opposite views. . . . This second Ministry of Pitt was a mistake from the very first. He lost all his popularity by taking a peerage. . . . As a peer and Lord Privy Seal he found himself in an uncongenial atmosphere. . . . His name, too, had lost a great deal of its power abroad. 'Pitt' had, indeed, been a word to conjure with; but there were no associations of defeat and humiliation connected with the name of 'Chatham.' . . . There were other difficulties, however, as well. His arrogance had increased, and it was so much intensified by irritating gout, that it became almost impossible to serve with him. His disease later almost approached madness. . . . The Ministry drifted helplessly about at the mercy of each wind and wave of opinion like a water-logged ship; and it was only the utter want of union among the Opposition which prevented its sinking entirely. As it was, they contrived to renew the breach with America, which had been almost entirely healed by Rockingham's repeal of the Stamp Act. Charles Townshend, the Chancellor of the Exchequer, was by far the ablest man left in the Cabinet, and he rapidly assumed the most prominent position. He had always been in favour of taxing America. He now brought forward a plan for raising a revenue from tea, glass, and paper [see U. S. A.: 1766-1767, and 1767-1768], by way of import duty at the American ports. . . . This wild measure was followed shortly by the death of its author, in September; and then the weakness of the Ministry became so obvious that, as Chatham still continued incapable, some fresh reinforcement was absolutely necessary. A coalition was effected with the Bloomsbury Gang; and, in consequence, Lords Gower, Weymouth, and Sandwich joined the Ministry. Lord Northington and General Conway retired. North succeeded Townshend at the Exchequer. Lord Hillsborough became the first Secretary of State for the Colonies, thus raising the number of Secretaries to three. This Ministry was probably the worst that had governed England since the days of the Cabal; and the short period of its existence was marked by a succession of arbitrary and foolish acts. On every important question that it had to deal with, it pursued a course diametrically opposed to Chatham's views; and yet with singular irony his nominal connection with it was not severed for some time. [that is, not until the following year, 1768]."—B. C. Skottowe, *Our Hanoverian kings*, pp. 234-230.

1768-1774.—John Wilkes and the king and Parliament again.—Middlesex elections.—In March, 1768, Wilkes, though outlawed by the court, returned to London from Paris and solicited a pardon from the king; but his petition was unnoticed. Parliament being then dissolved and writs issued for a new election, he offered himself as a candidate to represent the City of London. "He polled 1,247 votes, but was unsuccessful. On the day following this decision he issued an address to the freeholders of Middlesex. The election took place at Brentford, on the 28th of March. At the close of the poll the numbers were—Mr. Wilkes, 1,202; Mr. Cooke, 827; Sir W. B. Proctor, 807. This was a victory which astonished the public and terrified the ministry. The mob was in ecstasies. The citizens of London were compelled to illuminate their houses and to shout for 'Wilkes and liberty.' It was the earnest desire of the ministry to pardon the man whom they had persecuted, but the king remained inexorable. . . . A month after the election he wrote to Lord North: 'Though relying entirely on your attachment to my person as well as in your hatred of any lawless proceeding, yet I think it highly expedient to apprise you that the expulsion of Mr. Wilkes appears to be very essential, and must be effected.' What the sovereign counselled was duly accomplished. Before his expulsion, Wilkes was a prisoner in the King's Bench. Having surrendered, it was determined that his outlawry was informal; consequently it was reversed, and sentence was passed for the offences whereof he had been convicted. He was fined £1,000, and imprisoned for twenty-two months. On his way to prison he was rescued by the mob; but as soon as he could escape out of the hands of his boisterous friends he went and gave himself into the custody of the Marshal of the King's Bench. Parliament met on the 10th of April, and it was thought that he would be released in order to take his seat. A dense multitude assembled before the prison, but, balked in its purpose of escorting the popular favourite to the House, became furious, and commenced a riot. Soldiers were at hand prepared for this outbreak. They fired, wounding and slaughtering several persons; among others, they butchered a young man whom they found in a neighbouring house, and who was mistaken for a rioter they had pursued. At the inquest the jury brought in a verdict of wilful murder against the magistrate who ordered the firing, and the soldier who did the deed. The magistrate was tried and acquitted. The soldier was dismissed the service, but received in compensation, as a reward for his services, a pension of one shilling a day. A general order sent from the War Office by Lord Barrington conveyed his Majesty's express thanks to the troops employed, assuring them 'that every possible regard shall be shown to them; their zeal and good behaviour on this occasion deserve it; and in case any disagreeable circumstance should happen in the execution of their duty, they shall have every defence and protection that the law can authorise and this office can give.' This approbation of what the troops had done was the necessary supplement to a dispatch from Lord Weymouth sent before the riot, and intimating that force was to be used without scruple. Wilkes commented on both documents. His observations on the latter drew a complaint from Lord Weymouth of breach of privilege. This was made an additional pretext for his expulsion from the House of Commons.

Ten days afterwards he was re-elected, his opponent receiving five votes only. On the following day the House resolved 'that John Wilkes, Esquire, having been in this session of Parliament expelled this House, was and is incapable of being elected a member to serve in this present Parliament'; and his election was declared void. Again the freeholders of Middlesex returned him, and the House re-affirmed the above resolution. At another election he was opposed by Colonel Luttrell, a Court tool, when he polled 1,143 votes against 200 cast for Luttrell. It was declared, however, that the latter had been elected. Now began a struggle between the country, which had been outraged in the persons of the Middlesex electors, and a subservient majority in the House of Commons that did not hesitate to become instrumental in gratifying the personal resentment of a revengeful and obstinate king. The cry of 'Wilkes and liberty' was raised in quarters where the very name of the popular idol had been proscribed. It was evident that not the law only had been violated in his person, but that the Constitution itself had sustained a deadly wound. Wilkes was overwhelmed with substantial marks of sympathy. In the course of a few weeks £20,000 were subscribed to pay his debts. He could boast, too, that the courts of law had at length done what was right between him and one of the Secretaries of State who had signed the General Warrant, the other having been removed by death beyond the reach of justice. Lord Halifax was sentenced to pay £4,000 damages. These damages, and the costs of the proceedings, were defrayed out of the public purse. Lord North admitted that the outlay had exceeded £100,000. Thus the nation was doubly insulted by the ministers, who first violated the law, and then paid the costs of the proceedings out of the national taxes. On the 17th of April, 1770, Wilkes left the prison, to be elected in rapid succession to the offices—then much sought after, because held in high honour—of Alderman, Sheriff, and Lord Mayor of London. In 1774 he was permitted to take his seat as Member for Middlesex. After several failures, he succeeded in getting the resolutions of his incapacity to sit in the House formally expunged from its journals. He was elected Chamberlain of the City in 1779, and filled that lucrative and responsible post till his death, in 1797, at the age of seventy. Although the latter portion of his career as Member of Parliament has generally been considered a blank, yet it was marked by several incidents worthy of attention. He was a consistent and energetic opponent of the war with America."—W. F. Rae, *John Wilkes (Fortnightly Review, Sept., 1868, v. 10)*.

1770.—Fall of the Grafton ministry.—Beginning of the administration of Lord North.—"The incompetency of the ministry was . . . becoming obvious. In the first place it was divided within itself. The Prime Minister [Grafton], with the Chancellor and some others, were remnants of the Chatham ministry and admirers of Chatham's policy. The rest of the Cabinet were either men who represented Bedford's party, or members of that class whose views are sufficiently explained by their name, 'the King's friends.' Grafton, fonder of hunting and the turf than of politics, had by his indolence suffered himself to fall under the influence of the last-named party, and unconstitutional action [Middlesex election (see above):

1768-1774) had been the result which had brought discontent in England to the verge of open outbreak. Hillsborough, under the same influence, was hurrying along the road which led to the loss of America. On this point the Prime Minister had found himself in a minority in his own Cabinet. France too, under Choiseul [the great French minister of foreign affairs who arranged favorable peace terms for his country in 1763], in alliance with Spain, was beginning to think of revenge for the losses of the Seven Years' War. A crisis was evidently approaching, and the Opposition began to close their ranks. Chatham, yielding again to the necessities of party, made a public profession of friendship with Temple and George Grenville; and though there was no cordial connection, there was external alliance between the brothers and the old Whigs under Rockingham. In the first session of 1770 the storm broke. Notwithstanding the state of public affairs, the chief topic of the King's speech was the murrain among 'horned beasts;—a speech not of a king, but, said Junius, of 'a ruined grazier.' Chatham at once moved an amendment when the address in answer to this speech was proposed. He deplored the want of all European alliances, the fruit of our desertion of our allies at the Peace of Paris; he blamed the conduct of the ministry with regard to America, which, he thought, needed much gentle handling, inveighed strongly against the action of the Lower House in the case of Wilkes, and ended by moving that that action should at once be taken into consideration. At the sound of their old leader's voice his followers in the Cabinet could no longer be silent. Camden declared he had been a most unwilling party to the persecution of Wilkes, and though retaining the Seals, attacked and voted against the ministry. In the Lower House, Granby, one of the most popular men in England, followed the same course. James Grenville and Dunning, the Solicitor-General, also resigned. Chatham's motion was lost, but was followed up by Rockingham, who asked for a night to consider the state of the nation. . . . Grafton thus found himself in no state to meet the Opposition, and in his heart still admiring Chatham, and much disliking business, he suddenly and unexpectedly gave in his resignation the very day fixed for Rockingham's motion. The Opposition seemed to have everything in their own hands, but there was no real cordiality between the two sections. . . . The King with much quickness and decision, took advantage of this disunion. To him it was of paramount importance to retain his friends in office, and to avoid a new Parliament elected in the present excited state of the nation. There was only one of the late ministry capable of assuming the position of Prime Minister. This was Lord North, Chancellor of the Exchequer, and to him the King immediately and successfully applied, so that while the different sections of the Opposition were still unable to decide on any united action, they were astonished to find the old ministry reconstituted and their opportunity gone. The new Prime Minister . . . had great capacity for business and administration, and much sound sense; he was a first-rate debater, and gifted with a wonderful sweetness of temper, which enabled him to listen unmoved, or even to sleep, during the most violent attacks upon himself, and to turn aside the bitterest invectives with a happy joke. With his accession to the Premiership the unstable character of the Government ceased. Resting on the King, making himself no more than an instrument of the King's will, and thus commanding the support of all royal influence, from

whatever source derived, North was able to bid defiance to all enemies, till the ill effects of such a system of government, and of the King's policy, became so evident that the clamour for a really responsible minister grew too loud to be disregarded. [Lord North's ministry lasted from 1770-1782, longer than all the other ministries in the reign combined.] Thus is closed the great constitutional struggle of the early part of the reign—the struggle of the King, supported by the unrepresented masses, and the more liberal and independent of those who were represented, against the domination of the House of Commons. It was an attempt to break those trammels which, under the guise of liberty, the upper classes, the great lords and landed aristocracy, had succeeded after the Revolution in laying on both Crown and people. In that struggle the King had been victorious. But he did not recognize the alliance which had enabled him to succeed. He did not understand that the people had other objects much beyond his own."—J. F. Bright, *History of England, period 3*, pp. 1057-1060.

1771.—Last contention of Parliament against the press.—Freedom of reporting secured.—"The session of 1771 commenced with a new quarrel between the House of Commons and the country. The standing order for the exclusion of strangers, which had long existed (and which still exists), was seldom enforced, except when it was thought desirable that a question should be debated with closed doors. It was now attempted, by means of this order, to prevent the publication of the debates and proceedings of the House. It had long been the practice of the newspapers, and other periodical journals, to publish the debates of Parliament, under various thin disguises, and with more or less fulness and accuracy, from speeches furnished at length by the speakers themselves, to loose and meagre notes of more or less authenticity. One of the most attractive features of the 'Gentleman's Magazine, a monthly publication of respectability, which has survived to the present day, was an article which purported to be a report of the debates in Parliament. This report was, for nearly three years, prepared by Dr. Johnson, who never attended the galleries himself, and derived his information from persons who could seldom give him more than the names of the speakers, and the side which each of them took in the debate. The speeches were, therefore, the composition of Johnson himself; and some of the most admired oratory of the period was avowedly the product of his genius. Attempts were made from time to time, both within and without the walls of Parliament, to abolish, or at least to modify, the standing order for the exclusion of strangers, by means of which the license of reporting had been restricted; for there was no order of either House specifically prohibiting the publication of its debates. But such proposals had always been resisted by the leaders of parties, who thought that the privilege was one which might be evaded, but could not safely be formally relinquished. The practice of reporting, therefore, was tolerated on the understanding, that a decent disguise should be observed; and that no publication of the proceedings of Parliament should take place during the session. There can be little doubt, however, that the public journals would have

gone on, with the tacit connivance of the parliamentary chiefs, until they had practically established a right of reporting regularly the proceedings of both Houses, had not the presumptuous folly of inferior members provoked a conflict with the press upon this ground of privilege, and, in the result, driven Parliament reluctantly to yield what they would otherwise have quietly conceded. It was Colonel Onslow, member for Guildford, who rudely agitated a question which wiser men had been content to leave unvexed; and by his rash meddling, precipitated the very result which he thought he could prevent. He complained that the proceedings of the House had been inaccurately reported; and that the newspapers had even presumed to reflect on the public conduct of honourable members."—W. Massey, *History of England*, v. 2, ch. 15.—"Certain printers were in consequence ordered to attend the bar of the House. Some appeared and were discharged, after receiving, on their knees, a reprimand from the Speaker. Others evaded compliance; and one of them, John Miller, who failed to appear, was arrested by its messenger, but instead of submitting, sent for a constable and gave the messenger into custody for an assault and false imprisonment. They were both taken before the Lord Mayor (Mr. Brass Crosby), Mr. Alderman Oliver, and the notorious John Wilkes, who had recently been invested with the aldermanic gown. These civic magistrates, on the ground that the messenger was neither a peace-officer nor a constable, and that his warrant was not backed by a city magistrate, discharged the printer from custody, and committed the messenger to prison for an unlawful arrest. Two other printers, for whose apprehension a reward had been offered by a Government proclamation, were collusively apprehended by friends, and taken before Aldermen Wilkes and Oliver, who discharged the prisoners as 'not being accused of having committed any crime.' These proceedings at once brought the House into conflict with the Lord Mayor and Aldermen of London. The Lord Mayor and Alderman Oliver, who were both members of Parliament, were ordered by the House to attend in their places, and were subsequently committed to the Tower. Their imprisonment, instead of being a punishment, was one long-continued popular ovation, and from the date of their release, at the prorogation of Parliament shortly afterwards, the publication of debates has been pursued without any interference or restraint. Though still in theory a breach of privilege, reporting is now encouraged by Parliament as one of the main sources of its influence—its censure being reserved for wilful misrepresentation only. But reporters long continued beset with many difficulties. The taking of notes was prohibited, no places were reserved for reporters, and the power of a single member of either House to require the exclusion of strangers was frequently and capriciously employed. By the ancient usage of the House of Commons [until 1875] any one member by merely 'spying' strangers present could compel the Speaker to order their withdrawal."—T. P. Taswell-Langmead, *English constitutional history*, ch. 17.

1776-1778.—People, parties, king, and Lord North, in their relations to the American Revolution.—"The undoubted popularity of the war [in America] in its first stage had for some time continued to increase, and in the latter part of 1776 and 1777 it had probably attained its maximum. . . . The Whigs at this time very fully admitted that the genuine opinion of the country was with the Government and with the King. . . . The Declaration of Independence, and the known overtures of the Americans to France, were deemed the climax of insolence and ingratitude. The damage done to English commerce, not only in the West Indies but even around the English and Irish coast, excited a widespread bitterness. . . . In every stage of the contest the influence of the Opposition was employed to trammel the Government. . . . The statement of Wraxall that the Whig colours of buff and blue were first adopted by Fox in imitation of the uniform of Washington's troops, is, I believe, corroborated by no other writer; but there is no reason to question his assertion that the members of the Whig party in society and in both Houses of Parliament during the whole course of the war wished success to the American cause and rejoiced in the American triumphs. . . . While the Opposition needlessly and heedlessly intensified the national feeling against them, the King, on his side, did the utmost in his power to embitter the contest. It is only by examining his correspondence with Lord North that we fully realise how completely at this time he assumed the position not only of a prime minister but of a Cabinet, superintending, directing, and prescribing, in all its parts, the policy of the Government. . . . 'Every means of distressing America,' wrote the King, 'must meet with my concurrence.' He strongly supported the employment of Indians. . . . It was the King's friends who were most active in promoting all measures of violence. . . . The war was commonly called the 'King's war,' and its opponents were looked upon as opponents of the King. The person, however, who in the eye of history appears most culpable in this matter, was Lord North. . . . The publication of the correspondence of George III. . . . supplies one of the most striking and melancholy examples of the relation of the King to his Tory ministers. It appears from this correspondence that for the space of about five years North, at the treaty of the King, carried on a bloody, costly, and disastrous war in direct opposition to his own judgment and to his own wishes. . . . Again and again he entreated that his resignation might be accepted, but again and again he yielded to the request of the King, who threatened, if his minister resigned, to abdicate the throne. . . . The King was determined, under no circumstances, to treat with the Americans on the basis of the recognition of their independence; but he acknowledged, after the surrender of Burgoyne, and as soon as the French war had become inevitable, that unconditional submission could no longer be hoped for. . . . He consented, too, though apparently with extreme reluctance, and in consequence of the unanimous vote of the Cabinet, that new propositions should be made to the Americans." These overtures, conveyed to America by three Commissioners, were rejected, and the colonies concluded, in the spring of 1778, their alliance with France. "The moment was one of the most terrible in English history. England had not an ally in the world. . . . England, already exhausted

by a war which its distance made peculiarly terrible, had to confront the whole force of France, and was certain in a few months to have to encounter the whole force of Spain. . . . There was one man to whom, in this hour of panic and consternation, the eyes of all patriotic Englishmen were turned. . . . If any statesman could, at the last moment, conciliate [the Americans], dissolve the new alliance, and kindle into a flame the loyalist feeling which undoubtedly existed largely in America, it was Chatham. If, on the other hand, conciliation proved impossible, no statesman could for a moment be compared to him in the management of a war. Lord North implored the King to accept his resignation, and to send for Chatham. Bute, the old Tory favourite, breaking his long silence, spoke of Chatham as now indispensable. Lord Mansfield, the bitterest and ablest rival of Chatham, said, with tears in his eyes, that unless the King sent for Chatham the ship would assuredly go down. . . . The King was unmoved. He consented indeed—and he actually authorised Lord North to make the astounding proposition—to receive Chatham as a subordinate minister to North. . . . This episode appears to me the most criminal in the whole reign of George III., and in my own judgment it is as criminal as any of those acts which led Charles I. to the scaffold.”—W. E. H. Lecky, *History of England in the 18th century*, v. 4, ch. 14.—“George III. and Lord North have been made scapegoats for sins which were not exclusively their own. The minister, indeed, was only the vizier, who hated his work, but still did not shrink from it, out of a sentiment that is sometimes admired under the name of loyalty, but which in such a case it is difficult to distinguish from base servility. The impenetrable mind of the King was, in the case of the American war, the natural organ and representative of all the lurking ignorance and arbitrary humours of the entire community. It is totally unjust and inadequate to lay upon him the entire burden.”—J. Morley, *Edmund Burke: A historical study*, p. 135.—“No sane person in Great Britain now approves of the attempt to tax the colonies. No sane person does otherwise than rejoice that the colonies became free and independent. But let us in common fairness say a word for King George. In all that he did he was backed by the great mass of the British nation. And let us even say a word for the British nation also. Had the King and the nation been really wise, they would have let the colonies go without striking a blow. But then no king and no nation ever was really wise after that fashion. King George and the British nation were simply not wiser than other people. I believe that you may turn the pages of history from the earliest to the latest times, without finding a time when any king or any commonwealth, freely and willingly, without compulsion or equivalent, gave up power or dominion, or even mere extent of territory on the map, when there was no real power or dominion. Remember that seventeen years after the acknowledgment of American independence, King George still called himself King of France. Remember that, when the title was given up, some people thought it unwise to give it up. Remember that some people . . . regretted the separation between the crowns of Great Britain and Hanover. If they lived to see the year 1866, perhaps they grew wiser.”—E. A. Freeman, *The English people in its three homes (Lectures to American Audiences)*, pp. 183-184.

1778-1780.—Repeal of Catholic penal laws.—Gordon riots.—“The Quebec Act of 1774 [see CANADA: 1763-1774], establishing Catholicism in Canada, would a generation earlier have been impossible, and it was justly considered a remarkable sign of the altered condition of opinion that such a law should be enacted by a British Parliament, and should have created no serious disturbances in the country. . . . The success of the Quebec Act led Parliament, a few years later, to undertake the relief of the Catholics at home from some part of the atrocious penal laws to which they were still subject.”—W. E. H. Lecky, *History of England in the 18th century*, v. 3, ch. 3.

“On June 2, 1780, the Duke of Richmond called, in the House of Lords, for manhood suffrage and annual Parliaments. That very day the unfitnes of the multitude of those times for political power received a strong illustration. In 1778 Sir George Savile had carried a Bill relieving Roman Catholics of some of the hardships inflicted on them by the law. The cry of ‘No Popery’ was at once raised, and, whilst the Duke of Richmond was speaking to the peers, a mob, led by Lord George Gordon, a half-crazy fanatic, poured down to Westminster with a petition for the repeal of Savile’s Act. Members of both Houses were hustled and ill-used, and for some time the mob endeavoured to burst into the House of Commons. Failing in this, they streamed off, and sacked and burnt the chapels of Roman Catholic ambassadors. The mob, however, loved riot more than they hated Popery. They burnt Newgate and liberated the prisoners. They fell, with special eagerness, upon the houses of magistrates. For six days they were in complete possession of a considerable part of London, plundering and setting fire to houses at their pleasure. Soldiers alone could arrest such a flood of mischief; and when, at last, soldiers were ordered to attack the mob, the riot was suppressed.”—S. R. Gardiner, *Student’s history of England*, pp. 790-792.

1780-1782.—Declining strength of the government.—Rodney’s great naval victory.—Siege of Gibraltar.—“The fall of Lord North’s ministry, and with it the overthrow of the personal government of George III., was now close at hand. For a long time the government had been losing favour. In the summer of 1780, the British victories in South Carolina had done something to strengthen, yet when, in the autumn of that year, Parliament was dissolved, although the king complained that his expenses for purposes of corruption had been twice as great as ever before, the new Parliament was scarcely more favourable to the ministry than the old one. Misfortunes and perplexities crowded in the path of Lord North and his colleagues. The example of American resistance had told upon Ireland. . . . For more than a year there had been war in India, where Hyder Ali [great Indian commander and ruler; the most dangerous Asiatic foe

with which the English ever contended], for the moment, was carrying everything before him. France, eager to regain her lost foothold upon Hindustan, sent a strong armament thither, and insisted that England must give up all her Indian conquests except Bengal. For a moment England's great Eastern empire tottered, and was saved only by the superhuman efforts of Warren Hastings, aided by the wonderful military genius of Sir Eyre Coote. In May, 1781, the Spaniards had taken Pensacola, thus driving the British from their last position in Florida [see FLORIDA: 1779-1781]. In February, 1782, the Spanish fleet captured Minorca, and the siege of Gibraltar, which had been kept up for nearly three years, was pressed with redoubled energy. During the winter the French recaptured St. Eustatius, and handed it over to Holland; and Grasse's great fleet swept away all the British possessions in the West Indies, except Jamaica, Barbadoes, and Antigua. All this time the Northern League kept up its jealous watch upon British cruisers in the narrow seas, and among all the powers of Europe the government of George could not find a single friend. The maritime supremacy of England was, however, impaired but for a moment. Rodney was sent back to the West Indies, and on the 12th of April, 1782, his fleet of 36 ships encountered the French near the island of Sainte-Marie-Galante. The battle [called the "Battle of the Saints"] of eleven hours which ensued . . . was one of the most tremendous contests ever witnessed upon the ocean before the time of Nelson. The French were totally defeated, and Grasse was taken prisoner,—the first French commander-in-chief, by sea or land, who had fallen into an enemy's hands since Marshal Tallard gave up his sword to Mariborough, on the terrible day of Blenheim. France could do nothing to repair this crushing disaster. Her naval power was eliminated from the situation at a single blow; and in the course of the summer the English achieved another great success by overthrowing the Spaniards at Gibraltar, after a struggle which, for dogged tenacity, is scarcely paralleled in modern warfare. By the autumn of 1782, England, defeated in the United States, remained victorious and defiant as regarded the other parties to the war."—J. Fiske, *American Revolution*, v. 2, ch. 15.—"Gibraltar . . . had been closely invested for nearly three years. At first, the Spanish had endeavoured to starve the place; but their blockade having been on two occasions forced by the British fleet, they relinquished that plan, and commenced a regular siege. During the spring and summer of 1781, the fortress was bombarded, but with little success; in the month of November, the enemy were driven from their approaches, and the works themselves were almost destroyed by a sally from the garrison. Early in the year, however, the fall of Minorca enabled the Spanish to reform the siege of Gibraltar. De Grillon himself, the hero of Minorca, superseding Alvarez, assumed the chief command. . . . The garrison of Gibraltar comprised no more than 7,000 men; while the force of the allied monarchies amounted to 33,000 soldiers, with an immense train of artillery. De Grillon, however, who was well acquainted with the fortress, had little hope of taking it from the land side, but relied with confidence on the formidable preparations which he had made for bombarding it from the sea. Huge floating batteries, bomb-proof and shot-proof, were constructed; and it was calculated that the action of these tremendous engines alone would be sufficient to destroy the works. Besides the battering ships, of which ten were provided, a large armament of vessels

of all rates was equipped; and a grand attack was to take place, both from sea and land, with 400 pieces of artillery. Six months were consumed in these formidable preparations; and it was not until September that they were completed. A partial cannonade took place on the 9th and three following days; but the great attack, which was to decide the fate of the beleaguered fortress, was commenced on the 13th of September. On that day, the combined fleets of France and Spain, consisting of 47 sail of the line, besides numerous ships of inferior rate, were drawn out in order of battle before Gibraltar. Numerous bomb ketches, gun and mortar boats, dropped their anchors within close range; while the ten floating batteries were moored with strong iron chains within half gunshot of the walls. On the land 170 guns were prepared to open fire simultaneously with the ships; and 40,000 troops were held in readiness to rush in at the first practicable breach. . . . The grand attack was commenced at ten o'clock in the forenoon, by the fire of 400 pieces of artillery. The great floating batteries, securely anchored within 600 yards of the walls, poured in an incessant storm, from 142 guns. Elliot had less than 100 guns to reply to the cannonade both from sea and land; and of these he made the most judicious use. Disregarding the attack from every other quarter, he concentrated the whole of his ordnance on the floating batteries in front of him; for unless these were silenced, their force would prove irresistible. But for a long time the thunder of 80 guns made no impression on the enormous masses of wood and iron. The largest shells glanced harmless from their sloping roofs; the heaviest shot could not penetrate their hulls seven feet in thickness. Nevertheless, the artillery of the garrison was still unceasingly directed against these terrible engines of destruction. A storm of red-hot balls was poured down upon them; and about midday it was observed that the combustion caused by these missiles, which had hitherto been promptly extinguished, was beginning to take effect. Soon after, the partial cessation of the guns from the battering ships, and the volumes of smoke which issued from their decks, made it manifest they were on fire, and that all the efforts of the crews were required to subdue the conflagration. Towards evening, their guns became silent; and before midnight, the flames burst forth from the principal floating battery, which carried the Admiral's flag. . . . Eight of the 10 floating batteries were on fire during the night; and the only care of the besieged was to save from the flames and from the waters, the wretched survivors of that terrible flotilla, which had so recently menaced them with annihilation. . . . The loss of the enemy was computed at 2,000; that of the garrison, in killed and wounded, amounted to no more than 84. The labour of a few hours sufficed to repair the damage sustained by the works. The French and Spanish fleets remained in the Straits, expecting the appearance of the British squadron under Lord Howe; and relying on their superiority in ships and weight of metal, they still hoped that the result of an action at sea might enable them to resume the siege of Gibraltar. Howe, having been delayed by contrary winds, did not reach the Straits until the 9th of October; and, notwithstanding the superior array which the enemy presented, he was prepared to risk an engagement. But at this juncture, a storm having scattered the combined fleet, the British Admiral was enabled to land his stores and reinforcements without opposition. Having performed this duty, he set sail for England; nor did the Spanish Admiral, though still superior by eight sail of the line, venture to dispute

his passage. Such was the close of the great siege of Gibraltar; an undertaking which had been regarded by Spain as the chief object of the war, which she had prosecuted for three years, and which, at the last, had been pressed by the whole force of the allied monarchies. After this event, the war itself was virtually at an end."—W. Massey, *History of England: Reign of George III, v. 3, ch. 27*.—See also SPAIN: 1779-1783; HONDURAS, BRITISH: 1782-1783.

1782-1783.—Fall of Lord North.—Second Rockingham ministry.—Fox, Shelburne, and the

any longer. He gave permission to Lord North to announce his resignation, and parted with him with the characteristic words: 'Remember, my Lord, it is you who desert me, not I who desert you.' . . . Even when the long-deferred blow fell, and Lord North's Ministry was no more [Mar. 20, 1782], the King refused to send for Lord Rockingham. He still flattered himself that he might get together a Ministry from among the followers of Chatham and of Lord North [who were opposed to party connection and American independence], which would be able to restore peace without granting independence, and [Lord] Shelburne was the politician who he fixed upon to aid him in this scheme. . . . Shelburne, however, was too clever to fall into the trap. A Ministry which had against it the influence of the Rockingham connection and the talents of Charles [James] Fox, and would not receive the hearty support of Lord North's phalanx of placemen, was foredoomed to failure. The pear was not yet ripe. He saw clearly enough that his best chance of permanent success lay in becoming the successor, not the supplanter, of Rockingham.

WILLIAM PITT,  
EARL OF CHATHAM

KING GEORGE III

CHARLES  
JAMES FOX

American peace negotiations.—Shelburne ministry.—Coalition of Fox and North.—"There comes a point when even the most servile majority of an unrepresentative Parliament finds the strain of party allegiance too severe, and that point was reached when the surrender of Cornwallis at Yorktown became known in November, 1781. 'O God, it is all over!' cried Lord North, wringing his hands, when he heard of it. . . . On February 7, a vote of censure, moved by Fox, upon Lord Sandwich, was negatived by a majority of only twenty-two. On the 22nd, General Conway lost a motion in favour of putting an end to the war by only one vote. On the 27th, the motion was renewed in the form of a resolution and carried by a majority of nineteen [see U. S. A.: 1782 (February-May)]. Still the King would not give his consent to Lord North's resignation. Rather than commit himself to the opposition, he seriously thought of abdicating his crown and retiring to Hanover. . . . Indeed, if it had not been for his large family, and the character of the Prince of Wales, already too well known, it is far from improbable that he would have carried this idea into execution, and retired from a Government of which he was no longer master. By the 20th [of March], however, even George III. saw that the game could not be kept up

. . . His game was to wait. He respectfully declined to act without Rockingham. . . . Before Rockingham consented to take office, he procured a distinct pledge from the King that he would not put a veto upon American independence, if the Ministers recommended it; and on the 27th of March the triumph of the Opposition was completed by the formation of a Ministry, mainly representative of the old Whig families, pledged to a policy of economical reform, and of peace with America on the basis of the acknowledgment of independence. Fox received the reward of his services by being appointed Foreign Secretary, and Lord Shelburne took charge of the Home and Colonial Department. Rockingham himself went to the Treasury, Lord John Cavendish became Chancellor of the Exchequer, Lord Keppel First Lord of the Admiralty, Lord Camden President of the Council. Burke [Edmund Burke; came to London in 1750, entirely unknown, and entered Parliament in 1765] was made Paymaster of the Forces, and Sheridan Under-Secretary to his friend Fox. At the King's special request, Thurlow was allowed to remain as Chancellor. . . . The Cabinet no sooner met than it divided into the parties of Shelburne and of Fox, while Rockingham, Conway, and Cavendish tried to hold the balance between them,

and Thurlow artfully fomented the dissensions. . . . Few Administrations have done so much in a short time as did the Rockingham Ministry during the three months of its existence, and it so happened that the lion's share of the work fell to Fox. [Useless offices were abolished; contractors were excluded from the House of Commons; revenue officers were deprived of their vote, and legislative independence granted to Ireland.] Upon his appointment to office his friends noticed a change in habits and manner of life, as complete as that ascribed to Henry V. on his accession to the throne. He is said never to have touched a card during either of his three short terms of office. . . . By the division of work among the two Secretaries of State, all matters which related to the colonies were under the control of Shelburne, while those relating to foreign Governments belonged to the department of Fox. Consequently it became exceedingly important to these two Ministers whether independence was to be granted to the American colonies by the Crown of its own accord, or should be reserved in order to form part of the general treaty of peace. According to Fox's plan, independence was to be offered at once fully and freely to the Americans. They would thus gain at a blow all that they wanted. Their jealousy of French and Spanish interests in America would at once assert itself, and England would have no difficulty in bringing them over to her side in the negotiations with France. Such was Fox's scheme, but unfortunately, directly America became independent, she ceased to be in any way subject to Shelburne's management, and the negotiations for peace would pass wholly out of his control into the hands of Fox. . . . Shelburne at once threw his whole weight into the opposite scale. He urged with great effect that to give independence at once was to throw away the trump card. It was the chief concession which England would be required to make, the only one which she was prepared to make; and to make it at once, before she was even asked, was wilfully to deprive herself of her best weapon. The King and the Cabinet adopted Shelburne's view. Fox's scheme for the isolation of France failed, and a double negotiation for peace was set on foot. Shelburne and Franklin took charge of the treaty with America [see U. S. A.: 1782 (September)], Fox and M. de Vergennes that with France and Spain and Holland. An arrangement of this sort could hardly have succeeded had the two Secretaries been the firmest of friends; since they were rivals and enemies it was foredoomed to failure." Fox found occasion very soon to complain that important matters in Shelburne's negotiation with Franklin were kept from his knowledge, and once more he proposed to the Cabinet an immediate concession of independence to the Americans. Again he was outvoted, and, "defeated and despairing, only refrained from resigning there and then because he would not embitter Rockingham's last moments upon earth." This was on June 30. "On the 1st of July Rockingham died, and on the 2nd Shelburne accepted from the King the task of forming a Ministry." Fox, of course, declined to enter it, and suffered in influence because he could not make public the reasons for his inability to act with Lord Shelburne. "Only Lord Cavendish, Burke, and the Solicitor-General, Lee, left office with Portland and Fox, and the gap was more than supplied by the entrance of William Pitt [Lord Chatham's son, who had entered Parliament in 1780] into the Cabinet as Chancellor of the Exchequer. Fortune seemed to smile on Shelburne. He . . . might well look forward to a long and unclouded tenure of political power. His Administration lasted not quite seven months." It

was weakened by distrust and dissatisfaction among its members, and overturned in February, 1783, by a vote of censure on the peace which it had concluded with France, Spain and the American states. It was succeeded in the government by the famous coalition ministry formed under Fox and Lord North. "The Duke of Portland succeeded Shelburne at the Treasury. Lord North and Fox became the Secretaries of State [and were the real leaders in the cabinet]. Lord John Cavendish returned to the Exchequer, Keppel to the Admiralty, and Burke to the Paymastership, the followers of Lord North . . . were rewarded with the lower offices. Few combinations in the history of political parties have been received by historians and posterity with more unqualified condemnation than the coalition of 1783. . . . There is no evidence to show that at the time it struck politicians in general as being specially heinous."—H. O. Wakeman, *Life of Charles James Fox*, ch. 3-5.—Fox defended his union with Lord North by saying that the country needed "a broad and stable administration."—See also U. S. A.: 1782 (September-November).

1783-1787.—Fall of the coalition.—Ascendancy of the Younger Pitt.—His extraordinary grasp of power.—Attempted measures of reform.—On November 18, seven days after Parliament had convened, Fox introduced a bill for the better government of India. Fox's measure proposed that the government of the East India Company be replaced by seven commissioners, nominated by Parliament for a term of four years; it also remedied the system of monopolies and extortion. "It was clear that it [the bill] furnished an admirable weapon against an unpopular Coalition which had resisted economical reform, demanded a great income for a debauched prince, and now aimed at securing a monopoly of the vast patronage of India,—patronage which, genially exercised by Dundas, [Henry Dundas, later Viscount Melville and Baron Dunira; held offices under various ministries from 1776-1801] was soon to secure Scotland for Pitt. In the House of Commons the majority for the Bill was over 100; the loftiest eloquence of Burke was exerted in its favour; and Fox was, as ever, dauntless and crushing in debate. But outside Parliament the King schemed, and controversy raged. . . . When the Bill arrived at the House of Lords, the undertakers were ready. The King had seen Temple, and empowered him to communicate to all whom it might concern his august disapprobation. The uneasy whisper circulated, and the joints of the lords became as water. The peers who yearned for lieutenantcies or regiments, for stars or strawberry leaves; the prelates, who sought a larger sphere of usefulness; the minions of the bedchamber and the janissaries of the closet; all, temporal or spiritual, whose convictions were unequal to their appetite, rallied to the royal nod. . . . The result was overwhelming. The triumphant Coalition was paralysed by the rejection of their Bill. They rightly refused to resign, but the King could not sleep until he had resumed the seals. Late at night he sent for them. The messenger found North and Fox gaily seated at supper with their followers. At first he was not believed. 'The King would not dare do it,' exclaimed Fox. But the under Secretary charged with the message soon convinced them of its authenticity, and the seals were delivered with

a light heart. In such dramatic fashion, and the springtide of its youth, fell that famous government, unhonoured and unwept. 'England,' once said Mr. Disraeli, 'does not love coalitions.' She certainly did not love this one. On this occasion there was neither hesitation nor delay; the moment had come, and the man. Within 12 hours of the King's receiving the seals, Pitt had accepted the First Lordship of the Treasury and the Chancellorship of the Exchequer. That afternoon his writ was moved amid universal derision. And so commenced a supreme and unbroken Ministry of 17 years. Those who laughed were hardly blamable, for the difficulties were tremendous. . . . The composition of the Government was . . . the least of Pitt's embarrassments. The majority against him in the House of Commons was not less than 40 or 50 containing, with the exception of Pitt himself and Dundas, every debater of eminence; while he had, before the meeting of Parliament, to prepare and to obtain the approval of the East India Company to a scheme which should take the place of Burke's. [Fox's bill had been largely the work of Burke.] The Coalition Ministers were only dismissed on the

and amazed his enemies. He gave the place to Barré. . . . To a nation inured to jobs this came as a revelation. . . . Above and beyond all was the fact that Pitt, young, unaided, and alone, held his own with the great leaders allied against him. . . . In face of so resolute a resistance, the assailants began to melt away. Their divisions, though they always showed a superiority to the Government, betrayed notable diminution. . . . On the 25th of March Parliament was dissolved, the announcement being retorted by the unexplained theft of the Great Seal. When the elections were over, the party of Fox, it was found, had shared the fate of the host of Sennacherib. The number of Fox's martyrs—of Fox's followers who had earned that nickname by losing their seats—was 160. . . . The King and Pitt were supported on the tidal wave of one of those great convulsions of feeling, which in Great Britain relieve and express pent-up national sentiment, and which in other nations produce revolutions."—Lord Rosebery, *Pitt*, ch. 3.—"Three subjects then needed the attention of a great statesman, though none of them were so pressing as to force themselves on the attention of

WILLIAM PITT,  
THE YOUNGER

EDMUND  
BURKE

18th of December, 1783; but, when the House of Commons met on the 12th of January, 1784, all this had been done. The narrative of the next three months is stirring to read, but would require too much detail for our limits. . . . On the day of the meeting of Parliament, Pitt was defeated in two pitched divisions, the majorities against him being 39 and 54. His government seemed still-born. His colleagues were dismayed. The King came up from Windsor to support him. But in truth he needed no support. He had inherited from his father that confidence which made Chatham once say, 'I am sure that I can save this country, and that nobody else can'; which made himself say later, 'I place much dependence on my new colleagues; I place still more dependence on myself.' He had refused, in spite of the King's insistence, to dissolve; for he felt that the country required time. . . . The Clerkship of the Pells, a sinecure office worth not less than £3,000 a year, fell vacant the very day that Parliament met. It was universally expected that Pitt would take it as of right, and so acquire an independence, which would enable him to devote his life to politics, without care for the morrow. He had not £300 a year; his position was to the last degree precarious. . . . Pitt disappointed his friends

a little statesman. These were, our economical and financial legislation, the imperfection of our parliamentary representation, and the unhappy condition of Ireland. Pitt dealt with all three. . . . He brought in a series of resolutions consolidating our customs laws [1787], of which the inevitable complexity may be estimated by their number. They amounted to 133, and the number of Acts of Parliament which they restrained or completed was much greater. He attempted, and successfully, to apply the principles of Free Trade, the principles which he was the first of English statesmen to learn from Adam Smith, to the actual commerce of the country. [See *TARIFF*: 1784-1786.] . . . The financial reputation of Pitt has greatly suffered from the absurd praise which was once lavished on the worst part of it. The dread of national ruin from the augmentation of the national debt was a sort of nightmare in that age. . . . Mr. Pitt sympathised with the general apprehension and created the well-known 'Sinking Fund.' He proposed to apply annually a certain fixed sum to the payment of the debt, which was in itself excellent [as long as there was a surplus]. . . . [In 1702] he proposed to borrow the money to pay off the debt, and fancied that he thus diminished it. . . . The exposure of

this financial juggle, for though not intended to be so, such in fact it was, has reacted very unfavourably upon Mr. Pitt's deserved fame. . . . The subject of parliamentary reform is the one with which, in Mr. Pitt's early days, the public most connected his name, and is also that with which we are now least apt to connect it. . . . He proposed the abolition of the worst of the rotten boroughs fifty years before Lord Grey accomplished it. . . . If the strong counteracting influence of the French Revolution had not changed the national opinion, he would unquestionably have amended our parliamentary representation. . . . The state of Ireland was a more pressing difficulty than our financial confusion, our economical errors, or our parliamentary corruption. . . . He proposed at once to remedy the national danger of having two Parliaments, and to remove the incredible corruption of the old Irish Parliament, by uniting the three kingdoms in a single representative system, of which the Parliament should sit in England. [See below: 1801-1806] . . . Of these great reforms he was only permitted to carry a few into execution. His power, as we have described it, was great when his reign commenced, and very great it continued to be for very many years; but the time became unfavourable for all forwardlooking statesmanship."—W. Bagehot, *Biographical studies: William Pitt*.

1788-1789.—Serious illness of the king.—Regency question.—The king's derangement which began to show itself in the summer of 1788, was more serious and of longer duration than the first. "He was able . . . to sign a warrant for the further prorogation of Parliament by commission, from the 25th September to the 20th November. But, in the interval, the king's malady increased: he was wholly deprived of reason, and placed under restraint; and for several days his life was in danger. As no authority could be obtained from him for a further prorogation, both Houses assembled on the 20th November. . . . According to long established law, Parliament, without being opened by the Crown, had no authority to proceed to any business whatever; but the necessity of an occasion, for which the law had made no provision, was now superior to the law; and Parliament accordingly proceeded to deliberate upon the momentous questions to which the king's illness had given rise." By Mr. Fox it was maintained that "the Prince of Wales had as clear a right to exercise the power of sovereignty during the king's incapacity as if the king were actually dead; and that it was merely for the two Houses of Parliament to pronounce at what time he should commence the exercise of his right. . . . Mr. Pitt, on the other hand, maintained that as no legal provision had been made for carrying on the government, it belonged to the Houses of Parliament to make such provision." The discussion to which these differences, and many obstructing circumstances in the situation of affairs, gave rise, was so prolonged, that the king recovered his faculties

(February, 1789) before the Regency Bill, framed by Mr. Pitt, had been passed.—T. E. May, *Constitutional history of England*, v. 1, ch. 3.—The main features of this bill (which was passed in modified form in 1811) were as follows: The Prince might dismiss his ministers or dissolve Parliament, but he could not confer the peerage except on members of the royal family. He was restricted in his power of granting offices and pensions, and he could not give away any part of the king's estate. The management of the king and his household was placed in the hands of the Queen.

1793-1796.—Popular feeling towards the French Revolution.—Small number of the English Jacobins.—Pitt forced into war.—Tory panic and reign of terror.—Violence of government measures.—"That the war [of Revolutionary France] with Germany would widen into a vast European struggle, a struggle in which the peoples would rise against their oppressors, and the freedom which France had won diffuse itself over the world, no French revolutionist doubted for an hour. Nor did they doubt that in this struggle England would join them. It was from England that they had drawn those principles of political and social liberty which they believed themselves to be putting into practice. It was to England that they looked above all for approbation and sympathy. . . . To the revolutionists at Paris the attitude of England remained unintelligible and irritating. Instead of the aid they had counted on, they found but a cold neutrality. . . . But that this attitude was that of the English people as a whole was incredible to the French enthusiasts. . . . Their first work therefore they held to be the bringing about a revolution in England. . . . They strove, through a number of associations which had formed themselves under the name of Constitutional Clubs, to rouse the same spirit which they had roused in France; and the French envoy, Chauvelin, protested warmly against a proclamation which denounced this correspondence as seditious. . . . Burke was still working hard in writings whose extravagance of style was forgotten in their intensity of feeling to spread alarm throughout Europe. He had from the first encouraged the emigrant princes to take arms, and sent his son to join them at Coblenz. 'Be alarmists,' he wrote to them; 'diffuse terror!' But the royalist terror which he sowed would have been of little moment had it not roused a revolutionary terror in France. . . . In November the Convention decreed that France offered the aid of her soldiers to all nations who would strive for freedom. . . . In the teeth of treaties signed only two years before, and of the stipulation made by England when it pledged itself to neutrality, the French Government resolved to attack Holland, and ordered its generals to enforce by arms the opening of the Scheldt [see FRANCE: 1792-1793 (December-February)]. To do this was to force England into war. Public opinion was already pressing every day harder upon Pitt. . . . But even while withdrawing our Minister from Paris on the imprisonment of the King, to whose Court he had been commissioned, Pitt clung stubbornly to a policy of peace. . . . No hour of Pitt's life is so great as the hour when he stood lonely and passionless before the growth of

national passion, and refused to bow to the gathering cry for war. . . . But desperately as Pitt struggled for peace, his struggle was in vain. . . . Both sides ceased from diplomatic communications, and in February, 1793, France issued her Declaration of War. From that moment Pitt's power was at an end. His pride, his immovable firmness, and the general confidence of the nation, still kept him at the head of affairs; but he could do little save drift along with a tide of popular feeling which he never fully understood. Around him the country broke out in a fit of passion and panic which rivalled the passion and panic oversea. . . . The partisans of Republicanism were in reality but a few handfuls of men. . . . But in the mass of Englishmen the dread of these revolutionists passed for the hour into sheer panic. Even the bulk of the Whig party believed property and the constitution to be in peril, and forsook Fox when he still proclaimed his faith in France and the Revolution."—J. R. Green, *History of the English people*, v. 4, bk. 9, ch. 4.—The French Revolution brought disaster to the Whig party. It was discredited both by the secession of its moderate members and by the views of its extreme members. Finally the split between Burke and Fox widened the breach in the Whig ranks. "Burke himself said that not one man in a hundred was a Revolutionist. Fox's revolutionary sentiments met with no response, but with general reprobation, and caused even his friends to shrink from his side. Of the so-called Jacobin Societies, the Society for Constitutional Information numbered only a few hundred members, who, though they held extreme opinions, were headed by men of character, and were quite incapable of treason or violence. The Corresponding Society was of a more sinister character; but its numbers were computed only at 6,000, and it was swallowed up in the loyal masses of the people. . . . It is sad to say it, but when Pitt had once left the path of right, he fell headlong into evil. To gratify the ignoble fears and passions of his party, he commenced a series of attacks on English liberty of speaking and writing which Mr. Massey, a strong anti-revolutionist, characterizes as unparalleled since the time of Charles I. The country was filled with spies. A band of the most infamous informers was called into activity by the government. . . . There was a Tory reign of terror, to which a slight increase of the panic among the upper classes would probably have lent a redder hue. Among other measures of repression the Habeas Corpus Act was suspended; and the liberties of all men were thus placed at the mercy of the party in power. . . . In Scotland the Tory reign of terror was worse than in England."—G. Smith, *Three English statesmen*, pp. 239-247.—"The gaols were filled with political delinquents, and no man who professed himself a reformer could say, that the morrow might not see him a prisoner upon a charge of high treason. . . . But the rush towards despotism against which the Whigs could not stand, was arrested by the people. Although the Habeas Corpus had fallen, the Trial by Jury remained, and now, as it had done before, when the alarm of fictitious plots had disposed the nation to acquiesce in the surrender of its liberties, it opposed a barrier which Toryism could not pass." The trials which excited most interest were those of Hardy, who organized the Corresponding Society, and Horne Tooke. But no unlawful conduct or treasonable designs could be proved against them by credible witnesses, and both were acquitted. "The public joy was very general at these acquittals. . . . The war lost its popularity; bread grew scarce; commerce was crippled; . . . the easy success that had been anticipated was replaced by reverses. The

people clamoured and threw stones at the king, and Pitt eagerly took advantage of their violence to tear away the few shreds of the constitution which yet covered them. He brought forward the Seditious Meetings bill, and the Treasonable Practices bill [both enacted in 1795]. Bills which, among other provisions, placed the conduct of every political meeting under the protection of a magistrate, and rendered disobedience to his command a felony."—G. W. Cooke, *History of party*, v. 3, ch. 17.

1797.—Monetary panic and suspension of specie payments.—Defeat of the first reform movement.—Mutiny of the fleet.—Naval victories of Cape St. Vincent and Camperdown.—From 1793 to 1797 conditions in England grew from bad to worse. 1795 was marked by failure of crops, bread riots and extreme suffering among the poor. In 1796 a monetary crisis threatened, due to circumstances rising out of the war with France. Food had to be purchased abroad, and the markets of Spain, Holland, France and Italy were closed which caused a scarcity of specie. At the same time, fear of an invasion was aroused at home by the almost continuous failure of the English Allies. "The aspect of affairs in Britain had never been so clouded during the 18th century as at the beginning of the year 1797. The failure of Lord Malmesbury's mission to Paris had closed every hope of an honourable termination to the war, while of all her original allies, Austria alone remained; the national burdens were continually increasing, and the three-per-cents had fallen to fifty-one; while party spirit raged with uncommon violence, and Ireland was in a state of partial insurrection. A still greater disaster resulted from the panic arising from the dread of invasion, and which produced such a run on all the banks, that the Bank of England itself was reduced to payment in sixpences, and an Order in Council appeared (Feb. 26) for the suspension of all cash payments. This measure, at first only temporary, was prolonged from time to time by parliamentary enactments, making bank-notes a legal-tender; and

it was not till 1819, after the conclusion of peace, that the recurrence to metallic currency took place. The Opposition deemed this a favourable opportunity to renew their cherished project of parliamentary reform; and on 26th May, Mr. (afterwards Lord) Grey brought forward a plan chiefly remarkable for containing the outlines of that subsequently carried into effect in 1831. It was negative, however, after violent debates, by a majority of 258 against 93. After a similar strife of parties, the motion for the continuance of the war was carried by a great majority in both houses; and the requisite supplies were voted. . . . Unknown to the government, great discontent had for a long time prevailed in the navy. The exciting causes were principally the low rate of pay (which had not been raised since the time of Charles II.), the unequal distribution of prize-money, and undue severity in the maintenance of discipline. These grounds of complaint, with others not less well founded, gave rise to a general conspiracy, which broke out (April 15) in the Channel fleet [at Spithead] under Lord Bridport. All the ships fell under the power of the insurgents; but they maintained perfect order, and memorialised the Admiralty and the Commons on their grievances: their demands being examined by government, and found to be reasonable, were granted; and on the 7th of May the fleet returned to its duty. But scarcely was the spirit of disaffection quelled in this quarter, when it broke out in a more alarming form (May 22) among the squadron at the Nore, which was soon after (June 6) joined by the force which had been cruising off the Texel under Lord Duncan. . . . This second mutiny caused dreadful consternation in London; but the firmness of the King remained unshaken, and he was nobly seconded by the parliament. . . . The sailors, finding the national feelings strongly arrayed against them, became gradually sensible that their enterprise was desperate. One by one the ships returned to their duty; and on 15th June all had submitted. Parker and several other ringleaders suffered death; but clemency was extended to the multitude. . . . Notwithstanding all these dissensions, the British navy was never more terrible to its enemies than during this eventful year. On the 14th of February, the [French and] Spanish fleet . . . which had put to sea for the purpose of raising the blockade of the French harbours, was encountered off Cape St. Vincent by Sir John Jervis [with half the number of ships]. . . . By the old manœuvre of breaking the line, 9 of the Spanish ships were cut off from the rest; and the admiral, while attempting to regain them by wearing round the rear of the British line, was boldly assailed by Nelson and Collingwood [who distinguished themselves by their daring captures]. The Spanish armament, thus routed by little more than half its own force, retired in the deepest dejection to Cadiz, which was shortly after insulted by a bombardment from the gallant Nelson. A more important victory than that of Sir John Jervis (created in consequence Earl St. Vincent) was never gained at sea, from the evident superiority of skill and seamanship which it demonstrated in the British navy. The battle of St. Vincent disconcerted the plans of Truguet for the naval campaign; but later in the season a second attempt to reach Brest was made by a Dutch fleet of 15 sail of the line and 11 frigates, under the command of De Winter, a man of tried courage and experience. The British blockading fleet, under Admiral Duncan, [later created Earl of Camperdown] . . . consisted of 16 ships and 3 frigates, and the battle was fought (Oct. 16) off Camperdown, about nine miles from the shore of Holland. The manœuvres

of the British Admiral were directed to cut off the enemy's retreat to his own shores; and this having been accomplished, the action commenced yard-arm to yard-arm, and continued with the utmost fury for more than three hours. The Dutch sailors fought with the most admirable skill and courage, and proved themselves worthy descendants of Van Tromp and De Ruyter; but the prowess of the British was irresistible. 12 sail of the line, including the flagship, two 56-gun ships, and 2 frigates, struck their colours; but the nearness of the shore enabled two of the prizes to escape, and one 74-gun ship foundered. The obstinacy of the conflict was evidenced by the nearly equal number of killed and wounded, which amounted to 1,040 English, and 1,160 Dutch. . . . The only remaining operations of the year were the capture of Trinidad in February, by a force which soon after was repulsed from before Porto Rico; and an abortive attempt at a descent in Pembroke Bay by about 1,400 French."—*Epitome of Alison's history of Europe*, sect. 190-196, v. 5, ch. 22.

1801-1806.—Pitt's promise to the Irish Catholics broken by the king.—His resignation.—Addington ministry.—Peace of Amiens.—War resumed.—Pitt at the helm again.—His death.—Ministry of "All the Talents."—"The union with Ireland introduced a new topic of party discussion, which quickly became only second to that of parliamentary reform. . . . The demand of the Catholics to be admitted to the common rights of citizens. Pitt, whose Toryism was rather the imperiousness of a haughty master, than the cautious cowardice of the miser of power, thought their complaints were just. In his private negotiations with the Irish popular leaders he probably promised that emancipation should be the sequel to the union. In his place in parliament he certainly gave an intimation, which from the mouth of a minister could receive no second interpretation. Pitt was not a minister who governed by petty stratagems, by ambiguous professions, and by skilful shuffles: he was at least an honourable enemy. He prepared to fulfil the pledge he had given, and to admit the Catholics within the pale of the constitution. It had been better for the character of George III. had he imitated the candour of his minister; had he told him that he had made a promise he would not be suffered to fulfil, before he had obtained the advantage to gain which that promise had been made. When Pitt proposed Catholic emancipation as one of the topics of the king's speech, for the session of 1801, the royal negative was at once interposed, and when Dundas persisted in his attempt to overcome his master's objections, the king abruptly terminated the conference, saying, 'Scotch metaphysics cannot destroy religious obligations.' Pitt immediately tendered his resignation. . . . All that was brilliant in Toryism passed from the cabinet with the late minister. When Pitt and Canning were withdrawn, with their satellites, nothing remained of the Tory party but the mere courtiers who lived upon the favour of the king, and the insipid lees of the party; men who voted upon every subject in accordance with their one ruling idea—the certain ruin which must follow the first particle of innovation. Yet from these relics the king was obliged to form a new cabinet, for application to the Whigs was out of the question. These were more strenuous for emancipation than Pitt. Henry Addington, Pitt's speaker of the house of commons, was the person upon whom the king's choice fell; and he succeeded, with the assistance of the late premier, in filling up the offices at his disposal. . . . The peace of Amiens was the great work of this feeble administration [see FRANCE: 1801-1802], and formed a severe commentary upon the boastings of the Tories. 'Unless the monarchy of France be restored,' Pitt had said, eight years before, 'the monarchy of England is lost forever.' Eight years of warfare had succeeded, yet the monarchy of France was not restored, and the crusade was stayed. England had surrendered her conquests, France retained hers; the landmarks

of Europe had been in some degree restored; England, alone, remained burdened with the enduring consequences of the ruinous and useless strife. The peace was approved by the Whigs, who were glad of any respite from such a war, and by Pitt, who gave his support to the Addington administration. But he could not control his adherents. . . . As the instability of the peace grew manifest, the incompetency of the administration became generally acknowledged: with Pitt sometimes chiding, Windham and Canning, and Lords Spencer and Grenville continually attacking, and Fox and the Whigs only refraining from violent opposition from a knowledge that if Addington went out Pitt would be his successor, the conduct of the government was by no means an easy or a grateful task to a man destitute of commanding talents. When to these parliamentary difficulties were added a recommencement of the war [1803], and a popular panic at Bonaparte's threatened invasion, Addington's embarrassments became inextricable. He had performed the business which Pitt had assigned him; he had made an experimental peace, and had saved Pitt's honour with the Roman Catholics. The object of his appointment he had unconsciously completed, and no sooner did his predecessor manifest an intention of returning to office, than the ministerial majorities began to diminish, and Addington found himself without support. On the 12th of April [1804] it was announced that Mr. Addington had resigned, and Pitt appeared to resume his station as a matter of course. During his temporary retirement, Pitt had, however, lost one section of his supporters. The Grenville party and the Whigs had gradually approximated, and the former now refused to come into the new arrangements unless Fox was introduced into the cabinet. To this Pitt offered no objection, but the king was firm—or obstinate. . . . In the following year, Addington himself, now created Viscount Sidmouth, returned to office with the subordinate appointment of president of the council. The conflagration had again spread through Europe. . . . Pitt had the mortification to see his grand continental coalition [Russia, Austria and Great Britain], the produce of such immense expense and the object of such hope, shattered in one campaign ["Austerlitz"]. At home, Lord Melville, his most faithful political supporter, was attacked by a charge from which he could not defend him, and underwent the impeachment of the commons for malpractices in his office as treasurer of the navy. Lord Sidmouth and several others seceded from the cabinet, and Pitt, broken in health, and dispirited by reverses, had lost much of his wonted energy. Thus passed away the year 1805. On the 23d of January, 1806, Pitt expired. . . . The death of Pitt was the dissolution of his administration. The Tory party was scattered in divisions and subdivisions innumerable. Canning now recognised no political leader, but retained his old contempt for Sidmouth and his friends, and his hostility to the Grenvilles for their breach with Pitt. Castlereagh, William Dundas, Hawkesbury, or Barham, although sufficiently effective when Pitt was present to direct and to defend, would have made a hopeless figure without him in face of such an opposition as the house of commons now afforded. The administration, which was ironically designated by its opponents as 'All the Talents,' succeeded. Lord Grenville [leader of the aristocratic Whigs] was first lord of the treasury. Fox [leader of the popular Whigs] chose the office of secretary for foreign affairs with the hope of putting an end to the war. Windham was colonial secretary. Earl Spencer had the seals of the home department. Erskine was lord chancellor. Mr.

Grey was first lord of the admiralty. Sheridan, treasurer of the navy. Lord Sidmouth [leader of the Tories] was privy seal. Lord Henry Petty, who, although now only in his 26th year, had already acquired considerable distinction as an eloquent Whig speaker, was advanced to the post of chancellor of the exchequer, the vacant chair of Pitt. Such were the men who now assumed the reins under circumstances of unparalleled difficulty."—G. W. Cooke, *History of party*, v. 3, ch. 17-18.

1806-1812.—"Ministry of All the Talents."—Abolition of the slave trade.—Portland and Perceval ministries.—Confirmed insanity of George III.—Beginning of the regency of the prince of Wales.—Assassination of Perceval.—The "Ministry of All the Talents" is "remarkable solely for its mistakes, and is to be remembered chiefly for the death of Fox [September 13, 1806] and the abolition of the slave-trade. Fox was now destined at the close of his career to be disillusioned with regard to Napoleon. He at last thoroughly realized the insincerity of his hero. . . . The second great object of Fox's life he succeeded in attaining before his death;—this was the abolition of the slave-trade. For more than thirty years the question had been before the country, and a vigorous agitation had been conducted by Clarkson, Wilberforce, and Fox. Pitt was quite at one with them on this question, and had brought forward motions on the subject. The House of Lords, however, rejected all measures of this description during the Revolutionary War, under the influence of the Anti-Jacobin feeling. It was reserved for Fox to succeed in carrying a Bill inflicting heavy pecuniary punishments on the traffic in slaves. And yet this measure—the sole fruit of Fox's statesmanship—was wholly inadequate; nor was it till the slave-trade was made felony in 1811 that its final extinction was secured. [See also SLAVERY: 1792-1807.] The remaining acts of the Ministry were blunders. . . . Their financial system was a failure. They carried on the war so as to alienate their allies and to cover themselves with humiliation. Finally, they insisted on bringing forward a measure for the relief of the Catholics, though there was not the slightest hope of carrying it, and it could only cause a disruption of the Government. . . . The king and the Pittites were determined to oppose it, and so the Ministry agreed to drop the question under protest. George insisted on their withdrawing the protest, and as this was refused he dismissed them. . . . This then was the final triumph of George III. He had successfully dismissed this Ministry; he had maintained the principle that every Ministry is bound to withdraw any project displeasing to the king. These principles were totally inconsistent with Constitutional Government, and they indirectly precipitated Reform by rendering it absolutely necessary in order to curb the royal influence. . . . The Duke of Portland's sole claims to form a Ministry were his high rank, and the length of his previous services. His talents were never very great, and they were weakened by age and disease. The real leader was Mr. Perceval, the

Chancellor of the Exchequer, a dexterous debater and a patriotic statesman. This Government, being formed on the closest Tory basis and on the king's influence, was pledged to pursue a retrograde policy and to oppose all measures of Reform. The one really high-minded statesman in the Cabinet was Canning, the Foreign Minister. His advanced views, however, continually brought him into collision with Castlereagh, the War Minister, a man of much inferior talents and the narrowest Tory views. Quarrels inevitably arose between the two, and there was no real Prime Minister to hold them strongly under control. . . . At last the ill-feeling ended in a duel, which was followed by a mutual resignation on the ground that neither could serve with the other. This was followed by the resignation of Portland, who felt himself wholly unequal to the arduous task of managing the Ministry any longer. The leadership now devolved on Perceval, who found himself in an apparently hopeless condition. His only supporters were Lords Liverpool, Eldon, Palmerston, and Wellesley. Neither Canning, Castlereagh, nor Sidmouth (Addington) would join him. The miserable expedition to Walcheren [see below: 1809 (July-December)] had just ended in ignominy. The campaign in the Peninsula was regarded as a chimerical enterprise, got up mainly for the benefit of a Tory commander. Certainly the most capable man in the Cabinet was Lord Wellesley [brother of the famous general, Arthur Wellesley, Duke of Wellington], the Foreign Minister, but he was continually thwarted by the incapable men he had to deal with. However, as long as he remained at the Foreign Office, he supported the Peninsular War with vigour, and enabled his brother to carry out more effectually his plans with regard to the defence of Portugal. In November, 1810, the king was again seized with insanity, nor did he ever recover the use of his faculties during the rest of his life. The Ministry determined to bring forward Pitt's old Bill of 1788 in a somewhat more modified form, February, 1811. The Prince of Wales requested Grey and Grenville to criticize this, but, regarding their reply as lukewarm, he began to entertain an ill-will for them. At this moment the judicious flattery of his family brought him over from the Whigs, and he decided to continue Perceval in office. Wellesley, however, took the opportunity to resign, and was succeeded by Castlereagh, February, 1812. In May Perceval was assassinated by Mr. Bellingham, a lunatic, and his Ministry at once fell to pieces." —B. C. Skottowe, *Our Hanoverian kings*, bk. 10, ch. 3.

1809 (July-December).—Walcheren expedition.—“Three times before, during the war, it had occurred to one or another, connected with the government, that it would be a good thing to hold Antwerp, and command the Scheldt, seize the French ships in the river, and get possession of their arsenals and dockyards. On each occasion, men of military science and experience had been consulted; and invariably they had pronounced against the scheme. Now, however, what Mr. Pitt had considered impracticable, Lord Castlereagh [minister of war in the Portland cabinet], with the rashness of incapacity, resolved should be done: and, in order not to be hindered, he avoided consulting with those who would have objected to the enterprise. Though the scene of action was to be the swamps at the mouths of the Scheldt, he consulted no physician. Having himself neither naval, military, nor medical knowledge, he assumed the responsibility—except such as the King and the Duke of York chose to share. . . . It was May, 1809, before any stir was apparent which could lead men outside the Cabinet to infer that an expedition for the Scheldt was in contemplation; but so early as the beginning of April (it is now known), Mr. Canning signified that he could not share in the responsibility of an enterprise which must so involve his own office. . . . The fleet that rode in the channel consisted of 30 ships of the line, and 36 frigates, and a due proportion of small vessels: in all, 245 vessels of war; and 400 transports carried 40,000 soldiers. Only one hospital ship was provided for the whole expedition, though the Surgeon General implored the grant of two more. He gave his reasons, but was refused. . . . The naval commander was Sir Richard J. Strachan, whose title to the responsibility no one could perceive, while many who had more experience were unemployed. The military command was given (as the selection of the present Cabinet had been) to Lord Chatham [John Pitt, second Earl of Chatham], for no better reason than that he was a favourite with the King and Queen, who liked his gentle and courtly manners, and his easy and amiable temper. . . . The fatal mistake was made of not defining the respective authorities of the two commanders; and both being inexperienced or apathetic, each relied upon the other first, and cast the blame of failure upon him afterwards. In the autumn, an epigram of unknown origin was in every body's mouth, all over England:

'Lord Chatham, with his sword undrawn,  
Stood waiting for Sir Richard Strachan;  
Sir Richard, longing to be at 'em,  
Stood waiting for the Earl of Chatham.'

The fleet set sail on the 28th of July, and was on the coast of Holland the next day. The first discovery was that there were not boats enough to land the troops and the ordnance. The next was that no plan had been formed about how to proceed. The most experienced officers were for pushing on to Antwerp, 45 miles off, and taking it before it could be prepared for defence; but the commanders determined to take Flushing first. They set about it so slowly that a fortnight was consumed in preparations. In two days more, the 15th of August, Flushing was taken. After this, Lord Chatham paused to consider what he should do next; and it was the 21st before he began to propose to go on to Antwerp. Then came the next discovery, that, by this time two intermediate places had been so strengthened that there must be some fighting on the way. So he did nothing more but take possession of two small islands near Flushing. Not another blow was struck; not another league was traversed by this magnificent expedition. But the most important discovery of all now disclosed itself. The army had been brought into the swamps at the beginning of the sickly season. Fever sprang up under their feet, and 3,000 men were in hospital in a few days, just when it became necessary to reduce the rations, because provisions were falling short. On the 27th of August, Lord Chatham led a council of war to resolve that 'it was not advisable to pursue further operations.' But, if they could not proceed, neither could they remain where they were. The enemy had more spirit than their invaders. On the 30th and 31st, such a fire was opened from both banks of the river, that the ships were obliged to retire. Flushing was given up, and everything else except the island of Walcheren, which it was fatal to hold at this season. On the 4th of September, most of the ships were at home again; and Lord Chatham appeared on the 14th. Eleven thousand men were by that time in the fever, and he brought home as many as he could. Sir Eyre Coote, whom he left in command, was dismayed to see all the rest sinking down in disease at the rate of hundreds in a day. Though the men had been working in the swamps, up to the waist in marsh water, and the roofs of their sleeping places had been carried off by bombardment, so that they slept under a canopy of autumn fog, it was supposed that a supply of Thames water to drink would stop the sickness; and a supply of 500 tons per week was transmitted. At last, at the end of October, a hundred English bricklayers, with tools, bricks, and mortar, were sent over to mend the roofs; but they immediately dropped into the hospitals. Then the patients were to be accommodated in the towns; but to spare the inhabitants, the soldiers were laid down in damp churches; and their bedding had from the beginning been insufficient for their need. At last, government desired the chief officers of the army Medical Board to repair to Walcheren, and see what was the precise nature of the fever, and what could be done. The Surgeon-General and the Physician-General threw the duty upon each other. Government appointed it to the Physician-General, Sir Lucas Pepys; but he refused to go. Both officers were dismissed, and the medical department of the army was reorganized and greatly improved. The deaths were at this time from 200 to 300 a week. When Walcheren was evacuated, on the 23rd of December, nearly half the force sent out five months be-

fore were dead or missing; and of those who returned, 35,000 were admitted into the hospitals of England before the next 1st of June. Twenty millions sterling were spent on this expedition. It was the purchase money of tens of thousands of deaths, and of ineffaceable national disgrace."—H. Martineau, *History of England, 1800-1815, bk. 2, ch. 2.*

1812-1813.—Liverpool ministry.—Business depression and bad harvests.—Distress and rioting.—Luddites.—"Again there was much negotiation, and an attempt to introduce Lord Wellesley and Mr. Canning to the ministry. Of course they could not serve with Castlereagh; they were then asked to form a ministry with Grenville and Grey, but these Lords objected to the Peninsular War, to which Wellesley was pledged. Grenville and Grey then attempted a ministry of their own but quarrelled with Lord Moira on the appointments to the Household; and as an American war was threatening, and the ministry had already given up their Orders in Council (one of the chief causes of their unpopularity), the Regent rather than remain longer without a ministry, intrusted Lord Liverpool with the Premiership [from 1812-1827], with Castlereagh as his Foreign Secretary, and the old ministry remained in office. Before the day of triumph of this ministry arrived, while Napoleon was still at the height of his power, and the success of Wellington as yet uncertain, England had drifted into war with America. It is difficult to believe that this useless war might not have been avoided had the ministers been men of ability. It arose from the obstinate manner in which the Government clung to the execution of their retaliatory measures against France, regardless of the practical injury they were inflicting upon all neutrals. . . . The same motive of class aggrandizement which detracts from the virtue of the foreign policy of this ministry underlay the whole administration of home affairs. There was an incapacity to look at public affairs from any but a class or aristocratic point of view. The natural consequence was a constantly increasing mass of discontent among the lower orders, only kept in restraint by an overmastering fear felt by all those higher in rank of the possible revolutionary tendencies of any attempt at change. Much of the discontent was of course the inevitable consequence of the circumstances in which England was placed, and for which the Government was only answerable in so far as it created those circumstances. At the same time it is im-

possible not to blame the complacent manner in which the misery was ignored and the occasional success of individual merchants and contractors regarded as evidences of national prosperity. . . . A plentiful harvest in 1813, and the opening of many continental ports, did much to revive both trade and manufactures; but it was accompanied by a fall in the price of corn from 171s. to 75s. The consequence was widespread distress among the agriculturists, which involved the country banks, so that in the two following years 240 of them stopped payment. So great a crash could not fail to affect the manufacturing interest also; apparently, for the instant, the very restoration of peace brought widespread ruin. . . . Before the end of the year 1811, wages had sunk to 7s. 6d. a week. The manufacturing operatives were therefore in a state of absolute misery. Petitions signed by 40,000 or 50,000 men urged upon Parliament that they were starving; but there was another class which fared still worse. Machinery had by no means superseded hand-work. In thousands of hamlets and cottages handlooms still existed. The work was neither so good nor so rapid as work done by machinery; even at the best of times used chiefly as an auxiliary to agriculture, this hand labour could now scarcely find employment at all. Not unnaturally, without work and without food, these hand workers were very ready to believe that it was the machinery which caused their ruin, and so in fact it was; the change, though on the whole beneficial, had brought much individual misery. The people were not wise enough to see this. They rose in riots in many parts of England, chiefly about Nottingham, calling themselves Luddites (from the name of a certain idiot lad who some 30 years before had broken stocking-frames), gathered round them many of the disbanded soldiery with whom the country was thronged, and with a very perfect secret organization, carried out their object of machine-breaking. The unexpected thronging of the village at nightfall, a crowd of men with blackened faces, armed sentinels holding every approach, silence on all sides, the village inhabitants cowering behind closed doors, an hour or two's work of smashing and burning, and the disappearance of the crowd as rapidly as it had arrived—such were the incidents of the night riots."—J. 1816.—Domestic conditions at the close of the war.—"While the stupendous drama of the Revolutionary and Napoleonic wars and, later, the activities of [the peace] congresses were in progress, events of quite equally great moment to herself were taking place within the boundaries of Great Britain. An extraordinary transformation which, despite its fairly gradual character, is popularly known, and with sufficient accuracy, as the Industrial Revolution, had come over the country. In a relatively very brief space of time the novel phenomena appeared of the factory system, the *entrepreneur* class, the industrial towns of the north. The capitalist loomed large as never before, and the cleavage between Capital on the one side and Labour on the other became an essential feature of the industrial organization. With the rapid improvement in transit and the congregation of large masses in the towns, the old isolation of the countryside came to be broken down. Population became much less evenly scattered. At the same time it prodigiously increased: a fact which gave Mr Malthus and many others seriously, and often very gloomily, to think. In short, a great social as well as a great economic change was taking place. Changes of that order must inevitably produce corresponding political results. The Industrial Revolution almost immediately brought in its train all manner of abuses, wrongs and problems, taking men unawares almost, before they had acquired the habit of thinking of such things as problems at all, and when, accordingly, there existed no machinery by which to deal with them. The grievance of the early victims of the remorseless monster-mechanism of modern industrialism inevitably, justly, endeavoured to make itself heard [see also above: 1812-1813]. But the fear of revolution gripped the plenipotentiaries at the continental congresses. To the ears of both there seemed no difference between the loud outcry of the anarchic demagogue and the groanings of men driven into protest by the grim pressure of a system which seemed like a relentless machine. The fears of propagandist France had driven England into panic measures, suspension of Habeas Corpus, Seditious Meetings and Treasonable Practices Acts, the 'Six Acts,' press prosecutions innumerable, transportations, executions. Even after the French terror had gone there stood like a nerveless mass the deadweight of Tory reaction, the belief in simple repression as the mainstay of state policy. For the oppressed workers in the towns all forms of concerted action—to talk, to write, to meet—were equally seditious."—A. S. Turberville and F. W. Howe, *Great Britain in the latest age*, pp. 6-7.—See also INDUSTRIAL REVOLUTION: England. Underlying causes, to Mining inventions; AGRICULTURE: Modern: British Isles: Late 18th

to early 19th centuries; EUROPE: Modern; Revolutionary movement for self-government.

1816-1820.—Agitation for parliamentary reform.—Hampden clubs.—Spencean philanthropists.—Trials of William Hone.—The Spa-fields meeting and riot.—March of the blanketeers.—Massacre of Peterloo.—Six Acts.—Death of George III.—Accession of George IV.—Aside from failures of crops and the changes wrought by the industrial revolution, the long continental wars, the wastefulness of the government and the extravagance of the regent, produced alarming and distressing conditions in England. The period from 1816-1820 saw the rise of every sort of radicalism from that of sincere and sane reformers to that of violent and unprincipled agitators. The narrow Tory ministry made no attempt to better matters, but sought instead to stifle the voice of discontent by repressive measures of extreme severity. "From this time the name of Parliamentary Reform became, for the most part, a name of terror to the Government. . . . It passed away from the patronage of a few aristocratic lovers of popularity, to be advocated by writers of 'two-penny trash,' and to be discussed and organized by 'Hampden Clubs' of hungering philanthropists and unemployed 'weaver-boys.' Samuel Bamford, who thought it no disgrace to call himself 'a Radical' . . . says, 'at this time (1816) the writings of William Cobbett suddenly became of great authority; they were read on nearly every cottage hearth in the manufacturing districts of South Lancashire, in those of Leicester, Derby, and Nottingham; also in many of the Scottish manufacturing towns. Their influence was speedily visible.' Cobbett advocated Parliamentary Reform as the corrective of whatever miseries the lower classes suffered. A new order of politicians was called into action: 'The Sunday-schools of the preceding thirty years had produced many working men of sufficient talent to become readers, writers, and speakers in the village meetings for Parliamentary Reform; some also were found to possess a rude poetic talent, which rendered their effusions popular, and bestowed an additional charm on their assemblages; and by such various means, anxious listeners at first, and then zealous proselytes, were drawn from the cottages of quiet nooks and dingles to the weekly readings and discussions of the Hampden Clubs.' . . . In a Report of the Secret Committee of the House of Commons, presented on the 10th of February, 1817, the Hampden Clubs are described as 'associated professedly for the purpose of Parliamentary Reform, upon the most extended principle of universal suffrage and annual parliaments; but that 'in far the greater number of them . . . nothing short of a Revolution is the object expected and avowed.' The testimony of Samuel Bamford shows that, in this early period of their history, the Hampden Clubs limited their object to the attainment of Parliamentary Reform. . . . Bamford, at the beginning of 1817, came to London as a delegate from the Middleton Club, to attend a great meeting of delegates to be assembled in London. . . . The Middleton delegate was introduced, amidst the reeking tobacco-fog of a low tavern, to the leading members of a society called the 'Spencean Philanthropists.' They derived their name from that of a Mr. Spence, a schoolmaster in Yorkshire, who had conceived a plan for making the nation happy, by causing all the lands of the country to become the property of the State, which State should divide all the produce for the support of the people. . . . The Committee of the Spenceans openly med-

dled with sundry grave questions besides that of a community in land; and, amongst other notable projects, petitioned Parliament to do away with machinery. Amongst these fanatics some dangerous men had established themselves, such as Thistlewood, who subsequently paid the penalty of five years of maniacal plotting." A meeting held at Spa-fields on the 2d of December, 1816, in the interest of the Spencean Philanthropists, terminated in a senseless outbreak of riot, led by a young fanatic named Watson. The mob plundered some gunsmiths' shops, shot one gentleman who remonstrated, and set out to seize the Tower; but was dispersed by a few resolute magistrates and constables. "It is difficult to imagine a more degraded and dangerous position than that in which every political writer was placed during the year 1817. In the first place, he was subject, by a Secretary of State's warrant, to be imprisoned upon suspicion, under the Suspension of the Habeas Corpus Act. Secondly, he was open to an ex-officio information, under which he would be compelled to find bail, or be imprisoned. The power of ex-officio information had been extended so as to compel bail, by an Act of 1808; but from 1808 to 1811, during which three years forty such informations were laid, only one person was held to bail. In 1817 numerous ex-officio informations were filed, and the almost invariable practice then was to hold the alleged offender to bail, or, in default, to commit to prison. Under this Act Mr. Hone and others were committed to prison during this year. . . . The entire course of these proceedings was a signal failure. There was only one solitary instance of success—William Cobbett ran away. On the 28th of March he fled to America, suspending the publication of his 'Register' for four months. On the 12th of May earl Grey mentioned in the House of Lords that a Mr. Hone was proceeded against for publishing some blasphemous parody; but he had read one of the same nature, written, printed, and published, some years ago, by other people, without any notice having been officially taken of it. The parody to which earl Grey alluded, and a portion of which he recited, was Canning's famous parody, 'Praise Lepaux'; and he asked whether the authors, be they in the cabinet or in any other place, would also be found out and visited with the penalties of the law? This hint to the obscure publisher against whom these ex-officio informations had been filed for blasphemous and seditious parodies, was effectually worked out by him in the solitude of his prison, and in the poor dwelling where he had surrounded himself, as he had done from his earliest years, with a collection of odd and curious books. From these he had gathered an abundance of knowledge that was destined to perplex the technical acquirements of the Attorney-General, to whom the sword and buckler of his precedents would be wholly useless, and to change the determination of the boldest judge in the land [Lord Ellenborough] to convict at any rate, into the prostration of helpless despair. Altogether, the three trials of William Hone are amongst the most remarkable in our constitutional history. They produced more distinct effects upon the temper of the country than any public proceedings of that time. They taught the Government a lesson which has never been forgotten, and to which, as much as to any other cause, we owe the prodigious improvement as to the law of libel itself, and the use of the law, in our own day,—an improvement which leaves what is dangerous in the press to be corrected by the remedial power of the press itself; and which, instead of lamenting over the newly-acquired ability of the masses to read seditious and irreligious works,

depends upon the general diffusion of this ability as the surest corrective of the evils that are incident even to the best gift of heaven,—that of knowledge.”—C. Knight, *Popular history of England*, v. 8, ch. 5.—In 1817 “there was widespread distress. There were riots in the counties of England arising out of the distress. There were riots in various parts of London. Secret Committees were appointed by both Houses of the Legislature to inquire into the alleged disaffection of part of the people. The Habeas Corpus Act was suspended. The march of the Blanketeers from Manchester [March, 1817] caused panic and consternation through various circles in London. The march of the Blanketeers was a very simple and harmless project. A large number of the working-men in Manchester conceived the idea of walking to London to lay an account of their distress before the heads of the Government, and to ask that some remedy might be found, and also to appeal for the granting of Parliamentary reform. It was part of their arrangement that each man should carry a blanket with him, as they would, necessarily, have to sleep at many places along the way, and they were not exactly in funds to pay for first-class hotel accommodation. The nickname of Blanketeers was given to them because of their portable sleeping-arrangements. The whole project was simple, was touching in its simplicity. Even at this distance of time one cannot read about it without being moved by its pathetic childishness. These poor men thought they had nothing to do but to walk to London, and get to speech of Lord Liverpool, and justice would be done to them and their claims. The Government of Lord Liverpool dealt very roundly, and in a very different way, with the Blanketeers. If the poor man had been marching on London with pikes, muskets and swords, they could not have created a greater fury of panic and of passion in official circles. The Government, availing itself of the suspension of the Habeas Corpus Act, had the leaders of the movement captured and sent to prison, stopped the march by military force, and dispersed those who were taking part in it. . . . The ‘Massacre of Peterloo,’ as it is not inappropriately called, took place not long after. A great public meeting was held [August 16, 1819] at St. Peter’s Field, then on the outskirts of Manchester, now the site of the Free Trade Hall, which many years later rang so often to the thrilling tones of John Bright. The meeting was called to petition for Parliamentary reform. It should be remembered that in those days Manchester, Birmingham, and other great cities were without any manner of representation in Parliament. It was a vast meeting—some 80,000 men and women are stated to have been present. The yeomanry [a mounted militia force], for some reason impossible to understand; endeavoured to disperse the meeting, and actually dashed in upon the crowd, spurring their horses and flourishing their sabres. Eleven persons were killed, and several hundreds were wounded. [The latest authorities have reduced this number to five or six killed and about fifty wounded.] The Government brought in, as their panacea for popular trouble and discontent, the famous Six Acts. These Acts were simply measures to render it more easy for the authorities to put down or disperse meetings which they considered objectionable, and to suppress any manner of publication which they chose to call seditious. But among them were some Bills to prevent training and drilling, and the collection and use of arms. These measures show what the panic of the Government was. It was the conviction of the ruling classes that the poor and the working-classes of England were preparing a revo-

lution. . . . During all this time, the few genuine Radicals in the House of Commons were bringing on motion after motion for Parliamentary reform, just as Grattan and his friends were bringing forward motion after motion for Catholic Emancipation. In 1818, a motion by Sir Francis Burdett for annual Parliaments and universal suffrage was lost by a majority of 106 to nobody. . . . The motion had only two supporters—Burdett himself, and his colleague, Lord Cochrane. . . . The forms of the House require two tellers on either side, and a compliance with this inevitable rule took up the whole strength of Burdett’s party. . . . On January 20, 1820, the long reign of George III. came to an end. The life of the King closed in darkness of eyes and mind. Stone-blind, stone-deaf, and, except for rare lucid intervals, wholly out of his senses, the poor old King wandered from room to room of his palace, a touching picture, with his long, white, flowing beard, now repeating to himself the awful words of Milton—the ‘dark, dark, dark, amid the blaze of noon—irrecoverably dark’—now, in a happier mood, announcing himself to be in the companionship of angels. George, the Prince Regent, succeeded, of course, to the throne; and George IV. at once announced his willingness to retain the services of the Ministry of Lord Liverpool. The Whigs had at one time expected much from the coming of George IV. to the throne, but their hopes had begun to be chilled of late.”—J. 1820-1827.—Cato Street conspiracy.—Trial of Queen Caroline.—Canning in the foreign office.—Commercial crisis of 1825.—Canning as premier.—His death.—“Riot and social misery had, during the Regency, heralded the Reign. They did not cease to afflict the country. At once we are plunged into the wretched details of a conspiracy. Secret intelligence reached the Home Office to the effect that a man named Thistlewood, who had been a year in jail for challenging Lord Sidmouth, had with several accomplices laid a plot to murder the Ministers during a Cabinet dinner, which was to come off at Lord Harrowby’s. The guests did not go, and the police pounced on the gang, arming themselves in a stable in Cato Street, off the Edge-ware Road. Thistlewood blew out the candle, having first stabbed a policeman to the heart. For that night he got off; but, being taken next day, he was soon hanged, with his four leading associates. This

is called the Cato Street Conspiracy. . . . George IV., almost as soon as the crown became his own, began to stir in the matter of getting a divorce from his wife. He had married this poor Princess Caroline of Brunswick in 1795, merely for the purpose of getting his debts paid. Their first interview disappointed both. After some time of semi-banishment to Blackheath she had gone abroad to live chiefly in Italy, and had been made the subject of more than one 'delicate investigation' for the purpose of procuring evidence of infidelity against her. She now came to England (June 6, 1820), and passed from Dover to London through joyous and sympathizing crowds. [Because of the notoriously evil life of the king, the public was roused in her behalf.] The King sent a royal message to the Lords, asking for an inquiry into her conduct. Lord Liverpool and Lord Castlereagh laid before the Lords and Commons a green bag, stuffed with indecent and disgusting accusations against the Queen. Happily for her she had two champions, whose names shall not readily lose the lustre gained in her defence—Henry Brougham and Thomas Denman, her Attorney-General and Solicitor-General. After the failure of a negotiation, in which the Queen demanded two things that the Ministers refused—the insertion of her name in the Liturgy; [it is customary, on the accession of a monarch, to insert in the Book of Common Prayer, the names of the new king and his queen] and a proper reception at some foreign court—Lord Liverpool brought into the Upper House a 'Bill of Pains and Penalties,' which aimed at her degradation from the throne and the dissolution of her marriage. Through the fever-heat of a scorching summer the case went on, counsel and witnesses playing their respective parts before the Lords. . . . At length the Bill, carried on its third reading by a majority of only nine, was abandoned by the Ministry (November 10). And the country broke out into cheers and flaming windows. Had she rested content with the vindication of her fair fame, it would have been better for her own peace. But she went in public procession to St. Paul's to return thanks for her victory. And more rashly still in the following year she tried to force her way into Westminster Abbey during the Coronation of her husband (July 10, 1821). But mercy came a few days later from the King of kings. The people, true to her even in death, insisted that the hearse containing her remains should pass through the city; and in spite of bullets from the carbines of dragoons they gained their point, the Lord Mayor heading the procession till it had cleared the streets. . . . George Canning had resigned his office rather than take any part with the Liverpool Cabinet in supporting the 'Bill of Pains and Penalties,' and had gone to the Continent for the summer of the trial year. [Just as the position of the cabinet seemed more unbending and hopelessly reactionary than ever, a series of events changed the character of the Liverpool ministry.] Early in 1822 Lord Sidmouth . . . resigned the Home Office. He was succeeded by Robert Peel, a statesman destined to achieve eminence. Canning about the same time was offered the post of Governor-General of India," and accepted it; but this arrangement was suddenly changed by the death of Castlereagh, who committed suicide in August. Canning then became Foreign Secretary. "The spirit of Canning's foreign policy was diametrically opposed to that of Londonderry [Castlereagh]. . . . Refusing to interfere in Spanish affairs, he yet acknowledged the new-won freedom of the South American States, which had lately shaken off the Spanish yoke. To preserve peace and yet cut England loose from the Holy Alliance were the con-

flicting aims, which the genius of Canning enabled him to reconcile [see VERONA, CONGRESS OF]."—W. F. Collier, *History of England*, pp. 526-529.—"It became evident that the ministry would have to strengthen itself from the ranks of the moderate Conservatives, [among whom were Peel and Canning] . . . and in 1823 Huskisson also joined the ministry. The Cabinet at once adopted a more liberal policy. Peel began the reform of the criminal law, Huskisson introduced valuable improvements in the province of trade and finance—all in the direction of Free Trade,—and Canning infused a new spirit into our foreign policy."—A. Hassall, *Making of the British empire*, no. 6, p. 134.—"During the years 1824-25, the country, drunk with unusual prosperity, took that speculation fever which has afflicted her more than once during the last century and a half. . . . A crop of fungus companies sprang up temptingly from the heated soil of the Stock Exchange. . . . Shares were bought and gambled in. The winter passed; but spring shone on glutted markets, depreciated stock, no buyers, and no returns from the shadowy and distant investments in South America, which had absorbed so much capital. Then the crashing began—the weak broke first, the strong next, until banks went down by dozens, and commerce for the time was paralyzed. By causing the issue of one and two pound notes, by coining in great haste a new supply of sovereigns, and by inducing the Bank of England to lend money upon the security of goods—in fact to begin the pawnbroking business—the Government met the crisis, allayed the panic, and to some extent restored commercial credit. Apoplexy having struck down Lord Liverpool early in 1827, it became necessary to select a new Premier. Canning was the chosen man." He formed a cabinet with difficulty in April, Wellington, Peel, Eldon, and others of his former colleagues refusing to take office with him. His administration was brought abruptly to an end in August by his sudden death.—W. F. Collier, *History of England*, pp. 526-529.—"But before Navarino had been fought [between the English and Turks in the Greek war for independence], Canning, who on the death of Lord Liverpool (Feb. 17) had become Prime Minister on April 10, 1827, was dead. He had seen great improvements effected in commerce by the adoption of Mr. Huskisson's views [Huskisson, the genius of his age in finance and commerce, improved the conditions of colonial and foreign trade, and made great strides in clearing up the fiscal tangle at home], he had taken part in fresh endeavours to procure the abolition of slavery, he had realized the necessity of adopting measures for the lowering of the price of corn. Though opposed to the introduction of any scheme of parliamentary reform and to the relaxation of the Test and Corporation Acts, he was an advocate of Catholic Emancipation, the settlement of which question had become an absolute necessity. In Ireland a Catholic association had been formed in 1823, and in March, 1826, Sir Francis Burdett brought forward a Catholic Relief Bill, which passed the Commons, but was rejected by the House of Lords. During his short ministry, from April to August, 1827, Canning was supported by the moderate Tories and many Whigs. His liberal tendencies on such questions as Catholic Emancipation and the repeal of the Corn Laws were well known, and men like Wellington, Eldon, and Melville refused to join him. On August 8 he died, having restored England's position on the Continent, having inaugurated a system of non-intervention, and having broken up the Holy Alliance."—A. Hassall, *Making of the British empire*, no. 6, p. 136.

