**ESKIMO**, or **ESKIMAUAN**, FAMILY.—“Save a slight intermixture of European settlers, the Eskimo are the only inhabitants of the shores of Arctic America, and of both sides of Davis Strait and Baffin Bay, including Greenland, as well as a tract of about 400 miles on the Behring Strait coast of Asia. Southward they extend as far as about 50° N. L. on the eastern side, 60° on the western side of America, and from 55° to 60° on the shores of Hudson Bay. Only on the west the Eskimo near their frontier are interrupted on two small spots of the coast by the Indians, named Kennayans and Ugalezes, who have there advanced to the sea-shore for the sake of fishing. These coasts of Arctic America, of course, also comprise all the surrounding islands. Of these, the Aleutian Islands form an exceptional group; the inhabitants of these on the one hand distinctly differing from the coast people here mentioned, while on the other they show a closer relationship to the Eskimo than any other nation. The Aleutians, therefore, may be considered as only an abnormal branch of the Eskimo nation. . . . As regards their northern limits, the Eskimo people, or at least remains of their habitations, have been found nearly as far north as any Arctic explorers have hitherto advanced; and very possibly bands of them may live still farther to the north, as yet quite unknown to us. . . . On comparing the Eskimo with the neighbouring nations, their physical complexion certainly seems to point at an Asiatic origin; but, as far as we know, the latest investigations have also shown a transitional link to exist between the Eskimo and the other American nations, which would sufficiently indicate the possibility of a common origin from the same continent. As to their mode of life, the Eskimo decidedly resemble their American neighbours. . . . With regard to their language, the Eskimo also appear akin to the American nations in regard to its decidedly polysynthetic structure. Here, however, on the other hand, we meet with some very remarkable similarities between the Eskimo idiom and the language of Siberia, belonging to the Altaic or Finnish group. . . . According to the Sagas of the Icelanders, they were already met with on the east coast of Greenland about the year 1000, and almost at the same time on the east coast of the American continent. . . . Between the years 1000 and 1300 they do not seem to have occupied the land south of 65° N. L. on the west coast of Greenland, where the Scandinavian colonies were then situated. But the colonists seem to have been aware of their existence in higher latitudes, and to have lived in fear of an attack by them, since, in the year 1266, an expedition was sent out for the purpose of exploring the abodes of the Skraelings, as they were called by the colonists. . . . About the year 1450, the last accounts were received from the colonies, and the way to Greenland was entirely forgotten in the mother country. . . . The features of the natives in the Southern part of Greenland indicate a mixed descent from the Scandinavians and Eskimo, the former, however, not having left the slightest sign

of any influence on the nationality or culture of the present natives. In the year 1585, Greenland was discovered anew by John Davis, and found inhabited exclusively by Eskimo.”—H. Rink, *Tales and traditions of the Eskimo, introduction and ch. 6.*—“In 1869, I proposed for the Aleuts and people of Innuït stock collectively the term Orarians, as indicative of their coastwise distribution, and as supplying the need of a general term to designate a very well-defined race. . . . The Orarians are divided into two well-marked groups, namely the Innuïts, comprising all the so-called Eskimo and Tuskis and the Aleuts.”—W. H. Dall, *Tribes of the extreme Northwest (Contributions to North American Ethnology, v. 1, pt. 1).*—See also ALASKA: Natives; GREENLAND; INDIANS, AMERICAN: Cultural areas in North America: Eskimo area; Linguistic characteristics.

**ESPIONAGE ACT**, United States: Act of June 15, 1917, and its results.—“The so-called Espionage Act of June 15, 1917, among other things, conferred upon the President full power to control all exports from the United States. Title VII, which relates to this matter, reads as follows: Sec. 1. Whenever during the present war [World War] the President shall find that the public safety shall so require, and shall make proclamation thereof, it shall be unlawful to export from or ship or take out of the United States to any country named in such proclamation any article or articles mentioned in such proclamations, except at such time or times, and under such regulations and orders, and subject to such limitations and exceptions as the President shall prescribe, until otherwise ordered by the President or by Congress: *Provided, however,* That no preference shall be given to the ports of one State over those of another. . . . Sec. 3. Whenever there is reasonable cause to believe that any vessel, domestic or foreign, is about to carry out of the United States any article or articles in violation of the provisions of this title, the collector of customs for the district in which such vessel is located is hereby

authorized and empowered, subject to review by the Secretary of Commerce, to refuse clearance to any such vessel, domestic or foreign, for which clearance is required by law, to forbid the departure of such vessel from the port, and it shall thereupon be unlawful for such vessel to depart."—W. F. Willoughby, *Government organization in war time and after*, pp. 122-123.—"The espionage act prohibits the gathering of information to be disclosed to the enemy, at places connected with the national defense, such as dock yards, arsenals and munition plants; and the disclosing of plans of defense or the disposition of armed forces to the enemy. . . . An act amending the espionage law was signed May 16 [1918], providing penalties for seditious utterances or for publishing disloyal statements with intent to cripple or hinder the prosecution of the war."—C. Kettleborough, *Congressional legislation, 1917-1918 (American Political Science Review, Nov., 1918, pp. 670, 673)*.—"The free speech controversy. . . [during the World War] has chiefly gathered about the federal Espionage Act. This Act, . . . as originally enacted on June 15, 1917, established three new offenses: (1) false statements or reports interfering with military or naval operations or promoting the success of our enemies; (2) causing or attempting to cause insubordination, disloyalty, mutiny or refusal of duty in the military and naval forces; (3) obstruction of enlistments and recruiting. Attorney General Gregory reports that, although this Act proved an effective instrumentality against deliberate or organized disloyal propaganda, it did not reach the individual, casual, or impulsive disloyal utterances. Also some District Courts gave what he considered a narrow construction of the word 'obstruct' in clause (3), so that as he puts it, 'most of the teeth which we tried to put in were taken out.' . . . On May 16, 1918, Congress amended the Espionage Act by what is sometimes called the Sedition Act, adding nine more offenses to the original three, as follows: (4) saying or doing anything with intent to obstruct the sale of United States bonds, except by way of bona fide and not disloyal advice; (5) uttering, printing, writing, or publishing any disloyal, profane, scurrilous, or abusive language, or language intended to cause contempt, scorn, contumely or disrepute as regards the form of government of the United States; (6) or the Constitution; (7) or the flag; (8) or the uniform of the Army or Navy; (9) or any language intended to incite resistance to the United States or promote the cause of its enemies; (10) urging any curtailment of production of any things necessary to the prosecution of the war with intent to hinder its prosecution; (11) advocating, teaching, defending, or suggesting the doing of any of these acts; and (12) words or acts supporting or favoring the cause of any country at war with us, or opposing the cause of the United States therein. Whoever commits any one of these offenses in this or any future war is liable to a maximum penalty of \$10,000 fine or twenty years' imprisonment, or both."—Z. Chafee, Jr., *Freedom of speech in war time (Harvard Law Review, June, 1919, pp. 933-936)*.

**Trials under the Espionage Act.**—"In *Masses Publishing Co. v. Patten* Judge Hand was asked to enjoin the postmaster of New York from excluding from the mails *The Masses*, a monthly revolutionary journal, which contained several articles, poems, and cartoons attacking the war. The Espionage Act of 1917 made non-mailable any publication which violated the criminal provisions of that act, already summarized in this article. One important issue was, therefore, whether the post-

master was right in finding such a violation. This case did not raise the constitutional question whether Congress could make criminal any matter which tended to discourage the successful prosecution of the war, but involved only the construction of the statute, whether Congress had as yet gone so far. Judge Hand held that it had not and granted the injunction. He refused to turn the original Act, which obviously dealt only with interference with the conduct of military affairs, into a prohibition of all kinds of propaganda and a means for suppressing all hostile criticism and all opinion except that which encouraged and supported the existing policies of the war, or fell within the range of temperate argument."—*Ibid.*, pp. 960-961.—In the case of *United States v. Kraft*, tried in the U. S. Circuit Court of Appeals, in 1918, "The defendant was convicted of violating the third section of the Espionage Act of June 15, 1917, by uttering in the presence of soldiers of the United States army statements intended to cause insubordination, mutiny, disloyalty and refusal of duty on the part of such soldiers. The trial judge charged the jury that they might find a verdict of guilty only if satisfied that the statements alleged had actually been uttered and had been uttered with the intention on the part of the defendant to cause insubordination, mutiny, disloyalty, and refusal of duty. He refused to charge the duty that in order to convict the prosecution must prove that such insubordination, etc., had actually resulted from the defendant's remarks. This court held on appeal that the jury had been correctly charged. A violation of the clause of the statute in question results even from an entirely unsuccessful attempt to stir up mutiny and disloyalty in the army or navy. To make the defendant's guilt dependent upon the results of his criminal efforts would be equivalent to making it depend not upon what he did in the way of counseling disloyalty, but upon what his hearers did in the way of following his directions. In other words, the defendant could do all in his power to bring about disloyalty, but as long as he did not succeed he committed no crime. Such a construction is entirely foreign to the purpose of the Espionage Act, which aims to prevent not merely the results of disloyal propaganda but the propaganda itself."—R. E. Cushman, *Judicial decisions on public law (American Political Science Review, Nov., 1918, pp. 691-692)*.—"The United States Supreme Court did not have an opportunity to consider the Espionage Act until 1919, after the armistice was signed and almost all the District Court cases had been tried. Several appeals from conviction had resulted in a confession of error by the government, but at last four cases were heard and decided against the accused. Of these three were clear cases of incitement to resist the draft, so that no real question of free speech arose. Nevertheless the defense of constitutionality was raised, and denied by Justice Holmes. His fullest discussion is in *Schenck v. United States*."—Z. Chafee, Jr., *Freedom of speech in war time (Harvard Law Review, June, 1919, pp. 966-967)*.—"In three cases, convictions under the Espionage Act of 1917 were sustained notwithstanding the objection that, since the offense charged consisted solely of written or spoken utterances, the result was a violation of the First Amendment prohibiting the Congress from making any law 'abridging the freedom of speech or of the press.' The defendants had been found guilty of attempts or conspiracies to obstruct recruiting. In no case was it proven that the obstruction has occurred. Mr. Justice Holmes implied that the First Amendment imposes restriction on punishment for the use of

language as well as on the use of censorship. In *Schenck v. United States* he says: 'We admit that in many places and in ordinary times the defendants in saying all that was said in the circular would have been within their constitutional rights. But the character of every act depends upon the circumstances in which it is done. . . . When a nation is at war, many things that might be said in time of peace are such a hindrance to its effort that their utterance will not be endured so long as men fight and that no Court could regard them as protected by any constitutional right. It is thus apparent that the practical effect of the free speech amendment depends upon the scrutiny which an appellate court casts at the relation between the evidence offered and the verdict of the jury. In *Frohwerk v. United States* it was remarked that 'we do not lose our right to condemn either measures or men because the country is at war.' . . . The opinion in *Debs v. United States* adds little to the previous discussion except to point out that expressions which, under all the circumstances, would probably obstruct recruiting, are not protected because 'part of a general program and expressions of a general and conscientious belief.' The three cases can be fully understood only in the light of all the utterances involved. Space forbids their enumeration here, but there can be no doubt that all had pretty clearly implied nobility in any one who refused to acquiesce in the draft or contribute to the prosecution of the war.'—T. R. Powell, *Constitutional law in 1918-1919 (American Political Science Review, Feb., 1920, pp. 64-66)*.

Repeal of the amendment to section 3 (1921).—The amendment (passed May 16, 1918) to title 1, section 3 (Espionage Act) which provided penalties for seditious utterances and disloyal statements was repealed by the resolution of March 3, 1921, and this section of the Act of June, 1917, was restored to its former force, which dealt only with clearance of vessels carrying articles forbidden by the act.

ESSELENIAN FAMILY.—'The present

family was included by Latham in the heterogeneous group called by him Salinas. . . . The term Salinan (is now) restricted to the San Antonio and San Miguel languages, leaving the present family . . . [to be] called Esselenian, from the name of the single tribe Esselen, of which it is composed. . . . The tribe or tribes composing this family occupied a narrow strip of the California coast from Monterey Bay south to the vicinity of the Santa Lucia Mountain, a distance of about 50 miles.'—J. W. Powell, *Seventh annual report (Bureau of ethnology, pp. 75-76)*.

ESSEN, city of Rhenish Prussia near the Ruhr (see GERMANY: Map). From about 950 to 1803, it was governed by the abbess of a Benedictine nunnery; part of Prussia, 1803-1807; under the Napoleonic grand dukes of Berg, 1807-1814; was assigned to Prussia, 1815; of late years it has been famous for the vast Krupp steel and munitions works located there. See CAPITALISM: 19th-20th centuries.

ESSEN CONGRESS (1907). See LIQUOR PROBLEM: Germany: 1902-1907.

ESSENES.—'Apart from the great highroad of Jewish life, there lived in Palestine in the time of Christ a religious community which, though it grew up on Jewish soil, differed essentially in many points from traditional Judaism, and which, though it exercised no powerful influence upon the development of the people, deserves our attention as a peculiar problem in the history of religion. This community, the Essenes or Essæans, is generally, after the precedent of Josephus, placed beside the Pharisees and Sadducees as the third Jewish sect. But it scarcely needs the remark, that we have here to deal with a phenomenon of an entirely different kind. While the Pharisees and Sadducees were large political and religious parties, the Essenes might far rather be compared to a monastic order. There is indeed much that is enigmatical in them as to particulars. Even their name is obscure.

. . . The origin of the Essenes is as obscure as their name. Josephus first mentions them in the time of Jonathan the Maccabee, about 150 B. C., and speaks expressly of one Judas, an Essene, in the time of Aristobulus I (105-104 B. C.). According to this, the origin of the order would have to be placed in the second century before Christ. But it is questionable whether they proceeded simply from Judaism, or whether foreign and especially Hellenistic elements had not also an influence in their organization. . . . Philo and Josephus agree in estimating the number of the Essenes in their time at above 4,000. As far as is known, they lived only in Palestine, at least there are no certain traces of their occurrence out of Palestine. . . . For the sake of living as a community, they had special houses of the order in which they dwelt together. Their whole community was most strictly organized as a single body. . . . The strongest tie by which the members were united was absolute community of goods. 'The community among them is wonderful [says Josephus], one does not find that one possesses more than another. For it is the law, that those who enter deliver up their property to the order, so that there is nowhere to be seen, either the humiliation of poverty or the superfluity of wealth, but on the contrary one property for all as brethren, formed by the collection of the possessions of individuals.' 'They neither buy nor sell among each other; but while one gives to another what he wants, he receives in return what is useful to himself, and without anything in return they receive freely whatever they want'. . . . 'There is but one purse for all, and common expenses, common clothes, and common food in com-

mon meals. For community of dwelling, of life, and of meals is nowhere so firmly established and so developed as with them. And this is intelligible. For what they receive daily as wages for their labour, they do not keep for themselves, but put it together, and thus make the profits of their work common for those who desire to make use of it. And the sick are without anxiety on account of their inability to earn, because the common purse is in readiness for the care of them, and they may with all certainty meet their expenses from abundant stores.' . . . The daily labour of the Essenes was under strict regulation. It began with prayer, after which the members were dismissed to their work by the presidents. They reassembled for purifying ablutions, which were followed by the common meal. After this they again went to work, to assemble again for their evening meal. The chief employment of members of the order was agriculture. They likewise carried on, however, crafts of every kind. On the other hand, trading was forbidden as leading to covetousness, and also the making of weapons or of any kind of utensils that might injure men. . . . The Essenes are described by both Philo and Josephus as very connoisseurs in morality. . . . Their life was abstemious, simple and unpretending. 'They condemn sensual desires as sinful, and esteem moderation and freedom from passion as of the nature of virtue.' They only take food and drink till they have had enough; abstaining from passionate excitement, they are 'just dispensers of wrath.' At their meals they are 'contented with the same dish day by day, loving sufficiency and rejecting great expense as harmful to mind and body.' . . . There is not a slave among them, but all are free, mutually working for each other. All that they say is more certain than an oath. They forbid swearing, because it is worse than perjury. . . . Before every meal they bathe in cold water. They do the same after performing the functions of nature. . . . They esteem it seemly to wear white raiment at all times. . . . They entirely condemned marriage. Josephus indeed knew of a branch of the Essenes who permitted marriage. But these must at all events have formed a small minority. . . . A chief peculiarity of the Essenes was their common meals, which bore the character of sacrificial feasts. The food was prepared by priests, with the observance probably of certain rites of purification; for an Essene was not permitted to partake of any other food than this. The meals are described as follows by Josephus: 'After the bath of purification they betake themselves to a dwelling of their own, entrance into which is forbidden to all of another faith. And being clean they go into the refectory as into a sanctuary. . . . The priest prays before the meal, and none may eat before the prayer. After the meal he prays again. At the beginning and end they honour God as the giver of food. Then they put off their garments as sacred and go back to their work till evening. Returning, they feed again in the same manner.' In their worship, as well as in that of other Jews, the Holy Scriptures were read and explained; and Philo remarks, that they specially delighted in allegorical interpretation. They were extraordinarily strict in the celebration of the Sabbath. They did not venture on that day to move a vessel from its place, nor even to perform the functions of nature. In other respects too they showed themselves to be Jews. Though they were excluded from the temple they sent gifts of incense there. . . . Concerning their doctrine of the soul and of its immortality, Josephus expresses himself most fully. If we may trust his account, they taught that bodies are perishable, but souls im-

mortal, and that the latter dwelt originally in the subtlest æther, but being debased by sensual pleasures united themselves with bodies as with prisons; but when they are freed from the fetters of sense they will joyfully soar on high, as if delivered from long bondage. To the good (souls) is appointed a life beyond the ocean. . . . But to the bad (souls) is appointed a dark, cold region full of unceasing torment."—E. Schürer, *History of the Jewish people in the time of Jesus Christ*, v. 2.

**ESSENTIAL OILS.** See CHEMISTRY: Practical application: Essential oils and perfumes.

**ESSEX, Arthur Capel, 1st Earl of (in Capel line)** (1632-1683), English statesman; 1672-1677, privy councillor and lord-lieutenant of Ireland; 1679, commissioner of the treasury; 1682, leader of Monmouth's faction; arrested after the discovery of the Rye House Plot; imprisoned in 1683 and probably committed suicide.

**ESSEX, Robert Devereux, 2nd Earl of** (1566-1601), English courtier; favorite of Queen Elizabeth after the death of Leicester; 1596, one of several men appointed to the command of an expedition which defeated the Spanish fleet and pillaged and captured Cadiz; 1597, created earl marshal of England; 1599, lieutenant and governor-general of Ireland. Brought up on various charges, imprisoned, 1601, and condemned to death.—See also SPAIN: 1596; ULSTER: 1585-1608.

**ESSEX, Robert Devereux, 3rd Earl of** (1591-1646), English soldier; 1630, lieutenant-general of army sent against Scottish covenanters; 1642, appointed to the command of the parliamentary army. See ENGLAND: 1642 (January-August); 1643 (August-September); 1644 (January-July); 1644-1645.

**ESSEX, Walter Devereux, 1st Earl of** (1541-1576), English nobleman. Created knight of the Garter and earl of Essex in 1572, as reward for his services in suppressing the northern rebellion under the earls of Northumberland and Westmoreland; unsuccessful in his attempt to subdue and colonize Ulster, 1573-1576. See IRELAND: 1559-1603.

**ESSEX**, originally the kingdom formed by that body of the Saxon conquerors of Britain, in the fifth and sixth centuries, who acquired, from their geographical position in the island, the name of the East Saxons. It covered the present county of Essex, and London and Middlesex. See ENGLAND: 477-527.

**ESSEX**, famous American frigate in the War of 1812. For nearly two years it played havoc with British shipping.

**ESSEX, Forest of.** See EPPING FOREST.

**ESSEX JUNTO.**—In the Massachusetts election of 1781, "the representatives of the State in Congress, and some of the more moderate leaders at home, opposed Governor Hancock, the popular candidate, and supported James Bowdoin, who was thought to represent the more conservative elements. . . . It was at this time that Hancock is said to have bestowed on his opponents the title of the 'Essex Junto,' and this is the first appearance of the name in American politics. . . . The 'Junto' was generally supposed to be composed of such men as Theophilus Parsons, George Cabot, Fisher Ames, Stephen Higginson, the Lowells, Timothy Pickering, &c., and took its name from the county to which most of its reputed members originally belonged. . . . The reputed members of the 'Junto' held political power in Massachusetts [as leaders of the Federalist party] for more than a quarter of a century."—H. C. Lodge, *Life and letters of George Cabot*, pp. 17-22.—According to Chief Justice Parsons, as quoted by Colonel Pickering in his "Diary,"

the term "Essex Junto" was applied by one of the Massachusetts royal governors, before the Revolution, to certain gentlemen of Essex county who opposed his measures. Hancock, therefore, only revived the title and gave it currency, with a new application. The name first came into national use in 1798, when President Adams accused the Federal leaders (mainly Essex county men) in Massachusetts, of trying to force a war with France. These men later opposed the embargo and the War of 1812, so that the term "Essex Junto" became synonymous with New England Federalism.—See also U. S. A.: 1789-1792.

**ESSIGNY**, town in France south of St. Quentin, which was taken by the Germans in 1918. See **WORLD WAR**: 1918: II. Western front: d, 2.

**ESSLING**, or **Aspern, Battle of** (1809). See **AUSTRIA**: 1809-1814; **GERMANY**: 1809 (January-June).

**ESSUVII**, Gallic tribe established anciently in the modern French department of the Orne.—Napoleon III, *History of Caesar*, bk. 3, ch. 2, note.

**ESTAING**, Charles Hector, Comte d' (1729-1794), commander of French fleet sent to the United States. See U. S. A.: 1778 (July-November); 1779 (September-October).

**ESTATES**, Assembly of.—"An assembly of estates is an organised collection, made by representation or otherwise, of the several orders, states or conditions of men, who are recognised as possessing political power. A national council of clergy and barons is not an assembly of estates, because it does not include the body of the people, the plebs, the simple freemen or commons."—W. Stubbs, *Constitutional history of England*, ch. 15, sect. 185.—See also **ESTATES**, **THREE**.

**ESTATES**, **Laws governing**. See **EQUITY LAW**: 1786.

**ESTATES**, **Three**.—"The arrangement of the political factors in three estates is common, with some minor variations, to all the European constitutions, and depends on a principle of almost universal acceptance. This classification differs from the system of caste and from all divisions based on differences of blood or religion, historical or pre-historical. . . . In Christendom it has always taken the form of a distinction between clergy and laity, the latter being subdivided according to national custom into noble and non-noble, patrician and plebeian, warriors and traders, landowners and craftsmen. . . . The Aragonese cortes contained four brazos or arms, the clergy, the great barons or ricos hombres, the minor barons, knights or infanzones, and the towns. [See also **CORTES**: Early Spanish.] The Germanic diet comprised three colleges, the electors, the princes and the cities, the two former being arranged in distinct benches, lay and clerical [see also **DIET**: Germanic]. . . . The Castilian cortes arranged the clergy, the ricos hombres and the comunidades, in three estates. The Swedish diet was composed of clergy, barons, burghers and peasants. . . . In France, both in the States General and in the provincial estates, the division is into gantz de l'église, nobles, and gantz des bonnes villes. In England, after a transitional stage, in which the clergy, the greater and smaller barons, and the cities and boroughs, seemed likely to adopt the system used in Aragon and Scotland, and another in which the county and borough communities continued to assert an essential difference, the three estates of clergy, lords and commons, finally emerge as the political constituents of the nation, or, in their parliamentary form, as the lords spiritual and temporal and the commons. This familiar formula in either shape bears the impress of history. The term commons is not in itself

an appropriate expression for the third estate; it does not signify primarily the simple freemen, the plebs, but the plebs organised and combined in corporate communities, in a particular way for particular purposes. The commons are the communities or universities, the organised bodies of freemen of the shires and towns. . . . The third estate in England differs from the same estate in the continental constitutions, by including the landowners under baronial rank. In most of those systems it contains the representatives of the towns or chartered communities only."—W. Stubbs, *Constitutional history of England*, ch. 15, sect. 185, 193.—"The words 'gens de tiers et commun état' are found in many acts of the 15th century [in France]. The expressions 'tiers état,' 'commun état,' and 'le commun' are used indifferently. . . . This name of Tiers État, when used in its ordinary sense, properly comprises only the population of the privileged cities; but in effect it extends much beyond this; it includes not only the cities, but the villages and hamlets—not only the free commonalty, but all those for whom civil liberty is a privilege still to come."—Thierry, *Formation and progress of the Tiers État in France*, v. 1, pp. 61, 60.—See also **EUROPE**: Modern Period: Rise of the middle classes; **FRANCE**: 1787-1789; 1789 (May); 1789 (June); **SUFFRAGE**, **MANHOOD**: 1300-1600.

**ESTATES GENERAL**. See **STATES GENERAL**.

**ESTE**, House of.—"Descended from one of the northern families which settled in Italy during the darkest period of the middle ages, the Este traced their lineal descent up to the times of Charlemagne. They had taken advantage of the frequent dissensions between the popes and the German emperors of the houses of Saxony and Swabia, and acquired wide dominions in Lunigiana, and the March of Treviso, where the castle of Este, their family residence, was situated. Towards the middle of the 11th century, that family had been connected by marriages with the Guelphs of Bavaria, and one of the name of Este was eventually to become the common source from which sprung the illustrious houses of Brunswick and Hanover. The Este had warmly espoused the Guelph party [see **GUELPHS**], during the wars of the Lombard League. . . . Towards the year 1200, Azzo V, Marquis of Este, married Marchesella degli Adelardi, daughter of one of the most conspicuous Guelphs at Ferrara, where the influence of the House of Este was thus first established."—L. Mariotti (A. Gallenga), *Italy*, v. 2, pp. 62-63.—The Marquesses of Este became, "after some of the usual fluctuations, permanent lords of the cities of Ferrara [1204] and Modena [1288]. About the same time they lost their original holding of Este, which passed to Padua, and with Padua to Venice. Thus the nominal marquess of Este and real lord of Ferrara was not uncommonly spoken of as Marquess of Ferrara. In the 15th century these princes rose to ducal rank; but by that time the new doctrine of the temporal dominion of the Popes had made great advances. Modena, no man doubted, was a city of the Empire; but Ferrara was now held to be under the supremacy of the Pope. The Marquess Borsò had thus to seek his elevation to ducal rank from two separate lords. He was created Duke of Modena [1453] and Reggio by the Emperor, and afterwards Duke of Ferrara [1471] by the Pope. This difference of holding . . . led to the destruction of the power of the house of Este. In the times in which we are now concerned, their dominions lay in two masses. To the west lay the duchy of Modena and Reggio; apart from it to the east lay the duchy of

Ferrara. Not long after its creation, this last duchy was cut short by the surrender of the border-district of Rovigo to Venice. . . . Modena and Ferrara remained united, till Ferrara was annexed [1598] as an escheated fief to the dominions of its spiritual overlord. But the house of Este still reigned over Modena with Reggio and Mirandola, while its dominions were extended to the sea by the addition of Massa and other small possessions between Lucca and Genoa. The duchy in the end passed by female succession to the House of Austria [1771-1803].—E. A. Freeman, *Historical geography of Europe, ch. 8, sect. 3-4*.—"The government of the family of Este at Ferrara, Modena, and Reggio displays curious contrasts of violence and popularity. Within the palace frightful deeds were perpetrated; a princess was beheaded [1425] for alleged adultery with a stepson; legitimate and illegitimate children fled from the court, and even abroad their lives were threatened by assassins sent in pursuit of them (1471). Plots from without were incessant; the bastard of a bastard tried to wrest the crown from the lawful heir, Hercules I; this latter is said afterwards (1493) to have poisoned his wife on discovering that she, at the instigation of her brother, Ferrante of Naples, was going to poison him. This list of tragedies is closed by the plot of two bastards against their brothers, the ruling Duke Alfonso I. and the Cardinal Ippolito (1506), which was discovered in time, and punished with imprisonment for life. . . . It is undeniable that the dangers to which these princes were constantly exposed developed in them capacities of a remarkable kind."—J. Burckhardt, *Civilization of the period of the Renaissance in Italy, pt. 1, ch. 5*.—For the facts of the ending of the legitimate Italian line of Este, see PAPACY: 1597.

**ESTERHAZY**, Ferdinand Walzin (1847-1910), French officer, implicated in the Dreyfus case. He was dismissed from the army, and in 1899 confessed that he had written the bordereau which led to the condemnation of Dreyfus. See FRANCE: 1894-1906.

**ESTHONIA**, Baltic state, formerly a Russian government and one of Baltic provinces. In 1918 she declared herself free and was gradually recognized by all of the powers. The total population in 1921 was 1,750,000, and the area about 23,160 square miles.—See also BALTIC PROVINCES; BALTIC STATES: Esthonia.

**ETHICS**: Derivation of name.—"The terms 'ethics' and 'ethical' are derived from a Greek word *ethos* which originally meant customs, usages, especially those belonging to some group as distinguished from another, and later came to mean disposition, character. They are thus like the Latin word 'moral,' from *mores*. . . . Customs were not merely habitual ways of acting; they were ways approved by the group or society. To act contrary to the customs of the group brought severe disapproval. This might not be formulated in precisely our terms—right and wrong, good and bad,—but the attitude was the same in essence. The terms ethical and moral as applied to the conduct of today imply of course a far more complex and advanced type of life than the old words 'ethos' and 'mores,' . . . but the terms have a distinct value if they suggest the way in which the moral life had its beginning."—J. Dewey and J. H. Tufts, *Ethics*, pp. 1-2.

Origin of moral sentiments.—Primitive man.—"Notwithstanding that so much of the life of primitive man is lived on the nonmoral plane, and that much which is reckoned unto him for goodness is merely negative goodness, still in certain of his activities growing out of his clan relationships we discover the beginnings of all human morality. For . . . the true starting point of the moral evolution of mankind is to be sought in the altruistic sentiments nourished in the atmosphere of the kinship group. There is scarcely an ethical sentiment which does not appear here at least in a rudimentary form. Out of the most sacred and intimate relationships of the group we find springing up the

maternal virtues of patience, tenderness, and self-denial, and filial virtues of love, obedience, and reverence; out of the fellowship of the men in hunting and in war we see developing the manly virtues of courage, fortitude, self-control, and, above all, self-devotion to the common good; out of the hearth worship of ancestors we observe springing up many of those religious-ethical feelings and sentiments which form one of the chief moral forces in civilization; out of the sacrificial meal shared with the gods and the spirits of the dead through offerings of portions of the food and drink, we see forming customs of incalculable moral value in the ethical training of the race. A great part of the history of morals consists in the record of how these earliest forms of social virtues, first nourished by the customs, habits, and practices of the kinship group, have been gradually refined and developed into wider and richer forms of ethical sentiment and feeling."—P. V. N. Myers, *History as past ethics*, pp. 17-18.

**Egypt.**—"By the dawn of history there had been developed in ancient Egypt an enlightened and discriminating conscience. . . . But though the moral development, like the development of all other phases of Egyptian civilization, was early checked and thereafter made but slow progress, the essential refinement and clarification of the moral sense during prehistoric times, or in the obscure period of the earliest dynasties, is shown by various testimonies, as; for instance, in the moralization of the Osirian myth, . . . in the abandonment of the practice of human sacrifices at the tomb, and in the transition, concerning the conception of the life after death, from the continuance to the retribution theory. . . . This early standard of goodness is embodied in the so-called Negative Confession, in which the soul before the Osirian tribunal pleaded his innocence of the forty-two sins condemned by the Egyptian code of morality. . . . The moral standard of the Egyptians has been compared to that of the Romans after it had felt the influence of Stoicism and Christianity. Like the Roman ideal of excellence at its best, the Egyptian ideal tended to develop a strong and manly type of character, particularly in the ruling class. . . . Nor was the influence of the moral ideal of Egypt confined to the Egyptian land. . . . Later she made a rich bequest to European morality, a bequest only less important perhaps than that made by Judea. Her ideas of the future life, her meditations on death and the final judgment, reënforced the teachings of Christianity. . . . It is not without significance that Christian monasticism, with all its otherworldliness, had its beginnings in Egypt."—*Ibid.*, pp. 33-44.

**Babylonia and Assyria.**—"The ethical development . . . in Babylonia and Assyria . . . was such as to lift these peoples far above the low moral plane of primitive society. 'In the seventh century before Christ, if not earlier, the Babylonians and Assyrians possessed a system of morality which in many respects resembled that of the descendants of Abraham.' The ethical movement found its truest expression in the so-called penitential hymns, which are in spirit altogether like the penitential psalms of the Hebrew Scriptures. They exhibit the same intense yearning of the penitent soul for reconciliation and union with a god conceived as just and holy and piteous. . . . The great gods were conceived as the creators, the sustainers of man; as loving, compassionate, merciful, and forgiving. The religious-moral ideal was here verging toward the highest that man has ever been able to form, and could this standard have been steadily upheld and the lower abandoned, then Babylonia

and Assyria like Judea might have made precious contributions to the moral life of humanity. But this was not done. The tablets holding magical formulas and incantations, wholly devoid of all ethical character, outnumber a thousand to one those exhaling the spiritual perfume of genuine moral feeling and aspiration."—P. V. N. Myers, *History as past ethics*, pp. 46-48.

**China.**—"With the exception of the teachers of the ancient Hebrews, the leaders of thought of no people have so insistently interpreted life and history in terms of ethics as have the sages of the Chinese race. And, excepting the Hebrew teachers, no moralists have so emphasized duties while leaving rights—upon which the Western world in modern times has laid such stress—to take care of themselves. . . . The teachings of two great moralists, Confucius and Mencius, have been a vital force in the shaping of the moral ideal of China. . . . The duties given the highest place in this standard of character are filial obedience, reverence for superiors, a conforming to ancient custom, and the maintenance of the just medium. . . . The moral ideal of the Chinese has undergone little modification for upward of two millennia, such, for instance, as the ideal of the European peoples has undergone in a like period, because throughout this long term the influences acting upon the national life have been practically unchanged. . . . But now that the long-continued isolation of China has been broken, and she is being subjected to all the potent influences of the civilization of the West, it is certain that her social and mental life will be remolded and cast in new forms."—*Ibid.*, pp. 53-74.—See also ASIA: European influence; CHINESE LITERATURE; CONFUCIANISM: Ethics.

**Japan.**—"As in China, so in Old Japan the family rather than the individual was the social unit. . . . This organization of early Japanese society, with the family and its outgrowth, the clan, forming the basis of the fabric, was, as we shall learn, a potent force in the creation of the moral type of the nation. . . . Throughout all the past the vital religious element in the life of the Japanese peoples has been the Shinto cult, and this is now the established religion of the state. The system in its essence is ancestor and hero worship, the spirits of the dead being revered as guardian divinities. This cult has created moral feelings and family duties like those called into existence by the same cult in China. . . . [The] doctrine of the divine nature of the monarchy has exerted a profound influence upon the moral ideal of Japan and has had consequences of great moment. It has made unquestioning obedience and absolute loyalty to the Emperor the religious duties and preëminent virtues of the subject. In times preceding the twelfth century there grew up in Japan a feudal system which in many respects was remarkably like the feudal system of medieval Europe. . . . This system exerted a great influence upon the moral type. It developed a martial ideal of character known as Bushido, many of the virtues of which are almost identical with corresponding virtues in the European ideal of chivalry. . . . Along with the Chinese classics Confucianism was introduced into Japan about the middle of the sixth century of our era, and being in perfect accord with the native system of Shinto and with the Japanese ways of thinking, this cult of ancestors tended to reënforce native ethical tendencies and thus contributed essentially to make the virtues of filial obedience and reverence for superiors prominent in the growing type of character. Buddhism was introduced into Japan in the sixth century of our era. Its incoming had deep import for the moral life of the Japanese people.

... It helped to make gentleness, courtesy, and tenderness distinctive traits of the Japanese character. . . . [But] of all the influences which for more than two thousand years have been at work shaping and molding the moral ideal of the Japanese nation, those now entering from the Occidental world will doubtless leave the deepest impress upon the ethical type."—*Ibid.*, pp. 77-80.

India.—"The ethical evolution in India was . . . profoundly influenced by a prehistoric event, namely, the subjection of the original non-Aryan population of the land by an intruding Aryan people. As a result of the long and bitter struggle the two races became separated by a sharp line of race prejudice and hatred. . . . The population of the conquered districts of the peninsula became divided into two sharply defined classes. These constituted a model upon which Indian society was framed. Other classes were formed, and these gradually hardened into castes. . . . Four great castes arose: namely, priests or Brahmans, warriors and rulers, peasants and merchants, and sudras. Below these castes were the pariahs, or outcasts, made up of the most degraded of the natives. . . . Religion came in to consecrate this division of the people into privileged and nonprivileged classes. The sacred scriptures declare that the Brahmans sprang from the mouth of Brahma, the warriors from his arms, the peasants and traders from his thighs, and the sudras from his feet. . . . The rooted belief and dogma of the natural inequality of men has made Brahmanic ethics a thing of grades and classes, and has thus rendered impossible the evolution of a true morality, which required for its basis genuine sentiments of equality and brotherhood. . . . Of the different standards of morality of the several castes, that of the Brahman is . . . the highest. The study of the sacred books is for him the chief duty. . . . Among the secondary duties are the observance of the rules of purification, the practice of austerities, and doing no injury to created beings. . . . Here is a morality as pure and lofty as any taught by Hebrew prophets. But as in Judaism so in Brahmanism . . . as time passed there resulted an almost complete overshadowing of natural by ritual morality. . . . As there came a protest and reaction in Judea issuing in Christianity, so did there come a protest and reaction in Brahmanic India issuing in Buddhism. . . . Buddha interprets anew to men the divine message that all which is required of them is purity and justice and tenderness toward all creatures . . . and Buddhism, with its ethical enthusiasms and fresh hopes, marks a new era in the moral evolution of the peoples of the Eastern world."—P. V. N. Myers, *History as past ethics*, pp. 97-118.

Persia.—"The moral ideal of Persia, while doubtless largely the creation of the ethical feelings and convictions of the Iranian race, developed through many centuries of race experiences, nevertheless bears the unmistakable imprint of a unique personality. That the Zarathustra of tradition represents a real historical personage, there can hardly be longer a reasonable doubt. The time of Zarathustra's mission probably falls in the first half of the sixth century B. C. . . . The sum of what we may believe to have been his moral teachings was that man's full duty is purity and sincerity in thought, word, and deed, and an untiring warfare against evil."—*Ibid.*, p. 126.

Israel.—"After the conception of a just God and the ideal of the suffering Servant of Yahweh, . . . [the] doctrine of immortality, with its correlate teaching of future rewards and punishments, was perhaps the most important product, in its moral consequences, of the life and ethical experiences of

ancient Israel. It exercised little or no influence, at least no decisive influence, upon the moral evolution in Judaism, but, adopted by Christianity, it was given new force and currency, and for eighteen hundred years and more has been one of the great bulwarks and sanctions of morality in the Western world."—*Ibid.*, p. 167.

Greece, Ancient: B. C. 5th century.—Sophists and Socrates.—"The beginnings of ethics [in Greece] were a consequence of the rise of democracy among the states of Greece, which took place during the fifth century before Christ. . . . The sophists were the first Greeks to be professionally engaged in higher education; and consequently men of conservative tendencies were intensely prejudiced against them. They were doing for money what had always been the work of friendship, to be paid for only with respect and affection. . . . They gave scientific expression to a widespread spirit of unbelief. . . . Among the sophists the question was definitely raised: What is the natural basis, the permanent element . . . of morality, as distinguished from what is mere artifice and convention? . . . That there was such a permanent element seems to have been at first unquestioned. . . . Protagoras, the greatest of the sophists, maintained that there is, indeed, a universal element in morality, but one which, as he says, is 'not of natural or spontaneous growth.' . . . All men must have some laws; but one people has one code, and another has perhaps a radically different code, to each of which, equally and indifferently, the moral feelings are caused by training to attach themselves. What *seems* right to any people *is* right so far as that people is concerned. . . . The position of Socrates with reference to this whole movement of thought is peculiar. . . . As a constructive critic, Socrates . . . came between two fires. On the one hand he was very generally classed with the sophists as one who was impiously tampering with the moral convictions of the young men; and on the other hand the sophists and their friends looked upon him as a malicious enemy of free thought."—T. D. Laguna, *Introduction to the science of ethics*, pp. 105-113.

Greece, Ancient: B. C. 4th century.—Three schools of Greek ethics.—Platonic and Aristotelian systems.—Skeptics, cynics, stoics and eclectics.—"At the beginning of the fourth century . . . looms up the . . . question: What is goodness in general, and what is human happiness? And this soon becomes the primary issue between ethical thinkers. It divides them into three well-marked schools, holding the following distinctive theories: I. Hedonism, according to which happiness consists in pleasure, and unhappiness in pain, and things in general are good or bad according as they tend to produce pleasure or pain. II. Rigorism, according to which happiness is identical with virtue, and unhappiness with vice, and nothing else is good or evil. III. Energism (or the self-realization theory), according to which happiness consists in the moral exercise of man's faculties, and especially of his highest faculty (supposed to be pure reason); and things in general are good or evil according as they produce favorable or unfavorable conditions for such exercise. . . . The three views thus defined persisted side by side, with various compromises and harmonizations, throughout the whole history of the ancient science of ethics. Energism had decidedly the least influence in ancient times, but it has had an immense influence upon modern thought, especially in the nineteenth century. . . . The many-sidedness of Socrates's moral philosophy is such that it is no wonder that after his death his disciples at once sepa-

rated into at least three different schools, each emphasizing a different aspect of the master's doctrine. The leaders of these schools were, at first, naturally enough, certain of his older pupils: Euclid of Megara, Antisthenes of Athens, and Aristippus of Cyrene. Euclid [not the mathematician] was of a speculative turn of mind, and set himself to drawing the conclusions that followed from asserting that virtue is one; that it is knowledge of the good; that the only absolute good is virtue itself; and that what can be truly known must be eternal. And he emerged with the beautiful doctrine, that all that exists is one perfect being; all variety and change, and especially all evil, being an illusion. Antisthenes was an ardent reformer; and what struck him as important was the fact that virtue was in itself sufficient to make life worth living, and that, as the only unconditionally good thing, all else was to be despised in comparison with it. To the genial Aristippus the significant point was that the virtuous life was full of pleasure. After a few years, a much younger pupil of Socrates rose to a prominence in which he overshadowed all his elders. This was Plato of Athens. At the outset he stood closest to Euclid; but he developed all sides of Socrates's doctrine in a remarkable way. . . . According to Aristippus . . . what makes the happy life worth living is the pleasure in it. . . . Outside of the Cyrenaic school the pleasure-theory found important advocates [i. e. Epicurus (B. C. 341-270)]. Plato, in an early work (the *Protagoras*), adopted in a tentative way the main principles of the school, but tried to show that wisdom ought still to be considered as the sum of all virtue. . . . The great significance of Plato's ethics (as of all his thought) lies in its synthetic character. It is the result of a large-minded attempt to do justice to all the various one-sided views which others had assumed. His chief inspiration came from Socrates; but in the working out of his system Protagoras's conception of specific moral feelings, trained to their part by habituation, has a subordinate, but very important place. By the rigorist Antisthenes he was probably not affected; difference of character, as well as of social position, put a chasm between them. But that virtue is a good in itself, and not simply as a means to pleasure, was a doctrine that early appealed to his own generous nature. . . . More explicitly, he believes that pleasures differ according to the faculty whose exercise gives rise to them . . . that to know is the highest pleasure of which man is capable. . . . The ethics of Aristotle differs from that of Plato's riper years less in its contents than in its metaphysical basis. . . . We find, however, a great advance in precision of statement, due in part to controversy with other pupils of Plato. . . . If now we compare the Platonic and Aristotelian systems of ethics, the most important difference that emerges lies in Aristotle's insistence that moral virtue can never be a subject of exact knowledge, but must ever remain in the domain of individual perception, or tact. Plato's more direct followers in the Academy refused to follow this lead. They still hoped for an ethics of the mathematical pattern—a system of the individual and the state might be guided. . . . It is somewhat surprising to find that while Aristotle's school suffered very little change save a gradual decline, Plato's school underwent a series of striking revolutions. Some seventy years after Plato's death, Arcesilas introduced a thorough-going skepticism into the Academy; and this held sway there for two hundred years. The skeptics, of whom the greatest was Carneades (B. C. 213-120), denied the possibility of exact knowledge altogether. . . . In the first century B. C., this skept-

icism gradually gave way to a dogmatic eclecticism, which professed to harmonize the ethical teachings of Plato, Aristotle, and the older stoics, and presented the strange mixture that resulted, as a perfect science. . . . As the ancient energism was essentially aristocratic, so the democratic spirit is represented by the rigorism of the cynics and stoics. Happiness, they declared, is open in its fullness to every man. All classes are artificial. The virtue of master and slave, of the high-born and the lowly, of man and woman, are the same; and where virtue is present all inequalities are leveled. There are no conditions of fortune, to which virtue is subject in expressing itself in conduct; and the life according to virtue is the supreme good. . . . Among the disciples of Antisthenes was the famous Diogenes of Sinope (who sought 'a man' in the daytime with a lantern, and made himself at home in a tub). Diogenes and the later cynics (perhaps Antisthenes also) lived and dressed as common beggars. Crates of Thebes gave away considerable wealth on joining them, and influenced his betrothed wife Hipparchia to do the same. At the end of the fourth century the school became merged in stoicism. . . . The last of the great ethical systems of the pagan era, and (until the rise of Christianity) the strongest positive moral influence in the world, was stoicism, founded by Zeno of Citium about the end of the fourth century. . . . What is new in the ethics of Zeno and his successors is, first, a half metaphysical, half religious background; and secondly, a genetic theory of the relation of morality to instinct. Beyond this we have only elaborations of cynicism."—*Ibid.*, pp. 102-163.—See also EUROPE: Ancient: Greek civilization: Philosophy; HELLENISM: Hellenism and the Romans.

Greece, Ancient: B. C. 2nd-A. D. 4th centuries.—Græco-Roman ethics.—"In the history of Græco-Roman civilization the introduction of Hellenic philosophy into Rome—along with other elements of Hellenism—is a change of great moment; but in the development of Ethical theory its importance is of a secondary kind as the Romans never emerged from the state of discipleship to Greek teachers—at least as regards any fundamental points of philosophical doctrine. . . . Epicureanism gained hearers and followers among Romans open to new ideas; not long after, Stoicism was represented in Rome by Panætius; . . . early in the 1st century we find Philo there, teaching a semi-sceptical phase of Academic doctrine; nor were Peripatetics wanting. . . . The Academy, in its sceptical or its eclectic phase, had a still more famous advocate in Cicero, whose work, if we were studying the history of ethical literature, would claim a large share of our attention. . . . But in the development of ethical doctrine the importance of Cicero is comparatively small, since he scarcely exhibits any real independence of philosophic thought. . . . Stoicism . . . among all the products of Greek speculation, was that with which the moral consciousness of Rome had most real affinity. . . . The intensified religiousness of later Stoicism takes on a peculiar warmth of emotion in the meditations of the Stoic emperor, Marcus Aurelius Antoninus. . . . The view of Plutarch and others whom he represents is due to a combination of . . . Neo-Pythagorean influences with Platonic doctrine. But the general tendency that we are noting did not find its full expression in a reasoned philosophical system until we come to the latest-born of the great thinkers of antiquity—the Egyptian, Plotinus. . . . The ethics of Plotinus represent, we may say, the moral idealism of the Stoics cut loose from nature. Neo-Platonism is originally Alexandrine. . . . But however Oriental may have been

the cast of mind that eagerly embraced the theosophic and ascetic views . . . the forms of thought by which these views were philosophically reached are essentially Greek. . . . At the same time we ought not to overlook the affinities between the doctrine of Plotinus and that remarkable combination of Greek and Hebrew thought which Philo Judaeus had expounded two centuries before; nor the fact that Neo-Platonism was developed in conscious antagonism to the new religion which had spread from Judea and was already threatening the conquest of the Greco-Roman world, and also to those fantastic hybrids of Christianity and later paganism, the Gnostic Systems; nor finally that it furnished the chief theoretical support in the last desperate struggle that was made under Julian to retain the old polytheistic worship."—H. Sidgwick, *Outlines of the history of ethics*, pp. 94-95, 98-100, 105-108.

**Christian ethics.—A. D. 1st-4th centuries.—Beginnings.—Relation of Christianity to the age.—Its inheritance and new ideals.—Development of asceticism.—Disputes and doctrines of the early fathers.—**"Christianity floated into the Roman Empire on the wave of credulity that brought with it . . . [a] long train of Oriental superstitions and legends. In its moral aspect it was broadly distinguished from the systems around it, but its miracles were accepted by both friend and foe as the ordinary accompaniments of religious teaching. . . . We may conclude that what is called the evidential system had no prominent place in effecting the conversion of the Roman Empire. . . . The causes were the general tendencies of the age. . . . Christianity . . . proclaimed, amid a vast movement of social and national amalgamation, the universal brotherhood of mankind. . . . To a world . . . distracted by hostile creeds and colliding philosophies, it taught its doctrines, not as a human speculation, but as a Divine revelation, authenticated much less by reason than by faith."—W. E. H. Lecky, *History of European morals*, v. 1, pp. 373-374, 385-388.—"Christianity inherited the notion of a written divine code acknowledged as such by the 'true Israel' now potentially including the whole of mankind, or at least the chosen of all nations,—on the sincere acceptance of which the Christian's share of the divine promises to Israel depended. And though the ceremonial part of the old Hebrew code was altogether rejected, and with it all the supplementary jurisprudence resting on tradition and erudite commentary, still God's law was believed to be contained in the sacred books of the Jews, supplemented by the records of Christ's teaching and the writings of His apostles. By the recognition of this law the Church was constituted as an ordered community essentially distinct from the State, the distinction between the two being sharpened and hardened by the withdrawal of the early Christians from civil life, to avoid the performance of idolatrous ceremonies imposed as official expressions of loyalty; . . . by the persecutions which they had to endure. . . . Nor was the distinction obliterated by the recognition of Christianity as the state religion under Constantine. . . . Obedience, patience, benevolence, purity, humility, alienation from the 'world' and the 'flesh' are the chief novel or striking features which the Christian ideal of conduct suggests, so far as it can be placed side by side with that commonly accepted in Greco-Roman Society. . . . Partly the changes in the external conditions of Christianity. . . . partly the natural process of internal development, continually brought different features into prominence; while again, the important antagonisms of opinion, that from time to time expressed themselves in

sharp controversies within Christendom, sometimes involved ethical issues;—even in the Eastern Church until the great labor of a dogmatic construction began in the 4th century. Thus, for example, the anti-secular tendencies of the new creed . . . were exaggerated in the Montanist heresy; . . . on the other hand, Clement of Alexandria . . . maintained the value of pagan philosophy for the development of Christian faith into true knowledge (Gnosis). . . . Then we have to observe that when the Church through Constantine, entered into organic relation with civil society, the tendency of its more enthusiastic members to advocate an ascetic breach with man's natural life took a new direction. . . . A distinction was established between ordinary Christian virtue and monastic virtue. . . . At first the tendency to seek the complete isolation of the desert predominated; afterwards it became the accepted view that most of those who aspired after the more perfect way needed the support and control of an ordered community of persons with similar aspirations. . . . While the newly imported monasticism was spreading and gaining strength in the West, a development in Christian morality of a different kind took place through the more precise conception of the relation between human and divine agency in Christian good conduct which resulted from the Pelagian controversy; and more generally, through the impressive ethical influence of Augustine. By Justin and other apologists the need of redemption, faith, grace, is indeed recognized, but the theological system depending on these notions is not sufficiently developed to come into even apparent antagonism with the freedom of the will. . . . Under the influence of Ambrose and Augustine, the four cardinal virtues furnished a generally accepted scheme for the treatment of systematic ethics by subsequent ecclesiastical writers."—H. Sidgwick, *Outlines of the history of ethics*, pp. 112-125, 127-130, 134.

**5th-15th centuries.—Medieval ethics.—Systematizing of traditional ethics in western Christendom.—Ritualism in the East.—Rise of Mohammedanism.—Scholasticism (12th-14th centuries).—Humanism (14th century).—**The patristic age of Christianity comes to an end with Gregory the Great who is, in the West, the connecting link between the ancient and the medieval period. "The historical task of the Mediaeval Church in relation to the peoples whom it embraced in itself, determined also the ecclesiastical treatment of Ethics. This had reference partly to the regulation and education of the peoples by the rules of the Canon Law, especially those relating to the Confessional, and partly to the reproduction of the results of the Ancient Church in the Collections of Sentences and in Scholastic Science. In all this the externalization and legalization that distinguished the earlier period, as well as the operation of the non-Christian ancient influences, continued to go on. The moral Ideal, however, continued to be monasticism and the asceticism of desensualization; and this holds even of mysticism and its strivings."—C. E. Luthardt, *History of Christian ethics before the Reformation*, p. 285.—"In the East, a petrified creed and ritual and the despotism of secular rulers chilled intellectual activity. The Eastern Empire appeared to be strong for a while under Justinian, but it was strong only in appearance. The fairest parts of Italy were soon wrested from it by the Lombards. . . . In the sixth and beginning of the seventh century, the Persians ravaged the Asiatic provinces and carried their arms almost to the gates of Constantinople. A few years after the victories of Heraclius the Mohammedans began the career of conquest which tore

from the Empire the provinces that embraced the three patriarchates of Antioch, Jerusalem, and Alexandria."—G. P. Fisher, *History of Christian doctrine*, p. 200.—The rise and development of Mohammedanism, so important in medieval political history, is of no less significance in the history of medieval ethics. Here was the beginning of the great rival religion and moral code with which Christianity has to compete in its modern program of world extension. "The great revolution which in the seventh century of the Christian era agitated all Arabia and gave a new trend to vast currents of world history was essentially a moral revolution. It was the moral degradation of the Arab tribes, still clinging to an outgrown, idolatrous worship incapable longer of giving moral guidance to its followers, that stirred the soul and inspired the message of Mohammed. . . . Like all the other ethical systems of Asia, save those of genuine Christianity and Buddhism, the Islamic system lays special emphasis upon the performance of particular prescribed acts. . . . Instead of relying upon general principles for the guidance of the moral life, it lays its emphasis upon specific outer observances, such as almsgiving, fasting, pilgrimages, and stated prayers. The tendency of such a code of precise rules and commands . . . is to externalize morality and render the moral life conventional and mechanical. . . . Taken as a whole the ethical rules and commands of the Koran constitute an admirable code. . . . The very fact that, notwithstanding some serious defects and limitations, the code has been accepted by so large a part of the human race, and has, for over a thousand years, given moral guidance and inspiration to such vast multitudes, goes to prove that the great body of its rules and prescriptions of conduct are in general in line with the elemental laws of the moral world."—P. V. N. Myers, *History as past ethics*, pp. 288-289, 292.—Following the period of political confusion and intellectual decay of the tenth century, Christian ethics gained renewed impetus from the Hildebrandian movement of reform in the church of the eleventh century and developed along the intellectual line known as Scholasticism early in the twelfth century. The leaders in this movement were called the Schoolmen. "Anselm [c. 1100] stands at the head of the first period of Scholasticism, and he combines in himself the dialectical and the mystical element. These two elements then become separated, and the former is represented by Abelard in his Ethics which he seeks to construct from the conscience, while the latter is represented by Bernard of Clairvaux, in whom the mystical tendency of Ethics and the monastic disposition of the age are effectively embodied."—C. E. Luthardt, *History of Christian ethics before the Reformation*, pp. 285, 310-311.—"Thomas Aquinas [1225-1274] marks the culmination of Scholasticism both in its theology generally and in its ethics. As his combination of Aristotle and Augustine embraces and concludes the previous preparatory efforts in his system, he has become a standard for the theology, and especially for the ethics of the Roman Church, down to the present time. . . . With Duns Scotus [c. 1308] begins the dissolution of the alliance between theology and philosophy upon which the formal system of Thomas Aquinas rests. . . . Duns Scotus puts the primacy of the will in the place of the primacy of knowledge; and the conception of blessedness is consequently determined otherwise by him than by Thomas Aquinas, it being regarded not so much as a blessed vision of God, but rather as the disappearing of the will in the union of love with God as it rises to ecstasy. This view was especially cul-

tivated in the Franciscan order."—*Ibid.*, pp. 333, 346-347.—"Mysticism found its completest, but also its most questionable development in the sphere of the German mind, and in accordance with its subjective inwardness in the Dominican Order. . . . The ascetic ideal of life could not but come into collision with the actual reality of life and its claims, and thereby call forth a reaction of the moral thinking in the secular sense. . . . The secular way of thinking, characteristic of antiquity, found its most influential expression in opposition to the ecclesiastical-ascetic thinking in Humanism, which threatened the Church with a new heathenism of culture—a danger which was only averted by the Reformation in its own sphere. . . . The effect of Humanism in Germany was to promote Christianity, but the opposite was predominantly its attitude in Italy. . . . Petrarca (d. 1374) paid homage to the thought of the Stoics, and Marcellius Ficinus a follower of Plato, and the Platonic Academy, founded in Florence . . . in 1440 put Plato and Neo-Platonism straightway in the place of Christ and Christianity. Laurentius Valla, again, proclaimed his allegiance to the philosophy of Epicurus. The consequence of all this was the renewal of the ancient moral way of thinking, which declared the natural in itself to be moral. This gave rise to a paganism such as Erasmus saw reviving in Rome. . . . It belongs to the merits of the Reformation, that it averted this danger of a paganizing of Christendom by its return to the original powers of the moral life, and that it opened up to it the fountain of another moral spirit. This merit also belongs to the ethics of the Reformation."—C. E. Luthardt, *History of Christian ethics before the Reformation*, pp. 353, 375, 387-388.—See also EDUCATION: Medieval: 9th-15th centuries; EUROPE: Middle Ages: Scholastic revival.

15th-16th centuries.—Ethical influences of the Reformation and the Counter Reformation.—"A new era began with the Reformation. Faith became personal trust in God, the value of the individual was recognized, and ordinary vocations were regarded as the true sphere of moral life. But its greatest work was the placing of the Scriptures in the hands of the common people. Problems as to the relation of the individual to the State, and of the State to the Church, now arose. There was also a tendency to separate philosophical and Christian Ethics (Melancthon and Keckerman), though Amesius insisted on Ethics as purely theological. The Counter-Reformation produced Jesuistic casuistry against vigorous individual protests (Pascal). The verbal inspiration theory of Scripture developed in the post-Reformation period a new dogmatism, and Christian Ethics was a part of Dogmatic. The merit of having separated the two is usually ascribed to Danaeus and Calixtus. While Roman Catholic Ethics largely followed tradition and casuistic refinement in dealing with 'Cases' Protestant Ethics tended to be moulded from this time onwards, by the current philosophies, and within the various Churches, by the authorized Confessions of Faith."—D. Mackenzie, *Ethics and morality (Christian)*, (*Hastings' encyclopedia of religion and ethics*, v. 5, p. 468).

17th century.—Beginning of modern ethics.—"Modern Moral Philosophy starts with the wisdom of the Greeks as its working capital [Cambridge Platonists]. But from the first it had to deal with a more complex situation. . . . Where the Greek philosophers had something to appeal to which all men were in a measure ready to recognize in the State and the traditional laws and customs which the State maintained, the first problem of modern philosophy was to find a higher authority to which

either State or Church might appeal. . . . Thus modern systems have moved between the poles of an authoritative moral law and an unconstrained self-direction of human nature. . . . The ball is set rolling by Hobbes, in whose system the element of law, identified here with State law, becomes merely derivative. By the 'law of nature,' as we find it at this stage, each man seeks his own preservation. . . . [Thus] Hobbes reduces morality to egoism as its ultimate basis. . . . Butler, the form of whose theory is still determined by the questions set by Hobbes, elaborates a complete theory of the natural constitution of man in which conscience is, by the very law of constitution and with the approval of self-love itself established as the authoritative guide. . . . But to fall back on the supernatural was in effect to abandon the position and leave the way open for other lines of thought."—L. T. Hobhouse, *Morals in evolution*, pt. 2, pp. 207-208, 211-212.

18th-19th centuries.—Hedonism and energism.—Schools of the classical period.—Utilitarianism.—German influence.—Hegelianism.—Self-assertion.—"In the eighteenth century (which is the classical period in English ethics) the first place was taken by the psychological question: How do we perceive the distinctions between right and wrong, good and bad? The principal writers were divided into three schools, according as they professed: I. Intuitionism, or the view that the moral quality of conduct is its agreement or disagreement with an intuitively perceived body of law. II. Sentimentalism, according to which the moral quality of conduct or character is its capacity for stimulating a certain class of sensations or feelings. III. Utilitarianism (or the derivative theory), according to which the moral quality of conduct is its tendency to increase or decrease the general sum of pleasure; and the appreciation of this quality is not an innate faculty, but is developed in each man's experience from an original desire for pleasure."—T. D. Laguna, *Introduction to the science of ethics*, pp. 103-104.—"All the thinkers with whom we shall have to deal were hedonists in their general theory of values. All are agreed that pleasure is the sole ultimate good and pain the sole ultimate evil. I say this in spite of the fact that Shaftesbury (the founder of the moral-sense school) expressly rejects hedonism, and declares for the Aristotelian view; for in the details of his argument it is on the hedonistic theory that he constantly relies. The general acceptance of hedonism is largely due to the influence of John Locke, who gave forcible expression to it in his celebrated *Essay concerning Human Understanding* (1690),—a work which formed the background of English thought in the eighteenth century, and by which almost all the ethical writers were directly affected. . . . It was, then, not about values in general, but about moral values in particular, that men disagreed, and especially about the mode in which these values are perceived. . . . The student should realize that the difference between particular writers are not always so sharp as the main lines of cleavage between the three schools would lead us to expect. John Locke . . . is a curious mixture of intuitionism and the derivative theory. Joseph Butler (*Sermons upon Human Nature*, 1726), who partly on account of his position as a bishop of the English church, but far more on account of the simplicity, earnestness, and winning common sense of his writings, has had a lasting influence upon English ethics, shows affiliations with both of the nativistic schools. . . . Of the intuitionists [may be mentioned particularly] . . . Samuel Clarke (1706) and Richard

Price (1758); of the sentimentalists, Francis Hutcheson (1725 and 1755) and David Hume (1740 and 1751); of the utilitarians, John Gay (1731), William Paley (1785), and Jeremy Bentham (1789)."—*Ibid.*, pp. 198-200.—"The nineteenth century is marked by a revival of the ancient controversy between hedonism and energism, with regard to the nature of happiness. (In the eighteenth century the principal adherents of all schools had been more or less definitely hedonists, with only an occasional imperfect expression of the energistic view.) The hedonistic side was championed by descendants of the old utilitarians. The cause of energism was supported by men who were strongly influenced by the German idealistic philosophy that had its rise in the speculations of Immanuel Kant."—*Ibid.*, p. 104.—"All three lines of the classical English thought persisted; but utilitarianism came to possess an overshadowing importance. At the same time, however, it underwent certain decided modifications in its structure and temper. . . . Utilitarianism had lost its theological stamp. It was a theory of psychologists and of political reformers. Some of its most important adherents, including the most distinguished of all,—John Stuart Mill,—did not even believe in the existence of an omnipotent deity. The consequence was that less and less emphasis came to be placed upon the supernatural sanctions of morality, the rewards and punishments of a future world, and more upon the empirically observed sanctions. . . . In the latter part of the eighteenth century, the center of ethical speculation shifted from England to Germany. . . . Kant's work in ethics is in origin an attempt to rehabilitate intuitionism, and to demonstrate its reasonableness as against the moral-sense theory and utilitarianism. . . . Fichte, like Kant, looks upon the moral life as an everlasting struggle with sensuous inclination, in which we gradually approach an indefinitely distant ideal—the completed self. Fichte emphasizes, as Kant does not, the fact that man's moral life, in which his only true good consists, is essentially a social life—the fulfilling of a vocation, to which his actual relations with the society in which he lives call him. . . . But it was with the invasion of England and America by the Hegelian philosophy (which took place in the last quarter of the nineteenth century) that hedonism was first seriously weakened in its hold on English ethical thought. Hegel's system is a genial toning-down of Fichte's, under the influence of Plato and, especially, of Aristotle. . . . This moral theory, with the larger metaphysical system in which it was contained, was carried over into the English-speaking world by a band of veritable apostles—men who were burningly convinced of the essential truth of its doctrines, and filled with pity or contempt for all who could continue to think along the traditional English lines. The success of their endeavors was most rapid. By the end of the century almost all the principal chairs of philosophy in Great Britain and America were filled by Hegelians. At the present time [1914], though a strong tide of opposition to Hegelianism has arisen, the ablest critics recognize that there is much in the system, perhaps especially in its ethical doctrines, that is of permanent importance for science. . . . In the ethical controversies of the last quarter of the century, the two chief points at issue were (1) the significance for ethics of the Darwinian theory of evolution . . . and (2) the Hedonism which the utilitarian school still maintained as they received it from their eighteenth-century forbears, and which the Hegelians contemptuously repudiated. In the long controversy which raged over this latter point, a multitude of considerations were

presented on both sides, in part repeated from ancient writers, in part new."—T. D. Laguna, *Introduction to the science of ethics*, pp. 235-245.—"During the latter part of the nineteenth century, the theory was frequently advanced, that obligation and self-denial are wholly unnecessary for morality, and, indeed, that they belong only to a low, or false, type of morality. A higher type would consist simply in self-assertion. Nietzsche and Guyau are the chief representatives of this way of thinking. The former regards the Christian morality about him as essentially a slave-morality, a conspiracy of the under dogs to mitigate their wretchedness and, if possible, hold in check the tyranny of their oppressors. This is well enough for them; but for their masters, the aristocracy of art, science, and war, unscrupulous egoism is the only sane principle of life. Guyau's theory is less sensational. The true end of life, he declares, is the limitless expansion of life itself; and the only motive which it needs is its own inherent energy. The sense of compulsion, like the need of external rewards and punishments, is a mark of weakness. The strong will do what is good just because they are strong."—*Ibid.*, p. 405.

20th century.—Modern tendencies.—Social ethics.—"No such striking contributions to ethical theory in the established lines have appeared during the last twenty-five years as marked the preceding quarter century. Sidgwick's analysis of the morality of common sense, union of utilitarian criterion with intuitionist grounding of obligation and insistence upon the uniqueness of the moral (1874), Green's penetrating examination of the presuppositions of the moral consciousness (1883), Martineau's impressive presentation of certain high and fine factors in conscience (1885), Paulsen's catholic restatement of eudemonism (1889) had approached the subject on the level of the best thought of their day, but for the most part had employed familiar categories. Spencer's *Principles of Ethics* in its completed form falls within the period of our present survey, but the *Data of Ethics* had appeared in 1879 and *Justice* in 1891, and Wundt had in 1886 made use of custom and religion in explaining facts of the moral life. On the other hand, within the period in question the genetic study of morality has taken advantage both of the wealth of new material offered by anthropology and of the methods of interpretation suggested by social psychology. In common with law, religion, and art, ethics has found the comparative method indefinitely broadening in its outlook, and although the full bearing of the results in this field upon the criteria of conduct is far from having been fully adjudicated it is safe to say that a different perspective and a different relative emphasis is certain to prevail. The genetic method with its partially discerned implications for ethical theory has been one outstanding characteristic of the period. Second, and not yet so fully represented in the technical literature, is a return of interest to the economic, political, and social problems which marked the ethics of Aristotle, Adam Smith, German idealism, and the Utilitarians, but had in this country [United States] been rather timidly left to publicists or economists. This interest . . . reinforced by the Great War, . . . [became] a leading trend as a result of the reconstructions that [came] . . . with peace. . . . Partly because of the general influence of Darwin in replacing mere description by causal analysis, partly by a far more intelligent account of what savage conduct means to the savage, partly by a better psychology, we have abandoned largely the old categories as inept. Although we are still

largely in the descriptive stage so far as our study of the history of morality is concerned we have at least gained two working conceptions which change our whole perspective. These are: First, group life. Second, the moral as an intimate, inseparable part of the whole process of preserving, controlling, and valuing—hence not to be understood in isolation as moral sense, or as practical reason, or under any similar category. These working conceptions have made possible more adequate views of custom, of the origins of right and duty, of the psychology of the self. They enter into the question in which is focused the relation between moral origins and moral standards. . . . Developments . . . have come . . . as the result of the scientific conception of evolution. If, however, we ask what has affected most intensely the ethical thought of the period we must find an answer, not in science, but in the economic, political, and family life. . . . Democracy and socialism have confronted aristocracy and the cult of the superman. . . . Social ethics has been faced by new types of individualism. Feminism is suggesting radical changes in codes for [women and for men in relation to woman]. . . . The tide is now setting strongly toward increased liberty, yet for those who look back over many similar tides in human civilization . . . there is ground for belief that the new forces will set their own limits."—J. H. Tufts, *Ethics in the last twenty-five years* (*Philosophical Review*, Jan., 1917, pp. 28, 32, 40-41, 45).

**ETHIOPIA.**—The Ethiopia of the ancients, "in the ordinary and vague sense of the term, was a vast tract extending in length above a thousand miles, from the 9th to the 24th degree of north latitude, and in breadth almost 900 miles, from the shores of the Red Sea and Indian Ocean to the desert of the Sahara. This tract was inhabited for the most part by wild and barbarous tribes—herdsmen, hunters, or fishermen—who grew no corn, were unacquainted with bread, and subsisted on the milk and flesh of their cattle, or on game, turtle, and fish, salted or raw. The tribes had their own separate chiefs, and acknowledged no single head, but on the contrary were frequently at war one with the other, and sold their prisoners for slaves. [See also AFRICA: Races of Africa: Prehistoric peoples.] Such was Ethiopia in the common vague sense; but from this must be distinguished another narrower Ethiopia, known sometimes as 'Ethiopia Proper' or 'Ethiopia above Egypt,' the limits of which were, towards the south, the junction of the White and Blue Niles, and towards the north the Third Cataract. Into this tract, called sometimes 'the kingdom of Meroë,' Egyptian civilisation had, long before the eighth century [B. C.], deeply penetrated. Temples of the Egyptian type, stone pyramids, avenues of sphinxes, had been erected; a priesthood had been set up, which was regarded as derived from the Egyptian priesthood; monarchical institutions had been adopted; the whole tract formed ordinarily one kingdom, and the natives were not very much behind the Egyptians in arts or arms, or very different from them in manners, customs, and mode of life. Even in race the difference was not great. The Ethiopians were darker in complexion than the Egyptians, and possessed

probably a greater infusion of Nigrific blood; but there was a common stock at the root of the two races—Cush and Mizraim were brethren. In the region of Ethiopia Proper a very important position was occupied in the eighth century [B. C.] by Napata. Napata was situated midway in the great bend of the Nile, between lat. 18° and 19°. . . . It occupied the left bank of the river in the near vicinity of the modern Gebel Berkal. . . . Here, when the decline of Egypt enabled the Ethiopians to reclaim their ancient limits, the capital was fixed of that kingdom, which shortly became a rival of the old empire of the Pharaohs, and aspired to take its place. . . . The kingdom of Meroë, whereof it was the capital, reached southward as far as the modern Khartoum, and eastward stretched up to the Abyssinian highlands, including the valleys of the Atbara and its tributaries, together with most of the tract between the Atbara and the Blue Nile. . . . Napata continued down to Roman times a place of importance, and only sank to ruin in consequence of the campaigns of Petronius against Candacé in the first century after our era.”—G. Rawlinson, *History of ancient Egypt*, ch. 25.—See also **ABYSSINIA**; **ARABIA**: Sabæans; **EGYPT**; c. B. C. 1200-670; B. C. 670-525; **LIBYANS**; **SEMITES**.

**ETHNOLOGY.**—The term ethnology is derived from the Greek word “ethnōs” meaning people. When the term was first used scientifically, it designated the description of a people. This is the meaning of the title “Ethnology” for A. H. Kean’s book published in the latter part of the nineteenth century. He merely describes the various peoples of the world, but draws no comparisons and advances no theories about their civilizations. At the present time ethnology has come to mean more than mere descriptive material out of a traveler’s notebook. Ethnology has been defined as the science of culture. It uses the descriptive data analytically and synthetically. In this feature ethnology differs from ethnography, which is the systematic description of non-historic peoples, the old ethnology before it became theoretical. Any science of this kind necessarily evolves conflicting theories, many of which are still unsettled in ethnology. Two important theories in ethnology are the diffusionist point of view versus that of independent origin. The former group believes that the fundamental features of culture were invented only once and then spread to all parts of the world. The defenders of the theory of independent origin hold that the most universal things in culture were invented over and over again as use for them arose. Many arguments can be set forth favoring and opposing each of these theories and the best anthropological opinion of to-day favors neither theory to the exclusion of the other. Ethnologists are seeing more clearly than ever that each culture must be interpreted according to its own setting and history rather than wedged into any *a priori* notion about cultures in general. This suggests another contested field of ethnology. The classical English school insists on the formulation of general laws of cultural development, a kind of hold-over of the rule of evolutionary doctrine as it was applied by Spencer and Tylor to all fields of human development. On the other hand, the historical school of American anthropologists conceives the development of culture as a series of unique happenings which must be studied with regard to their specific settings and are not amenable to generalized treatment. This point of view has been adopted by most professional students of

ethnology as a working basis, but unfortunately it has not been expounded outside of strictly scientific journals so that the numerous sociologists, philosophers and economists who resort to ethnological data to illustrate their theories about society, still cling to the older concepts formed under the influence of the evolutionary theories which dominated scientific thought in the late nineteenth century.—See also **ANTHROPOLOGY**: Ethnology.

**ETRUSCANS.**—“At the time when Roman history begins, we find that a powerful and warlike race, far superior to the Latins in civilisation and in the arts of life, hemmed in the rising Roman dominion in the north. The Greeks called them Turrhenoi, the Romans called them Etrusci, they called themselves the Rasenna. Who they were and whence they came has ever been regarded as one of the most doubtful and difficult problems in ethnology. One conclusion only can be said to have been universally accepted both in ancient and in modern times. It is agreed on every hand that in all essential points, in language, in religion, in customs, and in appearance, the Etruscans were a race wholly different from the Latins. There is also an absolute agreement of all ancient tradition to the effect that the Etruscans were not the original inhabitants of Etruria, but that they were an intrusive race of conquerors. . . . It has been usually supposed that the Rasenna made their appearance in Italy some ten or twelve centuries before the Christian era. . . . For some six or seven centuries, the Etruscan power and territory continued steadily to increase, and ultimately stretched far south of the Tiber, Rome itself being included in the Etruscan dominion, and being ruled by an Etruscan dynasty. The early history of Rome is to a great extent the history of the uprising of the Latin race, and its long struggle for Italian supremacy with its Etruscan foe. It took Rome some six centuries of conflict to break through the obstinate barrier of the Etruscan power. The final conquest of Etruria by Rome was effected in the year 281 B. C. . . . The Rasennic people were collected mainly in the twelve great cities of Etruria proper, between the Arno and the Tiber. [Modern Tuscany takes its name from the ancient Etruscan inhabitants of the region.] This region was the real seat of the Etruscan power. . . . From the ‘Shah-nameh,’ the great Persian epic, we learn that the Aryan Persians called their nearest non-Aryan neighbours—the Turkic or Turcoman tribes to the north of them—by the name Turan, a word from which we derive the familiar ethnologic term Turanian. The Aryan Greeks, on the other hand, called the Turkic tribe of the Rasenna, the nearest non-Aryan race, by the name of Turrhenoi. The argument of this book is to prove that the Tyrhenians of Italy were of kindred race with the

Turanians of Turkestan. Is it too much to conjecture that the Greek form *Turrhene* may be identically the same word as the Persian form *Turan*?—I. Taylor, *Etruscan researches*, ch. 2.—“The utmost we can say is that several traces, apparently reliable, point to the conclusion that the Etruscans may be on the whole included among the Indo-Germans. . . . But even granting those points of connection, the Etruscan people appears with scarcely less isolated. ‘The Etruscans,’ Dionysius said long ago, ‘are like no other nation in language and manners’; and we have nothing to add to his statement. . . . Reliable traces of any advance of the Etruscans beyond the Tiber, by land, are altogether wanting. . . . South of the Tiber no Etruscan settlement can be pointed out as having owed its origin to founders who came by land; and that no indication whatever is discernible of any serious pressure by the Etruscans upon the Latin nation.”—T. Mommsen, *History of Rome*, bk. 1, ch. 9.—“Archæology has thrown some light on this strange people. Researches in North Italy prove that it never entered the Peninsula from the north. Researches in Etruria itself prove that the earliest Etruscan civilization resembled that which prevailed in the Eastern Mediterranean in the last days of the Aegean period. After all, the old legends were right. The ancients told how the Etruscans came from the east; archaeological evidence is now accumulating to confirm the legends. Precisely when they came or why is still obscure, nor can we identify them yet with any special tribe in prehistoric Greece, Pelasgian or other. Probably they were driven from their old homes, like the Phœnicians who built Carthage and the Phœacians who built Marseilles.”—F. Haverfield, *Authority and archaeology sacred and profane*, pt. 2, p. 305.—See also ITALY: Ancient; RELIGION: B. C. 750-A. D. 30; ROME: Ancient kingdom: B. C. 753-510; and Map of ancient Italy.

**ET TIREH**, strongly fortified village in Palestine near Gilgal. See WORLD WAR: 1918: VI. Turkish theater: c, 14.

**ETYMOLOGY**. See PHILOLOGY: 8.

**EUBŒA**.—“The island of Eubœa, long and narrow like Krête, and exhibiting a continuous backbone of lofty mountains from northwest to southeast, is separated from Bœotia at one point by a strait so narrow (celebrated in antiquity under the name of the Eurîpus) that the two were connected by a bridge for a large portion of the historical period of Greece, erected during the later times of the Peloponnesian war by the inhabitants of Chalkis [Chalcis]. Its general want of breadth leaves little room for plains. The area of the island consists principally of mountain, rock, dell, and ravine, suited in many parts for pasture, but rarely convenient for grain culture or town habitations. Some plains there were, however, of great fertility, especially that of Lelantum, bordering on the sea near Chalkis, and continuing from that city in a southerly direction towards Eretria. Chalkis and Eretria, both situated on the western coast, and both occupying parts of this fertile plain, were the two principal places in the island: the domain of each seems to have extended across the island from sea to sea. . . . Both were in early times governed by an oligarchy, which among the Chalkidians was called the Hippobotæ, or Horse feeders,—proprietors probably of most part of the plain called Lelantum.”—G. Grote, *History of Greece*, pt. 2, ch. 12.—See also NEGROPONT; GREECE: Map of ancient Greece.

B. C. 447.—Revolt against Athens. See ATHENS: B. C. 447; GREECE: B. C. 449-445.

**EUBOIC TALENT**. See TALENT.

**EUCHITES**.—In the fourth century a group of wandering Christian fanatics appeared in Mesopotamia and spread over Armenia, Asia Minor, and Syria. They believed that marriage was sinful and that spiritual purity came from long prayer. The Greeks called them Euchites although they were commonly known as Massalians. “In the eleventh century, in Thrace there was a numerous sect called Euchites, who were Enthusiasts like the ancient monastic sect of that name, but also Dualists.”—G. P. Fisher, *History of Christian doctrine*, pp. 202-203.—See also MYSTICISM.

**EUCKEN**, Rudolf Christoph (1846 - ), German philosopher. Studied with Reuter and Trendelenburg; became professor of philosophy at the university of Jena, 1874; evolved a theory of practical idealism which he called “Activism”; won the Nobel prize for literature, 1908. See HISTORY: 33; NOBEL PRIZES: Literature: 1908.

**EUCLED**, Greek mathematician, who lived in Alexandria at the beginning of the third century, B. C. His book “The Elements” of geometry is the basis for that study, even to the present day. Aside from this, he wrote several other works of great importance on the mathematical sciences. See HELLENISM: Science and invention; SCIENCE: Ancient Greek science.

**EUCLED**, or Euclides (5th century B. C.), Greek philosopher, a native of Megara. See ETHICS: Greece, Ancient: B. C. 4th century.

**EUDES** (d. 808), king of France, 887-898. See FRANCE: 877-987; PARIS: 885-886.

**EUDES**, Duke of Aquitaine (c. 665-735), sovereign of the region from the Loire river to the Pyrenees, southern France. With the help of Charles defeated the invading Arabs at the battle of Poitiers in 732. See AQUITAINE: 681-768.

**EUDISTES**, a religious order in France. See FRANCE: 1005-1006.

**EUDOXIA** (c. 400 A. D.), Byzantine empress. See ROME: Empire: 400-518.

**EUDOXIANS**, sect which derives its name from Eudoxius of Germanica, bishop of Constantinople, who was prominent in the Arian controversy in the fourth century. “The most lasting result of the activity of Eudoxius was the Arianism of the Germans. . . . To the council of 381 and the orthodox theologians of that time ‘Arians’ and ‘Eudoxians’ were synonymous conceptions.”—*New Schaff-Herzog religious encyclopedia*, v. 4, p. 201.

**EUDOXIUS** (d. 370), bishop of Constantinople, leader of the Eudoxians. See EUDOXIANS.

**EUFAULA**, city in southeastern Alabama, Barbour county, on the western bank of the Chattahoochee river. It was the scene of a serious election riot during the Reconstruction period. See ALABAMA: 1874.

**EUGENE**, the name of several popes. See EUGENIUS.

**EUGENE**, Ferdinand Pius, Archduke of Austria (1863- ), Austrian commander in the Bainsizza district during the World War. See WORLD WAR: 1915: III. Eastern front: c; 1917: IV. Austro-Italian front: d, 2.

**EUGENE OF SAVOY** (François Eugène) Prince (1663-1736), famous Austrian general. See AUSTRIA: Introduction; HUNGARY: 1600-1718; 1683-1690; GERMANY: 1704; 1706-1711; ITALY: 1701-1713; NETHERLANDS: 1708-1700; 1710-1712.

**EUGENIANS**, ancient tribal name of southern Ireland. See HY-NIALS.

**EUGENICS**: Meaning and purpose.—“We know that the old rule, ‘Increase and multiply,’ meant a vast amount of infant mortality, of starvation, of chronic disease, of widespread misery.

In abandoning that rule, as we have been forced to do, are we not now left free to seek that our children, though few, should be at all events fit, the finest, alike in physical and psychical constitution, that the world has seen? Thus has come about the recent expansion of that conception of *eugenics*—or the science and art of being well-born, and of breeding the human race a step nearer towards perfection—. . . Eugenics is beginning to be felt to possess a living actuality which it was not felt to possess before. Instead of being a benevolent scientific fad, it begins to present itself as the goal to which we are inevitably moving. . . Human eugenics need not be, and is not likely to be, a cold-blooded selection of partners by some outside scientific authority. But it may be, and is very likely to be, a slowly growing conviction—first among the more intelligent members of the community, and then by imitation and fashion among the less intelligent members—that our children, the future race, the torch-bearers of civilisation for succeeding ages, are not the mere result of chance or Providence, but that, in a very real sense, it is within our grasp to mould them, that the salvation or damnation of many future generations lies in our hands, since it depends on our wise and sane choice of a mate. . . Eventually, it seems evident, a general system, whether private or public, whereby all personal facts, biological and mental, normal and morbid, are duly and systematically registered, must become inevitable if we are to have a real guide as to those persons who are most fit or least fit to carry on the race. Unless they are full and frank, such records are useless. But it is obvious that for a long time to come such a system of registration must be private.”—H. Ellis, *Eugenics and St. Valentine (Nineteenth Century and After, May, 1906)*.—“‘Eugenics,’ wrote Francis Galton [1822-1911], who founded the science and coined the name, ‘is the study of agencies under social control that may improve or impair the racial qualities of future generations, either physically or mentally.’ Accepting Galton’s definition, we shall for our purposes slightly extend it by saying that applied eugenics embraces all such measures, in use or prospect either individually or collectively, as may improve or impair the racial qualities of future generations of man, either physically or mentally, whether or not this was the avowed purpose. It is one of the newest of sciences. It was practically forced into existence by logical necessity. The science of eugenics is the natural result of the spread and acceptance of organic evolution, following the publication of Darwin’s work on *The Origin of Species by Means of Natural Selection*, in 1850. It took a generation for his ideas to win the day; but then they revolutionized the intellectual life of the civilized world. Man came to realize that the course of nature is regular; that the observed sequences of events can be described in formulas which are called natural laws; he learned that he could achieve great results in plant and animal breeding by working in harmony with these laws. . . . However great may be the superiority of his mind, man is first of all an animal, subject to the natural laws that govern other animals. He can learn to comply with these laws; he can, therefore, take an active share in furthering the process of evolution toward a higher life. That, briefly, is the scope of the science of eugenics, as its founder, Sir Francis Galton, conceived it.”—P. Popenoe and R. H. Johnson, *Applied eugenics*, pp. 147-148.

Early history of eugenics.—Galton’s studies published, 1865.—Contents.—The teaching of eugenics is not wholly new. “The early Greeks

gave much thought to it, and with the insight which characterized them, they rightly put the emphasis on the constructive side; they sought to breed better men and women, not merely to accomplish a work of hygiene, to lessen taxes, and reduce suffering, by reducing the number of unfortunates among them. . . . For nearly two thousand years after this, [however] conscious eugenic ideals were largely ignored. Constant war reversed natural selection, as it is doing to-day, by killing off the physically fit and leaving the relatively unfit to reproduce the race; while monasticism and the enforced celibacy of the priesthood performed a similar office for many of the mentally superior, attracting them to a career in which they could leave no posterity. At the beginning of the last century a germ of modern eugenics is visible in Malthus’ famous essay on population, in which he directed attention to the importance of the birth-rate for human welfare, since this essay led Darwin and Wallace to enunciate the theory of natural selection, and to point out clearly the effects of artificial selection. . . . Eugenics . . . owes its beginning to Darwin’s cousin, Francis Galton. . . . He contributed largely to founding the science of meteorology, opened new paths in experimental psychology, introduced the system of finger prints to anthropology, and took up the study of heredity, published in 1865 a series of articles under the title of *Hereditary Talent and Genius*, which contained his first utterances on eugenics. . . . This was an elaborate and painstaking study of the biographies of 977 men who would rank, according to Galton’s estimate, as about 1 to 4,000 of the general population, in respect to achievement. The number of families found to contain more than one eminent man was 300, divided as follows: Judges, 85; Statesmen, 39; Commanders, 27; Literary, 33; Scientific, 43; Poets, 20; Artists, 28; Divines, 25. The close groupings of the interrelated eminence led to the conclusion that heredity plays a very important part in achievement. The greater success of real sons of great men as compared with adopted sons of great men likewise indicated, he thought, that success is due to actual biological heredity rather than to the good opportunities afforded the scion of the illustrious family. Galton’s conclusion was that by selecting from strains that produced eminence, a superior human stock could be bred.”—P. Popenoe and R. H. Johnson, *Applied eugenics*, pp. 150-152.—See also EVOLUTION: Mendel’s law.—Galton’s program included “1. Dissemination of a knowledge of the laws of heredity so far as they are surely known, and promotion of their farther study. . . . 2. Historical inquiry into the rates with which the various classes of society (classified according to civic usefulness) have contributed to the population at various times, in ancient and modern nations. . . . 3. Systematic collection of facts showing the circumstances under which large and thriving families have most frequently originated; in other words, the *conditions* of Eugenics. . . . 4. Influences affecting Marriage. Exactly the same kind of considerations apply to marriage. The passion of love seems so overpowering that it may be thought folly to try to direct its course. But plain facts do not confirm this view. Social influences of all kinds have immense power in the end, and they are very various. If unsuitable marriages from the Eugenic point of view were banned socially, or even regarded with the unreasonable disfavour which some attach to cousin-marriages, very few would be made. The multitude of marriage restrictions that have proved prohibitive among uncivilised people would require a volume to describe. 5. Persist-

ence in setting forth the national importance of Eugenics. There are three stages to be passed through. *Firstly* it must be made familiar as an academic question, until its exact importance has been understood and accepted as a fact; *Secondly* it must be recognised as a subject whose practical development deserves serious consideration; and *Thirdly* it must be introduced into the national conscience, like a new religion."—F. Galton, *Eugenics: Its definition, scope and aims* (*Sociological Papers*, 1904, pp. 47, 49-50).

**Modern development.**—"Through the munificence of Mr. Galton and the co-operation of the University of London the beginning of the attainment of these eugenic ideals has at length been rendered possible. The senate of the University has this year [1906] appointed Mr. Edgar Schuster, of New College, Oxford, to the Francis Galton Research Scholarship in Natural Eugenics. It will be Mr. Schuster's duty to carry out investigations into the history of classes and of families, and to deliver lectures and publish memoirs on the subject of his investigations. It is a beginning only, but the end no man can foresee."—H. Ellis, *Eugenics and St. Valentine* (*Nineteenth Century*, May, 1906).—"In all parts of Europe, the ideas of eugenics have gradually spread. In 1912 the first International Eugenics Congress was held at London, under the auspices of the Eugenics Education Society; more than 700 delegates were in attendance. Germany, Sweden, Switzerland and Austria are united in an International Eugenics Society and the [world] war led to the information of a number of separate societies in Germany. Hungary has formed an organization of its own, France has its society in Paris, and the Italian Anthropological Society of Denmark has similarly recognized eugenics by the formation of a separate section. The Institut Solvay of Belgium, a foundation with sociological aims, created a eugenics section several years ago; and in Holland a strong committee has been formed. Last of all, Sweden has put a large separate organization in the field. In the United States the subject has interested many women's clubs, college organizations and Young Men's Christian Associations, while the periodical press has given it a large amount of attention."—P. Popenoe and R. H. Johnson, *Applied eugenics*, p. 155

Harrison).

**EUGENIE** (Marie - Eugénie - Ignace-Augustine de Montijo) (1826-1920), empress of France, wife of Napoleon III, daughter of the count of Montijo, a grande dame of Spain. During the absence of the emperor, in the campaign of the Italian War of Liberation and at the front in the Franco-Prussian War, for which she is considered partly responsible, she acted as regent at Paris. At the fall of the empire she fled to England where she remained until her death. Her memoirs were edited by M. Fleury and published in 1920.

**EUGENIUS** (d. 304), secretary of Theodosius. He was proclaimed emperor of Gaul in 392. See **ROME**: Empire: 370-395.

**EUGENIUS I**, pope, 654-657.

**Eugenius II**, pope, 824-827.

**Eugenius III**, pope, 1145-1153.

**Eugenius IV** (1383-1447), pope, 1431-1447.

See **CHRONOLOGY**: Christian era; **PAPACY**: 1431-1448

**EUGUBINE TABLES**, name given to seven bronze tablets, the inscriptions of which are in the Umbrian language. See **PHILOLOGY**: 9.

**EULENBURG**, Prince Philip (1847- ), German diplomat, attacked by Maximilian Harden in the latter's paper. See **GERMANY**: 1007-1008.

**EUMENES** (c. 360-316 B.C.), Macedonian general under Alexander the Great; after his death, in 323 B.C., became the governor of Cappadocia, Paphlagonia and the sea-coast of Pontus. See **MACE DONIA**: B. C. 323-316.

**EUMOLPHIDÆ**, priestly family, the descendants of Eumolpus, a Greek legendary priest. See **PHYLÆ**.

**EUPATRIDÆ**.—"The Eupatridæ [in ancient Athens] are the wealthy and powerful men, belonging to the most distinguished families in all the various gentes, and principally living in the city of Athens, after the consolidation of Attica: from them are distinguished the middling and lower people, roughly classified into husbandmen and artisans. To the Eupatridæ is ascribed a religious as well as a political and social ascendancy. They are represented as the source of all authority on matters both sacred and profane."—G. Grote, *History of Greece*, pt. 2, ch. 10.—See also **GREECE**: B. C. 8th century.

**EUPEN**, town formerly part of Rhenish Prussia, ten miles southwest of Aix-la-Chapelle; ceded to Belgium after the World War. See **BELGIUM**: 1010 (June 28): Treaty of Versailles; 1920 (January).

**EUPHEMIOS**, ninth century emperor of Syracuse. See **SICILY**: 827-878.

**EUPHRATES**, river of western Asia, rising in Armenia, and flowing into the Persian Gulf. With its tributary, the Tigris, it forms the most important river system of southwestern Asia. In ancient times the two rivers flowed to the sea through separate channels, but alluvial deposits at mouth of the Euphrates gradually caused it to unite with the Tigris at Kurna, about 60 miles from the gulf. The historical importance of the river can hardly be over-estimated. Its valley was the cradle of primitive civilization, and the banks of the river are lined with ruins, testifying to the splendor that once flourished there.—See also **TIGRIS-EUPHRATES VALLEY**.

**EUPOLIS** (c. 446-411 B.C.), Greek dramatic poet. See **DRAMA**: Greek comedy.

**EURIC**, or Evaric, king of the Visigoths, c. 466-484. See **GOTHIS**: 453-484.

**EURIPIDES** (480-406 B.C.), Greek tragic dramatic poet. Broke away from tradition, and modernized drama to deal with human suffering. "If any single man could be held responsible for the inevitable growth of individualism, it would be perhaps Euripides (Euripides first; for though he did not exert nearly as great an influence on the world as Socrates, he reached a larger public in his own and the two next generations)."—J. B. Bury, *History of Greece*, p. 576 and footnote.—"Attic Greek in his hands had begun to assume the form in which it remained for a thousand years as the recognized literary language of the east of Europe and the great instrument and symbol of civilization."—G. Murray, *Euripides and his age*, p. 11.—See also **DRAMA**: Origin.

**EUROKS**, or Yuroks, tribe of American aborigines. See **MODOCS**.

**EUROPAL**, revised Esperanto. See **INTERNATIONAL LANGUAGE**: Other proposed languages.

## EUROPE

*Outline of Headings*

Geography.—Influence of contours and climate on population.—Routes of invasion.—Historical Europe.—Influence of Mediterranean on civilization.

## PREHISTORIC

Earliest remains of man.

HEIDELBERG MAN.—PITHECANTHROPUS.

PILDOWN MAN.

NEANDERTHAL SKELETON, MAN IN THE MOUTHERIAN STAGE.

GRIMALDI MAN.

CROMAGNON MAN.

Stone Age: Divisions.

PRE-CHELLEAN.

CHELLEAN.

ACHEULEAN.

MOUSTERIAN.

AURIGNACIAN.

Paleolithic art and culture.

Neolithic period: Question of gap between or continuance from Paleolithic period.—Oldest culture in Scandinavia: Neolithic.

Lake Dwellings of Switzerland.

Bronze Age: Gradual rise of culture.—Primitive trade.—Clothing.

SCANDINAVIA.

GREECE.

Iron Age.

SCANDINAVIA.

## INTRODUCTION TO HISTORIC PERIOD

Distribution of races of Europe.

Migrations.

Correlation of race, nationality and language.

Geographic background.

## ANCIENT

## Greek civilization

Its heritage.—Cretan and Ægean civilization.

Freedom of culture from oriental domination.

Secularism and skepticism.

Philosophy.—Eleatics, Epicureans, Plato, Aristotle.

Political development and fall.

Reasons for greatness.—Defects.

Spread of Hellenism.—Oriental mysticism.

## Roman civilization

Its origins.—Greek influences.—Characteristics of Roman culture.

Passing of the Roman Republic.—Gradual acquisition of a foreign empire.—Inadequacy of the republican constitution to guarantee peace and secure law and order.

Imperialism.—Its administrative excellence.

Effect of imperial dominion on the constitution.—Development of Roman law.

Græco-Roman knowledge.

Intellectual bankruptcy of the Græco-Roman civilization.—Neoplatonism and barbarism.—Adaptation of Christianity to the Græco-Roman world.

“Fall of Rome.”—Infiltration of the barbarians.—Eastern empire survives under Constantinople.

## MIDDLE AGES

Definition.—Extent of barbarian civilization.—Assimilation of ancient and barbarian cultures the function of the Middle Ages.—Meaning of the term “Dark Ages.”

Rise of the Frankish kingdom.—Empire of Charlemagne and its continuation in part of the work of Rome.

Roman civilization inherited in part by the Christian Church.—Benedictine Age.—Medieval view of Christianity.—Results of ecclesiastical domination in the Middle Ages.

Influence of feudalism.

Holy Roman and Papal empires.

Crusades and their result.

Saracenic civilization — Its influence on southern Europe.

Scholastic revival and Aristotle.—Rise of the universities.

Thirteenth century and the spirit of Scholasticism.—Some great schoolmen.

Survey of the limitations of the Middle Ages.

Growth of towns.—Development of guilds.

Political background.

Science.—Forces retarding.—Influences which combined to promote growth of the new period of the Renaissance.

Background of Protestant Reformation.—Its medieval character.

## RENAISSANCE AND REFORMATION

Earlier and later Renaissance.—Transition from the Middle Ages to the Renaissance.

Renaissance from various points of view.—Revolt against medieval spirit of anonymity.—Italy's priority in revival of learning.—Social conditions favoring Italian Renaissance.

Petrarch as a factor in and representative of the Renaissance.

Various Italian humanists.—Effect on art of change from asceticism to humanism.—Importance of printing.

Spirit of adventure and intellectual activity.—Leonardo da Vinci.—Columbus and the discovery of America.

Characteristics of the period and of the church.

Preliminary movements of Wycliffe and Huss. Erasmus and the Reformation.

Political situation in Luther's time.

Luther, his motives and his principles.

Melancthon, an aid to Luther.

Genevan reformers.—Calvin.—Spread of Calvinism.

Catholic Reformation, Jesuits and Council of Trent.

Summary of European thought between medieval and modern times.—Influence of Francis Bacon.—Relation of the Renaissance to modern period.

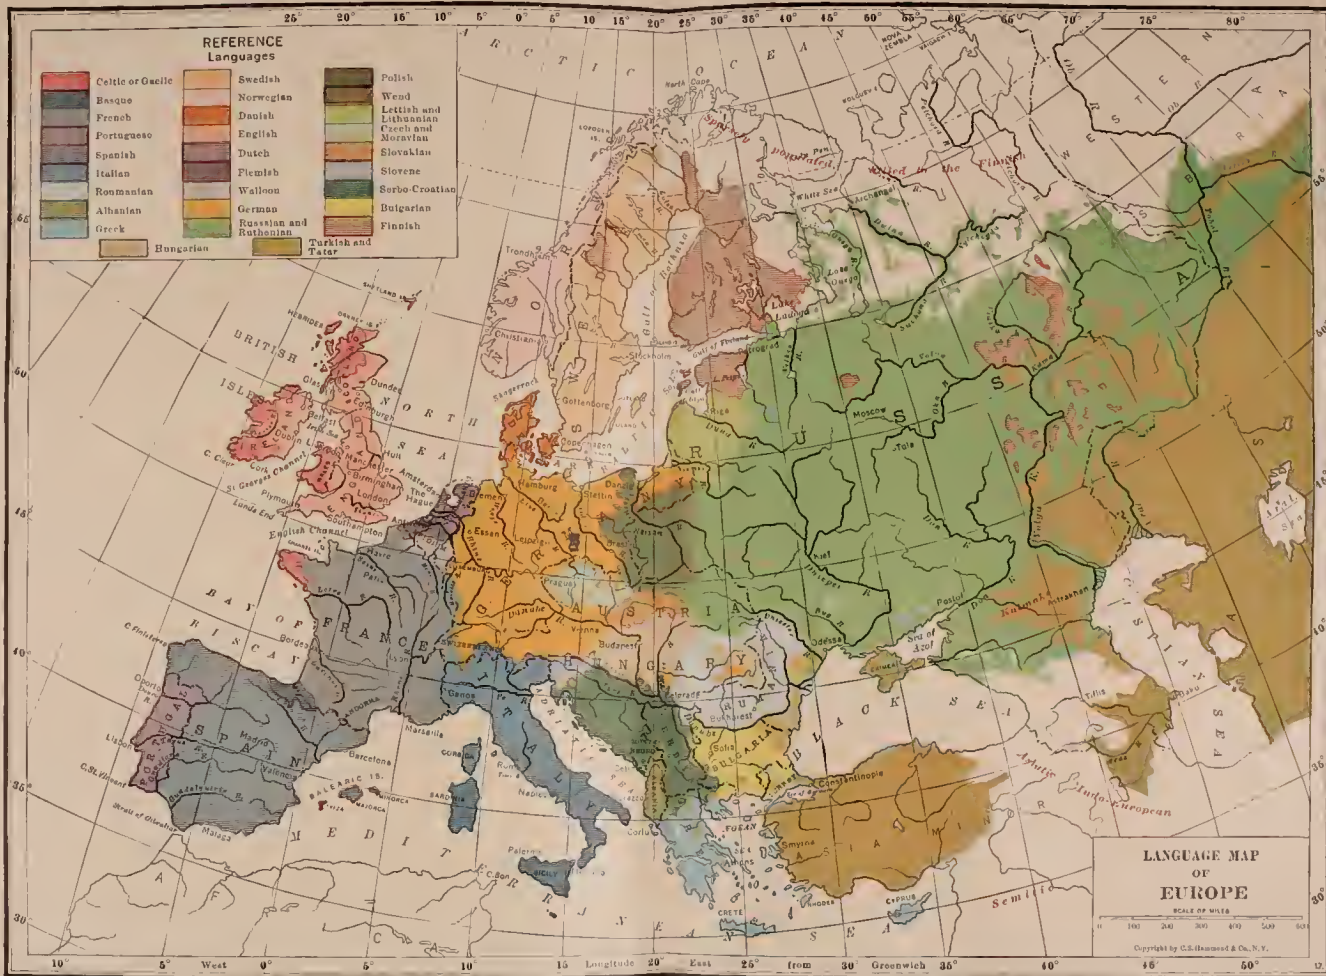

## MODERN

Expansion of Europe.—Introductory résumé.—Effects of the era of discovery.—World commerce, world finance, world politics and wars.

Rise of the nation-state in European polity.—Genesis of modern diplomacy.—Conception of international politics as the dealings of

Maps prepared specially for the **NEW LARNED**  
under direction of the editors and publishers.

"powers."—Attribution of personality to a power.

Rise of the Middle classes.—Supremacy of the first and second estates in the Middle Ages.—Effect of the Renaissance on the third estate.—Appearance of a wealthy merchant class at the beginning of modern times.—Political power of Middle Class.—French Revolution in the eighteenth century.

Birth of the scientific spirit.—Its far reaching influence on the modern world.—Resulting contributions made to civilization.—Advancement over the Greek period.

Revolutionary period.—Intellectual revolution in the seventeenth century.—Bacon and Descartes.—Awakening of the critical spirit.—Foundations laid of modern chemistry, biology and philosophy.—Revolutionary critics of the eighteenth century: Voltaire, Montesquieu, Rousseau and Diderot.

Era of the benevolent despots.

Industrial revolution.—France.—Great Britain.—Development of manufacturing.—Demands of the common people.—Manufacture of cloth and iron.

French Revolution.—Causes of its drastic thoroughness.—Its beneficial results.

Diffusion of French revolutionary ideas through the agency of Napoleon.—His legacy to France.—Results of the Napoleonic systems in the Piedmontese, Rhenish and Belgian departments of the empire.—Effects of the wars of Napoleon on Europe.

Summary of the chief factors of the nineteenth century.—Importance of its study.

Mechanical revolution.—Steam transport on land and sea.—Electric telegraph.—Bessemers converter.—Electric light and traction.

Revolutionary movement for self-government.—Political status of Europe in 1815.—Metternich and the policy of suppression.—Causes of the secrecy of the movement.—Revolution of 1830.

Political revolution of 1848.—Causes of its apparent failure.—Significance of the move-

ment.—Results of the revolution revealed by 1855.—Successes due to the leadership of the middle classes.

Russia's part in European history.—Causes for its late development.—Lack of homogeneity.—Lack of contact with Europe until after the Renaissance.—Peter the Great and the shifting of Russian currents westward.

Wars of the Great Powers (1848-1878).—Crimean War.—Solferino campaign, and the unification of Italy.—Austro-Prussian conflict.—Franco-Prussian War.—Balkan uprisings.—Significance of the Treaties of Frankfort (1871) and Berlin (1878).

Imperialism.—Its growth from nationalism.—Meaning and motives of Imperialism.

Russia in the nineteenth century.—Chief factors in the Russian liberal movement.—Emancipation of the Serfs.—Effect of Industrial revolution in Russia.—Rise of Marxian socialism.—Bolshevik movement.

Conflicting currents leading to the World War.—Conflict between the spirit of nationality and world economics.—Internationalism.—Problems brought about by imperialism.—Economic and militant unrest in Europe.

New map of Europe.—Before and after the World War.

New balance of powers.—Re-adjustment of the states of Europe.—Purpose of the new "balance."—The Great Powers.

League of Nations foundation of peace treaty.—Early steps in League movement.—Purpose of League.

Economic aftermath.—Lack of employment, profiteering and disillusionment of the soldier.—Revolutionary organizations formed.—Economic exhaustion after the war.

Far-reaching effects of the World War.—Outlook in 1921 and 1922.—Financial status of the nations.—Orgy of paper money making.

Intellectual development.—Expansion of science.—International character of inventions.—Influence of economics.—Hope for the future.

Geography.—Influence of contours and climate on population.—Routes of invasion.—Historical Europe.—Influence of Mediterranean on civilization.—"A map of the world or, preferably, a globe will show there is really but one ocean and that all land forms part of some island. The largest and most compact island is the 'Old World' with the broad tract of Asia to the east, the tongue of Africa to the south, and the 'shoulder' of Europe to the north-west. In the days before the discoveries of the great ocean routes, invasions of Europe could come only from the east and south, being limited actually to two natural routes, between the Urals and the Nile delta. A barrier of ice closed the northern sea, the Tundra was barren and inhospitable, and great impenetrable forests extended as far south as lat. 52° N., stretching in a broad belt from Western Europe to the Pacific Ocean. Consequently the penetration of Asia into Europe could only be effected south of the forest belt. . . . Europe can thus be likened to an almost closed circle with a double break on the south-east; and this isolation with a localised point of contact with the outer world has given it a political and economic history all its own. For this reason the north-west shoulder of Europe has been called a *continent*, although its physical features are but a continuation of those of Asia, Europe and Asia together forming the *geographical continent* of Eurasia. A vegetation

map will enable you to see the easiest routes of entry from Asia to Europe. From lat. 52° N. to lat. 45° N.—and, indeed, one might say as far south at lat. 30° N.—there are extensive grassy plains broken here and there by semi-deserts. These regions were inhabited by herdmen and horsemen, nomads who wandered and still wander in search of plunder or new feeding-grounds for their stock. Horde after horde rode from Central Asia through the Gate of Dzungaria westward into Europe until checked by the forested Carpathians. The main bodies of invaders turned either into the plains of the south or the more open regions of the forest-lands of the north-west. Smaller bands pushed on through the mountain passes or the Moravian Gate into the 'island' steppe of Hungary. . . . The change of environment from grass to forest land after possibly centuries of occupation, produced a change in the lives and occupations of the people. Instead of nomads they became settlers, cultivating the lands adjacent to their new homes. Such settlements necessitated organized labour, so that laws and customs also gradually changed. The forests of Europe became dotted with village communities, each administering its own local affairs, but claiming some affinity with other communities of the same tribe. New invaders were naturally tempted to seize these lands already cleared and under cultivation, so that migration has been ever westward along certain well-

marked inland routes of least resistance or along the coasts and river valleys of the Mediterranean. Among the rivers and swamps, the boat to some extent displaced the horse, so that we may say the herdmen and horsemen of Asia became the ploughmen and boatmen of Europe. Therefore, in these lands of the north-west, with their network of waterways, a new type of society developed, which differed entirely from the types of society of Asia or Africa. Many important phases of European history are the results of the struggles of the agriculturists already within the continent against the pastoralists desirous of entering. Those peoples who entered Europe through the Uralo-Caspian Gate differed considerably from those who crossed over from Asia Minor by way of the islands and peninsulas of the Ægean Sea. The former occupied the plains of the north, the latter the lands of the Mediterranean. Their racial differences were accentuated by geographical features and climate. The flow of the rivers shows that Europe, in general, slopes towards the north-west and the south-east from a watershed extending in an almost unbroken line from Mount Yalping Nor in the Urals, whence rise the Petchora and other rivers, to Mount Maladetta in the Pyrenees. The northern lands slope away from the sun, the southern lands towards it. Climatically, Europe falls into three divisions: the Mediterranean, with its very warm, dry summer and warm, moist winter, during which cereals and other crops are grown; the north-west temperate lands, with a climate tending to bleakness in winter; and an eastern region, which may be taken broadly as beyond the 32° F. winter isotherm—an area icebound and for the most part, snowclad during the winter months. The peoples of the north-west remained barbarian long after the Mediterranean races had become highly civilised, while those of the frozen east even lagged behind those of the north-west. Many European movements trace their origin to the struggle between the peoples of the north-west and those of the Mediterranean, as, for example, the expansion of the Roman Empire to the north, the barbarian invasions to the south, and the numerous attempts made by strong races from mediæval times to our own to obtain a 'through route' from north to south. Not until comparatively recent times have the peoples of the east—the Russians—really begun to take their place among the nations of the world. . . . Historical Europe, as we have thus defined it, comprises the areas draining to the northern and southern seas. To this we should perhaps add the Atlas regions—the Barbary States—since these, from early to modern times, have been linked intimately with the lands of the opposite shores by the waterway of the Western Mediterranean. The approximate limit eastwards is a line from Petrograd along the Volga and Don to the Sea of Azov. This is 'inner' Europe—the Europe of history. Surrounding 'inner' Europe is a fringe of debatable land—the north-eastern states of Africa, Syria, Asia Minor, and Russia beyond the Volga—possession of which has always been subject to dispute between Europeans and Asiatics. This is 'outer' Europe, to which, of course, no definite boundaries can be assigned. The Mediterranean is the home of European civilisation. There are many reasons for this. Situated between the forests to the north and the semi-deserts to the south, it was a transition zone in which periodicity of climate broke the hard control of the great belts of forest and desert, and allowed man to come in with his cultivated plants and domesticated animals. The warm climate mitigated the penalty of poverty; clothing and shelter were not so essential

as in the north-west or in Russia, while there was no season when Nature refused to give supplies of food. The beautiful sunshine, the blue sky, and the many other pleasing features of the Mediterranean, stimulated thought rather than hard work, and thought and the exchange of thought is the necessary beginning for a higher civilisation. It was possible, too, for places in the various parts of the coast to communicate easily and freely with each other. The Mediterranean is practically tideless; therefore there are no long stretches of sandy foreshore. Boats could be landed anywhere, and towns sprang up on the open bays—e.g., at Ver'ce, Naples, Genoa, Marseilles, and Barcelona—and not at river mouths, silted up as they were with sandbanks. Great storms seldom threatened to wreck even the smallest of boats, for the leeward side of the many islands was sure to offer shelter. Nether was it necessary, except on very rare occasions, to go out of sight of land. The mountainous mainland and islands could be distinctly seen in the clear atmosphere."—W. H. Barker and W. Rees, *Making of Europe*, pp. 1-4, 6, 7.

### PREHISTORIC

**Earliest remains of man.**—"Man emerges from the vast geologic history of the earth in the period known as the Pleistocene or Glacial and Post glacial. . . . It is our difficult but fascinating task to project in our imagination the extraordinary series of prehistoric material events which were witnessed by the successive races of Palaeolithic man in Europe. . . . Throughout this long epoch western Europe is to be viewed as a peninsula, surrounded in all sides by the sea and stretching westward from the great land mass of eastern Europe and of Asia, which was the chief theatre of evolution both of animal and human life."—H. F. Osborn, *Men of the old Stone Age*, pp. 18-19.—The chronology of the remains of prehistoric man is established through the geologic condition of the soil in which they are found; the remains of mammals found in the same stratum and the human anatomy together with the evidences of human industry are correlated. Pithecanthropus Erectus, the very earliest fossil of man, was found in Java and is beyond the European problem not only because of the distance geographically but also chronologically for even the oldest specimens found in Europe show a great advance over the Java fossil. To understand the significance of the discoveries of fossil man in Europe and to see the results of these discoveries in the proper correlation with the geographical and climatic conditions of a world which was still changing with comparative rapidity, the following table serves as a good introduction and summary.

**HEIDELBERG MAN.—PITHECANTHROPUS.**—"In 1907 a lower jaw, known now as the Heidelberg or Mauer jaw, was discovered by workmen in the sand-pit of Mauer near Heidelberg. The Mauer jaw is indeed a most remarkable specimen. The first general outcome of an inspection of the photographs or of the excellent casts (which may now be seen in many museums) is a profound impression of its enormous strength. . . . By every part of the specimen save one, this impression is confirmed. This massiveness, together with the complete absence of any prominence at the chin, would have caused great hesitation in regard to the pronouncement of a decision as to the probable nature of the fossil. The one paradoxical feature is the relatively small size of the teeth. All of these have been preserved, though on the left side the crowns

of four have been removed by accident in the process of clearing away some adherent earth and pebbles. The net result shows that the teeth are actually within the range of variation provided by human beings of races still extant, though commonly regarded as 'primitive,' if not pithecoïd (such as the aboriginal race of Australia). Yet these teeth are implanted in a jaw of such size and strength as render difficult the reference of the specimen to a human being. The most striking features of the Mauer jaw have been mentioned already. Before entering upon a further discussion of its probable nature, it will be well to note some of the other distinctive characters. Thus the portion . . . known technically as the ascending ramus is of great size, and particularly wide, surpassing all known human specimens in this respect. The upper margin of this part is very slightly excavated, a slight depression . . . replacing the very definite 'sigmoid' notch found in almost all human jaws (though the relative shallowness of this notch has been long recognized as distinctive of the lowest human types). The difference in vertical height between the uppermost points of the condyle . . . and the coronoid process . . . is therefore unusually small. On the other hand, the lower margin of the bone is undulating, so that it presents a hollow on each side, as well as one near the middle line in front. The two halves of the bone are definitely inclined to one another and this convergence is faintly marked in the two rows of teeth behind the canines. The latter teeth do not project markedly above the level of those adjacent to them. The incisor teeth are remarkably curved in their long axes, with a convexity in front. The prominences called 'genial tubercles' behind the chin are replaced by a shallow pit or fossa. . . . Of the three larger anthropoid apes available for comparison [with the Heidelberg jaws], it is hard to say which presents the closest similarity. The Gibbons do not appear to approach so nearly as these larger forms. Among the latter, no small range of individual variations occurs. My own comparisons shew that of the material at my disposal the mandible of an Orang-utan comes nearest to the Mauer jaw. But other mandibles of the same kind of ape (Orang-utan) are very different. The chief difficulty in assigning the possessor of the Mauer jaw to a pithecoïd stock has been mentioned already. It consists in the inadequate size of the teeth. In addition to this, other evidence comes from the results of an examination of the grinding surfaces (crowns) of the molar teeth. These resemble teeth of the more primitive human types rather than those of apes. Finally the convergence of the two rows when traced towards the canine or eye-tooth of each side, points in the same direction. . . . If the ape be thus rejected, the next question is, Would the Mauer jaw be appropriate to such a cranium as that of Pithecanthropus? I believe an affirmative answer is justifiable. It is true that an excellent authority (Keith) hesitates on the ground that the mandible seems too massive for the skull, though the same writer recognizes that, in regard to the teeth the comparison is apt. This is a difficult point. For instance the *H. moust. hauseri* . . . has a mandible which is far 'lower' than the capacity of the brain-case would lead one to expect. Therefore it seems that the degree of correlation between mandible and capacity is small, and to predict the size of the brain from evidence given by the jaw is not always safe. It is to be remembered that special stress was laid by Professor Dubois . . . on the fact that the teeth of Pithecanthropus when compared with the skull-cap are inadequately small, if judged by the ape-standard

of proportion. The characters of the teeth, in so far as upper and lower molars can be compared, present no obstacle to such an association, and in fact provide some additional evidence in its favour. The crucial point seems therefore to be the massiveness of the jaw. With regard to this, the following remarks may be made. First, that the skull-cap of Pithecanthropus is on all sides admitted to shew provision for powerful jaw-muscles. And further, in respect of actual measurements, the comparison of the transverse width of the Javanese skull-cap with that of the Mauer jaw is instructive. For the skull-cap measures 130 mm. in extreme width, the jaw 130 mm. . . .

TABLE SHOWING CORRELATION OF GEOLOGIC PERIODS, CULTURAL DEVELOPMENT TYPES OF MAN AND CLIMATIC CONDITIONS IN EARLY EUROPE\*

(Adapted from H. F. Osborn, in *Men of the Old Stone Age.*)

Geological Periods	Periods of Cultural Development	Type of Man	Climate, Flora, Fauna
	Prehistoric		
	Neolithic		
Post-glacial	8. Azilian-Tardenoisian 6. Solutrean 7. Magdalenian 5. Aurignacian	Upper Paleolithic Cro-Magnon Grimaldi	Recent Forest, Meadow Reindeer Period, Arctic Tundra, Steppe, Alpine
IV Glacial	25,000 years 4. Mousterian 50,000 years	Neanderthal "	Forest, Meadow Cold Fauna Arrival Steppe, Tundra Fauna
3d Inter-Glacial	3. Acheulean 75,000 years 2. Chellean 100,000 years 1. Pre-Chellean 125,000 years 150,000 years	Lower Paleolithic Pittdown	Last Warm African-Asiatic Fauna Also Forest, Meadow, Eurasiatic Fauna
III Glacial	Cold Tundra Fauna Woolly Mammoth and Rhinoceros. First Steppe and Reindeer.		
2d Inter-glacial	200,000 years 225,000-250,000 275,000-300,000 325,000 350,000	Heidelberg	Warm African-Asiatic Fauna
II Glacial	First Cold Fauna 400,000 years		
1st Inter-Glacial	425,000 years 450,000		Warm African-Asiatic Fauna
	475,000 years Cold Forest Bed	Pithecanthropus (Trinil)	
I Glacial	Fauna in S. Britain 500,000 years		
Pliocene	525,000		Pliocene Warm Forest

\* To be read upward for chronological sequence

"Passing from the consideration of Pithecanthropus to that of human beings, the general results of the comparisons that can be made will shew that the gap separating the jaw of Mauer from all modern human representatives is filled by human jaws of great prehistoric antiquity. The progress of an evolutionary development is accordingly well-illustrated by these specimens. And although *Homo heidelbergensis* is seen to be separated from his modern successors by great differences in form as well as a vast lapse of time, still

the intervening period does provide intermediate forms to bridge the gulf. Not the least interesting of many reflections conjured up by the Mauer jaw, is that this extraordinary form should be met with in a latitude so far north of that corresponding to the Javanese discoveries. This difference, together with that of longitude, suggests an immense range of distribution of these ancestral types."—W. L. H. Duckworth, *Prehistoric man*, pp. 10-16.—See also ANTHROPOLOGY: Physical.

**PILTOWN MAN.**—Late in 1912, in the locality of Piltown, Sussex, England, several fragments of bones of the "Dawn man" were recovered from a gravel deposit by Dr. Smith Woodward and Mr. Dawson. "The question of the geological age of these now celebrated specimens is naturally of first importance. It has been suspected by some that geologically they are not old at all; that they may even represent a deliberate hoax, a negro or Australian skull and a broken apejaw, artificially fossilized and 'planted' in the gravel-bed, to fool the

irregularly fractured flints, were also found in and around the gravel-pit. 3. One flint implement of Old Stone Age type was discovered *in situ* in the bed which lies immediately above the Dawn Man stratum. In brief, the discoveries of the Dawn Man finally refer his remains to the Palaeolithic (Old Stone Age), but the more precise date is not settled. . . .

"The temporal bone and its mastoid process, the back of the head and the whole brain-case, as well as the brain cast, are human in character, although of low type, while the lower jaw and dentition are prevailingly simian. And while this regional distribution of human and simian characters was unexpected and in a way unprecedented, it means, as Professor Elliot Smith has noted, that the erect pose of the body, the freeing of the hands from locomotive functions, and the human development of the brain were associated in the Piltown man with a more conservative or simian structure of the dentition and jaw. . . . Palaeontologists and com-

Modelled by Prof. J. H. McGregor on casts of the original skulls  
(Models in American Museum of Natural History.)

scientists. Against this suggestion tell the whole circumstances of the discovery. . . . None of the experts who have scrutinized the specimens and the gravel-pit and its surroundings has doubted the genuineness of the discovery. All agree that the Dawn Man dates at the very latest from the Old Stone age, and for the following reasons: 1. The dark stratum which yielded the human remains also contained a number of mammalian fossils, representing a primitive elephant (Stegodon), a mastodon (Mastodon arvernensis), a rhinoceros, a hippopotamus, a horse and a beaver. The mastodon and the stegodon belonged to species which were characteristic of the Pliocene epoch and on that account Professor Keith at first regarded the human remains as equally old; but Dr. Smith Woodward and Mr. Dawson maintained that the mastodon and rhinoceros teeth had been washed into the gravel bed from an older formation, because they had been rolled and were water-worn. The hippopotamus and the beaver may be of either Upper Pliocene or Pleistocene age. A fragmentary fossil antler of a red deer was found near by, but its association with the other remains is doubted. 2. 'Eoliths,' or

parative anatomists likewise recognize and value the differences between men and apes. They realize that even the lowest existing races of mankind are extremely superior to apes in mentality, in power of speech and in ability to use the hand as an organ of the will and intelligence. But they also believe that all these higher faculties, marvelous as they are, find their beginnings in the psychic and physical life of the apes, that the key to the mental and structural adaptations of mankind is to be found in the Primates alone among mammals. Such being the general viewpoint of palaeontologists and comparative anatomists, it need hardly be said that, to them, the Piltown man, far from disproving the 'Darwinian theory,' is indeed a sort of 'man in the making.' He is one of the innumerable experiments made in Nature's vast laboratory, an early branch of the prehuman stock which had achieved a low human stage of brain and brain-case, but which in face and dentition still bore unmistakable traces of derivation from large-brained, primitive anthropoid apes."—W. K. Gregory, *Dawn man of Piltown, England*, pp. 190-191, 198-200.—The Heidelberg jaw and possibly

the Piltdown skull are generally held to belong to the Chellean period. From the Acheulean period, which lies above, we have no human remains.—See also ANTHROPOLOGY: Physical.

NEANDERTHAL SKELETON, MAN IN THE MOUSTERIAN STAGE.—“The skeletons from Mauer and Piltdown are isolated phenomena. They do not link human life in Europe to anything that has gone before. They cannot therefore be brought forward as evidence that the continent of Europe was the scene of the development of Man . . . for their owners may just as well have been immigrants from some other region. . . . When we reach the Mousterian stage we at last find ourselves tolerably well supplied with material for the study of the physical characters of the tool-makers. . . . Le Moustier is situated near to the village of Les Eyzies on the right bank of the Vézère, [a tributary of the Dordogne, which is] a tributary of the Garonne flowing through the department of La Dordogne. Here . . . there is a little cave” in which remains have been discovered which “have been accepted as typical of the stage,” in the development of man, “called from the name of the place in question the Mousterian stage.”—R. A. S. Macalister, *European archaeology*, v. 1, pp. 204, 284, 285.—If we are very poor in human fossils of the lower Pleistocene, or Chellean, we are very rich in those of the Middle Pleistocene which corresponds almost to the Mousterian of the archæologists. We know already that this epoch is very different from the preceding one. It corresponds with the last glacial invasion. The flora and fauna of central and southern Europe were at the same time different from the flora and fauna of Chellean times and from the flora and fauna of today. They manifest a climate much more humid and much colder. The great extinct species of mammals were covered with a thick fleece: most of the species which still live, the reindeer, musk ox, glutton, wild goat, chamois, marmotte, inhabit only the northern countries or high mountains. From the archaeological point of view, there are also many changes. The flints are smaller, less thick, finer. The dominant types are the *pointes* and *raclours* cut and retouched on one face only. One sees for the first time some trace of the use of bone. We are then in the presence of conditions of a *milieu* quite different from those of the Chellean and much more severe: man obliged to protect himself against the rigors of the climate must modify his habitat. He took refuge in the caverns, he lived there, he died there, he left there the bones which we exhume today with so much interested curiosity. In 1856 a skull pan, the thigh bones, upper bone of each arm, shoulder blade, collar bone, and fragments of ribs were taken from the little grotto of Feldhofer, situated between Dusseldorf and Elberfeld (Rhenish Prussia) in the ravine called Neanderthal. This is the famous discovery called the Neanderthal man saved by Fühlrott and described by Schaaflausen.—Based on M. Boule, *Les Hommes fossiles*, p. 176.—“The only existing race [whose physiology] approaches that of the Neanderthal skull is the Australian, and even this does so only remotely. In the Australian skull the torus is rarely, if ever, so completely continuous and uniform as in the Neanderthal; its dimensions are less and its characters different. In the Neanderthal skull the torus receives additional emphasis from the presence of a corresponding depression which runs parallel with it along its upper margin. . . . This trough is spoken of as the frontal fossa; nothing resembling it occurs in the Australian skull. In the Australian skull it is the glabellar region of the torus that is most pro-

tuberant, projecting farthest immediately above the root of the nose, which looks as if it had been squeezed in close under the glabella; this gives an appearance of concentration—almost indeed of ferocity—to the Australian face. In the Neanderthal skull the torus does not descend in this fashion; it rises well above the eyes and root of the nose, recalling its disposition in the chimpanzee.”—W. J. Sollas, *Ancient hunters*, p. 187.—This skeleton was the first to attract scientific attention, and consequently man of this period is commonly spoken of as Neanderthal from the name of the locality in which the remains were discovered. These, however, are not the best source from which we obtain knowledge of man at this period. In 1864 at the congress of the British association, Busk, an English geologist, presented a human skull which had been found in 1848 in a quarry at Gibraltar. Busk compared this skull with that of Neanderthal. We cannot doubt the great antiquity of the Gibraltar skull. It is contemporaneous with the fauna of the deep deposits of the caverns described by Busk, which presents a southerly aspect of the fauna of the middle pleistocene. The human skull, and the bones of animals are in the same state of fossilization. The year 1866 was marked by the discovery of the jaw of La Naulette almost as celebrated as the skull pan of Neanderthal. Found by Dupont, an eminent Belgian geologist, in an intact bed, at Naulette near Dinant it was well dated by the animal debris of the Middle Pleistocene which accompanied it. The year 1886 was signalized by the very important discovery in the grotto of Spy in Belgium. Here all the desirable scientific conditions were realized. The stratigraphy was well established by a geologist, the fauna accompanying the human remains is that of the middle Pleistocene. The flints are of the Mousterian form.—Based on M. Boule, *Les Hommes fossiles*, pp. 180-181.—In Le Moustier “Mousterian man appears to have found a home for a prolonged period, and has left behind him very numerous and interesting relics. His chief occupations were hunting and fishing, and from the abundance of the remains of the horse, wild cattle and reindeer, we may infer that these animals were his mainstay. . . . But he hunted also many others, especially musk-ox, chamois and red deer. And now and again mammoth and woolly rhinoceros; while occasionally bears, lion, hyæna, glutton, arctic fox and other carnivores were overcome. . . . Le Moustier is particularly notable for the discovery there in 1907 of a human skeleton, that of a youth of sixteen years, which had obviously been covered up in Paleolithic times. This is one of several similar discoveries recorded from the caves of France. In the cave of La Chapelle-aux-Saints in the Department of Corrèze, for instance, the skeleton of a man about fifty years of age was revealed. . . . The body had obviously been buried in a grave, and not merely covered over with debris. Again in the cave of La Ferrassie, Dordogne, yet another skeleton has been unearthed. This discovery is particularly interesting, inasmuch as there is evidence in the cave-deposits of a succession of culture stages. At the very bottom occurred a bed of red sand, above which came a layer containing Acheulean implements, and overlying that a strata characterised by the presence of Mousterian artifacts. . . . It was at the bottom of this upper stratum that the skeleton lay. The succeeding layers contained artifacts differing from those of Mousterian type, and belonging to the Aurignacian stage of culture.”—J. Geikie, *Antiquity of man in Europe*, pp. 68-70.

We now reach a series of recent discoveries of

such interest that they must be described at more length. The first is that of the skeleton of La Chapelle-aux-Saints [found in August, 1908]. This fortunate discovery furnished the least incomplete and best preserved human Mousterian fossil known up to that time. The age of the skeleton is established as clearly as possible. The bed was very rich in cut flints comprising principally the two classic Mousterian types: *pointes* and *raclours*. The parts of the skeleton which have been reassembled are the skull and lower jaw, twenty-one vertebrae or fragments, about twenty ribs or fragments of ribs, a clavicle, two humerus, almost complete, the two radius, incomplete, the two cubitus, some bones of the hand, some pieces of the iliacs, the two rotulas, portions of the two tibiae, a tatus, a calcaneum, the five right metatarsals, two pieces of the left metatarsals, and a phalange. In January, 1900, a Swiss dealer in antiquities who had for too long exploited, on account of the Germans, the beds of Dordogne, made known the circumstances in which he had found and exhumed a human skeleton at Le Moustier, on August 10, 1908. The scientific value of this document is still singularly lessened by the penury of stratigraphic and serious paleontologic gifts. There is at La Ferrassie (Dordogne) a shelter under rocks of which M. Capitan and Peyrony explored during ten years the numerous superimposed layers, rich in objects worked by the Paleolithics. [Human remains were found on September 17, 1909, by Monsieur Peyrony.] At his invitation and that of his collaborator, Monsieur Capitan, several persons went to La Ferrassie, to be present and collaborate at the extraction of the skeleton, Messieurs Cartailhac, Breuil, Bouyssonie, and M. Boule assured themselves (1) that the stratigraphic plane is sensibly the same as that of La Chapelle-aux-Saints at the base of a Mousterian archaeological bed, reposing, according to Messieurs Capitan and Peyrony, on an Acheulean bed; (2) that it was a question of an individual of the Neanderthal type; (3) that the bones of that human fossil had retained their anatomic connection, and that they lay in the middle of the beds intact, but without trace of sepulture. The same bed yielded in 1910 to Monsieur Peyrony, a second skeleton, lying not far from the first. This denotes an individual more frail, of smaller stature, very probably feminine. Finally in 1912 there were collected some portions of the skeletons of two children. It seemed that we had there the remains of a whole family dead, perhaps by accident, buried by a falling in of the cave. In 1911, Dr. Henri Martin discovered at La Quina (Charente) a human skeleton in a clearly Mousterian milieu. The well-preserved parts of the head have the same character as those of the skull pan of Neanderthal, as the skull and the mandible of La Chapelle-aux-Saints. To sum up, of about twenty discoveries of which the generally satisfying state permits attribution to the middle Pleistocene about half consist only of pieces that are too fragmentary. The others have furnished etiological documents, lending themselves to complete morphological studies: The Neanderthal type of human fossil is thus known to us today by documents well preserved, easy to study and accounting for about fifteen individuals at least. We are then today in possession of a complete collection of material, relating to a homogeneous human type very different from all existing human types. This human type, which presents numerous characters of inferiority, must be designated under the name of *homo Neanderthalensis*. Here follows a very brief description of this type, based principally on the skeleton of La Chapelle-aux-Saints: The head of the man of La

Chapelle-aux-Saints, appears strange, even to the eyes of those unfamiliar with anatomy. It strikes us first by its very considerable dimensions, considering the small stature of the subject to which it belonged. It strikes us next by its bestial aspect, or it might be better to say by an *ensemble* of simian characters. The skull of elongated form is very elliptic; the eye sockets are enormous; the forehead is very tapering; the occipital region very projecting and depressed. The long face projects forward; the orbits are enormous; the nose, separated from the forehead by a deep depression, is short and very large; the superior maxillary forms a sort of muzzle; the mandible is robust, thick; the chin rudimentary. Seen from above, all the skulls of the Neanderthal man appear remarkably uniform. They are dolichocephalic. The cranial boxes are much more protuberant at the back than in front where the frontal is greatly narrowed. From a prolonged and careful study one can say that Neanderthal man was of small massive stature, with very short legs. The head was extremely large; the facial part very much developed in relation to the cerebral part. The cephalic index was medium; the skull very flat. The supraorbital arches were enormous, forming a continuous ridge; the forehead retreated; the occiput projected and was compressed vertically. The face was long and protuberant, with the cheek bones flat and retreating; the superior maxillary presented the form of a muzzle; but was devoid of canine fosses. The orbits were very large and round; the nose projecting, and prominent. The upper lip was long; the lower jaw robust and without a chin. The teeth were large (but distinctly human) and the back molars preserved their primitive traits. The vertebral column and bones of the members presented numerous pithecoïdal characters, denoting a biped or vertical attitude less perfect than in man of our own times. The cephalic mean capacity was about 1400 ccm. The cerebral conformation presented numerous simian or primitive characteristics, especially in the great relative reduction of the frontal lobes, and the general design of the circumvolutions.—Based on M. Boule, *Les Hommes fossiles*, pp. 180-193, 238.—“The total aspect of Neanderthal man may be characterized in the following manner: An enormous head placed upon a short and thick trunk, with limbs very short and thick-set, and very robust; the shoulders broad and stooping, with the head and neck habitually bent forward; . . . the arms relatively short as compared with the legs; the lower leg, as compared with the upper leg, shorter than in any of the existing races of men; the knee habitually bent forward without the power of straightening the joint or of standing fully erect; the hands extremely large and without the delicate play between the thumb and fingers characteristic of modern races. . . . Thus the ordinary attitudes characteristic of *Homo neanderthalensis* would be quite different from our own and most ungainly.”—H. F. Osborn, *Men of the old Stone Age*, pp. 243-244.

GRIMALDI MAN.—“Among the numerous human skeletons yielded by the caves of Mentone, two were discovered at a great depth in a cave known as the ‘Grotte des Enfants.’ The excavations were set on foot by the Prince of Monaco, and these particular skeletons have been designated the ‘Grimaldi’ remains. Their chief interest (apart from the evidence as to a definite interment having taken place) consists on the alleged presence of ‘negroid’ characters. The skeletons are those of a young man . . . and an aged woman. The late Professor

Gaudry examined the jaw of the male skeleton. He noted the large dimensions of the teeth, the prognathism, the feeble development of the chin, and upon such grounds pointed out the similarity of this jaw to those of aboriginal natives of Australia. Some years later Dr. Verneau, in describing the same remains, based a claim to (African) negroid affinity on those characters, adding thereto evidence drawn from a study of the limb bones. In both male and female alike, the lower limbs are long and slender, while the forearm and shinbones are relatively long when compared respectively with the arm and the thighbones. From a review of the evidence it seems that the term 'negroid' is scarcely justified, and there is no doubt that the Grimaldi skeletons could be matched without difficulty by skeletons of even recent date. Herein they are strongly contrasted with skeletons of the Neanderthal group. And although modern Europeans undoubtedly may possess any of the osteological characters claimed as 'negroid' by Dr. Verneau, nevertheless the African negro races possess those characters more frequently and more markedly. . . . Caution in accepting the designation 'negroid' is therefore based upon reluctance to allow positive evidence from two or three characters to outweigh numerous negative indications; and besides this consideration, it will be admitted that two specimens provide but a feeble basis for supporting the super-structure thus laid on their characters. Lastly Dr. Verneau has been at some pains to shew that skulls of the 'Grimaldi-negroid' type persist in modern times. Yet the possessors of many and probably most such modern crania were white men and not negroes. Enough has however been related to shew how widely the skeletons from the 'Grotte des Enfants' differ from the Palaeolithic remains associated as the Neanderthal type."—W. L. H. Duckworth, *Prehistoric man*, pp. 50, 52.

CROMAGNON MAN.—"There is a widely spread notion that our remote ancestors were a race of giants. Hitherto, as we have passed from type to type into a remote past that takes us well within the Glacial Period, the samples of ancient humanity preserved to us have been one and all people of a low stature—only five feet or a little over. Now we proceed to consider the oldest race of great stature that has yet been discovered, one which flourished in the south of France when the last of the cold periods was lifting from Europe. The first examples of this race were discovered in 1868, when a railway was being constructed in the valley of the Vézère, a tributary of the Dordogne. A cutting made in the debris at the foot of the limestone cliffs which flank the valley of the Vézère at Cro-Magnon, brought to light the skeletons of a man, of a woman, and part of the skull of a third individual. Hence this ancient type or race is usually named Cro-Magnon. We now know ten individuals of that race of which eight are men and two are women. The stature of five of the men can be estimated with some degree of exactness—it varies from 1820 to 1870 mm. (5 ft. 11½ in. to 6 ft. 1½ in.). The woman, as is usually the case in tall races, was evidently of a smaller stature; we can estimate the height of one only; she was young and measured 1560 mm. (5 ft. 3½ in.). The discovery of the human remains at Cro-Magnon in 1868 was made at the time when scientists were beginning to realize that the history of ancient man could be deciphered in the caves and old rock shelters along the valleys of the Dordogne and Vézère, and when a band of young men was arising in France who knew how to interpret the human signs found there. We owe our knowledge of the Cro-Magnon race to the

French School of Anthropologists. . . . The Cro-Magnon race was discovered at a period when, under Darwin's influence, anthropologists expected to find man becoming more primitive in mind and body as his history was traced into the past. The discovery at Cro-Magnon showed that the evolution of human types was not an orderly one, for, in size of brain, and in stature, the race which flourished in the south of Europe at the close of the Glacial Period was one of the finest the world has ever seen. Yet they must have been grim-visaged and savage-looking men. . . . It is in France itself that we find evidence as to the period at which the Cro-Magnon men appeared in Europe. Their brains were large and we naturally expect signs of a high mental development. In their hands art reached a stage of realism which has never been surpassed; they engraved the animals they hunted on bone and ivory with the accurate eye and hand of the true artist. Their implements of flint and bone are characteristic; hence the strata in the floors of caves formed during the time of the Cro-Magnon race can be recognized. The chief period of the Cro-Magnon race is named the Magdalenien, because in the La Madeleine rock shelter in the valley of the Vézère, three miles above Cro-Magnon, remains of their civilization are found abundantly. . . . The explorations of the caves on the shores of the Riviera near Mentone, under the auspices of the Prince of Monaco, have extended our knowledge of the Cro-Magnon type. The remains of the two negroes of Grimaldi, it will be remembered, were found in the Grotte des Enfants below strata which had accumulated in the course of long ages to a depth of 8½ metres—over 28 feet. The Grimaldi remains rested in a stratum which was evidently formed in a warm period, for it contained the remains of animals which we associate with a semi-tropical climate. In a stratum nearly 3 feet above the one containing the negroes was found the skeleton of a splendid specimen of the Cro-Magnon race. Remains of the fauna of a cooler climate then appear. If the reindeer then sought the climate it now prefers we may conclude that the temperature of the south of France resembled that which now prevails in the north of Europe and did so for a long period, for in the strata formed over the Cro-Magnon burial, to the extent of 20 feet, remains of the reindeer occur. There is evidence to show that the Cro-Magnon type persisted in Europe throughout the long period marked by the presence of the reindeer. The Cro-Magnon man was tall; the individual found in the Grotte des Enfants stood about 6 ft. 3 in. in life. His long collar bones show he was wide-shouldered, with a great breadth of chest. His thigh bones were long and straight and their shafts shaped like a razor, so strongly pronounced was the ridge for the attachment of muscles on its posterior aspect. The leg bones, or tibiae, as in the Grimaldi and in negroid races, were relatively and absolutely long. There are in this and a number of other features—the short, wide face, the prominent cheek bones and pointed chin—also traces of the negroid in the Cro-Magnon race. By the end of the reindeer period the Cro-Magnon race seems to have been absorbed by other races. The type has been identified amongst the Neolithic inhabitants of Switzerland. In form of head the natives of England who buried their dead in long mounds or barrows have much in common with the Cro-Magnon race. Although there is no race in Europe to-day that can be regarded as representative of this Palaeolithic people, yet in Germany, Switzerland, France, and Britain individuals of this type are not rare. They are the

tall men of commanding mien. It is likely enough that Cro-Magnon blood may be in their veins, but time and civilization have lengthened their faces, reduced the prominence of their cheek bones, diminished the strength of their jaws, and opened out their eye-sockets, thus removing the lowering sour visage which characterized the Cro-Magnon face."—A. Keith, *Ancient types of man*, pp. 64-66, 69, 71-73.—See also FRANCE: People.

**Stone Age: Divisions.**—With this brief description of the skeletal remains of ancient man as an introduction we can now turn to the remains of the culture of these people. In the strata where these fossils are found there are usually buried with them the same implements which they had fashioned. As the archaeologist digs down he finds the tools becoming more and more crude and asymmetrical. Archaeologists have divided the Stone Age, the period in which all these ancient types of man existed into two major periods: The Paleolithic and the Neolithic. In the Paleolithic period, brittle flint was used in stone work and the processes of chipping and flaking were employed. The flint comes in large nodules and the flaking process was used to shape a fragment broken from the nodule into the approximate shape of the implement; then the chipping was done around the edges to give it a sharp blade and also to reduce it to the final shape of the finished tool. In the Neolithic period, on the other hand, tough stones were used and other processes were introduced. A tough stone cannot be handled in the same way in which brittle stones had been hewn into shape. The technical processes of the Neolithic period were battering, grinding, pecking and polishing. The development of the Paleolithic period has been worked out very carefully and as can be seen from the table above, archaeologists here separated it into the lower and upper Paleolithic division, each with four stages of industrial development. The names Chellean, Acheulean, etc., refer to the particular Paleolithic stations in France and Belgium where the implements of this stage were found in preponderance. Some stations have in their succeeding strata, examples of practically all stages of Paleolithic industry.

**PRE-CHELLEAN.**—"In considering the Pre-Chellean [Heidelberg and Piltdown man] implements found at St. Acheul in 1906, we note that at this dawning stage of human invention the flint workers were not deliberately designing the form of their implements but were dealing rather with the chance shapes of shattered blocks of flint, seeking with a few well-directed blows to produce a sharp point or a good cutting edge. This was the beginning of the art of 'retouch,' which was done by means of light blows with a second stone instead of the hammer-stone with which the rough flakes were first knocked off. The retouch served a double purpose: Its first and most important object was further to sharpen the point or edge of the tool. This was done by chipping off small flakes from the upper side, so as to give the flint a saw-like edge. Its second object was to protect the hand of the user by blunting any sharp edges or points which might prevent a firm grip of the implement. Often the smooth, rounded end of the flint nodule, with crust intact, is carefully preserved for this purpose. . . . It is this grasping of the primitive tool by the hand to which the terms 'coup de poing,' 'Faustkeil,' and 'hand-axe' refer. 'Hand-stone' is, perhaps, the most fitting designation in our language, but it appears best to retain the original French designation, *coup de poing*. As the shape of the flint is purely due to chance, these Pre-Chellean implements are interpreted by

archaeologists chiefly according to the manner of retouch they have received. Already they are adapted to quite a variety of purposes, both as weapons of the chase and for trimming and shaping wooden implements and dressing hides. Thus Obermaier observes that the concave, serrated edges characteristic of some of these implements may well have been used for scraping the bark from branches and smoothing them down into poles; that the rough *coups de poing* would be well adapted to dividing flesh and dressing hides; that the sharp-pointed fragments could be used as borers, and others that are clumsier and heavier as planes. . . . The inventory of these ancestral Pre-Chellean forms of implements, used in industrial and domestic life, in the chase, and in war, is as follows: *Grattoir*, planing tool; *Racloir*, scraper; *Perçoir*, drill, borer; *Couteau*, knife; *Percuteur*, hammer-stone; *Pierre de jet*, throwing stone; Prototypes of *coup de poing*, hand-stone. It includes five, possibly six, chief types. The true *coup de poing*, a combination tool of Chellean times, is not yet developed in the Pre-Chellean, and the other implements, although similar in form, are more primitive. They are all in an experimental stage of development. Indications that this primitive industry spread over southeastern England as well, and that a succession of Pre-Chellean into Chellean culture may be demonstrated, occur in connection with the recent discovery of the very ancient Piltdown race."—A. F. Osborn, *Men of the old Stone Age*, pp. 128-130.

**CHELLEAN.**—"All over the world may be found traces of a Stone Age, ancient or modern, primitive implements of stone and flint analogous to those of the true Chellean period of western Europe but not really identical when very closely compared. These represent the early attempts of the human hand, directed by the primitive mind, to fashion hard materials into forms adapted to the purposes of war, the chase, and domestic life. . . . Compared with the Pre-Chellean flint workers the Chellean artisans advanced both by the improvement of the older types of implements and by the invention of new ones. As observed by Obermaier, the flint worker is still dependent on the chance shape of the shattered fragments of flint which he has not yet learned to shape symmetrically. In the experimental search after the most useful form of flint which could be grasped by the hand, the very characteristic Chellean *coup de poing* was evolved out of its Pre-Chellean prototype. This implement was made of an elongate nodule, either of quartzite or, preferably, of flint, and flaked by the hammer on both sides to a more or less almond shape; as a rule, the point and its adjacent edges are sharpened; the other end being rounded and blunted. Like most, if not all, of the Chellean implements, it was designed to be grasped by the bare hand and not furnished with a wooden haft or handle. It is not impossible that some of the pointed forms may have been wedged into a wooden handle, but there is no proof of it. In size the *coup de poing* varies from 4 to 8 inches in length, and examples have been found as large as 9½ inches. That it served a variety of purposes is indicated by the existence of four well-defined, different forms: first, a primitive, almond-shaped form; second, an ovaloid form; third, a disk form; and fourth, a pointed form resembling a lancehead. De Mortillet speaks of it as the only tool of the Chellean tribes, but in its various forms it served all the purposes of axe, saw, chisel, and awl, and was in truth a combination tool. Capitan also holds that the *coup de poing* is not a single tool but is designed to meet many various needs.

The primitive almond and ovaloid forms were designed for use along the edges, either for heavy hacking or for sawing; the disk forms may have been used as axes or as sling-stones; the more rounded forms would serve as knives and scrapers; while the pointed, lance-shaped forms might be used as daggers, both in war and in the chase. The Chellean flint workers also developed especially a number of small, pointed forms from the accidentally shaped fragments of flint, showing both short and long points carefully flaked and chipped. Thus, out of the small types of the Pre-Chellean there evolved a great variety of tools adapted to domestic purposes, to war, and to the chase."—*Ibid.*, pp. 148-149, 152-154.

ACHEULEAN.—"There is a close sequence between the *coup de poing* of the Chellean workers and its development into the finer and more symmetrical forms of the Acheulean. The latter, according to Obermaier, is distinguished by the flaking of the entire surface, by the far more skilful fashioning, and by the really symmetrical almond form which is attained by retouching both the surface and the edges. This more refined retouch becomes the means of producing symmetrical instruments, with straight, convex, or concave cutting edges, as well as finer and lighter tools. The early Acheulean industry belonged to a warm temperate climatic period and directly succeeds the Chellean, as shown in a most perfect manner in the quarries of the type station of St. Acheul on the Somme. In these earlier strata the prevailing forms of *coup de poing* are the 'pointed oval' and the 'lance-pointed,' the latter showing very simple chipping, a broad point, and a thick base. The oval *coups de poing* are smaller than the Chellean tools of the same kind, carefully fashioned on all sides and round the base, and very symmetrical; there are four distinct varieties of these: the almond type, oval almond-shaped, elongate oval, and subtriangular—the latter evolving into the finely modelled type of late Acheulean times: It may have been from these oval types that the disc form was finally evolved. There is wide difference of opinion regarding the use of these thin ovaloid, triangular, and disc forms. Obermaier considers that they may have been clamped in wood, or furnished with a shaft, thus forming a spear head. Another suggestion is that they were used with a leather guard to protect the hand; and there is no doubt that in either case they would have served as effective weapons in chase or war. Another view is that of Comont, who believes that not a single implement down to the very end of Acheulean times can be regarded as a weapon of war; this author maintains that many of these implements, including those dressed on both edges, were still in various ways grasped by the hand, although they do not present the firm, blunted grip of the ancient *coups de poing*. We also note the development of a type of *coup de poing*, with cutting blade fashioned straight across the end: this primitive chisel or adze-shaped tool may have been used as a chopper, or as an axe, in fashioning wooden tools. In the lance-pointed *coup de poing* of narrow, elongate shape, the flaking is very simple and the edges are continued into the short base, generally very thick, and often showing part of the original crust of the flint nodule, which is well adapted for the grip of the hand. This implement, which serves the original idea of the *coup de poing*, develops into the round-pointed and lance-pointed forms. There is no question that, whether in industrial use, in war, or in the chase, these implements were held only by the hand. The small implements of the early Acheulean included a great variety of designs developing out

of the far more primitive tools of Chellean and Pre-Chellean times, namely, the planing tool, the scraper, the borer, and the knife. Each of these types develops its own variety, often fashioned with great care, primitive blades, straight-edged cutting tools, with the back rounded or blunted for the grip of the fingers, scrapers with straight or curved edges, and *perçoirs* or borers. The scraping and planing tools, doubtless used for the dressing of hides, are now more carefully fashioned. We also observe the *racloir* and the scraper finished to a point which is the precursor of the graving tool of the Upper Paleolithic. Characteristic of this stage is the systematic use of large 'flakes' or outlying pieces of flint struck off from the core, which were used as scrapers or planes, or developed into small 'haches,' or *coups de poing*. The core or centre of the flint nodule still constitutes the material out of which the large typical implements are fashioned; but the *flake* begins to lend itself to a great variety of forms, as witnessed in the evolution of the Levallois knives of the Upper Acheulean and the highly varied flake implements of the Mousterian and Aurignacian industries."—H. F. Osborn, *Men of the old Stone Age*, pp. 169-172.

MOUSTERIAN.—"Two instruments are especially typical of the Mousterian industry [Neanderthal man] from beginning to end; these are the 'pointe' and the 'racloir.' The former, pointed and spear-shaped, is from 1 to 4 inches in length; the latter is a broad scraper, from 1 to 2 inches in width; and both have the distinctive peculiarity of being composed of a large flake of flint struck off from a larger bulb or nodule and of being retouched only on one side, leaving on the opposite side the smooth conchoidal surface of the flake. This point and scraper are highly characteristic not only of the early stages but of the Mousterian industry throughout its entire course, including even the late La Quina types, and their manner of making is obviously a modified usage of the late Acheulean discovery of the flakes of Levallois. . . . A matter of the greatest interest in the industrial development of western Europe at this time is the fact that this discovery of the *utilization of the flake*, whether in the 'lames de Levallois' or in the Mousterian point and scraper, led to the decline of the *coup de poing*. The retouched flakes of various shapes were easier to make and to repair and served equally well the purposes of skinning and dismembering game which had been previously served by the ancient *coup de poing*. . . . The Mousterian industry of the Neanderthals was thus devoted mainly to the development of the smaller forms of implements, for the most part retouched on one side only, and with a constant improvement of technique. . . . The most striking features of all the implements which may have been used in the chase are: first, the absence of any definite proof of their attachment to a shaft or handle; and second, the absence of any barbed or headed type of point. The use of the barb . . . appears to be a relatively recent discovery of the later cultures of Upper Paleolithic times."—*Ibid.*, pp. 250, 251, 253, 255.

AURIGNACIAN.—"There is evidence of various kinds that the Cro-Magnons arrived in western Europe, bringing in their Aurignacian industry, while the Neanderthals were still in possession of the country and practising their Mousterian industry. Thus in the valley of the Somme, Comont believes he has recognized a level of flints, exhibiting the primitive Aurignacian 'retouch' of Dordogne, but occurring beneath a late Mousterian level. Additional evidence of a contact between the in-

dustries of these two races is found at the stations of La Ferrassie, of Les Bouffia, and especially of the Abri Audit, where there is a distinct transition period, in which the characteristic types of the late Mousterian are found intermixed with a number of flints suggesting the early Aurignacian; here it would appear that the development of the Aurignacian is partly a local evolution, and not an invasion of wholly new types of implements. Breuil suggests that these mixed layers may perhaps be explained by the supposition that we have here degenerate or modified Mousterian tools, more or less influenced by contact with the Aurignacian industry of the Cro-Magnon race. Again, the burial customs of the Neanderthals were in many respects followed by the Cro-Magnons; they chose, in fact, the same kind of burial sites, namely, at the entrances of grottos or in proximity to the shelter. Some degree of ceremony must have marked burials, for with the remains were interred implements of industry and warfare together with offerings of food. Most of the Neanderthal burials were with the body extended; the two burials of the Grimaldi race were with the limbs in a flexed position and tightly bound to the body, probably with skin garments or thongs. The Cro-Magnon burials are either with the body extended, as in the Grottes de Grimaldi, or with the limbs flexed, as in the Aurignacian burial of Laugerie Haute. Whether the Neanderthals were exterminated entirely or whether they were driven out of the country is not known; the encounter was certainly between a very superior people, both physically and mentally, who possibly had the use of the bow and arrow, and a very inferior and somewhat degenerate people that had been already reduced physically and perhaps numerically by the severe climatic conditions of the fourth glaciation. The Neanderthals were dispossessed of all their dwelling-places and industrial stations by this new and vigorous race, for at no less than eighteen points the Aurignacian immediately succeeds upon the Mousterian industry and in a few instances Cro-Magnon burials occur very near the Neanderthal burial sites. . . . From recent excavation we know that at least from the Aurignacian period on these people also made bone tools. This negative evidence for earlier periods by no means proves that such tools did not exist for bone can decay and is more easily crushed than stone. Therefore it is not remarkable that we do not find bone tools at earlier stages, it is rather remarkable that we find them preserved from a period as early as the Aurignacian. Ceremonial wands, needles, tools, spear and javeline points, daggers, harpoon and fish hooks were made of bone. Another feature of Early European life is the art of prehistoric man."—H. F. Osborn, *Men of the old Stone Age*, pp. 250-255, 269-272.

**Paleolithic art and culture.**—"His canvas was the walls of the caverns and the sculptors found in bone, stone and ivory together with cave walls for bas-reliefs, ample material. The earliest art dates back to the Aurignacian period. The strongest proof of the unity of heredity as displayed in the dominant Cro-Magnon race in Europe from early Aurignacian until the close of Magdalenian times is the unity of their art impulse. This indicates a unity of mind and of spirit. It is something which could not pass to them from another race, like an industrial invention, but was inborn and creative. These people were the Palaeolithic Greeks; artistic observation and representation and a true sense of proportion and of beauty were instinct with them from the beginning. Their stone and bone industry may show vicissitudes and the

influence of invasion and of trade and the bringing in of new inventions, but their art shows a continuous evolution and development from first to last, animated by a single motive, namely, the appreciation of the beauty of form and the realistic representation of it. . . . In the archaic drawings of the caverns of Pair-non-Pair, La Grèze, and La Mouthe most of the animal figures are somewhat heavily and deeply engraved; the proportions are not true; the head is usually too small, with a large, short body which is often lightly modelled, resting on thin extremities. Quadrupeds are frequently represented with but two legs, as in the case of the mammoth. That the powers of observation were only gradually trained is shown by the fact that details which in later drawings are well observed are here overlooked; the profile drawings of animals, with one fore leg and one hind leg represented, are quite like those of children. The Cro-Magnon artist undertook this plastic work, choosing chiefly for his subject the female figure. These small plastic models were probably designed as idols; the figures are often misshapen; in the face the eyes frequently are not indicated at all; in some cases the ear is indicated; they recall the style of the modern cubists. More care is given to the sculpture of the form of the body than of the face. The ivory statue known as the Venus of Brassempouy lies at the base of the middle Aurignacian; of the same epoch are the female statuettes of Sireuil, and the torso from Pair-non-Pair, whereas the soapstone figurine of Mentone and the ivory statuettes of Trou Magrite, Belgium, belong to the late Aurignacian. The spread of these idols, which are altogether characteristic of the earlier period of the Upper Palaeolithic, is traced eastward to Willendorf, Austria, and to Brünn, Moravia. The chief divisions of Upper Palaeolithic art are as follows: (1) Drawing, engraving, and etching with fine flint points on surfaces of stone, bone, ivory, and the limestone walls of the caverns. (2) Sculpture in low or high relief, chiefly in stone, bone, and clay. (3) Sculpture in the round in stone, ivory, reindeer and stag horn. (4) Painting in line, in monochrome tone, and in polychromes of three or four colors, usually accompanied or preceded by line engraving, with flint points or low contour reliefs. (5) Conventional ornaments drawn from the repetition of animal or plant forms or the repetition of geometric lines.

"We have already traced the art of engraving, as it first appears in late Aurignacian times, into the Solutrean; in the latter it is but feebly represented. Its further development in early Magdalenian times is found in the engravings made with more delicate or more sharply pointed flint implements, capable of drawing an exceedingly fine line; these were doubtless the early Magdalenian *microliths*. The animal outlines, with an indication of hair, are frequently sketched with such exceedingly fine lines as to resemble etchings; the figures are often of very small dimensions and marked by much closer attention to details, such as the eyes, the ears, the hair both of the head and the mane, and the hoofs; the proportions are also much more exact, so that these engravings become very realistic. Breuil ascribes to the early Magdalenian the engraved mammoth tracings of Combarelles. Engravings of this period are also found in the grottos of Altamira in Spain, and of Font-de-Gaume in Dordogne, and to this stage belongs the group of does at Altamira, distinguished by the peculiar lines of the hair covering the face. The subjects chosen are chiefly the red deer, reindeer, mammoth, horse, chamois, and bison. The striated

drawings of Castillo and Altamira, which partly represent hair and are partly indications of shading, belong to this period. . . . The beginnings of painting in Aurignacian times, consisting of simple contours and crude outlines in red or black, with little or no attempt at shading, pass in early Magdalenian time into a long phase of monochromes, either in black or red, in which the technique pursues a number of variations, from simple linear treatment, continuous or dotted, to half tints or full tints, gradually encroaching on the sides of the body from the linear contour. . . . The grandest cavern thus far discovered in France is that of Niaux (1906), which from a small opening on the side of a lime-stone mountain and 300 feet above the River Vic de Sos extends almost horizontally 4,200 feet into the heart of the mountain. Not far from Tarascon on the Ariège it lay near one of the most accessible routes between France and Spain. Passing through the long gallery beyond the borders of the subterranean lake which bars the entrance, at a distance of half a mile we reach a great chamber where the overhanging walls of limestone have been finely polished by the sands and gravels transported by the subglacial streams; on these broad, slightly concave panels of a very light ochre color are drawings of a large number of bison and of horses, as fresh and brilliant as if they were the work of yesterday; the outlines drawn with black oxide of manganese and grease on the smooth stone resemble coarse lithography. The animals are drawn in splendid, bold contours, with no cross-hatching, but with solid masses of bright color here and there; the bison, as the most admired animal of the chase, is drawn majestically with a superb crest, the muzzle most perfectly outlined, the horns indicated by single lines only, the eyes with the defiant expression highly distinctive of the animal when wounded or enraged. Here for the first time are revealed the early Magdalenian methods of hunting the bison, for upon their flanks are clearly traced one or more arrow or spear heads with the shafts still attached; the most positive proof of the use of the arrow is the apparent termination of the wooden shaft in the feathers which are rudely represented in three of the drawings. There are also many silhouettes of horses which strongly resemble the pure Asiatic steppe type now living in the desert of Gobi, the Prze-walski horse, with erect mane and with no drooping forelock; in contrast to the bison, the eyes are rather dull and stupid in expression. There are also drawings of other types of horses, a very fine ibex, a chamois, a few outlines of wild cattle, and a very fine one of the royal stag; we find no reindeer or mammoth represented. In some of the narrower passages the rock has been beautifully sculptured by water, and the artists have been quick to take advantage of any natural lines to add a bit of color here or there and thus bring out the outline of a bison. . . . In Magdalenian times the Cro-Magnon race undoubtedly reached its highest development and its widest geographic distribution, but it would be a mistake to infer that the boundaries of the Magdalenian culture also mark the extreme migration points of this nomadic people, because the industries and inventions may well have spread far beyond the areas actually inhabited by the race itself. Absence of Magdalenian influence around the northerly coasts of the Mediterranean is certainly one of the most surprising facts. Breuil has suggested that Italy remained in an Aurignacian stage of development throughout Magdalenian times and indicates that there is much evidence that Magdalenian culture never penetrated into this peninsula, for in Italy the Aurignacian

industrial stage is succeeded by traces of the Azilian. This geographic gap, however, may be filled at any time by a fresh discovery. In Spain, also, the Magdalenian culture is known only in the Cantabrian Mountains, but never farther south, one of the earliest sites found in this region being the grotto of Peña la Miel, visited by Lartet in 1865, and one of the most famous, the cavern of Altamira, discovered by Sautuola in 1875; to the northeast is the station of Banyolas. So far the eastern provinces of Spain have not yielded any implements of engraved or sculptured bone. In contrast to this failure to reach southward, the Magdalenian culture is widely extended through France, Belgium, England, Germany, Switzerland, Austria, and as far east as Russia. It would appear either that the men of Magdalenian times wandered far and wide or that there was an extensive system of barter, because the discovery of shells brought for personal adornment from the Mediterranean seashores to various Magdalenian sites in France and in central Europe seems to indicate a widespread intercourse among these nomadic hunters and a system of trade reaching from the coasts of the Mediterranean and the Atlantic to the valley of the Neckar in Germany and along the Danube in Lower Austria."—H. F. Osborn, *Men of the old Stone Age*, pp. 315-316, 320-322, 306-308, 408-411.

Neolithic period: Question of gap between or continuance from Paleolithic period.—Oldest culture in Scandinavia: Neolithic.—The contrasts [between the Paleolithic and Neolithic Age] are numerous and striking. The Neolithic planes are often isolated from the Paleolithic by the intercalation of a sterile bed, denoting a longer or shorter period of inoccupation, all the pre-historians since Edouard Latet, have held that the two great divisions of the Age of Stone are separated by a lacuna, corresponding to a revolution. The more moderate in the matter were content to speak of a simple hiatus in our knowledge. "After the Magdalenian epoch," said M. Cartailhac, "there is—in our knowledge—a break in the continuity; a very long period of transition is still very obscure. And when we again see light, great changes have been accomplished; progress of the first order has been realized, the sum of the importations appear considerable. Thus, the reindeer has disappeared absolutely [in France and central Europe]; the populations are sedentary and practice agriculture; the implements and arms of stone are often polished; pottery is known . . . monuments are raised; art no more reproduces living nature." In the main, all of these theorists are right. It is clear that if the neolithic indicates an order of things quite new, notably the arrival of populations with industries and customs very different from those of the last Paleolithics, by virtue of the general principle of continuity the lacuna could not exist everywhere; from one day to another, the period of transition appears less obscure. The hiatus has, in effect, been filled, at least in great part, by Piette's beautiful researches in the cave of Le Mas d'Azil. The archaeological historian can today invoke numerous *faits à l'appui* of the existence of a period of transition of long duration, with multiple local aspects. What were then the populations of these intermediary ages? Unfortunately we have not many osteologic documents to respond to that question. There is at Oinet, near Nordlingen, in Bavaria, an interesting grotto, which was excavated in 1907 and 1908 by R. Schmidt, where thirty-three skulls were found. Of these the skulls of women and children, the most numerous, were ornamented with wolf teeth, and pierced shells, resembling those of Mas d'Azil.

Outside of some cervical vertebrae there was no trace of other parts of the skeletons, in consequence probably of special funeral rites. Twenty skulls have been reconstructed. They offer already an extraordinary *melange* of types. There are dolichocephalic forms, brachycephalic forms and intermediary forms. The Maglemose station has not delivered any human skeletons, and we know very little of the man of the Danish kitchen middens: Osborn's hypothesis that those of Maglemose must have belonged to the great blond race of the North is then up to the present quite groundless, although very plausible. On the other hand the kitchen middens of Mugeim, [Portugal] are very rich in human skeletons. Two very distinct types have been recognized. The first, and most numerous, is dolichocephalic, of short stature, and feeble cranial capacity. It seems that we are here in the presence of very old representatives of *Homo Mediterraneus*, and not of the descendants of the type of Cro-Magnon. From the anthropologic point of view, the Azilian and Tardenoisian remains offer us characteristics of transition by the persistence of physical types more or less apparent in the men of the Reindeer Age, [later Paleolithic] and by the appearance, timid at first, then more and more frequent of a brachycephalic type, newly come to European countries.—Based on M. Boule, *Les Hommes fossiles*, pp. 321, 338.

"The place of . . . origin [of Neolithic man] is obscure, but some at any rate seem to have arrived from the east, importing a totally new culture. These people may have been partly newcomers and partly the old Paleolithic folk *in situ* modified by this new culture. The birth-place of the new culture may have been at the head of the Persian Gulf . . . or in a more northerly locality, as far north even as South Siberia. It seems that we have to deal rather with a series of people held together by a common civilisation than with a single race, for skeletons of this period indicate a mingling of types. It is still a moot point whether or not all this differentiation took place before the arrival of the civilisation in the west, or whether part at least did not take place *in situ* in Western Europe, either from development from the older Paleolithic races, or by development of the newcomers themselves. There is anyhow the result of such a differentiation in Western Europe, for the type round the Mediterranean basin is different from that which occupied the backbone of the Continent, and this is different again from that which arrived at a slightly later date and occupied the northern area; and naturally hybrids were developed from these types. It has been said above that we probably have to deal with a series of peoples held together by a common culture. This culture consisted of: Agriculture. The domestication of animals. The manufacture of pottery. The polishing of stone implements. Later the discovery of metal smelting [this at a not much later date in regions rich in copper ores]."—M. C. Burkitt, *Prehistory*, p. 157.—The Neolithic culture can be explained to a great extent by forces from without. The changes in climate took away a large amount of the food supply and the people could no longer rely on the hunter, so domestication of animals became necessary. The dog was the first animal to be domesticated and after that the ox, sheep, goat and pig were added. For vegetable diet Neolithic man turned to agriculture. Wheat was the most common of the cereals but barley, oats and rye were also cultivated. Flax was used for textiles. Together with the beginning of agriculture went the development of the potter's art. No wheel was used and firing was done in the open, but crude as

the products were, the step was a significant one. "It is impossible to over-estimate the influence that agriculture and the domestication of animals have had on human civilisation. Not only has it increased the density of population, but it has also produced a communal life, by concentrating people who have a mutual interest in flocks, herds, and land cultivation. The increase in numbers helped to exterminate the hunting population of the country. . . . The earliest industries are very similar to those of the Azilio-Tardenoisian age, there being a large number of pigmy chipped flints along with developed flat trapeze-shaped flints. These were probably hafted in a wooden frame and formed what may be described as the teeth of a saw, or the working edge of a sickle. . . . These early times were also characterised by the Campigny pick, and a sort of hatchet (Campigny hatchet) the straight working edge of which is made by the removal of two flakes on either side. Scrapers of all shapes and sizes abound. The next later stage is when tongue-shaped hatchets were frequently polished; these are known as 'celts,' and were often hafted, stag's horn being sometimes used for the purpose. . . . In late Neolithic times we find great Megalithic erections connected with the burial of the dead, and these continue into the succeeding Bronze Age. They are sometimes of the nature of large single upright monoliths, known as Menhirs, which are of almost universal occurrence. There is also the Dolmen, consisting of a circle of monoliths, on which rests an immense slab of rock; this was probably a tomb. How these primitive folk managed to lift these lids on to the pillars of the dolmen is of course a complete mystery. . . . Another kind of Megalithic tomb is the so-called passage chamber grave, or *allée couverte*. This consists of a chamber of large flat upright flags, on which are laid cross flags for the roof. Sometimes when the chamber is large the roof is vaulted, or corbelled. Access to the chamber is gained by a long passage, made also of upright flags with a flagged roof. . . . The last type of Neolithic-Megalithic tomb is the stone 'cist.' The chamber of the *allée couverte* ceases to exist, the passage is shorter, and the end of the passage is used instead of a chamber. These are the latest Neolithic-Megalithic buildings known."—*Ibid.*, pp. 157, 158, 160, 161.—"The northwestern corner of Europe, including Scandinavia; Denmark and the Baltic plain of Germany, throughout the prehistoric period has been characterized by backwardness of culture as compared with the rest of Europe. It was populated from the south, deriving a large part of such primitive civilization as it possessed from the south and the southeast as well. . . . The Paleolithic . . . Age was entirely unrepresented in Sweden. The earliest and simplest stone implements discovered in the southern part of that country betray a degree of skill and culture far above that so long prevalent in France and Germany. Stone is not only rubbed and polished into shape, but the complicated art of boring holes in it has been learned. Norway also seems to be lacking in similar evidence of a human population in the very lowest stage of civilization. . . . In Denmark some few very rude implements have been found. . . . The kitchen middens, or shell heaps of Jutland, for which the region is most notable . . . abound in stone implements. They all represent man in the Neolithic stage."—W. Z. Ripley, *Races of Europe*, pp. 501, 507, 508.

**Lake Dwellings of Switzerland.**—Next in period and interest, come the Lake dwellings of Switzerland, where we find evidence of successive stages of culture, running into the Bronze Age.

"The most indubitable testimony that the Alpine race did not appear in western Europe, armed *cap-à-pie* with bronze and other attributes of culture, is afforded by the lake dwellings of Switzerland. Here in the pile-built villages of the Swiss lakes we can trace an uninterrupted development of civilization from the pure stone age through bronze and into iron. Beginning at a stage of civilization, as Schraeder in his great linguistic work observes, about equal to that of the ancient Aegean speaking peoples judged by the root-words known to us; not only knowledge of the metals, but of agriculture, of the domestication of animals, and of the finer arts of domestic life, have little by little been acquired. Equally certain it is that no change of physical type has occurred among these primitive Swiss, at least until the irruptions of the Teutonic Helvetians and others at the opening of the historic period. In the outlying portions of Europe, perhaps even in Gaul, it is extremely doubtful whether any closer connection between race and culture exists than in the Alps."—W. Z. Ripley, *Races of Europe*, p. 501.—See also LAKE DWELLINGS.

**Bronze Age: Gradual rise of culture.—Primitive trade.—Clothing.**—Towards the close of the Neolithic Age the inhabitants of western Europe had achieved as high a culture as was possible without the knowledge of metals. There are scholars who have tried to explain the development of culture by their biological change, especially as regards cranial capacity. By this time the biological type of Europe had become stable; the changes which have occurred since then are only minor variations that are appearing constantly in every race. When the term stable is used in connection with a racial type it is only a relative term. Since the end of the Paleolithic period there has been a constant acceleration in the rate of cultural change in western Europe. Since there has not been a corresponding change in the physical development of the European, the hypothesis of a correlation between the development of culture and physical type must be discarded. The transition from the Stone Age to the Bronze Age involves greater change than the change from Paleolithic to Neolithic industry, for here entirely new material demanding new technical processes is put into use. By bronze is meant a mixture of copper and tin. Besides bronze these people knew only one other metal, namely gold. It is well to remember, however, that the change from stone to bronze was not abrupt. Bronze and stone implement are found side by side, and in some parts of Europe the introduction of metal was made at a much later date than in others. If we look backward on prehistoric Europe, with its wastes and forests, we see its primitive culture rising slowly and painfully, by successive stages. No doubt this progressiveness was substantially aided by the incoming of peoples, but also by the primitive trade which must have existed from very early times, and of which we find traces in the amber of the north, which was carried to the south, in flints which have been discovered at long distances from their place of origin. How did these ancient European people dress? Of the dress of the Old Stone Age no evidence is left, though it is probable that the people were driven to clothe themselves in the skins of beasts, as they were driven to take refuge in the caves, for protection from the weather. In the Lake Dwellings of the New Stone Age, fragments of coarse net, made of flax fibres or straw, have been found. Rough spindle whorls also appear in the remains found in the Lake Dwellings. Up to the Bronze Period, we have no evidence of

the use of wool for garments; but some time between the later Neolithic and the late Bronze Period, the process of spinning and weaving wool into cloth was invented, and quite elaborate garments were made. Here we are indebted to Scandinavian burial customs for our knowledge. In a tumulus, or burial mound, near Rihe in Jutland, was found the remains of a body together with two caps, a coarse woolen cloak, two shawls, with long fringes, a woolen shirt, and cloth which appeared to have been used for leggings. In another tumulus, on the same farm, four bodies were found which had been clothed in woolen garments, and near Aarhus the discovery was made of the remains of a woman who had been wrapped in a shirt, a cloak which had been fashioned with sleeves, and two shawls. Authorities believe that all this apparel belongs to the Bronze Age, chiefly because weapons and ornaments of bronze were found with the garments.

**SCANDINAVIA.**—"Tardy in its human occupation and its stone culture Scandinavia was still more backward, as compared with the rest of Europe, in its transition to the age of bronze. . . . Nowhere else in Europe does the pure stone age seem to have been so unduly protracted. A necessary consequence of this was that stone working reached a higher stage of evolution here than anywhere else in the world save in America. . . . Bronze culture when it did at last appear in this remote part of Europe, came upon the scene suddenly and in full maturity. Whether this was as early as the eighth to the tenth century B. C. as Montelius avers, is disputed by many. . . . From what part of the world this knowledge of bronze ultimately came, we leave an open question, as also whether it came from Phœnician traders or direct from Greece as Worsaae affirms. . . . This bronze age, like that of stone, lasted a very long time—far longer than anywhere else on the continent."—W. Z. Ripley, *Races of Europe*, pp. 509-510.—Montelius believes that the art of working in bronze was learned by the Scandinavians through intercourse with other people, and was not accompanied by the immigration of strangers.

**GREECE.**—"Greece as portrayed in the Homeric poems, was in the transition between the Bronze and the Iron Ages. Though iron is mentioned, bronze was still used for almost all purposes, even for weapons. It is probable that Homer's description of the heroic age of Greece would in more than one respect apply to the south of Scandinavia three thousand years ago, at least if we do not allow our eyes to be dazzled by the poetic shimmer which hangs around the heroes of the Trojan war. That the condition of Greece during its Bronze Age was actually in many ways like that of the North during the same stage of its civilisation, has also been proved by the remarkable finds . . . made in Greece. It should however be borne in mind that the Bronze Age both began and ended in that country earlier than in the North."—O. Montelius, *Civilization of Sweden in heathen times*, p. 88.

**Iron Age.**—"In a secluded valley in Upper Austria, close to the border line of Salzburg, by the little Alpine hamlet of Hallstatt, a remarkable necropolis was discovered . . . which marked an epoch of archaeological research. . . . The primitive cultures here unearthed, represented by all kinds of weapons, implements and ornaments, bore no resemblance to any of the then known classical ones of the Mediterranean basin. Its graves contained no Roman coins or relics. There was nothing Greek about it. . . . It was obviously prehistoric; there was no suggestion of a likeness to the

early civilizations of Scandinavia. . . . It was even more primitive than the Etruscan, and entirely different from it, especially in its lack of the beautiful pottery known to these predecessors of the Romans. . . . Later discoveries all over eastern Europe south of the Danube, from the Tyrol over to the Balkan peninsula, as well as throughout northern Italy, Württemberg, and even over into northeastern France, the wide extension of this civilization proves that it must in a large measure have developed upon the spot, and not come as an importation from abroad. On the other hand, its affinity in many details with the cultures both of Italy and Greece proved that it had made heavy drafts upon each of these. . . . The primitive stage of European civilization, to which the term Hallstatt is specifically applied by archaeologists [from this find] is characterized by a knowledge both of bronze and iron, although the latter is relatively insignificant. Its rarity indicates that we have to do with the very beginnings of its use. In this early combination of bronze and iron the Hallstatt culture is in strong contrast with the rest of Europe. Almost everywhere else, as in Hungary, for example, a pure bronze age—sometimes one even of copper also—intervenes between the uses of stone and iron. Here, however, the two metals, bronze and iron appear simultaneously. . . . The Hallstatt civilization of bronze and iron roughly overlies the present area occupied by the brachycephalic Alpine race; yet this type is not always identified with the Alpine culture. It appears to have appeared in Europe in a far lower stage of civilization, and to have subsequently made progress culturally upon the spot.”—W. Z. Ripley, *Races of Europe*, pp. 400, 407.—“Hallstatt culture extended from the Iberian peninsula in the west to Hungary in the east, but scarcely reached Scandinavia, North Germany, Armorica or the British Isles where the Bronze Age may be said to have lasted down to about 500 B. C. Over such a vast domain the culture was not everywhere of a uniform type and Hoernes recognises four geographical divisions distinguished mainly by pottery and fibulae, and provisionally classified as Illyrian in the South West, or Adriatic region, in touch with Greece and Italy; Celtic in the Central or Danubian area; with an off-shoot in Western Germany, Northern Switzerland and Eastern France; and Germanic in parts of Germany, Bohemia, Moravia, Silesia and Posen. The Hallstatt period ends, roughly, at 500 B. C., and the Later Iron Age takes its name from the settlement of *La Tène*, in a bay of the Lake of Neuchâtel in Switzerland. This culture, while owing much to that of Hallstatt, and much also to foreign sources, possesses a distinct individuality, and though soon overpowered on the Continent by Roman influence, attained a remarkable brilliance in the Late Celtic period in the British Isles. That the peoples of the Metal Ages were physically well developed, and in a great part of Europe and Asia already of Aryan speech, there can be no reasonable doubt. A skull of the early Hallstatt period, from a grave near Wildenroth, Upper Bavaria, is described by Virchow as long-headed, with a cranial capacity of no less than 1585 c.c., strongly developed occiput, very high and narrow face and nose, and in every respect a superb specimen of the regular-featured, long-headed North European. But owing to the prevalence of cremation the evidence of race is inadequate. The Hallstatt population was undoubtedly mixed, and at Glasinatz in Bosnia, another site of Hallstatt civilisation, about a quarter of the skulls examined were brachycephalic. Their works, found in great abundance in the graves, especially of the

Bronze and Iron periods, but a detailed account of which belongs to the province of archaeology, interests us in many ways. The painted earthenware vases and incised metal-ware of all kinds enable the student to follow the progress of the arts of design and ornamentation in their upward development from the first tentative efforts of the prehistoric artist at pleasing effects. Human and animal figures, though rarely depicted, occasionally afford a curious insight into the customs and fashions of the times. On a clay vessel, found in 1806 at Lahse in Posen, is figured a regular hunting scene, where we see men mounted on horseback, or else on foot, armed with bow and arrow, pursuing the quarry (nobly-antlered stags), and returning to the pent-house after the chase.”—A. H. Keane, *Man, past and present*, pp. 28-29.

SCANDINAVIA.—“During the Iron Age the inhabitants of Sweden became first acquainted with iron, silver, brass, lead, glass, stamped coins (of foreign production), and learnt the art of soldering and gilding metal, &c., &c. And as works of iron could not, like those of bronze, be produced only by casting, the smith’s craft came to have far greater significance than it had had during the Bronze Age. But of the new discoveries of this period one of the most important was the art of writing, which the inhabitants of the North seem to have acquired soon after the beginning of the Christian era. The earliest alphabetical symbols in Sweden—indeed the only ones used in that country during the whole of heathen times—were the *runes*.”—O. Montelius, *Civilization of Sweden in heathen times*, p. 80.

## INTRODUCTION TO HISTORIC PERIOD

Distribution of races of Europe.—Before discussing the distribution of races in Europe it is well to understand thoroughly the concept of race as it is now used in anthropological treatises. It is obvious that the peoples of the world differ in physical characteristics from one another. But likewise do the people of a single country, a single community differ; and again people chosen at random from two distinct countries may look very much alike. Beginning with the family and the community there is variation among the members due to heredity and selection. Then members of two different communities may represent two different types and lastly the various types are linked together to form a race. This means that a race is the most extensive classification of mankind. In the nineteenth century it was customary to divide mankind into a great many races. Deniker as an exponent of this divided the peoples of Europe into six primary races, the Northern, the Littoral or Atlantic-Mediterranean, the Eastern, the Adriatic or Dinaric, the Ibero-Insular, and the Western or Cevenole, and added to this four secondary races, the Sub-Northern, North-Western, Vesterland, and Sub-Adriatic. Although some of these classifications have been retained, they are regarded from a different point of view. They are no longer considered races but merely types and variations of types. The present tendency is to reduce the number of existing race to three large divisions; the White, Mongoloid and Negroid. Of course under such a wide classification all the peoples of Europe are members of one race—the white—and therefore what we are discussing are not *races* of Eu-

rope but *types*. Ripley still calls his divisions, races, but in reality they are the three general types of the white race as found in Europe. They are: Teutonic, Alpine and Mediterranean. Before discussing these classifications in detail it is necessary to state briefly the standards which are used in determining races and type. Race is a purely biological classification and we must regard only physical characteristics in any discussion of racial classification. One feature of physical appearance is insufficient as a basis for division, so anthropologists have decided on the following group of criteria: head form, skin, hair and eye color, stature. All of these features are extremely variable in our race and the measurements of individuals from different races may coincide. Head form is measured by the cephalic index which is derived in the following way: The length of the head is taken from the glabella, a point between the eyes to the furthestmost point at the back of the head; the width of the head is taken at the widest point approximately over the ears. From these measurements an index is derived by the following formula:

$$\frac{\text{Width} \times 100}{\text{Length}} = \text{Cephalic Index}$$

The cephalic index is classified in the following groups:

$$\begin{aligned} X - 74.99 &= \text{Dolichocephalic} \\ 75.00 - 79.99 &= \text{Mesocephalic} \\ 80.00 - X &= \text{Brachycephalic} \end{aligned}$$

In other words the higher the index the broader the head. A factor of great assistance in identification of racial types is the connection between the proportions of the head and the form of the face. In Europe a relatively broad head is accompanied generally by a rounded face. It is important to bear in mind the fact that the shape of the head bears no direct relation to intellectual power or intelligence and therefore to culture. The term dolichocephalic can only be applied to a race or a type if one makes the mental reservation that such a generalization is very sweeping and may be contradicted by a multitude of individual measurements and even by group measurements. As to Europe, if we follow Ripley's classification of Teutonic or Northern, Alpine or Central and Mediterranean or Southern we find that the Northern types are generally dolichocephalic, the Alpine type both dolichocephalic and brachycephalic and the Southern type, dolichocephalic. The next standard is skin color. The range of skin color in every race is very great. Even in the white race there are some individuals with a darker skin color than many Mongols. This is particularly true of the Southern European types. With skin color there is usually associated eye and hair color. In Europe the range of eye color is from light blue to dark brown, the former being characteristic of the Northern type and the latter of the Southern with a mixture of the two in the Central or Alpine group. With the blue eyes goes blond hair and with the brown eyes dark hair making up the two well known types, blond and brunet, which characterize the Northern and Southern types respectively. The range of variability in each type of the skin, hair and eye color is so great that it can not be used as a safe index of racial type. It is very inferior to such a standard as head form as expressed in the cephalic index. Finally stature—here again the variability is very great. Much of this variability has been traced to the influences of geographical environments and economic condition. The standard of

living in the Scandinavian countries has risen considerably in the last century and the stature of the population has increased about 1½ inches. This fact alone would not prove any correlation between stature and economic condition, if there were not other observations to substantiate it from other countries. In the European types we can generally associate tall stature with the Northern peoples and short stature with the Southern peoples, but this statement must not be applied too rigidly for in this case as in the preceding standard of pigmentation, there is considerable variability within the type.

To summarize then the three European types we have: Northern (Teutonic of Ripley; Nordic of Deniker): dolichocephalic or long headed; long face, very light hair, blue eyes, tall stature, narrow acquiline nose. Central (Alpine of Ripley): brachycephalic; broad face, light chestnut hair, hazel-grey eyes, medium stature with tendency to stockiness; shape of nose variable, but often broad and heavy. Southern (Mediterranean of Ripley, Atlantic-Mediterranean of Deniker): dolichocephalic, long face, dark brown or black hair, dark eyes, stature medium height, slender, shape of nose rather broad. In spite of these distinctions between the physical type of European population it must be remembered that there is no such thing as a pure type anywhere on the continent. In no other part of the world, save possibly modern America, is there such an amalgamation of various peoples as there has been in Europe for centuries. There is a continual disappearance of tribes and appearance of new peoples. Even if the environment were uniform, pure types would be exceedingly rare. Rarely is an individual found who combines more than two traits of his racial type. So it must be borne in mind when racial types are classified that such divisions are the results of group averages and that every member of the group does not possess all the characteristics enumerated. . . .

It is a commonplace that the languages of the world are divided into large stocks or families. The one which has been most thoroughly studied is the "Aryan," "Indo-European," or "Indo-Germanic." It is generally agreed that Sanskrit was probably the oldest form of this linguistic family and that from somewhere in Asia this language spread over a large part of Asia and most of Europe. The Indo-European languages of Europe fall into four groups: Romance, Celtic, Teutonic and Latin-Slavic, and to these must be added Greek and Albanian. "The only non-Aryan language in Western Europe is Basque, spoken by a people dwelling on both sides of the Pyrenees. There seems little doubt that it is the last remnant of a great family of agglutinative languages which prevailed widely throughout Europe and probably also on the Southern shores of the Mediterranean in Neolithic times. . . . The Hungarian language belongs to the Finno-Ugrian stock, and was, of course, brought in by one of the numerous tribes of Mongoloid origin who wandered into Eastern and Central Europe during the Dark Ages. This language is now, however, spoken by a people who approximate to the Alpine type of Central Europe and have lost their Asiatic features. On the other hand, the Bulgarians, another Finnic people, have settled in the Eastern half of the Balkan Peninsula, and have exchanged their original language for a Slavonic one; while the Roumanians physically resembling their neighbours of Slavonic speech have exchanged a Slavonic tongue for a Romance one. . . . It has of course always been known that the Romance languages owe their present distribution not to the circumstance that they were car-

ried to the lands in which they now prevail by a single race, but to the fact that these lands were once under the influence of a common civilization. Hence, although we meet the expression 'Latin race' in newspapers and reviews, we do not encounter it in manuals of ethnology. The origin, growth and distribution of the Celtic, Teutonic and Slavic branches of the Aryan family are, however, shrouded in much obscurity, and this fact has enabled writers to employ these terms now in a linguistic and now in an ethnological sense. The tall fair-haired barbarians who swarmed down from the Alps upon the Italian plains were called by the classical writers Celts, though in the first century before the Christian era, at the time of Cæsar's conquest of Gaul, a distinction between the Celts and the Teutons began to be made. The Slavs do not, however, figure prominently in European history till Byzantine times. [From this brief survey it is quite clear that the three racial types of Europe are affiliated with diverse languages. The correlation of these two features will be discussed again].—A. L. Kroeber and T. T. Waterman, *Source book in anthropology*, pp. 182-184, 178.—See also ARYANS: Distribution; PHILGEOLOGY.

**Migrations.**—That man has veritable propensity for migration is shown in the history of every part of the globe. But there is always some cause for a great shifting of population. Reduced to simplest terms the cause is either an expulsion, or attraction, the former often resulting from a lack of food. Sooner or later almost every country has a population that exceeds its food supply. Then migration begins. Movements of men following the laws of physics are always in the line of least resistance and the control of migrations is due mainly to geographical conditions. The evidences for migrations are to be sought in physical characteristics of peoples, their material culture, their customs, folk lore and language. Although many of the phases of culture may be borrowed without a corresponding change in population, they may become good sources of evidence when used judiciously. "After the close of the Palaeolithic period the main existing races of Europe began to appear. Various branches of the Mediterranean race first spread over southern and western Europe and the British Islands as Neolithic man. The pygmy dolichocephals of Neolithic times, whose remains have been found in Switzerland, may possibly be representatives of a race that has disappeared, leaving traces of its short stature in other countries. During the Neolithic period the forerunners of the Alpine race expanded westwards along the mountainous forest-zone of Europe and up the valley of the Danube, and settled in central France. The Northern, or Nordic, race extended into western Europe later. As in western Asia, so in Europe, the Alpine race consists of short and tall stocks. On the whole, this race has kept faithfully to its upland habitat, but in Neolithic times members of it spread across western Germany to Denmark and south-western Norway, coming in contact with the tall, fair dolichocephals of the Northern race. Thus in north-central Europe a tall, broad-headed people arose who brought the fashion of erecting round barrows into Britain. According to Rice Holmes, bronze was brought to Britain by more typical members of the Alpine race, possibly about 1800 B. C., and the first of various invasions of Celtic-speaking peoples probably arrived here about 800 B. C. The Umbrians passed south into Italy during the bronze age, but were checked and driven up into the Apennines by the rise of the Etruscan power early in the first millennium B. C.

