Girls' Clubs, societies with a membership of girls banded together for recreation, study, mutual helpfulness, etc. Among girls there is apparently less spontaneity than among boys in regard to the formation of clubs, but large numbers of girls are found in clubs organized and to a greater or less degree supervised by older persons. In women's clubs so called, large numbers of girls are found either as regular members or in a junior branch or department. Some large societies, such as the Young Women's Christian Association, do not apply the name club to any of their branches, and could not accurately do so, and yet the opportunities they afford to girls, for entertainment, self-improvement and social intercourse, and the use of rooms for gatherings, reading, and writing, etc., afford to members what is largely equivalent to club membership, a fact appreciated by the girls themselves, who sometimes give as a reason for joining such societies, the wish to be connected with "a club." Many girls are found in the large organization known as King's Daughters and Sons, especially in the junior circles. In such bands, religious or benevolent features predominate, but the social element is cultivated in a greater or less degree. The Girls' Friendly Society is also largely of a religious nature, but in addition to church and missionary work, it provides opportunities for recreation and for the mental and industrial training of its members. Instruction in hygiene is an important feature, and music receives much attention. The aim of the society is to encourage purity of life, dutifulness to parents, faithfulness to employers, and thrift; and to cultivate a spirit of fellowship and kindliness. It ensures the privileges of the society to its members wherever they may be, by giving them an introduction from one branch to another. The parent society was started in England in 1875 (at a time when much interest was shown in "rescue work") with the central idea of helping young women along preventive rather than reformatory lines. The form of organization follows as far as possible that of the Church of England, being diocesan and parochial. Any girl of good character, 12 years of age or over may become a member, and younger girls may become probationers or candidates. Associate members must be communicants. This society now extends wherever the English language is spoken and is the largest society of girls and women in existence, numbering about 300. The Girls' Friendly Society in America is under the auspices of the Protestant Episcopal Church. Branches were started in Lowell, Mass., and in Baltimore, Md., soon after the organization of the English society, and a central council was formed in 1886. On 1 Oct. 1902 the society reported 435 branches, in 54 dioceses; and a total membership (including associates, probationers, candidates, etc.) of 25,399. There are six holiday houses, belonging respectively to the diocesan branches of Massachusetts, New York, Pennsylvania, Rhode Island, and New Jersey. The organs of the society are two monthly periodicals, 'The Girls' Friendly Magazine,' and 'The Associates' Record.' The central office is in the Church Missions House, New York. Some individual churches maintain girls' clubs as a part of their parish work. The club connected with St. Bartholomew's Church, New York, has a club-room, baths, classes of various kinds, and a mutual benefit fund. In the social, university, and college settlements in large cities throughout the United States, clubs for girls generally constitute an important feature of the work.

The use of the word "girl" in connection with working-girls' clubs is somewhat vague, as the term is very elastic in its application. In most working-women's clubs girls are admitted who have passed the age of 14, but in some cases there are also junior clubs for the younger girls. These "sub-clubs" are to some extent under the supervision of the older members, but usually have their own officers and constitution. The State and city associations of working-girls' clubs secure for the individual clubs belonging to them enlarged advantages and more effective working. The results of united effort are illustrated by the success of the movement for the early closing of stores in Boston in 1896–7, a step due in great part to clubs having a membership largely drawn from girls in stores and factories. One of the objects of the Massachusetts association is to assist clubs in obtaining the services of good teachers, physicians, and lecturers. Among the subjects very frequently taught in the classes connected with working-girls' clubs are plain sewing and embroidery, millinery, cooking, gymnastics, and singing. Lessons in English literature, elocution, French, German, stenography, drawing, modeling, and painting are also offered to many club members. In some of the clubs the teachers are paid, and in others they contribute their services. Besides the more formal lessons, talks are often given to club girls on hygiene, nursing, morals, manners, etc.; and concerts, lectures, and readings, with "evenings of travel" fill many of the evenings devoted to entertainment. Outings of various kinds form a summer feature in many clubs, and vacations are often made possible at cheaper rates than could otherwise be obtained by the members. Large clubs or associations conduct vacation houses at the seashore or in the country. The pleasures and privileges connected with club life form the brightest and most hopeful element in the life of many a self-supporting girl. See BOYS' CLUBS; CLUBS; KING'S DAUGHTERS AND SONS, INTERNATIONAL ORDER OF; LEND A HAND CLUBS; WOMEN'S CLUBS; WORKING WOMEN'S CLUBS.

Girls' Friendly Society. See GIRLS' CLUBS.

Gironde, zhē-rônd, France, a department, bounded north by the estuary which gives it its name, and the department of the Charente; east by Dordogne and Lotet-Garonne; south by Landes; and west by the Bay of Biscay; area, 4,140 square miles. The whole department, with exception of the west, which sends its waters either directly to the coast or the long series of lagoons by which it is lined, belongs to the basin of the Gironde, which is formed in its interior by the junction of the Dordogne and Garonne. The only other streams deserving of notice are the Leyre, which discharges itself into the most southern lagoon; the Ciron, a left affluent of the Dordogne; and the Isle, with its tributary Dronne. The quantity of waste land is very great, amounting to more than one third; while the arable land is rather less than one fourth of the whole surface. Of the remainder about one seventh is occupied by vineyards, and one ninth under wood. The great staple of production is wine. The most celebrated wines are Médoc, Graves, Côtes, Palus, and Entre-deux-Mers. (See WINES.) The trade, which has its centre at Bordeaux, is very important. The principal exports are wine, brandy, corn, flour, fruit, rosin, liqueurs, etc. For administrative purposes Gironde is divided into six arrondissements — Bordeaux, Bazas, Blaye, Lesparre, Libourne, and La Réole. The capital is Bordeaux (q.v.). Pop. (1901) 821,131.

Girondist, jĭ-rŏn'dĭst, or **Girondin,** the name of a great political party in France; one of the most powerful factors in the earlier part of the first French Revolution. When the Legislative Assembly met in 1791, it contained representatives of the upper, the middle, and the lower classes. The Girondists were the party of the middle classes, and were republican in sentiment, but suffered from the lack of a definite policy. They obtained their designation from the fact that their most celebrated leaders, Vergniaud, Guadet, and Gensonné, were members for the department of the Gironde, originally lawyers in the law court of Bordeaux. Sometimes they were called Brissotins from Brissot, their most eloquent leader. They were the most powerful party in the Assembly, and for a time shaped the policy of their country. When conservative Europe threatened France with invasion, the Girondists in April 1792, declared war, the Jacobins deprecating hostilities, as fearing the result. To overcome their monarchic rivals, the Girondists coquetted with the last-named party, and found that they had gained, not a servant, but a cruel and exacting master. The quarrel between the two arose after the massacres perpetrated in August and September 1792, and the extreme revolutionists ultimately prevailing, an armed mob on 31 May 1793 assailed the Convention, and demanded the imprisonment of 29 Girondist deputies. These were arrested on 2 June, and 21 of them were guillotined on 31 October. Others were subsequently put to death; a few escaping, reappeared in the Convention after the fall of Robespierre.

Girouard, Désiré, dā-zē-rā zhē-roo-är, Canadian jurist: b. Saint Timothée, P. Q., 7 July 1836. He practised his profession as a member of the Montreal bar 1860–95, and was a member of the Dominion Parliament for Jacques Cartier 1878–95. He carried the Deceased Wife's Sister Bill in 1882 and since 1895 has been a justice of the supreme court of Canada. He has published: 'Essai sur Lettres de Change' (1860); 'The Bill of Exchange Act' (1890); 'Lake St. Louis, Old and New and La Salle' (1893).

Girton (gėr'tŏn) **College,** England, a noted college for women, instituted at Hitchin in 1869, but removed to Girton, near Cambridge, in 1873. The students, 110 in number, are admitted after an entrance examination; the ordinary course extends over three years, half of each year being spent in college. Degree certificates are granted for the B.A. of Cambridge University.

Girty, gėr'tĭ, **Simon,** American frontiersman and leader of the Indians: b. present Dauphin County, Pa., 1741; d. Canada 1818. He became a second lieutenant of Virginia militia, later an Indian interpreter, deserted to the English in 1776, was appointed an interpreter to the English Indian department, and was declared a traitor by the Pennsylvania legislature. His name was popularly associated with many Indian atrocities on the frontier, although it is likely that he was not at any time commander of a large force and that his prestige among the savages was much less than was supposed. He did, however, lead the Indians who attacked Dunlap's Station (1791) and Fort Jefferson (1791).

Gisborne, gĭz'bôrn, **Frederick Newton,** Canadian telegrapher: b. Broughton, Lancashire, England, 8 March 1824; d. 29 Aug. 1892. He went to Canada in 1845 and soon after engaged in telegraph work. He laid before the Nova Scotia authorities in 1850 a plan for telegraphic communication between Newfoundland and Ireland, and the first cable in America was laid by him in 1852, connecting Prince Edward Island and New Brunswick. In 1879 he was appointed superintendent of the Dominion Telegraph Signal Service.

Gismondite, jĭs'mŏn-dīt, or **Gismondine** (named after C. G. Gismondi, an Italian mineralogist), a monoclinic transparent or translucent mineral of vitreous lustre, its hardness 4.5; specific gravity 2.27; sometimes colorless, sometimes white, bluish-white, grayish, or reddish. It is optically biaxial. Composition: Silica, 35.88; alumina, 27.23; lime, 13.12; potassa, 2.85, and water, 21.10. Occurs in leucitic lava near Rome and in Sicily.

Gissing, gĭs'sĭng, **George,** English novelist: b. Wakefield 22 Nov. 1857; d. Saint Jean de Luz, France, 28 Dec. 1903. In his stories he has made a remarkable study of the London masses, from the ranks of skilled labor to the most noisome human refuse of the slums, the result being half repulsive and wholly powerful. He has published: 'The Unclassed' (1884); 'Demos' (1886); 'Isabel Clarendon' (1886); 'Thyrza' (1887); 'A Life's Morning' (1888); 'The Nether World' (1889); 'The Emancipated' (1890); 'New Grub Street' (1891); 'Born in Exile' (1892); 'Denzil Quarrier' (1892); 'The Odd Women' (1893); 'In the Year of Jubilee' (1894); 'Eve's Ransom' (1895); 'The Whirlpool' (1897); 'Human Odds and Ends' (1897); 'The Town Traveler' (1898); 'Charles Dickens, a Critical Essay' (1898); 'The Crown of Life' (1899); 'Our Friend the Charlatan'; 'By the Ionian Sea' (1901).

Giulio Romano, joo'lē-ō rō-mä'nō, properly Giulio Pippi de Giannuzzi, Italian artist: b. Rome about 1492; d. Mantua 1 Nov. 1546. He assisted Raphael in several of the latter's works, including the 'Benefactors of the Church' in the Incendio del Borgo, and at Raphael's death completed the 'Battle of Constantine' and the 'Apparition of the Cross' in the Hall of Constantine in the Vatican. He built the Villa Madama, for which he painted a fresco of Polyphemus. In 1524 he accepted the invitation of the Duke of Mantua to undertake for him a series of architectural and pictorial works, and restored the Palazzo del Te, the cathedral, the streets, and a ducal palace at Marmirolo, near Mantua. Among other Mantuan works of his are the 'History of Troy,' in the castle, and 'Psyche,' 'Icarus,' and the 'Titans,' in the Te palace. In Bologna he designed the façade of the church of St. Petronio. Other works are the 'Martyrdom of Saint Stephen,' at Genoa; 'A Holy Family,' at Dresden; 'Mary and Jesus,' and the 'Madonna della Gatta.'

Gizeh, gē'zē, **Ghizeh,** or **Geezeh,** Egypt, a town on the left bank of the Nile, almost directly opposite Cairo. It was formerly an important place, beautified by palaces, but now forms a scene of ruins, amidst which the town is built. Five miles to the west are the great pyramids which have been named from this town, and here also is the famous Sphinx. Pop. about 11,500.

Gizzard, a stomach or a part of it or of the alimentary canal where it is unusually muscular and tough, so that it is able to crush or grind solid food. It is not possessed by animals whose food is soft or else is chewed before swallowing; and is best developed among seed-eating birds, which frequently swallow pebbles to assist the gizzard in its grinding work. Birds not accustomed to hard food, if compelled and able to adopt such a diet, will develop a serviceable gizzard. Various fishes, reptiles, crustaceans, insects, worms, and other invertebrates have gizzards. See *Digestive System* under Anatomy; Stomach.

Glace Bay, Canada, town of Cape Breton Island and County, Province of Nova Scotia, on the extreme eastern seacoast and on the Sydney & Louisburg R.R., 14 miles east of Sydney.

Industries.— The town and the surrounding district are underlaid with vast deposits of coal and almost the entire population is dependent upon the coal mines, five of which are within the town limits and three others closely adjoining. The Dominion Coal Company employs about 5,000 persons and has a yearly output from their mines of over 4,000,000 tons.

Banks and Churches.— There are three banks, branches of those located in other cities. Nearly half the population is Roman Catholic, while the Presbyterians have great predominance over the Evangelical bodies.

Public and Educational Institutions.— Saint Joseph's Hospital is the second largest in America and one of the finest in the province. On Table Head, a bleak promontory one mile east of the town, Marconi completed in December 1902 his first transatlantic wireless telegraph and sent his first wireless messages across the Atlantic. The educational system consists of common and convent schools.

Government and Population.— The town was incorporated in 1901, its affairs being administered by a mayor, elected yearly, and a council of six members, elected for two years. The majority of the population are of Highland Scotch descent. Pop. Glacé Bay and surrounding collieries (1901) 6,945; (1905) 16,000.

Glacial Acetic Acid. See Acetic Acid.

Glacial Drift. See Drift.

Glacial Period, or Ice Age. Over nearly all of the North American continent north of the 40th parallel and over a vast tract of the work of moving ice sheets or glaciers, rock surfaces have been ground and polished, great boulders have been carried long distances from the ledges whence they came, and the topography has characteristically rounded outlines. Since the marks of the ice chisel are plainly visible on hard rocks, and even on easily weathered rocks that have been protected by a thin layer of soil, it is evident that the ice finished its work recently.

Effects of Glaciation.— At the opening of the Glacial Period most of the land surface over which the ice advanced was covered by a deep soil grading through partly decayed rock into solid rock. Undoubtedly the ice did not level off the general surface of the country as much as has been supposed, but it wiped off the soil and partly decayed rock, rounded the outlines of hills, broadened north and south valleys and pushed before it or carried along a mass of detritus which formed whenever the ice stopped its advance, a terminal moraine. It is possible that clay and boulder were laid down in a thin sheet under the ice in places at least, forming what is known as boulder clay or till, near where was the southern edge of the ice, oval hills of clay and boulders known as drumlins. Other deposits were formed along the edge of the ice, from material worked over by water and known as stratified drift. These deposits include irregular hills of sand, gravel, and boulders, called kames, and long winding ridges of the same material called eskers. These latter are supposed to represent the filled channels of subglacial rivers. The irregular depressions known as pot holes, in a glaciated region, may sometimes represent where were isolated masses of ice when glacial detritus was deposited all around as the ice sheet retreated. It is in fact in the retreat of the ice front that topography was most modified, the terminal moraines, at each pause in the retreat, dammed river valleys, while the valleys were filled sometimes to a depth of hundreds of feet with detritus. Between the morainic dams in front and the ice in the rear, great lakes were formed, one of these, Lake Agassiz in Minnesota, the Dakotas, and Manitoba being 700 miles long from north to south. As the glacial retreat was recent, streams have not had time to cut down valleys and so a glaciated region is a region of lakes.

Cause and Duration of the Glacial Period.— Though several theories of the cause of the Glacial Period have been proposed, no one has received general acceptance, and the existence of Glacial periods in past geologic ages is still disputed. Probably there were Glacial periods before the Pleistocene. As to the Pleistocene, there is good evidence for believing that northern North America and probably Scandinavia were much elevated at the close of Tertiary time. This elevation of the land caused so heavy a snowfall that snow lay on the ground all the year round, and glaciers started. Another hypothesis, that of Croll, is that owing to variations in the eccentricity of the earth's orbit around the sun the hemisphere having winter when the earth was farthest from the sun, would for a period have protracted winters, and during this period great masses of ice might accumulate. Whatever the cause, the ice sheets formed and advanced. In North America three centres of glaciation are generally recognized, the Cordilleran, along the Rocky Mountains in British Columbia, whence the ice flowed eastward possibly 1,000 miles or more; the Keewatin, near Hudson Bay, whence the ice advanced southwest, south and southeast, reaching as far south as Iowa; and the Laurentide, north of the St. Lawrence River and in Labrador, whence the ice advanced over eastern Canada, New England, and the Central States as far west as the Mississippi River. These ice sheets did not advance simultaneously, but probably in the order named. Their retreat was accompanied or preceded by changes of level, until at the close of the Ice Age, during the so-called Champlain stage, or its equivalent, the Columbian, the ocean covered what is now dry land, and the climate was milder than now. The ice did not advance nor retreat steadily. Some geologists recognize in the Mississippi valley four or five advances and corresponding retreats, and speak of these as epochs or stages. The time since the close of the Ice Age has been variously estimated; average estimates being around 20,000 years. There is good evidence for believing that as much time elapsed between some of the advances of the ice. Hence it is sometimes said that we may be living to-day in an Inter-glacial Period. It is certain that man was in Europe in what is known as the Chellean Epoch, or early Pleistocene. He may have been in America at the same time, but no certain evidence of his presence has been found.

SAMUEL SANFORD,
Engineering and Mining Journal.

Glacier Bear, a small gray or "blue" bear (*Ursus emmonsi*) of the St. Elias Alps, Alaska. See BEARS.

Glacier, a current of ice derived from snow. Water, changed into vapor by sun-heat and carried by the winds over frosty highlands, is crystallized into snow. Glaciers take their rise in regions which lie above the snow-line. Upon these regions, from their geographical position and elevation, the quantity of snow that falls exceeds the quantity melted and evaporated. The surplus, instead of accumulating indefinitely, is changed by the pressure of its weight into ice, which, though hard and apparently as brittle and inflexible as glass, flows down toward the sea in beautiful swaying undulating lines, as if soft like honey or tar. Thus the overburdened regions above the snow-line are relieved and a continuous circulation is maintained,— ocean water flying away through the air in the form of vapor, but in returning creeping along the ground in the form of ice, grinding and crushing the rocks that lie in its way, and leaving a heavier track than anything else that moves on the face of the earth.

In general a glacier flows like a river, and drains off snow as a river drains off rain. At different places it moves at different rates, not only along its cross-sections, but along its length and from surface to bottom, as friction and the declivity of its bed varies. The velocity of the swiftest parts of the largest glaciers of the Alps is about from one foot to three feet per day; of the smallest, about as many inches. The lower central part of the Muir Glacier of Alaska flows about 10 feet a day. Some of the Greenland glaciers are said to flow much faster. Glacier motion, however slow, is continuous. It is less in winter than in summer, and slightly less in frosty nights than in warm and rainy days.

Crevasses.— Though obedient to the laws of liquid motion in general, a glacier refuses to stretch, as is shown by its breaking sharply asunder at right angles to tension strains, thus forming the so-called transversal, longitudinal, marginal, and *bergschrund* crevasses. The first two are caused by unevenness of the channel, the marginal by differential motion, the *bergschrund* by the glacier flowing away from the motionless snow attached to the head of its basin. The last is of course a feature of all glaciers; so are the marginal crevasses, since the middle of all glaciers flows faster than the sides; but large central areas, where the bed is regular in slope or slightly concave, are free from crevasses. The largest crevasses are several miles long, 1,000 feet deep or more, and 30 or 40 feet wide, though at first they are usually too narrow to admit a knife-blade. In some places all sorts of crevasses are interlaced, forming labyrinths of yawning gulfs defying the skill and will of the bravest mountaineer who tries to hew a way through them.

Regelation.— The brittleness of ice, with its flowing motion, is partly explained by regelation. In 1850 Faraday discovered that when two pieces of thawing ice are placed together they freeze at the points of contact. Snow at a temperature of 32° F., stuffed into a mold and squeezed, becomes transparent ice. So also fragments of ice pressed in a mold break, are crushed, and recongealed into a solid mass of the form of the mold, illustrating the breaking of glaciers and their regelation when from change of position the sides of the chasms, great or small, are pressed together.

Moraines.— The life of a glacier is one eternal grind. Its draining streams are always milky with rock mud rubbed off its bed, and separated from the large detached masses by the waters. Moraines, lateral, medial, and terminal, are the general detritus of a glacier and the weathered heights about it, drawn out and arranged by the ice currents, and located as their names indicate. The medial moraines, of which each glacier has one fewer than the number of its tributary glaciers, are formed by the union of two laterals at the confluence of the tributaries, and extend down the trunk in beautiful order. The terminal moraine is made up of parts of all the others. The moraine material, clay, sand, and boulders, of the great continental glaciers of the Ice Age, is often called drift. The detached rock masses, borne along by the ice currents and left in the terminal moraines, or if the glacier reaches the sea, dropped perhaps hundreds of miles away by icebergs, are called erratics.

The most striking features of large glaciers are the medial moraines, the lakes and streams on its surface, the wild ice cataracts corresponding to the cascades and rapids of rivers, and the discharging frontal wall, with its icebergs upheaving, sinking, and roaring amid eternal thunder. Glaciers vary widely in size and form; they may be classified as follows:

(*a*) Continental glaciers, of which only two now exist, the Greenland and South Polar ice caps.

(*b*) Glaciers of the first order, which are more or less river-like, flow into the sea, and terminate in berg-discharging ice cliffs.

(*c*) Glaciers of the second order, which approach the sea, but do not enter it, and of course do not discharge icebergs, waste from melting and evaporation equaling the snow supply.

(*d*) Glaciers of the third order, residual branches of those of the second, separated and made independent by the melting away of the trunks to which they belonged. Nearly all the glaciers of the world are now of this order.

Distribution of Glaciers.— Most of the glaciers of North America are distributed along the mountain ranges of the Pacific coast between lat. 36° 30′ and 36°. About 65 small residual glaciers a mile or less long still linger on the Sierra Nevada of California between lat. 36° 30′ and 38°, at an elevation of 11,000 to 12,000 feet above sea-level. Groups of larger glaciers drain the snow-fields of Mount Shasta and the high volcanic mountains of the Cascade Range in Oregon and Washington. From ice-crowned Mount Rainier, 14,600 feet high, eight glaciers, 5 to 10 miles long, descend into the forests to within 3,000 and 4,000 feet of sea-level. The

GLACIERS.

1. Small Residual Glacier. 2. Front of Columbia Glacier.

broad, lofty mountain chain extending along the coasts of British Columbia and southeastern Alaska is generally ice-laden; the upper branches of the main cañons are occupied by glaciers, which gradually increase in size and descend lower, up to the highest and snowiest region of Alaska between lat. 56° and 61°, where a considerable number flow into arms of the sea. This is the region of greatest glacial abundance on the continent. To the north of lat. 61° the glaciers gradually diminish in size to about lat. 62° 30′ or 63°. Beyond this, to the north end of the continent, few if any glaciers now exist, the ground being comparatively low and the snowfall light.

Glaciers of the third order, a mile or two to 15 or 20 miles long, fill the uppen cañons and hollows of the highest region in countless thousands.

The large glaciers of the second order number about 100. They are distributed along the coast from the mouth of the Stickeen River to Cook Inlet and the Alaska Peninsula, pouring their majestic floods from far-reaching fountains in the white recesses of the peaks. The expanded fan-shaped ends of many of this order are from two to four or five miles wide. The largest among these are the Malaspina Glacier, the Miles, Yakutat, Grand Plateau, Crillion, and La Pérouse, fronting the sea along the St. Elias and Fairweather mountains. The Malaspina is the largest of them all, being about 20 miles long and 65 or 70 miles wide,— a grand undulating ice prairie sloping gently from the base of the St. Elias Mountains, and separated from the sea by a girdle of forested moraines five or six miles wide, except at Icy Cape, where it presents bluffs of pure ice that are being undermined by the waves. The La Pérouse also presents ice bluffs to the open ocean, which at high tide are wave-washed, and small bergs are occasionally detached; but far the greater number terminate a mile or two from the tide line, back of moraines in rather low-spreading crevasse-gashed brows, over which one may easily climb.

The great glaciers of the first order flowing out into deep ocean water and discharging fleets of icebergs number about 31. One, the southmost, flows into the Le Conte Fiord in lat. 56° 50′. 4 into branches of Holkam Bay, 1 into Taku Fiord, 9 into the Glacier Bay fiords, 2 into Lituya Bay at the base of Mount Fairweather, 3 into Disenchantment Bay, and 11 into the wild fiords of Prince William Sound the northmost being a little above the 61st parallel.

The scenery of these fiords is of the grandest description. From wall to wall they are encumbered, often jambed with icebergs, which by the most active glaciers are discharged at intervals of a few minutes with thundering roaring that may be heard 5 or 10 miles away, proclaiming the restless work and power of these mighty crystal rivers, in striking contrast with the dead silence of those of the second order, though they also, except at their decaying ends, are ceaselessly flowing and grinding.

Glacier Bay is the iciest of the inlets which fringe the coast. Both to the north and south of it the glaciers are generally less lavishly snow-fed, and of course give birth to fewer icebergs. Of its nine glaciers of the first order, the Muir is the largest. It is about 50 miles long, the main trunk below the confluence of the principal tributaries is about 25 miles wide and probably about 1,500 feet deep. The berg-discharging part of the sea-wall is less than two miles wide, rises above the water to a height of 250 to 300 feet, and sinks to a depth of about 700 feet.

The grandest of the Prince William Sound glaciers are the Columbia, Barry, Harvard, Yale, and Harriman. Some of the smallest of the noble company descend flowery mountain-sides in the wildest and most imposing ice-cataracts.

Residual glaciers from a mile to 10 or 12 miles long, including neve, are distributed throughout the Rocky Mountain ranges from lat. 43° to 53°. The greater number lie between 50° and 52° 30′ at the heads of the Saskatchewan, Athabasca, and Columbia rivers. The largest groups are magnificent rags and patches of an ancient ice-sheet, some of them covering an area of 40 to nearly 100 square miles, and sending down river-like glaciers six to eight miles long.

Glaciers of the third order abound on the Alps, the Pyrenees, the Caucasus, the Scandinavian Peninsula, the Andes, the lofty snowy ranges of Asia, and on the mountains of New Zealand.

More than 1,000 with an area of about 1,200 square miles, have been surveyed and named in the Alps. The largest are river-like, 10 to 15 miles long, descend into the forests, and terminate at an elevation of 4,000 to 6,000 feet. Most of the smaller ones are like masses of pure snow, and terminate about 2,000 feet higher.

The Caucasus is perhaps about as heavily ice-laden as the Alps. Few of its glaciers are known to descend much lower than 6,000 and 7,000 feet. Those of the Pyrenees are comparatively small.

Many of the glaciers of Norway pour grandly down from extensive neve fields to within 1,000 feet of the sea-level. A few approach the shore and may rank as glaciers of the second order, while one, the only one in Europe of the first order, discharges into Jokul Fiord, near the 70th parallel. Between the larger glaciers flowing toward the heads of the fiords there are many hanging and cascading glaciers, ranged along the brows of plateaus, some of which pour over precipices in separate bergs with loud roaring like that of glaciers discharging into the sea. At the foot of the cliffs the battered fragments are welded, and thus these wild ice-streams, after their plunge through the air, are made whole again, and flow quietly on their way as "regenerated glaciers," the space between their upper and lower parts being only a wider kind of crevasse.

The low-descending New Zealand glaciers almost rival those of the Alps in size, while their beauty is greatly enhanced by the rich vegetation through which they flow.

The glaciers of South America are distributed along almost the whole extent of the Andes. According to Whymper those under the equator attain their greatest size on the snow-laden, storm-beaten summits of Antisana, Cayambe, and Chimborazo. On Cayambe, 12 glaciers of considerable size were counted, flowing from the central neve reservoir, descending to about 15,000 feet above sea-level. To the south of lat. 46° many approach the sea.

On the lofty mountain chains of Asia, especially the snowy Himalaya, Karakoram, Hindu-

Kush, Kuen-Lun, and Thian-Shan, thousands of little known residual glaciers still exist. The largest which have been explored are the magnificent Biafo and Baltoro Karakoram glaciers, 30 and 35 miles long, descending to about 11,500 and 12,000 feet.

Excepting Australia, which seems to have lost all its glaciers, Africa is glacially the poorest of the continents. Its only known glaciers are those of the two great snowy mountains, Kenia and Killimanjara, near the equator.

The Arctic islands — Jan Mayen, Nova Zembla, Spitzbergen, Franz-Joseph Land, and many others — are heavily ice-laden. Their largest glaciers are broad sheets discharging magnificent bergs into the frozen sea.

But it is on Greenland and the South Polar lands that glacier ice reaches its grandest development. Excepting a narrow interrupted strip around its shores, Greenland lies buried beneath a continuous mantle of ice thousands of feet in thickness, through which only the tops of its highest peaks, called «nunataks,» protrude. From this ice-cap huge glaciers pour into the sea, discharging icebergs of enormous dimensions, some of which sail into the Atlantic thousands of miles from home.

Still greater is the South Polar ice-cap, probably over two miles in thickness. The sea front of some of the glacier currents it pours forth are from 100 to over 400 miles wide, from which flat-topped island-like icebergs 5 to 10 miles long are discharged. Here the great cosmical winter of the Glacial Period still exists in severe, serene grandeur.

Greater Extension of Glaciers.— That a great part of the earth in both the northern and southern hemispheres, now warm and fruitful, was recently covered by flowing, grinding ice, is well known. Over the eastern half of North America from the Arctic regions to lat. 40° or lower, moraines and beds of moraine material variously modified, grooved, scored, and polished surfaces, with other characteristic traces of glacial action, are displayed in wonderful abundance and uniformity.

Along the mountain ranges of the west side of the continent they extend still farther south. The broad Rocky Mountain chain and the plains along its flanks abound in glacial traces on a grand scale. On the Sierra Nevada polished and striated rock surfaces the most evanescent of glacier inscriptions may still be found as far south as lat. 36°; while a degree or two farther north, at an elevation of 7,000 to 8,000 feet above the sea, there are broad glacier pavements in so perfect a state of preservation that they reflect the sunbeams like glass and attract the attention of every observer.

Over the greater part of Oregon, Washington, British Columbia, and the Arctic and sub-Arctic regions about Bering Sea and northwestern Alaska, the rocks in general are less resisting, and the weathering they have been subjected to is more destructive. Therefore the superficial records of glaciation are less clear in these northern regions than in California.

But in all glaciated regions there are other monuments of ice action which endure for tens of thousands of years after the simpler traces we have been considering have vanished. These are the sculpture and configuration of the landscape in general,— the cañons, valleys, fiords, mountains, ridges, and *roches moutonnées*, the forms, trends, and correlations of which are specifically glacial and almost imperishable. These also, it is true, suffer incessant waste, being constantly written upon by other agents. But because they are so colossal in size and peculiar in form and arrangement they continue to stand out clear and telling through every after-inscription, showing how great the ancient glaciers must have been, and how great are the geographical and topographical changes they have produced. On the Atlantic coast, where man is busiest, even in the parks and gardens of New York, glaciated rocks shine and call attention to the story of the Ice Period; and in orchards growing on moraine soil around the town of Victoria on the west side of the continent, fruitful boughs drop apples and peaches on the edges of glacier pavements, while the harbor rocks are still bright notwithstanding the centuries of wave-action they have been subject to. Thus strikingly are the works of ice displayed beside the works of man; yesterday in nature's chronology our continent now so fertile was a dreary wilderness of ice. No tale of fairyland is so exciting to the imagination as the story of the works and ways of snow-crystals banded together as glaciers and marching forth from their white tents on the highlands to develop earth's beauty, make beds of fertile food-soil, basins for lakes, valleys for rivers; to separate continents and sculpture their shores into countless islands, bays, sounds, and fringing fiords, then vanishing like clouds.

This change from icy darkness and death to life and light was slow as we count time, and is still going on wherever glaciers exist. The great winter of the Glacial Period is giving place to a great summer before which all the glaciers of the world are wasting away,— the Polar ice-caps, as well as the small shrinking remnants. All are shorter, narrower, shallower than they once were. The world is growing warmer, the snow-supply diminishing. But in trying to account for these changes we must bear in mind that the same sunshine that wastes glaciers nourishes them. In the formation of glaciers an enormous amount of sun heat is required to produce the vapor for the snow of which they are made. For the structure and physics of glaciers, see Agassiz, 'Système Glaciale'; J. D. Forbes, 'Travels in the Alps'; and 'Norway and Its Glaciers'; Tyndall, 'Glaciers of the Alps.'

John Muir,
Geologist, Explorer, and Naturalist.

Glad'den, Washington, American Congregational clergyman: b. Pottsgrove, Pa., 11 Feb. 1836. He was graduated at Williams College in 1859; ordained in the Congregational Church, and after several other pastorates became pastor of the First Congregational Church in Columbus, Ohio, in 1882. He is widely known as a writer on social reforms. His publications include: 'Plain Thoughts on the Art of Living' (1868); 'Workingmen and Their Employers' (1876); 'The Christian League of Connecticut' (1883); 'Things New and Old' (1884); 'The Young Men and the Churches' (1885); 'Applied Christianity' (1887); 'Parish Problems' (1888); 'Burning Questions' (1889); 'Who Wrote the Bible' (1891); 'Tools and the Man' (1893); 'Social Facts and Forces' (1897); 'Art and Morality'

(1897); 'The Christian Pastor' (1898); 'How Much is Left of the Old Doctrine' (1899); etc.

Gladiators (Lat. «swordsmen»), combatants who fought at public games in Rome for the entertainment of the spectators. Gladiators were first exhibited at Rome in 264 B.C., by Marcus and Decimus Brutus at the funeral of their father; and the custom probably originated in Etruria, where a slave was killed at his master's pyre. Gladiators also fought at public festivals and other entertainments. They were at first prisoners, slaves, or condemned criminals; but afterward freemen fought in the arena, either for hire or from choice. Under the empire persons of senatorial rank, and even women, fought in the arena. The regular gladiators were instructed in schools («ludi») established for this purpose. The overseer of the school («lanista») purchased the gladiators, trained them and rented them to those who gave games to the people. Men of position, especially such as aimed at popularity, sometimes kept gladiatorial schools of their own, and hired lanistæ to instruct them. The gladiators fought in the schools with wooden swords. The games were commenced by a «prælusio,» in which the combatants fought with their weapons o wood till, upon a signal, they assumed their arms, and began in earnest to fight in pairs. In case the vanquished was not killed in the combat, his fate was decided by the people. If they decreed his death, the thumb was held up in the air; the waving of handkerchiefs was the signal to save him. In general they suffered death with wonderful firmness, and the vanquished often exposed himself to the death-blow. If he wished to appeal to the people he raised his hand. When a gladiator was killed attendants dragged his body away with iron hooks. The gladiators were often released from further service, and presented with wooden swords, as badges of freedom, from which they were called «rudiarii.» The gladiators were divided into classes, according to their mode of fighting: the «andabatæ» fought blindfold; the «catervarii» fought in troops; the «essedarii» fought in chariots, like the Gauls and Britons. Other classes were the «retiarii,» armed with net and trident but unprotected by any armor, their usual opponents being armed as Gauls, and styled «mirmillones.»

The most celebrated gladiatorial statues are: (1) The Gladiator Borghese, a combatant with extended arm in the act of warding off a blow. It is a statue of the first rank, made of fine grained marble, and is now in the capitol, to which it was restored from Paris 1815. (2) The Dying Gladiator, purchased from the Ludovisian collection for the Museum Capitolinum. It is a dying warrior, and not a gladiator, probably, to judge by his «torques» or twisted necklace, a Gaul, who is wounded and is trying to rise.

Gladiolus, glā-dī'ō-lŭs (Lat. «a small sword»), a genus of plants of the order *Iridaceæ;* sword-lily. It received its name from the shape of its leaves. It has bulbous rhizomes, and the stems are leafy and bear beautiful flowers which, in garden culture, open in midsummer. There are nearly 100 species, some of them natives of southern Europe, the greater number being found in South Africa. Gladiolus is largely cultivated in the United States, and Long Island, N. Y., has important fields of it.

Glad'stone, Herbert John, English politician: b. London 7 Jan. 1854. He was educated at Eton and Oxford. He was private secretary to his father 1880–1; under-secretary home office 1892–4; first commissioner of works 1894–5; and Secretary of State for Home Affairs 1905. He sat in Parliament for Leeds 1880–5, and for Leeds West from 1885.

Gladstone, John Hall, English scientist: b. London 1827; d. 6 Oct. 1902. He was Fullerian professor of chemistry at the Royal Institution 1874–7, and a member of the London School Board 1873–94. He published: 'Life of Michael Faraday' (1872); 'Spelling Reform from an Educational Point of View' (1878); 'Chemistry of Secondary Batteries' (1883).

Gladstone, William Ewart, English statesman, orator, and author: b. Liverpool 29 Dec. 1809; d. Hawarden, England, 19 May 1898. He was educated at Eton and at Christ Church, Oxford. He had distinguished himself greatly as a speaker in the Oxford Debating Society and soon became known as a young man of promise, who would be able to render good service to the Conservative party. He was invited to contest the Scottish burgh of Newark and was elected. He delivered his maiden speech and made a decided impression on the House of Commons. In December 1834 Sir Robert Peel appointed him to the office of a junior lord of the treasury. The great struggle on the question of the repeal of the Corn Laws was now going on. It is a somewhat curious fact that he was not in the House of Commons during the eventful session when the great battle of free trade was fought and won.

Up to the time of the abolition of the Corn Laws, or at least of the movement which led to their abolition, he had been a Tory of a rather old-fashioned school and in 1847 represented Oxford in Parliament. He startled Europe and indeed the whole civilized world in 1851, by the terrible and only too truthful description which he gave in 1851 of the condition of the prisons of Naples, under the king who was known by the nickname «Bomba,» and the cruelties which were inflicted on political prisoners in particular.

By the death of Sir Robert Peel in 1850 he had lost a trusted leader and a true friend. But it was not until after Peel's death that he compelled the House of Commons and the country to recognize in him a supreme master of parliamentary debate. The first really great speech made by him in Parliament was made in the debate on Mr. Disraeli's budget in the winter of 1852, the first session of the new Parliament.

On the fall of the short-lived Tory administration Lord Aberdeen came into office and formed the famous coalition ministry. Lord Palmerston took what most people would have thought the uncongenial office of home secretary; Lord John Russell became secretary of foreign affairs. Gladstone was chancellor of the exchequer. His speech on the introduction of his first budget was waited for with great expectation; but it distanced all expectation. A budget speech from Gladstone thereafter came to be expected with the same kind of keen artistic longing as waits the first performance of a new opera by some great composer.

The Crimean war broke up the coalition ministry. A motion by Roebuck for inquiry into the condition of the army before Sebastopol was carried by a large majority against the government. Lord Aberdeen at once resigned. Lord Palmerston was the one indispensable man, and he became prime minister. Gladstone gave the government of Lord Palmerston a general support, until, after the attempt of Orsini on the life of the Emperor Napoleon III. in 1858; Palmerston introduced his ill-fated Conspiracy to Murder Bill. The government was defeated, Lord Palmerston resigned, and Lord Derby was called on to form a new ministry.

The year 1859 saw Lord Palmerston back again in office and Gladstone as chancellor of the exchequer. The budget of 1860 was remarkable. Gladstone introduced a provision for the abolition of the duty on paper — a duty which was simply a tax on reading, a tax upon popular education and the next session the Lords passed measure for the repeal of the duty. The death of Lord Palmerston in 1865 called Lord Russell to the position of prime minister. Gladstone's mind had long been turning in the direction of an extension or rather expansion of the suffrage. The bill he proposed was defeated (1866), but when Disraeli came into office he introduced a reform bill of his own, which was practically a measure of household suffrage for cities and boroughs.

About this time the attention of Gladstone began to be attracted to Ireland. He made short work with the Irish State Church. He defeated the government on a series of resolutions foreshowing his policy; the government appealed to the country; the Liberals returned to power, and Gladstone became prime minister (1868). In his first session of government he disestablished and disendowed the state Church in Ireland. In the next session he passed a measure which recognized the right of the Irish tenant to the value of the improvements he had himself made. For the first time in English history a system of national education was established. The Ballot Act was passed for the protection of voters. The system of purchase in the army was abolished — by something, it must be owned, a little in the nature of a *coup d'état*. Then he introduced a measure to improve the condition of university education in Ireland. The bill was thrown out and he tendered his resignation of office. Disraeli came back to power, and Gladstone retired from the leadership of the House of Commons (1874).

For a while he occupied himself in literary and historical studies, and he published essays and pamphlets. But even in his literary studies he would appear to have always kept glancing at the House of Commons. The Parliament which had gone from the spring of 1874 was dissolved in the spring of 1880, and Gladstone, after the famous Midlothian campaign had become prime minister once more.

It was an unpropitious hour at which to return to office. There were troubles in Egypt; there was impending war in the Sudan, and in South Africa. There was something very like an agrarian revolution going on in Ireland; and the Home Rule party in the House of Commons was under new, resolute, and uncompromising leadership. It is to the credit of the Conservative party that after a while they co-operated cordially with Gladstone in his reforming of 1885.

The use he made of office and power astonished his enemies, and startled and shocked not a few of his friends. His government had had in the years between 1881 and 1884 to fight a fierce battle against the policy of obstruction organized by Parnell, the leader of the Home Rule party. But when the elections under the new and extended Reform Bill were held, and the Irish Nationalist party came back 87 members out of the whole Irish representation of 103, in March 1886 he brought in a measure to give a statutory parliament to Ireland. In 1893 his Home Rule Bill was carried in the House of Commons, but was thrown out in the House of Lords. Owing to the increasing infirmities of age, especially impaired eyesight, the veteran statesman resigned 3 March 1894, and was succeeded by Lord Rosebery. He still took an interest in public affairs and busied himself with literary work. In January 1898 he published his reminiscences of Arthur Hallam; but falling seriously ill, after some months of suffering borne with noble fortitude, he died at Hawarden. He was buried in Westminster Abbey. Among Mr. Gladstone's works are: 'The State in its Relations with the Church' (1838); 'A Manual of Prayers from the Liturgy' (1845); 'Two Letters on the State Persecutions of the Neapolitan Government' (1851); 'Studies on Homer and the Homeric Age' (3 vols. 1858); 'A Chapter of Autobiography' (1868); 'Juventus Mundi' (1869); 'The Vatican Decrees, bearing on Civil Allegiance' (1874); 'Vaticanism' (1875); 'Homeric Synchronism Gleanings of Past Years' (7 vols. 1879); 'The Irish Question' (1886); 'A Translation of Horace' (1894); and 'The Psalter with a Concordance.'

Glagolitic (glag-ō-lĭt'ĭk) **Alphabet**, a Slavvonic alphabet classed as ancient Bulgarian. There is a MS. of the 11th century written in this alphabet in the Vatican, containing extracts of the Gospels for each day in the year; there are extant also three other MSS. written in the same letters.

The origin of this alphabet is undiscoverable. It is older than the Cyrillac; it may be a modification of Greek cursive writing; perhaps it is connected with Armenian and Albanian alphabets. Its use is confined to the liturgical books of Dalmatian Slavs. Cyril, a monk of Constantinople invented the Cyrillac alphabet, of which this has sometimes been considered a variant. Both of these differ from the current Russian alphabet.

Glagolitsa. See Glagolitic Alphabet.

Glair (Lat. *clarus*, clear, Fr. *clair*), the white of eggs prepared and used as a varnish for preserving paintings. For this purpose it is beaten to an even consistence, and commonly mixed with alcohol to make it work more freely, and with a little fine sugar to give it body and prevent it cracking, and then spread over the picture with a soft brush. Bookbinders also use it for finishing the leathern backs of books.

Glaisher, glā'shėr, **James Whitbread**, English meteorologist: b. Lewisham, Kent, 7 April 1809; d. Croydon, Surrey, 7 Feb. 1903. In 1840 he became superintendent of the magnetical and meteorological department of the Royal Ob-

WILLIAM EWART GLADSTONE.

servatory, a post which he held for 34 years. Between 1862 and 1866 he made 28 balloon ascents for the purpose of studying the higher strata of the atmosphere, on one occasion reaching a height of over seven miles. He was the founder of the Royal Meteorological Society, became a Fellow of the Royal Society in 1849, and wrote numerous papers on subjects relating to astronomy and meteorology.

Glance, English equivalent of the German *glanz*, a term applied to opaque minerals of which the high lustre and color indicate their metalliferous character. The following are some of them: *Antimonial copper-glance*, or wölchite, sulphide or antimony, copper, and lead, with a little iron; *antimony-glance*, or stibnite, sulphide of antimony; *bismuth-glance*, or bismuthinite, sulphide of bismuth; *cobalt-glance*, or cobaltite, sulph-arsenide of cobalt sometimes with a little iron, also nickel and antimony; *copper-glance*, sulphide of copper; *glance-blende*, or manganese blende, sulphide of manganese; *glance-coal*, anthracite; *iron-glance*, or specular iron, oxide of iron; *lead-glance*, sulphide of lead or galena; *nickel-glance*, amoibite or gersdorffite, arsenide and sulphide of nickel, with cobalt, iron, etc.; *silver-glance*, sulphide of silver; *yellow-gold-glance*, or sylvanite, telluride of gold and silver; *zinc-glance*, silicate of zinc. German miners use almost indifferently the term *glanz* and *kies*, the latter signifying pyrites, as iron pyrites, copper pyrites; but glance is not so frequently used among American and English miners, though copper-glance, antimony-glance, are sometimes employed by scientific men as well as in the mines.

Glan'ders, the most dangerous form of equinia, and one of the most formidable diseases to which horses are subject. It is diagnosed by a discharge from one or both nostrils, with a hard enlargement of the submaxillary glands. It is distinguished into acute and chronic. In acute glanders the discharge from both nostrils is so great as ultimately to impede respiration and produce death from suffocation. Chronic glanders may run on for years before it terminates in the acute form of the disease. The discharge is usually confined to one nostril, is only occasional and sometimes trivial, with a moderate swelling of the gland on the affected side. The only other symptom of disease is a harshness of the coat. In the latter stages the discharge becomes offensive. The disease is highly infectious, and acute glanders may be communicated to healthy horses and asses, while the animal first affected is still able to feed and work apparently as well as ever. It may even be communicated to man by the pustular matter coming in contact with any part where the skin is broken; and not a few deaths have happened through this cause. The disease is often difficult to determine, as the discharge is only offensive in the latter stages. The symptoms may be mitigated by tonics and other treatment, but it is rarely if ever cured. The disease is now known to be produced by a species of bacillus about the size of the tubercle-bacillus. See FARCY.

Glandina, glăn-dī'na, a genus of large spirally elongated snails (q.v.), which attain their maximum development in the southern United States and in Mexico. They include many species, all graceful in outline and beautifully colored. A rosy species (*Glandina truncata*) is common along the coast of Florida and westward, which varies greatly in size according to its circumstances, in favorable localities reaching a length of four inches. These mollusks are most commonly found among the marsh-grasses, where they hunt for and devour other snails by filing through their shells and rasping away the flesh by means of their lingual ribbons. Marine mollusks and other animals are also attacked.

Glasgow, the chief commercial and manufacturing city in Scotland, and as regards population the second in the British Isles, is situated on both banks of the Clyde, about 14 miles from Dumbarton where the river broadens into a Firth; latitude 35° 51′ 32″ N.; longitude 4° 17′ 54″ W. Distance northwest by north of London 348 miles, as the crow flies, and by the various railway routes from 400 to 450 miles; west by south of Edinburgh, by road and rail, from about 42 to 50 miles; south of Inverness 206 miles by rail. The original city was wholly in Lanarkshire but was extended into Renfrewshire. By statute the whole municipal area (12,796 acres) is now in Lanarkshire, and for certain administrative purposes that area forms by itself the County of the City of Glasgow.

Topography.— In prehistoric times, though subsequent to the appearance of man in the district, the lower part of the Clyde valley, including a large portion of the site occupied by the modern city, formed the bottom of an estuary, as is evidenced by the discovery of canoes as well as marine shells and other organisms in localities at a considerably higher level than the existing water-way. A very different condition of things existed when, in the 16th and 17th centuries, documentary evidence is procurable. Owing to shoals, produced by rock and other obstructions, no vessels other than small boats could then come within 12 miles of Glasgow. Deepening of the channel was commenced in the middle of the 18th century, and this and other improvements for facilitating navigation have since been prosecuted with such success that for a long time the largest trading vessels have had free access to the harbor at Broomielaw.

Glasgow streets are in general wide and straight. This is now the case even in the older portions of the city, the operations of the Improvements Trustees, under their act of 1866, having removed most of the buildings bordering on narrow thoroughfares and substituted spacious streets for the former overcrowded lanes. At first the citizens got building material, consisting of a light-colored freestone, within their own lands, and similar supplies were subsequently procured from quarries in the neighborhood; but a red sandstone brought from a distance is now being freely employed. Brick is seldom used in street frontage. Substantial masonry, combined with architectural beauty and amenity, generally prevails throughout the city.

Bridges.— The north and south sides of the river Clyde are connected by bridges and ferries at convenient intervals, and there is likewise a tunnel under the river Clyde for the accommodation both of pedestrians and vehicular traffic. The bridges are (1) the Caledonian Railway bridge, giving access to the Central Station; (2) Glasgow or Broomielaw bridge, 80 feet broad, in line with Jamaica street, rebuilt in 1899, the features and materials of Telford's earlier bridge of 1833-6 being retained; cost $500,000; (3) Portland Street suspension bridge; (4) Victoria bridge, erected in 1851 to replace the old Glasgow bridge, supposed to date from the 14th century; (5) the Glasgow and South-Western Railway bridge leading into Saint Enoch's Station; (6) the Albert bridge built in 1871 of stone and iron, in line with Saltmarket and Crown Street; cost $280,000; (7) Saint Andrew's suspension bridge and (8) Polmadie bridge, both communicating with Glasgow Green; (9) Rutherglen bridge, 60 feet wide, three granite arches, opened in 1896; cost about $367,500; and (10) Dalmarnock bridge. There are also several bridges over the river Kelvin and other streams within the city.

Parks.—Glasgow Green, superseding a smaller space known as the Old Green, though incorporating a portion of ancient burgh territory, was mainly formed on lands acquired in 1662 and subsequent years, but was not specially laid out as a public resort till the beginning of the 19th century. Since that time it has been chiefly used as a public park. Area 136 acres. One of the attractions is the People's Palace and Winter Garden, opened in 1898. The following are the other city parks, with the dates of acquisition and areas:—Kelvingrove Park, intersected by the river Kelvin (1857-97) 85 acres; Queen's Park, embracing an old British camp and part of the site of the battle of Langside (1857-94) 148 acres; Alexandra Park (1871-91) 104 acres; Cathkin Park, gifted by James Dick (1886) 49 acres; Ruchill Park (1892) 53 acres; Bellahouston Park (1895-1903) 185 acres; Tollcross Park (1897-1900) 83 acres; Richmond Park (1898) 44 acres; Springburn Park (1892-1900) 76 acres; Maxwell Park, gifted by Sir John Maxwell (1890) 21 acres; Rouken Glen Park, gifted by Mr. A. Cameron Corbett, M. P., (1905) 136 acres; Botanic Gardens, with extensive ranges of hot-houses and green-houses (1891-1901) 50 acres. Mr. Cameron Corbett has also gifted to the citizens the mountainous estate of Ardkinglas in Argyllshire, containing upwards of 14,000 acres.

Monuments, etc.—In George Square are statues of Queen Victoria, Prince Albert, James Watt, Lord Clyde, Robert Burns, Dr. Livingstone, Sir John Moore, Mr. Gladstone, and others, and in the centre a tall fluted Doric column surmounted by a statue of Sir Walter Scott. An equestrian statue of King William III. stands near Glasgow Cross, a similar statue of the Duke of Wellington is placed in front of the Royal Exchange in Queen Street, an obelisk to Nelson and the highly ornamental Doulton fountain are conspicuous in Glasgow Green, John Knox has a tall monument in the Necropolis, and a memorial pillar is erected on the site of the battle of Langside, where Queen Mary's chance of regaining the crown was finally lost.

Buildings.—The oldest as well as the most interesting and picturesque building is the Cathedral, erected piecemeal in and between the 12th and 16th centuries, mainly in the early English style but marked by individuality. It contains nave, aisles, transepts, choir, and crypt or lower church with chapter-house and Lady-chapel. Length of building 319 feet; breadth 63 feet; height of nave 90 feet and of choir 85 feet; height of central spire from floor of nave 217 feet. Two western towers were, under what is now regarded as a grievous error of judgment, removed in 1846 and 1848, respectively. In the vicinity of the Cathedral were the residences or manses of the 32 canons, all of which buildings have now disappeared with the exception of the manse which was occupied by the prebendary of Provan. This pre-Reformation dwelling, the oldest in Glasgow, is still occupied. The Cathedral belongs to and is maintained by the Crown, but the choir is used as one of the 10 city churches belonging to the municipal corporation, and the latter keep up the fittings connected with the religious services. Several of the other churches, belonging to different denominations, are of high architectural merit. Among other conspicuous buildings are those of the University, occupying about four acres of elevated ground, overlooking Kelvingrove Park. Consisting of an oblong rectangular pile, in the Collegiate Gothic style of the 14th century, and having a tower and open-work spire about 300 feet high, the new premises were opened in 1870, replacing the old college which stood in High Street on a site obtained shortly after the foundation of the original "Pedagogy" in 1451. At a short distance, on the opposite side of the River Kelvin, is the United Free Church College, built in the Italian style, with a high tower; and still nearer to the college, within the bounds of the Park, the new Art Galleries have been erected. Saint Andrew's Halls, for concerts and other public gatherings, were erected by private enterprise but were acquired in 1890 by the corporation who are at present using the adjoining ground for the erection of a fine building for their Mitchell Library. Besides the older City Hall in Candleriggs Street, the corporation possess other halls throughout the city for the accommodation of the respective districts. The City Chambers, in the Italian Renaissance style of architecture, and occupying the whole of the east side of George Square, with a central tower 216 feet high, were erected under the authority of an act of Parliament obtained in 1878 and were formally opened by Queen Victoria in 1888 though not occupied till the following year. Cost of site, buildings, and furnishings about $2,756,000. Also abutting on George Square are the General Post-Office, the Bank of Scotland, and the Merchants' House; and a few paces off, in George Street, is the partially erected Glasgow and West of Scotland Technical College, the foundation stone of which was laid by the King in 1903. Of other buildings throughout the city may be noted the Royal Exchange, in the Corinthian style, surrounded by a circular clock tower; the Stock Exchange, in the Byzantine style, the Athenæum buildings, the Deaf and Dumb Institution, the Christian Institute, the Royal Infirmary (the reconstruction of which is proceeding), and the Western and Victoria Infirmaries, the Hotels connected with Saint Enoch's Station and Central Station, and the Hall belonging to the Faculty of Procurators.

Libraries.—The principal libraries are (1) the University Library (founded in the 15th century) 220,000 volumes; (2) public libraries administered by the corporation, comprising the Mitchell Library (largest public reference library in Scotland) 175,000 volumes, with 16 district libraries (for defraying cost of which Mr. Andrew Carnegie gifted $500,000) each 8,000 to 12,000 volumes; (3) Stirling's Library (established 1792) 25,000 volumes; (4) Baillie's Institution Library, 22,000 volumes; (5) United Free Church College Library, 25,000 volumes; (6) Libraries of Faculty of Physicians and Surgeons, Faculty of Procurators, Glasgow Athenæum, and Royal Philosophical Society. There are also numerous libraries in connection with scientific and other societies, churches, etc.

Art Galleries.—The corporation may be said to have begun its collection of works of art in 1670 when portraits of Kings Charles I. and II. were ordered from London. Portraits of other sovereigns were subsequently procured and were hung in the Council Hall; but it was not till about the year 1856, when the town council acquired the exhibition galleries and pictures which had belonged to Baillie Archibald M'Lellan, that the gallery and museum enterprise in Glasgow took definite shape. In consequence of many munificent donations and of judicious purchases, the collection became more and more valuable and rapidly increased, necessitating the finding of additional accommodation. This object was attained when the new Art Galleries in Kelvingrove Park were occupied in 1902. Cost of construction $1,279,700. Branch art galleries have also been opened at the People's Palace on Glasgow Green (cost of construction, including Winter Garden, $83,375), and at Camphill in the Queen's Park.

Churches.—Churches of the various denominations are well represented, those of the Presbyterian order preponderating, but there are numerous places of worship belonging to the Episcopal Church of Scotland and the Roman Catholics, and the following are also represented:—Episcopal Church of England, Christadelphian, Congregational Union, Baptist, Wesleyan, Children of Zion, Old Scots Independent, Primitive Methodist, Catholic Apostolic, New Jerusalem, United Original Secession, Unitarian, Church of Christ, Friends' Meeting House, German Protestant, German Evangel, etc.

Educational Institutions.—The principal educational institutions are the University already referred to, Saint Mungo's College, the Glasgow and West of Scotland Technical College (including Anderson's College Medical School and Allan Glen's School); the United Free College (for Divinity students); Queen Margaret's College for women, connected with the University; the Glasgow Athenæum, the Glasgow School of Art, the Veterinary College, the West of Scotland Agricultural College, the Training Colleges for Teachers in connection with the Church of Scotland and the United Free Church, the Glasgow Academy, and the Kelvinside Academy, the High School, and others under the School Board, wth several educational establishments conducted by private enterprise.

Charitable Institutions.—Besides the three infirmaries already mentioned, Glasgow has an Eye Infirmary, the Royal Hospital for Sick Children, the Glasgow Samaritan Hospital for Women, the Glasgow Maternity Hospital, the Royal Asylum for the Blind, the Glasgow Institution for the Deaf and Dumb, the Glasgow Royal Asylum at Gartnavel, several minor hospitals and dispensaries, nursing institutions and convalescent homes.

Public Works.—The water supply of Glasgow was originally derived from the nearest streams and wells, and when these sources became insufficient water companies were formed for bringing in supplies by gravitation works and pipes. In 1855 the corporation acquired the works of these companies, at the same time obtaining statutory authority to bring water from Loch Katrine, 34½ miles north of Glasgow. Amount of capital expenditure on water supply to 31 May 1905, $20,199,925. Consumption per head (population of supply area 1,075,000) per day, 34 gallons for domestic purposes and 22½ gallons for trade and public purposes. The gas supply, formerly in the hands of private companies, was taken over by the corporation in 1869. Capital expenditure to 31 May 1905, $18,821,705. Street lighting and the lighting of common stairs, together with street cleansing, the fire brigade, and all matters relating to public health, including the management of fever hospitals, are under the charge of the Police department. In 1890 the corporation obtained statutory authority to supply electricity, and the necessary works having been put in operation, several of the streets are now lighted by that means, and the demand by the public both for lighting supply and motive power has been large and always on the increase. The total cost of the electricity works up to 31 May 1905, was about $6,220,810; there were 11,643 private consumers and 825 public lamps. In 1900 the corporation obtained from the Postmaster-General license to construct and work a telephone exchange over the Glasgow Telephone area, covering about 1 2-3 square miles. A telephone department was forthwith organized, and the work of construction proceeded with. The operating service began in 1901 and has gradually developed, but the National Telephone Company, which was first in the field, has been a powerful competitor for public patronage. Capital expenditure to 31 May 1905, $2,010,925. The undertaking was transferred to the Postmaster-General in 1906. Markets, slaughter-houses, and foreign animals' wharves are managed by the corporation, under a series of acts of parliament, the earliest of which was passed in 1845. The corporation likewise administer the Weights and Measures Acts, and manage several model lodging-houses, baths, and wash-houses, an Inebriates' Reformatory (situated in Ayrshire) and a labor bureau. The navigation of the river Clyde was in the hands of the corporation, exclusively, till 1825, when it was vested in a body of trustees under a constitution which has since been altered from time to time. Substantial changes were made in 1905. An extensive main drainage scheme for the collection and treatment of the sewage of Glasgow and adjacent districts (drainage area about 30 square miles) has been in progress for about 15 years and is expected to be completed within the next two or three years. Estimated cost about $10,000,000.

Railways.—The principal railway systems are the Caledonian, North British, and Glasgow and South Western, all of which have large modern termini in the heart of the city. There are underground railways, a cable subway, with a circular course passing twice under the river Clyde, and having convenient stations for various parts of the city. In 1894 street tramways, formerly worked by a company, were converted by the corporation into a municipal enterprise. In 1901 the whole system was changed from horse to overhead electric traction; existing length 160 miles of single track, and extensions proceeding; total capital expenditure to May 1906, $13,816,905; revenue to 31 May 1905, $3,839,520; net profit, $591,490; passengers for a year, 195,767,519, at fares of a cent and upwards.

Industry and Commerce.—Glasgow is one of the greatest industrial centres of the kingdom, and among its older industries are those connected with cotton, linen, and wool, including spinning and weaving, bleaching, calico printing, lace making, and Turkey-red dyeing. But of late years the progress of textile manufactures has been slow compared with the rapid development of the iron and steel industries. Mechanical engineering, marine engineering, and ship-building, with their connected trades, are in extensive operation while chemical industries, the manufacture of glass and pottery and brickmaking are also actively prosecuted. Some 300,000 tons of shipping are usually built in Glasgow yearly. The commerce of the city is commensurate in extent with the importance of its manufactures. The value of foreign and colonial produce imported in 1904 amounted to $69,730,030, that of home produce exported was $101,968,090. The rental of Glasgow in 1905–6 was $28,852,850. The combined local rates, imposed on owners and occupiers together, amount to about one-third of the rental.

Banks.—All the leading banks of Scotland are represented in Glasgow by numerous branches, and the Union Bank of Scotland and the Clydesdale Bank have their head offices here; as also have the Scottish Amicable, the City of Glasgow, and other Insurance Companies.

Government.—Municipal affairs are administered by a Town Council whose statutory designation is "the corporation," consisting of 78 members elected by the voters in 26 wards (numbering *in cumulo* 165,766), with the Dean of Guild (elected by the Merchants' House) and the Deacon-convener of the Trades (elected by the Trades' House) as *ex officio* members. The Lord Provost, 14 bailies, a River bailie, and deputy River bailie, a treasurer (honorary) and a master of works (honorary) are chosen by the councillors from their own number.

History.—The origin of Glasgow and its earliest community is beyond the reach of history. Joceline, the 12th century biographer of Kentigern, the patron saint of Glasgow, speaks of wandering through the streets and lanes of the city, and in the course of his narrative relates how its cemetery had been consecrated by Saint Ninian, the 5th century evangelist. More solid ground is touched in a legal document, which must have been compiled before the year 1124, setting forth the result of an inquiry made by King David, then Prince of Cumbria, into the possessions of the see of Glasgow, and from that time onwards a fairly continuous outline of the city's history is obtainable. The bishops and archbishops possessed a large territory, called in later times the Regality of Glasgow, of which Glasgow was the judicial centre. In 1175–8 King William the Lion authorized the bishops to have at Glasgow a burgh, with a weekly market and all the privileges of a royal burgh. Twelve years afterwards the same King granted right to the burgesses to hold a yearly fair in July, a privilege which still survives in Glasgow's annual holiday. The market cross of the new burgh occupied the spot where High Street and Saltmarket intersect Trongate and Gallowgate. A chapel dedicated to the Virgin Mary adjoined the market cross, and half a mile farther west, a few paces from the present Saint Enoch's station, another chapel was dedicated to Saint Tenew the mother of Saint Kentigern. Saint Enoch is merely a corruption of St. Tenew which local pronunciation reduced to the form of Sanct-enew (or -enoch). Another chapel dedicated to Saint Thomas the Martyr, was situated in the same locality. On the higher ground, adjoining the site chosen for the Cathedral, a British fort or rath probably existed in ancient times, giving name to Rattounraw, one of the most ancient of the existing thoroughfares; and, if so, the rath may be identified with the large earthen mound called "the know of grummell," removed in 1509 to fill up hollows about the town. The rath, or what else served as a stronghold, was in or before the 13th century, superseded by the Bishops' Castle, a structure which was not wholly removed till its site was required for the erection of the Royal Infirmary in 1792–4. The Cathedral canons and Church dependents dwelt in the vicinity of the Cathedral, while the industrial and trading community occupied the ground near the river, over which there was a primitive bridge at least as early as the year 1285. On the intervening space, somewhat precipitous, the Black Friars planted a convent and church in or before 1246. Between the years 1473 and 1479 the Greyfriars likewise settled in Glasgow, a little farther west, the site chosen by them being on the opposite side of the thoroughfare now called High Street. A church or chapel in the Gallowgate, dedicated to Saint Kentigern, was founded in 1500; about the same time another chapel was dedicated to Saint Roche on a site which is commemorated in the place name now transformed into Saint Rollox; and the collegiate church of Saint Mary and Saint Ann was founded on the site of the present Tron Church about the year 1525. Of the four pre-Reformation "hospitals," and their relative chapels, viz., the Hospital of Saint John of Polmadie, founded in or before the 13th century, the Leper Hospital, of an early but also uncertain date, Saint Nicholas Hospital, founded by Bishop Muirhead (1455-73), and Stablegreen Hospital, founded by Roland Blacader, subdean (1503-41); only some fragmentary endowments of Saint Nicholas Hospital survive, yielding small pensions to a few aged people. Glasgow was much pervaded by the ecclesiastical element. but this was to some extent advantageous as many of the church dignitaries were in favor at court, taking a prominent part in state affairs, and exerting their influence for the good of the citizens. At first the Reformation changes produced disorganization and loss of trade. An attempt to arrest decay in the district deserted by the clergy, by the transfer of some of the markets to that locality, proved unsuccessful, on account of difficulty of access. The earlier charters of Glasgow were granted to the Bishops who had the right to elect the provost and bailies. In 1611 King James VI. granted a charter to the community direct, and subsequent charters kept to that form, but it was not till 1690, after the abolition of Episcopacy, that the Town Council were allowed to elect their chief magistrates. Many of the inhabitants of Glasgow were opposed to the Union but the municipal authorities, both at that time and during the risings of 1715 and 1745, remained loyal to the government. Following the suppression of the latter rebellion, heritable jurisdictions were abolished and the regality courts were superseded by those of the sheriff, but the city retained its position as the judicial centre of the district. Shortly after this time the deepening operations on the river Clyde, to which reference has already been made, were commenced, and the city entered more fully upon that career of successful commercial prosperity which it has since continuously maintained.

Population.—The population of Glasgow has increased as follows: (1560) 4,500; (1600) 7,000; (1708) 12,766; (1763) 28,300; (1791) 66,578; (1803) 81,484; (1811), 100,749; (1841) 255,650; (1881) 511,415; (1891) 565,714; (1901) 761,709; (1907) estimated, 799,412. Number of occupied dwelling houses 165,766. Partick, Govan, and Pollokshaws, three suburban burghs, outside the municipality but connected with Glasgow by continuous lines of streets, had in 1901 a *cumulo* population of 141,762.

Bibliography.—Several histories of Glasgow have been published, those of John M'Ure, printed by James Duncan who introduced typemaking to Glasgow, in 1718 (1736); John Gibson (1777); Andrew Brown (1795); James Denholm (1797); and Dr. James Cleland (1816), being the earliest. Original research is well represented in the publications of the Maitland Club and the Scottish Burgh Records' Society, and the materials thus accumulated have been utilized in various works, such as Macgeorge's 'Old Glasgow' (1880); M'Gregor's 'History of Glasgow' (1881); and Marwick's 'Historical Introduction to Glasgow Charters' (1897). For less elaborate information, see the hand-books published in connection with the meetings of the British Association held in the city in 1901.

Robert Renwick,
Deputy Town Clerk, Glasgow.

Glasgow, The University of, a corporate body founded by a bull of Pope Nicholas V., dated 7 Jan. 1450-1, as a "*studium generale tam in theologia et in jure canonum et civili quam in artibus et in quacunque licita facultate,*" with the power of creating masters and doctors, who, together with the readers and students, were to enjoy the same privileges and immunities with the University of Bologna. A body of statutes was prepared, and the university established by the bishop and chapter in the same year. The university appears at first to have had neither property nor endowment. A purse was formed of the perquisites procured from matriculations, examinations, degrees, etc., and some of the earlier members bequeathed the patronage of a few small chaplaincies; but through the zeal of its founders and the civil and ecclesiastical immunities accorded to it, the new school of learning prospered, though in circumstances so little in accordance with modern notions of educational requirements. The clergy were induced to attend by offers of exemption from taxation and residence. The lectures in theology and in canon and civil law were read at the convent of the Dominicans; but the students of arts soon became so numerous that a house was provided for their residence called the pædagogium, and regular teachers were appointed.

In 1460 James, Lord Hamilton, bequeathed to Duncan Bunch, regent of the College of Arts, and his successors, a tenement in High Street, with four acres of land adjoining, for the use of said college. On this ground the classes of the university continued to meet for 410 years. In 1577 James VI. prescribed rules for the government of the university, and made a considerable addition to its funds. This new charter is called the Nova Erectio. It provided for a principal to teach theology and Holy Scriptures, who was also professor of Hebrew and Syriac; and three regents, of whom one taught Greek and rhetoric; another dialectics, morals and politics, with arithmetic and geometry; the third, physiology, geography, chronology, and astrology. Between this period and the Restoration the university continued to flourish, and the number of its professors increased; but at the Restoration the re-establishment of the Episcopacy deprived it of a great part of its revenues, and three of its chairs fell into abeyance. After the Revolution it continued gradually to expand the scope of its teaching, and has numbered among its professors and graduates many distinguished men. In the end of the 18th century it obtained by bequest the valuable anatomical museum, library, and other collections of the famous Dr. William Hunter. Later the old buildings became quite inadequate, and were sold. A grant for new buildings was procured from the government, a small sum was available from college funds, and public subscriptions were procured. In 1870 new buildings at Gilmorehill, which cost over $2,000,000, were erected.

The University of Glasgow comprises five faculties, namely, arts, science, medicine, law, recently added. The oldest chairs are those of moral philosophy (1577), natural philosophy (1577), logic and rhetoric (1577), Greek (1581), divinity (1630), Latin (previous to 1637), mathematics (revived 1601). In the first 20 years of the 18th century six professorships were either originally founded or revived, namely, Latin, Oriental languages, civil law, medicine, church history, anatomy; astronomy was added in 1760. The remaining 18 professorships were founded in the 19th century. The university was reconstituted by the Scottish University Act, 1858, and a similar revolution was effected under the act of 1889.

The students number about 2,000. There are numerous bursaries connected with the university, the annual total value of which is about $40,000. There are also medals and prizes given in connection with the various classes, and scholarships or exhibitions are awarded to students who prove successful in certain examinations. The Snell exhibitions, established in 1677, send 10 (or fewer) Glasgow students to Oxford. They are tenable for five years, and each exhibition yields $400 per annum. The two Eglinton fellowships, founded in 1862, tenable for three years, and each worth $500 annually, are awarded by competition to students who have just graduated in arts. Three Ewing fellowships, of the value of $400 per annum, and tenable for not more than five years, are also awarded by competition among graduates in arts. The Luke fellowship, about $400 per annum, tenable for three years, is awarded to graduates for excellence in English literature and history. The George A. Clark scholarships, four in number, are tenable for four years, their annual value being about $900. The examinations are respectively in classical literature, mental philosophy, mathematics, and natural science. The Metcalfe fellowship, founded 1870, annual value $500, tenable for three years, is designed to encourage studies in higher mathematics, practical astronomy, civil engineering, and chemistry. There is also the Black theological fellowship, worth $700 annually.

Glass, a hard, brittle, transparent substance, formed by fusing together mixtures of the silicates of potash, soda, lime, magnesia, alumina, and lead in various proportions, according to the quality or kind of glass required.

Flint glass is used in making table-ware and many articles of domestic furniture and fittings. The molten glass is taken from the pot by a ponty, and is blown or pressed into shape, or, by a combination of operations, is held in a mold while being blown.

Crown glass is taken by the ponty from the pot, and is then blown and whirled until it becomes globular. A ponty tipped with molten glass is applied to the bulb, the blowing tube is detached, leaving a hole. The globe being again whirled, the glass flashes into a circular disk, adhering by a boss in its centre to the ponty. Crown and flint glass are combined in the manufacture of achromatic lenses.

Sheet glass is glass withdrawn by the ponty from the pot and blown and whirled till it assumes a cylindrical form. The ends beings cut off, and the cylinder slit longitudinally, the sheet is heated, pressed, and rubbed until it is flattened out. This is also called cylinder glass or broad glass.

Plate glass is made by pouring it upon a table which has a marginal edge of a height equal to that designed for the thickness of the glass. A roller travels over the table, on the ledges and flattening out the glass, which is thus made of equal thickness throughout.

Toughened glass is made by heating till it is about to soften, and then plunging it into a bath of oil at a greatly lower temperature. Usually a mixture chiefly of oily substances, such as oils, tallow, wax, resin, and the like, is put in the bath; and some manufacturers who worked the process, for a time dropped the newly made glass vessels, while still hot, into the oleaginous mixture, by which plan neither reheating nor annealing by the ordinary process is required. After the articles acquire the temperature of the bath, they are removed.

Painted or *stained glass* is of two styles, enamel and mosaic glass. In enamel glass proper, certain fusible pigments are painted on a sheet of white glass, which is then fired and the result is a picture the tints of which even in the high lights are not wholly transparent. A modification of this method produces its picture partly by enameling on white glass, partly by the use of pot-metal glass the color of which is heightened or modified by the use of enamels.

Of the origin of glass manufacture we cannot speak with certainty. Pliny states that the ancient Phœnicians discovered by a happy accident how to make it. He relates that certain Phœnician merchants preparing a meal upon the seashore set their cooking vessel on a mass of natron (sub-carbonate of soda) and the union of the sand and alkali, when subjected to the fire, resulted in vitrification that drew the men's attention and led to subsequent efforts at imitation. According to Egyptologists the Egyptians made sham jewels of glass at least 5000 or 6000 B.C. In some of the most ancient tombs scarabs of glass have been found imitating rubies, emeralds, sapphires, and other precious stones, and the glass beads found broadcast in three parts of the globe were quite possibly passed off by traders on confiding barbarians as jewels of great price. As a medium of trade, beads are evidently of great antiquity. Those known as aggry have been attributed to both Egyptian and Phœnician sources. The beads vary greatly in color and pattern and some of them show fine workmanship and marked beauty. During the period when Egypt was part of the Roman empire much glass was produced in the Nile valley.

It is probable that the great centre of glass industry of mediæval and more recent times, Venice, received its early impulse and lessons from Constantinople. The art began there with the beginning of the city in the 7th century A.D. and there was a marked improvement after the conquest of Constantinople in 1204, and in 1291 the establishments were removed to the island of Murano, the manufacturers forming a guild with a register of nobility, and guarding their secret with the greatest jealousy. In 1436 their color glass came into note, and continued so till the close of the century; and in the 16th century lace patterns and mirrors were introduced. In the 15th and 16th centuries plain glass with tasteful ornaments in gilt and enamel; in the 16th, cracked lace and reticulated glass, and in the 17th century variegated or marbled glasses were produced.

The Venetian glass enjoyed for a long time the monopoly of commerce, and within recent years there has been a marked revival of the skill and enterprise of Venetian craftsmen. In Germany the oldest glass dates from the 16th century, and consists of goblets and tankards of white color, enameled with colored coats of arms and other devices, millefiori, and schmeltz glass. Engraved glass was first introduced by Casper Lehman at Prague in 1609 under imperial protection, and continued by his pupil Schwanhard; and ruby glass by Kunckel in 1679. In 1665 20 Venetian glass workers were brought by Colbert to Paris, where they set up the blowing of glass and the silvering of mirrors, the famous mirror hall in Versailles having been furnished by them. In 1688 an exclusive privilege of making large plates of glass by casting was conferred on Abraham Thevart. The name Thevart was assumed by a syndicate of capitalists formed to develop and work the invention of Louis Lucas de Nehon, who was the real inventor of plate glass and the founder of the Gobain works, one of the most extensive plate glass works in the world. In France oxide of lead flint glass was made at St. Cloud in 1784; another manufactory was subsequently established at St. Louis in 1790; and the St. Cloud establishment was removed to the vicinity of Mont Cenis, where it flourished till 1827.

It is uncertain whether glass was made in England before the 16th century, as that mentioned may have been imported from Flanders or Venice. In 644 Benedict Biscop introduced makers of glass windows into Northumbria; but window glass was not in general use for windows till the 15th century. Pressed glass was invented in the United States. See Glass Blowing; Glass, Cut; Glass Manufactures in America; Glass Staining.

George W. Hastings.

Glass Blowing, a mode of manufacturing various articles by taking a mass of viscid glass from the melting pot on the end of the blowing tube, and then inflating the mass by blowing through the tube, rolling on the marver, and exposing it at the furnace opening where its contained air is expanded and itself enlarged.

Although the forms into which blown glass is worked up are endless, the general methods of manufacture are the same, and a description of first-class lamp chimney works is illustrative of the blown glass industry in general. Perhaps the most important feature in the manufacture of lamp chimneys, or indeed of any form of glass-ware, is the mixing of the ingredients. As in the case of plate glass, the body of the mixture consists of a sand which is as nearly pure silica as can be obtained. The sand is quarried from silica rock, then thoroughly ground and sifted through a 40-mesh screen, the material being received at the works in the prepared condition. The second most important ingredient is litharge; while potash and soda are used as fluxes. When the above mixture is used for the best quality of lamp chimneys, about 50 per cent of the total is silica. The sand is melted in what is known as the furnace, the first and greatest of the glass blower's implements; it consists of two large domes set one above the other; the lower one stands over a large perforated grating (level with the ground), and is fired by gas, a large arch beneath conveying air to the furnace. In the sides of the lower dome as many recesses or mouths are made as there are workmen to make use of the furnace, and before each mouth a pot of glass mixture is placed; the pots are very large, like crucibles, and are molded from a specially prepared and very carefully kneaded pot clay; they stand 50 inches high and are generally 44 inches in their largest diameter, and will hold from three to four hundredweight of liquid glass; they are supported upon three small piers of brickwork resting on the floor of the furnace. The form of the furnace reverberates the flame from the roof down upon the pots, and they are placed at some distance within the furnace so that the flame may get between the wall and the pots. It takes about 24 hours to melt the contents of a pot.

The upper dome is used for annealing the glass, and is exactly similar to a large oven; it has three mouths, and a small flight of steps leads up to each. It is built upon the lower dome, its floor being made flat by filling up round the roof of the lower dome with brickwork; a small chimney opens from the top of the lower dome into the middle of the floor of the upper one, which conveys the fumes and smoke from it, and a flue from the upper dome leads it completely from the furnace.

The blowing is done with a long iron tube known as the blowpipe, which has a mouthpiece at one end, and is swelled out and thickened into a bell-mouth form at the lower end. In the process of blowing, the operator dips the thickened end into the melting pot and twists it around till he has gathered up a ball of molten glass of the desired size. The blowpipe is then withdrawn from the furnace and the ball of glass is rolled out to a conical shape on a plate and slightly inflated by blowing through the tube. The blowpipe is then handed to the second operator, who completes the operation of blowing. The bubble, if we may so call it, of glass is thicker and heavier at its lower end, and to secure the elongated form necessary in lamp chimneys the operator swings the blowpipe to and fro, thus causing the bubble to stretch by its own weight. By thus alternately swinging and blowing he brings the bubble to the required length, and approximately to the required diameter, and then places it within a hinged mold, which is opened to receive it, either by himself or one of his assistants. He then twists the pipe and blows at the same time, thus pressing the glass against the inner walls of the mold. The tube with the molded chimney attached is then withdrawn from the mold, and handed to another operator, who, with a pair of spring tongs, forms the flaring top of the lamp chimney and marks a sharp depression just outside its base, where it is to be broken away from the blowpipe. Although a large amount of blowing is done by hand and mouth, increasing use is being made of what is known as the Owens blowing machine, which substitutes mechanical for hand power. See Glass; Glass Manufactures in America.

Glass Crab, an immature condition of certain crabs (*Palinurus* and its allies) which for a time are flattened and perfectly transparent, as if formed of a sheet of glass, and have no resemblance to the parent form.

Glass, Cut or Incised. Glass is a singularly versatile material, at once refractory and yielding, yet lending itself to use in thousands of ways. It is as a means of artistic expression that it is chiefly interesting, for its utility is beyond all question. The iridescent chatoyant colors of antique glass — Nature's destructive action — do not distract us from the charm of perfect form. Venetian glass, the beautiful product of the lagoon-island of Murano, is so very impracticably fragile that even its possession is a care. Probably glass would have remained in a rather humble position if it had not been that a Bohemian glass-worker more than 200 years ago conceived the idea of a new invention, which was destined to change the glass product of the world. He thought of making the heavy "flint" or "lead" glass larger as regards the dimensions of the walls of the article, in order that he might have more stock to work on, so that he could deeply incise or cut the glass to form patterns, the sides of the rough cut being in turn polished to give the effect of a many-faceted jewel. The success of the new *objet d'art* was not immediate, and it was only when the crude designs and imperfect workmanship of the earlier cutters gave way to the labors of highly skilled artisans directed by talented designers that cut glass, or "art glass," as we might term it, took the place to which its great beauty entitles it. It is to America that we must look for the perfection and the superiority of design and skilful workmanship of this branch of the industry. There is no such thing as absolute interchangeability in the glass-cutting establishment, and the artistic bent of the various cutters is encouraged.

The peculiar product known as glass has as a base silica, which is fused with alkalies and metallic oxides to form a hard transparent substance. It can be wrought in various ways, and is susceptible of a high, and, when properly cut, a lasting finish. The raw materials consist of a sand, so called, of exceptional quality as regards sharpness and color. It is not a sand in the ordinary sense of the word, but is a quarried rock which has been crushed. This accounts for the uniformity of its color, which is so necessary in producing a steely-blue white glass, which is to be used for giving the prismatic colors caused by the cutting process. The red lead, saltpeter, and sodium carbonate are accurately mixed with the sand, and a small percentage of white arsenic or manganese is added to bleach or clarify it. The proportion is varied according to the nature of the finished product. A glass furnace is a large round or oval fire-brick oven, capable of holding an aggregation of melting pots, which rest under a floor in common under a dome called a crown. These pots are made of unbaked fire-clay. A mouth gives entrance for the raw material and the workmen's blowpipes, to which the molten glass adheres. A furnace may contain as many as sixteen pots arranged radially on the floor of the furnace. They are heated before setting, and are subsequently filled with about 1,600 pounds of raw material, which soon melts at a temperature of 2,500° F., caused by the intense flame of gas and air, which is deflected from the dome downward, the products of combustion passing out through a stack.

The glass gatherer receives his order for a specified size and shape for his article; and after obtaining a sample to guide his memory, takes his iron blowing-tube, and collecting sufficient of the molten glass from the pot in the furnace, rolls it to and fro on a metal plate to produce a uniformity of distribution of the mass, which is then reheated in a furnace called a "glory-hole." He then turns it over to a glass blower, who takes the pipe and blows the article to approximately its final shape. It is then reheated and given definite form and finish by the most expert workman of all three. The tender glass must now be annealed or tempered to equalize the strains, otherwise the piece would break. It is then placed in kilns or tempering ovens, where it is first reheated and then gradually cooled.

The heavy uncut articles are then ready for the cutting operation, by which they lose considerable weight. In some cases the loss is one third. The cutting operation really consists of three stages. The article is first roughed with sand and a steel grinding wheel. It is then smoothed by a stone cutting wheel, and is lastly finished by a wooden polishing wheel. A workman holds the article against the conical edge of a steel wheel secured to a shaft driven by belts and pulleys. Fine sharp clean sand and water are allowed to drip on the wheel from a cone-shaped bucket. The article is pressed against the rapidly rotating wheel, and is deeply scored or cut. The heaviest and principal lines in the pattern are roughed-in by these steel wheels and the sand. In order that all articles may stand level, the bottoms are ground on a horizontal grinding wheel, sand and water still being used. The rough article is now ready for the wet smoothing stones, which resemble steel wheels both as to size and edge, but no sand is used; these wheels follow the cuts that the steel wheels have made, and also cut in the finer lines of the pattern. The practically finished piece is now ready for the polisher, whose rouge-charged wheels are of wood, their size and edge being the same as those of the steel and stone wheels, and therefore adapted to follow every line with almost mathematical accuracy, which completes the process. While cut glass is made abroad, the examples lack shape and depth and uniformity of cut. For this reason the foreign trade in American cut glass is increasing every year.

Glass, Malleable. American glassmakers, since the beginning of the industry, have aimed to produce a glass that would have all the clearness and beauty of ordinary glass, and at the same time possess a toughness which would render it as little liable to fracture as many of the other manufactured articles of use and beauty. It is well known that the ancients discovered and made use of a process of manufacturing malleable glass; and in the glass-making world it has naturally been expected that it would be in the Old World that the process would sooner or later be reinvented. Louis Kauffeld, of Matthews, Ind., succeeded in 1903, after many years of endeavor, in producing a glass which will withstand extremely rough usage without breaking. The secret lies principally in the chemicals which are used and the proportion of ingredients which form the compound, although the furnaces and crucibles play an important part in the process.

The two chief things to be avoided in connection with the crucible are intense and prolonged heat from without and the corrosion of the raw materials within — two dangers of which nearly every glass-maker knows the ruinous effect. The effect of corrosion is readily proved by heating for a long time in a small crucible such substances as borax, red lead, or potassic or sodic carbonate. After a crucible has been in constant use for several months, and especially if it has contained flint or lead glass, the back and body will be found to be covered with innumerable small dents, which have undoubtedly been formed by corrosion.

The complaint so commonly heard of specky glass arises from the presence in the glass of white particles of an infusible aluminate formed by the combination of the alkaline or metallic ingredients of the glass with the alumina of the crucible. If the corrosion becomes concentrated at one point and prolonged for a considerable period a breach is formed, through which the molten glass escapes into the furnace. Knowing the dangers that have to be encountered in this way. Mr. Kauffeld is extremely careful in the selection and preparation of the clay as well as in the construction of the crucibles. The finely sifted raw clay, on its arrival at his manufactory, is mixed with a proportion of burnt clay considerably coarser in grain, varying in amount from one ninth to one fifth of its weight. The coarser particles tend to bind the clay and render the finished crucible less liable to crack from variation of temperature. Various tests have been made of Kauffeld's methods. For instance, a chimney was placed in a pail of ice-water, and after having remained a sufficient length of time to become as cold as the water, was taken out and immediately placed on a lamp with the blaze turned as high as possible. The blaze on the wick was turned so as to flow directly on the chimney, and the smoke which collected on the chimney ran down with the water without injuring the chimney. Next a chimney was placed over a small gas stove containing clay bricks used in heating such stoves. The fire was turned on full, the chimney remaining on the bricks. The fire finally brought the temperature to such a stage that one side of the chimney was drawn in and dropped down, and no crack was shown in the glass; but for a slight roughness on the outside, the glass was as clear as when placed in the fire.

Another test which was made was to place cold water in the chimney and hold the same over a fire until the water boiled. A large bulb was blown from the glass and filled with about one pint of water. It was then placed over the fire and allowed to remain there until it had boiled dry without apparent effect on the glass. Four chimneys were taken from the packing room and dropped one by one into a pail of boiling water. The chimneys were then hastily shifted into a pail of cold water that had just been drawn from a well, and the glass was not broken.

Glass Manufactures in America, a great industry that began in America near Jamestown, Va., in 1608. The hope of sudden wealth from the discovery of gold and silver was doubtless the chief cause for the formation of the London Company and its first attempt to colonize Virginia. It was, however, a commercial venture with the hope of profit; and this company did not forget the possibilities that were near at hand in its search for what it believed would be greater ones in the near future. The vessel which carried Capt. Newport on his second voyage in 1608 brought out also eight Poles and Germans to make pitch, tar, glass, mills, and soap-ashes, and the first exports of manufacures from what is now the United States were the results of the trials made at the first furnace erected in this country. It is said the works were destroyed at the massacre in 1622.

In 1795, the time from which this sketch is to be made, there is no record of any glass-works in Virginia. In the census of 1810 Virginia does not appear as a glass-making State. In the census of 1820 a glass-works is reported in Brooke County. It made that year $20,000 worth of glass; had $12,000 capital; paid out $8,000 for wages and $12,000 for materials and contingent expenses, or exactly the value of the product. It employed 14 men and 12 boys in 1827. It is reported that glass decanters of great beauty were made at these works, and white-flint and green-glass wares were made that rivaled the foreign. At the Tariff Convention in 1831 there were two flint-furnaces, with 12 pots, reported in operation in Wellsburg, and one, with 6 pots, at Wheeling, Va. Two window-glass furnaces were also reported at Wheeling. In 1840 one glass-works is reported in Brooke County (the Wellsburg), and three in Ohio County (the Wheeling).

The first mention of a glass-works in Pennsylvania is found in a letter written by William Penn, in August 1683, to the Free Society of Traders. In this letter he alludes to their tannery, saw-mill, and glass-works. Where these works were located, or what kinds of glass they made, is not known. In 1795 there was doubtless some glass made in Pennsylvania. A glass-house was sold on 6 March 1800, to Joseph Roberts, Jr., James Rutlans, and James Rowland, for $2,333, and was again sold in 1833 to Dr. T. W. Dyott. In eastern Pennsylvania, prior to 1831, a number of attempts seem to have been made with but little success, and the works carried on by Dr. Dyott were evidently looked upon as being of national importance. It is stated that President Jackson visited this establishment, which in 1833 consumed 15,000 barrels of rosin for fuel. From 250 to 300 men and boys were constantly employed; five furnaces were operated, which used both wood, coal, and rosin, melted 8,000 pounds of batch a day, and produced about 1,200 tons of glass a year, which was blown into apothecaries' vials, bottles, and shop-furniture. Dr. Dyott failed in 1838, and the works passed into other hands, and at this time are operated in the manufacture of green glass, and have quite a reputation for the making of demijohns.

Of early glass making in western Pennsylvania full accounts are given. It is claimed that Albert Gallatin commenced the first glass-works there at his settlement of New Geneva, 90 miles south of Pittsburg, on the Monongahela River. It seems to be generally accepted that the works were started in 1797, and were used for the manufacture of window-glass. The furnace was a small one, with 8 pots, using wood as fuel and ashes for alkali. The glass-house was 40 by 40; three sides frame and one side stone. One man could lift the pots, while now it would require four men to lift the pots used in window-glass works. The title of the firm was Gallatin & Company, but was afterward changed to the New Geneva Glass Works. It is said that for a time this enterprise was exceeding profitable, there being but two or possibly three other window-glass works in the country, most of the glass for that purpose being brought from England. The glass was sold at $14 per box of 100 feet, but was doubtless of inferior quality. A works at New Geneva was reported as late as 1832.

In 1796 Isaac Craig and James O'Hara erected the first glass-house in Pittsburg. It is claimed that these were the first works west of the mountains to make glass, and they are said to have started a month before those of Gallatin. These were the first works to use coal as a fuel, and were located at the south side of the Monongahela River, just above where it unites with the Allegheny to form the Ohio. The site, or part of it, has been continuously occupied as a glass-works. The use of coal was an innovation, and even as late as 1810 this fuel was not used in any of the glass-works in the United States other than those in Pittsburg. O'Hara and Craig were the pioneers in its use, and to them should be given the credit. As was the custom in window-glass factories in those days, one or more of the pots were used for the making of bottles, and among O'Hara's papers, found after his death, was a memorandum in his handwriting, stating: "To-day we made the first bottle, at a cost of $30,000."

As in all new enterprises, and particularly the making of glass, it is only men of perseverance and determination who succeed; and had not Craig and O'Hara been men of that character the venture would have fallen the first year. As a rule, the men who are secured from old-established glass factories are really not the best men; and not only did the early manufacturers suffer from a lack of experience, but also from the fact that their employees were not always capable of doing the work they were engaged to do. And it may be said that at the present time no new works, established in a location in which glass has not been made, can make a profit of any moment the first two or three years; and the first year must invariably be counted as a losing one. Craig wrote to Samuel Hodgson, of Philadelphia, 5 Aug. 1803:

> With respect to our glass manufacturing, the establishment has been attended with greater expense than we had estimated. This has been occasioned partly by very extensive buildings necessarily erected to accommodate a number of people employed in the manufacture, together with their families, and partly by the ignorance of some people in whose skill of that business we reposed too much confidence. Scarcity of some of the materials at the commencement of the manufacturing was also attended with considerable expense. We have, however, by perseverance and attention, brought the manufacture to comparative perfection. During the last blast, which commenced at the beginning of January, and continued six months, we made on an average 30 boxes a week of excellent window-glass, besides bottles and other hollow ware to the amount of one third the value of the window-glass, 8 by 10 selling at $13.50, 10 by 12 at $15, and other sizes in proportion.

In the fall of 1807, George Robinson, a carpenter, and Edward Ensell, an English glass worker, commenced the erection of a flint-glass works in Pittsburg, on the banks of the Monongahela. They appear, however, to have lacked capital, and were unable to finish the establishment, which, without being completed, was offered for sale. In August 1808 Thomas Bakewell and his friend, Robert Page, were induced to purchase this plant, on the representation of Ensell that he thoroughly understood the business. This was the beginning of the firm of Bakewell & Page, which by itself and successors continued in the manufacture of flint-glass until some time after the census of 1880. Bakewell experienced the trouble usual in a new business. His furnace was badly constructed; his workmen were not highly skilled, and would not permit the introduction of apprentices; and his materials were received from a distance at a time when transportation was difficult and expensive, pearl-ash and red lead coming over the mountains in wagons from Philadelphia, and pot-clay from Burlington, N. J. The sand was obtained near Pittsburg, but was yellowish, and up to that time had only been used for window-glass and bottles. The saltpetre came from the caves of Kentucky until 1825, when the supply was brought from Calcutta. These difficulties in time were overcome; good clay was procured from Holland, and purer materials were discovered, and Bakewell rebuilt his furnace on a better plan, competent workmen being either instructed or brought over from Europe. Through his energy and perseverance the works became eminently successful, and there is no doubt that Bakewell is entitled to the honor of erecting and operating the first flint-glass works in this country. The furnace built or completed in 1808 held six 20-inch pots; this was replaced in 1810 by a 10-pot furnace, and in 1814 another furnace of the same capacity was added to the works. The establishment was burned down in the great fire of 1845, but was immediately rebuilt.

Massachusetts has played a very important part in the production of glass, which was manufactured as early as 1639 at Salem. But, from all the records that exist, the history previous to the Revolution was one of failure. Shortly after the Revolution, Boston recommenced the manufacture of glass, which for many years had been one of the leading industries. The new enterprise, the Boston Crown-Glass Company, which was really the first successful glass-works in this country, was greatly helped by the liberal action of the State. In July 1787 Messrs. Whalley, Hunnewell, and others received from the legislature a charter conferring upon them the exclusive right to manufacture glass in Massachusetts for 15 years, and imposing a fine of $500 upon anyone infringing on this right. The capital stock was exempted from all taxes, and the workmen from all military duty. To counteract the effect of the bounty paid by England on the exportation of glass from the kingdom, a bounty was paid for every table of glass made. Owing to the many difficulties incident to the starting of a new industry, the operation of making glass did not commence until 1792. The company commenced with the manufacture of crown window-glass, and in 1798 produced glass to the value of $82,000 per annum. This concern was incorporated in 1809, and under the influence of the State bounty the proprietors were encouraged to continue their efforts, and became very successful. The glass was said to be superior to the imported, and well known throughout the United States as "Boston window-glass." These works were continued until 1826, when the company failed, from bad management. This early establishment led to the commencement of many others, but none of them could be considered successful. Many attempts have since been made in Massachusetts to establish the manufacture of window-glass. In 1860 a large establishment was erected for the manufacture of sheet window-glass, but its operation proved unprofitable, and at this time there is only one window-glass works in the State, located in Berkshire County.

The manufacture of flint-glass grew out of the Essex Street works. Thomas Caines, an employee there, was also a skilful blower and

metal mixer. He prevailed upon the management to allow him to build a small 6-pot furnace in a part of their works at South Boston. This furnace was fully employed during the War of 1812, and was the beginning of the flint-glass industry in Massachusetts; but it was compelled to cease work, and although several attempts were made to operate it between 1820 and 1840, they all failed. About the time this furnace was started, the Porcelain and Glass Manufacturing Company built a factory at East Cambridge. The furnace was a small one, containing 6 pots. Workmen were brought from abroad, but it proved a failure. The plant in 1815 was leased to a firm of workmen, Emmet, Fisher & Flowers; but they failed to agree, and in 1817 the Porcelain Company sold the property at auction to the New England Glass Company. This was the beginning of one of the most successful glass companies in this country. The works, when they commenced, had a small 6-pot furnace, the pots holding about 600 pounds; 40 hands were employed, and they produced glass to the value of $40,000. It was really the foundation of the flint-glass industry in the United States. The management was broad and liberal from the beginning; for 50 years they led in the production of flint and colored glass of all varieties. Workmen were brought from abroad, and every means employed that capital and skill could compass to produce results equal to anything in the world. In 1865, which was probably the highest point reached in their history, they operated 5 furnaces of 10 pots each, each pot holding 2,000 pounds; 500 hands were employed, and glass to the value of $500,000 was produced yearly. The influence of the New England Glass Works has been felt all over the land, as many of their employees and managers have been the means of establishing the industry in other parts of the country. Fine blown, cut, and pressed glass were made in great variety. The works are not now in existence.

When the western manufacturer commenced to make lime-glass with bicarbonate of soda and lime, in place of lead and pearl-ash, the thought in the minds of the management of the New England Works was that its success would be only temporary, and they failed to meet the changed condition. A very large proportion of their production at this time was pressed glass, and for several years, in the attempt to meet the competition of the cheap products of the western manufacturers with their more costly products, the works were run at a loss, which amounted during the last year they operated to more than $40,000. In 1888 they ceased operation.

In 1825 a plant was established at Sandwich, commencing in a small way, with one 8-pot furnace, and melted 7,000 pounds of glass. In 1865 it had been increased to 4 furnaces, 10 pots each, and a melting capacity of 100,000 pounds weekly. It was in these works that the modern invention of pressing glass was first successfully introduced, in 1827. In 1888, after several years of financial loss, the company suspended operation. They had built up quite a town at Sandwich, and up to 1865 had been prosperous and successful, employing for 63 years a large number of people, and making a fine line of cut, blown, colored, and pressed glass.

During the period in which these two Massachusetts factories were in existence they were in the lead, and while a number of others had been established, none had reached the success of these two noted works, which are now only a part of the record. Quite recently an attempt has been made to operate one of the furnaces at Sandwich, the success of which is yet to be demonstrated. At this time there are only four flint-furnaces operated in Massachusetts, two of them being at New Bedford, one at Somerville, and one at Sandwich. There are, besides, the window and part-plate works at Berkshire. So that Massachusetts, that in 1860 led the flint-glass industry in this country, has almost ceased to be a factor at this time.

Maryland was quite an important State in the early production of glass, and the attention of Congress was called to the value of the industry by John Frederick Amelung, who petitioned Congress to extend its patronage to his works at New Bremen. A motion was made in Congress to loan him not exceeding $8,000, on his giving security for its repayment. The motion was debated for several days, during which was brought out the fact that Amelung had spent over $100,000, and brought over from abroad over 200 workmen, in his attempts to establish the industry. The motion was defeated. In 1794 Amelung presented a petition for an increase of duties. These works appear to have been built at Fredericktown, but were afterward moved to Baltimore. They were not a success, and it is probable he crossed the mountains and helped to start the flint-works at Pittsburg. A plant was established for the making of window-glass in 1790, known as the Baltimore Glass Works. These are the window-glass works operated by Baker Brothers until quite recently. They have operated them since 1852. Maryland, however, since that period, has been quite a glass State. Window-glass and green and flint bottles have been made to a greater or less extent.

One of the earliest glass-works in this country was located at Allowaystown, in Salem County, N. J. It was the beginning of the glass industry in that State, and was built about the year 1760 by a German named Wister, who carried on the works until his failure in 1775. The workmen then went to Glassboro, and established the industry there. Plenty of pine-wood for fuel was found in this locality, and a very fair grade of sand, which was good enough for bottles, jars, vials, and the common kinds of green glass made by them. Glass making has been carried on at this place ever since that time. The first establishment commenced with a 6-pot furnace, but gradually extended until a town surrounded it. In 1870 there were factories at 37 different localities. Many of them ran for only a short period. The cheapness of wood and sand no doubt led to the building of many, and the fact that expensive buildings were not required, most of them being frame structures. With the exception of a flint-works at Jersey City and one at Camden, the glass made in New Jersey was bottles, jars, vials, and window-glass.

In New York State large quantities of glassware have been made, and some of the works have had a national reputation. In January 1785 Leonard de Neufville and his associates, the proprietors of a glass factory located 10 miles from Albany, at Dowesborough, in the midst of a well-wooded pine forest, applied to the legislature for aid in the undertaking, giving as a reason that $150,000 annually was sent abroad for glass. In 1793 the legislature of New York voted to loan them $3,000 for eight years without interest, and five years at 5 per cent, but by this time the works had passed out of the De Neufville family. The history of glass making in New York State shows that up to 1850 there had not been much headway made in establishing it on a permanently successful basis. Many factories were started, but ran for only a short time, and none of those in operation in 1850 are now in existence.

In 1820 some workmen left the New England Glass Works at East Cambridge and built a factory in New York city, under the firm name of Fisher & Gilland; but in 1823 the partnership was dissolved, and Gilland removed to Brooklyn, where he established what were known as the South Ferry Flint-Glass Works. Gilland up to 1850 was evidently very successful. He had the reputation of making the finest flint-glass made in this country, and at the London Exhibition in 1851 took a medal for the best flint-glass on exhibition. He afterward failed, and the works are not now in existence.

Like other industries in the United States, the history of the glass business was, between 1850 and 1860, one of great depression. Fine glass was made in New England and in New York and in one or two factories in Pittsburg, but the bulk of the product was of poor quality, and the window-glass did not in any way measure up to the imported glass. During this period, however, a great impetus was given to the flint-glass business by the making of coal-oil from coal and the later discovery of petroleum. The demand for lamps and lamp-chimneys was very extensive. One of the first to make a specialty of glass for lighting purposes was Christopher Dorflinger, who started with a capital of $1,000 in 1852, in Concord Street, Brooklyn. The furnace held 5 small pots, and was afterward increased to hold 7, until in 1861 he was operating 4 furnaces. The first year his sales amounted to $30,000, and he employed 85 people. When he left Brooklyn in 1865 his sales amounted to $300,000. The factories increased in Brooklyn, from 1858 to 1865, from 2 to 15, mostly making the same class of ware, which was principally for lighting purposes — lamp-chimneys, gas-globes, and lamps. In 1865 Dorflinger moved to White Mills, and established one of the best-known and largest of the manufactories of cut glass.

In 1860, from the best records we can get, the product of the glass factories did not exceed $7,000,000; 1861 and 1862 were off years. The excitement incident to the commencement of the War produced great depression, but from 1862 until 1870 the increase in production was very great, and the census showed 154 establishments, with 15,367 employees, producing glass to the value of $16,470,507, with a capital invested of $13,826,142. It was during this decade that great improvements were made in the making of pressed glass. The modern discovery of pressing glass was an American invention, and the credit is given to the Sandwich Glass Company, which, at the solicitation of a carpenter, in 1827 made a mold to press an article he wanted made. After that the mold increased rapidly in favor, but was used only for the commoner class of goods for many years, until the New England Glass Company, by a series of expensive molds, had produced some very fine effects in pressed glass. The triumphs of pressed glass in this country, however, came from Pittsburg. James B. Lyons, of the O'Hara Glass Works, Pittsburg, made for many years pressed glass only, and in 1867 made an exhibit at the Paris Exposition, and took the first prize for fine pressed glassware. Goblets and wine-glasses were made almost as fine and delicate as those made by the old mode of blowing and cutting. Prior to 1864 the pressed glass was either made of flint-glass, the ingredients of which were the best of sand, pearl-ash, refined saltpetre, and oxide of lead, and was a very good crystal glass, or from what was then known as German flint or lime glass, the ingredients of which were soda-ash, lime, nitrate of soda, and sand. This latter made a very inferior glass, apt to crack, and very poor in appearance. It was used principally in common tumblers and some lamp-chimneys.

In the winter of 1864, William Leighton, Sr., of the firm of Hobbs, Brockunier & Company, of Wheeling, made a series of experiments with bicarbonate of soda, with pure sand, lime, and refined nitrate of soda, and produced a very clear, brilliant glass, at a cost for the batch of not more than one third that of the lead-glass or flint batch. The result was a complete revolution in the pressed-glass business. It was impossible for the manufacturer making flint-glass to compete, and the result was that all had to adapt themselves to the change, and some were driven out of the business. Up to 1870 there had been very little change in the furnaces, which were mostly the old-fashioned type of round furnace, with the coal fired over the bench, or the Frisbie bucket-teaser, where the coal was pushed up from below. But the close competition and the desire for increased production led to the effort to get better results from the furnaces, and after 1870 larger furnaces were built, into which, by a series of flues, hot air was introduced to the combustion-chamber, and much greater heat secured with much less fuel. Many of the furnaces also hold from 13 to 15 pots, and many of the pots each hold two tons of glass.

The Centennial Exhibition held in Philadelphia gave a large impetus to so many industries. One of the great attractions was the glass-works operated by Gillinder & Sons, of Philadelphia. It was a complete establishment, showing the processes of melting, blowing, pressing, cutting, etching, and annealing. The furnace held six pots and melted double the amount of glass made by the first flint-glass works operated in this country by Bakewell & Page, in 1808. This was the first time anything of this kind was attempted in an international exhibition. The product was sold as souvenirs, and realized $96,000. Over $14,000 was paid to the Centennial Board of Finance as commission on the sales.

At the close of 1880 the glass trade was in a very prosperous condition. Prices were good, and the outlook looked promising for the future; and it is from this period we must date the wonderful progress of plate-glass making in this country. In 1880 there were but four plate-glass works in this country, and only three in operation. They were located at New Albany, Ind., Jeffersonville, Ind., Crystal City, Mo., and Louisville, Ky., the latter plant being idle. The first attempt to make plate-glass was made in 1852, when Tilton, Pepper & Scudder started a factory at Williamsburg, L. I. The works were under the management of Cuthbert Dixon, a plate-glass worker from the Thames Plate-Glass Works, London, England. They produced a good quality of rough plate, but, owing to the ruinous competition of the English and German manufacturers, at the end of two years they were compelled to close. There is some dispute as to where the first plate-glass was made in the United States, but there are existing proofs that the Williamsburg works were the first, based upon the records found in an old diary of the late William S. Dixon, of Pittsburg, who was employed there as pot maker, his father being the manager.

Attempts were made to make plate-glass at Cheshire, Mass., Lenox Furnace, Mass., and at Greenpoint, L. I., previous to 1860. There are records of polished plate-glass being made at Lenox in 1865, but it was not continued. The successful founder of the plate-glass industry in this country is James B. Ford, of Pittsburg. In the year 1869 Ford conceived the idea of making polished plate-glass, and with this in view visited the works at Lenox, gathered what information he could from the workmen who had been imported from abroad, and returned to New Albany with the determination to make plate-glass. Machinery for this purpose was imported, and the new plant was speedily successful so far as the production of plate-glass was concerned; but, like all new enterprises of the kind, it was not profitable, and in 1872 Ford withdrew. The factory was continued by William C. de Pauw until his death, and afterward by his heirs. He demonstrated, after a hard struggle, that polished plate-glass could be made here at a profit. Mr. Ford afterward built a factory at Louisville, Ky. It had two 12-pot furnaces and was equipped with the old-style French machinery. He ran these works for two years and sold out, removing to Jeffersonville, Ind., where he built a plant that he operated until he moved to Creighton, Pa., in 1881. Shortly after the building of the New Albany plant, E. B. Ward, of Detroit, and others, attracted by a very extensive deposit of sand of fine quality, originated the American Plate-Glass Company, with a capital stock of $250,000, and began in 1872 the erection of works at Crystal City, Mo. The capitalization was increased in 1874 to $500,000, and the works were operated until 1876, producing some glass of good quality; but, owing to lack of experience, the management failed to make a profit. In 1877 the works were reorganized, new capital was secured, A. E. Hitchcock, of St. Louis, president of the old company, continuing in charge. G. F. Neal, a practical plate-glass manager, took charge of the works, and a Siemens furnace was erected. The works have been largely increased, and plate-glass is made in Crystal City equal to any found in Europe. This was the condition of the plate-glass business when Ford built the Creighton Works in the midst of a rich gas-coal country. He built a factory with a capacity of 70,000 square feet per month. It was equipped with two 16-pot furnaces, 8 grinding and 16 polishing machines. This was really the first plate-glass works in this country that paid for the large investment required in its establishment.

While the success of these works was very largely helped by the experience that Ford had gained from his previous ventures, a new factor was introduced that had never been used in the making of plate-glass before. This was natural gas, which it was found could be used as a fuel. The Rochester Tumbler Works had used it in their leers, and partially in their furnaces, as far back as 1875; but not having sufficient for the furnaces, it was not a success. At about the time Mr. Ford was starting at Creighton, wells had been drilled that promised inexhaustible quantities of the new fuel. For glass making it is impossible to conceive of a more perfect fuel — no labor required for firemen, no dirt, no ashes, and a uniform heat, or just what was required. Natural gas was a great factor in the success of these works, which were sold by Ford to the Pittsburg Plate-Glass Company, who enlarged them in 1883, and increased the output from 70,000 square feet to 110,000 square feet finished product. Having a great desire to own and operate his own works, Ford, in 1884, commenced the building of a plant at Tarentum, Pa., with a capacity of 150,000 square feet per month. Before it was completed the Pittsburg Plate-Glass Company made him an offer, which he accepted, and the Tarentum plant became part of the Pittsburg Plate-Glass Works. The success of their plants resulted in the building of plate-glass works at Butler, Pa., in 1886, and at Cochran Station, Pa., in 1889.

Natural gas had been discovered in Indiana. A large plant was built at Kokomo, Ind., under the name of the Diamond Plate-Glass Company. The gas being in abundance, this same company erected another large factory 20 miles away, at Elwood, in 1891; and the extensive works at Charleroi and at Irwin, Pa., were erected the same year. The Pittsburg Plate-Glass Company in 1887 commenced the erection of what are now the largest plate-glass works in the world. The company bought 480 acres of land, and a town was laid out, and named Ford City, in honor of J. B. Ford, who is one of the largest stockholders. Under his personal supervision the works were built, which have a monthly capacity of 400,000 square feet. In 1891 the De Pauw Plate-Glass Company built a small plant at Alexandria, in the heart of the gas belt; but the panic of 1893 caused its suspension, and it has not been operated since.

The works mentioned have an aggregate monthly capacity of 1,785,000 square feet, or an annual maximum production of 21,420,000 square feet. In 1894 a movement was made by some of the companies for self-preservation, which resulted in the outright purchase by the Pittsburg Plate-Glass Works of all the plate-glass works in the United States, with the exception of those at Butler and Irwin Station and the De Pauw plants of Indiana.

The total number of furnaces is 43 of 20 pots each, and 2 of 16 pots each. Of this number there are in operation at this time only 23 furnaces, containing 460 pots. Plates of glass are made containing 180 square feet, or, say 12 by 15 feet. The success of the plate-glass business, which really dates back only 20 years, is one of the wonders of our age. Much credit must be given to J. B. Ford, and especially when we consider that when the factory at Creighton was started he was over 70 years of age, and had to impress upon the capitalists his own faith that the business could be made to pay. So far as Pennsylvania was concerned it was an entirely new venture, the census of 1880 showing that no plate-glass was then made in Pennsylvania.

From the year 1880 may be dated also the great success of window-glass making. Prior to this time, with few exceptions, the old furnaces and flattening-ovens that had been in use for 50 years were still prevailing. Fully 25 per cent of the window-glass used in this country was imported. For many years the workmen have been organized into a union, which not only takes in the blowers, but the gatherers, flatteners, and cutters; these last two being practically unskilled labor, and paid as such in European countries. Then, to mend matters and make competition worse, the manufacturers of Belgium and England had adopted what is known as the tank-furnace; no pots were required, a more uniform quality of glass could be depended upon, and a much larger production. James Chambers, of Pittsburg, who had succeeded his father in the manufacture of window-glass, was in 1887 operating 4 furnaces with 36 pots, using natural gas in his furnace and flattening-ovens. He had the improved flattening-ovens, but he came to the conclusion that something had to be done to put the window-glass business upon a better basis. He made a trip to Europe, obtained all the information possible, came back to Pittsburg and organized the Chambers & McKee Company, and, as president, planned, built, and operated the plant at a place on the Pennsylvania Railroad, 27 miles east of Pittsburg, called Jeanette. The foundation of the tanks was laid in 1888, and in the spring of 1889 they commenced making glass. Glass workers and manufacturers all over the country, with few exceptions, had predicted that the tanks would be a failure, and that window-glass could not be made that way; but the tanks were a success from the first.

Owing to financial disagreement, Chambers withdrew from the Chambers & McKee Company, and in 1892 formed a company and erected a factory at New Kensington, 19 miles from Pittsburg, on the Allegheny Valley Railroad, and built two continuous tanks that are said to be the largest in the world. They are 25 feet 6 inches wide, 130 feet long, inside measure; each furnace will hold 1,000 tons of molten glass, and has a melting capacity of 35 tons, turning out 600 boxes of single and 300 boxes of double strength every 24 hours. This is said to be the largest and most complete establishment in the world for the manufacture of window-glass.

The discovery of natural gas, and its application to the glass-furnaces, led to a very great increase in the building of flint- and green-glass works. To-day probably the largest flint-bottle works in the world are those of the Illinois Glass Works at Alton, where 4,500 people are employed. Here was blown in 1903 the largest glass bottle in the world. The next largest bottle works are those of Whitall, Tatum & Company, located at Millville, N. J. They have 13 flint-furnaces, in addition to 5 green-glass furnaces and a green-glass tank, and employ from 1,500 to 1,900 employees, according to the demand for their goods. This business has been principally built up since 1860. The Rochester Tumbler Company, at Rochester, Pa., was organized in 1872, and commenced making glass in July of the same year. They commenced with one 10-pot furnace and 90 employees, making a specialty of tumblers, and with a capacity of 12,000 dozen per week. At present they operate 7 furnaces with 88 pots, with a capacity of 75,000 dozen per week, or 150,000 tumblers each day. The melting capacity of the furnaces is 120 tons of sand per week. The pots are very large, and over 1,000 hands are employed. When they first commenced they made only common tumblers, but now they make every kind of tumblers, with a cutting, engraving, and decorating department. The works cover over seven acres of ground. They make their own barrels, boxes, and machinery, and almost everything used for the manufacture of glass. All the fuel used is natural gas. They do some export trade — probably more than any other concern in this country — and without question have the largest plant in the world making a specialty of tumblers.

The discovery of natural gas was the means of largely stimulating the erection of flint-glass furnaces, and many small towns offered land and a bonus in money to have a glass-works established in their boundaries. By this means many works were started by parties who had little knowledge of the business, so that the business was largely overdone, and prices in 1891 were such that little or no profit could be made. Labor was high, and, in view of there being so much demand for it, was aggressive and unreasonable in its claims, being backed up by its labor organizations. A number of manufacturers met together and formed a stock company under the name of the United States Glass Company, which company bought up 15 of the largest and most complete press manufacturers in the country, located in Pennsylvania, Ohio, and West Virginia. The 15 establishments had a capacity of 29 furnaces. The company afterward erected a plant at Gas City, Ind., with three 15-pot furnaces, to get the benefit of the natural gas fuel. The capital stock of the company was $4,158,100, $640,000 of which is preferred and $3,518,100 common stock. The first year of its existence as a corporation the sales amounted to very nearly $3,000,000. With a view of consolidating the plants the company bought 500 acres of land on the Monongahela River adjoining McKeesport, Pa., and erected two 15-pot furnaces. It is without question the largest flint-glass works in the world, and is almost able to supply this country with table-glass, if all the furnaces were in full operation. Quite a number of flint-glass works are operated in the making of glass for lighting purposes — arc-globes, gas-globes, and shades for electric lighting. There are six leading companies making these goods, four of them located in Philadelphia, one at Monaca, Pa., and one at Brooklyn, N. Y.

Gillinder & Sons, of Philadelphia, were the first of these works established, and operations were commenced in 1861 by William T. Gillinder, the father of the present owners. Their works have two furnaces, with 23 pots, and have a capacity of production to the amount of $400,000 per annum. It is impossible to continue further to enumerate special plants, but so far as glass making is concerned America is practically in-

FLINT OR GLASS SPONGES.

1, 3, 5, 6, 7 Various forms of glass sponges. 2, 4, 9, 10, 11, 12, 13, 14, 15, 16, 17 Specimens of flint or glass spicules which form the skeleton of the animals. 8 Cross section of a young sponge.

dependent. We have sand in almost every State of the Union fit to make glass. The sand of Massachusetts, Pennsylvania, and Missouri is equal to, if not better, than any other sand in the known world. Soda-ash and other chemicals are being made, and when the beet-sugar industry is fully established we shall be able to get pearl-ash from the ashes of the beet, so that it will not be necessary to import our potash from Germany. We have fire-clay for furnaces, which is found in many States of the Union, notably in New Jersey, Ohio, Pennsylvania, and Missouri. The pot-clay found near St. Louis, Mo., has been used for more than 40 years. It is a very superior clay, and for the making of glass-house pots is unsurpassed. It is capable of resisting a very high degree of heat, and will stand the changes of temperature much better than the most celebrated clays of Europe.

In the preparation of this article I have been aided very much in the early records by the 'History of Glass Making in the United States,' prepared by Joseph D. Weeks; and for information in regard to the various improvements in furnaces and leers, by H. L. Dixon, of Pittsburg, who has been identified with the building of many of the improved furnaces that have taken the place of the old furnaces. See Glass.

James Gillinder,
Franklin Flint-Glass Works, Philadelphia.

The following statistics from the United States census report for 1900 will be found valuable for comparison with the figures heretofore given :

COMPARATIVE SUMMARY OF THE GLASS TRADE, 1850 TO 1900.

	DATE OF CENSUS			
	1900	1890	1870	1850
Number of establishments	355	294	201	94
Capital	$61,423,903	$40,966,850	$14,111,642	$3,402,350
Salaried officials, clerks, etc., number	2,268	[2] 1,095	(3)	(3)
Salaries	$2,792,376	[2] $1,232,561	(3)	(3)
Wage-earners, average number	52,818	44,892	15,822	5,668
Total wages	$27,084,710	$20,885,961	$7,846,425	$2,094,576
Men, 16 years and over	42,173	36,064	11,505	5,571
Wages	$24,901,233	$19,546,351	(3)	(3)
Women, 16 years and over	3,529	1,885	715	97
Wages	$840,001	$332,245	(3)	(3)
Children, under 16 years	7,116	6,943	3,602	(3)
Wages	$1,343,476	$1,007,365	(3)	(3)
Miscellaneous expenses	$3,588,641	$2,267,696	(4)	(4)
Cost of materials used	$16,731,009	$12,140,985	$6,133,168	$1,556,833
Value of products	$56,539,712	$41,051,004	$19,235,862	$4,641,676

[2] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this table. [3] Not reported separately. [4] Not reported.

RANK OF STATES ACCORDING TO VALUE OF PRODUCTS, 1880 TO 1900.

States	Rank			Value of Products		
	1900	1890	1880	1900	1890	1880
United States	....	....	....	$56,539,712	$41,051,004	$21,154,571

[4] Includes the following states: 1890 — California, Colorado, Delaware, Georgia, Kentucky, Michigan, Wisconsin; 1900 — California, Colorado, Delaware, Georgia, Michigan, Virginia, Wisconsin.

Glass Painting. See GLASS STAINING.

Glass Snail, one of the minute, grass-haunting, hyaline land-snails of the genus *Vitrina*.

Glass-snake, or Joint-snake, a limbless, snake-like lizard of the genus *Ophisaurus* (family *Anguidæ*), which takes its name from the brittleness of the tail, which is more than twice the length of the body, and whose vertebræ are so slightly connected, that a part or all of the tail will easily break off, or may be cast off; but the lost part is quickly renewed. The head is very lizard-like. No vestige remains of limbs except two little spikes near the vent; the body is serpentiform, but the stiff armor of scales prevents the graceful movements of a serpent. The glass-snake (*O. pallasi*) of southeastern Europe may exceed a yard in length, and dwells in bushy districts where it can hide under leaves and sand, and catch snails and small animals. A smaller species (*O. ventralis*) is found in the Mississippi Valley and the southern United States. It is greenish-gray or brownish; sides largely yellow, with narrow black streaks; but the coloration varies greatly, especially in western specimens. Several nearly related species inhabit Central America. These lizards are rapacious and devour great numbers of ground-keeping insects and crayfish. They breed by means of eggs hidden in loose soil or leaves; and are of slow growth. They are said to be easily tamed, and to show intelligence.

Glass-sponges, certain silicious sponges are so-called from the fact that the fibres or spicules composing their solid framework or skeleton is like finely spun glass. The glass-sponges, such as the Venus' flower-basket (*Euplectella*) and allied forms, live in fine sandy mud in deep water. The *Euplectella* inhabits the ocean around the Philippine Islands in from 10 to 20 fathoms. It forms a hollow cylinder or basket-work of spicules, enlarging at the top, which is broad and a little convex; it grows rooted in the sandy mud, anchored by its long glass spikes, which at the extremity end in anchor-like hooks. A number of similar but shorter, more dense sponges (*Holtenia*, etc.) live at great depths in the Atlantic, one kind occurring in shallower water (100 fathoms) in the Gulf of Maine. The glass-sponge of the Japanese seas is *Hyalonema*, in which the stem is twisted, composed of fibres, like spun glass, while the body of the sponge is long and slender; it grows nearly three feet in length. These glass-sponges, with the spicules having three crossed axes, or six threads radiating from a common point, are grouped in a family (*Hexactinellidæ*). The efferent canals are loosely meshed, while the digestive chambers (ampullæ) are large and barrel-shaped.

Glass Staining and Glass Painting, the art of producing pictures on glass with vitrifiable colors; but a common extension of the meaning is to include all the make and design of ornamental glass windows. Originally there was but one method of making these, and that was to produce the pattern in outline with frames, into the grooves of which pieces of colored glass or of stained glass were fitted. In the Moslem East these frames were of plaster, or rarely of marble slabs pierced with openings. In Europe, since the 12th century, these frames have been of lead, rolled or drawn into what are called *cames*, that is, bars of an I section, the two grooves holding the glass firmly. Modern chemistry has so improved the art of glass staining, that large pictures may now be produced on single sheets of glass, but nowhere have such pictures been successful in an artistic sense. In the original painted glass windows the pictures resembled tables of mosaic work, in which there was no attempt at shading or modification of the tone. What is perhaps the earliest known application of colored glass to window decoration, in Europe, is that in the monastery of Tegernsee, in Upper Bavaria, which was secularized in 1802, and is now a private residence. The windows of this structure, executed in the latter half of the 10th century, like all the first attempts, were only tasteful arrangements of colored glass in a translucent mosaic.

In the early part of the 13th century the mosaic patterns gave way to more elaborate designs, not only in beautiful Arabesques, but even in pictorial composition. In all these the figures were composed of pieces of colored glass combined with marvelous skill and taste. The work of shading and making so-called half-tints was not attempted; but an effect not dissimilar was got by painting in opaque pigment upon the glass and breaking up this painted surface into patchings and spots, as when an artist draws in crayon or charcoal. The finest English examples of this early mosaic work are to be found in the cathedrals of Canterbury, Salisbury and Lincoln. In the 14th century the art of shading was advanced by removing certain portions of the colored surface. The first period of the art reached the culminating point in the 15th century, but with the passing of Gothic architecture, glass painting lost its artistic spirit. Subjects in which were arranged a multitude of personages with all the elaborate artifices of pictorial composition; buildings showing complex linear perspective; foreshortened figures; the play of light and shade — all this was attempted to be exhibited in painted windows. It soon became apparent that the true art was lost, and though windows continued to be painted, only a few artists acquired celebrity. Perhaps the best examples of the 15th century period are the windows of the Cologne cathedral.

About 1600, Bernhard von Linge, an artist from the Netherlands, residing in England, and who may be considered the father of the modern art of glass staining, established a school in London, whose influence is evident in the work of the present day. Francis Eginton (1737–1805), a native of England, accomplished much to restore the art during the 18th century. Among his numerous works, all of which are remarkable for brilliancy of coloring and delicacy of execution, are: 'The Banquet of the Queen of Sheba' (a copy from Hamilton); two 'Resurrections' (from Sir Joshua Reynolds); 'Christ Bearing the Cross' (from Morales); and 'The Soul of a Child' (from Peters). Other famous artists of this period were Jouffrey and Baumgartner. The Renaissance in glass painting was contemporaneous with the revival of Gothic architecture in the beginning of the 19th century. Four German artists, Mohn, Scheinert, Ligm and Frank, were prominent as glass stainers during the century. In 1850, through the generous assistance of King Louis of Bavaria, a school was founded at Munich under the direction of Gärtner and Hess, the latter a well-known historical painter, which obtained a world-wide celebrity. Still, however, the purists in Gothic art, and those who were most concerned in the Gothic Revival would have none of this glass of the early 19th century. It was seen that the smooth and clear modern glass would never do; and rough, partly opaque, flawed and bubbled glass was prepared on purpose. This material, known as "antique" and as "cathedral" glass, and by other names, allowed of a far more decorative effect.

In 1902 the chief centres of the art in Europe were at Birmingham, England; Edinburgh, Scotland; Paris and Sèvres, France, and Munich, Metz and Nuremberg in Germany.

Not until comparatively late in the 19th century did the art of glass staining obtain a place in the United States. Only a few years ago Americans were seemingly content with imported windows, or with poor imitations made here. In both cases the windows were but copies of mediæval work, seldom equaling the originals, and never showing an advance, either in artistic qualities or improvement of method over the windows of the Middle Ages. Several artists and some makers of church furniture began making fine windows, and to-day largely through their efforts American colored glass-windows have become celebrated for their color values and their color relations. John La Farge, Louis C. Tiffany and other American artists in glass painting and glass staining took up the art where the mediævalists stopped, in the study of the inherent properties of the glass, both in their color and texture, in order to obtain in the glass itself light and shade, through depth and irregularity of color, in union with inequality of surface. In this way they sought to avoid the dullness, opacity and thinness which invariably accompany the use of paint, and are marked characteristics of European glass work. It was an American idea to make glass in lumps and chip it into flakes, to corrugate it, to blow it into shapes, or to pull molten glass out of shape. By such means the artist has succeeded in obtaining effects in this obstinate material which were deemed impossible. There was introduced a few years since the use of opalescent glass, the plating of glass over glass and developing the mosaic system, substituting it for glass painting. Churches, houses, hotels, and theatres are now decorated by the mosaic stained glass which is largely a product of New York studios. Upward of $3,000,000 was invested in 1902 in the stained glass industry in the United States.

Glasse, glas, **Hannah**, English writer. She was the author of 'The Art of Cookery' (1747), a work whose claim to remembrance has depended chiefly on the mistaken reference to it of the proverbial "First catch your hare." In the fourth edition (1770) she is described as a habit-maker in Tavistock Street, Covent Garden.

Glauberite, glâ'bėr-īt, a mineral having the formula $Na_2SO_4.CaSO_4$, and crystallizing in the monoclinic system, usually in tabular forms. It is commonly pale yellow or gray in color, with a white streak. It has a hardness of from 2.5 to 3, and a specific gravity of from 2.7 to 2.85. Glauberite occurs in connection with rock salt in various parts of the world. In the United States is found at Borax Lake, San Bernardino County, Cal., and in tabular crystals in the Rio Verde Valley, Arizona.

Glauber's (glow'bėrz) **Salt**, sulphate of sodium, Na_2SO_4, so called from the German chemist, Glauber, who prepared it in 1658 by distillation of common salt with sulphuric acid, named it "sal mirabilis," identified it with the salt of a beneficial mineral water, and urged its good qualities. It occurs throughout Europe, especially at Carlsbad and Seidlitz, and in North America, notably at the Great Salt Lake in Utah. It forms oblique prisms which effloresce on the soil or on rocks. These are of a gray or yellow color, earthy, but transparent and vitreous when newly broken. It is readily soluble in water, and when heated or exposed to the air melts in its water of crystallization. Its chief use is in the manufacture of glass and sodium carbonate.

Glaucine, glâ'sĭn, an alkaloid contained in the leaves of *Glaucium flavum*, a sort of poppy. The leaves are macerated with acetic acid; the juice is pressed out, boiled, filtered and the filtrate is treated with lead nitrate, which precipitates lead fumarate. The filtrate is treated with H_2S, then the glaucine is precipitated with tannin, and the precipitate decomposed by chalk. Glaucine crystallizes out of water in small scales, is easily soluble in alcohol and ether, and forms crystalline salts.

Glaucodot, glâ'kō-dŏt, or **Glaucodote**, an orthorhombic, grayish, tin-white mineral of metallic lustre and black streak; hardness, 5; specific gravity, 6. Composition: Sulphur, 19.4; arsenic, 45.5; cobalt, 23.8; iron, 11.3. It occurs in chlorite slate in the province of Huasco in Chile, also in fine crystals in Sweden.

Glaucoma, glâ-kō'ma, a diseased condition of the eyeball characterized by a retention of the fluids within its cavity. As the fluids accumulate, pressure is exerted on the delicate lining, with resulting injury or destruction of sight. It is due to any causes operating so as to close the place of exit for the fluids of the inner chamber of the eyes. See EYE, DISEASES OF.

Glau'conite, an amorphous green opaque mineral, like earthy chlorite, with a dull or glistening lustre. It is a hydrous silicate of iron and potassium, averaging: Silica, 49.3; alumina, 3.6; sesquioxide of iron, 22.7; protoxide of iron, 6.3; potash, 8.3, and water, 9.6. Its hardness is 2, and its specific gravity about 2.3. There are two varieties of it; the one the green earth of cavities in eruptive rocks, the other the green grains in greensand formation, or anything similar.

Glaucophane, glâ'ko-fān, a mineral of the amphibole group, crystallizing in the monoclinic system, and closely resembling amphibole in form. It is a silicate of aluminum, sodium, iron and magnesium, with variable proportions of the two latter metals. It is blue or gray in color, translucent with a vitreous lustre, and has a hardness of from 6 to 6.5, and a specific gravity of about 3.10. Glaucophane occurs in certain crystalline and mica schists, and is found associated with mica, garnet, epidote and dial-lage. In the United States it occurs chiefly along the Coast Ranges of California.

Glaucus, glâ'kŭs, the name of several personages in Greek legend. (1) A sea-god, who was at first only a fisherman, and whose oracles were highly prized by fishermen, according to the legends. (2) The son of Hippolochus and grandson of Bellerophon. He assisted Priam in the Trojan war, and was foolish enough to exchange his golden armor for the iron suit of Diomed. He displayed much courage, but was killed by Ajax. (3) The son of Sisyphus, king of Corinth, by Merope, daughter of Atlas, and born in Potnia, Bœotia. He wished to make his mares swifter than others, for the purpose of vexing Venus, and Venus inspired the animals with such fury that they tore Glaucus to pieces as he returned from the games which had been celebrated by Adrastus in honor of his father. (4) The son of Minos II., and Pasiphæ, smothered in a cask of honey, and miraculously brought to life, by an herb sent by Polyidus the soothsayer.

Glaze (ceramic), a vitrified coating which gives to earthen-ware or porcelain its brilliance and impermeability.

Glazes are of three classes: the glaze proper (Fr. *couverte*), the soft glaze (Fr. *vernis*), and the enamel or opaque glaze (Fr. *émail*). The glaze proper is a silicate of calcium, potassium and aluminum, and is composed of feldspar, chalk or whiting, kaolin and quartz. It is applied either to the clay ware (Chinese) or to the soft burned biscuit (modern); the whole piece is then burned to a high temperature (about 1,500° C.). Soft glaze comprises the vast range of earthen-ware and faïence glazes, and includes the glazes of bone china and soft porcelain. A soft glaze is either a silicate or a boro silicate, and the bases employed include the oxides and carbonates of the following elements: Lead, zinc, potassium, sodium, calcium, barium, magnesium, and as coloring agents the salts of iron, cobalt, copper, nickel, antimony, chromium and manganese.

The range of temperature is very wide. A simple lead glaze will fuse at 900° C. and a hard glaze for white earthen-ware may need 1,350° of heat. Enamels are sometimes used over other glazes and sometimes upon the biscuit body. Their essential condition is opacity. Oxide of tin, alumina, calcium phosphate and calcium carbonate are used as opacifiers. The early wares made in Italy, Spain and Holland were of this type (see MAJOLICA). For convenience of application glazes are ground in water and held in suspension, the article to be glazed being plunged into the liquid. For this reason only insoluble substances can be used, and where it is necessary to introduce alkaline salts and soluble boric acid or borates these are rendered insoluble by being melted with insoluble and readily combined reagents, such as whiting and barium carbonate. This melt is called a "frit" and the operation of melting is known as "fritting." Hence some glazes, mainly of the second class, are called fritted glazes, and glazes which contain no frit are termed "raw" glazes. Fritted glazes are, as a rule, harder and clearer than those which contain no frit except in the case of porcelain glaze (couverte), which is made from natural substances without frit.

Glaze'brook, Richard Tetley, English scientist: b. 18 Sept. 1854. He was educated at Cambridge and was principal of University College, Liverpool, 1898–9, and has been director of the National Physical Laboratory from 1899. He has published various scientific text-books; 'Laws and Properties of Matter'; 'Clerk-Maxwell and Modern Physics'; etc.

Glazier, glā'zhėr, **Willard**, American author: b. Fowler, N. Y., 22 Aug. 1841; d. 25 April 1905. His works include: 'Capture, Prison Pen, and Escape' (1865), which was very popular; 'Three Years in the Federal Cavalry' (1870); 'Battles for the Union'; 'Heroes of Three Wars'; 'Peculiarities of American Cities'; and 'Down the Great River.'

Glazier, Lake, Minn., a body of water south of Lake Itasca, into which it empties through a swift and permanent stream about 6 feet wide; named for Capt. Willard Glazier, who claimed for it a geographical importance as the true source of the Mississippi. Lake Glazier has an area of 255 acres. It is estimated to be 1,582 feet above the Atlantic, and 3,184 miles from the Gulf of Mexico.

Glea'son, Elliott Perry, American inventor: b. Westmoreland, N. H., 27 June 1821; d. New York 26 Sept. 1901. Received a common school education; was one of the first to manufacture gas burners; and invented the regulating argand burner and other lighting devices.

Gleason, Frederick Grant, American musician: b. Middletown, Conn., 17 Dec. 1848. He was a pupil of Dudley Buck at Hartford, Conn., studied also at Leipsic, Berlin, and London, became an organist at Hartford, and in 1876 removed to Chicago, where he was active as composer, teacher, and musical critic of the *Tribune*. Among his works are songs, trios, sonatas; the cantatas, 'Praise of Harmony,' 'God Our Deliverer,' and 'The Culprit Fay'; and the operas 'Montezuma' and 'Otho Visconti.'

Glebe, glēb (Lat. "soil," "clod"), the land possessed as part of the revenue of an ecclesiastical benefice in England or Scotland, often scattered through the parish. Where there are arable lands the glebe must consist of 4 acres; where there is none the parson is entitled to 16 soums of grass next adjacent to the church — a soum of land being as much as will pasture 10 sheep or 1 cow — so that the actual extent will vary with the richness of the soil. The glebe must be taken as near the manse as possible; and where there is no manse, vicinity to the church is the criterion. In general, the glebe is the subject of much discussion in the ecclesiastical law of both countries. Although the incumbent is temporarily proprietor, he has no right of alienating the glebe.

Glede, glēd, an old British name for a bird of prey, the kite. See KITE.

Glee, in music, a vocal composition in three or more parts, generally consisting of two or three contrasted movements, the subject of which may be either gay, tender, grave or pathetic. It is distinguished from a madrigal by its want of contrapuntal harmony, and in the independence of its parts it differs from a part-song. It is essentially English in origin and cultivation, and the period during which its vogue was greatest and its form most perfect extended from 1760 to 1830.

Gleet, glēt, chronic urethritis; an obstinate inflammation of the urethra that follows acute gonorrhœa. The disease is evidenced by the continuation of the purulent discharge, or by a morning drop, or by the presence of shreds of mucous membrane appearing in the urine. It may be due to small ulcerated patches, the presence of a stricture, or inflammation continuing in the tiny pockets and glands. The cure of the inflammation requires astringent and antiseptic injections, usually some form of silver, and under some conditions the passage of steel sounds.

Glencoe, glĕn'kō, Minn., a village and county-seat of McLeod County, on the Chicago, M. & St. P. R.R. Stevens Seminary and St. Joseph's Academy are located here. Pop. (1900) 1,780.

Glendale, Battle of, also called **the Battle of Charles City Cross-roads, the Battle of Frazier's Farm**, and **the Battle of White Oak Swamp**. The battle of Gaines' Mill was fought on 27 June 1862. That night the Fifth corps and its supports crossed to the south side of the Chickahominy and destroyed the bridges, and the withdrawal of the Army of the Potomac to James River began. The battles of Allen's Farm and Savage Station were fought on the 29th, and on the morning of the 30th the Union army was across the White Oak Swamp Creek, covering the roads leading to James River and the immense trains on their way to Malvern Hill and Harrison's Landing. Franklin, on the right, with Smith's division of his own corps, Richardson's division of Sumner's, and Naglee's brigade of Keyes' corps, was at the bridge crossing of White Oak Swamp Creek. About two miles to the left, holding the intersection of the Charles City, Darbytown, and New Market roads, thus covering the Quaker road over which the trains must pass, was Sumner, with Sedgwick's division of his own corps. Heintzelman's two divisions of Hooker and Kearny, Slocum's division of Franklin's corps, and McCall's division. Slocum, on the right of Sumner's line, was on the Charles City road, about a mile in advance of the junction with the New Market and Quaker roads; Kearny was on Slocum's left between the Charles City and New Market roads; McCall was on Kearny's left, and Hooker to the left and rear of McCall; Sedgwick was in support to McCall, but during the forenoon, two of his brigades were sent to Franklin. Porter's and Keyes' corps were at or on the way to Malvern Hill. After making these dispositions McClellan left the field.

Gen. Lee's plan contemplated that Jackson should force a passage at the bridge held by Franklin, turn his right, and reach the Union rear; Holmes to attack and turn the Union left and prevent its reaching James River, while the divisions of Longstreet, A. P. Hill, and Huger, supported by Magruder, concentrating at the cross-roads, should cut McClellan's army in two and interrupt its retreat to the river. Early on the morning of the 30th Jackson advanced through Savage Station on Franklin, who opened upon him furiously with artillery and checked him. It was a great disappointment to Lee, and Jackson's want of enterprise on this occasion has been the subject of much criticism. Holmes advanced on the Confederate right with 6,000 men and 6 batteries, toward Malvern Hill, and was attacked by Warren's brigade of 1,50c men and 36 guns; the gunboats in the river opened upon him and he fell back in disorder, and called for help. Huger led the advance down the Charles City road; in an effort to determine the Union position and to protect his own flanks, his division became scattered, and he devoted the remainder of the day to reconnoitering and an almost harmless artillery duel with Slocum. While this division of 9,000 men frittered away the day, Longstreet and A. P. Hill were maintaining a furious contest.

Longstreet and A. P. Hill moved on the Darbytown road, Longstreet in advance, who, at noon, came upon McCall's pickets on the Frazier farm. Longstreet formed line and at 3 P.M. closely supported by A. P. Hill, attacked McCall, forced back his left brigade (Seymour's) after a hard struggle, and captured several guns. Hooker, with Grover's brigade, fell upon the flank of Longstreet's right brigade (Kemper's); Sumner's artillery, covering the opening between McCall and Hooker, opened fire, and Kemper was swept back just as Branch's and Pickett's brigades were advancing to his support, which in turn were checked, but kept up a stubborn fight until nightfall, when they were joined by Pender's and Archer's brigades of Hill's division, and held the ground from which Seymour had been driven. Wilcox's brigade, which had advanced on Pickett's left, captured Randol's and Cooper's batteries after a very obstinate fight, but was forced back by a counter-attack, and Cooper's battery was retaken. Field's brigade, coming to Wilcox's support, forced back Meade's brigade and captured some guns, but Meade rallied and drove it back. Farther on the Confederate left Pryor's and Featherston's brigades attacked Kearny's left and were several times repulsed. Slocum assisted Kearny with his New Jersey brigade, and Featherston's brigade being thrown into some disorder, Gregg's South Carolina brigade was sent to that part of the field. Late in the day Caldwell's brigade of Richardson's division moved from Franklin's position and reinforced Kearny's left. Two regiments only got into line and fired a volley; the engagement was about over, and darkness came with Kearny's line intact. Only one division, McCall's, had lost any ground during the day, and it lost its commander who was taken prisoner at the close of the engagement, and 14 guns. The Union troops had resisted three separate attacks on flank and rear, and under cover of their splendid fighting, involving great losses on both sides, the immense supply trains and the reserve artillery reached Malvern Hill at 4 o'clock in the afternoon. During the night the Union army fell back to Malvern Hill. Consult: 'Official Records,' Vol. XI.; 'McClellan's Own Story'; Webb, 'The Peninsula'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. Carman.

Glen'dive, Mont., a village and county-seat of Dawson County, on the Yellowstone River and on the Northern P. R.R. It is the centre of a stock-raising and agricultural region and has railroad repair shops. Pop. (1900) 1,200.

Glens Falls, N. Y., village in Warren County; on the Hudson River, Glens Falls Feeder to Champlain Canal, and the Delaware & Hudson R.R. and Hudson Valley Trolley System (running from Warrensburg to Troy); about 56 miles north from Albany, 50 miles from Troy, 18 miles from Saratoga, and nine miles from Lake George. The river at this point has a descent of about 60 feet with a succession of falls and rapids. Cooper in 'The Last of the Mohicans' has celebrated the falls at this place and the famous cave which lies under the limestone formation at this point. This cave cannot be seen at high water in the spring and fall; at other times it is accessible to any tourist who wishes to visit this quasi-historical spot.

Industries.— Glens Falls is in an agricultural region; in the vicinity of the river are extensive limestone and black marble quarries which have been worked for more than half a century. At the falls, are located some of the largest, most extensive, and costly paper mills in the world, as well as various other manufactories. The chief manufactures of the city are paper, pulp, wall paper, Portland cement, lime, lumber, collars, cuffs, shirts, ladies' shirt waists, flour, laths, Joubert & White buckboards, lanterns, machinery and foundry products, ale brewing, brick (ordinary and artificial), paper boxes, cigars, confectionery, gold and silver refining, and various minor enterprises. Twelve miles above Glens Falls is situated the great Spier Falls dam across the Hudson, built by the Hudson River Water Power Company, supplying electric light and power along the Hudson and Mohawk valleys as far south as Albany and west to Utica. This power is second only to Niagara in importance in this country.

Public Works, Institutions, Buildings, Etc.— Glens Falls has several miles of paved streets, a paid fire department, police, and all modern municipal equipments. The village owns its own water works system. Glens Falls has an excellent union school system and its new high school building completed in 1906 cost over $120,000. It has also Saint Mary's and Glens Falls Academies, Crandall Free Library, Parks' Hospital, Glens Falls Hospital, Glens Falls Home for Aged Women, and the Crandall Park. There are many fine buildings including the home office building of the Glens Falls Insurance Company, the State Armory of Company K, 2d Reg., N. Y. M., the Ordway Memorial Y. M. C. A. Building, the Village Hall (costing $60,000), and the Empire Theatre Building. There are 11 churches comprising all the leading denominations. Glens Falls has three national banks and a trust company with a combined capital of $436,400 and deposits of $5,636,396.

History and Population.— Glens Falls is situated on the Great War Trail leading from Lake George to Albany. Just outside the village limits at the Half-Way Brook was located throughout the French and Indian Wars and the Revolutionary War a fortified post. A tablet was erected in 1905 by the New York State Historical Association commemorating the two massacres which occurred at that spot during this period, also the encampment there of General Riedesel with Burgoyne's forces while on their way to Saratoga. Glens Falls was settled in 1763; incorporated in 1837 and again in 1874 and 1887. In 1864 the village was practically destroyed by fire. In 1884 and also in 1902 it was visited by disastrous conflagrations entailing a loss of hundreds of thousands of dollars. Pop. (1900) 12,613; (1905) 14,650.

James A. Holden.

Glen'wood, Iowa, a city and county-seat of Mills County, 20 miles from Council Bluffs, on the Chicago, B. & Q. R.R. The State Institution for Feeble Minded Children is located here. The chief industries include fruit-growing, farming, and vegetable canning. It has a city hall, court house, and several churches. Pop. (1900) 3,040.

Gliddon, George Robbins, American archæologist: b. Devonshire, England, 1809; d. Panama, Colombia, 1857. He succeeded his father as United States consul at Alexandria, and was for a long time engaged in archæological researches in Egypt and the Levant. Later he came to the United States, and lectured in many cities on Oriental archæology, and was appointed agent for the Honduras Interoceanic Railroad Company. His principal works include: 'Appeal to the Antiquaries of Europe on the Destruction of the Monuments of Egypt' (1841); 'Discourses on Egyptian Archæology' (1841); 'Otia Ægyptica' (1849); 'Ancient Egypt'; 'Types of Mankind, or Ethnological Researches Based upon the Ancient Monuments, Paintings, Sculptures, and Crania of Races, etc.,' etc.

Glinka, glĕn'kä, **Mikhail Ivanovitch**, Russian composer: b. government of Smolensk 1 June 1803; d. Berlin 15 Feb. 1857. In 1836 his opera 'Life for the Tsar' was presented with great success at St. Petersburg. He was regarded as the founder of Russian national opera, and was appointed director of the imperial Opera and Kapellmeister to the Tsar. A second operatic work, 'Russlan and Ludmilla' (1842), was inferior. His orchestral arrangements of Russian dances became well known in foreign countries. He wrote (in Russian) 'Memoirs and Correspondence with Relatives and Friends' (1887). Consult the study by Fouqué (1880).

Glisan, glĭs'an, **Rodney**, American physician: b. Lingamore, Frederick County, Md., 29 Jan. 1827. He was graduated from the medical department of the University of Maryland (Baltimore) in 1849, was assistant surgeon, United States Army, in 1850–60, afterward practised medicine in Portland, Ore., and in 1881 was a delegate to the Seventh International Medical Congress. His writings include a 'Journal of Army Life' (1874).

Globe, a sphere, a round solid body, generated by the revolution of a semicircle about its diameter. Globe, or artificial globe, in geography and astronomy, is more particularly used of a sphere made of metal, plaster, or pasteboard, on the surface of which is drawn a map or representation of either the heavens or the earth, the former being called a terrestrial and the latter a celestial globe. The celestial globe is intended as a representation of the heavens, on which the stars are marked according to their several situations. The terrestrial globe is an artificial representation of the earth, exhibiting its great divisions. The axis of the earth is an imaginary line passing through its centre, and the wire on which the artificial globe turns represents this line. The poles of the earth are the extremities of this axis. The brazen meridian is the circle in which the artificial globe turns, divided into 360 degrees. A degree of a great circle in the heavens is a space nearly equal to twice the apparent diameter of the sun, or to twice that of the moon when considerably elevated above the horizon. A degree on the equator of a terrestrial globe represents 60 geographical miles or 69.12 English miles.

Great circles, such as the equator, ecliptic, and the colures, divide the globe into two equal parts; small circles, as the tropics, polar circles, parallels of latitude, etc., divide the globe into two unequal parts. Meridians, or lines of longitude, are semicircles cutting the equator at right angles. In English maps and globes the first meridian is a great circle supposed to pass through the Royal Observatory at Greenwich. The equator, when referred to the heavens, is called the equinoctial, because when the sun appears in it the days and nights are equal all over the world. The declination of the sun, stars, and planets is counted from the equinoctial north and south. The ecliptic is a great circle in which the sun makes his apparent annual progress among the fixed stars; it is the real path of the earth around the sun. The zodiac on the celestial globe is a space which extends about 8° on either side of the ecliptic. Within this belt the motions of the planets are performed. The ecliptic and zodiac are divided into 12 equal parts called signs, each containing 30°; and the sun makes his apparent annual progress through the ecliptic at the rate of nearly a degree in a day. The colures are two great circles of the celestial sphere, one of which passes through the celestial poles and the equinoxes, and the other through the solstices and the celestial poles. The tropics are two smaller circles, each 23° 28′ from the equator, with which they are parallel; the northern is called the tropic of Cancer, the southern the tropic of Capricorn. The polar circles are two small circles parallel to the equinoctial, at the distance of 66° 32′ from it, and 23° 28′ from the poles.

Horizon when applied to the earth is either apparent or real. The sensible or visible horizon is the circle which bounds our view, where the sky appears to touch the earth or sea. It extends only a few miles. The real or true horizon is an imaginary plane passing through the centre of the earth parallel to the sensible horizon. The wooden horizon circumscribing the artificial globe represents the true horizon on the earth: it is divided into several concentric circles arranged in the following order: one containing the 32 points of the compass divided into half and quarter points; another with the 12 signs of the zodiac, with the figure and character of each sign; and another having the days of the month answering to each degree of the sun's place in the ecliptic, and the 12 calendar months. The cardinal points of the ecliptic are the equinoctial and the solstitial points, which mark out the four seasons of the year.

The zenith is a point in the heavens exactly overhead and is the superior pole of our horizon. The nadir is a point in the heavens exactly under our feet, being the inferior pole of our horizon, and the zenith or superior pole of the horizon of our antipodes.

The pole of any circle is a point on the surface of the globe 90° distant from every part of the circle. Thus the poles of the world are 90° from every part of the equator; the poles of the ecliptic (on the celestial globe) are 90° from every part of the ecliptic, and 23° 28′ from the poles of the equinoctial. The equinoctial points are in the signs of Aries and Libra, where the ecliptic cuts the equinoctial. The vernal equinox is called the first point of Aries, and the autumnal the first point of Libra. When the sun is in either of these points the days and nights on every part of the globe are equal to each other. The solstitial points are in Cancer and Capricorn. When the sun enters Cancer it is the longest day to all the inhabitants north of the equator, and the shortest day to those on the south side. When the sun enters Capricorn it is the shortest day to those who live in north latitude, and the longest day to those who live in south latitude. The latitude of a place on the terrestrial globe, or its distance from the equator in degrees and minutes, or geographical miles, is reckoned on the brass meridian from the equator toward the pole. The quadrant of altitude is a thin piece of brass divided upward from 0 to 90°, downward from 0 to 18°; when used it is generally screwed to the brass meridian. The upper divisions determine the distances of places on the earth, the distances of the celestial bodies, their latitudes, etc.; and the lower divisions are applied to finding the beginning, the end, and duration of twilight. The longitude of a place on the terrestrial globe is the distance of the meridian of that place from the prime meridian, reckoned in degrees and parts of a degree, on the equator. Longitude is either east or west, according as a place is east or west of the prime meridian. No place can have more than 180°, or half the circumference of the globe. Hour circles are the same as meridians. The brass meridian and these circles always correspond.

Globe-fish, a plectognathous fish of the family *Tetraodontidæ*, examples of which are found on all the warmer coasts of the world, especially within the tropics. Ordinarily they are oval, spinose, small-finned fishes, which nibble the barnacles and crush the small crustaceans and mollusks near shore, with the rodent-like teeth which give them the name "rabbit-fishes" in the West Indies. The moment any danger threatens they suck air or water into a large bladder-like expansion of the abdomen and distend the scaleless skin until they are as round as a ball, all the spines are rigid, and they rise and float at the surface belly upward,— a difficult and disagreeable mouthful; this odd method of self-defense has given them the names "bellows-fish," among English, and "tambor" among Spanish fishermen. Some tropical species are a foot or so in length, but those familiar as "puffers" or "swell-fish" along the coast of the eastern United States are much smaller and serviceable only as comical additions to an aquarium. The flesh of all is poor, and said to be poisonous. The two genera are Lagocephalus and Spheroides, the latter containing the familiar northern puffers. Compare DIODON.