1827-1828.—Removal of disabilities from the Dissenters.—Repeal of the Test and Corporation Acts.—“Early in 1827 a private member, of little influence, unexpectedly raised a dormant question. For the best part of a century the Dissenters had passively submitted to the anomalous position in which they had been placed by the Legislature [see above: 1662-1665; 1672-1673; 1711-1714]. Nominally unable to hold any office under the Crown, they were annually ‘whitewashed’ for their infringement of the law by the passage of an Indemnity Act. The Dissenters had hitherto been assenting parties to this policy. They fancied that the repeal of the Test and Corporation Acts would logically lead to the emancipation of the Roman Catholics, and they preferred remaining under a disability themselves to running the risk of conceding relief to others. The tacit understanding, which thus existed between the Church on one side and Dissent on the other, was maintained unbroken and almost unchallenged till 1827. It was challenged in that year by William Smith, the member for Norwich. Smith was a London banker; he was a Dissenter; and he felt keenly the ‘hard, unjust, and unnecessary’ law which disabled him from holding ‘any office, however insignificant, under the Crown,’ and from sitting ‘as a magistrate in any corporation without violating his conscience.’ Smith took the opportunity which the annual Indemnity Act afforded him of stating these views in the House of Commons. As he spoke the scales fell from the eyes of the Liberal members. The moment he sat down Harvey, the member for Colchester, twitted the Opposition with disregarding ‘the substantial claims of the Dissenters,’ while those of the Catholics were urged year after year ‘with the vehemence of party,’ and supported by ‘the mightiest powers of energy and eloquence.’ The taunt called up Lord John Russell, and elicited from him the declaration that he would bring forward a motion on the Test and Corporation Acts, ‘if the Protestant Dissenters should think it to their interest that he should do so.’ A year afterwards on the 26th of February, 1828—Lord John Russell [who later became one of the Whig leaders] rose to redeem the promise which he thus gave.” His motion “was carried by 237 votes to 193. The Ministry had sustained a crushing and unexpected reverse. For the moment it was doubtful whether it could continue in office. It was saved from the necessity of resigning by the moderation and dexterity of Peel. Peel considered that nothing could be more unfortunate for the Church than to involve the House of Commons in a conflict with the House of Lords on a religious question. . . . On his advice the Bishops consented to substitute a formal declaration for the test hitherto in force. The declaration, which con-

tained a promise that the maker of it would ‘never exert any power or any influence to injure or subvert the Protestant’ Established Church, was to be taken by the members of every corporation, and, at the pleasure of the Crown, by the holder of every office. Russell, though he disliked the declaration, assented to it for the sake of securing the success of his measure.” The bill was modified accordingly and passed both houses, though strenuously resisted by all the Tories of the old school.—S. Walpole, *History of England from 1815, v. 2, ch. 10.*

1827-1828.—Administration of Lord Goderich.—Advent of the Wellington ministry.—“The death of Mr. Canning placed Lord Goderich at the head of the government. The composition of the Cabinet was slightly altered. Mr. Huskisson became

ARTHUR WELLESLEY,  
DUKE OF WELLINGTON

Colonial Secretary, Mr. Herries Chancellor of the Exchequer. The government was generally considered to be weak, and not calculated for a long endurance. . . . The differences upon financial measures between Mr. Herries . . . and Mr. Huskisson . . . could not be reconciled by Lord Goderich, and he therefore tendered his resignation to the king on the 6th of January, 1828. His majesty immediately sent to lord Lyndhurst to desire that he and the duke of Wellington should come to Windsor. The king told the duke that he wished him to form a government of which he should be the head. . . . It was understood that lord Lyndhurst was to continue in office. The duke of Wellington immediately applied to Mr. Peel, who, returning to his post of Secretary of State for the Home Department, saw the impossibility of re-uniting in this administration those who had formed the Cabinet of lord Liverpool. He desired to strengthen the government of the duke of Wellington by the introduction of some of the more important of Mr. Canning’s friends into the Cabinet and to fill some of the

lessor offices. The earl of Dudley, Mr. Huskisson, lord Palmerston, and Mr. Charles Grant, became members of the new administration. Mr. William Lamb, afterwards lord Melbourne, was appointed Chief Secretary for Ireland. The ultra-Tories were greatly indignant at these arrangements. They groaned and reviled as if the world was unchanged."—C. Knight, *Popular history of England*, v. 8, ch. 13.

1830.—Reform movement.—Parliamentary representation before reform.—Unfair basis of representation.—Borough system.—Bribery.—The history of electoral reform goes back over a hundred and fifty years. "Sovereigns as far back as Elizabeth and James I had admitted the existence of . . . divers abuses in the electoral system. Each of these sovereigns had urged their correction. A partial and temporary correction was made during the Commonwealth by Cromwell: a reform which even so strong a royalist as Clarendon described as 'a warrantable alteration and fit to be made in better times.' A permanent correction was urged at the Restoration; again at the Revolution of 1688; again at the union of Scotland with England in 1707; and once more in 1800, at the union of Ireland with Great Britain. From the time of Elizabeth, when Wylson, Her Majesty's Secretary of State, in refusing the request of the Earl of Rutland for the Parliamentary enfranchisement of Newark, wrote 'it is thought that there are overmany (burgesses) already, and there will be a device hereafter to lessen the number for the decayed towns,' and from the time of James I . . . the question of the reform of the House of Commons had never long been at rest. . . . Until the eve of the Reform Act additions continued to be made to the code disqualifying office-holders. . . . [The] code . . . survived the Reform Act of 1832, and those of 1867 and 1884 [and] exists almost in its entirety to-day. The exclusions established by this voluminous code . . . [may be divided] into four groups. . . . Persons connected with the administration of justice, such as judges, recorders, registrars, and stipendiary magistrates; . . . persons representing the Crown as colonial governors, court officials, or subordinate members of the civil service; . . . persons connected with the collection of revenue or audit of public accounts; . . . persons connected with the administration of property for public purposes. . . . With the enactment of these laws, control of the House of Commons such as was exercised by George III at the time of the American Revolution, ceased to be possible. In the two centuries and a quarter which had intervened between the proclamation of 1604, in which James I charged sheriffs not to direct writs to decayed boroughs for elections of members of the House of Commons, and the drafting of the preamble of the Parliamentary Reform Act of 1832, the electoral system in England had undergone but little organic change."—E. and A. G. Porritt, *Unreformed House of Commons*, v. 1, pp. 220-221.—"In 1782 a number of friends of reform met at the house of the Duke of Richmond, decided that the moment had

come to raise the question in the House of Commons, and persuaded [the younger] Pitt to be their spokesman. On 7th of May he moved that 'a Committee be appointed to enquire into the present State of the Representation of the Commons of Great Britain in Parliament . . . but, to the great disappointment of the reformers, his resolution was defeated by twenty votes. . . . In July [1782] the Society for Constitutional Information issued an address 'to the people of Great Britain of all denominations, but particularly to those who subsist by honest industry.' . . . Reform, now and for some time to come, was demanded, not by the tradesman and the artisan, but by the country squire and the professional man. In this address we see them reaching downward in the social scale for encouragement and support. The 'mechanic' is told that he ought to share in political power; 'therefore, let your condition be ever so humble, when any one tells you that you should mind your own business and not meddle with State affairs, be assured he is either a knave or a fool. It is entirely owing to your negligence in the past that you have so much dirty work to inspect.' . . . [In May, 1783, Pitt] brought forward three resolutions for the prevention of bribery; the disfranchisement of corrupt boroughs . . . and an addition to the representation of London and the counties. But . . . the House of Commons refused even to vote directly upon the resolutions. . . . In December, 1784, Pitt gave Wyvill to understand that he would 'put forth his whole power and credit as a Man and as a Minister, honestly and boldly to carry a plan of Reform, by which our liberties will be placed on a footing of permanent security.' The hopes of leading reformers began to rise. . . . In April, 1785, Pitt asked leave to introduce a Reform Bill. . . . Leave to introduce the Bill was refused . . . [and] Pitt never again risked his power and credit as a man and a minister in the cause of parliamentary reform. . . . Henry Flood, one of the greatest of Irish orators, took up the cause which Pitt had abandoned, and moved that 'Leave be given to bring in a Bill for amending the Representation of the People in Parliament.'"—G. S. Veitch, *Genesis of parliamentary reform*, pp. 84, 87-88, 95-96, 99, 113.—Public opinion had not yet been educated up to the point of parliamentary reform, and outside of parliament there was no general agitation or expressed desire upon the subject, and Pitt's energies were turned toward reform in India, and in Ireland. It needed the French Revolution to awaken the minds of the nation at large, and during the revolutionary years all reform movements fell into disrepute. "In the last months of 1792 the democratic movement had been in most places suppressed, and everywhere dominated, by very practical demonstrations of aristocratic and popular displeasure. . . . [Courage was required in those days to enable a man to stand out as a friend of reform.] Prosecution of Reformers, dissenting ministers, and editors lend a sinister interest to several volumes of . . . 'State Trials.' In Scotland there was neither justice nor mercy. In England one man here and another there escaped by Erskine's wit and eloquence, but the greater number of those accused were ruined. . . . When . . . Scottish Democrats . . . began to hold meetings in favour of popular representation in Parliament, and to form associations to spread the demand . . . they were regarded as rebels, treated as such, . . . [and some even transported to Botany Bay]. In 1794, Pitt's attorney-general, Sir John Scott, better known . . . [as] Lord Eldon, tried to get Thomas Hardy, the founder of the Corresponding Society, condemned to death for

high treason on the ground that the object of the Corresponding Society was 'to form a representative government in this country'—*a representative government the direct contrary of the government which is established here.* (*Creevey Papers*, Nov. 4, 1834).—G. M. Trevelyan, *Lord Grey of the Reform Bill*, pp. 77, 79, 39-41, 121-note.—"Thomas Hardy's Corresponding Society was the first political and educational club of working men. It supplied the natural leaders of that class with the opportunity to emerge and lead; with the means of study and debate, and with an embryo organisation. . . . At the general election of July, 1802 Grey made a strong pronouncement at Alnwick for reform of Parliament as being 'indispensable.'"—*Ibid.*

RISE OF POPULAR OPINION.—"In 1807 Francis Place revived democratic politics by organising the Westminster electorate, Fox's old constituency, to bring in Sir Francis Burdett, a Radical. . . . In Parliament Burdett showed bitter dislike and contempt for the orthodox Whigs, and the failure of his motion for household suffrage and equal electoral divisions was all that he could expect. The official demand for Reform was made by Grey, who expressly limited himself to moderate proposals. . . . Two other motions in the Commons for moderate Reform . . . excited little interest. . . . High rents and profits combined with patriotic fervour to disincline the country for innovation. Desire for constitutional change seemed almost treasonable while . . . the Constitution was waging a struggle of life and death against the Republic or the Empire. . . . [In 1812], however, the advanced Reformers . . . thought it safe to emerge from their retirement, and the Union and Hampden clubs were founded to propagate Reform. . . . The rise of the great manufacturers . . . challenged the power of the old aristocracy, and even their despised operatives were making themselves felt. . . . In 1815 the final peace settlement transferred the tension from foreign to home affairs, and a complete change of spirit took place. . . . In the course of the next few years it [Reform] was vehemently canvassed . . . with a zeal, a bitterness, and a passionate sense of reality, such as it had never aroused before. The temporary distress . . . was aggravated by a succession of bad harvests. The general dissatisfaction meant a revival of strength to the powers opposed to Government. In 1816 began a popular agitation for Radical Reform which in three years almost rose to revolution point, and then subsided as suddenly as it had sprung up. . . . The misery of 1816 awoke in . . . [Cobbett] indignation against the governing class and a keen desire for Parliamentary Reform as a root of blessings to the poor. He proceeded to tour the country, urging his hearers to petition for Reform, and in November lowered the price of his 'Register' to twopence. The effect of this at a time when ordinary newspapers cost not less than sevenpence was most startling. The Middlesex election [see above 1768-1774] had shown one latent force in English politics; the agitation aroused by Cobbett revealed another not less full of possibilities. 'The labouring classes,' he wrote, 'seemed as if they had never heard a word on politics before.' By March, 1817, he had made the country too hot to hold him, and left for America, a fugitive from the combined terrors of the laws of sedition and of debt. . . . [See above: 1816-1820.] In May, 1821, Russell followed up . . . [a] sweeping measure [by John Lambton] with a proposal to transfer members to large towns from convicted boroughs. This was lost by only 31 votes; but when, next April, in view of 'the

present state of external peace and internal tranquillity,' and fortified by numerous petitions, Russell presumed to suggest to disfranchise 100 small boroughs partially and give their members to counties and large towns, he was beaten by 105. It is a telling sign of the new spirit that, whereas Pitt had proposed in 1785 to divide the available members between London and the counties, Russell assigned two-fifths of them to the towns. On this occasion he at least succeeded in drawing a clear statement of the case against Reform from its arch-enemy. In a Burke-like speech, whose eloquence long sounded in the ears of Parliament, [George] Canning declared that Reform on principle, other than the remedy of definite grievances, would destroy the Constitution; to establish one uniform right would be to exclude some important interests. He went further: 'I do not believe that to increase the power of the people—or rather to bring that power into more direct, immediate, and incessant operation upon the House—would enable the House to discharge its functions more usefully than it discharges them at present.' It was felt that Canning's speech had sealed the fate of Reform for some years. Only the disfranchisement of Gram-pound [a pocket borough], for notorious corruption, broke the charmed security of the old system. . . . Russell himself realised that the Commons were only reflecting the apathy of the country, and complained that some of the Whig leaders had succumbed to its deadening weight. . . . The financial crisis of 1825, preceded by the strikes which attended the repeal of the Combination Acts, and followed by distress in manufacturing districts, created an atmosphere of unrest contrasting strongly with the optimism . . . [which had prevailed during the previous] years. On the one hand Tories, strengthened by Canning's assertion that his opposition to Reform was based not on temporary circumstances but on unalterable principle, might plead the folly of mooted such a question at a time of disturbance; while Hobhouse, speaking to a motion introduced by Russell just before the dissolution of 1826, found in 'the reverses of the present day' strong proof of the financial incapacity of an unreformed House of Commons. But he saw no hope of carrying such a measure from the Opposition benches. The general election of this year, fought mainly on the subjects of Corn and Catholic Emancipation, made little change in party strength. Vastly different was the effect of the change brought about by Canning's promotion, in the spring of 1827, to the place so long filled by Lord Liverpool. The arrangements made broke up both great parties and left politics in a fluid condition in which anything might happen."—J. R. M. Butler, *Passing of Great Reform Bill*, pp. 25, 27, 28, 40, 41, 43.

INFLUENCE OF COBBETT.—"Cobbett and the Radicals were first in the field. Even while the excitement over the Catholic question was at its height, which indeed was never very great outside the parliamentary classes, Cobbett gave the need for Reform a foremost place in the doctrines of class antagonism he was now preaching. 'Great numbers of the people, in the labouring and middle rank of life, trace all the degradation and suffering of the country to a want of Parliamentary Reform; they cannot, if my Lord Grey can, perceive that the House of Commons is sufficiently under public opinion.' . . . If the distress would bring Reform, he hoped it would continue. 'In short, the game is up unless the aristocracy hasten forward and conciliate the people.' . . . No administration, no party, is guilty of the present misery; the nation is divided into two castes, alien

in interests, habits, and sympathies. Of the rich all interests are represented—the Land, Commerce, Shipping, East India merchants and West India planters, Brewers, 'Saints,' Sport, and Science. The people alone has no representation, and as a result the country is on the verge of beggary. The Reform movement among the working classes [began and continued as a demand for social revolution], ignoring any distinction between the aristocratic parties. . . . By the beginning of 1830 Reform had become a familiar topic to the minds of the middle classes; the discontent following on the bad winter was likely to make it practical. Cobbett, who beyond question had a wider influence in the country at this time than any other single man, had delivered a course of lectures at the Mechanics' Institute in London. In December he started on his Northern Tour, with a view to collecting information as to the real state of the people, besides addressing meetings and urging his hearers to agitate for Reform. . . . The London papers were taking the same line. One Whig journal, finding the question raised in *Blackwood's Magazine* whether education is calculated to make the lower classes better subjects, supplied the paraphrase: is it 'calculated to add to their affection for rotten boroughs, licensing, game and corn laws,' and the other results of an unreformed Parliament?'—*Ibid.*, pp. 56, 57, 58, 59.

STATE OF FRANCHISE BEFORE PASSAGE OF REFORM BILL.—"Holding the modern view of representation, which is largely the result of the historical success of Lord John Russell's bill, we smile in a superior way over the story of Old Sarum with its bare fields and two members, contrasted with unrepresented Manchester's rising population of 180,000. Birmingham, Leeds, Sheffield, Wolverhampton, Huddersfield, Gateshead, were also voteless, while eight members sat for the whole of London. The twenty-three northern counties of England included only seventy-four of the two hundred and three parliamentary boroughs in the country, in spite of the fact that the centre of gravity had been rapidly shifting northwards since the industrial revolution. The south coast, on the other hand, was dotted with boroughs, while Cornwall alone returned forty-four members, one less than the whole of Scotland. And, in view of the patron's influence, acquired, as the case might be, by money or hereditary connection, only a portion of the enfranchised boroughs could be said to return the members that sat for them."—*Ibid.*, p. 236.—"As far back as February 1793, while the country was resounding with preparations for the war in Flanders, the Friends of the People [had] brought out . . . [a] Report on the State of Parliamentary Representation. Its accuracy was not challenged, though it contained a printed list of the 'proprietors' [or "patrons"] of all the rotten boroughs of Great Britain; and Hardy tells us that it 'gave the people more information about the partial and corrupt state of the representation than any other publication at that time.' The tables showed that more than 300 out of the 513 representatives for England and Wales owed their return to individual 'proprietors': half a dozen were put in by the Lords of the Treasury; 88 were absolutely nominated by Peers, and 72 had their election secured by the influence of Peers; 82 were absolutely nominated by individuals below the rank of the peerage, and 57 had their election secured by the influence of such individuals [hence nomination was looked upon as synonymous with election]. The proprietors themselves numbered 71 Lords and 91 Commoners. The meagre number of 11,075 voters

returned a clear majority of the Members for England and Wales; 51 constituencies had less than fifty voters each. . . . Seats were openly advertised for sale in newspapers; if the proprietor became bankrupt, his borough influence was set down as a saleable asset. The price of a seat in Parliament, it was said, was better known than the price of a horse."—G. M. Trevelyan, *Lord Grey of the Reform Bill*, p. 74.—"£5000 had been left by will for the purchase of a seat in Parliament; . . . a seat had been reckoned amongst the saleable assets of a bankrupt. . . . This distortion of the representation by sale and purchase was rendered possible by the state of the 203 English parliamentary boroughs which returned the majority of the members of the House of Commons. With a few exceptions they were alike in returning two members, but . . . no uniform rule fixed the constitution of the boroughs or the franchise of the electors. . . . [Generally speaking the boroughs fell into four main classes: the scot and lot and potwalloper boroughs, freeman boroughs, burgh boroughs, and close corporation boroughs. In the first of these groups, which come more nearly than any other to manhood suffrage, every resident or household not a pauper had a vote but voters in a potwalloper borough had to show a separate doorway to his dwelling, and a fireplace. In the scot and lot boroughs the electors paid scot and lot, church and poor rates.] In 59 boroughs—populous places like Preston and Westminster, Southwark and Northampton, mere clusters of dwellings like Gatton, decayed towns like Gramppound,— . . . members were elected by the potwallopers, by the payers of scot and lot, or in accordance with some analogous custom. . . . [In the freeman boroughs (62) the suffrage was obtained by inheritance, apprenticeship, marriage with a freeman's daughter, or gift of the corporation, who might at any time create a sufficient number of non-resident freemen to turn a contested election.] Least popular of all was the constitution of the 43 boroughs . . . a close corporation elected the members. Tiverton, for instance, with its 5,000 inhabitants, had no say in the election of its representatives, who were chosen by the 25 members of the self-elected corporation."—G. S. Veitch, *Genesis of parliamentary reform*, pp. 3-7.—The classic example of the burghage or "rotten" borough is "Old Sarum, which James I would gladly have seen disfranchised in 1624. . . . On the site of what had once been Old Salisbury there remained, in 1776, one house; . . . but in 1792 this last remnant of a habitation had been demolished, and it was necessary to erect a tent to shelter the returning officer whilst he took the votes of the seven burghage-holders. . . . Tiny electorates like those described were manifestly easy to control. It was estimated in 1793 that 71 peers . . . [the Lords of the Treasury and 91 Commoners . . . could . . . nominate 306 members]. Control of a borough might be obtained either by purchase or by influence, and probably no single politician would have doubted, at the accession of George III, that influence, at any rate over what were called family boroughs, was perfectly legitimate. . . . Huge sums were spent on a single election. A contest at Lincoln in 1808 is said to have cost £25,000 or £30,000, and it is on record that a single candidate spent £30,000 during an election at Liverpool. In some places votes were sold at a fixed market price, varying from five guineas at Boston to forty guineas at Wallingford. But in times of special excitement the market rose. 'What,' says Shelburne, for instance, 'can you say to a blacksmith or to a common labouring man

who is offered seven hundred pounds for his vote."—*Ibid.*, pp. 8, 10, 11, 13.—"The representation of the counties was smaller—there were only 92 county members in England and Wales—but it was purer, and the first reformers set their hopes upon it. Early schemes of parliamentary reform all included an addition to the representation of the counties. . . . The representation of the counties was better than the representation of the boroughs, but it was not without faults. It was unequal, because a small county like Rutland had the same number of members as a large county like Lancashire; it was inequitable, because, whilst the freeholder voted, the copyholder, whose tenure differed only in form, did not."—E. and A. G. Porritt, *Unreformed House of Commons*, v. 1, p. 15.

1830.—Death of George IV.—Accession of William IV.—Fall of Wellington's ministry.—"On June 26, 1830, George IV died [and was succeeded by his brother, the duke of Clarence, who took the title of William IV]. Parliament was dissolved on July 24. It was a time of growing political excitement in England. The last memorable event of the dissolved Parliament had been the rejection of a proposal of Lord John Russell, the Whig leader, to enfranchise Leeds, Birmingham and Manchester. In Birmingham a new association, the Birmingham Political Union, originally formed for the purpose of advocating the free use of paper money, had postponed its original object in order first to carry Parliamentary Reform. Thomas Attwood was the leader of this movement, and he was working in close association with Francis Place and the Westminster Radicals. The rapidity with which this body grew, and the influence it exerted, appeared to Conservatives to bear a most disquieting similarity to the record of the Catholic Association. Meanwhile events were occurring across the Channel which stirred the friends of constitutional government into enthusiasm. On July 27 a revolution broke out in Paris, . . . and on August 7, Louis Philippe, Duke of Orleans, was proclaimed King of the French. At the same time the people of Belgium . . . rebelled and succeeded in establishing their independence [of Holland]. . . . [The success of the revolutions in] France and in Belgium, with but very little bloodshed, had the effect of rousing a common enthusiasm [in England] among Whigs and Radicals . . . [who] effected a partial fusion, and the Liberal Party of the nineteenth century was the result. Meanwhile the Tory Party was torn by dissension; . . . [but though the] Liberal candidates had a series of remarkable successes in the big constituencies, . . . the Tory Party had a nominal majority in the House of Commons, and the Duke of Wellington remained Prime Minister. In a very curious way the issues of Home and Foreign politics were blended. The King's Speech deplored the events in Belgium, and it was feared that war was contemplated in order to re-establish Dutch rule. Earl Grey called upon the House of Lords to prevent the danger of war by reforming Parliament. On the other hand the Duke of Wellington made his historic declaration [November 3] in favour of the Constitution as it was, declaring that if he 'had the task of creating a new Constitution he could not hope to create such perfection at once, but his great endeavour would be to form some description of Legislature which would produce the same results.' . . . [On November 9] the Ministers feared to allow the King and Queen to attend the Lord Mayor's Banquet. The danger feared was only partially connected with the agitation for

reform. The main cause for excitement was the unpopularity of the new force of Metropolitan Police that had just been created . . . as a necessary part of the policy of reform of the Criminal Law, . . . [by Sir Robert Peel who had] taken up the work . . . of substituting for the . . . nominal death penalties for innumerable offences moderate penalties which could actually be carried out, combined with an efficient police. . . . On November 15 the Ministry was defeated in the House of Commons and resigned."—G. Slater, *Making of modern England*, pp. 86, 87, 88.—See also EUROPE: Modern period: Revolutionary movement for self-government.

1830-1832.—Ministry of Earl Grey.—Struggle over passage of Reform Bill.—Reform Act of 1832.—"Earl Grey, leader of the Whigs in the House of Lords, was induced to undertake the task of forming a Cabinet. It was a Ministry partly of Whigs and partly of Canningites. Lord Althorp, the heir to a peerage, was Chancellor of the Exchequer. Lord Melbourne Home Secretary. Lord Palmerston, an Irish Peer sitting in the House of Commons, Foreign Secretary, the other chief members being Lord Russell, Lord Lansdowne, Lord Durham, Lord Goderich and Sir J. Graham. It was perhaps the most aristocratic Cabinet of the nineteenth century. The great difficulty in its formation was Henry Brougham, the one prominent man associated with the Whig Party who had displayed the qualities of a popular leader. He had been elected with enthusiasm by the freeholders of Yorkshire without even visiting the county. . . . He was made a Peer and given the Woolsack. [made lord chancellor] There he ceased in effect to be a political influence, and busied himself in wiping off the great accumulation of appeals which had been left to him by his predecessors. . . . Such was the Cabinet which had to deal with the great problem of drafting a Reform Bill sufficiently bold and comprehensive to win the enthusiasm of the more advanced reformers, and yet mild enough to secure the endorsement of a sufficient body of moderate opinion. In this effort they were extraordinarily successful."—G. Slater, *Making of modern England*, p. 88.—"The first announcement of the premier was that the government would take into immediate consideration the state of the representation, with a view to the correction of those defects which have been occasioned in it, by the operation of time; and with a view to the re-establishment of that confidence upon the part of the people, which he was afraid Parliament did not at present enjoy, to the full extent that is essential for the welfare and safety of the country, and the preservation of the government.' The government were now pledged to a measure of parliamentary reform; and during the Christmas recess were occupied in preparing it. Meanwhile, the cause was eagerly supported by the people. . . . So great were the difficulties with which the government had to contend, that they needed all the encouragement that the people could give. They had to encounter the reluctance of the king,—the interests of the proprietors of boroughs, which Mr. Pitt, unable to overcome, had sought to purchase,—the opposition of two thirds of the House of Lords, and perhaps of a majority of the House

of Commons,—and above all, the strong Tory spirit of the country. . . . On the 3d February, when Parliament reassembled, Lord Grey announced that the government had succeeded in framing 'a measure which would be effective, without exceeding the bounds of a just and well-advised moderation,' and which 'had received the unanimous consent of the whole government.' . . . On the 1st March, this measure was brought forward in the House of Commons by Lord John Russell, to whom,—though not in the cabinet,—this honorable duty had been justly confided. . . . On the 22d March, the second reading of the bill was carried by a majority of one only, in a House of 608,—probably the greatest number which, up to that time, had ever been assembled at a division. On the 10th of April, on going into committee, ministers found themselves in a minority of eight, on a resolution proposed by General Gascoyne, that the number of members returned for England ought not to be diminished. On the 21st, ministers announced that it was not their intention to proceed with the bill. On that same night, they were again defeated on a question of adjournment, by a majority of twenty-two. This last vote was decisive. The very next day, Parliament was prorogued by the king in person, 'with a view to its immediate dissolution.' It was one of the most critical days in the history of our country. . . . The people were now to decide the question;—and they decided it. A triumphant body of reformers was returned, pledged to carry the reform bill; and on the 6th July, the second reading of the renewed measure was agreed to, by a majority of 136. The most tedious and irritating discussions ensued in committee,—night after night; and the bill was not disposed of until the 21st September, when it was passed by a majority of 109. That the peers were still adverse to the bill was certain; but whether, at such a crisis, they would venture to oppose the national will, was doubtful. On the 7th October, after a debate of five nights,—one of the most memorable by which that House has ever been distinguished, and itself a great event in history,—the bill was rejected on the second reading, by a majority of forty-one. The battle was to be fought again. Ministers were too far pledged to the people to think of resigning; and on the motion of Lord Ebrington, they were immediately supported by a vote of confidence from the House of Commons. On the 20th October, Parliament was prorogued; and after a short interval of excitement, turbulence, and danger [see BRISTOL: 1831], met again on the 6th December. A third reform bill was immediately brought in,—changed in many respects,—and much improved by reason of the recent census, and other statistical investigations. Amongst other changes, the total number of members was no longer proposed to be reduced. This bill was read a second time on Sunday morning, the 18th of December, by a majority of 162. On the 23d March, it was passed by the House of Commons, and once more was before the House of Lords. Here the peril of again rejecting it could not be concealed,—the courage of some was shaken,—the patriotism of others aroused; and after a debate of four nights, the second reading was affirmed by the narrow majority of nine. But danger still awaited it. The peers who would no longer venture to reject such a bill, were preparing to change its essential character by amendments. Meanwhile the agitation of the people was becoming dangerous. . . . The time had come, when either the Lords must be coerced, or the ministers must resign. This alternative

was submitted to the king. He refused to create peers: the ministers resigned, and their resignation was accepted. Again the Commons came to the rescue of the bill and the reform ministry. On the motion of Lord Ebrington, an address was immediately voted by them, renewing their expressions of unaltered confidence in the late ministers, and imploring his Majesty 'to call to his councils such persons only as will carry into effect, unimpaired in all its essential provisions, that bill for reforming the representation of the people, which has recently passed this House.' . . . The public excitement was greater than ever; and the government and the people were in imminent danger of a bloody collision, when Earl Grey was recalled to the councils of his sovereign. The bill was now secure. The peers averted the threatened addition to their numbers by abstaining from further opposition; and the bill,—the Great Charter of 1832,—at length received the Royal Assent."—T. E. May, *Constitutional history of England, 1760-1860, v. 1, ch. 6.*—"The Reform Act of 1832 cracked the power of the aristocracy in elections in two ways: First by a redistribution of seats. Fifty-six of the least important boroughs lost their individual representation in the House of Commons and were merged in the surrounding county constituencies. Thirty other boroughs were deprived of one member apiece. These disfranchised boroughs were almost without exception of the 'Rotten' or 'pocket' variety, in each of which the electoral influence of an aristocratic or plutocratic patron had been complete. The seats thus rendered available were given to the more populous industrial districts. Sixty-five went to the larger towns, of which Manchester, Birmingham, Leeds, and Sheffield had hitherto possessed no individual representation. Sixty-five were given to the more industrial counties. The remaining thirteen went to Scotland and Ireland. The system of nomination was attacked in another way, for a new electoral franchise was introduced which increased the number of voters and thus made it more difficult for any electoral patron to control them. In boroughs the new franchise gave the vote to all house-holders who owned or rented a building worth ten pounds a year. In the county constituencies the Reform Act enfranchised tenants-at-will of land worth fifty pounds a year and copyholders or leaseholders of land worth ten pounds a year. The old freehold qualifications for county voters was left undisturbed; but all the old borough franchises, except that of the freemen, were abolished, although existing electors might continue to exercise their qualifications during their lives. For the first time in British electoral history a system of registration was introduced. Before being recognized as a voter, a qualified person must prove his qualification and have his name entered upon the electoral lists. To the leading politicians of the day there is little doubt but that the Reform Act seemed like a constitutional revolution. The Tories did not spare their prognostications of the anarchy that was sure to follow and even some of the reformers feared the disastrous effects of what they regarded as the new democracy. The Radicals, however, and the working-class leaders looked upon the reform as merely the first step. The latter felt that the advantage won was purely in the interests of the middle class and they looked forward to a further extension of the franchise which would make the electoral system really democratic. Francis Place, who understood and sympathized with the democratic reformers, believed that the new franchises were important not so much for

themselves as for what they promised for the future; they were, he said, the 'commencement of the breaking up of the old rotten system.' It is with this estimate that the opinion of posterity will probably concur. The Reform Act did not bring electoral power into the hands of the democracy; it did not even break the control of the middle classes. [It even took away the franchise from some who had had the constitutional right to use it.] But, as Mill put it, it did break the spell that had kept men bound to the fear of change, and although the democratic tide rose slowly, it proved, after 1832, to be irresistible. One reason why the Reform Act did not prove to have results immediately favorable to democracy, was that the new franchises did not increase the total electorate nearly as much as had been generally anticipated, either by the friends or the foes of parliamentary reform. Lord John Russell had estimated that the electorate would be doubled; but as a matter of fact the net increase in the number of electors in England and Wales was only some 200,000, or a gain of about fifty per cent.—C. Seymour and D. P. Frary, *How the world votes*, v. 1, pp. 116-118.—See also CABINET: English: Position during 19th century; SUFFRAGE, MANHOOD: British empire: 1832-1885.

1832-1833.—Abolition of slavery in the West Indies.—Trade monopoly of the East India Company withdrawn.—Factory bill.—Irish tithes.—"The period which succeeded the passing of the Reform Bill was one of immense activity and earnestness in legislation. . . . The first great reform was the complete abolition of the system of slavery in the British colonies. The slave trade had itself been suppressed so far as we could suppress it long before that time, [1807] but now the whole system of West Indian slavery was brought to an end [see SLAVERY: 1834-1838]. . . . A long agitation of the small but energetic anti-slavery party brought about this practical result in 1833. . . . Granville Sharpe, Zachary Macaulay, father of the historian and statesman, Thomas Fowell Buxton, Wilberforce, Brougham, and many others, had for a long time been striving hard to rouse up public opinion to the abolition of the slave system." The bill which passed Parliament gave immediate freedom to all children subsequently born, and to all those who were then under six years of age; while it determined for all other slaves a period of apprenticeship, lasting five years in one class and seven years in another, after which they attained absolute freedom. It appropriated £20,000,000 for the compensation of the slave-owners. "Another reform of no small importance was accomplished when the charter of the East India Company came to be renewed in 1833. The clause giving them a commercial monopoly of the trade of the East was abolished, and the trade thrown open to the merchants of the world [see INDIA: 1823-1833]. There were

other slaves in those days as well as the negro. There were slaves at home, slaves to all intents and purposes, who were condemned to a servitude as rigorous as that of the negro, and who, as far as personal treatment went, suffered more severely than negroes in the better class plantations. We speak now of the workers in the great mines and factories. No law up to this time regulated with anything like reasonable stringency the hours of labour in factories. . . . A commission was appointed to investigate the condition of those who worked in the factories. Lord Ashley, since everywhere known as the Earl of Shaftesbury, . . . brought forward the motion which ended in the appointment of the commission. The commission quickly brought together an immense amount of evidence to show the terrible effect, moral and physical, of the overworking of women and children, and an agitation set in for the purpose of limiting by law the duration of the hours of labour. . . . The principle of legislative interference to protect children working in factories was established by an Act passed in 1833, limiting the work of children to eight hours a day, and that of young persons under eighteen to 60 hours a week [see LABOR LEGISLATION: 1801-1878; SOCIAL INSURANCE: Details for various countries: Great Britain: 1833-1911]. The agitation then set on foot and led by Lord Ashley was engaged for years after in endeavouring to give that principle a more extended application. . . . Irish tithes were one of the grievances which came under the energetic action of this period of reform. The people of Ireland complained with justice of having to pay tithes for the maintenance of the church establishment in which they did not believe, and under whose roofs they never bent in worship." In 1832, committees of both Houses of Parliament reported in favor of the extinction of tithes; but the Government undertook temporarily a scheme whereby it made advances to the Irish clergy and assumed the collection of tithes among its own functions. It only succeeded in making matters worse, and several years passed before the adoption (in 1838) of a bill which "converted the tithe composition into a rent charge."—J. McCarthy, *Epoch of reform*, ch. 7-8.—When this church temporalities bill of 1833 was passed, its most popular features had been omitted, and it was accompanied by a coercion bill giving the Lord Lieutenant of Ireland drastic powers over counties that he considered to be in a state of disturbance.

1834-1837.—Resignation of Lord Grey and the reform ministry.—First Melbourne administration.—Peel's first ministry and Melbourne's second.—Death of William IV.—Accession of Queen Victoria.—In the reform Parliament of 1833 there was a large majority of Whigs, who were far from being united. The Opposition was also divided, a more liberal section of Tories, under

the leadership of Peel, adopting the name of "Conservatives." Although this Parliament had distinguished itself in abolishing slavery in the colonies and in passing the factory act, it was hopelessly split after the passage of the Irish church temporalities bill. A revival of the famous "appropriation clause" which had been omitted from the bill in its final form caused the downfall of Grey's ministry. Resolutions were brought forward in 1834 "that the Protestant Episcopal Church of Ireland much exceeded the spiritual wants of the Protestant population; that it was the right of the State, and of Parliament, to distribute church property, and that the temporal possessions of the Irish church ought to be reduced. The ministers determined to adopt a middle course and appoint a commission of inquiry. . . . While the negotiations were going on, news was received of the resignation of four of the most conservative members of the Cabinet, who regarded any interference with church property with abhorrence; they were Mr. Stanley, Sir James Graham, the Duke of Richmond, and the Earl of Ripon. . . . Owing to the difference of opinion in the Cabinet on the Irish coercion bill, on July 9, 1834, Earl Grey placed his resignation as Prime Minister in the hands of the king [the king, failing to unite Melbourne and Peel, resigned himself to a Whig ministry]. . . . On the 14th, Viscount Melbourne stated in the House of Lords that his Majesty had honored him with his commands for the formation of a ministry. He had undertaken the task, but it was not yet completed. There was very little change in the Cabinet. . . . The Irish Church Bill was again brought forward, and although it passed the Commons, was defeated in the Lords, August 1st. The king much disliked the church policy of the Whigs, and dreaded reform. [Personal differences in the Cabinet soon forced Melbourne out.] . . . On Sir Robert Peel's return from Italy, whence he had been called, he waited upon the king and accepted the office of First Lord of the Treasury and Chancellor of the Exchequer [November 1834]. . . . Prevented from forming a moderate Conservative ministry, he was reduced to fill his places with men of more pronounced opinions, which promised ill for any advance in reform. . . . The Foreign, Home, War, and Colonial offices were filled by Wellington, Goulburn, Herries, and Aberdeen; Lord Lyndhurst was Lord Chancellor; Harding, Secretary for Ireland; and Lord Wharcliffe, Privy Seal. With this ministry Peel had to meet a hostile House of Commons. . . . The Prime Minister therefore thought it necessary to dissolve Parliament, and took the opportunity [in what was called the 'Tamworth manifesto'] of declaring his policy. He declared his acceptance of the Reform Bill as a final settlement of the question. . . . The elections, [Jan. 1835] though they returned a House, as is generally the case, more favorable to the existing government than that which had been dissolved, still gave a considerable majority to the Liberals."—A. H. McCalman, *Abridged history of England*, pp. 565-570.—"The prime minister, abandoning his usual reserve, definitely pledged himself not only 'to advance, soberly and cautiously, in the path of progressive improvement,' but to bring forward specific measures. . . . On March 17, he brought in a bill to relieve dissenters from disabilities in respect of marriage, which met with general approval. . . . Still more important, as examples of conservative reform, were Peel's efforts to purge the established Church of abuses, and to introduce a voluntary commutation of tithes. . . . But the whig-radical allies of 1835 had not the smallest

intention of giving Peel a fair trial; nor indeed had they any other object beyond the recovery of power. . . . Peel had long been conscious of the hopelessness of his position and impatient of maintaining the struggle. . . . He firmly resolved to resign. On doing so [April 1835] he received from the whole conservative party, of which he was the creator, a most cordial address of thanks and confidence. Though his short administration had consolidated the whig forces for the moment, and given them a new lease of power, it showed him to be the foremost statesman in the country, and paved the way for his triumphant return to office. As Guizot said, he had proved himself 'the most liberal of conservatives, the most conservative of liberals, and the most capable man of all in both parties.' . . . [The King's] first idea was to fall back on Grey, who had already betrayed his growing mistrust of radicalism, but Grey declined to enter the lists again. There was no recourse but to recall Melbourne, whom the king personally liked. . . . The session of 1835, however, was rendered memorable by the enactment of one beneficent measure of the first magnitude. This measure—the municipal corporations act—was preceded, like the new poor law [Grey's ministry, 1834], by a thorough and exhaustive inquiry. . . . All were agreed on the necessity of sweeping away or expurgating the existing Irish corporations, but the whole strength of the conservative party in both houses was enlisted against the experiment of elective town councils. . . . Happily the commutation of tithes in England presented no political difficulties of the same nature. . . . An equally valuable and permanent legacy of this session is contained in two cognate acts regulating marriages and registration in England. . . . If the marriage act relieved a large class of the community from vexatious disabilities, the whole community assuredly owes the second reformed parliament a debt of gratitude for the registration act. . . . A bill was now passed, for the first time allowing prisoners on trial for felony to be defended by counsel. . . . A still more notable contribution to social improvement was made by Spring Rice, the chancellor of the exchequer, in consolidating the paper duties on a reduced scale, and lowering the stamp duty on newspapers from fourpence to one penny."—G. C. Brodrick and J. K. Fotheringham, *Political history of England*, v. xi, pp. 354-369.—"On June 9, 1837, a bulletin issued from Windsor Castle informing a loyal and really affectionate people that the king was ill. From the 12th they were regularly issued until the 10th, when the malady, inflammation of the lungs, had greatly increased. . . . On Tuesday, June 20th, the last of these official documents was issued. His Majesty had expired that morning at 2 o'clock. William died in the seventy-second year of his age and seventh year of his reign, leaving no legitimate issue. He was succeeded by his niece, Alexandrina Victoria."—A. H. McCalman, *Abridged history of England*, pp. 565-570.

1834-1839.—Poor law reform.—Amelioration of criminal laws.—Municipal Reform Act.—Education Act.—"The next great reform to follow the Reform Act was that of the Poor Law, resulting from the investigations of Blomfield, Sumner, and Nassau Senior. The Poor Law of 1834 was a great advance on its predecessor, and it has had no successor. A workable, efficient

system was evolved; the scandalous conditions of indiscriminate outdoor relief prevailing, amounting to pauperisation, were swept away. And the new workhouses were not over-full. They were the workhouses we know from *Oliver Twist*, often more dreaded than the gaols. The humanitarian instinct is not apparent in the Poor Law of 1834. [See also CHARITIES: England: 1834.] It was, however, the inspiration of some other reforms of the period—the abolition of capital punishment for such offences as forgery, coining, sacrilege, horse-stealing, and sheep-stealing. [See CRIMINAL LAW: 1832-1860.] The other most significant reforms of the thirties must be added to this enumeration, the Municipal Reform Act of 1835 [see MUNICIPAL GOVERNMENT: Development of the city as a local business unit] and the Education Act of 1839, which first established a central department for education and introduced the principle of compulsion. [See also EDUCATION: Modern: 19th century: England.]—A. S. Turberville, and F. W. Howe, *Great Britain in the latest age*, pp. 10, 11.—See also CIVIL SERVICE REFORM: Great Britain: 1834-1841.

1837-1839.—Opening of the reign of Queen Victoria.—End of personal rule.—Beginning of purely constitutional government.—Peel and the bedchamber question.—“The Duke of Wellington thought the accession of a woman to the sovereign's place would be fatal to the present hopes of the Tories [who were then expecting a turn of events in their favor, as against the Whig administration of Lord Melbourne]. ‘Peel,’ he said, ‘has no manners, and I have no small talk.’ He seemed to take it for granted that the new sovereign would choose her Ministers as a school-girl chooses her companions. He did not know, did not foresee, that with the accession of Queen Victoria the real reign of constitutional government in these islands was to begin. The late King had advanced somewhat on the ways of his predecessors, but his rule was still, to all intents and purposes, a personal rule. With the accession of Victoria the system of personal rule came to an end. The elections which at that time were necessary on the coming of a new sovereign went slightly in favour of the Tories. The Whigs had many troubles. They were not reformers enough for the great body of their supporters. . . . The Radicals had split off from them. They could not manage O’Connell. The Chartist fire was already burning. There was many a serious crisis in foreign policy—in China and in Egypt, for example. The Canadian Rebellion and the mission of Lord Durham involved the Whigs in fresh anxieties, and laid them open to new attacks from their enemies. On the top of all came some disturbances, of a legislative rather than an insurrectionary kind, in Jamaica, and the Government felt called upon to bring in a Bill to suspend for five years the Constitution of the island. A Liberal and reforming Ministry bringing in a Bill to suspend a Constitution is in a highly awkward and dangerous position. Peel saw his opportunity and opposed the Bill. The Government won by a majority of only 5. Lord Melbourne accepted the situation, and resigned [May 7, 1830]. The Queen sent for the Duke of Wellington, and he, of course, advised her to send for Peel. When Peel came, the young Queen told him with all the frankness of a girl that she was sorry to part with her late Ministers, and that she did not disapprove of their conduct,

but that she felt bound to act in accord with constitutional usages. Peel accepted the task of forming an Administration. And then came the famous dispute known as the ‘Bedchamber Question’—the ‘question de jupons.’ The Queen wished to retain her ladies-in-waiting; Peel insisted that there must be some change. Two of these ladies were closely related to Whig statesmen whose policy was diametrically opposed to that of Peel on no less important a question than the Government of Ireland. Peel insisted that he could not undertake to govern under such conditions. The Queen, acting on the advice of her late Ministers, would not give way. The whole dispute created immense excitement at the time. There was a good deal of misunderstanding on both sides. It was quietly settled, soon after, by a compromise which the . . . Prince Consort suggested, and which admitted that Peel had been in the right. . . . Its importance to us now is that, as Peel would not give way, the Whigs [under Melbourne] had to come back again, and they came back discredited and damaged, having, as Mr. Molesworth puts it, got back ‘behind the petticoats of the ladies-in-waiting.’—J. McCarthy, *Sir Robert Peel*, ch. 12.

1838-1842.—Chartist agitation.—“When the Parliament was opened by the Queen on the 5th of February, 1830, a passage in the Royal Speech had reference to a state of domestic affairs which presented an unhappy contrast to the universal loyalty which marked the period of the Coronation. Her Majesty said: ‘I have observed with pain the persevering efforts which have been made in some parts of the country to excite my subjects to disobedience and resistance to the law, and to recommend dangerous and illegal practices.’ Chartistism, which for ten subsequent years occasionally agitated the country, had then begun to take root. On the previous 12th of December a proclamation had been issued against illegal Chartist assemblies, several of which had been held, says the proclamation, ‘after sunset by torch-light.’ The persons attending these meetings were armed with guns and pikes; and demagogues, such as Feargus O’Connor and the Rev. Mr. Stephens at Bury, addressed the people in the most inflammatory language. . . . The document called ‘The People’s Charter,’ which was embodied in the form of a bill in 1838, comprised six points:—universal suffrage, excluding, however, women; division of the United Kingdom into equal electoral districts; vote by ballot; annual parliaments; no property qualification for members; and a payment to every member for his legislative services. These principles so quickly recommended themselves to the working-classes that in the session of 1830 the number of signatures to a petition presented to Parliament was upwards of a million and a quarter. The middle classes almost universally looked with extreme jealousy and apprehension upon any attempt for an extension of the franchise. The upper classes for the most part regarded the proceedings of the Chartists with a contempt which scarcely concealed their fears. This large section of the working population very soon became divided into what were called physical-force Chartists and moral-force Chartists. As a natural consequence, the principles and acts of the physical-force Chartists disgusted every supporter of order and of the rights of property.”—C. Knight, *Popu-*

lar history of England, v. 8, ch. 23.—“Nothing can be more unjust than to represent the leaders and promoters of the movement as mere factious and self-seeking demagogues. Some of them were men of great ability and eloquence; some were impassioned young poets, drawn from the class whom Kingsley has described in his ‘Alton Locke’; some were men of education; many were earnest and devoted fanatics; and, so far as we can judge, all, or nearly all, were sincere. Even the man who did the movement most harm, and who made himself most odious to all reasonable outsiders, the once famous, now forgotten, Feargus O’Connor, appears to have been sincere, and to have personally lost more than he gained by his Chartism. . . . He was of commanding presence, great stature, and almost gigantic strength. He had education; he had mixed in good society; he belonged to an old family. . . . There were many men in the movement of a nobler moral nature than poor, huge, wild Feargus O’Connor. There were men like Thomas Cooper, . . . devoted, impassioned, full of poetic aspiration, and no scant measure of poetic inspiration as well. Henry Vincent was a man of unimpeachable character. . . . Ernest Jones was as sincere and self-sacrificing a man as ever joined a sinking cause. . . . It is necessary to read such a book as Thomas Cooper’s Autobiography to understand how genuine was the poetic and political enthusiasm which was at the heart of the Chartist movement, and how bitter was the suffering which drove into its ranks so many thousands of stout working men who, in a country like England, might well have expected to be able to live by the hard work they were only too willing to do. One must read the Anti-Corn-Law Rhymes of Ebenezer Elliott to understand how the ‘bread tax’ became identified in the minds of the very best of the working class, and identified justly, with the system of political and economical legislation which was undoubtedly kept up, although not of conscious purpose, for the benefit of a class. . . . A whole literature of Chartist newspapers sprang up to advocate the cause. The *Northern Star*, owned and conducted by Feargus O’Connor, was the most popular and influential of them; but every great town had its Chartist press. Meetings were held at which sometimes very violent language was employed. . . . A formidable riot took place in Birmingham, where the authorities endeavoured to put down a Chartist meeting. . . . Efforts were made at times to bring about a compromise with the middle-class Liberals and the Anti-Corn-Law leaders; but all such attempts proved failures. The Chartists would not give up their Charter; many of them would not renounce the hope of seeing it carried by force. The Government began to prosecute some of the orators and leaders of the Charter movement; and some of these were convicted, imprisoned and treated with great severity. Henry Vincent’s imprisonment at Newport, in Wales, was the occasion of an attempt at rescue [November 4, 1830] which bore a very close resemblance indeed to a scheme of organised and armed rebellion.” A conflict occurred in which ten of the Chartists were killed, and some 50 were wounded. Three of the leaders, named Frost, Williams, and Jones, were tried and convicted on the charge of high treason, and were sentenced to death; but the sentence was commuted to one of transportation. “The trial and conviction of Frost, Williams, and Jones, did not put a stop to the Chartist agitation. On the contrary, that agitation seemed rather to wax and strengthen and grow broader because of the attempt at Newport and its consequences. . . .

There was no lack of what were called energetic measures on the part of the Government. The leading Chartists all over the country were prosecuted and tried, literally by hundreds. In most cases they were convicted and sentenced to terms of imprisonment. . . . The working classes grew more and more bitter against the Whigs, who they said had professed Liberalism only to gain their own ends. There was a profound distrust of the middle class and their leaders,” and it was for that reason that the Chartists would not join hands with the Anti-Corn-Law movement, then in full progress. “It is clear that at that time the Chartists, who represented the bulk of the artisan class in most of the large towns, did in their very hearts believe that England was ruled for the benefit of aristocrats and millionaires who were absolutely indifferent to the sufferings of the poor. It is equally clear that most of what are called the ruling class did really believe the English working men who joined the Chartist movement to be a race of fierce, unmanageable, and selfish communists, who, if they were allowed their own way for a moment, would prove themselves determined to overthrow throne, altar, and all established securities of society.”—J. McCarthy, *History of our own times*, v. 1, ch. 5.—Among the measures of coercion advocated in the councils of the Chartists was that of appointing and observing what was to be called a “sacred month,” during which the working classes throughout the whole kingdom were to abstain from every kind of labour, in the hope of compelling the governing classes to concede the charter.”—W. N. Molesworth, *History of England*, 1830-1874, v. 2, ch. 5.

1840.—Adoption of penny-postage.—“In 1837 Mr. Rowland Hill had published his plan of a cheap and uniform postage. A Committee of the House of Commons was appointed in 1837, which continued its inquiries throughout the session of 1838, and arrived at the conviction that the plan was feasible, and deserving of a trial under legislative sanction. After much discussion, and the experiment of a varying charge, the uniform rate for a letter not weighing more than half an ounce became, by order of the Treasury, one penny. This great reform came into operation on the 10th of January, 1840. Its final accomplishment is mainly due to the sagacity and perseverance of the man who first conceived the scheme.”—C. Knight, *Crown history of England*, p. 883.—“Up to this time the rates of postage on letters were very heavy, and varied according to the distance. For instance, a single letter conveyed from one part of a town to another cost 2d.; a letter from Reading, to London 7d.; from Brighton, 8d.; from Aberdeen, 1s. 3½d.; from Belfast, 1s. 4d. If the letter was written on more than a single sheet, the rate of postage was much higher.”—W. N. Molesworth, *History of England*, 1830-1874, v. 2, ch. 1.—See also POSTAL SYSTEM: 1803-1914.

1840.—Queen’s marriage.—“On January 16, 1840, the Queen, opening Parliament in person, announced her intention to marry her cousin,

Prince Albert of Saxe-Coburg-Gotha—a step which she trusted would be 'conducive to the interests of my people as well as to my own domestic happiness.' . . . It was indeed a marriage founded on affection. . . . The Queen had for a long time loved her cousin. He was nearly her own age, the Queen being the elder by three months and two or three days. Francis Charles Augustus Albert Emmanuel was the full name of the young Prince. He was the second son of Ernest, Duke of Saxe-Coburg-Saalfeld, and of his wife Louisa, daughter of Augustus, Duke of Saxe-Gotha-Altenberg. Prince Albert was born at the Rosenau, one of his father's residences, near Coburg, on August 26, 1819. . . . A marriage between the Princess Victoria and Prince Albert had been thought of as desirable among the families on both sides, but it was always wisely resolved that nothing should be said to the young Princess on the subject unless she herself showed a distinct liking for her cousin. In 1836, Prince Albert was brought by his father to England, and made the personal acquaintance of the Princess, and she seems at once to have been drawn toward him in the manner which her family and friends would most have desired. . . . The marriage of the Queen and the Prince took place on February 10, 1840."—J. McCarthy, *History of our own times*, v. 1, ch. 7.

1841-1842.—Fall of the Melbourne ministry.—Opening of the second administration of Sir Robert Peel.—In 1841, the Whig Ministry (Melbourne's) determined "to do something for freedom of trade. . . . Colonial timber and sugar were charged with a duty lighter than was imposed on foreign timber and sugar; and foreign sugar paid a lighter or a heavier duty according as it was imported from countries of slave labour or countries of free labour. It was resolved to raise the duty on colonial timber, but to lower the duty on foreign timber and foreign sugar, and at the same time to replace the sliding scale of the Corn Laws then in force [see TARIFF: 1815-1828] with a fixed duty of 8s. per quarter. . . . The concessions offered by the Ministry, too small to excite the enthusiasm of the free traders, were enough to rally all the threatened interests around Peel. Baring's revision of the sugar duties was rejected by a majority of 36. Everybody expected the Ministers to resign upon this defeat; but they merely announced the continuance of the former duties. Then Peel gave notice of a vote of want of confidence, and carried it on the 4th of June by a single vote in a House of 623 members. Instead of resigning, the Ministers appealed to the country. The elections went on through the last days of June and the whole of July. When the new Parliament was complete, it appeared that the Conservatives could count upon 367 votes in the House of Commons. The Ministry met Parliament on the 24th of August. Peel in the House of Commons and Ripon in the House of Lords moved amendments to the Address, which were carried by majorities of 91 and 72 respectively." The Ministry resigned and a Conservative Gov-

ernment was formed, with Peel at its head, as First Lord of the Treasury. "Wellington entered the Cabinet without office, and Lyndhurst assumed for the third time the honours of Lord Chancellor." Among the lesser members of the Administration—not in the Cabinet—was Mr. Gladstone, who became Vice-President of the Board of Trade. "This time Peel experienced no difficulty with regard to the Queen's Household. It had been previously arranged that in the case of Lord Melbourne's resignation three Whig Ladies, the Duchess of Bedford, the Duchess of Sutherland, and Lady Normanby, should resign of their own accord. One or two other changes in the Household contented Peel, and these the Queen accorded with a frankness which placed him entirely at his ease. . . . During the recess Peel took a wide survey of the ills affecting the commonwealth, and of the possible remedies. To supply the deficiency in the revenue without laying new burthens upon the humbler class; [to avert a financial crisis by a banking reform]; to revive our fainting manufactures by encouraging the importation of raw material; to assuage distress by making the price of provisions lower and more regular, without taking away that protection which he still believed essential to British agriculture; these were the tasks which Peel now bent his mind to compass. . . . Having solved [the problems] to his own satisfaction, he had to persuade his colleagues that they were right. Only one proved obstinate. The Duke of Buckingham would bear of no change in the degree of protection afforded to agriculture. He surrendered the Privy Seal, which was given to the Duke of Buccleugh. . . . The Queen's Speech recommended Parliament to consider the state of the laws affecting the importation of corn and other commodities. It announced the beginning of a revolution which few persons in England thought possible, although it was to be completed in little more than ten years."—F. C. Montague, *Life of Sir Robert Peel*, ch. 7-8.—See also TARIFF: 1842.

1846.—Vengeance of the Tory-Protectionists.—Overthrow of Peel.—Advent of Disraeli.—Ministry of Lord John Russell.—"Strange to say, the day when the Bill [extinguishing the duties on corn] was read in the House of Lords for the third time [June 25] saw the fall of Peel's Ministry. The fall was due to the state of Ireland. The Government had been bringing in a Coercion Bill for Ireland. It was introduced while the Corn Bill was yet passing through the House of Commons. The situation was critical. All the Irish followers of Mr. O'Connell would be sure to oppose the Coercion Bill. The Liberal party, at least when out of office, had usually made it their principle to oppose Coercion Bills, if they were not

attended with some promises of legislative reform. The English Radical members, led by Mr. Cobden and Mr. Bright [leaders of the anti-corn law movement], were certain to oppose coercion. If the protectionists should join with these other opponents of the Coercion Bill, the fate of the measure was assured, and with it the fate of the Government. This was exactly what happened. Eighty Protectionists followed Lord George Bentinck into the lobby against the Bill, in combination with the Free Traders, the Whigs, and the Irish Catholic and national members. The division took place on the second reading of the Bill on Thursday, June 25, and there was a majority of 73 against the Ministry."—J. McCarthy, *Epoch of reform*, p. 183.—Peel never again came back into office, but his work was an enduring monument to his greatness and entitles him to the rank of the foremost statesman of his generation. The revengeful Tory-Protectionist attack on Peel was led by Sir George Bentinck and Benjamin Disraeli, then just making himself felt in the House of Commons. It was distinctly grounded upon no objection in principle to the Irish Coercion bill, but on the declaration that they could "no longer trust Peel, and, 'must therefore refuse to give him unconstitutional powers.' . . . He had twice betrayed the party who had trusted his promises. . . . 'The gentlemen of England,' of whom it had once been Sir Robert's proudest boast to be the leader, declared against him. He was beaten by an overpowering majority, and his career as an English minister was closed. Disraeli's had been the hand which dethroned him, and to Disraeli himself, after three years of anarchy and uncertainty, descended the task of again building together the shattered ruins of the Conservative party. Very unwillingly they submitted to the unwelcome necessity. Canning and the elder Pitt had both been called adventurers, but they had birth and connection, and they were at least Englishmen. Disraeli had risen out of a despised race; he had never sued for their favours; he had voted and spoken as he pleased, whether they liked it or not. . . . He was without Court favour, and had hardly a powerful friend except Lord Lyndhurst. He had never been tried on the lower steps of the official ladder. He was young, too—only 42—after all the stir that he had made. There was no example of a rise so sudden under such conditions. But the Tory party had accepted and cheered his services, and he stood out alone among them as a debater of superior power. Their own trained men had all deserted them. Lord George remained for a year or two as nominal chief: but Lord George died; the conservatives could only consolidate themselves under a real leader, and Disraeli was the single person that they had who was equal to the situation. . . . He had overthrown Peel and succeeded to Peel's honours."—J. A. Froude, *Lord Beaconsfield*, ch. 9.—Although the Tory-Protectionists had accomplished the overthrow of Peel, they were not prepared to take the government into their own hands. The new ministry was formed under Lord John Russell, as first lord of the treasury, with Lord Palmerston in the foreign office, Sir George Grey in the home department, Earl Grey colonial secretary, Sir C. Wood chancellor of the Exchequer, and Mr. Macaulay paymaster-general.—W. C. Taylor, *Life and times of Sir Robert Peel*, v. 3, ch. 11.—The most important enactment of the Coercion Bill "(which subsequently gave it the name of the Curfew Act) was that which conferred on the executive Government the power in proclaimed districts of forbidding persons to be out of their

dwellings between sunset and sunrise. The right of proclaiming a district as a disturbed district was placed in the hands of the Lord-Lieutenant, who might station additional constabulary there, the whole expense of which was to be borne by the district."—J. F. Bright, *History of England*, period 4, p. 137.

1848.—Last Chartist demonstration.—"The more violent Chartists had broken from the Radical reformers, and had themselves divided into two sections; for their nominal leader, Feargus O'Connor, was at bitter enmity with more thoroughgoing and earnest leaders such as O'Brien and Cooper. O'Connor had not proved a very efficient guide. He had entered into a land scheme of a somewhat doubtful character. . . . He had also injudiciously taken up a position of active hostility to the free-traders, and while thus appearing as the champion of a falling cause had alienated many of his supporters. Yet the Parliament elected in 1846 contained several representatives of the Chartist principles, and O'Connor himself had been returned for Nottingham by a large majority over Hobhouse, a member of the new Ministry. The revolution in France gave a sudden and enormous impulse to the agitation. The country was filled with meetings at which violent speeches were uttered and hints, not obscure, dropped of the forcible establishment of a republic in England. A new Convention was summoned for the 6th of April, a vast petition was prepared, and a meeting, at which it was believed that half a million of people would have been present, was summoned to meet on Kennington Common on the 10th of April for the purpose of carrying the petition to the House in procession. The alarm felt in London was very great. It was thought necessary to swear in special constables, and the wealthier classes came forward in vast numbers to be enrolled. There are said to have been no less than 170,000 special constables. The military arrangements were entrusted to the Duke of Wellington; the public offices were guarded and fortified; public vehicles were forbidden to pass the streets lest they should be employed for barricades; and measures were taken to prevent the procession from crossing the bridges. . . . Such a display of determination seemed almost ridiculous when compared with what actually occurred. But it was in fact the cause of the harmless nature of the meeting. Instead of half a million, about 30,000 men assembled on Kennington Common. Feargus O'Connor was there; Mr. Maine, the Commissioner of Police, called him aside, told him he might hold his meeting, but that the procession would be stopped, and that he would be held personally responsible for any disorder that might occur. His heart had already begun to fail him, and he . . . used all his influence to put an end to the procession. His prudent advice was followed, and no disturbance of any importance took place. . . . The air of ridicule thrown over the Chartist movement by the abortive close of a demonstration which had been heralded with so much violent talk was increased by the disclosures attending the presentation of the petition." There were found to be only 2,000,000 names appended to the document, in-

stead of 5,000,000 as claimed, and great numbers of them were manifestly spurious. "This failure proved a death-blow to Chartism."—J. F. Bright, *History of England, period 4, pp. 176-178.*

1849-1850.—Don Pacifico affair.—Lord Palmerston's speech.—The little difficulty with Greece which came to a crisis in the last weeks of 1849 and the first of 1850 (see GREECE: 1849-1850), and which was commonly called the Don Pacifico affair, gave occasion for a memorable speech in Parliament by Lord Palmerston, defending his foreign policy against attacks. The speech (June 24, 1850), which occupied five hours, "from the dusk of one day till the dawn of another," was greatly admired, and proved immensely effective in raising the speaker's reputation. "The Don Pacifico debate was unquestionably an important landmark in the life of Lord Palmerston. Hitherto his merits had been known only to a select few; for the British public does not read Blue Books, and as a rule troubles itself very little about foreign politics at all. . . . But the Pacifico speech caught the ear of the nation, and was received with a universal verdict of approval. From that hour Lord Palmerston became the man of the people, and his rise to the premiership only a question of time."—L. C. Sanders, *Life of Viscount Palmerston, ch. 8.*

1851.—Great exhibition.—"The first of May, 1851, will always be memorable as the day on which the Great Exhibition was opened in Hyde Park. . . . Many exhibitions of a similar kind have taken place since. Some of these far surpassed that of Hyde Park in the splendour and variety of the collections brought together. Two of them at least—those of Paris in 1867 and 1878—were infinitely superior in the array and display of the products, the dresses, the inhabitants of far-divided countries. But the impression which the Hyde Park Exhibition made upon the ordinary mind was like that of the boy's first visit to the play—an impression never to be equalled. . . . The Hyde Park Exhibition was often described as the festival to open the long reign of Peace. It might, as a mere matter of chronology, be called without any impropriety the festival to celebrate the close of the short reign of Peace. From that year, 1851, it may be said fairly enough that the world has hardly known a week of peace. . . . The first idea of the Exhibition was conceived by Prince Albert; and it was his

energy and influence which succeeded in carrying the idea into practical execution. . . . Many persons were disposed to sneer at it; many were sceptical about its doing any good; not a few still regarded Prince Albert as a foreigner and a pedant, and were slow to believe that anything really practical was likely to be developed under his impulse and protection. . . . There was a great deal of difficulty in selecting a plan for the building. . . . Happily, a sudden inspiration struck Mr. (afterward Sir Joseph) Paxton, who was then in charge of the duke of Devonshire's superb grounds at Chatsworth. Why not try glass and iron? he asked himself. . . . Mr. Paxton sketched out his plan hastily, and the idea was eagerly accepted by the Royal Commissioners. He made many improvements afterwards in his design; but the palace of glass and iron arose within the specified time on the green turf of Hyde Park."—J. McCarthy, *History of our own times, v. 2, ch. 21.*

1851-1852.—Coup d'état in France and Lord Palmerston's dismissal from the cabinet.—Defeat and resignation of Lord John Russell.—First Derby-Disraeli ministry and the Aberdeen coalition ministry.—The "coup d'état" of December 2, 1851, by which Louis Napoleon made himself master of France (see FRANCE: 1851) brought about the dismissal of Lord Palmerston from the British ministry, followed quickly by the overthrow of the ministry which expelled him. "Lord Palmerston not only expressed privately to Count Walewski [the French ambassador] his approval of the 'coup d'état,' but on the 16th of December wrote a despatch to Lord Normanby, our [the British] representative in Paris, expressing in strong terms his satisfaction at the success of the French President's arbitrary action. This despatch was not submitted either to the Prime Minister or to the Queen, and of course the offence was of too serious a character to be passed over. A great deal of correspondence ensued, and as Palmerston's explanations were not deemed satisfactory, and he had clearly broken the undertaking he gave some time previously, he was dismissed from office. [Because of Palmerston's aggressive meddling, and his habit of carrying on his foreign correspondence over the Queen's head, she had found it necessary to rebuke him and had forbidden him to do anything without her knowledge, on pain of dismissal. He readily promised to follow her wishes, then proceeded to conduct himself as before.] . . . There were some who thought him irretrievably crushed from this time forward; but a very short time only elapsed before he retrieved his fortunes and was as powerful as ever. In February, 1852, Lord John Russell brought in a Militia Bill which was intended to develop a local militia for the defence of the country. Lord Palmerston strongly disapproved of the scope of the measure, and in committee moved an amendment to omit the word 'local,' so as to constitute a regular militia, which should be legally transportable all over the kingdom, and thus be always ready for any emergency. The Government were defeated by eleven votes, and as the Administration had been very weak for some time, Lord John resigned. Lord Derby formed a Ministry, and invited the co-operation of Palmerston, but the offer was declined, as the two statesmen differed on the question of imposing a duty on the importation of corn, and other matters."—G. B. Smith, *Prime ministers of Queen Victoria, pp. 264-265.*—"The new Ministry [in which Disraeli became chancellor of the exchequer] took their seats on the 27th of February, but it was

understood that a dissolution of Parliament would take place in the summer, by which the fate of the new Government would be decided, and that in the meantime the Opposition should hold its hand. The raw troops [of the Tory Party in the House of Commons], notwithstanding their inexperience, acquitted themselves with credit, and some good Bills were passed, the Militia Bill among the number, while a considerable addition to the strength of the Navy was effected by the Duke of Northumberland. No doubt, when the general election be-

Gladstone and Mr. Sidney Herbert were willing to join if Lord Palmerston might lead in the House of Commons. But the Queen put her veto on this arrangement, which accordingly fell to the ground; and Lord Derby had to meet the Opposition attack without any reinforcements. . . . On the 16th of December, . . . being defeated on the Budget by a majority of 19, Lord Derby at once resigned."—T. E. Keibel, *Life of the Earl of Derby*, ch. 6.—"The new Government [which succeeded that of Derby] was a coalition of Whigs and Peelites, with Sir

LORD PALMERSTON

WILLIAM EWART GLADSTONE

GEORGE CANNING

SIR ROBERT PEEL

BENJAMIN DISRAELI,  
EARL OF BEACONSFIELD

gan, the party had raised itself considerably in public estimation. But for one consideration the country would probably have been quite willing to entrust its destinies to their hands. But that one consideration was all important. . . . The Government was obliged to go to the country, to some extent, on Protectionist principles. It was known that a Derbyite majority meant a moderate import duty; and the consequence was that Lord Derby just lost the battle, though by a very narrow majority. When Parliament met in November, Lord Derby and Mr. Disraeli had a very difficult game to play. . . . Negotiations were again opened with Palmerston and the Peelites, and on this occasion

William Molesworth thrown in to represent the Radicals. Lord Aberdeen became Prime Minister, and Mr. Gladstone Chancellor of the Exchequer. The other Peelites in the Cabinet were the Duke of Newcastle, Sir James Graham, and Mr. Sidney Herbert."—G. W. E. Russell, *Right Honourable William Ewart Gladstone*, ch. 5.

1853-1856.—Crimean War.—"In February, 1854, the long peace after Waterloo ended with the

despatch of an ultimatum from Britain and France to St. Petersburg, and the Crimean War began. . . . The original cause of friction between France and Russia lay in a dispute over the guardianship of the rights of Christian pilgrims at Jerusalem; but a more important ground of difference rose from the pressure exercised by the Czar upon Turkey on behalf of the Christian provinces of Wallachia and Moldavia, which were desirous of forming themselves into the single principality of Roumania; [France was supported by Great Britain, as a means of checking the Russian advance on India.] Behind any arguments that could be raised for war there was a curious condition of the public mind, excited by the memories of the victories of Nelson and Wellington, forgetful of the sufferings of the war period, entirely ignorant of the evil reaction of war upon the national life, but comparatively awake to the injuries arising from internal political conflict. . . . The country plunged into war with blind enthusiasm."—G. Slater, *Making of modern England*, pp. 174, 175.—See also RUSSIA: 1853-1854; 1854-1856.

1853-1870.—Removal of taxes on newspapers.—Penny papers.—Rise of provincial daily press. See PRINTING AND THE PRESS: 1853-1870.

1855.—Popular discontent with the management of the war.—Fall of the Aberdeen ministry.—Palmerston's first premiership.—Brightening of prospects.—"Our army system entirely broke down [in the Crimea], and Lord Aberdeen and the Duke of Newcastle were made the scapegoats of the popular indignation. . . . But England was not only suffering from unpreparedness and want of administrative power in the War department; there were dissensions in the Cabinet. . . . Lord John Russell gave so much trouble, that Lord Aberdeen, after one of the numerous quarrels and reconciliations which occurred at this juncture, wrote to the Queen that nothing but a sense of public duty and the necessity for avoiding the scandal of a rupture kept him at his post. . . . At a little later stage . . . the difficulties were renewed. Mr. Roebuck gave notice of his motion for the appointment of a select committee to inquire into the condition of the army before Sebastopol, and Lord John definitively resigned. The Ministry remained in office to await the fate of Mr. Roebuck's motion, which was carried against them by the very large majority of 157." Lord Aberdeen now placed the resignation of the Cabinet in the hands of the Queen [January 31, 1855]. . . . Thus fell the Coalition Cabinet of Lord Aberdeen. In talent and parliamentary influence it was apparently one of the strongest Governments ever seen, but it suffered from a fatal want of cohesion."—G. B. Smith, *Prime ministers of Queen Victoria*, pp. 227-230.—In its short career, this ministry accomplished much that was excellent. Gladstone's budgets stamped him as the greatest financier of the century; the penalty of transportation was made to apply to fewer cases, and a civil service system was started. "Lord Palmerston had passed his 70th year when the Premiership came to him for the first time. On the fall of the Coalition Government the Queen sent for Lord Derby, and upon his failure for Lord John Russell. Palmerston was willing at the express request of her Majesty to serve once more under his old chief, but Clarendon and many of the Whigs not unnaturally positively refused to do so. Palmerston finally undertook and successfully achieved the task of forming a Government out of the somewhat heterogeneous elements at his command. Lord Clarendon continued at the Foreign Office, and Gladstone was still Chancellor of the Exchequer. The War Department [owing to the

mismanagement of the Crimean war, and the findings of the Roebuck Committee] was reorganised, the office of Secretary at War disappearing, and being finally merged in that of Secretary of State for War [whose department was concentrated in the hands of the secretary of war and the commander-in-chief]. Although Palmerston objected to Roebuck's Committee, he was practically compelled to accept it, and this led to the resignation of Gladstone, Graham and Herbert; their places being taken by Sir G. C. Lewis, Sir Charles Wood, and Lord John Russell."—Marquis of Lorne, *Viscount Palmerston*, ch. 10.—"It was a dark hour in the history of the nation when Lord Palmerston essayed the task which had been abandoned by the tried wisdom of Derby, Lansdowne, and John Russell. Far away in the Crimea the war was dragging on without much hope of a creditable solution, though the winter of discontent and mismanagement was happily over. The existence of the European concert was merely nominal. The Allies had discovered, many months previously, that, though Austria was staunch, Prussia was a faithless friend. . . . Between the belligerent powers the cloud of suspicion and distrust grew thicker; for [the Sultan] Abd-el-Medjid was known to be freely squandering his war loans on seraglios and palaces while Kars was starving; and though there was no reason for distrusting the present good faith of the Emperor of the French, his policy was straightforward only as long as he kept himself free from the influence of the gang of stock-jobbers and adventurers who composed his Ministry. Nor was the horizon much brighter on the side of England. A series of weak cabinets, and the absence of questions of organic reform, had completely relaxed the bonds of Party. If there was no regular Opposition, still less was there a regular majority. . . . And the hand that was to restore order out of chaos was not so steady as of yore. . . . Lord Palmerston was not himself during the first weeks of his leadership. But the prospect speedily brightened. Though Palmerston was considerably over seventy, he still retained a wonderful vigour of constitution. He was soon restored to health, and was always to be found at his post. . . . His generalship secured ample majorities for the Government in every division during the session. Of the energy which Lord Palmerston inspired into the operations against Sebastopol, there can hardly be two opinions."—L. C. Sanders, *Life of Viscount Palmerston*, ch. 10.

1858-1859.—Conspiracy Bill.—Fall of Palmerston's government.—Second ministry of Derby and Disraeli.—Lord Palmerston again premier.—"On January 14, 1858, an attempt was made to assassinate Napoleon III. by a gang of desperadoes, headed by Orsini, whose head-quarters had previously been in London. Not without some reason it was felt in France that such men ought not to be able to find shelter in this country, and the French Minister was ordered to make representations to that effect. Lord Palmerston, always anxious to cultivate the good feeling of the French nation, desired to pass a measure which should give to the British Government the

power to banish from England any foreigner conspiring in Britain against the life of a foreign sovereign. . . . An unfortunate outburst of vituperation against England in the French press, and the repetition of such language by officers of the French army who were received by the Emperor when they waited on him as a deputation, aroused very angry English feeling. Lord Palmerston had already introduced the Bill he desired to pass, and it had been read the first time by a majority of 200. But the foolish action of the French papers changed entirely the current of popular opinion. Lord Derby saw his advantage. An amendment to the second reading, which was practically a vote of censure, was carried against Lord Palmerston, and to his own surprise no less than to that of the country, he was obliged to resign. Lord Derby succeeded to Palmerston's vacant office. . . . Lord Derby's second Ministry was wrecked upon the fatal rock of Reform early in 1859 [but not before he had brought relief to the Jews who had been excluded from Parliament, even after the repeal of the Test Act], and at once appealed to the country. . . . The election of 1859 failed to give the Conservatives a majority, and soon after the opening of the session they were defeated upon a vote of want of confidence moved by Lord Hartington. Earl Granville was commissioned by the Queen to form a Ministry, because her Majesty felt that 'to make so marked a distinction as is implied in the choice of one or other as Prime Minister of two statesmen so full of years and honour as Lord Palmerston and Lord John Russell would be a very invidious and unwelcome task.' Each of these veterans was willing to serve under the other, but neither would follow the lead of a third. And so Granville failed, and to Palmerston was entrusted the task. . . . Russell went to the Foreign Office and Gladstone to the Exchequer."—Marquis of Lorne, *Viscount Palmerston*, ch. 10-11.

1861-1865.—Cotton famine.—"Upon a population, containing half a million of cotton operatives, in a career of rapid prosperity, the profits of 1860 reaching in some instances from 30 to 40 per cent upon the capital engaged; and with wages also at the highest point which they had ever touched, came the news of the American war, with the probable stoppage of 85 per cent of the raw material of their manufacture, . . . but the great mass of traders refused to credit a report which neither suited their opinions nor their interests. . . . There was a four months' supply held on this side the water at Christmas (1860). . . . During the greater part of the year 1861 the market was dull, and prices scarcely moved upwards. But towards the end of the year the aspect of affairs began to change. . . . The Federals [The North] had declared a blockade of the Southern ports, and, although as yet it was pretty much a 'paper blockade,' yet the newly established Confederate gov-

ernment was doing its best to render it effective. They believed that cotton was king in England, and that the old country could not do without it, and would be forced, in order to secure its release, to side with those who kept it prisoner. Mills began to run short time or to close in the month of October. . . . The poor-law guardians in the various unions were aware that the increase [in applicants] was not of the usual character. . . . The recipients of relief were at this time [December 1861] 12,000 (or about 25 per cent) more than in the January previous. And now serious thoughts began to agitate many minds; cotton was very largely held by speculators for a rise; . . . [and] the blockade was no longer on paper alone. . . . [In 1862 the recipients of charity were] 105 per cent above the average for the same period of the year. But this average gives no idea of the pressure in particular localities. . . . In Ashton there were 3,197; in Stockport, 8,588; and in Preston, 9,488 persons absolutely foodless; and who nevertheless declined to go to the guardians. . . . Committees [for relief] arose almost simultaneously in Ashton, Stockport, and Preston. . . . In August the flood had become a deluge, at which the stoutest heart might stand appalled. The increased recipients of poor-law relief were in a single month 33,000, being nearly as many as the total number chargeable in the same month of the previous year, whilst a further addition of more than 34,000 became chargeable to the relief committees. . . . Most of the cotton on hand at this period was of Indian growth, and needed alterations of machinery to make it workable at all. . . . There were not wanting men who saw, or thought they saw, a short way out of the difficulty, viz., by a recognition on the part of the English government of the Southern confederacy in America. And meetings were called in various places to memorialise the government to this effect. Such meetings were always balanced by counter meetings, at which it was shown that simple recognition would be waste of words; that it would not bring to our shores a single shipload of cotton, unless followed up by an armed force to break the blockade, which course if adopted would be war. . . . These meetings and counter meetings perhaps helped to steady the action of the government (notwithstanding the sympathy of some of its members towards the South), to confirm them in the policy of the royal proclamation, and to determine them to enforce the provisions of the Foreign Enlistment Act against all offenders. . . . The maximum pressure upon the relief committees was reached early in December, 1862, but the tide had turned before the end of the month."—J. Watts, *Facts of the cotton famine*, ch. 8 and 12.