The Etruscans are said by tradition to have come from Lydia, but this may have been mainly a cultural drift. [See also ETRUSCANS; ITALY: Ancient.] The mixed peoples of Northern and Alpine descent, in which the Northern blood predominated, appear to have possessed exceptional virility. The ancient writers indiscriminately termed them Keltoi, and described them as tall, fair-haired, and grey-eyed. [See also CELTS: Early history.] The earliest historical movement of this stock was that of the Achæans, who about 1450 B. C., with their iron weapons mastered the bronze-using inhabitants of Greece. [See also ACHÆA; GREECE: Indo-European migrations.] Later the Cimmerians, whom we are not justified in calling Kelts, from their home north of the Black Sea wandered into Thrace and crossed over to Asia Minor, others, when hard pressed by the Scythians, passed round the east side of the Black Sea to Asia Minor. [See also CIMMERIANS.] Celtic-speaking peoples during long periods swarmed across the Rhine into France, and were there firmly established at latest by the seventh century B. C. They are believed to have occupied Spain at the beginning of the sixth century B. C., and about the same time may have made their first appearance in Italy. A later and much more important wave, shortly before 400 B. C., broke up the Etruscan power and took Rome. A repetition of earlier movements westward across the Rhine is to be found in the case of the Belgæ, a Kelto-Teutonic people, who considerably before the first century B. C. occupied the north-eastern part of Gaul and about the same time acquired part of the south of Britain. [See also BRITAIN: Celtic tribes.] . . . Thenceforward the great movements in and from northern Europe were mainly those of purely Teutonic peoples. The Cimbric neighbours of and probably akin to the Teutoni, driven from the north of Denmark, it is said, by inundations, made their way into the Danube Valley, then turned west and ravaged Gaul; finally, they invaded Italy and were destroyed by the Romans in 101 B. C. [See also CIMBRI AND TEUTONES.] During the last two or three centuries before the Christian era the Teutonic peoples appear to have been pressing the Celtic peoples across the Rhine; this movement was stopped by the Romans from the time of Julius Cæsar onwards. Augustus actually reduced the whole of west Germany, but after his time the Romans had to be content with the Rhine as their frontier. In the latter part of the second century A. D., the Teutonic pressure became formidable on the Danube frontier, to which the campaigns of Marcus Aurelius gave a temporary relief. [See also GERMANY: 3rd century.] Not long afterwards the Goths were moving in a southeasterly direction, and early in the third century A. D. came in conflict with the Romans in the neighbourhood of the Black Sea. In the fourth century, when the Roman Empire was weak, the Goths, Vandals, and other Teutonic peoples made their way into the Balkan Peninsula and adjacent regions. [See also GOTHS; TEUTONES; VANDALS.] Early in the fifth century the Vandals moved westwards, overran Gaul and Spain, and formed a kingdom in the north of Africa. The result of this movement of the Vandals was that the Roman frontier in western Germany was destroyed, and the Alemanni and Bavarians pushed their way southwards as far as the Alps. [See also ALEMANNI.] A few years later the Visigoths penetrated into Italy and captured Rome in 410 A. D. [See also GOTHS: 376; 378]; thence they moved into the south of France and Spain, where their kingdom lasted until the beginning of the eighth century. [See also GOTHS: 400-403 to 453-484;

507-509; 507-511.] In the second quarter of the fifth century A.D., the Romans had to abandon all their territories west of the lower Rhine to the Franks, who for some three quarters of a century or more had been pushed westwards by the Saxons. The Frankish movements were brought to a head by Clovis, who towards the end of the fifth century succeeded in conquering almost the whole of Gaul. About 507 he deprived the Visigoths of southern Gaul of most of their possessions. [See also FRANKS: 481-511.] . . . Huns, coming from central Asia, appeared in Europe in the latter part of the fourth century, and were welded by Attila into a powerful kingdom, in central Europe. They conquered all the Teutonic peoples in this region, and through pressure from them the Burgundians were forced to move westwards into the east of France. [See also HUNS.] The disruption of the Huns resulted from their defeat at Chalons. Then the Ostrogoths, who had been subject to the Huns, began to assert their strength against the Romans. Under their king Theodoric they conquered Italy, where their kingdom lasted till about 554. [See also GOTHs: 350-375; 473-474; 473-488; 553.] In the meantime other Teutonic nations had been coming southwards to the Danube region, among them the Langobardi, who by this time had settled in what is now Austria. [See also LOMBARDS.] Some time in the sixth century a new wave of invasion spread from Asia, known as that of the Avars. They swept across Russia, driving Bulgars, Slavs, and others before them, till they reached the lower Danube, on the left bank of which Justinian gave them land. In 562 they fought with the Franks on the Elbe, Langobardi and Avars combined and crushed the Gepidae, who were dominant after the departure of the Ostrogoths, and in 567 the Langobardi, under their King Alboin, moved into Italy, where they permanently settled. This was the last of the great Teutonic migratory movements. The Avars were thus left in command of the greater part of the Danube valley. [See also AVARS.] Later, with the Slavs, who had reached Hungary across the Carpathians in the sixth century, they overran the Balkan Peninsula, nearly capturing Constantinople in 625; they were finally crushed in 796 by Pippin I. of Italy, acting for Charlemagne. In 635 the Bulgars, who had come with the Huns from the south Russian steppe, revolted from the Avar dominion and subsequently crossed the Danube into the Balkan Peninsula and effected settlements in Italy in 680. The Hungars had advanced from the Urals to the Volga in 550, and reached the Danube about 886. Joined by the Magyars and other Turki tribes they dominated the Slavs, and founded the kingdom of Hungary in Pannonia, which absorbed all that remained of the successive Hun and Avar empires of the fifth and sixth centuries. [See also HUNGARY: Origin; 896.] The westward migration of Asiatics into Europe ceased about the seventh century; their advance was for the future directed into Syria and along the north coast of Africa, but in the eighth century the Arabs with Berbers pushed into Spain and France from Mauretania, and later made incursions into other Mediterranean countries. We have seen that the British Isles were early inhabited by a branch of the Mediterranean stock, and were subsequently conquered by invasions of Keltic-speaking peoples. In the third century A.D. Teutonic peoples appeared in the British seas, and this movement increased in intensity during the following centuries, bringing the Jutes, Saxons, and Angles from Denmark into our country. About the same time the Saxons were raiding in Normandy and Picardy, and established themselves about

Bayeux. From the end of the eighth century onwards we find a series of maritime movements, often on a large scale, from Scandinavian countries. They brought about Scandinavian settlements in the British Isles in the course of the ninth century, and on the north coast of Europe, especially in Normandy. [See also BARBARIAN INVASIONS: 5th-6th centuries; ENGLAND: 449-473 to 547-633; 855-880; 979-1016; 1066; NORMANS; SCANDINAVIAN STATES: 8th-9th centuries.] At the same time other movements spread across the Baltic, the chief settlements being Kief and Novgorod, which led ultimately to the foundation of the Russian Empire by the Varangians in the course of the tenth century. [See also VARANGIANS; RUSSIA: 9th-12th centuries.] The Turks approached Europe from south of the Caspian Sea: in 1063 the Seljuks had crossed the Euphrates and in 1084 occupied Asia Minor; Jerusalem was captured in 1071. After the lapse of two centuries the Osmanli or Ottomans began a fresh advance from Phrygia, gradually establishing themselves in the Balkan peninsula; Macedonia was occupied in 1373, in 1385 they extended northwards and took Sophia, in 1453 Constantinople was taken, and in 1460 the Morea. [See also TURKEY: 1063-1073; 1240-1326; 1326-1359; 1360-1389.] Nearly a century later they conquered Hungary, which was under Turkish dominance from 1552 to 1687. The Slavs, who belong to the Alpine race, seem to have had their area of characterisation in Poland and the country between the Carpathians and the Dnieper; they may be identified with the Venedi. Lefevre emphasises the mixture of races embodied in the Slavs, between whom and the Germanic peoples constant overlapping has taken place. The great south and west movements of the Teutonic peoples were followed by corresponding advances of Slavonic tribes, who spread across the Oder and Elbe and down the Vistula to the Baltic. Their wide distribution over north-east Germany by the sixth century is attested by place-names. During the last millennium the German language has regained the ground lost, but the broad-headed Slavic type persists. The south-westward expansion of the Slavs had by the end of the sixth century carried them across Bohemia as far as the eastern Alps; thence they went across Pannonia and Illyria to the Adriatic, and in combination with the Avars occupied most of the Balkan Peninsula. By about the ninth century they had extended across the area occupied by the Finns and established themselves at Novgorod, and apparently penetrated to the Oka and Upper Volga. Their northward expansion was uninterrupted, but in the south-east it was checked by the advent of the Turks. The southern division of Slavs was cut off from the northern by the Magyar empire and later by the growth of the Roumans. [See also SLAVS.] This general survey of movements shows that the Neolithic trend of Asiatic peoples from east to west has been continued during the first millennium of our era by steppe peoples, in this case arriving north of the Caspian; the Osmanli, who came in somewhat later, alone followed the old route of the Alpine race. Although the hordes of Asiatic nomads made a profound impression in Europe and led to many movements of population, only in relatively few places did they effect permanent settlements. The Northern race, once settled along the shores of the Baltic and North Sea, constituted a fresh source of disturbance. They were a people lightly attached to the soil, and streams of migration radiated west and south; there was no special inducement to move east, and in any case advance in that direction was checked by invasions from Asia. On the other hand, the occur-

rence of gold in Ireland and the rich soil of France and northern Italy were strong attractions for migrating west and south. The Alpine peoples had developed the art of metal-working, first in bronze and later in iron, and, having command of the trans-European trade-routes, had advanced in civilization. Their culture profoundly affected the Nordic tribes with whom they came in contact, and with whom they mixed to a greater or less extent. It is these who formed the vanguard of the migrations from northern Europe. It is interesting to note that, despite all the movements which have taken place, the distribution of the racial elements in the population of Europe is very similar to that of late Neolithic times."—A. C. Haddon, *Wanderings of peoples*, pp. 40-49.—See also BARBARIAN INVASIONS.

#### Correlation of race, nationality and language.

—The correlation of these three features has been the subject of a long series of furious debating and writing. With this question there is always associated the desire to prove that the white race is superior to the others. One of the early exponents of this theory was Gobineau whose thesis is: the superiority of the white race and within it, of the Aryan family. More recently Madison Grant in the "Passing of the Great Race" again lauds the Nordic type as the one progressive, intelligent people. H. G. Wells seems to have a similar notion for he attempts in his "Outline of History" to show that the Greeks are affiliated with the Nordic type in order to explain their civilization. In all these discussions the bases of classification are hopelessly confused. Race is a biological concept; language is a feature of culture and nationality and is a purely arbitrary, unstable, territorial division, a comparatively recent development. "We see thus that in the history of Europe the races appeared first, the languages second and the nationalities last. The three great European races have been established roughly in their present position since the Bronze Age, perhaps even since the Neolithic. The great linguistic divisions, Romance, Celtic, Teutonic, Slavonic and Finno-Ugrian, occupy approximately the same geographical areas which they occupied a thousand years ago, but nationality is a phenomenon which scarcely existed before the Renaissance. Political accidents have determined why certain linguistic areas have attained to the dignity of independent States while others have been divided between two or more States and others again are in the position of submerged nationalities. This may be best illustrated by the political history of the Iberian Peninsula. The physical characters of the inhabitants of this part of Europe are remarkably uniform, the population being dolichocephalic and brunet. There is not a single brachycephalic province in Spain. Throughout the Peninsula four languages are spoken, the pre-Aryan Basque in three Northern provinces, Guipúzcoa, Viscaya and Alava, and three Romance tongues, Catalan in the Eastern portion of the Peninsula, Castilian throughout the centre from north to south, and Portuguese in the west extending across the Northern frontier of Portugal into the Spanish province of Galicia. If race in the physical sense was to decide political boundaries then the whole Peninsula ought to be under a single Government; if language, then, (setting aside the Basques) we should have three States, viz: Portugal, Castile, and Catalonia. As a matter of act, we have two—Portugal and another embracing Castilians and Catalans which we call Spain. When we look into the cause of this we find that it is due to a marriage contracted in the 15th century between a Queen of Castile and a King of Aragon; if, on the other hand, as Freeman

has pointed out, Isabella of Castile had married the King of Portugal instead of the King of Aragon, we should still have had one race and four languages in the Peninsula, but different nations from those which we find to-day. Since the inhabitants of Portugal and Castile would have formed a nation which we should still probably call Spain, while Aragon and Catalonia would have either formed a separate nation or would have become absorbed into France. [Europe offers one of the severest tests to anthropology in the unravelling of this problem. When we compare again the distribution of racial type in relation to language we see how very impossible it is to draw political frontiers along these lines. Rarely do the boundaries coincide, and political self determination for such scattered communities, as the linguistic colonies around the Baltic would create a veritable chaos.] . . . If then ethnologists would agree to denominate the three main physical types in Europe the Nordic, Alpine or Alpine-Armenoid and the Mediterranean, and to use the term 'Celtic,' 'Teutonic' and 'Slavonic' solely as linguistic terms as is now being done with the term 'Aryan,' an immense amount of confusion would be saved. By persisting in their use as racial terms we are only inviting confusion, as all must admit when we reflect that Celtic languages are spoken by peoples of Nordic type in Scotland, Mediterranean type in Ireland, and Alpine type in Brittany; Teutonic languages by peoples of Nordic type in Britain, Holland, Scandinavia and North Germany, and by members of the Alpine race in South Germany, Switzerland and Austria, while Slavonic tongues are spoken by Nordic peoples upon the shores of the Baltic and by Alpine ones in the Balkans, and, lastly, we find the Romance languages spread among the three races. These are spoken among peoples of Nordic type in Northern France and Belgium, among peoples of Alpine type in Central France and Northern Italy and among peoples of Mediterranean type in Southern France, Spain, Portugal and Italy. . . . Teutonic speech seems to have been communicated to peoples of Alpine stock by southerly and westerly migrations of the tall, blonde dolichocephals of Northern Europe. These problems are, however, all subordinate to the main one in the relations of race and language in Europe, viz., to which of the three European races must we ascribe the original introduction of Indo-European languages into our continent?"—A. L. Kroeber and T. T. Waterman, *Source book in anthropology*, pp. 181-184.—See also PHILOLOGY.

Geographic background.—"In many respects Europe may be considered the most favoured among the continents. The Caspian Sea, the Black Sea, 'the long intervention of the Mediterranean,' the Atlantic 'with its Baltic bulge and polar tentacles,' give the continent a matchless 'oceanic' position. There is therefore practically no desert in Europe, though the rainfall is uncertain in the Iberian peninsula and in eastern Russia. Steppe land is at a minimum compared with central Asia. And though the Alps, the core of the continent, are not inconsiderable in height, they do not form 'centres of repulsion' like the Himalayas or the Pamirs, which even birds avoid in their flight. West and south of the great Russian levels and Prussian plains, the development of the surface tends rather to beauty than to infertility. Moreover, no coast-line is so highly 'articulated,' and therefore good harbours are plentiful, along with navigable rivers facilitating commerce from the inmost centres of the country almost to every point upon the circumference. The broad result is that man has had freer development here than in any other continent, 'nature,'

having less coercive power over him than in Africa, Australia, Asia, or even the two Americas. Why then, in culture, did the continent ostensibly lag behind the north-east nook of Africa and all the other primary civilisations? . . . To say that the races were 'by nature' unoriginal is to give no explanation of how they not only came to acquire culture, but to climb to the supremest heights of civilised attainment. . . . The sober view of the case seems to be that the original European races were all potentially capable of progress, but were simply hampered by special conditions. What these conditions were we, of course, can never actually know. But positive factors of explanation may lie along such lines as these. The whole of southern Europe is mountainous, . . . indeed practically bisecting Europe in ancient days and causing peninsular life to evolve out of harmony with the 'hinterlands.' Then, again, the forests seem to have been considerable, and the valley bottoms and plains marshy and malarial, as many of them still remain. The general 'fragmentation' of the country would thus lead to a prolongation of the hunting and pastoral stages, and tillage would gain but slowly, not only through want of great fertile nuclei, but also through lack of protection from predatoriness on whatever scale. Even in later Roman times forests and quaking bogs abounded in 'Germany,' striking terror to the very soul of legionaries. The woodlands therefore might be as great an obstacle to advance in tillage in these times as the eastern forests of America to the Pilgrim Fathers, and probably encouraged methods of warfare similar to that of the forest Indians. Where the trees ceased on the borders of the great Russian plains, the pastoralist would have to be faced in all his ferocity. . . . The great rivers of the country, of course, still availed for travel, when, in the genial season, rain made the country a sea of mud. In winter, when the rivers were frozen over so was the mud, and even the swamps became traversible by the frost. Indeed, winter in Russia is the great season of travel. But the open horizons never seem to have presented any real obstacle to the advance of even the greatest masses of men. . . . So long as Europe remained uncultivated there would be no great plunder for the pastoralist, for it is tillage alone that makes wealth superabundant—at any rate, until these days of the exploitation of coal and iron, when manufactures are a still greater source of wealth. For centuries upon centuries, therefore, the country may have laboured simply under local antagonisms—its population and its riches thinning out west and south to the surf of the Atlantic, which was but a waste of waters until the discovery of America shifted the whole centre of gravity to the occident. But, when Greece and Rome began to manifest power and riches, their stores not only roused the predatoriness of the nearer 'barbarians,' but tempted tribes out of the very heart of Asia."—A. R. Cowan, *Master-clues in world-history*, pp. 73-77.—"We see the hunters of prehistoric Europe wandering through the tropical forests, especially in the regions which are now France and Spain, but also across the land-bridges at Gibraltar and Sicily, which connected Europe and Africa until far down in the Neolithic age. This intimate connection between southern Europe and northern Africa made culture diffusion across the Mediterranean easy, and before the end of the Quaternary Age the entire Mediterranean was fringed with communities of Paleolithic hunters. Today their weapons of flint are found encircling practically the whole Mediterranean. This fact brings the Near East into the great current of prehistoric life. Whether the rate of advance

was uniform and the successive stages therefore contemporaneous at first all around the Mediterranean is uncertain. If compared with the southern shores of the Mediterranean, Europe was undoubtedly at a serious disadvantage, as the northern mantle of ice crept southward and thousands of years of rigorous cold set in. It is now evident that the south-eastern corner of the Mediterranean eventually drew away from prehistoric Europe, and probably from prehistoric Asia also. The great Pleiocene rift in north-eastern Africa, which we call Egypt, furnished a home in every way so sheltered, so generously supplied by nature, and in climate so benign, that it enabled the savage Stone Age hunters of the Sahara, who had taken refuge there in Quaternary times, to leave Europe far behind in the advance toward civilization. As the Euphrates valley followed in this advance, it was in touch with the Nile culture, and there thus grew up the Egypto-Babylonian culture-nucleus on both sides of the inter-continental bridge connecting Africa and Eurasia."—J. H. Breasted, *Place of the Near Orient in the career of man (Journal of the American Oriental Society, June, 1919, pp. 164-165)*.

## ANCIENT

## Greek civilization

Its heritage.—Cretan and Ægean civilizations.—"That Crete itself—the 'Mid-Sea Land,' a kind of halfway house between three continents—should have been the cradle of our European civilization was, in fact, a logical consequence of its geographical position. An outlier of mainland Greece, almost opposite the mouths of the Nile, primitive intercourse between Crete and the farther shores of the Libyan Sea was still further facilitated by favorable winds and currents. In the eastern direction, on the other hand, island stepping-stones brought it into easy communication with the coast of Asia Minor, with which it was actually connected in late geological times. But the extraneous influences that were here operative from a remote period encountered on the island itself a primitive indigenous culture that had grown up there from immemorial time. . . . The continuous history of the Neolithic age is carried back at Knossos to an earlier epoch than is represented in the deposits of its geographically related areas on the Greek and Anatolian side. But sufficient materials for comparison exist to show that the Cretan branch belongs to a vast province of primitive culture that extended from southern Greece and the Ægean Islands throughout a wide region of Asia Minor and probably still further afield. . . . It is interesting to note that the first quickening impulse came to Crete from the Egyptian and not from the oriental side—the eastern factor, indeed, is of comparatively late appearance. My own researches have led me to the definite conclusion that cultural influences were already reaching Crete from beyond the Libyan Sea before the beginning of the Egypt-

tian dynasties. . . . The high early culture, the equal rival of that of Egypt and Babylonia, which thus began to take its rise in Crete in the fourth millennium before our era, flourished for some two thousand years, eventually dominating the Aegean and a large part of the Mediterranean Basin. To the civilization, as a whole, I ventured, from the name of the legendary king and lawgiver of Crete, to apply the name of 'Minoan,' which has received general acceptance. [See *ÆGEAN CIVILIZATION: Minoan Age.*] . . . Eastern elements are more and more traceable in Cretan culture and are evidenced by such phenomena as the introduction of chariots—themselves perhaps more remotely of Aryan-Iranian derivation—and by the occasional use of cylinder seals. . . . In spite of the overthrow which about the twelfth century before our era fell on the old Minoan dominion and the onrush of the new conquerors from the north, much of the old tradition still survived to form the base for the fabric of the later civilization of Greece."—A. Evans, *Origins of civilization in Europe (Annual Report of the Smithsonian Institution, 1916, pp. 439-444)*.—"From the close of the third millennium B. C., when Europe was slowly emerging from the Stone Age, Greece was constantly overrun by migrating shepherd chieftains and their clansmen, who, we believe, spoke an Aryan tongue and held Aryan institutions. They came overland from the north through a mountainous region, and brought with them, as precious possessions, the patriarchal system (basis of a strong polity), a rich spoken language, and a store of myths, but no writing so far as has been ascertained. . . . This invasion of a pastoral fighting folk, known to us through Homer as the Achæans, was a gradual infiltration from a remote past of chieftains and their retainers, at no time very numerous. . . . Tradition leads us to believe that some came from civilized lands, where their sires had already acquired great wealth; the last wave of Achæan invaders may even have brought iron. . . . Mercantile enterprise carried Ægeans, notably Cretans, to distant lands, in search of raw materials for their own use and for trade. Europe was a rich field for exploration, yielding hides, wool, and, above all, metals; for copper, tin, and iron were all to be found within the areas drained by the Danube. Dr. Mackenzie thinks, 'By the beginning of the Bronze Age, the valley of the Rhone must have played a dominant role of communication between the great world of the Mediterranean and the north; by that time it was probably already the high continental trade route towards the tin mines of Britain'—or of Brittany as M. Siret would suggest. The Black Sea gave them another highway, for by sailing to its eastern end they made connections with land routes from the region south-east of the Caspian, which was especially rich in tin. . . . Simultaneously with the Cretan expansion under King Minos there came increase of power and wealth among the lords of Argos, Mycenæ, and other pre-Hellenic capitals of Greece. Thucydides says: 'the dwellers on the sea-coast began to grow richer and live in a more settled manner; and some of them, finding their wealth increase beyond their expectations, surrounded their towns with walls.' These princes were kinsmen of the Minoans with an Achæan admixture. . . . The shaft-graves of Mycenæ and the bee-hive tomb of Vaphio contained art treasures of Cretan origin, made in the era just preceding the supposed reign of King Minos. It further appears that the increasing wealth of the Achæo-Pelasgian lords attracted Minoan artists and artisans to the chief pre-Hellenic centres on the mainland—a peaceful invasion. Mycenæan architecture is not so ob-

viously derived from Crete. The Pelasgians were themselves great builders, having at their command a better, more enduring stone than any the island produced."—C. H. and H. B. Hawes, *Crete the forerunner of Greece, pp. 146-151*.—"Simultaneously with its eastern expansion, which affected the coast of Phœnicia and Palestine as well as Cyprus, Minoan civilization now took firm hold of mainland Greece, while traces of its direct influence are found in the west Mediterranean basin—in Sicily, the Balearic Islands, and Spain. . . . Some vanguard at least of the Aryan Greek immigrants came into contact with this high Minoan culture at a time when it was still in its most flourishing condition. The evidence of Homer itself is conclusive. Arms and armor described in the poems are those of the Minoan prime, the fabled shield of Achilles, like that of Herakles described by Hesiod, with its elaborate scenes and variegated metal work, reflects the masterpieces of Minoan invention. Or, if we turn to the side of religion, the Greek temple seems to have sprung from a Minoan hall, its earliest pediment schemes are adaptations from the Minoan tympanum—such as we see in the Lion's Gate—the most archaic figures of the Hellenic goddesses, like the Spartan Orthia, have the attributes and attendant animals of the great Minoan mother."—A. Evans, *Origins of civilization in Europe (Annual Report of the Smithsonian Institution, 1916, pp. 443-444)*.—"As the Greek nomads ceased to wander and gradually shifted to a settled town life, they found Phœnician merchandise in every harbor town. The very garment which the Greek townsman wore he called by a Phœnician name (*chiton*) as he heard it from the Oriental traders along the harbor shores. As he continued to receive these products of Oriental art and industry, the Greek slowly learned the craftsmanship that produced these things. . . . Thumbing the Phœnician's papyrus invoices, the Greek tradesman eventually learned the meaning of the curious alphabetic signs, and then began to use them himself for the writing of Greek words, employing some of the signs as vowels, which were not represented in the Phœnician alphabet. . . . Thus after the destructive Greek invasion had crushed out the earliest literary culture that had arisen in Europe, both writing and its physical equipment were again introduced into Europe from the Orient. Such contributions from Oriental life make it perfectly just to say that Europe was at that time receiving civilization from the Orient for the second time. . . . As the Greek maritime ventures extended to all ports of the eastern Mediterranean, Greek merchants and gradually also Greek travelers, came into direct and firsthand contact with the vast fabric of civilized life in the Near Orient, especially after 600 B. C. . . . Under these circumstances it is not remarkable that archaic Greek sculpture shows unmistakable evidences of Egyptian influence. The impression of the magnificent cities of Egypt and Asia upon the minds of travelers like Hecataeus and Herodotus was not exhausted in literary expression alone. Greek builders must likewise have seen these cities and added definite impressions as well as sketches to the vague references to the splendors of the Orient with which all Greeks were familiar in the Homeric poems. Greek architecture then responded sensitively and promptly to the tremendous stimulus of the vast architectural monuments of the Orient. . . . While we have thus followed the great drift of civilized influence as we can discern it especially in monumental forms which have come out of the Orient into the West, we have found that these things suggest influences less material and not so easily exhibited in visualized

forms; just as the cathedral architecture of Europe, drawing its fundamental forms from the Orient, suggests the Oriental origin of the religion which it housed. . . . But Hellenic genius never permitted the Greeks to remain merely passive recipients of culture from without. Building on foundations largely Oriental, they erected a splendid structure of civilization which nobly expressed their marvelous gifts, and brought them an unchallenged supremacy which was already evident in the sixth century B. C. The leadership in civilization then passed finally and definitely from the Orient to Greece. In recognizing this fact we have reached the culmination of that vast synthesis which we are the first generation of men to be able to make—a synthesis which enables us to trace the developing life of man from a creature but little superior to the simians, through unnumbered ages of struggle and advance, leading us from the cave savages of southern France through the conquest of civilization in the Orient, its transition to Europe, and thus through the supreme achievement of Greek genius, to the highly developed life of man at the present day.”—J. H. Breasted, *Origins of civilization* (*Scientific Monthly*, Mar., 1920, pp. 249-268).—See also *ÆGEAN CIVILIZATION*; CRETE.

**Freedom of culture from Oriental domination.**—Before the appearance of the Greeks, the scattered tribes and communities throughout Europe had attained a certain degree of culture. Rude traders had forced their way along the rivers, and through the forests, and established the river routes which made the trade highways of Europe down through the Middle Ages until late modern times. Bronze and iron had long been known in northern and western Europe; the Phœnicians were plying their trade with Britain and the Baltic Sea, the potters of Spain, Italy, and France were busily at work, and their products, with that of the skilled bronze and copper smiths of the same countries, were finding their way as far as the British Channel. But in spite of its growth in culture, Europe had no civilization before the coming of the Greeks. That is the great gift which Greece came bearing in her hand. Greece, herself, owed much to Egyptian civilization, and still more to the Minoans, whose lands she usurped. But, we must not lay too much stress on the influence of either of these. She transmuted the good which she received in the alembic of her own consciousness, and the civilization which she bequeathed to us was all her own. Greek civilization is not made up of vases and statuary alone. The spirit that inspired it made it great, and this was never the possession of Egypt or of Crete. “The most important dowry of Minoan civilization to Greece was its ships. Drawn over a sea-way made easy, by countless stepping-stones, and which brought them at the end of every radius of their course in touch with an existing civilization, the Greek became a searover, and, like his national hero, Odysseus, ‘many men’s cities he saw and learned their mind.’ He mixed and competed with the merchants of Tyre and Sidon; he met Babylonian caravans in the bazaars of Lydia and Synope; he went as merchant or mercenary to Syria and to Egypt, fought in the armies of Nebuchadnezzar and sacked Jerusalem, in the armies of the Pharaohs and scratched his name on the colossi of Abû-Simbel; met Phrygian, Lydian and Assyrian. And when Persian power gathered up all the old civilizations of the Orient, the Greek was in daily, close, and by no means always unfriendly relation with the great cosmopolitan empire.”—R. Briffault, *Making of humanity*, pp. 119-120.—“The greater impulses to culture radiated from Egypt and Mesopotamia, be-

ing filtered through all the meshes of Asia Minor—the home of obscure but imperial Hittites, of trafficking Phœnicians, and still pastoral Hebrews, of Semitic and Aryan cultures innumerable. The Greeks of Europe refined upon these, not because they were ‘miraculous’ in their intelligence, which some scholars put forward as an ‘explanation,’ but simply because their relative freedom from the tyranny of kings and priests permitted an efflorescence which was denied to the vaulting human spirit in other directions. The mixture of races, the mountainous character of the country which induced diversity, while at the same time the long withdrawing gulfs encouraged the friction of customs and ideas along with every exchange of material products—these and other prosaic enough considerations should account for the Grecian outburst, which is only marvellous in the sense that the human intelligence is ‘miraculous’ to begin with. . . . The creative forces in Greek culture were practically those in operation elsewhere, though commerce (in which the Greeks piratically supplanted the Phœnicians) was of special account in their civilisation, that again being obviously a result of the total geographical conditions.”—A. R. Cowan, *Master-clues in the world-history*, pp. 77-79.

**Secularism and skepticism.**—“The primitive Greeks had, like every other race, their religious traditions and customs, their rituals and their mythology; and many eastern cults became inevitably acclimatized among them. But religion with the Greek tribes, as with the Norse, the Germanic, the Latin populations, stands for something altogether different as regards its character and the place it occupies in human life, from the religions of the eastern river-lands. And the difference depends upon the circumstance that the whole sphere of religious thought in the East was from the first indissolubly bound up with the chief source of class power and privilege; it was the religion of a theocracy whose power and authority rested wholly upon religious ideas, and whose culture accordingly moved exclusively within the orbit of religion. The religious rites and beliefs of the Greeks were, like those of other people, chiefly associated with the fertility of the soil, with the operations of agriculture, with seed-time and harvest. . . . With the Greeks the supernatural was merely an attempt at explanation, a form of speculation issued from the popular mind. It was democratic; it had no vested interest at its back, no consecrated guardians watchful, with all the force of self-preservative instincts, for the inviolate protection of its sanctity. The poets were at liberty and welcome to remodel traditional fables, to play with popular mythology as their fancy dictated. No inevitable connection was even recognized between morality and religion; there were rites due to the gods and to the dead, but relations with the living were a matter of natural justice. . . . Greece, like her goddess Athênê, appears to rise panoplied and full grown, and almost without a transition we find ourselves transported, as if by the stroke of her magic spear, into a modern atmosphere. Between an age of dim fable and the height of Athenian intellectual splendour scarcely two hundred years have elapsed; though in reality the development of Hellas has been silently proceeding for some eight centuries. In passing from Egypt, Assyria, Babylon, Persia, Judæa, into Greece, we step into a world which is actually closer to us than are the ten centuries intervening between the passing of Hellenism and the rebirth of Europe, a world which is western and modern, in which we move among the topics, problems, tendencies, discussions, criticisms, which occupy our own thought. It is not merely because

our intellectual heritage is Grecian that we feel at home there, it is not merely that the structure of our ideas, of our conceptions, our modes of expression, the forms of our literature, are the progeny of Greek thought; it is because Greece owed its own life, as we ours, to the liberation of the human mind from the gyves and shackles which weighed it down in the theocratic East. Greece made the European world. . . . All those varied culture-contacts would have availed little—they were little more than Phœnician and Minoan had enjoyed—had they not worked upon a material of new quality. The Greeks were, as none of those people had been, almost completely protected from the influence of tradition and from every form of power-thought. Therein lies the differentiating character of the reaction. No sacredness attached in their eyes to the culture which they took over from Cretan and Mycenaean. And those with which they came into relation through their intercourse with Persian, Phœnician, Egyptian, Babylonian, were approached with curiosity, interest, acquisitiveness, but with no superstitious reverence.”—R. Briffault, *Making of humanity*, pp. 117-118, 121.—“It is not, observe, that the Greek was more ingenious, cleverer, but simply that he was able to look at things secularly, that is, with his mind dissociated from the obsession of religious traditions and views. . . . Thus it was that when the Greek tribes came in contact with, and culled the fruits of the old civilizations, the civilizations of the Orient, they transformed them into a new power, a new phase of human evolution.”—*Ibid.*, pp. 124-135.—“The chief strength of the Greeks lay in their freedom from hampering intellectual tradition. They had no venerated classics, no holy books, no dead languages to master, no authorities to check their free speculation. As Lord Bacon said, they had no knowledge of antiquity and no antiquity of knowledge. . . . It was in these conditions that the possibilities of human criticism first showed themselves. The primitive notions of man, of the gods, and the workings of natural forces began to be overhauled on an unprecedented scale. The intelligence developed as exceptionally bold individuals came to have their suspicions of simple, spontaneous, and ancient ways of looking at things. Ultimately men appeared who professed to doubt everything.” But the Greeks were no exception in the general resentment against criticism. “Anaxagoras and Aristotle were banished for thinking as they did, Euripides was an object of abhorrence to the conservative of his day, and Socrates was actually executed for his godless teachings. The Greek thinkers furnish the first instance of intellectual freedom, of the self-detachment and self-abetting vigor of criticism which is most touchingly illustrated in the honest know-nothingism of Socrates. They discovered scepticism in the higher and proper significance of the word, and this was their supreme contribution to human thought.”—J. H. Robinson, *Mind in the making* (*Harper's Magazine*, Oct., 1920, p. 664.)—See also ATHENS: B. C. 461-431: Age of rationalism and skepticism; B. C. 336-332.

**Philosophy.**—Eleatics, Epicureans, Plato, Aristotle.—“The Eleatic philosophers, who appeared early in the Greek colonies on the coast of Italy, thought hard about space and motion. Empty space seemed as good as nothing, and as nothing could not be said to exist, space must be an illusion; and as motion implied space in which to take place, there could be no motion. So all things were really perfectly compact and at rest and all our impressions of change were the illusions of the thoughtless and the simple minded. Since one of the chief satisfactions of the metaphysicians

is to get away from the welter of our mutable world into a realm of assurance, this doctrine exercised a great fascination over many minds. The Eleatic conviction of unchanging stability received a new form in Plato's doctrine of eternal 'ideas,' and later developed into the comforting conception of the 'Absolute,' in which logical and world-weary souls have sought refuge from the times of Plotinus to those of Josiah Royce. But there was one group of Greek thinkers whose general notions of natural operations correspond in a striking manner to the findings of the most recent science. These were the Epicureans. Democritus was in no way a modern experimental scientist, but he met the Eleatic metaphysics with another set of speculative considerations which happened to be nearer what is now regarded as the truth than theirs. He rejected the Eleatic decisions against the reality of space and motion on the ground that, since motion obviously took place, the void must be a reality, even if the metaphysician could not conceive it. He hit upon the notion that all things were composed of minute indestructible particles (or atoms) of fixed kinds. Given motion and sufficient time, these might by fortuitous concourse make all possible combination. And it was one of these combinations which we call the world as we find it. For the atoms of various shapes were inherently capable of making up all material things, even the soul of man and the gods themselves. There was no permanence anywhere; all was no more than the shifting accidental and fleeting combinations of the permanent atoms of which the cosmos was composed. This doctrine was accepted by the noble Epicurus and his school and is delivered to us in the immortal poem of Lucretius on the nature of things. The Epicureans believed the gods to exist, for, like Anselm and Descartes, they thought we had an innate idea of them. But the divine beings led a life of elegant ease and took no account of man; neither his supplications and sweet-smelling sacrifices, nor his neglect and blasphemies ever disturbed their calm. Moreover, the human soul was dissipated at death. So the Epicureans flattered themselves that they had delivered man from his two chief apprehensions, the fear of the gods and the fear of death. For, as Lucretius says, he who understands the real nature of things will see that both are the illusions of ignorance. Thus one school of Greek thinkers attained to a complete rejection of superstition in the name of natural science. In Plato we have at once the scepticism and the metaphysics of his contemporaries. He has had his followers down through the ages, some of whom carried his scepticism to its utmost bounds; others of whom availed themselves of his metaphysics to rear systems of arrogant mystical dogmatism. He put his speculations in the form of dialogues—ostensible discussions in the marketplace or in the houses of philosophic Athenians. The Greek word for logic is *dialectic*, which really means 'discussion,' argumentation in the interest of fuller analysis, with the hope of more critical conclusions. The dialogues are the drama of his day employed in Plato's magical hand as a vehicle of discursive reason. . . . Plato's indecision and urbane fairmindedness are called irony. Now irony is seriousness without solemnity. It assumes that man is a serio-comic animal, and that no treatment of his affairs can be appropriate which accords him a consistency and dignity which he does not possess. . . . Human thought and conduct can only be treated broadly and truly in a mood of tolerant irony. It helies the logical precision of the long-faced, humorless writer on politics and ethics. . . . Plato made terms with the welter of things, but

sought relief in the conception of supernal models, eternal in the heavens, after which all things were imperfectly fashioned. He confessed that he could not bear to accept a world which was like a leaky pot or a man running at the nose. In short, he ascribed the highest form of existence to ideals and abstractions. . . . Ever since his time men have discussed the import of names. Is there such a thing as love, friendship, and honor, or are there only lovely things, friendly emotions in this individual and that, deeds which we may, according to our standards, pronounce honorable or dishonorable. If you believe in beauty, truth, and love as such you are a Platonist. If you believe that there are only individual instances and illustrations of various classified emotions and desires and acts, and that abstractions are only the inevitable categories of thought, you would in the Middle Ages have been called a 'nominalist.' . . . Previous to Aristotle, Greek thought had been wonderfully free and elastic. It had not settled into compartments or assumed an educational form which would secure its unrevised transmission from teacher to student. It was not gathered together in systematic treatises. Aristotle combined the supreme powers of an original and creative thinker with the impulses of a text-book writer. He loved order and classification. He supplied manuals of Ethics, Politics, Logic, Psychology, Physics, Metaphysics, Economics, Poetics, Zoology, Meteorology, Constitutional Law, and God only knows what not, for we do not have by any means all the things he wrote. And he was equally interested and perhaps equally capable in all the widely scattered fields in which he labored. And some of his manuals were so overwhelming in the conclusiveness of their reasoning, so all-embracing in their scope, that the mediæval universities may be forgiven for having made them the sole basis of a liberal education and for imposing fines on those who ventured to differ from 'The Philosopher.' He seemed to know everything that could be known and to have ordered up all earthly knowledge in an inspired codification which would stand the professors in good stead down to the day of judgment. Aristotle combined an essentially metaphysical taste with a preternatural power of observation in dealing with the workings of nature. In spite of his inevitable mistakes, which became the curse of later docile generations, no other thinker of whom we have record can really compare with him in the distinction and variety of his achievements. It is not his fault that posterity used his works to hamper further progress and clarification. He is the father of book knowledge and the grandfather of the commentator. After two or three hundred years of talking in the market-place, those Greeks predisposed to a speculation had thought all the thoughts and uttered all the criticisms of commonly accepted beliefs and of one another that could by any possibility occur to those who had little inclination to fare forth and extend their knowledge of the so-called realities of nature by painful and specialized research and examination. This is to me the chief reason why, except for some advances in mathematics, astronomy, geography, and the refinements of scholarship, the glorious period of the Greek mind is commonly and rightfully assumed to have come to an end about the time of Aristotle's death. Why did they not go on as modern scientists have gone on, with vistas of the unachieved still ahead of them? In the first place, Greek civilization was founded on slavery and a fixed condition of the industrial arts. The philosopher and scholar were stopped from fumbling with those every-day processes that were associated with the mean life of the slave and servant. Con-

sequently there was no one to devise the practical apparatus by which alone profound and ever-increasing knowledge of natural operations is possible. The mechanical inventiveness of the Greeks was slight, and hence they never came upon the lens; they had no microscope to reveal the minute, no telescope to attract the remote; they never devised a mechanical timepiece, a thermometer to a barometer, to say nothing of cameras and spectroscopes. Archimedes, it is reported, disdained to make any record of his ingenious devices, for they were unworthy the noble profession of a philosopher. Such inventions as were made were usually either toys or of a heavy practical character. So the next great step forward in the extension of the human mind awaited the disappearance of slavery and the slowly dawning suspicion and repudiation of the older metaphysics, which first became marked some three hundred years ago."—J. H. Robinson, *Mind in the making* (*Harper's Magazine*, Oct., 1920, pp. 665-668).—See also GREEK LITERATURE: Development of philosophical literature; EPICUREANISM; ETHICS: Greece, Ancient: B. C. 4th century.

Political development and fall.—"Greek life, at the time when Athens had taken a lead in repelling the Persians and had attained the zenith of its prosperity as an influence in the world, was city life; it was the period when the city state [the political unit of the Greeks] was seen at its best. In the earlier history of the Greek peninsula there had been the households of the Homeric kings, and the homes of a free Yeomanry, such as Hesiod describes. [But later] we find independent cities like Athens, inhabited partly by resident aliens, but very largely by free citizens both rich and poor. . . . Athens . . . afforded conditions and opportunities for the free political life of the individual citizens . . . and this it was which provided the real Greek contribution to economic and social progress. The oppressive subjection of the Egyptian population to the Pharaohs is at least partly accounted for by the control which the rulers had over . . . the food supply. A population that is economically dependent for the means of life can scarcely expect to be economically free. . . . The economic or industrial city enjoys a very different position [and] . . . is a type of social organization which shows a high degree of vitality. The influence of the introduction of money in facilitating personal independence has often been overlooked, and it is necessary to lay stress upon its importance as exhibited in Greece. The substitution of money taxation . . . is one considerable step in this direction; the man who is bound to render work of any kind is necessarily restricted [in his movements]. The man who pays taxes is free to move. . . . It is evident from the history of Athens that it contained a large number of poor citizens; many of these were doubtless men . . . who had been forced to leave the land and seek a living in the town. Others were men of alien extraction [who had no vote, no political power or duties but] . . . were compelled to pay a tax. It appears that the greater part of the industrial work in Athens itself was carried on by wage-earners; there were factories in which slave labor was employed, but on the whole it seems that slaves were employed in rural occupations and in mining, and that the greater part of the Athenian artisans were economically free."—W. Cunningham, *Western civilization*, pp. 02, 03, 07.—Greek civilization, even in Athens, which has been called a "superlative democracy," saw no horror in slavery; for in almost all the city states it was of a mild nature, and lost much of its sting perhaps by reason of the fact that no foreigner had civic rights. "Never were minds more free from cant or pretence

than the minds of the Athenians, and particularly those of Socrates, Plato, and Aristotle. Yet not one of these declares against the institution of slavery. If they had unequivocally thought it wrong, they would unequivocally have said so. On the contrary, they thought it part of the natural order of things. . . . Aristotle remarks, in his matter of fact way, that some men are born to be masters and others to obey. . . . [When Attic power was at its zenith its 100,000 citizens were obeyed by 365,000 slaves.] Slavery, in the long run exercised a very pernicious influence on Greek culture, and contributed greatly to its downfall. Slaves were for the most part foreigners, of the children of foreigners, and were bought from dealers, or were captives of warfare. Thus the great majority were not Greeks. Even free foreigners or aliens had no voice in public affairs, and consequently the slaves could have but small influence on the social and intellectual questions, which were settled between the citizens themselves. To the Athenians . . . the State was a sort of partnership for mutual benefit, that benefit being the safety and comfort of the common life. The full citizen was a sort of partner, and had an equal voice at those meetings for mutual interest which were called meetings of the Assembly or which went by other names."—T. G. Tucker, *Life in ancient Athens*, pp. 60, 73.—"We are accustomed to think of ancient history as moving with slow and dignified tread when compared with the rapid strides of more recent centuries; but let us look back for a moment over the history of Athens during the [fifth century B.C.]. . . . At the beginning of the century she was a small, unimportant state, with few people and little wealth. In the year 500 B.C. the great ruler of the most powerful kingdom in the world had decreed her destruction. At the end of the first quarter of the century Athens had swept the fleets of Persia from the sea, had wrested provinces from Persian sway, and was the chief member of a powerful confederacy. When the first half had been reached the little state had become the eye and center not only of Greece, but of all the Mediterranean world, mistress of the sea and of a large empire, the recipient of rich tithes from many tributary states. Her art had been raised from the crudest beginnings to a place that has never been equalled; her literature had become a model for all succeeding generations; her schools of thought had opened the book of philosophy for the whole world. Fifty years more and her empire was gone, her fleets destroyed, her wealth all dissipated, and she had fallen back to the level of a secondary state to foster those arts and schools which were henceforth to be her empire and her wealth."—H. C. Butler, *Story of Athens*, p. 312.—"Unfortunately, the golden age of Greek civilization was a very short period, lasting only a few hundred years (pre-eminently the sixth, the fifth and the fourth century B.C.); for Greece was fated to remain a group of rival states which could not unite and permanently co-operate. It may be idle to try to guess what Greece might have given the world, could these city-states have become a federated republic, similar to modern Switzerland, for example, and could they have given united loyalty to the leadership of their great men; but it is not idle to assert that political and social disintegration shortened this most wonderful of epochs. That is to say, Greece had either to unite and rule the world or to be ruled by the strong arm of the foreigner who could rule the world. The fates, or rather the inability to solve her economic and social problem, made Greece incapable of choosing the former. The political effect was that the city-

states of Greece lost their independence and became, first, part of the Macedonian empire, and, later, part of the Roman. The cultural effect was that the learned Greek and his pupils became the school-masters of the Mediterranean world, and, as is so often the case with schoolmasters, ceased to be intellectually progressive. In other words, after the downfall of the city-states the scientific enterprise commences to be given up and its place is taken more and more by other interests and by a mere endeavor to acquire what in the meantime has become a traditional wisdom."—W. T. Marvin, *History of European philosophy*, p. 68.

"In most of the departments of life [the Greek race] was intellectually by far the ablest . . . of its time. It failed in one of them—in the one in which failure is fatal—politics. The Greek was a political monomaniac. His political ideal could only have been realised permanently in a world where all were of equal ability and equal honesty. It was an ideal which in practical life tended to bring the second-rate man to the control of the affairs of the state. Therein lay its fatal defect. The time must come when one of the neighbouring races, under the leadership of a man or men of first-class ability, would curb the liberty of a race whose ideal of liberty precluded that discipline, that subordination of the individual, which is necessary for effective action. And the time was not long deferred. It came in the middle of the fourth century. The superior race which had entrusted its fortunes to politicians succumbed utterly to a race which, though inferior to it in nearly every department of life, was directed by the masterminds of statesmen. Democracy proved itself jealous of its greatest children. It preferred that mediocrity whose mental-workings it could understand, to a higher capacity whose breadth of view it could not grasp and therefore suspected. It is true that, now and again, at great crisis, it entrusted its fortunes to its most capable men; but its confidence was not lasting, because it was opposed to the very spirit which had produced and which pervaded democracy as understood by the Greek. . . . The fundamental idea of ancient democracy was that each citizen should participate personally in the government of the state by membership of the Assembly. Personal attendance at its meetings was absolutely requisite for the exercise of this right, inasmuch as the principle of representation was not recognised. In the initial stage of free communities the principle worked, no doubt, satisfactorily; but as the communities became larger this form of assembly became to a greater or less degree an anomaly. It was a question of distance and employment. . . . The larger the state grew, the less representative became the attendance; in fact the legislative power tended to pass more and more under the control of that section of the people which resided in the immediate neighbourhood of the place of meeting. In the case of Attica this defective feature in the constitution of the city state had peculiar and important influence on its political and economic history. The normal policy must have been largely controlled during the greater part of the fifth century by the town population of Athens and Piræus, and this despite the fact which is stated by Thucydides that even at the beginning of the Peloponnesian War the majority of the population of Attica resided in the country. . . . The issue at stake in the Peloponnesian War was not the fate of certain Greek states of the size of English counties. The issue was whether the most powerful race of the day should combine in the struggle for the mastery of the world, or should succumb by reason of division and

subdivision to some racial neighbour less powerful but more unified than itself. The victory of Athens would have meant a Hellenic Empire. The victory of Sparta and her allies meant a Greece hopelessly divided against itself. Speculation of what might have been had things turned out otherwise is idle dreaming, but the war must be reckoned among those whose issues have affected the history of the world up to our own time. Had Athens won in Sicily: had she used the great resources of that island against her dispirited rivals at home: had she subdued them, and led them in a war of conquest against the barbarian, she might have founded a Hellenic Empire, in which the Hellenic might have become more conscious of his racial responsibilities than of his individual rights. Had that come about, the whole course of subsequent history would have been immensely modified."—G. B. Grundy, *Thucydides and the history of his age*, pp. 136, 137.

**Reasons for greatness.—Defects.**—"The great characteristic which distinguished the most advanced of the Greeks from all other tribes or peoples was their assertion of intellectual independence. By them first the powers of the mind were resolutely used for the discovery of truth; and the fact that any such attempt was made at the cost of whatever failures and delusions marked the great chasm between the eastern and western Aryans, and insured the growth of the science of modern Europe. The Greek found himself the member of a human society with definite duties and a law which both challenged and commended itself to his allegiance. But if the thought of this law and these duties might set him pondering on the nature and source of his obligations, he was surrounded by objects which carried his mind on to inquiries of a wider compass. He found himself in a world of everlasting change. . . . Mythological explanations might be developed to any extent; but they amount to nothing more than the assertion that all phenomena are the acts of individual beings. The weak point of the system lay in the forming of cosmogonies. It might be easy to say that the mountain and the sea, that Erebus and Night, were all the children of Chaos: but whence came Chaos? In other words, whence came all things? The weakest attempt to answer this question marked a revolution in thought; and the Greek who first nerved himself to the effort achieved a task beyond the powers of Babylonian and Egyptian priests with all their wealth of astronomical observations. He began a new work, and he set about its accomplishment by the application of a new method. Henceforth the object to be aimed at was a knowledge of things in themselves, and the test of the truth or falsity of the theory must be the measure in which it explained or disagreed with ascertained facts. The first steps might be like the painful and uncertain totterings of infants: but the human mind had now begun the search for truth, and the torch thus lit was to be handed down from one Greek thinker to another, and from these to Galileo, Copernicus, and Newton."—G. W. Cox, *The Greeks and the Persians*, pp. 14, 15-16.—"Without underestimating a debt which the Greeks themselves acknowledged, it remains true to regard science and philosophy alike as in essence an original creation of the Greek genius. What grew up in Greece during the sixth and fifth centuries B.C. was the spirit of disinterested inquiry proceeding on rational methods. By the term disinterested I mean detached from ulterior objects. Geometry for the Greek was something more than the art of land measurement, astronomy something more than a means of regulating the calendar or foretelling an eclipse. It was a study of the nature of the heav-

ens, an attempt to penetrate the construction of the material universe. So with geometry. It might begin as an investigation of the relations of particular triangles, squares, and oblongs, but it developed into an attempt to grasp the nature of space relations and to understand them as depending on simple common principles. This is to say that in the hands of the Greeks these subjects first became sciences. But a still greater subject also became in their hands matter for disinterested rational inquiry. They developed what Aristotle called the science of Reality, or, as we call it, Philosophy—the attempt to approach by the rational criticism of experience the problem of the nature and origin of the universe and of man's place therein. They propounded the fundamental questions which still occupy the highest intellects of mankind. They laid the foundations of method and bequeathed to Europe the terminology which all exact thinking requires. Even when we speak of method we are using an Aristotelian term, and when we distinguish one subject from another we are employing the Latin translation of the word which Aristotle introduced. . . . It is with the advent of the Greek that the seal is placed upon the claim of the Mediterranean to be the birthplace of the highest type of human civilization, the centre from which a unity of the spirit was to spread, until, by material force as well as by the conquering mind, the European or Western man was recognized as in the forefront of the race. The supremacy of the Greek lay in his achievement in three directions, as a thinker, as an artist, and as the builder of the city-state. For our present purpose the first and the last are the most important and the first the most important of all. The city-state was important as the first example of a free, self-governing community in which the individual realized his powers by living—and dying—with and for his fellows. This new type of human community was of the highest moment in the sequel. In many points it was a model to the Romans, and thus became a fulcrum for the upward movement of the Western world. In the works, too, of the Greek philosophers, especially of Plato and Aristotle, it inspired the earliest and some of the deepest reflections on the nature of social life and government. But it never acquired the permanence of the political units needed to build up the European Commonwealth. For this nations were required, and the Greeks were a race and not a nation."—F. S. Marvin, *Unity of western civilization*, pp. 167, 168, 22.—See also above: Political development and fall.

**Spread of Hellenism.—Oriental mysticism.**—"Alexander's conquests soon exercised a widely extended influence on the commerce, literature, morals, and religion of the Greeks. . . . The connection of the Greeks with Assyria and Egypt, nevertheless, aided their progress in mathematics and scientific knowledge; yet astrology was the only new object of science which their Eastern studies added to the domain of the human intellect. From the time Berosus introduced astrology into Cos, it spread with inconceivable rapidity in Europe. It soon exercised a powerful influence over the religious opinions of the higher classes, naturally inclined to fatalism, and assisted in demoralizing the private and public character of the Greeks. . . . The general corruption of morals which followed from the Macedonian conquests, was the inevitable effect of the position in which mankind were everywhere placed. . . . The conquests of Alexander effected as great a change in religion as in manners. The Greeks willingly adopted the superstitious practices of the conquered nations.

and, without hesitation, paid their devotions at the shrines of foreign divinities; but, strange to say, they never appear to have profoundly investigated either the metaphysical opinions or the religious doctrines of the Eastern nations. They treated with neglect the pure theism of Moses, and the sublime religious system of Zoroaster, while they cultivated a knowledge of the astrology, necromancy, and sorcery of the Chaldaeans, Syrians, and Egyptians. The separation of the higher and lower ranks of society, which only commenced among the Greeks after their Asiatic conquests, produced a marked effect on the religious ideas of the nation. . . . The absurdities of popular paganism had been exposed and ridiculed, while its mythology had not yet been explained by philosophical allegories. No system of philosophy, on the other hand, had sought to enforce its moral truths among the people, by declaring the principle of man's responsibility. The lower orders were without philosophy, the higher without religion. . . . The education of the lower orders, which had always depended on the public lessons they had received from voluntary teachers in the public places of resort, was henceforward neglected; and the priests of the temples, the diviners and soothsayers, became their instructors and guides. Under such guidance, the old mythological fables, and the new wonders of the Eastern magicians, were employed as the surest means of rendering the superstitious feelings of the people, and the popular dread of supernatural influences, a source of profit to the priesthood. While the educated became the votaries of Chaldaeans and astrologers, the ignorant were the admirers of Egyptians and conjurers."—G. Finlay, *History of Greece*, v. 1, pp. 7, 9, 10, 12, 13.—"The Greeks first articulately conceived and deliberately pursued the ideal of Freedom. . . . They meant by it not merely freedom from physical or political constraint but also inward freedom from prejudice and passion, and they held that knowledge and freedom rendered one another possible. . . . [But, to their minds,] freedom and enlightenment was not in thought or practice designed for all men, but only for Greeks, and among them only in reality for a privileged minority. The notion of a civilized world or even a civilized Greece was, if present at all, present only in feeling or imagination, not in clear vision or distinct thought, still less as an ideal of practical politics. On the other hand the ideal so narrowly conceived was not *in principle* confined to a 'chosen people,' or to one strain of blood. It supplied a programme extensible to all who could show their title to be regarded as members of the common race of humanity. As the special features of Greek civilization faded, the lineaments of this common humanity emerged more clearly into view, and the Greek, when he was compelled to give up his parochialism and provincialism, found himself already in spirit prepared to take his place as a citizen of the world. He had learned his lesson, and to him the whole world went to school, first to learn of him what civilization meant and then to better his instructions. . . . In a word, modern thought, scientific and philosophic alike, has a unitary origin. It is derived from the Greek. The mode of this derivation is not simple, and would require considerable space to examine in detail. In outline it must suffice to say that the Greek culture was spread over the Eastern Mediterranean through the conquests of Alexander, and that as its capital Alexandria gradually replaced Athens. It flowed westward with the Roman conquests, when, as the Roman poet said, captured Greece took captive her barbarous conqueror and introduced the arts into rustic Latium."—F. S. Marvin, *Unity of western*

*civilization*, pp. 76-79, 168.—See also HELLENISM.

#### Roman civilization

Its origins.—Greek influences.—Characteristics of Roman culture.—"In 600 B. C. Italy was perhaps still called Hesperia, the Evening Land. The west, in which Homer had seen the golden sunset, seemed to men of that age to be the final Eldorado. But sailors' tales of its unrequited riches had reached the eastern Mediterranean so early that Phœnicians, before 1100 B. C., had sailed past Italy, and had found silver in Spain and tin in the far-off island of Britain. There is a certain fascination in imagining ourselves back in an era in which Europe, whose roads are now all carefully mapped—Europe, whose fields have been sown and ploughed and reaped for ages—lay mapless and full of mystery, and excited men's minds with the hope of gold. Adventurers set sail for her coasts in the same spirit in which Cortes and Pizarro sailed for Mexico and Peru. Phœnicia planted Carthage [about 822 B. C.] as a great outpost and naval base for the western Mediterranean. Europe began to stretch her arms towards Africa, as she still stretches them to-day, and Sicily, lying midway, became a battlefield. It is, indeed, this change of the battle-ground which strikes us in the opening of European history. In due time, no doubt, Rome sought out again the old battlefield in the East. It was part of her ruthless mission to bring Asia, Africa, and Europe into that triple contact which is to become even still closer than it is to-day. Just as the eyes of the modern world are turning rather to the Pacific than to the Atlantic, so, after the Greeks had destroyed the Persian fleet off the eastern shores of Europe [battle of Mycale, 479 B. C.], men became aware that a new era had already begun. The maritime race along the southern and the western coasts of Europe became keener, and the goals were extended. Presently Romans and Carthaginians would meet in Spain, Britain would become a prize, and bold seamen would sail over the German Ocean to the shores of the Baltic in search of amber. The islands acted like magnets and drew them from coast to coast."—W. R. Paterson, *Nemesis of nations*, pp. 220-221.—"The process of early civilisation in the Italian peninsula is historically clearer than in the Balkan termini settled by the Greeks. For Greeks themselves colonised southern Italy [about the middle of the eighth century B. C.] to such an extent that it was called 'greater Greece.' But their numbers and cohesion were not sufficiently great to enable them to unify the peninsula upon specifically Hellenistic lines, and political hegemony went to the ruder races of the north."—A. R. Cowan, *Masterclues in world-history*, p. 83.—But though political power was lost the Greeks obtained over their vanquishers an intellectual mastery such as no other people has ever made. "The superiority of Greece in all that concerned art and thought, was so unquestionable that (the Romans) absorbed eagerly all that Greece had to give. There is perhaps no instance in history of one people so influencing another. What was national in their [Roman] literature, religion, and thought was thrown aside, and they took over Greek forms and Greek ideas in every department of their religious, artistic and intellectual life."—A. J. Grant, *History of Europe*, p.

99.—“The oracles delivered by the Greek Sibyl, the prophetess of Apollo of Delphi, are deeply revered in Italy; gathered in the Sibylline Books, they are regarded by the Roman townsmen as mysterious revelations of the future. There are also other means of piercing the veil of the future, for the townsmen tell the peasant how the Etruscans are able to discover in the liver or the entrails of a sheep killed for sacrifice hints and signs of the outcome of the next war; but the peasant does not know as we do that this art was received by the Etruscans from the Babylonians by way of Asia Minor, whence the Etruscans have brought it to the Romans. An art like this appealed to the rather coldly calculating mind of the Roman. To such a mind, lacking a warm and vivid imagination, the Greek myths opened a new world. To such a mind the gods required only the fulfillment of all formal ceremonies, and if these were carried out with legal exactness, all would be well. As the Roman looked toward his gods he felt no doubts or problems, like those which troubled the spirit of Euripides. The Roman saw only a list of mechanical duties easily fulfilled. Hence he was fitted for great achievement in political and legal organization, but not for new and original developments in religion, art, literature, or even science.”—J. H. Breasted and J. H. Robinson, *Outlines of European history*, pp. 251, 252.—“Rome conquered the Western world with her roads, her armies, her laws, her language, and impressed even on barbarians the culture which she had herself adopted and developed. The Latin races which were in the van of civilisation up to the seventeenth century were the daughters of Rome and had little direct teaching from Greece. All this is perfectly true, but . . . assuming that the Romans were the carriers of enlightenment to the North and West of Europe, why did they depend so completely on Greek teaching; why did they one and all confess that this was the unique source of their progress? They came in due time into contact with the culture of Carthage, of Syria, of Egypt. But the splendours of these countries were never to the Romans more than mere curiosities, whereas Greek culture was the very breath of their intellectual life. Virgil, a very great poet, frames every one of his works on Greek models, and translates even from second-rate Greek work. Horace, a very great artist, prides himself on having made Greek lyrics at home in his country, and Lucretius, whose reputation for originality among modern critics is mainly due to the total loss of the original which he copied, himself claims as his main credit that he had ventured to reproduce a yet uncopied species of Greek poetry. It is hard to conceive a more complete case made out for the unparalleled influence of Hellenic genius upon proud and dominant neighbours.”—J. P. Mahaffy, *What have the Greeks done for modern civilization?* pp. 3-4.—“The Romans and the Greeks come before us in ancient history as great contrasts, both in character and achievement. Greece is the fountain head of art, science, philosophy; from Rome, Europe has derived its ideas of law and government. The Greeks were changeable, the Romans were conservative; the whole bent of the Greek mind was æsthetic and speculative; the Romans were practical and excelled pre-eminently in administration and war. But it must always be remembered that the Romans and the Greeks were nearly akin to one another. . . . Despite the vast difference in their destinies, despite the fact that Rome established the most enduring of all known empires, and Greece established nothing in the political sphere which was enduring at all, they start from the same point. Rome, like Athens . . . begins as a

city state.”—A. J. Grant, *History of Europe*, p. 67.

“Cicero [106-43 B.C.] already speaks with the cosmopolitan accent of modern civilisation. . . . It is not difficult to recognise the historical circumstances which probably were in the main instrumental in producing this change. With the rise of the Macedonian Empire, the intense but restricted culture of the Greeks became the culture of the world, losing much no doubt in intensity as it gained in expansion. The Greek went out into the world, and found that the barbarian whom he had thought to be incapable of rational cultivation was at least capable of reproducing his own culture. The conquest of the world by Hellenism had the necessary effect of changing the Hellenic conception of the world. The literature, the art, the philosophy of the Hellenic world might be on a lower plane than that of the Hellenic city, but it was Hellenic. If the Greek himself was thus compelled to admit that the barbarian was capable of entering into the commonwealth of Greek civilisation, if the Macedonian Empire convinced the philosophers of the homogeneity of the human race, this was necessarily and even more definitely the consequence of the Roman Empire. The Latin conqueror indeed was himself, to the Greek, one of the barbarians, and more or less the Latin recognised this,—more or less he was compelled to recognise that his intellectual and artistic culture came to him from the Greek. The Latin brought indeed, in his genius for law and administration, his own contribution to the cosmopolitan culture of the world, but that was all he brought. It was impossible for him to imagine himself to be the man possessed of reason and capable of virtue and to deny these qualities to others. The Roman Empire continued and carried on the work of the Macedonian Empire in welding the countries of the Mediterranean basin into one homogeneous whole. The homogeneity of the human race was in the Roman Empire no mere theory of the philosophers, but an actual fact of experience, a reality in political and social conditions. If the philosopher had learned to believe in the homogeneity of mankind under the Macedonian Empire, he was confirmed and strengthened in his belief by the experience of the Roman.”—A. J. Carlyle, *History of mediæval political theory in the west*, v. 1, pp. 10-11.—“Among the best of the Romans Hellenism produced a type seldom excelled in the world’s history; a type as superior to the old Roman model as the nobleman is to the burgher in most countries; a type we see in Rutilius Rufus, as compared with the elder Cato. . . . Hellenistic philosophy made itself a home in Italy, and acquired pupils who in the next generation became masters in their way, and showed in Cicero and Lucretius no mean rivals of the contemporary Greek. Lucretius is so essentially a Roman figure, and his poem so Roman a poem, that I will not turn aside to criticise it at any length. But as the author himself tells us, his philosophical masters were Democritus and Epicurus, his poetical masters Empedocles and Ennius, so that he claims originality only for having been the first to treat this Greek system of philosophy in Latin—perhaps in Latin poetry. . . . Yet, still, there is far more originality in Lucretius than he claims for himself. . . . However little he may have been appreciated by his compeers, posterity has recognised the first great success in reproducing Greek thought and Greek artistic style in a Roman dress. . . . The Romans were, indeed, imitators and pupils; but what pupils! . . . Till the poem of Lucretius and the works of Cicero, we may say that nothing in Latin worth reading existed on the subject. Who-

ever wanted to study philosophy, therefore, down to that time (60 B. C.) studied it in Greek. Nearly the same thing may be said of the arts of architecture, painting, and sculpture. There were, indeed, distinctly Roman features in architecture, but they were mere matters of building, and whatever was done in the way of design, in the way of adding beauty to strength, was done wholly under the advice and direction of the Greeks. The subservience to Hellenism in the way of internal household ornament was even more complete. No painting or sculpture from native artists would now be tolerated at Rome. . . . Much more serious was the acknowledged supremacy of the Greeks in literature of all kinds, and still more their insistence that this superiority depended mainly upon a careful system of intellectual education. . . . This is the point where Polybius, after his seventeen years' experience of Roman life, finds the capital flaw in the conduct of public affairs. In every Hellenistic state, he says, nothing engrosses the attention of legislators more than the question of education, whereas at Rome a most moral and serious government leaves the training of the young to the mistakes and hazards of private enterprise. . . . [The work of Terence had shown that] the Latin tongue had, after all, a future of its own, and was destined to pursue an independent course in literature. This latter expectation was realised by the rise of Lucilius, the first original Latin poet. . . . The attempt of Nævius to create a national poetry had failed, for the time was not ripe. The attempt of Lucilius succeeded, as the long line of Roman satirists abundantly proves. But the reaction in prose literature is still more remarkable. There were circulated during these days at least two specimens of Latin prose-writing which were essentially Roman, and yet in no wise lacking either force or purity. These were the speeches of Caius Gracchus—of which fragments remain—and the letters of his mother, Cornelia. Such books showed that Latin eloquence had powers of its own, and need not build entirely upon Greek rhetoric. . . . Thus even in letters Roman culture began to take its place beside Greek, and the whole civilised world was divided into those who knew Greek letters and those who knew Roman only. There was no antagonism in spirit between them, for the Romans never ceased to venerate Greek letters or to prize a knowledge of that language. . . . With Cicero Latin prose became distinctly a rival of the best Greek prose, and no critic who has honestly studied the great roll of Latin writers down to the Middle Ages can deny that here the Romans have produced a literature as first-rate, and as independent, as ever was produced by a people coming late in history, and therefore necessarily starting with great models before them."—J. P. Mahaffy, *Silver Age of the Greek world*, pp. 103-107, 110-111, 145.—See also LATIN LITERATURE; HELLENISM: Hellenism and the Romans.

**Passing of the Roman Republic.**—Gradual acquisition of a foreign empire.—Inadequacy of the republican constitution to guarantee peace and secure law and order.—"The motive power which brought about the expansion of Rome beyond the limits of the city was largely the necessity of defense against the intrusion of neighboring tribes living outside Latium, especially the Semnites and their kinsmen, who endeavored to seize the territory of the Latin tribes. The Latins found the leadership and the protection of the city invaluable under such circumstances, and a permanent league naturally developed uniting the tribes of Latium under the leadership of the city of Rome. The obligation to bear arms, if they owned land, gave to the peas-

ants of Latium the right to demand citizenship, and the men of all the straggling Latin communities, over thirty in number, were at length received as Roman citizens. It was herein that the Roman Senate displayed a sagacity which cannot be too much admired. While the Greek city always jealously guarded its citizenship and would not grant it to any one born outside its borders, the Roman Senate conferred citizenship as a means of expansion and increased power."—J. H. Breasted and J. H. Robinson, *Outlines of European history*, pt. 1, p. 254.—Sicily, the first really foreign possession, had, however, to be ruled as outside of the federation. This brought on the Second Punic War, which in its turn proved to be the first step toward true imperialism. "In times of real difficulty the Romans were accustomed to give to their state—the concentration and rapidity which a military crisis demand by the appointment of a dictator. He held office only for half a year, but during that time he was absolute. It was in effect the reestablishment of the monarchy for a limited period. . . . The theory of the Roman constitution was that all power emanated from the people. . . . But in fact it was the Senate which ruled, and its rule [was] immensely strengthened by the great [Punic] war [218-201 B. C.] through which it had guided the state with such success. . . . A more difficult task than even the defeat of Hannibal now lay before Rome. She would be pushed forward by ambition. . . . She would acquire dominion over distant countries. . . . but would she be able to govern them? How would her government of them affect her character and the nature of her institutions? Here was the great political question of the future, and the future was to show that the Roman republic was not equal to the new task."—A. J. Grant, *History of Europe*, pp. 94, 95.—Macedonia was the next conquest which was undertaken. Corinth (146 B. C.) like Carthage, was destroyed, and with these two powerful rivals removed the republic had nothing to fear. But a more subtle enemy weakened the rugged moral fiber of the conquerors. Conquest brought great wealth, and with wealth came corruption. Luxury was alien to their nature, and indulgence sapped the foundation of their character. The simplicity of Roman life was broken by the emergence of a rich capitalist class, and men used to the despotic power which they wielded over the provincials, did not easily adapt themselves to the restrictions of the republic on their return. "The Senate became more than ever the most efficient part of the government of Rome, but the Senate was more influenced than any other part of the State by the moral corruption which the winning of the empire had brought with it."—W. W. Fowler, *Rome*, p. 105.—"Two men of the noble class . . . [the Gracchi] endeavored to better the situation. . . . Both men lost their lives in the struggle. . . . A revolution began, with intermittent civil war which lasted a century [and in which military leaders used their power to gain their own ascendancy]. Such were the methods of Marius and Sulla. Marius [156-86 B. C.] on behalf of the people and distribution of lands; Sulla in defense of the Senate and the wealthy of Rome (81-79 B. C.). Sulla and the Senate triumphed . . . [but] at Sulla's death the struggle broke out anew. . . . Thus military leadership became the controlling power of the Roman world; and it was evident to the practical statesman that the old machinery of the Republic could never again restore order and stable government in Italy."—J. H. Breasted and J. H. Robinson, *Outlines of European history*, pp. 265, 266.—"It should be remembered . . . that there is a sense in which the transmarine wars of

Rome may be said to have been undertaken at least partly in self-defence. Rome was becoming dependent on foreign countries for her food supply; to have Sicily and Sardinia under her own control, rather than that of her possible enemies, was coming to be a matter of vital importance; the rich lands, in which Carthage stood, offered a very special temptation to hungry citizens. The first step of interference in Sicily appears to have been taken, far less from any scheme of ambition, than in the hope of disarming the possible hostility of Mamertine raiders and pirates [Campanian mercenaries, hired by the ruler of Sicily, who later seized a portion of the island for themselves]. . . . Doubtless there were proconsuls who were ambitious of military reputation, but there is comparatively little evidence of wanton aggression by the Roman state; it was, in fact, an extension rendered necessary for self-defence in changed conditions. In precisely the same way, the preservation of other alien communities in their rights and privileges was apparently a generous policy, and the hardships inflicted in republican times were not due to public oppression but to public neglect. The State provided no adequate securities against official rapacity and the private greed of Roman capitalists. The Roman Republic was indeed condemned, and it was inevitable that some other form of government should take its place. It had obviously failed in the two points which had lain at the foundation of all Roman prosperity. (i) One condition which the Romans aimed at securing was that of immunity from attack; they had made war in order to procure peace, and a guarantee for peace. But their dominion had become the prey of ambitious generals who led rival legions against one another. So long as a popular leader had the unfettered command of a distant province, there was at least the danger that he would build up a power which should make him an object of envy to other generals and a danger to the republic. The risk of attack from without seemed to be gone, but there was little hope of immunity from war at home. (ii) The second point, on which the well-being of the Roman dominion had rested, was the maintenance of law and order; this may be gathered from the freedom that was given to the allied communities, and the enforcement of law by Roman Praetors in other areas. The story of the maladministration of the provinces shows how entirely this condition of economic prosperity was lacking. The *publicani* and *negotiatores* were exhausting the most fertile areas; the private ambition of the generals induced chronic warfare, and the private greed of the speculators rendered the cultivation of the soil or the maintenance of industry a hopeless task. The pressing need of society was the establishment of peace, and the maintenance of such order that agriculture and the arts of life might revive. Only by the successful assumption of universal dominion could the dangers from ambitious generals be abated; only by the establishment of a strong personal rule and a reformed administration could internal order be secured."—W. Cunningham, *Western civilization*, pp. 160-161, 168-169.—The empire thus superseded the republic in the first century B. C.—See also **ROME: Republic.**

**Imperialism.—Its administrative excellence.**—"The words in which the Romans delighted as expressing their national characteristics, all tell the same tale: *gravitas*, the seriousness of demeanour which is the outward token of a steadfast purpose; *continentia*, self-restraint; *industria* and *diligentia*, words which we have inherited from them, need no explanation; *constantia*, perseverance in conduct; and last, not least, *virtus*, manliness, which origi-

nally meant activity and courage, and with ripening civilisation took on a broader and more ethical meaning. . . . But it is essential to note that this hard and practical turn of the Roman mind was in some ways curiously limited. It cannot be said that they excelled either in industrial or commercial pursuits. It was in another direction that their practical work drew them: to the arts and methods of discipline, law, government. We can see this peculiar gift showing itself at all stages of their development:—in the agricultural family which was the germ of their later growth, in the city-state which grew from that germ, and in the Empire, founded by the leaders of the city-states, and organized by Augustus and his successors. It is seen too in their military system, which won them their empire; they did not war merely for spoil or glory, but for clearly realized practical purposes. . . . [Nevertheless the Romans prized glory as the great achievement. In the pursuit of glory,] they refused to recognize defeat, [while] common sense enabled them to profit by adverse fortune. . . . Thus they went on from defeat to victory, conquest and government."—W. W. Fowler, *Rome*, pp. 13, 14, 15.—The three great forces which have moulded modern civilization:—Christianity, Greek thought and philosophy, Roman law, had their meeting place, and scattering place in Rome. It cannot be too often said that the greatest gifts of the Romans were their clear, logical reasoning powers in the region of law and order, and their great powers of administration, and of governing subject races. As has so often been pointed out, except in these fields, they were not an original people, and were therefore all the more fitted to assimilate, and spread Greek thought and Christian doctrine throughout the huge empire of varied nations and tongues which by their administrative genius they held together for a longer period than any other empire has yet endured. Moreover, their influence cast a seeming bond of unity over the motley races of Europe, which in a measure still endures. "If, when measured by the whole of humanity, Europe seems . . . to possess a unity of its own, it is because the civilization of the different European nations was derived from the same original source and was received, in the main, through the same channels. In the period of the widest expansion of the Roman empire one government extended over all that part of Europe which had been reclaimed from primitive barbarism. . . . Law, religion, and administration emanated from one centre and were directed toward one end. That centre was the imperial will, and that end its universal domination. From the Mediterranean to the North Sea, and the British Isles, from the shores of the Atlantic to the confines of Asia, Europe was politically one. . . . But the Roman empire was more than a European state, it was an international power, holding sway over vast areas in Asia and Africa; a world empire in which the Mediterranean that ancient highway of nations had become an inland waterway, and presiding over the destinies of men not only on the Rhine and the Danube, but on the Nile and Euphrates. . . . [In the reign of Trajan (A. D. 98-117) when it] reached the maximum of its territorial area. . . . its borders were almost coincident with the limits of civilization."—D. J. Hill, *History of diplomacy in Europe*, v. 1, pp. 1-3.—"The establishment of the Roman Empire . . . is the culminating fact of ancient history. . . . Its first great service was the establishment of peace. The years from the battle of Actium onwards for two centuries are without question the most peaceful period in the history of the lands embraced within the circuit of the Roman Empire. An army of

some 400,000 men sufficed to keep order in countries where there are now many millions of soldiers. The Latin language in the West and the Greek language in the East were already widespread, but it was after the establishment of the Roman Empire that the Latin language became the national language in the western provinces, and thus the modern French, Spanish, and Italian languages began to develop. [See also PHILOLOGY: 9; 11.] But it was not only the language of Rome that was accepted by the peoples of Western Europe, it was the ideas of her civilization, and especially the ideas of Roman law. . . . Although the foundations of Roman law are to be traced during the Republic, it was under the empire that it developed into a massive and logical system, which later generations looked back upon almost as a revelation, and which lies now at the basis of the legal systems of all European lands, though it has influenced the development of English law less than any other. Nor is it altogether true to say that the establishment of the Roman Empire was the overthrow of liberty. It meant the overthrow of free speech in Rome, and the historian sees with regret the loss of the dignity, and of the independence of the Senate and of the people of the city of Rome. But for the vast majority of the inhabitants of the empire there was gain not only in prosperity, but in liberty as well."—A. J. Grant, *History of Europe*, pp. 138, 139.—"To most of her subjects Rome allowed a very fair measure of self-government. . . . In the west, where there were no ancient civilizations . . . Rome introduced the elements of civil life. Round her military stations grew up centres . . . which became the great cities of Italy, Gaul, Spain, Britain, and South Germany. . . . [Over this supremely practical people, Greek thought and philosophy gained a strong hold at an early date. One school of philosophy], the Stoic, really chimed in with much that was best in the old Roman character."—C. R. L. Fletcher, *Making of western Europe*, v. 1, pp. 9, 10.—"The Stoics were the Pharisees of 'pagan philosophy.' As the Pharisees were the most Hebraic of the Hebrews, so it was Stoicism that came to be characteristic of the Roman creed."—T. G. Tucker, *Life in Roman world of Nero and St. Paul*, p. 407.—See also **ROME: Empire.**

**Effect of imperial dominion on\* the constitution.**—Development of Roman law.—"Until the conquests [of Rome] had proceeded quite far, Roman law was not more noteworthy than any other barbaric law. . . . The Romans laid a tremendous emphasis upon private rights; but, on the other hand, the state was regarded as a necessary means to secure the rights of the individual. The peculiar feature was the appeal to self-interest; and self-interest could be secured only through the state. So the state was both extremely autocratic and extremely democratic. This feature of Roman law was developed, largely at least, by the expansion of the state and the demands made upon the administrative system. The expansion was so rapid and the works and the public domain were so vast that individual enterprise had to be depended upon for practically all administrative purposes. When the Empire was established, administrative methods had been so far reduced to a system that public officials could manage public affairs with less abuse than was found unavoidable under the contract system. But in the earlier days it had seemed necessary to put up at auction the duties of collecting rents from the public domain, of fitting out ships and provisioning armies, of constructing roads, aqueducts, and other public works. Thus public ends were best served by private enterprise.

This led to a greater recognition of the rights of the individual, which the preservation of the patriarchal family had already made greater than among any other ancient people, and to the further emphasis of the idea of private property which had likewise received marked development under the influence of the family institutions. . . . The Romans formed a concentrated national state with an organization based on the administrative system of a single city. The struggle for existence was so severe that by the time they had conquered security war had come to have an æsthetic value for them, and so was carried on for its own sake. Their great end became war, though at the beginning their wars had economic causes or were carried on in self-defense. . . . War for the Romans was a permanent occupation. So, most naturally, the Romans came to have both a superior military organization and more intense national feelings. . . . The Roman political constitution, like that of the Greeks, fell to pieces under the stress of new conditions. But Rome never went through what she would acknowledge to be a revolution. . . . The constant pressure of external enemies made necessary a stable constitution; and the unassailable strength of the ruling classes and landlords—never overthrown, as at Athens, by the rapid rise of the industrial classes—permitted internal changes only by gradual stages. Practical necessities led to minute alterations from time to time, until the revolution was accomplished. The establishment of the republic meant little more than the change from a life-archon to annual archons and from a single ruler to two who might check one another. From the establishment of the republic (509 B. C.) to the end of the second Punic War (201 B. C.), the senate, composed of the aristocracy, was the real government of Rome. Though but a consultative body, the senate, like all legislatures, was able to make constant inroads on the executive; and had in this case particular advantages because the magistrates were elected for but a year, and were usually drawn from the classes strongest in the senate. The popular assemblies were seldom held, being called only when the magistrates summoned them. [See also **SENATE, ROMAN; ROME: Republic: B. C. 133.**] While the senate, however, was thus profiting by knowing its own mind and by having functions too indefinite to be curtailed, the conquests of the Roman armies, which the senate at first did so much to advance by supplying both wise plans and effective leaders, were sweeping together an empire whose government was to prove an impossible task even for the senate—for any magistrate or assembly, indeed, known to the constitution of the city-republic. . . . Not until she had circled the Mediterranean with her conquests, and had sent her armies deep into the three continents that touch its international waters, did she pause in the momentous undertaking of bringing the whole world to the feet of a single city. And her constitutional life itself felt every stroke of these conquests. This constant stress of war was of the deepest consequence to her politics. It soon became impossible to administer the vast empire by means of a municipal constitution. And yet no new system seemed possible to the Romans. They simply attempted to extend their city constitution over the whole world. . . . The problem was finally solved, not by raising the provincials to a real citizenship, but by bringing Rome to the level of the provinces by overthrowing the constitution and giving her a master like those of the provinces. Under the consuls the provinces had been administered as the property of Rome; under the emperors they were administered as integral parts of Rome.

These changes were made gradually. The transition period extended from the beginning of the agrarian movement of Tiberius Gracchus (133 B. C.) to the death of Augustus (14 A. D.). . . . By the end of the long reign of Augustus, the emperor had become the state personified. Every legislative and executive function was vested in him, and the magistrates became his personal representatives. His household officials took the place of the private contractors and irresponsible governors, and the system of administration employed was the admirable one which the Romans had worked out in the management of their private estates. Since the whole empire had become the private estate of the emperor, it would have seemed intolerable to continue the old system of irresponsible administration which had permitted speculators to exploit the provinces. The emperors began to look upon the empire as a whole, and that whole was larger than Rome. They could not but take as much interest in the prosperity of some of their fairest provinces as they took in Rome itself. This was especially true when the emperors, beginning with Trajan [A. D. 98-117], were most frequently themselves provincials. Finally, after all freemen had come to possess equal privileges, or rather to bear equal burdens, Caracalla's universal enfranchisement was but the recognition of an accomplished fact. The universal state was for the first time realized. . . . The Roman Empire . . . may be regarded as the embodiment of Greek political conceptions, rendered necessary by the gathering-together of all the nations of the world and the attempt to hold them all in one political community. The conception of the state which had come from the Socratic period would have been valueless but for the administrative capacity of the Romans. . . . The development of Roman law was . . . determined by the exigencies arising from the extension of Roman rule to foreign peoples. . . . The influence of Greek thought was unquestionably important. . . . The first codification of the primitive practices was the basis of all later law. The *Twelve Tables* was for a long time the only law, except a small body of decrees of the senate and a few legal principles established by agitation. [See also CODES: B. C. 509; ROME: Republic: B. C. 451-449.] In applying these simple principles the praetor, consciously or unconsciously, became the source of new law. This body of law, the *jus civile*, was applicable to Roman citizens only, it having been inconceivable that a foreigner should have a part in the sacred Roman customs. But with the growth of intercourse with foreigners, it became necessary to have established processes for cases arising between two aliens or between an alien and a Roman citizen. The precedents established in these equity cases before the praetor of the foreigners became the *jus gentium*. With the extension of the empire the latter law became the more important. The subject localities were permitted to retain their local institutions; but cases arising between natives of the province and Roman citizens, or between natives of two different provinces or even two different localities of the same province, had to be judged by the *jus gentium*, and the Roman governor had to exercise the function of the *praetor perigrinus*. Thus a great body of miscellaneous precedents strongly impregnated with Roman legal principles was developed. And this body of law came to be regarded as more natural and more equitable than the *jus civile*. The increasing complexity of the relations between the residents of the different sections of the empire naturally led to an examination of the *jus gentium* by lawyers and to the use of its leading principles in the interpretation of Roman law in general. At

this point the Roman lawyers were assisted by the conceptions borrowed from the Greeks, and especially from the Stoics. The Stoics were setting forth the idea of a world-citizenship corresponding to their conception of an ethical community of all men. . . . With the disappearance of Roman citizenship, or rather with its universalization, the *jus civile* necessarily disappeared, and the *jus gentium*, reduced to some order, became Roman law. Thus by the union of the practical codes of the Romans and the formative legal conceptions of the Greeks, Roman legal principles, which had originally been developed in their local application, were *universalized*. The development beyond this point was only a matter of amplification and arrangement. This great theoretical development was given the law chiefly by private jurists. The opinions of these great lawyers soon came to be recognized as of greater authority than the decisions of the courts. This development by commentators went on from the time of Cicero [106-43 B. C.] until about 250 A. D. After the opinions of the juris-consults had been recognized by custom for some time, and no other great lawyers arose to further expand the law, the emperors gave legal sanction to them. In addition to these important legal opinions, the *senatus consulta* and the imperial *constitutiones* entered into the body of the law. [See also CONSULTA, SENATUS.] The shaping forces, however, were found in the opinions of the jurisconsults. Naturally, the difficulty of harmonizing conflicting opinions and of choosing the real authorities in the great mass of law thus developed became greater and greater as time passed. Hence, after the legal principles had been worked out thoroughly, the demand arose for codification. This demand was an evidence of the decay of the Roman state; for during the period of vigor and expansion of institutional life, codification was impossible, and was probably never thought of. The Theodosian code of the latter part of the fourth century of our era was of considerable importance because of its influence on the earlier legislation of the Teutonic rulers. But the great codification was, of course, that made by Trebonian at the command of Justinian (529 A. D.). This gave Roman law its permanent shape and served as the basis for the new study of Roman law by the men of the Middle Ages. By the fourth century, A. D., the old republican legislation, the praetorial edicts, and the imperial constitutions had been almost completely fused by the jurists. The distinction between the *jus civile* and the *jus gentium* was by that time entirely obliterated. In the Justinian code the imperial constitutions and all other legislative acts became the *Codex*, the work of the philosophical lawyers became the *Pandects*, the summary statement of the whole was known as the *Institutions*, and the special decrees issued to fill gaps and clear the whole of inconsistencies were codified as the *Novels*. The whole was the *Corpus juris civilis*. [See also CORPUS JURIS CIVILIS.] This constituted the definite legal contribution of the Romans, made possible only when their empire was passing away. The contribution of the Romans was thus the framework of the institutional life of society. What the Greeks had stated as an ideal they practically realized, though in a cruder form—a universal society and a universal law. But the social organization had been too far perfected before the consummation of Hebrew life for the Hebrew element to be blended with the others in the constitution of the empire. . . . The importance for modern society of the Roman political system is not so much that it worked in the practical administration of the empire as that it served as a guide for the

organization of Europe."—J. D. Forrest, *Development of western civilization*, pp. 55-59, 61-64, 66.—See also CIVIL LAW.

**Graeco-Roman knowledge.**—"The century that saw the end of the Roman Republic and the beginning of the Empire may be accounted the apogee of Roman culture. The glory of Alexandria was on the wane. There were richer prizes in the new world-capital. It was the time of Cæsar and of Augustus, of Cicero and of Pompey, of Lucretius and of Virgil. . . . In what regard, let us ask, would a highly enlightened Alexandrian, or his compeer at Rome, heritor of the Greek tradition and fully abreast of the knowledge of his time, differ, in his larger world ideas, from a man of the same temper and standing now? It is evident enough from the pages of Lucretius, of Cicero, of Pliny, of Strabo, and of Cleomedes, that in many ways the difference was slight. The youth of that time were taught the geometry of Euclid. It is taught to the youth of our time with little addition and little change. The trigonometry of the Greeks was but slightly developed, their algebra scarce at all. Their system of notation was not decimal. It follows that they had no logarithms. The calculus was quite unknown. Their processes of computation were clumsy. . . . They understood that the earth is a sphere, and that it hangs, so far as any one may see, in empty space. Their minds had reached the conception that it rests on nothing. . . . They were metallurgists of long standing; but of chemical theory they had next to none. Their ideas of heat and other natural forces were of the crudest. They had not deciphered the hieroglyphics of the rocks. Of true conceptions of the age of the earth, or its formation, or of world formation in general, they could have had none at all."—C. Snyder, *World machine*, pp. 146-148.—It is to be noted that, whether because of the prevalence of slave labor, which is deadly to industrial initiative, or from some other cause, neither the Greeks nor the Romans made any independent addition to the sum total of industrial invention or scientific discovery. The arts of weaving textiles, making pottery, and glass, working in metals, of building, sculpture, painting, writing, had all been handed on to them from the East. The sciences of Astronomy and Mathematics were of oriental origin, and so little understood in Rome that Julius Cæsar sent to Egypt for students to work out the calendar which bears his name. The Romans, of a more practical nature than the Greeks, might conceivably have turned their minds into a more utilitarian direction, but, while the national life of Rome was still at an impressionable stage, it fell under the influence of Greece, and thenceforth continued to echo the abstractness of Greek thought. Moreover, the career of conquest in which Rome set out unduly elevated military to the detriment of civil life, so that it was looked upon as rather derogatory to engage in industrial pursuits, and the best minds of the nation were occupied solely in the business of war and administration. Nevertheless, the Romans were great master builders and engineers. They excelled in mining and drainage. They built great aqueducts, and bequeathed the art of road-making to the world. No one before them had built a solid road. "Above all people, before or since, the Greeks developed a love for harmony and proportion. . . . In Sculpture, architecture, drama, oratory and philosophy . . . [they] still rank among the world's masters. [Their contributions to civilization] were intellectual and spiritual. Above all the Greeks gave us the ideal of freedom regulated by self-control. . . . [Rome] a century before the birth of Christ unified new West and

old East into a Graeco-Roman world."—W. M. West, *Story of modern progress*, pp. 8, 9.—As far as pure thought and intellectual reasoning could go the Greeks had gone. But their knowledge was empirical, and lacking in the means of making precise experiments and observations. No new inventions appear until late in the Middle Ages, and knowledge had to wait until that time before it could be said to have become scientific.

**Intellectual bankruptcy of the Graeco-Roman civilization.**—Neoplatonism and barbarism.—**Adaptation of Christianity to the Graeco-Roman world.**—"The melancholy decline of Hellenism in the later Roman Empire was accompanied by the development of new types of intellectual enthusiasm based upon entirely different presuppositions in regard to man's origin and chief business in life. One of the great modern historical discoveries is that what we term 'medieval' thought was to all intents and purposes completely elaborated in the later Roman Empire, before the Germans disrupted the western portions of the vast commonwealth organized by Augustus. An emotional revolution had begun as early as Plutarch and had gradually served to denature the traditions of the intellectual life as they had come down from Athens. Reason became an object of suspicion; its impotence seemed to have been clearly proved; the intellectual class sought solace not so much in the restraints of Stoicism as in the *abandon* of Neoplatonism, and the vagaries of theurgy and of oriental mysticism. The clarity and moderation which we associate with Hellenism gave place to the depreciation of reason and a corresponding confidence in the supernatural. [See also NEOPLATONISM.] Plotinus [c. 205-270] maintained that only the meaner things of life come within the scope of reason; that the highest truth is supernatural; that it is through intuition rather than reason that we may hope to approach our highest aspirations. Harnack has well said that Neoplatonism, however lofty and inspiring in some of its aspects, implied nothing less than intellectual bankruptcy. 'The contempt for reason and science (for these are condemned when relegated to a second place) finally leads to barbarism, because it results in crass superstition, and is exposed to all manner of imposture. And, as a matter of fact, barbarism succeeded the flourishing period of Neoplatonism. . . . The masses grew up in superstition, and the Christian Church, which entered on the inheritance of Neoplatonism, was compelled to reckon with this and come to terms with it. Just when the bankruptcy of the ancient civilization and its lapse into barbarism could not have failed to reveal themselves, a kindly destiny placed on the stage of European history certain barbarian nations, for whom the work of a thousand years had as yet no existence. Thus the fact is obscured, though it does not escape the eye of one who looks below the surface, that the ancient world must necessarily have degenerated into barbarism of its own accord, because of its renunciation of this world. There was no longer any desire either to enjoy it, to master it, or to know it as it really is. A new world had been disclosed for which everything in this world was to be given up, and men were ready to sacrifice insight and understanding, in order to possess that other world with certainty. In the light which radiated from the world to come, that which in this world appeared absurd became wisdom, and wisdom became folly. It was just at this period that historical Christianity received its formulation in the works of the church fathers. It is suggestive that the greatest of these, Augustine, had been attracted both by the teachings of the Persian, Manes, and by the seductions

under direction of the editors and publishers.

of Neoplatonism."—J. H. Robinson, *New history*, p. 112.—"As the Vedas offer a glimpse into the antecedents of Greek mythology, so Hebrew studies open up vistas into the antecedents of Christian dogma. Christianity in its Patristic form was an adaptation of Hebrew religion to the Graeco-Roman world, and later, in the Protestant movement, a readaptation of the same to what we may call the Teutonic spirit. In the first adaptation, Hebrew positivism was wonderfully refined, transformed into a religion of redemption, and endowed with a semi-pagan mythology, a pseudo-Platonic metaphysics, and a quasi-Roman organization. In the second adaptation, Christianity received a new basis and standard in the spontaneous faith of the individual; and, as the traditions thus undermined in principle gradually dropped away, it was reduced by the German theologians to a romantic and mystical pantheism. Throughout its transformations, however, Christianity remains indebted to the Jews not only for its founder, but for the nucleus of its dogma, and ethical doctrine. . . . The poetic legends and patriarchal worship that had formerly made up the religion of Israel were transformed into two concrete and formidable engines—the Bible and the Church."—G. Santayana, *Life of reason*, pp. 69, 81.—"No judgment could well be shallower . . . than that which condemns a great religion for not being faithful to that local and partial impulse which may first have launched it into the world. A great religion has something better to consider: the conscience and imaginations of those it ministers to. The prophet who announced it first was a prophet only because he had a keener sense and clearer premonition than other men of their common necessities; and he loses his function and is a prophet no longer when the public need begins to outrun his intuitions. Could Hebraism spread over the Roman Empire and take the name of Christianity without adding anything to its native inspiration? Is it to be lamented that we are not all Jews? Yet what makes the difference is not the teaching of Jesus—which is pure Hebraism reduced to its spiritual essence—but the worship of Christ—something perfectly Greek. Christianity would have remained a Jewish sect had it not been made at once speculative, universal, and ideal by the infusion of Greek thought, and at the same time plastic and devotional by the adoption of pagan habits. . . . There were, we may say, two things in Apostolic teaching which rendered it capable of converting the world. One was the later Jewish morality and mysticism, beautifully expressed in Christ's parables and maxims, and illustrated by his miracles, those cures and absolutions which he was ready to dispense, whatever their sins, to such as called upon his name. This democratic and untrammelled charity could powerfully appeal to an age disenchanted with the world, and especially to those lower classes which pagan polity had covered with scorn and condemned to hopeless misery. The other point of contact which early Christianity had with the public need was the theme it offered to contemplation, the philosophy of history which it introduced into the western world, and the delicious unfathomable mysteries into which it launched the fancy. Here, too, the figure of Christ was the centre for all eyes. Its lowliness, its simplicity, its humanity were indeed, for a while, obstacles to its acceptance; they did not really lend themselves to the metaphysical interpretation which was required. Yet even Greek fable was not without its Apollo tending flocks and its Demeter mourning for her lost child and serving in meek disguise the child of another. Feeling was ripe for a mythology loaded with pathos. The

humble life, the homilies, the sufferings of Jesus could be felt in all their incomparable beauty all the more when the tenderness and tragedy of them, otherwise too poignant, were relieved by the story of his miraculous birth, his glorious resurrection, and his restored divinity. The gospel, thus grown acceptable to the pagan mind, was, however, but a grain of mustard-seed destined to branch and flower in its new soil in a miraculous manner."—*Ibid.*, pp. 84-86.—See also CHRISTIANITY: A. D. 35-64; 100-300: Need in Roman empire, etc.

"Fall of Rome."—Infiltration of the barbarians.—Eastern empire survives under Constantinople.—"It was the destiny of Rome to perish through its conquests. It is, in fact, soon annihilated by the Empire it has founded. In proportion as the East flourishes once more and the West expands; in proportion as the prosperity, the number and the power of the middle classes and the provincial aristocracies increase; the immense Empire assumes the form, no longer of a formidable engine of political and military dominion, but of one of those highly refined urban States that Hellenism had produced in the East. Created by a puritan and strictly national aristocracy of diplomatists and warriors, the Empire falls into the power of an aristocracy and bureaucracy, cosmopolitan, pacifist, lettered, philosophical; whose amalgamation is effected throughout the Empire, not any longer by a real or imaginary community of origins, traditions and history, but by a brilliant, though superficial, literary and philosophical culture, and by the political religion of the Empire and the emperor. The force of cohesion which internally binds together the enormous bulk of the Empire is no longer merely warfare and law; it is, above all, the urban civilization of the Hellenized East. In the same way as the Emperor at Rome, so do the rich families in the provinces dispense part of their wealth to beautify the cities; to increase the profits, the comforts and pleasures of the people; they build palaces, villas, theatres, temples, baths, aqueducts; they are liberal of corn, oil, amusements, money; they endow public services or establish charitable foundations. The Empire is covered with great and small cities, which rival each other in splendour and beauty; all expand through the constant influx of the poor populations of the campaigns, of artisans, of peasants grown rich. Schools are opened wherein the young of the middle class, by learning rhetoric, literature, philosophy, and law, prepare themselves for the bureaucratic functions which, from generation to generation, increase and ramify. It is this lettered and philosophical bureaucracy which introduces into the Roman law, originally empiric, the philosophical and systematic spirit; which introduces into the administration, originally authoritative, the juridic spirit. And it is thus that, during the second century, the Empire displays, in the sunshine of the Pax Romana which illumines the world, its innumerable cities all resplendent with marbles. But, alas, for but a brief period; for a fresh dissolution commences. The urban and cosmopolitan civilization which had linked, one with another, the various parts of this incongruous empire, begins, in the course of the third century, to act as a dissolvent force, which throws this brilliant world back into

the chaos from which it had drawn it. Little by little, with the spontaneous growth of the cities and of their luxury, that which the urban civilization consumes, exceeds the fertility of the campaigns, and these become depopulated; drained by the cities which absorb their population and their wealth. What human force will ever drive from the cities the rural populations after they have once tasted the conveniences, the pleasures, and the vices, of a refined civilization? Hereafter the Empire is devoured alive by the cities which swarm upon its enormous body. To nourish the populations which there crowd together; to amuse them and to dress them, the campaigns are harassed by a terrible fiscal regimen; agriculture is ruined; the material arts perish; finances break down; the administration falls into disorder; and soon the day will come when within the empire, by a monstrous inversion of the natural relations of things, the craftsmen of pleasure and luxury will multiply endlessly, while there will no longer be any peasants to till the fields, any bakers to make the bread, any sailors to plough the seas, any soldiers to defend the frontiers. It is the beginning of a social dissolution, the history of which is not yet written; in the midst of which there supervenes the greatest moral fermentations the world has ever undergone for the mysticism, the cosmopolitanism, the antimilitarism, the conflict which causes the old educated classes and the ancient Greco-Roman culture to clash with the barbarians, who invade the empire from without and from below, as well as the innumerable religious aberrations in formation; culminates in Christianity, which elaborates a superior morality, but whose spirit denies the very essence of the Empire; and destroys the vital substance of that ancient civilization. The Empire defends itself with the fury of despair, but without success. East and West separate, and the West, abandoned to itself, falls into decay."—G. Ferrero, *Europe's fateful hour*, pp. 01-03.—"It is questionable, therefore, if the European tribes could ever have overcome the empire of their own power and inclination. For many of them were inclined to look upon it rather with reverence and awe, and the dream of some of their leaders was merely to keep it going on the old lines with but a transfusion of blood. Though we are largely groping in the dark it seems reasonable to believe that the 'Germanic' tribes cantoned in central Europe were becoming sedentary under Roman example and tuition, were clearing their woods and draining their swamps like American pioneers later, and that the continent might have been won for agricultural civilisation centuries earlier than actually happened but for the uncontrollable barbarism of the dim Asiatic backgrounds. In the early Christian centuries the great plains disgorged westwards a barbaric tide impelled either by drought or set on the move after the completion of some inward imperial process, and instinctively marching forward for fresh booty as hordes of lemmings and buffaloes migrate in millions towards the sea. The Huns, who were more barbarous than the Romans, burst into Europe. They crumpled up the immense kingdom of the centenarian Hermanic [Ostrogothic king, c. 269-375], and, gathering up the *débris* of the defeated nations, surged towards the Atlantic. Though Attila was defeated in Gaul [battle of Chalons, 451], he seems to have remained practically as powerful as before. Turning south and east he destroyed Aquileia and actually threatened Rome, but was dissuaded for whatever reason. [See also BARBARIAN INVASIONS: 423-455.] Had he lived, it would probably only have been to the end of creating a greater atmospheric depression of the Mediterranean civilisation

than actually occurred. As it was, the Germanic tribes, disbanded under the enormous pressure which had originated perhaps beyond the Oxus, broke through the far-flung Roman barriers, and began a vigorous cantoning of themselves within various parts of the huge body politic, which it became their idea to exploit in the immemorial fashion but to the profit of a new caste. Already the immense structure had become practically bisected because of the co-existence of two different gravitational points, near the bases of the Alps and the Balkans respectively, and ministering to two worlds of west and east differing wholly in speech and much in economic interest and racial and religious ideas."—A. R. Cowan, *Master-clues in world-history*, pp. 90-92.—The "Fall of Rome dwelt on so much by historians as a definite break in the history of Europe was a decline so gradual that even the date 476 which by earlier historians was given as that of its final drop over the precipice is no more than a landmark in its continued descent."—C. R. L. Fletcher, *Making of western Europe*, v. 1, p. 78.—See also **ROME: Empire: 476**.—"The Roman Empire was still intact when Theodosius the Great died in 395. It was governed by a vast and elaborate bureaucracy of which we have an impressive picture in the official list of offices, which has come down to us, the so-called *Notitia Dignitatum*. A century later the western portion of the Empire was in a state of disintegration. We find kings of the Franks, Alemanni, Burgundians, West Goths, East Goths, and Vandals, each ruling over a more or less well-defined portion of the ancient Roman Empire. It is no longer possible to trace the process of dissolution in detail; indeed, the changes were so complicated, so varied, and so gradual that even if we were as well informed about the fifth century as we are in regard to the nineteenth, it would probably be impossible to give a clear account of the revolution, simply because it was inherently irregular and obscure."—J. H. Robinson, *Fall of Rome (Address before New England History Teachers' Association, Apr., 1906)*.—"With the settlement of the Visigoths in Southern Gaul [419], we may claim . . . to have reached at last the dividing line between the Old and New worlds. The futile timid Emperor Honorius . . . has left a mark on history which nothing can efface. . . . Honorius perceived that the only thing now to be done was to accept the logic of facts, to commence the recognition of nationalities within the boundaries of the West to pretend that it was all with the goodwill of Rome, and maintain a nominal suzerainty over all for Rome. . . . In Western Europe the Western Empire is henceforth but the shadow of a shade. . . . The deposition of Romulus at Ravenna in the year 476 can neither be dismissed as wholly unimportant, nor, on the other hand can it be taken as the beginning of Medieval as opposed to Ancient history. . . . [for, although with Romulus the long line of Augustan rulers disappeared from Rome] the 'Severance of the West' from the authority of the Roman Emperor at Constantinople must be placed a great deal later than 476."—C. R. L. Fletcher, *Making of western Europe*, v. 1, pp. 78, 96.—The history of Rome "explains how an empire is constituted and disintegrated; how a historic aristocracy is broken up, and how a democracy can perish of exhaustion; by what internal processes a republic is converted into a monarchy; a military and national State transformed into a state of lofty culture, and little by little exhausts itself entirely in intellectualism, exoticism, humanitarianism, cosmopolitanism. It shows how an authoritative régime ends by gradually enchainning itself in a very complicated juridical

system; it produces many revolutions and reactions; a great variety of repercussions of internal politics upon external, and conversely. . . . We see how a political religion is destroyed by a lofty literary and philosophical culture, and a new mystic religion arises which shapes itself from the debris of this same culture; as well as all kinds of minglings, contacts, encounters and conflicts between young and old peoples; between ancient civilizations and barbarisms; between different States, religions and laws. . . . It is a well-known fact that, above all during the last three centuries, after powerful States had begun to reconstruct themselves upon the political compartment of the Middle Ages, Rome, its history, its literature, its military system, its legislation, were regarded as an historical mirage, projected by the past in front of the generations which sought the road to the future. It has furnished different models to all generations for the resolution of the most opposite political problems. In the seventeenth and eighteenth centuries Rome is the example which all the great monarchies founded in Europe held before them; in the eighteenth and nineteenth centuries the history of the Roman Republic, by the fervent cultus of Brutus, by the scandalous romance of the Julii Claudii which Suetonius and Tacitus transmitted, fomented the opposition against absolute monarchy. After the French Revolution Rome once more supplied to monarchy, as argument and means of persuasion, the Cæsarean vindications of Drumann, Duruy, and Mommsen, and the panegyrics lavished on the imperial government. It may even be said that the most celebrated histories of Rome written in the nineteenth century were only written in view of the conflict which had begun between the republic and the monarchy."—G. Ferrero, *Europe's fateful hour*, pp. 94-95.—While Rome disintegrated "Constantinople [made capital of the Eastern Empire in 330] continued, but actually began to flourish more than ever, and, until the advent of the Saracens, was the only centre of light and leading in the obscured Mediterranean world. The different fates of the capitals are to be explained less in terms of psychology than of geography and economics. Constantinople is one of the most 'inevitable' capitals of the world, occupying a unique concentrating position at the junction of two continents and two of the greatest inland seas. No point was more clearly predestined as an *entrepôt*, and no situation lent itself so admirably to defence from the military point of view. [See also CONSTANTINOPLE.] Better than Rome, it could not only draw sustenance from its immediate surroundings, but its continental granaries were not only more accessible but less easily cut across the Roman lines of aliment. Thus, while the barbarians battered in vain at the eastern gates of the empire, they made enormous breaches in the west, and when Genseric and his Vandals captured Carthage [439] and stopped the grain supplies from north-west Africa, Rome collapsed—became frustrated like an annuitant suddenly deprived of a pension. [See also HUNS: 429-430.] Pastoralism, with its origins in the steppelands of inner Asia, thus gained ground not only over the beginnings of tillage civilisation in the great Russian plains, but also in the western woodlands and clearings right down through the Iberian and Italian peninsulas to the very fields of Carthage. Learning disappeared, culture became utterly obscured, commerce degenerated once more into naked piracy, war became more and more sectional while becoming more and not less ferocious; in a word, the Dark Ages descended upon the greater part of Europe. These may not have been so black as they are sometimes painted, but it is common

ground at any rate that there was very sensible decline which it is here suggested was due fundamentally to a triumph of relative nomadism over tillage—the climate and ethnos of central Asia over those of western Europe. [See also AGRICULTURE: Ancient; Discouragement, etc.] That may have been inevitable, but at any rate it was only temporary. The barbarians rotted down, or were so completely absorbed in all the more southerly lands they conquered that to-day there is hardly a trace of the 'Teutonic' type in North Africa, Spain, or Italy. They died and gave no sign, though it is not impossible the ethnic impression may ultimately have stood for good as well as barm in fashions that we cannot discover. Barbarians did not cease irrupting for centuries. They came not only from the east and surged right up to the walls of Constantinople; but swarmed out of Scandinavia as pirates not one whit less ferocious than Huns or Mongols. It cannot have been drought which set the Norsemen on the move, though it may have been scarcity however caused. But at any rate they plied their trade with an activity and daring which are unparalleled in the predatory annals of the sea, scouting to enormous distances from their northern base, and founding dynasties here and there which lasted for centuries. In their case, too, however, the political impression was probably out of all proportion to the ethnic, and who is of Norse descent to-day in Sicily or even Normandy no man can say. It speaks volumes for the strength of the tillage impulses that they revived in Europe, under such enormous distractions from east and north. But revive they did, and were even stimulated by influences which, though predatory in their origin, became transmuted into great civilising forces."—A. R. Cowan, *Master-clues in world-history*, pp. 90-95.—"In Italy . . . as in Spain and Gaul, the laws, the administrative system and the language remained Roman. But the emancipation of Italy and the western provinces from direct imperial control . . . has rightly been regarded as marking the opening of a new epoch. . . . It made possible in the West the development of a Romano-German civilisation; it facilitated the growth of new and distinct states and nationalities; finally it gave a new impulse to the influence of the Christian Church, and laid the foundations of the power of the bishops of Rome."—H. F. Pelham, *Outlines of Roman history* (ed. 4), p. 598.—See also **ROME: Empire.**

#### MIDDLE AGES

**Definition.—Extent of barbarian civilization.—Assimilation of ancient and barbarian cultures the function of the Middle Ages.—Meaning of the term "dark ages."**—"We commonly say that ancient history closed with the year 476 A. D. The great fact which marks the close of that age and the beginning of a new one is the conquest of the Western Roman Empire by the German tribes, a process which occupied the whole of the fifth century and more. [See **ROME: Empire: 455-476.**] . . . At this moment all the other provinces of the West were occupied, or just about to be occupied, by new German kingdoms, some faintly acknowledging the supremacy of the empire, others not at

all. When we turn to the close of medieval history we find no such general agreement as to the specific date which shall be selected to stand for that fact. . . . For the purpose of the present sketch the date 1520 must be chosen, because, although upon the political side, the whole Reformation period is clearly in the full current of modern international politics, still, in other directions, it just as plainly marks the transition from medieval to modern times. . . . It is a transition age. Lying, as it does, between two ages, in each of which there is an especially rapid advance of civilization, it is not itself primarily an age of progress. As compared with either ancient or modern history, the additions which were made during the middle ages to the common stock of civilization are few and unimportant. . . . The most evident general meaning of the age is that which has been hinted at above. It is assimilation. The greatest work which had to be done was to bring the German barbarian, who had taken possession of the ancient world and become everywhere the ruling race, up to such a level of attainment and understanding that he would be able to take up the work of civilization where antiquity had been forced to suspend it and go on with it from that point. Progress had ceased in the ancient world. Having brought civilization up to a certain point, the classical peoples seem to have been able to carry it no further. Even in those fields where the most remarkable results had been attained, as in that of the Roman law, nothing further seemed to be possible, except to work over the old results into new forms. Only in a single line, and that more or less in opposition to the general society of which it formed a part—only in the Christian church was there any evidence of energy and hopeful life. The creative power of antiquity seems to have been exhausted. But if the barbarians were physically the stronger race, and gifted with some legal and political notions worthy to join with those of the Romans in equal partnership, they were in other regards rude and barbarous—children in knowledge and understanding—in the actual point of civilization which they had reached by themselves, scarcely, if indeed at all, above the level of the best tribes of North American Indians. In capacity for civilization, in their ability to meet a corrupt civilization of a higher grade than their own, and not be permanently injured by it—though certainly some of the best of them, the Franks, for instance, seem to have had quite as great a capacity for absorbing the bad as the good—in the rapidity with which they responded to the stimulus of new ideas and experiences they were apparently superior even to the Cherokee. . . . They were filled with wonder at the evidences of skill and art which they saw on all sides, but they did not understand them and they could not use them. The story of the German warrior who, astonished at seeing ducks apparently swimming on the floor of the antechamber in which he was waiting, dashed his battle-axe at the beautiful mosaic to see if they were living, is thoroughly typical of the whole age. Much they destroyed through ignorance, and much in merely childish or savage moods. Much more was forgotten and disappeared because no one any longer cared for it or demanded its use. Art, which had long been slowly dying, at last perished. Science, no longer of interest to any one, disappeared. The knowledge of the Greek language was forgotten, almost the knowledge of the Latin. Skill of handicraft was lost. Roads and bridges fell out of repair. Intercommunication became difficult; commerce declined. Few common ideas and interests were left to bind the different parts of the empire, or even

of a province, together. The new governments were rarely able to enforce obedience everywhere, and often hardly cared to try. Crimes of violence became common. Force reigned where law and order had been supreme, and life and property were far less secure than they had been. . . . The larger part of all that the ancient world had gained seemed to be lost. But it was so in appearance only. Almost, if not quite, every achievement of the Greeks and the Romans in thought, in science, in law, in the practical arts, is now a part of our civilization. . . . For the moment it seemed lost, but it was only for the moment, and in the end the recovery was to be complete. . . . This age of final recovery—the age of the Renaissance—marks thus the completion of that process of education the absorption of the German in the civilization which he had conquered, so completely that he is able to take it up at the point at which the Greek and the Roman had been obliged to drop it, and to carry it on to still higher results. And so the Renaissance age is the last age of medieval history, and medieval history is the history of that education and absorption, of the process by which the German was brought into the classical world, and by which out of the two—the Roman civilization and the German energy and vigor and productive power, and new ideas and institutions a new organic unity was formed—modern society. This was the problem: To make out of the barbarized sixth century, stagnant and fragmentary, with little common life, without ideals or enthusiasms, the fifteenth century in full possession again of a common world civilization, keen, pushing, and enthusiastic. This was what the middle ages had to do, and this was what they did. It was a slow process."—G. B. Adams, *Civilization during the Middle Ages*, pp. 4, 8, 10-12.—"It is impossible to divide the past into distinct, clearly defined periods and prove that one age ended and another began in a particular year, such as 476, or 1453, or 1789. . . . It is true that a single event, such as an important battle which results in the loss of a nation's independence, may produce an abrupt change in the government. . . . [But this] affects the habits of a people but slowly in any case, and it may leave them quite unaltered. . . . We cannot, therefore, hope to fix any year or event which may properly be taken as the beginning of that long period which followed the downfall of the Roman state in western Europe and which is commonly called the Middle Ages. . . . Long before the German conquest, art and literature had begun to decline toward the level that they reached in the Middle Ages. Many of the ideas and conditions which prevailed after the coming of the barbarians were common enough before,—even the ignorance and want of taste which we associate particularly with the Middle Ages. The term *Middle Ages* is, then, a vague one. . . . [It means], roughly speaking, the period of nearly a thousand years that elapsed between the opening of the fifth century, when the disorder of the barbarian invasions was becoming general, and the fourteenth century, when Europe was well on its way to retrieve all that had been lost since the break-up of the Roman Empire. It used to be assumed, when there was much less interest in the period than there now is, that with the disruption of the Empire and the disorder that followed, practically all culture perished for centuries, that Europe entered upon the 'dark ages.' These were represented as dreary centuries of ignorance and violence in marked contrast to the civilization of the Greeks and Romans on the one hand, and to the enlightenment of modern times on the other. The more careful studies of the last

half century have made it clear that the Middle Ages were not 'dark' in the sense of being stagnant and unproductive. On the contrary, they were full of movement and growth, and we owe to them a great many things in our civilization which we should never have derived from Greece and Rome." —J. H. Robinson, *History of western Europe*, pp. 3-7.

Rise of the Frankish kingdom.—Empire of Charlemagne and its continuation in part of the work of Rome.—The Franks, alone of all the German tribes, became a wide power in the middle ages. The political inheritance of the Roman empire in the west passed to them; and they actually carried on the work which Rome had been doing. Henceforth they gave law and order to western Europe. They delayed for two centuries the founding of the kingdoms out of which the states of modern Europe had grown. They are condemned in the sight of history by the fact that they extirpated the spirit of toleration in religion and destroyed the balance of power among the new independent states of western Europe. By breaking up a family of nations living in distinct boundaries and dealing with each other on equal terms, they condemned Europe for a thousand years to the night of the dark ages. The successors of Clovis [c. 466-511] rapidly degenerated and the control of the state passed into the hands of their prime ministers, or Mayors of the Palace. [See FRANKS: 511-752.] The second of these, Charles Martel, saved Christianity from the Mohammedan lust for universal conquest. . . . The Mediterranean at this period has aptly been described as an 'ill-defended moat between Christian Europe and Mohammedan Africa.' In an eight days' battle at Xeres de la Frontera in 711 they [Mohammedans] overthrew the Visigothic power in Spain. [See SPAIN: 711-713.] Within a period of four years they overran Spain (except the mountainous north) and converted Narbonne, Arles, and Nismes in modern France into Mohammedan cities. . . . The impending danger united the Christian nations. In 732 Charles Martel defeated them in six hotly contested battles between Tours and Poitiers and stopped their advance. . . . With the pope's sanction, Pepin, the son and successor of Charles Martel, was crowned as king of the Franks in 752. . . . The pope, as an Italian sovereign, appealed to Pepin [against the Lombards] who marched into Italy, overthrew the Lombards, stripped them of a part of their lands, and bestowed them upon the pope. [See LOMBARDS: 754-774.] Pepin retained no territory for himself in Italy. His son and successor, Charles or Charlemagne, confirmed Pepin's gifts to the pope. . . . On Christmas day of the year 800, Charlemagne appeared in the church of St. Peter in Rome. As he knelt at the altar, the pope suddenly placed a crown upon his head and the dome resounded with the acclamations of the people, 'Long life and victory to Charles, the most pious Augustus, crowned by God, the great and pacific emperor of the Romans.' . . . The founders of the new empire regarded their state as a continuation of the Roman Empire. Charlemagne was held to be the legal successor of Augustus, through the eastern line of emperors, the sixty-eighth from Augustus. . . . His empire reached from the Ebro to the Carpathian mountains and from the Eider to the Liris. [See also FRANKS: 768-814.] As the Mohammedan dominions were now separated into two parts, the Mediterranean world was divided between two

Christian empires and two Mohammedan caliphates. But there was no balance of power between these four great states. As civilization and industries declined the difficulties of intercommunication made rapid conquest increasingly difficult and the four empires may be regarded as four separate, distinct, and insulated worlds which had little more influence upon each other than the four contemporary empires of Japan, China, Mexico, and Peru. Charlemagne had completely overthrown the balance of power in his separate world. His empire exhibited within a single lifetime all the phenomena of the rise and fall of a world-conquering nation which wrecks a community of happy and prosperous states, enjoys a brilliant and deceptive prosperity, and by its disintegration delivers its inhabitants to the chaos of a dark age. . . . Charlemagne died in 814. In 843 his empire was divided

CHARLEMAGNE

(After painting by Meissonier)

amongst his three sons: the eastland, which was the beginning of modern Germany; the westland, which was the beginning of modern France; and the middleland, a long narrow strip between the other two extending from northern Italy to the North Sea. [See also FRANKS: 814-002.] The middleland has ever since been a bone of contention between its two neighbors. From its territory arose Holland, Belgium, Luxemburg, Alsace, Lorraine, Switzerland, and Savoy. Feudalism soon disintegrated the empire into a vast number of little principalities which usurped the functions of the state and aspired to entire independence. The executive, legislative, and judicial powers passed into private hands, Europe was dissolved into its elements, and chaos reigned complete."—S. C. Vestal, *Maintenance of peace*, pp. 255-257.

Roman civilization inherited in part by the Christian church.—Benedictine Age.—Medieval view of Christianity.—Results of ecclesiastical domination in the Middle Ages.—"The strong Roman bias for organization and administration

was builded into the church—the result was the powerful Church of Rome with its hierarchal structure. After the Fall of Rome, the Roman proclivity for centralization of government lived on and produced within the Church a center of power that has been the marvel of church history. The Church Fathers directed the attention of the people to the next world and to preparation therefor. Sacramental and sacrificial methods of salvation were elaborated. The importance of improving social conditions was ignored. In fact, the injustices in the current social order were considered as disciplinary measures for the soul in its preparation for the next world. The improvement of living conditions was considered to be wasted effort, if not indicative of heretical tendencies of mind. . . . During the first half of the Middle Ages the dominant tendencies are Roman and Christian. The Roman power of organization gains increasing strength in its new form—the Church. The Christian influences were expressed in high ideals, new duties, and asceticism.”—E. S. Bogardus, *History of social thought*, pp. 145-147.—See also CHRISTIANITY: 312-337; 337-476.—“The greatest of all agencies in civilizing the Germans was the church. Its organization, which in many respects so closely paralleled the imperial organization, had been founded firmly before the migrations. All the Germans who had not already been converted became Christians soon after entering the Empire. The Franks, because they were Catholics, were especially influenced by the church; and, as their sway was extended more widely, the other tribes were brought under this influence. [See also CHRISTIANITY: 408-800.] It was, consequently, the one institution which exercised any real restraint upon the barbarian kings and leaders, although at times they chafed under its authority or rebelled against it. At first the officials of the church were almost all Romans, as some education was necessary for conducting its service. When the Frankish realm was divided into separate kingdoms, the church in Gaul was weakened. The members of the clergy in each kingdom were considered to be subjects of the king, and were not expected to have any intercourse with the clergy of the neighboring and usually hostile kingdoms. This isolation and partial subjection was one of the causes of the low state of Christianity in Gaul when St. Columban entered the land. This evil was done away with when all of the kingdoms were united under the powerful mayors of the palace. Boniface’s work was all-important in unifying the church and restoring its prestige, as well as in connecting it closely with Rome. His labors made it a far more potent agency in the preservation of the older civilization. The missions and councils bound together the churches in the various lands and the more backward sections profited by the presence of missionaries from the more civilized centers. The organization of the church made it stronger and preserved the prestige of Rome, the old capital of the Empire. And in turn the feeling of unconscious reverence for the Roman Empire, a feeling which was shared by every German who had come under the influence of Rome, enhanced the glory of the Roman Church. The members of the clergy, especially the missionaries, did much to bring the Romans and the Germans together; the bishops were the natural intercessors between the Roman population and the German kings; the church edifice was the common asylum for all who needed protection; the monastery welcomed both Germans and Romans as members. . . . As all education was under the control of the church Latin was its vehicle. This resulted in the preservation of much

of the old culture contained in the Latin literature, and enabled every educated man to profit by any Latin work which he could obtain.”—D. C. Munro, *Middle Ages*, pp. 81-83.—“It would be a mistake to suppose that the extraordinary eclipse which came over the whole of Western culture was merely the recrudescence of paganism, or again, that it was due merely to a triumph of religious fanaticism. Christianity, the new faith of Europe was, it is true, but little more than a revival, with some additions, of the old pagan cult. But in some sense the period of darkness had set in before the Church had gained its hold. Nero and the monsters of the purple preceded St. Augustine and the fathers. Imperial Rome was the penumbra; Christian Rome was the full shadow. There has been in recent years a tendency to revise somewhat the accepted picture of the Interregnum, to discover that the Dark Ages were not so very dark, the fanatics of the Church hardly so maniacal as the earlier historians would have led us to believe. Doubtless there were some exaggerations, many inaccuracies. Gregory the Great may not have burned the Palatine library. In the monasteries some faint traces of ancient learning survived. . . . Let us not lose sight of the main facts. Freedom of thought was stifled. Natural inquiry was dead. The arts of civilisation all but perished. Sanitation, and with it civic decency, almost disappeared. The Paris of the twelfth century was a pig-sty. This was generally true of Europe, outside of the Arabian dominion, through eight or ten centuries.”—C. Snyder, *World machine*, pp. 151-152.—“The period which intervenes between the time of Charles the Great and the eleventh century has been called the Benedictine Age. . . . It was the age, and the only age, during which European education was in the hands of Monks. With progress of the barbarian invasions, the old Imperial and municipal Schools had everywhere disappeared: their place had been taken by the episcopal and monastic Schools which the imperative needs of the Church had called into existence. It is generally acknowledged that the age which immediately followed the completion of the barbarian conquests is the darkest age in the intellectual history of Europe. Whatever view may be taken of the part played by Christian Theology in bringing about that rapid evanescence of intellectual light which culminated in the almost total night of the seventh century, it is at least certain that so much of the culture of the old Roman world as survived into medieval Europe survived by virtue of its association with Christianity. The truth is that the hostility of Christian theologians to secular culture was . . . the reflection of the political and social conditions of the time. If Gregory the Great interpreted the advance of the barbarian hosts, the slaughter and pillage which they brought in their train, as sure signs of the coming end, the events themselves were sufficiently calculated to discourage study and education apart altogether from any theological interpretation. . . . The Christianized barbarian recognised the spiritual, if he did not recognise the intellectual, needs of humanity; and some measure of intellectual cultivation was made necessary to the satisfaction of those spiritual needs by the narrowest interpretation of the religion whose principles had to be gathered from books, and whose services formed a small literature by themselves. Narrow as may have been the Churchman’s educational ideal, it was only among Churchmen that an educational ideal maintained itself at all.”—H. Rashdall, *Universities of Europe in the Middle Ages*, v. 1, pp. 26-27.—See also EDUCATION: Medieval: 4th-15th centuries.—“The mediæval view involved, not sim-

ply the conviction that the natural man is corrupt and depraved, but that he is fallen. Originally created holy, he lapsed from his high estate, and cannot raise himself again without supernatural aid. The idea was the exact opposite of modern evolutionary notions. Man did not begin on a low plane and gradually ascend, but on a high plane, from which he abruptly fell. Having fallen and transgressed the divine law, he is doomed to eternal punishment. . . . It was of a piece with the mediæval view of the world that Nature lost independent interest, and was subordinated to the eternal destinies of men. The heavens and the earth were to pass away, and hence it was not important to study them. Only spiritual things were worthy of attention. If Nature was investigated at all, it was for the light it might give of God and His will. According to Vincent of Beauvais, 'Natural science treats of the invisible causes of visible things,' and 'the knowledge of all wisdom has no value if it remain without the knowledge of God.' The few notable exceptions to this way of looking at things serve only to prove the rule. Under these circumstances natural science in the modern sense of the term was, of course, impossible. Only supernatural knowledge, which brings a man into touch with eternity and prepares him for life beyond the grave, has real and permanent worth. . . . The recognition of supernatural authority was carried so far in the Middle Ages that it even controlled men's ideas of the physical universe, and dictated the prevailing world-view of the period. It was commonly believed that in the Bible is contained an inspired account of the origin and structure of the world, and to depart from it is to fall not only into error but also into sin. According to St. Augustine nothing was to be accepted save on the authority of the Scriptures, 'for greater is that authority than all the powers of the human mind.' If any one wished to know more about the world in which he lived, he turned not to the world itself but to the Scriptures. Growth in the knowledge of Nature as well as of spiritual things could come only from a study of divine revelation. The supernaturalism of the Biblical writers was controlling in this sphere as in every other, and the world-view was far more primitive than that of the Greeks, for it was based upon the naive ideas of the Hebrew Scriptures. In the Catholicism of the Middle Ages humility, both moral and intellectual, was the supreme virtue, self-confidence the worst of sins. Religion found its highest exercise in magnifying God as the All-holy, Powerful, and Wise Being in contrast with corrupt, helpless, and blind humanity. Pride was the root of all evil. The fall of man, like the fall of Satan, was due to it, and from it sprang sacrilege, schism, and heresy, the most awful crimes; all were the fruits of self-love and self-confidence, the preference of one's own ways and opinions to those prescribed by the Church, God's representative on earth."—A. C. McGiffert, *Protestant thought before Kant*, pp. 3, 5-6, 8-9.—"This ecclesiastical conquest of those peoples before whose arms her political power had collapsed, was, indeed, in many respects a fortunate circumstance for Europe, even apart from the spiritual contribution which the Christian faith made to her peoples. It gave a sense of solidarity to Europeans as against the other races of the world, which neither feudalism nor the Empire afforded, and which came to be a powerful force in their conflicts with extra-European peoples. It provided a common meeting-place for men of all tongues and tribes. In more senses than one it maintained a common standard of life and thought among the diverse elements of which European society was composed, especially

after the barbarian invasions. It acted as a link between the old imperial and the tribal system, between Roman and Germanic ideals and practices, which enabled Europe in some measure to combine the two into a new form of polity and society. Its intellectual contribution was of like kind. Despite its opposition to the paganism of the classical as well as that of the barbarian world, it did much to preserve those parts of the ancient culture which were not antagonistic to its own faith and practice. It maintained Latin as the universal language of educated Europe. It preserved even while it modified the Roman legal tradition, forms, and phraseology. For some centuries it kept some knowledge of Greek. It continued the Roman legal tradition in the modified form of canon law. It kept alive the transmission of knowledge by the art of writing; it was the patron of music and architecture, and, in some sense, of literature. Long after the study of Greek decayed before the theological objections to pagan thought, the influence of Aristotle persisted as the dominant force in European intellectual processes. Long after Virgil was abandoned for the same reasons, the tongue in which he wrote was the common means of communication among the peoples of the continent and so maintained a unity which would otherwise have been lost. In many other directions the ecclesiastical influence worked for the perpetuation and the advance of civilization. The monasteries cleared and improved vast tracts of land and practised the principles of Roman husbandry. Monasteries and cathedrals alike carried on and encouraged schools and such education as they afforded; gave employment to artists, architects, and copyists; provided a refuge for men desiring to pursue an intellectual as well as a religious life. The monasteries in particular furnished entertainment for the traveler and succor for the needy and the sick. The church preserved, even if it neglected, the manuscripts of the classical world. And, in a thousand ways it ameliorated the harsh and unenlightened régime established by the Germanic conquerors, no less through its efforts toward checking feudal quarrels and private war than by the pressure it exerted directly and indirectly upon the rulers of the middle ages. . . . As the domination of the church grew stronger, it narrowed. Theology became its chief intellectual concern, logic its chief intellectual weapon, and the life to come its chief if not its only concern. In all fields which were not touched by theological considerations it remained a power for good; but with the development of its doctrines into irrefutable dogma, with the increase of its worldly strength and wealth, there came an inevitable decline in its intellectual openness. The mysteries of nature became the secrets of God, and so insoluble. Authority became the enemy of investigation; the true faith the irreconcilable foe not merely of heresy but of the paganism which it had conquered. In consequence, the writings of the classical world came first into neglect, then into disrepute, and finally under proscription. What little knowledge there was of scientific methods and results followed the same course, and man was thrown back upon himself as at once the source and the end of all knowledge, upon the Scriptures and the commentaries as the sole fount of inspiration, the church as the sole arbiter of intellectual as well as spiritual questions, and conformity to its decisions as the guide of life and thought."—W. C. Abbott, *Expansion of Europe*, v. 1, pp. 10-25.—"Almost all the ideas, and even the institutions of the Middle Ages, such as the church and monasticism and organized religious intolerance, really originated in the late Roman Empire. Moreover the intellectual revolution which

has ushered in the thought of our day did not get, well, under way until the seventeenth century. So one may say that Medieval thought began long before the accepted beginning of the Middle Ages.—J. H. Robinson, *Mind in the making*, pp. 119, 120.—Stoicism and the Neoplatonist idea of truth through intuition, as against reason, had an inevitable influence upon early Christian dogma, and fixed belief in miraculous events and the power of magic. Moreover, the great Christian Fathers, among whom are numbered Jerome, Athanasius, Ambrose and Augustine, made the groove in which medieval thought ran for centuries. These great men, disgusted with the welter of social degeneracy around them, turned their eyes away from worldly things to gaze upon the transcendental glory of a life to come, a glory which passed all knowledge and all power of reason. They set the seal of their approval upon monastic life, as the only hope of salvation from a wicked world, and believed that the evils of the time were but a prelude to the end of all earthly things. Why then fix one's thought on knowledge of the world around one? Moreover, learning was pagan, and the Christian Fathers were too near to paganism to carry on the ancient learning beside the new faith. Learning in the Roman world had already fallen to a very low ebb, and what there was was soon forgotten, and only a very small modicum of illy comprehended Greek knowledge was handed on together with the Latin tongue. Indeed it is doubtful, the influence of the Church Fathers apart, whether the half-barbarous peoples of the so-called "Dark Ages" would have given credence to anything but the fables and half truths which they believed of the physical world. When learning did revive "about the year 1100 and [made] a recovery of forgotten knowledge and a gradual accumulation of new information and inventions unknown . . . to any previous civilization [it went back] to the Roman Empire. The main presuppositions of the later Middle Ages . . . had been formulated by Church Fathers, transmitted through the Dark Age, and were now . . . elaborated under the influence of Aristotle's recovered works and built up into a majestic intellectual structure known as Scholasticism."—J. H. Robinson, *Mind in the making*, pp. 121, 122.—But this old new knowledge was hedged about by the interpretation of the medieval mind, and made a new barrier which for some time impeded the further advance of human knowledge.—See also MONASTICISM: Primitive forms, to 13th century.

Influence of feudalism.—The feudal system, which had a great and enduring influence on the history of Europe, grew up during a long period of revolution, in which the period of decay of the Roman Empire is included. "The western empire was first broken into barbarian kingdoms. These kingdoms were in turn effaced by anarchy or conquest, and gave place to the empire of Charlemagne. Charlemagne's empire was in turn broken in pieces by the disintegrating forces within it, and the universal sovereignty gave place once more to the sovereignties of a number of kings, whose jurisdiction was gradually limited by that of the feudal magnates in France, Germany, Italy, and part of Spain. The State in the Roman sense disappeared, and was only to reappear later with the assertion of the royal authority at the expense of the feudal magnate. This process of disintegration lasted from the fifth to the tenth century, and for the next three hundred years its results were crystallized in what is termed the feudal system in the greater part of Western Europe. . . . The roots of feudalism lie in the social institutions of the Romans as well as of the barbarians—in dependence on a superior,

involving restriction of liberty and of rights of property, common to Romans, Celts, and Teutons alike. . . . Imperial rule had, latterly at least, only taught the masses how to submit, and submission, in such an age, meant slavery. . . . It meant social desolation, the slavery of the small freeman in a large part of Europe for centuries to come. . . . The desire to escape military service by alienating his property to the Church was doubtless responsible to some extent for the loss of rights; but force, not volition, is in general the basis of this all-devouring system of usurpation. . . . There are insurrections in these degenerate centuries; eternal broils, in which the magnates of the time are concerned chiefly; dynastic quarrels which draw blood like water. . . . The freeman, while uttering his complaint against usurpation and oppression, submits to the prevailing doctrine that rights are for the few, servility for the many. So universal is this tendency towards dependence, that there must have been a sort of law of social gravitation towards it. It is a period of collapse, following a tremendous political and social upheaval; and it is this fact of social comatose, induced by the misgovernment of the later empire, that alone explains the ultimate relapse of almost the whole body of small freemen, within and partially without the limits of the western empire, under the domination of a caste, based on landed possession. The disappearance of the small free proprietor was contemporaneous with the rise of this landed aristocracy, lay and cleric, which threw at its expense. . . . However they came by their broad acres, whether by spoliation of the weak, inheritance, or royal generosity, the significant fact is patent in the ninth century that a powerful landed aristocracy over-shadows emperor, king, and people. Its members are the superiors of a greater or lesser number of dependants in virtue of the beneficiary tenure of the land which they hold. They enjoy, moreover, as superiors, certain immunities from the royal jurisdiction, and are consequently invested with certain rights of 'justice,' as they were called, over their dependants. . . . The feudal castle is the monument of this system of petty sovereignty, of subordination to a lord on which this sovereignty rests. Each castle is a citadel built for defence, and intended as a basis of attack. Hither the lord summons his vassals to rally in resistance to the aggression of a neighbour, or to sally forth for a foray into a hostile neighbour's domain. The massive donjon reminds us that society is in a state of war, and has hardened into its feudal form in the mould of a long period of lawlessness, usurpation, violence. Whatever the gradation of power and rank, all the members of this hierarchy are noble, all outside it are ignoble. They alone, in the strict period of feudalism, can hold a fief and inscribe armorial bearings, which now came into vogue, as the badge of their nobility. They constitute, especially in France and Germany, a veritable caste, which regards inter-marriage between noble and non-noble as degradation, dishonour. It is equally degrading for a 'gentleman' to engage in trade or follow any profession but that of arms. None but nobles can be members of any order of chivalry, or appear at the court of the territorial magnate. It is only in the Church that the lack of nobility is not a barrier to social progress, and even in the Church the higher dignities are usually reserved for scions of noble families. The people is the victim of a social tyranny which, in France and Germany, lasted into the eighteenth century. . . . Feudalism has indeed been lauded as a stage in the progress of liberty. It substituted, we are assured, the sovereignty of the individual for the despotism of Rome, and

INTERIOR OF NOBLEMAN'S CASTLE, CENTRAL EUROPE, 13TH CENTURY

it bequeathed the germs of liberty to modern times. It represented the *régime* of contract between individuals instead of the submission to an absolute central authority. Let us not forget, however, that the individual was confined to the members of an aristocratic caste, and that the mass was exposed to the despotism of this caste. There was no liberty, there were no rights for the mass as against the caste. The *régime* of contract was in fact the elaborate formula of the sovereignty of the few over the many. The sovereignty of the few might, if you will, be a necessary product of an age of anarchy, though I, for my part, have no liking for the word 'necessary' as applied to systems which involve the oppression, the degradation of the mass of a people in favour of a privileged class. In the dissolution of society, in the state of war, the vortex of anarchy from which this necessary product sprang, the main thing is the creation of some kind of order, and order can only be created in these circumstances by the mailed fist. The mailed fist uplifted in resistance to the marauding bands of Normans, Saracens, Hungarians, Huns was the only guarantee of protection, subsistence to the helpless population of a district. Protection, subsistence being indispensable to bare life, any expedient that ensured these must be credited with a certain efficacy. But the mailed fist was also uplifted in usurpation of the rights of those it professed to protect, and while it checked anarchy for the time being, it disintegrated the State, and led in turn to anarchy and oppression. To credit the system with philanthropy, as its champions do, is, in view of this fact to take too sanguine a view of feudal human nature. There is no philanthropy in the mailed fist, apart from the orders of chivalry who assumed the noble mission of protecting the oppressed, the weak. Its benefits have to be bought with the surrender of liberty, or property, or both. If it ensured protection, it blighted progress for centuries to come, and depressed the masses to a condition of servility which it took centuries more to efface."—J. Mackinnon, *History of modern liberty*, pp. 19, 21-23, 28, 32.—See also FEUDALISM.

**Holy Roman and Papal empires.**—"The empire revived by Charlemagne in the west as a universal state was again restored by Otto I, in 962, as a German and Italian state under the name of the Holy Roman Empire. [See also HOLY ROMAN EMPIRE.] At the invitation of Pope John XII, Otto entered Italy, pacified it, and received the Italian crown at Pavia, and the imperial crown at Rome. The rule was now established that the German king should be crowned as such at Aix-la-Chapelle, as king of Italy at Milan, and as emperor at Rome. As Emperors of the Holy Roman Empire, they represented the unity of western Christendom. But there was no real unity, no obedience except in the presence of the emperor and his army. Otto himself was twice compelled to capture Rome after he had become emperor. As a result of the struggles of the emperors to enforce obedience in Germany and Italy, these two countries were shattered into fragments which remained asunder until after the middle of the nineteenth century. In Italy the pope, as the sovereign of a small state, was a disintegrating power, opposed unalterably to the formation of a national state. Otto was the last emperor whose suzerainty was admitted by the French king. For all practical purposes, Spain, England, Norway, and Sweden were outside the empire, although particular acts of deference to the emperor may be cited to show that they depended upon the empire. The Norman rulers of Naples (1060-1180) were the rivals of the emperor; Venice maintained a proud independence;

and the Byzantine prince denied his claim to be emperor at all. The Franconian emperors held the title from 1024 to 1125; the Hohenstaufen, for over a century; the kings of Bohemia, for three successive reigns; and the Hapsburgs, with the exception of a single reign, from 1486 until the title became extinct in 1806. The emperors were chosen by a college of seven electors consisting, in 1263, of the archbishops of Mentz, Treves, and Cologne, and the dukes of the Franks, Swabians, Saxons, and Bavarians. New Electors were admitted as titles became extinct. The number was increased to eight in 1648 and to nine in 1692. [See also GERMANY: 1125-1272; SUFFRAGE, MANHOOD: 1100-1800.] The king of England, as head of the house of Brunswick-Luneburg, was an elector after the year 1714. The king of Prussia was an elector in his capacity of Margrave of Brandenburg. Until 1076, the pope and the emperor stood as coordinate and complementary sovereigns of Europe. With the accession of Hildebrand to the papacy in 1073 began a long struggle between the popes and the emperors for the temporal supremacy of the west. [See also PAPACY: 1056-1122; GERMANY: 1056-1122.] The popes sought, in the words of Mr. Bryce, to become 'a presiding power common to all Europe, a power which, while it should oversee the internal concerns of each country, not dethroning the king, but treating him as an hereditary viceroy, should be more especially charged to prevent strife between kingdoms, and to maintain the public order of Europe by being not only the fountain of international law, but also the judge in its causes and the enforcer of its sentences.' Armed by the respect which the sacredness of his office commanded, and by the control of the tremendous weapons of excommunication and interdict, the pope aimed at being the presiding power in a world confederacy. But the emperor, armed with more worldly weapons, aspired to perform the same functions in the universal empire. Each sought to found a world confederation. . . . A balance of power was formed between them. Each defeated the other of his purpose. The danger from the papacy was greatest; but the empire served as a clog upon its movements until the rising spirit of nationality compelled the old antagonists to combine for self-defense in a losing fight. It was a fundamental principle of papal policy to prevent the rise of a strong state in Italy. When the emperor waxed strong in Italy, the pope sided with his enemies; when any local Italian state became threatening, the pope aided the emperor. In the height of their power, the popes made and unmade emperors, compelled a king of France to take back his divorced queen, and forced an English king to surrender his kingdom and receive it as a papal fief. [In the middle of the eleventh century the popes, as the head of a European confederacy, led, or rather, encouraged Christendom in its assaults upon the infidels and for two centuries Europe seemed to have no object except to recover or keep possession of the tomb of the Saviour.] . . . The rulers of England, Spain, France, Denmark, Hungary, Poland, and Burgundy in succession repudiated the control of the emperor who sank from being lord of the world into a simple Teutonic king at the head of a Germanic confederation. Ill success followed him in the more limited sphere of his activities. The more abjectly helpless the emperor became, so much the more sonorous was the language in which the dignity of the crown was described. His power was eternal: no laws could bind him; no court could judge him; and he was answerable only to God. After the abdication of Charles V in 1556, the Empire became a purely Germanic power.

When it was dissolved it contained scarcely any territory that had formed part of the empire of Trajan. Napoleon finally destroyed it. Shortly after he [Napoleon] assumed the title of Emperor of the French in 1804, Francis II, the one hundred and twentieth emperor from Augustus, took the title of Hereditary Emperor of Austria, and on August 6, 1806, he resigned the title of Emperor of the Holy Roman Empire. Napoleon, beyond all doubt, intended to assume at Moscow the title of Roman emperor, as the successor of Charlemagne in the west and of the Czar and the Greek emperors in the east. The empire was continued at Constantinople until 1453. Five years later Ivan the Terrible took the title of Czar, and the Russian emperors from that date until 1917 continued the succession of the Roman emperors in the east. The Turkish sultans as sovereigns of Constantinople, claim to be the successors of the Roman emperors and bear the title of Keiser-i-Rum."—S. C. Vestal, *Maintenance of peace*, pp. 257-260.

**Crusades and their result.**—The Crusaders—the word comes from the practice of each member of an expedition wearing a cross on the front of his dress as he faced the Holy Land, on his back as he returned—were alike a symptom, and in large part the noblest expression of the mental unrest of the age. Europe was growing, and its unrest had already shown itself in the greater frequency of pilgrimages to the Holy City, now in the hands of the Saracens; in greater commercial activity; in the flocking of students to the seats of learning; in the murmurs and uprising of the peasantry. To this seething energy Pope Urban II gave an outlet when on a November day in 1095, at a council at Clermont, he made an oration which had a long-felt influence on the destinies of Europe. Describing the miseries of Christian populations under the Moslem heel, the odious desecration of the Holy Places and the hardships and humiliations imposed upon Christian pilgrims by the Turks, who had taken Jerusalem in 1076, he called upon Christendom to deliver them, and to go to the aid of the Byzantine empire, upon which the Turkish hordes were constantly encroaching. With a shout of "It is the will of God" his proposal was accepted. Within a year a hundred thousand men were on their way and for almost two centuries each generation saw at least one crusade. "Some of the results of the crusades . . . must . . . be obvious. . . . Thousands and thousands of Frenchmen, Germans, and Englishmen had traveled to the Orient by land and by sea. Most of them came from hamlets or castles where they could never have learned much of the great world beyond the confines of their native village or province. They suddenly found themselves in great cities and in the midst of unfamiliar peoples and customs. This could not fail to make them think and give them new ideas to carry home. The Crusade took the place of a liberal education. The crusaders came into contact with those who knew more than they did, above all the Arabs, and brought back with them new notions of comfort and luxury. Yet in attempting to estimate the debt of the West to the Crusades it should be remembered that many of the new things may well have come from Constantinople, or through the Saracens of Sicily and Spain, quite independently of the armed incursions into Syria. Moreover, during the twelfth and thirteenth centuries towns were rapidly growing up in Europe, trade and manufacturers were extending, and the universities were being founded. It would be absurd to suppose that without the Crusades this progress would not have taken place. So we may conclude that the distant expeditions and the

contact with strange and more highly civilized peoples did no more than hasten the improvement which was already perceptible before Urban made his ever-memorable address at Clermont."—J. H. Robinson, *History of western Europe*, v. 1, pp. 190-200.—"The crusades were expeditions of Christians organized by the Pope. . . . Every crusader was an armed pilgrim to whom the Church . . . remitted the penance which he owed. . . . In order to carry pilgrims to the Holy Land, the Mediterranean cities organized a transport service. . . . By land or sea, the European Christians went by millions to the Orient. The crusades were a sort of educational trip for them. They set out from their castles or villages without having seen anything. . . . They suddenly found themselves in new cities, in the midst of new countries, and in the presence of unknown customs. All this set them to thinking and gave them new ideas."—D. C. Munro and G. C. Sellery, *Medieval civilization*, pp. 248, 253, 254.—Whether or not the Crusades held back the Turks from Europe is a much discussed question. It is certain, however, that it was not until the westerners had completely withdrawn from Syria that they again began to threaten Constantinople.—See also CRUSADES.

**Saracenic civilization.**—Its influence on southern Europe.—"The Saracenic civilisation, indeed, presented a singular contrast to the sodden and seemingly irretrievable stagnation which had settled upon the rest of Europe. By a curious and violent paradox, the like of which has seldom been known, a fierce, ignorant, and warlike race, dominated by as intolerant a religion as perhaps had ever been known, became the conservators of such science and such knowledge as yet remained among men. They had not merely libraries; the empire was dotted with colleges, with great universities and medical schools. The first of the latter established in Europe was said to have been that of the Saracens at Salerno in Italy. The first astronomical observatory was that erected by them at Seville in Spain. The order of culture that obtained for a time among the Saracens was high. For two or three hundred years, from the time of the Khalif Al-Maimun, the wide area from Samarcand to Fez and Cordova was the theatre of a rich and varied life. Letters were again cultivated; a taste for the classics were revived. All the stores of ancient learning were exhumed, were translated, and subjected to exhaustive commentary. The measure of the earth was again undertaken. Astronomy again found high favour. Men of learning were again held in honour. The making of books became a trade. In Bagdad, Honian set up the earliest publishing house of which we know. The study of mathematics was again ardently prosecuted, our modern algebra developed."—C. Snyder, *World machine*, p. 154.—"Saracenic civilisation, absorbing and refining upon much ancient lore, shone with a glory as pronounced in its brilliance as contemporary Europe was remarkable for its gloom. For the Golden Age of Islam concurred with the Dark Ages of Christianity. It seems to be the case that, but for the impact of Saracenic science, Europe would have sunk to deeper depths of degradation than even were touched. At any rate, there is no doubt there were many borrowings from the 'infidels,' who, in agriculture, industry, and commerce, scored successes of the most memorable kind. It was probably in Spain that the efflorescence had its most striking display. [See SPAIN: 711-713, to 1476-1492.] Intensive agriculture was carried to perfection, manufactures of all sorts were engaged in, learning was encouraged, the lady doctor was not unknown; great, clean and

well-lit cities flourished in Spain, and the amenities of life were pronounced at a time when brutality, dirt, and superstition were the general appanage of feudal Europe. It took the Spaniards seven hundred years to recover their country from the Moors, but it took them only a generation or two to reduce the whole land to a condition of pastoral waste and of hide-bound intolerance. The Moors civilised Spain, the Spaniards brutalised it. [See MOORS: 1492-1609.] . . . Predatory as the Saracenic movement was in its origins, it became almost instantly transmuted into a high civilising influence, and the Arab outburst is almost the only thing of its kind which, from the present point of view, lends itself to almost unqualified historic commendation. The untutored Arabs in bursting out from their deserts had no intention of promoting learning, industry, and art. . . . Italy was only partially conquered by the Saracens, though they overran the whole country as mercenaries in the pay of 'Christian' potentates. There was therefore not the same war to the death between native and Moslem ideas and methods. The Italians, indeed, appear to have learned much from Saracenic science, and the economic life of the peninsula began to revive upon lines healthier far than the old imperialistic times, agriculture coming again to the front, and commerce attaining an amplitude hitherto undreamed of. An enormous commerce circulated in the Saracenic east. Europe coveted the spices and condiments of the tropics and the delicate fabrics of eastern art. While Constantinople largely served the Russian hinterland as regards these products, Italy became the mediator for the rest of Europe and her greatest republics—Venice, Genoa, and Pisa—lived mainly by the transit trade, the inland towns exploiting rather the native agriculture, and manufacturing on their own account, while Florence specialised also in banking. And, hand in hand with the economic revival, Italy, when it had brewed out its heavier barbarian ingredients, entered upon a new spiritual life worthier, because freer, than the old."—A. R. Cowan, *Master-clues in world-history*, pp. 98-101.—The Arabs "introduced and acclimatized not only flowers, but also many kinds of vegetables and fruits. The list of those with which Europe and America have been enriched through their agency would be a very long one. For they were especially interested in agriculture, as some of their sayings show: 'He who plants, he who sows, he who makes the earth bring forth food suited to man and beast performs an oblation of which account will be kept in heaven.' 'It is one of the duties of the government to make the canals necessary for the cultivation of the soil.' They had learned the methods practised in Mesopotamia, Syria, and Egypt. They studied the treatises which had been handed down and themselves wrote new and more scientific works on the use of manure and irrigation, on grafting, on the importance of allowing the land to lie fallow, on plant diseases and insect pests. Wherever they found a new vegetable, a beautiful flower, or an edible fruit, they attempted to grow it in their gardens and thence to transplant it to other lands. They were especially fond of carrying the products of their old homes to the new countries which they had conquered. . . . The list of the vegetable products which the Arabs gathered in their wanderings would be a long one and in many cases it is uncertain where these were found. From India probably they got rice, sugar-cane, oranges and turmeric; from Egypt, papyrus and cassia; from Syria, apricots, peaches, and lemons; from Persia, the silkworm and the mulberry tree. Bananas grew in Arabia itself. In some cases the country men-

tioned was not the original home, but seems to have been the place where the Arabs found the product. At all events they carried all of these to Sicily and Spain. In addition, they introduced into these countries cotton, pomegranates, saffron, madder, sumach, camomile, roses and other flowers, including the convolvulus or morning glory, and very many other products of the vegetable world."—D. C. Munro, *Middle Ages*, p. 217.—See also ARCHITECTURE: Medieval: Mohammedan; COMMERCE: Medieval: 5th-8th centuries; EDUCATION: Medieval: 9th-15th centuries; Saracen and Moorish learning; MEDICAL SCIENCE: Ancient: 7th-11th centuries: Medical art of the Arabs.

Scholastic revival and Aristotle.—Rise of the universities.—The awakening spirit of the peoples which had risen on the ruins of the Roman empire received added nourishment from the Crusades and the increase in commerce with the East which followed on them. Traditions of the Hellenic culture which began to filter in through the Arabians aroused curiosity and by the early part of the twelfth century the desire for learning had become a force in Europe. Students began to flock around noted teachers outside of the monasteries, and from this new movement universities began their growth. The movement also had an influence on the church. Theology began to be systematically taught on the framework created by Peter the Lombard's "Sentences," in which the Scriptures and the opinions of the Church Fathers were interpreted and defined. Law and medicine, the latter founded on the theories and knowledge gained by Hippocrates and Galen, were two important branches of study. Added to these was the study of Aristotle's works, which were at this period introduced to the awed minds of medieval students through a Latin translation combined later with a Latin translation of the commentary of Averroes, a famous Arab doctor. Albert Magnus and Thomas Aquinas, two great Dominicans, also prepared commentaries upon the works of Aristotle. "He was called The Philosopher, and so fully were scholars convinced that it had pleased Aristotle to say the last word upon each and every branch of knowledge that they humbly accepted him along with the Bible, the church fathers, and the canon and Roman law, as one of the unquestioned authorities which together formed a complete guide for humanity in conduct and in every branch of science."—J. H. Robinson, *History of western Europe*, p. 272.—But the schoolmen, as they were called, rested too much upon authority, and with all the subtlety of reasoning employed in the schools the scholastic age rather retarded than advanced independent thought and search for knowledge. "The rise of scholasticism took place in opposition to monasticism. In the ninth century the leading thinkers had not advanced beyond the conception of a natural social state, characterized by chaotic conditions, and organized by political machinery. By the twelfth century only the faintest glimmerings of a doctrine of popular sovereignty had begun to appear. The thought of the day was largely theological. . . . Scholasticism developed as a reaction against churchly asceticism. According to scholasticism the individual should look to reason rather than to church dogma for religious and spiritual guidance. Scholasticism repudiated church traditions as a guide for individual action; it turned to Aristotelian logic for its technique. . . . In religion, scholasticism reduced religious mysticism to rational forms. It based religion on learning rather than on authority; it pursued the methods of reasoning rather than of contemplation. Scholasticism furthered the advancement of learning; it

aided and developed the life of the universities. It encouraged the growth of independent thinking, although its decline set in about the fourteenth century, before it had had a fair opportunity to inaugurate a movement which would lead to an inductive or a positivistic philosophy, or sociology."—E. S. Bogardus, *History of social thought*, pp. 140-151.—See also CHRISTIANITY; 11th-16th centuries; EDUCATION: Medieval: 9th-15th centuries; Scholasticism; 11th-12th centuries.

**Thirteenth century and the spirit of Scholasticism.**—Some great Schoolmen.—"With the thirteenth century we reach what may fairly be called the springtime of the Renaissance. This was a season of great mental stir and eagerness; it was the age of Roger Bacon, Albertus Magnus, and Raymond Lully; of Thomas Aquinas and Duns Scotus; of St. Francis of Assisi, Cimabue, and Dante; architecture flourished in it; the founding of universities at Oxford, Cambridge, Siena, Naples, Padua, Salamanca, and Lisbon was a token of its widespread enthusiasm for intellectual things. But the world has often to wait a long time for the fulfilment of the promise of spring. The thirteenth century has been aptly described as a 'precocious age.' It was, in fact, too precocious. The social, political, commercial, and intellectual conditions did not yet exist to justify and make fruitful its efforts towards a larger life. Those efforts therefore proved abortive, and a reaction towards mediævalism followed. Even the universities, at first the centres of mental activity, soon became the very strongholds of scholasticism, and developed so powerful a tradition on the conservative side that they were later to become notorious for their obstinate adherence to the old modes and methods of thought, and their dogged resistance to the new spirit under all its forms. It must be clearly understood, however, that as the promise of the thirteenth century was greatest in Italy, so its fulfilment there was by no means so long delayed as in other parts of Europe. The tyranny of dogma and the resulting divorce of man from nature were also the chief causes of the sterility of that mediæval theological philosophy which we know as Scholasticism. The great scholastic thinkers—Erigena, Anselm, Thomas Aquinas, Duns Scotus, William of Ockham—were men of extraordinary mental power and acumen; the systems which they constructed with laborious care were marvels of sustained logical power. But their main effort was directed to the merely formal treatment of data furnished not by science, but by the organised doctrines of the Church; their work was not nourished upon reality; their speculations were neither guided nor checked by reference to objective fact. As a result, scholasticism remained practically stationary through the many centuries of its existence; and when it finally disappeared under the combined influences of the religious and scientific movements of the Renaissance, it left behind it little that could be turned to use as a factor in the progress of thought. The great problem of scholasticism was the complete reduction of theological dogma to systematic logical form. Its aim, therefore, was not the independent quest of truth, for no such independent quest was permitted, but the restatement in rational terms of truth already given. The unchallenged premiss of all scholastic thinking was the absolute finality of the teachings of the Church; and thus the primary business of the philosopher was to find the means by which he could prove that the truth of revelation is also the truth of reason. Philosophy was thus enlisted in the service

of the Church, and was held strictly to her position of subordination. The question of the relation of revelation and reason gave rise, indeed, to fundamentally opposed views. It was attacked from one side by Aquinas, with his theory of two distinct spheres of knowledge; from another side by Duns Scotus, with his assumption of the absolute unity of all knowledge in revelation. In just what way reason could best be made to support and justify faith was, therefore, a matter of fierce discussion, and the rival schools of the Thomists, or followers of Aquinas, and the Scotists, or followers of Scotus, continued to wrangle for upwards of three hundred years. But, whatever their differences, the common object of all the mediæval philosophers was the harmonising of human wisdom with the oracles of the Church. The conditions and methods of scholastic inquiry are thus, from our present point of view, much more important than the subjects dealt with. We must remember that the scholastic thinker was not even allowed to inquire into the value of these subjects, while he was certainly not free to follow up his ideas without consideration of direction or result. Both direction and result were prescribed beforehand. He had at all costs to reach a particular goal. Only the route was left open; and all roads had to lead to Rome. Philosophy existed only to make good by the processes of logic the dogmas which the Church imposed upon all men, and from which there could be no appeal."—W. H. Hudson, *Story of the Renaissance*, pp. 11, 131-132.—"Scholasticism is . . . exactly co-extensive with the Middle Ages proper, and may be described as a manifestation of the mediæval spirit. Of the great schoolmen, Lanfranc, Anselm, Bonaventura, Thomas Aquinas, were Italians; Alexander of Hales, John of Salisbury, Roger Bacon, Duns Scotus, Occam, were Britishers; Hugo of St. Victor and Albertus Magnus were Germans; Alan of Lille was a Fleming; Gerbert, William of Champeaux, Abélard, Bernard of Chartres, Bernard of Clairvaux, Roscellin, Gilbert de la Porrée, were Frenchmen. But these distinctions were meaningless in the Middle Ages: all these men were citizens of the Christian commonwealth—the intellectual capital of which was the University of Paris. It was so impossible to identify any master with any definite country that the birthplace of 'Alanus de Insulis' was sought in every 'island' in Western Christendom, from Sicily to Ireland, until the claims of Lille in Flanders were established. Roughly speaking, the history of scholasticism can be divided into three periods. In the earliest (eleventh to twelfth centuries) the works of Aristotle were still imperfectly known. St. Anselm evolved his 'ontological' argument: the existence of God was proved by the very existence in our minds of the concept of absolute perfection. But does a concept involve actuality? The central problem—which still lies at the foundation of all consistent thinking—was that of general ideas, or 'universals.' When we speak of 'man,' for instance, what reality corresponds to that term? Is there an idea of man in the abstract, anterior and superior to all individual men? . . . Or is the term a mere word, used for convenience' sake? Or again, is it more than a word, and yet less than an objective reality—a concept of the human mind? St. Anselm, William of Champeaux (1070-1121), and Gilbert de la Porrée maintained the *reality* of universals. They were called realists. Realism in this very special sense is almost synonymous with idealism, for the reality ascribed to universals is that of Plato's ideas. Roscellin reduced their existence to mere words: he was a nominalist. Abélard took the eclectic view: he was a conceptualist.

Naturally enough, realism was the official, conservative doctrine; it is easy to see how nominalism or even conceptualism would lead away from the solemn abstractions upon which theology was based, and favour straight rationalism or positivism. The change in the second period of scholasticism was due to the introduction of Aristotle's complete works, early in the thirteenth century. The Crusade which established the Latins in Constantinople in 1204 is partly responsible for this; but it was chiefly through the Arabs and the Jews of Andalusia and Southern France that the Greek master reached the Christian West. Aristotle, with his impressive encyclopædic knowledge, and his maturity of thought, secured an authority which seemed to be almost co-ordinate with that of the Bible. The intellectual dictatorship of a Pagan, however, was not accepted without qualms, especially when his works were flanked by the commentaries of an infidel, Avicenna or Averroes; a ban was placed in 1210-1215 upon the 'natural philosophy' and the metaphysics of the Stagirite. But this ban, never lifted, was quietly ignored. The delight in a richer source of knowledge overcame all scruples, and Aristotle became indeed the master, whose *Ipse dixit* was law. The task of the school was thenceforward to put the truths of religion in Aristotelian form. The Aristotelian revelation, the tremendous growth of the University of Paris, and the fact that in all domains the mediæval mind was reaching its maturity, brought about the golden age of scholasticism. Strangely enough, the Friars, whose collaboration was not welcomed by the older elements in the university, and who had been created for active work rather than for speculative research, took the lead in scholastic philosophy. It was a Franciscan, Alexander of Hales, the Irrefragable Doctor (*d.* 1248), who first made systematic use of Aristotelism. Bonaventura, the Seraphic Doctor (1221-74), Roger Bacon, the Wonderful Doctor (1213-c. 1294), Duns Scotus, the Most Subtle Doctor (1265?-1308), were Franciscans. Albertus Magnus, the Universal Doctor (1193-1280) and Thomas Aquinas, the Angelic Doctor (1225-74), were Dominicans. The great achievement of the age were those all-embracing treatises, . . . of which the most impressive and the most enduring was that of Saint Thomas. After that unique moment of splendour, under Saint Louis, when faith, institutions, art, literature, seemed in perfect harmony, scholasticism began to deteriorate. Bacon is visibly ill at ease in the thin abstract atmosphere of his time. Duns Scotus had the honour of being pitted against Saint Thomas, and the quarrels of Thomists and Scotists filled the schools; but the over-subtle doctor did much to ruin the cause he served with such indefatigable and perverse ingenuity; his name has become a by-word; dunce. Occam (*d.* 1347) revived nominalism, but already the force of scholasticism was spent. It was fast becoming that which we now mean by that term: interminable and pedantic disputations on points remote from any spiritual or material reality, a logical mill grinding nought."—A. L. Guérard, *French civilization*, pp. 206-208.—See also EDUCATION: Mediæval: 9th-15th centuries.

**Survey of the limitations of the Middle Ages.**—"The later middle ages found Europe conditioned not only by the demands of the feudal régime but by the scarcely less obstructive power of an entrenched ecclesiasticism. From an organization which laid stress upon souls and obedience rather than on mind and investigation there could never come the intellectual achievement upon which depended the progress of mankind. It was necessary

to substitute for the idea of conformity the principle of diversity before that advance was possible; and in this substitution lay the germ of that revolution which was to remold the world. . . . As the middle of the fifteenth century approached, in the face of the slowly altering tastes and habits of Europe, the defects came to bulk larger than the virtues in the minds of many men. In a changing world the church remained in a state of relatively arrested development, and its too rigid and inflexible adherence to its great tradition brought it into variance with the new spirit of the times. Like feudalism, it had outlived its generation; and unless, like the political system which was even then beginning to adapt itself to new ideas and new conditions, ecclesiasticism took on new form and spirit, it was only a question of time till it would find itself at variance with general if not universal tendencies. This condition was evident in many fields. In architecture, with its glory of the heaven-aspiring Gothic arch, its miracles of fretted stone, the middle ages, indeed, advanced beyond the classic pediment and arch. But the greatest triumphs of the sculptor's art,—and Gothic sculpture in its higher ranges revealed great beauty and skill,—much less the grotesques in which the mediæval artists found characteristic expression, despite their quaint and hideous fascination of perverted fancy, scarcely rivaled the triumphs of Phidias and Praxiteles. In two directions, indeed, mediæval craftsmen excelled. The one was their love of nature which expressed itself in the ornamentation of all their work in stone and metal. The other was their skill not only in the carving which adorned their buildings, but in their gold and silver productions, and in wrought iron. Here they were scarcely surpassed by any men before or since. But the same was not true of the pictorial art. Whether materials failed them, or whether this lay chiefly in the hands of those imbued with ecclesiastical influence, there was a great gulf fixed between the triumphs of the stone and metal workers and the puerile efforts of the painters. The elaborate illumination of missal and manuscript ill endured comparison with even the wall paintings of Roman villa decorators, much less with the lost masterpieces of Apelles and his successors. In every field where formal ecclesiasticism had made itself supreme 'the substitution of conventionalism for sympathy with observed life,' which is 'the first characteristic of the hopeless work of all ages,' the 'barbarism from which nothing could emerge and for which no future was possible but extinction' had blocked every avenue of advance. . . . With all their ingenuity and their summons to a purer faith, the writings of the church fathers poorly supplied in style or content the loss of Greek and Roman philosophy, which, save for Aristotle, had gradually disappeared from men's knowledge as ecclesiastical influence strengthened and narrowed. Still less could the church historians, bent on justifying the ways of God to man, fill the place of Livy or Tacitus, Herodotus or Thucydides. The crude turgidity of late Latin versifiers, and the cruder imagination of the miracle plays, were feeble substitutes for Virgil and Homer, the great triumvirate of the Greek masters of tragedy, the mockery of Aris-tophanes, or the undying charm of Horace and Pindar, Catullus and Sappho. Even the Scriptures, on which the church based its intellectual as well as its spiritual existence, had been almost as deeply submerged under the notes of the commentators as the classical masterpieces had been buried under the mass of mediæval theology. Finally the formal logic of Aristotle, supplemented by a concentrated devotion to theology and presently converted into

scholasticism, extended its barren empire over men's minds and sterilized their processes of thought, even while it sharpened their intelligence. For, with all its contribution to intellectual progress, it divorced men from the realities of life, and led them to believe that truth was to be achieved only by the exercise of the unaided intelligence, without observation, experiment, or that quality of vision and common-sense which embraces them all. From this situation Europeans might possibly have been saved by the study of the classics. But as little by little these had been discredited as pagan, the manuscripts which held the wisdom of the ancient world were too often neglected or destroyed, or turned to the uses of monastic chroniclers or accountants. Scholars degenerated into schoolmen. Science lost itself in the morasses of alchemy or astrology and became anathema to the faithful. Philosophy was overpowered by theology, and this world gave place to the next as the chief concern of learned men. Speculation replaced investigation, words took the place of facts, and mind endeavoured to produce from itself that knowledge and understanding which only comes from the intellect working upon material outside itself or in a medium not wholly intangible. It was, then, in their intellectual limitations that the deficiencies of the Europeans of the eleventh century were most serious. Their knowledge of the great scientific heritage, which is the conspicuous feature of man's present intellectual eminence, was all but wanting."—W. C. Abbott, *Expansion of Europe*, v. 1, pp. 22-26.

**Growth of towns.—Development of guilds.**—"In every part of the old Roman Empire some towns survived in spite of migrations, sieges, and conflagrations. . . . In the towns, the merchants found shelter, and some of the arts and crafts were carried on. Because of the difficulties of transportation, the inhabitants had to produce most of their own food, and many were occupied wholly or in part in agriculture. For protection the towns had to have walls; and as it was laborious and expensive to build these, and as it was difficult to defend extensive fortifications, the inclosed space was made as small as possible. Consequently the towns were usually crowded. New towns grew up under the protection of castles, to which the people could flee in time of peril. The needs of the lord of the castle and of his family and followers furnished employment for the skill of artisans and a market for the wares of merchants. When such a castle was a favorite residence of a king or powerful noble, the townsmen prospered. . . . When a castle or a fortified town was an important stronghold on a frontier, it was an especially favored resort for merchants both from within and without the kingdom. For this reason Bern in Switzerland and Halle in Saxony grew into important centers of trade. In a similar manner, places where markets were established under the protection of some strong lord frequently attracted a relatively large population; this [for instance] was true in the case of Magdeburg and Munich. . . . Many a village clustered about a monastery grew into a town. . . . Some places became towns because of a combination of two or more of these causes. Tours, for example, grew from three nuclei: the king's castle, the bishop's residence, and the monastery of St. Martin. It had been a Roman town; it was on the river Loire, which was a highway for trade; it was easily defensible; and it was a great resort for pilgrims. The two most important factors in the rise or continued existence of a town were the possibility of easy defense and the opportunity for trade. With the increase of population during the eleventh, twelfth, and thirteenth centuries towns

grew rapidly, and there was an opportunity also for new towns to be founded. . . . Life in the towns seems to have been full of zest and interest. People of the same trade lived usually in the same street or lane, and work was done in the open shops. There were many festivals. . . . Undoubtedly this interesting activity in the towns attracted men from the country then, just as it does now. The towns also offered greater freedom. Beginning in the eleventh century, there was a revolution that gradually spread throughout western Europe. It was not everywhere equally successful and it had many different outcomes; but its aims may be defined as, first, securing for a town a special jurisdiction and freer status; second, securing for the citizens the right of self-government to a greater or less degree. The German proverb '*Stadtluft macht frei*' ('City air makes free') was true on the whole, although there were many exceptions, and some cities had much less freedom than others. Usually a charter giving privileges was bought. The lords needed ready money, and frequently sold for a cash payment some of their rights of exploitation by feudal dues. Sometimes, when they realized what they had lost, they were afterward dissatisfied, and attempted to nullify the contract. In France many a 'commune' had to fight, sometimes unsuccessfully, to retain the rights it had bought. The word 'commune' originally meant that the inhabitants of a town had taken a mutual oath to aid one another, and not to permit a wrong to be done to a fellow-townsmen if they could prevent it. . . . The towns also offered opportunities for gaining wealth and bettering one's condition. A charter in England usually contained a provision that the town should have a gild merchant. This included those who were engaged in trade, and by the charter they secured a monopoly, so that no one not a member could buy or sell in the town, except under such conditions as the gild might make. . . . Gradually craft guilds superseded the gild merchant. These were associations of men engaged in the same trade, and their primary object was to make rules for the trade and to keep a monopoly for the members. A craft gild usually made only one thing; for instance, one gild made arrows, another bow-strings, and a third bows. The subdivision of industry was carried to very great lengths, so that in a single town there might be more than a dozen separate guilds making leather or leather products, or a gild might specialize in a single kind of hat, as the peacock-batters did. . . . The master workman had to have a house of his own, to know his trade, and to be of good moral character. In some guilds he was allowed to have only one apprentice, but might take a second when the first had nearly completed his term of apprenticeship. This was frequently six years. . . . Each craft gild had its patron saint and attended church in a body. Craft guilds acted as mutual aid societies for burials, for the care of widows, orphans, sick, and poor. . . . Their special duty was to maintain the quality of the product, but they seldom succeeded in doing this for any long period of time; for, in spite of stringent rules, there were many frauds."—D. C. Munro, *Middle Ages*, pp. 341, 342, 345-347.—See also GUILDS: Medieval.

**Development of commerce.** See COMMERCE: Medieval.

**Political background.**—Throughout the Middle Ages the political background of Europe was dominated by the still potent unifying influence of Rome, which had been perpetuated on the one hand by the Empire, on the other by the Church. "Empire and Papacy, said Zwingli, both come from Rome. The law of the one was Roman civil law, the law

of the other was Roman canon law, and in both cases it was universal. The world was one and indivisible, though it had two aspects, secular and ecclesiastical, temporal and spiritual. In one aspect the Emperor was its head, in the other the Pope. The two spheres were ill-defined, and the struggle between them fills the greater part of medieval history. . . . The contest waged in the closet and on the field of battle, with sword and dagger and spear, with bell, book and candle. It was ever a strife between two powers and two jurisdictions, both claiming to be universal and international. Although the voice of nationality is heard in the councils of Philip IV. of France and in the wars of the fourteenth century, the world is still to Dante one monarchy and the emperor Henry VII. is its monarch. This absence of nationality is characteristic of all medieval institutions. The empire is *ex hypothesi* an international organisation. It is associated with the German monarchy as a rule, but that is only an accident. . . . Alfonso of Castile is a candidate for the empire; he fails, but his Spanish nationality is no bar to his pretension. Later on, Henry VIII. and Francis I. are candidates for the imperial throne; German sentiment is against them, but there is no law to exclude an Englishman or a Frenchman. Any one can hold an imperial fief; a Pole or a Spaniard is the same as a German in the eyes of the law of the empire; they are no more foreigners than a Saxon or a Suabian. Law, in fact, is in the Middle Ages international. There are, it is true, various kinds of law, civil law, canon law, feudal law and folkright; and the differences are pronounced enough. But they are not national differences. Feudal custom is much the same, wherever you meet it in Western Europe. The tenant-in-chief, the mailed knight, the *curia regis*, the lord's demesne, the castle, rights of jurisdiction, obligations of defence, are everywhere. . . . If feudal law and custom were not national, still less so were Roman civil and Roman canon law. The emperor was the fountain of one. . . . The Pope was the fountain of the other. . . . The State might resist the application of canon law as the English barons did in 1236, and the Church might forbid the study of civil law as did Popes Honorius and Innocent III.; but in both cases it would be two universal claims contending in a particular locality, rather than a national contending against a universal sentiment. As with laws, so with letters. . . . Every one in Western Europe who could write, wrote the same language, and that was Latin. . . . Intercourse with foreign scholars was robbed of its impediments. . . . Alien and foreigner were not yet terms of insult and contempt. . . . Even the wars of the Middle Ages were not national; the greatest are the Crusades; then there are wars between Empire and Papacy, and lowest of all comes the feudal strife of vassal against vassal or vassal against his lord; there is no really national war before the Hundred Years' War between England and France. . . . Religion also was cosmopolitan; the Church universal was visible as well as invisible. It had divisions of course. There were laymen and priests, secular priests and regulars, monks and friars. But the sections were horizontal, not vertical; they ran all through Western Christendom, and did not divide it into geographical parts. The monastic orders were peculiarly international; the whole world was their parish; their general chapters were cosmopolitan parliament; and the rigidity of their international character brought them into sharp collision with the rising national spirit of the sixteenth century, and made them the first spoils of the Reformation."—A. F. Pollard, *Factors in modern history*, pp. 5-9.—

"In the Middle Ages there was little opportunity for either the nations of Christendom or the men who composed them to develop their individuality. Medieval Christendom was a single organisation, and the nations which composed it were distinguishable only as units in it. The Crusades are typical of the submergence of national under international interests. In them Christendom as a single fraternity placed itself under the banner of the Cross, actuated by none of the motives which inspire modern wars, territorial expansion, dynastic interests, or commercial gain, but obedient to the call of religion. National particularism was lost in the conception of Christendom as a single community of Christian people. As to the individual, birth determined the groove in which his life was to run. In the Church alone merit could raise him above the degree into which he had been born. At the same time the Church forbade the individual to work outside the channels itself prescribed. Independent research, such as Roger Bacon and Galileo conducted, was denounced as heretical, and invited persecution. Even his exalted position could not save Pope Sylvester II from suspicion that his great learning had been acquired by selling himself to the devil. The arts, painting, sculpture, and architecture were employed only in the Church's service. Science and philosophy were similarly restricted in their application. . . . In the early part of this period, the feudal order was dominant. . . . and the feudal monarchy a monarchy in theory only; in practice it was anarchy. From the king down to the lowest serf, the series of vassals was unbroken; but it was a hierarchy of private relations. [But nationalism and centralization of authority developed side by side.] By war, purchase, marriage and negotiation powerful duchies were established. . . . In the course of this development the kings were active participants. . . . [The growth of cities and participation in the crusades were both factors in the enlargement of kingly power. Moreover] when gunpowder was invented the character of warfare was radically changed. The heavy armor of the mounted knights and the spears and crossbows of the medieval footmen were worse than useless in the presence of disciplined troops armed with flintlocks. When soon afterward, artillery came into use, the Middle Ages had passed away, so far as warfare was concerned; and feudalism, . . . received its deathblow."—D. J. Hill, *History of diplomacy in the international development of Europe*, v. 1, pp. 366, 397, 372.

Science.—Retarding forces.—Influences which combined to promote growth of the new period of the Renaissance.—"The intellectual strength of the Middle Ages did not lie in scientific knowledge and achievement, but in a vivid quickening of the spiritual imagination. The scientific learning of the time, far from being a well-ordered system of knowledge, was merely a compilation of detached and ill-comprehended fragments. The medieval man had little ability to look things squarely in the face; he had no clear-eyed perception of the visible world. It was not his practice to deal in an objective way with the facts of the actual world about him. All things were veiled with a mist of subjectivity. The things that he saw were treated as symbols, and the things that he heard were understood as allegories. . . . The speculative life was held to be vastly more important than the practical life. The world was but a house of probation; wherein, then, lay the wisdom of earthly knowledge? So the medieval man devoted himself to the study of philosophy. But his philosophy was defective and misleading. It suffered from the

dictation of the Church. It was not a free inquiry into the constitution of the world of nature and the world of men. It was not an unhindered attempt to conceive of the universe as a rational entity. Instead it was merely an effort to put the theology of the time into a logical form, to prove that the teaching of the Church was identical with the universal and self-consistent truths of philosophy. To reinforce the unassailable authority of the medieval Church the scholars of the time invoked the infallible authority of medieval philosophy. So medieval philosophy was no more and no less than an endeavor to give a scientific statement of medieval theology. Another thing that acted as an obstacle to the progress of science in the Middle Ages and deprived men still further of the use of their own eyes was a slavish devotion to Aristotle. . . . Up to the thirteenth century Aristotle was known to Christendom only through some of his logical writings, a part of the *Organon* and the *Categories*. But the Greek philosopher's works can be understood only when studied in their entirety, and the fragments which the medieval scholars possessed are precisely the ones that have most need of the others in order rightly to be apprehended. Two other things added to the misrepresentation of Aristotle. The few books of the philosopher possessed by the medieval scholars had come to western Europe by way of Alexandria where they had been colored with the Neo-Platonic thought, and a number of books not written by Aristotle were ascribed to him. The real Aristotle was almost completely obscured until the thirteenth century. Medieval man knew him only as a logician, and even in that respect they knew him only imperfectly. Thus deceived by the infallible Doctor they wandered still further from the path of scientific thought than they had been sent by their perverted idea of the aim and the scope of philosophy. . . . By the middle of the thirteenth century much of the missing work of Aristotle had been restored. The additional thought of the Greek philosopher came into western Europe, in a circuitous way, from the Mohammedan school in Spain. . . . With this new guide the Europeans could proceed to something like a systematic and positive study of the world in which they lived. Later on, when the menace of the Turkish invasion grew more threatening, scholars from the Byzantine Empire brought the writings of Aristotle to Italy in the original Greek texts. Then the syllogism was dethroned and investigation set up in its place. This substitution of experiment and observation, however imperfectly it was applied, for the *a priori* methods of scholasticism constituted one of the most potent of all the revivals of the Renaissance. . . . Among the thirteenth-century forerunners of the revival of science three names stand out above all the others. The first is that of Albertus Magnus (1193-1280), a Dominican friar, who became convinced by the study of Aristotle and by his own investigations that a science of nature was possible. 'The visible world,' he said, 'was made for man's sake in order that man might arrive at the knowledge of God through observation of it.' So despite the hindrances of the time he began to search like any modern scientist with the instruments of analysis and synthesis into the secrets of nature. He catalogued the trees and plants known in his time, and he noted the influence of the physical environment upon human, animal and vegetable life. 'All that is here set down,' he wrote in regard to his work, 'is the result of my own experience, or has been borrowed from authors whom we know to have written what their personal experience has confirmed; for in these matters ex-

perience alone can be of certainty.' The second of these intellectual pioneers was Roger Bacon (1214-94), a far-sighted genius, one of the most powerful minds recorded in history, who made many important discoveries, and to whose credit must be placed a number of brilliant anticipatory guesses of modern science. Greater, however, than any of his discoveries, and more important than all of them combined, was the scientific method that he employed. He devoted his life to the reformation of the existing methods of scientific thought. The science of the Middle Ages descended from the highest concept, that of pure being, down to individual things. It set its seal of disapproval upon the method of proceeding from the particular units of a class upwards. In other words it declared the inductive method to be reprobate. . . . 'Secular science intoxicates, but not with charity,' said Bernard of Clairvaux: 'it obstructs, but does not fortify.' Quite opposite was the opinion of Bacon. . . . 'We must not give out adhesion to everything we hear and all we read,' he said; 'on the contrary, it is our duty to examine with the most careful scrutiny the opinions of our predecessors. . . . The third of these forerunners of modern science was Raymond Lull (1235-1315), a philosopher half-Mohammedan and half-Christian, theologian and naturalist, missionary and troubadour, the acutest intellect of the Spanish countries in the Middle Ages, whose aim it was to devise a system, an *ars magna*, for the purpose of ascertaining all truth by means of logical analysis. . . . This preliminary revival of science was at once the cause and the effect of the revival of letters. It received a great impetus, as we have seen, from the restoration of the writings of Aristotle. It quickened men's perception of facts, and it helped to renew the connection between words and things which scholasticism had done away with. It interested men in observation rather than in concepts. It taught them to proceed from individual things to abstraction, from example to application. Naturally they became curious to know more of that ancient world from which the intervening centuries separated them. So they looked about them with eagerness for further writings of those far-off Greeks, and the more they read the more were they impelled to their work of research and invention. By his reading of Latin authors Petrarch was helped to obtain a firm grasp upon the fundamental principles of science. Such was the inter-relation of the revival of science and the revival of letters. Men read the ancient authors, learned to see with their eyes and to imitate their observations and experiments. Then by their own work in observation, testing and correcting they arrived at independent and additional scientific achievements. Thus did they take up the threads of scientific investigation where long ago they had fallen from the hands of the ancients. In medicine they went back to Hippocrates and Galen, in botany to Theophrastus, Dioscorides and Pliny, in zoology to Aristotle, in mathematics to Euclid, Eratosthenes and Hipparchus, in physics to Archimedes, Vitruvius and Heron, in astronomy to the Pythagoreans, in jurisprudence to the *Corpus Juris*, and in politics to Plato as well as to Aristotle. All the great scientific investigators of the eras of the Renaissance and the Protestant Revolution lit their torches on the altar of the ancients. Each of the various revivals of the time contributed to the success of the others, for each, in addition to its own definite contributions to knowledge, aided in the production of an atmosphere that was favourable to the new thought. So was the narrow horizon of men pushed back; so was self-confidence restored to the reason of humanity. The revival of research was witnessed in

TYPICAL TOWN IN CENTRAL EUROPE, 12TH-15TH CENTURIES

many lines of human activity. In philosophy the thought of Plato, Aristotle, Socrates and other Greek philosophers and the works of Latin philosophers were recovered. As a result the ancient systems were extended and a new philosophy . . . was born. In the field of history we begin distinctly to discern the spirit of scientific criticism in the writings of Petrarch, and it is found as the controlling force in the work of Lorenzo Valla. Indeed, Valla, who was one of the greatest historians of the entire era, has been described by some writers as the founder of historical criticism."—E. M. Hulme, *Renaissance and the Protestant revolution*, pp. 124-129.—It is admitted that science owes much to the alchemists, herbalists and other experimenters of the thirteenth and fourteenth centuries. True, their work was done for practical reasons, for personal gain, for the sake of power; but the alchemists who sought to turn baser metals into gold, the herbalists who searched for the elixir of life, or experimented in secret poisons, all fell upon secrets of nature in their furtive or fugitive investigations, and passed them on. Besides, many of these men were no ignorant quacks; but were possessed with a passion for knowledge, which they too often had to indulge in secret, and to feed which they applied their sometimes ill gotten gains. In addition to these quasi scientists, master artisans, whose minds were influenced by the atmosphere of the age, made experiments in glass, in dyes, in metals and in other handicrafts. They also worked for personal gain, and generally handed the knowledge of their inventions or discoveries as secret formulas, for the enrichment of their families, but, the formulas ultimately became public, and the inventions laid the foundations for future industries.—See also SCIENCE: Middle Ages and the Renaissance; CHEMISTRY: General: Alchemists.

"We are now in a position to understand the real relation of the Mediæval to the Modern Age. The first was to civilization a period of recovery from interruption and disaster,—interruption and disaster that were really disguised blessings. It was a sort of spring-time, a germinal season, a period during which the seeds of Greek and Roman civilization, scattered everywhere by the wide extension of Roman power during the preceding era, were taking root in the good soil of the hearts and minds of a new race. During these centuries the arts, the sciences, the literature, and the institutions that characterize the modern era took shape, and gave promise of what they were to become; the leading modern nations grew into form, and the political divisions of Europe were more or less definitely outlined. In a word, the era bears the same relation to the Modern Age that the period of youth does to that of manhood. This conception of its real character as a germinal, formative period will tend to impress us with a proper sense of the importance of a careful study of its events and circumstances. It affords the key to modern history."—P. V. N. Myers, *Outlines of mediæval and modern history*, p. 5.

**Background of Protestant Reformation.**—Its mediæval character.—During the latter part of the Middle Ages, the desire for reform of the Church was constant. It was strongest and most apparent among laymen, for a famous monastic writer of the fourteenth century testified that the laity led better lives than the clergy. The scheme for governing the world by the hierarchy, pursued for three centuries had terminated in disaster. For a whole generation no one knew whether the Papacy was in Italy or in France. Many efforts had been made to reform the church. "One of the most important of the groups of reformers were the Wal-

denses, a sect which originated somewhere about 1170, in the western Alps, and the Poor Men of Lyons who were the followers of Peter Waldo. . . . [Another was] John Wiclif, a Master of Baliol College at Oxford . . . [who] with the aid of two friends translated the Bible into English. . . . The teaching of Wiclif failed to produce a lasting impression in England, but in the person of John Hus (1369-1413) it had a potent influence in the distant country of Bohemia. . . . Still another group of men who attempted to effect reform within the pale of the Church were the mystics who flourished especially in Germany, England and the Low countries, [and flowered in the organization known as the Brothers and Sisters of the Common Life.] None of these movements was able to effect a general reformation, nor did all succeed. Yet not one of them was in vain. They were all mingled in the great stream that was slowly gathering force and would soon burst into a flood. Each must be counted as a definite and permanent factor in bringing to pass the Protestant Revolution. Every accusation that Luther made and every reform that he suggested had resounded through Christendom long before the opening of the sixteenth century. . . . Everywhere the intellectual revival was breathing new life into the channels of European thought."—E. M. Hulme, *Renaissance and the Protestant revolution*, pp. 158, 159, 173.—Nor can the influence of the growth of nationality be overlooked. In their new-found independence of nationalism many people began to look askance at a power which claimed extra jurisdiction and political power over all the kingdoms of the earth. "The world was slipping from the control of the Church for better or for worse. But, in appearance, unity was preserved until Luther's challenge opened a struggle which led to a complete religious transformation of Europe, to the substitution in many countries of national churches for the one Catholic Church, and ultimately to the abandonment of the principle of coercion in matters of belief. . . . The Middle Ages knew little or nothing of the sentiment of nationality which is so powerful a factor in modern Europe. The peoples had not yet become conscious of their separateness, and nations were not divided from nations in the clear and rigid way in which they are to-day. Internationalism is a great mark of the Middle Ages. The government were jealous of one another and often fought fiercely; but there were agencies, organizations, and ideas connecting the people of all nations indiscriminately, and giving to Western Europe a sense of unity which it now lacks. The Church took no heed of national boundaries. Men of all races and tongues entered the ranks of the priesthood or joined one of the many orders of monks or friars. Difference of language counted for little in the Church, for Latin was the universal speech of educated men. Feudalism, too, was not a national force. . . . The empire which stood at the head of the feudal system was essentially international, and in its claims as universal as the Church itself. Within its borders were to be found not only Germans, but Frenchmen, Italians, Slavonians; and this corresponded so closely to the ideas of the time that no one thought it strange. Further, the universities were only loosely connected with the nations in which they were situated. The teachers were drawn readily from alien peoples, and the scholars passed from Italy to Germany, or from France to England without difficulty. But by the end of the fifteenth century national feeling was growing strong. It was to be found in Germany in spite of the manifold divisions of the country, but it was seen at its strongest in France, England, and Spain. In France

and England the long struggle of the Hundred Years' War had made the two nations conscious of their separate existence, and in Spain a similar result had been brought about by the long struggle against the Moors."—A. J. Grant, *History of Europe*, pp. 461, 462.—Politically, the Reformation "affected the independence of the princes, which they were able to fortify on the one side by utilizing the popular belief in the Lutheran doctrines for their own support, and on the other by appropriating to themselves the rich ecclesiastical properties. It would, however, be grossly unjust to infer that the real cause of the success of the Lutheran doctrines was the ambition of the princes. Prompted as it was in many cases by secular motives, the reform movement (in Germany) was a logical and necessary outcome of the constitution of the Germanic mind and nature in the presence of religious abuses which could no longer be tolerated."—D. J. Hill, *History of diplomacy in the international development of Europe*, v. 2, pp. 422-423.—Neither the mind nor the minds of men elsewhere in Europe had yet advanced beyond medieval thought or rather, it may well be said that the whole struggle throughout Europe, political, religious, and scientific was the outcome of the incipient growth of the modern mind. But when the break came, there was no essential intellectual difference between the adherents of the old church and the new. The reformers were possessed of no new knowledge. Protestants and Catholics had the same "patristic outlook on the world; their historical perspective was similar, their notions of the origin of man, of the Bible, with its types, prophecies, and miracles, of heaven and hell, of demons and angels, are all identical. To the early Protestants, as to Catholics, he who would be saved must accept the doctrine of the trine God and must be ever on his guard against the whisperings of reason and the innovations suggested by scientific advance. Luther and Melancthon denounced Copernicus in the name of the Bible. Melancthon reëdited, with enthusiastic approval, Ptolemy's astrology. Luther made repeated and bitter attacks upon reason; in whose eyes he freely confessed the presuppositions of Christianity to be absurd. Calvin gloried in man's initial and inherent moral impotency; and the doctrine of predestination seemed calculated to paralyze all human effort. The Protestants did not know any more about nature than their Catholic enemies; they were just as completely victimized by the demonology of Witchcraft. The [success of the] Protestant Revolt . . . [was not due] to any considerable confidence in criticism. As Gibbon pointed out, the loss of one conspicuous mystery—that of transubstantiation—was amply compensated by the stupendous doctrines of original sin, redemption, faith, grace, and predestination' which the Protestants strained from the epistles of St. Paul. Early Protestantism is, from an intellectual standpoint, essentially a phase of medieval religious history."—J. H. Robinson, *New history*, pp. 117-118.