Globe Tavern, Battle of. On 17 Aug. 1864 Gen. Grant, then investing Petersburg, directed that Warren's Fifth corps and some cavalry be sent to destroy as much as possible of the Weldon Railroad and make such a demonstration on Lee's right as would force him to withdraw a portion of his troops from the Shenandoah valley, so that Sheridan might strike a blow at the rest of them. Warren was instructed to move at 4 o'clock on the morning of the 18th and make a lodgment upon the railroad two miles south of the Vaughan road, and destroy it as far south as possible. A brigade of cavalry under Col. Spear was attached to his command. Warren moved as directed, drove back Dearing's Confederate cavalry brigade, and took possession of the railroad at Globe Tavern, about three miles south of Petersburg. Griffin's division was formed along the road, and began its destruction. Ayres' division moved up the road a mile or more beyond Griffin, and Crawford moved up on Ayres' right. About 2 P.M. Gen. Heth, with two brigades, moved out of the Confederate works, made a sudden attack upon Ayres' left, and drove it back; Ayres rallied, and retook the lost ground. The Union loss was 544 killed and wounded, and 392 missing. On the morning of the 19th Bragg's brigade was sent to the right of Crawford to support him and establish connection by a skirmish-line with the Ninth corps, and Willcox's and White's divisions of the Ninth corps were ordered to Warren's support. The woods were so dense and the roads so intricate that Bragg failed to establish a proper line, and before it could be connected and completed it was broken. A. P. Hill with Heth's two brigades, Mahone's three brigades, Fitzhugh Lee's cavalry, and Pegram's batteries, moved to the Vaughan road intersection. At 4.30 P.M. Mahone in column of fours, broke through Bragg's skirmish-line, faced to the right, and sweeping forward dispersed Crawford's division and the right of Ayres'; at the same time Heth opened on Ayres' centre and left. Warren rallied the broken parts of his line and, advancing, regained the lost ground, taking some prisoners. Willcox's division engaged Colquitt's brigade, drove it back, and captured some prisoners; and Mahone's entire command fell back rapidly in great confusion to their entrenchments, "carrying with them the parts of Warren's command disorganized by the attack on their rear in the woods, and a large portion of the pickets." Heth made repeated attempts to drive Ayres back, but failed. Warren's casualties for the day were 382 killed and wounded, and 2,518 missing. On the 20th Warren selected a position on the railroad a mile or two in rear of his line of battle of the 19th, chiefly on open ground, and entrenched. On the morning of the 21st A. P. Hill, with his own corps, part of Hoke's division, with Lee's cavalry, attacked his position, opening with 30 guns on his front and right flank, and at 10 o'clock made an assault, which was repulsed. Later Mahone attempted an assault on Warren's left, but the artillery fire broke his ranks before they came under musketry fire, and Warren, making an advance, captured 517 officers and men and six flags. Warren's loss was 301 killed, wounded, and missing. No further attempts were made upon Warren's position, and the entrenchments were extended by the Ninth corps from the Jerusalem plank-road to unite with Warren's on the Weldon Railroad. The Union troops engaged 18–21 August numbered about 20,000; the loss was 198 killed, 1,105 wounded, and 3,152 missing. The Confederates engaged numbered about 14,800; the number of their killed and wounded is estimated at 1,200. Consult: 'Official Records,' Vol. XLII.; Humphreys, 'The Virginia Campaign of 1864 and 1865'; Powell, 'The Fifth Army Corps'; Walker, 'The Second Army Corps.'

E. A. CARMAN.

Globe Theatre, the theatre in Southwark of which Shakespeare was a shareholder, and in which many of his plays were acted. The original theatre was built in 1593 on a tract of land between Maiden Lane (now New Park Street), and what was subsequently called Globe Alley; the site is now occupied by Barclay and Perkins Brewery. A patent was granted for this theatre by James I. in 1603. It was destroyed by fire in 1613 during the performance of Shakespeare's 'Henry the Eighth.' The accident was caused by the firing of the thatch roof, a cannon having been discharged during the performance, and the wadding shot from the stage pierced the roof. This was in 1613. The theatre was rebuilt the following year. In 1644 the structure was demolished to make room for dwelling houses. According to pictures and descriptions which have survived to the present day the old theatre must have been extremely dingy in the interior and uncomfortable both for the actors and spectators.

Globigerina, glŏb-ĭ-jĕ-rī'nä, one of the most common of the surface-living or pelagic Foraminifera (q.v.), a shelled protozoan of the class *Rhizopoda*. The animal is like an amœba, exceedingly simple, although throwing out a great number of long, slender thread-like pseudopods, with which it draws in and absorbs minute silicious plants, such as diatoms, etc., which serve as food. Though the animal is so simply organized, the limestone shell which it secretes is composed of several chambers, which are like their bubbles, hence the name of the commonest species, — *Globigerina bulloides*. It lives in countless numbers at the surface of the sea, floating on the top of the water, when the sea is calm, with its root-like arms or tentacles (pseudopodia) radiating from the body. The shell, which is of microscopic size, is perforated with fine openings through which the pseudopods pass out. After death the shells, when not dissolved, slowly fall or rain down to the bottom of the ocean, and so light and minute are they that it is calculated that it requires about a month for them to reach the bottom in the deeper parts of the ocean.

Globigerina Ooze.— The shells collect in such vast numbers on the floor of the ocean that a grain of the fine mud or ooze thus formed may contain nearly 50,000 of them. Chalk is formed of such foraminifers mingled with the debris of shells, corals, etc. Nummulitic limestone and greensand are mainly of foraminiferal origin. This ooze is a fine sticky mud-like sediment which covers the ocean bottom at great depths. Indeed, the ocean bottoms everywhere beyond the 100 to 500 fathom-line are free from any shore sediments. All this ooze is principally made up of the shells of this single species (*G. bulloides*) mentioned above. The more numerous these shells are at the surface, the greater is the depth at which they will accumulate at the bottom. There are only about 20 other species of these pelagic Foraminifera, yet as Murray states in his 'Report on the Scientific Results of the Voyage of H. M. S. Challenger,' so numerous are the individuals of the species that they usually make up over 90 per cent of the carbonate of lime present in the calcareous oozes of the abysses of the ocean. The remaining 10 per cent is mainly reddish clay. Great interest attaches to this subject because thick series of Tertiary and older rocks seem to have been formed out of similar oozes. Beside the globigerina oozes similar sticky deep-sea muds are formed of the shells of surface-living pteropods (q.v.), as also radiolarian oozes and diatom oozes, the latter confined to the Southern Ocean, a little to the north of the Antarctic Circle. The radiolarian ooze thus far has been detected only in the deepest abysses of the western and central Pacific. The red clay is derived by chemical changes from the globigerina ooze. See DEEP-SEA EXPLORATION for information as to the method of ascertaining these facts.

Glob'ulins, a term applied to one of the forms of proteids (q.v.) of animal or vegetable origin. The animal globulins are proteids which are insoluble in water, soluble in dilute salt solution, and insoluble in saturated solutions of sodium chloride and magnesium sulphate. They are coagulated by heat, the temperature causing the coagulation varying considerably. Fibrinogen, serum globulin of blood, paramyosinogen and myosinogen, of muscle, and vitellin, found in eggs, are examples of animal globulins. The plant globulins constitute the most important and abundant natural proteids of plants.

Glo'ria in Excel'sis, the original and Latin form of 'Glory be to God on High,' the opening words of the dismissal hymn in the liturgy of the English Church as well as of the Protestant Episcopal Church in the United States. It is used in the Roman Catholic Church at all masses excepting those for the dead. These opening words are taken from the hymn sung by the angels at the Nativity. The origin of this half-inspired composition is lost in remote antiquity. It is found in the eastern Church as early as the days of Athanasius, but was used at evening service (nocturns), and not in the liturgy, or communion office. It has been attributed to Telesphorus, bishop of Rome, 150 A.D. Pope Symmachus, 500 A.D., is said to have ordered its use at the commencement of the Sunday and holy-day services. The hymn in full is as follows: "Glory be to God on high, peace on earth, to men of good will. We praise thee, we bless thee, we worship thee, we glorify thee, we give thanks to thee for thy great glory, O Lord God, heavenly King, God the Father Almighty. O Lord, the only begotten Son Jesus Christ; O Lord God, Lamb of God, Son of the Father, that takest away the sins of the world, have mercy upon us. Thou that takest away the sins of the world have mercy upon us. Thou that takest away the sins of the world, receive our prayer. Thou that sittest at the right hand of God the Father, have mercy upon us. For thou only art holy; thou only art the Lord; thou only, O Christ, with the Holy Ghost, art most high in the glory of God the Father. Amen."

Gloria Pat'ri, the first words in their original Latin of the doxology sung or said in the services of the Roman Catholic Church, the English Church, and the Protestant Episcopal Church in the United States, and other religious bodies. It is employed as a refrain at the end of psalms and canticles as well as at other parts of the service. The complete form of the doxology is as follows: "Glory be to the Father, and to the Son, and to the Holy Ghost. As it was in the beginning, is now, and ever shall be, world without end. Amen." The doxology is common at the beginning of service in the Greek Church, and was employed at nocturns in the Western or Roman Catholic Church as early as the 6th century.

Gloss (Gr. "tongue"), the explanation of verbal difficulties in a literary work, written at the passages to which they refer. The words which are commonly the subject of these explanations are those taken without modification from a foreign language, provincialisms, obsolete and technical words, or such as are used by the author in some exceptional signification. The earliest glosses, as those in Greek, Latin, and Hebrew manuscripts, were interlinear; they were afterward placed in the margin, and extended finally in some instances to a sort of running commentary on an entire book. In Roman law the word is used also of an explanation, but the explanation is not merely of a word, but deals with the intent of the law. The glosses on the Justinian code, collected by Accursius in the first half of the 13th century, were held almost as high authority as the code.

Glossitis, glŏs-sī'tĭs. Acute glossitis is an uncommon disease of the tongue due to bites, burns, and stings. It starts in the deeper structure of the tongue, causing it to swell rapidly. The affection is very painful, but is ordinarily cured, if properly treated, in five or six days. Small or large incisions may be necessary. Chronic glossitis is a condition of the tongue, due to persistent use of tobacco, alcohol, and spices, in which the surface is reddened, cracked, and furrowed.

Glot'tis, the upper end, including the opening of the windpipe, which latter constitutes a narrow aperture covered by the epiglottis during the act of holding the breath or swallowing. The glottis contributes by dilatation and contraction to the modulation of the voice. It is sometimes called the rima glottis, a term more properly limited to the opening of the windpipe. See LARYNX.

Glottis, Œdema of the, a dangerous affection characterized by the effusion of serum in the tissues of the entrance and the inside of the larynx, causing an obstructive swelling. It is due to burns, scalds, and the lodgment of foreign bodies; to acute laryngitis or tonsilitis; to tuberculous and cancerous deposits; and to nephritis, measles, diphtheria, scarlet fever, and erysipelas. The symptoms which usually develop rapidly are pain, cough, loss of voice, and great difficulty of breathing. This difficulty of breathing, unless relieved, may go on to complete suffocation. Incision of the parts may give relief, or tracheotomy or intubation may have to be performed. See Nose and Throat.

Gloucester, Mass., a city and port of entry of Essex County, near the extremity of Cape Ann, and on the Boston & Maine R.R.; 32 miles northeast of Boston. It is one of the most important fishing ports and fish markets in the world, having over 500 vessels and 6,000 men engaged in the fisheries. Cod, haddock, halibut, herring, and mackerel are the principal catches. Besides extensive fisheries, the city has large manufactures of machinery, oil, fish-glue, shoes, twine, and cigars. Numerous vessels have been wrecked in the vicinity of Gloucester. A massive rock called Norman's Woe was the inspiration for Longfellow's famous poem, 'The Wreck of the Hesperus.' The city was founded in 1623, principally by settlers from Gloucester, England, from which it received its name; was incorporated as a town in 1642; and became a city in 1874. The city is governed by a mayor, elected annually, and by a bicameral council. The waterworks are operated by the city. It has the oldest Universalist church in the United States, founded in 1770. Pop. (1900) 26,121.

Gloucester City, N. J., a city in Camden County, on the Delaware River and on the Atlantic City and the West J. and Seashore R.R.'s. The manufactures include calico prints, woolen yarns, gas burners, and boats. The city was incorporated in 1868, and is governed by a mayor chosen every two years, and by a unicameral council. It has ferry connections with Philadelphia, and has electric lights and street railroads. Pop. (1900) 6,840.

Glove, an article of dress; a covering for the hand. Its use reaches back to remote antiquity. Laertes, the farmer-king, wore gloves to protect his hands from the thorns. Xenophon sneers at the Persians for wearing gloves to keep their hands warm. In their more robust days the Greeks and Romans scorned the use of gloves; but in later times they were used in Rome. The glove appears to have become a well-known article of dress in England about the 14th century, and corporations of glovers were in existence in the 15th century. In the days of Queen Elizabeth gloves were made with gauntlets upon which much rich and elaborate embroidery was worked.

Modern gloves are of two distinct classes, woven and knitted gloves, and those made of leather; and the making of these constitute entirely separate branches of manufacture. The manufacture of knitted or woven gloves is an industry allied to the hosiery trade, and the materials comprise all the ordinary fibres, the most important being silk and wool. In some cases these gloves are entirely made and finished by knitting; but in others, the pieces are separately fashioned and sewed together as in making leather gloves. The manufacture is widespread, but the headquarters of the thread and cloth glove trade are now Berlin and Saxony. The materials used for making leather gloves are principally the skin of deer, sheep, and lambs, goats and kids, the latter being the most important, though far more "kid" gloves are made of sheep than of kid leather. The skins for military and other heavy gloves — doe or buck leather — are prepared by the ordinary process of tanning, or are a fine kind of chamois leather. Those for what are called dressed kid gloves are subjected to a special method of tanning, by which, under the influence of heat, and treatment with a mixture of flour, yellow of egg, and alum, the material is rendered peculiarly soft and flexible. After the leather has been properly prepared it is cut into pieces of the required size, then folded over somewhat unequally, as the back should be larger than the front. Three cuts are then made through the doubled piece to produce the four fingers; an oblong hole is cut at the bending of the fold for the insertion of the thumb piece; the cutting of this of the exact shape and size requires considerable skill. The first and fourth fingers are completed by gussets or strips sewed only on their inner sides, while the second and third fingers require gussets on each side to complete them. Besides these, small pieces of a diamond shape are sewed in at the base of the fingers toward the palm of the hand.

A kind of vice or clamp, with minute teeth to regulate the stitches, is used in the making of hand-sewn gloves, by which method all the finest gloves are stitched. Sewing-machines are applied for the ornamental or embroidery stitching on the backs of fine gloves, and for almost the entire sewing of the cheaper and heavier gloves. The superiority of the French and the best English gloves depends chiefly on the adaptation of their shape to the structure of the hand by giving additional size where the flexure of the hand requires it.

Kid gloves are of two principal kinds, glacé and suède, according to the manner of dressing and finishing the leather used. Glacé gloves are those which are dressed, dyed, and polished on the hair or outer side of the skin, while suède gloves are carefully pared, smoothed, and dyed on the inner side of the skin for their purpose, and thus have the appearance of fine chamois. Paris and Grenoble are the chief seats of the French kid glove trade. Military gloves are made at Niort and Vendôme. Brussels and Copenhagen are also important glove-making centres. In England, Worcester is the principal seat of the glove industry; and in a specialty, the so-called English dogskin gloves made from tan skins of Cape sheep, the English manufacturers are without rivals. Rubber gloves are now made in both Europe and America and are largely used in operations demanding careful asepsis, particularly when the surgeon is forced to operate on a clean case after a septic wound. Gloves with roughened surfaces are made to facilitate the handling of instruments and ligatures. See Glove Manufacture in America.

Glove Manufacture, in America, dates from about the year 1760, when Sir William Johnson, chief agent of King George with the North American Indians, brought over from Scotland several families from Perthshire, which settled in the eastern part of what is now Fulton County, N. Y., calling the town Perth. Many of these settlers had been glove-makers and members of the glove guild in Scotland, and brought with them glove patterns and the proper needles and threads for glove making. The first gloves and mittens were used chiefly by the farmers and wood choppers as a protection for the hands while engaged in the rough and laborious work incident to their occupation. The entire output of the industry for many years was probably disposed of in the immediate vicinity. It was not until about 1809 that gloves were manufactured for more distant markets, and it is stated that Talmadge Edwards, a storekeeper of Johnstown, N. Y., was the pioneer in the manufacture of gloves in commercial quantities. Mr. Edwards took a bag of them on horseback to Albany when making a trip for the purpose of renewing his stock of merchandise. Finding a good demand for these articles, he had leather dressed in quantities, and secured farmers' girls to come to his factory to cut gloves, which were then sent out to farmers' wives to be sewed. In this manner the glove and mitten industry of the United States was established. During the incipient stages of this industry the goods produced were really mittens, and not gloves. A glove, as distinguished from a mitten, is a covering for the hand in which each finger is separately enclosed, the part above the hand varying in length according to fashion or convenience. About the year 1810 a glove manufacturer, who had been associated with Mr. Edwards, sold a part of his output by the dozen, and this is said to be the first instance in which they were sold by the quantity. The local demand continued to increase, and each year some enterprising manufacturer would venture to make an extended trip to dispose of his product. In 1825 Elisha Johnson, of Gloversville, N. Y., went to Boston with a load of gloves in a lumber wagon, making the journey in six weeks. This is said to have been the longest trip that had been made in connection with the industry up to that time, and the results were highly gratifying to those interested.

Until 1862 the manufacture of gloves in Fulton County, N. Y., although even then the chief manufacturing industry, was of comparatively small importance. The stimulating influence of a high protective tariff in 1862 showed itself in the increased business at Gloversville, Johnstown, and the adjoining village of Kingsborough, which became at once the leading sources of supply for the home market of gloves of medium grade. While the protective tariff stimulated home industry in one direction, it limited it in another. The domestic materials that could be used in glove making were confined practically to deer, lamb, and sheep skins. The peculiar qualities of the first established it firmly and independently of any tariff, but the others being inferior in quality to skins of foreign production, could not effectually exclude foreign made gloves, but were forced to share the market with them. Still, the demand for cheap and medium gloves was limited, and the American manufacturers saw their development arrested, while France, Germany, and England continued to supply all the finer grade of gloves used in this country. In 1872 the tariff on imported skins was removed amid intense opposition and doleful prediction of ruin to the home industry. A large number of skins came from all parts of the world, and the glovers turned their attention to tanning. Instantly experimenting began, and skill in tanning rapidly increased, so that the highest grade was attained, and to-day the various kinds of leather produced in Fulton County are unsurpassed in quality by that furnished in any other part of the world.

The introduction of free hides made American glove manufacturers far more prosperous than they had ever been previously. The quality of the product has steadily improved, and the variety has been increased until now American made gloves are steadily driving out the foreign gloves. The skill of American glovers is equal to that of foreign glove-makers, and in some respects — notably in the quality and style of the stitching, and in some grades, the shape — the American gloves are the best. The American glovers are more enterprising, and their styles are of a greater and better variety than foreign made gloves. Foreign expert workmen have been drawn over here from the great glove centres in Europe, so that the greatest skill has been secured here. The approximate value of the glove industry in Fulton County has reached about $10,000,000. Some of the firms do a business reaching as high as $1,000,000, but the majority, however, have small shops and do a small but profitable business.

Most of the work in Fulton County, as abroad, is done at the homes of the workers. The streets in Gloversville and Johnstown are lined with pretty and tasteful homes, in which the hum of the sewing-machine is constantly heard during the working hours of the day, but the workers are exceptionally fortunate in being able while earning good wages to enjoy all the comforts and surroundings of home, and in being practically their own masters and mistresses.

When the skins are received at the factory they are thoroughly soaked to open out the texture and prepare them for the removal of the hair. Then the skins are placed in vats of lime water, where for two or three weeks the lime works into the flesh and albuminous matter, and loosens the hair. The skins having thus been properly softened, the dirty but picturesque operation of removing the hair ensues. Before each beamer, as the workman is called, is an inclined semi-cylindrical slab of wood, covered with zinc. The skin is first spread upon this, and the broad curved beam of the knife glides across it from end to end, scraping and removing all the loosened hair, the scarf skin, and the small portion of animal matter still adhering to the skin. After unhairing, kid skins must be fermented in a drench of bran, whose purpose is to completely decompose the remaining albuminous matter, and also to remove all traces of the lime. The operation is extremely delicate.

With the preparation of kid leather, alum is the astringent curative agent. Its operation is accompanied by that of others, whose purpose is to secure elasticity, and pliability, and mainly to preserve that beautiful texture which makes kid leather superior to all others. These assistants in the process are eggs, flour, and salt. They are combined into what is called a custard, and there is certainly nothing repulsive in the idea of such a delicate agent being used. A proper quantity of the custard and a number of skins having been put together in a dash-wheel, where they are thrown about for some time, opens the pores of the skin, absorbs the custard freely, and becomes swelled by the chemical union of the custard and the skin. This having progressed satisfactorily, the skins are folded together with the fleshy side outward, and are dried by a gentle heat. They are now cured, but they are yet hard and rough. The breaking and "staking," as they are called, are now resorted to, to make the skins soft, pliable, and of even texture, removing the superfluous chemicals with which they have become charged, and the stiffness by manipulating the fibres. The operation of transforming the skin into leather is now finished, but age is necessary to secure perfect pliability and softness. The skins are therefore laid away to let the slow chemical operation going on within them be completed. After this has been accomplished the skins are ready for dyeing, cutting, and manufacturing.

Calf skins as well as horsehides are used in the manufacture of workingmen's gloves. They are tanned in two ways, namely, oil tan, with a preparation that makes them what is called "fire and water proof," and they are also dressed and have the same finish as the buck glove.

In the dye-rooms the skins which have already been aged are immersed in dye vats, where the delicate colors are imparted to them. The same care is not required in obtaining the ordinary range of dark colors, for these are "brushed" on, the skin being spread upon a glass slab and the dye being painted on with a brush. After they are dyed the skins are sometimes somewhat hard, and some classes have to be staked again in order to restore their pliability. The finishing touches to a kid skin are secured by rubbing the grain side over with a "size," which imparts a gloss. The experience of Gloversville manufacturers with buck gloves has enabled them to impart a special finish to a skin the same as the suède finish, which is very popular under the title of "mocha." This is the same as suède finish, which is produced in other countries, by shaving off the grain side of the skin at an early stage of its progress. The Gloversville method is much better, however, and has more perfect results. Here the grain is removed, and the velvet finish secured by buffing the surface on an emery wheel. The surface of the leather is cut away in minute particles by this process, and the result is an exceedingly even and velvety texture, superior to that obtained by other methods.

The concluding work is as follows: A marble slab lies before the cutter on a table, and every particle of dirt or other inequality is removed before "doling." The skin is spread, flesh side up, upon the slab, and the cutter goes over it with a broad-bladed chisel or knife, shaving down inequalities and removing all the fibrous portions. The dexterity with which this is done makes the operation appear extremely simple, but any but a skilled and experienced operative would almost surely cut through the skin. The most delicate part of the glove-maker's art, in which exact judgment is required, comes in preparing the "tranks" or slips from which the separate gloves are cut. The trank must be so cut as to have just enough leather to make a glove of a certain size and number. The operation would be easy enough if the material were hard and stiff, and if the elasticity were uniform, but this is rarely the case.

The gussets, facings, etc., are cut from the waste leather in the thumb opening at the same operation. In olden times an outline was traced upon the leather and the pattern was cut with shears. Modern invention has produced dies and presses, which are universally used. Similar dies are used in the cutting of the thumb pieces and forchettes or strips forming the sides of the fingers.

The gloves are somewhat unsightly as they come from the sewer's hands, and must be made trim and neat. To secure these desirable results the gloves are taken to the "laying-off" room. In this are long tables with a long row of brass hands projecting at an acute angle. These are filled with steam and are too hot to touch, but by ingenious devices they are so arranged that it is impossible to burn the glove or stiffen the leather by too much heat, a common defect in ordinary methods. The operation of the "laying-off room" is finished with surprising quickness. Before each table stands an operator, who slips a glove over each form, draws it down to shape, and after a moment's exposure to the warmth, removes it, smooth, shapely, and ready for the box.

About 25 years ago a skin called "mocha" was utilized, and has been ever since, in making fine gloves, and they are finished similar to the suède finish, giving them a very velvety appearance. They are very soft and pliable, and in fact have been almost as popular as the fine kid and lamb gloves. These mocha skins are all gathered in Arabia.

In 1900 Fulton County, N. Y., produced gloves to the value of $9,548,603, as against $17,048,658, the total value of the output in the United States. Fulton County had 166 out of the 381 factories in the United States and 7,981 wage-earners, as against 14,180, the total number in the United States.

COMPARATIVE SUMMARY OF THE GLOVE TRADE IN THE UNITED STATES FROM 1850 TO 1900.

	1900	1890	1880	1870	1860	1850
Number of establishments	397	324	300	221	126	110
Capital	$9,127,309	$5,977,820	$3,379,648	$2,340,550	$594,825	$181,200
Wage-earners, average number	14,436	8,187	7,697	4,058	1,429	1,938
Total wages	$4,217,845	$2,670,344	$1,655,695	$980,549	$330,419	$233,496
Cost of materials used	$9,554,105	$5,021,144	$4,351,469	$1,884,146	$537,589	$322,837
Value of products, including custom work and repairing	$17,048,656	$10,103,821	$7,379,605	$3,998,521	$1,176,795	$708,184

The imports of gloves from all countries amounted to $6,107,765 in 1900, of which we received $2,200,097 from France and $2,785,103 from Germany.

Benj. Lichtenberg,
Of J. Adler & Company, New York.

Glove or **Finger Sponge**, a poor variety of commercial sponge found about the Bermudas and in the Gulf of Mexico, which has a branching growth likened to the fingers of a hand or glove.

Glover, Elizabeth. See Bennett, Mary E.

Glover, John, American soldier: b. Salem, Mass., 1732; d. Marblehead, Mass., 1797. A shoemaker, and later a fisher at Marblehead, he was elected (1773) colonel of a militia regiment, known in the Revolution as the Fourteenth, or the "Marine" regiment. In 1775 he, with Stephen Moylan, was appointed director of the manning and equipment of vessels, in 1776 after the Continental defeat at Long Island superintended the transportation of the army to New York, and also directed the crossing of the Delaware previous to the battle of Trenton. Commissioned brigadier-general in 1777, he participated in Sullivan's Rhode Island expedition (1778), was a member of the court that tried André, and was retired in 1782. He sat in the Massachusetts convention that ratified the Constitution in 1788. A bronze statue of Glover stands in Commonwealth Avenue, Boston.

Glover, Richard, English poet: b. London 1712; d. there 25 Nov. 1785. In 1737 he published the epic poem of 'Leonidas,' which abounds in noble sentiments, considerably varied by incident and description; but wants interest, and is not sufficiently imaginative for lasting popularity. The 'Progress of Commerce' followed in 1739; one of the objects of which was to rouse a spirit of national hostility against the Spaniards and the ministry — a purpose which was much more effectually answered by his celebrated ballad of 'Hosier's Ghost.' In 1753 his tragedy of 'Boadicea' was performed with partial success. His 'Medea,' imitated from Euripides and Seneca, in 1761, obtained greater attention.

Glover, Stephen, English composer: b. London 1812; d. Bayswater, London, 7 Dec. 1870. He wrote nearly 1,500 compositions, including works for pianoforte, vocal duets, ballads, and songs, many of a sacred character, such as the 12 'Songs from the Holy Scriptures.' Among his published music are: 'The Monks of Old'; 'The Gypsy Countess'; 'What are the Wild Waves Saying?' and a setting for Longfellow's 'Excelsior.'

Glover, William Havard, English composer: b. Kilburn, London, 6 June 1819: d. New York 28 Oct. 1875. For several years he was musical critic of the London *Morning Post,* and in 1868 became conductor of Niblo's orchestra and a teacher in New York. His writings include the opera 'Ruy Blas' (Covent Garden 1861); a cantata, 'Tam o' Shanter,' first presented at the New Philharmonic in 1855 with Berlioz as conductor; and the overtures 'Manfred' and 'Comala.'

Gloversville, N. Y., city in Fulton County, on the Fonda, J. & G. R.R., 53 miles northwest of Albany. This is the most celebrated glove manufacturing centre in the world, producing over two thirds of the entire glove output of the United States. Here are the Nathan Littauer Hospital, the Parsons Free Library and other public institutions. Besides numerous large manufactories for gloves, gauntlets, and mittens, there are other factories of leather goods. It was incorporated as a village in 1851, although it was settled before the Revolution, being known as Stump City. It was chartered as a city in 1890. The municipal government under the revised charter of 1899 is administered by a mayor, who is elected by the people every two years, and a common council, elected for a like period. The members of the board of education and the water commissioners are also chosen by popular vote. The municipality owns and operates the water-works. Pop. (1900) 18,350.

Glow-worm. See FIRE-FLY.

Gloxinia, glŏk-sĭn'ĭ-a, a small genus of plants of the *Gesneraceæ,* distinguished by the somewhat bell-shaped corolla, the upper lip being shortest and two-lobed, the lower three-lobed, with the middle lobe largest, and also by the summit of the style being rounded and hollowed. The species are natives of tropical South America. They are now among the greatest ornaments of hothouses, owing to their handsome leaves and their graceful, beautifully colored flowers. The chief species is *G.* (*Ligeria*) *speciosa,* a Brazilian plant with large violet flowers, from which many fine varieties have been derived, usually associated under the specific name *G. hybrida.* Some species of *Sinningia* are also called gloxinias.

Glucic, gloo'sĭk, or **Glycic Acid,** an organic acid obtained from glucose or other compounds of a similar nature. When a solution of glucose is saturated with lime and allowed to stand for some weeks, the glucose is gradually decomposed, entering into combination with the lime to form a new substance known as glucate of calcium. By the addition of subacetate of lead, a bulky precipitate of glucate of lead is thrown down, and from this the free glucic acid may be prepared by separating the lead in the form of sulphid, by the action of sulphuretted hydrogen gas. Thus prepared, glucic acid is a colorless, amorphous mass, very soluble in water and in alcohol, and having an acid taste. The salts of glucic acid are mostly soluble in water, the sodium and barium salts being very hygroscopic. The formula of the acid is probably $C_{12}H_{22}O_{12}$.

Glucina, the oxid of glucinum (q.v.).

Glucinum, gloo-sĭ'nŭm, or **Beryllium,** a metallic element which occurs in the minerals beryl, chrysoberyl, phenacite, and euclase. The name "beryllium" was assigned to it on account of its occurrence in the beryl, and the name "glucinum" on account of the sweetish taste of its salts. Its chemical symbol is sometimes taken as Be, and sometimes as Gl. Glucinum is a dyad, with an atomic weight of about 9.08, and a specific gravity (when compressed) of about 1.85. It resembles steel in general appearance, and forms hard, hexagonal crystals which are unaffected by air at ordinary temperatures, and which are scarcely affected by oxygen or sulphur, even at a red heat, though when heated in chlorine the metal burns to the chlorid, $GlCl_2$. It dissolves readily in hydrochloric acid. Sulphuric acid and caustic potash or soda also dissolve it, but nitric acid, even when hot, and concentrated, acts upon it very slowly. The specific heat of metallic glucinum is about 0.400 at ordinary temperatures, but it increases rapidly as the temperature rises, and is about 0.58 at 500° F. The oxide of the metal, known as "glucina," GlO, was first ascertained to be a new earth by Vauquelin, who in 1798 obtained it from beryl, and pointed out that it differs from alumina in several important ways, notably in the fact that it does not form an alum. Metallic glucinum was first prepared by Wöhler in 1828, by the action of metallic potassium upon fused $BeCl_2$. Glucinum forms many salts, but the metal and its compounds are of interest only to the chemist, as they are not used for any purpose in ordinary life.

Gluck, glook, **Christoph Willibald**, RITTER VON, German composer: b. Weidenwang, Bavaria, 2 July 1714; d. Vienna 15 Nov. 1787. After studying six years at the Jesuit school at Komotow, where his musical talents were especially encouraged, he supported himself for a time by giving music lessons. Later he attracted the notice of Prince Lobkowitz, who enabled him to complete his musical education at Vienna. At 26 he was desired to write an opera for the court theatre at Milan and the result was his 'Artaserse,' which achieved a great success in spite of many innovations in composition introduced into the work. In 1742 he wrote: 'Demofoonte' for Milan; 'Demetrio ed Ipermnestra' for Venice; in 1743 'Artamene' for Cremona, and 'Siface' for Milan; in 1744 'Fedra' for the same theatre; and in 1745 'Allessandro nell' Indie' for Turin. His fame had now become European and he went to England to compose for the theatre in the Haymarket. On 7 Jan. 1746 that theatre was opened with 'La Caduta de' Giganti.' In London Gluck became deeply impressed with the majestic character of Handel's airs and choruses, and with the simple but natural dramatic style of Arne. Leaving London in 1746 he continued opera composition, among his later works being: 'Clemenza di Tito'; 'Le Cinese'; 'Il Trionfo di Camillo'; 'Antigone'; 'La Danza'; and 'Orfeo ed Euridice' (1762), his greatest work up to that time, and still a favorite in Germany after nearly a century and a half. It was followed by 'Alceste' (1766); and 'Paride ed Elena' (1769). In 1774 his 'Iphigénie en Aulide' was produced in Paris after a considerable amount of opposition from the musical critics of the old Italian and French school, at that time represented in Paris by Piccini. The most intense excitement prevailed: all Paris took sides, and for a long time the Gluckists and Piccinists contended with the same bitterness as did formerly the Jansenists and Jesuits, and in our own day Wagner and his opponents. The victory remained with the Gluckists. Shortly after the production of the 'Iphigénie,' the 'Orfeo' was adapted for and put on the French stage, and was followed by the 'Armide' in 1777, and by the 'Iphigenie en Tauride' in 1779, his last important work, and by many considered his greatest. It ends the series of works which directed the operatic genius of Méhul and Cherubini in France, and of Mozart, Beethoven, and Wagner in Germany. See 'Lives' by Marx (1863), Desnoiresterres (1872), Reissmann (1882).

Glu'cosan, or **Dextrosan**, $C_6H_{10}O_5$, a substance formed by heating anhydrous glucose to 340° F.; the anhydrous glucose that is required for the purpose being prepared by crystallizing ordinary glucose from its solution in 95 per cent alcohol. Glucosan is a colorless substance with a faint sweet taste. It is soluble in water and in alcohol, and is not fermentable by yeast. By the action of dilute mineral acids it is reconverted into glucose; and when heated for some time to 400° F. it turns to a brownish black color, and passes into caramel (q.v.).

Glucose, gloo'kōs (from Gr. γλυκυς sweet), a liquid substance obtained from corn, sometimes called "cereal syrup" when in solid state, known as grape-sugar or "cereal sugar." In Europe it is chiefly made from potato starch. Men noted nature's process of changing the starch stored in the cells of plants into different forms of sugar. In the case of cane-sugar (sucrose) they knew that the plant absorbs carbonic acid from the air; other acids from the soil; and by the aid of the sun's heat a chemical process is evolved that puts into the sugar-plant sucrose or cane-sugar, and into fruits and vegetables fruit-sugar which is found more plentifully in the grape than in any other fruit.

The chemist seeks to obtain sugar from starch by a somewhat analogous process, and one similar to that carried on in the human system during the process of digestion, when starch is changed into sugar. Cane-sugar and fruit-sugar as they exist in cane and fruits are natural products, but whether nature's order of combining the various articles composing fruit-sugar as found in fruits is the same as the order of combination followed by the chemist in making sugar from starch is a puzzling and debatable question. Some claim that while the glucose of fruits and glucose as obtained by the chemist may be identical so far as their constituent elements are concerned and the proportion of each which is present, it does not follow that they are the same thing, or that their dietetic value is as great. Neither does it follow that because the chemical composition of glucose (dextrose) is almost identical with that of cane-sugar (sucrose) its food value is quite as evenly matched.

Theory and Fact on Sugar.— A committee of experts of the National Academy of Sciences, reporting to the United States government in 1884 on glucose said: "Starch-sugar is in no way inferior to cane-sugar in healthfulness"; in answer to which a dealer asked: "How is it then that I can feed a hog on cane-sugar and make him fat; but if I should feed him on glucose he would not put on an ounce of fat as long as he lives?" Here theory ran against fact, and to this day there is a conflict over the question which will not be settled until the physiologist has made elaborate studies of the effect of glucose on the human system, a task almost impracticable, because the chemical condition of each individual stomach is an unknown quantity, and because each person is a law unto himself in the use made of food.

Nature and Chemist.—In the laboratory of nature the starch or gum ($C_6H_{10}O_5$) which is formed in the plant is treated by carbonic acid taken from the air, and by other acids absorbed from the soil and carried into the plant by the sap, and through the action of light and heat is changed into cane-sugar (sucrose) $C_{12}H_{22}O_{11}$.

Art or chemistry takes starch from corn (maize), treats it with hydrochloric or other acid, which is neutralized or removed by alkali, the resultant product being glucose $C_6H_{12}O_6$, differing in its constituent elements from cane-sugar in that it contains one more equivalent of water. If to $C_{12}H_{22}O_{11}$ (cane-sugar) is added H_2O, it is equal to twice $C_6H_{12}O_6$ or glucose $C_{12}H_{24}O_{12}$. "It remains," said a prominent manufacturer of glucose, "for some one to discover means for eliminating from glucose the one equivalent of water; and, that found, 'chemistry can make from starch an article the chemical formula for which is exactly like cane-sugar. And somebody will some day stumble over the method."

History of Glucose.— It was in 1792 that Lowitz announced that there was other than cane-sugar, he having obtained dextrose, a different variety, from grapes. In 1811 dextrose was obtained from starch by the action thereon of dilute sulphuric acid. By similar process Braconnot, in 1819, obtained it from linen rags, sawdust, or other vegetable fibre. During the reign of Napoleon Bonaparte starch-sugar was made to make good the deficiency which the continental blockade caused in the supply of cane-sugar. Early in the 19th century it was made from potato-starch in Germany, and during the latter half in France. From 1825 to the present time the chemists of France, Germany, and the United States have studied to improve processes, but nowhere in the world is glucose made so perfectly and at so low a cost as in the United States, where raw material is cheap, and the processes of manufacture so perfected that this country is fast meeting the European demand for glucose and causing the industry to dwindle in continental Europe. This country can manufacture glucose, send it to Europe, pay a 30 per cent tariff, and then undersell the makers of Europe, the proof of which is the statement which follows showing the exports of glucose from the United States. From 1838 the number of factories in France and Germany increased until 40 years later there were 85, and in the Austrian empire, where the industry began about 1840 or a few years earlier, over 100. In 1889 Germany had 30 glucose factories which produced 34,684,100 kilos glucose syrup; 2,748,000 kilos couleur.

The manufacture of glucose or grape-sugar from starch has been a prominent American industry for about 30 years. In March 1865 Dr. Goesling made glucose under a patent he had procured. The sample exhibited led to the formation of a stock company which purchased of Goesling, Bradley & Briggs their patent for manufacturing sugar and syrup from Indian corn. The company began the manufacture of glucose in the old sugar-refinery in Rose Street, New York. Unfortunately Dr. Goesling, the German chemist who was to superintend the manufacture of glucose, died before the first lot of glucose was marketed, and with him perished some of the secrets of manufacture. The small stock of glucose made was stored in the refinery, where later upon examination it was found in a solid condition, which alarmed the stockholders, for they knew of no use for grape-sugar, the name given to starch-sugar in its solid form. Neither knew they how to manufacture the glucose as a liquid substance. Their main dependence, Goesling was gone, and there seems to have been a lack of push, courage, and foresight on the part of the officers and stockholders of the Union Sugar Company in that they failed to secure expert chemists to work out the secrets of a process known only to Goesling. The few barrels of glucose the company owned were sold to the Tribune Association for a nominal sum, for use in the printing-rooms, after which the company came to grief, having paid $600,000 for the patents subject to a right to manufacture that belonged to a man named Fox. In 1877 the receiver of the Union Sugar Company sold for $2.50 the patents it controlled. A. W. Fox & Company did better. They improved the process and, while at first they used 200 to 300 bushels of corn per day, they gradually increased the quantity until thousands of bushels were daily required. In 1874 the Buffalo Grape-Sugar Company was organized: it grew into a vast concern, and might be said to be the parent of the present industry.

In 1884 there were 29 factories engaged in the manufacture of sugar or syrup from corn and having a combined capacity for absorbing 40,000 bushels of corn per day. At present there are five factories which in 1902 used an average of 175,000 bushels of corn every day. Four of the five companies are constituent properties of the Corn Products Company. The other, the New York Glucose Company, Shadyside, N. J., is of recent construction and is the only independent establishment in the country. The authorized capital of the Corn Products Company is $80,000,000. The process of manufacture has been greatly improved, so much so that, while in 1882 26 to 30 pounds of glucose was obtained from one bushel of corn, 40 pounds is now obtained. Glucose forms one of the leading exports, besides being very extensively used by brewers, candy-makers, preservers, honey-dealers, and manufacturers of vinegar.

Manufacture, Composition, and Commercial Standard.— The manufacture requires 80 hours, and includes 18 processes of manipulating the corn and starch obtained therefrom: (1) steeping; (2) grinding; (3) separation of the starch; (4) cleaning the starch; (5) collecting the starch; (6) washing the starch; (7) conversion by the action of hydrochloric acid; (8) neutralization; (9) bag-filtration; (10) bleaching with acid; (11) bone-black filtration; (12) concentration; (13) second bag-filtration; (14) acid treatment; (15) second bone-black filtration; (16) final concentration; (17) final filtration; (18) final treatment. After the corn is steeped it is ground in water, and the wet starch separated and converted in copper converters by the action of hydrochloric acid, which is later neutralized by chalk or other alkali; subjected to filtration, then concentrated in a vacuum-pan until it tests 41° Baumé or higher, the difference being in the amount of water eliminated; the product, glucose, a liquid substance, or grape-sugar if the process of conversion is carried farther.

The following observations are taken from a paper on 'The Determination of Glucose,' by Edward Gudeman (1902), Bulletin No. 73, Bureau of Chemistry, United States Department of Agriculture. Glucose is a thick amber-colored syrup 41° to 45° Baumé, containing 13 to 22.5 per cent of water. Grape-sugar is a solid 41° to 45° Baumé, containing 11 to 21.0 per cent of water. The old standard Baumé scale is still used in this industry, and the determinations are made at 140° F., results reported at 100° F., a correction of one degree being made for every 40° F. The standard accepted by the manufacturers and the trade is specific gravity 1.41152 — 42° Baumé. The conversion of starch with acids gives the commercial products known as dextrin, glucose, grape-sugar, and anhydrous grape-sugar (dextrose). Starch and its conversion products do not contain over 1 per cent impurities.

"If the conversion of starch with acid is carried to a point where a dilute iodine solution will just give a distinct color-reaction, we have glucose; continued to where 95 per cent alcohol gives a faint cloud, hardly a precipitate, we have grape-sugar containing about 85 per cent reducing-substance. For still higher converted sugars a time-factor must be introduced. Carried beyond a given point, a back conversion takes place, with strong decomposition and loss of purity.

"The ratio of the reducing-substance to non-reducing substance depends on the accuracy in stopping the conversion, for neutralization, at the exact point decided upon. This ratio determines whether the product is glucose or grape-sugar, and no sharp dividing line exists. The rotating powers of glucose and grape-sugar depend absolutely on this ratio. Actually no two batches of commercial glucose or grape-sugar are identical; for all practical purposes they are alike, as a few points either way from the standard decided upon will make no difference in the appearance, taste, or working qualities of these products."

Non-crystallization.— Glucose does not crystallize, as does cane-sugar (sucrose). A chemical process was devised by Dr. Arno Behr for the crystallization of glucose, but it is regarded as impracticable by reason of being too expensive. Dr. Behr added to the liquid glucose a very small quantity of crystallized anhydrous dextrose. The mixture is filled into molds, and in 72 hours will be a solid mass of crystals of anhydrous dextrose. The blocks are next placed in a centrifugal machine to throw out the still liquid syrup, and the anhydrous dextrose remains as a crystalline mass.

Varieties of Use.— Because glucose does not crystallize it is used extensively in the preserving industry. Fruit put up in a syrup wholly or partially made of glucose has a more plump and natural appearance than if preserved in sugar. Comb-honey, when put into glass jars, is surrounded by glucose which does not change in color or character, and therefore the honey always remains pleasing to the eye. It is very largely used for mixing with cane-sugar molasses; in the manufacture of table-syrup; as a substitute for malt in brewing; and very freely in the manufacture of candy. It is said to have from one half to two thirds the sweetening power of cane-sugar. The extent to which glucose is used in the making of jams, jellies, marmalades, preserves, and canned fruit, together with tables showing the composition of commercial glucose and the composition of the ash of glucose, has recently (1902) been stated in Bulletin No. 66, Bureau of Chemistry, United States Department of Agriculture; also with extensive tables showing the composition of the jams and other preserves in comparison with such as contained no glucose. This bulletin was prepared under the direction of W. D. Bigelow, chief of food laboratory.

Glucose is very largely used in the manufacture of confectionery. Some candies are nearly all glucose, particularly such as are sold for a penny. In the high-grade confections the finest grade is used, not as a substitute for sugar, but in the place of cream of tartar to "kill" or soften the grain of sugar, for which purpose only a small quantity is used. It is also used as a substitute for malt in the brewing of ale or beer, it being claimed that a lighter beer results than when pure malt is used, and that it is more palatable. It is assumed that commercial glucose is the same as the glucose which comes from the action of diastase in changing the starch in malt into maltose sugar. By using glucose direct, trouble and expense are saved to the brewer, as he is not compelled to use cereals which are, in the process of the brew, converted into glucose or grape-sugar. It is claimed that 100 pounds of glucose or grape-sugar is equal to 123 pounds of barley-malt, and is much cheaper. Various publications of the United States Department of Agriculture and the reports of Congressional committees contain a great deal of information on the use of glucose in brewing.

The Wholesomeness of Glucose.— This is really the most important question connected with glucose, and one that is still unsettled. It is a problem for the physiologist rather than the chemist. Owing to many improvements made in the last 20 years, the conclusion rendered by the government's experts in 1884 could be made much more emphatic in 1903. It was as follows: "The starch-sugar thus made and sent into commerce is of exceptional purity and uniformity of composition, and contains no injurious substance. Though at best having only about two thirds the sweetening power of cane-sugar, yet starch-sugar is in no way inferior to cane-sugar in healthfulness, there being no evidence before the committee that maize starch-sugar, either in its normal condition or fermented, has any deleterious effect upon the system, even when taken in large quantities."

On the other hand, E. H. Bartley, M.D., professor of chemistry and toxicology in the Long Island College Hospital, in a paper read before the American Chemical Society, 12 Jan. 1895, claims that glucose promotes gastric disturbances. "The principal forms," he says, "in which sugar is presented to the stomach by nature's foods are either milk-sugar or cane-sugar. These sugars are very different in properties from dextrose, and require digestion before they can be used in the body. They are not capable of assimilation as such, and must be converted into a glucose before they can be used, and this is only done in the intestine. From this it would seem that it was not intended that dextrose and levulose should be taken in any considerable amount in our food. They are not natural, but artificial foods. . . . It is not a rare thing to find persons who can eat rock-candy or maple-sugar with no unpleasant after effects, but the same amount of ordinary glucose-candy will cause distress or produce what is known as 'bilious vomiting.'" Dr. Bartley adds that he has "known several cases of death produced in this way, and in every case it was with candy containing glucose." On 4 Sept. 1903 Dr. Bartley confirmed the statement quoted above, and expressed the opinion that "glucose is not a wholesome food," and that "much damage is done by a too free use of it. The fact is that diabetics lose flesh rapidly. I can therefore believe the statement that while we know that cane-sugar, maltose, and milk-sugar will fatten, glucose will not."

Other authorities give an opinion similar to that of Dr. Bartley: but doctors disagree, and some of them certify that glucose is pre-eminently a fat-forming, heat-producing food; not only not injurious, but an essential article of food, without which in some form man cannot enjoy life. Such statements are based on the theory that chemistry and nature work by identical methods and produce identical substances. Says Dr. Cyrus Edson of New York: "Chemistry has shown man how to imitate exactly the product of nature. The honey of the flower and numerous other products of nature's laboratory can not only be imitated by man, but exactly reproduced by him through the agency of chemistry."

Dr. H. W. Wiley, chief chemist of the United States Department of Agriculture, testified before a committee of the United States Senate as follows: "I have had occasion to make careful examinations of almost every variety of food that has ever been exposed upon our markets for sale. In my opinion glucose is not deleterious to health. It is wholesome, somewhat sweet, readily digested. I have always found, from the time I first began to investigate food products, that the series of foods known as glucose or grape-sugar, when properly made, are valuable food material and not injurious."

The settlement of the vexed question of the wholesomeness of glucose, and its dietetic value as compared with cane-sugar, may be left to the physiologists. It is sufficient to add here that at least $50,000,000 is at present employed in its manufacture; that the industry is a great boon to the farmer, and adds materially to the revenue of the corn-producer; that official figures indicate that 1,200,000,000 pounds of cereal sugar and cereal syrup are annually consumed in the United States, while the foreign demand for them is constantly growing; that the exports of glucose or grape-sugar more than doubled from 1893 to 1901, rising from 101,546,814 pounds to 204,209,974 pounds; that in seven months of 1903 they reached 91,267,920 pounds, valued at $1,727,969, or 1.9 cents per pound; and that during 10 years, 1893–1903, the total exports were 1,708,201,551 pounds, valued at $28,139,768, or 1.06 cents per pound.

F. N. Barrett,
Of the 'American Grocer,' New York.

Glucosides, gloo'kō-sīdz, a large class of substances occurring in plants, which are distinguished by decomposing under the influence of ferments, acids, and alkalies into sugar and usually one other substance the nature of which differs with different plants. The composition of the glucosides varies, sometimes nitrogen is present, but in general the compound consists only of carbon, hydrogen, and oxygen. Their constitution is practically unknown; they have never been formed synthetically; only a few seem to be of the nature of compound ethers. When decomposed by the agents above mentioned they assimilate water, and usually yield glucose or dextrose, but some glucosides furnish other kinds of sugar. Of these naturally occurring compounds may be mentioned æsculin, colocynthin, which yields sugar and colocynthein; convallarin; convolvulin; crocin; daphnin; datiscin; digitalin; euxanthic acid; fraxin; gallotannic acid or tannin; glycyrrhizin; jalappin; phloridzin; populin; quercitrin; salicin; scammony; and xanthorhamnin. The following contain nitrogen; amygdalin; chitin; gelatin or isinglass, which when boiled for a long time with dilute sulphuric acid decomposes and yields a sugar; solanin; and myronic acid, in which sulphur is also present. The majority of these bodies are described under their respective heads. Amygdalin (q.v.) was the first known glucoside.

Glue, an impure gelatine, used as an adhesive, and commonly prepared from the clippings of hides, hoofs, horns, and sinews. These are steeped in lime-water, to remove the hair and blood, and then drained and dried in a current of air, that the lime may absorb carbonic acid, and thus prevent the injurious effects of the alkali upon the gelatine. The clippings are then boiled in water until the solution is found to gelatinize firmly on cooling. The impurities are allowed to settle, and the residuum to gelatinize in shallow wooden boxes; it is then cut into slices and dried upon nets. Good glue is semi-transparent, and free from spots and clouds. Marine glue, a composition used for cementing materials that are exposed to moisture, is made by dissolving 1 part of india-rubber in 12 parts of mineral naphtha, and adding 20 parts of powdered shellac; it resists wet, and cements glass and metals as well as wood. White fish-glue, or diamond cement, is made of isinglass dissolved in alcohol.

The glue industry in the United States was founded by Peter Cooper in 1827, when he established a factory in Brooklyn. About the same time a factory in Philadelphia was started by Charles Baeder and William Adamson. At present glue factories are centralizing near the great slaughter-houses of the Middle West, the sources of raw supplies, and the larger packing concerns, notably the Armours and the Swifts in Chicago and the Cudahy Company in Omaha, have their own glue plants. (See Packing Industry.) The factories still in the East are largely supplied with imported hides. The export trade is steadily growing and has passed the $500,000 mark per annum. France alone surpasses America in the quality of its finer glues, and these are imported for use in making straw hats. The finest glues made in the United States are prepared from sinews, and it is likely that continual experiment upon them will result in a product equal to the best imported from France. The following statistics show the growth of the industry since 1880:

GLUE FACTORIES IN THE UNITED STATES, 1880-1900.

	1880	1890	1900
Number of establishments	82	62	61
Capital	$3,916,750	$4,859,266	$6,144,407
Wage earners	1,801	1,697	1,618
Wages	$600,018	$676,089	$685,096
Cost of materials	$2,786,342	$2,510,927	$3,767,023
Value of products	$4,324,072	$4,270,460	$5,389,006

Glut-herring, or Blueback, a herring (*Pomolobus æstivalis*), abundant in the Southern States, and very similar to the alewife (q.v.), but it is more elongated, is darker on the back and has a black peritoneum and comparatively small eyes. The quality of its flesh is poor.

Gluten (Lat., glue), that constituent element in the vegetable kingdom which makes muscle and builds tissue. It is a combination of two substances, glutenin and gliadin, the latter forming about two thirds, the former one third, as found in wheat. It is a variable constituent of cereals that is now separated from the grain and used for human food and animal feeds. It has been designated as the spinal column in all vegetable life, and is a nitrogenous substance, belonging to the albuminoids, such as the white of egg, the lean of meat, etc. The "hard" wheats are richer in gluten than the "soft" varieties, and the gluten obtained from wheat is of higher dietetic value than the gluten of corn or rye, the latter being soft and of peculiar odor.

To obtain gluten from wheat, the grain is reduced to dough, and the starch removed by mechanical processes, the resultant product being a grayish, tough, elastic, sticky substance which, when produced in its purity and rightly proportioned in its gliadin-glutenin content, is capable of being drawn out into long bands or shreds.

In its highest refinement, gluten exhibits a fine molecular structure, delicate and sensitive to atmospheric conditions, and requires, after separation, immediate handling in its preparation for food.

About 16 pounds of gluten is obtained from 200 pounds of wheat-flour. On account of its high content of nitrogen, gluten soon deliquesces, sours and spoils after the separation from the starch, and demands an immediate treatment if desired for food purposes.

There is great variation in the character of the so-called gluten foods on the market, some of which are almost worthless and a fraud upon the public. Analyses made by the United States Department of Agriculture, by the Maine agricultural experiment station, and other agricultural stations, the results of which may be found in various bulletins issued by these organizations, show that many of the so-called glutens generally found on the market are scarcely better than ordinary white flour or bread.

The glutinous and other residues from the manufacture of starch and glucose are dried and made into cattle-feed, having a nutritive value about equal to brewer's grains. The glucose and starch makers assume that maize or corn consists of starch, gluten, germ, and bran, all but the starch being by-products, which are separated by injurious mechanical processes. The wet or free germs of the corn are dried, ground to meal, the oil extracted by hydraulic pressure, leaving oil-cake, a cattle-feed extensively used. The wet starch is run over vibratory sieves and over long wooden tables, the starch and gluten forming the mixture which passes through the sieves; the starch being deposited by gravity, the gluten passes off at the ends of the tables, forming wet gluten, which, when pressed and dried, constitutes the gluten-meal of commerce. About 5½ pounds is obtained from one bushel of corn.

The composition of gluten-meal is, protein 38 per cent, fat 3 per cent, and starch 40 per cent. This is one of the richest and best food products on the market. The nutritive value is very high, and the factor of digestibility ranges from 92 to 96 per cent. The gluten-meal is treated for the recovery of its starch, and gives two new products, a concentrated foodstuff, characterized by the large amount of proteids (60-70 per cent) it contains, and a maltose syrup. This foodstuff is suitable for animal consumption, and also for raising the percentage of proteids in feeds that have a small amount of these substances. When the wet bran and the wet gluten are mixed in the proportions as obtained from the original corn and the mixture dried, the resulting feed is known as gluten. This is the most common food product in the starch and glucose industry, and represents about 80 per cent of the food output. Its feeding value is very high, and its digestibility above 90 per cent. Its composition is about 28 per cent protein and 3 per cent fat.

Corn oil cake and gluten-meal are exported extensively. The bran and gluten feed is used almost exclusively in the United States. The production per bushel of corn is about 12½ pounds of food.

The New York agricultural experiment station Bulletin No. 198, November 1901, gives the result of analyses of feeding stuffs. The gluten-feed was of sorts ranging in price from $19 to $22 per ton. They show a protein content of from 14.8 per cent to 28.7 per cent; fat, 2.4 per cent to 5.6 per cent; some contained as high as 11.7 per cent crude fibre. Gluten-feed, made in Buffalo, from 24.9 per cent to 27.4 per cent of protein, sold under guarantee of 28 per cent; fat, 2.7 per cent to 4.2 per cent, sold under guarantee 3.3 per cent. Prices, $20 to $21 per ton. Gluten-meal, made in Chicago, 36.8 per cent to 39.1 per cent protein; 3.0 to 4.8 per cent fat; price $24 to $25 per ton.

The waste product in the manufacture of starch or sugar is relatively much richer in oil and protein than is corn. Most factories are removing part of the corn-oil from the waste, so that nearly all the gluten-meals carry much less oil than they did a few years ago. Gluten-feeds differ from gluten-meals in that they contain a good deal of the corn-bran, and hence less of protein and digestible carbohydrates, and more of the indigestible woody fibre. The relation of gluten to bread making is set forth in detail in Bulletin No. 67, United States Department of Agriculture. The food value of gum-gluten has been outlined by Prof. Nelson Clark Parshall in a pamphlet published by the Pure Gluten Food Company, New York.

F. N. Barrett,
Of the 'American Grocer,' New York.

Glut'ton (*Gulo*), a genus of carnivorous quadrupeds related to the sables and martens, but larger and distinguished by the moderately elongated head and the long, rather low body. Intermediate between the plantigrades and digitigrades, it has rounded, very short ears, and a simple fold below the tail, which distinguishes it from the badger, which is pouched and which the glutton otherwise resembles. The commonest species in America is the *Gulo borealis* or *luscus*, better known as the wolverine; it is about 28 inches from the tip of the nose to the root of the tail, which is about 8 inches long, if the hair at the extremity, 3 or 4 inches long, be included. The body is covered with thick, long hair. In summer its coloring is: face blackish as high as the eyebrows, and between these and the ears whitish or brownish; ears covered with coarse hairs; the lower jaw and the inside of the fore legs spotted with white; the back, thighs, and belly, brown or brownish black; sides, chestnut color. Its fur is of value and is used in northern Asia, where the wolverine is a native, for making and ornamenting robes. The animal, however, does not breed in sufficient numbers to furnish much fur to the traders. It is very voracious — although more so in fable and legend than in actual fact — at the same time slow and heavy in its motions, but remarkably acute in sight and hearing. It is of powerful frame, a match for any animal of its own size, and makes a strong resistance when attacked. It is one of the most destructive quadrupeds found in the northern part of America, killing numbers of young foxes and other animals; it is also a great enemy to beavers, watching for them as they come out into the open, or even breaking into their habitations.

Glycerin, glĭs'ē-rĭn, or **Glycerol**. In 1783 Scheele showed that by acting upon olive oil by oxid of lead a substance may be obtained which has a sweetish taste; and in the following year he showed that the same substance may be had by acting in a similar manner upon other oils and fats, such as butter. He also observed that the substance in question may be obtained in the form of a syrupy fluid: that although it has a sweetish taste like sugar, it cannot be fermented; and that although it gives oxalic acid by oxidation, it differs from sugar in many respects. He failed, however, to ascertain its true relation to the oils which furnish it, and to the lead plaster (or «lead soap») which accompanies its formation. The true explanation of the reactions was given some 30 years later by Chevreul, as a result of his famous researches upon the animal fats, which were begun about 1811, and were concluded about 1823. In the course of these researches Chevreul showed that an animal fat consists, in general, of a mixture of several definite chemical substances, each of which is itself a fat, and each of which consists of Scheele's sweetish substance (which is now called «glycerin»), combined with an organic acid. When the fat is treated with an alkali, or with lime or oxid of lead, the organic acid that is present combines with the alkali, or the lime, or the lead, to produce a new substance called a «soap,» the organic base (glycerin) which was previously combined with the acid being thereby set free. Since the time of Scheele and Chevreul much attention has been paid to glycerin and its compounds, and it is now universally agreed that glycerin is a triatomic alcohol (see ALCOHOL), having the formula $C_3H_5(OH)_3$; and that it forms an acid and an oxid, and various substitution compounds and esters, of which latter class the fats (q.v.) are the most important members, and are distinguished by the name of «glycerides.»

Glycerin sometimes occurs in nature in the uncombined form, notably as a constituent of palm-oil, and it is also a product of fermentation; but it is obtained on the large scale only by the decomposition of the fats. In soap making the fat is decomposed by heating with an alkali, the soap which is formed by the combination of the alkali with the organic acid of the fat remaining in solution until it is precipitated by the addition of common salt. The fluid that remains after the soap has been so precipitated contains the liberated glycerin, which can be separated by distilling in a partially exhausted boiler, the glycerin passing over with the water vapor, from which it may be subsequently separated by re-evaporation.

Glycerin is obtained in large quantities as a by-product in the manufacture of so-called «stearin» candles. In this case the fat is not saponified by an alkali, but beef fat, or some other fat that is rich in stearin, is acted upon by superheated steam, by which the stearin, or stearate of glycerin, is resolved into free stearic acid and free glycerin. Fat undergoes a similar transformation when treated with a mineral acid; but this method of producing glycerin has the disadvantage that the mineral acid is likely to combine to a certain extent, either with the glycerin, or with the liberated fatty acid, necessitating a subsequent treatment for its removal.

Pure glycerin is a colorless, odorless, syrupy liquid, with a pronounced sweet taste, and a specific gravity of about 1.27. It is insoluble in ether, but it mixes in all proportions with water and with alcohol. It has a considerable affinity for water, and absorbs moisture from the air quite readily. It boils at about 600° F., but with partial decomposition. Under reduced pressures it boils at lower temperatures. At a pressure of 12.5 millimetres of mercury, for example, it boils at 356° F., and may be distilled without change. By freezing, absolutely pure glycerin may be obtained in the form of deliquescent crystals, belonging to the trimetric system, and melting at about 68° F. Glycerin burns with an almost colorless flame, and dissolves many organic bodies that are insoluble in water. It also dissolves iodine, and many of the metallic oxids.

The solvent properties of glycerin render it valuable in pharmacy. It is also greatly used in the manufacture of nitroglycerin (q.v.), as a constituent of various toilet soaps, creams, and washes, as a preservative medium, and for use in gas meters and other mechanical appliances in which a liquid is needed which will not readily freeze nor evaporate.

Glycin, glī sĭn. See GLYCOCOLL.

Glycocholic (glī-kō-kŏl'ĭk) **Acid**, an organic acid, whose sodium salt is one of the main constituents of the bile of certain of the vertebrates. It may be most conveniently prepared by the following method: A drop of hydrochloric acid is added to fresh bile, and the mixture is shaken and filtered. The filtrate is allowed to stand after being shaken with hydrochloric acid and ether, until the glycocholic acid separates in the form of a bulky mass of needle-like crystals. These are collected upon a filter, washed with water containing hydrochloric acid and ether, and finally purified by recrystallization. Glycocholic acid is slightly sweet and bitter in its aqueous solution. It is readily soluble in alcohol, but dissolves sparingly in water, ether, and other solvents. It forms numerous salts, known as glycocholates, which are all soluble in alcohol. Those of the alkalis are also soluble in water, and yield lathers, like soap. Glycocholic acid has the formula $C_{26}H_{43}NO_6$, and when heated with potash it is resolved into cholic acid ($C_{24}H_{40}O_5$) and glycocoll ($C_2H_5NO_2$), apparently according to the equation $C_{26}H_{43}NO_6 + H_2O = C_{24}H_{40}O_5 + C_2H_5NO_2$.

Glycocoll, glī'kō-kŏl, **Glycin, Glycocin, Amido-Acetic Acid**, or **Gelatin Sugar**, a singular chemical substance obtained by heating glycocholic acid (q.v.) with an alkali, or by the long-continued boiling of gelatin, glue, or gelatinous tissues, with sulphuric acid, or with potash or baryta. When perfectly pure it crystallizes in tabular, monoclinic crystals; but slight quantities of certain impurities induce remarkable changes in its crystalline form. It is insoluble in alcohol and in ether, but is sparingly soluble in water, its solution having a sweet taste. According to its mode of formation from glue, glycocoll is a sugar, the glue acting the part of a glucoside; but it resembles an acid (although it is neutral to litmus paper) inasmuch as it combines with metallic oxids to form salts. It does not form salts with the metals of the alkalis, and probably not with those of the alkaline earths. In combining with acids, glycocoll acts as a base, forming definite salts such as the nitrate, acetate, oxalate, sulphate, and hydrochlorid. In these compounds the glycocoll has strongly basic properties, and, indeed, it is usually described as a base. The chemical formula of glycocoll is $C_2H_5NO_2$; or $CH_2(NH_2).COOH$.

Glycogen, glī'kō-jĕn ($C_6H_{10}O_5$), animal starch, a substance found in the livers of most animals, and to a very large extent in the muscles and other parts of fœtal animals. It is extracted from the liver of a newly killed animal by cutting the liver in pieces, plunging it into boiling water, triturating it to a fine paste, and extracting with water. The filtered fluid is mixed with moderately strong alcohol, which throws down a flocky precipitate. This is purified from coloring and nitrogenous matter, and at last the glycogen is obtained as an amorphous white powder, without taste or smell. It dissolves in water, but the solution is not absolutely clear; it is insoluble in alcohol. By boiling with acids, or by the action of ferments, glycogen is readily converted into sugar. By nitric acid it yields oxalic acid. The chief interest attaches to the physiological function of this substance, and the very discordant views taken with regard to it by different writers. Thus it is said to be the substance in the liver mainly concerned in the conversion of starch into sugar. Other physiologists affirm that no such transformation takes place, there being no proof of the increase of sugar after the action of the liver; so that at the present time its exact functions are unknown. It has been suggested that the sugars that are taken into the system with the food are stored up in the liver in the form of glycogen, to be drawn upon subsequently, according to the needs of the system.

Glycol, or **Ethylene Alcohol**, the most important of the dihydric alcohols (see Alcohol and Fatty Compounds) may be regarded as derived from the hydrocarbon ethane, C_2H_6, by the substitution of two molecules of hydroxyl (OH) for two molecules of hydrogen. It therefore has the formula $C_2H_4(OH)_2$. Glycol may be prepared by acting upon ethylene dibromide, $C_2H_4Br_2$, by potassium carbonate, K_2CO_3. The reaction is $C_2H_4Br_2 + K_2CO_3 + H_2O = C_2H_4(OH)_2 + 2KBr + CO_2$. Glycol is a colorless, odorless liquid, having a specific gravity of about 1.12, and a sweetish taste. It boils at about 388° F., and solidifies at 11° F. It mixes in all proportions with water and alcohol, and is used to some extent as a solvent. A great many compounds have been derived from glycol, but they are not of general interest. The word "glycol" is also used as a generic name for all the dihydric alcohols.

Glycollic (glī-kŏl'ĭk) **Acid**, or **Oxyacetic Acid**, an organic acid having the formula $HO.CH_2.COOH$, whose potassium salt (that is, potassium glycollate) exists in the grease obtained from sheep's wool, and in the juice of unripe grapes. It may be prepared by heating a mixture of glycerin, water, calcium hydrate, and precipitated silver oxid for four hours, after which the fluid is filtered, saturated with carbon dioxid, boiled, filtered again, and finally evaporated until calcium glycollate crystallizes out. The calcium glycollate is next decomposed by oxalic acid, and the filtered solution is neutralized with carbonate of lead. Upon evaporation, well-developed crystals of lead glycollate separate out; and a solution of these, when treated with the proper amount of sulphuric acid, yields free glycollic acid. By evaporation in a vacuum over concentrated sulphuric acid, and subsequent recrystallization from solution in anhydrous ether, the acid may be obtained in a very pure form. It is freely soluble in water, in alcohol, and in ether. Concentrated nitric acid oxidizes it to oxalic acid; and when distilled with excess of quicklime it decomposes with liberation of methane and hydrogen. Glycollic acid forms an extensive series of salts called glycollates, and it also yields numerous esters and other organic derivatives.

Gly'cosides, a class of vegetable principles which under the influences of heat, enzymes, or chemical action split into some form of sugar and some other body. Those glycosides which split into sugar and some other body are known as glucosides. When the sugar is rhamnose they are known as rhamnosides; if arabinose, they are known as arabinosides, etc. There are a great many glycosides in nature, and within recent years a large number have been made artificially. The chemical composition of the artificial glycosides is well understood, since they are the result of synthesis, but the make-up of the natural glycosides is not well understood. Glycosides play a very important role in nature. By reason of their bitterness and of their often being poisonous, they preserve seeds from destruction by animals, man included, until they shall have ripened, and then on germination plant enzymes or ferments acting on the glycosides set free a certain amount of sugar, which is of much service to the young developing plant. An excellent illustration of their protective qualities is seen in persimmons, which, when green, are so puckery by reason of the glycoside tannic acid that they are left severely alone. When ripe, however, the tannic acid is converted largely into sugar, and the fruit, then eaten and carried about by animals, can distribute its seed. In wild-cherry bark and in bitter almonds there is a glycoside amygdalin which is converted into sugar and hydrocyanic acid. In mustard the glycoside sinagrin acted upon by the plant ferment also found in the seed develops into sugar and the volatile oil of mustard plaster. Many fungi are capable of accompanied by its special ferment. Many glycosides are affected by heat. Some are split by cooking in water, but a boiling temperature is apt to destroy the action in many. Thus it is necessary to use cold water if one desires to obtain the volatile oil of mustard in making a mustard plaster. Many fungi are capable of breaking down glycosides, which fact is of a great deal of practical importance in medicine, for many active remedies which contain glycosides, if kept too long on the druggist's shelf, develop molds within them. These destroy the active principle of the drug and thus render it useless. In medicine the most important glycoside containing drugs belongs to what is known as the "digitalis group." Thus digitalis contains four or five, strophanthus two, apocynum two, and squills the same number. These bodies are all heart tonics in small doses and heart poisons in larger amounts. Consult Van Rijn, 'Die Glycoside' (1900).

Glycosuria, the presence of glucose in the urine. See Diabetes Mellitus.

Glycyrrhizin, glĭs-ĭ-rī'zĭn, or **Liquorice Sugar,** a peculiar organic substance which occurs in liquorice root (*Radix Glycyrrhizæ*), together with starch, malic acid, and various other matters. It may be prepared by extracting the dried and pulverized liquorice root with boiling water containing a small quantity of milk of lime, and precipitating the concentrated extract with cold acetic acid. The gelatinous precipitate is purified by dissolving it in 50 per cent alcohol, filtering through charcoal, and finally evaporating at 212° F. When dry, glycyrrhizin is an amorphous solid, which swells up in cold water but does not dissolve. It is only slightly soluble in alcohol or ether, but dissolves in hot water, and also in boiling glacial acetic acid. It reduces Fehling's solution when heated, and has been regarded as a glucoside; but although boiling with dilute acids decomposes it, it does not appear that any glucose or other sugar is formed, the chief products of the decomposition being parasaccharic acid and a brownish resin called glycyrrhetin. Glycyrrhizin is now more commonly regarded as a tribasic organic acid, and the name "glycyrrhizic acid" has been assigned to it. It has the probable formula $C_{44}H_{63}NO_{18}$, and forms numerous salts, which mostly have a sweet taste.

Glyoxal'ic Acid. See Glyoxylic Acid.

Glyox'aline, a substance having the chemical formula $C_3H_4N_2$, and prepared by acting slowly upon cold glyoxal with strong ammonia in slight excess. Glycosine is thrown down as a precipitate, and the filtrate, which contains glyoxaline, is boiled with milk of lime (to expel the ammonia), after which it is evaporated to a syrupy consistency, treated with absolute alcohol, and filtered. The liquid so obtained is distilled, yielding pure glyoxaline in a crystalline mass of dazzling whiteness. Glyoxaline melts at 192° F., and boils at 491° F. It is freely soluble in water, alcohol, and ether, and has an alkaline reaction. It acts as a base, and forms salts. It is also the starting point for a series of organic compounds of analogous composi-glycollate and calcium oxalate.

Glyoxyl'ic or **Glyoxalic Acid,** an organic acid having the formula H.CO.COOH, and existing in the unripe fruits of many plants. It may be prepared (along with glyoxal) by oxidizing alcohol with nitric acid. It is a thick, syrupy liquid having a specific gravity of about 1.3, and when allowed to stand over concentrated sulphuric acid it crystallizes in trimetric prisms containing water. Glyoxylic acid is very soluble in water, and can be distilled in a current of steam. It is a monobasic acid, forming crystalline salts called glyoxylates. By oxidizing agents it is converted into oxalic acid; by nascent hydrogen it is reduced to glycollic acid. It has also the properties of an aldehyde, reducing ammoniacal solutions of silver salts, forming a metallic mirror; also unites with alkaline bisulphites. Glyoxylic acid, when boiled with excess of lime water, yields calcium glycollate and calcium oxalate.

Glyp'todon, the typical genus of the extinct glyptodontia, or tortoise-armadillos, of South America. The back was covered by a solid bony carapace, without any movable rings such as the armadillo possesses, so that the animal was unable to roll up into a ball for protection; but the tail was protected by a succession of overlapping bony rings, and the head by a stout bony casque, while there was usually more or less armor on the under side of the body. The legs and feet were short and stout, and had hoofs on the toes instead of claws. The animal was 10 to 12 feet in length.

Gmeiner, John, American Roman Catholic clergyman: b. Barnau, Bavaria, 5 Dec. 1847. He studied at St. Francis' Seminary, Milwaukee, Wis., was ordained priest in 1870, was professor in the seminary, and later in St. Thomas' Seminary, St. Paul, Minn. In 1899 he became rector of St. Francis' Church, Buffalo, Minn. In 1893 he addressed the World's Parliament of Religions at Chicago on "The Primitive and Prospective Religious Unity of Mankind." His published writings include the volumes: 'Modern Scientific Views and Christian Doctrine Compared'; 'Emmanuel: the Saviour of the World'; 'Mediæval and Modern Cosmology.'

Gmel'inite, mĕl'-ĭ-nīt (for Prof. Charles Gmelin), a native hydrous silicate of aluminum, calcium and sodium, crystallizing in the rhombohedral system, usually with a hexagonal aspect. It is colorless or white, often with tinges of yellow, green or red, and transparent to translucent, with a vitreous lustre. It is brittle, with a hardness of 4.5 and a specific gravity of about 2.1. It loses much of its water of crystallization when heated in a closed tube, and dissolves in hydrochloric acid, with separation of free silica. Gmelinite occurs in the Harz Mountains, in Cyprus, and in parts of Italy and Ireland. It is also found at Cape Blomidon and at other points along the coast of Nova Scotia, and fine white crystals of it occur at Bergen Hill, N. J. The mineral was formerly called "hydrolite."

Gnadenhütten, gnā'dĕn-hüt-tĕn, **Massacre at.** For the westward retreat of the Delawares, and their partial conversion to Christianity by the Moravians, see their name. In 1772 their Great Council settled the Christian Indians on the Muskingum in three villages, Salem, Schönbrunn, and Gnadenhütten (Tabernacles of Grace), the latter being that of the Delawares. Through the Revolution these Indians as a body took no part in warfare, quietly cultivating their farms; but some of the younger ones joined the war-bands, which forced the Moravian villages to give them supplies and shelter. The whites were wrought up to frenzy by their atrocities, in which they accused the Christian Indians of being secret participants; and in 1781 a successful foray against the hostiles was only prevented from involving the Moravians by the efforts of Col. Brodhead. But the first blow against them was struck by the wild Indians and British. In the fall of 1781 Capt. Matthew Elliott, under orders from the British commandant at Detroit, with a body of white rangers and a miscellaneous horde of Indians from a half-dozen different tribes, forced them to leave their villages, which were half destroyed; the missionaries were taken to Detroit, and the Christian Indians left on the Sandusky plains, where the wild Indians would have massacred them but for the English. A few escaped and returned to the villages; they were captured by the Americans under Williamson, and taken to Fort Pitt, whose commandant, Gibson, their firm friend and attempted protector, sent them back to the villages unharmed. During the winter the rest suffered much from cold and hunger around Sandusky, and by the spring of 1782 some 150 had returned to the villages. Meantime the fiendish Indian outrages were going on; the borderers accused the Moravians of being privy to them, and denounced Gibson and Williamson for letting them go; and after a woman and child had been impaled alive by an Indian gang, who afterward refreshed themselves among the Moravians, the whites formed a party of near a hundred under Williamson to exterminate the latter. In March they gathered those in Salem and Gnadenhütten into two houses at the latter — those at Schönbrunn had been warned and escaped — under promises of good treatment; a council was held, at which 18 protested against the contemplated murder and withdrew, taking an Indian lad with them; the rest went in and killed the 96 inmates, after the latter had prayed and kissed each other farewell, only two other boys escaping. The best men of the borders denounced the cowardly butchery in unsparing language.

Gnat, năt, a somewhat indefinite term applied to various forms of small two-winged flies, especially those annoying to man and domestic animals. In England mosquitoes are known as "gnats," but in America the term is more restricted to species of the genus *Simulium*, known also as "buffalo gnats," "black-flies," and "turkey gnats," or midges. One of the most remarkable of these species on account of its minute size is the so-called punky or "no see um" of northern woods. The buffalo gnat is quite as bloodthirsty as the mosquito, but is most annoying to domestic animals, including poultry, which are frequently worried to death by swarms of it. These gnats differ from mosquitoes in that they are diurnal, while the latter normally fly by night. The larvæ of most of the gnats, with the exception of the gall and fungus gnats (qq.v.), are aquatic and do no harm in this stage. There is also a distinctive form of gnats which occur throughout our country, but reach their highest development in the Gulf States. The common species are *Hippelates flavipes* and *H. plebejus*, which in Florida occur in great numbers, and are the direct cause of the disease "sore eye" which from time to time becomes epidemic in the rural districts.

Gnat-catcher, or Gnat-snapper, any of various little birds that snap up minute insects on the wing. Specifically, in the United States, a small bluish-gray flycatcher (*Golioptila cærulea*), common from Maryland southward, and noted for the exquisite finish of its soft, lichen-covered nest, saddled upon a horizontal tree-limb. See Maynard, 'Birds of Florida' (1872).

Gnathobdellida, năth-ŏb-dĕl'ĭ-da, an order of leeches (q.v.), distinguished by the absence of a proboscis.

Gneiss, nīs, a metamorphic rock, consisting of orthoclase, quartz, and mica. It is akin to mica schist, but contains more orthoclase and less mica; it has the same components as granite, but is stratified or foliated. The geological genesis of gneiss is obscure. One theory is that gneiss is the result of the metamorphosis of sedimentary rocks; on this hypothesis gneiss is closely related to conglomerate, which is a mixture of sedimentary pebbles and fine grains resulting from the action of water, while gneiss owes its stratified form to other causes. In some cases this sedimentary theory may hold, but in others it is evident that gneiss is the production of eruptive forces, occurring, as it does, in purely igneous rocks. In the United States gneiss, in the ordinary usage of the term, is common, notably in New England and New York, the strata running northeast and southwest. It abounds in the mountains of central and northwestern Europe and in the ranges of South America. Gneiss is used as a building stone and for flagging.

Gnomé, nō-mā (Gr. "judgment," "adage"), a short, pithy saying, often expressed in figurative language, containing a reflection, a practical observation, or a maxim. Gnomés are a common form of early literature. In religious literature the proverbs of Solomon, those of Jesus, son of Sirach, and the sermon on the mount, are examples. The Sæmundian Edda has preserved excellent proverbs whose authorship is attributed to Odin. The word generally connotes Greek maxims or monitions, and Theognis, Phocylides, and others, are called the Gnomic poets, from their excellence in this sententious manner of writing.

Gnome (nōm) **Owl**, one of the burrowing or "elf" owls of the American plains: specifically, *Glaucidium gnoma*.

Gnomes, in European folk-lore, spirits which dwell in the interior of the earth, where they watch over hidden treasure, and hence are the patrons of miners. Ugliness is their appropriate quality, though the females, gnomides, are beautiful. Among them all Rubezahl (Number-nip) has obtained, by means of Musäus' popular tales, the greatest celebrity in Germany. The native country of these poetical beings is the East, whence they were introduced into Europe between the middle of the 15th and the beginning of the 16th century by the cultivators of cabalistic philosophy, Pico of Mirandola, Marsilius Ficinus, Paracelsus, Cardanus, and Reuchlin. The gnomes make a part of Pope's machinery in the 'Rape of the Lock.'

Gnomon, nō'mŏn, an astronomical instrument for measuring the altitudes and declinations of the sun and stars. It is usually a pillar or pyramid, erected upon level ground or on a pavement, and is especially used for making the more important observations. Many have preferred it to the smaller quadrants, both as more accurate and more easily made and applied. The most ancient observation of this kind extant is that made by Pytheas, in the time of Alexander the Great, at Marseilles, where he found the height of the gnomon was in proportion to the meridian shadow at the summer solstice, as 213½ to 600. This method of observation was by no means accurate in ancient times, since observers did not take into account the sun's parallax, which makes his apparent altitude less than it would be if the gnomon were placed at the centre of the earth; they also neglected refraction, by which the apparent height of the sun is somewhat increased; and made their calculations as if the shadows were terminated by a ray coming from the sun's centre; whereas it is bounded by one coming from the upper edge of his limb. These errors, however, may be easily allowed for; and, when this has been done, the ancient observations are generally found to coincide nearly with those of the moderns.

Gnomon, in geometry, is the space included between the lines forming two similar parallelograms usually squares, of which the smaller is inscribed within the larger, so as to have one angle in each common to both. For the gnomon of a dial see DIAL.

Gnossus. See CNOSSUS.

Gnosticism, nŏs'tĭ-sĭzm (Gr. γνῶσις, knowledge; γνωστικός, devoted to knowledge), the teaching of various sects in the first Christian century, who hovered on the borderland between Christianity and heathen thought. The systems they founded attempted to grapple with the most profound problems of philosophy, such as the creation of the world and the origin of evil. They taught that a series of divine emanations connected the Supreme Being with the visible universe: that human nature was dual, and that the acts of the body had no influence on the spirit. They blent their ideas of Christian truth with pagan and Jewish elements, or even with those received from the common belief in magic. They taught that the earthly life of Christ was unreal, that is, he was a phantom and incorporeal, and they held that knowledge (γνῶσις) as they possessed it, was superior to faith.

Thus there was a general tendency to trace the same religious idea through different mythologies (which were held to be the popular expression of religious ideas originally revealed), and the new religion which aimed at the redemption of the whole world was eagerly seized on as the embodiment of their unifying principle. Christianity was believed to be the full revelation of the deeper truth embedded in all the nature-religions. By adapting their presentation of Christianity to the form of the ancient mysteries the Gnostic teachers the more easily fastened themselves upon the Christian congregations, and succeeded in taking up a position within them as specially initiated persons, for which they found a natural support in the prevalent ascetic views and the powerful influence of free prophecy. But these were in time forced to separate themselves, and form sects, whose great diversity becoming the more apparent greatly counteracted the influence of the Gnostic leaven in the Christian communities. To maintain their theories in the face of the traditional doctrine of the churches they had recourse to the sources of that doctrine. They claimed to have special traditions from certain of Christ's disciples, and applied their exegetical skill to the allegorical interpretation of the written monuments of the apostolic age. Marcion (about 150), believing himself to be a consistent follower of Paul, rejected the authority of the earliest apostles, as well as the gospels emanating from the circles of their influence, and professed to hold "the gospel" known to Paul only. His collection of 10 epistles of Paul was the first attempt to fix the canon of the apostolic Scriptures. Such arbitrary treatment of the Scriptures led the Church to resort to a more through study of the historical tradition. In the struggle with Gnosticism it obtained a firm hold of the principle that that alone is to be held true Christianity which can be shown to be historically derived from Christ and his apostles, and it found the only means to check the license of Gnostic speculation in the development of a Christian theology in accordance with the positive character of historical Christianity.

The general principles of Gnostic thought may be here summarized, as fuller accounts of the principal schools are given under their own names or under those of their founders. For the practical doctrine of the redemption of men's souls from sin by Jesus Christ the Gnostics substituted a speculative doctrine of the redemption of the human spirit from matter by religious knowledge. The realistic eschatology of the primitive Church they entirely set aside. The evangelic element in their teaching was obscured by a cloud of heathen mythologies and philosophic subtleties. The Divine Demiurgos and Lawgiver of the Old Testament was distinguished from the Supreme Being, and the Hebrew idea of creation was superseded by that of a continuous process of emanations from the divine first cause. The present world was believed to be the result of a catastrophe in which the spirit fell under the power of matter, or of an original destiny that powers hostile to God should bring into existence a world in which the spirit born of God should be held in unwilling estrangement from him. All the Gnostic systems are more or less dualistic. In these dualistic theories a philosophical foundation was secured which was by the Gnostics developed to an extreme. The highest duty of man was to become united to the First Source of Spirit through *gnosis* and the absolute alienation of the human spirit from the body. Others, like Carpocrates and his son Epiphanes, expressed their contempt for the flesh and the ordinances of the Demiurgos in unbridled license. The contrasts of the flesh and the spirit and of the world and the kingdom of God are interpreted as the physical conflict of vast cosmic forces.

and are thereby stripped of their moral and religious significance. The intervention of Christ is the crisis, not only of the religious history of mankind, but of the whole development of the universe. As the final and perfect Æon he is distinguished from his visible manifestation. This is held to be (1) a real human life with which he was connected for a time, or (2) a heavenly or "psychical" creation, or (3) a mere phantasm. Men are divided into two classes: the Pneumatic or "spiritual," who are constitutionally receptive of Christ's revelation and life everlasting, and the Hylic or "material," who are doomed to perish. Valentinians and others add a third, or intermediate class, the Psychical, or men of "soul," who are not capable of apprehending a divine revelation, but only of the popular faith (*pistis*), yet thereby may attain to a degree of knowledge and salvation.

The 'Pistis Sophia,' edited by Schwartze and Petermann (Berlin 1853), is the only Gnostic work that has come down to us in a complete form, except those apocryphal Gospels and Acts of the Apostles which show a Gnostic tendency. Tatian's 'Diatessaron' was used in the Syrian Church down to the 5th century. The Gnostic Bardesanes of Edessa, one of the last of the Syrian Gnostics, was the founder of Syrian hymnology. See Mansell, 'Gnostic Heresies'; Neander, 'Genetische Entwickelung der vornehmsten gnostischen Systeme' (1818); Möller, 'Kirchengeschichte,' Vol. I. (1889); Renan, 'Origines du Christianisme'; King, 'The Gnostics and their Remains' (1887).

Gnostics, a religious philosophical sect, who boasted of a deeper insight into the origin of the world, and of the evil in the world, than the human understanding, so long as it remains in equilibrium, can deem admissible, or even possible. Simon the magician, of whom Luke speaks in the Acts of the Apostles, was the first among them. Even in his dogmas we discover the traces of ideas which were common to all the Gnostics. They may be reduced to the following principal heads: The world and the human race were created out of matter by one æon, called the *demiurge*, or, according to the later systems of the Gnostics, by several æons and angels. The æons made the bodies and the sensual soul of man (*sensorium, psyche*) of this matter; hence the origin of evil in man. God gave man the rational soul; hence the constant struggle of reason with sense. What are called gods by men (for instance, Jehovah, the God of the Jews), they say, are merely such æons or creators, under whose dominion man became more and more wicked and miserable. To destroy the power of these creators, and to free man from the power of matter, God sent the most exalted of all æons, to which character Simon first made pretension; he was followed in these pretensions by Menander, a Samaritan, the most celebrated of his scholars, who, toward the end of the 1st century, founded a sect at Antioch in Syria. Simon and Menander were enemies to Christianity. Cerinthus, a Jew, of whom John the Evangelist seems to have had some knowledge, combined these reveries with the doctrines of Christianity, and maintained that the most elevated æon, sent by God for the salvation of man, was Christ, who had descended upon Jesus, a Jew, in the form of a dove, and through him revealed the doctrines of Christianity. In the 2d century, during the reign of Hadrian and both the Antonines, these principles were adopted by certain Christian philosophers, who are more particularly known under the name of Gnostics, and still further refined, extended, and systematized. Saturninus, a Syrian, speaks of an unknown supreme God, who had generated many angels and powers; seven of these æons were, according to him, creators of the world, and soon fell from God; one of them, the God of the Jews, had seduced man to him, whence originated the difference between good and bad men. Saturninus also calls Christ the Saviour sent by God, and the Son of God; but the opinion that Christ was not actually born, and had not a real human body, but only an incorporeal image, is peculiar to him, on which account his followers and other later Gnostics who agreed with him in this respect were called *Docetæ* (from Greek δοκεῖν, to seem) and *Phantasiasts.* The system of Carpocrates, an Alexandrian, who also flourished during the reign of Hadrian, was distinguished from the one which we have just described in this respect only, that he considered Christ as a mere man, whose purer and more powerful soul had more accurately remembered what it had seen with God before its union with the body. The fathers of the Church, Clement of Alexandria, Irenæus, Eusebius and Epiphanius, from whom, in general, we derive all our information concerning the Gnostics, accuse the moral system of Carpocrates of destroying all distinctions between good and evil, and inculcating an unlimited indulgence of the sensual appetites. Certain it is that his followers practised the most detestable vices, and were the cause of many of the calumnies of the heathen writers concerning the Christians of this century. The Valentinian party, which rose toward the middle of the 2d century in Rome, and especially in Cyprus, and which was distinguished by its austere manners, was the most numerous of all the Gnostic sects, and continued until after the commencement of the 4th century. Marcion of Sinope, and Cerdo, a Syrian, renounced many of the absurdities of the earlier Gnostics, and formed a regular system, the characteristic of which was the rejection of the Old Testament. Bardesanes, a Syrian, and Hermogenes, an African, who, in the reign of the Emperor Commodus, apostatized from Christianity and established sects, bordered, in their hypotheses concerning the origin of good and evil, upon Gnosticism. On the whole, when we take into consideration the philosophical tendency of that age, the passion for the marvelous that had taken possession of the effeminate nations of the Roman empire, and the custom of pretending to a deeper insight into the secrets of nature and the divinity, it is not to be wondered at that a religious philosophy which adopted the most brilliant parts of Platonism, and which afforded nourishment alike to the imagination and to the vanity of secret wisdom, should have met with such universal success. By the austerity of its precepts, and its care for the well-being of the soul, it even prepossessed good men in its favor. The Gnostics were the Pietists of the 3d and 4th centuries. The Roman Catholic Church took occasion from their heresy to give greater precision to the articles of the orthodox faith. There have been no Gnostic sects since the 5th century; but many of the principles of their system of emanations reappear in later philosophical systems, drawn from the same sources as theirs. Plato's lively representation had given to the idea of the Godhead something substantial, which the Gnostics transferred to their æons: and Leibnitz's 'Effulgurations of God,' Ploucquet's 'Real Presentations of God,' St. Martin's 'Pictures and Mirrors,' and the like, as well as the Gnostic æons, are a proof that the essays of the human understanding to explain the creation and the origin of imperfect beings from the perfect always end in similar results. See GNOSTICISM.

Gnu, nū, a Hottentot name of one of the two species of wildebeest. The wildebeests are African antelopes, forming the genus *Connochetes.* The white-tailed gnu or "horned horse" (*C. gnu*) resembles, in form, partly the horse, partly the buffalo, and partly the stag. It is as large as a middle-sized horse, and its neck is adorned with a stiff erect mane. On the forehead the face is covered with an oblong tuft of stiff black hairs, turned upward. Beneath the lower jaw is also a thick, shaggy beard. The legs are long, and elegantly formed, like those of the stag; the space between the fore-legs is covered with long bushy hair. The tail is long and white. The horns are rough, and are enlarged at their base like those of the buffalo; they spring from the hinder part of the head, and, after bending forward beyond the eye, turn suddenly upward. Both sexes are furnished with these appendages. In the young animal they are perfectly straight, acquiring their flexure as the animal grows older. The gnu is affected by the sight of scarlet, like the buffalo or bull. When irritated, it expresses its resentment by plunging, curveting, tearing the ground with its hoofs, and butting with its head. The flesh is juicy, agreeable, and nourishing. This animal was formerly widespread and numerous, roving in small bands with zebras, etc.; but it is now nearly or quite extinct.

Another species, whose habitat was north of the Zambesi, has still escaped extirpation in the interior. It is named *C. taurina*, and has no long hair in front between the fore-legs; there are dark stripes on the sides, and the tail is shorter and black. Consult: Bryden, 'Nature and Sport in South Africa' (London 1897); Millais, 'A Breath from the Veldt' (1895); and the writings of South African sportsmen travelers from Gordon-Cumming (1850) onward.

Goa, a Tibetan gazelle.

Goa Powder, a substance found in the wood of the *Andira araroba*, a leguminous tree growing in Brazil and the West Indies. It derives its name from Goa, a Portuguese colony on the southwest coast of British India, to which it was imported from Bahia for the first time in 1852. It has a bitter taste, is considered efficacious in certain skin diseases, and is used in the preparation of chrysarobin.

Goajira, gō-ä-hē'rä, a peninsula in Colombia, which forms the most northerly point of South America. It lies west from the Gulf of Maracaibo, or Venezuela, and runs northeast from the Sierra Nevada de Santa Marta to the volcanic Sierra Macuira, which forms its apex, rising to a height of 2,800 feet. The coast is edged with sandbanks, but there is good anchorage at Bahia Honda. Its exports are dyewood, dividivi, pearls, and wood for cabinet work. Up to 1891 Venezuela laid claim to the peninsula, which in that year was formally ceded to Colombia.

Goajiros, gō-ä-hē'rōs, an Indian tribe inhabiting the peninsula of Goajira (q.v.). They are reckoned at 25,000 souls, are subdivided into numberless septs or clans, and for the most part are nomadic, but cultivate the soil and keep flocks and herds (sheep, goats, horned cattle, horses and asses). They also trade in dividivi and fine woods. They are good horsemen, and warriors, arming themselves with bow and poisoned arrows, and are also expert in the use of firearms. They are of fine physical build, especially the women, who are held in high esteem. They wear little clothing, but paint their bodies, and love fine harnesses for their horses. The Roman Catholic mission has been very successful in evangelizing them. Their language is a branch of the Arowak and Maipure group, and connects them ethnologically with the aborigines of the Bolivian Andes, and the plains of the Mahaica and Surinam rivers.

Goat. There is probably no other species of domestic animal that is so widely distributed over the earth as the goat, not excepting the horse, or the cow, or the sheep, yet there is none of them concerning which we have so little scientific information. We are told, however, that there are 10 species of wild goats, all but one of which (the Rocky Mountain goat) are confined to Europe and the Himalaya Mountains. These 10 species are divided into two groups — the ibexes and the goats proper. The ibexes are composed of two sub-species — *Capra falconeri* and *Capra ægagrus.* The *C. ægagrus* is the Paseng, or Bezoar goat, or wild goat, of Persia, and is the progenitor of *C. hircus*, through which are descended all of the domestic goats of all countries. These are numerous in kind and variable in characteristics. Of these only the Angora and the Cashmere breeds and the several breeds of milch goats are of special economic importance, and these only will be treated here.

The Angora Goat.—The history and development of the Angora goat can not be traced to the beginning, but there is evidence that it belonged to a distinctive breed even in the days of Abraham. So far as can be stated definitely at this time, this breed is a native of the vilayet of Angora, in Asia Minor. The capital of the vilayet is Angora, or Eugurieh, the ancient city of Ancyra, where it is believed that the Apostle Paul established one of the western Christian Churches.

The geographical distribution of this breed is not extensive, their raising as an industry being confined to Turkey in Asia, South Africa, and the United States. They have been transplanted to many of the European countries, but without successful result. Australia has had a small number for 50 years, but it is only at the present time that a strong effort is being made to build up an industry of importance there.

A few Angoras are thriving in Canada and experiments are being conducted with them in Porto Rico and Cuba. Approximately stated, there are 3,700,000 of these goats in Turkey, 5,000,000 in South Africa, and 800,000 in the United States. At this time they may be found in every State and Territory, including Alaska.

Angoras were introduced into the United States from Asia Minor in 1849 by Dr. James B. Davis, of Columbia, S. C. There were nine goats in this importation, and at that time and for several years later they were regarded as belonging to the Cashmere breed, but one only was a Cashmere, while the remaining eight were Angoras. Several other importations, usually in small lots, have been made from Asia Minor and South Africa. For ten years previous to the outbreak of the Civil War considerable effort was made to exploit this proposed new addition to the animal husbandry of the country, but this failed for various causes, and for many years after the war it seemed that the Angora goats were to prove an absolute failure here. The war had scattered or destroyed nearly all that were in the Eastern and Southern States, but a few that had found their way to California and the Southwest increased rapidly in numbers by crossing upon the long-haired Mexican goats. The redivivus of the industry came about the year 1900, when it was discovered that this country not only had the mills to consume all of the mohair of domestic production, but was also importing over a million pounds annually. The organization in the same year of the breeders into a registry and fair association gave to the industry its first impetus; and then the government assisted largely in exploiting the qualities of the animals. About this time, too, the ability of goats for destroying brushwood became widely known. These two leading features have tended to bring about a rapid growth of the industry.

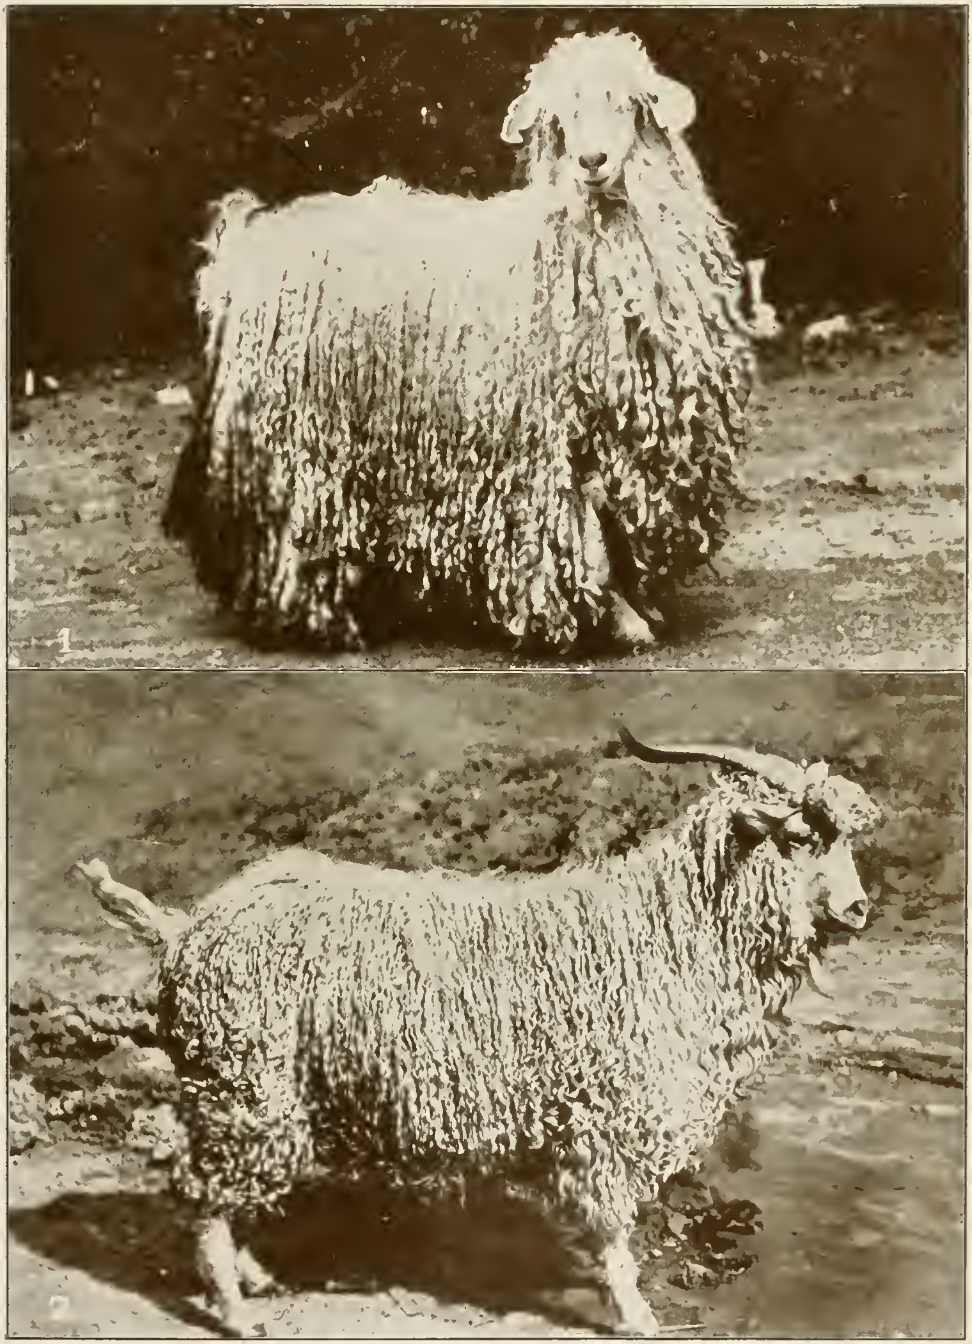
The Angora goat is small, weighing generally from 60 to 100 pounds, although many may be found in the United States that weigh as much as 140 pounds, and occasionally one much heavier than this. Males and females alike have horns and beards, except that in rare instances one without horns may be seen. The horns of the male grow to a length of 18 to 20 inches and turn upward, outward, and backward, while those of the female, which grow to a length of 8 to 10 inches, grow upward and point backward with only a slight inclination to twist. The ears are usually medium long and pendant, but there are frequent specimens having ears that are short, pointed, and pricked. Except in rare instances, the fleece is pure white, growing to an annual length of 10 inches and covering the entire body down to the knees and hocks. There is no goat odor with this breed except with the bucks at rutting time. The Angora usually has one kid at a birth; two are not uncommon, and three are seldom dropped.

The uses of the Angora goat in the United States are three: (1) For the production of mohair (see Mohair); (2) for the production of meat; and (3) for the destruction of brushwood and weeds. It is used rarely as a milch animal, owing to the uncertain quantity of milk which it yields.

The uses of mohair are many already and new ones are being invented frequently, so that there has been a constant and increasing demand for this product, with no indication that the supply will ever equal the demand. This feature of the industry is elaborated under the head of Mohair. The natural result of the many uses of this staple has been an increase in the number of goats and the breeding of animals of better quality. The average weight of the fleece at this time is about 3 pounds, but there are many animals of exceptional merit that will yield 12 pounds and even more and occasionally a flock that will average 5 pounds per head. A few more years of careful breeding will very likely increase the average per head for the whole country to 5 or 6 pounds. Within the last four or five years, during which time there has been intelligent effort made to increase the quantity of the fleece, there has been marked improvement, and the weight of the average fleece has probably gained 40 per cent. The future should show even better results. The goats yield heavier fleeces in the colder parts of the country than in the warmer sections; and those animals taken from the southwestern States to the northern part of the United States show an increase the first year.

The Angora is the only one of the numerous breeds of goats that yields a carcass that is edible at all ages. The Angora kids, like those of other breeds of goats, are considered a delicacy, and the mature animal is free from the strong taste that is characteristic of other breeds. The size, shape, and quality of the Angora carcass make it to resemble so much that of the sheep that the packers slaughter large numbers of the low grade Angoras and sell them as sheep mutton. A peculiarity of Angora mutton is that it requires a longer time for cooking than does sheep mutton. In the southwestern part of the country, especially on the large ranches, where it is difficult to keep meat fresh, many grade Angoras are slaughtered for food; but in other parts of the country, where the animals are usually of high grade, they are not generally slaughtered, being regarded as of more value for mohair production.

The predilection of goats for brushwood and weeds is characteristic of all breeds, but the Angoras are employed principally for this use because they are able to produce a marketable fleece at the same time they are cleaning up the land. In many parts of the United States they are regarded as of more value for clearing brushland than as mohair producers. This is especially true where the land cleared is suitable for raising large crops or growing vigorous orchards. The total area of land so cleared of brushwood by these goats aggregates many thousands of acres, and their work is done in a most satisfactory manner. The goats first eat every twig and leaf within their reach while standing on their hind legs, seldom making any choice as to species of tree, and later, if not given new pasture, will peel the bark from the saplings. If they are again placed upon land the second year, so that they may destroy the sprouts that put out from the stumps, their work will be completed, for the stump and roots then die. As the brushwood and weeds are destroyed and the sunlight thus permitted to reach the soil, the grass, if any variety is indigenous to the locality, will soon be



1. ANGORA GOAT — YOUNG DOE.
2. ANGORA GOAT — BUCK

observed to spring up and thereupon spread rapidly. Where a good variety is not indigenous, a common practice is to sow the seed. This method insures a grass pasture sooner than depending upon the natural grasses and their natural distribution over the cleared area. The goats prefer browsing upon the brushwood to feeding upon the most luscious grasses and clovers and will give the latter very little attention if there is enough of the former to satisfy their hunger. Their presence upon the soil and their indirect assistance in producing the pasture do not make the grass objectionable in any way to horses, cattle or sheep. It should be stated, however, that goats will thrive upon grass and clover if it becomes necessary, and there is no better rough feed for them in winter than clover hay.

The Cashmere goat flourishes in Kashmir, in India, whence it receives its name, and in Tibet. Its color is usually white, and in many other ways it resembles the Angora; but its heavier and outer coat is coarse and not of economic value. Its under coat, called pashm, is very fine and light in weight, and brings very high prices. The amount of pashm produced by each goat annually is between two and three ounces. Most of this fibre is secured by combing the animals when it loosens from the skin, but a considerable amount is picked from the bushes where the animals have rubbed in an effort to remove the sloughing hair. The famous Cashmere shawls, which, a half century and more ago sold at $100 to $2,000, were made of pashm. Dr. Davis brought one Cashmere doe to the United States with his Angora flock in 1849; a buck of this breed died on the voyage. Nine others came in the Brewer importation about 1858. The Cashmeres appeared not to be able to survive the climatic conditions to which they were subjected here, and at this time there is probably not a single specimen in this country. It is not known to the public whether any pashm finds its way to America in the raw state, but it is not likely that it does.

Milch Goats.—No one has attempted to state how many breeds of milch goats there are in the world; one writer says that there are no less than 16 in Switzerland. They are found in their pure state in all European and Asiatic countries and in several of the countries of northern Africa. Specimens of good milking qualities are numerous in South Africa and Australasia, and a very few may be found in the United States. Probably the deepest milker among all breeds is the Nubian, but it is suited to very warm climates only. With reference to their adaptability to our climate and soil, the following are probably of about equal merit: Toggenburg and Saanen of Switzerland, Maltese of Malta, and the Syrian of Palestine. Nearly all of the Swiss breeds are excellent, and also some of those of France and Spain.

In May 1904 there was an importation of 26 Toggenburg and Saanen goats into the United States, and at this time they are thriving well in Massachusetts, New York, New Jersey, and Maryland. So far as any records show, these are the only goats of pure blood that have been received, except four that came in 1893, which did not thrive well: but it is believed that a few kids of Italian goats have been brought here by immigrant families from Italy, and that these have matured and been crossed with the common goats that are usually found in the suburbs of the large cities, thus lending something of their milk characteristics to these latter goats. It is not difficult to find good milkers among these common goats.

A good milch goat should have the same leading characteristics that are possessed by a milch cow. The goat should be level on the back, with slightly dropping hips; the hair, whether long or short, should be kept trimmed close on the udder; the udder should have a shriveled appearance immediately after milking, and the teats should be long and slim.

Milch goats are prolific, seldom having fewer than two kids at a birth, and sometimes four of them. If not restrained they will breed three times in two years.

The quantity of milk that they give varies; a goat that will give two quarts of milk daily for six months is a good milker, but there are many of the best breeds that will yield four quarts a day with a lactation period of six to nine months. Thus it will be seen that, when body weight is considered, the goat is a larger producer of milk than the cow. The milk has a slightly different taste from that of the cow; the strong, acrid taste so often noted by those who have drunk it is due to unclean methods of milking. If the milk is drawn perfectly clean and kept clean, it does not have either taste or smell that is offensive. It is highly regarded in the Old World for its health-giving properties and as a food for children. It is used quite largely in the hospitals in the Swiss and French Alps for tuberculous patients and for those suffering from stomach troubles. The advocates of a milch goat industry in the United States base their arguments principally upon the healthfulness of the milk, although a large use of the goats by the poor in the suburbs of the great cities and in mining districts, it is believed, would prove very economical as well as healthful. Tuberculosis is seldom found in goats, and therefore the germs of the disease, which may be found in the milk of a very large percentage of cows, has never been reported in goat's milk. This fact gives to this milk its highest recommendation.

Kids that are not to be kept for breeding are disposed of for slaughter, and there is a good demand for them among certain classes in the large cities. The flesh is exceedingly delicate, and nothing but the prejudice of people against a matter which they have not tested prevents a larger production and consumption of kids. The kids should be from one to two months old when slaughtered, as after two months the flesh begins to grow tougher and stronger.

Common Goats.—According to the census report of 1900, there are over 1,000,000 common goats — that is, goats of no special line of breeding — in the United States. They can hardly be referred to as an industry, for they have thrived and increased in numbers in spite of neglect. They have been useful in an incidental manner only. A considerable number are used as pets for children, and occasionally a fair milker is found among them. Since the Angoras have demonstrated the ability of the goat to destroy brushwood, the common goats have been brought together in flocks in some localities and there employed also as brush destroyers. The greater number of common goats are simply tolerated.

Goat-skins.—During the fiscal year of 1904 the United States paid to foreign countries $25,962,020 for goat-skins, not including $4,636,213 paid for gloves, a large part of which was for kid gloves. These importations have been increasing in value annually because of the increased use of goat-skin leather in this country. These imports come chiefly from British India, Mexico, Germany, Russia, and Brazil. With this large expenditure for goat-skins, many persons have thought that the goat-skin industry ought to be developed in the United States, since we have here all that is desirable in the way of climatic, soil, and market conditions; but a recent investigation by an authority in the government service shows that the United States can not compete for this business, for the reason that in all of the countries where the skins are produced in large quantities the wages of goatherds is a mere pittance, and the carcass, however poor, is consumed for food. These two features preclude a goat-skin industry in this country. However, in connection with the milch goat industry there will be a considerable number of skins, and the prices paid are large enough to pay for caring for them. Goat-skins are used in the manufacture of shoes, gloves, music rolls, morocco for book bindings, etc. The skin of the Angora goat is used as rugs and robes with the hair intact, and also for children's muffs, capes, and for boas for ladies. The leather, like that from all skins having long hair, is not suitable for shoes or fine gloves, but is used largely for workmen's gloves and morocco.

The government, through the Department of Agriculture, has been lending encouragement to the goat industry in all its phases, and its publications on this subject are sent free to all applicants.

George Fayette Thompson,
Bureau of Animal Industry, Washington, D. C.

Goat-antelope, a term applied to certain small mountain-climbing ruminants, which in structure and habits are intermediate between typical goats and antelopes. Such are the white goat of the Rocky Mountains; the chamois of Europe; and the gorals, serows, etc., of the Himalayan and other Oriental mountain regions. For description see their English names.

Goat-fish, one of the gaudy and edible fishes, allied to the surmullets, of the genus *Upeneus*, which abound in the West Indies and Gulf of Mexico, and take their popular name from a fancied likeness of their bearded profile to a goat's. There are several species. The English sometimes call their filefish (q.v.) by this name.

Goat Island, (1) an island in the Niagara River which separates the Horseshoe and American falls. (2) A large island in San Francisco Bay, where there is a lighthouse and government station.

Goat-louse, a parasite living in the hair of goats. It is a biting louse of the genus *Trichodectes*, and that which infests the Angora goats (*T. limbatus*) is often troublesome. Various species occur in various parts of the world.

Goat-moth, a large European malodorous moth (*Cossus ligniperda*), whose caterpillar, the "auger-worm," feeds upon decayed wood, boring a tunnel at the end of which, after three years of growth, it forms a cocoon of chips gummed together by a secretion, and transforms within it.

Goatsbeard, a small rosaceous plant of American woodlands (*Aruncus aruncus*), closely allied to spiræa, with minute white flowers in dense panicles blooming in June, in rich woods of the Mississippi valley; and also on the northern Pacific coast and in Europe and Asia. The name is also given to a saxifrage (*Astilbe biternata*), and to dandelions of the genus *Adopogon* and some other plants.

Goatsuckers, a family of birds, defined under *Caprimulgidæ*, so erroneously named that the term should be abandoned. See Nightjar; Nighthawk; Whippoorwill, etc.

Gobat, gō-bä', **Samuel**, English missionary: b. Bern, Switzerland, 26 Jan. 1799; d. Jerusalem 12 May 1879. After completing a course in Oriental languages in the Mission House at Basel, he became a missionary, going to Abyssinia in 1826 for the English Church Missionary Society. In 1829 he had reached Gondar, but in 1832, upon the outbreak of war in that part of the country, he returned to England. In 1834 he made another journey to the same country, but owing to illness again had to go home. In 1839 he was sent to Malta, where he translated the Bible into Arabic, and in 1845 was appointed a director of the Protestant College. In 1846 Friedrich Wilhelm IV. of Prussia placed him in charge of the See of Jerusalem, an appointment which he held until his death. It was in the orphan schools and hospitals of Jerusalem, Nazareth, and other cities of Palestine that he did his greatest missionary work. He wrote: 'A Journal of Three Years in Abyssinia' (1847).

Gobelin (gōb-lăn') **Manufactory**, a tapestry manufactory at Paris, established by Colbert in 1667. The Gobelin tapestries excel everything of the kind in Europe. Many celebrated paintings of the Italian, French, and Spanish schools have, in the most marvelous manner, been transferred to tapestry. Among the more celebrated of these may be mentioned the portrait of Louis XIV., by Rigaud (the original of which is in the Louvre); 'The Assumption' of Titian, a large work, 23 feet in height; a head by Nicholas Poussin, copied by Marie Gilbert, etc. The first two of these are to be seen in the Gobelin Gallery. All are characterized by splendor of coloring and delicacy of execution. The establishment is now carried on at the expense of the government.

Gobi, gō'bē, **Desert of**, China, the Shamo, or "sand-sea" of the Chinese, an immense tract of desert country, occupying nearly the centre of the high tableland of eastern Asia, between lat. 35° and 45° N., and lon. 90° and 110° E., and extending over a large portion of Mongolia and Chinese Turkestan. Its length is probably about 1,800 miles; mean breadth, between 350 and 400 miles; area, 300,000 square miles. Its general elevation is over 4,000 feet above sea-level. The East Gobi is occupied by different tribes of the Mongolian race, who have numerous herds of camels, horses, and sheep. In the West Gobi are some nomadic tribes of the Tartar race. This tract is supposed at one time to have been a great inland sea.

Gobin, Hillary Asbury, American educator: b. Terre Haute, Ind., 25 March 1842. In 1862–5 he was in the Union army, was graduated from Indiana Asbury College (the present De Pauw University) in 1870, was admitted a licensed preacher of the Northwest Indiana conference of the Methodist Episcopal Church, and held various pastorates in Indiana. In 1880–6 he was professor of the Greek language and literature at De Pauw, in 1886–90 president of Baker University (Baldwin, Kan.), in 1890 became dean of the theological faculty at De Pauw. He was elected president of De Pauw in 1896. His writings comprise articles and reviews in religious and secular periodicals.

Gobineau, gō-bē-nō', **Joseph Arthur, Count de,** French diplomat and author: b. Bordeaux 1816; d. Paris 17 Oct. 1882. He served in the French diplomatic corps in the various capitals of Europe, at Athens in 1868, at Rio Janeiro, South America, and at Stockholm. Chief among his writings are: 'Troi ans en Asie' (1859); 'Les religiones et les philosophies dans l'Asie centrale' (1865); 'Historie des Perses' (1869), etc.

Goblet, gō-blā', **Albert Joseph,** Belgian soldier and statesman: b. Tournai 1790; d. 1873. He participated in the battle of Waterloo, and after the Revolution became minister of war, remaining in that position until he was made minister of foreign affairs in 1832. In 1837 he was appointed ambassador of Spain, a post he held for two years, and it was then that the title of Count d'Alviella was bestowed upon him by the Queen of Spain. In 1843 he was again appointed minister of foreign affairs and for two years in this capacity, his influence on all public matters was felt to a marked degree. He also planned the fortifications along the frontier of northern Belgium, and extended those already built around Antwerp. He wrote: 'Des cinq grandes puissances de l'Europe dans leurs rapports politiques et militaires avec la Belgique' (1863); 'Dix-huit mois de politique' (1865), etc.

Goblet, D'Alviella, Eugène, COUNT, Belgian archæologist and religious historian: b. 1846. He became professor of the history of religions at the University of Brussels, afterward being elected a Liberal member of the Belgian Chamber of Deputies. In 1892 he was elected to the Senate. After traveling through the Sahara Desert he began his writings, the more important of which are: 'Sahara and Lapland' (1875); 'Inde et Himalaya'; 'The Contemporary Evolution of Religious Thought in England, America, and India' (1885): 'The Migration of Symbols' (1894); and 'Ceque l'Inde doit à la Grèce' (1897).

Goblet, René, rē-nā gō-blā, French statesman: b. Aire-sur-la-Lys, 26 Nov. 1828; d. Paris, 13 Sept. 1905. He practised law at Amiens, and entering in 1871 the National Assembly, identified himself with the left Republican group, and became known as an orator, particularly through his part in the discussion respecting the revision of the pension-list for officials under the empire. In 1882 he became minister of the interior, in 1884 of education, and in 1885 of education and public worship. Prime minister in 1886–7, he was minister of foreign affairs in 1888–9, was elected senator in 1891, and sat in the Chamber of Deputies as a Radical in 1893–6.

Goby, gō'bĭ, any one of the 400 species of fishes belonging to the family *Gobiidæ*. They are small carnivorous animals, occurring chiefly on the bottoms of tropical seas and ponds. Most of the species have the ventral fins united into a sucking disk. Most interesting of the gobies are the mud-skippers (*Periophthalmus*) of the western Pacific, which hop about the shores by aid of their pectoral fins, feeding upon insects and naked mollusks. Many of the gobies make nests for their eggs.

God, the Supreme Being, the First Cause, and as considered nowadays throughout the civilized world, a spiritual being, self-existent, eternal and absolutely free and all-powerful, distinct from the matter which he has created in many forms, and which he conserves and controls.

There does not seem to have been a period of history where mankind was without belief in a supernatural author and governor of the universe. The most savage nations have some rudimentary ideas of God. Man is a religious as well as a rational animal. The instinct of belief in God is asserted by philosophical theists to be reconcilable with reason, although no competent apologist now stakes the existence of God on any one argument, or exhibits the proof as a series of syllogisms. It is rather maintained that the study of human history, of human nature especially on its moral and spiritual side, and of the world as far as science reveals it to us make for the existence of a God, demand such a postulate as the key to the universe, and render the belief in a personal God greatly more probable than any other thesis — a subject vastly too wide for discussion here. But it is necessary to name what are often referred to as the four great arguments for the existence of God.

(1) The *ontological* argument first formulated by St. Anselm proceeds from the notion of a most perfect being to infer his existence; without actual existence the idea would fall short of perfection. The argument was re-stated in a different shape by Descartes (q.v.) and by Samuel Clarke, and, though very contemptuously treated by Kant, is still an element of the argument that without a God the world is a chaos.

(2) The *cosmological* argument, employed by Aristotle, Aquinas, and a host of Christian authors, is an application of the principle of Causality (q.v.). We cannot conceive an infinite regression of finite causes; therefore beyond the last or first of the finite causes is the Infinite. From motion the argument is to a mover.

(3) The *teleological* argument, or argument from design, proceeds from the order and arrangement of the universe, the reign of law and beauty and adaptation, to the intelligent and supreme fountain of order. This is the most familiar of the arguments, especially on the lines laid down by Paley.

(4) The *moral* argument was that relied on by Kant (q.v.) when he destructively criticised the other three, and forms a part of most modern theistic arguments. God is a postulate of our

moral nature: and the moral law in us implies a lawgiver without us.

Consult: Flint, 'Theism' (1877); Harris, 'The Philosophical Basis of Theism' (1883); 'The Grounds of Theistic and Christian Belief' (1883); the Duke of Argyll, 'The Reign of Law' (1800); Kant's 'Critique of Pure Reason'; Mill's 'Three Essays'; Janet's 'Final Causes' (trans. 1878); Gifford Lectures (1888); Ronayne, 'God, Knowable and Known' (1898); Driscoll, 'Christian Philosophy — God' (1902).

God, Name of, in Different Languages, may be seen from the following list: Elohim, Hebrew; Gott, Swiss and German; Eilah, Chaldaic; Goed, Flemish; Eleah, Assyrian; Godt, Dutch; Alah, Turkish and Syriac; Alla, Malay; Goth, Teutonic; Allah, Arabic; Gude, Danish and Swedish; Teut, old Egyptian; Teun, new Egyptian; Gude, Norwegian; Teuti, Armarian; Bogo, Polish; Theos, Greek; Bung, Pollacca; Jubinat, Lapp; Sire, Persian; Magatal, Tartar; Deus, Latin; Diex, Latin, low; Diu, Gallic; Dieu, French; Dios, Spanish; Deos, Portuguese; Diet, old German; Diou, Provençal; Doue, low Breton; Dio, Italian; Dia, Irish; Deu, Olala tongue; Thios, Cretan; Jumala, Finch; As, Runic; Fetiyo, Zemblian; Istu, Pannonian; Rain, Hindostanee; Brama, Coromandel; Prussa, Chinese; Goezur, Japanese; Zannah, Madagascar; Puchecammac, Peruvian.

God Save the King (or **Queen**), the burden and common title of the English national anthem. Concerning the author and the composer opinions differ. It has been asserted that Henry Carey, who lived about the middle of the 18th century, was both; but, being ignorant of the rules of composition, employed Dr. Thornton, of Bath, or, according to some, Christopher Smith, Handel's clerk, to correct his rough draught, and add the bass. This story gave rise to the assertion that Handel was the composer. It appears to have been first published, together with the air, in the 'Gentleman's Magazine' in 1745, when the landing of the young Stuart called forth expressions of loyalty from the adherents of the reigning family. After Dr. Arne, the composer of "Rule Britannia," had brought it on the stage, it became very popular. According to a notice in the 'New Monthly Magazine,' Vol. IV. page 389, there is a copy of this national song, published without date by Riley and Williams, in which Antony Young, organist in London, is called the author of the air. There is also a story that this national song, as Burney, the author of the 'History of Music,' maintained, was not made for King George; but that, in the older versions, it ran thus, "God save great James our king"; and Burney adds, that it was originally written and set to music for the chapel of James II., but that no one dared own or sing it after the abdication of James, so that the song lay dormant 60 years before it was revived for George II. Another account ascribes the air to John Bull, who was organist to the chapel of Queen Elizabeth in the last years of her reign.

Godavari, gō-dä'va-rē, a large river in India. Its source is in the Western Ghauts, about 70 miles northeast of Bombay, and flows southeast into the Bay of Bengal. About 50 miles from the sea the river divides into two channels, the most northern of which flows into Coringa Bay. In the rainy season these branches are navigable, but only for small craft. Before the river divides there are three great obstacles to navigation, caused by three rocky barriers. Between 1861 and 1871 large sums of money were expended by the government on an attempt to open up the navigation of the river by canals going round these barriers, but finally the project was abandoned as involving too great an expenditure.

God'dard, Calvin Luther, American inventor: b. Covington, N. J., 22 Jan. 1820. He was graduated from Yale in 1845 and subsequently devoted his attention to the invention of labor-saving contrivances employed in the wool industry. Among his various inventions of this character may be cited feed rolls for carding machines, a burring picker for the purpose of cleansing wool, and solid packing burring machines.

Goderich, gŏd'rĭch, Canada, capital of Huron County, Ontario, port of entry, on Lake Huron at the mouth of the Maitland River, and the terminus of a branch of the Grand Trunk Railway; 119 miles west-northwest of Hamilton, 125 miles west of Toronto. It has a good harbor, steamship lines to various ports, and its people trade largely in fish, salt, and lumber. It is in a good farming district, lumbering and boat-building are important industries, its fisheries are extensive, and large salt-wells make salt refining its chief industry. There are also manufactories of foundry products, machinery, woolens, leather, boots and shoes, wooden ware, etc.; flour and saw mills; and large grain elevators. Pop. (1901) 4,158.

Godet, Frédéric, frā-dē-rĕk gō-dā, Swiss theologian: b. Neuchâtel, Switzerland, 25 Oct. 1812; d. 1900. After having been tutor to the crown prince of Prussia, he became in 1850 professor of theology at Neuchâtel. In 1873 he left the state Church and was appointed professor by the Free Church of Neuchâtel. He is best known for his great commentary on St. John's Gospel (1863–5; Eng. trans. 1877), followed by commentaries on Luke (trans. 1875), Romans (trans. 1881), and Corinthians, besides 'Conférences Apologétiques'; 'Etudes Bibliques' (trans. as 'Old Testament Studies and New Testament Studies' (1875–6); 'Introduction to Paul's Epistles' (1893).

Go'dey, Louis Antoine, American publisher: b. New York 6 June 1804; d. Philadelphia 29 Nov. 1878. He founded the periodical, 'Godey's Lady's Book,' the first of the kind in the United States, at Philadelphia, in 1830, and continued its editor and proprietor until its sale to a stock company in 1877. His other publications included 'Jarvis' Musical Library,' and the *Daily Chronicle*.

Godfather and Godmother (also, in infant baptism, called sponsors), the persons who, by presenting a child for the sacrament of baptism, and taking upon themselves the vows of faith and obedience, as proxies for the child, and in the name of the child, are reputed to contract toward the newly baptized the relation of spiritual parentage. In the Roman Catholic Church this spiritual relationship is regarded as a species of kindred (whence the name *gossip* or *God-sib*, "spiritually akin"), and constitutes an impediment of marriage between the sponsors upon the one hand and the baptized and the parents of the baptized on the other. Anciently, this impediment arose between the sponsors themselves; and it still extends much further in the Eastern than in the Western Church, although in the former it can arise only from baptism, whereas in the Roman Church the candidate for confirmation also is presented by a sponsor, though usually one of the same sex.

In the Church of England, by whose rule two godfathers and a godmother are required at the baptism of a male, and two godmothers and a godfather at that of a female, no impediment of marriage arises from the relation of the sponsors to the baptized. The parents of the baptized are not permitted to act as sponsors in the Roman Catholic Church, one of the objects of the institution being to provide instructors in case of the death of parents; but the rubric of the American Prayer-book does so allow.

The institution of sponsors was very ancient, and Tertullian (192 A.D.) speaks of the promises made by sponsors in baptism. In the early Church no more than one sponsor was required, a man for a man and a woman for a woman. In adult baptism, the godfathers and godmothers are not sponsors, but only "chosen witnesses," as the person to be baptized takes the vows himself and in his own name.

Godfrey, Elizabeth. See BEDFORD, JESSIE.

God'frey, Thomas, American poet: b. Philadelphia, Pa., 4 Dec. 1736; d. near Wilmington, N. C., 3 Aug. 1763. He is remembered as being the author of 'The Prince of Parthia' (1759), a tragedy, considered to be the first drama published in the United States. In 1763 appeared 'The Court of Fancy; a Poem,' and in 1767 his poems were collected in a volume by his friend, Nathaniel Evans.

Godfrey, Thomas, American mathematician and mechanician: b. Philadelphia 1704; d. December 1749. He was a glazier in his native city; but accidentally meeting with a mathematical treatise, was delighted with the study, mastered all the books on the subject that he could obtain, and instructed himself in Latin in order to read mathematical works in that language. He borrowed a copy of Newton's 'Principia' from James Logan, secretary of the commonwealth, and in 1730 communicated to him an improvement that he had made in the quadrant. In 1732 Logan gave an account of the invention to Dr. Edmund Halley, of England, in a letter. No answer was received after an interval of a year and a half, and then the invention of Godfrey was laid before the Royal Society by the botanist Peter Collinson. Meantime, in 1731, Halley had presented a paper containing a full description of an improvement of the quadrant similar to that of Godfrey. The rival claims were investigated by the Royal Society, and it was decided that they were both entitled to the honor of the invention, and a reward of £200 was bestowed on Godfrey. Franklin observed of Godfrey that, like most great mathematicians whom he had met, he was not a pleasant companion, since he expected universal precision in everything said, and was perpetually denying or distinguishing on trifles, to the disturbance of all conversation.

Godfrey of Bouillon, boo-yôn, king of Jerusalem: b. Baisy, in the Walloon Brabant, near Nivelles, 1061; d. Jerusalem 15 July 1100. In 1076 he succeeded his uncle in the duchy of Bouillon. He distinguished himself by his heroic courage at the siege of Rome, and the fame of his exploits procured him, in 1095, the command of one of the armies of the first crusade. In 1096 Godfrey, with his brothers Baldwin and Eustace, commenced his march to Constantinople, the meeting-place of the crusading armies. So great had been the difficulties of the way that it was only a short time before Christmas when he reached Constantinople. Here new delays occurred. The Emperor Alexius Comnenus would not consent to allow the crusaders to cross into Asia Minor until the leaders had sworn to give up to him all the lands which they should conquer which had previously belonged to the Roman empire, and to remain his faithful vassals for all time coming. This Godfrey at first indignantly refused to do, but after a long course of hostilities finally yielded to the demands of Alexius. On 1 May 1097 they crossed the Bosporus, and before the end of the year the crusaders encamped before Antioch. The town fell into their hands on 3 June 1098, but the citadel held out much longer. In the following year (15 July 1099) Godfrey took Jerusalem itself, after a five weeks' siege. The infidels were indiscriminately massacred, notwithstanding the endeavors of Godfrey to put a stop to the slaughter. Eight days after the capture of Jerusalem the leaders of the army elected him king of the city and the territory; but Godfrey declined the kingly title, contenting himself with that of duke and guardian of the holy sepulchre. The sultan of Egypt now raised an army of 400,000 men for the purpose of expelling the crusaders, but Godfrey gave him battle in the plain of Ascalon, on which occasion 100,000 men were left dead upon the field. This victory placed him in possession of nearly all the Holy Land. Godfrey now turned his attention to the organization of his newly established government, dying just a year after the capture of Jerusalem. He was buried in the Church of the Holy Sepulchre.

Godfrey of Strasburg. See GOTTFRIED OF STRASBURG.

Godhaven, gŏd'hävn, or **Lieuely,** Greenland, on Disco Island. It is the capital of the Danish Northern Inspectorate. Pop. 220.

Godiva, gō-dī'va, a legendary English heroine. She was the wife of Leofric, Earl of Mercia and Lord of Coventry in the reign of Edward the Confessor. The inhabitants of Coventry having on one occasion offended their master, he punished them by inflicting so heavy a fine that they were unable to pay it. In their distress they appealed to Lady Godiva to intercede for them, saying that if they paid the fine they must starve. Godiva, sympathizing with the people, went to her lord to plead that, for her sake, the tax might be remitted. Leofric, when she persisted in her entreaties, at last said half jocularly and half contemptuously, that he would grant her request if she would ride naked through the town of Coventry. Having first received permission from her lord to fulfil the condition imposed Godiva caused it to be made known on what terms the earl had agreed to relieve the people from the tax, and then proclaimed that on a certain day no one should leave his house before noon, that all windows and other apertures in the houses should be closed, and that no one should even look out until noon was past. She then mounted naked on her palfrey, rode through the town, and returned; and Leofric, in fulfilment of his promise, and in admiration of his wife's heroism, freed the inhabitants from the burdens he had imposed on them. Only one person, the story says, attempted to look out, and he was immediately struck blind. A mediæval pageant celebrating Godiva's ride was a feature of Coventry fair for several centuries, and an attempt was made to revive the pageant as late as 1883. See Tennyson, 'Godiva.'

God'kin, Edwin Lawrence, American journalist and essayist: b. Moyne, Ireland, 2 Oct. 1831; d. England 20 May 1901. He was graduated from Queen's College and subsequently was correspondent during the Crimean war for the London *Daily News* (1854–6). He came to the United States as correspondent of that journal and after some time spent in travel was admitted to the New York bar in 1858. During the Civil War period he corresponded both for the *Daily News* and the New York *Times,* and in 1865 established 'The Nation,' which was merged with the New York *Evening Post* in 1882. He continued to edit both papers from that date until shortly before his death. He published a 'History of Hungary' (1856); 'The Problems of Modern Democracy'; 'Reflections and Comments'; 'Unforeseen Tendencies of Democracy' (1898). He was an able, forceful writer who often strenuously opposed dominant political tendencies or principles, but whose entire conscientiousness was never disputed. Under his management the *Post* and the 'Nation' acquired a great influence over the more thoughtful members of the community.

Godless Month, the 10th month of the year with the Japanese, so called by them because then the lesser divinities were considered to be absent from their temples for the purpose of paying the annual respects to the celestial Dairi, a word which, in Japanese means "the Great Interior," that is, of the imperial palace, and in a general sense the person of the Mikado, whose title, "King of Heaven" or "Son of Heaven," implies his divine right to such homage.

God'man, John D., American naturalist and medical writer: b. Annapolis, Md., 1794; d. Germantown, Pa., 17 April 1830. In 1813 he entered as a sailor in the flotilla then stationed in Chesapeake Bay, but in 1815 left the service, and commenced the study of medicine. After lecturing for some time at Baltimore in the room of the professor of anatomy in the University of Maryland, and holding a chair of anatomy for a short time at Cincinnati, he settled in Philadelphia as a physician and private teacher of anatomy. His chief work is his 'American Natural History' (1828). He also wrote: 'Anatomical Investigations'; 'Account of some Irregularities of Structure and Morbid Anatomy'; 'Rambles of a Naturalist'; etc.

Godmother. See GODFATHER.

Godol'phin, Sidney, 1ST EARL OF, English statesman: b. near Helston, Cornwall, June 1645; d. Saint Albans 15 Sept. 1715. He was an opponent of James, Duke of York, and a supporter of Shaftesbury during the exclusion agitation, but nevertheless continued in office after the accession of James II. On the flight of that monarch, Godolphin voted for a regency, yet was, after the settlement of the crown on William and Mary, made first commissioner of the treasury. During the reign of Anne he was appointed lord high-treasurer of England, and did much to improve the public credit, and check corruption in the administration of the public funds. In 1706 he was made Earl of Godolphin, and four years afterward was obliged to retire from office.

Go'don, Sylvanus William, American naval officer: b. Philadelphia 18 June 1809; d. Blois, France, 10 May 1879. Appointed midshipman in 1819, he was active in the Mexican war, and in the Civil War, in command of the Mohican, with rank of captain, took part in Du Pont's attack on Port Royal (1861). In 1863 he was promoted commodore and in 1864–5 commanded the fourth division of Porter's fleet in the attacks on Fort Fisher. Having commanded the South Atlantic squadron in 1866–7 and the Brooklyn navy-yard in 1868–70, he was retired in 1871 with rank of rear-admiral.

Godowski, gō-dŏv'skē, **Leopold,** Polish-American pianist: b. Vilna, Russian Poland, 13 Feb. 1870. A pupil of the Hochschule of Berlin and afterward of Saint-Saens, he made concert tours in the United States in 1884–5 and 1890–1. In 1895–1900 he was director of the pianoforte department of the Chicago Conservatory, to which post he was again appointed in 1902. His compositions include concert arrangements of well-known works, concert studies, pianoforte works, and songs.

Godoy, José Francesco, hō-sā' frän-thēs'-kō gō-doi', Mexican diplomat: b. Tampico, Mexico, 9 Aug. 1851. He studied law, was admitted to the bar in California, and practised in California and Mexico. He was also active as a journalist, represented Mexico at the San Antonio International Fair (1889–90) and other gatherings of importance, was Mexican *chargé d'affaires* in the Central American republics (1893–6), and became first secretary of the Mexican embassy to the United States in 1896. He wrote various works in English and Spanish.

Godoy, Manuel, DUKE OF ALCUDIA, Spanish noble: better known as the Prince of Peace: b. Badajoz 12 May 1767; d. Paris 4 Oct. 1851. He entered the Guards in 1787, and was admitted to the presence of the queen, whom he at once captivated by his handsome person and pleasing manners. The imbecile king, Charles IV., was as much pleased with him as his spouse, and he was thus established as a favorite. In 1795, as a reward for the part he had taken in concluding peace with France, he was presented with a large landed estate, and made a knight of the Golden Fleece. It was on this occasion also that he was named by the king Prince of Peace. Other honors and largesses continued to shower upon him, till at last the whole power of the Spanish monarchy was concentrated in his hands. As he used it in the promotion of French rather than Spanish interests, he became extremely unpopular, and an outbreak took place in 1808. He in consequence sought an asylum in France, where he employed the influence which he still possessed over the Spanish king to induce him to abdicate in May 1808. Notwithstanding the enormous wealth which he had at one time accumulated, he lived a long time in Paris in poverty, maintained chiefly by a small pension from Louis Philippe. He was the author of a work published in a French translation made under his supervision (1836-8) under the title of 'Mémoires du Prince de la Paix, Don Manuel Godoy, duc de l'Alcudia.'

God's Truce, a mutual agreement between territorial nobles confirmed and sanctioned by the Church by which war and violence were to be abstained from for a certain period. In the 9th and 10th centuries the empire of Charlemagne had become broken up into small territories, dukedoms, baronies, counties. The right of private war was a settled principle of the times, and dissensions were frequent and bitter. The peasantry and farmers, especially, were sufferers from the ravages of this petty warfare. Even the monasteries, cathedral colleges and seats of learning were not left in peace and everything threatened anarchy and dissolution. It was at this point that the Church stepped in, as the minister of justice and the guardian of moral order. Stern ecclesiastical penalties were fulminated against all who in the reckless feudal warfare should disturb the peace of churches, priests, and tillers of the soil. The Truce of God was instituted and by its provisions no fighting men should go forth to war on certain days. The little border province of Roussilon was the place where this truce was first agreed upon in the year 1027. Fourteen years later the movement had spread over the whole of France, and later it extended to Germany, Italy, Spain, and England. The Truce of God in 1041 provided that peace was to last from Wednesday evening to Monday morning of each week; there was to be no war during Advent and Lent nor on certain specified holy days; the punishments for contumacy and disobedience were money fines, banishment for a long term of years, and excommunication; protection was specially extended to all women, pilgrims, priests, travelers, merchants, and agriculturists, and also to the farm implements and live stock of the peasantry. The Peace of God was confirmed by several councils of the Church, more especially by that of Clermont (1095), when Urban II. proclaimed its universal extension throughout Christendom.

Godthaab, göt'häb (Danish, "Good Hope"), Greenland, seaport, on the west coast, capital of the Danish Southern Inspectorate. It is the oldest town in Greenland, and was founded in 1721 by Hans Egede, a Norwegian missionary. Pop. 950.

Godunoff, Boris Feodorovitch, Russian czar: b. 1552; d. 13 April 1605. He was the chief member of the regency during the reign of the imbecile Feodor Ivanovitch (1584-98) who had married Godunoff's sister Irene. He was accused of having caused the death of the czarevitch Demetrius in 1591, but in 1598, upon the death of Feodor, was elected to the throne. In 1591 he had defeated the Khan of the Crimean Tartars and in 1589 was largely instrumental in effecting the separation of the Russian Church from the Patriarchate of Constantinople. His policy was in the main progressive, but much popular discontent, especially in Southern Russia, was caused by the favors shown by him to foreigners and by his introduction of numerous innovations and reforms.

God'win, or Godwine, Earl of the West Saxons, an Anglo-Saxon noble: b. about 990; d. 15 April 1053. Godwin became the leading Englishman in the first half of the 11th century, and was father of the last king of the English native stock. He ingratiated himself with Ulf, brother-in-law of King Canute, the latter gave him his daughter in marriage, and he soon became one of the most powerful of the English nobles. He was the most powerful factor in procuring the English throne for Edward the Confessor and from that time headed the national party in opposition to the Norman court favorites. He was enormously wealthy and Earl of Wessex; his son Harold (afterward king) was Earl of East Anglia; his son Swegen was Earl of Hereford, Gloucester, and Oxford; his wife's nephew, Beorn, was Earl of Hertfordshire and Buckinghamshire; and for the service he had rendered to the king Edward had married his daughter Editha. This union, however, was not happy. Editha was cruelly neglected by Edward, and her father, by his dislike of the Normans, incurred the royal enmity. A quarrel afterward arose between the king and Godwin, occasioned by the partiality of the former for Norman favorites, and Godwin in consequence headed a rebellion, but was compelled to submit and with his family quit the kingdom. His estates were confiscated and then given to favorites. Queen Editha was made to feel even more bitterly the misfortunes of her family. Her husband seized her dower; he took from her her jewels and her money; and allowing her only the attendance of one maiden, he closely confined her in the monastery of Wherwell, of which one of his sisters was lady-abbess. In September 1052, however, Godwin returned with an army, forced Edward to enter into negotiations with him, re-established himself triumphantly in his old supremacy and caused the expulsion from the kingdom of most of the Norman intruders.

Godwin, Francis, English bishop and author: b. Havington, Northamptonshire, 1561; d. 1633. He was graduated from Christ Church, Oxford, in 1580; took orders, and became successively rector of Sampford-Orcais in Somersetshire, vicar of Weston-in-Zoyland, and subdean of Exeter in 1587. In 1601 appeared his 'Catalogue of the Bishops of England since the First Planting of the Christian Religion in this Island,' a work which procured him the bishopric of Llandaff from Elizabeth. Revised editions of this work appeared in 1615 and in 1616 with a dedication to King James I, who in 1617 transferred him to the bishopric of Hereford. Godwin also wrote: 'Rerum Anglicarum, Henrico VIII, Edwardo VI, et Maria regnantibus, Annales' (1616, later published as the 'Annales of England'); 'Nuncius Inanimatus in Utopia' (1629); 'Computation of the value of the Roman Sesterce and Attic Talent' (1630); and 'The Man in the Moon, or a Discourse of a Voyage Thither, by Domingo Gonsales' (1638).

Godwin, Mrs. Mary Wollstonecraft, English writer, wife of William Godwin (q.v.): b. (place uncertain) 27 April 1759; d. London to Sept. 1797. Her father was Edward John Wollstonecraft, son of a wealthy manufacturer of Spitalfields, London. Her mother was Elizabeth Dixon, an Irish woman. The brutality of her father made Miss Wollstonecraft's home life almost unbearable; and when their mother died in 1780, she and her two sisters left their father's house. One of these sisters married a Mr. Bishop. He proved not less brutal than her father, drove her into hiding, and forced her, in 1783, to obtain a legal separation. The misfortunes of Mrs. Bishop, however, provided Miss Wollstonecraft with material for her posthumous unfinished novel 'The Wrongs of Women.' From 1783 to 1785 Miss Wollstonecraft conducted with this sister a school at Newington Green. From this work, she went to Lisbon to nurse a friend, Fanny Blood, with whom she had lived from 1780 to 1783, and who had since married a merchant, Hugh Skeys. The death of this friend, from childbirth, 29 November 1785, suggested to Miss Wollstonecraft a pamphlet entitled 'Thoughts on the Education of Daughters.' This pamphlet was accepted by Johnson the publisher, and so opened the way for a remunerative business connection.

In 1788, after an unpleasant year as governess in the family of Lord Kingsborough, Miss Wollstonecraft removed to London and found employment with Johnson. In the five years that followed, she worked for him as reader and translator, published the first and only volume of her 'Vindication of the Rights of Women' (1792), and made the acquaintance of many literary people, among whom was the man she afterward married, William Godwin.

Her interest in the principles of the French revolution led her in 1792 to Paris. There she met Gilbert Imlay, a former captain in the American revolution. Without the formality of a marriage, which both professed to disapprove, they lived as man and wife; and to them, at Havre, 14 May 1794, was born a daughter. Next year Miss Wollstonecraft followed Imlay to England. He sent her to Norway on business connected with his commercial speculations, and took the opportunity to carry on an intrigue with another woman. Returning, she first attempted suicide by drowning; then, reconciliation with Imlay. Finally, in March 1796, she agreed to a separation.

Her resumption of literary work brought her again in contact with William Godwin. Despite her experience with Imlay, she, like Godwin, still objected to a legal marriage. At length, however, both set aside their scruples; and on 29 March 1797, they were married. Mary, the future Mrs. Shelley, was born August 30. The mother, however, died of a fever a few days after—10 Sept. 1797. In her memory, her husband published, the following year, 'Memoirs of the Author of a Vindication of the Rights of Women.'

Her works include: 'Thoughts on the Education of Daughters' (1787); 'Vindication of the Rights of Men' (1790); 'Vindication of the Rights of Women' (1792); 'Historical and Moral View of the French Revolution' (1794); 'Letters written in Norway, Sweden, and Denmark' (1796); 'Posthumous Works' (1798).

Bibliography.—William Godwin, 'Memoirs' (1798); 'A Defense of the Character and Conduct of the late Mary Wollstonecraft Godwin,' anon. (1803); C. Kegan Paul, 'William Godwin, His Friends and Contemporaries' (1876), and 'Mary Wollstonecraft, with Prefatory Memoir' (1879).

ARTHUR H. NASON,
Instructor in English, New York University.

Godwin, Parke, American journalist: b. Paterson, N. J., 25 Feb. 1816; d. New York 7 Jan. 1904. He graduated at Princeton College in 1834, and having studied law in his native town was admitted to practice at the bar in Kentucky, but did not pursue the profession. From 1837 to the close of 1853, with the exception of one year, he was the coadjutor of his father-in-law, William Cullen Bryant (q.v.), in the editorial management of the New York *Evening Post.* In 1843, he issued for a time the 'Pathfinder,' a weekly periodical of a literary and political character. While connected with the *Evening Post* he contributed frequently to the 'Democratic Review,' and he also edited 'Putnam's Magazine' for a time. His acquaintance with German literature was exemplified by his translation of Zschokke's tales and of the first part of Goethe's autobiography. Other works of his are: 'A Popular View of the Doctrines of Charles Fourier' (1884); 'Constructive Democracy' (1844); 'Vala, a Mythological Tale' (1851); 'Handbook of Universal Biography' (1851); 'Political Essays' (1856); 'History of France' 1st vol. (1861); 'Cyclopædia of Biography' (1865); 'Out of the Past' (1870); 'A New Study of Shakespeare's Sonnets' (1900). He has also edited 'The Life and Works of William Cullen Bryant' (1884).

Godwin, William, English writer and political philosopher: b. Wisbeach, Cambridgeshire, England, 3 March 1756; d. London 7 April 1836. He attended various schools, and in 1771 became an usher in that of Robert Akers at Hindolveston. The next year his father, John Godwin, a dissenting minister, died; and in 1773 William removed with his mother to London where he entered Hoxton Academy. Four years later he began preaching; and between 1777 and 1783 he was minister at Ware in Hertfordshire, at Stowmarket in Suffolk, and, for a brief trial, at Beaconsfield.

Unsuccessful as a minister, he turned in 1783 to literary work. In the ten years that followed he supported himself—not over-successfully—by hack work, made many friends, especially among the Whig politicians and the sympathizers with the French Revolution, and formulated those radical opinions which he embodied in his 'Political Justice,' 1793. He had for some years been satisfied, he says in his Preface, "that monarchy was a species of government essentially corrupt." He owed this conviction to the political writings of Swift and to a perusal of the Latin historians. Nearly at the same time he derived much additional stimulus from several French productions on the nature of man . . . the 'Système de la Nature,' the works of Rousseau, and those of Helvetius. The work, he says, "was projected in the month of May, 1791: the composition was begun in the following September, and . . . occupied a space of 16 months." The book appeared in February 1793, when England was at a white heat over the execution of Louis XVI. and the French declaration of war against England and Holland. Godwin feared, not without cause, that he would be prosecuted for such a publication; but the government seems to have judged that a book costing three guineas would prove harmless. The book met immediate success, running through three editions within five years; but its author, repenting the radicalism of the first edition, made the second and third editions increasingly moderate. Godwin's political philosophy attracted wide attention; and although he never again attempted so large a subject as in his 'Political Justice,' yet he continued to have a following especially among young men. Of these, a few years later, Shelley is a notable instance.

Godwin's first and ablest novel, 'Caleb Williams,' appeared one year after 'Political Justice' (1794). The story, although since ridiculed by DeQuincey, enjoyed high success at the time. 'St. Leon, a Tale of the 16th Century' (1799), was also successful. Meanwhile, in 1796, Godwin had become intimate with Mary Wollstonecraft, then known as Mrs. Imlay. Both held that a legal marriage was undesirable; but, lacking the courage of their conviction, they were married 29 March 1797. Mrs. Godwin died September 10th after giving birth to a daughter, the future Mrs. Shelley. Four years later, having been rejected by at least two other women, Godwin married a Mrs. Clairmont. The union brought unhappiness and financial difficulties. In 1805, his wife undertook a publishing business. Under the name of Baldwin, he wrote children's books for her; and the Lambs gave them their 'Tales from Shakespeare.' By 1807, increasing business warranted a removal to a larger shop in Skinner street, Holborn. Godwin's circle of acquaintances included Coleridge, the Lambs, and Wordsworth. In 1811, the young Shelley was added. When, however, in 1813, Shelley put some of Godwin's moral theories into practice by eloping with Mary Godwin, the philosopher was enraged. A check for £1000 silenced him. When Shelley and Mary were married, three years later, Godwin was openly reconciled. He had need of the financial countenance of so wealthy a son-in-law. The publishing business was becoming less remunerative. In 1822, Godwin became bankrupt. Literary and political friends tried to aid him, but succeeded only in part. In 1833 they secured him the position of yeoman usher of the exchequer—an office without duties. He died 7 April 1836. Nine years later, DeQuincey wrote of him: "Godwin's name seems sinking out of remembrance; and he is remembered less by the novels that succeeded, or by the philosophy that he abjured, than as the man that had Mary Wollstonecraft for his wife, Mrs. Shelley for his daughter, and the immortal Shelley as his son-in-law."

His works include: 'Enquiry Concerning Political Justice and its Influence on Morals and Happiness' (1793); 'Things as they are; or the Adventures of Caleb Williams' (1794); 'The Enquirer . . . a series of Essays' (1797); 'Memoirs of the Author of a Vindication of the Rights of Women' (1798); 'St. Leon, a Tale of the 16th Century' (1799); 'Antonio, a Tragedy in Five Acts in Verse' (1800); 'Life of Geoffrey Chaucer' (1803); 'Lives of Edward and John Philips' (1815); 'Mandeville, a Tale of the 17th Century' (1817); 'Of Population . . . in answer to Mr. Malthus' (1820); 'History of the Commonwealth . . . to the Restoration of Charles II.' (4 vols. 1824–8).

Bibliography.— C. Kegan Paul's 'William Godwin, his Friends and Contemporaries' (2 vols. 1876).

Arthur H. Nason,
Instructor in English, New York University.