1865-1868.—Death of Palmerston.—Ministry of Lord John Russell.—Its unsatisfactory Reform bill and its resignation.—Triumph of the Adullamites.—Third administration of Derby and Disraeli, and its Reform bills.—"On the death of Lord Palmerston [which occurred October 18, 1865], the premiership was intrusted for the second time to Earl Russell [Lord John Russell

created Earl Russell in 1861], with Mr. Gladstone as leader in the House of Commons. The queen opened her seventh parliament (February 6, 1866), in person, for the first time since the prince consort's death [Dec. 14, 1861]. On March 12th Mr. Gladstone brought forward his scheme of reform."—A. H. McCalman, *Abridged history of England*, p. 603.—"The question of parliamentary reform was, in the 'fifties and 'sixties, almost entirely academic. It was raised by the *a priori* speculations of philosophical liberalism, rather than by democratic demand. The machine was, by general consent, working well. . . . But efficient machinery is not everything. Great urban populations were springing up, and little was being done for their education in citizenship. . . . Out of a total of 5,300,000 adult males in England and Wales only 000,000 enjoyed the parliamentary franchise. The new Reform Bill . . . introduced by Mr. Gladstone . . . dealt only with the franchise and was commended to the House as a simple and modest measure. It proposed to reduce the borough franchise to £7, estimated on the rental not the rateable value, and the county franchise to £14; to enfranchise lodgers, compound householders, and depositors in Saving Banks who had had £50 continuously to their credit for two years. Finally, it proposed to deal with a serious and increasing danger by the disfranchisement of Government employees in the dockyards. The estimate was that it would add 400,000 votes to the register. Moderate as the proposals appear in the light of later events, they were vehemently attacked at the time as dangerously democratic. It was Robert Lowe who, in Gladstone's phrase, 'really supplied the whole brains of the opposition.' During this year, indeed, 'and this year only he had such a command of the House as had never,' even in Gladstone's experience, 'been surpassed.' Lowe gathered round him a band of stalwart critics nicknamed by Bright the 'Adullamites'; and the 'Cave' proved formidable. Lord Grosvenor, one of the leaders of the 'Cave,' asked the House to decline to proceed with the franchise Bill until the scheme for redistribution was laid before it. In a House of 631 members the Ministry escaped defeat on Lord Grosvenor's amendment only by a majority of five (April 27th). On this point, therefore, the Government gave way and carried to a second reading a redistribution Bill. . . . [by which] the aggregate number of members would, . . . be unchanged. . . . The Government were beaten by 315 against 304 on an amendment moved by Lord Dunkellin, . . . [and] the Ministry at once tendered their resignation to the Queen. . . . [But,] on the very day on which Russell's Government was defeated, Prussia had declared war upon Austria and the German Bund [1866]. Central Europe was, in consequence, threatened with profound convulsion. . . . [The Queen] therefore urged her Ministers to reconsider their decision to resign. . . . Lord Russell acknowledged the force of the Queen's objections to a change of Ministry in the midst of a foreign crisis, but . . . ultimately persisted in resignation. . . . [And] the Queen called upon Lord Derby to form a Ministry. . . . He could not command, any more than he could in 1852 or 1858, a majority in the House of Commons, and he sought therefore, with complete constitutional propriety, to form a Ministry not exclusively Conservative in composition. Lord Clarendon and the Duke of Somerset, though strongly appealed to, declined to retain office, and the Adullamites would not serve under Lord Derby. . . . In the event, Lord Derby was compelled to rely entirely on his own party. . . . No sooner were the Whigs out and the Con-

servatives in than the people, . . . awoke to the fact that they were being defrauded of their political rights. Associations and leagues for the promotion of parliamentary reform sprang into existence. The most important of them—the Reform League—having held a demonstration in Trafalgar Square on July 2nd, announced its intention of organizing another demonstration in Hyde Park on July 23rd, . . . [but] when the procession arrived at the Park they found it closed against them. The leaders, . . . withdrew quietly to Trafalgar Square where the meeting was held, but, though the actual demonstrators departed, the mob lingered, broke down the railings, and swarmed into the Park itself, [and a] conflict ensued between the mob and the police: . . . During the autumn great meetings were held at Manchester, Birmingham, Leeds, Edinburgh, Glasgow, and many other towns. In all, a thousand such meetings were held, and on every side there was a clamorous demand for 'reform.' . . . Meanwhile the Derby-Disraeli Ministry was anxiously considering its position and its policy. . . . The Cabinet decided to proceed not by Bill, but by resolutions, . . . [thirteen in number which were designed to secure the support of both parties. On February 25, 1867, Disraeli brought in a bill to give effect to these resolutions. This bill] was the more moderate of two schemes which the Cabinet had for some time past been considering. On February 23rd . . . the Cabinet had agreed to the larger scheme. . . . [But] Lord Cranborne had discovered that it was too large for his taste, and on February 25th he and Lord Carnarvon refused to proceed with it. . . . The Cabinet, therefore, was hastily summoned. Disraeli produced his 'smaller scheme'; the disruption of the Ministry was, for the moment averted, and the smaller scheme [including a redistribution scheme] was duly presented to the House. . . . It was coldly received by Parliament; the Conservative party professed a preference for the larger scheme. . . . The 'resolutions' were formally withdrawn on February 26th; . . . and on [March] 18th Disraeli expounded to the House of Commons the larger scheme which . . . was admittedly a scheme of 'checks and counterpoises.' The borough franchise was to be associated with the direct payment of rates; every householder paying rates and having resided for two years, . . . [and] every one who paid £1 in direct taxes (other than licenses) was to have a vote, if he were also a rate-paying householder he was to have two votes. Besides these qualifications there were to be three others: an education franchise, a second based upon the possession of funded property, a third on that of a deposit in a savings bank. It was estimated that more than 1,000,000 voters would in all be added to the borough constituencies. In counties the rating qualification was to be £15 in place of a £50 rental, which, together with the 'lateral' franchises, would add, it was estimated, 330,000 voters to the county register. The redistribution proposals were identical with those propounded on February 25th. . . . The later parliamentary career of this famous measure is extraordinarily complicated. . . . This much at least is certain: that the Radical leaders, Gladstone [who had succeeded to the leadership of the party in 1866 when Lord John Russell finally resigned from office] and Bright, were not at that time prepared for household suffrage. . . . Disraeli, on the contrary, was not in the least afraid of a leap into the darkness of household suffrage, provided he could carry with him a sufficient number of his own party. Before the House got into Committee on the Bill the Radical leaders decided

to move an Instruction to the Committee which would have had the effect of excluding Bright's *residuum* [a small class of the poorest householders] from the suffrage. Such a motion was in complete accord with their settled convictions, but it was a grave tactical blunder. A Radical 'cave'—known as the 'Tea-room party' [their first meeting was held in the tea room]—rapidly formed itself, and the Instruction had to be abandoned. But Mr. Gladstone was not to be moved from his set purpose. He tabled a series of amendments of which the two most important were: (1) to delete the distinction between direct and indirect ratepayers, and thus admit to the franchise 'compound householders'; and (2) to fix an inferior limit of £5 rating value and thus exclude all householders, whether ratepayers or not, of the very lowest class. . . . In the event, Gladstone was defeated on his first amendment by a majority of twenty-one. The result was a staggering blow to his personal prestige and was a conspicuous triumph for the tactics of his rival. But the irony of the situation was that the result was achieved merely by the action of the 'Tea-room party,' who defeated their leader's first amendment because they disliked his second. . . . The triumph of the Tories was short-lived. In the later stages of the Bill the Liberals had it all their own way. One by one the counterpoises went by the board; the dual vote and the lateral or fancy franchises [which would have given a member of a learned profession, or university graduate, or the possessor of personal property over a certain amount, the right of plural voting] were abandoned; the two years' qualifying residence was reduced to one; a lodger franchise was inserted; the rating qualification for the county franchise was reduced from £15 to £12; the voting paper device was deleted. One great difficulty remained; one barrier still stood between the Bill and household suffrage . . . the compound householder [whose rates were indirectly paid by his landlord]. This was the last remnant of Conservatism left in the Bill. . . . Mr. Hodgkinson . . . proposed to solve the difficulty by . . . [resting the franchise] upon the principle of personal rating. Nevertheless, the Bill had become a Bill for 'household suffrage, pure and simple,' and there was justice in the plaint of Lord Cranborne that it represented a negation of all the principles professed by his party. . . . [It gave] a third member to Manchester, Liverpool, Leeds, Glasgow, and Birmingham, and a proposal, made in the House of Lords by Lord Cairns, that in these boroughs and in the three-member counties electors should be permitted to vote only for two candidates was, despite the strong opposition of Mr. Bright, accepted by the Commons. . . . Taken in conjunction with the Reform Bills for Scotland and Ireland (1868) the net result was that 6 boroughs returning two members each, and 5 boroughs returning one, were totally disfranchised, and 35 other boroughs lost one member each. Thus 52 seats were set free for redistribution. Of these the boroughs got 22 additional members, the counties 27, London University 1, and the Scotch Universities 2. The aggregate numbers of the House remained therefore constant. The Representation of the People Bill received the Royal assent on August 15th, 1867. A word may be added as to the Scotch and Irish Reform Bills which became law in 1868. The Scotch Bill followed the same lines as the English, except that the occupation franchise for counties was fixed at £14 instead of £12. In Ireland the county qualification already stood at £12, and was not, therefore, altered in 1868; the qualification in boroughs was reduced from £8 to £4, the latter being the inferior limit of direct rate-

payers. Lodgers were admitted on the same terms as in England—£10 a year rental for unfurnished rooms. Such was the parliamentary reform legislation of 1867-1868. The magnitude of the change effected none can gainsay. In all some 1,080,000 persons were enfranchised. In the towns, notwithstanding the original disclaimer of the principle, the Act meant the adoption of 'household suffrage pure and simple.'—J. A. R. 1868-1870.—Disestablishment of the Irish church.—Retirement of the Derby-Disraeli ministry.—Gladstone in power.—Irish Land Bill.—"On March 16, 1868, a remarkable debate took place in the House of Commons. It had for its subject the condition of Ireland, and it was introduced by a series of resolutions which Mr. John Francis Maguire, an Irish member, proposed. . . . It was on the fourth night of the debate that the importance of the occasion became fully manifest. Then it was that Mr. Gladstone spoke, and declared that in his opinion the time had come when the Irish Church as a State institution must cease to exist. Then every man in the House knew that the end was near. Mr. Maguire withdrew his resolutions. The cause he had to serve was now in the hands of one who, though not surely more earnest for its success, had incomparably greater power to serve it. There was probably not a single Englishman capable of forming an opinion who did not know that from the moment when Mr. Gladstone made his declaration, the fall of the Irish State Church had become merely a question of time. Men only waited to see how Mr. Gladstone would proceed to procure its fall. Public expectation was not long kept in suspense. A few days after the debate on Mr. Maguire's motion, Mr. Gladstone gave notice of three resolutions on the subject of the Irish State Church. The first declared that in the opinion of the House of Commons it was necessary that the Established Church of Ireland should cease to exist as an Establishment, due regard being had to all personal interests and to all individual rights of property. The second resolution pronounced it expedient to prevent the

creation of new personal interests by the exercise of any public patronage; and the third asked for an address to the Queen, praying that her Majesty would place at the disposal of Parliament her interest in the temporalities of the Irish Church. The object of these resolutions was simply to prepare for the actual disestablishment of the Church, by providing that no further appointments should be made, and that the action of patronage should be stayed, until Parliament should decide the fate of the whole institution. On March 30, 1868, Mr. Gladstone proposed his resolutions. Not many persons could have had much doubt as to the result of the debate. But if there were any such, their doubts must have begun to vanish when they read the notice of amendment to the resolutions which was given by Lord Stanley. The amendment proclaimed even more surely than the resolutions the impending fall of the Irish Church. Lord Stanley must have been supposed to speak in the name of the Government and the Conservative party; and his amendment merely declared that the House, while admitting that considerable modifications in the temporalities of the Church in Ireland might appear to be expedient, was of opinion 'that any proposition tending to the disestablishment or disendowment of the Church ought to be reserved for the decision of the new Parliament.' Lord Stanley's amendment asked only for delay. . . . The debate was one of great power and interest. . . . When the division was called there were 270 votes for the amendment, and 331 against it. The doom of the Irish Church was pronounced by a majority of 61. . . . Mr. Disraeli quietly observed that the Government must take some decisive step. . . . and a few days afterwards it was announced that as soon as the necessary business could be got through, Parliament would be dissolved and an appeal made to the country. On the last day of July the dissolution took place, and the elections came on in November. Not for many years had there been so important a general election. The keenest anxiety prevailed as to its results. The new constituencies created by the Reform Bill were to give their votes for the first time. The question at issue was not merely the existence of the Irish State Church. It was a general struggle of advanced Liberalism against Toryism. . . . The new Parliament was to all appearance less marked in its Liberalism than that which had gone before it. But so far as mere numbers went the Liberal party was much stronger than it had been. In the new House of Commons it could count upon a majority of about 120, whereas in the late Parliament it had but 60. Mr. Gladstone it was clear would now have everything in his own hands, and the country might look for a career of energetic reform. . . . Mr. Disraeli did not meet the new Parliament as Prime Minister. He decided very properly that it would be a mere waste of public time to wait for the formal vote of the House of Commons, which would inevitably command him to surrender. He at once resigned his office, and Mr. Gladstone was immediately sent for by the Queen, and invited to form an Administration. Mr. Gladstone, it would seem, was only beginning his career. He was nearly sixty years of age, but there were scarcely any evidences of advancing years to be seen on his face. . . . The Government he formed was one of remarkable strength. . . . Mr. Gladstone went to work at once with his Irish policy. On March 1, 1869, the Prime Minister introduced his measure for the disestablishment and partial disendowment of the Irish State Church. The proposals of the Government were, that the Irish Church should almost at once cease to exist as a State Establishment, and

should pass into the condition of a free Episcopal Church. As a matter of course the Irish bishops were to lose their seats in the House of Lords. A synodal, or governing body, was to be elected from the clergy and laity of the Church and was to be recognised by the Government, and duly incorporated. The union between the Churches of England and Ireland was to be dissolved, and the Irish Ecclesiastical Courts were to be abolished. There were various and complicated arrangements for the protection of the life interests of those already holding positions in the Irish Church, and for the appropriation of the fund which would return to the possession of the State when all these interests had been fairly considered and dealt with. . . . Many amendments were introduced and discussed; and some of these led to a controversy between the two Houses of Parliament; but the controversy ended in compromise. On July 26, 1869, the measure for the disestablishment of the Irish Church received the royal assent. Lord Derby did not long survive the passing of the measure which he had opposed with such fervour and so much pathetic dignity. He died before the Irish State Church had ceased to live. . . . When the Irish Church had been disposed of, Mr. Gladstone at once directed his energies to the Irish land system. . . . In a speech delivered by him during his electioneering campaign in Lancashire, he had declared that the Irish upas-tree had three great branches: the State Church, the Land Tenure System, and the System of Education, and that he meant to hew them all down if he could. On February 15, 1870, Mr. Gladstone introduced his Irish Land Bill into the House of Commons. [See IRELAND: 1870.] . . . It recognised a certain property or partnership of the tenant in the land which he tilled. Mr. Gladstone took the Ulster tenant-right as he found it, and made it a legal institution. In places where the Ulster practice, or something analogous to it, did not exist, he threw upon the landlord the burden of proof as regarded the right of eviction. The tenant disturbed in the possession of his land could claim compensation for improvements, and the bill reversed the existing assumption of the law by presuming all improvements to be the property of the tenant, and leaving it to the landlord, if he could, to prove the contrary. The bill established a special judiciary machinery for carrying out its provisions. . . . It put an end to the reign of the landlord's absolute power; it reduced the landlord to the level of every other proprietor, of every other man in the country who had anything to sell or hire. . . . The bill passed without substantial alteration. On August 1, 1870, the bill received the Royal assent. The second branch of the upas-tree had been hewn down. . . . Mr. Gladstone had dealt with Church and land; he had yet to deal with university education. He had gone with Irish ideas thus far."—J. McCarthy. *Short history of our own times*, ch. 23.

Bill.—“The great measure of the Session [of 1871] was of course the Army Bill, which was introduced by Mr. Cardwell, on the 16th of February. It abolished the system by which rich men obtained by purchase commissions and promotion in the army, and provided £8,000,000 to buy all commissions, as they fell in. . . . In future, commissions were to be awarded either to those who won them by open competition, or who had served as sub-alterns in the Militia, or to deserving non-commissioned officers. . . . The debate, which seemed interminable, ended in an anti-climax that astonished the Tory Opposition. Mr. Disraeli threw over the advocates of Purchase, evidently dreading an appeal to the country. . . . The Army Regulation Bill thus passed the Second Reading without a division,” and finally, with some amendments passed the House. “In the House of Lords the Bill was again obstructed. . . . Mr. Gladstone met them with a bold stroke. By statute it was enacted that only such terms of Purchase could exist as her Majesty chose to permit by Royal Warrant. The Queen, therefore, acting on Mr. Gladstone’s advice, cancelled her warrant permitting Purchase, and thus the opposition of the Peers was crushed by what Mr. Disraeli indignantly termed ‘the high-handed though not illegal’ exercise of the Royal Prerogative. The rage of the Tory Peers knew no bounds.” They “carried a vote of censure on the Government, who ignored it, and then their Lordships passed the Army Regulation Bill without any alterations. . . . The Session of 1871 was also made memorable by the struggle over the Ballot Bill, in the course of which nearly all the devices of factious obstruction were exhausted. . . . When the Bill reached the House of Lords, the real motive which dictated the . . . obstruction of the Conservative Opposition in the House of Commons was quickly revealed. The Lords rejected the Bill on the 18th. of August, not merely because they disliked and dreaded it, but because it had come to them too late for proper consideration. Ministers were more successful with some other measures. In spite of much conservative opposition they passed a Bill abolishing religious tests in the Universities of Oxford and Cambridge, and throwing open all academic distinctions and privileges except Divinity Degrees and Clerical Fellowships to students of all creeds and faiths.”—R. Wilson, *Life and times of Queen Victoria*, v. 2, ch. 16.

1873-1880.—Decline and fall of the Gladstone government.—Disraeli’s ministry.—His rise to the peerage, as earl of Beaconsfield.—Eastern question.—Overthrow of the administration.—Second Gladstone ministry.—“One of the little wars in which we had to engage broke out with the Ashantees [Hinterland, north of the Gold

Coast], a misunderstanding resulting from our purchase of the Dutch possessions (1873) in their neighbourhood. Troops and marines under Wolseley . . . were sent out to West Africa. Crossing the Prah River, January 20th. 1874, he defeated the Ashantees on the last day of that month at a place called Amoafu, entered and burnt their capital, Coomassie, and made a treaty with their King, Koffee, by which he withdrew all claims of sovereignty over the tribes under our protection. . . . The many Liberal measures carried by the Ministry caused moderate men to wish for a halt. Some restrictions on the licensed vintners turned that powerful body against the Administration, which, on attempting to carry an Irish University Bill in 1873, became suddenly aware of its unpopularity, as the second reading was only carried by a majority of three. Resignation followed. The erratic, but astute, Disraeli declined to undertake the responsibility of governing the country with the House of Commons then existing, consequently Mr. Gladstone resumed office; yet Conservative reaction progressed. He in September became Chancellor of the Exchequer (still holding the Premiership) and 23rd January, 1874, he suddenly dissolved Parliament, promising in a letter to the electors of Greenwich the final abolition of the income tax, and a reduction in some other ‘imposts.’ The elections went against him. The ‘harassed’ interests overturned the Ministry (17th February, 1874). . . . On the accession of the Conservative Government under Mr. Disraeli (February, 1874), the budget showed a balance of six millions in favour of the reduction of taxation. Consequently the sugar duties were abolished and the income tax reduced to 2d. in the pound. This, the ninth Parliament of Queen Victoria, sat for a little over six years. . . . Mr. Disraeli, now the Earl of Beaconsfield, was fond of giving the country surprises. One of these consisted in the purchase of the interest of the Khedive of Egypt in the Suez Canal for four millions sterling (February, 1876). [See CANALS: Asiatic: Suez canal.] Another was the acquisition of the Turkish Island of Cyprus, handed over for the guarantee to Turkey of her Asiatic provinces in the event of any future Russian encroachments. . . . As war had broken out in several of the Turkish provinces (1876), and as Russia had entered the lists for the insurgents against the Sultan, whom England was bound to support by solemn treaties, we were treated to a third surprise by the conveyance, in anticipation of a breach with Russia, of 7,000 troops from India to Malta. The Earl of Derby, looking upon this manœuvre as a menace to that Power, resigned his office, which was filled by Lord Salisbury (1878). . . . The war proving disastrous to Turkey, the treaty of St. Stephano (February, 1878), was concluded with Russia, by which the latter acquired additional territory in Asia Minor in violation of the treaty of Paris (1856). Our Government strongly remonstrated, and war seemed imminent. Through the intercession, however, of Bismarck, the German Chancellor, war was averted, and a congress soon met in Berlin, at which Britain was represented by Lords Salisbury and Beaconsfield; the result being the sanction of the treaty already made, with the exception that the town of Erzeroum was handed back to Turkey. Our ambassadors returned home rather pompously, the Prime Minister loftily declaring, that they had brought back ‘peace with honour.’ . . . Our expenses had rapidly increased, the wealthy commercial people began to distrust a Prime Minister who had brought us to the brink of war, the Irish debates, Irish poverty, and Irish outrages had brought

with them more or less discredit on the Ministry. . . . The Parliament was dissolved March 24th, but the elections went so decisively in favour of the Liberals that Beaconsfield resigned (April 23rd). Early in the following year he appeared in his place in the House of Peers, but died April 10th. Though Mr. Gladstone had in 1875 relinquished the political leadership in favour of Lord Hartington yet the 'Bulgarian Atrocities' and other writings brought him again so prominent before the public that his leadership was universally acknowledged by the party. . . . He now resumed office, taking the two posts so frequently held before by Prime Ministers since the days of William Pitt, who also held them. . . . The result of the general election of 1880 was the return of more Liberals to Parliament than Conservatives and Home Rulers together. The farming interest continued depressed both in Great Britain and Ireland, resulting in thousands of acres being thrown on the landlords' hands in the former country, and numerous harsh evictions in the latter for non-payment of rent. Mr. Gladstone determined to legislate anew on the Irish Land Question: and (1881) carried through both Houses that admirable measure known as the Irish Land Act, which for the first time in the history of that country secured to the tenant remuneration for his own industry. A Land Commission Court was established to fix Fair Rents for a period of 15 years. After a time leaseholders were included in this beneficent legislation.—R. Johnston, *Short history of the Queen's reign*, pp. 49-57.—See also IRELAND: 1881; 1881-1882.

1883.—Act for prevention of corrupt and illegal practices at parliamentary elections.—Prior to the General Election of 1880 there were those who hoped and believed that Corrupt Practices at Elections were decreasing. These hopes were based upon the growth of the constituencies

and their increased political intelligence, and also upon the operation of the Ballot Act. The disclosures following the General Election proved to be the most sanguine that this belief was an error. Corrupt practices were found to be more prevalent than ever. If in olden times larger aggregate sums were expended in bribery and treating, never probably had so many persons been bribed and treated as at the General Election of 1880. After that election nineteen petitions against returns on the ground of corrupt practices were presented. In eight instances the Judges reported that those practices had extensively prevailed, and in respect of seven of these the reports of the Commissioners appointed under the Act of 1852 demonstrated the alarming extent to which corruption of all kinds had grown. . . . A most serious feature in the Commissioners' Reports was the proof they afforded that bribery was regarded as a meritorious not as a disgraceful act. Thirty magistrates were reported as guilty of corrupt practices and removed from the Commission of the Peace by the Lord Chancellor. Mayors, aldermen, town-councillors, solicitors, the agents of the candidates, and others of a like class were found to have dealt with bribery as if it were a part of the necessary machinery for conducting an election. Worst of all, some of these persons had actually attained municipal honours, not only after they had committed these practices, but even after their misdeeds had been exposed by public inquiry. The Reports also showed, and a Parliamentary Return furnished still more conclusive proof, that election expenses were extravagant even to absurdity, and moreover were on the increase. The lowest estimate of the expenditure during the General Election of 1880 amounts to the enormous sum of two and a half millions. With another Reform Bill in view, the prospects of future elections were indeed alarming. . . . The necessity for some change was self-evident. Public opinion insisted that the subject should be dealt with, and the evil encountered. . . . The Queen's speech of the 6th of January, 1881, announced that a measure 'for the repression of corrupt practices' would be submitted to Parliament, and on the following day the Attorney-General (Sir Henry James), in forcible and eloquent terms, moved for leave to introduce his Bill. His proposals (severe as they seemed) were received with general approval and sympathy, both inside and outside the House of Commons, at a time when members and constituents alike were ashamed of the excesses so recently brought to light. It is true that the two and a half years' delay that intervened between the introduction of the Bill and its finally becoming law (a delay caused by the necessities of Irish legislation), sufficed very considerably to cool the enthusiasm of Parliament and the public. Yet enough desire for reform remained to carry in July, 1883, the Bill of January, 1881, modified indeed in detail, but with its principles intact and its main provisions unaltered. The measure which has now become the Parliamentary Elections Act of 1883, was in its conception pervaded by two principles. The first was to strike hard and home at corrupt practices; the second was to prohibit by positive legislation any expenditure in the conduct of an election which was not absolutely necessary. Bribery, undue influence, and personation, had long been crimes for which a man could be fined and imprisoned. Treating was now added to the same class of offences, and the punishment for all rendered more deterrent by a liability to hard labour. . . . Besides punishment on conviction, incapacities of a serious character are to result from a person being reported guilty of corrupt practices by Elec-

tion Judges or Election Commissioners. . . . A candidate reported personally guilty of corrupt practices can never sit again for the same constituency, and is rendered incapable of being a member of the House of Commons for seven years. All persons, whether candidates or not, are, on being reported, rendered incapable of holding any public office or exercising any franchise for the same period. Moreover, if any persons so found guilty are magistrates, barristers, solicitors, or members of other honourable professions, they are to be reported to the Lord Chancellor, Inns of Court, High Court of Justice, or other authority controlling their profession, and dealt with as in the case of professional misconduct. Licensed victuallers are, in a similar manner, to be reported to the licensing justices, who may on the next occasion refuse to renew their licenses. . . . The employment of all paid assistants except a very limited number is forbidden; no conveyances are to be paid for, and only a restricted number of committee rooms are to be engaged. Unnecessary payments for the exhibition of bills and addresses, and for flags, bands, torches, and the like are declared illegal. But these prohibitions of specific objects were not considered sufficient. Had these alone been enacted, the money of wealthy and reckless candidates would have found other channels in which to flow. . . . And thus it was that the 'maximum scale' was adopted as at once the most direct and the most efficacious means of limiting expenditure. Whether by himself or his agents, by direct payment or by contract, the candidate is forbidden to spend more in 'the conduct and management of an election' than the sums permitted by the Act, sums which depend in each case on the numerical extent of the constituency."—H. Hobhouse, *Parliamentary Elections (Corrupt and Illegal Practices) Act, 1883*, pp. 1-8.—See also SUFFRAGE, MANHOOD: British empire: 1832-1885.

1884.—Berlin conference for the discussion of affairs in Africa. See BERLIN ACT.

1884-1885.—Third Reform Bill and the Redistribution Bill.—Existing qualifications and disqualifications of the suffrage.—"Soon after Mr. Gladstone came into power in 1880, Mr. Trevelyan became a member of his Administration. Already the Premier had secured the co-operation of two other men new to office—Mr. Chamberlain and Sir Charles Dilke. . . . It was understood from the first that, with such men as his coadjutors, Mr. Gladstone was pledged to a still further Reform. He was pledged already, in fact, by his speeches in Midlothian. . . . On the 17th of October, 1883, a great Conference . . . held at Leeds, . . . was attended by no fewer than 2,000 delegates, who represented upwards of 500 Liberal Associations. It was presided over by Mr. John Morley. . . . To a man the delegates agreed as to the imperative necessity of household suffrage being extended to the counties; and almost to a man they agreed also as to the necessity of the measure being no longer delayed. . . . When Parliament met on the 5th of the following February . . . a measure for 'the enlargement of the occupation franchise in Parliamentary Elections throughout the United Kingdom' was distinctly promised in the Royal Speech; and the same evening Mr. Gladstone gave notice that 'on the first available day,' he would move for leave to bring in the bill. So much was the House of Commons occupied with affairs in Egypt and the Soudan [rebellion of the Mahdists], however, that it was not till the 29th of February that the Premier was able to fulfill his pledge."—W. Heaton, *Three reforms of Parliament*, ch. 6.—"This bill passed through the House of Commons, but the Lords, on the motion of Lord Cairns, declined

to assent to 'a fundamental change in the electoral body' until they had before them the details of the promised scheme for the redistribution of seats. The action of the Lords aroused a violent agitation in the country and bitter attacks were made upon the Second Chamber. Their action had logic and reason behind it, yet the country resented delay."

—J. A. R. Marriott, *England since Waterloo*, p. 491.—"On the 21st of July, a great meeting was held in Hyde Park, attended, it was believed, by upwards of 100,000 persons. . . . On the 30th of July, a great meeting of delegates was held in St. James's Hall, London. . . . Mr. John Morley, who presided, used some words respecting the House that had rejected the bill which were instantly caught up by Reformers everywhere. 'Be sure,' he said, 'that no power on earth can separate henceforth the question of mending the House of Commons from the question of mending, or ending, the House of Lords.' On the 4th of August, Mr. Bright, speaking at Birmingham, referred to the Lords as 'many of them the spawn of the plunder and the wars and the corruption of the dark ages of our country'; and his colleague, Mr. Chamberlain, used even bolder words: 'During the last one hundred years the House of Lords has never contributed one iota to popular liberties or popular freedom, or done anything to advance the common weal; and during that time it has protected every abuse and sheltered every privilege. . . . It is irresponsible without independence, obstinate without courage, arbitrary without judgment, and arrogant without knowledge.'—W. Heaton, *Three reforms of parliament*, ch. 6.—"The case was eminently one for compromise; but an impartial arbitrator was needed to bring the parties together. Rarely in modern politics has the Crown played a more useful part than in making peace between the two Parties and the two Houses in the autumn of 1884. The Queen was greatly impressed by the gravity of the situation, and during the recess she laboured . . . [successfully] to bring the two sides together. . . . Mr. Gladstone met Lord Salisbury and Sir Stafford Northcote, and discussed with them the details of the Redistribution Scheme. Satisfied on the main points, the Conservative Leaders allowed the Franchise Bill to pass, and in 1885 the Redistribution Act also became law. By the former the county was assimilated to the borough franchise, and some 2,000,000 voters were added to the electoral register. The latter went some way towards the principle of equal electoral areas."—J. A. R. Marriott, *England since Waterloo*, pp. 491, 492.

"That the Reform Act of 1884 was finally passed with the assent of both parties is not surprising. Whatever might be thought of the wisdom or unwisdom of the Act of 1867 no intelligible reason could be given for refusing to one section of the working classes the franchise which had been conceded to another. The reform was lateral and not vertical. Nor could the distinction any longer be drawn between the urban and rural householder, even if that distinction had been a sufficient reason for denying a vote to the latter, for a large proportion of the newly enfranchised voters lived in urban districts. No one was disfranchised by the bill. The property vote was retained, although constituting a violation of the uniformity of county and borough franchise aimed at by the Act; although, too, it might fairly have been contended that it was a mere survival of the old distinction between the property franchise in the counties and the occupation franchise in the boroughs, and that since occupation had become the qualification of the great majority of voters in counties as well as in boroughs the property vote was an anachronism.

No attempt was made to abolish plural voting. In order to satisfy a powerful Liberal opposition the Act of 1867, passed by a Conservative Government, went further than most Liberals desired; the same consideration, *mutatis mutandis*, caused the Act of 1884 to be drawn by a Liberal Government on Conservative lines. . . . By [the Redistribution] Act all boroughs with a population of less than 15,000 were disfranchised, and merged into their counties. These counties were subdivided into single-member districts, so that the voter who had lost his vote for the borough gained a vote for the electoral district of the county in which his borough was situated. Under this provision eighty boroughs were disfranchised in England, two in Scotland, and twenty-two in Ireland. All towns with a population under 50,000 were to be represented by one member only—a provision which deprived thirty-four boroughs in England and three in Ireland of one of their members. Macclesfield and Sandwich were disfranchised for corruption. Towns with a population of over 100,000 were divided into separate constituencies and received additional members in proportion to their population. The representation of the city of London was reduced to two, but greater London returned sixty-two members. Six additional members were given to England and twelve to Scotland, by which means the total number of members was raised from 652 to 670. Preferential treatment was accorded to Ireland; for whereas her population only entitled her to ninety-one, or at most to ninety-three, members she was allowed to retain the 105 members given her by the Reform Act of 1832. . . . The frequent differences between the two Houses during the Parliament of 1880, and the rejection of the first Franchise Bill by the Upper House, caused the powers and composition of that House to be much discussed during the general election of 1885, and proposals for its 'mending or ending' to be freely canvassed on Radical platforms. On the 5th of March, 1886, a resolution condemning the hereditary principle was moved by Mr. Labouchere in the House of Commons. Mr. Gladstone resisted this motion on the ground that it was inopportune. He said that he had always refused to assent to an abstract resolution unless he was prepared to follow it up by action, and that the time for this had not yet come. The resolution was defeated by a majority of thirty-six."—F. Holland, *May's constitutional history of England*, v. 3, pp. 39, 40, 43.—"Until the passing of the Representation of the People Act, 1884, no householder was qualified to vote unless he not only occupied a dwelling house, but occupied it either as owner or as the tenant of the owner. And where residence in an official or other house was necessary, or conducive to the efficient discharge of a man's duty or service, and was either expressly or impliedly made a part of such duty or service then the relation of landlord or tenant was held not to be created. The consequence was that a large number of persons who as officials, as employes, or as servants are required to reside in public buildings, on the premises of their employers or in houses assigned to them by their masters were held not to be entitled to the franchise. The effect of the three Acts taken together is that the County franchises are as follows:—1. Owners of Land, &c., of the annual value of £5, after deducting feu duty, ground annual, or other considerations which an owner may be bound to pay or to give an account for as a condition of his right. 2. Leaseholders under a lease of not less than 57 years or for the life of the tenant of the clear yearly value of £10, or for a period of not less than 10 years when the clear yearly value is not less than £50, or the

tenant is in actual personal occupancy of the land. 3. Occupiers of land, &c., of the clear yearly value of £10. 4. Householders. 5. Lodgers. 6. The service franchise. Borough franchises.—1. Occupiers of land or tenements of the annual value of £10. 2. Householders. 3. Lodgers. 4. The service franchise. The qualification for these franchises is in all material respects the same as for the corresponding franchises in the Scotch counties, and in the counties and boroughs of England and Wales. . . . The Acts relating to the franchise in Ireland are 2 & 3 Will. IV., c. 88, 13 & 14 Vict., c. 69, the representation of the People (Ireland) Act, 1868, and the Representation of the People Act, 1884. Read together they give the following qualifications:—County franchises.—1. Owners of freeholds of inheritance or of freeholds for lives renewable for ever rated to the poor at the annual value of £5. 2. Freeholders and copyholders of a clear annual value of £10. 3. Leaseholders of various terms and value. 4. Occupiers of land or a tenement of the clear annual value of £10. 5. Householders. 6. The lodger franchise. 7. The service franchise. Borough franchises.—1. Occupiers of lands and tenements of the annual value of £10. 2. Householders. . . . 3. Lodgers. 4. The service franchise. 5. Freemen in certain boroughs. . . . [The only classes of persons without the franchise were, therefore, those who had no fixed abode, bachelors who paid no rent and domestic servants and women.] All the franchises we have described . . . are subject to this condition, that no one, however qualified, can be registered or vote in respect of them if he is subjected to any legal incapacity to become or act as elector. . . . No alien unless certificated or naturalised, no minor, no lunatic or idiot, nor any person in such a state of drunkenness as to be incapable—is entitled to vote. Police magistrates in London and Dublin, and police officers throughout the country, including the members of the Royal Irish Constabulary, are disqualified from voting either generally or for constituencies within which their duties lie. In the case of the police the disqualification continues for six months after an officer has left the force. . . . Persons are disqualified who are convicted of treason or treason-felony, for which the sentence is death or penal servitude, or any term of imprisonment with hard labour or exceeding twelve months, until they have suffered their punishment (or such as may be substituted by competent authority), or until they receive a free pardon. Peers are disqualified from voting at the election of any member to serve in Parliament. A returning officer may not vote at any election for which he acts, unless the numbers are equal, when he may give a casting vote. No person is entitled to be registered in any year as a voter for any county or borough who has within twelve calendar months next previous to the last day of July in such year received parochial relief or other alms which by the law of Parliament disqualify from voting. Persons employed at an election for reward or payment are disqualified from voting thereat although they may be on the register. . . . The Corrupt and Illegal Practices Prevention Act, 1883, disqualifies a variety of offenders."—W. A. Holdsworth, *New reform act*, pp. 20-36.—See also SUFFRAGE, WOMAN: ENGLAND: 1860-1005. ALSO IN: J. Murdoch, *History of constitutional reform in Great Britain and Ireland*, pp. 277-308.—H. Jephson, *The platform*, v. 2, ch. 23.—E. Porritt, *Barriers to democracy in English electoral system*. 1885.—Fall of the Gladstone government.—Brief first ministry of Lord Salisbury.—"Almost simultaneously with the assembling of Parliament [February 10, 1885] had come the news of the fall of Khartoum and the death of General

Gordon [see EGYPT: 1884-1885]. These terrible events sent a thrill of horror and indignation throughout the country, and the Government was severely condemned in many quarters for its procrastination. Mr. Gladstone, who was strongly moved by Gordon's death, rose to the situation, and announced that it was necessary to overthrow the Mahdi at Khartoum, to renew operations against Osman Digma, and to construct a railway from Suakim to Berber with a view to a campaign in the autumn. A royal proclamation was issued calling out the reserves. Sir Stafford Northcote, initiated a debate on the Soudan question with a motion affirming that the risks and sacrifices which the Government appeared to be ready to encounter could only be justified by a distinct recognition of our responsibility for Egypt, and those portions of the Soudan which are necessary to its security. Mr. John Morley introduced an amendment to the motion, waiving any judgment on the policy of the Ministry, but expressing regret at its decision to continue the conflict with the Mahdi. Mr. Gladstone skilfully dealt with both motion and amendment. Observing that it was impossible to give rigid pledges as to the future, he appealed to the Liberal party, if they had not made up their minds to condemn and punish the Government, to strengthen their hands by an unmistakable vote of confidence. The Government obtained a majority of 14, the votes being 302 in their favour with 288 against; but many of those who supported the Government had also voted for the amendment by Mr. Morley. . . . Financial questions were extremely embarrassing to the Government, and it was not until the 30th of April that the Chancellor of the Exchequer was ready with his financial statement. He was called upon to deal with a deficit of upwards of a million, with a greatly depressed revenue, and with an estimated expenditure for the current year—including the vote of credit—of no less than £100,000,000. Amongst Mr. Childers's proposals was one to levy upon land an amount of taxation proportioned to that levied on personal property. There was also an augmentation of the spirit duties and of the beer duty. The country members were dissatisfied and demanded that no new charges should be thrown on the land till the promised relief of local taxation had been carried out. The agricultural and the liquor interests were discontented, as well as the Scotch and Irish members with the whiskey duty. The Chancellor made some concessions, but they were not regarded as sufficient, and on the Monday after the Whitsun holidays, the Opposition joined battle on a motion by Sir M. Hicks Beach. . . . Mr. Gladstone stated at the close of the debate that the Government would resign if defeated. The amendment was carried against them by 264 to 252, and the Ministry went out. . . . Lord Salisbury became Premier. . . . The general election . . . [was] fixed for November, 1885."—G. B. Smith, *Prime ministers of Queen Victoria*, pp. 373-377.

1885-1886.—Gladstone's return to power.—Home Rule Bill for Ireland and Irish Land Bill.—Their defeat.—Division of the Liberal party.—Lord Salisbury's ministry.—"The House of Commons which had been elected in November and December, 1885, was the first House of Commons which represented the whole body of the householders and lodgers of the United Kingdom. The result of the appeal to new constituencies and an enlarged electorate had taken all parties by surprise. The Tories found themselves, by the help of their Irish allies, successful in the towns beyond all their hopes; the Liberals, disappointed in the boroughs, had found compensation in unexpected suc-

cesses in the counties; and the Irish Nationalists had almost swept the board. . . . The Irish representation had undergone a still more remarkable change; . . . 85 were Home Rulers and only 18 were Tories. . . . It was soon clear enough that the alliance between the Tory Ministers and the Irish Nationalists was at an end." On the 25th of January, 1886, the Government was defeated on an amendment to the address, and on the 28th it resigned. Mr. Gladstone was invited to form a Ministry and did so with Lord Herschell for Lord Chancellor, Sir William Harcourt for Chancellor of the Exchequer, Mr. Childers for Home Secretary, Lord Granville for Secretary for the Colonies, Mr. John Morley for Chief Secretary for Ireland, and Mr. Chamberlain for President of the Local Government Board. On the 20th of March "Mr. Gladstone announced in the House of Commons that on the 8th of April he would ask for leave to bring in a bill 'to amend the provision for the future government of Ireland'; and that on the 15th he would ask leave to bring in a measure 'to make amended provision for the sale and purchase of land in Ireland.'" The same day Mr. Chamberlain and Mr. Trevelyan (Secretary for Ireland) resigned their seats in the Cabinet, and it was generally understood that differences of opinion on the Irish bills had arisen. On the 8th of April the House of Commons was densely crowded when Mr. Gladstone introduced his measure for giving Home Rule to Ireland. In a speech which lasted three hours and a half he set forth the details of his plan and the reasons on which they were based. The essential conditions observed in the framing of the measure, as he defined them, were these: "The unity of the Empire must not be placed in jeopardy; the minority must be protected; the political equality of the three countries must be maintained, and there must be an equitable distribution of Imperial burdens. He then discussed some proposals which had been made for the special treatment of Ulster. . . . The taxing power would be in the hands of the Irish legislature, but Customs and Excise duties connected with Customs would be solely in the control of the Imperial Parliament, Ireland's share in these being reserved for Ireland's use. . . . It was to consist of two orders, though not two Houses. It would be subject to all the prerogatives of the Crown; it would have nothing to do with Army or Navy, or with Foreign or Colonial relations. . . . Trade and navigation, coinage, currency, weights and measures, copyright, census, quarantine laws, and some other matters, were not to be within the powers of the Irish Parliament. . . . The Viceroyalty was to be left, but the Viceroy was not to quit office with an outgoing government, and no religious disability was to affect his appointment. He would have a Privy Council, and the executive would remain as at present, but might be changed by the action of the legislative body. . . . Judges, with the exception of two in the Court of Exchequer, would be appointed by the Irish government, and, like English judges, would hold their office during good behaviour. The Constabulary would remain under its present administration, Great Britain paying all charges over a million. Eventually, however, the whole police of Ireland would be under the Irish government. The civil servants would have two years' grace, with a choice of retirement on pension before passing under the Irish executive. Of the financial arrangements Mr. Gladstone spoke in careful and minute detail. He fixed the proportion of Imperial charges Ireland should pay at one-fifteenth, or in other words she would pay one part and Great Britain fourteen parts. . . ." On the 16th of April Mr. Gladstone

introduced his Irish Land Bill, connecting it with the Home Rule Bill as forming part of one great measure for the pacification of Ireland. In the meantime the opposition to his policy within the ranks of the Liberal party had been rapidly taking form. It was led by Lord Hartington, Mr. Chamberlain, Mr. Trevelyan, Sir Henry James, Sir John Lubbock, Mr. Goschen, and Mr. Courtney. It soon received the support of Mr. John Bright. The debate in the House, which lasted until the 3rd of June, was passionate and bitter. It ended in the defeat of the Government by a majority of 30 against the bill. The division was the largest which had ever been taken in the House of Commons, 657 members being present. The majority was made up of 249 Conservatives and 94 Liberals. The minority consisted of 228 Liberals and 85 Nationalists. Mr. Gladstone appealed to the country by a dissolution of Parliament. The elections were adverse to him. . . . Mr. Gladstone and his colleagues resigned and a new Ministry was formed under Lord Salisbury. The Liberals, in alliance with the Conservatives and giving their support to Lord Salisbury's Government, became organized as a distinct party under the leadership of Lord Hartington, and took the name of Liberal Unionists.—P. 1892-1893.—Fourth Gladstone ministry.—Passage of the Irish Home Rule Bill by the House of Commons.—Defeat by the Lords.—On June 28, 1892, Parliament was dissolved, having been in existence since 1886, and a new Parliament was summoned to meet on August 4. Great excitement prevailed in the ensuing elections, which turned almost entirely on the question of Home Rule for Ireland. The Liberal or Gladstone party, favouring Home Rule, won a majority of forty-two in the House of Commons; but in the representation of England alone there was a majority of seventy returned against it. In Ireland, the representation returned was 103 for Home Rule, and twenty-three against; in Scotland, fifty-one for and twenty-one

against; in Wales twenty-eight for and two against. Conservatives and Liberal Unionists (opposing Home Rule) lost little ground in the boroughs, as compared with the previous Parliament, but largely in the counties. As the result of the election, Lord Salisbury and his Ministry resigned August 12, and Gladstone was summoned to form a government. In the new cabinet, which was announced four days later, Earl Rosebery became foreign secretary; Baron Hirschell, lord chancellor; Sir William Vernon Harcourt, chancellor of the exchequer; Herbert H. Asquith, home secretary; and John Morley, chief secretary for Ireland. Although the new Parliament assembled in August, 1892, it was not until February 13 following that Gladstone introduced his bill to establish Home Rule in Ireland. The bill was under debate in the House of Commons until the night of September 1, 1893, when it passed that body by a vote of 301 to 267. "The bill provides for a Legislature for Ireland, consisting of the Queen and of two Houses—the Legislative Council and the Legislative Assembly. This Legislature, with certain restrictions, is authorized to make laws for the peace, order, and good government of Ireland in respect of matters exclusively relating to Ireland or some part thereof. The bill says that the powers of the Irish Legislature shall not extend to the making of any law respecting the establishment or endowment of religion or prohibiting the free exercise thereof, or imposing any disability or conferring any privilege on account of religious belief, or whereby any person may be deprived of life, liberty, or property without due process of law, or whereby private property may be taken without just compensation. According to the bill the executive power in Ireland shall continue vested in her Majesty the Queen, and the Lord Lieutenant, on behalf of her Majesty, shall exercise any prerogatives or other executive power of the Queen the exercise of which may be delegated to him by her Majesty, and shall in the Queen's name summon, prorogue and dissolve the Legislature. An Executive Committee of the Privy Council of Ireland is provided for, which 'shall aid and advise in the government of Ireland.' The Lord Lieutenant, with the advice and consent of the Executive Council, is authorized to give or withhold the assent of her Majesty to bills passed by the Houses of the Legislature. The Legislative Council by the terms of the bill shall consist of forty-eight Councillors. Every man shall be entitled to vote for a Councillor who owns or occupies any land or tenement of a ratable value of £20. The term of office of the Councillors is to be for eight years, which is not to be affected by dissolution, but one-half of the Councillors shall retire in every fourth year and their seats be filled by a new election. The Legislative Assembly is to consist of 103 members returned by the Parliamentary constituencies existing at present in Ireland. This Assembly, unless sooner dissolved, may exist for five years. The bill also provides for 80 Irish members in the House of Commons. In regard to finance, the bill provides that for the purposes of this act the public revenue shall be divided into general revenue and special revenue, and general revenue shall consist of the gross revenue collected in Ireland from taxes; the portion due to Ireland of the hereditary revenues of the crown which are managed by the Commissioners of Woods, an annual sum for the customs and excise duties collected in Great Britain on articles consumed in Ireland, provided that an annual sum of the customs and excise duties collected in Ireland on articles consumed in Great

Britain shall be deducted from the revenue collected in Ireland and treated as revenue collected in Great Britain; these annual sums to be determined by a committee appointed jointly by the Irish Government and the Imperial Treasury. It is also provided that one-third of the general revenue of Ireland and also that portion of any imperial miscellaneous revenue to which Ireland may claim to be entitled shall be paid into the Treasury of the United Kingdom as the contribution of Ireland to imperial liabilities and expenditures; this plan to continue for a term of six years, at the end of which time a new scheme of tax division shall be devised. The Legislature, in order to meet expenses of the public service, is authorized to impose taxes other than those now existing in Ireland. Ireland should also have charged up against her and be compelled to pay out of her own Treasury all salaries and pensions of Judges and liabilities of all kinds which Great Britain has assumed for her benefit. The bill further provides that appeal from courts in Ireland to the House of Lords shall cease and that all persons having the right of appeal shall have a like right to appeal to the Queen in council. The term of office of the Lord Lieutenant is fixed at six years. Ultimately the Royal Irish Constabulary shall cease to exist and no force other than the ordinary civil police shall be permitted to be formed. The Irish Legislature shall be summoned to meet on the first Tuesday in September, 1894, and the first election for members shall be held at such time before that day as may be fixed by her Majesty in council." In the House of Lords, the bill was defeated on September 8—the second reading postponed to a day six months from that date—by the overwhelming vote of 419 to forty-one.—See also IRELAND: 1885-1891.

1894-1895 (March-September).—Retirement of Gladstone from public life.—Earl of Rosebery prime minister.—Speech on the "predominant member" and Home Rule.—Weakening and overthrow of the Liberal government.—Dissolution of Parliament.—Conservative and Unionist triumph.—Third ministry of Lord Salisbury.—Gladstone, who had passed his eighty-fourth year, whose health was failing, and who might justly consider that his public work was done, resigned his post as prime minister on March 2, 1894, and the earl of Rosebery, on his recommendation, was called by the queen to take his place. Slight changes, otherwise, were made in the cabinet, but the spirit in the Liberal government was no longer the same. The new premier soon signified that his disposition in the matter of Home Rule for Ireland was not quite what Mr. Gladstone's had been, by using the following language in a speech (March 13) in the House of Lords: "Before Irish Home Rule is conceded by the Imperial Parliament England, as the predominant member of the partnership of the three kingdoms, will have to be convinced of its justice. That may seem to be a considerable admission to make, because your lordships will know that the majority of English members of Parliament, elected from England proper, are hostile to Home Rule. But I believe that the conviction of England in regard to Home Rule depends on one point alone, and that is the conduct of Ireland herself. I believe that if we

can go on showing this comparative absence of agrarian crime; if we can point to the continued harmony of Ireland with the great Liberal party of this country; if we can go on giving proofs and pledges that Ireland is entitled to be granted that boon which she has never ceased to demand since the Act of Union was passed, I believe that the conversion of England will not be of a slow or difficult character. My lords, the question of Home Rule is one that I regard not from the point of view of Ireland only. It has for me a triple aspect. It has, in the first place, the aspect that I believe that Ireland will never be contented until this measure of Home Rule be granted to her; and that, though you may come in on other issues and succeed us who sit here, your policy of palliatives is bound to fail. In the second place, I believe that not merely have we in our Irish policy to satisfy those who live in the island of Ireland itself, encompassed, as Mr. Disraeli once said, by that melancholy ocean, we have not merely to satisfy the Irish themselves within Ireland, but, for the good of our Empire and for the continuity and solidarity of our relations with our brethren across the Atlantic, it is necessary that we should produce an Irish policy which shall satisfy the Irish people. And, lastly, I view it from the highest Imperial grounds, because I believe that the maintenance of this Empire depends, not on centralization, but on decentralization, and that if you once commence to tread this path, you will have to give satisfaction under the same conditions certainly to Scotland, and possibly to Wales, not in the same degree or possibly in the same way, but so as to relieve this groaning Imperial Parliament from the burden of legislation under which it labours."

His remarks seemed to show an intention to postpone the pressing of the measure. Distrust arose among the Irish and uncertainty was created in the mind of the Liberal party. It became evident very quickly that the Liberals, with the loss of their old leader, had lost heart and faith in the policy to which he had committed them, and that a serious weakening of the political energies of the party had been produced. No measures which raised troublesome issues were undertaken in Parliament during the year; but, at the session which opened in the following February (1895), the government brought forward a number of highly important bills.

The first to be introduced was a bill "to terminate the Establishment of the Church of England in Wales and Monmouth." The bill made provision for the creation of a representative church body, giving power to the bishops, clergy and laity to hold synods and to legislate on ecclesiastical matters. It entrusted ecclesiastical revenues to a commission; provided for the transfer of churches and parsonages to the representative body of the church, and of burial grounds and glebes to parish, district, and town councils; other property of the church to be vested in the commission before mentioned, which should also have the charge of cathedrals, to keep them in repair. The bill had its first reading on February 28 and its second on April 1, but went no further. It shared the fate of the other measures of the government, including the bill to establish local control of the liquor traffic, and others for the remedying of defects in the Irish land law, and for the abolition of plural voting, all of which were extinguished by the sudden and unexpected overthrow of the government on June 21. It was defeated on a motion to reduce the salary of the secretary for war, which was made for no pur-

pose but to start a question as to the adequacy of the provision of certain ammunition stored for use. When the vote was found to be against the government there was great surprise in both parties. But the ministry had been steadily losing support and was quite willing to resign, which it did the next day.

Lord Salisbury was sent for by the queen and accepted the task of forming a new government, with the understanding that Parliament should be dissolved as soon as practicable, and the will of the country ascertained. In the new government, Lord Salisbury filled the office of secretary of state for foreign affairs, with that of Prime Minister; A. J. Balfour became first lord of the treasury; Sir Michael Hicks-Beach, chancellor of the exchequer; Joseph Chamberlain, secretary of state for the colonies; G. J. Goschen, first lord of the admiralty. Before the dissolution of Parliament, which occurred on July 6, a bill for the amendment of the Factories Act, on which both parties agreed, was passed. The elections that followed, beginning July 13, resulted in the return of a majority of 152 in favor of the new ministry, which represented the coalition of Conservatives and Liberal Unionists. The majority of the popular vote on the same side in the three kingdoms was a little more than 30,000, in a total poll of 4,792,512; but in England the new government received a majority of some 300,000. In Ireland the vote went heavily against them, and in Wales and Scotland to a lighter extent. Of the Irish members elected, twelve were of the Parnell faction and sixty-nine Anti-Parnell. The new Parliament came together August 12, and, after a brief session, at which little was done, was prorogued September 5.

1895 (March-July).—Agreement with Russia concerning the northern Afghan frontier and spheres of influence in the Pamir region. See ARGHANISTAN: 1895.

1896.—Report on old-age pensions.—The question of the practicability and expediency of a national system of pensions for old age, which had been agitated in England for some years, and which a royal commission, appointed in 1893, had already examined with great thoroughness and no definite result, was referred in 1896 to a committee of financial experts, with Lord Rothschild at their head. This committee reported that it could recommend no scheme as satisfactory, though it put forward that of Sir Spencer Walpole as open to less objection than others. The scheme in question was as follows: "1. Any person at 65 having an assured income of not less than 2s. 6d. and not more than 5s. may apply for a pension. 2. If the pensioning authority is satisfied as to the income a pension may be granted. 3. The applicant must not be physically or mentally infirm. 4. To an income of 2s. 6d. 2s. 6d. is to be added. To an income of 3s. od. 2s. od. is to be added. To an income of 4s. od. 1s. od. is to be added. 5. 'Assured income' includes real estate, leasehold property, securities, or annuities (Government, friendly society, or insurance office), but not out-relief. 6. The guardians are to be the pensioning authority. 7. Not more than half of the pension is to be paid out of Imperial taxation, the remainder out of local rates. 8. The pension is not to involve disenfranchisement."

The committee, however, pointed out some very strong objections to this scheme, which they roughly estimated as likely to apply to 443,333 persons, and to cost £2,300,000 a year. On the whole, while they regarded the Walpole scheme as

the best suggested, the Rothschild committee held that, like the rest, its inherent disadvantages outweighed its merits. In effect, they pronounced the establishment of old-age pensions to be impracticable.—See also SOCIAL INSURANCE: Details for various countries: Great Britain: 1833-1911.

1896 (May).—New radical party.—A new radical party, under the leadership of Sir Charles Dilke and Henry Labouchere, issued a statement of its policy (May 19), setting forth as its chief aim "the democratisation and devolution of Parliament."

1896 (June).—Agricultural Land Act.—Among the measures brought forward in Parliament this year and carried by the Conservative government was one which aroused bitter feeling and was sharply denounced, as being legislation in the interest of the landholding class, at the expense of the community at large. A ground of justice for it was found by its supporters, however, in the extreme agricultural depression of the time. This agricultural land bill, as it was styled, provided that, in the case of every rate to which it applied, agricultural land should be assessed in future on half its ratable value, while houses and buildings would still be assessed on the whole of their ratable value. The bill passed the Commons near the end of June, and went speedily through the House of Lords.

1896-1897.—"Voluntary Schools Act" and "Elementary Education Act."—The Conservative ministry of Lord Salisbury came to power, in England, in 1895, under pledges to the church that it would revise the educational system in the interest of the "voluntary schools" (mostly church schools), as against the secular or non-sectarian "board schools," which were steadily gaining ground from the former, and proving superior efficiency. A bill to that end, for England and Wales, was introduced at the end of March, 1896. In support of the bill it was stated that, in the previous year, the voluntary schools educated 2,445,812 children, as against 1,879,218 educated in the board schools, though the voluntary schools were, as a rule, "understaffed," had less qualified teachers, and labored generally under financial difficulties; but that a large proportion of the members of the Church of England, as well as Roman Catholics, made it a point of conscience that their children should be educated by teachers of their own denomination, and could not be forced to send them to board schools without a gross exercise of religious intolerance; that, finally, it would cost £25,345,635 to replace the voluntary schools, and £2,250,000 yearly to maintain board schools in their place, if they were not kept up. Therefore, it was contended that they should receive a more liberal allowance of state aid by parliamentary grant, to keep them alive and improve their efficiency. Connected with provisions

to that effect were others which would completely reorganize the system of school administration and control. They proposed to take the administration to a great extent from the committee of council on education, where it had been centralized, and to place it in the county councils, to be exercised by statutory educational committees appointed by each council. By what was called a "conscience clause," the bill required separate religious instruction to be given to children in schools (board or voluntary) wherever a "reasonable number of parents" required it. The measure was strenuously opposed on the ground that its aim was the extinction of the board schools; that it would give them only £17,000 out of £500,000, and give it, said Lord Rosebery, "without any vestige of control, so that in 8,000 places where only Church of England schools existed the Non-conformists would have only the vague protection of the conscience clause." So much debate was provoked by the bill, and so much time was being consumed by it, that the government was forced to drop the measure in June, in order to save the other business of the session from being spoiled,—promising, however, to bring it forward again the next January. The promise was redeemed, on the convening of Parliament in January, 1897, in so far that a new education bill was brought forward by the government; but the measure was very different from that of the previous session. It was addressed solely to the end of strengthening the voluntary or church schools against the board schools, firstly by increasing the aid to them from public funds, and secondly by uniting them in organized associations, under stronger governing bodies. The main provisions of the bill were:

"(1.) For aiding voluntary schools there shall be annually paid out of moneys provided by Parliament an aid grant, not exceeding in the aggregate five shillings per scholar for the whole number of scholars in those schools.

"(2.) The aid grant shall be distributed by the Education Department to such voluntary schools and in such manner and amounts, as the Department think best for the purpose of helping necessitous schools and increasing their efficiency, due regard being had to the maintenance of voluntary subscriptions.

"(3.) If associations of schools are constituted in such manner in such areas and with such governing bodies representative of the managers as are approved by the Education Department, there shall be allotted to each association while so approved, (a) a share of the aid grant to be computed according to the number of scholars in the schools of the association at the rate of five shillings per scholar, or, if the Department fix different rates for town and country schools respectively (which they are hereby empowered to do) then at those rates; and (b) a corresponding share of any sum which may be available out of the aid grant after distribution has been made to unassociated schools.

"(4.) The share so allotted to each such association shall be distributed as aforesaid by the Education Department after consulting the governing body of the association, and in accordance with any scheme prepared by that body which the Department for the time being approve.

"(5.) The Education Department may exclude a school from any share of the aid grant which it might otherwise receive, if, in the opinion of the Department, it unreasonably refuses or fails to join such an association, but the refusal or failure shall not be deemed unreasonable if the majority of the schools in the association belong to a re-

ligious denomination to which the school in question does not itself belong.

"(6.) The Education Department may require, as a condition of a school receiving a share of the aid grant, that the accounts of the receipts and expenditure of the school shall be annually audited in accordance with the regulations of the Department.

"(7.) The decision of the Education Department upon any question relating to the distribution or allotment of the aid grant, including the question whether an association is or is not in conformity with this Act, and whether a school is a town or a country school, shall be final."

The passage of the bill was resisted strenuously by the Liberals in the House of Commons. "Whether they regarded the bill from an educational, a constitutional, a parliamentary, or a social aspect," said Mr. John Morley, in his concluding speech in the debate, "he and his friends regarded it as a mischievous and reactionary measure." But the opposition was of no avail. The bill passed its third reading in the House of Commons, on the 25th of March, with a majority of 200 in its favor, the Irish Nationalists giving it their support. In the House of Lords it was ruled to be a money bill, which their lordships could not amend, and they passed it with little debate. In April, the government brought forward a second school bill, which increased the parliamentary grant to Board schools by £110,000. The sum was so trivial that it excited the scorn of the friends of the Board schools, and did nothing towards conciliating them. It became a law on the 3d of June.

1897 (May-June).—New cessions and concessions from China. See CHINA: 1897 (May-June).

1897 (May-July).—Workmen's Compensation Act.—A subject which had grown urgent, in England, for parliamentary attention, was that of a better provision in law for securing proper compensation to workmen for accidental injuries suffered in the course of their employment. The measure was not one that a Conservative government would be likely, under ordinary circumstances, to take up; since the class of large employers of labor, from which opposition to it came, were mostly in the Conservative ranks. But the Liberal Unionists, now in parliamentary coalition with the Conservatives, were called upon to favor such a piece of legislation by their creed, and rumor said that they bargained for it with their political partners, in exchange for the support they gave unwillingly to the Voluntary Schools Bill. At all

events, a bill which was first called the Employers' Liability bill, but finally named the Workmen's Compensation bill, was brought in to the House of Commons, by the government, in May, and was carried, after much debate, through both houses in July.—For text of the Act, see SOCIAL INSURANCE: Details for various countries: Great Britain: 1833-1911.

1897 (June).—Diamond jubilee of Queen Victoria.—The sixtieth anniversary of the coronation of Queen Victoria was celebrated in London on June 20, by religious services of great solemnity and impressiveness, and, two days later, by pageants of extraordinary pomp and magnificence, in which representatives of every people who acknowledge the queen's supremacy bore a part. Numerous functions and ceremonies followed to many of which the aged sovereign was able to lend her presence.

1898 (February).—British troops fighting in eight regions of the world.—“We are a people of peaceful traders—shopkeepers, our rivals of the Continent affirm—and are consequently at war on only eight points of the globe, with forces which in the aggregate only just exceed sixty thousand men. There are thirty-five thousand on the Indian Frontier fighting the clansmen of the Northern Himalayas, who, according to the Afridi sub-officers interrogated by Sir Henry Havelock-Allan, are all eager to enter our service; twenty-five thousand about to defeat the Khalifa at Omdurman; a thousand doing sentry duty in Crete; four hundred putting down an outbreak in Mekran; three hundred crushing a mutiny in Uganda; and some hundreds more restoring order in Lagos, Borneo and Basutoland. All these troops, though of different nationalities—Englishmen, Sikhs, Ghoorkas, Rajpoots, Malays, Egyptians, Soudanese, Haussas, and Wagandas—are under British officers, are paid from funds under British control, and are engaged in the self-same work, that of solidifying the ‘Pax Britannica,’ so that a commercial civilisation may have a fair chance to grow.”—*Spectator (London)*, Feb. 5, 1898.

1898 (May).—Death of Gladstone.—After a long and painful illness, the great statesman and leader of the Liberal party in England, William Ewart Gladstone, died on May 19. His death drew [eloquent] tributes in Parliament from his political opponents. It was said by Lord Salisbury that “the most distinguished political name of the century had been withdrawn from the roll of Englishmen.” Mr. Balfour described him as “the greatest member of the greatest deliberative assembly that the world had yet seen”; and expressed the belief that “they would never again have in that assembly any man who could reproduce what Mr. Gladstone was to his contemporaries.”

Lord Rosebery paid an eloquent tribute to the dead statesman. “This country,” he said, “this nation, loves brave men. Mr. Gladstone was the bravest of the brave. There was no cause so hopeless that he was afraid to undertake it; there was no amount of opposition that would cower him when once he had undertaken it.” With the con-

sent of Mrs. Gladstone and family, a public funeral was voted by Parliament, and the body of the great leader was laid in Westminster Abbey, on May 28.

1899 (August).—Board of Education Act.—An act of Parliament which became law on August 9, 1899, and operative on April 1, 1900, created a national board of education, “charged with the superintendance of matters relating to education in England and Wales,” and taking the place of the committee of the privy council on education, by which that function had previously been performed. The act provided that the board “shall consist of a President, and of the Lord President of the Council (unless he is appointed President of the Board), Her Majesty's Principal Secretary of State, the First Commissioner of Her Majesty's Treasury, and the Chancellor of Her Majesty's Exchequer. . . . The President of the Board shall be appointed by Her Majesty, and shall hold office during Her Majesty's pleasure.” The act provided further for the creation by her majesty in council of “a Consultative Committee consisting, as to not less than two-thirds, of persons qualified to represent the views of Universities and other bodies interested in education, for the purpose of—(a) framing, with the approval of the Board of Edu-

cation, regulations for a register of teachers. . . with an entry in respect to each teacher showing the date of his registration, and giving a brief record of his qualifications and experience; and (b) advising the Board of Education on any matter referred to the committee by the Board."—62 & 63 *Victoria*, ch. 33.

1900 (September).—Proclamation of Commonwealth of Australia. See AUSTRALIA: 1900 (September-December).

1900 (September-October).—Dissolution of Parliament.—Election of a new Parliament.—Victory for Conservatives and Liberal Unionists.—By royal proclamation, September 17, the existing Parliament was dissolved and order given for the issue of writs calling a new Parliament, the elections for which were held in October, concluding on the 24th of that month. The state of parties in the House of Commons resulting from the election was as follows: Conservatives, 334, Liberal Unionists, sixty-eight; total supporters of the Unionist Ministry, 402. Liberals and Labor members, 186, Nationalists (Irish), eighty-two; total opposition, 268. Unionist majority, 134, against 128 in the preceding Parliament. The issues in the election were those growing out of the South African War. Although most of the Liberals upheld the war, and the annexation of the South African republics, they sharply criticised the prior dealings of the colonial secretary, Joseph Chamberlain, with the Transvaal Boers, and the general conduct of the war. A number of the leading Liberals, particularly David Lloyd George, were uncompromising in condemnation of the war, of the policy which caused it, and of the proposed extinction of Boer independence. The sentiment of the country was shown by the election to be strongly against all questioning of the righteousness of the war or of the use to be made of victory in it.

1900 (November-December).—Fourth ministry of Lord Salisbury.—Brief session of Parliament.—For the fourth time, Lord Salisbury was called to the lead in government, and formed his ministry anew, making considerable changes. He relieved himself of the conduct of foreign affairs (which was transferred to the Marquess of Lansdowne), and took, with the office of prime minister, that of lord privy seal. St. John Brodrick (later created Lord Midleton), who had been an under-secretary, succeeded Lord Lansdowne as secretary of state for war. Mr. Balfour continued to be first lord of the treasury, and leader of the House; Mr. Chamberlain remained in the colonial office. Mr. Goschen retired and was created Viscount Goschen.

Parliament met on December 6 for the purpose set forth in a brief "Queen's Speech," as follows: "My Lords, and Gentlemen, It has become necessary to make further provision for the expenses incurred by the operations of my armies in South Africa and China. I have summoned you to hold a Special Session in order that you may give your sanction to the enactments required for this purpose. I will not enter upon other public matters requiring your attention until the ordinary meeting of Parliament in the spring." The estimates of the war office called for £16,000,000, and it was voted after a few days of debate, in which the causes and conduct of the war were criticised and defended by the two parties, and, on the 15th, Parliament was prorogued to February 14, 1901, by the queen's command.

1901 (January).—Death of Queen Victoria.—Accession of Edward VII.—On January 22, 1901, the long reign of Queen Victoria ended. She was eighty-two years old and had begun the sixty-fourth year of her reign, one of the longest in all European annals. The queen died at Osborne, Isle of Wight. The funeral, which took place on February 1, was, in accordance with her command,

# DESCENDANTS OF QUEEN VICTORIA

And of the Prince Consort, Albert, second son of the Duke of Saxe-Coburg and Gotha (b. 1819), whom she married February 10, 1840, and who died December 14, 1861.  
The queen died January 22, 1901.

\* These are marriages of first cousins.

a military one, and members of all the royal families of Europe were in the procession. In the afternoon, the funeral service was held at St. George's Chapel, Windsor, and on February 4, the coffin was privately removed to the mausoleum at Frogmore, in which the remains of the prince-consort already lay. "The demonstration of her people's sorrow testified to the spirit of loyalty to her person and position which had been evoked by her length of life and reign, her personal sorrows, and her recent manifestations of sympathy with her subjects' welfare. But the vital strength and popularity, which the grief at the Queen's death proved the monarchy to enjoy, were only in part due to her personal character and the conditions of her personal career. A force of circumstances which was not subject to any individual control largely contributed to the intense respect and affection on the part of the people of the Empire, which encircled her crown when her rule ended. The pas-

EDWARD VII

sion of loyalty with which she inspired her people during her last ten years was a comparatively late growth. . . . It was largely the outcome of the new conception of the British monarchy which sprang from the development of the colonies and dependencies of Great Britain, and the sudden strengthening of the sense of unity between them and the mother-country. The crown after 1880 became the living symbol of imperial unity, and every year events deepened the impression that the Queen in her own person typified the common interest and the common sympathy which spread a feeling of brotherhood through the territories that formed the British Empire."—S. Lee, *Queen Victoria*, pp. 540-542.—On January 24, the queen's eldest son Albert Edward, prince of Wales, was proclaimed king under the title of Edward VII.

ALSO IN: G. M. Trevelyan, *British history in the nineteenth century* (1782-1901).—L. Strachey, *Queen Victoria*.

1901 (February).—Opening of Parliament by Edward VII.—Parliament, reassembling on February 14, was formally opened by the king in person, with a degree of pomp and ceremony which

had been made strange by half a century of disuse.

Having submitted to the old test of a Protestant qualification for the throne, the king read his speech to Parliament, briefly stating the general posture of public affairs and setting forth the business which the two houses were asked by government to consider. The king was voted a civil list of £470,000 by the House of Commons, though this step, with its increase of £85,000 over that voted to Queen Victoria, was opposed by the Radicals, Laborites and Irish Nationalists, the last in retaliation for the refusal of the Lords to alter the declaration against transubstantiation taken by the king at the opening of Parliament. In this session the Demise of the Crown Bill was passed, rendering unnecessary reappointments to office upon the accession of a new ruler.

1901 (February).—Attitude of Liberal party towards the South African War.—At the annual meeting of the general committee of the National Liberal Federation, held at Rugby, February 27, 1901, more than 400 affiliated Liberal associations in England and Wales being represented by about 500 delegates, including many eminent men, the following resolution was adopted: "That this committee records its profound conviction that the long continuance of the deplorable war in South Africa, declared for electioneering purposes to be over last September, is due to the policy of demanding unconditional surrender and to a want of knowledge, foresight, and judgment on the part of the Government, who have neither demonstrated effectively to the Boers the military supremacy of Great Britain, nor so conducted the war as to induce them to lay down their arms; this committee bitterly laments the slaughter of thousands of brave men on both sides, the terrible loss of life from disease, owing in no small degree to the scandalous inadequacy of sanitary and hospital arrangements provided for our forces, and the enormous waste of resources in actual expenditure upon the war, in the devastation of territory, and in the economic embarrassments which must inevitably follow; the committee calls upon the Government to announce forthwith, and to carry out, on the cessation of hostilities, a policy for the settlement of South African affairs which will secure equal rights to the white races, just and humane treatment of natives, and such a measure of self-government as can honourably be accepted by a brave and high-spirited people."

1901 (February-April).—Views of Sir Alfred Milner on situation in South Africa. See SOUTH AFRICA, UNION OF: 1001 (February-April).

1901 (April).—Census statistics.—Relative numbers of males and females.—Agricultural industry.—Different kinds of areas.—The eleventh census of the population of England and Wales was taken April 1, 1901, "ascertaining the required information relating to the persons returned as living at midnight on Sunday, March 31st." The number enumerated in England and Wales, as finally revised at the census office, was 35,527,843; showing an increase of 3,525,318, or a decennial rate of increase of 12.17 per cent. upon the number returned at the preceding enumeration in April, 1801. Of the persons enumerated in England and Wales in 1001, 15,728,613 were males and 16,799,230 were females, the latter exceeding the former by 1,070,617. This, however, does not represent the relative numbers of the two sexes that belong to the population of the country; "for there are always men temporarily absent abroad as soldiers or seamen or for business purposes"; while, on the other hand, "the

enumerated population temporarily includes some soldiers and sailors who were born in Scotland and Ireland, as well as foreign sailors and business representatives." Making reckonings for these, "the population belonging to England and Wales at the date of the census may be estimated at 32,805,040 persons, of whom 16,005,810 were males, and 16,799,230 were females." During the ten years prior to 1901 the recorded male births in England exceeded the female births by 100,087, while the recorded deaths of males exceeded the deaths of females by 155,363. This would have about evened their numbers in the population of 1901; hence the existing excess of females is due, in the main, to the more extensive emigration or temporary absence of males.

Of the population of England and Wales less than 4 per cent. was born outside of those two divisions of the United Kingdom; not quite 1 per cent. was born in Scotland; a little more than 1.3 per cent. was born in Ireland; a trifle more than 1 per cent. in foreign countries, and an insignificant fraction in British colonies and dependencies. England, it will be seen, is troubled very slightly with problems arising from a mixed population.

The census of Scotland and Ireland, taken simultaneously with that of England and Wales, gave the former a population of 4,472,103, and the latter 4,458,775. Scotland had gained 46,456 since 1891; Ireland had lost in the same period 245,975. In the sixty years since 1841 Ireland had lost more than 3,700,000. The total of population in the United Kingdom, at midnight, March 31, 1901, was found to be 41,458,721; and the females exceeded the males in number by 1,253,905. The excess was least in Ireland.

Judged by the numbers engaged therein, the agricultural industry is still the most important in the United Kingdom; but, since 1881, it had been reduced from 2,362,331 males to 2,109,812 in 1901. The decline was far less in Ireland than in England, Scotland, or Wales. In England and Wales, the whole area of land, amounting to 37,129,162 acres, or 58,014 square miles, is divided by the census report into areas as follows:

	Acres.
Corn crops . . . . .	5,886,052
Green crops . . . . .	2,511,744
Clover and grasses under rotation . . . . .	3,262,926
Flax, hops, small fruit . . . . .	120,683
Bare fallow . . . . .	336,884
Permanent pasture or grass . . . . .	15,399,025
Mountain and heath land used for grazing . . . . .	3,556,636
Woods, plantations, nursery grounds, houses, streets, roads, railways, waste grounds, &c. . . . .	6,055,212
Total land area of England and Wales	37,129,162

The enumeration of "different kinds of areas," in England and Wales, as set forth in the census report, is interesting in some particulars—such as these: Fifty-four ancient counties; sixty-two administrative counties; 468 parliamentary areas; two ecclesiastical provinces; thirty-five ecclesiastical dioceses; 14,080 ecclesiastical parishes; 14,000 civil parishes; sixty-seven county boroughs; twenty-eight metropolitan boroughs with their wards; fifty-four county court circuits; 500 county court districts; 1122 urban districts (including 316 county or municipal boroughs) with the wards of those which are so subdivided; 664 rural districts.—*Census of England and Wales,*

1901. *General report (Parliamentary Papers, 1904, Cd. 2174).*

1902 (January).—Anglo-Japanese alliance. See JAPAN: 1895-1902.

1902 (March-November).—Education Act. See EDUCATION: Modern developments: 20th century: General education: England: Primary and secondary schools.

1902 (May).—Treaty with Abyssinia. See ABYSSINIA: 1902.

1902 (June-August).—Illness and deferred coronation of King Edward VII.—While England was preparing, in the last half of June, 1902, for the coronation of Edward VII, appointed to take place on the 26th, the king was stricken with appendicitis. After a successful operation, at the end of seven weeks he had recovered so fully as to be able to bear the fatigues and the strain of a trying ceremony, and on August 6 the king and queen were crowned in Westminster Abbey with less magnificence of public show than had been prepared for June 26, but nevertheless with regal pomp.

1902 (June-August).—Conference with prime ministers of self-governing colonies. See BRITISH EMPIRE: Colonial and imperial conferences: 1902.

1902 (July).—Resignation of Lord Salisbury.—Balfour's succession to premiership.—New ministry.—Failing health compelled the marquis of Salisbury to ask, on July 11, for relief from the cares of the office of prime minister. His resignation was accepted, and Arthur J. Balfour, first lord of the treasury in Lord Salisbury's ministry, was invited by the king to the vacant place. Some changes in the cabinet followed, Sir Michael Hicks-Beach retiring from the chancellorship of the exchequer, and being succeeded by C. T. Ritchie; A. Akers-Douglas entering the cabinet as home secretary; George Wyndham continuing in the office of chief secretary for Ireland, but coming into the cabinet; Austen Chamberlain, son of Joseph Chamberlain, also receiving a cabinet seat as postmaster-general.

1902 (September).—Arrangements of government with Cunard Company and International Mercantile Marine Company. See TRUSTS: International.

1902-1904.—Coercive proceedings against Venezuela concerted with Germany and Italy.—Settlement of claims secured.—Reference to The Hague.—Court of Arbitration. See VENEZUELA: 1902-1904.

1902-1904.—Mission of Colonel Younghusband to Tibet.—Its advance in force to Lhasa.—Treaty secured. See TIBET: 1902-1904.

1902-1905.—Relations with Japan.—Russo-Japanese War. See JAPAN: 1902-1905.

1902-1905.—Anti-Semitic feeling.—Aliens Bill. See JEWS: England: 1885-1905.

1903.—Passage of Land Purchase Act for Ireland. See IRELAND: 1903.

1903.—Agreement with United States regarding Alaskan boundary. See ALASKAN BOUNDARY QUESTION: 1903.

1903 (March).—Debate in Parliament on South African labor question. See SOUTH AFRICA, UNION OF: 1903-1904.

1903 (May).—Celebration of Empire day.—A Canadian custom of celebrating Queen Victoria's birthday, May 24, as Empire day, was taken up in Great Britain in 1903, and "the movement," says the *London Times*, "has spread with striking rapidity." In the schools, the morning of the day is given over to patriotic exercises, addresses on citizenship and the Empire, and to the singing of national songs, while the afternoon is a half-holiday.

1903 (May-September).—Chamberlain's tariff reform campaign.—In June, 1902, when, as secretary of state for the colonies, Joseph Chamberlain addressed the conference of prime ministers from the self-governing British colonies (see BRITISH EMPIRE: Colonial and imperial conferences: 1902), his mind was manifestly not prepared to accept as a practicable proposition their request that the United Kingdom would grant "preferential treatment to the products and manufactures of the Colonies." "Preferential treatment" meant an imperial protective-tariff policy, with discrimination of duties in favor of imports from British colonies. As the products of the colonies were mostly food stuffs and raw materials for manufacture, it meant a taxing of the supplies of these to British tables and British industries from every source outside the colonies. It meant an artificial higher pricing in the market of the British Isles for everything in which cost bears hardest on the livelihood and the living of their people. He had not yet been persuaded that the mother could afford to expend quite so much as this of her own well-being on premiums for the allegiance of her offspring.

In the course of the next year, however, the colonial secretary spent some weeks in South Africa, and seems to have been remarkably intensified in his imperialistic aims by what he saw and learned. He came home filled with the conviction that England must, for the sake of a really unified and incorporated empire, abandon the free opening of her markets, which gave her people the cheapest food and the cheapest materials for labor that the world at large could furnish, and must wall them and gate them, with differing keys to the locks, so that her own colonists might be given the "preferential" admission they claim. If he had arrived at that conviction before going to South Africa he had made no sign of it; but it was proclaimed soon after his return, in a speech to his constituents at Birmingham, on May 15, which shook England as no sudden development in politics had done for many years. The time had come, he declared, when the country must decide for or against a deliberate policy of imperial unification, which required it to reciprocate the preferential tariffs which the colonies had adopted or were offering to adopt. Canada had given Great Britain a preference in her tariff, first of 25 per cent., afterwards increased to 33⅓ per cent., and was ready to go farther if the British government would reciprocate, in allowing a drawback on the shilling corn duty (a duty which had then been levied for a year, and was about to be removed). At the colonial conference of the previous year the representatives of Australia and New Zealand had expressed readiness to act on the same line. A conference of the British colonies in South Africa

had recommended the legislatures of those colonies to give the mother country a similar preference on all dutiable goods of 25 per cent. Whether this policy of the colonies should be developed in the future or withdrawn depended now on the treatment given to it by the people of Great Britain.

Naturally this speech, from a minister as important and influential in the government and in his party as Chamberlain, caused an immense political commotion. It had suddenly injected a new issue into the politics of the United Kingdom, involving some reconstruction of the party in possession of power, and a fundamental readjustment of principles in some part of it.

Meantime the head of the government, Arthur J. Balfour, was acting like a faithful adherent to the English principle of freedom in trade, by advocating a repeal of the incongruous corn duty levied the year before, but speaking, at the same time, like a man of open mind on the question of preferential trade, treating it as one that demanded careful thought. "If foreign countries," he said, "should take the view that our self-governing colonies could be treated as separate nations we must resist their policy by fiscal retaliation. There must be a weapon to our hands with which to meet those who might attempt to disintegrate the empire by fiscal means. The question whether we should be justified in raising revenue with the object of drawing the different portions of the empire more closely together was certainly well worth consideration."

All that he said in these months conveyed the impression that he was in an undetermined, waiting state of mind on the question, not yet convinced that his colleague should be supported in the new policy proposed, but quite likely to be. That, however, was not the attitude in which he could hold the two coalesced parties, Conservative and Liberal Union, that were behind him in the government, the issue dividing both. The premier could suppress debate on it in Parliament, as he did, but everywhere else in the kingdom the rage of controversy gathered heat, and party lines on the side of the government were rapidly confused. Two members of the cabinet resigned, while Chamberlain kept his place in it until September 9, when he offered his resignation.

Chamberlain left the cabinet, therefore, and went out to preach the gospel of commercial imperialism, under the more carefully chosen name of "fiscal reform." His co-laborer, who stayed at the helm of state, was so favored by circumstances as to hold it for somewhat more than another year. But the propagandism made no satisfying progress in that year; it seems doubtful, indeed, if Chamberlain won as many disciples as he lost from his first following.—See also TARIFF: 1903-1906.

1905 (August).—New defensive agreement with Japan. See JAPAN: 1905-1914.

1905-1906.—Resignation of Balfour ministry.—Liberal party in power.—Sir Henry Campbell-Bannerman prime minister.—The Education Act of 1902, the apostasy of Chamberlain and his Conservative Unionist followers from British free trade principles, proclaimed in 1903, and the Licensing Act of 1904, had each, in turn, been productive of bitter disagreements and ruptures which rapidly lowered the strength of the party in power. It had been in control of the government since 1895, when its opposition to Irish Home Rule was endorsed by a large majority. The next election, in 1900, during the war in South Africa, reinforced its parliamentary support, and it could count, during the two years following, on more than 400 votes in the House of Commons, against about 268. Meanwhile a small band of clever, if not brilliant, members of the Liberal party began to attract public notice. The older ranks contained several famous men, such as James Bryce, John Morley, Sir William Harcourt, while to the younger generation belonged H. H. Asquith, Sir Edward Grey, David Lloyd George, Winston Churchill (who had gone over from the opposite camp), John Burns, the labor leader, and a few others. These found ample party ammunition to be expended against the Conservative and Liberal Unionists over the cause and conduct of the South African war, the introduction of Chinese labor into South Africa after that war, over sectarian education bills, veto powers of the Lords, unsatisfactory labor and housing conditions and discontent among the farmers. Most of these questions appealed strongly to the popular mind and gained for the Liberals growing support in the country. From the revival of the vexed tariff reform controversy by Chamberlain, and the prospect that the country's long-cherished "Free Trade" policy would be abandoned, the Conservative party was doomed. It was now their turn to suffer a "split." While perhaps most of them favored a return to the protectionist policy as pursued by Great Britain up to 1846, not a few held fast to free trade principles, notwithstanding the obvious fact that it was merely free imports and not free reciprocal trade at all that the country enjoyed. The opposing factions divided into "dumpers" and "anti-dumpers." During Mr. Balfour's three years' premiership the country was unable to gather exactly how he stood on the question. The Liberals paraded the "high price of food" danger, while the others painted the danger of extinction for home industries by permitting the free "dumping" of foreign goods on British soil. The high tariff wall encircling the United States was frequently held up as the root cause of the high wages and general prosperity which obtained in that country, but the British workman was frightened by the dear food theory and the Liberals won his unqualified support. It is also true that a vast number of hardened, life-long Conservatives turned to the Liberal party for salvation from the threatened innovation. But all these influences were not alone in strengthening the hold of Liberalism upon the electors. The party in power was suffering from "senile decay," as it was generally expressed; it had outlived its

mandate and its usefulness; it was challenged again and again to give the country an opportunity to express its feeling in the matter, by a dissolution of Parliament, without waiting for any nearer approach to the end of the term. This it would not do; but, on December 4, 1905, the premier, Mr. Balfour, surprised the country, and likewise his own cabinet, it was said, by placing his resignation in the hands of the king.

Sir Henry Campbell-Bannerman was invited by the king to form a ministry, and accepted the commission. The organization of his cabinet was completed within the week following Mr. Balfour's resignation, and it took office at once. Parliament was dissolved on January 8, 1906, and a new Parliament was summoned to meet on February 13. Elections began on January 12 and were finished for the most part by the 19th. In their total result, they returned 375 Liberals to the House of Commons, fifty-five Labor representatives, who would act on most questions with the Liberals, and eighty-three Irish Nationalists, whose attitude towards the new ministry would depend upon its attitude on Irish questions, and seemed more likely to be friendly than otherwise. Against this array on the side of Sir Henry and his colleagues, of pledged partisans and conditional allies, the Conservative Unionists had secured an opposition in the House that numbered only 157. The political overturn was one of the most remarkable that the United Kingdom has ever known; the Conservatives plus Liberal-Unionists were literally swamped, almost to extinction.

1905-1906.—Sudden German hostility to the Anglo-French agreement concerning Morocco.—Demand for an international conference.—Algeiras conference. See MOROCCO: 1905-1906; U. S. A.: 1005-1006.

1906 (April-December).—Education Bill, passed by Commons and killed by amendments in House of Lords.—Resolution of Commons, contemplating a change in legislative powers of House of Lords.—When the Education Bill brought forward by the government in April and passed by the Commons in December (see EDUCATION: Modern developments: 20th century: General education: England: Primary and secondary) had been killed by destructive amendments in the House of Lords, the prime minister, Sir Henry Campbell-Bannerman, proposed to the House of Commons a resolution, which was adopted, declaring that "the power of the other house to alter or reject bills passed by this house should be so

restricted by law as to secure that within the limits of a single Parliament the final decision of the House of Commons shall prevail." In plainer words, this proposed an amendment of what has been, since 1832, an unwritten but understood rule of the British constitution, namely, that the House of Lords cannot defeat a measure which has been passed by the Commons in successive parliaments, and thus certified, by an intervening election, as being the embodiment of a popular demand. The proposed amendment was to give the force of law to a repeated enactment of the House of Commons, even "within the limits of a single Parliament," and without the intervention of an election. See below: 1907-1908.

1906 (December).—**Workmen's Compensation Act.**—In 1906, the Liberal Parliament extended the compensation provided for in the Workmen's Compensation Act of 1897 to all industries. "By the Act of 1906 the workman received from his employer a sum not exceeding \$5.00 a week in case he was disabled by accident; in case of mortal injury the family of the workman received a lump sum of from \$750 to \$1500. It is an interesting fact that in the 23 years from 1884 to 1907, twenty other countries adopted similar measures for the compensation of workmen."—C. J. H. 1907-1908.—**Proposals in House of Lords of reform in its constitution.**—Consequent, no doubt, on the increase of popular hostility to the House of Lords which it had provoked by its dealing with the Education Bill of 1906, and the serious threatenings of an undertaking in the House of Commons to "end or mend" it as a branch of Parliament, the Lords, in 1907, gave thought

among themselves to the expediency of a constitutional reformation of their House. In February, a bill was proposed to them by Lord Newton which provided in its first two articles as follows:

"1.—(1) Alter the termination of the present session of Parliament a writ of summons to attend and to sit and vote in the House of Lords shall not be issued to any temporal peer of the peerage of England entitled by descent to an hereditary seat in the House of Lords (in this Act referred to as an hereditary peer), unless he is a representative or a qualified hereditary peer within the meaning of this Act, nor to any lord spiritual, unless he is a representative lord spiritual within the meaning of this Act."

"2. For the purpose of this Act the expression 'qualified hereditary peer' means an hereditary peer who possesses any of the qualifications specified in the First Schedule to this Act."

The schedule referred to was as follows: "QUALIFICATIONS ENTITLING AN HEREDITARY PEER TO A WRIT OF SUMMONS: I. The holding at any time of any of the following Offices:—1. High judicial office, within the meaning of the Appellate Jurisdiction Acts, 1876 and 1887. 2. The office of First Lord of the Treasury, Secretary of State, Chancellor of the Exchequer, President of the Council, or Head (not being a permanent Civil Servant) of any other Government Department. 3. The office of Lord Lieutenant of Ireland, and Secretary to the Lord Lieutenant. 4. Office of Viceroy of India, or a Governor of the Presidency of Madras or Bombay, or of Lieutenant-Governor of any Province of India. 5. Office of Governor-General of the Dominion of Canada or of the Commonwealth of Australia, or of High Commissioner of South Africa, or of Governor of any Colony. 6. The Office of Parliamentary Under Secretary, Parliamentary Secretary, or permanent Under Secretary, in any Government Department. 7. Office of Lord of the Admiralty or member of the Army Council. 8. Office of Minister plenipotentiary, or any higher office, in His Majesty's Diplomatic Service. 9. Office of Vice-Admiral, or any higher office, in His Majesty's Naval Forces, or of Lieutenant-General, or any higher office, in His Majesty's Land Forces.