"The Protestant Reformation was mediæval, not modern, in its spirit and interest, and the Protestant scholasticism of the seventeenth century . . . was a legitimate outcome of it. Bondage to an external law of faith and practice was for a long time as complete in Protestantism as in Catholicism, and the one was as conservative in the field of religious thought as the other. The immediate effect of the modern spirit, when it began to make its influence felt in Christianity, was as destructive of the new Protestantism as of the old Catholicism. This is seen clearly enough in Socinianism, and still more clearly in the rationalism of the eighteenth

century, where the modern spirit first found large expression within the religious sphere. The rationalism of the period was of all sorts and degrees, but in every phase of it there was the tendency to reject or modify the mediæval estimate of man. Greater intellectual sufficiency, and commonly greater moral ability were attributed to him than traditional theology was willing to grant. Often the deviation from orthodox doctrine was slight, often very great, but in every case the modern spirit was influential, and those doctrines which were based on the theory of the depravity and helplessness of man received least emphasis or were repudiated altogether. It cannot be too strongly emphasised that rationalism was at bottom as much of a break with Protestantism as with Catholicism. Its principles were not Protestant, but involved the rejection of Protestant and Catholic principles alike. Against modern views of every kind, Protestantism set itself as uncompromisingly as Catholicism. That rationalism ultimately made its home in Protestantism rather than in the older communion, was not because the former was in principle more tolerant of divergent views, but because the divisions within the Protestant ranks made greater tolerance a necessity. The break with the old ecclesiastical institution and the rise of new churches independent of it and of each other facilitated the gradual growth of a freedom in religious thought which could not have come had all Christendom remained under a single ecclesiastical control; but the break itself, and not any particular principles leading to it, made the new liberty possible. In the conflict of authorities there was room for new ideas to grow and flourish."—A. C. McGiffert, *Protestant thought before Kant*, pp. 186-187.—The Reformation "brought to a crisis the inherent conflict between mediævalism and modernism, between the pretensions of universal authority and local freedom, between the conception of imperial supremacy inherited from ancient Rome and territorial rights and liberties as conceived by modern nations. If Charles V had succeeded in suppressing Protestantism in Germany, he might have temporarily obstructed the course of history, but his success could not have been enduring; for his system was contrary to the laws of human development. Strange as it may seem to us, in all this struggle for religious unity, no voice made itself heard above the strife of princes in the name of the individual conscience and intelligence. The absolutism which Luther conferred upon the territorial princes Zwingli conferred upon the congregation. Defeated in the larger field, the spirit of imperialism took refuge in rulers and theologians, to judge and to condemn with a narrower judgment and a more bitter condemnation than that of popes and emperors. But in the Church and in the State a great principle was on its way toward victory; and no emperor could prevent, as no power less than the combined energies of mankind can secure, its final triumph."—D. J. Hill, *History of diplomacy in the international development of Europe*, v. 2, pp. 433-434.

#### RENAISSANCE AND REFORMATION

Earlier and later Renaissance.—Transition from the Middle Ages to the Renaissance.—"It

is becoming clear to the modern historical student that in the whole history of western Europe there is perhaps no sharper break than that which separates the earlier from the later Middle Ages."—J. H. Robinson, *New history*, p. 157.—Roughly speaking the later Middle Ages and the early Renaissance are practically synchronous. "The year 1100 was the threshold over which we passed from those centuries of gloom to two centuries of fruitful progress. That Age of the Crusades saw also the rise of towns, of universities, of popular literatures, of Gothic architecture in cathedrals and town halls, of the growth of France out of feudal fragments into one kingdom, and of the rise of courts and of Parliament in England. The year 1300, to which we have now come, is another milestone of progress, introducing two centuries of still more rapid advance. The period 1300-1520 we call the Age of the Renaissance, because those centuries are marked by a 'rebirth' of a long forgotten way of looking at life. That old way had expressed itself in the art and literature of the ancient Greeks. Accordingly, the men of the new age were passionately enthusiastic over all remains of the old classical period. The fundamental characteristic of the Renaissance, however, was not its devotion to the past, but its joyous self-trust in the present. The men of the Renaissance cared for the ancient culture because they found there what they themselves thought and felt. Between those classical times and the fourteenth century there had intervened centuries of very different life—which we have been studying. Those 'Middle Ages' had three marks on the intellectual side. (1) Ignorance was the general rule; and even the learned followed slavishly in the footsteps of some intellectual master. (2) Man as an individual counted for little. In all his activities he was part of some gild or order or corporation. (3) Interest in the future life was so intense that many good men neglected the present life. Beauty in nature was little regarded, or regarded as a temptation of the devil. The Renaissance changed all this. (1) For blind obedience to authority, it substituted the free inquiring way in which the Ancients had looked at things. (2) Men developed new self-reliance and self-confidence, and a fresh and lively originality. And (3) they awoke to delight in flower and sky and mountain, in the beauty of the human body, in all the pleasures of the natural world."—W. M. West, *Modern progress*, p. 120.—"The most potent of the forces which conducted Europe from medievalism to modernism was the recovery of the lost culture of ancient Greece and Rome, their literature, and, above all, the habit of liberal, untrammelled thought of which it was the outcome. [See also CLASSICS: Renaissance.] But it must not be supposed that the Renaissance fell upon unprepared soil. Humanism, as the revived study of classical literature was called, had been preceded by the Scholastic philosophy of the thirteenth century. . . . A knowledge of Latin was never wholly lost, though England, France, and Germany, where Scholasticism drew scholars to the subtleties of logic and metaphysics rather than to ancient literature, were more backward than Italy, where Scholasticism had less vogue. Greek was in a worse plight. After the fall of the Western Empire in the fifth century, knowledge of ancient Greek became almost extinct in Europe, and even in Constantinople, and no agencies existed for its teaching. Though she possessed no systematic teacher of Greek until the arrival of Manuel Chrysoloras at Florence in 1397, Italy herein also was ahead of the rest of Christendom. Indeed, the career of Dante (1265-1321) proves that the Italian sky was already bright

with the promise of dawn, and Dante's friend, Ambrogio di Bondone, or Giotto (d. 1337), painter, sculptor, and architect, was prophetic of the artistic revolution which accompanied the Renaissance."—C. S. Terry, *Short history of Europe*, pp. 3, 4.—See also EDUCATION: Modern: 15th-16th centuries.—"It would be inaccurate to identify the whole movement of the Renaissance with the process whereby the European nations recovered and appropriated the masterpieces of Greek and Latin literature. At the same time this reconquest of the classic world of thought was by far the most important achievement of the fifteenth and sixteenth centuries. . . . The revelation of what men were and what they wrought under the influence of other faiths and other impulses in distant ages with a different ideal for their aim, not only widened the narrow horizon of the Middle Ages, but it also restored self-confidence to the reason of humanity. Research and criticism began to take the place of scholastic speculation. Positive knowledge was substituted for the intuitive guesses of idealists and dreamers. The interests of the world received their due share of attention, and the *littera humaniores* of the student usurped upon the *divinarum rerum cognitio* of theologians. All through the Middle Ages uneasy and imperfect memories of Greece and Rome had haunted Europe. Alexander, the great conqueror; Hector, the noble knight and lover; Helen, who set Troy town on fire; Virgil, the magician; Dame Venus lingering about the hill of Hürsel—these phantoms, whereof the positive historic truth was lost, remained to sway the soul and stimulate desire in myth and saga. Deprived of actual knowledge imagination transformed what it remembered of the classic age into romance. . . . With regard to the actual knowledge of Latin literature possessed in the Middle Ages, it may be said in brief that Virgil was continually studied, and that a certain familiarity with Ovid, Lucan, Horace, Juvenal, and Statius was never lost. Among the prose-writers, portions of Cicero were used in education; but the compilations of Boethius, Priscian, Donatus, and Cassiodorus were more widely used. In the twelfth century the study of Roman law was revived, and the scholastic habit of thought found scope for subtlety in the discussion of cases and composition of glosses. . . . Of Greek there was absolutely no tradition left. When the names of Greek poets or philosophers are cited by mediæval authors, it at second hand from Latin sources; and the Aristotelian logic of the schoolmen came through Latin translations made by Jews from Arabian MSS. Occasionally it might happen that a Western scholar acquired Greek at Constantinople or in the south of Italy, where it was spoken; but this not imply Hellenic culture, nor did such knowledge form a part and parcel of his erudition. Greek was hardly less lost to Europe than Sanskrit in the first half of the eighteenth century. . . . The scholars who assembled in the lecture-rooms of Chrysoloras, felt that the Greek texts, whereof he alone supplied the key, contained those elements of spiritual freedom and intellectual culture without which the civilisation of the modern world would be impossible. Nor were they mistaken in what was then a guess rather than a certainty. The study of Greek implied the birth of criticism, comparison, research. Systems based on ignorance and superstition were destined to give way before it. The study of Greek opened philosophical horizons far beyond the dream-world of the churchmen and the monks; it stimulated the germs of science, suggested new astronomical hypotheses, and indirectly led to the discovery of America. The study of Greek resuscitated a sense

of the beautiful in art and literature. It subjected the creeds of Christianity, the language of the Gospels, the doctrine of S. Paul, to analysis, and commenced a new era for Biblical inquiry. . . . [In short] we are justified in regarding the point of contact between the Greek teacher Chrysoloras and his Florentine pupils as one of the most momentous crises in the history of civilisation."—J. A. Symonds, *Renaissance in Italy*, pp. 37-39, 47-48, 81-82.—"The Middle Ages do not by any means deserve the name of the Dark Ages, which used to be ignorantly and vaguely given them. But after the fifth century there was little speculation or intellectual curiosity until the twelfth. It was then that the Renaissance may be said to have begun though the phrase is usually confined to a later period. . . . This revival of classical learning had a profound effect upon the mind of Europe. It revealed societies full of beauty and nobleness before the rise and victory of Christianity; it introduced men to ideas on morality and philosophy widely different from those of orthodox Christianity; and it soon gave to the early Protestant controversialists an invaluable weapon in their power to interpret the original language of the New Testament. Further, it reopened to the world a vast treasure-house of truth and beauty, and there is no department of modern science or thought which has not been influenced by the revival. Fermenting, as it was, with the new thought, Europe could not be kept within the limitations of the mediæval world. But the Renaissance, as we have said, was much more than the revival of classical learning. It was also an artistic movement, the most important in the history of Europe since Pericles ruled in Athens. It produced great works in poetry, and buildings of great interest, while by the pictures and sculptures which it brought forth it gave to Europe a new sense for beauty. In poetry what came before the revival of Greek is much greater than what came after."—A. J. Grant, *History of Europe*, p. 465.

Renaissance from various points of view.—Revolt against mediæval spirit of anonymity.—Italy's priority in revival of learning.—Social conditions favouring Italian Renaissance.—"What do we mean by the Renaissance? Various answers suggest themselves according to the point of view we choose for the moment to adopt. The institutional historian fixes his attention on the birth of a new political consciousness with the decline of the mediæval idea of the Papacy and the Empire and the spread of the sentiment of nationality throughout Europe. The historian of society is mainly concerned with the birth of new social conditions accompanying the breaking up of the regime of feudalism and chivalry, the growth of commerce, and the beginnings of modern industrialism. The scientist emphasises the rediscovery of nature, the opening up of the world by maritime exploration, the founding of astronomy, anatomy, physiology, medicine, and the establishment of the true scientific method. For the historian of thought the principal interest of the Renaissance lies in the abandonment of the old theological scholasticism and the rise of the spirit of free rational inquiry. To the student of religious evolution, the Renaissance suggests the Reformation; to the lover of art and literature, the recovery of the masterpieces of pagan antiquity and the rebirth of the classic world. . . . The Renaissance meant many things. But, beneath them all, it meant a fundamental change in men's attitude towards themselves and the world. Through the mere shifting of their point of view, phases of life were revealed to them of which hitherto they had never dreamed, and, what is equally important, long familiar phases

were brought before them under a totally fresh light. A new spirit was everywhere at work. Its transforming power was shown alike in politics and society, in science, philosophy, and religion, in literature and art. In Prof. Jebb's words, 'the Renaissance, in the largest sense of the term, is the whole process of transition in Europe from the mediæval to the modern order.' To assign a single date for the opening of its history is therefore impossible. The middle ages came to an end at different times, not only in different countries, but also in different fields of activity. But the vital connection among the various component movements of the Renaissance is shown by the fact that they all fall within the same period. Roughly speaking, we may say that it began definitely in Italy towards the close of the fourteenth century with what is called the Revival of Learning; that it spread thence to other countries, notably Germany, France, and England, the spirit of classicism meanwhile blending with other influences different in origin but equally powerful; and that the transformation of life which resulted went on rapidly for more than two hundred years. . . . It may fairly be contended that the Renaissance of the fourteenth, fifteenth, and sixteenth centuries was carried on by the movement of enlightenment in the eighteenth; that the French Revolution was only another stage of it; that we are involved in it even to-day. It is certainly beyond question that the influences which the Renaissance generated, however much they may have changed their forms, have been and still are active forces in the shaping of modern civilisation. For practical purposes, however, we have to mark history off into artificial divisions; otherwise, an historical study would have neither beginning nor end. . . . In the last analysis, the Renaissance was the revolt of the whole man—mind and body alike—against the despotism of creeds, traditions, and arbitrary authority. It was the assertion of the right of the individual to himself and his own life. It marks 'the modern rebirth of the individual soul.' To appreciate the full significance of this, we must remember that the whole mediæval system had been fatal to the free development of individuality. In his relations with the State, the guild, the Church, the mediæval man was merely a unit in an organisation and existed only for its sake. The basis of feudalism was subordination. The great mediæval Church was the supreme incarnation of the despotic spirit; arrogantly laying claim to divine right, it sought to coerce the world into doing only what it ordered and believing only as it taught. Thus not independence but submission was proclaimed as the first of the virtues. The ethical accent was thrown, not upon self-realisation, but upon self-repression. Man was cramped in on every side. He did not belong to himself. He lived on sufferance. The condition of all his activity was that he should be an instrument; of all his thinking, that he should be an echo. One curious result which followed in the domain of literature and art is worth attention—the almost complete want of individuality in the works produced, the absence of the distinctively personal note. Everywhere we meet with what Brunetière calls the spirit of anonymity. There is nothing in poem or painting to reveal the character of the poet or artist behind it. One *roman* is just like another *roman*; one mystery-play just like another mystery-play; one *trouvère* or *minnesinger* just like another *trouvère* or *minnesinger*; one Madonna or Crucifixion just like another Madonna or Crucifixion. Individual genius had been swamped by tradition and convention. Thus, though there was immense intellectual activity dur-

ing the middle ages (for the supposition that they were ages of mental stagnation is wholly incorrect), such intellectual activity produced little of permanent value. . . . In Italy the later fourteenth century took up the work which the preceding century had begun; north of the Alps the intellectual impulse was not felt till the century following. We have thus to recognise Italy's priority in the great revival; and it is worth while to glance at certain outstanding causes of it because they serve to indicate the conditions which were requisite for the success of the Renaissance as a whole. The social and political life of Italy was singularly favourable to the growth of personality and the mental vigour and independence which were aspects of it. The communes or free towns of the twelfth, thirteenth, and fourteenth centuries were homes of civil and intellectual liberty. In them the individual citizen had the largest opportunity for self-realisation and self-assertion. Whatever might be the nominal form of government, these communes were markedly democratic in spirit. '*La carrière ouverte aux talents*,' was a phrase which in varying measure held good of them all. This democratic spirit was largely the result, and was everywhere the accompaniment, of the immense development of industry and trade. Their widely extended commercial enterprises brought these societies into peaceful intercourse with all sorts of different peoples, and this tended inevitably to breadth, flexibility, and freedom of thought. One result was the spread of a robust positive temper and habit of mind strongly hostile to dogmatism, sacerdotalism, and the priestly attitude towards life. Here also, as elsewhere, commerce was the uncompromising foe of feudalism and all its influences. The upper classes of the Italian city-commonwealths thus differed greatly from the upper classes in countries beyond the Alps. They were business men, in constant and intimate touch with the working population of the city; they were town men, whose lives were passed amid civic interests rather than in coarse sports and rural interests. At the time when, shut up in their gloomy fortresses, the feudal aristocracy of northern Europe knew nothing of domestic refinement and little even of comfort, the Italian gentry were already enjoying a home life which had much to commend it in the way of decency and grace. These circumstances had a direct influence on manners. Wealth brought leisure; it bred a taste for luxury; it provided ample opportunity and means for the gratification of that taste. Rich men began to devote a portion of their time to intellectual and artistic pursuits, and their zest for such things was further stimulated both by public admiration and by the rivalry of others situated like themselves. Finally, the extremely bracing atmosphere of these little communities, their internecine controversies in which passions ran high, their fierce contentions with other cities, all helped to make life full, varied, intense; to kindle curiosity, energy, and ambition; to bring out of every man whatever he had in him; to encourage and emphasise both the growth of personality and its unrestrained expression. It is extremely significant that the new movement began earliest and was strongest in communities in which the industrial spirit was most pronounced. It was not feudal Naples nor sacerdotal Rome which was the birthplace of the Italian Renaissance. It was democratic Florence. Viewed chronologically, the Renaissance begins in Italy with the revival of the Latin and Greek classics."—W. H. Hudson, *Story of the Renaissance*, pp. 1-6, 11-14.—"By the term Renaissance, or new birth, is indicated a natural movement, not to be explained by this or that characteristic, but to be accepted as an effort of

humanity for which at length the time had come, and in the onward progress of which we still participate. The history of the Renaissance is not the history of arts, or of sciences, or of literature, or even of nations. It is the history of the attainment of self-conscious freedom by the human spirit manifested in the European races. It is no mere political mutation, no new fashion of art, no restoration of classical standards of taste. The arts and the inventions, the knowledge and the books which suddenly became vital at the time of the Renaissance, had long lain neglected on the shores of the Dead Sea which we call the Middle Ages. It was not their discovery which caused the Renaissance. But it was the intellectual energy, the spontaneous outburst of intelligence, which enabled mankind at that moment to make use of them. The force then generated still continues, vital and expansive, in the spirit of the modern world. . . . The reason why Italy took the lead in the Renaissance was, that Italy possessed a language, a favourable climate, political freedom, and commercial prosperity, at a time when other nations were still semi-barbarous. . . . It was . . . at the beginning of the 14th century, when Italy had lost indeed the heroic spirit which we admire in her Communes of the 13th, but had gained instead ease, wealth, magnificence, and that repose which springs from long prosperity, that the new age at last began. . . . The great achievements of the Renaissance were the discovery of the world and the discovery of man. Under these two formulæ may be classified all the phenomena which properly belong to this period. The discovery of the world divides itself into two branches—the exploration of the globe, and the systematic exploration of the universe which is in fact what we call Science. Columbus made known America in 1492; the Portuguese rounded the Cape in 1497; Copernicus explained the solar system in 1507. It is not necessary to add anything to this plain statement. . . . In the discovery of man . . . it is possible to trace a twofold process. Man in his temporal relations, illustrated by Pagan antiquity, and man in his spiritual relations, illustrated by Biblical antiquity; these are the two regions, at first apparently distinct, afterwards found to be interpenetrative, which the critical and inquisitive genius of the Renaissance opened for investigation. In the former of these regions we find two agencies at work, art and scholarship. . . . Through the instrumentality of art, and of all the ideas which art introduced into daily life, the Renaissance wrought for the modern world a real resurrection of the body. . . . It was scholarship which revealed to men the wealth of their own minds, the dignity of human thought, the value of human speculation, the importance of human life regarded as a thing apart from religious rules and dogmas. . . . Not only did scholarship restore the classics and encourage literary criticism; it also restored the text of the Bible, and encouraged theological criticism. In the wake of theological freedom followed a free philosophy, no longer subject to the dogmas of the Church. . . . On the one side Descartes, and Bacon, and Spinoza, and Locke are sons of the Renaissance, champions of new-found philosophical freedom; on the other side, Luther is a son of the Renaissance, the herald of new-found religious freedom."—J. A. Symonds, *Renaissance in Italy: Age of the despots*, ch. 1— "It would be difficult to find any period in the history of modern Europe equal in importance with that distinguished in history under the name of the Renaissance. Standing midway between the decay of the Middle Ages and the growth of modern institutions, we may say that it was already dawn-

ing in the days of Dante Alighieri, in whose immortal works we find the synthesis of a dying age and the announcement of the birth of a new era. This new era—the Renaissance—began with Petrarch and his learned contemporaries, and ended with Martin Luther and the Reformation, which event not only produced signal changes in the history of those nations which remained Catholic, but transported beyond the Alps the centre of gravity of European culture.”—P. Villari, *Niccolo Machiavelli and his times*, v. 1, ch. 1.—J. Burckhardt, *Civilization of the period of the Renaissance in Italy*.—On the communication of the movement to France, as a notable consequence of the invasion of Italy by Charles VIII, see ITALY: 1494-1496.

Petrarch as a factor in and representative of the Renaissance.—“In Petrarch [1304-1374] . . . we clearly find, as controlling personal traits, all those specific features of the Renaissance which give it its distinguishing character as an intellectual revolution, and from their strong beginning in him they have never ceased among men. In the first place, he felt as no other man had done since the ancient days the beauty of nature and the pleasure of mere life, its sufficiency for itself; and he had also a sense of ability and power, and a self-confidence which led him to plan great things, and to hope for an immortality of fame in this world. In the second place, he had a most keen sense of the unity of past history, of the living bond of connection between himself and men of like sort in the ancient world. That world was for him no dead antiquity, but he lived and felt in it and with its poets and thinkers, as if they were his neighbors. His love for it amounted almost, if we may call it so, to an ecstatic enthusiasm, hardly understood by his own time, but it kindled in many others a similar feeling which has come down to us. The result is easily recognized in him as a genuine culture, the first of modern men in whom this can be found. It led, also, in his case, to what is another characteristic feature of the Renaissance—an intense desire to get possession of all the writings which the ancient world had produced. It was of vital importance, before any new work was begun, that the modern world should know what the ancients had accomplished, and be able to begin where they had left off. This preliminary work of collection was one of the most important services rendered by the men of the revival of learning. For the writings of the classic authors Petrarch sought with the utmost eagerness wherever he had an opportunity, and though the actual number which he was able to find, of those that had not been known to some one or other in medieval days, was very small, still his collection was a large one for a single man to make, and he opened that active search for the classics which was to produce such great results in the next hundred years. In another direction, also, Petrarch opened the age of the Renaissance. The great scientific advance which was made by this age over the middle ages does not consist so much in any actual discoveries or new contributions to knowledge which were made by it, as in the overthrow of authority as a final appeal, and the recovery of criticism and observation and comparison as the effective methods of work. Far more important was this restoration of the true method of science than any specific scientific work which was done in

the Renaissance age proper. Here again it is with Petrarch that the modern began. He attacked more than one old tradition and belief supported by authority with the new weapons of criticism and comparison, and in one case at least, in his investigation of the genuineness of charters purporting to have been granted by Julius Caesar and Nero to Austria, he showed himself thoroughly imbued with the spirit and master of the methods of modern science. Finally, Petrarch first put the modern spirit into conscious opposition to the medieval. The Renaissance meant rebellion and revolution. It meant a long and bitter struggle against the whole scholastic system, and all the follies and superstitions which flourished under its protection. Petrarch opened the attack along the whole line. Physicians, lawyers, astrologers, scholastic philosophers, the universities—all were enemies of the new learning, and so his enemies. And these attacks were not in set and formal polemics alone, his letters and almost all his writings were filled with them. It was the business of his life. He knew almost nothing of Plato, and yet he set him up boldly against the almost infallible Aristotle. He called the universities ‘nests of gloomy ignorance,’ and ridiculed their degrees. He says: ‘The youth ascends the platform mumbling nobody knows what. The elders applaud, the bells ring, the trumpets blare, the degree is conferred, and he descends a wise man who went up a fool.’ In the world of the new literature Petrarch obtained so great glory in his own lifetime, and exercised such a dictatorship that the ideas which he represented obtained an influence and extension which they might not otherwise perhaps have gained so rapidly. When he died, in 1374, the Renaissance was fully under way in Italy as a general movement, and, while in his own lifetime there is hardly another who is to be placed beside him in scholarship and knowledge of antiquity, there soon were many such, and before very long not a few who greatly surpassed him in these respects. But if his scholarship cannot be considered great according to modern standards, it will always remain his imperishable glory to have inaugurated the revival of learning.”—G. B. Adams, *Civilization during the Middle Ages*, pp. 375-377.—See also CLASSICS: Renaissance; ITALIAN LITERATURE: 1283-1375.

Various Italian humanists.—Effect on art of change from asceticism to humanism.—Importance of printing.—“The Italian humanists were for the most part scholars and men of letters. They were devotees of the classics, not original thinkers. A few, like Ficino and Mirandola, were philosophers as well as scholars, and devoted themselves to the task of expounding the Platonic philosophy and harmonising it with Christianity. They were also, what was only too rare in this age of reaction and transition, men of pure life and soaring purpose. But Ficino was no creative genius, and the prodigy Mirandola died too early to do justice to his great powers. There was one exception to the rule of intellectual mediocrity. It is that of Machiavelli, who . . . was a truly original genius, and struck out in a new path of inquiry. It was not in what these men did in the way of constructing a new philosophy; it was in the work they did in helping to emancipate the mind from traditional fetters that their highest merit lies. Their work was pre-eminently a work of liberation. The work of construction came later. They began the movement that was to evolve in a Bacon, a Locke, a Spinoza. They made modern free thought, modern science, possible. They discovered in a rational culture the solvent that was to dissolve the dead mass of tradition and authority. [See also

EDUCATION: Modern: 15th-16th centuries: Italy (the center, etc.) It was in the domain of art, rather than of thought, that the creative genius of the Italian Renaissance showed itself. Here it not only revealed, it created a new world. The Middle Ages were indeed immensely great in architecture. The mediæval cathedral is, in conception and execution, a masterpiece. It suggests both originality and boldness of idea, and, in its majesty and grandeur, stands out in striking contrast to the puniness and poverty of the achievements of the age in philosophy. [See also ARCHITECTURE: Mediæval; Romanesque; Gothic.] In sculpture and painting, however, the Middle Ages suffered from the blight of asceticism. The ascetic conception of both man and nature distorted, cramped, the artistic sense. The mind was the victim of an ill-regulated, diseased fancy which peopled the world with evil spirits, devils, monsters, whose grim forms haunted even its most splendid buildings, saw neither the truth nor the beauty of nature, and proclaimed the human as necessarily antagonistic to the divine. In such circumstances art could only be grotesque, childish. With the change of conception from the ascetic to the rational, the humanist view of life, the emancipation of art, as well as learning and philosophy, began. Mediæval crassness, grotesqueness, unnaturalness, disappeared before the plastic touch inspired by nature and antiquity. Turning from a mediæval Madonna or saint to the Madonnas or saints of a Raphael, a Leonardo da Vinci, a Michael Angelo, we at once feel that a new power as well as a new aspiration has enlarged and enriched the human spirit. Here, too, we learn that old things have passed away, all things have become new. In Raphael as in Machiavelli, in Michael Angelo as in Petrarch, the revolt against tradition and system speaks with unmistakable emphasis. The subject of this art may be largely Christian or ecclesiastical; the life it delineates is that of real human beings such as a Phidias sculptured. [See also ART: Relation of art and history.] The influence of the Renaissance north of the Alps showed itself in the same many-sided awakening of the human mind as in Italy. On scholarship, literature, art, education, science, it exercised the magic of a new inspiration. German scholars like Rudolf Agricola, Celtes, Wimpfeling, Reuchlin, Melanchthon, vied, in their erudition and their enthusiasm, with those of Italy. Germany, the land of the invention of printing had, too, its humanist societies and its famous printing presses, like that of Froben at Basle, to make war on obscurantism, and the older universities like Heidelberg, Erfurt, Vienna, readily joined in the attack. If Italy produced a Galileo, Germany produced a Müller (Regiomontanus), a Copernicus. The Germans, Dürer, Holbein, Cranach, are fitting peers of the great Italian masters. In Switzerland Zwingli was an enthusiastic humanist before he became an aggressive religious reformer. In France a whole galaxy of scholars—Faber, the Estiennes, father and son, printers as well as scholars, Budeus, Turnebus, Etienne Dolet, Vatable, &c., shone in the firmament of the Renaissance period. The Netherlands may claim to have given birth, in Erasmus, to the greatest of transalpine men of letters, who deservedly wielded the dictatorship of the literary republic of his day. They may claim, too, to have produced some of the greatest masters in the realm of art. England could boast of Colet, and More, and Tyndale; Scotland of Buchanan and Andrew Melville; Spain of a Lebriza and a Ximenes; Portugal of Tesiras. . . . The printer is, in truth, the greatest revolutionist that has ever appeared on earth. After the middle of the fifteenth century it was henceforth impos-

sible to crush the critical spirit by means of inquisitions and holy crusades. Pope and priest might well tremble for their supremacy in the presence of the press, though the press might print and publish for as well as against the Church. And the day was coming when the now omnipotent, absolute king would have equal cause to fear the power of the press. The danger to the king was as yet not so appreciable as to the pope and priest. But the critical spirit, born of the Renaissance, would not in the long-run stop short at theology or philosophy. It would apply itself to politics as well as to theology and philosophy, and, as the works of More and other political writers show, it would do so in a fashion by no means agreeable to absolute kings."—J. Mackinnon, *History of modern liberty*, v. 2, pp. 13-15, 18-19.—"The invention of the printing-press in the north put a new weapon into the hands of the humanists, and enabled them to bring the results of their labors to bear upon a vastly wider circle than before. The great results of this invention for civilization are to be found, not so much in the preservation as in the cheapening of books, and the popularizing of the means of knowledge. If the printing-press reduced the price of books to one-fifth the former price, as it seems to have done before it had been in operation very long, it much more than multiplied by five the number of persons who could own and use them. Although the spread of printing throughout Europe was slow as compared with the rate of modern times—an invention of similar importance to-day would probably get into use in the principal places of the world within a year or two—it was rapid for the middle ages. Invented, apparently, in a shape at least to be called really printing, about 1450, it was introduced into Italy in 1465, possibly slightly earlier; into France and Switzerland in 1470, into Holland and Belgium in 1473, into Spain in 1474, and into England between 1474 and 1477. By 1500 it was in use in eighteen countries, and at least two hundred and thirty-six places had printing-presses. . . . One immediate consequence of this invention was that the results of the revival of learning, its new spirit of independence, and its methods of criticism, could no longer be confined to one country or to those who were by calling scholars. They spread rapidly throughout Europe, affected large masses of the people who knew nothing of the classics, and became vital forces in that final revolution of which Luther's work forms a part."—G. B. Adams, *Civilization during the Middle Ages*, pp. 378-379.—See also PRINTING AND THE PRESS: Before 14th century; 1457-1480.

Spirit of adventure and intellectual activity.—Leonardo da Vinci.—Columbus and the discovery of America.—"At the opening of the *quattro cento*, into a cup of exquisite chalice Dante had poured the alembic of the new Italian tongue. Fleeing before the invading Turk, the exodus of the pedants into Italy had brought resurrection to the immortal works of Greece. Petrarch and Boccaccio, fired with enthusiasm for the new study, had made ancient learning again the fashion. From Marco Polo, . . . and other travellers had come dazzling tales of unknown lands. The spirit of adventure stirred anew. At the same time trade and commerce were flourishing as they had not flourished in centuries. The northerly lands of Europe were becoming rich. To the leisured class came time to learn, and with it the vanity to affect tastes and cultivate aptitudes which lifted them yet a little further from the crowd. The intellectual movement was widespread. The introduction and prevalent use of gunpowder resulted at last in a demand for a theory of explosions. A

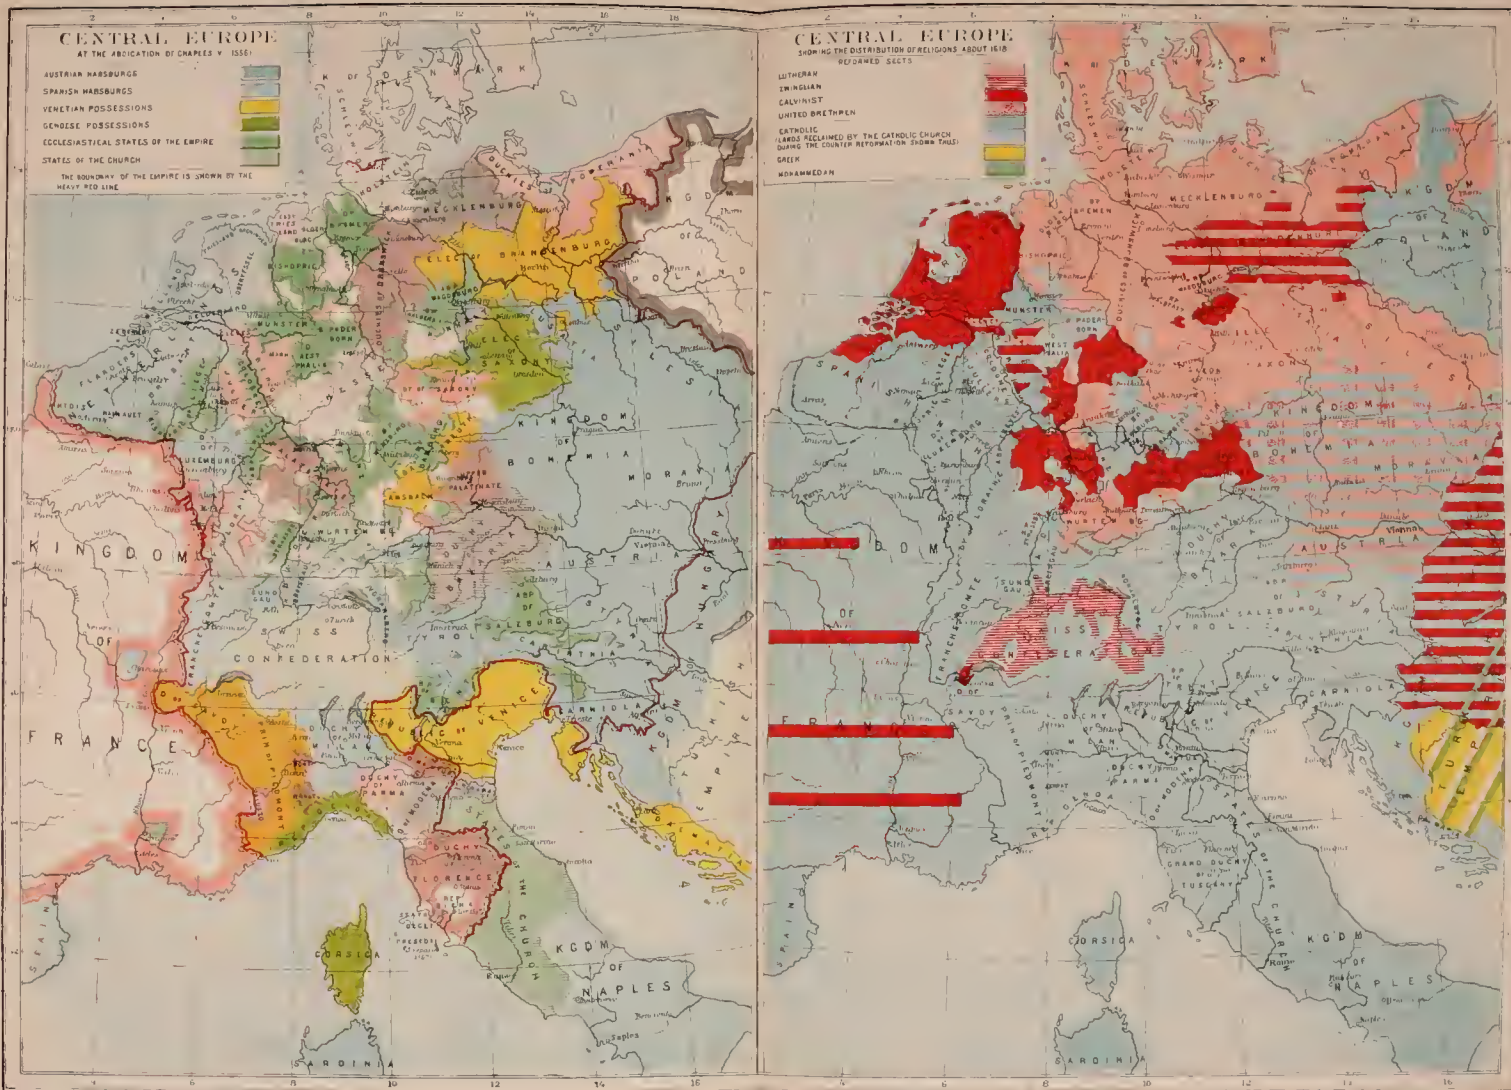

mingled chemistry and alchemy had been imported from the Moors. The zest for inquiry ran into channels the most diverse. In Leonardo da Vinci [1452-1519] was incarnated one of those multifarious minds which appear once in a century or more. Painter, poet, engineer, strategist, inventor of canal locks, a student of shells and stones, of plants and trees, of pigments and the effects of light, he became the founder of half-a-dozen sciences. To still larger results, in the far-off wilds of Great Britain, in the solitude of the cloister, and persecuted as a necromancer, Roger Bacon [c. 1214-1294] had toiled at the resuscitation of physical science. His works, filtering through the pens of Cardinal d'Ailly and others, caught at last the ear of a . . . masterful man, a wanderer and a thinker, half a pirate and half a seer; and out of the tumult of his ideas came at last the project of a voyage to India through the waters of the unknown west. The mystic needle which would pilot the mariner without the aid of headland or star had come into general use. Adventurous voyages were being undertaken. An era of maritime discovery had been begun. The circumnavigation of Africa was to be attempted anew. From one of his most distinguished countrymen, the Florentine astronomer Toscanelli, Columbus [1451-1506] had found reassurance for his great design. The ancient speculations of Eratosthenes and Strabo as to the feasibility of such a voyage and the existence of other and doubtless habitable continents, were being ardently discussed. For a century or more these ideas had been revived and popularised through the curious and widely read writings of Sir Jehan Maundeville, 'Knight of St. Albans.' The mistaken measures of the circle of the earth handed down from Ptolemy, the equally mistaken ideas as to the distance of India to the East, gave to the project a far less hazardous air than the reality would have presented. Still, it was difficult enough; in the minds of most, a fantastic dream. The discovery of the New World came to Europe like a bolt from the blue. Yet the quest of Columbus was in some sense as definite an inquiry as a laboratory experiment. . . . The scientific method, the rational use of experience, of inference from careful observation, of hypothesis and verification had won its first brilliant victory in the new time."—C. Snyder, *World machine*, pp. 159-160.—See also AMERICA: 15th century, and after; Map showing voyages of discovery.

**Characteristics of the period and of the church.**—"The Protestant Reformation was not exclusively nor even chiefly a religious movement. It involved a break with the historical ecclesiastical institution and the organisation of new churches independent of Rome, but the break itself was as much political as religious, both in its causes and in its results. Dissatisfaction with the existing order of things was widespread in Western Europe, and was coming to ever more active expression. It was not confined to one class of society, nor limited to one set of conditions. The period was marked by discontent and unrest, moral, religious, social, economical, and political. The conviction was growing that traditional customs and institutions needed adjustment to the new needs of a new age, and on every hand criticisms of the old were rife and programmes of reform were multiplying. For centuries the Church had been the most imposing institution in Europe, and the most influential factor in its life. Rightly or wrongly it was widely held responsible for current evils in every line, and every project for the betterment of society concerned itself in one or another way with the ecclesiastical establishment. As a rule, however, the

criticisms of the existing system affected only superficial details, and were neither radical nor far-reaching. Abuses in ecclesiastical administration, financial exactions on the part of the ecclesiastical authorities, ignorance, immorality, and venality on the part of the clergy—these constituted in most cases the burden of complaint. The fundamental principles on which the mediæval system rested were seldom made the object of criticism or of question. The traditional Catholic dogmas and the beliefs underlying existing religious practices were commonly taken for granted. Criticism confined itself chiefly, either to the over-emphasis of theology and the substitution of barren orthodoxy for practical religion, or to abuses in the application of accepted principles and the displacement of vital piety by formalism and externality."—A. C. McGiffert, *Protestant thought before Kant*, pp. 9-10.—"In the early Middle Ages, . . . [the church] became part of the feudal system so far as concerned its tenor and occupancy of land and the performance of its landed functions. Abbots and bishops held feudal rank, and usually were scions of noble or princely houses. This general condition of the Church did not pass with the Middle Ages. In Germany at the close of the fifteenth century, the higher ranks of the German clergy were filled with the sons of the nobility and the great benefices were held by princes. Such a condition might prove fuel for peasant uprisings, but could not, like papal exactions, incite Germans to revolt against a foreign papal Church. Before men revolt, they must distinguish and separate from themselves what they would revolt against. Everywhere the mediæval clergy, with their practices and privileges, made part of the social structure of the country. If they enjoyed exemptions and exclusive rights, so did the nobles, so did the burghers of the towns. Law applying to all men was of slow and jealous growth. Special rights of a locality or an order, or even of individuals, existed everywhere, and when contested were contested by some other special right. Hence the peculiar privileges of the clergy did not seem to separate them from other classes of society, whose rights were likewise privileges. . . . In Germany, however, the conflict over the investiture of the clergy with their lands and officers was long and bitter. It seemed to center in a struggle between Emperors and popes, and tended to rouse national antipathy. The German clergy took one side or the other. But the struggle produced in the minds of the nobility and princes and their followers, a sense of antagonism to the papacy. That seemed a foreign foe, and not the less so when it intervened in German politics, in favor of one royal candidate as against another. From the thirteenth century, German antipathy to Rome is voiced by those great German voices, Walter von der Vogelweide and Freidank, whoever the latter was. The current comes down the centuries, till it finds expression in the effective violence of an Ulrich von Hutten."—H. O. Taylor, *Thought and expression in the sixteenth century*, pp. 201-202.—"The later fifteenth century was a period of religious revival on a large scale in Central and Western Europe. Not only those forms of the religious life which have been referred to but also strictly Catholic piety was everywhere reanimated. It was a time of social and economic chaos. Plague, pestilence, and famine devastated large sections of the continent. New diseases made their appearance as a result of the growing intercourse between Europe and the Orient. The dread of Turkish invasion became more acute, and fear and demoralisation were seizing upon all classes of the community. The feeling of helplessness was common, and men were

looking in every direction for the strength and confidence they lacked in themselves. It was widely believed that the end of the world was at hand, and terror was everywhere abroad. Under these circumstances a recrudescence of mediæval piety in its crassest form took place. Pilgrimages, veneration of relics, multiplication of ascetic practices, increase of monasticism, mark the age in a notable degree. Serious-minded men felt themselves driven as seldom before to ward off evil by religious observances. All this was just the opposite of humanism in its effects. If the latter promoted self-confidence and self-reliance, the influences just referred to fostered self-distrust. If the one undermined the traditional superstition and transformed religion into ethics, the other encouraged the most vulgar kinds of religious practice, and strengthened the hold of the most primitive and superstitious rites and customs. To persons of this type humanism must seem barren, insufficient, and irreligious. It might meet the needs of men of modern temper, but it had nothing at all to offer those beset with religious fear and oppressed by their own helplessness. Luther was a typical figure in this respect, and the terror which drove him into the monastery a very common experience. If other forms of piety tended to diminish the influence of the ecclesiastical establishment and of traditional principles and practices, this common religious fear tended to bind them more firmly upon the consciences of the people. At the same time it made them receptive to new religious suggestions from any quarter, and led them to seize blindly upon any help that might be offered. In general the opening of the sixteenth century must be recognised as a time of ferment, excitement, and unrest in religion as in all other lines, a time pregnant with change, equally hospitable to the most radical and to the most reactionary movements. No one could foresee what would come out of it, and even now, looking back upon the period, it seems largely an accident that the current ultimately flowed in the direction it did rather than in some other."—A. C. McGiffert, *Protestant thought before Kant*, pp. 16-17.—See also PAPACY: 15th-16th centuries.

**Preliminary movements of Wycliffe and Huss.**—"It is possible that even without the vigorous leadership of Wycliffe [1324-1384] so favorable an age would have produced a demand for a religious reformation. As it was, the demand which was made seems almost wholly the result of his personal influence, of his earnest spirit and his deeply inquiring mind. In Wycliffe's work there was an attempted reformation of theology and of religion, of Christian doctrines and of the Christian life in about equal proportions, and, from the peculiar situation of things in England, it involved political ideas not necessarily connected with the others. It has been said that Wycliffe 'disowned and combated almost every distinguishing feature of the mediæval and papal church, as contrasted with the Protestant.' His 'poor priests' undoubtedly were messengers of good to the poorer classes, and the fact that so large a number of manuscripts as one hundred and sixty-five, containing larger or smaller parts of his translation of the Scriptures, has been found, shows conclusively how widely the copies were circulated and how carefully they were preserved. The division of political parties in England during Wycliffe's life served to protect him and his followers from serious persecution; but after the accession of the House of Lancaster to the throne this reason no longer existed, and the church had her way with the heretics. In 1401 the first English statute was passed punishing wrong theological opinions with death, and, in the few years

following, the Lollards, as Wycliffe's followers were called, were apparently exterminated. [See also ENGLAND: 1360-1414; CHURCH OF ENGLAND: 1066-1534; EDUCATION: Modern: 14th-16th centuries: England, Lollardism and the Renaissance; LOLLARDS.] If Wycliffe's influence died out in England it was continued upon the continent in the last great religious rebellion against the mediæval church which preceded Luther's. The close connection which was established between the English and Bohemian courts, and between the Universities of Prague and Oxford, as a result of the marriage of Richard II. and Anne of Bohemia, brought some Bohemian students into contact with Wycliffe's teachings and led to the carrying of his writings to their fatherland. The reform movement which resulted in Bohemia, whose leader was John Huss [1369-1415], followed in all essential matters the ideas of Wycliffe, but it placed the strongest emphasis upon other points, such, for example, as the communion in two kinds, from which one wing of the Hussites, the Utraquists, derived its name. Huss himself did not lay so much stress, perhaps, upon the translation of the Scriptures into the language of the people, but his appeal to the Bible as the final authority in questions of belief, and his assertion of his right to judge of its meaning for himself, were clear and emphatic, and his followers were as earnest translators as Wycliffe or the Waldensians could have desired. Huss and his disciple, Jerome of Prague, were burned at the stake by the Council of Constance, in 1415, but political reasons, the unending strife between the Slav and the German in part, gave his cause so much strength in Bohemia that, after twenty years of desperate warfare the revolt was ended by a compromise, and the church gave way to the Hussites, to a certain extent in the points upon which they insisted most strongly."—G. B. Adams, *Civilization during the Middle Ages*, pp. 418-419.—See also BOHEMIA: 1405-1415.

**Erasmus and the Reformation.**—"Notable among the phenomena of the age [of the Renaissance and Reformation] was the tendency which we know as humanism, the most modern expression of the intellectual life of the period. It is true that its significance has been greatly exaggerated, and the contrast between the intellectual life of the fifteenth and that of the thirteenth century much over-emphasised. At the same time it is abundantly clear that the general temper of those whom we call humanists was unlike that of the leading thinkers of the Middle Ages. The difference was not in the matter of seriousness, as often said, for in spite of the frivolity of many humanists, some of the most notable of them were as earnest in purpose as any of the leaders of the Mediæval Church. It lay rather in a difference of attitude toward the present world both of man and of nature, a recognition of its independent value and an interest in it for its own sake. There was widespread rebellion among the humanists against the trammels of mediæval Catholicism, and against the tyranny of the ecclesiastical establishment, and the growing loss of reverence for the existing system which made the spread of Protestantism possible was in no small part due to their influence, as was also the increasing conviction that a reformation of some sort was needed. But with the constructive work of the Protestant Reformation and with the framing of its principles and ideals they had little to do. Of the humanists who desired to promote a reformation of one kind or another, or at least to improve religious and moral conditions within the Church, Erasmus [1466-1536] of Rotterdam may be taken as a representative. To Erasmus Christianity was primarily an ethical system; Christ was its great

teacher and exemplar; and to be a Christian meant to conduct one's life in accordance with the principles which governed Him. Jesus appeared in the rôle of a sage, and Christianity under the aspect of a moral philosophy rather than a religion of redemption. In opposition to the schoolmen the elaborate theology of the Middle Ages was pushed to one side and the emphasis laid on practical conduct, and in opposition to the externality and formalism of the prevailing religious life of the day the inner disposition was made alone essential. All the paraphernalia of mediæval Christianity—its sacraments, relics, pilgrimages, rites and ceremonies, ecclesiasticism and asceticism—were looked on as unimportant. Not that they were necessarily bad in themselves, but that they were not of the essence of the Gospel, and became vicious when they obscured the more vital matters. The heart of Christianity, the one all-important thing according to Erasmus, is love for one's fellows, manifesting itself in charity, sympathy, and forbearance. The governing motive of Jesus' life was brotherly love, and in it the Christian life finds its controlling principle. Erasmus did not break with the Catholic Church, nor did he, in spite of the ridicule he continually heaped upon the follies and vices of priests and monks (as for instance in his *Praise of Folly*), reject the doctrines and principles of the mediæval system. He was an orthodox Catholic, as his work on the Symbol abundantly shows, but his teaching was inevitably disintegrating in its tendency, and Pope Paul IV was perfectly right in putting his works on the Index. The distinction between essential and non-essential in the existing system, and the reduction of the former to the moral principles taught by Jesus, must accrue to the neglect and disregard of a large part of the traditional theory and practice of the Catholic Church, and though Erasmus might not himself draw the natural conclusion, it was clear enough that others would. In his endeavour to bring out distinctly the essence of Christianity in contrast with the excrescences which so commonly obscured it, Erasmus, like most of the humanists, was led to lay emphasis upon the supreme authority of the Bible. . . . Erasmus himself published the first edition of the New Testament in the original Greek in 1516, and followed it with numerous commentaries and editions of the Fathers, who were supposed, after the apostles themselves, to be the most authentic witnesses to Christian truth, and the most competent interpreters of the Scriptures. The recognition of the authority of the Bible was not an innovation; theoretically it had been supreme since an early day. It had been the object of diligent and faithful study on the part of theologians, and the comfort and inspiration of multitudes of devout and pious souls during all the centuries. In the later Middle Ages vernacular translations of it became very common, and in many cases received ecclesiastical approval. But it was not the exclusive authority of Catholic Christians. The Church was believed to be the living and infallible mediator and interpreter of divine truth. To its custody the Bible had been committed, and in the light of its teaching it was read."—A. C. McGiffert, *Protestant thought before Kant*, pp. 11-13.—See also EDUCATION: Modern: 15th-16th centuries; Relation of Renaissance and Reformation; 16th century: Erasmus and the Reformation; BIBLE, ENGLISH: 14th-16th centuries.

**Political situation in Luther's time.**—"The political situation in Europe . . . at the time of Luther was, to all appearances at least, an essential condition of the ultimate success of the Reformation. The large possessions brought to-

gether through the fortunate marriages of the Hapsburgs had been united with those which the diplomatic skill of Ferdinand the Catholic had acquired. The 'civil arm,' as represented by the Emperor Charles V., would seem to have been strong enough to deal unhesitatingly with any unwelcome religious opinion which might arise. But Charles never found a moment when he could exert this strength against Protestantism, until it was too late. On the west was the rival power of France, less in extent and apparent resources, but not scattered like his own power, closely concentrated in the hands of the brilliant and ambitious Francis I. On the east was the equally dangerous Turkish empire, still at the height of its strength, and determined to push its conquests farther up the Danube valley. Three times after the Diet of Worms, where Luther was originally condemned, when Charles seemed free to use his whole power for the extermination of heresy, following no doubt his personal inclination as well as what he judged to be his political interests—in 1526, in 1529, and again in 1530—was he forced, each time by some sudden turn in the affairs of Europe, some new combination against him, sometimes with the pope among his enemies, to grant a momentary toleration. In 1532 was concluded the definite Peace of Nuremberg, the price of Protestant assistance against the Turks, by which a formal agreement was made to allow matters to remain as they were until the meeting of a general council. Under this arrangement Protestantism gained so much strength that when, in 1547, the emperor at last found himself able to attack its adherents, he could not entirely subdue them, although he nearly succeeded."—G. B. Adams, *Civilization during the Middle Ages*, pp. 424-425.—See also GERMANY: 1517-1523; PAPACY: 15th-16th centuries; 1517-1521.

**Luther, his motives and his principles.**—"Though educated in the University of Erfurt, the center of humanistic culture in Germany, Luther [1483-1546] was singularly untouched by the intellectual currents of his day. The impulses which controlled him were never those of the scholar, the scientist, or the philosopher. He cared little for clearness and consistency of thought. A satisfactory and adequate world-view was none of his concern. Of intellectual curiosity he had scarcely any; of interest in truth for truth's sake none at all. He had a marvellous command of the German language, and was a writer of great force and vigor, but he was no litterateur, and his works are strikingly devoid of the literary artifice and self-consciousness of his day. He was far and away the most commanding personality of the age, and he had mental gifts of a very high order, but his genius was wholly practical. He was pre-eminently a religious character, and his great work was accomplished in the religious sphere; but even there he was not controlled by intellectual motives. At a time when the spirit of the modern age was beginning to make itself felt in the religious thinking of his contemporaries, and questions as to the truth of traditional doctrines were widespread, he remained entirely without intellectual difficulties, finding no trouble with the most extreme supernaturalism and the crassest superstitions of the current faith. His confidence in the Catholic system was absolute, and his acceptance of its tenets complete, until he was shaken out of it by practical considerations which had nothing to do with theology, and were not in the least of an intellectual order. Under these circumstances it is a mistake to think of him as a theologian and of his work as a reformation of

theology. It is equally a mistake to think of him as a reformer in the institutional sphere. Existing institutions, like traditional theology, might be changed to a greater or less degree as a result of his labors, but the effect was incidental in the one case as in the other. His interest was wholly in the practical religious life, and all the differences between him and his Catholic contemporaries were simply the consequence of a radical divergence in this sphere. His own conception of the Christian life was the fruit of a personal experience too familiar to need recounting here. Driven into a

... His idea of Christian liberty was the most modern element in Luther's teaching, and did more than anything else to undermine the authority of the Catholic Church. One of the watchwords of the dawning modern age was liberty; escape from the trammels of traditional authority, and the assertion of the independence of the individual. Already this had voiced itself in various ways, but for the religious man there was apparently no escape from the dominance of the ecclesiastical system. . . . Fundamental in all his thinking was the doctrine of the depravity and helplessness of

monastery by fear of the wrath of God and by the desire to earn divine forgiveness and approval by meritorious works, he discovered that it was impossible to secure peace of mind by such a method, and was finally led to believe that the only road to peace lay in repudiating all righteousness of his own, and depending wholly upon the free grace of God in Christ. . . . To suppose that Luther's gospel of the free, forgiving love of God in Christ was unknown in the ancient and mediæval Church is a great mistake. Particularly in the Middle Ages it found frequent expression. But not before had the conviction meant so complete a revolution in a Christian's religious life, and never had it borne so radical fruit.

the natural man. This was not a mere accidental survival of the traditional way of looking at things, it was confirmed by his own experience, and remained permanently an essential part of his system. The peace which he finally attained in the monastery at Erfurt was not the result of a recognition of the moral ability and independence of man. On the contrary, he reached it only when he became convinced of the utter vanity of human effort, and renounced all merit whatsoever."—A. C. McGiffert, *Protestant thought before Kant*, pp. 20-47.—See also PAPACY: 1517; 1517-1521; 1521-1522; 1522-1525; BIBLE, ENGLISH: 14th-16th centuries; LUTHERAN CHURCH: 1517-1852; GERMANY: 1552-1561; NETHERLANDS: 1521-1555; EDUCATION:

**Melanchthon an aid to Luther.**—After Luther posted his ninety-five theses in 1517, there "came a year or two of controversy and angry disputes; and just at the right time came Philip Melanchthon [1497-1560], from the University of Tübingen, to strengthen the staff of the Elector's new University at Wittenberg—a man deep in Hebrew and Greek, a half-disciple of Erasmus—already pointed out as likely to turn out 'Erasmus II.' of gentle, sensitive, and affectionate nature, the very opposite of Luther, but yet just what was wanted in another Wittenberg Reformer—to help in argument and width of learning; to be in fact to Luther, partly what Erasmus had been to Colet. In the weary and hot disputes which now came upon Luther, Melanchthon was always at his elbow, and helped him in his arguments; while the fame of Luther's manly conduct and Melanchthon's learning all helped to draw students to the University from far and near, and so to spread the views of the Wittenberg Reformers more and more widely."—F. Seebohm, *Era of the Protestant revolution*, p. 100.—See also PAPACY: 1517-1521; 1530-1531; EDUCATION: Modern: 16th century: Melanchthon.

**Genevan reformers.—Calvin.—Spread of Calvinism.**—"Luther was too national—too German—a reformer, to admit of his becoming the universal prophet of Protestantism all over the world. Denmark, Sweden, and Norway, coming under German influence, did indeed become Lutheran; but the Protestants of France, England, Scotland, and America are not and never have been Lutherans. They came more under the influence of the Genevan reformers, of whom we must now speak. The chief of these was John Calvin (1509-1564). He was a Frenchman, born in 1509, and so was twenty-five years younger than Luther. He was educated at the universities of Paris and Orleans, adopted the Augustinian theology, as Wiclif, Huss, and Luther had done before him, and became a Protestant. In France heretics were burned, so he left his home to travel in Italy and Germany. In 1536, just as Erasmus was passing to his rest, he came to Basle, and began his public work as a Protestant reformer by publishing his 'Institutes of the Christian Religion.' It was these 'Institutes' of Calvin which gave rigid logical scholastic form to those Augustinian doctrines which . . . were held in common by most Protestant reformers from Wiclif to Luther, but which have been since called 'Calvinistic.' He differed from Luther both in theory and practice, on those points about which Zwingli and Luther had quarrelled. He rejected transubstantiation, which Luther did not altogether; and he founded his Church, like Zwingli, on the republican basis of the congregation rather than, as Luther did, on the civil power of the prince. He thus was in a sense more Protestant than Luther, though at that time only the Lutherans were called Protestants. Geneva soon became the sphere of his actions. It was in a state of anarchy, having rebelled from its bishop, who had been practically both ecclesiastical and civil ruler in one. Other French reformers had settled at Geneva before Calvin, and these shared his stern Protestant doctrines. But Calvin soon proved the most powerful preacher. Like Savonarola, he rebuked the vices of the people from the pulpit. At first this made him unpopular, and he was driven away; but in 1541 he was recalled by the people, and made practically both civil and religious dictator of the little state. He was in a sense Protestant Pope of Geneva, but deriving his power from the congregation. He and

his consistory held it their duty to force men to lead moral lives, go to church, give up dice, dancing, swearing, and so forth; and the council of the city supported this severe exercise of ecclesiastical power by their civil authority. Thus for twenty years Geneva was under the rule of Calvin and his fellow 'saints'; and an intolerant despotic rule it was. [See also GENEVA: 1536-1564.] Men were excommunicated for insulting Calvin, and sent to prison for mocking at his sermons. To impugn his doctrine was death or banishment. Hired spies watched people's conduct, and every unseemly word dropped in the street came to the ear of the elders. Children were liable to public punishment for insulting their parents, and men and women were drowned in the Rhone for sensual sins. Witchcraft and heresy were capital crimes; and one heretic, Servetus, was burned, with his books hung to his girdle, for honest difference of opinion from Calvin on an abstruse point of divinity. The same view of the functions of the Church which led him to exercise this severe discipline, led him also to control education. [See also EDUCATION: Modern: 16th century: Calvin.] He founded academies and schools; and when his system was applied to Scotland, as it afterwards was under John Knox, a school as well as a church was planted in every parish. . . . Whatever Calvin did at Geneva would have mattered little to the world if it had stopped there; but it did not. The historical importance of Calvin lies in the fact that he impressed upon Western Protestantism his rigid scholastic creed and his views of ecclesiastical discipline. The Protestants of France, called Huguenots, were and are mainly the offspring of Calvinism. [See also FRANCE: 1550-1561.] John Knox, the reformer of Scotland, and the Scotch Covenanters, were also disciples of Calvin; and so Scotch Protestantism received its impress from Geneva. The Puritans of England were also Calvinists. Cromwell was a Calvinist, and the rule of his 'saints' was on the Geneva model. The Pilgrim Fathers took with them from England to the New England across the Atlantic the Calvinistic creed, and, alas! its intolerance too. So engrained was it in their theological mind that, even though themselves fleeing from persecution, they themselves persecuted in the land of their refuge. Under the rule of the Boston saints there was as little religious liberty as under the rule of Calvin at Geneva. Nevertheless, the offspring of the Geneva school of reform deserve well of history. However narrow and hard in their creed and Puritanic in their manners, they were men of a sturdy Spartan type, ready to bear any amount of persecution and to push through any difficulties, democratic in their spirit and aggressive in their zeal. The banishment of the Huguenots from France took away the backbone of her religious life. Scotland would not be what she is but for Knox and his parish schools. England could not afford to lose the Puritan blood which mixes in her veins. New England owes a rich inheritance of stern virtues to her 'Pilgrim Fathers.'—F. Seebohm, *Era of the Protestant revolution*, pp. 106-109.—See also METHODIST CHURCH; PRESBYTERIAN CHURCHES: Theory of origin; PURITANS: 1620-1660.

**Catholic Reformation, Jesuits and Council of Trent.**—"One of the results of the Protestant revolution was the reform of the Catholic Church itself. We ought never to forget that the Roman Catholic Church of our own times is, in fact, a reformed Church as well as the Protestant Churches. . . . Good men of all parties had for long seen the necessity of a practical reform in the morals of the pope, clergy, and monks. . . . The necessity was

recognised in high quarters. Ferdinand and Isabella's great minister, Cardinal Ximenes, and the English ministers, Cardinal Morton and Cardinal Wolsey—three cardinals all of great power and undoubted loyalty to Rome—even went so far as to get bulls from the Pope, authorising them to visit and reform the monasteries. All good men cried out against the crimes of such a pope as Alexander VI. And it is not right to charge the Catholic Church wholesale with these crimes any more than it would be to charge the English nation with the matrimonial sins of Henry VIII. There was so strong a feeling all through the Church against these scandals that, after what had happened, they were not likely to occur again. The popes who came after Alexander VI. were not angels, but they were outwardly more decent than he, at all events. Julius II. . . . was the fighting pope. The scandal in his case was his lust of war and the extension of the Papal territory. Leo X. cared more for art and literature than for war, but he, too, had his faults, and the scandal in his case was a doubt whether, after all, he really believed in Christianity. Adrian VI. was an earnest and stern moral reformer—too stern for the times—and his reign was too short to produce much result. Clement VII. was a better man than many, though of blundering politics, letting down the Papal power, and becoming at last the prisoner and the tool of his Spanish conqueror, Charles V. All this while there were men in Italy of earnest Christian feeling who, like the Oxford reformers, were men of the new school on the one hand, and opposed to the semi-pagan scepticism of the mere 'humanists' of Italy on the other hand. These men longed for reform, not only in morals but also in doctrine. They wanted religion to be made a thing of the heart, that the gross superstition connected with indulgences and other abuses should be set aside, and some of them held the Augustinian doctrine of justification by faith. This gave them a sort of sympathy even with Luther, and they wanted such a reform of the Church as they hoped would win back the Protestants into her fold. Juan de Valdez, brother of Charles V.'s secretary, . . . was one of them. Reginald Pole (who opposed Henry VIII.'s revolt from Rome so strongly) and Gaspar Contarini (a Venetian nobleman of the highest character and influence in court circles) were of their number. They had among them eloquent preachers and ladies of rank, fortune, and beauty. They held together and exerted much influence, and there was a time when they seemed to be not without chance of success as mediators between the extreme Catholic and Protestant parties. Paul III. became pope in 1534, and the hopes of the reform party were raised by his making Pole and Contarini and some others of their friends cardinals. These men were on the most friendly terms with Erasmus, who in his old age was urging concord on religious parties and purity on the Church. It was rumoured that Erasmus himself was to be made a cardinal, and it was said that a red hat was on the way to Bishop Fisher when he was executed by Henry VIII. It was some of these and other signs of the times which cheered Sir Thomas More in his prison with the belief that better days were coming, that there was at least some chance of a reconciliation with the Protestants, and a healing of the schism by which the Church was rent. The prospect was for the moment promising. Paul III. wrote to Erasmus, telling him that he intended to call a council (as Erasmus had urged his predecessors to do) and asking for his influence and help both before and in the council. But things moved slowly. Cardinal Contarini was more zealous for a council than the

Pope, who was only half-inclined to it, fearing lest it might abridge his power. At length in 1541—five years after the death of Erasmus—the Pope deputed Contarini to meet the Protestants at the Diet of Ratisbon, and to try whether a reconciliation could be arranged with them. He was met by the gentle Melancthon (Luther distrusting the whole thing and keeping away), and they agreed upon the doctrine of justification by faith as the basis of reunion. For a moment a peace seemed within reach. But alas! other motives came in on the Pope's side. Francis I. urged upon him that concord and unity in Germany would make the Emperor—their common enemy—dangerously strong; and so Paul III. drew back. On the other side, Luther scented mischief in any peace with Rome. It was too good to be true; and he even hinted that the devil was somewhere and somehow at work in it. So everything was left over for settlement at the council which now at length the Pope was to convene—the famous Council of Trent. [See also PAPACY: 1534-1540; 1537-1503.] But meanwhile another power came upon the stage which was destined to take the reins out of the hands of the Italian mediating reformers, to close the door for reconciliation for ever, and to reform what was left of the Catholic Church on the narrow basis of reaction. . . . Ignatius Loyola, a young Spanish knight of noble family, . . . had perfected his plan—a soldier's plan—to found a religious army, perfect in discipline, in every soldier of which should be absolute devotion to one end, absolute obedience to his superior, with no human ties to hinder and no objects to divert him from the service required. It was in fact to be a new monastic order, and to be called the Society of Jesus. . . . While Loyola was studying at the university he came in contact with . . . [Francis Xavier]. Xavier became a disciple of Loyola; rivalled him in austerities, and ere long became the missionary of the Society, carrying his cross, breviary and wallet to India and the Indian Isles, and even to Japan and China, till at last he laid down his life after eleven long years of heroic labour. . . . Of such stuff were the first Jesuits made—a type of human nature which, rising up as it did just then, was of immense import to the future of the Catholic Church. It was in truth a reaction from the looseness both of morals and creed which had marked the recent condition of the Church. These men were pious, earnest, and devoted to the Church, because their minds were cast in a mould which allowed them still to believe in her pretensions. They had all the piety, fervour, energy, and boldness of the Protestant Reformers, but their reform took another direction. Instead of going back to St. Augustine as their exponent of the Bible, they took . . . St. Francis and the mediæval saints as their models, and rested with absolute faith on the authority of the mediæval Church. To reform the Catholic Church to mediæval standards by the formation of a new monastic order, having for its cornerstone the absolute surrender of free enquiry and free thought, and absolute obedience to supreme ecclesiastical authority—this was the project of Loyola. It was not abortive. Before its founder died he had succeeded in founding more than a hundred Jesuit colleges or houses for training Jesuits, and an immense number of educational establishments under their influence. He had many thousands of Jesuits in the rank and file of his order. He had divided Europe, India, Africa, and Brazil into twelve Jesuit provinces, in each of which he had his Jesuit officer, whilst he, their general, residing at Rome, wielded an influence over the world rivaling, if it did not exceed in power, that

of popes and kings. Its very success was the cause of its ultimate doom. The nations of Europe, after the experience of some generations, found it to interfere with their national freedom, as they had done the old ecclesiastical empire of Rome. They ultimately banished the Jesuits because of their power and because their presence and their plots endangered the safety of the state. But as yet the Society of Jesus was young, and had its work before it. The Order received Papal sanction in 1540. . . . The Council of Trent was opened in 1545. Cardinal Contarini, who had been the pope's confidant in matters relating to the Council, died before it assembled. But Cardinal Pole, Contarini the younger, and others of the mediating party, were members of the Council. They took the same line as at Ratisbon, and urged the doctrine of justification by faith as common Christian ground. But the Jesuits in the Council, under the instructions of Loyola, opposed it with all their might. The dispute was long and hot. . . . The Jesuits prevailed, and carried the decision of the Council their own way. Pole, on the plea of ill health, had left the Council, and the younger Contarini followed his example. It was clear there was to be no reconciliation. The party of reaction had gained the day. No sooner had the party of reaction taken the lead than Cardinal Caraffa (afterwards Pope Paul IV.) obtained powers to introduce into Rome the Inquisition—that terrible tribunal of persecution which in Spain had slain and banished so many Moors, Jews, and heretics under the sanction of the zeal of Queen Isabella. Persecution began, and some of the members of the mediating party were among its first victims. This was the work of the Council of Trent at its early sessions. Then, owing to a disagreement between the Pope and Charles V., it was adjourned for some years. Paul III. died, and two succeeding popes, before it really got to work again to any purpose under Paul IV. This was in 1555, the year in which, after the long struggle between Charles V. and Germany, the peace of Augsburg was come to, by which the revolt of the Protestant princes from Rome was first legally recognised as a thing which must be. The Council of Trent had now in its later sessions to reorganise what was left of the Catholic Church. It could not, and did not try to undo the revolts. The Jesuits were the ruling power. Reaction was the order of the day. Clerical abuses were corrected, and some sort of decency enforced. Provisions were made for the education of priests and for their devotion in future to active duties. But in points of doctrine there was reaction instead of concession. The divine authority of the Pope was confirmed. The creed of the Church was laid down once for all in rigid statements, which henceforth must be swallowed by the faithful. Finally, the Inquisition, imported from Spain, was extended to other countries, and charged with the suppression of heretical doctrines. In a word, the rule of the ecclesiastical empire was strengthened, and the bonds of the scholastic system tightened; but not for Christendom—only for those nations who still acknowledged the ecclesiastical supremacy of Rome. The Church was thus both reformed and narrowed by the decrees of the Council of Trent. Henceforth it tolerated within its fold neither the old diversity of doctrine on the one hand, nor the old laxity of morals on the other hand, and henceforth it was by no means coextensive with Western Christendom, as it once had been.”—F. Seebohm, *Era of the Protestant revolution*, pp. 190-203, 205-208.—See also JESUITS; EDUCATION: Modern: 16th-17th centuries: Jesuit teaching, etc.

Summary of European thought between medi-

eval and modern times.—Influence of Francis Bacon.—Relation of the Renaissance to modern period.—“The decay of scholasticism was brought about by the changing spirit of the new age. It collapsed simply because it was hopelessly out of harmony with the fresh intellectual conditions which resulted from the movements of the Renaissance as a whole. Humanism was naturally against it, and both directly, by its opposition to Roman theology, and indirectly, by its rupture with authority, the Protestant Reformation tended to bring it into disrepute. Incidentally, it may be remarked, the Platonism which was so important an outgrowth from the revival of classical learning was regarded as a counterblast to the Aristotelianism of the mediæval thinkers, and therefore helped to break down the intellectual tyranny of the schools. But the great enemy of scholasticism was, of course, the development of natural science. This was fatal to the claims and mental habits of the old philosophers, because it liberated thought from dogma, brought the mind of man back to nature and reality, and substituted the scientific method of inquiry for the purely syllogistic processes which had hitherto been in vogue. One name stands out supreme in this great chapter in the history of the Renaissance. It is the name of Francis Bacon [1561-1626]. Due regard being had to the work which other men had done before him or were doing at the same time, Bacon may still be considered as epoch-maker and pioneer. He more than any other thinker represents the transition from mediæval to modern thought. He chiefly was instrumental in turning philosophic effort from the barren wastes of theological and metaphysical speculation into the fruitful field of physical fact. To him in the main belongs the signal honour of overthrowing the old a priorism and establishing the inductive method in its stead. In the doctrines which he promulgated concerning man's relations with nature and the proper means of finding truth, we may mark the culmination of the entire movement of the Renaissance on its purely intellectual side. . . . Fired by the splendid ambition of making knowledge at once more progressive and more practical, Bacon set out to indicate his new instrument in science. That instrument, which is explained in detail in the ‘*Novum Organum*,’ is defined by the word induction.”—W. H. Hudson, *Story of the Renaissance*, pp. 135-136, 141.—“The Renaissance was far more than a revival of letters and art, though that was its most patent manifestation. It was, ‘in the largest sense of the term, the whole process of transition in Europe from the mediæval to the modern order’ (Sir Richard Jebb). It deprived the Empire and Papacy of their pre-eminence. Their authority ceased to be international and became local and restricted. Europe resolved itself into national units, and national churches and literatures emerged. The social order of the Middle Ages also hastened to its decline; for commerce and industry placed the merchant by the side of the knight-at-arms and land-owner. And with the social decay of Feudalism went a transformation of the political conditions under which it had flourished. It began to be held that government exists primarily in the interests of the governed. The history of England in the seventeenth century exemplifies that conception in practice. Machiavelli's *The Prince* and Sir Thomas More's *Utopia* are earlier manifestations of it in theory. Enormously stimulating also were the maritime and scientific discoveries of the period. The employment of the compass and the astrolabe facilitated maritime adventure, and led to the finding of a New World across the Atlantic, and to an enormous

extension of geographical knowledge. The discovery of gunpowder revolutionised the art of war and broke up medieval society. The invention of printing widened the influence of literature and knowledge. The astronomical discovery of Copernicus, which revealed the earth to be but one of many satellites of the sun, undermined a vast structure of superstition. . . . Underlying humanism and the revived study of classical literature was a new mental attitude, which was the motive force of the Renaissance and of the revolution accomplished by it. The dead authors were read as manifestations of a habit of mind, and independent outlook on life and the universe, which were absent from medieval literature. For centuries man's intellect had been in bondage to the Church, and had exercised itself only within the formulas which clerical authority sanctioned. But in the Greek and Roman authors the humanists found a literature in which the writer expressed his thoughts freely and looked out on the world with his own eyes, a characteristic of the classics which the humanists found vastly engaging. They adopted it to view their own age, and found themselves forthwith in conflict with its religion, science, and philosophy. The Renaissance manifested itself in different ways. In Central and Northern Europe it supported the religious upheaval which we call the Reformation. In Spain and Portugal is displayed itself in maritime and geographical activity. Everywhere it transformed art, and in Italy that was its preeminent and particular work. It was natural that such should be the case; for Italy could still look upon the monuments of her ancient glory, while her language was the offspring of that which Virgil, Horace, and Cicero spoke. She possessed also, to a greater degree than elsewhere in Europe, a wealthy and leisured class, able to devote itself and its means to the cause of art and letters. In particular, the Medici of Florence were generous patrons of humanism, and Popes, such as Leo X, the friend of Raffaele, supported a movement whose sinister influence on the Church they could not foresee."—C. S. Terry, *Short history of Europe*, pp. 2-4.

#### MODERN

Expansion of Europe.—Introductory résumé. —Effects of the era of discovery.—World commerce, world finance, world politics and wars. —"Europe today is no more than a portion of the 'European world.' The earth, almost in its entirety, is European in outlook, spirit and accomplishment. . . . The vast field of action which the European had made his own comprises two distinct areas: one inhabited by aboriginal folk having little or no civilization at all comparable with that of Europe, and the other occupied by certain peoples of Asia who had attained much earlier than the Europeans themselves a degree of civilization not only comparable with, but in some respects quite superior to, that which had been evolved in Europe. It is the expansion of Europe which has brought face to face the two great centres of culture that for many a century had looked in opposite directions. East and West have thus been joined in close and intimate contact with extraordinary results for both. The expansion of Europe may be summarized to mean simply, that Europe has borne its civilization to other parts of the world, and has brought back a variety of things that have altered its life and thought at home. Out of the New Worlds in the West and East the achievements of the European have brought forth a New Europe that has continued to speak the languages and cherish the traditions and customs of the

former home, that has sought to be freer, richer, more tolerant, less tied to ancient prejudices, more open to progress, and that has served accordingly to influence Old Europe in every phase of its existence. New things have been found, new forms of society created, new kinds of industry devised, new fields of commerce opened up, new opportunities for financial operations discovered, new ideas and new departments of knowledge made manifest and new concepts of national and international welfare evolved, all of which could not fail profoundly to affect Europe itself. Ancient civilizations aroused and energized, primitive beliefs and practices cast into modern moulds by the impact of the European, have yielded to him in return many a treasure, material and mental, by which his life and thought have become vastly enriched and diversified. From all that expansion has evoked in spirit and attainment—the zest of enterprise, eagerness for adventure, fame, wealth, new scenes and new homes, new places on the earth where a greater comfort and happiness might be assured, the introduction of the unknown and an increased use of the known—from its contact, in a word, with new lands, and new peoples in America, Asia, Africa and the isles of the sea, Europe has derived new impulses and new developments. With regard to the effects of expansion on the character and conditions of industry in Europe, while it may readily be granted that the products of lands and peoples overseas have served to widen the range of European manufactures and their employment in various arts and trades and, also, to call forth a higher degree of aptitude, skill and ingenuity on the part of European labor, these results in numerous cases have been dependent upon the possession at home of certain natural resources, such as coal and iron. This brings up the subject of the transcendent industrial changes that have taken place in Europe since the middle of the eighteenth century. The migration of Europeans who had opened up ocean highways to the uttermost parts of the earth has been followed by an industrial revolution in Europe, assuring the application on an enormous scale of resources long since available there but never used to the full extent of their potentiality. No one, probably, would deny that what is called the Commercial Revolution had a certain amount of influence on what may well be regarded as supplying the turning-point from 'modern' to 'contemporaneous' history. The real crux of the matter is, how far and in what respects the Industrial Revolution was the consequence of forces originating beyond the bounds of Europe, set in motion by Europeans and reacting upon Europe itself. . . . Another important feature of the transformation that has thus come about is the physical change in the centres of European commercial importance and the shift in location of the formative power wielded by trade over human affairs. From countries bordering the Mediterranean and the Baltic, which in medieval times enjoyed a practically absolute control of waterborne traffic, the dominance, vastly magnified, has passed westward to lands that face directly on the Atlantic or its immediate backwaters. It was not much before the nineteenth century that the ultimate effects of overseas trade became very distinctly perceptible. Indeed, it is only since the beginning of the age of steam navigation, at a time when European dependencies ranged well round the world, when new European nations had arisen out of vast regions once tenanted by savage or barbarous peoples, when the ancient civilizations of the Orient had been rendered thoroughly accessible to European traffic and when almost every portion of the earth had been brought into a regularity of com-

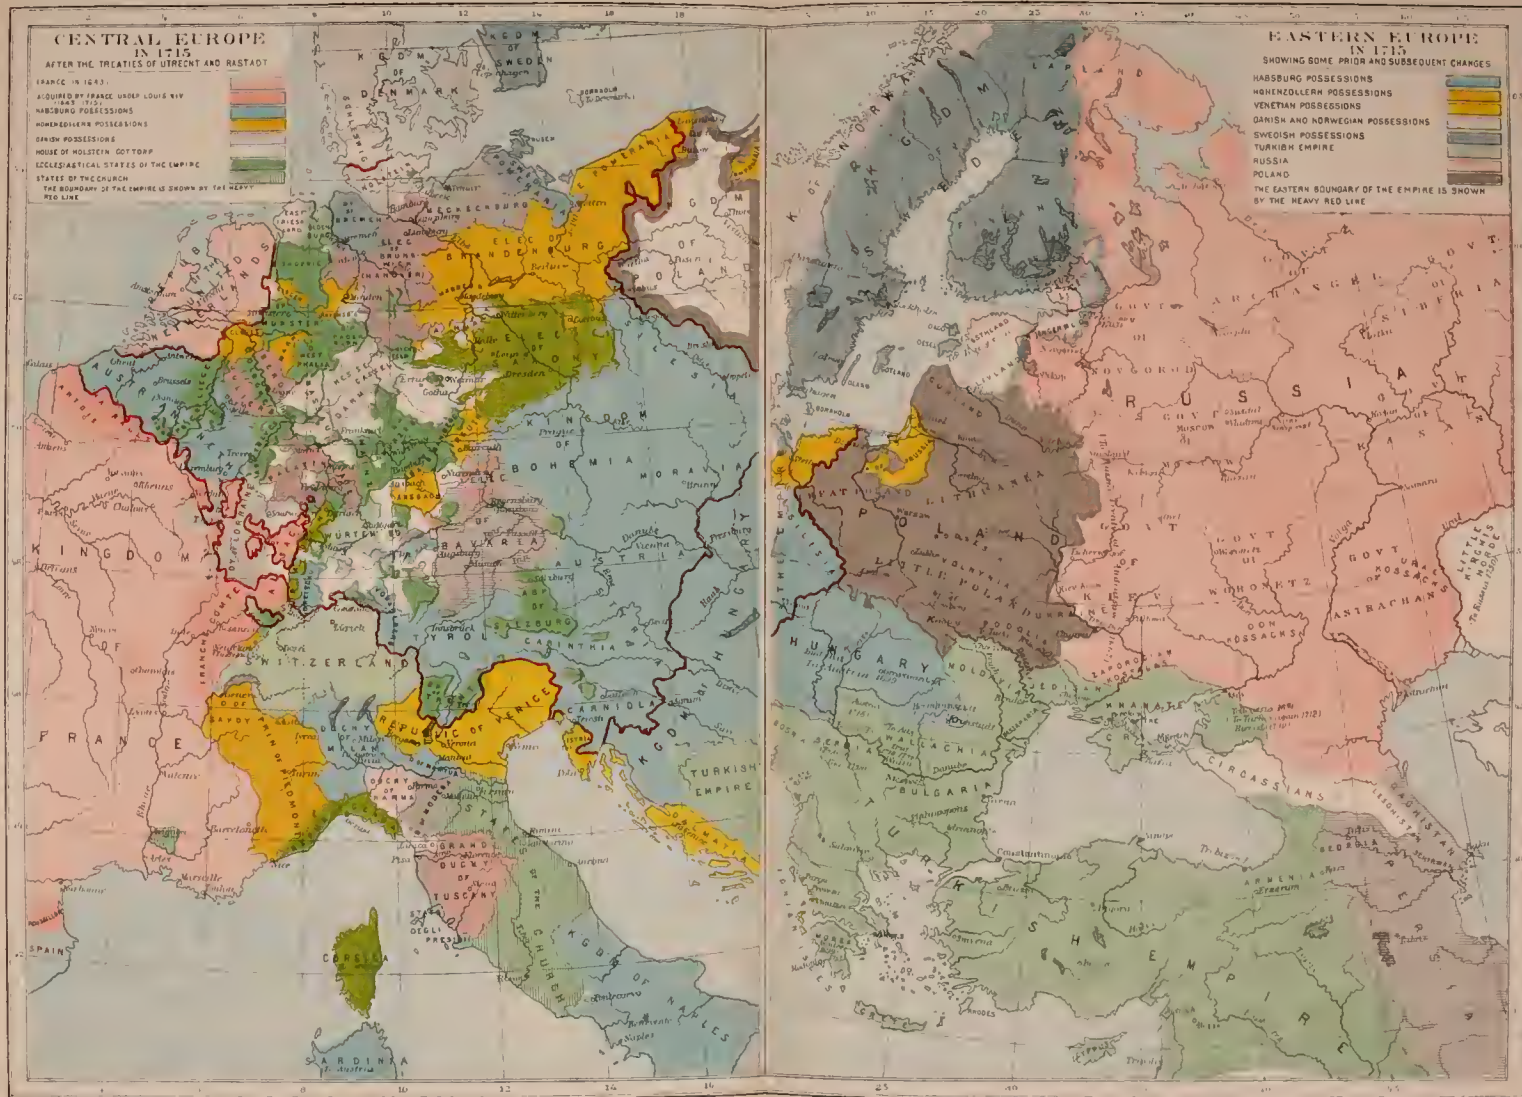

mercial intercourse, that the eventual consequences of the discovery which took place in the late fifteenth century have been made altogether apparent. Another great transformation in European conditions is that which has been accomplished by the financial revolution resulting from access to mines of the precious metals in lands beyond the sea. Emerging slowly at first and operating for some time in hardly perceptible fashion, it has come to alter profoundly the entire structure of economic life on the continent of Europe. But, as in the case of its fellow in the commercial field, its antecedent relation to the Industrial Revolution stands in need of a much fuller investigation than has been accorded it thus far. . . . From the sixteenth century onward, treasure found in America, Africa and Australia has served not only to replenish, but to fill to overflowing, the coffers of a medieval Europe which had been depleted by the withdrawal from circulation of masses of the precious metals and their conversion into ecclesiastical vessels and vestments, by the hoarding of them in cellars of manor-houses and in the carefully hidden strong-boxes of money-lenders and by exportation to an Orient that was accustomed to sell much and buy little. How great the actual amount has been will never be determined with anything like absolute certainty; but whatever it may have been, the fact in itself has far less importance than the actual effects upon the monetary situation. The consequences of the influx of the precious metals into Europe may be examined from numerous points of view. What had been largely a barter economy, for example, has been replaced by a money economy, upsetting completely the relations earlier existent between money and commodities. The financial revolution, moreover, has brought on tremendous fluctuations in the value of money and hence in prices, along with an inevitable disarrangement of the pecuniary standards of living. As in the case of the commercial revolution, the advantages or disadvantages of the process have accrued mainly to the countries of western Europe that have engaged most actively in the work of expansion. The power of the purse, wielded in medieval times by the lands of central Europe, has passed westward to those along the Atlantic seaboard. In consequence of their achievements overseas, it is they that have erected great stock exchanges and banks, that have received the strongest incentives to speculation, that have been afforded the most abundant opportunities for taxation. It is the nations of western Europe, also, that have been most enabled to spend vast sums for dynastic or national purposes, to equip huge armies and fleets, to construct magnificent buildings, to reward the genius of the artist and with their enormous wealth to do in general many things that the limited means of the period before the age of expansion had not permitted. They have had, it is true, to bear the burdens of dependencies which yield more deficits than revenues; but what they have gained in other respects makes the loss quite endurable. The origin of most of the international struggles that have arisen since the sixteenth century may be attributed in greater or less degree to questions concerned with interests on the sea and overseas. Unwillingness to permit any nation to dominate the common highway of mankind, commercial and colonial rivalry, resentment over an inequitable distribution of territorial dependencies and of opportunities for access on equal terms to world markets, the desire to possess extra-European sources of wealth or strength in general—all have lain at the root of these struggles. Sentiments or motives of this sort have prevented the establishment of an effective system of

international supervision and control over them, which might make cooperation rather than competition, the principle of belief and practice. The so-called 'double wars,' i. e., wars at once European and extra-European in their field of action, which have involved the successive elimination of national competitors until one alone should arise supreme on the seas and overseas and determine the balance of power for the continent, have had as a powerful cause the collision of interest provoked by expansion. European revolutions accordingly, have become world revolutions, and European conflicts have had to widen their scope over the earth. The expansion of Europe has created world politics with all the ensuing consequences for good and evil to Europe itself. Even the common opinion entertained by one European people about another has often been formed as a result of what has been done by either or both of them in activities overseas."—W. R. Shepherd, *Expansion of Europe (Political Science Quarterly, Mar., 1919, pp. 44-45, June, 1919, pp. 213-214, 219-222, Sept., 1919, pp. 406-407)*.—"The expansion of Europe began four hundred years ago with Columbus and Vasco da Gama, and before the end of the eighteenth century North and South America were already committed to the domination of peoples of European stock, the British were masters of a large part of India, and the Russian Empire reached a long arm across Siberia to the Pacific. . . . The question of expansion takes us beyond the geographical bounds of Europe, but we may warrantably consider it in its reaction on the parent continent. The conflict between expanding empires has been a familiar danger for ages. Even in modern times it is a common observation that the series of wars between France and England, the second Hundred Years' War as Seeley called it, from 1689 to 1815, became a duel for empire with mastery in America and India as the prize of the victor. The wars of 1854-6 and 1877-8 were due to Russia's expansion towards Constantinople; the nervous tension between Russia and Britain during the latter half of the nineteenth century was due to anticipated conflict in Asia; the war between Russia and Japan in 1904-5 was directly due to expansion and collision; and the series of crises that culminated in the outbreak of war in 1914 largely turned on rival ambitions and jealousies in the Balkans, Asia and North Africa. At the opening of the twentieth century peoples of European stock so largely controlled the rest of the world that further expansion almost inevitably meant war. The British flag flew over all of Australia, all of India, half of North America, a large part of south and central Africa, and islands and coasts beyond number. France was the mistress of Madagascar, Siam, and a huge dependency in north-west Africa. . . . Russia dominated north and central Asia."—C. F. Lavell, *Reconstruction and national life, pp. 1, 9-10*.—"Enterprise on the oceans and in distant lands has imparted an increased and far more general stimulus to all national concerns than had ever existed before. It has imbued national consciousness with tremendous vitality, encouraging it to broaden out into a spirit of imperialism which knows no bounds. It has created or strengthened antipathies among nations. Maritime and colonial ventures, the contact growing ever more intimate with non-European lands and peoples, have been of incalculable value for political purposes. As ambitions have been successively fostered by new acquisitions, the greater has become the desire for still more power."—W. R. Shepherd, *Expansion of Europe (Political Science Quarterly, Sept., 1919, p. 407)*.—See COMMERCE: Era of geographical expansion.

Rise of the nation-state in European polity.—Genesis of modern diplomacy.—Conception of international politics as the dealings of "Powers."—Attribution of personality to a power.—"England, . . . stood from the first outside the unified and unifying influence which, throughout the Middle Ages, moulded the life and decided the destinies of her continental neighbours. To this, among other reasons, must be attributed the 'precocious sense' of national identity and national unity which, in the view of foreign commentators upon English institutions, was the most characteristic and differentiating feature of medieval England. The people of this country attained nationhood at least three centuries before the people of any other country in western Europe. But as it takes two people to make a quarrel, so it seems to demand at least two nations to render possible an 'international' system. So long as the Empire and the Papacy retained any real political effectiveness the modern States-system could be nothing more than embryonic. By the end of the fifteenth century, however, the principle of Nationality was making rapid progress in two at least of the great States of Western Europe, France and Spain. In France unity was gradually achieved through the convergent operation of various forces. First and most important was the growing strength of the Crown. The monarchy made France. Out of a loosely-compacted bundle of feudal duchies and counties the Crown created a compact, coherent, and centralized State. The Crown was powerfully assisted in the completion of its task on the one hand by its alliance with the Church; on the other, by the development of a system of law and of legal procedure based upon the Justinian code. Of that legal system the Parliament of Paris was the focus and centre, and it would be difficult to over-estimate the part played in the unification of France by this great judicial institution. Hardly less important, in the long run, was the prolonged contest with England, known as the 'Hundred Years' War.' That war inflicted upon France indescribable sufferings, but by the time it was ended France was all but made. The contest with Charles the Bold of Burgundy continued and almost completed the process after the victory of Louis XI. Brittany alone of all the great duchies of medieval France remained independent, and in 1491, by the marriage of the young Duchess Anne with Charles VIII of France, Brittany was absorbed into the kingdom. At last France was able to take its place in the European polity as a Nation-State. If medieval France was a bundle of feudal duchies and counties, medieval Spain was a congeries of kingdoms. What the Hundred Years' War did for France was done for Spain by the secular crusade against the Moors. The gradual absorption of the smaller kingdoms by the monarchies of Aragon and Castile, the marriage of Ferdinand of Aragon with Isabella of Castile, the final expulsion of the Moors, and the conquest of Granada practically completed the consolidation of the peninsula, and in 1516 Charles I (afterwards the Emperor Charles V) succeeded to a united Crown. The unification—substantially simultaneous—of the French and Spanish kingdoms announced to Europe the passing of the centralized system of the Middle Ages, and the advent of a new era, distinguished by the emergence of a number of Nation-States, and by the recognition of their complete independence. The new era dawned at the end of the fifteenth or the beginning of the sixteenth century; the process was not completed until nearly the end of the nineteenth. Not until the decade 1870-80 was continental Europe exhaustively parcelled out among independent

States, based for the most part upon the recognition of the national idea. France, Spain, and the United Provinces emerged as Nation-States in the course of the sixteenth century; modern 'Austria' came to the birth with the virtual death of the medieval Empire at the Treaty of Westphalia (1648); a unified and self-conscious Russia was brought into being by the genius of Peter the Great, early in the eighteenth century; the birth of Prussia, due to the industry and persistence of the Hohenzollern Electors of Brandenburg, was almost coincident with that of Russia. But the rapid multiplication of Nation-States came only with the nineteenth century. Belgium as a Nation-State dates from 1830; Greece from the same time; while the Balkan States, Roumania, Serbia, Bulgaria, and Montenegro, gradually re-emerged from the superimposed dominion of the Ottoman Empire between 1850 and 1878. From the same period must be dated the birth of still greater Nation-States. The Italian *Risorgimento*, originating, as Mazzini admitted, in the Napoleonic occupation, stimulated by the sporadic revolutions of 1848, helped on, a further stage, by the calculating intervention of Napoleon III in 1859, brought near to fruition by the wise statesmanship and adroit diplomacy of Cavour and Victor Emmanuel, finally attained its zenith in 1870-1. In the same year, Bismarck, with the help of Roon and Moltke, completed the fabric of a united Germany.

"This catalogic summary may suffice to suggest that the European polity, regarded as a congeries of independent Nation-States, is the resultant of an evolutionary process of relatively recent date. Nor has the process escaped serious criticism directed against it from widely divergent standpoints. . . . In this new order of things modern diplomacy had its genesis. In the Middle Ages there had been much coming and going of special envoys on special missions, but a permanent embassy in a foreign State—apart, of course, from the Legatine system of the Papacy—was a thing unknown to medieval Europe; only gradually was the diplomatic system, as we know it, defined and elaborated. Hardly, however, had the old landmarks disappeared and the new States-system begun to emerge, before men set themselves to devise a new machinery for the regulation of international intercourse. Throughout the greater part of the sixteenth century Habsburg and Valois strove in internecine rivalry. Borrowing an idea familiar to medieval Italy, a distracted Europe sought more satisfactory and permanent solutions than that afforded by the balance of power."—J. A. R. Marriott, *European commonwealth*, pp. 27-30, 32.—Statesmen of the seventeenth century and after thought they had found this solution in the balance of power by the "powers," as opposed to a balance of power of monarchs. "Beneath the sway of the grand monarchs, a complex of notions and traditions was being woven as a net is woven, to catch and entangle men's minds, the conception of international politics not as a matter of dealings between princes, but as a matter of dealings between a kind of immortal Beings, the Powers. But what remained much more steadfast were the secretariats of the foreign ministries and the ideas of people who wrote of state concerns. So we find that the prince gradually became less important in men's minds than the 'power' of which he was the head. We begin to read less and less of the schemes and ambitions of King This or That, and more of the 'Designs of France' or the 'Ambitions of Prussia.' In an age when religious faith was declining, we find men displaying a new and vivid belief in the reality of these personifications. These vast vague phan-

toms, the 'powers,' crept insensibly into European political thought, until in the later eighteenth and in the nineteenth centuries they dominated it entirely. To this day they dominate it. In practical reality Europe . . . has given herself up altogether to the worship of this strange state mythology. To these sovereign deities, to the unity of 'Italy,' to the hegemony of 'Prussia,' to the glory of 'France,' and the destinies of 'Russia,' she has sacrificed many generations of possible unity, peace, and prosperity and the lives of millions of men."—H. G. Wells, *Outline of History*, v. 2, pp. 243, 244.

**Rise of the middle classes.—Supremacy of the first and second estates in the Middle Ages.—Effect of the Renaissance on the third estate.—Appearance of a wealthy merchant class at the beginning of modern times.—Political power of middle class.—French Revolution in the eighteenth century.—**A modern writer separates medieval society into three divisions: the prayers, the fighters, the workers—in other words the church, the nobles and the serfs. Each of these divisions was supposed to work for the good of all; the fighting men to keep the public peace; the workers to provide for the welfare of all; while the church looked after the spiritual needs of the whole people. Shortly the militant arm of the feudal system became of much greater importance than the workers. The church, while it stood apart, also became essentially part of the feudal system by reason of its great possessions and, at the same time the clergy, as possessors and guardians of all the learning of the time, assumed an immense amount of political importance in addition to the ascendancy given to them by their spiritual authority and the supernatural powers ascribed to them. Thus the learned and the powerful held the highest place, while the dull, plodding boers, who tilled the land, were held down by the superincumbent weight of those above them. Such a state of things was almost inevitable. "There was danger always and everywhere. If rival nobles were not fighting one another, there were foreign invaders of some kind devastating the country, bent on robbing, maltreating and enslaving the people whom they found in towns and villages and monasteries."—J. H. Robinson, *Medieval and modern times*, p. 92.—For these people there was no escape save under the protection of some powerful noble whether of the church or a layman, who would fight his battles, and whom in return he would pay with all he had—the produce of his farm, or the labor of his hands. "Feudalism is marked by the rendering of certain personal services where the modern world makes money payments. The Middle Ages were without a sufficient supply of coined money. . . . There was little capital in the Middle Ages, and when capital began to be a force it was always hostile to feudalism. . . . The unit and base of feudal society was everywhere the landed estate. . . . In the Middle Ages ownership of land gave most of the rights which we associate with sovereignty. The feudal lord could tax those who lived on his land; he could try them in his courts. Without the sovereignty of the landowner over his dependents feudalism could not have existed. . . . The serfs were the largest and most important class of those who worked upon the land, though free labourers were not unknown. It is difficult to generalize about the serf's condition, for it varied from time to time and from place to place. In one respect the serf was superior to the modern wage earner. He had security of tenure. Custom rather than law forbade the feudal noble to deprive him

of his cabin and the land which belonged to it, and the principle of heredity, which was so general in the Middle Ages, assured the descent of the serf's property from father to son. The serf must often have had a life of security and some comfort; but he could never escape from complete dependence upon his lord. At every turn he had to contribute to the well-being of his master. . . . Further, for any quarrel with his fellows or any dispute with his master, he had to appear in his master's court, there to be tried according to the forms laid down by custom, and to pay the fees demanded."—A. J. Grant, *History of Europe*, pp. 337-339.—In most of the European countries this third class had but little power of political expression, or possibility of self-government. There were exceptions of course, and some of these found their way upward through the church to honor and power. By the twelfth century, this impasse in which feudal society had been held began to break. 'One blow after another was leveled at feudalism. "The increased use of money in the twelfth and thirteenth centuries, which came with the awakening trade and industry, tended to break up the manor. The old habit of trading one thing for another without the intervention of money began to disappear. As time went on, neither the lord nor the serf was satisfied with the old system, which had answered well enough in the time of Charlemagne. The serfs, on the one hand, began to obtain money by the sale of their products in the markets of neighboring towns. They finally found it more profitable to pay the lord a certain sum instead of working for him, for they could then turn their whole attention to their own farms. The landlords, on the other hand, found it to their advantage to accept money in place of the services of their tenants. With this money the landlord could hire laborers to cultivate his fields and could buy the luxuries which were brought to his notice as commerce increased. So it came about that the lords gradually gave up their control over the peasants, and there was no longer very much difference between the serf and the freeman who paid a regular rent for his land. A serf might also gain his liberty by running away from his manor to a town. If he remained undiscovered, or was unclaimed by his lord, for a year and a day, he became a freeman."—J. H. Robinson, *Medieval and modern times*, p. 102.

With the breaking up of the political power of the feudal system, and the appearance of a well defined artisan class, the third estate began to hold up its head. With the introduction of printing, knowledge became more generally diffused, and ceased to be a monopoly of the clergy; wealth became more general; the merchant class began to rise, chiefly from the artisan class, and thus the great middle class came into being. "This Middle Class evolved. It was no sudden creation. At first the employer worked with his men, mixing with them daily, hardly distinguishable from them in his circumstances. The progress of industry and commerce, however, brought a more complex, a more highly organized industrial system; and as the change took place, the gulf between employer and employed widened, till at length they had little or nothing in common beyond the contract between them. . . . The growing wealth of the merchant quickly found an outlet in a flood of secondary wants, which tended ever to grow with the means of gratifying them. They were not, as with the noble, war and the chase. . . . His faculties were devoted to commerce. Its pursuit filled his mind; and one of his chief pleasures came to be the market, as the noble's had come to be the hunting-

field, with the additional advantage that that species of recreation tended to increase instead of scattering his wealth. The merchant also yielded to the desire for display; although that desire was strictly subordinated to his commercial interests. He built for himself a great house, and filled it with servants, and articles of use or ornament drawn from all quarters of the globe. The hospitality of the noble in the country found a counterpart in the banquets of the city. The gorgeous apparel of the court was rivalled by the extravagant and costly dress of the merchant's wife and household. . . . The rise of a middle class possessing wealth, and seeking gratification from it, led to progress in the arts and sciences. As their ships carried back reports from all quarters of the globe, and brought to the knowledge of the people the habits and traditions, the ideas and achievements of other nations, so this new stimulus to thought brought into existence a class of writers and thinkers who built up between them a literature in which was reflected every side of human character and experience. Thought provokes thought; and the exercise of the mental faculties brings to them additional power and strength. The towns were further distinguished from the country by this new mental life; and in the less martial times, the Court of the Sovereign became as famous for the luxurious fancies of its poets, as for the valour and pride of its knights. The pen, however, proved itself in the long run more powerful than the sword."—A. Hook, *Humanity and its problems*, pp. 181-184.—From this new middle class have come the larger number of the great thinkers to whom we owe not only almost all the new learning of the Renaissance, but also the beginning of the new science of modern times. In time, the middle class became of immense political importance. In the city republics of Italy, and the city states of Germany, it reached supreme power, and created a new aristocracy. In France, it produced the nobility of the robe. In the Netherlands, the sturdy burghers withstood the power of Spain. In England, where the middle class was partly rural under the influence of religion, combined with love of freedom, it crossed the Atlantic to found a new nation; at home it overthrew the monarchy, brought it back again, and finally changed the dynasty. Unhappily this newer class simply added its weight to still further crush down the unhappy workers, who were held to have no political powers, or power of judgment, and therefore no political rights, to education, or to any of the comforts or pleasures of life. It was not until the eighteenth and nineteenth centuries, after the widening circles of the Renaissance had reached their farthest point, and a new spirit of humanity was born, that any concerted effort was made to raise the great mass of humanity. Even in the eighteenth century the fate of the peasantry was pitiful in the extreme. In France, a centralized power, under an incompetent king, with a greedy and impoverished aristocracy, and a church whose bishops were self-seeking if not immoral, the oppression of the third estate was a potent factor in producing the excesses of the Revolution.—See also **ESTATES, Three; FEUDALISM: Organization; FRANCE: 1787-1789; 1789 (May); (June): Survey of France on eve of revolution: Condition of the people; LABOR REMUNERATION: Development of wage system; SERFDOM: 11th-17th centuries, and after; SUFFRAGE, MANHOOD: 1300-1600.**

**Birth of the scientific spirit.—Its far reaching influence on the modern world.—Resulting contributions made to civilization.—Advancement**

**over the Greek period.**—"Upon the industrial side, it is impossible, I think, to exaggerate the influence of travel, exploration and new commerce which fostered a romantic sense of adventure into novelty; loosened the hold of traditional beliefs; created a lively sense of new worlds to be investigated and subdued; produced new methods of manufacture, commerce, banking and finance; and then reacted everywhere to stimulate invention, and to introduce positive observation and active experimentation into science. The Crusades, the revival of the profane learning of antiquity and even more perhaps, the contact with the advanced learning of the Mohammedans, the increase of commerce with Asia and Africa, the introduction of the lens, compass and gunpowder, the finding and opening up of North and South America—most significantly called the New World—these are some of the obvious external facts. . . . Capitalism, rapid transit, and production for exchange against money and for profit, instead of against goods and for consumption, followed. This cursory and superficial reminder of vast and complicated events may suggest the mutual interdependence of the scientific revolution and the industrial revolution. Upon the one hand, modern industry is so much applied science. No amount of desire to make money, or to enjoy new commodities, no amount of mere practical energy and enterprise, would have effected the economic transformation of the last few centuries and generations. Improvements in mathematical, physical, chemical and biological science were prerequisites. Business men through engineers of different sorts, have laid hold of the new insights gained by scientific men into the hidden energies of nature, and have turned them to account. The modern mine, factory, railway, steamship, telegraph, all of the appliances and equipment of production, and transportation, express scientific knowledge. They would continue unimpaired even if the ordinary pecuniary accompaniments of economic activity were radically altered. In short, through the intermediary of invention, Bacon's watchword that knowledge is power and his dream of continuous empire over natural forces by means of natural science have been actualized. The industrial revolution by steam and electricity is the reply to Bacon's prophecy. On the other hand, it is equally true that the needs of modern industry have been tremendous stimuli to scientific investigation. . . . These four facts, natural science, experimentation, control and progress have been inextricably bound up together. That up to the present the application of the newer methods and results has influenced the means of life rather than its ends; or, better put, that human aims have so far been affected in an accidental rather than in an intelligently directed way, signifies that so far the change has been technical rather than human and moral, that it has been economic rather than adequately social."—J. Dewey, *Reconstruction in philosophy*, pp. 38-39, 41-43.—It has many times been stated, and that by men in high authority, that modern thought, modern intellectual capacity, in no way transcend those of the Greeks; that in art, they were not only our teachers but our superiors; in literature, we have advanced little or nothing beyond them; in recasts of all our scientific discoveries may be found in their works. But "marvelous as were the achievements of the Greeks in art and literature, and ingenious as they were in new and varied combinations of ideas, they paid too little attention to the common things of the world to devise the necessary means of penetrating its mysteries. They failed to come upon the lynx-eyed lens, or other instruments of modern investigation, and thus never gained a godlike vision of the re-

mote and the minute. Their critical thought was consequently not grounded in experimental or applied science, and without that the western world was unable to advance or even long maintain their high standards of criticism."—J. H. Robinson, *Mind in the making*, p. 118.—"If we compare ourselves with the ancient Greeks or Romans or with the peoples of the Middle Ages, we shall undoubtedly find that we are superior to them in some respects, though inferior in others. The Greeks were superior to us in art and literature; the Romans in law; the Middle Ages in certain branches of art, such as architecture. On the other hand, we are much wealthier, much more learned and much more powerful than the Greeks, the Romans, or the peoples of the Middle Ages. When confronted with these differences how are we then to decide whether the world has made progress in the centuries which have passed since the days of the ancient Greeks? If we are to answer such a question, we must first decide whether it is better to be a scholar or an artist, to construct steam engines or build beautiful cathedrals, to explore Africa or to be the creator of 'Antigone.' It is, however, obvious that every man and every age believes the work accomplished by himself and his age to be the most useful and the noblest of all, and that it is impossible to prove that riches are of greater or less value than beauty, or beauty of greater or less value than science. . . . We may, however, fairly affirm that the world has progressed when we compare our epoch as a whole with ancient Greece, for we enjoy Greek art and literature; we are acquainted with her philosophy; we have adopted some of her views and political principles, while we are acquainted with other arts unknown to the Greeks, mediæval architecture, and Japanese sculpture, amongst others; we are acquainted . . . with other systems of philosophy; we practise the virtues taught by Christianity, such as love of our neighbour, charity and purity; we add to their political principles those to which the French Revolution gave birth; we possess far wider geographical and scientific knowledge; we travel by railway, we speak across space and have learned to fly. . . . The ancient civilizations knew how to hold man in check and thus prevent him from committing great and dangerous acts of folly, but at the same time they limited his power of initiation and action. Modern civilization exalted human energy by freeing it from every fetter, and has enabled it to accomplish wonders, but it has at the same time removed the bonds which restrained it from committing acts of supreme folly. Our civilization will reach the zenith of glory and perfection when, by tempering the new powers it has created with the ancient wisdom it has forgotten, it succeeds in subduing the disorderly energies of men to the moderating influence of æsthetic, moral, religious and philosophical rules and principles which shall set a limit to them—a limit as wide as you will, but none the less clear and well defined."—G. Ferrero, *Europe's fateful hour*, pp. 231, 232, 233.—Thus love of our neighbor has been transferred into solicitude for the welfare of the common people, otherwise known as democracy; the true democracy which was unattainable in the slave ridden nations of Greece and Rome. Moreover, a wealth of practical inventions, such as were undreamed of in the days of Greece and Rome, not only made possible the Industrial Revolution, but also the scientific revolution which between them have bouleversed our mode of living and thinking. This change in living and thinking has been further fostered by the science of Political Economy, which was unknown both to ancient and mediæval civilization, and together with the results of the Industrial Revo-

lution have perforce brought about the turmoil of social revolution, and ideas of social readjustment which were unknown to the Greeks. The theory of evolution also, the child of exact science, could scarcely have come within the speculations of the Greeks, for whom all species were special creations, and fixed types. This theory, the discoveries which followed on it, and the sciences which surround it: anthropology, zoology, paleontology, have made an amazing difference between modern thought and the thought of old time.

Revolutionary period.—Intellectual revolution in the seventeenth century.—Bacon and Descartes.—Awakening of the critical spirit.—Foundations laid of modern chemistry, biology and philosophy.—Revolutionary critics of the eighteenth century: Voltaire, Montesquieu, Rousseau and Diderot.—"Modern history is of comparatively recent origin. The present system of society, with its industrial organization, democratic government, and scientific outlook, is a product of conditions that came into existence hardly a century ago; for in spite of Columbus, Luther, Copernicus, and Newton, the life and thought of the average person in Europe at the end of the eighteenth century were not very much different from that of his ancestors in the later Middle Ages. It is true that the mediæval system had received mighty blows at the hands of the Humanists of the Renaissance and of the Protestants of the Reformation; that the classics had received full recognition in the universities; that a system of national churches had displaced the international Catholic Church; that feudal aristocracy had given way to absolute monarchy; and that discoveries had expanded the known world. It is also true that the pioneers of science had begun to make those discoveries in physics and astronomy which were destined to reconstruct the whole intellectual horizon of Europe. But the great mass of people remained untouched by these changes; they continued to plow their fields in the same old way, to make things by hand, and to quarrel bitterly about religion. Many doubtless still believed the earth to be flat in spite of the Greeks, Columbus, and Magellan. In fact the religious wars and persecutions of the sixteenth, seventeenth, and eighteenth centuries showed mediævalism at its worst, for not only were heretics persecuted as of yore, but the Christian nations crusaded against one another. Protestants and Catholics alike, while millions of human beings were slaughtered for the 'greater glory of God' and for the special benefit of church or king. At the end of the eighteenth century there took place three great revolutions, which transformed every aspect of European society and created the world in which we now live. These movements were the Intellectual Revolution, which gave birth to new points of view in philosophy, literature, and science; the French Revolution, which proclaimed democratic principles of government; and the Industrial Revolution, which inaugurated our present economic life."—J. S. Schapiro, *Modern and contemporary European history*, pp. 1-2.

"At the opening of the seventeenth century a man of letters, of sufficient genius to be suspected by some of having written the plays of Shakespeare, directed his distinguished literary ability to the promotion and exaltation of natural science. Lord Bacon was the chief herald of that habit of scientific and critical thought which has played so novel and all-important a part in the making of the modern mind. . . . Never has there been a man better equipped with literary gifts to preach a new gospel than Francis Bacon. He spent years in devising eloquent and ingenious ways of delivering

learning from the 'discredits and disgraces' of the past, and in exhorting man to explore the realms of nature for his delight and profit. He never wearied of trumpeting forth the glories of the new knowledge which would come with the study of common things and the profitable uses to which it might be put in relieving man's estate. He impeached the medieval schoolmen for spinning out endless cobwebs of learning, remarkable for their fineness, but of no substance or spirit. He urged the learned to come out of their cells, study the creations of God, and build upon what they discovered a new and true philosophy."—J. H. Robinson, *Mind in the making*, pp. 151-152.—"With Bacon . . . (1561-1626) we are already on the very threshold of the Enlightenment [the intellectual revolution which really began in the early years of the seventeenth century], for with him the seething ferment of the Renaissance becomes clear and intelligible. But the new element is still working within the old rather than finding for itself an independent basis and creating its own form of expression. This thinker excels in boldness of conception, but has little gift for detail work. He, like his predecessors, is impelled by a soaring imagination, which gives his ideas a powerful impetus. . . . He too, has suggested more than he has worked out. So we count him as still belonging to that transitional period which ushers in the modern world."—R. C. Eucken, *Problem of human life* (tr.), pp. 336, 337.—"In his review of all the learning of his time and in his plans for its readvancement, Bacon treated nearly every phase of human endeavor, and almost without exception, he suggested methods of procedure which outstripped his own and the next following century."—J. J. Cross, *Bacon and the history of philosophy* (Columbia University Studies, *Studies in the History of Ideas*, p. 81).—Like Sir Thomas More, Bacon had ideas for the betterment of mankind which he describes in his *New Atlantis*. In this ideal commonwealth there was to be an academy of science, with elaborate equipment by means of which scholars could search out the secrets of nature. "Bacon is a philosopher of progress, he speaks of the increases which science can receive; of the dignity which science had lost, and which she recovers little by little. . . . Bacon wishes to renew all the sciences and take them out of the lamentable state in which he judged them to be. 'It is necessary to recommence all the work of humanity, having recourse to means more real than those which had hitherto been employed. It is necessary to undertake an entire restoration of the arts, sciences, in a word, of all human knowledge and cause them to rise on new foundations.'"—J. Delville, *L'Histoire de l'idée de progrès*, p. 164.—"He begins his work with a trenchant criticism, and a complete break with historical tradition. He finds the existing state of science utterly and wholly unsatisfactory, since it gives us neither the knowledge of things, nor the power to control them. . . . Once we thought tradition the mouthpiece of transcendent reason, but now we begin to doubt whether she really does hand down only the best achievements of the past. . . . We must, therefore free ourselves from all traditional authority, and begin our work all over again. Here we have a complete change in the attitude toward history; from a blind reverence of the past, we swim round into a blind rejection of it, and to an exclusive appreciation of the present. . . . With Bacon scientific enquiry does not stop short at mere knowing, but seeks to gain a technical control over nature; the real and true goal of the sciences is nothing less than the enrichment of human life by the introduction of new inventions and resources. . . .

How one single invention can alter the whole course of life is shown by the discovery of printing, gunpowder and the compass."—R. C. Eucken, *Problem of human life* (tr.), pp. 337, 340.—"Bacon showed a true insight into the needs and prospects of natural science, and his eloquent announcement of them was found inspiring in the next generation by Robert Boyle, the 'father of chemistry.' . . . The age of Bacon was one of great progress in the natural sciences [but Bacon himself made no great practical contribution to science] and was not very ready to welcome the contributions made by others. Of his countryman William Gilbert (1540-1603), the founder of the sciences of electricity and magnetism he speaks more often with contempt than approbation; and he ignored the great discovery of the true nature of the circulation of the blood by his own physician William Harvey (1578-1657) . . . nor did he bring himself to accept the theory . . . put forward by . . . Nicholas Copernicus in 1543 . . . the triumph of which has, more than anything else, made the medieval view of the universe seem remote and strange to us."—C. C. J. Webb, *History of philosophy*, pp. 140, 141.—"At the beginning of the seventeenth century Galileo made the capital discoveries which established both the Copernican theory and the science of dynamics. [See also ASTRONOMY: 130-1600.] Galileo's death in 1642 coincided with the birth of Sir Isaac Newton. Such is the sequence of the most influential names at the turning point of modern thought. Galileo's work . . . carried the strategic lines of Greek science across the frontiers of a New World, and Newton laid down the lines of permanent occupation and organized the conquest. [See also ELECTRICAL DISCOVERY: Early experiments; INVENTIONS: 18th century: Measurements.] The seventeenth century, with Descartes' application of algebra to geometry and Newton's and Leibnitz's invention of the differential and integral calculus, improved our methods of calculation to such a point that summary methods of vastly greater comprehensiveness and elasticity can be applied to any problem of which the elements can be measured. . . . The seventeenth century which witnessed this momentous extension of mathematical methods, also contains the cognate foundation of scientific physics. Accurate measurements began to be applied to the phenomena of light and heat, the expansion of gases, the various changes in the forms of matter apart from life."—F. S. Marvin, *Progress in history*, pp. 257, 258, 259.—"The transition from the Renaissance to the Enlightenment is neither sudden nor abrupt. In passing from the old to the new we meet many striking and interesting figures who combine the tendencies of both periods. . . . Foremost among them stands Kepler (1571-1630) in whom . . . despite his reverence for mind as the source of knowledge, there is a very clear appreciation of the value of experience and a painstaking observation of minute detail. It is the discoverer's proud boast that his respect for a difference of eight minutes of air paved the way for the reform of all astronomical science. [See also ASTRONOMY: 130-1600.] With Galileo . . . we at once breathe the air of the Enlightenment . . . a new spirit is awaking: all that is now needed is a great thinker to help it into full self-consciousness and bring life wholly under its control. Such a thinker we find in Descartes. . . .

"[Descartes uses] the ego as the basis of his world-philosophy . . . and his point is that if we are to have full confidence in our reason, there must be a God, an Absolute Reason, making our finite reason worthy of trust. . . . [This theory once settled to his own satisfaction,] Descartes does not only suc-

ceed in achieving a reform or, shall we say, a revolution in science; he inaugurates a new era in general culture. [See also MEDICAL SCIENCE: Modern: 17th century: Descartes, etc.] In the Middle Ages . . . Reason could do nothing without receiving the support and sanction of the supreme powers—tradition and authority. Now, however, there arises a culture the basis of which is man's own intuitive insight and the reason which dwells within him. [This is but the barest mention of the Cartesian philosophy and its effects. It had much influence on Descartes' contemporary and correspondent, Thomas Hobbes (1588-1679), who in his turn influenced Spinoza and Leibniz. Pierre Bayle, Spinoza, Leibniz, John Locke, these four still further added to the sum of knowledge gained in this great century and contributed largely to the world's thought. Greater tolerance gradually gained its way, a spirit of criticism was born, and accurate, scientific research was for the first time insisted upon.]—R. C. Eucken, *Problem of human life* (tr.), pp. 350, 351, 353, 354.—“With one or two exceptions—astronomy on the physical side, human anatomy on the biological—the reawakening in science lagged a century or more behind the renaissance in literature and in art. What the leaders of thought and of practice in the arts of writing, of painting and of sculpture in western Europe were effecting in the latter part of the fifteenth and throughout the sixteenth century began to be paralleled in the investigations of the physical laws of nature only at the end of the sixteenth century and throughout the first three quarters of the seventeenth. Writing broadly, we may say that, during the Stewart time, the sciences, as we now class them, were slowly but surely separating themselves out from the general mass of learning, segregating into secondary units; and, from a general amalgam of scientific knowledge, mathematics, astronomy, physics, chemistry, geology, mineralogy, zoology, botany, agriculture, even physiology (the offspring of anatomy and chemistry) were beginning to assert claims to individual and distinct existence. . . . Certain of the sciences, such as anatomy, physiology and, to a great extent, zoology and botany, had their inception in the art of medicine. But the last two owed much to the huntsman and the agriculturist. During the preceding century, the great Belgian anatomist Vesalius had broken loose from the bond of the written word which had strangled research for a thousand years, and had looked at the structure of the human body for himself; he taught what he could himself see and what he could show to his pupils. Under him, anatomy was the first of the natural sciences to break loose from the scholastic domination which had hitherto ever placed authority above experiment. As anatomy on the biological side, so astronomy on the physical, led the way. Copernicus had claimed that the sun was the centre of our system; but it was not until the following century, when the truth of his views was mathematically proved, that, first, men of science, and, later, the world at large, abandoned the views of Ptolemy, which, like those of Aristotle, of Galen and of Hippocrates, had obsessed the learned world since classical times. The great outburst of scientific enquiry which occurred during the seventeenth century was partly the result, and partly the cause, of the invention of numerous new methods and innumerable new instruments, by the use of which advance in natural knowledge was immensely facilitated. Early in the century (1614), Napier of Merchiston had made known his discovery of logarithms, and logarithmic tables were first published in 1617. Seven years later, the slide rule, which today plays a large part in physical and engineer-

ing science, was invented by Edmund Gunter. Decimals were coming into use and, at the close of the sixteenth century, algebra was being written in the notation we still employ. William Gilbert, physician to queen Elizabeth, published his experiments on electricity and magnetism in the last year of the sixteenth century. Galileo was using his newly constructed telescope; and, for the first time, Jupiter's satellites, the mountains in the moon and Saturn's rings were seen by human eye. The barometer, the thermometer and the air pump, and, later, the compound microscope, all came into being at the earlier part of our period, and by the middle of the century were in the hands of whoever cared to use them.”—*Progress of science* (*Cambridge history of English literature*, v. 3, pp. 349-350).

“The continued search for novelty, coupled with the interest in the physical world aroused by the geographical discoveries, led to the study of nature; and the results attained by Kepler, Bruno, Galileo, and later by Newton, furnished the key for the opening of the genuinely modern [critical] method of thought. This took place most fruitfully in England, France, and the Netherlands, Italy having been smothered by the Counter-Reformation, Germany crippled by the religious wars, and Spain brought to a permanent intellectual stagnation by a religious despotism. This problem of method was attacked by Bacon, Hobbes, and Descartes in the earlier years of the seventeenth century. . . . During all this time, theology had to be left as it was, or ignored altogether. Its reconstruction, as well as the development of a general social philosophy, had to be left until the consideration of the particular facts of the physical and biological sciences had proceeded so far as to warrant generalizations which could be used in cosmic and social philosophy. This did not take place until the nineteenth century, and then not in a thoroughgoing way until Darwin had made his contribution. . . . The psychology of the Middle Ages, the psychology of Hobbes, the psychology of Locke, the modern psychology which in some respects pursues the methods of the natural sciences, all have resulted from the modification of previous psychological notions by the forces of the social life. So, also, philosophy in general has had a course of development from the earliest theories of nature formulated in the Greek colonies, and of society formulated in Athens, but at every stage this development has been shaped by the nature and the society which have pressed themselves into men's consciousness. . . . The theories of Jerome and Augustine, of Anselm and Roscellin, of Descartes and Hobbes, of Voltaire and Rousseau, of Hegel and Comte [are] . . . not merely the vagaries of dreamers or geniuses, not merely theories about theories about facts, but the expression of the actual life of their times. Thought is as organically related to the whole as a factory or a legislature is, and can no more be adequately treated as an abstraction than such institutions can be so treated.”—J. D. Forrest, *Development of western civilization*, pp. 299, 302, 396.—“If conditions and ideals at the end of the eighteenth century were still largely medieval, the advanced thought of the day was distinctly modern, not only in tendency, but even in substance. It has seldom happened that great thinkers were so completely out of joint with their time as was the case with the eighteenth-century philosophers and scientists; and they began an attack on the old system which was unparalleled for audacity, virulence, and uncompromising radicalism. The leading spirit in the war against the *ancien régime* was Voltaire, the famous French philosopher, poet, and historian. His main idea

was that progress and enlightenment could come only when man exercised his reason untrammelled, and allowed his mind full play on all problems of life. Voltaire singled out the Church as the special object of his attack because she, more than any other institution, was the special conservator of tradition. Never had the Church encountered so bitter an enemy, who mocked irreverently at her most sacred mysteries, who questioned her every right and privilege, and who would be satisfied with nothing less than her complete destruction. Few men have done more to undermine the authority of the Catholic Church than Voltaire, whose weapon was a biting satire expressed with marvelous literary art. The attack on the State was led by Montesquieu and Rousseau. The former was quite moderate in his criticism of monarchy; he wished merely to see established in France the constitutional system of England, which he greatly admired. It was Rousseau who proclaimed ideas that threatened to undermine the very foundations of the old political system by questioning every reason for its existence. His famous treatise, *'The Social Contract,'* substituted the doctrine of popular sovereignty for that of divine right, and laid the theoretical basis of modern democracy. [See also FRANCE: 1789: Survey of France on eve of revolution: Literary forerunners.] The new science of Political Economy was founded by Quesnay and Turgot in France and by Adam Smith in England. People now began to think of their environment from the economic point of view, and to identify progress with material well-being; hitherto, progress had meant only religious, moral, and intellectual enlightenment. The economists bitterly attacked the iniquitous system of taxation then in vogue and the medieval regulation of commerce and industry which hindered improved production. The ideas of the philosophers and of the economists were widely spread by Diderot in his famous encyclopedia, which became the arsenal of knowledge from which were drawn the weapons to attack the old system. The period was prolific in other new sciences. Lavoisier laid the basis of modern chemistry by his successful experiments in decomposing air and water and by his analysis of combustion. [See CHEMISTRY: General: Modern period.] Lamarck's theory as to the evolution of bodily organs made him one of the founders of modern biology. Kant's philosophy enthroned moral law as the supreme governor of the universe and substituted an ethical for a religious view of the world. Lessing and Goethe completely rejected medievalism, which then so largely dominated German ideals, and replaced it by a modern outlook upon life.—J. S. Schapiro, *Modern and contemporary European history*, pp. 7-8.—See also SCIENCE: Middle Ages and Renaissance, and after.

**Era of the benevolent despots.**—"The eighteenth century has rightly been regarded as the age of enlightened despotism. In almost every quarter of Europe, from the Ural Mountains to the Lusitanian coast, from Stockholm to Naples, from Vienna to Berlin, it was possible at one time or another to admire the operations of a vigorous and progressive monarchy. In Russia there was Peter the Great, and after an interval Catherine II.; in Naples and Spain, Charles III.; in the Austrian dominations, Maria Theresa, Joseph II., and Leopold; in Prussia, Frederick the Great; in Sweden, Gustavus III. In each of these different countries the problems to be attacked, the abuses to be swept away had their own peculiar character, but one feature was common to the general malady. The evils of European society were rooted in feudalism and entrenched in privilege. It followed from this

that the power of the monarchy to cure the disease varied in direct proportion to the inability of the aristocracy to arrest its operations. Where the monarchy was absolute, where it was unfettered by the opposition of privileged corporations or estates, a campaign could be planned on a comprehensive design and pressed to a victorious and efficient conclusion. But in proportion as these conditions were unrealized, the struggle was likely to be long, arduous and perplexed. Nowhere was progress so swift and palpable as in Russia, where the Tsar united in his own person the supreme and absolute authority both in Church and State; nowhere so slow as in France, where the royal will was impeded by a powerful judicial corporation and by the great and opulent interests of a numerous and privileged aristocracy and a mundane and privileged Church."—H. A. L. Fisher, *Republican tradition in Europe*, pp. 62-63.

**Industrial revolution.**—France.—Great Britain.—Development of manufacturing.—Demands of the common people.—Manufacture of cloth and iron.—"In 1788 France was on the verge of revolution, if not of financial ruin. For a time the statesmen of rival nations congratulated themselves upon the diminished influence of this formidable power, but when the catastrophe came it proved to be so great that neighboring countries could not long escape its influence. Meanwhile, an industrial revolution had begun in Great Britain, which, ushering in an age of machinery, was destined to affect profoundly not only the struggle in France, but also the wider conflict into which that was merged. The nation which first equipped itself with the new instruments of manufacture would inevitably outrun its rivals in industrial development and the accumulation of wealth. In case of war, its larger financial resources would vastly increase its military and naval power. This became especially clear in the first decade of the nineteenth century when the French Revolution armed itself for the conquest of Europe and under the leadership of Napoleon undertook to humble Great Britain. Although the forces set in motion by these two revolutions seemed involved in a fatal conflict for mastery, their essential rôle was one of cooperation. The industrial revolution eventually furnished an economic foundation upon which the political and social principles of the French Revolution might erect the institutions of a democratic society. The development of manufacturing by machinery built up great cities, whose leaders gained an influence stronger than that of the old semi-feudal landlords or that of the more recent mercantile aristocracy. For a time society seemed simply to have exchanged masters, but in the end the new aristocracy and the old alike became responsive to the hopes and demands of the common people, who, crowded together in the cities, were conscious of their strength as well as of their rights. It was the inventions in two great industries, and in the application of power to render them effective, that gave to Great Britain at the close of the eighteenth century her extraordinary advantage over her neighbors and rivals. These industries were the manufacture of cloth, especially of cotton cloth, and the manufacture of iron."—H. E. Bourne, *Revolutionary period in Europe*, pp. 76-77.—"Slavery, a basic industrial force in Greek and Roman times, hindered the development of manufacturing industry, stifling free competition by its degraded economic standards and its wasteful methods. There was consequently a tendency in antiquity, culminating in the Roman Empire, for national consumption to exceed production. Modern nations have evaded this evil

by transforming raw materials of low intrinsic value into articles of great intrinsic worth through manufacturing processes. The peoples of Greece and Rome never developed any large-scale system of manufacture like that of the great industrial nations of to-day, because slavery was a constant obstacle. Manufacturing industry became a significant, economic activity during the later Middle Ages, when free artisans organized the craft guilds. But not until the coming of the machine and non-human motive power in modern times, did manufacturing industry attain a scale of organization commensurate with the vast commercial and agricultural activities of mankind. Indeed, the social economy of modern nations is different in this fundamental respect from that of ancient nations, for modern social organization reflects everywhere the influence of the machine. Agriculture, manufacturing industry and communication have been revolutionized, one after another, by the introduction of mechanical devices and machine power. These revolutions have been thoroughgoing and far-reaching. No intelligent understanding of modern social economy, in contrast to previous economic organization, is possible without a knowledge of these three great social revolutions of modern times. Their true significance once understood, however, it is possible to form an intelligent opinion upon problems of the contemporary social order."—F. S. Chapin, *Historical introduction to social economy, preface, p. vii.*—See also INDUSTRIAL REVOLUTION.

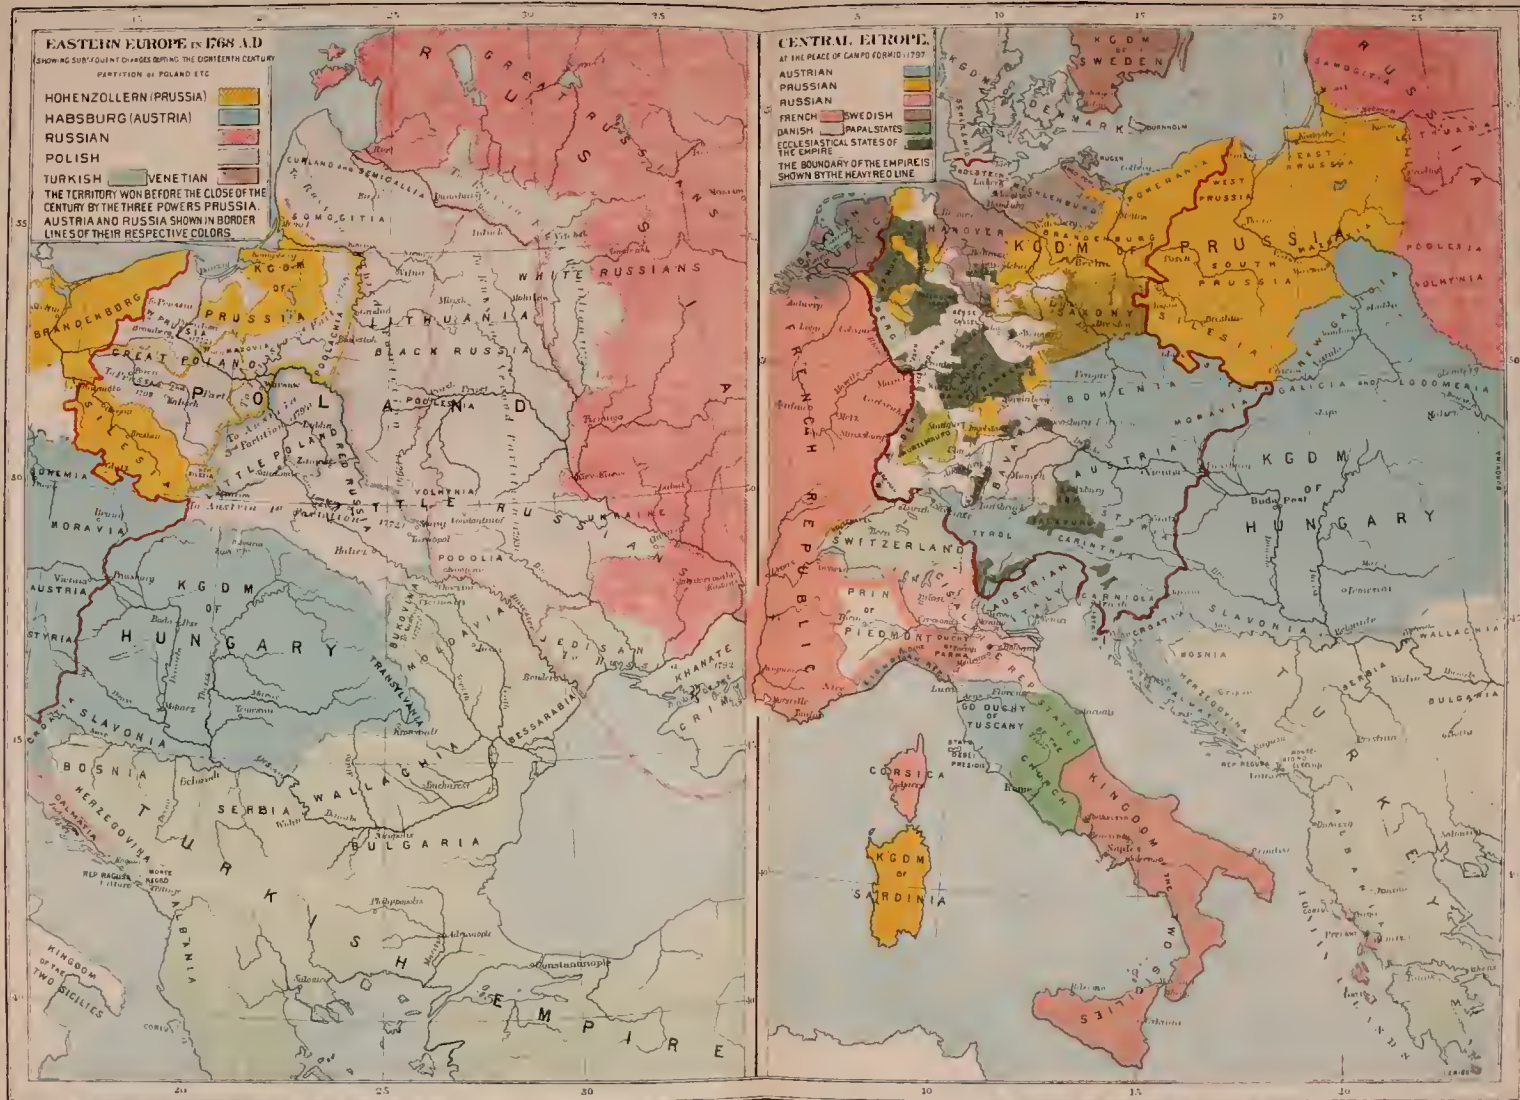

**French Revolution.—Causes of its drastic thoroughness.—Its beneficial results.**—"We are accustomed to think of the French Revolution as the beginning of that general disturbance by which the whole of Europe was swept into the maelstrom of war; but in truth, the causes of that gigantic conflict were not confined to France. [It was the outcome of awakened thought, of ideas which, at first confined to the educated classes had filtered down to the illiterate and, if it had not roused them to action, at least made them willing to follow self-appointed leaders into action.] The revolt in America, against the recrudescence of absolutism, the awakened civic consciousness in the Austrian Netherlands and in the Dutch Republic, and the reaffirmation of long forgotten privileges in France, were all symptoms of a great and irresistible movement of thought, the recoil from political dogmas which were no longer acceptable to enlightened minds. After all that Europe had endured since sovereign will had been substituted for principles of universal obligation, it was a logical necessity that the age of absolutism should be followed by the Revolutionary Era."—D. J. Hill, *History of diplomacy in the international development of Europe, v. 3, p. 680.*—It is not to France alone then that we must look for the reasons for the drastic thoroughness with which the Revolution was carried out; but to the events of all the centuries since the beginnings of the Renaissance. Wars of religion, wars of conquest, and the ambitions and passions of rulers had brought the conditions of the great body of the people to a parlous state. "It was everywhere deplorable, though varying more or less in different countries. The masses, who were peasants, were weighed down and hemmed in by laws and institutions and customs that took no account of their well-being. In one way or another they were outrageously taxed, so that but a small fraction of what they earned went for their support. Throughout most of Europe they did not possess what we regard as the mere beginnings of personal liberty, for, except in England and France, serfdom, with all its paralyzing restriction, was in force. No one dreamed that the people were en-

titled to education so that they might be better equipped for life. The great substructure of European society was an unhappy, unfree, unprotected, undeveloped mass of human beings, to whom opportunity for growth and improvement was closed on every side. . . . The distempers of every state were numerous and alarming. . . . There was a widespread feeling that revolutions, catastrophes, ruin were impending, that the body politic was nowhere in sound condition. Excessive expenditures for the maintenance of extravagant courts, . . . for armies and for wars . . . resulted in increasing disorder in the finances of the various states. Deficits were chronic, and no country except England had a budget, or public and official statement of expenditure and receipts. . . . The richer a man was the less taxes he paid proportionately. . . . Crushing therefore was the burden of the lower orders. It was truly a vicious circle."—C. D. Hazen, *French Revolution and Napoleon, pp. 46-40.*—It was not only in the realm of politics that the ferment which produced the Revolution was taking place. The seeds sown by the Renaissance and the philosophical age which followed it had flowered and fruited into a new science and new knowledge. Men had begun to think for themselves, and the literature of the time was filled with theories, some of them new and strange, which were later to be translated into terrible activity by more practical men than their authors. Bayle, Condorcet, D'Alembert, Diderot, Holbach, Montesquieu, Rousseau, Volney, Voltaire and others, preached the doctrine of reason and the overthrow of authority. Following hard upon them came the men of deeds, who with the hard broom of the Revolution swept clean the last cobwebs and fragments left by the feudal age. Europe was ripe for the eruption which took place in France, where a number of things contributed to weaken authority, a strongly centralized government, from which emanated oppression for the largest single body of people in Europe; irritating and humiliating relics of feudalism kept alive for the benefit of the irresponsible and highly favored upper classes; over-taxation of the peasantry; the return of a respectable body of this peasantry with ideas of revolution, republicanism and freedom from America, and the influence of those French writers of whom mention has been made above, who had spread throughout Europe new ideas of "how society, business, government should be readjusted, remodelled, and transformed."

"The history of the French revolution . . . began the era of new societies in Europe, as the English revolution had begun the era of new governments. This revolution not only modified the political power, but it entirely changed the internal existence of the nation. The forms of the society of the middle ages still remained. The land was divided into hostile provinces, the population into rival classes. The nobility had lost all their powers, but still retained all their distinctions: the people had no rights, royalty no limits; France was in an utter confusion of arbitrary administration, of class legislation and special privileges to special bodies. For these abuses the revolution substituted a system more conformable with justice, and better suited to our times. It substituted law in the place of arbitrary will, equality in that of privilege; delivered men from the distinctions of classes, the land from the barriers of provinces, trade from the shackles of corporations and fellowships, agriculture from feudal subjection and the oppression of tithes, property from the impediment of entails, and brought everything to the condition of one state, one system of law, one people. In order to effect such mighty reformation as this, the revolu-

tion had many obstacles to overcome, involving transient excesses with durable benefits. The privileged sought to prevent it; Europe to subject it; and thus forced into a struggle, it could not set bounds to its efforts, or moderate its victory. Resistance from within brought about the sovereignty of the multitude, and aggression from without, military domination. Yet the end was attained, in spite of anarchy and in spite of despotism; the old society was destroyed during the revolution, and the new one became established under the empire."—F. A. Mignet, *History of the French Revolution from 1789 to 1814*, pp. 1-2.—"For a time, some attempt was made to rediscover the mystic source of lawful authority in the will of the people; but as no one knew exactly where this will was to be found or how it was to be expressed or recognized, it was finally confounded and identified with the genius, the energy, the fortunes, and the victories of a single man. The Republic was, practically without intermission, governed by a dictatorship until an ex-captain of artillery . . . ascended the throne of France because he had proved that he knew how to rule and make war, and became the first champion of the new Divine Right of intelligence which was apparently imposing itself upon Europe."—G. Ferrero, *Problems of peace*, p. 18.—See also FRANCE: 1780: Survey of France on the eve of revolution, to 1790 (November).

Diffusion of French revolutionary ideas through the agency of Napoleon.—His legacy to France.—Results of the Napoleonic systems in the Piedmontese, Rhenish and Belgian departments of the empire.—Effects of the wars of Napoleon on Europe.—"The true greatness of Napoleon as a civil ruler lies in the fact, firstly that he saved for France the most valuable conquests of the French Revolution, social equality and industrial freedom; secondly that he brought to a conclusion the difficult operation of securing for the remodelled state the sanction and support of the Church, and thirdly that he gave to France a code of laws and a system of administration which remain substantially unchanged to-day. He saved equality which was a fierce national passion, and sacrificed liberty which had become a disease. The Code Napoléon, which he regarded as his main title to glory, is, so to speak, the last testament of the French Revolution. . . . Modern France is still very much as the Consulate left it. Parliamentary government has taken root, the Concordat has been denounced after an uneasy life of a hundred years, and some measure of decentralization has been effectually introduced into local government and the fabric of the University. The ideal of the lay state has become more widely held with the lapse of time, and is embodied in the scheme of compulsory secular education which the Third Republic owes to the oratory of Gambetta and the strenuous powers of Ferry. These changes, however, important though they be, have neither transformed the political spirit of France nor swept away the main blocks of Napoleonic granite, the Prefects, the Codes, the Legion of Honour, the *Lycée*. The most serious innovation is the Parliamentary system, introduced during the Hundred Days in deference to the public opinion of Paris and without faith in its merits by Napoleon himself, and accepted as the unpleasant necessity of vulgar times by the restored Bourbons. . . . It was part of the singular history of the Napoleonic memory that it became associated with liberal ideas in France and with national hopes in Italy and Poland. When Europe was given over to the autocrats, the faults of Napoleon were forgotten and his merits called to mind. Over and against the petty conventions

of court and caste he stood out as the supreme type of unaided human energy mounting to the highest pinnacle of fortune, and moulding the destiny of the world. It was forgotten that he had tried to manufacture a new nobility, that he had introduced privileged entails, that he had married an Austrian Archduchess, and copied the stiff ceremonials of Spain in Italy and of the *Ancien Régime* in France. In the sentiment of the common people he remained the Little Corporal sprung from nowhere, of the same humble clay as themselves, an everlasting proof that for the highest tasks of war and government it is not blue blood that is wanted, but the brain, heart, and nerve of the heroic man. So conceived the Napoleonic memory was at once a valuable safeguard against a possible reaction to the *Ancien Régime* and an important auxiliary to liberal ideas. The mischief was that this democratic and wholesome sentiment did not exhaust the content of the Imperial tradition, but was allied in it with the evil precedents of domestic tyranny and military expansion. The Second Empire was a testimony both to the living power of Napoleon's name and to the vitality of the ideas which were assumed to be associated with his system; and perhaps it is true to say that no catastrophe less complete than the Prussian War of 1870 would have been availing to exorcise the passion and lust of conquest which, having been aroused by the triumphs of the Revolution and the Empire, could not at once, as Alfred de Vigny shows us, be sent to sleep, but continued for half a century to vex and inflame the political conscience of France. Outside the frontiers of France the system of Napoleon seemed to be most firmly secured in the Piedmontese, Rhenish, and Belgian departments of the Grand Empire. Of these territories, the first became, after the cataclysm, the scene of a reaction so stupid and violent that all the good results of the French period were swept away, so that the work of liberalization had to be done over again almost from the beginning by D'Azeglio, Siccardi, and Cavour. In the Rhenish departments the seeds sown by the French Revolution were not so easily uprooted, and a numerous and prosperous peasant proprietary continued to testify to the enduring benefits conferred by twenty years of government under the French law. . . . After the storm and stress of a hundred years the inscription of the Revolution and the Empire is still clearly legible on the face of Belgian society and government. The two outstanding facts in the modern economic condition of Belgium are firstly a numerous peasant proprietary and secondly a great mass of low-paid and ill-organized labour in the towns. For each of these circumstances an explanation may probably be found in the history of those twenty years during which Belgium was an integral part of France. . . . The French violently broke up the trade guilds and corporations which were the glory of Belgium, substituting for these close and privileged groups the reign of unfettered individual competition. . . . It is usual to attach great importance to the encouragement which Napoleon gave to the idea of Polish nationality. . . . The alliance between France and Poland was a diplomatic tradition of the *Ancien Régime* and, had Napoleon never been born, a Frenchman would still have been more acceptable to a Pole than a Prussian, a Russian, or an Austrian. . . . What Napoleon did then was not to create a new sentiment of friendship, but to give to this inherent connexion of interest a certain amount of additional and palpable support by the creation of the Grand Duchy of Warsaw, to indocinate the Poles with the notion of a civilized state by the abolition of serfdom, by the introduction of

the Civil Code, and by the grant of parliamentary constitution, and finally to commend to the supporters of his dynasty the cause of Poland as a debt of honour and an article of faith. . . . It is only natural to expect that the Napoleonic influence would be specially strong in the Latin countries. . . . As all histories of modern Russia should begin with Peter the Great, so the epic of the *Risorgimento* opens with Napoleon. He made the Revolution a vital thing in Italy, and without a revolutionary party Italian unity would ever have been achieved. For a brief period all Italy was gathered under his sway, administered on French principles and ruled by French law."—H. A. L. Fisher, *Studies in history and politics*, pp. 200-209.—The French Revolution, Napoleon, his policy and his wars left ineffaceable marks on the face of Europe. The disappearance of the shadow of the Holy Roman Empire; the partial consolidation of Germany and of Italy, the increasing demand for constitutional government; the disappearance of serfdom from Germany and the rapid growth of a feeling of nationality which was fostered by the wars may be directly traced to the stirring movements of the time. "Much that Napoleon attempted beyond the ancient frontiers of France was lost by his overthrow; much however, remained. Only through a careful analysis of the progress of institutions after 1815, would it be possible to estimate the permanent influence of his efforts. . . . The statesmen of the victorious allies of 1815 thought that they had ended the Revolutionary movement. They were mistaken. . . . In the long era of peace which they secured men had time to forget that foreign domination and military despotism had been the counterpart of reform. The ideal of civil equality and social justice, which the deputies of 1789 had cherished, could now make its appeal with renewed force. The proof of its vitality is recorded in hundreds of great acts of legislation in the later years of the nineteenth century."—H. E. Bourne, *Revolutionary period in Europe*, pp. 464, 465.—See also FRANCE: 1801-1809; 1815: Influence of Napoleon.

**Summary of the chief factors of the nineteenth century.—Importance of its study.**—"No century in the whole history of the world calls for careful and scientific study more than the nineteenth, marked as it is on the one side by changes in material civilisation greater than those witnessed in any previous period, and on the other side by the three tremendous movements which we call the struggle for constitutional liberties and parliamentary government, the revival and partial triumph of nationalism, and the expansion of Europe. No previous century is so full of picturesque movement and dramatic interest as the times which witnessed the struggles for the liberation of the Christian peoples of the Balkan Peninsula from the Ottoman yoke, the attainment of freedom by the Republics of South America and by Belgium, the stirring stories of the unification of Italy and Germany, the struggles of Hungary and Poland, the Civil War in the United States, the exploration of Africa, and the growth of European dominion in Asia [all of which had a tremendous influence upon the international history of Europe]. The rapidity and vastness of the movements, the rise of the new nations and the shiftings of the 'balance of power,' the reaction upon the policy of governments of the growth of democracy and of representative institutions, the ever-increasing interdependence of politics and economics, the development of colonial enterprise as the outcome at once of victorious nationalism and of economic changes, the effect upon political organisation of the improved means

of transit and communication, and the complexity of the issues involved—all these combine to present a subject of study whose difficulty is exceeded only by its interest and value. It is admittedly a hard task, but thorough investigation of the history of Europe during these years, . . . is of the utmost importance."—P. Ashley, *Study of the nineteenth century (Transactions of the Royal Historical Society, new series, v. 20, pp. 135-136)*.

**Mechanical revolution.—Steam transport on land and sea.—Electric telegraph.—Bessemer converter.—Electric light and traction.**—"While throughout the nineteenth century the mind of Western civilization, which the Renaissance had released, gathered itself to the task of creative social and political reconstruction that still lies before it, there swept across the world a wave of universal change in human power and the material conditions of life that the first scientific efforts of that liberated mind had made possible. The prophecies of Roger Bacon began to live in reality. . . . The most obvious firstfruit was the steam-engine. The first steam-engines in the eighteenth century were pumping engines used to keep water out of the newly opened coal mines. . . . The railways . . . reduced the chief European distances to about a tenth of what they had been. They made it possible to carry out administrative work in areas ten times as great as any that had hitherto been workable under one administration. . . . The steamboat was, if anything, a little ahead of the steam-engine in its earlier phases. . . . [But] not until the middle of the century did the tonnage of steamships upon the sea begin to overhaul that of sailing-ships. After that the evolution in sea transport was rapid. . . . Concurrently with the development of steam transport upon land and sea a new and striking addition to the facilities of human intercourse arose out of the investigations of Volta, Galvani, and Faraday into various electrical phenomena. The electric telegraph came into existence in 1835. . . . These things, the steam railway and the electric telegraph, were to the popular imagination of the middle nineteenth century the most striking and revolutionary of inventions, but they were only the most conspicuous and clumsy firstfruits of a far more extensive process. . . . Far less conspicuous at first in everyday life, but finally far more important, was the extension of man's power over various structural materials. . . . The ancient world, because of its metallurgical inferiority, could not use steam. The steam engine, even the primitive pumping engine, could not develop before sheet iron was available. . . . As last as 1856 came the Bessemer process, and presently (1864) the open-hearth process, in which steel and every sort of iron could be melted, purified, and cast in a manner and upon a scale hitherto unheard of. To-day in the electric furnace one may see tons of incandescent steel swirling about like boiling milk in a saucepan. . . . Concurrently with this extension of mechanical possibilities the new science of electricity grew up. . . . Then suddenly came electric light and electric traction; and the transmutation of forces, the possibility of sending *power*, that could be changed into mechanical motion or light or heat as one chose, along a copper wire."—H. G. Wells, *Outline of history*, v. 2, pp. 385-390.—See also INDUSTRIAL REVOLUTION; INVENTIONS; ELECTRICAL DISCOVERY; STEAM NAVIGATION.

**Revolutionary movement for self-government.—Political status of Europe in 1815.—Metternich and the policy of suppression.—Causes of the secrecy of the movement.—Revolution of 1830.**—"When Europe settled down in 1815 after the revolutionary storm, absolute government of the

eighteenth-century pattern was still the rule in the great majority of states. In six states only—Britain, France, the Netherlands, Sweden-and-Norway, Poland, and Switzerland—parliamentary institutions of a more or less effective type survived (in the case of Britain) from the pre-revolutionary age, or had (in the other cases) been newly established or reorganised. But in no one of these cases did the system satisfy the ideals of the reformers. In Britain the system which had worked reasonably well in the eighteenth century no longer answered to the needs of the community, because the social transformation which was soon to extend its influence over the rest of Europe, had been at work for two generations; and its result had already been to make the old governing class no longer really representative of the nation. The Agrarian Revolution had brought the land into the possession of a greatly reduced number of owners; it had almost destroyed the once numerous class of small proprietors or 'yeomen'; it had substituted for them a greatly increased class of farmers renting their holdings from the great landlords; it had deprived the peasantry as a whole of an interest in the land they tilled, and reduced them to the rank of mere wage-earners; and between these classes there was no longer any such identity of interest as had once existed, but rather a sharp conflict. [See also AGRICULTURE: Modern: British Isles: Late 18th to early 19th centuries.] At the same time the Industrial Revolution had destroyed for ever the preponderant weight which had belonged to the agricultural classes; it had practically brought into being two classes which, as important elements in the nation, were new factors in English politics: the class of capitalist manufacturers and *entrepreneurs*, and the class of wage-earning operatives, clustered in vast numbers in the new towns of the Midlands and North. . . . The real control of local government remained in the hands of the landowning class; and that training in co-operation and in the management of public affairs in which most elements of the older England had had some share, was in effect denied to the makers of the new industrial England. Even the voluntary co-operation of associations for the safeguarding of their own interests was denied them, for the Anti-Combination Acts, inspired by the terror of secret societies to which the Revolution had given birth, forbade the establishment of trade unions or other such bodies. Manifestly, if the national unity of Britain was not to be undermined or destroyed, it had become necessary to undertake a reconstruction of the political system. But the traditional ruling class was not unnaturally blind to the necessity, was apt to see in the demands for change evidence of the existence of a dangerous revolutionary spirit, and was therefore tempted to sympathise with the reactionary elements which were at work in Europe during this age. Still, Britain possessed a parliament which, though out of touch with large elements of the nation, did effectively control the conduct of government; and Britain allowed practically free play to public discussion on political questions through the Press or otherwise. [See also SUFFRAGE, MANHOOD: British empire: 1295-1832.] In France, the restored monarchy of 1814 granted a 'Charter of Liberties' in the hope of gaining the affections of its subjects, and under this charter a parliament after the English model was established. But the representative house was elected on so narrow a franchise that there were only about 200,000 voters in the country; and its powers were regarded as existing by grant from the Crown, and were very restricted. In particular, it had no control over ministers. France continued to be governed in de-

tail by the highly organised bureaucracy taken over from Napoleon, and no element of popular control was permitted in local affairs, while the right of association was still more jealously regarded than in Britain. [See also FRANCE: 1814 (April-June) ] . . . Still, national affairs were publicly debated, and the Press was reasonably free: France, therefore, like Britain, was enviously regarded by other lands. In Sweden, an old-fashioned diet of four estates claimed legislative powers, but had no control over the executive. In Norway, when the people were in 1814 withdrawn without being consulted from the autocratic government of the king of Denmark and annexed to Sweden, they set up a very democratic legislature which the Swedish king was forced to recognise; but they were not able to control the ministers whom the Crown appointed. In Poland the Tsar Alexander I., in the first flush

PRINCE METTERNICH

of his vague liberal sentiments, set up in 1814 a semblance of a parliamentary system; but from the first it had little power, and was soon swept aside altogether. In the Swiss cantons a great variety of systems prevailed, from the rudimentary democracy of the forest cantons to the oligarchy of Bern; but the practice of Switzerland had practically no influence upon the rest of Europe. Everywhere else despotism prevailed. At first the Great Powers, whose 'august union' formed the dominating factor in the Europe of 1815, professed a mild willingness to permit the existence of self-governing institutions, provided that they were on the most modest scale. [See HOLY ALLIANCE ] . . . In Spain the leaders of the resistance against Napoleon had set up an extravagantly democratic system in 1812, but it was suppressed by the worthless King Ferdinand when he returned to his throne in 1814; nor did the ignorant and priest-ridden Spanish peasantry show any signs of regret for it. Alexander I of Russia thought himself a Liberal, but his liberal sentiments very quickly evaporated. Frederick

William III of Prussia had promised a constitution to his subjects in the excitement of 1813, but the promise was never fulfilled."—R. Muir, *National self-government*, pp. 63-66.

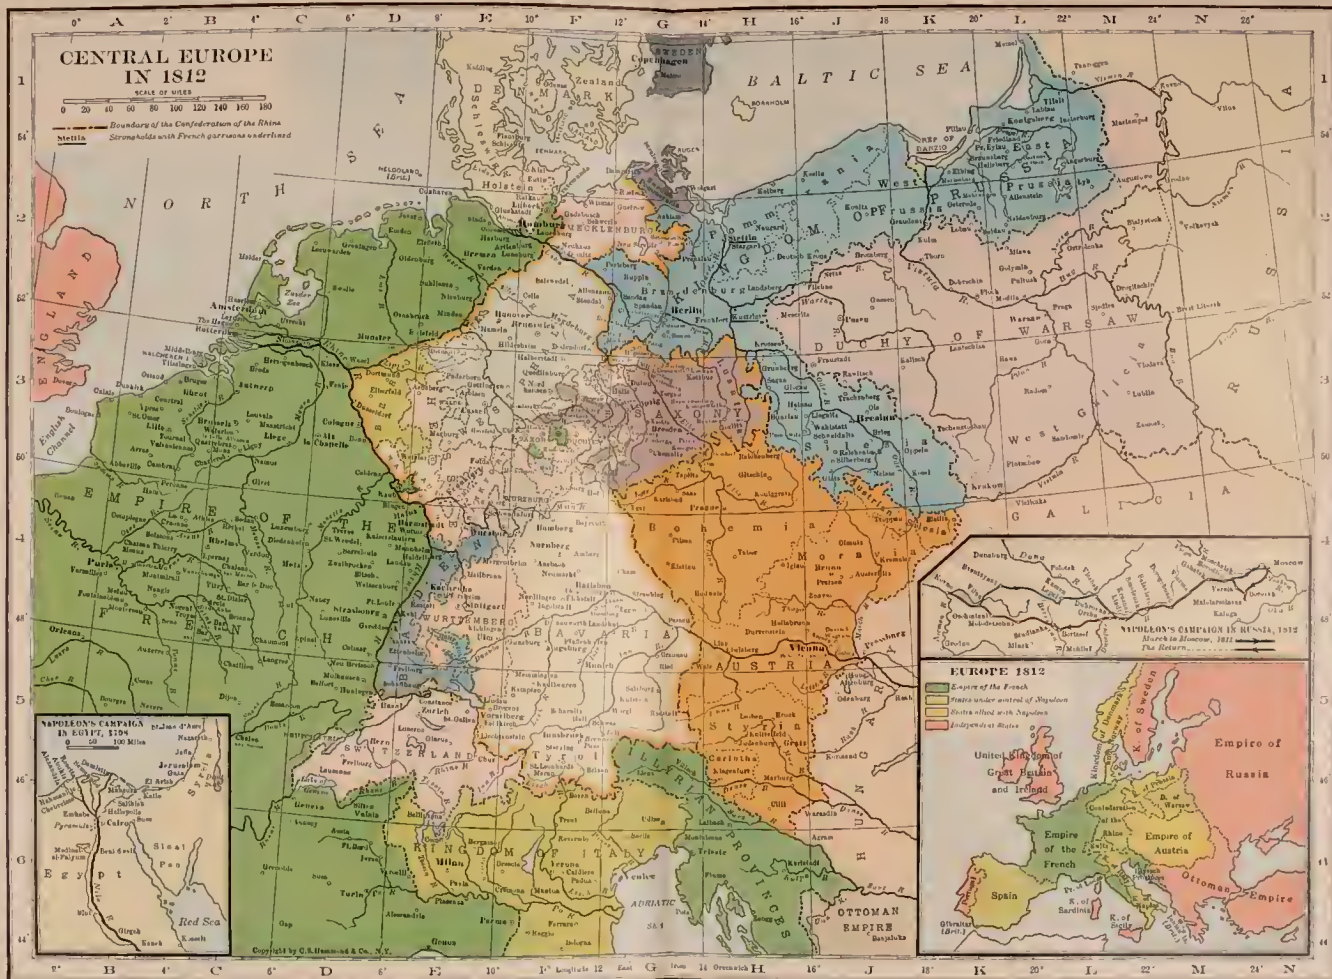

"Forty years of peace followed the treaties of Vienna. During that time the Industrial Revolution was introduced on the Continent, and the peoples of western Europe advanced rapidly in numbers, in wealth, and in political importance. The absence of wars between the great states was largely due to the influence of what was called the Grand Alliance. Originally this league was composed of the four Powers which had overthrown Napoleon (Austria, Prussia, Russia, and Great Britain). After 1818 France also was admitted to its councils. Its purpose was to maintain peace by enforcing the treaties of Vienna; but it developed into a league for suppressing Liberal ideas and upholding absolute government all over the Continent. The chief statesman of the Grand Alliance was Prince Metternich of Austria. He was a polished but cynical diplomatist who, until the middle of the nineteenth century, exercised a powerful influence in European politics. His ideas and policy were summed up, in his own words, as follows: 'The first need of society is to be maintained by strong authority, and not to govern itself. Therefore, let the governments govern, let them maintain the foundations of their institutions, both ancient and modern; for it is at all times dangerous to touch them. It certainly would not now, in the general confusion, be wise to do so.' More briefly, the essence of his policy has been declared to be, 'Do nothing, and let nothing be done,' in the way of democratic reforms or the disturbance of existing territorial arrangements. [See AUSTRIA: 1815-1835.] This was the policy which the five great Powers sought to enforce upon Europe. The means which they used were: (1) A series of congresses, held from time to time, in which the rulers or their representatives met to talk over the affairs of Europe. (2) When necessary, armed intervention was used; that is, one or more of the Powers were commissioned to interfere in the internal affairs of any state in which democratic movements threatened to disturb the peace of Europe, or to overthrow the sacred rights of legitimate sovereigns."—S. B. Harding, *New medieval and modern history*, pp. 567-568.—See also VIENNA, CONGRESS OF; AIX-LA-CHAPELLE: Congresses: 3.—"In face of these obstacles the demand for self-government, everywhere save in Britain, became a secret and underground movement. Just for that reason it was apt to assume extravagant forms, and to arouse by its mystery a vague terror among the ruling classes everywhere. . . . In most countries it drew its recruits mainly from among the professional classes. University professors and students (especially in Germany), military officers, lawyers, school-masters, and after a time the more educated artisans of the big towns, supplied its chief supporters. They were chiefly concerned in the unrest in Germany from 1810 onwards, which gave to Austria and Prussia the excuse for a rigid censorship of the Press and a close supervision of university teaching, and which persuaded the Diet of the German Confederation to prohibit the establishment of representative institutions. They brought about the revolutions of 1820-21 in Spain, Naples, and Piedmont; but these were so ill-conducted and aimed at such indefinite ends, that they would have collapsed of their own weakness even if the Powers had not intervened to suppress them. The main result of these first abortive attempts was that the Concert of Powers, with the sole exception of Britain, were brought to adopt an attitude of definite hostility

to the whole liberal movement, wherever and in whatever form it might show itself. [See also CONCERT OF POWERS: Efficacy.] . . . In 1830 a fresh and more earnest series of revolutionary movements broke out, beginning, as always, in France. They failed completely in Italy, in Germany; and in Poland, where they led only to an era of still more bitter and still more stupid reaction. But they obtained real and solid successes in Britain, in France, and in Belgium. These were, in truth, the first great victories for the cause of self-government during the nineteenth century; and in these three Western countries effective popular control over government was henceforth solidly established. There is much that is instructive in all these three revolutions, whose main result was the initiation of the experiment of middle-class rule, and it is worth while to analyse their outstanding features. In Britain alone did the change take place without overt violence, though even in Britain there was a good deal of rioting, and at more than one point during the two years' struggle for the first Reform Act it seemed almost impossible to avoid open fighting. [See also ENGLAND: 1830: Reform movement; 1830-1832.] In Belgium the establishment of a parliamentary system was the result of open rebellion against the subordination to Holland established in 1015 [see Belgium: 1830-1832]; in France it was achieved by fighting at the barricades in Paris. In Britain the main result of the revolution of 1830 was the enfranchisement of the middle class by the Reform Act of 1832. . . . The Cabinets of the mid-nineteenth century were as predominantly aristocratic in character as those of the eighteenth. But increasingly the governing ideas of national policy were coloured by the ideas of political and economic liberalism, of which the middle class was at this period the stronghold, in Britain as in other countries; and the doctrines of the middle-class prophets, Bentham and the Mills, Malthus and Ricardo, more and more determined the action of governments. The revolution of 1830 in France was less happy in its results, just because it was not supported by established tradition and habit of self-government. On the surface, indeed, the changes effected in the two countries seemed singularly alike. In France, as in Britain, the middle class now obtained political power. Moreover, as the new monarchy of the Orleanist branch held the throne (like William III. in 1688) by gift of the representatives of the nation, there could be no more talk of the parliamentary system existing by grace and by the grant of the Crown; no further claim, such as Charles X. had put forward, that the king could override the charter if in his discretion he thought fit to do so. To that extent 1830 may be said definitely to have established the sovereignty of the people in France, as 1688 established it in England. [See also FRANCE: 1815-1830.]

"The years from 1830 to 1848, which are pre-eminently the period of this underground fermentation, form one of the most fascinating periods of modern history; and it is strange that their essential features have been so little explored or discussed. For during these years, in a degree unknown in any other period, there was going on an all but universal European or cosmopolitan movement, mainly conducted in secret. Its object was the realisation of the twin ideals of Nationalism and Democracy, with which, here and there in the bigger centres of population, the new and half-formulated ideal of Socialism was beginning to be associated. . . . Inspired and encouraged by the success of the revolutions of 1830, partial and incomplete as it had been, the apostles of democracy

Maps prepared specially for the NEW LARNED  
under direction of the editors and publishers.

devoted themselves during the following years to an ardent and unceasing propaganda, the main centres of which were to be found among the revolutionary exiles gathered in Paris and London, in Brussels and Bern; for these were the only important centres where free discussion was possible. This feverish propaganda spread over the whole of Europe, and was conducted by means of secret clubs, and the dissemination of pamphlets and other literature. Everywhere it was eagerly welcomed, especially by students, and by the more educated artisans of the great cities. Governments were only half aware of its magnitude and strength, and for that reason were completely taken by surprise by the sudden unanimous upheaval of 1848 which was its consequence. The elaborate police-systems of Austria and Prussia were quite unable to combat it or even to reveal it. It penetrated even into the vast inchoate mass of the Russian people, and gave rise (in reaction against ferocious repression) to the movement of Nihilism, which took its birth during these years. There was only one European country in which this democratic agitation was allowed to proceed quite openly. This was Britain, where it took the form of the Chartist movement—an organised demand for manhood suffrage, vote by ballot and annual elections, behind which lay vague and conflicting schemes of social reorganisation."—R. Muir, *National self-government*, pp. 67-71, 73, 77-78.—See also DEMOCRACY: Tendencies of the 19th century.

Political revolution of 1848.—Causes of its apparent failure.—Significance of the movement.—Results of the revolution revealed by 1855.—Successes due to the leadership of the middle classes.—“The year 1848 brought the sudden culmination of all this long underground preparation. In February of that year the Orleanist monarchy, and the middle-class system which it represented, suddenly collapsed before the barricades of Paris, and a democratic republic based on universal suffrage was set up in its place. With amazing speed the infection spread from France into the neighbouring countries, whose soil had been so laboriously prepared. It seized possession of all the states of Germany and Italy, and produced a simultaneous upheaval among the discordant nationalities of Austria. Everywhere, in the face of an apparently unanimous public demand, the ruling governments found it impossible to offer any resistance. Everywhere parliamentary institutions, based upon universal suffrage, were set up. The whole of Metternich's reactionary system tumbled to pieces like a house of cards. In Germany not only were all the states, including Prussia, driven to consent to the establishment of democratic government, but a single parliament, elected by universal suffrage, met at Frankfort to draw up a constitution for a new united German state. But in the autumn of 1848 the reaction began. By the middle of 1850 the complete democratic triumph which had seemed within sight had everywhere become hopeless. [See GERMANY: 1848 to 1848-1850.] By 1850 the old régime seemed to be, everywhere except in France, fully restored; and in France itself the democratic republic of 1848 had by 1852 passed into the despotic Second Empire, more repressive in its policy than the middle-class monarchy of Louis Philippe, or even the restoration-monarchy of Louis XVIII., had ever been. [See FRANCE: 1842-1848 to 1851-1852.] The Austrian Empire returned to a hide-bound system of reaction yet more severe than that which had existed from 1815 to 1848. [See AUSTRIA: 1848-1850; 1840-1850.] Italy sank back again into disunion, and in every Italian state save one the old dark tyranny revived. In Germany the

deadening forms of the Confederation of 1815, which had been swept aside in 1848, were re-established, and the petty princes were left free to re-establish unqualified personal rule, and in most cases did so. From all these lands, so recently full of great hopes, a throng of exiles poured forth to take refuge in Britain or in America, and the victory of the system of self-government seemed in 1850 to be more distant than ever. Yet the failure of 1848 is highly instructive. It was due to two main causes. The first was that its leaders, and still more the bulk of their followers, were everywhere impracticable theorists, without any real experience in political affairs. The second was that because the democratic movement was cosmopolitan in character, and wholly disregarded distinctions of national tradition and temper, it came inevitably into conflict with the prickly spirit of national pride, which was a factor in the '48 even more potent than the Liberal movement itself. The Liberal cause was ruined in Austria by the antipathy between Magyars and Slavs. It was ruined in Germany by the difficulty of reconciling the demand for the unity of all the German lands (including German Austria) with the demand for an effective central representative control. It was ruined in Italy partly by provincial particularism, and partly by the failure of the Austrian peoples to recognise that the Italian cause was identical with their own; they combined with their zeal for liberty a resolution not to let their subject peoples escape from their rule, and therefore provided the armies which first crushed the Italian resistance, and could then be turned back upon their own insecurely established liberties."—R. Muir, *National self-government*, pp. 80-83.—“It would be incorrect to assume that the French Revolution of February, 1848, was the sole reason for those other disturbances that forced so many monarchs to tremble for their thrones. It was the occasion of the outbreak, but the causes were more deeply seated. There was a distinct sign of change in the working classes of all nations. Peace had brought prosperity; and prosperity had in turn created a spirit of antagonism towards the political barriers that monarchs had apparently created as checks towards future progress."—R. W. Jeffery, *New Europe*, p. 251.—The revolutionary movements at first glance, seemed on the whole to be a failure, but this was not so. “By 1855 the results of the period of liberal revolutions had been fully revealed. They were greater than could have been anticipated by any but the most sanguine prophets in 1815. The forms, at least, of representative government had been instituted in most of the European states. But there were only four states—Britain, Belgium, Holland, and Sardinia—in which the main lines of national policy were effectively determined by the representatives of the nation. In France universal suffrage, prematurely established, had led to the military autocracy of Napoleon III. In Prussia the old ruling factors retained their supremacy, unaffected by the forms of Parliament. Denmark had followed the Prussian example, and neither the old-fashioned estates of Sweden, nor the democratic assembly of Norway, had any control over the executive government. Spain had been nominally a constitutional state since 1834, but she was ruled in fact by a succession of cliques and military dictators. Portugal, nominally constitutional since 1826, was in much the same condition. Neither of these countries can in any real sense be described as self-governing, because in neither were the people sufficiently educated to be able to use the machinery that had been set up. Greece had obtained a parliamentary system in 1843, but it had been made

futile by the policy of the German prince, Otho of Bavaria, who occupied the Greek throne; and he was able thus to use the representative machinery, in the Prussian manner, as a sort of veil for absolutism, mainly because the people were not yet educated into the capacity for self-government. In the Austrian Empire, and in all the Italian states save Sardinia, a brutal and blind reaction was triumphant. In Russia and the Turkish Empire the supremacy of despotism had not yet been even shaken. Yet it was a real success which these forty years had achieved. In all the most progressive states the principle of popular participation in government had been, however grudgingly, accepted. These successes were, for the most part, due to the leadership of the middle classes, and they represented, on the whole, a victory for middle-class ideas, and especially for the ideas of the energetic classes of capitalist *entrepreneurs* who were everywhere guiding the fortunes of the new industries. They desired a share in government partly, of course, because the spirit of liberty was working in them. But they desired it also as a means of securing the removal of vexatious restrictions upon the operation of the potent new forces which they controlled. Freedom for them meant, in a pre-eminent degree, economic freedom, the withdrawal of restraints upon industry. They did not wish for political power in order that they might use it for the construction of a new social order, because they did not believe in the deliberate design or regulation of social activities by the state; in their view the new order would grow most healthily if it was left to itself. This view was most strongly held in Britain, where the influence of the industrial-capitalist class was more powerful than anywhere else; and in Britain this was pre-eminently the age of 'Manchesterism' and of *laissez-faire*: But the same attitude was perceptible in all the other lands where the industrial change was at work, though in other countries it was qualified and restrained by the surviving power of the old ruling elements, and by the tradition of strong government."—R. Muir, *National self-government*, pp. 93-95.—See also CONSTITUTIONS: 1850-1880.

Russia's part in European history.—Causes for its late development.—Lack of homogeneity.—Lack of contact with Europe until after the Renaissance.—Peter the Great and the shifting of Russian currents westward.—“For many centuries Russia had stood almost apart from the general current of European history. Her size is so very great and her development has been so very different from that of her sister nations that it may be said, with some degree of truth, that Russia constitutes a separate continent wedged in between Europe and Asia. This great empire has lagged far behind the other European nations in civilization and in political development. During the thirteenth century, when Western Europe had succeeded in establishing some degree of stable civilization under feudalism, Russia was still semi-barbaric; during the sixteenth and seventeenth centuries, when Western Europe was passing from feudalism toward national monarchy, Russia was moving toward a kind of feudalism; during the eighteenth and nineteenth centuries, when Western Europe was shaping constitutional governments, Russia was establishing absolute monarchy; for a generation preceding the World War, when Western Europe was rapidly putting government on a thoroughly democratic basis, be it in royal or republican form, Russia was desperately trying to establish a constitutional régime. The explanation for this backwardness must not be sought in the character of the Russian people, . . . for it is no more the

nature of the Russian to be conservative than it is the nature of the Frenchman to be progressive. In the highest forms of human endeavor, art, literature, and science, Russia has given striking evidence of a high degree of culture and originality. Tolstoy, Turgeniev, and Dostoevsky in literature; Tschaikovsky and Rubinstein in music; Antokolsky and Verestchagin in art; Mendeleiev and Metchnikov in science, are names of which the most civilized nations could be proud. The answer or answers must be sought elsewhere. In the first place, Russia had never been a part of the ancient Roman Empire; hence it did not receive the blessings of the classical civilization, the inestimable heritage of the nations of Western Europe. Secondly, Russia was outside of the pale of the great Catholic civilization of the Middle Ages, for the Slavic barbarians were first Christianized well along in the eleventh century by missionaries from Constantinople, who did not spread Greek civilization as effectively as the missionaries from Rome had spread Latin civilization. Thirdly, the Russians unfortunately, were conquered early in the thirteenth century by the semi-barbarous Tartars, who ruled the country for almost three centuries, and did their part in keeping Russia backward. In her early history the country consisted of what is now called Great Russia, an inland region of which the city of Moscow is the center. Having no seacoast, she could not get into close communication with the Mediterranean civilization of the South or with the Atlantic civilization of the West. Russia was a vast, landlocked, undulating plain over which barbarians roamed, a land so wild that it was hard to tell where 'man left off and nature began.' Cut off as she was from Western Europe, Russia missed the enlightenment and stimulus of the Renaissance and the vigorous shock of the Protestant Revolution. Even the waves of the French Revolution, which rolled over and flooded the lands of the Western nations, dashed in vain against the granite breakwater of Russian conservatism."—J. S. Schapiro, *Modern and contemporary European history*, pp. 499-500.—It is well to remember that Russia of the eighteenth century was composed mainly of the district known as Great Russia, and was much more homogeneous than the huge empire of the twentieth century which had grown by later accretions, which was held together only by the authority of the Czar, and of which large sections were lost with his fall. Parts of this later empire held and still hold no unity of any sort; neither ethnic, linguistic nor religious. Russia of the eighteenth century, when it first came into prominence in the international history and politics of Europe was more compact than the later empire, and more easily influenced by the legislation enacted by Peter the Great. "Peter the Great, if judged by the effect of his work on the development of Russia, must be considered one of the greatest figures of the eighteenth century. But the state of Russia at that time was too far removed from that of its more advanced neighbours for his reign to present many points of direct contact with the liberalism of the Western monarchies. Yet he has claims to an honourable position among the reforming sovereigns. The transfer of the hegemony of the North from Sweden to Russia, and the conversion of the latter from an Asiatic state into an influential European power, were events which demonstrated in good season the possible strength of autocracy. Henceforth the Western states had to reckon with a Russian factor in their international policy. This obligation, it is true, they at first believed to involve few less favourable incidents than assistance in partitioning Poland, or gratuitous crusades for the

discomfiture of the Turk, but it nevertheless urged with considerable cogency the possibilities within the reach of absolute power. . . . Nor did the effects of Peter's example stop here. Semi-barbarian though he was, and benighted as was his country, he exhibited in a conspicuous manner traits peculiarly characteristic of the liberal absolutism of the eighteenth century. To guide him in reforming the internal administration of Russia, he had recourse to the philosopher Leibniz; and to help him in improving the material and intellectual resources of his country, he laid under contribution every department of Western civilization. He despised no part of the enlightenment of his time, and ever showed himself to be animated by its spirit. . . . His rule was despotic to a degree known only by Russia among European nations. Yet he showed himself above all inspired with the belief that he was the trustee for his people, that it was for his nation that he worked, and that in his nation he would find the only worthy and enduring success. He loved the Russian people, says Kostomárov, not in the sense of the Russians contemporary with and subject to him, but in the sense of that ideal to which he wished to bring the people. . . . For Russia itself, Peter's greatest work was the annihilation of those barriers which had shut out the country from the influences of European civilization. Contact with the West was his prime concern and his most fruitful achievement. . . . His administrative reforms, his foundation of a system of popular education, his transference to the Crown of the power of the patriarchate, his endeavours to disseminate knowledge, and his attempt to lay upon Slavic barbarism a veneer of foreign manners, would have wrought but little had the country been left in Muscovite seclusion. As it was, Russia did not immediately profit to any great extent by these internal improvements. The force of the conservative opposition was so great that Peter's reforms would have sunk into abeyance on the removal of his stern will, unless influences from abroad had continued with short intermissions to breathe into them vital energy. When Peter died, the empire fell into the hands of an oligarchy tutored by the example of Sweden on the death of Charles XII. In his lifetime Peter found it impossible to form a staff of honest and capable agents; and when he did not employ foreigners, he had to depend on terror to secure the execution of his commands. On his death, the one Russian patriot was no more. All hope of further progress depended on the operation of foreign civilization, or the appearance of some great and enlightened successor. . . . On the organization of classes, Peter left a deep and lasting impression. . . . [As a result of his rule, and that of his successors, during the first half of the nineteenth century it came about that the upper classes of Russian society were drawn with wonderful rapidity into the vortex of European civilization while the bulk of the people remained almost stationary, and, chained to the soil and service of superiors, the Russian boors were cut off from all access to the West]; the traders pursued their calling, unharassed by the difficulties of the Archangel route, and slowly drew through the Baltic the advantages of intercourse with more advanced nations; the nobility, persuaded to renounce territorial importance, sought honourable employment by thronging the government service, and strove to shine by assuming the semblance of European culture. . . . Peter, by his sole exertions, compelled a vast empire to enter irrevocably into the fertilizing medium of European civilization."—A Weir, *Introduction to the history of modern Europe*, pp. 14-19.—But the peasants, down through the eigh-

teenth and nineteenth centuries were scarcely lifted from the bottom of the abyss of superstition and ignorance in which the seventeenth century found them, while an ever widening gap was made between them and the landed nobility. The result was the revolution of our day, with what profound effect upon the civilization of the world, no one can yet say.—See also RUSSIA.

Wars of the Great Powers (1848-1878).—Crimean War.—Solferino campaign and the unification of Italy.—Austro-Prussian conflicts.—Franco-Prussian war.—Balkan uprisings.—Significance of the Treaties of Frankfort (1871) and Berlin (1873).—After the Napoleonic wars Alexander I of Russia vainly hoped to keep Europe at peace by the slender thread of the Holy Alliance—a treaty made between the crowned heads of the four Great Powers—and by a strange freak of irony the first break came through the ambitious policy of his successor. Peace between the nations, however, was kept for over a quarter of a century; the whole of Europe was war weary, and the internal conditions of the individual countries precluded all possibilities of war for a time. When the break did come it was not premeditated by the transgressor, Nicholas I of Russia. He had no desire for war, but thought to steal a march on the other powers, and gain a hold on the possessions of the Turk (whom he dubbed the "sick man of Europe"). Turkey had already lost important parts of its European possessions; the map of the south of Europe had begun to change, the stage was being set for the great struggle of 1914. "Shortly after the Congress of Vienna the Serbians, who had for a number of years been in revolt against the Turks, were able to establish their practical independence (1817), and Serbia, with Belgrade as its capital, became a principality tributary to Turkey. . . . The next state to gain its independence was Greece, whose long conflict against Turkish despotism aroused throughout Europe the sympathy of all who appreciated the glories of ancient Greece [see GREECE: 1821-1820]. . . . At the opening of the nineteenth century . . . the national spirit once more awoke in Greece, and able writers made modern Greek a literary language and employed it in stirring appeals to the patriotism of their fellow countrymen. In 1821 an insurrection broke out in Morea, as the ancient Peloponnesus is now called. . . . On January 27, 1822, the Greek national assembly issued a proclamation of independence. . . . [The Russians played a prominent part in the negotiations which freed Greece and also] forced the Sultan to grant practical independence to the Danubian principalities of Wallachia and Moldavia which came thereby under Russian influence. Turkey was no longer able to oppose the wishes of the allies, and in 1832 Greece became an independent state. . . . [This the Tsar thought, gave him the looked for opportunity to claim the right to act as protector of the Christians throughout the Turkish dominions. He demanded that the Sultan should grant this right, and refusal by the Porte provided the excuse, sought by Nicholas, to occupy the Danube principalities. But] when news of this situation reached Paris, Napoleon III, who had recently become emperor, declared that France, in virtue of earlier treaties with the Porte, enjoyed the right to protect Catholic Christians. He found an ally in England, who was fearful that Russia might wrest Constantinople from the Turks and so get control of the Dardanelles and the eastern Mediterranean [her route to India]. When the Tsar's troops marched into the Turkish dominions, France and England came to the Sultan's assistance and declared war upon Russia in 1854. [The

outcome of a miserable war, and of the defeat of Russia was the Treaty of Paris, 1856, by which] the 'Sublime Porte' was taken into the family of European powers, from which it had hitherto been excluded as a barbarous government, and the other powers agreed not to interfere further with the domestic affairs of Turkey."—J. H. Robinson, *Medieval and modern times*, pp. 690-693.—See also RUSSIA: 1853-1854 to 1854-1856.—"The next phase of interest in this revival of the Great Power drama was the exploitation by the Emperor Napoleon III and the king of the small kingdom of Sardinia in North Italy, of the inconveniences and miseries of the divided state of Italy, and particularly of the Austrian rule in the north. The King of Sardinia, Victor Emmanuel, made an old-time bargain for Napoleon's help in return for the provinces of Nice and Savoy. The war between France and Sardinia on the one hand, and Austria on the other, broke out in 1859, and was over in a few weeks. The Austrians were badly beaten at Magenta and Solferino. Then, being threatened by Prussia on the Rhine, Napoleon made peace, leaving Sardinia the richer for Lombardy."—H. G. Wells, *Outline of history*, v. 2, pp. 440, 441.—"Italy was now ready to fuse into a single state. Tuscany, as well as Modena and Parma, voted (March, 1860) to unite with Piedmont. Garibaldi, . . . sailed for Sicily, where he assumed the dictatorship of the island in the name of Victor Emmanuel, 'King of Italy,' . . . and early in September he entered Naples itself, just as the king [Francis II, of Naples] fled from his capital. Garibaldi now proposed to march on Rome, [but the time for this had not come, and at the desire of Napoleon III the city was left in possession of the Pope although the rest of the Papal possessions were seized]. In February, 1861, the first Italian parliament was opened at Turin, and the process of really amalgamating the heterogeneous portions of the new kingdom [under Victor Emmanuel as king] began. [See also AUSTRIA: 1856-1859; ITALY: 1856-1859; 1859-1861.] . . .

"We must now follow the story of modern Prussia and see how its ruling classes, by means of three wars, made themselves masters of Germany. . . . The attempt of the constitutional assembly of Frankfurt in 1848-1849 to form a strong *democratic* empire under Prussia failed, because the king of Prussia refused to accept the crown, on the ground that the assembly had no right to offer it to him and that should he accept it he would, as he timidly feared, become involved in a war with Austria, which was excluded from the proposed union. With the accession of William I in 1858, a new era dawned for Prussia. An ambitious king came into power, whose great aim was to expel Austria from the German Confederation, and out of the remaining states to construct a firm union, under the domination of Prussia, which should take its place among the more important states of Europe. . . . In order to bring about the expulsion of Austria from the German Confederation, Bismarck took advantage of a situation that had already caused trouble in Germany, and which was known as the Schleswig-Holstein affair. The provinces of Schleswig and Holstein, although inhabited largely by Germans, had for centuries belonged to the king of Denmark. They were allowed, however, to retain their provincial assemblies, and were not considered a part of Denmark. . . . In 1863 the king of Denmark ventured, in spite of the opposition of Prussia, to incorporate Schleswig into his kingdom. Bismarck's first step was to invite Austria to cooperate with Prussia in settling the Schleswig-Holstein difficulty. As Denmark refused to

make any concessions, the two powers declared war, defeated the Danish army, and forced the king of Denmark to cede Schleswig-Holstein to the rulers of Prussia and Austria *jointly* (October, 1864). They were to make such disposition of the provinces as they saw fit. There was now no trouble in picking a quarrel with Austria. . . . Relations between [the two countries] grew more and more strained until finally, in June, 1866, Austria was compelled to call out the forces of the confederation to protect herself against Prussia. . . . All resistance on the part of the states of the north was promptly prevented, Austria was defeated on July 3 in the decisive battle of Sadowa, and within three weeks after the breaking off of diplomatic relations the war was practically over. Austria's influence was at an end, and Prussia had established her power to do with Germany as she pleased. [See also GERMANY: 1861-1866 to 1866-1867.] . . . No one was more chagrined by the abrupt termination of the war of 1866 and the speedy and decisive victory of Prussia than Napoleon III. He had hoped that the combatants might be weakened by a long struggle, and that at last he might have an opportunity to arbitrate and incidentally to extend the boundaries of France, as had happened after the Italian war. But Prussia came out of the conflict with greatly increased power and territory, while France had gained nothing. . . . His hopes of annexing Luxembourg as an offset for the gains that Prussia had made were also frustrated. One course remained for the French emperor, namely, to permit himself to be forced into a war with Prussia, which had especially roused the jealousy of France. The nominal pretext for hostilities was relatively unimportant. [War was declared by France in July, 1870.] . . . In a series of bloody encounters about Metz one of the French armies was defeated and finally shut up within the fortifications of the town. Seven weeks had not elapsed after the beginning of the war before the Germans had captured a second French army and made a prisoner of the emperor himself in the great battle of Sedan, September 1, 1870. The Germans then surrounded and laid siege to Paris. Napoleon III had been completely discredited by the disasters about Metz and at Sedan, and consequently the empire was abolished and France for the third time was declared a republic. [See also GERMANY: 1866-1870; FRANCE: 1870 (July-August) to 1871 (January-May).] In spite of the energy which the new government showed in arousing the French against the invaders, prolonged resistance was impossible. The French capital surrendered January 28, 1871, an armistice was arranged, and the war was to all intents and purposes over. . . . The war between France and Prussia in 1870, instead of hindering the development of Germany as Napoleon III had hoped it would, only served to consummate the work of 1866. The South German states,—Bavaria, Württemberg, Baden, and south Hesse,—having sent their troops to fight side by side with the Prussian forces, consented after their common victory over France to join the North German Federation. Surrounded by the German princes, William, King of Prussia and President of the North German Federation, was proclaimed German Emperor in the palace of Versailles, January, 1871. [See GERMANY: 1871 (January).] In this way the German Empire came into existence. With its victorious army and its wily chancellor, Bismarck, it immediately took an important place among the western powers of Europe and sought to increase its power."—J. H. Robinson, *Medieval and modern times*, pp. 612, 613, 615, 616, 617, 619, 620, 622.—By the Treaty of Frankfort, signed in 1871, France

was compelled to pay a large indemnity, and to cede to the victors all Alsace and part of the province of Lorraine. [See FRANCE: 1871 (January-May).] Six years later, Russia was again at war with Turkey over the Balkan countries, and the Near Eastern question had become acute. "In 1874 a failure of crops aggravated the intolerable conditions [in the Balkans] and an insurrection broke out in Bosnia and Herzegovina which set the whole Balkan peninsula aflame. . . . While the European powers, in their usual fashion, were exchanging futile diplomatic notes on the situation, Serbia and Montenegro declared war on the Sultan, and the Christians in the Balkan region made a frantic appeal to the West for immediate help. . . . The negotiations of the powers having come to nothing, Russia determined, in 1877, to act alone. Although the Turks fought well, Russia was victorious, and in 1878 a Russian army entered Adrianople. [See also RUSSIA: 1875-1877; TURKEY: 1861-1877; 1877-1878; 1878.] The Sultan was forced to sign a treaty with the Tsar and to recognize the independence of Serbia, Montenegro, Roumania, and Bulgaria. England and Austria had naturally serious objections to this treaty which increased the influence of Russia in the Balkan peninsula. They accordingly forced Tsar Alexander II to submit the whole matter to the consideration of a general European congress at Berlin. After prolonged and stormy sessions the Congress of Berlin agreed that Serbia, Roumania, and little Montenegro should be regarded as entirely independent of Turkey, and that Bulgaria should also be independent, except for the payment of a tribute to the Sultan. Bosnia, where the insurrection had begun, and the small province of Herzegovina were practically taken from the Sultan and turned over to Austria to be occupied and administered by her. Russia was given a tract east of the Black Sea. A few years after the congress Bulgaria quietly annexed the neighboring province of Eastern Roumelia, thus adding to her own importance and further decreasing what remained of Turkey in Europe. All that was left of the Turkish empire in Europe was a narrow strip of territory—less in extent than the state of Missouri—extending from the Black Sea to the Adriatic, to which the name 'Macedonia' was generally applied."—J. H. Robinson, *Medieval and modern times*, pp. 604-605.—The treaties of Frankfurt and Berlin had a profound effect upon the history of Europe. Their effects provided some of the chief irritants which resulted in provoking the Great War.—See also BERLIN, CONGRESS OF.