Godwin-Austen, a mountain peak said to be among the highest in the world; in the Mustagh range of the Himalayan system. Its height is 28,250 feet. Distinguished in the records of the great trigonometrical survey only by the sign K2, it was named in 1888 after Lieut.-Col. Godwin-Austen of the Trigonometrical Survey of India.

Godwin-Austen, Henry Haversham, English topographer and geologist: b. Teignmouth, 6 July 1834. He is the son of R. A. C. Godwin-Austen, the distinguished geologist; was educated at the Royal Military College, Sandhurst; joined the 24th Regiment of Foot in 1851; in 1852 went with his regiment to India and served with distinction in the Second Burmese War and Punjab. He then became topographical assistant in the Trigonometrical Survey of India, and in 1857 joined the Kashmir Survey party. While connected with this he surveyed a large part of Kashmir and Baltistan and discovered the enormous glaciers at the head of the Shigar River and Hunza Nagar frontier including the important Baltoro glacier. In 1862 he surveyed the Rupshu and Zaskar districts in Ladakh during July and August of that year making 13 ascents of mountain peaks, the highest of which was Mata, 20,607 feet. He then surveyed the Pang Kong Lake district nearly to Rudok in Chinese territory but was stopped in 1863 by the Lhassan governor; during the winter of 1862–3 was on special duty, with the last mission to Bhutan and mapped out the country between Darjeeling and Bunakha. In 1874 he served with the Bhutan Field Force and was present at the capture of Dalmgkote and Chamurchi forts; took part in the expedition against the Dafia tribe in the Eastern Himalayas; and in 1877 was retired from the army with the rank of lieutenant-colonel. In 1883 he was president of Section E (Geography) British Association, and from 1897–9 was president of the Malacological Society. Besides numerous scientific papers on geology and physical features he has written: 'On the Land and Freshwater Mollusca of India' (1882–99), in nine parts.

God'wits, a group of wading-birds allied to the sandpipers but with longer legs and bill, and distinguished from curlews by the straight not decurved bill. They constitute the genus *Limosa*, of which five species are known. All of them are summer residents of the northern part of the northern hemisphere, but on their migrations reach northern Africa and South America, while one species extends its flight to New Zealand. Our most common American species are the marbled godwit (*L. fedoa*) and the Hudsonian godwit (*L. hæmastica*), both known to gunners as "marlin." They are not nearly so common as are many other shore-birds on the Atlantic coast. In England two other species occur,— the black-tailed godwit (*L. limosa*) and the bar-tailed godwit (*L. lapponica*).

Goepp, Philip Henry, American musician: b. New York 23 June 1864. He was graduated from Harvard in 1884, and was admitted to the bar in Philadelphia in 1888, but turned his attention exclusively to music in 1891, and became active as organist, composer, and instructor. He has published anthems, songs, and part-songs, written some instrumental works yet in MS., and is the author of 'Annals of Music in Philadelphia' (1896); and 'Symphonies and Their Meaning' (1898).

Goes, goiz, **Pero de**, Portuguese colonist: b. Lisbon 1503; d. 1554. He was the leader of De Sousa's Brazilian expedition of 1530, and in 1532 began the successful cultivation of sugar-cane on a plantation not far from the coast of Brazil. Appointed by the king lieutenant to the governor-general, Sousa, he was of great service in the suppression of Indian depredations. It is stated that he carried to Europe (1547) the first specimens of the tobacco-plant seen there.

Goessman, gĕs'man, **Charles Anthony**, American chemist: b. Naumburg, Hesse-Cassel, Germany, 13 June 1827. He was educated at Göttingen, where he was assistant in the chemical laboratory in 1855–7; came to the United States in 1857; in 1857–69 held positions in commercial companies, and in 1866–8 was professor of chemistry in the Rensselaer Polytechnic Institute (Troy, N. Y.). In 1869 he became professor of chemistry in the Massachusetts Agricultural State College, Amherst, Mass., in 1882–94 was director of the State agricultural experiment station there. In 1886–7 he was president of the American Chemical Society. His papers on salt and the chemistry of natural brines, sugar and sugar manufacture, and his experiment station reports, are of particular value.

Goethe, Johann Wolfgang, yō'hän vŏlf'gäng gė'tė, German poet and critic: b. Frankfort-on-the-Main 28 Aug. 1749; d. Weimar 22 March 1832. He attended the University of Leipsic 1765–8 and in 1770 went to Strasburg where he met Herder and familiarized himself with Shakespeare, and in 1771 took his degree. After publishing two dramas anonymously, 'Götz von Berlichingen' in 1773 announced the dawn of a new era in German letters, and in 1774 'The Sorrows of Werther' made him world-famous. In 1775 he accepted the invitation of Duke Carl August and went to Weimar, his home for the rest of his life. His Italian journey, which marked an era in his career, occurred 1786–7. His friendship with Schiller, of far reaching influence in his poet's life, began in 1794, and ended only with Schiller's death in 1805. In 1806 Goethe married Christine Vulpius. For some years after going to Weimar he wrote but little, but his drama of 'Egmont' appeared in 1785, and thenceforward his leisure was devoted to composing, in prose, his great tragedy 'Iphigenie,' recast in verse in 1786; in writing the novel 'Wilhelm Meister'; and in building up his greatest work, 'Faust.' The succession of his works from 1789 forward was: 'Tasso,' a drama (1789); 'Metamorphosis of Plants' (1790); 'The Grand Cophta,' a dramatization of the affair of the 'Diamond Necklace'; 'Wilhelm Meister's Apprenticeship' (1796); 'Hermann und Dorothea' (1796–7); 'Elective Affinities' (1808); 'Fiction and Truth' (1811); 'West-Eastern Divan' (1814); 'Wilhelm Meister's Years of Travel' (1821); second part of 'Faust' (1831: the first part had appeared as 'A Fragment' in 1790).

His great life, extending over upward of four-score years, makes him a man of the 18th century and also of the 19th. He belongs not only to German but to European literature. And in the history of European literature his position is that of successor to Voltaire and Rousseau. Voltaire fought to enfranchise the understanding. Rousseau dreamed, brooded, suffered, to emancipate the heart. Here then were Goethe's two great predecessors: one a most vivacious intelligence, the other a brooding sensibility; one aiming at an emancipation of the understanding, but deficient in reverence and in love; the other aiming at an emancipation of the affections, but deficient in sanity of thought. In what relation stood Goethe to these great forces of the 18th century?

In his old age Goethe, speaking of Voltaire, uses the words "a universal source of light." But as a young man he was repelled by him. Into the influence of Rousseau, on the contrary, and into the general movement of feeling to which Rousseau belonged, Goethe in his youth was caught, almost inevitably; and he abandoned himself to it for a time, it might seem without restraint.

Yet Goethe differed from Rousseau as profoundly as he differed from Voltaire. The young creator of "Werther" may seem to have started on his career as a German Rousseau. In reality, "Werther" expressed only a fragment of Goethe's total self. A reserve force of will and an intellect growing daily in clearness and in energy would not permit him to end as Rousseau ended. In 'Götz von Berlichingen' there goes up a cry for freedom; it presents the more masculine side of that spirit of revolt from the bonds of the 18th century, that "return to nature," presented in its more feminine aspects by "Werther." But by degrees it became evident to Goethe that the only true ideal of freedom is a liberation not of the passions, not of the intellect, but of the whole man; that this involves a conciliation of all the powers and faculties within us; and that such a conciliation can be effected only by degrees, and by steadfast toil.

And so we find him willing during ten years at Weimar to undertake work which might appear to be fatal to the development of his genius. To reform army administration, make good roads, work the mines with energetic intelligence, restore the finances to order,— was this fit employment for one born to be a poet? Except a few lyrics and the prose 'Iphigenie,'

JOHANN WOLFGANG GOETHE.

these years produced no literary work of importance; yet Goethe himself speaks of them as his «zweite Schriftstellerepoche,»— his second epoch as a writer. They were needful to make him a master in the art of life, needful to put him into possession of all his powers. Men of genius are quick growers; but men of the highest genius, which includes the wisdom of human life, are not speedily ripe. At 26 he was a chief figure in German, even in European, literature; and from 26 to 37 he published, we may say, nothing. But he was well employed in widening the basis of his existence; in organizing his faculties; in conciliating passions, intellect, and will; in applying his mind to the real world; in endeavoring to comprehend it aright; in testing and training his powers by practical activity. A time came when he felt that his will and skill were mature; that he was no longer an apprentice in the art of living, but a master craftsman. Tasks that had grown irksome and were felt to be a distraction from higher duties, he now abandoned. Goethe fled for a time to Italy, there to receive his degree in the high-school of life, and to start upon a course of more advanced studies. Thenceforward until his closing days the record is one of almost uninterrupted labor in his proper fields of literature, art, and science. His task, regarded as a whole, was to do over again the work of the Renaissance. But whereas the Renaissance had been a large national or European movement, advancing toward its ends partly through popular passions and a new enthusiasm, the work which Goethe accomplished was more an affair of intelligence, criticism, conscious self-direction. It was less of a flood sweeping away old dikes and dams, and more of a dawn quietly and gradually drawing back the borders of darkness and widening the skirts of light. A completely developed human being, for the uses of the world,— this was the ideal in which Goethe's thoughts centred, and toward which his most important writings constantly tend. A completely developed State or commonwealth should follow, as an ideal arising out of the needs and demands of a complete individual. Goethe knew that growth comes not by self-observation and self-analysis, but by exercise. Therefore he turned himself and would turn his disciples to action, to the objective world; and in order that this action may be profitable, it must be definite and within a limited sphere. He preaches self-renunciation; the active self-abandonment of devotion to our appropriate work. Such is the teaching of ‹Wilhelm Meister›: it traces the progress of a youth far from extraordinary, yet having within him the capacity for growth, progress through a thousand errors and illusions, from splendid dreams to modest reality. Life is discovered by Wilhelm to be a difficult piece of scholarship. If we ask,— for this, after all, is the capital question of criticism,— What has Goethe done to make us better? the answer is: He has made each of us aspire and endeavor to be no fragment of manhood, but a man; he has taught us that to squander ourselves in vain desires is the road to spiritual poverty; that to discover our appropriate work, and embody our passion in such work, is the way to true wealth; that such passion and such toil must be not servile, but glad and free; that the use of our intelligence is not chiefly to destroy, but to guide our activity in construction; and that in doing our best work we incorporate ourselves in the best possible way in the life of our fellows. Such lessons may seem obvious; but they had not been taught by Goethe's great predecessors, Voltaire and Rousseau. Sanity for the imagination Goethe found in classical art. The young leader of the Romantic revival in Germany resigned his leadership; he seemed to his contemporaries to have lost the fire and impulse of his youth; his work was found cold and formal. A great change had indeed taken place within him; but his ardor had only grown steadier and stronger, extending now to every part of his complex nature. The change was a transition from what is merely inward and personal to what is outward and general. He did not go into bondage under the authority of the ancients; but he found their methods right, and he endeavored to work as they had worked. For a time the reaction carried him too far. But in the noble drama of ‹Iphigenie,› in the epic-idyll of ‹Hermann und Dorothea,› and in many of the ballads written during his period of close companionship with Schiller, we have examples of art at once modern in sentiment and classical in method. Goethe's faith in the methods of classical art never passed away, but his narrow exclusiveness yielded. He became, with certain guiding principles which served as a control, a great eclectic, appropriating to his own uses whatever he perceived to be excellent. As in ‹Hermann und Dorothea› he unites the influences of Greek art with true German feeling, so in his collection of short lyrics, the ‹West-Östlicher Divan› (West-Eastern Divan), he brings together the genius of the Orient and that of the Western world, and sheds over both the spiritual illumination of the wisdom of his elder years. Gradually his creative powers waned, but he was still interested in all — except perhaps politics — that can concern the mind; he was still the greatest of critics, entering with his intelligence into everything and understanding everything, as nearly universal in his sympathies as a human mind can be. The most invulnerable of Goethe's writings are his lyrical poems; against the best of these criticism can allege nothing. They need no interpreter. But the reader who studies them in chronological order will observe that as time went on, the lyric which is a spontaneous jet of feeling is replaced by the lyric in which there is constructive art and considerate evolution. In the poems of the ‹West-Östlicher Divan› Goethe returns to the lyric of spontaneity, but their inspiration is rather that of a gracious wisdom, at once serious and playful, than of passion. His period of romance and sentiment is best represented by ‹The Sorrows of Werther.› His adult wisdom of life is found most abundantly in ‹Wilhelm Meister's Apprenticeship.› The world has long since agreed that if Goethe is to be represented by a single work it shall be by ‹Faust.› And even those who perceive that ‹Faust› is best understood by being taken along with Goethe's other writings — his early ‹Prometheus,› his autobiography, his travels in Italy, his classical dramas, his scientific studies, his work as a critic, his vast correspondence, his conversations in old age — cannot quarrel with the judgment of the world.

'Faust,' if we include under that name the first and the second parts, is the work of Goethe's whole life. Begun and even far advanced in early manhood, it was taken up again in his midmost years, and completed with a faltering hand in the closing season of his old age. All his works, Goethe said, constituted a great confession. More than any other of his writings, 'Faust' is the confession of his life.

There are two ways in which the reader may deal with 'Faust.' He may choose for his own delight a fragment, detach it and disregard the rest; he may view this fragment, if he pleases, as a whole, as a rounded work of art. Such a reader will refuse to pass beyond the first part of the vast encyclopædic poem. To do this is legitimate. The earliest form in which we possess the drama, that of the transcript made by Fräulein von Göchhausen, is a tragedy which might be named 'The Tragedy of Margaret.' Possibilities of further development lay in the subject, were indeed required by it, and Goethe had probably already conceived certain of them; yet the stadium in the progress of Faust's history included in 'The Tragedy of Margaret' had a unity in itself. But a reader may approach 'Faust' otherwise; he may view it as expressing the complete mind of Goethe on some of the deepest problems of human life. Viewing it thus, he must accept the whole work as Goethe has given it; he must hold in abeyance, at least for a time, his own particular likings and dislikes. While keeping his mind open to all the poetry of 'Faust,' he will soon discover that here is something more than a poem; he finds in it the intellect, the character, the life of Goethe; it is a repository of the deepest thoughts and feelings concerning human existence of a wise seer.

The theme of 'Faust' as originally conceived was the turning of an idealist from his own private thoughts and dreams to the real world; from all that is unnatural,— systems, speculations, barren knowledge,— to nature and the founts of life; from the solitary cell to the company of men; to action, beauty, life, and love. If he can really succeed in achieving this wisely and well, Faust is saved. He is delivered from solitude, the inane of speculation, the vagueness of idealism, and made one with the band of his toiling fellows. But to accompany him there is the spirit of base worldliness, the realist, the cynic, who sees the meaner side of all that is actual, who if possible will seduce Faust into accepting the world apart from that elevating spirit which ennobles actual life, who will try to baffle and degrade Faust by degrading all that he now seeks,— action and beauty and life and love.

It is Goethe himself who is at odds with himself,— the realist Goethe set over against the idealist Goethe; and Mephistopheles is the base realist, the cynic whose endeavor is to mar the union of high poetry and high prose in human life, which union of high poetry with high prose Goethe always looked upon as the true condition of man's activity. Let Mephistopheles, the spirit of negation, try his worst, and at the last discover how an earnest striver's ways are justified by God. Faust may wander, err, fall, and grievously offend,—"as long as man lives, man errs"; but for him who ever strives upward, through all his errors, there is redemption in the end.

See Lives by Schäfer (1851), Lewes (1855), Goedeke (1877), Düntzer (1883), Heinemann (1899), Prem (1900), Witonsky (1900), Bielschowsky (1902 et seq.); Bernays, 'Der junge Goethe' (1875); Biedermann, 'Goethe Forschungen' (1879–99); Düntzer, 'Zur Goetheforschung' (1891); Zarncke, 'Goethe Schriften' (1897); Weissenfels, 'Der junge Goethe' (1899); Sell, 'Goethe's Stellung zu Religion und Christenthum' (1899); Vogel, 'Goethes Selbstzeugnisse über seine Stellung zur Religion' (1899); Menzel, 'Der Frankfurter Goethe' (1900); Fischer, 'Goethe und Napoleon' (1901); Funk, 'Goethe und Lavater' (1901); Bode, 'Goethes Aesthetik' (1901).

Goethite, gė'tīt, a hydrous sesquioxide of iron, contains when pure 62.9 per cent of iron. It differs from hematite in having a yellow streak and from limonite in containing more water and crystallizing in the orthorhombic system. The lower grade yellow or reddish iron ores of the Lake Superior region, particularly on the Mesabic range in Minnesota, contain considerable goethite and the mineral is thus an iron ore of some importance, though it is not distinguished commercially from limonite. See Iron.

Goetschius, gĕt'shĭ-ŭs, **Percy,** American musical scholar: b. Paterson, N. J., 30 Aug. 1853. He was graduated from the Stuttgart Conservatory, became an instructor there, and was appointed to a royal professorship by the king of Würtemberg. In 1890 he received appointment to the professorship of harmony, musical history and advanced pianoforte in the musical department of Syracuse University, and later was professor of composition in the New England Conservatory (Boston, Mass.), from which post he resigned in 1896. He became organist of the First Parish Church (Unitarian) of Brookline, Mass., in 1897. In addition to his compositions, including anthems, sacred songs, and instrumental works, he wrote: 'The Material Used in Musical Composition' (1882), 'The Theory and Practice of Tone Relations' (1892), 'The Homophonic Forms of Musical Composition' (1898).

Goetz, göts, **Theodor von,** German painter: b. Lieschen, Siberia, 1826; d. 1892. He began as a genre painter, but in 1848 entered the army and during the Schleswig-Holstein campaigns filled his portfolio with sketches of march and battle. He thenceforward devoted himself to painting military scenes, and became renowned as a battle painter. He took part in the Franco-Prussian war of 1870–1, and painted many striking incidents of the campaign. Noteworthy is his 'Episode in the Battle of Sedan' (1875), one among many remarkable canvases which render him the Horace of Germany.

Goffe, gŏf, **William,** English regicide: b. Sussex about 1605; d. Hadley, Mass., about 1679. He became a major-general in the parliamentary army, sat in the House of Commons and in Cromwell's "other house," and was one of the judges who signed Charles' death warrant. In 1660, with his father-in-law, Gen. Edward Whalley, he fled to America; and they lay in hiding round about New Haven from 1661 to

1664, when they went to Hadley, Massachusetts. There they lived for many years in seclusion; and it is there that, according to the well-known tradition, when the townsmen were called from the meeting-house to repel an Indian attack, and were standing irresolute, Goffe put himself at their head and drove off the foe, and then disappeared as suddenly as he had come. The genuineness of the story, however, has been questioned. His papers have been printed by the Massachusetts Historical Society. See Stiles, 'History of Three of the Judges of King Charles I.' (1794).

Gog and Magog, a king and his nation mentioned in Ezekiel, and the book of Revelations ("the prince of Rosh, Meshech and Tubal from the land of Tubal"). Gog, king of the Magog people, represented the northern hordes, who were to invade western Asia (Ezek. xxxviii. 39). Probably Gog was the Gyges of the Greeks, Gyges being a typical name for kings reigning northwest from the Assyrians. The event predicted was the irruption of the northern nations into Syria.

Gog and Magog are also the names given to two reputed giants of early British history, whose statues are erected in the Guildhall in London. The legend reported by Caxton with reference to these personages declares that they were the last two survivors of the sons of the 33 infamous daughters of the Emperor Diocletian, who, having murdered all their husbands, were sent to sea in a ship, and arriving in Britain and cohabiting there with demons, had a number of giants for their offspring. These giants, it is said, were conqnered and brought prisoners to London, where they were kept chained to the gates of a palace on the site of the Guildhall. When they died their place was taken by effigies of them. Effigies called Gog and Magog certainly existed in London at a very early period, and they were sometimes brought out and placed on a conspicuous place to welcome a sovereign entering the city, as was done to Henry V. in 1415; Philip and Mary in 1554; and Qneen Elizabeth in 1558. The old effigies were burned in the great fire in 1666. The present figures of Gog and Magog, which are 14 feet high, were erected in 1708.

Gog'gler, or **Goggle-eye,** names given colloquially to several fishes that have prominent eyes, as the rock-bass, the wall-eyed pike, and a tropical crevalle. American gunners call a duck, the surf scoter, "goggle-nose," in reference to spectacles-like spots on its bill.

Gogol, gō'gŏl, **Nik'olai Vassil'jevich,** Russian novelist and dramatist: b. in the government of Poltava 31 March 1809; d. Moscow 21 Feb. 1852. From an early period he manifested a great inclination for dramatic representation, and even endeavored to establish himself in the profession of an actor, but his first appearance was unsuccessful. After filling a situation in a government office, became successively professor of history in the Patriotic Institute, a private tutor, and, lastly, professor of history in the University of St. Petersburg. In none of these did he continue for any time, and presently took up his residence abroad, spending a long period in Italy. His works are extremely popular in Russia for their graphic and humorous delineation of everyday life and manners, and more especially Russian country life. Among them are: 'Evenings at the Farm' (1832); 'Mirgorod,' a collection of tales (1834); 'Dead Souls' (1842), a satirical novel, depicting the public abuses and barbarism of manners prevalent in the provinces; and 'The Reviser,' a satirical comedy of Russian officialdom.

Goitre, goi'tėr, an enlargement of the thyroid gland which may occur sporadically or be endemic. Isolated cases occur the world over. In the United States the disease is comparatively prevalent around Lake Ontario and in parts of Michigan. It is found endemically in the mountainous regions of Switzerland and Italy. The canse is unknown, although certain claims are made that the water is responsible. The symptoms of goitre consist of a more or less uniform enlargement of one or both lobes of the thyroid, causing a puffiness either on one side or both sides of the neck about the region of Adam's apple. When small, no inconvenience is caused thereby, but if the growth becomes extensive, pressure on the important structures of the neck may result in difficulty in breathing, and occasionally sudden death has resnlted. Tumors of the thyroid gland such as carcinoma and sarcoma, sometimes simulate goitre. One form of goitre, due to abnormal thyroid function, is known as Graves' disease (q.v.). See Exophthalmic Goitre.

Gokcha, gŏk-chä', **Goktscha,** or **Sevanga,** sā-vän'gä, a lake in Erivan, in Transcaucasia, Russia. It is 6,400 feet above the sea and has an area of about 540 square miles. A large number of small streams flow into it, but the outlet, the Sanga, which flows into the Aras, seems to convey only a small portion of the waters to the Caspian Sea.

Golcon'da, Ill., village, connty-seat of Pope County; on the Ohio River. It is the trade centre for a large farming country and for a mining district. Its manufactures are chiefly flour and lumber. Pop. 1,200.

Golcon'da, India, an extensive fortress of the Nizam, situated on a granite ridge, seven miles west of Hyderabad, India. In its immediate neighborhood are the ruins of an ancient city, once the metropolis of the powerful kingdom of Golconda, which reached its height at the close of the 16th century and endnred till 1687. The place itself is still strong; and about 600 yards distant are the solid mausoleums of its former sovereigns. The fort is held by a small garrison from Hyderabad, and serves as the Nizam's treasnry, and also as a state prison. Golconda is proverbially famous for its diamonds; but in truth, they were merely cnt and polished here.

Gold (chemical symbol, Au; atomic weight, 187), a metal distinguished from other common metallic elements by its beautiful characteristic yellow color which it preserves untarnished on exposure to the atmosphere under nearly all conditions. Many alloys of copper with zinc, tin, and aluminum have also a more or less golden-yellow color, and are used as substitutes for and imitations of gold, being sold under varions fanciful names, such as Dutch metal, Mannheim gold, Abyssinian gold, etc. Some of the bronzes have also a golden color. None of these resist atmospheric action like gold, but some are fairly permanent under ordinary conditions. Pure gold has a high metallic lustre, but is inferior in this respect to steel, platinum, and silver. The metal possesses a higher specific gravity than any common metal, but is exceeded in this respect by platinum. The specific gravity varies from 19.2 to 19.4, and the metal is thus $1\frac{1}{2}$ times heavier than lead and nearly twice as heavy as silver, bulk for bulk. Gold melts at 1045° C., being somewhat less fusible than silver and more fusible than copper. It does not melt in a common fire. At high temperatures the metal is sensibly volatile, and in the intense heat of the oxyhydrogen blowpipe or electric furnace may be vaporized. The vapor is purple.

The pure metal is somewhat harder than lead, but softer than copper, silver, platinum, zinc, or iron. It is consequently too soft, in the pure state, for the purposes to which it is generally applied. For practical application it is alloyed with copper or silver, and both these metals are often present. The former renders the gold redder and the latter paler than its true color. The proportion of gold contained in an alloy is expressed in degrees of fineness, or as "carats" and carat grains (4 grains = 1 carat). The fineness is expressed in parts per thousand, for example 916.6, or decimally, .9166. The carat value of the gold is expressed in parts of 24, pure gold being 24 carats fine. Thus 9-carat gold contains 9 parts of pure gold and 15 of a mixture of copper and silver, etc., commonly known as alloy. Sovereign gold consists of 11 parts gold and 1 copper; guinea gold, of 11 parts gold, $\frac{1}{2}$ part of copper, and $\frac{1}{2}$ part of silver. Standard and guinea gold are thus 22 carats fine (the legal standard for coins in the United Kingdom and colonies), and contain only 2 parts of alloy. The German, American, and Italian standard is 21.6 carat, and is composed of 1 part copper and 9 gold. The following table shows the relative amounts of gold and baser metal in alloys commonly employed:

Carats Fine	Pure Gold	Alloy	Fineness in Thousands
24	24		1000.00
22	22	2	916.66
21.6	21.6	2.4	900.00
18	18	6	750.00
15	15	9	625.00
12	12	12	500.00
9	9	15	375.00
4	4	20	166.6

The lowest recognized standard is 9 carat, but much gold of inferior quality is worked up into ornaments and commonly sold as real gold. Derby gold is also a common name for this poor material. In the United Kingdom articles of jewelry, plate, etc., are stamped with certain marks known as hall marks, or plate marks, as a guarantee that they have the quality they profess to have. Tampering with hall-marked articles is an indictable offense. Many specious imitations of hall marks are put upon sham jewelry, but always differ in some essential feature. Gold alloys of a red character are frequently colored. This consists in treating the article chemically in such a manner as to dissolve out the base metal constituting the alloy, leaving a covering of purer gold, paler than the original. For this purpose the articles are boiled with 1 part of salt, 1 of alum, 2 of saltpeter dissolved in 4 parts of water, for 20 minutes. Rolled gold is produced by applying thin sheets of gold to a plate of alloy and rolling down the compound sheet.

Pure gold has a tenacity of about 7 tons per square inch, and elongates about 30 per cent before breaking. A wire one tenth of an inch thick will support nearly 200 pounds. Its alloys with copper and silver are stronger. Standard gold has a tenacity of 18 tons (Austen), and extends 34 per cent before breaking. At very low temperatures this is greatly increased (Dewar). Gold is the most malleable of metals, and can be reduced to extremely thin leaves by hammering (see GOLD-BEATING). Such leaves sometimes do not exceed $\frac{1}{250000}$ of an inch in thickness, and transmit green light, though presenting an unbroken metallic surface. This is best seen by mounting on glass. The extreme thinness and high lustre of the metal have led to its use as an illustration of the extreme divisibility of matter. A particle of gold weighing only $\frac{1}{2500000}$ of a grain is readily visible to the naked eye. A grain of gold can be made to cover nearly 80 square inches of surface. The malleability of gold is seriously affected by the presence of minute quantities of arsenic, antimony, bismuth, lead, sulphur, selenium, and tellurium. Of the last 0.2 per cent, and of bismuth 0.5 is sufficient to render the metal crystalline and brittle. Traces of the above elements unfit the metal for gold-beating and coinage. These are removed by passing chlorine gas through the molten metal, or by treating the molten metal with mercuric chloride (corrosive sublimate). By continued hammering the metal is slightly hardened, and must be annealed. Gold surpasses all other metals in respect of ductility. The extreme ductility of the metal is shown by the fact that wires less than $\frac{1}{20000}$ of an inch thick were obtained by Wollaston by encasing a wire of gold in silver and drawing down the compound wire. The silver was dissolved off by treatment with nitric acid. A length of 500 feet of such wire weighs only 1 grain. Gold wire is used for making gold lace. Gold is also extremely flexible and tough. The pure metal breaks with a hackly fracture, but the appearance is greatly affected by impurities.

Chemical Properties.— Gold alloys readily with most metals. It is rapidly attacked by mercury, and dissolves in excess of that metal. If the liquid amalgam be squeezed through wash-leather a yellow pasty mass remains, which may be used in "wash" or "fire" gilding. This process, however, has been largely displaced by electro-gilding, in which the bath consists of the double cyanide of gold and potassium, and is used hot. The metal is unattacked by any of the simple acids, save selenic, but dissolves in any mixture in which chlorine, bromine, or iodine is liberated. The common solvent is aqua regia, a mixture of 1 part nitric acid and 3 or 4 of hydrochloric acid. The chlorine liberated from this mixture converts the gold into the trichloride, an exceedingly soluble body of high tinctorial power, yielding yellow solutions. In the finely-divided state gold is dissolved by chlorine water, bromine water, and iodine solution or tincture, the trichloride, tribromide, and triodide being produced. It also dissolves in potassium cyanide solutions (in the presence of air) and in cyanogen bromide. These solvents are employed in the extraction of gold from its ores. Oxides of gold can be prepared with some difficulty. The monoxide is thrown down when caustic potash is boiled with gold chloride solution to which a little acetate of soda has been added. A trioxide (Au_2O_3), a dioxide (Au_2O_2), and a tetroxide (Au_2O_4) are also known. What is known as fulminating gold, $Au_2O_3(NH_3)$, may be prepared by adding ammonia to a solution of gold chloride or by steeping the hydroxide in ammonia. It is a green or brownish powder, which detonates violently when gently heated or when struck. Two classes of gold salts exist. Of the aurous salts, the principal are sodium auro-sulphite, auro-thiosulphate, the cyanide and potassium auro-cyanide. Of the auric salts, the principal are the trichloride and the chloraurates. Gold trichloride crystallizes from solution in dark orange-red crystals, $AuCl_3 2H_2O$. It is extremely soluble in water, and volatilizes at 300° in a stream of chlorine gas, but is decomposed on heating to 200° in air with the formation of the monochloride and chlorine, and, at a higher temperature, of gold. It is soluble in ether, naphtha, and essential oils.

The chlor-aurates are combinations of gold chloride with sodium, potassium, and other alkaline chlorides. The best known are $KCl.AuCl_3.2H_2O$, and $NaCl.AuCl_3.2H_2O$, salts commonly sold as gold chloride for photographic purposes. Gold is precipitated from solution by most metals. Iron, copper, and zinc precipitate it readily, generally in a more or less pulverulent form devoid of metallic appearance. Oxalic acid, ferrous sulphate, sulphur dioxide, and sodium sulphite, carbon, grape-sugar, and many organic reducing agents, precipitate the gold from gold chloride. In some cases the metal is so finely divided that it imparts a ruby color to the liquid and does not settle for months. Purple of Cassius is the fine purple pigment produced by treating gold chloride solution with a mixture of tin chlorides, that is, stannous chloride containing a little stannic salt. It is used in glass staining, pottery, and enamel painting, and for coloring artificial gems, imparting a pink, rose, or red color. The addition of tin chloride to the solution obtained by treating an ore with aqua regia and boiling off the excess acid, is a delicate test for the presence of gold. Finely divided gold imparts to pottery and glass a color varying from pink to ruby. Gold resists chemical action to a greater extent than platinum or any other common metal, and in alloys protects base metals from the action of acids to a remarkable extent. Owing to the high specific gravity of gold (19.3) it is possible to roughly determine the richness of the alloy by taking the specific gravity of the article. This is impossible where platinum (specific gravity 21.4) is present in the alloy. The specific gravity of standard gold is 17.157, and of 18-carat gold 16.8.

Assay of Gold.— The touchstone is employed to determine approximately the quality of the gold. It is a hard, black, silicious or flinty slate known also as Lydian stone. Basalt and black Wedgewood ware are also employed. The metal to be examined is rubbed on the stone (any plating or coloring being first scraped off), and the streak compared with that made by needles of known composition differing from each other by one-half carat. The streak is also treated with nitric acid and a test acid, and the result of their action observed. Three or more sets of needles are employed, the chief being a gold-copper series, a gold-silver series, and a gold-silver-copper series. Sometimes five sets are employed, in which the proportions of silver and copper are varied. The series to which the article tested belongs is determined by comparison for color, hardness, and toughness, the latter being inferred from the dryness or greasiness of the streak. The streak is first treated with pure nitric acid (applied with a feather), which is afterward rubbed off. With brass and other spurious copper alloys the streak is completely and instantly dissolved, while poor gold leaves a very faint impression. Nitric acid does not affect any alloy above 15 carats fine. A test acid consisting of 98 parts nitric acid (specific gravity 1.34) and 2 of hydrochloric acid (specific gravity 1.173) is used if the streak has been unaffected by the nitric acid. Gold of 18 carats fine and over is not affected by this mixture in the cold. This method of testing is only used when a rough idea of the richness is all that is necessary for valuation purposes.

Accurate assays of gold alloys are made by wrapping a weighed quantity (either 5 grains or 0.5 gram) in sheet-lead, with sufficient silver to equal three times the weight of pure gold present. Lead to the amount of 34 times the weight of the sample is used for all alloys containing less than 50 per cent of gold, and less for richer alloys. The sample is dropped on to a bone-ash cup (cupel) previously heated to full redness in a muffle furnace. The copper and all base metals in the alloy are oxidized, and the oxides dissolved in the molten litharge formed by the oxidation of the lead added. The fused oxides are absorbed by the porous cupel, thus keeping the metallic surface clear, and at the end of the operation only silver and gold remain behind. After cooling, the button is rolled into a ribbon, annealed, coiled up, and boiled first in nitric acid of 1.16 specific gravity, and afterward in nitric acid of 1.26 specific gravity, to dissolve out the silver, and after washing the coherent cornet of gold is heated to dull redness in an annealing cup and weighed. The addition of silver in assaying is known as inquartation. It is necessary owing to the protective action exerted by gold on other metals.

World Production of Gold.— Gold is very widely distributed, smaller or larger quantities being found in nearly every country. The ancients obtained gold from the Spanish Peninsula, Greece, Asia Minor, and India. The Ophir of the Bible has been variously located. Possibly it was in East Africa. In more modern times Peru, Bolivia, Brazil, Chile, Mexico, and other countries of South and Central America furnished immense supplies of gold after the discovery of America until about 1850. By far the greatest discoveries of gold have been made during the 19th century. The discovery of the Californian placers in 1848, and of the Australian placers in 1851, produced a mad rush to the diggings. In 1858 gold was found in New Zealand, and in 1861 the Otago district became a large producer. Since then immense developments have taken place. Besides California, Montana, Arizona, Colorado, Nevada, Idaho, and others of the United States have furnished, and still furnish large supplies, and Alaska must also be added. British Columbia is an important source, both alluvial and quartz mining being followed. Canada has also entered the lists as a gold-producer, and the phenomenal discoveries of rich alluvial deposits in the Klondike region in the Yukon basin still furnish excitement. The rich finds in western Australia, in the Calgoorlie and Coolgardie districts, have recently placed that colony in the front rank as a gold-producer, while Victoria, South Australia, and New South Wales have long been large gold-producing countries. In Victoria much energy in the development, more especially of "deep lead" mining, is being put forth. The Witwatersrand district of the Transvaal has sprung into importance since 1886, and Johannesburg is now perhaps the largest gold-mining centre of the world. Russia is also an important producer, the gold being obtained beyond the Ural mountains. India also produces a considerable amount. Of the prospective gold fields the most likely are British Guiana, the hinterland of the Gold Coast, certain parts of China, and possibly East Africa. Gold has been found in several parts of the United Kingdom, principally around Dolgelly, in Merionethshire, in Sutherlandshire, in the Lead Hills, in the Wicklow Mountains, and other places in Ireland. The production of gold in recent years is shown in the tables given below. Such figures, however, are all more or less uncertain:

Country	1896 oz. fine gold	1897 oz. fine gold	1899 oz. fine gold
South Africa...	2,150,106	2,818,493	3,644,889
Australasia	2,185,872	2,690,278	3,777,559
Russia	1,041,794	1,121,511	3,164,603
United States..	2,568,132	2,774,935	3,506,679
Other countries	1,874,171	2,075,495	3,081,454
	9,820,075	11,483,712	15,175,184
Value	£41,713,715	£48,780,511	£64,309,450

The great increase in the Australian yield is due to the activity in western Australia; in the United States, to Colorado — which now excels California. Canada doubled her output in 1898 — the output being 701,459 ounces. This is due to the Klondike field. The crude bullion from the Transvaal in 1898 amounted to 4,545,014 ounces. In the decade 1831–40 the value of the average annual gold production of the world was £2,831,800; from 1841–50, £7,638,800, the California placers being by this time worked. In the period 1851–5 the average annual value was £29,195,400, in 1881–5 only £20,371,777. The phenomenal advance since 1885 is largely due to the development of the Transvaal, but since 1894 the United States, Australia (especially West Australia), and the Klondike region have greatly contributed to the increase; while the cyanide process for treating tailings has led to more perfect recovery of the metal from the ore treated. This phenomenal output of gold — considered along with the fact that much of the ore treated contains only a few pennyweights, and in some cases a few grains to the ton — will give some idea of the enormous amount of capital and energy employed in the search after the precious metal.

Production in the United States.— The following table shows the production of gold in the United States in the calendar year 1901:

Alabama	$ 3,900
Alaska	6,904,400
Arizona	4,193,400
California	15,730,700
Colorado	29,000,000
Georgia	144,900
Idaho	2,273,900
Maryland	200
Michigan	29,000
Missouri	700
Montana	5,023,300
Nevada	3,000,000
New Mexico	832,900
North Carolina	65,800
Oregon	1,777,800
South Carolina	120,900
South Dakota	6,601,800
Tennessee	200
Texas	1,100
Utah	3,824,300
Virginia	7,400
Washington	620,200
Wyoming	62,000
Total	$80,218,800
British Klondike	17,595,400

The total gold production of the world from the discovery of America by Columbus to the year 1900 is, according to the report of the United States mint, in round numbers, $9,811,000,000. Pure gold of this value would weigh about 16,272 tons, and occupy a space equal to 27,039 cubic feet. Graphically this amount could be represented by a solid circular tower of gold 20 feet in diameter, and 86 feet high. The total yearly world production of gold since 1900 would increase the height of such tower about 3 feet each year.

It has been calculated that the control by England of the African gold mines will result in a largely increased gold supply.

In 1898, the latest complete year before the Boer war, the Witwatersrand, or the "Rand," the Transvaal's principal mining district, produced $60,000,000 in gold. At the rate of increase for the previous few years, maintained through the part of 1899 before the war, the output would have been about $90,000,000 in that year if the conflict had been averted, and more than $100,000,000 in 1900. After mining has been fully resumed, the Rand's annual product, it is estimated by experts on the ground, will soon go up to $100,000,000, and by 1905 or 1906 it will be $125,000,000. It is estimated that that district will yield something like $3,000,000,000 in the next quarter of a century, or before the reef already being worked is exhausted.

There are to-day nearly 1,200 tons of gold in the vaults of the Treasury of the United States — the greatest hoard of the yellow metal ever gathered in the history of the world. Four hundred tons of this gold are piled, like bags of salt, within the four walls of the Sub-Treasury in Wall street, New York. Outside the Treasury hoard there is in circulation through the country a nearly equal amount of gold coin, making more than 2,500 tons of gold in the United States bearing the imprint of the eagle. The total value of this coin is more than $1,260,000,000.

Gold-beaters' Skin, a skin or membrane of great tenacity used in gold-beating (q.v.), and specially prepared from the outer coat of the cæcum of cattle. The intestines of 500 cattle are required to make a single packet or "mold" of gold-beaters' skin, the mold containing about 850 leaves, between which the gold to be hammered out is laid. See Gold-beating.

Gold-beating, the art of hammering gold into leaves of extreme thinness for the purposes of ornamental gilding. For this purpose pure gold is alloyed with small quantities of other metals according to the color required. Ten colors are recognized: red, pale-red, deep-red, orange, lemon, deep-pale, pale, pale-pale, deep-party, party, besides fine gold. In the deeper colors copper preponderates in the alloy, varying from ½ dwt. to ¾ dwt. per ounce, and no silver. The pale ones contain silver varying from a few grains to 1 dwt. per ounce. The middle ones contain from ¾ to a little over 1 dwt. of alloy, of which ⅔ is silver and ⅓ copper. Ordinary gold-leaf contains about 21 grains of alloy per ounce, and is thus nearly 23-carat fine. The operations are conducted as follows: The metal is melted and cast into ingots, which are rolled out into thin ribands between polished steel rolls. Each ounce of gold is rolled to a length of about 10 feet, the riband being 1½ inches wide and 0.0015 to .001 inch thick. This is cut up into pieces, each weighing about 6 grains, so that 2 ounces — that is, a "beating"— yields 160 to 170 such pieces. These are packed between intervening sheets of vellum, some 3 inches square, the surfaces of which have been rubbed over with fine plaster of Paris — brime — to prevent the gold from sticking. A number of blank pieces of vellum are placed at the top and bottom of the pile, and the packet is bound with straps of the same material. The cutch thus formed is beaten with a hammer weighing from 17 pounds upward, or by a power hammer, till the gold has been extended to the size of the parchment sheets. The packet is then unbound, the gold squares each divided into four by a steel knife, and the pieces packeted between sheets of gold-beaters' skin (q.v.) about 4½ inches square. A number of blank skins are placed at both top and bottom. The 600 to 700 pieces are all put into the same packet, and comprise what is called the shoder. The shoder is secured by slipping the pile into a parchment band, and again into a similar one at right angles, and is beaten with a round-faced hammer weighing from 9 to 12 pounds, until the gold has extended across the skins. When the gold has filled the shoder each leaf is divided into four pieces with a strip of bamboo sharpened on the long edge. The 2,500 to 2,800 pieces thus obtained are packed in three packets between fine gold-beaters' skin 5 inches square. Each of these packets constitutes a "mold." A large number of blank skins are placed at either side. The packet is secured as before, and each mold is beaten with the "finishing" or gold hammer, weighing from 7 to 10 pounds, till the metal extends to the edges of the skins, and in some places flows over. When the beating is finished the mold is opened. Each leaf is then lifted deftly by long wooden tweezers, placed, with a sudden downward movement, on a leather pad dusted with brime, and from the central part leaves 3⅜ inches square are cut by means of two sharpened bamboo strips fastened parallel to each other. The leaves are placed by the tweezers in books of soft paper rubbed over with red ochre, red bole, and brime to prevent the gold from sticking. If the leaf does not lie flat, a sudden puff of breath, well directed in the centre, lays it flat. Each book contains 25 leaves. Fine gold is more difficult to deal with than that containing a little alloy, owing to its liability to stick when the leaves touch. It, however, beats equally well. The leaf begins to transmit light when $\frac{1}{150000}$ of an inch thick. Ordinary gold-leaf varies from $\frac{1}{200000}$ to $\frac{1}{250000}$ of an inch thick.

Gold Coast Colony, a British crown colony on the coast of West Africa, bounded on the east by Togoland (German), and on the west by the Ivory Coast (French). Its coast line is about 350 miles; its area, inclusive of Adausi, Ashanti, and the Northern Territories, is about 75,000 square miles. Pop. 1,500,000, of whom 500 are Europeans. The native state of Ashanti lies inland, at the back of the central portion of the colony. The territories in the hinterland to the north of Ashanti, were erected into a separate district, the Northern Territories, in 1897 (area 38,000 square miles, pop. 317,964) and placed under the administration of a commissioner. The products are chiefly palm oil, gold, palm kernels, rubber, timber, etc. Chief town, Akkra, pop. 16,267. The government includes a governor, an executive council, and a legislative council of nine, none of whom are elected.

Trouble arose between the king of Kumassi, who had declared himself king of Ashanti in 1894, and the British authorities, and in 1895 an expedition was sent against him, under the command of Sir Francis Scott, which resulted in the submission of the king, who was afterward taken to the coast. The kings of Bekwai and Abodom also made their submission, and the country was placed under British protection, and a resident appointed at Kumassi. The Niger Convention drawn up by the Anglo-French Commission sitting at Paris, and signed 15 June 1898, and the agreement of Germany 1899, settled the boundaries of the hinterland to the west and the north. Bona and Dokta were given up to France, and the French had to concede Wa and other points to the east of the Volta, which had been occupied by them. The railroad from Sekondi to Tarquah was completed 1901, and in 1902 was prolonged 48 miles beyond the latter point. A line is also being laid to the gold mines of Princissu.

Gold-crest, or **Golden-crested Wren**. The British name for one of the Kinglets (q.v.).

Gold Cure, a specific discovered by Dr. Leslie E. Keeley, by the administration of which drunkenness, addiction to such drug habits as taking opium, or cocaine, as well as the tobacco habit are, it is claimed, cured by a renovation of the nerve cells. Dr. Keeley's theory is that all habits of the kind specified above are symptoms of physical disease and disorder, and may be treated like any other affection of the body. Keeley Institutes have been established all over the United States, and there is a Keeley Institute in London. The treatment consists in the administration of bichloride of gold, according to a prescription which has not been made public. According to the testimony of many reformed inebriates of both sexes the results of the Keeley Cure are genuine and lasting. According to the statistics recently issued by the Keeley Institute, the success of the cure extends to all classes. Out of 1,000 consecutive cases treated, 236 were housewives, 150 physicians and surgeons, 50 were without calling, 30 were attorneys, 29 were merchants, 23 were farmers, 20 were dentists; clergymen, authors and actors were also represented.

It takes four to six weeks to accomplish a complete cure, and testimonials are not wanting from many of the leading men and women in the country as to the efficacy of Dr. Keeley's specific, as they have seen it operating in the case of those who have been submitted to it. "The Keeley League" is an association of 30,000 men who have been cured by the specific and accompanying treatment. The total number which it is claimed have been released from the domination of the drink or drug habit is 300,000.

The discovery was made by Dr. Keeley in 1879, while he was practising physician in Dwight, Ill. In 1880 he opened his first institution at Dwight. The regular medical profession has not accepted with favor the claims of the Keeley Cure.

Gold Hill, Nevada, formerly a distinct village, but now a part of Virginia City. It is about 7,000 feet above the sea. It has rich silver mines, and several quartz mills. Here, on Mount Davidson, is the famous Comstock lode.

Gold Lace, a kind of lace made of gold wire, flattened between two polished steel rollers, into a ribbon which is twisted round a core of silk. The "gold wire" used in the manufacture of gold thread is nearly always composed of pure silver with a thin coating of gold in India. But in European countries it is only the very best qualities of this wire which are made of unalloyed silver. A good quality of English gold thread is made from wire consisting of 1 part of copper added to 25 of silver, which is afterward coated with gold. But alloys of copper and silver in many proportions are used, some wire containing only 1 part of silver to 60 of copper. The silver, or alloy of copper and silver, is made into a rod 1½ inches in diameter, and then annealed and polished to prepare it for its coating of gold. This is laid on in the form of leaves of pure gold, and subjected, for the best qualities of wire, to the fire-gilding process — that is, the gold-coated rod is heated to redness on burning charcoal, which causes the leaf to adhere firmly. Rods so treated are next smeared with wax, and drawn through the holes of a steel draw-plate. (See WIRE-DRAWING.) The wire is frequently annealed during the process of drawing, and this requires to be very skilfully done, or the golden tint of the surface is lost. Gold wire for thread is generally drawn down to a size measuring 1,100 to 1,400 yards to the ounce of metal. Finer sizes reach the length of 1,800 to 2,000 yards to the ounce, and to attain this fineness the wire is drawn through perforated gems, such as diamonds or rubies. The fine wire, after being annealed, is flattened between polished steel rollers. Finally the flat wire, or rather ribbon, is wound over yellow or orange colored silk, so as completely to envelop it, by a spinning engine. The gold thread is then finished. Some of the best qualities of the metal covering or "plate" of this thread have 12 pennyweights of gold to the pound of silver or of alloy. Inferior kinds have as little as 2 pennyweights to the pound, and still cheaper sorts of thread are covered with flattened copper wire which has received a thin coating of electro-deposited silver, and this afterward receives, on the outside of the thread only, a still thinner electro-deposited coating of gold — two grains of the precious metal covering 3,000 square inches of surface. For this very cheap kind of thread yellow cotton is used instead of silk.

The only difference between gold and silver thread is that the thin coating of gold is wanting on the latter. Gold thread is used in the manufacture of military lace. This, however, is a woven substance and not true lace; but some real lace is made both of gold and silver thread. Both kinds of thread are also used for facings of liveries, and for ecclesiastical robes, altar cloths, and banners. These and other fabrics are either embroidered or woven, but often only in part, with the thread. (See BROCADE; DAMASK; EMBROIDERY.) Much of the "gold thread" used for theatrical dresses and decorations has only a covering of Dutch metal and the "silver thread" in these is spun with a covering of a cheap white alloy, having a mere film of silver on the surface.

Gold Mining. Gold is usually found in nature in the metallic or native state, and may be distinguished from iron and copper pyrites and other yellow metallic minerals by its malleability and softness. Native gold is never pure. Its quality varies from about 800 to 950 fine, or about 20 to 23 carats (see GOLD). Electrum is a native alloy of silver and gold about 500 fine. A native amalgam with mercury also occurs. The metal sometimes occurs crystallized in octahedra and other cubic forms. It is also found in irregular masses which may be nodular, filiform, or arborescent, or it may form thin leaves merely gilding the surfaces of the rock. More commonly it exists in grains irregularly distributed through sand, gravel, or rock. These grains are sometimes so minute as to be invisible to the naked eye, and the presence of gold can only be detected by subjecting the rock to a careful assay, either by grinding with mercury, washing, or fire assay.

The metal occurs in (1) alluvial deposits, or "placers." These are deposits of gravel, sand, clay, or loam, consisting of the debris of weathered rocks, generally transported by running water from hillsides to valleys and plains. They mark and follow the courses of existing rivers or of rivers belonging to former ages. Gold is found in them in all degrees of coarseness, from minute specks or "colors" to masses weighing many ounces. One of these, designated the "Welcome Stranger," found at Dunolly in Victoria, weighed 2,195 ounces troy, and many others of large weight have been found.

These larger masses of gold have usually a more or less rugged and lumpy exterior, and are described as "nuggets." The largest usually occur near the source from which the gold in the alluvium has been derived. This source almost always consists of veins of quartz, or other material, occurring in one of the older rocks. Alluvial deposits vary in character from pipe clay to coarse gravel. The gravel is usually loose, but sometimes in working the deposits intervening layers are met with which are cemented together. These are known as "false bottoms." River sands also frequently contain gold. Alluvial deposits are often very rich, particularly in nuggets. This is largely due to the force of the water carrying forward the light earthy material, while the larger and heavier particles, owing to their greater resistance, accumulate nearer the source. (2) The formation which is known as "deep leads" consists of ancient river beds that have been covered by more recent deposits of drift, earth, or volcanic rocks, which have become hardened and consolidated. They are composed of sand, gravel, loam, and clay, the so-called "wash-dirt" or "pay dirt" varying from a few inches to several feet in thickness. Formerly these deep leads were the main drainage channels of the country, and in rain storms were heavily flooded, carrying the debris from the hillsides down the creeks and gullies. In Victoria the deep leads are often overlaid with a deposit of basalt known as "bluestone," showing volcanic action to have been instrumental in covering up the deposit. These deposits often extend out beyond the covered portion, and in mining operations trouble is occasioned by water which finds its way in through the exposed portion. Their direction is traced by boring. (3) In the primitive rocks gold occurs generally, though not invariably, in veins of quartz. The terms "lodes," "reefs," "ledges," are also used much in the same sense as veins. The metal is not uniformly desseminated through the rock, but occurs in most cases in rich streaks and pockets. Careful examination will often reveal its presence, but no general appearance of the quartz can be relied on. Highly mineralized quartz is generally most productive. The minerals usually present are silver, zinc, lead, copper, iron, nickel, bismuth, tellurium, and antimony-bearing minerals, the commonest being iron pyrites, mispickel, zinc blende, galena, copper pyrites, argentite and other silver ores, nagyagite and other tellurides, bismuthine, antimonite, limonite and hematite. Sometimes these — especially iron pyrites — are present in very large quantities. Near the surface this has been completely decomposed and partially converted into oxide of iron, conferring a reddish brown color on the more or less spongy rock. Such decomposed rocks containing much oxide of iron are described as "gossans." In the cavities small particles of free gold can often be observed. In the unaltered portions of the rock the accompanying minerals may be plainly distinguished. The veins may be compact and large, but the mineral streak often occupies only a portion of the lode, though many "leaders" may occur. Much of the lode is sometimes barren. In some quartz deposits the stone is uniformly rich; in others the gold is concentrated at certain points in what are known as pockets. According to a recent report from Cripple Creek, Colo., a mass weighing over a hundredweight with a slight admixture of quartz has been found there. A similar mass of less size was found some years ago in India, and another near Sydney, N. S. W., was 5 feet high, 1 foot wide, and 6 inches thick, full of threads, wires, lumps, and sheets of gold. It realized £15,000. The "banket" ore of South Africa resembles both alluvial deposits and reefs. It consists of a mass of quartz fragments mostly irregular, embedded in a cement of mineralized matter which carries the gold. This, near the surface, is completely "weathered," and an incrustation of oxide of iron remains surrounding the quartz. Strangely enough this deposit resembles a reef rather than an alluvium and extends to great depths. Several "deep" mines are now in operation. No satisfactory explanation can be given of this formation. Ores of other metals frequently contain gold. Iron and copper pyrites, antimonite, galena, and silver ores are often gold bearing. The precious metal is extracted in the smelting of the mineral. Gold occurs also in combination with tellurium and possibly with selenium, as well as in the free state. Most telluric ores are gold bearing, and the presence of this element is often looked on as an indication of gold.

Placer Mining.— When the alluvium is at the surface the exploration of the ground can proceed forthwith, and with pick and shovel the gravel is turned over and the nuggets taken out. The remainder is afterward washed to recover the finer particles of gold, in the pan, the dolly, or the cradle. When the "pay dirt" is covered with soil, etc., the "cover" is first removed to lay it bare, and the washing proceeded with. From the above references the presence of water is a most important item in the satisfactory exploiting of alluvium. The washing of sands and gravels is a simple matter. In washing in the pan —"panning out"— a quantity of the dirt free from the stones is put into a shallow iron or wooden dish some 15 inches in diameter, with a slight depression in the middle. It is then mixed with water, and the dish put with its edge just under water with one side a trifle lower than the other. Any lumps are broken up by hand. By a gentle whirling and jerking motion the sand and other light bodies are washed over the edge of the pan, and the heavy matters containing the gold remain at the bottom and accumulate in the central depression. Pebbles are thrown out, and the "colors" (specks of gold) are then sought after and picked out, or the whole heavy residue saved, dried, and blown, or treated with a little mercury to extract the gold.

The "dolly" or "tossing tub" is intended for washing fine stuff or coarsely crushed material passing through a sieve having 12 meshes to the linear inch. It consists of a circular tub in which the dirt is mixed with sufficient water, and is stirred around with a shovel or other implement three or four minutes. A little of the water is then removed, and the tub struck on its sides for some few minutes with a hammer to quicken the subsidence of the heavy matters. The water is then poured off with the lightest matters, and the upper portions of the remaining mud scraped off and thrown aside. Some fresh dirt is added and the operation repeated. By this means a gradual accumulation of gold takes places at the bottom of the tub — or kieve, as it is called — and is removed from time to time. Some tossing tubs are provided with rotary stirrers.

The "cradle" consists of a short box or trough six or seven feet long, mounted on a kind of rockers, and slightly inclined to allow the mud to run off. A box with a bottom of iron plate perforated with half-inch holes is placed over the higher end of the trough. Underneath this an inclined plate directs the stuff to the top of the trough, across the bottom of which strips of wood called riffles, about half an inch thick, are fixed transversely to arrest the heavy particles of gold. The "pay dirt" is thrown into the box at the top, and water is led into or poured on it. The finer portion is thus carried through the holes into the trough. Lumps are broken up and the cradle rocked from side to side with a jerking motion. The light matters are carried away by the water from the lower end of the trough, and the particles of gold and other heavy matters lodge behind the bars and are afterward collected.

Sluicing.— This is the method adopted where practicable for treating alluvial deposits. The "sluices" consist of troughs called "flumes," in sections about 12 feet long, mounted on trestles to give a sufficient inclination — from ¾ to 1½ inch to the foot. The lower ends of the troughs fit into the upper ends of the succeeding sections. The bottom of the sluice box is crossed transversely by bars of wood or iron. In long sluices these are about two inches thick and are supported by longitudinal bars, dividing the bottom of the sluice into rectangular spaces. The gravel is placed at the top and washed down by a stream of water, while the lumps in the hand sluices are broken up by raking them.

The smallest of the sluices, known as the "long tom," and worked by two or three men, consists of two such sections. Into the upper one the gravel is thrown, and the lower end is closed by an iron grid set at an angle, to keep back the pebbles and large stones, while the sand, etc., passes through to the lower trough. In this it deposits its gold and heavy matters behind the riffle bars which in these shorter sluices are not so thick. The longer sluices, for dealing with larger quantities of material at a time, are made 250 feet long, or longer in many cases, and if there are many stones in the stuff to be treated, the sluice is divided into two sections, placed at different levels. The lower end of the upper section is not blocked, but near it the bottom consists of an iron grating — the "grizzly." The stones are washed forward over the grating, and fall or are raked out at the end. Under the grating is the second section of the sluice, often arranged at right angles, or to run in an opposite direction and with a smaller inclination. On this the sand and fine particles carried by the water fall, so that the smaller particles of gold may be recovered. In sluicing, mercury is often fed in at the top of the sluice in order to amalgamate the gold, and the amalgam then lodges behind the riffles. In other cases the fine sand, after passing through the first section of the sluice, falls on inclined tables covered with blankets, rough cloth, or hides with the hairy side up, over which it flows in a thin stream. These "blanket strakes" serve to arrest and recover the fine gold. Amalgamated copper plates are employed for the same purpose in some cases, over which the fine sand flows before running to waste.

In dealing with the hard "cements" and "deep leads," the material is generally first treated in a "puddling" machine. In this the pay dirt is disintegrated by edge runners, or revolving rakes or harrows, or some other form of crushing or stirring apparatus, while a current of water carries the debris from the machine into the flumes and over the strakes. Much of the coarse gold remains in the puddling machine. Where the configuration of the ground admits, there is no difficulty in getting the necessary fall, but where the surface is level this has to be obtained artificially, by erecting very high poppetheads over the shafts from which the pay dirt is drawn. In some cases these are over 100 feet in height, the puddlers being placed on a platform at a suitable elevation, from which the flumes slant downward, being caried on trestles.

Hydraulic Mining.— In places where the ground is suitable, these deep leads and other alluvial deposits are worked by washing down the gravel by means of a powerful jet of water, a head of 200 to 250 feet being sometimes employed. The jet is delivered from a movable pivoted nozzle — the "monitor" or "giant"— against the bank of auriferous material, and the detached debris washed into sluices where the gold is deposited. These sluices are larger than those already mentioned, being sometimes 5 to 6 feet in width, 2 to 3 feet deep, and are often paved with stone and provided with iron riffle bars. Some of them are upward of a mile long. Mercury is always fed in at the top, and the amalgam recovered by raising the riffle bars after turning off the water and cleaning out the gravel. An immense water supply is required for this purpose, and the water is often brought for miles in "flumes" which cross gulches and valleys supported on trestles, and are carried in tunnels through hills. This is the cheapest mode of working. From two to four grains of gold per ton, and in some few cases less, is sufficient to pay expenses. If the material is exceptionally hard, blasting is resorted to in order to break it down, when the action of the jet is sufficient to disintegrate it. A "miner's inch" of water is the quantity that will flow through a hole an inch square in an inch board, under a head usually of 7 inches, but more or less according to the locality, the time of flow being specified. A 24-hour inch at 7 inches pressure is nearly 14,000 gallons. In other cases an inch reaches 17,000 gallons. The river gravels of Scotland, Ireland, and Wales, and many parts of Europe, have yielded gold, but the richest of such deposits are those of California, Klondike, and Australia. Magnetic iron sand, tin stone, ilmenite, sulphides, garnets, and diamonds are often associated with alluvial gold.

Quartz Mining.— In dealing with the material from veins or reefs of quartz and other hard substances containing free gold, the stuff is reduced to fine powder and then passed, suspended in water, over copper plates amalgamated with mercury, to which the gold adheres. The "tailings" are then treated either by "concentration" and the concentrates chlorinated, or the whole of the tailings is treated by the cyanide process. The ore to be crushed is first passed through a "stone breaker" or "ore crusher." In the Blake type the moving jaw permits the introduction of the larger lumps at the top, but only allows the crushed material to pass out at the bottom in pieces a little larger than walnuts. In the Gates type a gyrating cone revolves inside a fixed vertical cone. Both have ribbed surfaces, and they are of different angles, so that the large material introduced at the top is broken down before it can pass out at the bottom. The broken ore passes to the ore bins, thence to the feeders and on to the stamps, or some form of grinding mill. The lower part of the battery consists of a cast-iron box — "mortar box"— fitted on one or both sides with a fine screen of wire-cloth or perforated sheet metal. At the bottom of this box is a row of iron blocks called "dies," on which the stamps fall. The stamps are heavy cylindrical cast-iron blocks — heads — to which are attached loose steel facing pieces —"shoes"— fixed to the lower ends of the vertical iron rods — stems — moving up and down between guides carried by the framing. The stamps are raised by cams keyed on the revolving shaft. These engage with collars

— tappets — fixed on the stems. As the shaft revolves, the cam raises the stamp twice in each revolution and allows it to fall when the cam passes. The stamps are thus kept pounding away at the ore in the mortar box. The heads and their attachments weigh up to nearly half a ton, and make from 70 to 90 blows per minute. Five heads usually constitute a battery. Some mines have 200 stamps at work. Each head should crush about one and a half to two tons of ore per day. The motive power may be steam-engines or turbines. Some mills are driven electrically. In wet crushing mills a stream of water is admitted to the mortar box, and carries the crushed material through the screens. Mercury is fed into the mortar boxes in small quantities, and much of the gold is retained there on amalgamated copper plates. Slightly inclined amalgamated copper plates arranged in steps are placed in front of the battery, and over these the crushed ore pulp passes slowly as it leaves the mortar box, the gold being retained by the amalgamated surfaces. The plate nearest the battery is generally heavily silver plated. The "tailings" which may still contain some gold are treated as described below. The stamp battery is often replaced by roller crushing machines and grinding mills of various types, the objects of which are the same; and with certain ores these are even more effective. The best known of these are Krom rolls and the Huntingdon mill. Steam stamps are also employed, making up to 200 blows per minute.

Treatment of Amalgam.— The amalgam, both that which is retained on plates placed in the battery and that which accumulates on the plates outside, is collected from time to time. The plate just outside on which the splash from the battery falls, is made small so as to be readily removable for cleaning up. The other plates are not so often disturbed. The amalgam is ground with water in a small iron pan with a revolving muller —"clean-up pan"— to cleanse the amalgam from sand, etc. Afterward it is pressed in wash-leather, canvas, or other material to expel the excess of mercury, which is returned to the battery as required. The residue is "retorted," that is, it is heated in retorts to expel the mercury, which is condensed and recovered. The gold obtained is subsequently melted in crucibles and afterward refined. "Free-milling" ores yield nearly the whole of their gold by this treatment. Ores containing sulphides, arsenides, antimony, tellurium, etc., do not, and are described as "refractory ores." Free-milling ores are generally "weathered"; the minerals having been decomposed by the action of the atmosphere and water.

Treatment of Tailings.— Tailings always contain gold, either as "float" gold, "rusty" gold, or bound up in pyrites or other mineral occurring in the rock. Pulp (that is, the crushed rock) containing float gold is led through amalgamating pans, where it is ground with mercury before running to waste. In dealing with pyritical ores, when chlorination or grinding with mercury is resorted to, the pulp is passed to concentrating appliances, blankets, strakes and "vanners" being employed. Vanners are by far the most effective and generally employed. Each consists of a slightly sloping table, formed of an endless traveling belt of india-rubber which is stretched over rollers at the ends of a frame, and so mounted as to be capable of violent agitation while moving slowly in an upward direction. The vibrations number 200 a minute. The pulp is led on at the higher end, and the flow of the water carries the light matters down the slope, the separation being greatly assisted by the shaking movement. The residue is also sprayed with water, and the heavy matters only are carried forward by the belt over the higher end and pass into a box below, being then known as "concentrates." These may be ground for a prolonged period with mercury (old fashioned), or treated by chlorination. For cyanide treatment, concentration is unnecessary.

Chlorination Processes.— The concentrates are first calcined to remove the sulphur and arsenic, and to render the material more porous. The residue is treated in vats provided with false bottoms and with filter beds, or other suitable receptacles, having tightly fitting covers. The calcined ore, as free as possible from "slimes"— very fine material which becomes impervious when wet — is dampened with water and sifted into the vats, in order that it may lie lightly. The cover is put on and luted, but a plug in the top taken out. Chlorine gas is admitted slowly under the false bottom of the vat through a pipe for that purpose, and gradually lifts out the air. The plug is then inserted, and the chlorine allowed to act for some 30 to 40 hours, fresh supplies of the gas being added if found necessary. The vat is then ventilated, the cover removed, and the ore treated with water several times to dissolve the chloride of gold that has been formed. The solution drains through the filter bed, and passes out into the settling tank, where any sand, etc., is deposited. From the settlers it passes to the precipitating tanks, where a solution of sulphate of iron — ferrous sulphate — or other precipitant is added, and the whole thoroughly paddled or mixed by mechanical stirrers. The gold is thus precipitated as a brownish purple powder, which is allowed to settle, and the liquor is then siphoned off. Several batches of solution are thus treated, and the gold obtained is collected, washed with acids, dried, and melted in crucibles. Many modifications of the original process with special forms of plant have been introduced. In the Newberry-Vautin process air is pumped into the chlorinating vessel to increase the pressure; in the Pollok process hydraulic pressure and rotation are employed; and the Mears works under pressure of chlorine. In several of these modifications the chlorine is generated in the chlorinating vessel by means of bleaching powder, and either sulphuric acid or acid sulphate of soda. Various precipitants have also been employed. See Gold.

Pyritic Smelting.— This term is applied to a method of smelting pyritic gold ores in cupolas, with or without the addition of coke. If the ore contains above 40 per cent of sulphur no coke is necessary. On charging the ore into the cupola some of the sulphur is driven off by the heat, and part of the remainder when it reaches the twyers burns and furnishes sufficient heat to melt the regulus — a sulphide — and slag off the ferrous oxide resulting, and the quartz. A plentiful supply of air is required. The gold remains in the regulus, which also contains any copper present.

Gold Refining and Parting.— The crude bullion is dealt with according to its purity. Very base bullion is cupelled with lead, only the silver and gold remaining on the cupel. When less impure it is melted in crucibles and nitre and borax added to oxidize and flux the copper and other metals it contains. After this treatment the bullion still contains silver as well as small quantities of other metals, to separate which the gold is "parted." This is effected by boiling the alloy in acids to dissolve out the silver, but unless a sufficient quantity of silver is present the acid will not completely dissolve it. The gold is first alloyed with the necessary quantity of silver. For nitric acid parting the alloy contains two and a half or three times as much silver as gold. When sulphuric acid is employed it contains four times as much or more. The alloy is granulated by pouring the molten metal into water, and the granulated metal is then boiled with nitric acid in glass or platinum vessels, whereby the silver is converted into silver nitrate and dissolved, the gold remaining unattacked. After drawing off the solution the residue is washed, dried, and melted down. The silver in the solution is afterward recovered by precipitating it with hydrochloric acid as chloride, which is subsequently reduced to metal. At the same time the nitric acid is recovered. Sulphuric acid is often used in place of nitric, particularly in dealing with silver containing a little gold. The granulated metal is first boiled with sulphuric acid, in iron pans, suitably provided with covers to carry off the vapors for the recovery of the acid. This converts the silver into soluble sulphate of silver. After a second treatment the residue is washed, dried, and melted down. The silver is recovered from the sulphate by treatment with ferrous sulphate or other reducing agent, or by passing the solution over metallic copper, by which it is precipitated. The precipitated silver is afterward washed and melted down. When little silver is present it may be removed by melting the gold in a crucible and bubbling chlorine gas through the molten metal by means of a clay tube passing through a hole in the cover. The silver is converted into chloride, which melts and rises to the top of the metal. The gold is not chloridized, the temperature being sufficient to completely decompose its chloride. The scum contains some gold, and this is afterward recovered. Besides removing the silver, any traces of lead, antimony, bismuth, tellurium, or other base metals which would render the metal brittle are converted into chlorides and volatilized so that the metal is left tough and malleable. The process is often employed to toughen brittle gold. The employment of bichloride of mercury by gold-beaters to toughen the gold used for that purpose produces a similar effect, the chloride of mercury giving up half its chlorine for the purpose, and being volatilized as calomel. Platinum is separated from gold by alloying with so much silver as to reduce the platinum below 9 per cent. The alloy is then parted by nitric acid, when the platinum dissolves out with the silver. Osm-iridium, a hard alloy, which often occurs with alluvial gold, is removed from the metal before parting by allowing it to subside to the bottom of the pot after addition of silver. This it does owing to its being heavier than gold.

The Cyanide Process.— As defined in the letters patent, this process consists in separating precious metals from ore containing base metal by subjecting the powdered ore to the action of a cyanide solution containing cyanogen to one thousand parts of water. By treating the ore with this dilute cyanide solution, the gold or silver is obtained in the solution, while any base metals in the ore are left undissolved. From this latter solution the gold is precipitated by its disposition on filiform zinc. Chemically, the process is based on this reaction in which a double cyanide of gold and potassium is formed: $2Au + 4KCy + O + H_2O = 2KAuCy_2 + 2KHO$, or according to Feldtmann in his 'Notes on Gold Extraction': $2Au + 8HCy + 3O = 2AuHCy_4 + H_2O$. Two parts of gold plus four parts of cyanide of potassium, plus oxygen from the air, plus one part of water equals two parts of double cyanide of gold and two parts of potassium hydrate. The cyanide process is especially valuable in treating tailings heretofore left on the dumps, not being collectible on the amalgamated plates as is the coarser gold. For cyanide treatment, the free milling ore-tailings should be taken directly from the battery to the cyanide works as any decomposition products vitiates the action of the cyanide.

Stages in the Cyanide Treatment.— The first process consists in passing a dilute alkaline and cyanide wash through the powdered ore, saturating the latter. This first alkaline wash may be 3 parts cyanide of potassium (KCy) to 2,000 parts water and should contain 4 ounces of caustic soda per ton of the wash; after this, the saturated ore should leach for say three hours. The next process consists in passing a much stronger cyanide solution over the washed ore. This second solution should contain from one third to one half of 1 per cent cyanide of potassium (KCy), and 100 per cent water, according to the richness and nature of the tailings to be treated, and the diluted cyanide solution should not be less than one third the weight of the tailings in the vats. For this solution and its contact with the ore at least five hours should be allowed, after which the ore should remain nearly double this time in leaching and three or four for drying. It may now be assumed that much of the gold is in solution. The next process is to subject these tailings to another wash, the object being to wash out the dissolved gold. For this purpose, after the previous strong solution has been drained off, a wash of three fourths to four fifths of the weight of the ore and composed of 3 parts cyanide of potassium (KCy) to 2,000 parts water is used. The ore treated by this weak solution should remain for draining off six or eight hours: finally, a water wash should be applied, the quantity of water used being 7 per cent or more of the weight of this ore; this should be leached off for several hours.

The Precipitation.— The cyanide solutions containing gold, as they flow from the leaching vats, are passed through one or more precipitating boxes containing zinc shavings upon which the gold is precipitated. The quantity of gold cyanide solution flowing through each box containing the zinc shavings must be carefully regulated; which may be ascertained by assaying the solution at intervals. The zinc shavings having reconverted the gold into metallic forms, the next process is the collection of the metal. Care should be taken that no iron or metal other than zinc be exposed to the solutions in the boxes. The tray holding the zinc shavings is lifted out from the last compartment and moved up and down so that the fine particles of slime and zinc should fall through the sieve and settle in the bottom of the box.

The zinc shavings are next taken out of the tray and rubbed in the water to remove all the gold possible adhering to them. The tray is turned over and brushed down so as to remove any gold adhering to it. After this the solution of water in the zinc boxes is pumped into settling tanks, where it is allowed to stand for two weeks; thus giving the extremely fine particles of gold held in the suspension time to settle. Great care should be taken in pumping not to disturb the gold-zinc slimes at the bottom of the box. The gold-zinc slimes are now shoveled into enameled iron buckets and discharged through a 900-inch sieve, and washed and rubbed into the gold clean-up tank. The water having settled in the latter tank is siphoned off, and the precipitate (gold-shines) is drained off through plug holes and deposited upon a calico or linen filter, or into a filter press. When sufficiently dry, the gold-shines are on an iron plate or in iron pots and are ready for roasting and smelting, the object being to oxidize the greatest portion of the zinc which in the form of small chips and shavings, has fallen through the zinc box trays. Having placed the dried precipitate in a plumbago crucible and covered the same with usual fluxes — bi-carbonate of soda, borax, and sand in the proportion of 50 per cent bi-carb., 25 per cent borax and 16 per cent sand to 100 per cent by weight of precipitate — the entire mass is melted, poured into molds, and after settling and cooling may be turned out, and freed from the slag by hammering off the latter. Thus the pure gold bullion is obtained. In the treatment of ore-tailings by the cyanide process, the amount of cyanide necessary varies from three fourths of a pound to one and one fourth pounds per ton of tailings, and the cost of this amount is insignificant.

Estimates on the cost of cyanide plants can be only approximately stated. The following figures may, however, be considered within limits:

To treat 3,000 tons of ore per month........	$25,000
To treat 5,000 tons of ore per month........	37,500
To treat 7,000 tons of ore per month........	50,000
To treat 16,000 tons of ore per month........	90,000

Gold Mining, Dry Placer Method.— The latest invention of Thomas A. Edison has perfected a device for separating the gold from the placer gravel without the use of water. It has been impossible to work these fields because the water needed for the proper operation of the hydraulic system was not at hand.

Mr. Edison employs an air blast to separate the gold from the gravel and other impurities. Like most of his inventions this one is simple.

The old placer system, with the hydraulic stream, got out 75 per cent of the gold, but with Mr. Edison's system of dry washing, it is said, 98 per cent of the gold is saved. When water is obtainable the new system cannot compete with the hydraulic, because the stream washes out gold at the cost of 3 cents a ton while the new plan costs 8 cents.

After the gravel has been excavated by steam shovels it is conveyed to the mill, where it passes through, or over, a series of screens, thereby being separated into particles of uniform size. Each separator is so constructed as to handle gravel of a certain size, and the gravel is distributed automatically to a machine and thence passes to a hopper, situated on top of the separator. Here a roller regulates the feed of the gravel through a narrow slit in the top of the machine, and the gravel falls to the bottom.

Back of this slot and under it there is a rotary blower, which directs a powerful blast against the falling gravel, which falls down almost as a thin screen. The heaviest metal falls directly to the bottom of the separator, but the blast throws the lighter gravel, black sand and iron into a separate compartment, leaving the gold alone and so nearly undefiled that any impurities may be removed by simple processes.

Gold of Pleasure, an annual cruciferous plant (*Camelina sativa*), with abundant yellow flowers, called «cameline» by the French and «dotter» in Germany. It is a weed in lint-fields, but is also cultivated in parts of Europe for the sake of the oil in its seeds. Its seeds and oil-cake are, however, inferior to those of flax, rape or colza. The stems are used for thatch, and made into brooms; and their fibres are sometimes woven into very coarse cloth and packing-paper. The seeds are used for emollient poultices. *C. dentata* is similar, but is not cultivated.

Gold Reserve (United States Treasury). All banking institutions must retain, to pay to depositors or note-holders who may wish to recall their money or claim the fulfilment of the promises on the notes, a stock of coin of a kind satisfactory to the claimants. The amount of this «reserve» needed in quiet times is ascertainable by experience, and is but a small part of the total deposits or issues, as only a small and calculable percentage of customers will wish their money at one time; in times of panic no estimate can be made. The United States formerly directed the Treasury Department to hold a reserve of $100,000,000 in gold, to protect its credit; but the silver panic of 1894 showed that no such arbitrary figure is of any value. When no fear of government solvency was entertained, scarcely any was needed; when the enormous silver purchases had come to threaten a breakdown of national credit by its coming on the market, the sudden rush for gold brought the reserve within three days of extinction, and only the sales of bonds and the knowledge that the policy would be pursued prevented suspension of specie payments. The abandonment of the silver policy has made another «run» less likely; but the government prefers to retain a larger reserve than the former limit. The nominal reserve (see article below) is now $150,000,000; and the recent good business years and excess of exports had brought the actual cash on hand 1 Nov. 1902 up to $350,421,878.30.

Gold Standard and Gold Production. The metal gold is the only substance of which the earth is composed that is freely accepted in return for all services and in exchange for all other kinds of property by every race in the world. In other words, it is the world's standard of value; the one commodity the market for which cannot be glutted; the one substance that is everywhere accepted not only without compulsion and without limit as to quantity, but that is also the particular object of universal desire. As a mineral it has a history that is probably almost as old as the human race that has fought for its possession with so much avidity. No less than 1,400 years before the dawn of the Christian era, the Greeks were using it as an object of ornamentation, and yet even they were not the originators of the practice. They had borrowed the custom of wearing gold to make the person more attractive from the Egyptians, a people that had decked its women in gold more than 1,000 years before the Greeks had dreamed of utilizing it in this manner. It was, of course, the use of gold as an ornament that first suggested its subsequent use as money, and that finally made it the standard upon which the coinage of the world is based.

Among the many things for which the 19th century will always be memorable not the least important will be the fact that it was during this period that the single gold standard was adopted by practically all the civilized nations of the earth. Beginning with a monetary system that, in a broad sense, may be described as the double standard of silver and gold, the nations of the ancient world maintained this method until sometime in the Middle Age. From about the beginning of the seventh century, however, and until sometime in the 13th century, the single silver standard of coinage prevailed, and, when the double standard was then reintroduced, it remained in vogue until the 19th century, when the progressive financiers began to appreciate the need of a better system.

England was the nation that led the way in the work of exchanging the double standard of silver and gold for the single gold standard, but, while this was done in 1816, other countries were slow to follow in her footsteps. It was not until 1854, therefore, that the double standard was superseded by the single standard in Portugal, but Germany followed in 1871; the United States, in 1873; the Scandinavian States, in 1874; Holland, in 1875; France and the Latin Union, in 1876; Austria-Hungary, in 1892; British India, in 1893; Japan, in 1898, and Russia, in 1899. The gold standard also prevails in Roumania, Servia, Turkey, and Egypt, but, while all the South and Central American countries, with the exception of Bolivia, Colombia, Guatemala, Honduras, Nicaragua, Salvador, and Paraguay have adopted it, most of them are almost hopelessly entangled in a mass of irredeemable paper. It may thus be seen that, among all the nations of importance, China and Mexico alone failed to adopt the single gold standard during the 19th century, while the latter is now (1905) taking the necessary steps to remedy her financial ills by the adoption of such a standard.

It was not alone for this reason that the 19th century was closely identified with the history of gold, however, for it is this period that will always be noted for having been the occasion of two great events in the world's record; the greatest discovery of gold and the greatest production of gold. According to the statistics prepared by the director of the mint, the world's production of gold during the first half of the 19th century was $787,463,000, while, for the second half, it was $6,909,040,000. At the beginning of the century the most important gold-producing countries were Mexico, Colombia, Peru, Brazil, and Buenos Ayres, in the western hemisphere, and Russia and Hungary in the eastern hemisphere. With the exception of small quantities that were obtained in Africa and from the East Indies there was practically no other places where the metal could be found. During the period from 1801 to 1810, the average annual yield of these countries was not in excess of $12,000,000, and fully two-thirds of this amount came from the American mines. Owing to the revolutionary disturbances that broke out in Mexico and throughout South and Central America during the period between 1810 and 1824, the output of gold, as well as that of silver, was greatly reduced. At this time the world's production of gold declined until it reached the comparatively low average of about $7,600,000 per annum, an amount which, in the opinion of William Jacob, one of the best authorities of that period, was insufficient to supply the quantity used in the arts and to make good the loss by accidents, such as by abrasion, shipwreck, etc. As the restoration of peace was quite generally effected about this time, however, disaster was avoided ,for the increase in the production of gold, which began at once, steadily continued. Even the average output of Russia commenced to show some remarkable gains, her production between 1837 and 1848, averaging more than $12,500,000 per annum, which was in excess of the production of the entire world at the beginning of the century. The following table gives the details of the world's production during the first half of the century as computed by the director of the mint:

Period.	Annual average	Total for period
1801-1810	$11,815,000	$118,152,000
1811-1820	7,606,000	76,063,000
1821-1830	9,448,000	94,479,000
1831-1840	13,484,000	134,841,000
1841-1850	36,393,000	363,928,000
Half-century	$15,749,200	$787,463,000

The era of gold discovery dates from 1848, when James Wilson Marshall, on 19 January, discovered a small lump of gold in the tail-race of Sutter's saw-mill, in El Dorado County, Cal. Naturally such a discovery led to a search, not only of the bed of the stream but in the adjoining ground, and, in both places, rich deposits of the precious metal were found. The story of the rush that followed this find of new gold fields is a familiar tale to readers of American history. The news spread like wildfire through California, down the Pacific coast to South America, and finally east to the Atlantic States, and so to Europe. In response to these tidings gold hunters flocked from every inhabitable portion of the globe, with the result that the gold production of California alone amounted to $36,000,000, or a sum equal to that which the annual average of the entire world had attained during the preceding decade. A year later it had reached the sum of $56,000,000, and it was in that year that a similar discovery of placer gold was made in New South Wales, which was followed shortly by a still more important find in the colony of Victoria. New mines were also discovered in Russia during this period, and as all these discoveries were attended by great public excitement and heavy immigration the new mines were so well worked that the production of Australia and New Zealand soon aggregated $65,000,000, while that of Russia alone was in excess of $25,000,000.

The finding of the Comstock lode in Nevada was the next great discovery of the precious metal. This fissure vein, which was fully four miles long, was in rock of the Tertiary Age, and was situated at the base of Mt. Davidson, in the Virginia range, an offshoot of the Sierra Nevada. In the central part of the fissure its width is about 3,000 feet, while the gangue, or veinstone, is quartz, not uniformly distributed in the fissure, but coagulated in large bodies commonly known as "bonanzas." Apparently the metal had been deposited in this place in solution, while some idea of the tremendous magnitude of the deposit may be obtained from the fact that, since 1861, the year when it was first scientifically worked, the Comstock lode has yielded more than $350,000,000 of bullion. At the value ratio of 1 to 16.40 per cent. of the bullion produced was gold, while 60 per cent. was silver. As the richest ore bodies of the lode had been exhausted during the seventies, the annual yield gradually declined until, in 1882, it was less than $1,500,000, but as attention was then turned to the working of such lower-grade ores as had previously been neglected, the annual production gradually increased until it had again attained a figure of several millions.

It was about this time (1884) that there was discovered in the Witwatersrand of the Transvaal a deposit of gold that was destined to surpass in magnitude, not the Comstock alone, but every other find of the precious metal that the world had ever seen. Here the country rock is a bed of sandstone, interlaminated with deposits of conglomerate, known to the Dutch as "banket." It is this conglomerate that carries the gold, the average being 10 pennyweights per ton of material. Borings to the depth of 3,500 feet, however, have found the proportion of gold in this reef undiminished, while the outcroppings of the reef have been traced for a distance of 40 miles. The working of these mines gave the Transvaal a gold production of $78,070,761, in 1898. Then came the interruptions due to the war with Great Britain, in 1899, and this, with other disturbances, made a full resumption of the work impossible prior to about 1904, although it is believed that the output of the Rand willl yet equal the sum of $100,000,000.

The most surprising discovery of modern times, however, was the finding of the gold placers of the Klondike, in 1894. As the ground underneath which this gold is found is perpetually frozen, it is quite evident that these deposits must have been laid down at some age when the climate of that region was much warmer than it is at present. To procure this gold to-day, however, it is necessary to sink a shaft through the frozen ground by the use of hot boulders, after which the drift is run by building a fire against the face of the ground, the gravel which is then thrown out being left until summer, when it will thaw sufficiently to permit of washing and panning. It has been estimated that all the gravel which two men are able to throw out during the eight months of winter, can be washed by the same men in two months of the summer. In spite of the difficulties of mining and the cost of transportation the output of the Klondike region steadily increased until 1900, when it was estimated at more than $20,000,000. Since that time there has been a slight falling off in the product, which, in 1904, was figured as somewhat more than $16,000,000. Similar placer mines have also been discovered in the Cape Nome region of Alaska, and, in 1904, their output amounted to more than $9,000,000.

At the present time, however, the most important gold-bearing district within the borders of the United States is that at Cripple Creek, Col. This ore is a telluride, known to mineralogists as calaverite. The country rock is altered andesite, granite, or phonolite, containing thinly disseminated iron pyrites and tellurium minerals. The tellurium,, at or near the surface, is oxidized, and the gold, when it is visible, exists as an ochre-like powder known as "mustard gold." The tellurium, through a process of roasting, is oxidized, and the gold thus set free in the metallic state is easily soluble by cyanide or chlorination. The estimated yield of the Cripple Creek district in 1904 was $24,000,000. The increase in the gold production of Australia during recent years has also been a remarkable factor in extending the world's output. During 1900, new workings were established in West Australia, and these, with the product of the older mines, produce an amount of gold, which, in 1904, was approximated at nearly $88,000,000.

The statistics showing the world's production of gold during the second half of the century, as compiled by the director of the mint, are as follows:

Period.	Annual average.	Total of period.
1851-1855	$132,513,000	$662,566,000
1856-1860	134,083,000	670,415,000
1861-1865	122,989,000	614,944,000
1866-1870	129,614,000	648,071,000
1871-1875	115,577,000	577,883,000
1876-1880	114,586,000	572,391,000
1881-1885	99,116,000	495,582,000
1886-1890	112,895,000	564,474,000
1891-1895	162,947,000	814,736,000
1896-1900	257,506,000	1,287,978,000
Half-century	$138,181,000	$6,909,040,000

The production of the world by single years from 1901 to 1904, inclusive, was:

Year.	Production.
1901	$263,374,800
1902	295,889,600
1903	325,527,200
1904	346,892,200
Total for 4 years	$1,231,683,800

The world's production of gold in 1904, according to the same authority, was divided as follows:

Counties.	Value.
Australia	$87,767,300
Africa	85,913,900
United States	80,464,700
Russia	24,803,200
Canada	16,400,000
Mexico	12,605,300
India	11,485,500
China	4,500,000
All others	22,942,300
Total	$346,892,200

The production of the United States and its territories during 1904 was divided as follows:

State, etc.	Value.
Colorado	$24,395,800
California	18,994,800
Alaska	9,160,500
South Dakota	7,024,600
Montana	5,097,800
Nevada	4,307,800
Utah	4,215,000
Arizona	3,343,000
Idaho	1,503,700
Oregon	1,309,900
All others	1,110,900
Total	$80,464,700

In concluding this review of the gold situation it may be interesting to note the manner in which new supplies of gold operate on prices. From a commercial point of view, gold stands for purchasing power, and yet people do not mark up the prices of their goods merely because some new gold mine has been discovered, but the fact that some men have $2 in their pocket where they had only $1 before creates a greater demand for goods, and it is to this increased demand that the advance in prices is due. It was in this way that the new supplies of gold acted when they brought about an increase in both prices and wages during the 20 years succeeding the discovery of the precious metal in California. This result was not brought about because the community was richer for the privilege of having two dollars instead of one with which to transact a given amount of business, but because, as Professor Cairnes shows, the distributions of the earnings of society was shifted by giving the advantage to wage-earners over rentiers and others having a fixed income. The former had more steady employment and better wages than before, while the latter were compelled to pay higher prices for the goods which they consumed without experiencing a corresponding increase in their income.

Gold Standard Bill, a short name for the act of 14 March 1900, "To define and Fix the Standard of Value, to Maintain the Parity of All Forms of Money Issued or Coined by the United States, to Refund the Public Debt, and for Other Purposes." It provides that the dollar of 25.8 grains of gold, .9 fine, shall be the standard unit of value, and all forms of money issued or coined by the United States shall be maintained at a parity of value with this standard, and it shall be the duty of the secretary of the treasury to maintain such parity. All United States notes and treasury notes issued under the act of 14 July 1890 shall be redeemed in gold coin as above, and to secure this the secretary of the treasury is directed to set aside a reserve of $150,000,000 in gold coin and bullion, to be used for such redemption purposes only. If this reserve falls below $100,000,000 despite certain assigned methods of replenishing it, the secretary shall pledge the credit of the United States by issuing bonds at not exceeding 3 per cent interest, payable quarterly, exempt from all taxation. This is not to interfere with the legal-tender quality of silver money already in circulation. As fast as silver dollars are coined under previous acts, an equivalent amount of treasury notes shall be retired, and silver certificates issued instead. The coinage of subsidiary silver coins, and the recoinage of such as are out of circulation, is provided for. This act is not to prevent international bimetallism if it is found possible to secure a stable relation between gold and silver.

Goldau, gŏl'dow, a valley in Switzerland, in the canton of Schwyz, between Mount Rigi and the Rossberg. On 2 Sept. 1806 a landslide from Mount Rossberg destroyed the village of Goldau and three other villages situated in the valley, killing about 450 persons. A little village built in the valley, near the mines, is called Goldau. It has a population of about 490.

Goldchain, or Golden Moss. See STONECROP.

Gol'den, Colo., city, county-seat of Jefferson County; on Clear Creek, and on the Union P., the Denver, L. & G., and the Denver & G. R.R.'s; about 15 miles west of Denver. In the vicinity are deposits of coal and brick clay. The chief industries are smelting, the manufacturing of brick and pottery, and flour milling. A State Industrial School and a School of Mines are located here. Pop. 2,203.

Golden Age, among the Greeks and Romans was the reign of Saturn, whose blessings are described by Virgil in his eclogue addressed to Pollio. The Latin poet was borrowing from the Greek Hesiod who depicted the Golden Age as the patriarchal era of Saturn or Cronos. This was followed by the Silver Age of voluptuousness under Jupiter. Then came the Brazen or warlike age under Neptune. To this succeeded the Heroic Age under Mars, the Iron or utilitarian Age under Pluto, god of riches. The Golden Age in England was the reign of Elizabeth (1558–1603); in France under Louis XIV. The Golden Age of German literature included the period between Klopstock and Goethe (1750–1850). The Golden Age of Italian art was the famous 'Cinque Cento' extending from the life of Leonardo da Vinci (d. 1520) to Michelangelo (d. 1576).

Golden Beetle, one of the richly gilded beetles of the family *Chrysomelidæ* (q.v.).

Golden Bible, the Book of Mormon, which Joseph Smith, Jr., professed to have found in 1823. He declared that an angel appeared to him, and led him to the discovery. He was not, however, allowed to take up the gold plates on which the book was written until four years later. Joseph Smith was at first unable to read the "reformed Egyptian" characters in which the revelation was written until, in the same box with the plates, he discovered an instrument called Urim and Thummin, by the aid of which he translated the Golden Bible into English and published it in 1830, with the certificate of 11 men testifying that they had seen the plates of gold.

Golden Bull, a name given to several state documents; the principal ones are as follows:

1. Of Hungary, 1222, wrung from King Andrew II. by his nobles, just as Magna Charta was extorted from John of England. Andrew II. of Hungary, surnamed "Hierosolymitanus," was a feeble, self-willed, worthless king, like John of England. Its terms were:

The nobles and the Church were to be exempt from taxes.

The daughter of a noble without male heir shall inherit one fourth of his property.

No noble shall be obliged to follow the king in any foreign war.

The palatine (that is, mayor of the palace), shall be the supreme judge.

No foreigner to hold office or dignity without consent of the council of the realm.

The king shall not grant counties or offices of any kind in perpetuity.

If the king violates any of the laws in this bull, it shall not be treason to levy war on him.

This bull was so called because the attached seal was enclosed in a golden case or box. It is rather remarkable that one of the very first countries in Europe to effect the liberty of subjects should have been one of the last-born nations, the Huns of Hungary.

2. 'Bulla Aurea of the Empire,' 1356, published by Kaiser Karl IV. at the Diet of Nuremberg, and held the Magna Charta of Germany. It prevented a repetition of the contests which had hitherto arisen whenever a vacancy in the throne occurred; and regulated the functions, number and privileges of the electors. Called "golden" because the seal attached to the parchment was of gold instead of lead, or else that it was enclosed in a golden case.

It limited the number of electors to seven (three prelates and four lay princes). The prelates were the three Archbishops of Maine, Cologne, and Treves; the lay princes were the King of Bohemia, the Duke of Saxony, the Margraf of Brandenburg, and the Pfaizgraf of the Rhine. Their persons were declared sacred. Every question was to be decided by majority and without appeal.

Golden Calf, an idolatrous image, doubtless of Egyptian suggestion and symbolism, cast by Aaron from the earrings of the people, while the Israelites were encamped at the foot of Sinai, and Moses was absent on the Mount.

Golden Circle, Knights of the. See Knights of the Golden Circle.

Golden Cross, United Order of the. See United Order of the Golden Cross.

Golden-crowned Sparrow, Thrush, etc., birds so named for some conspicuous yellow marking on the top of the head. The sparrow (*Zonatrichia coronata*) is a near relative of the white-crowned, or Peabody bird (q.v.), and is seen in the United States only in the spring and fall; it sings brilliantly in its Arctic and Alaskan breeding-home. The golden-crowned "thrush" is a warbler, bettter known as "ovenbird" (q.v.). The "wren" or "gold-crest" is a kinglet (q.v.).

Golden or War Eagle. See Eagle.

Golden Eagle, Oriole, Plover, Shiner, Warbler. See Eagle; Oriole; Plover; etc.

Golden-eye, or Whistle-wing, a duck (*Clangula clangula*) which breeds numerously in all northern regions, where its nest is made in holes in trees, or (in Lapland) in suitable boxes placed in trees. The American birds form a geographical race called *Americana*. During cold weather they appear in the United States and the middle districts of Europe, traveling about in small, watchful parties which escape swiftly on the least alarm, and arouse all other ducks within sound of the loud noise made by their wings. An European name is "garrot." The general color of the drake is white beneath, with head and sides of neck rich green, back and tail grayish-black, and the bill bluish-black; it has a round white spot before each eye, the iris of which is golden yellow, and two white bands on the wing; length about 19 inches. The female is ashy, with rufous head. In the Rocky Mountains and northward occurs a second somewhat larger species, Barrow's golden-eye (*C. islandica*), which differs prominently in the greater extent of the loral spot.

Golden-eyed Fly, a lace-winged fly (q.v.).

Golden Fleece. See Argonauts.

Golden Fleece, Capture of the ("Argonautica"), an epic poem in four cantos, by Apollonius of Rhodes (235 B.C.), a contemporary of Ptolemy Philadelphus. Apollonius found all the elements of his poem in the legendary traditions of the Greeks; the expedition of the Argonauts being, next to the siege of Troy, the most famous event of the heroic ages. The third canto describes the conquest of the Golden Fleece, and the beginning of Medea's love for Jason, the development of which forms the finest portion of the poem. The Argonauts go through the most surprising adventures, and encounter perils of every description, before they are able to reach the port from which they started. These various events have allowed the poet to introduce brilliant mythological pictures such as his account of the Garden of the Hesperides. The work has been frequently translated, and is admittedly the masterpiece of Alexandrian literature. The 'Argonautica' of Valerius Flaccus is an imitation of that of Apollonius, regarded by most modern scholars as without originality or invention.

Golden Fleece, Order of, a celebrated order of knighthood in Austria and Spain, founded by Philip the Good, duke of Burgundy and the Netherlands, at Bruges, 10 Jan. 1429, on the occasion of his marriage with Isabella, daughter of King John I. of Portugal. The order was instituted for the glory of the saints and the protection of the Church, and the fleece was probably assumed for its emblem as much from being the material of the staple manufacture of the Low Countries as from its connection with heroic times. The number of the knights was 31, and they themselves filled up vacancies by vote. This continued till 1559, when Philip II. of Spain held the last (the 23d) chapter of the order in the cathedral of Ghent; and subsequently Philip obtained from Gregory XIII. permission to nominate the knights himself. After the death of the last Hapsburg king of Spain in 1700, the Emperor Charles VI. laid claim to the sole headship of the order in virtue of his possession of the Netherlands, and, taking with him the archives of the order, celebrated its inauguration with great magnificence at Vienna in 1713. 'Philip V. of Spain contested the claim of Charles; and the dispute, several times renewed, was at last tacitly adjusted by the introduction of the order in both countries. The insignia are a golden fleece (a sheepskin with the head and feet attached) hanging from a gold and blue enameled flint-stone emitting flames, and borne in its turn by a ray of fire. On the enameled obverse is inscribed *Pretium laborum non vile*. The decoration was originally suspended from a chain of alternate flints and rays, for which Charles V. allowed a red ribbon to be substituted, and the chain is now worn only by the grand-master. The Spanish decoration differs slightly from the Austrian. The costume consists of a long robe of deep red velvet, lined with white taffetas, and a long mantle of purple velvet lined with white satin, and richly trimmed with embroidery containing fire-stones and steels emitting flames and sparks. On the hem, which is of white satin, is embroidered in gold, *Je l'ay empris* («I have captured it»). There is also a cap of purple velvet embroidered in gold, with a hood, and the shoes and stockings are red. See Reiffenberg, 'Histoire de l'Ordre de Toison d'Or' (1830); and Zoller, 'Der Orden vom Goldenen Vlies' (1879).

Golden Gate, a channel at the entrance to San Francisco Bay, between the peninsula upon which is located San Francisco and the one upon which Sausalito stands. The average width is two miles, and the depth is sufficient for ocean steamers. It is guarded by Forts Pointe and Mason, both on the south shore, and by a fort on Alcatraz Island. The name was given to this channel by Drake, about 1578.

Golden Hind, The, one of the two vessels in Sir Humphrey Gilbert's colonizing expedition of 1583. Gilbert's own vessel was the Squirrel, and he went down with it in a storm. The Golden Hind, Capt. Edward Hales, returned to England with the news.

Golden Horn, the harbor of Constantinople, an inlet of the Bosporus; so called from its shape and beauty. See CONSTANTINOPLE.

Golden House of Nero, a palace which Nero erected for himself at Rome after the disastrous fire of 64 A.D. This palace stretched from the Palatine across the level area on which the Flavian amphitheatre was afterward built to the foot of the Esquiline. According to Tacitus, whose virulence is often unjust, Italy and the provinces were plundered to gratify the emperor's love of magnificence in the erection of this structure. Gold and precious stones blazed on its walls; the grounds around it were variegated with meadows, lakes, and shady woods, and it was considered one of the wonders of the Roman empire.

Golden Mole, or **Cape Mole**, a South African insectivore with fur showing golden iridescence. It has the habits of a mole, no external ears or tail, and the eyes covered with skin; but a greater structural resemblance to the potamogales (q.v.). Five species constitute the family *Chrysochloridæ*, differing from moles (q.v.) most markedly in the fact that the fore-feet are adapted for digging by the development of the middle toe into a powerful tool, and by a hollowing inward of the chest. The best known species is *Chrysochloris trevelyani*, about six inches long.

Golden Oriole, commonly known as the Baltimore oriole, an American bird (*Icterus galbula*), closely allied to the *Ploceidæ*, weaving birds of Asia. Its nest is skilfully constructed so as to hang in the form of a long slender pouch from the extremity of a bough. Its plumage is brilliantly contrasted in color, and as black and yellow were the armorial colors of Lord Baltimore it was named in early colonial days after that nobleman. It is found in the hot months as far north as the coast of New Brunswick, and westward from the Saskatchewan River to Texas and northern Louisiana. In winter it migrates to Panama and the West Indian Islands. It is a powerful and delightful songster. Its eggs are from 4 to 6 in number and hatch in 14 days. The golden oriole is the farmer's friend and destroys many insect pests which are destructive to vegetation.

Golden-rod (*Solidago*), a genus of plants belonging to the *Compositæ*, containing about 85 species, most of them natives of North America, where their brilliant yellow flowers are very conspicuous in the autumnal months, especially in Canada and the northeastern United States. Two or three species are found in Europe, and a few in South America and Mexico. They are perennial, chiefly herbaceous, with simple undivided leaves, and bear numerous small flowers, disposed in spikes or panicles. Among the marked forms of inflorescence are the pyramidal panicle of numerous, one-sided, scorpioid racemes, well illustrated by the *S. canadensis* and *S. rugosa;* the almost level cyme of the *S. rigida;* and the dense thyrsus-like cluster of the *S. speciosa*. The florets of the ray are about five in number, and yellow, the *S. bicolor* excepted, which has whitish rays. The dried leaves of the sweet-scented or anise-scented golden-rod (*S. odora*) have been used as a substitute for tea. This plant yields an aromatic oil with tonic properties. In Europe the different species are cultivated in gardens for ornament; one, the Aaron's rod (*S. virgaurea*), is common in Great Britain. The Alpine golden-rod is found on the summits of mountains in Maine, New Hampshire, and northern New York, and also in Europe. The sea-side or salt-marsh golden-rod (*S. sempervirens*) is an especially showy species; and the «yellow-weed» (*S. canadensis*) sometimes attains a height of eight feet. Some species found in New Zealand and St. Helena attain to the dimensions of trees.

Golden Rose, a rose of gold, or gilded, blessed by the Pope on the fourth Sunday of Lent and sent to some sovereign or other person who is known for his or her loyalty to the Holy See. It is sometimes sent to noted churches or sanctuaries.

Golden Rule, the rule laid down by Jesus in the Sermon on the Mount, and stated by him to be the law and the prophets — that is, a summary of their teaching: «Therefore all things whatsoever ye would that men should do to you, do ye even so to them» (Matt. vii. 12). This rule had already been «examined and adopted as a standard of ethics by westerns like Socrates and easterns like Theng-tsen, the disciple and friend of Confucius, some centuries before the birth of Christ.»

Golden Seal, Orange-root, Yellow Puccoon, or Yellow Indian Paint, a ranunculaceous perennial plant (*Hydrastis canadensis*) of wooded regions throughout the eastern United States, which sends up in early spring a hairy stem about a foot high, with large, deeply lobed leaves and a single greenish-white flower, followed by a head of crimson berries which resemble a raspberry. The root-stock is gathered by country people, especially in the South, for the sake of its thick orange-yellow bark from which a drastic and tonic medicine is made.

Golden State, California, so named on account of its gold deposits.

Golden Spur, Order of the, a papal order of knighthood, whose foundation has a legendary origin in Constantine the Great, or Pope Sylvester. Its institution can be traced historically to Pope Paul IV., 1559. The title of the members is "Count Hospitalers of the Lateran." The right of bestowing the order is vested in other prelates and kings beside the Pope. When it languished, Gregory XVI. revived it in 1841. It is intended to be bestowed as a recognition of conspicuous merit in personal character, science and art, and for services done to humanity and the Holy See. The badge is a gold Maltese cross with white enameled surface, to which a pendant spur is attached. On one face of the cross is a bust of Sylvester, with the inscription, *Sanctus Silvester Pont. Max.* (St. Sylvester, Pope). On the reverse is engraved "MDCCCXLI. Gregorious XVI. restituit" (Gregory XVI. restored it in 1841). The order has three grades; the ribbon is red with black stripes.

Golden Wasp, or Gold Wasp, a cuckoo-fly (q.v.)

Golden Wedding. See DIAMOND WEDDING.

Golden-winged Woodpecker. See WOODPECKER.

Goldfinch. (1) The familiar North American black-winged "yellowbirds" or "wild canaries" of the genus *Spinus,* the best known of which is the eastern thistle-bird or lettuce-bird (*S. tristis*), whose wave-like flight across the fields, each male singing sweetly in its course, forms one of the most pleasing incidents of a rural stroll. These little finches are bright golden-yellow, with the cap, wings, and tail black in the adult male; while the female and immature young are gray-brown and yellowish; and in autumn the male discards his conspicuous dress and assumes the plain attire of his mate. At this season they collect in flocks and remain together during the winter, seeking the seeds of the meadow-grasses and roadside weeds, especially thistles, and often coming near the house and barn. Their summer food includes more soft material, and they gather many caterpillars for their young. The goldfinch is one of the latest birds to make its nest, delaying until midsummer to fabricate the soft cup of hempen and downy materials which is lodged usually in some crotch of a village shade-tree, and contains half a dozen spotless bluish eggs. Several other species dwell in the western United States and southward. (2) The small European finch (*Carduelis carduelis*) to which the name first belonged, and whose habits are much the same as those above described, but which is more varied in plumage. The bill is horn-color, the tip black and the base encircled with crimson; nape of neck white; top of head, shoulder of wing and a part of the quills, black; remainder of wing dull yellow; back and rump dusky brown; under surface dull white. Its nest is neatly built of moss, twigs, roots, etc., lined with wool, is situated in bushes, hedges, or apple-trees, and the eggs are spotted with purple and brown. This finch is one of the sweetest singers of Europe, a favorite cage-bird, and the one most often taught pretty tricks; it is the most useful decoy in bird-catching. Examples are to be found in bird-stores all over the world; and in the neighborhood of New York many have escaped and are living wild in the parks and environs.

Goldfish, a carp (*Carassius auratus*), highly cultivated long ago in China as a domestic fish for the sake of its rich red-gold color, developed out of an originally much duller hue. It was introduced into England in 1728, and has spread over all of Europe and is naturalized in many waters of the United States as well as everywhere kept in household aquaria. The young are dark-colored, assuming the golden hue later in life, and sometimes losing it in old age, when the fish becomes silvery. The "silver fish" is a mere variety, as are the so-called "telescope fish" with large protruding eyes and the Japanese "butterfly fish," in which anal and caudal fins become more or less markedly double. All of these varieties thrive well in confinement when furnished with favorable conditions in the aquarium (q.v.), but are liable to fungus diseases of the skin. Diseased fish will infect all in an aquarium, and the aquarium itself, so that in the case of an inexpensive glass globe it is better to throw the receptacle away; a large aquarium should be emptied and thoroughly treated with some fungicide (q.v.) before new and healthy fish are installed. These fish are bred for sale by some fish culturists in various parts of the United States, who must exercise care or their stock will revert toward the original unadorned type of the species.

Golding, Arthur, English writer and translator: b. probably at London about 1536; d. about 1605. He finished the translation of Philippe de Mornay's treatise 'Sur la Vérité du Christianisme' which was begun by Sir Philip Sidney and entrusted to his care, publishing it under the title 'A Woorke Concerning the Trewenesse of the Christian Religion, etc.' (1589). Beside making translations of the works of Calvin and Beza, he also translated the first four books of Ovid's 'Metamorphoses' (1567).

Goldmark, Karl, Austrian composer: b. Keszthely, Hungary, 18 May 1830. He studied at the Vienna Conservatory. His first composition of note was the overture, 'Sakuntala' (1858); his first opera the 'Queen of Sheba' given at Vienna in 1875. His other works include: 'Merlin,' an opera performed for the first time at the Metropolitan Opera House, New York, in 1887; the overtures 'Prometheus,' 'In Spring,' and 'Penthesilea'; and the symphony 'The Country Wedding.'

Goldoni, gŏl-dō'nē, **Carlo,** Italian writer of comedies: b. Venice 1707; d. Paris 8 Jan. 1793. He early showed a taste for theatrical representations, reading every dramatic production of which he could obtain possession, especially the works of the popular comic poet Cicognini, and, when scarcely eight sketched a comedy, which excited the wonder of his relatives. His father, a physician then practising at Chiozza, destined him for the medical profession, and took him occasionally to visit his patients. But Goldoni, dissatisfied with this study, obtained permission to study law in Venice. Soon after, however, a relative procured for him a place in the Papal College at the University of Pavia, from which he was expelled for writing an abusive satire. His father died in 1731, and from this time Goldoni lived an unsettled and wandering life, resorting to various means to make a livelihood, but usually living as the companion of strolling players in a continual scene of dissipation and intrigue until 1736, when he married and removed to Venice.

Goldoni's merits in reforming the Italian theatre cannot be mistaken. Many of his numerous pieces still retain possession of the stage in his native country, and, in translations, of the stages of foreign countries. Among the numerous editions of his works, that published at Venice in 1788 and 1794–5, in 44 volumes, is the most complete; and that published at Florence in 53 volumes in 1827 the most elegant. Translations and imitations of some of his works have been made in French, German, and English. Goldoni wrote memoirs of himself in French, in which he also composed two comedies, one of which, 'Le Bourru bienfaisant,' was produced at Fontainebleau and Paris in 1771 with great applause, and has maintained itself on the stage. See 'Memoirs of Carlo Goldoni,' translated by Black with essay by W. D. Howells (1877); Rabany, 'Le Théatre et la Vie en Italie au XVIIIème siècle' (1896).

Golds'boro, N. C., city, county-seat of Wayne County; on the Neuse River, the Atlantic & N. C., the Southern, and the Atlantic C. L. R.R.'s; about 80 miles north of Wilmington, and 50 southeast of Raleigh. It is the site of a State Normal School for colored teachers, the Eastern Insane Asylum, and the Odd Fellows' Orphanage. The chief manufactures are cotton, agricultural implements, cotton-seed oil, furniture, mattresses, and machinery. Pop. 5,880.

Goldsboro, Kinston, and Goldsboro Bridge, Engagements at. On 11 Dec. 1862, Gen. Foster, in command of the Department of North Carolina, set out from Newbern for the purpose of taking Goldsboro and breaking the railroad that connected Richmond with the railway system of the South and Southwest, and then forming a junction with the Union forces at Suffolk and Norfolk, Va. He had four brigades of infantry, a regiment of cavalry, and seven batteries and two sections of batteries, in all about 11,500 men and 40 guns. He reached Southwest Creek on the 13th, to find the bridge destroyed and his passage disputed by about 400 Confederates, with three guns. The 9th New Jersey and 85th Pennsylvania soon routed this force, capturing one gun, and Foster pushed on toward Kinston, skirmishing heavily on the way, and when within a mile of the place, 14 December, encountered a force of 2,000 men under Gen. Evans, posted between the Neuse River and a deep swamp. After a sharp fight Evans was driven across the river, firing the bridge behind him; but the fire was extinguished and 400 prisoners and six guns were taken. Evans retreated through Kinston, reformed his command two miles beyond, and withdrew toward Goldsboro. Foster followed, had a successful engagement on the 16th, at White Hall and, when nearing Goldsboro 17 December, was checked by a heavy force under Gen. G. W. Smith at Goldsboro Bridge. Foster succeeded, however, in destroying the bridge of the Weldon & Wilmington Railroad over the Neuse, also several other bridges, and about six miles of railway, and retreated somewhat rapidly to Newbern, having lost during his eight days' campaign 92 killed, 487 wounded, and 12 missing. The Confederate loss was 71 killed, 268 wounded, and 496 prisoners. The prisoners were paroled.

Union Occupation of Goldsboro.— After the capture of Wilmington by Gen. Schofield 22 Feb. 1865, his next objective point and final destination was Goldsboro, where it had been arranged that he should unite forces with Gen. Sherman, who was marching north from Savannah. Forces were assembled at Newbern, and the march began on 1 March. Kinston was occupied 14 March, after some days' sharp fighting. (See Kinston, Battle of.) The railway and bridges were repaired, and Schofield entered Goldsboro with little opposition on the 21st, and two days later Sherman joined him. Consult: 'Official Records,' Vol. XVIII.; Cox, 'The March to the Sea.'

E. A. Carman.

Golds'borough, Louis Malesherbes, American naval officer: b. Washington, D. C., 18 Feb. 1805; d. there 20 Feb. 1887. In 1827 he rescued the English brig Comet from a Greek pirate whose force was five times greater than his own. In 1861 he was put in command of the North Atlantic blockading squadron and the advice given by him at this time resulted in the Burnside expedition and the capture of Roanoke Island with various other positions of strategic importance in North Carolina. He became rear-admiral in 1862.

Goldschmidt, Hermann, hĕr'män gōld'-shmit, German painter and astronomer: b. Frankfort-on-the-Main 17 June 1802; d. Fontainebleau, France, 10 Sept. 1866. He became a pupil of Schnorr and Cornelius, and went in 1836 to settle at Paris, where he exhibited many pictures, among which may be mentioned: 'Une femme en costume algérien'; 'Le jeune Florentin'; 'La poésie'; 'La Sibylle de Cumes'; 'L'offrande à Venus'; 'Cléopatre'; 'Vue de Rome'; 'Mort de Roméo et Juliette'; etc. In 1847 he suddenly conceived the design of becoming himself an astronomer, and in this new profession he rapidly became known as one of the ablest observers of celestial phenomena. Between 1852 and 1861 he discovered 14 telescopic planets, namely, Lutetia, Pomona, Atalanta, Harmonia, Daphne, Pales, Doris, Eugenia, Europa, Alexandra, Nysa, Melete, Danaë, and Panope. In 1863 his sight began to fail, making it impossible for him to continue his observations.

Goldschmidt, Jenny Lind. See Lind, Jenny.

Goldschmidt, Meier Aaron, Danish novelist and publicist: b. Vordingborg 26 Oct. 1819;

d. Copenhagen 15 Aug. 1887. He entered journalism when quite young, edited the comic paper 'Corsaren' (1840–6), and in 1847 founded a monthly publication in which he discussed the political movement of the time, and showed himself a strong advocate of constitutional freedom. His first novel, 'A Jew,' appeared in 1845; other novels of his are: 'Homeless' (1853); 'The Heir' (1865); and 'The Raven' (1867); he also wrote a few dramas, and his autobiography (1877). His novels are most remarkable for the skill with which he pictures the life of the Jews.

Goldschmidt, Otto, English composer: b. Hamburg, Germany, 21 Aug. 1829. He was a pupil of Mendelssohn and Hauptmann at the Leipsic Conservatory, became a resident of England in 1858, was appointed a professor in the Royal Academy of Music in 1863 and its vice-principal in 1866. From 1876–85 he was first musical director of the Bach Choir. He several times conducted the famous Lower Rhine Festivals at Düsseldorf. His compositions include the oratorio 'Ruth' (1867), and he also edited with Sterndale Bennett 'The Chorale Book for England.' In 1852 he married Jenny Lind (q. v.).

Goldsmith, Oliver, Irish poet and miscellaneous writer: b. Ireland,* 10 Nov. 1728; d. at 2 Brick Court, Middle Temple, London, 4 April 1774. Goldsmith, like Richardson, "flowered late." The son of a poor clergyman of the Established Church, his childhood was spent at Lissoy, a hamlet in Westmeath, lying to the right of the road from Ballymahon to Athlone. From the first instruction of a female relative, he passed to the care of the village schoolmaster, a roving old soldier who had fought in Queen Anne's wars. Thence he went to schools at Elphin, at Athlone, at Edgeworthstown, earning nowhere any particular distinction. He was regarded as dull and heavy intellectually, although physically he was robust and athletic. Now and then he surprised his family by an unexpected gift of repartee, and he scribbled verse early. But nothing occurred in his boyhood to favor the supposition that a genius had been born into the world of letters.

In June, 1744, after anticipating, in his own person, the plot of his later comedy of 'She Stoops to Conquer,' by mistaking the house of a gentleman at Ardagh for an inn, his father, impoverished by the attempt to portion his eldest daughter, sent him to Trinity College, Dublin, as a poor scholar. His college career was not brilliant. His tutor was hard and unsympathetic, and devoted to the mathematics which Goldsmith (like Gray and Swift) detested, though he had some faculty for "turning an ode of Horace." He got a small exhibition in 1747, a success which he unwisely celebrated by a mixed party in the garret which passed for his "rooms." Into this rejoicing his incensed tutor burst abruptly, and by knocking down the host, dispersed the guests. Thereupon his humiliated pupil ran away, vaguely bound for America. Matters were, however, patched up by his elder brother, and he returned to college, where, in February, 1749, he took a low degree.

He left no memories behind him but his name scratched upon a window-pane, a battered lexicon scored with "promises to pay," and the tradition that, after writing songs at five shillings a head for the Dublin ballad singers, he used to steal out in the twilight to hear them sung. When he returned to his widowed mother (his father had died during his college days), he had no more pressing vocation than to fish in the river Inny, blow the German flute, and take the chair at the village "free and easy." When he was old enough, he presented himself for ordination, but was rejected for incompetence, aggravated by red breeches. He next tried tutoring; made a little money, bought a good horse, and started again for America. In brief space he returned on a miserable hack, and without a penny. Law was then essayed. Being equipped with £50 for study in London, he lost it on the road to a sharper. Finally he did reach Edinburgh, to study physic. Upon the same pretext he went from Edinburgh to Leyden. Then, being again without means, he started — like Holberg — to make a kind of Grand Tour on foot through Europe. He visited France, Germany, Switzerland, and Italy, flute-playing and disputing at convents for a subsistence. In February, 1756, being then seven and twenty, he landed at Dover with a few half-pence in his pocket. He had, however, sent home to his brother from Switzerland a fragment of the poem which afterwards became 'The Traveller.'

For the moment literature seems to have been the last thing in his thoughts. He is suspected to have tried strolling; he is known to have been an apothecary's assistant, a poor physician (with a dubious foreign diploma), a reader and corrector of the press to Richardson the novelist, and an usher in a Peckham "academy." Here, at last, he drifted into authorship, being engaged by Griffiths of the 'Monthly Review' to supply "copy" of all work for that serial. With Griffiths he speedily fell out; and eventually found his way back to Peckham, where his old employer promised get him a foreign medical appointment. Meanwhile he published (1758), under a pseudonym, a translation of the 'Memoirs' of Jean Marteilhe of Bergerac, a Protestant condemned to the galleys for his religion. Failing, for unknown reasons, to take up the post at Coromandel which had been found for him, he tried to pass as a hospital mate. He was rejected at Surgeons' Hall in December, 1758, as "not qualified."

We next hear of him as living in a tiny court off the Old Bailey, writing a high-titled 'Enquiry into the State of Polite Learning in Europe.' This, superficial of necessity, but bright and epigrammatic, attracted some notice. He began a miscellany called 'The Bee,' and was employed on various periodicals. Then Smollett enlisted him for the 'British Magazine;' and for Newbery's 'Public Ledger' he wrote the delightful essays afterwards collected in 1762 as the 'Citizen of the World.' By this time the skies were opening. He had moved into better rooms at 6 Wine Office Court, Fleet street, made the acquaintance of Johnson, and

* The exact place of Goldsmith's birth is doubtful. It is usually said to be Pallas in Longford, but others make it Elphin, Roscommon.

was certain of employment. Besides dispersed papers, he wrote 'Memoirs of Voltaire,' a 'History of Mecklenburgh,' a 'Life of Richard Nash' (of Bath). What is more, he was writing the 'Vicar of Wakefield,' for in October, 1762, he sold a third share in that book to Benjamin Collins, a Salisbury printer, for £21. How this is to be reconciled with Boswell's story that Johnson sold the entire novel to a bookseller for £60 has not yet been explained; but internal evidence shows clearly that parts of the book were written in 1762.

His further career must be rapidly abridged. After much compiling for Newbery, which included an excellent 'History of England' in letters, he published, in December, 1764, his first long poem, 'The Traveller; or, a Prospect of Society.' Its sweetness of versification, its simple language and the beauty of its descriptions at once distinguished it as the best poem since the death of Pope. Its popularity drew attention to its writer's other work, and a volume of his collected essays followed in 1765. Upon these came 'The Vicar of Wakefield,' 1766. Its success, strange to say, was only gradual, but it continues to this day; and its inimitable types, its happy mingling of Christianity and character, its wholesome benevolence and practical wisdom are not likely to be forgotten. The Primrose family are citizens of the world.

Goldsmith's next triumph was on the stage. In January, 1768, he managed, after many vexations, to get a play produced at Covent Garden. This was 'The Good Natur'd Man,' in which he attempted to combat the insipid "genteel" comedy made popular by French models and the novels of Richardson. His efforts were only partially successful, though his profits were sufficient to enable him to move into fresh chambers in the Temple, whence, in a maze of miscellaneous "book-building," he sent forth, in May, 1770, another and a still more beautiful descriptive poem, 'The Deserted Village.' It was received with enthusiasm, and speedily ran through three editions. Three years later, though always hampered with task-work, he crowned his achievements with the comedy of 'She Stoops to Conquer.' In the interval which had elapsed since 'The Good Natur'd Man,' "genteel" comedy had passed into the "sentimental" stage. But Goldsmith's bustling piece, skilful in construction and brimming with humor and character, gave a knock-down blow to the lachrymose drama, which was eventually dispatched by Sheridan. A few months later, in April, 1774, Goldsmith died, and was buried in the Temple burying-ground. The Literary Club, to which he had belonged, erected a tablet to him in Westminster Abbey, with a well-known epitaph by Johnson. 'Retaliation' and the 'Haunch of Venison,' two of the happiest of his lighter poetical efforts, were published posthumously.

Goldsmith had many weaknesses. He had few physical advantages; and he was both sensitive and self-conscious. But he had the best heart in the world. "Let not his frailties be remembered," said his rugged old Mentor, Johnson; "he was a very great man." He was also a very great writer. To have died at 46, after 30 years of purposeless "eddying round and round," the author of two admirable didactic poems, an unique novel, and a comedy which still holds the boards, to say nothing of his essays and familiar verse, which are models in their way, is certainly to deserve a high position in the work of his century,— a position which he retains to-day in virtue of his simplicity, his kindliness, his humor, and the indefinable gift of genius.

Bibliography.— Goldsmith's life has been written by Prior (1837); Forster (1848–71); Washington Irving (1844–9); William Black, 'English Men of Letters' (1878); and Austin Dobson, 'Great Writers' (1888, revised American edition, 1899). His "miscellaneous works" were first published in four volumes (1801), with the so-called 'Percy Memoir.' Then, in 1820, came a "trade edition," followed by Prior (1837), and Cunningham (1854–5). The fullest modern edition is that of Gibbs 'Bohn's Standard Library' (5 vols., 1885–6). There are editions of the poems by Mitford 'Aldine series' (1831–95); Bolton Corney (1845), and in the 'Temple Library' (1889). A reprint of Marteilhe's 'Memoirs' was published in 1895, and a fac-simile reprint of the first edition of the 'Vicar of Wakefield' with a bibliography in 1885. Consult also Boswell's 'Johnson;' Macaulay, 'Encyclopædia Britannica;' Thackeray's 'English Humorists,' and 'Edinburgh Review,' 1846, by Lord Lytton.

Austin Dobson,
Author of 'Life of Goldsmith,' etc.

Goldsmith Beetle, an attractive northern dung-beetle (family *Scarabaeidæ*) measuring nearly an inch in length and shining like burnished gold. It is most abundant during May and June, flying principally at night; and, although it feeds on the foliage of various shade and fruit trees, seldom does much harm. The name is extended by entomologists to all scarabs of the sub family *Rutelinæ*.

Goldthread, a low smooth ranunculaceous herb (*Coptis trifolia*), closely related to hellebore, whose evergreen leaves are all basal, long-petioled, and divided into three serrate broadly obovate parts; and the flowers small and white on scapes. The root consists of long, bright, yellow, bitter threads. This plant contains a white alkaloid called coptine, and a tea made of it is tonic. It grows in boggy woods throughout all northern regions. See also Coptis.

Goldtit. See Verdin.

Goletta, gō-lĕt'tä, Africa, the port of the city of Tunis, from which it is 11 miles north. In the new quarter are the bey's palace, a large dock, and an arsenal defended by a battery. Pop. about 3,000.

Golf, anciently known as Goff, Gouff, or Gowff, a game of Dutch origin, but generally identified with Scotland, where as early as 1457 the local Parliament inveighed against its abuse, and whence it has become popularized throughout the English-speaking world. The word, derived from the German *Kolbe*, in Dutch *Kolf*, signifies a club. *Kolf*, resembling golf, is a very ancient pastime in Holland and Belgium, where it is usually played on the ice.

The modern game of golf is played with clubs and balls on specially prepared courses called *links*, generally laid out on open suitable grounds. The simplicity of the game is attractive to beginners, but with a little experience the beginner learns how necessary are practice, skill, and judgment to make one play well enough to be classed as a good golf player. The prime necessity is plenty of room. The ground best suited for the purpose is a reach of undulating country with a sandy soil, short, crisp turf, and plenty of holes or ruts, the latter forming the *hazards* — natural obstacles — or *bunkers* — artificial obstacles — necessary to prevent the game from being too easy. The *links* should not be less than three miles round nor more than five. Throughout it are distributed 18 artificial holes at any distance from 100 to 500 yards apart. The holes are 4½ inches in diameter, and each is surrounded with a *putting green*, a space 60 feet square and made as smooth as possible to enable the player to aim with accuracy. The other requisites are two small balls about two inches in diameter and made of gutta-percha, and a number of *clubs* adapted to the various contingencies likely to arise.

There are two styles of clubs, the wood and the iron; these consist of a long wooden handle, preferably of hickory, securely attached to a head of beech wood, or of steel as the case may be. Altogether there are 19 shapes of clubs, but six are usually sufficient for a player's needs. The different clubs are used under different circumstances; for example, the chief wooden-headed clubs are the *driver* and the *brassy*, the first being used for driving the ball a long distance, and the latter, which is shod with brass, being employed in special situations, as when the ball is in a hollow. The club called the *putter*, used when the ball is near the hole, has the head either of wood or of iron. The iron-headed clubs are the *cleek*, the *iron*, the *mashie*, and the *niblick*, all adapted for special purposes. The clubs are used for driving the balls into the holes, and the object of the player is to get his ball into all the holes successively with the fewest possible strokes. When played by two persons the game is called *singles;* when played by four persons in pairs, it is called *foursomes.* There are two chief methods of playing the game, known as *match play* and *medal play*. In the former, two players are usually pitted against each other. Attended by their *caddies*, boys carrying the bags containing the clubs, the players start from the *teeing* ground where one of them begins the match by placing his ball on a small heap of sand, or on an artificial rubber cone, known as a *tee*, and driving it as near as possible to the first hole. A good driving stroke from a tee would be 200 yards. The record, made at St. Andrews, Scotland, is 280 yards. The other player does the same with his ball, after which the player whose ball is farthest from the hole plays again. They continue thus until both balls have been holed. The player who takes the fewest strokes to do this is said to win the hole and counts one, and if both have taken the same number of strokes the hole is *halved* and neither counts. Having *holed* his ball the player takes it out, *tees* it again, and starts out for the next hole. Much of the interest of the game depends on the skilful play required to avoid the *hazards* and *bunkers* scattered over the course, or to get one's ball out when it lands in a difficult spot. In *medal play* the winner is the player who goes the round of the course in the fewest possible strokes irrespective of whether he had a majority of holes or not. Various modifications of these two modes of scoring are in use. A hole match may be won before the round is completed, as, for instance, when one competitor is four holes ahead with only three still to be played. When one player has a lead equal to the number of holes still unplayed, he is said to be *dormy* that number of holes; thus, a player when *dormy three* has a lead of three after playing the fourth last hole, in which case, though he may not win, he cannot lose. The central authority on the game in America regulating the various championships, etc., is the United States Golf Association organized 22 Dec. 1894, with which is now affiliated over 200 clubs throughout the country. Consult: Clark, 'Golf: A Royal and Ancient Game' (1899); Travis, 'Practical Golf' (1901); Richards, 'Royal Game of Golf' (1902).

Go'liad, Texas, city, county-seat of Goliad County; on the San Antonio River, and the Southern Pacific R.R., about 45 miles from the Gulf and 168 miles southwest of Galveston. Goliad gets its name from Hidalgo (q.v.), the patriot priest of Dolores, who in 1810 led the revolution in Mexico against Spain. When Goliad was founded the people did not dare to name it Hidalgo, so dropping the silent H and transposing the letters, they made the word Goliad. This place was the last site of the ancient mission of La Bahia del Espiritu Santo (1749). This mission was first founded at the place where La Salle built Fort Saint Louis in 1685. Goliad was the scene of a bloody contest (1812) between the so-called "Republican Army of the North," under Magee and Gutierrez, and the Mexicans. Here Magee died, evidently assassinated. In the Texas revolution (1835) Goliad was a point of strategical importance to the Texans. It was captured by Ben Milan and Collingsworth and became the base of military operations. The independence of Texas was declared here 20 Dec. 1835. Ira Ingram and Philip Dimmit were the leaders in formulating this declaration, and at the meeting there were 92 soldiers and all the citizens of the town. The official declaration of independence was made at Old Washington 2 March 1836. In Goliad, on Palm Sunday, 27 March 1836, the Mexican commander, Urrea, caused to be slaughtered 300 unarmed men who had surrendered, Fannin (q.v.) and his command. These defenseless men had been promised life and liberty before being marched out in squads and shot down like dogs. Urrea claimed he acted under orders from Santa Anna (q.v.). Afterward a rallying cry of the Texas troops under Sam Houston was "Remember Goliad." In 1902 Goliad was visited by a disastrous cyclone which swept away almost the whole town. Pop. 2,000.

Goliardery, gō'lĭ-är-dėr-ĭ, the name given to the *Carmina Burana*, a series of satirical Latin poems of the 13th century. They were the productions of the self-styled Goliardi, mediæval wandering students, disciples of the mythical Golias. While attacking the abuses and vices of the period, especially those existing in the Church, they glorified also the love of nature, women, and wine. This naturally antagonized the ecclesiastical mind which was prone to exaggerate into grave sins what ordinary men would consider as mere peccadilloes. From a classical standpoint the majority of the songs are generally below criticism; from a moral point of view, many of them are vigorous and healthful, and are popular among German students of the present day. Consult: Schmeller, 'Carmina Burana' (1894); Symonds, 'Wine, Women, and Song' (1884).

Goli'ath Beetle, one of the huge scarabe beetles of the cetonian genus *Goliathus*, distinguished by their large size, the horny processes on the head of the male, and the teeth-bearing lower-jaws. The name specifically belongs to *G. giganteus* of the Gold Coast, which is four inches long, and is chalky-white broadly and variously marked with black. It feeds almost entirely on the sap of trees. Compare HERCULES BEETLE.

Golomyn'ka, or **Oil-fish**, a goby-like fish (*Comephorus baikalensis*) found only in Lake Baikal, about a foot long, destitute of scales, and very soft, its whole substance abounding in oil, which is obtained from it by pressure. It is never eaten.

Golosh'es (Fr. *galoche*, "a patten, clog, or wooden shoe") (1) a kind of wooden clog, with a joint at the instep and upper leathers like those of very low shoes, worn in the Middle Ages. (2) India-rubber overshoes first manufactured in the United States and introduced into Great Britain about 1847. The term is now restricted to the latter meaning, and is used mostly in England, very rarely in the United States. See INDIA-RUBBER; RUBBER MANUFACTURES.

Go'marists, the ultra Calvinistic party in the Dutch National Church, so called from their leader, Francis Gomar (q.v.).

Gomez, gō'mēs, **Antonio Carlos**, Brazilian composer: b. Campinas 11 July 1839; d. Pará September 1896. He was a pupil at the Milan Conservatory, and had his first opera, 'A noite do castello,' presented at Rio de Janeiro in 1861. His 'Se sa minga' gained notable success at La Scala, Milan, in 1867, and was followed by a series of varying merit, including: 'Guarany' (1870); 'Salvator Rosa' (1874); and 'Lo Schiavo' (1889). He wrote the hymn 'Il saluto del Brasile' for the Centennial Exhibition at Philadelphia (1876), and a cantata, 'Colombo,' for the Columbian Exposition (1893). He was director of the Conservatory of Music at Pará, Brazil, 1895–6.

Gomez, Estevan, ēs'tā-vän, Portuguese navigator: b. about 1474; d. about 1530. He became an expert pilot in the Portuguese East Indian fleet, sailed in 1519 on Magellan's voyage as pilot of the Trinidad and was later transferred to the San Antonio, on board which he contrived a successful mutiny and then sailed for Spain. There he was imprisoned, but in a short time set free. It appears that in 1524–5 he was sent by Charles V. to explore the eastern coast of what is now the United States and discover a northern route to the Orient. A map executed in 1529 by Diego Ribeira, a cosmographer, marks the territory included between the present States of Rhode Island and New Jersey, Tierra de Gomez.

Gomez y Baez, ē bä'ēs, **Maximo**, Cuban soldier: b. Bani, Santo Domingo, 1831; d. Havana, Cuba, 17 June 1905. When Santo Domingo revolted against Spain he served as lieutenant of cavalry in the Spanish army; and when the freedom of the island was declared he went with the Spanish army to Cuba, but left the army because Gen. Villar maltreated some Cuban refugees. In 1868 he joined the Cuban insurrection, and through his ability and daring soon rose to a position of prominence, being in several successful engagements; though deprived of his command at one time, he was soon recalled, and rose to be major-general. On the failure of the rebellion, he left Cuba and settled on his farm in Santo Domingo. Returning to Cuba, he was influential in bringing about the insurrection of 1895–8, and was made commander-in-chief of the Cuban army. His policy was to avoid open engagements and to drive the Spaniards out by devastating the island and constant harrassing of their troops. When the American landed in Cuba (1898) he willingly co-operated with them. On 24 Feb. 1899 he marched into Havana at the head of his soldiers and was received by the United States authorities. In March of the same year he was deposed from his command by the Cuban Assembly on account of his accepting $3,000,000 for his army from the United States. He assisted the American governor-general in his work in the island, and was at one time suggested as a candidate for the presidency of the Cuban republic.

Gomez-Ferias, fā-rē'äs, **Valentin**, Mexican statesman: b. Guadalajara 14 Feb. 1781; d. Mexico City July 1858. He studied in the University of Guadalajara, was appointed a professor there in 1810, was a liberal member of the first constituent congress, was elected vice-president with Santa Anna, and in consequence of the latter's absence, assumed executive powers 1 April 1833. His administration was strongly opposed by the Clerical party; in 1835 a constitutional congress refused to acknowledge his authority, and he was exiled. He returned in 1838; in 1840 led an unsuccessful revolt, and again was banished. Having returned in 1845, he was elected vice-president in 1846; later a deputy to Congress, and was appointed postmaster-general under Alvarez.

Gompers, Samuel, American labor leader: b. London, England, 27 Jan. 1850. A cigar-maker by trade, he has been known as a zealous worker in the cause of the rights of labor, since his boyhood. He has been active in efforts to organize the working people, and was one of the founders of the American Federation of Labor, of which he is president. He has exerted much influence and has put forth various pamphlets on the labor question and the labor movement in general.

Gomuto, gō-moo'tō, a name in the East Indies for the stiff, strong fibre obtained from the leaves of the sugar-palm or areng (*Arenga saccharifera*) and hence often applied to the tree itself. This fibre, also called "ejow," is extensively used for ropes on account of its extraordinary strength and durability. At the base of the older leaves grows a woolly material called "baru," useful as stuffing for cushions, calking seams, and similar purposes. See PALM; SAGO.

Gonaives, gō-nä-ēv', Hayti, town on the west coast on the bay of the same name, 65 miles north-northwest of Port au Prince. It has an excellent harbor, a naval and military hospital, and a mineral spring. The exports are cotton, coffee, salt, and mahogany. Pop. 18,000.

Gonas. See HOTTENTOTS.

Goncourt, de, dė gôṅ-koor, EDMOND LOUIS ANTOINE HUOT: b. Nancy 26 May 1822; d. 16 July 1896; and JULES ALFRED HUOT DE: b. Paris 17 Dec. 1830; d. Auteuil 20 June 1870; French novelists. The Goncourt brothers were not men of letters but artists primarily, and in 1849 they set out, knapsack on back, to traverse France for drawings and water-colors. Their note-books made them writers as well as artists, and already in 1852 they had commenced that literary partnership which continued nearly 20 years. Their earliest serious works were a group of historical studies upon the second half of the 18th century, intended to be an effective resurrection of its habits of life, manners, and costume, which, though elaborate in detail lacked calm and impartial historical sense, breadth of view, and creative grasp of character. These books were: 'Histoire de la Société Française pendant la Révolution' (1854), 'La Société Française pendant le Directoire' (1855); 'Portraits intimes du XVIII. Siècle' (1856–8); 'Histoire de Marie Antoinette' (1858); 'Les Maitresses de Louis XV.' (1860), 'La Femme au XVIII. Siècle' (1862), and 'L'Amour au XVIII. Siècle' (1875); 'Gavarni' (1873), and 'L'Art au XVIII. Siècle' (1874). The more important work of the De Goncourt brothers was their novel writing; their conception of the novel was that it should be an imaginative attempt to grasp and summarize the results of close observation; their aim was to paint manners by taking the traits in which one man resembles a class; hence they select as generic types only persons of moderate faculties. Their novels include: 'Les Hommes de Lettres' (1860), republished in 1869 under the title 'Charles Demailly'; 'Sœur Philomène' (1861); 'Renée Mauperin' (1864); 'Germinie Lacerteux' (1865); 'Manette Salomon' (1867); and 'Madame Gervaisais.' After the death of his brother, Edmond wrote the 'La fille Elisa' (1878), a novel; 'L'Œuvre de Watteau' (1876); 'L'Œuvre de Prudhon' (1877); and 'La Maison d'un Artiste' (1881). Consult: Bellock and Shedlock, 'Edmond and Jules de Goncourt.'

Gon'dola, a long narrow boat used on the canals of Venice. The middle-sized gondolas are upward of 30 feet long and 4 to 5 feet broad; they always terminate at each end in a sharp point, which is raised perpendicularly to the ordinary height of a man. They have a well-furnished cabin amidship. They are propelled by rowing; the oarsman or gondolier stands in the stern facing forward; sometimes there are two gondoliers, the second one standing in the bow. They are usually painted black in accordance with an old law of the Venetian republic, which prescribed that all gondolas should be black, except those of the doge and the foreign ambassadors. The gondolas were until recently the only means of getting about the city; now steam-launches, acting as omnibuses, are also used.

Gonds, an aboriginal race of British India, a remnant of the Dravidians who were driven out of the plains by an early Aryan invasion. They took refuge in Gondawana, a territory pretty well identical with what are now called the Central Provinces. Here their seat was the Satpura plateau, between the rivers Pain Ganga, Pranhita and Godavari on the west and the Indravati on the east, while they were bordered on the north by the river Nerbudda. They still retain their dominion in the mountain forests of Orissa. Since 1781 they have become subjects of England, and their speech and religion have more and more conformed to those of the Hindu. Their language, known as Gondi, is a Dravidic branch of the Dekhan language. The contact with British civilization has not influenced them much in their highland lurking places. Their religion consists in a worship of many spirits, and they are enslaved to their priests. They have distinct physical characteristics which differentiate them from the Hindus. They are swarthy, almost black in complexion; their hair is long and black, though sometimes it is of a ruddy tinge. In countenance they have a broad forehead, and small, deep-set eyes. They wear little clothing. One of their clans, the Moria, tattoo their faces, and shave their heads. They do not like agriculture, but are much in demand as builders and roadmakers. According to the census of 1891 the total number of Gondi-speaking people in British India is 1,380,000, the majority of whom are found in the Central Provinces, the remainder being scattered through Bera and Hyderabad. Consult: Forsyth, 'Highlands of Central India' (1889); Dalton, 'Descriptive Ethnology of Bengal' (1872); Risley, 'Tribes and Castes of Bengal' (1892); Williamson, 'Gondi Grammar and Vocabulary.'

Gon'falon, an ensign or standard which used to be borne by the chief magistrates of many Italian cities, as Florence and Lucca. These magistrates were hence called gonfaloniers. The title of gonfalonier was also sometimes bestowed by the Roman Catholic Church on persons of distinction, who were called gonfaloniers of the Church.

Gong, an instrument of Chinese origin, made of a mixture of metals and shaped into a basin-like form, flat and large, with a rim a few inches deep. The sound of the gong is produced by striking it, while hung by the rim, with a mallet, which puts the metal into a state of vibration, and produces a loud piercing sound. The modern gong or gong-bell is sounded by striking it with a hammer operated by machinery.

Góngora, Luis de Góngora y Argote, loo-ēs' dā gōn'gō-rä ē är-gō'tā gōn'gō-rä, Spanish lyric poet: b. Cordova, 11 July 1561; d. there 23 May 1627. About 1614 he entered the Church, and became a prebendary of the cathedral at Cordova, and eventually chaplain to Philip III. Góngora's earlier writings — sonnets on a great variety of subjects, lyrical poems, odes, ballads, and songs for the guitar — are inspired with much true poetic feeling. His later works, consisting for the most part of longer poems, such as 'Solidades' (or Solitary Musings), 'Polifemo,' 'Pyramo y Thisbe,' are executed in an entirely different and novel style, characterized especially in respect of diction, by some of the same distinctive features as are found in Euphuism in England and Chiabrerism in Italy. This later style of Góngora, which his followers and imitators designated the *stilo culto,* is florid, pedantic, full of Latin inversions and mythological allusions, pompous, and mannered, and in many places very obscure. His works were never published during his lifetime. The first edition was printed by his friend, Vicuña, in 1627. See Churton, 'Góngora' (1862).

Goniatites, go"nĭ-a-tī'tēz, a group of ammonites (q.v.), including the earliest forms characterized by the structure of the septa, which are lobed, but without lateral denticulations, as in the higher ammonites; they consequently exhibit, in a section, a continuous undulating line. Some forms with slightly waved septa approach very near to the Nautilus. The siphonal portion is shorter than the sides, forming a sinus at the back, as in the Nautilus. The last chamber, the one tenanted by the animal, occupies a whole whorl, and has besides a considerable lateral expansion. The shells are small, seldom exceeding six inches in diameter. This genus is confined to the Palæozoic strata.

Goniom'eter, a device for measuring the angles of crystals. The application goniometer may be likened to a protractor with a rotary radius. It is a semicircle hinged at 90°, to which are attached two arms of steel which are directly applied to the crystal whose angles are to be measured. Far more accurate is the reflecting goniometer, consisting of a graduated circle mounted either vertically or horizontally upon a stand with an apparatus for adjusting the crystal, and one or two telescopes; it determines through what angular space the crystal must be turned that two rays of light reflected in turn from two surfaces shall have the same direction.

ननioph'olis, a primitive crocodile of the Jurassic Period. It is distinguished from modern crocodiles by several features, especially by the bi-concave vertebræ and the arrangement of the bony plates on the back. It once inhabited the Jurassic swamps and river-deltas in Europe and America, along with dinosaurs, turtles, etc. A complete skeleton is now exhibited in the Brussels Museum.

Gonorrhœa is perhaps the most universal and widespread of all diseases that affect the human race. Competent authorities have computed that fully three fourths of the adult male population and from one sixth to one third of the adult female population have contracted this disorder. The great majority of women who have gonorrhœa are reputable married women who have been infected by their husbands. Material as well as moral and sanitary conditions modify venereal morbidity. It is much greater in large centres of population than in suburban and rural communities.

Definition.— Gonorrhœa may be defined as a specific inflammation peculiar to certain mucous membranes, attended with the production of a purulent discharge. This discharge has the property of exciting a similar inflammation when brought in contact with other mucous surfaces susceptible to its action. The urethral mucous membrane in the male and the mucous membrane of the urethra, vagina, and cervix in the female are ordinarily the seat of gonorrhœal inflammation. Almost all mucous surfaces of the body, particularly the conjunctival mucous membrane, are susceptible to the irritant action of gonorrhœal pus.

Cause.— The cause of gonorrhœa is a specific micro-organism termed the gonococcus, which was discovered by Neisser in 1879. Inflammation of the urethra may result from a multiplicity of causes, chemical, irritant, and others, but true gonorrhœal inflammation has as its unique etiological factor the gonococcus.

The Gonococcus.— This micro-organism is a diplococcus; in shape each individual of a pair resembles a coffee bean — flat or slightly concave on one side and rounded on the other, with their flat surfaces opposed. The two hemispheres are separated by such a narrow interval that it is only recognizable under a lens of high power. The diplococci are grouped in pairs, fours, and other multiples of two. Their growth occurs by fissure, at right angles to the central interspace. The gonococci are always grouped in irregularly shaped columns, and are never met with in chains or pairs, as certain other micro-organisms. The differential characteristic of the gonococci is, that they quickly take a stain of aniline dyes and are more rapidly bleached than other micro-organisms. They may occur both within and without the pus and epithelial cells. In acute cases they are very numerous, but have a tendency to grow fewer with the decline of the inflammatory process. They are characterized by a marked longevity, are susceptible of existing in a latent state for an indefinite period, and are capable of being revived and exalted in virulence by local irritation which causes congestion of the parts, or when transferred to virgin tissues in which they find conditions favorable for their germination and growth. Numerous cases are on record where the gonococcus has been found still conserving all its virulence, and susceptible of being provoked into new activity by a variety of irritant causes years after infection.

Within the past two or three decades, our knowledge of gonorrhœa has undergone most marked and revolutionary changes. The old conception of gonorrhœa was that of a purely local disease, confined to the mucous tract in which it had its habitual origin, trivial in character, of limited duration, and entailing no serious consequences to the individual, except from neglected complications. The occasional occurrence of rheumatism, or of ophthalmia, which was recognized by the older observers, was thought to be due to the development of a latent rheumatic diathesis, to sympathetic inflammation, or simple metastasis. The idiosyncrasy of the patient was thought to play an important role in their production.

Since the discovery of the gonococcus, new facts have been developed, showing that instead of being limited to the genito-urinary tract, the range of its morbid action is much more extensive, and not infrequently is radiated to important internal organs. As a result of modern investigations, it may be positively affirmed that the gonococcus is susceptible of being taken up by the blood-vessels and lymphatics, and that it may affect almost every organ of the body. Staining and culture experiments have demonstrated its presence not only in the ovaries, tubes, and peritoneal cavity, which it reaches through invasion of the intermediate mucous membrane, but also in the lining membrane of the brain and cord, of the heart, of the pleura, liver, spleen, kidneys, as well as the joints and tendinous sheaths.

The number, variety, and gravity of these systemic manifestations has led to the serious consideration of the question whether gonorrhœa is not to be classed as a constitutional affection. The cause or relation between these systemic affections and the gonococcus has been proven by the identification of the gonococcus in the lesions it has produced. These general effects have been also ascribed not simply to the pathogenetic action of the gonococci, but to their toxins and the presence of certain pyogenic microbes associated with the gonococcus.

Complications.— The more common complications of gonorrhœa are acute and chronic inflammation of the prostate and bladder and seminal ducts and vesicles, the cord and testes.

Gonorrhœal Arthritis.— One of the most important complications of gonorrhœa is seen in certain joint-affections, which are usually described under the term of gonorrhœal rheumatism. This complication usually occurs from the second to the third week of the disease, but may develop as early as the fifth or sixth day. Gonorrhœal arthritis manifests a remarkable affinity for the large articulations, as the knee and ankle joints, the hip and elbow. Only one joint may be involved, constituting what is termed mono-articular arthritis, or a number of joints may be involved, constituting poly-articular arthritis. In the latter case, different joints are more likely to be involved in succession, rather than simultaneously. As a result of the inflammation of the synovial membrane, which is particularly involved, there often occur serous, fibrinous, or purulent effusions. It is essentially a hydrarthrosis, and in most instances the disease is confined to the synovial membrane of the joint during the whole course of the affection. Gonorrhœal arthritis is usually chronic in duration, often lasting from two to three or for many months. In some cases it is chronic and practically indefinite. Anchylosis or immobility of the joint from rapid formation of adhesions is a not infrequent termination. Very often the tendinous sheaths, the bursæ and fascia may be involved.

Unfortunately the treatment of gonorrhœal rheumatism is extremely unsatisfactory. It does not seem to be susceptible to the curative action of remedies which are valuable in attacks of ordinary rheumatism. In quite a large proportion of cases there is more or less deformity or permanent disability.

Gonorrhœal Ophthalmia.— There is usually recognized a distinction between an ophthalmia which is due to a septic absorption, like gonorrhœal rheumatism, and that form of purulent conjunctivitis which is caused by direct transference of pus containing gonococci to the eye. The former never results from the direct inoculation of the contagious matter. Its symptoms are milder, and there are rarely changes which occasion adhesions or permanent injury to the sight. On the contrary, purulent conjunctivitis is due to the inoculation of the mucous membrane of the conjunctiva. The inflammatory process is characterized by greater intensity and rapidity of action, and not infrequently results in partial or complete loss of vision. Unless prompt and efficient treatment be at once instituted the cornea may rapidly ulcerate and slough, and prolapse of the contents of the globe of the eye may occur through the perforation. These changes are sometimes almost incredibly rapid, taking place in three or four days, exceptionally in 24 hours, and leading to complete destruction of vision. In the ophthalmia of the new-born, the eyes of the child are liable to be soiled with the uterine and vaginal liquids containing gonococci — one of the most frequent causes of blindness. It is estimated that from 10 to 20 per cent of all blindness is caused by gonococcic infection.

Gonorrhœa in Women.— Our knowledge of gonorrhœa in women is essentially a modern acquisition. Until within recent years it had never been the subject of serious and careful study. In the female the local and general effects of gonorrhœa are apt to be much more serious and permanent, owing to the extent and character of the structures exposed to infection. The greater extent of the genital tract permits a larger field for infection by direct continuity of tissue. The periodic vascular changes incident to the menstrual period, and the more pronounced modifications caused by pregnancy, exert a marked influence in accentuating the gravity of gonorrhœa in women. As a result of these changes gonococci, invading the uterine cavity and ascending along the tubes and ovaries to the peritoneal covering, produce peritonitis. Not only do these inflammatory changes imperil the life and health of the woman (which danger, in many instances, can only be averted by an operation involving the sacrifice of her reproductive organs), but they may absolutely extinguish her hope of children. Gonorrhœa is one of the most prolific causes of sterility. The inflammatory changes result in the blocking up of the channels of communication between the ovaries and the uterine receptacle of the ovum, thus preventing contact with the germinative spermatozoids. This mechanical obstacle to the passage of the ovum is, as a rule, permanent and irrelievable. It thus happens that the aptitude of the gonorrhœic woman for conception is often extinguished by the first pregnancy, the first child representing the sum total of her productive energy. In this connection, it may be said that one of the complications of gonorrhœa affecting the male (epididymitis) is a very frequent cause of sterility in men. Neisser believes that gonorrhœa in the male is responsible for 45 per cent of sterile marriages. The proportion of sterility due to the husband is variously estimated from 17 to 25 per cent, and almost the entire proportion of sterility in women is due to gonorrhœa communicated to her by her husband. The low birth-rate of married women is not, as is generally supposed, always voluntary, but it often proceeds from physical causes relating to the health or productive capacity of the married parties; it is not from choice, but from incapacity.

Gonorrhœa as a Social Danger.—Owing to its great frequency, the persistent vitality and virulence of its germs, even after apparent cure, and especially to the grave nature of the infection in women, and the serious menace to the health and even the life of the victim — to say nothing of its destructive effects upon the procreative functions — gonorrhœa is now regarded by the medical profession as one of the most formidable social plagues of our age. Every year in this country thousands of young, innocent women are infected by their husbands, who in most cases are not aware that they carry with them the germs of a disease destined to wreck the health or lives of their partners. Many such women drag out a miserable existence of semi-invalidism, subject to painful or difficult menstruation, no longer able to walk freely, condemned to pass their days of suffering in a reclining position; and after years, it may be, of this suffering, worn out and desperate, they apply to the surgeon, who, at the price of the sacrifice of their generative organs, renders their existence possible in making them castrated women.

PRINCE A. MORROW, M.D.,
Author 'Relations of Social Disease and Marriage,' New York.