"II. Election to serve in the House of Commons on not less than two occasions before succeeding to the peerage."

In addition to the hereditary peers thus qualified to sit in the House of Lords as proposed to be reformed, the bill provided for the election by the peers, from their own number, of representatives, to the extent of one-fourth of their whole number; and likewise for the election by the lords spiritual, from their ranks, of representatives in the same proportion of number; such representatives to form part of the House of Lords in Parliament. It authorized, further, the appointment by the king of peers for life, to be "peers of Parliament," these never to exceed one hundred in number.

Debate on the bill in May resulted in the substitution for it of a resolution, that "a Select Committee be appointed to consider the suggestions which have from time to time been made for increasing the efficiency of the House of Lords in matters affecting legislation, and to report as to the desirability of adopting them, either in their original or in some modified form." The report of the committee (twenty-five in number, having Lord Rosebery for its elected chairman) was not brought in until near the close of the following year. Its recommendations were considerably on the lines of the bill described above. It sug-

gested that the reformed House of Lords should be made up of three classes of members, namely, hereditary peers who had held certain high public offices—much the same as those scheduled in Lord Newton's bill; two hundred representative "Peers of Parliament," elected from the whole body of the peerage, not for life, but for a single Parliament, and ten lords spiritual, to include the two archbishops and eight bishops to be elected. The self-governing colonies, in the judgment of the committee, should be represented in the House of Lords, and twenty years of service in the House of Commons should entitle an Irish peer to a seat in it. The plan submitted by the committee would reduce the House from 617 members to about 350. No action was taken on the report.

1907-1908.—*Small Holdings Act*.—First year of its operation.—*Housing proposed*.—In 1907 an act passed Parliament which provided for the acquisition by local authorities of land to be divided into small holdings for sale or lease to buyers or tenants who could not otherwise be placed on it for self-support. The results from the first year's operation of the act was reported in September, 1909, by the board of agriculture and fisheries, which administers the law. The following are statements from the report of the board: "Stated shortly, the result, so far as small holdings are concerned, of the first year's work since the *Small Holdings and Allotments Act, 1907*, came into operation has been that 23,285 applications have been received by county councils for 373,601 acres, that 13,202 applicants have been approved provisionally as suitable, that the estimated quantity of land required for the suitable applicants is 185,098 acres, that 214,417 acres have been acquired by county councils, of which 11,346 acres have been purchased for £370,965, and 10,071 acres leased for total rents amounting to £11,209, that the land acquired will provide for about 1,500 of the applicants, and that 504 of them were in actual possession of their holdings on December 31, 1908.

"It may seem at first sight that the progress that has been made in satisfying the keen demand for small holdings which the Act has disclosed has been small, but the figures do not give at all an adequate idea of the amount of work that has been actually done. It must be remembered that practically the whole of the first six months of the year were occupied in the preliminary work of constituting committees, issuing forms, receiving and tabulating applications and holding local inquiries, and that until this work was completed little progress could be made in the acquisition of land. . . . The rate at which land is being acquired is now increasing rapidly, and we have little doubt that by Michaelmas, 1909, not less than 50,000 acres will have been obtained. In addition to the holdings which have been provided by county councils, the returns we have obtained show that over 700 applicants have been supplied with holdings by landowners direct, mainly through the intervention of the councils.

"In considering the results already accomplished it must also be borne in mind that the problem is to fit particular men to particular land, and not merely to acquire whatever land may be in the market and to offer it in small holdings. The great majority of the applicants desire land in close proximity to their homes, and it is obviously more difficult to acquire a large number of detached plots than to take a whole farm or estate and divide it into a number of small holdings. . . .

"A striking feature of the applications made

under the Act has been the small extent to which the applicants desire to purchase their holdings. Out of the 23,295 applications received during the year, only 629, or 2.7 per cent., expressed a desire to purchase. . . . The Act imposes no direct obligation on councils to provide houses, but we are of opinion that where an applicant desires a holding to which he will devote his whole time and from which he will get his whole living councils should be prepared to erect a house and the necessary buildings."

1908.—*Estimate of King Edward VII as a diplomatist*.—Mr. Isaac N. Ford, the American newspaper correspondent in London, had much well-informed opinion in Europe and America to support him in the following estimate of the diplomatic influence exerted by King Edward, which he expressed in January, 1908: "At the opening of King Edward's reign Berlin was the center of European diplomacy, as Paris had been when Bismarck entered upon his series of machinations and triumphs. The personal ascendancy of the German Emperor was unchallenged in Europe. . . . In the course of seven years conditions have been transformed. London is now the diplomatic capital of Europe. Resentful enemies like France have been reconciled; friendships with America, Austria-Hungary, Italy, and Spain have been strengthened; strained relations with Russia and Germany have been eased; and by the alliance with Japan forces have been readjusted for the maintenance of existing order in the Pacific. A new balance of power has been established in Europe, and the diplomatic resources of the British Empire have been reinvigorated and enlarged. While there have been eminent statesmen in the British Foreign Office—Lord Lansdowne and Sir Edward Grey—these transformations have been mainly King Edward's work. Fifty years hence there may be a true sense of proportion, so that his services as an empire-builder and a peacemaker can be judged aright."

1909 (March).—Representation of the People Bill.—Proposed universal suffrage, including women.—Its second reading.—On the 20th of March, 1909, the second reading of a bill described as "the Representation of the People Bill" was moved and seconded in the House of Commons. Its provisions were substantially for universal suffrage, including women. In explaining the measure, the member who moved the second reading—a representative of the Labor party, Mr. Howard—said: "It was difficult, if not almost impossible, to deal with a reform of the franchise without at the same time dealing with woman suffrage, and it was difficult to deal with woman enfranchisement without at the same time making some alteration in the existing franchise law which should meet the condition of the new elements proposed to be placed on the register. The House must face the situation as a whole and handle the two reforms in one scheme, because by a coördinated Bill there would be a better chance of getting nearer a settlement. In the Bill that he submitted to the House there was no abolition of any old franchise. It proposed to create a residential franchise in order to do away with the hardships which any one with a knowledge of registration knew to exist in connexion with the occupation vote of men. The second clause provided for a restriction of plural voting, and the third clause related to the removal of the sex disqualification." Before debate began another member presented a monster petition against the political enfranchisement of women, said to contain 243,000 signatures. The attitude of the Government toward the bill was explained by Premier Asquith. It was well known, he said, that on the issue whether women should be granted the suffrage ministers were not of one mind. But they were strongly in favour of a wide reform of the existing suffrage. They desired the abolition of plural voting, the disappearance of the artificial distinctions between occupiers and lodgers, the material shortening of the period of qualification, and an effective simplification of the machinery of registration. But any measure to bring about these reforms ought,

in his opinion, if it was to take its place on the Statute-book, to proceed from the responsible Government of the day, and to be carefully remoulded in the light of prolonged parliamentary discussion. For these reasons he thought it was not necessary that the members of the government should vote for the second reading of the bill under consideration. After some hours of debate the closure was moved and the second reading of the bill was carried by 157 votes against 122.

1909 (April).—National debt of the United Kingdom.—The following official statement of the national debt of the United Kingdom was published in April, 1909: "On the 1st April, 1908, the aggregate gross liabilities of the State amounted to £762,326,051. On the 1st April, 1909, the corresponding figure was £754,121,309, showing a reduction of £8,204,742."

1909 (April-December).—Lloyd George's "War against Poverty" Budget.—Denounced as Socialistic.—Adopted by Commons and rejected by Lords.—As a formulated "Finance Bill," the budget was not submitted to the House of Commons and to the public in print until May 28. It was then entitled "A Bill to grant certain Duties of Customs and Inland Revenue (including Excise), to alter other Duties, and to amend the Law relating to Customs and Inland Revenue (including Excise), and the National Debt, and to make other provisions for the Financial Arrangements of the Year." Until then its provisions were known only from the statement of them made four weeks before by the chancellor of the exchequer, David Lloyd George, in a speech extended through several hours, which even his opponents characterized as "a wonderful effort." The chancellor's explanation of the budget rested primarily on the fact that an anticipated deficit of £15,762,000 required to be filled from new sources of revenue. Of the main causes of the deficit he said: "What is the increase of expenditure due to? It is very well known that it must be placed to the credit of two items, and practically two items alone. One is the navy, and the other is old-age pensions."

Proceeding next to survey the "inevitable expansion" of future expenditure to which he had referred at the outset, and which could be foreseen in connection with the navy and with social reform, the chancellor dealt at length on the demands that were pressing from the latter side and would not be postponed. He then began to unfold his plans for raising the means with which to deal with all these augmented demands on the government, and started them with a schedule of increased taxes on automobiles. Turning to an increase of the income-tax and of the estate duty, he proposed that for earned incomes under £2,000 the tax should remain at 9d. but that between £2,000 and £3,000 it should be 1s., and that all other incomes now liable to the shilling tax should pay 1s. 2d. Holding that the family man was entitled to more relief than the bachelor, he proposed that on all incomes under £500, in addition to existing abatements, a special abatement should be allowed of £10 for every child under 16 years of age. He hoped to get £160,000 by the partial restoration of the shilling duty and £3,000,000 from the additional 2d. on the higher incomes. There would also be a super-tax on incomes exceeding £5,000, to be levied on the amount by which such incomes exceeded £3,000. The tax would be at the rate of 6d. in the pound. Exclamations of disapproval arose from the Unionist benches when this was announced. The

yield from this super-tax, Lloyd George explained, would be in a full year £2,300,000; but for the current year not more than £500,000. He next came to the death duties. There would be no change in the case of estates up to £5,000, but between this limit and the limit of two millions graduation would be steepened. The duty on estates between £5,000 and £10,000 would be 4 per cent.; between £10,000 and £20,000, 5 per cent.; £20,000 to £40,000, 6 per cent.; £40,000 to £70,000, 7 per cent.; £70,000 to £100,000, 8 per cent.; £100,000 to £150,000, 9 per cent.; £150,000 to £200,000, 10 per cent.; £200,000 to £400,000, 11 per cent.; £400,000 to £600,000, 12 per cent.; £600,000 to £800,000, 13 per cent.; £800,000 to £1,000,000, 14 per cent., and above £1,000,000, 15 per cent. This new scale was estimated to yield £2,550,000 that year, £4,200,000 next year, and afterwards £4,400,000. The settled Estate duty he raised from 1 per cent. to 2 per cent. From this source he hoped to get £500,000 that year and £375,000 in 1910-1911. The Legacy and Succession duty was to be raised in some cases from 3 per cent. to 5 per cent., and in all others to 10 per cent. The yield from this in the next year would be £1,300,000, and would increase in the course of time to £2,150,000. Property alienated *inter vivos* within five years from death was to be liable to duty. Objects of national and scientific interest would only be chargeable for duty when they were actually sold. There were to be increased duties in bonds to bearer and in stock and share transfers. The estimated yield from the increased Stamp Duties would be for that year £650,000. Then he turned to land, drawing a marked distinction between the agricultural landowner and the urban landowner, of whom he spoke with some scorn. He proposed to levy a tax on the value accruing to land in the future through the enterprise of the community, taking the land apart from buildings and other improvements. This duty of 20 per cent. on unearned increment would be payable on two occasions—when land was sold and when land passed at death. A preliminary valuation of the land at the price which it might be expected to fetch at the present time would be necessary; and as the tax was to be imposed only on the unearned increment subsequently accruing on that valuation, the yield would probably be only £50,000 in 1909, but in future years it should prove a fruitful source of revenue. It was further proposed to levy an annual duty of one halfpenny in the pound on the capital value of undeveloped land and undeveloped minerals. Until the proposed valuation of the land of the United Kingdom on a capital basis was completed, it would be impossible to estimate the yield of this duty, but till then the duty would be calculated on the declarations of the owners, and in the current year he expected it to bring in £350,000. A 10 per cent. reversion duty was to be imposed on any benefit accruing to a lessor on the termination of a lease, and from this source a yield of £100,000 was anticipated. The three land taxes were, accordingly, calculated to produce £500,000 in the current year.

With regard to indirect taxation, he proposed to raise the present duty on spirits by 3s. od. per gallon. The yield, during the current year, he estimated at £1,600,000. He also proposed to increase the duty on unmanufactured tobacco from 3s. to 3s. 8d. per lb., with equivalent additions to the rates for cigars, cigarettes, and manufactured tobacco. The total estimated revenue was £162,590,000 and the total estimated expenditure

£162,102,000, leaving a margin of £488,000 for contingencies. In conclusion, anticipating the charge that he was imposing very heavy taxation for a time of peace, he declared it was a war budget. The government had declared implacable war against poverty. That Lloyd George's budget was a gage of battle and that the fight over it would be fierce was known to everybody, for the din of the conflict penetrated to every corner of every land. The key-note of the outcry against it was sounded in *The Times* of next morning, which opened its editorial comment with these words: "One general impression will be very widely made by the complicated and portentous Budget which Mr. Lloyd George expounded at enormous length yesterday. That is that the huge deficit of nearly sixteen millions is to be raised almost exclusively at the cost of the wealthy and the fairly well-to-do. They are struck at in all sorts of ways, through the income-tax, the legacy duties, the estate duties, the stamps upon their investments, their land, their royalties, their brewery dividends, and their motor-cars." So it was branded by its opponents as a "Socialist Budget" and its authors as allies of Socialism, throughout the campaign. This denunciation was applied especially to the tax on unearned increments of value in land, as such increments should occur hereafter. It was not until November 4, that the Finance Bill was brought to its third reading in the House of Commons, and was passed, by the heavy majority of 370 to 149. From the beginning it was known, of course, that the measure had few friends in the House of Lords, and would go down in defeat there if the peers ventured to assume the right to negative a money bill. For many generations they had not disputed the claim of the Commons to exclusive control of revenue legislation; but a theory had now been mooted, that Mr. Lloyd George's Budget Bill differed from a mere money bill by carrying Socialistic implications tacked on to it, which the House of Lords was under no obligation to accept. Whether the Lords would or would not be bold enough to act on this theory and throw down the bill, as they had thrown down so much of the non-financial legislation of the Liberal government, had been a serious question throughout the debates. Very soon after the bill had been passed over to the House of Lords it was known that the Conservative leaders had consented to its death in that body. What may be called the death sentence was pronounced on November 22, when Lord Lansdowne moved the following amendment to a motion for the second reading of the bill: "That this House is not justified in giving its consent to this bill until it has been submitted to the judgment of the country."

The archbishop of Canterbury and the spiritual lords generally refrained from taking sides on what they regarded as a political question; but the archbishop of York construed his duty differently, and added his voice to the remonstrance against Lord Lansdowne's motion. Close upon midnight, November 30, the House divided on that motion and it was carried, rejecting the Finance Bill, by a vote of 350 to 75. So big a vote—such a swarming of titled legislators to record it—had not been known within the memory of living men. Three days later, on December 3 the premier, Mr. Asquith, rose in the House of Commons and moved the adoption of the following declaration: "That the action of the House of Lords in refusing to pass into law the financial provision made by this House for the service of the year is a breach of the Constitution and a

usurpation of the rights of the Commons." After a short debate, the house divided on the motion, and it was adopted by 349 against 134. "The very principle of representative government was at stake. For if the Lords possessed the right they had assumed the situation was exactly this: that when the voters elected a majority of Conservatives to the Commons then the Conservatives would control the legislation; that, when they elected a majority of Liberals, the Conservatives would still control by being able to block all legislation they disliked by the veto of the House of Lords, always and permanently a body adhering to the Conservative party. An hereditary body, not subject to the people, could veto the people's wishes as expressed by the body that was representative, the House of Commons. In other words the aristocratic element in the state was really more powerful than the democratic, the house representing a class was more powerful than the house representing the people. The question of the budget and the question of the proper position and the future of the Upper Chamber were thus linked together. As these questions were of exceptional gravity the ministry resolved to seek the opinion of the voters."—C. D. Hazen, *Modern Europe*, p. 555.

1909 (May).—Majority vote in Commons for removing disabilities from Roman Catholics.—A bill for the removal of remaining disabilities from Roman Catholics passed its second reading in the House of Commons on May 14, by a vote of 133 to 123. Not being a government measure, the crowded program of business for the session gave no hope that it could be carried into law; but the vote was an encouragement.

1909 (June).—Imperial press conference. See BRITISH EMPIRE; Colonial and imperial conferences: 1909 (June).

1909 (July-August).—Imperial defence conference.—Conclusions and agreements. See WAR, PREPARATION FOR: 1909.

1909 (July-December).—Osborne judgment: Decision against the right of trade unions to pay salaries to members of Parliament.—On July 23, 1909, an appeal from an order of the court of appeal was argued before five legal members of the House of Lords, on the question whether the payment of members of Parliament chosen to represent the interests of a trade union was a lawful application of the funds of such union. The complainant in the case, a station porter named Osborne, had sued the Amalgamated Society of Railway Servants, of which he had been a member since 1892, to have it declared that one of the rules of the society, (which provides, amongst other things, for parliamentary representation and the enforced levy of contributions from the plaintiff and other members of the society, towards the payment of salaries, or maintenance allowance, to members of Parliament pledged to observe and fulfil the conditions imposed by the constitution of the Labor party therein referred to), is *ultra vires* and void, and that the society may be restrained from enforcing it. And in the alternative that it may be declared that a certain amendment or addition made to the rules in 1906 be declared to be illegal and void. The added rule, thus complained of, was as follows: "All candidates shall sign and accept the conditions of the Labour Party and be subject to their Whip."

The judgment of the Lords, rendered on December 21, sustained the order from the court below, dismissing the appeal. Their decision rested mainly on considerations relating to the rule quoted above, and stated briefly by one of their bench,

Lord James, as follows: "The effect of this rule and others that exist is that a member of the trade union is compelled to contribute to the support of a member of Parliament, who is compelled to answer the Whip of the Labour Party." I construe this condition as meaning that the member undertakes to forego his own judgment, and to vote in Parliament in accordance with the opinions of some person or persons acting on behalf of the Labour Party. And such vote would have to be given in respect of all matters, including those of a most general character—such as confidence in a Ministry or the policy of a Budget—matters unconnected directly at least with the interests of labour. Therefore I am of opinion that the application of money to the maintenance of a member whose action is so regulated is not within the powers of a trade union. If your Lordships decide on this branch of the case that the respondent is entitled to judgment, it is unnecessary that any opinion should be expressed upon the very broad constitutional question raised for the first time in the Court of Appeal affecting the general support of members."—See also below: 1911 (August): Payment of members of Parliament.

1910.—Two parliamentary elections in one year.—Death of Edward VII.—Accession of George V (May 6).—The Lords' veto.—Parliament was dissolved by royal proclamation early in January, and new elections commanded, the first of which took place on January 15, and the last on February 14. The result was generally disappointing, because wholly indecisive. The new House of Commons was found to be made up of 275 Liberals, 273 Unionists, seventy-one Nationalists (Irish), eleven Independent Nationalists, and forty Labor members. Neither of the political parties arrayed on the main issues involved had won a majority. The people had rendered no recognizable verdict on the budget, or on the tariff question, or on the abolition of the veto power claimed by the House of Lords.

Even with the support of the Labor members the Asquith ministry was in a minority. The balance was held by the Irish members; and it was only by compromise with them that either Liberals or Unionists could do anything.

"In the new Parliament the budget which had been thrown out the previous year was introduced again, without serious change. Again it passed the House of Commons and went to the Lords. That House yielded this time and passed the budget with all its so-called revolutionary and socialistic provisions. The Liberals now turned their attention to this question of the 'Lords' Veto,' or of the position proper for an hereditary, aristocratic chamber in a nation that pretended to be democratic, as did England.—the issue stated nearly twenty years before by Gladstone in his last speech in Parliament had now arrived at the crucial stage. What should be the relations between a deliberative assembly elected by the votes of more than six million voters and an hereditary body? The question was vehemently discussed inside Parlia-

ment and outside. Various suggestions for reform of the House of Lords were made by the members of that House itself, justly apprehensive for their future. The death of the popular King Edward VII (May 6, 1910), and the accession of George V, occurring in the midst of this passionate campaign, somewhat sobered the combatants, though only temporarily. Attempts were made to see if some compromise regarding the future of the House of Lords might not be worked out by the two parties. But the attempts were futile, the issue being too deep and too far-reaching. . . . The concrete form in which the deadlock presented itself was the radical bill of the Parliament Act, which had been introduced in April, by the government, passed by the House of Commons and rejected by the House of Lords. The ministry, wishing the opinion of the people on this new question, dissolved the House of Commons again and ordered new elections, the second within a single year (December, 1910). The result was that the parties came back each with practically the same number of members as before. The Government's majority was undiminished."—C. D. Hazen, *Modern Europe*, p. 556.

1911 (May).—Returns of the decennial census.—The total population of the United Kingdom was 45,216,665. The population of England and Wales was 36,075,260, showing an increase of 10.91 per cent., the lowest rate on record.

1911 (July).—Revision of Anglo-Japanese alliance. See ANGLO-JAPANESE ALLIANCE.

1911 (August).—Payment of members of Parliament.—"The members of the House of Commons were originally paid by the counties or boroughs that they represented; but during the Stuart period so many capable men seemed willing to serve in Parliament without remuneration that the practice of paying members died out. During the past half-century, however, many of the less wealthy representatives have been paid out of the campaign funds of the parties to which they belonged. The Irish members were supported largely by the contributions of Irish-Americans. The Laborites were paid by the contributions of the unions. Finally one Osborne, a railway employee in London, brought suit against a labor union [Amalgamated Society of Railway Servants] to prevent it from using its funds for political purposes. The case was taken to the House of Lords, and the law lords sustained Osborne's contention

(1909). This was a severe blow to the labor party, as its representatives could not afford to serve in Parliament without financial aid in some form. To break the force of the Osborne judgment, Parliament passed a bill for the payment of members [of the House of Commons only], the salary being fixed at £400 per year [beginning April 1]."—L. M. Larson, *Short history of England and the British empire*, p. 629.—But members, receiving salaries as officers of the House, or of the king's household, and as members of the ministry are excluded from this compensation.

CORONATION CHAIR OF ENGLAND'S KINGS

Beneath the seat is the famous Stone of Destiny, said to have been used as a pillow by the patriarch, Jacob, and taken to Tara in Ireland by early tribes. Upon this the Irish kings were inaugurated, until it was removed to Scotland and used for the coronation of the Scottish kings. It was taken to Westminster Abbey for the coronation of James VI as James I of England, and since used for all English kings.

1911 (August 18).—Passage of the Parliament Act.—Government dependence upon Irish and labor votes.—"The Asquith ministry now passed through the House of Commons a Parliament Bill restricting the power of the House of Lords in several important particulars and providing that the House of Commons should in last resort have its way in any controversy with the other chamber. This bill passed the House of Commons by a large majority. How could it be got through the House of Lords? Would the Lords be likely to vote in favor of the recognition of their inferiority to the other House, would they consent to the withdrawal from them of powers they had hitherto exercised, would they acquiesce in this

altered and reduced situation at the hands of a chamber whose measures they had been freely blocking for several years? Of course they would not if they could help it. But there is a way in which the opposition of the House of Lords can be overcome, no matter however overwhelming. The King can create new peers—as many as he likes—enough to overcome the majority against the measure in question. This supreme weapon the King, which of course in fact meant the Asquith ministry, was now prepared to use. Asquith announced that he had the consent of George V to create enough peers to secure the passage of the bill in case it was necessary. The threat was sufficient. The Lords on August 18, 1911, passed the Parliament Act which so profoundly altered their own status, power, and prestige. This measure established new processes of law-making. If the Lords withhold their assent from a money bill,

Commons are henceforth chosen for five, not seven years. . . . Thus the veto power of the House of Lords is gone entirely for all financial legislation, and for all other legislation its veto is merely suspensive. The Commons can have their way in the end. They may be delayed two years."—C. D. Hazen, *Modern European history*, pp. 481-482.—See also PARLIAMENT, ENGLISH: 1911.

KING GEORGE V AND QUEEN MARY

that is, any bill raising taxes or making appropriations, for more than one month after it has passed the House of Commons, the bill may be presented for the King's signature and on receiving it becomes law without the consent of the Lords. If a bill other than a money bill is passed by the Commons in three successive sessions, whether of the same Parliament or not, and is rejected by the Lords, it may on a third rejection by them be presented for the King's assent and on receiving that assent will become a law, notwithstanding the fact that the House of Lords has not consented to the bill—provided that two years have elapsed between the second reading of the bill in the first of those sessions and the date on which it passes the Commons for the third time [in the third session]. This Parliament or Veto Bill contained another important provision, substituting five years for seven as the maximum duration of a Parliament; that is, members of the

1912.—Foreign policy from commencement of reign of Edward VII.—Anglo-German and Anglo-French relations.—Lord Salisbury held the double office of premier and foreign minister from 1895 until 1900, when he handed the latter portfolio to Lord Lansdowne, who was succeeded, after the resignation of the Balfour administration in December, 1905, by Sir Edward Grey. It was under Lansdowne and Grey that Great Britain abandoned her policy of "splendid isolation" by concluding the Anglo-Japanese Alliance of 1902 (see JAPAN: 1895-1902), the Anglo-French Agreement of 1904 (see ENTENTE CORDIALE), and the Anglo-Russian Agreement of 1907 (see ANGLO-RUSSIAN AGREEMENT). England had learned that her vital nerves lay in the seapaths to the overseas dominions, particularly to her West Indian dependency, but also to the self-governing dominions—Canada and the Australian Commonwealth, New Zealand and (soon) the Union of

South Africa, from which her subsistence was largely drawn. To consolidate and safeguard these paths was the core of her policy, and her relations with the powers were affected less by the internal European questions than by the general scramble of France, Italy, Germany and Russia for colonies and for expansion in Asia, Africa and the islands of the Pacific Ocean, with the possibility of any of these powers being able to cut communications between England and the far-scattered component parts of the British empire. Giving the German point of view of this policy, Prince von Bülow, who was German chancellor from 1897 to 1909, said: "Up to quite recent times England's greatest and most important acquisitions in the wider world

their alliance with France and the complications in the East, Russia has often supported the Anglo-French *entente*, so that we are justified in speaking of a Triple *entente* as a counterpart to the Triple Alliance. . . . English leadership has sometimes made our life difficult, but just as often it has had a soothing and sobering effect on France, and has done excellent work for the preservation of peace in Europe."—*Ibid.*, p. 108.—See also TRIPLE ALLIANCE; WORLD WAR: Causes: Indirect: c.—"British policy has followed invariably a single principle, the security of her colonial and maritime empire, and in the first years of the new century British diplomats remained true to this principle. So long as Germany remained a land power they could

were made at the expense of France; this was the case in the Sudan, and earlier in Further India. But for France overseas politics are not vital, and therefore she was at liberty to subordinate her international interests to England's, thereby circumscribing Franco-British differences for the sake of an Anglo-French agreement. France paid this high price for England's friendship after she had been disappointed in her hopes of the Dual Alliance [France and Russia]. . . . At times Russian statesmen have even given France to understand that Russia was not willing to serve the cause of the French policy of revenge. . . . [The French] found compensation in the Anglo-French *entente* which at times seems a greater menace to us [Germany] than the Dual Alliance."—Prince von Bülow, *Imperial Germany*, pp. 83, 84.—"Owing to

afford to be indifferent to German diplomatic hegemony on the Continent. But with Germany menacing their maritime empire, it was imperative that the continental balance of power should be restored. The obvious method of restoration was an understanding with France. Splendid isolation was no longer even dignified, and it threatened to become perilous in the extreme.

"To Edward VII must go much of the credit for the successful termination of England's ancient quarrel with France. The efforts of the diplomats were greatly facilitated, it is true, by the eagerness of the commercial interests as well as by the new friendship of France and Italy; but it was the King who paved the way for serious negotiations by his visit to Paris. . . . Negotiations lasted eight months, and on April 8, 1904, the agreement was

signed."—C. Seymour, *Diplomatic background of the World War*, pp. 155-156.—"The differences which had divided the two countries, some of them serious, were swept away. The old dispute about the Newfoundland fisheries was settled by the French rights being bought out; spheres of influence were mapped out in Siam; agreements were come to as regards boundaries in Guinea and on the Gambia, and as regards tariffs in Madagascar. But the really important decision in the treaty of 1904, the kernel of the whole understanding, was that France recognized our position in Egypt and we recognized hers in Morocco. Each country was to have a free hand, as far as the other was concerned, in a portion of Northern Africa—ours to the east, France's in the west. Morocco has been a fateful word in the history of the events leading up to the Great War; and its significance was to be shown almost immediately. Germany had certain commercial interests in Morocco; but her real object on the north-west coast of Africa was a coaling-station. She was extremely badly off for such stations, and her possessions in South-west Africa suffered in consequence. She cast a covetous eye at the Moroccan ports of Agadir and Mogador. But the importance of the Morocco question has been, most of all, due to the fact that Germany used it as a touchstone whereby to test the strength of the forces opposed to her aggrandizement."—A. S. Turberville and F. A. Howe, *Great Britain in the latest age*, p. 60.—See also MOROCCO: 1907-1909; GERMANY: 1905-1906; 1911: Morocco crisis; WORLD WAR: Diplomatic background: 71, i.—"If we look at the history of Anglo-German relations before the war the inference is irresistible that it was not the object of developing in a peaceful atmosphere German commerce and industry that England objected to. Such a development might have been formidable for . . . [Great Britain]. It would have compelled great efforts on our part to improve the education of our people and our organization for peaceful enterprises. But it would have been legitimate. The objection of . . . [Great Britain] was directed against quite other things that were being done by Germany in order to attain her purpose. The essence of these was the attempt to get her way by creating armaments which should in effect place her neighbors at her mercy. We who live on islands, and are dependent for our food and our raw materials on our being able to protect their transport and with it ourselves from invasion, could not permit the sea-protection which had been recognized from generation to generation as a necessity for our preservation to be threatened by the creation of naval forces intended to make it precarious. As the navies of Europe were growing, not only those of France and Russia, but the navy of Italy also, we had to look, in the interests of our security, to friendly relations with these countries. We aimed at establishing such friendly relations, and our method was to get rid of all causes of friction, in Newfoundland, in Egypt, in the East, and in the Mediterranean. That was the policy which was implied in our Ententes. We were not willing to enter into military alliances and we did not do so. Our policy was purely a business policy, and everything else was consequential on this, including the growing sense of common interests and of the desire for the maintenance of peace. . . . It was only in order to preserve the general peace that we had entered the Entente, and the method of the Entente policy, the getting rid of all specific causes of difference, was one which had nothing objectionable in it. We urged Germany also to enter upon this path with us. We offered to

help her in her progress toward the attainment of a 'place in the sun.'"—R. B. Haldane, *Before the war*, pp. 105-106, 162.—The state of tension between England and Germany, to relieve which the diplomacy of Sir Edward Grey was addressed, had been kept up by the Moroccan crises of 1906 and 1911, particularly the latter when England manifested a friendship in behalf of France, which confirmed the French in the belief that British diplomatic support would strengthen into armed support in case of unprovoked German aggression; but gradually Anglo-German relations became more conciliatory. While the Triple Entente was strengthened as against the Triple Alliance, Italy, a member of the latter, increased her importance in 1912 by taking over the sovereignty of Tripoli and Cyrenaica from Turkey. The latter country then becoming involved in the First Balkan War with Bulgaria, Serbia, Montenegro and Greece, Sir Edward Grey brought about an improved situation among the Great Powers by their agreement to "localize hostilities" and by his proposal that they hold informal and non-committal consultations on the points on which Europe must agree in the final settlement of Balkan peace. London was the place of meeting both of the peace delegates from the Balkan states and of the ambassadors of the Powers. Thus, Sir Edward Grey, who had stated on November 27, 1911, in the House of Commons debate on foreign policy that "the wise policy for this country [England] is to expand as little as possible," was striving also to avert a general conflagration, which would inevitably result if the squabbles of small Balkan peoples were communicated to Austria and Russia, mutually antagonistic members of the respective Triple Alliance and Triple Entente. Almost simultaneously with the Second Balkan War, which broke out before the ink was dry on the Treaty of London, Winston Churchill, British first lord of admiralty, proposed a "naval holiday" which the German Admiral Tirpitz refused (see NAVAL HOLIDAY); yet England reduced her "two-power standard" at sea, and notwithstanding her *entente cordiale* with France, contented herself with rather inadequate land forces. Lord Haldane was then war secretary. The terms of the English obligations to France were reduced to writing by Sir Edward Grey, in a letter addressed by him to M. Paul Cambon, under date of November 22, 1912. Almost two years later, he (Sir Edward) revealed them to Parliament, on the eve of the World War, August 3, 1914. 1912-1913.—Lord Haldane's visit to Berlin.—German bid for British neutrality.—British and German naval increases.—"In February, at the request of the German emperor, Lord Haldane, then lord high chancellor of Great Britain, journeyed to Berlin to discuss Anglo-German relations with the German government. . . . If any one British statesman could have effected an Anglo-German understanding, that person was Lord Haldane. Educated in Germany and unusually appreciative of German culture, he was *persona grata* to the court of Berlin, without being any the less a staunch British patriot. The navy law of 1912 was under consideration when he arrived

in Berlin on February 9, 1912. In the course of his visit he saw the emperor and the leading German statesmen."—B. E. Schmitt, *England and Germany, 1740-1914*, pp. 346-347.—"My first interview was one with Herr von Bethmann-Hollweg, the Imperial Chancellor. . . . I told him of certain dangers quite frankly, and he listened and replied with what seemed to be a full understanding of our position. I said that the increasing action of Germany in piling up magnificent armaments was, of course, within the unfettered rights of the German people. But the policy had an inevitable consequence in the drawing together of other nations in the interests of their own security. This was what was happening. I told him frankly that we had made naval and military preparations, but only such as defense required, and as would be considered in Germany matter of routine. I went on to observe that our faces were set against aggression by any nation, and I told him, what seemed to relieve his mind, that we had no secret military treaties. But, I added, if France were attacked and an attempt made to occupy her territory, our neutrality must not be reckoned on by Germany. For one thing, it was obvious that our position as an island protected by the sea would be affected seriously if Germany had possession of the Channel ports on the northern shores of France. Again, we were under treaty obligation to come to the aid of Belgium in case of invasion, just as we were bound to defend Portugal and Japan in certain eventualities. In the third place, owing to our dependence on freedom of sea-communications for food and raw materials, we could not sit still if Germany elected to develop her fleet to such an extent as to imperil our naval protection. She might build more ships, but we should in that case lay down two keels for each one she laid down. . . . He [the chancellor, at the final interview on February 10] suggested that we might agree on the following formula:

"1. The High Contracting Powers assure each other mutually of their desire for peace and friendship.

"2. They will not, either of them, make any combination, or join in any combination, which is directed against the other. They expressly declare that they are not bound by any such combination.

"3. If either of the High Contracting Parties become entangled in a war with one or more other powers, the other of the High Contracting Parties will at least observe toward the power so entangled a benevolent neutrality, and use its utmost endeavor for the localization of the conflict. . . .

"4. The duty of neutrality which arises from the preceding article has no application in so far as it may not be reconcilable with existing agreements which the High Contracting Parties have already made.

"5. The making of new agreements which make it impossible for either of the Contracting Parties to observe neutrality toward the other beyond what is provided by the preceding limitations is excluded in conformity with the provisions contained in Article 2. . . .

"Anxious as I was to agree with the Chancellor, who seemed as keen as I was to meet me with expressions which I might take back to England for friendly consideration, I was unable to hold out to him the least prospect that we could accept the draft formula which he had just proposed. . . . He and I then sat down and redrafted what

he had prepared, on this basis, but without his committing himself to the view that it would be sufficient."—R. B. Haldane, *Before the war*, pp. 72-74, 79-80.—See also GERMANY: 1898-1914.—On the return of Lord Haldane to England, the attitude of the German chancellor lost something of its sincere desire for friendly relations. The copy of the fleet law presented to the English office showed unexpectedly large increases in the German navy. Hence restriction of both navies was out of the question, and England began quietly to strengthen and concentrate her navy under the guidance of Winston Churchill and Reginald McKenna.—See also WAR, PREPARATION FOR: 1912-1913; WORLD WAR: Diplomatic background: 71, x. ALSO IN: G. P. Gooch and J. H. B. Masterman, *Century of British foreign policy*, pp. 99, 100.

1912-1914.—Government of Ireland Bill (third home rule measure).—Its passage and suspension.—Welsh Disestablishment Bill passed and suspended.—"It was possible finally to pass a Home Rule Bill, to the principle of which the Liberal party had been committed for a quarter of a century. On April 11, 1912, Asquith introduced the third Home Rule Bill, granting Ireland a Parliament of her own, consisting of a Senate of forty members and a House of Commons of 164. If the two houses should disagree, then they were to sit and vote together. On certain subjects the Irish Parliament should not have the right to legislate, on peace or war, naval or military affairs, treaties, currency, foreign commerce. It could not establish or endow any religion or impose any religious disabilities. The Irish were to be represented in the Parliament in London by forty-two members instead of the previous number, 103. This measure was passionately opposed by the Conservative party and particularly by the Ulster party, Ulster being that province of Ireland in which the Protestants are strong. They went so far in their opposition as to threaten civil war in case Ulster were not exempted from the operation of this law. During the next two years the battle raged about this point, in conferences between political leaders, in discussions in parliament and the press. Attempts at compromise failed as the Home rule party would not consent to the exemption of a quarter of Ireland from the jurisdiction of the proposed Irish parliament. The bill was, however, passed and was immediately vetoed by the House of Lords. At the next session it was passed again and again vetoed by the Lords. Finally on May 25, 1914, it was passed a third time by the House of Commons by a vote of 351 to 274, a majority of 77. The bill was later rejected by the Lords. It might now become a law without their consent, in conformity with the Parliament Act of 1911. Only the formal assent of the King was necessary. But the ministry was so impressed with the vehemence and the determination of the 'Ulster party,' which went so far as to organize an army and establish a sort of provisional government, that it decided to continue discussions in order to see whether some compromise might not be arranged. These discussions were interrupted by the outbreak of the European war.

"Meanwhile, a bill disestablishing the Anglican Church in Wales had gone through the same process; had thrice been passed by the Commons and rejected by the Lords. Like the Home Rule Bill, it only awaited the signature of the sovereign. Finally that signature was given to both bills on September 18, 1914, but Parliament passed on that same day a bill suspending these laws from operation until the close of the war. England

now had far more serious things to consider and she wisely swept the deck clean of contentious domestic matters until a more convenient season."

1914.—Attitude of nation during the "twelve days" (July 24-Aug. 4).—"From July 24, when Russia first asked for British support, to the 2nd August, when a conditional promise of naval assistance was given to France, Sir E. Grey had consistently declined to give any promise of support to either of our present allies. He maintained that the position of Great Britain was that of a disinterested party whose influence for peace at Berlin and Vienna would be enhanced by the knowledge that we were not committed absolutely to either side in the existing dispute. He refused to believe that the best road to European peace lay through a show of force. We took no mobilization measures except to keep our fleet assembled and we confined ourselves to indicating clearly to Austria on the 27th July, and to Germany on the 29th July, that we could not engage to remain neutral if a European conflagration took place. We gave no pledge to our present allies, but to Germany we gave three times—on the 30th July, the 31st July, and the 1st August—a clear warning of the effect which would be produced on our attitude and on the sentiment of the British people by a violation of the neutrality of Belgium."—*Times documentary history of the war*, v. 1, *Introd. British Blue Book*.—"As late as August 1st very few people in Great Britain believed that the country would be drawn into the war. They regarded the conflict as a Balkan question in which they had no concern. One may almost say that the nation as a whole was very strongly opposed to the notion of intervening in any European war. . . . It may safely be affirmed that as

late as August 1st the British public was opposed to war, and the British government saw no reason for promising to intervene in any other than a diplomatic sense. But the current of events glided suddenly into a cataract sweeping along the government and nation alike with bewildering velocity. Saturday and Sunday, August 1st and 2nd, have been called the 'fateful days of the century.' They will pass into British history as a memorable week-end. They were days of intense suspense and mental conflict. On Saturday came the news of Germany's ultimatum to Russia, and of her message to France which, if not strictly an ultimatum, was an almost certain indication that war between Germany and France was inevitable. Contradictory impulses surged to and fro in the popular imagination. Antagonistic views with regard to public policy were sustained with passionate conviction. A monster peace meeting was held in Trafalgar Square on Sunday. . . . Cabinet meetings were held throughout the greater part of the day, and dissension threatened to disrupt the ministry, so that a coalition cabinet would have to be created in its place."—G. H. Allen, and others, *Great War*, v. 2, pp. 146, 155, 156.—See also WORLD WAR: Diplomatic background: 71, xxii.

1914 (July-August).—Mobilization of the fleet.—"As long ago as March, 1914, a test mobilization of the Home fleets, instead of the usual maneuvers, had been ordered to take place between the 16th and 23rd July. . . . On July 23 the Austrian ultimatum to Serbia was launched with the kaiser's vehement approval. [See WORLD WAR: Diplomatic background: 18; 20; 27; 71, xxiii.] On the 24th it was communicated to the British fleet, and Sir George Callaghan, the commander-in-chief, immediately reminded the Admiralty that he was under orders to disperse his fleet on the 27th. On the 26th the Serbian reply to Austria was rejected, and the Admiralty countermanded the dispersal of the fleet. . . . On the 27th the British fleet was concentrated and supplementary precautions ordered. . . . At 5 o'clock that evening [July 28] the British First fleet was ordered to Scapa Flow. . . . [On August 3rd] Sir George Callaghan, whose period of command had really terminated a year before, struck his flag and handed over to Sir John Jellicoe the fleet he had so admirably trained."—H. Newbolt, *Naval history of the war, 1914-1918*, pp. 27-29.—"During the two following days [after the 24th] conferences took place at the Admiralty as to the disposition of the Fleet . . . and, in view of the threatening political situation, the work of demobilization after the king's inspection at Spithead and the subsequent short fleet exercises was suspended, pending further developments. . . . We were very fortunate in having the Fleet concentrated at the outbreak of the war. People had often pictured war with Germany coming as a bolt from the blue, and even naval officers feared that when the occasion did arise, it would be found . . . that fear of precipitating a conflict had led the Government to delay concentration with the result that our squadrons would be separated when war was actually declared. Fortunately, the Admiralty in the last days of July, 1914, placed us at once in a strong strategic position. For this action the nation should be grateful to the First Lord [Winston Churchill] and First Sea Lord [Prince Louis of Battenberg]."—J. R. Jellicoe, *Grand fleet, 1914-1916*, pp. 3, 38.—See also WORLD WAR: 1914: IX. Naval operations: a.

1914 (August 3).—Meeting of Parliament.—Sir Edward Grey's speech.—Preparations for war.—Resignation of opposing cabinet mem-

bers.—“The center of interest lay in the Commons, and Sir Edward Grey's speech practically served for both Houses. He said that ministers, then as always, had worked for peace, but in vain. As to British obligations he had told the Russian foreign minister in 1908 that he could promise no more than diplomatic support, and in the existing crisis, till the day before, he had promised nothing more. During the general election of 1906, at the crisis which led to the Algeiras Conference, he had been asked if, should a Franco-German war break out, Great Britain would give armed support; he had replied that he could promise nothing which would not be fully supported by public opinion, but, if war were forced on France through the Anglo-French *entente* regarding Morocco, British public opinion would rally to her support. . . . In the Agadir crisis [1911] he took the same line, and on November 22, 1912, he exchanged letters with the French ambassador to this effect, but agreeing that if either Great Britain or France had grave reason to expect an attack by a third power of a menace to the general peace, both Governments should consult whether they should cooperate and what measures they should take in common. But the British government remained perfectly free to decide whether it should intervene. In the Morocco question, however, it was pledged to diplomatic support; in the existing crisis France was involved because of its obligation of honor to Russia, which did not apply to Great Britain, a power which did not even know the terms of the Franco-Russian alliance. But in view of the Anglo-French friendship, let every man look into his own heart and construe the extent of the British obligation for himself. In view of that friendship, the French fleet was concentrated in the Mediterranean, and if, in a war which France had not sought, her unprotected coasts were bombarded, he felt that Great Britain could not stand aside. And, from the point of view of British interests, suppose the French fleet withdrawn from the Mediterranean and Italy involved in the war, Great Britain, if she now stood aside, might be exposed to appalling risks. He had, therefore, on the previous afternoon given the French ambassador an authorised assurance that, if a hostile German fleet came into the Channel or [through the] North Sea the British government [fleet] would give France all the assistance in its power. He had just heard that the German government would be prepared, were Great Britain pledged to neutrality, to agree that the German fleet should not attack the northern coast of France, but that was far too narrow an engagement. There was also the question, hourly becoming more serious, of the neutrality of Belgium. In 1870, Prince Bismarck had acknowledged the sanctity of the Treaty of 1839, and the government could not take a narrower view of its obligations than Mr. Gladstone's government took in 1870. He had asked in the previous week the French and German governments whether they were prepared to respect that neutrality; and he quoted the replies: France had promised to do so, Germany had delayed replying, Belgium had promised neutrality. But Germany had sent Belgium an ultimatum; and the British government had been asked in the past week whether an assurance would satisfy it that Belgian integrity would be preserved after the war. It had replied, refusing to barter away its interests or obligations in Belgian neutrality. The king of the Belgians had that day telegraphed to King George, appealing to the British government to safeguard the integrity of Belgium. Great Britain had great and vital interests in the independence

of Belgium, and integrity was the least part of that independence. Compliance [on Belgium's part] with the ultimatum would be fatal to that independence, and that of Holland would then perish also. [See also *WORLD WAR: Diplomatic background: 35; 37.*] If Great Britain stood aside, ran away from her obligations, and merely intervened at the end of the war, her material force would be of little value, in view of the respect she would have lost. She would suffer terribly in the war in any case, but if she stood aside, she would be in no position after it to prevent Europe falling under the domination of one Power, and her moral position would be such as to have lost her all respect. The fleet was mobilized, the army was mobilizing, but no engagement had yet been taken to send abroad an expeditionary force. The one bright spot was Ireland. The feeling there made the Irish question a consideration that need not be taken into account. Unconditional neutrality was precluded by the commitment to France and the consideration of Belgium. To stand aside would be to sacrifice the good name of Great Britain without escaping the most serious economic consequences. The forces of the Crown were never more ready or more efficient; the government had worked for peace to the last moment, and beyond it; when the country realized the situation, they would have its united support. Mr. Bonar Law promised emphatically the full and unhesitating support of the Opposition, mentioning also, as another bright spot, the certainty of that of the Dominions. Mr. John Redmond, in a speech that made a profound sensation, declared that the events of recent years had completely altered the Nationalist feeling towards Great Britain. He recalled the support given by Catholics to the Irish Volunteers in the eighteenth century, and said that the government might withdraw all its troops from Ireland: her coasts would be defended by her armed sons, and the Nationalist Volunteers would gladly join in doing so with their brethren of the north [Ulster]. Mr. Ramsay Macdonald (Laborite) contended that the Foreign minister had not shown that the country was in danger, the Crimean and South African wars were fought on the plea of British honor; and the conflict could not be confined to the neutrality of Belgium. The Labor party wanted to know what would happen to Russia, and the annihilation of France was impossible. He admitted that the feeling of the House was against his followers, but they held that Great Britain should have remained neutral. . . . Meanwhile the Government prepared actively for war in other ways. It assumed the control of the railways, vesting it in a committee of general managers under the Board of Trade; it took over the two *Dreadnoughts* completed and nearly completed in Great Britain for Turkey, and the two destroyer leaders building for Chile; Field-Marshal Sir John French was appointed Inspector-General of the Forces, and it was understood that he was to command the Expeditionary Force; and Admiral Sir John Jellicoe was appointed to the supreme command of the Home Fleets, with Rear Admiral C. E. Madden as his Chief of Staff. . . . In the country generally the action of Germany and Sir Edward Grey's statement had driven the great mass of the Liberal and Labor parties to agree that war was inevitable and just. In the Ministry some members were still unconvinced. On Monday, August 3, four members of the Cabinet, it was said, still advocated peace; by next day there were but two, Lord Morley of Blackburn, Lord President of the Council, and Mr. John Burns, President of the

Board of Trade. They, however, resigned office; but it was stated that they had decided to do so independently and at different stages of the controversy, and largely to avoid hampering the freedom of the Cabinet in a great emergency. Their example was followed by Mr. Charles Trevelyan, . . . Secretary of the Board of Education. These three were replaced respectively by Earl Beauchamp, Mr. Runciman and Dr. Addison."—*Annual Register*, 1914, pp. 170-174.

"Alone of European statesmen, the Foreign secretary [Sir Edward Grey] worked day and night in the preservation of peace; but he was handicapped by the undefined character of our friendship with France. . . . It is not necessarily a condemnation of the policy of limited liability, though it suggests grave doubts as to its wisdom, that everyone was at liberty to 'construe' it for himself; that the Cabinet was divided at a critical moment; that France counted on naval and military aid as a debt of honor [see WORLD WAR: Diplomatic background: 49]; that Russia believed we should be dragged in, and that Germany expected us to stand out. Nor has the time yet come for a judicial verdict on the whole policy of Continental commitments, unaccompanied as they were by an army of Continental dimensions, or by a frank explanation to Parliament and the nation of their contingent liabilities. . . . We may with some confidence anticipate that British policy throughout the period covered by this chapter [from Agadir to Serajevo] was free from the slightest desire for territorial aggrandizement, and that the dearest wish of the British people was to maintain peace and promote goodwill among the nations of the earth."—G. P. Gooch and J. H. B. Masterman, *Century of British foreign policy*.—See also WORLD WAR: Diplomatic background: 56; BULGARIA: 1914.

1914 (August 4).—Ultimatum to Germany.—Rupture of diplomatic relations.—"When the news of the German declaration of war against Belgium and the violation of Belgian territory reached London, Sir Edward Grey dispatched a second telegram to Sir Edward Goschen [British ambassador at Berlin], which concluded thus: 'In these circumstances, and in view of the fact that Germany declined to give the same assurance respecting Belgium as France gave last week in reply to our request made simultaneously at Berlin and Paris, we must repeat that request, and ask that a satisfactory reply to it, and to my telegram of this morning, be received here by 12 o'clock to-night. If not, you are instructed to ask for your passports, and to say that His Majesty's Government feel bound to take all steps in their power to uphold the neutrality of Belgium and the observance of a treaty to which Germany is as much a party as ourselves.' It was after presenting this ultimatum that Sir Edward Goschen had his historic interview with the Imperial chancellor. . . . That night the mob broke the windows of the British embassy; but otherwise Sir Edward Goschen and his staff escaped the puerile indignities to which M. Cambon [French ambassador at Berlin] was subjected in leaving the country. It is pleasant to record that Herr von Jagow, whom we have not hitherto seen reason to regard with much respect, conducted himself like a perfect gentleman—which is more than can be said of his Imperial master."—W. Archer, *The thirteen days*, pp. 200-201.

1914 (Dec. 16 and 24).—German air-raids.—"One of the factors which agitated public opinion in Great Britain was the raiding of the east coast by a German naval squadron in December, when 110 civilians were killed by the bombardment at Hartlepool, seventeen at Scarborough, and two at Whitby, many women and children being included among the slain. The German authorities were probably actuated by the belief that a palpable demonstration of the vulnerability of Great Britain would profoundly influence opinion both in the British Isles and in neutral countries. . . . It is hardly too much to say that the raid was a failure, except as an opportunity for practice, and that the results were incommensurate with the risks. The chief effect seems to have been to intensify the belligerent spirit in England."—G. H. Allen, H. C. Whitehead, and F. E. Chadwick, *Great War*, v. 3, pp. 392-393.—See also WORLD WAR: 1915: X. 1914-1918.—Defense of the Realm Acts.—Extensive war powers exercised.—Trials by courts martial of offenders against the regulations.—"Perhaps of even more significance than the measures for the development of the combatant forces has been the far-reaching expansion of governmental authority in Great Britain for the maintenance of internal order, the suppression and prevention of acts at home which might interfere with the successful conduct of the war, and the regulation of business. Under the common law and statutes in force before the outbreak of war, a series of defensive measures was authorized and taken. But these were promptly followed by additional legislation conferring more and more extensive powers on the executive authorities; and these have been steadily amended and enlarged. Under these emergency acts there have been issued long series of regulations by Orders in Council, and orders by government departments and officials, establishing an intensive system of police control, affecting private property and personal liberty. To enforce these, new and summary methods of procedure have been devised, which limit or take away many of the former legal safeguards for the protection of individual rights. . . . Much more sweeping was the Royal Proclamation of August 4 (the date of the declaration of war against Germany), authorizing the Admiralty, the

Army Council or other officers to issue instructions and regulations for the public safety and the defense of the realm. This proclamation is of special significance because, issued in the name of the King, as an act of the Royal prerogative, without the formal approval of the Privy Council or the authority of any Act of Parliament, it asserted the prerogative power to take all measures necessary for securing the public safety and defense of the realm; nor were any limitations laid down as to the instructions or regulations which might be issued under the proclamation. . . . Much wider powers were conferred by the Defense of the Realm Act of August 8. This was supplemented by another act of August 28; and was further amended and revised by the Defense of the Realm Consolidation Act of November 27. Further modifications were made by later acts in 1915 and 1916. This legislation authorized regulations by Order in Council, for securing the public safety and defense of the realm; and for the trial and punishment of offenders against such regulations, and in particular against provisions to prevent communications with the enemy; to secure the safety of troops and ships, the means of communication and railways, ports and harbors; to prevent the spread of false and dangerous rumors; to secure the navigation of vessels in accordance with Admiralty directions; or to prevent assistance being given to the enemy or danger to the successful prosecution of the war. The original Defense of the Realm Act authorized the trial of offenders against the regulations by court-martial; or in the case of minor offenses, by courts of summary jurisdiction. The consolidation act of November was even more drastic, authorizing the death penalty in the case of offenses 'committed with the intention of assisting the enemy.' Opposition was raised in the House of Lords (by ex-Chancellor Lord Halsbury, Lord Parmoor and Viscount Bryce) to thus authorizing, for the first time in more than two centuries, a civilian to be sentenced to death without trial by jury; but the revision was enacted as proposed."—J. A. Fairlie, *British war administration*, pp. 120-123.

1914-1918.—Taxation policy.—Credit loans.—Budgets.—Revenue.—National debt.—"The foundation of English financial policy in the conduct of war has been and is, despite the criticisms implying the contrary, the system of taxation. The current expenses of government must be maintained and the interest and sinking fund of the public debt be paid by taxation. In the final analysis a war is financed from savings which may be brought into government hands by loans or taxation. The economic effects of the two methods differ, but no nation can finance its wars by taxes alone or by savings alone; hence the policy of taxation, supplemented by loans, becomes the fixed national policy. From the date of the opening of the war to April 30, 1918, four great budgets have been presented by three Chancellors of the Exchequer. The peace budget for the year 1914-15 was left standing as it was when introduced May, 1914. Using this as a basis the first war budget providing for increase of taxation was introduced November 16, 1914, for the period ending March 31, 1915. The second war budget was introduced September 21, 1915; the third, April 7, 1916; and the fourth, May 2, 1917. . . . Taking the tax revenues for the four financial years April 1, 1914, to April 1, 1918, there is an amount including arrears of possibly £200,000,000, a tax income of £1,800,000,000, which, with income from other sources, brings the total of income for the above mentioned period to £2,100,000,000. Con-

fining the time to the war period alone, the total aggregate revenue received amounts to £1,789,000,000 of which £1,543,000,000 was from taxes. The total expenses during the war period, August 1, 1914, to April 1, 1918, were £6,961,000,000. From this sum certain assets in the form of advances to Allies and Dominions, munition plants, shipping, etc., have been deducted by the Chancellor, leaving the amount at £5,000,000,000. If this is the case, 40 per cent of the war cost to Great Britain has been paid from revenue and 35 per cent from taxes [*Times* (London) Apr. 2, 1918]. In this estimate, however, an allowance of nearly £300,000,000 is made for taxes in arrears, and deductions of generous amounts for payments to Allies and Dominions are taken from the total expenditure. It is difficult in view of the many factors involved to reduce payments to a percentage that means very much. If the advances to Allies and Dominions are retained as a part of the war cost so far as Great Britain is concerned, the actual amount raised by taxation is practically one-fourth of the amount expended during the war. The extent to which the vote of credit has been carried as the means of securing authority for the financial conduct of the war is only realizable when the full facts have been clearly grasped. Beginning with a vote of £100,000,000 on August 6, 1914, the amounts reached as high as £650,000,000 on July 25, 1917. For the eight months ending March 31, 1915, the total of votes for that period were £362,000,000. In 1915-16 the votes amounted to £1,420,000,000, reaching £2,010,000,000 in the fiscal year 1916-17 and touching £2,800,000,000 or many millions beyond this last amount, in the fiscal year closing March 31, 1918. The total of these votes, including the last one of £550,000,000 on December 13, 1917, is £6,592,000,000. . . . All told there have been four great loans since the war started, though the last one did not have a fixed subscription period for the sale of bonds, as did the first three. The first loan was offered to the public in November, 1914, when £350,000,000 were subscribed, the second raised £616,000,000 in June, 1915, the third, £800,000,000 in January, 1917, and the last one was offered in October and November, 1917. The first three loans produced £1,800,000,000, the figures for the last loan show weekly sales varying from £9,000,000 to £40,000,000, though the average is in the neighborhood of £18,000,000. These offerings were not the only forms of borrowings undertaken; since the Treasury offered at the same time Exchequer bonds, Treasury bills, war expense certificates and savings stamp certificates. . . . The borrowing transactions of the English Government may be grouped: (1) subscribed loans; (2) forced loans; and (3) negotiable loans. The first consists of the various offerings for subscriptions made to the public in the form of bonds, stamps, certificates and Treasury bills; the second of currency note issues and the American dollar security scheme by which foreign bonds were brought into the possession of the Treasury for collateral uses. . . . The third class consists of the loans negotiated abroad.

"In September, 1917, the government changed its policy of fixed subscription periods for the sale of bonds and began the experiment of financing the war by a continuous issue of national war bonds. The experiment opened well with an average of about eighteen millions a week for three weeks and dropped to £10,000,000 a week by the last of November. . . . What began as an experiment has hardened into a policy in that it has been two years since the government called for a loan of

a fixed amount. The continuous loan from week to week had at least the advantage of drawing from the savings of the people the funds for war purposes, and avoided the necessity of negotiating extensive advances from the banks."—F. L. MacVey, *Financial history of Great Britain, 1914-1918*, pp. 26, 37-41, 49-51, 55-56, 68.—The invitation for a loan of a fixed amount was again made in 1921. "On April 1st, 1914, the National Debt of the United Kingdom was £708,000,000. The actual expenditure during the period [1915-1919] was £9,592,000,000. Deducting the expenditure which would have taken place if there had been no war, we find that the war expenditure during the five years ending March 31st, 1919, amounted to £8,492,000,000. The revenue raised during the same period, exclusive of all borrowing, amounted to £2,733,000,000. . . . In the ordinary way, if there had been no war, the revenue would have been adjusted to meet the expenditure, so we can assume that the revenue during the whole period would have been £11,100,000,000, and thus the amount of additional war taxation raised was £1,633,000,000. . . . If the pre-war National Debt be added to the net amount of cash borrowed we get a total of £7,567,000,000, while actually the nominal amount on March 31st, 1919, was £7,435,000,000 [assuming that national war bonds and war savings certificates were taken at their issue, not redemption price]. If the price of redemption were taken, the figure would be £7,552,000,000. . . . Of this total £1,350,000,000 is held abroad, and the balance £6,202,000,000, is held in this country."—H. G. Williams, *Britain's financial and economic position*, pp. 7-9.—On 1 Feb., 1919, the National Debt was stated to be £7,334,000,000 (\$36,670,000,000). "So far as we [England] are concerned, the cost of the war has been stated, in round figures, at £7,520,078,000,—made up, roughly, as follows: £1,278,714,000 borrowed from abroad (America), £1,000,000,000 realized by sales of British holdings in foreign investments, and £5,241,364,000 raised at home (of which £1,731,100,000 has been lent to our Allies, and £140,500,000 to the Dominions and India)."—H. 1915.—Munitions fabrication and the labor problem.—Treasury conference.—"What we stint in materials we squander in life; that is the one great lesson of munitions," said Mr. Lloyd George. For the first year of war the question of men seemed to present comparatively little difficulty. England's manhood came flocking to the banner of Lord Kitchener, but this war was clearly from the first "a struggle of machinery," as Kitchener repeated to the American iron-master, Charles M. Schwab, who with others in the United States and elsewhere, received large orders to furnish ord-

nance and ordnance supplies, since England had at the start only three government factories for their manufacture, and munitions for her army were hitherto contracted for from about a dozen large private British companies. The Navy indeed almost monopolized existing British resources. Already the richest industrial regions of Northern France and Belgium were in German possession, and in 1915 two-thirds of the Russian steel-producing area were added to German resources. To meet this situation the Ordnance bureau faced unparalleled difficulties of material and labor. It was still detached from great civilian industries, cut off from important sources of raw ingredients for explosives for the making of mines and shells, lack of which at the front became intolerable. Even the letting of subcontracts, during the first winter, to 3,000 establishments, which undertook to transform their works into munition plants, proved inadequate. Kitchener admitted that there had been "undoubtedly considerable delay in producing the material." As for labor the new conditions produced a great upheaval. The increase in the cost of living, suddenly occurring when the crisis caused the shutting down of many peace industries and the throwing men out of work at their accustomed occupations, the transformation of other factories into war-supplies establishments "stealing" skilled employes from one another by pyramiding offers of higher wages to labor and thereby making it at once independent and slack, the absorption of many skilled workers in Kitchener's army—these circumstances combined to suspend the former "laws of supply and demand." Besides, workmen at this time were naturally jealous of recently won privileges and inclined to push their advantages to the utmost, especially in view of evident profiteering on the part of many employes. Drinking and idleness were rife among them, strikes more frequent and extensive.—See also LIQUOR PROBLEM: England: 1914-1918.

During the early part of the year there was constant industrial unrest in the country. The constant and urgent demand for the utmost effort of working capacity was not, in the opinion of the workers, being met by a fair share of the employers' profits. There was a strike of engineers on the Clyde, involving about 10,000 men; trouble was brewing among the shipyard laborers both on the Clyde and at Southampton. On March 17, the Miners' Federation of Great Britain decided to ask for a twenty per cent increase in wages. "Under such circumstances a conference of representatives of thirty-five trade unions was called to meet the Chancellor of the Exchequer and the President of the Board of Trade at the Treasury on March 17. Mr. Lloyd George, in opening the conference, said that they did not wish to consider any particular trade dispute, but the general position in reference to maintaining the necessary output of munitions. . . . The Conference was concluded two days later, when a memorandum was issued containing the proposals which the workmen's representatives agreed to recommend to their members. The following were its chief points:—During the war period there should in no case be any stoppage of work upon munitions and equipments of war; all differences on wages or conditions of employment should be the subject of conferences between the parties. In all cases of failure to reach a settlement of disputes by the parties directly concerned or their representatives, the matter in dispute should be dealt with under any one of the three following alternatives—(a) the Committee on Production; (b) a single arbitrator agreed upon by the parties or appointed by the Board of

Trade; (c) a Court of Arbitration upon which labor is represented equally with the employers. An advisory committee representative of the workers engaged in production for [the] government requirements was to be appointed by the government. During the war period the present trade practices should be relaxed; and the relaxation of existing demarcation restrictions or the admission of semi-skilled or female labour should not affect adversely the rates customarily paid for the work."—*Annual Register*, 1915, pp. 87, 88.—These terms were embodied in the Munitions of War Act in July.—See also LABOR ORGANIZATION: 1913-1921; LABOR STRIKES AND BOYCOTTS: 1915; ARBITRATION AND CONCILIATION, INDUSTRIAL; Great Britain: 1880-1920.

1915.—Colliery recruiting courts.—National Registration Act.—"In the spring of 1915 a scheme of colliery recruiting courts was established by the Home secretary; and in June a committee was appointed to consider the readjustment of conditions of employment in the distributing trades in Scotland so as to release men for enlistment or other national services. . . . Recruiting was also promoted by entrusting the raising of local units to county and municipal committees, cooperating with officers appointed by the War Office. In some places this plan was a pronounced success. But the need for other measures became more urgent. On May 18, the age limit was increased to 40 years, and the height standard reduced to 5 feet, 2 inches. On the formation of the coalition cabinet, steps were taken for a more systematic canvass of the population. On June 29, 1915, a national registration bill was introduced and rapidly enacted into law. The purpose of this act was to form a comprehensive register of the population between the ages of 16 and 65 (with certain exceptions), and their occupations, and to ascertain whether they were able and willing to perform other work. Men between the ages of 19 and 41 were listed on special blanks, and men engaged in government work or in essential war industries were starred."—J. A. Fairlie, *British war administration*, p. 85.

1915.—Novel legislative and administrative measures.—Extension of term of Parliament.—Coalition cabinet.—Ministry of munitions.—Defects of the Asquith régime.—"During the sessions of 1915, some fifty war emergency Acts of Parliament were passed. The most important, as involving novel legislative principles and administrative agencies, were those establishing [in May] the new Ministry of Munitions, regulating the production of munitions of war, providing for a general system of national registration [June 20], limiting the price of coal, and restricting the increase of rent and mortgage interest. In addition there were statutes amending, revising and supplementing the previous legislation relating to the defense of the realm (including the control of the liquor traffic), the control of foreign trade, trading with enemy, the system of compensation and pensions for men in the armed forces, the national insurance system, and war loans and other financial measures. The laws relating to the exemption of trusts and evidence were amended; and emergency powers were given to universities and colleges. Moreover, the duration of the House of Commons (which should have expired under the Parliament Act of 1911 in 1915) was extended; the reelection of ministers after changes in the Cabinet was dispensed with, and local elections were postponed. . . . As the session of 1915 continued, evidence of uneasiness and dissatisfaction appeared both inside and outside of Parliament. The Cab-

inet still received general support, and there was no open attempt to force its retirement. But the policy of the Cabinet lacked stability and certainty. 'Where the people looked for leadership, they found the old inclination to wait and see.' . . . The resignation of Lord Fisher as First Sea Lord of the Admiralty, on May 15, brought to light the internal difficulties of the government; and helped to precipitate the crisis. No formal action in Parliament preceded the change of government; and what took place in private and informal conferences will not be fully known for some time. But it has been understood that the Unionist leaders informed Mr. Asquith that they could no longer maintain their attitude of restraining criticism unless important changes were made. As an outcome, a reorganization of the Cabinet was agreed to, Mr. Asquith remaining as Prime Minister, but with the admission of a number of Unionist and Labor members, forming a Coalition Cabinet. The Irish nationalists were also offered representation; but declined to serve so long as Home Rule for Ireland was not put into effect. When formally constituted the new coalition Cabinet consisted of twelve liberals, eight unionists, one labor member and Lord Kitchener, a total of twenty-two members, an increase of two over the old cabinet. The new positions were the newly created minister of munitions [Lloyd George, who was later succeeded by Reginald McKenna as chancellor of the exchequer] and Lord Lansdowne, as minister without portfolio. . . . [Lord Haldane retired with seven other Liberals.] A coalition cabinet of this kind was something new in British political history. There have been Coalition Cabinets before; but they had been only partial, and none had gone to the extent of absorbing nearly all the chief political leaders of the different parties, representing eighty-eight per cent. of the House of Commons and thus eliminating the organized opposition. . . . [While] the Coalition Cabinet promptly gave evidence of a more energetic policy, in measures for the creation of the new Ministry of Munitions and the Munitions of War Act, and in the administrative conduct of the war, disappointments as to the successful progress of both military and diplomatic affairs led to gradually increasing dissatisfaction and criticism. Paradoxically the disappearance of any formally organized opposition was followed by more openly expressed opposing, not enough to be formidable, but troublesome guerilla attacks, from a small group of doctrinaire Radicals and avowed Socialists. Moreover the growing feeling of unrest was much broader than the avowed opposition. It was urged that the Coalition Government was defective because of the size of the Cabinet, its composition, and the character of the Prime Minister. Members of all parties acknowledged that the Cabinet was too large for the most effective action. 'A body of twenty-three men of very unequal ability, tired by their departmental labors, and meeting every few days for a couple of hours, was, indeed, an impossible machinery for making war.' As early as September, 1915, the *London Times* advocated a smaller Cabinet, meeting every day, and relieved from departmental detail. In fact the traditional working of the British Cabinet system had already been altered in important respects. The public suspected that specific problems were referred formally to Cabinet committees and that the active direction of affairs was in the hands of a small group within the Cabinet. But there was no definite knowledge of the extent of the control of the Cabinet over its committees or over the de

*facto* directing group."—J. A. Fairlie, *British war administration*, pp. 33-36.

1915.—Clyde shipyard strike. See LABOR STRIKES AND BOYCOTTS: 1915.

1915.—Ministry of munitions.—Appeals to labor and to women.—Gas masks.—"The little group of men whom Mr. Lloyd George assembled round him at No. 6, Whitehall Gardens, during the Whit-week of 1915, certainly seemed to have no easy task before them. A new Ministry had been founded, and a Bill to define its functions was being drawn up. But the Ministry possessed neither buildings nor staff, neither furniture nor office paper. . . . How this new Department of State was gradually built up; how picked men from all over the country, and from the Civil Service, were gathered to the side of the new Min-

istry of those Civil Servants who came into the Munition Service should receive extra pay for extra work. Second division clerks raised to higher posts still continued to receive the old salaries; so great was the eagerness to save the country that men worked overtime without complaint. . . . It was precisely the combination of the best Civil Servants with the best commercial men that gave to the Ministry of Munitions such a marvellous touch of efficiency. Manufacturers coming up from the provinces were now pleasantly surprised to find a new swiftness of despatch in the conduct of their business. . . . At the same time the country as a whole found itself provided at last with a capable machinery for using its services. The whole of the United Kingdom was mapped out and in every district there sat a Committee who formed a careful estimate of the resources of that area. . . . On the basis of that estimate there now began to grow up, as if by magic, that vast net-

SOCIETY WOMEN WORKING IN MUNITION FACTORY DURING THE WORLD WAR

istry; how buildings were secured from day to day for the work of administration; how excessive hours were worked and excessive risks were run by old as well as young, and women as well as men,—this story has already been largely told in the Parliamentary statements of the Munition Ministers. . . . The British commercial classes were not, in the period before the war, particularly attached to Mr. Lloyd George. They had some 'bones to pick' with him. But it must be said, to their eternal credit, that when they realized the need of their country the old hatchet was at once put underground. They came in hundreds to help him. Many of them came without price, leaving their own factories and workshops, putting aside their chance of personal profit, and content to live on such salaries as their business could afford them. It is true that many of them have risen to high honour in this service. It is well that it should be so. . . . The Civil Servants also volunteered from all branches of the Service to undertake increased responsibility without additional gain. It was laid down from the beginning that

work of new war factories which saved the armies in France. . . . It was also part of the great stress of this crisis that the State must be sure of its labour and that it must be able to draw from that labour the utmost power of effort, sustained and continued through a prolonged period of time. . . . The policy finally agreed upon took shape in the first Munitions Act and the subsequent amending measures. Round those measures a great strife afterwards arose, and it may be worth while to say something as to their origin and justification. It was absolutely necessary, if the armies were to be properly supplied with the immense mass of munitions required, that the workers should both consent to the limitation of their freedom of movement and should also suspend a number of those limitations and conditions of toil which had been won in the course of the long conflict between Capital and Labour. It was desirable to come to a bargain; and with that view the Trade Unions were consulted at every point. If the Government must trust Labour, Labour must also trust the Government. Labour must have assurance that a

temporary suspension of conditions should not prejudice the position in time of peace. That assurance had been already given, and was now formally embodied in the Munitions Act. . . . Certainly the restrictions were very formidable. No workman or workwoman could leave their employment in the war factory without a special 'leaving certificate.' All rules or customs restricting labour were suspended; no strikes were allowed; and all questions of wages and hours were to be settled by compulsory arbitration. To administer these rules Munition Tribunals were set up in every district; and they had powers of inflicting heavy fines. Such provisions must depend largely on the good faith and good-will of employers; and there must always be some who will not 'play the game.' Hence the chronic movements of revolt—the rise of the shop stewards, the engineers' strike, the war-weariness of so many industrial districts in the summer of 1917. In the autumn of 1917 Mr. Winston Churchill, the new Minister of Munitions, found it possible to suspend the leaving certificate and to slacken some of these conditions. But there could be no doubt as to their necessity up to that time. . . . Mr. Lloyd George ventured on a bold appeal. He asked the women to come from their pleasures and their comforts; he asked them to save the lives of their brothers, their sweet-hearts, and their husbands. They came in multitudes. They filled the ranks, and they filled the shells. They silenced their sourest critics, even in their own sex. They worked by day and they worked by night. They earned for themselves a new position in the State. They showed that women could be patriots themselves, as well as the wives and mothers of patriots. [According to the War Cabinet Committee's report, by January, 1918, 7,000,000 women had directly replaced men in industry.] Not easily will England forget those splendid women of 1915-18. . . . Nothing was left undone. To fill up the ranks, unskilled men were trained to do the work of skilled. The Board of Trade organised a special army of Munition Volunteers. In the autumn of 1915 there was a great effort, in conjunction with the War Office, to bring back from the front some thousands of those numerous munition workers, iron-workers, and miners who had been allowed to recruit in the first fine flush of the recruiting enthusiasm in 1914 [which constituted 'Kitchener's Army']. Mr. Lloyd George gave his whole mind to this one question—the making of war material. . . . Above all he studied the German inventions. After a short while, thanks to the labors of our young scientists from the Universities, he was able to provide our soldiers with gas-masks that enabled them to face unshaken the worst deviltry of the enemy, and with gas that was a fit reply to theirs. [See POISON GAS: First employment at Ypres; Protected shelters.] He provided our men with flame-throwers which made them a fair match when they faced the flame-throwers of the Teuton. . . . Meanwhile, the soldiers at the front grew more confident and serene. They felt the support of the great working nation behind them. They grew more confident of supremacy. They knew that even the womenkind were 'doing their bit.' In each great battle, as the shells swept over their heads, they felt a new power at work in their favor. They 'went over the top' with the knowledge that the mailed fist of Prussia was to be met with the iron hammer of England."—H. Spender, *Prime minister [David Lloyd George]*, pp. 218-230.—See also ARBITRATION AND CONCILIATION, INDUSTRIAL: Great Britain: 1880-1920.

1915.—German blockade of Great Britain.—

English counter-blockade.—"The course of the present war has supplied a new and forceful demonstration that England's independent existence rests upon her ability to maintain control of the sea. Unable to nourish her population from her own soil, it has been the prime object of the German submarine campaign to cut the life-line which the British navy has maintained with the world's granaries. It has been fully realized on both sides that once this line should be severed, Britain's doom would be sealed; and every other consideration has been made subordinate to the one object,—of Germany to destroy England's commerce, and of Britain to conserve it."—W. H. Hobbs, *World War and its consequences*, pp. 294-295.—"Simultaneously with the declaration of war came the announcement that Great Britain would observe the rules of the Declaration of London in maritime war, and the British navy instituted its blockade of the German Empire. The great force of British sea power immediately became operant, and Germany found herself a besieged fortress. . . . Prior to February, 1915, foodstuffs had been permitted to enter Germany through the blockade, but on January 26, 1915, the *Bundesrath*, or Federal Council, announced that the German government would assume control of all stocks of flour and grain in the country. Arguing, therefore, that these commodities when imported into Germany would be commandeered and pass . . . to the military authorities, the British government placed them on the list of absolute contraband. . . . Seeking for a means of reply to British sea power, as exerted through the blockade, Germany found it in the submarine. . . . [and] on February 4, 1915, Admiral von Pohl, Chief of the Admiralty Staff of the German Navy, issued a statement involving a new form of naval warfare, declaring . . . the waters surrounding Great Britain and Ireland, including the whole English Channel, . . . to be [a] war zone. . . . That the policy outlined in this proclamation had no foundation in international law is tacitly acknowledged in the . . . memorandum, [which accompanied it] for it states that the action is taken in retaliation for the British blockade. It was, in essence, a notification to the world that German submarines would sink enemy and neutral vessels under conditions that rendered it impossible to provide for the safety of passengers and crews. . . . The doctrine of reprisals, however, is one that can be adopted by both sides in a controversy, and the British government soon indicated that it was thoroughly awake to its opportunities. Hence, on March 1, 1915, the British Premier made a statement in the House of Commons foreshadowing a still more rigid application of the blockade. . . . What was it that Germany hoped to gain by the adoption of this policy, and what was her justification? The main objective, of course, was the stoppage of men and supplies to the Allied forces and to compel Great Britain to relax the pressure of her blockade. These ends were to be achieved not only through the destruction of ships of the Allies but also by the methods adopted in their destruction. It was clearly Germany's policy to establish such a reign of terror on the sea that the morale of British and neutral seamen would be so broken down that all shipping would disappear from the seas. This plan was not a bad one, and had it not been for a certain streak of obstinacy in the British and their Allies it might have met with better success. The immediate result, therefore, was that the challenge of Germany was accepted, the blockade was still more rigidly applied under the doctrine of reprisals and the Allies' fleets set to work

to hunt submarines."—G. H. Allen, *Great War*, v. 4, pp. 368, 372, 373, 375, 376, 377, 382.—See also WORLD WAR: 1915: XI. Politics and diplomacy: b.

1915 (Oct. 21).—New recruiting scheme.—Lord Derby, having assumed direction of recruiting on the invitation of the war office inaugurated "the last effort on behalf of voluntary service," by a personal canvass throughout the country of every man between the ages of eighteen and forty, excluding only a certain number whose present employments were of greater use than their services as soldiers (chiefly munition workers). Divided into forty-six groups, the unmarried men according to their ages, formed the first twenty-three groups to be enlisted and married men thereafter twenty-three more groups; the latter were to be called when the unmarried groups were exhausted. Men who were induced to enlist would not necessarily be required all at once, and a great boom in recruiting made it appear probable for a time that compulsory service would be avoided. This hope faded toward the close of the year. December 12 was the last day of the scheme, upon the expiration of which enlistment for immediate service was the only course left open. But the number of unmarried men who were not attested was then figured at 650,000 and compulsion was deemed necessary.

1916 (January).—Conference of the labor party.—On January 25, a conference of the Labor party was held at Bristol. "While the conference of delegates representing more than 2,000,000 British trade unionists . . . was not, strictly speaking, a socialist gathering, it faithfully reflected the sentiment of the British labor socialist movement when it adopted two resolutions of a highly patriotic nature. The first, pledging the conference to assist the government as far as possible to carry the war to a victorious conclusion, was carried by a vote of 1,502,000 against 602,000. The second entirely approved the action of the parliamentary labor party in cooperating with other parties in the recruiting campaign by 1,847,000 against 206,000."—*New York Times Current History*, v. 6, p. 1068.

1916 (December).—Ministerial crisis.—Ascendancy of Lloyd George.—Reconstruction of ministry and the war cabinet.—Criticism of the government was rife in the later part of 1916. The country was war weary and captiously critical of the conduct of the war. There was much popular discontent, and this was made the occasion of a newspaper attack upon the cabinet, which had now grown to the number of twenty-three, rather an unwieldy size for the rapid decisions required for action in the great struggle. "The difficulties involved in the attempt to conduct war upon a scale of magnitude unprecedented in history by means of a cabinet of the old type, consisting of twenty-odd political leaders, whose time was divided between departmental, parliamentary and cabinet business, soon began to attract public attention. A number of committees were formed within the cabinet but these by no means solved the problem. The lead in 'educating' public opinion to a realization of the inadequacies of the existing system, and the need of more effective control of policy and co-ordination of administration was taken by the Northcliffe press. As early as September 1915, the Times urged the formation of a small War Cabinet."—P. L. Schuyler, *British war cabinet* (*Political Science Quarterly*, v. 33, no. 3, p. 380).—In an attack upon the government "the London 'Daily Mail,' one of Lord Northcliffe's papers, . . . [had] described the Government as consisting of 'twenty-three men who can never make up their minds.' . . . [An editorial in the London 'Daily Mail' charged that] 'the country, despite the fact that it knows very little of the truth, is exasperated [by the record of the cabinet]. In every direction it is the same. But exasperation is not enough. The waste of time, which means waste of life and all that is dearest to us, can only be ended if the nation ends this "Government." . . . Mr. Lloyd George alone shows foresight and courage. We, the nation, look to him to end this tragedy, for it is a tragedy that these appalling blunders should be in control of our affairs at this time.'"—*New York Times Current History*, v. 5, Jan., 1917, p. 618.—"For some time . . . the Cabinet had discussed the possibility of the formation of a smaller War Council. On November 18 [1916] Mr. Bonar Law had proposed that this Council should consist of himself, Mr. Asquith, and Mr. Lloyd George—a scheme which was rejected by Mr. Asquith. A week later Mr. Bonar Law had suggested, as an alternative, that a small body of Cabinet Ministers, of which Mr. Asquith should be President, and Mr. Lloyd George Acting Chairman and President in Mr. Asquith's absence, should sit daily in consultation with their naval, military, and other experts, and concern themselves entirely with the conduct of the war. It would seem that Mr. Asquith rejected this scheme also, and further, that it did not commend itself to Mr. Bonar Law's Unionist colleagues, who suggested that two councils should be formed, one charged with naval and military, and the other with civilian administration. Thus, by the end of November the whole question of the reconstruction of the War Council was still undecided."—W. Roch. *Mr. Lloyd George and the war*, pp. 170, 171.—"On December 1, 1916, Mr. Lloyd George finally touched off the fuse to the bomb that was to wreck Mr. Asquith's coalition government. The conduct of the war was at that time entrusted to a 'War Committee' of the cabinet, consisting of Mr. Asquith, Mr. Lloyd George, Mr. Bonar Law, Mr. Balfour, Mr. McKenna, Lord Curzon and Mr. Montagu. It appears, however, that this

committee had expanded, reckoning in its official advisers and regular ministerial visitors, into a body almost as unwieldy as the full cabinet. 'We have in fact almost reached the position,' remarked the *Times*, 'of seeing two cabinets sitting side by side and taking a hand in the war.' Lloyd George notified the prime minister that he could not remain in the government unless radical changes were made in the conduct of the war, and proposed that the War Committee should be limited to four members. His slate, moreover, did not include Mr. Asquith."—*Political Science Quarterly*, v. 33, no. 3, p. 381.—"Mr. Asquith remaining decided not to adopt their proposals, Lloyd George and Bonar Law resigned, as did the other Unionist Ministers. Mr. Asquith then held a meeting of the Liberal Ministers, and with their approval tendered his resignation to the King and advised that Bonar Law be commissioned to form a new Administration. At this stage King George took the unusual step of intervening by calling a conference of party leaders. Mr. Asquith and Lloyd George of the Liberals, Bonar Law and Mr. Balfour of the Unionists, and Mr. Henderson of the Labor Party were summoned to Buckingham Palace, where, it is said, the King tried to arrange a reconciliation. After the conference Bonar Law saw the King alone and declined to undertake the formation of a new Ministry. The King then sent for Lloyd George, and the same night . . . it was officially announced that he, with the co-operation of Bonar Law, had undertaken to form a new Government. Lloyd George's task was no easy one. He had no definite party following of his own; . . . the Labor Party was hostile, while the Irish Nationalists were against every Government that was not pledged to home rule. Only the Unionists, a minority of the whole House, could be depended upon. Nevertheless, the former War Secretary sat to work."—*New York Times Current History*, v. 5, Jan., 1917, p. 620.—"It is probable that when Mr. Asquith resigned he felt that he would nevertheless be . . . asked to form an Administration. He possessed a majority in the House of Commons. He had received friendly assurances from his Unionist colleagues. . . . He had added to his difficulties by his loyal support of Mr. Balfour. And yet, so strange are the inner workings of politics, so curious the psychology of politicians, that it was Mr. Balfour . . . who made possible the formation of Mr. Lloyd George's Government. On December 6 the King summoned a conference . . . and as a result of this conference Mr. Lloyd George undertook to endeavor to form an Administration, with the co-operation of Mr. Bonar Law. The support of the Labour Party was easily secured. A few vague promises with regard to the nationalisation of shipping and of mines, a few offices placed at their disposal, an appeal to patriotism, and the thing was done. With the exception of a few of Mr. Asquith's old colleagues, . . . most of the Liberals felt that the King's Government had to be carried on and were ready to help in any capacity. The Unionists presented a more difficult problem. For while a large section of the Unionist party were with Mr. Lloyd George, heart and soul, many of the Unionist members of the Cabinet were not pleased with Mr. Lloyd George's treatment of Mr. Asquith, . . . in addition to which, they had grave doubts of the stability of any Government he might form. However, on the way back from the Conference at Buckingham Palace Mr. Bonar Law . . . induced Mr. Balfour to serve as Foreign Secretary in Mr. Lloyd George's new Administration. This was decisive, for loyalty to Mr. Balfour

retained the services of Lord Robert Cecil. And every Unionist who was wanted was ready to rush in where both Mr. Balfour and Lord Robert Cecil were not unwilling to tread. On December 11 Mr. Lloyd George's Government was announced as follows: The War Cabinet: Mr. D. Lloyd George, Prime Minister; Lord Curzon, Lord President of the Council and Leader of the House of Lords; Mr. Henderson, Without portfolio; Lord Milner, Without portfolio. Mr. Bonar Law, Chancellor of the Exchequer, who . . . [was] asked by the Prime Minister to act as leader of the House of Commons, . . . [was] also a member, . . . [although not] expected to attend regularly. . . . [In this ministry] Mr. Balfour was Foreign Secretary, and Sir Edward Carson, First Lord of the Admiralty."—W. Roch, *Mr. Lloyd George and the war*, pp. 183, 184.—See also CABINET: English: War cabinets.