**Imperialism.—Its growth from nationalism.—Meaning and motives of imperialism.**—"Imperialism, the getting and holding colonial empire, was probably an inevitable stage in the evolution of mankind. It resulted partly from the superior power of some of the European nations and their greater ambitions which developed, partly because of the changes which accompanied the Industrial Revolution. After the introduction of the railroad and the steamship the world seemed smaller and its parts closer together. As a consequence of changes in the nineteenth century the population and the industries of Europe greatly expanded. The surplus population of England, Italy, and Germany went outside to other places. Australia, New Zealand, Canada, South Africa were all built up by such emigration, while the abler or the more adventurous went forth to such countries as India and Egypt to direct and govern the natives. For a long time great numbers of Germans left their homes, and many Italians went also, but they settled in the possessions of other powers, and were lost to the countries that produced them. There was

nothing which German leaders lamented more than that Germany had no colonies to which her emigrants would go and there develop a greater and vaster German Empire. Moreover, the expanding industrialism of countries like the German Empire and Great Britain fostered an increasing population, which could not be supported by domestic agriculture and which could get its food only by selling manufactured products abroad. Often it seemed to imperialists that these manufactures could be best sold in colonial possessions, and it was true that the colonies of Britain and France bought many things from them. Furthermore, industrialism depended on a supply of raw materials. A considerable portion of such products was, in the colonial empires, especially of Great Britain, Holland, and France. After the old colonial system was ended in the earlier part of the nineteenth century Britain did not bar other countries from trading with her colonies, but some powers were not so liberal, and there was always the possibility that a state might attempt to monopolize the resources of its colonial possessions. So, German imperialists believed it necessary for Germany's greatness that lands producing cotton, copper, rubber, and oil should be taken and held. Even when it was doubtful whether the mass of the people would be benefited by colonial acquisitions, and very doubtful whether colonies were wanted by them, individuals who hoped to gain special privileges of great wealth, or who wanted protection for their investments, were often able to arouse the patriotism of the rest of the people and their love of greatness and glory for their country, and lead them on to support colonial adventure. And just as small businesses were being consolidated into great corporations, so a large part of the resources of the earth were being gathered into the possession of the principal powers. It seemed to many that the future lay only with those powers, like Russia and the United States, which had vast territory in which to expand, or with those like Great Britain and France, which had obtained colonies over the sea. The German desire to get more territory or colonies while time still remained was probably one of the major causes of the Great War. [See also WORLD WAR: Causes: Indirect: h, 1, 2; i.] The subject populations were, probably, on the whole, better off than they would have been if left to themselves. That some of them were harshly and cruelly treated, that at best they had usually an inferior status, that they were often exploited, that they were ruled by aliens, that democracy and self-government were never extended to them, that they were denied many things which their European masters had, is quite true. If all this be considered from the point of view of what European liberals wanted for themselves, it appears very lamentable indeed. But it must be remembered that the people of Algeria, of India, of Egypt, and of Burma had not been able to develop democracy or much well being for the masses; that the negroes of Africa were far down in the scale of mankind, and that those who could survive were being rapidly lifted up through whole stages of human progress. Whatever evils attended imperialism, and they were not few or small, it is probable that the peoples affected were benefited and prepared for things better to come. It is certain, also, that Americans and Englishmen and Frenchmen were coming to have greater concern for their responsibilities and ever-greater desire to protect and improve the condition of the peoples over whom they ruled."—E. R. Turner, *Europe since 1870*, pp. 302-304.

"One of the most remarkable features of the modern age has been the extension of European

civilisation over the whole world. . . . It has been brought about by the creation of a succession of 'Empires' by the European nations, some of which have broken up, while others survive, but all of which have contributed their share to the general result; and for that reason the term 'Imperialism' is commonly employed to describe the spirit which has led to this astonishing and world-embracing movement of the modern age. The terms 'Empire' and 'Imperialism' are in some respects unfortunate, because of the suggestion of purely military dominion which they convey; and their habitual employment has led to some unhappy results. . . . There are four main motives which can be perceived at work in all the imperial activities of the European peoples during the last four centuries. The first, and perhaps the most potent, is the spirit of national pride, seeking to express itself in the establishment of its dominion over less highly organised peoples. In the exultation which follows the achievement of national unity each of the nation-states in turn, if the circumstances were at all favourable, has been tempted to impose its power over its neighbours, or even to seek the mastery of the world. From these attempts have sprung the greatest of the European wars. From them also have arisen all the colonial empires of the European states. . . . Nationalism, then, with its eagerness for dominion, may be regarded as the chief source of imperialism; and if its effects are unhappy when it tries to impress itself at the expense of peoples in whom the potentiality of nationhood exists, they are not necessarily unhappy in other cases. When it takes the form of the settlement of unpeopled lands, or the organisation and development of primitive barbaric peoples, or the reinvigoration and strengthening of old and decadent societies, it may prove itself a beneficent force. But it is beneficent only in so far as it leads to an enlargement of law and liberty. The second of the blended motives of imperial expansion is the desire for commercial profits; and this motive has played so prominent a part, especially in our own time, that we are apt to exaggerate its force, and to think of it as the sole motive. No doubt it has always been present in some degree in all imperial adventures. But until the nineteenth century it probably formed the predominant motive only in regard to the acquisition of tropical lands. So long as Europe continued to be able to produce as much as she needed of the food and the raw materials for industry that her soil and climate were capable of yielding, the commercial motive for acquiring territories in the temperate zone, which could produce only commodities of the same type, was comparatively weak; and the European settlements in these areas, which we have come to regard as the most important products of the imperialist movement, must in their origin and early settlement be mainly attributed to other than commercial motives. But Europe has always depended for most of her luxuries upon the tropics: gold and ivory and gems, spices and sugar and fine woven stuffs, have from a very early age found their way into Europe from India and the East, coming by slow and devious caravan routes to the shores of the Black Sea and the Mediterranean. . . . Hence the acquisition of a share in, or a monopoly of, these lucrative lines of trade became a primary object of ambition to all the great states. In the nineteenth century Europe began to be unable to supply her own needs in regard to the products of the temperate zone, and therefore to desire control over other areas of this type; but until then it was mainly in regard to the tropical or sub-tropical areas that the commercial motive formed the predominant element in

the imperial rivalries of the nation-states. And even to-day it is over these areas that their conflicts are most acute. A third motive for imperial expansion, which must not be overlooked, is the zeal for propaganda: the eagerness of virile peoples to propagate the religious and political ideas which they have adopted. But this is only another way of saying that nations are impelled upon the imperial career by the desire to extend the influence of their conception of civilisation, their *Kultur*. In one form or another this motive has always been present. At first it took the form of religious zeal. . . . In English colonisation, indeed, the missionary motive was never so strongly marked. But its place was taken by a parallel political motive. The belief that they were diffusing the free institutions in which they took so much pride certainly formed an element in the colonial activities of the English. . . . The fourth of the governing motives of imperial expansion is the need of finding new homes for the surplus population of the colonising people. This was not in any country a very powerful motive until the nineteenth century, for over-population did not exist in any serious degree in any of the European states until that age. Many of the political writers in seventeenth-century England, indeed, regarded the whole movement of colonisation with alarm, because it seemed to be drawing off men who could not be spared. . . . It is often said that the overflow of Europe over the world has been a sort of renewal of the folk-wandering of primitive ages. That is a misleading view: the movement has been far more deliberate and organised, and far less due to the pressure of external circumstances, than the early movements of peoples in the Old World. Not until the nineteenth century, when the industrial transformation of Europe brought about a really acute pressure of population, can it be said that the mere pressure of need, and the shortage of sustenance in their older homes, has sent large bodies of settlers into the new lands. Until that period the imperial movement has been due to voluntary and purposive action in a far higher degree than any of the blind early wanderings of peoples. The will-to-dominion of virile nations exulting in their nationhood; the desire to obtain a more abundant supply of luxuries than had earlier been available, and to make profits therefrom; the zeal of peoples to impose their mode of civilization upon as large a part of the world as possible; the existence in the Western world of many elements of restlessness and dissatisfaction, adventurers, portionless younger sons, or religious enthusiasts: these have been the main operative causes of this huge movement during the greater part of the four centuries over which it has extended."—R. Muir, *Expansion of Europe*, pp. 4-6, 8, 10-11.—See also COLONIZATION; IMMIGRATION AND EMIGRATION: European problems.

Russia in the nineteenth century.—Chief factors in the Russian liberal movement.—Emancipation of the serfs.—Effect of industrial revolution in Russia.—Rise of Marxian socialism.—Bolshevik movement.—"The great French ideas of the Revolution and Napoleon's time scarcely even touched Russia, whose people remained unreached by the influences that so profoundly altered life in the western half of the Continent. The government was an autocracy, with all the power of Church and State concentrated in the hands of the ruler, the tsar, while administration was actually carried on by a bureaucracy of numerous officials appointed by him and responsible to him. There was a small upper class of nobles, many of them poor and without much power. There was a small *bourgeoisie*, so scanty as compared with the vast num-

bers in the realm as scarcely to have any weight. Beneath was the great mass of the nation, the peasants, living in their lonely and dirty little villages in the forest and over the plains, carrying on a primitive agriculture, devoted adherents of the Greek Catholic or Orthodox faith, living in village communities and bound in serfdom, much as the peasants of western Europe had lived two or three centuries before. Few of these people could read or write. Most of them had the intellectual outlook of medieval peasants. Save in the petty concerns of their villages none of them had aught to do with the government of the country or any control over it. Many of them were oppressed by the judges and officials. For most of them life was hard and poverty-stricken, lonely, meager, and bare. . . . During the lifetime of Nicholas I [1796-1855] western and radical ideas had been almost completely kept out of Russia, through repression, censorship, and the unceasing vigilance of spies and police. Meanwhile, there was not only no progress in the country, but deterioration and decay set in, while the government became constantly more corrupt and inefficient. [Alexander I died in 1825, and his successor's reign was ushered in by a brief, badly organized revolt—the December conspiracy—which he never forgot or forgave. This, in spite of repressive methods, was the starting point of the liberal movement, which by devious, underground ways brought to light, in turn, emancipation, *Zemstvos* and the *Duma*.] So long as Russia was considered invincible in war it was possible to uphold the system [of repression] but during the Crimean War (1854-6) Russian armies were shamefully defeated, and it was evident that the people's discontent with evil conditions and poor administration at length would have to be appeased. . . . By the abolition of serfdom (1850-1866) [during the reign of Alexander II] the peasants were relieved of manorial obligations, made completely free, and given part of the lands on which they had worked. In 1864 the judicial system was reformed, jury trial and western principles being introduced. At the same time larger rights of local self-government were granted in the rural divisions, and, in 1870, also in the cities. But by that time the reform movement in Russia had come to an end. On the one hand there was reaction because the upper class believed that too-great innovations had been made. On the other hand, there was great disillusion and disappointment on the part of numerous simple people who had expected everything to be reformed, but who at once discovered much of evil still remaining. . . . [About the middle of the century the Nihilistic movement appeared, and for a time became a great force, its aim being the destruction of all existing institutions in Russia. Anarchism too had for a time a strong hold on individuals, and through them on nihilism; but because of its individualistic character, its influence was temporary.] The great turning-point in the history of Russia in the nineteenth century had come a little before 1870, following the disasters of the Crimean War and the death of Nicholas I, when, after a long period of conservatism and repression, it had seemed necessary at last to undertake changes and reforms. . . . In 1870 *dumas*, or councils, were established in the Russian cities. . . . Other changes were made, and it seemed that much improvement must result, but [Alexander II changed his policy to one of repression, and] disappointment and reaction soon clouded the prospect. [Denied the right of free speech, the revolutionists developed the system of plotting and spying known as underground Russia and adopted the use of firearms and bombs to which Alexander II

owed his death in 1881, when he was on the point of granting a constitution.] The forerunner of the great changes soon to take place . . . was the Industrial Revolution, after the emancipation of the serfs the most important thing in the history of Russia in the nineteenth century. . . . The consequences of the new industrialism in Russia were to some extent what they had been long before in England and France and later on in Austria-Hungary and the German Empire. About the middle of the nineteenth century more than nine tenths of the people of the Russian Empire lived scattered in the country, where they carried on their rude agricultural work. Upon this rural population, ignorant and extremely conservative, the earlier reformers and radicals had been unable to make any impression, and so the nihilist movement had come to an end largely because it remained a movement with leaders but without followers among the people. Now there grew up a larger urban population, an industrial proletariat more quickly responsive to the ideas of leaders who wished to change the government and the system that existed. [Alexander II continued the repressive methods of his predecessor.] . . . There now rose up the party of the Social Democrats, who hoped that later on the existing system would be overthrown, after which, in a regenerated Russia, there might be established the socialism which Karl Marx had once taught in western Europe. The new leaders obtained adherents more easily than the old, yet the urban population of Russia at the end of the century was still less than 14 per cent. of the whole. But the new ideas soon began to affect also the mass of the peasants, hitherto inert. The Social Democratic Party of the workmen organized the factory operatives of the towns, who tried to better their condition and get their reforms by strikes. Among the peasants, who had no land or who had not enough land to support them, the Socialist Revolutionary Party rose up, these peasants desiring to take from the great proprietors their estates, which were then to be divided among the peasants in small holdings. . . . [In the war of 1904-1905] Russia . . . yielded to Japan partly because her resources were strained, but mostly because such unrest and confusion had arisen that the whole structure of her government seemed near to collapse. The system which the government had upheld by force, by arbitrary arrests, by secret trial, by banishment to Siberia, through the power of the secret police and the army, could be maintained only so long as Russia was at peace. Now the government was deeply involved in a distant war . . . in which patriotic fervor was never aroused. . . . So the radicals among the workmen of the towns, the radical peasants in the country, the liberals of the upper and middle classes, and all the oppressed peoples—the Jews, the Poles, the Finns, and others—turned against the authorities; and in the confusion of the war it was no longer possible to resist them. . . . Nicholas II soon yielded to the general clamor. . . . In August, 1905, he proclaimed a law establishing an Imperial *Duma*, or assembly, to advise him in legislative work. . . . Then he issued the *October Manifesto* which established freedom of religion, of speech, and of association, and promised that thereafter no law should be made without the *Duma's* consent. A series of decrees provided that the members of the *Duma* should be elected practically by universal suffrage. The old Council of State, which had been much like a king's council in the Middle Ages, was now changed so that part of its members were indirectly elected, and it was made the upper house of the National Assembly with the *Duma* as the lower. These reforms had been

yielded in a period of great weakness. It was soon possible for most of them to be taken away. The bureaucracy of officials and most of the powerful upper class were sternly against the concessions. Moreover, the reformers almost immediately began to fall apart. . . . It was not long before the nobles, great landlords, and reactionaries generally, united, and becoming stronger, by means of armed forces known as the 'Black Hundreds,' began to drive away the radicals and undo the changes which they had accomplished. During the same time the tsar began to withdraw the powers he had given to the *Duma*. . . . Such was this first Russian Revolution. Temporarily, in the midst of the weakness of the government, it accomplished striking reforms, and was not unlike the first part of the French Revolution long before. But it was soon seen to be more like the Revolution of 1848 in central Europe, for its movers were really too weak to accomplish important, lasting results, and it soon lost most of its gains in the period of reaction that followed. There was needed a mightier outburst, more like the destructive part of the French Revolution, to quickly break the old order to pieces. . . . In the years between the Revolution of 1905 and the Great War the country seemed to settle down; slowly the harsh measures of government were lessened; the ravages of the war were repaired; the army was strengthened; a great appropriation was made to rebuild the navy; and increasingly Russia took her place once more in European councils. Again she became a powerful member of the Dual Alliance, and presently settling her differences with England, along with England and France made the Triple Entente. Her expansion in the Far East having been checked she turned again with greater interest to the Balkans, coming there into more and more dangerous rivalry with Austria-Hungary and the German Empire. It was this clash of interests which produced the Bosnian crisis of 1908-9, in which Russia yielded; the crisis of 1912, occasioned by the Balkan War, in which she held her own; and the crisis of 1914, which led to the War of the Nations, in which presently Russia, Austria-Hungary, and the German Empire all went down into ruin. . . . During the misery and confusion which overwhelmed that country in the latter part of the Great War, the old system completely collapsed. . . . [In March, 1918, bread riots broke out and a few days later the military revolt occurred. As a result Nicholas II abdicated on March 15th in favor of his brother Michael, who, however, refused the crown. Thus in the space of one short week the imperial power of the Romanovs was swept aside. After this] revolution had overthrown the old government, certain socialists, whose leaders were Lenine and Trotzky, forming a group called the *Bolsheviki*, seized power and maintained themselves. They then decreed some of the sweeping changes which Marx had long before hoped would come to pass. Private property and inheritance were abolished; land, capital, transportation were nationalized; and it was decreed that all people should work. By this time all over the world radical leaders were loudly proclaiming that socialism was the hope of the future, and that bolshevism was destined shortly to overthrow what they called the outworn systems. For the moment it appeared to many that the Russian Revolution was the most striking event since 1793, and that bolshevism held untold possibilities for good or for evil in the future. But it is probable that this revolution in Russia was less the result of the advance and the power of socialism than of the destruction, the uncertainty, and the general unrest, which proceeded from the War of the Nations."—

E. R. Turner, *Europe since 1870*, pp. 110-112, 269, 273, 274, 291, 292, 293-302, 537.—See also RUSSIA: 1801, and after.

Conflicting currents leading to the World War.—Conflict between the spirit of nationality and world economics.—Internationalism.—Problems brought about by imperialism.—Economic and militant unrest in Europe.—"This war [the World War, 1914-1918] and the diplomatic struggles which preceded it, have pressed the question of nationality upon the attention of all Europe. Some nations have been almost obsessed by it, others have been less conscious of its presence in their thoughts; but each, whether consciously or unconsciously, has been formulating its own version of the idea, and there is no more striking proof of national individuality than the extreme divergence between the lines they have followed. . . . There is nothing peculiar in the means by which Germany was welded together. All the national democracies of Europe have emerged originally from the same phase. . . . The 'Prussian' standpoint . . . [was] only disastrous because it . . . [was] an anachronism. Five centuries ago it was the most constructive political force in Europe. . . . A state must always have the means of satisfying its economic needs, and these have been complicated by the industrial revolution to an extraordinary degree. The medieval community demanded little beyond corn, cattle, and timber, which were ubiquitous, and could all be produced by the most limited section of the European area in sufficient quantity for its inhabitants. The modern community requires seams of coal and veins of metal, raw materials to transform by its minerals' agency, ports by which these raw materials may reach its factories from abroad and the finished products travel to foreign markets, and easy internal communications to link port, mine, industrial centre, and agricultural country-side as the nervous system links the different members of the human organism. Although there is only one state now where there were a hundred before, yet under such economic conditions the kingdom of Italy is really less self-sufficient than the superseded Duchy of Parma, and the united German Empire as cramped as Mecklenburg and Hesse were in days of particularism. This economic evolution explains the consolidation of the Hapsburg Monarchy. The Hungarian section of the complex is its agricultural hinterland. The Austrian half provides the minerals and industry. Italian Fiume and Trieste offer the necessary ports, and the railway-routes which link these outlets with the interior are bound to traverse the Slavonic provinces between the Adriatic and the Drave. These several regions, so antagonistic in national feeling, are profoundly complementary to one another in the economic sphere. Modern Austria-Hungary, then, owes its existence conspicuously to the industrial revolution; but we can discern the same force at work in developments which we commonly ascribe to the principle of nationality alone. The Prussian Zollverein was an important contributory cause in the creation of the Prussianized German Empire, and the abolition of internal customs-barriers coincided with the achievement of national self-government in Revolutionary France. There are thus two separate organizing principles at work on the map of modern Europe, Nationality and Economics, and they are fundamentally different in their character. . . . [They have] woven the whole world into its web, and triumphantly 'internationalized' the economic sphere of human life, the spirit of nationality has proved its essential particularism by spurring rival states into a world-

wide war."—A. Toynbee, *New Europe*, pp. 9, 14, 30-32, 35.

"The year 1870-71, . . . forms beyond dispute one of the great watersheds of Modern History. In the 'seventies of the nineteenth century a prolonged process of historical evolution reached its climax. Between 1815-71 many Nation-States came to the birth, and the map of Europe was transfigured. This transfiguration was, in the main, the resultant of two forces, seemingly antagonistic, but in effect not frequently convergent: the force, on the one hand, of disintegration; on the other, of a fresh integration. One obvious illustration of this process is afforded by the decay and disruption of the Ottoman Empire. That Empire was itself a wholly artificial product. It represented an alien mass superimposed upon vital elements, which, though submerged for centuries, were never wholly destroyed. The collapse of the Ottoman Empire permitted the submerged nationalities to re-emerge and take their place as independent Nation-States in the European polity. . . . Two of the great powers . . . simultaneously attained the goal of national unity. The Franco-German War, 1870-71, put the coping-stone upon the work of Bismarck in Germany, and upon that of Mazzini, Cavour, Garibaldi, and Victor Emmanuel in Italy. . . . Nor was the triumph of the doctrine confined to Europe. Nation-States have come into being under the ægis of the British Crown in North America, in South Africa, and in the Pacific. The Canadian Dominion, the Commonwealth of Australia, the Union of South Africa, and New Zealand, are not the less Nation-States because they are, and ardently desire to remain, constituent parts of the British Commonwealth. The South American republics have attained to the dignity of statehood in independence of the European States to which they owed their birth. The making of Nation-States may thus be regarded as the characteristic work of the nineteenth century, and more particularly of the period between 1815 and 1878. That work proceeded under the domination of two forces, both of which received a decided impulse from the first French Revolution and indirectly and undesignedly from the Napoleonic Conquests: the idea of nationality and the principle of liberty. Yet, as regards nation-building, the nineteenth century merely placed the coping-stone upon an edifice which had been in gradual course of erection ever since the last years of the fifteenth century. The main process of European history during the four centuries that closed in 1870-78 may be scientifically described as the evolution of the States-system, or alternatively as the triumph of Nationalism. . . . Neither the demarcation of Nation-States nor the striving for power (*Macht-streben*) among these self-conscious units has, however, completely exhausted the best energy and thought of Europe during the last four centuries. Hardly was the dominance of the idea of the Sovereign State established before men began to perceive its inconvenient and indeed disastrous consequences. There was no longer in Europe any Supreme Court of Appeal; European society was dissolved into its constituent atoms. From the development of nationalism there naturally proceeded internationalism: inter-national trade, inter-national diplomacy, above all, inter-national war. The cruel persistence of inter-national war led in time to a feeling after the possibility of inter-national law. Where was mankind to find a path of escape from conditions which even in the seventeenth century seemed to the finer minds to be intolerable? Two paths, and two only, appeared to open out. On the one hand, the re-establishment of a world-sovereignty; on the other,

the common acceptance of a system of law equally binding on all nations. From the seventeenth century to the twentieth these two ideas have struggled for ascendancy. The one looking back with regret to the lost unity of the Middle Ages; the other looking forward to a Federation of States, or possibly to a League of Peoples. . . . The outstanding feature of European history during the last fifty years is a shifting if not in the centre of political gravity, at least in its distribution: European history has ceased to be exclusively European. The inventions of physical science have completely revolutionised the conditions of world-history. The development of the means of transport and communication have brought the ends of the world together. 'The cardinal fact of geography in the twentieth century is the shortening of distances and the shrinkage of the globe. . . . The result is that problems, which a century ago, or even fifty years ago, were exclusively European, now concern the whole world.' So obviously is this proposition true that the history of the recent epoch has been summed up in a brilliant formula as the expansion of Europe. . . . Still, apart from England and her oceanic Empire, and apart from Russia, with a vast land Empire, half-European and half-Asiatic, Europe was in the main self-contained. During the last half-century all this has been altered. During that period there was no great European war. There was no war at all in Europe beyond the limits of the Ottoman Empire. Outside the Balkans there were hardly any changes in the political map of Europe. . . . The real activities of the European Powers have been for the most part displayed in the extra-European sphere. European diplomacy has been transformed into *Welt-Politik*, and the ideal of the *Welt-Politik* has been *Welt-macht*. It is not without significance that the dominating ideas of the new era should have to be expressed in the German language. For the peculiar characteristics of the new era must in large measure be ascribed to the astoundingly rapid rise of Germany, and German policy in the period of its domination has been largely inspired by three motives which, though most conspicuously illustrated in Germany, have also been in operation elsewhere and have driven the great nations towards the abyss of Armageddon. The forces which have thus moulded the history of the most recent era are those of industrialism, of commercialism, and imperialism. Industrially, the face of Europe has been transformed by the development of productive capacity under the domination of science. The age of coal and iron, of steam and electricity, to mention only the most obvious forces, has succeeded to the age of hand-labour, of pasturage and tillage. The country-dwellers have been brought together into towns and factories. The resulting development of productive capacity has contributed to an overmastering desire on the one hand for the command of those raw materials without which modern productive processes are impotent, and on the other for markets in which to dispose of the surplus commodities produced in profusion by modern industrial processes. . . . The new Industrialism has largely contributed to a revival of commercial-nationalism, the neo-protectionism first popularised in Germany by Friedrich List. In this way the dream of the statesmen and economists of the Manchester School has been dismally dissipated. The early triumphs of Cobdenite Free Trade were hailed in England and to some extent elsewhere as the inauguration of a new era in international relations. Free Trade would render war if not impossible at least ridiculous. International commerce if not international law would silence arms. The

demolition of commercial barriers was to be the prelude to a universal peace. . . . But the dream faded. The fiscal policy of England found few imitators. So far from 'breaking their mailed fleets and armed towers,' the wise who reigned (to say nothing of the wise who thought) piled armaments on armaments. So far from loosing from commerce her latest chain, they raised higher and higher their protective tariffs. Statesmen of the 'realistic' school turned not to Adam Smith but to Friedrich List for inspiration. Not cosmopolitanism but economic nationalism became the fashionable philosophy. Under the conditions of the modern world a further consequence almost necessarily ensued. To the forces of industrialism and commercialism was added that of Imperialism—a desire for the extension of territory. The British Empire is largely the product less of actual conquest than of simple settlement—the occupation and colonisation of the waste places of the earth. But by the time that the European States system was completed, by the time that Germany and Italy had attained to nationhood, these waste places had been largely occupied. Consequently the desire for territorial expansion could be satisfied on the part of the late-comers only by war and conquest. *Welt-Politik* thus came to involve *Welt-macht*."—J. A. R. Marriott, *Europe and beyond*, pp. 2-4, 6-7, 12-15.

"The immediate reason for the Great War may have been a murder, a monarch, a clique, a policy, or a philosophy. The underlying cause was unquestionably a militant spirit of unrest. The preceding decades plainly heralded one of those great crises in Man's historic evolution, such as the Reformation and the French Revolution, which stand forth as periods of 'reevaluation of all values.' The twentieth century dawned upon a wornout age, foredoomed to speedy dissolution. The omens clearly betokened its approaching end. All the ancient ideals and shibboleths were withering before the fiery breath of a destructive criticism. Everywhere the solid crust of tradition cracked and split under the premonitory tremors of the impending cataclysm. The old was patently about to make way for the new. Many observers saw in all this the symptoms of decadence. They were wrong. A decadent age cannot regenerate itself; it must gain salvation from without. The Roman Empire awaited sullenly the cleansing fire of Barbarism. But twentieth century Europe was in no such supine mood. Never had the race manifested a more superabundant energy. Never was thought more active or action more intense. A scant half-century had transformed a semi-rural continent into a swarming hive of industry, gorged with goods, capital and men. Its adventurous sons quartered the solid earth of the outer world. Its no less adventurous intellects invaded the unknown realms of science and speculation to wring from nature her hidden treasures and enrich the mental life. Never was Europe so wealthy, so eager, so virile, as on the fateful First of August, 1914. But—"Man does not live by bread alone." All this prosperity, all this mighty edifice of material well-being, rested upon outworn and insecure foundations. The stupendous changes of the preceding half-century had created a mechanical environment differing not merely in degree but in kind from that of past generations. Material conditions had radically altered: the idealistic framework had remained fundamentally the same. The soul of Europe was like a youthful giant pinched in his swaddling-clothes. The archaic bonds galled and chafed at every turn. Hence the profound dissatisfaction, the universal unrest. Had the European been a weakling he would have resigned himself in fatalistic

apathy, conformed to the cramping of bands of the past, and sunk gradually into a bloodless mummy like the ancient Egyptian or the citizen of decadent Rome. However, the twentieth century European was no weakling. He was every inch a man, instinct with virile life and resolved to attain a worthy future. . . . It is this revolt against the past, this determination to throw off cramping limitations even before the new ideal goals are yet in sight, which gives the key to recent European history. Everywhere we see bursting forth increasingly acute irruptions of human energy: a triumph of the dynamic over the static elements of life; a growing preference for violent and revolutionary, as contrasted with peaceful and evolutionary, solutions, running the whole politico-social gamut from 'Imperialism' to 'Syndicalism.' Everywhere we discern the spirit of unrest setting the stage for the final catastrophe. Although a catastrophe was inevitable, its exact nature was up to the last moment somewhat uncertain. For instance, it might conceivably have taken the form of a series of local convulsions within the various European state bodies. When the Great War began England was actually on the verge of civil strife, Russia was in the throes of an acute social revolt, Italy had just passed through a 'Red Week' threatening anarchy, and every European country was suffering from grave internal disorders. It was a strange, nightmarish time, that early summer of 1914, today quite overshadowed by subsequent events but which later ages will assign a proper place in the chain of world-history. However, it is through the weakest spot in the earth-crust that the pent-up lava bursts its way, and since the international situation was the most dangerous point of Europe's instability it was here that war's eruption took place. The story of the events leading up to the Great War has been told and re-told ad nauseam, and need not here be repeated. We recollect all the moves in the diplomatic game. We remember the varied setting of the historic background: the rivalry of Briton and Teuton, the feud of Teuton and Slav, the vendetta of Gaul and German, the Roman dream of Italy, the Balkan bear-garden, the awakening East. This . . . is not a story of current events. It is a study of Europe's state of mind. The point here emphasized is Europe's incredibly volcanic psychology when the cataclysm began."—T. L. Stoddard, *Present-day Europe*, pp. 3-6.—See also WORLD WAR: Causes: Indirect.

New map of Europe.—Before and after the World War.—"The easiest way to visualise [the change in the map of Europe, as a result of the war] is to draw up a bare list of the states of Europe in July, 1914, and in July, 1919, respectively. On the eve of war there were three republics, four empires (including a bevy of subsidiary reigning families), thirteen kingdoms, and the new-fledged principality of Albania. Since then an actual majority of the thrones has gone, three of the four Imperial dynasties have been overthrown, and with them the twenty odd German sub-dynasties. The two operetta dynasties of the Balkans (Montenegro and Albania) have shared the same fate; two others (the Bulgarian and the Greek) remain on sufferance. Of the four empires, the greatest has been severely curtailed after one of the most dramatic reversals of fate in all history. Two (Austria-Hungary and Turkey) have been dissolved into their component parts; while the fourth, though there is good hope of its ultimate recovery from anarchy and ruin, can never again assume its old imperialistic and centralist form. . . . [In 1919] the list runs—twelve kingdoms (Britain, Spain,

Italy, Belgium, Holland, Denmark, Norway, Sweden, Greece, Jugoslavia, Roumania, Bulgaria); one nominal empire (Turkey); ten republics (France, Switzerland, Portugal, Russia, Germany, German-Austria, Czecho-Slovakia, Hungary, Poland, Finland) and a number of nebulous formations whose fate is still in the balance, but most of which can only exist on a republican basis."—R. W. Seton-Watson (*New Europe*, July 31, 1919, p. 50).—See also WORLD WAR: Map of Europe at outbreak of war.

New balance of powers.—Re-adjustment of the states of Europe.—Purpose of the new "balance."—The Great Powers.—"On the ruins of Germany, Austria-Hungary, and Russia, a bewildering transformation had taken or was taking place. Germany had lost, partly permanently and partly for fifteen years, some 7,000,000 of her population, and some 37,000 square miles of territory. Austria and Hungary had become small agricultural countries, encircling huge half-disused capital cities. Two wholly new states had been created by the direct action of the victorious Powers—Poland and Czechoslovakia. Two other states—Roumania and Jugoslavia—had been so greatly enlarged that their pre-war dimensions seemed the mere nucleus of those to which they had now attained. Other states, again, had arisen out of the border-lands of the Czar's Empire, in consequence of the great revolutionary upheaval of 1917. . . . Certain shadowy political entities [have arisen], such as the Republic of Azerbaijan and the independent state of Arabia, testifying rather to the ingenuity of imperialist statesmen than to any indigenous growth of the national spirit. But even in the case of the new states possessing some real foundation in national consciousness, the frontiers were not finally settled; the new political unit was a rough sketch, rather than a finished picture. . . . The political system of Europe, in so far as any such system was emerging at all, was the old 'Balance of Power' in a new form. That ancient principle of foreign policy had been consistently advocated by the *Times* in England; and with more brilliance and logic by the Chauvinist press of France, which had poured open scorn on the new-fangled principles of 'nationality' and 'public right.' The phrase is meaningless, of course, if literally interpreted; but it is sufficiently clear if taken in its accepted interpretation, as meaning the greatest possible tilting of the balance in one direction, or in other words, an overwhelming preponderance of power. What gave a new form to the 'balance' now established, was that it was designed to resist, not one dangerous force, but two—the resentment of beaten enemies and the march of revolutionary Socialism. The real power of the new combination was wielded, during the year following the Armistice, by four states. Great Britain, America, France, and Japan—the only fully-armed Powers still standing erect amid the ruins—with a large group of satellites. The composition of this group varied from time to time, but Poland, Czechoslovakia, and Jugoslavia were its most valuable members. A more equivocal position had to be assigned to Italy and Roumania. The former had claims which could not be satisfied; she was in a state of thinly-veiled war with Jugoslavia; and she was from time to time coquetting with Germany. Roumania had begun by quarrelling with Jugoslavia over the pos-

session of the Banat of Temesvar. She then refused to accept the frontier with Hungary which was laid down in the Allied Armistice (November 3, 1918), and successfully insisted upon a more extended occupation of territory. She finally marched upon Buda-Pesth in flat defiance of 'Paris.' . . . None the less, Roumania still constituted an island of capitalist domination in the increasingly 'Bolshevist' South-Eastern corner of Europe, and as such could still be regarded as, potentially at any rate, an important factor in the 'balance.'"—C. R. and D. F. Buxton, *The world after the war*, pp. 20-21, 28, 42-44.

League of Nations foundation of peace treaty.—Early steps in League movement.—Purpose of League.—"The whole of the cement for the vast edifice erected with so much labor by the diplomats of Paris is provided by the Covenant of the League of Nations. . . . Whether the procedure adopted was the best; whether it was wise to elaborate the Covenant in the text of the Treaties of Peace . . . are questions on which there is room for differences of opinion. . . . But as things are, the whole structure rests to a large extent upon the observance of the Covenant. . . . Ever since the final dissolution of the unified system, in Church and State, bequeathed to the world by the Roman Empire ever since the emergence of the nation-State, and the evolution of a European polity based upon the recognition of the independence and equal rights of a number of separate States, men have been feeling after the discovery of some principle or device which should redeem Europe from the condition of international anarchy to which it seemed to be committed by the predominance of the nation-state. *Le nouveau Cynée* of Emérec Crucée; the *Great Design* of Henri IV, or of his minister, Sully; the *De Jure Belli et Pacis* of Hugo Grotius (1625); William Penn's *Essay towards the Present and Future Peace of Europe* (1693); the famous *Profit de traité, pour rendre la paix perpétuelle* of . . . Alibé de Saint-Pierre (1713); Immanuel Kant's essay on Perpetual Peace (1795)—all these contain one or more anticipations of the ideas which have taken shape in the covenant of the League of Nations; they all represent attempts—mostly made after long periods of prolonged war—to escape from a state of chaos and war and to discover some basis for a social compact among the nations which should restore to the world the supreme blessing of peace; they all sought to substitute for the rude arbitrament of war the procedure of an international court and the sanctions of international law. To not one of these schemes was there given a chance of practical application. The first practical attempt to organize peace was made by the Czar Alexander I. and took shape in the Holy Alliance of 1815. That attempt . . . founded upon the rock of intervention and the reason of the difficulty of discerning between external and internal affairs. . . . Can a League of Free Nations avoid the pitfall in which the Alliance of Autocrats was engulfed? Is it possible to reconcile the idea of an international Polity with the adequate recognition of the rights of individual nationalities? [These and other questions it is the task of the League of Nations to answer.] The League of Nations represents an attempt to organize the world against war. The task it essays is obviously one of supreme difficulty; the machinery of the League is at present embryonic, its members are painfully feeling their way. The ideals it professes offer an easy butt to the cynic and the pessimist. Yet who but the cynic would deny to the experiment, admittedly doubtful, a chance of demonstrating, if not its success, at least its failure?"—J. A. R. Mar-

riott, *Europe and beyond*, pp. 319, 322-324.—See also LEAGUE OF NATIONS.

**Economic aftermath.**—Lack of employment, profiteering and disillusionment of the soldier. — **Revolutionary organizations formed.**—Economic exhaustion after the war.—“The closing weeks of 1918 were a time of triumph for the peoples of the victorious states. Hostilities had ceased on November 11th . . . But the rosy colours of the picture soon began to fade. . . Prosperity did not revive. [For a time] the cost of living remained as high as before, and in some cases actually rose. While there was a falling off in the volume of employment directly caused by the War, the industries of peace did not revive. The wrath of the public was turned against the ‘profiteers,’ and hasty measures were taken to check their operations. But the causes of the continued distress lay far deeper. Though the guns were silent in the main theatre of war, the conditions of war had not disappeared. British troops were still serving abroad at the beginning of 1919 in Germany, Austria, Constantinople, Salonica, the Dobruja, Albania, Transcaucasia, Palestine, Syria, Asia Minor, Mesopotamia, Persia, Siberia and Russia. At home, the ‘sacred union’ of classes in the War, so far from abolishing the bitterness of class feeling, had been followed by a reaction in which that bitterness was accentuated. The discharged soldier was filled with indignation on finding that the hero of the battlefield was a very different person when he doffed his khaki, and returned to the bench or the mine or the office-stool. By the end of the year, the so-called ‘industrial unrest’—the railway strike in Britain, the steel strike in America, the transport and engineering strikes in France—had seriously alarmed the supporters of law and order. The French Socialist Party became each month more revolutionary in tone. In Italy the internal situation was admittedly revolutionary. The weakest of the great Allies, Italy nevertheless maintained the largest army, for the simple reason that she dared not demobilise it. The ‘arditi,’ originally the picked storming troops, had become a kind of political organization, utilised by the reactionary parties to overawe the mob. The War had not left the British Empire unaffected. Formidable risings had taken place in India and in Egypt. At the very doors of the mother-country, Ireland had risen in revolt. At the same General Election at which Britain expressed its satisfaction at the successful issue of the War, Ireland returned an overwhelming majority pledged to support an independent Irish Republic. The country was held down, under martial law, by some 100,000 British troops. . . Its origin, of course, was to be found in the economic exhaustion of the War. The immense destruction of capital values in houses, factories, mines, railways, ships, forests, and the like; the diversion of twenty millions of men from productive to unproductive labour; the blocking of the accustomed channels of international trade; these must in any case have reduced the countries concerned to poverty. But the exhaustion of the War was a cause which affected the victors as well as the vanquished; and if there had been no other, the difference between the two would have been comparatively small. ‘The enemy ‘collapsed,’ said Mr. Hoover, the head of the American Food Administration, ‘not only from military and naval defeat, but from total economic exhaustion; in this race to economic chaos, the European Allies were not far behind.’ . . . And the effects of such a policy [of economically crushing the enemy] could not be

confined to those against whom it was primarily directed. It had its repercussions upon all the neighbouring peoples, and created a havoc which involved enemies, neutrals, and friends alike. Its chief instrument was the blockade of Germany, Austria, Hungary, Bulgaria, and Soviet Russia.”—C. R. and D. F. Buxton, *The world after the war*, pp. 16-18, 67, 68.—See FRANCE: 1918-1920, and after; GERMANY: 1919 (August-November), and after; etc.

**Far-reaching effects of the World War.**—**Outlook in 1921 and 1922.**—Financial status of the nations.—**Orgy of paper money making.**—“People are just beginning to understand that the break-up of the political system of Europe in 1914 was a bigger, a more complex and a more prolonged process than appeared when the split took place. We now know that the armed conflict during the four years that followed was but the first act in a drama destined to extend its *mise en scène* and to complicate its plot until the whole world became its stage and all its peoples actors. New cracks continue to break up the old system into a variegated pattern of disorder, as the shock of the international struggle spreads to outlying areas and strikes into the internal structure of the several nations, making fresh fissures in their social-economic fabric. States and their constitutions, the ownership of property, the control of industry and the prevailing methods of distributing its product, every established institution, Church, Class, Party, down to the primordial unit, the Family, are subjected to new disruptive strains, and their affrighted guardians are fumbling after schemes of structural repair. The reason why they fumble is that they have failed to take account of certain important revelations which the tumultuous events of these years have made.”—J. A. Hobson, *Problems of a new world*, p. v.—“Is there anyone who still remembers Europe in the first months of 1914 or calls to mind the period which preceded the first year of the War? It all seems terribly remote, something like a prehistoric era, not only because the conditions of life have changed, but because our viewpoint on life has swerved to a different angle. Something like thirty million dead have dug a chasm between two ages. War killed many millions, disease accounted for many more, but the hardest reaper has been famine. The dead have built up a great cold barrier between the Europe of yesterday and the Europe of to-day. We have lived through two historic epochs, not through two different periods. Europe was happy and prosperous, while now, after the terrible World War, she is threatened with a decline and a reversion to brutality which suggest the fall of the Roman Empire. . . More than two-thirds of Europe is in a state of ferment, and everywhere there prevails a vague sense of uneasiness, ill-calculated to encourage important collective works. We live, as the saying is, ‘from hand to mouth.’ . . . The great conflict which has devastated Europe and upset the economic conditions of the world . . . has not only been the greatest war in history, but in its consequences it threatens to prove the worst war which has ravaged Europe in modern times. After nearly every nineteenth-century war there has been a marked revival of human activity. But this unprecedented clash of peoples has reduced the energy of all; it has darkened the minds of men, and spread the spirit of violence. Europe will be able to make up for her losses in lives and wealth. Time heals even the most painful wounds. But one thing she

Maps prepared specially for the NEW LARNED  
under direction of the editors and publishers.

has lost which, if she does not succeed in recovering it, must necessarily lead to her decline and fall: the spirit of solidarity. After the victory of the Entente the microbes of hate have developed and flourished in special cultures, consisting of natural egotism, imperialism, and a mania for conquest and expansion. . . . The sentiment of nationality, twisted and transformed into nationalism, aims at the subjugation and depression of other peoples. No civilized co-existence is possible where each nation proposes to harm instead of helping its neighbour. The spread of hatred among peoples has everywhere rendered more difficult the internal relations between social classes and the economic life of each country. . . . This tremendous war . . . has deeply perturbed the very life and existence of the victors. It has not produced a single manifestation of art or a single moral affirmation. For the last seven years [1914-1921] the universities of Europe appear to be stricken with paralysis: not one outstanding personality has been revealed. In almost every country the War has brought a sense of internal dissolution: everywhere this disquieting phenomenon is more or less noticeable. . . . Insurmountable barriers to the commerce of European nations are being created. People work less than they did in pre-war times, but everywhere a tendency is noticeable to consume more. Austria, Germany, Italy, France are not different phenomena, but different manifestations and phases of the same phenomenon. Before the War Europe, in spite of her great sub-divisions, represented a living economic whole. Today there are not only victors and vanquished, but currents of hate, ferments of violence . . . a situation which renders production, let alone its development and increase, utterly impossible. . . . The problem with which modern statesmen are confronted is very simple: can Europe continue in her decline without involving the ruin of civilization? And is it possible to stop this process of decay without finding some form of civil symbiosis which will ensure for all men a more human mode of living? . . . We have before us a problem, or rather a series of problems, which call for impartiality and calm if a satisfactory solution is to be arrived at. . . . Europe, which was the creditor of all other continents, has now become their debtor, . . . her working capacity has greatly decreased, chiefly owing to the negative change in her demographic structure. In pre-war times the ancient continent supplied new continents and new territories with a hardy race of pioneers, and held the record as regards population, both adult and infantile. . . . All this has changed considerably for the worse. . . .

"The United States is anxious to get rid, as far as possible, of European complications and responsibilities; France follows methods with which Great Britain and Italy are not wholly in sympathy, and it cannot be said that the three Great Powers of Western Europe are in perfect harmony. There is still a great deal of talk about common ends and ideals, and the necessity of applying the treaties in perfect accord and harmony, but everybody is convinced that to enforce the treaties, without attenuating or modifying their terms, would mean the ruin of Europe and the collapse of the victors after that of the vanquished. . . . A keen contest of nationalisms, land-grabbing and cornering of raw materials renders friendly relations between the thirty States of Europe extremely difficult. The most characteristic examples of nationalist violence have arisen out of the War, as in the case of Poland and other newborn States, which pursue vain dreams of empire while on the verge of dissolution through sheer lack of vital strength and energy, and

becoming every day more deeply engulfed in misery and ruin. . . . How many are the States of Europe? Before the War the political geography of Europe was almost tradition. To-day every part of Europe is in a state of flux. The only absolute certainty is that in Continental Europe conquerors and conquered are in a condition of spiritual, as well as economic, unrest. It is difficult indeed to say how many political unities there are and how many are lasting, and what new wars are being prepared, if a way of salvation is not found by some common endeavour to install peace, which the peace of Paris has not done. . . . The situation of Russia is so uncertain that no one knows whether new States will arise as a result of her continuous disintegration, or if she will be reconstructed in a solid, unified form, and other States amongst those which have arisen will fall. Without taking into account those traditional little States which are merely historical curiosities, as Monaco, San Marino, Andorra, Monte Santo, not counting Iceland as a State apart, not including the Saar, . . . but considering Montenegro as an existing State, Europe probably comprises thirty States. Some of them are, however, in such a condition that they do not give promise of the slightest guarantee of life or security. Europe has rather Balkanized herself: not only the War came from the Balkans, but also many ideas, which have been largely exploited in parliamentary and newspaper circles. . . . The historical procedure before the War was towards the formation of large territorial unities; the *post-bellum* procedure is entirely towards a process of dissolution, and the fractionizing, resulting a little from necessity and a little also from the desire to dismember the old Empires and to weaken Germany, has assumed proportions almost impossible to foresee. . . . So the balance-sheet of the peace. [in 1921] after three years from the armistice—that is, three years from the War—shows on the whole a worsening of the situation. The spirit of violence has not died out, and perhaps in some countries not even diminished; on the other hand the causes of material disagreement have increased, the inequality has augmented, the division between the two groups has grown, and the causes of hatred have been consolidated. An analysis of the foreign exchanges indicated a process of undoing and not a tendency to reconstruction. . . .

"Not only is the situation of Europe in every way uncertain, but there is a tendency in the groups of the victors on the Continent of Europe to increase the military budgets. The relationships of trade are being restored only slowly; commerce is spoken of as an aim. In Italy the dangers and perils of reopening trade with Germany have been seriously discussed; customs duties are raised every day; the industrial groups find easy propaganda for protection. . . . None of the countries which have come out of the war on the Continent have a financial position which helps toward a solid situation. All the financial documents of the various countries, which I have collected and studied with great care, contain enormous masses of expenses which are the consequences of the War; those of the conquering countries also contain enormous aggregations of expenses which are or can become the cause of new wars. . . . The conquered countries have not actually any finance. Germany has an increase of expenses which the fall of the mark renders more serious. In 1920 she spent not less than ninety-two milliards, ruining her circulation. How much has she spent in 1921? Austria and Hungary have budgets which are simply hypotheses. The . . . Austrian budget for 1921, assigned a sum of seventy-one milliards of crowns for expenses, and this for

a poor country with 7,000,000 inhabitants. A detailed examination of the financial situation of Czecho-Slovakia, of Rumania, and of the Serbo-Croat States gives results which are at the least alarming. Even Greece, which until yesterday had a solid structure, gallops now [1921] in a madness of expenditure which exceeds all her resources, and if she does not find a means to make peace with Turkey she will find her credit exhausted. . . . The situation of the exchange since the War has not sensibly bettered even for the great countries, and it is extraordinarily worse for the other countries. In June, 1921, France had a circulation of about thirty-eight milliards of francs, Belgium six milliards of francs, Italy of about eighteen milliards; Great Britain, between State notes and Bank of England notes, had hardly £434,000,000 sterling. . . . But the conquered countries have so abused their circulation that they almost live on the thought of it . . . as in fact, not a few of the conquering countries and those come out from the War do. Germany has passed eighty-eight milliards, and is rapidly approaching one hundred milliards. Now, when one thinks that the United States, after so many loans and after all the expenses of the War, has only a circulation of 4,557,000,000 dollars, one understands what difficulty Germany has to produce, to live, and to refurbish herself with raw materials. Only Great Britain of all the countries in Europe which have issued from the War has had a courageous financial policy. Public opinion, instead of pushing Parliament to financial dissipation, has insisted on economy. If the situation created by the War has transformed also the English circulation into unconvertible paper money, this is merely a passing fact. If the sterling loses on the dollar—that is, on gold—given the fact that the United States of America alone now have a money at par, almost a quarter of its value, this is also merely a transitory fact. Great Britain has the good sense to curtail expenses, and the sterling tends always to improve. France and Italy are in an intermediate position. Their money can be saved, but it will require energetic care and great economies, stern finance, a greater development of production, limitation of consumption, above all, of what is purchased from abroad. . . . Expressed on a per cental basis, the French franc [in 1921] is worth 47 centimes of the sterling and 36 of the dollar—that is to say, of gold. The Italian lira is worth 28 centimes of the sterling and 21 of the dollar. . . . France has a good many more resources than Italy: she has a smaller need of importations and a greater facility for exportations. But her public debt has reached 265 milliards, the circulation has well passed thirty-eight milliards, and they still fear to calculate amongst the extraordinary income of the budget the fifteen milliards a year which should come from Germany. Italy, with great difficulty of production and less concord inside the country, has a more true vision, and does not reckon any income which is not derived from her own resources. Her circulation does not pass eighteen milliards, and her debt exceeds by a little one hundred milliards. . . . As for the Austrian and Hungarian crowns, the Jugo-Slav crowns, the Rumanian lei, and all the other depreciated moneys, their fate is not doubtful, as their value is always descending, and the gold equivalent becomes almost indeterminate. . . . There is, then, the fantastic position of the public debts! They have reached now such figures that no imagination could have forecasted. France alone has a debt which of itself exceeds by a great deal all the debts of all the European States previous to the War: 265 milliards of francs. And Germany, the conquered country, has in her turn a debt

which exceeds 320 milliards of marks, and which is rapidly approaching 400 milliards. The debts of many countries are only recorded by feats of memory, because there is no practical interest in knowing whether Austria, Hungary, and especially Poland, has one debt or another, since the situation of the creditors is not a situation of reality. . . . All the States have increased their functions. So the discredit of the paper money and the Treasury bills which permit these heavy expenses in all the countries of Europe, even if in different degrees, is very great."—F. S. Nitti, *Peaceless Europe*, pp. 3-4, 16-23, 129-131, 183-187.—See also MONEY AND BANKING: Modern: 1914-1916; DEBTS, PUBLIC: World War and after; Problem of paying.

ALSO IN: *New Europe*, July 31, 1921.—*Problems of Europe* (Round Table, June, 1921).

"The war was not a contest between two similarly equipped belligerents. . . . It was a siege—a siege in which the besiegers won. And the condition of a besieged area, on the morrow of defeat, is economic exhaustion. Europe is an industrial continent. Her normal output of food-stuffs leaves one hundred million of her population unprovided for. The deficiency was met by imports from overseas, paid for out of the profits of trade and industry. Thus the siege, by cutting off central Europe from its overseas connection, upset the whole economy of the Continent, and the armistice found the blockaded area, a region extending from the occupied district of France to the Baltic republics and Constantinople, not only strictly rationed in respect to food-stuffs, but, what was far worse, denuded of the industrial raw materials needed to recuperate her economic life, and of the credit power needed to secure them. The issue of the war has proved once and for all that the world is now industrially interdependent, in that no single block of the earth's surface, if it is to maintain a civilized standard of life, to say nothing of an efficient system of defense, can dispense with materials drawn from all quarters of the globe; with the cotton of America and Egypt, the rubber of the tropics, the nickel of Canada, the copra of West Africa, the nitrates of Chile, and the jute of India. The growth of industrialism has made the world a single great society, and any action, such as the late war, which cuts off and isolates any one part of it, causes the severed member to wither. . . . No one of the states of continental Europe, we are told, is balancing its budget. How, then, are they meeting their expenses? By the aid of the printing-press. Some of them, like Germany, Austria, and Poland, are printing paper money on a huge scale; others, such as Czecho-Slovakia and Hungary, have attempted to set limits to the process. But the cumulative effect is undeniable. The public finances and the currencies of continental Europe are in inextricable confusion. But this does not mean that the countries themselves are in confusion or unable to do business with countries of stabler and less debased currency. The internal effect of paper money is to levy a tribute, for the benefit of the government, on all who possess such money or securities quoted in terms of it. In other words, it taxes the *ventier*, . . . automatically clipping piece after piece off every dollar that he possesses in the bank. . . . Central and east-central European countries are doing a large export business, so large that special anti-dumping legislation has been enacted against it in Great Britain, and they are doing it in terms of the currency of the countries to which the goods are sent, in dollars or sterling as the case may be. The same practice was followed by merchants in Central and South America in similar circumstances in times past. But if their citizens

can do good business and can undersell their Western competitors, it is obvious that the governments themselves cannot continue indefinitely to meet their obligations in this dangerously convenient manner. Some way must ultimately be found of disposing of this vast accumulation of paper-money and of putting the public finances of the European states once more on a sound basis. . . . For the last three or four generations, unmistakably since the eighteen-seventies, intermittently since 1848, the predominant 'progressive' force in European politics has been the socialist movement. It was a movement of town workmen protesting against the unfreedom and inhumanity of the growing industrial system, and its most resounding slogan was 'the class-war'—the war between the wage-earning class, 'the proletariat,' and the 'bourgeois,' or stock-holder, who owned the instruments and capital resources of production. It taught men to despise the appeal of nationality and patriotism, to recognize their common interest with 'wage-slaves' in all parts of the world, and to look forward with Messianic hope to a revolution which would sweep away the oppressors and establish the proletariat in the seat of power. . . . [But the war] involved an immense resurgence of the civic obligations, the traditional patriotism, latent in all classes, not least in the working class. Then, as a struggle proceeded, government control more and more superseded the well worn and much abused system of private management; and face to face with bureaucracy, the worker, always a conservative at heart, began to think more closely over the implications of socialization. Then after an intolerable strain, came 'the revolution,' bringing with it not only in Russia, but in Germany, in Austria, and in Hungary, governments manned by socialists. But they brought neither freedom nor happiness. They were, in fact, tied hand and foot by their dependence on overseas resources, and the 'comrades' from abroad showed no disposition to help them. Help came at length, through the despised machinery of capitalism, but it was help not to this or that class, but to employer and worker in a common need. Out of that common need is springing a common creed. Democratic, industrial thinkers in a Europe in which the *ventier* is prostrate and the relations of social classes have been transformed, are going back behind Karl Marx and his 'class struggle' to the great liberal prophet Mazzini, and finding in his gospel of industry as a cooperation in national service an inspiration for the life of their newly liberated communities."—A. E. Zimmern, *Economic prospect in Europe* (*Century Magazine*, Apr., 1922).

ALSO IN: E. R. Turner, *Europe, 1789-1920*, pp. 597-647.

Intellectual development.—Expansion of science.—International character of inventions.—Influence of economics.—Hope for the future.—“We are trying . . . to give some impression of the principal changes and developments of Western thought in what might roughly be called 'the last generation, [or the last half of the nineteenth and the opening years of the twentieth century]. . . . From the political point of view the two most impressive milestones, events which will always mark for the consciousness of the West the beginning and the end of a period, are no doubt the war of 1870 and the Great War which has just ended. . . . Nearly coincident with the political divisions there are important landmarks in the history of thought. During the 'sixties' . . . the Darwinian theory of development was gaining command in biology. To many thinkers there has appeared a clear connexion between that biological doctrine and the 'imperialism,' . . . which was so marked a feature of

the time. . . . Industrially the epoch is as clearly defined as it is in politics and science. For in 1871 . . . an act was passed [in England] . . . legalizing strikes and Trade Unions. And now at the end of the war, all over the world, society is faced by the problem of reconciling the full rights, and in some cases the extreme demands, of 'labour,' with democratic government and the prosperity and social union of the whole community. . . . In philosophy and literature a similar dividing line appears. In the 'sixties' Herbert Spencer was publishing the capital works of his system. The *Principles of Psychology* was published in 1872. This 'Synthetic Philosophy' has proved up to the present the last attempt of its kind, and with the vast increase of knowledge since Spencer's day it might well prove the last of all such syntheses carried out by a single mind. Specialism and criticism have gained the upper hand, and the fresh turn to harmony . . . is rather a harmony of spirit than an encyclopaedic unity such as the great masters of system from Descartes to Comte and Spencer had attempted before. In literature also the dates agree. Dickens, most typical of all early Victorians, died in 1870. George Eliot's last great novel, *Daniel Deronda*, was published in 1876. Victor Hugo's greatest poem, *La Légende des Siècles*, the imaginative synthesis of all the ages, appeared in the 'seventies.' . . . Here then is our period, marked in public affairs by a progress from one conflict, desperate and tragic, between two of the leading nations of the West, to another and still more terrible which swept the whole world into the maelstrom. . . . But it must be noted at once that these obvious landmarks, though striking, are in themselves superficial. . . . We may at least fairly treat them at starting simply as beaconhills to mark out the country we are traversing. . . . The first, and perhaps ultimately the weightiest, element we have to note is the continued and unexpected growth of science. Was there ever a more fertile period than the generation which succeeded Darwin's achievement in biology and Bunsen's and Kirchhoff's with the spectroscope? Both have created revolutions, one in our view of living things, the other in our view of matter. In physics the whole realm of radio-activity has come into our ken within these years, and during the same time chemistry, both organic and inorganic, has been equally enlarged. All branches of science in fact show a similar expansion, and a new school of mathematicians claim that they have recast the foundations of the fundamental science and assimilated it to the simplest laws of all thinking . . . Such an output of mental energy, rewarded by such a harvest of truth, is without precedent in man's evolution. No single generation before ever learnt so much not only of the world around it but also of the doings of previous generations. For since 1870 we have been living in an age as much distinguished for historical research as for natural science. . . . The material fruits of science are among our most familiar wonders—the motor-car, the aeroplane, wireless telegraphy. . . . All these things and the like are dependent upon the cooperation of a multitude of minds, the collective rather than the individual capacity of man. Men had dreamt for ages of flying, but it was not until the invention of the internal combustion engine that bird-like wings and the mechanical skill of man could be brought together and made effective. It is Humanity that flies, and not the individual man alone. The German Daimler, the French Levassor, are the two names which stand out most prominently in this later development of engineering as our own Watt and Stephenson stand in the history of the steam-

engine. Wireless telegraphy offers a similar story. Faraday, Maxwell, Hertz, Lodge, Marconi; the names are international. . . . In 1913, before even the League of Nations had been planned, Lord Bryce was telling an International Congress in London that 'the world is becoming one in an altogether new sense.' . . . The war, tragically as it has shaken this growing oneness of mankind, has not destroyed it. In some ways it has even stimulated growth. Against a background of blood and fire the League of Nations has been forced into actual being, and the long isolation alike of the ancient East and the youthful West has been broken down at last. . . . This war has been an accelerator of, not, as the Napoleonic, a brake upon, reform. Many reforms, especially in England, which had been long discussed and partly attempted before the war, were carried out with dispatch at its close. This was the case with education, with the franchise and with measures affecting the health, the housing, and the industrial conditions of the people. Comte, who died in 1857 just before our period, was perhaps the clearest voice in Europe to herald . . . the advance to international unity, and social reform within the State. It was he who, under the title of *Western Republic*, proclaimed the existence of a real unity of nations, whose business it was to strengthen themselves as a moral force, to act as trustees for the weaker people and lead the world. It was he who, in the phrase 'incorporation of the proletariat,' summed up all those social reforms in which we are immersed, which aim at making every citizen a full member of his nation."—F. S. Marvin, *Recent developments in European thought*, pp. 7-10, 13-14.

"Despite the strength of the nationalist idea, and the increased definition which it obtained during this period, the oneness of all European peoples was in every way being made clearer. Rapid and cheap communication made it easy for the peoples of every nation to become acquainted with their neighbours, and at the end of the nineteenth century practically every educated man travelled more widely than any but a few of the richest had done at the beginning of the century. Universal education, and the universal diffusion of a cheap Press, aided this process. All classes had—or could easily obtain—some knowledge of the principal features of each of the European states, and were daily informed of the principal events of current history: not very intelligently informed, perhaps; but it was a new thing that they should be informed at all. The greatest thinkers and imaginative writers of every country became the common possession of all the rest, and the influence of Ibsen, of Tolstoi, of Maeterlinck, of Anatole France was felt throughout Europe not only by the few, but by the vastly enlarged reading public of the world. Still more marked was this community of possession in the realms of science; the wonderful advance of the physical sciences during the nineteenth century has been a co-operative labour, in which it is impossible to disentangle the specific contribution of any individual nation, and the European character of scientific discussion had become so marked that every scholar of any eminence had found it indispensable to be, for the purposes of his daily work, tri-lingual, or at the very least bi-lingual. Students passed to and fro freely from the universities of one country to those of another. The knowledge and thought of the civilised world were a common possession to a degree never known since the days of the Roman Empire. This was the case also, though not quite so markedly, in the realms of political and social thought; for the political and social problems of all Europe, however varied the forms

they might assume, were eventually identical, being all equally the product of that process of industrialisation which, starting in England, had rapidly conquered the whole of Europe. The main political movements of the nineteenth century were in a remarkable degree international in character. This was true even of the nationalist movement, which was, in its earlier struggles, largely directed by cosmopolitan groups of exiles in London and Paris, who worked in harmony, and shared the same dreams and ideals. The simultaneity of the revolutionary outbreaks of 1848 forms a striking demonstration of the international character both of the nationalist and of the liberal movement, but the earlier risings of 1820 and 1830 were also linked up in a way which justified the contention of the reactionaries that they had to deal with a revolutionary agitation engineered in common for the whole of Europe. In the second half of the century this interchange of ideas, mainly conducted earlier by the middle classes, from among whom the preachers of nationalism and liberalism chiefly sprang, passed also to the artisan classes. There were conferences and common action between the trade unionists and the co-operative societies of all countries; English, French, German, Italian working-men met more and more frequently in congress, and were persuaded that they pursued a common cause, not limited by the bounds of any single state. The famous 'International,' which strove to give a common direction to the Socialist movement, was founded in London in 1867; and if it has not achieved much of a directly political character, it has emphasised the unity of all Europe among those classes which might be expected to feel it least, owing to the limitations imposed by circumstances upon their knowledge and range of thought. Europe, then—or rather, the whole civilised world—has become conscious of its unity in a way unparalleled in the earlier centuries of modern history, and to a degree unknown even in the Middle Ages. . . . But the most important sign and cause of this growing assimilation of the civilised world has been the immense activity of commerce and industry, which have undergone in the last half century an expansion and transformation of a magnitude that could never have been anticipated. No civilised people is now self-sufficient economically; each is dependent on all the rest. . . . The whole world has become a single vast and complex economic unit. Not only do the people of every country buy from and sell to the people of every other, but the industry and commerce of every country is in part financed by the capital of every other. So extraordinarily intertwined and interwoven are the financial concerns of all civilised states, that it has been possible for one school of thought to argue, with great plausibility, that war among these states had become all but impossible, and must, if it broke out, bring universal ruin and bankruptcy. Capital, they say, knows no country and no patriotism, but flows as by a law of nature whosoever it can be most remuneratively employed; and if international finance, dominated by a comparatively small number of men, seemed to present a great danger because of the power it wielded, at least it was tending, along with the international labour movement, to bind the modern industrial world into a single whole, within which wars of the old pattern for the aggrandisement of individual states must become more and more impossible."—R. Muir, *Nationalism and internationalism*, pp. 100-104.—"The West has committed itself to a general policy of education which aims at making every citizen a full partaker in the advance of the race. But it cannot be said that this policy has

yet been really tried. It is the acknowledged ideal to which in all Western countries partial steps have been taken, and the democracy, through their most enlightened leaders, will continue to press for its fulfilment. . . . Most of all, for the healing of the world is the greater soul needed, with a world consciousness, some knowledge, some sympathy, some hope for all mankind. On this enlargement of the soul, enlightened by science, we build the future. It is the crowning vision of the modern world, first sketched by Descartes, filled out and strengthened by the life and thought of three hundred years."—F. S. Marvin, *Recent developments of European thought*, pp. 23-24.

**EVANGELICAL ASSOCIATION.**—"Jacob Albright, originally a Lutheran, born in 1759, was the founder of the Evangelical Association. Near the close of the . . . [eighteenth] century he became an earnest revival preacher. He labored among the German-speaking population, and in 1800 formed a society of converts in Pennsylvania for 'social prayer and devotional' exercises every Sunday and every Wednesday night. This was the rise of the movement which resulted in the Evangelical Association. The first conference was held in 1807. This conference elected Jacob Albright a bishop. Two years later a church discipline very

similar to that of the Methodist Episcopal Church was published. Some years after the death of Bishop Albright (1808) the name Evangelical Association of North America was adopted. Previously to this his followers had been known as 'The Albright People,' or 'Albrights.' . . . Formerly the constituency of the church was almost entirely German; now it is largely English."—H. K. Carroll, *Religious forces of the United States*, pp. 139-140.—"A division in 1891 resulting in the organization of the United Evangelical Church took from the denomination a large number of ministers and members. This loss in membership has since been more than regained and at present efforts are being made for a reunion. . . . [In 1916, aside from its missions,] there were in Europe, connected with the Association, generally under the care of native preachers, 350 churches with 23,000 members; and in Canada, 124 churches, with 9,932 members. . . . The total membership for 1916 [in the United States] was given as 120,756."—*United States Census, Religious Bodies*, 1916, pt. 2, pp. 266-268.

**EVANGELICAL LUTHERAN CHURCH.** See LUTHERAN CHURCH: 1517-1852.

**EVANGELICAL PROTESTANT CHURCH OF NORTH AMERICA,** denomination formed in 1912, chiefly of independent German-American congregations of liberal faith. It is located mainly in Pennsylvania, Ohio, Indiana, Kentucky, Illinois, and Missouri. Statistics show thirty-seven churches of this denomination with 17,062 members in 1916.—*United States Census, Religious Bodies*, 1916, pt. 2, p. 272.

**EVANGELICAL SYNOD OF NORTH AMERICA, German.**—This name was given in 1877 to a union of several German Evangelical societies and synods. Since the beginning of the war with Germany, the word "German" has been dropped from the title. In 1916 there were 1,336 organizations of the Synod with 339,853 members.—*United States Census, Religious Bodies*, 1916, pt. 2, p. 307.

**EVANGELICAL UNION, German,** union of Protestant princes formed in 1608, and finally dissolved in 1621. See GERMANY: 1608-1618; 1621-1623.

**EVANGELISTIC ASSOCIATIONS.**—"Under this head are included various associations of churches [in the United States] which are more or less completely organized and have one general characteristic, namely, the conduct of evangelistic or missionary work. In a few cases they are practically denominations, but for the most part, while distinct from other religious bodies, they are dominated by the Evangelistic conception rather than by doctrinal or ecclesiastical distinctions. None of them is large, and some are very small and local in their character." The various associations of this nature listed in 1916 are the Apostolic Church, the Apostolic Christian Church, the Apostolic Faith Movement, the Christian Congregation, the Church of Daniel's Band, the Church of God as Organized by Christ, the Church Transcendent, Hephzibah Faith Missionary Association, the Holiness Methodist Churches, the Missionary Church Association, Peniel Missions, Pentecost Bands of the World, Pillar of Fire and the Voluntary Missionary Society in America. In 1916 there were a total of 208 organizations with 13,933 members.—*United States Census, Religious Bodies*, 1916, pt. 2, pp. 272-273.

**EVANS, Sir Arthur John (1851- ),** English archæologist. Excavated the prehistoric Palace of Knossos, 1900-1908. See ÆGEAN CIVILIZATION: Excavations and antiquities; Mycenaean area: Cretan area; ARCHÆOLOGY: Method and scope.

**EVANS, Edward Radcliffe Garth Russell** (1881- ), English explorer, with Scott's expedition to the South Pole. See ANTARCTIC EXPLORATION: 1910-1913.

**EVANS, Mary Ann.** See ELIOT, GEORGE.

**EVANS, Oliver** (1755-1819), American inventor. See AUTOMOBILES: 1780-1824.

**EVANS, Robley Dunglison** (1846-1912), American naval officer. See U. S. A.: 1907-1909.

**EVAN-THOMAS, Sir Hugh** (1862- ), British vice-admiral. At the battle of Jutland, he commanded the 5th Battle Squadron. See WORLD WAR: 1916. IX. Naval operations: a; a, 1; a, 9.

**EVAPORATOR: Use in refrigeration.** See INVENTIONS: 19th century: Refrigeration.

**EVARTS, William Maxwell** (1818-1901), American lawyer and statesman; chairman New York delegation to National Republican convention, 1860; counsel for President Johnson in the impeachment trial, 1868; attorney-general of the United States, 1868-1869; counsel for the United States on the "Alabama claims" at Geneva, 1872; counsel for the Republican party before the Electoral Commission, 1877; secretary of state under President Hayes, 1877-1881; delegate to the International Monetary Conference, 1881; member United States Senate, 1885-1891.

**EVEGNEE, fort near Liège, Belgium, captured by the Germans in 1914.** See WORLD WAR: 1914: I. Western front: b.

**EVENING SCHOOLS.** See EDUCATION: Modern developments: 20th century: Evening schools.

**EVER VICTORIOUS ARMY, force in China directed against the revolutionists in the Taiping rebellion.** See CHINA: 1850-1864.

**EVEREST, Mount, the highest mountain in the world.** It is a peak of the Himalayas, situated in Bengal, over 29,000 feet high. Its name is derived from Sir George Everest, British surveyor and geographer, who surveyed it and measured it by trigonometry in 1841. It has never been scaled. A party of scientists made the attempt in 1921-1922, but failed.

**EVERETT, Edward** (1794-1865), American orator, scholar and statesman; professor of Greek literature at Harvard, 1819-1825; editor of *North American Review*, 1820-1840; governor of Massachusetts, 1836-1840; minister plenipotentiary to Great Britain, 1841-1845; president of Harvard, 1846-1849; secretary of state under Fillmore, 1852; member of the Senate, 1853-1854.—See also U. S. A.: 1863 (November).

**EVERSHED, Thomas, American electrical discoverer.** See ELECTRICAL DISCOVERY: Electric power: 1896-1921.

**EVERT, Alexei.** See EWARTS.

**EVERTSEN, Cornelius** (fl. 1673), Dutch admiral in the reconquest of New Netherlands. See NEW YORK: 1673.

**EVESHAM, Battle of** (1265), battle which finished the civil war in England known as the Barons' War. It was fought Aug. 3, 1265, and Earl Simon de Montfort, the soul of the popular cause, was slain, with most of his followers. See BIRMINGHAM, ENGLAND: 1265-1266; ENGLAND: 1216-1272.

**EVICTED TENANTS BILL.** See IRELAND: 1907.

**EVICCTIONS, Irish.** See ABSENTEEISM; BOYCOTT: Origin; IRELAND: 1847-1860; 1880.

**EVIDENCE.** See COMMON LAW: 1450; 1456; 1470; 1650-1700; 1750-1800; 1792; 1848; 1851.

**EVOLUTION: Definition.**—According to Herbert Spencer "Evolution is an integration of matter and concomitant dissipation of motion, during which the matter passes from relatively indefinite,

incoherent homogeneity to a relatively definite, coherent heterogeneity; and during which the retained motion undergoes a parallel transformation."—S. Herbert, *First principles of evolution*, p. 306.—"It is customary to divide the whole realm of nature into two great parts: the inorganic and the organic. The former comprises all lifeless things, as stones, rocks, planets, suns, etc.; the latter contains the living beings with more or less differentiated parts (organs), from the lowest plants to the highest animals, including man. In addition . . . there are certain other phenomena, such as constitute the social life of a community, which are the result of the aggregation of a number of organisms . . . [and which] were called by Herbert Spencer 'superorganic.'"—*Ibid.*, p. 5-6.—"The general theory of organic evolution undertakes to explain by natural processes the origin of the existing world of living things, and in particular it seeks to account for three classes of phenomena, namely, (1) the diversities (variations, species, genera, etc.) of the living world; (2) progressive organization (increasing complexity of structure and function) from the lowest to the highest organisms and (3) the fitnesses (adaptations, etc.) of living things. Its aim is nothing less than a mechanistic explanation of the origin, development and present state of the entire world of life."—E. C. Conklin, *Mechanism of evolution in the light of heredity and development* (*Scientific Monthly*, Dec., 1910, p. 481).—See also EUGENICS: Meaning and purpose.

**Basis of the theory of organic evolution.**—"The general theory of organic evolution—for so long conveniently called the 'doctrine of descent'—has a tripod basis. (a) It rests . . . on definitely 'historical' evidence—on what can be actually proved in regard to ancestry. Thus recent discoveries have made the lineage of the elephant convincingly clear, equalling, if not surpassing, in evidential value that of the horse itself. (b) It rests also upon anatomical evidence, on the disclosure of structural resemblances, often beneath a mask of functional differences, which are in many cases so intimate, so thoroughgoing, so detailed, that it is impossible to doubt that they spell affiliation. (c) It rests thirdly upon embryological evidence, for the individual development seems almost to go out of its way to reveal the evolution of the race. The familiar development of frogspawn into tadpoles and froglings is in some respects almost startling in its recapitulation of the evolution of the Amphibian race from fish ancestors—an evolution vouched for by the data of palaeontology and comparative anatomy. . . . The anatomical data are of three kinds at least: (1) there is the recognition of homologies, *i. e.*, of deeply-rooted structural and developmental similarities; (2) there are the facts of classification, that species fades into species, that genus is linked to genus, that tentative genealogical trees are possible; and (3) there is the occurrence of vestigial structures, of which there is no feasible interpretation except in terms of past history."—P. Geddes and J. A. Thomson, *Evolution*, pp. 40-41.—See also EUGENICS: Meaning and purpose.

ALSO IN: H. W. Conn, *Method of evolution*.—R. S. Lull, *Organic evolution*.—M. M. Metcalf, *Organic evolution*.

**Explanation of the evolutionary hypothesis.**—"We are now in a position to observe that the theory of organic evolution is strongly recommended to our acceptance on merely antecedent grounds, by the fact that it is in full accordance with what is known as the principle of continuity. By the principle of continuity is meant the uniformity of nature, in virtue of which the many and

varied processes going on in nature are due to the same kind of method, i. e., the method of natural causation. To begin with, we must remember that the fact of evolution—or, which is the same thing, the fact of continuity in natural causation—has now been unquestionably proved in so many other and analogous departments of nature, that to suppose any interruption of this method as between species and species becomes, on grounds of such analogy alone, well-nigh incredible. For example, it is now a matter of demonstrated fact that throughout the range of inorganic nature the principles of evolution have obtained. It is no longer possible for any one to believe with our forefathers that the earth's surface has always existed as it now exists. For the science of geology has proved to demonstration that seas and lands are perpetually undergoing gradual changes of relative positions—continents and oceans supplanting each other in the course of ages, mountain-chains being slowly uplifted, again as slowly denuded, and so forth. Moreover, and as a closer analogy, within the limits of animate nature we know it is the universal law that every individual life undergoes a process of gradual development; and that breeds, races, or strains, may be brought into existence by the intentional use of natural processes—the results bearing an unmistakable resemblance to what we know as natural species. Again, even in the case of natural species themselves, there are two considerations which present enormous force from an antecedent point of view. The first is that organic forms are only then recognised as species when intermediate forms are absent. If the intermediate forms are actually living, or admit of being found in the fossil state, naturalists forthwith regard the whole series as varieties, and name all the members of it as belonging to the same species. Consequently it becomes obvious that naturalists, in their work of naming species, may only have been marking out the cases where intermediate or connecting forms have been lost to observation. . . . In other words, it was believed, and in many cases known, that if we could go far enough back in the history of the earth, we should everywhere find a tendency to mutual approximation between allied groups of species; so that, for instance, birds and reptiles would be found to be drawing nearer and nearer together, until eventually they would seem to become fused in a single type; that the existing distinctions between herbivorous and carnivorous mammals would be found to do likewise; and so on with all the larger group-distinctions, at any rate within the limits of the same sub-kingdoms. But although naturalists recognised this even in the pre-Darwinian days, they stoutly believed that a great exception was to be made in the case of species. . . . Mr. Wallace, who is one of our greatest authorities on geographical distribution, has laid it down as a general law, applicable to all the departments of organic nature, that, so far as observation can extend, "every species has come into existence coincident both in space and time with a pre-existing and closely allied species."—G. J. Romanes, *Darwin and after Darwin*, v. 1, pp. 15-22.

Historical development of the idea.—Greek physicists and philosophers.—Lucretius.—Early Christians.—Influence of botanical classification and geological discovery.—Lamarck.—Lyell.—Wallace, Darwin, Huxley and Haeckel.—Historical and social evolution.—"While it is true, as Prof. H. F. Osborn puts it, that "before and after Darwin" will always be the *ante et post urbem conditam* of biological history,' it is also true that the general idea of organic evolution is

very ancient. In his admirable sketch *From the Greeks to Darwin*, Prof. Osborn has shown that several of the ancient philosophers looked upon Nature as a gradual development and as still in process of change. In the suggestions of Empedocles, to take the best instance, there were 'four sparks of truth,—first, that the development of life was a gradual process; second, that plants were evolved before animals; third, that imperfect forms were gradually replaced (not succeeded) by perfect forms; fourth, that the natural cause of the production of perfect forms was the extinction of the imperfect.' But the fundamental idea of one stage giving origin to another was absent. As the blue Aegean teemed with treasures of beauty and threw many upon its shores, so did Nature produce like a fertile artist what had to be rejected as well as what was able to survive, but the idea of one species emerging out of another was not yet conceived. Aristotle's views of Nature seem to have been more definitely evolutionist than those of his predecessors, in this sense, at least, that he recognised not only an ascending scale, but a genetic series from polyp to man and an age-long movement towards perfection. 'It is due to the resistance of matter to form that Nature can only rise by degrees from lower to higher types.' 'Nature produces those things which, being continually moved by a certain principle contained in themselves, arrive at a certain end.'—Haeckel, Thomson, Weismann and others, *Evolution in modern thought*, pp. 3-4.—Among Greek thinkers the earlier Ionian physicists, including Thales, Anaximander, and Anaximenes, sought to explain the world as generation from a primordial matter. "Among the earliest of these was Anaximander, who lived 600 years before Christ. He thought that the earth was at first a fluid." The land, according to his theory, gradually appeared; man came from the water in the form of a big fish, which gradually acquired necessary limbs and organs; and animals and plants also developed from sea forms. "One hundred and fifty years later Empedocles announced a new thought. . . . In one respect . . . [his] opinion foreshadowed our later idea. It suggested that the more perfect animals had arisen out of the less perfect and that the change came gradually. Then came Anaxagoras, who was the first to believe that there was intelligent design back of the creation of animals and plants. He thought there had originally been a slime in which were the germs of all the later plants, animals, and minerals, mixed in a chaos. Gradually order arose." Out of the mixture, he thought, came the germs which developed into minerals, air, and ether; from the air came the germs of vegetation; and from the ether the germs of animals and men. "The greatest scientific thinker of early Greece was Aristotle. He . . . knew better than any other man of his times the . . . seaweeds and . . . marine animals. He was the first to think of them as a linked series, the higher developing out of the lower under the pressure of what he called a perfecting principle. . . . The Latin poet, Lucretius, wrote a poem on 'The Nature of Things.' . . . He describes how in the early years the beginnings of things . . . moved about among each other at first in utter confusion, each trying itself with the other. After many trials the proper members came together. When they had been thus placed the warmth of the sun shining down upon the earth helped the earth to reproduce the same sort of creatures." St. Augustine, one of the greatest of the fathers of the early church, declared that in his opinion the account of creation, as found in Genesis, simply meant that "in the beginning God planted in chaos the seed that afterward sprang up

into the heavens and the earth." Thomas Aquinas, at a later period, further developed this idea. More than four hundred years later, "the philosopher, Leibnitz, believed in an orderly creation that had advanced by regular degrees, and that the lower animals had thus developed into the higher. . . . By the middle of the eighteenth century men had begun to think more fearlessly." Immanuel Kant, in his "General History of Nature and Theory of the Heavens" recognized the likenesses between animals, already pointed out by Buffon. He felt sure that there was a relationship among all animals, and "tried hard to conceive of some natural underlying cause by which all could have come about."—S. C. Schmucker, *Meaning of evolution*, pp. 8-11, 13.—"These early suggestions were merely speculative. No attempt was made to support the theory by evidence, or to gather a systematic body of observed facts which demanded explanation. . . . Indeed, until the sciences of Zoology and Botany

JEAN BAPTISTE DE LAMARCK

had been gradually built up and a great body of observed facts had been gathered and arranged in orderly manner, no other procedure was possible; this did not take place until the end of the 18th and the beginning of the 19th Century. Even then, however, little real progress was made; scientific opinion was not ripe for such a bold generalization, and the teachings of Lamarck attracted few followers, especially as the overwhelming authority of Cuvier was exerted against these teachings. It is of interest to note that Lamarck (1744-1829) arrived at the revolutionary conception just as Darwin did nearly half a century later, through a study of the problems of species. . . . The concept received a more precise meaning and definition from the great Swedish naturalist Linnæus (1707-1778), who devised the modern scheme of the classification and nomenclature of animals and plants. . . . The Linnæan dogma, which prevailed down to the time of Darwin, is that 'there are as many species as God created in the beginning.' . . . Lamarck's best known work is his 'Philosophie zoologique.' . . . Most of the book is devoted to a consideration of

the causes which have led to the transformation of animals and the conclusion is that adaptation to the environment is the most efficient factor. This adaptation is to be explained by the fact that the conditions of life determine the manner in which animals make use of their organs; these are developed and perfected by use, but dwindle and are atrophied by disuse." According to Lamarck's theory, "the inheritance of acquired characteristics," the characteristics thus acquired during the lifetime of an animal might be inherited by the descendants. "The way for the great revolution effected by Darwin was prepared indirectly, and in a science which seemed to be very remote from the field of controversy, viz., Geology, and the pioneer who opened this new world was Sir Charles Lyell (1797-1875). Before Lyell began his great work, the interpretation of the earth's history was under the sway of Cuvier's theory of 'Catastrophism.' . . . In the sharpest contrast Lyell's theory was that of uniformitarianism, which insisted upon the uniformity and complete continuity of the earth's history and of the agencies which had wrought such profound changes upon and within the globe. . . . One might almost say that Darwin's work largely consisted in the application of Lyell's principle to the world of living beings."—W. Scott, *Theory of evolution*, pp. 6-12.

"It was long before men fully realised that authentic traces of extinct forms of life were to be found in the fossils embedded in the rocks. Isolated glimpses of this truth are seen here and there in the fifteenth and following centuries, but it was not till the eighteenth century that this view was consistently advocated. Hutton's (1726-1797) *Theory of the Earth*, published in 1785, taught that processes still going on were adequate to explain the formation of the stratified rocks, and the existence of embedded fossils. But even then no general agreement followed, and it was not till Lyell (1797-1875) collected all the evidence that had accumulated in his *Principles of Geology* (1830-33) that men of science were convinced, and realised that ages must have elapsed in geological processes, beside which the few thousand years of the received Biblical chronology were almost as nothing. The long series of fossil animals and plants of gradually increasing complexity, found by geologists in strata of different ages, raised once more the question of the evolution of species. The idea of the development of all existing forms of life from a few simple types had been held by some of the Greek philosophers, but it had vanished in the ascendancy of the Biblical story of the Creation, and been discredited further by the scientific doctrine of fixity of species prevalent in the eighteenth and early nineteenth centuries. Lamarck (1744-1829), it is true, had advocated a theory of evolution founded on the idea of the gradual development of organs under the stimulus of special use for many generations—the giraffe, for instance, acquiring its long neck by the continual efforts of its ancestors to browse on trees just beyond their reach. But no evidence was forthcoming of the inheritance of such acquired characters, and the balance of scientific opinion was decidedly against the evolutionary hypothesis. In 1858, however, a new suggestion was made independently by Charles Darwin (1809-1882) and Alfred Russel Wallace (b. 1823), fortified in the case of Darwin by illustrations drawn from many years' observation and experiment. Impressed by the severity of the struggle for life and for mates among animals and plants in a state of nature, Darwin and Wallace saw that a variation in structure or character which gave even a slight advantage to any individual might determine the

question whether or not it was to survive, obtain a mate, and rear offspring. Innate variations tend to be inherited, and thus a favourable variation might be perpetuated, developing in time into a new variety or species. In this way, the pressure of

THOMAS HENRY HUXLEY

natural selection might accentuate chance variations, and produce from a few prototypes all the existing species of living beings, gradually, throughout the long ages of geological time, moulding each species to suit its environment, and leaving it more fixed in type as the need for variation disappeared."—W. C. D. Whetham, *Foundations of science*, pp. 55-57.—"Thomas Henry Huxley (1825-05), one of the keenest, most analytical thinkers of the nineteenth century, not only defended the general doctrine of evolution against bishop Wilberforce and his aids, but was an able investigator in the fields of comparative anatomy and embryology. . . . Huxley himself accepted the theory of Natural Selection but not without some important reservations—these, however, did not prevent him from becoming its most ardent and successful champion. Darwin used to acknowledge Huxley's great service to him in undertaking the defense of the theory—a defense which his own hatred of controversy and state of health made him unwilling to undertake—by laughingly calling him 'my general agent' while Huxley himself in replying to the critics, declared he was 'Darwin's bulldog.' Ernst Haeckel (1834-1919) was one of the earliest and most influential followers of Darwin in Germany. In his *Generelle Morphologie*, published in 1866, seven years after the *Origin of Species* first appeared, he applied the doctrine of evolution, and especially the theory of Natural Selection, to the whole field of vertebrate morphology. Beyond question Haeckel over-applied the theory and in a sense weakened its influence by his rather uncritical use of materials. His writings have been translated into most languages and 'are popularly believed to represent the best scientific thought on 'the matter.' Biologists today, however,

are apt to look askance at Haeckel's works and to consider that they did more harm than good to Darwinism."—H. H. Newman, *Readings in evolution, genetics and eugenics*, pp. 29-30.—"When this theory (evolution) had overcome the opposition of those who held a too literal interpretation of the book of Genesis, it became the dominating idea of the second half of the nineteenth century. Its influence extended far beyond the confines of biological science. By giving a reasonable explanation of biological development, it justified the conception of evolution in general, and that conception was applied with varying measures of success to co-ordinate the phenomena of cosmical processes, the development of the human race, historical change, and social evolution. Even the specific idea of natural selection, or the survival of the fittest—the fittest for the particular existing environment—found application in other realms of thought. In especial it illuminated the tendencies of sociology, or the science of human societies, where progress has followed along much the same lines previously trodden by natural history. From the mere collection of tales of the marvellous and surprising, such as were at first brought back by travellers, traders, and missionaries—whose calling took them among unknown peoples—the study of mankind has advanced into the careful, sympathetic, and intelligent stage, which is now characteristic of anthropology and the allied subject of comparative religion. The results of the patient labour of spade and pick, among the sands of Egypt, and the waste cities of Palestine and Asia Minor, by which the relics of past civilisations have been brought to light, may be compared with the unfolding of the story of evolution by the study of the fossil contents of rocks. But there are yet vast areas awaiting the coming of the scientifically trained and equipped explorer. . . . Nevertheless the causes which have contributed to the rise and fall of civilisations are beginning to yield their lessons for the future. Mankind is subject to evolution, and the average composition and character of each race is always changing, not only absolutely but in rela-

ERNST HAECKEL

tion to other nations. Hence arises the importance of a study of the comparative rates of reproduction of different sections of a nation, and of other agencies that may affect racial qualities—the subject-matter of the study named Eugenics by the

late Sir Francis Galton (1822-1911), its founder."—W. C. D. Whetham, *Foundations of science*, pp. 57-58.—See also ANTHROPOLOGY: Scope of study; ENGLISH LITERATURE: 1832-1890.

Classification of theories of evolution.—"In all biological thinking we have to work with the categories Organism—Function—Environment, and theories of evolution may be classified in relation to these. To some it has always seemed that the fundamental fact is the living organism,—a creative agent, a striving will, a changeful Proteus, selecting its environment, adjusting itself to it, self-differentiating and self-adaptive. The necessity of recognising the importance of the organism is admitted by all Darwinians who start with inborn variations, but it is open to question whether the whole truth of what we might call the Goethian position is exhausted in the postulate of inherent variability. To others it has always seemed that the emphasis should be laid on Function,—on use and disuse, on doing and not doing. Practice makes perfect; *c'est à force de forger qu'on devient forgeron*. . . . To others it has always seemed that the emphasis should be laid on the Environment, which wakes the organism to action, prompts it to change, makes dints upon it, moulds it, prunes it, and finally, perhaps, kills it. It is again impossible to doubt that there is truth in this view, for even if environmentally induced 'modifications' be not transmissible, environmentally induced 'variations' are; and even if the direct influence of the environment be less important than many enthusiastic supporters of this view—may we call them Buffonians—think, there remains the indirect influence which Darwinians in part rely on,—the eliminative process. Even if the extreme view be held that the only orm of discriminate elimination that counts is inter-organismal competition, this might be included under the rubric of the animate environment. . . . Erasmus Darwin had a firm grip of the 'idea of the gradual formation and improvement of the Animal world,' and he had his theory of the process. No sentence is more characteristic than this: 'All animals undergo transformations which are in part produced by their own exertions, in response to pleasures and pains, and many of these acquired forms or propensities are transmitted to their posterity.' . . . In artificial selection the breeder chooses out for pairing only such individuals as possess the character desired by him in a somewhat higher degree than the rest of the race. Some of the descendants inherit this character, often in a still higher degree, and if this method be pursued throughout several generations, the race is transformed in respect of that particular character. Natural selection depends on the same three factors as artificial selection: on variability, inheritance, and selection for breeding, but this last is here carried out not by a breeder but by what Darwin called the 'struggle for existence.' . . . The 'struggle for existence,' . . . is not a direct struggle between carnivores and their prey, but is the assumed competition for survival between individuals of the

same species, of which, on an average, only those survive to reproduce which have the greatest power of resistance, while the others, less favourably constituted, perish early. This struggle is so keen, that, within a limited area, where the conditions of life have long remained unchanged, of every species, whatever be the degree of fertility, only two, on an average, of the descendants of each pair survive; the others succumb either to enemies, or to disadvantages of climate, or to accident. A high degree of fertility is thus not an indication of the special success of a species, but of the numerous dangers that have attended its evolution. Of the six young brought forth by a pair of elephants in the course of their lives only two survive in a given area; similarly, of the millions of eggs which two thread-worms leave behind them only two survive. It is thus possible to estimate the dangers which threaten a species by its ratio of elimination, or, since this cannot be done directly, by its fertility. Although a great number of the descendants of each generation fall victims to accident, among those that remain it is still the greater or less fitness of the organism that determines the 'selection for breeding purposes,' and it would be incomprehensible if, in this competition, it were not ultimately, that is, on an average, the best equipped which survive, in the sense of living long enough to reproduce. Thus the principle of natural selection is the selection of the best for reproduction, whether the 'best' refers to the whole constitution, to one or more parts of the organism, or to one or more stages of development. Every organ, every part, every character of an animal, fertility and intelligence included, must be improved in this manner, and be gradually brought up in the course of generations to its highest attainable state of perfection. And not only may improvement of parts be brought about in this way, but new parts and organs may arise, since, through the slow and minute steps of individual or 'fluctuating' variations, a part may be added here or dropped out there, and thus something new is produced. . . . Even if we were to assume an evolutionary force that is continually transforming the most primitive and the simplest forms of life into ever higher forms, and the homogeneity of primitive times into the infinite variety of the present, we should still be unable to infer from this alone how each of the numberless forms adapted to particular conditions of life should have appeared precisely at the right moment in the history of the earth to which their adaptations were appropriate, and precisely at the proper place in which all the conditions of life to which they were adapted occurred. . . . Without processes of selection we should be obliged to assume a 'pre-established harmony.' . . . There must therefore be an intrinsic connection between the conditions and the structural adaptations of the organism, and, since the conditions of life cannot be determined by the animal itself, the adaptations must be called forth by the conditions."—Haeckel, Thomson, Weismann and others, *Evolution in modern thought*, pp. 11-13, 25-27.

Darwin's theory of natural selection.—"The doctrine of natural selection forms the best basis for the detailed discussion of the way evolution is going on to-day. Much has been added to our knowledge of natural processes during post-Darwinian times, and new discoveries have supplemented and strengthened the original doctrine in numerous ways, although they have corrected certain of the minor details on the basis of fuller investigation. At the outset it must be clearly understood that Darwin's doctrine is concerned primarily with the method and not with the evidences

as to the actual *fact* of evolution. The 'Origin of Species' was published in 1859, and only the last of its fourteen chapters is devoted to a statement of the evidence that evolution is true. In this volume Darwin presented the results of more than twenty-five years of patient study of the phenomena of nature, utilizing the observations of wild life in many regions visited by him when he was the naturalist of the 'Beagle' during its famous voyage around the world. He also considered at length the results of the breeder's work with domesticated animals, and he showed for the first time that the latter have an evolutionary significance. Because his logical assembly of wide series of facts in this and later volumes did so much to convince the intellectual world of the reasonableness of evolution, Darwin is usually and wrongly hailed as the founder of the doctrine. It is interesting to note in passing that Alfred Russel Wallace presented a precisely similar outline of nature's workings at about the same time as the statement by Darwin of his theory of natural selection. But Wallace himself has said that the greater credit belongs to the latter investigator who had worked out a more complete analysis on the basis of far more extensive observation and research. The fundamental point from which the doctrine of natural selection proceeds is the fact that all creatures are more or less perfectly adapted to the circumstances which they must meet in carrying on their lives. . . . An animal is not an independent thing; its life is intertwined with the lives of countless other creatures, and its very living substance has been built up out of materials which with their endowments of energy have been wrested from the environment. Every animal, therefore, is engaged in an unceasing struggle to gain fresh food and new energy, while at the same time it is involved in a many-sided conflict with hordes of lesser and greater foes. It must prevail over all of them, or it must surrender unconditionally and die. There is no compromise, for the vast totality we individualize as the environment is stern and unyielding, and it never relents for even a moment's truce. To live, then, is to be adapted for successful warfare; and the question as to the mode of origin of species may be restated as an inquiry into the origin of the manifold adaptations by which species are enabled to meet the conditions of life. Why is adaptation a universal phenomenon of organic nature? The answer to this query given by Darwinism may be stated so simply as to seem almost an absurdity. It is, that if there ever were any unadapted organisms, they have disappeared, leaving the world to their more efficient kin. Natural selection proves to be a continuous process of trial and error on a gigantic scale, for all of living nature is involved. Its elements are clear and real; indeed, they are so obvious when our attention is called to them we wonder why their effects were not understood ages ago. These elements are (1) the universal occurrence of variation, (2) an excessive natural rate of multiplication, (3) the struggle for existence entailed by the foregoing, (4) the consequent elimination of the unfit and the survival of only those that are satisfactorily adapted, and (5) the inheritance of the congenital variations that make for success in the struggle for existence. It is true that these elements are by no means the ultimate causes of evolution, but their complexity does not lessen their validity and efficiency as the immediate factors of the process. . . .

"The doctrine of natural selection took form in the mind of Darwin mainly on account of three potent influences; these were, first, the geological doctrine of uniformitarianism proposed by Lyell, second, his own observations of wild life in many

lands and his analysis of the breeder's results with domesticated animals, and third, the writings of Malthus dealing with overpopulation. As Darwin had read the works of Buffon, Lamarck, and Erasmus Darwin, his grandfather, who had written a famous treatise under the title of 'Zoonomia,' he was familiar with the evidences known in his student days tending to prove that organic evolution was a real natural process. Lyell's doctrine of uniform geological history made an early and deep impression upon his mind, and it led him to ask himself whether the efficient causes of past evolution might not be revealed by an analysis of the present workings of nature. As naturalist of the 'Beagle' during its four years' cruise around the world, Darwin saw many new lands and observed varied circumstances under which the organisms of the tropics and other regions lived their lives. The fierce struggle for existence waged by the denizens of the jungle recalled to him the views of Malthus regard-

CHARLES ROBERT DARWIN

ing overpopulation and its results. These and other influences led him to begin the remarkable series of note-books, from which it is interesting indeed to learn how the doctrine of natural selection began to assume a definite and permanent form in his mind, as year followed year, and evidence was added to evidence. . . . Darwin was particularly impressed by the way mankind has dealt with the various species of domesticated animals, and he was the first naturalist to point out the correspondence between the breeder's method of 'artificial selection,' and the world-wide process of natural selection."—H. E. Crampton, *Doctrine of evolution*, pp. 116-118, 135-136.—"While Darwin always maintained that natural selection was by far the most important and efficient cause in producing transmutation, he admitted the action of other though minor factors. Thus he makes frequent appeal to the effects of use and disuse of organs, the agency which Lamarck had regarded as of such primary importance, and he advanced the theory of *sexual selection* to account for the brilliant colouring and elaborate

patterns of very many animals, especially of butterflies and birds. . . . Modern disciples of Darwin reject this factor and attribute little importance to sexual selection."—W. Scott, *Theory of evolution*, pp. 19-20.—"It is not possible in the present brief outline to describe all the results of recent investigations, but some of them are too important to be passed over. Perhaps the most interesting one is that the laws of heredity seem to be the same for man and other kinds of living creatures, as proved by Galton and Pearson and many others who have dealt with such characters as human stature, human eye color, and an extensive series of the peculiarities of lower animals and even of plants. The researches dealing with the physical basis of inheritance and its location in the organism have yielded the most striking and brilliant results."—H. E. Crampton, *Doctrine of evolution*, p. 142.

**Weismann's theory of continuity of the germ-plasm.**—"In multicellular organisms active growth occurs among the less differentiated cells which have retained a primitive richness in protoplasm, an embryonic character. Now the germ-cells, usually produced in enormous numbers, are derived from such undifferentiated cells set apart for the purpose of reproduction, sometimes from the very earliest stages of embryonic development. They may be traced back, and occasionally even be distinguished under the microscope through an unbroken lineage of embryonic cells to the fertilised ovum. Weismann's famous theory of the continuity of the germ-plasm is founded on these facts. According to it, the germ-plasm, that special protoplasm of the gametes, which is handed on by them from generation to generation, and gives rise to new individuals, is in a sense independent of the body or soma in which it develops. Whereas the rest of the multicellular organism, the soma, dies, the germ-cells continue for ever giving rise to new generations, the germ-plasm passing from parent to offspring. . . . The older writers on evolution generally assumed that the course of heredity and the progress of evolutionary change was greatly influenced by the direct action of the external environment and of the characters of the parents on those of their offspring. It was supposed that the changes directly induced in the body of the parent by such stimuli as temperature, moisture, nutrition, repeated use, or exercise and disuse, are inherited as such, and would reappear in the progeny. The theories of evolution propounded by Erasmus Darwin and by Lamarck were founded on this supposition; and even in the time of Darwin it was not yet questioned whether characters thus acquired by the parent in the course of its lifetime are directly inherited. It was not till Weismann critically examined the evidence for 'the inheritance of acquired characters' that the theory was definitely overthrown. He showed convincingly that mutilations (such as the repeated cutting off of the tail in dogs), the effects of use and disuse (such as callusities produced by friction, the enlargement of muscles or other organs, the fruits of education, &c.), or any direct modification due to the action of any particular stimulus, have never in any single instance been proved to be transmitted as such from one generation to another, while the evidence that they are not is overwhelming. These conclusions of Weismann, which had been to some extent foreshadowed by Pritchard and Galton, are the most important contribution to the science of evolution since the publication of Darwin's *Origin of Species*."—E. S. Goodrich, *Evolution of living organisms*, pp. 25, 32.

**Mendel's law.**—"Simultaneously with the late work of Darwin (1865), a series of researches was

being carried on in the cloister of Brunn which had they come to his notice, might have modified the history of Darwin's hypothesis. Gregor Johann Mendel, a native of Austrian Silesia, an Augustinian monk, and eventually Abbot or Prälat of the Königskloster, not satisfied that Darwin's view of natural selection was sufficient alone to explain the formation of new species, undertook a series of experiments on the hybridization or cross-breeding of peas. He published his results in the volumes of the local scientific society, where they lay buried for forty years. Their rediscovery, confirmation and extension by William Bateson and other workers marks the first step in the recent development of heredity as an exact experimental and industrial science. The essence of Mendel's discovery consists in the disclosure that in heredity certain characters may be treated as indivisible and apparently unalterable units, thus introducing what may perhaps be termed an atomic conception into the field of biology. An organism either has or has not one of these units; its presence or absence are a sharply contrasted pair of qualities. Thus the tall and dwarf varieties of the common eating pea, when self-fertilized, each breed true to type. When crossed with each other, all the hybrids are tall and one-quarter are dwarf. The dwarfs in turn all breed 'true,' but of the tall only one-third breed true, giving rise solely to tall plants, while in the next generation the remaining two-thirds repeat the phenomena of the first hybrid generations, again giving birth to pure dwarfs and mixed 'talls.' These relations are explained simply if we suppose that the germ cells of the original plants bear 'tallness' or 'dwarfness' as one pair of contrasted characters. When a tall plant is crossed with a dwarf dominant one, all the hybrids, though externally similar to the dominant parent, have germ cells half of which bear 'tallness' and the other half 'dwarfness' in their potential characters. Each germ cell bears one or other quality, but not both. Thus when, by the chance conjunction of a male with a female cell from these hybrids, a new individual is formed, it is an even chance whether, as regards the qualities of tallness and dwarfness, we get two like or two unlike cells to meet; and, if the cells be like, it is again an even chance whether they prove both 'tall' or both 'dwarf.' Hence, in the next generation, we get one quarter pure 'talls,' one quarter pure 'dwarfs,' while the remaining half are hybrids, which, since tallness is dominant, resemble the pure 'talls,' and in appearance give three-quarters of the seedlings that character. It will be seen that the methods of inheritance are different in the cases of dominant and recessive characters. While an individual can only transmit a dominant character to his descendants if he himself shows it, a recessive character may appear at any time in a pedigree if two individuals mate who carry the recessive character concealed in their germ cells, though not outwardly visible in themselves."—W. C. D. and C. D. Whetham, *Science and the human mind*, pp. 245-247.—"The task that Mendel set before himself was to gain some clear conception of the manner in which the definite and fixed varieties found within a species are related to one another, and he realised at the outset that the best chance of success lay in working with material of such a nature as to reduce the problem to its simplest terms. He decided that the plant with which he was to work must be normally self-fertilising and unlikely to be crossed through the interference of insects, while at the same time it must possess definite fixed varieties which bred true to type. In the common pea (*Pisum sativum*) he found the plant he sought. . . . In planning his crossing experiments Mendel adopted an attitude

which marked him off sharply from the earlier hybridisers. He realised that their failure to elucidate any general principle of heredity from the results of cross-fertilisation was due to their not having concentrated upon particular characters or traced them carefully through a sequence of generations. That source of failure he was careful to avoid, and throughout his experiments he crossed plants presenting sharply contrasted characters, and devoted his efforts to observing the behaviour of these characters in successive generations. Thus in one series of experiments he concentrated his attention on the transmission of the characters tallness and dwarfness, neglecting in so far as these experiments were concerned any other characters in which the parent plants might differ from one another. For this purpose he chose two strains of peas, one of about 6 feet in height, and another of about 1½ feet. Previous testing had shown that each strain bred true to its peculiar height. These two strains were artificially crossed with one another, and it was found to make no difference which was used as the pollen parent and which was used as the ovule parent. In either case the result was the same. The result of crossing tall with dwarf was in every case nothing but tall, as tall or even a little taller than the tall parent. For this reason Mendel termed tallness the dominant and dwarfness the recessive character. The next stage was to collect and sow the seeds of these tall hybrids. Such seeds in the following year gave rise to a mixed generation consisting of tall and dwarfs but no intermediates. By raising a considerable number of such plants Mendel was able to establish the fact that the number of tall which occurred in this generation was almost exactly three times as great as the number of the dwarfs. As in the previous year, seeds were carefully collected from this, the second hybrid generation, and in every case the seeds from each individual plant were harvested separately and separately sown in the following year. By this respect for the individuality of the different plants, however closely they resembled one another, Mendel found the clue that had eluded the efforts of all his predecessors. The seeds collected from the dwarf recessives bred true, giving nothing but dwarfs. And this was true for every dwarf tested. But with the tall it was quite otherwise. Although indistinguishable in appearance, some of them bred true, while others behaved like the original tall hybrids, giving a generation consisting of tall and dwarfs in the proportion of three of the former to one of the latter. Counting showed that the number of the tall which gave dwarfs was double that of the tall which bred true. . . . Mendel experimented with other pairs of contrasted characters and found that in every instance they followed the same scheme of inheritance. Thus coloured flowers were dominant to white, in the ripe seeds yellow was dominant to green, and round shape was dominant to wrinkled, and so on. In every case where the inheritance of an alternative pair of characters was concerned the effect of the cross in successive generations was to produce three and only three different sorts of individuals, viz. dominants which bred true, dominants which gave both dominant and recessive offspring in the ratio 3: 1, and recessives which always bred true."—R. G. Punnett, *Mendelism*, pp. 15-18.—"But in the majority of cases the conditions of inheritance are far more complicated than would appear from the study of two simply contrasted qualities in the green eating pea. For instance, qualities may act as dominants or recessives according to sex or other conditions. Characters may be linked in pairs so that one cannot appear without the

other, or again they may be incompatible and never be present together. Many Mendelian characters have now been traced in plants and animals; while, as a practical guide in breeding, the method has been successfully applied to unite certain desirable qualities and to exclude others of harmful tendency. By this means, Biffen has established new and valuable species of wheat, in which immunity to rust, high cropping power and certain baking qualities have been brought together in one and the same species owing to a long series of experiments based on the Mendelian laws of inheritance. The extension of this new method of research to mankind at once cleared away many old puzzles and opened up fresh fields of study. Many diseases and malformations have been proved to be dominant Mendelian characters; while deaf-mutism, and other defects, appear to be recessive, and therefore especially liable to appear in cousin marriages between sound individuals who come from families liable to the affliction. Of normal healthy characters, eye colour alone has yet definitely been proved to show Mendelian phenomena in its line of descent, brown colour being dominant to gray, though indications are not wanting that further analysis will disclose similar relations in many other directions. The application of such results is obvious. We can already predict accurately the probable results of human matings when the potential parents possess a character which has proved to be Mendelian in its line of descent. Increase of this knowledge is coming fast, and should soon form a valuable guide to the physician, to the sociologist, perhaps to the statesman. . . . Another aspect of evolutionary philosophy also has been affected by recent research. Though Lamarck's theory gave up its pride of chief place to that of Darwin, many accredited evolutionists continued to preach and act as though characters in man acquired by the reaction of the environment—as by exercise, training, or education—were handed down in their developed form to his offspring. Thus a comforting doctrine arose that we need but improve the acquirements of one transient generation for the next to be better innately—that the race by mere well-directed philanthropic enterprise would continue to improve indefinitely in mental and moral worth. Then came Weismann, who, led by the evidence that the germ cells of one individual are derived by direct descent from those of his parents, asked how characters acquired during life could affect the germ cells present almost before life began? He examined critically every suggested case of the inheritance of such a superimposed character, and found each case to crumble away under his analysis. We have not reached certainty. Some indications are believed to point to possible though rare occurrence of partial inheritance in a few insects and plants when modified by the environment. But, as a chief actor in the hereditary drama, the acquired character is discredited. Here again we touch the problems of sociology. Though political and social institutions acquired by one generation are certainly inherited by the next, and if well suited to the natural development of the people may help them progressively to advance in social organization by a process of cumulation, this inheritance of social organization is not evolution in the Darwinian sense. And, in the far more important and fundamental inborn qualities of the race, no rise of one generation by improved hygiene, exercise or education can affect, save indirectly, the qualities of the next. Selective parenthood, natural or conscious, is alone capable of raising our race or preventing its degeneration."—W. C. D. and

C. D. Whetham, *Science and the human mind*, pp. 247-250.

**Mutation theory of De Vries.**—"De Vries's new 'mutation theory' is clearly not an alternative but a complementary theory to natural selection, the Weismannian and Mendelian theories. Like these last, it emphasizes the importance of the congenital hereditary qualities contained in the germ plasm, though unlike the Darwinian doctrine it shows that sometimes new forms may arise by sudden leaps and not necessarily by the slow and gradual accumulation of slight modifications of fluctuations. The mutants like any other variants must present themselves before the jury of environmental circumstances, which passes judgment upon their conditions of adaptation, and they, too, must abide by the verdict that means life or death. . . . The explanation of natural evolution given by Darwinism, and the principles of Weismann, Mendel, and De Vries, still fails to solve the mystery completely, and appeal has been made to other agencies, even to teleology and to 'unknown' and 'unknowable' causes as well as to circumstantial factors. A combination of Lamarckian and Darwinian factors has been proposed by Osborn, Baldwin, and Lloyd Morgan, in the theory of organic selection. The theory of orthogenesis propounded by the Naegeli and Eimer, now gaining much ground, holds that evolution takes place in direct lines of progressive modification, and is not the result of apparent chance. Of these and similar theories, all we can say is that if they are true, they are not so well substantiated as the ones we have reviewed at greater length."—H. E. Crampton, *Doctrine of evolution*, pp. 147-149.

**Summary.—Metabolism.**—"Evolution from the scientific point of view, as it appears to an outside observer, may be represented as a vast and continuous series of changes in a continuous stream of living matter. Each stage in the process determines that which precedes it, and determines that which follows. The scientific generalisations based on the observation of non-living matter, the 'laws' of physics and chemistry, hold good when applied to the changes in living matter. There is no special living element, no mysterious life-force; but life, scientifically described, is a physico-chemical process taking place in the complex compounds of the ordinary elements which make up the protoplasm of living organisms. Metabolism, as this process is called, is due to the instability of these compounds, to the fact that external conditions or stimuli applied to them may alter their structure and composition. All the manifestations of life thus correspond to metabolic processes. From the very first origin of living protoplasm there has been an unbroken continuity of living processes and substance. The living organisms of the present day are the descendants of those of the past, and all the various forms of life are but the divergent streams from the original source of metabolism. Variation is due to change in the metabolism; all organisms are the products of the interaction of transmitted factors of metabolism (the factors of the inheritance) and factors of the environment. The ever-changing and continuous stream of living matter is diverted into this or that channel of differentiation and specialisation by the environment through natural selection. The environment moulds the organism, and the organism reacts on its environment, until in the case of man he seems to have become master of it and to shape his own destiny."—E. S. Goodrich, *Evolution of living organisms*, p. 105.

**EX CATHEDRA**, theological term derived from the use of the word *Cathedra* as applied to the chair or throne of a bishop in his cathedral church, on which he presides at solemn functions. The term *Cathedra* itself came to be taken as a symbol of authoritative doctrinal definition and thus led to the acceptance of the words "ex Cathedra" in the sense of a formal infallible decision of the pope. The Vatican Council sanctions this use of the expression when it says: "When the Roman Pontiff speaks *ex cathedra*—that is, when he, using his office as pastor and doctor of all Christians, in virtue of his Apostolic office defines a doctrine of faith and morals to be held by the whole Church, he, by the divine assistance, promised to him in the blessed Peter, possesses that infallibility with which the Divine Redeemer was pleased to invest His Church in the definition of doctrine on faith or morals, and that therefore, such definitions of the Roman Pontiff are irreformable in their own nature and not because of the consent of the Church."—*Bull pastor aeternus*, cap. 4.

**EX PARTE MILLIGAN**, United States Supreme Court decision. See SUPREME COURT: 1866-1873.

**EX POST FACTO LAW.**—The Constitution of the United States, in Article 1, Section 10, Clause 1, forbids any state to pass an *ex post facto* law.

**Definition and nature.**—"An Ex Post Facto Law is one which imposes a punishment for an act which was not punishable when it was committed, imposes additional punishment, or changes the rules of evidence, by which less or different testimony is sufficient to convict [Calder v. Bull, 3 Dall. 386, 390, 1 L. ed. 648]. It is essential to an *ex post facto* law, therefore, that it relate to criminal matters [Schwartz v. Adams, 228 U. S. 502, 33 S. C. t. 609, 57 L. ed. 980], that it be retroactive in its operation [U. S.—Chicago, etc., R. Co. v. Tranbarger, 238 U. S. 67, 35 S. C. t. 678, 59 L. ed. 1204 aff. 250 Mo. 46, 156 S. W. 694], and that it alter the situation of the accused party to his disadvantage. [Malloy v. South Carolina, 237 U. S. 180, 35 S. C. t. 507, 59 L. ed. 905.] And in general it may be said that any statute passed after the commission of an offense is *ex post facto* which alters the situation of any person accused thereof to his disadvantage. [Thompson v. Utah, 170 U. S. 343, 18 S. C. t. 620, 42 L. ed. 1061.] The constitutional prohibition applies to legislative acts, only, not to judicial acts. [Frank v. Mangum, 237 U. S. 309, 35 S. C. t. 582, 59 L. ed. 969.]"—*Ex post facto laws*, *Constitutional law* (*Corpus Juris*, pp. 1097-1098, v. 12).

**Classification.**—"The following classification of *ex post facto* laws made in an early case in the

United States supreme court has been approved in a large number of cases. (1st) Every law that makes an action done before the passing of the law, and which was innocent when done, criminal, and punishes such action. (2nd) Every law that aggravates a crime or makes it greater than it was when committed. (3rd) Every law that changes the punishment and inflicts a greater punishment than the law annexed to the crime committed. (4th) Every law that alters the legal rules of evidence and receives less or different testimony than the law required at the time of the commission of the offense in order to convict the offender. To this classification may be added: (5th) Every law which, assuming to regulate civil rights and remedies only, in effect imposes a penalty or the deprivation of a right for something which, when done, was lawful. And (6th) Every law which deprives persons accused of crime of some lawful protection to which they have become entitled such as the protection of a former conviction or acquittal, or of a proclamation of amnesty. [Cooley Const. L. p. 286.] And to make the classification sufficiently general to embrace all the laws which have been adjudged *ex post facto*: (7th) Every law which in relation to the offense or its consequences, alters the situation of a person to his disadvantage. [Frisby v. U. S., 38 App. (D. C.) 22, 37 L. R. A. N. S. 96.]—*Ibid.*, pp. 1100-1101.—See also SUPREME COURT: 1866-1873.

**EXCHEQUER, Chancellor of**. See CHANCELLOR: Of the Exchequer.

**EXCHEQUER, EXCHEQUER ROLLS, EXCHEQUER TALLIES**.—The Exchequer of the Norman kings was the court in which the whole financial business of the country was transacted, and as the whole administration of justice, and even the military organisation, was dependent upon the fiscal officers, the whole framework of society may be said to have passed annually under its review [see also COURTS: England: Origin] and development. It derived its name from the chequered cloth which covered the table at which the accounts were taken, a name which suggested to the spectator the idea of a game at chess between the receiver and the payer, the treasurer and the sheriff. . . . The record of the business was preserved in three great rolls; one kept by the Treasurer, another by the Chancellor, and a third by an officer nominated by the king, who registered the matters of legal and special importance. The rolls of the Treasurer and Chancellor were duplicates;

that of the former was called from its shape the great roll of the Pipe, and that of the latter the roll of the Chancery. These documents are mostly still in existence. The Pipe Rolls are complete from the second year of Henry II and the Chancellor's Rolls nearly so. Of the preceding period only one roll, that of the thirty-first year of Henry I., is preserved, and this with Domesday book is the most valuable store of information which exists for the administrative history of the age. The financial reports were made to the barons by the sheriffs of the counties. At Easter and Michaelmas each of these magistrates produced his own accounts and paid in to the Exchequer such an instalment or proffer as he could afford, retaining in hand sufficient money for current expenses. In token of receipt a tally was made; a long piece of wood in which a number of notches were cut, marking the pounds, shillings, and pence received; this stick was then split down the middle, each half contained exactly the same number of notches, and no alteration could of course be made without certain detection. . . . The fire which destroyed the old Houses of Parliament is said to have originated in the burning of the old Exchequer tallies.—W. Stubbs, *Constitutional history of England*, ch. 11, sect. 126.—“The wooden ‘tallies’ on which a large notch represented £1,000, and smaller notches other sums, while a halfpenny was denoted by a small round hole, were actually in use at the Exchequer until the year 1824.”—J. Lubbock, *Preface to Hall's ‘Antiquities and curiosities of the exchequer.’*—See also CURIA REGIS; CHESS.

**EXCLUSION OF ALIENS**. See IMMIGRATION AND EMIGRATION; RACE PROBLEMS.

**EXCOMMUNICATIONS AND INTERDICTS**.—“Excommunication, whatever opinions may be entertained as to its religious efficacy, was originally nothing more in appearance than the exercise of a right which every society claims, the expulsion of refractory members from its body. No direct temporal disadvantages attended this penalty for several ages; but as it was the most severe of spiritual censures, and tended to exclude the object of it, not only from a participation in religious rites, but in a considerable degree from the intercourse of Christian society, it was used sparingly and upon the gravest occasions. Gradually, as the church became more powerful and more imperious, excommunications were issued upon every provocation, rather as a weapon of ecclesiastical warfare than with any regard to its original intention. . . . Princes who felt the inadequacy of their own laws to secure obedience called in the assistance of more formidable sanctions. Several capitularies of Charlemagne denounce the penalty of excommunication against incendiaries or deserters from the army. Charles the Bald procured similar censures against his revolted vassals. Thus the boundary between temporal and spiritual offences grew every day less distinct; and the clergy were encouraged to fresh encroachments, as they discovered the secret of rendering them successful. . . . The support due to church censures by temporal judges is vaguely declared in the capitularies of Pepin and Charlemagne. It became in later ages a more established principle in France and England, and, I presume, in other countries. By our common law an excommunicated person is incapable of being a witness or of bringing an action; and he

may be detained in prison until he obtains absolution. By the Establishments of St. Louis, his estate or person might be attached by the magistrate. These actual penalties were attended by marks of abhorrence and ignominy still more calculated to make an impression on ordinary minds. They were to be shunned, like men infected with leprosy, by their servants, their friends, and their families. . . . But as excommunication, which attacked only one and perhaps a hardened sinner, was not always efficacious, the church had recourse to a more comprehensive punishment. For the offence of a nobleman she put a county, for that of a prince his entire kingdom, under an interdict or suspension of religious offices. No stretch of her tyranny was perhaps so outrageous as this. During an interdict the churches were closed, the bells silent, the dead unburied, no rite but those of baptism and extreme unction performed. Then penalty fell upon those who had neither partaken nor could have prevented the offence; and the offence was often but a private dispute, in which the pride of a pope or bishop had been wounded. Interdicts were so rare before the time of Gregory VII., that some have referred them to him as their author; instances may however be found of an earlier date."—H. Hallam, *Middle Ages*, ch. 7, pt. 1.

Among the more famous excommunications are the following:

Dollinger, Johann Joseph Ignaz von. See PAPACY: 1869-1870.

Florence. See FLORENCE: 1375-1378.

**EXECUTIVE MANSION, Washington.** See WHITE HOUSE.

**EXEGETÆ**, board of three persons in ancient Athens "to whom application might be made in all matters relating to sacred law, and also, probably, with regard to the significance of the Diosemia, or celestial phenomena and other signs by which future events were foretold."—G. F. Schömann, *Antiquities of Greece: The state*, pt. 3. ch. 3.

**EXEMPTION LAWS**, laws granting the legal right to individuals to be excused from certain services. See **COMMON LAW**: 1836.

**EXEQUATUR**: Installation of the consul.—"After the appointment of a consul, the sending government remits to the government of the country within whose jurisdiction his post exists his commission. This is done through its diplomatic representative accredited to that government, accompanied by instructions to apply for an exequatur. An exequatur is called in Turkey a *barat*. By an exequatur is meant a recognition of the consul by the foreign receiving state, and a warrant that he is permitted to proceed to perform the duties of his office as consul in the jurisdiction or territory for which he is appointed in accordance with law and usage. The conveyance of the exequatur may be by a formal document or letter patent signed by the sovereign and countersigned by the minister of foreign affairs, or it may be simply a notification that he is recognized and an exequatur granted, or it may be as in Austria that his commission is indorsed with the word 'exequatur' and stamped with the imperial seal. If the foreign state accords the exequatur without reservation, the rights, privileges, and immunities of the consul will be, as mentioned before, determined by the treaties and by the general principles of international law governing consular relations. If there are restrictions or interpretations that the receiving state desires to place upon the consular office to which the appointment has been made, such conditions will be named in accompaniment of the exequatur. If the state by which the consul is appointed accepts the exequatur with its restrictions the two states will be bound by the agreement. All states can refuse, by withholding an exequatur, to receive consuls on personal grounds or to receive them only in certain parts of their territory, so that a state has the right, if it so declare, to limit the exercise of consular functions by certain conditions. These conditions, however, must apply to consuls of all nations and not be based upon personal or national considerations. Such conditions, moreover, must not be in violation of any treaty existing between these two countries. The exequatur once granted, it becomes a duty on the part of the granting state to notify the local authorities and to give such publicity as may be necessary to inform the general public as well as the nationals of the state to which the consul belongs who happen to be residing within his district. It is established usage that the district named by the sending state should, as a rule, be accepted by the receiving state, as it is more particularly a matter of convenience of the sending state. In case of unsettled or changed political conditions in the district to which the consul is to be sent, the sending state has the right of naming the authorities to which application for an exequatur should be made, as it may easily involve a grave political question. This is even a graver matter when the receiving government grants recognition to a government by giving an exequatur to a consul of their appointment. It is not always necessary to ask for and obtain a formal exequatur for a consular agent. Frequently, on application, the foreign minister of the receiving state gives such exequatur in the form of a certificate of recognition. (Stowell, 'Le Consul,' pp. 257, etc.) In the case of delay,

due to absence of the proper central authorities or the distance of the capital from the district of the newly appointed consul, he may proceed to his post and enter upon the discharge of his duties on receiving permission from the proper local authorities of the place to act in his official capacity until the exequatur arrives. If a consul be guilty of illegal or improper conduct, he is liable to have his exequatur revoked, and if his conduct be criminal to be punished according to the laws of the country, or he may be sent out of the country at the option of the offended government. There have been a number of cases of the revocation of an exequatur as well as a refusal to grant it by various governments. Mr. Eugene Schuyler, in his work 'American Diplomacy,' says 'Refusals to grant the exequatur are not uncommon. An English consul was refused by Russia in the Caucasus because it was alleged he was hostile to the Russian Government and had expressed strong opinions about Russian movements in Asia. In our own history, without going further, a consul appointed to Beirut was rejected by Turkey because he was a clergyman and might be too much connected with the missionaries; another was rejected by Austria on account of his political opinions, he having previously been an Austrian subject.' During the Civil War, in 1861, Mr. Bunch, the British consul at Charleston who was exercising consular functions under an exequatur from the United States Government, had this exequatur revoked on account of various communications he had entered into with the Confederate Government and also because his conduct had all along 'been that not of a friend to this government or even of a neutral, but of a partisan of faction and disunion.' The British Government, although denying the charge that Mr. Bunch had acted as a partisan, did not dispute the President's right to withdraw Mr. Bunch's exequatur. Mr. Bunch continued to reside in Charleston during the time it remained in possession of the Confederate Government. Conviction of a person by a United States military commission at Manila of publishing seditious newspaper matter in violation of the articles of war precluded the recognition of such person as the consular agent of a foreign power at that place."—C. H. Stockton, *Outlines of international law*, pp. 225-227.

**EXETER**, Origin of.—"Isca Damnoniorum, Caer Wisc, Exanceaster, Exeter, keeping essentially the same name under all changes, stands distinguished as the one great English city which has, in a more marked way than any other, kept its unbroken being and its unbroken position throughout all ages. The City on the Exe, in all ages and in all tongues keeping its name as the City on the Exe, allows of an easy definition. . . . It is the one city [of England] in which we can feel sure that human habitation and city life have never ceased from the days of the early Cæsars to our own."—E. A. Freeman, *Exeter*, ch. 1-2.

**EXILARCH**, head of the Jews during the Babylonian captivity. See **JEWS**: 7th century.

**EXMOUTH**, Edward Pellew (1757-1833), English admiral. See **BARBARY STATES**: 1816.

**EXODUS FROM EGYPT**. See **JEWS**: Exodus.

**EXPATRIATION**.—"The question of expatriation is one of vital importance in the United States. . . . The Executive Government had always claimed an unlimited right of expatriation for the subjects of all other countries, but when the question presented itself in the Supreme Court, not one of the judges affirmed, while several denied, the right for its own citizens. To remedy this an Act of Congress was passed in 1868, which provides that 'Any declaration, instruction, order of de-

cision of any officer of the United States, which denies, restricts, impairs, or questions the right of expatriation is declared inconsistent with the fundamental principles of the Republic.' This Act is, however, only declaratory, and no provision is made in it respecting what is to be considered an act of expatriation. . . . Not until 1907 did the United States Government definitely lay down by an Act the conditions under which an American citizen shall be held to have expatriated himself. Thus the law of 1907 says: '(1) That any American citizen shall be deemed to have expatriated himself when he has been naturalized in any foreign State. (2) When any naturalized citizen shall have resided for two years in the foreign State from which he came, or for five years in any other foreign State, it shall be presumed that he has ceased to be an American citizen, and the place of his general abode shall be deemed his place of residence during the said years. *Provided*, however, that such presumption may be overcome on the presentation of satisfactory evidence to a diplomatic or consular officer of the United States, under such rules and regulations as the Department of the State may prescribe; and *provided*, also, that no American citizen shall be allowed to expatriate himself when his country is at war' The Act thus prescribes four means of effecting expatriation, viz., by naturalization in a foreign State, by taking the oath of allegiance to a foreign State, by residence of a naturalized citizen of the United States in a foreign country, by the marriage of an American woman to a foreigner. In addition to these four modes, a fifth may be mentioned, viz., desertion from the army or navy. At one time few States allowed their respective citizens to expatriate themselves; now nearly all countries allow them to do so, but the permission is discretionary and does not proceed from any obligatory rule of international law. The Argentine Republic appears to be a conspicuous exception, in that it does not allow its citizens to put off their nationality. In the case of Russia and Turkey, before expatriation can be duly effected the permission of the authorities must be obtained. A Frenchman may, by the law of France, divest himself of his nationality in several ways, amongst which are the following:—by naturalization abroad; by accepting a public office under a foreign Government without permission of his own Government; by accepting military service under a foreign Government without the authorization of his own Government, but here he remains subject to penalties to which he may be liable by French law. . . . German nationality may be lost:—by express deprivation for not performing military service; by residing abroad and failing to return when notified in time of war; by ten years' uninterrupted residence abroad without registering at a German consulate; by entering the service of a foreign State and not renouncing it on demand of the home Government. In Austria citizens who emigrate with permission are deemed to be foreigners; those who do so without leave lose their Austrian citizenship, but their rights as naturalized aliens appear to be disregarded. A Hungarian loses his nationality by release from his allegiance, or by unauthorized continuous absence for ten years. Italian citizenship is lost by renouncing it and emigrating, by naturalization in a foreign country without permission, and by entering foreign military service. Spanish nationality is lost by naturalization with leave of the Spanish Government; naturalization without leave will not necessarily relieve a Spaniard of obligations to Spain. In the majority of countries naturalization abroad liberates the emigrant from all obligations towards his

mother country.'—*Wheaton's Elements of international law*, pp. 248-250.—“Most of the international conflicts that have arisen concerning citizenship resulted from the denial of the right of expatriation. This was one of the chief causes of the war of 1812. England insisted that her subjects could not sever their allegiance from her without her consent, and therefore the fact of their naturalization in the United States did not remove them from their allegiance and duty to the British government, and she insisted upon the right to search American ships and impress into the British service naturalized American citizens. Similar questions have arisen in connection with the subjects of Germany becoming naturalized in the United States, and, upon returning to their native land, being compelled to render military service. The United States contended at the time and has since made treaties to the same effect, that when such citizens return to their native land they could be held for any liability or military duty which accrued before the date of the emigration, but not for any that accrued after such date. Similar treaties have been made between other nations. England by the naturalization act of 1870 granted the right of expatriation, and recognized the naturalization of her subjects abroad. There is no rule of law by which these conflicts can be adjusted. For the future as in the past, they will have to be solved as questions of international comity and conventional right.”—A. B. Hall, *Outline of international law*, p. 41.—See also IMMIGRATION AND EMIGRATION; INTERNATIONAL LAW; NATURALIZATION.

**EXPUNGING RESOLUTION.**—In 1834 the United States Senate passed resolutions introduced by Henry Clay censuring President Jackson for transferring certain deposits from the Bank of the United States. Jackson made a dignified protest against these resolutions when they were passed, and Senator Benton of Missouri gave notice that he would move to expunge them. Benton made this motion in successive sessions until the Senate, with a majority of Democrats passed it Jan. 16, 1837. A black line was drawn in the journal around the resolution of censure and the following words were written in: "Expunged by order of the Senate this sixteenth day of January, 1837." Clay, Calhoun and Webster strongly opposed the expunging resolution.

**EXTENSION WORK, Educational.** See EDUCATION: Modern developments: 20th century: Extension work; UNIVERSITIES AND COLLEGES: 1916; EDUCATION, AGRICULTURAL: United States; Ireland.

**EXTRITORIALITY, or Extra-territoriality:** Definition.—"It is universally agreed that sovereigns and the armies of a state, when in foreign territory, and that diplomatic agents, when within the country to which they are accredited, possess immunities from local jurisdiction in respect of their persons, and in the case of sovereigns and diplomatic agents with respect to their retinue, that these immunities generally carry with them local effects within the dwelling or place occupied by the individuals enjoying them, and that public ships of the state confer some measure of immunity upon persons on board of them. The relation created by these immunities is usually indicated by the metaphorical term extritoriality, the persons and things in enjoyment of them being regarded as detached portions of the state to which they belong, moving about on the surface of foreign territory and remaining separate from it."—W. E. Hall, *International law*, p. 173.

**Application to diplomatic agents.**—In the case of diplomatic agents, a large number of instances have arisen, the settlement of which has given the doctrine a fairly definite form. "Under no circumstances may an ambassador be tried for a criminal offence in the country to which he is accredited. The practice is well settled, and has been established in England since the case of Mendoza, the Spanish ambassador, who conspired to dethrone

Queen Elizabeth. Nor can he be arrested under ordinary criminal process; he may, however, be arrested by a high assertion of sovereign power for intriguing against the country in which his mission lies. Thus Count Gyllenberg, the Swedish ambassador in 1717, was detained for some time in an English prison for plotting against the Hanoverian dynasty. The French Government in 1718 arrested Prince Cellamare, the Spanish ambassador, on a similar charge. The case of Pantaleon Sa is hardly consistent with modern practice. Sa was the brother of the Portuguese ambassador accredited to the Commonwealth; under outrageous circumstances he, or men acting under his direction, killed one person and wounded several others, and for this offence he was indicted, tried, and executed. . . . The correct course when an ambassador is suspected of criminal acts was indicated so long ago as 1584 in an opinion which Gentilis and Hotman were asked to give in Mendoza's case. He must be handed over to the authorities of his own country. The latter precedent was followed (1718) in the case of Cellamare, who was conducted to the frontier by a military escort. . . . With regard to civil jurisdiction, there seems to be a general agreement that an ambassador is exempt in respect of all his official or private contracts, and so much property, real or personal, as is 'necessary to his dignity or comfort'; but there is no fixed international agreement in cases where he engages in trade, or is a large property holder in the country of his sojourn, such cases, of course, being very rare. The English common law seems to have allowed no immunity from civil jurisdiction at all to ambassadors. There is a dictum in Coke against the claim, but the law apparently remained uncertain until 1708. In that year the Czar's ambassador in London was arrested for a debt of £50. A criminal information was entered against those responsible for the arrest. While the point of law was still under consideration, the statute 7 Anne, c. 12 was passed. . . . This statute is a recognition of the principle, on which there is general agreement, of freedom from arrest and distraint, either of which might hamper an ambassador in the exercise of his diplomatic functions."—F. E. Smith, *International law*, p. 73-76.—"The right of asylum in the house of the ambassador is now generally denied. In 1726 the celebrated case of the Duke of Ripperda, charged with treason, gave rise to the decision by the Council of Castile that the duke could be taken from the English legation by force if necessary, because the legation, which had been established to promote good relations between the states, would otherwise be used for overthrowing the state in which it had been established. . . . The United States instructs its agents that 'The privilege of immunity from local jurisdiction does not embrace the right of asylum for persons outside of a representative's diplomatic or personal household.' This right is, however, recognized in practice, both by the United States, and European nations, so far as pertains to the houses of the diplomats in South American states. The United States, in 1870, tried without avail to induce the European nations to agree to the discontinuance of the practice. In 1801, in Chile, Minister Egan, of the United States, afforded refuge in the legation to a large number of the political followers of Balmaceda. Chile demanded his recall, but the United States maintained that there must be sufficient grounds for such action. In Eastern countries it has been the practice to afford asylum in legations in times of political disturbance and to political offenders. In 1805 the British ambassador at Constantinople gave asylum to the deposed grand vizier at Con-

stantinople. It may be said, however, that the tendency is to limit the granting of asylum to the fullest possible extent, and finally to abolish the practice altogether, as has been the case with the ancient extension of this privilege to the neighborhood of the legation under the name of *jus quarteriorum*."—G. G. Wilson and G. F. Tucker, *International law*, p. 185-186.—See also ASYLUM, RIGHT OF.

**Application to consuls.**—In general a consul is not entitled to the immunities of a diplomatic person. His peculiar status in non-Christian countries, however, provides an important instance of the application of extritoriality. Not only does the consul himself enjoy that relation, but all nationals of foreign countries, inasmuch as they are not subject to the jurisdiction of the state within which they reside, may be said to carry with them the character of the state to which they belong. Consular jurisdiction in itself forms a field of study, to which the term extritoriality is applied in a special sense.

ALSO IN: H. Jenkyns, *British rule and jurisdiction beyond the seas*.—F. E. Hinckley, *American consular jurisdiction in the orient*.

**Other applications.**—In the case of public ships, the doctrine is by no means fully defined or universally accepted. Before the complete abolition of slavery, questions were frequent, over cases of slaves taking refuge in ships of nations not recognizing slavery. A large degree of immunity is, however, accorded. Certain privileges are conceded even to merchant ships in port, but these are very limited. On the other hand, military forces in foreign territory are under the exclusive jurisdiction of their commanders, inasmuch as any other arrangement would be incompatible with military discipline. From this lack of uniformity and definition, some authorities argue "that the fiction of extritoriality is not needed . . . and even that its use is inconvenient. It is not needed, because the immunities possessed by different persons and things can be accounted for by referring their origin to motives of simple convenience or necessity, and because there is a reasonable correspondence between their present extent and that which would be expected on the supposition of such an origin. The only immunities, in fact, upon the scope of which the fiction of extritoriality has probably had much effect, are those of a vessel of war, which seem undoubtedly to owe some of the consolidation which they received during the [nineteenth] century to its influence. The fiction is moreover inconvenient, because it gives a false notion of identity between immunities which are really distinct both in object and extent, and because no set of immunities fully corresponds with what is implied in the doctrine."—W. E. Hall, *International law*, p. 207.

See also ASYLUM, RIGHT OF; CHINA: 1898 (May); EXTRADITION; JAPAN: 1895-1902.

**EXTRADITION: Definition.**—By international treaty.—Inter-state rendition.—"Extradition may be sufficiently defined to be the surrender by one nation to another of an individual accused or convicted of an offence outside of its own territory, and within the territorial jurisdiction of the other, which, being competent to try and to punish him, demands the surrender."—184 *U. S.* 280.—"In 1173, the ambassadors of the Abassines were treacherously slain by one of the Templars at Jerusalem. On demand being made to deliver up the offender, the Grand Master absolutely refused to do so, but added that he had prescribed penance to the culprit and had ordered him to be sent to the Pope. In the reign of Edward II some Florentine

merchants having been appointed collectors and receivers of the King's customs and rents in England, Wales, Ireland and Gascony, fled to Rome, carrying some of the money which they had collected with them. The King sent his letters of request to the Pope to desire that they might be arrested, and their persons and goods seized, and sent to England to satisfy the loss which he had sustained, promising, nevertheless, that they should not lose life nor limb. The Pope seems to have acted as requested. . . . Edward de la Pool (Earl of Suffolk) being attainted by Act of Parliament in the twelfth year of Henry VII fled to Spain. The King of Spain continuously refused to deliver him to England, but eventually did so on receiving promise that the Earl should not be put to death. . . . Cardinal Pole, having in his book 'Pro Ecclesiastical Unitatis Defensione' (*liber III*, p. 79) strongly suggested that the Emperor Charles should wage war against Henry VIII, that monarch demanded his extradition from the French King to answer for alleged treason. The Cardinal was at that time ambassador from the Pope to the French court, and the King refused to deliver up the ambassador. Queen Elizabeth was equally unsuccessful."—G. S. Baker, *Halleck's International law*, v. 1, pp. 251-3.—"Extradition is the delivery of a prosecuted individual to the state on whose territory he has committed a crime by the state on whose territory the criminal is for the time staying. Although Grotius (II, c. 21, §4) holds that every state has the duty either to punish itself or to surrender to the prosecuting state such individuals within its boundaries as have committed a crime abroad, and although there is as regards the majority of such cases an important interest of civilized mankind that this should be done, this rule of Grotius has never been adopted by the states and has, therefore, never become a rule of the law of nations. On the contrary, the states have always upheld their competence to grant asylum to foreign individuals as an inference from their territorial supremacy, those cases excepted which fall under the stipulations of special extradition treaties, if any. There is no universal rule of customary international law in existence which commands extradition. Since, however, modern civilization demands categorically extradition of criminals as a rule, numerous treaties have been concluded between the single states stipulating the cases in which extradition shall take place. According to these treaties, individuals prosecuted for more important crimes, political crimes excepted, are actually always surrendered to the prosecuting state, if not punished locally. But this solution of the problem of extradition is a product of the nineteenth century only. Before the eighteenth century extradition of ordinary criminals hardly occurred, although the states used them frequently to surrender to each other political fugitives, heretics and even emigrants, either in consequence of special treaties stipulating the surrender of such individuals, or voluntarily without such treaties. Matters began to undergo a change in the eighteenth century, for then treaties between neighboring states stipulated frequently the extradition of ordinary criminals besides that of political fugitives, conspirators, military deserters and the like. Vattel (*Vol. II*, §76) is able to assert in 1758 that murderers, incendiaries and thieves are regularly surrendered by neighboring states to each other. General treaties of extradition between all the members of the family of nations did not exist in the eighteenth century and there was hardly a necessity for such general treaties, since traffic was not so developed as nowadays and fugitive criminals seldom

succeeded in reaching a foreign territory beyond that of a neighboring state. In the nineteenth century, with the appearance of railways and transoceanic steamships, transit began to develop immensely, criminals used the opportunity to flee to distant foreign countries. It was then that the conviction was forced upon the states of civilized humanity that it was in their common interest to surrender ordinary criminals regularly to each other. General treaties of extradition became a necessity. There is no civilized state in existence which has not concluded such treaties with the majority of the other civilized states. Extradition of criminals between states is an established fact based upon treaties."—L. Oppenheim, *International law*, v. 1, pp. 383-384.—G. B. Davis, *Elements of international law*, pp. 167-180.

"With most countries, it has been the rule to regard the recovery of their fugitive subjects, charged with ordinary crimes, as an incident of the extraterritorial jurisdiction exercised through their ministers or consuls."—J. B. Moore, *Digest of international law*, v. 2, p. 633.—"There is no obligation upon a government, under the law of nations, to surrender fugitive criminals to a foreign power."—119 *U. S.* 407.—"It is within the power of Congress to provide by statute for the extradition of fugitives from justice of a foreign country without regard to any reciprocal treaty obligation."—180 *U. S.* 126.—"Whenever there is a treaty or convention for extradition between the government of the United States and any foreign government, any justice of the supreme court, circuit-judge, district judge, commissioner, authorized to do so by any of the courts of the United States, or judge of a court of record of general jurisdiction of any State, may, upon complaint, made under oath, charging any person found within the limits of any state, district or territory with having committed within the jurisdiction of any such foreign government any of the crimes provided for by such treaty or convention, issue his warrant for the apprehension of the person so charged, that he may be brought before such justice, judge or commissioner, to the end that the evidence of criminality may be heard and considered. If on such hearing he deems the evidence sufficient to sustain the charge under the provisions of the proper treaty, or convention, he shall certify the same, together with a copy of all testimony taken before him, to the Secretary of State, that a warrant may issue upon the requisition of the proper authorities of such foreign government, for the surrender of such person according to the stipulations of the treaty or convention; and he shall issue his warrant for the commitment of the person so charged to the proper gaol, there to remain until such surrender shall be made."—*United States Statutes*, Sect. 10110.—"Many of the Continental states maintain that extradition is a duty binding upon all civilized states, on the ground that the prevention of crime which would result from certainty of punishment is an object to be sought by all for the general good. Grotius, Vattel, Kent, Fiore, and many other authorities maintain this position. Bluntschli, Foelix, Klüber, G. F. de Martens, Pufendorf, Phillimore, Wheaton and the majority of authorities make the basis of extradition the conventional agreement of treaties. The large number of extradition treaties of the last half of the nineteenth century has made the practice general. Occasionally a state has, in the absence of treaties, voluntarily surrendered fugitives from justice as an act of courtesy. The extradition of Tweed by Spain in 1876 was an act of this kind. Such cases are not common, however, and it is safe to derive the principles from the general

practice as seen in treaties. Persons liable to extradition vary according to treaties. It is the general practice to surrender on demand of the state in which the crime is committed only those who are subjects of the state making the demand. This is the general rule of the Continental states. As Great Britain and the United States maintain the principle of territorial penal jurisdiction, it is customary for these states to uphold the idea of extradition even of their own subjects. . . . In case the accused whose extradition is demanded is a citizen of a third state, the practice is not uniform, though the best authorities seem to favor the granting of the extradition only after communication with and assent of the third state, on the ground that the state to which the subject has fled is responsible to the third state for its treatment of him. This practice has been followed in many European treaties. Ordinarily, not all criminals are liable to extradition, though treaty stipulations may cover cases usually excepted. Those accused of political crimes have, since the early part of the nineteenth century, been more and more generally exempt from extradition. During the last quarter of the nineteenth century few treaties have been made which do not make political criminals specifically non-extraditable. Political crimes accompanied by attacks upon the persons of the sovereign or of those holding political office or position are not, however, in the above category, but are usually extraditable. Even when an accused person is extradited there are limitations as to the jurisdiction of the state to which he goes. The trial must be for the offense or offenses enumerated in the treaty. For example, a treaty between two states enumerates among extraditable crimes murder, and does not enumerate larceny. A fugitive from one of the countries is accused of both murder and larceny. The country surrendering the criminal would not permit the trial of the criminal for any other crime than murder, until the criminal should have had opportunity to return to the state from which he was surrendered. For many years Great Britain claimed that a person surrendered in accordance with an extradition treaty should be tried only for the specific offense for which he was surrendered. The United States desired to include other offenses provided the person had been once surrendered. This position of Great Britain was accepted by the treaty of July 12, 1880. The conditions necessary for a claim for extradition are: (1) that the crime shall have been committed within the territorial or maritime jurisdiction of the state making the demand, (2) that there be sufficient evidence of guilt to establish a case, and (3) that the application be from the proper authority and in the proper form. . . . The person demanded may be placed under provisional arrest pending the full proceedings of extradition. Reasonable evidence of the identity of the person and of the facts of the crime must be furnished by the state making the demand."—G. G. Wilson and G. F. Tucker, *International law*, pp. 148-151.—See also *ASYLUM, RIGHT OF*.

"Interstate rendition, frequently but inaccurately referred to as 'interstate extradition,' is the right of one state to demand and the duty of another state to surrender fugitives from justice from the former state unto the latter, where they stand thereof, with the commission of crime. To characterize the procedure under this definition as 'interstate extradition' is plainly to misapply the real meaning of the word 'extradition,' as derived and understood from its long usage in connection with international law."—James A. Scott, *Law of interstate rendition*, Chicago, 1917, pp. 1-2.—"Interstate

rendition depends entirely upon paragraph 2, section 2, article IV of the Constitution of the United States and sections 5278 and 5279 of the Revised statutes. It is effected and controlled absolutely by the action of the state authorities without the consent or reference to the government of the United States."—*Ibid.*, p. 2.—"In interstate rendition, only a charge of crime is essential and where an indictment is found, or an affidavit is made against the fugitive, no evidentiary facts by deposition, as to the commission of the crime, is required. [Compare this with extradition requirements as stated above.]"—210 *U. S.* 387.—"In interstate rendition, if the acts charged constitute a crime in the demanding state, however frivolous, the fugitive must be surrendered, should all the lawful requirements be observed in his demand."—24 *How.* 66.—"In interstate rendition, a fugitive may be arrested and surrendered to another state for a political offence—treason." See UNITED STATES, CONSTITUTION OF: Article IV.

**FALABA**, British steamer which was sunk by a German submarine on March 25, 1915, with re-

sultant loss of 111 lives; one Leon C. Thresher was the first American citizen to lose his life in consequence of German submarine warfare. See U. S. A.: 1915 (March-May).

**FALAISE.**—"The Castle [in Normandy] where legend fixes the birth of William of Normandy, and where history fixes the famous homage of William of Scotland, is a vast donjon of the eleventh or twelfth century. One of the grandest of those massive square keeps which I have already spoken of as distinguishing the earliest military architecture of Normandy crowns the summit of a precipitous rock, fronted by another mass of rock, wilder still, on which the cannon of England were planted during Henry's siege. To these rocks, these 'felsen,' the spot owes its name of Falaise. . . . Between these two rugged heights lies a narrow dell. . . . The dell is crowded with mills and tanneries, but the mills and tanneries of Falaise have their share in the historic interest of the place. . . . In every form which the story has taken in history or legend, the mother of the Conqueror appears as the daughter of a tanner of Falaise."—E. A. Freeman, *Norman conquest*, ch. 8, sect. 1.—See also SCOTLAND: 1174-1189.

**FANARIOTS**. See PHANARIOTS.

**FANEUIL**, Peter (1700-1743), American merchant, the donor of Faneuil Hall in Boston. See FANEUIL HALL.

**FANEUIL HALL**.—"The fame of Faneuil Hall [Boston, Mass.] is as wide as the country itself. It has been called the 'Cradle of Liberty,' because dedicated by that early apostle of freedom, James Otis, to the cause of liberty, in a speech delivered in the hall in March, 1763. . . . Its walls have echoed to the voices of the great departed in times gone by, and in every great public exigency the people, with one accord, assembled together to take counsel within its hallowed precincts. . . . The Old Market-house . . . existing in Dock Square in 1734, was demolished by a mob in 1736-37. There was contention among the people as to whether they would be served at their houses in the old way, or resort to fixed localities, and one set of disputants took this summary method of settling the question. . . . In 1740, the question of the Market-house being revived, Peter Faneuil proposed to build one at his own cost on the town's land in Dock Square, upon condition that the town should legally authorize it, enact proper regulations, and maintain it for the purpose named. Mr. Faneuil's noble offer was courteously received, but such was the division of opinion on the subject that it was accepted by a majority of only seven votes, out of 727 persons voting. The building was completed in September, 1742, and three days after, at a meeting of citizens, the hall was formally accepted and a vote of thanks passed to the donor. . . . The town voted that the hall should be called Faneuil Hall forever. . . . The original size of the building was

40 by 100 feet, just half the present width; the hall would contain 1,000 persons. At the fire of January 13, 1763, the whole interior was destroyed, but the town voted to rebuild in March, and the State authorized a lottery in aid of the design. The first meeting after the rebuilding was held on the 14th March, 1763, when James Otis delivered the dedicatory address. In 1806 the Hall was enlarged in width to 80 feet, and by the addition of a third story."—S. A. Drake, *Old landmarks of Boston*, ch. 4.

**FANNIAN LAW.** See ORCHIAN, FANNIAN, DIDIAN LAWS.

**FANSHAWE**, Sir Edward Arthur (b. 1850), British general in command of the cavalry at the battle of Champagne, 1915. See **WORLD WAR**: 1915: II. Western front i, 1.

**FAO**, town at the head of the Persian gulf near the delta of the Tigris-Euphrates river, captured by the British in 1914. See **WORLD WAR**: 1914: IV. Turkey: i.

**FAR EAST.** See CHINA; JAPAN; KOREA, etc.

**FAR EASTERN AFFAIRS**, Division of. See STATE DEPARTMENT OF THE UNITED STATES: 1900-1913.

**FAR EASTERN QUESTION.**—The Far Eastern question includes the international policies of the European powers, the United States and Canada, with reference to China and Japan; problems arising from the relations between China and Japan, including the Korean question; the international disturbances in China; fortifications in the eastern Pacific and other perplexing problems, including the much vexed question of immigration.

**FAR EASTERN REPUBLIC**, new state erected in Eastern Siberia during September, 1920. Originally composed of the Transbaikal, Amur and Maritime Provinces of the former Russian empire, the republic embraced an area of over 650,000 square miles with a population of nearly two millions. The seat of government was established at Chita, the capital of Transbaikalia. In May, 1921, the Maritime Province withdrew from the republic and set up a new government at Vladivostok, which port was at the time occupied by Japanese troops. By this secession the republic was reduced by about 270,000 square miles. In November, 1922, the Far Eastern republic voted itself out of existence and joined with Soviet Russia. See SIBERIA.

**FASTI.**—"Dies Fasti were the days upon which the Courts of Justice [in ancient Rome] were open, and legal business could be transacted before the Praetor: the Dies Nefasti were those upon which the Courts were closed. . . . All days consecrated to the worship of the Gods by sacrifices, feasts or games, were named Festi. . . . For nearly four centuries and a-half after the foundation of the city the knowledge of the Calendar was confined to the Pontifices alone. . . . These secrets which might be, and doubtless often were, employed for political ends, were at length divulged in the year B. C. 314, by Cn. Flavius, who drew up tables embracing all this carefully-treasured information, and hung them up in the Forum for the inspection

of the public. From this time forward documents of this description were known by the name of Fasti. . . . These Fasti, in fact, corresponded very closely to a modern Almanac. . . . The Fasti just described have, to prevent confusion, been called *Calendaria*, or *Fasti Calendaria*, and must be carefully distinguished from certain compositions also named Fasti by the ancients. These were regular chronicles in which were recorded each year the names of the Consuls and other magistrates, together with the remarkable events, and the days on which they occurred. The most important were the *Annales Maximi*, kept by the Pontifex Maximus."—W. Ramsay, *Manual of Roman antiquities*, ch. 11.

**FASTOLF**, Sir John (c. 1378-1459), English soldier, lieutenant of Normandy and governor of Maine and Anjou, 1423; created a Knight of the Garter, 1426; defeated the French and Scots at the battle of the herrings, Feb. 12, 1429; with Talbot suffered a serious defeat at Patay, June 18, 1429. See FRANCE: 1429-1431.

**FATHOM**: Origin of the unit. See INVENTIONS: Ancient and medieval: Measurements.

**FATIMITE CALIPHS**, Arabian dynasty of northern Africa and Syria, 909-1171. See CALIPHATE: 908-1171; JERUSALEM: 1144-1187; MEDICAL SCIENCE: Ancient: 7th-11th centuries: Medical art of the Arabs.

**FAUBOURGS**, suburbs of a French city. See FRANCE: 1795 (April).

**FAUCHET**, Claude (1530-1601), French historian. See HISTORY: 23.

**FAULK**, Andrew Jackson (1814-1898), governor of Dakota territory. See DAKOTA TERRITORY: 1866-1870.

**FAURE**, François Félix (1841-1899), French statesman. Elected to National Assembly, August, 1881, under-secretary for colonies, under Jules Ferry, 1882-1885, and under P. A. Tirard, 1888-1893; vice president of the Chamber of Deputies, 1893; minister of marine under C. A. Dupuy, 1894; elected president of the Republic, 1894, upon the death of Casimir Perrier; died suddenly in February, 1899. See FRANCE: 1894-1895; 1899 (February-June).

**FAUSTINUS I** (1785-1867), emperor of Haiti. See HAITI, REPUBLIC OF: 1804-1880.

**FAUX-BOURDON**, method of singing. See MUSIC: Medieval: 12th century-1350.

"**FAVORITE SON**," popular candidates for nomination in presidential conventions of the United States. See ELECTIONS, PRESIDENTIAL: United States: Work of nominating conventions.

**FAYAL ISLAND**, westernmost of the Central Azores group. See AZORES.

**FAYOLLE**, Marie-Emile (1852- ), French marshal. Rendered distinguished service in the World War; grand officer of Legion of Honor, 1916; commanded group of armies of the Center, 1917; in Italy in command of French troops, 1917; Armies on the Somme, 1918; marshal of France, 1919. See WORLD WAR: 1916: II. Western front: c; c, 3; 1917: IV. Austro-Italian front: d, 5; 1918: II. Western front: c, 33.

**FAYUM**, province of Egypt, west of the Nile in the Libyan desert. See MÆRIS, LAKE.

**FEARLESS**, British cruiser which took part in the battle in the Bight of Heligoland, August 28, 1914. See WORLD WAR: 1916: IX. Naval operations: a, 4.

**FEAST OF LIBERTY**. See GREECE: B. C. 479: Persian wars: Plataea.

**FEAST OF THE HYACINTHIA**. See IYACINTHIA.

**FEBRONIANISM**. See FEBRONIUS.

**FEBRONIUS, FEBRONIANISM**.—"The German Church had been for nearly two centuries under the influence and finally under the domination of Jesuitism, but about the middle of the eighteenth century a reaction set in. It soon attained formidable proportions, aided as it was by the so-called 'Enlightenment' in philosophy, literature, and history. . . . [An] important consequence was a lessening of papal authority; episcopalistic ideas sprang up everywhere, and besides Gallicanism we find clearly expressed the 'natural rights' theories . . . and the doctrine of the omnipotence of the State. The last mentioned ideas [Febronianism] are to be found in a concentrated form in a work on the 'State of the Church and the Legitimate Power of the Roman Pontiff,' written in Latin by the suffragan bishop of Treves, Nicholas von Hontheim, and published under the pseudonym of Justinus Febronius in 1763. The author indicates on the title-page the object of the book, viz., the reunion of the different confessions, and for the attainment of this object he recommends a return to the constitution of the Primitive church. This was, indeed, a Utopia, but Febronius supported it by an exposition based on wide reading in Dutch, French, and German, and made a very impressive defense of the Episcopalian system. The eager reception of the book was immediately noted by the Curia, and in 1764 it was already on the Index. . . . In 1778 Clement Wenzel of Treves . . . obliged the almost octogenarian author to retract. But the matter was by no means ended by Hontheim's submission. On the contrary, it was soon seen that the Febronius affair was likely to have after-effects on ecclesiastical politics that would be very unpleasant for the Curia."—H. G. E. Krüger, *Papacy*, pp. 211-213.—Febronianism contends that the general council of the church is the final court of appeal and that even the pope is subject to its decisions.

**FEDERAL CONTROL ACT**, United States (1918). See RAILROADS: 1916-1920.

**FEDERAL COUNCIL OF CHURCHES OF CHRIST IN AMERICA**.—"The Federal Council is an organization officially representing most of the Protestant denominations of the United States. . . . The Council held its first meeting at Philadelphia in 1908 and was largely the culmination of previous voluntary federative movements, the chief of which had been the Evangelical Alliance and the National Federation of Churches and Christian Workers. . . . The difference between the Federal Council and the previous movements is that it is not an individual or voluntary agency, or simply an interdenominational fellowship, but is an officially and ecclesiastically constituted body. . . . It is the coöperation of the various denominations for service rather than an attempt to unite them upon definitions of theology and polity. . . . The Federal Council is thus constituted by thirty-one Protestant evangelical denominations, to express their common

voice and unite them in coöperative activities. It includes 148,532 local churches, with 19,504,102 members."—S. R. Warburton, ed., *Year Book of the churches*, 1920, p. 237.—"The united work undertaken by the Council is indicated by the titles of its Commissions. These Commissions are as follows: Federated Movements, State and Local Federations, Foreign Missions, Home Missions, Christian Education, Social Service, Evangelism, Family Life, Sunday Observance, Temperance, Peace and Arbitration, and Country Life. Other Special committees . . . are appointed from time to time to take up special activities calling for united action upon the part of the churches."—C. S. Macfarland, ed., *Churches of the federal council*, pp. 259-260.

**FEDERAL GOVERNMENT, FEDERATIONS.**—"Two requisites seem necessary to constitute a Federal Government in . . . its most perfect form. On the one hand, each of the members of the Union must be wholly independent in those matters which concern each member only. On the other hand, all must be subject to a common power in those matters which concern the whole body of members collectively. Thus each member will fix for itself the laws of its criminal jurisprudence, and even the details of its political constitution. And it will do this, not as a matter of privilege or concession from any higher power, but as a matter of absolute right, by virtue of its inherent powers as an independent commonwealth. But in all matters which concern the general body, the sovereignty of the several members will cease. Each member is perfectly independent within its own sphere; but there is another sphere in which its independence, or rather its separate existence, vanishes. It is invested with every right of sovereignty on one class of subjects, but there is another class of subjects on which it is as incapable of separate political action as any province or city of a monarchy or of an indivisible republic. . . . Four Federal Commonwealths . . . stand out, in four different ages of the world, as commanding, above all others, the attention of students of political history. Of these four, one belongs to what is usually known as 'ancient,' another to what is commonly called 'mediæval' history; a third arose in the period of transition between mediæval and modern history; the creation of the fourth may have been witnessed by some few of those who are still counted among living men. . . . These four Commonwealths are, First, the Achaian League [see ACHÆAN LEAGUE; GREECE: 280-146 B. C.] in the later days of Ancient Greece, whose most flourishing period comes within the third century before our era. Second, the Confederation of the Swiss Cantons [see SWITZERLAND, CONSTITUTION OF], which, with many changes in its extent and constitution, has lasted from the thirteenth century to our own day. Third, the Seven United Provinces of the Netherlands [see NETHERLANDS: 1577-1581, and after], whose Union arose in the War of Independence against Spain, and lasted, in a republican form, till the war of the French Revolution. Fourth, the United States of North America [see U. S. A.: 1787; 1787-1789; also U. S. A., CONSTITUTION OF], which formed a Federal Union after their revolt from the British Crown under George the Third, and whose destiny forms one of the most important, and certainly the most interesting, of the political problems of our own time. Of these four, three come sufficiently near to the full realization of the Federal idea to be entitled to rank among perfect Federal Governments. The Achaian League, and the United States since the adoption of the present Constitution, are indeed the most perfect developments of the Fed-

eral principle which the world has ever seen. The Swiss Confederation, in its origin a Union of the loosest kind, has gradually drawn the Federal bond tighter and tighter, till, within our own times, it has assumed a form which fairly entitles it to rank beside Achaia and America. The claim of the United Provinces is more doubtful; their union was at no period of their republican being so close as that of Achaia, America, and modern Switzerland."—E. A. Freeman, *History of federal government*, v. 1, pp. 3-6.

**Classification of federal governments.**—"To the classification of federal governments publicists have given great attention with unsatisfactory results. History shows a great variety of forms, ranging from the lowest possible organization, like that of the Amphictyonic Council [see AMPHICTYONIC COUNCIL] to the highly centralized and powerful German Empire. Many writers deny that any fixed boundaries can be described. The usual classification is, however, into three divisions,—the Staatenstaat, or state founded on states; the Staatenbund, or union of states—to which the term Confederacy nearly corresponds; and the Bundesstaat, or united state, which answers substantially to the term federation as usually employed. The Staatenstaat is defined to be a state in which the units are not individuals, but states, and which, therefore, has no operation directly on individuals, but deals with and legislates for its corporate members; they preserve undisturbed their powers of government over their own subjects. The usual example of a Staatenstaat is the Holy Roman Empire [see HOLY ROMAN EMPIRE: 962]. This conception . . . is, however, illogical in theory, and never has been carried out in practice. . . . Historically, also, the distinction is untenable. The Holy Roman Empire had courts, taxes, and even subjects not connected with the states. In theory it had superior claims upon all the individuals within the Empire; in practice it abandoned control over the states. The second category is better established. Jellinek says: 'When states form a permanent political alliance, of which common defence is at the very least the purpose, with permanent federal organs, there arises a Staatenbund.' This form of government is distinguished from an alliance by the fact that it has permanent federal organs; from a commercial league by its political purpose; from a Bundesstaat by its limited purpose. In other words, under Staatenbund are included the weaker forms of true federal government, in which there is independence from other powers, and, within the purposes of the union, independence from the constituent states. . . . The Staatenbund form includes most of the federal governments which have existed. The Greek confederations (except perhaps the Lycian and Achæan) and all the mediæval leagues were of this type: even the strong modern unions of the United States, Germany, and Switzerland, have gone through the Staatenbund stage in their earlier history. Between the Staatenbund and the more highly developed form, the Bundesstaat, no writer has described an accurate boundary. There are certain governments, notably those of Canada, Germany, Switzerland, and the United States, in which is found an elaborate and powerful central organism, including federal courts; to this organism is assigned all or nearly all the common concerns of the nation; within its exclusive control are war, foreign affairs, commerce, colonies, and national finances; and there is an efficient power of enforcement against states. Such governments undoubtedly are Bundesstaaten."—A. B. Hart, *Introduction to the study of federal government (Harvard Historical Monographs, no. 2, ch. 1)*.

Greek federations.—“Under the conditions of the Græco-Roman civic life there were but two practicable methods of forming a great state and diminishing the quantity of warfare. The one method was conquest with incorporation, the other method was federation. . . . Neither method was adopted by the Greeks in their day of greatness. The Spartan method of extending its power was conquest without incorporation: when Sparta conquered another Greek city, she sent a harmost to govern it like a tyrant; in other words she virtually enslaved the subject city. The efforts of Athens tended more in the direction of a peaceful federalism. In the great Delian confederacy [see GREECE: B. C. 477-461; 404-359 and ATHENS: B. C. 477], which developed into the maritime empire of Athens, the Ægean cities were treated as allies rather than subjects. As regards their local affairs they were in no way interfered with, and could they have been represented in some kind of a federal council at Athens, the course of Grecian history might have been wonderfully altered. As it was, they were all deprived of one essential element of sovereignty,—the power of controlling their own military forces. . . . In the century following the death of Alexander, in the closing age of Hellenic independence, the federal idea appears in a much more advanced stage of elaboration, though in a part of Greece which had been held of little account in the great days of Athens and Sparta. Between the Achaian federation, framed in 274 B. C., and the United States of America, there are some interesting points of resemblance which have been elaborately discussed by Mr. Freeman, in his ‘History of Federal Government.’ About the same time the Ætolian League [see ÆTOLIA] came into prominence in the north. Both these leagues were instances of true federal government, and were not mere confederations; that is, the central government acted directly upon all the citizens and not merely upon the local governments. Each of these leagues had for its chief executive officer a General elected for one year, with powers similar to those of an American President. In each the supreme assembly was a primary assembly at which every citizen from every city of the league had a right to be present, to speak, and to vote; but as a natural consequence these assemblies shrank into comparatively aristocratic bodies. In Ætolia, which was a group of mountain cantons similar to Switzerland, the federal union was more complete than in Achaia, which was a group of cities. . . . In so far as Greece contributed anything towards the formation of great and pacific political aggregates, she did it through attempts at federation. But in so low a state of political development as that which prevailed throughout the Mediterranean world in pre-Christian times, the more barbarous method of conquest with incorporation was more likely to be successful on a great scale. This was well illustrated in the history of Rome,—a civic community of the same generic type with Sparta and Athens, but presenting specific differences of the highest importance. . . . Rome early succeeded in freeing itself from that insuperable prejudice which elsewhere prevented the ancient city from admitting aliens to a share in its franchise. And in this victory over primeval political ideas lay the whole secret of Rome’s mighty career.”—J. Fiske, *American political ideas*, lect. 2.

Medieval leagues in Germany.—“It is hardly too much to say that the Lombard League led naturally to the leagues of German cities. [See CITIES, IMPERIAL AND FREE.] The exhausting efforts of the Hohenstaufen Emperors to secure dominion in Italy compelled them to grant privileges to the

cities in Germany; the weaker emperors, who followed, bought support with new charters and privileges. The inability of the Empire to keep the peace or to protect commerce led speedily to the formation of great unions of cities, usually commercial in origin, but very soon becoming political forces of prime importance. The first of these was the Rhenish League, formed in 1254. The more important cities of the Rhine valley, from Basle to Cologne, were the original members; but it eventually had seventy members, including several princes and ruling prelates. The league had Colloquia, or assemblies, at stated intervals; but, beyond deciding upon a general policy, and the assignment of military quotas, it had no legislative powers. There was, however, a Kommission, or federal court, which acted as arbiter in disputes between the members. The chief political service of the league was to maintain peace during the interregnum in the Empire (1250-1273). During the fourteenth century it fell apart, and many of its members joined the Hansa or Suabian League. [See LANDERJEDE.] . . . In 1377 seventeen Suabian cities, which had been mortgaged by the Emperor, united to defend their liberties. They received many accessions of German and Swiss cities; but in 1388 they were overthrown by Leopold III of Austria, and all combinations of cities were forbidden. A federal government they cannot be said to have possessed; but political, almost federal relations continued during the fifteenth century. The similar leagues of Frankfort and Wetterau were broken up about the same time. Other leagues of cities and cantons were in a like manner formed and dissolved,—among them the leagues of Hauenstein and Burgundy; and there was a confederation in Franche Comté, afterward French territory. All the mediæval leagues thus far mentioned were defensive, and had no extended relations beyond their own borders. The great Hanseatic League [see HANSA TOWNS], organized as a commercial union, developed into a political and international power, which negotiated and made war on its own account with foreign and German sovereigns; and which was for two centuries one of the leading powers of Europe.”—A. B. Hart, *Introduction to the study of federal government* (*Harvard Historical Monographs*, no. 2, ch. 3).

Medieval league of Lombardy.—When Frederick Barbarossa entered Italy for the fifth time in 1163, to enforce the despotic sovereignty over that country which the German kings, as emperors, were then claiming (see ITALY: 961-1039), a league of the Lombard cities was formed to resist him. “Verona, Vicenza, Padua, and Treviso, the most powerful towns of the Veronese marches, assembled their consuls in congress, to consider of the means of putting an end to a tyranny which overwhelmed them. The consuls of these four towns pledged themselves by oath in the name of their cities to give mutual support to each other in the assertion of their former rights, and in the resolution to reduce the imperial prerogatives to the point at which they were fixed under the reign of Henry IV. Frederick, informed of this association, returned hastily into Northern Italy, to put it down . . . but he soon perceived that the spirit of liberty had made progress in the Ghibeline cities as well as in those of the Guelphs. . . . Obligated to bend before a people which he considered only as revolted subjects, he soon renounced a contest so humiliating, and returned to Germany, to levy an army more submissive to him. Other and more pressing interests diverted his attention from this object till the autumn of 1166. . . . When Frederick, in the month of October, 1166, descended the mountains of the

Grisons to enter Italy by the territory of Brescia, he marched his army directly to Lodi, without permitting any act of hostility on the way. At Lodi, he assembled, towards the end of November, a diet of the kingdom of Italy, at which he promised the Lombards to redress the grievances occasioned by the abuses of power by his podestas, and to respect their just liberties; . . . to give greater weight to his negotiation, he marched his army into Central Italy. . . . The towns of the Veronese marches, seeing the emperor and his army pass without daring to attack them, became bolder: they assembled a new diet, in the beginning of April, at the convent of Pontida, between Milan and Bergamo. The consuls of Cremona, of Bergamo, of Brescia, of Mantua and Ferrara met there, and joined those of the marches. The union of the Guelphs and Ghibelines, for the common liberty, was hailed with universal joy. The deputies of the Cremonese, who had lent their aid to the destruction of Milan, seconded those of the Milanese villages in imploring aid of the confederated towns to rebuild the city of Milan. This confederation was called the League of Lombardy. The consuls took the oath, and their constituents afterwards repealed it, that every Lombard should unite for the recovery of the common liberty; that the league for this purpose should last twenty years; and, finally, that they should aid each other in repairing in common any damage experienced in this sacred cause, by any one member of the confederation: extending even to the past this contract for reciprocal security, the league resolved to rebuild Milan. . . . Lodi was soon afterwards compelled, by force of arms, to take the oath to the league; while the towns of Venice, Piacentia, Parma, Modena, and Bologna voluntarily and gladly joined the association."—J. C. L. de Sismondi, *History of the Italian republics*, ch. 2.—In 1226 the league was revived or renewed against Frederick II. "Milan and Bologna took the lead, and were followed by Piacenza, Verona, Brescia, Faenza, Mantua, Vercelli, Lodi, Bergamo, Turin, Alessandria, Vicenza, Padua, and Treviso. . . . Nothing could be more unlike, than the First and the Second Lombard Leagues. That of 1167, formed against Frederick the First after the most cruel provocation, was sanctioned by the Pope, and had for its end the deliverance of Lombardy. That of 1226, formed against Frederick the Second, after no provocation received, was discountenanced by the Pope, and resulted in the frustration of the Crusade and in sowing the germ of endless civil wars. This year is fixed upon by the Brescian Chronicler as the beginning of 'those plaguy factions of Guef and Ghibelline, which were so engrained into the minds of our forefathers, that they have handed them down as an heir-loom to their posterity, never to come to an end.'"—T. L. Kington, *History of Frederick the Second*, v. 1, pp. 265-266.

**Modern federations.**—"A remarkable phenomenon of the last hundred years is the impetus that has been given to the development of Federal institutions. First and foremost is the United States of America, where we have an example of the Federal Union in the most perfect form yet attained. Then comes Switzerland, of less importance than the United States of America, but most nearly approaching it in perfection. Again we have the German Empire [and later the republic (see GERMANY, CONSTITUTION OF THE EMPIRE; also CONSTITUTION OF THE REPUBLIC)] . . . which is truly a Federal Union, but a cumbrous one and full of anomalies. Next in importance comes the Dominion of Canada [see CANADA, CONSTITUTION OF]. . . . Lastly comes the Argentine Republic, Mexico,

[Brazil, South Africa] and the States of Colombia and Venezuela. This is a very remarkable list when we consider that never before the . . . [19th] century did more than two Federal Unions ever coexist, and that very rarely, and that even those unions were far from satisfying the true requirements of Federation. Nor is this all. Throughout the last hundred years we can mark a growing tendency in countries that have adopted the Federal type of Government to perfect that Federal type and make it more truly Federal than before. In the United States of America, for instance, the Constitution of 1789 was more truly Federal than the Articles of Confederation, and certainly since the Civil War we hear less of State Rights, and more of Union. It has indeed been remarked that the citizens of the United States have become fond of applying the words 'Nation' and 'National' to themselves in a manner formerly unknown. We can mark the same progress in Switzerland. Before 1789, Switzerland formed a very loose system of Confederated States—in 1815, a constitution more truly Federal was devised; in 1848, the Federal Union was more firmly consolidated; and lastly, in 1874, such changes were made in the Constitution that Switzerland now presents a very fairly perfect example of Federal Government. In Germany we may trace a similar movement. In 1815, the Germanic Confederation was formed [see GERMANY: 1814-1820]; but it was only a system of Confederated States, or what the Germans call Staatenbund; but after various changes, amongst others the exclusion of Austria in 1866, it became, in 1871, a composite State or, in German language, a Bundestaat."—*Federal government (Westminster Review)*, May, 1888, pp. 573-574).

**ARGENTINA.**—"Argentina is a Federal Republic; that is to say, the Provinces have autonomy, and are governed by their own constituted authorities and their own laws, except in such matters as are of a national character which are strictly defined by the Constitution. The Republic is divided into fourteen Provinces and ten Gobernaciones, or National Territories, the Federal Capital and seat of the National Government being Buenos Aires. . . . By the Constitution, when the population of a National territory exceeds 50,000, it has a right to be declared a Province. . . . In 1826, a Constitution, which has as its basis a unitarian system of government, was sanctioned on the 24th of December. After this attempt at a settlement, which soon became inoperative on account of the vehement opposition of the federal party, there was a period of anarchy which was marked by the tyranny of Rosas. On the fall of Rosas an arrangement called the 'Acuerdo de San Nicolás' was made, one of the provisions of which was the convocation of a Constituent Assembly with the object of drawing up a final Constitution. This Assembly or Congress met at Santa Fé in 1852 and continued its sittings until it had finished its work. The Constitution which now exists as the basis of Argentine government is that drawn up by this Congress. The Province of Buenos Aires was not represented in the Assembly and drew up an independent Constitution; but, after the battle of Cepeda, this province accepted the Constitution of 1853, with some modifications, which were incorporated at a national Convention at Sante Fé in September, 1860. The Constitution of 1853, as so amended, is that which is to-day the supreme authority and the basis of all civil, political, religious and other rights. By this Constitution, the Federal system of Government was adopted and the national and provincial interests of the nation are provided for."—A. S. Pennington, *Argentine re-*

public, pp. 52, 59.—See also ARGENTINA: 1819-1874; 1880-1891; ARGENTINA, CONSTITUTION OF.

ALSO IN: L. S. Rowe, *Federal system of the Argentine republic*.

AUSTRALIA.—“Beyond this, we have to note a further tendency to Federation. In the year 1880, a Bill passed the Imperial Parliament to permit of the formation of an Australasian Council for the purposes of forming the Australasian Colonies into a Federation. [See also AUSTRALIA: 1885-1892.]” —*Federal government (Westminster Review, May, 1888, pp. 573-574)*.—“The Commonwealth of Australia was constituted by an Act passed by the Parliament of the United Kingdom in 1900 known as ‘The Commonwealth of Australia Constitution Act.’ [See AUSTRALIA: 1900.] Prior to that date each individual State had its own Legislature and Executive, and the only means of joint legislative action was provided by the Federal Council of Australia, established in 1885, but in which New South Wales was unrepresented. Each of the other Colonies was represented on the Council by five members, who met together about once every two years for legislative purposes only. The Council had power to legislate with regard to the relations of the Australian Colonies with the islands of the Pacific, prevention of the influx of criminals, fisheries in Australian waters beyond territorial limits, the extradition of offenders against the law, and generally on any matters referred to it by order of Her Majesty in Council on the request of the Colonial Legislatures. It had also power to decide on any questions affecting the mutual relations of two or more Colonies referred to it by consent. Between 1886 and 1897 the Federal Council met seven times, but it was really a purely deliberative body, and the need for a more effective Federation was being increasingly felt, with a Federal Executive as well as Legislature, somewhat after the Canadian model. Towards the end of 1889 negotiations had been opened between the various Australian Colonies, as a result of which a Conference of the seven principal Colonies met at Melbourne on 6th February, 1890, at which it was unanimously resolved that the best interests of the Australian Colonies would be promoted by ‘Their early union under the Crown.’ Another Convention met at Sydney on 2d March, 1891, when, after an animated discussion, lasting over five weeks, a ‘Bill to Constitute a Commonwealth of Australia’ was drawn up and adopted. The Convention recommended that this Bill should be submitted by Parliaments of the several Colonies for the approval of the people, but for various reasons this was not immediately acted upon, and it was not until March, 1898, after several other preliminary Conferences, that a Convention of the Colonies which met at Melbourne adopted a Bill which was submitted to the popular vote for acceptance or rejection. The voting in Victoria, South Australia, and Tasmania was largely in favour of the Bill, but in New South Wales the statutory minimum number of affirmative votes was not obtained, so the matter fell through for a time. Eventually, however, the objections of the people of New South Wales (which largely centred round the fiscal question) were overcome, and on 20th June, 1899, it was accepted by a majority of about 25,000. Queensland also accepted the Bill in September of the same year, and so in the autumn of 1899 addresses to the Queen were presented by the five Colonies which had accepted the Bill, praying for its enactment. Delegates were appointed by the five Colonies, and also by Western Australia, to be present at Westminster during the passage of the Bill through Parliament, which duly took place with-

out much friction (July, 1900), and the Commonwealth of Australia was proclaimed at Sydney on 1st January, 1901. The Act provided for the inclusion of Western Australia in the Federation, which took place a few weeks later, so that the States comprised in the commonwealth, are now six in number, viz., New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania.”—J. C. Haig, *Federal solution, pp. 31-33*—See also AUSTRALIA: 1885-1892; 1900; 1901 (January); AUSTRALIA, CONSTITUTION OF.

BRAZIL.—Brazil has had a federal government since 1889. “Having adopted the system of government known as a Federal Republic, the country is named the United States of Brazil, comprising twenty separate States, which are, from a commercial point of view, practically small Republics, each being entirely self-governed. Every State maintains its own Administration, and uses for its own benefit the principal portion of its own revenues, such as taxes on real estate, and stamp duties on documents executed or legalised by the local authorities. The Federal Government, which, of course, supervises the Administration of the States, determines the general home and foreign policy of the country, exercising functions similar to those of the two Houses of Parliament of the United Kingdom of Great Britain and Ireland. The standing naval and military forces of the country are maintained by the Federal Government, which derives its principal revenue from the duties imposed upon foreign imports, dues for the entry of vessels, stamps, postal and telegraphic, and other charges. The Federal Government is composed of two houses—the Chamber of Deputies and the Senate. Each State sends the Senators to the National Congress, and the Federal capital sends the same number. These Senators are elected for nine years, one-third of the number being changed every three years. The Chamber of Deputies is composed of members elected directly by the people, in exactly the same manner as are the Senators. An article of the Constitution fixes the maximum number of deputies at one for every seventy thousand voters.” —C. W. Domville-Fife, *United States of Brazil, pp. 77-78*.—See also BRAZIL: 1889-1891; BRAZIL, CONSTITUTION OF.

BRITISH EMPIRE, PROJECTED FEDERATION OF. See BRITISH EMPIRE: Imperial federation proposals; LEAGUE OF NATIONS.

CANADIAN FEDERATION.—“A convention of thirty-three representative men was held in the autumn of 1864 in the historic city of Quebec, and after a deliberation of several weeks the result was the unanimous adoption of a set of seventy-two resolutions embodying the terms and conditions on which the provinces through their delegates agreed to a federal union in many respects similar in its general features to that of the United States federation, and in accordance with the principles of the English constitution. These resolutions had to be laid before the various legislatures and adopted in the shape of addresses to the queen whose sanction was necessary to embody the wishes of the provinces in an imperial statute.’ . . . In the early part of 1867 the imperial parliament, without a division, passed the statute known as the ‘British North America Act, 1867,’ which united in the first instance the province of Canada, now divided into Ontario and Quebec, with Nova Scotia and New Brunswick and made provisions for the coming in of the other provinces of Prince Edward Island, Newfoundland, British Columbia, and the admission of Rupert’s Land and the great North-west. Between 1867 and 1873 the provinces just named, with the exception of Newfoundland, which has

persistently remained out of the federation, became parts of the Dominion and the vast North-west Territory was at last acquired on terms eminently satisfactory to Canada and a new province of great promise formed out of that immense region, with a complete system of parliamentary government. . . . When the terms of the Union came to be arranged between the provinces in 1864, their conflicting interests had to be carefully considered and a system adopted which would always enable the Dominion to expand its limits and bring in new sections until it should embrace the northern half of the continent, which, as we have just shown, now constitutes the Dominion. It was soon found, after due deliberation, that the most feasible plan was a confederation resting on those principles which experience of the working of the federation of the United States showed was likely to give guarantees of elasticity and permanency. The maritime provinces had been in the enjoyment of an excellent system of laws and representative institutions for many years, and were not willing to yield their local autonomy in its entirety. The people of the province of Quebec, after experience of a union that lasted from 1841 to 1867, saw decidedly great advantages to themselves and their institutions in having a provincial government under their own control."—J. G. Bourinot, *Federal government in Canada*, lect. 1-2.—"The French in Canada would not willingly have entered a legislative union, but under a federal plan they obtained adequate assurance that their distinctive nationality would be preserved. But this concession to centrifugal tendencies once made, the plan of the Quebec Resolutions and of the Act founded upon them proceeds upon the hypothesis that a strong national government is a good and wholesome thing. The Senate, which represents the federal principle in the Constitution, is designedly weak. The legislative powers exclusively assigned to the Parliament of Canada are wide and numerous. The Governor-General of Canada in Council appoints the provincial governors and may exercise a veto upon provincial legislation, while upon the two important subjects of agriculture and immigration it is competent to the Dominion Parliament to make general laws, which in case of conflict override the enactments of the Provinces. The Constitution was hastily drafted and the partition of exclusive legislative functions between the Dominion and the Provinces has been so defined as to give rise to much ambiguity and litigation. But though the tendency of legal decisions has been to strengthen the position of the provincial legislatures, the Government of the Dominion stands out in sharp contrast to the Government of the United States. At Ottawa the Cabinet reflects the opinion of the majority of the popular assembly and controls the conduct of Parliament. At Washington the Cabinet is neither named by Congress, nor a sharer in its deliberations, nor a dictator of its policy. In Ottawa the Dominion Parliament has wide powers specifically and exclusively ascribed to it. At Washington Congress legislates within a comparatively narrow ambit. Finally, in Canada the residual legislative power is lodged with the central Parliament, in America with the several States."—H. A. L. Fisher, *Political unions*, pp. 24-25.—See also CANADA: 1867; CANADA, CONSTITUTION OF: 1867; 1871; 1886.

CENTRAL AMERICAN FEDERATION. See CENTRAL

AMERICA: 1821-1871; 1895-1902; 1921; CENTRAL AMERICA, CONSTITUTION OF; LATIN AMERICA: Forms of government.

GERMAN CONFEDERATION.—It "was first formed as the result of a civil war in which a considerable number of the small German states, allied with Austria, had been defeated by Prussia. As a result several of them were directly annexed to Prussia and the others north of the Main brought into a federal union in which Prussia was the dominating state. [See GERMANY: 1866.] The larger states south of the Main, Bavaria, Württemberg, and Baden, politically and tribally unfriendly to Prussia, were not included. It was the result of the great national successes in the Franco-Prussian War of 1870 which brought these states into the union and transformed the confederation into the Empire. [See GERMANY: 1866-1867; 1866-1870; 1870 (September-December).] But the constitution was not changed in its essential nature. The most interesting changes are those in which concessions were granted to the south German states to overcome their reluctance to enter the Empire and their fear of the encroachments of Prussia."—G. B. Adams, *British empire and a league of peace*, pp. 105-106.—When the German empire became the German republic in 1919 its status as a federal government was not materially changed. In the new constitution of August 13, "the territory is stated to consist of the territories of the German states. . . . The legislative competence of the national government is determined in a long enumeration of powers. It is considerably more extensive than that exercised by the imperial government under the old constitution. The special rights of the south German states are swept away. Such matters as the relation of church and state, land tenure, theaters and cinematographs, disposal of the dead, and the general control over public instruction are now placed within the field of national legislation. The national government, moreover, is given an unlimited power of taxation and thus freed from the necessity of relying upon matricular contributions from the states. There is thus exemplified the centripetal and unitary tendency so noticeable in all federal governments. The states enjoy the right of legislation in many of the matters included in the enumeration of national powers, so long as the national government does not exercise them, but such state laws are subject to the federal veto."—W. J. Shepard, *New German constitution* (*American Political Science Review*, Feb., 1920, pp. 38-39).—See also GERMANY, CONSTITUTION OF THE EMPIRE, AND CONSTITUTION OF THE REPUBLIC.

SOUTH AFRICAN UNION.—"Among existing federations we may regard the United States as representing one extreme, the extreme of power in the hands of the states, we may also consider the South African Union the other, of powers in the central government. The South African Union indeed goes so far towards this extreme that, though the process by which it was formed was clearly a federative process, the result is so nearly a unitary government that it can hardly be called a federation at all."—G. B. Adams, *British empire and a league of peace*, p. 101.—See SOUTH AFRICA, UNION OF: 1908-1909; 1910; SOUTH AFRICA, UNION OF: Constitution.

SWITZERLAND.—"Turning next to the oldest federation in Europe, that of Switzerland, which with various changes has survived from 1308, though its present constitution dates only from 1874, we find it now embraces three nationalities—German, French, Italian. The original nucleus of the State, however, was German, and even now three-fourths of the population are German. The twenty-two

distinct states are federated under one president elected annually, and the Federal Assembly of two chambers. . . . Each of the cantons is sovereign and independent, and has its own local parliament, scarcely any two being the same, but all based on universal suffrage. Each canton has its own budget of revenue and expenditure, and its own public debt."—J. N. Dalton, *Federal states of the world* (*Nineteenth Century*, July, 1884).—See also SWITZERLAND, CONSTITUTION OF.

**FERM, FIRMA, FARM**.—"A sort of composition for all the profits arising to the king [in England, Norman period] from his ancient claims on the land and from the judicial proceedings of the shire-moot; the rent of detached pieces of demesne land, the remnants of the ancient folk-land; the payments due from corporate bodies and individuals for the primitive gifts, the offerings made in kind, or the hospitality—the feorm-fultum—which the kings had a right to exact from their subjects, and which were before the time of Domesday generally commuted for money; the fines, or a portion of the fines, paid in the ordinary process of the county courts, and other small miscellaneous incidents. These had been, soon after the composition of Domesday, estimated at a fixed sum, which was regarded as a sort of rent or composition at which the county was let to the sheriff and recorded in the 'Rotulus Exactorious'; for this, under the name of ferm, he answered annually; if his receipts were in excess, he retained the balance as his lawful profit, the wages of his service; if the proceeds fell below the term, he had to pay the difference from his own purse. . . . The farm, ferm, or firma, the rent or composition for the ancient feorum-fultum, or provision payable in kind to the Anglo-Saxon kings. The history of the word in its French form would be interesting. The use of the word for a pecuniary payment is traced long before the Nor-

man Conquest."—W. Stubbs, *Constitutional history of England*, ch. 11, sect. 126, and note.

**FERMENTATION**, Study of. See MEDICAL SCIENCE: Modern: 19th century: Study of fermentation and its results.

1556.—Extent of territory. See EUROPE: Map of central Europe: 1556.

1597.—Annexation to the states of the church.—End of the house of Este.—Decay of the city and duchy. See PAPACY: 1597.

1848.—Occupied by Austrians. See FRANCE: 1842-1848.

**FERRARI**, Paolo (1822-1889), Italian dramatist and critic. See ITALIAN LITERATURE: 1710-1890; 1860-1920.

**FERRARIS**, Galileo (1847-1897), Italian electrical engineer and physicist, experimented with the electric motor. See ELECTRICAL DISCOVERY: 1823-1921.

**FERRER**, Francisco (1859-1909), Spanish revolutionist, founder of the Modern School in Spain. He was arrested on the charge of being head of an uprising and condemned to death in 1909. See SPAIN: 1909; FRANCE: 1909-1910 (July-November).

**FERRERO**, Guglielmo (1872- ), Italian historian and publicist. Perhaps his most important work is his "Greatness and decline of Rome." He also wrote "Between Two Worlds, Ancient Rome and Modern America: a Comparative Study of Morals and Manners," and collaborated with his father-in-law, Césaire Lombroso, on the latter's "Female Offender."

**FERRI**, Enrico (1856- ), Italian criminologist. See PRISON REFORM: Italy.

**FERRO**, island in Canary group, regarded in the 16th century as most westerly point of the Old World. See AMERICA: 1528-1648.

**FERRY**, Jules François Camille (1832-1893). French statesman. Prefect of the department of the Seine under the government of national defense, 1870-1871; minister to Athens, 1872-1873; minister of public instruction, 1870-1880; president of the council (premier), 1880-1881; minister of public instruction, 1882, when he succeeded in passing the Public Education Act; premier, a second time, 1883-1885; president of the senate, 1893. His name is chiefly associated with extension of French education and with the colonial expansion of France. See FRANCE: Colonial empire; 1875-1880.