Gonsalvo de Cordova, gōn-säl'vō dė kŏr'-dō-vä (Sp. gōn-thä'lō dā kŏr'dō-bä), in full GONSALVO HERNANDEZ DE CORDOVA Y AGUILAR, Spanish warrior: b. Montilla, near Cordova, 1453; d. Granada, 2 Dec. 1515. At the court of Ferdinand and Isabella, Gonsalvo attracted much attention by his personal beauty, his knightly skill, and the magnificence of his apparel and style of living. In the war with Granada, 1481–92, he took many places by storm, and vanquished the boldest Moors who dared to meet him in single combat. He was selected to carry on the difficult and dangerous negotiations with the Moorish king Abu Abdallah (or Boabdil), which resulted in the capitulation of Granada and the termination of Moorish rule in Spain. He helped Ferdinand II., king of Naples, to drive the French over the Neapolitan frontiers, and in 1500 delivered Zante and Cephalonia from the Turks and restored them to Venice. In the war between France and Spain, for the sovereignty of Naples, Gonsalvo gained successive victories, until by the fall of Gaëta, the French were forced to yield their claim upon Naples. Ferdinand now bestowed upon him the duchy of Sessa, and appointed him viceroy of Naples, with unlimited powers, which post he held until 1507, when the jealousy of the king caused his removal.

Gontcharoff, gōn-chä-rōf, **Ivan Alevander,** Russian novelist: b. Semborsk 18 June 1813; d. St. Petersburg 27 Sept. 1891. He studied at the University of Moscow, obtained a post in the finance ministry in 1835; published his first book, 'A Common Story' in 1837; subsequently was appointed an official in the censor's department, and then, until his retirement in 1873, was editor of the *Northern Post,* a government newspaper. His 'Oblomov' (1858), "a personification of that generic apathy which was, and still is, the common product of the material and moral conditions of Russian life," is his best work. He wrote also 'The Precipice' (1868) and some sketches.

Gon'ville and Caius (kēz) **College,** a college of Cambridge University, England, was founded in 1348 by Edmund Gonville of Terrington, Norfolk, and endowed for a master and three fellows. The original site was between Free School Lane and the churchyard of St. Botolph's. In 1353 William Bateman, bishop of Norwich, Gonville's executor, established the college where the Gonville Court at present stands, and altered the name to the Hall of the Annunciation of Blessed Mary the Virgin. In 1558 Dr. Caius obtained the royal charter by which all the former foundations were confirmed and his own foundation was established. By this charter the college was thenceforth to be called Gonville and Caius College. New statutes were given by which the college is henceforth to consist of a master, 30 fellows, and 36 scholars. The fellowships are all open, and are not vacated by marriage, but terminate generally at the end of 10 years from the full standing of M.A. The scholarships are also open. There are also connected with this college four studentships in medicine, founded by Charles Tancred, and two Harrow scholarships.

Gonzaga, gōn-zä'gä, **Thomaz Antonio Costa de,** Brazilian poet; called the Portuguese Anacreon: b. Oporto, August 1744; d. Mozambique 1809. After studying in the university of Coimbra, Portugal, he returned in 1768 to Brazil to enter on an official career. In 1788 he was about to marry a young lady of distinguished beauty when he became involved in a political conspiracy. The court condemned him to perpetual exile in an island on the coast of eastern Africa, which by special favor was commuted to 10 years' banishment to Mozambique. He left Brazil in 1793, and was attacked by fever soon after reaching Africa, from which he recovered only to fall into madness from the effect of the climate. The most interesting of his poems were composed during his captivity, and celebrate in mournful and tender verse the object of his love under the name of Marilia. They are popular alike in Brazil and Portugal, and have been often reprinted. In grace, tenderness, purity of style, and harmony of verse, Gonzaga ranks among the first Portuguese poets.

Gonzaga Family, a noted Italian family which held the supremacy in Mantua 1328–1707. On 14 Aug. 1328 LUDOVICO (or LUIGI GONZAGA) assumed the sovereignty after his sons had driven out the Bonacorsi family and taken possession of Mantua. He died 1360, aged 93. Among his descendants, GIAN FRANCESCO GONZAGA, in 1432, obtained possession of the city, with its territory, under the title of a marquisate, as a fief from the Emperor Sigismund. With VINCENZO II., the reigning line became extinct in 1627. The next heir would have been the Duke of Nevers, but the Duke of Guastalla, Ferdinand II., one degree more remote, laid claim to the whole inheritance, and Charles Emmanuel, Duke of Savoy, claimed Montferrat. It was evident that the house of Nevers had a legal right, and France, Venice, and the Pope supported him. Spain and Austria, on the other hand, supported the groundless claims of the Duke of Savoy, whence arose a war concerning the Mantuan succession, which ended with the triumph of Charles, Duke of Nevers. His grandson, CHARLES III., succeeded him in 1637, and during his reign the principality obtained full independence. He died in 1665. Many persons of this family have obtained military renown. Others have been conspicuous for their love of the arts and sciences. CÆSAR, in 1565, erected the academy Degl'invaghiti; and others of the family founded galleries of paintings and antiquities. Giulio Romano, under their patronage, established an extensive school for painting, and many celebrated artists received from them support and honor.

Gonzalez, gōn-sä'lĕs, **Manuel**, Mexican soldier and statesman: b. near Matamoros 18 June 1833; d. Mexico City 8 May 1893. He entered the army in 1839 and fought under Juarez in 1861. In the war against the French he joined Escobedo in 1865 and was made a brigadier-general. Later he joined the party of Diaz and was secretary of war under him 1877–80, and followed him as president of the Mexican republic 1880–4. After his retirement he was governor of Guanajuato.

Goober, or **Gouber**. See PEANUT.

Gooch, SIR **Daniel**, English engineer: b. Bedlington, England, 24 Aug. 1816; d. Clewer Park, England, 15 Oct. 1889. Besides inventing various improvements in the building of locomotives, he was active in furthering the laying of the first transatlantic cable. He sat in Parliament 1865–85, and was connected with the Great Western Railway as a superintendent 1837–64.

Gooch, Frank Austin, American chemist: b. Watertown, Mass., 2 May 1852. He was educated at Harvard and was assistant in the chemical laboratory there, 1872–5. He was subsequently chemist on the Northern Transcontinental Survey and United States Geological Survey, 1878–86, and has been professor of chemistry at Yale from 1886.

Gooch, SIR **William Bart**, English colonial administrator: b. Yarmouth 21 Oct. 1681; d. London 17 Dec. 1751. He was a soldier of Marlborough in the Netherlands, and was governor of Virginia from 1727 to 1747. In 1740 he accompanied Vernon's expedition against Cartagena, and in 1749, after a generally excellent and successful administration, returned to England. During his term of office he opposed religious toleration to religious organizations other than the Establishment.

Good, James Isaac, American (German) Reformed clergyman: b. York, Pa., 31 Dec. 1850. He was graduated from Lafayette College, Easton, Pa., in 1872; entered the Reformed ministry and has been successively pastor of Heidelberg Reformed Church, York, Pa., 1875–7; Heidelberg Reformed Church, Philadelphia, 1877–90; and Calvary Reformed Church, Reading, Pa., 1890–3. Since the last named year he has been professor of dogmatics at Ursinus College. He has published: 'Origin of the Reformed Church of Germany' (1887); 'Rambles Round Reformed Lands' (1889); 'History of the Reformed Church in the United States.'

Good, John Mason, English physician and author: b. Epping, Essex, 25 May 1764; d. Shepperton, Middlesex, 2 Jan. 1827. In 1793 he removed to London, where he carried on business for several years as a surgeon and apothecary, and after 1820 practised as a physician. His principal works are: 'Memoirs of the Life and Writings of Dr. Alexander Geddes' (1803); Translations of Solomon's Song and the Book of Job; a translation of Lucretius 'On the Nature of Things' (1805); 'Medical Technology' (1810); 'A Physiological System of Nosology' (1817); 'The Study of Medicine' (1822); and 'The Book of Nature' (1826).

Good Friday, the name applied by the Church of England to the Friday before Easter, sacred as commemorating the crucifixion of our Lord; the Great and Holy Parasceve is the Greek title of it, and it is called in the Roman Missal the Parasceve. This day was kept as a day of mourning, of rigid fast, and of special prayer from a very early period. Eusebius (260 A.D.) says that the day had been observed long before his time. Constantine ordered a cessation from all labor on that day. It was one of the two paschal days celebrated by the Christian Church, and in memory of the crucifixion was called by the Greeks Pascha Staurosimon or the "Pasch of the Cross." In the Roman Catholic Church the service of this day consists of what is called the Mass of the Presanctified, the sacred host not being consecrated on Good Friday, but reserved from the preceding day. Communion is forbidden on Good Friday, except in the case of the celebrant and of sick persons.

The most striking part of the ceremonial is the so-called "adoration of the cross," or, as it was called in the Old English popular vocabulary, "creeping to the cross." The black covering is removed from a large crucifix which is placed before the altar, and the entire congregation, commencing with the celebrant priest and his ministers, approach, and on their knees reverently kiss the figure of our crucified Lord. The very striking office of *Tenebræ* (darkness) is held on Good Friday, as well as on the preceding two days: it consists of the matins and lauds of the following day, and has this peculiarity, that by the close all the lights in the church have been gradually extinguished except one, which for a time (as a symbol of our Lord's death and burial) is hidden at the Epistle corner of the altar.

In the Church of England, and in the Protestant Episcopal Church of the United States, as well as in the Roman Catholic Church, Good Friday is celebrated with special solemnity: proper psalms are appointed, and one of the three special collects is a prayer for "all Jews, Turks, infidels, and heretics." In some churches of the English Church, and of the Protestant Episcopal Church, the *improperia*, or reproaches, adopted from the Roman service, are sung; and Bach's passion music is frequently heard. In England and Ireland Good Friday is by law a *dies non*, and all business is suspended; but this is not the case in Scotland or the United States. In Scotland the day till recently met with no peculiar attention, except from members of the Episcopal and Roman Catholic communions; but of late years there have been services in some Presbyterian churches in the larger towns.

A German savant, Prof. Hans Achelis of Königsberg, has decided on the basis of exact calculations made by the Royal Astronomical Society of Berlin that the date of the Crucifixion was 6 April 30 A.D.

Good Hope, Cape of. See CAPE OF GOOD HOPE.

Good Templars, a temperance society which combines the principles of teetotalism with certain mystic rites, imitated less or more from freemasonry, having secret signs, pass-words, and insignia peculiar to itself. It originated in Utica, N. Y., where it was organized by Daniel Cady and others, in 1851, and extended to England in 1868. There is no restriction placed on membership on account of color, age, or sex. The organization consists of local "subordinate" lodges, county "district" lodges, national "grand" lodges, and an international "right worthy" grand lodge. A "juvenile order" is also attached, and the Templars have founded an orphanage at Sunbury, near London, at a cost of $50,000. It has no beneficiary system. Its platform consists of total abstinence from all intoxicating liquors as a beverage, no license, but prohibition of manufacture and sale, and the election of men who will enforce the liquor laws. The motto of the order is "Faith, Hope, and Charity." It is an outgrowth of the Sons of Temperance.

Good-will, the benefit derived from a business beyond the mere value of the capital, stock, funds, or property employed in it, in consequence of the general public patronage and encouragement which it receives from constant and habitual customers. It is legally considered a subject of sale along with the stock, premises, fixtures, trade debts, etc. It is usual for the seller to enter into an express covenant not to carry on a business of the same kind at some specified moderate distance from the place where the purchaser resides, and if he breaks the covenant he is liable to an action for damages. In most of the States of the Union the purchaser of good-will can only cut the seller off from soliciting old customers of the business surrendered and from otherwise attempting to supplant the new tenant in popular favor, by securing a written contract.

Good'ale, Dora Read, American poet: b. Mount Washington, Berkshire County, Mass., 29 Oct. 1866. With her older sister, Elaine Goodale (q.v.), she began to write verse in early childhood. Her poems, and those of her sister, appeared in magazines at that time and attracted much favorable notice. With her sister she published: 'Apple Blossoms' (1878); 'In Berkshire with the Wild Flowers' (1879); 'All Round the Year' (1880). She has also published 'Heralds of Easter' (1887).

Goodale, Elaine (Mrs. Eastman), American poet: b. Mount Washington, Mass., 9 Oct. 1863. In June 1891, she was married to Charles A. Eastman, M.D., an educated Sioux Indian. At an early age she began to write verse and with her sister Dora (q.v.) published: 'Apple Blossoms: Verses of Two Children' (1878); 'In Berkshire with the Wild Flowers' (1879); 'Verses From Sky Farm' (1880). She was sole author of 'Journal of a Farmer's Daughter' (1881). She taught for some time in the Hampton Institute in Virginia, and edited the 'Southern Workman' (1883). In 1885 she visited the Great Sioux reservation, and subsequently taught school at White River Camp, Lower Brulé Agency, Dakota.

Goodale, George Lincoln, American botanist: b. Saco, Me., 3 Aug. 1839. He was graduated from Amherst College in 1860 and has been instructor and professor of botany at Harvard from 1872. He has published: 'Concerning a Few Common Plants' (1879); 'Physiological Botany' (1885); 'Wild Flowers of America' (1886); 'Useful Plants of the Future.'

Good'all, Edward, English line-engraver: b. Leeds 17 Sept. 1795; d. London 11 April 1870. He was self-taught, and early in his career attracted the notice of Turner, a number of whose pictures he engraved. He also engraved many plates for the annuals.

Goodall, Frederick, English painter: son of Edward Goodall (q.v.): b. London 17 Sept. 1822; d. London 29 July 1904. At 17 years of age he began to exhibit, and he has produced some pictures of high excellence. He was elected to the Royal Academy in 1863. Among important works of his are: 'Raising the Maypole in the Olden Time' (1851); 'Cranmer at the Traitors' Gate' (1856); 'The Subsiding of the Nile' (1873); 'Andromeda' (1887); 'The Thames from Windsor Castle' (1890); 'Isles of Loch Lomond' (1891); 'The Palm Grove' (1894).

Goode, George Brown, American naturalist: b. New Albany, Ind., 13 Feb. 1851; d. Washington, D. C., 6 Sept. 1896. He was graduated from Wesleyan University in 1870, and from 1887 was assistant secretary of the Smithsonian Institution. Among his publications are: 'Museums of the Future' (1890); 'American Fishes'; 'Nature and Economic History of the American Menhaden.'

Goode, Richard Urquhart, American geographer: b. Bedford, Va., 8 Dec. 1858; d. 1903. He studied at the Univ. of Virginia, was topographer to the United States Geological Survey in 1879–82, engineer and topographer of the Northern Transcontinental Survey in 1882–4, and in 1889 was appointed geographer of the United States Geological Survey. His writings include reports and articles in periodicals.

Goode, William Athelstane Murray, American newspaper correspondent: b. Newfoundland 10 June 1875. After service in the British merchant marine and the United States cavalry, he became assistant night city editor of the New York *Recorder*, later city editor of the *Mercury*, and finally correspondent of the Associated Press, of which he was representative on board the flagship New York during the Spanish-American war. He contributed to magazines and published 'With Sampson Through the War' (1899).

Goodell', Henry Hill, American educator: b. Constantinople, Turkey, 20 May 1839; d. at sea 23 April 1905. He was graduated from Amherst College in 1862; was in the Union army in 1862–3; professor in the Massachusetts Agricultural State College in 1867–86, and in 1886 became its president. For several years he was chairman of the Executive Committee of the Association of American Agricultural Colleges and experiment stations, and in that capacity did much to further the interests of agricultural education.

Goodell, William, American missionary: b. Templeton, Mass., 14 Feb. 1792; d. Philadelphia 18 Feb. 1867. He was graduated from Dartmouth College in 1817, and from the Andover Theological Seminary in 1820; was ordained to the Congregational ministry in 1822, and in the same year went to Syria as a missionary. In 1823 he assisted in the establishment of the mission-station at Beirut, in 1823–8 was active there, in 1828–31 at Malta, in 1831–65 at Constantinople. Among his most important works was the preparation of a translation of the Bible into Armeno-Turkish.

Goodell, William, American abolitionist: b. Coventry, N. Y., 1792; d. 1878. He was in business at different times in Providence, Alexandria, Va., and New York; in 1827 began at Providence the publication of the *Investigator,* and later was editor of a series of abolition periodicals, including the 'Friend of Man,' official mouthpiece of the New York Anti-slavery Society; the 'Radical Abolitionist,' and the 'Principia.' His published volumes include: 'The Democracy of Christianity' (1851); 'Slavery and Anti-slavery' (1852); 'The American Slave Code' (1853).

Goodknight, James Lincoln, American educator: b. Allen County, Ky., 24 Aug. 1846. He was graduated from Cumberland University (Lebanon, Tenn.) in 1871, from the Union Theological Seminary in 1879, studied also at Edinburgh and Jena, and was president of West Virginia University (Morgantown). From 1900 to 1904 he was president of Lincoln (Ill.) University. His articles have appeared in various periodicals.

Good'land, Kansas, county-seat of Sherman County; on the Chicago, R. I. & P. R.R. The manufactures are flour and machinery. The city contains railroad repair-shops and grain elevators, and is the centre of trade for a large agricultural region in which there are a number of cattle ranches. Pop. (1900) 1,059.

Good'man, Edward John, English journalist and novelist: b. London 19 Dec. 1836. He entered journalism in 1857 and has served on the editorial staffs of several prominent English journals, including the London *Daily Telegraph.* Besides 'The Best Tour in Norway' (1891); 'Wilson's Handbook to Norway' (1894); and 'New Ground in Norway' (1896), he is the author of the novels 'Too Curious' (1887); 'Paid in His Own Coin' (1888); 'His Other Self' (1889); 'The Only Witness' (1891); 'The Fate of Herbert Wayne' (1892); 'The Night of the Fog' (1895).

Good'now, Frank Johnson, American legal scholar: b. Brooklyn, N. Y., 18 Jan. 1859. He was graduated from Amherst College in 1879, from the Columbia Law School in 1882, studied also at the Paris Ecole Libre des Sciences Politiques and Berlin University, and was appointed to the chair of administrative law at Columbia in 1883. A recognized authority on municipal, administrative, and constitutional law, he published: 'Municipal Home Rule' (1890); 'Comparative Administrative Law' (1893), 'Municipal Problems' (1897); 'Politics and Administration' (1900).

Good'rich, Alfred John, American writer on musical subjects: b. Chilo, Ohio, 1847. Largely self-taught, he was professor of musical theory in several institutions, and from 1899 directed his attention wholly to writing and private instruction. 'Music as a Language' (1880); 'Complete Musical Analysis' (1889); and 'Analytical Harmony' (1894) are among his books.

Goodrich, Charles Augustus, American Congregational clergyman: b. Ridgefield, Conn., 1790; d. Hartford, Conn., 4 Jan. 1862. He was graduated at Yale in 1812 and held pastorates of Congregational churches in Worcester, Mass., 1816–20, Berlin, Conn., 1820–48, and Hartford, Conn., from 1848. He published: 'Lives of the Singers' (1829); 'History of the United States' (1852–55); 'Universal Traveler,' etc. He was a brother of S. G. Goodrich (q.v.).

Goodrich, Chauncey Allen, American clergyman and lexicographer: b. New Haven, Conn., 23 Oct. 1790; d. there 25 Feb. 1860. He was graduated at Yale College in 1810, and was tutor there 1812–14. After a course of theological study he entered the ministry and was pastor of a Congregational church in Middletown, Conn., 1816–17; was elected professor of rhetoric and oratory in Yale 1817–39, and became professor of pastoral theology in the theological department of the college in 1839. While tutor he published in 1814 a Greek grammar, translated chiefly from the grammar of Hachenberg. This he subsequently revised and enlarged, and published under his own name. It was often reprinted, and for many years was extensively used. About 1832 he published 'Latin Lessons' and 'Greek Lessons,' in which the precepts of grammar are throughout accompanied by practical exercises — a method subsequently applied by Ollendorff to modern languages. In 1828 Noah Webster (his father-in-law) entrusted to him the superintendence of the octavo abridgment of his large dictionary, by J. E. Worcester, with discretionary power to conform the orthography more nearly to the common standard. After several years of labor, he published in 1847 greatly enlarged and improved editions of the 4to and 8vo dictionaries of Dr. Webster. In 1856 he published in 8vo the university edition of Webster's dictionary, and in 1859 a new issue of the unabridged 4to dictionary.

Goodrich, Frank Boot («Dick Tinto»), American writer: b. Boston, Mass., 14 Dec. 1826; d. Morristown, N. J., 1894. He first became known by his Paris letters to the New York *Times.* He was the author of: 'Court of Napoleon: or, Society Under the First Empire' (1857); 'Women of Beauty and Heroism' (1859); 'World-Famous Women, from Semiramis to Eugénie' (1870); etc.

Goodrich, Samuel Griswold («Peter Parley»), American writer: b. Ridgefield, Conn., 19 Aug. 1793; d. New York, 9 May 1860. He began as a publisher in Hartford, and established himself in 1824 as a publisher in Boston. He edited there, from 1828 to 1842, 'The Token,' an annual to which he contributed several tales and poems, and in which also appeared some of Hawthorne's 'Twice-Told Tales.' His famous Peter Parley series of popular and juvenile books was begun soon after his removal to Boston, and gradually extended to more than 116 volumes, comprising geographies, histories, travels, stories, and various illustrations of the arts and sciences. The geniality of these, and the admirable manner in which the author enlisted the sympathies of children, procured for them an immense success, which led to the issue in England of some spurious books under the name of «Peter Parley.» In 1837 he published a collection entitled 'The Outcast, and

Other Poems'; and in 1838 an ethical and educational work entitled 'Fireside Education.' In 1841 appeared a selection from his various contributions to annuals and magazines under the name of 'Sketches from a Student's Window'; and in 1857 'Recollections of a Lifetime,' a most entertaining account of his own history and that of his contemporaries. 'Merry's Museum' and 'Parley's Magazine' were conducted by him from 1841 to 1854. Under Fillmore's presidency he acted as American consul at Paris, and published there in French a treatise on 'American Geography and History.' The last work from his pen was the 'Illustrated Natural History of the Animal Kingdom' (1859).

Good'sell, Daniel Ayres, American Methodist bishop: b. Newburg, N. Y., 5 Nov. 1840. Graduated from New York University (then the University of the City of New York) in 1859; he entered the Methodist ministry in the same year; in 1880–8 was literary editor of the 'Christian Advocate' of New York, and in 1888 was elected bishop and became secretary of the Methodist board of education. He wrote 'Nature and Character at Granite Bay' (1901).

Goodwin, J. Cheever, American dramatist: b. Boston 14 July 1850. He was graduated from Harvard in 1873, was a reporter on the Boston *Traveller* in 1873–4, and secretary to the comptroller of New York in 1886–91. His writings include verse in periodicals and many plays, among them some popular successes, such as 'Evangeline,' 'The Panjandrum,' 'Wang,' 'The Lion Tamer,' 'Lost, Strayed, or Stolen,' and 'The Monks of Malabar.'

Goodwin, Maud Wilder, American historiical novelist: b. 1856. She has published: 'The Colonial Cavalier'; 'The Head of a Hundred'; 'White Aprons: An Historical Romance'; 'Dolly Madison,' a biography; 'Historic New York' (1898); 'Sir Christopher'; 'Flint'; etc.

Goodwin, Nathaniel Carl, American actor: b. Boston 1857. His first appearance was made in 'Law in New York,' at the Howard Athenæum, Boston, and subsequently he became known in burlesque and light comedy. Among the dramas which he has since presented are: 'A Gilded Fool'; 'In Mizzoura'; 'An American Citizen'; his chief success, 'Nathan Hale'; and 'The Altar of Friendship.' He also essayed "Shylock" in Shakespeare's 'Merchant of Venice.'

Goodwin, William Watson, American Greek scholar: b. Concord, Mass., 9 May 1831. He was graduated at Harvard College in 1851; and was Eliot professor of Greek there 1860–1901. He published: 'Syntax of the Moods and Tenses of the Greek Verb'; 'Greek Grammar'; and a revised translation of 'Plutarch's Morals' (1871).

Good'y, a local name in the Southern States for a small bay fish (*Leiostomus xanthurus*), much liked as a pan-fish, and known also as "lafayette" and about New York as "spot." It is one of the family *Sciænidæ* (see DRUM-FISH), has a deep, compressed body, bluish above and silvery below, with "about 15 narrow, dark, wavy bands extending from the dorsal downward and forward to below lateral line; a round black humeral spot rather smaller than the eye." It abounds from Cape Cod to Texas.

Good'year, Charles, American inventor: b. New Haven, Conn., 29 Dec. 1800; d. New York 1 July 1860. After coming of age, he joined his father in the hardware business at Philadelphia. Among the improved implements introduced by them was the steel pitchfork, a substitute for the heavy iron fork previously used. The firm being overwhelmed by the commercial disasters of 1830, Goodyear selected as a new occupation the improvement of the manufacture of India rubber. The first important improvement made by him was at New York in 1836, being a method of treating the surface of native India rubber by dipping it into a preparation of nitric acid. This discovery enabled the manufacturer to expose an India rubber surface in his goods, which on account of adhesiveness was before impracticable. The nitric acid gas process, as it was called, was introduced into public use, and met with great favor, especially in the manufacture of shoes, which continued to be made by that process in great numbers at Providence, R. I., until it was superseded by the invention of vulcanized rubber, for which he obtained a patent in 1844. From this period he employed himself in ascertaining new methods of employing rubber till the patents granted him were 60 in number. He received medals from the Exhibitions at London (1851) and Paris (1855), but his rights were continually infringed, and he remained poor while others were enriched by his inventions.

Goodyear, William Henry, American writer on art: b. New Haven, Conn., 21 April 1846. He was appointed curator of the New York Metropolitan Museum of Art in 1881. He has published: 'Ancient and Modern History' (1883); 'History of Art' (1887); 'The Grammar of the Lotus' (1890); 'Roman and Mediæval Art' (1893); 'Renaissance and Modern Art' (1894); etc.

Goo'kin, Daniel, American author and official: b. Kent, England, about 1612; d. Cambridge, Mass., 19 March 1687. He came with his father to Virginia in 1621, whence he removed in 1644 to Massachusetts, in consequence of his sympathy with the doctrines of the Puritans. He settled in Cambridge, was soon after appointed a captain of militia, and in 1656 became superintendent of all the Indians who had submitted to the government of Massachusetts, an office which he held till his death. He protected the fugitive regicides in 1661, was appointed one of the two licensers of the Cambridge printing press in the following year, became unpopular during King Philip's war by the protection which, as a magistrate, he extended to the Indians, and in 1681 was made major-general of the colony. His 'Historical Collections of the Indians of Massachusetts' bears the date of 1674, and was first published by the Massachusetts Historical Society in 1792. He is said to have written also a history of New England, of which no manuscript has been found.

Goorkhas, goor'kaz. See GHURKAS.

Goosan'der. See MERGANSER.

Goose. See GEESE.

Goose-barnacle. See BARNACLE; BERNACLE-GOOSE.

Goose-fish, or Angler, a marine fish (*Lophius piscatorius*) of the order *Pediculati,* with an enormous head and mouth, no scales, and brightly colored fringes about the jaws, which serve as lures to attract within reach the small fishes on which it preys; the first three rays of the dorsal fin are separated from the others, and spring barbel-like from the top of the head, nodding in the water and attracting other small fishes,— hence the name "angler." Like all fishes of its order, the carpal bones are elongated to strengthen and widen the reach of the pectoral fins, by means of which the fish leaps after its prey. The angler is popularly supposed to catch geese and other swimming birds, whence its name. It reaches a length of four feet, but is useless, and the bane of fishermen. It is remarkable for its pinkish ribbon-like masses of eggs, a foot wide, 40 feet in length, which are not uncommon in summer floating at the surface of the ocean. The goose-fish occurs on both coasts of the North Atlantic and has other names, as "fishing-frog," and "all-mouth." Near relatives are the batfish and the frog-fishes.

Goose-grass, or Gosling-weed, two of the many names applied to a widely distributed troublesome weed (*Gallium aparine*). See BEDSTRAW; CLEAVERS.

Gooseberry, goos'- or gooz'bĕr-ĭ, various spiny shrubs of the genus *Ribes,* natural order *Saxifragaceæ* or *Grossulariaceæ,* mostly natives of the northern hemisphere, especially of North America; some species valued for their fruit (berries), others for their flowers. Of the half dozen species cultivated, the European gooseberry (*R. grossularia*), which appeared in gardens during the 16th century, has developed the largest number of varieties and attracted the widest interest. Its progeny furnish practically all the varieties exhibited at the annual gooseberry shows of England. The fruits of some of these varieties weigh more than an ounce, having been developed by selection and crossing from an original weight of about one quarter of an ounce. The varieties may be divided, like apples or pears, into culinary and dessert sorts. They have not proved generally successful in America, the climate being considered too dry for them. Of the American species, several of which bear finer fruits than the natural European species, *R. oxyacanthoides* is the only one that has produced widely cultivated varieties. It has also entered into many hybrids with the European species. These American varieties are all of the culinary class, or are used while too unripe to be palatable as dessert. The first one, Houghton, was introduced about 1835, and with its seedling, Bowning, still commands the market. In America attention has not been attracted to the gooseberry because the American people have not cultivated a taste for dessert gooseberries. Of the ornamental species, *R. speciosum* is cultivated for its nearly evergreen shining foliage and its fuchsia-like showy flowers. It is not hardy in the northern United States.

The gooseberry is one of the easiest fruits to propagate. Cuttings of mature wood are most frequently used, but layers and suckers are also employed. The plants thrive best upon rather heavy, moist soil, and generally fail upon light soils, especially if dry. They like partial shade and northern exposures. In the South they fail. The plants may be transplanted in spring or fall, about 5 feet apart each way, cultivated frequently until mid-summer, trained and pruned like the currant (q.v.), but somewhat more openly, kept free from fungous troubles by the use of a fungicide (q.v.) and of insects by the use of an insecticide (q.v.). The fungi most frequently found upon the plants are mildew (*Sphærotheca mors-uvæ*) and leaf spot (*Septoria ribis*). The former, which is a surface feeder, appears upon the green parts as a frost-like gray growth, which later becomes brown. Free circulation of air, good drainage and open training of the bushes helps to prevent attacks. Leaf spot produces brown spots upon the foliage, which may fall prematurely. Spraying early in the season is believed to be the only preventive. With few exceptions, the insects that attack the gooseberry also visit the currant (q.v.) and may be combated by the same remedies. Consult: Card, 'Bush Fruits' (New York 1898); Thory, 'Monographie ou Histoire Naturelle du Genre Grosseillier'; Bailey, 'Cyclopædia of American Horticulture' (1900–2).

Gooseberry Insects. See CURRANT-INSECTS.

Goosefoot, a family (*Chenopodiaceæ*) of annual or perennial herbs, rarely shrubs, with 75 to 80 genera and 550 to 600 species, of wide distribution. The typical genus (*Chenopodium*) contains about 60 species, 15 or 20 of which are native to North America, or have been naturalized, some of them almost ubiquitous weeds, such as the pigweed (*C. album*); the city goosefoot (*C. urbicum*), thriving in suburban lots and roadways; the sowbane (*C. murale*); the turnpike or feather-geranium or Jerusalem oak (*C. botrys*); the now world-wide Mexican tea (*C. ambrosiodes*); and the wormseed (*C. anthelminticum*), from which is brewed a homemade vermifuge. Other genera contain allied weeds, as the strawberry blite (*Blitum capitatum*); the large genus (*Atriplex*) of sea-side and salt-land weeds called oraches; the western white sage (*Eurotia lanata*), a gray-green, pubescent fodder plant of the western plains; the sea-blites (*Dondia*) and odd brittle glassworts of salt marshes; and the spiny greasewood and Russian thistle (qq.v.). See CHENOPODIUM.

Go'pher, a name given by the early French settlers in the United States to various animals which honeycomb (Fr. *gaufre*) the ground by burrowing in it. In the Central States the name refers to the too common "striped" gopher, or ground-squirrel (*Spermophilus tridecemlineatus*), a troublesome little animal about 10 inches long, a third of which is tail, which is dark-reddish brown, with 6 to 8 light stripes, alternating with lines of dots — about 13 in all; it is yellowish below, with a broad black stripe on each side. It is a familiar object on prairies and grassy fields throughout the upper half of the Mississippi valley, hurrying to and from its hole, or standing upright, but inconspicuous, curiously watching your movements, but ready to drop out of sight at the least alarm. The burrows are numerous everywhere, and are injurious not only by the space they occupy, and as traps for the feet of horses and cattle, but because they offer run-ways for water and so promote washing away of soil. Some of the holes are short, and are merely shelters; others are long, have a nest at the inner extremity, and side-chambers in which in the autumn large winter stores of seeds are laid away. Where these spermophiles are very numerous, as they have become in the grain-growing districts, of Iowa, Minnesota and the Dakotas, the amount of grain stolen or shaken down is a serious tax on agriculture. Another spermophile, more common northward, is Franklin's or the "gray" gopher (*S. franklini*), which is much larger and has a harsh coat of yellowish-grizzled hair. Several other species inhabit the more western plains. All are truly ground-squirrels of the family *Sciuridæ*, and closely related to the chipmunk (q.v.).

In the farther Northwest, however, the word "gopher" ordinarily means one of the large gray rodents of the family *Geomyidæ*, distinguished prominently by having in the cheeks capacious pouches, lined with fur; hence they are called pocket-gophers and pouched rats. The most familiar species is *Geomys bursarius*, which is about nine inches long and has short legs, close ears and a short hairy tail; the fore feet are very strong, with the three middle toe-nails long and well-adapted to digging, and its burrows are made with surprising rapidity. Its food includes all sorts of vegetable matters, and it often injures orchards by gnawing the roots. As fall approaches it gathers a store of seeds, tuberous roots, nuts, etc., and stows it in its deep residence-burrow, where the winter is passed in a partial torpidity varying with the climate. These provisions are carried in the cheek-pouches, which also serve to take out the loose soil from the burrows. On the Pacific coast occur several other species, some with large, pendent cheek-pouches. In the Southern States is found a species (*G. tuza*), locally called "Salamander," of large size and common in the sandy parts of Florida and the country north of it. The Northwest has a second and smaller kind of gopher (*Thomomys talpoides*), dusky bluish-gray in color, with the lower parts whitish, which is mole-like in its habits, and is known in Idaho as "camass-rat," on account of its fondness for the tubers of the liliaceous plant called camass (*Camassia esculenta*) by the Indians.

All of these animals are a pest to agriculture, and are increasing rather than diminishing in settled regions, owing partly to the increased food afforded them by crops, and partly to the destruction of their natural enemies, the birds of prey, snakes, weasels, foxes, badgers, wolves, etc., which formerly held them in check. Efforts are therefore made to exterminate them in various ways, of which the most effective is by suffocating them with bisulphide of carbon, placed in their holes by saturating some porous object and rolling it into the burrow. Several pamphlets issued by the United States Department of Agriculture describe the animals and their habits, and give directions for their suppression.

Gopher Snake, or Indigo Snake, a variety of a tropical colubrine snake (*Compsosoma corais*) common in the southwestern United States and eastward to Georgia, which reaches a length of 10 feet, and is brownish black with reddish markings about the mouth and throat. It burrows beneath loose soil, is harmless to man, and is believed to prey upon rattlesnakes at every opportunity.

Gopher State, a name sometimes given to Minnesota.

Gopher Tortoise or **Turtle,** a burrowing turtle (*Xerobates polyphemus*) of the southern United States, brownish in color with black head; yellowish below. It is herbivorous and gregarious, and is most frequently found in the pine barrens, where it is frequently eaten by the negroes, who are also fond of its eggs.

Go'ral, a goat-like antelope (*Nemorrhœdus goral*) from the Himalaya Mountains. It resembles somewhat the chamois, and remains in small bands on the highest parts of the mountains. Other species or varieties inhabit the high plateaus of Tibet and Mongolia.

Goramy, gō'ra-mĭ, or **Gourami,** goo'ra-mĭ, the Javanese name of a fish of the genus *Osphromenus* (*O. olfax*), family *Anabasidæ* or climbing perches, a native of China and the Eastern Archipelago, but introduced into the Mauritius, West India Islands, and Cayenne on account of the excellence of its flesh, where it has multiplied rapidly. It is deep in proportion to its length, and the dorsal and anal fins have numerous short spines, while the first ray of the ventral is protracted into a filament of extraordinary length. It is one of the few fishes which build nests, which it does by interweaving the stems and leaves of aquatic plants.

Gordiacea, gôr-dĭ-ā'sē-a, an order of *Nematohelminthes*, the hair-worms (q.v.).

Gordian Knot, a knot tied by Gordius in the rope which bound the yoke of his chariot to the axle-tree in such an artful manner that the ends of the cord could not be perceived. The Phrygians had learned by an oracle that a king would come to them riding in a car, and Gordius appearing thus at an opportune time, received the kingdom. He dedicated his car and yoke of oxen to Zeus, with the knot still untied. So intricate was it that the report went abroad that the empire of Asia was promised by the oracle to him who could untie it. Alexander the Great, wishing to inspire his soldiers with courage and his enemies with the belief that he was born to conquer Asia, cut the knot with his sword, and so claimed to have fulfilled the oracle. Hence to "cut the Gordian knot" is equivalent to removing or solving a difficulty by bold or unusual measures.

Gordia'nus, Marcus Antonius, the name of three Roman emperors, father, son, and grandson. The first, b. 158 A.D., had governed Africa for many years, when he was proclaimed emperor at the age of 80. He associated his son with him in the empire, but six weeks later the son was killed in fighting against the rival emperor Maximinus, and the father, in an agony of grief, died by his own hand. The grandson was proclaimed emperor by the soldiers in Rome 238 A.D., although not more than 15. He reigned six years, when he was assassinated by his soldiers at the instigation of Philip, prefect of the Prætorian guard.

Gordon, Archibald D., American dramatist: b. Ceylon 11 Oct. 1848; d. Port Richmond, Staten Island, N. Y., 9 Jan. 1895. He was dramatic critic for several New York and Chicago journals, and published: 'Trixie'; 'The Ugly Duckling'; 'Is Marriage a Failure?'; 'That Girl from Mexico.'

Gordon, Charles George ("CHINESE GORDON" or "GORDON PASHA"), English soldier: b. Woolwich 28 Jan. 1833; d. Khartum, Africa, 27 Jan. 1885. He entered the Royal Engineers as second lieutenant in 1852, and served in the Crimean war and during the Taiping rebellion, with the permission of the English military authorities, assumed the command of a special corps of Chinese, trained and led by European and American officers. With these materials he performed marvelous feats of skilful soldiership and succeeded in completely crushing the rebellion. The Chinese government was eager to express its gratitude, but he refused all offers of substantial reward. On his return to England with the rank of colonel, he was appointed chief engineer officer at Gravesend for the construction of the Thames defenses. Here, while his engineering work afforded ample scope for his military talents, the philanthropy of his nature had full scope. During the six years he lived at Gravesend his house was school, and hospital, and almshouse in turn. Many a waif he rescued from the gutter, establishing evening classes for their benefit, and keeping sight of the more deserving till they were provided with a career in life; all this being done on his pay as an English colonel, without any private resources whatever. In 1873, on the resignation by Sir Samuel Baker of his command, Gordon was appointed in his place, under the khedive of Egypt, and from 1874 until 1879 governed the vast region of the Sudan with credit to himself and with satisfaction to the Cairo administration. In 1881 Mohammed Ahmed, a Mussulman enthusiast, gave himself out to be the Mahdi — the long-expected Redeemer of Islam — and gathered a number of followers around him who threatened the safety of the Egyptian garrisons in the Sudan. It having been decided that the Sudan be evacuated, the presence of an English officer of high authority at Khartum was asked, with full power to withdraw all the garrisons in the Sudan, and make the best arrangements possible for the future government of the country. Gordon, at the request of the British government, proceeded to the Sudan in the hope that his great personal influence and knowledge of the country would help to set matters right. These hopes were not fulfilled; Gordon was shut up in Khartum by the troops of the Mahdi, and for a whole year he held that town against the Arabs who surrounded him. An English force under Wolseley was despatched for his relief, an advance corps of which sighted Khartum on 28 Jan. 1885, to find that the town had been treacherously betrayed into the hands of the Mahdi two days before, and that its heroic defender had been killed. Gordon had all the qualities which are found in a successful military leader, modified, however, by the strong religious feeling which tinged his mind from an early period, and which latterly became so intensified as to give him somewhat the character of a religious enthusiast and fatalist. He left a most interesting journal, kept during the latter period of his siege in Khartum. Consult: Hill, 'Gordon in Central Africa' (1881); Lives by Forbes (1884); Henry Gordon (1886); Boulger (1896).

Gordon, Charles William ("RALPH CONNOR"), Canadian author: b. Indian Lands, Glengarry, Ont., Canada, 1860. He was graduated at Toronto University in 1883 and at Knox College in 1887; was ordained to the Presbyterian ministry and was a missionary in the mining and lumbering regions of the Rocky Mountains 1890–4. He became pastor of St. Stephen's Church of Winnipeg in 1894, and wrote: 'Beyond the Marshes'; 'Black Rock'; 'Gwen's Canon'; 'The Sky Pilot'; 'Ould Michael'; 'The Man from Glengarry'; 'Glengarry School Days'; and 'The Prospector' (1904), works characterized by vivid descriptions of life and scenery in the Canadian West.

Gordon, LORD George, English agitator: b. London 26 Dec. 1751; d. there 1 Nov. 1793. He was a son of the Duke of Gordon, and entered Parliament in 1774. In 1778, a bill having been passed through Parliament for the relief of Roman Catholics from certain penalties and disabilities, a society called the Protestant Association of London was formed for the purpose of procuring its repeal. In the following year Lord George was elected its president, and in June 1780 headed an excited mob of about 100,000 persons, who went in procession to the House of Commons to present a petition against the measure. The dreadful riot which ensued, and which was not suppressed till after the destruction of many Catholic chapels and dwellings, the prison of Newgate, and the house of the chief justice, Lord Mansfield, led to the arrest of Lord George Gordon, and his trial on the charge of high treason; but no evidence being adduced of treasonable design, he was acquitted. He died, after having become a zealous professor of the Jewish faith.

Gordon, George Henry, American soldier: b. Charlestown, Mass., 19 July 1824; d. Framingham, Mass., 30 Aug. 1886. Graduated from West Point in 1846, he was employed on various duty, later resigned from the army, and practised law 1857–61. In 1861 he organized the Second Massachusetts Volunteers, and became colonel of the regiment. He commanded the United States troops in Florida in 1864, the eastern district of Virginia in 1865, and was mustered out in the latter year with rank of brigadier-general and brevet major-general of volunteers. He wrote a 'History of the Second Massachusetts Regiment' (1876), and other works on the war.

Gordon, John Brown, American soldier: b. Upson County, Ga., 6 July 1832; d. near Miami, Fla., 9 Jan. 1904. He was of Scotch ancestry, his grandfather being one of seven brothers who all fought for American independence in the War of the Revolution. He was graduated at the State University in 1852 and was, a few months later, admitted to the practice of law; but at the outbreak of the Civil War was engaged in mining operations near Raccoon Mountain, Alabama. Here was organized a company, called the "Raccoon Roughs," of which he was elected captain. This company was assigned to the 6th Alabama infantry, in which he rapidly rose through successive grades to that of colonel (28 April 1862). At Seven Pines, through the wounding of General Rodes, the command of the brigade fell upon him; and at Malvern Hill he led it in the grand charge of D. H. Hill's division against the Federal position. At Sharpsburg he was five times wounded. On 1 Nov. 1862 he was commissioned brigadier-general with command of a Georgia brigade of six regiments, which he led with great distinction at Chancellorsville and Gettysburg. On the march into Pennsylvania, just before the battle of Gettysburg, he reached Wrightsville on the Susquehanna, making the most extended advance achieved in the East by Confederates during the war. On the first day at Gettysburg he struck the extreme right of the Union army in Ewell's grand turning movement, by which the victory so desperately striven for by A. P. Hill was secured, and the Federals were driven through the town of Gettysburg to the heights beyond. On 6 May 1864, in the Wilderness leading two brigades, he fell at sunset upon Sedgwick's corps, driving the Federals from a large part of their works and capturing 600 prisoners, including Generals Seymour and Shaler.

On 12 May at Spottsylvania Court House, commanding Early's division, immediately after Hancock had overwhelmed Edward Johnson, Gordon by an impetuous charge first checked the Federals and then drove them back to the base of the salient, where the fight continued with great fury to the close of the day. Two days later Gordon was commissioned major-general and placed in command of Evans' Georgia brigade, Hays' and Stafford's Louisiana brigades, and Terry's Virginia brigade — the latter being made up of the remnants of the "Stonewall" brigade and other Virginia troops. With this command he participated, under Early, in the defeat of Hunter's expedition, the invasion of Maryland, the victory at the Monocacy, the march into the suburbs of Washington, and the battles against Sheridan in the Shenandoah Valley, being especially distinguished in the surprise and rout of Sheridan's army in the early morning at Cedar Creek. Having been assigned to the command of the Second corps of the Army of Northern Virginia, he held his lines with great tenacity, and in March 1865 made the brilliant dash by which he captured Fort Steadman and parts of the line to the right and left of it. Owing to the failure of the supporting column to arrive in time, he was obliged to retire to his original position. On the retreat from Petersburg he protected the rear, and at Appomattox commanded half of Lee's army, making a last brilliant charge of that heroic but now fearfully depleted host. After the surrender he called his men about him and made them a speech remarkable for its strong declarations of faith in God and earnest exhortations to endure defeat with patience, obey the laws, and rebuild their ruined homes and fortunes. He became the trusted leader of his people, was twice elected governor of Georgia, and for two terms represented his State in the Senate of the United States, on all occasions using his influence for peace and fraternity between the late warring sections. As commander-in-chief of the United Confederate Veterans' Association he possessed the enthusiastic love and devotion of his comrades, who would never entertain the idea of his retirement from the office to which they every year elected him, declaring repeatedly that death alone could remove him from that post of honor. His very successful lecture on 'The Last Days of the Confederacy' was well known in both North and South. His war-time reminiscences began to appear in 'Scribner's Magazine' in 1903 and were later published in book form.

Joseph T. Derry,
Author of 'The Story of the Confederate States.'

Gordon, Joseph Claybaugh, American educator: b. Piqua, Ohio, 9 March 1842; d. 1903. He was the earliest American advocate of oral education for the deaf and in 1869 organized the oral department of the Indiana Institution for the Deaf. He was professor of mathematics and chemistry in Gallaudet College, Washington, 1873–97, becoming superintendent of the Illinois Institution for the Education of the Deaf in 1897. He published: 'Education of Deaf Children'; 'Notes and Observations on the Education of the Deaf'; etc.

Gordon, Julien. See Cruger.

Gordon, William W., American soldier: b. Savannah, Ga., 14 Oct. 1834. Graduated from Yale in 1854, he served in the Confederate army during the Civil War, distinguishing himself at the battle of Frederick City, Md., and subsequently was in the cotton trade at Savannah. He was for six years a member of the State legislature of Georgia, was brigadier-general of volunteers in the Spanish-American war (mustered out 1899), and was appointed to the evacuation commission for Porto Rico.

Gordon-Cumming, Constance Frederica. See Cumming, Constance.

Gore, Christopher, American statesman: b. Boston 21 Sept. 1758; d. Waltham 1 March 1827. He was graduated at Harvard College in 1776, and studying law, was soon engaged in good practice. In 1789 he was appointed the first United States district attorney for Massachusetts; in 1796 was chosen one of the commissioners to settle the claims of the United States upon Great Britain for spoliations, and remained in London, successfully engaged in the duties of this office, about eight years. In 1803 he acted as *chargé d'affaires* during the absence of the American minister; in 1809 was chosen governor of Massachusetts; and in 1814 was elected to the United States Senate. He left about $100,000 to Harvard College. Gore Hall, the library building at Harvard, is named in his honor.

Gorgeana, gôr-jē-ăn'a, Me., now York, the first incorporated city in the United States. On 2 Dec. 1631 a grant was made to Sir Ferdinando Gorges and others of 24,000 acres on both sides of the Accomenticus (Agamenticus, now York) River. Settlements were founded here, and on 10 April 1641 were formed into a borough named Accomenticus or Agamenticus which on 1 March 1642 was given a city charter as Gorgeana, with a full apparatus of mayor, aldermen, courts, etc. It had an extent of three miles on the coast and seven up the river, a small tidal stream. In 1652 Maine submitted to Massachusetts; and to avoid the city charter and Gorges' rights, Gorgeana was reincorporated as the town of York.

Gorges, gôr'jĕz, Sir **Ferdinando,** colonial proprietor of Maine: b. Ashton, Somersetshire,

GENERAL JOHN BROWN GORDON.

about 1565; d. 1647. He was a partner in the conspiracy of the Earl of Essex, against whom he testified on his trial in 1601. When Waymouth returned in 1605 from his voyage to North America, and brought with him five Indian captives, Gorges took three of them into his house, caused them to be instructed in the English language, obtained information from them of the «stately islands and safe harbors» of their native country, and determined to become a proprietor of domains beyond the Atlantic. He persuaded Sir John Popham, lord chief justice of England, to share his intentions, and in 1606 the king incorporated two companies, the London colony, and the Plymouth colony, between which was divided the territory extending 50 miles inland from the 34th to the 45th parallel north latitude. The Plymouth colony had the northern portion, which was styled North Virginia. Three ships with 100 settlers sailed from Plymouth 31 May 1607, and reached the mouth of the Kennebec in Maine, where they began a settlement, abandoned the next spring. In 1616 Gorges sent out Richard Vines with a party, which encamped on the river Saco through the winter. In 1620 Gorges and his associates obtained a new incorporation for «the governing of New England in America,» which was empowered to hold territory extending westward from sea to sea between the 40th and 48th parallels north latitude. Gorges himself united with John Mason in taking grants of the district called Laconia, bounded by the Merrimack, the Kennebec, the ocean, and «the river of Canada,» and under his auspices several settlements were attempted. His son, Robert Gorges, was appointed in 1623 by the council for New England «general governor of the country.» This council resigned its charter to the king in 1635, and the elder Gorges now determined to establish a miniature sovereignty on his own domain. To this end he obtained from the king a charter constituting him lord proprietary of the province of Maine, with extraordinary governmental powers, to be transmissible with the property to his heirs and assigns. He sent his son Thomas to be deputy governor, and the officers took an oath of allegiance to the lord proprietary. The province was divided into two counties, of which Agamenticus (now York) and Saco were respectively the principal settlements; the former received a city charter, as Gorgeana, in 1642. But the fatal want was a deficiency of subjects; probably two thirds of the adult males were in places of authority; yet the little monarchy continued for nearly 10 years. When the four New England colonies formed a confederacy in 1643, the settlements of Gorges were excluded from it. On Gorges' death his colonists at length formed themselves into a body politic for the purposes of self-government, and submitted to the jurisdiction of Massachusetts. «The nature of Gorges,» says Bancroft, «was generous, and his piety sincere. He sought pleasure in doing good, fame by advancing Christianity among the heathen, a durable monument by erecting houses, villages, and towns.»

Gorgias, gôr'jĭ-as, Greek orator and sophist: b. Leontini, in Sicily. He flourished in the 5th century B.C., and was one of the earliest writers on rhetoric. He was one of the first who introduced cadence into prose. He also treated of common-places, and showed the use of them for the invention of arguments. This induced Plato to give the name of 'Gorgias' to his elegant dialogue on this subject. Gorgias is said to have reached the extraordinary age of 107 or 108 years. Two works attributed to him are extant, 'The Apology of Palamedes,' and the 'Encomium on Helena,' but their genuineness has been questioned by several critics. See Jebb, 'Attic Orators.'

Gorgo, gôr'gō, or **Gorgon**, according to Homer, one of the frightful phantoms of Hades; but Hesiod mentions three Gorgons, Stheno, Euryale, and Medusa. They were all immortal, except Medusa. Their hair was entwined with serpents, their hands were of brass, their body covered with impenetrable scales, their brazen teeth as long as the tusks of a wild boar, and they turned to stones all those who looked upon them. According to some authors, Perseus, when he went to the conquest of the Gorgons, was armed with an instrument like a scythe, by Hermes, and provided with a looking-glass by Athena, besides winged shoes and a helmet of Pluto, which rendered all objects clearly visible and open to the view, while the person who wore it remained totally invisible. With weapons like these Perseus obtained an easy victory. The head of Medusa remained in his hands, and he gave it to Athena, who placed it on her Ægis, with which she turned into stones all such as fixed their eyes upon it. The residence of the Gorgons was beyond the ocean toward the west, according to Hesiod.

Gorgo'nia, the type-genus of the *Gorgonidæ*, a family of alcyonarian coral-polyps, the «sea-fans» or «sea-whips,» which have a calcareous or horny axis, the colony often greatly branched, and the branches anastomosing. In the common gorgonia (*Rhipigorgia flabellum*) of the West Indies and Florida Keys the branches form a flat net-work. In this and other sea-fans the short calicles of the single retractile polyps stand perpendicularly to the axis, communicating by longitudinal vessels and branching canals. While by far the greater majority of the species are inhabitants of tropical waters, in the Arctic seas, and in the deeper, cold waters of the Newfoundland banks, and on St. George's Bank, two large species occur: *Primnoa reseda* and *Paragorgia arborea;* the latter is of great size, the stem being as thick through as a man's wrist, and the entire coral-stock over five feet in height.

Goril'la. This term is derived from the 'Periplus' of the Carthaginian navigator, Hanno, who described, 500 years before Christ, an island on the west coast of Africa as full of wild men, which his interpreter called Gorilloi. When, therefore, Dr. Thomas Savage brought the first specimen of this animal to the attention of science, in 1847, the name «gorilla» was naturally applied to it. It now appears probable that the «Gorilloi» of Hanno were probably baboons. The gorilla of science, of which but one species is known (*Gorilla gorilla*), is the largest of the apes and is of great interest, since with the chimpanzee and the orang-outang, it is the nearest living relative of man. Structurally it is very closely allied to the chimpanzee. It does not exceed 5½ feet in height, but in bulk considerably exceeds man. Its skin is black, the hair being blackish and turning gray in old individuals. The skull has the supraorbital ridges greatly developed and the crest in the sagittal line is large. The arms are long, the hand reaching to about the middle of the shank, while the hands are webbed to the end of the first joint of the fingers. In the foot the heel is more apparent than in other anthropoid apes, correlated with its more terrestrial life. They usually walk upon all fours, a gait rendered possible by the very long arms.

These apes are limited in their distribution to the forested region of the Gaboon, and go about in families led by an old male. They are mainly diurnal in their habits, seeking their food, which is largely vegetable, during the day. At night the female and young are said to ascend a tree while the male sleeps at its foot. The stories told of its ferocity are possibly exaggerated, yet it is without doubt an extremely dangerous animal when brought to bay. When making an attack the male stands erect and is said to knock his adversaries down with his hand and then to use his powerful teeth, the canines of which are greatly developed. Consult: Keith, 'Proceedings Zoological Society of London' (1899); for accounts of its habits: Huxley, 'Man's Place in Nature'; H. O. Forbes, 'Monkeys' (1894); and Hartmann, 'Anthropoid Apes' (1885).

J. S. Kingsley,
Professor of Zoology, Tufts College.

Gor'ky, Maxim, pen name of Alexei Maximovitch Pyeshkoff, Russian author: b. Nijni Novgorod 1868. He traveled over a large part of his native country as a tramp after serving in many employments from that of a ship's cook to that of a lawyer's clerk. The varied scenes and persons he saw in his vagabond life among the lowest of the population furnished him with rich material for his subsequent literary work, in which he takes upon himself to interpret *la misère* as it is in western and southwestern Europe. His style is like a flash-light revealing features of debased or tragic character with vivid realism, but his view of his subject is tinged with melancholy pessimism. Among his most admired works are: 'Foma Gordyeeff' (1902); 'Makar Chudra' (1892).

Gor'man, Arthur Pue, American legislator: b. Howard County, Md., 11 March 1839; d. Washington, D. C., 4 June 1906. Up to his 27th year he was a page in the United States Senate. He was then appointed Collector of Internal Revenue in the Fifth District of Maryland. In 1869 he was made general superintendent of the Chesapeake and Ohio Canal Company, and from 1872 was president of that corporation. His influence as a Democrat extended from the affairs of Maryland to national affairs and from the House of Delegates in his native State he was elected in 1893 to serve as Senator of the United States: to which office, after three years of private life, he was re-elected in 1902. He was prominent in opposing the Force Bill of 1889 and took part in the reframing of the Wilson Tariff Bill in 1894.

Gorringe, gôr'rĭnj, **Henry Honeychurch,** American naval officer: b. Barbadoes, W. I., 11 Aug. 1841; d. New York 6 July 1885. He came to the United States in youth, entered the Union navy in 1862, and served under Admiral Porter. He was promoted lieutenant-commander in 1865. He accomplished the removal of the Egyptian obelisk (Cleopatra's Needle), which the khedive had presented to the United States, from Egypt to New York city in 1880. He published a 'History of Egyptian Obelisks' (1885).

Gorse, or **Whin.** See Furze.

Gortchakoff, gŏr-chä-kof', **Alexander Mikhail'ovitch,** Russian diplomatist; cousin of the general of the same name: b. St. Petersburg 16 July 1798; d. Baden-Baden 1 March 1883. He entered the diplomatic service in 1824 as secretary to the Russian embassy in London. His experience in diplomacy was extended in Vienna, Florence, Stuttgart, and elsewhere, and he showed great skill in securing the neutrality of Austria during the Crimean war. In 1856 he became minister of foreign affairs, and in 1862 chancellor of the empire, having by that time made himself one of the foremost diplomatists of Europe. He was a prominent member of the Berlin Congress 1878, but his influence was then on the decline, and in 1882 he was superseded by M. de Giers.

Gortchakoff, Prince **Mikhail,** Russian general: b. 1795; d. Warsaw 30 May 1861. He took part as an artillery officer in the battle of Borodino in 1812, and served in the subsequent campaigns of the allies against the French. He acquired also a brilliant reputation in the Polish war of 1831; and in 1846 he was made governor of Warsaw. In 1855 he was appointed commander-in-chief in the Crimea, where he conducted the defense of Sebastopol. In 1856 he returned to Poland as governor of the country. By his express desire his body was carried to Sebastopol, and buried in the place he had so long and so bravely defended.

Gor'ton, Samuel, New England enthusiast, and first settler of Warwick, R. I.: b. Gorton, England, about 1600; d. Rhode Island November or December 1677. He did business in London as a clothier until 1636, when he embarked for New England, and settled at Boston. Religious disputes induced him to remove to Plymouth, where we first hear of him as a preacher. He soon exhibited such peculiar views that he was banished from the colony on a charge of heresy. With a few followers he then went to Aquetneck or Rhode Island, which had recently been settled by exiles from Massachusetts Bay; but falling again into trouble, was publicly whipped for calling the magistrates "just asses" and for other contemptuous acts, and was forced to seek an asylum with Roger Williams in Providence, about 1641. Here he became involved in the disputes of the colonists on certain questions of boundary. Gorton was then summoned to Boston, but refused to recognize the jurisdiction thus assumed, and about the same time removed to Shawomet, on the west side of Narragansett Bay, where he purchased land from the Sachem Miantonomo. But in June 1643 two inferior sachems contested his claims to the land, and applied to the general court at Boston for assistance. A body of 40 soldiers was consequently marched to Shawomet, and Gorton and 10 of his disciples were carried to Boston and condemned to hard labor, a sentence commuted to banishment in 1644. Gorton then went to

England, where he obtained from the Earl of Warwick an order for the land he claimed. Returning to Rhode Island in 1648 he founded the town of Warwick, thenceforth his home, and where he occasionally preached. He wrote several controversial works, the best known of which is 'Simplicitie's Defense Against Seven-Headed Policy' (1646). See Janes, 'Samuel Gorton' (1896).

Goschen, George Joachim, VISCOUNT, English financier: b. London 10 Aug. 1831; d. Hawkhurst, Kent, 7 Feb. 1907. He was educated at Oxford and entered Parliament as a Liberal for the city of London in 1863, which he represented till 1880. He was First Lord of the Admiralty, 1871–4. With M. Joubert he went to Egypt in 1876 on behalf of the bond-holders to reorganize the finances of that country, and two years afterward represented Great Britain at the international monetary conference held in Paris. In 1887 he became chancellor of the exchequer under Lord Salisbury, and in 1895 again took office under the same leader as First Lord of the Admiralty. From this office he retired toward the end of 1900, and was soon after raised to the peerage as Viscount Goschen. He represented Ripon in Parliament 1880–5, when he was returned for Edinburgh, and was member for St. George's, Hanover Square, 1887–1900. He wrote several financial and political pamphlets, and a work on the 'Theory of Foreign Exchanges' (1864).

Gos'hawk, a falcon of the genus *Astur*. The goshawk proper, or "gentle falcon" (*A. palumbarius*), was a favorite bird in falconry (q.v.), and is still used for large game, as rabbits, pheasants, and the geese from which it took its name. It is 21 inches in length, the crown, black, bordered on each side by a line of white, finely speckled with black; upper parts, slate, tinged with brown; legs, feathered half-way down, and, with the feet, yellow; tail-feathers with pale bands. It is to be found throughout Europe and central Asia; and it is a question whether the American goshawk (*A. atricapillus*) is really specifically different. The latter is a noble bird whose home is in the North, so that it is rarely seen south of the Canadian line except in winter, and uncommonly then. In its boldness, its marvelous power and control of flight, and its prey, it resembles our more familiar little falcons, the sharpshin and Cooper's hawk. Several other species inhabit the Orient, an Australian one being remarkable for its pure white color, with red irides.

It should be noted that the bird called "goshawk" in Scotland is the peregrine.

Goshen, Ind., city, county-seat of Elkhart County; on the Elkhart River, and on the Cleveland, C., C. & St. L., and the Lake Shore & M. S. R.R.'s; about 25 miles southeast of South Bend and 95 miles southeast of Chicago. It is situated in a fertile agricultural section of the State. Its principal industrial establishments are flour-mills, bicycle and machine shops, woolen-mills, sash and door factories, veneering and furniture shops; rubber goods, underclothing, mittens, and shirts are manufactured here. The city has large lumber, coal, and brick yards. Hay, grain, and live stock are the chief farm products shipped from Goshen to larger markets. The public library building and the high-school are the principal public buildings. The mayor holds office for two years. The city owns and operates the electric light plant and the waterworks. Pop. (1900) 7,810.

Goshen, N. Y., a village, railroad junction, and one of the county-seats of Orange County; on the New York, L. E. & W. and the Lehigh & N. E. R.R.'s; 59 miles northwest of New York. Goshen was founded in 1714, and incorporated in 1809; it has municipal waterworks. The manufactures include bricks, tiles, glass, cider, and foundry products, but the chief commercial interests are connected with the dairying industry, there being a considerable trade in milk, butter, and cheese, which are widely celebrated for their excellence. Pop. (1900) 2,826.

Gosling-grass. See BEDSTRAW.

Gosnold, gŏs'nōld, **Bartholomew,** English voyager to America: d. Jamestown, Va., 22 Aug. 1607. He joined Raleigh in his attempt to colonize Virginia, and after the failure of that enterprise was placed in command of an expedition fitted out at the cost of the Earl of Southampton and others for planting a settlement in New England. He sailed from Falmouth 26 March 1602, with one small vessel and a company of 32 persons, 20 of whom were colonists. Steering directly across the Atlantic, in seven weeks he reached Massachusetts Bay, first seeing land probably not far north of Nahant. Thence he turned south and landed on Cape Cod, to which he gave the name it still bears. Sailing around the promontory, and stopping at the island now known as No Man's Land, but which he called Martha's Vineyard, Gosnold anchored at the mouth of Buzzard's Bay, and resolved to plant his colony on an island which he called Elizabeth, and which now bears the Indian name of Cuttyhunk. The adventurers here built and fortified a house, but the hostility of the Indians, scarcity of provisions, and disputes about a division of the profits, disheartened them, and the whole party returned to England, taking a valuable cargo of sassafras root, then highly esteemed as a medicine, cedar, furs, and other commodities. Gosnold next turned his attention toward Virginia, and after long effort succeeded in organizing a company for colonization in that region, the heads of which were Edward Wingfield, Robert Hunt, and the famous Capt. John Smith. A charter was granted them by James I., 10 April 1606, the first instrument of that nature under which the English were planted in America; and on 19 Dec. 1606 Gosnold set sail with three small vessels and an ill-assorted band of 105 adventurers, only 12 of whom were laborers, and very few mechanics. After a tedious voyage, a storm having driven them into Chesapeake Bay (26 April 1607), they sailed up James River, which they named after the king, disembarked about 50 miles above its mouth, and founded the settlement of Jamestown. Sickness and various disasters destroyed 50 of their number before autumn, among whom was the projector of the colony. The Massachusetts township of Gosnold, comprising the Elizabeth Islands, was named in his honor.

Gospels. Our four gospels cannot perhaps be better described than by calling them "Memoirs of Jesus." Though they contain ample historical and biographical materials, they are neither histories nor biographies, in our modern sense of these terms. Moreover, each one has been written with the distinct purpose of edification. They do not relate facts simply as facts, but always with the object of awakening or strengthening faith. Each Evangelist has selected and arranged his materials in accordance with his conception of the best way to realize this aim. Altogether they give us but a small part of the life and activity of the Master, and yet they contain enough to make clear His character and mission. The recognition of these general characteristics is indispensable in the consideration of the critical questions which are connected with the study of the origin and interrelation of the four Gospels. In distinction from that of St. John, the first three gospels, since the days of Griesbach (latter part of 18th century) have been called "the Synoptics," for the reason that their accounts which are often parallel, give us a general view of the sayings and doings of Jesus. They differ from that of St. John in four particulars: (1) In the scene of Jesus' ministry, St. John confines himself almost entirely to Judea, while they are busy with the ministry in Galilee and the Perea. (2) In the number of Passovers noted. The Synoptics mention only one; St. John, at least three (ii. 13, vi. 4, xii. 1). Hence, so far forth, there seems to be a difference in the duration of the ministry. (3) In the events narrated. Apart from the events of the last or Passion week, St. John gives only three incidents in common with the other Gospels — the feeding of the multitude, vi. 1–13, the walking on the water, vi. 16–21, the anointing of Jesus by Mary of Bethany, xi. 55, xii. 11. (4) In the general teaching of Jesus. St. John's Gospel, as far as its teachings are concerned, deals quite exclusively with the person of Jesus, while the others make known to us the nature of the kingdom which he came to establish. These differences have made the fourth Gospel the subject of much study and speculation, and cause it still to be one of the difficult problems of New Testament criticism.

The Synoptic Problem.— For over 100 years students of the Gospels have been engaged upon the question of the origin and relationship of the Synoptic evangelists. No one can read these gospels attentively without being struck with the general resemblances in the narratives. These resemblances pertain to the place of our Lord's ministry — Galilee, to the time — only one Passover being given, and to the general order of events. More than one half of the incidents are the same in all three, and what is noteworthy regarding these is the close similarity in the language in which the incidents are given. Such facts point to a common relationship of some kind. Together with these resemblances, however, there are just as marked differences. The character as well as number of these differences is striking. What origin can account for both resemblances and differences? This is the Synoptic problem. In the course of the long period of work upon it, three typical solutions have been offered: (1) The solution of inter-dependence. This supposes that the Evangelists copied from one another and there have been as many variations in the form of the theory as there are possible orders of the Gospels. No one of them has proved satisfactory. Out of the discussions that were begotten, however, one important question early became prominent, and that was regarding the Gospel of St. Mark. Did St. Mark make his Gospel by compiling his account from the other two, or was his shorter narrative the basis of St. Matthew's and St. Luke's narrative? Griesbach brought Germany to accept the former view, and for a long time this view stood in the way of any advance in the criticism of the Gospels. That St. Mark is not an epitome or compilation of the other two, is now one of the assured results of criticism. As it became more and more evident from repeated attempts to show it, that the use of one gospel by another in the way of direct copying could not be defended, attention was turned to a possible origin back of them all — to some primitive form of gospel, which would explain all the facts. Hence (2) the solution by the supposition of a primitive gospel. By some (Eichborn, Ewald) this primitive gospel was supposed to be written; by others (Gieseler, Lange, Westcott, Godet) oral. The insurmountable objection to the method of solution by a primitive written source was in the number of translations and recensions postulated in order to account for our gospels in their present form. Eichborn and Ewald supposed nine such stages of work. These theories have proved too intricate and artificial for acceptance. The chief objections to the hypothesis of a primitive oral gospel, as directly the source of our gospels are: (1) That the supposition of some central apostolic tradition formed in or about Jerusalem makes it very difficult to account for the Gospel of St. John. Why did this tradition omit all that is found in the fourth Gospel? (2) "The agreement between the Gospels, in many instances, extends to phrases which are mere connecting links between the sections, which are just the kind that in fully oral tradition would be the first to vary." (3) "The likeness between the Gospels is not confined to agreement in the way of telling separate stories, but extends also to the order of arrangement (ex. Matt. xiv: 1, Mark vi: 14, and the way both narratives go back and explain the statement of the beheading of John). Criticism has not, however, cast away all that these theories have offered us. It is unquestionably true that the gospel existed first in an oral form, and it is also true that the oral gospel was in great part committed to writing before it became the content of our gospels. The solution, therefore, which is today accepted by the majority of scholars is that which postulates two main written sources. One of these is called the "Logia," and is attributed to St. Matthew; the other is "a narrative of events," attributed to St. Mark and taken by him from St. Peter. This conclusion reached by the way of patient, careful criticism, singularly accords with the testimony of Papias (see Eusebius, Hist. Ecc. III.), who says: "St. Mark, having become the interpreter of St. Peter, wrote down accurately, though not indeed in order, whatsoever of the things said or done by Christ." "St. Matthew wrote the oracles (Logia) in the Hebrew language, and everyone interpreted them as he was able." Several perplexing questions, however, have arisen in regard to each source, and all of them have not as yet been satisfactorily answered.

Let us look at them in order. In regard to the "Logia," the first question is, "What was their character?" Were they simply discourses, or discourses plus some introductory narrative material? One of the best discussions of this question is to be found in Lightfoot's 'Essays on Supernal Religion' (Essay on Papias). There is now general agreement in the judgment that they include an element of narrative. Again, "How are they related to the Gospel of St. Matthew?" The answer is that they form a large part of the Gospel, and for that reason have given to it the name of Matthew, though he did not write the book as we now have it. The original Matthew (Ur-Matthæus as Weiss calls it) contained simply the Logia, with a small number of incidents. The third question is, "In which Gospel do we get the Logia in their original form, in the book of St. Matthew or in that of St. Luke?" The best answer which has yet been given to this difficult question is this: "That the balance of probability is on the side of St. Luke's Gospel," and mainly for the reason that in St. Matthew we have aggregated unities like the Sermon on the Mount, the charge to the Twelve (chap. x.), the Parables by the Sea (chap. xiii.). In regard to the other source — The Narrative of Events — the first question of importance is this: Is our Gospel of St. Mark the original Narrative of Events? The description of Papias is confirmed by Irenæus, Clemens, Alexandrinus, Tertullian, Origen, Eusebius, and Jerome, so that there is sufficient witness to the relation of Mark and Peter, and the answer which criticism has given to the above question is, "that the Petrine source used by the two later synoptists was not an Ur-Markus, but St. Mark's Gospel, almost as we have it now."

Every student of the problem knows that these two "main documents," satisfactory as they are as the principal sources of Matthew and Luke, are only the "main sources." St. Luke has gone elsewhere for parts of his Gospel, and the relation of St. Matthew to St. Luke requires the supposition of more material than the Logia gives. Oral tradition has probably had its place along with written records. The problem yet requires much patient painstaking study.

The Gospel of St. Matthew.— (*a*) *Authorship.*— Papias is the first to tell us about a form of gospel written by St. Matthew (Eusebius H. E. III: 39) and Irenæus (Adv. Hae III : 1, 1), the first to name St. Matthew as the author of the first gospel. Just in what sense these statements are facts we must see later. Meanwhile a word about St. Matthew himself. He was a tax-gatherer before his acceptance of the call of Jesus (Matt. ix. 9). Promptly responding to the invitation of the Master to follow him, he became an eye-witness of much of the Lord's ministry. There is no good reason for denying his identity with the Levi of St. Mark ii. 14, Luke v. 27. Both his position as a tax-gatherer, requiring work with the pen, and his experience as a disciple fitted him to do the work which tradition has assigned to him.

Papias and Irenæus refer to this work as in Hebrew (Aramaic), but our first gospel is in Greek, and it gives no evidence of being a translation from a Hebrew original. The question then arises, what is the relation of our Greek Matthew to the Hebrew Matthew of tradition? Criticism in seeking to answer this question has reached the following conclusions: (1) That the Gospel according to the Hebrews, in either of its forms, Ebionite or Nazarene, was not identical with the Aramaic original of St. Matthew's Gospel; nor is our Greek Matthew a translation of the Gospel to the Hebrews. (2) That the Aramaic original of which Papias and Irenæus speak, was probably the collection of discourses now known as the Logia, compiled by St. Matthew, having very little narrative material, and reflecting in character the needs and conditions amid which these Logia at first took shape (See Weizäcker, Apostolic Age, Vol. II., chap. ii.) (3) That this Aramaic source has entirely disappeared. (4) That our present Gospel of St. Matthew originated in a desire to "expand the old Apostolic source, whose form no longer met the needs of the time, into a history of the life of Jesus which would correspond to these." (5) That the framework of St. Mark's Gospel was used for the narrative setting, but because of the importance and value of the discourse element, the resultant production was called the Gospel according to St. Matthew. (6) That other narrative material such as Chapters i., ii., xxviii., were taken either from other sources or from oral tradition (Weiss). (7) That this composite Gospel existed only in Greek form and is of unknown authorship. Space forbids entering upon the evidence for each of these statements; it can be found in the literature given at the end of the article.

(*b*) *The Purpose of the Gospel.*— It aims to show that Jesus was the Messiah, not in the way John does, by making evident the glory of His person in word and deed, but through the fulfilment of Old Testament prophecy. The author seeks at each step of the history to prove by Messianic prophecies (there are over 70 quotations and references to the Old Testament) the Messiahship of Jesus. This compels him to meet the objections of the Jews and also to lay bare their motives in opposing the teaching and claims of the Master. While, therefore, the Gospel is meant to strengthen and comfort Jewish Christians, it also has, as Godet claims, an apologetic aim.

The Gospel of St. Mark.— (*a*) *Authorship.* —There has been no reason discovered for disbelieving the testimony of Papias that Mark — the John Mark of Scripture — has given us in substance the "Memoirs of Peter" regarding Jesus. Some difference of opinion exists as to the meaning of the description "interpreter"— it being understood by some as the equivalent of "amanuensis"; by others as "translator." The Gospel bears abundant witness to the character of its depictions as being those of an eye-witness. They are circumstantial, pictorial, and vivid. Papias further says that "having become the interpreter of St. Peter, St. Mark wrote down accurately, though not indeed, in order, whatsoever he remembered of the things said or done by Christ." This statement about order, whatsoever he remembered of the things events given in the Gospel, which is progressive and helpful in understanding the public career of Jesus, but to the sequences of events in detail. A topical rather than a chronological plan is followed (see Bacon's 'Introduction to the New Testament,' pp. 189–190). So good is this order of St. Mark that both St. Matthew and St. Luke use it. Evidences of other sources besides the Petrine Memoirs are found, for example, in chapter xiii., for which the supposition of a separate written document seems needful; so too the narrative about Herod in chapter xiv. St. Mark adds some touches of his own.

(*b*) *The Purpose of the Gospel.*— The purpose of this vivid presentation of the activities of Jesus in Galilee and during the latter days in Jerusalem was not the mediating of the antagonistic tendencies in the church (Baur), nor the commendation of Paulinism (Pfleiderer), nor to counteract the effect of the delay in Christ's coming by making evident the Messianic character of the mission of Jesus (Weiss), but simply to show how "God anointed Jesus of Nazareth with the Holy Ghost and with power" and how He "went about doing good and healing all that were oppressed of the devil: for God was with him" (Acts x. 38). These are St. Peter's own words descriptive of the mission of Jesus. His Gospel gives the content of that description. Of course, the narrative was meant to be a support to faith and a means of winning men to faith.

The Gospel of St. Luke.— (*a*) *The Author.*— The Muratorian Fragment (c. 200 A.D.) is the earliest external witness to the name of St. Luke as the author of the third Gospel, "the third book of the Gospel, that according to Luke, the well-known physician." Irenæus follows with explicit testimony to the same effect, and all early tradition but seconds these witnesses. St. Luke was born, according to tradition, in Antioch, and was a Gentile. Godet's account of the strict supervision under which physicians were placed by the authorities at Rome argues an amount of culture for St. Luke quite above that of other men. St. Luke's name appears but three times in Scripture, Col. iv. 14, Philemon 24, 2 Timothy iv. 11. Of late years we have come to know him more fully as a writer, through the critical study of the Acts; and his character as a careful, philosophic historian has been ably set forth by Prof. Ramsay. (See Ramsay's 'St. Paul the Roman Traveller.') The common authorship of the Acts and the third Gospel is now generally accepted.

(*b*) *The Sources of the Gospel.*— The Introduction of the Gospel gives the author's plan of procedure and his purpose. Just what is involved in its designation of sources is difficult to say. He does not tell us whether they were oral or documentary, whether in Aramaic or Greek. The problem of the sources of St. Luke's Gospel is a complicated one, and entire unanimity has not been reached in its attempted solution. The following conclusions will give, in brief, some conception of the situation. (1) St. Mark's Gospel is one of his chief sources. Almost all of the contents of St. Mark (except vi. 45–viii. 20) are found in the third Gospel. Evidently St. Luke has used the Gospel of St. Mark as his framework, and here again criticism sees no need of postulating an Ur-Markus. It is to be noticed, however, that he omits some things recorded by St. Matthew and St. Mark, and records some things which St. Matthew and St. Mark omit. The explanations of this phenomenon have been different, but they have not invalidated the conclusion given above. (2) While St. Luke knew the Logia document in its original form, he was not familiar with our present Greek Matthew. The main reason for the latter part of this statement is discoverable in the way St. Matthew and St. Luke use the Gospel of St. Mark. "It is established," says Weiss, "as one of the indisputable results of Gospel-criticism that St. Luke's acquaintance with and use of the Apostolic source of the first Gospel is just as certain as his want of acquaintance with this Gospel itself." Where St. Matthew and St. Luke have material in common which is not found in St. Mark, another document is supposed to be the source, or oral tradition. (3) St. Luke has placed the great mass of the material which he took from the Apostolic source in the two sections which he has inserted into St. Mark's narrative, namely, in vi. 20–viii. 4, ix. 51–xviii. 14. (4) Besides these two main sources, the narrative of St. Mark and the Logia, St. Luke had other written sources, giving him the first two chapters, and the long Perean section. These may, indeed, have been parts of one source, which contained material covering the entire life of Jesus. The effect of St. Luke's hand, and the modifications of oral tradition are evident throughout the book. The uniformity of style and diction in the whole Gospel show that these varied sources were not merely put together, but were edited by St. Luke. The peculiarities of his Greek appear all through the Gospel.

(*c*) *The Purpose of the Gospel.*— It was written that Theophilus "might satisfy himself of the accuracy of the story which he had heard from others" (i. 4). Its appeal, through Theophilus, is to the Gentiles. "Luke," says Origen, "composed his Gospel for Gentile converts." In accord with this are its depiction of the humanity of Christ — the ideal man — and its broad spirit of universality.

Date and Integrity of the Synoptic Gospels.— (*a*) *Date.*— Much division of opinion exists as to the time of the writing of the Synoptic books. The materials out of which they were made originated, of course, much earlier than the gospels themselves. The time just before or just after 70 A.D. is that which now meets with much favor. Between 70–80 A.D. is the latest probable time for dating them.

(*b*) *The Integrity of the Gospels.*— Criticism has directed its attack mainly against the following parts of the Gospels: (1) Against the first two chapters of St. Matthew and St. Luke. The chief objections to these are (*a*) the wide differences in the accounts of the birth and infancy. (*b*) The character of the accounts themselves, containing angelic appearances, the visit of Magi, and the slaughter of the Innocents. (*c*) The miraculous conception. It is to be noticed that the difference in the accounts is fully explicable in the supposition that they are from different sources. St. Luke's story is undoubtedly from the Blessed Virgin Mary, and much in St. Matthew's story is traceable to Joseph. St. Luke's account in its delicacy, personages, and fidelity to the Old Testament point of view is inexplicable as a later Jewish-Christian fiction. Perhaps the angelic appearances are simply poetic descriptions of the conveyance of inward truths and facts. The story of the Magi has a rational explanation in an astrologer's interest in a planetary conjunction at a time when the widespread hope of a Messiah among the Jews would give it for these students of the heavens, a vital significance. Herod's well-known cruelty makes easily possible the massacre at Bethlehem. For the difficulties connected with the enrollment of Quirinius, see Prof. Ramsay's 'Was Christ born in Bethlehem?' After a possible satisfactory explanation of the attendant circumstances of the supernatural birth of Jesus, there yet remains an objection to the supernatural birth itself. This must be met on philosophic grounds, for it is really a philosophic objection. These chapters of Matthew and Luke are textually as well supported as any in the Gospels, and they have early and continued attestation in the Church. The silence of the New Testament regarding the miraculous conception is no argument against it, simply because of the nature of the subject.

(2) Again criticism has given special attention to the last 12 verses of St. Mark. The generally accepted conclusion is that these verses are a later addition to the Gospel, but that they embody a genuine apostolic tradition.

(3) The accounts of the Resurrection have also been the subject of destructive criticism. Here again we must distinguish between the accounts of the Resurrection, and the Resurrection itself. It has been truthfully said that "when we come to look into the narratives of the Resurrection, we find them unassimilated and unharmonized." Is this not due to the way in which our Gospels have come to us? Where so many witnesses were involved and so many occasions cited, is it not to be expected that there should be considerable variation in the testimony? The accounts have come to us from different sources. Some of them, like the walk to Emmaus, were personal memoirs; others, like those in St. John, were selected because of their value to him personally, for the purpose he has in view. There has been no studied attempt to fit them all to each other, but they all bear clear witness to the spontaneous, unmistakable acceptance of the fact of the Resurrection. Objections which go beyond this and impugn the fact, must be met on other grounds, and it is safe to say that the various theories which have involved the denial of an actual physical resurrection of Jesus, have thus far been quite inadequate to explain the faith of the Church. This leads us to mark as the great central point of attacks upon our Gospels (4) the miraculous element in them. Here is really the battleground to-day. All sane interpreters of these records will be in sympathy with the desire to avoid an exaggeration of the miraculous. This, however, is quite a different aim from that which tries to find for every miracle of Jesus a natural though wonderful method of procedure, for example, cures of the sick through the effect of a strong personality. Both philosophy and science take issue with the statements of the Evangelists in this matter. Meanwhile the study of documents shows that even in the residuum which all critics will acknowledge genuine, the miraculous element is present, and all schools of thought are compelled to acknowledge the character of Jesus itself as a miracle. The question is not now so much one of historical evidence as it is of philosophy.

The Gospel of St. John.— From the time in 1820 when Bretschneider published in Leipsic his 'Probabilities concerning the Nature and Origin of the Gospel and Epistles of John,' modern criticism has been engaged upon the problems of the Fourth Gospel. Authorship and historicity have been the two themes about which all this criticism has centred. The best history of the course of it will be found in Watkins' Bampton lectures for 1870. The day has gone by when this Gospel can any longer be called "A Philosophic Romance" or a "Theological Novel," and even since the day when Sanday reviewed the situation in the 'Expositor' (1891-2) a distinct advance has been made toward the traditional position. Partition theories are now in order, which means that we have a Johannine nucleus of history and discourse, used by another hand (preferably that of the Presbyter John) in working up the Gospel to its present shape. (See Wendt's 'The Gospel according to St. John.' We have already called attention to the differences between this Gospel and the Synoptics. It is almost entirely in consideration of the internal evidence that "problems" have arisen, for the judgment of Matthew Arnold is valid as regards the external evidence for authorship by St. John the Apostle, that "No one who had not a theory to serve would ever dream of doubting it." In order to appreciate the serious character of these problems, it will be necessary for us to consider the purpose and plan of the Gospel.

The Purpose and Plan of the Gospel.— The purpose is given in xx. 31, "These signs have been recorded that you may believe that Jesus is the Christ, the Son of God — and that through your belief you may have life in the knowledge of him." In the "glory" (i. 14) of Jesus we are to see, his interpretation to us (i. 18) in word and deed of the Father. We are called to look at Him, behind and in His work.

At once it is evident that the author is not aiming to give us a biography, nor a complete history. It certainly is not then a contradiction of history, if he chooses his material in order to make good his purpose. That he does select his materials is beyond question. The public announcement of the Messiahship of Jesus was at the Baptism. The earlier facts of His life, therefore, have no place in this Gospel. The author begins after the Temptation, when Jesus had entered upon the way of His public ministry, and is concerned only with the events of His public life. From this time each scene is to present Him to us in some new light, that at last, in the glory of them all, we shall say with St. Thomas, "My Lord and my God." Can the Gospel with such a definite plan as this be historical? Three things must be considered in making reply: (*a*) the facts themselves, (*b*) the discourses, (*c*) the representations of Christ. How are we to adjudge facts to be facts? Manifestly, by their verisimilitude as estimated from what we know from other sources of the historical situation in which they are placed.

Take for example the first chapter or the sixth, and estimate either in this way. Personages, situation, motives, and changing temper, are all alike such as only an eye-witness could give. All through the Gospel we have such evidence of an eye-witness. As far as the facts are concerned the relation of this Gospel to the Synoptics has been set forth by no one with more helpfulness than Godet (see Introduction to his Commentary on St. John). Under the two heads of (*a*) Correlations, and (*b*) Independence, he shows how the periods containing the facts fit to each other. In some instances

St. John is more truly historical than the Synoptics as, for example, in the placing of the Cleansing of the Temple, and in the dating of the Lord's death. When we come to (*b*) the Discourses, we enter a region peculiar, indeed, to the Fourth Gospel, and one which has caused much discussion. The solution of the problem which they offer will be facilitated by bearing in mind several considerations: (1) That they are for the most part, thematic — that is, they give us only great central teachings. (2) They come to us through the medium of the author's reflection.

Westcott calls our attention to the fact "that the discourses in Jerusalem show an intimate connection with the ideas which the festivals represented, which gained their full significance as men looked back upon them from the time when they had ceased to be." It was at these times that Jesus declared the meaning of His person and office, and the great themes impressed themselves upon a mind in sympathy with such forms of presentation. But the words heard in Jerusalem were larger, richer, fuller words when written down in Ephesus many years later. They record a spiritual mind's mature conception of the Master as that mind has discovered it in memories which from the first were striking and suggestive. Have we then a subjective element in these discourses? Unquestionably. Does that subjective element imperil the truth? Not in the least. It rather gives it to us in full proportions. These discourses are not a stenographic report of the words of Jesus. They are reproductions in the clear light of the Spirit's illumination. They contain the essential, eternal verities of Jesus' teaching. Hence we expect to find them all in the style of St. John, as they are; hence we expect to find interpretation added to them here and there, as we do; hence we find them grouped at times with no clear, definite situation given to them. The solution of the problem of the discourses lies not in the denial of their historicity, but in the admission of their subjectivity. The question then presents itself, "Have we the same Christ in the Fourth Gospel as in the Synoptics?" Yes; but seen from a different point of view. The Johannine Christology never rises higher than that given in Matt. xi. 25–28; Luke x. 21–22.

Authorship.— Two characteristics appear in the writer of the Fourth Gospel. (*a*) A memory for details, and (*b*) a mature, profound conception of Jesus. They point to the work of an old man, who had been an eye-witness of what he relates. It is sufficient for the purposes of this article to say that the supposition of the authorship by John the Apostle meets more of the alleged difficulties of the Johannine problem than any other supposition. Modern criticism, however, has received with much favor the name of John the Presbyter.

Literature on the Synoptic Problem.— Gloag, 'Introduction to Synoptic Gospels' (1895); Robinson, 'The Study of the Gospels' (1902); Rushbrook, 'Synopticon' (1880); Wright, 'Synopsis of the Gospels in Greek' (1896); Hawkins, 'Horæ Synopticæ' (1899); Weiss, 'Markus-Evangelium' (1872); 'Matthäus-Evangelium' (1876); Ewald, 'Das Hauptproblem der Evangelienfrage' (1890); Wendt, 'Die Lehre Jesu' (1890); Holtzmann, 'Die Synoptischen Evangelien' (1863); 'Einleitung in das Neue Testament' (1886); Westcott, 'Introduction to the Study of the Gospels' (1895); Wright, 'Composition of the Four Gospels'; Jolley, 'The Synoptic Problem for English Readers' (1893); Sanday, 'A Survey of the Synoptic Question' (1891); 'Inspiration,' Lecture VI. (1893); Burgon, 'The Last Twelve Verses of St. Mark.'

Literature of the Johannine Problem.— Thoma, 'Die Genesis des Johan. Evan.' (1892); Ewald, 'Das Hauptproblem der Evangelienfrage' (1890); Halcombe, 'What Think Ye of the Gospels?' (1893). J. S. Riggs,
Auburn Theological Seminary

Goss, Isham J. M., American eclectic physician and author: b. Oglethorpe County, Ga 16 Aug. 1819; d. Marietta, Ga., 25 Feb. 1896 He graduated at Emory College, Ga., and in 1844 in medicine from the medical department of the University of Georgia. For fourteen years he followed the practice of the regular or allopathic profession, when he was converted to American Eclecticism and became a leader of that school in the South. Several Eclectic colleges conferred upon him the honorary degree of doctor of medicine. In 1868 he filled the chair of practice in the Philadelphia Medical University and in 1877 the chair of Materia Medica and Therapeutics in the Georgia Eclectic Medical College, reorganized that year. He wrote 'Materia Medica' (1877); and 'Theory and Practice of Medicine' (1882).

Goss, Charles Frederic, American Presbyterian clergyman: b. Meridian, N. Y., 14 June 1852. He was graduated from Hamilton College in 1873, from the Auburn Theological Seminary in 1876, and was at first a home missionary. In 1894 he became pastor of the Avondale Presbyterian Church of Cincinnati. He was also appointed to the chair of Biblical literature in Cincinnati University, and published several volumes, including 'The Optimist,' 'The Philopolist,' and 'The Redemption of David Corson.'

Goss, Warren Lee, American writer: b. Brewster, Mass., 19 Aug. 1838. He studied at the Harvard Law School, served in the Civil War, first in the United States engineers and later in the 2d Massachusetts volunteers; was historian of the National Union of Ex-Prisoners of War. He has been active as editor, magazine-writer, and author of such volumes as 'The Soldier's Story of Captivity at Andersonville' (1866); and 'In the Navy' (1898).

Gosse, gŏs, **Edmund William**, English literary critic and poet: b. London 21 Sept. 1849. From 1875–1904 he was translator to the Board of Trade and since 1904 has been librarian to the House of Lords. In 1884–5 he lectured in the United States. He has made a special study of Scandinavian literature, and has published 'Studies in the Literature of Northern Europe' (1879). Other works of his are: 'Life of Gray' (1882); 'Seventeenth Century Studies: a Contribution to the History of English Poetry' (1883); 'From Shakespeare to Pope: an Inquiry into the Causes of the Rise of Classical Poetry in England' (1885); 'Life of Congreve' (1888); 'History of Eighteenth Century Literature' (1890); 'Life of Philip Henry Gosse, Naturalist' (1890); 'Gossip in a Library' (1891); 'Questions at Issue' (1893);

'The Jacobean Poets' (1894); 'Critical Kit-Kats' (1896); 'History of Modern English Literature' (1897); 'Life and Letters of Dr. Donne' (1899); 'Coventry Patmore' (1904). He has written a romance, 'The Secret of Narcisse' (1892); and several volumes of poems: 'Madrigals, Songs and Sonnets' (1870); 'On Viol and Flute' (1873); 'King Erik,' a tragedy (1876); 'The Unknown Lover,' a drama (1878); 'New Poems' (1879); 'Firdausi in Exile and Other Poems' (1886); 'In Russet and Silver' (1894); 'Collected Poems' (1896).

Gossyp'ium. See COTTON.

Gossypium Phospho, a valuable fertilizer composed of a mixture of cotton-seed meal and pulverized phosphate rock. The making of this fertilizer is an important industry in the South, where one factory has an output of 15,000 tons annually. The phosphate rock, which comes from South Carolina, passes through huge mills of great power, and is ground into a fine powder, after which it is carried through draft pipes to the top of a six-story tower, and there undergoes a process of refinement. The rich yellow meal which comes from the cotton-seed oil-mills is mixed with the ground phosphate, and adds materially to its strength as a fertilizer. The mixture thus obtained is collected into immense bins, and treated with sulphuric acid, assuming a semi-liquid state. It is then called gossypium phospho.

Gotha, Almanach de. See ALMANAC.

Go'tham, a parish of Nottinghamshire, England. The people obtained a reputation for stupidity and simplicity, and the satirical appellation of "the wise men of Gotham," owing to the tradition that King John journeyed through the town for the purpose of selecting a site for a palace, and the inhabitants not wishing to be burdened with the expenses of a royal residence, devised the plan of appearing stupid and foolish during the visit of his majesty. King John left in disgust; whereupon the Gothamites said: "More fools pass through than live in Gotham." The name Gotham is applied also to the city of New York. Thus used it appeared first in 'Salmagundi,' by Washington Irving and James K. Paulding. The authors may have had in mind the worldly wisdom of the city's inhabitants.

Gothenburg (gŏt'ĕn-boorg) **System,** a system of regulating the sale of spirituous liquors which had its origin in 1865, in Gothenburg, Sweden. A company is granted a monopoly of the sale of liquors in the town; managers at fixed salaries are placed in the public-houses, and after paying the expenses, and dividends not exceeding 6 per cent to shareholders (in Norway 5 per cent), the remainder of the profits are placed in the town treasury for the use of the general government and the agricultural society of the province. In Norway the profits, above the 5 per cent to shareholders, go to educational and charitable institutions. The system has been introduced into several towns in Sweden, Norway, and Finland. In the places where the system has been tried the number of drinking places has been lessened, the laws regarding the sale of liquors to minors and confirmed drunkards have been more rigidly observed; but the temptation to increase the revenue has in some places not promoted temperance.

Go'thia, the empire of the Visigoths, or Western Goths, which extended over Spain, and included Septimania, the territory which Theodoric held in Provence; Gaul, and the cities of Carcasonne, Narbonne, and Nimes. These he left to his son Amalarich, who, however, permitted Spain to be under the charge of the Gothic general Theudes, by whom he was eventually murdered. In the reign of Leovogild the kingdom of the Visigoths reached its climax of prosperity. He established his capital at Toledo (569–685) and encouraged art and literature. His sons Reccared and Ermengild were associated with him as co-regents. Ermengild, on becoming a convert to the Nicene faith as professed by Rome, was degraded from all dignity and imprisoned; he was promised his restoration on condition that he renounce the Catholic creed; refusing, he was put to death and was formally canonized in the 16th century by Pope Sixtus V. On the death of Leovogild, Reccared made profession of the Nicene creed, renounced Arianism, and he and his people became more closely amalgamated with the Gallic and Iberian peoples among whom they lived. In the course of the 7th century the Roman Catholic Church reached great power in the Visigothic state and ecclesiastical officials had the preponderating vote in the election of kings. Three sovereigns, Swinthila (620–631), Kindaswinth (641–649), and Wamba (672–680) tried to assert their independence, but each paid for his rashness by the loss of his throne. Witica (701–710) tried to remedy civil and ecclesiastical abuses, but the clergy opposed him, and the Gothic kingdom was already in a condition of deep decadence when the Moors arrived and defeated Roderick, his successor, on the banks of the Guadalete, August 711.

Gothic Architecture. The term Gothic implies barbarous, rude, uncivilized. It was applied by the writers of the 15th and 16th centuries, who, wishing to restore the Greco-Roman art to complete supremacy in Europe, thought to depreciate the style which it would replace. It is a most extraordinary instance of the ready adoption by the admirers of a style of a term first used contemptuously, for the term is in use in most languages in Europe. This is the style which followed the Romanesque architecture of Europe, rising out of it and being, in fact, Romanesque architecture with the addition of vaulting by means of ribs. This constructional change, introduced about 1165 in the royal domain of France, is explained under ARCHITECTURE. The improvement brought with it immense facility in vaulting internal spaces of irregular form; but inasmuch as in this way the whole thrust outward and horizontally was concentrated on a few definitely marked points, it became necessary to develop the buttress system (see BUTTRESS) and to make those masses of masonry very large and wide in the direction of the thrust. So it was that buttresses became what we see them in the choirs and apses of Gothic cathedrals — pieces of carefully built stone wall radiating from a common centre or, at least, forming a right angle with the general exterior wall of the church, their greatest dimension in the direction of the thrust coming from within.

and therefore they are much longer in-and-out than they are wide in the direction parallel to the wall. This, however, is merely the essential construction. Connected with this there arose many surprising changes. Thus the pointed arch, which had been well known in the eastern lands of the Mediterranean, which the crusaders must have seen in Egypt and Syria, and which was not unknown in the Romanesque architecture of France, became now an almost inevitable form, because these ribs of the vault could not be made to take perfectly circular curves across the open space from one point of support to another. They had to be made up of broken curves, that is, of two curves meeting one another at the apex or crown, and in this way the pointed arch would have originated had it not existed before. The Gothic style, however, adopted it as a decorative adjunct, treating all the external openings — windows, doorways and the separate members of arcades — with the pointed arch, and its decided and picturesque character soon affected the whole structure. Even where there was no vaulting, as in a dwelling house with floors of timber made of horizontal beams, window and door openings were still very commonly closed with the pointed arch.

As for the great height of the churches, that originated in the strong desire felt by the builder to get huge windows above the aisle roofs, that is to say, in the walls of the clearstory. The plan of the Gothic church being that of a high middle hall with much lower aisles, it was found that the windows in the walls of those aisles could not illuminate properly the whole interior. Moreover, it became a common practice to build chapels outside of the aisles, so that what had been windows became doorways leading from the aisles into the chapels. The clearstory windows, then, were almost the only light-giving openings, and as, in a moderate-sized church, the aisle would rise perhaps 16 feet to the spring of the vault and 28 feet to the crown or summit of the vaulting, the sloping roof of the aisle would rise at least 10 feet higher still, making a total of 38 feet to the sill of the windows which we wish to build in the clearstory. But those windows having their heads brought down to the shape of the pointed arch because they are crowded on both sides by the vault of the roof, will need to be at least 20 feet high to where their arch begins; so that in the small church which we are imagining here the height of the nave will be at least 130 feet. These would be the proportions of a Gothic church whose nave would be only 30 feet wide. But the great cathedrals had naves about 50 feet wide, and in consequence they would be from 170 to 175 feet high to the crown of the vault; and it may be repeated here that this vast height resulted in the first place from nothing more remote than the desire to get adequate space for windows. Of course in the end rivalry had something to do with it, and there is no doubt that a city starting a new cathedral had some pleasure in thinking that it would be higher and also wider than the churches of neighboring cities. The tendency to great height and to upward pointing masses is none the less a marked feature of Gothic art, and in connection with this the splendid Gothic towers must be considered, for they were always supposed to be roofed with sharply pointed spires. (See Tower, Spire.)

The necessity for the great windows mentioned above was still more evident as stained and painted glass became more splendid in effect and therefore involved a diminution of the daylight which could pass. These colored windows formed one of the special glories of Gothic art, and are, indeed, the most brilliant and also the most original decorative invention of the Middle Ages. (See Glass.) Another result of the great windows was the window tracery which supported the glass, that is to say, the invention of elaborate patterns wrought in the stone bars which divided up the immense windows. One window in Carlisle Cathedral is 27 feet wide. It is divided by vertical bars of stone into nine separate "lights," and these bars unite at the top of the window to produce an elaborately woven structure of beautiful effect.

Connected with this very surprising and unexampled system of building, the sculpture became surprisingly rich. That of the Romanesque churches had been, especially in France, very rich and varied, with splendid use of vegetable forms in leaf and flower, and a clever and picturesque employment of animal forms treated often in a very grotesque way. This was developed immensely by the Gothic stone-cutters, and by the middle of the 13th century there had taken shape a system of decorative sculpture the most admirably calculated to set off and adorn the structure itself, which the world has ever seen. In comparison with this, Greek architectural sculpture was ill adapted to its purpose as an adornment for magnificent buildings; and unequaled as were the Greek treatment of natural forms and power of design in pure sculpture, their art never undertook seriously the problem of decorating buildings. The Romans, in their sculpture of triumphal arches, set themselves more deliberately to the task of inventing an architectural sculpture, but never approached the variety, the richness and intrinsic interest of that of the 13th century.

Returning now to the structure of a Gothic church, it is to be noted that if we study the cross section of a church we shall see at once how the whole building is conceived. A very high middle hall is vaulted with stone. The vertically acting weight of that stone roof is supported on very slender stone pillars, but the thrust outward, nearly horizontal, is resisted by a strange structure called the flying buttress (q.v.). On either side of that hall is a much lower aisle, also vaulted, and the vault of this lower compartment thrusts inward against the great pillar which carries the high middle vault and also outward against the buttress built to receive it. Now what resists the inward thrust of the aisle vault? Nothing but the enormous weight of the load put upon the pier. This pier, standing between the middle hall and the aisle, would be pushed inward by the thrust of the aisle vault but for this superincumbent pressure; and the whole vertical height of that pillar somewhere from 120 to 180 feet may be relied upon to prevent that dislocation of its lower part, because all disturbing sideway thrust at the top is taken care of by the flying buttress. It is a wonderful structure for absolutely unscientific men to have worked out. It was, as can be shown, a matter of experiment. Engineering was as far as possible from being within the conception of the Gothic builders; for engineering is the application of mathematical computation to building, and the stone-cutters of the Middle Ages had no algebra, little arithmetic and only a feeble notion of geometry. Mathematics was in its infancy in the 12th century, and we cannot suppose that any of the great builders of that time knew how to compute the thrust or the weight of his building by any calculation whatever.

The history of Gothic architecture may be briefly stated as follows: During the years from 1180 to 1300 it spread all over what is now France; over the British Isles as far as they were civilized and prosperous; over the Low Countries at the north and Spain at the south, where, indeed, French architects were much employed; over the whole Rhine country except that the magnificent round-arched cathedrals of that region caused a certain stand to be made in favor of the original Romanesque; and over the more eastern countries of Europe in so far as Christian church-building was carried on freely. Some beautiful Gothic work was done in Hungary, Bohemia, and the lands on the Baltic. Italy alone received the style from the north with reluctance. The churches built for certain convents and monasteries in the 13th century were indeed completely Gothic of the Burgundian school — buildings as faultless in style as those of the north; but great cathedrals which were wholly out of the control of the conventual orders were built in a curious mixed style which we call "Italian-Gothic" and which needs to be designated by some such compound term. The Italians, with their classical and Greco-Roman affiliation, and the natural love of the southerner for broad, unbroken surfaces and rather dark interiors, would accept neither the huge windows of the true Gothic structure nor yet the system of buttresses and flying buttresses which made the exterior so picturesque, but also so irregular and diversified. They insisted on abundant space for wall paintings, for the putting up of wall tombs and relief sculpture of various forms, and for the decoration of the external walls by mosaic, flat carving in low relief and bands of parti-colored material. In this way there grew up the astonishing cathedral churches of Siena, Orvieto, Monza, Verona, and especially of Florence, and a great number of churches of the second rank, infinitely interesting on account of their beauty of detail, each one serving almost as a museum of lovely works of art, but never satisfactory as logical and complete structures in a coherent style. The style culminated in the great church of S. Petronio, at Bologna, a vast church which was begun about 1300 with the purpose of making it by much the largest church in Italy.

The epoch from about 1400 to 1520 was the time of the flamboyant or florid Gothic. The term flamboyant is properly applied only to the French buildings which have a curious flame-like tracery. In the partial abandonment of the system of ribbed vaulting, the style had lost its main reason for being, for although this was used in many churches, it was also neglected in others, where a solid cut-stone vault was used. The decorative form retained the common influence of the pointed arch, but the sections of moulding, the form of sculpture, the main masses of the building, became very much modified and always in the direction of extreme energy and even excessive picturesqueness. Those were the days of the magnificent towers covered with elaborate pinnacles to the very top, such as Antwerp in Belgium and Strasbourg on the Rhine. Those were the days of splendid porches covered with elaborate sculpture and having very noble statuary included in their adornment. It is a splendid style and lacks only the close coherence of decoration with the structure to receive unbounded admiration. The splendid town houses in the cities in Flanders, Hainault and Brabant form the culminating points of the style in civic architecture. A variety of flamboyant Gothic exists in Spain, which is of astonishing beauty and interest. In England the Tudor style (see TUDOR ARCHITECTURE) increased in popularity through the reigns of Henry VII., Henry VIII. and Elizabeth, and was completed by the introduction of fan-vaulting, the most beautiful architectural invention of the English, and the most original invention of the 16th century.

Gothic architecture disappeared on the complete admission of the classical style imported from Italy. This took place throughout the north of Europe as early as 1520, except in England, where throughout the period which we call Elizabethan and Jacobean there were occasional attempts at building in a mediæval way, usually in connection with previously existing buildings. In England, too, the close of the reign of James I. (1625) found a completely established classical style.

From that time on nothing was done until in the nineteenth century the study given to mediæval buildings was undertaken seriously by archæologists in the single direction of artistic curiosity, and by adherents of one or another Christian church or sect because of a supposed connection between the church and the Gothic style. It was in England that the most decided movement took place. It is known as the Gothic Revival, and has been the subject of much study in illustrated volumes and in the periodicals. As early as 1845 attempts were being made to build in the Gothic way; by 1855 much more was known of the style, and such buildings as the Oxford Museum and St. George's Church at Doncaster were built. Those two buildings represent two opposite types, the church being a faithful reproduction of a bygone style, the museum a new study of that style much recast and reshaped for the new requirements. The most important modern building in the mediæval style was the Westminster Palace or Houses of Parliament. These were, by special act of Parliament, required to be "Gothic or Elizabethan" in character, and the architect, Charles Barry, afterward made a baronet, adopted the latest of all styles that could possibly be called mediæval, that is, the Tudor style. Churches, especially those of the Church of Engand, were and still are almost exclusively built in some form of Gothic: and for thirty-five years, more or less, public buildings also were frequently designed in that way, but this tendency has disappeared. For the result of this movement see ARCHITECTURE. For the use of Gothic architecture in the United Stated see ARCHITECTURE, AMERICAN.

Author of 'Dictionary of Architecture.'

Gothic Art. The art of the times and the countries in which Gothic architecture flourished. The term is a misnomer, because even if the architectural style were rightly designated "Gothic," the wall-paintings, metal work, etc., of the time are not properly so described. Still no other term exists for those arts which prevailed in Europe from 1150 to the beginning of the Risorgimento in Italy (about 1375), and in the North until the decided beginning of the Renaissance (about 1500). There are certain arts of decoration which flourished in a wonderful way during this period, while others attained little excellence. Thus the pottery of the north of Europe and even of Italy during the period named, has never attracted much interest in modern times; very few examples of it remain, and what little there is that is effective in an artistic sense is decidedly Oriental (Saracen and Moslem) in character. Glass, too, is of little interest except in connection with windows, and apparently few glass vessels were made during the Middle Ages. On the other hand, metal-work was of singular interest. Bronze was not as common as it has always been in the East and as it was to be in Europe at a later period, but wrought iron reached a splendid development in the gratings, gates, window-bars, etc., of buildings, and in the singular enclosures made for tombs. Brass was cast in large sheets and hammered smooth and then engraved with arms and legends befitting the burial slab of a knight or noble lady; silversmiths' work was carried to a high pitch of excellence, and the common use of colored enamels applied to both bronze and to silver made the ecclesiastical implements and sacred vessels of the time extremely rich. Toward the close of the Middle Ages the complete plate armor of the nobles received a splendid decoration by means of reliefs and embossings, and by gilding in patterns and etching with acid. Very beautiful stuffs were hardly ever woven in Europe during this period; for splendid weaves France, Germany, and England sought the East; but the cloths and linens of the time were good and the common use of embroidery made the costume of the wealthy very splendid. The beauty of the costume, both in color and in form, affected the sculpture of the time; for, as the nude was hardly ever represented, the drapery of the figures became the chief object, with expression of face and gesture, of the architectural sculptors of the day. Both form and color were used freely in the beautiful ivory carvings which were richly painted and gilded.

Sculpture in connection with architecture is treated above. In the semi-architectural conditions of tombs and cenotaphs, life-size statues, usually recumbent, are found as early as the 13th century. These are of marble and other stone; and it is quite well ascertained that great numbers of statues in hammered bronze richly decorated with enamels existed at one time in the churches of western Europe; these also being of life-size for the most part. The raised chest or what seems the sarcophagus, the huge stone box which gives the name of altar-tomb to these monuments, often had its sides pierced with niches, and these occupied by statuettes of religious or symbolical meaning, and often of great beauty. The carvings of decorative objects are of great variety, such as mirror backs and boxes to contain small mirrors, panels of book covers, and statuettes of sacred subjects, sometimes 15 inches or more in height, in addition to elaborate bases upon which they stand.

Painting in the highest sense of the word, that is, the representation of human life and human sentiment, was used with reserve because it had to be applied either to the walls of the church and the palace, or to the vellum pages of a manuscript book. On this account we hardly think of the paintings of the Middle Ages as having led up to that of modern times; we think rather as the origin of modern work of the painting of the 14th century Italians, who themselves derived much of their art directly from Constantinople. Still there was a great skill showing itself in those two ways, and the comparatively few remains which exist in France and Germany of the paintings on walls and vaults during the years before 1500 are worthy to be compared with the splendid miniatures in the manuscripts. These last are not always religious; some manuscripts were of history and poetry and the illustrations given to those books were in keeping with their subject. There had been a great destruction of these splendid manuscripts, but many remain in public and private collections, and modern books have been devoted to their study and to the reproduction of their finest paintings. The special achievement in the art of decoration was in the brilliant windows of the time, but for this subject see GLASS, also GOTHIC ARCHITECTURE and WINDOW.

RUSSELL STURGIS,
Author of 'Dictionary of Architecture.'

Gothic Language, the language of the Goths, a member of the Teutonic branch of the Indo-European family. It is known through a Visigothic Bible translation of the 4th century A.D. The earliest historical indications concerning the home of the Goths place them along the lower course of the Vistula in modern Poland and Prussia between Warsaw and Dantzic. Here they remained as late as 150 A.D., but early in the following century, having been dislodged probably by the movements of their Hunnish neighbors, they appeared to the north of the lower Danube and on the northwestern shore of the Black Sea in modern Rumania and southwestern Russia as far east as Odessa. To the west on the Danube were the Visigoths, to the east, in southwestern Russia, the Ostrogoths. In 251 they defeated the Emperor Decius at Philippopolis, but in 270, after various incursions into Thrace and Greece, were driven back to their seat north of the Danube. They were known to the ancient historians and geographers as Gotones or Gothones, and later as Gothi, which points to the native name Gutans, or Gutos.

The only extant monuments of the language are: (1) Portions of a Bible translation, of a paraphrasing interpretation of the Gospel of John, and of a calendar contained in fragments of manuscripts written in Italy in the 6th century, presumably by Ostrogoths. (2) The signatures of Gothic witnesses on two Latin records or receipts, one at Naples, one formerly at Arezzo; the originals of which are now lost. A few Gothic words and names of alphabetic symbols in a Salzburg MS. now at Vienna. (3) A few Gothic words in a Latin epigram, a large number of proper names from Greek and Latin sources, and in old Spanish documents and inscriptions. (4) The scanty records of a Gothic language, probably Ostrogothic, preserved as late as the 16th century in the Crimea. The Bible translation, of which there remain portions of Matthew, Mark, Luke, John, Romans, 1 and 2 Corinthians, Galatians, Ephesians, Philippians, Colossians, 1 and 2 Thessalonians, 1 and 2 Timothy, Titus, Philemon, Esdras, Nehemiah, is associated always with the name Ulfilar or Ulfilas. He was probably himself a Goth, born about 310 A.D., made bishop of the Goths 341, removed 348, with a large body of his followers avoiding persecution, into Mœsia, south of the Danube; died 380 or 381, Ulfilas not only did the work of translation, probably of the entire Bible, but he invented an alphabet for it, using as a basis the Greek uncial alphabet of his time with preservation of its order, as well as of the numerical and phonetic values of the letters. He adapted it, however, to its purpose by the use of forms taken from the Latin and Runic alphabets, creating a system better for the purpose than either of the three.

The inflexion of nouns is distinguished by its relatively close approach to the original Indo-European system. Of the cases it preserves nominative, vocative, genitive, accusative, and dative, the latter including the original instrumental and locative, and to some extent the ablative.

In the remarks that follow we shall take the German and Latin as the bases of comparison. The Gothic article is as follows: *sa,* der; *so,* die; *thata,* das; gen. *this,* des; *thizos,* der; dat. *thamma,* dem; *thizai,* der; accus. *thana,* den; *tho,* die; *thata,* das; pl. masc. *thai,* fem. *thos,* neuter *tho,* die; gen. *thize,* der; dat. *thaim,* den; accus. *thans, thos, tho,* die. There are four cases, nominative, genitive, dative, and accusative; the ablative is only the dative with prepositions. The declensions are as follows: *a.* Strong: *fisks* (Lat. *piscis,* Germ. *Fisch,* fish), *fiskis, fiska, fisk;* pl. *fiskos, fiske, fiskam, fiskans.* *b.* Weak: *hairt-o* (Lat. *cor, cord-is,* Germ. *Herz,* heart), *-ins, -in, -o;* pl. *hairt-ona, -ane, -am, -ona.* Examples of promiscuous cases: *galaubein-as* (Germ. *Glauben-s*); *ahm-an* (Lat. *animum,* Germ. *Athem*); *hand-au* (dat. *Hand*), *-uns* (*Hände*), *-um* (*Händen*); *manag-eim* (dat. pl. *Mengen*); *vastjōs* (Lat. accus. pl. *vestes*); *sunus* (son), *-aus* (Germ. *Sohn-es*), *-au* (*Sohn-e*), pl. *-jus* (*Söhn-e*), etc.—Adjective: *gamain-s* (Germ. *gemein-er,* Lat. *communis*), fem. and neuter, *-a*; comparative degree: masc. *-za,* fem. *-zie,* neuter *-zo;* superlative: *-sts, -sta, -st.* Irregular: *gōda* (good), *batizo* (better), *batists* (best); *ubils, vairsiza* (evil, worse); *mikels, maizo, maizists* (Lat. *magnus, major, maximus*); *leitil, minniza, minnists* (*parvus* [little], *minor, minimus*). The numerals are: 1, *ains, aina, ain;* 2, *tvai, tvos, tva;* 3, *thrins;* 4, *fidvor, fidur;* 5, *fimf;* 6, *saihs;* 7, *sibun;* 8, *ahtau;* 9, *niun;* 10, *taihun, -tig;* 12, *tvalib, tvalif;* 20, *tvaimtig;* 30, *thrinstiguns,* etc.; 80, *ahtautehund;* 100, *hund;* 200, *tvahunda,* etc.; 1,000, *thusund.* Some of the pronouns are: *Ik, thu, is* (fem. *si,* neuter *ita;* Lat. *is, ea, id*); *meina, theina, izes* (*mei, tui, ejus*); *mis, thus, imma* (*mihi, tibi, ei*); *mik, thuk, ina* (Germ. *mich, dich, ihm*); dual. *vit, git* (we two, ye two); gen. *ugkis, igqvis* (of us two, etc.), etc.; *iains, silba, unsar, hveleiks, hvas,* etc. (Germ. *jener, selber, unser, welcher, was*). Examples of verbs: *visan* (Germ. *Wesen,* Lat. *esse*); *im, is, ist, siium, siith, sind,* (*sum, es, est; sumus, estis, sunt*); *vas, vast, vas, vesum, vesuth, vesum* (*fui, fuisti,* etc., Eng. was; future: *siiau, siiis, siiai,* etc.; *vairthan* (Germ. *werden*), *sōkian* (Lat. *sequi,* Germ. *suchen*) etc. The following verb is compared with Sanscrit and Latin: *bair-a* (Sans. *bhārā-mi,* Lat. *fer-o*),*-is* (*-si, -s*), *-ith* (*-ti, -t*); dual. *bair-aus* (Sans. *-ias*), *-ats* (*bhārā-tas*); it has no 3d person (Sans. *bhārē-tam*); pl. *bair-am* (Sans. *bhārā-vas,* Lat. *fer-i-mus*), *-ith* (*bhārā-tha, -tis*), *-und* (*-orti, -unt*); passive or middle: *bair-ada* (Sans. *bhār-ē,* Lat. *fer-or*), *-aza* (*-asē, -eris*), *-ada* (*-atē, -tur*), etc. The following are some of the adverbs, prepositions, and conjunctions: *aiv,* ever; *thar,* there; *her,* here; *iup,* upward; *uta,* outward; *af,* of; *at,* to; *fram,* from, of, for, since; *gau,* if; *inthammei,* whereas, Germ. *indem* (in that), etc.

Gothic Literature, the literature of the Goths, represented chiefly in the version of the Scriptures by Ulfilas, born in Cappadocia about 318, whence he was taken, together with his family, by the Goths, into Mœsia, became their second bishop about 348, and is considered as the translator of almost the whole Bible into Gothic (between 360 and 379). The *Codex Argenteus* (rather *Aureus et Argenteus*), containing a portion of the Gospels, translated by Ulfilas, with capitals of gold foil and the other letters of silver foil, deeply impressed into very fine vellum of a violet color, was made for the use of a Gothic king. It was a part of the plunder taken either by Clovis (507) from Toulouse, after the defeat of Alaric II., or by Childebert from King Amalaric (531). Anton Morillon, secretary to Cardinal Granvelle, found it in the monastery of Werden, near Cologne. Thence it was sent to Prague, and thence to Stockholm by Count Königsmark, after the storming of that city. Vossius, on visiting

Queen Christina, became its possessor (1655), and carried it to Holland, where it was purchased by Pufendorf (1662) for Count M. G. de la Gardie, chancellor of Sweden, who presented it to the University of Upsala (1669), having enclosed it in a silver case. It contained originally 640 pages, only 320 of which were legible in 1670, and a dozen leaves were purloined even of this remnant. Erik Benzel produced a splendid edition of it, and it was subsequently republished by Fr. Junius (Dort 1665), Georg Stiernhielm, from an exact transcript of the original by Derrer, which was burned at Upsala in 1702 (Stockholm 1671), and Edward Lye, from Benzel's edition (Oxford 1750). Johan Ihre, assisted by Sotberg, published a treatise on it, 'Ulphilas Illustratus' (Upsala 1752–5), and 'Fragmenta Versionis Ulphilanæ' (1763), which were reprinted by Dr. A. F. Büsching under the title 'Scripta Versionem Ulphilanam et Linguam Mœso-Gothcam illustrantia' (Berlin 1773). The version of the Bible was probably continued by others after Ulfilas, and the contents of the silver codex itself were revised in Latin versions. Fr. Ant. Knittel found at Wolfenbüttel (1756) a palimpsest with Gothic fragments of the epistle of Paul to the Romans (*Codex Carolinus*). Angelo Mai and Carlo Castiglione discovered at Milan five palimpsests, containing parts of Matthew, the epistles of Paul almost complete, some fragments of Ezra and Nehemiah, of a Gothic calendar, and of a homily. Castiglione edited the fragments of the epistles of St. Paul (1829–39). The epistles to the Hebrews and the Corinthians, the Apocalypse, and the Acts of the Apostles are wanting; but it is not known whether they were ever transalted into Gothic. Gothic signatures of names on documents were found at Naples (in the inscriptions of Donis), of which facsimiles were published by Sierakowsky and Massmann (fol., Vienna 1838). But the 'Gothicon' of Constantine Porphyrogenitus (lays sung at court by circus riders dressed in the garb of Goths, accompanied by the pandura, a sort of lyre), and the inscription on a yard-stick, are not genuine Gothic.

Goths, an ancient Teutonic tribe, whose earliest known home was the shores of the Baltic, between the Vistula and the Oder, where they were living in the 1st century after Christ. Thence they migrated in the 3d century to the regions adjoining the Black Sea. Many other tribes were incorporated with them, and by continual advances and conquests they established, under Ermenric (about 350), the great Gothic kingdom, extending from the Black Sea to the Gulf of Bothnia. This naturally brought the Goths into continual contact, on the west with the western Roman empire, and on the east with the eastern empire as centred at Constantinople. About the year 369 internal commotions produced the division of the great Gothic kingdom into the kingdom of the Ostrogoths (eastern Goths), on the shores of the Black Sea, from the Don to the Dnieper, and the kingdom of the Visigoths (western Goths), from the Dnieper to the Danube. About the year 375 vast multitudes of the Huns and of the Alans, which latter had been subdued by the Huns, poured out of Asia, and drove back the Ostrogoths upon the Visigoths. The Goths obtained permission from the Emperor Valens to settle in Thrace, but were driven to rebellion by the oppression of the imperial governor. In the war which ensued Valens himself was defeated and slain by them at Adrianople in 378. The Emperor Theodosius incorporated the Gothic army into his legions, and henceforth they had an important influence in the affairs of Constantinople. After many vicissitudes the Ostrogoths obtained a settlement in Pannonia and Slavonia, but not till the destruction of the kingdom of the Huns in 453. The Visigoths in process of time obtained a degree of power which excited alarm in Greece and Italy. In 369 Alaric made an irruption into Greece, laid waste the Peloponnesus, and became prefect of Illyria and king of the Visigoths. He invaded Italy about the beginning of the 5th century, and by that measure brought on the destruction of the Roman empire, since Stilicho, the Roman general, could only obtain a victory over Alaric at Verona (in 403) by withdrawing all the Roman troops from the borders of the Rhine. Alaric himself soon returned to Italy, and sacked Rome in 409, and a second time in 410. In 552 the Goths in Italy were finally overthrown in battle and expelled from the peninsula by Narses, general of Justinian. The Visigoths succeeded in establishing a new kingdom in the southern parts of Gaul and Spain, of which, toward the end of the 5th century, Provence, Languedoc, and Catalonia were the principal provinces, and Toulouse the seat of government. The last king, Roderick, died in 711 in battle against the Moors. Since the time of Constantine, Christianity appears to have taken root among the Goths, whence a Gothic bishop is mentioned as present at the Council of Nicæa, 325 A.D. Their form of Christianity was Arian, like that of their protector Valens, and their bishop Ulfilas. The introduction of Christianity among these Goths, and the circumstance of their dwelling near and even among civilized subjects of the Roman empire, greatly contributed to raising them in civilization above the other German tribes. See GOTHIC LANGUAGE; GOTHIC LITERATURE; GOTHIA; OSTROGOTHS; SEPTIMANIA; ULFILAS; VISIGOTHS.

Gottenburg, gŏt'ĕn-boorg, **Gothenburg**, or **Göteborg** (Swedish *Göteborg*, or *Götheborg*; Latin, *Gothoburgum*), Sweden, seaport, the second in the kingdom in respect to population and trade, capital of the county of the same name; situated on the Gota, five miles from its mouth, 255 miles west-southwest of Stockholm. It has a dry dock cut out of the solid rock; and the completion of the Gota canal, and also the railway facilities have greatly increased its commercial importance. Although founded in 1618, by Gustavus Adolphus, the town, in consequence of numerous fires, is quite modern,— the streets are at right angles and the houses well built. The manufactures include iron, steel, machinery, sail-cloth, linen, and leather, and there are oil-presses, cotton-mills, dye-works, and building-yards, at which a considerable number of vessels are launched; the most important industrial establishments are tobacco factories, porter breweries, and sugar-refineries. The trade is very extensive, the harbor being excellent and generally free from ice. Its commercial importance dates from the Continental blockade of 1806, when it became the chief British depot in northern Europe. The chief exports are iron and steel, copper, wood, tar, linseed, bark, bones, juniper berries, cranberries, and manufactured articles; the chief imports grain, sugar, coffee, tea, wine, salt, seal-oil, cotton yarn, and twist. Among social reforms the town is noted for its licensing system (see GOTHENBURG SYSTEM). Pop. (1897) 117,103.

Götterdämmerung, gĕt"tĕr-dĕm'mĕ-roong, «the twilight, or gathering nightfall of the gods,» the title of Wagner's closing opera in his Nibelungen cycle of dramas. The subject of the opera is what is called in Scandinavian mythology the *Ragnarok*, or end of the world. This was brought about largely by the admission of Loke, the god of evil and mischief, into Asgard, the abode of the gods. It was through Loke that Balder, the bright and good god, was slain and flung down into the abodes of Hel, the goddess of death. Confusion throughout the universe is the consequence. The sun and moon are swallowed by giants; continuous winters rage without an intervening summer; the earth trembles in the throes of earthquakes. Mountains topple down with a crash; the Fenriswolf breaks its chains and fetters. The Midgard serpent writhes to get free; the ship Naglfar, built of the finger-nails of dead men, passes over the sea, filled with giants of the frost and mountain; Loke leads the hosts of Hel and bursts upon the scene. The powers of evil rush to the battlefield Vigrid, while Heimdal blows his Gjallarhorn, Odin seeks the giants for advice, the other gods as well as the heroes of Valhal arm themselves and sally forth, and the battle begins. While the fight is still raging the immortal god Surt flings light and flame over the world, and the earth, reduced to ashes, sinks beneath the watery waste. See NIBELUNGENLIED; RAGAROK; and SCANDINAVIAN MYTHOLOGY.

Gottfried (gŏt'frēd) **of Strasburg**, German poet: probably b. Strasburg about 1200. He was not, like most of the Minnesingers (minstrels) of his age, a noble. Besides many lays, he was the author of the great chivalric poem, 'Tristan und Isolde,' derived from a Welsh original, but possessing as much originality of character as any other German classical work. For grace, elegance, and vivacity of description, richness of coloring, and melody of versification, this work stands alone in old German literature.

Gottheil, gŏt'hīl, **Gustav**, American rabbi: b. Pinne, Posen, 28 May 1827; d. New York 15 April 1903. Following in his boyhood the studies prescribed for Jewish youth, he was fortunate in broadening his education at the universities of Berlin and Bonn. In 1855 he was elected assistant rabbi at the Berlin Reform Temple, thus early showing his progressive tendencies. In 1861 he received a call to the Congregation of British Jews, Manchester, England, where he spent 13 years of effective work. In 1873 he was invited to the Temple Emanu El, of New York, first as assistant to Rev. Dr. Samuel Adler, and then, on the latter's retirement, as sole rabbi. In his new field his activity rapidly developed along the lines of education and benevolence. Under his personal impetus the Emanu El Preparatory School and the Jewish Ministers' Association were founded, and continued for some years. He organized the Emanu El Sisterhood of Personal Service, which, adopted by many other Congregations, has become a successful feature of communal benevolence. His voice and pen were largely enlisted in behalf of Judaism and the liberal movement, and he was often heard in Christian churches, while Christian clergymen occasionally occupied his pulpit. A favorite speaker at public gatherings, his enthusiasm, sympathy, and broad culture did much to win recognition for his co-religionists. In his last years he was an ardent champion of Dr. Herzel's movement to secure a place of shelter for persecuted Jews, the latest development of the Zionistic idea. Apart from contributions to a few magazines and reviews, his published works were a hymn book and 'Sun and Shield,' a book of daily devotion, in both of which he drew largely from non-Jewish sources.

Gottheil, Richard James Horatio, American Semitic scholar: b. Manchester, England, 13 Oct. 1862. He was graduated from Columbia in 1881, studied also at Berlin, Tübingen, and Leipsic, and became professor of Semitic languages in Columbia, director of the Oriental section of the New York public library, and (1898) president of the American Federation of Zionists, of whose principles he is an active exponent. He is also a member of the central committee of the general organization. He became an editor of the 'Jewish Encyclopædia' in 1901, and published 'The Syriac Grammar of Mar Elia of Zobha' (1887). He is a son of G. Gottheil (q.v.).

Göttingen, gĕt'tĭng-ĕn, Germany, town in the Prussian province of Hanover, in the valley of the Leine, 59 miles south-southeast of Hanover. It is a place of great antiquity, and was once famous for its fortifications. It contains a noted university, founded in 1734. Göttingen belonged to the Hanseatic League and enjoyed great prosperity until the Thirty Years' War. The manufactures consist chiefly of a few woolen tissues, tobacco, leather, paper, books, and philosophical instruments. Pop. 30,293.

Göttingen, University of, or **Georg-August University**, a German institution, was founded by George II. of England, known also as Georg August, elector of Hanover. The plan of the school was outlined as early as 1732, was established in 1734, and opened in 1737. Its popularity decreased after the expulsion of the seven professors: Albrecht, Dahlmann, Ewald, Gervinus, the two Grimms, and Weber, for political reasons, but it has recovered itself since 1866, and in 1901–2–3 it had an average attendance of over 1,000 students, and several eminent names among its professors. The principal building, to which William IV. of England contributed £3,000, was completed in 1837. Connected with the university are a museum with extensive and valuable collections, an observatory, a well-equipped school of anatomy, botanical gardens, and a library of about 500,000 printed volumes and nearly 6,000 manuscripts. It has also a pedagogical seminary, a gymnasium which dates from the 16th century, a museum, an art gallery of German and Flemish pictures. Consult: Pütter, Saalfield, and Oesterley, 'Die Georg-August Universitat.'

Gottschalk, gŏt'shälk, **Louis Moreau,** American pianist and composer: b. New Orleans, La., 8 May 1829; d. Rio de Janeiro, Brazil, 18 Dec. 1869. He studied in Paris and after his return to the United States in 1853 became the most popular pianist in America. His playing was confined to his own compositions. He traveled extensively in Mexico, the West Indies, and South America, and was taken fatally ill, while playing at Rio Janeiro his latest work, 'La Morte.'

Götz von Berlichingen. See BERLICHINGEN, GÖTZ VON.

Gough, gŏf, **John Bartholomew,** American temperance lecturer: b. Sandgate, Kent, England, 22 Aug. 1817; d. Frankford, Pa., 18 Feb. 1886. He came to America in 1829 and two years later became a bookbinder in New York. Falling into dissipation, he lost regular employment and was reduced to giving recitations and singing comic songs at low grog shops. In 1842 he was induced to attend a temperance meeting and take the pledge; and he then made up his mind not only to reform, but to influence others to do likewise. Save for a short relapse, a few months later, his pledge was kept, and ere long, as a temperance lecturer, he became one of the most popular of public speakers in America and England, which he visited on temperance tours 1853–5, 1857–60, and 1878. In later life he handled literary and social topics, as well as temperance themes in his lectures. He published an 'Autobiography' (1846; enlarged 1870); 'Orations' (1854); 'Temperance Lectures' (1879); 'Sunlight and Shadow, or Gleanings from My Life Work' (1880).

Goujon, Jean, zhŏñ goo-zhôñ, French sculptor and architect: b. Paris 1515; d. about 1570. He was employed with Pierre Lescot, architect of the Louvre, on the restorations of St. Germain l'Auxerrois, 1542–4; and after the accession of Henry II., decorated the Chateau d' Anet for the king and Diana of Poitiers. To him is ascribed what is considered the masterpiece of French sculpture, the 'Huntress Diana,' now in the Louvre collection, and the fountain of the Innocents at Paris was also his work.

Gould, goold, **Augustus Addison,** American zoologist: b. New Ipswich, N. H., 23 April 1805; d. Boston 15 Dec. 1866. He was graduated at Harvard 1825, and in 1856 became visiting physician to the Massachusetts General Hospital. His strong scientific tastes led him to take up investigations in botany, zoology, and conchology, and in the latter branch he became one of the most eminent authorities in the whole world. He published 'System of Natural History' (1833); 'Invertebrate Animals of Massachusetts' (1841); 'Otia Conchologica' (1863); 'Principles of Zoology' with Agassiz (1848).

Gould, Benjamin Apthorp, American astronomer: b. Boston, Mass., 27 Sept. 1824; d. Cambridge, Mass., 26 Nov. 1896. He was graduated at Harvard in 1844 and pursued the scientific study of astronomy at several foreign observatories, returning to America in 1848. In 1851 he assumed charge of the longitude department of the United States Coast Survey, and perfected methods for determining the longitudes telegraphically. By 1866, 20 longitudes in the United States had thus been determined. He was director of the national observatory at Cordova, Argentina, 1870–85, and there completed three extensive star catalogues, and conducted meteorological and climatological investigations. He was the founder and editor of the 'Astronomical Journal' (1849–61), and published 'On the Trans-Atlantic Longitude, as Determined by the Coast Survey' (1869); 'Uranometria Argentina' (1879); etc.

Gould, Elgin Ralston Lovell, American economist: b. Oshawa, Ontario, Canada, 15 Aug. 1860. He was graduated from Victoria University, was fellow (1882–4) and lecturer (1892–7) at the Johns Hopkins University, and professor in the University of Chicago (1895–6). In 1896 he became president of the City and Suburban Homes Company of New York, and at one time vice-president of the American Economic Association. He has written: 'The Housing of Working People'; 'Popular Control of the Liquor Traffic'; 'The Gothenburg System of Liquor Traffic'; 'The Social Condition of Labor.'

Gould, George Jay, American capitalist: b. New York 1858. He was the eldest son of Jay Gould (q.v.). In financial circles he was active chiefly in connection with his large railway interests, particularly as president, from 1888, of the Little Rock & Fort Smith Railroad, from 1892 of the Manhattan Elevated Railroad of New York, and from 1893 of the Saint Louis, Iron Mountain & Southern; the International & Great Northern; and the Missouri Pacific.

Gould, Hannah Flagg, American poet: b. Lancaster, Mass., 1789; d. Newburyport, Mass., 5 Sept. 1865. She was an aunt of B. A. Gould (q.v.), and at one time very popular as a verse writer. She published: 'Hymns and Poems for Children' (1854); 'The Golden Vase'; 'The Youth's Coronal' (1850); 'The Mother's Dream' (1853); etc. 'The Snow-Flake' and 'The Frost' are still remembered and quoted among her poems.

Gould, Helen Miller, American philanthropist: b. New York 20 June 1868. She is a daughter of Jay Gould (q.v.), and has achieved an extended fame through her benefactions for charitable and educational uses. At the opening of the war with Spain she not only contributed $100,000 to the United States government, but was active in the Woman's National War Relief Association, to which she was a generous contributor. Among other notable gifts of hers are that of $380.000 to New York University, etc., in 1898; $50,000 to the naval branch of the Young Men's Christian Association of Brooklyn; and $100.000 to New York University for a Hall of Fame for Great Americans, in 1900.

Gould, Jay, American financier: b. Roxbury, N. Y., 27 May 1836; d. New York 2 Dec. 1892. He was brought up to labor on his father's farm; and was for a short time a student at Hobart College. Here he learned surveying. After making surveys of Ulster, Albany and Delaware counties, he began his railroad career. This was directly after the panic of 1857. His first speculation was the purchase of the bonds of the Rutland & Washington Railroad. He himself became president, treasurer, and superintendent of the road. Soon afterward he effected a consolidation of his road with the Rensselaer & Saratoga line, withdrew his capital, removed to New York, opened a broker's office, and began dealing in Erie stocks and bonds. His aim was to gain control of the Erie. This he did by depressing the value of the stock and then buying it in. In association with James Fisk, Jr., he entered the directory of the company, was elected president, while Fisk became vice-president and treasurer. On the reorganization of the company, 1872, he lost official connection with it. He then invested in the Pacific railroads, secured control of several lines, built branches, and effected combinations which resulted in the establishment of what is known as the "Gould system." Jay Gould and his partner, Fisk in 1869 entered into a scheme to corner the gold market of New York and this resulted in the financial crisis and panic known as "Black Friday" (q.v.). The attempt netted them about $11,000,000.

Gould, John, English naturalist: b. Lyme, Dorsetshire, 14 Sept. 1804; d. London 3 Feb. 1881. His reputation as a taxidermist procured him the post of curator to the Museum of the Royal Zoological Society in 1827, and in 1832 he published 'A Century of Birds from the Himalayan Mountains.' He next undertook a work of much more extensive character, entitled the 'Birds of Europe,' published 1832–7. This was followed by: 'Birds of Australia' 1842–8; 'Mammals of Australia' (1859); 'Monograph of the Trochilidæ, or Family of Humming Birds' (1850); 'Monograph of the Odontophorinæ, or Partridges of America'; etc.

Gould, Sabine Baring. See Baring Gould, Sabine.

Gould, Thomas R., American sculptor: b. Boston 1818; d. 1881. He was a pupil of Seth Cheney, of Boston, and there established his first studio. From 1868 he was in Florence, Italy. His works include a statue of Hancock in the Lexington town-hall; portrait-busts of Junius Brutus Booth, Emerson, and Gov. John A. Andrew; and the ideal statues 'The West Wind,' 'Christ,' and 'Satan.'

Gounod, Charles François, shärl frän-swä goo-nō, French composer: b. Paris 17 June 1818; d. St. Cloud 18 Oct. 1893. He began his studies in the Paris Conservatory under Halévy, Le Sueur, and Paer, and carried the Rome prize with his cantata 'Fernando' in 1849. While in Rome he made Italian Church music his chief study. His mass in the style of Palestrina, which he composed in Vienna in 1843 after his return from Rome, was the first fruits of this study. On arriving at Paris he took charge of the music in the church of the Missions Etrangères, and produced no original work until April 1851, when his first opera, 'Sappho,' appeared. Gounod's next production was the five-act opera, 'The Bleeding Nun ('La Nonne sanglante') (1854). Following this was the comic opera founded on Molière's 'Le Médecin malgré lui' (1858), and the grand opera 'Faust et Marguerite,' which latter was a signal success and was produced with much enthusiasm in all the more important opera houses of Europe. Even in Germany, the home of the Faust legend in music and poetry, the originality, and wealth of melody of Gounod's music, together with his powerful orchestration were so manifest above all else in the opera, that his Faust became a favorite with the public. Later operas of his were: 'Philémon et Baucis' (1860), which was not popular; 'La Reine de Saba' (1862); 'Mireille' (1864); 'Roméo et Juliette' (1867), which was favorably received in every opera house of Germany; 'Polyeucte' (after Corneille's drama), which was a failure; finally the comic opera, 'Cinq Mars' (1877), and the last of his grand operas, 'Le Tribut of Zamora,' which was well received. Besides these operatic compositions he wrote much religious music, notably the 'Rédemption,' which was performed in England and later in Germany, and has been very popular in the United States. He also produced at Brussels his 'Mors et Vita,' and in addition wrote cantatas, symphonies, pieces for the piano and numerous songs. During the Franco-Prussian war (1870–1) he resided in England, where he formed the Gounod Choir, a chorus of mixed voices, whose concerts were widely popular. Consult: Claretie, 'Portraits Contemporains' (1875); Voss, 'Ein Lebensbild' (1895); Paguerre, 'Charles Gounod, sa vie et ses œuvres' (1890); Boret, 'Charles Gounod, His Life and His Works' (1890).

Goupil, Jules Adolphe, zhül ā-dōlf goo-pēl, French painter: b. Paris 7 May 1839; d. Neuilly 30 April 1883. He was a pupil in the studio of Ary Scheffer and achieved success by his powers as a portrait and genre painter. His most famous picture, 'Mme. Roland's Last Day in Prison,' is in the Luxembourg. His father, Adolph Goupil, did much to encourage the introduction of French art into this country: well known throughout Europe as a Parisian picture dealer, he opened a branch house in New York.

Goura, gow'ra, any one of a group of large, handsomely dressed pigeons of New Guinea, constituting the genus *Goura*, and distinguished by their fan-like crests, — the crowned pigeons. These birds are found near open or cultivated lands, ranging near the ground in small flocks, and feeding on buds, seeds, berries, and other fruits, and on worms, snails, and insects. In addition to the cooing heard in the nuptial season, they utter harsh, trumpet-like cries. During the heat of the day, or when alarmed, they hide in the thickest jungle. They make rude nests and lay only one white egg. The best-known species (*G. coronatus*) is a beautiful bird over two feet in total length. It is sometimes kept among poultry, and its flesh is much esteemed.

Gourami, goo'ra-mĭ. See Goramy.

Gourd, gōrd or goord, a plant of the genus *Cucurbita* or its fruit. In Europe the name is given generally to pumpkins, squashes, melons, etc.; but in America is restricted to those with hard-skinned, thin-fleshed inedible fruits, cultivated for ornament or because their excavated shells are useful as dippers, etc. See Calabash Gourd; Cucurbitaceæ.

The Hebrew word translated gourd in Scripture is apparently so much akin to the Greek word *kiki*, used by Dioscorides for the castor-oil plant (*Ricinus communis*), that the "gourd" of Scripture was probably that species. It is a euphorbiaceous plant. The wild gourd of Scripture is a plant which grew on a wild vine — that is, was procumbent, and had tendrils. It moreover produced "death in the pot"; discoverable in a moment by the taste. It was probably either the colocynth (*Citrullus colocynthis*), or the squirting cucumber (*Momordica elaterium*).

Gourd-seed. A fish. See BLACKHORSE.

Gourd-worm, the fluke-worm (q.v.) which affects the livers of sheep.

Gourgand, Gaspard, BARON DE, French general: b. Versailles 14 Sept. 1783; d. 25 July 1852. Entering the army as lieutenant of artillery in 1802, he distinguished himself in several important battles, and in the battle of Brienne saved Napoleon's life from the Cossacks. He subsequently became Napoleon's adjutant, and as his confidential secretary accompanied him to St. Helena, but for various political reasons left him in 1818. He was subsequently aid-de-camp to Louis Philippe, and became a member of the House of Peers in 1841. In the previous year he was made one of the commission appointed to bring the remains of Napoleon from St. Helena to France. He was passionately devoted to Napoleon and unreasonably jealous of those who attended upon the emperor in his exile. He assisted Napoleon in writing his 'Mèmoires' and was the author of 'La campagne de 1815'; 'Mèmoires pour servir a l'histoire de France sous Napoleon' (1822–3); 'Rèputation de la vie de Napoleon par Sir Walter Scott' (1827); and a remarkable journal kept during his stay at St. Helena, but which remained in MSS. till 1898. An English translation of selections from the journal by Mrs. Elizabeth Latimer (q.v.) appeared in 1903. The work is exceedingly prolix, but of great value, since it records with the minuteness of Pepys, or the precision of Boswell, the incidents of daily life and the conversations of the fallen emperor. In no other work can the personal side of Napoleon be so well studied as in Gourgaud's journal. An entire chapter is given to the emperor's criticisms on his own action at Waterloo, and of equal interest are his judgments concerning other great commanders from Cæsar's times to his own. His opinions regarding English character are essentially French in their character, and amusing from their entire misconception of it. But in this journal we are shown Napoleon's conversation on almost every conceivable subject, insignificant or important, and always with the frankest egotism.

Gourgues, Dominique de, dō-mē-nēk dė goorg, French soldier and adventurer: b. Mont-de-Marsan 1530; d. 1593. Captured by the Spaniards in Italy, where he was serving in the army of Maréchal de Strozzi (1557), he was condemned to the galleys and in 1559 his ship was taken by the Turks; the Turkish ship in turn fell into the hands of the Knights of Malta, who set him at liberty. After many voyages to Africa and South America he signalized his name by taking vengeance on the Spaniards of Fort San Mateo, who under Menendez had massacred the Huguenots of Fort Caroline, Florida. He razed Fort Mateo and killed in battle or hanged every Spaniard he found there.

Gourney, SIR **Goldworthy**, English inventor: b. Treator, England, 14 Feb. 1793; d. Reeds, England, 28 Feb. 1875. His early studies were in medicine, but he subsequently devoted himself to chemistry. Among important inventions by him are the oxyhydrogen blowpipe, lime-magnesium and oil-gas lights, the high-pressure steam jet, the tubular boiler, and steam carriage. He was knighted in 1863.

Gout, a disease of comparative infrequency, affecting for the most part the large joints of the foot or knee, and accompanied by a deposition in the joints of a salt of uric acid, notably sodium urate. It is a disease that has been observed for many centuries, and many of the older classical writers have left descriptions, jibes, and witticisms concerning it. Notwithstanding an immense amount of study of the many factors concerned with gout it remains true that the real essential causes of the disease are unknown. Gout is found throughout civilized communities, but it is no respecter of persons, alike affecting the rich and the poor, although it is more prevalent among the former. Whether the afflicted are the "fag-ends" of previously well-to-do families is unknown. Gout is thought to be much more common in England and in Germany than it is in the United States, and the few statistics available, while notoriously unreliable, seem to bear out this belief. Some observers believe that the disease is becoming more frequent in the United States. On this point, however, there are almost no reliable figures. It is a disease of middle years, and men are more often attacked than women.

The symptoms of gout may be grouped under three general heads, acute gout, chronic gout, and irregular gout. In acute gout there may be premonitory twinges of pain in the small joints of the hand or foot. These may be accompanied by dyspepsia, restlessness, and irritability. The urine is usually diminished in amount, is dark in color, and strong in odor. On cooling, a greater deposit of brick-dust urates occurs than is usual. This brick-dust sediment, it should be borne in mind, occurs in practically all healthy urine when cooled. It is not a sign of disease, and quacks would starve if the people did not believe their "brick-dust" horrors. The gout attack frequently commences in the middle of the night, or about 4 A.M., when the temperature of the body is nearly at its lowest point. There is excruciating pain in some one of the joints of the body, usually of the big toe. The pain is accompanied by swelling, redness, and stiffness of the joint, and there may be some constitutional disturbance with a rise of temperature to 102° and 103° F. The symptoms may slowly subside during the day, to recur with equal or diminished severity at a 24-hour interval. After 3, 4, or 6 days the swelling and pain gradually grow less and in 8 or 10 days the patient may be well. Other joints may be involved, and the attack may last only a few days or may persist for two weeks or more. Occasionally there are accompanying gastro-intestinal disturbances, with nausea, vomiting, diarrhœa, dyspnœa, and heart-depression. If an acute attack is followed by other attacks, a condition of chronic gout develops. The joints become sore and remain swollen, and a larger number of joints become involved in the reaction. The joints no longer lose their swollen appearance, since deposits of urates take place in the cartilages and in the ligaments, but become further enlarged and distorted. These local collections of urates are termed tophi, and they may be found in other joints — in the hands, knees, elbows, and even in the ear-cartilages. The frequent attacks of pain leave the patient much more irritable. He is apt to be dyspeptic, sallow-faced, and to show signs of disease in his heart and blood vessels. Under the term irregular gout have been grouped a veritable scrap-basket assortment of symptoms which different clinicians have thought were undeveloped cases of gout. By many authorities these irregular forms of so-called "gouty diathesis" are taken "with a grain of salt"; yet there is little doubt that a number of more or less definite symptoms are found in those who are moderately gouty which may be attributed to this disease. These irregular forms are frequent in gouty families and include certain forms of chronic eczema, attacks of biliousness with marked constipation, etc. Frequently there is a condition of arteriosclerosis (q.v.) with tendency to the development of slight dropsy or other symptoms of disease of the heart or kidneys. Nervous headaches or migraine may be another heritage, although migraine is such a common disturbance that its presence proves little for any of the many one-sided theories concerning it. Itching feet, hands, or eyeballs, irritable bladder with small quantities of acid, high-colored urine, are other symptoms attributed to irregular gout. Occasionally severe forms of eye-disease occur in those thought to be gouty, to account for which no other cause seems probable.

The cause of gout is really unknown. The theories are as numerous as the sands of the sea. A bad heredity is one of the most important factors, since from 50 to 60 per cent of gouty patients have had it left to them by their ancestors, one or two generations back. The boys seem more prone to this influence than the girls. Advancing age plays some part, the disease usually setting in before 50 years and generally after 40, although in the markedly hereditary forms the disease may come on much earlier, especially in the irregular manifestations. Alcohol is perhaps the most important contributory factor, those indulging in large quantities of fermented liquors seeming to be much more liable to contract the disease. Among the poor it is chiefly in the ale and beer drinkers that the disease is found. Overeating, lack of exercise, and minor injuries to the feet are also important causes of the development of gout. As for the general theories to account for the poisoning — for it seems like a poisoning — all at best are pure hypotheses. Uric acid is considered by many as the chief criminal, but beyond the fact that there is an increased amount of uric acid found in the urine during an attack, and deposits of a salt of uric acid in the joints, there is no proof of its causative influence. Many modern students believe this to be a purely secondary condition, and not a primary one. There is a marked increase in the metabolism of nucleoproteids (q.v.) which in large measure accounts for the increase in one of its products of oxidation, uric acid. Clifford Allbutt has well summed it up when he writes that we are far from sure that gout may not be due to some extrinsic element. The peculiar geography of gout is in need of careful inquiry; the effects of microbic infection of the kidney are unknown in their relation to the precipitation of uric acid. Again, some internal secretion may be at fault, as in diabetes. "Till we know then whether gout is a mere shortcoming in ordinary metabolism, or a peculiar perversion of it, or a static susceptibility of fibrous tissue, or a defect of some enzyme, or a perturbation of the nervous system, or again some factor from without, it appears we must confine the name of gout to the uratic precipitations which are known, and which can serve as a touchstone, and as to all other vague 'acidities,' 'flatulencies,' 'megrims,' and 'biliousness' of whatever occult kind, be content to treat them empirically, awaiting the results of the analysis of our nutritive life upon which biochemistry is actively and hopefully engaged." Summing up what is really known about the pathology of the disease, it seems established (1) that gout is a morbid condition, of which the most striking phenomena are acute attacks of arthritis (q.v.), which tend to recur and are accompanied by redness, pain, and œdema of the part; (2) that the affected joints are found to be the seat of a deposit of urate of sodium, which occurs first in the articular cartilages and afterward infiltrates all the surrounding structures; (3) that deposits of this material may also be found in other parts, such as the pinna of the ear, the bursæ, etc.; (4) that excess of uratic material may be demonstrated in the blood of a gouty patient, the amount being greatest before an acute attack, and least immediately after one; (5) that the influence of heredity in producing gout is undoubted; and that certain poisons, such as lead and malt liquors, may induce an attack. In the same manner our ignorance concerning the cause of gout may be summed up by saying (1) that it is not known how the excess of uratic matter is brought about, whether it is due to an increased intake with the food, to increased formation in the body, or to deficient elimination by the excretory organs; (2) that it is not known whether the uratic excess is the cause of the phenomena of the disease or is a mere casual accompaniment of the perverted state of nutrition; (3) that it is not known in the case of arthritic attacks whether the deposit of urate of soda is the cause or the effect of the local inflammation; in other words, that gout is a disease the cause of which is not yet understood.

The treatment, however, is on better foundations. Here empiricism has taught the general rule that most people eat and drink too much and that temperance in all things is beneficial in gout as in other experiences in life.

Treatment.— No routine line can be laid down that can be adapted suitably to all cases. Individualism — the treatment of the patient, rather than the disease — is the prime feature. The treatment for gout should include (1) the medicinal treatment of the gouty paroxysm, in acute gout; (2) the medicinal and dietetic treatment of the sub-acute and chronic conditions, and (3) the treatment of the affected joints, with the object of removing, if possible, the foreign deposits.