1916-1917.—Compulsory Military Service Acts.—Man power distribution board appointed.—Following close upon Lord Derby's voluntary recruiting campaign, the country was in a turmoil over the question of general compulsory service. The cabinet felt that its first duty was the redemption of Mr. Asquith's pledge that married men who volunteered should not be called until after all unmarried men. The only dissenting voice was that of Sir John Simon, home secretary, who resigned January 1. "A bill was introduced in the House of Commons on January 5, 1916, providing that unmarried men and widowers without children between the ages of 19 and 41 (with certain exemptions) should be deemed to have enlisted in His Majesty's forces." This was read a first time by a vote of 403 to 105; passed second reading on January 12, by a vote of 431 to 39; and after a brief committee stage passed a third reading on January 24, by a vote of 383 to 36. Two days later the bill passed the House of Lords; it received the Royal assent on January 27 and came into operation on February 10, 1916. The administration of the military service law involved the creation of a new series of governmental agencies to pass on claims for exemption. Local tribunals of 5 to 25 persons were provided in every local registration district; and from the decisions of these any person could appeal to one of the appeal tribunals, from which on leave of the appeal tribunal a further appeal could be taken to the central tribunal for Great Britain. By proclamation of February 10, the classes of unmarried men between the ages of 19 and 30 were summoned for March 2; further proclamations called up the remaining groups of unmarried men; on March 7, the attested married men between the ages of 19 and 26 were called; and later the remaining classes, those between the ages of 33 and 41, on April 27. On May 2, it was announced that the total military and naval effort exceeded five million men. A second military service act was passed in May, including all unattested men between the ages of 18 and 41, unless within the excepted classes, in those enlisted in the armed forces. This act also modified the grounds for exemption, and provided for the prolongation of expiring terms of service, and for the medical examination. The bill for this act passed second reading in the House of Commons by a vote of 328 to 36, and third reading by a vote of 250

to 35. This act closed some of the means of escape from military service; but criticisms continued to be made of the system of local tribunals and the provisions for exemptions, exceptions and reservations. Conflicts between different government departments led, toward the end of September, to the appointment of a Man power distribution board to determine such questions as the allocation or economic utilization of man power, and to direct the departments concerned to create the machinery necessary to coordinate their activities. Provisions for reopening the cases of men who had been excepted under earlier military service acts were made in the Military Services (Review of Exceptions) Act, 1917. A committee on the employment of conscientious objectors was established to arrange for the most effective use of this class of those excused from military service."—J. A. Fairlie, *British war administration*, pp. 87-88.—See also MILITARY ORGANIZATION: 32; WORLD WAR: 1916: XII. Political conditions in belligerent countries: d.

1917.—National service registration.—Recruiting for all essential war services, including military service, placed in the national service ministry.—On February 6, Mr. Neville Chamberlain opened a campaign for voluntary enlistment of labor to replace men who could be called to fight. Men between the ages of eighteen and sixty were urged to enlist, if they were not already engaged in work of national importance. Wages were to be paid at the standard rate with a minimum of twenty-five shillings a week. They would have to go wherever the director-general (Neville Chamberlain) might send them, but they would not be transferred to any occupation other than that for which they had enlisted. "On March 28, 1917, an act for establishing the Ministry of National Service and the purposes incidental thereto became law. This provided for a Minister of National Service under the title of Director General. . . . 'It is further provided that no Order in Council or regulation should authorize the compulsory employment or transfer of any person in or to any industry, occupation or service, or should impose any penalty for any breach of a voluntary agreement made by any person with the Director General of National Service.' (7 Geo. V, ch. 6.) The first plan of the new department was to call for volunteers to go wherever they were assigned. As this received only a slight response, conferences with employers and employes were begun to find out what men various firms could spare and to arrange for their transfer to the essential war work by the substitution offices of the department. The duplication of this work with that of the employment exchanges formerly connected with the Board of Trade and now in the new Ministry of Labor seems evident. Enrollment and transfer were to be purely voluntary. . . . In April the plan of the new department was called a 'fiasco,' and it was said that only a few hundred placements had actually been made. . . . A special report of the Select Committee on the Military Service (Review of Exceptions) Act, made on August 2, 1917, had recommended the transfer of the recruiting medical boards and of medical examinations for the military service to civilian control, and for the reexamination of the men waiting to be called up for military service. This recommendation was carried out, and much more, by the transfer of the whole work of recruiting for the military

service to the Ministry of National Service in the latter part of 1917—a step which added much to the importance of the work of this department.”—F. A. Fairlie, *British war administration*, pp. 253-255.—See also WORLD WAR: 1917: XII. Political conditions in belligerent countries; c.

1917.—Labor party and the Stockholm conference.—“The invitation of the Russian Council of Workers’ and Soldiers’ Deputies to attend a peace conference at Stockholm was accepted by the socialists . . . of Great Britain (August 10). . . . The government of Great Britain, through Sir Robert Cecil, denied permission to delegates of the Independent Labor Party to confer with fellow socialists in Petrograd, allowing them, however, to talk en route with other delegates from friendly countries. But the Sailors’ and Firemen’s Union of Great Britain, through Havelock Wilson, president, refused to have its members serve on any ship carrying the delegates, taking the position that there should be ‘no peace maneuvers until Germany had made the fullest restitution for the wholesale massacre of Allied sailors at sea.’ The delegation therefore remained at home.”—H. W. Laidler, *Socialism in thought and action*, p. 287-288.

1917-1918.—Continued industrial discontent.—“The tide of industrial discontent continued the rise which had begun in 1916. The following statistics show most clearly the extent of the increase in labor difficulties.

Period covered	Number of industrial disputes	Number of work people involved
Last 6 months, 1914.....	151	24,970
Year of 1915.....	706	452,571
Year of 1916.....	581	284,306
Year of 1917.....	688	820,727
First 6 months, 1918.....	567	312,750

“In the engineering and shipbuilding trades, complaints over pay, leaving certificates, dilution, failure on the part of employers to keep the records of changes in working rules, etc., have been almost continuous and have at times led to disputes of serious proportions. Open defiance of

the government, showing itself in the form of called strikes, has perhaps been infrequent, but voluntary cessation of work and other methods of showing dissatisfaction by curtailing production have been resorted to. In May, 1917, the dissatisfaction in the engineering trades came to a head. Employers were substituting piece work schedules for time schedules and the new rates of remuneration proved unsatisfactory. New machinery was being introduced and laborers were beginning to suspect that it would be impossible ever to carry out the pledges which had been made by employers under Schedule 2 of the Munitions Acts to restore the pre-war conditions. Two new subjects of complaint arose about this time: (1) The Government found it necessary to withdraw the exemption card agreement which it had made with the Amalgamated Society of Engineers, and which permitted all skilled men of that organization engaged on war work or enrolled as war munitions volunteers, who held exemption cards issued by the society, to escape military service. This withdrawal created great dissatisfaction, although, outside the engineering trades, this singling out of the Amalgamated Society for special privileges had produced dissatisfaction in other unions. (2) The Munitions of War (Amendment) Bill which had been introduced into the House of Commons authorized the dilution of labor on private work. The government had promised in 1915, when the Munitions of War Bill was being prepared, that it would not extend dilution to private work. The need of men for military service was now so great that it asked to be relieved of its promise. Many unions gave their consent, but the Amalgamated Society of Engineers would not do so. When the bill was brought up in the House of Commons, the engineers began to remain away from work and a silent strike was being carried on which by the middle of May was causing great embarrassment to the government. Steps were taken to conciliate the engineers and to make evident to them the need for a change in the government’s policy. Certain concessions were offered to them in return for their support. . . . These proposals were not, however, acceptable to the Amalgamated Society of Engineers and they would not agree to dilution on private work. Consequently, when Mr. Winston Churchill became Minister of Munitions, after some further efforts to reach an agreement with the unions, it was decided to omit this part of the scheme from the amendment to the Munitions Acts. Outside the engineering and shipbuilding trades, the strikes of 1916 and 1917 have not been of a very serious character. . . . Threats of a strike on the railways of the United Kingdom led the government to extend Part I of the Munitions Act, 1915, which pertains to the settlement of industrial disputes, to the railways on August 8, 1917. For the first four months of 1918 the strikes have been numerous, but can not be said to have been very serious or of long duration. They show, however, a disposition on the part of the men to take advantage of the war needs to demand changes favorable to labor, and the needs of employers and the government are such that concessions are usually made. The rising tide of industrial discontent among the laboring classes, as evidenced by the strike statistics which we have given, did not fail to impress the government officials responsible for the conduct of the war. Desiring to proceed in an intelligent manner to quell this discontent, the government decided in June, 1917, to appoint commissions of inquiry to investigate the causes of industrial unrest and to

make recommendations to the government in regard thereto. . . . The government commissions appointed on June 12, 1917, by the Prime minister, 'to inquire into a report upon industrial unrest and to make recommendations to the government at the earliest practicable date,' were eight in number, each covering a distinct geographical section of Great Britain. There were three members of each commission. They started at work almost immediately and worked with such speed that their reports had been received and advance copies placed in the hands of the Prime minister by July 17. The shortness of the time consumed may have made the inquiry less thorough than would be thought necessary in times of peace, but there is nothing to indicate that different conclusions would have resulted from a more lengthy investigation. Each commission held from ten to thirty meetings and examined from 100 to 200 witnesses, representing employers, trade unions and other interests concerned, and considered statements in writing submitted by interested parties."—M. B. Hammond, *British labor conditions and legislation during the War*, pp. 235, 238-240, 243-244.—"In order that the principal points of agreement and differences between the eight reports may be readily seen I submit the following brief summary of the commissioners' findings and recommendations: (1) High food prices in relation to wages, and unequal distribution of food. (2) Restriction of personal freedom and, in particular, the effects of the Munitions of War Acts. Workmen have been tied up to particular factories and have been unable to obtain wages in relation to their skill. In many cases the skilled man's wage is less than the wage of the unskilled. Too much centralization in London is reported. (3) Lack of confidence in the Government.—This is due to the surrender of trade-union customs and the feeling that promises as regards their restoration will not be kept. It has been emphasized by the omission to record changes of working conditions under Schedule II, article 7 of the Munitions of War Act. (4) Delay in settlement of disputes.—In some instances ten weeks have elapsed without a settlement, and after a strike has taken place, the matter has been put right within a few days. (5) Operation of the Military Service Acts. (6) Lack of housing in certain areas. (7) Restrictions on liquor. This is marked in some areas. (8) Industrial fatigue. (9) Lack of proper organization among the unions. (10) Lack of communal sense.—This is noticeable in southern Wales, where there has been a break-away from faith in parliamentary representation. (11) Inconsiderate treatment of women, whose wages are sometimes as low as 13s. (\$3.16). (12) Delay in granting pensions to soldiers, especially those in Class "W" Reserve. (13) Raising of the limit of income tax exemption. (14) The Workmen's Compensation Act.—The maximum of £1 (\$4.87) weekly is now inadequate."—G. N. Barnes, *Summary of the reports (U. S. Bureau of Labor Statistics, no. 237, Oct., 1917, p. 10)*.—See also LABOR LEGISLATION: 1909-1918; LABOR ORGANIZATION: 1919; British labor movement; LABOR PARTIES: 1868-1919.

1918.—Representation of the People Act.—Limited proportional representation.—Extension of the franchise to women.—"Conscientious objectors" disqualified.—Election of women to House of Commons.—"In the evening of Wednesday, February 6th, the royal assent was given to the Representation of the People Act, 1918, after the Bill had undergone a process of battledore and shuttlecock between the two Houses of Parliament probably unprecedented in the history of this country. The Commons had sent the Bill up to the Lords on December 7th, 1917, and the Upper House having devoted seventeen days to its consideration returned it on January 30th, 1918, with eighty-seven pages of amendments. Amongst these amendments was a proposal to substitute for the old system of single-member constituencies, each electing one member, a new system of large constituencies returning several members by the method of the single transferable vote. This system, known as Proportional Representation, had been rejected in the House of Commons by large majorities on three occasions, and thus the introduction of it by the Lords threatened to raise a serious conflict. The consideration of the Lords' amendments occupied the House of Commons from January 30th until Friday, February 1st, and the Commons, by a vote of 225 to 115, once more refused Proportional Representation. It was necessary for financial reasons to bring the Session to a close within the next few days, and the House of Lords therefore met on the following Monday and amended their first proposal by limiting the application of Proportional Representation to Parliamentary boroughs returning three or more members. This amendment came to the Commons on Tuesday, and was again rejected by 240 votes to 143. The Bill was returned to the Lords, who met at half-past two on Wednesday, and, being still obdurate in their attitude, they inserted in the Bill a new clause to the effect that Commissioners should be appointed to prepare a scheme under which about one hundred members are to be elected on the principle of Proportional Representation in certain town and country areas which are to be combined into single constituencies returning from three to seven members. This scheme is to require the approval of both Houses of Parliament before becoming effective. To this proposal Lord Curzon consented on behalf of the Government, and accordingly, when the Bill came down to the Commons at 5 p.m. on the same day, the Home Secretary

moved to agree with the Lords' amendment, and, as the Government Whips were put on, the amendment was accepted by 226 votes to 116. Thus, all outstanding differences between the two Houses having been disposed of, the Bill was submitted to the King and received the Royal Assent by Commission at eight o'clock in the same evening."—W. H. Dickinson, *Greatest reform act (Contemporary Review, Mar., 1918, pp. 241-242)*.

"The Act deals, among other topics, with the qualifications of electors; with the registration of electors and with the distribution of seats. It deals also with the method of voting. . . . As regards the qualification of electors, the scope of the present Act is infinitely wider than that of its predecessors. Instead of the seven alternative franchises which have hitherto existed, three only will in future be valid: of these by far the most important is *residence*; a second is the occupation of business premises; the third is the possession of a degree or, in the case of women, its equivalent, at a University. The ownership vote disappears, and with it, except in severely restricted form, plural voting. Henceforward a man may have at most two votes—one for his residence, and a second either for a constituency in which he carries on his business or for a University. The University franchise is widely extended, virtually to all who have taken the first degree, but in the case of the Universities returning two members, each elector will be entitled to give only one vote. This 'restricted' University vote is the only provision at present in the Act for the protection of minorities. (Logical and reasonable as part of a larger scheme for proportional representation, its survival will serve only to recall the peculiar genesis of the Bill.) University representation is allowed to continue, but only on condition that the conservatism of the old universities is not permitted to affect the balance of parties. By far the most striking innovation in the Bill remains to be noticed. For the first time the franchise is to be exercised by women as well as men; but the basis of qualification for the two sexes differs widely. A woman will be entitled to vote only if she is thirty years of age [and over] and is qualified as a 'local government elector'; in other words, is a ratepayer or the occupant of unfurnished lodgings; or is the wife of a man so qualified. Other clauses provide for the registration of 'absent voters' and for the casting of their votes either by post or by proxy. These provisions, cordially welcomed in the circumstances of the hour, will enable sailors, soldiers, and others engaged on work of national importance abroad or afloat to record their votes. In all, some 8,000,000 electors will, it is estimated, be added to the roll. The enfranchisement is, therefore, on a scale four times as large as that of 1834, eight times that of 1867, and more than sixteen times that of 1832. It should be added that one disqualification, that arising from the receipt of poor relief, is partially removed by the Bill, and one disqualification is imposed. There was a general—though not a universal—consensus of opinion that the men who have declined on grounds of conscience to take part in the defence of the country, should not now, nor in the immediate future, be allowed to have any share in the control of its government. As ultimately adopted the provision for the exclusion of conscientious objectors was, however, rigidly curtailed both as regards scope and duration. In effect it will apply only to the unworthy or the contumacious.

"The period of qualification is . . . reduced to

six months; the register will, therefore, have to be made up twice instead of once a year, . . . half the expenses . . . [to] be paid by the State, half out of local rates. . . . All polls are, at a General Election, . . . held on the same day, but the declaration of the poll . . . [may] be deferred by the provisions for taking the votes of absent voters. . . . The standard unit of population for each member . . . [was] taken at 70,000 in Great Britain, [and in Ireland at] 43,000. Forty-four old boroughs, including historic cities like Canterbury, Winchester and Chester, are extinguished, but boroughs with 50,000 or more inhabitants retain their separate representation, and the boroughs as a whole gain, on the balance, 36 members; the Universities, thanks to the enfranchisement of the new Universities, gain 6; and the counties lose 5. Thus the membership of the House is, unfortunately, increased by no less than 37 members: a serious addition to a House which is already unduly large. The numbers have, however, been decreased by the withdrawal of Irish members consequent on the arrangement by which Ireland became a dominion under the name of the Irish Free State."—J. A. R. Marriott, *New electorate and the new legislature (Fortnightly Review, Mar. 1, 1918, pp. 339, 340)*.

1918.—Election of women to House of Commons.—"Legislation supplementary to the British Representation of the People Act approved February 6, 1918, has lately made women eligible to sit in the house of commons. No sooner was the former measure, which enfranchised six million women, on the statute book than the question arose whether its effect was to make women eligible for election. The law officers of the crown held that no such right was conferred. Prospective women candidates, however, were not deterred; and the Labor party at once pronounced in favor of a bill to secure the desired object. The house of commons committed itself to the proposition October 23, when, by a vote of 274 to twenty-five, it declared it desirable that such a bill be passed forthwith. Opposition was half-hearted. . . . Such serious discussion as took place centered around the question of amending the bill so as to admit women to the various professions from which they are at present excluded. In the house of lords it was proposed that the measure be amended to enable peeresses in their own right to sit and vote in the second chamber; but the view prevailed that this subject should be left for separate legislation, and on November 15 the bill as it came from the house of commons was carried through the final stages. At the elections in December one woman was elected a member of the house of commons."—F. A. Ogg, *Women members of Parliament (American Political Science Review, Feb., 1919)*.—It was on December 1, 1910, that Lady Astor, having won the by-election at Plymouth, by a majority of 2,064 over her Labor and Liberal opponents, took her seat in the House of Commons. The first woman to be elected to Parliament, however, was the Countess Markiewicz, Sinn Féin, but she never took her seat.—See also SUFFRAGE, WOMAN: ENGLAND: 1006-1014; 1016-1018.

**1918 (June).—Reorganization of the Labor party.—Its aims.**—"The British Labor Party transformed itself during the first half of 1918. A federation of trade unions, trade councils and socialist societies, it became a national party of workers 'by hand or by brain.' Its many streams gathered into a watercourse. The passage of the Representation of the People Act, adding eight or more million voters to the electorate, made it necessary for the political labor movement to widen its course to take in these new affluents, or be swamped by the very suffrage reform it had helped bring into flood. Moreover, labor was forewarned by its leaders that the approach of reconstruction called for far-reaching engineering by the people themselves, if the post-bellum watersheds of existence were not to be controlled by the propertied interests through their hold on the old parties. . . . So, in six months' time came the reorganization of the British Labor Party, the breaking of the truce with the government and the formulation of its radical domestic platform. . . . By the new constitution adopted at a special conference in late February, provision was made for the first time for individual membership in the party, and special facilities were given to women electors to join. A local labor party was called for in each Parliamentary constituency, with separate sections for men and women. Hitherto, there had been less than 100 such locals. The National Executive was enlarged from sixteen members to twenty-two, thirteen to be chosen from the trade unions and other societies, five from the local organizations, and four from women. The 'objects' of the party (hitherto defined simply as 'to organize and maintain in Parliament and the country a political labor party') were expanded to include the promotion of the interests of all producers without distinction of class or occupation. These objects were set out under three headings—'National,' 'Inter-Dominion' and 'International.'"—P. U. Kellogg and A. Gleason, *British labor and the War*, pp. 105-106.

"The practice of empirical politics, the effort to secure this or that specific reform, will not suffice; Labour lays down its carefully thought-out, comprehensive plan for the reconstruction of society, which will guarantee freedom, security, and equality. We propose, as a first step, a series of national minima to protect the people's standard of life. For the workers of all grades and both sexes we demand and mean to secure proper legislative provision against unemployment, accident, and industrial disease, a reasonable amount of leisure, a minimum rate of wages. We shall insist upon a large and practicable scheme to protect the whole wage-earning class against the danger of unemployment and reduction of wages, with a consequent degradation of the standard of life, when the war ends and the forces are demobilised and the munitions factories cease work. The task of finding employment for disbanded fighting men and discharged munitions workers

we regard as a national obligation; we shall see to it that work is found for all, that the work is productive and socially useful, and that standard rates of wages shall be paid for this work. In the reorganisation of industry after the war, the Labour Party will claim for the workers an increasing share in the management and control of the factories and workshops. What the workers want is freedom, a definite elevation of their status, the abolition of the system of wage-slavery which destroyed their independence and made freedom in any real sense impossible. We believe that the path to the democratic control of industry lies in the common ownership of the means of production; and we shall strenuously resist every proposal to hand back to private capitalists the great industries and services that have come under Government control during the war. This control has been extended to the importation and distribution of many necessary commodities—many of the staple foods of the people and some of the raw materials of industry. More than the great key industries and vital services have come under control; and we do not mean to loosen the popular grip upon them, but on the contrary to strengthen it. In the field of national finance the Labour Party stands for a system of taxation regulated not by the interests of the possessing and profiteering classes, but by the claims of the professional housekeeping classes, whose interests are identical with those of the manual workers. We believe that indirect taxation upon commodities should not fall upon any necessity of life, but should be limited to luxuries, especially and principally those which it is socially desirable to extinguish. Direct taxation, we hold, upon large incomes and private fortunes is the method by which the greater part of the necessary revenue should be raised; we advocate the retention in some appropriate form of the excess profits tax; and we shall oppose every attempt to place upon the shoulders of the producing classes, the professional classes, and the small traders, the main financial burden of the war. We seek to prevent, by methods of common ownership and of taxation, the accumulation of great fortunes in private hands. Instead of senseless individual extravagances we desire to see the wealth of the nation expended for social purposes—for the constant improvement and increase of the nation's enterprises, to make provision for the sick, the aged, and the infirm, to establish a genuine national system of education, to provide the means of public improvements in all directions by which the happiness and health of the people will be ensured."—A. Henderson, *Aims of labour*, pp. 23-25.

**1918 (December).—Elections.—Triumph of Coalitionists.**—"War-time conditions joined with

a new and revolutionizing electoral law to give the British parliamentary elections of last December many novel features. The national electorate, including six million women, was twice as large as ever before; balloting, except by soldiers and other absentees, was confined to a single day; votes were allowed to be sent in by post, or to be cast by proxy; the usual party contest was replaced by a trial of strength between a coalition government which found support among practically all political elements and a number of groups whose physiognomy would hardly have been recognized by an antebellum observer. The first important question was whether there should be an election at all; that is, whether before the peace treaty was signed. The adoption of the Representation of the People Act a year ago set

of apprehension about the soldier vote, although in reality because the machinery which the party has been building up in the constituencies since its reorganization a year ago was as yet incomplete. The Coalition leaders, however, declared an early election a plain necessity. The existing Parliament dated from December, 1910, and hence had overrun the legal maximum by three years; five times since 1915 it had extended its own life. It is true that almost one-half of the members of the house of commons had been returned at by-elections since the general elections of 1910. But everyone conceded that the body had grown weary, spiritless, feeble, and unrepresentative. It was moribund, declared the premier, and lacking in authority from the broadened and altered electorate to deal with the great problems confronting

AERIAL VIEW OF WINDSOR CASTLE

up a presumption that Parliament would be dissolved reasonably soon. Military reverses in ensuing months discouraged any plans in that direction. But by mid-summer the situation on the various fronts was again well in hand, and thenceforward there were increasing signs that the coalition government meant to make an early appeal to the electorate for a fresh lease of power; and its purpose in the matter was definitely announced in the early autumn. The old-line Liberals, led by ex-Premier Asquith, roundly opposed the plan. They said that notwithstanding the arrangements contemplated in the new electoral law, a large proportion of the three million soldiers on foreign soil would be unable to vote. They urged, too, that no election was needed to enable Mr. Lloyd George's government to go to the peace conference with the mandate of a united people, this government had won the war, and no one disputed its right to make the peace. The Labor party also objected, avowedly because

the country. Britain's spokesmen at the peace conference must know that they had behind them a house of commons fully and freshly representative of the nation, and one which could be trusted to take up with unspent vigor the tasks of economic and social reconstruction. Non-Coalition Liberals charged that the premier was looking beyond the peace, and that what he really had in mind was a prolonged lease of power, to be obtained while the nation was disinclined to a political overturn, and to be employed in carrying out a program fashioned in collaboration with his Unionist supporters. Parliament was prorogued November 21, the dissolution following in four days. Already, on November 16, the premier and Mr. Bonar Law had opened the Coalition campaign at a meeting in Central Hall, Westminster; and soon thereafter they put their case formally before the voters in a joint manifesto. Notwithstanding their emphasis upon the imminence of the peace conference as a reason for holding an

election, the government leaders were curiously silent upon international matters until the campaign was far advanced. Of such topics [those purely British in character] seven were given principal emphasis: (1) land reform, with a view to the general increase of allotments and small holdings, the elevation of agricultural wages, the expansion of agricultural production, and especially the settlement of returned soldiers and sailors on the land; (2) housing reform, and the improvement of village life on 'large and comprehensive lines'; (3) fiscal legislation so shaped as to reduce the war debt with a minimum of injury to industry and credit, to avoid fresh taxes on food and raw materials, and to set up a preference in favor of the colonies upon existing or future duties; (4) liberation of industry as speedily as possible from government control; (5) reform of the house of lords, so as to create a second chamber 'which will be based upon direct contact with the people, and will, therefore, be representative enough adequately to perform its functions'; (6) execution of the pledge already given to 'develop responsible government in India by gradual stages'; and (7) solution of the Irish problem on the basis of self-government, but without either the severance of the island from the British Empire or the forced submission of the Protestant counties of Ulster to a Home rule parliament. . . . At Newcastle, November 29, Lloyd George declared for a 'relentlessly just' peace, the expulsion of enemy aliens, payment by Germany of the costs of the war up to the limits of her capacity, and the punishment of individuals (including the Kaiser) responsible for the war and for infractions of international law. There were plenty of evidences that the country was in a mood for social and political reform of a thoroughgoing character; but the popular attitude was rather that of assuming that such reform must and would come. The only questions on which the electorate allowed itself to be wrought up were those relating to the terms with Germany. It early became apparent that, outside of Ireland, the voters had three groups to choose from: the Coalition, the old-line Liberals, and the Laborites. Pronouncing the election 'a blunder and a calamity,' the non-coalition Liberals, led by Mr. Asquith, frankly avowed their purpose to maintain their party character. A declaration adopted by the National Liberal Federation at its Manchester meeting in October, and ratified by the Scottish Liberals' meeting at Glasgow, served as a platform. The campaign came to a close December 13 with a round of meetings almost up to pre-war standards, and on the following day the poll was taken for a total of 584 seats. One hundred and seven candidates had been returned unopposed; polling for the fifteen university seats began December 20; and in one constituency the poll had to be postponed on account of the death of a candidate. Already some four million voting papers, with a supply of envelopes and ballot boxes, had been distributed among the soldiers in the home camps and on the western front. At the close of the polling in the constituencies, December 14, the ballot boxes were sealed and deposited by the returning officers in places of security, usually the district police stations. For two weeks these officers continued to receive the ballots—duly signed and witnessed—sent in by post, and also the votes cast by proxy. The count took place December 28. No separate record was kept of the votes cast by absentees, or by any other special group of electors. But three or four facts seem fully substantiated: (1) not over 60 per cent of

the registered electors actually voted; (2) as the Liberal and Labor leaders predicted, large numbers of the soldiers overseas could not, or did not vote; (3) perhaps mainly owing to the shortness of time, the proxy system was made use of very sparingly; (4) contrary to the expectation of most preelection observers, the women cast a heavy vote. Under the circumstances comparisons with other elections are worth little. The outstanding feature of the results was the complete triumph of the Coalition. There was hardly room for doubt before the poll that the Coalition would win. But no one expected its margin of success to be so wide. Polling about five-ninths of the popular vote, it elected two-thirds of the house, having 472 seats, which means a clear majority of 240. The Asquith Liberals fared badly. The ex-premier and other leaders were defeated, and the party captured only 37 seats. Labor doubled its representation, with 65 seats. Yet this was by no means the showing that had been confidently predicted; and the three leaders, J. Ramsay MacDonald, Philip Snowden, and Arthur Henderson, were defeated. Forty-six non-coalition Unionists were elected, and two or three minor groups won scattering victories. Ireland was swept by the Sinn Feiners, who won 73 seats, while the Nationalists retained but 7. Before the election the Nationalists had 78 seats and the Sinn Feiners 6. The only woman candidate elected in the United Kingdom . . . [was] a Sinn Feiner. [See above: 1918: Election of women to House of Commons.] Whatever else these results signified, they meant that the nation indorsed the government that had brought it successfully through the war, that it approved the Coalition's peace plans so far as they had been announced, and that it wanted peace negotiated by the men at present in office. It was significant that very few candidates of pacifist or Bolshevik inclinations pulled through. The results meant, too, that the Irish situation had reached a new crisis. The premier repeatedly declared that the contest was not one of parties. None the less the party situation flowing from it cannot be ignored. Two important parties, the Liberals and the Nationalists, have been almost annihilated. Efforts to restore Liberal unity were futile before the elections, and there is room for doubt whether such unity will ever be restored. The leadership of the remnant is admittedly weak. There will be 164 Liberals in the new house of commons; but 127 of them were elected as supporters of the Coalition. In this connection it may be pointed out that not only is the Coalition's quota predominantly Unionist (335 Unionists, 127 Liberals, and 10 Laborites), but the house of commons as a whole is Unionist by a margin of 53 seats. For the moment this majority is split into Coalition and non-Coalition wings."—F. A. Ogg, *British parliamentary elections* (*Quarterly American Political Science Review*, Feb., 1919).

1918-1921.—Changes in land ownership.—"A great change is taking place in the ownership of English land, mainly as the result of heavy taxation. During the war, while the incomes of many

classes were rising rapidly, landowners were debarred by legislation from raising their rents, though their taxes and all their expenses were increasing. Simultaneously, most farmers were able to make very large profits, owing to the increased prices of agricultural produce. Thus, when the war ended, large numbers of owners of land, suffering from or threatened by serious poverty, eagerly jumped at the chance of selling many of the farms they owned to the tenant farmers. The tenants, with large balances at their banks as the result of war-profits, were temporarily bitten with the idea of becoming free-holders, and often paid high prices, which many of them . . . [later] repented. In addition, many people who had made money as manufacturers or merchants during the war were fired with the desire to establish themselves and their families as landed gentry, and sometimes bought whole estates when they were offered for sale; or, alternatively, bought the mansion house and pleasure-grounds, leaving the tenant farmer to buy the purely agricultural land; . . . [later on, however, depression in trade, and the fall in agricultural prices caused the demand for land to fall off, nevertheless] a good many properties were sold even in the year 1921, because the owners found that it was impossible for them to meet the heavy taxes imposed upon landed property after paying the increased charges necessary for the upkeep of their estates. Some idea of the extent to which changes in landownership have been taking place may be gathered from the fact that, in . . . five years [1916-1921], one firm alone has dealt . . . with changes of ownership covering roughly four per cent of the total area of Great Britain. . . . It is worth while to give one or two figures to indicate the financial position of English landowners. In the first place the figures published by the Inland Revenue Department emphasize very forcibly the statement . . . that, while the incomes of most classes in the community were greatly increased during the war, those of landowners remained stationary. . . . [In the second place] it is on landed property that taxation falls most heavily. This is the result partly of old traditions, partly of modern politics. In past centuries, when land was the principal as well as the most visible source of wealth, it was natural that the rulers of the country should treat land as the main basis for taxation. Even when attempts were made to tax movable as well as fixed property, they were not very successful, because of the greater facilities for evasion. The history of taxation in England is full of examples of acts of Parliament establishing the general taxation of all property, and even specifying that land should be taxed only after other forms of property; but in practice the burden remained upon the land, because the land could not be moved and could not escape observation. It is only when we reach the nineteenth century that the enormous growth of industrial wealth, and the concurrent improvement in administrative methods, rendered possible the raising of a large revenue from incomes other than those derived from land-ownership. But the landowner still continues to pay on the average more than his fair share, because it is less easy for him to conceal his income. For the purpose of income tax, the annual value of the land is officially assessed on the approximate basis of the rent paid, and the tenant is required to pay the tax and deduct the amount from his next payment of rent to his landlord. Thus the landowner cannot escape payment of the full amount. . . .

"The effect of these considerations has been in-

tensified by the political campaign of recent years against landownership in particular and capitalism in general. As a result of this campaign,—inspired partly by land nationalizers, partly by Socialists,—there has been a constant tendency to increase the relative burden of taxation falling on large properties. Up to a point this movement may have been justified. The primary principle of taxation, that men should be taxed according to their ability to pay, requires that the rich man should pay at a relatively higher rate than the poor man. Unfortunately, in England the principle has been carried so far that, while the majority of voters pay no income tax at all, a small minority of rich persons are taxed at a rate which is both unjust to them and injurious to the nation. In the case of persons engaged in industry or commerce, the present enormous scale of taxation in England handicaps industrial development by preventing the accumulation of the necessary capital; in the case of the owners of land, the high taxes are one of the main causes of that break-up of estates with which we are here concerned. It should be added that the burden of taxation does not end with the national income tax and super-tax. Local taxation has risen almost as rapidly as national taxation, and falls with special weight upon the owners of real property.

"To see how these cumulative burdens affect the financial position of the landowner, it is desirable to examine a few actual figures. Interesting particulars were published in the *London Times* of August 4, 1921, of one of the typical great English estates—the Duke of Bedford's—of 16,000 acres, situated in the counties of Bedfordshire and Buckinghamshire. The year dealt with is 1920. In that year the owner received a gross rental of £23,437. Out of that he had to pay for the upkeep of the estate no less than £18,648. This figure includes, not merely management charges and necessary repairs and renewals, but also such expenditure upon improvements as every conscientious landowner feels bound to make, in order to keep his estate up to date. In addition, there was a sum of £3684 which had to be paid, mainly for local taxes. The residue left to the owner was only £1105. Yet the income tax on land is so assessed that, though this was all that was left to the owner to spend on himself, when he had done his duty by his estate, he was called upon to pay no less than £3623 for income tax and super-tax. In addition, social custom and local traditions required him to pay various sums, amounting to over £2000, in the shape of pensions to employees and donations to the clergy and to local institutions. The final result, as certified by the duke's accountants, is that this agricultural estate cost him in the year 1920 a net sum of £5100, which he had to meet out of his other sources of income. . . . [But] there are many owners of agricultural estates in England who have no other sources of income, and for them the burden of taxation . . . [became] absolutely crushing. Some . . . [tried] to stave off the calamity of absolute collapse by cutting down their expenditure on the upkeep of their estates. . . . When it is remembered that the price of labor and of all materials had risen enormously . . . it will be seen that the reduction in expense can only mean a lower standard of upkeep. The money that would have been voluntarily spent by owner for the maintenance and improvement of his estate was forcibly taken from him by the Government, partly to meet the cost of the war, but partly also to pay for an enormously expensive civil administration. . . .

"The ownership of land in rural England involves obligations which place the landowner in a much worse position financially than that of a man drawing a corresponding income from stocks and shares. He cannot, therefore, face the same rate of taxation; yet, in practice, as above indicated, he is more heavily taxed. The inevitable consequence is that many landowners can no longer maintain their position. . . . In not a few cases the owner of the estate, unwilling to leave the locality endeared to him by long family traditions, takes refuge in one of the smaller houses or cottages on the property, where he can just afford to live on the narrow income remaining to him. . . . Doubtless many English landowners have lived more or less idle lives, and have devoted more of their time to hunting and shooting than to giving service to the community. Nevertheless, taken as a body, they have been one of the most valuable elements in the nation. The very conditions under which they have lived have given them qualities which are of the highest national value—a sense of duty, the spirit of sportsmanship, the spirit of comradeship. . . . Doubtless, in many cases inequality of social position does produce unjustifiable arrogance on the one side and a lack of independence on the other. Whether we shall ever be able to escape entirely from these admitted evils of inequality is perhaps doubtful; but it is quite certain that, if we attempt to remove these evils by trying to abolish all inequalities, our loss will be greater than our gain. The pursuit of the false ideal of universal equality can, in the long run, result only in universal degradation."—H. Cox, *Changes in land-ownership in England* (*Atlantic Monthly*, Apr., 1922, pp. 556-560).

1919.—British representation at the Peace Conference.—British aims.—Ratification of the treaty.—British gains.—The British delegation to the peace conference numbered some 200 with the same number for the clerical staff. The prime minister, David Lloyd George, with assurance of the support of the people given him in the December elections, had complete control of British policy. In his absence, Balfour represented him. "With the French desire for security British opinion was in hearty sympathy, but as to some of the French proposals for detaching the Rhine provinces there was hesitation. In dividing up the spoils outside of Europe, France and England would need to compromise conflicting claims in a friendly spirit. The surrender of the German fleet had already secured Great Britain in that supremacy of the seas which formed a cardinal policy, and all that remained to be done was to prevent the growth of a similar menace, and to refrain from agreeing to any form of disarmament or any definition of 'freedom of the seas' which should impair the superiority of the British fleet. The German merchant marine had been disposed of in large part, and the remainder could be claimed by way of reparation. German foreign commerce had been for the time extinguished. For the future, German economic competition, at least in its 'unfair' forms, was to be prevented. It was unfortunate that in his campaign speeches Lloyd George had aroused extravagant expectations as to what would be exacted from Germany. The

unreflecting public had been led to believe that the Kaiser and his chief aids would be promptly tried, and quite probably hanged in a row, and that Germany would be forced to pay the entire war debt of the British Empire. One of Lloyd George's tasks at the Conference was therefore to secure results which would not fall too far short of these expectations. Another of his difficulties was to keep the representatives of the Dominions in line, particularly as to the disposition of the German colonial possessions. With regard to these, and to the extra-European situation generally, the British leaders were determined to consolidate and protect their imperial interests in Africa and Asia, and to secure a satisfactory share in new commercial and investment opportunities. [See also WORLD WAR: 1918: X. Statement of war aims: a.]

"Under the British Constitution, the consent of Parliament is not required for treaties with foreign powers. In order to carry out some of the terms of the Treaty with Germany, however, an act of Parliament was necessary, and a bill was accordingly introduced. In effect this meant that the whole Treaty was before the representatives of the people, and it is probable that in the future this precedent will be followed, and that Parliament will thereby gain a greater degree of control over foreign policy. While the debates in the House of Commons brought out some opposition to the Treaty, chiefly from the Labor and Independent Liberal members, it was ratified by a large majority July 21. By another constitutional departure the Treaty was also laid before the legislatures of the four Dominions which had signed it, and was ratified by all of them by the middle of September. On October 10 the King-Emperor signed the act of ratification for the British Empire."—A. P. Scott, *Introduction to the peace treaties*, pp. 54-55, 194-195.—See also PARIS, CONFERENCE OF: Outline of work; VERSAILLES, TREATY OF: Conditions of peace; ST. GERMAIN, TREATY OF.

1919.—Trade disputes.—"Industrially, as well as politically, Great Britain is passing through troublous times. The year 1919 is described in a pamphlet published by the 'Industrial League and Council for the Improvement of Relations between Employers and Employed' as a disappointing year in industry. It is, indeed, a serious fact that in the first year after the cessation of hostilities something over 32,000,000 working days were lost through trade disputes, as compared with about 5,000,000 days in the preceding year. Scarcely a week has passed since the armistice was signed without bringing its strike or threat of strikes, and the observer abroad must have received the impression that Great Britain is in a chronic state of turmoil and chaos. Yet life in Great Britain, industrial, economic, social, religious—in short, in all its departments—goes on, generally, with little outward sign of internal dislocation and instability. From time to time the newspapers announce in big headlines that a fresh 'crisis' has arisen in the relations of employers and work-people in this or that branch of industry, or that 'grave trouble' is threatened for the Government and the nation by this or that powerful labor organisation. Sometimes the trouble comes to a head, and a few thousand men here or a few hundred thousand men there declare a strike. Usually the stoppage lasts only for a day or two. Even before it begins the machinery either of the State or of the trade union movement itself is generally in motion to avert it, or, at the worst, to curtail its duration, by means of conciliation."

1919-1920.—Ministerial changes.—"The small war cabinet set up in December, 1916, for the more effective prosecution of the war, was continued until October 27, 1919, when a new administration was organized. The members of the new cabinet were: Prime Minister and First Lord of the Treasury, David Lloyd George; Lord Privy Seal, A. Bonar Law; Lord President of the Council, Arthur J. Balfour; Chancellor of the Exchequer, Austen Chamberlain; without portfolio, G. N. Barnes (Labor); Chief Secretary for Ireland, J. I. Macpherson; Lord Chancellor, Lord Birkenhead (F. E. Smith); Home Secretary, E. Shortt; Secretary for Foreign Affairs, Earl Curzon; Secretary for the Colonies, Viscount Milner; Secretary for War and Air, Winston Churchill; Secretary for India, E. S. Montagu; First Lord of the Admiralty, Walter Long; Secretary for Scotland, R. Munro; President of the Board of Trade, Sir Auckland Geddes; President of the Ministry of Health, Dr. C. Addison; President of the Ministry of Agriculture, Lord Lee; President of the Board of Education, H. A. L. Fisher; Minister of Labor, Sir R. S. Horne; Minister of Transport, Sir Eric Geddes. In 1920, several ministerial changes occurred. Late in January, Mr. Barnes resigned from the cabinet; in February G. H. Roberts, Food Controller, and in March G. J. Wardle, parliamentary secretary to the Ministry of Labor, resigned from the Coalition ministry, its last Labor representatives. On March 1, Sir Auckland Geddes was appointed British Ambassador to the United States, and was succeeded as president of the Board of Trade by Sir Robert S. Horne, Minister of Labor; Dr. T. J. Mac-

namara, parliamentary and financial secretary to the Admiralty, became Minister of Labor."—*Political Science Quarterly, Sept., 1920, Supplement, p. 91.*—In April, Sir Hamar Greenwood became chief secretary for Ireland.

1919-1920.—Labor crisis.—Proposed nationalization of mines.—Reports of the Sankey commission.—"While a League of Nations was being propounded, there was something wrong in England. 'Nationalization' was the key-word in matters political, and there arose a powerful controversy over this principle. The Miners' Peace Charter demanded it for the mines, and an industrial conflict of great magnitude was only averted by the mutual acceptance of the Coal Mines Commission, to investigate the possibility of these demands, which included the nationalization of all mines and minerals, and a 30 per cent advance on earnings. The Commission, over which Mr. Justice Sankey presided, had extraordinary powers and wide scope, and it conducted an inquisition without precedent into the industry and the profits derived therefrom. The miners' strike notices were dated to expire on March 15th, and the Prime Minister promised that the Commission should present an interim report on March 31st, if they would hold up action for a fortnight. The evidence was heard in public, and was of a sensational character. . . . The first week of evidence severely shook the grounds of private ownership, which was most gravely indicted on grounds of wastefulness, inefficiency and profiteering, and the methods of distribution proved as vulnerable as the system of coal drawing. These general public impressions were supported by a wealth of detail in evidence which was not refuted by witnesses for the existing system. By agreed arrangement, official witnesses were heard first, then representatives of affected industries, next the parties interested in coal ownership, and finally the miners' witnesses, who sought a change in the system. How strange it seemed that this dramatic story should be revealed in the King's robing-room. Sir John Sankey made a most admirable chairman, but the composition of the Commission was too conflicting to yield unanimity in the Interim Report, and on March 20th, the appointed day, three separate Reports were presented, as follows: (1) The Majority Report, signed by Messrs. R. Smillie, Frank Hodges and Herbert Smith, Sir Leo Chiozza Money, Messrs. R. H. Tawney and Sidney Webb, conceding the miners' claims as not excessive, both as to wages and the six hour day. It declared that in the interest of the consumers, as much as in that of the miners, nationalization ought to be at once determined on. (2) The Sankey Report, signed by . . . Mr. Justice Sankey (Chairman), Mr. Arthur Balfour, Sir Arthur Duckham and Sir Thomas Royden, Bart. This recommended a seven hour day from July 16, 1919, and subject to the economic position, a six hour day from July 13, 1921; an advance in wages of 2s. per day, with 1s. for those under 16; the continuation of the Coal Mines Control Agreement; and it proceeded 'Even upon the evidence already given, the present system of ownership and working in the coal industry stands condemned, and some other system must be substituted for it, either nationalization or a method of unification by national purchases or by joint control. It is in the interests of the country that the colliery workers shall in the future have an effective voice in the direction of the mine.' It described houses in some districts as a reproach to our civilization, and suggested that a penny a ton might be collected on and raised to improve hous-

ing and amenities in colliery districts. The penny a ton represented one million per annum. (3) The Coalowners' Report, signed by Messrs. R. W. Cooper, J. T. Forgie, and Evan Williams, which advised an advance of 1s. 6d. per day, with 0d. for persons under 16, a seven hour day below ground, and eight hour day for surface workers. When the Reports were presented to the Government, Mr. Bonar Law, leader of the House, announced that the Government had adopted the Sankey Report 'in spirit and in letter,' but added that if a strike took place the Government would use all the resources of the State without hesitating. This Commission, with its searching evidence and its very important findings, takes rank as one of the most important achievements of organized

should be utilized for the purpose of distribution. . . . Twelve months later one heard very little of the Coal Commission. While it lasted its impress was deep, but daily impressions are varied, and soon exhaust each other. Thus the public memory of a great inquisition is not long. No sooner were the news pages of the daily Press devoted to other subjects than a wholesale and systematic advertising campaign against nationalization began, and it was maintained well into 1920. Pet arguments and phrases were re-served so effectively that nationalization became distinctly unpopular."—J. R. Raynes, *Pageant of England*, pp. 240-244.—See also LABOR ORGANIZATION: 1919: British labor movement; also 1910-1919; TRUSTS: Great Britain: 1919; DIRECT ACTION.

THE THRONE ROOM, WINDSOR CASTLE

labour. The miners withdrew their strike notices, and the Commission resumed its incomplete task. The second stage was even more important than the first, for it was investigating general principles of control upon a prospect already imminent of full agreement as to the future of this great key industry. . . . The second stage began on Wednesday, April 23rd, and during the 28 days on which evidence was heard 116 witnesses were examined. They included expert economists, royalty owners, Home Office witnesses, coal-owners, miners and miners' wives. Two members of the Commission—Mr. Webb and Sir Leo Money—also gave evidence. This time four Reports were presented: . . . All four Reports agreed upon recommending the State ownership of all seams of coal, 'once and for all in one final settlement, together with all easements and rights,' . . . that the machinery of local authorities and of the co-operative movement

1921.—Cabinet changes.—British premier as sails laborites as revolutionary.—Lord Milner resigned his portfolio as Secretary of State for the Colonies on Feb. 14, the reason for his doing so being, it was believed, the failure of the cabinet to adopt the recommendations made in his report on Egypt. On March 17 (see EGYPT: 1921: Lord Milner's report), Premier Lloyd George announced in the house of commons that Andrew Bonar Law had for reasons of health tendered his resignation as leader of the house. That same night at a public dinner the premier said, "When I see one chieftain after another with whom I have been in action during great events falling under the weight of their armor, I do not mind telling you I feel I am becoming very lonely. Public life in these days is an almost intolerable strain, and there is nothing I would like better if I could retire from that strain and be a spectator and witness of events." In urging the necessity of the continuance of the Coalition, the prime minister spoke of the menace of the Labor Party, which he said would become the dominating party in this country unless steps were taken to inform the electorate of the issues it was raising. They are issues of such magnitude; they are issues which are so threatening to the whole fabric of society. It is folly to quarrel about trivialities when you are confronted with issues of that character. I read the other day a newspaper which is subsidized by this party. This is what they say: "No reform, no mere nominal preservation or even advance of money wages in a particular industry or locality will ultimately affect the issue. Capitalism means the beating down of the poor into further poverty, and labor will have to face this unless it goes out to overthrow capitalism." Translated into action, what

does this mean? It means the destruction of private property, the destruction of private enterprise, the conversion of the whole means of production into a great State machine. That may be good, that may be bad—it may be very bad. But, make no mistake about it, it is a complete revolution.' The premier attacked the Independent Liberal Party for asking the Labor Party to join it in getting rid of the coalition and scouted the suggestion that the coalition was a combination to defend the interests of capital. 'It is primarily the business of the coalition to set the interests of the nation as a whole above the interests of any class,' he said. 'The nation should be our party; the nation should be our class, and the nation should be our concern. We must fight selfish sectional interests because they imperil national interests, and we must fight them from whatever quarter these sectional demands may spring. Our party, if it is to live, must be a really national party.'—*New York Times*, Mar. 18, 1921.

1921.—Local taxation.—Its rapid rise.—Local councils.—Their powers and duties.—'One of the differences in terminology between England and America is the use in the former country of the word 'rates' to denote what in the latter are called 'local taxes.' In England the 'rating question,' *simpliciter*, . . . is concerned with the muling of the householder, or 'rate-payer,' of the sums necessary for the upkeep of local government. . . . The outcry against higher rates has been even louder and more widespread than that against higher national taxes. The first resolution passed at an important representative conference held in London in November, 1920, denounced 'the recent rapid increase of the rates throughout the country' as 'an intolerable burden on trade and industry and upon all classes of rate-payers.' Public meetings of protest . . . [were] held in many places, accompanied in some instances by threats of refusal to pay. . . . It would occupy too much space to attempt to give here a complete account of the financial system of English local government, but a brief outline of it may be desirable. . . . The great cities, such as Manchester and Birmingham, are county boroughs, managed by county borough councils. Outside these are the areas administered by county councils. Below these come, in the more thickly populated districts, the non-county borough councils and the urban district councils, and, in the rural districts, the rural district councils. Below the rural district councils stand the parish councils. These various bodies administer, with varying degrees of responsibility, the laws relating to public health, education, the police, housing, the sale of intoxicants, highways, markets, old-age pensions and other poor relief, fire protection, public libraries, and so on. The income of these bodies is derived from rates, which are calculated upon the so called 'rateable value' of the property—mainly, occupied buildings—within their boundaries. The assessment is based upon the rent, with a certain allowance, usually about one-sixth, for the cost of keeping the place in repair. Thus a house actually rented at £60 a year would be assessed at £50. If it is not rented, the amount at which it might reasonably be rented is taken as the rateable value. A rate of so many shillings in the pound means a levy of this number of shillings for every pound of rateable value. On agricultural land only half-rates are paid. The officials of each parish send annual returns of its total rateable value to the county council, which then apportions its demands to the various minor bodies within its domain according to their ability to pay. These

minor authorities add to the demands of the county council whatever sum is needed for the public services peculiar to themselves, calculate what rate per pound of rateable value will be required to raise this amount, and make their levy accordingly. The proceeds of the rates are not the sole source of income at the disposal of the local authorities. They are assisted by 'grants in aid' from the national exchequer, which are assigned for specific purposes, and are either (1) so far fixed in amount as to be independent of any action of the local authority receiving them, (2) varying in some relation to the amount spent by the local authority, or (3) dependent on certain services being rendered by the local authority but not increasing in proportion to the amount spent. The subventions made for education and for the maintenance of the police are among the most notable examples of these grants in aid. For the present financial year the grants in aid are estimated to amount to about £70,000,000, while the income from the rates will be about £149,000,000. Ultimately, of course, the grants in aid come out of the pockets of the same persons as the rates; but in the one case, the citizen plays *qua* taxpayer, on a basis calculated according to the needs of the whole country, and in the other *qua* ratepayer, on the basis of the needs of his own county or county borough and of the rateable value of his own immediate neighborhood. The extraordinary increase in the burden of the rates during recent years will be realized from a few specimen figures. According to Sir Robert Giffen, a rate of 7s. 6d. in the pound is the utmost levy that a locality can sustain without detriment to its industries and enterprises, or, in other words, without damaging employment. But in nine of the metropolitan boroughs the rates in the forthcoming year will average over 21s. in the pound, and the average rate of the remainder will be about 17s. . . . The total amount raised by local rates in England and Wales has risen from £52,940,000 in the financial year ending 1904 to £61,273,000 in 1909, to £71,276,000 in 1914, to £84,500,000 in 1919, and, as mentioned above, to £149,000,000 in the current year [1921]. . . . To what causes is this startling increase in cost of local government to be attributed? There is a popular impression that it is due mainly to the new obligations—in such matters as education, public health, and so on—imposed by Parliament on local authorities in recent years. An examination of the figures, however, will show that only a small proportion of the increase is the result of new legislation. . . . Sir Arthur Chapman's estimate is that not more than 20 per cent of the increase is occasioned by the new burdens placed upon the local authorities by all the Government Departments combined. . . . [There are] strong objections. . . . [to] nationalization of these charges. It would further swell the size and power of a central bureaucracy that is already overgrown. If the national exchequer met the whole cost, it would be impossible to allow the local authorities to retain such control as they now possess over the expenditure of the money, and incidentally one of the best features in English public life would be destroyed, for no city would secure the services of its best men in the work of local government if the functions of the administrative bodies were thus impaired."—[In November] the mayor of Poplar and several of the members of the town council were imprisoned for their refusal to levy rates which, they declared, the borough was too poor to pay. As a result of this incident there has been introduced into Parliament a 'Local Authorities (Financial

Provisions) Bill' for the purpose of affording relief to the poorer boroughs within the London area.'—H. W. Harwill, *Problems of local taxation in England (Political Science Quarterly, Dec., 1921, pp. 561, 562, 564, 565, 566, 571)*.

1922 (February-April).—Opening of Parliament.—Lloyd George's victory.—Reading-Montagu incident.—When Parliament reassembled on February 7th, premier Lloyd George expressed the national gratification over the results of the Washington arms conference. A report by Sir Eric Geddes, chairman of the Committee on National Economy, called upon the government for drastic retrenchment, and pointed out that this could be achieved by naval and military reductions. It was proposed to reduce the national expenditure by £100,000,000, of which amount over £75,000,000 could be saved by retiring 50,000 officers and men from the army and 35,000 from the navy. . . . A sensation was created on March 8 by the publication in London of an important message from Lord Reading, viceroy of India, to the Secretary of State for India, Hon. Edwin S. Montagu. "In this message the viceroy declared that the support which the Moslem cause had received throughout all India and the intensity of Indian feeling over the terms of the Sèvres Treaty made its immediate revision imperative. The first Lloyd George knew of this was when he saw it in his morning paper at home. After consultation with other members of the Government, he sent for Mr. Montagu, declined to accept his explanations, and demanded his resignation forthwith, on the ground that he had violated, without cause or necessity, the rule of collective responsibility. . . . The text of this telegram, the publication of which at the Viceroy's urgent request led to Secretary Montagu's exit from official life, was as follows: 'On the eve of the Greek-Turk conference [this refers to the allied conference scheduled to meet in Paris on March 22] we feel that it is our duty again to lay before your Majesty's Government the intensity of feeling in India regarding the necessity for a revision of the Sèvres Treaty between Turkey and the Allies. The Government in India is fully conscious of the complexity of this problem, but India's record in the war, in which Indian Moslem soldiers participated in such great numbers and the support which the Indian Moslem cause has received in the entire nation, entitle her claim to the completest fulfillment and justify her reasonable aspirations. The Government in India par-

ticularly emphasizes the necessity of guaranteeing the neutrality of the Dardanelles and the security of its non-Moslem peoples. It also urges evacuation of Constantinople, sovereignty of the Sultan over holy places, restoration of the Turk in Thrace, also in Adrianople and Smyrna. The Government urges that these points are of supreme importance to India."—*New York Times Current History*, Apr., 1922.—"It was reported from Delhi that this startling message had been dispatched only after consultation with all the provincial administrations in India. It was received by Secretary Montagu at a time when Lloyd George was confined to his home by illness, and he authorized its publication on his own responsibility. It raised a tremendous storm, in which most of the thunder was furnished by Lloyd George himself. It also precipitated a bitter con-

been reduced from \$360,800,000 to \$272,800,000. The much-discussed budget was presented in the Commons on May 1 by Sir Robert Horne, Chancellor of the Exchequer. . . . The Chancellor . . . pointed out that whereas the debt to the United States two years ago was equivalent to £1,301,875,000 when exchange was \$3.30, it was now reduced to £946,820,000 with exchange at \$4.40, and when restored to par, as he hoped it would be soon, the debt would be £856,030,000. Estimated total Government expenditures dropped below the billion-pound mark for the first time since the close of the war at about £910,000,000."—*New York Times Current History*, June, 1922.—The income tax was reduced from six to five shillings in the pound; duty on tea was reduced from a shilling to eight pence per pound, while several other duties levied for revenue were correspondingly

HOUSE OF LORDS, WESTMINSTER

trovrsy between Mr. Montagu and Lord Curzon, the British Foreign Secretary. . . . The news of Mr. Montagu's resignation created considerable excitement in India, and Lord Reading himself expressed deep regret, declaring that the Indian people had lost a sincere friend."—*Ibid.*—A political crisis arose from a split between the two historic parties—Liberals and Conservatives—developing into a revolt against the Coalition ministry. A by-election in a Wolverhampton borough was carried by a Coalition Unionist against the Labor candidate, an event hailed as a triumph for Lloyd George. A resolution approving his policy with regard to the forthcoming Genoa Conference was carried in the Commons on April 3 by an overwhelming majority of 372 against 94.

1922 (April-May).—*Estimates and budget.*—Naval and military reductions.—The Army Estimates for 1922-1923 "showed that the armed force had been reduced to 215,000, as compared with 341,000 for the preceding year, and the cost had

lowered. An Admiralty Order issued on May 14 stated that, as a result of the Washington Conference for naval reduction, 1,835 naval officers would be retired out of a total strength of about 9,450 officers.

1922 (May-June).—Genoa conference. See GENOA CONFERENCE.

1922 (May-June).—Government defeat.—Women and House of Lords.—Palestine mandate in Parliament.—On a proposal to tax teachers in state schools five per cent, as a contribution towards providing pensions, the government suffered a defeat on May 16, by an adverse vote of 151 to 148. On the 10th the House of Lords in Committee of Privileges voted twenty to four against admitting Viscountess Rhondda, a peeress in her own right, to a seat in the Upper Chamber, a decision which barred twenty-one other peeresses from the House of Lords. On the 25th, after making a statement on the Genoa Conference, premier Lloyd George carried the House with him

by 235 votes to 26. The Palestine mandate was subjected to severe criticism in the Lords on June 20, when a motion condemning the government policy was carried by 60 to 29. Sir Henry H. Wilson, a distinguished soldier, member of Parliament from Ulster and organizer of Ulster defences, was shot and killed by two assassins in front of his house in London. The culprits were subsequently sentenced to death and executed.

1922 (July-August).—German reparations crisis.—London meeting of British and French premiers. See GERMANY: 1922 (July-August).

1922 (July-September).—Palestine mandate upheld in Commons.—Claims of United States Shipping Board settled.—British attitude on war debts.—Washington agreement ratified.—A debate in the Commons on July 4 resulted in a vote of 202 to 35 in favor of the Palestine mandate. On July 13, Great Britain paid \$12,000,000 in settlement of the claims of the United States Shipping Board for the services of American ships during and after the war. On August 1 the British government delivered a note to the governments of France, Italy, Portugal, Greece, Yugoslavia and Rumania to the effect that Great Britain would be unable to cancel the war debts owing to her "since the American Government had called upon his Majesty's Government to settle the war debt due to Washington. The note stated, however, that the British Government did not intend to try to collect more than it had to pay. Much speculation was indulged in . . . until Mr. Lloyd George explained in the House of Commons on August 3 that a settlement could not be made at the expense of the British taxpayer alone."—*New York Times Current History, September, 1922*.—King George affixed the royal assent to the Washington disarmament treaties on August 10, thus completing British ratification of those instruments.

1922 (October-November).—Resignation of Lloyd George.—End of the coalition.—General election.—Conservative victory.—Crushing defeat of Liberals.—Labor party as the new opposition.—During the early autumn there were numerous indications that the Coalition ministry had outlived the welcome accorded to it in the general election of December, 1918. There was murmuring in both Conservative and Liberal camps against the alleged "dictatorship" of Lloyd George and it was widely held that the Coalition, having steered the ship of state through the war and early reconstruction period, should be dissolved again into its component parts—Liberals, Conservatives and Laborites. As to the central figure around which the gathering storm was brewing—David Lloyd George—"no other [British] statesman has had to grapple with such gigantic problems. The work of Pitt, masterly though it was, must be considered as limited in scope in comparison with the mighty undertakings which the Prime Minister has had to shoulder." (Lord Rothermere.) "Mr. Lloyd George had founded the Ministry of Munitions; he had succeeded Lord Kitchener as Minister of War; he had been Prime Minister through the long anxieties and immense effort of the 1916-1918 period, and he reaped his reward when peace came in a popular adulation of which the staggering majority given to the Coalition he formed is but a faint indication. To a degree astonishing to remember, Mr. Lloyd George was the Coalition—its head and front, its center and circumference; its horse, foot and artillery. What vitality it had in those days

was his vitality; as he moved, so, like a shadow on the wall, it moved also. This dynamic predominance had, from the point of view of the man who enjoyed it, many advantages and one great defect. It enabled him to gather up into his own hands the executive functions of government to a degree never before vouchsafed to any preceding British Prime Minister; it allowed him a freedom of action comparable, and in some respects exceeding, that of the President of the United States . . . but, on the other hand, as it left him alone to reap the glory, so it bared his back, and his alone, to the punishment of failure. . . . He seemed to his critics—and it is only if we examine the grounds of criticism that we can explain his downfall—that he had struck at the very roots of representative government as Great Britain knows it; that he had not only assembled in his own person most of the attributes constitutionally reserved for the Cabinet, but that he had withdrawn himself from Parliament, which is the fount of power, and had thus degraded it to a mere vehicle for the validation of his decisions. . . . It would be tedious to recite the events in the Near East which drew Britain and France apart, which led up to the withdrawal of the French forces from the neutral zone of the Dardanelles, and which, as the victorious Turkish army advanced, left Great Britain as the only obstacle to the unhindered and practically unlimited re-entry of Turkey into Europe. What is important, in any survey of British politics, is to note the fact that the British people, war-weary and infinitely tax-weary, found themselves on the brink of another struggle, whose ultimate extent it would be impossible to predict, but whose effect upon the finances of the nation must inevitably be disastrous. Even though a resort to arms was happily averted, the critics of the Prime Minister were quick to point out that the military and naval measures made necessary by the crisis would involve an expenditure not less than \$150,000,000, and perhaps more. This was the vantage point that the opposition needed. On October 10 a meeting of Conservative members of Parliament decided, by 186 votes to 87, to withdraw from the Coalition and to go before the country at the next general election as a Conservative Party. When it is recalled that the Coalition looked for three-quarters of its strength to the Conservatives, it will be realized why the news of this vote so promptly brought the resignation of Mr. Lloyd George, and why he advised the King that the task of forming a new Government should be entrusted to the man whose influence had been paramount in securing it—Mr. Bonar Law."—W. Lewis, *New York Times Current History, Dec., 1922*.—Lloyd George resigned on October 19, and on the 23rd Bonar Law took office, with Stanley Baldwin as chancellor of the exchequer and Lord Curzon remaining in office as foreign secretary. The general election was fixed for November 15. The result of this "appeal to the country" came as a surprise even to those who confidently expected both the Coalition and the Liberal Party to go down before the public verdict. The Unionist or Conservative party captured 344 seats out of a total of 615; the Labor party took 138; the Liberals (Asquith-Grey followers) came third with sixty seats; Lloyd George National Liberals, fifty-seven; Independents, a new party, won five seats; Co-operative or "Anti-Waste" party secured four seats; Irish Nationalists two; Sinn Fein and Communist, one each. This grouping gave the Unionist government of A. Bonar Law a majority of seventy-three over all parties and raised the Labor Party, for the first time, to the rank of the offi-

cial Opposition. Winston Churchill was defeated by a Prohibitionist and eight other ministers of the Coalition government also lost their seats.

ENGLAND, Constitution of.—“Our English Constitution was never made, in the sense in which the Constitutions of many other countries have been made. There never was any moment when Englishmen drew out their political system in the shape of a formal document, whether as the carrying out of any abstract political theories or as the imitation of the past or present system of any other nation. There are indeed certain great political documents, each of which forms a landmark in our political history. There is the Great Charter [see MAGNA CARTA], the Petition of Right [see PETITION OF RIGHT], the Bill of Rights [see BILL OF RIGHTS]. But not one of these gave itself out as the enactment of anything new. All claimed to set forth, with new strength, it might be, and with new clearness, those rights of Englishmen which were already old. . . . The life and soul of English law has ever been precedent; we have always held that whatever our fathers once did their sons have a right to do again.”—E. A. Freeman, *Growth of the English constitution*, ch. 2.—“It is, in the first place, necessary to have a clear understanding of what we mean when we talk about ‘the English Constitution.’ Few terms in our language have been more laxly employed. . . . Still, the term, ‘the English Constitution’ is susceptible of full and accurate explanation; though it may not be easy to set it lucidly forth, without first investigating the archaeology of our history, rather more deeply than may suit hasty talkers and superficial thinkers. . . . Some furious Jacobins, at the close of the last century, used to clamor that there was no such thing as the English Constitution, because

it could not be produced in full written form, like that of the United States. . . . But an impartial and earnest investigator may still satisfy himself that England has a constitution, and that there is ample cause why she should cherish it. And by this it is meant that he will recognise and admire, in the history, the laws and the institutions of England, certain great leading principles, which have existed from the earliest period of our nationality down to the present time; expanding and adapting themselves to the progress of society and civilization, advancing and varying in development, but still essentially the same in substance and spirit. . . . These great primeval and enduring principles of our Constitution are as follows: The government of the country by an hereditary sovereign, ruling with limited powers, and bound to summon and consult a parliament of the whole realm, comprising hereditary peers and elective representatives of the commons. That without the sanction of parliament no tax of any kind can be imposed; and no law can be made, repealed, or altered. That no man be arbitrarily fined or imprisoned, that no man’s property or liberties be impaired, and that no man be in any way punished, except after a lawful trial. Trial by jury. That justice shall not be sold or delayed. These great constitutional principles can all be proved, either by express terms or by fair implication, from Magna Carta, and its . . . supplement [the statute ‘Confirmatio Cartarum’]. Their vigorous development was aided and attested in many subsequent statutes, especially in the Petition of Rights and the Bill of Rights. . . . Lord Chatham called these three ‘The Bible of the English Constitution,’ to which appeal is to be made on every grave political question.”—E. S. Creasy, *Rise and progress of the English constitution*, ch. 1.—“The fact that our constitution has to be collected from statutes, from legal decisions, from observation of the course of conduct of the business of politics; that much of what is written is of a negative sort, stating what the Crown and its ministers cannot do; that there is no part of it which an omnipotent Parliament may not change at will; all this is a puzzle not only to foreign jurists who are prepared to say, with De Tocqueville, that the English constitution does not exist, but to ourselves who are prepared to maintain that it is a monument, if only we can find it, of political sagacity. Those who praise it call it flexible; those who criticise it, unstable.”—W. R. Anson, *Law and custom of the constitution*, pt. 1, p. 35.—“The English Constitution is a body of rules and understandings more or less clearly defined, in accordance with which the various governmental agencies are kept in harmonious action. The greater part of these are not laws at all, but are mere understandings based upon custom, or growing out of the necessities of government. Yet, if we apply the American analogy to the English Constitution, we find that a part of it is actual law. . . . Some of the most important rules of the Constitution have had a judicial origin. . . . It will be observed that these rules are not mere understandings; they are laws, and laws enforced by the courts. That is, they are a part of the common law. Again, a part of what we [in America] should call constitutional law is, in England, enacted by Parliament. . . . Besides Magna Charta, the Petition of Right, the Habeas Corpus Act, and the Bill of Rights, [like-wise Parliament Act, 1910] there are many other acts of the English Parliament which, with us, hold a place in our written constitutions.”—J. Macy, *English constitution*, pp. 107-108.—See also PARLIAMENT, ENGLISH; CABINET: English.

## ENGLISH LITERATURE

**Formation.**—"Inheritance and environment are as important to a nation as to a man. Now up to the time of Chaucer we have to trace the heredity, to watch the ancestors, of our English literature. After that time the literature is born, a fresh power in the world, and we watch what happens to it under different masters; the influences that play upon it from other nations—France, Italy, Spain, Palestine, Rome, and Greece. These influences modify and affect it very much, for it is sensitive; but they cannot change its nature—that is determined by its inheritance. . . . Few nations have had a nobler heritage; few a heritage so complex. . . . The life of three great races has passed into our literature, and can be traced there, from century to century, even when distinct racial existence has long been lost in the wider personality of the nation. These three are the Celtic, the Anglo-Saxon, and the Norman. The Celts were in England first. . . . Our first knowledge finds them established in what are now England, Scotland, Ireland, and Wales, and also across the sea, in the fair wide land of France." After the invasion and withdrawal of the Roman conquerors of Britain, "great hordes from the Northlands of Germany and Scandinavia, whom we call Anglo-Saxons from the name of their two most important tribes, bore down upon the British like a flood, submerged them completely in England, and took and held for hundreds of years possession of the land. These Anglo-Saxons, however, left Ireland, Scotland, and Wales mainly Celtic, as they are to this day. Nor were the Celts as fully exterminated even in England as used to be supposed. Not only Celtic place-names, but a Celtic quality which the English have never lost, show that the Celts must have blended their traditions with those of their successors. This subtle Celtic spirit survived even the Norman invasion. For the Anglo-Saxons did not stay masters. In the eleventh century came the Normans. . . . It came to pass that they became in their turn the masters of England, and for the time checked all native expression on English soil. During several centuries it seemed as if literature in England were to be only a pallid reflection of that across the Channel. But this was not true. The literature of England was to become mighty and original. And when its great music at last made itself heard, the strains from three races clearly blended in its harmony."—V. D. Scudder, *Introduction to the study of English literature*, pp. 17-19.—See also CELTS: Ancient Irish sagas.

**3rd century.**—Celtic sources.—**Ancient Celt.**—**Literary characteristics.**—**Old Celtic fragments.**—"Influence of the Celt on English literature proceeds not from example set by one people and followed by another, but in the way of nature, by establishment of blood relationship, and the trans-

mission of modified and blended character to a succeeding generation. The pure Gael—now represented by the Irish and Scotch Celts—was, at his best, an artist. He had a sense of literature, he had active and bold imagination, joy in bright colour, skill in music, touches of a keen sense of honour in most savage times, and in religion fervent and self sacrificing zeal. In the Cymry—now represented by the Celts of Wales—there was the same artist nature. . . . The sense of literature was shown in the earliest times by the support of a distinct literary class among the Celts who then possessed the country. In Erin, the first headquarters of song and story, even in the third century, there was the poet with his staff of office, a square tablet staff, on the four sides of which he cut his verse; and there were degrees in literature. . . . Of the bold and active fancy that accompanied this Celtic sense of literature as an art, and of the Celt's delight in bright colour, almost any one of the old Gaelic poems will bear witness. . . . The delight in music—among the old Irish Celts in music of the harp and tabor, among the old Welsh Celts in music of the harp, the pipe, and the crowd—is another characteristic."—H. Morley, *First sketch of English literature*, pp. 8-10.—"Most of those Irish stories are part of the epic cycle of Conchobar and Cuchulainn, and concern the wars of Ulster and Connaught. They are in prose interspersed with verse. . . . If we look through the collections that have been made of them, we can see that the Celtic authors of that period are already remarkable for qualities that have since shone with extreme brilliancy among various nations belonging to the same race: the sense of form and beauty, the dramatic gift, fertility of invention. . . . Above all, such a dramatic gift is displayed as to stand unparalleled in any European literature at its dawn. . . . In such tales as the 'Murder of the Sons of Usnach' or 'Cuchulainn's Sickness' in which love finds a place, these remarkable traits are to be seen at their best. . . . No wonder that the descendants of these indefatigable inventors are men with rich literatures and that they happen some day to produce the greatest number of the plays that are acted, and of the novels that are read, all over the civilized world."—J. J. Jusserand, *Literary history of the English people*, pp. 11-13.—See also CELTS: Ancient Irish sagas.

**6th-11th centuries.**—**Anglo-Saxon and Danish sources.**—**Widsith.**—**Beowulf.**—**Christian literature.**—**English Chronicle.**—"Toward the close of the sixth century, the English tribes had as yet no literature. The use of their runes was much restricted; single signs or short sentences, proverbs, magic formulas, were scratched upon staves, drinking horns, swords, ornaments, etc. . . . Law and justice, myth and saga, history and practical

wisdom were handed down orally in poetical sayings, or flowing song. High esteem was paid to the art of 'finding sayings rightly bound', that is, in alliterative verse, and of speaking with skill and clearness. . . . The player and singer was called *gleóman*, gleeman. The word *scop* had a more special, and a more exalted significance, denoting the poets and singers who dwelt at a court. . . . Nevertheless, a longing for distant scenes, the Teutonic roving impulse, often seized him; and wandering from court to court, everywhere a welcome guest, he brought fresh songs, and tidings of strange people and events. A typical representative of this brotherhood of itinerant singers, named Widsith, or far-traveller, is the hero of an old song, the oldest monument of English poetry that remains to us. . . . Widsith, who was in Italy with Albion, must have 'spoken' when the immigration of the German tribes into England had virtually ceased. If his reminiscences reach back to a period when the English still dwelt in their original home, if, generally speaking, the personages who appear in his narrative, even when they are brought into mutual relation, partly belong to very diverse times, this merely proves that Widsith is a typical figure. But if, in the enumeration of peoples, the position as to the primitive abode of the English is authoritative, this may perhaps be explained only by the theory that the groundwork of the poem really descends from this early age, and that consequently it was not composed by a single poet, but grew up gradually. . . . The same conclusions hold good with regard to all extant remains of the Old English epic."—B. ten Brink, *Early English literature*, pp. 10-11, 23.—"The history of this period [Anglo-Saxon] is only gradually being written. Modern research is discovering old manuscripts that have lain hidden for ages, and is throwing fresh light on others that have been little regarded. But already we possess enough specimens of our early literature to enable us to make broad general statements as to its nature and the circumstances under which it was written. The greater part of our early literature is in verse. Anglo-Saxon verse has certain definite characteristics which distinguish it from the verse of any other period. Its metre is quite unlike the metre of modern English verse, and does not depend upon the number of syllables contained in each line. The lines are divided into halves by means of a pause, and each half line contains two accented syllables. There is no rhyme in Anglo-Saxon verse. Instead, there is studied alliteration, which forms an important element in the metrical structure; the two accented syllables in the first half of the line, and one of the accented syllables of the second half begin with the same letter. This is the rule, though there are many variations. The prose written during the Anglo-Saxon period is meagre in quantity and of small literary value. The *English Chronicle*, a few prefaces and translations by Alfred the Great, a collection of homilies and addresses—these are all the specimens we possess. Bede, we know, translated the Gospel of St. John into the English tongue, but no copy of his work has come down to us."—A. Cruse, *English literature through the ages*, p. 15.—Among the notable works extant of this early period is *Beowulf*, an epic poem. "*Beowulf* is a tale of adventure; the incidents in it are such as may be found in hundreds of other stories. Beowulf himself, the hero, is a champion and a slayer of monsters. He hears that the King of the Danes is plagued in his house by the visits of an ogre, who night after night comes and carries off one of the King's men. He goes on a visit to Den-

mark, sits up for the ogre, fights with him and mortally wounds him. That does not end the business, for the ogre's mother comes to revenge her son, and Beowulf has a second fight and kills her too, and is thanked and goes home again. Many years afterwards when he is king in his own country, Gautland (which is part of modern Sweden), a fiery dragon is accidentally stirred up from a long sleep and makes itself a pest to the country. Beowulf goes to attack the dragon, fights and wins, but is himself killed by the poison of the dragon. The poem ends with his funeral."—W. P. Ker, *English literature, medieval*, p. 32.—"*Beowulf*, because it is extant, has sometimes been overvalued, as if it were the work of an English Homer. But it was not preserved as the *Iliad* was, by the unanimous judgment of all the people through successive generations. It must have been of some importance at one time, or it would not have been copied out fair as a handsome book for the library of some gentleman. But many trashy things have been equally honoured in gentlemen's libraries, and it cannot be shown that *Beowulf* was nearly the best of its class. It was preserved by an accident; it has no right to the place of the most illustrious Anglo-Saxon epic poem. The story is commonplace and the plan is feeble. But there are some qualities in it which make it (accidentally or not, it hardly matters) the best worth studying of all the Anglo-Saxon poems. It is the largest extant piece in any old Teutonic language dealing poetically with native Teutonic subjects. It is the largest and fullest picture of life in the order to which it belongs; the only thing that shows incontestably the power of the old heroic poetry to deal on a fairly large scale with subjects taken from the national tradition. The impression left by *Beowulf*, when the carping critic has done his worst, is that of a noble manner of life, of courtesy and freedom, with the dignity of tragedy attending it, even though the poet fails, or does not attempt, to work out fully any proper tragic theme of his own."—*Ibid.*, pp. 29-31.—"One of the engaging figures of some centuries later is that of the earliest Christian poet of England, Caedmon. . . . Caedmon's poetry, written in Old English when religious writings in other countries more generally employed the Latin, is but part of the independence of the English church and the English people, part of that development of an individual life and an individual literature that has distinguished England. [See also BIBLE, ENGLISH: 7th-8th centuries.] . . . One other literary name it is important to remember, the name of Alfred, perhaps the gentlest of great kings. . . . No less than Beowulf, he was a people's king. . . . and there is a very homely kindness in the writings in which he tells about the affairs of his kingdom or reports the discoveries of those who have come back from their voyages and told him their stories. . . . These are the things that are perhaps most particularly to be remembered in this Anglo-Saxon period of English literature, the Beowulf, the songs of Caedmon, Bede's *Ecclesiastical History*, and the writings of King Alfred. One more name should be added here, . . . that of the religious poet Cynewulf. . . . It was with the reign of Alfred that England became more nearly a land of one people and could begin to grow into the arts of peace and a settled order. . . . This is the period when the tales of gleemen sung about the hall to the music of the harp pass into the more enduring form of the written word. It is the written word that makes a literature, and in monasteries and abbeys of England men were eagerly and joyously

copying the written words of others, making the wisdom of books their own, and out of their own experiences setting their thoughts in order for other men to read after them."—L. W. Smith and E. V. Hathaway, *Skyline in English literature*, pp. 13-18. —"It was the habit of the monasteries to put down on the *Easter Tables* the briefest and driest records of the events of the year, chiefly the deaths and enthronements of bishops and kings. . . . At the time of Aethelwulf or shortly after his death, some one man, and probably Bishop Swithun of Winchester, filled up the Winchester Annals from tradition back to Hengest, combined them with the Canterbury Chronicle, made a genealogy of the West Saxon kings from Aethelwulf to Cerdic, from Cerdic to Woden, and from Woden to Adam; and then, having inserted new matter throughout, told at some length the wars and death of Aethelwulf. This part of the *Chronicle*, running to 855 was found by Aelfred [Alfred] on his accession and remained as it was till the days of peace. Then about 801, having conceived the notion of making it a national history, he caused the whole to be gone over, and the part from the accession of his brother Aethelred, with a full account of his own wars with the Danes, to be written in. It is, from its style, the work of one man, and it may be that Aelfred did it himself. . . . In this recension many fresh entries were made from the Latin writers and Baeda's history. This then is the manuscript of the *Annals of Winchester* which, written by a single hand, was presented by Archbishop Parker to Corpus Christi College at Cambridge. . . . From 901 when Aelfred died, to 910, the story is but poorly recorded, but in 910 the pen is taken up by probably the same hand which wrote the account of the years from 804 to 897 with so much breadth, earnestness, and power."—S. A. Brooke, *English literature from the beginning to the Norman conquest*, pp. 224-225, 271-272.—"The 'Anglo-Saxon Chronicle,' running from Alfred's day to King Stephen's, and thus surviving the Norman Conquest, is the earliest historical writing in English prose. As we have seen, it was the work of the monks, regular soldiers of learning, living together under strict rules. . . . During the long cruel wars against the Danish raiders and settlers (900-960) many monasteries were overthrown. . . . Under Eadwig the Fair, St. Dunstan (957-975), peace was restored, and Dunstan could carry out reforms as Archbishop of Canterbury. . . . New monasteries, which often had schools attached to them, were built, and old monasteries were restored. . . . Ethelwold himself taught Latin to boys at Winchester, and had the Latin book of the rules of the Benedictine monks done into Anglo-Saxon. A set of Anglo-Saxon sermons survives from this age called 'The Blickling Homilies'. . . . In the school at Winchester Ælfric was trained (born 955?) and thence went to instruct the young monks in the abbey of Cerne in Dorset, where he preached homilies; he wrote them both in English and in Latin. His sermon on the 'Holy Housel,' that is the Holy Communion, contained ideas which the Protestants, at the Reformation, thought similar to their own, and they printed this homily. 'All is to be understood spiritually'. . . . The style of the prose is more or less alliterative, and a kind of rhythm is detected in some of the sermons, as if they were intended to be chanted. . . . His Dialogue (*Colloquium*) between a priest and a number of persons of various occupations, throws light on ways of living. He wrote Latin 'Lives of Saints,' and edited part of an English translation or paraphrase of the Bible, suitable as material for homilies. He

produced many other theological works, . . . being Abbot of Eynsham in Oxfordshire. The interest of Ælfric, Wulfstan, and the rest, for us, is that they upheld a standard of learning and of godly living, in evil times of fire and sword, and that English prose became a rather better literary instrument in their hands. . . . After the Conquest, Anglo-Saxon prose, save in the 'Chronicle,' was almost submerged, though, in poetry, there were doubtless plenty of popular ballads, for the most part lost or faintly traceable as translated into the Latin prose of some of the writers of history."—A. Lang, *History of English literature*, pp. 31-33. —See also ENGLAND: 855-880; HISTORY: 19; BALLAD: Ballad and history.

11th-14th centuries.—Effects of Norman conquest.—Edward the Confessor.—Latin chroniclers.—Poetry of the "langue d'oil."—"The Norman conquest of England from a literary point of view, did not begin on the autumn day that saw Harold's levies defeated by Norman archers on the slopes of Senlac. It began with the years which from his early youth onwards, Edward the Confessor, the grandson of a Norman duke, had spent in exile in Normandy; and with his intimacy with 'foreigners' and its inevitable consequences. The invasion of Norman favourites, which preceded and accompanied his accession to the throne, and their appointment, for a time, to the chief places in church and state, led to the tightening of the bonds that bound England to the Roman church, and paved the way for the period of Latin influence that followed the coming of William, Lanfranc and Anselm. . . . The development of Old English literature . . . was arrested. It was by no means, as some have urged, lifeless before this break in its history; and speculation would be futile as to what might have been its future, had there been no Norman conquest, . . . but the literary spirit of the people, though they were crushed under their Norman masters, never died out; it had little or no assistance at first from the alien lettered classes; and when it revived, it was 'with a difference.'"—A. R. Waller, *Norman conquest (Cambridge history of English literature, v. 1, ch. 8)*.—"Under William and his first successors, people wrote and sung in Latin, Caledonian, Welsh, Anglo-Saxon, the Roman of the troubadours, and sometimes the Roman of the troubadours. There were poets, bards, jongleurs, minstrels, conteors, fableors, gesteors, harpeors. Poetry assumed all sorts of forms, and gave to its productions all sorts of names: lays, ballads, rotruenges, carols, chansons de gestes, tales, sirventois, satires, fabliaux, jeux-partis, dicties. . . . There were romances of love, romances of chivalry, romances of St. Graal, romances of the Round Table, romances of Charlemagne, romances of Alexander, and sacred poems. . . . The miracles and mysteries formed an essential part of the literature of all Christian countries, from the tenth to the sixteenth centuries. The French language despised and warred against that of the Anglo-Saxon. . . . The very act of Parliament of 1362 which directs that the English idiom shall thenceforth be in use is drawn up in French. . . . After the battle of Crécy had been fought . . . whilst the English were . . . enumerating in French, the slain of the French army, it must have occurred to their minds that they had not always been conquerors, and that they preserved in their own language the very proof of their subjection, and of the fickleness of fortune. . . . At last, the Parliament convoked at Westminster the 20th of January 1483, under Richard III; drew up the bills in English, and its example was followed by

succeeding parliaments. The three kingdoms of Great Britain were on the verge of adopting the French language: Shakespeare would then have written in the idiom of Rabelais."—F. A. R. De Chateaubriand, *Sketches of English literature*, v. 1, pp. 66, 79, 93, 95-96.—"Of all the literary monuments of the remarkable revival of learning which followed the coming of the Normans, and which reached its zenith under Henry II, the greatest, alike in bulk and in permanent interest and value, is the voluminous mass of Latin chronicles compiled during the twelfth and thirteenth centuries. . . . So wide is their outlook, and so authoritative is their record of events, that, as Stubbs observes, 'it is from the English chroniclers of this period that much of the German history of the time has to be written.' The new England had become conscious of her power, and of her growing importance in the international economy of Europe. In literature the most signal expression is that consciousness in the work of the Latin chroniclers. . . . The twelfth century is, above all, the age of the birth of modern romance. The institutions of chivalry, the mystic symbolism of the church, the international currency of popular fabliaux, the importation of oriental stories of magic and wizardry—all contributed to the fashioning of the fantastic creations of the medieval romances. . . . Geoffrey of Monmouth, ambitious of supplying what previous writers had failed to tell about the kings of Britain before the coming of the English, wrote a chronicle which had all the charm and novelty of a romance of adventure. King Arthur, as a romantic hero, is Geoffrey's creation. Hence the most readable Latin chronicle of the twelfth century is one that has the least real claim to that title. But the *History of the Kings of Britain* is no more to be ruled out of a place in the chronicle literature of England than it is to be ousted from its assured pre-eminence as the fountain-head of Arthurian romance. For Geoffrey's legends not only wrought their spell upon innumerable poets and imaginative writers, but continued for generations to disturb the writers of history, and to mystify a long line of honest and laborious chroniclers. . . . The thirteenth century is emphatically the golden age of the monastic historians. At their head stands Matthew Paris, the greatest of all our medieval chroniclers; but his work only represents the crowning literary achievement of an enthusiasm and an industry that inspired every considerable monastery in the land. . . . The art of the historian proper, however, gradually began to decline after the death of Matthew Paris. Among the chroniclers who take us down to the fourteenth century there are few names worthy of a place in a history of literature."—W. L. Jones, *Latin chroniclers (Cambridge history of English literature, v. 1, ch. 9)*.—"One further consequence of the Norman Conquest must not be overlooked. Anglo-Saxon poetry was alliterative, that is, it employed initial or head rhyme rather than end rhyme. . . . End rhyme came in at this period with the Norman-French and the influence of Latin and French scholarship. The change was one from strength, a sort of pounding and insistent emphasis, to a greater refinement, variety, ease and complexity. All this, of course, made for greater fulness in the expression of thought, while life itself, and man's ideas about life were also growing fuller."—L. W. Smith and E. V. Hathaway, *Skyline in English literature*, pp. 29-30.—"The predominance of French poetry in Europe, during the twelfth and thirteenth centuries, is due to its poetry of the *langue d'oïl*, the poetry of northern France and of the tongue which is now the French language.

[See FRENCH LITERATURE: 5th-15th centuries.] In the twelfth century the bloom of this romance-poetry was earlier and stronger in England, at the court of our Anglo-Norman kings, than in France itself. But it was a bloom of French poetry; and as our native poetry formed itself, it formed itself out of this."—T. H. Ward, *English poets, v. 1, introduction*, p. 30.