**FERRYBRIDGE**, Battle of (1461). See ENGLAND: 1455-1471.

**FERRYLAND** (Verulam), old port of entry situated south of St. John's, Newfoundland. See NEWFOUNDLAND: 1610-1655.

**FERTILIZERS**: Origin.—Use by the ancients.—Knowledge of soil cultivation poor in the Middle Ages.—"The word 'manure,' when first

met with in English, possessed a much wider significance than it does to-day. Of the same origin as manœuvre, it meant, primarily, to work by hand, and it is used in that sense by Defoe in *Robinson Crusoe*—"The land which I had manured or dug"; but it also took on the extended meaning of any process or material by which the land could be ameliorated. In the seventeenth and early eighteenth centuries this latter sense alone began to prevail; agricultural writers enumerated "chalk, lime, marl, burnt clay, etc., as manures, and began to speak of the operations of cultivation as tillages or husbandry. . . . Farmyard manure is the typical 'manure'; marl or chalk would no longer be regarded as manure, because they do not feed the plant directly; while substances like basic slag or nitrate of soda, which simply supply one or other element in the nutrition of a plant, should be termed 'fertilisers' rather than artificial manures. The distinction is not, however, very clearly drawn, and manure and fertiliser are generally and unconsciously used as interchangeable terms. . . . It is impossible to assign a period to the discovery of the fertilising properties of the excrement of animals: agriculture must be almost coeval with the human race. . . . At any rate, when in Roman times we began to get some record of agricultural practices, we find that not only was the value of dung recognised, but that the virtues of certain other manures, such as marl, had been established. . . . But to whatever point the knowledge of manures had reached in the time of the Romans, for a long time it made no further advances and bade fair to be utterly lost with the irruption of the barbarians. . . . Doubtless the old traditions did not perish in the Romance countries, but as before were handed down from one generation to another; as long as corn and wine continued to be cultivated the immemorial precepts concerning their management would linger about the country side and be treasured in the memories of the workers in the fields. But during the Dark Ages this kind of knowledge sank below the level of whatever literature was being written. . . . In many English tenures we find that the flocks of the tenants had to be folded on the lord's land at night, the manure thus brought being one of his most valued privileges; while in Walter de Henley's *Husbandrie*, the great mediæval treatise on the duties of a land agent, we find instructions for the preservation of dung by the use of litter and marl. . . . When, with the general resurrection of learning at the Renaissance, we once more get books on agriculture, we find that either old tradition or the experience of men of an enquiring turn of mind, who had been trying all sorts of things on their land, had already built up a certain knowledge of manures and manuring. The value of marl and chalk, of woollen rags and ashes, was certainly known in the sixteenth century; men had even begun to reason a little on the mode of action of manures. For example, Bernard Palissy the potter, in his *Recepte Vèritable*, published in 1593, not only recommends the use of marl and lime, but can assign a reason for the value of ashes, and shows that the richness of farmyard manure resides in the portion soluble in water. . . . Despite the experience that was accumulating respecting the fertilising value of this or that substance, no real progress towards a theory of manuring was made until the close of the eighteenth and the beginning of the nineteenth century."—A. D. Hall, *Fertilisers and manures*, pp. 1-5.

Chemistry applied to soil cultivation.—Work of Boussingault.—Progress towards artificial manures in the seventeenth and eighteenth centuries.—Use of mineral manures in the nine-

teenth century.—Nitrogen-manures.—“Before the development of a science of chemistry it was naturally impossible to form any idea of how a plant came to grow; while the nature of the plant itself, of the air, water, and earth were equally unknown, no correct opinion could be reached as to how the latter gave rise to the former. . . . Boussingault . . . was the first man to undertake field experiments on a practical scale. Farming his own land at Bechelbronne, Alsace, from 1834 onwards, he systematically weighed crops and manure and analysed both so as to obtain a balance-sheet showing the quantities of carbon and nitrogen added in manure and removed in the crops. He thus in 1838 demonstrated on a working scale the enormous amounts of carbon which are assimilated by the plant from the atmosphere—far greater quantities than the humus in the soil could continue to supply. Boussingault’s experiments led him to conclude that the plant derives its nitrogen from the soil, though he also showed that in certain rotations more nitrogen is removed in the crop than is supplied in the manure. . . . It has been indicated how impossible it is to recover the date of the original discovery of the fertilising value of the substances we now call artificial manures; only by an occasional allusion in the older books can we find that particular materials were in common use at the period of the writer. Blithe’s *English Improver*, published in 1653, mentions the value of rags, wool, marrow bones or fish bones, horn shavings, soot, and wood ashes; and Evelyn, writing a few years later, adds also blood, hair, feathers, hoofs, skin, fish, malt dust, and meal of decayed corn, so that a knowledge of the value of these materials must have been widespread. William Ellis, a Hertfordshire farmer who wrote in 1732, enumerates a long list of ‘hand manures,’ the use of which he regarded as characteristic of Hertfordshire farming in his day. These include soot, wood ashes, woollen rags, horn shavings, hoofs, hair, coney clippings, oil cake, and malt dust; and the regular part they evidently played in the farming of that district show that they must have been known and used for a long time previous to Ellis’s writings. Throughout the eighteenth century we hear of the same materials, and also of bones, which Ellis does not mention, though their value is stated by several of the seventeenth century writers. Early in the nineteenth century we begin to hear of guano from Peru, though the first importation did not take place until 1840. The importation of nitrate of soda from Chile had begun a year or two before; its value as manure was for a time in doubt, though as early as 1669 Sir Kenelm Digby had recounted an experiment to show how much barley plants were benefited by watering with a weak solution of nitre, and Evelyn in 1675 had written: ‘I firmly believe that were saltpetre to be obtained in plenty, we should need but few other composts to meliorate our ground.’ The employment of ammoniacal salts seems to have begun entirely upon theoretical grounds; de Saussure had attributed the nitrogen of vegetation to the ammonia in the atmosphere, and in this he was followed by Liebig; fortunately, about the same time, the manufacture of coal-gas gave to the world a cheap source of ammonium salts. Lawes had already been trying them before Liebig’s paper of 1840, and when the Rothamsted experiments were definitely started in 1843, a mixture of muriate and sulphate of ammonia became their standard nitrogenous manure. The use of mineral phosphates as manure begins with Lawes’ super-patents in 1842, although no mineral phosphates were available on a large scale until Henslow’s discovery of the coprolite beds of

Cambridgeshire in 1845, soon after which time Lawes and others took them up as material for the manufacture of superphosphates. Putting aside the various methods adopted for the utilisation of slaughter-house refuse, etc., no further novel manurial substances can be said to have been introduced until the development of the Stassfurt potash deposits, which began about 1860, and the discovery of basic slag in 1870, which has been followed in the last few years by various processes for bringing atmospheric nitrogen into a combined form.”—*Ibid.*, pp. 5, 7, 11-13.—“Investigations made since 1886 have shown that certain bacilli play a very striking part in the process whereby plants assimilate nitrogen. There are certain bacilli in tilled soil which, while performing their vital processes, exhibit the remarkable property of causing the combination of nitrogen with oxygen. The compounds that are produced in this way react, in turn, with substances in the soil to form compounds that dissolve in water—chiefly salts of nitric acid—and these soluble compounds are then assimilated by plants. . . . Plants are known, belonging to the leguminous class, on whose root-nodes so much nitrogen-containing material is stored, in consequence of the activity of bacilli, that the soil is constantly rendered richer in nitrogen compounds by their growth; such plants are known as nitrogen-gatherers. If, then, plants whose roots do not possess this property are cultivated on a certain soil which has been sown the previous year with these nitrogen-gatherers, those plants find a store of material which supports their growth, although the soil has not been directly manured with nitrogen compounds. . . . Attempts were made to apply these nitrogen-gathering bacilli directly to soil culture. The bacilli were bred in pure cultures which were brought into the market with the name nitragin. Before they were sown, the seeds were soaked in nitragin diluted with thin milk, so that the nitrogen-gathering bacilli adhered to each seed. The results of many experiments, made from the year 1806, have led to such unsatisfactory results that the method must be regarded as valueless to agriculture. Now, before all this was known, experiments had shown that the addition to the soil of materials that contain nitrogen—or, as one may say, the assistance of the activity of the bacilli—was very beneficial to the growth of plants. Those nitrogen compounds which are soluble in water are of course the most efficient. There are four compounds which can be obtained in such quantities, and at so moderate a price, as to make them suitable to the agriculturist for this purpose. One of these compounds is sulphate of ammonia; the second is Chili saltpetre; the third is calcium nitride; and the fourth is calcium nitrate. . . . Experiments have shown that saltpetre provides plants with nitrogen more quickly and more thoroughly than any other nitrogen-manure. The third source of nitrogen, calcium nitride, came into use in 1903. . . . Professor Franck discovered that when nitrogen is passed over heated calcium carbide—and nitrogen can be cheaply obtained from the air—a compound, calcium nitride, is formed. The first factory of calcium nitride was established, in 1905, by a German company, at Piano d’Orta in Italy, the site being chosen because of the cheap supply of power obtained from water. The yearly output of this factory is 80,000 centners (nearly 4,000 tons). A considerable amount of calcium nitride is now worked up into sulphate of ammonia, in the factories, and in this way the nitrogen of the atmosphere is made available for agriculture. The problem of applying atmospheric nitrogen to agriculture was solved in quite a different way by Birkeland

and Eyde. It had been known for long that traces of nitric acid were formed by passing electric sparks through moist air. The work of Birkeland and Eyde, and of many other investigators since 1909, has so increased the yield of nitric acid that agriculturists have been able to buy nitric acid produced from the air, in the form of nitrate of calcium, at a sufficiently cheap price.—Dr. Lassar-Cohn, *Chemistry in daily life* (tr. by M. M. P. Muir), pp. 48-51.—See also CHEMISTRY, AGRICULTURAL.

**FETIALES**, or *Feciales*.—"The duties of the *feciales*, or *feciales* [among the Romans], extended over every branch of international law. They gave advice on all matters of peace or war, and the conclusion of treaties and alliances. . . . They fulfilled the same functions as heralds, and, as such, were frequently entrusted with important communications. They were also sent on regular embassies. To them was entrusted the reception and entertainment of foreign envoys. They were required to decide on the justice of a war about to commence, and to proclaim and consecrate it according to certain established formalities. . . . The College of *Feciales* consisted of nearly twenty members, with a president, who was called *Pater Patratus*, because it was necessary that he should have both father and children living, that he might be supposed to take greater interest in the welfare of the State, and look backwards as well as forwards. . . . The name of *Feciales* . . . still existed under the emperors, as well as that of *Pater Patratus*, though only as a title of honour, while the institution itself was for ever annihilated; and, after the reign of Tiberius, we cannot find any trace of it."—E. **FEUDALISM: Definition**.—Origin and scope.—"Feudalism is a word loosely used to cover a form of society existing over a large part of the

surface of Europe for many centuries. Its roots may be found in the time of the Roman Empire; it took definite shape in the ninth century, and it did not quite disappear from Western Europe until the end of the eighteenth century. It was thus an important feature of European life for nearly a thousand years. It extended also over a very wide area. It lay at the foundation of the life and institutions of Great Britain, . . . [where] it was always restrained from full growth . . . by the strength of the monarchy; France and Germany were the countries where it could be seen in its freest development; it was important in Spain and Italy; and though Poland, Bohemia, Hungary, and Russia were not technically feudal countries, they exhibited some of the characteristics of feudalism in a striking manner, and retained them when they had died out elsewhere in Europe. . . . Feudalism was in fact a spontaneous development, the result of the forces, needs and ideas of the time."—A. J. Grant, *History of Europe*, pp. 336, 337.—The origin of the institution was both Germanic and Roman. "If the tribe to which they belonged was at peace for any length of time, many of the noble [German] youths voluntarily sought other tribes that were at war, because a quiet life was irksome and they gained renown more readily in the midst of perils. Consequently the young men enrolled themselves under the leadership of some chief renowned in war. . . . When they went into battle it was a disgrace for the chief to be outdone in deeds of valor and for his band of followers—the *comitatus*—not to match the courage of their chief; furthermore for any one of the followers to have survived his chief and come unharmed out of a battle was lifelong infamy. [See also *COMITATUS*.] . . . In the Roman society at the beginning of the fifth century there was no civil equality of persons and the lower classes of freemen had fallen almost completely under the power of the nobles. Some of the small land-holders had been violently dispossessed. Frequently poor men with small farms had been compelled to place themselves under the patronage (*patrocinium*) of some wealthy and powerful neighbor in order to secure protection or to escape the burdensome taxation; such protection the powerful man was usually willing to grant, but as payment for his patronage he required the transfer to himself of the title to the land which the poorer man had owned; usually the former owner, as long as he lived, was allowed the usufruct or tenure of the land. Thus the land was passing into the hands of the nobles, and the latter frequently had more than their *coloni* and slaves could cultivate. Consequently, rather than let it lie idle, they often granted the request (*precarium*) of a poor man for the use of some land. Usually there was no payment demanded, but on the other hand the grant could be terminated at any moment when the owner desired, so the user had a precarious tenure. The *patrocinium* and *precarium* became well established, and on each estate the inhabitants looked to the proprietor for protection and the means of earning a livelihood. Consequently it was natural that the administration of justice should also fall into the hands of the proprietors, and many of them possessed a *de facto* private jurisdiction in their villas during the later decades of the Roman rule. . . . After the Germans had become the masters in Gaul, some Roman nobles retained their possessions and became companions and officials of the barbarian rulers. Some lands were confiscated by the invaders and distributed among the companions of the kings, in return for military service or other duties. In either case the tenants and small holders depended

almost wholly, upon the great proprietors for protection and livelihood, and had to serve them in return. . . . All of the Germans, and later all men who were wealthy enough, had to serve in the king's army for several months each year at their own expense. These were the general conditions during all the time from the fifth to the tenth century, and it was in this framework that the kings were obliged to carry on their functions. The customs which had prevailed under the Roman rule were not unlike some of the German customs, and the new institutions which grew out of the fusion have long been a bone of contention between the different schools of historians. One school lays stress upon the Roman origins and shows how vassalage and fiefs developed from the *patrocinium* and *precarium*; the other school derives the vassal relation from the German *comitatus* and points out that the land relation in the fief is the natural outcome of the idea of a gift among the primitive Germans, who were like children, ready to give away anything which they did not desire at the moment, but feeling that they had a perfect right to reclaim the gift if they wanted it. Consequently when the land was distributed among the followers of a German king they had only the tenure and not the ownership, which still was vested theoretically in the king."—D. C. Munro, *Middle Ages*, 395-1272, pp. 31, 120, 127.—See also GAUL: 5th-10th centuries; FRANKS: 500-768; EUROPE: Middle Ages: Influence of feudalism; HEERBAN.

Continental growth.—Decay of free peasantry.—Growth of vassal class.—Influence of invasions.—Dynastic wars.—Rise of vassal states.—Feudal cavalry.—Ravages of the Danes.—Investiture and its symbols.—"The time of Lewis [the Pious] being one in which the central power was rapidly growing weaker, and the independence of the local counts growing more marked, we cannot doubt that the mailed and horsed retainers of these notables must have been continually growing in numbers and importance as compared with the unarmoured infantry of the local levies. The perpetual civil wars which occupied the later years of Lewis' reign are so full of sudden desertions and inexplicable changes from side to side on the part of large bodies of troops, that we see that the self-interest of the counts has become of more importance than the general loyalty of their subjects. Docile obedience to the royal ban has been replaced by the most open treason. Owing to the emperor's foolish liberality to his sons, the realm had four rulers at once, and ambitious nobles could cloak their private schemes by pretending to adhere to one or other of the rebellious young kings. When the will of the local ruler became of more importance than that of the nominal head of the empire, the day of feudalism was beginning to draw nigh. Already in the time of Charles the Great we find the counts accused of pressing hardly upon the smaller freemen, exacting from them illegal impositions and services—misdemeanours against which the capitularies declaim again and again. Under weak rulers like Lewis and his sons the evil was perpetually growing worse. At the same time, the other characteristic sign of feudalism, in its social as opposed to its political aspect—the commendation of an ever-growing proportion of the smaller landholding classes to their greater neighbours—was steadily going forward.

"Probably the heavy burdens of military service on distant frontiers, which Charles had imposed on his subjects, was not one of the least of the causes of the decay of the free peasantry. The duty which had been comparatively light in the lesser realm of the Merovings was immeasurably increased by the

vast extension towards the Elbe and Danube. But the tendencies toward feudalism in the State, with the corresponding tendency towards the depreciation of the national levies of foot-soldiery, would have been comparatively slow in its progress if it had not been suddenly strengthened by new influences from without. The transformation of Western Europe from the military point of view was to a very large extent the direct result of the incursions of the Northmen. The lesser troubles caused by the Magyars on the eastern frontier and the Saracens in Italy were co-operating causes, but not to be compared in importance with the effect of the raids of the Scandinavians. . . . By the year 800 both the Frankish and the English realms possessed an aristocracy, originally dependent on the kings, and wholly official in character—a 'nobility of service.' . . . On the Continent it now included not only actual holders of countships or great offices about the court, but large numbers of persons, both lay and clerical, who held 'beneficia,' feudal grants of land, from the king. [See also BENEFICIUM.] Each of these counts and *vassi* of various sorts had his bands of personal followers, landed or unlanded, *homines casati*, or sub-tenants with holdings of various size. The vassal-class was steadily growing; a family which had once held office and received grants of 'beneficia' did not drop back into the ranks of the ordinary freemen. The class, too, was already tending to encroach on its proper neighbours; the counts were using their official position, the holders of 'beneficia' their less legal but equally efficient powers of bringing pressure to bear on the smaller men. Above all, the Church was extending its boundaries on every side so rapidly, that, as early as 831, Lothar, the son of Lewis the Pious, began special legislation against the handing over of land to the 'dead hand.' When the hideous distress caused by the Danish invasions came to aid the already existing tendency towards feudalisation, the result was easy to foresee. By the end of the tenth century the vast majority of the smaller freemen had passed under the control of their greater neighbours, either by voluntary commendation, or as the result of deliberate encroachment. Nor were the Danish invasions less powerful in hastening the development of the other side of feudalism, the establishment of the counts and dukes as hereditary local potentates, who practically could no longer be displaced by the crown. There was an obvious convenience during the time of trouble in letting the son succeed to the father's government; none would know so well as he the needs and capacities of the district in which he had been brought up. Moreover, there was danger, in those days of incessant dynastic war, in the attempt to remove a powerful noble from his father's post; he might at once transfer his allegiance to some other member of the Carolingian house. Charles the Bald and his short-lived successors habitually bought respite from the peril of the moment by letting the son succeed to his progenitor's office. In the next generation, the counties of West Francia had become hereditary fiefs, in which the right of succession was looked upon as fixed and absolute. In every one of the great vassal States of the later middle age, we find that the commencement of succession within the family starts from the years between the fatal battle of Fontenay and the deposition of Charles the Fat. . . . Now, as we have already seen, the Frankish counts and vassals were accustomed to serve on horseback, and were expected to bring their retainers to the host mounted like themselves, even before the death of Charles the Great. The development of feudalism, therefore, meant the development of cavalry. . . . Dur-

ing the last seventy years of the ninth century, the infantry were always growing less and the cavalry more, just as the freemen were disappearing and the vassals growing ever more numerous. Already, by the middle of the century, the cavalry were the most important arm; in Nithard's account of the manœuvres of his patron Charles the Bald before and after Fontenay, the language used leads us to think that most of the young king's followers must have been mounted. Thirty years later, when this same king invaded Austrasia to snatch territory from his nephew Lewis, he is made to exclaim that 'his army was so great that their horses would drink up the Rhine, so that he might go over dryshod.' The definite date at which we may set the permanent depression of the infantry force in West Francia, is in 806. From this year dates the celebrated clause in the Edict of Pitres, in which Charles orders that every Frank who has a horse, or is rich enough to have one, must come mounted to the host. His words are that, 'pagenses Franci qui caballos habent aut habere possunt cum suis comitibus in hostem pergant,' and no one in future is to spoil a man liable to service of his horse under any pretence. The phrase *pagenses Franci* is evidently intended to cover the surviving freeholders due for service under the count. The 'men' of the *seniores* were already obliged to come horsed, by much older edicts. . . . By the time that the tenth century has arrived, the infantry in West Francia seem wholly to have disappeared; in such battles as the bloody field of Soissons, where King Robert was slain, both armies, without exception, seem to have been composed of mounted men. It is easy to understand the military meaning of the change; it was not merely that the impetus of the mailed horseman alone could break the Danish shield-wall. Almost more important was the fact that the cavalry only could keep up with the swiftly-moving Viking, when he had purveyed himself a horse, and was ranging over the countryside at his wicked will. The local count who could put a few hundred mailed horsemen of approved valour in the field, men bound to him by every tie of discipline and obedience, and practised in arms, was a far more formidable foe to the invader than ten thousand men of the *ban*. . . . The moment that the Frankish cavalry had reached its full development, the career of the Viking was terribly circumscribed. At last, his only method of dealing with it was to learn to fight on horseback himself; the art was acquired too late to influence the general course of history in Western Europe, but by the end of the tenth century the Norman horse was equal to any in Christendom. In the eleventh it was the flower of the chivalry of the first Crusade. . . . The Danish ravages in Germany are of little importance after the year 900; in the Western realm they continued much later, but were never so threatening again as they had been in the years before 886. For the future, the Frankish victories are almost as numerous as those of the Northmen. . . . But it was the new fortifications, even more than the battles, that saved France from utter ruin. When every town had surrounded itself with a ring-wall, and endeavoured to block its river with a fortified bridge-head, the Danes found their sphere of operations much limited. They wanted plunder, not year-long sieges with doubtful success at the end; a gallant resistance like that of Paris in 886, or Sens in 887, not only saved the particular town that was holding out, but was of indirect benefit to every other place that might have to stand a siege hereafter, since it lessened the self-confidence of the Danes, and forced them to contemplate the possibilities of similar failures in the

future. There was little gain in harrying the open country; not only had it been plundered already by fifty previous raids, but now the peasantry flocked into fortified places with all that was worth carrying away. The refuges and strongholds were now numerous enough to afford shelter to the whole countryside; for during several generations, bishops, counts, abbots, and great vassals were hard at work, fortifying every point of vantage. Not only great towns but small were soon wall-girt, and private castles supplemented them as points of resistance. A good deal of this work was only wood-work or palisading, not solid stone; but if properly held, it yet served its purpose."—C. Oman, *History of the art of war*. pp. 87-88, 102-108.—See also MILITARY ORGANIZATION: 15; CRUSADES: Effects and consequences.—"The Franks, like the Lombards, learned the use of cavalry from the Moors or Saracens. Charles Martel was led by his experiences after the battle of Poitiers to the conclusion that only with the help of mounted armies could these enemies be opposed with lasting success. It was between 732 and 758 that the introduction of cavalry service into the Frankish army took place; it had hitherto consisted mainly of infantry. The attempt was first made, and with marked success, in Aquitaine and Septimania; almost contemporaneously also among the Lombards. In order to place the secular nobles in condition to fit out larger masses of cavalry a forced loan from the church was carried through by Charles Martel and his sons, it being under the latter that the matter was first placed upon a legal footing. The nobles received ecclesiastical benefices from the crown and regranted them in the way of sub-loans. The custom of having a 'following' and the old existing relationships of a vassal to his lord furnished a model for the responsibilities of those receiving benefices at first and at second hand. The secular nobles became thus at once vassals of the crown and lords (seigneurs) of those to whom they themselves in turn made grants. The duty of the vassals to do cavalry service was based on the 'commendation'; their fief was not the condition of their doing service but their reward for it. Hence the custom of denominating the fief (Lehn) as a 'fee' (feudum)—a designation which was first applied in southern France, and which in Germany, occasionally in the eleventh and even more frequently in the twelfth century, is used side by side with the older term 'benefice,' until in the course of the first half of the 13th century it completely displaces it. With the further development of cavalry service that of the feudal system kept regular pace. Already in the later Carolingian period Lorraine and Burgundy followed southern France and Italy in becoming feudalized states. To the east of the Rhine on the contrary the most flourishing time of cavalry service and of the feudal system falls in the time of the Hohenstaufens, having undoubtedly been furthered by the Crusades. Here even as late as the middle of the twelfth century the horsemen preferred dismounting and fighting with the sword because they could not yet manage their steeds and the regular cavalry weapons, the shield and the spear, like their western neighbors. But never in Germany did feudalism make its way into daily life as far as it did in France, where the maxim held true: 'nulle terre sans seigneur.' There never was here a lack of considerable allodial possessions, although occasionally, out of respect for the feudal theory, these were put down as 'fiefs of the sun.' The principle, too, was firmly maintained that a fief granted from one's own property was no true fief; for so thoroughly was feudal law the law governing the

realm that a true fief could only be founded on the fief above it, in such manner that the king was always the highest feudal lord. That was the reason why a fief without homage, that is, without the relationship of vassalage and the need of doing military service for the state, could not be looked upon as a true fief. The knight's fee only (*feudum militare*) was such, and only a man of knightly character, who united a knightly manner of living with knightly pedigree, was 'perfect in feudal law,'—in possession, namely, of full feudal rights or of the 'Heerschild.' Whether or not he had been personally dubbed knight made no difference; the fief of a man who was still a squire was also a true fief. . . . The object of the feudal grant could be anything which assured a regular emolument,—especially land, tithes, rents, and other sources of income, tolls and jurisdictions, churches and monasteries; above all, offices of state. In course of time the earlier distinction between the office and the fief which was meant to go with the office ceased to be made. . . . The formal course of procedure when granting was a combination, exactly on the old plan, of the act of commendation, now called *Hulde*, which was the basis of vassalage, and the act of conferring (investiture) which established the real right of the man to the fief. . . . The *Hulde* consisted in giving the hand (= the performing of *mannschaft*, *homagium*, *hominium*, *Hulde*) often combined with the giving of a kiss and the taking of an oath (the swearing of *fidelitas* or *Hulde*) by which the man swore to be 'true, loyal and willing' as regarded his lord. The custom earlier connected with commendation of presenting a weapon had lost its former significance and had become merged in the ceremony of investiture: the weapon had become a symbol of investiture. . . . These symbols of investiture were in part the same as in territorial law: the glove, the hat, the cape, the staff, the twig; occasionally probably also a ring, but quite especially the sword or spear. As regarded the principalities it had quite early become the custom to fasten a banner on the end of the spear in token of the royal rights of supremacy that were to be conferred. Thus the banner became the sole symbol of investiture in the granting of secular principalities and the latter themselves came to be called 'banner fiefs.' The installation of the ecclesiastical princes by the king took place originally without any distinction being made between the office and the appanage of the office. It was done by conferring the pastoral staff (*ferula*, *virga pastoralis*) of the former bishop or abbot; in the case of bishops since the time of Henry III, by handing the ring and crosier. In the course of the struggle concerning the ecclesiastical investitures both sides came to the conviction that a distinction could be made between the appanaging of the church with secular estates and jurisdictions on the one hand, and the office itself and the immediate appurtenances of the church—the so-called 'sacred objects' on the other. A union was arrived at in the Concordat of Worms which provided that for the granting of the former (the so-called *Regalia*) the secular symbol of the sceptre might replace the purely ecclesiastical symbols. As this custom was retained even after the incorporation of the ecclesiastical principalities in the feudalized state-system, the ecclesiastical principalities, as opposed to the secular banner-fiefs, were distinguished as 'sceptre-fiefs.'—Schröder, *Lehrbuch der deutschen Rechtsgeschichte* (1889) pp. 381-388.—'By the time at which we have arrived (the Hohenstaufen Period) the knights themselves, 'ordo equestris major,' had come to form a class so distinct and so exclusive that no outsiders could enter it except in the course of three generations

or by special decree of the king. Only to those whose fathers and grandfathers were of knightly origin could fiefs now be granted; only such could engage in judicial combat, in knightly sports and, above all, in the tournament or joust. . . . Feudalism did much to awaken a moral sentiment; fidelity, truth and sincerity were the suppositions upon which the whole system rested, and a great solidarity of interests came to exist between the lord and his vassals. The latter might bring no public charges against their master in matters affecting his life, limb or honor; on three grand occasions, in case of captivity, the knighting of his son, the marriage of his daughter, they were obliged to furnish him with pecuniary aid. Knightly honor and knightly graces come in the twelfth century to be a matter of fashion and custom; a new and important element, too, the adoration of woman, is introduced. [See also CHIVALRY.] A whole literature arises that has to do almost exclusively with knightly prowess and with knightly love."—E. F. Henderson, *History of Germany in the Middle Ages*, pp. 424-425.—See also ENGLAND: 958; 959-975; 1066-1071; 1154-1189; FRANCE: 987-1327; SCOTLAND: 10th-11th centuries; 1066-1003; SWITZERLAND: 536-843; BELGIUM: Ancient and medieval history; YEOMEN; WOMAN'S RIGHTS: 300-1400; 1100-1400; SUFFRAGE, MANHOOD: 1000-1300; 1200-1600; IRELAND: 13th-14th centuries; 1269; COMMUNE, MEDIEVAL: 12th century; JERSEY AND GUERNSEY.

Disastrous effects of private wars.—'Truce of God.'—'Feudalism, it has been said, 'was not a disease.' It was a spontaneous stage in the development of society, and at a time of toppling governments and barbarian invasions it performed a necessary service in the maintenance of some sort of social bond. But feudalism was always liable to the disease of anarchy. Each feudal lord upon his estates was in effect sovereign, and the feudal tie was wholly insufficient to maintain harmony. Private war was a recognized right of a feudal chief. . . . So obvious were the disastrous effects of it, and so incapable was the state of putting a stop to it, that other expedients were tried to destroy it or mitigate it. One of these was the Truce of God. The Church, the best organized of all mediæval institutions, attempted to do what the rulers of Europe were unable to do. First the attempt was made absolutely to prohibit private war, and then to limit it within certain periods. The kings often gave the movement their support. In 1085 the emperor Henry IV. proclaimed the Truce of God for Germany. His object, he said, was, as a permanent peace could not be established, at least to exempt certain days from warfare. It was ordained therefore 'that from the first day of the advent of our Lord until the end of the day of Epiphany, and from the beginning of Septuagesima until the eighth day after Pentecost, and on every Thursday, Friday, Saturday, and Sunday until sunrise on Monday, peace shall be observed.' The Church was strong, but not strong enough to restrain with a word the warlike passions of feudal barons, though the Truce of God had some effect in limiting and mitigating warfare."—A. J. Grant, *History of Europe*, pp. 341-342.—See also TRUCE OF GOD.

Decentralizing effect.—Influence on ownership of land.—Seigniorial rights.—Appanages.—'Of the two dominant systems which the middle ages had produced, the Empire and feudalism,

the second . . . almost wholly overpowered the first. It . . . divided Europe into a complex of more or less independent states, infinitely various in size and condition. These were bound together by ties, strong in theory, but in practice weak and provocative of endless strife. So long as feudal principles and practices prevailed it was impossible to establish even considerable kingdoms, much less a European empire. And social progress was scarcely less impossible so long as the class distinction between noble and non-noble which feudalism imposed upon society was maintained, so long as Europe was divided horizontally rather than vertically and knights of whatever nationality had more in common with their order in other lands than with their own vassals. . . . Little by little society tended to divide itself into two classes, the noble and the non-noble, proprietor and tenant, lord and peasant. Little by little government tended to associate itself with landholding; and, as the middle ages went on, the institution of feudalism spread gradually through the continent. It was a form of society and government based on the possession of land, in which the lower classes were bound to the soil and looked to their lords for protection, justice, and some measure of order, in return for their services as tillers of the soil or followers in war. In turn the lord was bound to his overlord by obligation of military service, and the feudal chain led, in theory at least, to the king himself. . . . [But the power of the king was little more than theoretical over the great feudatory dukes, counts and margraves, who in their own territories ruled as monarchs, made treaties between themselves, or waged war against one another, or against the king. Even at the time of the French Revolution some of the great rulers still had the right to exercise both the high justice and the low.] Moreover, feudalism was productive of a system of society which over-spread western Europe with a multitude of estates or manors. [See also AGRICULTURE: Medieval: Manorial system.] Here, for the most part, the lesser nobility lived, and many of them, like their superiors, possessed one or more castles, built for defense, surrounded by the cottages of their tenants, and forming independent and almost wholly self-supporting social and economic units. Here and there, at places convenient for military purposes or more often for trade, had risen towns, many dating from even pre-Roman times, walled and moated like the castles. Scattered no less widely over the continent, as time went on, were monastic houses, often of great magnificence, surrounded by the lands belonging to the order which they represented. About them, too, had not seldom grown up villages like those about the castles. To the great landlords, nobles and clergy alike, belonged not merely the land but the chief public utilities of that simple agricultural society, the mill at which the grain was ground, the smithy at which the tools and armor were made or repaired, often the ovens in which the bread was baked [the seigniorial rights of later date]. Under their lords' direction roads were kept up by the tenants, to the nobles and monastic orders went the tolls and charges of the trade carried on within their domains, by pedlars or by fairs, which brought them in touch with the outside world. Gradually the towns emancipated themselves from this overlordship."—W. C. Abbott, *Expansion of Europe*, pp. 8, 13-15.—Growing out of the feudal system came also the appanage system by which sections of territory were lopped off to provide for the younger children of rulers. This practice produced not only some of the great duchies and

counties in France and Germany, but also many of the minor states of the empire. These were a source of weakness to the crown; were used as pawns in marriage, and helped to create political changes, as for instance Cleves, Juliers and Berg, which had so much influence in Prussian history.—See also APPANAGE.

**Organization.**—Political and economic tenures.—"In considering the question of the . . . feudal system . . . it is first necessary to determine the sense in which the word feudal is used. In ordinary practice the term is most commonly used somewhat loosely and vaguely to include all kinds of dependent relationships, economic or political, without reference to their institutional character. . . . But the student of institutions cannot be contented with the vague and general. . . . If the word carries with it the meaning systematic, it is a wrong word to use, for there was always much of variety in the details of feudalism as seen in different countries, or even in different parts of the same country. But feudalism did bring together the relationships which belonged to it, from top to bottom, into something like an organized whole which may be called in that sense a system. But little study of the feudalism of Western Europe in the eleventh and twelfth centuries is necessary in order to see that it united in itself two quite different sets of relations and interests. On one side we have the feudalism of lords and ladies, of knights and vassals, of courts and castles and tournaments. But the main business in the world of this sort of feudalism was not chivalry which reached its highest development when this sort of feudalism had almost disappeared. Its real business was to furnish some degree of political organization to society at a time when the lack of common ideas and the break-down of the means of intercommunication made a centralized government in a large state an impossibility. This side of feudalism was essentially political. The services which the vassal paid to his lord for the fief which he had received from him were political. By putting these services together the army was formed, and the law court, council and legislature constituted. As defence was the one great need of the time, the aspect of this side of feudalism was strikingly military, but providing for defence was by no means its only function. The baron was also the active agent by whom all the operations of government were carried on. From his class the administrative officers were drawn, and the justices, and the great officers of the crown, when a real central government began to be reconstituted. It was during the time when a central government could exist in scarcely anything more than name that the great service of feudalism was performed and then, if order was maintained and law enforced, it was due to the local baron whose allegiance to those above him in rising tiers of mesne lords to the king kept alive the idea and formal existence of the state for better times. This sort of feudalism grew out of Roman institutional practices at the time when the Empire was falling to pieces. They developed by very slow degrees, and it is only towards the end of the ninth century that we can say that feudalism as a political system had really been formed. It was finally perfected in the tenth century, and the great feudal age of Western Europe was the eleventh and twelfth centuries. It declined rapidly in the thirteenth and disappeared in the fourteenth century, leaving as its social legacy to the future the modern systems of nobility. On the other hand, this political organization, when it began to take possession of society, found already existing an organization of agriculture which had been formed during the

same period as itself and under the influence of the same general causes but out of original elements and institutions quite unlike its own, and upon this agricultural organization it based itself. . . . Many features of this organization seem superficially parallel to features of political feudalism. It made much of dependent land tenures and of persons in dependent relation to a lord; and it enforced the private jurisdiction of the lord over his unfree tenants and occasionally over some freemen. But the essential institutional characteristics and the purposes sought were wholly different. Agriculture was the chief investment of capital possible to the time; it was almost the only form of industry that had survived; and it was the agriculturist who kept society alive during the feudal age. The baron who paid the rent for his fief in political services to the state obtained the income which enabled him to perform them and to maintain his rank from the economic returns of his domain manors, and the king at the head of the state obtained his chief income in the same way from his domain manors. These two sides of feudalism had not merely a different origin in institutions of the later Empire which were distinct from one another, but they remained distinct in institutions and law so long as they existed side by side. The feudal age never confused them. It always maintained sharply the difference between military tenure and economic tenure, between noble tenure and the servile holding. A given piece of land was as a rule held at the same moment under both kinds of tenure by two different men. The baron held the manor from the king as a knight's fee by the service, let us say, of one knight at his own expense. The greater part of the same manor was held at the same time by servile and free tenants whose economic tenures furnished the labor by which the manor was cultivated and its income obtained. But each tenure was easily distinguished from the other, and each was regulated by its own rules of law, enforced in its own distinct courts. As these two sides of feudalism were distinct in origin and remained distinct during the great period of their history, so their ultimate fate was different. Political feudalism had begun to disappear by the middle of the thirteenth century because the state was discovering better methods of getting its business done, and it did not survive the fourteenth century. Better methods of agricultural organization were discovered more slowly, and the manorial system remained in existence with its law and its courts for two hundred years longer. It was even brought over into some of the American colonies in the seventeenth century, and we now have the printed records of colonial manor courts. . . . A clear perception of the distinction between political and economic feudalism . . . is essential to any understanding of the system in operation, but it is not easy to gain. It was political feudalism which was new to England [at the Conquest], and in constitutional history Norman feudalism must be conceived of not chiefly as a social organization, nor as a method of giving endowment and rank to a national nobility, but as a means of carrying on government. Economic feudalism already existed in England considerably developed, but as a result of the Conquest it was probably extended geographically throughout the kingdom and it was perfected and made more definite. Let us begin with this proposition: During the feudal age two different men held the same piece of land, by two different kinds of tenure, under two different systems of law. On each of these two sides of feudalism the unit is the same piece of land. On the economic side it is known as the manor, on the political as the knight's fee. As a

manor it is a unit in the agricultural organization of the kingdom, and its purpose is economic, that is, it is regarded as a source of income. Its cultivated area is divided into two portions, the lord's domain and the 'tenures,' or holdings of the free and servile dwellers in the manor. The tenants in the manor hold their lands of the lord by a variety of services and payments in kind to which they are held. In the eleventh century actual money payments were relatively unimportant. Payments in kind were of real value to the lord, and the labor services which were due him were used to cultivate his own domain lands, from which his chief income was derived. The services of the free tenants differed at this time from those of the servile tenants chiefly in the fact that they were fixed in amount and could not be varied at the will of the lord. Free and servile alike must attend and constitute the court of the manor, or domanial court, from which the lord obtained considerable income. This court, however, had no governmental function, except the simplest police justice, corresponding to that of the township only, and in all the organization of the manor, and all the services rendered to the lord, the purpose was plainly economic. It was to furnish the lord with the income which enabled him to perform the feudal obligations which he had assumed towards his lord and to maintain his place in the society of his time. A manor so held 'in hand' by the lord, and used for income, was called a 'domain manor,' the word 'domain' being used in a slightly different sense from its use with reference to the domain land within the manor; but its use was economic, contrasting the manors used for income with those which the lords granted to their vassals on a tenure of feudal services. All ranks in the feudal hierarchy must have their domain manors from the simple knight whose only manor must be held in domain, through the various grades of barons who must keep 'in hand' manors enough to maintain their rank, to the king at the top whose domain manors greatly exceeded in number those of the richest baron, partly because he must meet some of the expenses of the state from their income. This body of domain manors, with the economic services by which the lands were held within the manors, and the customary law by which the holdings were regulated in the domanial courts, is the economic feudal system. The political feudal system was a coördinate, coincident scheme, in which the same manors were held, but by a quite different set of services, regulated by their own law. The king was at the head of this hierarchy also. As such he was the owner of all the land of the kingdom, or sometimes to be entirely logical the feudal lawyers said that he held the kingdom of God. All other holders of land at any rate were tenants, tenants in chief of the king or of some mesne lord who stood between them and the king. Of the land of the kingdom, which came by degrees all of it to be considered as contained in manors, the king retained 'in hand' a certain number of manors as domain manors. The others he divided out among his tenants in chief according to their rank, great barons and minor barons. The services which he obtained in return from these tenants were political in character and by them the state got the larger part of its business done. The most common service was military, and the feudal system was the chief dependence of the state for its army. In the same way, as the payment of another feudal service, it got its central great council or curia regis which was at once national council, legislature and highest court. Even when the central court began to cast off by differentiation judicial institutions which were of a more fixed character, practically permanent

A TOURNAMENT IN THE 12TH CENTURY

and becoming professional, the idea still lingered that the justices were barons and the peers of all other barons. Even the central administrative machinery was manned and operated chiefly by vassals of the king who were paid not salaries but manors to be held by these services. The practice of the time distinguished between manors held by services of this kind and those held by military services. The former were called serjeanties, grand serjeanties if the services were clearly honorable in character, petty serjeanties if the services were insignificant or more nearly of a menial nature, but serjeanties were feudal, though not military, tenures. They endowed the civil service of the feudal age. The tenant in chief on receiving his fief did the same thing with it that the king had done. Let us say for example's sake that the king grants to the earl of Surrey 80 manors for the service of 40 knights. The earl retains 30 manors as his domain manors and enfeoffs vassals in the remaining fifty for the service of 45 knights, for it was the general rule that the great baron enfeoffed more knights than his service to the king called for, so as to increase his own social and political consideration. This process of enfeoffing rear-vassals was called sub-infeudation. The earl's vassals did the same with their fiefs and so on down to the unit, . . . the simple knight holding a single manor. Each of these vassals from top to bottom assumed not merely the obligation of military service but also of all the customary feudal services, including that of court service, and each lord maintained his own baronial court, if he had feudal tenants enough to justify it, in which the cases of his vassals concerning their holdings and their relations to one another and to himself were judged according to the feudal law. The customary feudal services due from the vassal to his lord included certain payments of money which must be carefully distinguished from payments of an economic character. When the vassal as heir succeeded to the fief he paid a 'relief,' a *relevium*, a taking up again of the fief, which meant that in theory the ownership of the lord entered between the occupation of his vassal and that of the heir. In practice in the case of the tenants in chief the ownership of the king did enter and actual possession, called 'primer seisin,' or first possession, was taken of the fief by the officers of the king. It was only on payment of the relief that the heir obtained recognition and the right to perform homage, swear fealty, and receive the formal investiture which gave him legal possession of his fief. That is, the relief was a payment intended to keep alive in every generation the fact that the holder of the land was a tenant merely and not the owner."—G. B. Adams, *Constitutional history of England*, pp. 41-45, 61-65.—See also AGRICULTURE: Medieval; Manorial system.—"After the feudal system of tenure had been fully established, all lands were held subject to certain additional obligations, which were due either to the King, (not as sovereign, but as feudal lord) from the original grantees, called tenants-in-chief (*tenentes in capite*), or to the tenants-in-chief themselves from their under tenants. Of these obligations the most honourable was that of knight-service. This was the tenure by which the King granted out fiefs to his followers, and by which they in turn provided for their own military retainers. The lands of the bishops and dignified ecclesiastics, and of most of the religious foundations, were also held by this tenure. A few exceptions only were made in favour of lands which had been immemorially held in frankalmoign, or freeholds. On the grant of a fief, the tenant was publicly invested with the land by a symbolical or

actual delivery, termed livery of seisin. He then did homage, so called from the words used in the ceremony: 'Je deigne votre homme' ['I become your man']. . . . In the case of a subtenant (*vassor* [or vassal]), his oath of fealty was guarded by a reservation of the faith due to his sovereign lord the King. For every portion of land of the annual value of £20, which constituted a knight's fee [in England], the tenant was bound, whenever required, to render the services of a knight properly armed and accoutred, to serve in the field forty days at his own expense. . . . Tenure by knight-service was also subject to several other incidents of a burdensome character. . . . There was a species of tenancy in chief by Grand Serjeanty, . . . whereby the tenant was bound, instead of serving the King generally in his wars, to do some special service in his own proper person, as to carry the King's banner or lance, or to be his champion, butler, or other officer at his coronation. . . . Grants of land were also made by the King to his inferior followers and personal attendants, to be held by meaner services. . . . Hence, probably, arose tenure by Petit Serjeanty, though later on we find that term restricted to tenure 'in capite' by the service of rendering yearly some implement of war to the King. . . . Tenure in Free Socage (which still subsists under the modern denomination of Freehold, and may be regarded as the representative of the primitive alodial ownership) denotes, in its most general and extensive signification, a tenure by any certain and determinate service, as to pay a fixed money rent, or to plough the lord's land for a fixed number of days in the year. . . . Tenure in Burgage was a kind of town socage. It applied to tenements in any ancient borough, held by the burgesses, of the King or other lord, by fixed rents or services. . . . This tenure, which still subsists, is subject to a variety of local customs, the most remarkable of which is that of borough-English, by which the burgage tenement descends to the youngest instead of to the eldest son. Gavelkind is almost confined to the county of Kent. . . . The lands are held by suit of court and fealty, a service in its nature certain. The tenant in Gavelkind retained many of the properties of alodial ownership: his lands were devisable by will; in case of intestacy they descended to all his sons equally; they were not liable to escheat for felony. . . . and they could be aliened by the tenant at the age of fifteen. [See also ALOD.] Below Free Socage was the tenure in Villeinage, by which the agricultural labourers, both free and servile, held the land which was to them in lieu of money wages."—T. P. Taswell-Langmead, *English constitutional history*, pp. 58-65.—See also FRANCE: 1314-1328; 1461-1468; 1780; Survey of France on the eve of the revolution; Résumé of causes; SERFDOM; CAPITALISM: 15th-10th centuries; CORVÉE; HUNGARY: 1825-1844; BOUVINES, BATTLE OF; BRITANY: 1401.

Feudal aids.—"In theory the duty of the noble vassal towards his lord was a purely personal one and to commute it for a money payment was a degradation of the whole feudal relation. The payment of money, especially if it were a fixed and regular payment, carried with it a certain ignoble idea against which, in the form of state taxation, the feudal spirit rebelled to the last. When the vassal agreed to pay something to his lord, he called it, not a tax, but an 'aid' (*auxilium*), and made it generally payable, not regularly, like the tax-bill of the citizen, but only upon certain occasions—a present, as it were, coming out of his good-will and not from compulsion; e. g., whenever

a fief was newly granted, when it changed its lord, and sometimes when it changed its vassal, it was from the beginning customary to acknowledge the investiture by a small gift to the lord, primarily as a symbol of the grant; then, as the institution grew and manners became more luxurious, the gift increased in value and was thought of as an actual price for the investiture, until finally, at the close of our period, it suffered the fate of all similar contributions and was changed into a definite money payment, still retaining, however, its early name of 'relief.' . . . The occasions for levying the aids were various but always, in theory, of an exceptional sort. The journey of a lord to the court of his suzerain, or to Rome, or to join a crusade, the knighting of his eldest son, the marriage of his eldest daughter, and his ransom from imprisonment are among the most frequent of the feudal 'aids.' The right of the lord to be entertained and provisioned, together with all his following, was one of the most burdensome, and at the same time, most difficult to regulate. Its conversion into a money-tax was, perhaps for this reason, earlier than that of many other of the feudal contributions."—E. Emerton, *Medieval Europe*, ch. 14.—See also TAXATION: Growth from earliest times; LABOR REMUNERATION: Development of wage system.

**Administration of justice.**—"The administration of justice was not more successful under feudalism than the maintenance of order; and nowhere is there a greater contrast between the Middle Ages and the classical world on the one hand and the modern world on the other than in the character of trials and the conception of justice. The administration of justice was in the hands of the feudal noble and the vassals whom he called to his council. His superior in the feudal hierarchy would sometimes interfere, but each nobleman was tenacious of his judicial rights, which were a valuable property. M. Seignobos writes of justice under the feudal régime as follows: 'The court makes no effort to probe the question to the bottom and to determine what really has happened; it judges not according to equity and reason, but according to the forms established by custom. Feudal justice is essentially an affair of forms, and has its strict rules, like a game; the only business of the judges is to see that the rules are observed, to judge the points and proclaim the winner. Every trial consists of several acts consecrated by tradition and accompanied by a solemn form of words. A movement or a word contrary to the rule is enough to condemn the litigant. At Lille a man who moved his hand, which rested upon the gospels, while he took his oath, at once lost his case.' The most characteristic of the legal processes of feudal society were the ordeal and the trial by battle. There were many forms of ordeal, all irrational and superstitious. . . . Reason, evidence, justice had here no place. The function of the court was merely to decide the conditions and to register the result. The practice must have given an evil and dangerous advantage to mere physical strength and placed no check upon the bully. When the men of the Middle Ages, accustomed to such methods of procedure, became acquainted with the principles and methods of Roman law, they were amazed at the difference. For Roman law acted in the interest of society at large, sought after the truth, balanced evidence, and aimed at justice. It seemed to the twelfth and thirteenth century like a new revelation, and the admiration for Roman law partly accounts for the readiness of many of the best minds of Europe to accept the claims of the holy Roman Empire."—A. J. Grant, *History of Europe*, pp. 342-343.—See also COURTS: England: Origin and development;

**Feudal system in Asia.**—"The authority of the Emperors [in China] during the early centuries was slight, the country being partitioned among feudal princes or dukes, often at war with one another, and many of them at times more powerful than their sovereign-lord. Thus Honan, which was under the direct rule of the Emperor, was the only province in which his authority was much felt, though as Son of Heaven he was . . . in theory the divinely-appointed ruler of the whole world, to whom all other monarchs are tributary. The result of this system was that the country was in a chronic state of civil war, the central authority being far too weak to maintain order among the turbulent dukes."—I. C. Hannah, *Brief history of eastern Asia*, p. 9.—See also CHINA: Origin of the people.—"Ching [under the Chou dynasty] was, in fact, gradually resolved into a group of many states, virtually independent of each other, owing only a nominal allegiance to the emperor, and organized on a basis corresponding somewhat to the feudal system of Europe. . . . The closing centuries of the dynasty are known technically as the period of the 'Contending States.' The different principalities that made up the empire fell to warring with one another on a gigantic scale with fearful results in carnage and in destruction of property. The imperial dignity was reduced to a shadow. Gradually by sheer strength and skill out of the struggle emerged as a leader the state of Ch'in. . . . The princes of Ch'in, . . . finally assumed the imperial throne. . . . The first of the new line to take the title of emperor . . . felt it to be necessary to found the Chinese state entirely anew. To this end he . . . [endeavored] to abolish the last traces of feudalism and to make of the empire a highly centralized monarchy. . . . [Under the founder of the Han dynasty however,] the feudalism of the Chou was reinstated, but was much modified and curtailed. The power of the emperor was supreme and under a number of vigorous monarchs became increasingly such in practice as well as in theory."—K. S. Latourette, *Development of China*, pp. 20, 26, 27, 31.

A type of feudalism was also instituted in India, under the Moguls. "Once firmly seated on the throne, Akbar began the series of conquests which have made his name famous. . . . The vast Empire thus built up, larger, probably, than had ever before existed in India, was most carefully organized. Amirs, absolutely responsible for all their actions to the Sultan—or Great Mogul, as the sovereigns of this Line are usually called—were set over the conquered provinces; while, to minimise the hatred between Moslem and Hindu, a feudal system was instituted to include them both on an equal footing, Amir being the title of the highest grade."—I. C. Hannah, *Brief history of eastern Asia*, p. 113.—See also INDIA: 1300-1605; MILITARY ORGANIZATION: 35.

**FEZZAN**, the Phazania of the ancient Romans; a part of the Sahara region in northern Africa became in 1842 a dependency of the Turkish province of Tripoli; it passed to Italy in 1912, when Tripoli was annexed by that country.

**FIALA**, Anthony (1869- ), American Arctic explorer. See ARCTIC EXPLORATION: 1901-1909.

**FIANNA EIRINN**, ancient militia of Erin, famous in old Irish romance and song.—T. Moore, *History of Ireland*, v. 1, ch. 7.

**FIAT MONEY**, currency which has no intrinsic value. It is merely a government's promise to pay. Such money depreciates in value whenever, for any cause, there is doubt about the ability of the government to fulfill its promise. If the government is overthrown, the fiat money is likely to be worthless. Examples of such money are the "Continental" money of the time of the American Revolution, the French "Assignats" of 1789-1796, and the notes of the Confederate States of America.

**FICHTE**, Johann Gottlieb (1762-1814), German philosopher, the leader of the new idealism, the aim of which was the "reform of life no less than the reform of science and philosophy. . . . [He] wrote a number of works on the *Science of Knowledge*, *Natural Right*, and *Ethics*. . . . Fichte's basal thought . . . is the notion of freedom, the idea that the will, or ego, is not a thing among things, a mere link in the causal chain, but free self-determining activity. . . . The study of knowledge will . . . prove to be the most important subject of philosophical inquiry, and to this Fichte constantly addressed himself during his strenuous career. The *Wissenschaftslehre* is the key to all knowledge: in it he offers a comprehensive and detailed account of the conditions, principles or presuppositions of both theoretical and practical reason."—F. Thilly, *History of philosophy*, pp. 434, 433.—See also ETHICS: 18th-19th centuries; GERMANY: 1808.

**FIELD**, Stephen Johnson (1816-1899), American jurist, chief justice of California, 1859-1863; associate justice of the Supreme Court, 1863-1867. See SUPREME COURT: 1866-1873; 1867-1884.

**FIELD OF LIES.**—Ludwig, or Louis, the Pious, son and successor of Charlemagne, was a man of gentle character, and good intentions—too amiable and too honest in his virtues for the commanding of a great empire in times so rude. He lost the control of his state, and his family, alike. His own sons headed a succession of revolts against his authority. The second of these insurrections occurred in the year 833. Father and sons confronted one another with hostile armies, on the plain of Rothfeld, not far from Colmar in Alsace. Intrigue instead of battle settled the controversy for the time being. The adherents of the old emperor were all enticed away from him. To signify the treacherous methods by which this defection was brought about, the "Rothfeld" (Red-field) on which it occurred received the name of "Lügenfeld," or Field of Lies.—J. C. L. de Sismondi, *French under the Carolingians* (tr. by Bellingham), ch. 7.

**FIELD OF THE CLOTH OF GOLD.**—The place of the famous meeting of Henry VIII of England with Francis I of France, which took place in the summer of 1520 (see FRANCE: 1520-1523), is notable in history, from the magnificence of the preparations made for it, as the Field of the Cloth of Gold. It was at Guisnes, or between Guisnes and Arde, near Calais (then English territory). "Guisnes and its castle offered little attraction, and if possible less accommodation, to the gay throng now to be gathered within its walls. . . . But on the castle green, within the limits of a few weeks, and in the face of great difficulties, the English artists of that day contrived a summer palace, more like a vision of romance, the creation of some fairy dream (if the accounts of eye-witnesses of all classes may be trusted), than the dull every-day reality of clay-born bricks and mortar. No 'palace of art' in these secluded climates of the West ever so truly deserved its name. . . . The palace was an exact square of 328 feet. It was pierced on every side with oriel windows and clerestories curiously glazed, the mullions and posts of which were overlaid with gold. An embattled gate, ornamented on both sides with statues representing men in various attitudes of war, and flanked by an embattled tower, guarded the entrance. From this gate to the entrance of the palace arose in long ascent a sloping daïs or hall-pace, along which were grouped 'images of sore and terrible countenances,' in armour of argentine or bright metal. At the entrance, under an embowed landing place, facing the great doors, stood 'antique' (classical) figures girt with olive branches. The passages, the roofs of the galleries from place to place and from chamber to chamber, were ceiled and covered with white silk, fluted and embowed with silken hanging of divers colours and braided cloths, 'which showed like bullions of fine burnished gold.' The roofs of the chambers were studded with roses, set in lozenges, and diapered on a ground of fine gold. Panels enriched with antique carving and gilt bosses covered the spaces between the windows; whilst all along the corridors and from every window hung tapestry of silk and gold, embroidered with figures. . . . To the palace was attached a spacious chapel, still more sumptuously adorned. Its altars were hung with cloth of gold tissue embroidered with pearls; cloth of gold covered the walls and desks. . . . Outside the palace gate, on the greensward, stood a gilt fountain, of antique workmanship, with a statue of Bacchus 'birlyng the wine.' Three runlets, fed by secret conduits hid beneath the earth, spouted claret, hypocras, and water into as many silver cups, to quench the thirst of all comers. . . . In long array, in the plain beyond, 2,800 tents stretched their white canvas before the eyes of the spectator, gay

with the pennons, badges, and devices of the various occupants; whilst miscellaneous followers, in tens of thousands, attracted by profit or the novelty of the scene, camped on the grass and filled the surrounding slopes, in spite of the severity of provost-marshal and reiterated threats of mutilation and chastisement. . . . From the 4th of June, when Henry first entered Guisnes, the festivities continued with unabated splendour for twenty days. . . . The two kings parted on the best of terms, as the world thought."—J. S. Brewer, *Reign of Henry VIII*, ch. 12.

**FIFTH MONARCHY MEN**.—One of the most extreme and fanatical of the politico-religious sects or factions which rose in England during the commonwealth and the protectoral reign of Cromwell, was that of the so-called Fifth Monarchy Men, of whom Major-General Harrison was the chief. Their belief is thus described by Carlyle: "The common mode of treating Universal History, . . . not yet entirely fallen obsolete in this country, though it has been abandoned with much ridicule everywhere else for half a century now, was to group the Aggregate Transactions of the Human Species into Four Monarchies: the Assyrian Monarchy of Nebuchadnezzar and Company; the Persian of Cyrus and ditto; the Greek of Alexander; and lastly the Roman. These I think were they; but am no great authority on the subject. Under the dregs of this last, or Roman Empire, which is maintained yet by express name in Germany, 'Das heilige Römische Reich,' we poor moderns still live. But now say Major-General Harrison and a number of men, founding on Bible Prophecies, Now shall be a Fifth Monarchy, by far the blesseddest and the only real one,—the Monarchy of Jesus Christ, his Saints reigning for Him here on Earth,—if not He himself which is probable or possible,—for a thousand years, &c., &c.—O Heavens, there are tears for human destiny; and immortal Hope itself is beautiful because it is steeped in Sorrow, and foolish Desire lies vanquished under its feet! They who merely laugh at Harrison take but a small portion

of his meaning with them."—T. Carlyle, *Oliver Cromwell's letters and speeches*, pt. 8, speech 2.—The Fifth Monarchy fanaticism, sternly repressed by Oliver Cromwell, gave some signs of turbulence during Richard Cromwell's protectorate, and broke out in a mad way the year after the Restoration. The attempted insurrection in London was headed by one Venner, and was called Venner's insurrection. It was easily put down. "It came as the expiring flash of a fanatical creed, which had blended itself with Puritanism, greatly to the detriment of the latter; and, dying out rather slowly, it left behind the quiet element of Millenarianism."—J. Stoughton, *History of religion in England*, v. 3, ch. 4.

**FIGUERAS Y MORACAS**, Estanislao (1819-1882), Spanish statesman. Elected deputy from Barcelona, 1851; became leader of his party; exiled for participation in a plot against Narvaez, 1867; president of the executive, February-June, 1873.

**FIJI ISLANDS**, group of about two hundred and fifty islands in the south Pacific, which form the link between Polynesia and Melanesia. (See **BRITISH EMPIRE**: Extent.) "The first known European who mentions Fiji is the Dutch navigator Tasman, who in 1643 passed between the islands of Taviuni and Kalmea, and the straits to this day bear his name. He christened the group Prince William's Islands. Captains Cook, Bligh, and Wilson are among the early discoverers who mention the group. . . . In 1808 a brig called the *Elisa* was wrecked off the reef of Nairai, and the escaped crew and passengers, mostly runaway convicts from New South Wales, found there were seven powerful chiefs in the group, that of Verata being leader. The sailors and convicts, however, under the command of a certain Charley Savage, took the side of the Bau people [Bau being one of the small islands of the group]. Powder and shot soon settled the question of ascendancy, and since the *Elisa* was lost Bau has retained it. The chief of Bau at this time was a certain Na Ulivou, and was a brave leader of men. So great was his success that he was accorded the title of Vuni Valu, 'Root of War,' or as some translators have it, 'Source of Power,'—a distinction which has since been hereditary in the chiefs of Bau. Internecine fighting chiefly constituted the Fijian life of those days, but the Vuni Valu of the time maintained the position he had won. He died in 1820, and was succeeded by his brother Tanoa, who, after a troubled reign, five years of which were passed in exile, died on the 8th of December, 1852."—H. S. Cooper, *Coral lands*, v. 1, ch. 2, 4.—"After 1835, two Wesleyan missionaries . . . penetrated to the Fiji Islands. . . . They found there . . . a certain organisation, a sort of customary law, fourteen kinglets, statesmen, politicians, and persons whose business it was to carry from tribe to tribe the news of the day. . . . Among the great chiefs of the Fijian archipelago, Thakombau [spelt, after the orthography invented by the missionaries, Cakobau, which does not correspond with the sound of the word] occupied the first rank, thanks to his intelligence, his energy, and the extent of his dominions. For greater personal safety, he resided in the little island of Bau. He succeeded even in getting himself proclaimed King of Fiji

by a certain number of great chiefs. But an attempt of his to subjugate the other tribes became the cause of his downfall. . . . The missionaries had endeavoured in vain to convert him; but this task was accomplished by the King of Tonga. Thakombau, menaced by a formidable coalition of Fijian chiefs, had applied to King George of Tonga for assistance. The latter came at the head of an imposing force, rescued the King of the Fijis, who was then besieged in his small island, re-established his authority, and enjoined him to embrace the faith of the whites. He obeyed, and the other chiefs followed his example. Thus it was that in 1857 Christianity was introduced into the archipelago. The second part of Thakombau's reign was, so far as he was personally concerned, an alternation of ups and downs, but for his country, a period of progress, inasmuch as the manners of the people became more and more civilised, and cannibalism gradually disappeared. . . . This was . . . in great part due to the missionaries, who had acquired a great influence in political matters, and also to the English Consulate, then recently established at Levuka. But the wars continued, and the prestige of the king declined; so, following the advice of his white friends, he endeavoured to get rid of the dangers that surrounded him by granting his subjects a constitution similar to that which the American missionaries had introduced in the Sandwich Islands. But it appeared that the worthy Fijians were not yet ripe for these blessings. The king's position got worse and worse, and in the end became altogether untenable. One means of escape alone remained: to cede his kingdom to the British Crown, and this he did in 1874. [See PACIFIC OCEAN: 1800-1914.] In the latter years of his reign, his two principal advisers were his daughter, the Princess Antiquilla, and an English resident, Mr. Thurston. . . . From his abdication to his death in 1882, Thakombau lived a retired life, with his numerous family, at his former capital, Bau, maintaining the most friendly relations with the English authorities, and sometimes giving them useful advice. . . . From now [1884] nearly ten years the Fijian Archipelago, including the group of the Exploring Islands, has been under British rule. It owes to that rule undeniable benefits: a comparative degree of prosperity; domestic peace, notwithstanding tribal animosities which in spite of restraint still continue in a latent form; perfect security of life and property; indirect but effectual protection against the enticements of kidnappers, and finally, an organisation adapted as far as is possible to local traditions and usages. . . . A small body of troops, composed exclusively of natives, protects the lives of the Governor and his family, as well as his staff and the white residents."—Baron von Hübnér, *Through the British empire*, v. 2, pt. 5, ch. 2.—See also TONGA ISLANDS.—It is true generally of the South Sea islands, which include the Fiji group, that "the islands were happily populous when the first white men settled there. But year by year the populations have dwindled. The white man brought death. The first settlers were deserters from ships and escaped convicts from the penal settlements of Australia. Then came traders and whalers, reckless men and many of them evil. They brought to the islands the vices of the white man and his diseases. Then came the recruiters, who 'shanghaied' the blacks for enforced labor in Australia. And the missionaries came. And the majority of the islanders who came under missionary influence gave over the healthful custom of oiling their bodies as a protection against wet and chill and put on clothes. Pneumonia and tuberculosis have carried them off

by the hundreds. They struggle little against death. For they live now in an alien civilization in which the wars and dances that made life zestful of old have little part. Though here and there a new lease on life seems to have been taken by an island population, for the most part the old races continued to die and a new population drifts slowly in—half-breeds, Chinese, Malays, Indians and a handful of governing whites. [See also PACIFIC OCEAN: People.] The South Seas are becoming important commercially. The island where Captain Cook was killed now does a thriving business in tourists and pineapple. The Fiji Islanders have turned Methodist and, discarding war as a profession, have taken to producing copra. Everywhere among the island groups western planters have planted coconut groves in which island peoples are learning the meaning of daily labor; for copra, or the dried meat of the coconut, is greatly desired in the West for making soaps and butter substitutes and the many other things for which vegetable oils are needed. Sharks' fins and a sea-slug called *bêche-de-mer* are important articles of trade for the Chinese market. Mother-of-pearl, vanilla, rubber—tropical products of many sorts—are being demanded each year in increasing quantities. And great nations are finding in the markets of the islands a field for rivalry in the sale of manufactured goods. Sewing-machines clatter in palm-leaf huts. European cotton prints and laces have superseded the native tapa-cloth, and European perfumes and cosmetics are taking the place of the fragrant hibiscus and coconut-oil. The islands are being 'developed'. . . . The natives who live on the eighty habitable [Fiji] islands are classed as Melanesians, but though they are black, like their neighbors to the west, and have thick, woolly hair, which they bleach with lime and wear in a great mop, they have, too, well-built bodies and handsome faces, inherited from Polynesian ancestors. The Fiji Islands, to the Occidental, call up gruesome feasts of 'long pig', and tales of barbarous cruelty. It is true that the Fijians were once among the fiercest of the islanders. They were the greediest of cannibals, and practised cruelties that made cannibalism sink into insignificance. Yet cruelty for the Fijians was largely a matter of habit. Even in the days of savagery, they possessed the qualities that make them now model citizens. Most of the Fijians are Wesleyan Methodists. Nearly every village has its meeting-house to which the Fijians are called to worship by the big, musical drums that less than a century ago announced cannibal feasts. In connection with each church is a school. Suva, the capital—a thriving little metropolis with all the ear-marks of civilization, including a town hall, a museum, a Carnegie library, a hospital, an insane asylum, a row of shops with plate glass windows, hotels and a jail—boasts several churches and a fine cathedral."—*Asia*, Apr., 1921, pp. 307, 311, 374.—See also MELANESIA; TONGA ISLANDS.

FILCHNER, William (1877- ), German scientist and explorer. Leader of a German expedition to the South Pole which started out in May, 1911, and returned to Buenos Aires in 1913. See ANTARCTIC EXPLORATION: 1913.

FILI, class of poets among the early Irish, who originally practiced certain rites of incantation. Their art was called Filidecht. At first Fili and bard were separate, but as the true Filidecht gradually fell into disuse, the two branches came together.

**FILIBUSTER.**—"The difference between a filibuster and a freebooter is one of ends rather than of means. Some authorities say that the words have a common etymology; but others, including Charlevoix, maintain that the filibuster derived his name from his original occupation, that of a cruiser in a 'flibote,' or 'Vly-boat,' first used on the river Vly, in Holland. Yet another writer says that the name was first given to the gallant followers of Dominique de Gourgues, who sailed from Finisterre, or Finibuster, in France, on the famous expedition against Fort Caroline in 1567 [see FLORIDA: 1567-1568]. The name, whatever its origin, was long current in the Spanish as 'filibustero' before it became adopted into the English. So adopted, it has been used to describe a type of adventurer who occupied a curious place in American history during the decade from 1850 to 1860."—J. J. Roche, *Story of the filibusters*, ch. 1.—See also AMERICA: 1639-1700.—In American politics a "filibuster" is a member of a legislature who seeks to prevent the passage of a bill by "talking it to death," making dilatory motions or otherwise delaying its consideration.—See also CONGRESS OF THE UNITED STATES: Senate: Freedom of debate; U. S. A.: 1806-1807; NICARAGUA: 1855-1860.

**FILIDECHT**. See FILL.

**FILIOQUE CONTROVERSY.**—"The Council of Toledo, held under King Reccared, A. D. 589, at which the Visigothic Church of Spain formally abjured Arianism and adopted the orthodox faith, put forth a version of the great creed of Nicæa in which they had interpolated an additional clause, which stated that the Holy Ghost proceeded from the Father 'and from the Son' (Filioque). Under what influence the council took upon itself to make an addition to the creed of the universal Church is unknown. It is probable that the motive of the addition was to make a stronger protest against the Arian denial of the co-equal Godhead of the Son. The Spanish Church naturally took a special interest in the addition it had made to the symbol of Nicæa, and sustained it in subsequent councils. . . . The Frankish Church seems to have early adopted it from their Spanish neighbours. . . . The question was brought before a council held at Aix in A. D. 809. . . . The council formally approved of the addition to the creed, and Charles [Charlemagne] sent two bishops and the abbot of Corbie to Rome to request the pope's concurrence in the decision. Leo, at a conference with the envoys, expressed his agreement with the doctrine, but strongly opposed its insertion into the creed. . . . Notwithstanding the pope's protest, the addition was adopted throughout the Frankish Empire. When the Emperor Henry V. was crowned at Rome, A. D. 1014, he induced Pope Benedict VIII. to allow the creed with the filioque to be chanted after the Gospel at High Mass; so it came to be generally used in Rome; and at length Pope Nicholas I. insisted on its adoption throughout the West. At a later period the controversy was revived, and it became the ostensible ground of the final breach (A. D. 1054) between the Churches of the West and those of the East."—E. L. Cutts, *Charlemagne*, ch. 23.—"The Filioque controversy relates to the eternal procession of the Holy Spirit, and is a continuation of the trinitarian controversies of the Nicene age. It marks the chief and almost the only important dogmatic difference between the Greek and Latin churches, . . . and has occasioned, deepened, and perpetuated the greatest schism in Christendom. The single word Filioque keeps the oldest, largest and most nearly related

churches divided since the ninth century, and still forbids a reunion."—P. Schaff, *History of the Catholic church*, v. 4, ch. 11, sect. 107.—See also CHRISTIANITY: 330-606.

**FINLAND**: Territory.—Physical features.—Native name.—Population.—Agriculture.—Labor conditions.—Industries.—Natural resources.—Economic conditions.—"Finland is situated in Northern Europe, on the shores of the Baltic; her

adjacent countries are Sweden in the west [Norway in the north] and Russia in the east."—*Republic of Finland, Central Statistical Bureau (Finland), p. 1.*—It is a marshy land, dotted with innumerable lakes. From the nature of the country the Finns got their native name—*Soumilaiset*—which translated into English means—"the people of the fens."—Based on I. D. Levine, *Resurrected nations, p. 173.*—See also RUSSIA: Map of Russia and the new border states.—"Of all the new nations of Europe, Finland is farthest north. What are its resources? What is the physical basis of its strength? . . . Finland is a third as large as Ontario. While the extreme north grades into Arctic tundra, the country as a whole resembles the Lake Superior region in surface and climate. Everywhere the surface is rocky and lake-dotted, with an irregular drainage, a thin soil, and an extensive forest cover. In the milder south, where there is a deeper soil, there are farms producing hardy grains like rye, barley, and oats. The population of Finland is 3,500,000 [1921]. Helsingfors, the capital, has 187,000. The towns are small, and include only 15 per cent of the population (in the United States about half the population is urban). In the cold and remote north the density of population is less than 1 to the square mile; but in the warmer and more fertile south, on the edge of the Gulf of Finland, it reaches 93 to the square mile. Half of the population lives by agriculture and cattle raising, but only 8.5 per cent of the land is cultivated or used for pasture. Nearly a third of the surface is covered with peat marsh and bog, and nearly half is forested. Barley is grown up to latitude 68° north and rye to 64°, or to 67° in favorable years. The farther north one goes the longer—and also the hotter—the summer days; and whereas barley takes 116 days to ripen in the Aland Islands, there are but 63 days between sowing and harvest in the higher latitudes, the limit of its range. No other civilized race lives so far north as the people of Finland. 'The Finns have been bred in the school of adversity.' As a whole the country is poor and famines are not rare. In 1867, for example, there was a fearful dearth, owing chiefly to the poor crop of rye, the principal food. Again in 1869 there was general want, due to the partial failure of the potato crop. The Finns have emigrated in large numbers, chiefly to North America, for Finland cannot support its people on its own produce. The chief wealth of Finland lies in its forests and its water power. Of the 3,000,000 horse power available, only 100,000 are now [1920] in use. In 1913, wood and wood products formed 75 per cent of the exports of the country. Mineral resources are almost unknown. The total mileage of railways is 2,500, which, in relation to the number of people, is a high figure, . . . [but] in relation to area . . . is small. The long and indented seacoast, with innumerable havens and extensive fishing grounds, has naturally bred sailors. . . . For the most part settlements in Finland follow the watercourses, . . . because these are the natural ready made means of communication. Finland has forty times as much water as France. Certain canals date from the Middle Ages. The Saima Canal connects lakes of the Saima system, which covers 2,600 square miles of water, the largest lake group in Europe, of which more than 2,000 square miles are in Finland, . . . directly with the Gulf of Finland and is an outlet of incalculable benefit to the country."—I. Bowman, *New world, pp. 371, 372.*—The area of Finland in 1922 was 149,586 square miles.

"The overwhelming majority of the people in Finland are agricultural labourers. . . . Wages on the

land are low, the weekly wage of a labourer being on an average throughout the country rather below than above 10s, without food. Moreover, winter wages are considerably lower than those paid in summer, and the winter period lasts at least six months of the year. Employment upon home industries fills up the gap, but pay in most branches is low. . . . In general, the peasantry are hardy and laborious."—*Finland, Handbook no. 47, Historical section, Great Britain Foreign Office, p. 83.*—"Methods of cultivation in Finland vary very much according to the district. The most primitive is that of clearing forest land by fire, using the wood ash as manure, and practising an intensive rotation of crops. . . . This method is being gradually abandoned. [It is wasteful and impracticable, as the land becomes unfruitful in a few years.]"—*Finland, Handbook no. 47, Historical section, Great Britain Foreign Office, p. 87.*—"The vast labour spent by the former agricultural inhabitants has, however, for the greater part been taken up by modern industries, and the relative decrease of this part of the inhabitants is an unavoidable consequence of the richer and more detailed division of labour, as well as the consequential change in the economical life, in the direction of developing other natural resources according to modern methods of production."—L. Ekstrand, *Economical powers of Finland (Joint Stock Bank for Foreign Trade, Helsingfors, p. 6).*—"The labouring population of the towns is in general well housed and appears to enjoy a comfort and prosperity of a reasonably high level. Strikes and lockouts showed a decreasing tendency before the war."—*Finland, Handbook no. 47, Historical section, Great Britain Foreign Office, p. 83.*—"Industry in Finland has made remarkable progress. Home industries and handicrafts were common in this country from of old and reached a high standard. By the close of the Middle Ages, Finland had already a considerable export trade. Manufactures, however, began to develop only about [the end of last century]. . . . The young manufacturing industry of Finland tends to be concentrated in modern enterprises on a large scale."—*Economic World, Jan. 31, 1920, p. 155.*—"During the war [World War] new industries . . . attracted more and more attention and a new central establishment, the Industrial Office of Finland, has been founded to encourage the creation of new branches. There . . . [were] established also during the war a special central laboratory for technical chemical investigation, and a Finnish turfi office, to utilize the wealth hidden in the innumerable [peat] swamps."—*Ibid., June 21, 1919, p. 870.*—"The forests . . . have had great influence upon the country's economy in many respects. They have not only been of vital importance for . . . [its] agriculture, but also for . . . [its] industry. The forests produce in the first place cheap raw material for the various, day by day more extensive, export industries, with the produce of which the country has been able to pay for such imported goods as foodstuffs and other material, and the forests have also otherwise helped to develop success, wealth, and increase of population."—L. Ekstrand, *Economical powers of Finland (Joint Stock Bank for Foreign Trade, Helsingfors).*—"During the war [World War] the rearing of live-stock deteriorated considerably. . . . The war had occasioned serious losses to the mercantile marine, . . . and this in its turn adversely affected the export trade. **Education.** See EDUCATION: Modern developments: 20th century: General education: Finland; EDUCATION, ART: Modern: Finland.

**Ethnology.—Language.**—"The Finns are generally thought to belong to the Finno-Ugrian family, a people of Mongolian origin allied to the Lapps and Ostyaks and more remotely to the Magyars and Turks. They probably entered Finland twelve to fourteen centuries ago, after a certain amount of admixture with Slavs. One branch of the Finns, the Karelians, is found in the Kem district of Russia on the White Sea. There, however, they are largely Russified. The Finns form the middle and peasant classes in Finland. About 10 per cent. of the total population are Finns. Most of the remainder are Swedes, with a few Lapps, several thousand Russians, about 1,000 Jews, and 1,000 Gypsies. There were at one time about 2,000 Germans, principally in Viborg and Helsingfors. . . . Of Finnish there are two chief dialects, the Karelian or eastern, showing Russian influence, and the Tavastland or western, which has been much modified by Aryan influence and contains many Swedish words. The written form of the language has been common to all educated Finns for about a century. Finnish is the sole tongue of the peasants and of most of the lower and middle classes in the towns and it is understood, though not used, by most of the Swedish population."—*Finland, Handbook no. 47, Historical section, Great Britain Foreign Office, 1920, pp. 7-8.*—See also TURANIAN RACES AND LANGUAGES; PHILOLOGY: 20; HUNGARY: Origin.

**Ancient incantations.** See MEDICAL SCIENCE: Ancient Finns.

**Early settlements.**—"The colonization of Finland may be traced back to the first centuries A.D. Two separate nationalities have gone to the formation of its people, i.e. the Finns and Swedes. In the course of time these nationalities have, however, merged into one nation. The archipelago and the coast were populated first, and from there the migration spread gradually upwards along the rivers and water systems, conquering by hard struggle a wild land, covered with vast virgin forests and immense swamps."—*Republic of Finland, Central Statistical Bureau (Finland) p. 1.*

**1157-1809.—Conversion to Christianity.—Under Swedish rule.—Made grand duchy.—Russian conquest and annexation.—Constitutional independence.**—"The Finns were converted to Christianity by the Swedes, who for this purpose undertook crusades in the years 1157, 1240 and 1293. At the same time Finland was united politically to Sweden. As the Finns, however, at this epoch had attained almost the same degree of culture as the Swedes, the union with Sweden in no way implied the subjugation of an inferior nation. There was no political distinction between Finns and Swedes . . . and the local administration was entrusted to Finlanders. Although the first Bishops of Finland were English and Swedish, the episcopal seat of the country was occupied from 1291 by a Finn. In the year 1362 the first fundamental law of Finland was established, giving the people the right to take part in the election of the kings of Sweden-Finland. The geographical position of the country also contributed to its distinction, and an independent national existence [apart from Sweden] was fully assured it. . . . This political and spiritual union of Finland with Sweden lasted nearly six hundred years. The Finnish people had during the process of

colonization not only to surmount all the difficulties of a wild and uncultivated country, but were also forced, for several centuries, repeatedly to contend against the swarms advancing from the east, in order to maintain their culture newly won. The Finlanders formed as it were a wall of defence against the Russians, and in recognition of this service, John III, king of Sweden and Finland, in 1581 raised Finland to a Grand Duchy. It was also at this time that Finland received her coat of arms."—*Republic of Finland, Central Statistical Bureau (Finland), pp. 1-2.*—In the Seventeenth century Gustavus Adolphus established a diet composed of nobility, clergy, burghers, and peasants. He and his successor did much toward the advancement of the country. "However, on account of the thinness of the population, the eastern enemy succeeded many times in penetrating deep into the country, devastating again and again the fruits of good labour. Perhaps the darkest period in the history of Finland was the first two decades of the eighteenth century, when the troops of the Czar Peter the Great—while the Finnish army was taking part in the wars of Charles XII in distant lands—occupied the defenceless country, and held it under the bloody tyranny for twenty years, destroying and devastating in the cruelest way, by fire and sword. . . . This reign of terror, which was brought to an end by the conclusion of peace at Usikaupunki (Nystad) in the year 1721 [when the eastern division of Finland was ceded to Russia], has been styled by the people of Finland 'the time of great hate.' [See also SWEDEN: 1720-1702.] As a result of the war of 1808-1809 [Gustavus VI against Russia], Finland was forced to unite itself to Russia. At the assembled Diet of the Estates of Finland at Borga (Porvoo), the Emperor of Russia, Alexander I, signed, on the 27 March, 1809, a decree, guaranteeing the constitution of Finland [and took title of grand-duke of Finland]."—*Ibid., pp. 2-3.*—See also SWEDEN: 1807-1810; GERMANY: 1807 (June-July); FRANCE: 1807-1808 (August-November).

**1809-1898.—Independence of Finland under Alexander I, II, and III.—Commencement of the national movement.**—"For ninety years after its union with Russian (1809), Finland was practically a distinct state, the tsar as grand-duke governing by means of a nominated senate and a Diet organized on the Swedish model with separate representative bodies of nobles, clergymen, burghers, and peasants. Of the total population of two and one half millions in 1899, the bulk were peasants, . . . preserving their Finnish language and costume; but the upper classes were mainly Swedish, and Swedish was long the official language of the local government. All the inhabitants were Lutheran in religion and jealous of Russian encroachments on their traditional liberties."—C. J. H. Hayes, *Political and social history of modern Europe, p. 468.*—"The Finnish national movement may . . . be said to date from the eighteenth century, although it did not attain its climax until a century later. This movement first aimed at the liberation of the Finns from the cultural Swedish domination. The Finnish language, which is totally foreign to the Swedish, but which had been suppressed, was now revived and propagated. . . . The man mostly responsible for the evolution of a Finnish literary tongue, thus furnishing the backbone for the nationalist movement, was Elias Lönnrot. Born in 1802, a poet by nature, he early devoted himself to the collection of Finnish folk-poetry. For nearly twenty years he journeyed into the remotest corners of his

country, gathering material for a national epic. The fruit of his labors was the famous 'Kalevala,' Finland's Homer, and one of the finest poetical treasures in the literature of the world. [The first edition was published in 1835.] Around Lönnrot gathered the leaders of the rising generation. . . . [In 1844] the first Finnish periodical had already made its appearance, laying the foundation for the Fennoman (Finnish-Finn), as opposed to the Svekomans (Swedish-Finn), party. The country was thus divided into two camps."—J. D. Levine, *Resurrected nations*, pp. 174-181.—The publication of the "Kalevala" gave a great impulse to the study of the Finnish language. More than 300,000 legends, sagas and proverbs have been collected.—See also MUSIC: Folk music and nationalism: England.

1899-1903.—Blow at the constitutional rights of the country.—Russification of the Finnish army.—Resistance to the violation of constitutional rights.—Despotic measures of the tsar.—Plehve's defence.—"The Panславists worked for the political and economic solidarity of Finland and Russia. In 1890 two Commissions were appointed in Petersburg to bring Finnish coinage, customs, and postage into greater conformity with that of the Empire. Separate Finnish postage was abolished in 1899. Greater changes were contemplated. In July 1898 an extraordinary session of the Diet was called to meet on January 19, 1899; on August 24th the Tsar issued his Peace Manifesto, and six days later, August 30th, he appointed Bobrikoff Governor-General of Finland. This was a blow in the face of the 'right and justice' invoked by the Tsar in his Peace Manifesto, for Bobrikoff was notorious for his terroristic rule of the Baltic provinces. On January 10th he laid a Bill before the Diet to bring the Finnish Army into conformity with that of the Empire. The Finnish Army was to be four times larger and to be Russianized and incorporated in the Russian Army. Bobrikoff told the Diet the Bill *must* be passed. . . . The Bill was to be submitted to the Imperial Council 'as a matter of concern to the whole Empire of which the Grand Duchy of Finland is an inseparable part.' . . . While the Bill was being debated the Imperial Manifesto of February 15, 1899, came as a bolt from the blue. . . . All Finnish matters of Imperial interest were hereafter to be dealt with by Russian institutions, the Tsar to decide which matters were Imperial or exclusively local and Finnish. By ten votes to ten the Senate published this manifesto under protest. The Diet declared itself ready to double the number of Finnish troops, and stated that the new military Bill could not become law without the concurring consent of the Emperor Grand Duke and the Estates; it published an *exposé* of Finland's relations to the Empire and the rights of the Diet. The Tsar gave an ungracious answer to their remonstrance."—J. Stefansson, *Denmark and Sweden*, pp. 358-359.

ALSO IN: I. D. Levine, *Resurrected nations*, pp. 178-179.

The measure for Russifying the Finnish army, proposed in 1899, became a law on July 11, 1901. It placed all Finnish troops under the orders of the Russian commander in Finland, authorized the putting of Finnish conscripts into the Russian regiments stationed in Finland, and subjected Finnish regiments to service, when required, outside of Finland, from which service they had been constitutionally exempt hitherto. The resistance to this gross violation of time-honored rights was universal and determined. Conscripts refused to an-

swer the call to military service, subjecting themselves to the penalties for desertion, and practically the whole population stood ready to protect them. Extensive movements of emigration to America and elsewhere were begun. At the same time the tsar's authority, as the common sovereign of Finland and Russia, was used in many ways as autocratically in his constitutional realm as in that where his absolutism knew no bounds. The powers of the Russian governor-general of Finland were enlarged; the Finnish archives were removed to St. Petersburg; Cossacks were sent into the abused country with their knouts to quell resistance to the army law; but the resistance went on, taking presently a more passive form. Communes refused to elect the conscription boards which the law prescribed for carrying out the levy of recruits, and heavy fines were imposed on them without effect. In November, 1902, a convention of delegates from all parts of Finland, composed largely of peasants and workmen, resolved to "continue everywhere, unswervingly, and until legal conditions are restored to the country, the passive resistance against all measures conflicting with, or calculated to abolish, our fundamental laws." An elaborate defence of these Russifying measures in Finland was addressed, in August, 1903, by the Russian minister of the interior, Plehve, to W. T. Stead, editor of the *English Review of Reviews*, by way of reply to an "open letter" to himself on the subject, by Mr. Stead, published in the *Review* of that month. Plehve justified these measures as "the incidental expression of Russian policy, necessitated by an open mutiny against the government in Finland." He emphasized, however, the fact that "the realization of the fundamental aim which the Russian government has set itself in Finland, —i.e., the confirming in that land of the principle of imperial unity,—must continue."—See also RUSSIA: 1902-1904.

1904. — Assassination of Governor-General Bobrikov.—As executor of the Russifying policy in Finland Bobrikov was cordially hated. "On June 16, 1904, Eugen Schauman [a Finnish member of the parliamentary opposition] shot Bobrikov with a pistol as he was entering the Senate House, and immediately afterwards shot himself. . . . The new governor, Prince Obolenski, was conciliatory. He allowed most of the exiled patriots to come back."—J. Stefansson, *Denmark and Sweden*, pp. 362-363.

1905.—Successful revolt against Russifying oppressions.—Concessions by the tsar.—Restoration of ancient liberties.—"In October 1905 the gigantic general strike in Russia wrested from the Tsar the promise of a Constitution. Finland decided to do likewise. From October 31st to November 6th a general strike took place in Finland. The Governor-General and the Senate resigned. The Svecomans and the so-called Young Finns—who desired coöperation with the Swedes against the Panславist danger—formed a 'constitutional' party . . . [and forced the governor, Prince John Obolenski, to send] a petition to the Tsar. His answer was the manifesto of November 4, 1905, which suspended the manifesto of February 15, 1899, and promised to develop the rights of the Finnish people on the basis of their Fundamental Laws, reformed and modernized."—J. Stefansson, *Denmark and Sweden*, p. 363.—The first of the tsar's manifestos bore the following command: "By the grace of God, we, Nicholas II, etc., command the opening at Helsingfors, December 20, of an extraordinary Diet to consider the following questions: *First*.—The proposals for the budget of 1906-07, provisional taxes, and a loan for railway construction. *Second*.—A bill providing, by a new

fundamental law, a parliament for Finland on the basis of universal suffrage, with the establishment of the responsibility of the local authorities to the nation's deputies. *Third.*—Bills granting liberty of the press, of meeting, and of unions."

A subsequent manifesto announced: "We have ordered the elaboration of bills reforming the fundamental laws for submission to the deputies of the nation, and we order the abrogation of the manifesto of February 15, 1899; the ukase of April 15, 1903, concerning measures for the maintenance of public order and tranquillity; the imperial ukase of November 23, 1903, according exceptional rights to the gendarmerie in the grand duchy; Article 12 of the ukase of July 13, 1902, on Finnish legislation; the ukase of September 21, 1902, on the reform of the Senate and the extension of powers of governors; the ukase of April 8, 1903, on instructions for the governor-general and the assistant governor of Finland; the law of July 25, 1901, on military service; the ukase of August 13, 1902, on the duties of civic officials in Finland; the ukase of August 27, 1902, on the resignation of administrative officials and judicial responsibility for offenses and crimes of officials, and the ukase of July 15, 1900, on meetings. We further order the Senate to proceed immediately with the revision of the other regulations enumerated in the petition, and we order the immediate suppression of the censorship. The Senate should prepare bills granting liberty of speech, of the press, of meeting, and of union; a national assembly on the basis of universal suffrage, and the responsibility of the local authorities as soon as possible, in order that the Diet may discuss them. We trust that the measures enumerated, being dictated by a desire to benefit Finland, will strengthen the ties uniting the Finnish nation to its sovereign."

"On the military question a compromise had already been arranged; Finland was once again exempted from the Russian Conscription, but in return the Finnish Legislature undertook to pay an annual contribution to the Imperial Treasury."—R. Butler, *New eastern Europe*, p. 13.—An article quoted from a Danish magazine tells in a few words how the bloodless revolution was accomplished: "The weapon used for the purpose of paralyzing the government was the general strike. It may be questioned to which class belongs the chief part of honor in this struggle. A marvelous unity characterized the whole movement. While post, telegraph, and railroad traffic was stopped the entire light supply was cut off. The strike extended even into the private kitchen, and this was one of the reasons which hastened the departure of the Russian officials. In the meantime the question was not only should Russian guns be directed on Helsingfors, but also should personal safety be maintained. That so few transgressions of the law occurred with the whole police force on strike is a splendid testimony for the Finnish people. The revolution in Finland stands hence as an unparalleled example of a popular upheaval."

Also in: E. Young, *Finland*.

1906.—Reformed constitution ratified by the tsar (Nicholas II).—Political enfranchisement of women.—The Finnish constitution was restored by the decree of November 17, 1905. Following on this the Diet was elected, and sat in December for the first time since 1890, for the purpose of drafting a constitution. "The Senate was reconstituted and composed of constitutionalists with Leo Mechelin at their head. A conciliatory Governor-General, Gerard, was appointed. The Diet

passed a new Law of the Diet. There was to be one single chamber consisting of two hundred members, elected for three years. Every man and woman over twenty-four years of age had the right to vote in the elections for the Finnish Parliament, and was eligible as a member of it. Proportional representation, according to the d'Hondt system, was to be introduced. This was the most democratic Parliament in the world. [The president was elected by direct vote for a term of six years.] The number of voters was increased from 100,000 to 1,250,000, and 25 women were elected in the first elections to sit in the new Parliament. Thus the Finlanders were the first nation not only to give parliamentary suffrage to women, but to give them seats in Parliament."—J. Stefansson, *Denmark and Sweden*, pp. 363-364.—See also SUFFRAGE, WOMAN: Finland.—In 1906 the grand duchy received from Nicholas a grant of this constitution.

Also in: J. S. Shapiro, *Modern and contemporary European history*, pp. 554, 555.

1908-1909.—Russian measures for the destruction of the constitutional autonomy of Finland.—"The Tsar had not time to spare for Finland. He was grappling with revolution at home, and the first and second Duma were not obsequious. As soon as he had got a Duma after his heart the Russian Press began to attack Finland for hatching dangerous revolutionary plots. Questions were asked in the Duma whether Russian authority extended to Finland. Stolypin answered, in May, 1908, that the autonomy of Finland was a spontaneous gift of the Tsar which could be taken back if misused. Russian interests must predominate in Finland, whose relations to Russia were wholly determined by the Treaty of Frederikshamn. In vain Milyukoff defended Finland eloquently against the reactionaries in the Duma. On June 2, 1908, the Tsar issued an ordinance that all Finnish questions should be laid directly before the Russian Ministerial Council, who were to determine which of them were Imperial and discuss them. The Secretary of State for Finland was no longer to report separately to the Tsar. This was an abrogation of the Finnish Constitution, against which Senate and Diet both protested. When the Speaker referred to it in his opening speech the Diet was dissolved."—J. Stefansson, *Denmark and Sweden*, p. 364.—A new election was held early in May, 1909. The election produced substantially the same popular representation in the new Diet that had characterized its predecessor, and its attitude toward the autocratic invasion of Finnish rights was the same. Meantime, the tsar, in sanctioning an act of the previous Diet, after its dissolution, had done it in terms that were deemed contrary to the constitution of Finland, and the Senate petitioned him for a modification of them. His reply was a rebuke and a command that they promulgate the law. Thereupon the vice president of the Senate and four of its members resigned. The remaining five voted with the presiding governor-general for the promulgation. In October, 1909, an imperial rescript decreed that military service legislation for Finland should be transferred to the imperial legislature; and that until such legislation was enacted Finland should pay into the Russian exchequer an annual contribution of 10,000,000 marks (\$2,000,000), to be increased gradually to 20,000,000 marks. This left the Finnish Diet no voice in the appropriation. In October the four vacant seats were filled by an appointment of naval and military officers who were said to be "technically Finnish citizens," but all of whom, save one, had spent their lives in

Russia. In November, the Diet rejected the government bill for the Russian military appropriation, and a request that it be re-introduced in constitution form was sent to the emperor, who accepted the resignations of the five remaining Finnish senators, which had already been sent in, and dissolved the Diet. Some months prior to this time a joint committee of Russians and Finns had been appointed to formulate rules of principle that should apply in future to legislation for Finland. The two constituents of this Russo-Finnish committee were hopelessly opposed in their views of the relation existing between the constitutional grand duchy of Finland and the autocratic empire of Russia, by virtue of their having a common sovereign. Toward the end of November their failure to come to any agreement was made known; and on December 22, a majority vote of the Russian members favored the reduction of Finland to the status of provincial autonomy. The Russians maintained that the constitution did not bind Russia as the sovereign power, and that a new procedure could, therefore, be adopted by Russian legislation. They proposed that legislation on such matters as the Russian language in Finland, the principles of Finnish administration, police, administration of justice, public education, formation of business companies and of associations, public meetings, press, importation of foreign literature, customs tariffs, literary and artistic copyright, monetary system, means of communication, including pilot and lighthouse service, and many other subjects, should be enacted by the Imperial legislation. In addition the report contained a clause providing that other matters might be removed from the competency of the Diet by imperial legislation. It was also proposed that Finland should be represented in the Duma by five members, one of whom should be elected by Russian residents, who were not citizens of Finland; and that the Diet should be represented on the Imperial Council by one member. Following this, (on December 24) the imperial cabinet approved new regulations whereby all documents issued by the Chancellery of the governor-general of Finland shall be worded in Russian without a Finnish or Swedish translation.

1909-1914.—Interference with the country's constitutional rights.—Passive resistance of the Diet.—“The Russian Government prepared and passed through the Duma during the years 1909-1914 a quantity of legislation relating to Russo-Finnish, and sometimes to purely Finnish, questions. To all this legislation the Finnish Diet at the instance of the bourgeois parties, with the occasional exception of the Old Finns, opposed a passive resistance. When the laws were referred to the Diet for its opinion the Diet refused to consider them. Certain Finnish judges declared them illegal. To this policy of passive resistance the Socialists gave a general adhesion, but were at pains on more than one occasion to proclaim solidarity with the Russian proletariat.”—R. Butler, *New eastern Europe*, p. 16.

1910.—Trade union statistics. See LABOR ORGANIZATION: 1910-1910.

1910.—Fresh elections to the Finnish Diet.—Russian Duma assumed authority over Finland.—A new Diet chosen at elections held early in February, 1910, comprised: Old Finns, 42; Young Finns, 28; Swedish People's party, 26; Social Democrats, 86; Agrarians, 17; Christian Labor party, 1. Fifteen women were elected, nine of them by the Social Democrats. In the same year the Russian Council of Ministers accepted a report of the Russian members of the commission and

“virtually abolished the authority of the Finnish Diet, making it a mere shell of legislative institution. This program was accepted by the reactionary Duma and later made permanent. . . . The imperial ‘program’ for Finland was not pressed in its entirety, mainly because of the commotion in Europe.”—I. D. Levine, *Resurrected nations*, pp. 185-186.

ALSO IN: G. Renwick, *Finland to-day*.

1917.—Revival of the Nationalist movement.—Conflict between capital and labor.—Proclamation of independence.—Recognition by western powers.—Beginning of Red revolution.—“With the Russian Revolution [1917] came the revival of Finnish nationalist and socialist activities. . . . The Fennoman movement—such is the name given to the Finnish Renaissance—would perhaps not have gone so far, had it been purely linguistic. But it had almost from the first a political—and it now has in addition an economic—aspect in which the linguistic side of the movement has been wellnigh lost. . . . The old fight between the Fennoman and Svekoman parties became overshadowed by the struggle between capital and labor. . . . The increase in the profits of the capitalist [during the first two years of the World War] was followed by a demand for corresponding increase of wages; and, as in every belligerent country, the readjustment of the national wage-bill was not unattended by friction. The growth of the proletariat in the towns as a consequence of the industrial expansion brought new voting strength to the Socialist Party, and incidentally added to the unruly elements of the population. At the elections of 1916 the Socialists obtained an absolute majority in the Diet, returning 103 out of 200 members. When a few months later the Revolution broke out in Russia, it found the Finnish bourgeoisie in an alarmed and suspicious frame of mind. The disorders which accompanied the Revolution in Helsingfors, and particularly in Viborg, where a detachment of Russian soldiers put some twenty officers to death at the instigation of Finnish agitators from Helsingfors, recalled unpleasant memories of the Sveaborg affair in 1906; and it was largely by way of counter-propaganda to the Socialists, and as a means of cutting the connection between the latter and the revolutionaries in Petrograd, that the bourgeois parties began . . . to press for the complete independence of Finland.”—R. Butler, *New eastern Europe*, pp. 10, 17, 18.—“This was opposed however, by the Russian Provisional Government, both under Prince Lvoff and under M. Kerensky, although the latter was willing to grant wide autonomous powers. The Russian Government ordered the dissolution of the Finnish Diet in August, owing to the recalcitrant behaviour of the assembly. . . . [However] in October a measure was introduced in the Diet establishing the independence of Finland from Russia in all matters except foreign relations, but after the Bolsheviks came into power in Petrograd, another Bill was introduced by Senator Svin Kufvud, declaring the absolute and sovereign independence of the Finnish Republic. The Bill passed in December, and at the end of the year . . . the country was recognised as independent by the French and Swedish Governments, and early in 1918 the Danish and Norse Cabinets took the same action.”—*Annual Register*, 1917, p. 250; 1918, p. 237.—“In the autumn of 1917, the coalition of the bourgeois parties to beat out the Socialists was momentarily successful. The coalition returned 102 members to the Diet to the Socialists' 92. After a failure at compromise, a Ministry was formed excluding the Socialists al-

together. The Russian Bolsheviks did what they could to drive their Finnish comrades to be, as Lenin put it, 'Less meek.' And after the bourgeois majority had authorized the Government to take any measures thought necessary to preserve order, after appeals for help had been addressed to several foreign powers and White Guards had begun to drill, the Left seized the power. On January 27, 1918, the Diet was surrounded; the railways, telegraphs and telephones seized, and the Red revolution was on."—A. B. Ruhl, *New masters of the Baltic*, p. 24.

1918.—Treaty with Germany.—Red terror followed by White terror.—"Torp" tenancy abolished.—Regency.—Declaration of monarchy.—On March 8, "inspired by the wish to establish a condition of peace and friendship between the two countries, after the announcement of the independence of Finland and its recognition by Germany, the Imperial German Government and the Finnish Government have resolved to conclude a peace treaty . . . [by which] the contracting parties declare that no state of war exists between Germany and Finland, and that they are resolved henceforth to live in peace and friendship with one another. Germany will do what she can to bring about the recognition of the independence of Finland by all the Powers. On the other hand, Finland will not cede any part of her possessions to any foreign Power or grant a servitude on her sovereign territory to any such Power without first having come to an understanding with Germany on the matter."—*Finland, Handbook no. 47, Historical section, Great Britain Foreign Office*, p. 125.—The treaty further made provision for the immediate resumption of consular and diplomatic relations, the replacement by new treaties of the treaties which had elapsed, owing to the war between Germany and Russia, the non-fortification of the Aland islands, and payment of indemnities for damages done by the parties in each other's territory.

The Red revolution which began in the early part of 1918 "lasted a little over two months—until early April, when General Mannerheim and his White Guards, aided by a German expeditionary force under General von der Goltz defeated the Reds utterly, captured some 20,000 of them, and reprisals began. At no time during the Red régime was there organized killing on a large scale. Helsingfors was taken without bloodshed and given up after slight resistance. The Terror—and it was real terror—was due to desultory but more or less constant killing during all that time; here by groups of peasants, with a grievance, real or imagined, against the local land-owners; there by bands of criminals or degenerates turned loose on the community when the Reds opened the prisons. Hideous things happened. . . . The word 'murder' is so loosely used by both sides in Finland that one must accept figures with the greatest caution, but it seems safe to say that the number of Red killings to which that term might reasonably be applied was not more than 1,000. This would include those shot while trying to get through the Red lines to the White forces organizing in the north. . . . [Finland, under the old régime] was a region of large estates and rather patriarchal customs, and the 'torp' farmers, who owned no land but paid for their little farms by working for the proprietor—two days with man and horse a week, for instance, for the use of sixteen acres—were dissatisfied. There were a good many of these 'torp' tenants on most estates. . . . There must have been scores of . . . wholly unjustifiable killings among the better sort

of land-owners in Russia. . . . It might be said in this case that the 'torp' peasants have now the right, by a subsequent decree of the Diet, to buy the farm which they have cultivated at the price which their land would have sold for before the war. In addition to killing there was a good deal of sacking and general destruction. And although Finland was on the verge of starvation—and presently to be over it—cattle were slaughtered for no reason at all and hay and grain burned. . . . The Whites, cooperating with the Germans, attacked the main Red force from two sides, cut their communications, and captured some 20,000 of them in a herd. So far as armed resistance was concerned the revolution was soon crushed. It is estimated that about 10,000 Finns were killed on each side in actual fighting. Svinhufvud became Regent and continued as such during the terrible summer of 1918, when all Finland was more or less in a state of starvation and thousands of Red prisoners were dying in the prison camps. In October the Diet—from which the Socialist members had been removed by the simple method of accusing them of treason—declared for a monarchy with the German prince, Frederick Charles of Hesse, for King. It should not be assumed that this necessarily represented merely blind reaction, although some of the ultra-conservative Finns, especially Swedish-Finns, are undoubtedly reactionary enough. There were quite sane and moderate men who felt, during the summer of 1918, that in the then state of the world and of Finland, experiment with republican government could never succeed. The war, however, decided the matter. When the Germans were beaten in the West, the prince decided that he did not care to become king of Finland. Svinhufvud, who had been pro-German all along, stepped out, and Mannerheim, who had gone abroad, was recalled [Dec. 11, 1918] and made Regent."—A. B. Ruhl, *New masters of the Baltic*, pp. 25-28, 31-32.—See also BALTIC STATES: Esthonia: 1918-1919: Struggle against Germans.

1918-1920.—Famine.—Work of American Relief Administration.—Revival of trade.—"There were, according to the official figures, after the first weeding out of the obviously innocent, 73,915 Red prisoners. The Reds assert that the number was nearer 90,000, or nearly 3 per cent of the entire population. . . . Everybody was pinched for food in Finland in 1918 and the winter of 1919. People made bread out of bark and straw and sawdust. With a condition of literal starvation among thousands of the population outside, it is not difficult—even without accepting the Red assertion that prisoners were deliberately starved—to imagine conditions in the camps. . . . A *Manchester Guardian* correspondent, an intelligent but prejudiced observer, in quoting these figures, estimated that between 25,000 and 30,000 Reds had been destroyed in one way and another after the White Guard was victorious and the revolution supposedly crushed. . . . [In 1919 American Food Relief ships arrived with wheat and other supplies.] A food-importing corporation, including representatives from the co-operative societies which are so highly developed in Finland, had had charge of food importation for the greater part of the war, and they supplied useful statistics. The Finnish Government contributed 300,000 marks. A central committee was formed. . . . including various public-spirited Finns, with experience useful in such work. This committee, in cooperation with the Food Ministry, took charge of the organization of sub-committees and the distribution of the food delivered to it by the . . . [American Relief Administration]. Here, as elsewhere, food for children was given away instead of

sold, local committees working with the Food Ministry attending to its distribution and preparation. Half the expense of transport was borne by the Food Ministry, half by the Finnish railways. By the end of June about 40,000 children were being fed, and we had given outright (food for adults was sold at cost) about \$525,000. . . . A supplementary program followed the original one, and by the summer of 1920 conditions were such—the American Red Cross had meantime come in—that the . . . [American Relief Association] could discontinue its work in Finland. Bread and sugar cards were still used, but the supply of food, even of white bread, was comparatively normal. . . . The revolution and the closing up of Russia . . . paralyzed industry and trade. Not a pound of paper went abroad in 1918 from January to July. New connections had to be built up in the West and these were hindered, not merely by distance and lack of shipping, but by the distrust of a state so close to Bolshevik Russia. Not even the 'Whitest' Finnish banker or manufacturer could visit the United States, for instance, in 1919 and the early part of 1920, without special individual permission from the State Department. Slowly the new market was made. More than 48,000 tons of paper went abroad in 1919. In the first five months of 1920 this figure had already been passed."—A. B. Ruhl, *New masters of the Baltic*, pp. 34, 35, 41, 51, 55, 57, 58.—See also INTERNATIONAL RELIEF: American Relief Administration.

1919.—Agricultural coöperation. See CO-OPERATION: Finland.

1919.—Trade union statistics. See LABOR ORGANIZATION: 1919-1919.

1919-1920.—Republic formed.—Skyddskorps or protective guards.—Amnesty Bill.—"In June, 1919, the Diet—to which the March election had given the Socialists 80 out of 200 seats—adopted a Republican constitution, providing for a one chamber parliament with a cabinet and a president to be elected, first by the Diet and afterward by the people for a term of six years. With the moderate-liberal Professor [K. J.] Stahlberg as President, order and food again in the land, and Finland's independence recognised by various friendly powers, the little country began to assume the outer air of peace and stability."—A. B. Ruhl, *New masters of the Baltic*, p. 32.—"The Protective guards, or Skyddskorps, were formed in February, 1919, while Mannerheim was still in power. Their duties are those of a civil guard, their members being chiefly drawn from peasant proprietors. Attempts were undoubtedly made during the Summer of 1919 to use them for political purposes, and the impression got about that Mannerheim intended to use them for his advance on Petrograd. This made them very much distrusted by the Socialists, who extorted a promise from the President Stahlberg at his election that he would disband them."—*New Europe*, Mar. 4, 1920, p. 184.—An Amnesty bill was passed, which became a law on Jan. 30, when President Stahlberg affixed his signature to it. The new act provided for the release of about 3,000 prisoners, and the restoration of civil rights to about 40,000 of those who sided with the Reds in the Civil War.

1920.—Principal parties in the Diet.—Status of Socialists.—Political unrest.—Åland islands.—"In the old Finnish Diet, before Finnish independence was realised, the main political parties were the two Finnish Nationalist Parties—the Old Finns (Conservative) and the Young Finns (Liberal); the Swedish National Party; the Agrarians (chiefly peasants), and the Social Democrats. Since the Civil War the party formations have

undergone a change, and there are now [1920] five main political parties in the Diet, of which far the most numerous is the Social Democratic. . . . After the Socialists the most numerous party in the present Diet is the Agrarian, with forty-two seats. The Agrarians are essentially a peasant party, strongly republican and democratic. Together with the Progressive Party, they form the Centre bloc from which the present Government has been formed. The Progressive Party, with twenty-two seats in the Diet, is the direct successor of the Young Finns. The present party dates from the end of 1918, when the bulk of the Young Finns, who had remained true to Republican traditions during the German occupation, united with a number of Old Finns who disapproved of German attempts to force a monarchy on the country. This party consists chiefly of the Finnish *intelligentsia* who, though keen Finnish Nationalists, are not Chauvinist and deprecate the dissensions between Finns and Swedes. They have supplied the majority of the present Government, one of their most prominent members being Mr. Holsti, the present Minister for Foreign Affairs. To the right of the Centre bloc came the Kokoomus (Coalition) Party with twenty-eight seats in the Diet, and the Swedish Party with twenty-two. The Kokoomus Party was founded at the same time as the Progressive Party, and is composed of the bulk of the Old Finns and the Right Wing of the Young Finns, who abandoned their former political standpoint as a result of the Civil War. They favour a Constitutional Monarchy; but, failing that, they demand sufficient guarantees to free the administration from becoming the mere tool of a single Chamber. . . . The Swedish Party, with twenty-two seats in the Diet, unites under its banner the majority of the Swedish population in Finland, though a group known as the Swedish Republican Left has now broken away and has thrown in its lot with the Centre bloc. The hero of the Swedish Party is General Mannerheim, and the hostility of the present Government to Mannerheim's policy makes the Swedish Party the most bitter opponents of the Government's policy both in home and foreign affairs. . . . The Socialists are divided into several camps and Socialism is in a state of flux. . . . At the moment the Moderates in the party outnumber the Left Socialists, who differ very little from the Communists; but the pressure of the latter is strong. . . . Finland is at present passing through a critical phase of her existence as an independent state. She is near the storm-centre of social upheaval in Eastern Europe, and it is difficult for her statesmen to steer a prudent course between reaction and communism. . . . The policy of the present government has been to win over the working classes by conciliation and leniency, but progress in this direction has been slow. There are constant rumours of trouble, and excitement has been caused by the return of Mannerheim to Finland. The workmen fear a *coup* on the part of the Whites; the latter fear disturbance from the Reds. The Civil War left many evils behind it, and with Soviet Russia just beyond the frontiers, the transition from war to peace is slow and difficult."—*New Europe*, Mar. 4, 1920, pp. 181-184.—During the year 1920, relations between Finland and Sweden over the question of the Åland islands reached an alarming state. The Finlanders claimed sovereignty over them on the grounds that the islands were necessary to the national existence of Finland. Their geographical position makes them the natural key to the defense of that country.

1920.—Compulsory school law. See EDUCATION: Modern developments: 20th century: General education: Finland.

1920 (October-December).—Treaty of Dorpat.—“Finland’s chief territorial problem lies on her eastern frontier, long in dispute with Soviet Russia. The main points in contention were the question of an outlet for Finland on the Arctic Ocean (Pechenga region) and the disposition of Eastern Karelia, a province occupied by a people racially allied to the Finns. An agreement was finally reached in a treaty signed 14 October 1920 and ratified 20 December 1920. The boundary articles of the treaty of Dorpat assign to Finland a strip of the Arctic coast and connecting territory; . . . and other articles provide for the neutralization of the frontier. The treaty also guarantees autonomy to eastern Karelia and to the Karelian population of Archangel and Olonetz (Northeast of Lake Ladoga), which is Greek Orthodox in religion and Russian in civilization and has no marked political preference. Transportation and rafting of timber on waters crossing the boundary line is to be permitted to both countries. Commercial freedom of wide scope is guaranteed in articles on the use of ports, railways, telegraph lines, freight and customs rates, on fishing rights, harbor fees, and the like. The Pechenga region which Finland gained is a small, barren strip on the Arctic shore. Its significance arises out of the tempering effect exercised by a branch of the warmer waters of the north Atlantic drift (usually called the Gulf Stream), whereby the ports of Pechenga and Alexandrovsk, 250 miles north of the Arctic Circle . . . remain open throughout the winter months, when all the ports of the eastern Baltic and the White Sea are closed by ice.”—I. Bowman, *New world*, p. 370.—See also RUSSIA: 1920.

1921.—Final report of commission on Aland islands.—Islands awarded to Finland by Council of the League of Nations. See ALAND ISLANDS: 1921.

1921-1922.—Friction with Russia.—“Relations between Finland and Soviet Russia reached a crisis in December 1921 owing to the uprising of the Finnish population of Eastern Karelia. . . . The Finns denied all complicity with the new government set up by the Karelians in November 1921. . . . In January 1922 Finland brought the whole controversy up before the League of Nations, which accepted the task of investigation of the merits of the controversy.”—*New York Times Current History*, Jan., 1922, p. 660; June, 1922, p. 867.

1922.—Presidential Election Bill.—Land legislation.—Interned ship agreement with Russia.—“The bill establishing the Presidential election by 300 electors chosen by the general suffrage was passed by the Diet Oct. 20. This act merely confirms the original constitutional provision. President Stahlberg’s election by the Diet had been exceptional to meet the emergency of an unsettled time in the country, and there had been much controversy as to whether the constitutional indirect-election law should take effect at the end of President Stahlberg’s six-year term, in 1925. The agrarian law was passed Oct. 14, limiting the area of private estates to something like 300 hectares. All the excess areas of the large estates are to be subdivided into small farms for sale at a specified, reasonable rate to persons without land. At the same time the Diet provided for Governmental care of the foreign-owned estates left by Russian and other proprietors during the war of independence. Instead of selling these estates for

back taxes, the Government is to take care of them for five years, but will appropriate those whose owners do not appear by that time and pay the tax arrears, plus the care-taking expenses. In October the reciprocal agreement between Finland and Soviet Russia for the return of each other’s ships, interned since the war of Finnish independence, was carried out according to the Dorpat Treaty terms.”—*New York Times Current History*, Dec., 1922, p. 522.

FIRE-EATERS, name applied in the United States to the extreme pro-slavery advocates of the South.

FIRES.—The following is a list of important fires in the world’s history:

A. D. 64, July 10. Rome, Italy. The fire raged for nine days destroying a great part of the city; it constitutes the greatest fire in the annals of Rome.—See also ROME: Empire: A. D. 54-64.

1666, September 6. London, England. “The Great Fire” burned four days, sweeping 436 acres, destroying 13,200 houses, many public buildings and 90 churches, including St. Paul’s Cathedral. Property loss estimated between 8,000,000 and 12,000,000 pounds sterling, which was an immense sum considering the very low values of

commodities at that time.—See also LONDON: 1666.

1812, September 15. Moscow, Russia, four-fifths of the city destroyed.—See also RUSSIA: 1812 (September).

1820, June 10. Savannah, Ga., loss \$5,000,000.

1825, October. New Brunswick, Canada, 5,500 square miles burned over by a forest fire destroying several towns and part of Fredericton.

1835, December 6. New York City, area of 60 acres, south of Wall street to East River, 674 buildings burned; loss between \$10,000,000 and \$20,000,000.

1842, May 14. Hamburg, Germany, 1,992 buildings destroyed; damage estimated at \$35,000,000; Senate, public offices and library also destroyed.

1845, May 28. Quebec, Canada, 1,050 houses destroyed.

1845, June 28. Quebec, Canada, 1,200 houses destroyed.

1845, July 19. New York City, Wall and Broad streets district, 302 buildings destroyed; loss \$6,000,000.

1848, August 10. Albany, N. Y., loss \$5,000,000.

1849-51. San Francisco, Calif., five conflagrations in three years, each destroying great portions of the city.

1852. Sacramento, Calif., 2,500 buildings, practically the entire city destroyed.

1852, July 8. Montreal, Canada, 350 acres in area; loss \$5,000,000.

1854. Newcastle-on-Tyne, England, \$5,000,000 property loss.

1861, June 22. London, England, "Tooley Street" fire, dock warehouses; loss nearly \$10,000,000.

1861, December 12. Charleston, S. C., loss \$10,000,000.

1866, July 4. Portland, Me., firecracker started fire which destroyed \$10,000,000 in property.

1866, October. Quebec, Canada, 300 acres in area; 2,000 houses and 17 churches burned; loss \$3,000,000.

1871, October 9. Chicago, Ill., "The Chicago Fire," 2,500 acres in area; 15,000 buildings destroyed; loss \$175,000,000.—See also CHICAGO: 1871.

1872, November 9. Boston, Mass., 80 acres in area; 750 buildings destroyed; property loss estimated at \$75,000,000.

1875, October 26. Virginia City, Nev., loss \$7,500,000.

1876, September 3. St. Hyacinthe, Quebec, 600 buildings in an area of 100 acres destroyed; loss \$1,500,000.

1877, June 20. St. John, New Brunswick, 350 acres in area; loss about \$15,000,000.

1881, June 8. Quebec, Canada, 50 acres in area; loss over \$2,000,000.

1880, June. Seattle, Wash., mercantile section; loss \$6,000,000.

1880, August. Spokane, Wash.; fire swept almost the entire city; loss, \$4,800,000.

1880, November 26. Lynn, Mass., 60 acres in area, 300 buildings burned.

1880, November 28. Boston, Mass., three acres in area; loss \$2,800,000.

1892, October 28. Milwaukee, Wis., 46 acres in area; property loss \$2,500,000.

1893, March 10. Boston, Mass., 2½ acres in area; loss \$3,000,000.

1895. Toronto, Canada. Three fires in the early part of the year were of conflagration proportions.

1897, June 19. London, England, "Cripplegate" fire, 56 buildings destroyed, 40 damaged.

1897, November 21. Melbourne, Australia, property loss \$4,000,000.

1898, September 10. New Westminster, Canada, business section and part of residential section destroyed.

1900, April 26. Hull, Canada, 800 acres in area, including spread to Ottawa across the river; property loss \$7,500,000.

1901, January 23. Montreal, Canada, "Board of Trade" fire, five acres in area; property loss over \$3,000,000.

1901, May 3. Jacksonville, Fla., area two miles long, one-half mile wide; property loss \$10,000,000.

1902, February 8. Paterson, N. J., two conflagrations practically simultaneous; one 250 acres in area, the other 15 acres; total property loss nearly \$6,000,000.

1903, May 20. St. Hyacinthe, Quebec, 40 acres in area destroyed.

1904, February 7 and 8. Baltimore, Md., many so-called fire-proof buildings in the business district destroyed with a loss of \$50,000,000.

1904, April 10. Toronto, Canada, 20 acres in area; loss \$12,000,000.

1906, April 18. San Francisco, Calif., greater part of business district and a large portion of residential area destroyed; property loss over \$400,000,000.—See also SAN FRANCISCO: 1906.

1908, April 12. Chelsea, Mass., business center and best residential section destroyed; loss over \$10,000,000.

1911, May 21. Atlanta, Georgia, 300 acres in area, 1,938 buildings destroyed; loss \$5,500,000—two simultaneous fires.

1912, February 1. Houston, Texas., loss \$4,500,000.

1914, June 25 and 26. Salem, Mass., 251 acres in area, 1,600 buildings destroyed; loss \$8,000,000.

1915, September 4. Newport News, Va., loss \$2,000,000.

1916, March 21. Paris, Tex., 264 acres in area, 1,440 buildings destroyed; loss \$10,000,000.

1916, March 22 and 23. Augusta, Ga., 160 acres in business and residential district, 682 buildings destroyed; loss \$4,250,000.

1916, March 26. Nashville, Tenn., 64 acres in area, 648 buildings destroyed; loss \$1,500,000.

1916, July 30. Black Tom, N. J., loss \$4,000,000.

1917, January 11. Kingland, N. J., loss \$12,000,000.

1917, January 30. Hartford, Conn., loss \$1,500,000.

1917, February 1. Pittsburgh, Pa., loss \$2,000,000.

1917, February 3. Detroit, Mich., Saxon Motors; loss \$2,600,000.

1917, May 21. Atlanta, Ga., loss \$5,000,000.

1917, October 13. Brooklyn, N. Y., loss \$2,000,000.

1917, November 1. Baltimore, Md., loss \$3,500,000.

1917, December 6. Halifax, Nova Scotia, loss \$2,000,000.

1918, October 5. Morgan, N. J., loss \$20,000,000.

1918, October. Minn., forest fires many towns and inhabitants burned; loss \$30,000,000.

1922, March 14. Chicago, Ill., loss \$5,000,000; business block in "Loop" district.—Based on *Insurance Almanac and Encyclopedia*, 1922, pp. 659-660.

1922, September 14. Smyrna, Asia Minor, about 1,000 lives were lost and \$200,000,000 worth of property.—See also SMYRNA.

**FIRE-WORSHIPERS**, certain cults which pay devotion to fire as a sacred element. Fire-gods occur in most primitive religions, and in some rela-

tively advanced cults. The religion of Zoroaster is often incorrectly referred to as fire-worship.

1763.—Rights secured to France on the island of Newfoundland and in the gulf of St. Lawrence by the Treaty of Paris.—Articles V and VI of the Treaty of Paris (1763), which transferred Canada and all its islands from France to England, are in the following language: "The subjects of France shall have the liberty of fishing and drying, on a part of the coasts of the island of Newfoundland, such as it is specified in the 13th Article of the Treaty of Utrecht; which article is renewed and confirmed by the present treaty (except what relates to the island of Cape Breton, as well as to the other islands and coasts, in the mouth and in the gulph of St. Laurence); and his Britannic majesty consents to leave to the subjects of the most Christian king the liberty of fishing in the gulph of St. Laurence, on condition that the subjects of France do not exercise the said fishery, but at the distance of three leagues from all the coasts belonging to Great Britain, as well those of the continent, as those of the islands situated in the said gulph of St. Laurence. And as to what relates to the fishery on the coasts of the island of Cape Breton out of the said gulph, the subjects of the most Christian king shall not be permitted to exercise the said fishery, but at the distance of 15 leagues from the coasts of the island of Cape Breton; and the fishery on the coasts of Nova Scotia or Acadia, and everywhere else out of the said gulph, shall remain on the foot of former treaties. Art. VI. The King of Great Britain cedes the islands of St. Peter and Miquelon, in full right, to his most Christian majesty, to serve as a shelter to the French fishermen: and his said most Christian majesty engages not to fortify the said islands; to erect no buildings upon them, but merely for the convenience of the fishery; and to keep upon them a guard of 50 men only for the police."—*Text of the treaty (Parliamentary history, v. 15, p. 1295).*

1783.—Rights secured to the United States by the Treaty of Paris. See **U. S. A.: 1783** (September).

1814-1818.—Disputed rights of American fishermen after the War of 1812.—Silence of the Treaty of Ghent.—Convention of 1818.—In the Treaty of 1783 "we [United States] claimed that the liberty which was secured to the inhabitants of the United States to take fish on the coasts

of Newfoundland, under the limitation of not drying or curing the same on that island, and also on the other coasts, bays, and creeks, together with the limited rights of drying or curing fish on the coasts of Nova Scotia, Magdalen Islands, and Labrador, were not created or conferred by that treaty, but were simply recognized by it as already existing. They had been enjoyed before the Revolution by the Americans in common with other subjects of Great Britain, and had, indeed, been conquered, from the French chiefly, through the valor and sacrifices of the colonies of New England and New York. The treaty was therefore considered analogous to a deed of partition. It defined the boundaries between the two countries and all the rights and privileges belonging to them. We insisted that the article respecting fisheries was therefore to be regarded as identical with the possession of land or the demarcation of boundary. We also claimed that the treaty, being one that recognized independence, conceded territory, and defined boundaries, belonged to that class which is permanent in its nature and is not affected by subsequent suspension of friendly relations. The English, however, insisted that this treaty was not a unity; that while some of its provisions were permanent, other stipulations were temporary and could be abrogated, and that, in fact, they were abrogated by the war of 1812; that the very difference of the language used showed that while the rights of deep-sea fishing were permanent, the liberties of fishing were created and conferred by that treaty, and had therefore been taken away by the war. These were the two opposite views of the respective governments at the conferences which ended in the treaty of Ghent, of 1814." No compromise appearing to be practicable, the commissioners agreed, at length, to drop the subject from consideration. "For that reason the treaty of Ghent is entirely silent as to the fishery question [see U. S. A.: 1814 (December)]. . . . In consequence of conflicts arising between our fishermen and the British authorities, our point of view was very strongly maintained by Mr. Adams in his correspondence with the British Foreign Office, and finally, on October 20, 1818, Mr. Rush, then our minister at London, assisted by Mr. Gallatin, succeeded in signing a treaty, which among other things settled out rights and privileges by the first article, as follows: . . . 'It is agreed between the high contracting parties that the inhabitants of the said United States shall have forever, in common with the subjects of his Britannic Majesty, the liberty of taking fish of any kind on that part of the southern coast of Newfoundland which extends from Cape Ray to the Rameau Islands; on the western and northern coasts of Newfoundland from the said Cape Ray to the Qurpon Islands; on the shores of the Magdalen Islands, and also on the coasts, bays, harbors, and creeks from Mont Joly, on the southern coast of Labrador, to and through the straits of Belle Isle, and thence northwardly indefinitely along the coast. And that the American fishermen shall have liberty forever to dry and cure fish in any of the unsettled bays, harbors, and creeks in the southern part of Newfoundland herein-before described, and of the coasts of Labrador; but as soon as the same, or any portion thereof, shall be settled, it shall not be lawful for said fishermen to dry or cure fish at such portion, so settled, without previous agreement for such purpose with the inhabitants, proprietors, or possessors of the ground. And the United States hereby renounces forever any liberty heretofore enjoyed, claimed by the inhabitants thereof to take, dry, or cure fish on or within three marine miles

of any of the coasts, bays, creeks, or harbors of his Britannic Majesty's dominions in America not included in the above-mentioned limits. Provided, however, That the American fishermen shall be permitted to enter such bays or harbors for the purpose of shelter, of repairing damages therein, of purchasing wood, and obtaining water, and for no other purpose whatever. But they shall be under such restrictions as shall be necessary to prevent their taking, drying, or curing fish therein, or in any other manner whatever abusing the privileges hereby secured to them.' The American plenipotentiaries evidently labored to obtain as extensive a district of territory as possible for inshore fishing, and were willing to give up privileges, then apparently of small amount, but now much more important, than of using other bays and harbors for shelter and kindred purposes. For that reason they acquiesced in omitting the word 'bait' in the first sentence of the proviso after 'water.' . . . The power of obtaining bait for use in the deep-sea fisheries is one which our fishermen were afterward very anxious to secure. But the mackerel fisheries in those waters did not begin until several years later. The only contention then was about the cod fisheries."—E. Schuyler, *American diplomacy, ch. 8.—Treaties and conventions between the United States and other powers (ed. of 1889), pp. 415-418.*

1819-1854.—Act of 1819.—Restrictions passed by the legislature of Nova Scotia.—Coasts patrolled by English war vessels.—"On June 14, 1819, an act, closely following the language of the article, was passed by the imperial parliament to carry it into effect; and from that time down to 1836, little trouble seems to have occurred. But in that year the legislature of Nova Scotia passed an act, by which the 'hovering' of vessels within three miles of the coasts and harbors was sought to be prevented by various regulations and penalties; and claims were subsequently asserted to exclude American fishermen from all bays and even from all waters within lines drawn from headland to headland, to forbid them to navigate the Gut of Canso, and to deny them all privileges of traffic, including the purchase of bait and supplies in the British colonial ports. From 1830 down to 1854 there were numerous seizures, and in 1852 the home government sent over a force of war steamers and sailing vessels to assist in patrolling the coast."—J. B. Moore, *Principles of American diplomacy, p. 141.*

1820-1901.—Whaling in the Pacific and Arctic regions. See COMMERCE: Commercial Age: 1820-1920.

1821-1824.—Russian attempt to exclude foreign fishing in Bering sea.—Convention between United States and Russia opening the Pacific ocean to fishing.—Fishery controversies of the nineteenth century were not confined to the north Atlantic. The fisheries of the north Pacific began to become valuable to Russia and "by an imperial ukase or edict of July 8, 1700, Paul I. of Russia granted to the Russian-American Company various important rights on the Russian coasts in America, including that of fishing. Twenty-two years later—on September 7, 1821—there was issued by the Emperor Alexander another ukase, the apparent effect of which was much more far-reaching, since it purported to exclude foreigners from carrying on commerce and from whaling and fishing on the northwest coast of America, from Bering Strait down to the fifty-first parallel of north latitude, and forbade them even to approach within a hundred Italian miles of the coast. Against this ukase both the United States and Great Britain

protested, and it was never enforced. . . . On the other hand, a convention was concluded between the United States and Russia on April 17, 1824, by which it was agreed that 'in any part of the great ocean, commonly called the Pacific Ocean, or South Sea,' the citizens or subjects of the high contracting parties should be 'neither disturbed nor restrained, either in navigation or in fishing.' A treaty in similar terms was made by Great Britain in the following year."—J. B. Moore, *American diplomacy*, p. 98.

**1854-1866.—Privileges defined under the Canadian Reciprocity Treaty.**—By the first article of the American-Canadian Reciprocity Treaty of 1854 it was agreed that, "in addition to the liberty secured to the United States fishermen by the . . . convention of October 20, 1818, of taking, curing, and drying fish on certain coasts of the British North American Colonies therein defined, the inhabitants of the United States shall have, in common with the subjects of Her Britannic Majesty, the liberty to take fish of every kind, except shell-fish, on the sea-coasts and shores, and in the bays, harbors, and creeks of Canada, New Brunswick, Nova Scotia, Prince Edward's Island, and of the several islands thereunto adjacent, without being restricted to any distance from the shore, with permission to land upon the coasts and shores of those colonies and the islands thereof, and also upon the Magdalen Islands, for the purpose of drying their nets and curing their fish; provided that, in so doing, they do not interfere with the rights of private property, or with British fishermen, in the peaceable use of any part of the said coast in their occupancy for the same purpose. It is understood that the above-mentioned liberty applies solely to the sea-fishery, and that the salmon and shad fisheries, and all fisheries in rivers and the mouths of rivers, are hereby reserved exclusively for British fishermen." The same article provided for the appointment of commissioners and an arbitrator or umpire to settle any disputes that might arise "as to the places to which the reservation of exclusive right to British fishermen contained in this article, and that of fishermen of the United States contained in the next succeeding article, apply." By the second article of the treaty British subjects received privileges on the eastern sea-coasts and shores of the United States north of the 36th parallel of north latitude, identical with those given by the first article to citizens of the United States on the coasts and shores mentioned above.—*Treaties and conventions between the United States and other powers* (ed. of 1866), pp. 448-452.—This treaty was abrogated in 1866 by the United States.

**1867-1899.—Fisheries in the Pacific.** See **BERING SEA QUESTION**; **CANADA**: 1808-1899; **COMMERCE**: Commercial Age: 1820-1920.

**1871.—Reciprocal privileges adjusted between Great Britain and the United States by the Treaty of Washington.** See **ALABAMA CLAIMS**: 1871.

**1877-1898.—Halifax award.**—**Termination of the fishery articles of the Treaty of Washington.**—**Rejected Treaty of 1888.**—In accordance with the terms of Articles 22 and 23 of the Treaty of Washington (see **ALABAMA CLAIMS**: 1871), a commission appointed to award compensation to Great Britain for the superior value of the fishery privileges conceded to the citizens of the United States by that treaty, met at Halifax on June 5, 1877. The United States was represented on the commission by E. H. Kellogg, of Massachusetts, and Great Britain by Sir Alexander F. Gault, of Canada. The two governments having failed to agree in the selection of the third commissioner,

the latter was named, as the treaty provided, by the Austrian ambassador at London, who designated M. Maurice Delfosse, Belgian minister at Washington. The award was made November 27, 1877, when, "by a vote of two to one, the Commissioners decided that the United States was to pay \$5,500,000 for the use of the fishing privileges for 12 years. The decision produced profound astonishment in the United States." Dissatisfaction with the Halifax award, and generally with the main provisions of the Treaty of Washington relating to the fisheries, was so great in the United States that, when, in 1878, Congress appropriated money for the payment of the award, it inserted in the bill a clause to the effect that "Articles 18 and 21 of the Treaty between the United States and Great Britain concluded on the 8th of May, 1871, ought to be terminated at the earliest period consistent with the provisions of Article 33 of the same Treaty." "It is a curious fact that during the time intervening between the signing of the treaty of Washington and the Halifax award an almost complete change took place in the character of the fisheries. The method of taking mackerel was completely revolutionized by the introduction of the purse-seine, by means of which vast quantities of the fish were captured far out in the open sea by enclosing them in huge nets. . . . This change in the method of fishing brought about a change in the fishing grounds. . . . The result of this change was very greatly to diminish the value of the North-eastern Fisheries to the United States fishermen. . . . [On July 1, 1883] in pursuance of instructions from Congress, the President gave the required notice of the desire of the United States to terminate the Fishery Articles of the Treaty of Washington, which consequently came to an end the 1st of July, 1885. The termination of the treaty fell in the midst of the fishing season, and, at the suggestion of the British Minister, Secretary Bayard entered into a temporary arrangement whereby the American fishermen were allowed the privileges of the treaty during the remainder of the season, with the understanding that the President should bring the question before Congress at its next session and recommend a joint Commission by the Governments of the United States and Great Britain." This was done, but Congress disapproved the recommendation. The question of rights under former treaties, especially that of 1818, remained open, and became a subject of much irritation between the United States and the neighboring British American provinces. The local regulations of the latter were enforced with stringency and harshness against American fishermen; the latter solicited and procured retaliatory legislation from Congress. To end this unsatisfactory state of affairs, a treaty was negotiated at Washington in February, 1888, by Thomas F. Bayard, secretary of State, William L. Putnam and James B. Angell, plenipotentiaries on the part of the United States, and Joseph Chamberlain, M. P., Sir L. S. Sackville West and Sir Charles Tupper, plenipotentiaries on the part of Great Britain, which treaty was approved by the president and sent to the Senate, but rejected by that body on August 21, by a negative vote of 30 against 27 in its favor.—C. B. Elliott, *United States and the north-eastern fisheries*, pp. 79-100.—"President Cleveland then recommended to Congress a definite course of retaliation. . . . This recommendation failed; . . . a system of licenses was established, continued for the time being to operate by virtue of Canadian orders in council. The fisheries question was one of the subjects considered by the Quebec commission of 1868, but no conclusive results on any matter were reached by

that body."—J. B. Moore, *American diplomacy*, p. 97.

1908.—Convention respecting the protection, preservation, and propagation of food fishes in the waters contiguous to the United States and Canada.—The following are the articles of a convention negotiated at Washington and signed by Ambassador James Bryce, for the government of Great Britain, and by Secretary Elihu Root, for that of the United States, on April 11, 1908. Ratifications of the convention were exchanged on June 4.

ARTICLE 1. The time, seasons, and methods of fishing in the waters contiguous to the United States and Canada as specified in Article 4 of this Convention, and the nets, engines, gear, apparatus, and appliances which may be used therein, shall be fixed and determined by uniform and common international regulations, restrictions, and provisions; and to that end the High Contracting Parties agree to appoint, within three months after this Convention is proclaimed, a Commission to be known as the International Fisheries Commission, consisting of one person named by each Government.

ARTICLE 2. It shall be the duty of this International Fisheries Commission, within six months after being named, to prepare a system of uniform and common International Regulations for the protection and preservation of the food fishes in each of the waters prescribed in Article 4 of this Convention, which Regulations shall embrace close seasons, limitations as to the character, size, and manner of use of nets, engines, gear, apparatus, and other appliances; a uniform system of registry by each Government in waters where required for the more convenient regulation of commercial fishing by its own citizens or subjects within its own territorial waters or any part of such waters; an arrangement for concurrent measures for the propagation of fish; and such other provisions and measures as the Commission shall deem necessary.

ARTICLE 3. The two Governments engage to put into operation and to enforce by legislation and executive action, with as little delay as possible, the Regulations, restrictions, and provision with appropriate penalties for all breaches thereof; and the date when they shall be put into operation shall be fixed by the concurrent proclamations of the President of the United States and the Governor-General of the Dominion of Canada in Council. And it is further agreed that jurisdiction shall be exercised by either Government, as well over citizens or subjects of either party apprehended for violation of the Regulations in any of its own waters to which said Regulations apply, as over its own citizens or subjects found within its own jurisdiction who shall have violated said Regulations within the waters of the other party.

ARTICLE 4. It is agreed that the waters within which the aforementioned Regulations are to be applied shall be as follows: (1) The territorial waters of Passamaquoddy Bay; (2) The St. John

and St. Croix Rivers; (3) Lake Memphremagog; (4) Lake Champlain; (5) the St. Lawrence River, where the said River constitutes the International Boundary; (6) Lake Ontario; (7) the Niagara River; (8) Lake Erie; (9) the waters connecting Lake Erie and Lake Huron, including Lake St. Clair; (10) Lake Huron, excluding Georgian Bay but including North Channel; (11) St. Mary's River and Lake Superior; (12) Rainy River and Rainy Lake; (13) Lake of the Woods; (14) the Strait of San Juan de Fuca, those parts of Washington Sound, the Gulf of Georgia and Puget Sound lying between the parallels of 48° 10' and 49° 20'; (15) and such other contiguous waters as may be recommended by the International Fisheries Commission and approved by the two Governments. It is agreed on the part of Great Britain that the Canadian Government will protect by adequate regulations the food fishes frequenting the Fraser River.

The two Governments engage to have prepared as soon as practicable charts of the waters described in this Article, with the International Boundary Line indicated thereon; and to establish such additional boundary monuments, buoys, and marks as may be recommended by the Commission.

ARTICLE 5. The International Fisheries Commission shall continue in existence so long as this Convention shall be in force, and each Government shall have the power to fill, and shall fill from time to time, any vacancy which may occur in its representation on the Commission. Each Government shall pay its own Commissioner, and any joint expenses shall be paid by the two Governments in equal moieties.

ARTICLE 6. The Regulations, restrictions, and provisions provided for in this Convention shall remain in force for a period of four years from the date of their executive promulgation, and thereafter until one year from the date when either the Government of Great Britain or of the United States shall give notice to the other of its desire for their revision; and immediately upon such notice being given the Commission shall proceed to make a revision thereof, which Revised Regulation, if adopted and promulgated by the President of the United States and the Governor-General of Canada in Council, shall remain in force for another period of four years and thereafter until one year from the date when a further notice of revision is given as above provided in this Article. It shall, however, be in the power of the two Governments, by joint or concurrent action upon the recommendation of the Commission, to make modifications at any time in the Regulations.

ARTICLE 7. The present Convention shall be duly ratified by His Britannic Majesty and by the President of the United States, by and with the advice and consent of the Senate thereof, and the ratifications shall be exchanged in Washington as soon as practicable.

1909.—Depression in Newfoundland. See NEWFOUNDLAND: 1909.

1909-1910.—Hague arbitration of Newfoundland fishery dispute.—"By an agreement of January 27, 1909, the north Atlantic fisheries dispute was referred to The Hague Court. Five arbitrators sat, and, September 7, 1910, signed the award, holding that Great Britain, or the local colony, might by laws or ordinances designed to preserve the fisheries or public order and morals, but subject to review by a mixed commission of experts, regulate the exercise of the 'liberties' not renounced in 1818; that, while persons not inhabiting the United States might be enrolled on American fish-

ing-vessels, they gained no treaty immunities; that such vessels, though exempt from commercial formalities, and from dues not imposed on British fishermen, should, if proper conveniences existed, report their presence, and, even when coming in for shelter, repairs, wood, or water, might be required when staying over forty-eight hours similarly to report, personally or by telegraph. American fishing-vessels, if commercially documented, might, it was held, exercise privileges, but not when on a fishing voyage. The award, adopting the provisions of the Bayard-Chamberlain arrangement [see above: 1877-1808], delimited certain waters as exclusively British, and for the rest recommended, as to bays, the ten-mile rule. The right of the Americans to fish on the treaty coasts of Newfoundland and the Magdalen Islands, was affirmed."—J. B. Moore, *Principles of American diplomacy*, pp. 152-156.—See also NEWFOUNDLAND: 1905-1909.

1911-1912.—*Fur-seal convention of 1911.—Agreement between United States, Great Britain and Japan.—Seal Bill of 1912.*—"In spite of the efforts made for their protection, the number of seals in the north Pacific diminished rather than increased. Warm discussions, conducted with epithets as well as with figures, took place as to the respectively injurious effects of pelagic sealing and killing on land. Besides, the controversy tended, like that regarding the suffrage, to follow sexual lines, the killing on land affecting chiefly the fathers of the race, while that on the sea destroyed chiefly the mothers. Eventually, a further treaty was entered into by the United States and Great Britain on February 7, 1911, but its provisions were in the main either duplicated or superseded by the treaty concluded at Washington, on the 7th of the following July, between the United States, Great Britain, Japan, and Russia, for the protection of sea-otters as well as of fur-seals. By this treaty the contracting parties agreed for a definite period of fifteen years to prohibit all persons subject to their laws and treaties, and also their vessels, from engaging in 'pelagic sealing'—which was defined, for the purpose of the convention, as the 'killing, capturing, or pursuing' in the waters of the north Pacific above 30° latitude, including the seas of Bering, Kamchatka, Okhotsk, and Japan. The waters thus designated were to be patrolled. Offenders against the treaty were subject to arrest on the high seas by the authorities of any of the contractants, but must be handed over to their own nation for trial; while skins not certified as taken under the authority of the respective powers were excluded from importation. Sea-otters were similarly protected. On the other hand, the powers undertook to solace one another for foregoing the exercise of the right to kill at sea by furnishing certain compensations, chiefly out of the profits of killing on land. In case the number of seals visiting the United States islands in any year fell below 100,000, or the Russian islands below 18,000, or the Japanese below 6,500, it was permissible to suspend all killing without any allowance in skins or in money till the specified standard should again be exceeded. Subject to this stipulation, each of the powers possessing, within the designated area, islands and shores frequented by seals, agreed to deliver up a certain gross percentage, in number and value, of the skins thereon taken. Of the skins taken on the islands and shores of the United States and of Russia, the governments of Canada and Japan were each to receive 15 per cent., while of those taken on Japanese islands and shores, the United States, Japan, and Russia were each to get 10 per cent.;

but it was further stipulated that Canada and Japan should each receive from the American herd not less than one thousand skins annually. In case any British islands or shores should become the resort of seals, the United States, Japan, and Russia were each to receive 10 per cent. of the skins thereon taken. These stipulations, however, do not limit the right of the territorial sovereigns from time to time altogether to suspend the killing of seals on their respective shores and islands, or to impose restrictions and regulations necessary to protect and preserve the herd and to increase its number. But, if killing is altogether prohibited, for any reason other than that the number of visiting seals has fallen below the standard, then the United States must during such suspension pay Great Britain and Japan each an annual sum of \$10,000 for which it may, after killing is resumed, reimburse itself by retaining skins taken in excess of the minimum of one thousand agreed to be turned over. Russia agreed, during the last ten years of the conventional term of fifteen, to kill in each year at least 5 per cent. of the seals visiting her hauling-grounds and rookeries, provided this did not exceed 85 per cent. of the three-year-old male seals hauling in such year. Japan made a similar engagement in regard to the killing of her seals. Finally, the United States agreed, when the treaty took effect, to advance to Great Britain and to Japan, each, on account of the skins to which they would be entitled, the sum of \$200,000, and to repay itself by retaining an equivalent in skins, reckoned by their market value in London less cost of transportation, such reckoning, if disputed, to be made by an 'umpire,' chosen by the governments concerned. In explanation of the standard of valuation thus adopted, the fact may be stated that London had for many years been the almost exclusive seat of the industry of dressing sealskins. The undressed skins, therefore, for the most part found their way thither; and it was the only place where a market value of such skins, resulting from public sales at stated seasons, could then be said to exist. These circumstances also help to elucidate the diversity, which prior negotiations had at times disclosed, between the inclinations of the British and those of the Canadian government, the latter having an immediate interest in pelagic sealing, while the former was substantially interested in preserving a flourishing industry which was said to affect the livelihood of ten thousand persons in England, and which was dependent upon a steady and permanent supply of the raw material."—J. B. Moore, *Principles of American diplomacy*, pp. 152-156.—"On February 15, 1912, a bill, which has since become a law, was introduced in the House of Representatives to give effect to certain provisions of the treaty of 1911. An effort was at once made by certain interested parties, ostensibly for the welfare of the herd, to attach to this bill an amendment providing for the suspension of land sealing for the period of the treaty. This amendment was virtually defeated in the House, the bill passing that body with provision for a single season's suspension only. In the Senate, however, the fight was more successful, a 10-year close season for land sealing being secured. In conference with the House the period of suspension of land sealing was reduced to 5 years, and this is the present law [1912]. A provision of the amendment permits a limited killing for food for the natives on the fur-seal islands."—United States Fisheries Bureau, *Economic Circular no. 4*, Dec. 20, 1912, pp. 4-5.

1915.—*Halibut fishing in the Pacific.—Trade diverted to Canada.*—"Prior to 1915 nearly all of

the halibut supply for the East was obtained through Alaskan ports and Seattle. The halibut banks lie largely about 700 miles north of Seattle and extend for 1,500 miles along the Alaskan coast but outside of the 3-mile limit. They are thought to be the most extensive halibut banks in the world. . . . Early in 1915 the Grand Trunk Pacific Railroad was completed to Prince Rupert. It was largely financed by the Canadian Government, which laid out the town site of Prince Rupert at the terminus of the railroad. Prince Rupert is about 600 miles north of Seattle and within 32 miles of the Alaskan coast. It is 600 miles nearer the halibut grounds than Seattle, lying directly on the line between Seattle and the Alaskan ports and fishing banks . . . with rail connections to the eastern market . . . [and] the halibut industry was rapidly diverted to Canadian ports, especially Prince Rupert. Many of the Seattle firms were compelled to open offices at Prince Rupert; Alaskan plants were shut down and much of their business transferred to Prince Rupert."—*Congressional Record*, Aug. 25, 1915.

FIUME, "free" city-state situated at the head of Quarnero bay on the eastern side of the Gulf of Fiume, at the head of the Adriatic sea. The area of the state is about eleven square miles, including a narrow strip of coast line, which provides a road to Italian territory to the north. The population is estimated at 50,000. The city, which had attained great importance as a sea port, under Austro-Hungarian dominance, became a storm center between the Italians and Jugo-Slavs after the armistice which terminated the World War.

After the Napoleonic era, Fiume belonged alternately to Croatia and Hungary until 1870 when it became definitely a Hungarian possession, and the

kingdom's only outlet to the sea. "Fiume has a splendid harbor upon the development of which the Hungarian Government . . . spent millions. The docking facilities are of the most modern kind. Ships can tie up at the docks of Fiume and their cargoes can be stored in warehouses at terminals equal to those controlled by the Bush Terminal Company in Brooklyn. The city had every reason to look forward with confidence to a great commercial future. It is well built, with notable streets and some imposing public buildings."—F. W. Halsey, ed., *Literary Digest History of the World War*, v. 10, pp. 379.—Fiume's prosperity began when its railways made it the port of a growing hinterland. The timber of Carniola and Croatia, the corn of the Hungarian plain, English coal, colonial products, etc., go to swell a traffic which from 130,000 tons in 1869 had risen to 4,000,000 tons in 1913.

1915-1918.—Pact of London.—Allied occupations.—The secret Treaty of London (April, 1915), known as the "Pact of London" recognized by section 5th that the whole coast of Croatia, the port of Fiume and the small ports of Nevie and Carlopago shall be included in the territory of Croatia.—See also EUROPE: Modern: Political map.—The city was taken from Hungary by the allies in the World War, and its strategic commercial situation made it one of the great prizes of victory, a prize which was claimed both by Italy and the new kingdom of the Serbs, Croats and Slovenes, commonly known as Jugo-Slavia. Fiume, until its status could be definitely fixed by the Peace Conference, was nominally under the allied control as arranged by the Diaz armistice of Nov. 4, but the fact that the people of Fiume, on Oct. 30, 1918, had declared for adhesion to Italy and established a civil government, and that on Nov. 16, a strong Italian force had taken possession of the city in order to save the people from the Croats somewhat complicated matters, particularly when the French temporarily took over one of the harbors as a port of debarkation for food supplies.—See also HUNGARY: 1918: End of the World War.—"The Austrian armistice required the evacuation of the territory assigned to Italy by the pact of London, and it was occupied by Italian troops. Just before the armistice, in the confused days when Austria-Hungary was falling to pieces, the city of Fiume had proclaimed its desire to be united with Italy. The Croatians attempted to gain possession of the town for the new South Slav State which was forming, but Italian and later other Allied troops occupied it. . . . The Italians seemed willing to modify their claims to Dalmatia if Fiume, to which they had no claim under the Treaty of London, were given to them instead. The South Slavs insisted on having both Dalmatia and Fiume and a large part of eastern Istria, enough, that is, to control the main railroad to Fiume. . . . The [geographical] situation in many ways resembles the Polish outlet at Dantzic, and the proposal to make Fiume a free city under the protection of the League of Nations was soon put forward. Difficulties then arose as to the customs régime to which the town should belong, and as to the nation which should look after its diplomatic interests in other countries. England and France, though they felt bound to carry out the Treaty of London if Italy insisted, were anxious to see a compromise which should satisfy both sides."—A. P. Scott, *Introduction to the peace treaties*, p. 276-277.—See also LONDON, TREATY OR PACT OF.

1919.—Claims of Italians and Jugo-Slavs.—Arguments for each side.—At the Peace confer-

ence the Italian delegates, Orlando (prime minister) and Sonnino, made a strong claim for the city. On behalf of this claim it was argued that the majority of the population (something over half) was Italians; the education Italian. "It has always been truly Italian in its atmosphere; its architecture is Italian; its mode of outdoor life has been such as one finds in Italy; most of its stores . . . are Italian, though the best and largest before the war were kept by Austrian Jews, and most hotel-keepers and tradesmen spoke German. But it was absurd to attempt to separate Fiume from the neighboring Slavonic city, Sussak, for administrative purposes. The stream that divided them is scarcely wider than the Bronx river. A great number of the population of Sussak simply reside there and work in Fiume; Sussak bears the same relation to Fiume that Brooklyn bears to Manhattan. Surrounding hills hem in the two communities as a unit apart from the hinterland."—F. W. Halsey, ed., *Literary Digest history of the World War*, v. 10, p. 380.—As against this claim Milenko R. Vesnitch, Serbian delegate, claimed the city as necessary to the prosperity of Jugo-Slavia, and on behalf of this claim various arguments were raised. It was said that the problem of Fiume was above all economic. "Its severance from Jugoslavia would not only be an injury in which the new State could never tamely acquiesce, but would spell utter ruin for Fiume itself, since the Croats, if deprived of their chief port would have no course save to divert the railway traffic to Bucari, where they could not be interfered with. It is quite true that in five or ten years the whole problem may have been transformed, and that when the railways of Jugoslavia have been completed, Spalato will become her chief commercial outlet. But as matters stand to-day, Fiume is the only Jugoslav port which has a broadgauge railway connection with the interior, and must therefore, for a long time to come, be the chief harbour of Serbia and Croatia alike. Indeed, even if the trade of Belgrade is eventually diverted farther to the south, Fiume will always remain the chief Adriatic outlet of Zagreb, Budapest, Central and Southern Hungary, and even of Bohemia."—R. W. Seton-Watson, *Europe in the melting pot*, pp. 316, 317.—"Fiume's economic life is Jugoslav. Cut off from Jugoslavia, it is doomed to decay; while the Jugoslav State, robbed of its only real port, is condemned to vegetate and suffer, and is placed before the alternative of falling into the economic vassalage of its neighbor, or of resorting to a policy of resistance which can only end in a fresh conflict. The importance of Fiume rests above all upon the sea, the harbor, the mercantile fleet. Now, the great majority of this fleet is Jugoslav. [Croatian.] The leading shipowners, almost all the captains and officers, practically all the crews, are Croats; . . . there are no Italian companies. All the shipowner organizations are Croat. Not one of the big banks of Fiume is Italian; four are Croat, two Croat-Italian mixed, one Magyar, one Austro-Hungarian. The Italians only have municipal savings banks. All the big fortunes of Fiume are Jugoslav, not Italian. Seven-tenths of the house property there are Jugoslav. . . . This [entire] domination of the Adriatic would give Italy control of all the communications of Western Europe with Jugoslavia—not only the sea route, but the only two main railways—the Mont Cenis or Simplon route to Trieste, and the Arlberg-Pustertal route between the Brenner and Toblach, a corner assured to Italy for strategic reasons under the Treaty of London."—*La question de Fiume* (*New Europe*, Mar. 13, 1919, pp. 212-213).—See

also ITALY: 1918-1919; ADRIATIC QUESTION: Summary of arguments, etc.

1919.—Attitude of President Wilson at peace conference.—Support by Lloyd George and Clemenceau.—The Italian premier, Signor Orlando, and his colleagues, made demand for Fiume on the ground that the changed conditions made its allocation to Croatia no longer valid and rather brought it within the scope of the principle of self-determination. President Wilson strenuously opposed this demand, and on April 14, 1919, handed to Signor Orlando a memorandum which set out at length the reasons for his opposition to the Italian claim. This memorandum said in part: "It is commonly agreed, and I very heartily adhere to the agreement, that the ports of Trieste and Pola, and with them the greater part of the Istrian Peninsula, should be ceded to Italy, her eastern frontier running along the natural strategic line established by the physical conformation of the country—a line which it has been attempted to draw with some degree of accuracy on the attached map. Within this line on the Italian side will lie considerable bodies of non-Italian populations, but their fortunes are so naturally linked by the nature of the country itself with the rest of the Italian people that I think their inclusion is fully justified. There would be no justification in my judgment in including Fiume, or any part of the coastline to the south of Fiume, within the boundaries of the Italian Kingdom. Fiume is by situation and by all the circumstances of its development not an Italian, but an international, port serving the countries to the east and north of the Gulf of Fiume. Just because it is an international port and cannot with justice be subordinated to any one sovereignty, it is my clear judgment that it should enjoy a very considerable degree of genuine autonomy, and while it should be included no doubt within the customs system of the new Jugoslav State, it should nevertheless be left free in its own interest, and in the interest of the States lying about it, to devote itself to the service of the commerce which naturally and inevitably seeks an outlet or inlet at its port. The States which it serves will be new States. They will have complete confidence in their access to an outlet on the sea. The friendship and the connections of the future will largely depend upon such an arrangement as I have suggested, and friendship, co-operation, and freedom of action must underlie every arrangement of peace if peace is to be lasting. . . . These are conclusions which I am forced to by the understandings which underlie the whole situation of the present peace. . . . [The memorandum concludes by stating that by following the course thus laid out] at the very outset we shall have avoided the fatal error of making Italy's nearest neighbors on her east her enemies, and nursing just such a sense of injustice as has disturbed the peace of Europe for generations together, and played no small part in bringing on the terrible conflict through which we have just passed."—*New York Times Current History*, June, 1919, p. 411.—On April 23, 1919, President Wilson issued an emphatic declaration that he would not yield on the Fiume question. He referred to the "Fourteen Points" and particularly to Numbers 9 and 10. "A readjustment of the frontier of Italy [he said] should be effected along clearly recognizable lines of nationality," (Number 9) and "Serbia [should be] accorded free and secure access to the sea," (Number 10)—principles which were proclaimed before the entire dissolution of the Dual Monarchy was contemplated. "If those principles are to be adhered to Fiume must serve

as the outlet of the commerce, not of Italy, but of the land to the north and northeast of that port. Hungary, Bohemia, Rumania, and the States of the new Yugoslav group. To assign Fiume to Italy would be to create the feeling that we have deliberately put the port, upon which all those countries chiefly depend for their access to the Mediterranean, in the hands of a power of which it did not form an integral part, and whose sovereignty, if set up there, must inevitably seem foreign, not domestic or identified with the commercial and industrial life of the regions which the port must serve. It is for that reason, no doubt, that Fiume was not included in the Pact [Treaty] of London, but was definitely assigned to the Croats. And the reason why the line of the Pact of London swept about many of the islands of the eastern coast of the Adriatic and around the portion of the Dalmatian coast which lies most open to that sea was not only that here and there on those islands, and here and there on that coast, there are bodies of people of Italian blood and connection, but also, and no doubt chiefly, because it was felt that it was necessary for Italy to have a foothold amid the channels of the Eastern Adriatic in order that she might make her own coasts safe against the naval aggression of Austria-Hungary. But Austria-Hungary no longer exists. It is proposed that the fortifications which the Austrian Government constructed there shall be razed and permanently destroyed. It is part also of the new plan of European order which centers in the League of Nations that the new States erected there shall accept a limitation of armaments which puts aggression out of the question. There can be no fear of the unfair treatment of groups of Italian people there, because adequate guarantees will be given, under international sanction, of the equal and equitable treatment of all racial or national minorities."—*New York Times Current History, June, 1919, pp. 405, 406.*

In his reply, Premier Orlando declared that the Italian claim was based on the principles of President Wilson's "Fourteen Points." Citing the president's argument that the concessions granted bring Italy to its natural defenses, the Alps, he said in rebuttal, "This problem is that of the Adriatic in which is summed up all the rights of both the ancient and the new Italy, all her sufferings throughout the centuries and all the benefits she is destined to bring to the great international community." The Presidential message affirms that with the concessions which she has received, Italy would attain the walls of the Alps, which are her natural defences. "This recognition is of great importance, provided that the eastern flank of this wall does not remain open and that the right of Italy should be interpreted to include the line of Monte Nevoso, north and west of Fiume, which separates the waters running toward the Black Sea and the Mediterranean. [Monte Nevoso was awarded to Italy by the Treaty of Rapallo.] Without this protection a dangerous breach is left in this admirable barrier of the Alps, rupturing the unquestionable political, economic, and historical unity of the Istrian Peninsula. I contend, furthermore, that he who is entitled to the honor of proclaiming to the world the right of the free determination of peoples should recognize this right for Fiume, an ancient Italian city which proclaimed its Italian nature before the Italian ships arrived—an admirable example of national consciousness perpetuated throughout centuries. To deny this right only because of the small number concerned would mean the admission that the criterion of justice toward peoples

varies according to their territorial extent."—*New York Times Current History, June, 1919, p. 408.*—A meeting between the British, French and Italian premiers and President Wilson was arranged by Lloyd George, with the hope of settling the dispute, but the discussion was fruitless, and the Italian delegates withdrew from the conference on April 21, 1919.—Lloyd George "supported President Wilson in the difference with Italy over Fiume, and Clemenceau supported both. But he always hoped to effect a settlement by persuasion. When President Wilson had made up his mind to issue an appeal to the Italian nation, Mr. Lloyd George persuaded him to agree to a postponement of twenty-four hours. President Wilson kept precisely to his promise. But it unfortunately happened that, just as the twenty-four hours expired, delicate negotiations were proceeding between Orlando and Mr. Lloyd George, and there were still hopes of a settlement. The appeal was published in the afternoon papers of Paris, and its immediate effects were to offend the Italian delegates, throw them back on to the point of honor, and drive them out of the Peace Conference. President Wilson acted with his usual high and simple honesty; but in this case, at any rate, if the aim was peace, open diplomacy did not score a conspicuous triumph."—H. Spender, *Prime minister, pp. 294-295.*—The expectation was that "under the arrangement of the Pact of London (by which the principal Allies [Russia pledging particular help to Italy] agreed each and severally not to conclude a separate peace) the further progress of negotiations with Germany would be impossible. It was to meet this contention that in a protocol to the actual Treaty [of Versailles] subsequently presented, it was laid down that the Treaty should come into operation so soon as it has been ratified by Germany and any three of the five principal Allies. The withdrawal of the Italian delegates from Paris was not of long duration, and Signor Orlando and his colleagues returned on May 5 [1919] to negotiate. Agitation, however, continued violent in Italy, notwithstanding a large number of proposals which were put forward in the hope of meeting a difficult case. On June 20 [1919 the Orlando] . . . government fell. Signor Nitti, who became premier on June 23, included in his party some members of the Giolitti party, which before Italy came into the war, had stood for the maintenance of neutrality. The German Treaty was signed and the Fiume question still left in abeyance even after the further Treaty [St. Germain] had been presented to Austria."—*Hazell Annual and Almanack, 1920, p. 710.*—See also PARIS, CONFERENCE OF: Courses of discussion.

1919.—Conflict between French and Italian troops.—In July a quarrel occurred between the French and Italian troops in the city. "Italian accounts deal principally with the cause—the tearing up of an Italian flag and other insults alleged to have been inflicted by French soldiers on Italian soldiers and Italo-Fiumeians. The French accounts, including that of an American correspondent, deal with an unprovoked attack by a mob and [by] Italian soldiers and sailors, more or less under orders, upon the French compound, and the slaying there of half a dozen French Asiatics and the wounding of twenty. The day after the riot General Savy, the commander of the French troops at Fiume, described the affair in the *Giornale D'Italia* as 'most deplorable,' and added that it would be a 'mistake to generalize and make the fault of a few that of the whole French contingent.' The same day the National Council of Fiume passed a resolution asking the withdrawal

of the French troops, as their presence endangered friendly Franco-Italian relations."—*New York Times Current History*, Aug., 1919.

1919-1921.—Seizure by D'Annunzio.—Dictatorship.—Made an independent state by the Treaty of Rapallo.—Provisional government.—"It is understood that an arrangement [of the Italian-Jugo-Slav dispute] had almost been reached when a dramatic stroke threw everything into confusion once more. On September 17, 1919, Gabriele D'Annunzio, the Italian poet and soldier, who had been fervently pressing the extreme nationalistic claims, persuaded some Italian troops to seize Fiume in the name of the annexationist cause. No one dared to put a forcible end to his comic-opera adventure for fear of causing a popular uprising in Italy."—A. P. Scott, *Introduction to peace treaties*, p. 277.—Two days before the seizure, D'Annunzio, "on September 15th, supported by a force of *Arditti*, went to Fiume and proclaimed a union of the city with Italy. Fiume thus

GABRIELE D'ANNUNZIO

became plunged into a state of anarchy. British and French troops left the city, lowering their flags at D'Annunzio's request. . . . By September 19th D'Annunzio's army had increased to over 11,000, including 1,600 volunteers from Trieste, and Fiume was ablaze with flags, her streets filled with marching soldiers and her air vibrant with the confidence felt by men who, under the command of D'Annunzio, had marched into the city and were able firmly to hold it. Soldiers were to be seen everywhere. Motor-trucks lurched through the streets carrying armed men from one point to another, and hundreds of troops could be seen at any hour marching with the greatest precision and the strictest military discipline."—F. W. Halsey, ed. *Literary Digest history of the World War*, v. 10, pp. 378-379.—The environs of the city and district and some of the neighboring islands also fell in possession of D'Annunzio, who called himself "Rector of the Regency of the Quarnero" and declared Fiume an independent state of which he remained in possession until December, 1920. Meantime the governments of the two countries were endeavoring to make a direct settlement, and an agreement

was reached on November 10. "On November 12, [1920] at Rapallo, a little winter resort near Genoa, a treaty [was signed] between Italy and the kingdom of the Serbs, the Croats, and the Slovenes, which settled their differences as to the Adriatic. By this treaty Fiume with a small strip running along the gulf, becomes independent. Thus far, we might be in Paris instead of at Rapallo. But the Wilson line in Istria becomes a thing of dreams. Not only do the Italians get a frontier touching that of Fiume; not only do they get all of Istria; but the line near Laibach goes even east of the line of the Pact of London, making a strategic frontier even more strategic than before."

—D. H. Miller, *Adriatic negotiations at Paris (Atlantic Monthly, Aug., 1921)*.—See also RAPALLO, TREATY OF (1920).—D'Annunzio "vehemently denounced the treaty. When it became evident that Italy intended to enforce . . . [its] terms D'Annunzio on December 3 condemned the government as traitorous and declared war on Italy. After considerable parley with the obdurate poet, Fiume was bombarded on December 27, 1920, by Italian regulars. . . . [The city authorities accepted the government edict on December 20] and D'Annunzio after expressing his disappointment that the people of Italy had not rallied to his standard, departed, January 18, for Paris. Elections to a constituent assembly . . . held April 24, [1921] resulted in the defeat of the Nationalists."—*Political Science Quarterly, Supplement, Sept., 1921*.—"The Rome government endeavored to regain authority by the institution of a blockade, but the strong feeling in the Italian nation and army, over whom d'Annunzio had established a popular hold, made action on its part extremely difficult. On November 14, d'Annunzio, evading the blockade, made a further raiding visit to Zara and even persuaded Admiral Millo to put the ship *Zeffiro* at the disposal of the committee of the inhabitants, in order that they too might proceed to Fiume."—*Hazell Annual and Almanack, 1920, p. 710*.—The *Zeffiro*, however, remained under government control, although some other Italian boats as well as several bodies of troops went over to D'Annunzio. A month later owing to terrorism on the part of some brigands, former D'Annunzio followers, the leader of the autonomists, Riccardo Zanella, formed his government at Buccari, on the Jugo-Slav side of the bay. In October, 1921, Zanella was elected president of the state, by the constituent assembly.

1922 (March).—Overthrow of provisional government by Fascisti.—Trouble was again brewed in Fiume in 1922 by the Italian Fascisti, and as the result of severe fighting on March 3 (when the government palace was bombarded) the provisional government retired to Jugo-Slav territory. "Order was maintained by Italian carabinieri, and the Italian government was asked to take over the administration. . . . The Italian Government's attitude was that though it realized the delicacy of the situation, . . . it was in honor bound to execute the terms of the treaty with Jugoslavia. The first step taken by the Cabinet was to send Italian troops to the city to make sure that there should be no further outbreaks. Some 500 carabinieri were sent on March 5 to reinforce the carabinieri already on the ground. . . . [Riccardo Zanella, the president] by this time had been taken away on a torpedo boat. . . . On March 17 the Italian Government ordered the occupation of Fiume by Italian troops, as a decisive step toward fulfilling its promises under the Treaty of Rapallo."—*New York Times Current History, Apr., 1922, pp. 169, 170*.

**FIVE HUNDRED**, Council of the lower house of the French legislature created in 1795. See FRANCE: 1795 (June-September).

**FIVE MEMBERS**.—As an act of vengeance against the leaders of the parliamentary opposition, King Charles I attempted to arrest and impeach five members of the House of Commons for high treason. See ENGLAND: 1642 (January).

**FIVE-MILE ACT**, act passed in England in 1665; directed against Nonconformist clergy who were forbidden to teach or come within five miles of a city or corporate town unless they took the oath of non-resistance. See ENGLAND: 1662-1665.

**FIVE NATIONS OF INDIANS**.—The five original tribes of the Iroquois confederacy,—the Mohawks, Oneidas, Onondagas, Cayugas, and Senecas,—were commonly called by the English the Five Nations. Subsequently, in 1715, a sixth tribe, the Tuscaroras, belonging to the same stock, was admitted to the confederacy, and its members were then known as the Six Nations. See IROQUOIS CONFEDERACY: Tribes of the south; HIAWATHA; NEW YORK: 1684.

**FIVE THOUSAND**, Athenian assembly. See ATHENS: B. C. 413-411.

**FLACIUS, Matthias**, surnamed Illyricus (1520-1575), German Lutheran theologian. See HISTORY: 23.

**FLAGELLANTS**.—"Although the Church's forgiveness for sin might now [fourteenth century] be easily obtained in other ways, still flagellation was not only greatly admired among the religious, but was also held in such high estimation by the common people, that in case of any calamity or plague, they thought they could propitiate the supposed wrath of God in no more effectual manner than by scourging, and processions of scourgers; just as though the Church's ordinary means of atonement were insufficient for extraordinary cases. . . . Clement VI. put an end to the public processions of Flagellants, which were already widely prevalent: but penance by the scourge was only thus forced into concealment. . . . Thus there now rose heretical Flagellants, called also by the common name of Beghards. . . . When the Whitemen (Bianchi) [see WHITE PENITENTS], scourging themselves as they went, descended from the Alps

into Italy, they were received almost everywhere with enthusiasm by the clergy and the people; but in the Papal territory death was prepared for their leader, and the rest accordingly dispersed themselves."—J. C. L. Gieseler, *Compendium of ecclesiastical history*, v. 4, sect. 123.—"Divided into companies of male and female devotees, under a leader and two masters, they stripped themselves naked to the waist, and publicly scourged themselves, or each other, till their shoulders were covered with blood. This expiatory ceremony was repeated every morning and afternoon for thirty-three days, equal in number to the years which Christ is thought to have lived upon earth. . . . The Flagellants appeared first in Hungary; but missionary societies were soon formed, and they hastened to impart the knowledge of the new gospel to foreign nations. . . . A colony reached England, and landed in London. . . . The missionaries made not a single proselyte."—J. Lingard, *History of England*, v. 4, ch. 1.

**FLAGLER, Henry M.** (1830-1913), American capitalist interested in developing the east coast of Florida, and in the extension of railway there. See FLORIDA: 1885-1915; RAILROADS: 1912-1915.

**FLAGS: Origin**.—A search for the origin of national flags brings us back to very early times when sacred emblems were carried before the host on the march or in battle as a protection and a guide. "The earlier national symbols were ordinary images or badges wrought in metal, stone or wood, and carried at the top of a pole or spear. Thus the host of Egypt marched to war beneath the sacred emblems of their gods or the fan of feathers of the Pharaohs. . . . The Greeks in like manner used symbols of their deities such as the owl of Athens . . . though Homer makes Agamemnon use a purple veil as a rallying signal. The sculptures of Persepolis show us that the Persians adopted the figures of the sun, the eagle and the like which in time were replaced by the blacksmith's apron. In Rome, the original standard was . . . [a] simple wisp of straw. . . . Under the later Dictators this gave place to a hand erect; or the figure of a horse or wolf or other animal was used until the eagle alone was adopted. . . . The vexillum or cavalry flag was according to Livy a square piece of textile material fixed to a cross-bar at the end of a spear, often richly fringed and either plain or with devices, and was undoubtedly a flag. . . . Later on the Romans adopted for their auxiliaries the dragon of Parthia which in time became the standard of the Emperors of the West and the origin of the golden dragon of Wessex and the red dragon of Wales. The Jutes carried the rampant white horse, at first as an image, which became the flag of the Men of Kent; the Danes carried the raven, also at first as an image and then as a flag which when captured in 878 was a small triangular banner, fringed, bearing a black raven on a blood-red field. The Gauls fought under a carved lion, bull or bear until they adopted the Roman eagle. The Imperial Standard or Labarum of Constantine [the Great] and his successors resembled the cavalry vexillum. It was of purple silk richly embroidered with gold, and, though generally hung from a horizontal cross-bar like that we now know as a banner, was in later days occasionally displayed in accordance with present usage by attaching one of the sides to a staff—a style adopted from the Saracens. The Roman standards were guarded with religious veneration in the temples of the chief cities, and, after Christianity was adopted, and particularly after the emperor's portrait appeared on them, in the churches; and modern practice follows ancient

precedent. At the presentation of colours to a regiment a solemn service of prayer and praise is held . . . and when they return in honour, . . . [in most countries] they are reverently deposited in some church or public building, such as the forty in Edinburgh cathedral, never to be removed until nothing is left but the staff on which they were borne. . . .

"The sacred standard of the Turks, fabled to have been given to Mohammed by the Angel Gabriel, was used by the prophet as a curtain which, when he was lying, was torn down by Ayesha and given by her to serve as the chief banner of Islam, and it is still preserved, being of green silk on a pole surmounted by a golden hand that holds a copy of the Kôran. Pope Alexander II sent a consecrated white banner to William of Normandy previous to his expedition against Harold, and the Normans fought under it at Hastings; and when the armies of Christendom went forth to rescue the Holy Land from the infidel they received their banners from the foot of the altar. . . . Banners . . . were formerly part of the usual ornaments of the altar and are still largely used to add to the pomp of religious processions. Heraldic and political devices upon flags are of later date, and even when these came freely into vogue they did not supplant ecclesiastical symbols. [The pennons and standards of the knights and barons in feudal times were carried in battle as guides to their men and rallying points, or flown from castles and fortresses to show whether they were held by friends or enemies.] The banners of the original orders of Knighthood belong to the religious group. . . . The Templars carried before them to battle a banner black over white horizontal which they called Beauséant 'because they were fair and favourable to the friends of Christ but black and terrible to His enemies.' The Teutonic Knights bore the black cross patée on a white field which survives in the Iron Cross [of Prussia]."—W. J. Gordon, *Flags of the world*, pp. 2-4, 6.

In the Middle Ages, a simple knight carried on his lance a long fluttering pennon, which bore his device. If he were honored by being made a banneret on the field, the ends were torn off by the commander-in-chief, and the square banner handed back to be preserved as a token of the honor done him. The guidhomme, our guidon, was also pennon shaped; but the banner of all above the rank of banneret was square. Guidons were used as guides for large bodies of mounted men. The size of pennons, banners and standards was carefully prescribed. Thus the pennon of the knight was two and a half yards long; the banner of the banneret the square of the pennon with its tails torn off—bannerets, it is said, were first created in the fourteenth century; the banner of the baron was three feet square, while the standard of a king was five feet square, and that of an emperor six feet square. "The old badge of the Percies was the white lion statant. . . . The guilds and companies of the Middle Ages had all their special banners that came out, as do those of their successors, on occasions of civic pageantry; and in many cases, as shone in the illuminated MSS. in the British Museum and elsewhere, they were carried to battle by the companies of men provided at the cost of those corporations."—*Ibid.*, p. 20.—In later times each regiment of soldiers, following this ancient custom, adopted a distinctive flag, the "regimental color" to be carried with the national flag. Both colors were carried into battle under care of the color guard, and many inspiring tales have been handed down in the histories of regiments of deeds of valor done and lives lost to save the colors. But

during the South African war it was found that the colors made so good a mark for modern long distance arms of precision that their use in warfare was discontinued. Colors are now deposited in a place of security when the regiment goes to war, as when, during the World War, American flags were hung in St. Paul's Cathedral with reverent ceremony, and kept there while the army was in France. Aerial observation makes the use of flags, even at headquarters, highly dangerous, and in the World War commanders of all grades were forced to deny themselves the honor of displaying their colors. "The first legal and international obligation on record to carry colours at sea appears to have been agreed upon at the Convention of Bruges when Edward I and Guy, Count of Flanders, undertook that their respective subjects should 'for the future carry in their ensigns or flags the arms of their own ports certifying their belonging to the said ports,' but the Cinque Ports had carried colours for many years before, and a sort of code of flag etiquette was already in existence."—*Ibid.*, p. 32.

"In its earlier form as a flag the Standard was long and tapering with fringed or bordered edges and split rounded ends. It generally bore its possessor's badge and motto, and varied in size according to his rank. Too large to be carried into battle, it was generally used to mark the actual position of its owner on ceremonial occasions. The term Standard now correctly means the personal flag of the [ruler of any state]."—*Ibid.*, p. 4.

It is from the standard, however, that national flags and their present day use have originated. The standard of the king became associated with his person, as a symbol of his sovereignty. But as the idea of sovereignty was transferred from the person of the king to the state, by a natural process of thought, the flag which had been adopted as a national emblem became the symbol of the state itself, and the object of patriotic fervor. In the flags of some of the nations, some of the king's devices are still shown, in others, entirely new designs have been chosen.

**Austria.**—The old standard of imperial Austria-Hungary had a yellow ground, surrounded by flames, represented by a black border, or tressure, dented red and white. The arms were the black double-headed eagle, of the Holy Roman Empire, surmounted by the crown of Austria, bearing in its claws the sword and scepter and the orb, and on its wings the arms of the provinces. A shield on its breast carried insignia to represent the houses of Hapsburg and Lorraine, and the arch-duchy of Austria, the whole being surrounded by the colors of the Golden Fleece and of Maria Theresa. The imperial ensign was composed of three horizontal stripes, red on white on red, with the arms of Austria and Hungary imposed side by side on the white. In 1869, the outer half of the lower stripe was colored green, the Hungarian tri-color, to symbolize the union between the countries. When the union was broken, and Austria became a republic, the green color was dropped, the royal arms dispensed with, and the national flag is now a simple ensign of three horizontal stripes, of equal width, in two colors—red on white on red.

**Belgium.**—Belgium flies the vertical tricolour, black, yellow, red, the old colours of Brabant. With the royal arms, of which the shield is the golden lion on black of Brabant, this is the standard; without the arms, it is used by both warships and merchant vessels."—W. J. Gordon, *Flags of the world*, p. 238.

**Brazil.**—"In the imperial days [of Brazil] the flag was green with a yellow diamond as now and

a shield flanked with sprigs of coffee and tobacco. Crown, shield and sprigs have gone, and in their place is a blue celestial globe, once an armillary sphere, with a white equator on which is written 'Ordem e progresso,' the globe sprinkled with stars [to represent the constellation of the Southern Cross]. The Brazilian badge is the Southern Cross, yet again, in the centre of a . . . five-pointed star of yellow and green; [surrounded by sprays] begirt by twenty-one [silver] stars in its complete form [the constellation on blue] as borne by the president is centered in his standard which is green, and besides the badge displays the date '15 de Novembro de 1889.'—W. J. Gordon, *Flags of the world*, p. 208.—The badge is borne on an upward-turned sword. The stars represent the provinces and the city of Janeiro.

**British Empire and dominions.**—"The Royal Standard [of the British empire] is the symbol of the personal tie that unites the British power throughout the world under one King. In it the three golden lions stand for England, the red lion rampant for Scotland, the golden harp for Ireland, being the three States of the United Kingdom from which the empire grew. . . . How the three lions of England arose is not clear as it might be. . . . The first unquestionable example of an heraldic device is that of a demi-lion rampant on the seal of Philip I, Count of Flanders, in 1164, and the first English shield of arms is that of Geoffrey Magnaville, Earl of Essex, in 1165. Both these are in the reign of Henry II, and so late as that monarch the royal bearing is still traditional when it is said that on his marriage with Eleanor of Aquitaine and Guienne he incorporated with his own two lions the single lion of his father-in-law. During his crusading experiences *Cœur-de-Lion's* banner bore 'two lions combattant or [gold],' as appear on his first great seal; but on his second great seal we have the 'three lions passant guardant, in pale or, on a field gules [red,]' which have been described as his father's arms. The date of this seal is 1105. . . . The rampant lion was borne by William the Lion [of Scotland] about 1165, and, within the tressure [border], is first seen on the Great Seal of King Alexander II, who married the daughter of King John. The same device without any modification of colour or form was thenceforward borne by all the Sovereigns of Scotland, and on the accession of James to the throne of the United Kingdom, in the year 1603, became an integral part of the Royal Standard. . . . An early standard of Ireland has three golden crowns on a blue field, and arranged over each other as are the English lions; and a commission appointed in the reign of Edward IV, . . . reported in favour of the three crowns. . . . Henry VIII substituted the harp on the coins, [and this was added to the Royal Standard in] the reign of James I. . . .

"And now for the National Flag, . . . [which with added emblems is used throughout the empire, except in the Irish Free State]. The Cross of St. George was worn as a badge, over the armour, by every English soldier in the fourteenth century, if the custom did not prevail at a much earlier period. . . . On the union of the two crowns at the accession of James VI of Scotland to the English throne, the Cross of St. Andrew was combined with that of St. George, but the English ships still flew the red cross in the foretop and Scottish ships the white cross. The Cross of St. Andrew is a saltire, that is, it is shaped like the letter X. . . . On the blending of the two kingdoms into one under the sovereignty of King James, it became necessary to design a new flag that should typify this union, and blend together the emblems of the

two patron saints—the flag of the united kingdoms of England and Scotland, henceforth to be known as Great Britain. . . . The ordinance for the reunion of Scotland with England and Ireland was promulgated on April 12th 1654. In the first flag following that ordinance, England and Scotland were represented by the crosses of St. George and St. Andrew, and Ireland by a golden harp on a blue ground. . . . The harp, however, seemed quite out of place in this flag, and another was tried in which St. George was in the first and fourth, St. Andrew in the second, and the red saltire on white daringly placed in the third as representing Ireland. This was a most unsatisfactory arrangement for visibility at sea, and the old Union was reverted to, but as Ireland was not shown on it, a golden harp was placed in the centre, and at the Restoration the harp was removed and the flag became as it was at the death of Charles I. And such it remained until the union of Ireland with Great Britain in 1801 when a new Union Flag had to be devised in which some emblem of Ireland had to be introduced; and for this purpose the . . . cross of St. Patrick was added. . . . The dimensions of the Union Flag are officially given as follows:—in the St. George's Cross the red cross is one fifth the width of the flag and its white borders one fifteenth the width of the flag, that is one third the width of the red cross; in the St. Andrew's and St. Patrick's Crosses the red is one fifteenth the width of the flags, or one third the width of St. George's Cross, that is equal to the border of that cross, the narrow white border is one thirtieth the width of the flag, or one sixth the width of the red of St. George's Cross, the broad white border is one tenth the width of the flag, or one half the red of St. George's Cross, and therefore equal to the red and narrow white together. . . . There are three British ensigns, the white, the blue, and the red; the white ensign, the white flag with the red cross of St. George and the Union in the upper canton, being distinctive of the Royal Navy [the fighting flag]."—W. J. Gordon, *Flags of the world*, pp. 37-39, 41, 46, 49, 51, 53, 59, 60, 64, 65.—The blue ensign is borne by ships of the naval reserve, or ships of the merchant marine, commanded by naval reserve officers. The red ensign is borne by all other merchant ships. The red ensign has also been practically adopted by the dominions as the national flag, each dominion having its own badge surrounded by a wreath in the fly, or, in the case of the governor-generals, superimposed on the intersection of the crosses. The blue ensign is used on government ships.

**Canada.**—"The arms of Canada, appearing on the Dominion flag will be found to consist of those of Ontario, Quebec, Nova Scotia and New Brunswick combined, and date from 1860. It is owing to this fact that the other provinces find no place there; their . . . [entrance into the confederation] being subsequent to that date."—*World's flags at a glance*, p. 7.

**China.**—For centuries, China used the five clawed imperial dragon as its emblem. The Chinese color was yellow, and the standard showed a blue dragon on a yellow ground, devouring a red sun. At the overthrow of the empire, the navy adopted a red ensign, with a large rayed sun in white on a blue canton. The merchant flag, which also does duty as a national flag, has five horizontal stripes, red on yellow, on blue, on white, on black, to represent China, Manchuria, Mongolia, Tibet and Turkestan. The army flag has a black, eight-pointed star, tipped with golden balls, centered on a red field. In the center is a golden

disk, surrounded by eight others, one for each point of the star.

**Czecho-Slovakia.**—Czecho-Slovakia, which obtained its independence in 1918, adopted an interesting flag, in which a blue peak, the emblem of the Carpathians, is based on the hoist end of the fly, and let in on the Bohemian colors—two broad stripes, white over red. For its coat of arms, it kept the arms of Bohemia, on which are quartered the shields of the other states of the republic.

**Denmark.**—“The Danish ensign is . . . swallow-tailed, and the white cross is not tapered out into a point but ends squarely, the inner edges of the red tails leading off from the upper and lower edges of the bar. This is the Dannebrog, one of the oldest national flags in continuous use. In the year 1219, King Waldemar of Denmark . . . saw, a white cross in the red sky. He was then leading his troops to battle against the pagan Livonians, and gladly welcomed such an assurance of celestial aid in answer to his prayers, and as soon as could be, adopted it as his country's flag under the well-known name which signifies the strength of Denmark. The Danish merchant flag is rectangular, with the bar of the cross longer towards the fly than towards the hoist.”—W. J. Gordon, *Flags of the world*, p. 237.

**Egypt.** See EGYPT: 1922 (April-September).

**Finland.**—The flag adopted by Finland, when she declared her independence in 1917, is a white swallow-tailed ensign, with an upright cross of dark blue upon it. The flag of the merchant marine is oblong without the crest.

**France.**—“The early history of the French flag is lost in obscurity, and it is not always easy to trace the various modifications that it has undergone. At the earliest date of which we have record we find the kings of the Franks marshalling their forces under the plain blue flag known as the Chape . . . [or cape of] St. Martin. . . . The Chape de St. Martin was originally in the keeping of the monks of the Abbey of Marmoutiers, and popular belief held it to be a portion of the actual blue cloak that the legend affirms the Saint divided with the beggar suppliant. . . . We find it borne by Clovis in the year 507 against Alaric, and again by Charlemagne at the battle of Narbonne; and time after time it led the hosts of France to victory. When the kings of France transferred the seat of government to Paris, the great local Saint, St. Denis, was held in high honour, and the scarlet flag [the oriflamme] of the Abbey Church of St. Denis gradually ousted the blue flag of St. Martin, and [by the tenth century] ‘St. Denis’ became the war-cry of France. . . . The ‘Chronique de Flandre’ describes . . . [the flag] as having three points and tassels of green silk attached thereto, while an English authority says, ‘The celestial auriflamb, . . . [was] a square redde banner.’ Du Cange . . . affirms that it was simple, ‘sans portraiture d’oultre affaire’ . . . —a plain scarlet flag. The last time that the sacred ensign was borne to battle was at Agincourt. . . . The precise date when the golden fleurs-de-lys were added to the blue flag [of St. Martin] is open to doubt, but we find the form at a very early date, and from the first recognition of heraldic coats of arms this blazon was the accepted cognizance of the kings of France. . . . Originally the fleurs-de-lys were powdered . . . over the whole surface, but in the reign of Charles V., A. D. 1365, the number was reduced to three. The meaning of the fleur-de-lys has given rise to much controversy; some will tell us that it is a lily flower or an iris, while others affirm that it is a lance-head. . . . The lilies were held for centuries in great favour; and the fleur-

de-lys did not finally disappear from the flag of France until the downfall of Louis Philippe in the year 1848. . . . The whole history of the flag prior to the Great Revolution, is somewhat confused, and in the year 1669, which we may consider about the middle of the Bourbon or white flag period, [white was the color of the Bourbons] we find the order given by the Minister of the Marine that ‘the ensigns are to be blue, powdered with yellow fleurs-de-lys, with a large white cross in the middle.’ Merchant ships were to wear the same flag as the ships of war except that in the canton corner was to be placed the device of their province or town. Before the end of the year . . . [new decree ordered] that ‘the ensigns at the stern are to be in all cases white,’ while the merchants were to fly the white flag with the device of the port in the corner. The white flag was sometimes plain, . . . and at other times provided with yellow fleurs-de-lys. On the restoration of the Bourbons in 1814, . . . the white flag was again the flag of the nation, and remained so until 1830, its last appearance in France. . . . The well-known tricolor of France . . . dates from the era of the Revolution and came into existence in 1789. It has, with the exception of the short Bourbon Restoration, been the flag of France for over a century, and it remains so to this day, though it underwent some few modifications ere it settled down to the present form. Thus, for instance, on October 24th, 1790, it was decreed that the colour next the staff was to be red, the central strip white and the outer blue, but on February 15th, 1794, it was ordered that . . . ‘the national flag shall be formed of the three national colours in equal bands placed vertically, the hoist being blue, the centre white, and the fly red.’ . . . During the first and second Empire the Imperial Standard was still the tricolor, but it bore in the centre of the white strip the eagle; and all three strips were richly diapered over with the golden bees of the Napoleons. The national flag was the tricolor pure and simple, both for the Imperial and the Commercial Navy. As the flags of the army were borne on staffs surmounted by a golden eagle, the term ‘eagle’ was often applied to these colours.”—F. F. Hulme, *Flags of the world*, pp. 105-109.

**Germany.**—“In October, 1867, the North German Confederation originated the first German national flag, three stripes, black, white and red, horizontal, in which the red represents the old Hansa. In January, 1871 . . . the imperial flags were introduced, the merchant flag remaining as it was and forming the upper canton of the black-cross white ensign, the cross in the canton, as on the jack, being the iron cross, as we now know it, of the old Teutonic Knights, the ‘Teutsch Ritterdom,’ as Carlyle says, ‘which flamed like a bright blessed beacon through the night of things in those northern countries’ when ‘the Prussians were a fierce fighting people, fanatically Anti-Christian.’ The same cross, with its bars a little less incurved, is the principal feature of the standard, which, like the presidential flags of several of the American republics, bears on it the date of its origin.”—W. J. Gordon, *Flags of the world*, pp. 230-240.—To the old merchant flag the German republic added a “union” of three bars, black, red, yellow, the colors of the revolutionists in 1848.

**Greece.**—“The Greeks adopted pale blue and white as a compliment to the Bavarian prince who, in 1833, was . . . [the] first king, but when the Bavarian influence departed the colour became dark blue. The standard is a white rectangular cross on dark blue with the royal arms in the centre, the shield of which has the Danish giants as

supporters, and bears on its dark blue field a prominent white rectangular cross, so that it looks like a miniature copy of the flag. The ensign has nine horizontal stripes, of which five are dark blue and the others white, and in the canton is a reproduction of the standard with a crown taking the place of the arms, the merchant flag being without the crown."—W. J. Gordon, *Flags of the world*, pp. 234-235.

Italy.—"The badge of Italy is a white cross on a red field [the bars of which extend to the edges of the shield]. . . . The Savoy cross is the centre of the Italian standard, . . . it is the centre of the national flag, and it was the nucleus of modern Italy. . . . Italy had been a kingdom before under Napoleon with Eugène Beaubarnais as his viceroy, and Napoleon designed the flag for it, a tricolour of green, white and red, vertical. . . . In 1848 this flag, which had been withdrawn on the downfall of the emperor, was hoisted again by the nationalists of the peninsula, being accepted by the King of Sardinia as the ensign of his own dominion, and charged by him with the arms of Savoy. Thus Italy regained the old tricolour for its merchant flag, which would be as Napoleon left it, were it not . . . [that Mexico adopted the same colors, and as a distinction the Italian merchant flag] bears the Savoy shield without a crown. The ensign has the crown. The jack is square, being a white cross on red with a broad blue border taking the place of the border of the shield"—W. J. Gordon, *Flags of the world*, pp. 232-233.

Japan.—"Japan has always been happy in its choice of flags, and as the Japanese captured Korea in the first century of our era their history is a long one; indeed it is said to begin in 600 B. C. The standard is the golden chrysanthemum of sixteen rays, that of the emperor being rectangular, that of the empress swallowtailed, that of the crown prince [also rectangular] with the flower in a white frame. Japan is the land of the rising sun, and the sun as a plain red ball on a white field is its . . . merchant flag."—W. J. Gordon, *Flags of the world*, p. 217.—The ensign is the rising sun in red, with radiating rays, set a little to the left of the center of a white field.

Jugo-Slavia.—The flag of the kingdom of the Serbs, Croats and Slovenes, commonly known as Jugo-Slavia, is the Serbian flag, a variation of the red, white and blue tri-color—blue on white on red, in horizontal stripes of equal width. This flag, under which Serbia fought throughout the Balkan Wars and the World War, was adopted in the union of 1918.

Mexico.—"Mexico has had many flags, home and foreign, but the green, white and red tricolour it flies now was simply taken from the Italians because it looked pretty, and the meaning for it found afterwards. Italy protested unavailingly; but as Mexico declined to change, she placed the shield of Savoy without the crown in the white stripe of the Italian merchant flag, the shield with a crown having already been used in the ensign; and to this the Mexicans replied by placing on their warship flag the eagle and snake, the eagle standing on a prickly pear. Thus the Mexican merchant flag is the Italian flag without the Savoy shield."—W. J. Gordon, *Flags of the world*, p. 201.