The horizontal or slightly elevated position for the limb, with a cradle to take off the weight of the bed-clothes, warm packs, soothing lotions such as the lead and opium wash, and an oil-silk covering constitute the main features in the local treatment of an acute attack. Internally, colchicum, in dosage to be determined by the physician, is the best remedy. A brisk cathartic aids the action of the colchicum, and a mild diuretic may be combined to advantage — citrate of potash, cider, lemonade, being reliable. The pain and insomnia should be controlled by the visiting practitioner. Opium in all its forms is to be avoided. In the treatment of chronic gout attention must be paid to diet. Malt liquors are to be avoided, and the heavy wines, such as port and burgundy. There is no good reason why any particular form of food should be eliminated, but it is paramount that simplicity and undereating rather than overeating should be the rule. The so-called uric acid theory of gout is a pathological hobgoblin. Copious drinking of alkaline waters is of value — largely because of the water. Potassium salts seem to be of service. A bracing air, low humidity, absence of cold east winds, constitute the chief climatic conditions to be sought.

Smith Ely Jelliffe,
Editor 'Journal of Mental and Nervous Diseases.'

Goutweed, or **Goutwort**, a species of wild carrot (*Ægopodium podagraria*) introduced from Europe, where in England it is known as masterwort, herb-gerard, and now a weed in waste places along the Atlantic coast.

Gouverneur, goo'vėr-nėr, N. Y., village in St. Lawrence County; on the Oswegatchie River, the Rome & W. R.R.; about 40 miles south of Ogdensburg. It has large marble works; the talc mines nearby are well developed, and considerable iron ore is mined, and wood-pulp is manufactured. It is in a good agricultural region. Pop. 3,700.

Government is the term used to describe the mechanism or *ensemble* of agencies through which a body-politic formulates and executes its will.

Governments de facto and de jure.— Since they act only as the agents of the sovereign political power, governmental agents in order legally to exercise the functions of their offices, are obliged to possess a delegation of powers from the state they represent. In case they are not able to produce a sufficient evidence of this authorization, their acts are *ultra vires*, and as such of no legal force, and they themselves are subject to civil or criminal suit at the instance of parties whose persons or property they may have injured by their acts.

It not infrequently happens, however, that persons claiming political authority, while able to produce satisfactory evidence of their official status and competence, do so by referring to grants of power from a political sovereignty, the legitimacy of which is not admitted by the parties over whom their authority is attempted to be exercised. It thus becomes necessary to distinguish between governments *de facto* (*sed non de jure*) and governments *de jure*.

The terms *de facto* and *de jure* are applicable to governments in a purely relative sense. That is to say, which of the two is properly descriptive of a given political organization depends upon the point of view of those who characterize it. Thus a government is *de jure* as well as *de facto* when it has been established by, claims to represent, and is in fact guided by the will of a state the legitimacy of which is recognized by the individuals over whom its control is extended. It is *de facto* but not *de jure* to any particular individual when, though actually in existence and able to exercise a certain amount of power, its legal character is denied by that individual. Thus in the case of an attempted revolution; from the standpoint of those who have repudiated their allegiance to the old state, refuse obedience to its government, and have organized for themselves a new political machinery, the old government has but an actual and not a legal existence, the new government being the only one in their eyes possessing a legal basis. Upon the other hand, from the point of view of those who still support the old state, the newly established government has but a *de facto* existence, the old government being conceived as the one legal organization. Thus, during the American Civil War, the existence of the southern Confederacy as a state was never recognized by the United States nor by foreign powers. The existence of a *de facto* Confederate government was, however, admitted, and its soldiers recognized as belligerents. The continued allegiance of its supporters to the United States was, however, always asserted by the United States, and no legal force of any sort was ever ascribed, then, or after the end of the war, to any of its acts. No formal treaty of peace was entered into with the southern Confederacy, the surrender of its armies being received simply as military acts, and its government permitted to go out of actual existence without any formal act to mark its demise.

The Ethical Right of Governments to Exist. — The concrete question as to the moral right of a particular government to exist and to coerce individuals, is often confused with the abstract one as to the moral justification for the existence of political restraint in general. These two questions are, however, quite distinct, and are to be answered upon quite different principles. So long as men's interests conflict, or, at least, so long as they are conceived by them to conflict, coercion of some sort must result, for the desires of all, under such circumstances, cannot be satisfied. Some will have to give way to others, or all yield in part. The force bringing about the final settlement may be individual, social, political, or religious, but in any case restraint is applied and the freedom of action of the individuals concerned correspondingly interfered with. This being so, it is clear that the question as to the ethical legitimacy of coercion by the state is not to be answered by viewing such coercion as a restraint upon individuals who otherwise would possess entire freedom of action. Rather it is to be viewed as a control of individuals who, but for the existence of political government and law, would be subject to the compulsion of other forces. In other words, so long as men's desires conflict there cannot properly be raised the abstract question as to the rightfulness of restraint humanly imposed, or even the question as to its proper amount. The conflict of desires makes coercion inevitable, and the extent of this conflict fixes its amount. The only questions, therefore, that rightfully may be raised are as to the form that the compulsion shall assume, and the general principles that shall guide it. The justification, then, for the existence of any particular political authority, if justification there be, consists in the fact that it furnishes a more intelligent, more beneficial, more just, and less painful form of restraint than that which, in its absence, any other force or forces would supply. A state and its government is but an instrument humanly devised for a people's good. It, therefore, has to be justified by its works. There is, thus, no theoretical difficulty in conceiving of a political authority so corruptly and oppressively administered as to cause evils overbalancing those that it prevents. In such a case, it has no ethical right to be. Practically speaking, however, there can be no question but that so grievous are the inevitable evils of lawlessness and anarchy that it is difficult to picture to oneself a political régime so evil in its effects as to render preferable to it a complete absence of political order.

To repeat, then, for the question so often stated in the abstract form as that of the right of the state to be, should be substituted that as to the right of its government to be and to exercise the functions that it does and to exercise them in the manner that it does. As the author of this article has elsewhere had occasion to state it: "The right to be of the political authority itself is not in issue, for, abstractly considered, that is, as apart from any particular form of organization, or manner of operation, there is no basis upon which a judgment may be founded. It is not until the state manifests its power and authority that material is afforded to which moral estimates may be applied."

The Doctrine of the "Consent of the Governed." — We are now prepared to examine the meaning and validity of that doctrine, promulgated in the Declaration of Independence, and accepted as fundamental in American political philosophy, according to which all governments "derive their just powers from the consent of the governed."

Without stopping to consider what the founders of the American Union probably meant by this phrase, it may be here said that the principle stated by it has a validity only in so far as it is held to state or imply that all governments should be so administered as to promote to as high a degree as is possible the good of all the governed; and that, therefore, the governed have at all times the moral right — though not necessarily the legal right — to see to it that this is done, and consequently the right, if there be no better way, of overturning an existing government and establishing in its place one more likely to subserve their own general good. Impliedly, then, the doctrine properly means that every state should be so organized as to render possible and easy the discovery of the best interests of the governed. As, however, generally speaking, these best interests are most certainly to be determined by the intelligent wishes of those concerned, this means, in the first place, that, so far as the state itself is able to provide them, agencies should exist for developing the intelligences of its citizens and thus qualifying them to know their own best interests; in the second place that adequate provision should be made for the free expression by the people of their wishes; and, finally, in the third place, that sufficient guarantees should exist that these wishes when made known will be heeded by those in power.

That the foregoing requirements of an ethically defensible government may be satisfied, it is necessary that all public officials shall be held strictly responsible, politically and civilly, for the manner in which they exercise the powers entrusted to them; that freedom of speech and press shall prevail; that the rights to petition, to assemble peaceably, and to bear arms shall exist; and that political privileges — the suffrage and the right to be elected or appointed to public office — shall be as widely extended as the intelligence and morality of the citizens will permit. Speaking negatively the doctrine of the "consent of the governed" does not support the legal right, nor, except in extreme cases, the moral right, of each individual citizen to refuse obedience to particular laws which he may consider unjust, nor at will to cast off his allegiance to his state, nor to claim the suffrage or public office as an abstract right.

The ethical right of one people forcibly to subject another people to its political authority, that is, to destroy the sovereignty of its state and annex its territory, as, for example, the right of the United States to control the political destinies of the Filipinos, or of England to extend her authority over the peoples of the South African Republic (Transvaal), and the Orange Free State, is a somewhat different question from that of the right of a particular government to exercise a control over its own citizens. There is an exceedingly strong presumption not only that a given people best knows its own interests and the means of advancing them, but that, stimulated by the consciousness of national independence, it will develop its latent potentialities in a manner that it will not, or cannot, do when subjected to an alien authority. But this presumption, however strong, is one that may be rebutted. It may be made sufficiently plain that a people, because of a lack of intellectual and moral development or a deficiency in natural ability and temperament, is not able either to perceive its own best interests or so to govern its conduct as to realize them when perceived, or, in determining upon its domestic or foreign policies, to give sufficient weight to the moral and legal rights of other states and their citizens. The interests of civilization are superior to those of any particular people. Judged from this general standpoint, it may, therefore, often happen that the forcible subjection of one people to the political rule of another is justified. This right of course appears most plainly in the case of the subjection of an uncivilized people to a civilized nation, but is not necessarily limited to such a case. The continued unsatisfactory political conditions existing among many of the peoples of South and Central America, of the races inhabiting the Balkan Peninsula and of the whole of the Turkish dominions certainly furnishes to the other states of Europe and America a very strong basis of right to intervention. The language of Prof. J. W. Burgess is hardly too strong when, after adverting to the fact that it is in the interest of the world's best civilization that law and order and the true liberty consistent therewith shall reign everywhere upon the globe, he declares that "a state or states, endowed with a capacity for political organization, may righteously assume sovereignty over, and undertake to create order for, a politically incompetent population."

Classifications of Governments.— As many different classifications of governments may be made as there are characteristics of governments suitable for selection as differentiating elements or factors. The best known of these possible classifications is the one that has come down to us from ancient times, which divides the various kinds of political organization into three main classes, according as the supreme political control is in the hands of a single individual, in which case the government is known as a monarchy; in the hands of a few persons, when it is described as an aristocracy; or in the hands of the general citizen populace, when it is termed a democracy. A further, or sub-classification divides each of these three types into normal and corrupt forms, the corrupt monarchy being termed a tyranny, the corrupt aristocracy an oligarchy, and the corrupt democracy an ochlocracy or mobocracy. A still further subdivision divides monarchies into elective and hereditary according to the source whence the monarch derives his right to office; and into absolute or limited (or constitutional) according as the monarch in the exercise of his authority, is, or is not, controlled by definite constitutional principles and by the action of other governmental officials selected by the people; aristocracies into particular types according to the principle, wealth, or birth, upon which membership in the ruling class is determined; and democracies into direct and indirect according to whether their people directly participate in the control of the state or delegate the exercise of their sovereign powers to officials selected by and responsible to themselves. In the latter case the government is known as a representative democracy or republic. The Constitution of the United States, without defining the term, provides that: "The United States shall guarantee to every State in this Union a republican form of government." The Federal courts, though they have several times been called upon to construe and apply this clause, have never attempted directly to determine the meaning of the term "republican form of government." The eminent constitutional jurist, Judge Cooley, gives, however, the following definition which has been generally accepted as correctly expressing the meaning of the phrase as employed in American law and American political thought:

By republican government, he says, is understood a government by representatives chosen by the people, and it contrasts on one side with a democracy, in which the people or community as an organized whole wield sovereign powers of government, and on the other with the rule of one man, as king, emperor, czar, or sultan, or with that of one class of men, as an aristocracy. In strictness, a republican government is by no means inconsistent with monarchical forms, for a king may be merely an hereditary or elective executive, while the powers of legislation are left exclusively to a representative body freely chosen by the people. It is to be observed, however, that it is a republican form of government that is to be guaranteed; and in the light of the undoubted fact that by the Revolution it was expected and intended to throw off monarchical and aristocratic forms, there can be no question but that by a republican form of government was intended a government in which not only would the people's representatives make the laws, and their agents administer them, but the people would also, directly or indirectly, choose the executive. But it would by no means follow that the whole body of the people, or even the whole body of adult or competent persons, would be admitted to political privileges; and in any republican state, the law must determine the qualifications for admission to the elective franchise.

Another term, often used as synonymous with democracy, is popular government. Strictly speaking, however, this latter term should be employed not to designate any distinct form of political organization, but to describe any government the actual administration of which is to a considerable degree subject to the control of the people. A popular government is thus, in effect, a free government and as such is properly to be contrasted with a despotic government in which the will of the ruler or rulers and not that of the ruled controls. It is in this sense that we speak of the movement toward popular government as having made great strides in England and elsewhere during the last 75 years, though monarchical forms have still been retained.

So closely connected with the advance of popular government, as to be almost identified with it, has been the development during the last century of constitutional government. Those general principles, written or unwritten, that determined the governmental organization of a state and fix the legal competences of its several organs and officials, taken collectively, are termed its constitution. In this sense every state has a constitution, and its government may be spoken of as constitutional. But in its stricter and more usual sense, a constitutional government is one in which the principles determining its specific character, and the extent and mode of exercise of its powers, are definitely determined, and, in general, reduced to precise written statement, and embodied in an instrument or instruments which are not subject to abrogation or amendment except according to certain specified formalities. By this means not only are definiteness of authority, and responsibility of those in power secured, but guaranties provided that existing political liberties shall not be changed except under conditions which usually include a popular assent directly or indirectly given. The value of constitutional government is thus usually but not necessarily that in it the exercise or the direct control of sovereignty is placed in the hands of the people. Its essential feature is that the manner in which the sovereign power is to be exercised by the state is definitely determined. A constitutional government, may therefore, both in form and effect, be but slightly popular in character. In fine, then, the difference between a constitutional and a popular government is that in the former the attempt is made to render the citizens secure against arbitrary action on the part of their rulers; in the latter, means exist for discovering and enforcing the wishes of the governed. The progress of popular government and of constitutional government, has almost always gone hand in hand, for the reason that it is but natural that, once established in the effective control of their states, the citizen bodies should have sought to render their power secure by the adoption of instruments of government that might not be altered except under certain prescribed conditions.

The truest tests of the excellence of all governments are the facilities they afford for the formation of an enlightened opinion of the people upon matters of political importance and the precise ascertainment of that "general will" when formed, and the exactness with which the policies it dictates are carried out in practice. The development of popular constitutional governments means that these results are being achieved to an increasing extent. As Prof. Lester F. Ward has said: "Government is becoming more and more the organ of social consciousness, and more and more the servant of the social will. Our Declaration of Independence, which recites that government derives its just powers from the consent of the governed, has already been outgrown. It is no longer the consent, but the positively known will of the governed, from which government now derives its powers."

A characteristic feature of almost all constitutional governments is the existence of a system of what have been called "checks and balances." According to this system the several functions of political rule are so distributed among different organs of government that no one of them is given sufficient power to assume an autocratic, despotic control of the state. Thus, in general, the making, the interpreting, and the enforcing of laws are placed in different hands. The executive is thus unable to take legal action without the authorization of the legislature, and the acts of both the legislature and executive are subject to review in the courts. Furthermore, the legislative body is usually divided into two chambers, the approval of both, together with that of the chief executive, being required for a valid act of legislation; executive officials are often elected for but short terms of office, and in case of nonfeasance or malfeasance of office are subject to impeachment and summary removal from office, and subject to civil and criminal suit for any illegal conduct while in office. In the United States of America the most powerful check of all consists in the fact that the courts have the power of declaring void all legislative acts inconsistent with the provisions of the written constitutions of the United States and of its constituent commonwealths. In those European states which possess written constitutions the courts have not this power, the legislatures being construed to be the judges as to the constitutionality of their own acts.

Presidential and Parliamentary Governments. — A very important classification of constitutional governments is that which divides them into Presidential and Parliamentary.

Presidential government, to accept the excellent definition of Burgess, "is that form in which the state, the sovereign, makes the executive independent of the legislature, both in tenure and prerogative, and furnishes him with sufficient power to prevent the legislature from trenching upon the sphere marked out by the state as executive independence and prerogative." Thus the governments of the United States and of Germany are of this type. Upon the other hand, "Parliamentary government is that form in which the state confers upon the legislature the complete control of the administration of law. Under this form the legislature originates the tenure of the real (though perhaps not the nominal) executive, and terminates it at pleasure; and under this form the exercise of no executive prerogative, in any sense and manner unapproved by the legislature, can be successfully undertaken." As further descriptive of this parliamentary type it should be said that this controlling power thus vested in the legislature, almost inevitably tends to become concentrated in its more popular chamber. The government of England best illustrates this form of government. That of France may also be placed in this category. Because the real executive power in a parliamentary government is almost always in the hands of a cabinet of officials holding office only so long as they are able to retain the support of the legislature, this form of political rule is often spoken of as Cabinet government.

The Sphere of Government.— The legal power of a constitutional government at any given time is determined by law. The sphere of political control thus marked out includes all those interests which the state has determined require public control. As we have already learned, legally the state is omnipotent, and therefore may subject to its regulation any matter that it sees fit. Actually, however, considerations of utility and expediency of course control. Regarding the exercise of certain powers, no opportunity for the employment of discretion exists. In order to maintain itself as a sovereign, independent body-politic, it is absolutely necessary that the state should obtain sufficient means, and exercise sufficient authority, to protect itself against attacks from foreign sources, and to maintain law and order, that is, to protect persons and their property throughout its own dominions. The powers, the exercise of which is thus called for, may, therefore, be termed "essential powers," and in the aggregate they constitute the essential sphere of the state. By some writers they are spoken of as "police powers." German writers, however, it should be said, use this term somewhat differently, designating as a "Police State" (*Polizeistaat*) one that English and American writers denominate a "Paternal State." The propriety of the exercise by the political power of these essential duties is not denied by any one except the anarchist. Contrasted to these essential, or, to use the adjective employed by President Wilson, the "constituent" functions of government, which must be exercised by a state in one way or another, are what may be called the non-essential or ministrant functions which all civilized states to a greater or less extent exercise. The activities included in this class are those performed by the state for the promotion of the economic, physical, and moral welfare of its people.

As not being absolutely essential to the very existence of the state, there are many who while admitting the necessity for, and the rightfulness of, political control in matters of police protection and national self-defense, assert that the assumption by the state of a right thus further to control the conduct of its citizens, is an ethically unjustifiable interference with their freedom, even though the aim of such interference is to advance their own good. In order to maintain this position, however, they are obliged to fall back upon a doctrine of "natural rights," the invalidity of which is now all but universally recognized. Starting, as from a premise, with the right of a particular state or government to be, as determined by the principles already laid down in this article, the conclusion necessarily follows that, in each individual case, the question whether or not a given matter, whatever its character, shall be subjected to public control, is one the answer to which should be determined wholly by expediency — construing of course expediency so as to include moral as well as material considerations. The arguments of those who urge the establishment of a socialistic or communistic régime are, therefore, not to be met by the simple predication of an abstract individualistic, *laissez-faire* doctrine, according to which an extension of state activities beyond the mere maintenance of order and national independence, is ethically unjustified whatever the results to which it may lead. The claims of socialists and communists, in other words, may properly be rejected only by showing that the actual results to which their proposed politics, if adopted, would in all probability lead, would be ethically unjust, or economically disastrous, or both.

This is not the proper place to discuss either socialism or communism. This one observation may be made, however, that the performance by the state of non-essential duties is not, in very many cases, a step toward socialism. The essential aim of socialism is to suppress competition. When there is assumed by the state a function which otherwise would certainly, or in all probability, not be performed at all, it can hardly be said that the field of private initiative is thereby lessened. Under the head of these non-essential, non-socialistic duties, may be grouped all those state activities that are educative rather than coercive, informative rather than controlling. Of this character, for instance, is almost all of the work done in the Departments of Labor and Commerce, and of Agriculture, the Bureau of Education, the Fish Commission, and other scientific bureaus of the United States government.

As to what the actual sphere of government in America and Europe is destined to become within the next few years we, of course, can only speculate. The probabilities, however, would seem to be that we are to see a considerable extension of state activities in the sphere of these non-essential, non-socialistic functions. The movement in this direction has for some time been very pronounced and is certainly one not to be deprecated. In the field of socialistic activities, namely, those the exercise of which by the state almost necessarily involves a corresponding diminution of the field of possible private enterprise, the greatest extension of public control within the immediate future will in all probability be seen in the assumption of the ownership and control by central and local governments of the so-called natural monopolies, and in the regulation by law of privately owned and managed industries in which the interests of the general public have become pronounced. Whether the movement toward increased governmental control in this last respect will proceed as rapidly as it has done during recent years one cannot say. The observation may be made, however, that, together with those forces, which, born of the increasing complexity of our social and economic life, tend to make necessary an extension of the activities of the state, there are other agencies the influence of which may be in the opposite direction. Out of an increased intellectual enlightenment and a more widely diffused spirit of altruism may easily arise both an increased ability and a stronger disposition to solve social and economic problems without a resort to the coercion of law. See STATE.

W. W. WILLOUGHBY,
Johns Hopkins University.

Government by Injunction, a term used to characterize the putting down of strikes by judicial power of laying injunctions. The first direct interference of the national government in labor troubles was the dissolution of the great Pullman strike at Chicago in 1894, on the ground that it interfered with the carrying of United States mails. This was an executive act; but the courts have since interfered in cases where violence was making the transaction of government business impossible, and brought irresistible government power to bear.

Government Printing House, a large printing establishment at Washington, D. C., controlled and operated by the government for the publication of congressional proceedings, department reports, scientific bulletins, etc. It is considered the largest printing-office, public or private, in the world. A new building was erected in 1902 for its accommodation at a cost of about $2,500,000. Its floor space represents a total area of 14 acres. More than 4,000 persons are employed in this establishment. The cost of maintaining the establishment approximates $6,000,000 per year.

Government of the United States. See UNITED STATES.

Governor, in the United States. The head of an English trading corporation, as the East India Company or the Bank of England, was called the governor; hence it was natural to give that title to the heads of the colonies which grew out of them. These governors were elected by the people in Connecticut and Rhode Island, and down to 1686 in Massachusetts; in the crown colonies they were appointed by the sovereign, and in the proprietary colonies by the proprietor. The name, from the long struggles with the royal governors, had a disagreeable sound in the public ear in many colonies; and when the Revolution swept these away, in several cases they were replaced by councils, of whom the president or chairman was really the governor. Hence, in those times "President" of a State was often used as a current though not official title. Where and when a single executive was adopted, south of New York he was at first usually chosen by the legislature. At present, in most States the governor has a veto, which may be overridden in all cases by a two thirds vote of both Houses, and in some by a bare majority. Sometimes he has the power of granting pardons; in other cases he is one member of a board of pardons. He sometimes appoints commissions and executive boards. He is always commander-in-chief of the State militia, and is obligated to assist local officers in suppressing insurrections, and is empowered to call on the President for help if necessary; in turn, he is the President's chief agent in furnishing men and supplies in case of national war. And like the President, he sends a message to the legislature at the beginning of each session, recommending such legislation as he wishes.

Governor, a device which regulates the admission of steam to a steam-engine, according to the rate of motion. The intention is to maintain uniform velocity, and any acceleration of speed above a given rate causes a valve to be partially closed, diminishing the area of steam passage. The favorite form of governor has a pair of balls suspended from a vertical shaft, so as to swing outward when the shaft is rotated. The greater the speed the greater the centrifugal force, and consequently the farther the balls depart from the axis of rotation; the inclination of the ball arms is made effective in working the valve. See STEAM-ENGINE.

Governor's Island, a small fortified island in New York Bay, south of the Battery, and at the entrance to East River. It is separated from Brooklyn by Buttermilk Channel. In 1621, under the name of Nutten Island, it was a station of the West India Company. Later it was used as a residence by the colonial governors of New York, hence its present name. Wouter Van Twiller was the first governor (1637) to use the island for a country residence. In 1708 it was in use as a quarantine station, and in 1784 Gov. George Clinton leased the island to a company who used it for a summer resort and a race-course. Lord Cornbury in 1702 and Gov. Hardy in 1756 urged the erection of batteries on the island; but no definite action was taken until 1794, when there were rumors of a war with France, the State of New York appropriated $250,000 for the erection of a fort and earthworks. The general government appropriated $31,117, and the money was expended for the construction of Fort Jay in the centre of the island. Other sums were used later in improving the fort, but in 1801 the work ceased until 1806–7, when from "an enclosed work of earth and wood" the fort was improved and faced with permanent masonry at a cost of $30,000, and was named Fort Columbus, as at present. The designs for Fort Columbus, also Castle Williams, were made by Jonathan Williams, Lafayette's chief engineer of the army. The plans called for 104 guns for Fort Columbus and 100 guns for Castle Williams. The latter fort exists to this day (1903) practically as it was when completed in 1811. Its area is three fifths of a circle which is 200 feet in diameter, and the walls are 40 feet high. In 1861–5 Castle Williams was used as a prison for Confederates; at one time there were as many as 1,000 prisoners. After the War of 1812 a fortification called South Battery was built at a place to command Buttermilk Channel. Governor's Island is the army headquarters of the Department of the East, a most important military post, embracing the coast from Maine to Florida and including Porto Rico. It has less the look of war than many smaller forts, but it has a garrison usually of three companies, and it is used as a military prison, nearly all the prisoners being deserters. A little church, under the care of Trinity parish, Manhattan, residences for the officers and some storage places are the only buildings in addition to the forts. At the beginning of the 17th century the island was 1,500 feet long and 900 feet wide with an elevation above high-water of 20 feet. Its whole area then was 100 acres. The tide-waters have washed away a large portion of the island, and now (1903) the area is only 65 acres. The War Department has begun the work of reclaiming from the sea the land washed away. It is expected that in 1904 or 1905 the island will be restored to its former area. The need of modern forts and better defensive equipment on Governor's Island no longer exists since an excellent system of fortifications has been established at the entrance to The Narrows and along the shores of Long Island Sound.

Governor's Island, a fortified island belonging to Suffolk County, Mass., in Boston harbor. It is just north of the main ship-channel and of Castle Island. The fortifications form part of the system of defense of Boston harbor. Fort Winthrop, the keep or réduit, is an enclosed quadrangular fort with open barbette batteries.

Gow'er, John, English poet: b. probably about 1330; d. London October 1408. But little is known of his life save that he was rich and well educated, did not marry till late in life, and became blind about 1400. His tomb is still to be seen in St. Saviour's, Southwark. He was a personal friend of Chaucer, who, in dedicating to him his 'Troilus and Cressida,' addresses him as the "moral Gower" — an epithet that has indissolubly linked itself with his name. Gower wrote three large works in as many languages: the 'Speculum Meditantis,' in French verse, not now extant; the 'Vox Clamantis,' a tedious poem in Latin elegiac verse, written 1382–4, describing the rising of the mob under Wat Tyler; and the long poem entitled 'Confessio Amantis,' written "in our English . . . for England's sake," the date uncertain, but at least the poem was in existence in 1392–3. There are extant also 50 French ballads, written by Gower in his youth (Roxburghe Club, 1818).

'Confessio Amantis' consists of a prologue and eight books, written in verses of eight syllables, rhyming in pairs. The long prologue gives a sombre account of the state of the world at that time, and the poem opens by introducing the author himself in the character of an unhappy lover. It ends with the lover's petition in a strophic poem addressed to Venus, her judgment, and finally the lover's cure and absolution. Without originality, narrative power, pathos, or humor, Gower yet commands respect for the laborious equality of his verse, and his work remains a splendid monument of English. The best edition is that by Pauli (1857). There is a serviceable reprint by Henry Morley in his 'Carisbrooke Library' (1889).

Gower, LORD Ronald Sutherland, English author and sculptor: b. 1845. He was the second son of the 2d Duke and 20th Earl of Sutherland. Educated at Trinity College, Cambridge, he sat in Parliament for Sutherland, and also became known as the sculptor of such works as 'The Old Guard at Waterloo,' and the Shakespeare monument at Stratford-on-Avon. Among his writings are: 'My Reminiscences' (1883), a work of much interest; 'The Tower of London' (1901); and 'Old Diaries.'

Gowrie (gow'rĭ) **Conspiracy,** an unexplained episode in Scottish history. On 5 Aug. 1600, James VI., afterward James I. of England, came to Gowrie House, the residence of the Earl of Gowrie, in the suburbs of Perth, having been lured thither, according to one account, by the report of a suspicious person there held in custody. After dining, the king was led aside by Alexander Ruthven, younger brother of the earl, and the king's attendants were told that his majesty had left the castle. An attempt was made by Ruthven, either to murder or to bind the king, who struggled desperately and shouted for help. His retinue coming to his rescue slew Ruthven and Gowrie. The motives of the two brothers have been variously explained. The current belief is that they intended to capture the king and either give him up to England or administer the government in his name in the interest of that country and in that of the Scotch Presbyterian leaders. Others supposed that their object was merely to avenge the death of their father, who had been executed a few years previously. The heavy indebtedness of the king to Gowrie was another cause of irritation. Gowrie House was destroyed and the estates confiscated.

Goyanna, gō-yän'nä, Brazil, city in the state of Pernambuco; on the Goyanna River, about 20 miles from the Atlantic. It is a shipping port for sugar, dyewoods, cabinet woods, and cotton. Pop. 5,000.

Goyaz, gō-yäz', Brazil, a state completely enclosed between the states of Maranhão, Piauhy, Bahia, Minas Geraes, São Paulo, Matto Grosso, and Pará. Its area is estimated at 747,311 square kilometres, or, say, 287,714 square miles; but, as a large part of the Araguaya-Tocatins basin is unexplored, a precise statement in regard to the extent of its territory cannot be justified. The Goyaz plateau with the Pyreneus Mountain range constitute the watershed which divides the basin of the Tocatins and Araguaya rivers from the São Francisco and Paraná basins; the headwaters of the Araguaya and the Paraguay are near one another; and thus the point of divergence of great river-systems is found within this state. The climate of the plateau is excellent; among the mountains extremes of heat and cold are felt; and large districts are well adapted to agriculture. Forests extend along the river-courses, while the elevated lands of the interior have only occasional clusters of trees. The chief products are tobacco, rubber, and cattle; the gold and diamond washings which at one time were supposed to be important now yield very little. The capital, Goyaz, formerly called Villa Boa, has about 8,000 inhabitants. The population of the state was given as 260,395 in 1901, but of that number nearly all were Indians or Mestizos, the civilized element being inconsiderable as yet. The special interest attached to this state is due to a circumstance which is mentioned in a geographical sketch of Brazil (Washington 1901; compiled by the Bureau of the American Republics), in the following terms: "This state enjoys a splendid climate, and has been selected for the site of the future capital of the republic, the constitution providing for its location on the plateau of Goyaz. A special commission, at the head of which is the director of the observatory of Rio de Janeiro, has already marked the site for the new capital, which is a space 14,400 kilometres square on the Upper Tocatins, in the Pyreneus range of mountains. It has an elevation of from 200 to 300 metres above the level of the plateau and is drained by numerous streams of pure water, being the centre of the three hydrographic systems of Brazil. . . . It is here, near the point of divergence of her three great rivers, that Brazil wishes to establish the national capital." But the site thus selected has no natural means of communication with the Brazilian coast. The Tocatins-Araguaya is navigable for only about one tenth of its entire length; its course is broken by falls and rapids, and as it approaches the Gulf of the Amazon it becomes very shallow. Canals and railways would be required in order to make the rivers commercial highways; moreover the state is without seaboard — is, indeed, far inland. The isolation of the proposed capital suggests that of Bogotá.

Marrion Wilcox,
Authority on Spanish America.

Gracchus, gräk'ŭs, **Tiberius Sempronius** and **Gaius Sempronius,** two Roman statesmen: b. about 163 B.C. and 159 B.C.; d. 133 B.C. and 121 B.C. In their attempt to obtain reforms favorable to the commons, they awakened popular commotions of which they themselves became the victims. Tiberius served under the command of his brother-in-law, the younger Scipio, at the siege of Carthage, and was the first man to mount the walls. He was subsequently quæstor to the consul Mancinus, who at that time waged war against the Numantines in Spain. After the defeat of Mancinus, he concluded a treaty with the Numantines, which, without being disgraceful to the Romans, secured to the Numantines their independence. This treaty, however, was opposed by the aristocratic party and repudiated by the senate. Tiberius, nevertheless, upheld by the populace, in 133 B.C. was elected tribune of the plebs, and sought to reform the condition of the poorer citizens who were without land, and, since the great estates of the wealthy were cultivated by slaves, also largely without employment. He endeavored to attain his object by the revival of the Licinian Rogations of 367. It had been decreed, on the proposition of the tribune, Licinius Stolo, "that no one should possess more than 500 acres (*jugera,* each 28,000 square feet) of the public domain (*ager publicus*), and that the overplus should be equally divided among the plebeians." This law, which was now called the Gracchan, the Sempronian, or by way of eminence the agrarian law, he revived, but with the introduction of several softening clauses. The proposition of Tiberius Gracchus was met with the most determined opposition by the ruling party. To counteract his plans the senate gained over one of the tribunes, Marcus Octavius; and when Tiberius, after having, according to custom, exposed his law 19 days to the public view, proceeded to take the votes of the assembled people upon it, Octavius interposed with his veto, and thus seemed at once to have defeated the whole undertaking. Tiberius now exerted all the prerogative of his office, sealed up the treasury, and forbade all the authorities the discharge of their several offices. He saw, however, that this was of no service to his plan. He therefore took a step till then unheard of in Roman history. At the next assembly of the people he obtained the expulsion of Octavius from office, as faithless to the cause of the people. The bill was thus passed, and a committee consisting of Tiberius himself, his brother Gaius, and his father-in-law Appius Claudius appointed to carry out its various provisions. All the difficulties which stood in the way of the law now appeared in their full light. Even the preparatory business of ascertaining which was the public land, and which private property, was found to have its full share. Outcries and complaints were made from every part of Italy. When June of the following year came on, in which the tribunes for the next year were to be elected, Tiberius, who had endeavored to regain the favor of the people by some new propositions, offered himself again as a candidate for the office. The aristocrats used every effort to prevent his election, and the ferment in Rome was carried to the highest pitch. One election day went by without any election being made. On the next a vast multitude beset the forum, and the senate assembled in the neighboring Temple of Faith (Fides). Tiberius strove in vain to speak, and was killed in the tumult which followed. The place of the murdered Tiberius was filled by Licinius Crassus, father-in-law of Gaius Gracchus; and on his death Carbo, Fulvius Flaccus, and Gaius Gracchus constituted the committee appointed for the enforcement of the law.

In this way the parties had struggled with varying success, when, in 123 B.C., the younger Gracchus, who, as quæstor, had been with the army in Sardinia, obtained the tribuneship. With more various and shining talents than his brother, he united a stormy eloquence, which carried away his hearers. In the discharge of his office as tribune he first of all renewed his brother's law, which had meanwhile fallen into disuse, and revenged his memory by expelling many of his most violent enemies from the city. At the same time he carried through a law "that every month corn should be sold to the poor at a low fixed rate," and by another law effected some alleviations in the rigor of the military service, and ensured for the soldiers clothing, besides their pay. The people were animated with an unlimited enthusiasm for their favorite; his enemies were terrified and weakened; hence he obtained the renewal of his office for the following year with ease. His attempt to introduce 300 knights into the senate failed; but on the other hand, at his proposal the administration of justice was taken from the senate and transferred to the equestrian order. This gave rise to a new political power in the Roman commonwealth, which, holding a station intermediate between the senate and the people, had a most powerful influence in its subsequent history. The senate now resorted to a new but sure means of destroying Gaius. Livius Drusus, a tribune gained over to their interests, had the art to withdraw the affections of the populace from Gaius by making greater promises to them, and thus obtained a superior popularity for himself and the senate. Hence it resulted that Gaius did not obtain a third tribuneship, and Opimius, one of his bitterest enemies, was chosen to the consulate. In the ensuing civil disturbances Gaius was killed at his request by his slave.

Grace, William Russell, American merchant: b. Queenstown, Cork, Ireland, 10 May 1832; d. New York 21 March 1904. In 1846 he worked his way on a sailing vessel to New York; in 1850 went to Callao, Peru, where he became a clerk in the shipping office of Bryce & Company, and later partner in the firm, which eventually assumed the style of Grace Brothers & Company. He organized the firm of W. R. Grace & Company, now the leading American house in the South and Central American trade, with main offices at New York, and branches at London, San Francisco, Lima, Callao, Valparaiso, Santiago, and Concepcion. In 1891 he also established the New York and Pacific Steamship Company. He was Democratic mayor of New York in 1881–2 and 1885–6. His philanthropies were numerous, including the gift of one fourth the cargo of the U. S. S. Constellation, despatched to the aid of the Irish famine sufferers of 1880; and large sums for the building and maintenance of the Grace Institute, established by him in 1897 at New York for the instruction of women in domestic arts and sciences, trades, and occupations. He became a member of the American Museum of Natural History and the American Geographical Society, and organized and was elected president of the Nicaraguan canal syndicate, an organization of capital for securing to the United States control of the waterway.

Grace of God, an expression borrowed from St. Paul's writings. The Apostle frequently employs the term grace in the sense of a gift which enables those who have it to do what they could not do without it. In common parlance we use such expressions as the "gift of music," the "gift of poetry," as belonging to one who might acquire many accomplishments, but could never acquire what is meant by a gift for anything. St. Paul, speaking of his own conversion, his calling to the apostolate, and his many labors, says: "By the grace of God I am what I am." Again he addresses his followers in these words: "By grace are ye saved; not of yourselves, it is the gift of God."

The Church of England and the Protestant Episcopal Church in the United States teach that grace is the assistance given by God to those who believe in Him, so that they may please Him and keep His commandments. All the Reformed Churches agree on this point and they also agree that no man can do good works "as God hath willed and commanded them to be done" (39 Articles), that is, from a right motive and in a religious spirit of devotion, without the grace of God. They also teach that the principal means of grace is prayer, and study of the Scriptures, which latter make a man "thoroughly furnished unto all good works" (1 Tim. iii. 17). To these means of grace the Catechism in the Book of Common Prayer adds the two sacraments, of Baptism and of the Lord's Supper, which are not only means of grace, but also "outward and visible signs" and "pledges" of the grace received by those who participate in them. The following is the doctrine of the Roman Catholic Church regarding grace, which that Church has made plain by dogmatic definitions. As defined by the eminent Roman Catholic theologian, Perrone, grace is "that gratuitous inward aid (*auxilium*) which God affords to fallen man through Christ's merits, to enable him to perform supernatural acts, so that he may attain justification and persevere therein" (Prælect. Theol., c. de Gratia). The Roman Catholic Church's doctrine of grace is opposed on one side to the teachings of Pelagius, who denied the necessity of grace, and on the other to the teachings of those who held that without grace every act of man is a sin, and specifically that "the constancy of Socrates, the continence of Xenocrates . . . must be regarded, not as virtues but as vices" (Melanc. Loci Theol.); and that "from man's corrupt nature proceeds naught that is not worthy of condemnation" (damnabile: Inst. i. 2). Roman Catholic doctrine holds the middle ground between these extremes. As against the Pelagians the Roman Catholic Church teaches that for all acts conducive to salvation (*salutares*) the inner grace of the Holy Spirit is necessary (Conc. Trid. Sess. VI., can. ii. 3). As against Melancthon, Baius, and the Jansenists, the same Church teaches that fallen man, before he receives the gift or grace of faith, can perform acts that are morally good. Further, the Roman Catholic Church, in opposition to the teaching of Calvin, teaches that a man once justified may fall from that state. Again, the Roman Catholic Church teaches that in all his acts conducive to salvation (*salutaribus*) man is free; in other words, grace imposes on man no necessity.

The Council of Trent in Can. iv. of Sess. VI., thus defines the Roman Catholic doctrine of the freedom of man's will while co-operating with grace: "If one shall say that man's free will, moved and stirred by God, co-operates not, by giving assent to God so inciting and calling, toward disposing and fitting himself for grace of justification; or that he cannot, if he wishes, dissent; but that like some lifeless thing he cannot do anything at all and is wholly passive: be he anathema." The Roman Catholic Church further teaches that the state of grace and holiness in which man was constituted in Paradise was supernatural, something added to the perfection of his human nature; in contradiction to those who teach that this state was in the same sense natural to him as any of his mental or bodily faculties. In consistency with this view such teachers hold that in his fall Adam lost all power and faculty for doing any good act, and that whatever he did was sin.

Graces (Greek, *Charites*, translated by the Romans *Gratiæ*), the goddesses of grace, from whom, according to Pindar, comes everything beautiful and agreeable, through whom alone man becomes wise and glorious. According to Hesiod, and most poets and mythologists, Zeus was their father, and Eurynome their mother. Hesiod gives them the names of *Aglaia* (brilliancy), *Thalia* (the blooming), and *Euphrosyne* (mirth). Homer mentions them in the 'Iliad' as handmaids of Hera (Juno), but in the 'Odyssey' as those of Aphrodite. He conceived them as forming a numerous troop of attendant goddesses, whose office it was to render happy the days of the immortals. Later poets considered them as allegorical images. They not only improve corporeal charms, they have an influence also upon music, eloquence, poetry, and other arts; and the execution of acts of benevolence and gratitude is likewise superintended by them. In the earliest times the statues of the Graces represented clothed forms; at a later period they were represented as nude. They had many temples in Greece, partly dedicated to them alone, partly in common with other deities, particularly Aphrodite, the Muses, Eros, Hermes, and Apollo. Their festivals were called in Greece Charisia. It was customary to swear by the Graces, and libations of wine were offered them at meals. The most celebrated Graces of modern sculpture are those of Canova and Thorwaldsen.

Gradientia, grā-dĭ-ĕn'shĭ-a. See Urodela.

Gradual (Lat. *Graduale*), in the liturgy of the Roman Catholic Church, an antiphon which is sung by the choir or recited by the celebrant of the Mass, immediately after the intoning or the reading of the Epistle (first lesson). The gradual nearly always consists of two or three verses from the Psalms, suggestive of thoughts pertinent to the office of the day. Thus the gradual for the festival of Holy Innocents (28 December) is from the 123d Psalm (in the English Bible 124th): "Our soul is escaped even as a bird out of the snare of the fowler: the snare is broken and we are delivered; our help standeth in the name of the Lord who made heaven and earth." *Graduale* or *Liber Gradualis* is also the name of a service-book of the Latin Church's liturgy: it takes its name from the gradual as just explained, and contains all the graduals for the Sundays and festivals of the entire year, for the use of the choir.

Graduation Act, of 4 Aug. 1854, "An Act to Gradually Reduce the Price of the Public Lands to Actual Settlers." All public lands which had been in the market for 10 years and upward prior to the passage of the act were to be sold for $1 per acre; all 15 years, 75 cents; all 20 years, 50 cents; all 25 years, 25 cents; all 30 years, 12½ cents — except United States reservations, grants to States for railroad purposes, or mineral lands held at over $1.25 per acre. No one was to have over 320 acres including lands previously taken up.

Gra'dy, Henry Woodfin, American journalist and orator: b. Athens, Ga., 24 May 1850; d. Atlanta, Ga., 23 Dec. 1889. He was graduated from the University of Georgia in 1868, studied at the University of Virginia in 1868–70, began his journalistic career with contributions to the Atlanta *Constitution*, and for that journal in 1870 described a press tour of Georgia and the resources and possibilities of the State. At Rome, Ga., he edited the *Courier*, and later established and edited the unsuccessful *Daily Commercial*. In 1871 he became Georgia correspondent of the New York *Herald*, and in the same year purchased an interest in the *Herald* of Atlanta, publication of which was suspended in 1876. He then established the *Courier*, which did not long continue, and in 1880 bought a quarter interest in the *Constitution*, of which paper he remained until his death editor and part owner. He was an able journalist, writing for the New York *Herald* some noteworthy letters, including an account of the Hamburg riots in South Carolina; and while editor of the *Constitution*, publishing in its columns vivid descriptions of the Charleston earthquake, and in various magazines articles on the condition and promise of the South. He also became locally known for his oratory, largely through his lecture, 'Just Human,' given at Atlanta. In 1886, at the annual banquet of the New England Society in New York, he made a distinguished address on 'The New South,' which was widely printed and at once gave him a national prominence. Other well-known speeches by him were one on prohibition at Atlanta in 1887, one at the Texas State Fair in Dallas in 1888, and his final and greatest effort, 'The Future of the

HENRY WOODFIN GRADY.

Negro' (December 1889), before the Merchants' Association of Boston. Grady was the first to present to the North the views of the more enlightened portion of the reconstructed South,— its belief that the «struggle between the States was war and not rebellion,» but at the same time its readiness to identify itself with the united progress of the nation. His eloquent services in this behalf were of much importance. He aided in the establishment of the Confederate Veterans' Home, the election of Gen. J. B. Gordon as governor of the State, and the organization of the Atlanta expositions of 1887 and 1889. He declined public office, but was frequently mentioned for nomination to the United States Senate. Consult the 'Life,' by Lee (1896).

Graebner, grĕb'nĕr, **August L.**, American Lutheran theologian: b. Frankentrost, Mich., 10 July 1849. He studied at Concordia College (Ft. Wayne, Ind.) and the Concordia Theological Seminary (St. Louis, Mo.), was ordained to the Lutheran ministry in 1878, and was professor of theology in the Lutheran Theological Seminary from 1878–87. In 1887 he became professor of theology in Concordia College (St. Louis). His writings include theological works in German; and in English: 'Life of Luther' (1883); 'Life of John Sebastian Bach' (1885); 'Outlines of Doctrinal Theology' (1898); and other volumes.

Graffiti, grăf-fē'tē, the name given by archæologists to the rude designs and inscriptions of popular origin drawn or engraved with the style upon the walls of ancient towns and buildings, particularly of Rome and Pompeii. Many of these are valuable for the light they throw on popular habits and modes of thought, and the illustrations they often in consequence afford of ancient authors. Graffiti have been found in Greece and Egypt. Some are traced with chalk or plaster, but the majority are scratched on stone or plaster with the stilus, which helps to account for their preservation. Those in Pompeii are found in the Latin, Greek, and Oscan languages, showing that the ancient language of Campania was still extant among a portion of the populace. The inscriptions are most frequently amatory or humorous, sometimes malicious or obscene. In Rome they occur frequently in the catacombs, particularly of Sta. Agnese and San Calisto. Many of these are by Christians, some by Pagans, in ridicule of Christianity. See GRAPHITOLOGY.

Graft'age, the process and practice (origin unknown) of propagating plants by the insertion in one of a bud (stock) or twig (scion) of another. It also includes the discussion of all questions relating thereto. The stock may be a complete plant, as in peach budding, or only a part, in which case it may be either a root or a stem part. In some instances (inarching, see below) both plants may have roots. Since the process is dependent upon the coalescence of the cambium (q.v.) of stock and scion the first essential is to make these two surfaces abut; the second is to check evaporation from the cut surfaces.

The many scores of styles of graftage fall naturally into three main groups:

1. *Inarching*, or *grafting* by *approach*, the uniting of two plants before the severance of the scion from the plant upon which it grows. After union the scion is severed below the point of contact and the parts of the stock above this point are removed. The method is rarely practised except with subjects hard to graft by more popular methods and for correcting defects of form, such as Y-crotches in fruit trees, a living brace being formed between the two arms. Since it is the only graftage found in nature, it is supposed to be the progenitor of modern methods.

2. *Budding* or *bud-grafting*, the inserting of a single bud beneath the bark of the stock or in some cases (for example, annular or ring budding) in the place of a piece of bark removed. It is always practised upon small stocks preferably under two years old and always when the bark readily separates from the wood as in spring or late summer. Since spring is a very busy season in nurseries, budding is practically all done during summer. The universally popular method is the shield, so-called from the shape of the scion. It is practically the only method employed in propagating the stone fruits — peaches, plums, etc. The seedling stocks, which are usually not less than one fourth inch in diameter, are stripped of their leaves close to the ground, are cut through the bark twice on the shady side, the cuts forming a T, the bark lifted gently with the specially formed ivory knife-handle, and the bud inserted and tied with raffia, bast, or cotton. A small portion of the bark and a little of the leaf stalk accompany the bud, the latter to act as a handle. In about two weeks, if the bud has taken, the binding is cut on the side opposite the bud to prevent «strangulation.» In case of a failure other attempts are made. No visible growth occurs during that season, but in the spring the bud should become a shoot and the original top of the seedling stock should then be cut a few inches above the union, and later, when the union is firm this stub is cut off short. At the close of that season the tree is ready for sale.

3. *Grafting proper*, the inserting of a twig into a stock. The methods under this heading may be divided according to the maturity of the scion whether dormant or growing, and also as to the position the graft occupies, whether upon the root, the crown, the stem or the branches. By far the largest amount of grafting is done with dormant wood, and probably upon roots, though grafting upon the branches is widely popular. In *whip-grafting*, which is the one most practised with roots, especially in the nursery propagation of apples and pears and performed in early winter, the seedling roots are specially grown and are as nearly the size of the scions as possible. Both stock and scion are formed alike, two cuts being made, one rather long, diagonally across, and the other parallel with the direction of growth, thus forming a sort of tongue. The tongue of each is then fitted into the slot of the other, the pieces wrapped with waxed string, and stored in a moist, cool place until spring, when they are planted in the nursery. Usually they are sold after two seasons' growth.

Cleft-grafting is most frequently used upon parts of trees above ground or with grapes just below the surface. The stock is sawed across at right angles to the direction of growth, split with a knife and held open with a wedge until the twigs (scions) bearing two or three buds and whittled to a wedge form below are inserted, one at each end of the slit. The wedge is then removed and the wounded surfaces waxed. This method is practised most upon stocks too large for whip-grafting, limbs even as large as three inches in diameter being sometimes used. As a rule small stocks give more satisfactory results. The method is universally employed to change long-established trees to other varieties.

Some other frequently employed methods are: (1) *Bridge-grafting*, which is used for saving young trees that have been girdled by mice or rabbits or otherwise deprived of their bark. The edges of the injured surface are trimmed above and below, and scions, with wedge-shaped ends, are fitted beneath the bark at each of these points. The whole is then covered with wax. Any sprouts that appear are rubbed off so as to force all growth into the stem. The scions soon unite upon their sides as well as to the original trunk. (2) *Veneer-grafting*, which is widely used in greenhouses, consists in inserting a scion upon the side of the stock, binding and protecting it from the air. The method is practised with both ripened and immature wood.

Protection from the air is gained in budding by bringing the bark of the stock in close contact with the scion and by bandages; in grafting, by applying a bunch of damp moss (a greenhouse practice) or covering of grafting wax, grafting clay, etc. (outdoor practice). One of the most popular waxes is made as follows: Melt and thoroughly mix together 3 pounds of mutton tallow, 5 of beeswax, and 10 of resin; pour into cold water and work with the hands until the color of pulled molasses taffy. Apply closely while warm enough to spread readily by pressure of the hand. For use in *whip-grafting* balls of woolen yarn are soaked in melted wax and wound around the grafts. Soft waxes are less useful, since they are likely to melt on warm days and in warm climates. No horticultural practice except that of cuttage can compare with graftage in extent of usage and apparent necessity. Like cuttage, its strong points are ease and certainty of operation, maintenance of a variety "true to type" with the comparatively rare exceptions of bud variation, and the modifications which it permits in the habits of plants. Some of the more important of these last are dwarfing, produced by grafting a strong growing scion upon a small growing stock, as pear upon quince; hastening or increasing fruitfulness, as when scions from bearing wood are top-grafted or budded upon young established trees already in the orchard; to counteract injuries (see *bridge-grafting* above); to change poor or unproductive trees into useful ones (see *cleft-grafting* above); to make possible the growing of certain trees upon uncongenial soils, as peaches budded upon plum stocks for heavy soils and plums upon peach stocks for light soils, etc.

Much popular misconception exists as to the limits of grafting. In many instances the possibilities have been found wholly within the individual species: that is, various different but related species fail to unite and grow. Generally, however, the limits are within the genus; for example, plums, peaches, cherries, apricots, etc., readily thrive upon one another. Again there are a few instances of different genera which unite, as among cacti. Genera are, however, arbitrary, man-made groups. Permanent unions between oaks and roses, grapes, and pears, and similar widely separated plants have not been reported by reputable horticulturists. Consult: Bailey, 'Cyclopedia of American Horticulture' (New York 1900-2); id., 'Nursery Book' (id. 1896); Fuller, 'Propagation of Plants' (id. 1887); Baltet, 'L'Art de Greffer,' and its English translation, 'Budding and Grafting.'

Grafton, Charles Chapman, American Protestant Episcopal bishop: b. Boston 12 April 1830. After a course in law at Harvard, he studied divinity and was ordained priest in 1858. He was rector of the Church of the Advent, Boston, 1872-88, and in 1889 was consecrated bishop of Fond du Lac. His writings include 'Plain Suggestions for a Reverent Celebration of the Holy Communion.'

Grafton, Mass., town in Worcester County; on the New York, N. H. & H., and the Boston & A. R.R.'s; about 6 miles southeast of Worcester and 9 miles northwest of Milford. In 1728 the first permanent white settlement was made, and the town was incorporated in 1735. As early as 1660 John Eliot (q.v.) established here a settlement of Indians whom he had converted. The manufactures are cotton goods, threads, boxes, boots and shoes, emery, and underclothing. Pop. (1900) 4,869.

Grafton, N. Dak., city, county-seat of Walsh County; on the Park River, the Great N., and the Northern P. R.R.'s; 15 miles west of the Red River of the North. It is in the great wheat region, and is the trade centre of Walsh County. It has grain elevators, flour-mills, and cattle-yards, and manufactures farming implements. It is the seat of the State Institute for the Feebleminded. Pop. (1900) 2,378.

Grafton, W. Va., city and county-seat of Taylor County, located in the northern part of the State, 100 miles southeast of Wheeling, and on the Tygart Valley River, and the Baltimore & O. R.R. The city is the terminus of four branches of the Baltimore and O. R.R., and owes its importance to the establishment of the Baltimore & O. R.R. machine shops. It also has flour and planing mills, a wooden pump factory, foundries, cigar and glass factories, and is also engaged in mining and agriculture. There are eight churches, public and parochial schools, and five banks, with a combined capital of $310,000, and there are two weekly papers published. A national cemetery is within the city limits containing 1,261 graves, 600 of which are nameless. Municipal affairs are administered by a mayor and council of eight members, elected for two years. The city owns its waterworks and electric lighting plant. It was founded in 1854, incorporated in 1856, and received its charter as a city in 1899. The population are mainly English and German. Pop. (1900) 5,650.

A. J. Wilkinson.

Graham, grā'am, **Charles Kinnaird,** American civil engineer: b. New York 3 June 1824; d. Lakewood, N. J., 15 April 1889. He entered the navy in 1841, during the Mexican war served with the Gulf squadron, after study of engineering was appointed constructing engineer of the Brooklyn navy-yard, whose great dry-dock and landing-ways were built by him. At the outbreak of the Civil War he volunteered in the Federal army, and during the War he was twice wounded at Gettysburg and there taken prisoner; commanded the gunboat flotilla in Gen. Butler's expedition up the James River, and was brevetted major-general of volunteers (1865). He was successively chief-engineer of the New York dock department in 1873–5, surveyor of the port in 1878–83, and naval officer in 1883–5.

Graham, Isabella (Marshall), American educator and philanthropist: b. Lanarkshire, Scotland, 29 July 1742; d. New York 27 July 1814. From 1774 she was a teacher in Scotland, where, in Edinburgh, she inaugurated the work which led to the organization of the Society for the Relief of the Destitute Sick. In 1789 she removed to New York, and there for several years conducted a successful school. Her philanthropies were many, and were particularly in the interests of education, religious and secular. She founded in 1814 the Society for the Promotion of Industry Among the Poor.

Graham, James Duncan, American topographical engineer: b. Prince William County, Va., 4 April 1799; d. Boston 28 Dec. 1865. Graduated from the United States Military Academy in 1817, he entered the corps of topographical engineers, in which he attained major's rank in 1838, was astronomer to the survey which determined the boundary line between the United States and the republic of Texas (1839–40), and later United States astronomer in the joint survey of the boundary between the United States and the British provinces. In the determination also of the boundary between the United States and Mexico he held a similar post. Subsequently he directed harbor improvements in the lakes of the North and Northwest, in which he was the first to detect the presence of a lunar tide, and was superintending engineer of the Boston harbor sea-walls and of repairs in various harbor-works along the Atlantic coast.

Graham, John, Viscount Dundee, commonly called Claverhouse, Scottish commander: b. near Dundee, Scotland; d. Killiecrankie 17 July 1689. He went abroad and entered the service, first of France and afterward of Holland, but returned to Scotland in 1677, where he was appointed captain of a troop of horse raised to enforce compliance with the establishment of Episcopacy. He distinguished himself by an unscrupulous zeal in this service, and waged an exterminating war against conventicles. The Covenanters were driven to resistance, and a body of them defeated Claverhouse at Drumclog on 1 June 1679. The Duke of Monmouth, however, defeated the insurgents at Bothwell Brig on 22 June, and Claverhouse was then sent into the west of Scotland with absolute power, and exercised it in such a manner as to lead to the belief that in addition to the persecuting policy of his superiors he was actuated by personal revenge. The more terrible he made himself to the Covenanters the more acceptable his career was to the government. In November 1688, after William had landed, he received from James in London the titles of Lord Graham of Claverhouse and Viscount Dundee. When the king fled he retired to the north, followed, by order of the Convention, by Gen. Mackay. Claverhouse was joined by some of the Highland chiefs occupying Perth, and finally encountered Mackay in the pass of Killiecrankie, whom he defeated, but was killed in the battle. Attempts have been made by Sir Walter Scott and others to throw a halo of sentimentality and heroism around his character; but it is clear that he was the willing instrument of a cruel government, and had himself little sentiment or softness in his nature. See Napier, 'Memorials and Letters of John Graham of Claverhouse' (1859–62); Mowbray Morris, 'Claverhouse' (1887).

Graham, Sylvester, American reformer: b. Suffield, Conn., 1794; d. 1851. He studied at Amherst College, was ordained to the ministry of the Presbyterian Church about 1826, and became known as a lecturer on temperance and dietetics. His proposed cure for alcoholism was based upon a vegetarian diet. The article of food made of unsifted wheat flour and known as Graham bread was introduced by him into general use. His writings include: 'Bread and Bread-Making,' and the 'Graham Lectures on the Science of Human Life' (1839).

Graham, Thomas, D.C.L., Scottish chemist: b. Glasgow 21 Dec. 1805; d. London 16 Sept. 1869. He was educated at the University of Glasgow, and in 1828 communicated to the Royal Society of Edinburgh the results of experiments on the absorption of vapors by liquids. In 1831 he laid before the Royal Society of Edinburgh the result of a series of experiments on 10 different gases, from which he arrived at the conclusion that gases tend to diffuse inversely as the square root of their specific gravities, a conclusion which has been received as the law of the diffusion of gases. In 1837 he was elected professor of chemistry in the University of London, and soon afterward was appointed assayer to the mint. In 1840 he received the gold medal of the Royal Society, and the next year was chosen first president of the Chemical Society, which he had assisted in founding. He now began to be employed as consulting chemist in various mercantile and public undertakings, and it was by his recommendation that wood-spirit, or methylic alcohol, was used to render spirits sold free of duty for trade or scientific purposes unfit for consumption as a beverage. In 1846 he assisted in founding the Cavendish Society, of which he was elected president, an office he retained till the close of his life. At the same time he was engaged in investigations on the diffusion of liquids, and was the earliest to fully develop that theory. He made many other important discoveries, and was the author of 'Elements of Chemistry' (1837) and various professional papers.

Graham, William Alexander, American politician: b. Lincoln County, N. C., 5 Sept. 1804; d. Saratoga Springs, N. Y., 11 Aug. 1875. He was graduated from the University of North Carolina in 1824, was admitted to the bar in 1826, and entered practice at Hillsboro. From 1833 he was repeatedly elected to the House of Commons, of which in 1839–40 he was speaker. In 1840–3 he was in the United States Senate, in 1844 and 1846 was elected Whig governor of North Carolina, declined a third term, and in 1850–2 was secretary of the navy, in which capacity he organized Perry's expedition to Japan. Though at first opposed to secession, he later identified his fortunes with those of his State, and in 1864 took his seat in the Senate of the Confederacy. Subsequent to the war he was an executor of the Peabody fund for the promotion of education in the South, and a member of the commission for settlement of the undetermined boundary line between Virginia and Maryland.

Graham Land, a tract of land in the Antarctic; discovered in 1832 by Bisco, master of a British sealer. In 1894 Larsen, a Norwegian, reported the discovery of a continent, one portion of which he named King Oscar II. Land and another part Foyne Land. Both proved to be on the coast of Graham Land. The Belgian expedition of 1897–8 explored the west coast, and gave it the name of Palmer Land, in honor of Nathan Palmer, an American sealer, who discovered this coast in 1818. Capt. James Cook (q.v.) reported, in 1774, finding land in the Antarctic, but not a continent.

Grail, The Holy. The cup or bowl from which Christ drank at the Last Supper. The history of the grail as given in most romances is substantially as follows: After the Last Supper the cup came into the possession of Joseph of Arimathea, who caught in it some of the blood that flowed from the wounds of the crucified Saviour. Being miraculously conveyed to England to escape persecution, he carried the precious vessel with him. Throughout his life it furnished him with food and drink, and with spiritual sustenance as well; and at his death he charged his successor to guard it faithfully. It was handed down from generation to generation, the Fisher King being a descendant of Joseph. This vessel is the grail. According to other versions, the grail chooses its own knights. It possesses miraculous properties, and at times is instinct with divine life. To discover its abiding-place and become one of its guardians is the ambition of good and valiant men, but only the pure in heart may find it. One form of the legend represents three of Arthur's knights, Galahad, Perceval, and Bors, as being blessed with a sight of the holy relic. Galahad is said to have had it in his possession, who at his death transferred it to Perceval, and after the death of the latter the cup was taken up into heaven. Students of folk-lore connect Perceval of the Christian legend with the Siegfried of early German literature and Celtic mythology, but the account of a sacred spear and bowl, as given in the grail romances, appears to be mainly of Christian legendary origin, and to be based upon the lives of saints and certain apocryphal books of the New Testament, principally the Gospel of Nicodemus. It is probable that the Perceval story was familiar, in one or more of its many different forms, to the people of western Britain, before their conversion to Christianity. When the French romancers of the 12th century began to develop the grail idea,— the idea of a sacramental symbol, dwelling among men but discoverable only by the brave and pure,— they wove into their narrations tales of chivalry, mysterious adventures, and legends of folk-lore. Chrestien de Troyes, who was possibly the first writer from whom a grail romance has come down to us, was evidently intending to fuse certain elements of the grail and Perceval legends. He began his work about 1189, but died without completing it. Chrestien's poem was taken up by several other French writers after his death. An introduction was fitted to it, in which a violent attempt was made to reconcile the Christian and heathen elements. Many thousands of lines were also added, by various hands, in the early years of the 13th century. Meanwhile, probably before the end of the 12th century, Robert de Borron had written, in Old French verse, a trilogy, 'Joseph,' 'Merlin,' 'Perceval,' of which the 'Joseph' and part of the 'Merlin' have been preserved. It was he especially who gave to all the material a Christian character. There are also later prose adaptations of his work. Great difficulty is occasioned by our ignorance of where to place the French prose romance, the 'Queste del Saint Graal,' generally attributed to Walter Map, or Mapes, and another, the 'Grand Saint Graal,' often accredited to Borron. In these the Christian symbolizing tendency is strong, and the story of Perceval is buried under many complicated tales of knight-errantry. They were, however, probably written before 1204. The 'Queste' having been one of the romances followed by Malory in his 'Morte Arthure,' the Galahad story has had a marked influence upon later literature. There are several other members of the early cycle of grail romances, but only one is of great importance,— the 'Parzival' of Wolfram von Eschenbach. The 'Parzival' is his *magnum opus*. It is also the finest narrative poem of which the authorship is known, between the era of classical antiquity and the 'Divine Comedy' of Dante. Furthermore, it is the most complete, and virtually the final, mediæval handling of the two great themes which are involved in the legend of the holy grail, and which Wolfram more thoroughly blends than any other poet.

During the next 250 years it was the mission of the legend of the holy grail to be the spiritualizing tributary of a broader stream of literature, the full current of Arthurian romance. It then remained in obscurity until the 19th century. Modern English and German poets in reviving the story of the grail, have been moved by the same moral earnestness as Wolfram von Eschenbach, and by the same desire to show the way to seekers after the spiritual life. The best-known of the many modern embodiments of this legend are Tennyson's 'Holy Grail' and the text of Wagner's musical drama 'Parsifal.'

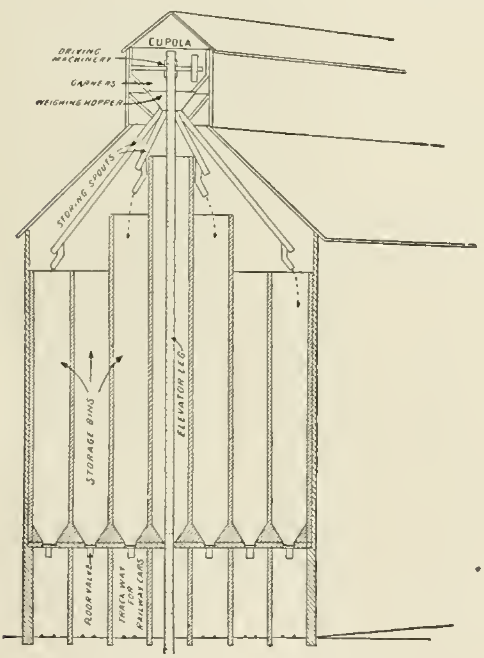
Grain, any cereal cultivated on account of its seed for the production of meal or flour. All kinds of grain contain nutritious particles of a similar character, although they vary, both in their quantity and in their mixture, in various grains. These elements are: (1) Gluten, which affords the strongest nourishment for the animal body. (2) Fecula or starch, which is very nutritious, although not so much so as gluten, which, however, it seems to render more digestible. (3) A sweet mucilage, which is more nutritious than starch, but is small in quantity, and renders the grain liable to the vinous and acetous fermentation. (4) A digestible, aromatic substance contained in the hulls, which consist of a fibrous matter. (5) Moisture, which is predominant even in the driest grain, and increases the weight of the mass, although it lessens the specific gravity; it affords no nourishment, hastens the decomposition of all kinds of grain, if they are not kept very dry, and influences germination. See articles under names of different cereals.

Grain Elevator, a structure equipped with elevating machinery for the purpose of loading, storing, and cleaning grain which is subsequently unloaded directly into railway cars, canal boats, or grain-carrying vessels for transportation.

It consists of a rectangular building or "house," surmounted by a smaller structure called the "cupola." The house is divided into a series of deep storage bins, while the cupola contains the machinery for operating the "elevator leg," the turnhead spouts, the garners, the weighing machines, and the cleaning machinery. It is usually constructed of timber with brick outside walls for the house, and corrugated sheet iron for the roof and walls



Sectional Diagram of Grain Elevator.

of the cupola. Many elevators, practically fireproof, are built with solid brick walls enclosing steel bins surmounted by steel framed cupolas roofed with terra-cotta or sheet iron, while the bins of some of the European structures are made of steel skeletons embedded in concrete. In the United States further protection is obtained by housing the steel storage bins and the operating machinery in separate fireproof buildings, the grain being handled between them by a system of pneumatic conveyors.

The elevator leg consists of a framing the foot of which extends below the floors of the bins, while its head reaches to the topmost story of the cupola. Within this framing a belt conveyor, made up of several thicknesses of canvas and sheet rubber, usually 36 inches wide and three quarters of an inch thick, is operated by steam power. The belt, which is of the endless type and carries a series of metallic buckets, passes over two pulleys, one at the foot and the other at the head of the leg and lifts the grain to the turnhead spouts in the cupola.

Unloading and storing is accomplished as follows: The grain-laden cars are usually run up along the side of the building so that each car is placed directly under an elevator leg. Two men in each car, operating shovels by ropes from a steam-driven shovel shaft, shovel the grain into the pits of the elevator leg, and thus fill the buckets of the conveyor, which, operating continuously, carries it up to the cupola, where the buckets are tipped over automatically and their contents discharged into the turnhead spouts. From these the grain passes by gravity into the garners, thence into the hoppers of the weighing machines, which are usually gauged exactly for 100 pounds, thence to the cleaners if desirable, and finally through a system of spouts to the storage bins.

When used for unloading grain from ships to railway cars the elevator legs are placed outside the house and their feet lowered into the hold of the vessel through the hatchways. The conveyors carry the grain to the turnhead spouts from which it passes to the storage bins, and thence through the floor valves of the bins to the cars placed beneath them. Under such conditions they are called "marine elevators," and when the arrangement is mounted on a barge or float to permit of its being moved from place to place, it is commonly known as a "floating elevator."

To unload grain from an elevator into the grain-carrying vessels of the Great Lakes, the vessel is made fast alongside of the house, and its hatches being removed, the grain is poured by gravity in a perfect torrent into its hold through great spouts which extend to the hatchways from the floor valves of the bins. The discharging capacity of these spouts ranges from 12,000 to 60,000 bushels per hour, and load vessels of the greatest capacity in two or three hours.

The loading and storing capacities of individual elevators vary greatly according to their location. Innumerable small structures capable of handling only a few thousands of bushels each are located along the lines of railway traversing the grain-bearing regions of the Western States; but those at the large centres of flour manufacture and grain transportation, such as Minneapolis, Duluth, and Chicago, are of mammoth proportions, with individual capacities ranging from 500,000 to 5,000,000 bushels. One of the medium sized elevators at Duluth is 285 feet long, 85 feet wide, and 150 feet high. Nine belt conveyors driven by a 200 horse-power steam engine lift the grain to a height of 145 feet to the turnhead spouts. Each belt carries 125 buckets having a capacity of one peck each, so that the total load at any working instant is about 270 bushels or 15,000 pounds, representing an unloading capacity of 12,000 bushels per hour. The storage bins are each 60 feet deep by 20 x 10 feet cross section, with a capacity of 12,000 cubic feet, thus giving the elevator a total storing capacity of 1,500,000 bushels.

The cost and rendering of elevator service is fixed and regulated by different conditions in the different States. In Illinois the elevators are compelled to receive and store, up to their full capacity and without discrimination, all the grain brought to them for that purpose, provided it is free from disease or other impurities. The maximum charge allowed for this service is 1¼ cents per bushel for the first 10 days or any portion thereof, and ½ cent per bushel for each subsequent 10-day interval. The elevators at each of the three cities mentioned have a total capacity of about 35,000,000 bushels, and each group handles about 70,000,000 bushels of grain annually.

William Morey, Jr., C.E.,
Consulting Civil and Mechanical Engineer, New York City.

Grain, Handling and Transportation of. The methods of handling the grain produced in the Northwest, the various stages through which it passes from the field to the consumer, the means and appliances employed and incidentally the volume of grain handled, and the cost and method of transportation are important factors in the agricultural development of the Great West.

The States of Minnesota and the Dakotas are the spring wheat States, producing the bulk of that incomparable variety in the United States. The process of seeding and harvesting is much the same with the small farmer with his 160 acres as the large one with his thousands of acres. Both use similar machinery, differing only in the amount used. It is a self-evident fact that in the production of grain and the manufacture of flour, as well as in all other manufacturing industries, the profit depends in a very large degree upon the volume of business done. The tendency in all lines has been to cheapen the cost by increasing the volume.

Minnesota and the Dakotas produce a yearly average of 133,000,000 bushels of wheat, 55,000,000 bushels of corn, 87,000,000 bushels of oats, 1,000,000 bushels of rye, and 22,000,000 bushels of barley. At most towns in these spring wheat States, along the lines of railroads are small elevators, to which the farmer takes his grain either to sell, store, or ship, according to his inclination or ability. These elevators receive the grain for storage or for shipment to the primary or semi-terminal elevators at Minneapolis or Duluth. Well-informed farmers and dealers estimate the cost of production of a bushel of wheat to be from 40 to 45 cents. The average cost of transferring the grain from the farm or initial point of shipment to either Minneapolis or Duluth (rates being about the same) is about 10 cents per bushel. The charges for storing grain at these points are about three fourths of a cent per bushel for the first 15 days, including cleaning.

The average yearly receipts of wheat in round numbers at Minneapolis for the last 12 years were 73,000,000 bushels, of which about 54,000,000 bushels were manufactured into flour. The elevator capacity at Minneapolis is 36,000,000 bushels.

State Inspection.— In Minnesota the State inspection of grain is accomplished by well-qualified men having a technical knowledge of their work and experienced as well, under rules prescribed by the State Board of Appeals. The board of inspection is composed of six members, three of whom are located at Minneapolis and three at Duluth. If the inspector's report is not satisfactory to the buyer or seller, the aggrieved party can appeal to the Appeal Board, whose decision is final. The mode of inspection is as follows: The first step of the inspector is to go with the sealer, who opens the car, breaking the railroad seal for the inspector, who enters the car, and takes several samples of grain by probing to the bottom of a car in several places with an instrument provided for that purpose. From these samples he mixes and makes a general sample, from which his report as to grade under the rules is made. The car is then resealed with a State seal, the railroad seal number and the seal number substituted by the State having been duly recorded by the sealer.

Weighing.— After the cars of grain have been transferred to the elevators, the grain doors are removed, which allows the grain to fall into pits under the cars. The assistant weighers take the number and initial of the car, see that no grain is left in the car and that the shipment has been elevated to the scale floor at the top of the elevator. The grain is then carefully weighed and distributed to the different storage bins of the elevator and, after cleaning, is ready for shipment eastward. The charge for inspecting and weighing a car of grain is 50 cents. The record of every car inspected and weighed is carefully preserved by the two departments, each of which gives to every owner or agent a certificate of grade and weight. These certificates form the basis of settlement of the consignor with the consignee, the freight bills of the railroad companies and supply the necessary information to the grain registrar, whose duties will be more clearly defined hereafter. The State employs a scale expert, whose duty it is to examine and test the scales used at Minneapolis and Duluth, to see that they are in perfect condition at all times.

Grain Registration.— In those elevators termed regular, under the rules of the exchanges at Minneapolis and Duluth, great care is used to prevent any irregularities as to grade and quantity. After the grain has been inspected and weighed as before described, and the elevators have reported to the State registrar, he issues certificates which show the name of the elevator, the date the grain was received, the number and initial of the car, the number of bushels and the grade. These receipts must be returned to the registrar and canceled before the grain can be shipped. The registered receipts are mainly used as collateral upon which to obtain money at the banks, and are considered and approximate as nearly to perfect securities as any found in the West. Many years of experience have proven that this standard of securities has been very high and safe.

Duluth as a Semi-terminal Point.— Duluth is a primary or semi-terminal market, the same as Minneapolis. The system of inspection, weighing and registration is identically the same; but Duluth, being the point where rails and water meet, and being Minnesota's only lake port, the method of shipment of grain is different from that at Minneapolis. The elevator capacity at

Duluth is 34,000,000 bushels, the average receipts of wheat for past 12 years being in round numbers 62,000,000 bushels, of which some 8,000,000 bushels are manufactured into flour at the Duluth-Superior mills. The balance is mostly consumed in eastern markets, although some years a million bushels have been exported.

Water Transportation.— On the Great Lakes large steel freighters carry the products of the prairie farms of the West at greater reduced cost than in years past. The evolution is from the little 100-ton steam-barge of 30 years ago to the 10,000-ton steamer of to-day, and it frequently happens that vessels loading at the elevators at the head of the Lakes, take at one load all the grain grown on a whole township of land.

The question of cheap transportation eastward of the varied and enormous products of the Northwest has been the subject of congressional legislation for many years; and that it was wisely considered by that body is evidenced by the governmental appropriations of over $10,000,000 since 1881 for the purpose of building locks, widening and deepening canals and improving the channel through the river at Sault Ste. Marie. That the full benefit of the improvements at the "Soo" be fully realized to the end that vessels might load to their full capacity, an appropriation was made a few years ago of $3,150,000 for deepening the channels in the joint harbor of Duluth and Superior, to 20 feet, thus enabling vessels trading between Duluth and Buffalo to load to that depth. The benefit of this is shown by the fact that the average size of vessels trading at the head of Lake Superior has grown from 336 tons in 1885 to 1,940 tons in 1902. With economy in production by the aid of improved labor-saving machinery, and larger and better vessels operated at less sums proportionately, it is no wonder that the cost of seeding and harvesting the grain and transporting it to the seaboard has been reduced to the minimum.

Loss in Transit.— The average loss per 1,000 bushels of wheat in transfer from Duluth or Chicago to Buffalo in 1902 was 14 pounds, or about one peck for each 1,000 bushels, showing that the weighing of grain by the large elevators has been reduced to a science. Quick despatch at the Duluth elevators during the season of large receipts is proverbial and it is frequently the case that some of these large vessels load at the rate of 60,000 bushels per hour. The average freight rates on grain from Duluth to Buffalo for the last six years has been 22 mills per bushel. From Buffalo to New York the rates for the same period have averaged about three and one third cents.

With closer trade relations with Canada by removing the duty on wheat, the amount of grain that would find its way east via the Great Lakes would be greatly augmented. About 75 per cent of the grain going east by water from Duluth, goes to Buffalo, 11 per cent to Chicago and Lake Erie ports, and 14 per cent to Canadian ports.

H. B. Moore,
Secretary Duluth Board of Trade.

Grain Insects. Stored grain, corn, nuts, and the like, are frequently infested and injured by various insects. About 40 kinds of weevils (q.v.) lay their eggs upon dry grain, and their grubs bore into and devour the kernel, so that when they are numerous great damage may ensue. It has been estimated that the annual loss in the United States from this cause alone is about $40,000,000. The most important of these pests are the granary-weevil (*Calandra granaria*) and the rice-weevil (*C. oryza*). The former is wingless, evidence that it was domesticated ages ago. It multiplies so rapidly, developing from egg to adult in about six weeks, that five or six generations might be produced annually in a warm temperature. The rice-weevil has well-developed wings, which it seldom uses, showing a strong tendency to become wingless in time. Much injury to stored grain is also caused by other beetles, particularly by three species (*Silvanus surinamensis, Cathartus gemellatus* and *C. advena*), but they usually follow the attacks of other insects. The cadelle (*Tenebroides mauritanicus*) is to be included in this category, as it has a pernicious habit of gnawing into kernels of grain and destroying the embryo or germ. Great harm in granaries is done also by small moths related to the clothes-moth, whose caterpillars bind the grains together, forming clots, which both spoil the edible quality of the cereal, and clog mill machinery. The most familiar of these is the European *Sitotroga cerealella*, often called Angoumois grain-moth, but known as "fly-weevil" in the southern States, where it is so prevalent that grain can nowhere be stored for a long time. Another imported grain-moth, troublesome in the United States since about 1890, is *Ephestia kühniella;* and a third (*Tinea granella*), is especially harmful to wheat in Europe, but not prevalent in America. Injury by the Angoumois grain-moth and the rice-weevil, which obtain entrance to the grain in the fields, can be largely prevented by early harvesting and by threshing as soon as possible. The standard remedy for all grain insects, however, is bisulphid of carbon, applied at the rate of one or two ounces to every hundred pounds of infested grain, which is effective in proportion to the tight closing of the bins. Exposure should last as long as possible, unless the seed is desired for planting, when an exposure of 24 hours is sufficient and will not detract from the germinating power. In buildings that cannot be tightly closed a larger quantity of the insecticide must be used, and repetition of treatment is necessary in warm weather at intervals of six weeks or more. Frequent stirring about of the grain is helpful against these insects; and granaries whenever emptied should be thoroughly cleaned and whitewashed. See Flour and Meal Insects.

Grain-poisoning. See Ergotism.

Graining. (1) In leather manufacture, the process of rubbing leather with a board to raise the grain. The leather having been shaved to a thickness at the beam, and daubed, is hung up to dry, and is then folded, grain side in, and rubbed on the flesh side with a pommel or crippler to give the leather a granular appearance and render it supple. The hide is then extended and rubbed on the grain side. This is termed bruising. Also a process for giving markings to the surface of leather to imitate the wrinkled appearance of morocco, hog-skin, and some other leathers.

(2) In painting, the imitation of the natural grain of wood by means of tools. Combs,

brushes, rollers, and the corner of a folded rag are used in making the various patterns.

(3) In lithography, a mode of giving a certain texture to the face of a stone. One stone is laid on another with a quantity of sifted sand of a given fineness, and by a peculiar oscillation and gradual progression the surface is cut into a set of fine prominences more or less deep and distant, according to the character of the work to be placed on the stone.

Grakle, grăk'l, the name of several kinds of birds. In the United States the blackbirds (especially the larger ones) of the family *Icteridæ*. (See BLACKBIRD.) In India and eastward a myna (q.v.) or some related bird formerly classified in the miscellaneous group *Gracula*.

Gramineæ, grā-mĭn'e-ē. See GRASSES.

Grammar, in its widest sense is the science of language, treating of the words of which language is composed, and their mutual relations when combined in a sentence for the expression of thought. Universal grammar is the science of verbal expression throughout all languages; comparative grammar studies the words and grammatical forms of a group of kindred languages — the Aryan group, for example; a particular grammar deals with the words and grammatical forms of a single language. But the study of words, their meanings, their origins and their histories may be regarded as belonging to lexicography rather than to grammar proper: the proper field of grammar would then be the study of the methods by which the relations between words in a sentence and between sentence and sentence are determined. The English language as it exists differs in important respects from the Germanic dialects from which it is sprung: it has lost great part of its native vocabulary and has taken to itself a very considerable portion of the vocabulary of Latin, either direct from that language or through the French. And its mode of expressing the relations between words has been immensely simplified by eliminating the inflexions which in those early dialects were very numerous. The grammatical rules which regulated English speech in the several stages of its development became antiquated as the change proceeded, and now English is less under control of grammatical rules than perhaps any of the other languages of culture.

Here comes into view the important difference which exists between the languages which express by inflexions the mutual relations of words in a sentence, and the languages which indicate those relations merely by the position of the words. English is the type of a language almost without inflexions: Latin is an example of one that abounds in inflexions. English has but one case inflexion of nouns, the s of the possessive case; and an objective case inflexion of pronouns: he, him; they, them; who, whom, etc. As Marsh observes (Lectures on the English Language, 393) this inflected possessive of nouns expresses in modern English almost exclusively the notion of property or appurtenance and applies to persons or to animated creatures: hence we say "a man's hand," "a horse's hoof," but not "the house's roof." Though the Germanic dialects from which English is sprung had inflexions of adjectives, both for gender and number, no trace of them now remains in English. In Latin, nouns, pronouns, adjectives, verbs, all have numerous inflexions to denote all manner of relations between the words of a sentence. An adjective is of the gender of the noun to which it belongs: Good man is *bonus vir*, good girl, *bona puella*, and these two phrases are in the nominative case plural *boni viri, bonæ puellæ*. Declinable parts of speech in Latin have six cases in singular and plural, viz.: nominative, genitive, dative, accusative, vocative, ablative. The verb in English has but two inflections, the d or ed of the past indefinite or præterite, as, sail, sailed, and the participial inflexion ing. But the Latin verb has four modes, indicative, subjunctive, imperative, infinitive, also present and future participles and the two forms called "supines": all these in the active voice, and all constituting inflexions. The tenses, each with a distinctive inflexion for the three persons and for singular and plural are the present, imperfect, perfect, pluperfect, future, and future-perfect: not all of these tenses run through all the modes. In the passive voice the perfect, pluperfect, and future-perfect are not inflexional.

English being practically uninflected, position in the sentence determines the mutual relations of the words. In the sentence "Titus teaches Julia the letters," no different arrangement of the words can be made without rendering the whole unintelligible. But convert the sentence into Latin, and in whatsoever order the words be written, the sense is ever the same: "*Titus Juliam literas docet*," or "*Literas Juliam docet Titus*," etc. Again, "Proteus drove his flock to view the high mountains" (mountain tops) — *Proteus pecus egit altos visere montes;* no change of position of the words affects the sense. In passing it may be noted that Horace's phrase, "*pecus egit visere*," drove (his) flock to see, is in Latin a poetical license, and in prose the idea would be differently expressed: but the phrase in English is grammatically correct both for prose and poetry.

English knows nothing of grammatical gender: in other languages grammatical gender attaches to all nouns, whether distinguished by sex or not. The modern Latinish languages, French, Spanish, and Italian, attribute gender, masculine or feminine, to all nouns; but Latin has also a neuter gender. In Latin *domus* (house) is feminine, *murus* (wall) masculine, *jumentum* (beast of burden) neuter; and of course adjectives qualifying such nouns must agree with them in gender. In English there is a tendency even toward eliminating nouns feminine which designate women as engaged in sundry employments — that of instruction, authorship, etc., and to substitute for instructress, authoress, etc., instructor, author, doctor; so, too, women are masters of arts, bachelors of arts, etc.

The subjunctive mode of verbs in English has gone almost quite out of use. In Latin the subjunctive form possessed very great importance in defining with precision a writer's or a speaker's meaning. A notable peculiarity of English grammar is that it permits a word to serve both as noun and adjective, as when we say a sword thrust, a marble building: such phrases would be rendered into Latin by *gladii ictus* (thrust of sword), *ædificium marmoreum;* rendered literally, they would be unintelligible.

Equally peculiar to the grammar of English is the use of nouns as verbs, as "to shovel snow," "to pen a letter"; or even of proper names, as "to burk," to "boycott"; and "macadamize," might better have been "macadam." English cannot be compared with Latin grammar with regard to the use of the definite article, for Latin has not the article: but when English is compared with other modern European languages, as German, French, Italian, etc., the English article is seen to be a "definite" article indeed. In those languages such words as time, life, humanity, patriotism, always have the article, but in English only when a definite time, life, etc., are in question.

JOSEPH FITZGERALD,
Author of 'Word and Phrase.'

Grammar-schools. See EDUCATION, SECONDARY.

Gramme, grăm, the standard unit of French measures of weight. A gramme = 15.43248 grains troy, from which the equivalents in English measure for the other weights can easily be found; thus:

		Grains Troy		Pounds Avoirdupois
Centigramme	=	.1543234	=	.0000220462
Decigramme	=	1.543234	=	.000220462
GRAMME	=	15.43234	=	.00220462
Decagramme	=	154.3234	=	.0220462
Hectogramme	=	1543.234	=	.220462
Kilogramme	=	15432.34	=	2.20462
Myriagramme	=	154323.4	=	22.0462
Quintal	=	1543234	=	220.462

See METRIC SYSTEM.

Gram'ophone. A sound-reproducing apparatus invented by Emile Berliner. In principle it is similar to the phonograph (q.v.) and the graphophone (q.v.), but differs from these by employing a glass disk coated with lampblack instead of a cylinder of wax for its record. This disk carries a stylus connecting with a diaphragm which is vibrated by the sound-waves, and records those vibrations upon the lampblack surface in the form of a long spiral, as the disk is revolved in a horizontal plane. Unlike the record cylinders of the phonograph or graphophone, the disk cannot be used directly to reproduce the sounds thus recorded, and for that purpose a corresponding disk of hard rubber, prepared from a metal die photo-mechanically etched from the original markings on the lampblack coating of the glass disk is employed.

Gram'pians, Grampian Hills, or **Grampian Mountains.** (1) The mountain system of Scotland, extending across the country from northeast to southwest, for a distance of about 150 miles, and separating the Highlands from the Lowlands. Its limits are not well defined, but it may be said to commence near the southwest end of Loch Awe, on the west coast of Argyleshire, where the main ridge runs, in a well-marked course, along the northern boundaries of Perthshire to Cairn Ealer, where it separates into two distinct branches — one stretching north-northeast on the north side of the Dee, and terminating near Huntly; the other running nearly due east on the south side of that river, and terminating in the neighborhood of Stonehaven. With the exception of Ben Nevis, the Grampians comprise all the highest mountains in Scotland. Among these are Ben Cruachan, 3,689 feet; Ben Lomond, 3,192 feet; Ben Lawers, 3,984 feet; Schichallion, 3,547 feet; Ben Macdhui, 4,296 feet; Cairngorm, 4,084 feet; Cairntoul, 4,241 feet. The more remarkable passes are those of Aberfoyle, Glenshee, and Killiecrankie.

(2) A low range of mountains in the western part of Victoria, in Australia, are called Grampians.

Gram'pus, or **Cowfish,** a genus of porpoises of the family *Delphinidæ*. The species inhabiting the North Atlantic (*Grampus griseus*), reaches a length of about 12 feet. The head is globose, with a slight indication of a beak; the lower jaw shorter than the upper; dorsal fin high and falcate. The upper surfaces of the body are gray in color, the belly grayish white. The body is usually marked with numerous, irregular, light-colored lines which are believed to be due to the attacks of the cuttlefish. The young have the front of the head yellowish white, and six or seven vertical white lines on the sides. There are from 6 to 14 rather large, blunt teeth in the lower jaw, but none in the upper jaw. On the Atlantic coast of North America the grampus occurs singly or in small schools, ranging southward to New Jersey. It also occurs on the coasts of Europe. A closely allied species (*G. Stearnsii*) inhabits the North Pacific, and the genus has been reported from the Cape of Good Hope and New Zealand. The grampus feeds upon cuttlefish, and yields oil of superior quality. The name grampus (from the Italian *gran pesce,* meaning simply "large fish") is applied also to various other cetaceans, and especially to the killer whale (*Orcinus orca*) and to the blackfish (*Globicephala*).

Gran Chaco, grän chä'kō, **El,** a territory of Argentina, Bolivia, and Paraguay, S. A., bounded south and west by Santiago del Estero, and west by Tucuman and Salta. Area, about 275,000 square miles. It is watered by the Vermejo and Pilcomayo and numerous other branches of the Paraguay. In the west it is intersected by spurs of the Andes, and in the east forms extensive plains and marshes, with tracts at times entirely inundated, while in the south are vast sandy deserts, interspersed with salt pools. It is thinly inhabited by Indians, who live chiefly by hunting and fishing. In some parts the forests are extensive, and the vegetation rich. Pop. 10,422.

Granada, grā-nä'da (Sp. grā-nä'dā), (1) An ancient kingdom, subsequently a province of southern Spain, bounded by Andalusia, Murcia, and the Mediterranean. It was part of the Roman province of Boetica, and after the Saracen invasion became an independent Moorish kingdom until it was conquered by Ferdinand and Isabella in 1492, when it became one of the 13 old provinces; it had an area of 11,100 square miles, and since 1833 is divided into the provinces of Granada, Almeria, and Malaga. (2) The modern province, with a coast line of 66 miles on the Mediterranean, has an area of 4,928 square miles. It is picturesquely diversified by mountains and valleys, the chief range being the Sierra Nevada, which attains a maximum altitude of 11,781 feet in the Cerro de Mulhacen, the loftiest summit in Spain. The province watered by the Guadalfeo, the Jenil, and Darro is comparatively fertile and well cultivated; and abounds in mineral wealth. Pop. (1900) 492,460. The capital is (3) Granada, the ancient metropolis of the Moors. It is romantically situated on the rivers Darro and Jenil, at the foot of the snow-capped Sierra Nevada, which forms a background to the crescent-shaped city, with its terraced streets, turrets, and gilded cupolas rising above each other, the whole crowned by the Alhambra (q.v.), the famous citadel palace of the Moorish rulers. Seen from a distance the city has an imposing appearance, but the interior is in a state of decay, and the streets are narrow, irregular, and dirty. The principal buildings besides the Alhambra are, the Generalife, the royal Moorish summer palace, commanding a magnificent prospect; the cathedral, an irregular but splendid building; the archiepiscopal palace; and the residence of the provincial captain-general. Granada is the seat of a university founded in 1531, of several colleges, a normal school, and a school of art. It has various manufactures of local importance only, such as silks and woolens, leather, paper, hats, etc. Granada was founded by the Moors before 800, near the site of the ancient Illiberis, and from 1036 to 1234 was included in the kingdom of Cordova. In 1235 it became the capital of a new kingdom, and attained almost matchless splendor. In 1491 it remained the last stronghold of the Moors in Spain, and mustered 60,000 men to resist Ferdinand and Isabella. The defense proved unavailing, and the besiegers took possession in 1492. A year later it was made the seat of an archbishopric. The great body of its inhabitants still were Moors, and its prosperity continued almost without diminution till 1610, when it declined with the decree expelling the Moors from Spain. Pop. (1900) 75,900.

Granada, Nicaragua. (1) City, capital of the department of Granada; on Lake Nicaragua. It was founded in 1522 and was formerly the chief town of the republic, but has suffered greatly from the civil wars. It is a trading centre for dyewoods, cacao, gold and silver filigree hand-made ornaments, and hides. Pop. 11,879. (2) The department of Granada lies between the Pacific and Lakes Nicaragua and Managua; area about 2,600 square miles. The Mombacho Mountain, an extinct volcano, is the highest peak.

Granadil'la, the edible fruit of certain tropical species of passion-flowers (q.v.).

Gra'nary, The, an ancient burial ground in Boston, Mass., in Tremont Street. Here are buried Paul Revere, Samuel Adams, John Hancock, Peter Faneuil, Chief Justice Sewall, and several of the old colonial governors of Massachusetts.

Granbery, John Cowper, Bishop of the M. E. Church South: b. Norfolk, Va., 5 Dec. 1829; d. Ashland, Va., 1 April 1907. Graduated Randolph-Macon College in 1848, he entered the Methodist ministry in that year, was a chaplain in the Confederate army in 1861–5, and in 1875–82 professor of moral philosophy and practical theology in Vanderbilt University. His publications include: 'Twelve Sermons' (1896) and 'Experience the Crowning Evidence of the Christian Religion' (1900).

Gran'bury, Texas, town, county-seat of Hood County; on the Brazos River, the Fort W. and R. G. R.R. The chief manufactures are flour and farm implements. It has a cotton-gin, and is a trade centre for the products of the surrounding agricultural region. Pop. (1901) 3,773.

Gran'by, Canada, town, in Shefford County in the province of Quebec; about 40 miles southeast of Montreal. It is in an agricultural region, and its manufactures are chiefly for the local trade. Pop. (1901) 3,773.

Granby Token (1737), a private copper coinage issued by John Higley of Granby, Conn., where there were copper mines afterward used as Tory prisons and workshops. The obverse was a deer, with the legend "Value Me as You Please"; Roman numerals III and crescent. The reverse was three hammers on a triangular field, each surmounted by a crown, and with the legend "I Am Good Copper."

Grand, Sarah, pseudonym of Frances Elizabeth Clarke, English novelist: b. Ireland. When 16, she married Lieut.-Col. M'Fall, with whom she traveled in India, China and Japan; in 1901 she visited the United States. She has been active in the woman's movement, in England, serving as president of a Society for Woman's Suffrage, and of the Woman's International Progressive Union, and as vice-president of the Scottish Association for the Promotion of Woman's Public Work. Her first novel was 'Ideala,' written at 26, but the first work to give her a wide reputation was 'The Heavenly Twins' (1893). Her other writings include: 'Singularly Deluded'; 'A Domestic Experience'; 'Our Manifold Nature' (1894); 'The Beth Book' (1897); 'The Modern Man and Maid' (1898); 'Babs the Impossible' (1900).

Grand Army of the Republic, a patriotic association, organized in the interest of the surviving representatives of the military and naval forces of the Civil War, the families of those dead, and such objects as they think cognate with these. The membership is of soldiers and sailors of the War, honorably discharged or continuing, and State militia on active duty subject to national call during that time. It was worked up in Illinois in the winter of 1865–6, by Dr. B. F. Stephenson and Rev. W. J. Rudolph, the surgeon and the chaplain of the 14th Illinois Infantry; the first post was organized at Decatur, Ill., 6 April 1866; the first national "encampment" was held at Indianapolis 20 Nov. 1866. Its assigned objects are fraternity, commemoration, and assistance among the above classes; and it has aided in establishing soldiers' homes and memorials, and maintaining and educating soldiers' orphans. It also caused the institution of Memorial Day. It ruled in 1869 that it should not be used for partisan work, nominations, or debates, but naturally it has been a powerful factor in political calculations and the shaping of party conduct regarding both nomination of candidates for office and legislative action. It has also given out strong utterances against restraining liberality in pension legislation, and has used its influence to prevent official restriction in the expenditure of money under such legislation. It has headquarters in Philadelphia, and in 1902 reported 6,416 posts throughout the country, each State being a department with a commander. The membership was 263,745; it had been over 400,000 at one time. The deaths during the year were 8,299. There is a national council of administration of 45. It holds annual meetings or encampments in the chief cities; the uniform is dark blue with black slouch hat. Its badge is a bronze star hung from a strap and ribbon flag; on the star in relief are a soldier and sailor clasping hands in front of a figure of Liberty, with two freedmen in the foreground, the United States flag on the sides. See WOMAN'S RELIEF CORPS.

Grand Cañon of the Colorado. See COLORADO RIVER; CAÑON; POWELL, JOHN WESLEY.

Grand Falls, or **Colebrooke,** Canada, port of entry, in Victoria County in New Brunswick; on the Saint John River, which is navigable to this point. The falls, which give the name to the place, are about 80 feet in height. Considerable trade is carried on in the agricultural products, and the small game which is abundant in the vicinity. Pop. 1,545.

Grand Falls, a cataract of the Grand River, in Labrador, British America. These falls are in a cañon of the Grand River, 25 miles long and nearly 500 feet deep. About four miles above the falls the river begins a rapid descent of 200 feet to the falls, where the precipice is 320 feet deep and 200 feet wide. Below the falls is another rapid descent of about 300 feet, and then a gradual descent to the ocean. The total descent from the beginning of the first above the falls to the ocean is about 2,000 feet. This cañon was discovered in 1839 by a Hudson Bay Company official named McLean: but no further report being made its existence became a memory until 1891, when it was rediscovered and in 1894 surveyed by the Canadian Geological Survey. (See GRAND RIVER.) Consult 'Report by Canadian Geological Survey.'

Grand Forks, N. Dak., city, county-seat of Grand Forks County; on the Red River of the North and the Red Lake River, and on the Northern P. and the Great N. R.R.'s; about 25 miles west of Crookston and 80 miles north of Fargo. It was settled in 1871 and incorporated in 1881. It is situated in an agricultural and lumbering region. Its chief manufactures are flour, lumber, foundry products, bricks, woolen goods, and steam-boilers. In addition to the trade in its manufactured articles it has a large trade in live stock, wheat, oats, and potatoes. It is the seat of the North Dakota State University, opened in 1884, the Grand Forks College, the Northwestern Normal College, and Saint Bernard's College. The city owns the electric-light plant for street lighting and the waterworks. In the last decade the city increased in population over 50 per cent. Pop. (1900) 7,652.

Grand Gulf, a locality in Mississippi, on the Mississippi River, south of Vicksburg. The Confederate batteries at this place were attacked by the forces under Farragut 31 March 1863, and frequent shelling and bombarding occurred from that time until May 3, when the place surrendered to the land and naval forces under Grant and Porter.

Grand Haven, Mich., a port of entry, city, and county-seat of Ottawa County, on Lake Michigan, at the mouth of Grand River, and on the Detroit, G. H. & M., and the Chicago & W. M. R.R.'s, 110 miles northeast of Chicago. It has an excellent harbor with two lighthouses; there is steamboat connection with the principal lake ports, and a large trade in lumber, grain, flour, leather, etc, is carried on. The city was founded in 1835; it is a summer resort of some popularity, with a noted mineral spring; has municipal waterworks and electric lighting plant, electric street railroads, a public library, and a fine park. Among its educational institutions is Akeley College for Girls. Its industries include the manufacture of lumber, wooden-ware, furniture, refrigerators, machinery, pianos, brass novelties, matches, shoes, barrels, etc.; market gardening is lucratively engaged in and the lake fisheries are important. Pop. (1900) 4,743.

Grand Island, Neb., city, county-seat of Hall County; near the Platte River; on the Burlington & M., the Union P., the Saint J. & G. I. R.R.'s; about 85 miles west of Lincoln and 127 miles southwest of Omaha. The first permanent settlement was made in 1869, and it was incorporated in 1872. It is situated in a fertile agricultural region. The chief manufactures are sugar, beet sugar, flour, canned fruits and vegetables, and brooms. Large repair shops for the Union Pacific Railroad are located here. There is an extensive trade in the manufactured articles, live stock, and wheat. Grand Island contains a number of wholesale establishments and is the distributing centre for a large section of the northwest of Nebraska. The State Soldiers' and Sailors' Home and St. Francis Hospital are located here. It is the seat of Grand Island College, opened in 1892 under the auspices of the Baptist Church, and it has a large free library. The present city charter, of 1901, provides for the election of a mayor every two years and a city council, in whom is vested the government. The city owns the waterworks. Pop. (1900) 7,554.

Grand Junction, Colo., city, county-seat of Mesa County; at the junction of the Grand and Gunnison rivers, on the Colorado and M. and the Denver & R. G. R.R.'s; about 97 miles northwest of Gunnison. It is in the midst of a good farming country, where the land is irrigated. It has a pyritic smelter, and a beet-sugar factory, flour- and lumber-mills. Its trade is chiefly in coal, lumber, bricks, grains, fruits, and vegetables. It is the seat of the Teller Institute, a school for Indian pupils. The waterworks and street car lines are owned by the municipality. Pop. (1900) 3,503.

Grand Jury. See JURY.

Grand Lake, one of the shallow bodies of water in the southern part of Louisiana, about 50 miles long. Its chief inlets are Atchafalaya and Grand rivers, and Lake Vernet. Its outlet is Myrtle Bayou, which flows in Atchafalaya Bay, an arm of the Gulf of Mexico.

Grand Manan, mă-năn', an island at the entrance of the Bay of Fundy, off the coast of Maine. It belongs to Charlotte County, in New Brunswick, Can.; area, about 100 square miles. On the north coast, at Indian Beach, is a settlement of Indians. Fishing is the chief occupation, but the large forests still furnish material for ship-building and some lumber. The island is a favorite summer resort, because of its climate and abundance of small game. Pop. 2,590.

Grand Prix de Rome, grän prē dė rōm, a prize given annually by the Academy of Fine Arts in Paris to the most successful competitor in painting, music, sculpture, etc. The winners of the prize become the charge of the government for four years and are sent to Rome to reside. See ECOLE DES BEAUX ARTS.

Grand Rapids, Mich., city and county-seat of Kent County, second to Detroit in population and importance, is situated on both sides of Grand River, about 30 miles from Lake Michigan, 152 miles from Detroit, 180 miles from Chicago; lat. 42° 57′ 49.02″ N., lon. 85° 40′ 1.65″ W.

Railroads.—The first railroad into Grand Rapids was the Grand Trunk, from Detroit to Grand Haven, in 1858. Since then have been built the Grand Rapids & Indiana, the Michigan Central, the Lake Shore & Michigan Southern, and the Pere Marquette. These roads radiate in 11 different directions, with through trains to all important Michigan cities, Chicago, Cincinnati, and Toledo. The Grand Rapids & Indiana and the Pere Marquette have extensive shops, the latter established in the past year and representing an investment in land, buildings, and equipment of over $500,000. Two interurban lines run out of the city, the Grand Rapids, Holland & Lake Michigan to Holland and Saugatuck, with South Haven, Saint Joseph, and Chicago future objective points; and the Grand Rapids, Grand Haven & Muskegon. Another line is under contract to be built (1905) to Ionia and thence to Lansing, and lines south to Kalamazoo and north to Rockford are projected.

Industries.—Grand Rapids is the base of supplies and the distributing point for western and northern Michigan. It has large wholesale and jobbing houses in groceries, provisions, clothing, dry goods, millinery, carpets, crockery, drugs, paper, cigars, boots and shoes, knit goods, sporting goods, hardware, mill supplies, and in other lines. The chief industry is the manufacture of furniture (see FURNITURE INDUSTRY), with 38 factories, capital $8,005,713, employing 6,654 hands, and annual product valued at $9,409,097. These statistics are from the special United States census taken in 1904. New York and Chicago in their order exceed Grand Rapids in the volume of their furniture production, but Grand Rapids is the recognized leader in design, finish, and quality. Semi-annually, in January for the spring season, and July for the fall, buyers come here from all parts of the United States and from foreign lands to inspect the new styles and to place orders. The semi-annual visitors number from 800 to 1,000. Between 300 and 400 manufacturers of furniture and kindred lines in other parts of the country semi-annually send their samples here for the buyers to inspect. The outside manufacturers occupy large furniture exposition buildings, built for their use, in the heart of the city. There are four of these exposition buildings, one occupying an entire square, five stories high, and two more are projected.

Other important industries and the value of the annual product are (1904): Flour and grist-mill products, $2,370,787; machinery and foundry, $1,265,298; bread and bakery goods, $1,178,138; lumber and planing-mill, $967,396; carriages and wagons, $494,617; hosiery and knit goods, $590,472; wood ornaments, $419,827; men's clothing, $337,900; tobacco and cigars, $574,726; shirts, $111,625; miscellaneous, $11,-802,898. The census shows a total of 389 factories, with $25,915,861 capital, employing 15,707 hands, paying $7,392,748 in wages, using $14,615,-176 worth of material, and producing goods valued at $31,032,589. The largest sticky fly-paper and carpet-sweeper factories in the world are located here. Twenty-five per cent of the total United States production of gypsum is from the Grand Rapids quarries.

Fruit-growing.—Grand Rapids is also the centre of the West Michigan fruit belt, which extends along Lake Michigan from Saint Joseph to Traverse City. The 1904 peach crop in Michigan was a partial failure, but 479,000 bushels of peaches were marketed here; also 741,000 bushels of apples; 57,000 bushels of cherries, 52,000 bushels of plums; 8,300 barrels of pears; 200,000 crates of strawberries; 96,000 of blackberries; 91,500 of raspberries, besides large quantities of other fruit. The value of the crop marketed here was estimated at $1,850,-280. This does not include the large quantities of fruit purchased from this city as a base in Mason, Oceana, Muskegon, Ottawa, Allegan, and Van Buren counties and shipped direct to the consuming market. With an average crop the peaches marketed here will exceed 1,000,000 bushels. This is also an important winter lettuce centre, Chicago, Cincinnati, Saint Louis, and even New York drawing on the Grand Rapids growers for their supplies. One of the most popular varieties of winter lettuce originated here and is named the Grand Rapids.

Banks.—The city has five national banks capitalized at $2,300,000, five state banks capitalized at $650,000, and one trust company $200,000. A sixth state bank, capital $100,000 will begin business early in the summer of 1905. The January 1905 statement showed total loans and discounts, $15,868,050.88; stocks, bonds, and mortgages, $6,495,646.93; commercial deposits, $7,733,544.54; savings and certificate deposits, $11,486,877.91; and total deposits, $21,-415,024.93. The bank clearings in 1904 were $101,037,199.30.

Churches, Schools, etc.—All the Christian church denominations are represented with congregations and churches. The bishops of the Grand Rapids Catholic diocese and West Michigan Protestant Episcopal diocese live here. The Catholics have a cathedral. The total value of church property is estimated at $1,500,000. The Catholics hold $455,800; Holland Reformed, $228,100; Methodist Episcopal, $153,900; Congregational, $117,900; Baptist, $110,100; Protestant Episcopal, $100,200; Lutheran, $98,800; Presbyterian, $68,200; and other denominations in smaller amounts.

The Holland Theological Seminary, one of the chief educational institutions of the Holland Reformed Church in America, is located here. The Catholics, Lutherans, and Holland Reformed Churches have parochial schools accommodating about 5,000 pupils.

The city owns one high school and 35 ward schools, estimated in value at $1,510,000, managed by an elective board of education of 24 members and the mayor *ex officio*. A movement is on foot to reduce the board to a smaller body. It is also proposed to build a manual training school to cost $60,000. The school enrolment is about 15,000; the cost of maintenance by direct taxation is about $400,000.

The Ryerson public library, a gift to the city of his birth by Martin A. Ryerson of Chicago, contains 65,000 volumes. It is controlled by an elective board of five members. The museum, under the control of the board of education, occupies property costing $30,000, and is especially strong in natural history specimens.

Public Institutions.— The Michigan Soldiers' Home, maintained by the State, with accommodations for 1,000 veterans and 200 widows, is located three miles north of the city. The Michigan Masonic Home, maintained by the Michigan Grand Lodge of Masons, with 250 inmates, is located three miles east of the city. There are three large hospitals, two orphan asylums, one home for the aged, two refuges for unfortunate women, and several minor philanthropics. The city maintains a hospital and the county has a farm and hospital.

Public Buildings.— The public buildings are city hall, valued at $300,000; court-house, $250,000; federal building and post-office, $350,000; county jail, $50,000; Ryerson public building, $350,000; museum, $30,000; police headquarters, $66,000. A bill was favorably reported in the last Congress appropriating $500,000 for a new government building.

Newspapers, Theatres, etc.— The city has three daily newspapers, *The Grand Rapids Herald* (morning), and *The Press* and *The Post* (evening). The city has four theatres.

Clubs and Societies.— The Peninsular Club with 350 business men members owns a club house in the heart of the city valued with real estate at $150,000. The Lakeside Club with 800 members has a club house at Reeds Lake costing $60,000. The Kent County Club owns 100 acres of land and a $15,000 club house in the north part of the city. The Germans have four club houses and halls; the Irish, the Danish and the Polish each one. The Ladies' Literary Club, the Grand Rapids Woman's Club, the West Side Ladies' Literary Club, and the St. Cecelia (musical) Society, all made up exclusively of women, own club houses. The Ladies' Literary club house, built about 30 years ago, was one of the first of the kind in the country. The Young Men's Christian Association has nearly 1,000 members and owns and occupies a building that cost $60,000. The Grand Rapids board of trade has 1,200 members.

Parks and Resorts.— The city has John Ball Park of 100 acres, the original 40 acres of which was the gift of John Ball; the Antoine Campau Park of five acres, the gift of Martin A. Ryerson; Highland Park of eight acres; Fulton Street Park occupying a square, and numerous small parks. The parks are estimated in value at $350,000. Comstock Park of 100 acres is owned by the West Michigan Fair Association, and if it shall cease to be used for fair purposes the property will revert to the city. Reeds Lake, three miles east of the city, and North Park, near the Soldiers' Home up the river, are popular nearby summer resorts. The Lake Michigan resorts at Saugatuck, Holland, Grand Haven, and Muskegon are one hour away by rail. The northern Michigan resorts are easily accessible.

Public Utilities.— The city owns its own waterworks, with Grand River as a source of supply and 150 miles of mains of all sizes, also owns its own electric lighting plant, garbage burner and market. There are 286 miles of street, of which 173 miles are improved. Of the latter, 7 miles are asphalt, 9 brick on concrete foundations, 4 cedar block on concrete, and 6 macadam. Six bridges owned by the city span the river, one at Bridge Street being of concrete construction, four steel and one wood Commercial lighting is furnished by the Grand Rapids Gas Light Company and Edison Electric Light Company, each having a monopoly in its field. The Grand Rapids Railway Company with 60 miles of track, mostly double, controls the street railways.

Government.— Municipal affairs are conducted by a mayor, elected for a term of two years, and a council of 24 aldermen, two from each ward elected for two-year terms, half retiring each year. The fire and police departments, the health, the poor, and the public works departments are under the control of boards appointed by the mayor. The total bonded indebtedness of the city is $2,203,000, of which $1,025,000 is water, $218,000 schools, and $460,000 street improvements. The property owned by the city is estimated in value at $5,593,483.66, not including the schools, library and museum properties. The expenditures for public improvements in 1904 aggregated $233,846, of which $212,091 was for street improvements and $21,755 for sewers.

History.— In 1828 Louis Campau established an Indian trading station here, and in 1831, after the government survey, made the first entry of land. The first settlers, Joel Guild and family, arrived in June 1833. Grand Rapids was incorporated as a village in 1838 and as a city in 1850.

Population.— (1850), 2,686; (1870), 16,507; (1890), 64,147; (1900), 87,565, and the State census of 1904 gave it 95,718. Thickly settled suburbs will add approximately 10,000.

LEWIS G. STUART,
Managing Editor, 'The Grand Rapids Herald.'

Grand Rapids, Wis., a city and the county-seat of Wood County, on the Wisconsin River, the Wisconsin C., the Chicago, M. & St. P., the Chicago & N., and other railroads, about 70 miles northwest of Oshkosh. The river is spanned by a fine bridge connecting with Centralia, a suburban municipality prior to 1900, when it was incorporated with Grand Rapids. Lumbering and agriculture are the chief occupations of the inhabitants and there are lumber, pulp, paper, and flour mills, manufactures of furniture, foundries and machine shops. In the neighborhood are deposits of kaolin. Pop. (1900) 4,493.

Grand Rapids & Indiana Railway Company. This company, fifth in succession, owning a completed line of railroad starting at Fort Wayne, Ind., running thence northerly through the city of Grand Rapids and the western section of Michigan to the Straits of Mackinac, 366.63 miles main line, with spurs and branches in Michigan, aggregating 413.69 miles, had its inception first in January 1854, at Hartford, Ind., where a company known as Grand Rapids & Indiana Company No. 1 was formed with the idea of building a railroad from Louisville, Ky., to the Michigan pineries, but accomplished nothing more than locating a line from Hartford to the northern State line of Indiana, and also as far as Sturgis, Mich.

In May 1855 the Grand Rapids & Southern Railroad Company was organized in Michigan by the same interests to build a railroad from Grand Rapids to the Indiana State line, and consolidated with the first company in September 1855, forming Grand Rapids & Indiana Company No. 2. Upon this company the State of Michigan, by an act of 14 Feb. 1857, conferred the lands granted to the State by an Act of Congress 3 June 1856, to aid in the construction of a railroad from Grand Rapids to some point on Little Traverse Bay.

In June 1857 the Grand Rapids & Mackinaw Railroad Company and the Grand Rapids & Fort Wayne Railroad Company were created and consolidated, forming Grand Rapids & Indiana Company No. 3.

The first 13 years of the life of this enterprise is replete with failures to construct any portion of its line between Fort Wayne and Grand Rapids. With the aid derived from the bonds voted by the cities of Fort Wayne and Grand Rapids it finally completed in December 1867 the first 20 miles of road from Grand Rapids north to Cedar Springs. As early as 1860 and 1861 the company had made two mortgages, the first to secure $5,000,000 and the second $4,500,000.

On 30 Sept. 1869 a contract was entered into by the Pennsylvania Railroad Company, lessee of the Pittsburgh, Fort Wayne & Chicago Railway, the Continental Improvement Company, and the Grand Rapids & Indiana Railroad Company, for an issue of $8,000,000 seven per cent bonds, secured upon the lands and road, running 30 years from 1 Oct. 1869— $4,000,000 of which were guaranteed by the Pittsburgh, Fort Wayne & Chicago Railway Company, and $4,000,000 unguaranteed. With part of the proceeds of these bonds and the proceeds of $3,000,000 of debenture bonds, the Continental Improvement Company completed the road from Fort Wayne to Petoskey (Little Traverse Bay) in November 1873. The cost of road and equipment as per settlement contract was $10,848,250.

In June 1871 the Grand Rapids & Indiana Railroad Company took a lease for 99 years of the Cincinnati, Richmond & Fort Wayne Railroad, then building, and which was completed in December 1871, from Richmond, Ind., to Adams (five miles east of Fort Wayne), 86 miles, to be used as an outlet south of Fort Wayne for the traffic of the Grand Rapids & Indiana Railroad.

The Continental Improvement Company, under a contract with the Traverse City Railroad Company, dated December 1871, completed the Traverse City Railroad from Traverse City to Walton Junction, 26 miles, in December 1872, and this road was leased to the Grand Rapids & Indiana Railroad Company for 50 years from January 1883, rental being net earnings, which were guaranteed to equal annual interest on first mortgage bonds, $250,000.

In June 1881 the Grand Rapids, Indiana & Mackinaw Railroad Company was organized in the interest of the Grand Rapids & Indiana Railroad Company for the purpose of extending its road from Bay View to Mackinaw City. This portion of the line was open for operation in July 1882. This company was consolidated with Grand Rapids & Indiana Company (No. 3) in October 1884, under the name of Grand Rapids & Indiana Company (No. 4).

The Bay View, Little Traverse & Mackinaw Railroad Company, line from Bay View to Harbor Springs, Mich., six miles, completed its road in 1882; was sold under foreclosure proceedings in February 1888, and purchased at sale by the Grand Rapids & Indiana Railroad Company, which owned all its stock and bonds.

The Muskegon, Grand Rapids & Indiana Railroad Company was organized in the interest of the Grand Rapids & Indiana Railroad Company in February 1886. The road was completed from Muskegon to Grand Rapids, 37 miles, in December 1886, and leased to the Grand Rapids & Indiana Railroad Company for 99 years from time of its completion, June 1886, rental being net earnings, which were guaranteed by the lessee to be equal to the fixed charges (interest on $750,000 five per cent bonds), and 20 per cent of gross earnings of all business interchanged; but the excess of expenditure over earnings forced the sale under foreclosure 10 June 1896.

A new company was organized as the Grand Rapids & Indiana Railway Company, was incorporated in Indiana and Michigan in July 1896, and commenced operation of the road 1 Aug. 1896, with a capital stock of $6,000,000. Of this, $4,291,000 was exchanged for third mortgage 5 per cent bonds, and $1,500,700 for debts, and also provided for a second mortgage of $5,000,000 (2 per cent first year, 3 per cent two years, and 4 per cent thereafter), of which $3,062,000 were exchanged for second mortgage bonds and certain debts of the old company; the remainder held in treasury for necessary betterments to the property in its then depleted condition.

For the year ending 31 Dec. 1904 the total earnings were $3,302,346, and the operating expenses were $2,680,487, thus showing net earnings for the year of $621,859.

By economical management and wise expenditures for betterments and additions, the company was enabled to make a slight return in the shape of dividends to its shareholders, first in 1900, beginning with 1 per cent and now paying 3 per cent; but is confronted by such hostile legislation in Michigan, both in the reduction of its passenger fares and increased taxation, to such an extent that it is a serious question whether it can continue the small return to those who furnished the capital, so long in advance of its needs, to develop western Michigan and northern Indiana.

W. R. Shelby,
Vice-President G. R. & I. Ry. Co.

Grand Remonstrance, a document of protest against misgovernment, drawn up by the House of Commons on 22 Nov. 1641 and presented to Charles I. of England on 1 Dec. 1641. The causes leading up to this written protest were many, and its passage, by a majority of 11, by the House after a long, stormy debate, was undoubtedly hastened by the outbreak of rebellion in Ireland, and also the absence of the king, who at the time was in Scotland. The Puritan leaders had become disgusted with the intrigues carried on by the king with the Earl of Montrose, and in this document the grievances were set forth in such a manner that they were in fact an indictment of the whole governmental policy of the king. The imprisonment of members of Parliament without cause, the billeting of soldiers, the high-handed methods of the Star Chamber, High Commission, and the Council of the North, the excessive abuses of the commercial monopolies, and the unwarranted extension of the royal forests, as well as other minor grievances, in all 204 sections, were the points discussed in the manifesto. In it were also asked the appointment of new ministers, and that to a synod of learned divines be given the task of Church reform. King Charles ridiculed the document when it was presented for his consideration; on 10 December gave an indirect reply to the criticisms contained therein in shape of a proclamation on religion; on 23 December answered the petition in an extremely evasive manner; and on 3 Jan. 1642, before the House of Lords, impeached the leaders in the Commons who were most opposed to him, and who had been most instrumental in the passage of the document.

Grand River, a tributary of the Colorado River, which has its rise in the northwestern part of the State of Colorado, in the Rocky Mountains, and flows south by west into the State of Utah to latitude 40° 39', and then almost directly south to 35° 40', where it unites with the Green River (q.v.) to form the Colorado. Its length is almost 400 miles. Its chief tributaries are the Dolores and Gunnison. There are many deep cañons along its course through the mountains, and although much of the valley land is fertile, but few settlements have as yet been made.

Grand River, in the southern part of Iowa, has its source in the central part of Adair County and flows southeast through several counties in Iowa and Missouri, a distance of about 300 miles, into the Missouri River at Brunswick, Mo.

Grand, or **Hamilton River**, in Labrador, is the largest river in this section of British America which flows into the Atlantic Ocean. Part of its course is through a mountainous region, and it is the outlet of several lakes. The Canadian Geological Survey of 1894 gives the first reliable descriptions of this river and the adjacent country. See GRAND FALLS.

Grand River, in Michigan, has its rise in Jackson County, flows north and west in an irregular course for about one half its distance, then west by north to Lake Michigan. Its whole length is nearly 300 miles, although a direct line from its source to its mouth is only about 100 miles. It is navigable from Grand Haven, at its mouth, to Grand Rapids, a distance of 40 miles.

Grand Traverse Bay, an extension of Lake Michigan projecting into the State of Michigan, and named from Grand Traverse County, by which it is bounded on the south. The southern part of the bay is divided into two arms by Preogenise Point, the western arm being bounded by Leelenaw County and the eastern arm by Antrim County.

Grand Trianon, grän trē-ä-nôn, Versailles, France, a one-storied palace of considerable extent, formerly a private residence of the French sovereigns, and originally built for Madame de Maintenon by Louis XIV. The palace is visited for its historic interest; its numerous apartments retain much of the original furniture, and contain several fine modern works of art. It is called the Grand or Great Trianon to distinguish it from the Petit Trianon (q.v.).

Grandledge, Mich., city in Eaton County, on the Grand River and the Pere M. R.R.; 14 miles northwest of Lansing. The manufactures are flour, canned goods, sewer-pipe, furniture, and foundry products; and its trade is in its manufactured articles, and the products of the surrounding agricultural country. Pop. (1900) 2,161.

Grand Old Man, The, a name popularly applied to W. E. Gladstone (q.v.).

Grandpré, grän-prā, Canada, village in King's County, in the province of Nova Scotia; on the Minas Basin. Longfellow's poem, 'Evangeline,' has made famous this village and the country around. In 1613 the French settlers living here were driven from their homes by British soldiers. (See NOVA SCOTIA.) Consult Eaton, 'Acadian Legends and Lyrics.' •

Grandville, grän-vēl. See GERARD, JEAN I. I.

Granet, grä-nā', **François Marius**, French painter: b. Aix, in Provence, 1775; d. there 21 Nov. 1849. After studying under Constantin and David, in 1802 he went to Rome, spending much of his life there. He gained an enviable reputation as a painter of architectural subjects, though no small number of his works are historical. He was appointed custodian of the paintings in the Louvre in 1826, and upon his death bequeathed his fortune to his native city for the erection and maintenance of a museum there. The most famous of his works are: 'Interieur de l'église des Capuchins à Rome' (1819); 'Englise souterraine d'Assise' (1823); 'Le Tasse visitè dans sa prison par Montaigne'; and 'Prise d'habit au couvent de Saint-Claire à Rome.'

Grange. See GRANGERS.

Grangemouth, Scotland, city and seaport of southeast Stirlingshire, situated near the confluence of the Carron and Forth rivers, and about three miles northeast of Falkirk. Situated as it is, close to the Firth of Forth, and at the entrance of the Clyde Canal, it is one of the most important of Scottish ports, ranking third in value of imports and exports. The immense docks are 28 acres in extent, the timber basins cover 32 acres, and the total quayage amounts to about 2,300 yards. The principal industries are ship-building and coal-mining, while the manufacture of iron and steel, brick and tile is carried on to a considerable extent. The total value of imports in 1898 was about $13,000,000, an increase from $5,500,000 in 1888; the exports in 1888 were valued at $3,500,000, which in 1898 increased to $11,000,000. The main article exported was coal, and the imports consisted mostly of timber, pig-iron, and iron ore. The town has a building for its administrative purposes; there are also a public library, a public institute, and a large park. Pop. (1901) 7,968.

Granger, grān'jėr, **Francis**, American politician: b. Suffield, Conn., 1792; d. 1868. He was the son of Gideon Granger (q.v.). Graduated from Yale in 1811, he began the practice of law in 1814, was elected from Ontario County to the State legislature of New York in 1825, was re-elected in 1826, and was a delegate to the Harrisburg (Pa.) Protectionist convention. He was prominent in the anti-Masonic movement of the time. In 1834 he was a leading candidate of the newly organized Whigs for the nomination for governor, and in 1834 and 1838 was elected to Congress, and in 1841 became postmaster-general in President Harrison's cabinet. He sat again in Congress in 1841–2, led the stampede of the Whig convention at Syracuse in 1850, and in 1861 was a member of the Peace convention held at Washington.

Granger, Gideon, American politician: b. Suffield, Conn., 19 July 1767; d. 31 Dec. 1822. He was graduated at Yale College in 1787, and having been admitted to the bar, rose to eminence in his profession, and was elected a member of the legislature of his native State. He had an active part in establishing the Connecticut school fund, and in 1801 President Jefferson appointed him postmaster-general. He retained office during both of Jefferson's terms, and was reappointed by President Madison, whose policy he nevertheless opposed. He was consequently displaced in 1814, soon after Madison's second inauguration. He then removed to Canandaigua, N. Y., and was chosen a member of the senate of New York in 1819. He promoted internal improvements, and gave 1,000 acres to further the construction of the Erie canal.

Granger, Gordon, American soldier: b. New York 1821; d. Santa Fé, N. M., 10 Jan. 1876. He was graduated from the United States Military Academy in 1845, served with distinction in the Mexican war, during the Civil War was appointed, in 1862, to the command of the Army of Kentucky, with rank of major-general of volunteers, was prominent at Chickamauga, commanded a division at Fort Gaines (Ala.) (1864), and the Thirteenth Army corps in the capture of Fort Morgan. Brevetted major-general for the capture of these forts, he was mustered out of the volunteers in 1866; in that year was promoted to be colonel, and afterward was commander of the district of New Mexico.

Granger, James, English writer and print collector: b. Shaston, Dorset, in 1723; d. Shiplake, Oxfordshire, 4 April 1776. After graduating from Christ Church, Oxford, in 1743, he took holy orders and was assigned to the vicarage of Shiplake. After a long pastorate there he went on a tour through Holland, in 1773. He wrote: 'A Biographical History of England . . . with a preface showing the utility of a collection of engraved portraits, etc.' (1769). By 1824 his works had received enough additions to make six volumes. In 1806 the Rev. Mark Nohle edited another edition of his works, and since then several editions of his works, together with additions by other authors, have appeared. Two of his sermons were also published, entitled 'An Apology for the Brute Creation' (1772); and 'The Nature and Extent of Industry' (1775).

Granger, Robert Seaman, American soldier: b. Zanesville, Ohio, 24 May 1816; d. Washington, D. C., 25 April 1894. A graduate of the United States Military Academy, he served in the Seminole, Mexican, and Civil wars, and in the last named was brigadier-general of volunteers in 1862–5. During the Civil War he commanded the military district of northern Alabama, in 1864, in the same year defended Decatur against Hood, and in 1865, during the occupation commanded northern Alabama.

Granger Cases (said by Justice Field during the trial to be the popular term outside for the whole group; but only as being in the farmers' interest, not because the Patrons of Husbandry, or any of its lodges as such, had anything to do with them), six cases decided in the United States Supreme Court, October term, 1876, all bearing on the same point and decided on the same principles. They were Munn *v.* Illinois; Chicago, B. & Q. R.R. Co. *v.* Iowa; Peik *v.* Chicago & N. W. R.R. Co.; Chicago, M. & St. P. R.R. Co. *v.* Ackley; Winona & St. P. R.R. Co. *v.* Blake; and Stone *v.* Wisconsin. The first, whose decision ruled the others and was given at much the greatest length, was to test whether the act of the Illinois legislature, 25 April 1871, to regulate public warehouses and the inspection and handling of grain, was constitutional. The case was an extreme one: the act was passed for warehouses only in "cities of over 100,000 people" (Chicago), and was therefore a special discrimination; it laid a host of minute, costly, and laborious impositions on warehousemen and elevator owners, and obliged them to publish daily in the newspapers a table of the charges made the previous year, which must not be increased during the current year — therefore, of course, never, as each year was a canon for the next. The court decided that, according to immemorial common law, the government had a right to regulate the use of property for the public good, and to fix maximum charges for public services of those with whom the public has no choice but to deal. Such regulations were never supposed to deprive private owners of their property, but the devotion of property to a use in which the public has an interest subjects it *pro tanto* to public control. In other words, the public is a partner in public corporations. The forms of law may be changed at the will of the legislative body, so long as they only give new effect to old provisions. And warehouses exclusively within one State may be regulated by State legislation, even though their business involves interstate relations. Justice Field made a powerful dissenting argument, concurred in by Justice Strong, on the ground that the legislature had no right to meddle with private business, and it was simply giving that body the power to confiscate private property, contrary to the Constitution. The railroad cases were all against the power of the States under legislation to enforce maximum transportation rates. The decisions were the same in essence, but the court declined to pronounce that the roads would forfeit their charter if they disobeyed the law, which, nevertheless was not repugnant to the Constitution. The division of the court was the same; and Justice Field again stated the case for the companies. It was, that the charters of the roads were constitutional, and the right to reasonable compensation was the essential feature of the grant; that what was reasonable was a question for the judges and not the legislature to determine. Such regulation of fares as would take from a company the power to meet its just obligations was illegal, and only the courts could determine the facts; this, therefore, was taking away private property without process of law. Such an interpretation of the limits of legislative power over corporations places them at the mercy of every legislative majority. It makes all business public business, and practically destroys all the guaranties of the Constitution.

Grangers, the popular name for the Patrons of Husbandry, a secret association in the interests of agriculture. In 1866 the government sent O. H. Kelley (on the staff of the Department of Agriculture) to inspect and report on agricultural conditions in the South, and suggest means of improving them; he found them very wretched, and the farmers poor, backward, and disintegrated. Considering organization the first requisite for self-defense, and for securing improved methods and needed legislation, he, with six others, formed in December 1867 the National Grange (Farm) of Patrons of Industry. Only farmers could be members; but their women were admitted both to membership and office. The machinery was like that of other secret societies; the local bodies were called granges, and each State had its State grange. There were four «degrees» in local granges, one in State «Pomona,» and two in national («Flora» and «Ceres»). For the first four years the growth was slow; in 1872 it began to spread rapidly, in a year it had over 10,000 granges, and in 1875 its membership was 1,500,000, distributed through every State in the Union. By its rules the order was to have no part in political work, nominations, or discussions, and as an order it had none, but the members could not be expected to neglect the very object of its existence, and almost immediately they began work against railroad rates and discriminations, trusts, «futures,» oleomargarin, etc., besides forming the chief part of the great movement against hard money (see GREENBACK PARTY) — in all of which their organization, and the consequent bid for their support from political parties, aided them enormously. It is therefore not surprising that «granger» has become a typical adjective for all measures in the supposed interest of the western and southern farmers, or of which they form the chief support, the word having the sanction of the highest court (see GRANGER CASES). The Department of Agriculture as a Cabinet office, the act for founding experiment stations, and the Interstate Commerce Bureau are among the more legitimate fruits of the order; others are the subject of much difference of opinion. It has also done much to form co-operative societies, and attempted to make the grain-elevator system a portion of it. The political element, however, was discrediting the whole movement by its excesses and ill judgment, and finally took separate shape as the Farmers' Alliance and the Populist Party (qq.v.), leaving the diminished Patrons of Husbandry to a useful and growing social and industrial influence. Consult: 'American Annals of Political Science,' Vol. IV.; 'Popular Science Monthly,' Vol. XXXII.

Granite, an unstratified rock, normally consisting of three simple minerals, feldspar, quartz, and mica, or, in Dana's nomenclature, of orthoclase, quartz, and mica. For a long time the universally accepted view which is still the prevalent one, was that it is an «igneous» rock of a «plutonic» type. The difficulty has, however, to be encountered that it is not seen in process of formation on the earth's surface. This has been met by the hypothesis that it originates beneath the surface and under high pressure, produced in most cases by earth, but in some instances by a weight of incumbent water. Like surface volcanic rocks it has been fused and afterward cooled; but it does not, like them, comprehend tuffs and breccias, etc., but assumes a crystalline texture, destitute of pores, or cellular cavities to which gases entangled in lava or any such rock give rise. It is in favor of its igneous origin that it has in many places broken through ordinary sedimentary or metamorphic strata, sending veins through them in various directions. It rarely, however, overtops or caps them, as if coming up molten through a crater it had overflowed them above. Hence the term proposed for it — «underlying» — to distinguish it from the volcanic rocks, called «overlying» rocks. It is of all ages, some granite in the Alps having broken up the strata during Tertiary times. Granite encloses fluid cavities, having in them water, containing chlorides of potassium and sodium, with sulphates of potash, soda, and lime. Granite hills have a peculiar rounded form, with a scanty vegetation. They are easily distinguishable from the flat-topped precipice flanked basaltic hills. Von Buch considers that granitic mountains so much tend to be portions of a sphere, that he looks upon them as ellipsoidal bubbles, which were forced upward only in a partially fluid state; then, when the upper dome-shaped surface contracted, many granitic blocks were formed. Granite is of much economic value as a building stone. The production of granite in the United States in 1900 was valued at $12,675,617. The leading States in its production were Maine, Massachusetts, Vermont, and Delaware. See GEOLOGY; STONE.

Granite State, The, the popular name of New Hampshire. Fine building granite is quarried at many points, notably at Plymouth, Concord, Milford, Pelham, etc.

Grant, Sir Alexander, English educator: b. New York 13 Sept. 1826; d. Edinburgh 30 Nov. 1884. He went to India in 1859, and in 1862 became principal of the Elphinstone College, Madras, and in 1863 was made vice-chancellor of Bombay University. In 1868 he returned to Scotland to become principal of the University of Edinburgh, a position which he held till his death. He wrote: 'Story of the University of Edinburgh' (1883); and annotated and edited Aristotle's 'Ethics' and Xenophon.

Grant, Frederick Dent, American soldier: b. St. Louis, Mo., 30 May 1850. The eldest son of Gen. Ulysses S. Grant (q.v.), he was graduated from the United States Military Academy in 1871, was assigned to the 4th cavalry, was aide-de-camp to Sheridan in the latter's Indian campaigns, in 1874 served in the Black Hills expedition, and in 1881 resigned from the army with rank of colonel. Later in business at New York, he was minister to Austria in 1888–93, and a police commissioner of New York in 1897 during the Strong administration. At the outbreak of the Spanish-American war (1898) he became colonel of the 144th New York volunteers, was in the same year appointed brigadier-general of volunteers, served for a year in Porto Rico, and subsequently commanded the military district of San Juan. He was also stationed in the Philippines, and appointed brigadier-general in the regular service in 1901.

Grant, James Augustus, British soldier and explorer: b. Nairn, Scotland, 1827; d. there 11 Feb. 1892. He accompanied Capt. Speke in his search for the sources of the Nile (1860–3), when they explored the Victoria Nyanza and were rewarded by the discovery of the river issuing from the north of the lake. This expedition was described in a volume entitled 'A Walk Across Africa' (1874).

Grant, Robert, American author and judge: b. Boston, Mass., 24 Jan. 1852. He was graduated from Harvard in 1873 and the Harvard Law School in 1879, and has practised law in his native city since 1879. He was one of the water commissioners of Boston 1888–93, and in the latter year became a judge of probate and insolvency for Suffolk County, Mass. He has published: 'The Little Tin Gods on Wheels' (1879); 'Confessions of a Frivolous Girl' (1880); 'The Lambs,' verse (1882); 'An Average Man' (883); 'Face to Face' (1886); 'Jack Hall' (1887); 'Jack in the Bush' (1888); 'The Reflections of a Married Man' (1892); 'The Opinions of a Philosopher' (1893); 'The Art of Living' (1895); 'The Bachelor's Christmas' (1895); 'Search Light Letters' (1899); 'Unleavened Bread,' a novel which has been widely read (1900).

Grant, Ulysses Simpson, American general and 18th President of the United States: b. 27 April 1822, in a small two-room cabin situated in Point Pleasant, a village in southern Ohio, about 40 miles above Cincinnati; d. Mt. McGregor, N. Y., 23 July 1885. His father, Jesse R. Grant, was a powerful, alert, and resolute man, ready of speech and of fair education for the time. Ulysses Grant grew to be a sturdy, self-reliant boy. He loved horses, and became a remarkable rider and teamster at a very early age. At the age of 17 he was a fair scholar for his opportunities, and his ambitious father procured for him an appointment to the Military Academy at West Point.

His record at West Point was a good one in mathematics and fair in most of his studies. He graduated at about the middle of his class, which numbered 39. He asked to be assigned to cavalry duty, but was brevetted second lieutenant of the 4th infantry, and ordered to Jefferson Barracks, near St. Louis. Here he remained till the spring of 1844, when his regiment was ordered to a point on the southwestern frontier, near the present town of Natchitoches, La. Here he remained till May 1845, when the Mexican War opened, and for the next three years he served with his regiment in every battle except Buena Vista. He was twice promoted for gallant conduct, and demonstrated his great coolness, resource, and bravery under the hottest fire. He was regimental quartermaster much of the time, and might honorably have kept out of battle, but contrived to be in the forefront with his command.

He was regimental quartermaster at Fort Vancouver, near Portland, Oregon, for one year. In 1853 he was promoted to a captaincy and ordered to Fort Humboldt, near Eureka in California. In 1854, becoming disheartened by the never-ending vista of barrack life, and despairing of being able to have his wife and children with him, he sent in his resignation, to take effect 31 July 1854 and returned to St. Louis.

His father-in-law, Frederick Dent, who lived about 10 miles out of St. Louis, set aside some 60 or 80 acres of land for his use, and thereon he built with his own hands a log cabin, which he called "Hardscrabble." For nearly four years he lived the life of a farmer. He plowed, hoed, cleared the land, hauled wood and props to the mines, and endured all the hardships and privations of a small farmer.

In the spring of 1860, despairing of getting a foothold in St. Louis, he removed to Galena, Ill., where his father had established a leather store, a branch of his tannery in Covington, Ky. When Galena held a war meeting to raise a company, Capt. Grant, because of his military experience, was made president of the meeting, and afterward was offered the captaincy of the company, which he refused, saying: "I have been a captain in the regular army. I am fitted to command a regiment."

He wrote at once a patriotic letter to his father-in-law, wherein he said: "I foresee the doom of slavery." He accompanied the company to Springfield, where his military experience was needed. He mustered in several regiments, among them the 7th Congressional Regiment at Mattoon. He made such an impression on this regiment that they named their camp in his honor, and about the middle of June sent a delegation of officers to ask that he be made colonel. Col. Grant marched his men overland, being the first commander of the State to decline railway transportation. His efficiency soon appeared, and he was given the command of all the troops in and about Mexico, Mo. At this point he received a despatch from E. B. Washburne, congressman for his district, that President Lincoln had made him brigadier-general.

In February 1862, with an army of 20,000 men and accompanied by Commander Foote's flotilla, he took Fort Henry and marched on Fort Donelson. On the 16th of the same month he had invested Donelson and had beaten the enemy within their works. Gen. Simon Buckner, his old classmate and comrade, was in command. He wrote to Grant, asking for commissioners to agree upon terms. Grant replied: "No terms except an unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." Buckner surrendered, and Grant's sturdy words flamed over the land, making him "Unconditional Surrender Grant." On 6 April the Federals at Shiloh or Pittsburg Landing were attacked by a large Confederate force commanded by Gen. A. S. Johnston, and beaten back to the Tennessee with heavy loss. Grant, having reformed his lines and been reinforced by Buell, renewed the battle on the 7th, and the Confederates, who, Johnston having been killed, were commanded

ULYSSES SIMPSON GRANT,

EIGHTEENTH PRESIDENT OF THE UNITED STATES.

by Beauregard, were driven from the field. In January 1863 Grant began to assemble his troops to attack Vicksburg, but high water kept him inactive till the following April. Corinth was occupied on 30 May and on 3 July Pemberton at Vicksburg surrendered the largest body of troops ever captured on this continent up to that time, and Grant became the "man of destiny" of the army.

He was made commander of all the armies of the Mississippi, and proceeded to Chattanooga to rescue Rosecrans and his beleaguered army. In a series of swift and dramatic battles he captured Lookout Mountain and Missionary Ridge. The victory at Chattanooga opened the way for Sherman's march into Georgia, and practically closed the war so far as the West was concerned. In February 1864 Congress created and conferred upon Gen. Grant the rank of lieutenant-general, and the following month he assumed command of the armies of the United States, and immediately put himself in position against the army of northern Virginia commanded by Gen. Robert E. Lee. In the bloody campaign that followed (See WILDERNESS, THE BATTLE OF THE) slowly and inexorably Grant forced Lee and his army back upon Richmond. Petersburg fell on 2 April, and Richmond on 3 April; on 9 April 1865 Lee surrendered at Appomattox, and, Sherman having consummated his victorious march to the sea, the war was ended. Grant's terms with the captured general and the Southern army were so generous as to win the respect and admiration of the Southern people. Grant now returned to Washington. In 1866 he was promoted to the rank of general and every honor possible was bestowed upon him. In August 1867, Gen. Grant consented to fill the office of secretary of war *ad interim*, but, the Senate having refused to approve the suspension, January 1868 he surrendered the office to Mr. Stanton.

He was the chief citizen of the Republic at the close of the war, and when Lincoln was assassinated he was the mainstay of the Republic. He became inevitably a candidate for President, and was elected with great enthusiasm in 1868. In 1872 he was re-elected, and during his two terms his one great purpose was to reconstruct the nation. In 1878, two years after his second term had ended, he went on a trip around the world, visiting all the great courts and kings of the leading nations.

In 1880 he was defeated as candidate for nomination for a third term. Shortly after this he moved to New York, and became a nominal partner in the firm of Grant & Ward. His name was used in the business; he had little connection with it, for he was growing old and failing in health. In May 1884, through the rascality of his partner, Ferdinand Ward, the firm failed, and Gen. Grant lost every dollar he owned.

Now came the most heroic year of his life. Suffering almost ceaseless pain, with the death shadow on him, he sat down to write his autobiography for the benefit of his wife. He complained not at all, and allowed nothing to stand in the way of his work. He wrote on steadily, up to the very day of his death, long after the power of speech was gone, revising his proofs, correcting his judgments of commanders as new evidence arose, and in the end producing a book which was a marvel of simple sincerity and modesty of statement and of transparent clarity of style. It took rank at once as one of the great martial biographies of the world.

At his grave the North and South stood side by side in friendship, and the great captains of opposing armies walked shoulder to shoulder, bearing his body to its final rest on the bank of the Hudson River. The world knew his faults, his mistakes, and his weaknesses; but they were all forgotten in the memory of his great deeds as a warrior, and of his gentleness, modesty, candor, and purity as a man. Since then it becomes increasingly more evident that he is to take his place as one of three or four figures of the first class in our national history. He was a man of action, and his deeds were of the kind which mark epochs in history.

Grant University, a coeducational institution in Chattanooga, Tenn., with departments in Athens, Tenn., founded in 1867, under the auspices of the Methodist Episcopal Church; reported at the close of 1900: Professors and instructors, 65; students, 781; volumes in the library, 6,000.

Grants Pass, Ore., city, county-seat of Josephine County; on the Rogue River and on the Southern P. R.R.; in the southeastern part of the State, about 60 miles from the Pacific. It is the commercial centre of an agricultural, lumbering, and mining region; and its chief manufactures are lumber, flour, wood products, machinery for the farms, mines, and for lumbering, and bricks. It has large railroad repair shops. Pop. (1900) 2,290.

Granula'tion Tissue, the tissue formed in wounds to repair loss of substance. Through the clot in a fresh wound certain cells of the blood wander and begin to form new tissue. Blood vessels in tiny loops pass out from the sides of the wound. On the surface these loops form small rounded elevations, spoken of as "granulations." As the process goes on, the new tissue contracts, drawing in the sides of the wound; the skin grows out in delicate points from the margins of the cut. If the granulations pass beyond the surface-line because of irritation, they are spoken of as "superfluous" granulations or "proud flesh."

Gran'ville, Granville George Leveson-Gower, 2D EARL, English statesman: b. London 11 May 1815; d. there 31 March 1891. He was educated at Eton and Oxford; entered Parliament in 1836 for Morpeth, afterward for Lichfield, both in the Liberal interest. In 1855 he became president of the council, and ministerial leader of the House of Lords (1855-8). From 1859 to 1866 he was again president of the council, having previously failed to form a ministry under himself as premier. In 1868 he was colonial secretary under Gladstone, and in 1870 succeeded to the secretaryship for foreign affairs, which he held until 1874. During this period he negotiated the Treaty of 1870, guaranteeing the independence of Belgium, and "protested" against the Russian repudiation of the Black Sea clause of the Treaty of Paris. On the return of Gladstone to office in 1880 he was foreign secretary until 1885.

Granville, N. Y., village, in Washington County; on the Delaware & H. R.R.; about 37 miles northeast of Saratoga Springs and 57 miles northeast of Troy. The village is in an agricultural section, but nearby are valuable slate and building-stone quarries. The slate is used for mantels, roofing, and marbleized slating. The trade of the town is in stone and slate from the quarries, butter, cheese, hay, and vegetables. Population of the township of Granville, which includes several small villages, (1900), 5,217; of the village of Granville (1900), 2,700.

Granville, Ohio, a village in Licking County, on Raccoon Creek, and on the Toledo & O. C. R.R., about 25 miles northeast of Columbus. It has agricultural and manufacturing interests, but is chiefly noted for its educational institutions, which include Denison University (Baptist), and the Shepardson College for Women. Pop. (1900) 1,425.

Grape Culture. The grape is believed to be the oldest of our cultivated fruits. Although some 1,500 varieties of grapes are cultivated in Europe, they are practically all from a single species of the vine, known as the *Vitis vinifera.* It is supposed to have been indigenous to Asia, where it was widely planted by different peoples centuries before it was introduced into Europe. The Phœnicians have the credit of introducing the culture of the vine into Europe, first into the islands of the Grecian Archipelago and thence into Greece and Italy. The Romans carried vine culture, as a part of their civilization, wherever they settled. Thus, the vine had become well rooted in the south of France, in the neighborhood of Marseilles, at the beginning of the present era. Its culture during the next 200 years spread northward.

The native grapes of America are of entirely different types from the European kinds. The reason is that they come from different species of vines. So that in America, we cultivate two distinct types of grapes: (1) the native varieties, which are indigenous to the country; and (2) the vinifera, or European kinds, which have been transplanted here, and thrive out-doors only on the Pacific coast.

The vine and its cultivation engaged the attention of early colonists, who were encouraged by the authorities and by the lawmakers. The Virginia Assembly passed an act awarding premiums to successful grape growers. When the second charter was granted to Rhode Island by Charles II. in 1663 it contained an inducement to anyone who would plant a vineyard. Queen Christina in her instructions to John Printz, governor of New Sweden, urged that vine growing be encouraged, and she instructed the governor to give the matter his personal attention.

Many of the immigrants to the different colonies came from noted vineyard districts of the Old World. It was only natural that they should try to introduce here the cultivation of those European vines with which they were most familiar. Thus, most of the early attempts to establish vineyards for profit were by foreign, or foreign-born settlers. In 1792 or 1793 Pierre Legaux, a Frenchman, interested a number of Philadelphia gentlemen in his enterprise, and a company was incorporated for the purpose of planting vines. A vineyard was set out at Springmill, near Philadelphia, on the Schuylkill River. Foreign varieties of grapes were tried, but the experiment proved a failure.

About the same period (1790–3) a colony of Swiss grape growers from about Lake Geneva raised a fund of $10,000 and vineyards were planted in Jessamine County, Ky. Foreign varieties of grapes were tried, as had been done previously, but they all ran out and perished. Some years later, or about 1802, certain members of the Swiss colony removed to a place which they called New Switzerland (now Vevay, Indiana), on the Ohio River, 45 miles below Cincinnati. After failing with the best grapes imported from Switzerland, they tried a native variety called the "Cape," or the "Alexander" grape, and they then met with some success. This was largely due to the skill and experience of one member, John James Dufour, who joined the colony about 1805. He was an intelligent and observing vine-dresser, and afterward wrote a small treatise on grape culture and wine making — one of the first books on the subject published in this country. Dufour produced wine, which had a fair sale in the West, but by 1835 or 1840 the wines of Vevay were little heard of, and a few years later the vineyards had nearly disappeared.

Such, in brief, were the leading attempts to introduce the cultivation of European grapes into the Eastern States, beginning in 1620; not one lasting success is recorded.

However, in 1851 the European grape was being grown with success about the different missions. The popular variety was a kind now known as the "Mission grape," which is extensively cultivated in Southern California to this day. Other and better of almost all the leading varieties of European vines have been planted in that State, and their cultivation was a success from the beginning. Our native grapes grow there also, but they are not cultivated to any extent west of the Rocky Mountains. Therefore, grape culture, especially in California, constitutes a separate chapter in American viticulture.

The Cultivation of American Grapes.— After experience had shown that European varieties of grapes would not thrive, practical horticulturists began to turn their attention to the native vines found growing wild, or partially cultivated. They saw that success lay in that direction. But the trouble was to obtain a native grape of superior quality for the table and for wine.

In 1819 Maj. John Adlum noticed a vine growing in a garden at Georgetown, D. C. The grape struck him as having many excellent qualities. He first supposed it to be a European variety, but the grape was really a native of North Carolina, where it was discovered in 1802, and it took its name from the Catawba River. Maj. Adlum was enthusiastic in his estimate of the value of the Catawba grape. In a letter, written shortly before his death to the Hon. Nicholas Longworth of Cincinnati, Ohio, he says: "I have done my country a greater benefit in introducing this grape than I would have done if I had paid the national debt."

There is no doubt that the Catawba grape has played an important part in the grape and wine industry of the United States. This was largely due to the heroic efforts of Nicholas Longworth, who is called "the father of American grape culture." He spent 40 years or more of his life and $200,000 in establishing vineyards in the Ohio Valley, and his wine cellars at Cincinnati, Ohio. His persistent effort to make the industry a success is a fine example of American energy and enterprise. Longworth obtained thousands of vines from Bordeaux and Burgundy, from the Rhine district of Germany, from Madeira (6,000 vines), and from the Jura (7,000 vines) in hopes of finding grapes which would thrive in his Ohio vineyards. He also tried native grapes, but most of these were given up for the Catawba, which he first received from Maj. Adlum in 1825.

Not only as a pioneer, but as a leader in grape and wine growing, Longworth exercised great influence on the industry. Many able and practical men in Cincinnati became interested in grape culture and, in 1848, the Cincinnati Horticultural Society estimated that within 20 miles of the city more than 1,200 acres were planted in vineyards. During the next three or four years, some six or eight wine cellars were established at Cincinnati. Longworth had two. At his cellars dry and sweet wines were made, and "sparkling Catawba"— the latter produced by fermentation in the bottle after the method of French champagne. It was after a visit to Mr. Longworth that the poet Longfellow wrote his celebrated poem on 'Catawba Wine.'

In 1858, Erskine made a report to the British government on the extent and condition of viticulture in the United States. He gave the vineyard area of the several States, as follows: 3,000 acres in Ohio; 1,000 in Indiana; 500 in Kentucky; 500 each in Missouri and Illinois; 300 in South Carolina; 200 in North Carolina; 100 in Georgia — a total of 5,600 acres of vineyard in the United States. Even at this time grape culture in the Ohio Valley was on the decline. The vines there were being steadily destroyed by mildew and rot. By 1865, these vineyards, which promised so much pleasure and profit, and on which so much labor and money had been expended, were disappearing, and a few years later the grape and wine industry of the Ohio Valley became a thing of the past.

At that time the methods of successfully treating the two principal fungus diseases of the native vine — mildew and black rot — were not known to our viticulturists. Later on the discovery was made that black rot may be kept almost under control by a preparation of sulphate of copper, called the "Bordeaux mixture"— the cheapest and best fungicide ever introduced. As black rot prevailed from an early date in all the vineyards east of the Rocky Mountains, it was only after an efficient remedy was found that grape culture could become commercially profitable in the various eastern States. In California, on the other hand, the vineyards were rather free from fungus diseases, but there, as in France, the phylloxera began its ravages about in 1875, and has been the worst scourge of the vineyards on the Pacific coast since then.

The Growth of Grape Culture in the Eastern States.— About 1865 the grape-growing industry became rooted in the Hudson River Valley, the lake regions of central and western New York, and in northern Ohio, and on the islands in Lake Erie. New York, Ohio, and Missouri are the leading States in the order named. Then come Virginia, North Carolina, Indiana, Illinois, and Kansas. There are small vineyard districts comprising from 500 to 1,500 acres in Georgia, Florida, New Jersey, Michigan, Kansas, Tennessee, and many other States.