14th century.—Age of Chaucer.—Beginnings of English poetry of social consciousness.—Minstrels.—Renaissance retarded.—"Geoffrey Chaucer [c. 1340-1400] is the greatest English writer between the Norman Conquest and the age of Elizabeth. He was the first courtly poet in English, the first to equal the French in any of the fields in which they shone, the first to feel and to utilize any of the splendid achievements of Italian poetry. He had genius as well as talent; he was a conscious artist, not merely an industrious writer. Such is his eminence that we are ever tempted to estimate him, not by his compatriots or his contemporaries, but by the best writers of the classical and the modern literatures. Chaucer was not a deliberate reformer of the English language. He used the current dialect of his native city. In this dialect he wrote with the care and consistency of a literary artist. He did not labor to reduce or to normalize inflection, or to expand the vocabulary by introduction of foreign terms; it has been shown that, passage for passage, *Piers Plowman* contains a somewhat greater proportionate use of foreign elements than does Chaucer, and that, on like themes treated in a like spirit, the proportion of native elements in the two writers would probably be about the same. Chaucer's conscious effort in this field consists in his persistent loyalty to the vernacular, in face of the temptations of Latin and French. By producing a large body of excellent literature in London English, as unpurposed consequences he assisted toward the dominance of that dialect, he made composition in the native tongue respectable in any class of society, and, being widely imitated for over a century, he affected the literary language and helped to establish a standard speech. For smoothness, facility, grace, variety, and novelty, Chaucer was the greatest English metrist up to the time of Shakespeare, and is to be classed among the most notable writers of English verse in any period. His achievement is the greater from the paucity of forms in earlier English verse, and from the comparatively unsettled state of the language that he had to use. In the *House of Fame*, the *Duchesse*, and perhaps the *Romaunt*, he employed the short couplet—long familiar from the *Roman de la Rose*, and practised admirably in the *Owl and the Nightingale*; in *Sir Thopas* he used the tail-rime popular in the later romances; and perhaps it was he who wrote the two tetrameter quatrains abab of the *Proverbs*. He introduced into English the pentameter couplet in the *Legend* and most of the *Canterbury Tales*, and *tersa rima* in the *Complaint to his Lady*."—J. E. Wells, *Manual of the writings in Middle English*, pp. 500-600.

"One of the finest passages in English criticism of poetry is Dryden's estimate of Chaucer in the Preface to the *Fables*. Chaucer is taken by Dryden, in the year 1700, as an example of that sincerity and truth to Nature which makes the essence of classical poetry. In this classical quality, Dryden thinks that Ovid is far inferior to Chaucer. Dryden makes allowance for Chaucer's old-fashioned language, and he did not fully understand the beauty of Chaucer's verse, but still he judges him as a modern writer with respect to his imagination; to no modern writer does he give higher

praise than to Chaucer. This truth to Nature, in virtue of which Chaucer is a classic, will be found to be limited in some of his works by conventions which are not always easy to understand. Among these should not be reckoned the dream allegory. For though it may appear strange at first that Chaucer should have gone back to this in so late a work as the Prologue to the *Legend of Good Women*, yet it does not prevent him from speaking his mind either in earlier or later poems. In the *Book of the Duchess*, the *Parliament of Birds*, the Prologue to the *Legend*, one feels that Chaucer is dealing with life, and saying what he really thinks, in spite of the conventions. *The House of Fame*, which is a dream poem, might almost have been written for a wager, to show that he could bring in everything traditional, everything most common in the old artificial poetry, and yet be original and fresh through it all. But there are some stories—the *Clerk's Tale*, and the *Franklin's Tale*—in which he uses conventions of another sort and is partially disabled by them. These are stories of a kind much favoured in the Middle Ages, turning each upon one single obligation which, for the time, is regarded as if it were the only rule of conduct. . . . In the *Legend of Good Women* he is limited in a different way, and not so severely. He has to tell 'the Saints' Lives of Cupid'—the Legends of the Heroines who have been martyrs for love; and as in the Legend of the Saints of the Church, the same motives are repeated, the trials of loyalty, the grief and pity. The Legend was left unfinished. . . . But the stories are distinct, and all are beautiful—the legends of Cleopatra, Queen and Martyr, of Thisbe and Ariadne, and the rest. Another poem which may be compared with the *Legend of Good Women* is the *Monk's Tale*—an early work to which Chaucer made later additions—his book of the *Falls of Princes*. The Canterbury pilgrims find it too depressing, and in their criticism of the Monk's tragedies Chaucer may possibly have been thinking also of his unfinished *Legend of Good Women*. But what has been said of the Legend may be repeated about the Monk's Tale; there is the same kind of pathos in all the chapters, but they are all varied. One of the tragedies is the most considerable thing which Chaucer took from Dante; the story of Ugolino in the *Inferno*, 'Hugelyn Erle of Pise.' It is uncertain whether Chaucer knew the *Decameron* of Boccaccio, but the art of his comic stories is very like that of the Italian, to whom he owed so much in other ways. It is the art of comic imagination, using a perfect style which does not need to be compared with the unsophisticated old French ribaldry of the *fabliaux* to be appreciated, though a comparison of that sort will show how far the Middle Ages had been left behind by Boccaccio and Chaucer. Among the interludes in the *Canterbury Tales* there are two especially, the monologues of the Wife of Bath and the Pardoner, where Chaucer has discovered one of the most successful forms of comic poetry, and the Canon's Yeoman's prologue may be reckoned as a third along with them, though there, and also in the *Canon's Yeoman's Tale*, the humour is of a peculiar sort, with less character in it, and more satire—like the curious learned satire of which Ben Jonson was fond. It is remarkable that the tales told by the Wife of Bath and the Pardoner are both in a different tone from their discourses about themselves. Without *Troilus and Criseyde* the works of Chaucer would be an immense variety—romance and sentiment, humour and observation, expressed in poetical language that has never been equalled for truth and liveliness. But it is only in *Troilus* that Chaucer uses his full

powers together in harmony. All the world, it might be said, is reflected in the various poems of Chaucer; *Troilus* is the one poem which brings it all into a single picture. In the history of English poetry it is the close of the Middle Ages."—W. P. Ker, *English literature, medieval*, pp. 247-252.

"Gower [d. 1408] should always be remembered along with Chaucer; he is what Chaucer might have been without genius and without his Italian reading, but with his critical tact, and much of his skill in verse and diction. The *Confessio Amantis* is monotonous, but it is not dull. Much of it at a time is wearisome, but as it is composed of a number of separate stories, it can be read in bits, and ought to be so read. Taken one at a time the clear bright little passages come out with a meaning and a charm that may be lost when the book is read too perseveringly. The *Confessio Amantis* is one of the medieval works in which a number of different conventions are used together. In its design it resembles the *Romance of the Rose*; and like the *Romance of the Rose* it belongs to the pattern of Boethius; it is in the form of a conversation between the poet and a divine interpreter. As a collection of stories, all held together in one frame, it follows the example set by the *Book of the Seven Wise Masters*. Like the *Romance of the Rose* again it is an encyclopædia of the art of love. Very fortunately, in some of the incidental passages it gets away from conventions and authorities, and enlarges in a modern good-tempered fashion on the vanities of the current time. There is more wickedness in Gower than is commonly suspected. Chaucer is not the only ironical critic of his age; and in his satire Gower appears to be, no less than Chaucer, independent of French examples, using his wit about the things and the humours which he could observe in the real life of his own experience."—*Ibid.*, pp. 225-226.—"After Gower come Occleve and Lydgate. . . . Poetry and religion are no longer capable of suggesting a genuine sentiment. . . . Continually we meet with dull abstractions, used up and barren; it is the scholastic phase of poetry."—H. A. Taine, *History of English literature*, v. 1, p. 138.—"The Elizabethan and Jacobean dramatists regarded themselves as the lineal descendants of the poets of the fourteenth century; they made use of their materials; they inherited something of their spirit; they even reproduced features of their style. If we are to understand the motives of the finished poetical architecture of the writers of the English Renaissance, we must examine the foundations on which they are built. . . . Gower, Lydgate, Occleve, and others may be in themselves the dull folk that M. Taine finds them, but they rise to a position of some dignity when they are regarded as the pioneers of our poetry."—J. Courthope, *History of English poetry*, v. 1, preface, pp. xix-xx.—"The merry charm of Chaucer's 'Canterbury Tales' afforded infinite delectation to a reading public of Church and clerkdom. But it is one thing to reach the public, quite another to reach the people; and the more difficult achievement was Langland's [c. 1330-c. 1400]. His grave verse went straight to the heart of the still Teutonic race, indifferent to the facile French lilt of Chaucer. Serfs and laborers, seemingly inaccessible to influences of culture, as they staggered along under their heavy loads, eagerly welcomed the 'Visions of Piers the Plowman,' of 'Do Well, Do Better, and Do Best.' They heard, pondered, and repeated, till they realized that their souls had found utterance at last. The central version of the great poem—for the author rewrote it three times—antedated by only two or three years the Peasants' Revolt under Wat

Tyler and John Ball. This was the first largely significant prophecy in England of a distinct industrial movement. . . . The first note of the social revolution is heard in its confused echoes. . . . Langland was thus a direct power, as few poets have ever been, upon an awakening national life. The revolt failed. . . . Times passed, conditions changed. The poem of Langland was forgotten. Nor was any other destiny possible to it. Consciously or unconsciously, Langland rejected all elements of the common life offered from above, from culture, learning, knighthood. . . . 'The Canterbury Tales' are of the same half-century as 'The Vision' of Langland; and still the wayfaring man may rejoice in their fresh romance and bewitching melody, while the solemn measures of Chaucer's brother-poet chant to the scholar and the seeker alone. . . . This is the book of the people. . . . Sharing the people's sorrows, it shares also their fate; it is forgotten. . . . This appeal is the first word of the social literature of England."—V. D. Scudder, *Social ideals in English letters*, pp. 21-23, 45.—"The presents, the favor of the great, rendered enviable the lot of the minstrels; they multiplied accordingly. . . . Popular movements were the occasion for satirical songs against the great, songs composed by minstrels and soon known by heart among the crowd. . . . The renown of the popular rebel, Robin Hood, the outlaw, who lived in the twelfth century if he ever lived, went on increasing. His manly virtues were extolled; picturesque companions were, later, invented for him: Friar Tuck, Maid Marion, Little John and all the imaginary inhabitants of Sherwood Forest; listeners were told how this pious man, who, even in the worst danger, waited till mass was over before thinking of his safety, boldly robbed the great lords and high prelates, but was merciful to the poor; which was an indirect notice to the brigands of the time that they should be careful to discern in their rounds between the tares and the wheat. The sympathy of the minstrels for ideas of emancipation which had made such great progress in the fourteenth century, was not only evinced in their songs, but also in the remodelled romances recited by them in presence of the nobles, and which henceforth were full of high-flown declarations on the equality of men. . . . Poets and popular singers had thus an influence over social movements, less through the maxims scattered throughout their great works than by those little unpolished pieces struck off on the moment, which the lesser of them composed and sang for the people, at the cross-roads in times of trouble, or by the peasants' hearth in ordinary times, as a reward for hospitality."—J. J. Jusserand, *English wayfaring life in the Middle Ages*, pp. 212-213, 215-216.—"We may conclude . . . that the progress of the 'new learning' in England was somewhat retarded by the peculiar conditions of the time. In the fourteenth century the influence of Italian culture is apparent in the later works of Chaucer, and the spirit of the Reformation was anticipated by Wyclif; but these men were far ahead of their time, and it was not until toward the end of the fifteenth century, when the long struggle for the crown had been ended by the accession of Henry VII, that the Italian influence began again vitally to affect England."—H. S. Pancoast, *Introduction to English literature*, p. 175.—See also PHILOLOGY: 18; BALLAD: Development.

15th century.—Dawn of the Renaissance.—Transition period.—"The fifteenth century dawned upon an England that had outlived the energising idealism of the twelfth century. The vigorous vitality of that era had been paralysed by

the wasteful futilities of the Hundred Years' War with France, and divided councils at home. Feudalism that had been a power in Norman times in evolving order and solidarity out of anarchy and confusion, survived now only as a spent force. No longer did it suit the needs of the nation. The plaint of Langland, the anathema of Wycliff, bear witness to the general unrest and disorganization. The sterility of English literature after Chaucer testifies to the lowered vitality of the time. Yet once again is the old saying justified that it is darkest before the dawn. There has been a stirring of fresh life, a kindling of new desires in Italy and Germany. . . . But while Italy was on fire with the new sunrise, it was still for England merely a streak of light upon the horizon."—A. Compton-Rickett, *History of English literature*, pp. 77-78.—"The general lessons of the fifteenth century are rather unusually easy to disentangle; indeed, the very want of intrinsic, and so misleading, interest leaves these lessons all the more exposed. In poetry we have little or no progress to chronicle, and a surprisingly small amount of positive achievement, this latter being found almost wholly in the small group of the better Scottish poets [James the First, Robert Henryson, William Dunbar and Gavin Douglas] and in the anonymous writers of ballads and carols. . . . The mystery and miracle play had perhaps for centuries—certainly for some century and a half—been practiced by the not always rude mechanicals of probably every great town in the kingdom. The farce-interludes, originally introduced to prevent the effect being too solemn. . . . had gradually detached themselves and constituted almost an independent kind. That religious feeling after the Reformation exaggerated the dislike of Catholicism for dramatic performance as such, and did not maintain the exceptional tolerance for religious drama, mattered little. The excessive earnestness and sternness of the time, required easement in some direction, and found it in this. . . . Of prose . . . it is possible to speak with less allowance. That the period gives one of the best books in English literature [Mallory's *Morte d'Arthur* printed by Caxton] may be partly . . . an accident; that the translations, not yet final but substantively formed, of the Bible and the adaptations of the Liturgy at its close have supplied nearly four centuries since with models of exquisite cadence, of enchanting selection and arrangement of vocabulary, is, if not an accident, the result of . . . circumstances not all of which . . . are literary. But it is no accident, it is of the essence of literary history and development of the time, that the resources, the practice, the duties, the opportunities, of prose continue during the whole course of the period steadily to expand, to subdivide themselves, to acquire diversity, adequacy, accomplishment. . . . It is scarcely too much to say that the fifteenth century, with a few years backward into the fourteenth and onwards into the sixteenth, plays the same part in regard to English prose that the thirteenth century, with probably (for our knowledge is dimmer here) a few years backward into the twelfth century and certainly more than a few forward into the fourteenth, plays in regard to English verse."—G. Saintsbury, *Short history of English literature*, pp. 215-218.—See also PRINTING AND THE PRESS: 1476-1401.

1530-1660.—English Renaissance.—Poetry.—The sonnet.—Spenser.—Raleigh.—Sidney.—Daniel.—Drayton.—Shakespeare.—Miscellaneous prose writers.—Fiction.—Lyly.—Greene.—Nashe.—Sidney's *Arcadia*.—Lodge.—Bacon.—Burton.—Milton.—Donne.—"We now pass to the period designated as Elizabethan. . . . It is the

period of Spenser, Shakespeare and Milton. It is clearly defined in the first, reaches its zenith in the second, and passes away in the third."—J. Bascom, *Philosophy of English literature*, p. 69.—"Much more markedly than in the case of most period-divisions, 'Elizabethan' literature divides naturally and internally according to the historic label, at least as regards its rise. Every labelled period, of course, is found to dovetail into its antecedent; and the first printed poetry current under Elizabeth was mostly written in her father's reign. But between 1530 and 1580 there is none the less a difference as between two eras. Between the poetry of Hawes, Barclay, and Skelton, and the poetry of Wyatt, Surrey, Sackville, and Spenser; between the prose of Elyot and Lord Berners and the prose of Bacon and Hooker; between the dramatic interludes of Cornish and John Heywood and the drama of Marlowe, Jonson, and Shakespeare, there is a far more marked leap in development than can be noted in any previous period of three generations since Chaucer. There has been at once an epochal change in verse form, a swift ascent from the Middle Ages to the topmost height of the Renaissance in dramatic aim and achievement, and a no less marvellous rise in prose diction and doctrine from an old world naïveté, half scholastic, half rustic, to a deeply reflective and wholly civilized way of writing and ratiocination. . . . The new verse is clearly motivated by and modelled on Italian and French example. . . . In the short love poems of Wyatt and Surrey . . . poetry has . . . ceased to be book-making and the lyrical supersedes the didactic motive. . . . Upon that innovating stir of poetic impulses there followed, within a quarter of a century, a far greater and more enduring artistic florescence, also stimulated by foreign example, but deeply rooted too in vernacular art, . . . the large output of the eager and fertile muse of Spenser. Here it is that Elizabethan narrative and lyric poetry reaches the height of its power and luxuriance, reaching out a magisterial hand to Milton in the next age, and making possible his epic by demonstrating the poetic wealth of the living tongue. . . . Between Spenser's stanza and his varied rhyming measures on the one hand, and on the other the blank verse of the drama as finally established by the triumph of Marlowe and perfected by Shakespeare, the foundations of modern English poetry were completely laid within the space of a few years. . . . In drama the Elizabethan innovation is the most marked of all."—J. M. Robertson, *Elizabethan literature*, pp. 11, 13-15.

"The age of Elizabeth is above all the age of song. . . . The origin of the modern lyric of art in the poetry of Wyatt and Surrey . . . has already been [alluded to]. *Tottel's Miscellany* is the first book of modern English lyrical poetry, and it includes what the following generation regarded as the best of the lyrical output of the reign of Henry VIII. . . . From 1580 to 1590, for example, it was the custom to express lyrical sentiment for the most part in the terms of the pastoral."—F. E. Schelling, *English literature during the lifetime of Shakespeare*, pp. 120-122.—"*The Shepherds' Calendar* [Edmund Spenser, c. 1552-1599] is the first successful attempt to write poetical pastoral eclogues in English. . . . Notwithstanding that *The Shepherds' Calendar* is . . . imitative of foreign poets, written in a mode which seems strained and artificial to us to-day, and weighted by a conservative adherence to an archaic vocabulary and an obsolete system of rhythm in parts, the poem was an immediate success, and Spenser was enthusiastically hailed as 'the new poet' in a chorus of praise. . . . [It] is more than a set of eclogues on amorous

and trifling subjects. It contains underneath a thin disguise of pastoral form, a deep undercurrent of sturdy and independent opinion. . . . The *Epithalamion* which celebrated his marriage, in June, 1594, has been truly described as 'one of the grandest lyrics in English poetry.' . . . And now as to Spenser's famous book, *The Faery Queen*. Fortunately for our understanding of its scope and meaning, we have Spenser's own interesting letter to Raleigh. Therein we learn that *The Faery Queen* is 'a continued allegory or dark conceit,' and that 'the general end thereof . . . is to fashion a gentleman or noble person in virtuous and gentle discipline.' . . . [The] stupendous plan was never completed. The six finished books give the legend (each in twelve cantos, averaging fifty or sixty stanzas each) of Holiness, Temperance, Chastity, Friendship, Justice, and Courtesy; while a fragment of two 'Cantos on Mutability' is supposed to have belonged to a seventh book (not necessarily seventh in order) on Constancy. . . . As *The Faery Queen* remains to us, it is like some fragment of ancient sculpture, the more beautiful from its incompleteness. However, such is its exquisite detail and such its chainlike quality of unity in continuance, that it is probable that we are not much the losers by this. Indeed, with all its elaborate plan, *The Faery Queen* must be pronounced one of the most plotless epics in existence. Moreover the narrative, despite its graces and variety, is repetitious, if continuous. . . . Two allegories underlie the story of *The Faery Queen*, one figuring forth abstract virtues and religious qualities, the other the concrete presentation of the same. . . . The Spenserian stanza [consisting of nine lines and rhyming ababbcbcc] is Spenser's own, and is certainly to be regarded as one of the happiest inventions in formal versification. Its adaptation, moreover, to the style and subject of *The Faery Queen* is perfect; for the Spenserian stanza combines the advantage of a beautiful integral form, of sufficient scope to admit every variety of cadence, with the unusual additional faculty of linking well stanza to stanza. . . . The paradox of Spenser's genius lies in his combination in harmonious union of a passionate love of the sensuously beautiful with the purest and sternest ethical spirit of his time. This it is that makes Spenser alike the poet of the Renaissance and the poet of the Reformation. . . . Raleigh [c. 1552-1618] was deeply interested in the exploitation of England, to his own advantage as well as the empire's. [See also HISTORY; 24.] But he was likewise a poet possessed of a 'lofty and insolent vein,' scorning the world, its snares and vanities. Raleigh had been a friend of Marlowe, and reputed a member of a club of atheists, or at least free-thinkers, in his youth; yet it was to him that Spenser confided the ethical scheme of his ideal of a moral world in *The Faery Queen*."—*Ibid.*, pp. 48-49, 54, 56-57, 59-61, 296.—"The last [decade] of the sixteenth century, is the time of the sonnet. Introduced into the language by Wyatt, first practised in sequence and raised to the standard of exquisite poetry by Sidney [1554-1586], the Elizabethan sonnet appears to have owed, almost from the first, nearly as much to France as to Italy."—F. E. Schelling, *English literature during the lifetime of Shakespeare*, pp. 128-129.—"*Astrophel and Stella* (like the rest of Sidney's work) was printed after his death, appearing first in a surreptitious edition in 1591, and procured for the printers by Thomas Nash [or Nashe]. This earliest sequence of its kind in the language consists of one hundred and ten sonnets with a few intercalated lyrics in other measures. The series was indubitably inspired by the sonnets of Petrarch and the Platonic

ideals of love therein upheld by the Italian poet's cult of his ideal mistress, Laura."—*Ibid.*, p. 29.—"The first and surreptitious edition of *Astrophel and Stella* . . . included not only Sidney's sequence, but 'sundry other rare sonnets of divers noblemen and gentlemen,' notably twenty-eight sonnets of Samuel Daniel [1562-1619]. . . . The poet resented this premature publication of his work, and in the following year put forth a true edition of his *Delia*, which included the sonnets already published together with many others and a narrative poem, *The Complaint of Rosamund*. Daniel's poetry was so well received that in the next year, 1594, he issued another edition, called *Delia and Rosamund Augmented*. Neither of these poems was without its effect upon the non-dramatic poetry of Shakespeare. And indeed Daniel deserved his popularity; for versatility of expression, choiceness and polish of diction, grace and leisurely dignity of style, all are his; though no one could be carried away by his fervor, and the flowers of his ornamentation seem artificial at times. . . . Sonneteering now became the fashion, and sequence after sequence, in repeated editions, issued from the press. Drayton [1563-1631] added the writing of sonnets to his multiform literary activities. . . . Giles Fletcher, in his *Licia*, turned from travel and diplomacy; . . . Sir John Davies from the law; Spenser from epic poetry and Shakespeare from the stage to sonneteering. . . . [Among] the sonnet sequences of amatory import, five . . . stand out distinct in poetical merit above the rest: these are, in order of time, Sidney's *Astrophel*, Daniel's *Delia*, Drayton's *Idea*, the *Amoretti* of Spenser, and the *Sonnets* of Shakespeare. . . . Michael Drayton's career in poetry was to be a long and honorable one, for to him, as to the other poets just mentioned, sonneteering was but the passing fashion of the moment. In the longer reaches of his work, Drayton is a Spenserian, as shown in his love of allegory and the pastoral mode, the sweet continuousness of his measures, his natural felicity, even in his want of design and lengthy elaborateness. And for all these things in time Drayton's popularity came to equal almost that of his master. But the earlier sonnets of Drayton preceded both Spenser and Shakespeare. Drayton's sonnets, judged as a whole, appear to echo successively Daniel, Sidney, and Shakespeare. Drayton's *Idea* began with a few sonnets among several pastorals, published in 1593. . . . The definitive edition of 1610, *Idea* had come to contain many sonnets, written long after the sonnet-craze, while other earlier ones had been suppressed. Indeed, one sonnet of Drayton's (the one beginning 'Since there's no help, come, let us kiss and part') which impressionistic criticism has discovered to be 'so fine that nobody but Shakespeare could have written it,' appears for the first time in this edition of 1610, three years after Shakespeare's death. Drayton's sonnets in general have less of grace and art than those of Daniel; at times they are even somewhat harsh. Despite their 'originals,' they seem less Italianate than the earlier sequences, although their metrical facility and ease are prevailing, and two or three will maintain their place among the very best sonnets of their time. . . . A critical analysis of the *Amoretti* discloses that the series falls naturally into two parts, the second beginning with the sixty-third sonnet. Up to that point the sonnets are concerned with Spenser's courtship. In the second part, the lofty celebration of love's victory is the poet's theme. . . . [In Shakespeare's (1564-1616) *Sonnets*] the poet has become the devoted friend of a youth, much younger than himself and of a

station in life above him. At much the same time he yields to a passionate infatuation for a dark lady who keeps both men in her toils to their undoing. The first group of sonnets details the growth and fluctuations of the poet's affection for his friend. . . . The second series deals more briefly with the poet's passion for his mistress whose 'blackness'—to use the Elizabethan word—he extols above the lily fairness of other men's beloveds; whom he reproaches for her unfaithfulness and for the wreck which she finally makes of the devotion of his friend as well as of his own. . . . As a sequence the *Sonnets* of Shakespeare are not pleasing. The story is not attractive, nor the uncontrol with which it is told. It produces the effect of a vivid, terrible, and confused dream; its very beauties seem the flowers of a heated and overwrought imagination; and while it strikes one in only a few of its interpolated notes as unreal, there is a distortion about it. . . . But if we come to the consideration of individual sonnets, here is

SHAKESPEARE

(From the engraving by Martin Droeshout)

Shakespeare preëminent. Unequal as the sonnets are, considered together,—some of them on a level with Lynebe or Barnes—there remains a collection, the poetic excellence, the masterly touch and truth of which no other poetry of the Elizabethan age can approach."—F. E. Schelling, *English literature during the lifetime of Shakespeare*, pp. 120-131, 137-139, 144-145.—"As with his plays, Shakespeare, instead of looking for new subjects, chose well-known ones, often treated and constantly alluded to; their popularity was, in his eyes, an inducement. . . . The myth of Venus and Adonis, drawn from the most popular of Latin poets, Ovid, had been told in English by Spenser, summed up by Lodge, alluded to by Marlowe, Greene, and others. The story of Lucrece, drawn from Livy and Ovid, had been told by Chaucer, Gower, Lydgate, Paynter, Barnabe Googe, and had been the subject of numerous ballads. The two pictures were as a foil one for the other, the first being devoted to sensual love and the second to constancy. But both dealt with physical love, and were sure to please the inmates of 'Castle Joyeous.' In contrast to the sombre group of the puritans, still

glittered and frisked in the sunlight the group of the young noblemen, all beribboned and gilded, superb, careless, well-read, enamoured of beauty, leading free lives, ancestors of those long-plumed cavaliers who were to display such valour and meet such tragic fates. To these dilettantes, whom the poets and artists of Italy, and already more than one English author, had familiarised with the splendours and the debauches of Olympus, Shakespeare offered sensual pictures, complacently painted with an expert, leisurely hand, in glowing colours, enchanting to the eye of the unchaste. As he had surpassed in 'Titus Andronicus' the horrors of 'Tamburlaine,' so he surpasses in his 'Venus' the grace of past 'Scyllas' and the indelicacy of future 'Pygmalions.' It is, indeed, the group of worldly readers alone that Shakespeare seeks to please; even in his dedication to Southampton he adopts their disdainful and ironical tone; for them he describes his temptress, for them he modulates the exquisite music of his lines, displays his nudities, and through Venus's lips sings his hymn to physical love. 'Lucrece,' another risky subject, is treated by him with more reserve. If the melody of the verse remains sweet and the colouring brilliant, the poet transforms his heroes into reasoners and their discourses fill most of the work. . . . The poet, having, in using their own methods, surpassed the amourist and lyrical writers then in fashion, was thenceforth, and for that very reason, recognised by all as a poet; his two booklets had a considerable sale, especially his 'Venus,' which attained, during his lifetime, seven editions, more than did any of his plays. He gained, thanks to these works, a rank of his own on the English Parnassus."—J. J. Jusserand, *Literary history of the English people*, pp. 204-208.

"If the Elizabethan drama is a new birth alike as to form and content, no less does Elizabethan prose tell of a rapid development of mental life. . . . Sir Thomas More [1478-1535] . . . [threw] out in his youth, under Henry VIII, a work in Latin, the *Utopia*, which is quite abreast of any Elizabethan book in the keenness and originality of its criticism of life."—J. M. Robertson, *Elizabethan literature*, p. 16.—"Among those who, following Erasmus, strove to make use of the writings of antiquity for the instruction and edification of their contemporaries . . . [was] Sir Thomas Elyot [c. 1490-1546]. . . . [He] is best known by his treatise, *The Boke named the Governour*. . . . It is a lengthy and exhaustive treatise on the education which those who are destined to govern ought to receive. . . . The whole book is full of classical reminiscences taken either directly from the authors of antiquity or borrowed from the humanists of Italy."—T. M. Lindsay, *Englishmen and the classical Renaissance (Cambridge history of English literature, v. 3, ch. 1, pp. 21, 22)*.—"Roger Ascham, [c. 1515] who survived until 1568, was the leading writer of the age in English; his influence was strenuously opposed to the introduction of those French and Italian forces which would have softened and mellowed the harshness of the English tongue so beneficially, and he was all in favour of a crabbed imitation of Greek models, the true beauty of which, it is safe to say, no one in his day comprehended in the modern spirit. It is impossible to call Ascham an agreeable writer, and pure pedantry to insist upon his mastery of English. His efforts were all in an academic direction, and his suspicion of ornament was in diametric opposition to the instinct of the nation, as to be presently and in the great age abundantly revealed. Meanwhile to Ascham and his disciples the only thing needful seemed to be 'to speak

plainly and nakedly after the common sort of men in few works.'"—E. Gosse, *Modern English literature*, pp. 79-80.—See also EDUCATION: Modern: 1510-1570: Ascham and the Scholemaster.—"Had it not been for Italy, the novel might have tarried for another hundred years. Rhetoric and song were indigenous to the race: Spenser, Marlowe, Shakespeare would have found articulate speech, Italy or no Italy. But it may reasonably be doubted whether we should have had the Elizabethan novelist. . . . The Elizabethan prose writers who distinguished themselves in prose fiction were John Lyly, Robert Greene, Thomas Lodge, Sir Philip Sidney and Thomas Nash."—A. Compton-Rickett, *History of English literature*, p. 105.—"With the fresh tides of pleasure and of passion which flowed in upon English life and English literature in Elizabethan days arose new questions for those whose temper was serious, and who could not be content with a culture which ignored the moral nature of man. . . . A reconciliation of this kind was aimed at by Lyly [1553-1606] in his *Euphues*, and it was presented in a novel literary form—a decorated prose, in which the sentences are patterned out and enriched with ornament according to certain rules easy to understand and to apply. Art in prose-writing was a demand of persons of culture, and it was not yet felt that the highest art conceals itself. Here was a prose-style in which every sentence was turned out of the mould as exact in all its ornaments as a piece of our cheap cast-iron. . . . This prose of Lyly's was like nothing human, like nothing natural, therefore it was so much the more distinctively the product of art. But the detestable style of Lyly was only one of the chief sources of the popularity of his book, which passed through ten editions between its first publication and 1636. The other great recommendation was that it endeavoured to effect a reconciliation between Renaissance culture and the old morality of England. . . . Religion, education, literature, manners were seriously handled, and yet with the gleam and brilliance of the newest fashion in prose-writing. Above all *Euphues* treated in an edifying spirit of love; honour was done to woman; honour was done in particular to English matrons and maids. . . . The tale was no old-fashioned romance of knightly adventures; it was an Odyssey of culture, including in that word moral culture; the young men and maidens of whom it told were in fact those of Elizabethan England. We can perceive why the book became popular. Such grace and wit as belonged to Lyly are best seen in his courtly plays; but he is a moral teacher in his prose. . . . Lyly wrote as a superior person, as a reformer of manners, as a reformer of style. Robert Greene [c. 1560-1592] was by no means a superior person; he lay open to all the various influences of the time, gave himself away to this and to that, wrote in every style on every subject admitting of imaginative treatment, imitated Lyly, imitated Marlowe, refurbished tales from the Italian, addressed himself to readers of refinement, addressed himself to the vulgar, snatched a hasty popularity, and achieved no masterpiece. His non-dramatic works have been thrown by M. Jusserand, the historian of the Elizabethan novel, into four groups, and the classification is sufficiently comprehensive and correct: his novels proper, or romantic love stories, called by Greene his 'love-pamphlets'; his patriotic pamphlets; his 'conny-catching' writings, in which 'he depicts actual fact, and tells tales of real life foreshadowing in some degree DeLoe's manner,' with descriptions of low London company and the ways of sharpers, and cut-purses,

and women of ill-fame; last, his Repentances, pamphlets in which Greene shadows forth a portion of his own pitiful history, records the errors of his past, and makes feeble resolutions of amendment. Starting on his literary career as a disciple of Lyly, he attempted afterwards the Arcadian pastoral style, the amorous-chivalric style, the classical transformed into the romantic, the grouped tales set within a narrative framework, and whatever other form might lend itself to the taste of the time. . . . *Ciceronis Amor, Tullie's Love*, one of the most popular of Greene's prose works, although classical in name, is in fact romantic, re-handling, as seems probable, certain motives suggested by Boccaccio. . . . If any of Greene's romances be read at the present day, by all means let it be *Pandosto* . . . [and his] most studied piece of pastoral, *Menaphon or Arcadia*. . . . The style is excessively elaborate, so heavily cumbered with ornament as to make the reader's task laborious; but according to the manner of not a few Elizabethan romances (a manner, perhaps, derived from the Spanish romance of *Diana*), songs are interspersed, and in these we may find our reward for toiling through the trammelling flowers with which Greene obstructs the path of his narrative."—E. Dowden, *Essays, modern and Elizabethan*, pp. 336-370, 372-374, 376.—"Like his friend Greene, Nashe [1567-1601] was responsible, in the first place, for certain pamphlets dealing with the social life of London; but he does not confine himself, as was the case with Greene, to the out-cast and the pariah, nor, on the other hand, does he find much attraction in the steady-going citizen. His attack is directed against respectable roguery, against foolish affectations and empty superstition, and these things proved excellent whetstones for his satirical wit. His *Anatomie of Absurditie* (1589) is a characteristic study of contemporary manners. He plays with the theme of Stubbes's *Anatomy of Abuses* (1583); but, while he does not deny that much evil was abroad, he yet contrives to find much that is amusing in the 'licentious follies' assailed by the puritan. In *Pierce Penniless, his Supplication to the Divell* (1592), where he figures as Pierce, Nashe gives a fair taste of his quality. . . . All this pamphleteering work, however, was completely overshadowed by his picturesque novel *The Unfortunate Traveller or the life of Jack Wilton*, which appeared in 1594, and which was the most remarkable work of its kind before the time of Defoe. It relates the lively adventures of the rogue-hero, an English page, who wanders abroad, and comes into contact with many kinds of society. . . . The form of this work, in the first place, is of great interest, for it resembles the picturesque type indigenous to Spain. . . . The main characteristics of Nashe's mature prose are its naturalness and force. Most of his contemporaries had aimed at refinement rather than strength, they relied upon artifice which soon lost its power of appeal. But Nashe, dealing with plain things, writes in plain prose, and it was but natural for the satirist of contemporary affectations to dismiss from his practice the prose absurdities of the time."—J. W. H. Atkins, *Elizabethan prose fiction (Cambridge history of English literature, v. 3, ch. 6, pp. 362-364, 366)*.—"In such a book as Sidney's *Arcadia* there was a threefold attraction—that of knightly adventure, which had pleased the elder generation of Elizabethan readers, and which, if somewhat modernised, had an attraction even for the young; secondly, the charm of the new courtly Arcadianism; and last, the fascination of a personal story and personal allusions under the veil. To these

we should add in Sidney's case the interest of a new prose style, far less crudely artificial than that which Lyly had adopted from his Spanish model, Guevara; a style somewhat effeminate it is true, with no strong progressive current in it, but winding and wandering with a certain grace and melody, advancing and delaying, but never stagnating. The *Arcadia* to be enjoyed aright should be viewed as a poem; so Milton correctly describes it; so Sidney himself authorises us to describe it by the passage in his *Apologie [for Poetrie]*, in which he maintains that verse is only an accident and not an essential of poetry. . . . The tangle of adventures is ingeniously unravelled and unravelled, showing a real gift on Sidney's part for romantic narrative. The situations are skilfully devised for bringing to light what Sidney describes as 'mysteries of passion.' The dialogue suffers from the absence of those limitations and that nearness to reality which produced genuine dialogue on the stage; it consists of a series of *tirades*, and the soliloquy is an interminable *tirade* addressed by the speaker to himself. The pastoral element is twofold: there are the ideal shepherds and shepherdesses who love, and carol, and dance, and address one another in the newest forms of exotic or classical verse; and there are the genuine rustics who furnish rude material for the comic scenes of the romance. Unhappily Sidney's gift for the humorous was hardly richer than that of a serious schoolboy who makes painful efforts to be funny. . . . And if we set aside Sidney's *Arcadia* there is no pastoral romance of Elizabeth's days which will better reward the reader than the *Rosalynde* of Lodge [c. 1558-1625], on which Shakespeare founded his play. . . . Lodge's romance stands in a middle place between the *Tale of Gamelyn*, that early English ballad narrative which Chaucer probably intended to rehandle and put into the mouth of his yeoman-pilgrim to Canterbury, and Shakespeare's *As You Like It*. A comparison of the three forms in which the story is told—the mediæval ballad, the Renaissance prose idyl, and the Shakespearean comedy, will show how all the rough and rude features of his original disappear in Lodge's dainty restoration."—E. Dowden, *Essays, modern and Elizabethan*, pp. 376-377, 379-380.

"The first sixty years of the seventeenth century represent an interval between two great literary periods, and the writings of the time possess some of the characteristics of each of these. During the reign of James I the Renaissance spirit, though enfeebled, was still operative; only it worked with greater sobriety and restraint, and through man's intellectual rather than through his imaginative powers. So we get the brilliant philosophical and scientific works of Francis Bacon, and the dramas of Ben Jonson somewhat overweighted with their classical learning. All through the reign the general interest in religious questions was deepening, and soon these began to absorb the attention of the finest intellects of the age. In 1625, when Charles I succeeded his father, Puritanism had become so powerful a force in the country that it was clear it must, sooner or later, have a large influence upon the national literature. Anglicanism, which, since the days of Elizabeth's Church Settlement, had been striving to establish itself, had been greatly advanced by Hooker's Ecclesiastical Polity; and the new king's strong attachment to the national Church raised it to a still higher position. The poems of Herbert, Crashaw, Vaughan, and Sandys, and in a lesser degree those of Robert Herrick, show how effectively Anglicanism was working as a literary force. There

was also a group of Court poets, led by Lovelace and Suckling. These produced a quantity of pleasant and tuneful verse that had much of the careless grace of the Elizabethan lyrics, but little of their freshness and spontaneity. Most of these singers were silenced at the breaking out of the great Civil War which, by diverting the energies of the nation, operated against the production of any really great work. The supremacy of the Puritans closed the theatres, and so put a stop to dramatic production. It turned Milton from a poet into a writer of violent political pamphlets; it drove Cowley and Waller, poets of high repute in their day, into exile. So that as we approach the end of this period, it seems almost as if English literature is threatened with extinction."—A. Cruse, *English literature through the ages*, pp. 195-196.—"Yet the decadence is not at all of a kind which announces a long literary dead season, but only of that which shows that the old order is changing to a new. . . . To this period belong not only Milton but Taylor, Browne, Clarendon, Hobbes (four of the greatest names in English prose), the strange union of learning in matter and quaintness in form which characterizes Fuller and Burton, the great dramatic work of Massinger and Ford. To it also belongs the exquisite if sometimes artificial school of poetry which grew up under . . . Ben Jonson on the one hand, and . . . Donne on the other—a school which has produced lyrical work not surpassed by that of any other school or time. . . . If then we speak of decadence, it is necessary to describe . . . what is meant. . . . The art is constantly admirable but it is almost obtrusively art—a proposition which is universally true even of the greatest name of the time, of Milton, and which applies equally to Taylor and to Browne, to Massinger and to Ford, sometimes even to Herrick . . . and almost always to Carew. . . . In the drama things are much worse. . . . Perhaps, though the prose names of the times are greater than those of its dramatists, or, excluding Milton's, of its poets, the signs of something wrong are clearest in prose."—G. Saintsbury, *History of Elizabethan literature*, pp. 455-457.—"The *Essays* . . . are . . . Bacon's [1561-1626] securest title to literary fame. They owe something to Montaigne, but, in place of a leisured abundance, they have, in the typical instances, a terse compact brevity, the result of a long process of sifting. They may be divided into those in which he speaks as politician and statesman (here he is indebted to Plutarch and Machiavelli); as moralist and adviser; and as thinker and imaginative writer. His prudence and sagacity, though of the earth earthy, are almost unassailable. His devotion to the cause of knowledge is that of a supreme idealist. Nevertheless, in more human relationships his mental force and subtlety are mated curiously with emotional poverty. His prose has great pliancy; some essays are in the periodic sentence of complex structure, some in his 'folded enigmatical way,' balanced clauses accumulating sometimes three deep. His pages are studded with salient anecdote, quotation, and misquotation, especially from the Roman world, Bacon's model in antiquity. At their best, they have a magisterial fullness of thought, a splendour of rhythmic art, an economy of wording, and an arresting quality of figurative statement far outweighing their lack of orderliness and coherence; not many things with so many imperfections upon them are so freely admitted to be classic. *The New Atlantis* is Bacon's version of Utopia. [See also EDUCATION: Modern: 1561-1626.] **BURTON'S** [1577-1640] *Anatomy of Melancholy*, 1621, groups its ency-

clopedic learning about the symptoms of melancholy; it is a mine of bookish wit, of modern and antique instances, of scholarlike irony and humour, and its sentences are stiff with Latin quotations; it could only have been produced in an age before experimental science had won its footing."—W. T. Young, *Introduction to the study of English literature*, pp. 66-67.—"It has been justly said that . . . [John Milton, 1607-1674] represented the fourth great influence in English prosody. . . . The serious and meditative spirit infused by Puritanism into the poetry of the time turned Milton's thoughts from such subjects as the Arthurian Legend (once considered by him), and his epic genius found perfect expression in the Biblical story of the Fall of Man. . . . Possessing a sense of beauty, as keen though less unrestrained than that possessed by the Elizabethans, Milton's devotion to form and coherence separates him from the great Romantics, and gives to the beauty of his verse a delicacy and gravity all its own. . . . Nowhere is this quality of beauty better displayed than in the early poems, in *Allegro*, *Penseroso*, *Comus*, and *Lycidas*. They have all the freshness and charm of youth, and exhibit the lighter and more fanciful side of Milton's genius. . . . With this sense of beauty is combined a stateliness of manner which gives a high dignity to Milton's poetry, that has never been surpassed, and rarely equalled in our literature. . . . The modern reader may regard with but languid interest the celestial pageant that Milton unrolls before him in his lengthy epics, but the merits of *Paradise Lost* and *Paradise Regained* do not depend upon the reader's taste in theology, but upon the stark grandeur of many descriptive passages, and the passionate love of Nature which glows throughout the poet's work. It meets us first in the fresh sweetness of *L'Allegro* and *Il Penseroso*: . . . gains strength and dignity in *Lycidas*: . . . and thrills us with sublime splendour in *Paradise Lost* and *Samson Agonistes*. . . . Of Milton's prose writings it may be said that uncompromising directness and passionate vehemence characterise all these documents. . . . What interests us here is the extraordinary display in the pamphlets of Milton's passion for Independence. . . . The least ephemeral of the tracts, and the best known, is the *Areopagitica*—a speech for the liberty of unlicensed Printing. [See also CENSORSHIP: England.] . . . Variety, flexibility, lyric passion; these are qualities for which we may search Milton in vain; and in these matters Shakespeare is supremely great. But in loftiness of thought, splendid dignity of expression, and rhythmic felicities, Milton has few peers, no superior. [See also EDUCATION: Modern: 17th century: Milton.] Wordsworth owed much, Landor and Tennyson something, to his prosodic genius. The matter of his work is necessarily limited in its interest and significance, but there has been no finer exponent of the 'grand manner,' and it is impossible to exaggerate the influence of his wonderful diction upon the history of poetry from his own day down to the day of William Watson. . . . In many ways it is not unfair to summarise Donne's [1573-1631] remarkable genius by saying that he was an Elizabethan Browning, and placed beside Spenser, the two poets shine somewhat in the same fashion as Tennyson and Browning did in the Victorian age. His metrical roughness, his obscurities of method, his bewildering allusiveness, his ardent imagination, his taste for metaphysics, and his unexpected divergence into sweet and delightful music, all these things may remind the modern reader of the author of *Sordello*, and *Men and Women*. ENGLISH POETS AND MEN OF LETTERS

about him is his emphatic revolt from the smooth sweetness of most Elizabethan verse; and although he had the power to utter dulcet and harmonious sounds, he seems to have deliberately adopted a harsh and often staccato method in order to break away from contemporary tradition. . . . His poetry falls naturally into three divisions: (1) Amorous, (2) Metaphysical, (3) Satirical. The amorous work includes his earliest work, and the mingling at times of sensuality and cynical wit reminds one of Byron. His metaphysical and satirical work bulks the most largely, and towards the end of his life he wrote little verse, devoting his powers entirely to homiletical literature. An illustration of the metaphysical may be found in his curious poems *The Progress of the Soul* and *Metempsychosis*, in which he pursues the vital spark through various transmigrations, including those of a bird and a fish. As an illustration of his satires may be instanced his fourth satire detailing the character of a Bore. These were framed in rhyming couplets on the Latin model, and influenced both Dryden and Pope. . . . Donne, unlike most of his contemporaries, excelled in reflective imagination. The Elizabethan imagination was on the whole a richly observant one; there were scores of writers overflowing with a wealth of perceptive life; but, save in Shakespeare, there is singularly little metaphysical power in the men of the age. With Donne it may be said Elizabethan poetry closes, and the Caroline poetry begins. . . . Of his more remarkable followers may be mentioned Robert Herrick, Thomas Carew, Crashaw, Henry Vaughan, George Herbert, and Lord Herbert of Cherbury."—A. Compton-Rickett, *History of English literature*, pp. 178-180, 182-184.—See also DRAMA: 1558-1502; 1592-1648; BIBLE, ENGLISH: 16th century; ENGLAND: 1558-1603; Literature.

1660-1780.—Restoration period.—Classical revival.—Age of Dryden and Pope.—Minor poets.—Burns.—Development of the novel.—Defoe.—Swift.—Realism in fiction.—Richardson.—Fielding.—Sterne.—Smollett.—Johnson and his friends, Goldsmith and Burke.—"By the time that Charles II came to the throne the Elizabethan spirit had entirely died out of our literature. The gay, daring, gallant note was gone, and in its place sounded the deep and solemn music of conquered but unsubdued Puritanism. The intense moral earnestness of the Puritan, and his pre-occupation with matters of religion made it impossible for him to write on light or secular subjects; while the echo of the long and bitter strife which had ended in the Restoration gave added sternness to his words. It was not long, however, before a new influence came to drive out the spirit of Puritanism. The brilliant, witty and dissolute court of Charles II inspired a literature which reflected its own qualities. More especially is this the case with the drama of the period; no more sparkling comedies can be found than those of Congreve, Wycherley and their school, and none of such low moral tone. Enthusiasm gave way to a cool cynicism, wit was valued far more highly than the finest imaginative qualities. At the same time all exuberance of expression was pruned away, and a clear, lucid, concise style was cultivated, both in poetry and prose. The great creative age with its adventurous methods was over, and an age of intellectual brilliancy took its place."—A. Cruse, *English literature through the ages*, p. 231.—"The great writer of the period . . . was John Dryden.

. . . Precursors of the classical school . . . pass into insignificance. . . . Waller was writing excellent couplets before Dryden was born but it was part of Dryden's greatness not so much to introduce phases of thought as to adopt and illuminate them. . . . He did not take up poetry in earnest till all intelligent Englishmen had decided what kind of poetry it was they wanted. And then Dryden, confident of his audience, made the distich of Waller an instrument on which to play his boldest music."—E. Gosse, *Eighteenth century literature*, p. 9.—"Great as a critic and satirist and poet, he [Dryden] falls short of the supreme gift which enables the seer to reveal a world of beauty and goodness to humanity. When Dryden [1631-1700] was born Shakspeare had been dead for fifteen years, and Ben Jonson had six years yet to live; Milton had yet to write *L'Allegro* and *Il Penseroso*, while *Paradise Lost* was far in the future. So closely is the life of Dryden linked with the greatest names in English literature, and yet how remote in spirit and temper seem Dryden and his age from the age and men of the Elizabethan period! He belongs to his successors, to Swift, to Addison, to Pope—men who were younger respectively by thirty-six, forty-one, and fifty-seven years. He belongs to an age of religious and political trickery and turmoil, to a time when society was artificial and corrupt and literature was characterized by vigor and commonsense rather than by sweetness and imagination. Dryden himself had a robust nature; had his delicacy and refinement of taste equalled his intellectual sturdiness, his writings would have a charm which they often lack."—E. W. Chubb, *Masters of English literature*, p. 82.—"Alexander Pope, 1688-1744, is the typical poet of the generation after Dryden; a town-dweller, suspicious of enthusiasm, a satirist, a critic, devoid of lyric gift, accepting authority from France, a killed and conscientious artist in form, much beholden to a shibboleth called 'nature,' compounded of scraps from Boileau, Horace, and Aristotle with a strong infusion of eighteenth century common sense—a thing as remote as possible from 'nature' as Wordsworth thought of it. Pope's poetry, practically all in the heroic couplet, included criticism, satire, translation, and ethics; in his *Essay on Criticism*, 1711, he had attained perfect ease and polish. His satires are of three classes: (i) the brilliant mock-heroic *Rape of the Lock*, 1712-14, a gay satire of the cavalier world; (ii) *The Dunciad*, 1728, of which the part attacking dulness is excellent and necessary, but the personal abuse of Grub Street hacks and of Theobald (who exposed the textual failings in Pope's edition of Shakespeare, 1725) does Pope himself a disservice; (iii) his most mature and most accomplished *Epistles* (including the masterly one to Arbuthnot, 1735) and the *Imitations of Horace*, 1733-0. These are a mingled yarn of the best and worst in Pope; there is sane judgment, fine irony, concern for letters, loyal friendship to Swift, Arbuthnot, Gay, and the rest of the Scriblerus circle; but accompanying these things are personalities such as the malicious and plausible distortion of Addison and the venomous portrait of Hervey. His translations of the *Iliad*, 1715-20, and *Odyssey* (with coadjutors) are masterly, though far from literal, re-interpretations, in pointed antithetical couplets, after the taste of the time; but they undoubtedly retain something of the Homeric lightness and energy. *An Essay on Man*, 1733, elaborates a philosophy based on the inconsequent optimism of the brilliant but superficial Bolingbroke. . . . He is a craftsman of infinite patience,

aiming at polished perfection of speech. To achieve this he employs the arts of elegance, lucidity, antithesis, and 'wit,' which by Pope's time had come to mean the incisive and memorable expression of familiar ideas. His tendency to compress his meaning into single lines or, at most, into the distich, together with his extraordinary power of crystallising thought into words, produces the effect of a shower of metrical epigrams; it reveals, too, the lack of such wide-sweeping imaginative conception as would require the space of the paragraph for its statement. . . . These effects are what Pope offers in compensation for his abandonment of the bolder freedoms of Dryden, whose couplet had a constant tendency to *enjambement*, that is to overflow, to triple riming lines, and to alexandrines. Criticism, since Wordsworth, has been prone to belittle Pope; and it cannot be denied that there were uncomfortable traits in his character. Nevertheless, the last word on him ought rather to be an acknowledgment of his conscientious and unceasing devotion to his craft of letters."—W. T. Young, *Introduction to the study of English literature*, pp. 117-119.—The eighteenth century "saw also a further stage in the reaction against the artificial style in poetry that had marked the age of Pope. In 1747 William Collins [1721-1759] published his beautiful series of odes—*To Evening*, *The Passions*, and *To Pity*. Collins was a friend and admirer of Thomson, whose death he mourned in the fine poem beginning, 'In yonder grave a Druid lies,' but his lyrical gift was far greater than that of the elder poet. 'Here,' says Swinburne, 'in the twilight that followed on the splendid sunset of Pope, was at last a poet who was content to sing out what he had in him—to sing, and not to say, without a glimpse of wit or a flash of eloquence.' Collins's Odes were followed by Gray's [1716-1771] *Elegy Written in a Country Churchyard*, which was published in 1750, though it was probably written about 1742. Gray wrote also various other poems including *The Progress of Poesy* and *The Bard*. In 1752 was born the unfortunate poet, Chatterton, who, when he was only fifteen years old, began to produce poems which he declared were the work of Thomas Rowley, a priest of Bristol, who had lived in the fifteenth century, and had been discovered by him, Chatterton. In spite of the great merit of his work, he failed to gain such recognition and employment as would preserve him from starvation, and he died by his own hand, before he was eighteen years old. In 1783 came Cowper's [1731-1800] *Task*, which marks a great step forward; and three years later were published the early lyrics of Robert Burns."—A. Cruse, *English literature through the ages*, p. 319.—"At Mossgiel in Mauchline, . . . amidst the press of uphill work to make ends meet, most of his [Burns, 1759-1796] best poetry was written as he cut the furrows at the tail of the plough. The enumeration merely of these masterpieces in vernacular verse is a source of pleasure; among them were *Poor Mailie* (1782), *Green Grow the Rashes O*, *Corn Rigs*, *Mary Morison*, *To a Mouse*, *To a Mountain Daisy*, *To a Louse*, *Epistle to William Simpson*, *Jolly Beggars*, *Hallowe'en*, *Holy Willie*, *Holy Fair*, *Address to the Unco' Guid*, *The Cotter's Saturday Night*, and *The Two Dogs* (1786). . . . At Dumfries, though the rate of production was less than at Mauchline, he wrote some of his finest songs. Some 184 of these in all were written for the later volumes of Johnson's *Musical Museum*, among them *Ye Banks and Braes of Bonnie Doon* (1791), *Of A' the Airts*, *Willie Brew'd a Peck of Maut*, *What Can a Young Lassie Do wi'*

*an Auld Man*, *Bonnie Wee Thing*, *Ae Fond Kiss*, *The Birks of Aberfeldie*, *My Wife's a Winsome Wee Thing*, *Auld Lang Syne*, *Comin' thro' the Rye*, *Scots Wha Hae*, made while riding in a snowstorm across the wilds of Kenmure in 1793, and *Is There for Honest Poverty* (1794). . . . In his satire and descriptive vein Burns is racy to the last degree of the poets of North Britain for at least three centuries before his advent. The appearance of strange isolation which is sometimes assigned to his poetry and its ideals is dissipated when we examine its antecedents. From the influences that had gone to mould the English poetry of the century—Pope, Thomson, Gray, Cowper—he stood aloof. In this respect it is almost impossible to overemphasize his isolation. . . . So Burns, like La Fontaine, like Sterne, like Turner, like many men of genius whose native faculty has been richest, had forerunners to whom, as far as themes and models and dialect went, he owed an incalculable amount. . . . The fountain of his literary activity was his fondness for Scottish songs, and his special predecessor in the vernacular poetry of the keenly observant and grimly humorous type, to which he was specially addicted, was Robert Fergusson, the Teniers of Scots song. . . . Burns is the poet of passion. His love of woman inspired him with songs which rank with those of Shakespeare and Shelley as the most perfect and the most inspired of all English lyrics—the finest in the world. Burns's poetic ardour is not of the intellectual type. His emotion is not reflected or remembered, it is directly heartfelt."—T. Secombe, *Age of Johnson*, pp. 208, 300-302, 304.—"The strange and beautiful lyrics of William Blake which appeared between 1783 and 1795 brought lyric poetry to the stage at which it was ready for the great development which came with the nineteenth century."—A. Cruse, *English literature through the ages*, p. 319.

"E. B. Chancellor in *The Eighteenth Century in London* has pointed out 'how easily we may construct the life of eighteenth century London from the pages of its contemporary writers. We may find it in the pages of Addison, of Fielding, of Smollett, of Richardson, and Fanny Burney and Jane Austen. With Sir Roger de Coverley one can haunt the clubs and coffee houses, the City and the Temple. From the pages of *The Spectator* and *The Tatler* a host of scenes rise up. The enthusiasm at Garrick's performances, the sad scenes in the Fleet prison, the sponging houses, the tea drinkings, the dances, the whole glittering, absorbing life of the period comes to life again even to its minutest detail. It is improbable that any period has been so meticulously rendered in letters for generations to come as that of the eighteenth century in London.'"—*Days of Bartholomew Fair* (*New York Times Book Review and Magazine*, Feb. 6, 1921, p. 4).—"That species of English prose composition . . . which is represented by the modern novel and romance, took its rise in the reign of George I with the fictions of Daniel Defoe [1650-1731]. The mediæval romances of chivalry had been succeeded by the heroic romances of the 17th century; ponderous work, full of conventional adventures, interminable intrigues and metaphysical gallantry. . . . These folio romances have long since been consigned to the shelves of ancient libraries. Neither the short Italian 'Novella' nor the still shorter and more licentious French 'Nouvelle' ever took root in England. . . . Defoe's principal fictions, varying as they did in character and subject, took all of them the form of autobiographies. The first edition of 'Robinson Crusoe,' in octavo, 1719,

sets it forth on the title page as—'The Life and . . . Adventures of Robinson Crusoe, . . . Written by Himself, London. . . ' Defoe's talent of 'lying like truth' by clothing his fictions with very probable circumstances was possessed in a very full measure by the author of the 'Travels of Captain Lemuel Gulliver.' This unique production of Dean Swift came before the London public seven years after 'Robinson Crusoe.'—J. M. Graham, *Literature and art in Great Britain*, pp. 47-48.—'Jonathan Swift [1667-1745] is one of the four greatest writers of England. . . . *Gulliver's Travels* is one of those few books, pleasant or unpleasant, light or profound, which may be read and reread at all ages, even when other books have been exhausted and laid aside. . . . It is, without question, of the highest rank. Swift's book, like most of the masterpieces of European imagination, is an adventurous journey which affords a pretext for a critical survey of humanity. . . . [It] does not mount toward redemption. It makes no concessions to optimism. His pitiless hatred for humanity increases from chapter to chapter, even to the final insult. Along the way everything has been denied, everything has been stripped of glamor: politics, religion, morals, valor, knowledge, thought, history, civilization. It remains only for the poor Yahoos, naked and unmasked, to reveal to us at the last as we really are: mere apes, wild, stupid, evil. . . . Swift is not only a simple, clear, and clean-cut writer: he is original. . . . There had been earlier accounts of imaginary voyages to strange lands; but no author has succeeded, as Swift was to do, in fusing intense satire with amusing narrative.'—G. Papini, *Four and twenty minds*, pp. 219, 221, 225-226.—'In the *Battle of the Books* he [Swift] had assumed the pedantry of the scholar; in the *Tale of a Tub* with amazing audacity he fell foul of the pedantry of divines; . . . and then in his first political writings began to expose the corrupt and selfish nature of politicians—though at present only of Whig politicians. Swift is one of the most impressive of all literary figures.'—L. Stephen, *English literature and society in the eighteenth century*, p. 77.—'In the eighteenth century came the decline of the drama for which the novel had been waiting. . . . When Richardson and Fielding published their novels there was nothing to compete with fiction in the popular taste. It would seem as though the novel had been waiting for this favourable circumstance. In a sudden burst of prolific inventiveness, which can be paralleled in all letters only by the period of Marlowe and Shakespeare, masterpiece after masterpiece poured from the press. Within two generations, besides Richardson and Fielding came Sterne and Goldsmith and Smollett and Fanny Burney in naturalism and Horace Walpole and Mrs. Radcliffe in the new way of romance. Novels by minor authors were published by thousands as well. The novel, in fact, besides being the occasion of literature of the highest class, attracted by its lucrativeness that under-current of journey-work authorship which had hitherto busied itself in poetry or plays. Fiction has been its chief occupation ever since. . . . Abroad Richardson won immediate recognition. . . . He gave the first impulse to modern French fiction. At home, less happily, he set going the sentimental school, and it was only when that had passed away that—in . . . Miss Austen—his influence comes to its own. . . . Fielding's imitators . . . kept the way which lead to Thackeray and Dickens—the main road of the English Novel.'—G. H. Mair, *English literature, modern*, pp. 217-218, 224.

—'Samuel Richardson's [1689-1761] contribution to the development of the novel was almost what Harvey's discovery of the heart's action was to the study of medicine. . . . In two months the two volumes of the original *Pamela* were finished. The book was published at the close of 1740, and it very soon bore out the author's prediction as to its being the forerunner of a new species of writing. . . . But the European reputation of *Pamela* was far eclipsed by that of *Clarissa*. Richardson was the Roundhead, Fielding [1707-1754] the Cavalier, of our present epoch—that of the genesis of the modern English novel. One showed his descent from and affinity with Bunyan, the other traced a clear pedigree from Suckling and Sedley. . . . Richardson had a large portion of the intensity of genius, but he lacked both the vigorous humour and the literary accomplishment of his rival. Fielding, indeed, combined breadth and keenness, classical culture and a delicate Gallic irony, to an extent rare among English writers. . . . *The History of the Adventures of Joseph Andrews and of his friend Mr. Abraham Adams* [was published in 1742]. The hero of this remarkable parody was the brother of Richardson's *Pamela*. . . . Fielding's genius for the development of character, having once found scope, was not to be confined within the bounds of a mere travesty. The story soon follows a free course of development, the writer's art being lavished with a free hand upon the character of Parson Adams. . . . [He] is in many respects Fielding's finest and most original conception, and the character seems to represent in some measure Fielding's own free but generous philosophy. . . . *The History of Tom Jones, a Foundling*, . . . appeared in February, 1749. . . . And since its appearance all the very best judges have sounded its praise. . . . *Amelia* followed *Tom Jones* on December 10, 1751. . . . If the plot is inferior to that of *Tom Jones*, the descriptions and characters are second to none in prose fiction.'—T. Seccombe, *Age of Johnson*, pp. 156-157, 150, 163, 165-166, 160-170.—'By Laurence Sterne [1713-1768] the course of fiction was reversed a little way towards Addison and Steele in the two incomparable books which are his legacy to English literature. We call *Tristram Shandy* (1760-67) and *A Sentimental Journey* (1768) novels, because we know not what else to call them; nor is it easy to define their fugitive and rare originality. Sterne was not a moralist in the mode of Richardson or of Fielding; it is to be feared that he was a complete ethical heretic; but he brought to his country as gifts the strained laughter that breaks into tears, and the melancholy wit that saves itself by an outburst of buffoonery. . . . If in Sterne the qualities of imagination were heightened, and the susceptibilities permitted to become as feverish and neurotic as possible, the action of Tobias Smollett [1721-1771] was absolutely the reverse. This rough and strong writer was troubled with no superfluous refinements of instinct. He delighted in creating types of eccentric profligates and ruffians, and to do this was to withdraw from the novel as Richardson, Fielding, and Sterne conceived it, back into a form of the picaresque romance. He did not realise what his greatest compeers were doing, and when he wrote *Roderick Random* (1748) he avowedly modelled it on *Gil Blas*, coming, as critics have observed, even closer to the Spanish *picares* spirit than did Le Sage himself. . . . Three years later he published *Peregrine Pickle* (1751), and just before he died, in 1771, *Humphrey Clinker*. The abundant remainder of his work is negligible, these three books alone being worthy of note in a sketch of

literature so summary as this. In the work of the three greater novelists the element of veracity is very strong, even though in the case of Sterne it may seem concealed beneath a variegated affectation of manner. In each, however, the main aim, and the principal element of originality, is the observation of mankind as it really exists. But Smollet was not great enough to continue this admirable innovation; he went back to the older, easier, method of gibbeting a peculiarity and exaggerating an exception. He was also much inferior to his rivals in the power of constructing a story, and in his rude zeal to 'subject folly to ridicule, and vice to indignation,' he raced from one rough episode to another, bestowing very little attention upon that evolution of character which should be the essence of successful fiction. . . . With the work of these four novelists, whose best thoughts were given to fiction, were associated two or three isolated contributions to the novel, among which

SAMUEL JOHNSON

(After the portrait by Sir Joshua Reynolds)

the *Vicar of Wakefield* and *Rasselas* are the most celebrated."—E. Gosse, *Modern English literature*, pp. 244-247.

"Everywhere during this . . . period [1740-1780] the buried and forgotten seeds of romantic fancy were becoming stimulated, and were pushing their shoots above ground in a Percy's *Reliques*, in a *Castle of Otranto*, in a *Descent of Odin*. Meanwhile what was mainly visible to the public was the figure of Dr. Samuel Johnson [1700-1784], a sesquipedalian dictator, not writing very much or in a superlatively excellent manner, but talking publicly, or semi-publicly, in a style hitherto unprecedented, and laying down the law on all subjects. Around this great man collects whatever there is of normal genius in the generation—Goldsmith and Burke, Gibbon and Reynolds, Boswell and Garrick,—and a group is formed, to the student of personal manners the most interesting that literary history can supply. So rich is the age in anecdote, so great in critical prestige, that the student must look closely and carefully to perceive that it is rapidly declining in intellectual force of

every kind, and by 1780 is only waiting for the decease of two or three old men to sink completely into a condition of general mediocrity."—E. Gosse, *Eighteenth century literature*, p. 382.—"Johnson's burly figure, in the last half of the eighteenth century, dominates all others. . . . By any hackwork he could secure, Johnson eked out a living. 'London' [1738] made rather a hit and gave him something of a name to start with. . . . [Eleven years later] appeared his 'Vanity of Human Wishes,' another satirical poem, stronger and finer than 'London.' Both of these poems were imitated from Juvenal, for whose sardonic genius Johnson had much affinity. At about this time, he also tried his hand at periodical essays after the fashion of Addison; and the *Rambler* and the *Idler* had a certain success and increased his reputation, though we find it hard to enjoy them today. But his 'Dictionary of the English Language' is Johnson's most important achievement. He planned it in 1747, finished it in 1755; and it was a great work. It takes a vigorous and courageous mind to plan a dictionary, and to put it through, as Johnson did, practically by himself. . . . The publication of the Dictionary gave Johnson a commanding position in the world of letters, and soon placed him above want. Not at once, however, for, in 1750, we find him writing with great rapidity his philosophical romance of 'Rasselas,' to defray the expenses of his mother's funeral. This became the most popular of his works, and one may meet translations of it all over the world. . . . After this time Johnson did not write much, until in his ripe old age he produced, as prefaces to an edition of the poets, those 'Lives' which are really his best and most living works. . . . His understanding was singularly powerful in all regions which it was competent to enter, and, as we read the happily abundant records of his words, we feel that he was indeed a masterly critic of society and life."—V. D. Scudder, *Introduction to the study of English literature*, pp. 365, 368-370.—"In 1762, through Johnson's influence, Goldsmith [1728-1774], when under arrest for debt, received £60 for his yet unfinished *Vicar of Wakefield*. The work was published in 1766, and established his reputation. Meanwhile, in 1764, the publication of *The Traveller* had brought him into the front rank of living poets. . . . In May, 1770, he published, with a singularly happy dedication to Reynolds, his *Deserted Village*, which greatly increased his fame as a poet. This was followed by his successful play *She Stoops to Conquer*, given at Covent Garden in March, 1773. Meanwhile he had 'written for bread,' or rather compiled with a flowing pen from materials that came readiest to hand, his histories of England, Rome, and Greece; his biographies of Nash and Voltaire; and his *Animated Nature*, drawn from Buffon with not a few grotesque interpolations, such as his description of tigers in Canada. . . . Indifference to the literary ideals of the time allowed free play to the excellent, gentle humour, which found its natural expression in his comedies, antagonistic in conception as they were to the sentimental dramas of the day. He managed, similarly, to retain among all the formalisms of the fashion the great gift of natural fun, partly inherited, in part derived from his close contact with the people. In his poetry, apart from the easy flow, the qualities which distinguished him most above the level of the school of Pope are the traits of artless nature, the semi-colloquial emphasis with which certain words or phrases are happily repeated, the unstudied wealth of metaphors. The even flow of his narrative, which so excites our admiration, indicates the profit that he

derived from a discriminating admiration for Voltaire and the limpid French prose of that day. Amiable, various and bland, it needs his own pen, as Hazlitt says, to describe the careless inimitable grace with which he illustrates every kind of excellence."—T. Seccombe, *Age of Johnson*, pp. 23, 25.—"The last of those great men who formed the Johnsonian circle is Edmund Burke [1729-1797], and he is the greatest of all. . . . Burke's temperament was that of the poet, and that was why everything was seen through the golden haze of imagination. His first book, the memorable essay on the *Sublime and Beautiful*, is the manifesto of a poetic genius. It is the index to Burke's mind, and sufficiently declares on what food he had nourished his thoughts. . . . But it would be a mistake to suppose that Burke always uses one style, and that a style of superb rhetorical adornment. He uses whatever style best suits his immediate purpose. He can be terse, unadorned, homely, colloquial, as well gorgeous, ingenious, and philosophical. . . . He is never monotonous, because he is always various. He can write in the clearest and most uncoloured of prose, as in his *Thoughts on the Present Discontents*; or in glowing diatribe, as in his *Reflections on the French Revolution*; or with an overwhelming passion of scorn and anger, as in the famous *Letter to a Noble Lord*. . . . The greatest of Burke's writings, and the one which produced the most profound effect upon his times and his own fortunes, was his *Reflections on the French Revolution*. Nothing that he wrote [except the *Speech on Conciliation*] has been more widely read, and in it the best and worst qualities of his genius are displayed with singular abandonment."—W. J. Dawson, *Makers of English prose*, pp. 66, 73-74, 76.—See also DRAMA: 1600-1800; HISTORY: 25; JUNIUS LETTERS.

1780-1830. — Triumph of romanticism. — Wordsworth and Coleridge.—Shelley, Byron and Keats.—Effect of romantic movement on the novel.—Periodical literature and criticism. —De Quincey.—Lamb.—Landor.—"We see the Romantic revolt or renaissance . . . growing up under the joint influences of the opening of mediæval and foreign literature; of the excitement of the wars of the French Revolution; of the more hidden but perhaps more potent force of simple ebb-and-flow which governs the world in all things, though some fondly call it Progress; and of the even more mysterious chance or choice which from time to time brings into the world, generally in groups, persons suited to effect the necessary changes. The 'Return to Nature,' or . . . the taking up of a new standpoint in regard to nature, made half-unconsciously by men like Cowper and Crabbe, assisted without intending it by men like Burns and Blake, [see also above: 1660-1780] effected in intention if not in full achievement by feeble but lucky pioneers like Bowles, asserts itself once for all in the *Lyrical Ballads*, and then works itself out in different—in almost all possibly different—ways through the varying administrations of the same spirit by Wordsworth and Coleridge, Shelley and Keats, in the highest and primary rank, by Scott and Byron in the next, by Southey, Campbell, Leigh Hunt, Moore, and others in the third." —G. Saintsbury, *Nineteenth century literature*, p. 432.—"The first half of the nineteenth century records the triumph of Romanticism in literature and of democracy in government; and the two movements are so closely associated, in so many nations and in so many periods of history that one must wonder if there be not some relation of cause and effect between them. Just as we understand the tremendous energizing influence of Puritanism

in the matter of English liberty by remembering that the common people had begun to read, and that their book was the Bible, so we may understand this age of popular government by remembering that the chief subject of romantic literature was the essential nobleness of common men and the value of the individual. . . . Liberty is fundamentally an ideal; and that ideal . . . was kept steadily before men's minds by a multitude of books and pamphlets as far apart as Burns's *Poems* and Thomas Paine's *Rights of Man*,—all read eagerly by the common people, all proclaiming the dignity of common life, and all uttering the same passionate cry against every form of class or caste oppression. [See also U.S.A.: 1776 (January-June): King George's war measures.] . . . It is intensely interesting to note how literature at first reflected the political turmoil of the age; and then, when the turmoil was over and England began her mighty work of reform, how literature suddenly developed a new creative spirit which shows itself in the poetry of Wordsworth, Coleridge, Byron, Shelley, Keats, and in the prose of Scott, Jane Austen, Lamb and De Quincey. . . . Thus in the early days . . . Coleridge and Southey formed their youthful scheme of . . . an ideal commonwealth, in which the principles of More's *Utopia* should be put to practice. . . . Coleridge and Wordsworth best represent the romantic genius of the age in which they live, though Scott had a greater literary reputation and Byron and Shelley had larger audiences. The second characteristic of this age is that it is emphatically an age of poetry. . . . The glory of the age is in the poetry of Scott, Wordsworth, Coleridge, Byron, Shelley, Keats, Moore, and Southey. Of its prose works, those of Scott alone have attained a very wide reading though the essays of Charles Lamb and the novels of Jane Austen have slowly won for themselves a secure place in the history of our literature. Coleridge and Southey . . . wrote far more prose than poetry; and Southey's prose is much better than his verse. It was characteristic of the spirit of this age so different from our own, that Southey could say, in order to earn money, he wrote in verse 'what would otherwise have been better written in prose.'"—W. J. Long, *English literature, its history and significance*, pp. 369-370, 372-373.—"While Scott [1771-1832] was busy collecting the fragments of Border minstrelsy and translating German ballads, two other young poets, far to the south, were preparing their share in the literary revolution. In those same years (1795-98) Wordsworth [1770-1850] and Coleridge [1772-1834] were wandering together over the Somerset downs and along the coast of Devon. . . . The first fruits of these walks and talks was that epoch-making book, the 'Lyrical Ballads'; the first edition of which was published in 1798, and the second, with an additional volume and the famous preface by Wordsworth, in 1800." —H. A. Beers, *History of English romanticism in the nineteenth century*, p. 48.—"In [it] . . . Wordsworth defined 'good poetry' as 'the spontaneous overflow of powerful feeling.' This definition was itself a protest against that mechanical conception of poetry as a thing made according to 'rules,' which, though already challenged, maintained its place in the orthodox critical creed. In the same essay he explained his own aims in writing in words which, while they were meant to refer immediately to the *Ballads*, have also an interest in connection with all his work. 'The principal object, then, proposed in these *Poems*,' he declares, 'was to choose incidents and situations from common life, and to relate or describe them throughout, as far as possible, in a selection of language really used by men,

and, at the same time, to throw over them a certain colouring of imagination, whereby ordinary things should be presented to the mind in an unusual aspect'; and he goes on to say that 'humble and rustic life was generally chosen because, for reasons which he details, 'in that condition the essential passions of the heart find a better soil in which they can attain their maturity, are less under restraint, and speak a plainer and more emphatic language' than elsewhere. . . . The foregoing considerations provide a key to the greater part of Wordsworth's narrative and descriptive poetry. But he was not merely a narrative and descriptive poet. In his own view he was essentially a philosophical poet: 'Every great poet is a teacher,' he wrote to his friend Beaumont; 'I wish either to be considered as a teacher or as nothing.' The larger part of his work was, therefore, inspired by a directly didactic aim, and even his narrative poems generally carry a moral."—W. H. Hudson, *Short history of English literature in the nineteenth century*, pp. 15-17.—"With his establishment among the Lakes Wordsworth entered definitely upon the practice of the art which was henceforth to be his chief occupation. . . . [In 1805] he completed . . . though it was not published till after his death, a long autobiographical poem, *The Prelude, or Growth of a Poet's Mind*, the purpose of which was 'to record in verse the origin and progress of his own powers,' and which thus provides a valuable introduction to the body of his work. Another long poem, *The Excursion*, setting forth his philosophy of life in nine books of blank verse, appeared in 1814. . . . The great *Ode on Intimations of Immortality* (1807) is the crowning example of the poetry in which he continued to express his thoughts on the ultimate problems of life. . . . For more than thirty years he went on writing with all his characteristic devotion and industry, but though he much increased the bulk he added little to the value of his output. Occasionally the old spirit came upon him, as in the verses *Composed upon an Evening of Extraordinary Splendour and Beauty* (1818), and here and there in the *Sonnets on the River Duddon* (1820). But speaking generally, his really great work was now done. Among his later productions mention may be made of the series of *Ecclesiastical Sonnets* (1822), in which he traces the history of the Church in England from the introduction of Christianity down to his own day."—*Ibid.*, pp. 13-14.—"In analysing his philosophy of life we may conveniently regard him, first as a poet of nature, and then as a poet of man. . . . Nature for him was the embodiment of the Universal Spirit, the presence of which he felt in the living world about him and at the same time (for the human soul is at one with the soul of nature) 'in the mind of man' (*Tintern Abbey*). This sense of the spirituality of nature and of the kinship of nature and man lay at the basis of his thought, and from it arose his conception of communion with nature as the great means of attaining that knowledge of transcendental truth which is for ever beyond the reach of science and the 'meddling intellect.' . . . Nature he proclaimed as the greatest of all teachers. The transition is easy from Wordsworth the poet of nature to Wordsworth the poet of man. Though he early repudiated his revolutionary creed, one great revolutionary idea remained at the core of his teaching—that of the innate and essential dignity of man. . . . As a poet of man and ethical teacher, Wordsworth thus everywhere reveals his vital connection with some of the underlying principles of the Revolution. In practical politics he had become a reactionary. But his work from first to last, with its emphasis upon

the simplification of life and the essential worth of human nature, must still be regarded as part and parcel of the general democratic movement of his time. His limitations are very marked. His outlook upon life was narrow; his interests were extremely circumscribed; he had little narrative or dramatic power; while too much engrossed by the moral truths he was solicitous to enforce, he frequently, especially in his later years, allowed his poetry to degenerate into the most prosaic didacticism. But within his restricted sphere he holds his place secure. He is great because he makes us feel the tranquillising beauty of nature and the sanctity of common life; because he touches what he handles with a peculiar and winning charm; and because in his really supreme moments the simple nobility of his thought is wedded to a simple nobility of style."—W. H. Hudson, *Short history of English literature in the nineteenth century*, pp. 17-20.—"Coleridge's contributions to romantic poetry are few though precious. . . . He stands for so much in the history of English thought, he influenced his own and the following generation on so many sides, that his romanticism shows like a mere incident in his intellectual history. His blossoming time was short at the best, and ended practically with the century. After his return from Germany in 1799 and his settlement at Kewswick in 1800, he produced little verse of any importance beyond the second part of 'Christabel' (written in 1800, published in 1816). His creative impulse failed him, and he became more and more involved in theology, metaphysics, political philosophy, and literary criticism. . . . Coleridge's four contributions to the 'Lyrical Ballads' included his masterpiece, 'The Ancient Mariner.' This is the high-water mark of romantic poetry. . . . In [it] . . . are present in the highest degree the mystery, indefiniteness, and strangeness which are the marks of romantic art. . . . 'The Ancient Mariner' is the baseless fabric of a vision. We are put under a spell, like the wedding guest, and carried off to the isolation and remoteness of mid-ocean. . . . The first part of 'Christabel' was written in 1797; the second in 1800; and the poem, in its unfinished state, was given to the press in 1816. Meanwhile it had become widely known in manuscript. . . . 'Christabel' is more distinctly mediæval than 'The Ancient Mariner,' and is full of Gothic elements. . . . If 'The Ancient Mariner' is a ballad, 'Christabel' is, in form, a *roman of adventures*, or metrical chivalry tale, written in variations of the octosyllabic couplet. . . . 'Christabel' is not so unique and perfect a thing as 'The Ancient Mariner,' but it has the same haunting charm, and displays the same subtle art in the use of the supernatural. . . . The rest of Coleridge's ballad work is small in quantity. . . . Lines of a specifically romantic colouring are of course to be found scattered about nearly everywhere in Coleridge; like the musical little song that follows the invocation to the soul of Alvar in 'Remorse': . . . or the wild touch of folk poesy in that marvellous opium dream, 'Kubla Khan.' . . . In taking account of Coleridge's services to the cause of romanticism, his critical writings should not be overlooked. . . . He represented, theoretically as well as practically, the reaction against eighteenth-century academicism, the Popean tradition in poetry, and the maxims of pseudo-classical criticism. In his analysis and vindication of the principles of romantic art, he brought to bear a philosophic depth and subtlety such as had never before been applied in England to a merely belletristic subject. He revolutionised, for one thing, the critical view of Shakspeare, devoting several lecture courses to the exposition of

the thesis that 'Shakespeare's judgment was commensurate with his genius.' . . . Compared with these Shakespeare notes, with the chapters on Wordsworth in the 'Biographia Literaria,' and with the *obiter dicta* sown through Coleridge's prose, all previous English criticism appears crude and superficial."—H. A. Beers, *History of English romanticism in the nineteenth century*, pp. 49, 74, 76-77, 80-82, 86-89.

"Two decades, approximately, separate the emergence of the younger group of the poets of this period, Byron, Shelley and Keats, from that of Wordsworth, Coleridge and Scott. To the elder group, all three were both deeply indebted and, in various subtle and intricate ways, akin. Yet, the younger group stand sharply and definitely apart; they are not merely of a younger generation but of a different age. The revolution, which had profoundly disturbed the elder poets, had, for the younger, already become history; the ideas and aspirations which Wordsworth and Coleridge first embraced and then did battle with, and which Scott consistently abhorred, had passed into the blood of Byron and Shelley, and kindled humanitarian ardours even in the artist Keats. And they are all, definitely, less English. Poetry, in their hands, loses almost entire touch with the national life and the historic traditions of England; nor was it mere accident that Shelley and Byron lived their best years, and produced their greatest poetry, in Italy, or that Keats, in his London suburb, sang of Endymion and the moon, of magic casements and perilous seas. . . . In *Queen Mab* (surreptitiously published 1813), his [Shelley's, 1792-1822] Godwinian creed is proclaimed from the mouths of legendary personages, inspired, as is their loose irregular verse, by the mythical epics of Southey. Shelley was soon to leave *Queen Mab* far behind; yet, its passionate sincerity, and the indefinable promise of genius in its very extravagances, make it very impressive. . . . During the autumn of 1815, he wrote, in the glades of Windsor, *Alastor*, his first authentic and unmistakable poem. The harsh notes and crude philosophy of *Queen Mab* are no longer heard; Southey has yielded place to Coleridge and Wordsworth, to the romantic chasm of *Kubla Khan*, and the visionary boy of *The Excursion*. The blank verse, too, is built upon the noble, plain music of Wordsworth, but with delicate suspensions and cadences and wayward undulations of his own. Yet, the mood and purport of this first genuine achievement of Shelley is one of frustration and farewell. . . . *Alastor* is the tragedy of the idealist who seeks in reality the counterpart of his ideal. . . . *Laon and Cythna* (later renamed *The Revolt of Islam*), . . . is a brilliant dream-wool of poetry, in which are wrought figures, now purely allegoric, like the eagle and the snake—the evil and the noble cause—now symbolic, like the hero and the heroine themselves, who wage the eternal war of love and truth against tyranny. . . . *Prometheus Unbound* is not to be judged as an essay in the philosophy of progress; but neither is it to be treated merely as a tissue of lovely imagery and music. Shelley's ardour, fortified and misled by the cold extravagances of Godwin, hurried him over the slow course of social evolution. He conceived both the evil in human nature and the process of overcoming it with strange, sublime simplicity. But the ideal of love and endurance, which he sees fulfilled by regenerated man, stands on a different plane; it is rooted in existing human nature, and expresses a state towards which all genuine progress must advance. And, when he portrays the universe as at one with the moral strivings of man, he is uttering no fugitive or isolated

extravagance, but the perennial faith of idealists in all ages. Under forms of thought derived from the atheist and materialist Godwin, Shelley has given, in *Prometheus Unbound*, magnificent expression to the faith of Plato and of Christ. . . . *Prometheus* and *The Cenci* had no successors. But he was himself in the full tide of growth; in lyric, at least, he now showed a finished mastery which, even in his great lyric drama, he had not always reached; and he struck out upon fresh and delightful adventures. In *The Sensitive Plant*, the loveliness of an Italian flower garden in spring, and its autumn decay, inspired a Shelleyan myth, akin in purport to *Alastor*, but with a new, delicate plasticity, like that of the contemporary *Skylark*. His flowers, commonly impressionist hints of colour and perfume, are now finely articulated and characterised; they are Shelleyan flowers, but, like those of Shakespeare, they are, recognisably, nature's own

LORD BYRON

In 'the sensitive plant' itself, Shelley found a new symbol for his own 'love of love,' 'companionless,' like the poet in *Alastor* and the 'one frail form' of *Adonais*; and, as in *Adonais*, the mood of lament at the passing of beauty and the seeming frustration of love merges in a note of assurance, here not ecstatic but serene, that beauty and love are, in reality, the eternal things. . . . *The Ode to the West Wind* . . . originates directly in that impassioned intuition which is the first condition of poetry. . . . Nowhere does Shelley's voice reach a more poignantly personal note or more perfect spontaneity. . . . A century has almost passed, and Shelley is still the subject of keener debate than any of his poetic contemporaries, not excepting Byron. That he is one of the greatest of lyric poets is eagerly allowed by his most hostile critics."—C. H. Herford, *Shelley (Cambridge history of English literature, v. 12, pp. 57, 50, 61, 67, 70-72, 76)*.—"The first two books of *Childe Harold* [Byron, 1788-1824] and the oriental tales—*The Giaour*, *The Bride of Abydos*, *The Corsair* and *The Siege of Corinth*—were the immediate outcome

of this year [1809-1810] of travel, but the memory of the scenes which he had witnessed remained freshly in his mind when, years afterwards, he composed *Don Juan*, and, at the close of his life, played his heroic part in the liberation of Greece. . . . His *Lament of Tasso*, *Prophecy of Dante* and *Francesca of Rimini* are an imperishable witness to the sympathy which he felt with the works and tragic destinies of two of Italy's greatest poets; his Venetian tragedies and *Sardanapalus* show the influence upon him of Alfieri, while his indebtedness to the great Italian mock-heroic school, from Berni to Casti, is everywhere manifest in *Beppo* and in his great masterpiece, *Don Juan*. . . . After taking up his residence on the continent, other forms of poetry claimed his first attention; but the appearance of *The Prisoner of Chillon* in 1816, *Mazeppa* in 1819 and *The Island* in 1823 shows that Byron never wholly relinquished his delight in the verse-tale. . . . In *Parisina*, and, still more, in *The Prisoner of Chillon*, there is a welcome return to a simpler style: the gorgeous east no longer holds him in fee, and he breaks away both from rhetorical speech and melo-dramatic situations. . . . Love of political freedom, which was always the noblest passion in Byron's soul, inspired the poem, and here, as in the third canto of *Childe Harold*, written about the same time, we are conscious of the influence of Wordsworth. . . . A new note is struck in *Mazeppa*. The mood of *The Prisoner of Chillon* is one of elegiac tenderness, whereas, here, we are conscious of the glory of swift motion, as we follow the Cossack soldier in his life-in-death ride across the Russian steppes. . . . His latest dramas, and his verse-tale, *The Island*, not to mention certain romantic episodes which find a place in *Don Juan*, show that Byron never wholly abandoned romance, but, from the time when he wrote *Beppo* (1818), realism was the master-bias of his mind, while the break with classicism was complete. With this triumph of realism, satire once more comes into full play: it is no longer the formal satire of the Augustan school, such as he had essayed in *English Bards and Scotch Reviewers*, but burlesque satire, unconstrained and whimsical, and delighting in the sudden anticlimaxes and grotesque incongruities which find a spacious hiding-place in the *ottava rima*. . . . In *Don Juan*, the work upon which his literary powers were chiefly expended during his last five years in Italy (1818-23), Byron attains to the full disclosure of his personality and the final expression of his genius. . . . Yet, *Don Juan* is a veritable *Comédie Humaine*, the work of a man who has stripped life of its illusions, and has learnt, through suffering and the satiety of pleasure, to look upon society with the searching eye of Chaucer and the pitilessness of Mephistopheles. In the comedy which is here enacted, some of the characters are great historic figures, others thinly veiled portraits of men and women who had helped to shape the poet's own chequered career, while others, again, are merely creatures of the imagination or serve as types of the modern civilisation with which Byron was at war. . . . Judged as a work of art, *Don Juan* is well-nigh perfect. Byron's indebtedness to his Italian masters is almost as great in diction as in verse, but what he borrowed he made peculiarly his own; a bold imitator, he is himself inimitable."—F. W. Moorman, *Byron (Cambridge history of English literature, v. 12, pp. 32-33, 45-52, 54-55)*.—See also DRAMA: 1815-1877.—"Among all the writers of his generation, Keats [1795-1821] was most purely the poet, the artist of the beautiful. His sensitive imagination thrilled to every touch of beauty from whatever quarter. . . . In the Greek mythology he found a world of

lovely images ready to his hand; in the poetry of Spenser, Chaucer, and Ariosto he found another such world. . . . Indeed, there is in Keats' style a 'natural magic' which forces us back to Shakspeare for comparison; a noticeable likeness to the diction of the Elizabethans, when the classics were still a living spring of inspiration, and not a set of copies held *in terrorem* over the head of every new poet. Keats' break with the classical tradition was early and decisive. In his first volume (1817) there is a piece entitled 'Sleep and Poetry,' composed after a night passed at Leigh Hunt's cottage near Hampstead, which contains his literary declaration of faith. . . . A spark from Spenser kindled the flame of poetry in Keats. . . . Keats' earliest known verses are an 'Imitation of Spenser' in four stanzas. His allusions to him are frequent, and his fugitive poems include a 'Sonnet to Spenser' and a number of 'Spenserian Stanzas.' But his only really important experiment in the measure of 'The Faëry Queen' was 'The Eve of St. Agnes.' . . . This exquisite creation has all the insignia of romantic art and has them in a dangerous degree. It is brilliant with colour, richly ornate, tremulous with emotion. Only the fine instinct of the artist saved it from the overlaid decoration and cloying sweetness of 'Endymion,' and kept it chaste in its warmth. As it is, the story is almost too slight for its descriptive mantle 'rough with gems and gold.' Such as it is, it is of Keats' invention and of the 'Romeo and Juliet' variety of plot. . . . Possibly 'La Belle Dame sans Merci' borrows a hint from the love-crazed knight in Coleridge's 'Love,' who is haunted by a fiend in the likeness of an angel; but here the comparison is to Keats' advantage. . . . It is in the Pre-Raphaelites that Keats' influence on our later poetry is seen in its most concentrated shape. But it is traceable in Tennyson, in Hood, in the Brownings, and in many others, where his name is by no means written in water. 'Wordsworth,' says Lowell, 'has influenced most the ideas of succeeding poets; Keats their forms.'"—H. A. Beers, *History of English romanticism in the nineteenth century*, pp. 113-114, 120, 123, 125-127, 131.