Netherlands.—"Holland [or the Netherlands] came into existence as an independent state in 1570, when the Dutch adopted as their flag the colours of William, Prince of Orange, their famous leader—orange, white and blue. At first there was great latitude of treatment, the number of bars of each colour and their order being variable, but in

1599 it was officially fixed that the flag of the Netherlands was to be orange, white and blue in three horizontal stripes of equal width. How the orange came to be changed to red is not yet known, but . . . the Dutch flag in 1643 was the tricolour we know of—red, white and blue [in horizontal bars]. During the French Revolution, when Holland became the Batavian Republic under the French, the naval flag had in the upper canton a figure of Liberty on a white field, but the innovation was not popular [and soon disappeared]."—W. J. Gordon, *Flags of the world*, pp. 237-238.

Poland.—The new republic of Poland adopted in 1918 a flag of white and red horizontal stripes. Centered in the upper half is a red shield, emblazoned with a crowned white eagle. The stripes have taken the place of the blue St. Andrew on a white field, which was formerly used.

Portugal.—"As a republic [Portugal] retains as its 'emblem' the arms of the monarchy, the simple and effective device of the seven castles and five shields. The shields commemorate the great victory of Alfonso Henriquez in 1139 over the five Moorish princes at the battle of Ourique, while the five white circles placed on each symbolize the five wounds of the Saviour in whose strength he defeated the infidels and became the first king of Portugal. The scarlet border with its castles was added by Alfonso III after his marriage in 1252 with the daughter of Alfonso the Wise, King of Castile. These arms have been unaltered for centuries. . . . The republican ensign is green and red vertical with the shield framed in an armillary sphere, such as used to appear on the Braganza arms of Brazil; and in this ensign the Portuguese have taken a hint from the French and made the red larger than the green."—*Ibid.*, pp. 30, 231.

Russia.—"On the Russian [imperial] standard the introduction of the black two-headed eagle dated back to the year 1472, when Ivan the Great married Sophia, a niece of Constantine Palaeologus, and thence assumed the arms of the Greek empire. On the breast of the eagle . . . [was] an escutcheon bearing on its red field in silver the figure of St. George slaying the dragon, the whole being surrounded by the collar of St. Andrew. On the displayed wings of the eagle . . . [were] other shields with the arms of Kieff, a silver angel on an azure field; of Novgorod, two black bears on a golden shield; of Voldermirz, a golden lion rampant on a red shield; of Kasan, a black wyvern on a silver ground, and so forth; and between the eagle's legs . . . the blue Cross of St. Andrew which, on a white field, . . . [was] the Russian ensign. The merchant flag . . . [was] a horizontal tricolour of white, blue and red. Once upon a time it was the Dutch flag reversed, then the same flag with a blue St. Andrew in the white to distinguish it. Peter the Great took the original flag with him from Amsterdam and hoisted it upside down, but the idea of a Russian being a Dutchman in distress was not pleasing to the national pride, and so the stripes were rearranged. The jack—white St. George on red, combined with blue St. Andrew edged with white . . . [was] one of the handsomest afloat."—W. J. Gordon, *Flags of the world*, pp. 235-236.—The imperial flag was replaced after the revolution of 1917 with the all red flag. See RUSSIA, SOVIET CONSTITUTION OF.

Siam.—The merchant flag is horizontally barred with red on yellow, on red, on white on red, the central stripe being much wider than the others. The merchant flag is quite new, and is used in place of the ancient red flag, centered with the white elephant, without trappings, which is so well known as the flag of Siam.

Spain.—“The war and mercantile flags of Spain have undergone many changes, and their early history is very difficult to unravel; but on May 28th, 1785, the flags were adopted that have continued in use ever since. . . . The flag of the Spanish Navy . . . consists . . . of three stripes—a central yellow one, and a red one, somewhat narrower, above and below. The original proportion was that the yellow should be equal in width to the two red ones combined. This central stripe is charged, near the hoist, with an escutcheon containing the arms of Castile and Leon, and surmounted by the royal crown. The mercantile flag . . . is also red and yellow. The yellow stripe in the centre is without the escutcheon, and in width it should be equal to one-third of the entire depth of the flag, the remaining thirds above and below it being divided into two equal strips, the one red and the other yellow.”—F. E. Hulme, *Flags of the world*, p. 110.—The elaborate standard combines the lion of Leon, the castle of Castile; the device of Sicily, the red and white stripes of the arms of Austria, the ancient flag of Burgundy, the black lion on gold of Flanders, the red eagle of Antwerp, the golden lion of Brabant, the arms of Portugal and the fleur-de-lys of France, and is thus almost an epitome of the history of the pretensions of the royal house.

Sweden.—“Sweden has flown the yellow cross on the pale blue field since Gustavus Vasa became its king in 1523, and its ensign like that of the other two Scandinavian powers is swallow-tailed. It has also the horizontal bar of the cross prolonged into a point so as to give the flag three tails. In the national flag the bar is unpointed and the space between the tails is filled up with the blue field, thus bringing the upright of the cross on the boundary of the inner third. The standard is the ensign with a white square in the centre on which is the royal coat of arms.”—W. J. Gordon, *Flags of the world*, p. 236.

Switzerland.—“The Swiss, being in want of a flag, chose the simple white cross of the Crusaders, and Gautier tells us why. ‘The first time it is mentioned is in the chronicle of Justinger and Béarnois.’ He says, after giving an enumeration of the Swiss forces leaving Berne to march against the coalition of nobles in 1338—‘And all were distinguished by the sign of the Holy Cross, a white cross on a red shield, for the reason that the freeing of the nation was for them a cause as sacred as the deliverance of the Holy Places!’ Truly an excellent flag and an excellent reason for it.”—W. J. Gordon, *Flags of the world*, p. 231.

Turkey.—The flag of Turkey has a long and interesting history. “The crescent moon and star, were adopted by the Turks as their device on the capture of Constantinople by Mahomet II., in 1453. They were originally the symbol of Diana, the Patroness of Byzantium, and were adopted by the Ottomans as a badge of triumph. Prior to that event, the crescent was a very common charge in the armorial bearings of English Knights, but it fell into considerable disuse when it became the special device of the Mohamedans. . . . Though the crescent was, . . . originally a Pagan symbol, it remained throughout the rise and development of the Greek Church the special mark of Constantinople, and even now in Moscow and other Russian cities the crescent and the cross may be seen combined on the churches, the object being to indicate the Byzantine origin of the Russian Church. . . . The War Flag of Turkey . . . [and the flag of the merchant service both carry] the crescent and star on the scarlet field. . . . In a map bearing the date 1502 the Turkish Dominions are

marked by a scarlet flag having three points and bearing three black crescents, while in a sheet of flags with the comparatively modern date of 1735, ‘Turk’ is represented by a blue flag with three crescents in white upon it. The personal flag of the Sultan . . . is scarlet, and bears in its centre the device of the reigning sovereign: hence it undergoes a change at each accession to the throne. This device, known as the Tughra, is placed on the coinage, postal stamps, etc., as well as on the Royal flag, and consists of the name of the Sultan, the title Khan, and the epithet *El muzaffar daima*, signifying the ever-victorious. The history of the Tughra is curious: When Sultan Murad I. entered into a treaty of peace with the Ragusans, he was not sufficiently scholarly to be able to affix his signature to the document, so he wetted his open hand with ink and pressed it on the paper, the first, second, and third fingers making smears in fairly close proximity, while the thumb and fourth finger were apart on either side. Within the mark thus made, the Ottoman Scribes wrote the name of Murad, his title, and the epithet that bore testimony to his ever-victorious career. The Tughra remains the symbol of this, the three upright forms being the three fingers of Murad, the rounded line to the left the thumb, and the line to the right the little finger; these leading forms do not vary, but the smaller characters change with the change of sovereign.”—F. E. Hulme, *Flags of the world*, pp. 110-121.

United States of America.—The history of the flag of the United States of America dates from Revolutionary times and may have had its origin in Washington’s heraldic device. At the outbreak of the revolt of the colonies, a variety of devices appeared on the flags borne by the Continental troops. A pine tree seems to have been the favorite New England emblem; a coiled serpent, with the motto, “Beware,” or “Don’t tread on me,” was that of the South. A representation of the thirteen colonies by alternate red and white stripes on a flag is said to have been made first at Washington’s headquarters, Cambridge, on January 2, 1776. The blue field of white stars, in the corner (the part of a flag called “the union”) was introduced, by order of Congress, on June 14, 1777. There seems to be no doubt that the first flag, thus determined by law to be the flag of the United States, was made by Mrs. Betsey Ross, an upholsterer, on Arch street, Philadelphia, and, according to tradition, Washington pencilled the plan of it. The first military use of the flag is claimed to have been at Fort Stanwix (now Rome, N. Y.), when the fort was besieged in August, 1777. The banner was improvised on that occasion, out of a red petticoat, a white shirt, and Col. Gansevoort’s blue cloak. “On June 14, 1777, John Adams, in pursuance of the report of a committee, introduced in the Continental Congress at Philadelphia the following resolution which was passed unanimously: ‘Resolved, That the flag of the thirteen United States shall be thirteen stripes, alternate red and white; that the union be thirteen stars, white on a blue field, representing a new constellation.’ Even after this there was delay in promulgating the action of Congress. The public announcement to the nation was made on September 3, 1777. Throughout the month of June, 1777, Washington’s Army Headquarters were at Middlebrook Heights, near Bound Brook, New Jersey. To this place came a courier riding swift from Philadelphia on the evening of June 14, with news of the action of Congress, and next morning, according to all evidence scrupulously weighed in late years by the State of New Jersey, the new na-

tional flag was raised before the commander-in-chief over his headquarters and formally designated the new flag of the Republic. . . . In 1791 Vermont was admitted as a state, and the next year Kentucky was admitted, thus making fifteen states in the Union. On May 1, 1795, Congress with short-sighted judgment, enacted a law providing that the flag 'be fifteen stripes.' This was the national ensign for twenty-three years; it was this flag that waved over Ft. McHenry when Francis Scott Key wrote 'The Star Spangled Banner.' Finally, on March 4, 1818, Congress enacted the law which fixes the form of the flag for all time. The act is as follows: 'An Act to Establish the Flag of the United States. Section 1. Be it enacted,' etc., 'That from and after the fourth day of July next, the flag of the United States be thirteen horizontal stripes, alternate red and white; that the Union have twenty stars, white in a blue field. Section 2. Be it further enacted, That on the admission of every new State into the Union, one Star be added to the Union of the Flag; and that such addition shall take effect on the fourth of July next succeeding such admission.' (The Act was approved by President Monroe on April 4, 1818.)"—P. R. Dillon, *American anniversaries*, pp. 124-126.—Another account of the origin of the flags gives more detail, and slightly varying particulars. "Our fathers of the thirteen colonies . . . raised at Cambridge, Mass., January 1, 1776, the 'Unions' of the two countries, Netherlands and Great Britain, that had held sovereignty of the land they lived on. . . . From 1609 to 1664, a tricolored republican flag of a federal union of states had floated over New Netherland, or the soil of the four middle colonies, later called New York, New Jersey, Pennsylvania and Delaware as the flag of the homeland. The seven alternate red and white stripes recalled to our fathers, in 1776, the successful revolt against 'taxation without representation,' or, as the Dutch Parliament of 1477 put it, 'no taxation without consent.' . . . The stripes have never left the flag, because they represent a vital fundamental idea. They have been from first to last the one permanent element in our national standard. When unfurled, January 1, 1776, the first Union flag raised over the first American army mirrored true history. Flags many, of astonishing variety of color, inscription and emblem came into view and use. There were pine trees, rattlesnakes, beavers, threefold knotted cords, with their thirteen ends free, a chain or circle of thirteen rings linked together, and other objects notably American, with some borrowed from heraldry, or from British or Dutch history. In the latter case, the sheaf of arrows, the hat of liberty, and the Netherlands lion were ancestral. Meanwhile, officers of the seventeen Continental men-of-war and of scores of privateers kept clamoring for something significant to display in foreign ports, especially while buying munitions of war. These calls for a 'distinctive standard' increased in volume even to indignant remonstrance. Still there was nothing, until June 14, 1777, except local or colonial symbols and 'the Congress flag' of the thirteen stripes. . . . Abundance of exact documentary proof shows that the thirteen stripes were ever present, but there is no proof that the stars were. In the book of photographs of extant flags used, or alleged to be used in the American Revolution (made by Gherardi Davis, New York, 1908), the field of stars is rarely seen and in none with absolute surety, before 1780, but the stripes are always in evidence. . . . The record of the Continental Congress, June 14, 1777, reads as follows: 'Resolved, that the flag of the United States be

thirteen stripes, alternate red and white, that the Union be thirteen stars, white in a blue field, representing a new constellation.' The entry in the journal of Captain Abraham Swarthout of Colonel Gansevoort's New York regiment, written August 3, 1777, in Fort Schuyler, shows beyond cavil, where the first flag of stars and stripes, of which we have record, was made and hoisted; but this was in a fort not in the field, or at the head of a regiment. The vote of Congress on the flag was not officially published until September 3, 1777. There is no record that the Stars and Stripes were carried at Brandywine, Pa., at Gooch's Bridge, Del., or that even the 'Quiberon' French salute of November 1, 1777, to the U.S.S. 'Ranger,' commanded by Paul Jones, was given to any but the striped flag without stars. . . . In fact the resolution of Congress of June 14, 1777, was not headed, even by Washington himself, or even by the Board of War. One Continental officer wrote with surprise on August 3, 1777: 'It appears by the papers that Congress resolved on the 14th of June last,' &c. As late as May 10, 1779, Washington in correspondence with the Board of War, states that applications came to him repeatedly for drums and colors, but there were many varying flags for particular regiments, and 'it is not yet settled what is the standard of the United States.' The War Board replied, through Richard Peters, that if 'General Washington would favor the Board with his opinion on the subject as to what was the one common flag of the United States,' a recommendation to Congress would be made and they would get the materials and 'order a number for the army.' Replying on September 3, 1779, Washington says nothing about stars, but recommended that the number belonging to the regiments from each State should be 'inserted within the curve of the serpent.' In 1847 the Dutch Government politely made the inquiry, 'What is the American flag?' In 1857, in the harbor of New York, nine different styles of arrangement of stars were noted in one day. On March 16, 1896, the Secretary of War, Daniel Lamont, ordered that the constellation should be in six rows."—W. E. Griffin, *Origin of the flag of the United States (Independent, July 4, 1912)*.—"The official flags of the United States, those used by the Army and Navy, have, from the very beginning, had the stars arranged in parallel rows. The suggestion that the first flag was made with a circle of stars can not be authenticated. The earliest official flags show the parallel arrangement. May 18, 1818, James Monroe, President of the United States, issued an order that the arrangement of the stars should be in parallel rows on the flags used by the Army and Navy, and other branches of the United States Government. President Monroe also decided that the official flags should be in the proportion of 14 feet to 24; that the union must be one-third of the length of the flag and seven-thirteenths of its depth, so that from the top to the bottom of the union there will be seven stripes, and six stripes from the bottom of the union to the bottom of the flag. The lower stripe and the top stripe to be red. Seven red and six white."—*Congressional Record, Sixty-fifth Congress, 1st Session, v. 55, no. 62, June 14, 1917, p. 3880*.—"Utah was admitted into the Union on January 4, 1866, and in anticipation of placing the forty-fifth star in the canton of the flag, to mark that event, the following order relative to army flags was issued: 'War Department, Washington, March 18, 1866. The field or union of the National flag in use in the army will, on and after July 4, 1866, consist of forty-five stars, in six rows, the first, third and fifth rows to have

eight stars, and the second, fourth and sixth rows seven stars each, in a blue field. . . . Secretary Herbert agreed to the same arrangement for the ensigns of the navy, and from July 4, 1896, to July 4, 1908, the stars in the army and navy flags were placed in accordance with the above design. On July 4, 1908, the 46th star for the State of Oklahoma was placed on the blue field. These stars were in six rows, the first, third, fourth, and sixth, having eight stars, and the second and fifth rows having seven stars each. The arrangement of the stars continued until the States of New Mexico and Arizona were represented on the flag. On July 4, 1912, two stars were added to mark the admission of these States into the Union. These 48 stars were placed in six rows of eight stars each, with the corresponding stars of each row in a vertical line, and this arrangement still continues."—P. D. Harrison, *Stars and stripes and other American flags*, pp. 79, 80.—When the President visits a vessel of the United States his flag is broken at the main as he reaches the deck and kept flying as long as he remains on board. This is a blue flag, bearing the coat of arms shown on the President's seal, and four white stars (sign of command) arranged one in each corner. This flag dates from 1915. Prior to that time the President's flag bore a large crimson star outlined with white, which held the coat of arms of the United States. Outside of this and within its angles were powdered stars representing the states in the Union.

**FLAMBARD, Ranulf (Ralph)** (d. 1128), English ecclesiastic and statesman. Bishop of Durham (1099); chief minister of William Rufus; confined most of his attention to financial affairs; furthered the building of the cathedral in his see; fortified Durham; built Norham castle and endowed the college of Christchurch, Hampshire.

**FLAMENS, FLAMINES.**—"The pontifices, like several other priestly brotherhoods [of ancient Rome] . . . had sacrificial priests (flamines) attached to them, whose name was derived from 'flare' (to blow the fire). The number of flamines attached to the pontifices was fifteen, the three highest of whom, . . . viz., the Flamen Dialis, Martialis, and Quirinalis, were always chosen from old patrician families. . . . Free from all civil duties, the Flamen Dialis, with his wife and children, exclusively devoted himself to the service of the deity. His house . . . lay on the Palatine hill. His marriage was dissoluble by death only; he was not allowed to take an oath, mount a horse, or look at an army. He was forbidden to remain a night away from his house, and his hand touched nothing unclean, for which reason he never approached a corpse or a burial-place. . . . In the daytime the Flamen Dialis was not allowed to take off his headdress, and he was obliged to resign his office in case it fell off by accident. In his belt he carried the sacrificial knife, and in his hand he held a rod, in order to keep off the people on his way to the sacrifice. For the same purpose he was preceded by a lictor, who compelled everybody on the way to lay down his work, the flamen not being allowed to see the business of daily life."—E. Guhl and W. Koner, *Life of the Greeks and Romans*, sect. 103.—See also AUGURS.

**FLANDERS**, geographical title covering the territory which at one time was the County of Flanders. It now corresponds to two departments of France, Nord and Pas-de-Calais, the southern part of the province of Zealand, Holland and the provinces of East and West Flanders, Belgium. See **NETHERLANDS**: Map of the Netherlands and Belgium.

863.—**Creation of the County.**—Judith, daughter of Charles the Bald, of France (not yet called France), and a twice widowed Queen of England, through hardly yet out of her girlhood (she had wedded Ethelwulf and Ethelbald, father and son, in succession), took a mate, at last, more to her liking, by a runaway match with one of her father's foresters, named Baudouin, or Baldwin, Bras-de-fer. This was in 862. King Charles, in his wrath, caused the impudent forester to be outlawed and excommunicated, both; but after a year of intercession and mediation he forgave the pair and established them in a suitable fief. Baudouin was made Count or Marquis of Flanders. "Previously to Baudouin's era, Flanders or 'Flandria' is a designation belonging, as learned men conjecture, to a Gau or Pagus, afterwards known as the Franc de Bruges, and noticed only in a single charter. Popularly, the name of Flanders had obtained with respect to a much larger surrounding Belgic country. . . . The name of 'Flanders' was thus given to the wide, and in a degree indefinite tract, of which the Forester Baudouin and his predecessors had the official range or care. According to the idiom of the Middle Ages, the term 'Forest' did not exactly convey the idea which the word now suggests, not being applied exclusively to wood-land, but to any wild and unreclaimed region. . . . Any etymology of the name of Flamingia, or Flanders, which we can guess at, seems intended to designate that the land was so called from being half-drowned. Thirty-five inundations, which afflicted the country at various intervals from the tenth to the sixteenth century, have entirely altered the coast-line; and the interior features of the country, though less affected, have been much changed by the diversions which the river-courses have sustained. . . . Whatever had been the original amplitude of the districts over which Baudouin had any control or authority, the boundaries were now enlarged and defined. Kneeling before Charles-le-Chauve [Charles the Bald] placing his hands between the hands of the Sovereign, he received his 'honour':—the Forester of Flanders was created Count or Marquis. All the countries between the Scheldt, the Somme and the sea, became his benefice; so that only a narrow and contested tract divided Baudouin's Flanders from Normandy. According to an ancient nomenclature, ten counties, to wit, Theerenburch, Arras, Boulogne, Guisnes, Saint-Paul, Hesdin, Blandemont, Bruges, Harlebec, and Tournay, were comprehended in the noble grant which Baudouin obtained from his father-in-law."—F. 13th century.—Industry, commerce and wealth of the Flemings.—“In the 13th century, Flanders was the most populous and the richest country in Europe. She owed the fact to the briskness of her manufacturing and commercial undertakings, not only amongst her neighbours, but throughout Southern and Eastern Europe. . . . Cloth, and all manner of woollen stuffs, were the principal articles of Flemish production, and it was chiefly from England that Flanders drew her supply of wool, the raw material of her industry. Thence arose between the two countries commercial relations which could not fail to acquire political importance. As early as the middle of the 12th century, several Flemish towns formed a society for founding in England a commercial exchange, which obtained great privileges, and, under the name of the Flemish hanse of London, reached rapid development. The merchants of Bruges had taken the initiative in it; but soon all the towns of Flanders—and Flanders was covered with towns—Ghent, Lille, Ypres, Courtrai, Furnes, Alost, St. Omer, and Douai, entered the confederation, and made unity as well as extension of liberties in respect of Flemish commerce the object of their joint efforts. Their prosperity became celebrated; and its celebrity gave it increase. It was a burgher of Bruges who was governor of the hanse of London, and he was called the Count of the Hanse. The fair of Bruges, held in the month of May, brought together traders from the whole world. ‘Thither came for exchange,’ says the most modern and most enlightened historian of Flanders (Baron Kervyn de Lettenhove, ‘Histoire de Flandre,’ t. ii., p. 309), ‘the produce of the North and the South, the riches collected in the pilgrimages to Novgorod, and those brought over by the caravans from Samarcand and Bagdad, the pitch of Norway and the oils of Andalusia, the furs of Russia and the dates from the Atlas, the metals of Hungary and Bohemia, the figs of Granada, the honey of Portugal, the wax of Morocco, and the spice of Egypt; whereby, says an ancient manuscript, no land is to be compared in merchandise to the land of Flanders.’ . . . So much prosperity made the Counts of Flanders very puissant lords. ‘Marguerite II., called “the Black,” Countess of Flanders and Hainault, from 1244 to 1280, was extremely rich,’ says a chronicler, ‘not only in lands, but in furniture, jewels, and money; . . . insomuch that she kept up the state of queen rather than countess.’ Nearly all the Flemish towns were strongly organised communes, in which prosperity had won liberty, and which became before long small republics, sufficiently powerful not only for the defence of their municipal rights against the Counts of Flanders, their lords, but for offering an armed resistance to such of the sovereigns their neighbours as attempted to conquer them or to trammel them in their commercial relations, or to draw upon their wealth by forced contributions or by plunder.”—F. P. Guizot, *Popular history of France*, ch. 18.—See also COMMERCE: Medieval: 8th-16th centuries; BRUGES: 13th-15th centuries.

1299-1304.—War with Philip the Fair.—As the Flemings advanced in wealth and consequence, the feudal dependence of their country upon the French crown grew increasingly irksome and oppressive to them, and their attitude towards France became one of confirmed hostility. At the same time, they

were drawn to a friendly leaning towards England by common commercial interests. This showed itself decisively on the occasion of the quarrel that arose (1205) between Philip IV, called the Fair, and Edward I of England, concerning the rule of the latter in Aquitaine or Guienne. The French king found allies in Scotland; the English king found allies in Flanders. An alliance of marriage, in fact, had been arranged to take place between king Edward and the daughter of Guy de Dampierre, count of Flanders; but Philip contrived treacherously to get possession of the persons of the count and his daughter and imprisoned them both at Paris, declaring the states of the count to be forfeited. In 1209 the two kings settled their quarrel and abandoned their allies on both sides—Scotland to the tender mercies of Edward, and Flanders to the vengeance of the malignant king Philip the Fair. The territory of the Flemings was annexed to the crown of France, and Jacques de Châtillon, uncle of the queen, was appointed governor. Before two years had passed the impatient Flemings were in furious revolt. The insurrection began at Bruges, May 18, 1302, and more than 3,000 Frenchmen in that city were massacred in the first rage of the insurgents. This massacre was called the Bruges Matins. A French army entered Flanders to put down the rising and was confronted at Courtrai (July 11, 1302) by the Flemish militia. The latter were led by young Guy de Dampierre and a few knights, who dismounted to fight on equal terms with their fellows. “About 20,000 militia, armed only with pikes, which they employed also as implements of husbandry, resolved to abide the onset of 8,000 Knights of gentle blood, 10,000 archers, and 30,000 foot-soldiers, animated by the presence and directed by the military skill of Robert, Count of Artois, and of Raoul de Nesle, Constable of France. Courtrai was the object of attack, and the Flemings, anxious for its safety, arranged themselves on a plain before the town, covered in front by a canal.” An altercation which occurred between the two French commanders led to the making of a blind and furious charge on the part of the French horsemen, ignorant and heedless of the canal, into which they plunged, horses and riders together, in one inextricable mass, and where, in their helplessness, they were slain without scruple by the Flemings. “Philip had lost his most experienced Generals, and the flower of his troops; but his obstinacy was unbending.” In repeated campaigns during the next two years, Philip strove hard to retrieve the disaster of Courtrai. He succeeded, at last (1304), in achieving, with the help of the Genoese, a naval victory in the Zurruck-Zee, followed by a victory, personally his own, at Mons-en-Puelle, in September of the same year. Then, finding the Flemings as dauntlessly ready as ever to renew the fight, he gave up to their obstinacy and acknowledged the independence of the county. A treaty was signed, in which “the independence of Flanders was acknowledged under its Count, Robert de Bethune (the eldest son of Guy de Dampierre), who, together with his brothers and all the other Flemish prisoners, was to be restored to liberty. The Flemings, on the other hand, consented to surrender those districts beyond the Lys in which the French language was vernacularly spoken; and to this territory were added the cities of Douai, Lille, and their dependencies. They engaged, moreover, to furnish by instalments 200,000 livres in order to cover the expenses which Philip had incurred by their invasion.”—E. Smedley, *History of France*, pt. 1, ch. 7.

1314.—Dishonesty of Philip of France.—Philip was one of the most treacherous of princes, and his treaty with the Flemings did not secure them against him. "The Flemings, who had paid the whole of the money stipulated by the treaty of 1305, demanded the restitution of that part of Flanders which had been given up as a pledge; but Philippe refused to restore it on the plea that it had been given to him absolutely and not conditionally. He commenced hostilities [1314] by seizing upon the counties of Nevers and R  thel, belonging to the count of Flanders and his eldest son, who replied by laying siege to Lille." Philip was making great exertions to raise money for a vigorous prosecution of the war, when he died suddenly, Nov. 25, 1314, as the result of an accident in hunting.—T. Wright, *History of France*, v. 1, bk. 2, ch. 2.

1328.—Battle of Cassel.—The first act of Philip of Valois, King of France, after his coronation in 1328, was to take up the cause of his cousin, Louis de Nevers, Count of Flanders, who had been driven from his territories by the independent burghers of Bruges, Ypres, and other cities, and who had left to him no town save Ghent, in which he dared to appear. The French king "gathered a great host of feudal lords, who rejoiced in the thought of Flemish spoil, and marched to Arras, and thence onwards into Flanders. He pitched his tent under the hill of Cassel, 'with the fairest and greatest host in the world' around him. The Flemish, under Claus Dennequin, lay on the hill-top; thence they came down all unawares in three columns on the French camp in the evening, and surprised the King at supper and all but took him. The French soon recovered from the surprise; 'for God would not consent that lords should be discomfited by such rirraff': they slew the Flemish Captain Dennequin, and of the rest but few escaped; 'for they deemed not to flee,' so stubborn were those despised weavers of Flanders. This little battle, with its great carnage of Flemish, sufficed to lay all Flanders at the feet of its conqueror."—G. W. Kitchen, *History of France*, bk. 4, ch. 1.—"Sixteen thousand Flemings had marched to the attack in three divisions. Three heaps of slain were counted on the morrow in the French lines, amounting altogether to 13,000 corpses; and it is said that Louis . . . inflicted death upon 10,000 more of the rebels."—E. Smedley, *History of France*, pt. 1, ch. 8.

ALSO IN: J. Froissart, *Chronicles* (Johnes tr.), bk. 1, ch. 21-22.

1335-1337.—Revolt under Jacques van Artevelde.—Alliance with England.—The most important measure by which Edward III of England prepared himself for the invasion of France, as a claimant of the French crown (see FRANCE: 1328-1339) was the securing of an alliance with the Flemish burghers. This was made easy for him by his enemies. "The Flemings happened to have a count who was wholly French—Louis de Nevers—who was only count through the battle of Cassel and the humiliation of his country, and who resided at Paris, at the court of Philippe de Valois. Without consulting his subjects, he ordered a general arrest of all the English throughout Flanders; on which Edward had all the Flemings in England arrested. The commerce, which was the life-blood of each country, was thus suddenly broken off. To attack the English through Guyenne and Flanders was to wound them in their most sensible parts, to deprive them of cloth and wine. They sold their wool at Bruges, in order to buy wine at Bordeaux. On the other hand, without English

wool, the Flemings were at a standstill. Edward prohibited the exportation of wool, reduced Flanders to despair, and forced her to fling herself into his arms. At first, a crowd of Flemish workmen emigrated into England, whither they were allured at any cost, and by every kind of flattery and caress. . . . I take it that the English character has been seriously modified by these emigrations, which went on during the whole of the fourteenth century. Previously, we find no indications of that patient industry which now distinguishes the English. By endeavouring to separate Flanders and England the French king only stimulated Flemish emigration, and laid the foundation of England's manufactures. Meanwhile, Flanders did not resign herself. The towns burst into insurrection. They had long hated the count, either because he supported the country against the monopoly of the towns, or because he admitted the foreigners, the Frenchmen, to a share of their commerce. The men of Ghent, who undoubtedly repented of having withheld their aid from those of Ypres and of Bruges at the battle of Cassel, chose, in 1337, as their leader, the brewer, Jacquemart Artevelde. Supported by the guilds, and, in particular, by the fulers and clothiers, Artevelde organized a vigorous tyranny. He assembled at Ghent the men of the three great cities, and showed them that they could not live without the king of England; for all Flanders depended on cloth-making, and, without wool, one could not make cloth; therefore he recommended them to keep the English king their friend."—J. Michelet, *History of France*, bk. 6, ch. 1.

ALSO IN: F. P. Guizot, *Popular history of France*, ch. 20.—J. Hutton, *James and Philip van Artevelde*, pt. 3.—J. Froissart, *Chronicles* (Johnes tr.), bk. 1, ch. 29.

1345.—End of Jacques van Artevelde.—"Jacob von Artveld, the citizen of Ghent that was so much attached to the king of England, still maintained the same despotic power over all Flanders. He had promised the king of England, that he would give him the inheritance of Flanders, invest his son the prince of Wales with it, and make it a duchy instead of an earldom. Upon which account the king was, at this period, about St. John the Baptist's day, 1345, come to Sluys, with a numerous attendance of barons and knights. He had brought the prince of Wales with him, in order that Jacob von Artveld's promises might be realized. The king remained on board his fleet in the harbour of Sluys, where he kept his court. His friends in Flanders came thither to see and visit him; and there were many conferences between the king and Jacob von Artveld on one side, and the councils from the different capital towns on the other, relative to the agreement before mentioned. . . . When on his return he [van Artevelde] came to Ghent about midday, the townsmen who were informed of the hour he was expected, had assembled in the street that he was to pass through; as soon as they saw him, they began to murmur, and put their heads close together, saying, 'Here comes one who is too much the master, and wants to order in Flanders according to his will and pleasure, which must not be longer borne.' With this they had also spread a rumour through the town, that Jacob von Artveld had collected all the revenues of Flanders, for nine years and more. . . . Of this great treasure he had sent part into England. This information inflamed those of Ghent with rage; and, as he was riding up the streets, he perceived that there was something in agitation against him; for those who were wont to salute him very respectfully, now turned their backs, and

went into their houses. He began therefore to suspect all was not as usual; and as soon as he had dismounted, and entered his hôtel, he ordered the doors and windows to be shut and fastened. Scarcely had his servants done this, when the street which he inhabited was filled from one end to the other with all sorts of people, but especially by the lowest of the mechanics. His mansion was surrounded on every side, attacked and broken into by force. Those within did all they could to defend it, and killed and wounded many: but at last they could not hold out against such vigorous attacks, for three parts of the town were there. When Jacob von Artaveld saw what efforts were making, and how hardly he was pushed, he came to a window; and, with his head uncovered, began to use humble and fine language. . . . When Jacob von Artaveld saw that he could not appease or calm them, he shut the window, and intended getting out of his house the back way, to take shelter in a church adjoining; but his hôtel was already broken into on that side, and upwards of four hundred were there calling out for him. At last he was seized by them, and slain without mercy: his death-stroke was given him by a sadler, called Thomas Denys. In this manner did Jacob von Artaveld end his days, who in his time had been complete master of Flanders. Poor men first raised him, and wicked men slew him."—J. Froissart, *Chronicles* (Johnes tr.), v. 1, bk. 1, ch. 115.

1379-1381.—Revolt of the White Hoods.—“We will . . . speak of the war in Flanders, which began about this time [1379]. The people were very murderous and cruel, and multitudes were slain or driven out of the country. The country itself was so much ruined, that it was said a hundred years would not restore it to the situation it was in before the war. Before the commencement of these wars in Flanders, the country was so fertile, and everything in such abundance, that it was marvellous to see; and the inhabitants of the principal towns lived in very grand state. You must know that this war originated in the pride and hatred that several of the chief towns bore to each other: those of Ghent against Bruges, and others, in like manner, vying with each other through envy. However, this could not have created a war without the consent of their lord, the earl of Flanders, who was so much loved and feared that no one dared anger him.” It is in these words that the old court chronicler, Froissart, begins his fully detailed and graphic narrative of the miserable years, from 1379 to 1384, during which the communes of Flanders were at war with one another and at war with their worthless and oppressive count, Louis de Maele. The picturesque chronicle is colored with the prejudices of Froissart against the Flemish burghers and in favor of their lord; but no one can doubt that the always turbulent citizens were jealous of rights which the always rapacious lord never ceased to encroach upon. As Froissart tells the story, the outbreak of war began with an attempt on the part of the men of Bruges to dig a canal which would divert the waters of the river Lys. When the men of Ghent had news of this unfriendly undertaking, they took counsel of one John Yoens, or John Lyon, a burgher of much cunning, who had formerly been in favor with the count, but whom his enemies had supplanted. “When he [John Lyon] was prevailed on to speak, he said: ‘Gentlemen, if you wish to risk this business, and put an end to it, you must renew an ancient custom that formerly subsisted in the town of Ghent: I mean, you must first put on white-hoods, and choose a leader, to whom every one may look, and rally at his signals.’ This

harangue was eagerly listened to, and they all cried out, ‘We will have it so, we will have it so! now let us put on white-hoods.’ White-hoods were directly made, and given out to those among them who loved war better than peace, and had nothing to lose. John Lyon was elected chief of the White Hoods. He very willingly accepted of this office, to avenge himself on his enemies, to embroil the towns of Ghent and Bruges with each other and with the earl their lord. He was ordered, as their chief, to march against the pioneers and diggers from Bruges, and had with him 200 such people as preferred rioting to quiet.”—J. Froissart, *Chronicles* (Johnes tr.), bk. 2, ch. 36-102.—When the White Hoods had driven the ditchers of Bruges from their canal, they returned to Ghent, but not to disband. Presently the jealous count required them to lay aside the peculiar badge of their association, which they declined to do. Then Count Louis sent his bailiff into Ghent with 200 horsemen, to arrest John Lyon, and some others of his band. The White Hoods rallied, slew the bailiff and drove his posse from the town; after which unmistakable deed Ghent and the count were distinctly at war. The city of the White Hoods took prompt measures to secure the alliance and support of its neighbors. Some nine or ten thousand of its citizens marched to Bruges, and partly by persuasion, partly by force, partly by the help of the popular party in the town, they effected a treaty of friendship, and alliance—which did not endure, however, very long. Courtray, Damme, Ypres and other cities joined the league and it soon presented a formidable array. Oudenarde, strongly fortified by the count, became the key of the situation, and was besieged by the citizen-militia. In the midst of the siege, the Duke of Burgundy, son-in-law of the count, made successful efforts to bring about a peace (Dec., 1379). “The count promised to forget the past and return to his residence in Ghent. This peace, however, was of short duration; and the count, after passing only two or three days in Ghent, alleged some cause of dissatisfaction and returned to Lille, to recommence hostilities, in the course of which, with the assistance of the richer citizens, he made himself master of Bruges. Another peace was signed in the August of 1380, which was no more durable than the former, and the count reduced Ypres; and, at the head of an army of 60,000 men, laid siege to Ghent itself, the chief and soul of the popular confederacy, in the month of September. But the citizens of Ghent defended themselves so well that he was obliged to raise the siege in the middle of November, and agree to a truce. This truce also was broken by the count’s party, the war renewed in the beginning of the year 1381, and the men of Ghent experienced a disastrous defeat in the battle of Nevelle towards the middle of May. It was a war of extermination, and was carried on with extreme ferocity. . . . Ghent itself, now closely blockaded by the count’s troops, was only saved by the great qualities of Philip Van Artevelde [son of Jacques Van Artevelde, of the revolution of 1337], who, by a sort of peaceful revolution, was placed at the head of affairs [Jan. 25, 1381]. The victory of Beverholt, in which the count was defeated with great slaughter, and only escaped with difficulty, made the town of Ghent again master of Flanders.”—T. Wright, *History of France*, bk. 2, ch. 8.

1382.—Rebellion crushed.—By the marriage of Philip, Duke of Burgundy, to the daughter and

heir of the Count of Flanders, that powerful French prince had become interested in the suppression of the revolt of the Flemish burghers and the restoration of the count to his lordship. His nephew, the young king of France, Charles VI, was easily persuaded to undertake a campaign to that end, and an army of considerable magnitude was personally led northwards by the monarch of fourteen years. "The object of the expedition was not only to restore to the Count of Flanders his authority, but to punish the turbulent commons, who stirred up those of France to imitate their example. Froissart avows it to have been a war between the commons and the aristocracy. The Flemings were commanded by Artaveldt, son of the famous brewer, the ally of Edward III. The town of Ghent had been reduced to the extreme of distress and famine by the count and the people of Bruges, who supported him. Artaveldt led the people of Ghent in a forlorn hope against Bruges, defeated the army of the count, and broke into the rival town, which he took and plundered. After this disaster, the count had recourse to France. The passage of the river Lys, which defended Flanders, was courageously undertaken, and effected with some hazard by the French. The Flemings were rather dispirited by this first success: nevertheless, they assembled their forces; and the two armies of French knights and Flemish citizens met at Rosebecque [or Rosebeck], between Ypres and Courtray. The 27th of November, 1382, was the day of battle. Artaveldt had stationed his army on a height, to await the attack of the French, but their impatience forced him to commence. Forming his troops into one solid square. Artaveldt led them against the French centre. Froissart compares their charge to the headlong rush of a wild boar. It broke the opposite line, penetrating into its ranks: but the wings of the French turned upon the flank of the Flemings, which, not having the advantage of a charge or impulse, were beaten by the French men at arms. Pressed upon one another, the Flemings had not room to fight: they were hemmed in, surrounded, and slaughtered: no quarter was asked or given; nearly 30,000 perished. The 9,000 Ghen-tois that had marched under their banner were counted, to a man, amongst the slain: Artaveldt, their general, was among the foremost who had fallen. Charles ordered his body to be hung upon a tree. It was at Courtray, very near to the field where this battle was fought, that Robert of Artois, with a French army, had perished beneath the swords of the Flemings, nearly a century previous. The gilded spurs of the French knights still adorned the walls of the cathedral of Courtray. The victory of Rosebecque in the eyes of Charles had not sufficiently repaid the former defeat: the town of Courtray was pillaged and burnt; its famous clock was removed to Dijon, and formed the third wonder of this kind in France. Paris and Sens alone possessing similar ornaments. The battle of Rosebecque proved more unfortunate for the commons of France than for those of Flanders. Ghent, notwithstanding her loss of 9,000 slain, did not yield to the conqueror, but held out the war for two years longer; and did not finally submit until the Duke of Burgundy, at the death of their count, guaranteed to the burghers the full enjoyment of their privileges. The king avenged himself on the mutinous city of Paris; entered it as a conqueror; took the chains from the streets and unhinged the gates: one hundred of the citizens were sent to the scaffold; the property of the rich was confiscated; and all the ancient and most onerous taxes, the gabelle, the duty on sales, as well as that of entry, were declared by royal ordinance to be

established anew. The principal towns of the kingdom were visited with the same punishments and exactions. The victory of Rosebecque overthrew the commons of France, which were crushed under the feet of the young monarch and his nobles."—E. E. Crowe, *History of France*, ch. 4.

1383.—Bishop of Norwich's crusade.—The crushing defeat of the Flemings at Rosebeke produced alarm in England, where the triumph of the French was quickly felt to be threatening. "English merchants were expelled from Bruges, and their property was confiscated. Calais even was in danger. The French were at Dunkirk and Gravelines, and might by a sudden dash on Calais drive the English out." There had been aid from England promised to Van Artevelde, but the promise had only helped on the ruin of the Ghent patriot by misleading him. No help had come when he needed it. Now, when it was too late, the English bestirred themselves. For some months there had been on foot among them a Crusade, which Pope Urban VI had proclaimed against the supporters of the rival Pope Clement VII—the "Schismatics." France took the side of the latter and was counted among the Schismatics. Accordingly, Pope Urban's crusade, so far as the English people could be moved to engage in it, was now directed against the French in Flanders. It was led by the Bishop of Norwich, who succeeded in rousing a very considerable degree of enthusiasm in the country for the movement, despite the earnest opposition of Wyclif and his followers. The crusading army assembled at Calais in the spring of 1383, professedly for a campaign in France; but the Bishop found excuses for leading it into Flanders. Gravelines was first attacked, carried by storm, and its male defenders slaughtered to a man. An army of French and Flemings, encountered near Dunkirk, was routed, with fearful carnage, and the whole coast, including Dunkirk, fell into the hands of the English. Then they laid siege to Ypres, and there their disasters began. The city held out with stubbornness from the 6th of June until the 10th of August, when the baffled besiegers—repulsed in a last desperate assault which they had made on the 8th—marched away. "Ypres might rejoice, but the disasters of the long siege proved final. Her stately faubourgs were not rebuilt, and she has never again taken her former rank among the cities of Flanders." In September a powerful French army entered Flanders, and the English crusaders could do nothing but retreat before it, giving up Cassel (which the French burned), then Bergues, then Bourbourg, after a siege, and, finally, setting fire to Gravelines and abandoning that place. "Gravelines was utterly destroyed, but the French soon began to rebuild it. It was re-peopled from the surrounding country, and fortified strongly as a menace to Calais." The Crusaders returned to England "dripping with blood and disgracing their country. Blessed be God who confounds the proud," says one sharp critic, who appears to have been a monk of Canterbury."—G. M. Wrong, *Crusade of mcccxxxiii*.

1383.—Joined to the dominions of the Duke of Burgundy.—"Charles V [of France] had formed the design of obtaining Flanders for his brother Philip, Duke of Burgundy, afterwards known as Philip the Bold—by marrying him to Margaret [daughter and heir of Louis de Mace], count of

Flanders]. To gain the good will of the Communes, he engaged to restore the three bailiwicks of Lille, Douai, and Orchies as a substitute for the 10,000 livres a year promised to Louis de Mæle and his successors in 1351, as well as the towns of Peronne, Crèvecœur, Arleux and Château-Chinon, assigned to him in 1358. . . . On the 13th May, 1369, the 'Lion of Flanders' once more floated, after an interval of half a century, over the walls of Lille, Douai, and Orchies, and at the same time Flemish garrisons marched into St. Omer, Aire, Béthune and Hesdin. The marriage ceremony took place at Ghent on the 10th of June." The Duke of Burgundy waited fourteen years for the heritage of his wife. In January, 1383, Count Louis died, and Flanders was added to the great and growing dominion of the new Burgundian house.—J. Hutton, *James and Philip van Artevelde*, ch. 14 and 18. FLATHEADS (SALISHAN FAMILY).—"The name Flathead was commonly given to the Choctaws, though, says Du Pratz, he saw no reason why they should be so distinguished, when the practice of flattening the head was so general. And in the enumeration just cited [Documentary Hist. of N. Y., v. 1, p. 24] the next paragraph . . . is: 'The Flatheads, Cherakis, Chicachas, and Totiris are included under the name of Flatheads by the Iroquois.'"—M. F. Force, *Some early notices of the Indians of Ohio*, p. 32.—"The Salish . . . are distinctively known as Flatheads, though the custom of deforming the cranium is not confined to them."—D. G. Brinton, *American race*, p. 107.—"In . . . early times the hunters and trappers could not discover why the Blackfeet and Flatheads [of Mon-

tana] received their respective designations, for the feet of the former are no more inclined to sable than any other part of the body, while the heads of the latter possess their fair proportion of roundness. Indeed it is only below the falls and rapids that real Flatheads appear, and at the mouth of the Columbia that they flourish most supernaturally. The tribes who practice the custom of flattening the head, and who lived at the mouth of the Columbia, differed little from each other in laws, manners or customs, and were composed of the Cathlamahs, Killmucks, Clatsops, Chinooks and Chilts. The abominable custom of flattening their heads prevails among them all."—P. Roman, *Historical sketch of the Flathead Indian nation*, p. 17.—In Major Powell's linguistic classification, the "Salishan Family" (Flathead) is given a distinct place.—J. W. Powell, *Seventh annual report of the bureau of ethnology*, p. 102.

FLAVIAN AMPHITHEATER. See COLOSSEUM.

FLAVIAN FAMILY.—"We have designated the second period of the [Roman] Empire by the name of the Flavian family—the family of Vespasian [Titus Flavius Vespasian]. The nine Emperors who were successively invested with the purple, in the space of the 123 years from his accession, were not all, however, of Flavian race, even by the rites of adoption, which in Rome was become a second nature; but the respect of the world for the virtues of Flavius Vespasian induced them all to assume his name, and most of them showed themselves worthy of such an affiliation. Vespasian had been invested with the purple at Alexandria, on the 1st of July, A. D. 69; he died in 70. His two sons reigned in succession after him; Titus,

from 79 to 81; Domitian, from 81 to 96. The latter having been assassinated, Nerva, then an old man, was raised to the throne by the Senate (96-98). He adopted Trajan (98-117), who adopted Adrian (117-138). Adrian adopted Antonius Pius (138-161), who adopted Marcus Aurelius (161-180); and Commodus succeeded his father, Marcus Aurelius (180-192). No period in history presents such a succession of good and great men upon any throne: two monsters, Domitian and Commodus, interrupt and terminate it."—J. C. L. Sisoni, *Fall of the Roman empire*, ch. 2.—See also **ROME: Empire: A. D. 70-96.**

**FLETCHER VS. PECK.**—"This case arose over the question of a title to land which rested ultimately on the Georgia act of 1795. . . . In a detailed and luminous opinion [1810], Marshall decided in favor of the title. In the course of this decision he took up the point as to the validity of the act of 1795, which was the result of the operation of corrupt motives. Marshall thought that the fact of the corruption of the legislators could not in any way affect the title of an honest holder under the law, and doubted whether it was within the province of the judiciary to control the conduct of a bribed legislature. He did not say so, but the inference is not a violent one that the people of Georgia should have selected legislators who were not open to bribery. At all events, having chosen the legislature whose majority acted from impure motives, the people, whose representatives they were, were bound by their act. For these and other reasons, the title of an innocent holder under the act of 1795 in itself was good. Then Marshall took up the question of the validity of the Rescinding Act; he laid down the general principle that its validity might well be doubted were Georgia a single sovereign power. As a matter of fact, however, she was a member of the American Union, and in common with other states her legislature was limited in its power. Especially was this the case as to bills of attainder, *ex post facto* laws, and laws impairing the obligations of contracts. The Rescinding Act of 1796 was clearly an *ex post facto* law; it had some of the elements of an act of attainder in that it led to a confiscation of property, and it impaired the obligation of contracts, for a grant of land by legislative act was

clearly a contract within the meaning of the Constitution. The Eleventh Amendment had been adopted to preserve Georgia from the indignity of being sued by the Yazoo men; and now the supreme court of the United States, regardless of Georgia dignity, had decided that the Yazoo land titles were good in law."—E. Channing, *Jeffersonian system*, pp. 137-139.—Yazoo men were landjobbers. There were two companies which bought land from the legislature of Georgia in 1789, known as the Virginia Yazoo Company and the South Carolina Yazoo Company.—See also **SUPREME COURT: 1789-1835.**

**FLEURS-DE-LIS**, coat of arms of France from the reign of Louis VII to the revolution and again under the restoration. According to some, they represent the iris or the marsh lily in remembrance of the marshy fatherland of the early Franks; according to others they reproduce the shape of an ancient iron halberd. This heraldic design, whatever may be its origin, is found on the scepter or on the crown or robes of many princes, both French and foreign. Louis VII seems to be the first to claim it for France, taking, on his departure for the second crusade (1147-1149), an azure blue banner strewn with fleurs de lis. Under Philippe III (1270-1285), but chiefly from the time of Charles V (1364-1380), the number of the fleurs-de-lis on the royal escutcheon was reduced to three.—L. **FLORENCE**, formerly the capital of Tuscany; now the most important city of central Italy north of Rome. It is situated on both banks of the river Arno, which at this point flows through a broad, fertile valley between two spurs of the Apennines. From this valley, bordered with gently-sloping hills, covered with olive groves, orchards and vineyards it has derived its title, "Firenze la Bella" (Florence the Beautiful). More than any other city, Florence was the cradle of Italian culture. Few cities are so rich in collections of works of artistic and historic interest. The chief art galleries are the Uffizi, the Pitti and the Academia; the two former are among the finest in the world. The estimated population in 1915 was 242,147.

ALSO IN: E. Hutton, *Italy and the Italians*.

**Origin and name.**—"Fæulæ was situated on a hill above Florence. Florentine traditions call it the metropolis of Florence, which would accordingly be a colony of Fæsulæ; but a statement in Machiavelli and others describes Florence as a colony of Sulla, and this statement must have been derived from some local chronicle. Fæsulæ was no doubt an ancient Etruscan town, probably one of the twelve. It was taken in the war of Sulla [B. C. 82-81]. . . . My conjecture is, that Sulla not only built a strong fort on the top of the hill of Fæsulæ, but also the new colony of Florentia below, and gave to it the 'ager Fæsulanus.'"—B. G. Niebuhr, *Lectures on ancient ethnography and geography*, v. 2, p. 22.—"We can reasonably suppose that the ancient trading nations may have pushed their small craft up the Arno to the present site of Florence, and thus have gained a more immediate communication with the flourishing city of Fiesole than they could through other ports of Etruria, from whatever race its people might have sprung. Admitting the high antiquity of Fiesole, the imagined work of Atlas, and the tomb of his celestial daughter, we may easily believe that a market was from very early times established in the plain, where both by land and water the rural produce could be brought for sale without ascending the steep on which that city stood. Such arrangements would naturally result from the common course of events, and a more convenient spot could scarcely be found than the present site of Florence, to which the Arno is still navigable by boats from its mouth, and at that time perhaps by two branches. . . . 'There were,' says Villani, 'inhabitants round San Giovanni, because the people of Fiesole held their market there one day in the week, and it was called the Field of Mars, the ancient name: however it was always, from the first, the market of the Fiesolines, and thus it was called before Florence existed.' And again: 'The Prætor Florinus, with a Roman army, encamped beyond the Arno towards Fiesole and had two small villages there, . . . where the people of Fiesole one day in the week held a general market with the neighbouring towns and villages.' . . . On the site of this camp, as we are also assured by Villani, was erected the city of Florence, after the capture of Fiesole by Pompey, Cæsar, and Marius; but Leonardo Arcino, following Malespini, asserts that it was the work of Sulla's legions, who were already in possession of Fiesole. . . . The variety of opinions almost equals the number of authors. . . . It may be reasonably concluded that Florence, springing originally from Fiesole, finally rose to the rank of a Roman colony and the seat of provincial government; a miniature of Rome, with its Campus Martius, its Capitol, Forum, temple of Mars, aqueducts, baths, theatre and amphitheatre, all erected in imitation of the 'Eternal City'; for vestiges of all these are still existing either in name or substance. The name of Florence is as dark as its

origin, and a thousand derivations have confused the brains of antiquarians and their readers without much enlightening them, while the beautiful Giagiolo or Iris, the city's emblem, still clings to her old grey walls, as if to assert its right to be considered as the genuine source of her poetic appellation. From the profusion of these flowers that formerly decorated the meads between the rivers Mugnone and Arno, has sprung one of the most popular opinions on the subject; for a white plant of the same species having shown itself amongst the rising fabrics, the incident was poetically seized upon and the Lily then first assumed its station in the crimson banner of Florence."—H. E. Napier, *Florentine history*, bk. 1, ch. 1.

406.—Siege of Radagaisus.—Deliverance by Stilicho. See **ROME**: Empire: 404-408.

12th century.—Acquisition of republican independence.—"There is . . . an assertion by Villani, that Florence contained 'twenty-two thousand fighting men, without counting the old men and children,' about the middle of the sixth century; and modern statisticians have based on this statement an estimate which would make the population of the city at that period about sixty-one thousand. There are reasons too for believing that very little difference in the population took place during several centuries after that time. Then came the sudden increase arising from the destruction, more or less entire, of Fiesole, and the incorporation of its inhabitants with those of the newer city, which led to the building of the second walls. . . . An estimate taking the inhabitants of the city at something between seventy and eighty thousand at the period respecting which we are inquiring [beginning of the 12th century] would in all probability be not very wide of the mark. The government of the city was at that time lodged in the hands of magistrates exercising both legislative and administrative authority, called Consuls, assisted by a senate composed of a hundred citizens of worth—buoni uomini. These Consuls 'guided everything, and governed the city, and decided causes, and administered justice.' They remained in office for one year. How long this form of government had been established in Florence is uncertain. It was not in existence in the year 807; but it was in activity in 1102. From 1138 we have a nearly complete roll of the names of the consuls for each year down to 1219. . . . The first recorded deeds of the young community thus governed, and beginning to feel conscious and proud of its increasing strength, were characteristic enough of the tone of opinion and sentiment which prevailed within its walls, and of the career on which it was entering. 'In the year 1107,' says Malispini, 'the city of Florence being much increased, the Florentines, wishing to extend their territory, determined to make war against any castle or fortress which would not be obedient to them. And in that year they took by force Monte Orlando, which belonged to certain gentlemen who would not be obedient to the city. And they were defeated, and the castle was destroyed.' These 'gentlemen,' so styled by the civic historian who thus curtly records the destruction of their home, in contradistinction to the citizens who by no means considered themselves such, were the descendants or representatives of those knights and captains, mostly of German race, to whom the Emperors had made grants of the soil according to the feudal practice and system. They held directly of the Empire, and in no wise owed allegiance or obedience of any sort to the community of Florence. But they occupied almost all the country around the rising city; and the citizens 'wanted to extend their territory.' Besides, these territorial

lords were, as has been said, gentlemen, and lived as such, stopping wayfarers on the highways, levying tolls in the neighbourhood of their strongholds, and in many ways making themselves disagreeable neighbours to peaceable folks. . . . The next incident on the record, however, would seem to show that peaceful townfolk as well as marauding nobles were liable to be overrun by the car of manifest destiny, if they came in the way of it. 'In the same year,' says the curt old historian, 'the men of Prato rebelled against the Florentines; wherefore they went out in battle against it, and took it by siege and destroyed it.' Prato rebelled against Florence! It is a very singular statement; for there is not the shadow of a pretence put forward, or the smallest ground for imagining that Florence had or could have claimed any sort of suzerainty over Prato. . . . The territorial nobles, however, who held castles in the district around Florence were the principal objects of the early prowess of the citizens; and of course offence against them was offence against the Emperor. . . . In 1113, accordingly, we find an Imperial vicar residing in Tuscany at St. Miniato; not the convent-topped hill of that name in the immediate neighbourhood of Florence, but a little mountain city of the same name, overlooking the lower Valdarno, about half way between Florence and Pisa. . . . There the Imperial Vicars perched themselves hawk-like, with their Imperial troops, and swooped down from time to time to chastise and bring back such cities of the plain as too audaciously set at naught the authority of the Emperor. And really these upstart Florentines were taking the bit between their teeth, and going on in a way that no Imperial Vicar could tolerate. . . . So the indignant cry of the harried Counts Cadolingi, and of several other nobles holding of the Empire, whose houses had been burned over their heads by these audacious citizens, went up to the ears of 'Messer Ruberto,' the Vicar, in San Miniato. Whereupon that noble knight, indignant at the wrong done to his fellow nobles, as well as at the offence against the authority of his master the Emperor, forthwith put lance in rest, called out his men, and descended from his mountain fortress to take summary vengeance on the audacious city. On his way thither he had to pass through that very gorge where the castle of Monte Orlando had stood, and under the ruins of the house from which the noble vassals of the Empire had been harried. . . . There were the leathern-jerked citizens on the very scene of their late misdeed, come out to oppose the further progress of the Emperor's Vicar and his soldiers. And there, as the historian writes, with curiously impassible brevity, 'the said Messer Ruberto was discomfited and killed.' And nothing further is heard of him, or of any after consequences resulting from the deed. Learned legal antiquaries insist much on the fact that the independence of Florence and the other Communes was never 'recognised' by the Emperors; and they are no doubt perfectly accurate in saying so. One would think, however, that that unlucky Vicar of theirs, Messer Ruberto, must have 'recognised' the fact, though somewhat tardily."—T. A. Trollope, *History of the commonwealth of Florence*, v. 1, bk. 1, ch. 1.—Countess Matilda, the famous friend of Pope Gregory VII, whose wide dominion included Tuscany, died in 1115, bequeathing her vast possessions to the Church (see PAPACY: 1077-1102). "In reality she was only entitled thus to bequeath her allodial lands, the remainder being imperial fiefs. But as it was not always easy to distinguish between the two sorts, and the popes were naturally anxious to get as much as they could, a fresh source of contention was added to the constant

quarrels between the Empire and the Church. 'Henry IV immediately despatched a representative into Tuscany, who under the title of Marchio, Judex, or Praeses, was to govern the Marquisate in his name.' 'Nobody,' says Professor Villari, 'could legally dispute his right to do this: but the opposition of the Pope, the attitude of the towns which now considered themselves independent and the universal confusion rendered the Marquis's authority illusory. The imperial representatives had no choice but to put themselves at the head of the feudal nobility of the contado and unite it into a Germanic party hostile to the cities. In the documents of the period the members of this party are continually described as Teutonici.' By throwing herself in this juncture on the side of the Pope, and thus becoming the declared opponent of the empire and the feudal lords, Florence practically proclaimed her independence. The grandi, having the same interests with the working classes, identified themselves with these; became their leaders, their consuls in fact if not yet in name. Thus was the consular commune born, or, rather, thus did it recognize itself on reaching manhood; for born, in reality, it had already been for some time, only so quietly and unconsciously that nobody had marked its origin or, until now, its growth. The first direct consequence of this self-recognition was that the rulers were chosen out of a larger number of families. As long as Matilda had chosen the officers to whom the government of the town was entrusted, the Uberti and a few others who formed their clan, their kinsmen, and their connections had been selected, to the exclusion of the mass of the citizens. Now more people were admitted to a share in the administration: the offices were of shorter duration, and out of those selected to govern each family had its turn. But those who had formerly been privileged—the Uberti and others of the same tendencies and influence—were necessarily discontented with this state of things, and there are indications in Villani of burnings and of tumults such as later, when the era of faction fights had fairly begun, so often desolated the streets of Florence."—B. Duffy, *Tuscan republics*, ch. 6.—See also ITALY: 1056-1152.

1215-1250.—Beginning, causes and meaning of the strife of the Guelfs and Ghibellines.—Almost from the beginning of the 13th century, all Italy, and Florence more than other Italian communities, became distracted and convulsed by a contest of raging factions. "The main distinction was that between Ghibellines and Guelfs—two names in their origin far removed from Italy. They were first heard in Germany in 1140, when at Winsberg in Suabia a battle was fought between two contending claimants of the Empire; the one, Conrad of Hohenstauffen, Duke of Franconia, chose for his battle-cry 'Waiblingen,' the name of his patrimonial castle in Württemberg; the other, Henry the Lion, Duke of Saxony, chose his own family name of 'Welf,' or 'Wölf.' Conrad proved victorious, and his kindred to the fourth ensuing generation occupied the imperial throne; yet both war-cries survived the contest which gave them birth, lingering on in Germany as equivalents of Imperialist and anti-Imperialist. By a process perfectly clear to philologists, they were modified in Italy into the forms Ghibellino and Guelfo; and the Popes being there the great opponents of the Emperors, an Italian Guelf was a Papalist. The cities were mainly Guelf; the nobles most frequently Ghibelline. A private feud had been the means of involving Florence in the contest."—M. F. Rossetti, *Shadow of Dante*, ch. 3.—"The Florentines kept themselves united till the year 1215, rendering obedience to the ruling power, and anxious only to preserve their

own safety. But, as the diseases which attack our bodies are more dangerous and mortal in proportion as they are delayed, so Florence, though late to take part in the sects of Italy, was afterwards the more afflicted by them. The cause of her first division is well known, having been recorded by Dante and many other writers; I shall, however, briefly notice it. Amongst the most powerful families of Florence were the Buondelmonti and the Uberti; next to these were the Amidei and the Donati. Of the Donati family there was a rich widow who had a daughter of exquisite beauty, for whom, in her own mind, she had fixed upon Buondelmonti, a young gentleman, the head of the Buondelmonti family, as her husband; but either from negligence, or because she thought it might be accomplished at any time, she had not made known her intention, when it happened that the cavalier betrothed himself to a maiden of the Amidei family. This grieved the Donati widow exceedingly; but she hoped, with her daughter's beauty, to disturb the arrangement before the celebration of the marriage; and from an upper apartment, seeing Buondelmonti approach her house alone, she descended, and as he was passing she said to him, 'I am glad to learn you have chosen a wife, although I had reserved my daughter for you'; and, pushing the door open, presented her to his view. The cavalier, seeing the beauty of the girl, . . . became inflamed with such an ardent desire to possess her, that, not thinking of the promise given, or the injury he committed in breaking it, or of the evils which his breach of faith might bring upon himself, said, 'Since you have reserved her for me, I should be very ungrateful indeed to refuse her, being yet at liberty to choose'; and without any delay married her. As soon as the fact became known, the Amidei and the Uberti, whose families were allied, were filled with rage, and some of them, lying in wait for him, assassinated him as he was riding through the streets. "This murder divided the whole city; one party espousing the cause of the Buondelmonti, the other that of the Uberti; and . . . they contended with each other for many years, without one being able to destroy the other. Florence continued in these troubles till the time of Frederick II., who, being king of Naples, endeavoured to strengthen himself against the church; and, to give greater stability to his power in Tuscany, favoured the Uberti and their followers, who, with his assistance, expelled the Buondelmonti; thus our city, as all the rest of Italy had long time been, became divided into Guelphs and Ghibellines."—N. Machiavelli, *History of Florence*, bk. 2, ch. 1.—"Speaking generally, the Ghibellines were the party of the emperor, and the Guelphs the party of the Pope; the Ghibellines were on the side of authority, or sometimes of oppression, the Guelphs were on the side of liberty and self-government. Again, the Ghibellines were the supporters of an universal empire of which Italy was to be the head, the Guelphs were on the side of national life and national individuality. . . . If these definitions could be considered as exhaustive, there would be little doubt as to the side to which our sympathies should be given. . . . We should . . . expect all patriots to be Guelphs, and the Ghibelline party to be composed of men who were too spiritless to resist despotic power, or too selfish to surrender it. But, on the other hand, we must never forget that Dante was a Ghibelline."—O. Browning, *Guelphs and Ghibellines*, ch. 2.—See also ITALY: 1215.

1248-1278.—Wars of a generation of the Guelphs and Ghibellines.—In 1248, the Ghibellines, at the instigation of Frederick II, and with help from his German soldiery, expelled the Guelphs from the city, after desperate fighting for several days, and de-

stroyed the mansions of their chiefs, to the number of 38. In 1250 there was a rising of the people—of the under-stratum which the cleavage of parties hardly penetrated—and a popular constitution of government was brought into force. At the same time, the high towers, which were the strongholds of the contending nobles, were thrown down. An attempt was then made by the leaders of the people to restore peace between the Ghibellines and the Guelphs, but the effort was vain; whereupon the Guelphs (in January, 1251) came back to the city, and the Ghibellines were either driven away or were shut up in their city castles, to which they had retired when the people rose. In 1258 the restless Ghibellines plotted with Manfred, King of the Two Sicilies, to regain possession of Florence. The plot was discovered, and the enraged people drove the last lingerers of the faction from their midst and pulled down their palaces. The great palace of the Uberti family, most obnoxious of all, was not only razed, but a decree was made that no building should ever stand again on its accursed site. The exiled Ghibellines took refuge at Siena, and there plotted again with King Manfred, who sent troops to aid them. The Florentines did not wait to be attacked, but marched out to meet them on Siense territory, and suffered a terrible defeat at Montaperti (September 4, 1260), in the battle that Dante refers to, "which coloured the river Arbia red." "On that day," says Villani, . . . 'was broken and destroyed the old popular government of Florence, which had existed for ten years with so great power and dignity, and had won so many victories.' Few events have ever left a more endurable impression on the memory of a people than this great battle between two cities and parties animated both of them by the most unquenchable hatred. The memory of that day has lasted through 600 years, more freshly perhaps in Siena than in Florence." As a natural consequence of their defeat at Montaperti, the Guelphs were again forced to fly into exile from Florence, and this expatriation included a large number of even the commoner people. "So thorough had been the defeat, so complete the Ghibelline ascendancy resulting from it, that in every city the same scene on a lesser scale was taking place. Many of the smaller towns, which had always been Guelph in their sympathies, were now subjected to Ghibelline despotism. One refuge alone remained in Tuscany—Lucca. . . . And thither the whole body of the expatriated Guelphs betook themselves. . . . The Ghibellines entered Florence in triumph on the 16th of September, three days after their enemies had left it. . . . The city seemed like a desert. The gates were standing open and unguarded; the streets were empty; the comparatively few inhabitants who remained, almost entirely of the lowest class of the populace, were shut up in their obscure dwellings, or were on their knees in the churches. And what was worse, the conquerors did not come back alone. They had invited a foreign despot to restore order"; and so King Manfred's general, Giordano da Anghona, established Count Guido Novello in Florence as Manfred's vicar. "All the constitutional authorities established by the people, and the whole framework of the former government, were destroyed, and the city was ruled entirely by direction transmitted from the King's Sicilian court." There were serious proposals, even, that Florence itself should be destroyed, and the saving of the noble city from that untimely fate is credited to one patriotic noble, of the Uberti family, who withstood the proposition, alone. "The Ghibelline army marched on Lucca, and had not much more difficulty in reducing that city. The government was put into Ghibelline hands, and Lucca became a Ghibelline city like all

the rest of Tuscany. The Lucchese were not required by the victors to turn their own Guelphs out of the city. But it was imperatively insisted on that every Guelph not a native citizen should be thrust forth from the gates." The unfortunate Florentines, thus made homeless again, now found shelter at Bologna, and presently helped their friends at Modena and Reggio to overcome the Ghibellines in those cities and recover control. But for five years their condition was one of wretchedness. Then Charles of Anjou was brought into Italy (1265) by the Pope, to snatch the crown of the Two Sicilies from King Manfred, and succeeded in his undertaking.—See ITALY: 1250-1268.—The prop of the Ghibellines was broken. Guido Novello and his troopers rode away from Florence; 800 French horsemen, sent by the new Angevin king, under Guy de Montfort, took their places; the Guelphs swarmed in again—the Ghibellines swarmed out; the popular constitution was restored, with new features more popular than before. In 1273 there was a great attempt made by Pope Gregory X in person, to reconcile the factions in Florence; but it had so little success that the Holy Father left the city in disgust and pronounced it under interdict for three years. In 1278 the attempt was renewed with somewhat better success. " 'And now,' says Villani, 'the Ghibellines were at liberty to return to Florence, they and their families. . . . And the said Ghibellines had back again their goods and possessions; except that certain of the leading families were ordered, for the safety of the city, to remain for a certain time beyond the boundaries of the Florentine territory.' In fact, little more is heard henceforward of the Ghibellines as a faction within the walls of Florence. The old name, as a rallying cry for the Tory or Imperialist party, was still raised here and there in Tuscany; and Pisa still called herself Ghibelline. But the stream of progress had run past them and left them stranded."—T. A. Trollope, *History of the commonwealth of Florence*, v. 1, bk. 1, ch. 4-5; bk. 2, ch. 1.

1250-1293.—Development of the popular constitution of the commonwealth.—"When it became clear that the republic was to rule itself henceforth untrammelled by imperial interference, the people [in 1250] divided themselves into six districts, and chose for each district two Ancients, who administered the government in concert with the Potestà and the Captain of the People. The Ancients were a relic of the old Roman municipal organization. . . . The body of the citizens, or the popolo, were ultimately sovereigns in the State. Assembled under the banners of their several companies, they formed a parlamento for delegating their own power to each successive government. Their representatives, again, arranged in two councils, called the Council of the People and the Council of the Commune, under the presidency of the Captain of the People and the Potestà, ratified the measures which had previously been proposed and carried by the executive authority or signoria. Under this simple State system the Florentines placed themselves at the head of the Tuscan League, fought the battles of the Church, asserted their sovereignty by issuing the golden florin of the republic, and flourished until 1266. In that year an important change was effected in the Constitution. The whole population of Florence consisted, on the one hand, of nobles or Grandi, as they were called in Tuscany, and on the other hand of working people. The latter, divided into traders and handicraftsmen, were distributed in guilds called Arti; and at that time there were

seven Greater and five Lesser Arti, the most influential of all being the Guild of the Wool Merchants. These guilds had their halls for meeting, their colleges of chief officers, their beads, called Consoli or Priors, and their flags. In 1266 it was decided that the administration of the commonwealth should be placed simply and wholly in the hands of the Arti, and the Priors of these industrial companies became the lords of Signory of Florence. No inhabitant of the city who had not enrolled himself as a craftsman in one of the guilds could exercise any function of burghership. To be scioperato, or without industry, was to be without power, without rank or place of honour in the State. The revolution which placed the Arti at the head of the republic had the practical effect of excluding the Grandi altogether from the government. . . . In 1293, after the Ghibellines had been defeated in the great battle of Campaldino, a series of severe enactments, called the Ordinances of Justice, were decreed against the unruly Grandi. All civic rights were taken from them; the severest penalties were attached to their slightest infringement of municipal law; their titles to land were limited; the privilege of living within the city walls was allowed them only under galling restrictions; and last, not least, a supreme magistrate, named the Gonfalonier of Justice, was created for the special purpose of watching them and carrying out the penal code against them. Henceforward Florence was governed exclusively by merchants and artisans. The Grandi hastened to enroll themselves in the guilds, exchanging their former titles and dignities for the solid privilege of burghership. The exact parallel to this industrial constitution for a commonwealth, carrying on wars with emperors and princes, holding haughty captains in its pay, and dictating laws to subject cities cannot, I think, be elsewhere found in history [but comparison with Soviet Russia may be of interest]. It is as unique as the Florence of Dante and Giotto is unique."—J. A. Symonds, *Florence and the Medici (Sketches and studies in Italy, ch. 5)*.—See also SUFFRAGE, MANHOOD: 1000-1300; LOT, USE OF: Florence.

1284-1293.—War with Pisa. See PISA: 1063-1293.

1289.—Victory of Campaldino, and the jealousy among its heroes.—In 1289 the Ghibellines of Arezzo having expelled the Guelphs from that city, the Florentines made war in the cause of the latter and won a great victory at Campaldino. This "raised the renown and the military spirit of the Guelph party, for the fame of the battle was very great; the hosts contained the choicest chivalry of either side, armed and appointed with emulous splendour. The fighting was hard, there was brilliant and conspicuous gallantry, and the victory was complete. It sealed Guelph ascendancy. The Ghibelline warrior-bishop of Arezzo fell, with three of the Uberti, and other Ghibelline chiefs. . . . In this battle the Guelph leaders had won great glory. The hero of the day was the proudest, handsomest, craftiest, most winning, most ambitious, most unscrupulous Guelph noble in Florence—one of a family who inherited the spirit and recklessness of the proscribed Uberti, and did not refuse the popular epithet of 'Malefami'—Corso Donati. He did not come back from the field of Campaldino, where he had won the battle by disobeying orders, with any increased disposition to yield to rivals, or court the populace, or respect other men's rights. Those rivals, too—and they also had fought gallantly in the post of honour at Campaldino—were such as

he hated from his soul—rivals whom he despised, and who yet were too strong for him [the family of the Cerchi]. His blood was ancient, they were upstarts; he was a soldier, they were traders; he was poor, they the richest men in Florence. . . . They had crossed him in marriages, bargains, inheritances. . . . The glories of Campaldino were not as oil on these troubled waters. The conquerors flouted each other all the more fiercely in the streets on their return, and ill-treated the lower people with less scruple."—R. W. Church, *Dante and other essays*, pp. 27-31.

1295-1300.—New factions in the city, and Dante's relations to them.—Bianchi and Neri (Whites and Blacks).—Among the Nobles "who resisted the oppression of the people, Corso Donati must have been the chief, but he did not at first come forward; with one of his usual stratagems, however, he was the cause of a new revolution [January, 1295], which drove Giano della Bella, the leader of the people, from the city. . . . Notwithstanding the fall of Giano, the Nobles did not return into power. He was succeeded as a popular leader by one much his inferior, one Pecora, surnamed, from his trade, the Butcher. New disputes arose between the nobles and the people, and between the upper and lower ranks of the people itself. Villani tells us that, in the year 1295, 'many families, who were neither tyrannical nor powerful, withdrew from the order of the nobles, and enrolled themselves among the people, diminishing the power of the nobles and increasing that of the people.' Dante must have been precisely one of those nobles 'who were neither tyrannical nor powerful'; and . . . it is certain that he was among those who passed over from their own order to that of the Popolani, by being matriculated in one of the Arts. In a register from 1297 to 1300, of the Art of the physicians and druggists, the fifth of the seven major Arts, he is found matriculated in these words: 'Dante d'Aldighiero degli Aldighieri poeta fiorentino.' . . . Dante, by this means, obtained office under the popular government. . . . The new factions that arose in Florence, in almost all Tuscany, and in some of the cities in other parts of Italy, were merely subdivisions of the Gueft party; merely what, in time, happens to every faction after a period of prosperity, a division of the ultras and of the moderates, or of those who hold more or less extravagant views. . . . All this happened to the Gueft party in a very few years, and the Neri and Bianchi, the names of the two divisions of that party, which had arisen in 1300, were no longer mentioned ten years afterwards, but were again lost in the primitive appellations of Guefts and Ghibellines. Thus this episode would possess little interest, and would be scarcely mentioned in the history of Italy, or even of Florence, had not the name of our sublime Poet been involved in it; and, after his love, it is the most important circumstance of his life, and the one to which he most frequently alludes in his *Commedia*. It thus becomes a subject worthy of history. . . . Florentine historians attribute Corso Donati's hatred towards Vieri de Cerchi to envy. . . . This envy arose to such a height between Dante's neighbours in Florence that he has rendered it immortal. 'Through envy,' says Villani, 'the citizens began to divide into factions, and one of the principal feuds began in the Sesto dello Scandalo, near the gate of St. Pietro, between the families of the Cerchi and the Donati [from which latter family came Dante's wife]. . . . Messer Vieri was the head of the House of the Cerchi, and he and his house were powerful in affairs, possessing

a numerous kindred; they were very rich merchants, for their company was one of the greatest in the world.'" The state of animosity between these two families "was existing in Florence in the beginning of 1300, when it was increased by another rather similar family quarrel that had arisen in Pistoia. . . . 'There was in Pistoia a family which amounted to more than 100 men capable of bearing arms; it was not of great antiquity, but was powerful, wealthy, and numerous; it was descended from one Cancellieri Notaio, and from him they had preserved Cancellieri as their family name. From the children of the two wives of this man were descended the 107 men of arms that have been enumerated; one of the wives having been named Madonna Bianca, her descendants were called Cancellieri Bianchi (White Cancellieri); and the descendants of the other wife, in opposition, were called Cancellieri Neri (Black Cancellieri).'" Between these two branches of the family of the Cancellieri there arose, some time near the end of the thirteenth century, an implacable feud. "Florence . . . exercised a supremacy over Pistoia . . . and fearing that these internal dissensions might do injury to the Gueft party, she took upon herself the lordship or supremacy of that city. The principal Cancellieri, both Bianchi and Neri, were banished to Florence itself; 'the Neri took up their abode in the house of the Frescobaldi, beyond the Arno; the Bianchi at the house of the Cerchi, in the Garbo, from being connected with them by kindred. But as one sick sheep infects another, and is injurious to the flock, so this cursed seed of discord, that had departed from Pistoia and had now entered Florence, corrupted all the Florentines, and divided them into two parties.' . . . The Cerchi, formerly called the Forest party (*parte selvaggia*), now assumed the name of Bianchi; and those who followed the Donati were now called Neri. . . . 'There sided with [the Bianchi, says Villani] the families of the Popolani and petty artisans, and all the Ghibellines, whether Nobles or Popolani.' . . . Thus the usual position in which the two parties stood was altered; for hitherto the Nobles had almost always been Ghibellines, and the Popolani Guefts; but now, if the Popolani were not Ghibellines, they were at least not such strong Guefts as the nobles. Sometimes these parties are referred to as White Guefts and Black Guefts."—C. Balbo, *Life and times of Dante*, ch. 10.

Also in: H. E. Napier, *Florentine history*, v. 1, bk. 1, ch. 14.—N. Machiavelli, *Florentine histories*, bk. 2.

14th century.—Industrial prosperity of the city.—"John Villani has given us an ample and precise account of the state of Florence in the earlier part of the 14th century. The revenue of the Republic amounted to 300,000 florins, a sum which, allowing for the depreciation of the precious metals, was at least equivalent to 600,000 pounds sterling; a larger sum than England and Ireland, two centuries ago, yielded annually to Elizabeth—a larger sum than, according to any computation which we have seen, the Grand Duke of Tuscany now derives from a territory of much greater extent. The manufacture of wool alone employed 200 factories and 30,000 workmen. The cloth annually produced sold, at an average, for 1,200,000 florins; a sum fairly equal, in exchangeable value, to two millions and a half of our money. Four hundred thousand florins were annually coined. Eighty banks conducted the commercial operations, not of Florence only, but of all Europe. The transactions of these establishments were sometimes of a magnitude which may surprise even the contemporaries of the Barings and the Rothschilds. Two houses advanced

to Edward the Third of England upwards of 300,000 marks, at a time when the mark contained more silver than 50 shillings of the present day, and when the value of silver was more than quadruple of what it now is. The city and its environs contained 170,000 inhabitants. In the various schools about 10,000 children were taught to read; 1,200 studied arithmetic; 600 received a learned education. The progress of elegant literature and of the fine arts was proportioned to that of the public prosperity. . . . Early in the 14th century came forth the Divine Comedy, beyond comparison the greatest work of imagination which had appeared since the poems of Homer. The following generation produced indeed no second Dante: but it was eminently distinguished by general intellectual activity. The study of the Latin writers had never been wholly neglected in Italy. But Petrarch introduced a more profound, liberal, and elegant scholarship; and communicated to his countrymen that enthusiasm for the literature, the history, and the antiquities of Rome, which divided his own heart with a frigid mistress and a more frigid Muse. Boccaccio turned their attention to the more sublime and graceful models of Greece."—T. B. Macaulay, *Machiavelli* (*Essays*, v. 1).

1301-1313. — Triumph of the Neri. — Banishment of Dante and his party.—Downfall and death of Corso Donati.—"In the year 1301, a serious affray took place between the two parties [the Bianchi and the Neri]; the whole city was in arms; the law, and the authority of the Signoria, among whom was the poet Dante Alighieri, was set at naught by the great men of each side, while the best citizens looked on with fear and trembling. The Donati, fearing that unaided they would not be a match for their adversaries, proposed that they should put themselves under a ruler of the family of the king of France. Such a direct attack on the independence of the state was not to be borne by the Signoria, among whom the poet had great influence. At his instigation they armed the populace, and with their assistance compelled the heads of the contending parties to lay down their arms, and sent into exile Messer Donati and others who had proposed the calling in of foreigners. A sentence of banishment was also pronounced against the most violent men of the party of the Bianchi, most of whom, however, were allowed, under various pretences, to return to their country. The party of the Donati in their exile carried on those intrigues which they had commenced while at home. They derived considerable assistance from the king of France's brother, Charles of Valois, whom Pope Boniface had brought into Italy. That prince managed, by means of promises, which he subsequently violated, to get admission for himself, together with several of the Neri, and the legate of the pope, into Florence. He then produced letters, generally suspected to be forgeries, charging the leaders of the Bianchi with conspiracy. The popularity of the accused party had already been on the wane, and after a violent tumult, the chief men among them, including Dante, were obliged to leave the city; their goods were confiscated, and their houses destroyed. . . . From this time Corso Donati, the head of the faction of the Neri, became the chief man at Florence. The accounts of its state at this period, taken from the most credible historians, warrant us in thinking that the severe invectives of Dante are not to be ascribed merely to indignation or resentment at the harsh treatment he had received. . . . The city was rent by more violent dissensions than ever. There were now three distinct sources of contention—the jealousy between the people and the nobles, the disputes between the

Bianchi and the Neri, and those between the Ghibellines and the Guelfs. It was in vain that the legate of Pope Benedict, a man of great piety, went thither for the sake of trying to restore order. The inhabitants showed how little they respected him by exhibiting a scandalous representation of hell on the river Arno; and, after renewing his efforts without success, he cursed the city and departed [1302]. The reign of Corso Donati ended like that of most of those who have succeeded to power by popular violence. Six years after the banishment of his adversaries he was suspected, not without reason, of endeavouring to make himself independent of constitutional restraints. The Signori declared him guilty of rebellion. After a protracted resistance he made his escape from the city, but was pursued and taken at Rovesca [1308]. When he was led captive by those among whom his authority had lately been paramount, he threw himself under his horse, and, after having been dragged some distance, he was dispatched by one of the captors. . . . The party that had been raised by Corso Donati continued to hold the chief power at Florence even after the death of their chief. The exiled faction, in the words of one of their leaders, . . . had not learned the art of returning to their country as well as their adversaries. Four years after the events alluded to, the Emperor, Henry VII, made some negotiations in their favour, which but imperfectly succeeded. The Florentines, however, were awed when he approached their city at the head of his army; and in the extremity of their danger they implored the assistance of King Robert of Naples, and made him Lord of their city for the space of five years. The Emperor's mysterious death [August 24, 1313] at Buonconvento freed them from their alarm."—W. P. Urquhart, *Life and times of Francesco Sforza*, v. 1, bk. 1, ch. 3.

1336-1338.—Alliance with Venice against Mastino della Scala. See VERONA: 1260-1338.

1341-1343.—Defeat by the Pisans before Lucca.—Brief tyranny of the Duke of Athens.—In 1341, Mastino della Scala, of Verona, who had become master of Lucca in 1335 by treachery, offered to sell that town to the Florentines. The bargain was concluded; "but it appeared to the Pisans the signal of their own servitude, for it cut off all communication between them and the Ghibellines of Lombardy. They immediately advanced their militia into the Lucchese states to prevent the Florentines from taking possession of the town; vanquished them in battle, on the 2d of October, 1341, under the walls of Lucca; and, on the 6th of July following, took possession of that city for themselves. The people of Florence attributed this train of disasters to the incapacity of their magistrates. . . . At this period, Gauttier [Walter] de Brienne, duke of Athens, a French noble, but born in Greece, passed through Florence on his way from Naples to France. The duchy of Athens had remained in his family from the conquest of Constantinople till it was taken from his father in 1312. . . . It was for this man the Florentines, after their defeat at Lucca, took a sudden fancy. . . .

On the 1st of August, 1342, they obliged the signoria to confer on him the title of captain of justice, and to give him the command of their militia." A month later, the duke, by his arts, had worked such a ferment among the lower classes of the population that they "proclaimed him sovereign lord of Florence for his life, forced the public palace, drove from it the gonfalonier and the priori, and installed him there in their place. . . . Happily, Florence was not ripe for slavery: ten months sufficed for the duke of Athens to draw from it 400,000 golden florins, which he sent either to France or Naples; but ten months sufficed also to undeceive all parties who had placed any confidence in him," and by a universal rising, in July, 1343, he was driven from the city.—J. C. L. de Sismondi, *History of the Italian republics*, ch. 6.

1348.—Plague.—"In the year then of our Lord 1348, there happened at Florence, the finest city in all Italy, a most terrible plague; which, whether owing to the influence of the planets, or that it was sent from God as a just punishment for our sins, had broken out some years before in the Levant, and after passing from place to place, and making incredible havoc all the way, had now reached the west. There, spite of all the means that art and human foresight could suggest, such as keeping the city clear from filth, the exclusion of all suspected persons, and the publication of copious instructions for the preservation of health; and notwithstanding manifold humble supplications offered to God in processions and otherwise; it began to show itself in the spring of the aforesaid year, in a sad and wonderful manner. Unlike what had been seen in the east, where bleeding from the nose is the fatal prognostic, here there appeared certain tumours in the groin or under the armpits, some as big as a small apple, others as an egg; and afterwards purple spots in most parts of the body; in some cases large and but few in number, in others smaller and more numerous—both sorts the usual messengers of death. To the cure of this malady, neither medical knowledge nor the power of drugs was of any effect. . . . Nearly all died the third day from the first appearance of the symptoms, some sooner, some later, without any fever or other accessory symptoms. What gave the more virulence to this plague, was that, by being communicated from the sick to the hale, it spread daily, like fire when it comes in contact with large masses of combustibles. Nor was it caught only by conversing with, or coming near the sick, but even by touching their clothes, or anything that they had before touched. . . . These facts, and others of the like sort, occasioned various fears and devices amongst those who survived, all tending to the same uncharitable and cruel end; which was, to avoid the sick, and everything that had been near them, expecting by that means to save themselves. And some holding it best to live temperately, and to avoid excesses of all kinds, made parties, and shut themselves up from the rest of the world. . . . Others maintained free living to be a better preservative, and would baulk no passion or appetite they wished to gratify, drinking and revelling incessantly from tavern to tavern, or in private houses (which were frequently found deserted by the owners, and therefore common to every one), yet strenuously avoiding, with all this brutal indulgence, to come near the infected. And such, at that time, was the public distrest, that the laws, human and divine, were no more regarded; for the officers to put them in force being either dead, sick, or in want of persons to assist them, every one did just as he pleased. . . . I pass over

the little regard that citizens and relations showed to each other; for their terror was such that a brother even fled from a brother, a wife from her husband, and, what is more uncommon, a parent from his own child. . . . Such was the cruelty of Heaven, and perhaps of men, that between March and July following, according to authentic reckonings, upwards of 100,000 souls perished in the city only; whereas, before that calamity, it was not supposed to have contained so many inhabitants. What magnificent dwellings, what noble palaces, were then depopulated to the last inhabitant!"—G. Boccaccio, *Decameron*, introduction.—See also BLACK DEATH.

1358.—Captains of the Guelf party and the "Ammoniti."—"The magistracy called the 'Capitani di Parte Guelfa,'—the Captains of the Guelf party,—was instituted in the year 1267; and it was remarked, when the institution of it was recorded, that the conception of a magistracy avowedly formed to govern a community, not only by the authority of, but in the interest of one section only of its members, was an extraordinary proof of the unfit-ness of the Florentines for self-government, and a forewarning of the infallible certainty that the attempt to rule the Commonwealth on such principles would come to a bad ending. In the year 1358, a little less than a century after the first establishment of this strange magistracy, it began to develop the mischievous capabilities inherent in the nature of it, in a very alarming manner. . . . In 1358 this magistracy consisted of four members. . . . These men, 'born,' says Ammirato, 'for the public ruin, under pretext of zeal for the Guelf cause' . . . caused a law to be passed, according to which any citizen or Florentine subject who had ever held, or should thereafter hold, any office in the Commonwealth, might be either openly or secretly accused before the tribunal of the Captains of the Guelf Party of being Ghibelline, or not genuine Guelf. If the accusation was supported by six witnesses worthy of belief, the accused might be condemned to death or to fine at the discretion of the Captains. . . . It will be readily conceived that the passing of such a law, in a city bristling with party hatreds and feuds, was the signal for the commencement of a reign of terror." The citizens proscribed were "said to be 'admonished'; and the condemnations were called 'admonizioni'; and henceforward for many years the 'ammonizioni' [or 'ammoniti'] play a large part in the domestic history and political struggles of Florence."—T. A. Trollope, *History of the commonwealth of Florence*, v. 2, bk. 3, ch. 7.

1359-1391.—Free Company of Sir John Hawkwood and the wars with Pisa, with Milan, and with the pope. See ITALY: 1343-1303.

1375-1378.—War with the pope in support of the oppressed States of the Church.—Eight Saints of War.—Terrible excommunication.—In 1375, the Florentines became engaged in war with Pope Gregory XI, supporting a revolt of the States of the Church, which were heavily oppressed by the representatives of their papal sovereign (see PAPACY: 1352-1378). "Nevertheless, so profoundly revered was the church that even the sound of war against a pope appeared to many little less than blasphemy: numbers opposed on this pretence, but really from party motives alone." But "a general council assembled and declared the cause of liberty paramount to every other consideration; the war was affirmed to be rather against the injustice and tyranny of foreign governors than the church itself. . . . All the ecclesiastical cities then

groaning under French oppression were to be invited to revolt and boldly achieve their independence. These spirited resolutions were instantly executed, and on the 8th of August, 1375, Alessandro de' Bardi [and seven other citizens] . . . were formed into a supreme council of war called 'Gli Otto della Guerra'; and afterwards, from their able conduct, 'Gli Otto Santi della Guerra' [The Eight Saints of War]; armed with the concentrated power of the whole Florentine nation in what regarded war." A terrible sentence of excommunication was launched against the Florentines by the Pope. "Their souls were solemnly condemned to the pains of hell; fire and water were interdicted; their persons and property outlawed in every Christian land, and they were finally declared lawful prey for all who chose to sell, plunder, or kill them as though they were mere slaves or infidels."—H. E. Napier, *Florentine history*, v. 2, bk. 1, ch. 26.

1378-1427.—Completer democratizing of the commonwealth.—Tumult of the Ciompi.—Rise of commercial aristocracy.—First appearance of the Medici in Florentine history.—Though the reign of the Duke of Athens lasted rather less than a year, "it bore important fruits; for the tyrant, seeking to support himself upon the favour of the common people, gave political power to the Lesser Arts at the expense of the Greater, and confused the old State-system by enlarging the democracy. The net result of these events for Florence was, first, that the city became habituated to rancorous party-strife, involving exiles and proscriptions, and, secondly, that it lost its primitive social hierarchy of classes. . . . Civil strife now declared itself as a conflict between labour and capital. The members of the Lesser Arts, craftsmen who plied trades subordinate to those of the Greater Arts, rose up against their social and political superiors, demanding a larger share in the government, a more equal distribution of profits, higher wages, and privileges that should place them on an absolute equality with the wealthy merchants. It was in the year 1378 that the proletariat broke out into rebellion. Previous events had prepared the way for, this revolt. First of all, the republic had been democratized through the destruction of the Grandi and through the popular policy pursued to gain his own ends by the Duke of Athens. Secondly, society had been shaken to its very foundation by the great plague of 1348 . . . nor had 30 years sufficed to restore their relative position to grades and ranks confounded by an overwhelming calamity. . . . Rising in a mass to claim their privileges, the artisans ejected the Signory from the Public Palace, and for awhile Florence was at the mercy of the mob. It is worthy of notice that the Medici, whose name is scarcely known before this epoch, now come for one moment to the front. Salvestro de' Medici was Gonfalonier of Justice at the time when the tumult first broke out. He followed the faction of the handicraftsmen, and became the hero of the day. I cannot discover that he did more than extend a sort of passive protection to their cause. Yet there is no doubt that the attachment of the working classes to the house of Medici dates from this period. The rebellion of 1378 is known in Florentine history as the Tumult of the Ciompi. The name Ciompi strictly means the Wool-Carders. One set of operatives in the city, and that the largest, gave its title to the whole body of the labourers. For some months these craftsmen governed the republic, appointing their own Signory and passing laws in their own interest; but, as is usual, the proletariat found itself incapable of

sustained government. The ambition and discontent of the Ciompi foamed themselves away, and industrious workingmen began to see that trade was languishing and credit on the wane. By their own act at last they restored the government to the Priors of the Greater Arti. Still the movement had not been without grave consequences. It completed the levelling of classes, which had been steadily advancing from the first in Florence. After the Ciompi riot there was no longer not only any distinction between noble and burgher, but the distinction between greater and lesser guilds was practically swept away. . . . The proper political conditions had been formed for unscrupulous adventurers. Florence had become a democracy without social organisation. . . . The time was come for the Albizzi to attempt an oligarchy, and for the Medici to begin the enslavement of the State. The Constitution of Florence offered many points of weakness to the attacks of such intriguers. In the first place it was in its origin not a political but an industrial organisation—a simple group of guilds invested with the sovereign authority. . . . It had no permanent head, like the Doge of Venice, no fixed senate like the Venetian Grand Council; its chief magistrates, the Signory, were elected for short periods of two months, and their mode of election was open to the gravest criticism. Supposed to be chosen by lot, they were really selected from lists drawn up by the factions in power from time to time. These factions contrived to exclude the names of all but their adherents from the bags, or 'borse,' in which the burghers eligible for election had to be inscribed. Furthermore, it was not possible for this shifting Signory to conduct affairs requiring sustained effort and secret deliberation; therefore recourse was being continually had to dictatorial Commissions. The people, summoned in parliament upon the Great Square, were asked to confer plenipotentiary authority upon a committee called Balia [see BALIA OF FLORENCE], who proceeded to do what they chose in the State; and who retained power after the emergency for which they were created passed away. . . . It was through these [and other specified] defects that the democracy merged gradually into a despotism. The art of the Medici consisted in a scientific comprehension of these very imperfections, a methodic use of them for their own purposes, and a steady opposition to any attempts made to substitute a stricter system. . . . Florence, in the middle of the 14th century, was a vast beehive of industry. Distinctions of rank among burghers, qualified to vote and hold office, were theoretically unknown. Highly educated men, of more than princely wealth, spent their time in shops and counting-houses, and trained their sons to follow trades. Military service at this period was abandoned by the citizens; they preferred to pay mercenary troops for the conduct of their wars. Nor was there, as in Venice, any outlet for their energies upon the seas. Florence had no navy, no great port—she only kept a small fleet for the protection of her commerce. Thus the vigour of the commonwealth was concentrated on itself; while the influence of citizens, through their affiliated trading-houses, correspondents, and agents, extended like a network over Europe. . . . Accordingly we find that out of the very bosom of the people a new plutocratic aristocracy begins to rise. . . . These nobles of the purse obtained the name of 'Popolani Nobili'; and it was they who now began to play at high stakes for the supreme power. . . . The opening of the second half of the 14th century had been signalled by the feuds of two great houses, both risen from the people. These were the Albizzi and the Ricci."

# THE FAMILY OF THE MEDICI, IN FLORENCE.

(See below).</p>	<p>Ferdinand Charles, married Leopold, Count of Tyrol. (See above).</p>	

The Albizzi triumphed, in the conflict of the two houses, and became all-powerful for a time in Florence; but the wars with the Visconti, of Milan, in which they engaged the city, made necessary a heavy burden of taxation, which they rendered more grievous by distributing it unfairly. "This imprudent financial policy began the ruin of the Albizzi. It caused a clamour in the city for a new system of more just taxation, which was too powerful to be resisted. The voice of the people made itself loudly heard; and with the people on this occasion sided Giovanni de' Medici. This was in 1427. It is here that the Medici appear upon that memorable scene where in the future they are to play the first part. Giovanni de' Medici did not belong to the same branch of his family as the Salvestro who favoured the people at the time of the Ciompi Tumult. But he adopted the same popular policy. To his sons Cosimo and Lorenzo he bequeathed on his death-bed the rule that they should invariably adhere to the cause of the multitude, found their influence on that, and avoid the arts of factious and ambitious leaders."—J. A. Symonds, *Florence and the Medici (Sketches and studies in Italy, ch. 5)*.

ALSO IN: A. von Reumont, *Lorenzo de' Medici, v. 1, bk. 1, ch. 2*.—T. A. Trollope, *History of the commonwealth of Florence, v. 2, bk. 4-5*.

1390-1402.—War with Gian Galeazzo Visconti, duke of Milan.—"Already in 1386, the growing power of Giangaleazzo Visconti, the tenth duke of Milan of that family, began to give umbrage, not only to all the sovereign princes, his neighbours, but also to Florence [see MILAN: 1277-1447]. . . . Florence . . . had cause enough to feel uneasy at the progress of such a man in his career of successful invasion and usurpation;—Florence, no more specially than other of the free towns around her, save that Florence seems always to have thought that she had more to lose from the loss of her liberty than any of the other cities . . . and felt always called upon to take upon herself the duty of standing forward as the champion and supporter of the principles of republicanism and free government. . . . The Pope, Urban VI., added another element of disturbance to the condition of Italy. For in his anxiety to recover sundry cities mainly in Umbria and Romagna . . . he was exceedingly unscrupulous of means, and might at any moment be found allying himself with the enemies of free government and of the old Guelph cause in Italy. Venice, also, having most improvidently and unwisely allied herself with Visconti, constituted another element of danger, and an additional cause of uneasiness and watchfulness to the Florentine government. In the spring of 1388, therefore, a board of ten, 'Dieci di Balìa,' was elected for the general management of 'all those measures concerning war and peace which should be adopted by the entire Florentine people.'" The first war with Visconti was declared by the republic in May, 1390, and was so successfully conducted for the Florentines by Sir John Hawkwood that it terminated in a treaty signed January 26, 1392, which bound the Duke of Milan not to meddle in any way with the affairs of Tuscany. For ten years this agreement seems to have been tolerably well adhered to; but in 1402 the rapacious Duke entered upon new encroachments, which forced the Florentines to take up arms again. Their only allies were Bologna and Padua (or Francesco Carrara of Padua), and the armies of the three states were defeated in a terribly bloody battle fought near Bologna on the 26th of June. "Bologna fell into the hands of Visconti. Great was the dismay and terror in Florence when the

news . . . reached the city. It was neither more nor less than the fall, as the historian says, of the fortress which was the bulwark of Florence. Now she lay absolutely open to the invader." But the invader did not come. He was stricken with the plague and died, in September, and Florence and Italy were saved from the tyranny which he had seemed able to extend over the whole.—T. A. Trollope, *History of the commonwealth of Florence, v. 2, bk. 4, ch. 4-5*.

14th-15th centuries.—Commercial enterprise, industrial energy, wealth and culture of the city.—"During the 14th and 15th centuries Florentine wealth increased in an extraordinary degree. Earlier generations had compelled the powerful barons of the district to live in the city; and even yet the exercise of the rights of citizenship was dependent on having a residence there. The influx of outsiders was, however, much more owing to the attractions offered by the city, whether in business, profession, or pleasure, than to compulsion. . . . The situation of the city is not favorable to the natural growth of commerce, especially under the conditions which preceded the building of railroads. At a considerable distance from the sea, on a river navigable only for very small craft, and surrounded by hills which rendered difficult the construction of good roads,—the fact that the city did prosper so marvellously is in itself proof of the remarkable energy and ability of its people. They needed above all things a sea-port, and to obtain a good one they waged some of their most exhausting wars. Their principal wealth, however, came through their financial operations, which extended throughout Europe, and penetrated even to Morocco and the Orient. Their manufactures also, especially of wool and silk, brought in enormous returns, and made not only the fortunes but also, in one famous case at least, the name of the families engaged in them. Their superiority over the rest of Christendom in these pursuits was but one side of that remarkable, universal talent which is the most astonishing feature of the Florentine life of that age. With the hardihood of youth, they were not only ready but eager to engage in new enterprises, whether at home or abroad. . . . As a result of their energy and ability, riches poured into their coffers,—a mighty stream of gold, in the use of which they showed so much judgment, that the after world has feasted to our day, and for centuries to come, will probably continue to feast without satiety on the good things which they caused to be made, and left behind them. Of all the legacies for which we have to thank Florence, none are so well known and so universally recognized as the treasures of art created by her sons, many of which yet remain within her walls, the marvel and delight of all who behold them. As the Florentines were ready to try experiments in politics, manufactures, and commerce, so also in all branches of the fine arts they tried experiments, left the old, beaten paths of their forefathers, and created something original, useful, and beautiful for themselves. Christian art from the time of the Roman Empire to Cimabue had made comparatively little progress; but a son of the Florentine fields was to start a revolution which should lead to the production of some of the most marvellous works which have proceeded from the hand of man. The idea that the fine arts are more successfully cultivated under the patronage of princes than under-republican rule is very widespread, and is occasionally accepted almost as a dogma; but the history of Athens and of Florence teaches us without any doubt that the two most artistic epochs in the history of the world have

had their rise in republics. . . . Some writers, dazzled by the splendors of the Medici, entirely lose sight of the fact that both Dante and Petrarch were dead before the Medici were even heard of, and that the greatest works, at least in architecture, were all begun long before they were leaders in Florentine affairs. That family did much, yes very much, for the advancement of art and letters; but they did not do all or nearly all that was done in Florence. . . . Though civil discord and foreign war were very frequent, Florentine life is nevertheless an illustration rather of what Herbert Spencer calls the commercial stage of civilization, than of the war-like period. Her citizens were above all things merchants, and were generally much more willing to pay to avoid a war than to conduct one. They strove for glory, not in feats of arms, but in literary contests and in peaceful emulation in the encouragement of learning and the fine arts."—W. B. Scaife, *Florentine life*, pp. 16-19.—See also MONEY AND BANKING: Medieval; 12th-14th centuries: Florentine banking.

1433-1464.—Ascendancy of Cosimo de' Medici.—In 1433, Cosmo, or Cosimo de' Medici, the son of Giovanni de' Medici, was the recognized leader of the opposition to the oligarchy controlled by Rinaldo de' Albizzi. Cosmo inherited from his father a large fortune and a business as a merchant and banker which he maintained and increased. "He lived splendidly; he was a great supporter of all literary men, and spent and distributed his great wealth amongst his fellow citizens. He was courteous and liberal, and was looked upon with almost unbounded respect and affection by a large party in the state. Rinaldo was bent upon his ruin, and in 1433, when he had a Signoria devoted to his party, he cited Cosmo before the Council, and shut him up in a tower of the Public Palace. Great excitement was caused by this violent step, and two days after the Signoria held a parliament of the people. The great bell of the city was tolled, and the people gathered round the Palace. Then the gates of the Palace were thrown open, and the Signoria, the Colleges of Arts, and the Gonfaloniere came forth, and asked the people if they would have a Balia. So a Balia was appointed, the names being proposed by the Signoria, to decide on the fate of Cosmo. At first it was proposed to kill him, but he was only banished, much against the will of Rinaldo, who knew that, if he lived, he would some day come back again. The next year the Signoria was favourable to him; another Balia was appointed; the party of the Albizzi was banished, and Cosmo was recalled. He was received with a greeting such as men give to a conqueror, and was hailed as the 'Father of his Country.' This triumphant return gave the Medici a power in the Republic which they never afterwards lost. The banished party fled to the court of the Duke of Milan, and stirred him up to war against the city."—W. Hunt, *History of Italy*, ch. 6, sect. 5.—"Cosimo de' Medici did not content himself with rendering his old opponents harmless; he took care also that none of his adherents should become too powerful and dangerous to him. Therefore, remarks Francesco Guicciardini, he retained the Signoria, as well as the taxes, in his hand, in order to be able to pro-

mote or oppress individuals at will. In other things the citizens enjoyed greater freedom and acted more according to their own pleasure than later, in the days of his grandson, for he let the reins hang loose if he was only sure of his own position. It was just in this that his great art lay, to guide things according to his will, and yet to make his partisans believe that he shared his authority with them. . . . 'It is well known' remarks [Guicciardini] . . . 'how much nobility and wealth were destroyed by Cosimo and his descendants by taxation. The Medici never allowed a fixed method and legal distribution, but always reserved to themselves the power of bearing heavily upon individuals according to their pleasure. . . . He [Cosimo] maintained great reserve in his whole manner of life. For a quarter of a century he was the almost absolute director of the State, but he never assumed the show of his dignity. . . . The ruler of the Florentine State remained citizen, agriculturist, and merchant. In his appearance and bearing there was nothing which distinguished him from others. . . . He ruled the money market, not only in Italy, but throughout Europe. He had banks in all the western countries, and his experience and the excellent memory which never failed him, with his strong love of order, enabled him to guide everything from Florence, which he never quitted after 1438." The death of Cosimo occurred on the 1st day of August, 1464.—A. von Reumont, *Lorenzo de' Medici*, v. 1, bk. 1, ch. 6, 8.—"The last troubled days of the Florentine democracy had not proved quite unproductive of art. It was the time of Giotto's undisputed sway. Many works of which the 15th century gets the glory because it finished them were ordered and begun amidst the confusion and terrible agitation of the demagoguery. . . . Under the oligarchy, in the relative calm that came with oppression, a taste for art as well as for letters began to develop in Florence as elsewhere." But "Cosimo de' Medici had rare good fortune. In his time, and under his rule, capricious chance united at Florence talents as numerous as they were diverse—the universal Brunelleschi, the polished and elegant Ghiberti, the rough and powerful Donatello, the suave Angelico, the masculine Masaccio. . . . Cosimo lived long enough to see the collapse of the admirable talent which flourished upon the banks of the Arno, and soon spread throughout Italy, and to feel the void left by it. It is true his grandson saw a new harvest, but as inferior to that which preceded it, as it was to that which followed it."—F.-T. Perrens, *History of Florence*, 1434-1531, bk. 1, ch. 6.

1450-1454.—Alliance with Francesco Sforza, of Milan, and war with Venice, Naples, Savoy, and other states. See MILAN: 1447-1454.

1458-1469.—Lucas Pitti, and the building of the Pitti palace.—Piero de' Medici and the five agents of his tyranny.—Until 1455, Cosmo de' Medici shared the government of Florence in some degree with Neri Capponi, an able statesman, who had taken an eminent part in public affairs for many years—during the domination of the Albizzi, as well as afterwards. "When Neri Capponi died, the council refused to call a new parliament to replace the balia, whose power expired on the 1st of July, 1455. . . . The election of the signoria was again made fairly by lot. . . . the contributions were again equitably apportioned,—the tribunals ceased to listen to the recommendations of those who, till then, had made a traffic of distributive justice." This recovery of freedom in Florence was enjoyed for about three years; but when, in 1458, Lucas Pitti, "rich, powerful, and bold," was named gonfalonier, Cosmo conspired with him to reimpose

the yoke. "Pitti assembled the parliament; but not till he had filled all the avenues of the public square with soldiers or armed peasants. The people, menaced and trembling within this circle, consented to name a new *balia*, more violent and tyrannical than any of the preceding. It was composed of 352 persons, to whom was delegated all the power of the republic. They exiled a great number of the citizens who had shown the most attachment to liberty, and they even put some to death." When, in 1463, Cosmo's second son, Giovanni, on whom his hopes were centered, died, Lucas Pitti "looked on himself henceforth as the only chief of the state. It was about this time that he undertook the building of that magnificent palace which now [1832] forms the residence of the grand-dukes. The republican equality was not only offended by the splendour of this regal dwelling; but the construction of it afforded Pitti an occasion for marking his contempt of liberty and the laws. He made of this building an asylum for all fugitives from justice, whom no public officer dared pursue when once he [they?] took part in the labour. At the same time individuals, as well as communities, who would obtain some favour from the republic, knew that the only means of being heard was to offer Lucas Pitti some precious wood or marble to be employed in the construction of his palace. When Cosmo de' Medici died, at his country-house of Careggi, on the 1st of August, 1464, Lucas Pitti felt himself released from the control imposed by the virtue and moderation of that great citizen. . . . His [Cosmo's] son, Pietro de' Medici, then 48 years of age, supposed that he should succeed to the administration of the republic, as he had succeeded to the wealth of his father, by hereditary right: but the state of his health did not admit of his attending regularly to business, or of his inspiring his rivals with much fear. To diminish the weight of affairs which oppressed him, he resolved on withdrawing a part of his immense fortune from commerce; recalling all his loans made in partnership with other merchants; and laying out this money in land. But this unexpected demand of considerable capital occasioned a fatal shock to the commerce of Florence; at the same time that it alienated all the debtors of the house of Medici, and deprived it of much of its popularity. The death of Sforza, also, which took place on the 8th of March, 1466, deprived the Medicean party of its firmest support abroad. . . . The friends of liberty at Florence soon perceived that Lucas Pitti and Pietro de' Medici no longer agreed together; and they recovered courage when the latter proposed to the council the calling of a parliament, in order to renew the *balia*, the power of which expired on the 1st of September, 1465; his proposition was rejected. The magistracy began again to be drawn by lot from among the members of the party victorious in 1434. This return of liberty, however, was but of short duration. Pitti and Medici were reconciled: they agreed to call a parliament, and to direct it in concert; to intimidate it, they surrounded it with foreign troops. But Medici, on the nomination of the *balia*, on the 2d of September, 1466, found means of admitting his own partisans only, and excluding all those of Lucas Pitti. The citizens who had shown any zeal for liberty were all exiled. . . . Lucas Pitti ruined himself in building his palace. His talents were judged to bear no proportion to his ambition: the friends of liberty, as well as those of Medici, equally detested him; and he remained deprived of all power in a city which he had so largely contributed to enslave. Italy became filled with Florentine emigrants: every revo-

lution, even every convocation of parliament, was followed by the exile of many citizens. . . . At Florence, the citizens who escaped proscription trembled to see despotism established in their republic; but the lower orders were in general contented, and made no attempt to second Bartolomeo Coleoni, when he entered Tuscany, in 1467, at the head of the Florentine emigrants, who had taken him into their pay. Commerce prospered; manufactures were carried on with great activity; high wages supported in comfort all who lived by their labour; and the Medici entertained them with shows and festivals, keeping them in a sort of perpetual carnival, amidst which the people soon lost all thought of liberty. Pietro de' Medici was always in too bad a state of health to exercise in person the sovereignty he had usurped over his country; he left it to five or six citizens, who reigned in his name. . . . They not only transacted all business, but appropriated to themselves all the profit; they sold their influence and credit; they gratified their cupidity or their vengeance; but they took care not to act in their own names, or to pledge their own responsibility; they left that to the house of Medici. Pietro, during the latter months of his life, perceived the disorder and corruption of his agents. He was afflicted to see his memory thus stained, and he addressed them the severest reprimands; he even entered into correspondence with the emigrants, whom he thought of recalling, when he died, on the 2d of December, 1469. His two sons, Lorenzo and Giuliano, the elder of whom was not 21 years of age, . . . given up to all the pleasures of their age, had yet no ambition. The power of the state remained in the hands of the five citizens who had exercised it under Pietro."—J. C. L. de Sismondi, *History of the Italian republics*, ch. 11.

1469-1492.—Conspiracy of the Pazzi.—Government of Lorenzo the Magnificent.—Death of liberty.—Golden age of letters and art.—Lorenzo inherited his grandfather's political sagacity and far surpassed him in talent and literary culture. In many respects too he was a very different man. Cosimo never left his business office; Lorenzo neglected it, and had so little commercial aptitude that he was obliged to retire from business, in order not to lose his abundant patrimony. Cosimo was frugal in his personal expenses and lent freely to others; Lorenzo loved splendid living, and thus gained the title of the Magnificent; he spent immoderately for the advancement of literary men; he gave himself up to dissipation which ruined his health and shortened his days. His manner of living reduced him to such straits, that he had to sell some of his possessions and obtain money from his friends. Nor did this suffice; for he even meddled with the public money, a thing that had never happened in Cosimo's time. Very often, in his greed of unlawful gain, he had the Florentine armies paid by his own bank; he also appropriated the sums collected in the Monte Comune or treasury of the public debt, and those in the Monte delle Fanciulle where were marriage portions accumulated by private savings—money hitherto held sacred by all. Stimulated by the same greed, he, in the year 1472 joined the Florentine contractors for the wealthy alum mines of Volterra, at the moment in which that city was on the verge of rebellion in order to free itself from a contract which it deemed unjust. And Lorenzo, with the weight of his authority, pushed matters to such a point that war broke out, soon to be followed by a most cruel sack of the unhappy city, a very unusual event in Tuscany. For all this he was universally blamed. But he was excessively haughty

and cared for no man; he would tolerate no equals, would be first in everything—even in games. He interfered in all matters, even in private concerns and in marriages: nothing could take place without his consent. In overthrowing the powerful and exalting men of low condition, he showed none of the care and precaution so uniformly observed by Cosimo. It is not then surprising if his enemies increased so fast that the formidable conspiracy of the Pazzi broke out on the 26th April, 1478. In this plot, hatched in the Vatican itself where Sixtus IV was Lorenzo's determined enemy, many of the mightiest Florentine families took part. In the cathedral, at the moment of the elevation of the Host, the conspirators' daggers were unsheathed. Giuliano dei Medici was stabbed to death, but Lorenzo defended himself with his sword and saved his own life. The tumult was so great that it seemed as though the walls of the church were shaken. The populace rose to the cry of 'Palle! Palle!' the Medici watchword, and the enemies of the Medici were slaughtered in the streets or hung from the windows of the Palazzo Vecchio. There, among others, were seen the dangling corpses of Archbishop Salviati and of Francesco Pazzi, who in their last struggles had gripped each other with their teeth and remained thus for some time. More than seventy persons perished on that day, and Lorenzo, taking advantage of the opportunity, pushed matters to extremity by his confiscations, banishments, and sentences of death. Thereby his power would have been infinitely increased if Pope Sixtus IV, blinded by rage, had not been induced to excommunicate Florence, and make war against it, in conjunction with Ferdinand of Aragon. On this Lorenzo, without losing a moment, went straight to Naples, and made the king understand how much better it served his interests that Florence should have but one ruler instead of a republican government, always liable to change and certainly never friendly to Naples. So he returned with peace re-established and boundless authority and popularity. Now indeed he might have called himself lord of the city, and it must have seemed easy to him to destroy the republican government altogether. With his pride and ambition it is certain that he had an intense desire to stand on the same level with the other princes and tyrants of Italy, the more so as at that moment success seemed entirely within his grasp. But Lorenzo showed that his political shrewdness was not to be blinded by prosperity, and knowing Florence well, he remained firm to the traditional policy of his house, that of dominating the Republic, while apparently respecting it. He was well determined to render his power solid and durable; but to that end he had recourse to a most ingenious reform, by means of which, without abandoning the old road, he thoroughly succeeded in his object. In place of the usual five-yearly Balia, he instituted, in 1480, the Council of Seventy, which renewed itself and was like a permanent Balia with still wider power. This, composed of men entirely devoted to his cause, secured the government to him forever. By this Council, say the chroniclers of the time, liberty was wholly buried and undone, but certainly the most important affairs of the State were carried on in it by intelligent and cultivated men, who largely promoted its material prosperity. Florence still called itself a republic, nominally the old institutions were still in existence, but all this seemed and was nothing but an empty mockery. Lorenzo, absolute lord of all, might certainly be called a tyrant, surrounded by lackeys and courtiers. . . . Yet he dazzled all men by the splendour of his rule, so that [Guicciardini] observes,

that though Lorenzo was a tyrant, 'it would be impossible to imagine a better and more pleasing tyrant.' Industry, commerce, public works had all received a mighty impulse. In no city in the world had the civil equality of modern States reached the degree to which it had attained not merely in Florence itself, but in its whole territory and throughout all Tuscany. Administration and secular justice proceeded regularly enough in ordinary cases, crime was diminished, and, above all, literary culture had become a substantial element of the new State. Learned men were employed in public offices, and from Florence spread a light that illuminated the world. . . . But Lorenzo's policy could found nothing that was permanent. Unrivalled as a model of sagacity and prudence, it promoted in Florence the development of all the new elements of which modern society was to be the outcome, without succeeding in fusing them together; for his was a policy of equivocation and deceit, directed by a man of much genius, who had no higher aim than his own interest and that of his family, to which he never hesitated to sacrifice the interests of his people."—P. Villari, *Machiavelli and his times*, v. 1, ch. 2, sect. 2.—"The state of Florence at this period was very remarkable. The most independent and tumultuous of towns was spellbound under the sway of Lorenzo de' Medici, the grandson of Cosimo who built San Marco; and scarcely seemed even to recollect its freedom, so absorbed was it in the present advantages conferred by 'a strong government,' and solaced by shows, entertainments, festivals, pomp, and display of all kinds. It was the very height of that classic revival so famous in the later history of the world, and the higher classes of society, having shaken themselves apart with graceful contempt from the lower, had begun to frame their lives according to a pagan model, leaving the other and much bigger half of the world to pursue its superstitions undisturbed. Florence was as near a pagan city as it was possible for its rulers to make it. Its intellectual existence was entirely given up to the past; its days were spent in that worship of antiquity which has no power of discrimination, and deifies not only the wisdom but the trivialities of its golden epoch. Lorenzo reigned in the midst of a lettered crowd of classic parasites and flatterers, writing poems which his courtiers found better than Alighieri's, and surrounding himself with those eloquent slaves who make a prince's name more famous than arms or victories, and who have still left a prejudice in the minds of all literature-loving people in favour of their patron. A man of superb health and physical power, who can give himself up to debauch all night without interfering with his power of working all day, and whose mind is so versatile that he can sack a town one morning and discourse upon the beauties of Plato the next, and weave joyous ballads through both occupations—gives his flatterers reason when they applaud him. The few righteous men in the city, the citizens who still thought of Florence above all, kept apart, overwhelmed by the tide which ran in favour of that leading citizen of Florence who had gained the control of the once high-spirited and freedom-loving people. Society had never been more dissolute, more selfish, or more utterly deprived of any higher aim. Barren scholarship, busy over grammatical questions, and elegant philosophy, snipping and piecing its logical systems, formed the top dressing to that half-brutal, half-superstitious ignorance which in such communities is the general portion of the poor. The dilettante world dreamed hazily of a restoration of the worship of the pagan gods; Cardinal

Bembo bade his friend beware of reading St. Paul's epistles, lest their barbarous style should corrupt his taste; and even such a man as Pico della Mirandola declared the 'Divina Commedia' to be inferior to the 'Canti Carnascialeschi' of Lorenzo de' Medici. . . . Thus limited intellectually, the age of Lorenzo was still more hopeless morally, full of debauchery, cruelty, and corruption, violating oaths, betraying trusts, believing in nothing but Greek manuscripts, coins, and statues, caring for nothing but pleasure. This was the world in which Savonarola found himself."—M. O. Oliphant, *Makers of Florence*, ch. 9.—"Terrible municipal enmities had produced so much evil as to relax ancient republican energy. After so much destruction repose was necessary. To antique sobriety and gravity succeed love of pleasure and the quest of luxury. The belligerent class of great nobles were expelled and the energetic class of artisans crushed. Bourgeois rulers were to rule, and to rule tranquilly. Like the Medicis, their chiefs, they manufacture, trade, bank and make fortunes in order to expend them in intellectual fashion. War no longer fastens its cares upon them, as formerly, with a bitter and tragic grasp; they manage it through the paid bands of condottieri, and these as cunning traffickers, reduce it to cavalcades; when they slaughter each other it is by mistake; historians cite battles in which three, and sometimes only one soldier remains on the field. Diplomacy takes the place of force, and the mind expands as character weakens. Through this mitigation of war and through the establishment of principalities or of local tyrannies, it seems that Italy, like the great European monarchies, had just attained to its equilibrium. Peace is partially established and the useful arts germinate in all directions upon an improved social soil like a good harvest on a cleared and well-ploughed field. The peasant is no longer a serf of the glebe, but a metayer; he nominates his own municipal magistrates, possesses arms and a communal treasury; he lives in enclosed bourgs, the houses of which, built of stone and cement, are large, convenient, and often elegant. Near Florence he erects walls, and near Lucca he constructs turf terraces in order to favor cultivation. Lombardy has its irrigations and rotation of crops; entire districts, now so many deserts around Lombardy and Rome, are still inhabited and richly productive. In the upper class the bourgeois and the noble labor since the chiefs of Florence are hereditary bankers and commercial interests are not endangered. Marble quarries are worked at Carrara, and foundry fires are lighted in the Maremma. We find in the cities manufactories of silk, glass, paper, books, flax, wool and hemp; Italy alone produces as much as all Europe and furnishes to it all its luxuries. Thus diffused commerce and industry are not servile occupations tending to narrow or debase the mind. A great merchant is a pacific general, whose mind expands in contact with men and things. Like a military chieftain he organizes expeditions and enterprises and makes discoveries. . . . The Medicis possess sixteen banking-houses in Europe; they bind together through their business Russia and Spain, Scotland and Syria; they possess mines of alum throughout Italy, paying to the Pope for one of them a hundred thousand florins per annum; they entertain at their court representatives of all the powers of Europe and become the councillors and moderators of all Italy. In a small state like Florence, and in a country without a national army like Italy, such an influence becomes ascendant in and through itself; a control over private fortunes leads to a management of the public funds,

and without striking a blow or using violence, a private individual finds himself director of the state. . . . These banking magistrates are liberal as well as capable. In thirty-seven years the ancestors of Lorenzo expend six hundred and sixty thousand florins in works of charity and of public utility. Lorenzo himself is a citizen of the antique stamp, almost a Pericles, capable of rushing into the arms of his enemy, the king of Naples, in order to avert, through personal seductions and eloquence, a war which menaces the safety of his country. His private fortune is a sort of public treasury, and his palace a second hotel-de-ville. He entertains the learned, aids them with his purse, makes friends of them, corresponds with them, defrays the expenses of editions of their works, purchases manuscripts, statues and medals, patronizes promising young artists, opens to them his gardens, his collections, his house and his table, and with that cordial familiarity and that openness, sincerity and simplicity of heart which place the protected on a footing of equality with the protector as man to man and not as an inferior in relation to a superior. This is the representative man whom his contemporaries all accept as the accomplished man of the century, no longer a Farinata or an Alghieri of ancient Florence, a spirit rigid, exalted and militant to its utmost capacity, but a balanced, moderate and cultivated genius, one who, through the genial sway of his serene and beneficent intellect, binds up into one sheaf all talents and all beauties. It is a pleasure to see them expanding around him. On the one hand writers are restoring and, on the other, constructing. From the time of Petrarch Greek and Latin manuscripts are sought for, and now they are to be exhumed in the convents of Italy, Switzerland, Germany and France. They are deciphered and restored with the aid of the savants of Constantinople. A decade of Livy or a treatise by Cicero, is a precious gift solicited by princes; some learned man passes ten years of travel in ransacking distant libraries in order to find a lost book of Tacitus, while the sixteen authors rescued from oblivion by the Poggios are counted as so many titles to immortal fame. . . . Style again becomes noble and at the same time clear, and the health, joy and serenity diffused through antique life re-enters the human mind with the harmonious proportions of language and the measured graces of diction. From refined language they pass to vulgar language, and the Italian is born by the side of the Latin. . . . Here in the restored paganism, shines out epicurean gaiety, a determination to enjoy at any and all hours, and that instinct for pleasure which a grave philosophy and political sobriety had thus far tempered and restrained. With Pulci, Berni, Bibiena, Ariosto, Bandelli, Aretino, and so many others, we soon see the advent of voluptuous debauchery and open skepticism, and later a cynical unbounded licentiousness. These joyous and refined civilizations based on a worship of pleasure and intellectuality—Greece of the fourth century, Provence of the twelfth, and Italy of the sixteenth—were not enduring. Man in these lacks some checks. After sudden outbursts of genius and creativeness he wanders away in the direction of license and egotism; the degenerate artist and thinker makes room for the sophist and the dilettant. But in this transient brilliancy his beauty was charming. . . . It is in this world, again become pagan, that painting revives, and the new tastes she is to gratify show beforehand the road she is to follow; henceforth she is to decorate the houses of rich merchants who love antiquity and who desire to live daintily."—H. A. Taine, *Italy*,

1490-1498.—Preaching of Savonarola.—Coming of Charles VIII of France, and expulsion of the Medici.—Great religious revival and Christianization of the commonwealth.—Conflict with the Church and fall of Savonarola.—Girolamo, or Jerome Savonarola, a Dominican monk, born at Ferrara in 1452, educated to be a physician, but led by early disgust with the world to renounce his intended profession and give himself to the religious life, was sent to the convent of St. Mark, in Florence, in 1490, when he had reached the age of 37. "He began his career as a reader and lecturer, and his lectures, though only intended for novices, drew a large audience. He then lectured in the garden of the cloister, under a large rosebush, where many intellectual men came from the city to hear him. At length he began to preach in the Church of St. Mark's, and his subject was the Apocalypse, out of which he predicted the restoration of the Church in Italy, which he declared God would bring about by a severe visitation. Its influence upon his hearers was overpowering; there was no room in the church for the brethren; his fame spread abroad and he was next appointed to preach the sermons in the cathedral. . . . Amid the luxurious, æsthetic, semi-pagan life of Florence, in the ears of the rich citizens, the licentious youth, the learned Platonists, he denounced the revival of paganism, the corruptions of the Church, the ignorance and consequent slavery of the people, and declared that God would visit Italy with some terrible punishment, and that it would soon come. He spoke severe words about the priests, declared to the people that the Scriptures were the only guides to salvation; that salvation did not come from external works, as the Church taught, but from faith in Christ, from giving up the heart to Him, and if He forgave sin, there was no need for any other absolution. Scarcely had he been a year in Florence when he was made prior of the monastery. There was a custom in vogue, a relic of the old times, for every new prior to go to the king or ruler and ask his favour. This homage was then due to Lorenzo di Medici, but Savonarola declared he would never submit to it, saying—'From whom have I received my office, from God or Lorenzo? Let us pray for grace to the Highest.' Lorenzo passed over this slight, being anxious to acquire the friendship of one whom he clearly saw would exert great influence over the Florentines. Burlamachi, his contemporary biographer, tells us that Lorenzo tried all kinds of plans to win the friendship of Savonarola: he attended the church of St. Mark; listened to his sermons; gave large sums of money to him for the poor; loitered in the garden to attract his attention—but with little success. Savonarola treated him with respect, gave his money away to the poor, but avoided him and denounced him. Another plan was tried; five distinguished men waited on Savonarola, and begged him to spare such elevated persons in his sermons, to treat more of generalities, and not to foretell the future. They received a prophetic answer: 'Go tell your master, Lorenzo, to repent of his sins, or God will punish him and his. Does he threaten me with banishment? Well, I am but a stranger, and he is the first citizen in Florence, but let him know that I shall remain and he must soon depart!' What

happened shortly after caused the people to begin to regard Savonarola as a prophet, and won him that terrible fame which caused his downfall. . . . Lorenzo died on the 8th April, 1492, and from that time Savonarola becomes more prominent. He directed his exertions to the accomplishment of three objects—the reformation of his monastery, the reformation of the Florentine State, and the reformation of the Church. He changed the whole character of his monastery. . . . Then he proceeded to State matters, and in this step we come to the problem of his life—was he a prophet or a fanatic? Let the facts speak for themselves. Lorenzo was succeeded by his son Pietro, who was vastly inferior to his father in learning and statesmanship. His only idea appears to have been a desire to unite Florence and Naples into one principality; this created for him many enemies, and men began to fancy that the great house of Medici would terminate with him. So, it appears, thought Savonarola, and announced the fact at first privately

SAVONAROLA

amongst his friends; in a short time, however, he began to prophecy their downfall publicly. During the years 1492 and 1494, he was actively engaged in preaching. In Advent of the former year, he began his thirteen sermons upon Noah's Ark. In 1493 he preached the Lent sermons at Bologna, and upon his return he began preaching in the cathedral. In these sermons he predicted the approaching fall of the State to the astonishment of all his hearers, who had not the slightest apprehension of danger: 'The Lord has declared that His sword shall come upon the land swiftly and soon.' This was the burden of a sermon preached on Advent Sunday, 1492. At the close of 1493, and as the new year approached, he spoke out more plainly and definitely. He declared that one should come over the Alps who was called, like Cyrus, of whom Jeremiah wrote; and he should, sword in hand, wreak vengeance upon the tyrants of Italy. . . . His preaching had always exerted a marvellous influence upon people, as we shall hereafter note, but they could not understand the cause of these predictions. The city was at peace; gay and joyous as usual, and no fear was entertained; but towards the end of the year came the fulfilment.

Charles VIII., King of France, called into Italy by Duke Ludovico of Milan, came over the Alps with an immense army, took Naples, and advanced on Florence. The expulsion of the Medici from Florence soon followed. Pietro, being captured, signed an agreement to deliver up all his strongholds to Charles VIII., and to pay him 200,000 ducats (see ITALY: 1494-1496). The utmost indignation seized the Florentines when they heard of this treaty. The Signori sent heralds to Charles to negotiate for milder terms, and their chief was Savonarola, who addressed the King like a prophet, begged him to take pity on Italy, and save her. His words had the desired effect. Charles made more easy terms, and left it to the Florentine people to settle their own State. In the meantime Pietro returned, but he found Florence in the greatest excitement—the royal palace was closed; stones were thrown at him; he summoned his guards, but the people took to arms, and he was compelled to fly to his brothers Giovanni and Giuliano. The Signori declared them to be traitors, and set a price upon their heads. Their palace and its treasures fell into the hands of the people. The friends of the Medici, however, were not all extinct; and as a discussion arose which was likely to lead to a struggle, Savonarola summoned the people to meet under the dome of St. Mark. . . . In fact, the formation of the new State fell upon Savonarola, for the people looked up to him as an inspired prophet. He proposed that 3,200 citizens should form themselves into a general council. Then they drew lots for a third part, who for six months were to act together as an executive body and represent the general council, another one-third for the next three months, and so on; so that every citizen had his turn in the council every eighteen months. They ultimately found it convenient to reduce the number to 80—in fact, Savonarola's Democracy was rapidly becoming oligarchic. Each of these 80 representatives was to be 40 years of age; they voted with black and white beans, six being a legal majority. But the Chief of the State was to be Christ; He was to be the new monarch. His next step was to induce them to proclaim a general amnesty, in which he succeeded only through vigorously preaching to them that forgiveness was sweeter than vengeance—that freedom and peace were more loving than strife and hatred. . . . He was now at the height of his power; his voice ruled the State; he is the only instance in Europe of a monk openly leading a republic. The people regarded him as something more than human: they knew of his nights spent in prayer; of his long fasts; of his unbounded charity. . . . Few preachers ever exerted such influence upon the minds of crowds, such a vitalizing influence; he changed the whole character of Florentine society. Libertines abandoned their vices; the theatres and taverns were empty; there was no card playing, nor dice throwing; the love of fasting grew so general, that meat could not be sold; the city of Florence was God's city, and its government a Theocracy. There was a custom in Florence, during Carnival time, for the children to go from house to house and bid people give up their cherished pleasures; and so great was the enthusiasm at this period that people gave up their cards, their dice and backgammon boards, the ladies their perfumed waters, veils, paint-pots, false hair, musical instruments, harps, lutes, licentious tales, especially those of Boccaccio, dream books, romances, and popular songs. All this booty was gathered together in a heap in the market place, the people assembled, the Signori took their places, and children clothed in white, with olive branches on their heads, re-

ceived from them the burning torches, and set fire to the pile amid the blast of trumpets and chant of psalms, which were continued till the whole was consumed. . . . His fame had now reached other countries; foreigners visited Florence solely for the purpose of seeing and hearing him. The Sultan of Turkey allowed his sermons to be translated and circulated in his dominions. But in the midst of his prosperity his enemies were not idle: as he progressed their jealousy increased: his preaching displeased them, terrified them, and amongst these the most bitter and virulent were the young sons of the upper classes: they called his followers 'howlers' (Piagnoni), and so raged against him that they gained the name, now immortalised in history, of the Arrabbiati (the furies): this party was increased by the old friends of the Medici, who called him a rebel and leader of the lower classes. Dolfo Spini, a young man of position and wealth, commanded this party, and used every effort to destroy the reputation of Savonarola, to incite the people against him, and to ruin him. They bore the name of 'Compagnacci'; they wrote satires about the Piagnoni; they circulated slanders about the monk who was making Florence the laughing stock of Europe; but Savonarola went on his way indifferent to the signs already manifesting themselves amongst his countrymen, ever most sensitive to ridicule. He also strove to reform the Church: he delineated the Apostolic Church as a model upon which he would build up that of Florence. . . . By this time, the intelligence of his doings, and the gist of his preaching and writing, which had been carefully transmitted to Rome by his enemies, began to attract the attention of the Pope, Alexander VI., who tried what had frequently proved an infallible remedy, and offered Savonarola a Cardinal's hat, which he at once refused. He was then invited to Rome, but thought it prudent to excuse himself. When the controversy between him and the Pope appeared to approach a crisis, Savonarola took a step which somewhat hurried the catastrophe. He wrote to the Kings of France and Spain, and the Emperor of Germany, to call a General Council to take into consideration the Reform of the Church. One of these letters reached the Pope, through a spy of Duke Ludovico Moro, of Milan, whom Savonarola had denounced. The result was the issue of a Breve (October, 1496), which forbade him to preach. The Pope then ordered the Congregation of St. Mark to be broken up and amalgamated with another. For a time Savonarola, at the advice of his friends, remained quiet; but at this last step, to break up the institution he had established, he was aroused to action. He denounced Rome as the source of all the poison which was undermining the constitution of the Church; declared that its evil fame stunk in men's nostrils. The Pope then applied to the Signori to deliver up this enemy of the Church, but to no purpose. The Franciscans were ordered to preach against him, but they made no impression. Then came the last thunderbolt: a Bann was issued (12th May, 1497), which was announced by the Franciscans. During the time of his suspension and his excommunication, many things happened which tended to his downfall, although his friends gathered round him: the rapid change of ministry brought in turn friends of the Medici to the helm; they introduced the young Compagnacci into the Council, and gradually his enemies were increasing in the Government to a strong party." The fickle Florentine mob now took sides with them against the monk whom it had recently adored, and on the 7th of April, 1498, in the midst of a raging

tumult, Savonarola was taken into custody by the Signori of the city. With the assent of the Pope, he was subjected seven times to torture upon the rack, to force from him a recantation of all that he had taught and preached, and on the 23d of May he was hanged and burned, in company with two of his disciples.—O. T. Hill, *Introduction to Savonarola's "Triumph of the Cross."*

1498-1500.—Threatened by the Medici, on one side, and Cæsar Borgia on the other.—New division of parties.—“After the death of Savonarola things changed with such a degree of rapidity that the Arrabbiati had not time to consider in what manner they could restrict the government; but they soon became convinced that the only salvation for the Republic was to adopt the course which had been recommended by the Friar. Piero and Giuliano dei Medici were in fact already in the neighbourhood of Florence, supported by a powerful Venetian army. It became, therefore, absolutely necessary for the Arrabbiati to unite with the Piagnoni, in order to defend themselves against so many dangers and so many enemies. By great good fortune, the Duke of Milan, from jealousy of the Venetians, came to their assistance to ward off the danger; but who could trust to his friendship—who could place any reliance on his fidelity? As to Alexander Borgia, he who had held out such great hopes, and had made so many promises, in order to get Savonarola put to death, no sooner was his object attained than he gave full sway to his unbridled passions. It seemed as if the death of the poor Friar had released both the Pope and his son, Duke Valentino, from all restraints upon their lusts and ambition. The Pope formed intimate alliances with Turks and Jews, a thing hitherto unheard of. He, in one year, set up twelve cardinals' hats for sale. The history of the incests and murders of the family of Borgia is too well known to render it necessary for us to enter into any detailed account of them here. The great object of the Pope was to form a State for his son in the Romagna; and so great was the ambition of Duke Valentino, that he contemplated extending his power over the whole of Italy, Tuscany being the first part he meant to seize upon. With that view he was always endeavouring to create new dangers to the Republic; at one time he caused Arezzo to rise against it; at another time he threatened to bring back Piero de' Medici; and he was continually ravaging their territory. The consequence was, that the Florentines were obliged to grant him an annual subsidy of 36,000 ducats, under the name of condotta (military pay); but even that did not restrain him from every now and then, under various pretexts, overrunning and laying waste their territory. Thus did Alexander Borgia fulfil those promises to the Republic by which they had been induced to murder Savonarola. The Arrabbiati were at length convinced that to defend themselves against the Medici and Borgia, their only course was to cultivate the alliance with France, and unite in good faith with the Piagnoni. Thus they completely adopted the line of policy which Savonarola had advised; and the consequence was, that their affairs got order and their exertions were attended with a success far beyond what could have been anticipated.”—P. Villari, *History of Savonarola and of his times*, v.

2, *conclusion*.—“A new division of parties may be said to have taken place under the three denominations of ‘Palleschi’ [a name derived from the watchword of the Mediceans, ‘palle, palle,’ which alluded to the well-known balls in the coat of arms of the Medici family], ‘Ottimati,’ and ‘Popolani.’ The first . . . were for the Medici and themselves. . . . The ‘Ottimati’ were in eager search for a sort of visionary government where a few of the noblest blood, the most illustrious connexions and the greatest riches, were to rule Florence without any regard to the Medici. . . . The Popolani, who formed the great majority, loved civic liberty, therefore were constantly watching the Medici and other potent and ambitious men.”—H. E. Napier, *Florentine history*, v. 4, bk. 2, ch. 8.

1502-1569.—Ten years under Piero Soderini.—Restoration of the Medici and their second expulsion.—Siege of the city by the imperial army.—Final surrender to Medicean tyranny.—Creation of the grand duchy of Tuscany.—“In 1502, it was decreed that the Gonfalonier should hold office for life—should be in fact a Doge. To this important post of permanent president Piero Soderini was appointed; and in his hands were placed the chief affairs of the republic. . . . During the ten years which elapsed between 1502 and 1512, Piero Soderini administered Florence with an outward show of great prosperity. He regained Pisa and maintained an honourable foreign policy in the midst of the wars stirred up by the League of Cambray. Meanwhile the young princes of the house of Medici had grown to manhood in exile. The Cardinal Giovanni was 37 in 1512. His brother Giuliano was 33. Both of these men were better fitted than their brother Piero to fight the battles of the family. Giovanni, in particular, had inherited no small portion of the Medicean craft. During the troubled reign of Julius II, he kept very quiet, cementing his connection with powerful men in Rome, but making no effort to regain his hold on Florence. Now the moment for striking a decisive blow had come. After the battle of Ravenna in 1512, the French were driven out of Italy, and the Sforzas returned to Milan; the Spanish troops, under the Viceroy Cardona, remained masters of the country. Following the camp of these Spaniards, Giovanni de' Medici entered Tuscany in August, and caused the restoration of the Medici to be announced in Florence. The people, assembled by Soderini, resolved to resist to the uttermost. . . . Yet their courage failed on August 20th, when news reached them of the capture and the sack of Prato. Prato is a sunny little city a few miles distant from the walls of Florence, famous for the beauty of its women, the richness of its gardens, and the grace of its buildings. Into this gem of cities the savage soldiery of Spain marched in the bright autumnal weather, and turned the paradise into a hell. It is even now impossible to read of what they did in Prato without shuddering. Cruelty and lust, sordid greed for gold, and cold delight in bloodshed, could go no further. Giovanni de' Medici, by nature mild and voluptuous, averse to violence of all kinds, had to smile approval, while the Spanish Viceroy knocked thus with mailed hand for him at the door of Florence. The Florentines were paralysed with terror. They deposed Soderini and received the Medici. Giovanni and Giuliano entered their devastated palace in the Via Larga, abolished the Grand Council, and dealt with the republic as they listed. . . . It is not likely that they would have succeeded in maintaining their authority—for they were poor and ill-supported by friends outside the city—except for one

most lucky circumstance: that was the election of Giovanni de' Medici to the Papacy in 1513. The creation of Leo X. spread satisfaction throughout Italy. . . . Florence shared in the general rejoicing. . . . It seemed as though the Republic, swayed by him, might make herself the first city in Italy, and restore the glories of her Guelph ascendancy upon the platform of Renaissance statecraft. There was now no overt opposition to the Medici in Florence. How to govern the city from Rome, and how to advance the fortunes of his brother Giuliano and his nephew Lorenzo (Piero's son, a young man of 21), occupied the Pope's most serious attention. For Lorenzo, Leo obtained the Duchy of Urbino and the hand of a French princess. Giuliano was named Gonfalonier of the Church. He also received the French title of Duke of Nemours and the hand of Filiberta, Princess of Savoy. . . . Giulio, the Pope's bastard cousin, was made cardinal. . . . To Lorenzo, Duke of Urbino, the titular head of the family, was committed the government of Florence. . . . Florence now for the first time saw a regular court established in her midst, with a prince, who, though he bore a foreign title, was in fact her master. The joyous days of Lorenzo the Magnificent returned. . . . But this prosperity was no less brief than it was brilliant. A few years sufficed to sweep off all the chiefs of the great house. Giuliano died in 1516, leaving only a bastard son, Ippolito. Lorenzo died in 1519, leaving a bastard son, Alessandro, and a daughter, six days old, who lived to be the Queen of France. Leo died in 1521. There remained now no legitimate male descendants from the stock of Cosimo. The honours and pretensions of the Medici devolved upon three bastards,—on the Cardinal Giulio, and the two boys, Alessandro and Ippolito. Of these, Alessandro was a mulatto, his mother having been a Moorish slave in the Palace of Urbino; and whether his father was Giulio, or Giuliano, or a base groom, was not known for certain. To such extremities were the Medici reduced. . . . Giulio de' Medici was left in 1521 to administer the State of Florence single-handed. He was archbishop, and he resided in the city, holding it with the grasp of an absolute ruler. . . . In 1523, the Pope, Adrian VI., expired after a short papacy, from which he gained no honour and Italy no profit. Giulio hurried to Rome, and, by the clever use of his large influence, caused himself to be elected with the title of Clement VII." Then followed the strife of France and Spain—of Francis I. and Charles V.—for the possession of Italy, and the barbarous sack of Rome in 1527 (see ITALY: 1523-1527; 1527; 1527-1529). "When the Florentines knew what was happening in Rome, they rose and forced the Cardinal Passerini [whom the pope had appointed to act as his vicegerent in the government of Florence] to depart with the Medicean bastards from the city. . . . The whole male population was enrolled in a militia. The Grand Council was reformed, and the republic was restored upon the basis of 1405. Niccolo Capponi was elected Gonfalonier. The name of Christ was again registered as chief of the commonwealth—to such an extent did the memory of Savonarola still sway the popular imagination. The new State hastened to form an alliance with France, and Malatesta Baglioni was chosen as military Commander-in-Chief. Meanwhile the city armed itself for siege—Michel Angelo Buonarroti and Francesco da San Gallo undertaking the construction of new forts and ramparts. These measures were adopted with sudden decision, because it was soon known that Clement had made peace with the Emperor, and that the army which had sacked Rome

was going to be marched on Florence. . . . On September 4 [1529], the Prince of Orange appeared before the walls, and opened the memorable siege. It lasted eight months, at the end of which time, betrayed by their generals, divided among themselves, and worn out with delays, the Florentines capitulated. . . . The long yoke of the Medici had undermined the character of the Florentines. This, their last glorious struggle for liberty, was but a flash in the pan—a final flare up of the dying lamp. . . . What remains of Florentine history may be briefly told. Clement, now the undisputed arbiter of power and honour in the city, chose Alessandro de' Medici to be prince. Alessandro was created Duke of Civitá di Penna, and married to a natural daughter of Charles V. Ippolito was made a cardinal." Ippolito was subsequently poisoned by Alessandro, and Alessandro was murdered by another kinsman, who suffered assassination in his turn. "When Alessandro was killed in 1539, Clement had himself been dead five years. Thus the whole posterity of Cosimo de' Medici, with the exception of Catherine, Queen of France [daughter of Lorenzo, duke of Urbino, the son of Piero de' Medici], was utterly extinguished. But the Medici had struck root so firmly in the State, and had so remodelled it upon the type of tyranny, that the Florentines were no longer able to do without them. The chiefs of the Ottimati selected Cosimo, a descendant from Lorenzo, brother of the Cosimo who founded the power of the House. "He it was who obtained [1569] the title of Grand Duke of Tuscany from the Pope—a title confirmed by the Emperor, fortified by Austrian alliances, and transmitted through his heirs to the present [nineteenth] century."—J. A. Symonds, *Sketches and studies in Italy (Florence and the Medici, ch. 5)*.—The history of Florence since the sixteenth century is largely absorbed in the history of Italy.

FLORES, Juan José (1800-1864), Spanish-American general. First president of Ecuador,

1830-1835; re-elected in 1839 and 1843; resigned in 1845 and went to Europe. He was recalled in 1863 to defend Ecuador against General Franco. See **ECUADOR**: 1822-1888.

**FLORES, Venancio** (1809-1868), Spanish-American soldier. Leader of the revolt in Uruguay, 1853; provisional president of Uruguay, 1865; president, 1866. He allied himself with Brazil and Argentina in the war against Paraguay. See **URUGUAY**: 1821-1905.

**FLORES**, island in the Dutch East Indies, east of Java, about 224 miles long and 37 miles across. It is the seat of several active volcanoes, and the interior is covered with dense forests which have not yet been explored. It is divided into two administrative districts, one of which is attached to the government of Celebes and the other to the residency of Timor. The natives are of Papuan stock, but there are many Malays along the coast. Until 1850 the Portuguese claimed portions of the island.

**FLORES**, island in the Azores group celebrated for the naval battle fought in 1591 between Richard Grenville, in command of the *Revenge*, and a Spanish fleet. See **AZORES**.

**FLORIDA**: Geographical description.—Area and population.—“The peculiar shape of Florida almost forbids description. It is an irregularly formed peninsula whose Atlantic coast line trends almost southeast. The state has an arm extending westward from its central line a distance almost as great as its north and south extension. Its length by a north and south air line, from the St. Mary’s river to Key West, the southernmost point of United States’ continental possessions, is approximately four hundred and twenty-five miles. The extreme width across the northern part of the state, from the ocean to the Perdido river, which marks the Alabama boundary, is three hundred and seventy miles. The lower peninsula in its greatest width, about the line of Tampa, measures one hundred and fifty miles. In area Florida is the second state east of the Mississippi river, Georgia alone being larger. It contains a surface area of 58,666 square miles, of which 3,805, or a little more than 6 per cent, are fresh water surface. The coast line of the state measures approximately thirteen hundred miles, which by the indentations of bays and sounds are increased to almost sixteen hundred miles.”—G. M. Chapin, *Florida, historical*, v. 1, pp. 84, 87.—In 1922 the population was estimated at 966,206.

**Resources**.—The conditions governing the geological formation of Florida led to the creation of immense deposits of phosphates, peat and valuable clays, including fullers’ earth and kaolin; but generally speaking Florida is an agricultural state with a total acreage of 4,878,344, of which 1,886,277 acres are improved; and the chief products are oranges, pineapples, cotton, and tobacco. Forests of valuable timber cover about 308,268 acres.

1512.—**Discovery and naming by Ponce de Leon**. See **AMERICA**: 1512.

1528-1542.—**Expeditions of Narvaez and Hernando de Soto**.—Wide Spanish application of the name Florida.—“The voyages of Garay [1510-1523] and Vasquez de Ayllon [1520-1526] threw new light on the discoveries of Ponce, and the general outline of the coasts of Florida became known to the Spaniards. Meanwhile, Cortés had conquered Mexico, and the fame of that iniquitous but magnificent exploit rang through all Spain.

Many an impatient cavalier burned to achieve a kindred fortune. To the excited fancy of the Spaniards the unknown land of Florida seemed the seat of surpassing wealth, and Pamphilo de Narvaez essayed to possess himself of its fancied treasures. Landing on its shores [1528], and proclaiming destruction to the Indians unless they acknowledged the sovereignty of the Pope and the Emperor, he advanced into the forests with 300 men. Nothing could exceed their sufferings. Nowhere could they find the gold they came to seek. The village of Appalache, where they hoped to gain a rich booty, offered nothing but a few mean wigwams. The horses gave out and the famished soldiers fed upon their flesh. The men sickened, and the Indians unceasingly harassed their march. At length, after 280 leagues of wandering, they found themselves on the northern shore of the Gulf of Mexico, and desperately put to sea in such crazy boats as their skill and means could construct. Cold, disease, famine, thirst, and the fury of the waves, melted them away. Narvaez himself perished, and of his wretched followers no more than four escaped, reaching by land, after years of vicissitude, the Christian settlements of New Spain. . . . Cabeça de Vaca was one of the four who escaped, and, after living for years among the tribes of Mississippi, crossed the River Mississippi near Memphis, journeyed westward by the waters of the Arkansas and Red River to New Mexico and Chihuahua, thence to Cinaloa on the Gulf of California, and thence to Mexico. The narrative is one of the most remarkable of the early relations. . . . The interior of the vast country then comprehended under the name of Florida still remained unexplored. . . . Hernando de Soto . . . companion of Pizarro in the conquest of Peru . . . asked and obtained permission [1537] to conquer Florida. While this design was in agitation, Cabeça de Vaca, one of those who had survived the expedition of Narvaez, appeared in Spain, and for purposes of his own spread abroad the mischievous falsehood that Florida was the richest country yet discovered. De Soto’s plans were embraced with enthusiasm. Nobles and gentlemen contended for the privilege of joining his standard; and, setting sail with an ample armament, he landed [May, 1539] at the Bay of Espiritu Santo, now Tampa Bay, in Florida, with 620 chosen men, a band as gallant and well appointed, as eager in purpose and audacious in hope, as ever trod the shores of the New World. . . . The adventurers began their march. Their story has been often told. For month after month and year after year, the procession of priests and cavaliers, cross-bowman, arquebusiers, and Indian captives laden with the baggage, still wandered on through wild and boundless wastes, lured hither and thither by the ignis-fatuus of their hopes. They traversed great portions of Georgia, Alabama, and Mississippi, everywhere inflicting and enduring misery, but never approaching their phantom El Dorado. At length, in the third year of their journeying, they reached the banks of the Mississippi, 132 years before its second [or third?] discovery by Marquette. . . . The Spaniards crossed over at a point above the mouth of the Arkansas. They advanced westward, but found no treasures,—nothing indeed but hardships, and an Indian enemy, furious, writes one of their officers, ‘as mad dogs.’ They heard of a country towards the north where maize could not be cultivated because the vast herds of wild cattle devoured it. They penetrated so far that they entered the range of the roving prairie-tribes. . . . Finding neither gold nor the South Sea, for both of which they had hoped, they returned to the banks of the Mississippi. De Soto

... fell into deep dejection, followed by an attack of fever, and soon after died miserably [May 21, 1542]. To preserve his body from the Indians his followers sank it at midnight in the river, and the sullen waters of the Mississippi buried his ambition and his hopes. The adventurers were now, with few exceptions, disgusted with the enterprise, and longed only to escape from the scene of their miseries. After a vain attempt to reach Mexico by land, they again turned back to the Mississippi, and labored, with all the resources which their desperate necessity could suggest, to construct vessels in which they might make their way to some Christian settlement. . . . Seven brigantines were finished and launched; and, trusting their lives on board these frail vessels, they descended the Mississippi, running the gauntlet between hostile tribes who fiercely attacked them. Reaching the Gulf, though not without the loss of eleven of their number, they made sail for the Spanish settlement on the River Panuco, where they arrived safely, and where the inhabitants met them with a cordial welcome. Three hundred and eleven men thus escaped with life, leaving behind them the bones of their comrades, strewn broadcast through the wilderness. De Soto's fate proved an insufficient warning, for those were still found who begged a fresh commission for the conquest of Florida; but the Emperor would not hear them. A more pacific enterprise was undertaken by Cancellor [or Cancer], a Dominican monk, who with several brother-ecclesiastics undertook to convert the natives to the true faith, but was murdered in the attempt. . . . Not a Spaniard had yet gained foothold in Florida. That name, as the Spaniards of that day understood it, comprehended the whole country extending from the Atlantic on the east to the longitude of New Mexico on the west, and from the Gulf of Mexico and the River of Palms indefinitely northward towards the polar Sea. This vast territory was claimed by Spain in right of the discoveries of Columbus, the grant of the Pope, and the various expeditions mentioned above. England claimed it in right of the discoveries of Cabot, while France could advance no better title than might be derived from the voyage of Verrazano and vague traditions of earlier visits of Breton adventurers."—F. Parkman, *Pioneers of France in the New World*, ch. 1.

1549-1559.—Expeditions for conquest.—De Luna's effort to colonize Florida.—"Other expeditions for conquest or for the conversion of the native Florida tribes to Spanish Catholicism followed. Four Franciscan brothers came from Havana in 1549. They landed in Espiritu Santo Bay to labor for the spiritual welfare of the Indians. Three of them were murdered almost as they touched the shore, thus early in the history of the country staining its soil with the blood of religious martyrdom. The last of these expeditions of conquest was that commanded by Tristan de Luna, which was equipped by the Spanish viceroy of Mexico, and sailed from Vera Cruz in August, 1550. It landed at the present site of Pensacola, about one thousand soldiers, sailors, priests and friars. A reconnoitering party explored the country as far north as Tennessee, finding many traces of De Soto's travels. Their reports encouraged De Luna to undertake to col-

onize the lands they had explored, but his men demanded that they return home and many of them deserted on the supply ships that had come to their relief. De Luna was soon recalled and this project for colonizing Florida was abandoned. The historical significance of De Luna's expedition lies in the fact that it was the first settlement or temporary occupation by Europeans of the present site of Pensacola, and it was the first exploration of the Alabama and Tennessee territory. This practically was the last of the Spanish expeditions, which from the time of De Soto, almost fifty years before, had devastated the territory known as Florida. . . . The net result of the half century of aggressive oppression was the dim knowledge of a land of unknown limits, which the invaders pronounced 'the richest country in the world.' Not a single settlement of white men had been planted permanently in all the vast region and nothing had been accomplished toward introducing European civilization into the country."—G. M. Chapin, *Florida, historical*, v. 1, pp. 16-17.

1562-1563.—First colonizing attempt of the French Huguenots.—About the middle of the sixteenth century, certain of the Protestants of France began to turn their thoughts to the new world as a possible place of refuge from the persecutions they were suffering at home. "Some of the French sea-ports became strong-holds of the Huguenots. Their most prominent supporter, Coligny, was high admiral of France. These Huguenots looked toward the new countries as the proper field in which to secure a retreat from persecution, and to found a new religious commonwealth. Probably many of the French 'corsarios' following the track of the Portuguese and Spaniards to the West Indies and the coasts of Brazil, were Huguenots. . . . The first scheme for a Protestant colony in the new world was suggested by Admiral Coligny in 1554, and intended for the coast of Brazil, to which an expedition, under Durand de Villegagnon, was sent with ships and colonists. This expedition arrived at the Bay of Rio de Janeiro in 1555, and founded there the first European settlement. It was followed the next year by another expedition. But the whole enterprise came to an end by divisions among the colonists, occasioned by the treacherous, despotic, and cruel proceedings of its commander, a reputed Catholic. The colony was finally subverted by the Portuguese, who, in 1560, sent out an armament against it, and took possession of the Bay of Rio de Janeiro. . . . After the unfortunate end of the French enterprise to South America, Admiral Coligny, who may be styled the Raleigh of France, turned his attention to the eastern shores of North America; the whole of which had become known in France from the voyage of Verrazano, and the French expeditions to Canada and the Banks of Newfoundland." In February, 1562, an expedition, fitted out by Coligny, sailed from Havre de Grace, under Jean Ribault, with René de Laudonnière forming one of the company. Ribault arrived on the Florida coast in the neighborhood of the present harbor of St. Augustine, and thence sailed north. "At last, in about 32° 30' N. he found an excellent broad and deep harbor, which he named Port Royal, which probably is the present Broad River, or Port Royal entrance. . . . He found this port and the surrounding country so advantageous and of such 'singular beauty,' that he resolved to leave here a part of his men in a small fort. . . . A pillar with the arms of France was therefore erected, and a fort constructed, fur-

nished with cannon, ammunition, and provisions, and named 'Charlesfort.' Thirty volunteers were placed in it, and it became the second European settlement ever attempted upon the east coast of the United States. Its position was probably not far from the site of the present town of Beaufort, on Port Royal River. Having accomplished this, and made a certain captain, Albert de la Pieria, 'a soldier of great experience,' commander of Charlesfort, he took leave of his countrymen, and left Port Royal on the 11th day of June," arriving in France on July 20. "On his arrival in France, Ribault found the country in a state of great commotion. The civil war between the Huguenots and the Catholics was raging, and neither the king nor the admiral had time to listen to Ribault's solicitations, to send relief to the settlers left in 'French Florida.' Those colonists remained, therefore, during the remainder of 1562, and the following winter, without assistance from France; and after many trials and sufferings, they were at last forced, in 1563, to abandon their settlement and the new country." Having constructed a ship, with great difficulty, they put to sea; but suffered horribly on the tedious voyage, from want of food and water, until they were rescued by an English vessel and taken to England.—J. G. Kohl, *History of the discovery of Maine (Maine Historical Society Collections, 2nd series, v. 1, ch. 11)*.

ALSO IN: F. Parkman, *Pioneers of France in the New World, ch. 3*.—Father Charlevoix, *History of New France* (tr. by J. G. Shea), v. 1, bk. 3.—T. E. V. Smith, *Villegaignon (American Society of Church History, v. 3)*.

1564-1565.—Second Huguenot colony, and the cry in Spain against it.—"After the treacherous peace between Charles IX. and the Huguenots, Coligny renewed his solicitations for the colonization of Florida. The king gave consent; in 1564 three ships were conceded for the service; and Laudonnière, who, in the former voyage, had been upon the American coast, a man of great intelligence, though a seaman rather than a soldier, was appointed to lead forth the colony. . . . A voyage of 60 days brought the fleet, by the way of the Canaries and the Antilles, to the shores of Florida in June. The harbor of Port Royal, rendered gloomy by recollections of misery, was avoided; and, after searching the coast, and discovering places which were so full of amenity that melancholy itself could not but change its humor as it gazed, the followers of Calvin planted themselves on the banks of the river May [now called the St. John's], near St. John's bluff. They sung a psalm of thanksgiving, and gathered courage from acts of devotion. The fort now erected was called Carolina. . . . The French were hospitably welcomed by the natives; a monument, bearing the arms of France, was crowned with laurels, and its base encircled with baskets of corn. What need is there of minutely relating the simple manners of the red men, the dissensions of rival tribes, the largesses offered to the strangers to secure their protection or their alliance, the improvident prodigality with which careless soldiers wasted the supplies of food; the certain approach of scarcity; the gifts and the tribute levied from the Indians by entreaty, menace or force? By degrees the confidence of the red men was exhausted; they had welcomed powerful guests, who promised to become their benefactors, and who now robbed their humble granaries. But the worst evil in the new settlement was the character of the emigrants. Though patriotism and religious enthusiasm had prompted

the expedition, the inferior class of the colonists was a motley group of dissolute men. Mutinies were frequent. The men were mad with the passion for sudden wealth; and in December a party, under the pretence of desiring to escape from famine, compelled Laudonnière to sign an order permitting their embarkation for New Spain. No sooner were they possessed of this apparent sanction of the chief than they began a career of piracy against the Spaniards. The act of crime and temerity was soon avenged. The pirate vessel was taken, and most of the men disposed of as prisoners or slaves. The few that escaped in a boat sought shelter at Fort Carolina, where Laudonnière sentenced the ringleaders to death. During these events the scarcity became extreme; and the friendship of the natives was forfeited by unprofitable severity. March of 1565 was gone, and there were no supplies from France; April passed away, and the expected recruits had not arrived; May brought nothing to sustain the hopes of the exiles, and they resolved to attempt a return to Europe. In August, Sir John Hawkins, the slave merchant, arrived from the West Indies. He came fresh from the sale of a cargo of Africans, whom he had kidnapped with signal ruthlessness; and he now displayed the most generous sympathy, not only furnishing a liberal supply of provisions, but relinquishing a vessel from his own fleet. The colony was on the point of embarking when sails were descried. Ribault had arrived to assume the command, bringing with him supplies of every kind, emigrants with their families, garden-seeds, implements of husbandry, and the various kinds of domestic animals. The French, now wild with joy, seemed about to acquire a home, and Calvinism to become fixed in the inviting regions of Florida. But Spain had never abandoned her claim to that territory, where, if she had not planted colonies, she had buried many hundreds of her bravest sons. . . . There appeared at the Spanish court a commander well fitted for reckless acts. Pedro Melendez [or Menendez] de Aviles . . . had acquired wealth in Spanish America, which was no school of benevolence, and his conduct there had provoked an inquiry, which, after a long arrest, ended in his conviction. . . . Philip II. suggested the conquest and colonization of Florida; and in May, 1565, a compact was framed and confirmed by which Melendez, who desired an opportunity to retrieve his honor, was constituted the hereditary governor of a territory of almost unlimited extent. On his part he stipulated, at his own cost, in the following May, to invade Florida with 500 men; to complete its conquest within three years; to explore its currents and channels, the dangers of its coasts, and the depth of its havens; to establish a colony of at least 500 persons, of whom 100 should be married men; with 12 ecclesiastics, besides four Jesuits. . . . Meantime, news arrived, as the French writers assert through the treachery of the court of France, that the Huguenots had made a plantation in Florida, and that Ribault was preparing to set sail with re-enforcements. The cry was raised that the heretics must be extirpated; and Melendez readily obtained the forces which he required."—G. Bancroft, *History of the United States (author's last revision), pt. 1, ch. 4*.

1565.—Spanish capture of Fort Caroline and massacre of the Huguenots.—Founding of St.

**Augustine.**—"The expedition under Menendez consisted of an army of 2,600 soldiers and officers. He sailed straight for Florida, intending to attack Fort Caroline with no delay. In fact he sighted the mouth of the port [Sept. 4, 1565] two months after starting; but, considering the position occupied by the French ships, he judged it prudent to defer the attack, and make it, if possible, from the land. A council of war was held in Fort Caroline, presided over by Ribaut. Laudonnière proposed that, while Ribaut held the fort with the ships, he, with his old soldiers, who knew the country well, aided by the Floridians as auxiliaries, should engage the Spaniards in the woods, and harass them by perpetual combats in labyrinths to which they were wholly unaccustomed. The advice was good, but it was not followed. Ribaut proposed to follow the Spanish fleet with his own—lighter and more easily handled—fall on the enemy when the soldiers were all disembarked, and, after taking and burning the ships, to attack the army. In the face of remonstrances from all the officers, he persisted in this project. Disaster followed the attempt. A violent gale arose. The French ships were wrecked upon the Floridan coast; the men lost their arms, their powder, and their clothes; they escaped with their bare lives. There was no longer the question of conquering the Spaniards, but of saving themselves. The garrison of Caroline consisted of 150 soldiers, of whom 40 were sick. The rest of the colony was composed of sick and wounded Protestant ministers, workmen, 'royal commissioners,' and so forth. Laudonnière was in command. They awaited the attack for several days, yet the Spaniards came not. They were wading miserably through the marshes in the forests, under tropical rains, discouraged, and out of heart." But when, at length, the exhausted and despairing Spaniards, toiling through the marshes, from St. Augustine, where they had landed and established their settlement, reached the French fort (Sept. 20), "there was actually no watch on the ramparts. Three companies of Spaniards simultaneously rushed from the forest, and attacked the fortress on the south, the west and the south-west. There was but little resistance from the surprised garrison. There was hardly time to grasp a sword. About 20 escaped by flight, including the Captain, Laudonnière; the rest were every one massacred. None were spared except women and children under fifteen; and, in the first rage of the onslaught, even these were murdered with the rest. There still lay in the port three ships, commanded by Jacques Ribaut, brother [son] of the unfortunate Governor. One of these was quickly sent to the bottom by the cannon of the fort; the other two cut their cables, and slipped out of reach into the roadstead, where they lay, waiting for a favourable wind, for three days. They picked up the fugitives who had been wandering half-starved in the woods, and then set sail from this unlucky land. . . . There remained, however, the little army, under Ribaut, which had lost most of its arms in the wreck, and was now wandering along the Floridan shore." When Ribaut and his men reached Fort Caroline and saw the Spanish flag flying, they turned and retreated southward. Not many days later, they were intercepted by Menendez, near St. Augustine, to which post he had returned. The first party of the French who came up, 200 in number, and who were in a starving state, surrendered to the Spaniard, and laid down their arms. "They were brought across the river in small companies, and their hands tied

behind their backs. On landing, they were asked if they were Catholics. Eight out of the 200 professed allegiance to that religion; the rest were all Protestants. Menendez traced out a line on the ground with his cane. The prisoners were marched up one by one to the line; on reaching it, they were stabbed. Next day, Ribaut arrived with the rest of the army. The same pourparlers began. But this time a blacker treachery was adopted." An officer, sent by Menendez, pledged his honor to the French that the lives of all should be spared if they laid down their arms. "It is not clear how many of the French accepted the conditions. A certain number refused them, and escaped into the woods. What is certain is, that Ribaut, with nearly all his men, were tied back to back, four together. Those who said they were Catholics, were set on one side; the rest were all massacred as they stood. . . . Outside the circle of the slaughtered and the slaughterers stood the priest, Mendoza, encouraging, approving, exhorting the butchers."—W. Besant, *Gaspard de Coligny, ch. 7.*—The long dispatch in which Menendez reported his fiendish work to the Spanish king has been brought to light in the archives at Seville, and there is this endorsement on it, in the hand-writing of Philip II: "Say to him that, as to those he has killed, he has done well; and as to those he has saved, they shall be sent to the galleys."—F. Parkman, *Pioneers of France in the New World, ch. 7-8.*

1567-1568.—Vengeance of Dominic de Gourgues.—"As might have been expected, all attempts to rouse the French court into demanding redress were vain. Spain, above all other nations, knew the arts by which a corrupt court might be swayed, and the same intrigues which, fifty years later, sent Raleigh to the block and well-nigh ended the young colony of Virginia, now kept France quiet. But though the court refused to move, an avenger was not wanting. Dominic de Gourgues had already known as a prisoner of war the horrors of the Spanish galleys. Whether he was a Huguenot is uncertain. Happily in France, as the history of that and all later ages proved, the religion of the Catholic did not necessarily deaden the feelings of the patriot. Seldom has there been a deed of more reckless daring than that which Dominic de Gourgues now undertook. With the proceeds of his patrimony he bought three small ships, manned by eighty sailors and a hundred men-at-arms. He then obtained a commission as a slaver on the coast of Guinea, and in the summer of 1567 set sail. With these paltry resources he aimed at overthrowing a settlement which had already destroyed a force of twenty times his number, and which might have been strengthened in the interval. . . . To the mass of his followers he did not reveal the true secret of his voyage till he had reached the West Indies. Then he disclosed his real purpose. His men were of the same spirit as their leader. Desperate though the enterprise seemed, De Gourgues' only difficulty was to restrain his followers from undue haste. Happily for their attempt, they had allies on whom they had not reckoned. The fickle savages had at first welcomed the Spaniards, but the tyranny of the new comers soon wrought a change, and the Spaniards in Florida, like the Spaniards in every part of the New World, were looked on as hateful tyrants. So when De Gourgues landed he at once found a ready body of allies. . . . Three days were spent in making ready, and then De Gourgues, with a hundred and sixty

of his own men and his Indian allies, marched against the enemy. In spite of the hostility of the Indians, the Spaniards seem to have taken no precaution against a sudden attack. Menendez himself had left the colony. The Spanish force was divided between three forts, and no proper precautions were taken for keeping up the communications between them. Each was successively seized, the garrison slain or made prisoners, and, as each fort fell, those in the next could only make vague guesses as to the extent of the danger. Even when divided into three the Spanish force outnumbered that of De Gourgues, and savages with bows and arrows would have counted for little against men with fire arms and behind walls. But after the downfall of the first fort a panic seemed to seize the Spaniards, and the French achieved an almost bloodless victory. After the death of Ribault and his followers nothing could be looked for but merciless retaliation, and De Gourgues copied the severity, though not the perfidy of his enemies. The very details of Menendez' act were imitated, and the trees on which the prisoners were hung bore the inscription: 'Not as Spaniards, but as traitors, robbers, and murderers.' Five weeks later De Gourgues anchored under the walls of Rochelle. . . . His attack did not wholly extirpate the Spanish power in Florida. Menendez received the blessing of the Pope as a chosen instrument for the conversion of the Indians, returned to America and restored his settlement. As before, he soon made the Indians his deadly enemies. The Spanish settlement held on, but it was not till two centuries later that its existence made itself remembered by one brief but glorious episode in the history of the English colonies.—J. A. Doyle, *The English in America: Virginia, &c., ch. 5.*

1580-1665.—Sir Francis Drake raids St. Augustine.—Series of attacks by privateers and Indians.—“Sir Francis Drake, in 1580, attacked the garrison at St. Augustine. He destroyed the fort and sacked the treasure chest that he found. The little settlement was rebuilt, and in 1593, twelve Franciscan brothers made it their headquarters for extending the Catholic missions and religion throughout the peninsula. Five years later began a series of attacks and massacres upon the Spanish missions by the Indians, but not discouraged by these disasters the missionaries became even more aggressive, and increasing success seemed to crown their efforts. . . . The raid of Sir Francis Drake upon St. Augustine was that of a privateer, and the city was again made the victim of a similar attack in 1665. The Spaniards made frequent complaints to the English authorities of this lawlessness. The Carolinians, in turn, declared that the Spaniards were constantly inciting the Indians to attack the English settlements. It is entirely probable that both charges were quite within the bounds of truth.”—G. M. Chapin, *Florida, historical, v. 1, pp. 27, 34.*

1628.—Claimed by France, and placed, with New France, under the control of the Company of the Hundred Associates. See CANADA: 1616-1628.

1629.—Claimed in part by England and embraced in the Carolina grant to Sir Robert Heath. See AMERICA: 1620.

1740.—Unsuccessful attack on St. Augustine by the English of Georgia and Carolina. See GEORGIA: 1738-1743.

1763 (February).—Ceded to Great Britain by Spain in the Treaty of Paris. See SEVEN YEARS' WAR: Treaties which ended the war; LOUISIANA: 1762-1766.

1763 (July).—Possession by the English.—“When, in July [1763], possession was taken of Florida, its inhabitants, of every age and sex, men, women, children, and servants, numbered but 3,000; and, of these, the men were nearly all in the pay of the Catholic king. The possession of it had cost him nearly \$230,000 annually; and now it was accepted by England as a compensation for Havana. Most of the people, receiving from the Spanish treasury indemnity for their losses, had migrated to Cuba, taking with them the bones of their saints and the ashes of their distinguished dead. The western province of Florida extended to the Mississippi on the line of latitude of 31°. On the 20th of October, the French surrendered the post of Mobile, with its brick fort, which was fast crumbling to ruins. A month later, the slight stockade at Tombigbee, in the west of the Chocta country, was delivered up. In a congress of the Catawbas, Cherokees, Creeks, Chicasas, and Choctas, held on the 10th of November, at Augusta, the governors of Virginia and the colonies south of it were present, and the peace with the Indians of the South and South-west was ratified.”—G. Bancroft, *History of the United States (author's last revision), v. 3, p. 64.*

1763 (October).—English provinces, east and west, constituted by the king's proclamation. See NORTHWEST TERRITORY OF UNITED STATES.

1767-1774.—First colonization of great importance.—Dr. Andrew Turnbull, leader.—Location of colony.—Revolt of laborers.—Failure of the project.—“Among the early colonization propositions, the first of large importance of which record has been kept, was that backed by English capitalists, under the leadership of Dr. Andrew Turnbull, a Scotchman of some wealth. At an expense of one hundred and sixty thousand dollars, he and his associates recruited from Smyrna, the islands of the Mediterranean, Italy, and the Island of Minorca, fifteen hundred people and settled them on a tract of several thousand acres near Mosquito Inlet, on the eastern side of the state. To the settlement they gave the name New Smyrna, and this attaches to the locality today. The colonists were under indentures by which in consideration of the sums paid for their passage and support, they were to labor for their employers without wages for a specified number of years, after which they were to receive allotments of land in proportion to the size of their respective families. The location was well chosen, among natural conditions closely resembling those from which the settlers had come. Much labor was expended in building roads, opening canals for drainage and transportation, and for other improvements which remain and are in use today. Special attention was given to the cultivation of indigo and sugar cane, but various other crops were raised successfully. The colony was prosperous, but within a few years complaints were made of the injustice and hardships inflicted by the managers, who appear to have reduced the tenants to a pitiable condition. A revolt of the laborers brought more severe restrictions and the execution of the leaders. These complaints were brought to the ears of the attorney general and the governor of St. Augustine. Proceedings were begun in the English courts there to cancel the indentures and the colonists were released from their contract obligations. The original colony had been reduced by death and suffering to about six hundred persons, men, women, and children, and the

survivors were brought to St. Augustine where they were given allotments for homes in that section of the city north of the fort, where their descendants remain to the present time. These immigrants were known as Minorcans and the name still belongs to the remnant of the race. The Turnbull colony was established in Florida in 1767 and it was dissolved nine years later. It appears financially to have been a total loss, for it was abandoned before it could have become largely profitable. The cause of its failure can only be conjectured, but the uncertain and conflicting reports of history appear to relieve Dr. Turnbull of much of the direct blame, for it is handed down that the cruelties which resulted in the disbandment of the colony were inflicted by his overseers without his knowledge and during his absences from the place. Governor Grant resigned his position in 1771 and was succeeded by Lieutenant-Governor Moultrie, and he by Patrick Tonnyn in 1774.—G. M. Chapin, *Florida, historical*, v. 1, pp. 44-45.

1779-1781.—Reconquest of West Florida by the Spanish commander at New Orleans.—“In the summer of 1779 Spain had declared war against Great Britain. Galvez [the Spanish commander at New Orleans] discovered that the British were planning the surprise of New Orleans, and, under cover of preparations for defense, made haste to take the offensive. Four days before the time he had appointed to move, a hurricane destroyed a large number of houses in the town, and spread ruin to crops and dwellings up and down the ‘coast,’ and sunk his gun flotilla. . . . Repairing his disasters as best he could, and hastening his ostensibly defensive preparations, he marched, on the 22d of August, 1779, against the British forts on the Mississippi. His . . . little army of 1,434 men was without tents, other military furniture, or a single engineer. The gun fleet followed in the river abreast of their line of march along its shores, carrying one 24-, five 18-, and four 4-pounders. With this force, in the space of about three weeks, Fort Bute on bayou Manchac, Baton Rouge and Fort Panmure, 8 vessels, 556 regulars, and a number of sailors, militiamen, and free blacks, fell into the hands of the Spaniards. The next year, 1780, re-enforced from Havana, Galvez again left New Orleans by way of the Balize with 2,000 men, regulars, militia, and free blacks, and on the 15th of March took Fort Charlotte on Mobile river. Galvez next conceived the much larger project of taking Pensacola. Failing to secure re-enforcements from Havana by writing for them, he sailed to that place in October, to make his application in person, intending to move with them directly on the enemy. After many delays and disappointments he succeeded, and early in March, 1781, appeared before Pensacola with a ship of the line, two frigates, and transports containing 1,400 soldiers well furnished with artillery and ammunition. Here he was joined by such troops as could be spared from Mobile, and by Don Estevan Miró from New Orleans, at the head of the Louisiana forces, and on the afternoon of the 16th of March, though practically unsupported by the naval fleet, until dishonor was staring its jealous commanders in the face, moved under hot fire, through a passage of great peril, and took up a besieging position. . . . It is only necessary to state that, on the 9th of May, 1781, Pensacola, with a garrison of 800 men, and the whole of West Florida, were surrendered to Galvez. Louisiana had heretofore been included under one domination with Cuba, but now one of the several rewards bestowed upon her governor was the captain-generalship of Louisiana and West Florida.”—G. E. Waring, Jr., and G. W.

Cable, *History and present condition of New Orleans (United States tenth census, v. 19)*.—See also SPAIN: 1779-1783.

1783-1787.—Question of boundaries between Spain and the United States, and the question of the navigation of the Mississippi.—“By the treaty of 1783 between Great Britain on the one part and the United States and her allies, France and Spain, on the other, Great Britain acknowledged the independence of the colonies, and recognized as a part of their southern boundary a line drawn due east from a point in the Mississippi River, in latitude 31° north, to the middle of the Appalachicola; and at the same time she ceded to Spain by a separate agreement the two Floridas, but without defining their northern boundaries. This omission gave rise to a dispute between Spain and the United States as to their respective limits. On the part of Spain it was contended that by the act of Great Britain, of 1764, the northern boundary of West Florida had been fixed at the line running due east from the mouth of the Yazoo to the Chattahoochee, and that all south of that line had been ceded to her; whilst on the other hand, the United States as strenuously maintained that the act fixing and enlarging the limits of West Florida was superseded by the recent treaty, which extended their southern boundary to the 31st degree of north latitude, a hundred and ten miles further south than the one claimed by Spain. Spain, however, had possession of the disputed territory by right of conquest, and evidently had no intention of giving it up. She strengthened her garrisons at Baton Rouge and Natchez, and built a fort at Vicksburg, and subsequently one at New Madrid, on the Missouri side of the Mississippi, just below the mouth of the Ohio; and of the latter she made a port of entry where vessels from the Ohio were obliged to land and declare their cargoes. She even denied the right of the United States to the region between the Mississippi and the Alleghany Mountains, which had been ceded to them by Great Britain, on the ground that the conquests made by Governor Galvez, of West Florida, and by Don Eugenio Pierre, of Fort St. Joseph, ‘near the sources of the Illinois,’ had vested the title to all this country in her; and she insisted that what she did not own was possessed by the Indians, and could not therefore belong to the United States. Even as late as 1795, she claimed to have bought from the Chickasaws the bluffs which bear their name, and which are situated on the east bank of the Mississippi some distance north of the most northerly boundary ever assigned by Great Britain to West Florida. Here, then, was cause for ‘a very pretty quarrel,’ and to add to the ill feeling which grew out of it, Spain denied the right of the people of the United States to the ‘free navigation of the Mississippi,’—a right which had been conceded to them by Great Britain with all the formalities with which she had received it from France. . . . What was needed to make the right of any value to the people of the Ohio valley was the additional right to take their produce into a Spanish port, New Orleans, and either sell it then and there, or else store it, subject to certain conditions, until such time as it suited them to transfer it to sea-going vessels. This right Spain would not concede; and as the people of the Ohio valley were determined to have it, cost what it might, it brought on a series of intrigues between the Spanish governors of Louisiana and certain influential citizens west of the Alleghanies which threatened

the stability of the American Union almost before it was formed."—L. Carr, *Missouri*, ch. 4.

ALSO IN: E. Schuyler, *American diplomacy*, ch. 6.

1798-1810.—Causes leading to the intervention of the United States in West Florida.—Capture of the Baton Rouge fort, and seizure of the Spanish governor.—Independence of West Florida declared.—Confusion and anarchy.—The intervention by the United States in West Florida was due to two distinct causes—a spirit of territorial acquisition, expressing itself in popular clamor, fruitless diplomacy, and a series of frontier disturbances; and domestic revolt within the territory itself. The increase of American population in the southwest, particularly in the Natchez and Tombigbee districts of Mississippi Territory before and immediately after 1798, created a popular demand for an uninterrupted outlet to the Gulf of Mexico. This was only partially appeased by the uncertain privilege of deposit at New Orleans or the later purchase of Louisiana. . . . To those citizens of the United States who lived just above the thirty-first parallel the exactions levied by the Spaniards on their commerce at Mobile and the temptation afforded by the presence at Baton Rouge of a Bourbon regiment lacking all prestige, were continual incentives to border forays or to personal controversies and animosities that almost exhausted the patience of both governments and led both to appeal and to the sinister arbitration of Napoleon. For nearly two decades our State Department attempted to deal with the problems presented by the spirit of expansion and ensuing frontier disturbances, either by directly purchasing the whole of the Floridas from Spain or by securing the strategic portion through untenable claims strengthened by subservency to France or England. When diplomatic bargain or chicane failed to gain the coveted region, the inhabitants of West Florida took advantage of Spain's necessity to revolt and thus force the American authorities to intervene, for the double purpose of preserving order in their own contiguous territories and of realizing their territorial ambition. It was this intervention that brought the revolted region into the Union and ultimately led to the acquisition of the rest of the Floridas. Jefferson had perceived the possibility of such a result while yet a member of Washington's Cabinet. Hearing that Governor Quesada of East Florida was inviting foreigners to settle in his territory, he thus expressed himself to his superior: "I wish a hundred thousand of our inhabitants would accept the invitation. It may be the means of delivering to us peaceably what may otherwise cost a war. In the meantime we may complain of this seduction of our inhabitants just enough to make them believe we think it very wise policy for them and confirm them in it." Meanwhile Jefferson and his successors, largely influenced by his direct suggestion and advice, skilfully utilized every diplomatic opportunity from the Nootka Sound episode to the overthrow of the Bourbon rulers of Spain to secure the Floridas. . . . The cession of Louisiana by France to the United States placed a new importance upon Spain's retention of the Floridas. [See also U. S. A.: 1803.] . . . If the Louisiana Purchase emphasized the importance of the Floridas to Spain, it also brought into prominence the fact that most of the inhabitants of the Floridas expected and desired annexation to the United States. When, to their disappointment, the American commissioners accepted Louisiana without demanding West Florida, the inhabitants of the Bayou Sara region, who were mostly of Anglo-American origin,

began a series of border outrages in which the Kempers gained an unpleasant notoriety. At the same time renewed Spanish exactions at Mobile aroused the resentment of the settlers of the Tombigbee region, largely peopled by recent American immigrants from Georgia, the Carolinas, and Tennessee. . . . For many years Governor Claiborne's letters emphasize the unsatisfactory conditions existing on the West Florida border, and his active knowledge of the situation enabled him, at the critical juncture, to advise the American government as to its proper course. . . . In 1807 General James Wilkinson brought to the attention of the administration a 'letter from a Gentleman in New Orleans' (probably Claiborne) of which he gave the following significant extracts:

"Since your departure from this place, discontent begins to assume a very formidable aspect amongst the people of West Florida. They are ripe for violent measures. Two of their head men are now in this place, who tell me "that if the United States will not protect them they will solicit the assistance of England." The taking of Baton Rouge and Pensacola they speak of as matters of trifling achievement. They have about 400 men who will follow their standard to any length they please.' Jefferson's pulse was then experiencing an unexpected flutter on account of the unwarranted attack upon the Chesapeake; and from this fact the menace of British intervention in West Florida, so strongly emphasized in Claiborne's letter, acquired an additional significance. . . . The concluding period of Jefferson's administration and the first few months of the next were marked by a policy of chafing delay and indecision in regard to Florida affairs."—I. J. Cox, *American intervention in West Florida* (*American Historical Review*, v. 17, no. 2, Jan., 1912, pp. 200-205).—In April, 1810, the adventurer, Samuel Fulton, now a Spanish subject residing at Baton Rouge, tendered his services to Madison, in case Spain succumbed to Bonaparte and Congress and the President desired to take possession of the contiguous territory. . . . More effective than this offer, which may be regarded as typical of the attitude of many leading citizens in West Florida, were the reports of Governor Holmes of Mississippi, supplemented by the personal representations of Governor W. C. C. Claiborne. . . . On June 14, 1810, Claiborne was empowered to write to William Wykoff, jr., a member of the Executive Council of Orleans Territory, advising him that in view of the prospect of South American independence West Florida might likewise seize the opportunity to become free. . . . On the 20th of June, 1810, Governor Holmes of Mississippi wrote to Robert Smith, secretary of state, that anarchy ruled throughout the neighboring province, where the regular authorities had ceased altogether to exercise their functions and voluntary police associations were absolutely ineffective. With regard to its future status the mixed population was divided into different national factions, of which the most important, the American, desired ultimate annexation to the United States. . . . On the 1st of July the people of the Feliciana District, the most populous of West Florida, held a meeting for the purpose of proposing a general committee to exercise the powers of government in the province, with the co-operation of the existing Spanish officials. . . . While the majority desired annexation to the United States, they hesitated to ask openly for assistance, lest they should be overwhelmed by forces from Havana before the United States could act upon their application. . . . To add to the confusion of the members of the Florida convention, there were rumors that a filibuster-

ing force was being organized in the Mississippi Territory to assist them in winning their freedom. This, with premature newspaper reports of their independence, prevented cordial relations with Governor De Lassus. . . . The harmony between De Lassus and the convention leaders was broken on Saturday, September 22, when the latter, fearing treachery on the part of the Spanish governor, instructed their military representative, Philemon Thomas, to capture the fort at Baton Rouge. Thomas accomplished this early on the morning of the twenty-third, at the same time seizing the governor, and three days later the convention formally declared the independence of West Florida. On Monday, September 24, Holmes learned of the determination of the Florida convention to attack Baton Rouge, and this report was supplemented on the following day by a letter from Pinkneyville telling of its capture. This letter was accompanied by a petition asking for a mobilization of both regular troops and territorial militia to protect the border from possible disturbance arising from anticipated disorder in West Florida. . . . The Mississippi executive immediately requested Colonel Cushing to prepare two companies of regulars for patrolling the frontier at Pinkneyville, in order to guard against fugitive slaves from below the line and possible filibustering parties above. Later he changed this detail to one company for patrol duty and one company to be held in readiness at Fort Adams, and emphasized the danger from possible insurrection amongst the slaves. During the next few days he also issued orders to mobilize the whole territorial militia, and by so doing indicated a desire not only to protect his own jurisdiction but suggested the possibility of moral support to the Florida 'Conventionalists.' . . . In the course of the next eight days Madison received another communication from Holmes, dated October 3. This enclosed a copy of the West Florida Declaration of Independence, passed on September 26, a personal address of the West Florida convention to Holmes, and an explanatory letter addressed by its president, John Rhea, to the Secretary of State. It is interesting to note that in the folio edition of the *American State Papers* these documents are published as enclosures in Governor Holmes's despatch of October 17. Madison certainly had them before him when he issued his proclamation of October 27 and directed his Secretary of State how to instruct Claiborne to take possession of West Florida. . . . A month later, on the distant West Florida border Claiborne and Holmes were jointly planning how to carry out the President's instruction in the most effectual manner, and with the least possible disturbance. . . . On the evening of December 9, Holmes and his company were suffered to enter the town without opposition, and Skipwith in an interview reported that he personally had abandoned any thought of resisting the American agents, but he stated that he could not answer for the troops within the fort. On the following morning Holmes had an interview with their commander, John Ballinger, and assured him that for the present those who were deserters would not be molested, and ultimately he believed the President would pardon them. Ballinger then stated that he had concluded to surrender the fort to the United States troops. By this time Claiborne with the regulars under Covington had already effected a landing some two miles above the town. Shortly thereafter Holmes reported to him the pleasing information that 'the armed citizens called here the convention troops are ready to retire from the fort and acknowledge the authority of the United States,' without insisting upon any terms.—I. J.

Cox, *American Historical Review*, v. 17, no. 2, Jan., 1912, pp. 297-305, 309.

1811-1813.—Secret statutes of the United States relative to Florida.—Possession taken by the Americans from the Mississippi to the Perdido.—In January, Congress passed an act in secret session authorizing the president to take possession of East as well as of West Florida. "In 1811, at the third session of the Eleventh Congress, two statutes and a joint resolution in regard to Florida were passed at secret sessions of the Senate and of the House of Representatives, and these enactments were approved by President James Madison. On January 3, 1811, President Madison sent a 'confidential' message to Congress transmitting certain papers therein mentioned and containing the following:

"Taking into view the tenor of these several communications, the posture of things with which they are connected, the intimate relation of the country adjoining the United States, eastward of the river Perdido, to their security and tranquillity, and the peculiar interest they otherwise have in its destiny, I recommend to the consideration of Congress, the seasonableness of a declaration that the United States could not see, without serious inquietude, any part of a neighboring territory, in which they have, in different respects, so deep and so just a concern, pass from the hands of Spain into those of any other foreign Power. I recommend to their consideration, also, the expediency of authorizing the Executive to take temporary possession of any part or parts of the said territory, in pursuance of arrangements which may be desired by the Spanish authorities; and for making provision for the government of the same, during such possession. The wisdom of Congress will, at the same time, determine how far it may be expedient to provide for the event of a subversion of the Spanish authorities within the territory in question, and an apprehended occupancy thereof by any other foreign Power.' Without quoting at length from the accounts of the subsequent proceedings in Congress, it may be said that not only were the debates and votes secret in both Houses of Congress, but also that the necessary messages exchanged between the two Houses and the notifications from President Madison of his approval of the resolution and statutes were received as confidential and behind closed doors, and that the House of Representatives by a vote of 51 to 40 refused to remove 'the injunction of secrecy.' These two statutes and resolution are found in volume 3, *United States Statutes at Large*, pages 471, 472. . . . The texts of the statutes and resolution are as follows:

"Taking into view the peculiar situation of Spain, and of her American provinces; and considering the influence which the destiny of the territory adjoining the southern border of the United States may have upon their security, tranquillity, and commerce; Therefore,

"Resolved by the Senate and House of Representatives of the United States of America, in Congress assembled, That the United States, under the peculiar circumstances of the existing crisis, cannot, without serious inquietude, see any part of the said territory pass into the hands of any foreign power; and that a due regard to their own safety compels them to provide, under certain contingencies, for the temporary occupation of the said territory; they, at the same time, declare that the said territory shall, in their hands, remain subject to future negotiation.