The grape industry of the Hudson River Valley was fairly established in the early sixties. Here, the Isabella grape was the leading variety. Like the Catawba, the Isabella is regarded as a native of North Carolina. About 1810 a vine was sent from the South to Col. George Gibbs, who planted it in his garden at Brooklyn, N. Y. A few years later, one of the successful pioneer viticulturists of this country, William Prince, of Long Island, N. Y., introduced this variety to growers, and he named it the "Isabella" in honor of Mrs. Isabella Gibbs. For a long time the Isabella was the standard grape in the New York vineyards, but of late years it has given place to other varieties.

Several varieties of grapes of good quality originated in the Hudson River district. Perhaps the most desirable kinds were the Iona, and the Eumelan. The former was originated by Dr. C. W. Grant, of Iona Island, N. Y. With the Delaware it is considered one of the finest flavored grapes of American origin. The Eumelan is more for wine making than for eating. The vineyards of the Hudson River district in 1890 comprised about 13,000 acres. Since then the industry has gone backward, and at the present time the vineyard area is estimated at from 8,000 to 9,000 acres. There are one or two wine cellars in this district, but about 80 or 90 per cent of the grapes raised along the Hudson River are sold for table purposes.

The Lake Keuka District.— Small plantings of vines were made at Hammondsport, N. Y., at the head of Lake Keuka, from 1850 to 1860. But it was not until after 1865 that the grape industry there began to assume some commercial importance. In 1890, when the statistics of viticulture were gathered for the first time in the United States, there were more than 12,000 acres of bearing vines in the Lake Keuka district, and the growers shipped 20,000 tons, or 40,000,000 pounds, of table grapes to market annually. In addition to that amount, some 5,000 tons of grapes were sold to the local wine cellars. The vineyard acreage in this section did not continue to increase so fast, and in 1903 there were in the district 15,000 acres of vines.

The vintage begins usually the first week in September, when the early varieties (such as the Concords and Delawares) ripen. It lasts until the middle of October, when the last of the Catawbas are gathered. The crop is picked in boxes, which hold from 35 to 40 pounds. The clusters of fruit are cut from the vines by grape shears. When the boxes are filled they are carried to the end of the rows, where they are gathered two or three times a day and taken to the packing-house. Here the grapes are sorted, and packed in 5- and 10-pound baskets. This work is done mostly by women and girls.

The bulk of the grape crop is shipped by fast freight to the large city markets — to New York, Boston, Philadelphia. Within the past few years new markets have been opened in the Far West, and now it is common to find New York State grapes for sale in Denver, Omaha, Kansas City, and even in Manitoba. The experiment was tried of shipping grapes to England, but while the fruit arrived there in fair condition, the cost and prices received did not warrant making further efforts.

The Lake Keuka grape growers now have a long range of season — that is, they can supply table grapes from early in September till the following March and April. The early varieties cannot be held very long, but the Catawba, for example, which ripens late, is a "good keeper." The grapes are stored in crates or trays in a cool building or cellar, and by proper ventilation and by maintaining an even temperature they can be kept fresh and fair till spring. Some years ago the only grapes in market in mid-winter were hothouse grapes, which cost from 50 cents to $1.50 a pound. Now these outdoor-grown grapes can readily be bought in January or February at 5 and 10 cents a pound.

The wine industry has also made striking progress in the Lake Keuka district. From the 2 or 3 cellars the number has increased to 12 at or near Hammondsport, N. Y. This section of New York State is often called "the American champagne district," as it produces about two thirds of all the champagne made in the United States.

There are two important areas of vineyards adjoining the Keuka district, namely, the Seneca Lake district of about 5,000 acres of vines in Seneca and Schuyler counties; the Canandaigua district of about 3,000 acres of vineyard bordering on Canandaigua Lake.

The Chautauqua Grape Belt.— This is the greatest single strip of vineyard in the United States. It stretches from the hills surrounding Chautauqua Lake in western New York, along the shore of Lake Erie for some 50 miles. There are about 25,000 acres of vineyard in this belt. The growth of grape culture in the Chautauqua district was remarkably rapid. The industry began about 1860. It grew and prospered, and in 1900 the Chautauqua grape belt contained about 25,000 acres of vines. The annual yield of this district is about 4,000 carloads of grapes. Each car holds from 2,300 to 2,500 baskets. In addition, probably one third, or more, of this amount is used to make wine. The making of unfermented grape juice has become quite a large and growing industry in the Chautauqua district.

The bulk of the crop (about 80 per cent) is handled by an association of growers. The grapes are graded according to their quality, and the returns from the shipments are "pooled." Each grower gets his pro rata share, after deducting expenses. About 85 per cent of the grapes grown in the Chautauqua belt are of the Concord variety.

The Northern Ohio Vineyards.— Soon after the decay of grape culture in the Ohio River Valley, about Cincinnati, the industry became established in northern Ohio along Lake Erie. Here, the Catawba grape, which was destroyed by fungus diseases in the former locality, survived and soon became the leading variety. There are large stretches of vineyards all along the Lake Erie shore from Ashtabula to Sandusky. There are also several islands in Lake Erie covered with vines; of which Kelley's Island and Middle Bass Island are the best known. The total area of these vineyards in northern Ohio is estimated at from 8,000 to 10,000 acres. From several towns in the northern tier of counties in Ohio, large quantities of table grapes are shipped, principally to western markets. The average crop from the Euclid or Cleveland district has been about 1,500 carloads. The yield about Sandusky and on the Lake Erie islands is mostly taken by the wine cellars.

Summary.— In the districts above described, the growing of grapes (both for the table and for wine making) is regarded as the chief industry. There are considerable vineyard areas in several of the southern and of the western States, and these may become important in the near future. New sections are being planted to vines from time to time; for example, of late years there has been quite an increase of vineyards in southern Michigan, and in the Ozark Mountain region of Arkansas and of southwestern Missouri.

Of American grape culture east of the Rocky Mountains two things may here be noted: First, although some 800 varieties are grown and flourish, yet the bulk of the crop in the leading districts consists of only two or three varieties, namely — the Concord, Catawba, and Delaware; secondly, two thirds of the grapes raised in the East are sold and used for table purposes, while only one third of the crop is made into wine. It is just the reverse in California, for there two thirds of the grape crop is turned into wine, the balance being used for raisins and the table. Therefore, not only in the fact that practically all of the grapes are foreign or European varieties, but in making wine the leading product of the vineyard crop in California is sharply defined from the industry east of the Rocky Mountains.

Grape Culture on the Pacific Coast.— Mention has already been made of the Spanish Fathers, who planted small patches of vineyards about their missions in southern California as early as 1770. The first plantings were at the mission of San Gabriel, and in the course of the next 75 years there were vineyards of from 5 to 25 acres extending from San Diego north as far as Sonoma County. The missions were abolished and their property confiscated in 1845.

The early settlers who began pouring into California in 1849 were more interested in gold than in grapes, and it was not until the year 1858 that a genuine and widespread interest in grape growing arose in the new State. During the next three or four years many vineyards were planted, and the industry began to attract considerable attention, so much so that, in 1861, Gov. Downey was authorized by the legislature to appoint three commissioners "to report upon the best means and ways to promote the improvement and culture of the grape vine in California." One of the commissioners appointed was Col. Agoston Haraszthy, who, by his writings and his efforts, was largely responsible for this renewed interest in grape culture. He went to Europe, visited the leading vineyard districts there, and secured 100,000 vines embracing 1,400 varieties. These vines and cuttings were distributed from time to time in small lots to growers in different parts of California, and they formed a basis for the viticultural industry in that State.

The first, or experimental, era of the young industry may be said to go from 1861 to 1871. During this period the most popular grape was the old "Mission." It was hardy, vigorous, and a good bearer. The "Mission" yielded a dry wine of rather inferior quality, which for some years prejudiced dealers and buyers against the Californian product. It will, however, produce a sweet wine, of the sherry type, of good quality.

After a while it was demonstrated that the fine wine grapes of Europe would succeed and flourish in different parts of California. And then French, German, and Italian vintners turned their attention to the vines they knew or had grown in the Old Country.

After 1871 grape growing in the State began to go backward, and this continued till 1879, when there came a "turn" in the industry. There was a short crop that year; the prices for grapes and wine went up, and soon there was renewed interest in viticulture. In response to a demand, a State Board of Viticulture was created in 1880. The board was composed of able and practical growers from the leading districts of the State, and their work resulted in a revival of the industry.

According to the census of 1890, there were then in California 155,272 acres of bearing vines; the output of wine that year amounted to 14,626,000 gallons. The wine crop reached its height in 1897, when it was 34,000 gallons. The dry and sweet wine production of California for 1902 is put at 28,000,000 gallons. The assessors' returns for the present year (1903) show a total area of vines in California of 230,675 acres, of which 118,209 acres are in wine grapes, and 89,792 acres in raisin grapes, and the balance table grapes. See Raisin Industry, American.

The shipping of California table grapes to the eastern markets now amounts to about 1,200 carloads. The California shippers of table grapes labor under the difficulty of long distance from their markets. They have fine, beautiful varieties of grapes, but many of them will not stand the journey to the eastern markets.

The leading varieties of California table grapes are: Flame Tokay, Emperor, Cornichon, Black Malvoisie, Rose of Peru, Muscats, Thompson's Seedless, the Chasselas varieties.

Practical Side of Grape Culture.— The practical part of vine-growing can not be learned from books, but is the result of hard work and years of experience. However, some of the more important features of vine cultivation may be mentioned. Of course, climate, location, and soil play an important part in the yield and in the quality of the fruit. From early times the vine was generally set out on the hills with southern or eastern exposure. It is another curious fact that the leading grape districts of Europe and of the United States are located near a body of water. It is so in the great Medoc district of France, situated between the rivers Garonne and Gironde, and in Germany along the river Rhine. In the eastern States we have the leading districts along the Hudson River, on the banks of Lake Keuka in central New York, and along the shores of Lake Erie in northern Ohio. Such large bodies of water keep the vines from late spring or early fall frosts, and from heavy dews and fogs.

Propagation.— The propagation of the vine may be accomplished by seeds, cuttings, layers, and grafts. The wild grape grows from, and multiplies by, the seed only. It reproduces itself, and its seedlings differ seldom from the parent vine. But, if we take the seed of the cultivated vine, the seedlings show a wide variation, and that is seldom wanted, unless as an experiment to obtain new varieties. The usual method of vine propagation is by cuttings, which are made in the winter from the trimming of the vines. The cuttings are planted early in the spring, after the ground is thoroughly well prepared. It is usual to let the plants grow one or two years. The methods of transplanting these vines are various, due to the nature of the vines and to the methods followed in the various districts. Thus, in California rooted vines of one year are preferred; in the eastern States growers prefer two-year-old transplanted vines.

Grafting.— The grafting of the vine, as with other woody plants, is quite easy, although it may be done in a number of ways. The time to graft is early in the spring before the sap starts. Fully a dozen methods have been named and described. The two kinds in most common use are the ordinary cleft or shoulder-graft, and the English or whip-graft. An ordinary graft is simply done by cutting the vine off three or four inches below the surface of the ground, then split with a grafting chisel, and held open with a wedge until the scion is fitted exactly into place. The cleft may be tied with a string, or covered with clay or grafting wax, and then the earth is heaped about the graft, leaving one bud of the scion above the surface. Grafting is of great importance to every vine grower in Europe and in California. For it is by grafting European vines on American stock that they can be protected from that dread scourge, phylloxera.

Pruning and Training.— The value of removing a portion of the vine, and other woody plants, was recognized at a very early date. Most of our native grapes are more vigorous growers and show a greater tendency to climb and spread than do the European vines. Pruning relates to the removal of such parts of the vine as ensures better fruit and larger yield. The general principles of pruning are practically the same for all vines, and these principles as given by Prof. L. H. Bailey are: (1) Fruit is borne on wood of the present season, which arises from wood of the previous season; (2) a vine should bear only a limited number of clusters, and (3) the bearing wood should be kept near the original trunk or head of the vine. Thus, the wood is constantly renewed, and new shoots which give wood, or canes, for the following year, are called "renewals."

Training relates to the form and disposition of the different parts of the vine. It is not necessary to describe the different methods of training. Each large vineyard district has its own system.

Brief mention may be made of the three well-known ways of training the native vine outside of California: (1) The so-called "Kniffin system" first obtained in the Hudson River district. The vine is allowed to grow at will the first season after planting; the second year it is cut back two or three buds from the ground, and from the stub only one shoot is allowed to grow. This is tied to a stake, at intervals, as it grows, to keep it straight to the height of the trellis. In the third year posts are set about 16 feet apart between every two vines. Two wires are then stretched along the posts, the upper wire about five and a half feet above the ground, and the lower one about half way between the upper wire and the ground. The vine is now tied to each wire, and cut off even with the upper one. The next year all the buds on the vine are rubbed off, except four — two for each wire. The two arms on the top wire are often bent down to the second wire, thus forming a droop, and the system is known as the "drooping system" of training.

(2) The Chautauqua system of vine training, as it may be called, is largely used in the vineyards of that district. In the first year the vine is cut back to three or four buds. The second year it is cut back to five or six buds, and three of the strongest shoots are left to grow the fruit-bearing arms for the third year. The trellis consists of three wires. Each year three or four of the strongest new canes are trained upon the trellis spread out in a fan shape.

(3) The Munson system of vine training is named after T. V. Munson, of Texas, a prominent viticulturist and is adapted to the native vines of the southern States. The trellis used is little different from that of the other systems. Thus, the posts are set about 24 feet apart, and carry two lines of wire. The vine is pruned back in the first year, and the next year the two arms may be allowed to bear a few clusters, if the vine is strong. The "bearing arms" are then cut back to 1 or 2 eyes each; the other arms to 8 or 10 eyes. These arms bear the next year, and are pruned for the third year quite short, while the bearing arms for the next year are pruned long. By this system of training there is a shifting of the bearing canes from one side of the vine to the other; all of which, it is claimed, gives vigor to the vine and a good distribution of the fruit.

Diseases of the Vine.— These are caused by animal and vegetable parasites. Of the former the worst and best known is the phylloxera. An American entomologist, the late Prof. C. V. Riley, discovered that some of our native American vines, were infested by phylloxera, but they successfully resisted its attacks. He therefore recommended to the French and other growers of European grapes, that they graft their vines on American stocks. This proved to be the solution of the problem, and practically all of the millions of vines planted in France during the past 25 years, are on "resistant stocks," or American species of vines. It is the same in California, where the vineyards destroyed by phylloxera, have been and are being replaced by vines grafted on American stocks. The main thing now is to get the right "resistant vines" for different soils and different climates. The other insect pests are the grape leaf-hopper, the root-worm, the flea-beetle, thrips, rose-bug, etc.

The leaf- or vine-hopper often does considerable damages in the vineyards of the East as well as in California. The best remedy so far recommended is a solution of whale-oil soap applied in a spray. The root-worm is at present working in the vineyards of Chautauqua and in northern Ohio. Two or three sprayings of arsenate of lead during the season is recommended, but thorough cultivation is regarded as the best check to the root-worm. See INSECTICIDES.

The leading vegetable diseases of the vine are mildew, black rot, oidium, anthracnose, anaheim, etc. The effects of mildew are seen on the leaves, stem, and the fruit. This disease is indigenous in this country, and first appeared in 1878 in Europe, where it spread over the vineyard districts, France, Germany, Italy, and Spain, doing great damage.

Black rot was also introduced into Europe from the United States, but there it was not as serious as with us. The rot first affects the leaves and then passes to the fruit. The condition most favorable for the spread of both mildew and black rot is warm, moist weather. See FUNGI and FUNGICIDES.

The Evolution of American Grapes.—It should be noted, in conclusion, that the development of American grape culture has been a process of evolution with a survival of the fittest. Thus, the improvement in the quality of our native grapes has been something remarkable. It represents the difference between the wild grape — coarse, harsh, and often disagreeable in taste and smell — and the cultivated grape — tender, luscious, and sweet and delicate in flavor.

The botanists have described and put American grape vines into some 12 or 13 groups or classes. Only 4 American species of vines have been cultivated and developed to any extent, as follows: (1) *Vitis Labrusca;* (2) *V. Estivalis;* (3) *V. Riparia;* (4) *V. Rupestris.*

The *V. Labrusca* is generally known as the "fox grape," and is a native of the Atlantic slope from New England to South Carolina. The largest number of varieties of grapes in all the Eastern States now cultivated spring from this species, which includes the Concord, the Catawba, etc.

The *V. Estivalis* is the "summer grape" of the Middle and Southern States. Several varieties (such as the Lenoir or Jacquez, Herbemont, Cunningham, etc.) have been much used in France and in California as a grafting stock.

The *V. Riparia* is the grape vine of the river banks, and is found growing wild from Canada to the lower Mississippi Valley. This species is very highly regarded in France and California as a stock on which vinifera vines have been grafted with success.

The *V. Rupestris* is native of the country west of the Mississippi River from Missouri to Texas. The varieties of this species have not been much cultivated, but are used, almost exclusively, as resistant stocks in France and in California.

Thus far, the efforts of our horticulturists to develop and improve many new varieties of American grapes has been confined to a few species. In 1830 William Prince enumerated but 88 varieties of native grapes; to-day there are more than 800 kinds. Already they have accomplished splendid results by cultivation, and by hybridizing our vines with the best foreign kinds. We may look in the near future for the production of many choice grapes which will combine all the vigor, beauty of foliage, and resistance to disease of the Labrusca and other American families with the delicate and fine qualities of the vinifera, or European varieties.

Bibliography.— The most complete books on grape culture have been written by the French experts, but their writings do not apply to American grape culture. Among the best books on the subject in French we may name the following: Guyot's 'Etude des Vignobles de France,' 3 vols., Paris 1876; Foex's 'Cours complet Viticulture,' Paris 1875, and Coste-Floret's 'Les Travaux du Vignoble,' Paris 1898. The leading journal is the 'Revue de Viticulture,' published at Paris.

Books on American or Easterr Grape Culture: Fuller, 'Grape Culturist,' New York 1866; Mead, 'Treatise on American Grape Culture,' New York 1867; Husmann, 'American Grape-Growing and Wine-Making,' New York 1896. The most complete account of our native wines is found in the 'Descriptive Catalogue of American Grape Vines,' by Bush & Son & Meissner, 4th ed. St. Louis 1895. Consult also: Prof. L. H. Bailey, 'Evolution of Our Native Fruits'; the reports and bulletins of the United States Department of Agriculture.

Books on California Grape Culture: Husmann, 'Grape Culture and Wine-Making in California,' San Francisco 1880; E. J. Wickson, 'California Fruits'; Hyatt, 'Grape Culture and Handbook for California'; Wait, 'Wines and Vines of California,' San Francisco 1889; also the reports of the Board of State Viticultural Commissioners of California, 1881-1893. See VITICULTURE; WINE-MAKING.

LEE J. VANCE,
Editor 'American Wine Press,' New York.

Grape Ferns. See FERNS AND FERN ALLIES, *Ophioglossales.*

Grape, or Globe, Hyacinth. See HYACINTH.

Grape Insect-pests. More than 200 species of insects have been observed preying on the grape-vine in America. The principal pest is the phylloxera (*Ph. vastatrix*), which first attracted attention by its ravages in the vineyards of France about 1865. It now occurs in vine-growing countries all over the world, and is the worst of the very few insect-pests that have emigrated from America. It caused the destruction of 2,500,000 acres of vineyards in the United States in 1884. The phylloxera is a minute brownish plant-louse of the aphid family. (See APHIS.) The winged females appear in Europe from August to October. Each lays about four parthenogenetic ova on the under surface of the vine-leaves. These ova develop in late autumn into males and females — wingless and without the characteristic piercing and sucking mouth-organs — which migrate to the stem of the vine. There each female lays a single egg under the bark. This egg lies dormant throughout the winter, and develops in April or May into a wingless but voracious "vine-louse." This form may pass to the leaves, on which it lays parthenogenetic eggs, and forms galls; but in Europe it attacks the roots, and lays its eggs there. From these in about 8 days young develop, which become mature females in about 20 days, and lay more eggs in the roots. Half a dozen or more of these parthenogenetic generations follow in rapid succession throughout the summer. The roots become knotted and deformed; the whole plant suffers, and, though it may survive for several seasons, eventually dies. In midsummer, among the subterranean forms, a generation is born whose members, after four, instead of the usual three, moltings associated with adolescence, become the larger winged females with which we commenced.

The destruction of this scourge of the grape-vine, without also injuring or destroying the plants, has proved exceedingly difficult when attempted upon a large scale, where the expense prevents the use of chemicals or methods effective in a small garden. Water, wherever it can be applied to the soil so as to saturate and keep it saturated for a time, has proved a safe and effectual destroyer, because the insect cannot live in a medium saturated with water for long. Chemical remedies, such as bisulphide of carbon, have succeeded, when injected into the soil about the roots. In some of the French vineyards grafting the cultivated vines on certain of the native vines of America has been tried with some success. Although the insect seems to feed on the roots of these vines, the greater vigor of the American stocks appears to enable them to resist the injuries inflicted on them.

An important vine-pest in certain parts of the United States is the grape root-worm (*Fidia viticida*). Injury is chiefly due to the work of the larvæ or "root-worms," but the beetles also injure the plants by gnawing many holes in their surfaces. The larvæ may be destroyed with bisulphid of carbon injections in the soil about the roots; or better by saturating the soil with kerosene emulsion, 10 times diluted, and systematic spraying. One of the most troublesome enemies of the vine is the rosechafer (*Macrodactylus subspinosus*), which is best kept in subjection by planting trap-crops of plants bearing white flowers which blossom at an earlier date than the grape, such as white rose, blackberry, spiræa, and deutzia. The grape-vine flea-beetle (*Haltica chalybea*) does considerable damage at times to grape leaves, but can readily be destroyed with an arsenical spray, and may also be caught in the same manner as the plum curculio, by jarring the insects on to collecting frames saturated with kerosene. Nearly everywhere leaves will be seen drawn together and slowly assuming a brownish hue, and when these are opened a small caterpillar will be found actively wriggling about. This is the grape leaf-folder (*Desmia funeralis*). When vines are sprayed for leaf-feeding insects some of these leaf-folders will be destroyed, but picking and burning the affected leaves is more effective, taking care that the larvæ do not escape to the earth during the process. Leaf-hoppers do much injury in some localities, particularly on the Pacific coast, and several other important enemies of the grape are known, including cutworms, which climb and defoliate vines at night, the grape-berry moth, which destroys the berry, and the grape curculio, which has the same habit. Consult: Cornu, 'Etudes sur le Phylloxera vastatrix' (1879); Lichtenstein, 'Histoire du Phylloxera' (1878); Riley, 'Sixth Annual Report of the State Entomologist of Missouri' (1874); Saunders, 'Insects Injurious to Fruits' (1883); Marlatt, 'Farmers' Bulletin, No. 70,' issued by the United States Department of Agriculture; Bruner, 'Report of the Nebraska State Horticultural Society' for 1895, which gives an extensive bibliography; Riley, 'Third Report State Entomologist of Missouri' (1871).

Grape-shot is a combination of small cannon balls put into a thick canvas bag, and corded strongly together, or fixed in a cylindrical frame, the diameter of which is equal to that of the ball adapted to the cannon. The number of shot in grape varies according to the service or size of the guns, usually, however, a round of grape-shot consists of nine balls in tiers of three.

Grape-sugar. See GLUCOSE.

Grapefruit, Pomelo, Pomelos, Pumelo, Shaddock, Forbidden Fruit, Fruit of Paradise, a tree (*Citrus Decumana*) of the natural order *Rutaceæ,* native of southeastern Asia, from whence it has been introduced in many warm countries. It is widely cultivated in the West Indies, California and somewhat in southern Florida. The lemon-colored fruit, which is as large as a large orange, is highly prized for its usually pale yellow or greenish-white subacid lemon-like pulp. Propagation and cultivation are practically the same as for the lemon and orange (qq.v.).

Graphic Method, a pictorial method of representing forces, motions, etc., by lines. Similarly, any other physical quantity, such as temperature, atmospheric pressure, or barometric height, electric potential, etc., may be represented by straight lines. Graphic methods are largely employed in physical investigations as aids to calculation, and for the purpose of exhibiting the nature of the law according to which some phenomena vary. The principal use of this method is to show the mutual variations of two quantities. This we will illustrate by a particular example. Suppose a table is drawn up, in one column of which are the months of the year, and in the other the corresponding average temperatures of the air, at some particular place, during these months (the average temperature for each month being the mean of the daily temperatures). Let two lines, OX and OY, be drawn from O, one horizontally, the other vertically; let the successive months of the year be represented on any convenient scale along OX, and let temperature be measured along OY, also on a convenient scale. Corresponding to each month in the year there will be a length along OX, and to each temperature there will correspond a point on OY. At the middle point corresponding to each month draw perpendicular to OX a line representing the temperature on the scale of OY. A series of lines will thus be obtained, through the upper ends of which there may be drawn, freehand, a smooth curve. The points on the curve in the figure represent the upper ends of these lines. A general glance at such a curve will reveal certain features regarding the temperature of the whole year; at what dates maxima and minima occurred; when the temperature rose or fell quickest, and so on.

Graphite. Graphite is manufactured in large quantities at Niagara Falls from the ordinary forms of amorphous carbon, large quantities of anthracite coal being converted into this product. The present artificial production of graphite amounts to no less than 1,250 tons per annum. The art of converting the various forms of amorphous carbon into graphite was discovered and developed by Mr. E. G. Acheson, to whom the art of producing carborundum is also due.

E. G. Acheson.

Graph'ophone. An apparatus similar in principle to the Edison phonograph (q.v.), and designed to reproduce human speech and other sounds. It was invented conjointly by Messrs. C. A. Bell and Charles S. Tainter, and differs from the phonograph merely in its mechanical details of construction, and in the employment of a wax-coated cylinder of pasteboard instead of a solid wax cylinder.

Graph'otype, a process of engraving discovered in 1860 by De Witt Clinton Hitchcock, by which the valuable improvement is effected of enabling the artist to be his own engraver. The discovery is utilized in the following manner: French chalk is by a careful process ground to the finest powder, which is repeatedly passed through a wire-cloth with 10,000 holes to the square inch. It is then laid between a smooth plate of zinc and a smooth plate of steel, and submitted to intense hydraulic pressure, after which it is sized to prepare it for the artist. The pencils used by the artist are of sable-hair, and the ink is composed of lamp-black and glue. The drawing, when finished, is gently rubbed with silk velvet or fitch-hair brushes until the chalk between the ink lines is entirely removed to the depth of one eighth inch. The block is then hardened by steeping it in an alkaline silicate, by which the whole of the chalk is converted into stone. Molds are then taken of it, from which stereotype plates are cast for printing. See Zincotype.

Graptolites, grăp'tō-līts, a name given to fossils, characteristic of the Upper Cambrian, Ordovician, and Silurian strata, now regarded as belonging to the Cœlenterata, and to that class under which the sea-firs (*Sertularia*, etc.) are arranged. They consist of a rod or axis, which appears solid, but may have been hollow during life, and of cells disposed on both sides of this rod. These cells open one above another in the same vertical plane, while, by the other end, they open into a cavity which is common to all the cells on one side of the axis, this common cavity being characteristic of the Hydrozoa. These fossils seem to have been of horny consistence during life, for they are, with few exceptions, found flattened on the surface of shales and never calcareous. They live rooted in the mud; not attached to any object, but simply anchored by their base, like the living sea-pens.

Gras, Felix, fā-lěks, Provençal writer: b. Malemont, near Avignon, 3 May 1844; d. Avignon 4 March 1901. His education ceased at 17, when he returned to his father's farm, from which he was sent, in 1864, to Avignon and articled to Jules Giéia, a man of letters as well as a lawyer, and a member of Félibrige, a Provençal literary club of which Frederic Mistral (q.v.) was a member. Amid such surroundings he accepted law as his profession but resolved on literature as his vocation. In 1876 he published his first important work, an epic poem in 12 cantos, 'Li Carbounié,' which won for him the first place among Provençal writers of the younger generation. 'Toloza,' an epic recounting the crusade of Simon de Montfort against the Albigenses, followed in 1882. He proved himself second only to Mistral among Meridionals by a collection of his shorter poems to which he gave the title 'Lou Roumanceers Prouvençal' (1887). In his collections of prose stories, 'La Papalmo' (1891), he fancifully describes, in vivid, racy style, the loves and hates, sensuality and "superstition" of the papal court at Avignon. His greatest popular success, 'Li Rouge dóu Miejour' (1896), was published in a translation, 'The Reds of the Midi,' before it saw the light in France, where it is not so popular as among those who read it in the English version alone. A more recent work, which has been translated in the United States under the title 'The White Terror,' describes the retaliatory violence of the Royalists in the south, when the storm of the Revolution had swept by. For 10 years previous to his death he had been Capoulié, or president of the Félibrige.

Grasmere, grăs'mēr, England, village, in Westmoreland County; on the lake of the same name. It has been made famous by the "Lake School of Poets," Wordsworth, Southey, and Coleridge. Many places in Grasmere and the surrounding lake country have been mentioned in the poems of the authors who frequented this section, especially by Wordsworth. The graves of Wordsworth and Hartley Coleridge are in Grasmere.

Grass. See GRASSES IN THE UNITED STATES.

Grass, Straw, or Pampas Cat, a wildcat (*Felis pajeros*) of southern South America, common on the grassy plains. It is described by Hudson ('A Naturalist in La Plata,' 1892) as not unlike the European wildcat in its robust form and dark color, "but a longer, more powerful animal, inexpressibly savage in disposition."

Grass-bass, the calico-bass (q.v.).

Grass, China. See RAMIE.

Grass-finch. See VESPER SPARROW.

Grass-pink, or Calopogon, a showy orchid (*Limodorum tuberosum*), with a small bulbous root, large ovate leaves, sheathed at the base, and flowers growing in a loose spike upon a slender stem 12 to 18 inches high; they are butterfly-shaped, fragrant and magenta pink; and the lip, which is exquisitely bearded with gay colors, remains on the upper side of the flower, giving the blossom an upside-down appearance. It is common in boggy places from Florida to Newfoundland. Several other species of the genus occur in the South, one of which (*L. multiflorum*) bears many more flowers than does the grass-pink.

Grass-snake. In the United States a greenish unstriped variety of the garter-snake (q.v.). In Great Britain the European water-snake (*Tropidonotus natrix*), which closely resembles our American water-snake (q.v.), but is rather more terrestrial and even arboreal in its habits. It is the only serpent in England except the viper, and does not occur in Ireland or Scotland, but is common all over southern and central Europe, in Algeria, Asia Minor, and eastward to India.

Grass-snipe, a gunner's name for the jack-snipe (q.v.), and some other shore-birds of similar habits.

Grass-tree, the popular name for certain tree-like Australian sedges (*Juncaceæ*). Their large stems are crowned by thick tufts of narrow, pendulous foliage which in turn display cylindrical flower-spikes like exaggerated cattails. The plant contains an aromatic resin (Botany-bay gum or gum acaroides) employed in pharmacy, and also used by the natives for a variety of purposes, such as calking canoes, and as a cement or glue. These plants are also called 'black-boys' from the appearance of the stems when charred by fire, and from the fact that the black-skinned natives often use them as a means of concealment, or even imitate the appearance of a charred stem by crouching into a similar attitude, and so escape the eyes of enemies.

Grass Valley, Cal., city, in Nevada County; on the Nevada County Narrow Gauge R.R.; about 3 miles northeast of Marysville. It was one of the first settlements made after gold had been discovered in the State. It is in a rich gold quartz mining region, and the chief occupations are connected with mining. It has granite and marble works, a distillery, and large wineries. Pop. 4,825.

Grass Worm, the caterpillar of a noctuid moth (*Laphygma frugiperda*), which often does great damage to grasses and cereals in the Southern States, and to a great variety of crop plants, as in 1899, when a serious outbreak of this species extended from Mexico to Chicago. In the North it is known as the fall army-worm, from the fact that it appears and travels in greatest numbers in the autumn, devouring nearly every form of vegetation encountered in its line of march.

Grass-wrack, a maritime grass. See EEL-GRASS.

Grasse, François Joseph Paul, frăṅ swä zhō-zĕf pōl gräs, COUNT DE, French admiral: b. Valettes, Provence, 1723; d. Paris 11 Jan. 1788. He first entered the navy of the Knights of Malta, and served against the Turks; in 1749 entered the French navy, became captain in 1762, and rear admiral in 1778, and was appointed to command a squadron sent to the West Indies. In 1781 he was given the rank of admiral and sent with a fleet to coöperate with the land forces in the American colonies. He first assisted at the taking of Tobago, in the West Indies, then sailed to the mouth of the Chesapeake, where he repulsed the attack of the British fleet under the command of Graves, prevented aid from reaching Cornwallis at Yorktown, and cut off his retreat, thus materially assisting the decisive American victory there; for these services he received the thanks of Congress. He then went to the West Indies, where for a time he was successful against the British, capturing the island of St. Christopher; but on 12 April 1782 was surprised by the English fleet under Rodney, and after a hard fight defeated, and taken prisoner. He was accused of carelessness and even treachery, but was exonerated by an official investigation, and at the time of his death held the rank of lieutenant-general of the naval forces of France.

Grasserie, a disease of silkworms (q.v.).

Grasses in the United States. The term "grass" is popularly applied to the green herbage on which cattle and other beasts feed, and thus includes many plants which are not botanically related to the true grasses, such as the clovers, alfalfa, sanfoin, vetches, spurry, etc., frequently referred to as "artificial grasses," while it excludes some of the most important of the true grasses, namely, the cereals. The true grasses constitute the botanical family *Gramineæ*. They are distinguished from related groups of plants in that the leaves are arranged in two opposite rows on the stem, with a single leaf at each joint. The stems (culms) are usually hollow except at the joints, and the base of the leaf forms a sheath which surrounds the stem above the joints. The sheath is usually extended a short distance above the base of the blade of the leaf, in a delicate, whitish structure closely surrounding the stem, called the ligule, the office of which seems to be to prevent rain-water from percolating between the sheath and the stem. The grass flower usually consists of the following parts: flowering glume, palet, lodicule, one to six stamens (usually three), and a one-celled ovary usually with two styles tipped with plumose stigmas. The flowers are usually arranged in two rows on opposite sides of the rachilla, constituting a spikelet. At the base of the spikelet are usually two empty glumes. The empty glumes, flowering glumes, and palet constitute the "chaff." The spikelet may contain one to many flowers. The lodicule, which stands in front of the flowering glume, is very small, usually not noticeable except on close examination. At flowering time, the lodicule becomes greatly swollen, and by this means spreads the flower open. In spikelets that contain several flowers, the palet, or inner chaff, rests with its back against the rachilla, and is concave on the back, with a nerve or keel on either side. The edges of the palet are overlapped by the edges of the flowering glume, or outer chaff. The spikelets are arranged either in spikes, as in wheat, or in panicles, as in oats. Popularly, these are referred to as the "seed-head," and this term will be frequently used in this sense in this article. The fruit of the grasses is a seed-like grain, either adherent to the chaff, as in barley, or free from it, as in wheat.

This is one of the largest and most widely disseminated families of plants, and by far the most important to mankind. It includes the cereals, wheat, oats, barley, rye, rice, millets, and corn, sugarcane, sorghum, the cane of the southern canebrakes and the bamboo of the Old World, in addition to the common grasses of the fields and prairies. It furnishes the principal food of both man and beast, and some of the most beautiful ornamental plants (reed, Ravenna grass, plume-grass, ribbon-grass, etc.). The grasses are the foundation of agriculture. Their principal development is in the temperate zones, though grasses are found wherever vegetation flourishes. Singularly enough, the most important grasses, the cereal grains, are not known in the wild state, and their cultivation extends so far back into antiquity that even their places of origin are unknown. Either their wild counterparts have become extinct, or the cereals have been so changed by cultivation that their wild forms are no longer recognizable. There are in all about 4,000 distinct species of grasses known. The species of only two natural orders of flowering plants exceed this number, namely, the *Compositæ* and the *Leguminosæ,* though in the number of individual plants the grasses far surpass all others. The total number of grass species growing in the United States is about 1,400; in the limits of the State of Washington about 275 species are found. Originally, nearly half the area of this country consisted of prairies, the principal herbage of which was grasses. The existence of these vast stretches of grass-land has never been fully accounted for. It is not due simply to climatic and soil conditions, for many species of trees readily grow on the prairies when placed there by man. In recent years, vast areas that were formerly occupied by grasses have been invaded by various shrubs and trees, particularly the mesquite tree of the Southwest. This has occurred simultaneously with the destruction of the grasses by stock, indicating that the presence of the grasses is inimical to forest growth. It is well known that grasses thrive best on the more compact soils. On such soils, the abundant growth of grass, with the fires that have swept over these regions in dry seasons from time immemorial, has kept in check those classes of vegetation which could not quickly recuperate after the destruction by fire of their aërial portions. On the coarser types of soil, the sparse growth of grass, and the consequent lack of fuel to feed the fires, has enabled forest trees to become established. These facts, while they do not entirely account for the existence of prairies, are undoubtedly an important element. The prairies are particularly developed in the arid and semi-arid regions where frequent drouth has augmented the destruction occasioned by fires, and particularly on the heavier soils of that region which retain sufficient moisture to enable the grasses to form a complete covering over the soil.

Of the many grasses (popularly known as such) native to this country, or of the introduced grasses that have become established here, comparatively few are of economic importance. Their principal use is as food for live stock. Most of them grow too sparsely to be important for this purpose, and many of them are not nutritious enough to make them valuable as food. A considerable number, however, are both nutritious and palatable to stock. Yet the number of these which are propagated artificially is exceedingly small when compared with the total number of species. This is partly accounted for by the fact that a few species are surpassingly useful by reason of abundant growth, ease of propagation, nutritive value, and palatability. When such a grass becomes established in a region to which it is adapted, the effort to find other valuable sorts in a measure ceases. But there are vast sections of country, particularly in the cotton-producing States and the arid and semi-arid West, where good grasses, adapted to local soil and climatic conditions, have not yet become established as field crops. Not that there are no good grasses known in these regions, for there are many of them; but it happens that these grasses are not easily propagated or have some characteristic which renders them undesirable. The well-known and valuable buffalo grass (*Bulbilis dactyloides*) of the West and Southwest is an example in point. It is one of the most nutritious and palatable of all the grasses, and produces abundant feed; but it produces very little seed, and that only on trailing vine-like stems, from which it is impractical to harvest it. Many of the grasses which formerly constituted important factors on the ranges of the West, and which are eminently adapted to the climatic and soil conditions there, are rendered useless on cultivated lands by reason of their poor seed habits. What the breeder's art may accomplish in rendering these now useless grasses useful, by improving their seed habits, remains to be seen. The leading tame grasses of the country are as follows:

Timothy (*Phleum pratense*).— The acreage of this grass in the United States is twice as great as that of all other cultivated grasses put together. It may be said to be the hay grass of the country. Its supremacy is due first of all to its excellent seed habits. The seed from an acre of it will seed a larger acreage than is the case with any other grass. The seed is easily harvested, and retains its vitality for several years. It also produces relatively large yields of hay, which, although not so nutritious as the hay from some other grasses, is eaten readily by all kinds of stock. It is particularly valuable for horses, because of its favorable physiological effect on the digestive apparatus. Owners of livery stables, whose horses are liable to be subjected to hard driving after heavy feeding, will feed no other hay when timothy is available. Timothy is usually sown with wheat, in fall, at the rate of about eight pounds of seed per acre, the seed being cast on the bare ground behind the drill-plows. Clover is then frequently added, at the same rate, in early spring, though farmers who raise much hay for sale prefer to omit the clover, as the pure timothy is preferred by horsemen. After the wheat crop is harvested, the grass is ordinarily used for pasture in the fall. The next season a large yield of hay is obtained (one to three or more tons per acre, according to the fertility of the soil), but the yield decreases thereafter to such an extent that the best farmers do not attempt to maintain a timothy meadow for more than two seasons, though such fields are frequently used for pasture for two or three years longer, before breaking them up for corn. In the latter case, bluegrass seed (*Poa pratensis*) is frequently scattered on the timothy sod, so that the pasture consists largely of bluegrass. The production of timothy hay is confined largely to the region north of and including the eastern third of Kansas and Nebraska, and to certain restricted localities in the Rocky Mountains and Pacific coast States; but timothy hay is used almost exclusively by horsemen in the large cities of all sections of the country.

Kentucky Bluegrass, June Grass, or Bluegrass (*Poa pratensis*).— Next to timothy this is the most important grass in this country, though it seldom grows large enough to cut for hay. It is undoubtedly the leading pasture grass in America. Its distribution is nearly identical with that of timothy. It does not extend south of the Ohio River except in a circular area about 100 miles in diameter in Kentucky, with a point 25 miles north of Lexington as a centre; and in certain portions of Tennessee and the mountainous portions of the southern States. In Kentucky and Tennessee its distribution is closely confined to the Cambrian rocks, which are rich in both lime and magnesia. Perhaps no other grass is so acceptable to stock as bluegrass. It is one of the most nutritious of grasses, and it is a notable fact that stock raising has never become a prominent feature of farming anywhere in the United States outside of the bluegrass region, except of course in the range country of the West, where ranching rather than farming is the prevailing form of agriculture. The best bluegrass pastures are those which are kept free from weeds and bushes, not cropped too closely and constantly, and upon which fattening stock are fed grain and mill products. Such pastures last indefinitely, but are hardly productive enough to justify their maintenance except on rough lands not well adapted to the cultivation of ordinary crops. So highly prized are the bluegrass pastures in many sections that they are seldom broken up; for it is a difficult matter to establish a good bluegrass pasture, a process requiring several years.

Millet.— The term millet is applied to three more or less distinct groups of grasses. The more common millets in this country are the foxtail millets (*Chætochloa italica*). They include the well-known foxtail, a common weed springing up in grain fields after harvest, and the hay-producing varieties, Hungarian grass, German millet, golden millet, and a few others, all annuals which produce an abundant crop of coarse hay of rather inferior quality. They are grown mostly as catch crops, being sown in late spring and early summer on fields where other crops have failed because of drouth. They are hence confined largely to the semi-humid region extending from North Dakota to Texas. Millet hay, when fed to horses that have no other roughness, has the peculiar property of producing acute rheumatic affections of the joints; but when fed with other hay, the damage from this source is very slight. Another group of millets, frequently called broomcorn millets, are varieties of the species *Panicum miliaceum*. These are little known in this country, though they constitute important bread-producing crops in central Asia. A third kind of millet, usually known as Japanese millet, is a variety of the common barnyard grass, *Panicum crus-galli*. Some forms of this grass are common weeds all over this country. Some of the varieties produce large crops of coarse but palatable hay, particularly on wet lands in the southern States. The seed of one variety is used for food by certain Indian tribes of the Southwest. Other varieties are similarly used in the Old World. This group of millets probably deserves more attention that it has yet received in this country.

Redtop (*Agrostis alba*).— This grass and its variety *vulgaris* are widely distributed in this country, occupying the whole of the timothy and bluegrass region, and extending considerably farther south; but the only section in which it may be said to hold first place is in a limited area in southeastern Illinois and adjacent parts of Kentucky. In this section, practically all of the redtop seed of the country is produced. It is rather distinctly a wet-land grass, and is usually a valuable constituent of meadows and pastures on moist lands in all parts of the country except the extreme south. In yield of hay it is distinctly inferior to timothy, but it withstands cropping and trampling by stock much better. Although quite nutritious, it is not nearly so well relished by stock as timothy or bluegrass.

Orchard Grass (*Dactylis glomerata*).— In its distribution in this country, this grass is identical with redtop, but it is adapted to drier soils. Particularly in the southern portion of its area, orchard grass flourishes in the shade of trees, hence its popular name. It may be said to be important as a hay grass only in that part of its range which extends beyond the limits of the timothy region. It is particularly important in the clay soils around the base of the Appalachian range from Virginia southward, though it thrives equally well throughout the timothy region. This grass produces a large yield of rather coarse hay, which, however, is of excellent quality if cut by the time the blossoming period is over. If allowed to stand longer, the quality of the hay deteriorates rapidly because of the formation of woody tissue in the stems. A rather serious objection to it is that it is inclined to grow in bunches, making a rough and uneven surface difficult to mow; yet it is undoubtedly the best of the hay grasses in those portions of its region where timothy does not succeed. It is also an excellent pasture grass, withstanding much hard usage, and furnishing large quantities of herbage. In New Zealand, where this grass is very popular, and in England, it is known as cock's-foot, from the fancied resemblance of its branching seed-head to a chicken's foot.

Bermuda (*Cynodon dactylon*).— With some reservations, it may be stated that what bluegrass is to the North, Bermuda is to the South. The differences are: Bermuda revels in the heat of summer, while bluegrass makes little growth in hot, dry weather. It stands drouth much better than bluegrass. On good land, Bermuda furnishes good crops of hay, which bluegrass does not. Bermuda stands trampling even better than bluegrass, and yields more pasture. On the other hand, Bermuda furnishes pasture only during the warm season; and while it furnishes larger amounts of feed than bluegrass, stock do not relish it quite so well. The seed of Bermuda is also quite unreliable and very high-priced, so that, to insure getting a stand of it, it is the usual custom to plant small pieces of sod, which soon spread over the ground and form a complete covering. One of the most characteristic features of Bermuda is its habit of sending out long runners which run along the surface of the ground, taking root at the joints. This renders it a matter of considerable difficulty to eradicate the grass when it is once established. But this may be done by growing densely shading crops, such as oats in winter, followed by cowpeas or velvet beans in summer, for one or two seasons. A single season of clean culture, such as cotton receives, will then completely destroy the Bermuda. *St. Lucie Grass* is a variety of Bermuda which is found in Florida and near the Gulf coast. It grows considerably larger than the species, and is said to remain green longer in the fall.

Johnson Grass or Means Grass (*Sorghum halapensis*).— This grass was introduced into South Carolina from Turkey near the middle of the last century. In that State it is generally known as Means grass, from Gov. Means, who did much to popularize it. It was later taken to Mississippi by a Mr. Johnson, where it became widely known under his name. The most prominent characteristic of Johnson grass is its habit of producing an enormous growth of underground stems (rootstocks, or rhizomes), from each joint of which a new plant may be produced. It is therefore a matter of extreme difficulty to get rid of the grass when it is once established. It is now very generally distributed over the cotton-producing States, and is the most formidable weed found in the South. It is generally believed that it cannot be exterminated by any practicable means. This, however, is not the case. If the land is thoroughly plowed in autumn, with a disk plow or a good turning plow, the rootstocks dragged from the ground with a good harrow, or better, a root-digger; plowed again in midwinter; then plowed and thoroughly harrowed again in late spring, again removing all the roots possible, a crop of cotton may be grown the following summer nearly free from grass. If then the grass be persistently pulled or cut during the summer, never allowing it to reach a height of four inches, it can be completely eradicated. It is practicable to do this, for very little grass will appear in the cotton, and what does appear will be attached to loose roots easily pulled from the ground. While Johnson grass produces rootstocks in abundance, it spreads very slowly by this means, but spreads rapidly by seed. These are produced in great quantity, are readily eaten by stock, and are thus carried over all parts of a farm on which it has once gained a foothold. Johnson grass usually gives three cuttings of hay in a season, of about a ton each on good land. The hay is of excellent quality, particularly for cattle and for all horses except livery horses liable to be subjected to hard driving after a full feed. In such cases its laxative and diuretic effect becomes objectionable. As a pasture grass it can not be compared with Bermuda, though it is greatly relished by all kinds of stock. It is soon killed down completely when heavily pastured, but when the land is plowed it springs up again.

Brome Grass (*Bromus inermis*).— This is a recent introduction from east central Europe, and on the prairie soils of the Northwest and the Pacific Northwest, it occupies the place that bluegrass holds on the glacial drift of the more humid climate to the East. It is much larger than bluegrass, and hence furnishes more feed. It is much relished by all classes of stock. Stock eat with great avidity the straw from which seed is harvested, and the hay, cut just after the blossoms fall, is of excellent quality. Brome grass forms an excellent sod.

Italian Rye Grass (*Lolium italicum*).— This is perhaps the most important of all the meadow grasses in England and on the continent of Europe. It is relished by stock better perhaps than any other of the cultivated grasses; yet, for some reason not entirely clear, it is almost unknown in America. The only section of the country in which it has gained favor is in northwestern California, western Oregon, and western Washington. It is adapted to a very wide range of soils. It thrives remarkably on land reclaimed from salt marshes by dyking, and it is also a valuable grass on upland soils that are inclined to be dry. Practically speaking, it is an annual, but if properly managed it reseeds itself in such a manner as to be practically a perennial. It is a valuable constituent of all pasture mixtures, and is a hay grass of much value. It is not well adapted to single culture, being rather too weak of stem to stand alone.

English Rye Grass (*Lolium perenne*).— This differs from the last in no essential respect except that it does not grow quite so tall, and is slightly more inclined to a perennial habit. It is an important European grass practically unknown in America.

Tall Fescue and Meadow Fescue (*Festuca elatior*, and variety *pratensis*).— These two grasses differ in no essential particular (from the agriculturist's standpoint) except that the first is taller and more leafy than the second, and therefore more valuable as a forage plant. The smaller form is frequently known as English bluegrass, a name which has led to much confusion, and which should be abandoned. It is not closely related to our Kentucky bluegrass, nor to Canadian bluegrass (*Poa compressa*). Tall fescue is much confused with meadow fescue by seedsmen, and it not infrequently occurs that seed of the latter is sold under the name of tall fescue. This fact has hindered the recognition of the decided merits of tall fescue. Next to Italian and English rye grass, these two grasses are the most important cultivated grasses in Europe. But like the rye grasses, they have never been recognized as valuable grasses in this country except in a few restricted localities.

Tall Oat Grass (*Arrhenatherum avenaceum*).— This grass is found occasionally in all parts of the country, but is nowhere an important crop. Stock do not eat it readily at first, but soon become accustomed to it, and then eat it freely. It has considerable value both for hay and for pasture.

Cheat, or Chess (*Bromus secalinus*).— In the central and eastern States, cheat is a pernicious weed in wheat fields, and it is popularly believed that, under certain unknown conditions, wheat turns into cheat, and it avails nothing that the fallacy of this notion has been demonstrated time and time again. In some parts of the South, and in the Willamette Valley in Oregon, cheat is sometimes grown for hay. It produces a large yield of rather poor hay. Being an annual, it is of little value for pasture.

Velvet Grass (*Holcus lanatus*).— This grass is common in the Pacific coast region along roadsides and in waste places. On sandy soils along the coast and on peaty soils that dry out in summer, velvet grass is perhaps the most profitable hay and pasture grass, because the better grasses do not succeed. Stock usually refuse to eat it until driven by hunger, but they will soon acquire a taste for it, and it is exceedingly nutritious. Its worst faults are its low yield and lack of palatability.

Canadian Bluegrass (*Poa compressa*).— A grass of small economic value, found quite generally over the northern States and in Canada. It is of some value as a sand binder, and, when kept closely mowed, it forms a smooth, even sod in lawns.

Crab Grass (*Panicum sanguinale*).— This is not, strictly speaking, a cultivated grass. It springs up in cornfields in late summer, and frequently furnishes a considerable crop of hay, which is of fair quality. It is universal in the South and extends northward to the Missouri and Ohio rivers.

Fodder Grasses.— Under this term we may include the coarse-growing grasses such as the sorghums, Kafir corn, Milo maize, teosinte, etc. On account of their large size, they require to be handled in a different manner from the common hay grasses. They are usually cut and shocked after the manner of fodder corn, though most of them may be handled by haying machinery if they are sown quite thick.

The sorghums (saccharine sorghums) were introduced into this country about the middle of the last century, and were extensively grown for syrup making before the now universal adulteration of this class of food materials destroyed the market for all farm-made syrups. At present little sorghum syrup is produced, but the sorghum plant is much grown for fodder. Its most valuable characteristic is its ability to withstand protracted drouth. It is therefore especially adapted to the western edge of the humid region, where it is exceedingly popular. Sorghum is also very generally grown in all the southern States, where the fodder is particularly valuable as a feed for the plantation mules. In all the cotton-growing States, as well as along the edge of the great plains, sorghum is a much more certain crop than corn (maize). Kansas is the leading State in the production of this crop. Some varieties are grown as far north as Minnesota and North Dakota. In the South two or three cuttings may be made in a season.

Several varieties of Kafir corn (non-saccharine sorghums) have become established in this country in recent years. The plant resembles a low-growing, branching, very leafy sorghum. It is cultivated either for fodder or for grain, of which latter it yields abundant crops. The grain is inferior to corn, but its more certain yield in dry seasons renders it a valuable crop in the same sections where sorghum is grown. It is rather more distinctly a southern crop than sorghum, being grown most largely in Kansas, Oklahoma, Texas, and New Mexico. Milo maize is not very widely known in this country, but it is gaining a foothold in parts of Texas, where it is grown after the manner of sorghum and is said to furnish large crops of valuable fodder or hay. Teosinte (*Euchlenea mexicana*) is a tropical plant somewhat resembling sorghum, but in reality more closely related to corn (maize). It does not produce seed in this country, but on rich alluvial soils in the southern States it produces enormous yields of green fodder much relished by cattle. It is of no account on poor thin soils. Near the cities, where dairying is an important industry, this crop is of great value in the South. It may be cut several times in a season, and there is no waste in feeding it, as the stalks are readily eaten.

Pearl millet may be classed with the sorghums on account of its manner of growth, but botanically it is quite different from them. It is a native of Africa, and was introduced in this country about 30 years ago. It has been tried very generally over the country, but has never gained favor. The seed is frequently unreliable, and the stems are inclined to be woody when approaching maturity.

A large number of our wild grasses have more or less economic importance. In fact, a majority of them furnish food for domesticated animals, while some are important for other reasons, as will appear in the discussion below. Only a few, however, are of sufficient importance to warrant their mention here. It is somewhat remarkable that none of our wild grasses have been domesticated during the past hundred years. This is perhaps due to the fact that the best of them were brought into cultivation very early in the history of the country. The more important genera of our wild grasses are:

Andropogon.— This genus is particularly well developed along the eastern edge of the western plains, where several species form important constituents of the immense acreage of wild hay cut in that region; also in the southern States, where it constitutes the major part of the growth of grasses in open woods and abandoned fields. *A. virginicus* is one of the most abundant grasses from Maryland southward. These grasses are large and coarse, and are not much relished by stock except in the early stage of their growth, whence the common practice of burning over the prairies to start a new growth of tender grass.

Agropyron.— This genus is particularly characteristic of the northern Rocky Mountain States, where several species are valuable for forage. They are, as a rule, better relished by stock than the preceding, and some of them furnish hay of excellent quality. *A. occidentale* is the well-known blue-stem of the mountain regions and the western margin of the plains. It has strongly creeping rootstocks, and is perhaps the best hay grass among the wild species in the region where it grows. There is reason to believe that it will in time constitute an important crop on cultivated lands, particularly in the moister valleys of the northern portion of the arid region. *A. divergens* is the common bunch grass of eastern Washington and Oregon and northern Idaho. It is valuable on the ranges, and furnishes very good hay where the rainfall is 20 inches or more. *A. repens* is the well-known quack grass of our northern States. On account of its great development of rootstocks it is a very pernicious weed. Yet it furnishes fairly good forage, and is recommended by some for cultivation in the semi-arid region. It also has some value as a sand binder. *A. tenerum,* the slender wheat-grass of the northwestern prairies, is a good hay grass, seed of which may now be had on the markets.

Ammophila.— A genus of one species, known as beach grass; in Australia and South Africa called "marram." This is as yet the only species of grass that has been used successfully in northern latitudes as a sand-binding grass on dunes near the coast. For this purpose it is invaluable. Extensive plantations of it have been made on both the Atlantic and Pacific coasts; also on dunes near the Great Lakes. It is propagated by digging up bunches of the grass, separating each one into several small bunches, and then resetting them in the sand.

Arundinaria.— The cane of the southern cane-brakes, a relative of the Oriental bamboos. It is much utilized as winter forage for cattle, which frequently winter in good condition in the brakes. There are two closely related species, the larger one furnishing the common cane fishing rods.

Avena.— *A. fatua,* the wild oats of the spring-wheat producing States, is a weed in wheat fields. In several States the common hay is cut from patches in wheat fields taken by wild oats. If cut early enough the hay is of fair quality. Wild oats form an important constituent of the forage on the ranges of portions of the State of California.

Bouteloua.— This is one of the most characteristic genera of the arid regions of America, particularly in the Southwest. Side oats grama (*B. curtipendula*) is a handsome and valuable grass on the plains, where it furnishes much valuable feed. Blue grama (*B. oligostachya*) is the buffalo grass of the plains of eastern Montana, and is also a valuable forage plant.

Bulbilis.— Buffalo grass (*B. dactyloides*) is probably the most valuable wild grass of the plains region, extending from the Dakotas and Montana to southern Texas and New Mexico. It is one of the most nutritious grasses, rivaling Kentucky bluegrass in this respect, but is less productive than the latter. In Texas and elsewhere there were formerly vast areas of buffalo grass forming a compact sod; but owing to overstocking, and the depredations of prairie dogs, the grass is now much less in evidence. It is not well adapted to use on cultivated land because of its poor seed habits.

Calamagrostis.— An important genus along the northern border of the United States. Bluejoint (*C. canadensis*) is an important constituent of swamp hay, of which a large acreage is cut in Minnesota, Iowa, and adjacent States.

Cenchrus.— Two species of *Cenchrus* are found in sandy soils in the South and West. They are noted for the hard spiny "burs" in which the seed are found. They are known as "sand burs," and are pernicious weeds in sandy soils.

Setaria (*Chætochloa*).— The foxtail grasses. Two species, the yellow foxtail and green foxtail, are useless weeds which spring up in wheat fields after harvest.

Distichlis.— Salt grass (*D. spicata*) is common in salt water marshes on the coasts, and on alkali soils in the arid regions. It has some value as a forage plant.

Elymus.— This is a large and important genus. Several representatives are widely distributed, and some possess considerable value as forage plants. *E. condensatus* (giant rye grass) is a very characteristic grass in lowlands in the arid regions, where it grows in large clumps, attaining a height of 6 or 7 feet. While not greatly relished by stock, it frequently suffices to sustain life during periods when other grasses are covered by snow. It has been sown on cultivated land in some irrigated lands of the West, particularly where alkali has begun to appear, and it furnishes large crops of hay. This hay is rather too laxative for horses, but is said to make good feed for cattle. *E. triticoides* (wild wheat) is found in great abundance on wet meadows in eastern Oregon and adjacent regions, where it is frequently cut for hay. The forage is said to be excellent. *E. canadensis* is a very variable species, common throughout the central and northern States. Some forms of it are characterized by strongly developed rootstocks, and thrive in the sandiest soils. It probably has considerable value for holding embankments in places where the soil is sandy. It is also a good forage grass, and is worth more attention than it has yet received for this purpose in the semi-arid region.

Festuca.— One of the characteristic genera of the western States. *F. ovina* (sheep's fescue) is one of the most abundant and most valuable grasses of the ranges in the mountain regions.

Hordeum.— Squirrel-tail grass (*H. jubatum*) is common on the plains of the West, particularly in the north. When young and tender it is eaten by stock. When mature, its rough beards are often injurious to stock; they penetrate into wounds in the mucous membrane of the mouth and into crevices in broken teeth, and often cause the death of horses and cattle. *H. murinum,* a species found on the Pacific coast, has barbed beards which penetrate the skin of young animals. It is a most pernicious pest.

Muhlenbergia.— A genus particularly well developed in the South, where several species of it are usually found in moist or shady places. Nimble Will (*M. diffusa*) is one of the commonest species. A genus of no particular value.

Panicularia.— Four species of *Panicularia* are common swamp grasses of the northern States. They are all excellent forage grasses, but are little utilized, since they seldom grow in situations that permit them to be harvested.

Panicum.— One of the largest and most important genera of grasses in the United States, particularly prominent in the southern States.

Several species have already been noticed in the list of tame grasses above. These are crab grass, Colorado grass, Japanese millet, and the broom-corn millets. The most prominent remaining species are: *P. amarum,* a grass with long creeping stems, common on sands near the coast from Connecticut to Florida and along the Gulf coast. This species is of considerable value for holding drifting sands. *P. capillare,* Old Witch grass, tickle grass, an annual with widely branching panicles, common and sometimes troublesome as a weed in cultivated ground. *P. maximum,* Guinea grass, introduced into Florida from the tropics. A valuable fodder plant, furnishing several cuttings in a season, sometimes confused with Johnson grass, but much less hardy. *P. proliferum,* sprouting crab grass, growing in much the same region as crab grass, but extending farther northward. It springs up in cultivated fields in late summer, and is occasionally utilized as pasture or hay. *P. virgatum,* switch grass, ranging from Maine to the Gulf and westward to the Rocky Mountains. It is a perennial, 3 to 5 feet high, and, if cut very early, furnishes a large yield of fairly good hay. It deserves attention as a hay and pasture grass in semi-arid regions.

Paspalum.— Another large and important genus. Seeds usually in digitate spikes resembling those of crab grass. Carpet grass (*P. compressum*) is a valuable pasture grass near the Gulf coast, particularly on sandy soils. On such soils it will even drive out Bermuda when closely pastured. Its spreading stems form a dense carpet-like growth which gives it its popular name of "carpet grass." Water grass (*P. dilatatum*) is another common grass in all the southern States, frequently found in wet lands. Its seed has recently been placed on the market, and it is used to some extent as a hay and pasture grass. Knot grass (*P. distichum*), with creeping stems, is also common in the South, where it is frequently mistaken for Bermuda, which it closely resembles. Said to be valuable on wet lands as pasture.

Phalaris.— One of the species of this genus (*P. arundinacea*), known as "reed canary" grass, is one of the most thoroughly cosmopolitan species in this country. It is found all over the country, usually on wet or overflowed land, but frequently on uplands as well. It is a perennial with creeping rootstocks (underground stems) growing 4 to 6 feet high. Few grasses are better relished by stock, either as hay or as pasture; and, were it not for its habit of shedding its seeds the moment they are mature, it would undoubtedly have become an important cultivated grass long ago. *P. canariensis* is the well-known canary grass, seed of which is commonly used as food for canary birds.

Poa.— This is one of the most characteristic genera of this country, some representatives of it being well-nigh universal, except in the far South. Kentucky bluegrass, the June grass of the northern States, one of the most important grasses in America, has been fully discussed under the tame grasses above. Many varieties of this species are found in the wild state in the Northwest, where it is of great importance as a range grass. Even in the region of its greatest importance it is a semi-wild plant, springing up everywhere from seed scattered by the wind or by stock. It is the finest pasture grass in the world, but not the most productive. *P. annua* is another representative of the genus found all over the country. It is particularly common in the South and on the Pacific coast, where it remains green during the entire winter. This species is not native here, but is fast becoming one of our commonest grasses. It is frequently found in lawns, and in cultivated grounds. It seldom attains a height of more than a few inches. Texas bluegrass (*P. arachnifera*) is noted for the cottony appearance of its seed. It is also a valuable grass for winter pasture in the South, but is somewhat difficult to establish in a pasture. Like Bermuda, it is usually propagated by setting small pieces of the sod a foot or two apart each way. It is a native of Texas, but is nowhere very abundant. Many species of Poa are found in the far Northwest, where they are important range grasses. *P. laevigata* is frequently cut for hay on wet meadows in the mountain regions of Oregon and Washington.

Savastana.— Vanilla grass (*S. odorata*), commonly called "sweet grass" in the Northwest, is found from New England to Oregon and Washington. It is noted for its strong vanilla-like odor, resembling the odor of sweet vernal grass. The dried leaves are used by the Indians in weaving small mats and boxes, in which condition they retain their characteristic odor.

Spartina.— Cord grass (*S. cynosuroides*) is an important constituent of the swamp hay of which large quantities are cut in Minnesota, Wisconsin, and Iowa. It is frequently found in large areas growing alone, as if it had been sown there by hand. The hay is of fair quality, and the yield large.

Sporobolus.— Another characteristic genus of the West and Southwest, where several species are important on the ranges. Saccaton (*S. wrightii*) is common in Arizona and New Mexico, where it grows in large clumps, and is frequently cut for hay. Although decidedly coarse, the hay is valued as forage. Dropseed (*S. cryptandrus*), common on the western plains and in the Rocky Mountains, is much relished by stock.

Stenotaphrum.— A single species, *S. dimidiatum,* is of importance. It is frequently used as a lawn grass from Charleston, S. C., southward. Sometimes called Charleston lawn grass and Mission grass. This is the pimento grass of Jamaica. In New South Wales it is called buffalo grass. It grows on all kinds of soils, from heavy clay to almost pure sand, but is seldom found far from the seashore.

Stipa.— A large and important genus in our western flora. Several species are remarkably long-awned on the flowering glumes, giving them the popular designation of needle grasses. Some of them have the lower end of the seed produced into a hard, sharp joint which frequently penetrates the skin of animals, rendering these species somewhat of a nuisance to stockmen. Many of them, however, make excellent hay on the great plains. *S. leucotricha* is the bearded mesquite of central and southern Texas, a valuable wild hay grass. *S. vaseyi,* found in the Rocky Mountains at altitudes of 5,000 to 6,000 feet, has the peculiar property of inducing sleep in stock that eat it, for which reason it is known as "sleepy grass." No harm, further than a desire to sleep, seems to follow a feast on this grass; the effects wear off gradually in a day or two.

Uniola.— One species (*U. latifolia*) has large panicles of broad, drooping spikelets, rendering it exceedingly graceful. It is used as an ornamental, and is indeed one of the most beautiful of the grasses. It is found from Pennsylvania westward to Illinois and southward. *U. paniculata*, seaside oats, grows abundantly on the sands of our southern Atlantic coast, and on the Gulf coast, where it serves as a sand binder.

Zizania.— Wild rice; Tuscarora rice. Wild rice (*Z. aquatica*) is one of the most striking in appearance of any of the American grasses. It occurs on mud flats almost all over the country. It is very abundant on the tide flats of the Delaware and Potomac rivers, as well as in many other places both in the United States and Canada. A field of it in bloom presents a very pleasing appearance with its large, graceful panicles, yellow below with a great wealth of staminate flowers in drooping branches of the panicle, the upper, pistillate branches rising gracefully at various angles. When found in situations that permit it to be harvested, Indian rice is cut for forage, yielding enormous quantities of succulent feed much relished by stock. The seed is gathered in quantity for food by Indians in the northern States and in Canada. It is frequently planted in mud or shallow water for its seed, of which fish and birds are exceedingly fond. The seed is gathered in boats, into which it is threshed from the tall stems growing in water. The seed keeps best under water.

Ornamental Grasses.— A number of valuable ornamental grasses have been mentioned above. A few others deserve notice. Reed (*Arundo donax*) is found in door yards in nearly all parts of the country, particularly in the South, though it thrives quite well at the North. It frequently attains a height of 15 feet or more. It resembles sorghum, but is more leafy and more graceful in appearance. It is a perennial, springing up in early spring from the roots. As a background for smaller ornamental plants it is invaluable. Many of the bamboos are exceedingly useful as ornamental plants. Only a few species are adapted to northern latitudes. A garden variety of *Phalaris arundinacea* is common in this country under the name of ribbon grass. Its leaves are striped with white. There is also a similar striped variety of reed. *Coix lachryma-jobi*, Job's tears, is a small to medium-sized grass frequently found in gardens and door yards; it is noted for the indurated, tear-shaped covering of the seed. *Eulalia japonica* of the Orient, *Erianthus ravennæ* (Ravenna grass) of Italy, and *Gynerium argenteum* (Pampas grass) of the Argentine pampas are other well-known and deservedly popular ornamental grasses.

W. J. Spillman,
Agrostologist U. S. Department of Agriculture.

Grass'hopper-frog, or Cricket-frog, a small agile, noisy frog (*Acris gryllus*), common throughout the warmer half of the United States, whose spring cry is like the rattling produced by striking rapidly together two resonant pebbles. It is about an inch long, brown with a blackish triangular patch on the back of the head and a dorsal stripe. Its eggs are attached in little masses to a blade of marsh-grass.

Grasshoppers and Locust-plagues, insects of comparatively large size of the orthopterous families *Acridiidæ* and *Locustidæ*, or short-horned and long-horned grasshoppers respectively. In Great Britain and her colonies the former are the "locusts" of popular speech, and only the *Locustidæ* are called "grasshoppers." For the allied family of crickets, see Gryllidæ. The *Acridiidæ* have the antennæ shorter than the body and blunt, the ovipositor short and its parts divergent at the tip, and the sound-producing organs (see Orthoptera), on the hind thighs and outer edge of the forewings. In the *Locustidæ* the antennæ are long and tapering, the ovipositor long and sword-like, and the sound-organs are at the inner base of the forewings. This latter family embraces the katydids, tree-crickets, green meadow-grasshoppers, and certain western species erroniously called "crickets," and the group is more particularly treated under Katydid. In both families the hinder legs are greatly enlarged, enabling the insects to make the long leaps so characteristic of them; their wings are also capable of carrying them in some cases many hundreds of miles.

The short-horned grasshoppers are those of greatest interest economically, and those responsible for the "locust" plagues of Africa, Arabia, and southern Asia, as also in our West. From time to time vast bodies of certain species sweep from one region to another in swarms many square miles in area and so dense as to darken the sun, feeding on grasses and herbage, and consuming not only crops and pasturage as if by fire, but stripping bushes and trees of foliage and even of the bark. In the ancient world such visitations, which frequently extended into central Europe, caused extensive local famines, sometimes resulting in the loss of hundreds of thousands of human beings and vast numbers of grazing animals. Such "plagues" lasted for two or three years, the hosts breeding numerously at first, but gradually dying out and ceasing to reproduce outside the limits of their permanent breeding-grounds. The reproduction of grasshoppers consists in the deposit in autumn of eggs laid in bunches, covered with a secretion which hardens into a case or "pod," beneath the surface of the ground, into which the ovipositor is deeply thrust, and where the eggs remain to be hatched the following spring; in warm countries, however, two generations may take place annually. The locusts referred to in Scripture belonged probably to the species now named *Schistocerca peregrina*, of North Africa and Arabia. The swarms which from time to time appear in South Africa are of *Pachytylus migratoroides*; while *P. migratorius* is the best-known one of southern Europe and Asia. Similar species inhabit the open interior regions of both North and South America, a species of *Acridium* afflicting Argentina.

Of the many species in the United States those of the genus *Melanoplus* are of greatest interest because frequently destructive of crops. The most conspicuous is *M. spretus*, the Rocky Mountain locust, which has been a scourge of agriculture west of the Mississippi River ever since settlements began there. Among the more recent great plagues were those of 1856 and 1874, the latter enduring three years and causing widespread ruin throughout the whole region between the Mississippi River and the Rocky Mountains. The federal government appointed a commission of entomologists to investigate the habits of the insect, and its three 'Reports'

(1877, 1879, and 1882) are exhaustive essays on the subject. It was found that these and other destructive locusts bred throughout the whole plains region in the river bottoms and sunny depressions, and that little could be hoped for in defence except the gradual effect of cultivation in destroying the eggs and young by late and early plowing. This effect has been gained with unexpected celerity; and troublesome grasshoppers now breed in considerable numbers only in northern Idaho and central British Columbia. Swarms occasionally migrate and do damage, but the extensive plagues of the past will probably not recur. Nevertheless, grasshoppers are likely often to be locally harmful in the West, and must be combatted intelligently. The most valuable preventives are the burning over or deep plowing of breeding grounds, so as to turn the eggs out and kill them in the fall or before they can hatch in the spring. The grasshoppers themselves may be captured by means of "hopper-dozers" or kerosene pans. A cheap destroyer consisting of one part of Paris green thoroughly mixed in 60 parts of fresh horse-dung, two pounds of salt to half a barrel of the mixture being added, after being dissolved in water. This mixture is scattered broadcast along the edges of crops where infestation is feared, and the locusts, liking and eating the poison, die a few days later. The ordinary bran-arsenic mixture for cut-worms may also be used, and in some regions wheat fields are protected by a trap-crop of rye sown in a strip around the fields and poisoned by spraying with Paris green.

Grass'quits, a group of interesting little seed-eating finches of the West Indies, belonging mainly to the genus *Sporophila,* and flocking in grassy lands and pasturage.

Gra'tian, or **Gratianus Franciscus,** Benedictine writer of the 12th century. He was a native of Chiusi, and is considered the founder of the science of canon law. He was the author of a famous work, entitled 'Decretum; or, Concordia discordantium Canonum,' in which he endeavors to reconcile those canons that seem to contradict each other. It is a rich storehouse of the canon law of the Middle Ages. The best edition of the text is found in the 'Corpus Juris Canonici' of Richter (1833–9).

Gratian, or **Gratianus,** grā-shĭ-ā'nŭs, Roman emperor; eldest son of the Emperor Valentinian: b. Sirmium, Pannonia, 359 A.D.; d. Lyons 383. When only eight he was raised by his father to the rank of Augustus. On the death of Valentinian in 375 the eastern part of the empire still remained subject to Valens, and Gratian was obliged to share the western part with a half-brother, a child of four years, associated with him under the title of Valentinian II. In the early part of his reign the Goths and Alemanni made incursions into the Danubian provinces and into Gaul. They were repeatedly defeated by Gratian and his generals, but they also advanced into the eastern empire, and defeated and killed Valens in 378. Gratian then bestowed the eastern empire upon Theodosius, one of his generals.

Gratiola, grā-tī'ō-la, a genus of scrophulariaceous plants with many species widely distributed in temperate regions. A notable representative is the European hedge-hyssop (*Gratiola officinalis,* which is extremely bitter, acts violently as a purgative, diuretic, and emetic, and in overdoses is an acrid poison. It was formerly highly esteemed as a medicine, and its virtues were supposed to depend on a bitter resinous principle called "gratiolin."

Grattan, grăt'an, **Henry,** Irish orator and statesman: b. Dublin 3 July 1746; d. London 4 June 1820. He was called to the Irish bar in 1772, and in 1775 was elected member for Charlemont in the Parliament of Ireland. He immediately became distinguished in the opposition, and infused that spirit into the country which produced in 1782 a repeal of the statute of 6th George I., which had enacted that the crown of Ireland was inseparably connected with that of Great Britain; that Ireland was bound by British acts of Parliament when named therein; that the Irish House of Lords had no jurisdiction in matters of repeal; and that the last resort in all cases of law and equity was the British House of Lords. For his share in the acquirement of this concession the Irish Parliament voted him £50,000 and a house and lands for him and his heirs forever. He became the leader of the country party in the House of Commons, and the head of the Irish Whigs. Disgusted by the Irish rebellion and its manifold horrors, he temporarily seceded from Parliament, but the project of a union being brought forward by Pitt, he once more obtained a seat in Parliament for the purpose of opposing it. When it was carried, however, he did not refuse a seat in the United House of Commons, being returned in 1805 for Malton in Yorkshire, and in the following year for Dublin. His later years were chiefly occupied in a warm and energetic support of Catholic emancipation. Grattan was the zealous friend of Ireland from first to last. As a public speaker he had to contend with a defective voice; but his eloquence was bold and commanding, combining strength with beauty, and energy and elevation with elegance. The best collection of Grattan's parliamentary speeches is that edited in 1822 by his son Henry, who also wrote an account of his 'Life and Times' (1839–46). See Lecky, 'Leaders of Public Opinion in Ireland' (1871); Dunlop, 'Henry Grattan' (1889).

Gratz, Rebecca, American educator: b. Philadelphia 4 March 1782; d. Philadelphia 27 Aug. 1869. Of a family noted for wealth and culture, she showed her bent of mind by founding in 1838 in Philadelphia the Hebrew Sunday-school, the oldest society of its kind in America, and for 32 years she was at its head. Apart from her labors in behalf of the Jewish poor and needy, she was quick to respond to the claims of charity without regard for creed, and she was long regarded as Philadelphia's representative Jewess for her simple piety, personal charm, and social standing. Her name will always be associated with Scott's 'Ivanhoe,' for once when Washington Irving was visiting Sir Walter Scott and learned that a Jewess was to be introduced in the latter's novel, then in course of preparation, the American described Rebecca Gratz with so much warmth — she was a dear friend of his betrothed, Miss Hoffman, whose early death produced such poignant grief — that Scott was deeply impressed. When 'Ivanhoe' was finished he sent the first copy to Irving, with the inquiry whether the "Rebecca" of romance compared favorably with the "Rebecca" of reality. Miss Gratz's portrait is preserved, after a painting by Thomas Sully, in John Sartain's 'Reminiscences of a very Old Man' (D. Appleton & Company 1900).

Grau, Maurice, b. Brunn, Austria, 1849; d. Paris, France, 14 March 1907. He came to the U. S. with his parents in 1854; was graduated from the New York College in 1867 and from Columbia Law School. From 1872 until 1903 he was the most prominent operatic manager in America, securing a long line of singers, musicians, and actors, including names so diverse as Aimée, Rubinstein, Salvini, Sarah Bernhardt, Patti, Irving, Coquelin, Jane Hading, Mounet-Sully, Mme. Rejane. As director of the Maurice Grau Opera Company, he brought some of the most famous singers of the day to America.

Grau, Miguel, mē-gĕl' grow, Spanish-American admiral: b. Piura, Peru, 1834; d. 1879. After studying in the naval school at Callao he entered the Peruvian navy as a midshipman in 1852. In 1871 he was put in command of the turret ship Huascar and in the Chilean war of 1879 was killed by the explosion of a shell while engaged with two ironclads of the enemy.

Graubünden. See GRISONS.

Gravatt, William Loyall, American Protestant Episcopal bishop: b Port Royal, Va., 15 Dec. 1858. He was educated at Virginia State College and Virginia Theological Seminary. Deacon's orders were conferred upon him in 1884 and he was advanced to the priesthood in 1885. In 1899 he was consecrated bishop of western Virginia.

Gravel. See CALCULUS.

Gravel-root. See EUPATORIUM.

Gravelotte, gräv'lŏt, **Battle of**, one of the most severely contested and most important conflicts of the Franco-German war (q.v.). It is named after a village of Lorraine, seven miles west of Metz, but is also called by the French the battle of ST. PRIVAT, and of GRAVELOTTE and REZONVILLE. After the disastrous defeats at Wörth and at Forbach on 6 Aug. 1870 the French in two armies, one under MacMahon and one under Bazaine, retreated along the line of the Moselle, their object being to join forces at Châlons. To prevent this the first German army under Prince Frederick Charles intercepted Bazaine by a circuitous march, forced upon him the battle of Courcelles and Mars-la-Tour, and compelled him to keep within touch of Metz. On 18 August the armies of Prince Frederick Charles and Steinmetz, numbering about 211,000 troops under the command of King William, attacked the position. Bazaine had taken position with about 111,000 men around Gravelotte to the west of Metz. By a flanking movement the Germans captured St. Privat and defeated the French attempt to break through at Gravelotte. After nine hours' desperate fighting, in which the Germans lost over 28,000 men and the French over 12,000, the latter were forced to retreat into Metz, which was immediately invested by Prince Frederick Charles, and capitulated two months later on 27 October.

Graves, Anson Rogers, American Protestant Episcopal bishop: b. Wells, Rutland County, Vt., 13 April 1842. After being graduated at Hobart College, he took a course at the General Theological Seminary 1870. When the missionary district of Platte (now designated the missionary district of Laramie) was constituted in 1889, he was consecrated first bishop 1 Jan. 1890.

Graves, Frederick Rogers, American Protestant Episcopal bishop: b. Auburn, N. Y., 1858. He was graduated at Hobart College (1878), and the General Theological Seminary (1881). His ministry has been devoted to work in China, he having been ordained for the foreign missionary field, deacon in 1881 and priest in 1882. His consecration as bishop of Shanghai took place in 1893. He has published several works in Chinese.

Graves, John Temple, American journalist and orator: b. Wellington Church, Abbeville District, S. C., 9 Nov. 1856. He was graduated at the University of Georgia in 1875. He is generally classed with Henry Grady as an orator and leader of patriotic sentiment in the South. He has been on the staff of the Atlanta *Journal* since 1892, and is an advocate by pen as well as by voice of a separation between the white and colored races in the United States.

Gravitation. The law of gravitation is the law discovered by Newton, according to which every portion of matter attracts every other portion with a force directly proportional to the product of the two masses, and inversely proportional to the square of the distance between them. The motion of the planets round the sun in ellipses, each marking out the area of its orbit at a constant rate, and each having a year proportional to the square root of the cube of its mean distance from the sun, implies that there is such a force on each planet exactly proportioned to its mass, directed toward, and inversely as the square of its distance from the sun. The lines of force radiate out from the sun on all sides equally, and always grasp any matter with a force proportional to its mass, whatever planet that matter belongs to. Since the force is always proportional to the mass acted on, and produces the same change of velocity whatever that mass may be, the change of velocity tells us nothing about the mass in which it takes place, but only about the mass which is pulling. If, however, we compare the accelerations due to different pulling bodies, as for instance that of the sun pulling the earth with that of the earth pulling the moon, or if we compare changes in motion due to the different planets pulling each other, then we can compare their masses and weigh them one against another and each against the sun.

All this was clearly seen by Newton, and was set forth in his 'System of the World' (3d ed., p. 41). Kepler (q.v.) had indeed given the laws, deduced from observation, according to which the planets describe their orbits. From these Newton deduced the laws of the force in the case of the planets; and subsequently he generalized the statement of them, by showing the identity of the nature of the force that retains the moon in her orbit, and that which attracts matter near to the surface of the earth. Kepler's laws state, first, that every planet revolves round the sun in an ellipse, of which the sun occupies one focus: second, that the velocity of any planet at different parts of its orbit is such that the radius vector from the sun to the planet sweeps over equal areas in equal times; and third, that the distances of the various planets are so related to the periods of their revolution that the squares of the periodic times are proportional to the cubes of the mean distances from the sun. From these laws Newton made the following deductions: He inferred from the second law that the planet is acted on by a central force that is always directed toward the sun. From Kepler's first law he deduced the law of variation of the force for any one planet, and found that the force varies inversely as the square of the distance of the planet from the sun. Lastly, he concluded from Kepler's third law a relation between the forces on the various planets; namely, that the forces on equal masses of the different planets are inversely proportional to the squares of the distances of those planets from the sun. This law indicates the identity of the nature of the force that acts on the different planets. Newton next proceeded to consider the motions of the moon; and to ask the question, «Is not the force that causes the moon to fall toward the earth the same as that which influences falling bodies near to the earth's surface?» This question he attempted to put to the test of calculation. At first he was unsuccessful. The then received estimate of the dimensions of the earth were so far from correct that the comparison between the force of attraction in a stone and that in the moon at her distance from the earth did not exactly agree with his theory, and he was obliged to give it up for nearly 20 years. It was not till 1684, when he heard a paper of Picard read at the Royal Society of London, on new geodetical measurements of the earth, that he obtained accurate data to work with; and, returning home, he set to work to examine the question afresh.

Newton saw that a mountain mass might be used, and weighed against the earth by finding how much it deflected the plumb-line at its base. The density of the mountain could be found from specimens of the rocks composing it, and the distance of its parts from the plumb-line by a survey. The deflection of the vertical would then give the mass of the earth. Not long after Newton's death the mountain experiment was actually tried. The honor of making the first experiments on gravitation belongs to Pierre Bouguer (q.v.), whose splendid work does not appear to have received the credit due it.

Having established the law of gravitation throughout the solar system, it was natural to infer the universality of its action. We know on the one hand, by observing the motion of the planets and satellites, the asteroids, and the comets, that the law holds with great exactness for all these bodies; on the other hand, experiments of Cavendish with balls of lead, and of others, verify its exactness down to very short measurable distances: and though we are unable with our present appliances to determine the orbits of double stars and of other stellar systems, still we seem to be fully justified in assuming that in these cases also the law stated above holds, at least, very approximately.

The track was first laid down by Newton, based on astronomical observations, and only made firmer and broader by every later observation. Important work in Europe has recently been done in gravitational experiments by the late Prof. U. Jolly, and by Profs. Braun, Boys, and Poynting, who, with others, have advanced beyond the results of Henry Cavendish (q.v.), whose device, known as the Cavendish experiment, for determining the density of the earth, has so long interested scientists. The latest research has verified Newton's celebrated guess that "the quantity of the whole matter of the earth may be five or six times greater than if it consisted all of water."

No inquiry on gravitation has showed that it is related to anything but the masses of the attracting and the attracted bodies. It appears to have no relation to physical or chemical condition of the acting masses or to the intervening medium. This independence of gravitation of any quality but mass, bars the way to any explanation of its nature or source.

There is a point respecting the law which is almost universally passed over without notice, although it is one of the most important questions with respect to the construction of any theory to account for gravitation; namely, the exact proportionality of the gravitating forces of any two bodies to their masses. The most delicate experiments show no deviation from the exactness of this law; nor has the most accurate observation of planetary bodies sufficed to detect any such deviation. This is the fact proved by the well-known guinea-and-feather experiment, in which it is shown that though a mass of gold and a feather do not fall equally fast under ordinary circumstances, because of the unequal resistance of the air in the two cases, yet that, the air being removed by means of the air-pump, they fall with equal velocity. The experiment proves that the force of gravity in the two cases is exactly proportional to the mass of the guinea and of the feather. Newton showed the same thing himself with far greater minuteness by vibrating balls of various materials similarly suspended. In this, which is known as Newton's pendulum experiment, it is shown that pendulums of equal length vibrate in equal times whatever be the material and the masses of which the bobs of the pendulum are made. By this experiment, when performed with all the nicety at command, it is probable that any deviation amounting to a ten-thousandth or a hundred-thousandth part of the whole amount considered could be detected. Planetary motions prove the law to even a greater degree of accuracy. It is curious that this portion of the law, though it is only proved by experiment and observation, is hardly ever, if ever, referred to by popular writers. It is either assumed without pretense of proof, or is passed over without remark.

Notwithstanding the vast interest and importance of the study which this subject presents, and all the labors of eminent scientists in endeavors to solve its complex problems, it still remains to be said that the world is yet without any theory which can really be considered as explaining gravitation. Consult Mackenzie, 'The Laws of Gravitation' (1900).

Revised by Simon Newcomb.

Gravity, in physics, the terrestrial gravitation, the operation of the law of gravitation on the earth, specially in making heavy bodies fall in all parts of the planet in the direction of its centre. Newton (q.v.) and Bessel have shown that in a vacuum a sovereign and a feather will fall with equal speed, though the rate will be different in the atmospheric air. The attraction of the whole earth, considered as a sphere, on a body at its surface, is the same as if the whole matter of the earth were collected at its centre. The attraction of the earth on a body within its surface is the same as if the spherical shell situated between the body and the earth's surface was removed; or is the same as if all the matter situated nearer to the earth's surface than the body was collected at the centre, and all the matter situated at a greater distance was removed. The weight of a body is proportioned to the attraction which it exerts, hence gravity in many cases means simply weight (q.v.).

Gravity, Specific. See SPECIFIC GRAVITY.

Gray, Asa, American botanist: b. Paris, Oneida County, N. Y., 18 Nov. 1810; d. Cambridge, Mass., 30 Jan. 1888. He was graduated at the Fairfield Medical College in 1831; but had already acquired a taste for natural science which led him to abandon the practice of medicine for the study of botany. The flora of the United States was by no means well known and classified at that period, and many botanical problems were to be solved by the attainment of new data in his chosen science. He had attracted notice so early as 1834 and was appointed botanist to the Wilkes Exploring Expedition, which was so dilatory in starting that he resigned the position in 1837, and in 1842 was elected Fisher professor of natural history at Harvard University. Between the resignation of his post as botanist to the Wilkes Expedition and his acceptance of the chair at Harvard, he took the opportunity of traveling over Europe, where he made many social and scientific friends and in England met Dean Church of St. Paul's, London, then Fellow of Oriel College, Oxford, with whom he kept up a correspondence of the most intimate friendship until his death. Both were many-sided men of keen intellect and reverent minds. From 1842 to 1873, when he retired from his professorate at Cambridge, the life of Gray is to be read in his published works. He gradually developed the reputation of a botanist of the first rank, one of the greatest of his century, and certainly the greatest his country had ever produced. His lot was cast at a point in the history of science when the artificial system of botany was to pass away, and the new and natural method was to undergo development. There were vast masses of new material constantly pouring in from the newly explored middle western Territories, together with the rich spoils that government expeditions were bringing by sea from the Pacific coast. Prof. Gray, with the assistance of Dr. John Torrey (see TORREY, JOHN), set about to arrange these multitudinous specimens in accordance with the newest methods; to identify, name and classify them. His work was to be called the 'Flora of North America,' and was to be a comprehensive history of the botany of the country upon a classification basis of natural affinity. This work was not completed beyond the order of *Compositæ*, as the constant accessions of new specimens rendered the portions already published out of date, and proved that the attempt at so colossal an undertaking would be premature before all the material was in, and every specimen had been deliberately examined and classified. Yet Gray's pen could not be idle, and he published volume after volume in which he showed he was as clear and concise as an exponent of botany in its elementary principles, as he was skilful and bold in wide generalizations and profound analysis. His scientific position was that of a theistic evolutionist. He dissented from Darwin's opinion that variation was the result of fortuitous contingencies. He was a teleologist and believed that species were differentiated according to a preordained plan in the mind of a creator, and he was of the spirit that could subscribe to evolution and yet repeat the Catholic creed. His principal writings are as follows: 'Elements of Botany' (1836); 'Structural and Systematical Botany' (1879); 'Manual of Botany for the Northern United States' (1848); 'Genera Boreali-Americana Illustrata' (1849); 'Botany of the United States Exploring Expedition under Captain Wilkes' (1854); 'Plantæ Wrightianæ Texano-Neomexicanæ' (1853); 'Darwiniana, Essays and Reviews Pertaining to Darwinism' (1876); 'Synoptical Flora of North America' (1884); 'Natural Science and Religion' (1880); published posthumously, 'Scientific Papers of Asa Gray' (1889); and 'Letters of Asa Gray' (1894).

Gray, Barry. See COFFIN, ROBERT BARRY.

Gray, David, American journalist: b. Buffalo, N. Y., 8 Aug. 1870. He was graduated from Harvard in 1892, entered journalism in 1893 as a reporter and editorial writer for the Rochester *Union and Advertiser*, became managing editor of the Buffalo *Courier* in 1897, and after a course in law was admitted to the bar in 1899. He has published 'Gallops,' a collection of fox-hunting sketches reprinted from the 'Century.'

Gray, Elisha, American inventor: b. Barnesville, Ohio, 2 Aug. 1835; d. Newtonville, Mass., 21 Jan. 1901. During his attendance at Oberlin College his skill in handicraft enabled him to support himself by carpentry. He left college to apply himself to the improvement of electrical apparatus; and in 1867 received his first patent for a self-adjusting telegraph relay. He subsequently invented the telegraphic switch and annunciator for hotels, the telegraphic repeater, the private telegraph line printer, etc. The litigation between him and Alexander Graham Bell, both of whom claimed to be inventors of the telephone, resulted in a verdict in favor of the latter, whose rights were sustained by the Supreme Court. The telautograph, by which written messages were to be sent over the telephone or telegraph, was patented by him in 1893. For many years he was engaged practically in the manufacture of electrical apparatus in Chicago and Cleveland and founded the Gray Electric Company in Highland Park, Ill. The Congress of Electricians at the World's Columbian Exposition was organized by him in 1893, and he was elected to preside at its sittings. Among his writings the most notable are: 'Experimental Researches in Electro-Harmonic Telegraphy and Telephony' (1878); and 'Elementary Talks on Science.'

Gray, Henry Peters, American painter: b. New York, 23 June 1819; d. there 12 Nov. 1877. He was a pupil of Daniel Huntington in 1838, and after several years abroad he established himself in New York, and was president of the National Academy 1869-71. Among the most important of his works are: 'Wages of War,' now in the Metropolitan Museum; 'The Judgment of Paris'; 'Cupid Begging his Arrows'; 'Apple of Discord'; 'Blessed are the Pure in Heart,' an illustration of Irving's 'Pride of the Village'; 'Hagar and the Angel.'

Gray, Horace, American jurist: b. Boston 24 March 1828; d. Nahant, Mass., 15 Sept. 1902. He was graduated from Harvard in 1845. from the Harvard Law School in 1849; studied law also in the office of Judge Lowell; was admitted to the bar in 1851, and in 1854-61 was reporter of the Massachusetts supreme court. At the same time he became a leader of the Massachusetts bar, in 1864 was appointed an associate justice of the State supreme court, and in 1873-81 was chief justice. In 1881 he was appointed to the Supreme Court of the United States, and this post he held until his resignation in 1902.

Gray, John Purdue, American alienist: b. Half Moon, Pa., 1825; d. Utica, N. Y., 29 Nov. 1886. He was graduated from Dickinson College in 1846 and took a medical degree at the University of Pennsylvania in 1848. He was successively assistant physician and medical superintendent of the New York State Asylum at Utica. He introduced many improvements into the treatment of the insane, and was for many years editor of the 'American Journal of Insanity.'

Gray, Maxwell. See TUTTIET.

Gray, Robert, American discoverer: b. Tiverton, R. I., May 1755; d. Charleston, S. C., 1806. In 1787 he was appointed to the command of the sloop Washington, equipped by Boston merchants for trade with the Indians of the Pacific coast. He returned in the Columbia in 1790. and, proceeding by way of Canton, was the first to carry the United States flag around the earth. During a second voyage he discovered the Columbia River, which he named from his ship. He was subsequently in command of trading vessels.

Gray, William Crane, American Protestant Episcopal bishop: b. Lambertville. N. J., 6 Sept. 1835. He was graduated at Kenyon College (1859): ordained deacon in 1859 and priest in 1860. He was consecrated bishop of southern Florida in 1892.

Gray, Thomas, English poet and scholar: b. Cornhill, London, 26 Dec. 1716; d. Cambridge 30 July 1771. He was the fifth child and only survivor of 12 infants born to Philip Gray, a money-scrivener, and Dorothy Antrobus, a one-time milliner. The father was brutal and maltreated his wife, who had to support herself and her son. When Gray was 11 he was sent to Eton, where his uncle William Antrobus was one of the masters. Here he formed a close intimacy with a few boys of quiet tastes—notably with Horace Walpole (q.v.) and Richard West, upon whose death in 1742 he wrote one of the few sonnets to be found in the literature of the early 18th century. Seven years later (1734), Gray became a pensioner at Peterhouse, Cambridge, Walpole coming up the next year, but to another college. Gray found the courses at Cambridge unsatisfactory, his tastes being at that time literary rather than scientific and philosophical, and he was not sociable or inclined to sports. He left in 1738 without taking a degree, and lived a few months in London before he accepted Horace Walpole's invitation to become his companion on a "grand tour" of the Continent. They left England late in March 1739, spent some months in France and Switzerland, crossed into Italy in November, visited Florence, Rome, and other cities, returned to Florence in July 1740 and passed some time with Horace Mann, the English minister, afterwards Walpole's correspondent, and in April 1741 started for Venice but parted at Reggio in consequence of a quarrel as famous as it is mysterious in its details. It seems quite certain that Walpole's confession to William Mason (q.v.), the poet and biographer of Gray, that he treated his sensitive companion superciliously and so caused the rupture, is in essentials the true explanation; it seems also certain that their friendship would never have been renewed if anything very disgraceful had occurred; but it is equally likely that something happened about which it was desirable to keep silence. Gray went on to Venice by himself, returned through Verona, Milan, and other places, paid a second visit to the Grande Chartreuse, where he wrote in the album the famous 'Alcaic Ode' (August 1741—the original was destroyed by a mob in the French Revolution), and reached home 1 Sept. 1741. Two months later, his father, with whom Gray seems to have been on better terms than the parent's brutality warranted, died of gout after having squandered a fairly considerable fortune.

Gray and his mother remained in London for some time, the former, suffering from a naturally morbid temperament and the loss of his friend West, making but slight efforts to enter the profession he was dallying with, the law. In October 1742 Mrs. Gray went to live with her two sisters in the house of one of them at Stoke Poges in Buckinghamshire, and Gray betook himself to Cambridge in order to study the civil law. He was made LL.B. in 1743, but really spent most of his time reading Greek and annotating what he read with the care he had displayed in noting down what interested him during his tour.

Cambridge, though he disliked the place and had few congenial friends there, became practically Gray's residence for the rest of his life, since he could live comfortably on his small income and could have access to books. Among his few friends, who did not, however, remain in Cambridge permanently, were his correspondents Dr. Thomas Wharton and the Rev. William Mason, the latter a rather servile literary follower. In 1744 the friendship with Walpole was renewed and Gray became a visitor to Strawberry Hill. He also went every summer to Stoke Poges to see his mother, who died there in 1753. But he could never be drawn out by others, and he never "spoke out." A small literary controversy has arisen over the reasons of his sterility as a writer, some attributing it mainly to his retiring character and his constitutional melancholy and delicate health (*cf.* D. C. Tovey, 'Gray and his Friends' (1890); and

W. L. Phelps, 'Selections from Gray's Poems' (1894); others, of whom Matthew Arnold is the main exponent, emphasizing the blighting influence exercised upon Gray's essentially romantic genius by the dominance of the pseudo-classical school of Pope (*cf.* Arnold's essay on Gray in Ward's Poets, Vol. III.). There is probably something in both views. Gray was shrinking and fastidious in temperament, and he was also depressed by the standards of his age in respect to poetry; for, if he was not, he presents, as Arnold claimed, the extraordinary phenomenon of a poet whose achievements show the powers of a master producing far less than equally fastidious and delicate masters who have had the good fortune to write in epochs more propitious to their genius.

Meanwhile, Gray, indolent and irresolute though he was, had slowly laid the basis of his fame as a poet. In 1742 he wrote the sonnet to West, and the pensive and beautiful 'Ode on a Distant Prospect of Eton College' (published anonymously, 1747). In 1743 he began, but soon discontinued, his ably sententious poem on "The Alliance of Education and Government" —forestalled by the appearance of Montesquieu's 'Esprit des Lois,' but an interesting proof that Gray tried to get himself somewhat in touch with his contemporaries. Five years later the 'Ode to Spring' and the stanzas on the drowning of Walpole's cat appeared, and in 1749 he took up again the most famous of all his poems, the 'Elegy Written in a Country Churchyard,' which had been begun in 1742. It was finished at Stoke Poges in June 1750, and attracted so much attention in manuscript that a pirate announced his intention of printing it. This caused Gray to authorize Dodsley, to whom he rather loftily yielded all the profits, to print an edition in February 1751. It attained at once the popularity it has never lost, and was much imitated and parodied throughout the western world. In August 1750 that admirable piece of *vers de société*, 'A Long Story,' was written, and in 1753 his six best poems, including a 'Hymn to Adversity,' were published with designs by Richard Bentley. The next four years saw the writing and printing (at Strawberry Hill) of the two Pindaric odes, 'The Progress of Poesy' and 'The Bard'—not the earliest but among the best of their kind in English and exhibiting, as Gray and Arnold thought, the highest reaches of Gray's poetic genius. Curiously enough many people found them obscure, but they had warm admirers from the beginning, one of whom secured for Gray, late in 1757, the offer of the Laureateship, which he declined.

The rest of Gray's life is summed up in his friendships, his studies, and his travels. In 1756 he changed his quarters from Peterhouse to Pembroke because some undergraduates, hearing that his fear of fire had caused him to buy a rope ladder, induced him by their cries to use it and in consequence to land himself in a tub of water. The rude prank was not followed by the proper punishment, and Gray was very indignant. He found consolation, however, in making young friends like Norton Nicholls, in studying (1759-61) in the newly opened British Museum, and in taking tours through regions marked by romantic scenery, to the beauties of which he was one of the first Englishmen to open his eyes appreciatively in a modern fashion. In 1764 and 1765 he visited Scotland (making friends with a fellow Romanticist, James Beattie—q.v.), and in 1769 he paid the famous visit to the English Lakes described in his journal. In connection with his love of romantic scenery and with the morbid temperament, which gave him his post of eminence among the "Churchyard Poets," should be mentioned his enthusiasm for the buildings and the writings of the "Gothic" past—another characteristic feature of the new school of revolt from classicism. Gray was delighted with Macpherson's 'Ossian' and wrote in imitation of the Norse and Welsh his 'Fatal Sisters'; 'Descent of Odin'; and 'Triumphs of Owen' (published 1768). In 1762 he had applied for the regius professorship of history and modern languages at Cambridge but had failed to secure it; six years later, his successful competitor having died from an accident when drunk, the post with its good salary and nominal duties was given to Gray. He did not wish to seem ungrateful and so, in return for the Duke of Grafton's kindness, he wrote an ode for the installation of that worthy as chancellor of Cambridge (1 July 1769). The next year he visited London with his young friend, the Swiss naturalist Bonstetten, but in 1771 he was forced to deny himself the pleasure of going to see this friend in his foreign home. He was taken violently ill with gout of the stomach and died on July 30. He was buried a week later in a vault with his mother at Stoke Poges.

Despite the paucity of his poetry, Gray's position as a classic has long been secure. He is the chief English elegist and eminent as a master of the elaborate, not the simple and singing lyric. His letters are among the most charming of his period, and his notes on classical and mediæval authors, on genealogy, heraldry, painting, architecture, ornithology, and botany show the extraordinary range of his accomplishments. His knowledge of Norse has been greatly exaggerated (*cf.* G. L. Kittredge in Phelps), but in certain senses Leslie Stephen did not exaggerate when he wrote in the 'Dictionary of National Biography,' apropos of a man who could admire almost equally Shakespeare and Racine, that Gray, "the most learned of all our poets . . . was naturally an eclectic."

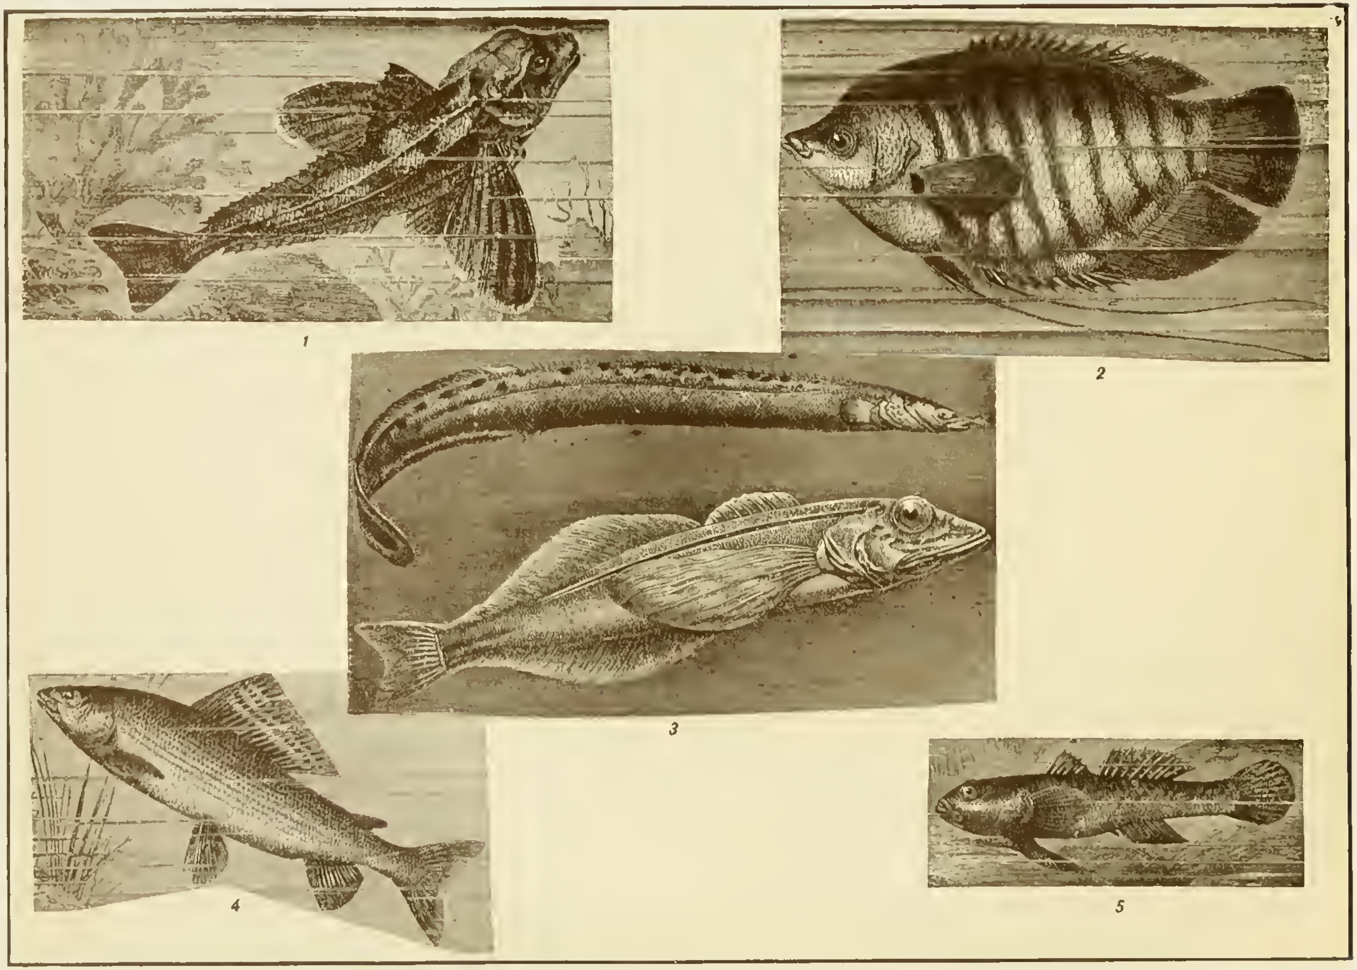
Bibliography.—For Gray's life see the biography by Mason (1774)—not that by Johnson, which is one of the worst of the 'Lives,'—and also the letters given in the editions of Mitford and Gosse. The latter (4 Vols., 1884) is the fullest. There are numerous editions of the poems, *e.g.*, the new 'Aldine' by John Bradshaw (1891); and there is a fair amount of criticism to be found in the books previously named and in Gosse's biography in the 'English Men of Letters' (1882). Add the works of Phelps and Beers on English Romanticism in the 18th century and the histories of English literature, as well as a good essay by Lowell. Tovey's 'Gray and His Friends' contains a considerable amount of previously unpublished material.

William P. Trent,
Professor of English Literature, Columbia University.

Gray Duck, the gadwall (q.v.).

Gray Whale (of California). See Rorqual.

Grayback, the name, in popular speech, of several animals strikingly gray in color, as the



1. Gurnard (Trigla hirundo). 2. Gourami (Osphromenus olfax).
3. Indian Spring Eel (Mastacembelus armatus), above; and Golomynka or Oilfish of Lake Bailkal (Comephorus baikalensis), below.
4. Grayling (Thymallus thymallus). 5. European Goby (Gobius fluviatilis).

gray whale (see Rorqual); the knot (q.v.) and certain other shorebirds; or a body-louse. See Louse.

Graybeard Moss. See Usnea.

Graydon, James Weir, American inventor: b. 18 Jan. 1848. He was graduated at the United States Naval Academy; served during the Civil War period in the Federal army under Sherman and Grant; was later promoted lieutenant in the navy, and resigned. His inventions include a dynamite gun; the Graydon gigantic wheels; an aërial torpedo; a cable system of torpedoes, and a railway carriage heater, all bearing his name.

Grayhen. Feminine of Blackcock (q.v.).

Graylag Goose. See Geese.

Grayling, A fish of the family *Thymallidæ*, much resembling a slender salmon, 15 to 18 inches long, and formerly included in the salmon family. Some five species of the single genus *Thymallus* are known, all inhabitants of northern regions, in rapid streams where the water is clear and cool, and the bottom sandy or pebbly. Its habits are similar to those of trout, except that it spawns in the spring. Its flesh is excellent, with an odor and flavor, when fresh, of wild thyme. It is caught by fly-fishing as for trout, and is a favorite with anglers. Two species are known in North America, each with so limited and scattered a distribution that they are regarded as modified relics of a preglacial circumpolar species. The Arctic grayling, or «poisson bleu» (*T. signifer*) of the fur-hunters, inhabits only the Mackenzie basin and rivers in Alaska. The more southerly and familiar grayling (*T. tricolor*) is restricted to certain streams in northern Michigan, where it is almost extinct, and seems incapable of recovery by fish-cultural methods; and to Montana. These fish are distinguished from trout or salmon by the large size of the dorsal fin and by their grayish hue, with half-a-dozen deep blue spots on the fore part of the abdomen. Consult: Pritt's ‹Book of the Grayling› (London 1888); and Jordan & Evermann's ‹American Food and Game Fishes› (New York 1902).

Gray's Inn, one of the four Inns of Court, in London, situated on the north side of Holborn and to the west of Gray's Inn Lane. It contains a hall of the period of 1560. It derives its name from the noble family of Gray of Wilton, whose residence it originally was.

Gray's Peak, a peak in the Colorado range, in Colorado, and one of the highest in the Rocky Mountains. Its height is 14,341 feet. It was named in honor of Asa Gray, the botanist.

Gray'weather, or **Graywether,** a sandstone of the Tertiary strata scattered over the surface of the ground in Dorsetshire and Wiltshire, England. It was from these stones that the famous druidical circles were built.

Grease-bug, or **Overflow-bug,** a ground-beetle (*Platynus maculicollis*), common in California, and occasionally a pest in houses because of its disagreeable odor when crushed, and because it nibbles bread and meats.

Greasewood, a small, very thorny, almost leafless shrub (*Sarcobatus vermiculatus*) of the goosefoot family (q.v.), which abounds among the sage-brush on the arid plains of the western United States, especially where the soil is saline. The wood, which is yellow and very hard and tough, frequently supplies the only fuel available there, and burns with a bright hot crackling blaze suggesting grease.

Great Auk. See Garefowl.

Great Awakening, the popular name of a great and tenacious «revival» in New England, 1740–5, under the influence of Jonathan Edwards and George Whitefield. Edwards had created a similar excitement in Northampton five years before, the embers of which were still glowing, but on Whitefield's visiting him in the fall of 1740, and preaching his thrilling sermons in addition to Edwards', the wave spread all through New England, involving over 150 towns, and rising almost to frenzy. It was marked by the extremest accompaniments of bodily seizures, convulsions, hysteria, etc., and aimed especially to bring young children under its control. Edwards was rightly considered its author, and was fiercely denounced for its irrationality and evil effects on public worship, as well as the temporary ruin of calm and fruitful work; he defended it for some time, but its results at last came to be deplored even by its champions, and by 1742 it was threatening not only the peace but the life of the churches. So bad were its effects that to the reaction has been attributed the religious deadness of the country for the next 60 or 70 years. The separation of the «converted» into an arrogant clique who often seceded in separate churches, the upspringing of a horde of ignorant lay preachers making physical effects the touchstone of religion, the indecent rivalry in «manifestations,» the denunciation of all the trained ministry as lacking divine grace, were only a part of its demoralizing outcomes. The faculties of Yale and Harvard colleges pronounced against it, as did the leading divines; the Massachusetts General Convention of 1743 added its testimony, and in Connecticut an effort was made to enforce the Saybrook Platform against the independence of congregations.

Great Barrington, Mass., town in Berkshire County, on the New York, N. H. & H. R.R.; 40 miles west of Holyoke. In the town are three villages: Great Barrington, Housatonic and Van Deusen. It was settled in 1725, but formed a part of Sheffield until 1761. William Cullen Bryant was town clerk for several years, and the thoughts in many of his poems were suggested by the beautiful Berkshire scenery. The town has a good public library, the Hopkins Memorial Manse, the Sedgwick Institute, and a number of good elementary schools. The manufactures are cotton goods, electrical apparatus, and paper. Pop. 5,872. Consult: Taylor, ‹History of Great Barrington.›

Great Basin, a vast region of interior drainage, a triangular plateau of North America, occupying the western part of Utah, and nearly the whole of Nevada, parts of Oregon and California, and extending at its northeast angle into Idaho. It is bounded on the west by the Sierra Nevada and on the east by the Wasatch Mountains. The base of the triangle at the north is 500 miles from east to west, and the extent from north to south is 800 miles. The area is about 210,000 square miles, a little larger than France. It is traversed by numerous mountain ranges, irregular in arrangement; the valleys are mostly sinks, the chief drainage centre being Great Salt Lake (q.v.). The areas of greatest depression are to be found near the borders, and the greatest elevation near the central part. The highest range is the East Humboldt, one peak of which, Mount Bonpland, is 11,321 feet in height. Volcanic masses form or conceal the original rocks of many of these ranges. The slopes and the geological markings show that the lakes and rivers which once existed within this region have become smaller and some have disappeared. The greater portion of this section was once in the basin of the Columbia River. The Great Basin contains many streams and lakes (the latter for the most part salt) whose waters never reach the ocean, but are either taken up by evaporation or their waters sink in the desert sands. The mean annual rainfall ranges in different localities from 4 to 15 inches. The plateau is nearly destitute of trees, and in general only the upper parts of the valleys are clothed with desert shrubs, their lower portions often being covered with muddy water or with several inches of alkaline salts left by evaporation. The chief arid places are the Great Salt Lake Desert, the Mohave Desert, and the Carson Desert. This Basin is rich in mineral wealth; gold, silver, iron ore, and copper exist here in large quantities.

The Great Basin is among the large interior drainage sections of the world; but the interior drainage basin of Asia is 23 times as great, and the Sahara 16 times as great.

Great Bear Lake. See Bear Lake, Great.

Great Bend, Kan., city, county-seat of Barton County; on the Arkansas River, the Missouri P. and the A., T. & S. F. R.R.'s; about 92 miles northwest of Wichita. The Central Normal College is located here. It is a trade centre for the surrounding agricultural region, and contains flour mills and iron works. Pop. 2,500.

Great Bridge, Va., Battle at, 9 Dec. 1775. Lord Dunmore, royal governor of Virginia, hearing that a patriot force from North Carolina was on the way to occupy Norfolk, the largest town in Virginia and its chief port, built a rough fort at Great Bridge, over the Elizabeth River, commanding the southern approach. The Virginia patriots raised a band of sharpshooters, including John Marshall, afterward Chief Justice of the United States Supreme Court, took possession of the opposite bank, and in a 15-minute fight, which cost Dunmore 61 regulars and the militia none, forced him to abandon the fort. A few days later the Virginians occupied Norfolk, which the spiteful governor set on fire before taking refuge in a war-ship in the harbor. The town was reduced to ashes.

CONTENTS OF THE DEPARTMENT OF GREAT BRITAIN

GREAT BRITAIN:

HISTORY AND MODERN DEVELOPMENT.

INTRODUCTORY.

The following series of articles, dealing with various aspects of the life of the United Kingdom, is intended to present a coherent account of present British conditions and activities, and of the historical circumstances which have led up to them. On a balance of considerations the usual encyclopædic arrangement in alphabetical order has been abandoned. Encyclopædias are used by two classes of people — for reference by those who have access to other books, for reading by those who must live in the main removed from books. For purposes of reference there is no doubt much to be said for the alphabetical order of arrangement. But knowledge is organic; no fact can be understood in isolation, or fully understood apart from the general scheme and atmosphere of the department of knowledge to which it belongs. Even for reference it is therefore likely that matter grouped according to some natural order, if supplemented by an alphabetical index, will convey the truer impression. For continuous reading there can of course be no question of the superiority of such an order.

The characteristic of British Institutions is that it is impossible to understand them apart from their history. They rarely have logical consistency, for the English suspect ideas, notwithstanding the fact that in certain departments the world owes great ideas to some Englishmen. The typical Englishman suspects an idea because he is impressed with the complexity of experience. He is a creature of habit, not so much from inertia as from caution. His political wisdom does not express itself in such phrases as "Liberty, Equality, and Fraternity," but in practical and limited expressions such as "Freedom of Speech," or "Freedom from Arrest," and in such working laws as that "the remedy of grievances must precede supply." He is willing to change his habits, but only when they have become inconvenient to him because of changed conditions.

The British constitution has never been reduced to writing. It is matter of habit, and throughout history has been in a state of flux. Thus the English manage to combine a curious conservatism with a way of advancing in some matters ahead of the rest of mankind. They have little feeling for symmetry, and are not hurt by anomalies, hence their practical sense of compromise, and their trust in the curative power of time. Though the least consciously historical of all the great races, their institutions are only explicable with the aid of history. Therefore the aim set before the contributors to the British section of this Encyclopædia has been to sketch the leading characteristics of the British nation, and so to sketch them that they are seen to be the natural outcome of history.

The fifty-five articles which follow fall into eight groups. First we have a group concerned with the Making of England, the senior and predominant partner in the United Kingdom. Here the history of Britain, and especially of England, is told with a definite object. There are some episodes and some aspects of history which have chiefly an archæological value. Their results no less than their causes are past. But there are others whose results have endured, and are embodied in the features of to-day. Bagehot somewhere compared the different standpoints in history to the different grouping of the monuments of the same city when seen from two different towers. The perspective of these articles is that of the social and economic observer of to-day, who seeks to explain the present in the light of the past rather than the past in the light of the present. We have nine articles in the first group, viz.:—

A.— THE MAKING OF ENGLAND.

2. Geographical Environment The Editor.
3. The Conquests............Dr. Thomas Hodgkin.
4. Mediaeval England........Prof. T. F. Tout.
5. The Reformation.........Prof. A. F. Pollard.
6. The XVIIth Century......Dr. William A. Shaw.
7. The XVIIIth Century:
   (a) Political Sketch.....Dr. Lilian Knowles.
   (b) The French Wars... Dr. J. Holland Rose.
8. The XIXth Century:
   (a) Political Sketch.....Dr. J. Holland Rose.
   (b) Political Parties.....Sir Thomas Raleigh.

In the second group we have a description of the Mechanism of British Government, both Central and Local. Historical considerations have not been, and indeed could not be wholly excluded, but the aim of the articles in this group is to explain the system, so far as there is a system, and the habits of British Government. The point which will probably strike an American as characteristic of the whole machine is its centralization. The sharp distinction and counterbalance of legislative, executive, and judicial functions, and of local and central powers, are unknown. So far as natural laws and the prejudices begotten of history permit, Parliament is omnipotent. Within Parliament the House of Commons, and within the Commons the Cabinet, and within the Cabinet the Prime Minister count for more than any other force.* It is within the power of no court of law to declare that Parliament has acted *ultra vires*, and the local authorities have no rights which cannot be overridden by Act of Parliament. In this second group we have five articles:

* This statement is not invalidated by the fact that some members of the Cabinet, and sometimes even the Prime Minister, are chosen from the House of Lords.

B.— THE MECHANISM OF GOVERNMENT.

9. PARLIAMENT......... SIR COURTENAY ILBERT.
10. CROWN AND CABINET. PROF. EDWARD JENKS.
11. THE JUDICIAL SYSTEM DR. WM. BLAKE ODGERS, K. C.
12. LOCAL GOVERNMENT.. SIDNEY AND BEATRICE WEBB.
13. THE CIVIL SERVICE.. MR. GRAHAM WALLAS.

Then there follows a small group of articles dealing with the peculiarities of the three Junior Partners in the United Kingdom. Scotland was a Centralized Monarchy, long allied with France in hostility to England. She retains her own law and churches, but similarity of race and of resources have permitted of her blending with England into a single economic organism. Ireland has never been a single independent state, yet geographical, religious, and economic causes have always held her apart from England, notwithstanding the strategical necessity which has prevented and prevents her separation. Wales has had even less of national history than Ireland, yet the Welsh race has maintained a separate vitality, although expressed rather in literary than political institutions. There is perhaps no greater political anomaly in the world than the peculiarly illogical — characteristically British — relations of the four nationalities which form the United Kingdom. The articles of this third group are as follows:

C.— THE JUNIOR PARTNERS.

14. SCOTLAND................ PROF. P. HUME BROWN.
15. IRELAND................. THE REV. T. A. FINLAY.
16. WALES................... PROF. EDWARD ANWYL.

From political government we turn in the next group of articles to the Control and Movement of the National Wealth. The banker and the merchant, the ship-owner and the railway chairman compete in these days with the political statesman for the control of humanity. In this department also of the national life of Britain centralization is characteristic. English banking and railway management are centralized in London, and in a less degree the same is true also of British shipping and commerce. Though some banks and railways and many shipping companies have their head offices outside the Metropolis, yet the banking and railway clearing houses, and Lloyds, the chief seat of shipping insurance, are within it. Even the Scottish and Irish banks depend ultimately on the gold reserve of the Bank of England. Britain, in other words, is a single compact organism with a metropolitan nucleus containing one-sixth of its population. No other important centre is at a greater distance than can be traversed by an express train between the morning and the evening meal. Thus it comes about that a relatively small group of leaders, known either directly or indirectly to one another, go near to controlling all departments of the national life. In other words, Britain is essentially an oligarchy limited by democracy. This fourth group consists of seven articles:

D.— THE CONTROL AND MOVEMENT OF WEALTH.

17. NATIONAL FINANCE....... DR. EDWIN CANNAN.
18. BANKING AND CURRENCY .. SIR FELIX SCHUSTER AND MR. ERNEST SYKES.
19. COMMERCE:
   (a) XVIIIth CENTURY.. DR. LILIAN KNOWLES.
   (b) PRESENT DAY....... MR. A. J. SARGENT.
20. SHIPPING:
   (a) NAVIGATION ACTS... DR. LILIAN KNOWLES.
   (b) PRESENT DAY....... MR. RUSSELL REA, M. P.
21. RAILWAYS................ MR. W. M. ACWORTH.

We then turn to the fifth group which deals with the Production of British Wealth. Here necessarily there is greater decentralization for we come closer to the soil, the mines, and the coasts. The great staple industries of Britain are away from the Metropolis, and in the industrial districts we find a new social and intellectual atmosphere. The three minor nationalities and the Industrial North of England are the democratic forces which compete with the agricultural, commercial, and administrative oligarchy in London. The articles of this group are:

E.— THE PRODUCTION OF WEALTH.

22. AGRICULTURE:
   (a) THE LAND LAWS...... MR. J. FISCHER WILLIAMS.
   (b) XVIIIth CENTURY..... DR. LILIAN KNOWLES.
   (c) XIXth CENTURY...... MR. A. D. HALL.
23. FISHERIES.................. SIR HERBERT MAXWELL.
24. MINING..................... PROF. R. A. S. REDMAYNE.
25. INDUSTRIES:
   (a) INDUSTRIAL REVOLUTION DR. LILIAN KNOWLES.
   (b) EXISTING INDUSTRIES.. MR. W. A. S. HEWINS.

The institutions discussed in the next, the sixth group, are chiefly products of northern industrial thought. The trade unions and the industrial co-operative societies have originated in the north, and have there reached their most efficient and general development. From that region, also, has come the stimulus for factory legislation. The articles in the sixth group are as follows:

F.— INDUSTRIAL RE-ORGANIZATION.

26. TRADE UNIONISM..... SIDNEY and BEATRICE WEBB.
27. THE LABOR POLITICAL MOVEMENT......... MR. E. R. PEASE.
28. CO-OPERATION.......... MR. H. W. MACROSTY.
29. FACTORY LEGISLATION. SIDNEY and BEATRICE WEBB.

The articles in these six groups have dealt with political and economic power. In the seventh group we turn to what may be described as the ideal life of the nation — its religion, its education, and its amusements. But even here one cannot help being struck by the essential unity of English life. The churches and society are intimately concerned with politics. No large interest in Britain holds aloof from government. The typical English education aims at the shaping of character for political and commercial activities rather than at intellectual training for the achievements of scholarship. The articles of the seventh group are:

G.— THE IDEAL LIFE OF THE NATION.

30. RELIGION:
   (a) THE CHURCH OF ENGLAND........ DR. A. C. HEADLAM.
   (b) NONCONFORMITY.... THE REV. DR. JOHN BROWN.
   (c) ROMAN CATHOLICISM MONSIGNOR BERNARD WARD.
   (d) JUDAISM........... MR. ISRAEL ABRAHAMS.
31. EDUCATION:
   (a) GENERAL........... MR. GRAHAM BALFOUR.
   (b) MEDICAL........... DR. FRANCIS FREMANTLE.
   (c) ENGINEERING....... PROF. D. S. CAPPER.
32. SOCIETY.................. THE HON. MRS. ALFRED LYTTELTON.
33. SPORT.................... THE RIGHT HON. ALFRED LYTTELTON, K. C., M. P.
34. THE FINE ARTS......... MR. A. J. FINBERG.
35. NEWSPAPERS............. MR. J. A. SPENDER.
36. THE TREND OF THOUGHT AND LITERATURE IN THE XIXth CENTURY....... DR. SIDNEY LEE.

Finally, we have an eighth group of articles dealing with the external expression of British life. Here we find the same forces in action — the dominant imperialism of London, with its great tradition of statesmanship, limited by the partially antagonistic ideals of the industrial and democratic north. The eighth group of articles is as follows:

II.— EXTERNAL RELATIONS.

37. Navy.................... Lieut. Carlyon Bellairs, R. N., M. P.
38. Army.................... The Right Hon. H. O. Arnold-Forster, M. P.
39. Foreign Policy:
 (a) In Relation to Europe........... The Hon. George Peel.
 (b) In Relation to India............ Sir Walter Lawrence.
40. The Free Trade Movement.................... Mr. J. St. Joe Strachey
41. The Tariff Reform Movement.................... Mr. J. L. Garvin.
42. The Reaction of the Empire on the Mother Country.............. Mr. J. L. Garvin.

The writers of the articles in these eight groups are authorities on their respective subjects. They all speak either from long study or long practical experience, and I desire to thank them for the pains they have taken with the object of presenting as complete a picture of the political, social, and economic condition of the Old Country as space would permit of. The intention of each has been to convey the key ideas and not merely the statistics of the department entrusted to him. Bibliographies have been appended throughout, as a guide to readers who would pursue further particular studies in which they are interested. In these days when libraries are multiplying throughout the Anglo-Saxon world, the function of an Encyclopædia should not only be to reply to the questions which arise incidentally to study and business, but also to act as a guide to the leading sources of information which we may reasonably expect to find on the shelves of a good library.

H. J. Mackinder.

THE MAKING OF ENGLAND.

2. Great Britain — Geographical Environment. The Greeks could not have played their decisive rôle in history had they not dwelt in the centre of the lands, amid the islands and peninsulas between Europe and Asia. Nor is it likely that any race less happily endowed could have achieved what the Greeks achieved even in that favored environment. A like relation is true as between the British race and the British Isles.

The origins of the British race are recounted in the next article of this volume. It is the aim of the present article to analyse the geographical influences which have contributed to British history.

Popular philosophy, as embodied in Shakespearian phrases such as the "moat defensive" and the "silver streak," would dismiss the matter as almost too simple and obvious for set discussion. The insularity of Britain has no doubt counted for more than any other single geographical cause, but the British polity and character are in fact the product of a very singular combination of geographical no less than historical circumstances. For the purposes of this short summary the major geographical controls of British development may be grouped under the nine following heads:

1. Insularity.
2. Shallow surrounding seas.
3. Neighborhood to the continent.
4. Relation to the chief linguistic frontier of Europe.
5. Climate determined by oceanic winds.
6. Internal natural divisions.
7. Adequacy of economic bases.
8. Geographical momentum.
9. The consequences of sea power.

1. *Insularity.*— Britain has not been successfully invaded since the defeat at Hastings eight and a half centuries ago. The Englishman is ever conscious of this fact — it is a frequent argument in twentieth century political speeches. The victories over the Spanish Armada and at Trafalgar have served to increase the sense of security, and freedom at home and empire abroad are the twin results. At home there has been an ineradicable jealousy of a standing army, and there has therefore been freedom for the development of what Bagehot described as "government by talk." The navy on the other hand has at most times been viewed with favor, for it has screened the experiments and mistakes by which popular government has been slowly nurtured. These mistakes were often such as would have involved a continental nation in the consequences of a Jena or a Sedan.

Insularity has also permitted of a concentration of purpose upon the sea which was impossible for the other maritime states along the western seaboard of Europe. England succeeded where Portugal, Spain, France, and Holland failed, because, in the absence of a land frontier, her economic resources could be focussed on adventure beyond the seas. In this regard it must be borne in mind that sea-power does not rest on the navy alone, but on the co-operation of a mobile army with a dominant navy. An army limited to this subsidiary use has been possible for Britain because of her insularity. By her navy and amphibious army Britain won North America and the sovereignity of the Indies, while France and Holland were involved in continental wars. It was by the exhaustion of her enemies rather than by her victories that Britain achieved her empire. This is surely the truth which lies behind Seeley's famous utterance "that Britain made an empire in a fit of absence of mind." Behind her girdle of seas she fought with a limited liability and was immune at home though often defeated abroad.

John Bull's insularity of character is the natural result of his strong frontier. Elsewhere the types of humanity merge gradually where political frontiers are crossed. In some respects this contrast between the British and the continental peoples was in the past even more obvious than to-day. Not only, on the one hand, is the traffic over the seas more frequent now, and Britain's isolation in time of peace less marked, but on the other hand, the change at the conventional continental frontier has been emphasized owing to the centralized character of the modern great state. It is the stalwart Prussian Protestant who does duty now-a-days on the frontier of Alsace-Lorraine, not the Swabian, shorter, darker, and Catholic neighbor of the Frenchman across the line. Ever since the days of the first Edward, the Englishman has felt himself a foreigner from the moment that he landed at Calais or Boulogne.

2. *Shallow Surrounding Seas.*— The British Isles are the emergent portions of a great shoal known as the Continental Shelf, which stands out seaward from the mainland coast. Precisely as waves grow taller until they break on the foreshore, so the tides, which measure in mid-ocean only some two or three feet in amplitude, are magnified several fold as they pass on to the British shoal. Strong currents are thus generated as the wide British seas alternately deepen and drain low. Cæsar bore eloquent testimony to the influence of our tidal currents in the defeat of his strategy. The British tides, however, have had a uniting as well as a disuniting influence. Streams and streamlets whose mouths in other parts of the world would be mere creeks without fame, in these seas bear the historic names of Thames and Severn, Rhine and Seine. Even in the days of steam motive power, the flow and ebb of the Thames to and past London are worth much money annually — a fact which is one of the chief arguments against the scheme often proposed for erecting a dam below the metropolis and so keeping the water permanently high. What the tides were in the days before steam is evident from the position, many miles from the open sea, of such ports as London, Antwerp, and Hamburg.

Nor must it be forgotten that the shallow seas around Britain are exceptionally productive of fish. The fishermen of Holland became the carriers from Lisbon to the Baltic, and when Lisbon fell temporarily under the power of Spain, these same Dutchmen extended their voyages to the Indies. To-day, however, the fishermen of England and Scotland are in a great majority on the international fishing grounds of the North Sea, and the powerful steam fishing vessels which are now being built extend their operations as far as Iceland on the one hand and the coast of Morocco on the other. It is an important fact for a state whose power is on the sea that there are no fewer than one hundred thousand English, Scotch, and Irish who earn their living wholly or in part by sea fishing.

3. *Neighborhood to the Continent.*— Britain would have had small significance in the world had her position been distant from the historic shores of Europe. It is of course true that the ancient writers from Virgil to Shakespeare are full of the remoteness of Britain at the end of the known world. It is true also that until a relatively late period in history Britain did not count among the powers which shaped the destiny of mankind. These very facts however have enabled Britain to play a part in the last two or three centuries which is comparable to that played by the Greeks on the smaller stage of the earlier time. Because of her neighborhood to Europe, Britain was deeply and repeatedly influenced from several distinct quarters, yet because of her insularity was never permanently attached to any one centre of European culture. It has been Britain's function to amalgamate the several elements of European civilization, and then to spread Europe to all the shores of the world. At least four streams of blood — Neolithic, Celtic, Roman, and Teutonic — and four linguistic influences, all drawn from across the narrow seas, have gone to the making of modern Britain. Yet the Englishman of to-day differs generically from all the species of continental European. Britain has been and is *of* Europe yet not *in* Europe.

From this point of view it is important also to notice that the hilly parts of the British Isles are in the north and the west — toward the ocean that is to say, not toward the continent. As a result, the agricultural England of the plain, the dominant partner in the United Kingdom, lies toward the channel, and London is close neighbor to Paris and the Netherlands. History would have been far other than it has been had the hills been in the south-east and the plains in the north and west.

4. *Relation to the Chief Linguistic Frontier of Europe.*— A glance at a map of Europe showing the areas occupied by the several languages would make it clear that the most important linguistic frontier, that between the Romance and Teutonic tongues, traverses Europe diagonally from the Alps, and comes down to the coast in the northern corner of France, within sight of Dover Castle. England has received from the Rhine, the Elbe, and the Norwegian fjords her Teutonic language and the rudiments of her free institutions, while she has taken from the Seine, and from the western Mediterranean beyond, her Christianity and her scholarship. Scandinavia on the one hand and Spain on the other possess a geographical separation almost as definitely secure as that of Britain, but Scandinavia is Teutonic and Spain is Romance. Britain has been cross-fertilized from both sources.

Moreover, Britain has re-acted upon the dual Europe with the power due to her position. If the adjoining continent, with its greater population and greater aggregate wealth, had been united politically, the independence of Britain would have been impossible. As Mr. Peel has shown in his article (see GREAT BRITAIN — FOREIGN POLICY IN RELATION TO EUROPE), we have at most times used our power to defeat every bid for general European dominion. Rome conquered a large part of Europe and she also subdued Britain. Napoleon's aim was to invade England, and England only defeated him by overthrowing his European Empire. The task of holding Europe disunited has been facilitated in every age by the fundamental antagonism of Roman and Teuton. Britain's immediate neighbors across the Channel, to-day, as in the time of Napoleon, of Louis XV., of Louis XIV., and of Charles V., are on the Rhine and also on the Seine. In the same connection let us note that in the year 1066, at Stamford

Bridge and at Hastings, England exchanged, as Dr. Hodgkin points out (The Conquests) in this volume, a period of Teutonic for a period of Romance influence.

5. *Climate Determined by Oceanic Winds.*— Britain lies further north than any other country of equally old civilization. Great Britain occupies almost precisely the same latitudes as Labrador. The prevalent westerly wind from the Atlantic, and the set of the Atlantic waters from the tropical southwest carry the warmth and moisture of lower latitudes into a great climatic bay over Britain, in which long frosts and long droughts are equally rare. Unlike either the south or the east of Europe, there is labor in the fields at all seasons, for Britain has neither a Mediterranean summer nor a Russian winter. May not the moral effect of this continuity of effort account for some of the so-called Anglo-Saxon characteristics? Yet the mists of the oceanic air and the long northern nights are often as unfavorable to repose in the open as the other conditions are favorable to work there. Hence a second Anglo-Saxon characteristic, the home round the fireside.

Nor, it must be remembered, is climatic control limited to agriculture and domestic conditions. There are splendid waterways in the wide plains of eastern Germany and Russia, but navigation is there intermittent owing to the long grip of the winter frosts. The rivers of Spain and Italy have abundant volume after the rains and the thaw in the mountains, but they are reduced in the summer to strips of pebble desert. The smaller waterways of England, closed neither in winter nor summer, were long ago made navigable by means of locks.

6. *Internal Natural Divisions.*— Britain is divided into the two islands of Great Britain and Ireland. The same causes which have separated British conditions as a whole from those of continental Europe have of course tended to separate Irish conditions from those of Great Britain, but they have acted with less effect, because Britain by her position has been driven to obtain sea power, and thus for many purposes to remove her frontiers from her own coast to the coasts across the water. Thus Ireland has been strategically enveloped by England, yet because adequate English man-power was lacking in the time of Henry II., Queen Elizabeth, and Cromwell, was never completely assimilated to England. Ireland conquered, and necessarily conquered, by England, is in the position that Britain would be in if there were a united Europe across the Channel. Had Ireland been an organized kingdom in the early Middle Ages, instead of a group of rival and hostile tribes, she would have supported Scotland against England, would have retained her independence longer, and when modern conditions rendered union inevitable, would have come into the sisterhood like Scotland as an organized force capable of holding her own.

What every map does not show, however, is the coherent area of bleak uplands occupying the centre of the length of Great Britain, and dividing the agricultural lowland of England from the smaller lowland of Scotland. This upland area has no single name, but is known in different parts as the Southern Uplands of Scotland, the Cheviot Hills, the Pennine Moors, and the Lake Mountains. Until a century and a half ago it had but a sparse population, and was in fact a broad natural frontier between the England of London and the Scotland of Edinburgh. This "border," utilized by a people of Teutonic tenacity, was the geographical position from which Scotland for six centuries held at bay the superior might of England. Not a little of the effect of modern British action in the world is due to the interaction of the two national characters thus evolved in antagonism.

The central uplands of Great Britain between England and Scotland are now the seat of great industries, and for most purposes the two countries form a single economic organism. But in the Highlands of Scotland on the one hand, and in the broad upland of Wales on the other, a remnant of Celtic speech still survives. In all parts of the world there is a marked contrast between the highlander and the lowlander, but this contrast is here increased by that between Celt and Teuton. Formerly marriage was between neighbors, and provincialisms were inbred. But modern facilities for communication lead to distant intermarriages, which are rapidly imparting a national solidarity of blood to states like Britain. This crossing of highlander and lowlander, Celt and Teuton, within Britain must be productive of a change in the race which may prove something far other than the mere striking of an average.

7. *Adequacy of Economic Bases.*— All the preceding advantages — insularity, shallow surrounding seas, continental neighborhood, linguistic division among rivals, soft climate, and internal stimulative contrasts — would, however, have been of little value unless Britain had had length and breadth enough to supply the economic bases for a people able to count among the Powers of Europe. It is therefore important to note on the map of Europe a certain rough equality as between the great natural regions — the Spanish, Italian, and Balkan Peninsulas; the plain of the Middle Danube; the French land between the Alps, the Pyrenees, the Bay, and the Channel; the north German plain; and the southern habitable portion of Scandinavia. Even the vast Russian plain, after all only partially European, must not deceive by the space which it occupies on the map. North and east of the great bend of the Volga at Kazan it contributes little to the strength of the Russian people. Many advantages and disadvantages, moreover, compensate for such differences of mere area in this bundle of natural regions which we call Europe. Thus there is a rough equality of resource among the tenant nations, and this has sufficed for a balance of power during several centuries.

Until within the last few generations agriculture was the chief economic base of these nations. For the reason given just now — the separation of their agricultural plains — England, Scotland, and Ireland were separate economic organisms. Relatively to her population, England was until lately so adequately endowed with land that in the Middle Ages she was the principal exporter of wool, and in the 18th century, of wheat, to the continent of Europe. The vast improvement of agriculture achieved by the English farmer in the 18th century was one of the chief causes — if not the chief — of the wealth which enabled England to defeat Napoleon. (See GREAT BRITAIN — AGRICULTURE IN THE 18TH CENTURY, by Dr. Knowles).

Though agriculture still remains the greatest single industry, yet by the aggregate of her industries Britain is now an industrial rather than an agricultural country. In other words, she rests on her output of coal rather than of wheat and meat. The change has, however, been fully accomplished only in the last two generations.

The new economic conditions have been variously influenced by geography. In the first place Scotland has been effectively united to England. The barren uplands in the north of England — in the isthmus, that is to say, connecting the two countries — are rich in coal, and a population has grown up in this part of the island drawn both from Scottish and English sources, and of an intermediate character. Moreover, Scotland, by virtue of her own coal, has been able to share in the advantages of the imperial and economic policies of England. At the time of the union of the two parliaments in 1707 Glasgow was only a village.

The dominance of the trader over the farmer led in the 19th century to a reversal of the long-settled British policy of protection. England and Scotland no longer rest economically on the resources of their own territories. They produce coal, and are the seat of labor and of capital, but four-fifths of their wheat they import, and one-fifth of their people are engaged on manufactures for export. Ireland, however, has very little coal, and must still depend on her agricultural products. Thus, while Scotland and England are now a single economic organism, Ireland — with the exception of Belfast — is another and separate organism. There is an antagonism of economic interest between Ireland and Great Britain which may be compared to the antagonism of interest between the Southern States and the Northern before the Civil War. If in her own interest Great Britain were to revert to her former economic policy, an incidental result in the long run might possibly be to reconcile Ireland to her.

8. *Geographical Momentum.*— We must not however seek to ascribe the present strategic and economic position of Britain in the world, in so far as it depends on geographical causes, wholly to the present action of those causes. There is such a thing as geographical momentum. The causes which originally led to the establishment of a market in a given place may have ceased to act, but the habit of the customers will long compel salesmen to resort to it. London at the present moment is the greatest general store in the world. It has no staple industry, but parcels of almost everything manufactured in other parts of Britain, and, indeed, in almost all parts of the world, are warehoused there. Except for large quantities of staple goods, many smaller communities find it convenient to give their orders and to make their payments in London. Formerly, no doubt, as Emerson has said, England as the great shop-keeping nation had a good stand in the world. Her chief customers were along the European coast opposite. But now part, at any rate, of her influence is due to momentum from the past, to the start given to her during the Napoleonic Wars, and by the fact that in the days before railroads she had coal near the waterways.

9. *The Consequences of Sea Power.*—Britain now lives in part on the products of her own land and seas, in part as a manufacturer for other countries, and in part as a market. But she also obtains profit from her position as the chief sea power. By this power she prevents her enemies from uniting, she retains certain open markets, and she protects her carrying trade. Sea power, however, is a condition of the existence not only of the British Empire, but also of the United Kingdom. This was early made evident. When Edward the First conquered the Principality of Wales, he moved the fleet of the Cinque ports, then the only fleet available for the English king, into the rear of his opponent. This he could not have done had not the Lord of the Isles been defeated shortly beforehand by the Scotch. For several previous centuries sea power along the oceanic borders of Britain had been in the possession of a Norse state established in the fringe of islands which extend round the west of Scotland from the Shetlands to the Isle of Man. Unless Britain has command of her seas the Shetlands and the Orkneys, and indeed Ireland itself, might be held by the foreigner against her, and the foreign invader might establish his bases even in the remoter peninsulas, say of Scotland or Wales. It was from such a peninsular base at Lisbon that Wellington conducted the war against France at the beginning of the 19th century.

The very need of sea power, or in other words, of the sea itself, renders it impossible to put territorial limits to naval action. Britain can command in the British seas only if she can also command in waters more remote. Her fleets are now concentrated in European waters because her possible naval opponents are there to be found, and for no other reason. It follows, however, that Malta and Gibraltar, the bases of the Mediterranean and Atlantic fleets, are in reality not merely milestones on the road to India, but also outposts for the defence of London. It is this characteristic of sea power, now familiar to all the world through the writings of Captain Mahan, which renders it necessary for modern Britain — faced by Powers that rest upon half continents — to extend her economic bases beyond her original insular territory. Whether this is to be done by the method of increasing the insular factories and holding open the over-seas markets, or by such a federation with her colonies as will in effect base her navy on the agriculture and factories of a wider land, is the present issue of British politics — the outcome of many centuries of history in an insular and yet European geographical environment.

3. Great Britain—The Conquests. Two, at least, of the great inrolling waves of conquest, which have left their mark on the people and the institutions of Britain, had spent their force before any historian arose to record them, and are thus for us like the forgotten events of our unconscious childhood. As to these we can only speak darkly and doubtfully according to the scanty evidence furnished by excavations of the barrows in which the bones of Prehistoric Man are laid. Judging from these, we are able to say that in the dawn of the history of Britain, our island was inhabited by a race ignorant of the use of metals, of the manufacture of pottery, and of the art of weaving, but accustomed to the use of stone implements such as wedges, axes, and hammers, which they fashioned with considerable skill. This race is one of those called Neolithic, to distinguish them from the incalculably older races of Palæolithic Man, who also used stone implements, but who lived before that mighty parenthesis in human history which is called the Great Ice Age. What the Neolithic inhabitants of Britain may have called themselves we are utterly unable to say. For convenience they are generally spoken of as Iberian, in order to indicate a possible connection with the aboriginal inhabitants of Spain, now represented by the Basques; but this connection is only an ethnological guess and must not be taken as an established fact. The race in question buried their dead in long barrows, the excavation of which shows that they were of short stature, with skulls tending to the long rather than the broad shape (Dolicho-cephalic rather than Brachy-cephalic) and that they were probably black-haired and of dark complexion.

To these aborigines of Britain entered two tall and fair-haired races, both of them probably belonging to that great family of nations which we call Celtic. The first of these invading races wielded weapons of bronze; the second was acquainted with the use of iron, and this may account for their victory over their predecessors. At present the tendency of scholars is to identify the bronze-using people with the Gaels (or as they are now generally termed the Goidels), who have left their chief mark on the populations of the Scottish Highlands, of Ireland, and of Gaul. The wielders of iron would be the race (now called Brythonic) which gave its name to Britain; which occupied the greater part of the southern half of the island when Cæsar landed; which survives under the name of Cymri in the mountains and valleys of Wales; and whose language, once spoken in Cornwall and Cumberland, is the dearest possession of the eloquent Welsh and has a large currency among the peasants of Brittany. As to the date of these several movements accurate information entirely fails us, but it is probable that several centuries elapsed between the arrival of the two waves, the Goidelic and the Brythonic, and that all had been accomplished several generations before the birth of Christ.

It was in the year 55 B.C. that the Roman eagles were first seen on this side of the straits of Dover. Whether Julius Cæsar seriously contemplated the conquest of Britain, or whether his two expeditions in that and the following year were only theatrical performances meant to overawe the tribesmen of Gaul and to dazzle the populace of Rome, is a question not easily answered. It is certain that, if an abiding conquest was his aim, he had greatly underrated the difficulty of the task. His own narrative, much more candid than that of most generals who indite their own bulletins, shows clearly that neither expedition was really successful, that the Britons fought well, that the dense forests of their land, and the chopping tides of their seas powerfully aided their resistance, and that Cæsar himself, after the midsummer of 54 B.C., never desired any closer view of the white cliffs of Britain.

But though Cæsar was foiled, Rome remained and was still the world-conquering city. In the year 43 A.D. when Claudius was Emperor of Rome, an expedition was fitted out for the conquest of Britain. The commander was the high-born senator Aulus Plautius, and he had under his orders four legions with a proportionate number of cavalry and "allies." The latter were for the most part armed more lightly than the legionaries and were generally stationed in the wings, while the legionaries fought in the centre. The total number of Plautius' soldiers cannot have been less, and may have been considerably more, than 40,000. For 17 years no serious misadventure hindered the onward progress of the Roman arms, though the Silures of South Wales, under their king, Caratacus, kept the invaders at bay for many years. In the year 59, however, we find the Roman general Suetonius Paulinus crossing the Menai Straits and conquering Anglesey, and the Roman soldiers quartered at Chester and at Lincoln. Then came (60) a terrible reverse of fortune, the only serious set-back to the Roman career of conquest in these early centuries. Maddened by the tyranny of a grasping Roman official, Boadicea, queen of the Iceni (a tribe who inhabited what is now the county of Norfolk), called her countrymen to arms, sacked the Roman colony of Camulodunum (Colchester) and the cities of Verulamium and Londinium, and threatened to root the Romans out of the land. Suetonius, however, hastened back into the centre of the island and there, giving battle to the far more numerous forces of the barbarians, achieved a decisive victory.

After this the Roman frontier was pushed steadily forward, especially by the famous general Julius Agricola (78–84) till it nearly coincided with that which is now the northern boundary of England. About the year 120 the Emperor Hadrian is believed to have built that noble stone wall from the estuary of the Tyne to the Solway, of which important fragments still remain, forming one of the most interesting memorials of Roman domination north of the Alps. Another wall, of turf, was drawn by Hadrian's successor, Antoninus Pius, across the lowlands of Scotland from Forth to Clyde, but it was probably not maintained for long as a boundary of the empire, and the hold of the Roman legions on any part of Caledonia was always precarious. We cannot now do more than briefly allude to the expedition of the aged Emperor Severus, in which he is said to have reached the northern extremity of the island and carefully noted the duration of the long midsummer days.

Notwithstanding many incursions of the barbarians, and the obviously failing strength of the Empire, the 3d and 4th centuries were probably not on the whole calamitous times for the now reconciled and submissive inhabitants of Roman Britain. At last in 383 a general named Maximus rebelled against the Emperor Gratian, assumed the purple robe, and carried his legions into Gaul to enforce his claim. It may be doubted whether the wealthy and timid provincials ever slept soundly after that fatal departure. True, the rebellion was in course of time suppressed, and some portion of the legions struggled back to Britain, but more mutinies followed, Rome itself was in danger from Alaric and his Goths, and at last about 407, the last of the Roman legions quitted the island never to return.

Of the next act in the great drama, the conquest of England by the English, we have hardly any trustworthy information. The broad outlines of the conquest may be traced. Three tribes of the Low German stock from the shores of the Baltic and the North Sea certainly established themselves here in the course of the 5th century. The Jutes settled in Kent and the Isle of Wight, the South Saxons gave their name to Sussex, the East Saxons to Essex, the West Saxons established themselves in Hampshire and Wilts, the East Angles in Norfolk and Suffolk, the Middle Angles in the Midland counties where they founded the kingdom of Mercia. Deira and Bernicia, the two kingdoms which sometime coalesced into Northumbria, were also Anglian settlements: but how and when all these territorial changes took place we really cannot state with certainty. Even the 'Saxon Chronicle,' which professes to give dates for the foundation of the kingdoms of Kent, Sussex, and Wessex, tells us scarcely anything about Northumbria in these early years, and nothing at all about the other three kingdoms.

The ordinary story of the Saxon conquest is thus told. On the departure of the Roman legions the Britons, sore pressed by the incursions of the Northern and Irish barbarians, the Picts and Scots, called on "Aëtius, thrice consul," for aid which he was unable to give them. Thereupon they foolishly turned to the Saxon and kindred continental tribes for help. Hengist and Horsa, Jutish princes, came at the call, landed on the coast of Kent, repelled the Caledonians, but refused to quit the country after the work of liberation was accomplished. The infatuated passion of Vortigern, the elderly British king, for Rowena, daughter of Hengist, aided the designs of the invaders, who sent over to the continent for more and ever more of their countrymen till the conquest at least of the eastern half of the island was accomplished.

For the story thus told the evidence is not satisfactory. It chiefly consists of the narrative of a Welsh ecclesiastic named Gildas, who lived a century and a half after the legions quitted Britain, and who, though an earnest Christian patriot, was evidently but slenderly furnished with historical knowledge. Nor do the very meagre details of the conquest which are supplied by the 'Saxon Chronicle' carry us much further. That Chronicle was itself probably not compiled till three or four centuries after the invasion, though some of the material included in it may be of a much earlier date.

On the whole all that we can safely say appears to be that apparently throughout the 5th century a series of attacks on the Romano-British population was being made by the Germanic tribes which the Romans had known by the name of Saxons. These attacks had begun, even in the 4th century and, in order to guard against them, the emperors had created a high official who bore the name of "Count of the Saxon Shore." The invasion may possibly have culminated in the year 449, the year assigned by the 'Saxon Chronicle' to the landing of Hengist and Horsa, but there is some reason to think that even that specific event took place eight years earlier. The name of the first West Saxon chieftain, Cerdic, interests us because it is from him that the present royal house of Great Britain derives its origin. His career of conquest, which had been most successful, was possibly stayed about the year 516 by a great victory which Gildas reports the Britons to have won at "Mount Badon." In the present state of our historical knowledge no one can deny that this victory (about which the 'Saxon Chronicle' is silent) may have been won by a Romano-British hero named Arthur.

About 60 years later (577) the great victory of Deorham, won by Ceawlin, the grandson of Cerdic, once more carried forward the invading flood and finally separated the Britons of Wales from their kinsmen in the district which was then called West Wales, but which we now know as Cornwall.