"As all strong emotions tend to extremes, the age produced a new type of novel which seems rather hysterical now, but which in its own day delighted multitudes of readers whose nerves were somewhat excited, and who reveled in 'bogey' stories of supernatural terror. Mrs. Anne Radcliffe . . . was one of the most successful writers of this school of exaggerated romance. . . . In marked contrast to these extravagant stories is the enduring work of Jane Austen, with her charming descriptions of everyday life, and of Maria Edgeworth, whose wonderful pictures of Irish life suggested to Walter Scott the idea of writing his Scottish romances. . . . In this age literary criticism became firmly established by the appearance of such magazines as the *Edinburgh Review* (1802), *The Quarterly Review* (1808), *Blackwood's Magazine* (1817), *The Westminster Review* (1824), *The Spectator* (1828), *The Athenæum* (1828), and *Fraser's Magazine* (1830). . . . At first their criticisms were largely destructive . . . but with added wisdom, criticism assumed its true function of construction. And when these magazines began to seek and to publish the works of unknown writers, like Hazlitt, Lamb, and Leigh Hunt, they discovered the chief mission of the modern magazine, which is to give every writer of ability the opportunity to make his work known to the world."—W. J. Long, *English literature, its history and significance*, pp. 360-370, 374-375.—"De Quincey [1785-1850] is at his best in the *Confessions* and parts of the *Suspiria*, because in these writings he found the fullest opportunity

for the display of emotion and imagination. By nature and instinct he was a poet; by which I mean that his apprehension of things was essentially poetic. There are indeed passages in the *Confessions* which are so exquisitely modulated that they may be described as lyric, and they produce the kind of æsthetic pleasure which is peculiar to great poetry. . . . From the moment that the *Confessions of an English Opium-eater* saw the light, De Quincey was famous. His matter and style were new and entrancing, the story deeply suggestive and affecting. But in later generations the story is familiar, and its novelty is discounted. . . . De Quincey was as deficient as Poe; but, like Poe, he was one of the greatest of literary artists, loving and using his art for its own sake in the main, and it is as a literary artist of extraordinary accomplishment that De Quincey will be remembered. . . . The art of essay-writing which De Quincey perfected in one form, was carried to a yet rarer perfection by Charles Lamb [1775-1834]. In his hands it became a vehicle of the brightest banter, of the most intimate personal confession, and of a peculiarly humane and tender wisdom. . . . In January, 1820, *The London Magazine* was founded, and in the August number the first *Essay of Elia* appeared. Lamb was now forty-five. His gift had taken long to ripen; he now found himself, and in the essay discovered the one form of literary expression adequate to his genius. . . . Upon the whole, it may be said that a more religious-minded man than Lamb has not left his mark on English literature. Not, of course, that he has anything to do with creeds, dogmas, or churches; to these he is absolutely indifferent. It is rather in the width of his charity, his sense of pity, his fine feeling about things that his religion lies. He never writes so beautifully as when his theme is the affections. . . . There is deep essential reverence underlying his most extravagant badinage. Just he must, but never at sacred things. . . . Lamb's writings differ widely in quality, though it is scarcely possible to speak of good and bad as it is with most authors. There are degrees of excellence, but no positively inferior work. His best essays are his most intimate; these partake of the nature of confessions, and thus belong to the rarest form of literature. In his lightest vein of pure drollery there is nothing to surpass the *Dissertation upon Roast Pig*. It must also be remembered that Lamb was one of the finest critics whom English literature has produced. . . . A student, a philosopher, a thinker; a man of original mind and great critical discernment; a poet of great sweetness within his own range; a most human-hearted man, sorely tried, but never soured by adversity; humble, magnanimous, charitable in all his thoughts and acts—one of the most quaint and lovable figures in all English literature—such was Charles Lamb."—W. J. Dawson, *Makers of English prose*, pp. 155, 160, 162-163, 172, 174, 176.—"Landor's literary career began with poetry, and to the close of his long life he wrote poetry, often of the very highest order. . . . It was not until Landor had come to the confines of mid-life that he finally adopted the form of literary expression best suited to his genius. . . . No sooner had he settled in Florence than this idea of dramatic dialogues with the great personages of the past took possession of his mind, and the result was the *Imaginary Conversations*, which are the finest fruit of his genius, and his enduring monument. . . . The quality which strikes one most in these *Imaginary Conversations* is the enormous variety of Landor's power. They range through the whole realm of human history, and there is no part of

that history which he has not thoroughly comprehended. Everywhere there is adequate knowledge and often profound scholarship; everywhere there is also strenuous thinking, and a marvellous energy of conception and expression. . . . Another kind of writing in which Landor excelled may be best described as 'fantasy.' Perhaps the noblest specimens of this work are the *Dream of Boccaccio* and the *Dream of Petrarca*. Each is distinguished by peculiar delicacy of sentiment, beauty of cadence, and grace of imagination. They illustrate also in a very striking manner the thorough paganism of Landor's mind."—*Ibid.*, pp. 133, 138, 139, 141, 145.

1832-1880.—Victorian Era.—Carlyle, Ruskin and Arnold.—Tennyson and Browning.—Mrs. Browning.—Modern fiction.—Dickens, Thackeray, George Eliot and Meredith.—Minor novelists.—"In one direction the Victorian age achieved a salient and momentous advance. The Romantic Revival had been interested in nature, in the past, and in a lesser degree in art, but it had not been interested in men and women. . . . The Victorian age extended the imaginative sensibility which its predecessor had brought to bear on nature and history, to the complexities of human life. It searched for individuality in character, studied it with a loving minuteness, and built up out of its discoveries amongst men and women a body of literature which in its very mode of conception was more closely related to life, and thus the object of greater interest and excitement to its readers, than anything which had been written in the previous ages. It is the direct result of this extension of romanticism that the novel became the characteristic means of literary expression of the time, and that Browning, the poet who more than all others represents the essential spirit of his age, should have been as it were, a novelist in verse. Only one other literary form, indeed, could have ministered adequately to this awakened interest, but by some luck not easy to understand, the drama, which might have done with greater economy and directness the work the novel had to do, remained outside the main stream of literary activity. To the drama at last it would seem that we are returning, and it may be that in the future the direct representation of the clash of human life which is still mainly in the hands of our novelists, may come back to its own domain. The Victorian age then added humanity to nature and art as the subject-matter of literature. But it went further than that. For the first time since the Renaissance, came an era which was conscious of itself as an epoch in the history of mankind, and confident of its mission. . . . The nineteenth century, by the discoveries of its men of science, and by the remarkable and rapid succession of inventions which revolutionized the outward face of life, made hardly less alteration in accepted ways of thinking."—G. H. Mair, *English literature, modern*, pp. 191-193.—"If . . . we ask which authors of the Victorian Age among those no longer living have played the most vital part in the evolution of social ideals, the answer comes clear. From 1830 to 1880 no men of pure letters so held the public ear as Carlyle, Ruskin, Arnold. . . . Carlyle's kinship was with Germany, Ruskin's with Italy, Arnold's with France. Carlyle's eyes were in his conscience, Ruskin's in his heart, Arnold's in the normal place, his head. Each turned away from the dominant interest of his youth,—history, art-criticism, or poetry,—to focus the most earnest thought of his prime sternly and earnestly on the social anomalies and paradoxes of modern life."—V. D. Scudder, *Social ideals in English letters*, p. 123.—"Emerson once called

Carlyle [1795-1881] 'a trip-hammer with an Æolian attachment.' He certainly is one of the most massive . . . and vehement literary forces of the prolific age in which he lived. In his sharp denunciation of the sham and hypocrisy of his times, he stands out like a fiery prophet of Israel hurling anathemas upon a sinning and perverse generation; but along with this vehemence there is a strain of pathos and sympathy as gentle as the music of the Æolian harp. . . . In his rage against this sordid materialism of his age he may have been unjust to men; . . . in his adoration of Great Men as the inspired leaders of humanity he was unjust to the advocates of a wide Democracy, but these are but limitations that stamp his humanity; above these limitations one feels the burning hatred of Sham and Insincerity and the holy ardor of a soul that loves the truth. . . . He was not perfect; but his biographer need not apologize for the character of Thomas Carlyle. He was intolerant; he had no appreciation of the world of art and music; he never understood the work of men like Darwin; he misjudged democracy and upheld slavery; he seldom placed the proper evaluation on the work of his contemporaries—yet what a grand figure he is!"—E. W. Chubb, *Masters of English Literature*, pp. 354-355, 371-372.—See also HISTORY: 27.—"Among the other great Victorian writers, the most obvious disciple of Carlyle in his opposition to the materialism of modern life is John Ruskin [1819-1900]. But Ruskin is much more than any man's disciple; and he also contrasts strongly with Carlyle, first because a large part of his life was devoted to the study of Art—he is the single great art-critic in English Literature—and also because he is one of the great preachers of that nineteenth century humanitarianism at which Carlyle was wont to sneer. . . . His career as a writer began immediately after he left the University [Oxford]. It falls naturally into two parts, the first of about twenty years, when he was concerned almost altogether with Art, chiefly painting and architecture; and the second somewhat longer, when he was intensely absorbed in the problems of society and strenuously working as a social reformer. From the outset, however, he was actuated by an ardent didactic purpose; he wrote of Art in order to awake men's spiritual natures to a joyful delight in the Beautiful and thus to lead them to God, its Author. . . . To Ruskin morality and religion are inseparable from Art, so that he deals searchingly, if incidentally, with those subjects as well. Among his fundamental principles are the ideas that a beneficent God has created the world and its beauty directly for man's use and pleasure; that all true art and all true life are service of God and should be filled with a spirit of reverence; that art should reveal truth; and that really great and good art can spring only from noble natures and a sound national life. . . . The publication of the last volume of *Modern Painters* in 1860 roughly marks the end of Ruskin's first period. Several influences had by this time begun to sadden him. . . . Meanwhile, acquaintance with Carlyle had combined with experience to convince him of the comparative ineffectualness of mere art criticism as a social and religious force. He had come to feel with increasing indignation that the modern industrial system, the materialistic political economy founded on it, and the whole modern organization of society reduce the mass of men to a state of intellectual, social, and religious squalor and blindness, and that while they continue in this condition it is of little use to talk to them about Beauty. He believed that some of the first

steps in the necessary redemptive process must be the education of the poor and a return to what he conceived . . . to have been the conditions of medieval labor, when each craftsman was not a mere machine but an intelligent and original artistic creator; but the underlying essential was to free industry from the spirit of selfish money getting and permeate it with Christian sympathy and respect for man as man. . . . With his customary vigor, Ruskin proceeded henceforth to devote himself to the enunciation, and so far as possible, the realization of these beliefs. . . . Ruskin, like Carlyle, was a strange compound of genius, nobility, and unreasonableness, but as time goes on, his dogmatism and violence may well be more and more forgotten, while his idealism, his penetrating interpretation of art and life, his fruitful work for a more tolerable social order, and his magnificent mastery of style and description assure him a permanent place in the history of English literature and of civilization. Contemporary with Carlyle and Ruskin and fully worthy to rank with them stands still a third great preacher of social and spiritual regeneration, Matthew Arnold [1822-1888], whose personality and message, however, were very different from theirs and who was also one of the chief Victorian poets. . . . Up to 1867, his literary production consisted chiefly of poetry, very carefully composed and very limited in amount, and for two five-year terms, from 1857 to 1867, he held the Professorship of Poetry at Oxford. . . . His retirement from this position virtually marks the very distinct change from the first to the second main period of his career. For with deliberate self-sacrifice he now turned from poetry to prose essays, because he felt that through the latter medium he could render what seemed to him a more necessary public service. With characteristic self-confidence, and obeying his inherited tendency to didacticism, he appointed himself, in effect, a critic of English national life, beliefs, and taste, and set out to instruct the public in matters of literature, social relations, politics, and religion. In many essays, published separately or in periodicals, he persevered in this task until his death in 1888. As a poet Arnold is generally admitted to rank among the Victorians next after Tennyson and Browning. . . . In his work. . . delicate melody and sensuous beauty were at first much less conspicuous than a high moral sense, though after the first the elements of external beauty greatly developed, often to the finest effect. In form and spirit his poetry is one of the very best later reflections of that of Greece, dominated by thought, dignified, and polished with the utmost care. *Sohrab and Rustum*, his most ambitious and greatest single poem, is a very close and admirable imitation of *The Iliad*. Yet, as the almost intolerable pathos of *Sohrab and Rustum* witnesses, Arnold is not by any means deficient, any more than the Greek poets were, in emotion. He affords, in fact, a striking example of classical form and spirit united with the deep, self-conscious, meditative feeling of modern Romanticism. . . . There is a striking contrast . . . between the manner of Arnold's poetry and that of his prose. In the latter, he entirely abandons the querulous note and assumes instead a tone of easy assurance, jaunty and delightfully satirical. Increasing maturity had taught him that merely to sit regarding the past was useless, and that he himself had a definite doctrine, worthy of being preached with all aggressiveness. . . . As a literary critic he is uneven, and, as elsewhere, sometimes superficial; but his fine appreciation and generally clear vision make him refreshingly stimulating. His point of view is unusually

broader, his chief general purpose being to free English taste from its insularity, to give it sympathetic acquaintance with the peculiar excellences of other literatures. . . . The differences between Arnold's teaching and that of his two great contemporaries are . . . clear. All three are occupied with the pressing necessity of regenerating society. Carlyle would accomplish this end by means of great individual characters inspired by confidence in the spiritual life and dominating their times by moral strength; Ruskin would accomplish it by humanizing social conditions and spiritualizing and refining all men's natures through devotion to the principles of moral Right and esthetic Beauty; Arnold would leaven the crude mass of society, so far as possible, by permeating it with all the myriad influences of spiritual, moral, and esthetic culture. . . . Arnold's style is one of the most charming features of his work. Clear, direct, and elegant, it reflects most attractively his own high breeding; but it is also eminently forceful, and marked by very skillful emphasis and reiteration. . . . He has none of the gorgeousness of Ruskin or the titanic strength of Carlyle, but he can be finely eloquent, and he is certainly one of the masters of polished effectiveness."—R. H. Fletcher, *History of English literature*, pp. 390-399, 402.

"The same movement visible in the poetry of Arnold and Clough may be detected still moulding and modifying the works of Tennyson [1809-1892]. In the year 1850 *In Memoriam* appeared. . . . The *Idylls of the King* are the outcome of an interest in Arthurian legends that seems to have gradually developed. . . . Each idyll is a separate story, related to the others because all are parts of one greater story. But the idylls have not the coherence required in the books of an epic. Tennyson was conscious of the want of unity, and he sought for a principle of connexion in allegory. At best the allegory is very indistinct; it appears chiefly in the parts later in order of publication; and we may suspect that it was an after-thought meant to supply a defect to which the author slowly awakened. The very name, *Idylls of the King*, serves as a warning not to expect too much unity. . . . The *Idylls* were, as they still are, Tennyson's greatest experiment in blank verse; and next to Milton's *Paradise Lost* they are the finest body of non-dramatic blank verse in the language. [See also ARTHURIAN LEGEND.] . . . When we come down to later years the principal change visible in Tennyson's work is the development of the dramatic element. . . . The old smoothness and melody are in great part gone, but a number of pieces prove that Tennyson retained the skill though he did not always choose to exercise it. . . . But while we may legitimately mourn for what time took away, we ought to rejoice over what it added, rather than left. If there is less melody there is more strength; if the delightful dreamy languor of *The Lotus-Eaters* is gone, we have the vivid truth of *The Northern Farmer* and *The Northern Cobbler*, and the tragic pathos of *Rizpah*; if the romantic sentiment of *Locksley Hall* is lost, something more valuable has taken its place in the criticism of life in *Locksley Hall Sixty Years After*. . . . Tennyson wrote up to the very close of his long life. His last publications were *The Foresters* and *The Death of Ænone*. They show some decline of power. *Demeter* too (1889) was probably a little below his level. But previous to that, though there had been change, there had been nothing that can be called decay. For the long period of sixty years and upwards Tennyson had written, and with rare exceptions he had written greatly. From the death of Wordsworth to his

own death he was almost universally looked upon as the first poet of his time. No one else has wielded so great an influence. In no other poet's work is the record of change during the period so clearly written. In part he made the age, in still larger measure it made him. The hesitancy of his early work was typical of the spirit of the time. The gradual awakening, the deeper thought, the larger subjects, the more varied interests of the intermediate period, were typical too. In this last period, while Tennyson was as faithful as ever to the law of his own development, he did not move precisely with the time. Another race was rising and other palms were to be won. [See also DRAMA: 1815-1877.] **Browning** [1812-1889] could not go through the same phase of develop-

ROBERT BROWNING

ment, for in him the intellectual element from the first was even abnormally prominent. Yet in Browning too the influence of the time is felt. . . . In *The Pope* and in *Rabbi Ben Ezra*, we have Browning's deepest treatment of the problems which interested him most, and we have not that sacrifice of poetry to philosophy which mars *La Saisiaz*. We may say that about this time Browning discovered the vital interest of his generation, and discovered also where his own strength lay. The effect is seen in the uniform excellence of his work. The publications of the twenty years between 1850 and 1870, taken as a whole, certainly surpass what he had done before or what he did afterwards. *Men and Women* (1855) has been probably the most popular and the most widely read of all his writings; *Dramatis Personæ* (1864) is even richer in poetry, but has been commonly felt to be more difficult in thought; while *The Ring and the Book* (1868-1869) is by almost all com-

petent judges pronounced his masterpiece. The plan of *The Ring and the Book*, whereby the same story is told ten times over from ten different points of view, is defensible only on the ground that it succeeds. Nearly half the poem is hardly worth reading; yet the other half so splendidly redeems it that *The Ring and the Book* ranks among the great poems of modern times. The pictures of Caponsacchi, of Guido, of Pompilia and of the Pope are all great. Guido has the interest, unique in this poem, of appearing twice; and there is no better illustration of the subtlety of Browning's thought than the difference between the Count, plausible, supple and polished, pleading for his life, and the man Guido, stripped of all but bare humanity, condemned to death, first desperately petitioning, then tearing off the veil of hypocrisy and uttering his terrible truths both about himself and the messengers who bear his sentence. Pompilia is Browning's most perfect female character; but, though a beautiful creation, she illustrates one of

CHARLES DICKENS

the defects in his dramatic art. She speaks Browning's speech, and she thinks his thought. Simple child as she is, there is a depth of philosophy in her utterances that is not in strict keeping with her character; and she, like all Browning's men and women, uses the abrupt vivid language of the poet. Notwithstanding his almost passionate repudiation of the idea, Browning is a self-revealing poet; and nowhere does he reveal himself more than in the Pope, the greatest character in *The Ring and the Book*. In him the resemblance to Browning himself does not matter, it rather adds a new interest. The mind can conceive and picture nothing higher than its own ideal best; and the Pope is Browning's ideal man, great in intellect, in morals and in faith. . . . To Browning's middle period belong likewise many of his love-poems, and these are unique in the English language. Others, like Shakespeare and Burns and Shelley, have given a more purely captivating expression to the ardour of love; no one else has so worked out its philosophy. Not that Browning's poems are deficient in feeling; the expressions of his own love for his wife, 'O lyric love' and *One Word More*, would suffice to refute

such a criticism. But he prefers to take an aspect of passion and to explain it by the way of thought. He is analytical. . . . No poet free, as Browning is, from the taint of asceticism has ever treated the passion of love in a manner so little physical as he. There are in his works errors of taste that cause a shudder; but they are not here. It was likewise during this period that Browning was at his dramatic best. Nearly all his best pieces are dramatic in conception, though sometimes, as in the love-poems, we are confined to single aspects of character. . . . In the last twenty years of his life Browning, on the whole, appears at his worst. . . . Some of his later writings may be not unfairly described as merely treatises in verse. . . . His last volume, *Asolando* (1889), will always have a special interest for its publication coincidentally with his death; and it illustrates how his favourite ideas remained fixed to the end. . . . Browning's last word to the world, the epilogue to *Asolando*, is most distinctive of his style and tone of thought. He held throughout a steady optimism, all the more cheering because it is the optimism of a man of wide knowledge of the world, and one who has looked evil in the face. [See also DRAMA: 1815-1877.] Elizabeth Barrett Browning [1806-1861] was an author at an earlier date than her husband . . . but her first work of any note was *The Seraphim* (1838). . . . There are two points of special and peculiar interest in connexion with Mrs. Browning. She has only one possible rival, Christina Rossetti, for the honour of being the greatest poetess who has written in English; and her marriage with Browning formed a union without parallel in literature. Moreover, in relation to Mrs. Browning's works, sex is not a mere accident. She is a woman in all her modes of thought and feeling, and she is so especially in her very finest work. Her greatest contribution to literature, *Sonnets from the Portuguese* [1850], derives its unique interest from being the expression of the woman's love; and *A Child's Grave at Florence* could hardly have been written but by a woman and a mother. . . . [The sonnets] are the genuine utterance of a woman's heart, at once humbled and exalted by love; and in this respect they are unique. The woman's passion, from the woman's point of view, has seldom found expression at all in literature, and this particular aspect of it never."—H. Walker, *Age of Tennyson*, pp. 220, 222-225, 227-235.

"At the very beginning of the period [Victorian] fiction turned away from donjon and tourney, and sought for background the street, the club, the England of today. With occasional lapses into romanticism, it has remained insistently modern. . . . Dickens and Thackeray uncovered and revealed the social layer of early Victorian life. About 1850, their simple reproductions gave place to the novel of protest and arraignment; this in its turn is yielding nowadays to the novel of constructive suggestion, whether in the form of avowed literary Utopias, or of schemes for social salvation in would-be realistic garb. We have had indeed no social fiction so great as that of Russia; but we have had Dickens and Thackeray; we have had George Eliot, George Meredith, and Thomas Hardy; we have had for lesser folk, Reade, Trollope, Kingsley, Disraeli, Macdonald. Our social novels illustrate and supplement our social essays. . . . Beneath all . . . lies . . . a strange and contradictory civilization which we cannot yet interpret, tingling with self-consciousness, yet unaware of much in its own tendencies. . . . Our literature has confronted a social situation dramatic, difficult and complex. . . . Reading these books chronologically, we follow the unconscious changes in public sentiment; its vary-

ing emphases, theories, advances, recoils."—V. D. Scudder, *Social ideals in English letters*, pp. 125-126.—"The perspective of time has made it clear that among the Victorian novelists, as among the poets, three definitely surpass the others. With

WILLIAM MAKEPEACE THACKERAY

Dickens and Thackeray is to be ranked George Eliot (Mary Anne Evans)."—R. H. Fletcher, *History of English literature*, p. 437.—"Dickens' [1812-1870] popularity, in his own day and since, is due chiefly: (1) to his intense human sympathy; (2) to his unsurpassed emotional and dramatic power; and (3) to his aggressive humanitarian zeal for the reform of all evils and abuses, whether they weigh upon the oppressed classes or upon helpless individuals. Himself sprung from the lower middle class, and thoroughly acquainted with the life of the poor and apparently of sufferers in all ranks, he is one of the most moving spokesmen whom they have ever had. . . . Dickens' magnificent emotional power is not balanced, however, by a corresponding intellectual quality; in his work, as in his temperament and bearing, emotion is always in danger of running to excess. One of his great elements of strength is his sense of humor, which has created an almost unlimited number of delightful scenes and characters; but it very generally becomes riotous and so ends in sheer farce and caricature, as the names of many of the characters suggested at the outset. Indeed, Dickens has been rightly designated a grotesque novelist—the greatest of all grotesque novelists."—*Ibid.*, pp. 430-431.—"Thackeray [1811-1863] belongs to the select group of the greatest writers of English fiction. 'I cannot help telling the truth as I view it, and describing what I see.' . . . Such is the serious attitude, such the philosophy of this interesting personality, this great-hearted, gifted writer whose theory of fiction places him among the realists, but whose practice is shot through and through with an idealism, a tenderness that precludes our classifying him with the strict disciples of realism. With malice toward none and with charity for all he held the mirror up to life as he saw it; that his mirror did not reflect a world of enchanting beauty and goodness must not be at-

tribute o cynicism but to sincerity. . . . While there is still a diversity of opinion as to his rank as a novelist, the opinion as to the high quality of his style is unanimous. Long ago Carlyle said, 'Nobody in our day, I should say, wrote with such perfection of style.' And as discriminating a critic as Mr. Brownell, who objects to the contentious special pleading of Macaulay, the exaltation of Carlyle, the rhapsody of Ruskin, and the periodic stateliness of Gibbon, finds the style of Thackeray perfectly sound and classical. It is simple, copious, and natural."—E. W. Chubb, *Masters of English literature*, pp. 313, 331-332.—"Endowed with one of the strongest minds that any woman ever has possessed, from her very infancy [George Eliot, 1819-1880] . . . studied and read widely. . . . Circumstances combined with her unusual ability to make her entire life one of too high pressure, and her first struggle was religious. . . . She fell under the influence of some rationalistic acquaintances who led her to adopt the scientific Positivism of the French philosopher Comte. . . . One of the most attractive qualities, especially in her earlier books, is her warm and unaffected human sympathy. . . . The aspiration, pathos and tragedy of life, especially among the lower and middle classes in the country and the small towns, can scarcely be interpreted with more feeling, tenderness, or power than in her pages. But her sympathy does not blind her to the world of comedy; figures like Mrs. Poyser in *Adam Bede* are delightful. . . . The really controlling forces in George Eliot's work were intellectual and moral. She started out with the determination to render the facts of life with minute and conscientious accuracy, . . . and as a result her books, from the beginning, are masterpieces of the best sort of realism. . . . More fundamental than her sympathy . . . is her instinct for scientific analysis. Like a biologist or a botanist,

GEORGE ELIOT

and with much more deliberate effort than most of her fellow-craftsmen, she traces and scrutinizes all the acts and motives of her characters until she reaches and reveals their absolute inmost truth. . . . Inevitably, with her disposition, the scientific tend-

ency grew upon her. Beginning with *Middlemarch* (1872), which is perhaps her masterpiece, it seems to some critics decidedly too preponderant, giving to her novels too much the atmosphere of psychological text-books; and along with it goes much introduction of the actual facts of nineteenth century science. Her really primary instinct, however, is the moral one. The supremacy of moral law may fairly be called the general theme of all her works; to demonstrating it her scientific method is really in the main auxiliary; and in spite of her accuracy it makes of her more an idealist than a realist. . . . In technique, her very hard work generally assured mastery. Her novels are firmly knit and well-proportioned, and have the inevitable movement of life itself; while her great scenes equal those of Thackeray in dramatic power and, at their best, in reserve and suggestiveness."—R. H. Fletcher, *History of English literature*, pp. 437-441.—"It is significant of the slow growth of George Meredith's [1828-1909] literary reputation that, though we think of him as the successor of George Eliot, his first novel appeared before hers. He published *The Shaving of Shagpat* in 1856. *The Ordeal of Richard Feverel* appeared in 1859, and other works at intervals of two or three years down to 1895; of these, *Beauchamp's Career* (1876), *The Egoist* (1879), *Diana of the Crossways* (1885), and *One of Our Conquerors* (1890), are the most noteworthy. Meredith, like George Eliot, is a psychologist, and in some sort a moralist. But while George Eliot tries to make her characters individual, and then to make their lives typical by showing how the laws of the moral world get themselves enforced, as it were, automatically, Meredith tends to make his characters types, embodiments of the particular quality which he is interested in exploiting. Again, George Eliot works through tragedy, Meredith often through comedy; the one scourges evil-doers, the other makes them ridiculous. George Eliot seeks to present a fully developed background, and is at pains to make her characters talk with absolute realism; Meredith concentrates attention upon his typical characters, and cares little whether his men and women talk naturally so long as they embody the essential, spiritual truth of humanity. His dialogue is more highly compressed, more heavily loaded with meaning, than it could be in actual life. The same pursuit of the essential makes him abrupt in structure; he shifts the scene suddenly, he drops the thread of his story and picks it up again where he will, in such a manner as to render it difficult for any but a practised reader to follow him. Like Browning, instead of presenting his tale in plain, clear narrative, he prefers to give it to us in flashes and half-lights, as it is seen from different points of view."—W. V. Moody and R. M. Lovett, *History of English literature*, pp. 379-380.—"In Charlotte Brontë [1816-1855] the imagination never attained to such tragic splendor as in her sister; her novels are, however, more nearly in contact with actual life. The first of them, *Jane Eyre* (1847), opens with a transcript from Miss Brontë's own life at boarding-school, but the heroine soon passes beyond the world of the author's experience into the romantic realm of her longing and imagination. . . . Psychologically she is a study of the author's inner life, and her romantic experience is symbolical of the attempt which Charlotte and her sisters made to enlarge and color their oppressive little world with the spaces and splendors of the imagination. It was the honesty of Miss Brontë's romanticism that made *Jane Eyre* successful both with the critics and with the public. Under the advice of the critics, Miss Brontë abandoned gothic machinery in her later

books, *Shirley* (1849) and *Villette* (1853). . . . Charles Kingsley (1819-1875) shared Miss Brontë's serious view of fiction; and his position in the world was such as to connect him with large issues. . . . His novels fall into two divisions. In the earlier ones, *Yeast* (1848) and *Alton Locke* (1850), Kingsley gives a view of the problems which perplexed men's minds in the middle years of the century, the years of the Catholic revival and of Chartism; and he tries to point out a middle course between Catholicism and scepticism in religion, between Toryism and revolution in politics. In the second division he carries his purpose into the historical novel. *Hypatia* (1853) is a study of the struggle between Christianity and Paganism, in Alexandria, during the fifth century. His masterpiece, *Westward Ho!* (1855), is a vigorous story of the times of Elizabeth, depicting the English contest with Spain by sea and in America. In both these novels, Kingsley sought to develop his ideal of manhood, a compound of physical energy and intellectual moderation to which he felt in some way that the Catholic Church was dangerous. In both he displays many of the qualities of the artist. His scene has the vividness and splendor of painting, and his incident, though at times childishly unconvincing, is often superbly dramatic. The religious and social problems of England found a less passionate exponent in Mrs. Elizabeth Gaskell (1810-1865), the wife of a Unitarian clergyman in Manchester. Her life brought her into contact with the industrial and social difficulties growing out of the struggle between master and workman; and these she treated with great skill in *Mary Barton* (1848), and in *North and South* (1855). In *Cranford* (1853), her best known book, she entered a different field, that of realistic observation developed in a somewhat fantastic setting."—*Ibid.*, pp. 374-376.

1832-1890. — Humanitarianism. — Spencer and Mill. — Evolution. — Darwin and Huxley. — Physical science. — Tyndall. — "In the presence of the modern situation, social, industrial, political, thinker after thinker relapses into helplessness. Some offer panaceas. Some take refuge in criticising these panaceas. Some betake themselves to comforting and sedative confidence in the laws of nature. What if, watching the workings of earnest minds, we find a steady trend of thought in one direction. Retrospect is true prophecy, and we may come to recognize through all vagary and contradictory clamor the slow advance of a great idea. A mighty struggle for social salvation, not yet fully in evidence, but inexorably preparing, lies behind all incidents of modern life and art. The great social literature before 1880 reveals the gathering of the forces. To discover the issue was the work of that period. To face it is the work of our own."—V. D. Scudder, *Social ideals in English letters*, pp. 126-127.—"The new spirit is seen . . . most fully . . . in the writings of Herbert Spencer (1820-1903), the philosopher of evolution. Unfortunately Spencer was not an attractive writer, and his volumes probably contain more hard thinking than is to be found in any other author of the century. Spencer had little of the poet in his composition, and while he was carrying out his great plan of unifying all knowledge he sought nothing more than the expression of his ideas in the clearest and most unambiguous form. . . . If Spencer was the focus of the evolutionary doctrine, several men of attractive personality and some literary distinction dealt effectively with the accessory portions of it."—E. W. Edmunds and F. Spooner, *Story of English literature*, v. 3, pp. 217, 220.—See also HISTORY: 34.—"Mill [1806-1873] . . . devoted

his best work and talents to the construction of a system of utilitarian ethics, thus following Jeremy Bentham (1748-1832), a founder of *The Westminster Review*, to which Mill was a constant contributor. Mill's *System of Logic* (1843) was faithful to the inductive method of contemporary science, with its patient investigation of phenomena. His studies of *Political Economy* appeared in the following year, and led to a more extensive treatise on the *Principles of Political Economy* in 1848. These works, which rank as English classics, suffer from the same defect of underrating the influence of human nature. The individualists reckoned without socialism, and British moral philosophy in the first half of the nineteenth century was slow in learning its lesson from Continental and Transatlantic writers. The influence on Mill of Auguste Comte, the French Positivist philosopher, and the inventor of the term, if not of the science, of sociology, proved considerable in later life, when Mill added *On Liberty, Representative Government and Utilitarianism* to the longer treatises of twenty years before. Later still, he collected from reviews a number of *Dissertations and Discussions*, which afford very interesting reading. They include a paper on 'Poetry and its Varieties,' which Herbert Spencer, for all his learning, could never have composed.—L. Magnus, *English literature in the nineteenth century*, pp. 221-222.—"In his *Origin of Species*, Charles Darwin (1809-82), by providing a simple natural explanation of the evolution of organic species, compelled the old school of thinkers to trim their weapons against the whole idea. . . . *The Origin of Species* is one of those books the appearance of which marks an epoch in the intellectual growth of the world; and in every respect it is worthy to do so. As a piece of writing it is lucid and dignified, never slovenly and never ornate. [See also EVOLUTION: Darwin's theory.] Darwin, of course, made no pretensions to purely literary distinction; but no style could have fitted its subject better than this. . . . One of the most retiring of men, Darwin fortunately found an expositor in Professor Huxley (1825-05), one of the most masterly among nineteenth century prose-writers. In a series of lectures and essays Huxley drove home the lessons of Darwinism with crushing force. *Man's Place in Nature* (1863) presented the case for the physical evolution of man from the lower animals with final and unanswerable arguments. In *Lay Sermons* (1870) and in *Science and Culture* (1881) Huxley was the convincing advocate of the dignity of science; he did much to obtain for science its proper recognition by educationalists, and published admirable little text-books on Physiography, Physiology, and Zoology."—E. W. Edmunds and F. Spooner, *Story of English literature*, v. 3, pp. 221-222.—"The establishment of the theory of evolution by natural selection was the great intellectual event of the century. . . . 'Biology like theology has its dogmas. . . . All great truths, like Darwin's law of selection, acquire a momentum which sustains half-truths and pure dogmas' . . . and there was no prominent writer of the period who escaped altogether from the quickening and disturbing effects of the evolutionary hypothesis and its implications."—J. W. Cunliffe, *English literature during the last half century*, p. 11.—See also EVOLUTION: Historical development of the idea.—"Professor John Tyndall (1820-03) was the Huxley of Physical Science, and his works on *Heat, Sound, Light*, first delivered in the form of lectures beautifully illustrated by experiments, gave a fresh fascination to subjects of unavoidable difficulty. His delightful writings on the Alps are true scientific holidays."—E. W. Edmunds and F.

Spooner, *Story of English literature*, v. 3, p. 223.— See also EUGENICS: Early history.

1833-1909.—Oxford movement.—Keble and Newman.—Pre-Raphaelite brotherhood.—Rossetti and Morris.—Swinburne.—"The Oxford Movement . . . constitutes one of the most interesting chapters in the spiritual history of the century. It was a concerted attempt on the part of a few young Oxford men, re-enforced later by numerous adherents, to reclaim the Church of England from the torpor and deadness into which it had fallen, and to give it once more the poetry, the mystic symbolism, and the spiritual charm, which had characterized the Catholic Church in the Middle Ages. The original inspiration of the movement was given by John Keble (1792-1866), author of *The Christian Year*, after Herbert's *Temple* the best book of devotional verse in English. [It was to his sermon on *National Apostasy*, preached July 14, 1833, that Newman ascribed the beginning of the Oxford movement.] The greatest force in the spiritual revolution, however, was John Henry Newman, afterward Cardinal Newman (1801-1890). . . . In reply to a charge of hypocrisy made by Charles Kingsley, Newman wrote an account of his religious life previous to his entering the Catholic Church, entitled *Apologia pro Vita Sua*. The exquisite sincerity of this confession revolutionized the popular estimate of Newman, and made him henceforth an object of veneration even to those who differed from him most bitterly on theological questions. . . . Newman's prose style is characterized at its best by an unobtrusive distinction, and by a kind of aerial transparency in comparison with which even Arnold's prose appears slightly dense. . . . Newman, it may almost be said, has no manner, or at least his manner is so completely one with his matter that it passes unobserved; his words convey his meaning as ether conveys light. . . . Newman, in certain passages especially of his *Apologia* and his *Idea of a University*, has perhaps come nearer than any prose-writer of this century in England, to the type of perfect prose. . . . But he was also a mystic and a poet, gifted with a literary power of the most winning and magnetic kind. His influence upon pure literature has therefore been great. [See also OXFORD OR TRACTARIAN MOVEMENT.] His mediæval cast of mind, his passionate perception of the beauty of the symbolism embodied in the mediæval church, united with Ruskin's devotion to mediæval art to influence a remarkable group of young painters and poets, known as the 'Preraphaelites.' The 'Preraphaelite movement' was in its essence an attempt to spiritualize art and poetry, kindred with the attempt of the 'Oxford movement' to spiritualize the English church. The 'Preraphaelite Brotherhood' was strictly not a literary, but an artistic organization, consisting of a number of young painters and sculptors banded together for the avowed purpose of redeeming English art from conventionality, and of recalling it to nature. They took as their models those early Italian painters preceding Raphael, who had treated the most mystical of religious themes with simple-hearted realism. For subjects the Preraphaelites went back to the Middle Ages, and their work took on the mystical, allegorical, and religious character inseparable from mediæval thought. A kind of naive earnestness and simplicity of treatment, with a mystical and intangible poetry of conception, were the dominant qualities in the work of these young enthusiasts, who took their mission very seriously, as a 'holy war and crusade against the age.' Several members of the Brotherhood were poets as well as

painters and sculptors; and there grew out of the artistic movement a literary one, which found its first expression in a little magazine called 'The Germ,' published for a short time during 1850. [See also PAINTING: Europe (19th century).] In 'The Germ' appeared the early work of two poets who best represent this peculiar renaissance of nineteenth century poetry, Dante Gabriel Rossetti [1828-1882] and William Morris [1834-1896]. . . . Dante Gabriel was the eldest of four children, of whom two others attained distinction in literature: William Michael as a critic, Christina as a lyrical poet, gifted beyond any English woman except Mrs. Browning with the poetic instinct, and outranking even her in delicate and spontaneous melody. At nineteen Rossetti adopted the career of painter; and a year later he wrote the poem which perhaps best illustrates the Pre-Raphaelite movement on its literary side, 'The Blessed Damosel.' The Blessed Damosel, wearing the 'white rose of Mary's gift,' and holding the mystic lilies, leans from the 'gold bar of Heaven,' yearning for her earthly lover, and picturing to herself the time when she shall lead him with her among the celestial groves and by the living waters of God. The sights and sounds of Heaven are imaged forth in the poem with a concreteness which would be startling if it were not so solemnized by spiritual meaning, and so freighted with spiritual awe. . . . Besides the touching emotion of the poem, the wonderful beauty and reach of its imagery, it has a melody sweeter and more sensitive than Rossetti ever attained afterward. . . . *The House of Life*, in the final form which it took in the volume of 1881, consists of a hundred and one sonnets, dealing with the poet's love-history and loss. The language and the imagery are here more elaborate than in Rossetti's earlier work, and the music more conscious and artful. . . . As a whole, Rossetti's poetry is marked by great picturesqueness and visual beauty. It is 'painter's poetry,' in that its appeal is constantly to the eye. Music it has too, but the tendency to load itself with elaborate detail often defeats the music, and makes of the verse a kind of poetical tapestry, stiff with emblazoned images."—W. V. Moody and R. M. Lovett, *History of English literature*, pp. 341-346.—"Morris's work was directed to certain ends by the requirements of his age, but his spirit was one to which the age had no logical claim. He came not in due time but by some large generosity of the gods. . . . To suggest that the man who created *Jason* and *The Earthly Paradise*, *Sigurd* and *Love is Enough* had anything but the profoundest reverence for his art, and especially for the supreme expression of his art—poetry—would be a preposterous insult if it were not ludicrous. Art was his gospel, and all his social teaching and activity were but an effort to bring his gospel to pass upon earth. . . . The basis of Morris's social creed was an unchanging faith in the essential dignity of the nature of man. . . . His desire always was that men should at least be allowed to prove themselves freely. From the turbulent passions and sorrows inseparable from humanity he asked no escape, taking them gladly as the darker threads in the many-coloured web of our heritage, but he denounced fiercely the doctrine that, finding men forced into daily betrayal of themselves, blandly announced that here was proof of their radical meanness and unworth. . . . Principles of exchange and of labour for the common good were a necessary complement of his belief that a man must get from his labour two things: joy in the work itself and the means whereby to live, . . . and in

his poetry was the same endeavour embodied in creative imagination."—J. Drinkwater, *William Morris, a critical study*, pp. 194, 197-198, 200-202.—See also PRINTING AND THE PRESS: 1889-1900.—"The Catholic reactionism of Newman, the mediævalism of Ruskin and the Pre-Raphaelites, may be thought of as an attempt to escape from the hard material views of life forced upon the age by modern science. A somewhat similar attempt to escape from the overburdening moral seriousness and the too insistent ethical purpose of Victorian literature, may be traced in the early poetry of Algernon Charles Swinburne [1837-1909], especially in his first series of *Poems and Ballads* (1866). . . . In his later work, however, Swinburne has struck a more manly note, finding his inspiration in the ideal of freedom, personal and political; in his love of the sea, the poetry of which he has given with unexampled beauty and force; in an enthusiasm, wholesouled and generous, for great art; and in an exquisite perception of the beauty and pathos of child-life. Besides his voluminous lyrical work, he has essayed epic narrative in *Tristram of Lyonesse*; and he has produced a number of dramas, some, like *Chastelard* and *Marino Faliero*, being studies in the Elizabethan manner, others, as *Atalanta in Calydon* and *Erechtheus*, being written on the Greek model. Whatever may be the intellectual or moral value of Swinburne's poetry, it is certain that as a technical master of verse, as a musician in words, he is very great. . . . His excellences are present in the highest degree, and his faults almost absent, in his masterpiece, *Atalanta in Calydon* (1865), which ranks almost on a level with the *Samson Agonistes* of Milton as an attempt to give in English verse the essential form and spirit of Greek drama. [See also DRAMA: 1815-1877.] . . . Swinburne is the last of the Victorian poets, the latest survivor of the era which began with the appearance of Tennyson and Browning in the third decade of the century."—W. V. Moody and R. M. Lovett, *History of English literature*, pp. 349-350.

1880-1920.—Transition period.—Poetry and prose in the eighteen nineties.—Celtic revival.—Georgian poetry.—"The last half century was a period of extraordinarily rapid transition, political, social, and intellectual. Men were called upon to adjust their minds often with painful suddenness, to new systems of governments, new states of society, and new modes of thought. . . . The general sweep of thought was revolutionary; there was no political principle, no religious dogma, no social tradition, no moral convention that was not called in question. . . . Future generations will doubtless discern more constructive achievement than is obvious to the contemporary spectator. . . . A new era was begun, and though the march of progress . . . [has been] interrupted by the Great War, the . . . task of humanity . . . [is] to take up the task of reconstruction, so far as may be, where the catastrophe of 1914 suspended it."—J. W. Cunliffe, *English literature during the last half century*, pp. 14-15.—In drawing "a rough picture of some of the lines of contemporary writing . . . the most remarkable feature of the age . . . is without doubt its inattention to poetry. . . . Probably the only writer of verse who is at the same time a poet and has acquired a large popularity and public influence is Mr. Kipling [1865- . . .]. He is great because he discovered a new subject-matter, and because of the white heat of imagination which in his best things he brought to bear on it and by which he transposed it into poetry. It is Mr. Kipling's special distinction that the

apparatus of modern civilization—steam engines, and steamships, and telegraph lines, and the art of flight—take on in his hands a poetic quality as authentic and inspiring as any that ever was cast over the implements of other and what the mass of men believe to have been more picturesque days. Romance is in the present, so he teaches us. . . . That and the great discovery of India . . . give him the hold that he has . . . over the minds of his readers. It is in a territory poles apart from Mr. Kipling that the main stream of romantic poetry flows. Apart from the gravely delicate and scholarly work of Mr. Bridges, and the poetry of some others who work separately away from their fellows, English romantic poetry has concentrated itself into one chief school—the school of the 'Celtic Revival' of which the leader is Mr. W. B. Yeats."—G. H. Mair, *English literature, modern*, pp. 238-240.—Several of the later Victorian novelists reaped a late reward in the early part of the present period. These are Thomas Hardy, interpreter of the tragedy of country life (and poet, as well); Samuel Butler, whose "Way of all Flesh" shocked the sensibilities of his own day; and George Gissing, who in "New Grub Street" and other novels depicting the working classes voiced the pessimistic creed that "misery is the keynote of modern life" and whose critical study of Dickens is rated higher. These have been followed by H. G. Wells with his plea for intellectual freedom through research; George Moore, realistic novelist and temperamental historian of the Irish Renaissance; Joseph Conrad, whose creative art has won for him the title of "master" from his contemporaries, though undoubtedly the influence of Wells is of a broader social scope; John Galsworthy, whose sociological interests reflect the romantic spirit in a singularly delicate and poetic expression; Arnold Bennett, whose "Clayhanger" and "Old Wives' Tales" remain amid much litter; Hugh Walpole, May Sinclair, Gilbert Cannon, Compton Mackenzie, D. H. Lawrence and others, to all of whom have been attributed merit of one kind or another in present day fiction. Most of the prose that we have considered is fiction. Outside of that, George Bernard Shaw, apostle of heresy, has attained to the most conspicuous place in stimulating intellectual thought not only through the drama but through his characteristic "Prefaces."

"The movement of the Eighteen Nineties, . . . which has most engaged the attention of writers, the movement called 'Decadent,' or by the names of Oscar Wilde or Aubrey Beardsley, the movement Max Nordau denounced in Europe generally, and recently summed up by *The Times* under the epithet 'The Yellow Nineties,' does even now [1913] dominate the vision as we look backwards. And, indeed, though only a part of the renaissance, it was sufficiently 'brilliant,' to use one of its own *cliches*, to dazzle those capable of being dazzled by the achievements of art and letters for many years to come. For a renaissance of art and ideas which in literature had for exemplars Oscar Wilde (his best books were all published in the Nineties), Bernard Shaw, H. G. Wells, Rudyard Kipling, John Davidson, Hubert Crackenthorpe, W. B. Yeats, J. M. Barrie, Alice Meynell, George Moore, Israel Zangwill, Henry Harland, George Gissing, 'John Oliver Hobbes,' Grant Allen, Quiller Couch, Max Beerbohm, Cunninghame Graham, Fiona Macleod (William Sharp), Richard Le Gallienne, Ernest Dowson, Arthur Symonds, Lionel Johnson, and A. B. Walkley . . . could not have been other than arresting, could not, indeed, be other than important in the history of our race.

For, whatever may be the ultimate place of these workers in literature and painting in the national memory, and whatever value we set upon them then and now, few will deny that even the least of them did not contribute something of lasting or of temporary worth to the sensations and ideas of their age, or its vision of life, and to its conception of spiritual or mental power. . . . Literary reputations beginning in the Seventies and Eighties, and only in a few cases awaiting further buttressing in the Nineties, were numerous; these, besides those already named, included W. H. Mallock, Edmund Gosse, Andrew Lang, Robert Louis Stevenson, Frederic Harrison, William Ernest Henley, John Addington Symonds, Arthur Pinero, Sidney Colvin, Austin Dobson, Edward Dowden, H. D. Traill, Theodore Watts-Dunton, Stopford Brooke, James Payn, Leslie Stephen, Henry James, Grant Allen, William Black, Robert Bridges, Frederick Wedmore, and among more popular writers, Marie Corelli, Rider Haggard, and Hall Caine. Mrs. Humphry Ward had become famous on the publication of *Robert Elsmere*, in 1888, but the importance of her work during the succeeding decade places her, as it does also George Moore, Rudyard Kipling and George Gissing, each of whom did good work before 1890, in the newer movement. This latter was not, however, to have its effect on the younger generation alone, it was so irresistible as to inspire even those whose life-work was more or less done to new and modern activities. Thus Thomas Hardy began a new phase of his art in 1891 with *Tess of the D'Urbervilles*, following it with the masterly, and ultra-modern, *Jude the Obscure*, in 1895. He also published his first volume of poems, *Wessex Poems*, in 1898. William Morris published most of his prose romances in the Nineties, including *News from Nowhere*, in 1891, and in quick succession *The Roots of the Mountains*, *The Story of the Glittering Plain*, *The Wood Beyond the World*, and *The Well at the World's End*. *The Water of the Wondrous Isles* and *The Story of the Sundering Flood* were left in manuscript and published after his death. John Addington Symonds, whose chief work, *The History of the Italian Renaissance*, was completed between the years 1875-1886, published *In the Key of Blue*, a book so typical in some ways of the Nineties that it might well have been written by one of the younger generation. . . . The great veteran of black-and-white art, George du Maurier, suddenly became a popular novelist with the famous *Tribby* in 1894, which had been preceded by *Peter Ibbetson* (1891) and succeeded by *The Martian* (1896); and another veteran artist of great eminence also reasserted himself as a writer of first-rate power during the period, for it was not until 1890 that James McNeill Whistler collected and published in a delightful volume his 'Ten O'Clock' lecture, and his various letters to the newspapers, with other press cuttings, under the appropriate title of *The Gentle Art of Making Enemies*. . . . Further evidence of the stimulating atmosphere of the period is to be found in the number of writers who sprang into existence out of the *Zeitgeist* of the decade, as people in this country were beginning to call the spirit of the times. I do not mean those who were of the period in the narrower sense, but those who, taking that which every writer takes from his time, were sufficiently general in attitude not to have been peculiar to any movement. Among such writers may be named J. M. Barrie, Conan Doyle, Maurice Hewlett, Owen Seaman, Barry Pain, Pett Ridge, Israel Zangwill, Anthony Hope, W. H. Hudson, Joseph Conrad, Jerome K. Jerome, Stanley

Weyman, H. A. Vacbell, Stephen Phillips, Henry Newbolt, A. E. Housman, Arthur Christopher Benson, William Watson, Allen Upward, and the late G. W. Stevens, all of whom published their first notable work in the Nineties, and in many cases their best work. . . . Delightful among *fin de siècle* writers were those masters of a new urbanity, which, although in the direct tradition of Addison and Steele, of Dr. Johnson and Charles Lamb, possessed a *flair* of its own, a whimsical perversity, a 'brilliance,' quite new to English letters. First and most eminent of these urbane essayists, for like their earlier prototypes they practised mainly the essayist's art, comes Max Beerbohm, who considered himself out-moded at the age of twenty-four and celebrated the discovery by collecting his essays in a slim, red volume with paper label and uncut edges, and publishing them at the sign of The Bodley Head, in 1896, under the title of *The Works of Max Beerbohm*. From the same publishing house came fascinating volumes by G. S. Street, who satirised suburbans, talked charmingly of books, art and persons, and in *The Autobiography of a Boy* revealed the irony of the youth who wanted to be himself, and to live his own scarlet life, without having any particular self to become or any definite life to live, save that of matching his silk dressing-gown with the furniture of his room. There were also Charles Whibley, who wrote able studies of scoundrels and dandies; Richard Le Gallienne, who made a fine art of praise and, besides reviving the picaresque novel of flirtation in *The Quest of the Golden Girl*, became a sort of *fin de siècle* Leigh Hunt; John Davidson, who wrote the *Fleet Street Eclogues* and some curiously urbane novels, but who was more poet than essayist, and, latterly, was so much interested in ideas that he became a philosopher using literature as his medium; and Arthur Symons, poet of the music hall, the café and the *demi-monde*, literary impressionist of towns, and penetrating critic of the writers and ideas of the decadence in France and England. Another group of writers strongly associated with the period received its inspiration from the Celtic revival. Its chief figure was William Butler Yeats, the Irish poet and dramatist, whose earliest volumes of distinction, *The Countess Kathleen* and *The Celtic Twilight*, were published in 1892 and 1893. With him were Dr. Douglas Hyde, George Kussel (A.E.), John Eglington, Lady Gregory, and others, who together made up the Irish Literary Movement, which eventually established the Irish National Theatre in Abbey Street, Dublin, and produced the greatest of modern Irish dramatists, John Millington Synge. . . . Next to W. B. Yeats the most prominent figure of the Celtic revival was Fiona Macleod, whose first book, *Pharais: A Romance of the Isles*, appeared in 1894. There was also another Scottish movement, very widely appreciated on this side of the border. It was called the 'Kail Yard School,' and included the popular dialect fiction of J. M. Barrie, S. R. Crockett and the late 'Ian Maclaren.' . . . [George Moore's] vivid piece of realism, *Esther Waters* (1894), made history also by being the first notable novel to be banned by the libraries and placed on the *Index Expurgatorius* of Messrs W. H. Smith & Son.—H. Jackson, *Eighteen Nineties*, pp. 39-40, 44-49.—"It was not until the new century was well-advanced that a more hopeful and appreciative spirit [of poetry] was to be remarked. When the little collection entitled 'Georgian Poetry' 1911-12 was issued in the latter year, it was 'in the belief that English poetry is now again putting on a new strength and beauty, and that we are at

the beginning of another "Georgian period" which may take rank in due time with several great poetic ages of the past.' The modest enterprise met with a cordial reception from the public and was followed by . . . other volumes . . . going far to sustain the spirit of hopefulness the first volume had engendered. . . . This feeling . . . received further encouragement from 'New Numbers' (1914) by Wilfrid Wilson Gibson, Rupert Brooke, Lascelles Abercrombie and John Drinkwater, the first of a series of collections of verse intended to be published quarterly; but across this brilliant dawn there fell the black shadow of the Great War." Of these "Georgians," who belong to no distinct school, but who "seem to have 'poetical sinews in them' and to have done work which is likely to endure" we may mention John Masefield, known best for his sea poems and "August, 1914"; Rupert Brooke, "suddenly rising to the height of a great opportunity and as suddenly extinguished by death in the service of the cause he celebrated"; Wilfrid Wilson Gibson, who has aimed "to catch the gleam of romance in everyday life without ever losing hold of reality"; William H. Davies; Walter de la Mare; and Lascelles Abercrombie.—J. W. Cunliffe, *English literature during the last half century*, pp. 246-268.—See also DRAMA: 1843-1895; 1888-1921; 1892-1921.

1914-1922.—Effect of the World War on poetry.—Brooke, Nichols, Sassoon and Graves.—New realism in fiction.—"In the first months of the war it seemed generally agreed by critics and creative artists alike that the genius of expression itself was doomed to disappear in the immediate future. Works of imagination, we were assured, must cease to trouble the mind of man; no poetry worthy of the name was likely to be written during the next twenty years. It was a depressing prospect; but fortunately the prophecy was no sooner uttered than the event asserted its fallacy. A torrent of poetry began at once to pour from the press. . . . The first poems to be written by soldier-poets were almost inevitably touched by a certain irresistible sense of self-pity. Rupert Brooke's sonnet 'The Soldier' is the natural utterance of a young man who is leaving behind him everything that made life worth living, and who, faced by the prospect of an untimely death, seeks his consolation in bringing the future into some sort of permanent relation with the past. . . . And other poems, like Mr. Robert Nichols's 'Farewell,' and the 'Into Battle' of Julian Grenfell, are inspired by the same vague uncertainty, the same tremulous trust that a man may be remembered as having shown the courage which all the education of his youth was designed to breed. . . . Mr. Siegfried Sassoon, perhaps, has expressed better than any one else this emancipation of the soldier's heart from the taint of selfishness. It is the animating spirit of his vivid little piece of realism, 'In the Pink.' . . . The old, familiar glosses upon war are indeed effectually held up to scorn by our young realists. Mr. Siegfried Sassoon's 'They,' with its bitter arraignment of episcopal platitude, is well-balanced by the same poet's almost vindictive cameo of a London music-hall in wartime. . . . Sympathy has merged itself in a furious detestation of all those false pretences which in the past have presented the military spirit as a sort of enclosed garden of the poets' fantasy. The men who have seen the thing as it is have left the rest of us in no sort of doubt upon one indisputable fact. The poetry of the future will hardly venture to sentimentalise on experience which can prompt so sincere and so overwhelming an indignation. And indeed it is already to be noted that

among those poets also, who have not themselves made personal trial of war, a new and restrained spirit may be recognised. . . . This realism of the intellectual aspect of War, as contrasted with the merely material realism of lamp-black and lightning, has indeed afforded poetry a new scope for the imagination; and particularly in the work of Captain Graves, Mr. Siegfried Sassoon, and some of that of Mr. Robert Nichols, it has produced verse of a quality which could not, perhaps, have found inspiration at all in times of peace and contentment."—A. Waugh, *Tradition and change*, pp. 40, 48-50, 66.—"The last few years [1919] have seen a new movement in English fiction so full of vigour, sincerity, and spiritual beauty as to promise for the future, if only its edge be not dulled by the traffic of time, an entire revolution in the conventions of the British novel, clearing away a vast burden of traditional cant, and establishing a fresh and decent relation between the essential facts of life and their artistic revelation. . . . It is, in effect, a New Realism of the emotions, as contrasted with the conventional realism of conditions and environment; its interest is not the material convenience or inconvenience of life, but the spiritual achievement of man, and his ultimate realisation of his soul's possibilities. For the artist of the new realism the Kingdom of Heaven lies within the soul of man; for the realist of the last generation it was almost invariably sought from without, in the individual's relation with the rest of the world, and in the general improvement of social and human conditions. And the advance from external consolations to the consolations of the soul is an evident advance of the highest significance and of the most hopeful promise for the future. . . . We hail, then, in this latest development of English fiction a definite, sincere, and successful attempt to speak the truth about the things that belong to peace of the human soul. It is definite because it breaks finally with a number of retarding conventions which obliged the novelist to muster his characters in pens, some labelled virtuous and some vicious, and both classes expected to behave in every occurring situation precisely in accordance with the label of its class. The New Realism goes straight to the heart of man, and finds it of mingled yarn, good and ill together. It is sincere again because, while it recognises the omnipotent claim of romance and true sentiment, it has banished sentimentality altogether from the stage. False romanticism is no longer permitted to veil the facts of human nature, and the shame that is afraid of the naked beauty of pure passion is nailed implacably to the counter as false coin. . . . The New Realism, after all, is only the old Idealism, seen from the other side."—*Ibid.*, pp. 205-206, 221-222.

ENGLISHRY.—To check the assassination of his tyrannical Norman followers by the exasperated English, William the Conqueror ordained that the whole Hundred within which one was slain should pay a heavy penalty. "In connexion with this enactment there grew up the famous law of 'Englishry,' by which every murdered man was presumed to be a Norman, unless proofs of 'Englishry' were made by the four nearest relatives of the deceased. 'Presentments of Englishry,' as they were technically termed, are recorded in the reign of Richard I., but not later."—T. P. Taswell-Langmead, *English constitutional history*, p. 68.

ENTANGLING ALLIANCES, phrase used in American diplomacy. The expression "entangling alliances" does not occur in Washington's Farewell Address, although he advised against them. [See U. S. A.: 1700.] It "was given currency by Jefferson. In his first inaugural address he summed up the principles by which he proposed to regulate his foreign policy in the following terms: 'Peace, Commerce, and honest friendship with all nations, entangling alliances with none.'"—J. H. Latané, *From isolation to leadership*, p. 12.—"By 1820 we had not only shaken ourselves loose from the entanglements of European inter-

national politics, but we had formulated rules of conduct designed to make that separation permanent. . . . 'Our policy in regard to Europe, which was adopted at an early stage of the wars which have so long agitated that quarter of the globe, nevertheless remains the same, which is, not to interfere in the internal concerns of any of its powers; to consider the government de facto as the legitimate government for us. . . . But in regard to those [the American] continents circumstances are eminently and conspicuously different. It is impossible that the allied powers should extend their political system to any portion of either continent without endangering our peace and happiness; nor can anyone believe that our southern brethren, if left to themselves would adopt it.' . . . This policy forced Monroe to leave out of his message a recommendation for the recognition of revolutionary Greece, as that would have been an interference in European affairs; yet the stand taken was so obviously but a stretching of our oldest policy, of the movement begun by our own Revolution, that it was heartily approved. . . . The separation of the American and European spheres of influence, and the closing of the era of colonization—were grounded on facts, permanent interests, and the waxing strength of the United States. Although not incorporated in law, either national or international, they have stood. Europe has actually respected the territorial integrity and political independence of the Americas, and our people have until to-day embraced as one of their most cherished ideals the statement of Monroe's policy, founded as it was on their fundamental desire to pursue untrammelled the course of their own development and to hold Europe at ocean's length. Possibly its association with the venerable and non-contentious figure of Monroe gave it quicker and more general hold on the public mind if it had taken its name from its real author, the belligerent Adams. From time to time the mantle of the Monroe Doctrine has been spread over the additions and interpretations, till the name now stands for much that was not imagined at its announcement. It is possible that, by tending to crystallize our ideas, it has in the long run hampered our adjustment to conditions; for national interests are only relatively permanent, and their relationship with one another changes constantly. There can be no doubt, however, of the advantage that it was to us, in the period of untutored democracy upon which we were just entering, to 'have out a sheet anchor of fixed and respected policy.'—C. R. Fish, *American diplomacy*, pp. 2, 211-212, 217-218.—At the second Hague peace conference, in 1907, the delegates of the United States were instructed by Secretary of State Root as follows: "The policy of the United States to avoid entangling alliances and to refrain from any interference or participation in the political affairs of Europe must be kept in mind, and may impose upon you some degree of reserve in respect of some of the questions which are discussed by the Conference. In the First Conference the American delegates accompanied their vote upon the report of the committee regarding the limitation of armaments by the following declaration: 'That the United States, in so doing, does not express any opinion as to the course to be taken by the States of Europe. This declaration is not meant to indicate mere indifference to a difficult problem, because it does not affect the United States immediately, but expresses a determination to refrain from enunciating opinions upon matters into which, as concerning Europe alone, the United States has no claim to enter. The

words drawn up by M. Bourgeois, and adopted by the first commission, received also the cordial interest and sympathy with which the United States, while carefully abstaining from anything that might resemble interference, regards all movements that are thought to tend to the welfare of Europe.' Before signing the arbitration convention of the First Conference the delegates of the United States put upon record the following declaration: 'Nothing contained in this Convention shall be construed as to require the United States of America to depart from its traditional policy of not intruding upon, interfering with, or entangling itself in the political questions or policy or internal administration of any foreign State; nor shall anything contained in the said Convention be construed to imply a relinquishment by the United States of America of its traditional attitude toward purely American questions.' These declarations have received the approval of this Government, and they should be regarded by you as illustrating the caution which you are to exercise in preventing our participation in matters of general and world-wide concern from drawing us into political affairs of Europe."—E. Root, *Instructions to the American delegates to The Hague conference of 1907 (Publication no. 17 of Carnegie Endowment for International Peace, Division of Intercourse and Education, p. 64)*.—"Neutrality and isolation were correlative. They were both based on the view that we were a remote and distant people and had no intimate concern with what was going on in the great world across the seas. The failure of neutrality and the abandonment of isolation [in 1917] mark a radical, though inevitable, change in our attitude toward world politics. We do not propose, however, to abandon the great principles for which we as a nation have stood, but rather to extend them and give them a world-wide application. In his address to the Senate on January 22, 1917, the President [Wilson] said: 'I am proposing, as it were, that the nations should with one accord adopt the doctrine of President Monroe as the doctrine of the world; that no nation should seek to extend its polity over any other nation or people, but that every people should be left free to determine its own polity, its own way of development, unhindered, unthreatened, unafraid, the little along with the great and powerful. I am proposing that all nations henceforth avoid entangling alliances which would draw them into competitions of power, catch them in a net of intrigue and selfish rivalry, and disturb their own affairs with influences intruded from without. There is no entangling alliance in a concert of power.' In other words, the Monroe Doctrine, stripped of its imperialistic tendencies, is to be internationalized, and the American policy of isolation, in the sense of avoiding secret alliances, is to become a fundamental principle of the new international order."—J. L. Latane, *From isolation to leadership*, pp. 186-188.—See also MONROE DOCTRINE; U. S. A.: 1823; 1917; 1919 (July-September).

**ENTEBBE**, capital of Uganda, Africa. See UGANDA: 1911-1914.

**ENTENTE**, Little. See JUGO-SLAVIA: 1920.

**ENTENTE CORDIALE**, the popular name applied by the French to the establishment of friendly relations ("understanding") by the Anglo-French Agreement of 1904. The Anglo-Russian Agreement of 1907 converted the dual understanding into the Triple Entente. (See also ENGLAND: 1912.) Strictly speaking, there were three agreements, or two declarations and one formal convention, signed on April 8th, 1904, constituting, together, the Anglo-French Entente. The first, a "Declaration respecting Egypt and Morocco," ran as follows:

ARTICLE I. His Britannic Majesty's Government declare that they have no intention of altering the political status of Egypt. The Government of the French Republic, for their part, declare that they will not obstruct the action of Great Britain in that country by asking that a limit of time be fixed for the British occupation or in any other manner, and that they give their assent to the draft Khedivial Decree annexed to the present Arrangement, containing the guarantees considered necessary for the protection of the interests of the Egyptian bondholders, on the condition that, after its promulgation, it cannot be modified in any way without the consent of the Powers Signatory of the Convention of London of 1885. It is agreed that the post of Director-General of Antiquities in Egypt shall continue, as in the past, to be entrusted to a French *savant*. The French schools in Egypt shall continue to enjoy the same liberty as in the past.

ARTICLE II. The Government of the French Republic declare that they have no intention of altering the political status of Morocco. His Britannic Majesty's Government, for their part, recognize that it appertains to France, more particularly as a Power whose dominions are continuous for a great distance with those of Morocco, to preserve order in that country, and to provide assistance for the purpose of all administrative, economic, financial, and military reforms which it may require. They declare that they will not obstruct the action taken by France for this purpose, provided that such action shall leave intact the rights which Great Britain, in virtue of Treaties, Conventions, and usage, enjoys in Morocco, including the right of coasting trade between the ports of Morocco, enjoyed by British vessels since 1901.

ARTICLE III. His Britannic Majesty's Government, for their part, will respect the rights which France, in virtue of Treaties, Conventions, and usage, enjoys in Egypt, including the right of coasting trade between Egyptian ports accorded to French vessels.

ARTICLE IV. The two Governments, being equally attached to the principle of commercial liberty both in Egypt and Morocco, declare that they will not, in those countries, countenance any inequality either in the imposition of customs duties or other taxes, or of railway transport charges. The trade of both nations with Morocco and with Egypt shall enjoy the same treatment in transit through the French and British possessions in Africa. An Agreement between the two Governments shall settle the conditions of such transit and shall determine the points of entry. This mutual engagement shall be binding for a period of thirty years. Unless this stipulation is expressly

denounced at least one year in advance, the period shall be extended for five years at a time. Nevertheless, the Government of the French Republic reserve to themselves in Morocco, and His Britannic Majesty's Government reserve to themselves in Egypt, the right to see that the concessions for roads, railways, ports, &c., are only granted on such conditions as will maintain intact the authority of the State over these great undertakings of public interest.

ARTICLE V. His Britannic Majesty's Government declare that they will use their influence in order that the French officials now in the Egyptian service may not be placed under conditions less advantageous than those applying to the British officials in the same service. The Government of the French Republic, for their part, would make no objection to the application of analogous conditions to British officials now in the Moorish service.

ARTICLE VI. In order to insure the free passage of the Suez Canal, His Britannic Majesty's Government declare that they adhere to the stipulations of the Treaty of the 29th October, 1888, and that they agree to their being put in force. The free passage of the Canal being thus guaranteed, the execution of the last sentence of paragraph 1 as well as of paragraph 2 of Article VIII of that Treaty will remain in abeyance.

ARTICLE VII. In order to secure the free passage of the Straits of Gibraltar, the two Governments agree not to permit the erection of any fortifications or strategic works on that portion of the coast of Morocco comprised between, but not including, Melilla and the heights which command the right bank of the River Sebou. This condition does not, however, apply to the places at present in the occupation of Spain on the Moorish coast of the Mediterranean.

ARTICLE VIII. The two Governments, inspired by their feeling of sincere friendship for Spain, take into special consideration the interests which that country derives from her geographical position and from her territorial possessions on the Moorish coast of the Mediterranean. In regard to these interests the French Government will come to an understanding with the Spanish Government. The agreement which may be come to on the subject between France and Spain shall be communicated to his Britannic Majesty's Government.

ARTICLE IX. The two Governments agree to afford to one another their diplomatic support, in order to obtain the execution of the clauses of the present Declaration regarding Egypt and Morocco."

The more formally designated Convention relates to questions concerning the Newfoundland fisheries and certain boundaries between French and English possessions in Africa. The articles respecting Newfoundland and the fisheries are as follows:

ARTICLE I. France renounces the privileges established to her advantage by Article XIII of the Treaty of Utrecht, and confirmed or modified by subsequent provisions.

"ARTICLE II. France retains for her citizens, on a footing of equality with British subjects, the right of fishing in the territorial waters on that portion of the coast of Newfoundland comprised between Cape St. John and Cape Ray, passing by the north; this right shall be exercised during the usual fishing season closing for all persons on the 20th October of each year. The French may therefore fish there for every kind of fish, including bait and also shell fish. They may enter any port or harbour on the said coast and may there obtain supplies or bait and shelter on the same conditions as the inhabi-

tants of Newfoundland, but they will remain subject to the local Regulations in force; they may also fish at the mouths of the rivers, but without going beyond a straight line drawn between the two extremities of the banks, where the river enters the sea. They shall not make use of stake-nets or fixed engines without permission of the local authorities. On the above-mentioned portion of the coast, British subjects and French citizens shall be subject alike to the laws and Regulations now in force, or which may hereafter be passed for the establishment of a close time in regard to any particular kind of fish, or for the improvement of the fisheries. Notice of any fresh laws or Regulations shall be given to the Government of the French Republic three months before they come into operation. The policing of the fishing on the above-mentioned portion of the coast, and for prevention of illicit liquor traffic and smuggling of spirits, shall form the subject of Regulations drawn up in agreement by the two Governments.

"ARTICLE III A pecuniary indemnity shall be awarded by His Britannic Majesty's Government to the French citizens engaged in fishing or the preparation of fish on the 'Treaty Shore,' who are obliged, either to abandon the establishments they possess there, or to give up their occupation, in consequence of the modification introduced by the present Convention into the existing state of affairs. This indemnity cannot be claimed by the parties interested unless they have been engaged in their business prior to the closing of the fishing season of 1903. Claims for indemnity shall be submitted to an Arbitral Tribunal, composed of an officer of each nation, and, in the event of disagreement, of an Umpire appointed in accordance with the procedure laid down by Article XXXII of The Hague Convention. The details regulating the constitution of the Tribunal, and the conditions of the inquiries to be instituted for the purpose of substantiating the claims, shall form the subject of special Agreement between the two Governments.

"ARTICLE IV His Britannic Majesty's Government, recognizing that, in addition to the indemnity referred to in the preceding Article, some territorial compensation is due to France in return for the surrender of her privilege in that part of the Island of Newfoundland referred to in Article II, agree with the Government of the French Republic to the provisions embodied in the following Articles."

The provisions here referred to, contained in the subsequent articles, modify the former frontier between Senegambia and the English colony of the Gambia, "so as to give to France Yarbutenda and the lands and landing places belonging to that locality"; cede to France "the group known as the Isles de Los, and situated opposite Konakry"; and substitute a new boundary, to the east of the Niger, for that which was fixed between the French and British possessions by the Convention of 1898. The declaration which concludes the series of agreements has to do with matters in Siam, Madagascar, and New Hebrides. As to Siam, the two governments "declare by mutual agreement that the influence of Great Britain shall be recognized by France in the territories situated to the west of the basin of the River Menam, and that the influence of France shall be recognized by Great Britain in the territories situated to the east of the same region, all the Siamese possessions on the east and southeast of the zone above described and the adjacent islands coming thus henceforth under French influence, and, on the other hand, all Siamese possessions on the west of this zone and of the Gulf of Siam, including the Malay Peninsula and

the adjacent islands, coming under English influence. The two Contracting Parties, disclaiming all idea of annexing any Siamese territory, and determined to abstain from any act which might contravene the provisions of existing Treaties, agree that, with this reservation, and so far as either of them is concerned, the two Governments shall each have respectively liberty of action in their spheres of influence as above defined." The further agreements were, on the part of the British government, to withdraw a protest it had raised against the customs tariff established in Madagascar, and, on the part of the two governments, "to draw up in concert an arrangement which, without involving any modification of the political *status quo*, shall put an end to the difficulties arising from the absence of jurisdiction over the natives of the New Hebrides." In the British Parliamentary Paper (Cd. 1952, April, 1904) which gave official publication to these Agreements, they are accompanied by an explanatory despatch from the Marquess of Lansdowne, British Foreign Secretary, to Sir E. Monson, Ambassador at Paris, which affirms distinctly that "if any European Power is to have a predominant influence in Morocco, that Power is France." The language of the despatch on this subject is as follows:

"The condition of that country [Morocco] has for a long time been unsatisfactory and fraught with danger. The authority of the Sultan over a large portion of his dominions is that of a titular Chief rather than of a Ruler. Life and property are unsafe, the natural resources of the country are undeveloped, and trade, though increasing, is hampered by the political situation. In these respects the contrast between Morocco and Egypt is marked. In spite of well-meant efforts to assist the Sultan, but little progress has been effected, and at this moment the prospect is probably as little hopeful as it ever has been. Without the intervention of a strong and civilized Power there appears to be no probability of a real improvement in the condition of the country. It seems not unnatural that, in these circumstances, France should regard it as falling to her lot to assume the task of attempting the regeneration of the country. Her Algerian possessions adjoin those of the Sultan throughout the length of a frontier of several hundred miles. She has been compelled from time to time to undertake military operations of considerable difficulty, and at much cost, in order to put an end to the disturbances which continually arise amongst tribes adjoining the Algerian frontier—tribes which, although nominally the subjects of the Sultan, are, in fact, almost entirely beyond his control. The trade of France with Morocco is again—if that across the Algerian frontier be included—of considerable importance, and compares not unfavourably with our own. In these circumstances, France, although in no wise desiring to annex the Sultan's dominions or to subvert his authority, seeks to extend her influence in Morocco, and is ready to submit to sacrifices and to incur responsibilities with the object of putting an end to the condition of anarchy which prevails upon the borders of Algeria. His Majesty's Government are not prepared to assume such responsibilities, or to make such sacrifices, and they have therefore readily admitted that if any European Power is to have a predominant influence in Morocco, that Power is France. . . . From the point of view of Great Britain the most important part of the Agreement which has been concluded in respect of Egypt is the recognition by the French Government of the predominant position of Great Britain in that country. They fully admit that the fulfilment of

the task upon which we entered in 1883 must not be impeded by any suggestion on their part that our interest in Egypt is of a temporary character, and they undertake that, so far as they are concerned, we shall not be impeded in the performance of that task. This undertaking will enable us to pursue our work in Egypt without, so far as France is concerned, arousing international susceptibilities. It is true that the other Great Powers of Europe also enjoy, in virtue of existing arrangements, a privileged position in Egypt; but the interests of France—historical, political, and financial—so far outweigh those of the other Powers, with the exception of Great Britain, that so long as we work in harmony with France, there seems no reason to anticipate difficulty at the hands of the other powers.”—See also FRANCE: 1904-1906.

**ENTHUSIASTS.**—“The term ‘Enthusiasts’ has also had a technical sense, as in the Elizabethan period. Jewel, Rogers, . . . and others speak of ‘Enthusiasts’ as they do of the Anabaptists. During the Commonwealth period, and afterward, the term was frequently applied to the Puritans in a tone of depreciation, as by Robert South, who preached a special sermon on the subject, ‘Enthusiasts not led by the spirit of God,’ meaning . . . the Puritans.”—*New Schaff-Herzog religious encyclopedia*, v. 4, p. 149.

**ENTOMOLOGY.** Bureau of, United States. See AGRICULTURE, DEPARTMENT OF, UNITED STATES.

**ENTRY,** Peaceable. See COMMON LAW: 1382.

**ENVER PASHA** (1882- ), Turkish soldier, formerly leader of the Young Turkey Party and minister for war. He was the prime mover in the revolution of 1908; commanded an army in the Balkan Wars of 1912-1913, and was mainly instrumental in bringing Turkey into the World War on the side of Germany; on the defeat of Turkey in 1918 he fled from the country with his colleague, Talaat Pasha, taking with him a large amount of money from the Turkish treasury.—See also TURKEY: 1908; WORLD WAR: 1914: IV. Turkey: c; 1915: VI. Turkey: a, 4. xvii.

**ENZELI,** town of Persia on the Caspian sea, entered by the Russians in 1918 during the World War. See WORLD WAR: 1918: VI. Turkish theater: a, 7.

**EONIANIS,** followers of Eon d'Etoile (Eudo de Stella), wealthy nobleman and heretical fanatic in Brittany in the twelfth century. He imagined himself to be the Messiah and in his vehemence against the hierarchy and his zeal for apocalyptic views, led his adherents into violent excesses. Eon himself died in prison, some of his disciples were burned at the stake and the heresy was condemned by the Council of Reims. This movement is not to be confused with that of the Cathari which was active in Brittany during the same period.

ALSO IN: *New Schaff-Herzog religious encyclopedia*, v. 4, p. 200.

**EORFORMICK,** English name for old Roman city of Eboracum. See EBORACUM.

**EORL AND CEORL.**—“The modern English forms of these words have completely lost their ancient meaning. The word ‘Earl,’ after several fluctuations, has settled down as the title of one rank in the Peerage; the word ‘Churl’ has come to be a word of moral reprobation, irrespective of the rank of the person who is guilty of the offence. But in the primary meaning of the words, ‘Eorl’ and ‘Ceorl’—words whose happy jingle causes them to be constantly opposed to each other—form an exhaustive division of the free members of the state. The distinction in modern language is most nearly expressed by the words ‘Gentle’ and ‘Simple.’ The ‘Ceorl’ is the simple freeman, the mere

unit in the army or in the assembly, whom no distinction of birth or office marks out from his fellows.”—E. A. Freeman, *History of the Norman conquest of England*, ch. 3, sect. 2.—See also ÆTHEL; ENGLAND: End of 6th century; 958.

**EORMEN STREET.** See ERMYN STREET.

**EÖTVÖS,** Jozsef, Baron (1813-1871), Hungarian statesman. See HUNGARY: 1868-1890.

**EPAMINONDAS** (c. 418-362), Theban general and statesman. Studied with the Pythagorean philosopher, Lysis of Tarentum; came forward as a supporter of the Theban democracy; represented Thebes at the congress of Sparta, 371 B. C.; commanded the Boeotian army which met and defeated the Spartans at Leuctra, July, 371 B. C.; invaded Laconia, 370; restored Messenia as an independent state, 369; fought and was mortally wounded in the great battle at Mantinea, 362.—See also GREECE: B. C. 379-371; 371-362; THEBES: B. C. 378.

**EPARCH,** early Christian title. See CHRISTIANITY: 312-337.

**ÉPÉE,** Charles Michel, Abbé de l' (1712-1780), one of the founders of the first regular school for the deaf and dumb. See EDUCATION: Modern developments: 20th century: Education for the deaf, blind, and feeble-minded: Deaf mutes.

**EPEIROS.** See EPIRUS.

**EPHAH.**—“The ephah, or bath, was the unit of measures of capacity for both liquids and grain [among the ancient Jews]. The ephah is considered by Queipo to have been the measure of water contained in the ancient Egyptian cubic foot, and thus equivalent to 20.376 litres, or 6.468 imperial gallons, and to have been nearly identical with the ancient Egyptian artaba and the Greek metretes. For liquids, the ephah was divided into six hin, and the twelfth part of the hin was the log. As a grain measure, the ephah was divided into ten omers, or gomers. The omer measure of manna gathered by the Israelites in the desert as a day's food for each adult person was thus equal to 2.6 imperial quarts. The largest measure of capacity both for liquids and dry commodities was the cor of twelve ephabs.”—H. W. Chisholm, *On the science of weighing and measuring*, ch. 2.

**EPHEBI,** Athens, group of young men in ancient Greece who formed a college which was under state control. See EDUCATION: Ancient: B. C. 7th-A. D. 3rd centuries: Greece: University of Athens.

**EPHES-DAMMIM,** Battle of.—The battle, according to the Bible, which followed David's encounter with Goliath, the Philistine giant.

**EPHESIA,** one of the twelve cities of Asia Minor that belonged to the Ionic Amphictyony.

**EPHESIAN TEMPLE,** erected in honor of Diana, and regarded as one of the seven wonders of the world. See EPHEBUS: Ephesian temple.

**EPHESUS:** Ephesian temple.—“The ancient city of Ephesus was situated [in Lydia] on the river Cayster, which falls into the Bay of Scala Nova, on the western coast of Asia Minor [see GREECE: Map of ancient Greece]. Of the origin and foundation of Ephesus we have no historical record. Stories were told which ascribed the settlement of the place to Androklos, the son of the Athenian king, Codrus. . . . With other Ionian cities of Asia Minor, Ephesus fell into the hands of Cræsus [500-540 B. C.], the last of the kings of Lydia, and, on the overthrow of Cræsus by Cyrus, it passed under the heavier yoke of the Persian despot. Although from that time, during a period of at least five centuries, to the conquest by the Romans, the city underwent great changes of fortune, it never lost its grandeur and importance. The Temple of Artemis (Diana), whose splendour

has almost become proverbial, tended chiefly to make Ephesus the most attractive and notable of all the cities of Asia Minor. Its magnificent harbour was filled with Greek and Phœnician merchantmen, and multitudes flocked from all parts to profit by its commerce and to worship at the shrine of its tutelary goddess. The City Port was fully four miles from the sea, which has not, as has been supposed, receded far. . . . During the generations which immediately followed the conquest of Lydia and the rest of Asia Minor by the Persian kings, the arts of Greece attained their highest perfection, and it was within this short period of little more than two centuries that the great Temple of Artemis was three times built upon the same site, and, as recent researches have found, each time on the same grand scale."—J. T. Wood, *Discoveries at Ephesus*, ch. 1.—The excavations which were carried on at Ephesus by Mr. Wood for the British Museum, during eleven years, from 1863 until 1874, resulted in the uncovering of a large part of the site of the great Temple and the determining of its architectural features, besides bringing to light many inscriptions and much valuable sculpture. The account given in the work named above is exceedingly interesting. The Austrian Archaeological Institute carried on excavations at Ephesus from 1896 to the opening of the World War.

**Ionian conquest and occupation.** See ASIA MINOR: B. C. 1100.

**Ancient commerce.**—"The spot on the Asiatic coast which corresponded most nearly with Coriuth on the European, was Ephesus, a city which, in the time of Herodotus, had been the starting point of caravans for Upper Asia, but which, under the change of dynasties and ruin of empires, had dwindled into a mere provincial town. The mild sway of Augustus restored it to wealth and eminence, and as the official capital of the province of Asia, it was reputed to be the metropolis of no less than 500 cities."—C. Merivale, *History of the Romans*, ch. 40.—The account of the apostle Paul's labors of three years at Ephesus shows the city as still prosperous and influential, but its history under the Byzantine Empire is unimportant.

**B. C. 86.—Renews allegiance to Rome.** See MITHRADATIC WARS.

**A. D. 35-100.—Work of the apostle Paul.—Spread of Christianity.** See CHRISTIANITY: A. D. 35-60; 50-100.

**431 and 449.—General council and the "Robber Synod."** See NESTORIAN AND MONOPHYSITE CONTROVERSY.

**EPHETÆ.**—A board of fifty-one judges instituted by the legislation of Draco, at Athens, for the trial of crimes of bloodshed upon the Areopagus.—G. F. Schömann, *Antiquities of Greece: The State*, pt. 3, ch. 3.