"Approved, January 15, 1811."

"An act to enable the President of the United States, under certain contingencies, to take possession of the country lying east of the river Perdido, and south of the state of Georgia and the Mississippi territory, and for other purposes.

"Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That the President of the United States be, and he is hereby, authorized to take possession of, and occupy, all or any part of the territory lying east of the river Perdido, and south of the state of Georgia and the Mississippi territory, in case an arrangement has been, or shall be made with the local authority of the said territory, for delivering up the possession of the same, or any part thereof, by any foreign government; and he may, for the purpose of taking possession, and occupying the territory aforesaid, and in order to maintain therein the authority of the United States, employ any part of the army and navy of the United States which he may deem necessary.

"Sec. 2. And be it further enacted, That one hundred thousand dollars be appropriated for defraying such expenses as the President may deem necessary for obtaining possession as aforesaid, and the security of the said territory, to be applied under the direction of the President, out of any moneys in the treasury not otherwise appropriated.

"Sec. 3. And be it further enacted, That in case possession of the territory aforesaid shall be obtained by the United States, as aforesaid, that until other provision be made by Congress, the President be, and he is hereby authorized to establish, within the territory aforesaid, a temporary government, and the military, civil, and judicial powers thereof shall be vested in such person and persons, and be exercised in such manner as he may direct, for the protection and maintenance of the inhabitants of the said territory in the full enjoyment of their liberty, property, and religion.

"Approved, January 15, 1811."

"An act concerning an act to enable the President of the United States, under certain contingencies, to take possession of the country lying east of the river Perdido, and south of the state of Georgia and the Mississippi territory, and for other purposes, and the declaration accompanying the same.

"Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That this act, and the act passed during the present session of Congress, entitled "An act to enable the President of the United States, under certain contingencies, to take possession of the country lying east of the river Perdido, and south of the state of Georgia and the Mississippi territory, and for other purposes," and the declaration accompanying the same, be not printed or published, until the end of the next session of Congress, unless directed by the President of the United States, any law or usage to the contrary notwithstanding.

"Approved March 3, 1811."

"From the foregoing it appears that these enactments were not published or promulgated in due course; they are found in volume 3 of the Statutes at Large immediately after the various acts of April 20, 1818, one of which (Chapter 80) was entitled 'An Act to provide for the publication of the laws of the United States, and for other purposes.'—D. H. Miller, *Secret statutes of the United States, a memorandum*, pp. 4-6.—By an act of Congress passed in April, 1812, "that part of

Florida recently taken possession of, as far east as Pearl River, was annexed to the new state [of Louisiana]. The remaining territory, as far as the Perdido, though Mobile still remained in the hands of the Spaniards, was annexed, by another act, to the Mississippi Territory." A year later, in April, 1813, General Wilkinson was instructed to take possession of Mobile, and to occupy all the territory claimed, to the Perdido, which he accordingly did, without bloodshed.—R. Hildreth, *History of the United States, 2d series*, v. 3, ch. 23, 24, 26.—See also LOUISIANA: 1813-1815.

1812-1819.—War of 1812.—British fleet in Pensacola harbor.—Fugitive negroes and the first Seminole War.—Jackson's campaign.—"The War of 1812, between the United States and England, involved Florida once more. A British fleet entered the harbor of Pensacola and with the consent of the Spanish governor landed troops. The British flag was raised over the forts and the Indians of that region were incited to carry on hostilities against the settlers in Georgia. They were armed with British guns and ammunition and were promised liberal bounties for their attacks. General Andrew Jackson was sent by the United States Government in 1814, to put an end to these depredations upon Americans. With a body of regulars he marched against Pensacola and stormed the town. He drove the British forces from Forts St. Michel and Barancas, and occupied the city. He then marched with his forces to New Orleans."—G. M. Chapin, *Florida, historical*, v. 1, p. 48.—"The tranquillity of Monroe's administration was soon seriously threatened by the renewal of trouble with the Southern Indians [the Seminoles, and the refugee Creeks]. . . . The origin of the difficulty was twofold: first, the injustice which has always marked the treatment of Indian tribes whose lands were coveted by the white; and secondly, the revival of the old grievance, that Florida was a refuge for the fugitive slaves of Georgia and South Carolina. . . . The Seminoles had never withheld a welcome to the Georgia negro who preferred their wild freedom to the lash of an overseer on a cotton or rice plantation. The Georgians could never forget that the grandchildren of their grandfathers' fugitive slaves were roaming about the Everglades of Florida. . . . So long as there were Seminoles in Florida, and so long as Florida belonged to Spain, just so long would the negroes of Georgia find an asylum in Florida with the Seminoles. . . . A war with the Indians of Florida, therefore, was always literally and emphatically a slave-hunt. A reclamation for fugitives was always repulsed by the Seminoles and the Spaniards, and, as they could be redeemed in no other way, Georgia was always urging the Federal Government to war."—W. C. Bryant and S. H. Gay, *Popular history of the United States*, v. 4, ch. 10.—During the War of 1812-1814, the English, who were permitted by Spain to make use of Florida with considerable freedom, and who received no little assistance from the refugee negroes and Creek Indians, "had built a fort on the Appalachian River, about 15 miles from its mouth, and had collected there an immense amount of arms and ammunition. . . . When the war ended, the English left the arms and ammunition in the fort. The negroes seized the fort, and it became known as the 'Negro Fort.' The authorities of the United States sent General Gaines to the Florida frontier with troops, to establish peace on the border. The Negro Fort was a source of anxiety both to the military authorities and to the slave-owners of Georgia," and a pretext was soon found—whether valid or not seems uncertain—for

attacking it. "A hot shot penetrated one of the magazines, and the whole fort was blown to pieces, July 27, 1816. There were 300 negro men, women and children, and 20 Choctaws in the fort; 270 were killed. Only three came out unhurt, and these were killed by the allied Indians. . . . During 1817 there were frequent collisions on the frontiers between Whites and Indians. . . . On the 20th of November, General Gaines sent a force of 250 men to Fowlstown, the headquarters of the chief of the 'Redsticks,' or hostile Creeks. They approached the town in the early morning, and were fired on. An engagement followed. The town was taken and burned. . . . The Indians of that section, after this, began general hostilities, attacked the boats which were ascending the Appalachicola, and massacred the persons in them. . . . In December, on receipt of intelligence of the battle at Fowlstown and the attack on the boats, Jackson was ordered to take command in Georgia. He wrote to President Monroe: 'Let it be signified to me through any channel (say Mr. J. Rhea) that the possession of the Floridas would be desirable to the United States, and in sixty days it will be accomplished.' Much was afterwards made to depend on this letter. Monroe was ill when it reached Washington, and he did not see or read it until a year afterwards, when some reference was made to it. Jackson construed the orders which he received from Calhoun with reference to this letter. . . . He certainly supposed, however, that he had the secret concurrence of the administration in conquering Florida. . . . He advanced through Georgia with great haste and was on the Florida frontier in March, 1818. He . . . immediately advanced to St. Mark's, which place he captured."—W. G. Sumner, *Andrew Jackson as a public man*, ch. 3.—"On his way down the Appalachicola he found the Indians and negroes at work in the fields, and unconscious of any impending attack. Some of them fled to St. Mark's. His theory, in which he supposed that he was supported by the administration, was that he was to pursue the Indians until he caught them, wherever they might go; that he was to respect Spanish rights as far as he could consistently with that purpose; and that the excuse for his proceedings was that Spain could not police her own territory, or restrain the Indians. Jackson's proceedings were based on two positive but arbitrary assumptions: (1) That the Indians got aid and encouragement from St. Mark's and Pensacola. (This the Spaniards always denied, but perhaps a third assumption of Jackson might be mentioned: that the word of a Spanish official was of no value.) (2) That Great Britain kept paid emissaries employed in Florida to stir up trouble for the United States. This latter assumption was a matter of profound belief generally in the United States." Acting upon it with no hesitation, Jackson caused a Scotch trader named Arbuthnot, whom he found at St. Mark's, and an English lieutenant of marines, Ambrister by name, who was taken prisoner among the Seminoles, to be condemned by court martial and executed, although no substantial evidence of their being in any way answerable for Indian hostilities was adduced. "Learning that the Spanish authorities at Pensacola were furnishing the Indians with arms, General Jackson marched against that place for the second time. It was quickly capitulated, the governor and many of his troops having fled to Fort Barancas. General Jackson established a provisional government over West Florida, with Colonel King as civil and military governor. This government was continued fourteen months, when Pensacola was restored to Spanish authority in

September, 1819."—G. M. Chapin, *Florida, historical*, v. 1, pp. 48-49.

1819-1821.—Cession by Spain to the United States.—"Jackson's vigorous proceedings in Florida would seem not to have been without effect. Pending the discussion in Congress on his conduct, the Spanish minister, under new instructions from home, signed a treaty for the cession of Florida, in extinction of the various American claims, for the satisfaction of which the United States agreed to pay to the claimants \$5,000,000. The Louisiana boundary, as fixed by this treaty, was a compromise between the respective offers heretofore made, though leaning a good deal to the American side: the Sabine to the 32d degree of north latitude; thence a north meridian line to the Red River; the course of that river to the 100th degree of longitude east [? west] from Greenwich; thence north by that meridian to the Arkansas; up that river to its head, and to the 42d degree of north latitude; and along that degree to the Pacific."—R. Hildreth, *History of the United States*, 2d series, v. 3, ch. 31-32.—"On the fifth of October Forsyth's [the American minister to Spain] efforts were rewarded by the Spanish cortes which, after annulling the three land grants, advised the king to ratify the treaty, which he did October 24, 1819. At the same time the cortes declared that they 'had observed with great mortification and pain that besides the alienation of valuable provinces of the Spanish monarchy . . . the Spanish negotiator of the treaty had left altogether unprovided for and had renounced all the just claims of Spanish subjects upon the United States for which indemnity had been stipulated by the convention of 1802.' [It was not until February, 1821, that the ratification of the Spanish Government was received.] The treaty was ratified [in 1819 by the United States] despite the opposition of Clay who had declared that Florida must come to us sooner or later; 'that ripened fruit will not more surely fall. Florida is enclosed between Georgia and Alabama and cannot escape. Texas may.' Only four votes were cast against it: Brown of Louisiana, a brother-in-law of Clay; Richard M. Johnson of Kentucky from mere political subserviency to Clay; Williams of Tennessee from a violent hatred of General Jackson; and Trimble of Ohio from 'some maggot of the brain.'

"Mr. Benton was bitter in his regrets that the western boundary had not been extended much further westward into Texas. Besides cutting off Texas, the treaty, he declared, dismembered the Mississippi, mutilated two of its noblest rivers, and brought a non-slave-holding foreign dominion to the neighborhood of New Orleans. He declared that 'the Spanish government had offered us more than we had accepted' and that our policy and not hers had deprived us of Texas and the vast territory between the Red River and Upper Arkansas. Political considerations had entered into the question, for the repugnance in the northeast was not merely to territorial aggrandizement in the southwest but to the subsequent extension of slavery in that quarter. To prevent the slavery extension question from becoming a test in the presidential election was, he declared, the true reason for thus giving away Texas. But the treaty met with popular approval and Mr. Benton was forced to admit that he stood 'solitary and alone' in the matter, not a paper in the United States supporting his opposition. Jefferson remained inflexibly opposed to its ratification. East Florida was delivered by Governor Coppinger to Lieutenant Robert Butler of the

United States army, July 10, 1821, and on that day the Spanish flag was finally lowered from the walls of St. Augustine, where it had so long and so proudly waved. The stars and stripes announced the second acquisition to the young nation of the New World. Before the end of the cession during which the Florida treaty was ratified, Congress did not have time to legislate for the new territory. An act was passed, however, extending to it the revenue law and the laws against slave trade which had already existed in the United States. In April, General Jackson was appointed governor of Florida, possessing all the powers of the captain generals of Cuba and the Spanish governors of Florida, except those of granting lands and laying taxes. An American governor under Spanish law, of American territory not under the constitution—an anomalous position pregnant with possibilities for complications of serious import. With what was attributed to the traditional Spanish policy, the actual cession of Florida was not accomplished until July 17. In the meantime Jackson fumed, and his fury and his hatred for Spain and things and people Spanish increased in geometric proportion."—H. B. Fuller, *Purchase of Florida*, pp. 321-323.

1819-1829.—Judicial decisions growing out of acquisition of West Florida.—“In the two years’ struggle over the ratification of the treaty West Florida was not specifically involved. Late in 1819, by the act for the admission of Alabama, the remaining portion to the Perdido became an integral part of the American Union. For a time it seemed that Great Britain might attempt to seize Cuba as a counterpoise to the rest of the Floridas and thus separate the twin objects of Jefferson’s diplomacy. The American government avoided this danger by refraining from seizing the peninsula by force. Finally Spain, deserted by the other powers and torn by revolution, resumed for a time a constitutional form of government. In October, 1820, the short-lived Cortes consented to ratify the treaty, and on the twenty-second of the following February, the American Senate again accepted it with only four dissenting votes. The long drawn dispute was diplomatically settled. This settlement, however, in no wise determined the rightfulness of the American contention. Late in the following decade a case involving a land grant in Feliciana gave Chief-Justice Marshall a chance to express his opinion upon this point, had he chosen to avail himself of it. Something of the animosity displayed toward Jefferson in *Marbury v. Madison* or at the Burr trial might have led him to undo the argument upon which the third president and his advisers had based their specious claims. But a decision of this sort would have run counter to the national policy of a quarter century. In the region involved it would favor the land speculator at the expense of the actual settler. Marshall, therefore, rendered a decision in keeping with national interpretation, but he threw upon the earlier Republican administrations the responsibility for a condition that left the court no other alternative. According to Marshall’s *dictum* in *Foster v. Neilson*, France made no declaration on the limits of Louisiana until after she had sold it to the United States. Vital political considerations then prevented the latter from accepting her declaration. We have already noted at length what these ‘vital considerations’ were. In a controversy over boundaries, the chief-justice continued, the courts of

each country must be guided by the measures of their own government. The judiciary cannot decide international questions; its function is to decide individual rights. If the course of the United States was a plain one, the court would hesitate to pronounce it erroneous. Whatever the opinion of the individual judge may be, it is his duty to conform his decision to the will of the legislature clearly expressed. A treaty in the United States is equivalent to an act of legislation, and is thus part of the law of the land. The Louisiana court had dismissed the case on the ground that Spain had no right to grant land in West Florida, on January 2, 1804. Marshall ruled that in so doing the court had committed no error. In the case of *Newcombe v. Skipwith* the superior court of the Territory of Orleans under Judge Martin had already decided that West Florida formed part of the Louisiana Purchase. Evidently the courts, both local and national, were unwilling to override the action of executive and Congress. That body was less careful to remain consistent. In the Nineteenth Congress the House of Representatives favored a claim of De Lassus for the money that the convention seized, but the Senate refused to concur. In 1849 the government finally paid the heirs of a certain De la Francia for the arms that he had furnished Kemper, but only because Jackson had later used them in the defense of New Orleans. With these partial exceptions the government consistently maintained its attitude upon this mooted question. More than thirty years after the above incident, certain citizens of Louisiana resident in the Florida parishes, now by subdivision numbering eight, attempted a more extensive raid on the federal treasury. Under the plea that these parishes constituted the heirs of the defunct State of West Florida, they claimed the domain which their reputed ancestor, in 1810, conquered from the king of Spain. The American occupation of that year was due, they said, to the invitation extended by that State, and not to the reasons urged in the president’s proclamation. The American government had virtually abandoned its contention that West Florida was part of Louisiana in 1805, at the close of Monroe’s mission. Strategic reasons urged it to take the country before Great Britain should do so and cut off New Orleans. Unless the American government wished to follow precedents established in India rather than in America, it could justify the occupation only by the invitation of its inhabitants.”—I. J. Cox, *West Florida controversy*, pp. 655-650.—On the whole subject of the United States as the natural heir to Spain on the North American continent, and the discussions of our right and duty to absorb the Spanish provinces as fast as possible, there is an interesting letter from William Wirt to John Calhoun, which gives an echo of contemporary arguments and prophecies.

“To Mr. John Calhoun of  
Richmond, Va.

“Washington, Oct. 25, 1810.

“Upon my word this is a bright as well as a bold thought—and were it not for the very near approach of Congress, to whom the question of peace or war properly belongs, I believe it would be quite as well to right ourselves, by the short cut you propose. I believe that Virgil’s coal turned loose, at the close of a long winter, into a rich meadow, would not enjoy the luxuriant frolic more than Jackson would, to be turned loose into the Spanish Provinces, Cuba included. What antics, what tantarums, what didos would be cut—stand clear all ye Arbuthnots and Ambristers, and all ye Seminolean and Spanish chiefs—for the devil is to

play among the tailors. Suppose you drop this hint to congress, either through the members whom you know, or through the papers. I think it would be well worth their while to enquire whether the temporary occupation of the Texas, as far as the Colorado, would not be expedient, considering the inability of Spain to hold it, even against intruders, for the purpose of meeting the final decree of the court—and then when we have it (and Florida, for the same reason, viz. its protection for the right owner) we may, after the example of Spain, go on to negociate at our ease. But I am against the example of the French republic—no fraternal hugs by force—it does not suit the genius of our government. Justice, forbearance, generosity, moderation and magnanimity are the characteristics with which we ought to seek to clothe our nation—all these, however, are perfectly compatible with the cool and firm assertion of our rights—and although Spain, from her imbecility, would be an object of pity, if her ludicrous arrogance did not make her one of contempt, yet I think we have humored her childish and wayward caprices long enough—and I would take her playthings from her, 'till she came to her sober senses and to a sense of justice toward us. The truth of the matter is that all these provinces must fall off from Spain, in a very few years, whether we take them or not. The parent trunk is rotten, and can no longer sustain such extensive and ponderous branches. 'The date of knock[?] is out' and 'off must drop the sympathetic snout' not that the analogy is precise in this case—for it is not by sympathetic decay that the provinces will fall—but by the weight of their luxuriance and by the disposition of Spain to repress and circumscribe their growth and to trim them into a senile subjection to her whims. I believe that every man who observes what is going on, is satisfied that all that tissue of provinces down to the isthmus will be independent in a few years. Now tell me what will be the consequence of their separate independence, each for itself or their forming themselves into one or several confederations. Would it be better for us, for our peace, that they should hold this separate existence, or that they should be incorporated with us. If in the infant state the stronger powers of Europe shd. make a run at them, supposing them to continue separate, what should be our course? Should we aid them? If we should what would be the consequences Russia being, as she certainly would, among the ambitious invaders, for she has indicated already a strong hankering after our coast on the Pacific—only observe with what great events this movement of the Spanish colonies is pregnant—pray how far can you see into the womb of time? I think (as at present advised) that it wd. have a good effect on the powers of Europe, to make these provinces a part of ourselves as fast as it can be constitutionally done—for I don't think that either of them (the powers of Europe) would be very forward, to seek a quarrel with us, wantonly. I think that less than half a century will find the U. S. at the Stony Mountains and powerful enough to cope, in a defensive war, with the combined world. How hard is it upon us, that we cannot live to see these things—but we can look from Mount Pisgah, with Moses, upon this promised land."—W. Wirt, *Letter of William Wirt (American Historical Review, v. 25, no. 4)*.

1835-1843.—Second Seminole War.—Dade's massacre.—"The conflict with the Seminoles was one of the legacies left by Jackson to Van Buren;

it lasted as long as the Revolutionary War, cost thirty millions of dollars, and baffled the efforts of several generals and numerous troops, who had previously shown themselves equal to any in the world. . . . As is usually the case in Indian wars there had been wrong done by each side; but in this instance we were the more to blame, although the Indians themselves were far from being merely harmless and suffering innocents. The Seminoles were being deprived of their lands in pursuance of the general policy of removing all the Indians west of the Mississippi. They had agreed to go, under pressure, and influenced, probably, by fraudulent representations; but they declined to fulfill their agreement. If they had been treated wisely and firmly they might probably have been allowed to remain without serious injury to the surrounding whites. But no such treatment was attempted, and as a result we were plunged in one of the most harassing Indian wars we ever waged. In their gloomy, tangled swamps, and among the unknown and untrodden recesses of the everglades, the Indians found a secure asylum; and they issued from their haunts to burn and ravage almost all the settled parts of Florida, fairly depopulating five counties. . . . The great Seminole leader, Osceola, was captured only by deliberate treachery and breach of faith on our part, and the Indians were worn out rather than conquered. This was partly owing to their remarkable capacities as bush-fighters, but infinitely more to the nature of their territory. Our troops generally fought with great bravery; but there is very little else in the struggle, either as regards its origin or the manner in which it was carried on, to which an American can look back with any satisfaction."—T. Roosevelt, *Life of Thomas H. Benton, ch. 10*.—"At the beginning of [the] . . . troubles with the native tribes, the number of Indians in Florida was estimated at two thousand, including warriors, women, and children besides the negroes who had escaped from the plantations and had made their abode with the natives. That this was a serious underestimate became apparent later and led to entirely inadequate preparations for the subjugation. Almost countless raids were made by the unruly red men; women and children were ruthlessly slaughtered, plantations laid waste, crops destroyed and buildings burned, until the industrial development of the state, from the Everglades to the northern and western boundaries was stopped. In many encounters the regular troops, unfamiliar with savage methods of warfare, were defeated. By ambush the Indians massacred detached commands and committed horrible indignities upon the bodies of their dead foes. The most notable of these treacherous slaughters was Dade's Massacre, which occurred near the present town of Bushnell in Sumter county, December 28, 1835. It aroused a feeling of horror in every part of the country and forced upon the Federal Government a realization of the serious task it had in dealing with the Florida Indians. It was brought about when Major Francis L. Dade, Fourth Infantry, U. S. A., was ordered with his command from his station at Key West to reinforce the post at Fort King. Marching from Tampa, where he had come by boat, he had one company of infantry and two companies of artillery, the force under his command numbering eight officers and one hundred privates. Crossing the Hillsborough and Withlacoochee rivers, the little force proceeded in open formation through several miles of prairie country, the road being bordered by low growing palmetto scrub. Behind these lurked one hundred and eighty Indians under Chief Mican-

opy. At a signal from the red warriors poured forth a volley of rifle fire, each selecting his particular victim. Half of Major Dade's command fell at the first round of fire and the slaughter was continued by the merciless savages until the last soldier had fallen, wounded or dead. So sudden had been the onslaught that effective resistance was impossible. The horrible work of the Indians was completed by a band of renegade negroes, who came upon the scene and beat to death every soldier who showed signs of life. From this bloody field one private escaped to Tampa and told the story. General Duncan L. Clinch was in command of the United States troops in Florida until 1836, when General Winfield Scott assumed command in person. During this period the depredations of the Indians were frequent and bold all over the state, but especially in the section west and southwest from the present location of Jacksonville, and in western Florida along the banks of the Apalachicola river. General Scott's campaign was practically fruitless and upon General R. K. Call of Florida, devolved the command of the regular and volunteer forces in the field. In November of the same year, 1836, General Thomas Jesup relieved him in command. He had eight thousand troops at his disposal. He organized a campaign and pushed operations against the Indians southward toward the Everglades, then the stronghold of the native tribes. He accomplished more by his aggressive and relentless methods than had been done by any or all of the preceding commanders."

1838-1845.—Effort to secure admission to the Union.—Land grant.—First governor.—First legislature.—“A movement to secure the admission of Florida to the Union as a state was begun in 1838, and a constitutional convention was assembled late in that year. The continuance of the Indian wars at that time, however, postponed further action until 1845. The policy of the Federal Congress had been to maintain the equilibrium of political power in the United States Senate by admitting new states, northern and southern, together, and accordingly Florida and Iowa were admitted by concurrent acts of Congress on March 3, 1845. [See also U. S. A.: 1845: Preserving the equilibrium, etc.; Iowa: 1830-1844.] A supplemental act of the same date gave to Florida a grant of eight entire sections of land whereon to establish a seat of government; also the sixteenth section in every township, or its equivalent, for the support of public schools, and two townships for establishing two seminaries of learning, one to be located east and the other west of the Suwanee river; also five hundred thousand acres for internal improvements, besides five per cent of the net proceeds from the sale of public lands, the same to be applied for the purposes of education. William D. Mosely was the first governor of Florida, chosen under the new constitution. Tallahassee, which had been the territorial capital, was continued as the seat of the state government, and the first Legislature was convened there in June, 1845.”—G. M. Chapin, *Florida, historical*, v. 1, p. 56.

1861 (January).—Secession from the union.—“The Florida Legislature in regular session, in November, 1860, provided for a convention of the people of the state, which met at Tallahassee in January of the following year, and on the

tenth day of that month, an ordinance of secession was adopted by a vote of sixty-two to seven. It declared the State of Florida to be a sovereign and independent nation, and it rescinded all ordinances that recognized the union with the United States. Florida's representatives in both branches of Congress withdrew from that body. Federal judges and other United States officials in the state resigned, excepting those at Key West.”—G. M. Chapin, *Florida, historical*, v. 1, p. 59.—See also U. S. A.: 1861 (January-February).

1862 (February-April).—Temporary union conquests and occupation.—Discouragement of Unionists. See U. S. A.: 1862 (February-April: Georgia-Florida).

1864.—Unsuccessful federal attempt to occupy the state.—Battle of Olustee. See U. S. A.: 1864 (January-February: Florida).

1865-1868.—Reconstruction under President Johnson's plan.—Legislature's refusal to ratify the Fourteenth amendment to the federal government.—Final admission.—“The Confederate forces in Florida made formal surrender to General McCook May 20, 1865. President Johnson appointed Judge William Marvin the provisional governor of the state in July, and in August he issued a call for an election of delegates to a constitutional convention, to be held in October. An amnesty oath was required as a qualification to vote at this election, and this oath was taken by seven thousand and forty-two persons in the entire state. Fifty-six delegates were chosen: the convention repealed the Ordinance of Secession and adopted a new constitution. This instrument provided for the election in November of a Governor, cabinet officers, a legislature, county officers and Congressional representatives. The entire vote cast at the election was less than four thousand. Davis S. Walker was elected Governor and took his office on December 20th. The functions of the state government were resumed during the following year, and citizens returned to their ordinary occupations. The Legislature met in December, 1866, and refused to ratify the Fourteenth Amendment to the Federal Constitution, on the ground that it virtually disfranchised the most intelligent classes in the south. The Reconstruction Law of 1867, passed over the President's veto, placed the southern states under the supreme military control of the United States. It practically disfranchised all who had served with the Confederate armies or who had given aid to the enemies of the United States.”—G. M. Chapin, *Florida, historical*, v. 1, pp. 64-65.—In June, 1868, after a constitution had been finally drafted on the Congressional Act of 1867, Florida was readmitted into the Union.—See also U. S. A.: 1865 (May-July), and after to 1868-1870: Reconstruction complete.

1872-1874.—Ossian B. Hart as governor.—“Ossian B. Hart was elected Governor in 1872 and the increasing population of the state by this time entitled it to two representatives in Congress. Governor Hart died in 1874 and was succeeded by Lieut.-Gov. Marcus L. Stearns.”—G. M. Chapin, *Florida, historical*, v. 1, p. 66.

1876-1884.—Electoral contest in Hayes-Tilden election.—Election of governors, 1876 and 1880.—Railroad construction.—“The election of 1870 in Florida being the logical product of Reconstruction politics was very ugly. It was, in fact, the bitter developed fruit of eight gnarled and twisted years. Every important incident and issue and condition in the campaign and the aftermath was foreshadowed in the experiences of these eight years. It would have been very

strange if politics in Florida in 1876 had been clean and straight. . . . Florida's electorate was well trained by sad experience for this disgraceful finale of Reconstruction and Radical rule. . . . As the fateful November 7th drew near, wilder and uglier rumors spread abroad. The contest was a real one. In some localities it was a rough one. Republican campaign managers sought to make it seem a desperate one for the physical safety of Radicals in Florida. 'The coming election is the crisis of free government in Florida,' declared the Republican state campaign committee, on October 23rd, in an address sent broadcast over the state. . . . Popular excitement increased as the days passed. Radical leaders helped it on for a purpose. Negroes were restless and mass meetings were frequent. 'In view of the excited condition of the public mind,' announced Governor Stearns on October 31st, 'and the in some degree well founded apprehension of coming trouble growing out of the bitter political canvass now in progress in this State . . . I earnestly call upon all citizens to temper zeal with discretion and to deprecate fraud, violence, and disorder.' The distribution of Federal troops over the state was desired by Radicals, and the troops were readily obtained. Several weeks before election day the war department began to distribute squads of regulars over the state. The presence of a few United States soldiers went a long way toward protecting black Radicals from possible onslaughts by exasperated and excited whites. On the 8th of October a battery of the Fifth United States Artillery was ordered to move from Tampa to Gainesville (in the midst of the Black Belt)—'to arrive between the 1st and 7th (of November), to go into encampment, and to remain until the 14th.' Squads of ten soldiers each were ordered from St. Augustine to Lake City and Quincy, and twenty soldiers were sent to Madison. A battery of the Fifth Artillery was sent from Barrancas to Marianna and another battery to Pensacola. . . . The presence of soldiers was useful in restraining Democrats who were, as a rule, seeking to carry the elections at almost any cost. They were not over-scrupulous about means. They sought results primarily. The key-note of their campaign method was not persuasion. That had failed. The key-note was threatened violence and economic coercion. That was positive, and that had already partially succeeded. The Democrats stood for a white man's government. They promised honest and inexpensive reform. 'Such reform was needed, God knows,' said one man. It is true that Florida had been undergoing reform since 1867, but the result had not been satisfactory to the whites. The State was very poor, taxes were very high, and society was in a bitter turmoil. The election methods of Conservative reformers in 1876, when judged apart from environment and in the light of exalted ethics, were rather bad. Democrats did not forge election returns, because being out of office that privilege accrued to Republicans; but they bulldozed opponents at the end of a halter or the point of a gun into voting with them or not voting at all. They did not manufacture spurious poll lists because that too was a Republican privilege, but they distributed spurious ballots to illiterate blacks and some did not hesitate to vote twice or three times on election day."—W. W. Davis, *Civil War and reconstruction in Florida*, pp. 687, 701-703.—See also U. S. A.: 1876-1877.—"George F. Drew was elected Governor [1876] by a democratic vote. He was chosen at the same general election which was so close through the United States that Flor-

ida's four electoral votes were necessary to decide between Samuel J. Tilden and Rutherford B. Hayes for the presidency, which was awarded to the republican candidate by the Electoral Commission. Governor Drew's election was welcomed by the people of Florida as a return to home rule. The state's finances which had fallen to a low ebb, revived and its bonds rose in the markets from the quotation of sixty-five cents on the dollar to par; taxes were reduced and a new era of prosperity was begun, wherein the industrial and agricultural growth of the state started in earnest. . . . William D. Bloxham was elected Governor in 1880 and his administration was marked by the inception of many railroad and other industrial enterprises. A number of charters was granted by the Legislature for railroad construction, accompanied by grants of lands. By the close of the year 1884, one thousand and forty-five miles of rail lines had been built in the state. The sections through which they were run were settled rapidly and the orange industry began to be important."—G. M. Chapin, *Florida, historical*, v. 1, pp. 66-67.

1884-1892.—Governors of this period.—"Edward A. Perry was elected Governor in 1884 and, according to custom, assumed his office at the beginning of the following year. Francis P. Fleming was elected his successor in 1888, the vote of the state at this election being 66,641. Henry L. Mitchell was his successor in 1892, and William D. Bloxham was called for the second time to the executive chair in 1896."—G. M. Chapin, *Florida, historical*, v. 1, p. 70.

1885-1887.—Constitutional convention.—Office of lieutenant-governor abolished.—Legislative sessions made biennial.—"A constitutional convention was called in 1885, and the instrument then adopted became effective January 1, 1887. This constitution showed an increasing socialistic tendency among the people, in that it provided, with subsequent amendments, for the election of practically all state, county, and judicial officers by popular vote, the judges of the Circuit Courts being still excepted, and these are appointed by the Governor. It was, in the opinion of a considerable number of the legal authorities of the state, not so effective an instrument as the constitution of 1868, which had been adopted under the stress of Federal military power, and which placed in the hands of the Governor the appointment of a large majority of all officers in the executive and judicial branches of the state administration. In connection with the state primary election law, it practically gives to the qualified electors of the state the naming of all their officers, state and national, with the exceptions named. The large majorities in Florida being democratic, all the administrations since 1876 have been directed by that political party. By the constitution of 1885, the office of lieutenant-governor was abolished, the duties of that position devolving upon the president of the State Senate. The regular sessions of the State Legislature were made biennial, beginning in April of the odd numbered years and the sessions were limited to sixty days."—G. M. Chapin, *Florida, historical*, v. 1, p. 69.

1885-1915.—Development of the East Coast transportation facilities.—"In 1885 the East Coast of Florida was little better than a wilderness. . . . There were no transportation facilities, and to many people it seemed certain that in the entire region there never would be railroads of consequence. . . . But in 1885 Henry M. Flagler . . . deliberately set himself the task of develop-

ing the resources of the entire East Coast. . . . He built a hotel in St. Augustine. . . . While the hotel was building he bought the little narrow-gauge railroad that ran from Jacksonville to . . . St. Augustine. . . . In 1896 trains were running to Miami. . . . [He] learned of the fertile lands to the south of Miami, and pushed the road twenty-eight miles to Homestead. . . . Then came the climax of the Flagler dream: Key West. . . . This was the gateway to Havana; this was the nearest point in the United States to the Panama Canal; this was the key to the trade of South America. . . . [Flagler] dared to undertake the problem. . . . 'Flagler's Folly' was the name popularly given to the projected route over the one hundred and twenty-eight miles from Homestead to Key West."—J. T. Paris, *Florida's sea board magnificent* (Travel, Jan., 1922, pp. 30-31). About \$15,000,000 was expended on this enterprise; and in the early part of 1915 through train service from New York to Havana was established.—See also RAILROADS: 1912-1915.

1888-1905.—Yellow fever.—Creation of state board of health.—Dr. Joseph Y. Porter's control of the yellow fever pestilence.—"No story of health conditions in Florida, indeed, no history of the state itself, would be complete without a recognition of the work that has been accomplished by the State Board of Health. Jacksonville was visited in 1888 by the scourge of yellow fever. One person in every four of the entire population was a victim of the disease. Two of the remaining three fled the city to escape the plague. One person of every ten who had the infection died from it. The first official act of Gov. Francis P. Fleming, who came to the executive chair of Florida in January, 1889, was to call a special session of the Legislature to provide for the creation and maintenance of a state board or commission to have charge of health affairs. That board was duly organized and as its executive head, the health officer of Florida, Dr. Joseph Y. Porter was elected. . . . For one hundred and forty years before the discovery, in 1900, by Dr. Walter Reed that the infection of yellow fever is mosquito-borne, Cuba and its capital city had stood as a constant peril to Florida and to the United States. For fifty years the average of deaths in Havana alone from the loathsome disease, had been two each day. [See MEDICAL SCIENCE: Modern; 19th century; Discovery of the secret of malaria.] Florida extends five hundred miles nearer to that city than any other part of the United States. It has constant and intimate relations with it, and it was due to this circumstance that Florida had become the natural entryway for the disease into this country, certainly an important one. Five years after Doctor Reed's discovery, the Florida State Board of Health had the opportunity to try out the management of yellow fever according to the new declarations of science and to give the final test to the theories that had led to the world's emancipation from the disease. When the time came, Doctor Porter and his board demonstrated for the first time on American soil that the pestilence could be controlled and stamped out by the careful and scientific isolation of infected cases. The spread of the disease was prevented in three threatened epidemics at later periods, and instead of continuing as a menace to the rest of the nation, Florida was made a bulwark of protection against the infection from the West Indies and the South and Central American countries."—G. M. Chapin, *Florida, historical*, v. 1, pp. 135-136.

1889.—Discovery of rich deposits of phosphates.—"In 1881 Mr. J. F. LeBarron, C. E. found phosphate pebble in Pease Creek, but it attracted no attention at the time, and it was not until 1889 that, in sinking a well at Dunellon, in Marion County, rock which proved to be phosphate of a high grade was found, and the value of the deposits appreciated. Discoveries soon began to be made in other localities, and the whole country was being searched for phosphate deposits. Companies were formed, lands purchased and machinery obtained to put the phosphate deposits in a condition to be shipped to the manufacturers of fertilizer. The phosphate belt extends for about two hundred miles along the western portion of the peninsula, through the counties of Jefferson, Madison, Taylor, Marion, Citrus, Hernando, Sumter, and Pasco, and in the beds of several rivers."—G. R. Fairbanks, *Florida, its history and romance*, pp. 232-233.

1894-1901.—"Great Freeze."—Amount of damage.—Jacksonville fire.—"The 'Great Freeze' came on the night of December 29, 1894. The temperature went to fourteen degrees above zero at Jacksonville and lower in some of the northern sections of the peninsula. Two million boxes of ungathered oranges on the trees were frozen solid. Young trees were killed and the older and hardier trees were seriously damaged. Not quite five weeks later, on the night of February 7, another destructive cold came, killing practically all the citrus trees that had survived the previous disaster in the northern and middle portions of the state. The losses from these two storms, directly and indirectly, amounted to no less than fifty millions of dollars. The result was an entire revolution in the orange growing industry, the groves being renewed further south in the state. The industry has reached proportions as great as those which were destroyed, and it is increasing in importance and value each year. The fire which swept Jacksonville, May 3, 1901, was one of the great conflagrations of history. The financial loss was above fifteen million dollars, but Jacksonville's recovery from that disaster has far surpassed all losses and has excited the admiration of the world."—G. M. Chapin, *Florida, historical*, v. 1, p. 73.

1898.—Part played in Spanish-American War.—"The proximity of Florida to Cuba caused much interest and substantial sympathy to be shown to the insurgents in Cuba, who in 1895 began the determined effort to free the island from Spanish rule. Large numbers of Cubans had come into Florida, and formed a considerable portion of the population of Key West and Tampa, and had settled in considerable numbers in other portions of the State. As the contest went on and the insurgents gained strength, expeditions were secretly formed from time to time in Florida ports, and cargoes of arms and ammunition were successfully landed on the coast of Cuba. The efforts of the government officials to prevent these infractions of the laws of neutrality were generally ineffectual. Small and swift steamers darted out at night from unexpected and unguarded localities, and were soon beyond the range of detection. One of these, called the *Three Friends*, achieved considerable fame. The sympathies of the people of the State, as well as of other parts of the country, sided with the insurgents. The harsh methods adopted by the Spanish governors as the war went on, still more effected a strong anti-Spanish public sentiment, and the relations between the two countries became strained. Senators and representatives who had visited

Cuba made vivid statements before Congress of the harrowing scenes they had witnessed there, and when the popular mind was greatly excited on behalf of the suffering Cubans, the treacherous destruction of the battleship *Maine* in Havana harbor by a submarine mine added fuel to the flame and easily led on to hostilities. Florida naturally became the gathering point for the troops called out by the President, and Tampa and its vicinity were occupied by large bodies of regulars and volunteers. The Santiago expedition sailed from Tampa, while Key West became the rendezvous of the naval forces. Later on extensive camps were established at Jacksonville, Miami, and Fernandina. Fort Clinch, at Fernandina, was garrisoned and mines planted in the harbor. The First Florida Volunteers went early in the service, under Colonel Lovell. Major-Gen. Fitzhugh Lee was encamped with the Seventh Corps, awaiting orders to proceed to Cuba or Puerto Rico, when the destruction of Cervera's fleet and the surrender of Santiago expedited the negotiations for peace which resulted in the signing of the protocol and suspension of hostilities on the 13th day of August, 1898.—G. R. Fairbanks, *Florida, its history and romance*, pp. 236-237.—See also U. S. A.: 1898 (March-April, to July-December).

1909-1910.—Attempts to amend the constitution.—In 1909 the legislature passed a bill providing for the submission at the general election, November, 1910, of an amendment to the constitution providing for state-wide prohibition, which failed of ratification by the electors. The Beard Disenfranchisement Resolution, designed to eliminate the negro vote, was also defeated.

1912.—Opening of the Key West extension to Florida of the East Coast Railway. See RAILROADS: 1912-1915.

1913.—Florida child labor campaign.—“The meeting of the National Child Labor Committee in Jacksonville [in] March [1913] has borne fruit in the passage of a child labor law in Florida by the Legislature which adjourned June 6 [of that year]. . . . The bill was drafted on the basis of the Uniform Child Labor Law, with some modifications to suit Florida conditions. . . . The only open opposition came from the Jacksonville *Times-Union*, a paper unusually timid concerning anything that might affect corporation interests, and from the Western Union Telegraph Company. . . . So vigorous was this opposition that it seemed to the writer too great to be overcome without risk of the whole bill, and a substitute measure was prepared on the basis of a bill which passed the Florida house four years [before]. This substitute fixes a ten-year age limit for boys and a sixteen-year age limit for girls in the newsboy service, with a twelve-year age limit for work in stores and the street trades generally, these two sections applying only to cities of 6,000 population or more. The third section prohibits the employment of children in factories, workshops, theaters, etc., under fourteen years of age anywhere in the state. Sixteen years is made the limit for dangerous occupations and processes, eighteen years for the night messenger service and twenty-one years for employment in places where intoxicating liquors are sold. Night work is prohibited and the hours for children under sixteen years of age are nine a day, fifty-four a week. The general provisions of the Uniform Child Labor Law slightly modified prescribe the procedure for securing certificates of employment under the direction of the school authorities. The beginning of legislation in the state for industrial

safety and health is made by provisions for safety appliances, sanitation, and seats for girls in establishments employing children under sixteen years of age. The bill provides for a state labor inspector, man or woman, whose sole duty is the enforcement of the child labor act.”—A. J. McKelway, *Florida child labor campaign* (Survey, July 12, 1913).

1913.—Lands for Japanese.—Primary election law.—After the alien law passed by California, citizens and business men of Florida offered tracts of land in Clay and Duval counties near Jacksonville to Japanese settlers. So much opposition arose that a special session of the legislature was urged. Finally the offer of land was withdrawn. The same year a general primary election law was passed.

1916.—Grandfather clause to constitution defeated.—A proposed “grandfather clause” to the constitution was defeated by a vote of 19,688 to 10,518.

1916-1917.—Migration of negroes. See RACE PROBLEMS: 1905-1921.

1917.—Law relative to convict labor on highway work.—Seminole Indians assigned to a reservation.—“Under a law enacted in 1917, the State Road Department of Florida was authorized to use convict labor upon the roads within its jurisdiction.”—W. F. Cocke, *Increasing use of convicts on highway work in Florida* (American City, July, 1919).—In 1917 arrangements were concluded between the federal government and the state of Florida whereby the Seminole Indians acquired a reservation. The reservation includes 100,000 acres of land near Ten Thousand Islands. The federal government is to act in capacity of helper in encouraging the Indians to cultivate the soil and raise stock.

1918.—Ratification of the eighteenth amendment.—Part played in the World War.—The eighteenth amendment was ratified by Florida on December 14, 1918. By the close of the war Florida had furnished the federal government with 33,331 soldiers, or .89 per cent. of the whole force.

1920 (November).—Elections.—In November Cary M. Hardee was elected governor.

1921.—Drainage of swamps around Lake Okeechobee. See CONSERVATION OF NATURAL RESOURCES: United States: 1890-1921.

**FOLCLAND**, or **Folkland**.—Public land, among the early English. "It comprised the whole area that was not at the original allotment assigned

to individuals or communities, and that was not subsequently divided into estates of bookland [bookland]. The folkland was the standing treasury of the country; no alienation of any part of it could be made without the consent of the national council; but it might be allowed to individuals to hold portions of it subject to rents and other services to the state."—W. Stubbs, *Constitutional history of England*, ch. 5, sect. 36.—The theory here stated is questioned by Prof. Vinogradoff, who says: "I venture to suggest that folkland need not mean the land owned by the people. Bookland is land that is held by bookright; folkland is land that is held by folkright. The folkland is what our scholars have called *ethel*, and *alod*, and *familyland*, and *yrfeland*; it is land held under the old restrictive common-law, the law which keeps land in families, as contrasted with land which is held under a book, under a 'privilegium,' modelled on Roman precedents, expressed in Latin words, armed with ecclesiastical sanctions, and making for free alienation and individualism."—P. Vinogradoff, *Folkland (English Historical Review, Jan., 1893)*. —See also **ALOD**.

**FOLKLAND**. See **FOLCLAND**.

**FOLKLORE**, "literally, 'the learning of the people'—was coined in 1846 by the late Mr. W. J. Thoms to replace the earlier expression 'popular antiquities.' It has established itself as the generic term under which the traditional Beliefs, Customs, Stories, Songs, and Sayings current among backward peoples, or retained by the uncultured classes of more advanced peoples, are comprehended and included. It comprises early and barbaric beliefs about the world of Nature, animate and inanimate; about human nature and things made by man; about a spirit world and man's relations with it; about witchcraft, spells, charms, amulets, luck, omens, disease, and death. It further includes customs and rites as to marriage and inheritance, childhood and adult life, and as to festivals, warfare, hunting, fishing, cattle-keeping, etc.; also myths, legends, folk-tales, ballads, songs, proverbs, riddles, and nursery rhymes. In short, it covers everything which makes part of the mental equipment of the folk as distinguished from their technical skill. . . . Folklore, in fact, is the expression of the psychology of early man, whether in the fields of philosophy, religion, science, and medicine, in social organization and ceremonial, or in the more strictly intellectual regions of history, poetry, and other literature. . . . The scientific study of folklore consists in bringing modern scientific methods of accurate observation and inductive reasoning to bear upon these varied forms of Tradition, just as they have been brought to bear upon other phenomena. The study of this traditional lore began with the observation that among the less cultured inhabitants of all the countries of modern Europe there exists a vast body of curious beliefs, customs, and stories, orally handed down from generation to generation, and essentially the property of the unlearned and backward portion of the community."—C. S. Burne, *Handbook of*

*folklore*, pp. 1-2.—While collections of folklore go back to ancient times the scientific study of the subject is of comparatively recent date. Among the first to provoke an interest in folklore and to place it on a scientific basis were Herder and the brothers Grimm in Germany. Since their time the study of folklore has widened in scope and the interest in it has spread to practically every civilized country with the result that numerous folklore societies have been founded and systematic research is being done in it.—See also MYTHOLOGY; SAGAS; SCANDINAVIAN LITERATURE: 9th-14th centuries.

United States. See U. S. A.: 1917 (June): Food and Fuel Control Act; FOOD REGULATION: 1918.

**FOOD REGULATION**.—Food regulation or control by governments is so new a principle, at least on a large scale, that history contains few examples of it. At any time when the food supply of a country is threatened, some attempt to regulate its production and distribution is made; but these attempts have necessarily been sporadic and short lived. Means of transportation between places, as well as provisions for storage, and political control as applied to economic problems, have been so inadequate in most countries in the past that such an experiment could scarcely succeed. On the other hand in modern times, the facilities of transport, and the ease with which the products of the vast regions of new and fertile lands could be rushed from place to place, precluded all idea of making such an attempt, until the unprecedented conditions of the World War made it necessary on a scale of magnitude hitherto unthought of. The earliest record of food regulation is given in the Book of Genesis, which tells of the storage of grain in the land of Egypt by Joseph against the lean years to come. And Joseph said to Pharaoh, "look out a man discreet and wise, and set him over the land of Egypt . . . and let him appoint officers over the land, and take up the fifth part of the land of Egypt in the seven plenteous years. And let them . . . lay up corn under the hand of Pharaoh, and let them keep food in the cities. And that food shall be for store to the land against the seven years of famine, which shall be in the land of Egypt; that the land perish not through the famine. . . . And Pharaoh said unto Joseph . . . Thou shalt be over my house, and according unto thy word shall all my people be ruled. . . . See, I have set thee over all the land of Egypt. . . . And Joseph went out from the presence of Pharaoh, and went throughout all the land of Egypt. . . . And he gathered up all the food . . . and laid up the food in the cities. . . . And the seven years of dearth began to come: . . . and the dearth was in all the lands; but in all the land of Egypt there was bread. And when all the land of Egypt was famished, the people cried to Pharaoh for bread: and Pharaoh said unto all the Egyptians, Go unto Joseph, what he saith unto you, do. . . . And Joseph opened all the storehouses, and sold unto the Egyptians; and the famine waxed sore in the land of Egypt. And all the countries came into Egypt to Joseph for to buy corn; because that the famine was so sore in all lands."—*Genesis*, 41: 33-57.

13th-14th centuries.—Early attempts to regulate prices of wheat and bread in England. See PRICE CONTROL: Ancient and medieval.

1462.—Food regulation in Scotland.—"Constant wars was waged, by the councils as well as by Parliament, against the forestaller who bought up merchandize before it came to the market, the regrater who bought in the goods to resell to his neighbours at a profit, and the disloyal brother who gave his name to transactions in which an unfreeman had the real interest. . . . An Edinburgh statute of 1462 gives a good idea of prevailing views: 'It is statute that the victuals that comes in and the timber at the port of Leith by strangers shall be bought in the tolbooth as manner is of before, for a certain price, and if it beis not bought, that no neighbour take in hand to buy the said victuals or timber to retail again upon the neighbours, and gif any does, the said victual and timber shall be taken by the officers and distribute among the neighbours at the price that is bidden before in the tolbooth; that gif any man of other

boroughs would buy the said victuals to have furth of the town, the neighbours to buy it at that price that they give therefor, to be distribute amongst the neighbours. Item, that no neighbour or other take upon hand to warn any strangers of the price of the victuals in the country, nor that nae neighbours shape them to buy any victuals or to bid any price therefore before their entry, and who so does in the country or breaks this statute shall pay to the kirk work of St. Giles ilk person singularly by himself one chaldor of wheat without remission."—J. M. Thomson, *Public records of Scotland*, pp. 151, 152.

1793-1794.—French law of maximum prices during the Revolution. See PRICE CONTROL: 1793-1798.

1885-1914.—Development of world's food supplies before the World War.—Increase in wheat acreage.—Apparent adequacy of supply.—It was only with the development of the vast machinery of modern international trade—as a result of modern means for swift distribution and large-scale production—that the possibility of any extensive regulation of food became possible. In the years preceding the World War, the food-problem became, for the first time, a world problem; and the necessity for regulation of the whole machinery of production and distribution, in a crisis, became obvious. "For two or three decades before the war the predominant economic fact was the cheapness of the main necessaries of life, and the steadiness of prices in the world's markets year by year, of the chief articles of food. . . . [But—and it is easy to overlook the significance of this fact] the main food crops take a year, or, under favorable conditions, six months, to grow; cattle and sheep take two or three years to mature; the producer, when he decides to risk his capital and labour, must consciously or unconsciously calculate a long way ahead the probable state of the world's markets, which depend largely on the effect of similar calculations made by competing producers in other parts of the globe. And when he has calculated and toiled, Nature intervenes, doubles or halves his expected crops, or decimates his herds and flocks. It may therefore be said that the maintenance of so even a balance between the world's supplies and the world's demands is remarkable. In this connection, it may be noted that as in any single country all the food crops of the year may fail—as they practically did in [England] . . . no longer ago than 1879, and in many previous 'famine' years which English history records—so there is ever the possibility that all the crops in the world may fail in the same year. That event is improbable, but it cannot be said that the risk is negligible. The world's supplies of food, therefore, depend partly on the efforts of man, and partly on the kindness of Nature; their distribution depends entirely on the enterprise of man. The organisation which brought, with unflinching regularity, from diverse and remote corners of the globe, the daily meal of the humblest consumer, was a triumph of human endeavour. The intricacy of the machinery which worked with such smoothness was apparent when the operations of war interfered with it. Apart from direct enemy action, a dislocation of the machine was caused immediately ships had to be withdrawn from the regular trade routes, and the delicacy of the adjustment of the several parts was demonstrated when the heavy hand of the State had to be introduced, in substitution for the lighter and more flexible fingers of those who were previously responsible."—S. Litman, *Prices and price control in Great Britain and United States*, pp. 7, 9-11.—"The wheat area

in a number of countries in 1911 and in 1901, when compared with the census returns of the two dates, gives some indication of the extent to which production kept pace with population during the decade. . . . These figures show that during the first decade of the century wheat-growing was extended by about 46,000,000 acres, while the population of the same countries increased by 93,000,000, and the number of acres of wheat per 1,000 persons increased from 280 to 310. The quantity of wheat represented by an acre varies widely, and is, generally speaking, in inverse ratio to the area under cultivation in each country. Thus in Belgium, with some 400,000 acres, the average yield per acre was about 37 bushels, and in the United Kingdom, with less than 2,000,000 acres, 33 bushels; while in European Russia, with 60,000,000 acres, it was 9½; and in India, with 28,000,000 acres, 11½ bushels. [See also AGRICULTURE: Modern: General survey.] An attempt to make a similar comparison of the position of the world's resources of meat, gave conflicting and less satisfactory results. Within the British Empire the numbers of cattle, sheep and pigs showed no general increase in relation to population, except in South Africa, where cattle and sheep markedly increased. In Europe, Denmark increased her stock of cattle, but in most countries neither the herds nor the flocks had increased with the growth of population, the tendency being in the opposite direction. In most other countries the figures for this period were too untrustworthy to afford any guide. Without relying overmuch on the dubious evidence of international statistics, from which safe inferences can be drawn only when the many traps for the unwary which they contain are fully appreciated, it may be said that up to the outbreak of war there was no cause for anxiety as to the adequacy of the world's supply of food to meet the demand for any period which seriously concerned the present generation. The exploitation of new lands, brought within reach by the development of transport, was rapidly proceeding, and vast areas of immense potentiality were being harnessed to the service of mankind. With all the resources of civilisation man must, in a sense, ever live from hand to mouth, trusting from year to year that the ancient promise will not fail. But apart from this, his subsistence was assured, and the spectre of famine was only to be feared if it were invoked by the deliberate action of his fellow-creatures."—R. H. Rew, *Food supplies in peace and war*, pp. 16, 18-19.

1901-1918.—Australian food regulation laws. See CHILD WELFARE LEGISLATION: 1001-1018.

1914-1915.—General dislocation of international food supply at the outbreak of the World War.—Disorganization of shipping.—Loss of German sugar supplies.—Harvests.—Increase in wheat acreage.—Stimulus to meat production.—"The first blow fell upon shipping. The mercantile marine of Germany representing about 11 per cent. of the world's tonnage, disappeared, and heavy drafts were made on allied shipping for the transport of troops and stores; ships and even fishing fleets were destroyed. Trade routes were denuded; ocean services . . . were interrupted. . . . In the belligerent countries land transport was similarly reduced and crippled. . . . Before long the ever-increasing demands of the fighting forces, and the development of the submarine attack, so reduced the world's tonnage available for commercial use, as practically to stop all international trade, except in food and material for carrying on the war. . . . International trade in foodstuffs was, in the first instance, mainly affected by the loss of the sugar supplies of Germany and Austria, and

in a lesser degree by the interference with supplies of butter and eggs from Russia. A still heavier blow was struck when Turkey entered the war, and the closing of the Dardanelles blockaded the Russian and Balkan grain supplies. On the other hand, the demand on the world's food supplies was reduced by the elimination of Central Europe from the oversea markets, in which Germany had been a heavy buyer. . . . The wheat crop in the United States in 1914 was fortunately good, and although in Canada it was short, the total supply from North America was well above the average. Everything depended, however, on the crops of Argentina and India. In India a notable effort was made to increase the wheat acreage, and no less than 4,000,000 acres were added. In the following spring India produced one of the largest wheat crops she had ever grown, although the actual shipment of the surplus presented special difficulties. In Argentina, although the acreage was not increased, the crop was exceptionally large, but Australia had one of the smallest crops on record, and was, in fact, an importing country for that season. The war lasted for just over four 'cereal' or harvest years, as they are commonly reckoned, and the first—September-August, 1914-15—was the most critical as regards the world's wheat supplies. Only the bumper crops in India and Argentina, which were not available until the spring, saved the situation after the Russian supplies were cut off in February, 1915. Owing to the unusual lateness of the harvest of 1915 in North America, the supplies had to suffice for thirteen months, but even then there was a substantial quantity available for export but not shipped before August, 1915, which counted as a 'carry over' for the following year. Thereafter there was no deficiency of supplies in sight, although, owing to increasing difficulty of finding the necessary tonnage, large quantities could not be brought to market. The fact was, that wheat-growers responded alertly to the demand. India, being the first country after the outbreak of war to have a sowing time, at once, as has been noted, increased her acreage, and both the United States and Canada did the same, although their crops could not be available until the next 'cereal' year. In North America about 12,000,000 acres more wheat were sown at the first seed-time after war was declared. Australia, which was the most unfavourably situated, as regards both time and distance, increased her wheat area in 1915 by 3,000,000 acres, or about 30 per cent. Altogether, therefore, it may be said that during the first year of the war, the area of wheat in the world was extended by over 18,000,000 acres. The exceptional crops of 1915-16 brought a natural reaction, and the breadth of wheat sown somewhat decreased in later years, owing to the menace to the wheat-grower of the accumulated surplus, especially in Australia. Some stimulus was given to meat production, particularly in Brazil and South Africa, but as the export of meat from countries south of the equator is dependent entirely on the number of vessels with refrigerating fittings, as the available supply of such vessels was known to be limited, and its increase practically impossible, the risks of marketing additional numbers of cattle and sheep when they had been bred and reared were obviously deterrent. . . . After America had come into the war, an energetic attempt was made in the United States to supply the deficiency of the Allies in bacon and pig-products, which for a time disturbed the great swine-feeding and packing industry of that country."—*Ibid.*, pp. 31, 33, 35-38.—See also PRICE CONTROL: 1914-1916.

1914-1918.—Legislative enactments in Great

Britain for the control of the food supply.—Control of sugar.—Attempt to regulate meat supply.—Extension of government control to petrol and wheat.—Attempts to increase home production of grains.—Woman's Land Army.—Establishment of Food Production Committee.—Voluntary rationing.—Compulsory rationing.—Restrictions on alcoholic liquors.—Problems of distribution.—"At the end of 1914 a Cabinet committee, with Mr. Asquith as Chairman, had undertaken an enquiry into food prices . . . in Great Britain. On February 11, [1915] which had been set apart for a debate on the subject, Mr. Asquith stated that he anticipated that large wheat supplies would be available in June. . . . When the discussion was resumed on Feb. 17th, Mr. Tootill, on behalf of the Labour Party, moved an amendment urging the Government 'to prevent a continuance of these indefensible increases [in profits] by employing the shipping and railway facilities necessary to put the required supplies on the market, by fixing maximum prices, and by acquiring control of commodities that are or may be subject to artificial rises.' . . . One effect of the agitation . . . was the appointment of two Departmental Committees, one, presided over by Lord Milner, on the production of food in England and Wales, the other, with Mr. T. W. Russel as chairman, to consider the same question for Ireland. The reports were issued on August 31st. Both reported that to increase the area in the United Kingdom under tillage, and so increase the home supply of grain, it would be necessary to guarantee a minimum price to farmers, but this proposal the Government were unable to accept. Board of Trade reports showed a continuous rise in food prices, which were estimated to have advanced 40 per cent. as the result of the first year of war. . . . The great rise in meat prices, attributed in part to the enormous increase in freights, affecting the South American supplies particularly, and in part to the heavy purchases on account of the British and also the French War Office, brought an announcement from Mr. Runciman on May 4th that the Government had requisitioned the entire meat supply from Australia and New Zealand, but would put upon the market any surplus not required for the troops. Following on a Slaughter of Animals Order by the Board of Agriculture, a Maintenance of Live Stock Bill was introduced into the House of Commons by Mr. Acland to restrict the slaughter of immature animals. It passed a second reading on June 22nd, and, after completing its stages, was passed also through the Lords on July 15th."—T. A. Ingram, *Hazell Annual and Almanack*, 1916, pp. 510-511.—"The imposition of a system of compulsory rationing was under active discussion during this period, and while the appeal for voluntary rationing was being made, a department of the Food Ministry was set up to prepare a scheme of general compulsory rationing for use, if and when required. The German and other systems were carefully examined, and two alternative schemes—one of which was with some modification eventually adopted—were elaborated in detail, and considered by a special Committee, in readiness for the decision of the Government."—R. H. Rew, *Food supplies in peace and war*, p. 82.—"Food supply exercised the attention of Parliament and the Government throughout the year [1916]. On Feb. 23 the House was specially adjourned to hear a statement by Mr. Lloyd George as to the necessity of a drastic reduction in imports in order to meet the increasing calls on tonnage. The Prime Minister pointed out that 70 to 80% of wheat used in Great Britain had hitherto been imported, but now every effort

must be made to increase this year's and next year's harvest, and he outlined plans which would bring 3,000,000 additional acres under the plough in return for a guaranteed minimum price to farmers. . . . At the same time agricultural labourers were to be guaranteed a minimum wage of 25s. a week. The proposals in respect of wheat and agricultural wages were embodied in the Corn Production Bill, of which the second reading was moved by Mr. Prothero, President of the Board of Agriculture, on April 24. The suggested guarantee of price brought opposition from the Free Trade members under the leadership of Mr. Runniman, who maintained that national security would be better safe-guarded by storing sufficient wheat. The second reading was carried without a division, but the discussions in Committee were prolonged. . . . The Bill was applied to Ireland, but under the direct control of the Irish Department. . . . [It passed on August 20 and] received the Royal Assent on Aug. 21.

"Measures to preserve the supplies of flour already in or subsequently to be imported into the country were begun even before the setting-up of the Ministry of Food. A new grade of flour was decreed as from Nov. 27, 1916, and on Jan. 1 a 'standard' loaf made with this flour became compulsory. The use of wheat for brewing purposes was prohibited, and severe restrictions were also placed on the use of other grains in distilleries. On the appointment of Lord Devonport to be Food Controller, . . . an appeal was made for the ploughing-up of pasturage and the encouragement of allotments. Portions of many public parks were ploughed in this way. Simultaneously, the National Service Ministry began to raise a Women's Land Army to undertake farm labour. The War Office released a number of German prisoners for service under guard, and an arrangement was made between the Board of Agriculture and the War Office by which recruiting for the Army from the land was restricted and soldiers in training were temporarily employed in ploughing and seeding. A Food Production Committee, with Col. Sir Arthur Lee, M.P., as Director-General, was set up to carry out an order under the Defence of the Realm Act, authorising the public entry on unoccupied land. The Committee were also charged with the purchase and operation of tractors on a large scale. On Feb. 4 [1917] Lord Devonport issued an appeal for voluntary rationing in the matter of bread, meat and sugar. The Order in regard to the quality and consumption of flour was varied from time to time during the summer. On March 11 an Order required that bread should not be sold if less than twelve hours' old, and abolished fancy loaves by requiring all loaves to be of certain specified shapes and weights. On March 26 Mr. Kennedy Jones, M.P., was given the direction of a vigorous food economy campaign. Complete control of all bread-stuffs was assumed by the Ministry on April 4. On May 3 a Royal Proclamation calling on the people to abstain from unnecessary consumption of grain was ordered to be read in churches on four consecutive Sundays. Next day the State took over control of a first instalment of 261 mills. Lord Devonport resigned office on June 1, and was succeeded by Lord Rhondda on June 15. . . .

"Sugar, the imports and distribution of which had been controlled from early in the war, was the first food commodity it was found necessary to ration otherwise than voluntarily. The issue of application forms for sugar-cards began on Sept. 15, sale was permitted by registered retailers only after Oct. 1, the cards were issued to the public by Oct. 26, and the distribution was to be fully con-

trolled as from Jan. 1, 1918. . . . One meatless day per week was made compulsory on April 17, but this Order was withdrawn, as was another limiting the number of 'courses' to be served in restaurants. Instead, the cost of meals in certain popular restaurants was restricted to 1s. 3d. exclusive of liquor. On Feb. 28 the House of Commons resolved to place itself in line with the rest of the country and observe in its own bars the close restriction on the sale of liquors imposed on the country generally. Hours of sale were already reduced within fine limits throughout the country. . . . The exportation of beer, except under licence, was prohibited in April; but on July 5 the Government announced that the output of beer allowed for home consumption would be increased during the ensuing quarter by one-third. . . . As a complement to this concession the Government agreed in October to permit a corresponding increase in the wines and spirits to be released from bond."—T. A. Ingram, *Hazell Annual and Almanack*, 1918, pp. 883-884.—"Whether the adoption of the ticket system of compulsory rationing was decided upon by the Government at the right time, or in the best form, is another of those debatable questions about which those interested may dispute indefinitely. From the point of view of the conservation of food supplies, it is not certain that it was in all cases the only means, or even the best means, of securing that object, and, indeed, it was not primarily from that point of view that it was eventually put into force. After the resignation of Lord Devonport, and the appointment of the late Lord Rhondda as Food Controller in June, 1917, a considerable period elapsed during which the new Minister was taking stock of the position and deciding on his course of action. During this time the unequal distribution of supplies, which had previously aroused dissatisfaction in some localities, led to serious and general protests, and it may be said that 'queues' were the immediate cause of the introduction of the 'coupon.' The chief recommendation of the ticket system, which outweighed all objections, is that it is the best means by which equality as between individuals can be secured. . . . On the whole, the system, irksome, as it was, worked successfully. The evident reluctance of the Government to adopt it, and the very unsatisfactory situation which had arisen before they did so, helped to secure its acceptance by the nation. The people felt convinced that it was necessary. . . . When all criticism has been made, and all defects noted, it may fairly be said that the compulsory rationing in food in [Great Britain] . . . was accomplished without serious difficulty owing largely to the good sense and public spirit displayed by the people generally. The foods rationed were meat, sugar, butter, margarine and lard, and the fact that the most vital of all—bread—was not rationed, is sufficient evidence that wheat supplies were never in serious danger. When the war ended in November, 1918, the stocks of wheat and flour in the country were practically as large as at any time during the war and, of course, very much larger than in time of peace. Nearly every article of food was subject to maximum prices; the supply and distribution of all the primary articles were either completely taken over or subject to strict official supervision. Supplies were on the whole well maintained up to the requirements of the nation, though meat, bacon and butter were at times scarce. Much the most difficult of the problems of the Food Ministry was the control of distribution. The arrangement had necessarily to be different for each of the main articles, and in the end very complicated administrative machinery was

constructed throughout the country. Schemes for the distribution of various commodities began to be devised early in 1917, when the plans for rationing were laid down in readiness for the decision of the Government. The control of certain imports of butter and cheese had been exercised by the Board of Trade at a still earlier date, and the Sugar Commission had, from the beginning of the war, adopted a comparatively simple and effective method. Broadly, the principle of these early schemes was the tying of retailer to wholesaler and wholesaler to importer, on the basis of the amount of business done by each at a previous period known as the datum period. This plan had the merit of preserving and utilising the normal trade channels of distribution, was simple and inexpensive to work, and avoided the need for the employment of a large staff of officials. One defect of the datum period system was, that it did not allow for changes in population and other alterations, but this was remedied by adopting the plan of basing the distribution on the actual requirements of the retailer for the supply of his registered customers. Much more complicated arrangements were subsequently made in connection with the distribution of potatoes, milk, meat and some other articles. The scheme of meat distribution was the most elaborate as it involved the collection and distribution of home live-stock as well as of imported meat. The system consisted of two main parts: (a) a territorial organisation for the control of live-stock, and (b) an organisation of the meat trade for the regulation of distribution. The initial stages of the process were marked by the registration of auctioneers, cattle-dealers, butchers and slaughter-house keepers, and by fixing maximum prices first for meat, and later, under a grading system, for fat cattle and sheep. The grading system did not work very satisfactorily, and sale by dead weight at Government slaughter-houses was substituted in many districts. The unit was an area consisting of one or more counties, under a Live-Stock Commissioner, and the pivot of the scheme was the Area Meat Agent, working with the Commissioner, who were notified of the requirements of the district and arranged for its supply, either in cattle or dead meat. The retailer was allowed to buy only upon a permit, but in a number of cases a Butchers' Committee was formed for the Food Control Committee's district which bought for the district on a single permit."—R. H. Rew, *Food supplies in peace and war*, pp. 83-85, 80-95.—See also LIQUOR PROBLEM: England: 1914-1918.—"Grain stocks in this country were diminishing in 1915, partly because of purchase for foreign account in the name of the Allied Powers. This was why the British Government first interfered in that year. Even then its action was meant to be exceptional. It ordered a large tonnage to America, where a surplus of grain waited shipment. As an apt consequence, there was a rapid fall in Atlantic freights. Heavy cargoes of grain were brought over. There was immediate relief of the home situation. Prices were brought down. But severe loss was caused to private traders who had laid in stocks. . . . The stocks built up for a time by the first effort of Government action soon declined again, and to a lower level than ever. The position was dangerous. Once more the British Government acted. It restored temporary safety by importing a reserve of wheat. Again this reduced buying by private firms. What was done on one hand for increasing the national store was undone on the other. Merchants were naturally still more unwilling than before to hold stocks and buy ahead. A parallel action of

public and private supply could not exist. The public power, once used in the national interest, must squeeze out private effort. In the autumn of 1916 the decisive choice was made at last. It was two years after the institution of a public monopoly of sugar when there was established something bigger than any vision of corn imagined by Joseph in Egypt—a Government monopoly of the whole British import of wheat. The Royal Commission on Wheat Supplies was created to furnish the country and keep full stocks. Appointed on October 11, 1916, it extended until it became responsible for the purchase outside the United Kingdom not only of all cereals, but of the whole Biblical category—grain, beans, peas, and pulse. . . . We must understand clearly how practical a body this was. . . . Including members of the grain trade, with others to give all the experience and knowledge required for the task in hand, the Wheat Commission met daily. It was in touch from the first with the grain market in all such parts of the world as were accessible under the conditions of war-time. At the outset, for instance, it made large purchases direct from the Australian Government; but soon there was no tonnage available to carry over what had been bought, and nothing further was done in that quarter. . . . It is worth while to note the method—how the export surpluses of the world's wheat were bought up by whole crops and harvests. In the United States the wide buying necessary was done through a single agency called the Wheat Export Company of America. It was linked up with the directing body in Britain by including members of the grain trade who were also members of the . . . Commission. It need hardly be said that firms worked for the Commission as controlled agents, guaranteed by the Treasury a rate of profit fixed in a certain relation to pre-war business."—J. L. Garvin, *Economic foundations of peace*, pp. 44-46.—See also PRICE CONTROL: 1914-1918: World War: Great Britain; 1917-1919.

1914-1918.—German food policy.—During the continuance of the war it was stated that "it was perfectly well known in official circles, . . . [before the end of October, 1914] that the harvest of 1914 showed a great falling-off—probably 15 per cent. below that of the preceding year. . . . [But] the measures adopted by the Government for the storage of food led to the actual loss of a considerable quantity of it. For instance, 14 per cent. of the potatoes stored by one large urban municipality went bad, and this was only typical of what happened elsewhere; and the smell of rotting potatoes under the arches of one of the big Berlin railway stations compelled the residents in the neighbourhood to appeal to the sanitary authorities. . . . The farmer is permitted to keep back from his crops an allowance for his own consumption and that of his labourers, and on all the rest he benefits by prices which, even when fixed by Government, are much above those obtained before the war. . . . Having a shrewd suspicion of what was going to happen, the Government, when on July 23 [1915] it revised the maximum prices of corn for the coming year, was obliged to leave them at the old level, reducing them just a trifle in industrial regions and putting them up a trifle in the eastern provinces where the agrarians are strong. Rye prices were left 35 per cent. above their level in 1913; and rye bread which fell somewhat, was still, at the . . . beginning of August, 40 per cent. above the pre-war year. But, relying on having the machinery of control already in working order, the Government . . . increased by one-eighth the allotment of flour to local authorities, so as to allow of supplementary bread-tickets

being sold to labourers certified as engaged in heavy work. . . . The establishment of the new Imperial Fodder Office to take control of fodder supplies . . . made things no better. . . . The measures of the Government . . . [were] constantly met by evasion and subterfuge of every description. Against its will it . . . [was] driven, time after time, from a policy of maximum prices to a policy of state monopoly, merely because the peasants would not bring their stuff to market. The quite unnecessary scare about potatoes in the early spring, with its unfortunate consequences, was brought about simply by the cunning of the peasants in concealing their stocks. Even the regulations about bread . . . [were] far from meeting with ungrudging obedience. So numerous . . . were the cases of infringement of regulations by the bakers, that in a great city like Frankfort the municipal court had to give up the whole of every Wednesday to such cases, until the Government conferred summary jurisdiction on the Public Prosecutors."—W. J. Ashley, *Germany's food supply*, pp. 10, 16, 17, 24-26, 29, 30.—"The food policy of the German Government for the coming economic year could be best illustrated by giving here a summary of recently issued food regulations. It is to be regretted that this can not be done, because for some time the Bureau of Labor Statistics has been unable to obtain German official publications. . . . [However,] Dr. Schlittenbauer, director of the Agricultural Central Coöperative Society of Ratisbon and a well-known leader of the Bavarian agrarians, on the imperial economic plan for 1917-18 [has written an article on the subject]. This article furnishes in a summary form a very useful conspectus of the various food orders for the current harvest year and, in addition, contains some severe criticisms of the regulations discussed. According to Dr. Schlittenbauer, the special features of the new economic plan for the 1917 harvest are: (1) The altered policy as to price; (2) the new imperial grain regulation."—United States Department of Labor, Bureau of Labor Statistics, *Food situation in central Europe, 1917, Apr., 1918*, pp. 10-11.—See also GERMANY: 1916-1918.

1914-1918.—Rationing in Germany.—Breach of regulations.—Illicit trading.—"The German Authorities felt themselves obliged to attempt to ration strictly the whole food of the population. No such system as this, involving all the main articles of food, can succeed unless it is combined with mass feeding. Although we may speak of an average man and assign to him a certain ration, the amount of food required by an individual depends on his stature, age, sex, occupation and environment. No two individuals are alike. A ration sufficient for one individual will be too much for another, and too little for a third. This fact was recognised in England by confining the rationing to certain articles, such as meat, fats and sugar, leaving the chief food of the poor, bread, unrationed, so that each individual could obtain of this as much as he required in order to make up his total food to his bodily requirements. In the case of the German ration, very few articles were available for supplementing it according to the needs of the individuals. Owing to the lack of grain for poultry eggs almost disappeared. Fish was only obtainable in small quantities and at high prices, so that for the poorer class of the population, the only supplementary food obtainable consisted of vegetables (turnips, carrots, cabbages, &c.). . . . The heavy and heaviest workers obtained increased rations, and these were still

further added to by the action of the big firms in buying up, with the cognizance of the Government, food obtained directly from the farms, and distributing these foods to their workmen at a price below the cost. . . . In the case of the chemical factories of Leverhusen at Cologne and of Scherings in Berlin, I estimated that the workmen's rations amounted to about 2,500 to 2,600 calories per day, an amount quite insufficient on which to do an ordinary day's work. At the iron-works and mines round Kattowitz the caloric value of the total ration obtained by the workers was considerably higher, and amounted indeed to what might be considered an adequate figure, viz., 3,500 calories per working man. These workmen were receiving 1,800 calories per day on ordinary ration cards, and 1,760 calories per day more from food which had been brought by the company in illicit trading, and was distributed to the workers at reduced prices. . . . It should be noted, however, that the dependents of these workmen were only receiving under 1,600 calories per head per day, and that the extra rations granted to the workers, nearly 18,000 in number, would also have to serve the needs of their dependents, about 80,000 in number. But even allowing that the workmen received 3,000 calories the quality of the food was very defective, especially as regards fat. The great complaint of the workmen was not so much the deficient quantity of food as its monotonous quality, its indigestibility, and the absence of fat for spreading on the bread or for cooking the food. Kattowitz, from its proximity to the Polish frontier, is especially favourably situated for the purchase in illicit trading of smuggled food. [The] . . . action of the large firms in buying food outside the ration for the sake of their employees, though approved by the authorities, was entirely outside the law. Firms bid against one another in order to obtain a sufficient amount of the ever diminishing quantities of foods. Then Municipalities, who could not obtain from the supplying districts assigned to them amounts adequate to fulfil the obligation on their ration cards, also came into the market and bid against one another for food for distribution to their population, the difference between the price paid for the food, and the price charged to the consumer falling on the rates. Such authority for the breaking of the law could only have the effect of weakening the combined forces of all the food regulations. Private persons came into the market, and an active illicit trade grew up in food produced on the farms. . . . [It was estimated by the Germans at the time that] from twenty-five to thirty-three per cent. of food released by self-suppliers . . . [was subject to this illicit trade, at large profits. The well-to-do, if they chose, could live as before, while the poorer classes could now and then exchange their work for butter or eggs. But, after all is said, from] the summer of 1916 the German population has had to live on a ration *per head* of about 1,500 calories with about 200 calories more available in the form of vegetables. A heavy worker is receiving another 300 calories in additional bread and meat. When the man is a member of a family he will receive more than his ration at the expense of the wife and children, and the man's ration may thus be increased to 2,250 or to 2,550 calories in the case of heavy workers."—E. H. Starling, *Report on food conditions in Germany*, pp. 5-7.—See also GERMANY: 1914-1915; 1916: Ministry of food supplies.

1916-1917.—Food crisis in Russia. See RUSSIA: 1916: Food shortage; 1917 (Mar. 8-15).

1916-1918.—Mass feeding in Germany.—Food-card system.—"At least for the period of the war

'mass feeding' seems to be thoroughly established in Germany. Of the 563 communes, each with 10,000 or more inhabitants, and with a total population of 26,700,000, there were only 56, with 857,000 inhabitants, without mass-feeding arrangements; 472 communes, with 24,354,000 inhabitants, reported the existence of 2,207 such establishments, of which 1,076 are general war kitchens, 116 middle-class kitchens, 528 factory kitchens, and 487 kitchens of various kinds. Although most towns provided only midday dinners, most kitchens are arranged for at least two shifts of cooks. The average output of the 2,207 establishments amounted in February, 1917, to a daily production of 2,528,401 liters [quarts] of food, which allowed 10.4 liters daily per 100 inhabitants of the 24,354,000 total inhabitants in question, as against 8.8 liters in January. The highest possible daily output would promise a total of 4,208,741 liters, or 17.8 liters per 100 inhabitants. The comparative popularity of mass feeding is a good index to the actual condition of the food supply. War kitchens are being increasingly patronized by members of the middle class. The number of middle-class and officials' kitchens and of soup kitchens in Berlin has now almost reached a hundred; 35,000 portions of food and 14,000 portions of soup are served daily, and 8,000 portions of bone soup are distributed to heavy workers and children. The portions are generous and a second helping can be obtained at low prices. Food tickets are issued in general by three methods. In Berlin and some other towns the porters of the large blocks of flats in which almost everybody lives obtain the tickets from the authorities and distribute them to the individual families. In Munich and a decreasing number of towns, school children and other voluntary helpers take the tickets round. The method becoming most general is, however, to compel each family to fetch its tickets for itself from a local office on one or more fixed dates, arranged so as to prevent an undue rush of applicants. The advantage of this method over the others is that complaints are investigated and settled on the spot. The last occasion on which Leipzig distributed tickets by volunteer messengers to its 155,000 families produced nearly 100,000 complaints. The person who fetches the tickets for a family has to produce their individual police registration cards and sometimes special food-ticket registration documents, and is often requested to bring their birth certificates. The issuing office keeps a card register showing changes in the membership of each family, all such changes having to be reported immediately. Under the first two methods of issuing tickets a receipt has to be given by the recipient. Tickets are taken out at intervals ranging from every three months down to every month or less. The more frequent the issue, the less is the danger of forgery, as the appearance of each successive series of tickets can be varied. Hoarding and anticipation of supplies are prevented by making each ticket valid only for a single week, or fortnight. The original and simplest form of German food ticket is a card with detachable coupons, printed so as to be difficult of imitation. It now must generally be signed by the holder; it is never transferable. Other varieties used locally for general or special purposes are books containing a page with separable coupons for every article. Such a book occasionally represents the rations for a whole family. On the whole, the use of one card for every article and for every person is found most satisfactory, while general tickets or books are issued with blank coupons to be used in buying any exceptional

supplies which the local authority may be able from time to time to provide; e.g., dried vegetables and farinaceous foods are not regularly on sale, but can be bought at irregular intervals on specified coupons of the general food ticket. The comparatively simple ticket system described above worked well in Germany for bread and flour down to the end of 1915; but it required for its successful operation the existence of a considerable margin of stocks in the retail shops, so that the ticket holder may be certain of being served in some shop near his home. The extreme scarcity of all foods, which began to prevail in 1916 and still continues, has necessitated the introduction of important complications; and, speaking generally, bread, flour (usually), and sugar are now the only foods to which the simple system still applies. For meat, milk, fats, potatoes, and other foods, especially those which are only distributed occasionally, the purchaser must become the registered customer of a particular shop, and very frequently he must place his order a week or more in advance. The shop is supplied in exact proportion to the number of its registered customers or of the advance orders received. To prevent the formation of food queues (waiting lines), a number is assigned to every customer, and the tradesman announces in his window what numbers will be served at particular hours. One hour in the day is reserved for persons who prove by a certificate from their employers or otherwise that they could not attend when their numbers were up. These refinements prevent the necessity for a margin; but they involve the issue of special registration tickets, complicate enormously the problem of removals, and subject the public to a very great inconvenience. In conclusion, one observation may be made by way of caution. The ticket system is the effect, not the cause, of the German food crisis. If it has to some extent lessened the supply of food by discouraging production and dislocating trade, it has undoubtedly saved the nation from early defeat in the war by reducing consumption to a minimum far below any that voluntary effort could have secured."—J. Maurice and others, ed., *Economics of war*, pp. 307-309.—See also WORLD WAR: 1916: XII. Political conditions, etc.: b; 1917: XII. Political conditions, etc.: e.

1917-1918.—Food control in the United States during the World War.—Opposition to compulsory rationing and price-fixing.—Encouragement of agriculture.—Lever Act.—United States Food and Fuel Administration.—Appointment of Herbert Hoover as food administrator.—Encouragement of production and elimination of waste.—Regulation of sugar manufacture and distribution.—"Analysis of the food situation as it confronted the United States on our entrance into the war showed that if it was to be met, action had to be taken in respect to almost every element of the food trade from production to consumption. . . . In declaring against anything like a compulsory rationing of the population or even the fixing of prices generally, it was nevertheless recognized that legislation was desirable . . . to confer upon the Government enlarged powers to carry out its determinations in respect to food control and coerce the minority who might be unwilling loyally to comply with the Government's plan. Such legislation was secured by the passage of two Acts, both approved on August 10, 1917, and entitled respectively, 'An Act To provide further for the national security and defense by stimulating agriculture and facilitating the distribution of agricultural products,'

and 'An Act To provide further for the national security and defense by encouraging the production, conserving the supply and controlling the distribution of food products and fuel.' The first of these Acts had for its special purpose the enlargement of the powers of the Department of Agriculture and the grant to it of increased appropriations with which to carry on its work. It thus authorized the Secretary of Agriculture 'to investigate and ascertain the demand for, the supply, consumption, costs, and prices of, and the basic facts relating to the ownership, production, transportation, manufacture, storage and distribution of foods, food materials, feeds, seeds, fertilizers, agricultural implements, and machinery and any article required in connection with the production, distribution, or utilization of food,' and made it obligatory upon all persons . . . to answer all inquiries regarding such matters addressed to them. . . . If necessary, the Secretary of Agriculture was authorized to grow seeds and furnish them to farmers at cost. Finally, the President was authorized to direct any agency or organization of the Government to cooperate with the Secretary of Agriculture in carrying out the purposes of the Act and to coordinate their activities so as to avoid any preventable loss or duplication of work. This Act, it was provided, should continue in force not later than the beginning of the next fiscal year after the close of the war. . . . The Food and Fuel Control Act, or the Lever Act, from the name of its author, was a much more important and radical measure. It had for its purpose to provide for the establishment of a system of rigid governmental control over almost all the processes involved in the production, distribution, and consumption of a large number of . . . necessities, the most important of which were foodstuffs, feeds, fertilizers, farm machinery, coal and other fuels, and all industries . . . serving these economic interests, and to authorize the President to create such agencies and issue such orders and regulations as he deemed desirable for carrying into effect the purposes of the Act. This law is thus the organic act of both the Food and Fuel Administrations. . . . [See U. S. A.: 1917 (June): Food and fuel control act.] On the same day that this Act became law, August 10, 1917, the President issued an executive order creating an independent service for the administration of those features of the law having to do with food products and related industries under the name of the United States Food Administration and designated Herbert C. Hoover as its head, with the title of United States Food Administrator. . . . [Hoover had already been appointed (May 19, 1917) by the President to act as far as possible under the laws which were then in existence. The keynote of his administration] was that of making an appeal to the patriotism of the farmers and the consuming public voluntarily to do each his part in carrying out a food production and conservation programme as worked out by the Food Administration, and of bringing into play the compulsory features of the law only after all other efforts had failed. This programme of the Food Administration involved a number of activities which, for purposes of consideration at least, can be fairly well distinguished. . . . [Food production was stimulated, the cultivation of all available land, including small gardens, and the selection of crops were encouraged; an active propaganda for the promotion of economy and conservation was carried on.] The Food Administration did not content itself with a general appeal but distributed broadcast a vast amount

of literature, carefully prepared by . . . experts, . . . giving specific instructions in respect to what constituted a well balanced diet; what articles of relative abundance could be . . . [substituted for those of which there was a world scarcity or world need; avoidance of waste; the best manner of drying, canning, or otherwise preparing fruits and vegetables so as to fully utilize perishable products; and scores of analogous features]."—W. F. Willoughby, *Government organization in war-time and after*, pp. 261-272.—"The distribution of beet sugar was entrusted to a Sugar Distributing Committee appointed by Mr. Hoover; this committee was composed of representatives of beet sugar producers and brokers of the beet sugar territory of the United States. Local representatives of this central organization were established at many points throughout the country; they allocated the sugar to dealers and saw to it that government regulations were complied with. Sugar was shipped to dealers from the nearest factory. All those engaged in the business of importing sugar, of manufacturing sugar from sugar cane or beets or of refining sugar were required to secure on or before October 1, 1917, a license. (*Industrial News Survey*, July 1-8, 1918, p. 5.) Shortly after an agreement was reached [in the United States] with beet sugar factories, steps were taken to bring under control all other sugar interests. On September 21, 1917, the International Sugar Committee was created, which included the representatives of England, France, Italy and Canada, as well as of the United States. An international agreement was necessary in order to deal with the Cuban situation. The committee took charge of the buying and transportation of Cuban sugar to the Allies, the neutrals and the American cane sugar refiners. The sugar set aside for the United States was allotted to the refiners by the American Refiners' Committee, composed of refiners and their sales agents. The subsequent distribution of cane sugar was left in the hands of the Food Administration. At the time of the appointment of the International Committee, the amount of unsold Cuban sugar was very small, not over 50,000 tons. In an effort to keep down the price for the 1917-18 crop, concerning which the Food Administration was then negotiating with Cuban producers, the committee requested the American refiners to keep out of the Cuban market. . . . While negotiations were pending, some of the eastern refiners in Atlantic coast towns had to close down for lack of raw sugar. There was also a lack of refined sugar and in many places people were obliged to pay 12 to 15 cents a pound or more. (*Commercial and Financial Chronicle*, March 2, 1918, p. 876.) As a result, an investigation into the shortage of sugar was instituted by the Senate. During the hearings before the Investigating Committee in December, 1917, accusations were made by Mr. Claus A. Spreckels that the shortage of sugar was due to Mr. Hoover forbidding the purchase of raw material at a price higher than the one fixed by the Sugar Committee; it was also charged that by announcing a prospective sugar shortage Mr. Hoover had caused a panic among consumers, with a subsequent hoarding of the staple, and that therefore he himself was partially responsible for the shortage. . . . In his reply to the critics, Mr. Hoover attributed the shortage in the United States to the heavy movement of sugar from the western hemisphere to Europe. . . . The rationing of manufacturers using sugar began in October, 1917, when those producing nonessentials were limited to 50 per cent of their normal requirements. A subsequent ruling

directed that manufacturers of nonessentials starting after April 1, 1918, should be allotted no sugar whatever. There was no definite rationing of consumers until the middle of 1918. Previous to this date, requests had been made that the consumers curtail their consumption of sugar voluntarily. . . . In view of the shortage, the Food Administration suggested at first that the consumption of sugar be cut to 67 pounds per person, but it soon realized that such a consumption could not be maintained. . . . According to regulations, which became effective on July 1, the householders were limited to 3 pounds of sugar per month per person, with a special allowance of 25 pounds of sugar for home canning purposes. This meant a reduction of some 25 per cent from normal consumption, but, as the Food Administration remarked, it was still nearly double the ration in the Allied countries and was ample for every economical use. In order to secure justice in distribution and to make the restrictive plans as effective as possible, no manufacturer or wholesaler of sugar was allowed after July 1 to sell any sugar except to buyers who secured a certificate from the local food administrators indicating the quantity they were allowed to buy. The users of sugar were divided into five classes: A. Candy makers, soft drink, chocolate and cocoa manufacturers, tobacco manufacturers, makers of flavoring extracts, syrups, sweet pickles, etc. B. Commercial canners . . . makers of drugs, explosives, etc. C. Public eating places. . . . D. Manufacturers of all bakery products. E. Retailers and others selling for direct consumption. (*U. S. Department of Labor, Monthly Labor Review, pp. 139-140.*) Each class was entitled to a certain allotment of sugar for the months of July, August and September, 1918, the allotment varying from 50 per cent of the amount of sugar they used in the corresponding months of 1917 (Class A) to all the sugar that the manufacturers required (Class B). No sugar was allowed to leather tanners and to manufacturers of non-edibles. On July 13, 1918, at the direction of the President, the United States Sugar Equalization Board was formed for the purpose of better controlling distribution and prices of sugar. The board was empowered to purchase, manufacture, sell, store and handle raw and refined cane and beet sugar, syrups and molasses. (*U. S. Food Administration, Proclamations and Executive Orders by the President, p. 30.*) In view of a continued shortage of sugar the per capita consumption of sugar was cut from 3 pounds to 2 pounds per month, the reduction to remain in force from August 1 to January 1. Other changes in the sugar regulations were the increase of the wholesalers' margin from 25 cents to 35 cents per 100 pounds, and the raise in the New York price of Cuban raws by 5 cents per 100 pounds; the latter was done to cover extra war risks, after the appearance of a few German submarines in American waters. The handling of the sugar situation on the whole seems to have been conducive to a more equal distribution of sugar among the different sections of the country, as well as among the various classes of the population."—S. Litman, *Prices and price control in Great Britain and the United States during the World War, pp. 240-241, 243, 245-247.*—See also EMBARGO: During the World War; LIQUOR PROBLEM: United States: 1913-1910; PRICE CONTROL: 1917-1910: United States; U. S. A.: 1917-1910: Effect of the war.

1917-1918.—Allied food control.—"The Food Control [which had its beginning in September, 1917] took its final international shape in 1918, when the Council of Four was set up. This body

included the four Food Controllers of principal importance, namely, those of the United States, Great Britain, France, and Italy. In 1917 a scientific commission had already been organized to find, if possible, methods of solving the food problems of the Allies, and during the same year another body took over the control of meats and fats. The business of this organization was to administer the buying and distribution of meats, butter, cheese, oils and fats of all kinds, and canned goods. A wheat executive worked in America through two agencies. The vexing problem of transport was handled by the Inter-Allied Maritime Transport Council, which was formed after the Paris Conference in 1917. In the very beginning, the French wished to make of this a paramount economic body. Through the nature of its work, it came in the end to make its influence felt through the whole organization of the Allies and to become almost supreme. In charge of each of the twenty-one chief raw materials was a Program Committee, by which the varying claims of the Allies were adjudged and a division made of the common stock, so far as it would go. The list of [food] commodities thus administered included [cereals, oils and seeds, sugar, meats and fats]."—J. Bakeless, *Economic causes of modern war, pp. 223, 224.*

1918.—Abolition of food regulations in United States.—Appeal for continued economy.—"WASHINGTON, Dec. 22 [1918].—Announcement was made by the Federal Food Administration tonight of the issuance of orders dropping all food restrictions beginning tomorrow morning. From time to time various regulations have been abandoned, and since Oct. 21 last the principal specific food regulations in force were those known as the 'twelve general orders for public eating places.' These latter are to be dropped, effective tomorrow morning. In rescinding the 'twelve general orders' the Food Administration emphasizes the need for continued care in food in order that the United States may meet its pledge to relieve conditions abroad. The twelve general orders for public eating places, which were designed as a war measure to restrict food at the time the devices of meatless and wheatless days and the substitution of one food for another were abandoned, went into effect on Oct. 21. It is estimated that 9,000,000 persons take their meals in public eating places—hotels, restaurants, cafés, clubs, and dining cars—and the food saving through this system of conservation is declared by Federal food officials to have been very great, despite the fact that compilation of the total savings has not been possible to date.

"In notifying the Hotel Chairmen on the staffs of the Federal Administration of the decision to rescind the present food regulations the Hotel Division of the Food Administration asked that they hold themselves in readiness to assist in putting into effect any specific measure which public eating places, through developments in world relief, may in the future be called upon to carry out. The twelve general orders provided that no public eating place should serve bread or toast as a garniture or under meat, allow any bread to be brought to the table until after the first course, or serve to one patron at any one meal more than one kind of meat. Bacon was barred as garniture. A half ounce of butter was regarded as a portion, and cheese was limited to a half ounce for a meal. Nos. 8 and 9 referred to the sugar restriction. The others referred to waste and the use of cream and butter fats.

"Notwithstanding the lifting of food restrictions

the Food Administration will not cease its activities entirely until a Presidential proclamation releases the public from the Food Control act. . . . The New York Federal Food Board issued a statement yesterday urging the proprietors of eating places to continue conservation of all foodstuffs. "There should be no waste or extravagance in the use of any foods," said the statement. "All food should be prepared and served with the idea constantly in mind that America must send 20,000,000 tons of food to hungry Europe during the next twelve months and that the greater part of this food can be secured only by saving."—*New York Times*, Dec. 23, 1918.

1918-1920.—Famine in Finland.—Work of American Relief Administration. See FINLAND: 1918-1920.

1918-1920.—Food regulation at close of war, and after.—"Everywhere [in Europe], states (and even provinces or districts within each state) endeavored to keep their food and other vital productions as much as possible for themselves, and therefore restricted exports. Everywhere, the tendency was also to restrict imports of luxuries and other 'unnecessary' things in order to protect the rate of exchange; and, lastly, everywhere, traffic and travelling generally were subjected to many regulations and restrictions, either in order to secure the working of the internal distribution, the control of food, coal and raw materials introduced during the war or to conform to the Peace Treaty. . . . Austria had during a long time to buy grain, flour and meat in America, Manchuria, etc., and even sugar in Java, instead of getting them from her neighbors who had an abundance of these foodstuffs. Generally in all states, including Austria, exports were restricted not only where there was a scarcity, but also when a great surplus was available for export, as in the case of sugar and coal in Czecho-Slovakia. . . . Every state tried to control the export of its chief products in order to exact greater advantages from neighbors dependent on these supplies."—F. Hertz, *Present day social and industrial conditions in Austria* (*Supplement to the Annals of the American Academy of Political and Social Science*, Nov., 1921).

Reports issued by the International Institute of Agriculture in 1920 stated that a "Belgian decree of 17th December, 1918, regulates the sale of butter fixing the quantity which producers must sell to the Government and that which they may themselves hold. Another Belgian decree of 27th December, 1918, regulates the trade in meats, requiring all dealers in frozen beef, veal, etc., to modify the quantities to the Ministry of Industry. A Belgian law of 14th July, 1919, authorises the government to allow the importation of foreign cattle. . . . A Belgian law of the 30th July, 1919, confers on a special body, organized as a commercial society, the obligation to undertake all the commercial operations necessary to secure the requisite supply of cereals for the Belgian people. A Belgian decree of the 10th August, 1919, enacts that all the cereals, of whatever sort, which are not strictly necessary to the farmers for the needs of their respective business, must be handed over to the commission for acquiring grain for the supply of the Belgian people. . . . A Danish law, No. 501, of the 19th September, 1919, requires all farmers to consign to the State granaries all the harvested cereals, except the quantity needed for sowing in the Autumn of 1919. The Government will remit to the farmers the price fixed by law, and can also allow them maize and concentrated cattle feed corresponding to their respective needs.

Another Danish law of the 31st October, 1919, No. 596, contains measures for assuring food supplies for the population and authorises the government and the communes to take steps to fight the high prices of food-stuffs. . . . A French law of 6th January, 1919, aims at promoting the intensification of agricultural production during and after the war. It establishes regional and departmental agricultural offices to promote improved methods of farming, more especially by organising experimental stations, by spreading information and by the development of agricultural associations. The organisation and mode of procedure of these offices is regulated by a decree of 25th April, 1919, which provides in each department for the opening of a departmental agricultural office managed by a Board of 5 members designated by the general council, two to be selected from among its members and the others to represent the leading agricultural groups. A regional agricultural office is established for each region consisting of the general inspector of agriculture for the region, and of two delegates of the departmental offices of the region. . . . An Italian decree of 2nd September, 1919, No. 1633, empowers the prefects to authorise the temporary occupation of lands by legally constituted agricultural associations who undertake to grow cereal and vegetable crops on same. The period of occupation may not exceed four years and the owner will receive a fair compensation to be determined, in case of failure to come to an agreement, by a board of arbitration. Before the period of occupation terminates the occupying association may ask that it be made permanent in the case of lands susceptible of important cultural transformations or which come under the provisions of the law on land reclamation and drainage. . . . A Japanese decree of 17th April, 1919, No. 13, deals with provisioning the country in cereals and rice and authorises the Ministry of Agriculture and Commerce to grant, through the prefectures, rewards to those farmers who increase their yields. . . . A Norwegian law of 22nd March, 1918, enacts measures to promote agricultural production. It deals first of all with agricultural mobilisation and requires that all persons domiciled in the Kingdom and fit to work assist in farm work. In the second place it provides for the expropriation of lands which are badly cultivated and empowers the municipalities to take over estates inadequately farmed with their respective equipment in return for the payment of a fair compensation. Lands thus ceded may be farmed by the municipalities wholly or partially, or may be rented to persons whose farms are of inadequate size for their needs. A Norwegian law of 17th July, 1918, regulates the price of food-stuffs, and empowers the government to fix maxima prices, to forbid the hoarding of commodities and to regulate the production and sale of food-stuffs. . . . A Spanish decree of 7th March, 1919, contains measures to control the hoarding of food-stuffs providing penalties for offenders. The holders of food-stuffs, fuel, cattle feeds and chemical fertilisers are required to notify same to the proper authorities. Persons who fail to do so are held to be hoarders and as such are liable to the penalties enacted. . . . A Spanish decree of the 21st November, 1919, establishes a special department in the Ministry of Supplies under the title of government tribunal. It will consider and decide appeals relating to food control fines which exceed 500 pesetas, it will also consider appeals against decisions pronounced by the administrative commissions on the same subjects. . . . A Swiss decree

of 15th February, 1919, aims at increasing the production of food-stuffs. It requires owners or renters of lands to cultivate an area equal at least to that under cultivation during the previous season. The Cantonal authorities are empowered to compel the owners of lands susceptible of improvements to carry them out forthwith, or to expropriate the lands and make the improvements themselves with the assistance of the Federal government. The cantonal authorities may, in return for adequate guarantees, cede this right to the communal authorities in the case of lands placed under their jurisdiction. . . . A Swiss decree of 27th May, 1919, limits the consumption of meat restricting the sale to certain days in the week. It also limits the slaughtering of large cattle and provides restrictions for the trade in cattle. . . . A federal law of the *United States* of 4th March, 1919, aims at promoting the production of cereals and empowers the President to make regulations, promulgate decrees, conclude agreements, and collaborate with any organisation or person to attain this end. The President is also empowered to guarantee a minimum price to producers and to grant indemnities for the conservation, carriage, and storage of wheat in elevators."—*International Yearbook of Agricultural Legislation*, v. 9, 1919, pp. xix-xxi, xxiii, xxvii-xxviii, xxxvi.

In 1920 the Institute reported that "The question of providing food stuffs for the populations, though much less acute than in past years, has given rise to various provisions. . . . A considerable number of laws and decrees refer to the delicate and difficult problem of increase in production in the transition period, . . . [thus] a *Belgian* decree of 19th May, 1920, contains regulations for the declaration of cultivated areas. Every cultivator of a homestead consisting of more than a hectare has to declare to the municipal authorities of his district the exact areas under cultivation of various kinds, adding details as to the labour employed on his farm, and the beasts which he owns. The data thus collected is sent to the Ministry of Industry, Work and Supplies for elaboration. . . . [Another decree] regulates the trade and distribution of cereals and flour. Mills authorised to grind cereals provided by the Government can only sell the flour produced thus to factories and traders designated by the Ministry, which is also authorised to issue special regulations as to the conditions to be observed in making such purchases, and the maximum quantity to be furnished. A law of 1st July, 1920, of the *Dominion of Canada* contains rules regulating trade in food stuffs for animals and poultry with the exception of corn, hay, straw, bran, etc. . . . A *Danish* law of 10th September, 1920, contains provisions to regulate the trade in the yield of the 1920-1921 crops. . . . All agriculturists shall deposit in the State deposits the whole wheat and rye crop, with the exception of the quantity necessary for seed to be sown on their property. The law also decides the price to be paid for wheat and rye, allowing for increase or decrease in this price for grain either above or below the average. When the provisioning of the country with bread grain is secured, the Ministry for Agriculture is authorised to export any surplus which may exist. The export of oats and barley is forbidden in the law, but the Minister for Agriculture is allowed to grant special concessions for export on condition that the exporter pays a suitable tax. A *Danish* Law of 28th July, 1920, regulates the provision of sugar for the population for the years 1920-1921. To this end the Ministry for Agriculture has powers to make arrangements with all the beet sugar factories in the country by

which all cultivators of beet-roots for sugar refining receive a minimum price per hectoliter of beets consigned from the 1920 crop. . . . A *French* law of 9th August, 1920, deals with the supply of food stuffs for the country. The law provides that the population shall be assured of bread supplies by means of purchases by private treaty of wheat and flour at prices to be arranged by suitable decrees. If the amount thus purchased is not sufficient for the needs of the country, the magistrates can resort to requisition. . . . [A] decree of 25th August, 1920, fixes the rules for the distribution of cereals, flour and bread. . . . The law also provides a premium of 200 francs per hectare cultivated under wheat and 80 francs per hectare under rye for the cultivators of devastated lands. . . . A *French* decree of 18th October, 1920, regulated trade in cattle for slaughtering and meat placed on sale for food purposes. . . . A *Swiss* decree of 31st January, 1920, makes it obligatory on whoever possesses land in any manner whatsoever, to cultivate it reasonably, so that all the productive ability of the land shall be used, so as to increase the output of food stuffs and forage. Gardens, ground dedicated to sport, private and public parks must be given over to agriculture and reasonably cultivated. In order to increase the agricultural production of the country, the Cantonal governments are given power to requisition all uncultivated lands and to cultivate them either directly or by means of associations or private individuals."—*International Yearbook of Agricultural Legislation*, v. 10, 1920, pp. xii-xvi, xxiii.

1918-1922.—Work of the American Relief Administration under Hoover. See INTERNATIONAL RELIEF: American Relief Administration.

1920.—Necessity for regulation of food productions in the *United States*.—Herbert Hoover, speaking in 1920, said: "Expansion of the possible wheat area in the *United States* is now comparatively limited unless we retrench on other essential production. In fact, there is even, indeed, serious shrinkage of wheat area in prospect, due to the unconquered invasion of rust in our spring wheat areas of the Northwest. This threatened deficiency must be maintained by an inducement to expand wheat production in the Southwest. Furthermore, our average yield of wheat per acre must have a steady increase if we are to meet the necessities of an advancing population. An increase from our average of less than sixteen bushels toward the average of western European production of over twenty-five bushels per acre is in the main the possible source of supply in the long run. This can only be obtained by more intensive cultivation and the larger use of fertilizers, and those extra costs do not show a profitable return ratio in prices. The American farmer naturally can only engage in extra expense for extra return. It is sometimes said that our breadstuff needs will outgrow our capacity for the production of wheat. This is not necessarily the case within our century, for it is always possible to contemplate an increase per acre that would keep pace with our increase in population, but this cannot be accomplished on the basis of the pre-war ratio prices of wheat to other commodities."

1921-1922.—Regulation of meat packing industry in the *United States*.—"The meat-packing industry of the *United States* has passed under the supervision of the Government, also the buying and selling of live stock in commerce. Together these twin industries represent an invested capital of about \$20,000,000,000; with the possible exception of the railroads, they may be called the largest business venture in the *United States*. The

Packers and Stockyards act, passed on Jan. 24, 1921, placed both of them under the control of the Department of Agriculture and created an entirely new administrative unit to perform the new function thus imposed upon the Secretary of Agriculture. . . . The organization of the Packers and Stockyards Administration, the bureau which will henceforth execute the Government's functions in this untrodden field. . . . [The law is] among the first fruits of the activities of the 'farmer bloc' in Congress.

"The production of live stock for food purposes is carried on in every State. The live stock is usually purchased from the small producers by dealers, who forward it to the stockyards in various cities. In the stockyards it is received by other dealers or commission men, who in turn sell it to the meat packers. Certain large producers ship their own stock direct to the yards without the intervention of the local dealers. These stockyards are scattered all over the country, from Arabi, La., and El Paso, Texas, to New York, St. Paul and Spokane. The act places all these stockyard services—buying and selling, marketing, feeding, watering, holding, delivery, shipment, weighing and handling of live stock—under Government control, provided that the animals are bought and sold in interstate commerce, and most of them are so bought and sold.

"From the stockyards the Government follows the live stock to the meat packers, who transform it into food products—fresh meats, smoked meats, canned meats, lard and every other edible meat food. There are also by-products, such as fertilizer. All these products are then shipped to the four corners of the country, and the Government control follows them wherever they go. The same is true of dairy products, poultry and eggs, when handled by the meat packers. Beginning with the stockyards, the Government supervision follows the buying and selling of all these food products and by-products through every channel of interstate commerce until the shipments reach the wholesale local dealers.

"'Packer control' legislation is an old question. It has been hanging fire for a quarter of a century. For many years the stock raisers . . . have been firmly convinced that the large meat packers were in a permanent conspiracy to destroy competition in the buying of live stock, and thus depress prices to the detriment of producers. There was also a conviction that the stockyards were controlled by the same interests—and always against the farmers. Among the consumers of meat products, on the other hand, there was a . . . feeling that the packers were arbitrarily 'boosting' the prices of meat products. The general idea was that the packers defrauded the farmers by buying their live stock for less than its real value, and then defrauded the consumers by profiteering in the manufactured meat products. . . . The immediate parent of the present Packers and Stockyards act is a Federal investigation conducted only three years ago. . . . In 1916 the charge was persistently made both in the press and in Congress that the constantly rising prices of food products were caused by artificial and illegal combinations in restraint of trade. On Feb. 7, 1917, President Wilson took official cognizance of this charge in a communication to the Federal Trade Commission. . . . 'Pursuant to the authority conferred upon me by the act creating the Federal Trade Commission, I direct the commission, within the scope of its powers, to investigate and report the facts relating to the production, ownership, manufacture, storage and distribution of

foodstuffs and the products or by-products arising from or in connection with their preparation and manufacture; to ascertain the facts bearing on alleged violations of the anti-trust acts, and particularly upon the question whether there are manipulations, combinations, conspiracies or restraints of trade out of harmony with the law or the public interest.' [In pursuance of this order] the Federal Trade Commission engaged Francis J. Heney to make the investigation. Mr. Heney conducted a spectacular and thorough investigation, and the Packers and Stockyards act is the reply of Congress and the President to the findings of the Federal Trade Commission based upon Mr. Heney's researches into the packing industry.

"The Federal Trade Commission made its report to President Wilson on July 3, 1918 . . . [in which it stated], 'It appears that five great packing concerns of the country . . . have attained such a dominant position that they control at will the market in which they buy their supplies, the market in which they sell their products, and hold the fortunes of their competitors in their hands. Not only is the business of gathering, preparing and selling meat products in their control, but an almost countless number of by-product industries are similarly dominated; and, not content with reaching out for mastery of commodities which are used as substitutes for meat and its by-products, they have invaded allied industries and even unrelated ones. The producer of live stock is at the mercy of these five companies, because they control of the market places, storage facilities and the to some extent the rolling stock which transports the product to market. The competitors of these five concerns are at their mercy because of the control of the market places, storage facilities and the refrigerator cars for distribution. The consumer of meat products is at the mercy of these five because both producer and competitor are helpless to bring relief. . . . The power [it reported] has been and is being unfairly and illegally used to manipulate live-stock markets, restrict interstate and international supplies of food, control the prices of dressed meats and other foods, defraud both the producers of food and consumers, crush effective competition, secure special privileges from railroads, stockyard companies and municipalities, and profiteer. . . . The purposes of this combination are: to monopolize and divide among the several interests the distribution of the food supply not only of the United States but of all countries which produce a food surplus, and, as a result of this monopolistic position, to extort excessive profits from the people not only of the United States but of a large part of the world. To secure these ends the combination employs practically every method of unfair competition known to the commission . . . among which may be mentioned the following: Bogus independents, local price discriminations, short weighing, acquiring stock in competing companies, shutting competitors out of live-stock markets.'

"Following the report of the Federal Trade Commission the packers opened a nation-wide campaign of denial and defense. A large sum of money was spent in publicity to break down the commission's charges. Congress took up the matter, and week after week, in session after session, the packers and their counsel confronted the commission and its experts before committees of both houses. But, true or false, the commission's report stuck. The farming and stock-raising interests believed the commission's charges were true, and nothing could shake their belief. The Packers and Stockyards act followed.

"This act is designed to prevent the practices described in the Federal Trade Commission's report to President Wilson on the meat-packing industry. Under the act the packers are prohibited: 'From any unfair, unjustly discriminatory, or deceptive practice or device; From giving undue or unreasonable preference or advantage to any person or locality; From apportioning the supply of any article between them, where the tendency or effect of such apportionment would restrain commerce or create monopoly; From dealing with any person for the purpose, or with the effect, of manipulating or controlling prices, or creating a monopoly or restraining commerce; From engaging in any course of business for the purpose, or with the effect, of manipulating or controlling prices, or of creating a monopoly in buying, selling or dealing in any article, or restraining commerce; From conspiring or combining with any other person to apportion territory or purchases or sales, or to manipulate or control prices; From aiding or abetting the doing of any of the foregoing acts.' The Secretary of Agriculture may also require the packers to 'keep such accounts, records and memoranda as will fully and correctly disclose all transactions in their business, including the ownership of such business by stockholding or otherwise.'

"For violation of the terms of the act packers or their agents will be liable to a fine of from \$1,000 to \$10,000 or may be sent to prison for terms ranging from one year to five years, according to the seriousness of the infraction. The privilege is given to the packers, as to the stockyard men, to appeal to the United States courts against such penalties imposed by the Secretary of Agriculture. As for the stockyard men, the law requires all owners, live-stock dealers and commission merchants to register with the Secretary of Agriculture, file their price schedules and change those schedules to conform with the decree of the Secretary in case he finds them unreasonable. The stockyard owners and others are also required to keep their accounts in the manner prescribed by the Secretary of Agriculture so as to disclose all their transactions and the ownership of their business."—*New York Times Current History, Mar., 1922.*

**FOOT, Roman.**—"The unit of lineal measure [with the Romans] was the Pes, which occupied the same place in the Roman system as the Foot does in our own. According to the most accurate researches, the Pes was equal to about 11.64 inches imperial measure, or .97 of an English foot. The Pes being supposed to represent the length of the foot in a well proportioned man, various divisions and multiples of the Pes were named after standards derived from the human frame. Thus: Pes = 16 Digni, i. e. finger-breadths, [or] 4 Palmi, i. e. hand-breadths; Sesquipes = 1 cubitus, i. e. length from elbow to extremity of middle finger. The Pes was also divided into 12 Pollices, i. e. thumb-joint-lengths, otherwise called Unciae (whence our word 'inch')."—W. Ramsay, *Manual of Roman antiquities, ch. 13.*

**FOOTE, Andrew Hull** (1806-1863), American naval officer, in the gun-boat campaign on the western rivers during the Civil War; captured Fort Henry and Island Number 10, 1862; wounded in the combined attack on Fort Donelson. See U. S. A.: 1862 (January-February: Kentucky-Tennessee); (March-April: On the Mississippi).

**FOOTE, Arthur William** (1853- ), American born and American trained composer; studied with Emery, Paine, and Lang; appointed organist, First Unitarian Church, Boston, 1878. His greatest

works are an orchestral suite, and a symphonic prologue, "Francesca da Rimini."

**FOOTE, Samuel Augustus** (1780-1846), American legislator. Served in state legislature; member of Congress, 1819-1821, 1823-1825; senator from Connecticut, 1827-1833; governor of Connecticut, 1834-1836; author of the Foote Resolutions.

**FOOTE RESOLUTIONS**, presented in the United States Senate December 29, 1829, by Senator Foote of Connecticut. They provided for restrictions on land sales and were vigorously opposed by western senators, notably Thomas Hart Benton of Missouri. The southern states rights advocates sought to draw the western men to their side and this led to the famous Webster-Hayne debate.

**FORAKER, Joseph Benson** (1846-1917), American Republican legislator and governor; served in Army of the Cumberland during the Civil War; judge of the Superior Court of Ohio, 1879-1882; governor of Ohio, 1886-1890; United States senator, 1897-1909; introduced the Foraker Act of 1900 for the government of Porto Rico.

**FORAKER ACT** (1900). See U. S. A.: 1900-1901.

**FORBACH, or Spicheren, Battle of.** See FRANCE: 1870 (July-August).

**FORBES, William Cameron** (1870- ), governor-general of the Philippines, 1909-1913. See BAGUIO.

**FORCADOS**, port of southern Nigeria. See CAMEROONS: Occupation by Germany.

**FORCE, Peter** (1790-1868), American historian; founder of the American Historical Society, 1835. See AMERICAN HISTORICAL ASSOCIATION.

**FORCE BILL: 1833.**—Act designed to prevent nullification and secession. See U. S. A.: 1828-1833.

1871.—Act to enforce the Fourteenth Amendment. See U. S. A.: 1871 (April).

**FORCHEIN**, city in Bavaria, at the junction of the Wiesent and the Regnitz. It is famous as the seat of Diets. See PAPACY: 1056-1122.

**FORD, Henry** (1863- ), American automobile manufacturer. See AUTOMOBILES: 1889-1905; 1892-1916.

**FORD, John** (1586-c. 1640), English dramatist. See DRAMA: 1592-1648.

**FORD LEGAL AID BUREAU.** See LEGAL AID: United States: Important factors in administration of legal aid.

**FORDE, Francis** (d. 1770), British colonel in India. See INDIA: 1758-1761.

**FORDNEY TARIFF BILL.** See TARIFF: 1921 (May); U. S. A.: 1921.

**FOREIGN EXCHANGE.** See MONEY AND BANKING: Modern period: 1912-1913: Federal reserve system; 1913-1920.

**FOREIGN LEGION**, body of French troops composed of adventurous spirits from all parts of the world. They have served with Maximilian in Mexico, in Algeria and Morocco and in the World War, and enjoy a high reputation for valor. They are subject to the strictest discipline of any military body in the world.

**FOREST CANTONS, Swiss.** See SWITZERLAND: Three forest cantons.

**FOREST PATROL, Aerial.** See AVIATION: Development of airplanes, etc.: 1918-1921: Air service after World War.

VAATION OF NATURAL RESOURCES; ALASKA: 1884-1912; AGRICULTURE, DEPARTMENT OF; WORLD WAR: Miscellaneous auxiliary services: XI. Devastation: b, 4.

**FORLANINI, Enrico**, Italian inventor. See AVIATION: Development of balloons and dirigibles: 1806-1914.

**FORLI**, capital of the province of the same name, in Italy, situated on the old Æmilian way. See ITALY: 1412-1447; VENICE: 1494-1503.

**FORMALDEHYDE**: Production. See CHEMISTRY: Practical application: Drugs.

**FORMIDABLE**, British cruiser, torpedoed and sunk by the Germans, January, 1915, in the English Channel on her way to the Dardanelles.

**FORMIGAS**, small island of the Azores group.

**FORMORIANS**. See FOMORIANS.

**FORMOSA**: Geographic description.—“Formosa, or Taiwan, as it is called by the Chinese, is about 400 miles south of the mouth of the Yangtse, and 100 from the mainland of China. [See also CHINA: Map.] It lies between 25° 20' and 21° 50' north latitude, is nearly 240 miles long, by an average of 75 miles wide, and has an area of about 12,000 square miles [with a population of 3,654,398]. It is remarkable for its beauty and fertility, and also for the variety of its products. It was formerly attached to the province of Fohkien, and governed by a resident commissioner; but since the Franco-Chinese War, during which the French, under Admiral Courbet [1884-1885], were foiled in their efforts to take possession of it, it has been erected into an independent province by imperial decree.”—J. H. Wilson, *China*, ch. 18.—In 1895 the island was ceded to Japan. “Ranges of slaty and schistose mountains, mainly of the Tertiary age, run through its length, some of their peaks towering as high as 13,000 feet. The eastern coast is rocky and steep, affording very few landing places; but the western coast consists of flat, fertile, alluvial plains, where are raised rice, sugar cane, tea, ramie, bananas, oranges, and sweet potatoes. Among the mountains grow gigantic trees of various kinds, the most important being camphor and hinoki (*Thuya obtusa*). The island is as beautiful as it is fertile. The Portuguese navigators, as they sailed along the eastern coast, were so charmed by its precipitous but wooded mountains, its fantastic rocks and the foaming billows which dash against them, that they put down in their log-book their favorite name of ‘Ihla Formosa.’ From the other side, the Chinese, who can quite easily reach the western coast in their junks—the distance from Foochow to a Formosan port is only a little over a hundred miles—were struck with its beauty, as from their anchorage they saw hillsides inhabited and cultivated, and they called it Taiwan, the ‘Terraced Bay,’ which is still the official designation of the island. The Japanese, too, had long known of it, and in times past venturesome spirits used to frequent it, but in later days only the poetical name ‘Takasago’ (The High Sandy Tract) remained, suggesting in popular fancy a land of lotus-eaters.”—I. Nitobe, *Japanese nation*, p. 233.—See also JAPAN: Name.

1874-1910.—Conquest by Japan.—Opium problem.—Public health.—Head-hunters.—General development.—“In 1874, in order to obtain redress for a murder of Japanese sailors by savages on the eastern coast of Formosa, the Japanese government undertook to take possession of the southern part of Formosa, asserting that it did not belong to China because she either would not or could not govern its savage inhabitants. By the intervention of the British minister, Sir T. F. Wade,

war was prevented, the Japanese withdrawing and the Chinese remaining in control; but the former still coveted the island, and finally secured it, as one of the results of their war with China, in 1894-5.”—S. W. Williams, *Middle kingdom*, ch. 26, v. 2.—See also JAPAN: 1868-1894; SHIMONOSEKI, TREATY OF (1895).

“When the war between China and Japan came to an end [1895], Formosa was most unexpectedly brought into prominence. When Japan proposed that China should cede the island, we were not at all sure that the suggestion would be regarded with favor. But the Chinese plenipotentiary, Li Hung-Chang, took up the proposition, as though it were wise on the part of his country to be freed from an encumbrance, and he even commiserated Japan for acquiring it. He pointed out that the island was not amenable to good government: (1) that brigandage could never be exterminated; (2) that the practice of smoking opium was too deep-rooted and wide-spread among the people, to eradicate; (3) that the climate was not salubrious; and (4) that the presence of head-hunting was a constant menace to economic development. The island, somewhat like Sicily, had, in the course of its history, been subject to the flags of various nations. Holland, Spain, and China ruled it at different times; a Hungarian nobleman once dominated it; and at one time Japanese pirates had practically usurped supreme power over it. In 1884, the French under the celebrated Admiral Courbet planted the tricolor on its shores, where it waved for eight months. . . . In accordance with the stipulation of the treaty of Shimonoseki, one of our [Japanese] generals, Count Kabayama, was dispatched as Governor-General of Formosa. In that capacity, he was about to land on the island with a large army, when he was met by the Chinese plenipotentiary at the port of Kelung, and in an interview which took place on board the steamer *Yokohama Maru*, the 17th of April, 1895, it was arranged that a landing should be effected without opposition. This marked the first occupation of the island by our troops. [See also CHINA: 1894-1895.] There were at that time some Imperial Chinese soldiers still remaining in the island, and they were ordered to disarm and leave the country. Many did so, but a few remained to oppose our advance; there were also a few patriots who did not feel ready to accept our terms—not prepared to accept alien rule,—and these either went from the island or took up arms against us. The so-called patriots proclaimed a republic, one of the very few republics ever started in Asia. Though the island was pacified, no one knew what would happen next. We did not understand the character of the people. Very few Japanese could speak Formosan, and fewer Formosans could speak Japanese. There was naturally mutual distrust and suspicion. The bandits abounded everywhere. Under these conditions military rule was the only form of government that could be adopted until better assurance could be obtained of the disposition of the people. The first Governor-General was Count Kabayama [1895], known as a hero of the Chino-Japanese War; the second was no less a man than Prince Katsura [1896], of international fame as our Prime-Minister during the war with Russia; and the third was General Nogi [1896], of Port Arthur renown. Finding that the country could ill afford such a luxury as a colony, the Parliament of Japan cut down its appropriation of six or seven million yen payable from the national treasury by about one-third, thus reducing the subsidy to only four millions. Viscount Kodama, who, as a member of the General Staff,

had made a study of the Formosan problem, was ready to accept the governorship and the task of putting to rights the bankrupt housekeeping of the colony. In the choice of his assistant, the civil governor, he made the discovery, as he called it, of a man who proved himself a true right hand, and who in efficiency actually exceeded his most sanguine expectations. I refer to Baron Goto. . . . Until he was made civil governor of Formosa under Kodama, he had been known as an expert on hygiene, having been a physician. The advent of these two men in Formosa marked a new era in our colonial administration. Upon entering their new duties early in 1898, the first thing they did was to bring about a practical suspension of military rule; at least, it was made subservient to civil administration. Military rule is apt to become harsh, and to the Chinese especially, who are not accustomed to respect the army, it is doubly harsh. When General Kodama went to Formosa, he found brigandage still rampant, and with military rule in abeyance there was some likelihood of its becoming worse. To offset this, the constabulary department was organised and made efficient by proper care in choosing men for the police and by educating them in the rudiments of law and industries, to prepare them for their difficult and delicate tasks. Exceedingly arduous are their callings, for these policemen are required not only to represent law and order but are expected to be teachers as well. They keep account, for instance, of every resident of the island, and they watch over every man and woman who smokes opium; they must become acquainted with children of school-age and know which children go to school and which do not. Our Formosan police are expected to instruct the people how to take care of themselves, especially in regard to pests, and about disinfection. They perform many duties that would scarcely be required even of the Trooper Police of Australia. They often live in villages where there are no Japanese other than the members of their own families. Of course, they must know the Formosan language and speak it. Now, under civil administration, armies were not mobilised against brigands, and if there was any trouble, it was the policemen who had to cope with the situation. The brigands were first invited to subject themselves to law, and if they surrendered their arms, they were assured not only of protection but of means of subsistence. Not a few leaders took the hint and were given special privileges. Those who resisted to the end were necessarily treated as disturbers and as criminals. Twelve years ago the brigands were so powerful that the capital of Formosa, Taihoku (Taipeh), was assaulted by them; but in the last ten years [written in 1912] we have scarcely heard of them. . . .

"[A] great evil in the island . . . was the smoking of opium. When the island was taken over, this subject was much discussed by our people. Some said opium-smoking must be summarily and unconditionally abolished by law. . . . What took Baron Goto for the first time to Formosa was the mission of studying this question from a medical standpoint, and the plan he drew up was for the gradual suppression of the evil. The *modus operandi* was the control of the production by the Government; because, if the Government monopolises the production and manufacture of opium, it can restrict the quantity as well as improve the quality so as to make it less harmful. Smuggling was watched and punished. . . . In 1900 those addicted to the habit numbered in round figures 170,000, or 6.3 per cent. of the population. . . . In

five years the number decreased to 130,000 or 3.5 per cent of the population. . . . Thus, the second evil . . . in Formosa has been greatly weakened and seems destined to disappear. [See also OPIUM PROBLEM: 1905; 1918.]

"Chiefly owing, directly or indirectly, to malaria, the population of Formosa has never been very great. . . . The fact that new-comers from Japan are so easily attacked is the greatest drawback to colonising the island. Sugar-mills, for want of sufficient labour, have imported Japanese; but usually one-third of them cannot be depended upon—that is to say, the efficiency of labour may be said to be diminished by one-third on account of malaria. Even under present conditions every effort is made to drive out malaria. . . . In the barracks outside of Taihoku, there is little malaria. In the town itself, the improved drainage . . . has evidently contributed toward the same end. So, also, has the good water supply, which has taken the place of wells and cisterns. Then, too, new building regulations enforce better ventilation and access to sunlight. In the principal cities, large portions of the town have been entirely rebuilt. . . . Other cities, notably Tainan in the south, are making sanitary improvements, so that they will probably show a similar immunity within a few years. As for the island at large, owing to the fact that irrigation is the very life of rice-culture, there are necessarily unlimited breeding-places for mosquitoes. . . . Smallpox and cholera have been practically eliminated from the list of prevalent diseases. With the bubonic plague, the Government has had a pretty hard fight. Dr. Takaki, who has been chief of sanitation for some years, has devoted his energy and scientific knowledge to the eradication of it by every possible means, so that there has been a steady and regular decrease of pest since 1906. Thus the third great impediment . . . in Taiwan is being steadily overcome, and now I reach the fourth and last obstruction,—namely, the presence of head-hunting tribes, allied to the head-hunters of Borneo made familiar by the pen of Professor Haddon. These Malay people are the oldest known inhabitants of the island. That they are not autochthonous is evident from the tradition, current among many tribes, that their ancestors arrived in a boat from some distant quarter. At present they number about one hundred and fifteen thousand. They are in a very primitive state of social life. The only art with which they are acquainted is agriculture, and that of a very rude sort. They have scarcely any clothing; a few tribes wear none. Their houses are usually built of wood and bamboo and are roofed with slate or straw. Scrupulously clean in their personal habits, bathing frequently, they keep their huts very neat. In character, they are brave and fierce when roused to ire; otherwise, friendly and childlike. They must have occupied the alluvial plains of the coast in years gone by, but were driven upward by the Chinese immigrants, Hakkas and Haklos, until they now dwell among almost inaccessible heights. What concerns us most nearly in their manner of life is their much venerated custom of consecrating any auspicious occasion by obtaining a human head. . . . The district where they roam is marked off by outposts, which I shall soon describe. Like the 'Forbidden Territory' or *boma* in British East Africa, no one is allowed to enter the 'Savage Boundary' without permit from the authorities. The importance of this decree will be obvious if I state that its area covers more than half of the island, and when the savages want a head, they steal down, hide themselves among the underbrush or among the

branches of trees, and shoot the first unlucky man who passes by. . . . During Chinese ascendancy the Government built a line of military posts, somewhat like the *trocha*, of which one still sees remains in Cuba. But after we had tried different methods, we came at last to the use of electrically charged wire fences. . . . These Malay tribes resemble the Japanese more than they do the Chinese, and they themselves say of the Japanese that we are their kin and that the Chinese are their enemies. And now every year, . . . we are getting better control over them by constantly advancing the fence, and owing to the fact that they are in want of salt, cut off as they are from the sea. Then we say, 'We will give you salt if you will come down and give up your weapons.' Thus tribe after tribe has recognised our power through the instrumentality of salt, and has submitted itself to Japanese rule. Here I may say, to the credit of these primitive men, that when once their promise of good behaviour is made, it is kept. When they submit themselves, we build them houses, give them agricultural tools and implements, give them land, and let them continue their means of livelihood in peace. . . .

"With the money that we could raise in the island, every year we had to get some subsidy from the national treasury. It was thought that such a subsidy would be necessary until 1910. But by the development of Formosan industries—the better cultivation of rice, the improved production of Oolong tea, for which you are the best customer, the control of the camphor industry (for nearly all the camphor that you use, if not artificial, is produced in Formosa), the successful encouragement of cane culture, which has increased the output of sugar sixfold in the last ten years—by developing these industries, we can get money enough in the island to do all the work that is needed to be done there. An accurate cadastral survey made landed property secure, enhanced its value, and added indirectly to its tax-paying capacity. The consumption tax placed on sugar alone brings in more than one-third of the public revenue. The growth of Formosa's foreign trade has been such that the customs now return no mean sum. The administration of the Island has been so successful that it attained financial independence two years before [1908] the expiration of the term fixed for it. There still remains much to be done. Irrigation work, for instance, is being carried out on a large scale. Then, there is the improvement of the harbours. Both in the north, at Kelung, and in the south, at Takao, commodious and deep harbours are now being constructed or improved. We have built a railroad from one end of the island to the other, but there is demand for further extension. Schools and hospitals are to be met with in every village and town, but more are needed. In all these things we think that we have succeeded quite well, especially when we compare our colony of Formosa with the experiments that other nations are making."—I. Nitobe, *Japanese nation*, pp. 237-252.

1906.—**Earthquake.**—Over 6,000 persons were reported killed or injured in an earthquake that occurred in the island of Formosa in March, 1906.

1906-1919.—**Development of the camphor and sugar industries.**—Consul Samuel C. Reat, of Tamsui, has prepared the following review of the camphor industry of the island of Formosa: "Camphor trees are found only in the mountainous districts, in the heart of the island, that have been and are in the possession of the head-hunting tribes of Formosa. By an apparent perversity of nature the camphor trees seem to flourish best in

the regions inhabited by the fiercest tribes. It is into the mountain fastnesses, to the very habitations of the hostile aborigines, that the camphor workers must penetrate. Truces with the savages, effected by gifts, have at times brought temporary tranquillity, but these periods have been short and of uncertain duration. Since the Japanese occupation fatalities in this work have decreased. This, in part due to a conciliatory policy adopted by the Japanese officials, is the result of civilizing influences, difficult to define, yet unmistakably at work. In spite of the improved conditions 451 people connected with the camphor industry were slain by savages during the last three years, the number in 1909 being 96. The camphor monopoly, directed by the Formosan Government, has been operating ten fiscal years. The first eight years were remarkably successful, and in 1906-7, a phenomenal year, the profits of the Formosan Government are said, upon the most trustworthy authority, to have reached \$1,500,000 gold. This may be partially verified by comparing the price that camphor brought that year (as high as \$80 per picul of 133 pounds) with the estimated price paid by the Government to the camphor producer, which is said to have been about \$15 per picul. These high prices could not be maintained. A reaction followed in 1907, caused in part by the appearance in the market of German synthetic camphor, and in part by business conditions depressing the world's markets generally. At the close of the fiscal year in 1908 there developed no indication of a satisfactory profit for the camphor monopoly. . . . [In 1910 the export of camphor amounted to 3,073,735 yen.] Under the Formosan Government monopoly regulations all camphor and camphor oil that have been produced in Formosa must be sold to the Monopoly Bureau. Under this system the amount of camphor to be placed on the market, the price to be paid to the producer, and the price to be paid to the vendee are fixed by the Government. The privilege of engaging in the camphor industry is granted by the Government to individuals and companies upon application. The applicant is required to furnish some evidence of his financial standing. A certain territory is allotted to each operator, and he must confine his operations within the particular district designated in his license."

"The sugar industry has experienced its greatest development since the outbreak of the European war. In 1915 the output of sugar in Japan proper was 140,000,000 *kin* and in Formosa about 420,000,000 *kin*, a total of 560,000,000 *kin*. At the same time exports of sugar from Japan have naturally increased and imports correspondingly decreased. Comparing the first nine months of 1916 with the same period in 1917 we have the following figures:

	Exports	Imports
January to September, 1916	¥6,701,157	¥7,211,401
January to September, 1917	10,101,341	4,835,331

Thus there was an increase of well over nine million *yen* in exports of sugar in the first nine months of the year as compared with the previous year, and a decrease of over two million *yen* in imports. . . . In Formosa sugar has been cultivated since the 16th century, being introduced by the Chinese. When Formosa was occupied by the Dutch in 1624 sugar was already a staple product of the island. For the next forty years the Dutch did all they could to develop the industry. When Teiseiko of China drove out the Dutch in 1666 he devoted much attention to the cultivation of sugar

cane, importing new plants from Fukien, after which rapid progress was made. After the island passed under the full control of China some 20 years later, no remarkable progress was seen in sugar cultivation. However, the industry was steadily carried on and the output was exported to Japan, China, England, North America and Australia. In 1895 when Japan came into possession of Formosa she was too much occupied with the subjugation of the savages to give proper attention to the sugar industry, and it declined until 1898, when the Government resolved to protect and encourage it. In 1902 the industry came under official protection, and with increase of capital, knowledge and modern methods both cane cultivation and sugar refining underwent radical improvement. To-day Formosa is one of the great sugar producing centers of the world. . . . The area under cultivation has also extended to an acreage much greater than formerly, about four times that under cultivation at the time of Japan's occupation in 1895. During the past ten years or so [written in 1918] the output of sugar from Formosa has increased more than sevenfold in value. [In 1910 the export of sugar amounted to 7,542,252 yen.] . . . The development of the sugar industry in Formosa owes not a little to the energy and direction of the large sugar companies that have been established there, bringing in adequate capital and forming an association for the protection of the industry."—Teizo Ito, *Formosan sugar industry* (*Japan Magazine*, Feb., 1918).

1920-1921.—Railways.—Budget.—Roads are in process of construction throughout the island, 378 miles of railway being opened in 1920. The budget for 1920-1921 balanced with an estimated expenditure and revenue of 94,368,309 yen.

**FORUMS OF ROME**: Forum Romanum.—"The Topographical Centre of Ancient Rome was the low ground lying between the Palatine, the Velia, the Esquiline, the Viminal, and the Capitoline [five hills]. When the Palatine city had extended its boundaries to the adjacent heights, this became the natural meeting-place for trade and political action. These two functions were carefully separated, the political assemblies being held on the Comitium, a small and definitely marked-out area, which lay at the northwest corner of the much larger and undetermined area where the people met for other purposes. This was called the Forum, or market-place. Although there was no natural line of demarcation between Forum and Comitium, they were kept distinct in use until the middle of the second century B. C. After that date they gradually lost their separate identity, and the phrase *Comitium et Forum* conveyed but one idea. This valley was originally swampy, being the natural basin for the drainage of the surrounding hills. . . . The end of the first period was marked by the beginning of a systematic attempt to drain the swampy ground. This was effected by constructing sewers, and especially the Cloaca Maxima. . . . During the . . . first three centuries of the republic the Forum became an increasingly important part of the city. . . . Two things contributed to change the character and appearance of the Forum at the beginning of the second century, B. C.,—the erection of the Macellum, or market house, north of the Forum, and of the three basilicas, Porcia, Aemilia, and Sempronia, and, fifty years later, of the Opimia. . . . The erection of the basilicas added greatly to the appearance of the Forum; but their main object was to afford convenient and sheltered halls where the Romans could meet to transact the steadily

increasing business of the capital."—S. B. Platner, *Topography and monuments of ancient Rome*, pp. 164-167.

Imperial.—The imperial period "witnessed the complete rebuilding of the Forum, a process which was just begun by Julius Cæsar, and carried out by Augustus and Tiberius. Later emperors did something; but, with the exception of the temples of Vespasian and Faustina, the arch of Septimius Severus, the eight pedestals and columns in front of the basilica Julia, and a few minor changes, the Forum of the empire, which is known to us by its ruins, is the work of Augustus and Tiberius."—*Ibid.*, p. 167.—"The fourth forum [was] built by Vespasian, and the fifth [was] begun by Domitian and completed by

one mile long, and supported by about twelve hundred columns, public libraries and archives, and the finest and richest shops of the metropolis."—R. Lanciani, *Ancient Rome in the light of modern discoveries*, pp. 84-89.

**FOUCHE, Joseph, Duc d'Otranto** (1763-1820), French revolutionist. Deputy to the convention, 1792-1795; a leading Jacobin; minister to the Cisalpine republic, 1798; minister to the Netherlands, 1799; minister of police under Napoleon I, 1799-1802, 1804-1810, 1815; was in charge of the provisional government set up after Napoleon's defeat at Waterloo.

**FOULLON, Joseph François** (1717-1789), French administrator. Intendant general of the army during the Seven Years' War and later became intendant general of finance, 1771; minister of the king's household, 1780. See FRANCE: 1789 (July): Surrender of authority by the king.

**FOUNDATIONS, Educational and philanthropic, United States: Carnegie Foundations.**—The best known of the foundations made by Andrew Carnegie include the Carnegie Institution of Washington, the Carnegie Institute of Technology, Pittsburgh, Carnegie Hero Fund, Carnegie Endowment for International Peace, Carnegie Foundation for the Advancement of Teaching, Carnegie Corporation of New York. This last is the latest and greatest of his philanthropies. Before his death he endowed it with \$125,000,000. After his death, its share of his residuary estate amounted to about \$11,000,000, and by the terms of the trust, he gave the five trustees in whom these vast sums are vested an absolutely free hand to use them for the promotion of civilization in whatever way they, in their judgment, should decide was best. This enabled them to use very large amounts in aiding the Red Cross (\$1,500,000), the Knights of Columbus (\$250,000), the Y. M. C. A. (\$250,000), and Y. W. C. A. (\$100,000) in war work, in building cantonment libraries (\$320,000), in the study of means of Americanization (\$204,000), for the National Research Council (\$5,420,000), Church pension fund (about \$325,000). The Carnegie Foundation for the Advancement of Learning, however, is from its name the endowment which is categorically known as the Carnegie Foundation. It was at first intended by its founder that the original fund provided should be used for retiring allowances for the teachers of higher educational institutions in the United States, Newfoundland and Canada. It was soon found, however, that the system which was instituted was rather impractical, and the foundation was soon changed and enlarged into a regular scheme of pension insurance. "The Carnegie Foundation was the outcome of Mr. Carnegie's sympathy with the cause of education, and of his desire to be of service to the teachers of America. In a letter of April 16, 1905, announcing a gift for this cause, he wrote: 'I have reached the conclusion that the least rewarded of all the professions is that of the teacher in our higher educational institutions. . . . Able men hesitate to accept teaching as a career, and many old professors whose places should be occupied by younger men can not be retired. . . . I have, therefore, transferred to you and your successors, as Trustees, \$10,000,000 five

per cent first mortgage bonds of the United States Steel Corporation, the revenue from which is to provide retiring pensions for the teachers of universities, colleges and technical schools in our country, Canada and Newfoundland, under such conditions as you may adopt from time to time.' . . . The Executive Committee . . . obtained from the Congress of the United States an act of incorporation. This act enabled the corporation to receive and maintain funds for paying pensions to college teachers in the United States, Canada and Newfoundland, and 'in general to do and perform all things necessary to encourage, uphold and dignify the profession of the teacher and the cause of higher education' in these three countries. . . . The rules adopted [by the board] for conferring retiring allowances were based upon length of service and upon age. Twenty-five years of service as a professor was the minimum basis of the service pension and sixty-five years the minimum limit of age at which retirement could be asked. . . . Mr. Carnegie in March, 1908, offered five millions of dollars additional endowment to enable the Trustees to enlarge the number of institutions 'should the governing boards of any State universities apply for participation in the fund and the legislature and governor of the State approve such application.' He directed that this sum and the original gift of ten millions be considered a single endowment. In accordance with these conditions, application has been made on behalf of all of our State universities for a share in the pensions provided by this endowment, and these applications have been approved by the legislatures and governors of the respective States. Similar action has been taken in the provinces of Canada. . . . When the Carnegie Foundation was incorporated in the spring of 1906, there was no conception of a pension plan in the minds of Mr. Carnegie and of his Trustees, except that of the free payment of pensions to as many teachers as the income of the endowment would provide. In making such payments, the Trustees had clearly recognized that such pensions or allowances must be stipendiary in character, that is to say, they must have some fair relation to the active salary. . . . Within a very short time the defects of this plan began to show themselves. The establishment of a privilege so valuable as a free pension, when restricted to a limited number of institutions, involved discriminations between institutions which as time passed became more and more difficult to justify. . . . The evidence brought together convinced the Trustees that a non-contributory pension, . . . was not in the permanent interest of the college teacher, and that it should be transformed into a system in which the expense could be definitely estimated in advance. . . . The following plan was therefore adopted: For five years no change is made. At the end of that period the minimum age of retirement is raised, year by year, one year at a time, for a second period of five years, by which time it has been brought to seventy years. After the first five years, a teacher retiring before the minimum age will receive an allowance diminished by one-fifteenth for every year by which he anticipates the minimum age. This arrangement will still require a very large expenditure, and one that will absorb practically the whole income of the Foundation for fifty years. In addition there will be expended the entire principal and interest of one million dollars accumulated by the Foundation and a large reserve fund of eleven millions of dollars, contributed by the Carnegie Corpora-

tion for this purpose. The Foundation will expend, during the next fifty years, some sixty millions of dollars in carrying out the expectations of the teachers in the associated institutions."—*Manual of the public benefactions of Andrew Carnegie*, pp. 129-132, 138-139, 141, 146.—"In the charter of the Foundation, provision is made for engaging in any endeavor within the field of education that tends to promote and advance the profession of the teacher. . . . Recognizing in value of such work, Mr. Carnegie . . . offered \$1,250,000 of four per cent bonds as an endowment for a Division of Educational Inquiry. The Trustees accepted this gift as a separate trust, and the fifty thousand dollars of annual income has been devoted to the work of educational inquiry. . . . In the prosecution of educational studies, the Foundation has offered to those who thus cooperated with it the largest measure of freedom, both in their methods and in their utterances."—*Manual of the public benefactions of Andrew Carnegie*, pp. 135, 136.—See also **CARNEGIE HERO FUND**; **CARNEGIE INSTITUTE, PITTSBURGH**; **CARNEGIE INSTITUTION, WASHINGTON**; **PEACE MOVEMENT**: Peace organizations.

**FOUR COURTS**, the four powers, Austria, England, Prussia and Russia. France was admitted in 1815. See **VIENNA, CONGRESS OF**.

**FOUR HUNDRED**, Athens, council of 400 invested with the powers of government by the Athenians in 411 B.C. See **ATHENS**: B.C. 413-411.

**FOUR MASTERS.**—Four Irish antiquaries of the seventeenth century, who compiled the mixed collection of legend and history called the "Annals of the Kingdom of Ireland," are commonly known as the Four Masters. They were Michael O'Clery, a lay brother of the order of St. Francis; Conaire O'Clery, brother of Michael; Cucogry or Peregrine O'Clery, head of the Tirconnell sept of the O'Clerys, to which Michael and Conaire belonged; and Ferfeasa O'Mulconry, of whom nothing is known, except that he was a native of the county of Roscommon. The "Annals" of the Four Masters have been translated into English from the Irish tongue by John O'Donovan.—J. O'Donovan, *Introduction to annals of the kingdom of Ireland by the Four Masters*.—See also **ANNALS**: Irish.

**FOUR MILE LAW**, law regulating the sale of liquor in Tennessee. See **TENNESSEE**: 1887-1908.

**"FOUR MINUTE" MEN**, volunteer national organization of which the members, in 1917-1918, made four minute patriotic speeches in motion picture theaters all over the United States.—See also **WORLD WAR**: Miscellaneous auxiliary services: III. Press reports, etc.: d, 5.

**FOUR POWER TREATY**, ratification in Japan. See **JAPAN**: 1921-1922.

**FOURDRINIER, Henry (1766-1854)**, English inventor of paper-making machine. See **INVENTIONS**: 19th century: Industry.

**FOURIER, François Charles Marie (1772-1837)**, French socialist. See **SOCIALISM**: 1832-1847.

**FOURIERISM**, name applied to Charles Fourier's social theories. See **SOCIALISM**: 1832-1847; 1840-1847.

**FOURTEEN DIAMOND RINGS, Case of.** See **U. S. A.**: 1900-1901.

**FOURTEEN POINTS**, statement of war aims made by President Wilson in 1918. See **WORLD WAR**: 1918: X. Statement of war aims: b; c; d; **U. S. A.**: 1918 (January).

**FOURTEENTH AMENDMENT**, an amendment to the Constitution of the United States guaranteeing the civil rights of the negro, and establishing a new basis of representation, finally ratified, July 20, 1868. See **U. S. A.**: 1865-1866 (December-April); 1866 (June); 1866-1867 (October-March); 1871 (April); **SUFFRAGE, MANHOOD**: United States: 1864-1921.

**FOURTH OF JULY**, anniversary of the adoption of the American Declaration of Independence. See **U. S. A.**: 1776 (July).

**FOWEY**, small seaport of Cornwall, England, twenty-two miles west of Plymouth. See **ENGLAND**: 1644 (August-September).

**FOWLER VS. MILLER**, first interstate dispute to come up to the Supreme Court, 1799. See **SUPREME COURT**: 1835-1864.

**FOWLTOWN, Battle of (1817)**. See **FLORIDA**: 1812-1819.

**FOX, Charles James (1749-1806)**, English statesman and orator. Member of Parliament, 1768; junior lord of the admiralty under Lord North, 1770-1772; lord of the treasury, 1772-1774; dismissed because of opposition to the king; foreign secretary in Whig ministry of Rockingham, 1782; secretary of state, with North, 1783; in 1806 until his death, foreign secretary. Fox opposed the war with the American colonies, and the wars with France, urged the abolition of slavery, and secured the passage of the Libel Act. See **ENGLAND**: 1782-1783; 1783-1787; 1806-1812.

**FOX, George (1624-1601)**, English Quaker, founder of the Society of Friends. See **FRIENDS, SOCIETY OF**: Origin and early history.

**FOX, Henry.** See HOLLAND, HENRY FOX, 1ST BARON.

**FOX INDIANS,** American aboriginal tribe, a branch of the Algonquian family. See INDIANS, AMERICAN: Cultural areas in North America: Eastern woodlands area; ALGONQUIAN FAMILY; SACS.

1712.—Massacre at Detroit. See WISCONSIN: 1712-1740.

1812.—Allied with the English in War of 1812. See MISSOURI: 1812-1815.

1832.—Black Hawk War. See ILLINOIS: 1832.

**FOXTON, Justin Fox Greenlaw** (1840-1916), Australian statesman; member of Queensland Parliament for Carnarvon, 1883-1904; member of federal council of Australia; member of Parliament for Brisbane, 1906-1910; representative at Imperial Defense Conference, 1909. See WAR,

PREPARATION FOR: 1909: British Imperial Defense Conference.

**FOYERS DU SOLDAT.** See Y. M. C. A.: World War activities: 1914-1919: Work in France; FRANCE: 1914-1918: French women and their activities, etc.

**FRACTURES.** See MEDICAL SCIENCE: Modern: 20th century: Advance in surgical methods.

**FRAGONARD, Jean Honoré** (1732-1806), French painter. See PAINTING: French.

**FRAM,** vessel used by Nansen in his Polar exploration. See ANTARCTIC EXPLORATION: 1911-1912; ARCTIC EXPLORATION: 1867-1901.

**FRAME PILE DWELLINGS.** See LAKE DWELLINGS.

**FRANCE, Anatole** (Anatole Thibaut) (1844- ), French novelist and miscellaneous writer. See FRENCH LITERATURE: 1800-1921.

## FRANCE

**Geographic description.—Climate.—Area and population.**—France is a country of Western Europe, comprised between  $51^{\circ} 5'$  and  $42^{\circ} 20'$  of Latitude N. It is thus almost exactly half-way between the North Pole and the Equator. . . . On account of the influence of the Gulf Stream and of the prevailing west winds, the greater part of France is more temperate than its latitude would suggest. France is in the heart of the region best suited to the development of the white race. . . . Texas is considerably larger, and California not much smaller. In comparison with other Western European States, France does not look so insignificant. The British Isles are barely three-fifths the size of France. France is thus too large ever to fear that powerful neighbours will absorb her or turn her into their satellite, as might be the case with Denmark, Holland, or Belgium; but it is not a huge, self-contained continent or subcontinent, capable of evolving an independent culture. It is an organic, essential part of a larger unit, Western Europe. By far the most important point in this connection is that France, and France alone, borders at the same time on the Mediterranean, the Atlantic, and the North Sea. Thus she is both a Northern and a Southern Power, but not in the same degree. Historically, the whole of France belongs to the Mediterranean world, of which Rome was so long the centre. The valley of the Rhone and the isthmus of Gascony afforded easy access to the north and the west, as far as the Seine, the Rhine, and the Atlantic Ocean. Thus Gaul was early conquered by Roman arms, Roman law, and the Latin language. . . . Geographically, France is primarily a Northern country. . . . From Italy it is separated by the highest mountains in Europe, the Alps; from Spain, by the lower but less accessible Pyrenees. It has less than 400 miles of coast on the Mediterranean, against 700 on the North Sea and the Channel, and 865 on the Ocean. The western half of that Mediterranean coast is marshy and feverish; the eastern half is cut off from the rest of the country by abrupt and barren hills, or even by mountains. The highroad from the Mediterranean to the North, the Rhone Valley, is fertile enough, but exceedingly narrow; the river is abundant and picturesque, but impetuous and almost untamable—'a mad bull rushing southward,' as Michelet called it. On the contrary, between France, North Germany and Belgium

there are no natural obstacles. The Moselle, the Meuse, the Scheldt have the upper part of their course in France. The north-eastern boundary of France is purely artificial. The heart of French power, Paris, is far to the north."—A. L. Guérard, *French civilization in the 19th century*, pp. 18-19. —"Of the great surrection of primary rocks which once ran across Europe from Bohemia to Wales, two main fragments remain in France, Armorica and the Central Mountains (Massif Central). The latter, under the formidable pressure of the geologic waves to which the Alps and Pyrenees are due, are dislocated, and lifted in part above their former altitude. The mountains of France, therefore, belong to different systems and ages, and offer very different aspects. Whilst primitive Armorica and Ardennes have been eroded into plateaux of moderate elevation, the comparatively recent Alps and Pyrenees have preserved the sharpness of their outlines. The rest of France consists mainly in three groups of plains: the Parisian basin, which includes the watershed of the river Seine and much of the middle Loire; the Aquitanian basin, watered by the Garonne and the Dordogne; and the narrow valley of the Saône, and Rhône. Now the chief factor in the unity of France is the fact that communications have always been easy from each of these basins into the others. Thus, ascending the Rhône and its tributary the Saône, we come to the rich province of Burgundy, whence we pass easily into the valleys of the Loire, of the Seine and its affluents, and even of the Meuse and the Rhine. The Pass of Naurouze, between the Pyrenean foothills and the last of the Cevennes, gives access from the Mediterranean to the valley of the Garonne. Only 640 feet high, it was used as early as the reign of Louis XIV for a canal, and the transformation of this canal so as to admit sea-going vessels is not beyond the range of possibility. Most important of all is the depression of Poitou, which, between the primitive masses of Armorica and the Central Mountains, connects the great basins of Paris and of Aquitania. There we find one of the important keys to French history: had Poitou been less accessible, Aquitania would be a separate nation to-day."—A. L. Guérard, *French civilization, from its origins to the close of the Middle Ages*, pp. 31-32. —"France is the result of physical geography, no doubt, but also of an equilibrium

between contending influences of race and cultures, and perhaps still more of a definite long-continued policy. What holds France together is the Capetian tradition first of all, then the principles and souvenirs of the Revolution and a strictly centralized form of government. This centralization system we take to be one of the causes, rather than the result, of national unity. The Convention, which had so deep an instinct of French tradition, fought like grim death for the indivisibility of the Republic, against all federalists. France is the product of the human will—the will of kings at first, then will of the people.

“Varied in its aspects, France is no less varied in its climates. French geographers generally recognize seven. The Parisian or Sequanian region, under the influence of its northern latitude mitigated by its proximity to the Channel, has a cool climate (mean temperature 50°), equable in the main, but offering constant variations; a climate of samples, which fanciful meteorologists liken to the proverbial fickleness of the Parisian mind. Rains are light but frequent; they often make winter slushy rather than severe, and summer as cool and wet as spring. The Breton or Armorican climate, under the influence of the Gulf Stream, is a little warmer (51.8°) and decidedly maritime: cool summers that do not allow the vine to thrive, very mild winters, frequent mists and rains. The Girondin climate reigns over Poitou and the basin of the Garonne. It is also a maritime climate, mild and seldom too dry, but, on account of its more southern position, warmer and sunnier than that of Brittany (53.6°); it is ideally suitable for wine, fruit, and cereals. The Central Mountains vary in climate according to their exposure, altitude, and geological formation; on the whole, the Auvergne climate is cool (51°) but extreme; summers may be locally scorching, winters are almost invariably very hard. Snow, rare and light in the West and South of France, here falls heavily and covers the ground for months. The Vosgian or eastern climate, embracing northern Franche-Comté, eastern Burgundy and Champagne, and the whole of Lorraine, is typically continental, with long sharp winters, brief and hot summers which enable the vine to prosper on favoured hill-sides (average 48.2°). The Rhodian or Lyonnese climate, farther south and on a lower altitude, but uninfluenced by the sea and hemmed in by mountains, is warmer (51.8°), extreme, changeable, with abundant rains. The Mediterranean climate, by far the warmest (57.5°), offers mild winters, long, dry summers, when nature assumes that appearance of deadness so characteristic of Northern Africa or the South-Western United States; a ‘choleric’ climate withal, as Michelet would have it, with sudden downpours and thunderstorms, with winds raging from the Mediterranean or down the air-shaft of the Rhone Valley. Sheltered by the Alps, the Riviera in winter is a paradise.”—A. L. Guérard, *French civilization in the 19th century*, pp. 21-23.—Since the ending of the World War, some important additions have been made to the territory and resources of France. In accordance with the terms of the Peace Treaty with Germany (June 28, 1919) Alsace-Lorraine has been transferred to France, to date from the armistice of November 11, 1918. The districts of Lower Alsace, Upper Alsace and Lorraine become the departments of Bas-Rhin Alsace (1,848 square miles and population 700,038), Haut-Rhin (1,354 square miles, population 517,865), and Moselle (2,403 square miles, population 655,211). The total area thus added to France is 5,605 square

miles and the population thereof, according to the census of 1910, is 1,874,014. The total area of France is (1921) 212,659 square miles and the population is estimated at 39,209,766. By the Treaty of Versailles (article 45), as a compensation for the destruction of coal mines in the north of France, France has obtained from Germany the exclusive rights of exploitation of the coal mines in the Saar Basin. This district is about 220 square miles in area and the population is 640,733. For the next fifteen years the Saar Basin will be governed by a Commission of Five, chosen by the League of Nations. At the end of fifteen years the population will determine by vote which one of the three alternatives they wish to accept:—the continuance of the rule set up by the Treaty, incorporation with France, or union with Germany.

**Resources.**—“In spite of a widespread and flattering prejudice, France was by no means bountifully endowed by nature. Barren mountains cover nearly one-third of her territory. Except for her narrow golden belt, Brittany is sterile. The Landes are vast tracts of shifting dunes, partly reclaimed under the Second Empire. There are traces in Sologne and the Dombes of the marshes that once covered a large portion of the country. Almost at the gate of Paris, Champagne Pouilleuse (beggarly) is a bare, bleak plain. . . . Much of the present fertility of France is due to unremitting labour: hence the peculiar love of the French peasant for that soil which requires such efforts, but repays them without stint. Neither is France ideally well favoured for commerce. Its position on four seas is advantageous. But, compared with England, Japan, Italy or Greece, its shape is massive, its coastline small in proportion to the total area, and, in consequence, its coast-wise trade comparatively unimportant. [See also **COMMERCE**: Commercial Age: 1914-1921.] The most maritime province, Brittany, is the most un-French. There are few good natural harbours. Brest, the best in spite of a dangerous pass, is far from all centres of production. Le Havre is ever on the defensive: the sea, it was aptly said, is British at heart: it scours the English coast, deepens its harbours, and chokes with silt their French rivals. As a highway of commerce, the longest river, the Loire, is almost useless; the most abundant, the Rhône, is too much of a torrent ever to rival the Rhine or the Elbe; the Garonne is worse than mediocre; the unassuming Seine alone is excellent and capable of almost indefinite improvement. Already as smooth and regular as a canal, 11 feet deep as far as Paris, it could easily be made accessible to large sea-going vessels. France is poor in minerals. Precious metals are almost non-existent; coal, ‘the bread of industry,’ is found only in a few districts, especially in the North, in geological formations more broken and more expensive to work than in England. The total output amounted in 1911 only to 38 million tons, against 455 in America, 268 in England, 234 in Germany. Iron is more abundant, especially since the discovery of the rich basin of Briey in Lorraine. But iron and coal are not found side by side, and there is no cheap way of conveying the one to the other. The proposed North-Eastern Canal, between the metallurgic basin of Lorraine and the coalfields of the North, would be an extremely difficult and costly piece of engineering. On the other hand, France is well-rounded in its economic life, almost self-supporting, at the mercy neither of foreign supplies nor of one exclusive national staple. It offers a sufficiency of all es-

sentials—bread, vegetables, fruit; the French would add wine—all of excellent quality. Beef and mutton can hardly compare with the English products; but poultry is plentiful, and 'la poule au pot' [stewed chicken], which good King Henry wished every one of his subjects to enjoy of a Sunday, is a toothsome dish. Long centuries of civilization have given France industrial treasures as precious as coal and iron: an artistic tradition and generations of skilled craftsmen. Owing to the immense variety of her resources, although each in particular may seem mediocre, France weathers industrial crises better than her more venturesome and reckless rivals."—A. L. Guérard, *French civilization in the 19th century*, pp. 23-25.

**Colonial empire.**—"France had to provide an outlet for her capital and the produce of her industry: some of her politicians, notably Jules Ferry, saw in colonial expansion the most direct path for France to regain her place among the great European powers. . . . In the vast territories she now possesses outside of France she rules over more than 54,000,000 people: her colonial empire is second largest in the world, coming after that of Great Britain. Since the Franco-Prussian War she has added to her colonies by the conquest of Tunis (1881), Tongking (1885), Madagascar (1895), Dahomey and the Ivory Coast (1887), French Congo (1893). Ferry was her greatest pioneer of colonial expansion; another was M. Doumer, who was made governor-general of Indo-China in 1896; his great administrative powers soon put the French colonies of that continent on a sound footing. In 1890 England and France signed a treaty assigning Madagascar and the 'light soil' of the Sahara to France. The French colonies at the present day [1914] are: In *Africa*: Algeria, which forms a protectorate under a governor-general; Tunis, Morocco, French West Africa including Senegal, French Guinea, the Ivory Coast, Dahomey, the Algerian Sahara, French Congo, French East Africa including Madagascar and Somaliland, Kerguelen, Réunion, St. Paul, and Amsterdam. [Cameroon and Togoland were acquired in 1919 as a result of the World War, and are held under a mandate of the League of Nations.] In *Asia*: Cochin China, Annam (which was formed into a protectorate in 1885), Tongking, Laos, and Cambodia, also French India (including Pondicherry, Mahé, Karikal, Chandernagore), and Kwang-Chow-Wan. In *Australasia or Oceania*: The Society Islands and Caledonia. In *America*: Martinique, Guadeloupe, and some smaller islands in the West Indies; Cayenne or French Guiana in South America, and some islands off Newfoundland, St. Pierre, Miquelon, etc."—V. Duruy, *Short history of France*, v. 2, pp. 540-541.—The ministry of the colonies, created as a separate department in 1894, has charge of the administration of the French colonial possessions. Algeria, Tunis and Morocco are not under its jurisdiction. Algeria is not regarded as a colony but as part of France, and the administration of Tunis and Morocco is directed by the ministry of foreign affairs. Most of the colonies have a governor and an elective council, and send representatives to the French legislature. Réunion, Martinique and Guadeloupe send each a senator and two deputies; French India is represented by a deputy and a senator; Senegal, Guiana and Cochin-China each have a deputy. Most of the other colonies are represented on the "Conseil Supérieur des Colonies." "Though the acquisition of these colonies has given the Republic the prestige of standing second only to England in the extent of

her territorial possessions, it has not proved financially profitable to France. Her nationals are not colonists by nature, chiefly because there has always been a plot of ground or a position open at home for each son of the small families for which the country is noted. The result in the colonies is that the number of white men is not sufficient to raise productivity to any great extent either by their own toil or as leaders. Almost every white colonial is a government official. Especially in Africa have there been plans for the building of railroads and the development of trade routes, but accomplishment has not been great. Even Algeria, which is nearest to France, has the largest white population, and is the most advanced in every way, is a source of deficit to the French treasury. [In 1921, France spent 28,663,613 francs for the civil administration of the colonies; 212,742,276 francs for military services, and 10,740,714 francs for penitentiary services, making a total of 252,146,603 francs.] What the attitude of the colonials would be toward France during the war was a question about which utter lack of knowledge threw a harrowing uncertainty at the beginning. They proved completely loyal. The Senegalese with their black faces and whirling white draperies and huge knives made a picturesque and terrifying addition to the grim panorama of battle; less warlike peoples were invaluable in the service of support as road menders, and from them were drawn many of the labor battalions which did valuable work in the less spectacular efforts to win the war."—V. Duruy, *Short history of France*, v. 2, pp. 703-704.

**People.**—"Racial epitome of all Europe."—"Before the Franks, the Romans, the Gauls, there lived in France Iberians [q.v.] and Ligurians [q.v.]. And before them? Unnamed tribes, cave and lake dwellers, the Crô-Magnon, the Neanderthal races. . . . All these elements are now hopelessly mixed: throughout the course of French history there is no sign of a race prejudice checking this process of amalgamation. France has been a melting-pot for over two thousand years of recorded history, and for untold centuries before. . . . These three races are found in France—the Nordic in Flanders and Normandy, the Alpine in Savoy, Auvergne and Brittany, the Mediterranean in the Aquitanian and Provençal south. In no other country are more than two of these races fully represented: France is therefore a racial epitome of all Europe. But this plain statement would not do justice to the complexity of the French population. We should add, first of all, two minor but extremely curious elements: the Basques, broad-shouldered and slim-waisted like the ancient Egyptians, with faces broad at the temples, and tapering into a pointed chin; and a group of peasants in Dordogne, fairly tall, long-headed, with broad faces, men who have been identified with the prehistoric Crô-Magnon race. Then the combination of traits is not always in harmony with the ideal types defined by anthropology. The inhabitants of Burgundy and Alsace, for instance, are darkish and round-headed like the Alpines; but they are also tall, which is the joint result of an admixture of Teutonic blood and of the fertility of their provinces. The Bretons are stocky, round-headed, frequently dark-haired; but their eyes are blue—a Nordic trait. The great majority of the French belong to a strongly Teutonized Alpine stock. This type is undistinguishable from the similar population of Southern and Western Germany."—A. L. Guérard, *French civilization, from its origins to the close*

of the Middle Ages, pp. 55-56.—“The Gauls, whatever they may have been, were neither aborigines nor even, perhaps, the first conquerors of the land. The primitive inhabitants are often referred to—darkly—as Celtiberians, and the Basques are sometimes held to be a remnant of these early occupiers of the soil. After the Gauls came the Romans, who subdued the north of the country from 154 to 121 B. C. (Gallia Braccata or Narbonensis, modern Provence), and the rest, as far as the Rhine, under Julius Cæsar, from 58 to 51 B. C. Four centuries later, after a long period of gradual infiltration, sometimes checked, sometimes encouraged by Rome, Gaul was flooded with migrating Barbarians. The Visigoths, the Burgundians, and the Franks took up their abode in the land. The invasions, properly so-called, ended with the repulse of the Huns and of the Avars. In the ninth and tenth centuries the Northmen harried the coasts, penetrated far inland along the valleys of the Seine and of the Loire, and finally secured the rich province which still bears their name (Normandy). The prehistoric and shadowy Celtiberians, the Gauls, the Romans, the Franks, and the Northmen, such are the main elements of the French people. All other historical influences are so small as to be almost negligible. The Greeks founded several cities on the Mediterranean shore: Nice, Monaco, Antibes, and especially Massilia—Marseilles. The Arabs, defeated by Charles Martel, occupied Aquitania for some time, and to their sojourn some ethnographers ascribe the sporadic existence of Saracenic types among the Southern peasantry. There is practically no trace of the protracted English tenure of Guienne, nor of Spanish rule in Franche-Comté. All invasions of France since the Hundred Years' War were so short and of so purely military a nature that they could not affect the population in any perceptible degree. More important than all spectacular crises are the constant and silent migrations which have never completely ceased in modern times and continue to the present day. Throughout the nineteenth century France has attracted Poles, Russians, and Italians, driven from their countries by the tyranny of the Tsars or of Austria. The number of these refugees was never very large, but they were élite, and Polish names in particular are not infrequent among French writers and scientists. The immigration of common labourers is surprisingly small, in view of the facts that France is both richer and more sparsely populated than her neighbours, and that there is no legal restraint to the inflowing of foreign workmen. Belgians, Italians, and Poles, however, are an ever-increasing factor even in rural districts at harvest-time, and especially in industrial centres.”—A. L. Guérard, *French civilization in the 19th century*, pp. 29-30.—See also EUROPE: Ethnology; Migrations: Map showing Barbaric migrations.

**Language.**—There is considerable diversity of dialect. There are “the Flemings of the Hazebrouck district, in Northern France, who speak a Dutch dialect; the West Bretons, whose mother tongue is Celtic; the Basques in the Pyrenees, who are using a curious agglutinative language, possibly the most primitive in Europe, whose affinities are still baffling philologists; and a majority of the Alsatiens, whose *patois* is unmistakably Germanic. It should be added that there are now several hundred thousand pure Germans under the French flag. Standard French is spoken by the common people along the middle course of the Seine and of the Loire, in all the larger cities, and by the educated everywhere. This

standard French or Francian was originally a northern dialect; throughout the south it is still a superimposed, official language. In nearly one-third of France even the middle classes use for daily intercourse *patois*, which are forms of the old Langue d'Oc. Mistral and his friends, in the nineteenth century, have revived the great tradition of Provençal literature. Within that southern sphere the dialect of Roussillon is Catalanian rather than Provençal; those of Nice and Corsica are closer to Italian. These linguistic differences, however, do not mar the unity of the French nation. The minor tongues are not officially encouraged; but neither are they persecuted in the way Polish, Danish, and French used to be by Imperial Germany. There is no talk of secession; and there is no thought of annexing Southern Belgium or Western Switzerland because they happen to speak French.”—A. L. Guérard, *French civilization, from its origins to the close of the Middle Ages*, pp. 52-53.—See also FRENCH LITERATURE: 5th-15th centuries; PHILOLOGY: 9; 11.

**481-843.**—Under the Franks.—Division of Charlemagne's empire. See EUROPE: Middle Ages: Rise of Frankish kingdom; FRANKS.

**841-911.**—Ravages and settlements of the Northmen. See NORMANS: 841 to 876-911; PARIS: 845; 857-861; 885-886.

**9th century.**—Introduction of the modern name.—At the time of the division of the empire of Charlemagne between his three grandsons, which was made a definite and lasting political separation by the treaty of Verdun, 843, “the people of the West [western Europe] had come to be divided, with more and more distinctness, into two classes, those composed of Franks and Germans, who still adhered to the Teutonic dialects, and those, composed of Franks, Gallo-Romans, and Aquitanians, who used the Romance dialects, or the *patois* which had grown out of a corrupted Latin. The former clung to the name of Germans, while the latter, not to lose all share in the glory of the Frankish name, began to call themselves Franci, and their country Francia Nova, or New France. . . . Francia was the Latin name of Frankland, and had long before been applied to the dominions of the Franks on both sides of the Rhine. Their country was then divided into East and West Francia; but in the time of Karl the Great [Charlemagne] and Ludwig Pious, we find the monk of St. Gall using the terms Francia Nova, in opposition to the Francia, *quæ dicitur antiqua*.”—P. Godwin, *History of France: Ancient Gaul*, ch. 18, with note.—“As for the mere name of Francia, like other names of the kind, it shifted its geographical use according to the wanderings of the people from whom it was derived. After many such changes of meaning, it gradually settled down as the name for those parts of Germany and Gaul where it still abides. There are the Teutonic or Austrian [or Austrasian] Francia, part of which still keeps the name of Franken or Franconia, and the Romance or Neustrian Francia, which by various annexations has grown into modern France.”—E. A. Freeman, *Historical geography of Europe*, v. 1, p. 121.—“As late as the reign of Frederick Barbarossa, the name of Frank was still used, and used too with an air of triumph, as equivalent to the name of German. The Kings and kingdoms of this age had indeed no fixed titles, because all were still looked on as mere portions of the great Frankish

realm. Another step has now been taken towards the creation of modern France; but the older state of things has not yet wholly passed away. Germany has no definite name; for a long time it is 'Francia Orientalis,' 'Francia Teutonica'; then it becomes 'Regnum Teutonicum,' 'Regnum Teutonicorum.' But it is equally clear that, within the limits of that Western or Latin France, Francia and Francus were fast getting their modern meanings of France and Frenchmen, as distinguished from Frank or German."—E. A. Freeman, *Franks and the Gauls (Historical essays, 1st series, no. 7)*.

**843.—Kingdom of Charles the Bald.**—The first actual kingdom of France (Francia Nova—Francia Occidentalis) was formed in the partition of the empire of Charlemagne between his three grandsons, by the treaty of Verdun, 843. (See VERDUN, TREATY OF: 843.) It was assigned to Charles, called "the Bald," and comprised the Neustria of the older Frank divisions, together with Aquitaine. It "had for its eastern boundary the Meuse, the Saône and the Rhone; which, nevertheless, can only be understood of the Upper Meuse, since Brabant was certainly not comprised in it"; and it extended southwards beyond the Pyrenees to the Ebro.—H. Hallam, *Middle Ages, ch. 1, pt. 1, foot-note*.—"Charles and his successors have some claim to be accounted French. They rule over a large part of France, and are cut away from their older connexion with Germany. Still, in reality they are Germans and Franks. They speak German, they yearn after the old imperial name, they have no national feeling at all. On the other hand, the great lords of Neustria, as it used to be called, are ready to move in that direction, and to take the first steps towards a new national life. They cease to look back to the Rhine, and occupy themselves in a continual struggle with their kings. Feudal power is founded, and with it the claims of the bishops rise to their highest point. But we have not yet come to a kingdom of France. . . . It was no proper French kingdom; but a dying branch of the Empire of Charles the Great. . . . Charles the Bald, entering on his part of the Caroling Empire, found three large districts which refused to recognise him. These were Aquitaine, whose king was Pippin II; Septimania, in the hands of Bernard; and Brittany under Nominoë. He attempted to reduce them; but Brittany and Septimania defied him, while over Aquitaine he was little more than a nominal suzerain."—G. W. Kitchen, *History of France, v. 1, bk. 2, pt. 2, ch. 5*.—See also FRANKS: 814-962; GERMANY: 843-962.

**861.—Origin of the duchy and of the house of Capet.**—In 861, Charles the Bald, king of that part of the dismembered empire of Charlemagne which grew into the kingdom of France, was struggling with many difficulties: defending himself against the hostile ambition of his brother, Louis the German; striving to establish his authority in Brittany and Aquitaine; harried and harassed by Norse pirates; surrounded by domestic treachery and feudal restiveness. All of his many foes were more or less in league against him, and the soul of their combination appears to have been a certain bold adventurer—a stranger of uncertain origin, a Saxon, as some say—who bore the name of Robert the Strong. In this alien enemy, King Charles, who never lacked shrewdness, discovered a possible friend. He opened negotiations with Robert the Strong, and a bargain was soon made which transferred the sword and

the energy of the potent mercenary to the service of the king. "Soon after, a Placitum or Great Council was held at Compiègne. In this assembly, and by the assent of the Optimates, the Seine and its islands, and that most important island Paris, and all the country between Seine and Loire, were granted to Robert, the Duchy of France, though not yet so called, moreover the Angevine Marches, or County of Outre-Maine, all to be held by Robert-le-Fort as harriers against Northmen and Bretons, and by which cessions the realm was to be defended. Only a portion of this dominion owned the obedience of Charles: the Bretons were in their own country, the Northmen in the country they were making their own; the grant therefore was a license to Robert to win as much as he could, and to keep his acquisitions should he succeed. . . . Robert kept the Northmen in check, yet only by incessant exertion. He inured the future kings of France, his two young sons, Eudes and Robert, to the tug of war, making them his companions in his enterprises. The banks of the Loire were particularly guarded by him, for here the principal attacks were directed." Robert the Strong fought valiantly, as he had contracted to do, for five years, or more, and then, in an unlucky battle with the Danes, one summer day in 866, he fell. "Thus died the first of the Capets." All the honors and possessions which he had received from the king were then transferred, not to his sons, but to one Hugh, count of Burgundy, who became also duke or Marquis of France and count of Anjou. Twenty years later, however, the older son of Robert, Eudes, turns up in history again as count of Paris, and nothing is known of the means by which the family, soon to become royal, has recovered its footing and its importance.—F. Palgrave, *History of Normandy and England, v. 1, bk. 1, ch. 3*.

**877-987.—End of the Carolingian monarchy and rise of the Capetian.**—Charles the Bald died in 877 and was succeeded by his son Louis, called "the Stammerer," who reigned only two years. His two sons, Louis and Carloman, were joint kings for a short space, struggling with the Northmen and losing the provinces out of which Duke Boson of Provence, brother-in-law of Charles the Bald, formed the kingdom of Arles. Louis died in 882 and Carloman two years afterwards; thereupon Charles, surnamed "the Fat," king of Lombardy and Germany, and also emperor (nephew of Charles the Bald), became likewise king of France, and briefly reunited under his feebly handled sceptre the greater part of the old empire of Charlemagne. When he died, in 888, a party of the nobles, tired of his race, met and elected Count Eudes (or Odo), the valiant Count of Paris, who had just defended his city with obstinate courage against the Northmen, to be their king. The sovereignty of Eudes was not acknowledged by the nation at large. His opponents found a Carling to set up against him, in the person of the boy Charles,—youngest son of Louis "the Stammerer," born after his father's death,—who appears in history as Charles "the Simple." Eudes, after some years of war, gave up to Charles a small domain, between the Seine and the Meuse, acknowledged his feudal superiority and agreed that the whole kingdom should be surrendered to him on his (Eudes') death. In accordance with this agreement, Charles the Simple became sole king in 898, when Eudes died, and the country which acknowledged his nominal sovereignty fell into a more distracted state than ever. The Northmen established themselves in permanent oc-

cupation of the country on the lower Seine, and Charles, in 911, made a formal cession of it to their duke, Rollo, thus creating the great duchy of Normandy. (See also NORMANDY: 911-1000.) In 922 the nobles grew once more disgusted with the feebleness of their king and crowned duke Robert, brother of the late king Eudes, driving Charles into his stronghold of Laon. (q.v.) The Normans came to Charles' help and his rival Robert was killed in a battle. But Charles was defeated, was inveigled into the hands of one of the rebel lords—Herbert of Vermandois—and kept a prisoner until he died, in 929. One Rodolf of Burgundy had been chosen king, meantime, and reigned until his death, in 936. Then legitimacy triumphed again, and a young son of Charles the Simple, who had been reared in England, was sent for and crowned. This king—Louis IV—his son, Lothair, and his grandson, Louis V, kept possession of the shaking throne for half-a-century; but their actual kingdom was much of the time reduced to little more than the royal city of Laon and its immediate territories. When Louis died, in 987, leaving no nearer heir than his uncle, Charles, duke of Lorraine, there was no longer any serious attempt to keep up the Carolingian line. Hugh, duke of France—whose grandfather Robert, and whose granduncle Eudes had been crowned kings, before him, and whose father, "Hugh the Great," had been the king-maker of the period since—was now called to the throne and settled himself firmly in the seat which a long line of his descendants would hold. He was known as Hugh Capet to his contemporaries, and it is thought that he got the name from his wearing of the hood, cap, or cape of St. Martin—he being the abbot of St. Martin at Tours, in addition to his other high dignities.—G. W. Kitchin, *History of France*, v. 1, bk. 2, pt. 2, ch. 5, bk. 3, ch. 1.—See also BURGUNDY: 888-1032.

987.—Accession of Hugh Capet.—Structure and political relations of the kingdom of the early Capetians.—Rights of the throne.—"On the accession of the third race [the Capetians], France, properly so called, only comprised the territory between the Somme and the Loire; it was bounded by the counties of Flanders and Vermandois on the north; by Normandy and Brittany on the west; by the Champagne on the east; by the duchy of Aquitaine on the south. The territory within these bounds was the duchy of France, the patrimonial possession of the Capets, and constituted the royal domain. The great fiefs of the crown, in addition to the duchy of France, were the duchy of Normandy, the duchy of Burgundy, nearly the whole of Flanders, formed into a county, the county of Champagne, the duchy of Aquitaine, and the county of Toulouse. . . . The sovereigns of these various states were the great vassals of the crown and peers of France; Lorraine and a portion of Flanders were dependent on the Germanic crown, while Brittany was a fief of the duchy of Normandy. . . . The county of Barcelona beyond the Alps was also one of the great fiefs of the crown of France."—E. de

Bonnechose, *History of France: Second epoch*, bk. 1, ch. 2.—"With the exception of the Spanish March and of part of Flanders, all these states have long been fully incorporated with the French monarchy. But we must remember that, under the earlier French Kings, the connexion of most of these provinces with their nominal suzerain was even looser than the connexion of the German princes after the Peace of Westphalia with the Viennese Emperors. A great French Duke was as independent within his own dominions as an Elector of Saxony or Bavaria, and there were no common institutions, no Diet or assembly of any kind, to bring him into contact either with his liege lord or with his fellow-vassals. Aquitaine and Toulouse . . . seem almost to have forgotten that there was any King of the French at all, or at all events that they had anything to do with him. They did not often even pay him the compliment of waging war upon him, a mode of recognition of his existence which was constantly indulged in by their brethren of Normandy and Flanders."—E. A. Freeman, *Franks and the Gauls (Historical essays, 1st series, no. 7)*.—"When France was detached from the Empire in the ninth century, of all three imperial regions she was the one which seemed least likely to form a nation. There was no unity in the country west of the Scheldt, the Meuse, and the Rhone. Various principalities, duchies, or counties were here formed, but each of them was divided into secular fiefs and ecclesiastical territories. Over these fiefs and territories the authority of the duke or the count, which was supposed to represent that of the king, was exercised only in case these seigneurs had sufficient power, derived from their own personal estates. Destitute of domains and almost starving, the king, in official documents, asked what means he might find on which to live with some degree of decency. From time to time, amid this chaos, he discussed the theory of his authority. He was a lean and solemn phantom, straying about among living men who were very rude and energetic. The phantom kept constantly growing leaner, but royalty did not vanish. People were accustomed to its existence, and the men of those days could not conceive of a revolution. By the election of Hugh Capet, in 987, royalty became a reality, because the king, as Duke of Francia, had lands, money, and followers. It would be out of place to seek a plan of conduct and a methodical line of policy in the actions of the Capetians, for they employed simultaneously every sort of expedient. During more than three centuries they had male offspring; thus the chief merit of the dynasty was that it endured. As always happens, out of the practice developed a law; and this happy accident produced a lawful hereditary succession, which was a great element of strength. Moreover the king had a whole arsenal of rights: old rights of Carolingian royalty, preserving the remembrance of imperial power, which the study of the Roman law was soon to resuscitate, transforming these apparitions into formidable realities; old rights conferred by the coronation, which were impossible to define, and hence incontestable; and rights of suzerainty, newer and more real, which were definitely determined and codified as feudalism developed and which, joined to the other rights mentioned above, made the king proprietor of France. These are the elements that Capetian royalty contributed to the play of fortuitous circumstances."—E. Lavisse, *General view of the political history of Europe*, ch. 3.—See also TWELVE PEERS OF FRANCE.

987.—Paris becomes the capital. See PARIS: 987.

987-1327.—Feudal period.—Suspension of the powers of royalty.—“The period in the history of France, of which we are about to write, began with the consecration of Hugues Capet, at Reims, the 3rd of July, 987, but it is a period which would but improperly take its name from the Capetians; for throughout this time royalty was, as it were, annihilated in France; the social bond was broken, and the country which extends from the Rhine to the Pyrenees, and from the English Channel to the Gulf of Lyon, was governed by a confederation of princes rarely under the influence of a common will, and united only by the Feudal System. While France was confederated under feudal administration, the legislative power was suspended. Hugues Capet and his successors, until the accession of St. Louis, had not the right of making laws; the nation had no diet, no regularly constituted assemblies whose authority it acknowledged. The Feudal System, tacitly adopted, and developed by custom, was solely acknowledged by the numerous sovereigns who divided the provinces among themselves. It replaced the social bond, the monarch, and the legislator. . . . The period . . . is therefore like a long interregnum, during which the royal authority was suspended, although the name of king was always preserved. He who bore this title in the midst of a republic of princes was only distinguished from them by some honorary prerogative, and he exercised over them scarcely any authority. Until very near the end of the 11th century, these princes were scarcely less numerous than the castles which covered France. No authority was acknowledged at a distance, and every fortress gave its lord rank among the sovereigns. The conquest of England by the Normans broke the equilibrium between the feudal lords; one of the confederate princes, became a king in 1066, gradually extended, until 1179, his domination over more than half of France; and although it was not he who bore the title of king of the French, it may be imagined that in time the rest of the country would also pass under his yoke. Philip the August and his son, during the forty-six last years of the same period, reconquered almost all the fiefs which the English kings had united, brought the other great vassals back to obedience, and changed the feudal confederation which had ruled France into a monarchy, which incorporated the Feudal System in its constitution.”—J. C. L. de Sismondi, *France under the feudal system* (tr. by W. Bellingham), ch. 1.—“The feudal period, that is, the period when the feudal system was the dominant fact of our country, . . . is comprehended between Hugh Capet and Philippe de Valois, that is, it embraces the 11th, 12th and 13th centuries. . . . At the end of the 10th century, royalty and the commons were not visible, or at all events scarcely visible. At the commencement of the 14th century, royalty was the head of the state, the commons were the body of the nation. The two forces to which the feudal system was to succumb had then attained, not, indeed, their entire development, but a decided preponderance. . . . With the 14th century, the character of war changed. Then began the foreign wars; no longer a vassal against suzerain, or vassal against vassal, but nation against nation, government against government. On the accession of Philippe de Valois, the great wars between the French and the English broke out—the claims of the kings of England, not upon any particularly fief, but

upon the whole land, and upon the throne of France—and they continued up to Louis XI. They were no longer feudal, but national wars; a certain proof that the feudal period stopped at this limit, that another society had already commenced.”—F. P. Guizot, *History of civilization*, 2d course, lect. 1.—See also EUROPE: Middle Ages; Influence of feudalism; FEUDALISM: Organization; Continental growth.

1100.—Extent of the kingdom.—“When Louis [VI] was adopted by his father in 1100, the crown had as its own domain only the county of Paris, Hurepoix, the Gatinais, the Orléanis, half the county of Sens, the French Vexin, and Bourges, together with some ill-defined rights over the episcopal cities of Rheims, Beauvais, Laon, Noyon, Soissons, Amiens. And even within these narrow limits the royal power was but thinly spread over the surface. The barons in their castles were in fact independent, and oppressed the merchants and poor folk as they would. The king had also acknowledged rights of suzerainty over Champagne, Burgundy, Normandy, Brittany, Flanders, and Boulogne; but, in most cases, the only obedience the feudal lords stooped to was that of duly performing the act of homage to the king on first succession to a fief. He also claimed suzerainty, which was not conceded, over the South of France; over Provence and Lorraine he did not even put forth a claim of lordship.”—G. W. Kitchin, *History of France*, v. 1, bk. 3, ch. 5.