The Saxon conquest was apparently never an easy one, and became harder and slower as time went on. By the middle of the 6th century, roughly speaking, the invaders occupied all of England that lies east of a line drawn from Berwick to Portland; but it had taken at least three generations to reach so far. Then came the above-mentioned victory of Deorham and the extension of the Saxon border far into Devonshire. In the North-west during the 7th and 8th centuries, the Northumbrian kings cut short the British kingdom of Strathclyde, and perhaps reduced it into a condition of something like vassalage. On the Welsh marches, Offa, the great king of Mercia, in the 8th century, carried the western border of England from the Severn to the Wye, and by a substantial earthwork, some vestiges of which still remain and are known as Offa's Dyke, fixed the dividing line between England and Wales almost in its present position. The actual conquest of Wales and its complete subjection to the English kings had to wait till the 13th century, when it was accomplished by Edward I.

The four centuries which intervened between the departure of the legions and the accession of Egbert are generally felt by the historical student as a wearisome interlude in which nothing is done toward the real business of the drama, the creation of an united England. In truth, no thought that such was the real action of the play probably visited the minds of the chief performers. The invaders belonged to various clans, tribes, and communities, and though they must have spoken the same or nearly the same language, they had only the feeblest conception of duty toward one common country. Even within the limits of the same race we look in vain for any active principle of brotherhood. Angle seems to war against Angle, and Saxon against Saxon, just as cheerfully as either would war against the other. It is true that the moral conquest which lies outside the scope of this paper, the conversion of the English to Christianity (600–686), did something toward quickening the sense of national unity; but notwithstanding the Church's influence, this was still weak when Egbert ascended the West Saxon throne, nor can he, notwithstanding the ascendency which he exercised over the other still subsisting kingdoms, be regarded as truly king over all England. It was the terrible Danish invasions and the fact that only one champion, the hero king of Wessex, was found able to resist them, which finally established the unity of Anglo-Saxon Britain under the rule of Alfred and his descendants. We call the new invaders, for convenience sake, Danes, but in truth they came not only from Denmark, but from Norway, perhaps from all the harbors of the Scandinavian seas. In 789 the Danish storm began to blow, and with one or two lulls, it blew for three centuries, till Harold Hardrada lay dead on the field of Stamford Bridge. In the year just mentioned (789) three Danish ships appeared off the coast of Devonshire. The mariners resisted the attempt of the king's steward to levy toll upon them, slew him, and sailed away. Four years afterward came another and more deadly invasion. "The heathen men," says the Chronicle, "miserably destroyed God's church at Lindisfarne, with rapine and slaughter." This ravage of one of the holiest places in Western Christendom showed the savage heathenism of the invaders and struck terror into the hearts of noble and peasant alike, who saw that no sanctuary could be of any avail when the terrible raven standard of the Danes was flapping in their harbors.

The usual course of one of the early Danish invasions was something like this. When spring days dawned a little fleet of ships, or rather long boats, undecked, with one mast in each, and seats for 60 rowers, would push off from the Danish or Norwegian coast and appear in English or French waters. (It must be remembered that France and Germany suffered almost as severely as England from the Danish ravages.) The mariners steered their barks into some estuary, such as that which then severed Thanet from the mainland, and leaving them there under a sufficient guard, spread themselves over the country in quest of horses. When they had thus mounted themselves at the expense of the victim country, they made rapid excursions far and wide over the land, burning towns, plundering monasteries and churches, fighting with and generally defeating the *caldorman* or lord-lieutenant of a county, who at the head of his rustic militia (*fyrd*) came forth to fight his brave but stupid battle of defense. Their enemies accuse them of inhuman crimes: the torture of prisoners, the violation of women, the mirthful slaughter of little children; but there is some doubt how far these atrocities can be fairly taken as typical of the general character of the Danish invasions. Of one feature of these invasions there can be no doubt: that is, of the special hostility which they displayed to the churches and monasteries of Western Europe. The historical literature of our country has probably to lament the loss of priceless manuscripts, especially in the convents of Northumbria and Mercia, caused by the ravages of the Danes.

When the summer was drawing to a close, and when the long boats were gorged with the plunder of half a dozen counties, the unwelcome intruders would return to their ships, glide away out of the channel in which they had cast anchor, and for that year the harried and wasted land would see them no more. This, at least, was the case in the first stage of the invasions, for about 60 years after the sack of Landisfarne. Then, in 851, as the Chronicles tell us, "the heathen men settled themselves over winter in Thanet." From that time the invasions of the Danes assumed a more and more permanent character: from mere freebooters they became conquerors: Northumbria and Mercia were bound to their chariot wheels, and the whole of England would have been subjugated by them but for the war of liberation which was successfully waged against them by Alfred the Great (871–900).

Though Alfred broke the Danish yoke, and although his son and grandson, Edward and Athelstan, triumphantly asserted the supremacy of the English crown over the Danish chieftains who were left in the land, the result of the warlike operations of the 9th and 10th centuries was to cause an immense infusion of Scandinavian blood into the population of England. The Danelaw, as it was called, included the greater part of the country northeast of the Watling Street, the old Roman road which ran from London to Chester; and in many parts of this region, notably in Lincolnshire and the East Riding of Yorkshire, the names of places still bear witness by their terminations to the existence there of a large number of Danish settlements. It cannot be doubted that this Scandinavian element when subjected, as it soon was, to the humanizing influence of Christianity, was a most valuable and virile ingredient in the population of England.

Through the greater part of the 10th century the Danish inhabitants of England were kept under by the strong hand of the English kings, and the Danish invasions nearly ceased. Near the end of that century they were resumed, and owing to the portentous weakness of Ethelred and his counsellors, they achieved a greater measure of success than ever before. An archbishop was martyred; six successive payments of tribute were paid in the vain hope of inducing the invaders to cease from ravage; and finally the descendants of Cerdic had to quit the realm, and Canute the Dane sat upon the throne of England. As king, however, the Scandinavian conqueror healed many of the wounds which his countrymen had inflicted as ravagers; and the long and prosperous reign of the Christian Canute marks practically the end of the period during which the Danish pirates were a source of terror to the Saxons. The reign of Canute, however, coincided with one event in the nature of a conquest, not favorable to England. In the year 1018 Malcolm, king of Scotland, won the battle of Carham over the men of Northumbria and thereby succeeded in forcing back the English frontier from the Firth of Forth to the line which it now occupies of the Cheviots and the Tweed. The rich country of the Lothians, which for near five centuries had formed part of the kingdom of Northumbria, was now permanently added to Scotland.

The line of Canute came to a speedy end in the persons of his worthless sons; and thereafter, during the central years of the 11th century, under the reign of Edward the Confessor, there was going forward a peaceful conquest of England by the Normans under favor of the Norman-minded king. In truth there was much to admire in this young Norman race, strong with Scandinavian energy, but refined and liberalized by the memories of Roman culture which still lingered in the shattered empire of Charlemagne. Hard and grasping as the Norman warrior might be — and William the Conqueror was a typical Norman in this respect — he was at this period generally chaste and temperate. His devotion to the Church was not a mere hypocritical pretense, nor was it only testified by the magnificent cathedrals which he erected. As statesman, as architect, and as warrior, it must be admitted that the Norman knight much outshone the Saxon *thegns* whom he supplanted.

The peaceful conquest of England by Norman influence which had been for a time arrested by the successful rebellion of the half-Danish family of Godwin was succeeded by the bloody conquest of 1066. Many causes concurred toward this event: the utter feebleness of the representatives of the line of Cerdic; an uneasy consciousness that Harold Godwineson, who had been raised to the throne on the death of Edward the Confessor, was no rightful wearer of the West Saxon crown; the long-lasting feud between his family and that of the sons of Leofric; but above all the grieviously ill-timed invasion of the Norwegian Harold Hardrada. It was on an ill day for Scandinavia as well as for himself that he landed with his ally, the traitor Tostig, on the coast of Yorkshire. Unable to conquer England himself, and winning nothing from her king but the seven feet of earth assigned for his grave at Stamford Bridge, he nevertheless left her panting and breathless for the encounter with a mightier and unwearied foe.

By the battle of Hastings, England, which had been for centuries closely linked with Scandinavian interests, was wrenched away from that connection, and was forced to revolve in the same orbit with the Latin-speaking races of western Europe. A revival of the empire of Canute, which had bound England, Norway, and Denmark together, was made forever impossible. The eyes of the English king turned henceforth toward Rouen, Paris, Angers, Bordeaux; the lands of the northeast on the far side of the German Ocean were to him a well-nigh forgotten world.

As a matter of tactics the victory of Hastings seems to have been due to William's skillful combination of archers and cavalry. The English forces, though much more imperfectly disciplined and less inured to war than the Normans, stood well at bay for many hours behind the shield-wall which they knew so well how to weave, but they were galled by the thick-flying arrows of the Normans, and were tempted, by the feigned flight of the enemy, to rush down the hill after them. Then did William's cavalry, galloping up, thrust themselves in between their broken ranks, and throw them into confusion from which they never recovered. Since the 14th of October 1066 no foreign conqueror has permanently established himself on English soil, and we may therefore here close our brief and rapid sketch of the Conquests of England.

Bibliography.—For prehistoric man, consult Dawkins's ‹Early Man in Britain,› and Beddoe's ‹The Races of Britain.›

For the interesting subject of British coinage, the great authority is Sir John Evans in his two works, ‹Coins of the Ancient Britons,› and the supplement thereto.

For the Roman Conquest, consult ‹Cæsar's Commentaries,› (Books IV. and V.); Tacitus, ‹Annals› (Book XIV.), and ‹Life of Agricola›; Dion Cassius, ‹Historia Romana;› the lives of the Roman Emperors, which go by the name of the ‹Historia Augusta,› and the History of Ammianus Marcellinus.

For the end of the Roman period consult Paulus Orosius, ‹Histories› (Book 7. Anglo-Saxon affairs). The two chief British authorities are the ‹Liber Querulus› of Gildas, edited by the Rev. Hugh Williams, and Nennius, ‹Historia Brittonum,› edited by Stevenson for the Historical Society, and by Mommsen in ‹Monumenta Germaniæ Historica.› For the Anglo-Saxon side of the same events the chief authorities are ‹The Anglo-Saxon Chronicle,› and Bede's ‹Historia Ecclesiastica,› both edited by Rev. Charles Plummer. For the history of the 7th century, we may add ‹The Life of Wilfrid,› by Eddius in the volume ‹Historians of the Church of York,› edited by J. Raine (Rolls Series).

The chief authority for the personal history of Alfred the Great is Asser, ‹De Rebus Gestis Aelfredi,› recently edited by W. H. Stevenson, who in a convincing manner has vindicated Asser's authority. The works of King Alfred have been published in two volumes, Oxford, 1852–53.

Some light is thrown on the Danish invasions by the Heimskringla (in the Saga Library, edited by Morris and Magnusson), also by Vigfusson and Powell's ‹Corpus Poeticum Boreale.› For the Norman Conquest, the chief authorities are Ordericus Vitalis, the ‹Roman de Rou› of William Wace and pre-eminently the ‹Bayeux Tapestry,› edited by F. R. Fowke, London. Modern writers on the subject are too numerous to mention here, but reference may be made for the Roman period to Mommsen's ‹Provinces of the Roman Empire,› (Vol. I of the English translation), and F. Haverfield's contributions to the Victoria County History of England.

For later history it will be sufficient to refer to J. R. Green's ‹Making of England› and ‹The Conquest of England,› to E. A. Freeman's ‹Norman Conquest,› to Sir James Ramsay's ‹Foundations of England,› and to C. F. Keary's ‹Vikings in Western Christendom.› But for the whole subject of the bibliography of English history from the earliest times to the 15th century no better guide can be found than ‹Sources

and Literature of English History,' by Charles Gross, of Harvard University.

THOMAS HODGKIN,
Author of 'Italy and Her Invaders,' 'Life of Charles the Great,' 'Political History of England' (Vol. I.), etc.

4. Great Britain—Mediæval England. The foreign invader had finished his task when the last results of the Norman conquest of England were slowly worked out during the Norman and Angevin periods. For the future the development of the country was to depend upon resources supplied from within. The first stage in this new growth is marked by the reigns of Henry II. and his sons. From one point of view Henry II.'s work was but a continuation of that of his grandfather, Henry I. Recent investigation has shown that few of the characteristic features of Henry II.'s policy were specifically his own, and that he never departed far from the lines laid down by his grandfather. Yet the use Henry made of the materials thus provided for him constituted a new departure in our history. Dr. Stubbs' well-known description of Henry's reign as a "period of amalgamation" remains as true as ever. Before his days, the English and Norman peoples and English and Norman institutions remained separate, though side by side. It was the mission of the Angevin despotism to grind down both English and Norman into a common nation with a common set of institutions. At first the process was a mechanical one, for the combination was due exclusively to the will of an absolute monarch, working through the most effective administrative machinery which mediæval times had up to now witnessed. As long as the Angevin despotism remained intact, the English and Norman races and institutions continued to be kept together through this external pressure. But they became accustomed to the new conditions, and when the system of Henry II., which had survived the neglects of Richard I., broke down through the active tyranny of John, the union had become organic to such an extent that it continued, despite the relaxation of the severe pressure which had brought it about.

The most permanent feature of Henry II.'s work lay in the establishment of the unity of England, and the control of the country by a unified administration dependent upon the central power. Though the upper classes long continued to speak French and to bear French names, they became as English in spirit as their native-born tenants and vassals. Yet neither Henry nor his subjects had any consciousness of the results of his work. Henry selected England for more treatment than he devoted to the rest of his dominions, not because he was an English patriot, but because circumstances gave him greater control over his English kingdom than over any other part of his extensive territories. His own personal ambition was rather to build up a cosmopolitan Angevin empire, than a national English kingdom. This ideal could not be realized because it brought his house into direct conflict with the growing monarchy of France, whose kings were engaged in carrying out over their dominions similar work to that which Henry had accomplished for his island kingdom. With the falling away of Normandy, Anjou, and Poitou from John, and their absorption into the monarchy of Philip Augustus, the Angevin empire collapsed. Henry II.'s continental possessions had contributed next to nothing toward the development of England, but the work he had accomplished in unifying them had materially smoothed the path by which the French national state was to attain to greatness. The retention of Gascony in the hands of the English kings kept up the friction between the two nations and brought about that hereditary enmity of France and England, which was so characteristic a feature of all later mediæval history. Thus the failures as well as the success of the Angevin rulers had their permanent importance. This was even more notably the case with other aspects of Henry II.'s policy which may be described as premature rather than as impossible. Conspicuous among these were the efforts of Henry II. to enlarge the English kingdom into a monarchy over all the British islands. The conquest of the more fertile parts of Ireland by Anglo-Norman feudal adventurers set up in that island the uneasy dependence of a Celtic people on the English King's feudal vassals which had already been established in southern and eastern Wales since the days of Henry I. Side by side with this, something like a Norman conquest of Scotland was effected, not so much by the enforced recognition of English supremacy by unwilling Scottish kings, as by the gradual infiltration into the northern kingdom of the system and habit of thought which had gained the ascendancy in Henry's own realm. Even the least successful of Henry II.'s efforts was not without influence on the future. After the martyrdom of Saint Thomas of Canterbury, Henry II. renounced as hopeless any heroic attempt to limit the sphere of the jurisdiction and authority of the Church. Yet his watchfulness in controlling and regulating what he deemed the usurpations of the clerical power was renewed from time to time by the more strenuous of his successors, and finally attained a full triumph in the period of the Reformation. For all these reasons, the reign of Henry II. is among the most pregnant of future consequences in all British history.

The personal prowess and contemporary fame of Richard I. cannot blind us to the insignificance of his reign in results. His brother, John, was the worst and most unlucky of English kings, but the consequences of his failures and blunders determined the whole future course of English history. John's unsuccessful conflict with Innocent III. emphasized that triumph of the Church, which even his father had been unable to prevent. The break up of the Angevin empire, though precipitated by his caprice and neglect, was sooner or later inevitable. More important than either of these was the reaction against his domestic authority, which resulted in the union of barons and people in an effort to limit the autocracy of the Crown. The Angevin despotism had done its best work in bringing about the union of England. Like all despotisms, it was a bad thing in itself, even when necessary as the only alternative to feudal anarchy. In John's capricious hands it did not so much as secure the continuance of the law and order for which England had long been willing to pay a heavy price. When the mass of the English people, abandoning their traditional devotion to the monarchs who had saved them from feudal disorder, united with the baronial leaders to wrest from the unwilling king the grant of Magna Charta, the first faint beginnings of English liberty and constitutional government were already at hand.

Of recent years it has become almost the fashion to decry the importance of Magna Charta. It is easy to see that John, in sealing the charter, thought of nothing but obtaining a momentary respite, and repudiated his act as soon as he found it safe to do so. It is equally patent that the barons who forced John to accept the charter were mere feudalists, careless of all but their personal wrongs and the grievances of their class, and quite unconscious that they were acting otherwise than their ancestors had always acted. Yet emphasizing the unworthiness of these men should not blind us to the significance of their work. However unconscious they were of their high mission, the Fitzwalters and the Vescys were in a very real sense the pioneers of English liberty. The opportune death of the tyrant, the withdrawal from England of the barons' dangerous ally, Louis of France, and the wisdom of the papal legate, Gualo, who accepted in the name of his ward, the infant Henry III., the charter which John had repudiated, insured the permanence of their principles. For nearly a century the great event of English history is the struggle for the charter. Under the long minority of Henry III. the ideas of limited monarchy and constitutional control, which were its essence, had time to assert themselves. When the young king attained manhood, his personal weakness made impossible any effective attempt on his part to carry on the government on autocratic Angevin lines. The aristocratic control of the administration was now secured, though it was long before that control was vigorous or effective. The chief danger to England was that the nobles in resuming their former power might also have fallen back on the old separatist ambitions of their feudal ancestors. Luckily the reaction toward feudalism was slight and easily suppressed. The baronage of Henry III.'s reign was a very different body from that of Norman times, and only a few isolated individuals still cherished the ancient feudal ambition of each nobleman ruling like a king over his own hereditary estate, and caring nothing for the manner in which the central government of the country was carried on. The barons of the 13th century accepted the unity of England, and accepted the central administration which the Norman and Angevin kings had built up. Their chief concern was to see that the government of the country was under their own control, and not regulated by the king's despotic caprice. Thus the unity of England remained, but the central government was henceforth an aristocracy rather than an autocracy. The barons claimed to be the hereditary counsellors of the Crown. Even a strong king was compelled to frame his policy to their liking, and to admit them into a sort of partnership with him. Under a weak king, like Henry III., the barons aspired to rule the realm as they would. Their moment of triumph came in 1258, when the Provisions of Oxford transferred the administration of the country from the monarch to a committee of 15 barons, without whose counsel and consent the king was not permitted to take any action. Thus the Angevin despotism developed into the constitutional monarchy of later times, though at this stage the only effective limiting force was the baronial aristocracy. Side by side with this constitutional development was the blossoming of every aspect of mediæval life, which made the 13th century one of the most brilliant periods of English annals. The age of Henry III. witnessed the consummation of Gothic architecture; the beginnings of the most spiritual aspects of mediæval Christendom in the orders of mendicant friars; the rise of a new intellectual life in the scholastic philosophy, and the organization of teachers and scholars, called universities. For a long time the political weakness of the reign of Henry III. checked the general progress of the nation, but with the revolt of the barons a new political development began.

The purely baronial conception of the English Parliament had hardly been formulated when its inadequacy became self-evident. Even in Norman and Angevin times the authority of the Crown had been largely based on the mute but hearty support which the average Englishman gave to the one power which could maintain order, and save him from the caprice of the local feudal tyrant. The machinery by which this popular backing of the royal authority had been effected still survived in the popular local courts, and the jury system of Henry II. had enlarged the representative principle by affording facilities for representative committees of the shire moots to treat directly with the king or his agents. Administrative convenience and financial necessity brought about during the first half of the 13th century a further extension of the idea of representation. It became not unusual for knights, representing the shires, and burgesses, chosen from the boroughs, to be gathered together in a single assembly to voice complaints, frame laws, testify to ancient customs, and make extraordinary grants of money. Such was the state of things when the narrowness and selfishness of the triumphant baronial oligarchy provoked a strong reaction among their own more enlightened supporters, and gave a unique chance to the broader-minded friends of the monarchy to rescue it from the impotence into which it had fallen. Simon of Montfort, Earl of Leicester, made himself the leader of the former; Edward, the king's son, the future Edward I., put himself at the head of the latter movement. The momentary triumph of Earl Simon over both his baronial colleagues and his royalist enemies was marked by the Parliament of 1265, which, if not the "first House of Commons," was at least the first occasion when the new machinery of representation was applied to the determination of grave political issues. The effect of Simon's work was that the lesser landholders and the citizens were called upon to enlarge the narrow circle which had hitherto alone aspired to control the crown. Though Simon perished within a few months on the field of Evesham, his enemy and supplanter, Edward I., carried on and completed the work. Edward was every inch a king, and loved power too well to abandon any of it willingly. But he dreaded the might of the greater barons and of the still independent Church; he appreciated the advantage of having the people on his side; and he was the first king after the conquest who was in a real sense an Englishman. Up to now the progress made in England had been on lines common to all Christendom. There is nothing specifically English in the Church, the friars, Gothic art, scholastic philosophy, the universities, feudal warfare, or even in the system of representative control of the Crown by the estates. At last under Edward I. a newer and more specially national note is sounded. Under this great king the constitutional system became perfected; the council of the nation became permanently strengthened with a popular and representative element; the baronial parliament was enlarged with the three estates of barons, clergy, and commons. Edward I. was even less of an innovator than Henry II., but old ideas took new shapes under his direction. The materials of the Constitution had been supplied during the creative period of the barons' wars. His work, as Stubbs has truly said, was a work of definition. Henceforward the main outlines of the Constitution were clearly marked out and defined. As far as outward forms went, they remained as Edward established them, until quite modern times.

The most permanent result of Edward I.'s work was the creation of the English parliamentary system. Edward's other ambitions were less completely realized. He aspired, with but little success, to maintain his position in Gascony and on the Continent against Philip the Fair, the greatest of the mediæval Kings of France. He aimed at playing a prominent part in Europe, and checking the ever-growing usurpations of the Church in the political sphere, and at establishing his authority over all the British Islands. In most of these directions he was not very successful, except that by the destruction of the state of Llewelyn of Wales he made the English monarch supreme over southern Britain. Even in his lifetime his attempt to absorb Scotland showed no great prospect of success. Under his unworthy son, Edward II., Robert Bruce's great triumph at Bannockburn (1314) secured the independence of Scotland and made permanent the division of the English race into two unequal halves. So far as concerned internal politics, the reign of Edward II. seemed marked by an equally strong reaction. The Lord Earl Ordainers and their leader, Thomas of Lancaster, take us back to the oligarchical atmosphere of the Provisions of Oxford. It was only after their fall that the Despensers identified the triumphant monarchy with the representative parliamentary system. The revolution of 1326, which cost Edward II. his throne and his life, perpetuated the constitutional authority of the estates. During the long reign of Edward III., the king's foreign preoccupations made it essential for him to keep on fair terms with his subjects. The subsidies and support, necessary to enable Edward III. to carry on the early stages of the Hundred Years' War with France, finally consolidated the constitutional fabric and ensured its permanence.

England had already become a nation under Edward I. During the reign of his grandson Edward III. the might of the English state was revealed to all Europe by the extraordinary military successes which laid low the ancient feudal fashion of fighting in famous battles such as those of Crecy and Poitiers. It was now that the English King first aspired to be lord of the seas, and that English mariners and wool merchants prepared the way for the industrial England that was ultimately to supersede the military state that now claimed a great place in the affairs of Europe. It was the age of Chaucer and Wycliffe, when the English tongue and English literature blossomed anew, and when the new nation became impatient of the narrow limits and strict restraints of the mediæval fashions of life and thought. It was in this age that the Church first provoked successful opposition, and first manifested signs of conscious weakness. The ravages of the Black Death, the direst of mediæval pestilences, undermined the old social order and prepared the way for all that ultimately differentiated the social and economic system of England from that of its continental neighbors. Chivalry, whose deeds were glorified in the pages of Froissart, was threatened with decay at the moment of its apparent triumph. The brilliant successes of the French war were succeeded by disastrous failures. In his embarrassed old age Edward III. saw the loss of his foreign conquests, and the undermining of his authority at home. During the troubled reign of his grandson, Richard II., the economic troubles of the period culminated in that Peasant Revolt of 1381 which, even in its failure, was to ring the knell of villeinage and the old social system. As Richard attained manhood, he ventured upon the most serious effort made by a later mediæval king to overthrow the constitutional system, and strove to make himself an autocrat like his ancestors and his contemporaries, the French kings. His boldness drove him from his throne to a prison where he soon met his fate. With the Revolution of 1399 England was brought back permanently to the constitutional path.

The Revolution of 1399 was a conservative reaction in at least two directions. It restored the old parliamentary Constitution and insured the loyal continuance of a limited monarchy by establishing on the throne with a parliamentary title that house of Lancaster, which since the days of Earl Thomas had almost continuously led the constitutional opposition to the sovereign. Under the Lancastinian kings the mediæval constitutional monarchy attained its height. Not only weak kings, like Henry IV. and Henry VI., were perforce true to their constitutional obligations. We see the same loyalty even in a strong monarch like Henry V., who was vigorous enough to renew Edward III.'s claim to the French throne and lucky enough to profit by French divisions and make himself ruler of the more important half of the French monarchy. Under Henry V. also the other characteristic feature of Lancastinian policy manifested itself most fully. This was the ecclesiastical reaction in favor of the strict orthodoxy with which the house of Lancaster was as much identified as with constitutional principles. If Edward III. and Richard II. had trifled with Wycliffe and his followers, Henry IV. and Henry V. were only content with extirpating Lollardy and all its works. Their policy was made easier by the socialistic and revolutionary extremes into which some of the Lollards had drifted. The early 15th century was not ripe for radical revolution in the Church, and the downfall of heresy was the more rapid and complete since Wycliffe's teaching had never really established itself in popular favor. For another hundred years the majestic unity of the mediæval Church was to be maintained. But even leading churchmen were half conscious that the Church's hold over men's minds was no longer what it had been. The life and freshness of mediæval Christianity were gone, even though the Church remained as rich, as proud, and as outwardly glorious as ever. In its weakness the Church clung for support to the State which in the great day of mediæval religion it had aspired to direct and control. A chief feature of 15th century life is the political ecclesiastic serving Church and State with equal fidelity, but discharging his duty to both masters in a thoroughly worldly spirit.

Lancastinian constitutionalism lasted little more than 60 years, though Lancastinian orthodoxy preserved England from religious revolution for nearly a century and a half. It was soon found that constitutional government under mediæval conditions meant weak government. Power went, not to the people at large, but to the great landholders. A turbulent aristocracy took advantage of the rule of a weak king to wage hereditary feuds against its rivals and reduce the land to a condition of chronic anarchy. Things grew worse when a revival of French nationality followed the wonderful deeds of Joan of Arc, and Henry was gradually deprived of the monarchy of France which had been conferred on him in his cradle with the good-will of many millions of Frenchmen. The bloodthirsty heroes of the French war transferred their fierce activity from France to their native land, and the permanent anarchy developed into a generation of intermittent civil war. This is the period of the so-called Wars of the Roses, which, beginning with the first battle of Saint Albans in 1455, went on with occasional breaks until the Battle of Bosworth in 1485. The nominal occasion for these wars was the legitimist claim of the house of York as the true heirs of Edward III., but the real cause of the triumph of York over Lancaster lay not in Edward IV.'s superior nearness in blood to the common ancestor, so much as in the fact that Edward IV. was a strong man who could give the English people the peace and order which were necessary to enable the ordinary citizen to till his farm or transact his daily business. The fall of Henry VI. involved the failure of mediæval constitutionalism, and the supersession of a lawless anarchy that adopted the name of liberty by the capable and autocratic rule of a vigorous monarch, who cared little for constitutional forms and everything for making his authority supreme. Family divisions within the Yorkist house and the last expiring efforts of the baronial party retarded the restoration of a strong monarchy after the death of Edward IV. and gave the house of Lancaster a chance of reasserting itself. Lancaster was now represented by the Welsh house of Tudor, which on the female side claimed a connection of doubtful legitimacy with the line of John of Gaunt. But Henry Tudor's triumph at Bosworth Field meant not the abandonment but the strengthening of the new system of strong monarchy which Edward IV. had first begun. The Tudor despotism continued the Yorkist tradition and made permanent the fall of mediæval constitutionalism. But the middle ages were now wearing themselves out. The Church and the baronage had in turn exhausted themselves, and even the disorder of the Wars of the Roses did not do much to check the growth of the middle classes, and the spread of a higher standard of national prosperity than more heroic earlier conditions had permitted. The Reformation and the Renaissance were at hand, and a new chapter in English history was about to open.

Bibliography.— W. Stubbs' 'Constitutional History of England,' in three volumes, gives not only the most authoritative account of the development of the English mediæval constitution, but the most broad and general commentary on the turning points of mediæval political history. More political details can be found in the three volumes of the new 'Political History of England,' edited by W. Hunt and R. L. Poole, which cover this period; Vol. 2, 1066–1216, by G. B. Adams; Vol. 3, 1216–1377, by T. F. Tout, and Vol. 4, 1377–1485, by C. W. C. Oman. For ecclesiastical history, consult W. R. W. Stephens' 'History of the English Church,' 1066–1272; and W. W. Capes' 'History of the English Church in the 14th and 15th Centuries.' Economic history can best be studied in W. Cunningham's 'Growth of English Industry and Commerce,' Vol. 1; and in W. J. Ashley's 'Economic History,' Vol. 1, parts 1 and 2. Much information can be gleaned from the unequal but often useful 'Social England,' Vols. 1 and 2, edited by H. D. Traill. Mary Bateson's 'Mediæval England,' 1066–1350 ('Story of the Nations') is very valuable from the same point of view. Among many studies of detached periods, persons and aspects of the subject may be included Mrs. J. R. Green's 'Henry II.,' and T. F. Tout's 'Edward I.' (both in the 'English Statesman Series'); Stubbs' 'Early Plantagenets,' and Warburton's 'Edward III.' ('Epochs of Modern History'); C. L. Kingsford's 'Henry V.' ('Heroes of the Nations'); W. Hunt's 'English Church in the Middle Ages,' and R. L. Poole's 'Wycliffe and the Movements for Reform' (both in 'Epochs of Church History'); G. W. Prothero's and C. Bémont's 'Simon de Montfort,' the latter in French; F. A. Gasquet's 'Henry III. and the Church,' and the same writer's 'English Monastic Life' ('The Antiquary's Books'). Kate Norgate's 'England under the Angevin Kings' and 'Jack Lackland' are important for the 12th and early 13th centuries; H. W. C. Davis' 'England under the Normans and Angevins' is valuable up to 1272; G. M. Trevelyan's 'England in the Age of Wycliffe'; A. Réville's and C. Petit-Dutaillis' 'Le Soulèvement des Travailleurs d'Angleterre en 1381'; J. H. Wylie's elaborate 'History of Henry IV.' (4 Vols.); J. Gairdner's 'Introduction to the Paston Letters,' and the same writer's 'Life and Reign of Richard III.'. Sir J. H. Ramsay's 'Lancaster and York' (2 Vols.) are a great storehouse of facts for the period 1399 to 1485.

THOMAS FREDERICK TOUT,
Professor of Mediæval and Modern History, University of Manchester.

5. **Great Britain — The Reformation.** There are three main factors in the Reformation. It represents, first, the conflict of the

growing spirit of nationality, symbolized by the State, with the mediæval idea of the unity of the civilized world, expressed especially in the Catholicism of the visible Church. Secondly, it embodies the revolt of a laity increasing in wealth, education, and intelligence, against the control and privileges of a priesthood declining in enthusiasm, conviction, and moral fervor; and, as such, it may also be described as the religious aspect of the political advent of the middle classes. Thirdly, it is an assertion of individuality against a collectivist control over thought, opinion, and curiosity. These three ingredients are found in varying proportions in different countries. The second element was obvious everywhere, though it was weak in such countries as Spain and Poland, where a commercial class was almost non-existent. In Germany, where national unity had been shattered in the struggle for Empire, and where particularism ran riot in the absence of national control, national feeling, after a momentary explosion in the Hundred *Gravamina* and a transient enthusiasm for Luther at the Diet of Worms, failed to concentrate in practical channels, and individual Protestantism held sway until it too became the state religion of territorial princes. In England all three elements were present, though individuality, or Protestantism, fought an unequal fight with the New Monarchy and toleration was beaten by an Established Church.

The spirit of nationality, of which the New Monarchy and the Established Church were the outward manifestations, had been stimulated by reaction against foreign influences in the 13th century, misdirected in the 14th toward the conquest of France, and dissipated in the 15th by civil broils. At length it found unity and direction under the Tudors, who frankly and firmly based their power upon new social forces. Feudalism, as represented by the great noble houses, was discredited and trampled under foot; political authority was taken from it and entrusted to lay or ecclesiastical ministers, who, like Wolsey, Cromwell, Cecil, Walsingham, were sprung from the upper or lower middle classes. Order at home and peace abroad were dictated by the interests of these commercial classes. Peace with money was Henry VII.'s ideal. Even Henry VIII. compressed the wars of a reign of 38 years into a few months, and insisted that they should not disturb trade relations with the Netherlands; and Elizabeth's wars were waged for piracy or self-defence. The age of chivalry was gone; wars, if waged at all, were waged with ledgers, not with lances. Men were made esquires and knights in the countinghouse and not on the field of battle.

For these struggles new kinds of brains were wanted, different from those which had designed mediæval castles or coats of arms. The day of the knight had passed away, and to him there succeeded the merchant, the manufacturer, the financial expert. These men were as yet unused to political responsibility; they needed training under the Tudors — and they got it. Under that dictatorship Parliament was moulded and developed as the instrument of government, and Parliament is the work of the Tudors to an extent which an age nurtured on Parliamentary legends is unwilling to admit. Parliamentary privileges first became real in the 16th century; freedom of speech, freedom from arrest, and control of taxation are conceded, not because monarchy is weak, but because it recognizes that the people are its source of strength. Parliament is the foundation, not the rival, of Tudor power. It is true that in the interests of expediency and efficiency many a time-honored maxim is strained or broken; benevolences are levied, though benevolences had been declared illegal; but that is because benevolences, in the words of a Tudor statesman, "do not grieve the common people." Morton's Fork and Dudley's Mills were instruments of extortion, but the operation was not painful to the poor. Dukes and cardinals passed suddenly and swiftly from the palace to the prison, but the man in the street did not pass his time in palaces and generally escaped the prison. The success of a dynasty, whose tyranny has been so loudly denounced, is, in the absence of the usual supports of despotism — a standing army or a vast bureaucracy — only to be explained on the supposition that, while the vocal classes were offended, the dumb masses were content.

It was the work of Henry VII. to base the Tudor throne upon the interests of the commercial classes. His son appealed to national feeling against a universal Papacy and to lay impatience of ecclesiastical control. But he did not appreciate either grievance until Pope and Church crossed his personal will. The first half of his reign was a brilliant and somewhat tawdry pageant, staged by Wolsey with the effect, if not with the object, of diverting the king's and the nation's mind from more serious matters. In it England played the part of arbiter of Europe with a success due to the wealth left by Henry VII., to Wolsey's diplomatic skill, and to the evenly balanced rivalry between Charles V. and Francis I. But the pageant came to an end; wars and subsidies to foreign princes exhausted Henry's wealth (1522); Parliament refused to become the paymaster of Europe (1523); the balance between Charles and Francis was destroyed at Pavia (1525), and Wolsey's influence abroad collapsed. A domestic question intruded into Henry's notice. Catherine of Aragon was now (1527) beyond child-bearing, and her only issue was the Princess Mary. No Queen regnant had ever sat on the English throne, and it was popularly thought that they were disqualified. Henry VIII. had no brothers, and no nephews except the alien Scottish King, whose title as an alien might be barred at common law. A recrudescence of the struggle for the crown was feared, and various claimants had already been suggested. The prospect was horrible to a generation begotten in the civil wars; and as early as 1514 it was rumored at Rome that Henry would get a divorce because of Catherine's failure to present him with an heir to the throne and of the estrangement between England and Spain. But matters mended in this last respect, and the Princess Mary arrived on the scene; she gave promise of brothers, and Henry was satisfied for the time. But brothers never came, and the idea of a divorce revived. There were precedents enough in Henry's family circle; both husbands of his sister Mary had been released from inconvenient matrimonial ties, and his sister Margaret was no less favored by the Papacy. Henry's need was quite as great as theirs, his merits in his own eyes greater. Anne Boleyn doubtless added zest to the suit, but Henry's anxiety for a wife and not a mistress was due to the state of the succession.

He met with unexpected obstacles. Pavia had made not only Francis but also Clement VII. practically the prisoner of Catherine of Aragon's nephew. Charles cared little for his aunt, but it was a matter of vital importance to him that a princess who was half a Spaniard should sit on the English throne and secure England for the Spanish instead of the French alliance. His control over Clement would make a divorce harder for Henry VIII. than it had been for Louis XII., Henry IV. of Castile, Margaret, Queen of Scotland, or the Duke of Suffolk.

For a time, indeed, success seemed possible and near. France recovered from Pavia and sent an army into Italy. Charles's star seemed on the wane: Cement was freed and Campeggio was sent to England in 1528 with a commission ample for Henry's requirements. But appearances were deceptive; the French hope failed; Campeggio was ordered to do nothing except pass the time till the fortune of war should decide the divorce. In 1529 Italy became imperialist and Clement with it; Campeggio was recalled, and the case revoked to Rome. As Wolsey said, this meant not merely his own fall but the ruin of the Church in England. He alone stood for 15 years between it and its enemies. The Parliament of 1514 had anticipated some of the demands of 1529–36. The unpopularity of the Church alarmed ecclesiastics at that time, and men knew well enough that the Crown had only to abandon the Church for the Church to fall. Doctrine had little to do with this antipathy at first. It was the privileges, the perquisites and the power of the Church which excited discontent; not its ritual or its dogma. The laity were Catholic and they did not object to persecution; but they did object to persecution by priests; they wanted lay control of the penal machine, and they envied the wealth of the Church. In spite of theological appearances it was a commercial and utilitarian age which saw no advantage in vast endowments for contemplative monks or for non-reproductive purposes, and in holy-days on which men were precluded from the pursuit of wealth. There was moreover the sentimental grievance against Papal power which was the tool of a national enemy, and the growing spirit of nationality caused everything foreign, and especially a foreign jurisdiction, to be regarded with suspicion.

The first thing Henry did in 1529 was to turn out his ecclesiastical ministers, and put laymen into their places. This restored harmony between Parliament and the government; and although there were occasions on which Henry VIII. came into conflict with the Reformation Parliament and had to give way, both were bent for different reasons on "reforming" the Church in the sense of reducing its power. The foundation of that power was the Papacy, an institution beyond the reach of national control. The Church in England could never be curbed so long as it drew support from an independent authority. Nor indeed could a reformation, in a more legitimate sense, be effected by any other means than the national state. General councils had failed; Popes had ceased to try; the acts of a national Church acting independently of the Papacy would be *ipso facto* void. Not a monastery could be dissolved without the Papal sanction; and Archbishop Warham said that he was merely commissary of the Pope, exercising as *legatus natus* a jurisdiction which he did not possess as primate. The national state was the only authority which could act independently of the Pope. The Reformation was therefore a revolution carried out by Acts of Parliament at the expense of the Church. By the successive acts of Annates, Appeals, and Supremacy the financial and jurisdictional rights of the Pope over the Church in England were transferred to the King; the Church was nationalized by the substitution of a national for a cosmopolitan head, and it became the Church *of* and not the Church *in* England.

Such a transformation was incompatible with the continued existence of the monastic orders. They were a negation of the national principle, being essentially international in government and in spirit. They had secured exemption from every sort of national control; and their immediate subjection to the Papacy caused them to be regarded as in a special sense the militia of the Pope. This was the ultimate cause of their dissolution, as opposed to their reform. The necessity for reform was admitted by a Papal commission in 1537, but Henry VIII. and Cromwell assumed the case for mending the monasteries to be a case for ending them. They were also useful as a gigantic bribe to induce the upper class laity to concur in Henry's measures and support them after his death; but this use of monastic endowments forbade their devotion to educational purposes, and from this point of view an unequalled opportunity in English history was sacrificed.

So far as doctrine was concerned, Henry VIII. made comparatively little change, though the denial of purgatory in 1536 cut deep at the root of the Catholic system and there were indications that the King was preparing for further changes in 1546–7. But the general impression was, as Hooper said, that the king had destroyed the Pope but not Popery; the doctrinal reformation was the work of Edward VI.'s ministers. Protector Somerset's changes were comparatively moderate and are represented by the first Act of Uniformity and the First Book of Common Prayer (1549). The latter especially was a compromise and its design was to open the door for the new learning without closing it upon the old. The definite breach with Catholicism came when Somerset had fallen as the result of his sympathies with the peasants in their protest against enclosures. Northumberland, who engineered the reaction against the Protector's liberal policy, played for the support of the extreme Protestants on whom alone he could rely in an attempt to exclude the Princess Mary from the throne. In 1552 by the Second Act of Uniformity and Second Book of Common Prayer the door was definitely shut on Catholicism; but so far as inspiration was sought from the continent and not from Wycliffe, that inspiration was Zwinglian and not Calvinistic. It was not till the Marian exiles returned from Geneva that Calvin began to exert an appreciable influence on the Church in England.

Northumberland's championship was enough to ruin any cause; and the identification of Protestantism with his harsh and violent rule involved it in a discredit from which it was only redeemed by the blood of the Marian martyrs. Queen Mary came to the throne as a representative of the Tudor tradition against a self-seeking revolutionist; even her Spanish marriage was based on the approved policy of alliance with the House of Burgundy, and in religious matters few dreamed at first of anything more than a return to the system of Henry VIII. Wyatt's ill-advised rebellion, the truculent spirit of Mary herself, the character and conduct of many of the Reformers were responsible for the persecution which reached its height in 1555–6. It involved a gross miscalculation. Englishmen of that day were not squeamish, but no generation in England had witnessed anything like the burnings of Queen Mary. They rehabilitated instead of discrediting the Reformation; and the subsequent popularity of Foxe's 'Book of Martyrs,' with all its exaggerations, is proof of the impress of the persecution on the national mind. It was deepened by the association of this violent policy at home with weakness and disaster abroad. Tudor prestige depended largely upon the figure they cut in Europe, and Mary's well authenticated remark about Calais illustrates her appreciation of the failure of her policy. Her fate was hardly less tragic, though more deserved than her mother's.

Elizabeth personified the revolt from Rome, but not a Protestant or a Catholic theology. She was purely a *politique*, and if she ostentatiously kissed the Bible in the streets on her way to coronation, she was careful to show the crucifix in her private chapel to her brother-in-law's ambassador; and the ambiguity of the Ornaments Rubric had its value in international politics. That the late persecutions would cease was certain, but all the rest was made as doubtful as might be to the prying eyes of the foreigner. It was, however, largely a diplomatic pose adopted by the Queen, partly to parry a real danger and partly because it was of the essence of her nature to shirk responsibility. The wonderful unanimity with which the bishops refused to countenance Elizabeth and her ecclesiastical settlement shows that they were under no misapprehension. That settlement was no mere return to the Anglo-Catholicism of Henry VIII.; it did not go so far as the second Prayer Book of Edward, but it went a good deal farther than the first. Nor was repudiation of Catholicism so novel or so dangerous a thing as in Henry's reign. By the Peace of Augsburg (1555) the Empire had resigned itself to the public licensing of heresy. Calvinism was planted in the heart of Europe; the revolt of Scotland from the Papacy withdrew a thorn from England's side, and civil war in France placed another Catholic country *hors de combat*. Spain alone could think of a Catholic Crusade, and Philip II. soon had enough to do with heretics and rebels in his own dominions. Elizabeth had more to fear from plots than from invasion, and her main task was to keep her subjects in a state of tolerable suspense until the financial and military weakness of the realm had been repaired. State and Church had become so closely interwoven that national unity was thought to require some sort of ecclesiastical uniformity. But it was to be one of externals principally; men must go to Church on Sundays, but Elizabeth boasted that she made no windows into men's souls. It was, however, impossible to avoid religious persecution when one religion involved a royal, and another a papal supremacy over both Church and State; and religious persecution went on in England until the Church practically abandoned politics and the State theology.

The plots against Elizabeth were, however, almost as much political as religious. The Bull of Deposition (1570) was a convenient screen; but even Philip II. did not launch his Armada until Mary Stuart had left him her claims to the English throne and Drake had goaded him into fury by attacks on Spanish trade. The northern Earls who rebelled in 1569 were fighting the fight of expiring feudalism as much as of the Counter-Reformation; nor is it easy to believe that the Catholic religion was the sole concern of the Queen who married the Protestant Bothwell according to Protestant rites. The political chessboard was divided into national and religious squares, and the moves were often complex; for while the bishops were supposed to keep to their own color, the rival Queens and their knights might move on either. From the dynastic point of view Elizabeth was handicapped. Precluded from matrimony by a physical defect, she had to leave the succession to look after itself, and makeshift with suitors. She prolonged this game almost beyond the limits of public decency; but it was done with inimitable skill and gave England an invaluable breathing space of 30 years. At length the success of Parma in consolidating his power in the Southern Netherlands (1580–84) and the stroke of fortune which gave Philip the crown of Portugal with its colonial empire, its harbors and its navy (1580) induced him to make a bid for the title of which the death of Mary Tudor had deprived him, and the death of Mary Stuart had left him heir. It was a forlorn hope from the first. Philip's failure in the Netherlands might have warned him of the odds against him under circumstances far less favorable. There is no reason to suppose that Philip would have been successful even if the Armada had disgorged its hosts on English shores. Drake and his colleagues saved England not from conquest but from a bloody and perhaps a long drawn struggle fought on English soil.

With the defeat of the Armada the work of the Tudors was done. Their dictatorship was the result of an emergency at first domestic and then foreign. So long as the danger lasted of internal disruption or external attack, Englishmen acquiesced in the despotic maxims of *droit administratif* and Roman civil law. The people supported arbitrary government to avoid a greater ill; but with the danger there passed the need and the inclination to subordinate self-government to national security. Elizabeth lingered a few more years on the stage, but she was losing touch with her people. Her waywardness, as Parliament told James I., was only tolerated because of her age and her sex, and the Commons were girding themselves for their hundred years' war with the Crown.

Albert Frederick Pollard,
Professor of Constitutional History, University College, London, author of 'England under Protector Somerset,' 'Henry VIII.', etc.

6. **Great Britain—English History of the 17th Century.** The intensely dramatic nature of the events of the political life of England in the 17th century has led every English and American historian to attribute to the period an exaggerated importance. The generally accepted view held by these historians is that the Stuarts attempted to perpetuate or to live up to the pure type of Tudor despotism, and that partly because of their want of personal popularity, and partly because of the silent growth of national self-consciousness, the attempt was a failure; and that as a consequence the century witnessed the definitive overthrow of the Tudor system of paternal despotism — an overthrow in which the chief operating factor was the Great Rebellion.

Such a view involves a serious misconception of the real nature of the problem which the century had to solve and at the same time a still more serious misconception of the actual constitutional advance which that century achieved.

The real problem which the century had to solve was not the setting up of one ideal of State or government upon the ruins of another ideal. History does not concern itself with ideals. It concerns itself with men and things — men who are flesh and blood and intensely practical, and things which are more sternly practical still — such things as, when they mount the saddle, ride mankind. The real problem of the century was how to bridge over the gulf between the executive and the legislative.

Under Elizabeth the central power from which the whole executive machinery radiated was the Privy Council. That body was simply a small permanent Council of Government or Council of State. With the sovereign at its head, it was the government. The whole executive administration of the country rested upon it. Without dividing itself up into committees at all, but simply sitting together as a single and permanent body, this Council decided each and every question of administration, whether relating to the land forces, the calling out of the militia, their equipment, and the whole plan of any military operations, or to the naval forces, including the arranging of transport, the making of contracts with the victualler, and the stragetical distribution of men and ships, or again to diplomacy, including every species of confidential letters and instructions to ambassadors and agents abroad, or again to finance, including especially a most strict control of issues out of the exchequer, or finally to every branch of internal administration and law, the main channel of communication in this last instance being the justices of the peace in the counties.

Where does the Parliament, England's glory, come in in such an enumeration? The answer is simple. It finds no place whatever in it. And if Elizabeth, to take her for the moment as the type, had been able to live off her own, as the kings of England were then supposed to do, never a word would have been heard of a Parliament. So long as it could pay its way the executive was efficient and sufficient without the Parliament. During the 44 years that Elizabeth reigned she called 13 Parliaments at irregular periods but with an average interval between each of more than three years. These Parliaments sat as a rule about two months. The total aggregate period of session of the whole 13 Parliaments was less than 34 months. So that out of the whole 44 years of her reign the Privy Council or executive had uncontrolled management of the nation for nearly 42 years. Nor would it be correct to say that during the remaining two and a half years the executive was confronted by the Parliament. That body was called simply for the purpose of supplying the government with money. Having dutifully voted its tenths and fifteenths it was allowed to legislate on non-contentious matters and was then dissolved. In the whole of the statutes of Elizabeth's reign there is not one of any constitutional importance. More than this, not the slightest attempt was ever made by the legislative to extort from the executive an account of the expenditure of the money thus granted by the Parliament. Once the subsidies were voted there was an end of the matter as far as the two Houses were concerned.

After James I. came to the throne this docile attitude of the Parliament to the executive gradually changed. The important point about this change of attitude is not the cause which brought it about, but the form it took, the way in which it expressed itself. That expression is focussed for us in the terms of the Great Contract, the failure of which led to the dissolution of James's first Parliament in 1610. In this bargain of the Great Contract James's position was comparatively simple. In the first year of his reign the Parliament had granted him for life the subsidy of tonnage and poundage. That grant practically put him in the same position financially which Elizabeth had been in throughout her reign. His revenue (from Crown Lands, royalties, casualties, and customs) was his own. He was expected to live on it, and by that phrase was meant that out of his own he should provide for the whole government of the country — regal, legal, civil, military, and naval. If debts arose or extraordinary occasions demanded, he would have to ask for extra grants of tenths and fifteenths just as Elizabeth had been obliged to do. These extra grants Parliament never refused to the Virgin Queen; nor did James's first Parliament refuse them to him. But James tried for something more than this. He tried to get an increase of "his own," of his life revenue, that standing, permanent, ordinary revenue out of which he had to defray the ordinary expenditure of the State. Nor was the Parliament indisposed to meet him. It accepted the general principle of his demand, and agreed tentatively to increase his life revenue by £100,000 a year on certain conditions. These conditions embodied the Parliament's demands on the subject of their grievances, the Impositions, such oppressive royalties as purveyance, and certain ecclesiastical complaints.

Stretch or construe these points as we will we shall not find in them anything in the nature of a challenge from the legislative to the executive. All the points which the Commons demanded were to be conceded by the Crown as a matter of bargain. They were to be voluntary sacrifices of prerogative on the part of the king in return for so much cash. When carried out, the executive was still as before to occupy the whole governmental field alone. No part whatever of that field was it for a moment in the Parliament's mind to itself occupy or usurp. It never dreamed of demanding some control over the executive, or even the slightest share in it, either by requesting to be consulted in affairs of State, or by claiming the appointment of any of the king's ministers. The executive was the king's, the ministers were the king's, his completely and his alone, and Parliament never once thought of challenging such a flower of the prerogative. Had the Great Contract gone through the only difference would have been that for the future the king's executive would have agreed to avoid certain acts or to cease the exercise of certain rights of prerogative which had been felt as a grievance. For the rest the executive would have been stronger, not weaker, by the compact, for it would have been better able to pay its way, and so to avoid frequent appeals to the Commons.

Equally noticeable with the subject-matter of the Great Contract was its form. The negotiation was carried on as if it were a treaty between two foreign and totally unrelated powers. The want of connection between the two parties to it could not have been more complete if the king had belonged to one country and the Parliament to another. And between these two parties, the executive and the legislative, the Crown and the Parliament, there was not even a regular and recognized channel of communication. Practically the only means of intercourse was a direct message or speech from the king on the one hand or a petition from the Commons on the other. For the rest all was haphazard. Such members of the executive as sat in the House acted individually each as he thought fit, or as he was bidden, in promoting the king's business. On its side the Court party or the executive had no more thought of creating and working some piece of machinery by which the king's business could be piloted smoothly through the House than the House had on its side of ever challenging a share in the executive. There was a gulf between the two which neither side dreamed of permanently bridging over. On neither side did the slightest conception exist of a Constitution in which the executive and the legislative should be linked together.

It was the problem of the 17th century first of all to perceive the necessity of such a link, and then to invent the mechanism. If this statement is a correct diagnosis of the true bearing of English 17th century history, then the constitutional importance which has hitherto been attributed to that history will be found to be exaggerated. For the simple fact remains that the clear perception of the need was only attained at the close of that century, and the mechanism itself was only gradually elaborated in the 18th century.

Fortunately or unfortunately the Great Contract broke down, and from that moment commenced that antagonism between Crown and Parliament which was destined to produce the Great Rebellion. The steps by which that antagonism developed itself until it blazed out in open war need not be detailed here. They are the commonplaces of history. The point to notice is that the moment the antagonism emerged the opposition of Parliament to executive, or of nation to Crown became not so much constitutional as political. What is the distinction between these two terms? The difference is fundamental, for whilst the one is a matter of principle and abiding, the other is a thing of time and place, and may be transitory. Had the nation said to James through Parliament as its mouthpiece, "You represent and wish to perpetuate the Tudor type of government by prerogative; we have outgrown that and claim for ourselves a share in the government," such an attitude would have been constitutional. But nothing of the kind was either said or thought of. The opposition which developed itself was conditioned in its form by the mere force of circumstance. When, after ten years of rule without a Parliament, James in 1621 summoned his third Parliament, there were reasonable prospects of a complete agreement. The House, glowing with Protestant fervor, made not the slightest reference to the old burning question of impositions. It sat down at once to consider supply for the support of a war in defense of the Palatinate. For the first fortnight of the session James could have done anything he pleased with the Commons. Ten months later, in December 1621, after with his own hands tearing out of the journals the Protestation of the Commons, the king dissolved the Parliament in anger and sent three of its members to prison. How could so complete a change have happened? The answer is simple. The Constitution provided no mechanism by which James could explain to the Parliament his foreign policy. He could not, nor would he if he could, take the whole House into his confidence, and he never thought, any more than did the House itself, of such a device as that of taking a select few of the leaders of the Commons into his counsels. Nothing is more remarkable in this Parliament than the scrupulous regard which the House paid to the king's prerogative in the matter of foreign affairs. It was for the king, and the king alone, to make treaties and to decide peace or war, nor could they press him to disclose his policy. Had the Commons felt as certain of the patriotic and Protestant trend of James's foreign policy as the Parliament of Elizabeth's days had been of her foreign policy, not a word of criticism or contention would have been heard. But they were not so certain, and as a consequence felt that they were being called upon to vote supply for a policy which might even be the very opposite of that which the nation yearned for. Then a side issue arose. In his impatience at the slightest doubt being cast upon his foreign policy James was led to assert his view of the prerogative in so dogmatic a way as practically to deny free speech to the House. To this the House of Commons replied by the Protestation, in which they claimed practically nothing but the parliamentary privilege of freedom of speech, just as it had claimed it in Elizabeth's day. This, and this alone, was the cause of the breach.

Will any one contend that there is anything of constitutional principle in this? If the Parliament had said "We demand to know what your foreign policy is, and that it is in accordance with our views before we vote supply" there would have been constitutional principle involved. But over and over again the Commons disclaimed any such idea. If James was antiquated in his devotion to the Tudor ideal of prerogative the Parliament was just as antiquated as he in their devotion to it, for they distinctly admitted his view, and when they joined issue with him it was on the minor point and on the lower plane of parliamentary privilege.

A remarkable change, however, though transitory as it proved, came over the scene as James's reign came to a close. For some unexplained reason his powers decayed whilst he was still young, for he died at the early age of 57. Whether it was due to this premature decay, or to his own intense chagrin at the failure of his long negotiation with Spain, we cannot say. But certain it is that for the last two years of his reign he was a mere tool in the hands of Buckingham. Had it not been for this senility it is certain that the astounding constitutional departure which marked the career of his last Parliament would never have been enacted. James met that Parliament with the practical confession that his foreign policy had been a failure, and he invited their co-operation in the evolving of a policy to take its place. He informed the Houses that his secretaries would tell them the whole story of the marriage treaty with Spain. After they had heard the story, he continued "I shall entreat your good and sound advice. . . . I assure you you may freely advise me, seeing of my princely fidelity you are invited thereto."

The marvellous thing about this sudden and revolutionary surrender of prerogative by James is that it sprang from the dictates of Buckingham. But more extraordinary still was the sequel. Following the dictates of the imperious favorite as tamely as a sheep, James, after receiving the advice of both Houses, informed them that if they made him a grant for a war they might appoint their own treasurers to see to the spending of the money, and further "I promise you on the word of a king that although war and peace be the peculiar prerogative of kings, yet as I have advised with you in the treaties on which war may ensue, so I will not treat nor accept of a peace without first acquainting you with it and having your advice." (8 March 1623–24.)

Accordingly when twelve days later the Commons voted three subsidies and three fifteenths the money was ordered to be paid to treasurers appointed by Parliament and not into the Exchequer: and at the same time the Houses in an address to the king plainly laid down the object for which the money was voted.

In the whole course of 17th century history, including the civil war and regicide, there is no more revolutionary incident than this complete, sudden, uninvited surrender of prerogative on the part of James. Had it happened as the result of deliberate thought, and whilst James was still in his prime, it would have shortened by more than a century the birth throes of modern constitutionalism, and have saved the Stuarts from exile.

But it did not so happen. It was a momentary inspiration of Buckingham's, the genesis of which is to be explained by the favorite's own personal position and policy at the time, and it was by him forced upon the feeble king with an impetuosity that swept everything before it. But as with all Buckingham's inspirations, it was no more than a flash and almost as soon over. After the old king's death the versatile but unstable minister made one or two disingenuous efforts to revert to such relations with the Commons. Though the mouth of his creature, Sir John Coke, he submitted to Parliament in July 1625 a rough statement of the expenditure of the subsidies granted in 1624 and again in the following month of August 1625, when the Parliament was sitting at Oxford because of the plague, the lord treasurer made a similar statement. But further than this the concession was not carried. From the position which James had adopted in 1624 Charles gradually receded, not so much from deliberate design as from the mere force of circumstance and from a growing perception of the revolutionary consequences which that position entailed. The desire on the part of the Commons to inquire into the expenditure of the subsidies led them to utter their opinions on the merits of Charles's foreign policy, and in particular to call into question the advice given to the king by the Council of War as to that expenditure. The moment this was clear to Charles any further surrender of prerogative was impossible. Backed by the king the members of the Council of War refused to reply to the interrogatories of the Commons. Their resistance proved successful. Before the determined attitude which Charles thus took up the House quietly receded and dropped any further attempt at pressing the interrogatories. (March 1626.)

With this incident practically ended the whole two years' episode of attempting to take the Parliament into partnership with the executive by means of a voluntary and undefined surrender of prerogative. Had the king allowed the members of the Council of War to answer the interrogatories of the House the principle of ministerial responsibility (that is, the responsibility of the executive to the Parliament, and not to the king alone) would have stood forth in abrupt nakedness. When Charles resisted that demand the emergence of such a principle was postponed for a century. For be it borne in mind, the impeachment of Buckingham, and the later proceedings against Strafford, Clarendon, and Danby never advanced the enunciation of that principle a jot. The mere punishment of a minister great or small does not imply ministerial responsibility in our sense of the phrase. All through the 17th century the ministers were the king's servants and were responsible to him, their master, alone. After the exile of Clarendon the Commons did not demand to be consulted as to the choice of his successor, or as to the policy of his successor. Charles had simply sacrificed one of his servants. That was all. Then he engaged another servant to do exactly the same things, and went on as gay and unconcerned as before.

But had the episode of 1624–26 ended differently the acceptance of the principle of the responsibility of ministers to Parliament as well as to Crown would have led inevitably to the forging of some such link between the executive and the legislative as only came generations later. From the moment such a link had been forged questions of adequate supply for the services and of a proper audit, and again questions of the personal liberty of the subject, of habeas corpus, and what not, would have solved themselves harmoniously. For the participation of the Parliament in the executive would have insensibly tinged the spirit of the whole administration of the country. As compared with the evolution of such a principle the Petition of Right, habeas corpus, nay, even the Revolution itself, are minor incidents.

Such I take to be the true constitutional bearing of 17th century history.

The remainder of the reign of Charles I. when he ruled without a Parliament, the outbreak of the Civil War, and the consequent military despotism of Cromwell are devoid of constitutional significance. The rule of Oliver Cromwell was a despotism as pure as that of the Tudors, the only difference being that the prerogative of the Crown, which had formed the ultimate sanction of the executive government of James I. and Charles I. was replaced by the naked power of the sword. The quarrels between Oliver and his Parliaments were in substance and essence the same which had been fought between Charles and his Parliaments. They one and all turned upon the question as to whether and how far the Parliament, the legislative, should thrust itself into the domain of the executive, notably, of course, but not solely, in the matter of the command of the forces. To any such demand Oliver's reply was a much more peremptory, indignant, instantaneous *non possumus* than ever James or Charles could have uttered. And when the sword fell from his dying grasp and the succeeding anarchy swept away the chances alike of his dynasty and of pure republicanism, the Great Rebellion had become a mere tale that is told. When Charles II. returned at the Restoration in 1660 the Stuart dynasty reassumed the inheritance of an undiminished prerogative, one that is in no whit distinguishable from the prerogative wielded by Elizabeth, James I., or Charles I. He was granted a revenue for life which might, had it been fully realized and carefully husbanded, have made him independent of the Parliament. He was left in uncontrolled possession of the executive. His ministers were his own, nominated by him and responsible alone to him. His revenue was his own, to spend as he pleased, without the slightest restriction in the way of appropriation. His foreign policy was his own, he could make war or peace or treaty unquestioned, and as he chose. Had it not been for the outbreak of the Dutch War it is probable that his reign would have witnessed no parliamentary incursion upon his prerogative. As it was, when under the strain of the shame caused by the first Dutch War the Parliament did actually make an incursion into the domain of the executive, the novel departure took exactly the same form which it had taken in 1624 under James I. No more speaking comment than this could be passed upon the fruitlessness and futility of the intervening period of civil war, regicide and revolution.

The full story of the episode in question is too long to be given here. It has been treated fully in the introduction of the second volume of the 'Calendar of Treasury Books.' In brief, what happened was this: With the full consent of the executive (Charles himself) the Parliament in voting supply for the Dutch War appropriated that supply specifically to that war. The necessary corollary was that a few months afterward the Commons were driven to demand an account of the expenditure of that supply. Had the war been successful there would have been no boggling over such an account. But the war had not been successful. It had brought with it disaster and humiliation, and men's minds were correspondingly inflamed. But even so, the action of the Commons was astonishingly mild. Although the inquiry might have led the Commons to cover the whole field of administration and to question the whole conduct of the executive during the war, the Parliament practically in the end restricted its attention to the question of the auditing of the accounts. Charles at first resisted the proposal as a breach on his prerogative; but in the finish, with his usual subtle adroitness, he gave way.

The immediate outcome of the inquiry was in great measure the exoneration of the executive from the suspicion of financial dishonesty. But the immediate result is insignificant by the side of the ultimate results. On the one hand it furnished a now unchallengable precedent for appropriation of supply and for audit of accounts; and once the right of auditing accounts should be fully conceded, the further right of questioning the conduct and policy of the executive was bound to follow. Once that consequence was fully established the gulf which sundered the (king's) executive from the (people's) Parliament was narrowing and a bridge was being built over it. The Parliament was coming to identify its interests with those of the executive instead of maintaining an attitude of permanent aloofness or even hostility. Of the two parties to this conversion the Parliament itself was slower of comprehension and more unwilling of movement than the Crown. For to identify itself with the administration was to forfeit all the vantage ground of complaint and agitation on which it had stood in the past. Accordingly the change did not actually accomplish itself in Charles II.'s time. For the rest of his reign the parliamentary opposition was swayed by motives which were merely and purely factious. But as the century drew to a close the gulf was in great measure bridged over, and in the course of the 18th century the new structure was perfected. The executive ceased to be the personal property, appanage, officialdom of the king. It became identified with the parliamentary system through the device of parliamentary departmental heads; and the practice of annual estimates took the responsibility for the financial administration of the country from the shoulders of the king, and laid it upon the broader shoulders of the Parliament. From that moment the development of English constitutional and political life has been smooth and harmonious.

But these ultimate results lay unfolded in the bosom of the future. To Charles II. the Commission of Accounts taught another and quite different lesson. It taught him the art of parliamentary management, not merely how to buy off the opposition, but also how to organize his own friends in the House. Danby's corrupt leadership of the Parliament, and the various devices employed to influence the constituencies on the one hand, and Sir William Temple's scheme of a reorganization of the Privy Council on the other, are but manifestations of this side of Charles's statecraft. Thanks to this statecraft of parliamentary management, Charles remained easily master of the situation for the rest of his reign, and when he died he left to his brother a prerogative as unimpaired as that which James I. had wielded — complete control of the executive at home, complete control of the forces, complete control of the foreign policy of the nation.

From the point of view which has been thus expounded, what was the historical significance of the Revolution of 1688? In a sentence it lies not so much in the direct challenging of prerogative as in the quiet, undefined, unobserved usurpation of it by the Parliament. In the first place the Parliament voted a standing revenue of £1,200,000 for the support of the Crown in the time of peace. This was exactly the sum which the Restoration Parliament had granted Charles II. in 1660. But whereas in 1660 that sum was meant to cover the complete national expenditure, civil and military alike, the details and management of which were left absolutely unchallenged in Charles's hands, the vote in 1689 was intended only for the civil establishment in time of peace. Immediately after this vote the Parliament proceeded to consider the question of separate supply for the army, navy, and ordnance, and in order thereto detailed estimates of the charge of the army and navy were laid before the House.

Herein lies the Great Revolution — not in the clauses of the Bill of Rights. For the moment the Parliament realized that the provision for and regulation of the army and navy was its province it had assumed to itself half the domain of that kingly prerogative which had endured through Tudor and Stuart times. It had stepped over the gulf which had hitherto divided the domain of the executive from that of the legislative. Once this first step had been taken, there remained only the problem of evolving the machinery by which the participation of the Parliament in the executive should be expressed and regulated. The course of the evolution of that machinery — the selection by the Crown of its advisers and administrative departmental heads from the chiefs of the parties in the Parliament — was determined by the mere force of circumstance, that is, by the situation in which William III., and again, a generation later, George I., each found himself as the imported ruler of a strange country. The gradual development of the party system of government afforded the key to the solution of the problem of which the 17th century had been so long in labor. For when once the obvious step had been taken of selecting the party chiefs as the heads of the various executive departments, the development of the system of Cabinet government was bound to follow sooner or later. But even so, generations had still to elapse before this new parliamentary executive fully grasped the control of that last and most highly prized flower of the kingly prerogative, the direction of the foreign policy of the country.

So far as these results depended upon the mere accidents of the Revolution of 1688 and of the Hanoverian Succession they may be regarded as, in a sense, fortuitous. If it is true that England has blundered into an empire, much more true is it that she has blundered into a Constitution.

If the ordinarily accepted view of the constitutional importance of our 17th century history is wide of the mark and distorted, much more truly may this be said of the ordinary view as to the religious history of that period.

The chief outstanding features of that religious history are, firstly, the absolutely unreasoning fear of a Catholic reaction, and, secondly, the temporary exaltation of Puritanism.

The two are by no means synonymous. For whereas the jealous fear of Catholicism was national, pervading the country blindly from end to end, the triumphant emergence of Puritanism was local, partial, temporary. But if the two are not synonymous they have been alike in their fate. With the inscrutable irony of her passionless lips the Muse of History has consigned them both to the region of human futilities. The further we are drifted from the 17th century by the stream of time the more difficult does it become to us to realize the standpoint of that century on the question of the Catholic reaction. We can see now that whatever form that attempted reaction took, whether it be of the theological discussions which waged in the presence of James I. as the divines flocked round his chair, or of Laud's unattainable conception of an unifying Catholicity, or again of Charles II.'s cynical but more statesmanlike conception of Indulgence, or finally of James II.'s grossly bigoted intrigue, in one and all of these or any other forms the movement was doomed to failure before its birth. The panic, the absolutely unreasoning fear, the blinded and relentless fury which seized the nation again and again throughout the period and which not only accounted largely for the rebellion of 1642 and the revolution of 1688, but also left their malignant trail on two centuries of our later history, fill us to-day with only a sense of disdainful surprise.

As for Puritanism, the second religious phenomenon of the century, the judgment of our own day has been more sympathetic, partly because it has been the fashion since Carlyle's day to speak of it in terms of respect, and partly because the movement has not yet lost its force in English and American life. But be it borne in mind, in the 17th century Puritanism in its day of power did not show itself a constructive force either in the domain of dogma or in the domain of ecclesiasticism. The dogmatic wrangles of the Westminster Assembly — the discussions as to the method of the imputation of Christ's righteousness and what not else — are utterly meaningless to us. And when Puritanism was called upon to solve the problem of the erection of a national church it completely failed. In the mere interests of human tolerance Cromwell, himself a Puritan of the Puritans, was forced to take the problem out of the hands of his co-religionists and thereby to dash to the ground their half-finished and futile structure. And will anyone contend that either in its persecuted birth or in its day of exaltation, when for a brief span it wielded the wooden sword, or again in its day of adversity when at the Restoration 2,000 of its ministers left the national church to wander in the byways of Separatist Dissent, that in any one of these its forms Puritanism was ever a missionary movement or a missionary church in the sense in which 18th century Methodism was a missionary movement? Such contention could not be maintained. The basis of Puritanism was dogmatic and clerical throughout; the fervor of humanity never breathed into it a spark of missionary fire. Its zeal was spent in the dogmatic defense of forms of church government, in the safe-guarding of the church membership of each little community. To the nobler issues of life, to the higher conception of toleration, of humanity, of national religion it was, and throughout the succeeding century it remained, cold and dead.

Bibliography.— The original authorities for 17th century English history consist of:

1. Parliamentary records: the 'Lords Journal' and 'Commons Journals' which are in print; and much material still in manuscript at the House of Lords, but which is being gradually printed by the Historical Manuscript Commission. The only full edition of the Acts of Parliament is the 'Statutes of the Realm,' but this collection does not contain the Commonwealth Acts and Ordinances. These latter can only be obtained from the collections of Husband and Scobell, and from the separately printed ordinances.

2. The archives in the Public Record Office: comprising mainly (a) Domestic State Papers calendared up to 1675 and from 1689–93. (b) Foreign State Papers, not calendared at all for the 17th century. (c) Colonial papers, only partially calendared. (d) Certain departmental archives, and Commonwealth Committee archives, only partially calendared as yet. Of the departmental archives the Treasury Records are the only ones at present being calendared; similarly the printing of the 'Register of the Privy Council' has not yet reached the 17th century.

3. Archives not preserved at the Public Record Office, viz.: (a) Collections of manuscripts and individual manuscripts at the British Museum, at the Bodleian (including the Clarendon manuscripts, Carte manuscripts, and Tanner manuscripts), and at Lambeth (including the Commonwealth Church Manuscripts). So far as these sources have been worked at all it has only been by individual effort or by societies such as the Camden. Of the manuscripts printed by the Camden Society, the 'Clarke Papers,' 'Nicholas Papers,' and 'Lauderdale Papers' may be particularly instanced. (b) The archives in the possession of private families are being systematically printed by the Historical Manuscripts Commission. So many of the reports bear on the 17th century that it is almost impossible to particularize, but the 'Buccleuch manuscripts,' 'Portland manuscripts,' 'Ormonde manuscripts,' 'Cowper manuscripts,' 'Rutland manuscripts,' 'Fleming manuscripts,' 'Stuart manuscripts,' and 'Kenyon manuscripts' may be specially instanced.

4. Printed collections of state papers, viz.: Winwood, Sydney, Roe, Wentworth, Rushworth, Nalson, Thurloe, Milton, Clarendon, Orrery, Macpherson, Hardwicke, Rochester, Carstairs, Kemble, and Stuart Papers.

5. Diaries, memoirs, etc., other than those published by the Camden Society and other societies, viz.: Whitlock, Burton, Ludlow, Holles, Fairfax, Hutchinson, Price, Herbert, Reresby, Warwick, Berkley, Evelyn, Pepys, Anchitell Grey, Luttrell, Ellis Letters.

6. Constructive synoptic works: Rapin, and Tindal, Baker, Clarendon's 'History' and 'Life,' Carte's 'Ormond,' Kennett's 'Register' and 'History,' Burnet's 'Own Time,' Andrew Marvell's works, Sir William Temple's works, Boyer, Ralph and Dalrymple.

7. Of tract literature the mass is so great

that the portions which have been printed in the 'Cabala,' 'Harleian Miscellany,' 'Somers' Tracts,' 'State Tracts of Charles II.', and 'State Tracts of William III.', are an inconsiderable fragment of the whole.

8. Of modern constructive historical work the only English one worthy of the name is S. R. Gardner's great work covering the years 1603–54. Carlyle's 'Cromwell' is a constructive work of distorted view; Macauley's history for the later part of the century represents a type of historical writing which is deservedly falling into disrepute among professional historians. Ranke's 'History of England,' and Doctor Ono Klopp's work on the fall of the House of Stuart are scientific and exhaustive. For Church History, Shaw's 'History of the Commonwealth Church' is a specialized work covering only the years 1640–60. The various denominations of the Dissenting Churches, as also the Quakers have an abundant historical literature of their own, but, generally speaking, neither the religious history of the century as a whole, nor the intensely important and interesting economic history of the century have as yet received adequate specialized attention, though Doctor Cunningham has covered many aspects and much of the ground of the latter section in his 'Growth of English History and Commerce.'

William A. Shaw,
Author of 'The History of the Church Under the Commonwealth;' 'The Knights of England,' Editor of the 'Calendar of Treasury Records' at H. M. Record Office, etc.

7. (a). **Great Britain — Eighteenth Century.** *Historical Sketch.*—The 17th century had settled two very important questions. It had been finally decided in 1689 that the government was to be carried on in accordance with the will of the House of Commons and that there should be freedom for both religious and political opinion outside Parliament. The questions of taxation without consent of Parliament and of the state control of religion, which had convulsed the 17th century, were no longer all-absorbing, and the 18th century found an outlet for its energies in new directions. It is therefore the century of great economic advance, of commercial wars, of the expansion of trade, of the growth of colonies, culminating toward the end in the transformation of the whole rural and industrial life of the country.

The leading features of the period from 1702 to 1815 are those connected with the rule of the great Whig aristocracy in Parliament, the expansion of England abroad in spite of the opposition of France, the consolidation of the Britannic state at home and the change of the whole character of the country by the coming of machinery. See Great Britain — Industrial Revolution.

The great constitutional fact of the 18th century is that the era of the responsibility of the monarch for the welfare of the nation had passed away for ever. William III. had been called to the throne by Parliament and it was on Parliament that he depended for his support. In 1702 the Crown was vested by an Act of Parliament in the Electress Sophia of Hanover and her Protestant descendants, and the first two Georges happened to be men who were thoroughly German and so left English affairs to the English Parliament. Hence the predominance of the House of Commons became firmly established. It was found convenient that a group of ministers should form a committee to carry on the affairs of the nation. Gradually it became the rule for them to be chosen from the party which had the majority in the House of Commons and to vote under the leadership of one man. The delegation of monarchy to the Prime Minister and the Cabinet was accomplished by the end of the 18th Century. See Great Britain — Crown and Cabinet.

The Revolution of 1689 had split the country into two great parties — the Whigs and the Tories. The Whigs, who were the active commercial party, were in favor of a Protestant succession and toleration in matters of religion. As they believed in a Parliamentary King as opposed to a King by Divine Right they were bound to reduce the power of the monarchy but to support the existing line which they themselves had chosen. The Tories had to choose in 1689 between their religion and their King. If they supported the King they would destroy the Established Church and set up the Roman Catholic Church. Hence they decided against the King and joined the Whigs to get rid of the Stuarts. Then they repented, especially when they found that the Whigs obtained all the emoluments of office, and to restore themselves to power they looked to France and the descendants of James II. who had French support. Meanwhile they were quite willing to join the Whigs in depriving the Hanoverians of as much power as possible and so we see both parties disposed to lessen the power of the Crown. It was not until the reign of George III. that the Tories became reconciled to and supported the King *de facto*. The Whigs were the great war party because they were anti-French; the Tories were the peace party since in France lay their hopes of getting back their own King.

In the reigns of William III. and Anne the monarch was still able to hold the balance between the two parties. Under the first two Georges the Crown could only exercise its power by means of great Ministers, notably Sir Robert Walpole. George III. determined to throw off the yoke of Parliament and was successful in bringing in the Tories under Lord North in 1770, but even so popular and determined a King as George III. found it impossible to carry on the Government except through Pitt. The power of the Crown was still further weakened during the period of mental incapacity of the monarch and by the incompetence of his immediate successors.

During the 18th century it was gradually found advisable in the interests of the despatch of business that the King should choose his ministers from that party which had a majority in the House of Commons. In 1696 a party ministry had been formed, but the lesson was only slowly learned that the Ministry must depend on the state of parties in the Lower House. In the time of William and Anne composite ministries were the rule. Under George I. and George II. there was a constant Whig majority in the Commons and a Whig Ministry in power. In 1784, however, George III. was successful in keeping Pitt in power notwithstanding an adverse majority in the Lower House. But the King only anticipated the decision of the country, for at the next election a House was returned which supported Pitt, and from that time the Prime Minister and the Cabinet have always been chosen from the predominant party.

Thus, monarchy, as it "withered on the throne took root in the Cabinet." The Parliamentary Government of the 18th century was however by no means government by the people. It was government by the great aristocratic families, tempered by deference to public opinion. It was not till the electoral reforms of the 19th century that the democracy became predominant. The great era of English expansion and the command of sea power were attained under an aristocracy and not under a democracy.

The question of English colonial expansion during this period centres round the long struggle with the French. The most profitable line of trade in the world was considered to be that of the Spanish colonies and the adjacent islands, and with these England drove a considerable contraband traffic. On the other side of the world there were the riches of the East and the wealth of the Spice Islands. It seemed probable in 1701 that France, the great commercial rival of England, would inherit the throne of Spain, drive out the English from the Spanish Main and dominate that trade. Hence England's intervention in the War of the Spanish Succession. By a series of brilliant battles won by the Duke of Marlborough between 1704 and 1709 she attained her object, for by the Treaty of Utrecht (1713) England gained Gibraltar, Port Mahon, Nova Scotia, and Newfoundland; while the rights of the Hudson's Bay Company in their vast territory were definitely recognized. England had secured a base from which to operate against the French, and at the same time by the Assiento Contract (see Great Britain — Eighteenth Century Commerce) she won a share in the monopoly of Spain in America and prevented it being closed to her by France. The war left Holland and France financially exhausted. The Dutch trade began to fall behind. France was heaping up financial burdens which were to lead to national bankruptcy. England alone was in a position adequately to maintain a navy and the command of the sea. She thus became the foremost sea power and secured her trade supremacy in one of the most important quarters of the globe. An attempt to interfere with it led to the war with Spain in 1739, which merged into the war of the Austrian Succession ending in 1748.

In another direction, however, that trade supremacy was being threatened. In India a French and an English East India Company each had trading factories or settlements, the English posts being Bombay, Madras, and Calcutta. They were not subject to the English Government, but were under the Company, and England had no governmental responsibility whatever in the matter.

In India there prevailed, about the middle of the 18th century, a wild anarchy due to the break-up of the Mogul Empire in 1707, and military adventurers were beginning to make themselves supreme in various parts. The French governor of Pondicherry, Dupleix, a man of great military genius, began to perceive that it was quite possible for Europeans to gain predominance in the general scramble; and by supporting various native rulers and organizing native troops on the European model he soon made himself one of the chief powers in India. If the English were not to be ousted altogether they too had to organize. Clive copied the French policy so successfully that English influence became predominant, and the future of India fell into the hands of the English. The French settlements were restored, but they were no longer military establishments, and France was reduced to relative unimportance. In 1784 the English government became responsible for the administration of India, while the East India Company continued to have a monopoly of the trade.

The dominance of England on the Spanish Main and in India was followed by the ousting of the French in North America. The French had established themselves at the mouth of the Mississippi, and claimed all the country lying between the Saint Lawrence and the Mississippi west of the Alleghany mountains. The Seven Years' War in Europe gave England a chance to fight the matter out, and at the Peace of Paris in 1763 England gained Canada, all the land west of the Mississippi, four West Indian islands, and a promise not to fortify the French settlements in India; and from Spain she obtained Florida.

Thus by 1763 England was mistress of the whole American continent, and the dominant European power in India, while the trade and commerce of the East and West were in her supreme control.

England then felt that as she had done so much to protect the young colonies from being swallowed up by the French they ought to pay part of the cost of their own defence in future. She accordingly proceeded to increase the tax on colonial imports, and to prevent evasion instituted a stricter enforcement of the Navigation Acts. She also imposed a stamp tax. The colonists, who were no longer afraid of the French, wished to be free to work out their own destiny in their own way. Hence the revolt of the Americans in 1776, ending in the recognition of their independence in 1783. France and Spain had joined in against England, and, although the result was the loss of the American colonies, England was given a welcome opportunity of sweeping French commerce off the seas, and of finally ruining the Dutch shipping. England emerged in 1783 more decidedly than ever the great trading power of the world.

The loss of the thirteen American colonies raised the question of the disposal of convicts, since they could no longer be sent to the United States. Hence the Government turned its attention to Australia which had been explored by Captain Cook between 1768 and 1770. The island had been the resort of a few traders, but much preliminary work needed doing before it could become attractive to settlers, and the result was that convicts were despatched in 1788 to Botany Bay to do the preliminary work of road-making. Then, as the wool famine in England became more and more acute, the destiny of the colony shaped itself along the line of sheep-farming.

After the Revolutionary and Napoleonic wars England made a further addition to her possessions, gaining the Cape, from which she has been able to build up a South African Empire. Ceylon, British Guiana, Trinidad, Heligoland and Mauritius, were minor acquisitions made in 1815; and the foundations of her Far Eastern Empire were laid in the cession of Penang in 1786, which gave England a footing in the Straits Settlements.

The United Kingdom emerged from the Napoleonic wars with a huge national debt, but with an enormously increased trade; with fifty years start of Europe in manufacturing, and with the unrivalled possession of the sea-power which had been her definite goal from the time of Elizabeth onwards.

This great expansion could not have been accomplished if England had not been blessed with internal peace. Had Scotland declined in 1702 to accept a German line of kings and decided to pursue, as a large faction wished, her own independent way with her own king, England would have been in constant danger of invasion from the north on behalf of the Stuarts, or of intervention from an unfriendly kingdom. The Scotch, having been shut out of the best trading parts of the world, tried to establish themselves on the Isthmus of Darien, but met with disastrous failure, a failure which they laid to the door of England. In England this undertaking aroused a great fear of ultimate Scotch success in this particular line of commerce. It seemed better to absorb the Scotch than have them as rivals. England was also anxious to secure the assent of the Scotch to the House of Brunswick as the ruler of the two kingdoms and she accordingly offered them a share in the whole of the English trade if they would acquiesce in a union. The Scotch, who were most anxious to get a part of the English trade monopoly, assented. The union of the two kingdoms was thus accomplished, the Scotch sending members to the English Parliament and giving up their own, but preserving freedom in matters of religion. Scotland thus merged her individuality in that of England and accepted English trade privileges as a setoff against a German king.

Ireland was less fortunate. There was not the same necessity for conciliating her. The Irish Parliament was dependent on England, and when the Irish tried to set up their own king — James II.— they suffered crushing defeat at the battle of the Boyne. The English were not afraid of Ireland as they were afraid of Scotland. Ireland was a conquered country and as such must take the conditions imposed. She was, moreover, Roman Catholic, and England could not absorb her in the same way as she had Scotland. Hence Ireland was deliberately prevented from becoming prosperous by a series of laws which shut her out of the colonial trade and destroyed her woollen manufactures and cattle trade. At the same time a series of penal laws against the Roman Catholics were instituted which gave the power into the hands of the Protestant minority.

Both trade disabilities and religious oppression were successful in preventing Ireland from being a danger to England till the revolt of the American colonies gave Ireland the opportunity of claiming an independent Parliament, which demand was conceded in 1782. It became a question then of settling the trade relations between the two kingdoms and of the Irish contribution toward Imperial defence. No satisfactory solution had been reached when civil war broke out between the Irish Protestants and Roman Catholics. England felt that the Protestant interests in Ireland needed protection. Moreover the Irish finances became very involved, and it seemed as if Ireland was on the verge of national bankruptcy. The English manufacturers wished to secure the Irish market whereas the Irish Parliament showed a disposition to impose protective duties even as against England. It seemed best to the statesmen of the time to solve all these various problems by a complete union of the two countries. Scotland had come into the English system when the era of Whig protection was beginning, and she prospered exceedingly. It was hoped that Ireland would do the same. But Ireland came in just when England was engaged in a life and death struggle with France. She felt all the effects of the dislocation of trade and of the great financial strain. Later on her nascent industries were exposed to the overwhelming competition of the English machine-made products, and her provision and corn trade were vitally and injuriously affected by the English free-trade reforms, while she had no compensation as England had in her manufacturing prosperity.

Vast indeed are the changes recorded in the history of the 18th century. At the beginning of that century Scotland, jealous, sullen and separate, was a constant menace to the expansion of England; at the end she had become united with her southern neighbor in a political union cemented by identical trade interests. Ireland also had been united in a common Parliament, but cannot be said to have been absorbed in the same way. William III., like his predecessor on the English throne, acted as his own Prime Minister. Long before the death of George III. the monarch had given place to one of his powerful ministers as the real head of the executive government. In the early years of the century party ties sat lightly upon Ministers; at the end of it a Cabinet which was not homogeneous would have been an anomaly. At the beginning of the century France seemed destined to inherit the riches of the Spanish Main and the East Indies. The end of the century saw French commerce swept from the seas in East and West, and India under British rule. England's colonial empire of the first part of the 18th century was English speaking and not extensive. By the end of the century her principal English speaking possessions had cut themselves adrift; but had been replaced by a scattered empire of many races; and the foundations had been laid of that wide empire, the superstructure of which is not even yet complete.

Appointed Lecturer in Economic History, University of London.

7. (b). **Great Britain — The French Wars of the Eighteenth Century.** Hostility to France is one of the chief characteristics of British policy in the 18th century. It may be ascribed to various motives, religious, dynastic, commercial, and to the purely political motive of maintaining the balance of power. At the beginning of the century the first and last of these motives were uppermost. The first collision between the two powers arose out of the efforts of Louis XIV. of France to gain complete control of the Spanish dominions, then comprising Southern Italy, Milan, and the greater part of the Flemish Netherlands, as well as a large portion of the New World. He would hear of no compromise such as was suggested by William III. of England, the Dutch Republic, and the House of Hapsburg, but, in the lack of a direct descendant of the Spanish Bourbons, claimed the crown of Spain for his grandson (subsequently Philip V. of Spain), a great-grandson of Philip IV. of Spain. He did more. He captured the Dutch troops who shared in the defence of the "barrier fortresses" of the Netherlands; and in 1701, on the death of James II., formerly king of England, but now an exile in France, he promptly recognized his son as King of England. The affront rekindled in England the dormant zeal for the Protestant succession; the House of Commons had to cease from its factious opposition to "Dutch William"; and the King prepared vigorously to curb the designs of Louis XIV. for a universal monarchy. He sent Marlborough with 10,000 troops to protect the Dutch Netherlands, and even the death of William, and the accession of Queen Anne, who leaned to the Tory or peace party, could not avert war. William's last diplomatic work, the grand alliance (1701), with Austria and the Dutch Republic held good, and the elector of Brandenburg-Prussia joined the league on the understanding that he should receive the royal title in Prussia, as Frederick I.

The world was soon startled by the display of genius such as had never been seen in the campaigns of William III. Clogged, as he was, by the dilatory procedure of the Dutch, Marlborough effected little of note in the years 1702–3; but in 1704, when the Hapsburg forces were sore beset in South Germany by the Franco-Bavarian army, he resolved to march up the Rhine valley to the help of the Imperialists in Swabia. Skilfully misleading the French as to his intentions, he surprised the hostile forces near Donauwörth on the Upper Danube and clinched this success by a brilliant triumph at Blenheim, 13 Aug. 1704. A daring attack delivered across marshy ground against the French centre cut their array in twain, and drove thousands of fugitives into the Danube. Of an army 60,000 strong in the morning, only some 20,000 survived uncaptured at night. Marlborough was able to effect little in the year 1705, when the interest centred on the brilliant though unsubstantial triumphs won by Lord Peterborough in Spain. In the campaign of 1706, Marlborough struck a decisive blow at the French army under Villeroi near Ramillies (23 May); the capture of Brussels, Ghent, and Antwerp resulted from this victory, which also had the effect of lessening the pressure on the Imperialist leader, Prince Eugene, in Northern Italy. In 1707 the tide seemed to turn in favor of the French and Spaniards; the latter on 25 April gained a complete victory at Almanza, regained most of the eastern and northeastern provinces of Spain for the Bourbon cause. In July 1708, however, Marlborough utterly overthrew the French at Oudenard on the River Scheldt, and followed up his success by bringing the great fortress of Lille to surrender (December). These events laid the Spanish Netherlands at the feet of the allies and opened up a way into France.

Nevertheless, Louis XIV. rejected their terms, and, making an appeal to his people, continued the war with fresh vigor, which was seen in his troops during the stubborn and murderous conflict at Malplequet, 11 Sept. 1709. The skill of Marlborough and Eugene gained the day, but it was a barren triumph. The war dragged on for three years more; but the growing desire for peace in England, and the partisan intrigues which resulted in the recall and disgrace of Marlborough, brought it to a conclusion in the Peace of Utrecht, 13 March 1713. Great Britain secured Gibraltar and Minorca, Nova Scotia, parts of Newfoundland, districts around Hudson's Bay, and the French part of Saint Christopher's. Spain, by what was called the Assiento Treaty, granted to her the sole right of importing slaves into the Spanish colonies of America. The Dutch retained their hold on most of the "barrier fortresses" of the Netherlands, and that territory, along with Naples and the Milanese, went to the Hapsburg Emperor, Charles VI. Philip V. retained Spain and the Indies, Great Britain rather shabbily deserting the Catalans whom she had instigated to rise against the Bourbon ruler. The treaty was not one to be proud of; but it restored the balance of power, and rendered impossible any further attack by Louis XIV. on Great Britain and Holland. The phantom of an almost universal monarchy ceased to trouble the world until it reappeared a century later in the person of Napoleon. Further, this war of the Spanish Succession so far exhausted France, Spain and Holland, as to leave Great Britain mistress of the seas.

The accession of the House of Hanover in

1714 tended to embroil Great Britain in the political struggles of Central Europe. As electors of Hanover, the Georges were among the chief dignitaries of that venerable but decaying fabric, the Holy Roman Empire, and involved England in the disputes caused by the rivalry of the Houses of Hapsburg and Hohenzollern. The War of the Austrian Succession, which opened in 1740 with the seizure of Silesia by Frederick the Great of Prussia, aroused the sympathy of Britons with the young ruler, Maria Theresa of Austria; and when France joined the ranks of her would-be despoilers, Great Britain intervened in order to maintain her power as a counterpoise to that of France. George II., leading his troops in person, gained a victory over the French at Dettingen on the River Main, 27 June 1743; but two years later (11 May 1745) the British arms sustained a serious reverse at Fontenoy, near Tournay, where the genius of the Maréchal de Saxe prevailed over the stubborn valor of the British infantry. The Guards' Brigade retrieved the honor of the Union Jack by a splendid advance, which, if supported by cavalry, might have turned the fortunes of the day. As it was, the defeat at Fontenoy and the romantic campaign of "Bonnie Prince Charlie," grandson of James II., in Scotland, clogged British efforts on the continent with results disastrous to her allies. At sea, however, and in the colonies, the Union Jack was nearly everywhere successful, the capture of Louisburg (21 June 1745), leading to the reduction of Cape Breton Island and the opening of the Saint Lawrence to British attacks. Both powers at length became weary of the war, and by the Peace of Aix-la-Chapelle (October 1748), agreed to restore their conquests — a clause deeply resented by British seamen and merchants. France, however, guaranteed the Belgic Netherlands to Austria, and agreed to dismantle the fortifications of Dunkirk. The balance of power was thus restored, both in European and Colonial affairs.

In 1756 Austria's grievance against Prussia concerning the Province of Silesia lit the flames of war both in Europe, Canada, and India. Already France and Great Britain were practically at war in the valley of the Ohio and in the Carnatic, owing to the masterful policy there pushed on by Montcalm and Dupleix. Therefore, when France, reversing her traditional policy, allied herself with Austria for the partition of Prussia, Frederick the Great naturally became the ally of the Court of London (January 1756). At first matters went ill with the two Protestant States; Frederick could not at first make head against the coalition (joined by Saxony and Russia); and Great Britain lost Minorca, largely through Admiral Byng, who was executed. Matters did not mend until in June 1757, George II. recalled to office the one inspiring personality in English public life, William Pitt. Acting on the principle summed up in his famous phrase —"I will win America in Germany"— he lavished subsidies on Frederick the Great. Slowly but surely the tide turned; Frederick's brilliant victory at Rossbach (5 Nov. 1757), over the French and their allies paralyzed the French government; and the results of favoritism and incompetence became apparent. The French navy was speedily worsted in several fights; Louisburg surrendered to Boscawen on 26 July 1758, and Prince Edward Island also fell to the Union Jack. Late in November British and Colonial troops captured Fort Duquesne on the Ohio and it was renamed Pittsburg. In India success was chequered with failure. By the victory of Plassey (23 June 1757), Clive had subdued Bengal; but after the arrival of French reinforcements, Count Lally, the successor of Dupleix, captured Fort Saint David and nearly took Madras. Gradually the pressure of sea power told in favor of Great Britain, and the long struggle for the possession of the Carnatic was decided by Eyre Coote's brilliant victory of Wandewash (22 Jan. 1760), which led up to the capture of the French stronghold, Pondicherry, a year later.

Meanwhile, though Frederick the Great was very hard pressed, his ally reaped the full reward foreseen by Pitt. That statesman had the gift of choosing the right men; and his sagacity discerned in a young officer, Wolfe, the conqueror of Canada. The manner in which Wolfe captured the Heights of Abraham (13 Sept. 1759) is too well known to need description. Quebec and ultimately the whole of Canada were the fruits of a victory, which itself resulted from the ability of the mistress of the seas to attack when, where, and in what force she chose.

After the accession of George III. to the throne, and of the Bute Ministry to power, the Anglo-Prussian alliance lapsed; but the war with France continued. By the (third) Bourbon Family Compact, Spain made common cause with her neighbor; but the British navy overbore all opposition at sea; and in February 1763, the Peace of Paris put an end to what had now become merely a maritime and colonial war. France ceded Canada, Cape Breton Island, Prince Edward Island, together with Grenada, Saint Vincent, Dominica, and Tobago, as well as Senegal in Africa. Spain ceded Florida, but received from France as indemnity the great district of Louisiana. Great Britain restored to France several of her conquests in the East and West Indies, also to Spain parts of Cuba. Save that France handed back Minorca to England, the changes in Europe very slightly affected the Island Power; but she emerged, from what had been at first merely a continental war, the greatest of the world powers.

The completeness of her triumph brought its nemesis. The American War of Independence furnished France with the longed-for opportunity for revenge. She declared war formally against England in 1778 after her volunteers had long been helping the colonists. Soon the maritime policy of her rival leagued together the northern powers in the League of the Armed Neutrals. That war, however, having been described in the article United States — American Revolution, it is unnecessary to comment on it here, or to advert to the influence which sea power exerted on the decisive event, the surrender of Cornwallis at Yorktown (10 Oct. 1781). By the Treaty of Versailles (3 Sept. 1783), France recovered Senegal, several West India islands, acquired extended fishery rights on "the French Shore" of Newfoundland, and gained Tobago. Of all the wars between England and France, that of 1778-1783 was most completely colonial in character and in its results. Never before had France dealt her rival so serious a blow; but it recoiled on herself; for the ideas of liberty and civic equality which her soldiers learned in the land of Washington were now carried back to the mother country with results fatal to the Bourbon monarchy.

The Revolutionary War (1793-1802), stands apart from the previous struggles in that it was at the outset largely, though by no means wholly, a war of opinion. It turned mainly on the question whether the French Republic could with impunity set aside the rights of the Dutch Republic over the navigation of the lower part of the River Scheldt, which Great Britain by the treaty of 1788 had undertaken to guarantee. The French in their resolve to make Antwerp a great port, persisted in ignoring that treaty; and matters were in a very strained state between England and France, when the execution of Louis XVI. at Paris, 21 Jan. 1793, made all hope of compromise impossible. The French on 1 Feb. 1793, declared war against Great Britain and Holland. These powers therefore joined the first coalition (Austria, Prussia, "the Empire," Sardinia, and Naples); but the jealousy of Austria and Prussia, the incompetency of the allied leaders, and the enthusiasm and energy of the French soon drove the allies out of their territory. A British force was defeated at Hondschoote near Dunkirk, and had to retire toward Ostend (September 1793). Two months later Admiral Hood's bluejackets and their Spanish and Neapolitan allies were driven from redoubts near Toulon; mainly owing to the skilful dispositions of Bonaparte, and had to abandon that seaport. The campaigns in Flanders languished owing to the paucity of the British forces, which had to leave the Low Countries early in 1795. In that year Prussia came to terms with France.

The coalition was shattered by the astonishing triumphs of Bonaparte in Italy (1796-1797), which compelled Sardinia, Naples, and finally Austria, to make peace. Holland and Spain, having become allies of the French, the war became solely maritime and colonial. Mutinies at Spithead and the Nore (April-June 1797), threatened to complete England's ruin; but the gloom of that year was brightened by the victory won by Jervis and Nelson over the Spaniards off Cape Saint Vincent (Feb. 14), by Duncan's triumph over the Dutch fleet at Camperdown (Oct. 11). Pitt's overtures for peace to the French government in August-September, came to naught. The scene of war then shifted to the Mediterranean where Bonaparte's great expedition captured Malta and Egypt, with a view to the eventual conquest of India. His schemes were thwarted by Nelson's brilliant victory near the mouth of the Nile (1 Aug. 1798); and the pressure of sea power received further illustration by a severe check administered to Bonaparte at Acre by Sir Sidney Smith's squadron. Britain put forth great efforts in India, where Wellesley's capture of Seriogapatam early in 1799 led to the overthrow and death of that ambitious ruler, Tippoo Sahib; and after Bonaparte's secret departure from Egypt, a British expedition under Abercrombie and Hutchinson finally compelled the French army which he left behind to surrender (27 Aug. 1801). Malta had fallen to the British fleet in 1800.

Meanwhile, the aggressive conduct of the French government in Europe had enabled Pitt to form a second coalition which swept the French forces from Germany and Italy. An Anglo-Russian force in Holland, however, fared badly and finally had to leave the country (Oct. 1799). At the close of the year Russia left the coalition. In 1800 the allies lost ground rapidly. Bonaparte, virtually master of France after the *coup d' état* of Brumaire (Nov. 1799), overthrew the Austrians at Marengo (14 June 1800); Moreau completed their disasters at Hohenlinden in December, and the Court of Vienna came to terms with France early in 1801. Bonaparte with rare skill now prepared to turn the tables against England by effecting an alliance with Russia, and reviving the League of the Armed Neutrals. Again his aims were thwarted by Nelson, whose victory at Copenhagen (2 April 1801), paralyzed the league. The assassination of the Czar Paul, and the accession of Alexander I., facilitated a compromise on maritime affairs; and the losses of the French in Egypt and Malta predisposed them to peace with England. Ultimately the belligerents came to terms in the Treaty of Amiens (27 March 1802), whereby England agreed to restore all her colonial conquests to France, Spain, and Holland (including the Cape of Good Hope to the last-named), except Trinidad and Ceylon, which the Spaniards and Dutch, respectively, ceded to her. Malta was to be restored to the Knights of Saint John (on conditions which proved to be unworkable), while Egypt reverted to Turkey.

In the Anglo-French wars of the 18th century the importance of the commercial and colonial motives is increasingly apparent. The first two struggles originated in dynastic affairs relating to the then dominant principle of the balance of power; but the increasing solidity of the European States and the growth of commerce under conditions which were almost prohibitive to foreigners, turned the gaze of statesmen more and more to the new lands beyond the seas. The result may be estimated by reading over the causes and results of the wars here briefly set forth. Europe, after settling down on the foundations laid in 1713 and 1748, occupied less attention from statesmen at London and Paris. The French Revolution brought matters back sharply to the old field of debate between the two powers,—the Netherlands; but when the weakness of the coalition, and the genius of Bonaparte made France paramount on the Continent, the struggle quickly became one for supremacy in the Levant, and the East and West Indies. The vigor with which he played the rôles of Cæsar and Alexander the Great would have enabled him to wrest from England her world empire had he not been confronted by Nelson. Even so, the struggle between the secular rivals ended in 1802 on terms on the whole favorable to France; and it was soon clear that the first consul viewed the Peace of Amiens as an opportunity for strengthening the position of France in Europe, as well as her fleet and her colonies, in order to resume the struggle for empire under conditions far more favorable than Louis XIV. had ever known.

Bibliography.— For a short account of the wars of the 18th century, consult the histories of England by Dr. J. F. Bright, J. R. Green, and

Dr. S. R. Gardiner; also 'The Balance of Power — 1715–1789,' by A. Hassall. The fullest accounts are to be found in the 'History of England in the Eighteenth Century,' by W. E. H. Lecky (6 vols.), and the 'History of England Since the Peace of Utrecht,' by Earl Stanhope (7 vols.). Fortescue, 'History of the British Army.' Capt. A. T. Mahan, 'Influence of Sea Power Upon History,' and Sir W. J. Seeley, 'The Expansion of England,' very suggestively treat certain parts of the subject. The chief monographs bearing on special topics are Colonel Parnell, 'War of the Spanish Succession'; Lord Wolseley, 'Life of Marlborough' (incomplete); W. Stebbing, 'Peterborough'; F. H. Skrine, 'Fontenoy'; 'Chatham,' by F. Harrison, also by A. S. McDowell; Parkman, 'Montcalm and Wolfe'; J. Winsor, 'Struggle in America' between England and France (1697–1763); Sir C. Wilson, 'Clive'; Sir A. Lyall, 'Warren Hastings'; C. B. Malleson, 'History of the French in India.'

For the American Revolution, consult the 'Cambridge Modern History' (vol. VII.); the works of John Fiske, Bancroft, J. M. Ludlow, Sir G. O. Trevelyan; and, for the part played by France therein, T. Balch, 'The French in America During the War of Independence'; C. Towers, 'Lafayette in the American Revolution.'

8. (a). Great Britain — The Nineteenth Century. The history of the British people in the 19th century is dominated by three facts or tendencies, themselves the outcome of its past history and its physical environment: (1) a portentous development of the national resources, resulting from the industrial revolution, improved agriculture, and the colonial expansion of the 18th century; (2) consequent collisions or friction with other growing nations, especially Imperial France and Imperial Germany; (3) a revulsion of feeling in favor of peace, attention to domestic reforms and commercial expansion by pacific methods. These three phases of national life are closely related; the first is connected with the life of the 18th century of whose achievements — scientific and mechanical, military and maritime — it was the continuation. The second or warlike movement originated in the effort of an expansive but insular people to seek over-seas the material resources wanting at home, and prompted the efforts associated with the names of Nelson and Wellington, Dalhousie and Dufferin, John A. Macdonald, Parkes, Roberts, Kitchener and Cecil Rhodes. The third tendency, prudential or philanthropic in its origin, has as spokesmen Fox, Bentham, Shaftesbury, Peel, Cobden and Gladstone. The following brief sketch is not intended to be a commentary on these statements; but they may be regarded as sign-posts helping the historical traveller along paths which, though far from easy, yet frequently run on parallel or converging lines.

The first 15 years of the century witnessed a phenomenal development both of the material resources of Great Britain and of the strife with France — both of them well marked features of the previous years. In the years 1801–1815 the inventions of Watt, Cartwright, Trevithick and George Stevenson led to an enormous expansion of the factory system and means of locomotion. But in those same years the material resources of the land were consumed in a struggle for national existence. The year 1803, which saw the renewal of war between England and France after the brief truce of Amiens, is marked by the exhibition of Trevithick's first locomotive. In the year of Waterloo (1815) Stevenson proved his Killingworth locomotive to be a practical success. The skill and expansive energies of man, which went to feed the flames of the great war, were also in large measure its cause. The rise of Napoleon to absolute power in France and his masterful interventions in neighboring States, his prohibition of British imports, and his endeavor to found a Colonial Empire at the expense of that of Britain brought about the mightiest of all Anglo-French wars, that of 1803–1814. It is worthy of notice that the influence of the autocrat brought back the struggle from the sphere of opinion to that of material and colonial interests characteristic of the 18th century. The war had three well marked stages. Toward the close of 1805 Trafalgar left England mistress of the seas, while Austerlitz made Napoleon master of the Continent. In the next two years he strove to mass all the continental states against her in a commercial war styled the Continental System. Its pressure seemed to be bringing England to the verge of bankruptcy; but in 1808 the revolt of Spain threw open the Iberian Peninsula and the Spanish and Portuguese colonies in America to British trade. The defection of Russia in 1812 ruined Napoleon's prospects and the subsequent compaigns (1813–1815) assured the triumph of England and the overthrow of the great Emperor. Her gains were colonial. Mauritius, Tobago and Saint Lucia were yielded up by France. For the Cape of Good Hope, Dutch Guiana, and Curaçoa, conquered during the war, the victor paid to Holland a sum of £6,000,000. Malta, Heligoland and a protectorate over the Ionian Isles were the sole acquisitions in Europe from a war which added more than £600,000,000 to the national debt. The strain had been terrible and nothing but the new strength gained from the factory system, improved agriculture, and the mastery of the seas, could have brought the country through. Pitt, "the pilot who weathered the storm," died in 1806; but his heirs, the Tories, held on to power until 1830.

The burden of debt hung like a millstone round the neck of the nation for the next generation. In place of an income tax (then viewed as essentially a war tax) imposts were in and after 1815 placed on all possible articles, including foreign corn. Demonstrations and riots were the result; repressive measures, such as the Six Acts of 1819, were of no avail; and the unpopularity of George IV. (1820-1830) brought the monarchy itself into danger. Yet this time of malaise and political reaction was not fruitless. Canning, as Foreign Secretary, did much to thwart the reactionary policy of the monarchs who had framed the Holy Alliance, and his encouragement of the Liberals of Spain and of the Greek patriots led to notable results in the lives of those peoples, as also in the attitude of the United States toward Europe. The abolition of civic disabilities affecting Nonconformists in 1828, and the emancipation of Roman Catholics in 1829 with the reluctant assent of the Wellington Ministry, showed that the days of privilege were over.

The event of the next year ushered in a new era. The death of George IV. brought to the throne his far more popular brother William IV.; and the general election, held during the excitement caused by the deposition of the elder House of Bourbon in the revolution of July 1830, in Paris, led to the return of a majority favorable to electoral reform at Westminster. After a long and acrid struggle the Reform Bill of 1832 was passed. It enfranchised in all parliamentary boroughs householders paying a rental of £10, also copyholders in the counties. It disfranchised a number of very small boroughs and transferred their voting power to the new manufacturing towns and districts. Thus the influence exerted by the second French Revolution on English democracy was far more favorable than that of the first revolution. The anarchy and the wars resulting from that great upheaval put back the cause of parliamentary reform in England for 50 years. The seeming success of the second revolution (July 1830) now added vigor to the English movement which had meanwhile been strengthened by the silent yet potent changes in the distribution of population and modes of life resulting from the industrial revolution. That change, ever working with accelerated energy, necessitated the transference of power from the old rural England to the new manufacturing England; and thanks to the accession of William IV. in 1830, and of Victoria in 1837, this momentous revolution took place peacefully. While breaking the power of the old Tory party, it rooted the monarchy more firmly in the hearts of the people.

The ensuing decades were times of great strain and stress, but they were met firmly and on the whole successfully. The wider sympathies and business aptitudes of the new Parliament showed themselves in the Factory Act (1833) of Lord Ashley — afterward Lord Shaftesbury; in the emancipation of slaves in British colonies, for which a sum of £20,000,000 was voted as compensation to the owners; and in the Poor Law Amendment Act of 1834 which cut at the roots of the growing evil of pauperism. Nevertheless the working classes of the great towns were in a state sometimes bordering on sedition, partly owing to resentment against the Whigs for refusing to extend the franchise laid down in 1832, and still more owing to the harsh administration of the new Poor Law. Trade depression, low wages, high taxes and dear corn swelled the volume of discontent. It took form in two well defined movements, Chartism and the Anti-Corn Law League, which, beginning in the year 1837, ran a parallel and competitive course, and ended in the year 1848, the former in failure, the latter amidst almost complete success. This difference in the fortunes of the two movements may be ascribed to the following causes. The Chartists, (q.v.) sought to cure evils, which sprang mainly from economic causes, by purely political means. The six points of their Charter were (1) annual Parliaments, (2) manhood suffrage, (3) equal electoral districts, (4) payment of members of Parliament, (5) abolition of the property qualification for members of Parliament, and (6) vote by ballot. This programme (a revival of the advanced Whig programme of 1780) aimed at benefiting the working classes through Parliament. The Free Traders sought to benefit them by altering taxation so as to let in free, or nearly free, the necessaries and small comforts of life. Further, Chartism suffered from the unwise means used by the physical force wing of the party whose leaders fell out with one another. The Free Traders on the other hand had excellent leaders, Cobden and Bright, whose arguments finally brought over to their side large numbers of the workingmen and the Prime Minister himself, Sir Robert Peel.

This able man had pieced together the Conservative party from the more malleable of the fragments of the old Tory faction; and, largely owing to the failures of the Whigs in finance, he came back to power after the general election of 1841 with a strong and apparently homogeneous following. His openness of mind soon brought him into collision with very many of his followers. He became a Free Trader, while they remained Protectionists. He soon came to see that the long series of deficits could be ended only by recourse to direct taxation; and in his budgets of 1842 and 1845 he abolished or greatly lessened duties on large numbers of articles, making good the temporary loss by an Income Tax of 7d in the £. He also lessened the sliding scale duties on foreign corn. The result was seen in improved trade and in a decline of pauperism and misery. In 1845-6 the Irish famine brought him to sacrifice the corn duties — a measure which earned him unmeasured abuse from Disraeli and Lord George Bentinck and the gratitude of the poor throughout the whole Kingdom. Thus the working classes gained their chief aims through the efforts of the Free Traders and the legislation of Peel. Consequently when the continental revolutions of the spring of 1848 induced the physical force Chartists to copy the methods which had been successful in Paris, Berlin and Vienna, the result was a ludicrous fiasco, which brought Chartism as an organized movement to an end. The spirit that had animated its best leaders, namely a burning love of freedom and a passionate desire for the moral and mental uplifting of the working classes, lived on in those Radical parsons, F. D. Maurice and Charles Kingsley, in the second founders of the Co-operative and Friendly Society movements, and in the later Radicals, who by wise methods soon gained four of the six points of the Charter.

The same yearnings after ideals for other than those realisable by mere party strifes and sordid commercialism infused much of the best work of Carlyle and of his young disciple Ruskin, and throbbed in the youthful poems of Tennyson, Browning and Swinburne.

The decade of the forties, marked by political discontent, but dignified by ideal aspirations in all spheres — the disruption in the church of Scotland, the Anglican movement in the church of England and the pre-Raphaelite movement in art, belong to that momentous epoch — faded away into a period marked by expanding trade and mental quiescence. Gold discoveries, railways, steamships, these were the chief preoccupation of mankind; and under their subtle alchemy democracy and idealism of all kinds vanished for a time, both in England and on the Continent. As often happens in these expansive epochs (which recur after the introspective, critical and reforming epochs), a collision occurred with another growing Power, Russia. The Crimean War resulted largely from the efforts of that stern autocrat, the Czar Nicholas I., to browbeat the Turks, whose political power was then thought to be essential to the security of the overland route to India. The hope entertained by the British nation that the Sultan would reform his government and grant religious liberty soon proved to be vain; and England came to see that she had championed a moribund cause. She gained nothing by the war; and its first reverses did much to promote the ferment in native circles in India which led to the terrible mutiny of 1857.

Affairs in Europe soon engrossed public attention. In the Crimean War, England had had the alliance of Napoleon III. of France and of Victor Emanuel II. of the Kingdom of Sardinia. Her relations with the French Emperor speedily cooled; and complications in the years 1858–59 brought the two people so near to a conflict as to lead to the revival of the volunteer movement. Far different was the attitude of the nation toward the Italian movement for liberation and unity. The masterly statecraft of the Piedmontese statesman, Cavour, and the heroic deeds of Garibaldi in southern Italy in 1860 aroused the keenest interest. The diplomatic help given by British statesmen, Palmerston and Lord John Russell, then laid the basis of that friendship which has since subsisted between Great Britain and the United Kingdom of Italy.

Amidst these excitements Cobden did good service by promoting a commercial treaty between England and France on free trade lines, (it held good for the years 1860–1870) and Gladstone, the Chancellor of the Exchequer, by his budgets of the early sixties succeeded in further cheapening the necessaries of life. But no advance was made on purely political lines, firstly because the influence of Palmerston, the Prime Minister, barred the way, and secondly because popular interest centred largely in the wars of that troubled period — the American Civil War (which at one time portended a strife between the two kindred peoples), the Danish War of 1864, and the Austro-Prussian War of 1866. The end of this last struggle brought a lull which favored the hopes of reformers. The death of Palmerston on 18 Oct. 1865, removed another barrier; for, since the death of the Prince Consort at the close of 1861, his influence in the political world had been almost without bounds. Other causes now helped to turn attention to home affairs. The cattle plague and the sharp financial crisis of the year 1865, the Fenian outrages of the next year, and the general state of malaise throughout the United Kingdom brought men once more to that critical or introspective mood which is favorable to political reform. A singular concatenation of events brought into office in June 1866 a Conservative Ministry headed by Lord Derby and Mr. Disraeli — into office but not into power, for they were face to face with a hostile majority, irritated by the recent rejection of a moderate Reform Bill championed by Lord John Russell and Mr. Gladstone. The result was a series of acrobatic performances whereby Disraeli, erstwhile the denouncer of the inconsistencies of Peel, foisted on his party in 1867 a measure far more democratic than that of the previous year. Household suffrage was thenceforth the law of the land for all parliamentary boroughs. After a short time of uneasy balancing, the Conservative Ministry was overthrown by the general election of November 1868.

Democracy now came in as with a flood. The Gladstone Ministry (December 1868 — February 1874), carried legislative activity to lengths never before seen in England. The Disestablishment of the Irish Church (1869); the Irish Land Act and the Elementary Education Act (1870); the abolition of the system of purchase in the army, and the appointment of the Local Government Board (1871); the Ballot Act and Licensing Act (1872); the Supreme Court of Judicature Act (1873) — these were the chief measures passed in this period, which witnessed also the settlement of the Russian claims respecting the Black Sea and the Alabama claims urged by the United States. In these matters, as in the sphere of foreign policy generally, the Ministry was deemed to have sacrificed British interests needlessly.

The outcome of this feeling, and of the alarm felt by many classes at home whose interests were injured or threatened, was seen in the general election of February 1874, which marked a sharp reaction in favor of Imperialism and a spirited foreign policy. Disraeli (created Earl of Beaconsfield in August 1876) came back to power at a time when the Eastern Question entered on an acute phase. The years 1875–1878 were overshadowed by the atrocities committed by the Turks on their Christian fellow subjects, and by the Russo-Turkish War. Sharp differences of feeling were caused by Lord Beaconsfield's treatment of these events, as also by his acquisition of Cyprus (June 1878). Depression of trade at home and the outbreak of wars in Zululand and Afghanistan in 1879 made the Ministry more and more unpopular, with the result that the election of March 1880 brought back Gladstone to power with a large majority. His second ministry (April 1880 — June 1885), coincided with a time of great ferment in Ireland and of unrest abroad, with which he coped manfully but not very successfully. Irish affairs were not settled by his drastic Irish Land Act of 1881; his very large concessions to the Boers of the Transvaal in 1881 and 1884 aroused a most bitter feeling among loyalists in South Africa and sowed the seeds of future trouble. British intervention in Egypt (1882) was successful, but had as an unfortunate corollary the despatch of General Gordon to Khartum; and the dealings of the Ministry with Russia respecting the Afghan frontier at Penjdeh, as also with Germany respecting various colonial questions on the coasts of Africa and New Guinea, were marked neither by foresight nor firmness. In the midst of these disturbances Gladstone, with characteristic tenacity, pushed through the Reform Bill of 1884 and the Redistribution Bill of 1885 in face of prolonged opposition from the Lords. The former measure extended household suffrage to the counties; the latter divided the whole country into electoral districts with some approach to numerical equality.

The general election of 1885 was of singular interest as marshaling the revivified forces of Democracy and Imperialism. The former won, thanks to the votes of the newly enfranchised agricultural laborers; but the triumphant Liberal party was split in twain by Gladstone's Irish Home Rule Bill and Land Bill (April 1886). The general election of July 1886 reversed the decision arrived at 18 months earlier, and Lord Salisbury took office with a Unionist Ministry which sought — as he phrased it — to govern Ireland "honestly, consistently and resolutely." It also passed the local Government Bill (1888) the Irish Land Purchase Bill (1891) and strengthened the Army and Navy, and adopted a firmer tone on foreign affairs. In 1892 the swing of the pendulum brought Gladstone back to power — for the fourth time,— but in 1894 he retired and Lord Rosebery undertook to reconstitute the Ministry. Even his versatility failed to solve the difficulties arising from disunion in the cabinet and in the Liberal party, and from the tension in public opinion caused by massacres of Christians in Armenia and Crete. He resigned in 1895, and the ensuing elections brought back the Unionists to office with a majority larger than had been known since 1832. Lord Salisbury's new Ministry, which included some Liberal Unionists, had to grapple with a succession of difficulties — the Venezuelan affair, complicated by President Cleveland's message, Dr. Jameson's raid in South Africa, complicated by Kaiser Wilhelm's famous telegram, oppression and anarchy in Crete and many parts of the Turkish Empire, and the campaign against the Dervishes on the Upper Nile.

To these matters we cannot advert. We can point out here only two chief facts in the political history of the century — the gradual effacement of the old party lines, and the curious periodicity in the political life of Great Britain. To dwell on the latter of these, it is clear that the main tendency has been toward democracy and industrial development by peaceful means — a tendency dominant in the periods 1816–1848, 1866–1874, 1880–1886, 1892–1895. The intervening years were marked either by the quiescence which comes naturally after great constructive efforts, or by the striving after national security and the consolidation of the Empire which results inevitably from the insular position and expansive force of a virile people. The century closed, as it began, amidst what may be termed the imperial impulse, of which industrialism has been the unconscious but all powerful feeder. The era of great production, coinciding as it does with one of militarism and protection on the Continent of Europe, imposes on England the need of looking and living beyond the seas to an extent unimaginable to the men of Nelson's generation. In this dualism of her interests, democratic and imperial, lies the great problem of her political life — a problem never to be solved but ever keeping her faculties tense and keen.

Bibliography.—We can name here only a few of the chief works dealing with the outstanding events of British political life and with the men who made history in the 19th century. Besides the text books on the English history of the period written by Dr. Bright and Dr. Gardiner, there are 'History of England — 1800–1815' and 'History of the Thirty Years' Peace — 1816–1846' by Harriet Martineau; 'History of England from 1815' (6 vols.) by Sir Spencer Walpole (continued up to 1900); 'A History of Our Own Times' by Justin McCarthy, (continued up to 1900, 4 vols.); 'Social England' (vols. V. and VI.) edited by Dr. Traill; 'The Political History of England,' vol. XI. (1801–1837) by Hon. G. C. Brodrick and J. K. Fotheringham; vol. XII. (1837–1901) by S. J. Low. Also the following biographies: 'Pitt' by Lord Rosebery (1 vol.) also by J. H. Rose (2 vols.); 'Life of Nelson' by Captain Mahan (2 vols.); 'Life of Wellington' by Sir Herbert Maxwell (2 vols.); 'George Canning' by H. W. V. Temperley; 'Peel' by J. R. Thursfield; 'Life of Palmerston' (1846–1865) (2 vols.) by Hon. Evelyn Ashlet; 'Life of Lord John Russell' by Spencer Walpole (2 vols.); 'Life of Cobden' and 'Life of Gladstone' (3 vols.) by John Morley; 'Life of Lord Granville' by Lord Fitzmaurice (2 vols.); 'Life of Lord Randolph Churchill' by Winston Churchill (2 vols.).

Author of 'The Development of the European Nations, 1870–1900.'

8. (b). Great Britain — The Political Parties. Party government begins, in primitive society, with the struggle for power, the nature of which is determined in each case by local and tribal conditions, and by the influence of men who are or aspire to be leaders. At a later stage, when abstract logic is applied to questions of policy, the parties begin to argue from principles; they profess themselves friends of the people, friends of the better class, and so forth. The principles invoked are not scientific propositions; they are rather forms of language, such as are received with favor in a mixed assembly; the party-leader uses them so as to combine opinions and interests, to draw together a working majority. Each party borrows freely what seems to be effective and popular in the programme of its opponents. Moderate men of all parties think very much alike; they are kept apart by the personal struggle for power.

These general truths are well illustrated by the contest between Whigs and Tories in the 17th century. The Whigs were an aristocratic party, relying on the nobles, the landed gentry, and the City of London. Their principle was, the supremacy of the law: they were determined that the courts which administer the law, and the high court of Parliament which makes the law, should be freed from the arbitrary interference of the King. Moderate Tories did not undervalue the law; they argued that by law the King was entitled to obedience, and that the King then reigning had done nothing to forfeit his claim. The Whigs carried their point in 1688, by bringing in a foreign king, a capable, magnanimous man, not less firmly attached to his royal prerogative than the Stuart Kings had been. With the advent of the House of Hanover in 1714, Whig principles came once more to the front; for the first George and his son were Germans; they needed an interpreter between the King and the people; and the statesman who could manage the House of Commons was not, like Strafford or Clarendon, dependent on the support of his royal master. George III. on the other hand was a patriotic Englishman; he thought himself strong enough to choose his own ministers and to throw off the yoke of the Whig nobles. If he had possessed the administrative talent of Frederick the Great, he might have made himself the head of the Government and set himself above the parties. But King George was neither a great statesman nor a great soldier; he relied too much on the smaller arts of political management; and in the middle of his long reign he came under the influence of a minister whose commanding character excluded the king from the personal conduct of national business. It is to Pitt that we owe the outline of our modern constitution. At Windsor he was the servant of the Crown, arguing, often in vain, against the obstinate purpose of his master. In the Cabinet he was himself master; he chose his colleagues, and dismissed them when they opposed his policy. In the House of Commons, which was still an aristocratic body, his ascendency was never seriously disputed, and he filled the House of Lords with peers of his own creation. So it was that Pitt, by birth and training a Whig, became the founder of the new Tory party.

Pitt's opinions were those of an official Liberal. He wished to reform the electoral system, to remove religious disabilities, to relax the rigor of laws which prevented the expansion of trade. But the fates had imposed upon him the task of steering the ship of State through a period of wars and revolutions: the work of reform was postponed to the necessities of foreign and domestic policy. When the great minister died, his unfinished schemes fell into the hands of men with whom postponement was a settled habit. During the long Tory administration of Lord Liverpool there was, in principle, but little difference between the parties. The middle classes were impatient, and some of them joined the workingmen in declaring that neither of the aristocratic parties could be trusted. These independent men called themselves radical reformers, and they sympathized with the aspirations of democracy in America, in Ireland, and on the continent of Europe.

The Reform Act of 1832 was a Whig compromise; it failed to satisfy the Radicals, but it gave them a foothold which they never lost. It was indeed the first attempt to apply abstract principles to the English constitution, and it started a momentous process of change. Tradition was dethroned, and the old party names had become unpopular. The Whigs began to call themselves Liberals, a name which some of them declined, because it suggested humanitarian tendencies with which they were not in sympathy. Macaulay, for example, would not call himself a Liberal, because, as he said, he was in favor of "war, church establishments, and hanging." The Tories in their turn became Conservatives; they accepted the results of 1832, but deprecated any further change in fundamental institutions. The Radicals of that day were middle-class men, disciples of Bentham; they stood for cheap government, freedom of contract, and individualism. Socialism made its appeal to the unenfranchised laborers, but as yet without much visible success. The Factory Acts, for example, were carried by Tory humanitarians, against the opposition of Radical manufacturers. Free trade, when it came, was the work of a Conservative administration; the Liberals approved; the older Whigs, like Lord Melbourne, thought that Peel had betrayed the landed interest. Lord Derby, a hereditary Whig, was carried over to the conservative Tories by his fears for the Church and his dislike of free trade.

The conflicting tendencies of the half-century after the first Reform Act are summed up in the careers of two men who were to take a leading part in the transition to democracy. Disraeli entered life as a Radical; he was always hostile to the Whig oligarchy. His sympathies were with the Tories; his father, a quiet scholar, had taught him to take the side of the Stuart Kings, and to regard the old nobility as the true leaders of the people. If Peel had given him office, he might have become an orthodox Conservative; but the leaders of that party had no place for an able Jew, who lacked the public school and University stamp. Disraeli took his revenge by attacking Peel and his free-trade policy; his merciless wit gave him the ascendency, even with men who still distrusted him; he gained the confidence of Lord Derby, and in alliance with him began the construction of what was really a new party, the party of Tory democracy. In 1867 the new Tories took their famous "leap in the dark" by establishing household suffrage in the boroughs. The immediate result was a crushing Liberal victory; but in 1874 the forces of Tory democracy were strong enough to place their leaders in power. Six years later, the pendulum swung back, and Mr. Gladstone was once more supreme.

Lord Beaconsfield died in the moment of defeat, but his genius presides over the party which he formed, and profoundly affects the mind of the nation. He never concealed his belief that the conduct of public affairs, especially foreign affairs, must be left to sovereigns and statesmen. At the same time, he was always in sympathy with the aspirations of the workingmen. He was the only public man of his generation who perceived that Benthamite Liberalism was certain, sooner or later, to become unpopular, and he prepared the way for that modified socialism which is now the accepted creed of both parties. And again he perceived that Englishmen, without distinction of class, are conscious of their position as an imperial power, and determined to maintain it.

Disraeli himself, in his earlier days, had taken the narrower views of England's responsibility to India and the colonies; his later speeches are full of the sentiment of empire. Englishmen are all (to some extent) socialists now; and are all (in one sense or another) imperialists.

Mr. Gladstone began his career as the rising hope of Oxford Toryism. He was honestly afraid of Radicalism; he distrusted the Whigs; the mission of the Tory party was to "maintain truth" by supporting the Church of England. At the age of 30 he published his book on 'The State in its Relations with the Church' — a noble vindication of the Church as a spiritual society, pledged to maintain her conflict with sin and selfishness, a society to which the support of the State is not essential, but may, under proper conditions, be useful. It was in the interest of the State that Gladstone argued for the establishment and endowment of the Church. His argument was coldly received; the qualified approval of Peel, the scornful criticism of Macaulay, began to work a change in Gladstone's political mind. No criticism touched his ideal; but in the present age of the world the ideal was, perhaps, unattainable. If Whigs and Conservatives were equally unable to rise to his conception of the Church, if the price of establishment was to be subordination to the State, what then? The Church, to preserve her freedom and purity, might withdraw from the alliance, surrendering those of her privileges which might be found inconsistent with abstract political justice. Within a few years after the publication of his book, Mr. Gladstone was discussing the possible advantages of disestablishment.

Sir Robert Peel was not pleased to see an able young party man so preoccupied with ecclesiastical questions. He drew Gladstone into his ministry, placed him at the Board of Trade, and worked him very hard. In the transition to free trade, master and pupil moved steadily together. While Peel was leader, there could be no doubt as to Gladstone's party connection; when that guiding influence was removed, he was carried about by various kinds of doctrine. Though more than half a Liberal, he was still afraid of Radicalism. He approved of Lord Palmerston's passive resistance to the extension of the franchise, but this was his only link of sympathy with the coming leader of the Liberal party. There was much agreement between Gladstone and Lord Derby; both were Oxford Tories, and devoted Churchmen; but by this time Lord Derby was identified with Disraeli, and the Peelites would not serve under the man who had planted so many barbed arrows in the sensitive spirit of their chief. After long hesitation, Mr. Gladstone threw in his lot with the Liberals. In June 1859 he supported Lord Derby in a critical division; ten days later he took office under Lord Palmerston.

As a member of a Liberal Government, Gladstone stood committed to parliamentary reform. His Whig colleagues discovered with alarm that this late convert was not merely a reformer; he was a democrat. He declared, from the Treasury bench, that the laboring class had a moral right to come within the pale of the Constitution. There was now only one link between the Liberal champion and the Toryism of his youth; he was still member for the University of Oxford. That link was severed when the University rejected him in 1865. Mr. Gladstone appealed to the people of Lancashire, and entered on the first of those oratorical campaigns, which were to change the face of English politics.

The franchise question was settled, for a time, by the Tories in 1867, and the popular vote of 1868 was a personal vote for Mr. Gladstone. With a wide and varied electorate, and many interests competing for notice, the people are easily persuaded to accept the supremacy of one man, who, like General Jackson, "acts always for the good of the country." Under such conditions, the leader of opposition, if he knows his business, has his rival at a disadvantage. It is the men in power who have to make terms with foreign governments, and to protect the national purse; however well they do, it is always easy to show that they might have done better. Mr. Disraeli made good use of his opportunities, and in 1873 the tide of Liberal success was ebbing rapidly. Mr. Gladstone was alarmed, and he would fain have made his defeat on the Irish University question an excuse for bringing his opponents into office. Disraeli saw the snare and avoided it, and the wisdom of his tactics was justified by the Conservative victory of 1874. As a leader of opposition, Mr. Gladstone disregarded what were then supposed to be the conventions of party life. He retired from responsible leadership; returned to the field just at the moment when his action was most likely to embarrass his successors; and finally presented himself to the country as a candidate for power. In the election of 1880 his success was complete, and the death of Lord Beaconsfield left him without a personal rival. But once more the tide ebbed as rapidly as it had risen. In a few years it became evident that the Liberal party was hopelessly divided on three issues of cardinal importance — disestablishment of the Church, Home Rule for Ireland, and the schemes of modified socialism advocated by Mr. Chamberlain. Old badges and cries were out of date. Mr. Parnell was forming an Irish party, so severely disciplined that no member of it could break away or disobey orders. For a few eventful months there was also a Fourth Party, a small band of Tories who obstructed their own leaders, addressed themselves in a democratic spirit to the conservative rank and file, and made themselves so strong that in 1885 Lord Salisbury was compelled to take them into partnership.

At the general election of 1885, Mr. Gladstone endeavored to keep his party undivided by postponing all troublesome questions. He did not declare against Home Rule, but he pointed out the danger of allowing Mr. Parnell to hold the balance of power. This was his reason for asking the country to give the Liberals a majority large enough to make them independent of the Irish vote. In the event, parties were so distributed that the Conservatives and Parnellites, if combined, would be equal or superior in number to the Liberals. Mr. Gladstone accepted Home Rule. It would be quite unfair to represent his conversion as a bid for power and nothing more. The argument for Home Rule was a strong one, and both the great parties were studying it in a practical spirit. But, with a'l his vast experience of affairs, Mr. Gladstone was subject to illusions. He believed that the Irish demand, as presented by him to the electors of England and Scotland, would prove to 'be irresistible. In this belief he cashiered those of his supporters who refused to follow, and when the House of Commons rejected his proposals, he hurried on a "penal dissolution" and went again to the country. The "classes," he said, were against him; he appealed to the "masses." The masses responded by placing the Unionists in power.

In the Parliament of 1886–92 the Liberal Unionists occupied a position somewhat analogous to that of the Peelites in 1850. They were stronger in ability than either of the great parties; they sat on the Liberal benches, and co-operated steadily with the Conservatives. Lord Salisbury in office did himself no discredit; but he had to make himself responsible for unpopular measures. The Crimes Act of 1887 was in itself a moderate measure, but it was a deep disappointment to many who had begun to hope that Ireland might be governed without repressive legislation. A good many independent Liberals fell quietly into line with their old party; the swing of the pendulum was felt. In 1892 Mr. Gladstone became Prime Minister for the fourth time, and entered buoyantly on the task of framing a second scheme of Home Rule. When the scheme appeared, his party saw plainly that it was not an improvement on the Bill of 1886. Discipline was maintained; the Bill of 1893 was carried through the House of Commons, and it was darkly intimated that the House of Lords must accept it, or take the consequences. The Lords rejected the Bill by a very large majority. Mr. Gladstone was at the end of his physical resources; and Lord Rosebery was not the man to succeed where the old leader had failed. The election of 1895 vindicated the shrewd forecast of the Lords and restored Lord Salisbury to office.

From this time forth the Liberal Unionists were identified with the Conservatives; but in consenting to share the spoils of victory they did not withdraw the Liberal or Radical opinions which they had professed. Mr. Chamberlain, for example, has not withdrawn his objection to church establishments; he cannot, of course, give effect to his opinion so long as he retains his connection with the Unionist Party, which is pledged, as a party, to the defence of two established Churches. On that question no difficulty has arisen, but, at the height of its success, the party has been broken up by the controversy initiated by Mr. Chamberlain's attack on "one-sided free trade." As conceived by its author, the plan of modified protection has two aspects, socialist and imperialist. It aims at securing constant employment for the British workingman, and at consolidating home interests with those of the colonies by means of preferential tariffs. The plan has been advocated in a series of speeches which could hardly be excelled for clearness and force; but the electors are not convinced. In January 1906 the fiscal question held the field; and free trade carried all before it. The Unionist Party is left, for the moment, in a helpless minority: its leaders find comfort in recalling the precedents of 1841, 1874, and 1886 — the years in which the Conservative party recovered its ground after an apparently crushing defeat.

The Government in power is supported by the Whig Liberals and by the Radicals, who combine Manchester doctrines with modified socialism as best they can. In former Parliaments, labor members were few, and voted with the Liberals. They still prefer Liberals to Unionists, but their support is given in return for concessions which put a strain on the Liberal members of the Cabinet. On Irish questions, the Nationalists vote with Government, on the understanding that Mr. Gladstone's policy will be revived at an early date; but where Catholic schools are concerned that vote is hostile to the educational policy which commends itself to most Liberals. The Unionists' opposition is seriously embarrassed by differences of opinion in regard to free trade. Amid these currents and cross-currents, the leader of the moment must steer the best course he can; at any moment forces now in conflict with one another may combine to sweep him out of his place. We still defer to the notion that there are two great parties in the State; but the House of Commons has in fact become a collection of groups, like the Reichstag or the Chamber of Deputies.

Fellow of All Souls College, Oxford, formerly Legal Member of the Viceroy's Council in India.

THE MECHANISM OF GOVERNMENT.

9. **Great Britain — Parliament.** The British Parliament has its roots deep in the past. It has legislated continuously for a period of more than 600 years, a record unapproached in the history of the world. It has been developed by successive stages from the Great Council of the Norman and Angevin Kings. Much of its ceremonial dates from Plantagenet times. The foundations of this procedure are imbedded in Elizabethan Journals. It holds its sittings in a royal palace, which, though for the most part modern in its structure, is venerable in its associations. The New Palace Yard, through which members of the House of Commons hurry to their daily duties, is the yard of the new palace which William Rufus built, and

which is still represented by Westminster Hall. There is scarcely a feature of Parliament which can be adequately described without long historical explanations.

Parliament consists of the King, the House of Lords, and the House of Commons, or, as described in the enacting formula of Acts of Parliament, the King's most excellent Majesty, the Lords Spiritual and Temporal, and the Commons. These are not as is often, but erroneously, supposed, the three Estates of the Realm. The clergy, who once counted as a separate Estate from the Lords and Commons, have long ceased to do so. The bishops, or some of them, sit, as Lords Spiritual, in the House of Lords. The inferior clergy are, for purposes of representation, merged in the laity, and represented in the Commons. An image of the full Parliament, as it existed in Plantagenet times, may still be seen when the King in person formally opens Parliament at the beginning of a session. The King sits on his throne, attended by his great officers of State. The benches of the House of Lords are occupied by the Lords Spiritual and Temporal, and by the peeresses. The judges, summoned as attendants, sit on their woolsacks in the middle. The Commons, as beseems their humbler station, find such room as they can, in or about the bar, with their Speaker at their head.

The King, acting on the advice of his Ministers, summons, prorogues and dissolves Parliament. He communicates with the two Houses by speech from the throne, commission, message and otherwise. He gives his assent to Bills by commission. But he does not take part in, or attend, the deliberations of either House. Since Charles I. attempted to arrest the five members no King or Queen has been seen inside the House of Commons. Charles II. sought amusement in listening to debates of the House of Lords, but his example has not been followed.

The House of Lords consisted at the end of 1905 of nearly 600 members, including 3 Princes of the Blood Royal, 2 Archbishops, 22 Dukes, 23 Marquises, 126 Earls, 31 Viscounts, 24 Bishops, 315 Barons, 16 Scottish and 28 Irish representative peers. There are more than 24 bishops, but there is only room for 24 of them to sit as peers in the House of Lords. A junior bishop has to wait, unless he holds the see of Durham, Winchester, or London. Representatives of the Scottish and Irish peerage are elected by their peers, Scottish peers for each Parliament, Irish peers for life. But many of the peers of Scotland and Ireland are also peers of the United Kingdom and sit as such. Of the barons a few hold life peerages, as being, or having been, Lords of appeal; the other Lords Temporal hold hereditary peerages.

The House of Commons consists of 670 members, 465 for England, 30 for Wales, 72 for Scotland, and 103 for Ireland. Single-member constituencies are the general rule, but in a few cases one constituency returns two members. Every male householder who has resided in his constituency for a year, and has paid or compounded for his rates, is entitled to be registered, and, when registered, to vote as a parliamentary elector for that constituency. This is the most general franchise, but there are others, including the occupation of lodgings rented at £10 a year, and the ownership or occupation of land or buildings of a certain value. Some of the universities return members, elected by their graduates. Women are not entitled to the parliamentary franchise. A proposal to abolish the plural vote, *i. e.* the right to vote in more than one place, is now before Parliament. Subject to disqualifications arising from peerage, holding of office, bankruptcy, and conviction of treason or felony, every British subject who is of full age is eligible as a member of the House of Commons. A peer of the United Kingdom or of Scotland is not eligible, but a peer of Ireland is eligible for any but an Irish seat. For instance Lord Palmerston was an Irish peer. Where a member of the House of Commons is described as a Lord, he is either an Irish peer, or, more frequently, a commoner holding a courtesy title as son of a peer. Members of the permanent civil service, and most judges, are ineligible.

The evidence of election is the return sent to the Crown Office by the returning officer at the election. If the validity of an election is disputed, the question is tried and decided by election judges appointed by, and from among members of, the High Court. A member must, before sitting or voting as such, except in the election of Speaker, take the oath of allegiance, or make an affirmation to the same effect.

The chief alterations in the electoral law which took place in the 19th century were the Reform Act of 1832 which abolished pocket boroughs and enfranchised the middle classes; the Reform Act of 1867 which, by establishing household suffrage and introducing the lodger franchise in boroughs enfranchised the urban working man, the Ballot Act, 1872, which introduced secret voting, the Reform Act of 1884, which enfranchised the rural laborer by extending household franchise to the counties; and the Redistribution of Seats Act, 1885, which made single member constituencies the general rule, and raised the number of seats to 670.

The two houses hold their sittings in the Palace of Westminster, which is appropriated to their use and to the use of the offices connected with them. The chambers in which they sit are so placed that, if the intervening doors are open, the King's throne at the south end of the House of Lords is visible from the Speaker's chair at the north end of the House of Commons. The House of Commons does not occupy the site of the old Saint Stephen's Chapel, which was burnt down in 1834, but is constructed on the same general plan, and does not provide sitting accommodation, in the body of the House, for more than about 300 out of the 670 members. For discomfort of crowding there is some compensation in case of hearing.

The accident that the House of Commons sits in a narrow room, with benches facing each other, and not, like most Continental legislatures, in a semi-circular space, with seats arranged like those of a theatre, makes for the two party system, and against groups shading into each other.

The duration of a Parliament is limited by the Septennial Act of George the First's reign to seven years, but its existence is always terminated by dissolution before the expiration of that period. The royal proclamation which dissolves one parliament always summons another.

There are, or may be, several sessions of the same Parliament. A session is terminated by prorogation, which is an act of the Crown, done on the advice of Ministers. The business of each session begins with a King's speech, which announces its programme, and ends with another King's speech, which reviews its proceedings. Each House has the power of adjourning its sitting from time to time. Thus it adjourns from day to day, and always adjourns for a short recess at Easter and Whitsuntide. The two Houses usually meet in February and sit till some time in August, but sometimes hold a late autumn sitting after an autumn recess. The time of meeting is practically fixed by the financial year, which ends on 31 March. Estimates for the ensuing financial year cannot well be got ready before February, and there is certain financial business which must be got through before the end of March.

Each House has its own staff. The Lord Chancellor is Speaker of the House of Lords, and is assisted by a salaried Lord Chairman of Committees. The House has a permanent clerical staff with the Clerk of Parliaments at its head. The Gentleman Usher of the Black Rod, who has a Yeoman Usher to assist him, summons the Commons when their attendance is required in the House of Lords, and performs certain other functions, mostly ceremonial.

The Speaker of the House of Commons is elected by the House from among its own members for each Parliament. He is the representative and spokesman of the House in its collective capacity (whence his name); he presides at meetings of the House; and he declares and interprets its law. He is independent of party, and his tenure of office is not affected by a change of ministry. His powers are more extensive than those of the Speaker of the House of Lords. He has an official residence, besides his salary. He is assisted by a Chairman and Deputy-Chairman of Ways and Means, who take the chair at meetings of a committee of the whole House (there are temporary chairmen also) and who can take the Speaker's place as Deputy Speaker during his temporary absence. These are the only members of the House who receive salaries as officials of the House.

The Clerk of the House of Commons is the head of its clerical staff. The Sergeant-at-Arms sees to the maintenance of order within the precincts and to the execution of the orders of the House, and, as Housekeeper, looks after its domestic staff and arrangements.

The law of Parliament consists of the rights, usages, practice and regulations of each House. It may be classified, from a Benthamic point of view, as a substantive law of rights and privileges, and an adjective law of procedure; or, again, as an unwritten customary law to be gathered from precedents and decisions, and an enacted law to be found in orders of the Houses. The substantive law would include the rules which govern the rights of each House, or of the individual members of each House, in their relations to each other, to the Crown, to the executive and judicial authorities of the country, and to individuals and bodies outside Parliament.

The privileges which are formally claimed by the House of Commons by its Speaker at the beginning of each Parliament, bulked large in the 17th century controversies between the King and Parliament, and were much insisted on by the Commons of the 18th century, but in the 20th century have retired into the background. The cases in which a member of Parliament, as such, can claim any exceptional privilege or immunity are now few and rare.

The House of Lords is not only a branch of the legislature but the ultimate court of appeal from the ordinary courts of the United Kingdom. (Appeals from the colonies and dependencies and ecclesiastical and certain other appeals lie to the Judicial Committee of the Privy Council.) It performs its judicial functions exclusively through those of its members who hold or have held high judicial offices. It holds its judicial sittings in the morning, and can sit judicially when the legislature is not sitting. For legislative and general business, its sittings begin at 4.15 in the afternoon and, as a rule, are not of long duration. The cases in which they extend over the dinner hour are exceptional. It does not sit on Wednesday or Saturday.

The House of Commons, when in session, sits from 2.45 to 11 on Monday, Tuesday, Wednesday and Thursday, and from 12 to 5 on Friday. It begins with uncontentious private bills and other formal business. Questions to Ministers (which are not put on Fridays), occupy or may occupy the time till 3.45. As soon as questions have been disposed of, the public business of the day begins. Opposed business is not taken after 11, unless it belongs to a special "exempted" class, or unless the eleven o'clock rule is suspended.

The business of the House of Commons is three-fold, legislative, financial, critical. It makes laws with the concurrence of the House of Lords and of the Crown. It imposes taxes and appropriates revenue. By means of questions and discussions, it criticizes and controls the action of the executive.

While a project of law is before either of the two Houses it is called a Bill. When it has received the royal assent it is called an Act. A bill may be introduced into either House by a member of that House. When it has been introduced, it is read a first time and is printed by order of the House. The stage of first reading is formal. On the second reading questions of principle are discussed. If the second reading is affirmed, the bill goes to a committee, which, in the House of Commons, is either a committee of the whole House, or one of the standing committees on bills, or a select committee. In the absence of special order it goes, under the existing orders, to a committee of the whole House.

A committee of the whole House is really the House itself sitting in a less formal manner, presided over by a chairman at the table, the Speaker's chair being vacant, and freed from some of the restrictions which attach to proceedings when the Speaker is in the chair.

The standing committees on bills, of which there are at present two, are constituted by the committee of selection, and are intended to be microcosms of the whole House. Each of them consists of not less than 60 members, and the quorum of each is 20.

A select committee is appointed by the House, and its members are nominated by the House itself, or, in some cases, either wholly or partially by the committee of selection. The nomination of members by the House is made in pursuance of arrangements between the "whips" of the several parties. There may be joint select committees of the two Houses. When a bill has gone to a select committee, it must subsequently pass through a committee of the whole House, but this is not a case with a bill sent to a standing committee.

At the committee stage a bill is gone through clause by clause, and amendments are proposed, discussed, and, if agreed to, made in the bill. When the consideration of a bill in committee is concluded, it is reported to the House, with or without amendments, as the case may be. On consideration of the report, there is an opportunity for making further amendments.

The next stage is the third reading. In the House of Commons this is the final stage, and only verbal amendments can be proposed. In the House of Lords substantial amendments can be moved at this stage, and also on the subsequent question, not put in the House of Commons "that this bill do pass."

When a bill has been passed by either House it is sent by message to the other House to pass through its several stages there. If the second House amends a bill thus sent to it, it requests the concurrence of the originating House in the amendments. Should the two Houses differ, amendments and counter amendments pass to and fro until an agreement is arrived at. But if no agreement can be arranged, the bill drops. If a public bill is not either passed or withdrawn in the course of a session, it lapses at the end of the session.

The final stage of a bill is the royal assent, which is given, by commission, in the House of Lords, in the presence of representatives of both Houses. As the King can only act on the advice of his Ministers, who presumably command a majority in one of the two Houses, the royal assent to a bill is now given as a matter of course. The last instance of refusal was in the reign of Queen Anne.

A distinction is drawn between public bills, the object of which is to alter the general law, and private bills, the object of which is to alter the law relating to some particular locality, or to confer rights on or relieve from liability some particular person or body of persons. The procedure on private bills differs materially from that on public bills, and is governed by a different set of standing orders.

Every private bill goes, after second reading, to a small committee, before whom, if the bill is opposed, witnesses are called and counsel heard. The proceedings before these committees are quasi-judicial in their nature. Many things which used to be done by private bills, are now done by provisional orders, which are made by a public department, after local enquiry, and when made, are confirmed by provisional order confirmation bills, to which they are scheduled. Sometimes, to prevent hardships, the proceedings on a private bill are continued, by special order, to another session.

The right of granting money in Parliament belongs exclusively to the House of Commons. The House of Lords assents to, and may reject, a grant of money, but cannot initiate or alter a grant.

The right of the House of Commons to grant or raise money is subject to two important restrictions. It cannot vote money except in pursuance of a request from the Crown. It cannot impose or increase a tax unless the tax or its increase is declared by the constitutional advisers of the Crown to be necessary for the public service.

The demand by the Crown for the grant of money for the service of each financial year is made in the speech from the throne at the beginning of each session. As soon as practicable afterward estimates are presented to the House showing the amount which will be required for the public service. Supplementary financial estimates for the current financial year are also, if necessary, presented. The ordinary annual estimates are presented in three parts or divisions, each comprising one of the three branches of the public service, namely, the navy, the army, and the civil service. Each estimate contains first, an estimate of the total grant thereby demanded, and, then, a statement of the detailed expenditure under each grant, divided into subheads or items. For the purpose of considering these estimates, and voting the money required, the House resolves itself, at the beginning of each session, into a committee of the whole House, which is called the committee of supply. Not less than 20 days must be allotted in each session for the sittings of this committee. Votes which have not been previously considered and disposed of by the committee are passed *en bloc* at the end of the session. When the resolutions for the votes have been passed by the committee they are reported to and confirmed (technically "agreed to") by resolution of the House. Resolutions authorizing the grant out of the Consolidated Fund of the money required to make good the supply voted in committee of supply are passed by another committee of the whole House, called the committee of ways and means, and are also confirmed by resolutions of the House. And these resolutions are finally confirmed by one or more Acts of Parliament called Consolidated Fund Acts, and by the annual Appropriation Act which is passed when the supply for the year has been disposed of. Before the end of each financial year, a vote on account is always necessary to supply the current expenses of the civil service during the next financial year, and, for a similar reason, a sufficient amount of money must also be voted for the Navy and Army, in whose case there is greater facility for transferring money provisionally from one vote to another. A Consolidated Fund Act confirming these votes must also be passed before the end of the financial year, *i. e.* before March 31. It follows from the principles laid down above, that the committee of supply and the House can reduce, but cannot increase, a grant asked for by the estimates. Nor can they alter its destination.

Once a year the Chancellor of Exchequer, in committee of ways and means, makes his annual budget statement, reviewing the revenue and expenditure of the past financial year, estimating the revenue and expenditure for the next financial year, and proposing such increases or remissions of taxation as are in his opinion required for, or justified by, the position. These proposals are embodied in resolutions which, when passed by the committee of ways and means, and agreed to by the House, are confirmed by an Act of Parliament, called the Finance Act of the year. Here again the House and its committee can dissent from, or reduce, a proposed tax, but cannot impose or increase a tax.

Under the Cabinet system the executive government is dependent on the support of Parliament, and, in particular, of the House of Commons. The King appoints a Prime Minister who can command a majority in that House. The Prime Minister selects the members of his Cabinet, and the holders of minor political offices, from among those of his followers who have, or are likely to have, seats in one of the two Houses. The Ministry as a whole, and each Minister separately, is responsible to Parliament, and particularly to the House that supplies the money without which government cannot be carried on. If a Ministry cannot retain the confidence of that House the Prime Minister must either resign or appeal to the country by a dissolution of Parliament.

The control of the House of Commons over the executive Government can be exercised, not only by withholding assent to the legislative and financial proposals of the Government, but in various other ways. Thus it can obtain information as to the proceedings of the Government by means of questions and of orders for the production of documents.

Any member has the right to address a question to any Minister of the Crown, being also a member of the House, about the public affairs with which he is officially connected, or a matter of administration for which he is responsible. The proper object of such a question is to obtain information on a matter of fact within the special cognizance of the Minister, and the rules and practice of the House limit the right to ask questions so as to confine them to this object. Except in special cases, notice of any such question must appear on the notice paper at least one day before the answer is to be given. If a member wishes his question to be answered orally, he marks it with an asterisk, and a time is set apart at the beginning of each afternoon sitting for the answering of such questions. Debate is not allowed during this period, but an unsatisfactory answer may, if the matter is of sufficient urgency and importance, give rise to a motion for adjournment, so as to provide opportunity for discussion at a later period of the day.