**EPHORS.**—"Magistrates, called by the name of Ephors, existed in many Dorian as well as in other States [of ancient Greece], although our knowledge with regard to them extends no further than to the fact of their existence [and that they were probably in existence to the middle of the eighth century B. C.]; while the name, which signifies quite generally 'overseers,' affords room for no conclusion as to their political position or importance. In Sparta, however, the Board of Five Ephors became, in the course of time, a magistracy of such dignity and influence that no other can be found in any free State with which it can be compared. Concerning its first institution nothing certain can be ascertained. . . . The following appears to be a probable account:—The Ephors

were originally magistrates appointed by the kings, partly to render them special assistance in the judicial decision of private disputes,—a function which they continued to exercise in later times,—partly to undertake, as lieutenants of the kings, other of their functions, during their absence in military service, or through some other cause. . . . When the monarchy and the Gerousia wished to re-establish their ancient influence in opposition to the popular assembly, they were obliged to agree to a concession which should give some security to the people that this power should not be abused to their detriment. This concession consisted in the fact that the Ephors were independently authorized to exercise control over the kings themselves. . . . The Ephors were enabled to interfere in every department of the administration, and to remove or punish whatever they found to be contrary to the laws or adverse to the public interest."—G. F. Schömann, *Antiquities of Greece: The State*, pt. 3, ch. 1, sect. 8.—See also GREECE: B. C. 8th-5th centuries; SPARTA: Constitution ascribed to Lycurgus.

**EPHRAIM**, tribe of Israel named from the younger son of Joseph. See JEWS: Conquest of Canaan; Israel under the Judges; Kingdoms of Israel and Judah.

**EPHRATA**, semi-monastic community founded by Conrad Beissel. See DUNKARDS.

**EPHTHALITES**, or White Huns. See HUNS, WHITE.

**EPIC.**—"The epic in general, ancient and modern, may be described as a dispassionate recital in dignified rhythmic narrative of a momentous theme or action fulfilled by heroic characters and supernatural agencies under the control of a sovereign destiny. The theme involves the political or religious interests of a people or of mankind; it commands the respect due to popular tradition or to traditional ideals. The poem awakens the sense of the mysterious, the awful, and the sublime; through perilous crises it uplifts and calms the strife of frail humanity."—C. M. Gayley, *Principles of poetry*, pp. xciv-xcv.—See also ARTHURIAN LEGEND; BALLAD: Definition; Development; ENGLISH LITERATURE: 6th-16th centuries; FRENCH LITERATURE: 1050-1350; GERMAN LITERATURE: 1050-1350; HISTORY: 13; LATIN LITERATURE: B. C. 264-169; SAGA; VOLSUNGA-SAGA.

**EPICHARMUS OF SICILY** (c. 540-450 B. C.), Greek comic poet and dramatist. See DRAMA: Greek comedy.

**EPICETETUS** (born c. 60 A. D.), Stoic philosopher and moralist. His name comes from the Greek, meaning "acquired"; his original name is unknown. He was born a slave, but won favor and freedom through his attainments. He was exiled in 90 by Domitian who hated the Stoics for their opposition to his tyranny. Many of his teachings were reported by his pupil, Arrian, and have come down to us in the form of maxims, of singular beauty, marked by that high idealistic philosophy which is generally associated with Christian teaching. There is no evidence that Epictetus knew anything about Christianity.

**EPICUREANISM**, school of philosophy in Athens founded (about 306 B. C.) on the teachings of Epicurus (342-270 B. C.), and following the hedonistic Cyrenaic school. Its doctrine was that "pleasure is the goal at which we all aim, and, indeed, ought to aim: happiness is the highest good."—F. Thilly, *History of philosophy*, p. 101.—"Owing to its simplicity, its anti-mystical character and its easy application, the Epicurean system became a formidable rival of Platonism, Peripateticism, and Stoicism. Italy received it with especial favor. . . .

During the reign of the Caesars, Stoicism was represented by the Republican opposition, while Epicureanism gathered around its standard the partisans of the new order of things, who were fortunate in being able to realize the ideals of the master under the auspices of a great and peaceful power. Protected as it was by the Emperors, the school destroyed what remained of the crumbling edifice of polytheism, and at the same time attacked the new religion and the supernatural Christian."—E. A. Weber, *History of philosophy*, p. 139.—"Epicurus, the son of Neocles the Athenian, was born in Samos in December, 342, or January, 341, B. C. Introduced to the doctrine of Democritus by Nausiphanes, and instructed by Pamphilus the Platonist, he came forward as a teacher in Colophon, Mitylene, and Lampsacus, and after 306 B. C. in Athens. Here his garden was the meeting-place of a circle which was filled with the deepest admiration for Epicurus and his teaching, and united intimate social intercourse with philosophic studies. Women as well as men belonged to it. . . . With Epicurus far more exclusively than with Zeno his philosophic system is simply a means for practical objects. He cared little for learned investigation and the mathematical sciences, to which he objected that they were useless and did not correspond to reality; and indeed his own education in both respects was very insufficient. Even in dialectics he ascribed a value only to the inquiries into the criterion. This part of his system he called the Canonic. Physics in his opinion are only needed because the knowledge of natural causes frees us from the fear of the gods and death, and a knowledge of human nature shows us what we ought to desire or avoid. Hence this part of philosophy also has no independent importance. If with the Stoics empiricism and materialism are connected with practical onesidedness, the same connection is still more strongly marked in Epicurus. It is entirely in the spirit of an ethical system, which regards the individual in himself only, that the material Individual is looked upon as the originally Real, and sensuous perception as the source of our presentations. If man finds his highest mission in preserving his individual life from disturbance, he must not seek in the universe for the traces of a reason, on which he had to support himself and to whose laws he must become subject. Nor must he make any attempt to secure a theoretic basis for his conduct by a knowledge of these laws. The world presents itself to him as a mechanism; within this he arranges his life as well as he can, but he need not know more of it than that upon which his own weal or woe depends. For this experience and natural intelligence appear to be sufficient without much logical apparatus. Epicurus' view of the world was in the first instance determined by the desire to exclude the interference of supernatural causes from the world. Such an interference must deprive man of all inward security and keep him in constant fear. This result the philosopher hopes to obtain most certainly by a purely mechanical explanation of nature. When he looked for such among the older systems (for he was neither inclined nor qualified to form a theory of his own in natural science) none corresponded to his object more completely than that which seemed to afford the best points of connection with his ethical individualism—which had first attracted him, and was perhaps alone accurately known to him. This was the atomism of Democritus. Like Democritus, Epicurus explains the atoms and the void as the primary elements of all things. He takes the same view of the atoms as Democritus, only he ascribes to them

a limited, not an infinite variety of shapes. By virtue of their weight the atoms descend in empty space; but as they all fall with equal rapidity (as Aristotle pointed out) and hence cannot dash upon one another, and also because such an assumption seemed necessary for the freedom of the will, Epicurus assumed that they deviated at will to an infinitesimal degree from the perpendicular line. Hence they dash on one another and become complicated, rebound, are partly forced upward, and thus give rise to those circular movements which create innumerable worlds in the most different parts of endless space. These worlds, which are separated by portions of merely empty space, present the greatest variety of conditions; but they have all arisen in time, and with time they will again pass away. . . . As Epicurus in his *Physics* explained the atoms as the source of all being, he regards the individual in his *Ethics* as the aim of all action. The measure for distinguishing good and evil is our feeling. The only absolute good is pleasure, after which all living things strive; the only absolute evil is pain, which all avoid. Hence in general Epicurus, like Aristippus, regards pleasure as the final object of our action. Yet by pleasure he does not mean the individual sensations of pleasure as such, but the happiness of an entire life. Our judgment must decide on separate enjoyments or pains by their relation to this. Further, he believes that the real importance of pleasure consists only in the satisfaction of a need, and hence in the removal of what is not pleasurable; our final object is not positive pleasure, but freedom from pain; not the motion, but the repose of the spirit. As the most essential conditions of this repose lie in the state of our feelings, Epicurus regards the pleasures and pains of the mind as far more important than those of the body. For however publicly and plainly he declares (in spite of some different expressions) that all pleasure and pain arise in the last resort from bodily conditions, yet he observes that only present delights and pains act upon the body, whereas the soul is moved by those of the past and the future. These feelings, which rest upon memory, hope, and fear, are in his view so much the more violent that he feels himself justified in extolling the absolute power of the spirit over bodily pains with the same exaggeration as the Cynics and Stoics. The severest pains are only of short duration and quickly put an end to life; the less severe can be borne and overcome by superior intellectual enjoyments. Virtue is only a condition of repose of mind, but it is so indispensable a condition that, even according to Epicurus, happiness is indissolubly connected with virtue, however small the independent value which his system allows us to attribute to it. Insight frees us from the prejudices which disturb us, from empty fancies and wishes; it teaches us the true art of life. Self-control preserves us from sorrows by correct conduct in regard to pleasure and pain, bravery by the contempt of death and suffering; to justice we owe it that no fear of punishment disturbs our equanimity. Epicurus himself led a pattern life, and his sayings frequently exhibit a purity of sentiment which goes far beyond their unsatisfactory scientific foundation. His ideal of the wise man approaches closely to the Stoic. If he does not ascribe to him either the Stoic apathy or their contempt of sensual enjoyment, yet he represents him as so completely master of his desires that they never lead him astray. He describes him as so independent of all external things, his happiness as so complete, and his wisdom as so inalienable, that he can say of him no less than the Stoics of their ideal, that he walks as a god among men, and even

on bread and water he need not envy Zeus. In harmony with this ideal Epicurus' rules of life aim in the first instance at procuring for the individual, as such, a contented and independent existence by liberating him from prejudices and controlling his desires. Living himself an unusually moderate and contented life, he urges others to contentment. Even of actual desires only a part aims at what is necessary; by far the greatest portion seeks what is unnatural and useless. Among the latter Epicurus especially places the desire for honour and glory. Hence he does not require the suppression of the sensual impulses; he will not forbid a rich enjoyment of life, but all the more vehemently does he insist that a man shall not make himself dependent on these things. The point is not to use little, but to need little. A man is not to bind himself absolutely even to life. Epicurus allows him to withdraw himself from intolerable miseries by a voluntary death, though he is of opinion that such miseries rarely happen."—E. Zeller, *Outlines of the history of Greek philosophy*, pp. 255-260, 264-266.—See also ATHENS: B. C. 336-322; DEISM: English deism; EUROPE: Ancient: Greek civilization: Philosophy.

**EPICURUS** (342-270 B. C.), Greek philosopher. See EPICUREANISM.

**EPIDAMNUS**, city in ancient Greece, the cause of a quarrel between Corcyra and Corinth which started the Peloponnesian War. See CORCYRA; DURAZZO; GREECE: B. C. 435-432: Causes of the Peloponnesian War.

**EPIDAURUS**, ancient city in southern Greece, which resisted Athens' attacks in 478 B. C. It was in the Achaean league. See ATHENS: B. C. 419-416; GREECE: B. C. 280-146; THEATER.

**EPIDEMICS**. See BLACK DEATH; MEDICAL SCIENCE: Modern: 1914-1918: War medicine and surgery; PLAGUE; PUBLIC HEALTH.

**EPIDII**, early Celtic tribe. See BRITAIN: Celtic tribes.

**EPIGAMIA**, the right of marriage in ancient Athens.—G. F. Schömann, *Antiquities of Greece: The State*, pt. 3, ch. 3.

**EPIGONI**, sons of the Argive chiefs. See BŒOTIA.

**EPIGRAPHY**, term used to denote the study, classification and explanation of ancient inscriptions. See HISTORY: 10; 25.

**EPINAL**, French fortress on the upper Moselle, eastern France; occupied by the Germans in 1870.

**EPIPOLÆ**, one of the parts or divisions of the ancient city of Syracuse, Sicily.

**EPIROT LEAGUE**.—"The temporary greatness of the Molossian kingdom [of Epeiros, or Epirus] under Alexander and Pyrrhus is matter of general history. Our immediate business is with the republican government which succeeded on the bloody extinction of royalty and the royal line [which occurred 230 B. C.]. Epeiros now became a republic; of the details of its constitution we know nothing, but its form can hardly fail to have been federal. The Epirots formed one political body; Polybios always speaks of them, like the Achaeans and Akarnanians, as one people acting with one will. Decrees are passed, ambassadors are sent and received, in the name of the whole Epirot people, and Epeiros had, like Akarnania, a federal coinage bearing the common name of the whole nation."—E. A. Freeman, *History of federal government*, bk. 4, sect. 1.

**EPIRUS, EPIROTS**.—"Passing over the borders of Akarnania [in ancient western Greece] we find small nations or tribes not considered as Greeks, but known, from the fourth century B. C. downwards, under the common name of Epirots.

[See GREECE: Map of ancient Greece.] This word signifies, properly, inhabitants of a continent, as opposed to those of an island or a peninsula. It came only gradually to be applied by the Greeks as their comprehensive denomination to designate all those diverse tribes, between the Ambrakian Gulf on the south and west, Pindus on the east, and the Illyrians and Macedonians to the north and north-east. Of these Epirots the principal were—the Chaonians, Thesprotians, Kassopians, and Molossians, who occupied the country inland as well as maritime along the Ionian Sea, from the Akrokeraunian mountains to the borders of Ambrakia in the interior of the Ambrakian Gulf. . . . Among these various tribes it is difficult to discriminate the semi-Hellenic from the non-Hellenic; for Herodotus considers both Molossians and Thesprotians as Hellenic,—and the oracle of Dōdōna, as well as the Nekomanteion (or holy cavern for evoking the dead) of Acheron, were both in the territory of the Thesprotians, and both (in the time of the historian) Hellenic. Thucydides, on the other hand, treats both Molossians and Thesprotians as barbaric. . . . Epirus is essentially a pastoral country: its cattle as well as its shepherds and shepherds' dogs were celebrated throughout all antiquity; and its population then, as now, found divided village residence the most suitable to their means and occupations. . . . Both the Chaonians and Thesprotians appear, in the time of Thucydides, as having no kings; there was a privileged kingly race, but the presiding chief was changed from year to year. The Molossians, however, had a line of kings, succeeding from father to son, which professed to trace its descent through fifteen generations downward from Achilles and Neoptolemus to Tharypas about the year 400 B. C."—G. Grote, *History of Greece*, pt. 2, ch. 24.—The Molossian kings subsequently extended their sovereignty over the whole country and styled themselves kings of Epirus. Pyrrhus, whose war with Rome (see ROME: Republic: B. C. 281-272) is one of the well known episodes of history, was the most ambitious and energetic of the dynasty (see MACEDONIA: B. C. 207-280); Hannibal reckoned him among the greatest of soldiers. In the next century Epirus fell under the dominion of Rome. Subsequently it formed part of the Byzantine empire; then became a separate principality, ruled by a branch of the imperial Comnenian family; was conquered by the Turks in 1466 and is now represented by the southern half of Albania.—See also ŒNOTIANS.

**B. C. 48**.—Cæsar's decisive battle at Pharsalia. See ROME: Republic: B. C. 48.

**1204-1350**.—Greek despotat.—From the ruins of the Byzantine empire, overthrown by the Crusaders and the Venetians in 1204, "that portion . . . situated to the west of the range of Pindus was saved from feudal domination by Michael, a natural son of Constantine Angelos, the uncle of the Emperors Isaac II and Alexius III. After the conquest of Constantinople, he escaped into Epirus, where his marriage with a lady of the country gave him some influence; and assuming the direction of the administration of the whole country from Dyrrachium to Naupactus, he collected a considerable military force, and established the seat of his authority generally at Ioannina or Arta. . . . History has unfortunately preserved very little information concerning the organisation and social condition of the different classes and races which inhabited the dominions of the princes of Epirus. Almost the only facts that have been preserved relate to the wars and alliances of the despots and their families with the Byzantine emperors and the Latin princes. . . . They all assumed the name of

Angelos Komnenos Dukas; and the title of despot, by which they are generally distinguished, was a Byzantine honorary distinction, never borne by the earlier members of the family until it had been conferred on them by the Greek emperor. Michael I, the founder of the despotat, distinguished himself by his talents as a soldier and a negotiator. He extended his authority over all Epirus, Acarnania and Etolia, and a part of Macedonia and Thessaly. Though virtually independent, he acknowledged Theodore I (Laskaris), [at Nicæa] as the lawful emperor of the East." The able and unscrupulous brother of Michael, Theodore, who became his successor in 1214, extinguished by conquest the Lombard kingdom of Saloniki, in Macedonia (1222), and assumed the title of emperor, in rivalry with the Greek emperor at Nicæa, establishing his capital at Thessalonica. The empire of Thessalonica was short lived. Its capital was taken by the emperor of Nicæa, in 1234, and Michael's son John, then reigning, was forced to resign the imperial title. The despotat of Epirus survived for another century, much torn and distracted by wars and domestic conflicts. In 1350 its remaining territory was occupied by the king of Servia, and finally it was swallowed up in the conquests of the Turks.—G. Finlay, *History of Greece from its conquest by the Crusaders*, ch. 6.

1358-1443.—Under Albanian rule. See ALBANIA: Medieval period; 1358-1443.

1478-1878.—Part of Albanian history.—The history of Epirus in modern times is that of southern Albania. This region has a mixed population, consisting mainly of Greeks, Albanians, Serbs and Vlachs. (See also ALBANIA: Name and people.) The Epirots themselves (the Greeks of Epirus) have a strong attachment to Greece, which has made them the object of persecution at the hands of both Turks and Albanians. With the decline of the Ottoman power and the increase of anarchy and lawlessness Albania came under the practically independent sovereignty of Ali Pasha of Tepelen, an Albanian, whose rule lasted from about 1750 to 1822. Although the Epirots fought for Greek independence in the Revolution of 1821-1820, Epirus was left in Turkish hands at the close of the war. Likewise, after the redistribution of territory resulting from the treaties of San Stefano and Berlin, Epirus again fell to the Turks. See ALBANIA: 1478-1878; BALKAN STATES: 1878.

1830-1912.—Albanian and Turkish oppression.—"From 1830 to 1912 the Greek Epirotes underwent a period of relentless oppression on the part of the Albanians. . . . The leading Greek families of Epirus were proscribed, . . . [the] clergy were persecuted, . . . schools which had been respected by the Sultans from the time of Ali Pasha were attacked. . . . It was in 1908 that the Greek Premier Theotokis wrote to Ismael Kemal Bey asking what were the aims of the Albanians as to Epirus should Greece assist the Albanians to win their independence. Ismael replied that the just boundaries between Albania and Greece should be a line drawn from Valona to Monastir. [Since the Turks came to terms with the Albanians, this failed to materialize.] . . . The Young Turks, having failed in their attempt to Turkify the Albanians found it next best to Albanicize the Greeks, the Serbs and the Vlachs. . . . The war of 1912 came just in time to save Epirus from a violent denationalization."—N. J. Cassavetes, *Outlines of northern Epirus at the peace conference*, pp. 34-35.

1881.—Part ceded to Greece by Turkey. See GREECE: 1862-1881.

1912-1919.—Revolt in northern Epirus after the Balkan War.—Italian occupation during World War and after.—In 1912 "the Triple Alliance was ready to plunge the world into the Great War. The Balkan mêlée was offering an excellent opportunity. Sir Edward Grey and President Poincaré perceived the danger. They sought to avoid the catastrophe. They persuaded Serbia to withdraw from the sea, and prevailed upon Mr. Venizelos to renounce the Greek claims on Epirus. Thus, in 1913, in order to postpone the Great War, Northern Epirus was awarded to the Kingdom of Albania. The Greek army was forced to evacuate all the territory occupied in 1913. . . . [In 1914] the Epirot population rose, . . . declared their country independent and autonomous, and completely defeated all the Albanian armies sent against them under Austrian, Turkish, and Italian officers. The Provisional Government of Northern Epirus, under George Zographos, appealed for aid to the Powers, and asked that Northern Epirus be allowed to join itself to Greece. . . . The Powers consented, and the Greek Army returned to Northern Epirus amid the frenzied enthusiasm of the population which believed that this reoccupation meant permanent union with Greece. Such was the state of affairs in Northern Epirus in 1914. The diplomats of the Central Powers had made up their minds that Northern Epirus was too fanatically attached to Greece to be separated by force. In 1914, the Great War broke out. In 1915, Mr. Venizelos was forced to resign and all Albania was occupied by the Austrians. . . . [Later] Italy occupied Northern Epirus; drove out the Greek civil authorities; forced the Greek schools to close; initiated a violent . . . persecution of the Greek clergy; and imprisoned all the inhabitants who refused to call themselves either Italians or Albanians. . . . The Epirotic question has two aspects, namely, the Greek, and the Albanian. In its Greek aspect the question is a demand on the part of the Epirotes to unite themselves to Greece. In its Albanian aspect it is an attempt on the part of certain Albanians, Austrians and Italians to incorporate Northern Epirus in the future State of Albania."—*Ibid.*, pp. 1-4.—See also GREECE: 1913; Second Balkan war.

1919-1922.—Allied settlement.—The Greek troops were permitted by the Allies to reoccupy Epirus in 1919, and the Italians withdrew their forces in April, 1920. The Albanians, however, made an appeal in 1921 to the League of Nations against the frontier claimed by Greece, but the sections handed over to Greece have been allowed to remain in her hands. In 1922 an International Commission was engaged in determining the boundary line between Greece and Albania.

EPISCOPACY, term applied to a system of church organization in which the bishop is the chief ecclesiastical authority of a specified district. See CHRISTIANITY: 100-300; Church organization; SCOTLAND: 1572; 1587; 1660-1660.

EPISCOPAL CHURCH. See CHURCH OF ENGLAND: Protestant episcopal church

EPISTATES, presiding officer of the ancient Athenian council and popular assembly.

EPISTLES OF PAUL. See CHRISTIANITY: A. D. 35-60.

EPONYM, EPONYMUS, the name-giving hero of primitive myths, in which tribes and races of people set before themselves, partly by tradition, partly by imagination, an heroic personage who is supposed to be their common progenitor and the source of their name.

EPONYM CANON OF ASSYRIA. See ASSYRIA, EPONYM CANON OF.

**EPPING FOREST**, once so extensive that it covered the whole county of Essex, England, and was called the Forest of Essex. Subsequently, when diminished in size, it was called Waitham forest. Still later, when further retrenched, it took the name of Epping, from a town that is embraced in it. It is still quite large, and within recent years it has been formally declared by the Queen "a people's park."—J. C. Brown, *Forests of England*.

**EPULONES**.—"The epulones [at Rome] formed a college for the administration of the sacred festivals."—C. Merivale, *History of the Romans*, ch. 31.

**EPWORTH LEAGUE**, organization of young people in the Methodist Episcopal Church, instituted at Cleveland, Ohio, 1889, and adopted by the General Conference of the Methodist Episcopal Church, 1892. The first International Epworth League Convention was held in Cleveland, in 1893. These Conventions were held biennially until the Denver Convention, in 1905, since which they have been quadrennial. "The General Conference at Des Moines, Ia., May, 1920, . . . [enacted three important items of legislation:] First, The name of the controlling body was changed from the 'Epworth League Board of Control,' to 'The Board of the Epworth League.' . . . Second, The standing of the Epworth League in relation to the Church was changed. For the first time in its history the League is recognized as a regular Church board, and is included in the legislation which created the Council of Boards of Benevolence. . . . Third, The superintendent of the Junior League now will continue in office until his or her successor is appointed, instead of having the term of office terminate with a pastorate."—*Methodist Year Book*, 1921, pp. 259-260.—In 1921, the estimated membership was about 773,602.

**EQUADOR**. See **ECUADOR**.

**EQUAL RIGHTS PARTY**. See **LOCOFOCOS**; **NEW YORK**: 1835-1837.

**EQUALS**, socialistic society in France. See **SOCIALISM**: 1753-1797.

**EQUANCOURT**, town in France, northeast of Péronne, which was attacked by the Germans in 1918. See **WORLD WAR**: 1918: II. Western front: c, 12.

**EQUESTRIAN ORDER**, Roman.—"The selection of the burgess cavalry was vested in the censors. It was, no doubt, the duty of these to make the selection on purely military grounds, and at their musters to insist that all horsemen incapacitated by age or otherwise, or at all unserviceable, should surrender their public horse; but it was not easy to hinder them from looking to noble birth more than to capacity, and from allowing men of standing, who were once admitted, senators particularly, to retain their horse beyond the proper time. Accordingly it became the practical rule for the senators to vote in the eighteen equestrian centuries, and the other places in these were assigned chiefly to the younger men of the nobility. The military system, of course, suffered from this, not so much through the unfitness for effective service of no small part of the legionary cavalry, as through the destruction of military equality to which the change gave rise; the noble youth more and more withdrew from serving in the infantry, and the legionary cavalry became a close aristocratic corps."—T. Mommsen, *History of Rome*, bk. 3, ch. 11.—"The eighteen centuries, therefore, in course of time . . . lost their original military character and remained only as a voting body. It was by the transformation thus effected in the character of the eighteen centuries of knights, whilst the cavalry service passed over to the richer citizens

not included in the senatorial families, that a new class of Roman citizens began gradually to be formed, distinct from the nobility proper and from the mass of the people, and designated as the equestrian order."—W. Ihne, *History of Rome*, bk. 7, ch. 1.—The equestrian order became a legally constituted class under the judicial law of Caius Gracchus, 123 B. C., which fixed its membership by a census, and transferred to it the judicial functions previously exercised by the senators only. It formed a kind of monetary aristocracy.—*Ibid.*, bk. 7, ch. 6.

**EQUITABLE CONVERSION**, Law of. See **EQUITY LAW**: 1702-1714.

**EQUITABLE LIFE INSURANCE**, London. See **INSURANCE**: Life: Early forms.

**EQUITY COURTS**, United States. See **COURTS**: United States: Organization of federal courts; **COURTS**: England: Origin of the court of equity.

**EQUITY LAW**: Nature of equity.—Maxims of equity.—"The word 'equity,' as employed in American and English law, is derived from the Roman word 'equitas' meaning equality. Philosophical jurisprudence in Bracton's time distinguished between *acquitias* and *rigor juris*. Equity always stood as synonymous with justice. It is a separate but incomplete system of jurisprudence administered side by side with the common law, having its own rules, precedents and fixed principles and dealing remedial justice. Equity means that the Royal Tribunal is not so strictly bound by rules that it can not defeat the devices of those who would use legal forms for the purposes of chicane; it means also that the justices are in some degree free to consider all the circumstances of those cases that come before them and to adapt the means to the end."—F. Pollock and F. W. Maitland, *History of English law*, v. 1, p. 168.—"Equity jurisprudence may properly be said to be that portion of remedial justice which is exclusively administered by a Court of Equity as contradistinguished from that portion of remedial justice which is exclusively administered by a Court of Common Law."—J. Story, *Commentaries on equity jurisprudence*, v. 1, p. 19.—"The ethical character of equitable relief is, of course, most pronounced in cases in which equity gives not merely a better remedy than the law gives, but the only remedy. Instances of the exclusive jurisdiction of equity are found among the earliest bills in chancery. For example, bills for the recovery of property got from the plaintiff by the fraud of the defendant; bills for the return of the consideration for a promise which the defendant refuses to perform; bills for reimbursement for expenses incurred by the plaintiff in reliance upon the defendant's promise, afterwards broken; bills by the bailor for the recovery of a chattel from a defendant in possession of it after the death of the bailee."—J. B. Ames, *Origin of uses and trusts (Harvard Law Review*, 1908, v. 21, pp. 261-274).

ALSO IN: *Select essays in Anglo-American legal history*, v. 2, pp. 738-739.

"The principle that equity acts upon the person is, and always has been, the key to the mastery of equity. The difference between the judgment at law and the decree in equity goes to the root of the matter. The law regards chiefly the right of the plaintiff, and gives judgment that he recover the land, debt, or damages because they are his. Equity lays the stress upon the duty of the defendant, and decrees that he do, or refrain from doing, a certain thing because he ought to act or forbear. It is because of this emphasis upon the defendant's duty that equity is so much more

ethical than the law. The difference between the two in this respect appears even in cases of concurrent jurisdiction. The moral standard of the man who commits no breach of contract or tort, or, having committed the one or the other, does his best to restore the *status quo*, is obviously higher than that of the man who breaks his contract, or commits a tort, and then refuses to do more than make pecuniary compensation for his wrong. It is this higher standard that equity enforces, when the legal remedy of pecuniary compensation would be inadequate, by commanding the defendant to refrain from the commission of a tort, or breach of contract, or by compelling him, after commission of the one or the other, by means of a mandatory injunction, or a decree for specific performance, so called, to make specific reparation for his wrong."

—J. B. Ames, *Origin and uses of trusts* (*Harvard Law Review*, 1908, v. 21, pp. 261-274).—"A court of equity, which is never active in relief against conscience or public convenience, has always refused its aid to stale demands, where the party has slept upon his rights and acquiesced for a great length of time. Nothing can call forth this court into activity but conscience, good faith and reasonable diligence."—Lord Camden, 3 *Brown Ch.* 638.

ALSO IN: 95 *U. S.* 200; 75 *Ill.* 275.

"Those principles which are so fundamental and essential that they may with propriety be termed maxims of equity are the following: Equity regards as done which ought to be done; equity looks to the intent, rather than to the form; he who seeks equity must do equity; he who comes into equity must come with clean hands; equality is equity; where there are equal equities, the first in time shall prevail; where there is equal equity, the law must prevail; equity aids the vigilant, not those who slumber on their rights; equity imputes an intention to fulfill an obligation; equity will not suffer a wrong without a remedy; and equity follows the law. It must not be supposed that all these maxims are equally important, or that all have been equally fruitful in the development of doctrines and rules; but it is no exaggeration to say that he who has grasped them all with a clear comprehension of their full meaning and effects has already obtained an insight into whatever is essential and distinctive in the system of equity jurisprudence, and has found the explanation of its peculiar doctrines and rules."—J. N. Pomeroy, *Treatise on equity jurisprudence*, v. 1, p. 674.—"All rules in equity must be sufficiently elastic to do equity in particular cases under consideration. There are few rules that have no exceptions and equity will not apply rules which will not result in doing equity."—*Thatcher v. Thatcher* (Me.) 104 A. 515.

449-1066.—Early masters in chancery.—"As we approach the era of the Conquest, we find distinct traces of the Masters in Chancery, who, though in sacred orders, were well trained in jurisprudence, and assisted the chancellor in preparing writs and grants, as well as in the service of the royal chapel. They formed a sort of college of justice, of which he was the head. They all sate in the Wittenagemote, and, as 'Law Lords,' are supposed to have had great weight in the deliberations of that assembly."—Lord Campbell, *Lives of the chancellors*, v. 1, p. 53.

596.—Chancellor, keeper of the great seal.—"From the conversion of the Anglo-Saxons to Christianity by the preaching of St. Augustine, the King always had near his person a priest, to whom was entrusted the care of his chapel, and who was his confessor. This person, selected from the

most learned and able of his order, and greatly superior in accomplishments to the unlettered laymen attending the Court, soon acted as private secretary to the King, and gained his confidence in affairs of state. The present demarcation between civil and ecclesiastical employments was then little regarded, and to this same person was assigned the business of superintending writs and grants, with the custody of the great seal."—Lord Campbell, *Lives of the chancellors*, v. 1, p. 27.

1066.—Master of the rolls.—"The office of master, formerly called the Clerk or Keeper of the Rolls, is recognized at this early period, though at this time he appears to have been the Chancellor's deputy, not an independent officer."—G. Spence, *Equity jurisdiction of the court of chancery*, v. 1, p. 100.

1066-1154.—Chancellor as secretary of state.—Under the Norman kings, the chancellor was a kind of secretary of state. His functions were political rather than judicial. He attended to the royal correspondence, kept the royal accounts, and drew up writs for the administration of justice. He was also the keeper of the seal.—F. C. Montague, *Elements of English constitutional history*, p. 27.—See also CHANCELLOR: British.

1067.—First lord chancellor.—"The first keeper of the seals who was endowed with the title of Lord Chancellor was Maurice, who received the great seal in 1067. The incumbents of the office were for a long period ecclesiastics; and they usually enjoyed episcopal or archiepiscopal rank, and lived in the London palaces attached to their sees or provinces. The first Keeper of the seals of England was Fitzgilbert, appointed by Queen Matilda soon after her coronation, and there was no other layman appointed until the reign of Edward III."—L. J. Bigelow, *Bench and bar*, p. 23.

1169.—Uses and trusts.—"According to the law of England, trusts may be created 'inter vivos' as well as by testament, and their history is a curious one, beginning, like that of the Roman 'fidei commissa,' with an attempt to evade the law. The Statutes of Mortmain, passed to prevent the alienation of lands to religious houses, led to the introduction of 'uses,' by which the grantor alienated his land to a friend to hold 'to the use' of a monastery the clerical chancellors giving legal validity to the wish thus expressed. Although this particular device was put a stop to by 15 Ric. II. c. 5, 'uses' continued to be employed for other purposes, having been found more malleable than what was called, by way of contrast, 'the legal estate.' They offered indeed so many modes of escaping the rigour of the law, that, after several other statutes had been passed with a view of curtailing their advantages, the 27 Hen. VIII. c. 10 enacted that, where any one was seised to a use, the legal estate should be deemed to be in him to whose use he was seised. The statute did not apply to trusts of personal property, nor to trusts of land where any active duty was cast upon the trustee, nor where a use was limited 'upon a use,' i. e. where the person in whose favour a use was created was himself to hold the estate to the use of some one else. There continued therefore to be a number of cases in which, in spite of the 'Statute of Uses,' the Court of Chancery was able to carry out its policy of enforcing what had otherwise been merely moral duties. The system thus arising has grown to enormous dimensions, and trusts, which, according to the definition of Lord Hardwicke, are 'such a confidence between parties that no action at law will lie, but there is merely a case for the consideration of courts of equity,' are inserted not only in wills, but also

in marriage settlements, arrangements with creditors, and numberless other instruments necessary for the comfort of families and the development of commerce."—T. E. Holland, *Elements of jurisprudence*, 5th ed., p. 217.

1253.—Lady keeper of the seals.—"Having occasion to cross the sea and visit Gascony, 1253, Henry III. made her [Queen Eleanor] keeper of the seal during his absence, and in that character she in her own person presided in the 'Aula Regia,' hearing causes, and, it is to be feared, forming her decisions less in accordance with justice than her own private interests. Never did judge set law and equity more fearfully at naught."—L. J. Bigelow, *Bench and bar*, p. 28.

1258.—No writs except de cursu.—"In the year 1258 the Provisions of Oxford were promulgated; two separate clauses of which bound the chancellor to issue no more writs except writs 'of course' without command of the King and his Council present with him. This, with the growing independence of the judiciary on the one hand, and the settlement of legal process on the other, terminated the right to issue special writs, and at last fixed the common writs in unchangeable form; most of which had by this time become developed into the final form in which for six centuries they were treated as precedents of declaration."—M. M. Bigelow, *History of procedure*, p. 197.

1272-1307.—Chancellor's functions.—"In the reign of Edward I. the Chancellor begins to appear in the three characters in which we now know him; as a great political officer, as the head of a department for the issue of writs and the custody of documents in which the King's interest is concerned, as the administrator of the King's grace."—W. R. Anson, *Law and custom of the constitution*, pt. 2, p. 146.—"The English legal system is a system of royal justice. All original writs are royal commands, and must be sealed by the Chancellor. The Chancery is 'the forge, or shop, of all originals.' In the same way all important government acts—treaties with foreign states, the assembly of Parliament, royal grants—must pass the seal, and must therefore pass under his review. Applicants for justice in the Courts of Common Law, petitioners to the King, to the Council, or to Parliament, will sooner or later come to the Chancery either for an original writ or to obtain the execution of the answer endorsed upon their petition. The Chancellor and the Chancery are thus in direct connection with all parts of the constitution. This accounts for the extraordinary range and variety of the Chancellor's duties."—W. S. Holdsworth, *History of English law*, v. 1, pp. 104-105.

1330.—Chancery stationary at Westminster.—"There was likewise introduced about this time a great improvement in the administration of justice, by rendering the Court of Chancery stationary at Westminster. The ancient kings of England were constantly migrating,—one principal reason for which was, that the same part of the country, even with the aid of purveyance and pre-emption, could not long support the court and all the royal retainers, and render in kind due to the King could be best consumed on the spot. Therefore, if he kept Christmas at Westminster, he would keep Easter at Winchester, and Pentecost at Gloucester, visiting his many palaces and manors in rotation. The Aula Regis, and afterwards the courts into which it was partitioned, were ambulatory along with him—to the great vexation of the suitors. This grievance was partly corrected by Magna Charta, which enacted

that the Court of Common Pleas should be held 'in a certain place,'—a corner of Westminster Hall being fixed upon for that purpose. In point of law, the Court of King's Bench and the Court of Chancery may still be held in any county of England,—'wheresoever in England the King or the Chancellor may be.' Down to the commencement of the reign of Edward III., the King's Bench and the Chancery actually had continued to follow the King's person, the Chancellor and his officers being entitled to part of the purveyance made for the royal household. By 28 Edw. I., c. 5, the Lord Chancellor and the Justices of the King's Bench were ordered to follow the King, so that he might have at all times near him sages of the law able to order all matters which should come to the Court. But the two Courts were now by the King's command fixed in the places where, unless on a few extraordinary occasions, they continued to be held down to our own times, at the upper end of Westminster Hall, the King's Bench on the left hand, and the Chancery on the right, both remaining open to the Hall, and a bar erected to keep off the multitude from pressing on the judges."—Lord Campbell, *Lives of the chancellors*, v. 1, p. 181.

1348.—"Matters of grace" committed to the chancellor.—"In the 22nd year of Edward III., matters which were of grace were definitely committed to the Chancellor for decision, and from this point there begins to develop that body of rules—supplementing the deficiencies or correcting the harshness of the Common Law—which we call Equity."—W. R. Anson, *Law and custom of the constitution*, pt. 2, p. 147.—See also CHANCELLOR: British.

Also IN: D. M. Kerly, *History of the court of chancery*, p. 31.

1383.—Early instance of subpoena.—"It is said that John Waltham, Bishop of Salisbury, who was Keeper of the Rolls about the 5th of Richard II., considerably enlarged this new jurisdiction; that, to give efficacy to it, he invented, or more properly, was the first who adopted in that court, the writ of subpoena, a process which had before been used by the council, and is very plainly alluded to in the statutes of the last reign, though not under that name. This writ summoned the party to appear under a penalty, and answer such things as should be objected against him; upon this a petition was lodged, containing the articles of complaint to which he was then compelled to answer. These articles used to contain suggestions of injuries suffered, for which no remedy was to be had in the courts of common law, and therefore the complainant prayed advice and relief of the chancellor."—J. Reeves, *History of English law* (Finlason's ed.), v. 3, p. 384.

1394.—Chancery with its own mode of procedure.—"From the time of passing the stat. 17 Richard II. we may consider that the Court of Chancery was established as a distinct and permanent court, having separate jurisdiction, with its own peculiar mode of procedure similar to that which had prevailed in the Council, though perhaps it was not wholly yet separated from the Council."—G. Spence, *Equity jurisdiction of the court of chancery*, v. 1, p. 345.

1422.—Chancery cases appear in year books.—"It is beyond a doubt that this [chancery] court had begun to exercise its judicial authority in the reigns of Richard II., Henry IV. and V. . . . But we do not find in our books any report of cases there determined till 37 Henry VI., except only on the subject of uses; which, as has been before remarked, might give rise to the opinion, that the

first equitable judicature was concerned in the support of uses."—J. Reeves, *History of English law* (Finlason's ed.), v. 3, p. 553.

**1443.—No distinction between examination and answer.**—The earliest record of written answers is in 21 Henry VI. Before that time little, if any, distinction was made between the examination and the answer.—D. M. Kerly, *History of courts of chancery*, p. 51.

**1461-1483.—Distinction between proceeding by bill and by petition.**—"A written statement of the grievance being required to be filed before the issuing of the subpoena, with security to pay damages and costs,—bills now acquired form, and the distinction arose between the proceeding by bill and by petition. The same regularity was observed in the subsequent stages of the suit. Whereas formerly the defendant was generally examined viva voce when he appeared in obedience to the subpoena, the practice now was to put in a written answer, commencing with a protestation against the truth or sufficiency of the matters contained in the bill, stating the facts relied upon by the defendant, and concluding with a prayer that he may be dismissed, with his costs. There were likewise, for the purpose of introducing new facts, special replications and rejoinders, which continued till the reign of Elizabeth, but which have been rendered unnecessary by the modern practice of amending the bill and answer. Pleas and demurrers now appear. Although the pleadings were in English, the decrees on the bill continued to be in Latin down to the reign of Henry VIII. Bills to perpetuate testimony, to set out metes and bounds, and for injunctions against proceedings at law, and to stay waste, became frequent."—Lord Campbell, *Lives of the chancellors*, v. 1, p. 309.

**1461-1483.—Jurisdiction of chancery over trusts.**—"The equitable jurisdiction of the Court of Chancery may be considered as making its greatest advances in this reign [Edw. IV]. The point was now settled, that there being a feoffment to uses, the 'cestui que' use, or person beneficially entitled, could maintain no action at law, the Judges saying that he had neither 'jus in re' or 'jus ad rem,' and that their forms could not be moulded so as to afford him any effectual relief, either as to the land or the profits. The Chancellors, therefore, with general applause, declared that they would proceed by subpoena against the feoffee to compel him to perform a duty which in conscience was binding upon him, and gradually extended the remedy against his heir and against his alienee with notice of the trust, although they held, as their successors have done, that the purchaser of the legal estate for valuable consideration without notice might retain the land for his own benefit. They therefore now freely made decrees requiring the trustee to convey according to the directions of the 'cestui que trust,' or person beneficially interested; and the most important branch of the equitable jurisdiction of the Court over trusts was firmly and irrevocably established."—Lord Campbell, *Lives of the chancellors*, v. 1, p. 300.

**1538.—Lord keeper of the great seal.**—"Between the death, resignation, or removal of one chancellor, and the appointment of another, the Great Seal, instead of remaining in the personal custody of the Sovereign, was sometimes entrusted to a temporal keeper, either with limited authority (as only to seal writs), or with all the powers, though not with the rank of Chancellor. At last the practice grew up of occasionally appointing a person to hold the Great Seal with the title of

'Keeper,' where it was meant that he should permanently hold it in his own right and discharge all the duties belonging to it. Queen Elizabeth, ever sparing in the conferring of dignities, having given the Great Seal with the title of 'Keeper' to Sir Nicholas Bacon, objections were made to the legality of some of his acts,—and to obviate these, a statute was passed declaring that 'the Lord Keeper of the Great Seal for the time being shall have the same place, pre-eminence, and jurisdiction as the Lord Chancellor of England' Since then there never have been a Chancellor and Keeper of the Great Seal concurrently, and the only difference between the two titles is, that the one is more sounding than the other, and is regarded as a higher mark of royal favor."—Lord Campbell, *Lives of the chancellors*, v. 1, p. 40.

Also in: W. R. Anson, *Law and custom of the constitution*, v. 2, p. 150.

**1558.—Increase of business in the court of chancery.**—"The business of the Court of Chancery had now so much increased that to dispose of it satisfactorily required a Judge regularly trained to the profession of the law, and willing to devote to it all his energy and industry. The Statute of Wills, the Statute of Uses, the new modes of conveyancing introduced for avoiding transmutation of possession, the questions which arose respecting the property of the dissolved monasteries, and the great increase of commerce and wealth in the nation, brought such a number of important suits into the Court of Chancery, that the holder of the Great Seal could no longer satisfy the public by occasionally stealing a few hours from his political occupations, to dispose of bills and petitions, and not only was his daily attendance demanded in Westminster Hall during term time, but it was necessary that he should sit, for a portion of each vacation, either at his own house, or in some convenient place appointed by him for clearing off his arrears."—Lord Campbell, *Lives of the chancellors*, v. 2, p. 05.

**1567-1632.—Actions of assumpsit in equity.**—"The late development of the implied contract to pay 'quantum meruit,' and to indemnify a surety, would be the more surprising, but for the fact that Equity gave relief to tailors and the like, and to sureties long before the common law held them. Spence, although at a loss to account for the jurisdiction, mentions a suit brought in Chancery, in 1567, by a tailor, to recover the amount due for clothes furnished. The suit was referred to the Queen's tailor, to ascertain the amount due, and upon his report a decree was made. The learned writer adds that 'there were suits for wages and many others of like nature.' A surety who had no counter-bond filed a bill against his principal in 1632, in a case which would seem to have been one of the earliest of the kind, for the reporter, after stating that there was a decree for the plaintiff, adds 'quod nota.'—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, pp. 50-60).

**1592.—All chancellors, save one, lawyers.**—"No regular judicial system at that time prevailed in the court; but the suitor when he thought himself aggrieved, found a desultory and uncertain remedy, according to the private opinion of the chancellor, who was generally an ecclesiastic, or sometimes (though rarely) a statesman: no lawyer having sat in the court of chancery from the times of the chief justices Thorpe and Knyvet, successively chancellors to King Edward III. in 1372 and 1373, to the promotion of Sir Thomas More by King Henry VIII., in 1530. After which the great seal was indiscriminately committed to

the custody of lawyers or courtiers, or churchmen, according as the convenience of the times and the disposition of the prince required, till Sargeant Puckering was made lord keeper in 1592; from which time to the present the court of chancery has always been filled by a lawyer, excepting the interval from 1621 to 1625, when the seal was entrusted to Dr. Williams, then dean of Westminster, but afterwards bishop of Lincoln; who had been chaplain to Lord Ellesmere when chancellor."—W. Blackstone, *Commentaries*, bk. 3, ch. 4.

1595.—Injunctions against suits at law.—Opposition of common law courts.—“The strongest inclination was shown to maintain this opposition to the court of equity, not only by the courts, but by the legislature. The stat. 27 Elizabeth, c. 1., which, in very general words, restrains all application to other jurisdictions to impeach or impede the execution of judgments given in the king's courts, under penalty of a praemunire, has been interpreted, as well as stat. Richard II., c. 5, not only as imposing a restraint upon popish claims of judicature, but also of the equitable jurisdiction in Chancery; and in the thirty-first and thirty-second years of this reign, a counsellor-at-law was indicted in the King's Bench on the statute of praemunire, for exhibiting a bill in Chancery after judgment had gone against his client in the King's Bench. Under this and the like control, the Court of Chancery still continued to extend its authority, supported, in some degree, by the momentum it acquired in the time of Cardinal Wolsey.”—J. Reeves, *History of English law* (Finlason's ed.), v. 5, pp. 386-387.

1596.—Lord Ellesmere and his decisions.—Kerly says the earliest chancellors' decisions that have come down to us are those of Lord Ellesmere. He was the first chancellor to establish equity upon the basis of precedents. But compare Reeves (Finlason's), *History of English Law*, v. 3, p. 553, who mentions decisions in the Year Books.—D. M. Kerly, *History of the court of chancery*, p. 98.

1601.—Cy-pres doctrine.—“There is no trace of the doctrine being put into practice in England before the Reformation, although in the earliest reported cases where it has been applied it is treated as a well recognized rule, and as one owing its origin to the traditional favour with which charities had always been regarded. Much of the obscurity which covers the introduction of the doctrine into our Law may perhaps be explained by the fact that, in the earliest times, purely charitable gifts, as they would now be understood, were almost unknown. The piety of donors was most generally displayed in gifts to religious houses, and the application of the subject matter of such gifts was exclusively in the Superiors of the different Orders, and entirely exempt from secular control. From the religious houses the administration of charitable gifts passed to the Chancellor, as keeper of the King's conscience, the latter having as ‘*parens patriae*’ the general superintendence of all infants, idiots, lunatics and charities. And it was not until some time later that this jurisdiction became gradually merged, and then only in cases where trusts were interposed, in the general jurisdiction of the Chancery Courts. It is not necessary to go into the long vexed question as to when that actually took place. It is enough to say that it is now pretty conclusively established that the jurisdiction of the Chancery Courts over charitable trusts existed anterior to, and independently of, the Statute of Charitable Uses, 43 Eliz., c. 4. As charitable gifts generally involved the existence of

a trust reposed in some one, it was natural that the Chancery Court, which assumed jurisdiction over trusts, should have gradually extended that jurisdiction over charities generally; but the origin of the power, that it was one delegated by the Crown to the Chancellor, must not be lost sight of, as in this way, probably, can be best explained the curious distinct jurisdictions vested in the Crown and the Chancery Courts respectively to apply gifts *Cy pres*, the limits of which, though long uncertain, were finally determined by Lord Eldon in the celebrated case of *Moggridge v. Thackwell*, 7 ves. 69. If we remember that the original jurisdiction in all charitable matters was in the Crown, and that even after the Chancery Courts acquired a jurisdiction over trusts, there was still a class of cases untouched by such jurisdiction, we shall better understand how the prerogative of the Crown still remained in a certain class of cases, as we shall see hereafter. However this may be, there is no doubt that when the Chancery Courts obtained the jurisdiction over the charities, which they have never lost, the liberal principles of the Civil or Canon Law as to the carrying out of such gifts were the sources and inspirations of their decisions. And hence the *Cy pres* doctrine became gradually well recognised, though the mode of its application has varied from time to time. Perhaps the most striking instances of this liberal construction are to be found in the series of cases which, by a very strained interpretation of the Statute of Elizabeth with regard to charitable uses, decided that gifts to such uses in favour of corporations, which could not take by devise under the old Wills Act, 32 Hen. VIII., c. 1, were good as operating in the nature of an appointment of the trust in equity, and that the intendment of the statute being in favour of charitable gifts, all deficiencies of assurance were to be supplied by the Courts. Although, historically, there may be no connection between the power of the King over the administration of charities, and the dispensing power reserved to him by the earlier Mortmain Acts, the one being, as we have seen, a right of Prerogative, the other a Feudal right in his capacity as ultimate Lord of the fee, it is perhaps not wholly out of place to allude shortly to the latter, particularly as the two appear not to have been kept distinct in later times. By the earlier Mortmain Acts, the dispensing power of the King, as Lord Paramount, to waive forfeitures under these Acts was recognised, and gifts of land to religious or charitable corporations were made not ‘*ipso facto*’ void, but only voidable at the instance of the immediate Lord, or, on his default, of the King and after the statute ‘*quia emptores*,’ which practically abolished mesne seignories, the Royal license became in most cases sufficient to secure the validity of the gift. The power of suspending statutes being declared illegal at the Revolution, it was deemed prudent, seeing that the grant of licenses in Mortmain imported an exercise of such suspending power, to give these licenses a Parliamentary sanction; and accordingly, by 7 and 8 William III., c. 37, it was declared that the King might grant licenses to aliens in Mortmain, and also to purchase, acquire, and hold lands in Mortmain in perpetuity without pain of forfeiture. The right of the mesne lord was thus passed over, and the dispensing power of the Crown, from being originally a Feudal right, became converted practically into one of Prerogative. The celebrated Statute of 1 Edward VI., c. 14, against superstitious uses, which is perhaps the earliest statutory recognition of the *Cy pres* doctrine, points also strongly to the

original jurisdiction in these matters being in the King."—H. L. Manby (*Law Magazine and Review*, 4th series, v. 15, 1889-1890, p. 203).—The author proceeds to trace at some length the subsequent developments of the doctrine both judicial and statutory. The doctrine is not generally recognised in the United States.

1603-1625.—Equity and the construction of wills.—"After a violent struggle between Lord Coke and Lord Ellesmere, the jurisdiction of the Court of Chancery to stay by injunction execution on judgments at law was finally established. In this reign [James I] the Court made another attempt,—which was speedily abandoned,—to determine upon the validity of wills,—and it has been long settled that the validity of wills of real property shall be referred to courts of law, and the validity of wills of personal property to the Ecclesiastical Courts,—equity only putting a construction upon them when their validity has been established."—Lord Campbell, *Lives of the chancellors*, v. 2, p. 386.

1612.—Right of redemption.—The right to redeem after the day dates from the reign of James I. From the time of Edward IV (1461-83) a mortgagor could redeem after the day if accident, or a collateral agreement, or fraud by mortgagee, prevented payment.—D. M. Kerly, *History of the court of chancery*, p. 143.

1616.—Contest between equity and common-law courts.—"In the time of Lord Ellesmere (A.D. 1616) arose that notable dispute between the courts of law and equity, set on foot by Sir Edward Coke, then chief justice of the court of king's bench; whether a court of equity could give relief after or against a judgment at the common law? This contest was so warmly carried on, that indictments were preferred against the suitors, the solicitors, the counsel, and even a master in chancery, for having incurred a 'præmunire,' by questioning in a court of equity a judgment in the court of king's bench, obtained by a gross fraud and imposition. This matter being brought before the king, was by him referred to his learned counsel for their advice and opinion; who reported so strongly in favor of the courts of equity, that his majesty gave judgment in their behalf."—W. Blackstone, *Commentaries*, bk. 3, p. 54.

1616.—Relief against judgments at law.—"This was in 1616, the year of the memorable contest between Lord Coke and Lord Ellesmere as to the power of equity to restrain the execution of common-law judgment obtained by fraud. . . . The right of equity to enforce specific performance, where damages at law would be an inadequate remedy, has never since been questioned."—J. B. Ames, *Specific performance of contracts* (*Green Bag*, v. 1, p. 27).

1671.—Doctrine of tacking established.—"It is the established doctrine in the English law, that if there be three mortgages in succession, and all duly registered, or a mortgage, and then a judgment, and then a second mortgage upon the estate, the junior mortgagee may purchase in the first mortgage, and tack it to his mortgage, and by that contrivance 'squeeze out' the middle mortgage, and gain preference over it. The same rule would apply if the first, as well as the second incumbrance, was a judgment; but the incumbrancer who tacks must always be a mortgagee, for he stands in the light of a bona fide purchaser, parting with his money upon the security of the mortgage. . . . In the English law, the rule is under some reasonable qualification. The last mortgagee cannot tack, if, when he took his mort-

gage, he had notice in fact . . . of the intervening incumbrance. . . . The English doctrine of tacking was first solemnly established in *Marsh v. Lee* [2 Vent. 337], under the assistance of Sir Matthew Hale, who compared the operation to a plank in shipwreck gained by the last mortgagee; and the subject was afterwards very fully and accurately expounded by the Master of the Rolls, in *Brace v. Duchess of Marlborough* [2 P. Wms. 491].—J. Kent, *Commentaries*, pt. 6, lect. 58.

1702-1714.—Equitable conversion.—"He [Lord Harcourt] first established the important doctrine, that if money is directed either by deed or will to be laid out in land, the money shall be taken to be land, even as to collateral heirs."—Lord Campbell, *Lives of the chancellors*, v. 4, p. 374.

1736-1756.—Lord Hardwicke developed system of precedents.—It was under Lord Hardwicke that the jurisdiction of Equity was fully developed. During the twenty years of his chancellorship the great branches of equitable jurisdiction were laid out, and his decisions were regularly cited as authority until after Lord Eldon's time.—D. M. Kerly, *History of the court of chancery*, pp. 175-177.

1742.—Control of corporations.—"That the directors of a corporation shall manage its affairs honestly and carefully is primarily a right of the corporation itself rather than of the individual stockholders. . . . The only authority before the present century is the case of the *Charitable Corporation v. Sutton*, decided by Lord Hardwicke [2 Atk. 400]. But this case is the basis . . . of all subsequent decisions on the point, and it is still quoted as containing an accurate exposition of the law. The corporation was charitable only in name, being a joint-stock corporation for lending money on pledges. By the fraud of some of the directors, . . . and by the negligence of the rest, loans were made without proper security. The bill was against the directors and other officers, 'to have a satisfaction for a breach of trust, fraud, and mismanagement.' Lord Hardwicke granted the relief prayed, and a part of his decision is well worth quoting. He says: 'Committee-men are most properly agents to those who employ them in this trust, and who empower them to direct and superintend the affairs of the corporation. In this respect they may be guilty of acts of commission or omission, of malfeasance or nonfeasance. . . . Nor will I ever determine that a court of equity cannot lay hold of every breach of trust, let the person be guilty of it either in a private or public capacity.'"—S. Williston, *History of the law of business* (*Harvard Law Review*, v. 2, pp. 158-159).

1782.—Demurrer to bill of discovery.—"Originally, it appears not to have been contemplated that a demurrer or plea would lie to a bill of discovery, unless it were a demurrer or plea to the nature of the discovery sought or to the jurisdiction of the court, e. g., a plea of purchase for value; and, though it was a result of this doctrine that plaintiffs might compel discovery to which they were not entitled, it seems to have been supposed that they were not likely to do so to any injurious effect, since they must do it at their own expense. But this view was afterwards abandoned, and in 1782 it was decided that, if a bill of discovery in aid of an action at law stated no good cause of action against the defendant, it might be demurred to on that ground, i. e., that it showed on its face no right to relief at law, and, therefore, no right to discovery in equity. Three years later in *Ilindman v. Taylor*, the question was raised whether a defendant could protect himself for answering a bill for discovery by setting up an affirma-

tive defence by plea; and, though Lord Thurlow decided the question in the negative, his decision has since been overruled; and it is now fully settled that any defence may be set up to a bill for discovery by demurrer or plea, the same as to a bill for relief; and, if successful, it will protect the defendant from answering."—C. C. Langdell, *Summary of equity pleading*, pp. 204-205.

1786.—Injunction after decree to pay proceeds of estate into court.—"As soon as a decree is made, . . . under which the executor will be required to pay the proceeds of the whole estate into court, an injunction ought to be granted against the enforcement of any claim against the estate by an action at law; and accordingly such has been the established rule for more than a hundred years. . . . The first injunction that was granted expressly upon the ground above explained was that granted by Lord Thurlow, in 1782, in the case of Brooks v. Reynolds. . . . In the subsequent case of Kenyon v. Worthington, . . . an application to Lord Thurlow for an injunction was resisted by counsel of the greatest eminence. The resistance, however, was unsuccessful, and the injunction was granted. This was in 1786; and from that time the question was regarded as settled."—C. C. Langdell, *Equity jurisdiction* (*Harvard Law Review*, v. 5, pp. 122-123).

1792.—Negative pleas.—"In *Gun v. Prior*, Forest, 88, note, 1 Cox, 197, 2 Dickens, 657, Cas. in Eq. Pl. 47, a negative plea was overruled by Lord Thurlow after a full argument. This was in 1785. Two years later, the question came before the same judge again, and, after another full argument, was decided the same way. *Newman v. Wallis*, 2 Bro. C. C. 143, Cas. in Eq. Pl. 52. But in 1792, in the case of *Hall v. Noyes*, 3 Bro. C. C. 483, 489, Cas. in Eq. Pl. 223, 227, Lord Thurlow took occasion to say that he had changed his opinion upon the subject of negative pleas, and that his former decisions were wrong; and since then the right to plead a negative plea has not been questioned."—C. C. Langdell, *Summary of equity pleading*, p. 114, note.

1801-1827.—Lord Eldon settled rules of equity.—"The doctrine of this Court," he [Lord Eldon] said himself, "ought to be as well settled and as uniform, almost, as those of the common law, laying down fixed principles, but taking care that they are to be applied according to the circumstances of each case. I cannot agree that the doctrines of this Court are to be changed by every succeeding judge. Nothing would inflict on me greater pain than the recollection that I had done any thing to justify the reproach that the Equity of this Court varies like the Chancellor's foot." Certainly the reproach he dreaded cannot justly be inflicted upon his memory. . . . From his time onward the development of equity was effected ostensibly, and, in the great majority of cases, actually, by strict deduction from the principles to be discovered in decided cases, and the work of subsequent Chancery judges has been, for the most part, confined, as Lord Eldon's was, to tracing out these principles into detail, and to rationalising them by repeated review and definition."—D. M. Kerly, *History of the Court of Chancery*, p. 182.

1811-1845.—Contributions of Judge Story and Chancellor Kent to equity law in the United States.—"We are next to regard Story during his thirty-five years of judicial service. He performed an amount of judicial labor almost without parallel, either in quality or quantity, in the history of jurisprudence. His judgments in the Circuit Court comprehended thirteen volumes. His opinions in the Supreme Court are found in thirty-five

volumes. Most of these decisions are on matters of grave difficulty, and many of them of first impression. Story absolutely created a vast amount of law for our country. Indeed, he was essentially a builder. When he came to the bench, the law of admiralty was quite vague and unformed; his genius formed it as exclusively as Stowell's did in England. He also did much toward building up the equity system which has become part of our jurisprudence. In questions of international and constitutional law, the breadth and variety of his legal learning enabled him to shine with peculiar brilliancy. It is sufficient to say that there is scarcely any branch of the law which he has not greatly illustrated and enlarged,—prize, constitutional, admiralty, patent, copyright, insurance, real estate, commercial law so called, and equity,—all were gracefully familiar to him. The most celebrated of his judgments are *De Lovio v. Boit*, in which he investigates the jurisdiction of the Admiralty; *Martin v. Hunter's Lessee*, which examines the appellate jurisdiction of the United States Supreme Court; *Dartmouth College v. Woodward*, in which the question was, whether the charter of a college was a contract within the meaning of the constitutional provision prohibiting the enactment, by any State, of laws impairing the obligations of contracts; his dissenting opinion in *Charles River Bridge Company v. The Warren Bridge*, involving substantially the same question as the last case; and the opinion in the *Girard will case*. These are the most celebrated, but are scarcely superior to scores of his opinions in cases never heard of beyond the legal profession."—I. Browne, *Short studies of great lawyers*, pp. 293-295.

In February, 1814, James Kent was appointed chancellor, at that time the highest judicial office in New York state. "The powers and jurisdiction of the court of chancery were not clearly defined. There were scarcely any precedents of its decisions, to which reference could be made in case of doubt. Without any other guide, he felt at liberty to exercise such powers of the English chancery as he deemed applicable under the Constitution and laws of the State, subject to the correction of the Court of Errors, on appeal. . . . On the 31st of July, 1823, having attained the age of sixty years, the period limited by the Constitution for the tenure of his office, he retired from the court, after hearing and deciding every case that had been brought before him. On this occasion the members of the bar residing in the City of New York, presented him an address. After speaking of the inestimable benefits conferred on the community by his judicial labors for five and twenty years they say: 'During this long course of services, so useful and honorable, and which will form the most brilliant period in our judicial history, you have, by a series of decisions in law and equity, distinguished alike for practical wisdom, profound learning, deep research and accurate discrimination, contributed to establish the fabric of our jurisprudence on those sound principles that have been sanctioned by the experience of mankind, and expounded by the enlightened and venerable sages of the law. Though others may hereafter enlarge and adorn the edifice whose deep and solid foundations were laid by the wise and patriotic framers of our government, in that common law which they claimed for the people as their noblest inheritance, your labors on this magnificent structure will forever remain eminently conspicuous, command the applause of the present generation, and exciting the admiration and gratitude of future ages.'"—C. B. Waite, *James Kent* (*Chicago Law Times*, v. 3, pp. 339-341).

1821.—Negative pleas to be supported by an answer.—“The principle of negative pleas was first established by the introduction of anomalous pleas; but it was not perceived at first that anomalous pleas involved the admission of pure negative pleas. It would often happen, however, that a defendant would have no affirmative defence to a bill, and yet the bill could not be supported because of the falsity of some material allegation contained in it; and, if the defendant could deny this false allegation by a negative plea, he would thereby avoid giving discovery as to all other parts of the bill. At length, therefore, the experiment of setting up such a plea was tried; and, though unsuccessful at first, it prevailed in the end, and negative pleas became fully established. If they had been well understood, they might have proved a moderate success, although they were wholly foreign to the system into which they were incorporated; but, as it was, their introduction was attended with infinite mischief and trouble, and they did much to bring the system into disrepute. For example, it was not clearly understood for a long time that a pure negative plea required the support of an answer; and there was no direct decision to that effect until the case of *Sanders v. King*, 6 Madd. 61, Cas. in Eq. Pl. 74, decided in 1821.”—C. C. Langdell, *Summary of equity pleading*, pp. 113-114.

1834.—First statute of limitations in equity.—“None of the English statutes of limitation, prior to 3 & 4 Wm. IV., c. 27, had any application to suits in equity. Indeed, they contained no general terms embracing all actions at law, but named specifically all actions to which they applied; and they made no mention whatever of suits in equity. If a plaintiff sued in equity, when he might have brought an action at law, and the time for bringing the action was limited by statute, the statute might in a certain sense be pleaded to the suit in equity; for the defendant might say that, if the plaintiff had sued at law, his action would have been barred; that the declared policy of the law therefore, was against the plaintiff's recovering; and hence the cause was not one of which a court of equity ought to take cognizance. In strictness, however, the plea in such a case would be to the jurisdiction of the court.”—C. C. Langdell, *Summary of equity pleading*, pp. 149-150.

1836.—Personal character of shares of stock first established in England.—“The most accurate definition of the nature of the property acquired by the purchase of a share of stock in a corporation is that it is a fraction of all the rights and duties of the stockholders composing the corporation. Such does not seem to have been the clearly recognized view till after the beginning of the present century. The old idea was rather that the corporation held all its property strictly as a trustee, and that the shareholders were, strictly speaking, ‘cestuis que trust,’ being in equity co-owners of the corporate property. . . . It was not until the decision of *Bligh v. Brent* [Y. & C. 268], in 1836, that the modern view was established in England.”—S. Williston (*Harvard Law Review*, v. 2, pp. 149-151).

1875.—Patents, copyrights and trade-marks.—“In modern times the inventor of a new process obtains from the State, by way of recompense for the benefit he has conferred upon society, and in order to encourage others to follow his example, not only an exclusive privilege of using the new process for a fixed term of years, but also the right of letting or selling his privilege to another. Such an indulgence is called a patent-right, and a very similar favour, known as copy-right, is granted

to the authors of books, and to [artists]. . . . It has been a somewhat vexed question whether a ‘trade-mark’ is to be added to the list of intangible objects of ownership. It was at any rate so treated in a series of judgments by Lord Westbury, which, it seems, are still good law. He says, for instance, ‘Imposition on the public is indeed necessary for the plaintiff's title, but in this way only, that it is the test of the invasion by the defendant of the plaintiff's right of property.’ [Citing 33 L. J. Ch. 204; cf. 35 Ch. D., *Oakley v. Dalton*.] It was also so described in the ‘Trade Marks Registration Act,’ 1875 [§§ 3, 4, 5], as it was in the French law of 1857 relating to ‘*Marques de fabrique et de commerce*.’ . . . Patent-right in England is older than the Statute of Monopolies, 21 Jac. I. c. 3, and copy-right is obscurely traceable previously to the Act of 8 Anne, c. 19, but trade-marks were first protected in the present century.”—T. E. Holland, *Elements of jurisprudence*, 5th ed., p. 183.—See also COPYRIGHT: 1766-1800.

1909.—American copyrights.—See COPYRIGHT: 1790-1909.

1912.—New federal equity rules.—“The new federal equity rules promulgated November 4, 1912, by the United States Supreme Court, effective February 1, 1913, have been subjected to close scrutiny and many rigorous tests. Notwithstanding the fact that numerous attorneys felt that the changes made by these rules were of such a radical nature as to seriously handicap the proper trial of equity causes, and in some instances to entirely defeat the ends of justice, these rules are not working any real hardships. Where consistently and fairly administered, they are securing the ends sought, viz. that of securing a more speedy termination of equity litigation with the minimum of expense to litigants.”—W. R. Lane, *One year under the new federal equity rules* (*Harvard Law Review*, v. 27, 1013-1014, p. 629).—See also SUPREME COURT: 1888-1913.

1920.—Non-validity of a marriage entered into in jest.—“The status of marriage has its inception in contract, and its validity depends largely upon the validity of the contract upon which it is based. A court of chancery, by virtue of its ordinary equity powers, possesses jurisdiction to entertain a suit for the purpose of annulling a marriage supposed to be void, or as to the validity of which some doubt may exist. A marriage ceremony, though actually and legally performed, when entered into in jest, with no intention of entering into the actual marriage status and all that implies, and with the understanding that the parties are not to be bound thereby, or assume towards each other the relation ordinarily implied in its performance, including the duties, obligations, rights, and privileges incident thereto and followed by no subsequent acts or conduct indicative of a purpose to enter into such relation, does not constitute a legal basis for the marriage status, and the pretended marriage may be annulled in equity at the suit of either party.”—*American law reports annotated*, v. xi, pp. 212-216.

the piano and harp. See INVENTIONS: 18th century: Piano; 19th century: Piano.

**ERAS:** Christian, French revolutionary, Hindu, Jewish, Julian, Mohammedan, Olympiads, Roman, Spanish, etc. See CHRONOLOGY.

**ERASMUS, Desiderius** (c. 1466-1536), Dutch theologian. One of the greatest scholars of the Renaissance and Reformation; leader in the Humanist movement. He traveled widely in Europe, making his longest stays in London and Basel. In his famous satire "The Praise of Folly," he protested against the forms and vices of Roman Catholicism. His edition of the Greek Bible formed a basis of comparison for the Vulgate edition.—See also BIBLE, ENGLISH: 14th-16th centuries; CLASSICS: Renaissance; EDUCATION: Modern: 15th-16th centuries: Relation of Renaissance and Reformation; 16th century: Erasmus; 16th century: Colet and St. Paul's school; EUROPE: Renaissance and Reformation: Erasmus.

**ERASTIANISM**, doctrine which "received its name from Thomas Erastus, a German physician of the 16th century, contemporary with Luther. The work in which he delivered his theory and reasonings on the subject is entitled 'De Excommunicatione Ecclesiastica.' . . . The Erastians . . . held that religion is an affair between man and his creator, in which no other man or society of men was entitled to interpose. . . . Proceeding on this ground, they maintained that every man calling himself a Christian has a right to make resort to any Christian place of worship, and partake in all its ordinances. Simple as this idea is, it strikes at the root of all priestcraft."—W. Godwin, *History of the Commonwealth*, v. 1, ch. 13.—In his book on excommunication (also called "Seventy-five Theses") Erastus argued that the church could not inflict punishment, that a pastor was merely the instructor of his flock, and that members could be excluded for doctrinal reasons only. "Erastianism" as used later by those who would entirely subject the church government to the authority of the state finds no expression in his book. "The whole movement [the Reformation in England] was tinged with Erastianism, so that all the details of its proceedings cannot be defended on strictly ecclesiastical principles. . . . There was indeed . . . a theoretical Erastianism, . . . which, had it been carried out to its logical issue, would have inflicted an irreparable mischief on the English Church. . . . In Queen Mary's time, when the mistakes of Reformation zealots would not be expected to occur, stronger and more pronounced acts of Erastianism are found than even under Henry and Edward. . . . [That the Church of England owes much to Archbishop Laud is incontestable. In his policy] against the Church in particular he wielded the royal prerogative in such a fashion as to make the ecclesiastical government of his day more completely Erastian than it had been in the time of Henry VIII. . . . A declaration issued by the Parliament with respect to religion plainly shows that the tone of a total repudiation of and revolt from the Church was not one that could be safely adopted even by those who desired to please the persons most opposed to the old order of things. It says, 'They intended a due and necessary reformation of the government and liturgy of the Church and to take away nothing in the one or the other but what should be evil and justly offensive, or at least unnecessary and burdensome; and for

the better effecting thereof, speedily to have consultation with learned and godly divines; and because that would never of itself attain the end sought therein, they would also use their utmost endeavours to establish learned and preaching ministers with a good and sufficient maintenance throughout the whole kingdom, wherein many dark corners were miserably destitute of the means of salvation, and many poor ministers wanted necessary provision.' Here there is no expression in favour of Presbyterianism or against Episcopacy as a principle. In fact something very different was contemplated by the Parliament. The majority of the members were no doubt of Erastian views. [According to "Braille's Letters," ii, 265: "The most of the House of Commons are downright Erastians."] They intended to reform the church in their own fashion."—G. G. Perry, *History of the English church*, v. 2, pp. 10-13, 415, 452-453.

**ERASTUS, Thomas** (1524-1583), Swiss-German theologian. See ERASTIANISM.

**ERATOSTHENES OF ALEXANDRIA** (c. 276-c. 194 B.C.), Greek scientific writer. See ALEXANDRIA: B. C. 282-246; EDUCATION: Ancient: B. C. 3rd-A. D. 3rd centuries; HELLENISM: Science and invention.

**ERCTE**, mountain in Sicily, near Palermo, held by Hamilcar during the first Punic War. See ERYX; PUNIC WARS: FIRST.

**ERDELLI**, General, Russian commander of the 11th Army in 1917 under the Kerensky régime. This army was demoralized and crushed by the German attack.

**ERDINI**. See IRELAND: Tribes of early Celtic inhabitants.

**EREBUS AND TERROR**, ships commanded by Ross in Antarctic explorations. See ANTARCTIC EXPLORATION: 1839-1845.

**ERECTHEION AT ATHENS**.—"At a very early period there was, opposite the long northern side of the Parthenon, a temple which, according to Herodotus, was dedicated jointly to Athene Polias and the Attic hero, Erectheus. . . . This temple was destroyed by fire while the Persians held the city. Not unlikely the rebuilding of the Erectheion was begun by Perikles together with that of the other destroyed temples of the Akropolis; but as it was not finished by him, it is generally not mentioned amongst his works. . . . This temple was renowned amongst the ancients as one of the most beautiful and perfect in existence, and seems to have remained almost intact down to the time of the Turks. The siege of Athens by the Venetians in 1687 seems to have been fatal to the Erectheion, as it was to the Parthenon."—E. Guhl and W. Koner, *Life of the Greeks*, sect. 14.—See also ACROPOLIS OF ATHENS; ARCHITECTURE: Classic: Greek; TEMPLES: Stage of culture represented, etc.

**ERFURT UNIVERSITY.** See UNIVERSITIES AND COLLEGES: 1348-1826.

**ERIC**, name of several kings of Denmark, Norway and Sweden.

**Eric I**, The Usurper, king of Denmark, 850-854.

**Eric II**, king of Denmark, 854-883.

**Eric I or III**, The Good, king of Denmark, 1095-1103.

**Eric II or IV**, Emun, king of Denmark, 1135-1137.

**Eric III or V**, The Lamb, king of Denmark, 1137-1147.

**Eric IV or VI**, Plovpenning, king of Denmark, 1241-1250.

**Eric V or VII**, Glipping, king of Denmark, 1250-1286.

**Eric VI or VIII**, Menved, king of Denmark, 1286-1320.

**Eric VII of Pomerania or Eric XIII of Sweden**, king of Denmark, Norway, and Sweden, 1397-1440.

**Eric I**, Blodaexe, king of Norway, c. 898-940.

**Eric II**, Priestthater, king of Norway, 1280-1290.

**Eric I or IX**, Saint, king of Sweden, 1155-1160. See SWEDEN: 1150-1160.

**Eric II or X**, Knutsson, king of Sweden, 1210-1216.

**Eric III or XI**, The Stammerer, king of Sweden, 1222-1250.

**Eric IV or XII**, king of Sweden, 1350-1350.

**Eric XIII of Sweden or Eric VII of Pomerania**, king of Sweden, 1412-1440.

**Eric XIV** (1533-1577), king of Sweden, 1560-1560. See SWEDEN: 1523-1604.

**ERIC**, The Red (c. 950-1000), viking and explorer, founded first Norse settlement in Greenland. See AMERICA: 10th-11th centuries.

**ERICHCSEN**, Mylius, Danish explorer of Greenland coast. See ARCTIC EXPLORATION: 1901-1900.

**ERICSSON**, John (1803-1889), Swedish engineer who perfected the screw propeller for navigation. In the Civil War designed and built the *Monitor* for the United States Navy. See U. S. A.: 1862 (March); WARSHIPS: 1856-1905; STEAM NAVIGATION: On the ocean; SWEDEN: 1901.

**ERIE**, city in Pennsylvania on Lake Erie. Its site is that of the old French fort Presque Isle, built in 1753. (See CANADA: 1700-1735.) It was taken possession of by the English in 1760, and in 1763, during Pontiac's War, surrendered to the Indians; regained by the British in 1764. It was yielded to the United States in 1785; laid out as a town in 1795; became the headquarters of Commodore Perry in the War of 1812.

**ERIE, Fort**, old English fort on the Canadian side of Lake Erie, and opposite Buffalo.

1764-1791.—**Origin.**—Four years after the British conquest of Canada, in 1764, Colonel John Bradstreet built a blockhouse and stockade near the site of the later Fort Erie, which was not constructed until 1791. When war with the United States broke out, in 1812, the British considered the new fort untenable, or unnecessary, and evacuated and partly destroyed it, in May, 1813.—C. K. Remington, *Old Fort Erie*.

1814.—**Siege and the destruction.** See U. S. A.: 1814 (July-September).

1866.—**Fenian invasion.** See CANADA: 1866-1871; IRELAND: 1858-1867.

**ERIE**, Lake, most southern of the five Great Lakes, drained by the St. Lawrence River.

**Indian name.** See NIAGARA: Name, etc.

1679.—**Navigated by La Salle.** See CANADA: 1669-1687.

1813.—**Perry's naval victory.** See U. S. A.: 1812-1813.

**ERIE CANAL**, waterway traversing New York State and connecting the Great Lakes with the Hudson River. See BARGE CANAL; CANALS: American; Erie Canal; NEW YORK: 1817-1825; 1890-1900.

**ERIE INDIANS.** See HURONS; IROQUOIS CONFEDERACY: Their conquests.

**ERIE RAILROAD.** See RAILROADS: 1850-1860; 1921: Twenty rail systems.

**ERIGENA**, John Scotus (c. 810-880), Irish philosopher and theologian. Gave medieval philosophy its logical character; combined in his system pantheism and neo-Platonism, and was the forerunner of the scholastics. His chief work "De Divisione Naturae" was condemned by the church.—See also EDUCATION: Medieval: 9th-15th centuries; MYSTICISM.

**ERIN**, ancient and poetical name for Ireland. See IRELAND.

**ERITREA**, Italian colony in northeastern Africa, on the shore of the Red sea. (See AFRICA: Map.) It has a coast-line of about 650 miles and a total area of about 50,000 square miles, though authorities differ as to the area. The population inclusive of Europeans was estimated in 1921 to be 450,000. Italy's first foothold in this territory was secured when in March, 1870, it purchased Assab and the neighboring region from the sultan Berehan of Raheita for a coaling station. Assab was declared an Italian colony July 5, 1882. Various treaties were concluded with the sultan of Aussa between 1883 and 1888 enlarging the Italian territory. "On the first day of January, 1800, a decree was issued by the Italian Government uniting the various Italian possessions on the west coast of the Red Sea into one colony, which was given the name of the Colony of Eritrea, 'so named after the Erythracum Mare of the Romans.' At first the form of government was a military one, but after the defeat of the Italian forces by the Abyssinians this was changed to a civil administration directly responsible to the Minister of Foreign Affairs in Rome. [See also ITALY: 1895-1800.] . . . 'The frontiers were defined by a French-Italian convention (January 24, 1900), fixing the frontier between French Somaliland and the Italian possessions at Rahtala, and also by various agreements with Great Britain and Abyssinia. A tripartite agreement between Italy, Abyssinia, and Great Britain, entered into on the fifteenth of May, 1902, placed the territory of the Kanama tribe on the north bank of the Setit, within Eritrea. The convention of May 16, 1900, settled the Abyssinia-Eritrea frontier in the Afar country, the boundary being fixed at sixty kilometres from the coast.' In the southern part of the colony there are several small sultanates, for example Aussa and Raheita, which, although still possessing a certain similitude of independence, are nevertheless under Italian protection. The Dahlak archipelago and other groups of islands in the Red Sea, but near the African shore, belong to Eritrea. . . . The Afar region, in the extreme south, is partly in Eritrea and partly in Abyssinia, while the Afar people are found in French Somaliland in considerable numbers. . . . In former times they were bold and terribly successful pirates, and to-day their descendants are the only fishermen in the Red Sea who dare hunt the big and combative *dugong*. The line between Eritrea and French Somaliland is just north of the straits of Bab-el-Mandeb, on the opposite shore of which stands Perim, with which place Massawa is connected by a submarine cable giving telegraphic connection to all parts of the

world. There are land telegraph lines pretty well over the colony and fairly good roads. One railway, sixty-five miles long, connects Massawa with Asmara, the capital of the colony; wisely chosen as such, for it stands on the Hamasen plateau, at an elevation of seventy-eight hundred feet above the sea.—J. K. Goodrich, *Africa of to-day*, pp. 145-148.

ALSO IN: A. B. Wyde, *Modern Abyssinia*, ch. v-ix.

**ERIVAN**, important Armenian center in Transcaucasian Russia. It is the capital of the government of the same name, and is a leading Armenian episcopal see. The population of the city in 1919 was about 90,000.

**ERLANGEN UNIVERSITY**, Germany. See UNIVERSITIES AND COLLEGES: 1604-1906.

**ERMANARIC**, or Hermanaric (fl. 350-376), king of the East Goths; built up a kingdom which extended from the Danube to the Baltic; drove the Vandals out of Dacia; and compelled the allegiance of the neighboring tribes. See GOTHS: 350-375; 376.

**ERMELAND**, diocese in east Prussia; formed into a bishopric in 1243. See PRUSSIA: 13th century.

**ERMYN STREET**, corruption of Eormen street, the Saxon name of one of the great Roman roads in Britain, which ran from London to Lincoln. See ROMAN ROADS IN BRITAIN.

**ERNEST AUGUSTUS** (1771-1851), king of Hanover, formerly duke of Cumberland. See GERMANY: 1817-1840; HANOVER, OR BRUNSWICK-LUNEBURG: 1837.

**ERNESTINE LINE OF SAXONY**. See SAXONY: 1180-1553.

**ERPEDITANI**. See IRELAND: Tribes of early Celtic inhabitants.

**ERRAZURIZ**, Federico (d. 1901), Chilean political figure. See CHILE: 1896; 1901.

**ERSE MANUSCRIPTS AND LANGUAGE**. See CELTS: Ancient Irish sagas; PHILOLOGY: 11.

**ERSKINE**, David Montagu (1776-1825), British diplomat. See U. S. A.: 1808-1810.

**ERTANG**, sacred book of the Manicheans. See MANICHEANS.

**ERVINE**, St. John Greer (1883- ), Irish dramatist and novelist. See DRAMA: 1892-1921.

**ERYTHEA**, ancient name. See CADIZ: Location.

**ERYTHRÆ, ERYTHRÆAN SIBYL**.—Erythræ was an ancient Ionian city on the Lydian coast of Asia Minor, opposite the island of Chios or Scio. It was chiefly famous as the home or seat of one of the most venerated of the sibyls—prophetic women—of antiquity. The collection of Sibylline oracles which was sacredly preserved at Rome appears to have been largely derived from Erythræ. The Cumean Sibyl is sometimes identified with her Erythræan sister, who is said to have passed into Europe.—See also SIBYLS.

**ERYTHRÆAN SEA**.—The Erythræan sea, in the widest sense of the term, as used by the ancients, comprised "the Arabian Gulf (or what we now call the Red sea), the coasts of Africa outside the straits of Bab el Mandeb as far as they had then been explored, as well as those of Arabia and India down to the extremity of the Malabar coast." The Periplus of the Erythræan Sea is a geographical treatise of great importance which we owe to some unknown Greek writer supposed to be nearly contemporary with Pliny. It is "a kind of manual for the instruction of navigators and traders in the Erythræan Sea."—E. H. Bunbury, *History of ancient geography*, ch. 25.—"The Erythræan Sea is an appellation . . . in all appearance

deduced [by the ancients] from their entrance into it by the straits of the Red Sea, styled Erythra by the Greeks, and not excluding the gulph of Persia, to which the fabulous history of a king Erythras is more peculiarly appropriate."—W. Vincent, *Periplus of the Erythræan Sea*, bk. 1, preliminary disquisition.—See also ATLANTIC OCEAN: Ancient geography.

**ERYX**, town originally Phœnician or Carthaginian on the northwestern coast of Sicily. It stood on the slope of a mountain which was crowned with an ancient temple of Aphrodite, and which gave the name Erycina to the goddess when her worship was introduced at Rome. See PUNIC WARS: FIRST.

**ERZEBERGER**, Mathias (1875-1921), German statesman and leader of the Center or Catholic party; urged the end of the World War on the basis of no annexations and no indemnities, 1917; was minister without portfolio in the cabinet appointed, February 13, 1919; in June, 1919, became vice-premier and minister of finance. He was assassinated in 1921.—See also GERMANY: 1917 (July-October); WORLD WAR: 1918: XI. End of the war: a, 6; a, 8.

**ERZERUM**, town and vilayet of Armenia (see ARABIA: Map), 120 miles southeast of Trebizond; considered the strongest fortress in the Turkish empire. Before railroads were introduced was important point on line of caravan traffic; belonged to Turkey since 1517; has been objective point in wars between Russia and Turkey (see TURKEY: 1877-1878); was captured by the Russians under Grand Duke Nicholas and General Yudenich, February 16, 1916, which put an end to the projected Turkish invasion of Egypt during the World War.—See also WORLD WAR: 1916: VI. Turkish theater: d, 1 and 2.

1919-1920.—Importance in the Armenia-Turkish boundary question. See ARMENIA: 1919-1920; SÈVRES, TREATY OF (1920): Part III: Political clauses: Armenia.

**ERZINGAN**, city eighty miles west of Erzerum, Armenia. On July 25, 1916, it was captured by the Russian general, Yudenich. See WORLD WAR: 1916: VI. Turkish theater: d, 6.

**ESARHADDON**, king of Assyria and Babylonia; ruled from 681 to 668 B. C.; famous for his conquests. See ASSYRIA: Later Assyrian Empire; EGYPT: B. C. 670-525.

**ESCALANTE**, Silvestre Velez de, Franciscan friar and explorer. See COLORADO: 1776-1858; UTAH: 1540-1776.

**ESCALON**. See ASCALON.

**ESCH**, town in Luxemburg, occupied by the Americans in 1918. See WORLD WAR: 1918: XI. End of the war: c.

**ESCH-CUMMINS ACT** (1920). See RAILROADS: 1916-1920; 1920: Esch-Cummins Act.

**ESCHEATED HONOURS**. See HONOURS, ESCHATED.

**ESCHENBACH**, Wolfram von. See WOLFRAM VON ESCHENBACH.

**ESCOCÈS**, political faction of free masons in Mexico. See MEXICO: 1822-1828.

**ESCOMBOLI**. See STAMBOUL.

**ESCORIAL**, largest building in Spain and most notable monument of the Griego-Romano style. See ARCHITECTURE: Renaissance: Spain; SPAIN: 1550-1563.

**ESCURRA**, Juan Antonio, Paraguayan president, deposed in 1904. See PARAGUAY: 1902-1915.

**ESCUYER**, or Esquire, shield bearer to the knight. See CHIVALRY.

**ESDRAELON**, or Plain of Jezreel, famous valley in Palestine to which some refer the name

Armageddon. Here Gideon defeated the Midianites, and it was the scene of Napoleon's victory over the Turks (1799). In September, 1918, the Turkish army was finally defeated in this region by the British.—See also MEGIDDO; PALESTINE; Land; WORLD WAR: 1918: VI. Turkish theater: c, 16.

**ESHER**, Reginald Baliol Brett, 2nd Viscount (1852- ), British public official, member of committee on imperial defense; made a report on conditions in India. See INDIA: 1921-1922; WAR, PREPARATION FOR: 1907-1909: British army reorganization.