12th-13th centuries.—Rise of the privileged bourgeoisies and the communes.—Double movement of urban emancipation.—“The 12th and 13th centuries saw the production of that marvelous movement of emancipation which gave liberty to serfs, created privileged bourgeoisies and independent communes, caused new cities and fortresses to issue from the earth, freed the corporations of merchants and artisans, in a word placed at the first stroke, beside royalty, feudality and the church, a fourth social force destined to absorb one day the three others. While the cultivator of the soil passed by enfranchisement from the category of things sold or given away into that of the free people (the only ambition permitted to the defenseless unfortunates who inhabited isolated farms or unwalled villages), the population grouped in the urban centers tried to limit or at least to regulate the intolerable exploitation of which it was the object. The bourgeois, that is to say, the inhabitants of walled cities, born under the shelter of a donjon or an abbey, and the citizens of the ancient episcopal cities, rivaled each other in efforts to obtain from the seigneurial power a condition more endurable in point of taxation, and the suppression of the most embarrassing hindrances to their commerce and manufactures. These inhabitants of towns and cities constituted, if only by being grouped together, a force with which feudality was very soon obliged to reckon. Divided, besides, into merchants' societies and companies of workmen, they found within themselves the germ of organization which permitted collective resistance. The seigneur, intimidated, won by an offer of money, or decided by the thought that his domination would be more lucrative if the city became more prosperous, made the concessions which were asked of him. Thanks to a favorable concurrence

of circumstances, charters of franchises were multiplied in all parts of France. At the end of the 12th century, the national territory, in the north as well as the south, was covered with these privileged cities or bourgeoisies, which, while remaining administered, judicially and politically, by seignorial officers, had acquired, in matters financial, commercial and industrial, the liberties necessary to their free development. Feudality very soon found such an advantage in regulating thus the exploitation of the bourgeois, that it took the initiative itself in creating, in the uninhabited parts of its domains, privileged cities, complete in all their parts, designed to become so many centers of attraction for foreigners. It is the innumerable bourgeoisies and 'villes neuves' which represent the normal form of urban emancipation. Certain centers of population obtained at the first stroke the most extensive civil and financial liberties; but, in the majority of cases, the bourgeois could win their franchises only bit by bit, at the price of heavy pecuniary sacrifices, or as the result of an admirable perseverance in watching for opportunities and seizing them. The history of the privileged cities, whose principal virtue was a long patience, offers nothing moving or dramatic. . . . But the spectacle of these laborious masses persisting, in obscurity and silence, in the demand for their right to security and well-being, does not the less merit all our attention. What forces itself upon the meditations of the historian, in the domain of municipal institutions, is just the progress, slow and obscure, but certain, of the dependent bourgeoisie. . . . The development of the seignorial cities offers such a variety of aspects, their progressive and regular conquests were so important in the constitution of our rights public and private, that too much care and effort cannot be devoted to retracing minutely their course. This history is more than any other that of the origin of our third estate. It was in the privileged cities, to which the great majority of the urban population belonged, that it began its political education. The city charters constituted the durable lower stratum of its first liberties. In other words the third estate did not issue suddenly from the more or less revolutionary movement which gave birth to the independent communes: it owes its formation and its progress above all to this double pacific evolution: the possessors of fiefs enfranchising their bourgeoisie and the latter passing little by little entirely from the seignorial government under that of royalty. This was not the opinion which prevailed at the time when the founder of the science of municipal institutions, Augustin Thierry, published in the 'Courrier Français' his admirable 'Lettres' on the revolutions of the communes. The commune, a city dowered with judicial and political privileges, which conferred upon it a certain independence, administered by its elected magistrates, proud of its fortified inclosure, of its belfry, of its militia,—the commune passed at that time as the pre-eminent type of the free city of the middle ages. That great movement of urban and rural emancipation which stirred the France of the 12th century to its very depths was personified in it. So the commune concentrated historical interest upon itself, leaving in the shade all other forms of popular evolution. Guizot, who had the sense of truth rather than that of the picturesque, tried to combat this exclusive tendency. In the brilliant lessons that he gave at the Sorbonne on the history of the origins of the third estate, he showed, with his customary clearness, that the

development of the bourgeois class was not accomplished by any single method; that the progress realized in the cities where the communal régime had never succeeded in establishing itself must also be taken into account. The impression left by the highly colored and dramatic recitals of Augustin Thierry remained for a long time the stronger. . . . Contemporary science has not only assigned to itself the mission of completing the work of the historians of the Restoration: it has desired also to improve it by rectifying, upon many points, the exaggerated opinions and false judgments of which the history of our urban institutions was at first the victim. It has been perceived that the communal movement properly so called did not have, upon the destinies of the popular class, the decisive, preponderant influence which was attributed to it 'a priori.' The commune, a brilliant but ephemeral form of the emancipation of the bourgeoisie, has been set back little by little into its true place. It is now no longer regarded as an essential manifestation of our first democratic aspirations. One might be tempted to see on the contrary, in that collective seigneuiry, often hostile to the other social elements, impregnated with the spirit of 'particularisme,' made for war and agitated without cessation by warlike passions, an original but tardy product of the feudal principle. . . . We must be resigned to a fact in regard to which nothing can be done: the absence of documents relative to the municipal constitution of cities and towns during four hundred years, from the 7th century to the 11th. From all appearances, this enormous hiatus will never be overcome. . . . Facts being lacking, scholars have had recourse to conjecture. Some among them have supposed that the principal characteristics of the Gallo-Roman municipalities were perpetuated during this period. At bottom, their hypothesis rests principally upon analogies of names. . . . From the point of view of positive science, the Germanic origin of the communes is not more easy of demonstration. . . . It is even doubtful whether the essential element of the communal institution, the confederation formed by the inhabitants, under the guaranty of the mutual oath, belongs exclusively to the customs of the Germans. The theory of Augustin Thierry, which made of the commune a special application of the Scandinavian gilde, has been judged too narrow by contemporary scholars. They have reproached him with reason for having localized an institution which belongs entirely to the Germanic race. But the principle of association, applied in the cities, is not a fact purely German. . . . Association is a fact which is neither Germanic nor Roman; it is universal, and is produced spontaneously among all peoples, in all social classes, when circumstances exact and favor its appearance. The communal revolution then is a national event. The commune was born, like other forms of popular emancipation, from the need which the inhabitants of the cities had of substituting a limited and regulated exploitation for the arbitrary exploitation of which they were the victims. Such is the point of departure of the institution. We must always return to the definition of it given by Guibert de Nogent. It is true as a basis, although it does not embrace all the characteristics of the object defined: 'Commune new name, detestable name! By it the censitaires are freed from all service in consideration of a simple annual tax; by it they are condemned, for the infraction of the law, only to a penalty legally determined; by it, they cease to

be subjected to the other pecuniary charges by which the serfs are overwhelmed.' At certain points, this limitation of the seignorial power was made amicably, by pacific transaction between the seigneur and his bourgeois. Elsewhere, an insurrection, more or less prolonged, was necessary in order to establish it. When this popular movement had as a result, not only the assuring to the people the most necessary liberties which were demanded, but besides that of abating to their advantage the political position of the master, by taking from him a part of his seignorial prerogatives, there arose not only a free city, but a commune, a bourgeois seignury, invested with a certain political and judicial power. This definition of the commune implies that originally it was not possible to establish it otherwise than by a pressure exerted, more or less violently, upon the seignorial authority. We have the direct proof of it for some of our free municipalities; but it is presumable that many other communes whose primitive history we do not know have owed equally to force the winning of their first liberties. . . . We do not mean that, in the first period of the history of urban emancipation, all the communes, without exception, were obliged to pass through the phase of insurrection or of open resistance. There were some which profited (as the cities of the Flemish region in 1127) by a combination of exceptional circumstances to attain political liberty without striking a blow. Among these circumstances must be mentioned in the first rank the prolonged vacancy of an episcopal see and the disappearance of a laic lord, dead without direct heir, leaving a succession disputed by numerous competitors. But ordinarily, the accession of the bourgeoisie to the rank of political power did not take place pacifically. Either the seigneur struggled against his rebellious subjects, or he feared the struggle and bent before the accomplished fact. In all cases it was necessary that the people were conscious of their power and imposed their will. This is proven by the dramatic episodes which the narrations of Augustin Thierry have forever rendered celebrated. . . . Later, in the decline of the 12th century, it must be recognized that the opinion of the dominant class ceased to be as hostile to the communes. When the conviction had been acquired that the popular movement was irresistible, it was tolerated; the best means even were sought to derive advantage from it. The Church always remained upon the defensive; but the king and the great feudal lords perceived that in certain respects the commune might be a useful instrument. They accepted then the communal organization, and they even came to create it where it was not spontaneously established. But it is easy to convince one's self that the communes of this category, those which owe their creation to the connivance or even to the initiative of the seigneur, did not possess the same degree of independence as the communes of the primitive epoch, founded by insurrection. On the whole, the communal revolution was only one of the aspects of the vast movement of political and social reaction which the excesses of the feudal régime engendered everywhere from the 11th to the 14th century. . . . One would like to possess the text of one of those oaths by which the bourgeois of the northern communes bound themselves together, for the first time, with or without the consent of their seigneur, in the most ancient period of the communal evolution. It would be of the highest interest for the historian to know how they set about it,

what words were pronounced to form what the contemporary writers called a 'conjunction,' a 'conspiracy,' a 'confédération.' No document of this nature and of that primitive epoch has come down to us. . . . The sum total of the sworn bourgeois constituted the commune. The commune was most often called 'communia,' but also, with varying termination, 'communa,' 'communio,' 'communitas.' Properly speaking and especially with reference to the origin, the name commune was given not to the city, but to the association of the inhabitants who had taken oath. For this reason also the expression 'commune jurée' was used. Later the acceptance of the word was enlarged; it designated the city itself, considered as a geographical unit. . . . The members of the commune, those who formed part of the sworn association, were properly called 'the sworn of the commune,' 'jurati communie,' or, by abridgment, 'the sworn,' 'jurati.' They were designated also by the expression: 'the men of the commune,' or, 'those who belong to the commune,' 'qui sunt de communia.' They were also entitled 'bourgeois,' 'burgenses,' more rarely, 'bourgeois jurés'; sometimes also 'voisins,' 'vicini,' or even 'friends,' 'amici.' . . . We are far from having complete light on the question as to what conditions were exacted from those who entered the communal association, and to what classes of persons the access to the bourgeoisie was open or interdicted. The variety of local usages, and above all the impossibility of finding texts which apply to the most ancient period of urban emancipation, will always embarrass the historian. To find upon these matters clear documents, developed and precise, we must come down, generally, to the end of the 13th century or even to the century following, that is to say, to the epoch of the decadence of the communal régime. . . . The bourgeois could not be diseased, that is to say, undoubtedly, tainted with an incurable malady, and especially a contagious malady, as leprosy. . . . The communal law excluded also bastards. On this point it was in accord with the customary law of a very great number of French regions. . . . They refused also to receive into their number inhabitants encumbered with debts. The condition of debtor constituted in effect a kind of servitude. He no longer belonged to himself; his goods might become the property of the creditor, and he could be imprisoned. . . . With still more reason does it appear inadmissible that the serf should be called to benefit by the commune. The question of urban serfdom, in its relations with the communal institution, is extremely obscure, delicate and complex. There are however two facts in regard to which affirmation is allowable. It cannot be doubted that at the epoch of the formation of the communes, at the opening of the 12th century, there were no longer any serfs in many of the urban centers. It may be held also as certain that the desire to bring about the disappearance of this serfdom was one of the principal motives which urged the inhabitants to claim their independence. . . . The inhabitant who united all the conditions legally required for admission to the bourgeoisie was besides obliged to pay a town-duc ('droit d'entrée'). . . . If it was not always easy to enter a communal body, neither could one leave it as easily as might have been desired. The 'issue de commune' exacted the performance of a certain number of troublesome formalities. . . . So, it was necessary to pay to become a communist, and to pay yet more in order to cease to be one. The bourgeois was riveted to his

bourgeoisie. . . . Up to this point we have examined only half the problem of the formation of the commune, approaching it on its general side. There remains the question whether all the popular element which existed in the city formed part of the body of bourgeoisie, and whether the privileged class, that of the nobles and clergy, was not excluded from it. . . . We shall have to admit as a general rule, that the nobles and the clergy while taking oath to the commune, did not in reality enter it. What must be rejected, is the sort of absolute, inviolable rule which has been formed on this opinion. In the middle ages especially there was no rule without exception. . . . The commune was an institution rather ephemeral. As a really independent seignury, it scarcely endured more than two centuries. The excesses of the communists, their bad financial administration, their intestine divisions, the hostility of the Church, the onerous patronage of the 'haut suzerain,' and especially of the king: such were the immediate causes of this rapid decadence. The communes perished victims of their own faults, but also of the hate of the numerous enemies interested in their downfall. . . . The principal cause of the premature downfall of the communal régime is without any doubt the considerable development of the monarchical power in France at the end of the 13th century. The same force which annihilated feudalism, to the profit of the national unit, was also that which caused the prompt disappearance of the independence of the bourgeois seigneuries. With its privileges and its autonomy, the commune impeded the action of the Capetians. Those quarrelsome and restless republics had no reason for existence, in the midst of the peaceful and obedient bourgeoisie upon which royalty had laid its hand. The commune then was sacrificed to the monarchical interest. In Italy and in Germany, the free cities enjoyed their independence much longer, by reason of the absence of the central power or of its weakness."—A. Luchaire, *Les communes Françaises à l'époque des Capétiens directs* (tr. from the French), pp. 1-16, 45-56, 65, 288-290.—See also CAPITALISM: 12th-13th centuries; COMMUNE, MEDIEVAL; BOURGEOIS.

1108-1180.—Reigns of Louis VI and Louis VII.—Henry II of England inherits one half of France.—Accession of Philip II.—Gain and loss of Aquitaine.—"Louis VI, or 'the Fat' was the first able man whom the line of Hugh Capet had produced since it mounted the throne. He made the first attempt at curbing the nobles, assisted by Suger, the Abbot of St. Denys. The only possibility of doing this was to obtain the aid of one party of nobles against another; and when any unusually flagrant offence had been committed, Louis called together the nobles, bishops, and abbots of his domain, and obtained their consent and assistance in making war on the guilty man, and overthrowing his castle, thus, in some degree, lessening the sense of utter impunity which had caused so many violences and such savage recklessness. He also permitted a few of the cities to purchase the right of self-government. . . . The royal authority had begun to be respected by 1137, when Louis VI. died, having just effected the marriage of his son, Louis VII., with Eleanor, the heiress of the Dukes of Aquitaine—thus hoping to

make the crown really more powerful than the great princes who owed it homage. At this time lived the great St. Bernard, Abbot of Clairvaux, who had a wonderful influence over men's minds. . . . Bernard roused the young king Louis VII. to go on the second crusade [see CRUSADES: 1147-1149], which was undertaken by the Emperor and the other princes of Europe to relieve the distress of the kingdom of Palestine. . . . Though Louis did reach Palestine, it was with weakened forces; he could effect nothing by his campaign, and Eleanor, who had accompanied him, seems to have been entirely corrupted by the evil habits of the Franks settled in the East. Soon after his return, Louis dissolved his marriage; and Eleanor became the wife of Henry, Count of Anjou, who soon after inherited the kingdom of England as our Henry II., as well as the duchy of Normandy, and betrothed his third son to the heiress of Brittany [see AQUITAINE: 1137-1152]. Eleanor's marriage seemed to undo all that Louis VI. had done in raising the royal power; for Henry completely overshadowed Louis, whose only resource was in feeble endeavours to take part against him in his many family quarrels. The whole reign of Louis the Young, the title that adhered to him on account of his simple, childish nature, is only a record of weakness and disaster, till he died in 1180. . . . Powerful in fact as Henry II. was, it was his gathering so large a part of France under his rule which was, in the end, to build up the greatness of the French kings. What had held them in check was the existence of the great fiefs or provinces, each with its own line of dukes or counts, and all practically independent of the king. But now nearly all the provinces of southern and western France were gathered into the hand of a single ruler; and though he was a Frenchman in blood, yet, as he was King of England, this ruler seemed to his French subjects no Frenchman, but a foreigner. They began therefore to look to the French king to free them from a foreign ruler; and the son of Louis VII., called Philip Augustus, was ready to take advantage of their disposition."—C. M. Yonge, *History of France (Historical primers, ch. 1, sect. 6-7)*.

1180-1223.—Economic and social survey of the time of Philip Augustus.—Limitations of trade.—Famines.—Brigandage.—Faith in relics and miracles as protection against evils of the time.—"It takes some effort of imagination to picture the economic condition of medieval France, especially the agricultural conditions, so different from those of today. The extensive forests and moors, the limited arable land, the rudimentary agricultural methods, the incessant compromising and annihilating of the peasants' efforts by war, or by the hard feudal laws of the chase, all explain why land yielded small returns, and why the necessary balance between production and population did not exist, except in years of abundance. The inadequacy of traffic increased that of production. Since each district was isolated, and currency was scarce, nobles and clerics depended very largely upon incomes in kind from their tenants; and these incomes, by way of caution, they stored in their granaries and cellars. The subjects, the agriculturists, lived on what remained after the deduction of the seigniors' portion. In good years the surplus of grain and wine might be sold, but the poor and insecure roads, and the enormous tolls and duties laid on goods by the seigniors, shackled trade. Markets

were poorly provisioned; produce, half of which nowadays enters into trade, was then almost entirely consumed at home, and towns were correspondingly less populous and trade less active. And thus it came about that in normal years the absence of a demand and the infrequency of transactions depreciated prices; whereas, in years of want, the supply found itself suddenly far beneath the demand and prices rose to frightful figures. There was some improvement over the eleventh century, in which forty-eight famine years are recorded; yet, in the reign of Philip Augustus, eleven famines occurred. Men died of hunger, on an average, one year in every four. The famine of 1195, following in the wake of the hurricane which had destroyed the crops of 1194, was heartrending, because it lasted four years. Grain, wine, oil, and salt reached extraordinary prices. People ate grape-skins in place of bread and even dead animals and roots. It is the misfortune of the times that each of these calamities engendered others. Famine produced brigandage. 'To escape death by starvation, many persons became robbers and were hanged,' says the chronicler of Anchin. He misstates the facts: the greater part of the brigands lived on their thefts with impunity. These parasites of the highway were, for the most part, mercenary soldiers, Aragonese, Navarrese, Basques, Brabanters, and Germans—desperadoes come to enter the service of kings and princes. When their pay stopped, they robbed and murdered on their own account. These *rou-tiers* [highwaymen] or *cottereaux* [robbers in armor] of Philip Augustus, who reappeared in the 'grand companies' of Charles V, and the *écorceurs* ["fleecers"] of Charles VII, are an open sore of society, a necessary evil, an instrument of war which all the world decries, yet which no one can do without. In vain the church excommunicates these brigands and fulminates against those who employ them. They supply the lack of feudal forces, therefore are they seen in all wars. Their chiefs rendered such important services that kings made them great personages, well paid and provided with titles and fiefs. Those of the bandits thus honored remain celebrated: Mercadier, the friend and general-in-chief of Richard the Lion-Hearted; Cadoc, the ally of Philip Augustus; and Fule de Breaute, the agent of John Lackland. The ravages of these paid or unpaid borders in hostile, and even in friendly, territory, were simply frightful. In northern France the Capetians, the Plantagenets, and certain counts of Flanders and Champagne were able to restrain the scourge and combat it with success,—but what could be done beyond the Loire in Berry, Auvergne, Poitou, Gascony, Languedoc, and Provence, regions more difficult of defense and surveillance? There the highwayman flourished; fires, murders, and rape everywhere marked his passage; especially did he prey on religious houses and churches; he seemed to hate the priest and to feel an obligation to outrage everything which pertained to religion and to worship. This was because the clerics had more that was worth taking, and because by excommunication they aroused the people against him. The brigands of Berry burned churches at pleasure and took captive whole troops of priests and monks. . . . In this atmosphere of misfortune and fright the most characteristic trait of the middle ages appeared: the belief in marvels, portents, and the frequent intervention of supernatural forces. Superstition under a thousand forms is always at the bottom of individual intelligence and is the common mark of all classes of men. In this

respect the middle age directly carried on the ancient world, and the Christian of the time of Philip Augustus resembled the pagan of former times. Impregnated with the supernatural, haunted by childish fancies and by visions well known to weakened constitutions, he was convinced that everything was an omen, a forewarning of punishment from on high, a good or a bad sign of the will of Heaven. To him, natural scourges were only visitations of the power of God or the saints: he must submit or seek to avert these calamities by prayer. There lay the chief utility of the church, and the first cause of her influence. The prayers of clerics and monks were the most important public services and must suffer neither interruption nor respite, for they were the safeguard of the entire people. All the superstitious practices of antiquity were transmitted to the feudal age. Vainly did the church combat this survival of paganism. Superstition, stronger than religion, molded the idea of Christianity to its own uses. The church herself could not prevent it. Monks who wrote history shared in the belief of their contemporaries. The true religion of the middle age, to be frank, is the worship of relics. How could men of that time raise themselves to the metaphysical and moral conceptions of Christian doctrine? To the masses religion was the veneration of the remains of saints or of objects which had been used by Jesus or the Virgin. It was believed that divine intervention in human affairs manifested itself especially through the power of relics. Therefore hardly anything was done, whether in public or private life, without having recourse to the protection or the guarantee of these sacred objects. Relics were brought to councils and assemblies; on them the most solemn oaths were taken, treaties between entire peoples, and conventions between individuals, were sworn. They were the shield and buckler of cities. Was there need of asking God to end a long-enduring rain? A procession was held and the relics were shown. Whoever undertook a distant pilgrimage, a dangerous voyage, or a campaign of war, first went to pray to a saint, to see and touch a relic. The chevalier put some relics in the hilt of his sword; the tradesman, in a little sack suspended from his neck. One of the most frequent penances enjoined by the church, and one of the surest means of safety, the great fountain of spiritual benefits, was a pilgrimage to the tomb of some saint. The more remote and difficult of access the shrine the greater was the merit of the pilgrim. These saints and relics, moreover, were graded like earthly powers. Happy those who could venerate the bones of an apostle, one of those privileged beings who were in touch with Christ; happy, above all others, those who could visit Jerusalem and the Holy Sepulcher! But it was not necessary to leave one's country; the Christian found right in France well-known sanctuaries to which the believers flocked: Sainte-Genevieve at Paris; Saint-Denis; Saint Martin at Tours; Mont Saint-Michel; Notre-Dame at Chartres; Notre-Dame at Veze-lay; Saint-Martial at Limoges; Notre-Dame at Puy; Rocamadour; Saint-Foi at Vonques; Saint-Sernin at Toulouse. Here the sinner put himself at peace with God and gained a quiet conscience: the sick found a cure, for saints heal more surely than medicines. The *physicus*, be he Christian or Jew, was very expensive, and was only an ignorant empiricist. The medical journals of the time were collections of miracles, *libri miraculorum*, written in the centers of pilgrimage."—A.

Lucaire, *Social France at the time of Philip Augustus*, pp. 7-10, 19, 28-29.

1180-1224.—Kingdom extended by Philip Augustus.—Normandy, Maine and Anjou recovered from the English kings.—When the king of England became possessed of more than one-half of France, "one might venture perhaps to conjecture that the sceptre of France would eventually have passed from the Capets to the Plantagenets, if the vexatious quarrel with Becket at one time, and the successive rebellions fomented by Louis at a later period, had not embarrassed the great talents and ambitious spirit of Henry. But the scene quite changed when Philip Augustus, son of Louis VII., came upon the stage [1180]. No prince comparable to him in systematic ambition and military enterprise had reigned in France since Charlemagne. From his reign the French monarchy dates the recovery of its lustre. He wrested from the count of Flanders the Vermandois (that part of Picardy which borders on the Isle of France and Champagne), and subsequently, the County of Artois. But the most important conquests of Philip were obtained against the kings of England. Even Richard I., with all his prowess, lost ground in struggling against an adversary not less active, and more politic, than himself. But when John not only took possession of his brother's dominions, but confirmed his usurpation by the murder, as was very probably surmised, of the heir, Philip, artfully taking advantage of the general indignation, summoned him as his vassal to the court of his peers. John demanded a safe-conduct. Willingly, said Philip; let him come unmolested. And return? inquired the English envoy. If the judgment of his peers permit him, replied the king. By all the saints of France, he exclaimed, when further pressed, he shall not return unless acquitted. . . . John, not appearing at his summons, was declared guilty of felony, and his fiefs confiscated. The execution of this sentence was not intrusted to a dilatory arm. Philip poured his troops into Normandy, and took town after town, while the king of England, infatuated by his own wickedness and cowardice, made hardly an attempt at defence. In two years [1203-1204] Normandy, Maine, and Anjou were irrecoverably lost. Poitou and Guienne resisted longer; but the conquest of the first was completed [1224] by Louis VIII., successor of Philip."—H. Hallam, *Middle Ages*, ch. 1, pt. 1.—See also ENGLAND: 1205; ANJOU: 1206-1442.

1214.—Effects of battle of Bouvines.—"If the fortune of the day had been different, the consolidation of the French monarchy might have been delayed for centuries. The Plantagenets might have won back their lost Norman and Angevin dominions, the counts of Flanders might have cut themselves free from their suzerain, and the emperor might have excluded the French influence from the Lotharingian border-lands. Never again till the time of Charles V. and Francis I. did France see such a formidable array of enemies gathered against her.

That Philip Augustus was able to beat them off with the forces of his newly-constituted realm is a cause for wonder, and the best testimony of his personal abilities and courage. Without Bouvines he would go down in the records of history as an intriguer of the type of Louis XI. rather than a warrior. Assuredly no one would have guessed from his conduct in the Holy Land, or from the details of his weary war with Richard Cœur de Lion, that he would have the firmness and the nerve to put everything at stake, and deliver and win the greatest pitched battle of his age. Freed from his long quarrel with the Pope by the homage done at Dover on May 15, 1213, John of England had set his considerable diplomatic talents to work, in order to build up a great coalition against the King of France. He was determined to win back the lost lands of his ancestors on the Seine and Loire, and, since his own discontented realm could not furnish him with sufficient forces for carrying out the scheme, it was necessary to seek foreign aid. England was chafing against his misrule so bitterly that he could only aid the confederacy with his purse and his hordes of mercenaries. The most important of John's allies was his nephew, the Emperor Otto IV., who had his own grievance against Philip, because the latter was supporting against him the young Frederic of Swabia, who claimed the Imperial throne. Otto was losing ground in Germany, and hoped to recover his reputation by a successful campaign in the West, where he could count on the aid of the majority of the princes of the Netherlands. Next in importance to the emperor, though not next in rank in the coalition, was Ferdinand, Count of Flanders, who had fallen out with his suzerain owing to Philip's grasping behaviour in taking from him his towns of Aire and St. Omer."—C. Oman, *History of the art of war*, p. 457.—See also BOUVINES, BATTLE OF.

1223.—Accession of King Louis VIII.

1226-1270.—Reign of Louis IX (St. Louis).—Protection and expansion of royal power under Queen Blanche during the minority of Louis.—Undermining of feudalism and extension and consolidation of the royal power by Louis through the administration of justice and informal establishment of law.—"Of the forty-four years of St. Louis' reign, nearly fifteen, with a long interval of separation, pertained to the government of Queen Blanche of Castille, rather than that of the king, her son. Louis, at his accession in 1226, was only eleven; and he remained a minor up to the age of twenty-one, in 1236, for the time of majority in the case of royalty was not yet specially and rigorously fixed. During those ten years Queen Blanche governed France; not at all, as is commonly asserted, with the official title of regent, but simply as guardian of the king, her son. . . . It was not until twenty-two years had passed, in 1248, that Louis, on starting for the crusade, officially delegated to his mother the kingly authority, and that Blanche, during her son's absence, really governed with the title of regent. . . . During the first period of his government, and so long as her son's minority lasted, Queen Blanche had to grapple with intrigues, plots, insurrections, and open war; and, what was still worse for her, with the insults and calumnies of the crown's great vassals, burning to seize once more, under a woman's government, the independence and power which had been effectually disputed with them by Philip Augustus. Blanche resisted their attempts, at one time with open and persevering energy, at another dex-

terously with all the tact, address, and allurements of a woman. Though she was now forty years of age she was beautiful, elegant, attractive, full of resources and of grace. . . . The malcontents spread the most odious scandals about her. . . . Neither in the events nor in the writings of the period is it easy to find anything which can authorize the accusations made by the foes of Queen Blanche. . . . What St. Louis really owed to his mother, and it was a great deal, was the steady triumph which, whether by arms or by negotiation, Blanche gained over the great vassals, and the preponderance which, amidst the struggles of the feudal system, she secured for the kingship of her son in his minority. . . . When Louis reached his majority, his entrance upon personal exercise of the kingly power produced no change in the conduct of public affairs. . . . The kingship of the son was a continuance of the mother's government."—G. Masson, *St. Louis*, pp. 44-56.—“The fundamental institution upon which all the social edifice rested, in the time of Saint Louis, was royalty. But this royalty, from the double point of view of theory and practice, was very different from what it had been originally. In principle it was the divine right, that is, it was an emanation from the Most High, and the king held of no other seigneur. This is what the feudal maxim expressed after its fashion: ‘The king holds only of God and his sword.’ . . . Royalty was transmitted by heredity, from father to son, and by primogeniture. However, this heredity, which had formerly needed a sort of election to confirm it, or at least popular acclamation, needed now to be hallowed by the unction of the church. Consecration, joined to the privilege of being the eldest of the royal race, made the king. . . . It must not be thought however that the ideas of the time attributed to the hereditary principle a force absolute and superior to all interests. . . . The royal power, besides, had not yet a material force sufficiently great to dominate everywhere as absolute master. Under the two first lines, it was exercised in the same degree over all points of the territory; from the accession of the third, on the contrary, it was only a power of two degrees, having a very unequal action according to the territory and the locality. A part of France composed the royal domain: it was the patrimony of the Capetian house, increased by conquest or successive acquisitions. There, the king exercised an authority almost without limit; he was on his own ground. All the rest formed duchies, counties, or seigneuries of different sorts, possessed hereditarily by great vassals, more or less independent originally. Here the king was only the suzerain; he had scarcely any rights excepting to homage, to military service, to pecuniary assistance in certain stated cases, and to some privileges called royal, as that of coining money. The entire royal policy, from Philip Augustus to Louis XI., consisted in skilfully increasing the first of these parts by absorbing little by little the second. . . . The possessions of the crown . . . formed two or three separate groups, cut up in the most fantastic fashion, and connected only as the result of long effort. All the rest of the kingdom was composed of great fiefs escaping the direct action of royalty, and themselves subdivided into lesser fiefs, which complicated infinitely the hierarchy of persons and lands. The principal were the counties of Flanders, Boulogne, Saint Pol, Ponthieu, Aumale, Eu, Soissons, Dreux, Montford-l’Amaury; the bishoprics of Tournai, Beauvais, Noyon, Laon, Lisieux, Reims, Langres, Châlons, the titularies of which

were at the same time counts or seigneurs; the vast county of Champagne, uniting those of Rétel, Grandpré, Roucy, Brienne, Joigny and the county Porcien; the duchy of Burgundy, so powerful and so extensive; the counties of Nevers, Tonnerre, Auxerre, Beaujeu, Forez, Auvergne; the seignury of Bourbon; the counties of Blois and of Chartres; the county or duchy of Brittany; Guienne, and, before 1271, the county of Toulouse; the bishoprics of Albi, Cahors, Mende, Lodève, Agde, Maguelonne, belonging temporarily as well as spiritually to their respective bishops; finally the seignury of Montpellier, holding of the last of these bishoprics. To which must yet be added the appanages given by Louis VIII. to his younger sons, that is, the counties of Artois, Anjou, Poitiers, with their dependencies. . . . So when the government of the kingdom at this epoch is spoken of, it must be understood to mean that of only the least considerable part of the territory,—that is, of the part which was directly submitted to the authority of the king. In this part the sovereign himself exercised the power, assisted, as ordained by the theories examined above, by auxiliaries taken from the nation. There were neither ministers nor a deliberative corps, properly speaking; however there was very nearly the equivalent. On one side, the great officers of the crown and the royal council, on the other the parliament and the chamber of accounts (exchequer), or at least their primitive nucleus, constituted the principal machinery of the central government, and had, each, its special powers. The great officers, of whom there had at first been five, were only four from the reign of Philip Augustus, who had suppressed the sénéchal owing to the possibility of his becoming dangerous by reason of the progressive extension of his jurisdiction; they were the bouteiller, who had become the administrator of the royal expenditure; the chambrier, elevated to the care of the treasury; the connétable, a kind of military superintendent; and the chancellor, who had the disposition of the royal seal. These four personages represented in a certain degree, secretaries of state. The two latter had a preponderant influence, one in time of peace, the other in time of war. To the chancellor belonged the drawing up and the proper execution (legalization) of the royal diplomas: this power alone made him the arbiter of the interests of all private individuals. As to the constable, he had the chief direction of the army, and all those who composed it, barons, knights, paid troops, owed him obedience. The king, in person, had the supreme command; but he frequently allowed the constable to exercise it, and, in order not to impose too heavy a burden upon him, or rather to prevent his taking a too exclusive authority, he had appointed as coadjutors two ‘maréchaux de France’ who were second in command. . . . The king's council had not yet a very fixed form. Saint Louis submitted important questions to the persons about him, clerics, knights or men of the people; but he chose these advisers according to the nature of the questions, having temporary counsellors rather than a permanent council. Among these counsellors some were more especially occupied with justice, others with finance, others with political affairs. These three categories are the germ of the parliament, of the exchequer, and of the council of state; but they then formed an indistinct ensemble, called simply the king's court. They were not completely separated so as to form independent institutions until the time of Philippe le Bel. . . . The superior

jurisdiction is represented by the parliament. The organization of this famous body was begun in the lifetime of Philip Augustus. Under the reign of this prince [Saint Louis], and notably as a result of his absence, the 'cour du roi' had begun to render more and more frequent decisions. The section which was occupied with judicial affairs, appears to have taken on, in the time of Saint Louis, an individual and independent existence. Instead of following the sovereign and meeting when he thought it expedient, it became sedentary. . . . The date at which the series of the famous registers of the parliament, known under the name of Olim, begins may be considered that of the definitive creation of this great institution. It will be remarked that it coincides with the general reform of the administration of the kingdom undertaken by the good king on his return from Syria. . . . From its birth the parliament tended to become, in the hands of royalty, a means of domination over the great vassals. Not only were the seigneurs insensibly eliminated from it, to the advantage of the clergy, the lawyers, and the officers of the crown, but by a series of skilful victories, its action was extended little by little over all the fiefs situated outside the royal domain, that is, over all France. It is again Saint Louis who caused this great and decisive advance toward the authority of the suzerain. He brought it about especially by the abolition of the judicial duel and by the multiplication of appeals to the parliament. . . . As for the appeals, the interdiction of 'fausser jugement' (refusal to submit to the sentence pronounced) was not the only cause of their multiplication. Many of the great vassals were led to bring their affairs before the king's court, either on account of the confidence inspired by the well known equity of Saint Louis, or by the skill of the royal agents, who neglected no opportunity to cause the acceptance of the arbitration of the crown; and those who did not resign themselves to it were sometimes compelled to do so. The appeals of their subjects naturally took the same route; however, they continued to employ the medium of the sénéchal's court or that of the bailli, while those of the barons and the princes of the blood went directly to Paris. No general law was promulgated in regard to the matter. Royalty was content to recover little by little, by partial measures, the superior jurisdiction formerly usurped by the feudality. . . . Above and outside of the parliament justice was rendered by the king in person. . . . Saint Louis, always thoughtful of the interests of the lowly, had a liking for this expeditious manner of terminating suits. Nearly every morning, he sent two or three members of his council to inquire, at the palace gate, if there were not some private individuals there wishing to discuss their affairs before him; from this came the name 'plaids de la porte' [hearings at the gate] given to this kind of audience. If his counsellors could not bring the parties to an agreement, he called the latter into his own room, examined their case with his scrupulous impartiality, and rendered the final sentence himself on the spot. Joinville, who took part more than once in these summary judgments, thus describes to us their very simple mechanism. 'The king had his work regulated in such a way, that monseigneur de Nesle and the good count de Soissons, and the rest of us who were about him, who had heard our masses, went to hear the "plaids de la porte," which are now called "requêtes" (petitions). And when he returned from the monastery, he sent for us, seated himself at

the foot of his bed, made us all sit around him, and asked us if there were any cases to despatch which could not be disposed of without him; and we named them to him, and he sent for the parties and asked them: Why do you not take what our people offer you? And they said: Sire, because they offer us little. Then he said to them: You should take what they are willing to give you. And the saintly man labored in this way, with all his might to set them in a just and reasonable path.' Here the great peacemaker is clearly seen; private individuals as well as princes, he desired to reconcile all, make all agree. These patriarchal audiences often had for theater the garden of the palace or the wood of Vincennes."—A. Lecoq de la Marche, *La France sous Saint Louis et sous Philippe le Hardi*, liv. 1, ch. 2, and liv. 2, ch. 1 and 3.—"St. Louis struck at the spirit of the Middle Age, and therein insured the downfall of its forms and whole embodiment. He fought the last battles against feudalism, because, by a surer means than battling, he took, and unconsciously, the life-blood from the opposition to the royal authority. Unconsciously, we say; he did not look on the old order of things as evil, and try to introduce a better; he did not selfishly contend for the extension of his own power; he was neither a great reformer, nor a (so-called) wise king. He undermined feudalism, because he hated injustice; he warred with the Middle Age, because he could not tolerate its disregard of human rights; and he paved the way for Philip-le-bel's struggle with the papacy, because he looked upon religion and the church as instruments for man's salvation, not as tools for worldly aggrandizement. He is, perhaps, the only monarch on record who failed in most of what he undertook of active enterprise, who was under the control of the prejudices of his age, who was a true conservative, who never dreamed of effecting great social changes,—and who yet, by his mere virtues, his sense of duty, his power of conscience, made the mightiest and most vital reforms. One of these reforms was the abolition of the trial by combat. . . . It is not our purpose to follow Louis either in his first or second crusade." (See CRUSADES: 1248-1254; 1270-1271.) On returning, in 1254, from his first crusade, "scarce had he landed, before he began that course of legislation which continued until once more he embarked. . . . In his first legislative action, Louis proposed to himself these objects,—to put an end to judicial partiality, to prevent needless and oppressive imprisonment for debt, to stop unfounded criminal prosecutions, and to mitigate the horrors of legalized torture. In connection with these general topics, he made laws to bear oppressively upon the Jews, to punish prostitution and gambling, and to diminish intemperance. And it is worthy of remark, that this last point was to be attained by forbidding innkeepers to sell to any others than travellers,—a measure now (six hundred years later) under discussion in some parts of our Union, with a view to the same end. But the wish which this rare monarch had to recompense all who had been wronged by himself and forefathers was the uppermost wish of his soul. . . . Commissioners were sent into every province of the kingdom to examine each alleged case of royal injustice, and with power in most instances to make instant restitution. He himself went forth to hear and judge in the neighborhood of his capital, and as far north as Normandy. . . . As he grew yet older, the spirit of generosity grew stronger daily in his bosom. He would have no

hand in the affairs of Europe, save to act, wherever he could, as peacemaker. Many occasions occurred where all urged him to profit by power and a show of right, a naked legal title, to possess himself of valuable fiefs; but Louis shook his

baron-hating legists, he so ordained, in conformity with the Roman law, that, under given circumstances, almost any case might be referred to his tribunal. This, of course, gave to the king's judgment-seat and to him more of influence than any

SAINT LOUIS ADMINISTERING JUSTICE

(From the painting by Ronget, at Versailles Gallery)

head sorrowfully and sternly, and did as his inmost soul told him the law of God directed. . . . There had been for some reigns back a growing disposition to refer certain questions to the king's tribunals, as being regal, not baronial questions. Louis the Ninth gave to this disposition distinct form and value, and, under the influence of the

other step ever taken had done. . . . It . . . threw at once the balance of power into the royal hands. . . . It became necessary to make the occasional sitting of the king's council or parliament, which exercised certain judicial functions, permanent; and to change its composition, by diminishing the feudal and increasing the legal or legist element.

Thus everywhere, in the barons' courts, the king's court, and the central parliament, the Roman, legal, organized element began to predominate over the German, feudal, barbaric tendencies, and the foundation-stones of modern society were laid. But the just soul of Louis and the prejudices of his Romanized counsellors were not arrayed against the old Teutonic barbarism alone, with its endless private wars and judicial duels; they stood equally opposed to the extravagant claims of the Roman hierarchy. . . . The first calm, deliberate, consistent opposition to the centralizing power of the great see was that offered by its truest friend and most honest ally, Louis of France. From 1260 to 1268, step by step was taken by the defender of the liberties of the Gallican church, until, in the year last named, he published his 'Pragmatic Sanction' [see below: 1268].—*Saint Louis of France* (*North American Review*, Apr., 1846).—See also PARLEMENT OF PARIS.

1268.—Pragmatic Sanction of Saint Louis.—Assertion of the rights of the Gallican church.—"The continual usurpations of the popes produced the celebrated Pragmatic Sanction of St. Louis [about 1268]. This edict, the authority of which, though probably without cause, has been sometimes disputed, contains three important provisions; namely that all prelates and other patrons shall enjoy their full rights as to the collation of benefices, according to the canons; that churches shall possess freely their rights of election; and that no tax or pecuniary exaction shall be levied by the pope, without consent of the king and of the national church. We do not find, however, that the French government acted up to the spirit of this ordinance."—H. Hallam, *Middle Ages*, ch. 7, pt. 2.—"This Edict appeared either during the last year of Clement IV., . . . or during the vacancy in the Pontificate. . . . It became the barrier against which the encroachments of the ecclesiastical power were destined to break; nor was it swept away till a stronger barrier had arisen in the unlimited power of the French crown." It "became a great Charter of Independence to the Gallican Church."—H. H. Milman, *History of Latin Christianity*, v. 5, bk. 11, ch. 4.

1270-1285.—*Sons of Saint Louis*.—Origin of the Houses of Valois and Bourbon.—Saint Louis left several sons, the elder of whom succeeded him as Philip III, and his youngest son was Robert, count of Clermont and lord of Bourbon, the ancestor of all the branches of the House of Bourbon. Philip III died in 1285, when he was succeeded by his son, Philip IV. A younger son, Charles, count of Valois, was the ancestor of the Valois branch of the royal family.—See also BOURBON, HOUSE OF; VALOIS, HOUSE OF.

1285-1314.—Reign of Philip IV.—His conflict with the pope and establishment of papal residence at Avignon.—Destruction of the Templars.—Philip IV, "le Bel" (the Handsome), came to the throne on the death of his father, Philip "le Hardi," in 1285. He was presently involved in war with Edward I of England, who crossed to Flanders in 1297, intending to invade

France, but was recalled by the revolt in Scotland, under Wallace, and peace was made in 1303. The Flemings, who had provoked Philip by their alliance with the English, were thus left to suffer his resentment. They bore themselves valiantly in a war which lasted several years, and inflicted upon the knights of France a fearful defeat at Courtrai, in 1302. In the end, the French king substantially failed in his designs upon Flanders (see FLANDERS: 1299-1304). "It is probable that this long struggle would have been still protracted, but for a general quarrel which had sprung up some time before its close, between the French king and Pope Boniface VIII., concerning the [taxation of the clergy and the] right of nomination to vacant bishoprics within the dominions of Philippe. The latter, on seeing Bernard Saissetti thrust into the Bishopric of Pamiers by the pontiff's sole authority, caused the Bishop to be arrested by night, and, after subjecting him to various indignities, consigned him to prison on a charge of treason, heresy, and blasphemy. Boniface remonstrated against this outrage and violence in a bull known in history, by its opening words 'Ausculata, fili,' [Listen, my son] in which he asserted his power 'over nations and kingdoms, to root out and to pull down, to destroy and to throw down, to build and to plant,' and concluded by informing Philippe that he had summoned all the superior clergy of France to an assembly at Rome on the 1st of the following November, in order to deliberate on the remedies for such abuses as those of which the king had been guilty. Philippe, by no means intimidated by this measure, convoked a full and early assembly of the three estates of his kingdom, to decide upon the conduct of him whom the orthodox, up to that time, had been in the habit of deeming infallible. This (10th April 1302) was the first meeting of a Parliament, properly so called, in France. [See also SUFFRAGE, MANHOOD: 1300-1600.] . . . The chambers unanimously approved and applauded the conduct of the king, and resolved to maintain the honour of the crown and the nation from foreign insult or domination; and to mark their decision more conclusively, they concurred with the sovereign in prohibiting the clergy from attending the Pope's summons to Rome. The papal bull was burned as publicly as possible. . . . The Pope, alarmed at these novel and bold proceedings, sought instantly to avert their consequences by soothing explanations; but Philippe would not now be turned aside from his course. He summoned a convocation of the Gallican prelates, in which by the mouth of William de Nogaret, his chancellor, he represented the occupier of St. Peter's chair as the father of lies and an evil-doer; and he demanded the seizure of this pseudo-pope, and his imprisonment until he could be brought before a legitimate tribunal to receive the punishment due to his numerous crimes. Boniface now declared that the French king was excommunicated, and cited him by his confessor to appear in the papal court at Rome within three months, to make submission and atonement for his contumacy. . . . While this unseemly quarrel . . . seemed to be growing interminable in its complexities, the daring of a few men opened a shorter path to its end than could have been anticipated. William of Nogaret associating to him Sciarra Colonna, a noble Roman, who, having been driven from his native city by Boniface and subjected to various hardships, had found refuge in Paris, passed, with a train of three hundred horsemen, and a much larger body of picked in-

fantry, secretly into Italy, with the intention of surprising the Pope at his summer residence in his native town of Anagni. . . . The papal palace was captured after a feeble resistance, and the cardinals and personal attendants of the Pontiff fled for their lives. . . . The Condottieri . . . dragged the Pope from his throne, and conveying him into the street, mounted him upon a lean horse without saddle or bridle, with his head to the animal's tail, and thus conducted him in a sort of pilgrimage through the town. He was then consigned prisoner to one of the chambers of his palace and placed under guard; while the body of his captors dispersed themselves through the splendid apartments in eager pursuit of plunder. Three days were thus occupied; but at the end of that time the . . . people of Anagni . . . took arms in behalf of their fellow-townsmen and spiritual father, and falling upon the French while still indulging in the licence of the sack, drove Nogaret and Colonna from their quarters, and either expelled or massacred the whole of their followers." The Pope returned to Rome in so great a rage that his reason gave way, and soon afterwards he was found dead in his bed. "The scandal of these proceedings throughout Christendom was immense; and Philippe adopted every precaution to avert evil consequences from himself by paying court to Benedict XI, who succeeded to the tiara. This Pope, however, though he for some time temporised, could not be long deaf to the loud voices of the clergy which called for punishment upon the oppressors of the church. Ere he had reigned nine months he found himself compelled to excommunicate the plunderers of Anagni; and a few days afterwards he perished, under circumstances which leave little doubt of his having been poisoned. . . . The king of France profited largely by the crime; since, besides gaining time for the subsidence of excitement, he was subsequently enabled, by his intrigues, to procure the election of a person pledged not only to grant him absolution for all past offences, but to stigmatise the memory of Boniface, to restore the deposed Colonna to his honours and estates, to nominate several French ecclesiastics to the college of cardinals, and to grant to the king the tenths of the Gallican church for a term of five years. The pontiff who thus seems to have been the first of his race to lower the pretensions of his office, was Bertrand de Goth, originally a private gentleman of Bazadors, and subsequently promoted to the Archiepiscopal See of Bordeaux. He assumed the title of Clement V., and after receiving investiture at Lyons, fixed the apostolic residence at Avignon, where it continued, under successive occupants, for a period, the length of which caused it to be denominated by the Italians the Babylonian captivity. This quarrel settled, Philippe engaged in another undertaking, the safe-conduct of which required all his skill and unscrupulousness. This important enterprise was no less than the destruction and plunder of the military order of Knights Templars. . . . Public discontent . . . had, by a variety of circumstances, been excited throughout the realm. Among the number of exactions, the coin had been debased to meet the exigencies of the state, and this obstructing the operations of commerce, and inflicting wrongs to a greater or less extent upon all classes, every one loudly complained of injustice, robbery and oppression, and in the end several tumults occurred, in which the residence of the king himself was attacked, and the whole population were with difficulty restrained from insurrection. In

Burgundy, Champagne, Artois and Forez, indeed, the nobles, and burges class having for the first time made common cause of their grievances, spoke openly of revolt against the royal authority, unless the administration should be reformed, and equity be substituted in the king's courts for the frauds, extortions and malversations, which prevailed. The sudden death of Philippe—owing to a fall from his horse while hunting the wild boar in the forest of Fontainebleau—on the 29th of November, 1314, delivered the people from their tyrant, and the crown from the consequences of a general rebellion. Pope Clement, the king's firm friend, had gone to his last account on the 20th of the preceding April. Louis X. le Hutin (the Quarrelsome) ascended the throne at the mature age of twenty-five."—G. M. Bussey and T. Gaspey, *Pictorial history of France*, v. 1, ch. 4.—See also PAPACY: 1294-1348; ITALY: 1310-1313; Visitation of the emperor; TEMPLARS: 1307-1314; FLANDERS: 1314.

14th century.—Financiers in Paris.—Capitalism in the provinces. See CAPITALISM: 14th century.

1314-1328.—Louis X, Philip V, Charles IV.—Feudal reaction.—Philip-le-Bel died in 1314. "With the accession of his son, Louis X., so well surnamed Hutin (disorder, tumult), comes a violent reaction of the feudal, local, provincial spirit, which seeks to dash in pieces the still feeble fabric of unity, demands dismemberment, and claims chaos. The Duke of Brittany arrogates the right of judgment without appeal; so does the exchequer of Rouen. Amiens will not have the king's sergeants subpoena before the barons, or his provosts remove any prisoner from the town's jurisdiction. Burgundy and Nevers require the king to respect the privileges of feudal justice. . . . The common demand of the barons is that the king shall renounce all intermeddling with their men. . . . The young monarch grants and signs all; there are only three points to which he demurs, and which he seeks to defer. The Burgundian barons contest with him the jurisdiction over the rivers, roads, and consecrated places. The nobles of Champagne doubt the king's right to lead them to war out of their own province. Those of Amiens, with true Picard impetuosity, require without any circumlocution, that all gentlemen may war upon each other, and not enter into securities, but ride, go, come, and be armed for war, and pay forfeit to one another. . . . The king's reply to these absurd and insolent demands is merely: 'We will order examination of the registers of my lord St. Louis, and give to the said nobles two trustworthy persons, to be nominated by our council, to verify and inquire diligently into the truth of the said article.' The reply was adroit enough. The general cry was for a return to the good customs of St. Louis: it being forgotten that St. Louis had done his utmost to put a stop to private wars. But by thus invoking the name of St. Louis, they meant to express their wish for the old feudal independence—for the opposite of the quasi-legal, the venal, and pettifogging government of Philippe-le-Bel. The barons set about destroying, bit by bit, all the changes introduced by the late king. But they could not believe him dead so long as there survived his Alter Ego, his mayor of the palace, Enguerrand de Marigny, who, in the latter years of his reign, had been coadjutor and rector of the kingdom, and who had allowed his statue to be raised in the palace by the side of the king's. His real name was Le Portier; but along with the

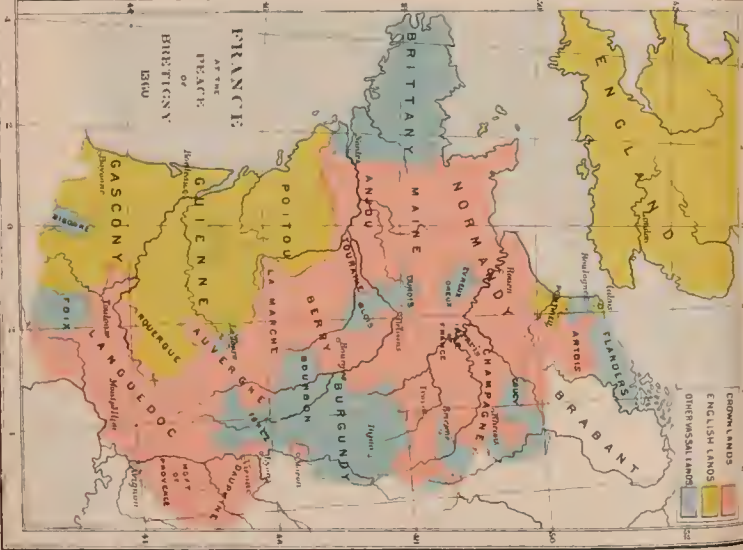

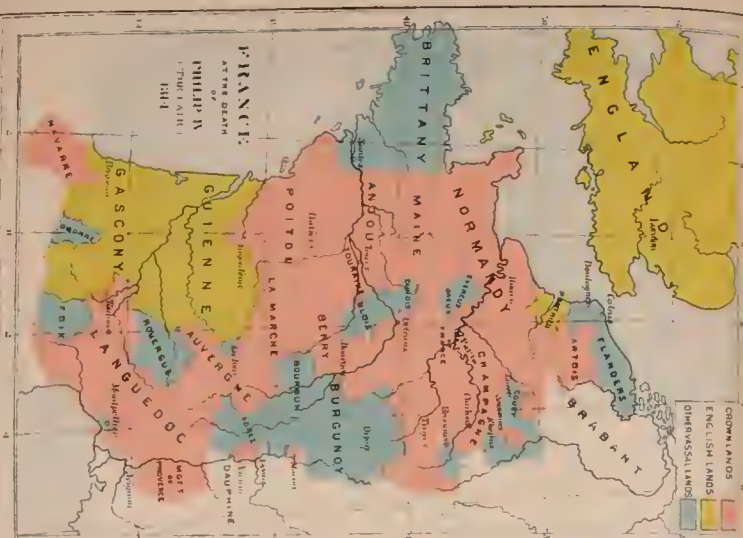

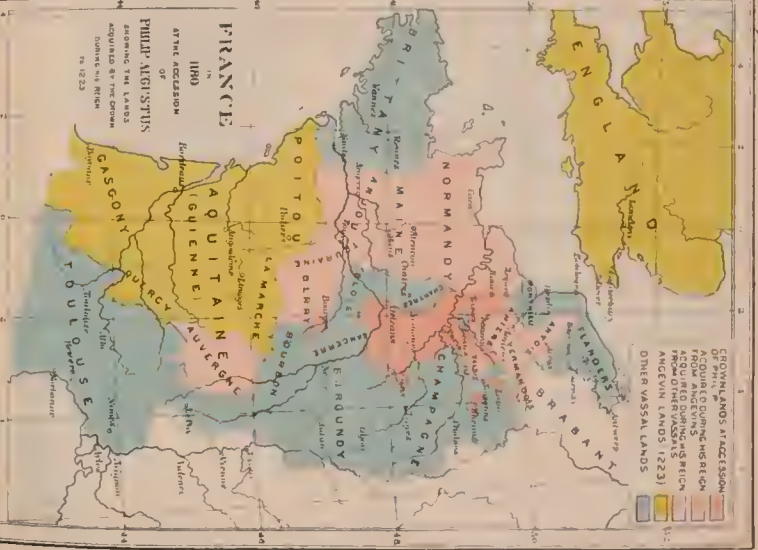

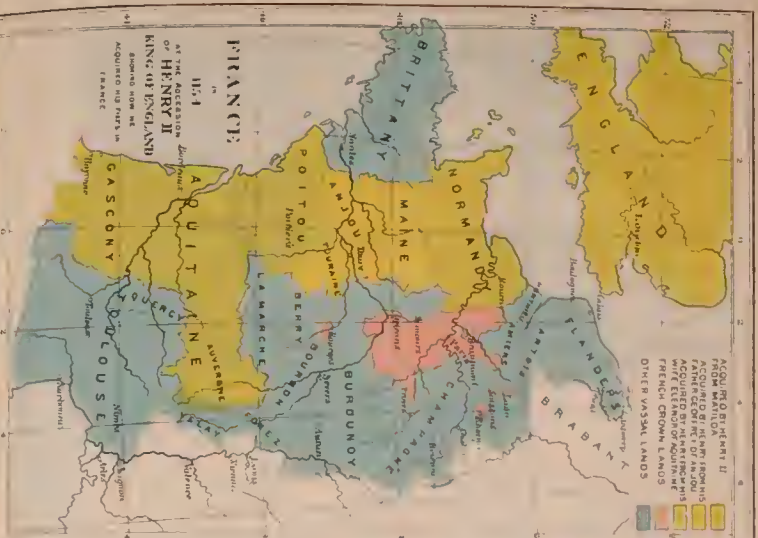

estates he bought the name of Marigny. . . . It was in the Temple, in the very spot where Marigny had installed his master for the spoliation of the Templars, that the young king Louis repaired to hear the solemn accusation brought against him. His accuser was Philippe-le-Bel's brother, the violent Charles of Valois, a busy man, of mediocre abilities, who put himself at the head of the barons. . . . To effect his destruction, Charles of Valois had recourse to the grand accusation of the day, which none could surmount. It was discovered, or presumed, that Marigny's wife or sister, in order to effect his acquittal, or bewitch the king, had caused one Jacques de Lor to make certain small figures: 'The said Jacques, thrown into prison, hangs himself in despair, and then his wife, and Enguerrand's sisters are thrown into prison, and Enguerrand himself, condemned before the knights . . . is hung at Paris on the thieves' gibbet.' . . . Marigny's best vengeance was that the crown, so strong in his care, sank after him into the most deplorable weakness. Louis-le-Hutin, needing money for the Flemish war, treated as equal with equal, with the city of Paris. The nobles of Champagne and Picardy hastened to take advantage of the right of private war which they had just reacquired, and made war on the countess of Artois, without troubling themselves about the judgment rendered by the king, who had awarded this fief to her. All the barons had resumed the privilege of coining; Charles of Valois, the king's uncle, setting them the example. But instead of coining for their own domains only, conformably to the ordinances of Philippe-le-Hardi and Philippe-le-Bel, they minted coin by wholesale, and gave it currency throughout the kingdom. On this, the king had perforce to arouse himself, and return to the administration of Marigny and of Philippe-le-Bel. He denounced the coinage of the barons (November the 10th, 1315); ordained that it should pass current on their own lands only; and fixed the value of the royal coin relatively to thirteen different coinages, which thirty-one bishops or barons had the right of minting on their own territories. In St. Louis's time, eighty nobles had enjoyed this right. The young feudal king, humanized by the want of money, did not disdain to treat with serfs and with Jews. . . . It is curious to see the son of Philippe-le-Bel admitting serfs to liberty [see SERFDOM: 5th-18th centuries]; but it is trouble lost. The merchant vainly swells his voice and enlarges on the worth of his merchandise; the poor serfs will have none of it. Had they buried in the ground some bad piece of money, they took care not to dig it up to buy a bit of parchment. In vain does the king wax wroth at seeing them dull to the value of the boon offered. At last, he directs the commissioners deputed to superintend the enfranchisement, to value the property of such serfs as preferred 'remaining in the sorriness (chétivité) of slavery,' and to tax them 'as sufficiently and to such extent as the condition and wealth of the individuals may conveniently allow, and as the necessity of our war requires.' But with all this it is a grand spectacle to see proclamation made from the throne itself of the imprescriptible right of every man to liberty. The serfs do not buy this right, but they will remember both the royal lesson, and the dangerous appeal to which it instigates against the barons. The short and obscure reign of Philippe-le-Long [Philip V., 1316-1322] is scarcely less important as regards the public law of France, than even that of Philippe-le-Bel. In

the first place, his accession to the throne decides a great question. As Louis Hutin left his queen pregnant, his brother Philippe is regent and guardian of the future infant. This child dies soon after its birth, and Philippe proclaims himself king to the prejudice of a daughter of his brother's; a step which was the more surprising from the fact that Philippe-le-Bel had maintained the right of female succession in regard to Franche-Comté and Artois. The barons were desirous that daughters should be excluded from inheriting fiefs, but that they should succeed to the throne of France; and their chief, Charles of Valois, favored his grandniece against his nephew Philippe. Philippe assembled the States, and gained his cause, which, at bottom, was good, by absurd reasons. He alleged in his favor the old German law of the Franks, which excluded daughters from the Salic land; and maintained that the crown of France was too noble a fief to fall into hands used to the distaff ('pour tomber en quenouille')—a feudal argument, the effect of which was to ruin feudality. . . . By thus rejecting the right of the daughters at the very moment it was gradually triumphing over the fiefs, the crown acquired its character of receiving always without ever giving; and a bold revocation, at this time, of all donations made since St. Louis's day, seems to contain the principle of the inalienableness of the royal domain. Unfortunately, the feudal spirit which resumed strength under the Valois in favor of private wars, led to fatal creations of appanages, and founded, to the advantage of the different branches of the royal family, a princely feudality as embarrassing to Charles VI. and Louis XI., as the other had been to Philippe-le-Bel. This contested succession and disaffection of the barons force Philippe-le-Long into the paths of Philippe-le-Bel. He flatters the cities, Paris, and, above all, the University,—the grand power of Paris. He causes his barons to take the oath of fidelity to him, in presence of the masters of the university, and with their approval. He wishes his good cities to be provided with armories; their citizens to keep their arms in a sure place; and appoints them a captain in each bailiwick or district (March the 12th, 1316). . . . Praiseworthy beginnings of order and of government brought no relief to the sufferings of the people. During the reign of Louis Hutin, a horrible mortality had swept off, it was said, the third of the population of the North. The Flemish war had exhausted the last resources of the country. . . . Men's imaginations becoming excited, a great movement took place among the people. As in the days of St. Louis, a multitude of poor people, of peasants, of shepherds or pastoureaux, as they were called, flock together and say that they seek to go beyond the sea, that they are destined to recover the Holy Land. . . . They wended their way towards the South, everywhere massacring the Jews; whom the king's officers vainly tried to protect. At last, troops were got together at Toulouse, who fell upon the Pastoureaux, and hanging them up by twenties and thirties the rest dispersed. . . . Philippe-le-Long . . . was seized with fever in the course of the same year, (1321), in the month of August, without his physicians being able to guess its cause. He languished five months, and died. . . . His brother Charles [Charles IV., 1322-1328] succeeded him, without bestowing a thought more on the rights of Philippe's daughter, than Philippe had done to those of Louis's daughter. The period of Charles's reign is as barren of facts with regard to France, as it is rich in

Maps prepared specially for the NEW LARNED under direction of the editors and publishers.

them respecting Germany, England, and Flanders. The Flemings imprison their count. The Germans are divided between Frederick of Austria and Lewis of Bavaria, who takes his rival prisoner at Muhldorf. In the midst of the universal divisions, France seems strong from the circumstance of its being one. Charles-le-Bel interferes in favor of the count of Flanders. He attempts, with the pope's aid, to make himself emperor; and his sister, Isabella, makes herself actual queen of England by the murder of Edward II. . . . Charles-le-Bel . . . died almost at the same time as Edward, leaving only a daughter; so that he was succeeded by a cousin of his. All that fine family of princes who had sat near their father at the Council of Vienne was extinct. In the popular belief, the curses of Boniface had taken effect. . . . This memorable epoch, which depresses England so low, and in proportion, raises France so high, presents, nevertheless, in the two countries two analogous events. In England, the barons have overthrown Edward II. In France, the feudal party places on the throne the feudal branch of the Valois."—J. Michelet, *History of France*, v. 1, bk. 5-6.—See also VALOIS, HOUSE OF.

1314-1347.—King's control of the papacy in its contest with the emperor. See GERMANY: 1314-1347.

1320.—Invasion of Milan. See ITALY: 1313-1330.

1328.—Accession of Philip VI.—Extent of the royal domain.—Great vassals.—Possessions of foreign princes in France.—Splendors of the monarchy on the eve of the calamitous war.—On the accession of the House of Valois to the French throne, in the person of Philip VI (1328), the royal domain had acquired a great increase of extent. In the two centuries since Philip I it had gained, "by conquest, by confiscation, or by inheritance, Berry, or the Viscounty of Bourges, Normandy, Maine, Anjou, Poitou, Valois, Vermandois, the counties of Auvergne, and Boulogne, a part of Champagne and Brie, Lyonnais, Angoumois, Marche, nearly the whole of Languedoc, and, lastly, the kingdom of Navarre, which belonging in her own right to queen Jeanne, mother of the last three Capetians [Jeanne, heiress of the kingdom of Navarre and of the counties of Champagne and Brie, was married to Philip IV., and was the mother of Louis X., Philip V. and Charles IV.], Charles IV. united with the crown. [See also NAVARRE: 1284-1328.] But the custom among the kings of giving apanages or estates to the princes of their house detached afresh from the domain a great part of the reunited territories, and created powerful princely houses, of which the chiefs often made themselves formidable to the monarchs. Among these great houses of the Capetian race, the most formidable were: the house of Burgundy, which traced back to king Robert; the house of Dreux, issue of a son of Louis the Big, and which added by a marriage the duchy of Brittany to the county of that name; the house of Anjou, issue of Charles, brother of Saint Louis, which was united in 1290 with that of Valois; the house of Bourbon, descending from Robert, Count of Clermont, sixth son of Saint Louis; and the house of Alençon, which traced back to Philip III., and possessed the duchy of Alençon and Perche. Besides these great princely houses of Capetian stock, which owed their grandeur and their origin to their apanages, there were many others which held considerable rank in France, and of which the possessions were transmissible to women; while

the apanages were all masculine fiefs. The most powerful of these houses were those of Flanders, Penthièvre, Châtillon, Montmorency, Brienne, Coucy, Vendôme, Auvergne, Foix, and Armagnac. The vast possessions of the two last houses were in the country of the Langue d'Oc. The counts of Foix were also masters of Bearn, and those of Armagnac possessed Fezensac, Rouergue, and other large seigniories. Many foreign princes, besides, had possessions in France at the accession of the Valois. The king of England was lord of Ponthieu, of Aunis, of Saintonge, and of the duchy of Aquitaine; the king of Navarre was count of Evreux, and possessor of many other towns in Normandy; the king of Majorca was proprietor of the seigniorship of Montpellier; the duke of Lorraine, vassal of the German empire, paid homage to the king of France for many fiefs that he held in Champagne; and, lastly, the Pope possessed the county Venaisin, detached from Provence."—E. de Bonnechose, *History of France*, v. 1, p. 224.—"Indisputably, the king of France [Philip VI., or Philip de Valois] was at this moment [1328] a great king. He had just reinstated Flanders in its state of dependence on him. [See FLANDERS: 1328.] The king of England had done him homage for his French provinces. His cousins reigned at Naples and in Hungary. He was protector of the king of Scotland. He was surrounded by a court of kings—by those of Navarre, Majorca, Bohemia; and the Scottish monarch was often one of the circle. The famous John of Bohemia, of the house of Luxembourg, and father to the emperor Charles IV., declared that he could not live out of Paris, 'the most chivalrous residence in the world' He fluttered over all Europe, but ever returned to the court of the great king of France—where was kept up one constant festival, where jousts and tournaments ever went on, and the romances of chivalry, king Arthur and the round table, were realized."—J. Michelet, *History of France*, bk. 6, ch. 1.

1328-1339.—Claim of Edward III of England to the French crown.—"History tells us that Philip, king of France, surnamed the Fair, had three sons, beside his beautiful daughter Isabella, married to the king of England [Edward II.]. These three sons were very handsome. The eldest, Lewis, king of Navarre during the lifetime of his father, was called Lewis Hutin [Louis X.]; the second was named Philip the Great, or the Long [Philip V.]; and the third, Charles [Charles IV.] All these were kings of France, after their father Philip, by legitimate succession, one after the other, without having by marriage any male heirs; yet, on the death of the last king, Charles, the twelve peers and barons of France did not give the kingdom to Isabella, the sister, who was queen of England, because they said and maintained, and still do insist, that the kingdom of France is so noble that it ought not to go to a woman; consequently neither to Isabella, nor to her son, the king of England [Edward III.]; for they hold that the son of a woman cannot claim any right of succession, where that woman has none herself. For these reasons the twelve peers and barons of France unanimously gave the kingdom of France to the lord Philip of Valois, nephew to king Philip, and thus put aside the queen of England, who was sister to Charles, the late king of France, and her son. Thus, as it seemed to many people, the succession went out of the right line; which has been the occasion of the most destructive wars and devastations of countries, as

Clementia,  
(daughter of  
Emperor Rudolf I.).

**ROBERT,**  
*King of Naples,*  
1309-1343,  
married  
Isolande  
*of Aragon.*

John,  
*Duke of Durazzo,*  
married  
Agnes  
*of Talleyrand-*  
*Perigord.*

Margaret,  
married  
Charles  
*of Valois.*

Blanche,  
married  
James II.,  
*King of Aragon.*

**CHARLES ROBERT,**  
*King of Hungary,*  
married  
Elizabeth  
*of Poland.*

Charles,  
died 1338,  
married  
Mary  
*of Valois.*

Charles,  
died 1348,  
married  
Mary,  
(granddaughter  
of Robert).

Louis,  
married  
Margaret San  
Severino  
*of Corigliano.*

**PHILIP VI.,**  
*King of France,*  
married  
Jeanne  
*of Burgundy.*

**ALFONSO IV.,**  
*King of Aragon,*  
married  
Theresa d'Enteca.

**LOUIS,**  
*(The Great),*  
*King of Hungary,*  
1342-1382,  
*King of Poland,*  
1370-1382.

Andrew,  
died 1345,  
married  
Joanna I.  
(See below.)

**JOANNA I.,**  
*Queen of Naples,*  
1343-1381,  
died 1382,  
married\*\*  
four times.

Margaret,  
married  
Charles III.  
(See below.)

**CHARLES III.,**  
*King of Naples,*  
1381-1386,  
married  
Margaret.  
(See above.)

**JOHN II.,**  
*King of France,*  
married  
Bona  
*of Bohemia.*

**PETER IV.,**  
*King of Aragon,*  
married  
Eleanor  
*of Sicily.*

**MARY,**  
*Queen of Hungary,*  
1382-1392,  
married  
Sigismund  
(afterward Emperor

Adopted  
Louis I.,  
*of Anjou.*  
(See below.)

**LADISLAS,**  
*King of Naples,*  
1386-1414

**JOANNA II.,**  
*Queen of Naples,*  
married\*\*\*  
twice.

**LOUIS I.,**  
*Duke of Anjou,*  
*Count of Provence,*  
1339-1384,  
*King of Naples,*  
1382-1384,  
married  
Mary  
*of Brittany.*

Eleanor,  
married  
John I.,  
*King of Castile.*

\* See ANJOU: 1206-1442.

\*\* Married (1) Andrew, son of Charles Robert of Hungary; (2) Louis of Tarentum; (3) James, King of Aragon; (4) Otto of Brunswick.

\*\*\* Married (1) William of Austria; (2) James, Count of La Marche.

# HOUSE OF ANJOU.\*

FEB.

APRIL.

JULY.

OCTH.

NOV.

Adopted  
1. René  
of Anjou.  
2. Alfonso V.,  
King of Aragon.  
(See below,  
8th generation.)

**LOUIS III.,**  
*Duke of Anjou,*  
*Count of Provence,*  
*titular King of Naples,*  
1417-1434,  
married  
Margaret  
of Savoy.

**RÉNÉ,**  
*Duke of Anjou and Lorraine,*  
*Count of Provence,*  
1434-1480,  
*King of Naples,*  
1435-1442,  
married  
Isabella  
of Lorraine.  
(See Genealogy,  
under LORRAINE).

Margaret,  
married  
Henry VI.,  
*King of England.*

Charles II.,  
*Count of Maine,*  
died 1481.  
(Bequeathed Anjou,  
Maine, Provence,  
and his claim to Naples,  
to Louis XI., *King of France*).

Charles I.,  
*Count of Maine,*  
married  
Isabella  
of Luxemburg.

**ALFONSO V.,**  
*King of Aragon,*  
1416-1458,  
or **ALFONSO I.,**  
*King of Sicily,*  
1416-1458,  
*King of Naples,*  
1443-1458

**FERDINAND I.,**  
(natural son of Alfonso I.),  
*King of Naples,*  
1458-1494,  
married  
Isabella  
of Clermont.

**ALFONSO II.,**  
*King of Naples,*  
1494-1495,  
married  
Ippolita Sforza  
of Milan.

**FERDINAND II.,**  
*King of Naples,*  
1495-1496

**LOUIS II.,**  
*Duke of Anjou,*  
*Count of Provence,*  
1384-1417,  
*titular King of Naples,*  
1389-1399,  
married  
Isolande  
of Aragon.

**FERDINAND I.,**  
*King of Aragon,*  
married  
Eleanor  
of Albuquerque.

well in France as elsewhere, as you will learn hereafter; the real object of this history being to relate the great enterprises and deeds of arms achieved in these wars, for from the time of good Charlemagne, king of France, never were such feats performed."—J. Froissart, *Chronicles* (Johnes tr.), *bk. 1, ch. 4*.—"From the moment of Charles IV.'s death [1328], Edward III. of England buoyed himself up with a notion of his title to the crown of France, in right of his mother Isabel, sister to the three last kings. We can have no hesitation in condemning the injustice of this pretension. Whether the Salic law were or were not valid, no advantage could be gained by Edward. Even if he could forget the express or tacit decision of all France, there stood in his way Jane, the daughter of Louis X., three [daughters] of Philip the Long, and one of Charles the Fair. Aware of this, Edward set up a distinction, that, although females were excluded from succession, the same rule did not apply to their male issue; and thus, though his mother Isabel could not herself become queen of France, she might transmit a title to him. But this was contrary to the commonest rules of inheritance; and if it could have been regarded at all, Jane had a son, afterwards the famous king of Navarre [Charles the Bad], who stood one degree nearer to the crown than Edward. It is asserted in some French authorities that Edward preferred a claim to the regency immediately after the decease of Charles the Fair, and that the States-General, or at least the peers of France, adjudged that dignity to Philip de Valois. Whether this be true or not, it is clear that he entertained projects of recovering his right as early, though his youth and the embarrassed circumstances of his government threw insuperable obstacles in the way of their execution. He did liege homage, therefore, to Philip for Guienne, and for several years, while the affairs of Scotland engrossed his attention, gave no signs of meditating a more magnificent enterprise. As he advanced in manhood, and felt the consciousness of his strength, his early designs grew mature, and produced a series of the most important and interesting revolutions in the fortunes of France."—H. Hallam, *Middle Ages, ch. 1, pt. 1*.—See also SALIC LAW: Application to the Regal Succession in France.

1337-1360.—Beginning of the "Hundred Years' War."—Five periods of the war.—English victory at Poitiers.—Peace of Bretigny (1360).—It was not until 1337 that Edward III felt prepared to assert formally his claim to the French crown and to assume the title of king of France. In July of the following year he began undertakings to enforce his pretended right, by crossing with a considerable force to the continent. He wintered at Antwerp, concerting measures with the Flemings, who had espoused his cause, and arranging an alliance with the emperor-king of Germany, whose name bore more weight than his arms. In 1339 a formal declaration of hostilities was made and the long war—the Hundred Years' War, as it has been called—of English kings for the sovereignty of France, began. "This great war may well be divided into five periods. The first ends with the Peace of Bretigny in 1360 (1337-1360), and includes the great days of Crécy [1346] and Poitiers [1356], as well as the taking of Calais [see CALAIS: 1346-1347]; the second runs to the death of Charles the Wise in 1380; these are the days of Du Guesclin and the English reverses: the third begins with the renewal of the war under Henry V. of England, and ends

with the Regency of the Duke of Bedford at Paris, including the field of Azincourt [1415] and the Treaty of Troyes (1415-1422): the fourth is the epoch of Jeanne D'Arc and ends with the second establishment of the English at Paris (1428-1431): and the fifth and last runs on to the final expulsion of the English after the Battle of Castillon in 1453. Thus, though it is not uncommonly called the Hundred Years War, the struggle really extended over a period of a hundred and sixteen years."—G. W. Kitchin, *History of France, bk. 4, ch. 1-7*.—"No war had broken out in Europe, since the fall of the Roman Empire, so memorable as that of Edward III. and his successors against France, whether we consider its duration, its object, or the magnitude and variety of its events. It was a struggle of one hundred and twenty years, interrupted but once by a regular pacification, where the most ancient and extensive dominion in the civilised world was the prize, twice lost and twice recovered in the conflict. . . . There is, indeed, ample room for national exultation at the names of Crécy, Poitiers and Azincourt. So great was the disparity of numbers upon those famous days, that we cannot, with the French historians, attribute the discomfiture of their hosts merely to mistaken tactics and too impetuous valour. . . . These victories, and the qualities that secured them, must chiefly be ascribed to the freedom of our constitution, and to the superior condition of the people. Not the nobility of England, not the feudal tenants, won the battles of Crécy and Poitiers; for these were fully matched in the ranks of France; but the yeomen who drew the bow with strong and steady arms, accustomed to use it in their native fields, and rendered fearless by personal competence and civil freedom. . . . Yet the glorious termination to which Edward was enabled, at least for a time, to bring the contest, was rather the work of fortune than of valour and prudence. Until the battle of Poitiers [1356] he had made no progress towards the conquest of France. That country was too vast, and his army too small, for such a revolution. The victory of Crécy gave him nothing but Calais. . . . But at Poitiers he obtained the greatest of prizes, by taking prisoner the king of France. [See also POITIERS, BATTLE OF.] Not only the love of freedom tempted that prince to ransom himself by the utmost sacrifices, but his captivity left France defenceless and seemed to annihilate the monarchy itself. . . . There is no affliction which did not fall upon France during this miserable period. . . . Subdued by these misfortunes, though Edward had made but slight progress towards the conquest of the country, the regent of France, afterwards Charles V., submitted to the peace of Bretigni. [See also BREITIGNY, TREATY OF.] By this treaty, not to mention less important articles, all Guienne, Gascony, Poitou, Saintonge, the Limousin, and the Angoumois, as well as Calais, and the county of Ponthieu, were ceded in full sovereignty to Edward; a price abundantly compensating his renunciation of the title of France, which was the sole concession stipulated in return."—H. Hallam, *Middle Ages, ch. 1, pt. 2*.—See also ENGLAND: 1333-1380.

ALSO IN: J. Froissart, *Chronicles* (Johnes tr.), *bk. 1, ch. 1-212*.—W. Longman, *History of Edward III, v. 1, ch. 6-22*.—F. P. Guizot, *Popular history of France, ch. 20*.—D. F. Jamison, *Life and times of Bertrand du Guesclin, v. 1, ch. 4-10*.

1347-1348.—Black plague.—"Epochs of moral depression are those, too, of great mortality. . . . In the last years of Philippe de Valois' reign,

the depopulation was rapid. The misery and physical suffering which prevailed were insufficient to account for it; for they had not reached the extreme at which they subsequently arrived. Yet, to adduce but one instance, the population of a single town, Narbonne, fell off in the space of four or five years from the year 1300, by 500 families. Upon this too tardy diminution of the human race followed extermination,—the great black plague, or pestilence, which at once heaped up mountains of dead throughout Christendom. It began in Provence, in the year 1347, on All Saints' Day, continued sixteen months, and carried off two-thirds of the inhabitants. The same wholesale destruction befell Languedoc. At Montpellier, out of twelve consuls, ten died. At Narbonne, 30,000 persons perished. In several places, these remained only a tithe of the inhabitants. All that the careless Froissart says of this fearful visitation, and that only incidentally, is—“For at this time there prevailed throughout the world generally a disease called epidemic, which destroyed a third of its inhabitants.” This pestilence did not break out in the north of the kingdom until August, 1348, where it first showed itself at Paris and St. Denys. So fearful were its ravages at Paris, that, according to some, 800, according to others, 500, daily sank under it. . . . As there was neither famine at the time nor want of food, but, on the contrary great abundance, this plague was said to proceed from infection of the air and of the springs. The Jews were again charged with this, and the people cruelly fell upon them.”—J. Michelet, *History of France*, bk. 6, ch. 1.—See also BLACK DEATH.

1350.—Accession of King John II.

1356-1358.—Temporary stimulus to democracy in defeat of Poitiers.—Assembly of the States-General under leadership of Paris.—Assumption of right of national representation and legislation by bourgeoisie.—Etienne Marcel, and anticipation of modern republican institutions under his leadership.—“The disaster of Poitiers [1356] excited in the minds of the people a sentiment of national grief, mixed with indignation and scorn at the nobility who had fled before an army so inferior in number. Those nobles who passed through the cities and towns on their return from the battle were pursued with imprecations and outrages. The Parisian bourgeoisie, animated with enthusiasm and courage, took upon itself at all risks the charge of its own defense; whilst the eldest son of the king, a youth of only nineteen, who had been one of the first to fly, assumed the government as lieutenant of his father. It was at the summons of this prince that the states assembled again at Paris before the time which they had appointed. The same deputies returned to the number of 800, of whom 400 were of the bourgeoisie; and the work of reform, rudely sketched in the preceding session, was resumed under the same influence, with an enthusiasm which partook of the character of revolutionary impulse. The assembly commenced by concentrating its action in a committee of twenty-four members, deliberating, as far as appears, without distinction of orders; it then intimated its resolutions under the form of petitions, which were as follow: The authority of the states declared supreme in all affairs of administration and finance, the impeachment of all the counsellors of the king, the dismissal in a body of the officers of justice, and the creation of a council of reformers taken from the three orders; lastly, the prohibition to conclude any truce without the

assent of the three states, and the right on their part to re-assemble at their own will without a royal summons. The lieutenant of the king, Charles Duke of Normandy, exerted in vain the resources of a precocious ability to escape these imperious demands; he was compelled to yield everything. The States governed in his name; but dissension, springing from the mutual jealousy of the different orders, was soon introduced into their body. The preponderating influence of the bourgeois appeared intolerable to the nobles, who, in consequence, deserted the assembly and retired home. The deputies of the clergy remained longer at their posts, but they also withdrew at last; and, under the name of the States-General, none remained but the representatives of the cities, alone charged with all the responsibilities of the reform and the affairs of the kingdom. Bowing to a necessity of central action, they submitted of their own accord to the deputation of Paris; and soon, by the tendency of circumstances, and in consequence of the hostile attitude of the Regent, the question of supremacy of the states became a Parisian question, subject to the chances of a popular émeute [riot] and the guardianship of the municipal power. At this point appears a man whose character has grown into historical importance in our days from our greater facilities of understanding it, Etienne [Stephen] Marcel, ‘*prévôt des marchands*’—that is to say, mayor of the municipality of Paris. This *échevin* [sheriff] of the 14th century, by a remarkable anticipation, designed and attempted things which seem to belong only to recent revolutions. Social unity, and administrative uniformity; political rights, co-extensive and equal with civil rights; the principle of public authority transferred from the crown to the nation; the States-General changed, under the influence of the third order, into a national representation; the will of the people admitted as sovereign in the presence of the depositary of the royal power; the influence of Paris over the provinces, as the head of opinion and centre of the general movement; the democratic dictatorship, and the influence of terror exercised in the name of the common weal; new colours assumed and carried as a sign of patriotic union and symbol of reform; the transference of royalty itself from one branch of the family to the other, with a view to the cause of reform and the interest of the people—such were the circumstances and the scenes which have given to our own as well as the preceding century their political character. It is strange to find the whole of it comprised in the three years over which the name of the *Prévôt Marcel* predominates. His short and stormy career was, as it were, a premature attempt at the grand designs of Providence, and the mirror of the bloody changes of fortune through which those designs were destined to advance to their accomplishment under the impulse of human passions. Marcel lived and died for an idea—that of hastening on, by the force of the masses, the work of gradual equalisation commenced by the kings themselves; but it was his misfortune and his crime to be unrelenting in carrying out his convictions. To the impetuosity of a tribune who did not shrink even from murder he added the talent of organization; he left in the grand city, which he had ruled with a stern and absolute sway, powerful institutions, noble works, and a name which two centuries afterwards his descendants bore with pride as a title of nobility.”—A. Thierry, *Formation and progress of the Tiers État*, v. 1, ch. 2.—See also STATES-GENERAL OF FRANCE.

1358.—Peasant resistance to feudalism.—Insurrection of the Jacquerie.—“The miseries of France weighed more and more heavily on the peasantry; and none regarded them. They stood apart from the cities, knowing little of them; the nobles despised them and robbed them of their substance or their labour. . . . At last the peasantry (May, 1358), weary of their woes, rose up to work their own revenge and ruin. They began in the Beauvais country and there fell on the nobles, attacking and destroying castles, and slaying their inmates: it was the old unvarying story. They made themselves a kind of king, a man of Clermont in the Beauvoism, named William Callet. Froissart imagines that the name ‘Jacques Bonhomme’ meant a particular person, a leader in these risings. Froissart however had no accurate knowledge of the peasant and his ways. Jacques Bonhomme was the common nickname, the ‘Giles’ or ‘Hodge’ of France, the name of the peasant generally; and from it such risings as this of 1358 came to be called the ‘Jacquerie,’ or the disturbances of the ‘Jacques.’ The nobles were soon out against them, and the whole land was full of anarchy. Princes and nobles, angry peasants with their ‘iron shod sticks and knives,’ free-lances, English bands of pillagers, all made up a scene of utter confusion: ‘cultivation ceased, commerce ceased, security was at an end.’ The burghers of Paris and Meaux sent a force to help the peasants, who were besieging the fortress at Meaux, held by the nobles; these were suddenly attacked and routed by the Captal de Buch and the Count de Foix, ‘then on their return from Prussia.’ The King of Navarre also fell on them, took by stratagem their leader Callet, tortured and hanged him. In six weeks the fire was quenched in blood.”—G. W. Kitchin, *History of France*, ch. 2, sect. 3.—“Froissard relates the horrible details of the Jacquerie with the same placid interest which characterises his description of battles, tournaments, and the pageantry of chivalry. The charm and brilliancy of his narrative have long popularised his injustice and his errors, which are self-apparent when compared with the authors and chroniclers of his time. . . . The chronicles contemporary of the Jacquerie confine themselves to a few words on the subject, although, with the exception of the Continuator of Nangis, they were all hostile to the cause of the peasants. The private and local documents on the subjects say very little more. The Continuator of Nangis has drawn his information from various sources. He takes care to state that he has witnessed almost all he relates. After describing the sufferings of the peasants, he adds that the laws of justice authorised them to rise in revolt against the nobles of France. His respected testimony reduces the insurrection to comparatively small proportions. The hundred thousand Jacques of Froissard are reduced to something like five or six thousand men, a number much more probable when it is considered that the insurrection remained a purely local one, and that, in consequence of the ravages we have mentioned, the whole open country had lost about two-thirds of its inhabitants. He states very clearly that the peasants killed indiscriminately, and without pity, men and children, but he does not say anything of those details of atrocity related by Froissard. He only alludes once to a report of some outrages offered to some noble ladies; he speaks of it as a vague rumour. He describes the insurgents, after the first explosion of their vindictive fury, as pausing—amazed at their own boldness, and terrified at their own crimes, and the nobles, recovering from their terror, taking immediate advantage of this sudden torpor and paralysis—assembling and slaughtering all, innocent and guilty, burning houses

and villages. If we turn to other writers contemporary with the Jacquerie, we find that Louvet, author of the ‘History of the District of Beauvais,’ does not say much on the subject, and evinces also a sympathy for the peasants: the paucity of his remarks on a subject represented by Froissard as a gigantic, bloody tragedy, raises legitimate doubts as to the veracity of the latter. There is another authority on the events of that period, which may be considered as more weighty, in consequence of its ecclesiastical character; it is the ‘cartulaire,’ or journal of the Abbot of Beauvais. . . . There is no trace in it of the horror and indescribable terror . . . [the rising] must have inspired if the peasants had committed the atrocities attributed to them by the feudal historian, Froissard. On the contrary, the vengeance of the peasants falls into the shade, as it were, in contrast with the merciless reaction of the nobles, along with the sanguinary oppression of the English. The writer of the ‘Abbey of Beauvais,’ and the anonymous monk, ‘Continuator of Nangis,’ concur with each other in their account of the Jacquerie. Their judgments are similar, and they manifest the same moderation. Their opinions, moreover, are confirmed by a higher authority, a testimony that must be considered as indisputable, namely, the letters of amnesty of the Regent of France, which are all preserved; they bear the date of 10th August, 1358, and refer to all the acts committed on the occasion of the Jacquerie. In these he proves himself more severe upon the reaction of the nobles than on the revolt of the peasants. . . . There is not the slightest allusion to the monstrosities related by Froissard, which the Regent could not have failed to stigmatise, as he is well known for having entertained an unscrupulous hatred to any popular movement, or any claims of the people. The manner, on the contrary, in which the Jacquerie are represented in this official document, is full of signification; it represents the men of the open country assembling spontaneously in various localities, in order to deliberate on the means of resisting the English, and suddenly, as with a mutual agreement, turning fiercely on the nobles, who were the real cause of their misery, and of the disgrace of France, on the days of Crecy and Poitiers. . . . It has also been forgotten that many citizens took an active part in the Jacquerie. The great chronicles of France state that the majority were peasants, labouring people, but that there were also among them citizens, and even gentlemen, who, no doubt, were impelled by personal hatred and vengeance. Many rich men joined the peasants, and became their leaders. The bourgeoisie, in its struggles with royalty, could not refuse to take advantage of such a diversion; and Beauvais, Senlis, Amiens, Paris, and Meaux accepted the Jacquerie. Moreover, almost all the poorer classes of the cities sympathised with the revolted peasants. The Jacquerie broke out on the 21st of May, 1358, and not in November, 1357, as erroneously stated by Froissard, in the districts around Beauvais and Clermont-sur-Oise. The peasants, merely armed with pikes, sticks, fragments of their ploughs, rushed on their masters, murdered their families, and burned down their castles. The country comprised between Beauvais and Melun was the principal scene of this war of extermination. . . . The Jacquerie had commenced on the 21st of May. On the 9th of June . . . it was already terminated. It was, therefore, in reality, an insurrection of less than three weeks’ duration. The reprisals of the nobles had already commenced on the 9th of June, and continued through the whole of July, and the greater part of August. Froissard states that the Jacquerie lasted over six weeks, thus comprising in his reckoning three weeks of the ferocious ven-

geance of the nobles, and casting on Jacques Bonhomme the responsibility of the massacres of which he had been the victim, as well as those he had committed in his furious despair."—Prof. De Vericour, *Jacquerie (Royal Historical Society Transactions, v. 1)*.

1360-1363.—Children's plague. See PLAGUE: 1360-1363.

1360-1380.—English conquests recovered.—The Peace of Bretigny brought little peace to France or little diminution of the troubles of the kingdom. In some respects there was a change for the worse introduced. The armies which had ravaged the country dissolved into plundering bands which afflicted it even more. Great numbers of mercenaries from both sides were set free, who gathered into Free Companies, as they were called, under leaders of fit recklessness and valor, and swarmed over the land, warring on all prosperity and all the peaceful industries of the time, seeking booty wherever it might be found (see ITALY: 1343-1393). Civil war, too, was kept alive by the intrigues and conspiracies of the Navarrese king, Charles the Bad; and war in Brittany, over a disputed succession to the dukedom, was actually stipulated for, by French and English, in their treaty of general peace. But when the chivalric but hapless King John died, in 1364, the new king, Charles V, who had been regent during his captivity, developed an unexpected capacity for government. He brought to the front the famous Breton warrior Du Guesclin—rough, ignorant, unchivalric—but a fighter of the first order in his hard-fighting day. He contrived with adroitness to rid France, mostly, of the Free Companies, by sending them, with Du Guesclin at their head, into Spain, where they drove Peter the Cruel from the throne of Castile, and fought the English, who undertook, wickedly and foolishly, to sustain him. The Black Prince won a great battle, at Najara or Navarette (1367), took Du Guesclin prisoner and restored the cruel Pedro to his throne. But it was a victory fatal to English interests in France. Half the army of the English prince perished of a pestilent fever before he led it back to Aquitaine, and he himself was marked for early death by the same malady. He had been made duke of Aquitaine, or Guienne, and held the government of the country. The war in Spain proved expensive; he taxed his Gascon and Aquitanian subjects heavily. He was ill, irritable, and treated them harshly. Discontent became widely spread, and the king of France subtly stirred it up until he felt prepared to make use of it in actual war. At last, in 1368, he challenged a rupture of the Peace of Bretigny by summoning King Edward, as his vassal, to answer complaints from Aquitaine. In April of the next year he formally declared war and opened hostilities the same day. His cunning policy was not to fight, but to waste and wear the enemy out. Its wisdom was well-proved by the result. Day by day the English lost ground; the footing they had gained in France was found to be everywhere insecure. The dying Black Prince achieved one hideous triumph at Limoges, where he slew 3,000 people to punish a revolt; then he was carried home to end his days in England. In 1376 he died, and one year later his father, King Edward, followed him to the grave, and a child of eleven (Richard II) came to the English throne. But the same calamity befell France in 1380, when Charles the Wise died, leaving an heir to the throne only twelve years of age. In both kingdoms the minority of the sovereign gave rise to factious intrigues and distracting feuds. The war went on at intervals, with frequent truces and armistices, and

with little result beyond the animosities which it kept alive. But the English possessions, by this time, had been reduced to Calais and Guines, with some small parts of Aquitaine adjoining the cities of Bordeaux and Bayonne. And thus, it may be said, the situation was prolonged through a generation, until Henry V of England resumed afresh the undertaking of Edward III.—F. P. Guizot, *Popular history of France, ch. 22*—See also SPAIN: 1366-1369.

1380-1415.—Reign of the dukes.—Civil war of Armagnacs and Burgundians.—"Charles VI. had arrived at the age of eleven years and some months when his father died [1380]. His three paternal uncles, the Dukes of Anjou, Berry, and Burgundy, and his maternal uncle, the Duke of Bourbon, disputed among themselves concerning his guardianship and the regency. They agreed to emancipate the young King immediately after his coronation, which was to take place during the year, and the regency was to remain until that period in the hands of the eldest, the Duke of Anjou." But the duke of Anjou was soon afterwards lured into Italy by the fatal gift of a claim to the crown of Naples (see ITALY: 1343-1389), and perished in striving to realize it. The surviving uncles misgoverned the country between them until 1389, when the young king was persuaded to throw off their yoke. The nation rejoiced for three years in the experience and the prospect of administrative reforms; but suddenly, in July, 1392, the young king became demented, and "then commenced the third fatal epoch of that disastrous reign. The faction of the dukes again seized power," but only to waste and afflict the kingdom by dissensions among themselves. The number of the rival dukes was now increased by the addition of the duke of Orleans, brother of the king, who showed himself as ruthless and rapacious as any. "Charles was still considered to be reigning; each one sought in turn to get possession of him, and each one watched his lucid moments in order to stand well in power. His flashes of reason were still more melancholy than his fits of delirium. Incapable of attending to his affairs, or of having a will of his own, always subservient to the dominant party, he appeared to employ his few glimmerings of reason only in sanctioning the most tyrannical acts and the most odious abuses. It was in this manner that the kingdom of France was governed during twenty-eight years." In 1404, the duke of Burgundy, Philip the Bold, having died, the duke of Orleans acquired supreme authority and exercised it most oppressively. But the new duke of Burgundy, John the Fearless, made his appearance on the scene ere long, arriving from his county of Flanders with an army and threatening civil war. Terms of peace, however, were arranged between the two dukes and an apparent reconciliation took place. On the very next day the duke of Orleans was assassinated (1407), and the duke of Burgundy openly proclaimed his instigation of the deed. Out of that treacherous murder sprang a war of factions so

deadly that France was delivered by it to foreign conquest, and destroyed, we may say, for the time being, as a nation. The elder of the young princes of Orleans, sons of the murdered duke, had married a daughter of Count Bernard of Armagnac, and Count Bernard became the leader of the party which supported them and sought to avenge them, as against the duke of Burgundy and his party. Hence the former acquired the name of Armagnacs; the latter were called Burgundians. Armagnac led an army of Gascons (1410) and threatened Paris, "where John the Fearless caressed the vilest populace. Burgundy relied on the name of the king, whom he held in his power, and armed in the capital a corps of one hundred young butchers or horse-knackers, who, from John Caboche, their chief, took the name of Cabochiens. A frightful war, interrupted by truces violated on both sides, commenced between the party of Armagnac and that of Burgundy. Both sides appealed to the English, and sold France to them. The Armagnacs pillaged and ravaged the environs of Paris with unheard-of cruelties, while the Cabochiens caused the capital they defended to tremble. The States-General, convoked for the first time for thirty years, were dumb—without courage and without strength. The Parliament was silent, the university made itself the organ of the populace, and the butchers made the laws. They pillaged, imprisoned and slaughtered with impunity, according to their savage fury, and found judges to condemn their victims. . . . The reaction broke out at last. Tired of so many atrocities, the bourgeoisie took up arms, and shook off the yoke of the horse-knackers. The Dauphin was delivered by them. He mounted on horseback, and, at the head of the militia, went to the Hôtel de Ville, from which place he drove out Caboche and his brigands. The counter revolution was established. Burgundy departed, and the power passed to the Armagnacs. The princes re-entered Paris, and King Charles took up the oriflamme (the royal standard of France), to make war against John the Fearless, whose instrument he had been a short time before. His army was victorious. Burgundy submitted, and the treaty of Arras [1415] suspended the war, but not the executions and the ravages. Henry V., King of England, judged this a propitious moment to descend upon France, which had not a vessel to oppose the invaders."—E. de Bonnechese, *History of France*, v. 1, pp. 266-270.—See also FLANDERS: 1382; NETHERLANDS: 1406-1417; SOISSONS: 1414; Pillage and destruction by the Armagnacs.

1415.—Hundred Years' War renewed by Henry V of England.—Claims and demands of Henry.—Battle of Agincourt.—"When Henry V. resolved to recover what he claimed as the inheritance of his predecessors, he had to begin, it may be said, the work of conquest over again. Allies, however, he had, whose assistance he was to find very useful. The dynasty of De Montfort had been established in possession of the dukedom of Brittany

in a great measure by English help, and though the relations between the two countries had not been invariably friendly since that time, the sense of this obligation, and, still more powerfully, a jealous fear of the French king, inclined Brittany to the English alliance. The Dukes of Burgundy, though they had no such motives of gratitude towards England, felt a far stronger hostility towards France. The feud between the rival factions which went by the names of Burgundians and Armagnacs had now been raging for several years; and though the attitude of the Burgundians varied—at the great struggle of Agincourt they were allies, though lukewarm and even doubtful allies, of the French—they ultimately ranked themselves decidedly on Henry's side. In 1414, then, Henry formally demanded, as the heir of Isabella, mother of his great-grandfather Edward, the crown of France. This claim the French princes wholly refused to consider. Henry then moderated his demands so far, at least, as to allow Charles to remain in nominal possession of his kingdom; but . . . France was to cede to England, no longer as a feudal superior making a grant to a vassal, but in full sovereignty, the provinces of Normandy, Maine, and Anjou, together with all that was comprised in the ancient duchy of Aquitaine. Half, too, of Provence was claimed, and the arrears of the ransom of King John, amounting to 1,200,000 crowns, were also to be paid. Finally, the French king was to give his youngest daughter, Katharine, in marriage to Henry, with a portion of 2,000,000 crowns. The French ministers offered, in answer, to yield the duchy of Aquitaine, comprising the provinces of Anjou, Gascony, Guienne, Poitou, and to give the hand of the princess Katharine with a dowry of 600,000 crowns." Negotiations went on through several months, with small chance of success, while Henry prepared for war. His preparations were completed in the summer of 1415, and on the 11th of August in that year he set sail from Southampton, with an army of 6,000 men-at-arms and 24,000 archers, very completely equipped, and accompanied with cannon and other engines of war. Landing in the estuary of the Seine, the invaders first captured the important Norman seaport of Harfleur, after a siege of a month, and expelled the inhabitants from the town. It was an important acquisition; but it had cost the English heavily. They were ill-supplied with food; they had suffered from much rain; 2,000 had died of an epidemic of dysentery. The army was in no condition for a forward movement. "The safest course would now have been to return at once; and this seems to have been pressed upon the king by the majority of his counsellors. But this prudent advice did not approve itself to Henry's adventurous temper. . . . He determined . . . to make what may be called a military parade to Calais. This involved a march of not less than 150 miles through a hostile country, a dangerous, and, but that one who cherishes such designs as Henry's must make a reputation for daring, a useless operation; but the king's determined will overcame all opposition." Leaving a strong garrison at Harfleur, Henry set out upon his march. Arrived at the Somme, his further progress was disputed, and he was forced to make a long detour before he could effect a crossing of the river. On the 24th of October, he encountered the French army, strongly posted at the village of Azincour or Agincourt, barring the road to Calais; and there, on the morning of the 25th, after a night of drenching rain, the great battle, which shines with so dazzling a glory in English history, was fought. There seems to be no doubt that the English were greatly outnumbered by the French—according to Monstrelet they were but one to six;

but the masses on the French side were unskillfully handled and no advantage was got from them. The deadly shafts of the terrible English archers built such a rampart of corpses in their front that it actually sheltered them from the charge of the French cavalry. "Everywhere the French were routed, slain, or taken. The victory of the English was complete. . . . The French loss was enormous. Monstrelet gives a long list of the chief princes and nobles who fell on that fatal field. . . . We are disposed to trust his estimate, which, including princes, knights and men-at-arms of every degree, he puts at 10,000. . . . Only 1,600 are said to have been 'of low degree.' . . . The number of knights and gentlemen taken prisoners was 1,500. Among them were Charles, Duke of Orleans, and the Duke of Bourbon, both princes of the blood-royal. . . . Brilliant as was the victory which Henry had won at Agincourt, it had, it may be said, no immediate results. . . . The army resumed its interrupted march to Calais, which was about forty miles distant. At Calais a council of war was held, and the resolution to return to England unanimously taken. A few days were allowed for refreshment, and about the middle of November the army embarked."—A. J. Church, *Henry the Fifth*, ch. 6-10.

1415-1419.—Massacre of Armagnacs—Murder of the duke of Burgundy.—"The captivity of so many princes of the blood as had been taken prisoner at Agincourt might have seemed likely at least to remove some of the elements of discord; but it so happened that the captives were the most moderate and least ambitious men. The gentle, poetical Duke of Orleans, the good Duke of Bourbon, and the patriotic and gallant Arthur de Richemont, had been taken, while the savage Duke of Burgundy and the violent Gascon Count of Armagnac, Constable of France, remained at the head of their hostile factions. . . . The Count d'Armagnac now reigned supreme; no prince of the blood came to the councils, and the king and dauphin were absolutely in his hands. . . . The Duke of Burgundy was, however, advancing with his forces, and the Parisians were always far more inclined to him than to the other party. . . . For a whole day's ride round the environs of the city, every farmhouse had been sacked or burnt. Indeed, it was said in Paris a man had only to be called a Burgundian, or anywhere else in the Isle of France an Armagnac, to be instantly put to death. All the soldiers who had been posted to guard Normandy and Picardy against the English were recalled to defend Paris against the Duke of Burgundy; and Henry V. could have found no more favourable moment for a second expedition." The English king took advantage of his opportunity and landed in Normandy August 1, 1417, finding nobody to oppose him in the field. The factions were employed too busily in cutting each other's throats,—especially after the Burgundians had regained possession of Paris, which they did in the following spring. Thereupon the Parisian mob rose and ferociously massacred all the partisans of Armagnac, while the Burgundians looked and approved. "The prison was forced; Armagnac himself was dragged out and slain in the court. . . . The court of each prison became a slaughter-house; the prisoners were called down one by one, and there murdered, till the assassins were up to their ankles in blood. The women were as savage as the men, and dragged the corpses about

the streets in derision. The prison slaughter had but given a passion for further carnage, and the murderers broke open the houses in search of Armagnacs, killing not only men, but women, children, and even new-born babes, to whom in their diabolical frenzy they refused baptism, as being little Armagnacs. The massacre lasted from four o'clock on Sunday morning to ten o'clock on Monday. Some say that 3,000 perished, others 1,600, and the Duke of Burgundy's servants reported the numbers as only 400." Meantime Henry V was besieging Rouen, and starving Paris by cutting off the supplies for which it depended on the Seine. In August there was another rising of the Parisian mob and another massacre. In January, 1419, Rouen surrendered, and attempts at peace followed, both parties making a truce with the English invader. The imperious demands of King Henry finally impelled the two French factions to draw together and to make a common cause of the deliverance of the kingdom. At least that was the profession with which the dauphin and the duke of Burgundy met, in July, and went through the forms of a reconciliation. Perhaps there were treacherous intentions on both sides. On one side the treachery was consummated a month later (September 10, 1419), when, a second meeting between Duke John the Fearless and the dauphin taking place at the Bridge of Montereau, the duke was basely assassinated in the dauphin's presence. This murder, by which the Armagnacs, who controlled the young dauphin, hoped to break their rivals down, only kindled afresh the passions which were destroying France and delivering it an easy prey to foreign conquest.—C. M. Yonge, *Cameos from English history: Second series*, ch. 28-29.

1417-1422.—Burgundy's revenge.—Triumph of Henry V.—Throne of France signed away to Henry V and his heirs forever in Treaty of Troyes by the duke of Burgundy.—Resistance of the towns to Treaty of Troyes.—Death of Henry V.—"Whilst civil war was . . . penetrating to the very core of the kingship, foreign war was making its way again into the kingdom. Henry V., after the battle of Agincourt, had returned to London, and had left his army to repose and reorganize after its sufferings and its losses. It was not until eighteen months afterwards, on the 1st of August, 1417, that he landed at Touques, not far from Honfleur, with fresh troops, and resumed his campaign in France. Between 1417 and 1419 he successively laid siege to nearly all the towns of importance in Normandy, to Caen, Bayeux, Falaise, Evreux, Coutances, Laigle, St. Lô, Cherbourg, &c., &c. Some he occupied after a short resistance, others were sold to him by their governors; but when, in the month of July, 1418, he undertook the siege of Rouen, he encountered there a long and serious struggle. Rouen had at that time, it is said, a population of 150,000 souls, which was animated by ardent patriotism. The Rouennese, on the approach of the English, had repaired their gates, their ramparts, and their moats; had demanded reinforcements from the King of France and the Duke of Burgundy; and had ordered every person incapable of bearing arms or procuring provisions for ten months to leave the city. Twelve thousand old men, women and children were thus expelled, and died either round the place or whilst roving in misery over the neighbouring country. . . . Fifteen thousand men of city-militia, 4,000 regular soldiers, 300 spearmen and as many archers from Paris, and it is not quite known how many men-at-arms sent by the Duke of Burgundy, de-

fended Rouen for more than five months amidst all the usual sufferings of strictly-besieged cities." On January 13th, 1419, the town was surrendered. "It was 215 years since Philip Augustus had won Rouen by conquest from John Lackland, King of England." After this great success there were truces brought about between all parties, and much negotiation, which came to nothing—except the treacherous murder of the duke of Burgundy, as related above. Then the situation changed. The son and successor of the murdered duke, afterwards known as Philip the Good, took sides, at once, with the English king and committed himself to a war of revenge, indifferent to the fate of France. "On the 17th of October [1419] was opened at Arras a congress between the plenipotentiaries of England and those of Burgundy. On the 20th of November a special truce was granted to the Parisians, whilst Henry V., in concert with Duke Philip of Burgundy, was prosecuting the war against the dauphin. On the 2d of December the bases were laid of an agreement between the English and the Burgundians. The preliminaries of the treaty, which was drawn up in accordance with these bases, were signed on the 9th of April, 1420, by King Charles VI. [now controlled by the Burgundians], and on the 20th communicated at Paris by the chancellor of France to the parliament." On May 20th following, the treaty, definitive and complete, was signed by Henry V and promulgated at Troyes. By this Treaty of Troyes, Princess Catherine, daughter of the king of France, was given in marriage to King Henry; Charles VI was guaranteed his possession of the French crown while he lived; on his death, "the crown and kingdom of France, with all their rights and appurtenances," were solemnly conveyed to Henry V of England and his heirs, forever. "The revulsion against the treaty of Troyes was real and serious, even in the very heart of the party attached to the Duke of Burgundy. He was obliged to lay upon several of his servants formal injunctions to swear to this peace, which seemed to them treason. . . . In the duchy of Burgundy the majority of the towns refused to take the oath to the King of England. The most decisive and the most helpful proof of this awakening of national feeling was the ease experienced by the dauphin, who was one day to be Charles VII., in maintaining the war which, after the treaty of Troyes, was, in his father's and his mother's name, made upon him by the King of England and the Duke of Burgundy. This war lasted more than three years. Several towns, amongst others, Melun, Crottoy, Meaux, and St. Riquier, offered an obstinate resistance to the attacks of the English and Burgundians. . . . It was in Perche, Anjou, Maine, on the banks of the Loire, and in Southern France, that the dauphin found most of his enterprising and devoted partisans. The sojourn made by Henry V. at Paris, in December, 1420, with his wife, Queen Catherine, King Charles VI., Queen Isabel, and the Duke of Burgundy, was not, in spite of galas and acclamations, a substantial and durable success for him. . . . Towards the end of August, 1422, Henry V. fell ill; and, too stout-hearted to delude himself as to his condition, he . . . had himself removed to Vincennes, called his councillors about him, and gave them his last royal instructions. . . . He expired on the 31st of August, 1422, at the age of thirty-four."—F. P. Guizot, *Popular history of France*, ch. 23.—At Paris, "the two sovereigns [Henry V and Charles VI] kept distinct courts. That of Henry was by far the most splendidly equipped and numerous attended of the two. He was the rising sun, and all men looked to him. All offices of trust and profit were at his disposal, and the nobles and gentlemen of France flocked into

his ante-chambers."—A. J. Church, *Henry the Fifth*, ch. 15.

1422.—Accession of King Charles VII.

1429-1431.—Chaos following death of Henry V.—Appearance of Jeanne d'Arc.—"Voices" and her mission.—Military operations.—Coronation of Charles VII.—The Maid delivered to and sentenced by the Inquisition.—Execution.—Reversal of sentence twenty years later.—Beatification and canonization.—Summary of her character.—"France divided—two kings, two regencies, two armies, two governments, two nations, two nobilities, two systems of justice—met face to face: father, son, mother, uncles, nephews, citizens, and strangers, fought for the right, the soil, the throne, the cities, the spoil and the blood of the nation. The King of England died at Vincennes [August 31, 1422], and was shortly followed [October 22] by Charles VI., father of the twelve children of Isabel, leaving the kingdom to the stranger and to ruin. The Duke of Bedford insolently took possession of the Regency in the name of England, pursued the handful of nobles who wished to remain French with the dauphin, defeated them at the battle of Verneuil [August 17, 1424], and exiled the queen, who had become a burden to the government after having been an instrument of usurpation. He then concentrated the armies of England, France and Burgundy round Orleans, which was defended by some thousands of the partisans of the dauphin, and which comprised almost all that remained of the kingdom of France. The land was everywhere ravaged by the passing and repassing of these bands—sometimes friends, sometimes enemies—driving each other on, wave after wave, like the billows of the Atlantic; ravaging crops, burning towns, dispersing, robbing, and ill-treating the population. In this disorganization of the country, the young dauphin, sometimes awakened by the complaints of his people, at others absorbed in the pleasures natural to his age, was making love to Agnes Sorel in the castle of Loches. . . . Such was the state of the nation when Providence showed it a savior in a child."—A. de Lamartine, *Memoirs of celebrated characters: Joan of Arc*.—The child was Jeanne D'Arc, or Joan of Arc, better known in history as the Maid of Orleans,—daughter of a husbandman who tilled his own few acres at the village of Domrémy, in Upper Lorraine. Research in recent years has brought to light more than was formerly known of the family and the circumstances of the heroic Maid. "Jacques d'Arc and Isabelle de Vouthon had three sons, Jacquemin, Jean, and Pierre, and two daughters, the elder named Catherine, the younger Jeanne or rather Jeannette, she who was by her heroism to immortalize her line. Two documents . . . prove with evidence that Jacques d'Arc figured in the first rank of the notables of Domrémy. In the first of these, dated Maxey-sur-Meuse, October 7, 1423, he is styled 'doyen' of that village, and by this title comes immediately after the mayor and aldermen. . . . In the second document, drawn up at Vaucouleurs March 31, 1427, Jacques d'Arc appears as the agent of the inhabitants of Domrémy in a suit of great importance which they then had to sustain before Robert de Baudricourt, captain of Vaucouleurs. . . . Like the legendary beech of her native village, the childhood of the virgin of Domrémy sprang out of a soil full of vigor and was in the main haunted by beneficent fairies. Born in a fertile and smiling corner of the earth, the issue of an honest family, whose laborious mediocrity was elevated enough to touch nobility when ennobling

itself by alms-giving, and humble enough to remain in contact with all the poor; endowed by nature with a robust body, a sound intelligence and an energetic spirit, the little Jeannette d'Arc became under these gentle influences all goodness and all love."—S. Luce, *Jeanne d'Arc à Domrémy* (tr. from the French), ch. 2-3.—"Of the visions of the

succour of Orleans, where Dunois, the Bastard of Orleans, was in command" A. de Lamartine, *Memoirs of celebrated characters: Joan of Arc*—"It is perhaps curious that the attention of her historians should have been so generally directed to the psychological and mystical side of her character, . . . to the neglect of her career as a warrior and leader

JOAN OF ARC AT THE SIEGE OF ORLEANS  
(After a mural painting by Lenepven in the Pantheon)

pious young maiden—of the voices she heard—of the conviction which came upon her that she was called by God to deliver her country—and of the enthusiasm of faith with which she went about her mission until all people bent to her as the messenger and minister of God—the story is a familiar one to all. In April, 1429, Joan was sent by the king, from Blois, with 10,000 or 12,000 men, to the

For the Maid of France was primarily concerned with a purely military task—the expulsion of the English invaders from France; she employed in its fulfilment none but military means; she won in her short and meteoric career a series of victories of which any soldier might well have been proud, and which would, in any other person, have established a claim to military talent of a high order; and she

eventually met in the field of battle a soldier's misfortune, which should have entitled her to a soldier's treatment at the hands of her enemies. She remains for all time an outstanding military figure in a period fruitful in warriors, if somewhat barren in generals. Yet there is no book in English which deals primarily with this phase of her career. . . . The military situation at the moment of the Maid's entry into the foreground of her country's story was full of ill-omen for France. The country was leaderless, disheartened and hopeless. The contemptible Dauphin, the nominal ruler, had lost faith in himself and his cause, and, withdrawn from the zone of fighting, where faithful soldiers still strove to stem the English invasion, spent his time idling and merrymaking with worthless companions. . . . The powerful Duke of Burgundy, France's greatest vassal, was in league with the foreign foe; their united armies held all North-eastern France as far as the line of the Loire, all North-western France as far as the Norman and Breton marches and a great slice of the finest provinces in the South. Disorder, jealousy and self-seeking racked the ranks of the French Royalists from end to end. . . . Morally and materially, then, the French armies were at their nadir when the Maid came on the scene in the spring of 1429, at a time when the English, having consolidated their gains in the North and North-west of France, were opening their advance against the South by besieging Orléans. Her first self-appointed task was the raising of this siege, and in this the Maid showed that she appreciated the strategic situation correctly. Orléans was the key to the line of the Loire, which was already partly held by the English on either side of the city. Its full possession by them would not only cut off the French garrisons in Perche and the Orléannais from all hope of succour, but would form an admirable base for an advance southwards, in conjunction with the troops of Burgundy from the area of Auxerre, against the heart of loyalist France. But the English forces besieging Orléans were neither commensurate with the importance nor equal to the demands of their task; the north-eastern front of the city lay open for exit and entry, and it was clear that by this route a large force might be brought and, reinforced by the garrison, debouch with good hopes of success against some point of the thinly held investing lines. The French resolved to make this attempt. The first part of the programme was carried out without a hitch. The Maid led a force of some seven thousand men, together with a convoy of supplies, safely into the city without the besiegers attempting to molest its progress. She now disposed of some ten thousand troops in all, available for active operations outside the walls, the garrisoning of which could be entrusted to the communal militia, about four to five thousand men. The besieging army, which had been recently weakened by the defection of the Burgundian contingent, numbered also about ten thousand men, but these were dispersed in a wide perimeter of some six miles; a sortie had therefore good chances of overwhelming them in detail before they could be fully concentrated for battle, and it was only a question of the direction of this sortie. The main body of the English army was distributed among the forts and works on the north bank of the Loire; eight thousand of its ten thousand men were in this sector; the remaining two thousand held posts on the south bank. . . . The attack began on May 6th. The Maid showed herself a great captain in battle, and it is agreed by all historians that the victory was in reality hers. It was she who overcame the panic which occurred as the result of an English counter-attack from the Augustins and led the final successful assault. It

was she who on the morrow refused to pay heed to the counsels of the fainthearted captains, content with this half success; it was she who, despite their resolve of the evening of the 6th to abstain from further attacks, led out the communal militia to the attack of the Tourelles, thus compelling the rest of the army for very shame to follow her example. In so acting, Jeanne did but follow the excellent maxim that the best is the enemy of the good, and that it is better consistently to pursue a mediocre plan to its end than to be constantly vacillating between one or other of several, perhaps better, schemes. The Tourelles fell, after fierce and desperate fighting, into the hands of the French, thanks again largely to the moral ascendancy and bold personal example of the Maid; and the south bank of the Loire was once for all clear of the enemy. . . . The siege of Orléans was raised and a new moral and military strength thus assured to the exultant French, who were enraptured at their victory and full of praise and thanks to God and the Maid. And indeed the victory had been primarily of her making. She had by her talents and courage saved the second city of France from capture, upheld the line of the Loire like a buckler covering the heart of the country, and destroyed once for all the legend of English invincibility on the battlefield. The fact that, had her counsel been fully followed, a whole English army must have been annihilated, with all the moral effect of such a victory throughout both France and Britain, was forgotten in the glory of her actual triumph. The Maid seems to have felt confident that even now, with the English army still in being to the south of Paris, she could lead the Dauphin to Reims for his coronation. To this end all her endeavours were henceforth directed. She was urged to it not only by her 'voices' but by a true appreciation of the political and military situation. But it was felt by all, even by her, that the time for this decisive move had hardly come, and that as a preliminary it was necessary to clear the English garrisons from the middle course of the Loire, and so obtain a good jumping-off ground for the proposed advance on Reims. This mission was therefore entrusted to a small army of about eight thousand fighting men, under the nominal command of the young Duke of Alençon; his instructions were, however, that he should conform entirely to the counsel of the Maid, who thus held a position analogous to that of the modern German Chief of Staff exercising the real command in the name of some young princeling, his nominal superior. The army assembled around Orléans early in June found itself in the centre of the English garrisons on the Loire, and in a position to deal with those above or below the city, as seemed best. Jeanne, true to her principle of dealing the decisive blow at the main body of the enemy at the earliest possible moment, determined to move first against Jargeau, the strongest of the garrisons, under the capable charge of the Earl of Suffolk. The latter's outposts were driven to seek refuge within the town walls after a smart encounter, and the assault was ordered for the early morning of the 13th. After a violent bombardment, continuing throughout all the 12th, and some four hours' severe fighting on the next day, the garrison, numbering about five hundred men, were compelled to lay down their arms. The river above Orléans was thus freed, but there was no time to be lost. News had come in that Fastolf was now actually on the march southwards from Paris with reinforcements and supplies for the English detachments on the Loire, and that his arrival might be looked for any day. The French, who had been joined by fresh contingents, bringing their total up to thirteen thousand men,

resolved therefore to push forward the operations against the English garrisons of Meung and Beaugency before Fastolf could arrive to their rescue. Talbot was in occupation of the latter place, with the main part of the forces under his command; and Jeanne, faithful to her invincible practice, counselled that he should next be dealt with. The army therefore passed by Meung, after capturing the bridgehead on the south bank, and undertook the siege of Beaugency; but Talbot, with the main body of his men, had already, on hearing of the fall of Jargeau, marched out to the northwards and effected his junction with Fastolf at Janville, on the Orléans-Paris road, some twenty miles north of the former place. The French meanwhile had opened their trenches against Beaugency, which with a reduced garrison only held out till the evening of June 17th. Talbot and Fastolf appeared before the place that day and offered battle to the investing force, but feeling themselves unable to attack the lines of circumvallation, fell back to Meung, with the idea of recapturing the bridgehead on the south bank from the French. This project they were about to put into execution on the morning of the 18th, when the news of the fall of Beaugency warned them that in a few hours the whole French army might be upon them; accordingly, they at once commenced their retirement towards the north. They had no time to lose, for the French army was hard on their heels, and came up with the English rearguard some miles south of Patay. Talbot and Fastolf decided to stand for battle with their backs against that village, and left a rearguard under command of the former to hold a gap between two thick hedges barring the plains, and thus to allow time for the main body to get into position. But the French advance guard under La Hire and Poton de Naintrailles, having received orders from the Maid to 'strike boldly and the enemy would take flight,' rode down and overwhelmed this rearguard and drove it back on Fastolf's main body, which was hastening to its chosen position before Patay, while that force was still in column of march. The whole English army was quickly dispersed. Talbot, Scales and many other notables were taken prisoners, and over two thousand two hundred dead were left on the field. The French victory was complete. As a result of it the line of the Loire and all the surrounding country came indisputably under their control; the only available field army of their enemies had been destroyed in fair fight, and the moral superiority, first achieved by the relief of Orléans, was incontestably bound to the French banners. One can hardly do better than quote, as comment on this brilliant and masterly campaign of the Maid's (the first and only one in which she was allowed a free hand), the verdict of General Dragomirov: Only on June 10th were her hands freed and permission given her to march with Alençon's army against the English garrisons on the Loire. On the 14th she took Jargeau by storm; on the 15th the bridgehead of Meung; on the 17th Beaugency; and on the 18th she defeated Talbot and Fastolf in a pitched battle. The result of these five days—two assaults and one battle—was not unworthily of Napoleon himself, and was a measure of the Maid's powers when she was allowed their free and untrammelled exercise. And Caronge adds: With Jeanne the conception and the execution are worthy of each other. The dominating idea is that of an audacious and persevering offensive, as with Napoleon, fixing the enemy, allowing him no time for deliberation and breaking him both materially and morally. The execution, forcible as it is, is in full accord with the circumstances.—E. W. Sheppard, *Sainte Jeanne D'Arc as a soldier* (*National Review*,

*Sept., 1920, pp. 107-113.*)—"The king was crowned [July 17, 1429], and Joan's mission was accomplished. 'Noble king,' said she, embracing his knees in the Cathedral after the coronation, 'now is accomplished the will of God, which commanded me to bring you to this city of Rheims to receive your holy unction—now that you at last are king, and that the kingdom of France is yours.' . . . From that moment a great depression, and a fatal hesitation seem to have come over her. The king, the people, and the army, to whom she had given victory, wished her to remain always their prophetess, their guide, and their enduring miracle. But she now only a weak woman, lost amid courts and camps, and she felt her weakness beneath her armor. Her heart alone remained courageous, but had ceased to be inspired." She urged an attack on Paris (Sept. 8, 1429) and experienced her first failure, being grievously wounded in the assault. The following spring, Compiègne being besieged, she entered the town to take part in the defence. The same evening (May 24, 1430) she led a sortie which was repulsed, and she was taken prisoner in the retreat. Some think she was betrayed by the commandant of the town, who ordered the raising of the drawbridge just as her horse was being spurred upon it. Once in the hands of her enemies, the doom of the unfortunate Maid was sealed. Sir Lionel de Ligny, her captor, gave his prisoner to the count of Luxembourg, who yielded her to the duke of Burgundy, who surrendered her to the English, who delivered her to the Inquisition, by which she was tried, condemned and burned to death, at Rouen, as a witch (May 30, 1431). "It was a complex crime, in which each party got rid of responsibility, but in which the accusation rests with Paris [the university of Paris was foremost among the pursuers of the wonderful Maid], the cowardice with Luxembourg, the sentence with the Inquisition, the blame and punishment with England, and the disgrace and ingratitude with France. This bartering about Joan by her enemies, of whom the fiercest were her countrymen, had lasted six months. . . . During these six months, the influence of this goddess of war upon the troops of Charles VII.—her spirit, which still guided the camp and council of the king—the patriotic, though superstitious, veneration of the people, which her captivity only doubled,—and, lastly, the absence of the Duke of Burgundy, . . . all these causes had brought reverse after reverse upon the English, and a series of successes to Charles VII. Joan, although absent, triumphed everywhere."—A. de Lamartine, *Memoirs of celebrated characters: Joan of Arc.*

"Jeanne d'Arc was out to death by the sentence of the Roman Catholic Church in May, 1431. Twenty years had hardly elapsed when a tribunal of the same Church re-examined and reversed the sentence. The King of France, whose failing fortunes she had restored, but who had made no effort to save her in her peril, was now better advised, and ordered a new trial of her case. Pope Calixtus III., in consequence of this royal demand, and in compliance with the request of the mother and brothers of the heroic girl, directed the Archbishop of Reims and the Bishops of Paris and Coutances to preside on the occasion. Seven or eight months were occupied in this investigation. Witnesses came from all parts to testify in her favor. The old people from her native town; the younger companions of her childhood; Dunois and the Duke d'Alençon, both comrades in her military leadership; Louis de Contes, her page; D'Aulon, her squire; Pasquerel, her confessor; those who saw her in her prison, and those who stood near her at the scaffold; even the officials and notaries employed by her enemies,—all appeared in turns to testify to

some separate trait in her lovely character. In their depositions was revealed the pure and modest life of the young girl in her father's home,—her simplicity of character and inspired firmness of soul during her famous career. All these witnesses testified to her patience amid her sufferings after she fell into the hands of the English, and to her boldness before the tribunal of her enemies. They also described the sudden illuminations which showed her the crafty purposes of her judges. After hearing this evidence the court declared that the charges brought against Jeanne were calumnious and false, and the former sentence null and of no effect. They commanded that this decree be read publicly in the place where she had been so cruelly put to death, and also in the city of Orleans which she had delivered. Thus there is no history which rests on more authentic materials than that of Jeanne d'Arc. The English, not satisfied with putting her to death with the utmost barbarity, endeavored to blast her reputation and destroy her character by the sentence of the ecclesiastical courts. That no monument might ever be built over her remains, they cast her ashes into the Seine; but, unconsciously, they had erected a far nobler monument to her memory in the trial itself. . . . After sleeping four hundred years in the Royal Library at Paris, a cloud of witnesses come forth from their graves to declare what they knew and saw. Ninety had appeared before the court of Revision to testify in her favor,—thirty-four of them from her native town. Three of the greatest generals of France—Dunois, D'Alençon, and De Gaucourt—bear witness to her military prowess. We have her own words given in answer to thirty public and private examinations during her trials. . . . Five large octavo volumes, edited by Jules Quicherat in 1854, reproduced, in the old Latin and French, the official record of the two trials of Condemnation and Revision. This is taken from the original manuscripts in the Bibliothèque Royale. These records were translated into modern French, and published in 1858 in two large octavo volumes, by E. O'Reilly, Counsellor of the Imperial Court at Rouen. Again, M. Wallon, Secretary of the Academy of Inscriptions, has collected in one volume, published in 1876, every important fact bearing on this story. . . . The four hundred and fifty years which have passed since the death of the Maid of Orleans<sup>6</sup> have purified her memory from the stains with which prejudice and ignorance had soiled it; but it has been reserved for the nineteenth century to do full justice to the heroine of the fifteenth."—J. F. Clarke, *Events and epochs in religious history*, pp. 167-170.—"Always a saint in the popular mind, the canonization of Joan of Arc on May 16 [1920] in the historic basilica at Rome five hundred years after her martyrdom 'was hardly more than an official ratification of a sainthood revered by free peoples everywhere.' . . . The canonization ceremony, conducted by Pope Benedict, was described in the press dispatches as the most impressive function in several centuries. Thirty thousand persons, including 140 descendants of the shepherd girl's family and Church dignitaries from all parts of the world, witnessed the rites in St. Peter's. . . . Burned five centuries ago as a heretic and a witch, the French shepherd-girl is to-day an international heroine, and, says the *New York Tribune*, 'it was an outstanding fact of our campaign in the Great War that Joan of Arc was almost as much the heroine of the dough-boy as of the *poilu*.' The decree of heroicity was published in 1904; the proof of the three required miracles—three modern cures following invocation to Joan—was admitted in 1908; beatification ensued in 1909, and in March, 1919, the Pope's decision was given for canoniza-

tion. 'Joan's exaltation would have come before had it not been for powerful influence in the way,' says the *New York Evening Post*. 'The Court of France, which, under Charles VII., abandoned the Maid; the University of Paris, which condemned her as traitor and heretic; the Burgundians, whom she fought—these the Church was long reluctant to offend.' . . . She was the last, most perfect embodiment of chivalry and of profound medieval faith. That an untaught rustic girl of seventeen should in four months rise to command armies, defeat an apparently invincible foe, and reunite a France that for years had been the prey of a ruthless blood feud between the Duke of Burgundy and the Dauphin, with foreign enemies and mercenary nobles exploiting the civil war—this seems almost the wild imagings of romantic chroniclers. Her sublime courage and perfect simplicity are understandable."—*Saint Joan of Arc (Literary Digest, v. 65, June 5, 1920, p. 47)*.—"After all that can be done by the rationalising process, the mystery remains of an untutored and unlettered girl of eighteen years old not only imposing her will upon captains and courtiers, but showing a skill and judgment worthy . . . of the greatest commanders. . . . While we must give due weight and consideration to the age in which this marvel showed itself on the stage of history, . . . yet when all allowance is made there remains this sane, strong, solid girl leaving her humble home, and in two short months accomplishing more than Caesar or Alexander accomplished in so much time, and at an age when even Alexander had as yet achieved nothing. . . . Jeanne herself was in no way marked out from her companions by any special accomplishments or ambition. . . . She was intensely pious, but in no way introspective or morbid. God and His angels and saints were as real to her, more real indeed, than the men and women of her native village. Her doubts and misgivings as to her own unfitness she put aside as impertinences, when assured of her divine mission. No shadow of spiritual inflation or egotism is to be seen in all these things. Rather she held by the belief that her unworthiness in the world's eye was the cause of her being chosen as a simple instrument in the hands of the Lord. . . . The evidence . . . shows us clearly the magnitude of her achievements. . . . But the marvel is that these stupendous achievements were not the results of mere enthusiasm, great and potent though that was, but of settled, farseeing skill and prudence on the part of Jeanne, joined to a strength of soul and purpose which multiplied the strength of the army tenfold. Like Cromwell she 'new-modelled' the army. The licentious gaiety of the feudal warrior had to give way to the sobriety and seemliness which became a Christian camp. The voluptuary and the blasphemer had to amend their lives. To revels succeeded prayers and fasts and vigils. Yet never for a moment did this great amendment degenerate into formalism or hypocrisy. Like all great souls she awakened latent good and drove vice abashed from her presence without any conscious spiritual superiority in herself. Men were ashamed to be base in such a presence. Nor did she ever become a law unto herself, . . . rather she was more than ever observant of all the duties and claims and observances of ordinary religious obligation, being ever in heart the simple maid whom the Lord for His own mysterious purpose, and without any merit of hers, had chosen for a mighty task. The great qualities won for her the ready submission of the soldiers, while her name and fame brought levies of ardent volunteers,—eagerly contending for the glory of serving under such a leader. Her frame was hardy and enduring. . . . She ate sparingly and drank hardly at all, moisten-

ing a crust in wine, or, greatly fatigued, tasting a little as a restorative. While her woman's nature showed itself in her burst of tears when dishonouring names were flung at her by some brutal English soldiers, still there always came a quick moral reinforcement which restored her serene fortitude in the midst of indignities and perils. The story of her prison life is a record of shame to her gaolers. Chained, mocked at, threatened and insulted, her serenity never failed. She was in God's hand, and she bowed to his will. . . . The trial is one of the most enthralling dramas in all history. The caution, the skill, the simplicity withal, shown by Jeanne in her answers to bewildering and entrapping questions, well earned the praise bestowed twenty years later by the accomplished lawyers who wrote on the case, sustaining the appeal for a new hearing. The report gives all the details of the inquiry with fulness and accuracy, and when we carefully examine its course, we must agree with the canonists who said that the forms of law were indeed adhered to, but its spirit was grossly violated. The judges in Jeanne's case fortified themselves with the decision of the University of Paris, but that decision was procured by laying before the University what purported to be the statements of Jeanne, but what were in truth selected passages from her statements torn from qualifying contexts and often with the suppression of governing words. By a sentence, so obtained and so buttressed, Jeanne d'Arc was done to death. The story of the execution is one of the most heart-rending incidents in history."—T. D. Murray, *Jeanne d'Arc, Introduction*, pp. vii-viii, x, xii, xv, xix, xxii-xxiii.

1431-1453.—Expulsion of the English.—Treaty of Arras.—Gradual loss of all English possessions in France except Calais.—"In Joan of Arc the English certainly destroyed the cause of their late reverses. But the impulse had been given, and the crime of base vengeance could not stay it. Fortune declared every where and in every way against them. In vain was Henry VI. brought to Paris, crowned at Notre Dame, and made to exercise all the functions of royalty in court and parliament. The duke of Burgundy, disgusted with the English, became at last reconciled to Charles, who spared no sacrifice to win the support of so powerful a subject. The amplest possible amends were made for the murder of the late duke. The towns beyond the Somme were ceded to Burgundy, and the reigning duke [but not his successors] was exempted from all homage towards the king of France. Such was the famous treaty of Arras [September 21, 1435], which restored to Charles his throne, and deprived the English of all hopes of retaining their conquests in the kingdom. The crimes and misrule of the Orleans faction were forgotten; popularity ebbed in favour of Charles. . . . One of the gates of Paris was betrayed by the citizens to the constable and Dunois [April, 1436]. Willoughby, the governor, was obliged to shut himself up in the Bastille with his garrison, from whence they retired to Rouen. Charles VII. entered his capital, after twenty years' exclusion from it, in November, 1437. Thenceforward the war lost its

serious character. Charles was gradually established on his throne, and the struggle between the two nations was feebly carried on, broken merely by a few sieges and enterprises, mostly to the disadvantage of the English. . . . There had been frequent endeavours and conferences towards a peace between the French and English. The demands on either side proved irreconcilable. A truce was however concluded, in 1444, which lasted four years; it was sealed by the marriage of Henry VI. with Margaret of Anjou, daughter of René, and granddaughter of Louis, who had perished while leading an army to the conquest of Naples. . . . In 1449 the truce was allowed to expire. The quarrels of York and Lancaster had commenced, and England was unable to defend her foreign possessions. Normandy was invaded. The gallant Talbot could not preserve Rouen with a disaffected population, and Charles recovered without loss of blood [1449] the second capital of his dominions. The only blow struck by the English for the preservation of Normandy was at Fourmigny near Bayeux. . . . Normandy was for ever lost to the English after this action or skirmish. The following year Guyenne was invaded by the count de Dunois. He met with no resistance. The great towns at that day had grown wealthy, and their maxim was to avoid a siege at all hazards. Lord Talbot was killed in an engagement at Castillon (1453), and with that hero expired the last hopes of his country in regard to France. Guyenne was lost [1453] as well as Normandy, and Calais remained to England the only fruit of so much blood spilt and so many victories achieved."—E. E. Crowe, *History of France*, v. 1, ch. 4.—See also AQUITAIN: 1366-1453.

1438.—Pragmatic Sanction of Charles VII.—Reforming decrees of the council of Basel adopted for the Gallican church.—After the rupture between the reforming council of Basel and Pope Eugenius IV (see PAPACY: 1431-1448), Charles VII of France "determined to adopt in his own kingdom such of the decrees of the Council as were for his advantage, seeing that no opposition could be made by the Pope. Accordingly a Synod was summoned at Bourges on May 1, 1438. The ambassadors of Pope and Council urged their respective causes. It was agreed that the King should write to Pope and Council to stay their hands in proceeding against one another; meanwhile, that the reformation be not lost, some of the Basel decrees should be maintained in France by royal authority. The results of the synod's deliberation were laid before the King, and on July 7 were made binding as a pragmatic sanction on the French Church. The Pragmatic Sanction enacted that General Councils were to be held every ten years, and recognised the authority of the Council of Basel. The Pope was no longer to reserve any of the greater ecclesiastical appointments, but elections were to be duly made by the rightful patrons. Grants to benefices in expectancy, 'whence all agree that many evils arise,' were to cease, as well as reservations. In all cathedral churches, one prebend was to be given to a theologian who had studied for ten years in a university, and who was to lecture or preach at least once a week. Benefices were to be conferred in future, one-third on graduates, two-thirds on deserving clergy. Appeals to Rome, except for important causes, were forbidden. The number of Cardinals was to be 24, each of the age of 30 at least. Annates and first-fruits were no longer to be paid to the Pope,

but only the necessary legal fees on institution. Regulations were made for greater reverence in the conduct of Divine service; prayers were to be said by the priest in an audible voice; mummeries in churches were forbidden, and clerical concubinage was to be punished by suspension for three months. Such were the chief reforms of its own special grievances, which France wished to establish. It was the first step in the assertion of the rights of national Churches to arrange for themselves the details of their own ecclesiastical organisation."—M. Creighton, *History of the papacy during the period of the Reformation*, v. 2, bk. 3, ch. 9.

1447.—Origin of claims of the House of Orleans to the duchy of Milan. See MILAN: 1447-1454.

1453-1461. — Reconstructed kingdom. — New plant of Absolutism.—“At the expulsion of the English, France emerged from the chaos with an altered character and new features of government. The royal authority and supreme jurisdiction of the parliament were universally recognised. Yet there was a tendency towards insubordination left among the great nobility, arising in part from the remains of old feudal privileges, but still more from that lax administration which, in the convulsive struggles of the war, had been suffered to prevail. In the south were some considerable vassals, the houses of Foix, Albret, and Armagnac, who, on account of their distance from the seat of empire, had always maintained a very independent conduct. The dukes of Britany and Burgundy were of a more formidable character, and might rather be ranked among foreign powers than privileged subjects. The princes, too, of the royal blood, who, during the late reign, had learned to partake or contend for the management, were ill-inclined towards Charles VII., himself jealous, from old recollections of their ascendancy. They saw that the constitution was verging rapidly towards an absolute monarchy, from the direction of which they would studiously be excluded. This apprehension gave rise to several attempts at rebellion during the reign of Charles VII., and to the war, commonly entitled, for the Public Weal (*‘du bien public’*), under Louis XI. [See below: 1461-1468.] Among the pretenses alleged by the revolvers in each of these, the injuries of the people were not forgotten; but from the people they received small support. Weary of civil dissension, and anxious for a strong government to secure them from depredation, the French had no inducement to intrust even their real grievances to a few malcontent princes, whose regard for the common good they had much reason to distrust. Every circumstance favoured Charles VII. and his son in the attainment of arbitrary power. The country was pillaged by military ruffians. Some of these had been led by the dauphin to a war in Germany, but the remainder still infested the high roads and villages. Charles established his companies of ordonnance, the basis of the French regular army, in order to protect the country from such depredators. They consisted of about nine thousand soldiers, all cavalry, of whom fifteen hundred were heavy-armed; a force not very considerable, but the first, except mere body-guards, which had been raised in any part of Europe as a national standing army. These troops were paid out of the produce of a permanent tax, called the *taille*; an innovation still more important than the former. But the present benefit cheating the people, now prone to submissive habits, little or no opposition was made, except in Guienne, the inhabitants of which had speedy reason to regret the mild government of England, and vainly en-

deavoured to return to its protection. It was not long before the new despotism exhibited itself in its harshest character. Louis XI., son of Charles VII., who during his father's reign, had been connected with the discontented princes, came to the throne greatly endowed with those virtues and vices which conspire to the success of a king."—H. Hallam, *Middle Ages*, ch. 1, pt. 2.

1461.—Accession of King Louis XI.—Contemporary portrait of him by Commines.—“Of all the princes that I ever knew, the wisest and most dexterous to extricate himself out of any danger or difficulty in time of adversity, was our master King Louis XI. He was the humblest in his conversation and habit, and the most painful and indefatigable to win over any man to his side that he thought capable of doing him either mischief or service: though he was often refused, he would never give over a man that he wished to gain, but still pressed and continued his insinuations, promising him largely, and presenting him with such sums and honours as he knew would gratify his ambition; and for such as he had discarded in time of peace and prosperity, he paid dear (when he had occasion for them) to recover them again; but when he had once reconciled them, he retained no enmity towards them for what had passed, but employed them freely for the future. He was naturally kind and indulgent to persons of mean estate, and hostile to all great men who had no need of him. Never prince was so conversable, nor so inquisitive as he, for his desire was to know everybody he could; and indeed he knew all persons of any authority or worth in England, Spain, Portugal and Italy, in the territories of the Dukes of Burgundy and Bretagne, and among his own subjects; and by those qualities he preserved the crown upon his head, which was in much danger by the enemies he had created to himself upon his accession to the throne. But above all, his great bounty and liberality did him the greatest service: and yet, as he behaved himself wisely in time of distress, so when he thought himself a little out of danger, though it were but by a truce, he would disoblige the servants and officers of his court by mean and petty ways, which were little to his advantage; and as for peace, he could hardly endure the thoughts of it. He spoke slightly of most people, and rather before their faces, than behind their backs, unless he was afraid of them, and of that sort there were a great many, for he was naturally somewhat timorous. . . . I will not censure him, or say I ever saw a better prince; for though he oppressed his subjects himself he would never see them injured by anybody else.”—P. de Commines, *Memoirs*, bk. 1, ch. 10; bk. 6, ch. 11.

1461-1468.—Character and reign of Louis XI. —Union of feudal princes in the League of the Public Weal.—Defeat of the league.—End of power of feudalism, and final triumph of absolute monarchy.—“He [Louis XI.] was the first, as, indeed (with the solitary exception of Louis Philippe), he is still the only king of France whose mind was ever prepared for the duties of that high station by any course of severe and systematic study. Before he ascended the throne of his ancestors he had profoundly meditated the great Italian authors, and the institutions and maxims of the Italian republics. From those lessons he had derived a low esteem of his fellowmen, and

especially of those among them upon whom wealth, and rank, and power had descended as an hereditary birthright. . . . He clearly understood, and pursued with inflexible steadfastness of purpose the elevation of his country and the grandeur of his own royal house and lineage; but he pursued them with a torpid imagination, a cold heart, and a ruthless will. He regarded mankind as a physiologist contemplates the living subjects of his science, or as a chess-player surveys the pieces on his board. . . . It has been said of Louis XI., that the appearance of the men of the Revolution of 1789 first made him intelligible. . . . Louis was the first of the terrible Ideologists of France—of that class of men who, to enthrone an idolized idea, will offer whole hecatombs of human sacrifices at the shrine of their idol. The Idea of Louis was that of levelling all powers in the state, in order that the administration of the affairs, the possession of the wealth, and the enjoyment of the honours of his kingdom might be grasped by himself and his successors as their solitary and unrivalled dominion. . . . Before his accession to the throne, all the great fiefs into which France had been divided under the earlier Capetian kings had, with the exception of Bretagne, been either annexed to the royal domain, or reduced to a state of dependence on the crown. But, under the name of Apanages, these ancient divisions of the kingdom into separate principalities had reappeared. The territorial feudalism of the Middle Ages seemed to be reviving in the persons of the younger branches of the royal house. The Dukes of Burgundy had thus become the rulers of a state [see *BURGUNDY*: 1467] which, under the government of more politic princes, might readily, in fulfillment of their desires, have attained the rank of an independent kingdom. The Duke of Bretagne, still asserting the peculiar privileges of his duchy, was rather an ally than a subject of the king of France. Charles, Duke of Berri, the brother of Louis, aspired to the possession of the same advantages. And these three great territorial potentates, in alliance with the Duc de Bourbon and the Comte de St. Pol, the brothers-in-law of Louis and of his queen, united together to form that confederacy against him to which they gave the very inappropriate title of La Ligue du Bien Public. It was, however, a title which recognized the growing strength of the Tiers État, and of that public opinion to which the Tiers État at once gave utterance and imparted authority. Selfish ambition was thus compelled to assume the mask of patriotism. The princes veiled their insatiable appetite for their own personal advantages under the popular and plausible demands of administrative reforms—of the reduction of imposts—of the government of the people by their representatives—and, consequently, of the convocation of the States-General. To these pretensions Louis was unable to make any effectual resistance." An indecisive but bloody battle was fought at Montlehery, near Paris (July 16, 1465), from which both armies retreated with every appearance of defeat. The capital was besieged ineffectually for some weeks by the league; then the king yielded, or seemed to do so, and the Treaty of Conflans was signed. "He assented, in terms at least, to all the demands of his antagonists. He granted to the Duke of Berri the duchy of Normandy as an apanage transmissible in perpetuity to his male heirs. . . . The confederates then laid down their arms. The wily monarch bided his time. He had bestowed on them advantages which he well knew would destroy their popularity and so subvert the basis of their power, and which he also knew the state of public opinion would not allow them to

retain. To wrest those advantages from their hands, it was only necessary to comply with their last stipulation, and to convene the States-General. They met accordingly, at Tours, on the 6th of April, 1468." As Louis had anticipated—or, rather, as he had planned—the States-General cancelled the grant of Normandy to the duke of Berri (which the king had been able already to recover possession of, owing to quarrels between the dukes of Berri and Britany) and, generally, took away from the princes of the league nearly all that they had extorted in the Treaty of Conflans. On the express invitation of the king they appointed a commission to reform abuses in the government—which commission "attempted little and effected nothing"—and, then, having assisted the cunning king to overcome his threatening nobles, the States-General were dissolved, to meet no more while Louis XI occupied the throne. In a desperate situation he had used the dangerous weapon against his enemies with effect; he was too prudent to draw it from the sheath a second time.—J. Stephen, *Lectures on the history of France*, lect. 11.—"The career of Louis XI presents a curious problem. How could a ruler whose morality fell below that of Jonathan Wild yet achieve some of the greatest permanent results of patriotic statesmanship, and be esteemed not only by himself but by so calm an observer as Commines the model of kingly virtue? As to Louis's moral character and principles, or want of principle, not a doubt can be entertained. To say he committed the acts of a villain is to fall far short of the truth. . . . He possessed a kind of religious belief, but it was a species of religion which a respectable heathen would have scorned. He attempted to bribe heaven, or rather the saints, just as he attempted to win over his Swiss allies—that is, by gifts of money. . . . Yet this man, who was daunted by no cruelty, and who could be bound by no oath save one, did work which all statesmen must admire, and . . . I am of opinion that the troubles he was involved in, in his youth, when he fled from his father, and resided six years together with Philip Duke of Burgundy, were of great service to him; for there he learned to be complaisant to such as he had occasion to use, which was no slight advantage of adversity. As soon as he found himself a powerful and crowned king, his mind was wholly bent upon revenge; but he quickly found the inconvenience of this, repented by degrees of his indiscretion, and made sufficient reparation for his folly and error, by regaining those he had injured, as shall be related hereafter. Besides, I am very confident that if his education had not been different from the usual education of such nobles as I have seen in France, he could not so easily have worked himself out of his troubles; for they are brought up to nothing but to make themselves ridiculous, both in their clothes and discourse; they have no knowledge of letters; no wise man is suffered to come near them, to improve their understandings; they have governors who manage their business, but they do nothing themselves."—Such is the account of Louis XI. which Philip de Commines gives in one of the early chapters of his delightful Memoirs. In a later chapter he tells naively of the king's suspicions and fears, and of what he suffered, at the end of his life, as the penalty of his cruel and crafty dealings with his subjects: "Some five or six months before his death, he began to suspect everybody, especially those who were most capable and deserving of the administration of affairs. He was afraid of his son, and caused him to be kept close, so that no man saw or discoursed with him, but by his special command. At last he grew

suspicious of his daughter, and of his son-in-law the Duke of Bourbon, and required an account of what persons came to speak with them at Plessis, and broke up a council which the Duke of Bourbon was holding there, by his order. . . . He was still attended by his physician, Master James Coctier, to whom in five months' time he had given fifty-four thousand crowns in ready money, besides the bishopric of Amiens for his nephew, and other great offices and estates for himself and his friends; yet his doctor used him very roughly indeed; one would not have given such outrageous language to one's servants as he gave the King, who stood in such awe of him, that he durst not forbid him his presence. It is true he complained of his impudence afterwards, but he durst not change him as he had done all the rest of his servants; because he had told him after a most audacious manner one day, 'I know well that some time or other you will dismiss me from court, as you have done the rest; but he sure (and he confirmed it with a great oath) you shall not live eight days after it'; with which expression the King was so terrified, that ever after he did nothing but flatter and bribe him, which must needs have been a great mortification to a prince who had been humbly obeyed all his life by so many good and brave men. The King had ordered several cruel prisons to be made; some were cages of iron, and some of wood, but all were covered with iron plates both within and without, with terrible locks, about eight feet wide and seven high; the first contriver of them was the Bishop of Verdun, who was immediately put in the first of them that was made, where he continued fourteen years. Many bitter curses he has had since for his invention, and some from me as I lay in one of them eight months together in the minority of our present King. He also ordered heavy and terrible fetters to be made in Germany, and particularly a certain ring for the feet, which was extremely hard to be opened, and fitted like an iron collar, with a thick weighty chain, and a great globe of iron at the end of it, most unreasonably heavy, which engines were called the King's Nets. . . . As in his time this barbarous variety of prisons was invented, so before he died he himself was in greater torment, and more terrible apprehension than those whom he had imprisoned; which I look upon as a great mercy towards him, and as a part of his purgatory; and I have mentioned it here to show that there is no person, of what station or dignity soever, but suffers some time or other, either publicly or privately, especially if he has caused other people to suffer. The King, towards the latter end of his days, caused his castle of Plessis-les-Tours to be encompassed with great bars of iron in the form of thick grating, and at the four corners of the house four sparrow-nests of iron, strong, massy, and thick, were built. The grates were without the wall on the other side of the ditch, and sank to the bottom. Several spikes of iron were fastened into the wall, set as thick by one another as was possible, and each furnished with three or four points. He likewise placed ten bow-men in the ditches, to shoot at any man that durst approach the castle before the opening of the gates, and he ordered they should lie in the ditches, but retire to the sparrow-nests upon occasion. He was sensible enough that this fortification was too weak to keep out an army, or any great body of men, but he had no fear of such an attack; his great apprehension was, that some of the nobility of his kingdom, having intelligence within, might attempt to make themselves masters of the castle by night. . . . Is it possible then to keep a prince

(with any regard to his quality) in a closer prison than he kept himself? The cages which were made for other people were about eight feet square; and he (though so great a monarch) had but a small court of the castle to walk in, and seldom made use of that, but generally kept himself in the gallery, out of which he went into the chambers on his way to mass, but never passed through the court . . . which French patriots must fervently approve. He was the creator of modern France. When he came to the throne it seemed more than likely that an utterly selfish and treacherous nobility would tear the country in pieces. The English still threatened to repeat the horrors of their invasions. The House of Burgundy overbalanced the power of the crown, and stimulated lawlessness throughout the whole country. The peasantry were miserably oppressed, and the middle classes could not prosper for want of that rule of law which is the first requisite for civilization. When Louis died, the existence of France and the power of the French crown was secured: 'He had extended the frontiers of his kingdom; Picardy, Provence, Burgundy, Anjou, Maine, Roussillon had been compelled to acknowledge the immediate authority of the crown.' He had crushed the feudal oligarchy; he had seen his most dangerous enemy destroyed by the resistance of the Swiss; he had baffled the attempt to construct a state which would have imperilled the national existence of France; he had put an end to all risk of English invasion; and he left France the most powerful country in Europe. Her internal government was no doubt oppressive, but, at any rate, it secured the rule of law; and his schemes for her benefit were still unfinished. He died regretting that he could not carry out his plans for the reform of the law and for the protection of commerce; and, in the opinion of Commines, if God had granted him the grace of living five or six years more, he would greatly have benefited his realm. He died commending his soul to the intercession of the Virgin, and the last words caught from his lips were: 'Lord, in thee have I trusted; let me never be confounded.' Nor should this be taken as the expression of hopeless self-delusion or gratuitous hypocrisy. In the opinion of Commines, uttered after the king's death, 'he was more wise, more liberal, and more virtuous in all things than any contemporary sovereign.' The expressions of Commines were, it may be said, but the echo of the low moral tone of the age. This, no doubt, is true; but the fact that the age did not condemn acts which, taken alone, seem to argue the utmost depravity, still needs explanation. The matter is the more worthy of consideration because Louis represents, though in an exaggerated form, the vices and virtues of a special body of rulers. He was the incarnation, so to speak, of kingcraft. The word and the idea it represents have now become out of date, but for about two centuries—say, roughly, from the middle of the seventeenth century—the idea of a great king was that of a monarch who ruled by means of cunning, intrigue, and disregard of ordinary moral rules. We here come across the fact which explains both the career and the reputation of Louis and of others, such as Henry VII. of England, who were masters of kingcraft. The universal feeling of the time, shared by subjects no less than by rulers, was that a king was not bound by the rules of morality, and especially by the rules of honesty, which bind other men. Until you realize this fact, nothing is more incomprehensible than the adulation lavished by men such as Bacon or Casaubon on a ruler such as James I. . . . The real puzzle is to ascertain how

this feeling that kings were above the moral law came into existence. The facts of history afford the necessary explanation. When the modern European world was falling into shape the one thing required for national prosperity was the growth of a power which might check the disorders of the feudal nobility, and secure for the mass of the people the blessings of an orderly government. The only power which, in most cases, could achieve this end, was the crown. In England the monarchs put an end to the wars of the nobility. In France the growth of the monarchy secured not only internal quiet, but protection from external invasion. In these and in other cases the interest of the crown and the interest of the people became for a time identical. . . . Acts which would have seemed villainous when done to promote a purely private interest, became mere devices of statesmanship when performed in the interest of the public. The maxims that the king can do no wrong, and that the safety of the people is the highest law, blended together in the minds of ambitious rulers. The result was the production of men like Louis XI."—A. V. Dicey, *Willert's Louis XI (Nation, Dec. 7, 1876)*.—"A careful examination of the reign of Louis the Eleventh has particularly impressed upon me one fact, that the ends for which he toiled and sinned throughout his whole life were attained at last rather by circumstances than by his labours. The supreme object of all his schemes was to crush that most formidable of all his foes, Burgundy. And yet had Charles confined his ambition within reasonable limits, had he possessed an ordinary share of statecraft, and, above all, could he have controlled those fiery passions, which drove him to the verge of madness, he would have won the game quite easily. Louis lacked one of the essential qualities of statecraft—patience; and was wholly destitute of that necessity of ambition—boldness. An irritable restlessness was one of the salient points of his character. His courtiers and attendants were ever intriguing to embroil him in war, 'because,' says Comines, 'the nature of the King was such, that unless he was at war with some foreign prince, he would certainly find some quarrel or other at home with his servants, domestics, or officers, for his mind must be always working.' His mood was ever changing, and he was by turns confiding, suspicious, avaricious, prodigal, audacious, and timid. He frequently nullified his most crafty schemes by impatience for the result. He would sow the seed with the utmost care, but he could not wait for the fructification. In this he was false to the practice of those Italian statesmen who were avowedly his models. It was this irritable restlessness which brought down upon him the hatred of all classes, from the noble to the serf; for we find him at one time cunningly bidding for popularity, and immediately afterwards destroying all he had gained by some rash and inconsiderate act. His extreme timidity hampered the execution of all his plans. He had not even the holdness of the coward who will fight when all the strength is on his own side. Constantly at war, during a reign of twenty-two years there were fought but two battles, Montlhéry and Guingette, both of which, strange to say, were undecided, and both of which were fought against his will and counsel. . . . He left France larger by one-fourth than he had inherited it; but out of the five provinces which he acquired, Provence was bequeathed him, Roussillon was pawned to him by the usurping King of Navarre, and Burgundy was won for him by the Swiss. His triumphs were much more the result of fortune than the efforts of his own genius."

1482.—Treaty of Arras.—By marriage to Mary of Burgundy, Maximilian I of Austria acquired the large Burgundian possessions. Louis XI of France, however, claimed the whole, but by the Treaty of Arras (December, 1482) he received only Picardy, the Boulonnais, and Burgundy proper.

1483.—Kingdom as left by Louis XI.—Louis XI, who died August 30, 1483, "had joined to the crown Berry, the apauage of his brother, Provence, the duchy of Burgundy, Anjou, Maine, Ponthieu, the counties of Auxerre, of Mâcon, Charolais, the Free County, Artois, Marche, Armagnac, Cerdagne, and Roussillon. . . . The seven latter provinces did not yet remain irrevocably united with France: one part was given anew in apauage, and the other part restored to foreign sovereigns, and only returned one by one to the crown of France. . . . The principal work of Louis XI. was the abatement of the second feudality, which had raised itself on the ruins of the first, and which, without him, would have replunged France into anarchy. The chiefs of that feudality were, however, more formidable, since, for the most part, they belonged to the blood royal of France. Their powerful houses, which possessed at the accession of that prince a considerable part of the kingdom, were those of Orleans, Anjou, Burgundy, and Bourbon. They found themselves much weakened at his death, and dispossessed in great part, as we have seen in the history of the reign, by confiscations, treaties, gifts or heritages. By the side of these houses, which issued from that of France, there were others whose power extended still, at this period, in the limits of France proper, over vast domains. Those of Luxembourg and La Mark possessed great wealth upon the frontier of the north; that of Vaudemont had inherited Lorraine and the duchy of Bar; the house of La Tour was powerful in Auvergne; in the south the houses of Foix and Albert ruled, the first in the valley of Ariège, the second between the Adour and the Pyrenees. In the west the house of Brittany had guarded its independence; but the moment approached when this beautiful province was to be forever united with the crown. Lastly, two foreign sovereigns held possessions in France: the Pope had Avignon and the county Venaissin; and the Duke of Savoy possessed, between the Rhone and the Saône, Bugey and Valromey. The time was still distant when the royal authority would be seen freely exercised through every territory comprised in the natural limits of the kingdom. But Louis XI. did much to attain this aim, and after him no princely or vassal house was powerful enough to resist the crown by its own forces, and to put the throne in peril."—É. de Bonnechose, *History of France, v. 1, pp. 315-318, and foot-note*.

1483.—Accession of King Charles VIII.

1485-1487.—League of the Princes.—Charles VIII, son and successor of Louis XI, came to the throne at the age of thirteen, on the death of his father in 1483. His eldest sister, Anne, married to the lord of Beaujeu, made herself practically

regent of the kingdom, by sheer ability and force of character, and ruled during the minority, pursuing the lines of her father's policy. The princes of the blood-royal, with the dukes of Orleans and Bourbon at their head, formed a league against her. They were supported by many nobles, including Philip de Commines, the count of Dunois and the prince of Orange. They also received aid from the duke of Brittany, and from Maximilian of Austria, who now controlled the Netherlands. Anne's general, La Trémouille, defeated the league in a decisive battle (1487) near St. Aubin du Cormier, where the duke of Orleans, the prince of Orange, and many nobles and knights were made prisoners. The duke and the prince were sent to Anne, who shut them up in strong places, while most of their companions were summarily executed.—E. de Bonnechose, *History of France*, v. 1, bk. 3, ch. 3.

1492-1515.—Reigns of Charles VIII and Louis XII.—Italian expeditions and wars.—Effects on France.—Beginning of the Renaissance.—Louis XI was succeeded by his son, Charles VIII, a boy of thirteen years, whose elder sister Anne governed the kingdom until he came of age. She dealt firmly with a rebellion of the nobles and suppressed it. She frustrated an intended marriage of Anne of Brittany with Maximilian of Austria, which would have drawn the last of the great semi-independent fiefs into a dangerous relationship, and she made Charles instead of his rival the husband of the Breton heiress. When Charles, who had little intelligence, assumed the government, he was excited with dreams of making good the pretensions of the Second House of Anjou to the kingdom of Naples. Those pretensions, which had been bequeathed to Louis XI, and which Charles VIII had now inherited, had the following origin: "In the eleventh century, Robert Guiscard, of the Norman family of Hauteville, at the head of a band of adventurers, took possession of Sicily and South Italy, then in a state of complete anarchy. Roger, the son of Robert, founded the Kingdom of the Two Sicilies under the Pope's suzerainty. In 1189 the Guiscard family became extinct, whereupon the German Emperor laid claim to the kingdom in the right of his wife Constance, daughter of one of the Norman kings. The Roman Pontiffs, dreading such powerful neighbours, were adverse to the arrangement, and in 1254 King Conrad, being succeeded by his son Conradin, still a minor, furnished a pretext for bestowing the crown of the Two Sicilies on Charles d'Anjou, brother of St. Louis. Manfred, guardian of the boy Conradin, and a natural son of the Emperor Frederick II., raised an army against Charles d'Anjou, but was defeated, and fell in the encounter of 1266. Two years later, Prince Conradin was cruelly beheaded in Naples. Before his death, however, he made a will, by which he invested Peter III. of Aragon, son-in-law of Manfred, with full power over the Two Sicilies, exhorting him to avenge his death [see ITALY (Southern): 1250-1268]. This bequest was the origin of the rivalry between the houses of Aragon and Anjou, a rivalry which developed into open antagonism when the island of Sicily was given up to Peter of Aragon and his descendants, while Charles d'Anjou still held Naples for himself and his heirs [see ITALY (Southern): 1282-1300]. In 1435 Joan

II., Queen of Naples, bequeathed her estates to Alfonso V. of Aragon, surnamed the Magnanimous, to the exclusion of Louis III. of Anjou. After a long and bloody struggle, Alfonso succeeded in driving the Anjou dynasty out of Naples [see ITALY (Southern): 1343-1389; 1386-1414]. Louis III. was the last representative of this once-powerful family. He returned to France, survived his defeat two-and-twenty years, and by his will left all his rights to the Count of Maine, his nephew, who, on his death, transferred them to Louis XI. The wily Louis was not tempted to claim this worthless legacy. His successor, Charles VIII., less matter-of-fact, and more romantic, was beguiled into a series of brilliant, though sterile, expeditions, disastrous to national interests, neglecting the Flemish provinces, the liege vassals of France, and thoroughly French at heart. Charles VIII. put himself at the head of his nobles, made a triumphal entry into Naples and returned without having gained an inch of territory [see ITALY: 1492-1494, and 1494-1496; PISA: 1494-1509]. De Commines judges the whole affair a mystery; it was, in fact, one of those dazzling and chivalrous adventures with which the French delighted to astonish Europe. Louis XII., like Charles VIII. [whom he succeeded in 1498], proclaimed his right to Naples, and also to the Duchy of Milan, inherited from his grandmother, Valentine de Visconti. These pretended rights were more than doubtful. The Emperor Wenceslas, on conferring the duchy on the Viscontis, excluded women from the inheritance, and both Louis XI. and Charles VIII. recognised the validity of the Salic law in Milan by concluding an alliance with the Sforzas. [In 1450 the Sforzas seized Milan after the Visconti family had died out.] The seventeen years of Louis XII.'s reign were absorbed in these Italian wars, in which the French invariably began by victory, and as invariably ended in defeat. The League of Cambrai, the Battles of Agnadell, Ravenna, Novara, the Treaties of Grenada and Blois, are the principal episodes of this unlucky campaign."—C. Coignet, *Francis the First and his times*, ch. 3.—See also ITALY: 1499-1500; FLORENCE: 1498-1500; SALIC LAW.—"The warriors of France came back from Italy with the wonders of the South on their lips and her treasures in their hands. They brought with them books and paintings, they brought with them armour inlaid with gold and silver, tapestries enriched with precious metals, embroidered clothing, and even household furniture. Distributed by many hands in many different places, each precious thing became a separate centre of initiative power. The châteaux of the country nobles boasted the treasures which had fallen to the share of their lords at Genoa or at Naples; and the great women of the court were eager to divide the spoil. The contagion spread rapidly. Even in the most fantastic moment of Gothic inspiration, the French artist gave evidence that his right hand obeyed a national instinct for order, for balance, for completeness, and that his eye preferred, in obedience to a national predilection, the most refined harmonies of colour. Step by step he had been feeling his way; now, the broken link of tradition was again made fast; the workmen of Paris and the workmen of Athens joined hands, united by the genius of Italy. It must not, however, be supposed that no intercourse had previously existed between France and Italy. The roads by Narbonne and Lyons were worn by many feet. The artists of Tours and Poitiers, the artists of Paris and Dijon, were alike familiar with the path to Rome. But an intercourse, hitherto restricted, was rendered by the wars of Charles VIII. all but

universal. . . Cruelly as the Italians had suffered at the hands of Charles VIII. they still looked to France for help; they knew that though they had been injured they had not been betrayed. But the weak and generous impulses of Charles VIII. found no place in the councils of his successors. . . . The doom of Italy was pronounced. Substantially the compact was this. Aided by Borgia, the French were to destroy the free cities of the north, and in return France was to aid Borgia in breaking the power of the independent nobles who yet resisted Papal aggression in the south. [Cæsar Borgia was the son of Pope Alexander VI.] In July 1499 the work began. At first the Italians failed to realise what had taken place. When the French army entered the Milanese territory the inhabitants fraternised with the troops, Milan, Genoa, Pavia opened their gates with joy. But in a few months the course of events, in the south, aroused a dread anxiety. There, Borgia, under the protection of the French king, and with the assistance of the French arms, was triumphantly glutting his brutal rage and lust, whilst Frenchmen were forced to look on helpless and indignant. Milan, justly terrified, made an attempt to throw herself on the mercy of her old ruler. To no purpose. Louis went back over the Alps, leaving a strong hand and a strong garrison in Milan, and dragging with him the unfortunate Louis Sforza, a miserable proof of the final destruction of the most brilliant court of Upper Italy. . . . By the campaign of 1507, the work, thus begun, was consummated. The ancient spirit of independence still lingered in Genoa, and Venice was not yet crushed. There were still fresh laurels to be won. In this Holy War the Pope [Julius II] and the Emperor willingly joined forces with France [League of Cambrai 1508]. . . . The deathblow was first given to Genoa. She was forced, Marot tells us, 'la corde au cou, la glaive sous la gorge, implorer la clémence de ce prince.' Venice was next traitorously surprised and irreparably injured. Having thus brilliantly achieved the task of first destroying the lettered courts, and next the free cities of Italy, Louis died, bequeathing to François I. the shame of fighting out a hopeless struggle for supremacy against allies who, no longer needing help, had combined to drive the French from the field. There was, indeed, one other duty to be performed. The shattered remains of Italian civilisation might be collected, and Paris might receive the men whom Italy could no longer employ. The French returned to France empty of honour, gorged with plunder, satiated with rape and rapine, boasting of cities sacked, and garrisons put to the sword. They had sucked the lifeblood of Italy, but her death brought new life to France. The impetus thus acquired by art and letters coincided with a change in political and social constitutions. The gradual process of centralisation which had begun with Louis XI. transformed the life of the whole nation. . . . The royal court began to take proportions hitherto unknown. It gradually became a centre which gathered together the rich, the learned, and the skilled. Artists, who had previously been limited in training, isolated in life, and narrowed in activity by the rigid conservative action of the great guilds and corporations, were thus brought into immediate contact with the best culture of their day. For the Humanists did not form a class apart, and their example incited those with whom they lived to effort after attainments as varied as their own, whilst the Court made a rallying point for all, which gave a sense of countenance and protection even to those who might never hope to enter it. . . . Emancipation of the

individual is the watchword of the sixteenth century; to the artist it brought relief from the trammels of a caste thraldom, and the ceaseless efforts of the Humanists find an answer even in the new forms seen slowly breaking through the sheath of Gothic art."—Mrs. M. Pattison, *Renaissance of art in France*, v. 1, ch. 1.

1513-1515.—English invasion under Henry VIII.—Battle of the Spurs.—Marriage of Louis XII with Mary of England.—King's death.—Accession of Francis I.—"The long preparations of Henry VIII. of England for the invasion of France [in pursuance of the 'Holy League' against Louis XII, formed by Pope Julius II and renewed by Leo X,—see ITALY: 1510-1513] being completed, that king, in the summer of 1513, landed at Calais, whither a great part of his army had already been transported. The offer of 100,000 golden crowns easily persuaded the Emperor to promise his assistance, at the head of a body of Swiss and Germans. But at the moment Henry was about to penetrate into France, he received the excuses of Maximilian [Maximilian I, Holy Roman Emperor from 1493-1510], who, notwithstanding a large advance received from England, found himself unable to levy the promised succours. Nothing disheartened by this breach of faith, the King of England had already advanced into Artois; when the Emperor, attended by a few German nobles, appeared in the English camp, and was cordially welcomed by Henry, who duly appreciated his military skill and local knowledge. A valuable accession of strength was also obtained by the junction of a large body of Swiss, who, encouraged by the victory of Novara, had already crossed the Jura, and now marched to the seat of war. The poverty of the Emperor degraded him to the rank of a mercenary of England; and Henry consented to grant him the daily allowance of 100 crowns for his table. But humiliating as this compact was to Maximilian, the King of England reaped great benefit from his presence. A promiscuous multitude of Germans had flocked to the English camp, in hopes of partaking in the spoil; and the arrival of their valiant Emperor

excited a burst of enthusiasm. The siege of Terouenne was formed: but the bravery of the besieged baffled the efforts of the allies; and a month elapsed, during which the English sustained severe loss from frequent and successful sorties. By the advice of the Emperor, Henry resolved to risk a battle with the French, and the plain of Guinegate was once more the field of conflict [August 18, 1513]. This spot, where Maximilian had formerly struck terror into the legions of Louis XI., now became the scene of a rapid and undisputed victory. The French were surprised by the allies, and gave way to a sudden panic; and the shameful flight of the cavalry abandoned the bravest of their leaders to the hands of their enemies. The Duke of Longueville, La Palisse, Imbercourt, and the renowned Chevalier Bayard, were made prisoners; and the ridicule of the conquerors commemorated the inglorious flight by designating the rout as the Battle of the Spurs. The capture of Terouenne immediately followed; and the fall of Tournay soon afterwards opened a splendid prospect to the King of England. Meanwhile the safety of France was threatened in another quarter. A large body of Swiss, levied in the name of Maximilian but paid with the gold of the Pope, burst into Burgundy; and Dijon was with difficulty saved from capture. From this danger, however, France was extricated by the dexterous negotiation of Trémouille; and the Swiss were induced to withdraw. . . . Louis now became seriously desirous of peace. He made overtures to the Pope, and was received into favour upon consenting to renounce the Council of Pisa. [See PAPACY: 1377-1417.] He conciliated the Kings of Aragon and England by proposals of marriage; he offered his second daughter Renée to the young Charles of Spain; and his second Queen, Anne of Britany, being now dead, he proposed to unite himself with Mary of England, the favourite sister of Henry. . . . But though peace was made upon this footing, the former of the projected marriages never took place: the latter, however, was magnificently solemnized, and proved fatal to Louis. The amorous King forgot his advanced age in the arms of his young and beautiful bride; his constitution gave way under the protracted festivities consequent on his nuptials; and on the 1st of January, 1515, Louis XII. was snatched from his adoring people, in his 53d year. He was succeeded by his kinsman and son-in-law, Francis, Count of Angoulême, who stood next in hereditary succession, and was reputed one of the most accomplished princes that ever mounted the throne of France."—R. Comyn, *History of the western empire*, v. 2, ch. 38.

Also in: J. S. Brewer, *Reign of Henry VIII*, ch. 1.—L. von Ranke, *History of the Latin and Teutonic nations from 1494 to 1514*, bk. 2, ch. 4, sect. 7-8.

1515.—Accession of Francis I.—Invasion of Italy.—Battle of Marignano.—"François I. was in his 21st year when he ascended the throne of France. His education in all manly accomplishments was perfect, and . . . he manifested . . . an intelligence which had been carefully cultivated. . . . Unfortunately his moral qualities had been profoundly corrupted by the example of his mother, Louise of Savoy, a clever and ambitious woman, but selfish, unscrupulous, and above all shamelessly licentious. Louise had been an object of jealousy to Anne of Britany, who had always kept her in the shade, and she now snatched eagerly at the prospect of enjoying power and perhaps of reigning in the name of her son, whose love for his mother led him to allow her to exercise an influence which was often fatal to the interests of

his kingdom. . . . Charles, duke of Bourbon, who was notoriously the favoured lover of Louise, was appointed to the office of constable, which had remained vacant since 1488; and one of her favourite ministers, Antoine Duprat, first president of the parliament of Paris, was entrusted with the seals. Both were men of great capacity; but the first was remarkable for his pride, and the latter for his moral depravity. The first cares of the new king of France were to prepare for war. . . . Unfortunately for his country, François I. shared in the infatuation which had dragged his predecessors into the wars in Italy; and all these warlike preparations were designed for the reconquest of Milan. He had already intimated his design by assuming at his coronation the titles of king of France and duke of Milan. . . . He entered into an alliance with Charles of Austria [grandson of Maximilian I], prince of Castile, who had now reached his majority and assumed the government of the Netherlands. . . . A treaty between these two princes, concluded on the 24th of March, 1515, guaranteed to each party not only the estates they held or which might subsequently descend to them, but even their conquests. . . . The republic of Venice and the king of England renewed the alliances into which they had entered with the late king, but Ferdinand of Aragon refused even to prolong the truce unless the whole of Italy were included in it, and he entered into a separate alliance with the emperor, the Duke of Milan, and the Swiss, to oppose the designs of the French king. The efforts of François I. to gain over the Swiss had been defeated by the influence of the cardinal of Sion. Yet the pope, Leo X., hesitated, and avoided compromising himself with either party. In the course of the month of July [1515], the most formidable army which had yet been led from France into Italy was assembled in the district between Grenoble and Embrun, and the king, after entrusting the regency to his mother, Louise, with unlimited powers, proceeded to place himself at its head."—T. Wright, *History of France*, v. 1, bk. 3, ch. 1.—"The passes in Italy had already been occupied by the Swiss under their captain general Galeazzo Visconti. Galeazzo makes their number not more than 6,000. . . . They were posted at Susa, commanding the two roads from Mont Cenis and Geneva, by one of which the French must pass or abandon their artillery. In this perplexity it was proposed by Triulcio to force a lower passage across the Cottian Alps leading to Saluzzo. The attempt was attended with almost insurmountable difficulties. . . . But the French troops with wonderful spirits and alacrity . . . were not to be baffled. They dropped their artillery by cables from steep to steep; down one range of mountains and up another, until five days had been spent in this perilous enterprise, and they found themselves safe in the plains of Saluzzo. Happily the Swiss, secure in their position at Susa, had never dreamed of the possibility of such a passage. . . . Prosper Colonna, who commanded in Italy for the Pope, was sitting down to his comfortable dinner at Villa Franca, when a scout covered with dust dashed into his apartment announcing that the French had crossed the Alps. The next minute the town was filled with the advanced guard, under the Sieur d'Ymbercourt and the celebrated Bayard. The Swiss at Susa had still the advantage of position, and might have hindered the passage of the main body of the French; but they had no horse to transport their artillery, were badly led, and evidently divided in their councils. They retired upon Novara," and to Milan, intending to effect a junction with the viceroy of Naples, who advanced to Cremona.

On the morning of the 13th of September, Cardinal Scheimer harangued the Swiss and urged them to attack the French in their camp, which was at Marignano, or Melignano, twelve miles away. His fatal advice was acted on with excitement and haste. "The day was hot and dusty. The advanced guard of the French was under the command of the Constable of Bourbon, whose vigilance defeated any advantage the Swiss might otherwise have gained by the suddenness and rapidity of their movements. At nine o'clock in the morning, as Bourbon was sitting down at table, a scout, dripping with water, made his appearance. He had left Milan only a few hours before, had waded the canals, and came to announce the approach of the enemy. . . . The Swiss came on apace; they had disencumbered themselves of their hats and caps, and thrown off their shoes, the better to fight without slipping. They made a dash at the French artillery, and were foiled after hard fighting. . . . It was an autumnal afternoon; the sun had gone down; dust and night-fall separated and confused the combatants. The French trumpets sounded a retreat; both armies crouched down in the darkness within cast of a tennis-ball of each other. . . . Where they fought, there each man laid down to rest when darkness came on, within hand-grip of his foe." The next morning, "the autumnal mist crawled slowly away, and once more exposed the combatants to each other's view. The advantage of the ground was on the side of the French. They were drawn up in a valley protected by a ditch full of water. Though the Swiss had taken no refreshment that night, they renewed the fight with unimpaired animosity and vigour. . . . Francis, surrounded by a body of mounted gentlemen, performed prodigies of valour. The night had given him opportunity for the better arrangement of his troops; and as the day wore on, and the sun grew hot, the Swiss, though 'marvellously deliberate, brave, and obstinate,' began to give way. The arrival of the Venetian general, D'Alviano, with fresh troops, made the French victory complete. But the Swiss retreated inch by inch with the greatest deliberation, carrying off their great guns on their shoulders. . . . The French were too exhausted to follow. And their victory had cost them dear; for the Swiss, with peculiar hatred to the French gentry and the lance-knights, had shown no mercy. They spared none, and made no prisoners. The glory of the battle was great. . . . The Swiss, the best troops in Europe, and hitherto reckoned invincible . . . had been the terror and scourge of Italy, equally formidable to friend and foe, and now their prestige was extinguished. But it was not in these merely military aspects that the battle of Marignano was important. No one who reads the French chronicles of the times, can fail to perceive that it was a battle of opinions and of classes even more than of nations; of a fierce and rising democratical element, now rolled back for a short season, only to display itself in another form against royalty and nobility:—of the burgher classes against feudality. . . . The old romantic element, overlaid for a time by the political convulsions of the last century, had once more gained the ascendant. It was to blaze forth and revive, before it died out entirely, in the Sydneys and Raleighs of Queen Elizabeth's reign; it was to lighten up the glorious imagination of Spenser before it faded into the dull prose of Puritan divinity, and the cold grey dawn of inductive philosophy. But its last great battle was the battle of Marignano."—J. S. Brewer, *Reign of Henry VIII.*, v. 1, ch. 3.

1515-1518.—Francis I in possession of Milan.—Treaties with the Swiss and the pope.—Nullification of the Pragmatic Sanction of Charles VII.—Concordat of Bologna.—"On the 15th of September, the day after the battle [of Marignano], the Swiss took the road back to their mountains. Francis I. entered Milan in triumph. Maximilian Sforza took refuge in the castle, and twenty days afterwards on the 4th of October, surrendered, consenting to retire to France, with a pension of 30,000 crowns, and the promise of being recommended for a cardinal's hat, and almost consoled for his downfall 'by the pleasure of being delivered from the insolence of the Swiss, the exactions of the Emperor Maximilian, and the rascalities of the Spaniards.' Fifteen years afterwards, in June, 1530, he died in oblivion at Paris. Francis I. regained possession of all Milanese, adding thereto, with the pope's consent, the duchies of Parma and Piacenza, which had been detached from it. . . . Two treaties, one of November 7, 1515, and the other of November 29, 1516, re-established not only peace, but perpetual alliance, between the King of France and the thirteen Swiss Cantons, with stipulated conditions in detail. Whilst these negotiations were in progress, Francis I. and Leo X., by a treaty published at Viterbo, on the 13th of October, proclaimed their hearty reconciliation. The pope guaranteed to Francis I. the duchy of Milan, restored to him those of Parma and Piacenza, and recalled his troops which were still serving against the Venetians." At the same time, arrangements were made for a personal meeting of the pope and the French king, which took place at Bologna in December, 1515. "Francis did not attempt to hide his design of reconquering the kingdom of Naples, which Ferdinand the Catholic had wrongfully usurped, and he demanded the pope's countenance. The pope did not care to refuse, but he pointed out to the king that everything foretold the very near death of King Ferdinand; and 'Your Majesty,' said he, 'will then have a natural opportunity for claiming your rights; and as for me, free, as I shall then be, from my engagements with the King of Arragon in respect of the crown of Naples, I shall find it easier to respond to your majesty's wish.' The pope merely wanted to gain time. Francis, putting aside for the moment the kingdom of Naples, spoke of Charles VII.'s Pragmatic Sanction [see above: 1438], and the necessity of putting an end to the difficulties which had arisen on this subject between the court of Rome and the Kings of France, his predecessors. 'As to that,' said the pope, 'I could not grant what your predecessors demanded; but be not uneasy; I have a compensation to propose to you which will prove to you how dear your interests are to me.' The two sovereigns had, without doubt, already come to an understanding on this point, when, after a three days' interview with Leo X., Francis I. returned to Milan, leaving at Bologna, for the purpose of treating in detail the affair of the Pragmatic Sanction, his chancellor, Duprat, who had accompanied him during all this campaign as his adviser and negotiator. . . . The popes . . . had all of them protested since the days of Charles VII. against the Pragmatic Sanction as an attack upon their rights, and had demanded its abolition. In 1461, Louis XI. . . . had yielded for a moment to the demand of Pope Pius II., whose countenance he desired to gain, and had abrogated the Pragmatic; but, not having obtained what he wanted thereby, and having met with strong opposition in the Parliament of Paris to his concession, he

had let it drop without formally retracting it. . . . This important edict, then, was still vigorous in 1515, when Francis I., after his victory at Melegnano and his reconciliation with the pope, left Chancellor Duprat at Bologna to pursue the negotiation reopened on that subject. The 'compensation,' of which Leo X., on redemanding the abolition of the Pragmatic Sanction, had given a peep to Francis I., could not fail to have charms for a prince so little scrupulous, and for his still less scrupulous chancellor. The pope proposed that the Pragmatic, once for all abolished, should be replaced by a Concordat between the two sovereigns, and that this Concordat, whilst putting a stop to the election of the clergy by the faithful, should transfer to the king the right of nomination to bishoprics and other great ecclesiastical offices and benefices, reserving to the pope the right of presentation of prelates nominated by the king. This, considering the condition of society and government in the 16th century, in the absence of political and religious liberty, was to take away from the church her own existence, and divide her between two masters, without giving her, as regarded either of them, any other guarantee of independence than the mere chance of their dissensions and quarrels. . . . Francis I. and his chancellor saw in the proposed Concordat nothing but the great increment of influence it secured to them, by making all the dignitaries of the church supplicants at first and then clients of the kingship. After some difficulties as to points of detail, the Concordat was concluded and signed on the 18th of August, 1516. Five months afterwards, on the 5th of February, 1517, the king repaired in person to Parliament, to which he had summoned many prelates and doctors of the University. The Chancellor explained the points of the Concordat. . . . The king ordered its registration, 'for the good of his kingdom and for quittance of the promise he had given the pope.' For more than a year the parliament at Paris resisted the royal order, and it was not until the 22d of March, 1518, that it yielded to the king's threats and proceeded to registration of the Concordat, with forms and reservations "which were evidence of compulsion. The other Parliaments of France followed with more or less zeal . . . the example shown by that of Paris. The University was heartily disposed to push resistance farther than had been done by Parliament."—F. P. Guizot, *Popular history of France*, v. 4, ch. 28.—It should be remembered that the French parliament had no resemblance to what is known as a parliamentary body. They were higher courts of law and were next in importance to the king's council. However, they did more than try lawsuits, for as guardians of the law they registered all the king's edicts and by their refusal against any edict which they considered inadequate or unjust they frequently influenced the trend of legislation.—See also COURTS: France: Lack of uniformity; PARLIAMENT OF PARIS.

"The execution of the Concordat was vigorously contested for years afterwards. Cathedrals and monastic chapters proceeded to elect bishops and abbots under the provisions of the Pragmatic Sanction; and every such case became a fresh source of exasperation between the contending powers. . . . But the Parliament, though clamouring loudly for the 'Gallican liberties,' and making a gallant stand for national independence as against the usurpations of Rome, was unable to maintain its ground against the overpowering despotism of the Crown. The monarchical authority ultimately achieved a complete triumph. In 1527 a peremptory royal ordinance prohibited the courts of Parliament from taking further cognisance of causes

affecting elections to consistorial benefices and conventual priories; and all such matters were transferred to the sole jurisdiction of the Council of State. After this the agitation against the Concordat gradually subsided. But although, in virtue of its compulsory registration by the Parliament, the Concordat became part of the law of the land, it is certain that the Gallican Church never accepted this flagrant invasion of its liberties."—W. H. Jervis, *History of the church of France*, v. 1, pp. 109-110.—See also CONCORDAT: 1515-1801.

1515-1547.—Institution of the Court.—Baneful influence.—"Francis I. instituted the Court, and this had a decisive influence upon the manners of the nobility. Those lords, whose respects royalty had difficulty in keeping when they were at their castles, having come to court, prostrated themselves before the throne, and yielded obedience with their whole hearts. A few words will describe this Court. The king lodged and fed in his own large palace, which was fitted for the purpose, the flower of the French nobility. Some of these lords were in his service, under the title of offices of his household—as chamberlains, purveyors, equerries, &c. Large numbers of domestic officers were created solely as an excuse for their presence. Others lived there, without duties, simply as guests. All these, besides lodging and food, had often a pension as well. A third class were given only a lodging, and provided their own table; but all were amused and entertained with various pleasures, at the expense of the king. Balls, carousals, stately ceremonials, grand dinners, theatricals, conversations inspired by the presence of fair women, constant intercourse of all kinds, where each could choose for himself, and where the refined and literary found a place as well as the vain and profligate,—such was court life, a truly different thing from the monotonous and brutal existence of the feudal lord at his castle in the depths of his province. So, from all sides, nobles flocked to court, to gratify both the most refined tastes and the most degraded passions. Some came hoping to make their fortune, a word from the king sufficing to enrich a man; others came to gain a rank in the army, a lucrative post in the finance department, an abbey, or a bishopric. From the time kings held court, it became almost a law, that nothing should be granted to a nobleman who lived beyond its pale. Those lords who persisted in staying on their own estates were supposed to rail against the administration, or, as we of the present would express it, to be in opposition. 'They must indeed be men of gross minds who are not tempted by the polish of the court; at all events it is very insolent in them to show so little wish to see their sovereign, and enjoy the honor of living under his roof.' Such was almost precisely the opinion of the king in regard to the provincial nobility. . . . Ambition drew the nobles to court; ambition, society, and dissipation kept them there. To incur the displeasure of their master, and be exiled from court was, first, to lose all hope of advancement, and then to fall from paradise into purgatory. It killed some people. But life was much more expensive at court than in the castles. As in all society where each is constantly in the presence of his neighbor, there was unbounded rivalry as to who should be most brilliant, most superb. The old revenues did not suffice, while, at the same time, the inevitable result of the absence of the lords was to decrease them. Whilst the expenses of the noblemen at Chambord or Versailles were steadily on the increase, his intendant, alone and unrestrained upon the estate, filled his own pockets, and sent less money every quarter, so that, to keep up the proper rank, the lord was forced to beg a pension from the king. Low indeed was the downfall of

the old pride and feudal independence. The question was how to obtain these pensions, ranks, offices, and favors of all kinds. The virtues most prized and rewarded by the kings were not civic virtues,—capacity, and services of value for the public good; what pleased them was, naturally devotion to their person, blind obedience, flattery, and subservience.”—P. Lacombe, *Short history of the French people*, ch. 23.

1516-1517.—Maximilian's attempt against Milan.—Diplomatic intrigues.—Treaty of Noyon.—After Francis I had taken possession of Milan, and while Pope Leo X was making professions of friendship to him at Bologna, a scheme took shape among the French king's enemies for depriving him of his conquest, and the pope was privy to it. “Henry VIII. would not openly break the peace between England and France, but he offered to supply Maximilian with Swiss troops for an attack upon Milan. It was useless to send money to Maximilian, who would have spent it on himself”; but troops were hired for the emperor by the English agent, Pace, and “at the beginning of March [1516] the joint army of Maximilian and the Swiss assembled at Trent. On March 24 they were within a few miles of Milan, and their success seemed sure, when suddenly Maximilian found that his resources were exhausted and refused to proceed; next day he withdrew his troops and abandoned his allies. . . . The expedition was a total failure; yet English gold had not been spent in vain, as the Swiss were prevented from entirely joining the French, and Francis I. was reminded that his position in Italy was by no means secure. Leo X., meanwhile, in the words of Pace, ‘had played marvellously with both hands in this enterprise.’ . . . England was now the chief opponent of the ambitious schemes of France, and aimed at bringing about a league with Maximilian, Charles [who had just succeeded Ferdinand of Spain, deceased January 23, 1516], the Pope, and the Swiss. But Charles's ministers, chief of whom was Croy, lord of Chievres, had a care above all for the interests of Flanders, and so were greatly under the influence of France. . . . France and England entered into a diplomatic warfare over the alliance with Charles. First, England on April 10 recognised Charles as King of Spain, Navarre, and the Two Sicilies; then Wolsey strove to make peace between Venice and Maximilian as a first step towards detaching Venice from its French alliance.” On the other hand, negotiations were secretly carried on and (August 13) “the treaty of Noyon was concluded between Francis I. and Charles. Charles was to marry Louise, the daughter of Francis I., an infant of one year old, and receive as her dower the French claims on Naples; Venice was to pay Maximilian 200,000 ducats for Brescia and Verona; in case he refused this offer and continued the war, Charles was at liberty to help his grandfather, and Francis I. to help the Venetians, without any breach of the peace now made between them. . . . In spite of the efforts of England, Francis I. was everywhere successful in settling his difficulties. On November 29 a perpetual peace was made at Friburg between France and the Swiss Cantons; on December 3 the treaty of Noyon was renewed, and Maximilian was included in its provisions. Peace was made between him and Venice by the provision that Maximilian was to hand over Verona to Charles, who in turn should give it up to the King of France, who delivered it to the Venetians; Maximilian in return received 100,000 ducats from Venice and as much from France. The compact was duly carried out: ‘On February 8, 1517,’ wrote the Cardinal of Sion, ‘Verona belonged to the Emperor; on the 9th to the King Catholic; on the 15th to the French; on

the 17th to the Venetians.’ Such was the end of the wars that had arisen from the League of Cambrai. After a struggle of eight years the powers that had confederated to destroy Venice came together to restore her to her former place. Venice might well exult in this reward of her long constancy, her sacrifices and her disasters.”—M. Creighton, *History of the papacy, during the period of the Reformation*, v. 4, bk. 5, ch. 19.

1519.—Candidacy of Francis I for the imperial crown. See GERMANY: 1519.

1520-1523.—Rivalry of Francis I and Charles V.—Emperor's successes with England and the pope.—Francis' failure in Spain and his loss of Milan.—Wrongs and treason of the constable of Bourbon.—“With their candidature for the Imperial crown, burst forth the inextinguishable rivalry between Francis I. and Charles V. The former claimed Naples for himself and Navarre for Henry d'Albret: the Emperor demanded the Milanese as a fief of the Empire, and the Duchy of Burgundy. Their resources were about equal. If the empire of Charles were more extensive the kingdom of France was more compact. The Emperor's subjects were richer, but his authority more circumscribed. The reputation of the French cavalry was not inferior to that of the Spanish infantry. Victory would belong to the one who should win over the King of England to his side. . . . Both gave pensions to his Prime Minister, Cardinal Wolsey; they each asked the hand of his daughter Mary, one for the dauphin, the other for himself. Francis I. obtained from him an interview at Calais, and forgetting that he wished to gain his favour, eclipsed him by his elegance and magnificence [see FIELD OF THE CLOTH OF GOLD]. Charles V., more adroit, had anticipated this interview by visiting Henry VIII. in England. He had secured Wolsey by giving him hopes of the tiara. . . . Everything succeeded with the Emperor. He gained Leo X. to his side and thus obtained sufficient influence to raise his tutor, Adrian of Utrecht, to the papacy [on the death of Leo, December 1, 1521]. The French penetrated into Spain, but arrived too late to aid the rising there [in Navarre, 1521]. The governor of the Milanese, Lautrec, who is said to have exiled from Milan nearly half its inhabitants, was driven out of Lombardy [and the pope retook Parma and Placentia]. He met with the same fate again in the following year: the Swiss, who were ill-paid, asked either for dismissal or battle, and allowed themselves to be beaten at La Bicoque [April 29, 1522]. The money intended for the troops had been used for other purposes by the Queen-mother, who hated Lautrec. At the moment when Francis I. was thinking of re-entering Italy, an internal enemy threw France into the utmost danger. Francis had given mortal offence to the Constable of Bourbon, one of those who had most contributed to the victory of Marignan. Charles, Count of Montpensier and Dauphin of Auvergne, held by virtue of his wife, a granddaughter of Louis XI., the Duchy of Bourbon, and the counties of Clermont, La Marche and other domains, which made him the first noble in the kingdom. On the death of his wife, the Queen-mother, Louise of Savoy, who had wanted to marry the Constable and had been refused by him, resolved to ruin him. She disputed with him this rich inheritance and obtained from her son that the property should be provisionally sequestered. Bourbon, exasperated, resolved to pass over to the Emperor (1523). Half a century earlier, revolt did not mean disloyalty. The most accomplished knights in France, Dunois and John of Calabria, had joined the ‘League for

the public weal.' . . . But now it was no question of a revolt against the king; such a thing was impossible in France at this time. It was a conspiracy against the very existence of France that Bourbon was plotting with foreigners. He promised Charles V. to attack Burgundy as soon as Francis I. had crossed the Alps, and to rouse into revolt five provinces of which he believed himself master; the kingdom of Provence was to be re-established in his favour, and France, partitioned between Spain and England, would have ceased to exist as a nation. He was soon able to enjoy the reverses of his country."—J. Michelet, *Summary of modern history*, ch. 6.—"Henry VIII. and Charles V. were both ready to secure the services of the ex-Constable. He decided in favour of Charles as the more powerful of the two. . . . These secret negotiations were carried on in the spring of 1523, while Francis I. (having sent a sufficient force to protect his northern frontier) was preparing to make Italy the seat of war. With this object the king ordered a rendezvous of the army at Lyons, in the beginning of September, and having arranged to pass through Moulins on his way to join the forces, called upon the Constable to meet him there and to proceed with him to Lyons. Already vague rumours of an understanding between the Emperor and Bourbon had reached Francis, who gave no credence to them; but on his way M. de Brézé, Seneschal of Normandy, attached to the Court of Louise of Savoy, sent such precise details of the affair by two Norman gentlemen in the Constable's service that doubt was no longer possible." Francis accordingly entered Moulins with a considerable force, and went straight to Bourbon, who feigned illness. The Constable stoutly denied to the king all the charges which the latter revealed to him, and Francis, who was strongly urged to order his arrest, refused to do so. But a few days later, when the king had gone forward to Lyons, Bourbon, pretending to follow him, rode away to his strong castle of Chantelles, from whence he wrote letters demanding the restitution of his estates. As soon as his flight was known, Francis sent forces to seize him; but the Constable, taking one companion with him, made his way out of the kingdom in disguise. Escaping to Italy, he was there placed in command of the imperial army.—C. Coignet, *Francis I and his times*, ch. 4.—See also AUSTRIA: 1519-1555.

1523-1525.—French army enters Italy and is defeated at Romagnano.—Death of Bayard.—Second invasion of Italy by Francis I.—Defeat and capture at Pavia.—"Bonnivet, the personal enemy of Bourbon, was now entrusted with the command of the French army. He marched without opposition into the Milanese, and might have taken the capital had he pushed on to its gates. Having by irresolution lost it, he retreated to winter quarters behind the Tesino. The operations of the English in Picardy, of the imperialists [supporters of Charles V] in Champagne, and of the Spaniards near the Pyrenees, were equally insignificant. The spring of 1524 brought on an action, if the attack of one point can be called such, which