The House can, on the motion of any member, obtain returns supplying such information on matters of public importance as is obtainable through departments of the Government. A motion for a return may be opposed on grounds of public policy, such as that the disclosure of the information sought is not for the public interest, or that its supply would involve unreasonable labor and expense, but much information thus sought is periodically supplied in the form of "unopposed returns." The Government can also, and frequently does, on its own initiative, lay papers before the House. Such papers are known as "Command Papers." These returns and papers, together with the returns presented in pursuance of directions contained in Acts of Parliament, and the Reports of Parliamentary Committees and of Royal Commissions, make up the formidable mass of official literature popularly known as "Blue Books."

But the principal opportunity for criticising the administrative action of the Government is afforded by the discussions in committee of supply, for which, as has been stated above, a minimum number of days must be set aside in each session. On the old principle that redress of grievances should precede the grant of supply, the action of each Minister and of the departments and officers over whom he has control, can be discussed on the vote for the branch of expenditure concerned. As has been seen, the House can reduce but cannot increase expenditure proposed by the Crown, and therefore any complaint made in committee of supply must be based on a motion for reduction of a vote, even, paradoxical as it may seem, though it be a complaint of insufficient expenditure. Other opportunities for criticising the action of the Government and raising questions of public policy are supplied by the debate, at the beginning of each session, on the address in reply to the speech from the throne, by debate on motions which must be made when the House first goes into committee of supply on the navy, army, and civil service estimates respectively, by the evening sittings appropriated to the discussion of private members' motions, by the second and third reading stages of the Consolidated Fund Bills and the Appropriation Bill, and by the motions which have to be made for the adjournment of the House over a recess.

A full account of parliamentary procedure would be impossible here. Some points have been touched on above, a few others may be briefly noted.

Each House has power to make its own orders, supplementing or modifying its customary rules of practice. A standing order continues in force until repealed. Other orders may be made for a particular session, for a more limited period, or for a particular occasion.

In the House of Commons any question of the law or practice of the House is decided, as a point of order, by the Speaker, or, in committee, by the chairman.

In the House of Commons, government business has precedence at most sittings, and Thursdays are usually devoted to committee of supply. Private members' bills have precedence on Fridays, and private members' motions have precedence, during part of the session, between 8.15 and 11 on the evenings of Tuesday and Wednesday.

The quorum of the House of Commons, and

of a committee of the whole House, is 40. (In the House of Lords the quorum is 3.)

A matter requiring the decision of the House or of a committee is decided by means of a question put from the chair on a motion proposed by a member.

If the opinion of the Speaker or chairman as to the decision of a question is challenged, he allows two minutes to elapse, in order to enable members to assemble, and then puts the question again. If his opinion is again challenged he directs the Ayes to go to the right and the Noes to the left, and appoints two tellers for each. The Ayes and Noes then pass through their respective division lobbies, on each side of the House, their names are taken down by the division clerks, and they are counted by the tellers, who announce the result at the table of the House.

If a debate on a question is unduly protracted, it can be terminated by means of what is called the closure, the procedure on which is as follows: A member rising in his place may claim to move "That the question be now put," and, unless it appears to the chair that the motion is an abuse of the rules of the House, or an infringement of the rights of the House, this preliminary question must be put forthwith, and, if it is carried, the main question is put forthwith and decided without amendment or debate. But a motion for the closure cannot be made unless the Speaker or the chairman of ways and means (or, in certain cases, his deputy) is in the chair, and is not carried unless it appears on a division that not less than 100 members voted in its support. The result is to leave to the chair discretion as to the time and circumstances in which closure should, with propriety, be granted.

The Speaker and chairman are also clothed with powers for checking irrelevance, prolixity, repetition and obstruction, for preventing the abuse of dilatory motions, and for maintaining order and decorum. If a member is guilty of grossly disorderly conduct, the Speaker or the chairman of a committee of the whole House can order him to withdraw from the House. If a member disregards the authority of the chair, or abuses the rules of the House by persistently and wilfully obstructing its business, he can be "named" for the offence by the Speaker or by the chairman of a committee of the whole House, and the House can, on motion made, make an order suspending him from the service of the House for the rest of the session. Orders of this kind, when made by the House, or by the Speaker or chairman, are enforced if necessary by the sergeant-at-arms with such assistance as may be required. In the case of grave disorder arising in the House, the Speaker may, if he thinks it necessary, adjourn the House without question put, or suspend the sitting.

The Parliament at Westminster is not only the oldest, but the mother of all existing Parliaments. Those who framed the constitution of the United States took the British constitution as their model, but studied it through the spectacles of Montesquieu, and thus brought about that separation between the executive and the legislative powers which makes such an essential difference between the British House of Commons and the American Congress. English Parliamentary procedure has made the tour of the world. The rules adopted by the French assembly after the Restoration were based on a sketch of English parliamentary procedure supplied to Mirabeau by Dumont. The influence of English practice, derived either directly or through the medium of France, can be traced in the procedure of all Continental legislatures. Thomas Jefferson, when President of the United States, drew up for the use of Congress a manual consisting largely of extracts from English parliamentary precedents, and Jefferson's Manual is still an authoritative work. Every legislature of a British Colony conforms to the rules, forms, usages and practices of the British House of Commons, except so far as they have been locally modified. Of all parliamentary institutions throughout the world the Parliament at Westminster remains the archetype.

Parliament. 3d ed., Oxford 1897); Dicey 'The Law of the Constitution'; Todd (Alpheus) 'Parliamentary Government in England' (2d ed., 1887–89, *out of print*); Do. abridged and revised by Sir Spencer Walpole (London 1892, a very useful abridgement of Todd's work); Ilbert (Sir Courtenay) 'Legislative Methods and Forms' (Oxford 1901); Courtney (Lord, formerly Rt. Hon. Leonard) 'The Working Constitution of the United Kingdom' (London 1901); Low (Sidney) 'The Governance of England' (London 1904). For the early history of Parliamentary procedure consult Stubbs 'Constitutional History of England' (esp. ch. xx). For Parliamentary procedure before the Reform Act of 1832, consult Porritt 'The Unreformed House of Commons' (Cambridge 1903). The fullest historical account of English Parliamentary procedure is to be found in Redlich 'Recht und Technik des Englischen Parliamentarismus' (Leipzig 1905). For documents illustrating the development of Parliamentary institutions consult Stubbs 'Select Charters, Etc.'; Prothero 'Select Statutes, Etc.'; Gardener 'The Constitutional Documents of the Puritan Revolution'.

COURTENAY ILBERT,
Clerk of the House of Commons.

10. Great Britain — Crown and Cabinet. The crown is a chattel, and is kept in the Tower of London. But the genius of the British race, striving unconsciously toward the expression of national unity and permanence, has come to personify it as a power, which, though necessarily wielded by or in the name of an individual ruler, exists independently of the lives of kings and queens. The materials of which the crown is composed will outlast the lives of many rulers. Whilst they are mortal, is it not, in the strictest sense, immortal?

The late Dr. Hearn pointed out, in his admirable work entitled 'The Government of England,' that, in spite of the progress toward democracy of the 19th century, the British Constitution remained, in a very real sense, a monarchy. Not only is it still true that, as regards all foreign communities, the Empire is represented by the monarch alone, and that it would be a gross breach of political etiquette for any person or body to attempt to open up any other channel of official communication with a foreign community, but it is equally true, that every internal act of State — legislative, executive, or judicial — both in the United Kingdom and in the dominions beyond the narrow seas, is done in the name of the monarch, and that no such act can be *ultra vires.* It is of the essence of the British conception of State sovereignty that the monarch is incapable of committing legal wrong.

This apparently Oriental dogma is, however, balanced by the equally fundamental doctrine, that for every political act of the monarch there is an appropriate agent, and that such agent acts at his peril. In some cases, the peril is remote and uncertain; in others it is prompt and definite. The Parliament which advises bad legislation is amenable only to the judgment of the electors expressed at the polls. The judge who abuses his office, though he may be dismissed by the monarch for actual illegality, is amenable, so far as the citizen is concerned, only to the vote of Parliament. But the executive official who breaks the law is liable to an action in the ordinary courts by the humblest citizen whom he has injured; and his plea of "superior orders," though it may involve the superior also in liability, will not absolve the actual delinquent. And thus, inasmuch as, in the enormous complexity of State action, it is hardly possible for the personal act of the monarch to reach the individual except through the hands of some intermediary, the subject is rarely without redress. Even the House of Lords, the greatest anomaly in the Constitution, can be made to feel the pressure of public opinion.

The Independence of Ministers.— The natural consequence of this fundamental principle of the responsibility of the Crown agent is the independence of the agent toward the Crown. Historically speaking, the claim of independence was first put forward by the judiciary, whose members, though for centuries both in law and in fact the servants of the monarch, liable to dismissal at pleasure, succeeded, before the end of the Middle Ages, in banishing the king from his own law courts, and in acting as an independent department of State. Down to the end of the 17th century, their success varied with the political balance of power; but it was assured, soon after the Revolution, by the Act of Settlement, which, in fact, made the judges independent of the Crown, though still, technically, liable to dismissal for actual misconduct.

Meanwhile, Parliament, a later institution than the courts of law, had, by a series of struggles which have made it famous in the world's history, succeeded, not merely in emancipating itself from the control of the monarch, but in establishing itself as an essential part of the national government. The history of these struggles is told elsewhere.

Here it is sufficient to remember that, on his restoration to the throne, Charles II. realized that Parliament could be cajoled, but could no longer be bullied. Even the enthusiastic loyalty of the Restoration Parliaments would not tolerate violence, though it fell a somewhat easy prey to the more sinister influence of corruption.

The Executive was much longer in securing its independence. Down to the Revolution, the holders of executive offices were, in fact as well as name, "His Majesty's servants." Outside legislation and judicature the personal will of the king directed the policy of the country, subject only to the indirect check of a refusal by the House of Commons to grant supplies. But, with the accession of a foreign ruler, in the person of William III., and a renewal of the foreign element with the accession of the House of Brunswick, affairs rapidly changed. William was absorbed in great foreign schemes, and left home affairs to his Ministers. Anne was lethargic, and indifferent to matters which did not concern her personal comfort or the interests of the Church. George I. knew no English, and soon ceased to attend meetings of the Council, except purely formal meetings where his presence was absolutely essential. Thus the real control of affairs passed into the hands of the great officials of State.

At this point there was a real danger (not sufficiently appreciated by English historians) that the government of England would become a bureaucracy, each department in effect the private preserve of its chief, pursuing its way regardless of, or even in opposition to, the other departments, and intriguing for power and privilege. From this danger the country was saved by the peculiarities of the political situation, and by the financial power, based on long established tradition, of the House of Commons.

Ministers and the House of Commons.— During the first half of the 18th century, the dominating feature of the political situation was the possibility of a Jacobite restoration. So long as the throne was occupied by a daughter of James II., or even by the husband of one of those daughters, the country accepted the Revolution settlement with acquiescence, if not with enthusiasm. But, when it became clear that Anne would die childless, the hopes of the Jacobites revived. It was with difficulty that the Queen herself had been brought to accept the scheme of the Act of Settlement of 1700, by which the succession to the throne, on the failure of her issue, had been settled on the Princess Sophia of Hanover, the granddaughter in the female line of James I. The politically useful legend, that the "Old Pretender" (the son born to James II. on the eve of his flight) was a supposititious child, had long been exploded; the child himself, now a young man of winning personality, was prepared, at Anne's death to vindicate the claim which had passed to him on the death of his father; and the Queen was believed to sympathize fully with his ambitions. The House of Hanover was regarded as a mere stalking-horse for the ambitions of the Whig statesmen; and the first two of its princes to occupy the throne of Great Britain and Ireland were looked upon by the mass of the people as foreigners. In 1715, and again in 1745, the fate of the throne trembled in the balance.

Thus the Ministers of George I. and George II. carried their lives, or at least their fortunes, in their hands. A Jacobite restoration meant, at the very least, banishment and confiscation for them, if not something worse. They could not afford to run unnecessary risks.

There can be little doubt that the Whig leaders would have been glad, in spite of their constitutional principles, to dispense with the presence of Parliament during these troubled years. Apart from the possibility — the probability — that it might result in an accession of strength to the Jacobites in the House of Commons, there was always the fear that the license of a General Election would be made the cover of a Jacobite *coup de main*. This fear is shown by the striking step taken soon after the accession of George I.; when the Parliament, at the urgent instigation of Ministers, prolonged the term of existence, not merely of its successors, but of itself, from three to seven years, by the Septennial Act of 1716.

Fortunately, however, it was not possible for the Whig leaders to dispense with the assistance of Parliament; and this for the good old reason which had for so long been the sheet-anchor of Parliament in its struggle for power. In spite of the large hereditary revenue settled upon the Crown at the Restoration, and the rich inheritance of the Crown lands, George I. and George II., like their predecessors, continually needed money; and the only stable source of money was a vote of the House of Commons. The chief secret of Walpole's favor at Court, as well as of his ascendancy over his colleagues, was the power which he possessed of securing this vote. For the first time in the history of England, the power of the Executive depended, openly though not officially, on the fluctuating moods of the representative House.

Gradually, then, by the teaching of events, the Ministers of George I. and George II. began to realize the conditions upon which Cabinet government depends for its success. It was necessary, if they were to prevent the commission of blunders which might bring down the dynasty and its supporters in one common ruin, that they should, in fact, control the action of the king. To secure this control, naturally very distasteful to monarchs brought up in the absolutist traditions of mediæval Germany, it was necessary that they should (under forms of deferential politeness) be able both to coerce and to bribe the occupant of the throne. So long as they acted as individuals, the former object was unattainable; for both George I. and George II. were quite shrewd enough to be able to play off one rival against another. But a threat of resignation by all his Ministers at once was more than a foreign ruler, ignorant of the temper of his subjects and of the machinery of government, could safely disregard. Equally was it desirable, if not essential, that Ministers, if they desired to bribe the king, should act together. For the means of bribery were only to be obtained from the House of Commons; and that House, though it doubtless regarded this new harmony of Ministers with deep suspicion, found it more difficult to refuse supplies demanded by the unanimous voice of the Government, than when it could plead as an answer to the demands of one Minister, that his colleagues differed from him as to the wisdom of his plans. Thus gradually, from no very honorable motives, but as a mere counsel of expediency, Ministers acquired the habit of talking over their plans together; and the rival, and often openly quarrelling Ministers of William III. and Anne, were replaced by the Cabinets of George I. and his son. No doubt the unanimity, such as it was, was mainly superficial; but, for all that, in a matter wherein appearances counted for much, it was important.

The Modern Cabinet.—So much it seemed necessary to say to account for the appearance in English politics of a phenomenon so remarkable as the Cabinet, and so difficult to refer, for an explanation of its origin, to any particular crisis or any official document. Indeed one of the most striking features of the Cabinet system is its wholly informal character — a feature which adds both to its utility and to its interest as an object of study. It is natural, no doubt, that no one but those who have taken part in its proceedings should be able to speak authoritatively of the details of the working of a great political organ. But it is none the less curious that, until the appearance of the masterly essay of Bagehot, entitled 'The English Constitution,' in 1867, even the general outlines of the system by which they had in fact been governed for upwards of a century should have been unfamiliar to a people so keenly interested in politics as the British. And yet that such was the case is shown by the almost ludicrous difficulties experienced by the self-governing colonies of Australia, when, in the 50's, they endeavored to introduce it into their new Constitutions.

But here we must leave the historical method, passing by the vigorous but unsuccessful attempt of George III. to overturn a system which he thoroughly disliked, the brilliant new development introduced by Pitt in his gallant struggle against the coalition of Fox and North in 1784, the remonstrance made by Queen Victoria against the application of its principles to the famous "Bed-chamber" question in 1839, and the more successful vindication of her rights by the same monarch against Lord Palmerston in 1850. Let us make some attempt to enumerate the essential features of the system as it exists to-day.

Its Executive Character.— The first point to notice is, that the Cabinet is not a mere council of political experts, but a body of working administrators. With one or two exceptions, each of its members is actually responsible to Crown and Parliament for the conduct of some department of State. It is true that he is, almost invariably, chosen rather for his general political importance than for his skill in the affairs of his department, *i. e.* an office is found for him because his presence in the Cabinet is desirable. But, none the less, the official character of its members gives the Cabinet a power which no mere advisory council could ever exert. Not only is the Cabinet aware of the awkward secrets of public business, and the practical difficulties of carrying out any line of policy, it is its own executor; for, except in the improbable case of disloyalty to his colleagues, the Minister to whose department the carrying out of that policy belongs, at once insists upon its adoption by his subordinates, the officials of his department.

Its Parliamentary Influence.— In the second place, and still more important, the Cabinet wields vast Parliamentary influence. In effect, its members are invariably members of Parliament, though, legally speaking, no one of them need be; and most of them are men of commanding personal weight in the House of Commons. We have seen how the necessity of conciliating Parliament was forced upon the Ministers of George I. and George II. It is now fairly well understood that the influence exercised by those Ministers was obtained by means not the most creditable. But the death-blow to Parliamentary corruption, already checked by the Place Act of 1742, was dealt when Pitt appealed from the House of Commons to the country in 1784; and the *coup de grace* was given by the Reform Act of 1832. Since that date, the place of the old sinister influence of the "spoils" has been taken by the organization of the party system (see POLITICAL PARTIES); and the substitution of examination for patronage, in the vast mass of appointments to the permanent Civil Service, has rendered the working of the party system comparatively pure. For the most part, Ministers control Parliament by the support of followers who honestly believe their policy to be good, or, at least, the best available; and such corruption as exists is confined to the polling booths.

The Escape of 1705.— One of the most curious facts in the whole history of the Cabinet is that this control of Parliament by Ministers was very nearly becoming, so far at least as the House of Commons was concerned, a legal impossibility. The Act of Settlement of 1700 (so often alluded to) contained a clause expressly excluding from the representative House all holders of office under the Crown. This part of the Act, however, was not intended to take effect until the accession of the House of Hanover; and, before that date, it had been repealed by another Act of the year 1705. But neither the statesmen of 1700 nor those of 1705 appear to have had any idea of the importance of the question.

Dependence of the Cabinet on the House of Commons.— But it is of the first importance to remember that the influence of the Cabinet on Parliament is at least counter-balanced by the influence of Parliament on the Cabinet. Apart from the general attitude of the House of Commons toward Ministers, which is, of course, vital, the opportunities which occur in both Houses for criticising every action of the Executive are of daily occurrence during the session of Parliament. In fact, one of the chief cares of the Prime Minister in forming his Cabinet is to provide acceptable champions of its acts in either House. It is a constitutional maxim, that every Department must be represented in both Houses, so that there may always be present some responsible Minister to explain and give information upon any point of administration which any member of either House may choose to raise. This explanation and information are rendered chiefly in the form of answers to questions of which due notice has been given; and a glance at the Question-Paper for any day will reveal the vast and detailed mass of information which Ministers must be prepared to supply to Parliament. A Minister can, of course, plead "reasons of State" for withholding information. But such a plea is apt to provoke suspicion; and if, for that or any other reason, the reply of a Minister is not considered satisfactory, further steps can be taken (such as a motion for adjournment, a proposal to reduce the Estimates, or even a vote of want of confidence), in order to impress upon a Cabinet the error of its ways. The discussion on the Budget is the grand opportunity for criticism of the Executive by Parliament; and, though the power is sometimes abused, it cannot be denied that the constant liability of Ministers to justify their conduct in Parliament is one of the most valuable principles of the Cabinet system.

But the essential character of that feature of the Cabinet system which we are now discussing, is best proved by the unquestioned rule of constitutional custom: that a Cabinet defeated on an actual vote in the House of Commons must instantly either resign or persuade the king to dissolve Parliament. The former alternative, established by the resignation of Walpole in 1742, on the apparently irrelevant question of the Chippenham election, was long thought to be the inevitable sequel of defeat in the House of Commons. But Pitt, in 1784, added the second alternative, with striking success. Whether the king is bound to grant a dissolution upon the request of a Cabinet, is a delicate question which is said to turn on the point whether the Cabinet was in office when the previous General Election occurred. If so, the country has pronounced its opinion; and the Cabinet is not entitled to a second verdict. Probably, however, the true doctrine is, that if there is any reasonable probability of the Cabinet securing a majority in the country, it is entitled to a dissolution. Needless to say, if the verdict of the polls is against it, the Ministry at once resigns, as Gladstone's Government did in 1874, and Lord Beaconsfield's in 1880. It may be incidentally remarked, that the fall of the Cabinet results in the resignation of about 30 other high officials, *e. g.* the law officers, the under-secretaries of State and the chief household officials, who, though not members of the Cabinet, are more or less in its confidence, and are, in contrast to the permanent officials of the civil service, "liable to retire from office on political grounds." These removable officials, together with the Cabinet, constitute the "Government" or "Ministry."

Informal Character of the Cabinet.— The third cardinal principle of the Cabinet system is its completely informal character. The Cabinet is indifferently described as a committee of Parliament and a committee of the Privy Council; but, in law it is neither. It is true that in each House of Parliament there is a Ministerial (not a Cabinet) bench; and that, in the House of Commons, the Cabinet wields a great and growing control over business. None the less, it is undoubted that its members sit by virtue of their membership of the House, and not by virtue of their offices, and that the measures which they propose, though commonly called "Government measures," are, with the exception of financial proposals, technically brought forward in their capacity of influential members of the House, and not as Crown officials. Even the King's Speech, though unquestionably drawn up by the Cabinet, is delivered in the House of Lords by the King himself or by special commissioners; while in the Commons it is read by the Speaker, who is not a Government official.

On its executive side, the Cabinet is equally informal. Its members are always made members of the Privy Council, in order that the oath of secrecy may be administered to them. But, as a body, it has no legal existence. It is never constituted by Order in Council, the Clerk of the Council is not present at its meetings, no minute or record of its proceedings is made, no decrees or orders are issued in its name, and it is never alluded to in Acts of Parliament, though the phrase "Responsible Minister of the Crown" is once or twice to be found in the Statute-Book. The various departments, such as the Admiralty and Treasury Boards, have, by tradition or statute, certain limited powers of issuing orders and regulations; but, in the vast majority of cases, the deliberations of the Cabinet appear in the guise of Orders in Council, *i. e.* commands of the King, issued by the advice of the Privy Council, or in the form of simple executive acts of the Crown, signified through the appropriate Minister. Both these classes of acts always receive the personal approval of the King, in whose name they are done, though the approval of the Privy Council is a pure formality.

The Unity of the Cabinet.— Fourthly, the unity of the Cabinet is expressed by the Prime Minister, though it is only within a very short time (January 1906) that the existence of the working head of the Ministry has been formally recognized, and that only by a place in the official Table of Precedence. No Prime Minister's department exists, though the Estimates have recently provided for two or three private secretaries. Like his colleagues, the Prime Minister is simply the holder of an executive post, though it is usual to appoint him to a well-paid sinecure, in order that he may have time to devote to the general policy of the Government. But even this practice is very recent. Walpole, who really created the position of Prime Minister, always declined to assume the designation; and the fiction was long maintained by the unwise practice of charging the holder of the position with the actual cares of a working department, such as the Foreign Office or the Exchequer.

And, even now, the precise relations between the Prime Minister and the Cabinet as a whole depend more upon the nice balance of circumstances than upon any well-defined tradition. The fact that the Prime Minister has been charged with the formation of the Ministry, a fact which in itself is usually (though not always) a consequence of his election as leader of his party whilst in Opposition, necessarily gives him a strong position with regard to his colleagues, who are, in a sense, his nominees. This advantage is strengthened by the rule that the collective decisions of the Cabinet are always communicated to the King by his mouth, whilst his prominence in the public eye tends also in the same direction. But the desirability of including in a Ministry the ablest and most popular members of the party, the desire of avoiding any appearance of schism in the ranks of the Government, and the almost unfettered discretion conceded to individual Ministers in the administration of their own departments, upon the business of which they communicate directly with the King, all combine to prevent the leadership of the Prime Minister, in normal circumstances, solidifying into actual control. Whether this result is desirable or not, may be regarded as an open question. On the one hand, a weak Prime Minister is said to imply a weak Cabinet; and the moral is pointed by a reference to the history of the recent Balfour Government. On the other, a Prime Minister of overpowering strength is not without his drawbacks. It is often said, for example, that the Liberal Party was driven into its long exile in 1895, because, in the later days of his leadership, none of his colleagues was "able to stand up to Mr. G."

The Position of the Crown.— In concluding this brief sketch of the working of the Cabinet system, it may be well to anticipate a criticism which every succinct account of the working of British politics is likely to raise in the mind of a reader not himself personally familiar with its atmosphere. A foreign observer may well be expected to say, though it would hardly ever occur to a Briton to say: "What then is the use of the King, if he is merely the mouthpiece of his Ministers; if, except on the rarest occasions, he is bound to accept the advice tendered to him by his constitutional advisers? Does it not really seem as though the famous proposal for a 'cast-iron king' would fit the present British Constitution?"

The first answer to this criticism is the reminder that, though politics are an important side of public life in the British Empire, they do not by any means exhaust its interests. And the occupant of the throne is by no means confined to the sphere of politics. As the head of society, as the patron of religious, charitable, and scientific enterprises, as the encourager of art and sport, as the focus of that spectacular world which, even to the phlegmatic Briton, is no small share of his existence, the opportunities of the monarch are unlimited, and his personal discretion unfettered. To secure the presence of the King at any function, is to place success beyond the range of doubt. For the King to take a personal interest in the prosperity of a public enterprise, is the surest guarantee of its popularity. The recently organized King's Hospital Fund is but one of countless examples of this truth. And with all these matters the Cabinet has no concern.

But, even in the realm of politics, the King is very far from being the mere figure-head which superficial observers have sometimes supposed. It is true that the splendid service which the King renders to the State as the embodiment and symbol of the unity and permanence of a world-wide empire is, perhaps, the greatest of all the functions of the Crown; and, it may be added, there can hardly be any position more truly splendid, more worthy of the highest powers, more capable of being used as an instrument of good. Its singular value is that, while it affords scope for the powers of genius, the position is capable of being reasonably well filled by any man or woman of moderate ability and first-rate training, while even an unworthy holder cannot do very much harm in it. In other words, it is a position singularly well suited to an hereditary monarch.

And it would be a great mistake to assume that, even in the realm of politics, the function of the monarch is confined to the outward show of things, and has no place behind the scenes, where the real fates of nations are decided. Bagehot, in his work before referred to, has summarized, with his usual justice, the political rights to which a constitutional monarch, in a system like the British, is entitled. He has "the right to be consulted, the right to encourage, the right to warn." And, as the same writer very truly remarks, such rights, in the hands of a monarch of sense and sagacity, and it may be added, of experience, are singularly effective. In modern conditions, the air of a Court is by no means so fatal to width of outlook and knowledge of the world as in the days before the popular press and facile traveling. The late Queen Victoria, for example, was learning politics by instinct when many of her future Ministers were absorbed in the sports of youth or the narrow cares of professional life. Words of warning or encouragment must have fallen with singular force from her lips upon the ears of men upon whom rested the tremendous responsibilities of empire; while the completeness with which she could enforce her undoubted constitutional rights was shown in the famous letter in which she consigned Lord Palmerston to temporary oblivion in 1850. On that occasion Her Majesty simply insisted upon her undoubted right to be distinctly informed of every event, in contemplation or progress, which might result in an act of the Crown, "in order that she may as distinctly know to what she is giving her royal sanction."

Of late years suggestions have from time to time been made to the effect that the occupant of the throne should take a more personal and ostentatious part in the details of government. These suggestions not only savor of the political backwater, but they are singularly ill-advised in the interests of the monarchy. Britons feel so keenly upon political matters, that any one, however exalted, who takes part in controversial or debatable matters, inevitably meets with hostile criticism and periods of unpopularity. From such untoward accidents the Crown is entirely saved by virtue of its present unique position. Even where, as during the last two or three years of the Balfour Ministry, the policy of the Government was unpopular with the majority of the community, no one dreamed of blaming the King, for everyone assumed that he had nothing to do with it. How different was the attitude of the country to George III. during the long period in which he strove to restore the older type of monarchy. But perhaps the most complete testimony to the success of the present system, so far as the Crown is concerned, is the fact that republicanism, even as an academic ideal, has practically ceased to exist in the British Empire. Among all the schemes of political reform which are from time to time mooted, no one ever contemplates the disappearance or modification of the powers of the Crown; for the very good reason that the Crown, so far from being a stumbling-block in the way of reform, is seen to be capable of being employed as a valuable instrument to secure it. The working of the Cabinet system makes the Crown a splendid fixed sun, surrounded by a constellation of rolling planets destined, from time to time, to disappear from sight. No one becomes tired of the sun, because the desire for occasional change, planted in every human breast, is satisfied by the appearance and disappearance of the planets. The Cabinet system may be open to severe criticism; but its defects will not be amended by any change which would reduce the monarch from his proud position as head of an united nation, to the leadership of a faction of irresponsible politicians, opposition to whom would mean opposition to the avowed personal wishes of the Crown.

Bibliography.— Considering its importance, very few writers have attempted to deal in detail with the history and working of the Cabinet system. The following works will be found useful in studying the subject. *History:* Morley, 'Walpole' (English Statesmen Series); Jenks, 'Parliamentary England' (Story of the Nations Series). *Working:* Bagehot, 'The English Constitution' (1872); Hearn, 'The Government of England' (chaps. viii–x); Anson, 'Law and Custom of the Constitution' (part II. The Crown, chap. iii. Oxford 1896); Traill, 'Central Government' (English Citizen Series).

EDWARD JENKS,
Principal and Director of Legal Studies of the Law Society.

11. Great Britain — The Judicial System in England and Wales. The English judicial system, like the English law, grew up naturally and spontaneously. It is of native growth. It has never been constructed *en bloc* on any scientific or strictly logical principle; but it is perhaps none the worse for this. It still contains anomalies, which are relics of Anglo-Saxon custom or Norman feudalism; but such anomalies are historically interesting and do not at all seriously impede the working of the more modern machinery.

We now draw a sharp distinction between courts of civil and courts of criminal jurisdiction. In the former debtors are compelled to pay the money which they owe, and wrongdoers to compensate those whom they have injured; so that the proceedings, if successful, generally end in a judgment that the defendant shall pay the plaintiff so much money. The object of criminal proceedings, on the other hand, is to punish more serious offences and to prevent their repetition. Hence these proceedings, if successful, terminate in a sentence inflicting fine or imprisonment on the offender. And for each purpose we now have separate courts. This was not so formerly. At the time of the Norman conquest the most important tribunal in England was the Shiregemôt, or County Court. This court took cognizance of felonies, breaches of the peace, nuisances, and other offences which concerned the State, as well as of actions involving title to lands and other civil suits, which concerned only the individual suitors; it also heard appeals from inferior tribunals, such as the hundred court. In Saxon times the County Court met twice or thrice a year. In the 13th century in the larger counties it met every month.

Under Henry II. the royal power made itself felt throughout the kingdom. His justices in eyre made their circuits through the land, and tried the more important civil and criminal cases in the County Court. By the Assize of Clarendon (1166) all landholders were obliged to attend twice a year to meet the King's justices. This was the origin of the County Assizes. To this day the King's judges still come at least twice a year into every county in England. To the larger counties two judges come together, one of whom tries civil causes and the other criminal cases—

"The great judge and the little judge,
The judges of a size!"

From the ordinary meetings of this ancient County Court are descended both the County Quarter Sessions and the modern County Courts. At the Assizes any crime can be tried which has been committed within the county, whether treason, felony, or misdemeanor. At Quarter Sessions no crime can be tried, which is punishable with death or imprisonment for life (except burglary); other grave offences, such as perjury and forgery, are also excepted. These Sessions are held at least four times a year in each county; the justices of the peace for the county — unpaid laymen — are the judges.

The civil jurisdiction of the ancient County Court had become almost obsolete, when the County Courts Act of 1846 was passed. This act created the modern County Court, which is held in every town of any size in England, at least six times a year. Actions for breach of promise of marriage, libel, slander, and seduction cannot be commenced in the County Court; nor can actions of ejectment or any other action involving the title to any land worth more than £50 a year, or to any toll, fair, market, or franchise; nor any action of contract or tort, in which the plaintiff claims more than £100. There are 56 County Court judges; they are appointed by the Lord Chancellor, and must be barristers of at least seven years' standing.

So much for the counties. But even in Anglo-Saxon times, cities such as Winchester, York, and London had acquired the right of holding courts of their own in which an officer appointed by the citizens themselves would decide all civil disputes which arose within the limits of the city, and also exercise some criminal jurisdiction over the citizens. In less important towns, however, it was found difficult to exclude the jurisdiction of the County Court. But in the 13th and 14th centuries the policy of the Crown was to strengthen the towns in order to create a counterpoise to the power of the nobles. The three Edwards and Richard II. granted many charters to boroughs, which created borough courts of criminal and in some cases also of civil jurisdiction. The citizens were proud of these local courts, for they were a badge of their independence. Some of them have fallen into disuse; from the others are directly descended our present Borough Courts of Quarter Sessions and our civil Borough Courts of Record.

In 111 of the larger towns in England and Wales there is held at least four times a year a Court of Quarter Sessions, which has the same criminal jurisdiction and adopts the same procedure as the Court of Quarter Sessions in a county. The judge of each of these courts is called a Recorder. He is the sole judge of the court, for although the justices of the peace for the borough are often present on the bench, they take no part in the proceedings. A Recorder is appointed by the Crown on the recommendation of the Home Secretary. He must be a barrister of not less than five years' standing. He is *ex officio* a justice of the peace for the borough. He may sit in Parliament for any other constituency but not for the borough for which he is Recorder.

In 18 of the largest cities or towns there exists also a Borough Court of Record of civil jurisdiction—such for instance as the Mayor's Court, London; the Court of Passage at Liverpool; the Salford Court of Record, and the Tolzey Court at Bristol. The jurisdiction of these courts is generally limited to causes of action arising within the borough, but unlimited as to the amount which can be claimed in the action. In most of them the Recorder of the borough is the judge.

When our Plantagenet kings were firmly established on the throne, judicial power became more centralized. The King's Council gradually extended the scope of its operations. It acquired important judicial functions; it became a court in which the King, in theory, was always present. From this council sprang gradually the courts of King's Bench, Common Pleas, and Exchequer; which for many centuries were the three Superior Courts of Common Law at Westminster.

Then as civilization advanced, it was found that the rigid rules of the common law required modification to meet special cases. Ancient custom had to yield to improved morality. The Lord Chancellor, who was at first an ecclesiastic, became "the keeper of the King's conscience." He presided over the Court of Chancery, which soon assumed power to restrain suitors from "unconscientiously" enforcing their strict legal rights. This Court of Equity, which usually sat in Lincoln's Inn, thus acquired control over the three courts of law at Westminster. Two systems of judicature in fact flourished side by side, which were in many respects at variance with each other. What was right at law was often wrong in equity. Judgment would be given on the same facts for the plaintiff in Westminster Hall, for the defendant at Lincoln's Inn.

By the end of the 18th century the Court of Chancery had become more technical, if that were possible, than the courts of common law themselves; its procedure had ceased to be elastic; it would only grant relief in certain specified cases. A plaintiff, who had undoubtedly a strong moral claim, was constantly told that he had no equity. And both at law and in equity, cumbrous procedure, technical pleadings, and preposterous rules of evidence caused the suitors much vexation of spirit, much unnecessary expense, and worst of all, intolerable delay. "Lord Eldon and the Court of Chancery pressed heavily upon mankind" (Bagehot).

Attempts were made from time to time to deal with this state of things by legislation—notably by the Common Law Procedure Acts of 1852 and 1854, the Chancery Procedure Act, 1852, and the Consolidated Orders in Chancery of 1845 and 1860. At last in 1873, Lord Selborne, then Lord Chancellor, with the assistance of Lord Cairns, his opponent in politics, carried successfully through Parliament the Judicature Act, which came into force on 2 Nov. 1875. This Act created the Supreme Court of Judicature, which administers law and equity concurrently. Its procedure is straightforward and simple. Every court now applies the same principles of law and equity to the actual facts of the case; every court has power to grant whatever form of relief the nature of the case may require, whether legal or equitable. This was the greatest and most beneficial law reform of Queen Victoria's long reign. On 4 Dec. 1882, outward expression was given to this fusion of law and equity by physically uniting the courts in one building—the new Royal Courts of Justice.

The Supreme Court of Judicature is composed of the Court of Appeal, and the High Court of Justice. Thus the civil courts at present are: The County Court, the Borough Court of Record, the High Court of Justice, the Court of Appeal, the House of Lords, and the Judicial Committee of the Privy Council. The High Court of Justice is divided into the Chancery Division, the King's Bench Division, and the Probate, Divorce, and Admiralty Division.

The Chancery Division has now six judges who work in pairs, each pair having four masters and a staff of clerks working under them. The bulk of the work of the Chancery Division consists of the equity business, to which its organization is especially adapted. Its powers are, nevertheless, not confined to any particular subject-matter; it administers law as well as equity, though it never tries a case with a jury.

The Lord Chief Justice of England, assisted by 14 puisne (*i. e.* junior) judges, conducts the business of the King's Bench Division. These judges try civil causes either with or without a jury; they preside at the Assizes, civil and criminal, all over England and Wales; they hear appeals from County Courts and magistrates, and prohibit all inferior tribunals from exceeding their jurisdiction.

In the Probate, Divorce, and Admiralty Division, there are two judges who decide as to the validity of wills, grant divorces, and manage the admiralty business of the country.

The rules of court made under the Judicature Act have defined the procedure in the High Court of Justice, which is simple and elastic. A Master now decides all interlocutory matters on a summons for directions, *e. g.* whether the action shall proceed with or without pleadings, with or without a formal trial, with or without discovery of documents and interrogatories as the nature of the case requires. Every amendment in any record, pleading, or proceeding that is requisite for the purpose of deciding the real matter in controversy can be made at any stage of the proceeding.

The Court of Appeal is composed of the Master of the Rolls and five Lords Justices, with the occasional assistance of the Lord Chancellor, the Lord Chief Justice of England, and the President of the Probate, Divorce, and Admiralty Division.

The Lord Chief Justice of England, the Master of the Rolls, and the Lords Justices are appointed by the Prime Minister; the puisne judges of the High Court of Justice are appointed by the Lord Chancellor.

From the decision of the Court of Appeal, appeal lies to the House of Lords — to the judicial body known by this name, not to the legislative assembly. An ordinary peer of the realm can no longer sit in the House of Lords when it is exercising judicial functions. The Judicial Committee of the Privy Council hears appeals in ecclesiastical matters and also from the Colonies. These appellate courts will probably soon be merged in one; they have been strengthened by the appointment of four paid Lords of Appeal.

The criminal courts now are: The Magistrate's Court, the Borough Quarter Sessions, the County Quarter Sessions, the Assizes, the Central Criminal Court, the King's Bench Division of the High Court of Justice, and the Court for the consideration of Crown Cases Reserved.

The proceedings usually commence with a *summons*, bidding the accused appear in court before the magistrates on a certain day: in some cases a *warrant* will be issued at once for his arrest. Simple matters are disposed of summarily by the magistrates. Graver cases are sent for trial to Quarter Sessions or to the Assizes. In these graver cases, the prosecution states in detail the precise charge against the prisoner in a pleading which is called an *indictment*. This is laid before a *grand jury;* and the accused will not be put on his trial unless the grand jury think that there is a case against him fit to be tried. If the grand jury is of this opinion they return the indictment into court, marked "True bill," and the prisoner is then *arraigned*. In some few cases the prisoner must state his defence in a written *plea;* but, as a rule, he merely pleads "guilty" or "not guilty" orally from the dock. If he pleads "guilty", or if after pleading "not guilty" he is tried and convicted, he may be sentenced to fine, imprisonment, or death, according to the nature of the crime which he has committed.

The Central Criminal Court — better known as the Old Bailey — tries all treasons, felonies, and misdemeanors committed in the Metropolitan district or within the jurisdiction of the admiralty. The lighter crimes are usually disposed of by the Recorder of London or the Common Sergeant; the graver by a judge of the High Court, who attends for the purpose. This court is at once both Assizes and Quarter Sessions for the city of London, and assizes for the counties of London and Middlesex and for certain specified portions of the counties of Essex, Kent, and Surrey.

The King's Bench Division occasionally exercises jurisdiction as a court of first instance in cases of grave public importance, such as the trials at bar of Dr. Jameson and Col. Lynch in 1896 and 1903 respectively. It also has an appellate jurisdiction over cases brought before it on writs of error or certiorari or on "special cases" stated by justices of the peace.

The Court for the consideration of Crown Cases Reserved is at present the only criminal court of appeal. It deals only with points of law submitted to it by the judge, who presided at the trial. There is no appeal where the prisoner has been acquitted. The court consists of at least five judges of the High Court of Justice, of whom the Lord Chief Justice of England must be one, unless he is prevented from attending by illness.

In the County Court and before magistrates, solicitors act as advocates. In all the other Courts only barristers can be heard at the actual trial, or on "appeal"; though solicitors are allowed to argue minor questions in Judges' Chambers. A barrister must be a member of an Inn of Court; he must have passed the Bar Examinations, and then have been "called to the bar" by his Inn. The four Inns of Court in London possess the monopoly of calling men to the bar; they will not "call" any woman. In litigation in the High Court it is necessary to employ both a solicitor and a barrister; the solicitor prepares the case for trial, and "instructs" the barrister by delivering a "brief" to him. Solicitors also dispose of a vast amount of non-litigious business. Every solicitor must have been articled to a solicitor for at least three years, and must have passed the Solicitors' Examinations at the Law Institution in Chancer Lane, London, W. C.

Bencher of the Middle Temple, Recorder of Plymouth, Director of Legal Studies at the Inns of Court.

12. Great Britain — Local Government. As in other large and populous countries, the work of government in England* is classified as being either national or local. This classification has no reference to the place in which the work is done or to the area benefited; in England at any rate, it is based in practice — whatever may have been its origin — exclusively on the systems upon which these two branches of public administration are organized and controlled. That part of the work of government which is undertaken by the national organization of the state, directed from its capital, and administered under the direct orders of its executive head or principal legislature is termed national government; and is, indeed, by historians, politicians, and citizens alike, often exclusively thought of as government. That part which is left to subordinate organizations, relating only to particular geographical areas within the state; and which is immediately directed by and responsible to authorities belonging to those areas, subject only to more or less supervision, help, and superior control by the national government, is termed local government. In England and Wales, even more than in most other countries, the choice of the particular functions of government to be thus left to local authorities, and the amount and kind of the supervision, help, and superior control exercised by the national government in respect of each of these functions, have been determined rather by historical antecedents than by any consistent or logical theory. The aggregate amount, variety and relative importance of local government has, during the past half century, steadily increased; until it has come in the United Kingdom, nearly to equal in magnitude (measured by the annual cost of administration) that of the national government itself. This increase has not been due to any transfer of services from the sphere of national to that of local government. Such few transfers as have occurred (like that of the prisons in 1877) have been actually in the other direction. The enormous development of English local government which has marked the last half century has been due, partly, to the great expansion of the cities, which need more government than rural districts, partly to the progressive demand for new and increased services such as schools and libraries, and partly to the tendency to transfer the administration of services of common use from the sphere of private to that of public — usually local — administration.

*With England is included Wales and the Scilly Isles, but not Scotland or Ireland, which have entirely distinct systems of local government; as have also the Channel Isles and the Isle of Man.

THE SERVICES ADMINISTERED BY LOCAL AUTHORITIES.

The government at present entrusted to local authorities in England and Wales may be divided into four great classes, which we may term respectively the collective organization of public services, the collective regulation of individual conduct, the collective provision for special classes of the community, and the collective taxation upon individual citizens by which the net cost of the whole of the local government work is met. It has been a consequence of the great development of local government during the past half century, and of the absence of any logical or deliberately thought out plan of organization, that this or any other systematic analysis of local government functions does not correspond exactly with any definite classification of local governing bodies. We must therefore describe separately function and structure.

The collective organization of public services, though later in its great development than some other branches, now makes up the largest part of English local government.

1. *Protection.*— We have first the fundamental service of the protection of the individual citizen against aggression, for which there is, from one end of England to the other — not excluding even the most rural or the most desolate regions — a series of salaried, professional and highly organized local forces of preventive police. In marked contrast with the practice of most other European countries (and, indeed, with that of Ireland), these police forces, 187 in number, are (with the exception of that for the metropolitan area) exclusively under the control of the respective local authorities, and are subject neither to orders from, nor to control by the national executive. They are (outside the metropolitan area) entirely appointed, controlled, and paid by particular local authorities; in municipal boroughs, the town councils by their "watch committees"; in counties, by what are known as "standing joint committees," of which half the members are chosen by the County Council and half by the Justices of the Peace in Quarter Sessions. The total cost of mainte-

nance of the provincial police forces is three and one third million pounds, and that of the two metropolitan forces two and one quarter million pounds per annum, for which 44,000 men are maintained. A separate grant of part of this cost (at first a quarter, latterly one half) was long made from the national exchequer, conditionally on the local authority (1) permitting the Home Secretary to have its force inspected annually by an officer appointed for the purpose, (2) maintaining it at such a standard of strength and efficiency as the Home Secretary might consider satisfactory. No separate police grant is now made, the amounts (aggregating £3,000,000 per annum) having been merged in larger general contributions in aid of local authorities; but a certificate by the Home Secretary that the above conditions have been fulfilled is still annually required before payment is made. In the metropolitan district (which for this purpose extends to an area of more than 15 miles radius from Charing Cross) there are two police forces; one of small size, maintained by the Corporation of the City of London, without exchequer aid or Home Office inspection, for the protection of the one square mile of the old city; and the other the largest in the world, organized as a local force, but commanded without any shadow of local control, by officers appointed by the national executive itself (Home Office); at the cost, partly of a fixed local rate of five pence in the pound, which meets about half the expense, and partly of the national exchequer; for the protection of the 900 square miles of the metropolitan area. ('Annual Home Office Reports as to Police'; 'History of Police in England,' by W. L. M. Lee, 1902.)

While the central courts of justice form part of the national government, some of the minor tribunals are (though the judges are never elective) supplied by local government, either in form of (a) petty criminal courts held by the local justices of the peace; (b) the more important Courts of Quarter Sessions, held by the same; (c) stipendiary police magistrates in various cities, appointed by the national executive, but paid for by the cities themselves; and (d) a few local civil courts maintained in the City of London and some other of the older cities. The stipendiary police magistrates in the metropolitan district (outside the old city) are maintained in the same way as the metropolitan police force. ('Justice and Police,' by F. W. Maitland.)

Protection from fire is afforded by separately organized fire brigades, having no connection with the police. These are in all cases exclusively under the control of the local authorities; in London, the County Council; in the municipal boroughs, the Municipal Corporation; in other places, the Urban District Council, or the Parish Council. In London, the fire brigade is second in size and cost only to that of New York, and it is not clear whether, for the particular conditions of its task, its efficiency is second to that of any in the world. Its strength is 1,375 men, and its cost £240,000 per annum, toward which the fire insurance companies have to contribute a trifling percentage of the value they severally insure in London, and the national exchequer unconditionally contributes £10,000 a year in respect of the large amount of national property in the metropolis. Some of the provincial cities have also salaried professional fire brigades, often highly efficient. In less populous centres, according to the unfettered discretion of the particular local authority in each case, the fire protection passes by insensible gradations (some salaried professionals, men in other occupations partially paid for fire service, or unpaid but organized volunteers) down to the mere provision of a hand pump or buckets, to be used by any zealous citizen. Protection against fire in theatres and music halls, and against such methods of building houses generally as might facilitate dangerous fires, is afforded, in the metropolis, by the stringent regulations and inspection by the London County Council under its special building act. In other towns the Municipal Corporation takes such action of a similar kind as it thinks fit, by way of by-laws. Protection against drowning is afforded in the bathing season by the boats and boatmen provided by only a few seaside municipal corporations.

2. *Locomotion.*— In so far as locomotion is not abandoned to private enterprise (railways, most river steamers, some tramways, omnibuses, etc.), the whole provision for this service is left in England to the local authorities. The maintenance of roads is performed, over every part of England and Wales, by one kind of local governing body or another. Within London, it is the council of the particular metropolitan borough; in the municipal boroughs, it is the corporation; in other towns, it is the urban district council; and wherever none of these authorities exists, it is the rural district council which is responsible for this service. The method and standard adopted in each locality is left to the unfettered discretion of its local authority, which (for the 95,177 miles of by-roads) has itself to bear all the expense. But for what are deemed main roads (apart from London and the principal cities which are called county boroughs), the county council either itself undertakes the service or else contributes to the minor local authority a sum agreed between them as the cost of keeping up such main roads, of which there are 27,367 miles. The average amount per mile annually spent on road maintenance is main roads, £60; by-roads, £20. The county council, outside London and the county boroughs, moreover, maintain the bridges over streams, etc., with some exceptions. Where, as in urban districts, the road becomes a street, its maintenance naturally becomes more costly, and altogether new needs of paving, cleansing, and lighting arise, to be dealt with and paid for in each case by the local authority concerned, at its unfettered discretion. Further developments of the same service, undertaken under special powers, are the short lengths of canal of the Exeter and York municipal corporations, and the extensive canal navigation owned and operated by the Gloucestershire county council; the harbors, piers, and docks maintained by about 50 local authorities; the numerous bridges over the Thames, constructed and maintained partly by the Corporation of the City of London, partly by the London County Council; similar bridges over rivers in other cities nearly always maintained by the local municipal corporation; the great

tunnels under the Thames constructed by the London County Council; a few old-fashioned ferry services maintained (as at Saltash, Middlesborough, and Sunderland) by various local authorities; the development of the ferry into a moving "floating bridge" by the corporation of Southampton; and into river steamboat services across the Mersey by the Corporation of Birkenhead; across the Thames at Woolwich by the London County Council; and up and down the Thames by the same local authority. In other directions the road has been developed into a tramway; and cars — horse, steam, or electric — are now (1906) owned by about fifty local authorities, and operated under municipal management by an ever increasing number of them (in 1906 over 30), including the valuable hundred miles of track already worked by the London County Council, with gross receipts from fares which, in a normal year of full electric working, may be put at more than £1,500,000 sterling. In one or two cities the municipal corporation has obtained exceptional power to run an omnibus service in conjunction with the tramways. In all other cases the omnibus service, together with either the ownership and management of the tramway service, or else its operation under terminable lease from the local authority, is left to private enterprise. A few bridges constructed by groups of capitalists, with power to charge tolls, are still in the same position, as are most of the canals, and all the railways and coast steamboats. The 19th century has seen a marked tendency toward freeing from toll the use of the various means of locomotion maintained by local authorities. Their roads and streets — once barred to all but pedestrians by tollgates — are now invariably free; the bridges, on many of which even pedestrians were charged a toll, are now (with the exception of a few capitalistic ventures, still in private hands) uniformly free; the tunnels under the Thames are free to vehicles as well as to pedestrians; the steamboat service by which the London County Council maintains the Woolwich ferry is equally free; while the tendency in the municipal tramway canal and steamboat services is to charge only the smallest fares or tolls.

3. *Water Supply.*— The supply of water is only in a steadily diminishing number of cities, of which the largest are Bristol and Newcastle, a matter for private enterprise. In a couple of hundred cities this public service is in the hands of the local authority, usually the municipal corporation, or (as in the metropolitan district), of a council made up of representatives of different local authorities, the aggregate amount of capital invested in these public water enterprises being about £100,000,000 sterling. It is now generally thought to be a defect that there is no systematic distribution, among the great centres of population, of the natural water basins; and no local authorities entitled to control them.

4. *Heat, Light, and Power.*—Gas for lighting, heating, and power is produced and supplied, under the authority of separate statutes, in about 670 cities and towns, besides a number of smaller installations started without statutory powers. These gas works were, in their origin, mostly private enterprises (though the local governing body of Manchester started its own gas works in 1816), but there has been a steady tendency to municipalization, until 210 towns now (1906) govern their own gas production, with a capital of £40,000,000 sterling invested in their enterprises. During the last quarter of a century on an average five cities a year have municipalized their gas supply; and as these comprise a majority of the smaller consumers, no less than 46 per cent of the entire number of the users of gas in the United Kingdom are thus co-operatively supplied by themselves as citizens (Annual Returns as to Gas Works, Board of Trade). Electricity, starting only within the past quarter of a century, has been even more predominately a matter of municipal enterprise. More than 100 towns have their own municipal electricity supply, in which some £25,000,000 sterling is now invested. In Manchester the municipal corporation supplies also hydraulic power.

5. *Education.*— The extensive public service of education — as a function of local government scarcely a generation old — now makes up more than a sixth of the total expenditure of the local authorities. While the national executive, by contributing about a third of this expenditure on education, exercises great influence by means of the conditions which it attaches to its grants, the power of the local authorities to provide what kind and what amount of educational facilities they deem fit over and above the national minimum, is (so far as secular subjects are concerned) now practically unlimited. There is no limit to their current expenditure, or to the amount of rate they may levy. There is no limit of grade or of age. Anything that is education — whether elementary, secondary, or university in grade; whether infant or adult; whether literary, scientific, artistic, technological, or professional in kind — the local authority may, if it chooses, provide, without requiring any sanction or approval, in whatever way it chooses, under whatever regulations it chooses, gratuitously or at any fee. It is legally restrained only (1) by the statutory exclusion (or only conditional admission) of religious instruction in the nature of a catechism distinctive of any particular denomination; (2) by the statutory obligation to provide the "national minimum" of efficient elementary schools for all children between 5 and 14 requiring elementary instruction; (3) by the need for sanction of any projects for raising funds by loans. In practice, the dislike of the citizens to an undue increase in the rates restrains the local authorities at present to a comparatively limited use of their vast powers. While elementary schools, of one sort or another,— now always free and compulsorily attended — exist in adequate numbers, there is, as yet, a quite insufficient supply of secondary schools, apart from those maintained from ancient endowments, under separate governing bodies; and whilst, in most cities, much has been done for technological education of an elementary grade, the provision for university education and the higher technological instruction is, compared with the need, still only rudimentary. For everything above the elementary school, fees are charged. On the other hand, London has a "scholarship ladder" unequaled in extent and genuine accessibility anywhere in the world. By an unlimited provision of free

places coupled with maintenance allowances, awarded on a merely qualifying examination, the opportunity for secondary and university education is effectively opened even to the poorest child of more than average ability. Other local authorities have less extensive scholarship schemes on similar lines.

6. *Miscellaneous Services.*— Brevity compels the grouping together of a large number of diverse public services organized and administered by local authorities. With the exception of a few ancient chartered rights in the hands of private owners (of which Covent Garden in London is by far the most important), the markets are in public ownership, involving a total capital of some £7.000,000 sterling, and (while a few are leased) usually under public administration; often including warehouse accommodation, weighing machines, sometimes cold-storage and abattoir. The municipal provision of workmen's blocks in towns and of cottages in the country has been carried on to a great extent, not only by the London County Council, which has already (1906) over 20,000 people in its dwellings, but also by about 50 other authorities. ('The Housing Handbook,' by W. Thompson, 1904.) The existence of a few «joint-stock» cemeteries serves to remind us that the provision and management of burial grounds is an important function of the local authorities, in which millions of capital is invested, extending in one or two cases (as at Hull), to the provision of crematoria. Interment is, however, the business of the undertaker, and remains everywhere in private hands; not even subjected, as is the case in some continental cities, to public control. The provision of parks and recreation grounds, with bands of music, gymnasia, facilities for games, etc., has been lavishly undertaken. Hundreds of cities and towns have free public libraries and reading rooms; others have also public picture galleries and museums which are uniformly free; whilst a couple of hundred places provide for their citizens swimming and other baths, and public laundries, at low fees. Among the other miscellaneous public services maintained by English local authorities are the Bradford "conditioning house," or wool-grading establishment, the Burnley municipal cold storage, the Doncaster race course, and the Battersea and Saint Helen's municipal supplies of sterilized milk. The tendency of local authorities to embark in these enterprises has led to a discussion of what is called «municipal trading,» during which municipalization has proceeded at a greater rate than ever. (For the abstract case against this tendency, consult 'Municipal Trade,' by L. Darwin (1903); for an equally abstract defence, 'The Commonsense of Municipal Trading,' by G. Bernard Shaw (1904), and 'Mind Your Own Business,' by R. B. Suthers (1905); for statistics, 'The Municipal Yearbook' and 'The London Manual' (both annually); the seven volumes of 'Local Taxation Returns' annually published by the Local Government Board; and the periodical return of 'Reproductive Undertakings carried on by Municipal Boroughs,' also issued by that office.) In 1906 the amount of capital under municipal management cannot be put at less than £500,000,000 sterling; the aggregate municipal indebtedness (all repayable within 20 to 60 years), being over £400,000,000 sterling. Manchester and Birmingham have over £20 per head of population of capital under municipal management.

The part played by local government authorities in England in the collective regulation of individual conduct is less conspicuous than their organization of municipal services, but it is too important to be ignored. It is not merely that practically all these authorities exercise, in their power of making by-laws, a minor legislative function, on which we to a great extent depend for the prevention and suppression of nuisances, the regulation of the streets, all the ramifications of public health, and the operations of building and various noxious trades. If, as in England we must, we include among local authorities the justices of the peace, the regulation of the sale of alcoholic drink, the places where it may be sold, and to some slight extent the hours during which the sale may take place, fall within the discretion of local governing bodies. Finally, in the direction and control of all the provincial police forces, the local authorities have virtually extensive and scarcely defined opportunities of supervising and restraining any overt manifestations of individual conduct which is «disorderly» in character, and of which local public opinion disapproves.

The collective provision for special classes of the community is one of the oldest and was, until lately, the most costly of the functions of local government in England. Under the comprehensive term of the Poor Law there is now included a whole array of specialized provisions for orphan and deserted children, for the sick, for persons of unsound mind, for physical and mental «defectives,» for the aged and infirm, and for the men and women who become destitute, together with their children. The total amount spent on this service is about £15,000,000 sterling annually. Beyond the ancient limits of the Poor Law, and still within the sphere of local government, we have, in addition, the provision of hospitals for lunatics, idiots, and epileptics; the costly arrangements for maintaining and medically treating those suffering from any infectious disease; and the organized provision now made for the temporarily unemployed — making an aggregate annual expenditure from public funds on the care of particularly distressed or afflicted classes of the community, falling not far short of £20,000,000 sterling.

The taxation by which the local authorities maintain all these services (apart from the revenue of municipal property, the receipts from municipal services and contributions from the national exchequer), is levied entirely by themselves. They cannot create a new tax, but once the kind of impost is authorized by Parliament, the rate at which the citizen shall be charged is, as a rule, left to the unrestrained discretion of the local governing body. In amount, there is no limit to its taxing power. Of the total gross revenues of the English local authorities, which may (1906) be put at about £110,000,000 sterling, about 14,000,000 is received from the national exchequer, leaving some 96,000,000 to be raised locally. Of this nearly 30,000,000 is derived from the receipts from the various municipal enterprises that we have described, 3,000,000 from other municipal property, 1,000,000 from fines and fees, and 5,000,000 in reimbursements and miscellaneous receipts, leaving about 57,000,000 to be raised by local taxation. Tolls and dues (apart from those connected with markets and harbors) yield less than 500,000. The whole of the balance is found by one tax, the so-called "rate," a periodical levy, upon the occupiers of the real estate within the area of each local authority, of a specified proportionate part of the assessed annual value of that real estate. This universal impost, known as the Local Rate (sometimes as the Poor Rate, the District Rate, the Police Rate, etc.), varies widely from place to place, but is most commonly between two and eight shillings in the pound, or between 10 and 40 per cent of the annual rental. The actual average for all purposes, including both urban and rural areas, is (1906) about three shillings and sixpence in the pound, equivalent to an annual levy on the capital value of the real estate of less than one per cent, and to an annual contribution per head of population of about 17 shillings and sixpence. It is an interesting and little known statistical fact that the amount of this local taxation per head is only about the same as it was a century ago. This local tax is legally payable by the occupier of every house or farm, or other separate holding of real estate, who (if, as is commonly the case, he is not himself the owner), is left to make his own contractual relation with the owner or "landlord;" normally the occupier pays the rates in addition to his rent. But in "flats" forming part of large blocks, and in property of small annual value, especially that let by the week, the owner usually "compounds" with the local authority, in consideration of a discount to pay the rates himself instead of throwing the burden on the occupier (the so-called "compound householder"), whose rent then includes both rent and rates.

LOCAL GOVERNING BODIES.

English local government is everywhere, and for all purposes, carried on by one particular form of political machinery, which to the Englishman seems so inevitable that he seldom thinks of describing it. The powers and duties of government are vested, not in any officers personally, but in a board or council of members, having jurisdiction, for specific branches of administration, over a definite area. This governing body, which is uniformly unpaid and composed of citizens more or less engaged in their own avocations, appoints, supervises, and directs a staff of salaried, professional officers (the "municipal civil service"), by whom the actual functions are performed. The staff of salaried officers is invariably appointed by the governing body; and (though service is nominally only during pleasure), the appointments are habitually permanent, terminable only on misconduct. There is no such thing in English local government as removal for political reasons, or in order to make a vacancy. The board or council acts collectively, by resolutions agreed to at its meetings by a majority of the members present. Its deliberations are presided over by one of its own number, called chairman or mayor, whom it freely elects; and not by a person separately elected by the people for the presidential position, or appointed to it by some outside authority. Perhaps for this reason, it is a distinctive feature in English local governing bodies that the presiding member has but little personal power or responsibility, apart from presiding. Though in practice he often exercises out of sessions, some executive power, by giving orders to the salaried staff, this is always done in the name of the board or council, and subject to its ratification. The board or council habitually divides itself into committees, each charged with the supervision of a particular branch of the government, and required to report to the main body. The result is an intimate combination of legislative, executive, and occasionally even judicial operations, which the Englishman takes for granted as "administration." It may be added that national politics have little influence on local government. The salaried staff is almost universally "out of politics." In many cases, perhaps the majority, the elections are not contested on political grounds, or seriously fought by the political organizations. In London and many of the large boroughs, the elections are thus fought, but the issues are not primarily those of national politics, nor is the cleavage of opinion exactly the same. And once elected, the members (even where the contests have been keen) seldom habitually allow their politics or party divisions to affect their municipal administration.

The organization of local government in England, once extremely complicated, has been much simplified by recent statutes. The era of reform began, indeed, in 1834-35, when the ancient municipal corporations were made elective and systematized, and the Poor Law was placed in the hands of elective Boards of Guardians. Between 1848 and 1875, a system of elective rural and urban district councils was created principally for sanitation and roads. In 1888, the county councils were established on an elective basis, to take over from the nonelective justices of the peace the civil administration of the counties. In 1894, the rural parishes were provided with elective parish councils; and in 1900 the different parts of London with metropolitan borough councils. By these successive statutes every part of England and Wales has been placed under local governing bodies annually or triennially elected on the widest possible residential qualification, women having a vote whenever they are independent householders, and being eligible for election to all but town and county councils. There is, speaking broadly, no property qualification for election, and (unlike the English parliamentary ballotings) no obligation on the candidate to provide the election expenses. The members of the local governing bodies receive no salary or other remuneration for their work. Only very exceptionally, in positions such as the mayoralty of an important city, is any allowance paid even for expenses.

In spite of simplifying statutes, English local government is still shared among various strata of different authorities, constituted for different purposes under different statutes. London, moreover, with its 4,750,000 of inhabitants, has a local government of its own, and must be considered apart. We take first the network of local authorities administering the more obvious services of municipal government, including sanitation and education. To begin with the parish, we see this ancient ecclesiastical area in the rural districts forming the lowest unit of government; administered, if small, by the parish meeting open to all adults; if large, by a parish council triennially elected by the householders. The parish meeting or parish council may light the village, protect the footpaths and village green, establish libraries and reading rooms, baths and public laundries; but its power to tax is limited. Next to it stands the rural district council, dealing with roads and sanitation, triennially elected by and acting for the householders of a group of parishes. Places in which the population has become aggregated together, needing greater and more varied local government services, are (by Local Government Board order) given the status of urban districts. The householders of these urban areas elect an urban district council, which combines the functions of the parish council and the rural district council, with greatly extended powers. A steadily increasing number of urban districts (now over 300 in number) have, sometimes because of past historical importance, sometimes because of present populousness, been given by the Crown (nowadays the Privy Council) the status of chartered municipal corporations; these elect their councils annually by thirds instead of triennially, and women are not eligible as members. Moreover their councils elect to preside over them, not a chairman but a mayor; and they coöpt into their own bodies additional members styled aldermen. Such of them as have any considerable population (127 in number), have their own police forces, under the control of their own town councils. Apart from minor technicalities there is practically no other difference between an urban district which is, and one which is not, a municipal corporation. The words "town" and "borough," it may be mentioned, are used in England, for any urban place, irrespective of size. The word "city" is of equally lax usage, but it ought to be restricted to those towns, large or small, which have been specifically termed or created cities by statute or royal enactment. Above all these bodies stands the county council; elected triennially by the occupiers of houses or lands within the county, whether residing in rural parishes, urban districts or municipal corporations. The county council is the authority for education; it provides the public lunatic asylums; it either pays for or itself maintains the main roads; it administers various minor services for the county as a whole; and it exercises a certain amount of supervision and criticism and some slight control over the minor local authorities. It contributes half the members (the justices of the peace nominating the other half) to the standing joint committee, which controls the county police force.

Most of the boroughs over 50,000 inhabitants (and some ancient towns below that population) stand outside the area of the administrative county, and are neither represented in nor controlled by the county council. These, the so-called county boroughs (now over 60 in number) are entirely autonomous municipal corporations, which have, in addition, the powers of county councils. The town council, elected in the same manner as that of other municipal corporations, and presided over by a mayor (or in six cases a lord mayor) is (apart from the administration of justice and of the Poor Law) the sole local governing authority of the city, with practically unlimited autonomy within the scope of the statutory authority entrusted by Parliament to local authorities generally; and not even subject, as regards its expenditure on all but one or two subjects, to the general Local Government Board audit. It is an important feature of these county boroughs that they (like the other municipal corporations of any size) have their own police forces, exclusively under the control of their own town councils (by the "watch committee").

The 4,750,000 who inhabit the metropolis have a more complex local government than the citizens of Liverpool or Manchester. London is divided into 29 metropolitan boroughs, one of them being the ancient city preserving still its Corporation, its lord mayor, and other dignitaries and various other peculiarities. These metropolitan boroughs have each a council, elected triennially by the householders, which administers the paving, cleansing, and lighting of the streets, the minor house drainage, the removal of refuse, the suppression of nuisances and the collection of all the municipal taxes. The City Corporation, in addition, manages, with its own considerable estates, the central markets, some of the bridges, the special city police force and (in part) the port of London. Above these local bodies stands the London County Council, with annual receipts and expenditures exceeding £9,000,000 sterling, with 118 members elected triennially by the householders of the whole administrative county of London, together with 19 coöpted aldermen; and responsible for education, main drainage, parks, and recreation grounds, the lunatic asylums, the tramway service, the river steamboats, the great street improvements, the demolition of « slum » areas and the erection of new dwellings, the administration of the stringent Building Act and a host of miscellaneous county services, together with the management of the debt of London, not only for its own needs, but also for those of the other local bodies (except the City Corporation). The water supply of the whole metropolitan district, extending to much more than the county area, is in the hands of the Metropolitan Water Board, a body made up of representatives of all the local authorities concerned. The Thames is administered by the Thames Conservancy Board, a body constituted on a similar plan.

The foregoing survey of English local government omits two branches, which, from historical causes, still retain their separate organizations. Nearly the whole of the collective provision for special classes (but not that for lunatics, nor that for persons suffering from infectious diseases) is in the hands of what are called the Poor Law authorities. The country is for this purpose divided into 656 unions of parishes, often not corresponding with the boundaries of urban districts, municipal corporations, county boroughs or counties. The householders of each of these unions elect either annually or triennially, a board of guardians, which administers the public provision for the aged and infirm, the orphan and deserted children, the indigent sick, the tramps or vagrants, and the destitute of every kind. These boards of guardians levy, for the cost of their schools, infirmaries, workhouses and "outdoor relief," an unlimited tax on householders, the celebrated poor rate. They have complete discretion as to the amount of money that they will spend, and as to the amount of the relief that they will afford (above the legal "national minimum" of preventing death by starvation); but their discretion as to the mode of relief, as to the erection of buildings, as to the appointment of officers, and as to the raising of loans is guided, and, in the last resort, controlled, by the Local Government Board, which has (in this branch of local government more than in any other) the power of issuing peremptory orders having the force of law. In London, where there are 31 boards of guardians, these have also a joint body, the Metropolitan Asylums Board, made up chiefly of their nominees, which manages the infectious disease hospitals and the asylums for idiots. It should be said that there is a great tendency to make, by rearrangement of the unions, the areas of these Poor Law units coincide with those of rural and urban districts the county boroughs. The persons who are elected as members of rural district councils already serve also, without other election, as Poor Law guardians. It is not unlikely that a few years will see the boards of guardians abolished and their duties transferred in county boroughs to the town council; in counties, partly to the county council and partly to the urban or rural district council, and in London, partly to the London County Council, and partly to the metropolitan borough councils.

The other important branch of local government with an organization of its own, and the only one not upon an elective basis, is that of the Justices of the Peace. These are gentlemen of position who are individually appointed by the Crown (the Lord Chancellor), by being included in what is termed the Commission of the Peace. In practice, however, they are almost always chosen by the Lord Lieutenant of the county, who, in most counties, defers informally to the wishes of the existing justices. Thus, the "County Benches" are, in effect, recruited to a great extent by an informal system of coöptation. The principal function of the justices is that of acting as magistrates. Any one justice can issue summonses to appear and warrants to the police for the apprehension of offenders; any two within each county can hold a petty criminal court ("Petty Sessions"), with power to inflict sentences of fine and short terms of imprisonment (subject to appeal to Quarter Sessions), or to commit to prison pending trial at a higher court; and once a quarter, the meeting of justices in "Quarter Sessions" forms a criminal court trying, with a jury, all but the most serious crimes, such as murder and grave felonies. At Divisional Sessions, the justices license retailers of alcoholic drink, nominally at their discretion, but really without effective powers of refusing the renewal of existing licenses, except for grave misconduct. A recent statute enables them to award compensation, charged by a special rate on the district concerned, to the holders of licenses which they withdraw merely on the ground that they are unnecessary. Finally, the Justices in Quarter Sessions, by nominating half the members of the standing joint committee (the County Council sending the other half) go far to control the county police force. It should be said that a slight elective element is infused into the County Benches by the fact that the chairmen of the urban district councils are *ex officio* justices. The county boroughs, and also most of the smaller municipalities, have commissions of the peace separate from those of the counties, and the Justices of the Peace so appointed usually comprise the Mayor for the time being, and the leading members of the town council. They have the same judicial and licensing powers (though no control over the borough police force); but in most towns of any size they perform few judicial duties. In many towns there is also a stipendiary professional police magistrate, appointed by the Crown (Home Office) at the request and at the expense of the town council, who relieves the justices of the police court work. In towns having their own Court of Quarter Sessions, the duties of judge are performed by the Recorder, also appointed by the Crown (Lord Chancellor), who is always a barrister of position, merely visiting the town for the purpose of holding the quarterly court, and receiving for this duty a small annual stipend.

There remain to be mentioned certain local authorities standing outside the general system. At Liverpool and some other ports the port is managed by a harbor trust or board, usually elected by the payers of dock or port dues, including the shipowners, with more or less representation of other local governing bodies. The Mersey Docks and Harbor Board, as the Liverpool port authority is called, administers a series of docks representing a capital outlay of some £30,000,000 sterling. In low-lying or marsh districts there are ancient bodies called commissioners of sewers, appointed in form by the Crown (Lord Chancellor), but practically renewing themselves by coöptation. These bodies maintain the seawalls, sluices and embankments, enforcing on the neighboring land owners their obligations of tenure, and levying on them the cost of necessary common works. The most exceptional of these authorities is that of Romney Marsh, in Kent, where the owners for the time being of 23 ancient estates are, by themselves or their deputies, "Lords of the Level," with extensive taxing and judicial powers for the maintenance of the great seawall.

RELATION BETWEEN LOCAL AUTHORITIES AND THE NATIONAL EXECUTIVE.

In the matter of the relation between the national executive and the authorities administering the various services of local government, England occupies a position intermediate between that of France on the one hand, and the New England or Western States of the United States on the other. The very real autonomy of the English local governing body—greatest in the County Borough, or in such bodies as the Mersey Docks and Harbor Board or the Commissioners of Sewers of Romney Marsh, and least in the Boards of Guardians—marks it off from any analogous authority in continental Europe. The English local authority for each area is formed without any intervention of the national executive (except in the cases of the Justices of the Peace and the ordinary commissioners of sewers, and then mainly in form only), and entirely independently of its volition. It is, for the most part, not subject to the orders of any part of the national executive; it has, in nearly every case, real and complete discretion as to the manner in which its services shall be rendered or the law of the land carried out; it can, for the most part, determine whether or not a particular service shall be supplied in its locality; in all cases it decides on its own responsibility upon its own budget of expenditure, and (whilst not able to impose a new kind of tax) as to the rate of the taxation—of the kind prescribed by statute—which it will levy upon its constituency; and whilst in particular instances it is required to obtain the approval of the national executive, either for its projects or to its actual administration, its practical independence is such that a stubborn local authority usually gets very nearly its own way. To an Englishman, as to an American, it is almost inconceivable that a local authority should be appointed, wholly or in part, by the national executive (unless merely in form); that it should receive and obey orders from the Minister of the Interior; or that it should have to submit its budget for the approval of any superior. On the other hand, no local authority in England—whatever the case may have been in times past—has any original, inherent, or independent powers. With the possible exception of the ancient corporation of the City of London, all the English local authorities of to-day plainly owe their origin to and derive their governmental powers exclusively from the statutes which Parliament has enacted concerning them; and they are, without exception, in all cases, subject to the conditions and limitations of those and any new statutes. A local governing body has, in England and Wales, no rights, powers, privileges or duties inherent in it merely because it is representative of the people of the particular locality; or secured to it by a constitution or other authority independent of the national legislature for the time being. Nor is there in England anything corresponding to the complete separation between the state executive and the local authorities and their mutual independence of each other that characterizes so many of the United States of America. Every local authority in England is required by law at least to furnish an annual statement of its accounts to the Local Government Board; nearly all of them have to obtain the approval of that branch of the national executive before incurring expenditure to be met out of borrowed money, and before raising a loan; most of them receive annual grants from the national exchequer in aid of their expenditure on particular local services, and have therefore to comply with the conditions that may be attached to these grants by the Treasury, the Board of Education, the Home Office, the Board of Agriculture, or the Local Government Board; finally, nearly all of them have to submit—but the municipal corporations only in respect of part of their work—to an annual audit of their accounts by auditors appointed by and responsible to the Local Government Board. These auditors do not carry out, however, the wishes of the national executive; what they have to do is to prevent disobedience to the statutes of the national legislature. They have, in fact, to act in a judicial rather than in an executive capacity, having no power to override a mere exercise of the discretion of the local authority, but they are authorized, and indeed required, whatever the Local Government Board, or other executive authority might desire, subject to appeal to the ordinary courts of law, peremptorily to disallow and to cause to be refunded, any expenditure that (whether in respect of its subject matter, or by reason of fraud, embezzlement or mere waste) falls outside the statutory powers conferred upon the local authority. It should, moreover, be added that any difference of opinion between the Local Government Board (or other branch of the national executive) and a local authority, or between two local authorities, as to their respective legal powers and obligations, has to be determined (unless by mutual consent) not by the decision of any executive officer or by the national executive itself—not even by any special tribunal which the national executive might influence—but, as in the United States, by the ordinary Courts of Justice, applying to the dispute the ordinary law of the land, exactly as if it were a dispute between private individuals. In the same way, when a local authority disobeys or fails to comply with any of the statutes, or acts in excess of its powers, it can be coerced to obedience (apart from such disallowance of unlawful expenditure by the auditor, or such withdrawal of financial assistance from the national exchequer as has been already mentioned) only by means of actions in the ordinary Courts of Justice, which have to be initiated either by aggrieved individuals or by the national executive under the ordinary law.

But any description of the relation between the national executive and the local governing bodies in England would miss the most important feature if it omitted to lay stress on the Grant in Aid. It is the system of grants in aid from the national exchequer upon which the smooth and efficient working of the whole organization to a large extent depends. The expressed purposes of these grants in aid are (*a*) to assist poor localities, and prevent the local rates rising to an oppressive height, by promoting a partial equalization of burden; and (*b*) to induce apathetic or backward local authorities to incur expenditure on local services in which the community as a whole has a strong interest. Even more important to the student of political science is the utility of these national subventions to local government, when given in their most efficient form, in securing national efficiency, without destruction of genuine local autonomy. The basis of English local government is the statutory enactment, by the national legislature, of a minimum standard in each public service (notably in sanitation, education and police), the attainment of which is legally obligatory on every local authority, and is legally enforceable by mandamus. Beyond that national minimum in each public service, each local authority has complete discretion. It can, at the expense of its ever-rising local rates, and subject to the control implied in periodical popular election, do as much or as little as it chooses. But if it chooses to comply with certain specified conditions imposed by the national executive—conditions designed to secure a constantly rising standard of efficiency in particular services—it can (especially in education) obtain national grants in aid of its local expenditure, so calculated as to share the financial burden of increased efficiency between the national exchequer and the local rates. The position of authoritative criticism and ultimate power to withhold the grant, which this relation gives to the national executive—while leaving the local authority both freedom of decision and a genuine choice among methods, as well as complete autonomy in the appointment of officers—appears, on the whole, the best possible device for combining administrative efficiency with local popular control.

Bibliography.— Besides the authorities cited in the text the student should consult 'English Local Government,' by Dr. Joseph Redlich and F. W. Hirst; or 'The Parish and the County,' by Sidney and Beatrice Webb, 1906, forming the first of several volumes of an analytic and historical account of 'English local government from the revolution to the municipal corporations' act.' Brief descriptions of the actual organization of to-day are 'Local Government,' by Percy Ashley (1905); and 'Local Government,' by Dr. Blake Odgers (1902).

Joint authors of 'Industrial Democracy,' etc.

13. Great Britain — Civil Service. The present organization of the English Civil Service may be said to have originated in the appointment by Order in Council in 1855 of a Civil Service Commission sufficiently strong and independent to check in some degree the then existing abuses of Parliamentary patronage.

In the earlier years of the reign of George III. the King had kept patronage in his own hands, and had used it with the single view of increasing his personal power. Edmund Burke's reform of the Civil List (1782) brought in a new and more permanent organization of the government offices, which made royal pressure on the "placemen" more difficult. In 1809 a Superannuation Act had the practical effect of giving civil servants the right to hold their office during good behavior. From 1810 they were paid by salary instead of by fees, and from 1816 the salaries of many posts were provided by a Parliamentary grant. By this time the royal power was exercised by the cabinet ministers, and they, through the "Patronage Secretary to the Treasury," who acted (and still acts) as Parliamentary "whip," avowedly used their patronage on the nomination of individual members of Parliament as a means of keeping together a majority in the House of Commons. Lord John Russell, in his 'History of English Government and Constitution' 1823 (page 402), speaks of Parliamentary patronage as being "of late years more completely organized."

The legislation which followed the Reform Bill of 1832 increased the number and importance of civil service posts, while the growth of the railway system and of other forms of joint stock enterprise made it more difficult for the government to retain its few really able officials. The majority of the persons appointed on the nomination of ministers and members of Parliament were notoriously incompetent. Each party respected the appointments of its predecessor and no one lost his post on a change of government — a fact which, while it mitigated the evils of the spoils system, added to the permanent inefficiency of the service. Occasionally a strong man (like Sir James Stephen, 1789 1859, or Herman Merivale, 1806–1874), was appointed from outside in middle age for special work, but as a rule men were appointed young and were employed for their first 10 or 15 years in copying letters and other routine occupations. The effect on the personnel of the offices is described by Sir Charles Trevelyan and Sir Stafford Northcote (Report on the Civil Service, 1854): "Admission into the civil service is indeed eagerly sought after, but it is for the unambitious and the indolent or incapable that it is chiefly desired. Those whose abilities do not warrant an expectation that they will succeed in the open professions, where they must encounter the competition of their contemporaries, and those whom indolence of temperament or physical infirmities unfit for active exertion, are placed in the civil service."

The effect on the constituencies was even worse. Sir Charles Trevelyan, writing many years later, says: "Every borough and county except a few of the largest had its local manager on either side — a banker, brewer, or solicitor — who purchased the vote and support of the leading men by a judicious application of the loaves and fishes. The corruption so engendered was more constant and general than the bribery carried on by means of money, and it was also more influential, in the degree in which a provision for life for a son or some other person in whom a voter was interested was more valuable than the customary five-pound note." (Eaton, 'Civil Service in Great Britain,' p. 431).

In 1853 the government appointed Sir Charles Trevelyan, with Sir Stafford Northcote as his colleague, to inquire into the whole question. Trevelyan had been (1826–1838) in the service of the East India Company and was the brother-in-law of Macaulay, who had been (1832–1834) secretary to the India Board of Control and (1834–1838) legal member of the Governor-General's Council. In 1833 Macaulay had suggested open competition for the "writerships" of the East India Company as the only effective method of controlling the patronage of the directors.

The Government of India Bill of 1853 carried this proposal into effect, the first open examination being held by the India Board in 1855.

Trevelyan and Northcote's report was presented in January 1854, and proposed open competition for the English civil service, and the separation of the service into higher and lower divisions. Gladstone, as Chancellor of the Exchequer in Lord Aberdeen's government, agreed with the scheme, and civil service reform was promised in the Queen's speech of 1854. Meanwhile the report had been sent round to a number of distinguished educators and administrators whose opinions, mostly pessimistic, were published by the government (Reports and Papers, 1854–55). In March 1854 the Crimean War began, which prevented any large reform being undertaken and the scheme was denounced in the House of Lords, by Lord Malmesbury and others, 13 March 1854, as inconsistent with aristocratic government.

In January 1855 Lord Palmerston, who disapproved of Trevelyan's scheme, became Prime Minister. But the administrative disasters of the war had stirred public opinion, and a strong Administrative Reform Association, under the leadership of Sir Henry Layard, had been formed. Dickens expressed the popular indignation of the time in his picture of the Tite Barnacle family in 'Little Dorrit' (1855-57), which perhaps was partly inspired by Carlyle's attack on "Downing Street" in his 'Latter Day Pamphlets' (1859). Palmerston so far gave way as to create by Order in Council (21 May 1855) a Civil Service Commission whose duty it should be to conduct an independent examination of all nominees. Resolutions in the House of Commons in favor of open competition were lost (10 July 1855) and carried 24 April 1856, and in 1857.

From the first, some of the examinations conducted by the Civil Service Commissioners were in fact competitive, owing to the nomination of more candidates than there were appointments. In 1860 a strong Select Committee inquired into the whole question and reported that their own preference was in favor of open competition, but that in order that the government should not go beyond public opinion they recommended the extension of this system of "limited competition" to the civil service generally. The evidence taken by the committee showed that some of the older civil servants still objected to the examination system, even under the conditions which had prevailed since 1855, on the ground that it had introduced "a class of men above their work." The opinions of one of the better officials who had been introduced by the old system of unchecked nomination are expressed in Anthony Trollope's novel 'The Three Clerks' (1858).

The recommendations of the Select Committee were accepted by the government, and for the next 10 years a competition between at least three nominated candidates took place for each appointment.

The introduction of household suffrage in towns by Disraeli's "Leap in the Dark" Reform Bill (1867) and the defeat of the Conservative party at the election of 1868, altered the whole political position of the civil service question. The existing aristocratic political families felt that their hold on patronage was gone, and were afraid of the results which would follow from the use of patronage by members of Parliament under the pressure of the newly enfranchised voters. The system of open competition for the Indian civil service introduced 15 years before had worked well, and Gladstone was able to publish (4 July 1870), almost without opposition, an Order in Council throwing open to competition most of the government offices. The Foreign Office and the Home Office (which controls the police) were excepted, owing to a belief that secrecy was better secured by a system of nomination. A few years later (1873) the Home Office was thrown open.

When the post-office took over the telegraphs from the railway companies in 1870 it was found that a few women officials were at work. These were retained, and since then the number of women civil servants has been increased. There were 7,000 of them recorded in the census of 1881, 15,000 in 1891, and 16,000 in 1901. A few women have been appointed to important posts as inspectors.

Gladstone's Order in Council of 1870 still in essentials regulates admission to the English Civil Service, though alterations of name have occurred, such as the substitution of "Second Division" for "Lower Division" in 1890, and changes of salary, status, and examination subjects.

The system has been worked with a certain amount of elasticity. Men of all ages are from time to time appointed without competition to posts involving special knowledge, and competitive examination is never used in such cases as a test of qualifications. In some cases, as in the starting by the Liberal government of 1892-95 of the Labor Department of the Board of Trade and the Inquiries Department of the Board of Education, appointments have been given without examination to men from outside, although the work to be done is similar to that done elsewhere by civil servants recruited in the ordinary way. Inspectors are practically never appointed by examination, and the "Examiners" of the Board of Education, whose work is practically that of the "first division clerks" in other offices, are appointed by the president of the Board, generally from men who have just distinguished themselves at Oxford or Cambridge. Artisans at the royal dockyards and on other government work are appointed without competitive examination from lists of waiting applicants, and the same method is used for recruiting the police of London (which is under the central government). The younger "second division clerks" are allowed to compete on equal (or slightly more favorable) terms with the outside candidates for first division clerkships, but in no case is competitive examination used as the method of selection for promotion within the service.

Speaking generally it may be said that the English government believes that competitive examination in the ordinary subjects of study is an excellent way of selecting young men for employment at the end of their school or university career, whether at 17 or at 22 years of age, but that it is not effective when applied to men engaged in professional work or as a test of professional knowledge. The fact however that the main body of the officials are appointed by competition has produced an *esprit du corps* which keeps the whole service out of politics, and the exceptional cases of appointment by nomination neither excite nor as a rule deserve criticism.

Any serious modification in the present arrangements which may be introduced in the future will probably be due to the changes which are going on in the English educational system. In 1855 and in 1870 almost all young Englishmen of the well-to-do classes who did not enter the army or navy went through the same course of education in classics and mathematics at the old endowed "public schools" and the two great universities. Professional preparation for the young "gentlemen" followed graduation, and therefore it was very easy immediately after graduation to compare their abilities and acquirements by examination. Those who failed began, without feeling that they had wasted either time or effort, preparation for the Bar or the Church or the "public school" teaching profession, or more often started their professional work with little or no preparation. In the same way an examination for the lower civil service confined to reading, writing, and arithmetic, corresponded to the facts of the time, for few boys who did not go through the public school course learnt much else. Since 1870 the number of "secondary" and "higher grade" schools with a fairly wide curriculum has enormously increased. In 1898 it was found that the old narrow examination for the lower division had become by the mere force of competition a difficult and technical test for which boys left their schools and prepared themselves at crammers. A wider curriculum including modern languages and science was therefore substituted. This fact and the facilities in London and other cities for obtaining higher education in evening classes is tending to lessen the educational advantages possessed by the average first division clerk over a clever and ambitious second division clerk, and to break down the original reason for their life-long difference of status.

A still greater difficulty is being created by the changes which are going on in English higher education. The English university course, both in the older universities, and still more in the new universities which are springing up in the great towns, is becoming increasingly specialized. Students come to the university for professional courses such as medicine or engineering, or law, or if they devote themselves to humanistic studies specialize on history, or philosophy, or philology. A course which is likely to lead to success in the first division examination (with which the Indian civil service examination was combined in 1897) must consist of several different non-technical subjects pursued with almost equal diligence. Such a course may tend, for those young men who have to work for their livelihood, to lead to no profession except the civil service and perhaps teaching. If so, the original advantage of that generalized examination which was introduced under Macaulay's influence into both the home and the Indian higher civil service will come to an end. It will be no longer possible for the clever youths from the universities to compete each year for civil service posts before finally deciding on their career. The generalized course will itself have become a special preparation, and it will be difficult to resist the argument that a specialized examination involving, as it does for instance in Germany, a technical course of study in law and economics would produce better results.

The term "civil service" is in England only used of the service of the central state. That fact has helped to disguise the unity of the problem of administrative employment under the central and the local government. The census figures class them together and show that the local employees are growing in number as fast as the central.

	National.	Local.
1871	53,000	51,000
1881	50,000	53,000
1891	79,000	64,000
1901	90,000	71,000

Only a few of the larger local governing bodies have a system of competitive examination for their administrative service and "influence" is undoubtedly very powerful in securing appointments under the rest. At the same time, as the size of local governing areas and the importance of local work increases, the need of abler and better trained officials is making itself felt. It is certainly not desirable that each local service should be a "water-tight compartment," admission to which must be sought by a separate examination and within which alone promotion can be hoped for. Nor is it probable either that the central state will lay down (as it does in the case of Medical Officers of Health) certain qualifications which must be possessed by all persons appointed to local administrative posts, or that the local bodies will combine for a general competitive examination from the successful candidates at which all local bodies may draw. But if a course of preparation including perhaps law, statistics, and "Staatswissenschaft" became accepted by public opinion as the best preparation for a professional administrator, it is probable that the central and local officials would be appointed to a large extent from the same body of candidates. At present, however, opinion in England might be suspicious of a "bureaucracy" trained, as in Germany, on a common body of knowledge and in a common form of thought.

Burke in his reform of 1782 not only helped to create the class of professional "cival servants" but attempted to distribute some of their work upon a more logical and economical basis. What we now call "Government Departments" consisted then of the clerical staff attached, either to certain ancient offices of State, such as those of the Lord Chancellor, the Chancellor of the Exchequer, the Postmaster General, and the Secretaries of State, or to Committees of the Privy Council, or to Boards of Commissioners administering other ancient offices such as those of the Lord High Treasurer, or the Lord High Admiral. Each office had "grown" of itself, and new offices had been created as work increased and without reference to any consistent plan. Of the two principal Secretaries of State, for instance, the Secretary of the North conducted all correspondence with the Northern powers of Europe, and the Secretary for the South not only corresponded with France, Spain, etc., but carried on Irish business and the whole police and other work of the "Home" Department. Burke re-divided their duties, making the Northern Department the office of the Foreign Secretary, and the Southern Department that of the Home Secretary. At the same time, England having lost the greater part of her Empire, he suppressed the Colonial Secretary, who had existed since 1768, and who had by hopelessly unworkable arrangement shared his duties with a Committee of the Privy Council called the Board of Trade and Plantations. The work of both was given to the Home Secretary.

But it was not until the period of legislative activity which followed the Reform Bill of 1832 that anything like a complete survey was made of the functions of government, or that any serious attempt was undertaken to create a department for each function. Both the recognition of the need of such a survey and the actual form taken by the redistribution of powers were largely influenced to the suggestions of Jeremy Bentham in his 'Constitutional Code' and other writings.

The Board of Works (Bentham's «Domain Minister») was created in 1832; the Poor Law Commission (Bentham's «Indigence Relief Minister») was created in 1834, became the Poor Law Board in 1847, and was merged in the Local Government Board in 1871; the Committee of Council for Education (Bentham's «Education Minister») was created in 1839 and became the Board of Education in 1899; and the Registrar General (to superintend Bentham's «Local Registrars» of vital statistics) was created in 1837. Separate Secretaries of State were appointed for War and Colonies in 1854, and for India in 1858. A Secretary for Scotland was created in 1885, and a Board of Agriculture in 1889.

At present under a bewildering variety of names (Boards, Commissioners, Secretaries, etc.) a fairly logical system is in existence. Nearly all the work of the executive government is divided among about fifteen main departments. At the head of each department is a political chief who sits in the Cabinet and who is assisted by another member of the Government, who generally sits in that House in which the Cabinet member does not sit.

In 1906 the Departmental chiefs and their Parliamentary assistants were: for Finance, the Chancellor of the Exchequer assisted by the Financial Secretary to the Treasury; for the Home Office (Police, etc.), Foreign Office, Colonial Office, War Office and India Office, a Secretary of State with a Parliamentary Undersecretary in each case; for Scotland and Ireland, a Secretary and Chief Secretary; the President of the Local Government Board (dealing with Poor Relief, Public Health and other functions administered by local authorities), with a Parliamentary Undersecretary; the President of the Board of Education, whose assistant (in the House of Lords) is called Lord President of the Council and is (1906) in the Cabinet; the President of the Board of Trade, with a Parliamentary Undersecretary; the President of the Board of Agriculture, without one; and the Postmaster General.

Bibliography.— The only book on the whole subject is D. B. Eaton's 'English Civil Service' (1880), a careful record of facts, but written without special knowledge of English conditions. The rise of the Indian civil service is admirably treated in A. L. Lowell's 'Colonial Civil Service' (1900). But the main sources are the reports and evidence of the successive Parliamentary committees and royal commissions which have sat on the subject, especially the Report of Sir Stafford Northcote and Sir Charles Trevelyan (1854), Reports and Papers on the reorganization of the Civil Service (1854–55), The Select Committee on the Civil Service (1860), The Playfair Commission (1874), and the Ridley Commission (1887). For the organization of government departments, consult Sir William Anson's 'Law and Custom of the Constitution,' Vol. II.

THE JUNIOR PARTNERS.

14. Great Britain — Scottish History. *From the Invasion of Agricola in* 80 A. D. *to the Death of Alexander III. in* 1286.— In the main lines of its development Scotland has from the beginning been subjected to the same general influences that have determined the civilization of all the countries of Western Christendom. Like each of these countries, however, it has had a history of its own which has given a specific stamp to the character of its people, to its institutions, laws, customs, and social arrangements. Among the nations of Europe Scotland has an individuality as distinctive as that of any of its more powerful neighbors, and it has made its own contribution to the general sum of knowledge and to the advancement of humanity. Let us in a rapid survey glance at the general and special conditions under which her people became a nation and acquired the characteristics by which she is known to the world.

Remote as is her geographical position, Scotland, from the moment it appears in history, was an integral part of Western Europe. Like England, France, and other countries she also came under the domination of the Roman Empire, and her history begins with the invasion of Agricola in the year 80 A.D. In her case, however (and it is a note of difference at the very beginning of her history), the Roman dominion never passed beyond a military occupation, and, except material remains, left no permanent impression of its presence. The next powerful influence that helped to determine the future of Europe was the spread of Christianity, and for this influence Scotland had not long to wait. About the year 563 Saint Columba introduced Irish Christianity into the country north of the River Forth, and by the first quarter of the 8th century the whole of North Britain came nominally under the jurisdiction of the Bishop of Rome. Christianity was a common factor in the process which led to the formation of the nations of Western Europe, but in Scotland, as in other countries, there were specific conditions that determined the character of her development and permanently influenced the genius of her people. There was first the physical nature of the country, and, second, the fact that peoples speaking different languages divided the land between them. As far as her internal history is concerned, the dominating physical fact was the division of its surface into a Highland and a Lowland country. The River Forth «that bridles the wild Highlandman,» dividing these two territorial sections by a natural line, has been, in fact, a determining factor in the development of the Scottish nation. To the north and the south of the Forth respectively there have existed to the present day two distinct peoples, speaking different languages and possessing different characteristics, partly the result of original racial idiosyncrasies and partly the result of their respective histories. The mutual relations between these two peoples, it will be seen, have been of the first importance in the history of the Scottish nation.

In the first quarter of the 11th century the entire mainland of Scotland was nominally consolidated under one ruler, Malcolm II., who came of the Celtic race beyond the Forth. Though territorially consolidated, however, there was little cohesion between the northern and southern sections of the Kingdom, and the process in the next stage of national development (1100–1300) was the knitting of the bonds between the different peoples and their gradual subjection to an acknowledged head. In this process, also, there were general causes at work which were common to Christendom, and causes which were peculiar to Scotland herself. The general causes were the introduction of the feudal system, the organization of the Church with Rome as its centre, and the growth of towns and municipal institutions — all the result of the general movement among the countries of Western Europe. Peculiar to Scotland itself during this period of her development was the decisive supremacy obtained by the Teutonic over the Celtic peoples in the direction of the national destinies. The marriage (1079–1093) of Malcolm Canmore, a Celtic prince, with the Saxon Margaret marks the beginning of the struggle between the two races which was to decide whether there was to be the Scotland which exists to-day. From that marriage issued a line of kings with Teutonic names, Teutonic sympathies, and with the abiding purpose of Teutonizing the national institutions. The reasons for this policy are sufficiently obvious. The country between the Firth of Forth and the Tweed, which had been acquired through conquest by the Celtic kings of the north, and whose inhabitants were mainly Teutonic, was the most valuable part of their kingdom, and naturally tended to become its political centre. From the death of Malcolm Canmore in 1093 to the death of Alexander III. in 1286, therefore, the task of the successive Scottish kings was, on the one hand, to defend the southern part of their dominions against the encroachments of England, and, on the other, to hold in check their Celtic subjects to the north of the Forth and in the extensive district of Galloway (also mainly Celtic) in the southwest. By the death of Alexander the task had been accomplished, and Scotland was now a consolidated kingdom, effectually ruled by one acknowledged prince, with Teutonic influences in the ascendant.

The Struggle for Independence.— The death of Alexander III.'s only heir, Margaret of Norway, led to the attempt of Edward I. of England and his immediate successors to attach Scotland to the English Crown, and for more than half a century she had to fight for her bare existence as a nation. The results of the struggle were of the highest importance for the future of her people. Successfully maintaining her independence, by the very effort she made for self-preservation she became a united nation with a consciousness of a distinct destiny which had not been present to her even in the "golden days" of Alexander III. By the ordeal they had passed through, moreover, the Teutonic section of her people, who had been mainly interested in the issue of the struggle, acquired that national characteristic "the carl o' hemp in man" — that dogged persistence, which the world has recognized as a peculiarity of the typical Lowland Scot. But, as we shall see, there was another result of the struggle for independence which, if it did not affect the national character, powerfully influenced Scotland's laws and institutions, political, social, and municipal. In the contest with England she had sought the alliance of France, and for two centuries and a half she was in closer contact with France than with England. Previous to the War of Independence it was from England she had borrowed what she needed; now it was to France that she looked as her model.

The Development of National Institutions Under French Influence, 1472–1542.— From the death of David II. in 1472 to the beginning of the reign of Mary in 1542 is a well-marked period of Scottish history, during which the national institutions assumed the general form which they maintained till the union of the Scottish and English Parliaments in 1707. Throughout this entire period the dread of English aggression was still the constant preoccupation of the people, and this permanent dread at once deepened the national traits of hardihood and caution and contributed to the strengthening of national sentiment. In the development of institutions we have again to note the action of causes common to western Europe. Like the kings of other countries the Kings of Scots deliberately aimed at crushing the power of the feudal nobles and establishing a central authority over which they should be supreme. But in this endeavor they were checked by two hostile forces — the power of the Scottish nobles themselves and the insubordination of their Celtic subjects in the Highlands and the Western Islands. As the result of these opposing forces, whose relative strength was constantly changing, a Parliament like that of England, with well-defined privileges and efficaciously representing the different classes of the people, could not come to birth in Scotland. In the Scottish Parliament or Estates (so-called in imitation of the French *Etats*), the Lords Temporal and Spiritual, the Commissioners for the Shires and Burghs, sat in one House and nominally legislated for the nation, but the actual power of the Parliament was in the hands of a committee known as "The Lords of the Articles," the choice of which lay with the king or the greater barons according as the one or the other was in the ascendant. Till the Scottish Parliament ceased to exist, therefore, it was but the convenient instrument of whatever authority chanced to preponderate in the State. In the case of other institutions it was from France that Scotland borrowed the models she sought to imitate. It was from France, mainly during the period of which we are speaking, that she took over the Roman law, thus departing from the example of England; and the College of Justice (the present Court of Session), established by James V. in 1532, was formed on the pattern of the *Parlement* of Paris. In the election of municipal bodies in the burghs the method of France was likewise adopted (the retiring body electing its successor), a method which prevailed till as late as the 18th century. From France, also, during the same period was taken the arrangement of feu-farm by which land was leased in perpetuity — an arrangement encouraged by the Estates and intended (ineffectually as it proved) to remedy the system of short and precarious leases which till the 19th century disastrously affected agriculture in Scotland. When to these borrowings we add the fact that the majority of highly educated Scots studied in the schools of France, it will be seen that, apart from the political results of the alliance, the influence of France in Scotland is one of the important facts in the national development.

From the Reformation to the Revolution, 1542–1689. *Adoption of Protestantism and Alienation From France.*— With the beginning of the reign of Mary (1542) Scotland makes a new departure and enters on a period which definitely closes with the Revolution of 1689. The dominating fact of the period was the adoption of Protestantism in place of Catholicism as the national religion (1560). The immediate result of the change of religion was alienation from France as a Catholic country and approach to England, with an ever-growing conviction on the part of both peoples that political union was in the interests of both. But there were other results from the religious revolution which permanently affected the national character and the future of the country. For the first time in the nation's history an issue was presented which the public mind was mature enough to comprehend and which was of a nature to evoke the inherent contrarieties of thought and feeling which divide man from man. From the change of religion and the political consequences it involved there resulted a collision between two types of mind which have been in antagonism ever since. But this very collision of opposites produced a quickening of the general consciousness which made Scotland a nation in the strictest sense of the word. From the Reformation to the Revolution the country was cleft in twain by two opposing principles and two opposing parties, between which compromise was impossible and political equilibrium was unattainable. On the one side were the successive Stewart kings who aimed at absolute control in Church and State, and on the other, the religious party which adopted Presbyterianism as its form of church polity and which maintained the Church's independence of the State. After a struggle that had lasted above a century came the Revolution of 1689, when England and Scotland both cast out the House of Stewart and a new order began.

From the Revolution in 1689 up to the Present Time; The Union of Scottish and English Parliaments (1707); The Jacobite Risings; Subsequent Privileges; Modern Development.— For Scotland as for England the Revolution marks the beginning of the modern time. Throughout the foregoing period theological considerations had dominated the public mind equally in affairs of Church and State; henceforward secular interests become more and more the impelling motives that determine the action at once of the State and of the individual. The immediate result of this changed attitude was the union of the English and Scottish Parliaments in 1707. In the previous century ecclesiastical differences had been a bar to this union; now considerations of reciprocal interests determined both nations to accept it. For Scotland the union was a necessity if she was to take her place among the nations. Hitherto she had labored under disadvantages which, in spite of the strenuous efforts of her people, had impeded her free development. Her remote situation, her limited area of arable soil, her long antagonism to England, her political and religious distractions, and, as the result of all these concurrent disadvantages, the meagreness of capital, had crippled her in all her efforts to develop her resources and to compete with more fortunate nations. The immediate consequences of the union, however, did not give promise of the future that was in store for her. The old jealousies between the two partners increased rather than abated, and for fully half a century Scotland sullenly acquiesced in a union into which (such was the feeling generally expressed) she had been entrapped by unscrupulous statesmen, and from which she had only received insult and injury. The Jacobite risings of 1715 and 1745 are the significant commentary on the state of feeling even in the Lowlands, but, as the issue of both enterprises proved, the heart of the nation was too deeply committed to the new order to revert to a régime that would have been inherently opposed to the spirit of the new time.

By the middle of the 18th century the advantages that accrued from the union were no longer doubtful, and henceforward the industrial and commercial progress of the country exceeded the expectations of its most sanguine advocates. Manufactures multiplied; the mineral wealth of the country and the riches of its seas were utilized for the first time on an extensive scale. Foreign trade had hitherto been almost entirely restricted to the exchange of commodities with the countries bordering on the German Ocean and the Baltic Sea, but by the opening up of trade with America, Glasgow, Greenock, and Paisley — mere villages at the time of the union — grew into great towns and important commercial centres. Hitherto, also, of the three types of burghs peculiar to Scotland — Burghs of Barony, Burghs of Regality, and Royal Burghs — only the last had enjoyed the privilege of foreign trade in staple commodities, but this privilege gradually fell into abeyance, and every burgh with sufficient enterprise was at liberty to compete with its neighbors. In connection with the burghs a further progress has to be noted. In Scotland, as in other countries during the Middle Ages, trade and commerce had been shackled by conditions, necessary at the time but which were incompatible with free national development. Only Royal Burghs had possessed the privilege of being the homes of the great industrial crafts; in all the three types of burghs only burgesses had the right of pursuing any form of trade; jealous rivalry prevented free commercial intercourse between the different towns of the kingdom; and, finally, the fixing of the prices of commodities by the town councils or by the state obstructed the natural competition which is the life of trade. Later than in England, though not later than in France and Germany, these restrictions gradually ceased to be operative, and in 1846 «exclusive privileges» in trade and commerce were formally abolished by Act of Parliament.

Thus by the awakened spirit of her people and the surprising development of her resources, Scotland, for long a thorn in the side of her more powerful neighbor, came to be England's valuable ally in the building up of empire. To the growth of the British colonies it is admitted that she has contributed even more than her relative share: the number of pioneers whom she has sent to New Zealand, to Australia, and Canada is relatively greater than has proceeded from England, and equally out of proportion is the number of rulers and soldiers she has given to India and the other dependencies. In science, philosophy and literature it is sufficient to recall the names of Watt, Adam Smith, Hume, Burns, Scott, and Carlyle, to prove that she has contributed her own quota to the common stock of material and spiritual wellbeing.

In the rapid development of the country the Lowlands of the south and east were the principal agents, but the Highlands also were powerfully affected by the transformation of the rest of the kingdom. The risings of 1715 and 1745 may be regarded as the last efforts of the Celtic population of Scotland against the Teutonic element, to which it had been in permanent antagonism since the time of Malcolm Canmore. Through the action of the government after the last attempts of the Stewarts to recover their heritage the Highlands ceased to be a source of danger, but became a source of economic perplexity. The social conditions under which the Highlanders had hitherto lived now came to an end: the time-honored raids into the Lowlands were no longer possible, and the Highland chieftain ceased to be a feudal lord and became a proprietor interested in the produce of his land. Thus arose the problem, even yet imperfectly solved, how under their conditions of climate and surface and soil the Highlands might be made a tolerable abode for their populations and a partaker in the general prosperity of the country. But, though in the past debarred by physical conditions from playing a main part in the material development of the country as a whole, the Highlander is yet a constituent element of the Scottish nation. The nature of his home, the romance that has come to surround his character and his history are valuable assets among the national possessions. The natural complements the one of the other, the Lowland Scot supplies the cautious persistency, the sure hold of the fact indispensable in the conditions of modern life, while his Highland fellow-countryman by his quicker emotions and his natural grace is a standing reminder that there are other ideals than those of mere material prosperity.

Religion and Education.— We have seen that during the 16th and 17th centuries public affairs in Scotland were dominated by ecclesiastical considerations, and that at the Revolution of 1689 this domination came to an end, and material interests came more and more to occupy the public mind. Nevertheless, though religion thus ceased to be the determining factor in the national policy, it still remained a subject of absorbing public interest to the community at large, and throughout the 18th and 19th centuries religious controversy fills a large place in the national history. As a result of the Revolution, Episcopalianism, which had been made the national church by Charles II. at his Restoration in 1660, and which clung to the House of Stewart as its founder and patron, was disestablished in 1689, and Presbyterianism put in its place (1690), was bound by its own interests to support the Revolution régime. The National Church thus established remains till the present day, but in the course of the last two centuries there have been frequent secessions, resulting in the formation of various religious bodies of more or less importance. By the restoration of lay patronage in 1712 a division of opinion was created which led to the first Secession under Ebenezer Erskeil, whose members are known as the «Associate Presbytery,» or popularly as «Seceders.» Among the Seceders themselves there soon arose a division regarding the oath of allegiance enacted from the Scottish burghs, from which sprang the two bodies, respectively denominated Burghers and Anti-burghers. In 1761 came another Secession from the Established Church, also occasioned by difficulties connected with patronage — the new Secession taking the name of the «Presbytery of Relief.» In 1820 the Burghers and Anti-burghers united under the designation of the «Associate Synod of the Secession Church,» and in 1847 this body joined that of the Relief, to form the «United Presbyterian Church.» In 1843, one of the memorable years in Scottish Ecclesiastical history, the national church suffered its greatest disaster since the Revolution. Once more on the question of patronage, as involving the question of spiritual independence — the right of a church to independence of the State in all matters touching purity of doctrine — a numerous body of its ministers, led by Dr. Chalmers, effected the "Disruption" and set up what was known as the "Free Church of Scotland." Finally, in 1900, the Free Church and the United Presbyterian Church united under the name of the "United Free Church of Scotland." In this union, however, a minority of the Free Church refused to concur, and a judgment of the House of Lords (1904) decided that the property of the church belonged to the minority — a decision which occasioned an Act of Parliament appointing a commission to allocate the property between the two sections. Thus at the present time in Scotland there are two main bodies of the Presbyterian Church: the Established Church and the United Free Church. The Scottish Episcopal Church and the Roman Catholic Church, the latter mainly consisting of persons of Irish extraction, are the two other chief religious denominations. In the recent history of Scottish elementary education the most memorable event is the Education Act of 1872, by which Board Schools were substituted for the old Parish Schools and education was made compulsory from the age of five to thirteen. Seventeen years later elementary education was made free. While Scotland has always compared favorably with other countries in its provision for elementary education, her provision for secondary education remains defective, and she is now impatiently awaiting an Act which will remedy the disadvantage. Within the last half century the universities of Scotland have undergone reforms which have changed their original character and were intended to adapt them to modern needs. By the University (Scotland) Act of 1858 they received a common constitution, and by the Universities Act of 1889 this common constitution was further reformed. The supreme body in each case is a University Court; there is also a Senabus, consisting of principal and professors, who regulate internal administration. There are four universities — Edinburgh, Glasgow, Aberdeen, and St. Andrew's, to which last the University College of Dundee is affiliated.

Law and Justice.— The law of Scotland was originally based on Roman law, but there has been a gradual assimilation between the law of Scotland and that of England. This has been specially the case with mercantile law, which is now mainly identical in both countries. The system of real property law, however, is fundamentally different from that of England. In England the fee simple can be split up into estates for life, while fee simple in Scotland cannot be split up; and what is called a life-rent is merely a burden on the fee. Estates in remainder are unknown; the fee is destined to institutes and substitutes, and the word entail means in Scotland only a destination that cannot be broken except under defined conditions. In Scotland, in the law of contracts no consideration is necessary to make a contract actionable. In Scotland, law and equity have never been separated, but have always formed a single system. The law of personal and domestic relations, being largely founded on Roman law, differs in its broad principles from that of England. The tendency, however, has been to assimilate the two in the course of modern legislative changes. Marriage, for example, need not in Scotland be celebrated *in facie ecclesiae,* but can be constituted by mere informal contract of the parties. Marriage can also be more readily dissolved — desertion being sufficient ground of itself. The administration of the civil law is vested in the Court of Sessions subject to appeal to the House of Lords. This tribunal consists of an Inner or Appellate House, which sits in two Divisions, one of which is presided over by the Lord President and the other by the Lord Justice Clerk. There is also an Outer House, consisting of five Judges of First Instance who sit singly under the title of Lords Ordinary. There are also in each county local Courts with restricted jurisdiction, presided over by sheriffs or sheriff-substitutes, which in many respects correspond to the County Courts in England, but have a somewhat wider jurisdiction. The criminal law is administered by the same body of judges sitting on the criminal side and with a somewhat different organization. In his capacity as Head of the High Court of Judiciary, the Lord President is Lord Justice-General of Scotland. There are also Magistrates' Courts, burgh and county, which exercise police jurisdiction. These magistrates are for the most part unpaid laymen.

PETER HUME BROWN,
Professor of Ancient (Scottish) History and Palæography in the University of Edinburgh: Author of 'History of Scotland', 'Scotland before 1700', 'Biography of John Knox,' etc.

15. Great Britain — Irish History. Ireland, lying to the west of Great Britain, forms one kingdom with it, which is known as the United Kingdom of Great Britain and Ireland. This designation was introduced in the year 1800, when the Act of Union which united the Parliament of Ireland with that of Great Britain was passed. So far as political institutions can avail, Ireland is one with the neighboring country. But in spite of the political tie she stands widely divided from Great Britain by most of the characteristics which are distinctive of a nation — historical traditions, racial spirit, social and economic conditions. The distinction is marked even in the physical character of the island. Possessing little mineral wealth — iron ores in Antrim and Leitrim and some coal deposits in Antrim, Leitrim and Kilkenny — Ireland has not within itself the resources of a manufacturing country. The great central plain, stretching across the island from sea to sea, richly covered with vegetation, is adapted to pastoral and agricultural industries only, while the hilly regions to the north and south offer a soil that only tillage can make fruitful. Though water is abundant, water-power is deficient, owing to the generally low level of the country, fully one-half of which does not rise to an elevation of 300 feet above the sea.

Ancient Legends.— From the earliest times to which tradition reaches back Ireland was occupied by off-shoots of that great Celtic race which spread from the Hellespont to the English Channel. Lying within easy reach of the coast of Gaul it was exposed to the incursions of the sea-faring Celts of northern Europe. According to the ancient legends it was successively overrun and conquered by five different invading tribes. The last of these were the Milesians. The legends represent these invaders as migrating from Spain about 700 B.C. and establishing their sovereignty over the whole of Ireland. Modern scholars incline to the view that the story of the Milesian invasion is the record in tradition of an invasion by British Celts which took place most probably about the beginning of the Christian era. The political organization of the Irish Celts was strictly tribal. The land of the country was parcelled out among a number of petty chiefs or heads of tribes, who owed certain duties of tribute and service to the more powerful over-kings; above these again was the Ard-righ or chief king whose authority was acknowledged in proportion to his power to make it effective. The tribal organization remained an enduring source of national weakness; it hindered the growth of an effective national power; it prevented any effective combination of the national forces against foreign invasion.

Christianity Established. — In the second half of the fifth century Ireland was converted to Christianity; its conversion was the work of a few years. That the new faith was accepted readily may be due to the fact that the previous religion of the people — if it can be called a religion — was ill-defined and unsystematized; a definite belief with a definite system of worship would not have been surrendered without a struggle. Saint Patrick, and the other founders of the Irish Church, accommodated themselves to the political organization of the country. Monastic institutions, established on lands granted by the converted chieftains, became the centres of church government, their jurisdiction being coterminous with the territory on which they were founded. They seem to have been regarded as identified with the local civil organization and were freely plundered and destroyed in the raids which, in the absence of a controlling central power, the petty rulers made on one another. This notwithstanding, monasticism exhibited remarkable developments in Ireland. For three centuries after the death of Saint Patrick the Irish monastic schools were the centres of learning in Europe. Scholars flocked to them from Great Britain and the continent; and from these schools went forth the teachers who carried faith and knowledge among the Teutonic conquerors of the Roman Empire. This missionary activity declined with the growth of civilized institutions in the new kingdoms that had been formed out of Rome's possessions. The source of supply was moreover sadly disturbed in Ireland. (See MONARCHISM.) At the beginning of the 9th century the Northmen, at the same time that they began their raids on England, extended their incursions to Ireland. They succeeded in establishing a few important strongholds on the coast and carried fire and sword through a country whose warring rulers met them as enemies or received them as allies according to the needs of their struggles with native rivals. The monasteries were a special object of hate to the Vikings; when their power was at length broken, in the 11th century, Irish monasticism was found to have run its course, and the field lay open to the Latin or Benedictine monasticism which was to succeed it.

Establishment of English Power. — With the 12th century opens that long chapter of Irish history which records the relations of Ireland to England. The history of those relations is the history of Ireland to the present day. In 1169 the first body of Anglo-Norman adventurers crossed the Irish Sea, the precursors of many a subsequent expedition. They came as the allies of a native chief who had been expelled from his territory. They came to stay, and after them came, in long succession, other bodies of adventurers. It was thus the foundations of English power in Ireland were laid. It was a fitful and tedious process, carried out for four centuries without any definite plan, and at no time during that period with forces sufficient to effect a general conquest. On the other hand the native Irish, owing to their tribal organization, and to the absence of an effective central authority among them, were never able to unite for common defense against the invaders. The growth of a national spirit and a national life was rendered impossible. Politically there were two Irelands within the island — one, that portion of the country in which English law prevailed, and the authority of the English Lord Deputy was recognized, and which came to be called the Pale; and, outside this, another, ruled by Irish chieftains, or by Anglo-Norman lords who adopted Irish customs, and who obeyed or resisted the authority of the Crown as suited their interests. Parliamentary institutions were introduced into Ireland soon after their establishment in England. But, as they were for the English settlers only, and were set in motion chiefly to provide subsidies for the English monarch, and as representation was bestowed much as the Lord Deputy chose to distribute it, the occasional summoning of a Parliament did little to promote the evolution of a national government. With the reign of Henry VIII. came the Reformation (q.v.), and, with this, the introduction of a new element of discord into Ireland. Racial and political feuds were now intensified and embittered by religious antagonism. Throughout the desolating wars of Elizabeth's reign, the «Plantations» of James I., and the sanguinary campaign of Cromwell (q.v.) the policy of at once destroying the «Irish Enemie,» and extirpating popery, was consistently pursued. The defeat of the Irish at the Boyne (1689) made the English interest in Ireland definitively safe from armed attack. The English power was now supreme, and it might have been anticipated that the country would enter on a career of economic and political development. But this was not to be for some time yet. Religious hate divided the country as effectually as animosities of race. A penal code was passed against the Catholic religion which demoralized alike those who administered it and those whom it oppressed. Mr. Lecky describes it as «ingeniously contrived to injure, to insult, and to impoverish the people of Ireland.» It is evident there could be no development of political organization in a country four-fifths of whose inhabitants were by law «excluded from Parliament, from the magistracy and from the bar, could not vote at elections, could not act as constables, sheriffs or jurymen, were debarred from every means of educating their children, from acting as schoolmasters, ushers or private tutors, could not marry Protestants, or purchase «manors, tenements, hereditaments or life annuities.» (LECKY.)

English Repression, Subsequent Poverty, and Passage of Land Acts.—A vigorous national spirit is the best cure for the excesses of religious intolerance, and through the 18th century there were causes at work which tended to create and develop this spirit. The English government, under pressure from English agriculturists and manufacturers, had, since the Restoration (1660), hampered by restrictive legislation every Irish industry which seemed likely to compete with England in the home or foreign market. This policy of stifling or starving industry affected Irish Protestants and Catholics alike, and roused in them the sense of common national interests. The ablest spokesmen of the dominant party began to demand free trade for Ireland, a free Parliament, and emancipation for the Catholics. Free trade and a free Parliament were secured, and some of the more galling disabilities of the Catholics were removed. A genuine national life began to animate the country, and its progress during the period of its Parliamentary independence was unexampled. As Lord Clare put it, "No nation on the habitable globe had advanced in cultivation, commerce and manufacture, with the same rapidity as Ireland from 1782 to 1800."

But in 1800 the Act of Union put an end to the Irish Parliament, checked the further growth of that prosperity which had been stimulated by distinctively Irish legislation, and hindered the further development of that spirit of religious tolerance which the sense of common economic needs and interests was generating. Explain it as we may, England and Ireland will not, and apparently cannot, form one economic organism, in which one stream of industrial life will circulate. The long series of repressive Acts directed against Irish industries is proof of this for the centuries that are past. For our own time, the proof is furnished still more cogently. The 19th century was, for Great Britain, a period of unexampled prosperity. Her growth in wealth, in power, in population was continuous. She secured for herself the supremacy among the manufacturing and trading nations of the world, and from that eminence she has not yet been displaced. But while Great Britain was thus rising to unexampled industrial greatness, the remaining portion of "the United Kingdom" was declining in wealth and population with a rapidity which has no modern parallel. Thirty years after the Irish Parliament had been abolished, the industries which had flourished under its care had almost disappeared. The people of Ireland were, in consequence, thrown wholly upon the land. Competition for the one available means of livelihood became excessive, holdings were divided and sub-divided, and rents rose far above the economic level. The population grew, but the means of subsistence did not increase proportionately. The peasantry subsisted mainly on the potato crop; in 1846 this crop failed and famine followed. The repeal of the Corn Laws, and the competition of foreign countries, brought down the prices of agricultural produce. High rents could no longer be paid by small tillage farmers. The only farm industry as yet safe from foreign competition was that of cattle raising — the means of rapid transport from the United States, the Argentine Republic and Australia had not yet been perfected — and to make room for large grazing farms the small cultivators were ruthlessly cleared off the land. With the famine and the clearances began a movement of emigration which has reduced the population by nearly one-half. But in time the grazing ranches of the United States and the Argentine, and the sheep farms of Australia were brought within reach of the English markets, and prices fell so far that the graziers could no longer pay the high rents. An agrarian revolution was the consequence. The Government intervened, first to fix farm rents on the basis of current prices, and, when this was found unsatisfactory, to mediate for the sale of the land to the occupiers with the aid of State credit.

A series of Land Purchase Acts was passed, and the transfer of the land to the tenants is now proceeding on a large scale. The last Purchase Act passed in 1903 provided for an advance to the tenant purchasers of £100,000,000 sterling.

Remedial Legislation Passed by English Parliament.— It must be said that the English Government has done much during the last half century to repair the injustices of the centuries preceding. Let us reckon briefly what has been done. Passing over Catholic Emancipation (1829) and the establishment of the system of primary education known as the "National" system (1831), both of which measures belong to the first half of the century, we have to put to the account of the English Parliament and Government, the Disestablishment of the Irish Church (1869) which gave equality to all religions before the law; the system of intermediate education (1878); the Royal University (1879), defective inasmuch as it does not *give* university education, but merely *tests* it and confers degrees; Local Government (1898), which bestows on elected bodies the administration of local affairs; the series of Land Acts designed to improve the position of the occupier — the Act of 1870, which put a check on arbitrary eviction, and gave the tenant compensation for disturbance; the Act of 1881, which established a tribunal to which the tenant could appeal for the fixing of a fair rent; the Act of 1885, which made the first advance (£5,000,000) to the tenants for the purchase of their holdings; the Act of 1888, which made another advance of £5,000,000; the Act of 1891, which advanced £33,000,000 for the same purpose; the Act of 1896, which amended the preceding acts; and finally, the Wyndham Act of 1903, which facilitated the operations of purchase and increased the loan for buying out the landlords to £100,000,000.

Previous to the passing of this last great measure a Department of Agriculture and Technical Instruction was established (1898) to instruct the people in the improved modern methods of agriculture and to diffuse among them a knowledge of the industrial arts.

Under these acts the operations of purchase have been carried out on a large scale. Up to 1902, under the earlier acts, over 70,000 tenants had purchased their holdings at sums amounting in the aggregate to over £20,000,000. In January, 1906, the sales under the Wyndham Act had amounted to £7,207,548.

Prospects. — In spite of all this remedial legislation it cannot be said that the prospects of Irish industry are improving. The manufactures are confined chiefly to the northeastern corner of the island, where the shipbuilding industry of Belfast, and the linen industry in the city and surrounding country employ a large number of hands. If we except the brewing industry in Dublin we may say that the rest of the country is devoted to farming. The farming is not of the intensive kind; of the

20,350,000 acres which form the area of Ireland close on 13,000,000 acres are devoted to permanent pasture and meadow, and thus, as has been said, "Two-thirds of the country is never touched by plough or spade." Under these conditions a large population cannot be maintained in comfort. Hence the ceaseless flow of emigration, chiefly to the United States and Canada. In 1841 the population was 8,175,124; in 1901 it was 4,458,775, and the drain still continues. Discontent is the natural consequence. The cost of the administration of justice is nearly double what it is in England, where the population is more than six times that of Ireland; and 10 times what it is in Scotland, where the population is about equal to that of Ireland. Of the 103 members sent by Ireland to the Imperial Parliament over 80 are sent there to offer persistent resistance to the English Government of Ireland. On the whole it must be admitted that under this government Ireland has not enjoyed the good fortune which the framers of the Act of Union promised her. Nor has Great Britain derived from the union the advantages which the authors of the measure anticipated. The predictions of Grattan and the other far-seeing opponents of the Act have found melancholy fulfilment, and English statesmen of the present day seem warranted by the experience of a century in reverting to the policy — now finding such favor amongst them — of trusting to self-government as the best means of securing material prosperity for Ireland and political harmony between the sister countries.

The Churches.— The principal religious denominations of Ireland are the Roman Catholic, the Episcopalian Protestant (late Church of Ireland, disestablished in 1869), the Presbyterian and the Methodist. The respective numbers of these communions, according to the census of 1901, are: Catholics, 3,308,000; Episcopalian Protestants, 581,000; Presbyterians, 443,000; Methodists, 62,000. The constitution and government of the Catholic, Presbyterian and Methodist bodies are the same in Ireland as in other countries. There are in Ireland 28 Roman Catholic dioceses, with 4 archbishops and 24 bishops, 1,084 parishes, and a total of 3,157 priests. The Presbyterian Church, mainly confined to Ulster, is governed by a General Assembly, in which are represented 571 congregations with 653 ministers arranged under 33 Presbyteries. The affairs of the Methodist body are managed by a General Conference which meets annually; the number of ministers in Ireland, according to the latest returns, is 254. The constitution of the Protestant Episcopalian Church presents some points of special interest. The constitution of this Church was framed under the Irish Church Act of 1869, by which the "Church of Ireland" was disestablished. The supreme authority is vested in the General Synod. The General Synod consists of two houses: the House of Bishops, which includes all members of the Protestant episcopacy, and the House of Representatives, consisting of 208 clerical and 416 lay members. These representatives are elected by the clerical and lay members of the Diocesan Synods, which, in their turn, are elected by the clergy and laity respectively of the several dioceses. The General Synod is the supreme authority in all matters relating to discipline and doctrine within the Church. The funds of the Church are held by a body of trustees called the Representative Body. The capital sums in the hands of this body amount, according to the most recent returns, to 8½ millions sterling.

Executive.— The supreme executive authority in Ireland is vested in the King's representative, the Lord Lieutenant, who enjoys the title of Lieutenant-general and General-governor of Ireland. He is appointed by the Crown, is a peer, and must be Protestant. Sometimes he has a seat in the Cabinet and takes an active part in the Government of the country; more frequently he is a mere figurehead, the real executive authority being held by the "Chief Secretary to the Lord Lieutenant." The Chief Secretary is usually a Cabinet Minister, and is responsible to the House of Commons for the acts of the Government. The salary of the Lord Lieutenant is £20,000; that of the Chief Secretary, £4,425.

Local Administration.— By the Local Government (Ireland) Act, 1898, administrative functions in reference to highways, public health, and relief of the poor, were assigned to local bodies elected by the rate-payers — Borough Councils for the six largest towns; County Councils for the counties; and under these, Urban Councils for the smaller towns, and Rural District Councils for the country districts.

Judiciary.—At the head of the Irish judicial system is the High Court of Justice, with a Court of Appeal. The High Court includes two divisions — the Chancery and King's Bench Division. The work of these courts is done by a Lord Chancellor and 16 Judges, all appointed by the Crown, with aggregate salaries amounting to £64,000. Cases of less importance are dealt with by the recorders of the cities, three in number, and 18 county court judges, who hold their sessions at various centres through the country. The aggregate salaries of these subordinate judges amount to £31,000. A numerous unpaid magistracy, assisted by "stipendiary" or paid magistrates, deals with minor cases.

Police.— The police force of the country is wholly under Government control. Dublin has a local police force, controlled by Government, consisting of about 1,000 men, and maintained at a cost of £163,000, of which £110,000 is contributed by the Exchequer. The rest of the country is policed by the "Royal Irish Constabulary," a semi-military force of about 10,000 men maintained by Government at a yearly cost of £1,300,000.

16. Great Britain — Wales. Wales derives its name from a Teutonic root meaning foreign, applied to the country by the English invaders of Britain. In Welsh it is called *Cymru* (formerly spelled *Kymry*), a name, in spite of a superficial resemblance, entirely unconnected with the Cimbri or the Cimmerii. The Welsh term for a Welshman is *Cymro* (plur. *Cymry*), a derivative of the old Celtic *Combrox* (plur. *Combroges*), meaning a "fellow countryman." This name is now thought to have been given by the Welsh and the northern remnants of the ancient Britons to themselves in post-Roman times in their joint struggles against the English. Before this they seem to have used for themselves the general term Britons (Lat. *Britanni, Brittŏnes*). For certain purposes, chiefly educational, Monmouthshire is now counted as part of Wales. In Roman times the chief tribes in Wales were the Ordovices in the north and centre, the Silures in the southeast, and the Demetæ in southwest Wales. In the post-Roman period, and until the assimilation of the Welsh territorial system to that of England, the chief divisions were Gwynedd (in the northwest), Powys (in the centre and northeast), Gwent (in the southeast) and Dyfed (in the southwest), together with the contiguous parts of South Wales. This latter division in its totality was often called Deheubarth (*i. e.* the south part). These divisions practically survive in the dioceses of Bangor, Saint Asaph, Llandaff, and Saint David's respectively. The country was anciently divided into cantrefydd (hundreds), and each cantref was usually divided into two cymydau (commotes). Some of these cantrefydd (pl. of can[t] *(hundred)*, and tref *(homestead)*, such as Rhufoniog (Romaniacus), in Denbighshire, Dunoding, the land of Dunod (from Donatus), in Carnarvonshire and West Merioneth, bear Latin names, and must have clearly obtained these names during or after the Roman occupation. The division into county and borough divisions is due to the assimilation of the Welsh territorial system to that of England. The title "Prince of Wales," derived from the ancient principality of Wales, is now conferred by the reigning sovereign on the heir-apparent. In recent times, the connection of this title with Wales has been emphasized by the acceptance of the office of Chancellor of the University of Wales by His Majesty King Edward VII., then Prince of Wales, and afterward by the present heir to the throne. Wales has also recently received recognition of her national emblem of the Red Dragon as part of the armorial bearings of the Prince of Wales.

The Welsh people, though comprising subvarieties, form a distinct type among the peoples of the United Kingdom. The causes of this are largely physical and economic, acting from the remotest times, and on this basis the Welsh have developed a political, social and mental history of their own. The individuality of Wales is the more remarkable owing to her proximity to England and her exposure to English influences. The country stands, however, in the most obvious contrast to the central plain of England on which it borders, and its individuality has, to a great extent, a geographical basis. Wales consists almost entirely of a mass of mountains and uplands, intersected by various streams and rivers, the largest of which, the Dee, the Severn and the Wye, are on the east. In the lower valleys and the more level districts of the country, there are tracts of good land, but the upper valleys in the mountainous districts are subject to very heavy rainfalls, and are of little value for agriculture. There are also many large upland tracts, which can only be used for sheep-grazing. The population of rural Wales varies in density, but, owing to the smallness of the farms, it is often larger in proportion than in some of the agricultural districts of England. In the last century the distribution of the population of Wales underwent a great change by the discovery (especially in the south Wales coal-field) of great mineral wealth; and the consequent attraction of large masses of people into the industrial districts. These economic developments, too, have had a great effect on the social evolution of modern Wales.

Social Evolution and History.—The available evidence as to the prevalent type of the Welsh people shows that they are on the whole less fair, tall and bulky than the farmers of the English plains. They are, as a rule, more wiry and hardy than muscular, and a certain predominance of the nervous over the muscular system gives them, in certain districts especially, an air of keenness, sensitiveness and vivacity. The freshness of the air and the beauty and variety of the scenery also contribute to this end, as well as to an appreciation of linguistic aptness and poetic imagery. The excellent voices of Welshmen, too, are mainly due to the purity of the air. Brachy-cephalic types are rare, but mesocephalism prevails. Though the extreme blonde type is uncommon, there is a fair proportion of light or reddish hair, and, in south Wales especially, a considerable admixture of pale-faced, black-haired and markedly dolicho-cephalic men, who look as if their type had been evolved in the shelter of the ancient forests of the country. Generally speaking, it may be stated that the prevalent types are the natural counterparts of the conditions of life of the Welsh farmer and his dependents, with its hard toil, careful calculation and plain fare. Out of doors there is abundance of fresh air, but indoor ventilation is often sadly neglected, and in some districts phthisis is common.

The necessary interdependence of the members of the scattered communities of rural Wales has produced a certain sociability, fluency and aptitude for coöperation in public affairs, though in religious matters there is considerable cleavage. The chief religious denominations are the Calvinistic Methodists, the Independents and the Baptists. In purely Welsh districts crime is very rare. The conditions of Welsh agriculture from the remotest times, under necessities of soil and climate which often frustrated man's best hopes, have created a deep-rooted sense of man's dependence on powers that are beyond his control, and beneath the markedly religious spirit of the Welsh people there lies this fundamental instinct, the traditional intensity of which at times finds vivid expression. To this feeling are also linked a sense of the pathos of life, which has found utterance in Welsh poetry, a deep attachment to the soil, a minimizing of the importance of human distinctions in the face of the powers of Nature, and a passion for a kind of natural justice, which has expressed itself in modern times mainly in a demand for religious equality and the disestablishment and disendowment of the State Church, and in the desire to correct by means of education the disabilities of birth and station.

The social evolution of the country has been largely conditioned by its geography. This is such that the economic value of land varies greatly. Until recent times, the stress of competition was almost entirely for the surface products of the soil. The discovery of mineral wealth, however, has now given the economic, social and political evolution new directions. In the hunting, pastoral, fishing and agricultural life of man in the Stone, Bronze and Iron Ages, right down to modern times, whether Wales was invaded by Iberian, Goidel, Brython, Belgian, Roman, Saxon or Norman, the motive of the struggle was essentially the same, namely, the possession of the good lands of the country, such as the river valleys and the flatter districts afforded. In Wales, the records of the ancient system of land tenure suggest that the weaker and stronger communities came to be interspersed, the better type of holdings being held by freemen in family groups, while the unfree villagers farmed their land mainly by a system of co-tillage. The basis of social life was mainly tribal, and the necessary social adjustments produced a correlative body of custom and law.

The successive invasions of the country have left numerous archæological traces, as for example, the fortresses of unmortared stone of which Trerceiri in Carnarvonshire is an excellent instance. This fortress is now assigned by archæologists to about 100–50 B.C. The Romans developed the road communication; and worked some of the lead mines of the country. After the departure of the Romans, the western coasts were harassed by invaders from Ireland, and Britons from the north appear to have been invited to assist in their expulsion. Some of these families, notably that of Cunedda Woledig, remained in Wales and became the founders of Welsh local dynasties. The struggles against the English and the Normans brought war into the foreground of Welsh life. The conquest of Wales by Edward I. led to the establishment of a network of castles and garrison towns, governed by English law and custom, while the country districts remained Welsh. This led to constant friction, and the revolt of Owen Glyndwr (Glendower) was essentially a struggle of the country against the towns. The reign of Henry VII. (a descendant of an Anglesea Welshman, Owen Tudor) was hailed with great enthusiasm in Wales, but it was this prince and his son Henry VIII. who finally assimilated the Welsh legal system to that of England. Wales maintained its attachments to the Crown even through the Civil War, and until the second half of the 19th century was mainly conservative in politics.

The discovery of coal, slate, lead and other minerals, as well as the industrial and commercial revolution generally, has given the life of Wales a new aspect. In Glamorganshire, Monmouthshire, East Carmarthenshire, East Denbighshire and the slate districts of Carnarvonshire there are thriving and progressive industrial communities, with corresponding facilities for communication by land and sea. The rapid development in question is well exemplified in the case of Cardiff, (q.v.) which has grown in a few decades from being a moderate sized market town into one of the leading coal-ports of Britain. New docks, too, for Irish and Atlantic traffic have been built by the Great Western Railway at Goodwick in Pembrokeshire. There is in Wales a considerable sea-faring population and in Montgomeryshire, Carmarthenshire and Merionethshire there are some woollen factories. The industrial districts of Wales and the large towns of England, as well as the United States and the colonies, have absorbed the superfluous population of the Welsh country districts, until depopulation has in several places been the result. The price of agricultural labor has gone up, and, owing to the greater possibility of finding employment elsewhere, there is a more independent attitude toward the governing classes in religion and politics. Local government has more and more fallen into the hands of Liberals and Nonconformists, and there are now no Welsh Conservatives in the House of Commons, but the landowners are mostly Conservatives. See Great Britain: Local Government.

Side by side with this development, there has grown up a desire for a measure of national self-government, especially in the sphere of education; and the first instalment of this was given in 1897 by the establishment of the Central Welsh Board for Intermediate Education, for the purpose of controlling the secondary schools founded under the Welsh Intermediate Education Act of 1889. These schools have made very rapid progress, and now contain over 10,000 children. The establishment of the University of Wales, federating the University College of Aberystwyth (founded in 1872), Bangor (1884), and Cardiff (1883) is a phase of the same movement. Royal charters, too, have been granted for the foundation of a Welsh national museum at Cardiff and a Welsh national library at Aberystwyth. Several private collections of Welsh MSS. have been already bought for the latter. The great difficulty, however, in the way of complete national development and unification is the absence of a metropolis within easy reach of all parts. The most convenient meeting-place for the whole of Wales is Shrewsbury (the ancient Pengwern), which lies outside the Welsh border.

In addition to the foregoing factors of modern Welsh development, it should be stated that in the summer months there is a very great influx into Wales of visitors from England and elsewhere, in search of health and pleasure, and that for their accommodation whole towns have grown up along the coast. This link with England has helped to bring Wales into closer and closer touch with the outer world, while still living its own life and maintaining its individuality. Of the fine arts music and poetry are the only ones that have received extensive cultivation.

Language.— The Welsh language (called in Welsh *Yr iaith Gymraeg*) is an Indo-European tongue belonging, together with Breton and Cornish, to the Brythonic branch of the Celtic family. The first form of Celtic speech introduced into Wales in the Bronze period was probably Goidelic (to which Irish belongs), and Prof. Rhys thinks, from the evidence of the Goidelic Ogam inscriptions, that Goidelic lingered in Wales into the 7th century A.D. Welsh has undergone far more changes due to analogy and the like than Irish, and its grammar, which is now in the analytic stage, has been greatly simplified. About 800 Welsh words were borrowed from Latin during the Roman occupation of Britain. There are several dialects and subdialects of spoken Welsh, but the literary language has a historical tradition of its own. The spelling is almost entirely phonetic. Some of the river-names of Wales may be pre-Celtic. The Welsh language has a vigorous life, though English is now almost universally known. See CELTIC LANGUAGES.

Literature.—Wales has produced a very considerable body of literature, and the literary instinct is very widely disseminated among the people. The poetry contains many gems, especially as the poetic expression of the common lot and destiny of man. The oldest extant poem belongs to the 9th century A.D., but its form and diction show that there was already behind it a literary tradition. The earliest manuscript collections of Welsh poetry are the 'Black Book of Carmarthen' (12th century), the 'Book of Aneirin' (early 13th century); and the 'Book of Taliessin' (14th century). Several of the poems therein contained are shown by internal evidence to be pre-Norman. The literature of Wales is best viewed as a social product, secular and ecclesiastical. The mediæval prose writings are developments from the oral narratives told at the courts of the Welsh princes, annalistic expansions, translations from Latin and French, lives of the saints, Arthurian legends (q.v.) and other literature popular in the Middle Ages, such as the prophecies of the Sibyl and Merlin and the Helen and Charlemagne narratives. The mediæval poetry consists mainly of elegies, eulogies and hymns.

The chief literary centres at this time were the courts of the princes and the monasteries. After the decline of Welsh independence, Welsh poets still had many social patrons, and many poems were dedicated to them. The poetry of love and nature, too, which succeeded the older poetry of war, found expression in the beautiful verse of *Dafydd ab Gwilym* and his imitators. Another phase of poetry which flourished, especially in the 15th and 16th centuries, was that of minute description and epigrammatic conciseness. The metres tended to be intricate and difficult. The Reformation and the revival of learning led to the translation of the Bible, the composition of Welsh grammars (two of which are in Latin), the study of Welsh history and the composition of metrical versions of the Psalms. In the 18th century Welsh poetry and literature generally expanded into new types, and the result was the institution of the National Eisteddfod and of various societies for the encouragement of Welsh literature. The Eisteddfod has also given a great stimulus to the music of Wales.

During the 19th century Welsh literature and Welsh studies of every kind have been greatly advanced, and, in addition to the Welsh books published, there is a flourishing newspaper and periodical press. The national quarterly journals ('Y Geninen,' the *Leek*, and 'Y Traethodydd,' the *Essayist*) often contain articles by Welsh scholars that are of high literary merit. The bent of the national mind at the present day is toward theology, philosophy, history, criticism and politics. The educational institutions of Wales are creating a public which demands critical thought and modern methods, but whose instinctive attachment to the main lines of Welsh life has preserved a love for those forms of literary expression in the Welsh tongue which are the inherited and natural correlatives of that life. Welsh literature tends to survive to-day, owing to the unwillingness of Welshmen to give up the language and forms of expression that are the psychical correlatives of the typical life of the land of which they themselves are the products. The prevalence of the Welsh language as the tongue of religion even in English towns, has its root also in the same instinctive feeling for the tradition of the life of the race. See CELTIC LANGUAGES.

THE CONTROL AND MOVEMENT OF WEALTH.

17. Great Britain — National Finance. *National Debt.*— The National Debt of the United Kingdom, in the sense in which the term is understood in several official returns, amounted on 31 March 1906 to £743,000,000, but in addition to this there were various amounts outstanding which had been borrowed for military, naval, and other works and brought the "Aggregate Gross Liabilities" up to £789,000,000. Further, a sum of £71,000,000 had been borrowed and lent to local authorities, and another sum of £25,000,000 had been borrowed for the purpose of establishing occupying land-ownership in Ireland by the expropriation of the former landlords. The total £885,000,000 nominally consisted of £585,000,000 of consolidated 2½ per cent stock ("consols") redeemable at par at the option of the State only after April 1923, £49,000,000 of nearly similar stocks and permanent debt to the Banks of England and Ireland, £30,000,000 of 2¾ per cent war stock and bonds which the State is bound to redeem at par in 1910, £43,000,000 of treasury bills and exchequer bonds repayable at various dates, £82,000,000 of the capital value of terminable annuities, £71,000,000 of local loans 3 per cent stock redeemable at the option of the State only after 1912, and £25,000,000 of 2¾ per cent Irish land stock, half of which is similarly redeemable after 1921 and the other half after 1933. But most of the terminable annuities, nearly 80,000,000 of the consols, and about 50,000,000 of the other securities are not in the hands of the public, but are held by the State itself against its liability to the savings bank depositors, so that it would give a truer account of the real position to say that the total debt consisted of about £685,000,000 in the securities just enumerated, and about £200,000,000 in money payable on demand or at very short notice to savings bank depositors.

The main body of the debt is chiefly due to the wars in which the country was engaged between 1688 and 1815. During that period the debt grew from nothing (except a trifling sum which Charles II. had borrowed from the goldsmiths) to nearly £900,000,000. It then underwent steady diminution till in 1899 it had fallen to £628,000,000. The South African war brought it up again to £771,000,000 in 1903, since which year it has once more been diminishing. The £46,000,000 of works debt has all been incurred since 1890, and most of it since 1900, when it only amounted to £10,000,000. The amount lent to local authorities was only £8,000,000 in 1840, and £26,000,000 in 1887. The Irish land debt took its rise in 1891, but most of it is much more recent.

The interest and sinking fund of the Irish land debt is naturally provided for chiefly by the payments made by the new Irish landowners, who are paying for their land by instalments, but a portion falls on funds which would otherwise benefit Irish local taxpayers and another portion is defrayed by the taxpayers of the United Kingdom. The local loans debt is adequately provided for by the interest and repayments received from the local authorities. The works debt is made a charge upon the annual parliamentary votes for the departments concerned, in such a way that each loan will be extinguished in 30 years at most. For the main body of the debt the practice has been since 1876 to devote by legislation a certain annual sum, called the "permanent" or "fixed" annual charge, to interest and repayment taken together. As the sum thus devoted considerably exceeds the interest, this plan, if carried out without modification and without interruption owing to fresh borrowing, would practically convert the whole debt into a terminable annuity, and extinguish it in a very moderate length of time. But as a matter of fact the "fixed charge" was reduced from £28,000,000 to £26,000,000 in 1888 and by two steps to £23,000,000 in 1900, and it was only the fresh borrowings of the South African war which led to its restoration to £28,000,000 in 1905. The difference between the "fixed charge" and the interest is sometimes called the "New Sinking Fund." The "Old Sinking Fund" is any actual surplus realized in the year. The general law is that this also must be devoted to repayment of debt, but when any considerable surplus happens to be realized, special legislation usually interferes with the operation of the rule.

Expenditure.— The total expenditure on revenue account for the financial year 1905–6 is stated at £140,500,000, to which may be added £10,000,000, the yield of certain general taxes which is paid over to local authorities without being technically received into the Exchequer. The total may be classified conveniently as follows: Fixed annual charge for the main body of the debt, £28,000,000; army, £29,000,000; navy, £33,000,000; education, £16,000,000; miscellaneous, including the cost of collection of taxes, the administration of justice and the civil services not included under heads already enumerated, £17,000,000; post office, including telegraphs, £16,000,000; and amount handed over to local authorities, £11,000,000. The amount credited to education is chiefly made over to local school authorities, but only on conditions which give the central government a very large measure of control, not only over the expenditure of the money so granted, but also over what is raised from local sources. The £11,000,000 granted to local authorities, commonly called the "Exchequer Subsidies" or "grants in aid of rates," consist of sums which are either fixed or vary with the yield of certain taxes, and are not now directly connected with central control, with the exception that an amount equal to half the cost of the pay and clothing of a police force may be deducted from the grants due to an authority if it fails to maintain its police force to the satisfaction of inspectors employed by the central government. The method of distribution between the various authorities is extremely complicated, and differs in England, Scotland, and Ireland. Scarcely anyone professes to understand it, and it is based on no sort of principle except that it is largely dependent on certain proportions which prevailed in 1888. This plan was adopted as a temporary expedient, and has been continued not on account of its merits, but because it existed.

Revenue.— The total revenue, including the £10,000,000 of allocated taxes already mentioned, amounted to £154,000,000. The great heads were: Customs, £34,500,000; excise (internal duties on commodities), £35,600,000; estate duties (inheritance taxes), £17,300,000; income tax, £31,300,000; stamps, £8,200,000; house duty, £1,000,000; post office and telegraphs, £21,000,000; and miscellaneous revenue, £3,800,000. The customs included only one export duty, that imposed upon coal, producing £2,300,000, and this was abolished in 1906. The imports of tobacco brought in £13,400,000, tea, £6,800,000; sugar, £6,200,000; spirits, wine, and beer, £5,100,000. The excise drew in one way and another nearly £33,000,000 from taxes on the manufacture or sale of beer and spirits, so that nearly £38,000,000, or 30 per cent of the whole tax-revenue, was derived from intoxicating liquors. The inheritance taxes, christened by Gladstone and now commonly called the "Death Duties," consist of two distinct parts, one of which is graduated from one to eight per cent according to the aggregate value of the whole property left by the deceased; so that if a man dies worth £400, one per cent has to be paid, and if he dies worth over £1,000,000, eight per cent. The other part is graduated according to the relationship of the new owners of the property to the deceased, so that for example, while property bequeathed to descendants or ascendants is exempt, property falling to brothers or nephews is charged three per cent, and property falling to persons without any relationship to the deceased is charged 10 per cent. Thus, taking the two parts together, if a man leaving £400 bequeaths it all to his children, one per cent only will be paid, while on a millionaire's estate left to persons not related to him, the duties will together amount to 18 per cent. The Income Tax was levied at the rate of 1s. in the £ (*i. e.* five per cent), but incomes under £160 are exempt, and "abatements" are allowed on incomes between £160 and £700, which, when the rate is 1s., amount to £8 to persons having between £160 and £400, £7 10s. when the income is between £400 and £500, £6 when between £500 and £600, and £3 10s. when between £600 and £700. Much the greater portion of this tax is "collected at the source," or at any rate before the income actually reaches the ultimate recipient. For example, the tax on the income arising from lands and buildings is collected from the occupier, who then, if he is not the owner, has an inalienable right to deduct the tax when paying his rent; so too the tax on the income from stocks, shares, and bonds of corporations is collected from the corporation. But this practice does not defeat the right of the individual landowner or stockholder to exemption or abatement if his total income from all sources is under the prescribed limits; he makes up accounts with the collectors, declaring his whole income and showing how much has been deducted from its various parts, and if it then appears that too much has been paid, the excess is repaid to him in cash. So far as the portion collected at the source is concerned, the tax works with great efficiency. The amount of evasion which takes place in regard to the other part, for which personal declarations of the amount of income are required, is very variously estimated, but there is little doubt that it is in process of diminution owing to the greater publicity of modern methods of business and to the checks supplied by the death-duties, which are administered by the same department. Stamps consist mainly of duties on commercial and speculative transactions. The House duty is levied at the rate of 9d. in the £ (3¾ per cent) of the rental value, but there are lower rates for houses of between £20 and £60 rental value, and houses under £20 in Great Britain and all houses in Ireland are exempt. The Post and Telegraph receipts include a heavy tax of 10 per cent on the gross takings of the National Telephone Company, as well as the receipts of the Post Office from its own telephone trunk wires and its telephone service in London and a few other places where it competes with the National Company. The whole of the Post Office profit comes from the mails, the telegraph business being a losing one. In miscellaneous revenue the most important item is about a £1,000,000 from the Suez Canal Company's shares, which, it is well to remember, are a wasting property, the canal having been constructed on a 99-year concession.

Local Finance.— To give an absolutely accurate account of the finances of local authorities in the United Kingdom is impossible owing to the complicated relationship of the various local authorities to each other and to the central government, and also because the three kingdoms, England, Scotland, and Ireland, have entirely different systems and methods of account-keeping. The aggregate debt in 1904, including of course the £71,000,000 of debt to the central government mentioned above, is stated (after deducting accumulated sinking funds) at about £450,000,000, but about £40,000,000 of this consists of the debt of harbor and dock trustees which is secured only on the harbors and docks, and in no way upon the taxes of any locality, and therefore ought not to be reckoned as local debt. The remainder represents capital invested in (taking the larger of the various items approximately in order of magnitude) waterworks, street and road improvements, schools, drainage, gasworks, tramways, electric works, workhouses, asylums, and the innumerable other works and buildings required by modern civilized and especially urban communities. The aggregate annual repayments of debt and payments to sinking funds amount to a little over two per cent on the total, but the annual additions considerably exceed this amount, so that the debt increased nearly £200,000,000 in the 10 years before 1904. Since then there has been an exceptional increase owing to the conversion of the capital of the London water companies into debt of a board representing the various local authorities within the area of supply; this adds about £40,000,000 without much altering the liabilities of the inhabitants or owners of the area concerned. About half the total capital has been raised for purposes which are often provided for by private enterprise, such as waterworks, gasworks, docks, electric works, tramways, and cemeteries, and the other half for purposes which are seldom so provided for in modern communities.

The expenditure from revenue of the authorities, including repayment of debt, amounted in the year 1902–3 to about £111,000,000. About £15,000,000 of this was met by the allocated taxes and other national grants, chiefly for education, spoken of above, about £58,000,000 by "rates," and the rest by the special charges levied for commodities and services supplied, and all kinds of miscellaneous revenue. The accounts of subsequent years will show very large increases in the national grants for education received by the local authorities, not only because the grants for education have actually increased, but also, and in much larger measure, because under the Education Act of 1902, the local authorities now receive the grants for the "voluntary" schools handed over to them by the act. The amount raised by special charges for commodities supplied will also be very largely increased in consequence of the fact that Londoners' payments for water are now received by a local authority, instead of by a number of companies.

The "rates" are taxes levied by the local authorities at a rate of so many shillings or pence in the pound of the annual value of land and all things attached to the land in the concrete form of buildings or works of any kind. The idea of the Elizabethan rate for the relief of the poor undoubtedly was to assess inhabitants according to their ability, and down to 1840 attempts were frequently made to extend the system which long prevailed in some parts of the country of assessing stock in trade and other visible personal property. But experience showed that such taxation was utterly unsuitable for small localities, and when the law courts at last began to favor these attempts, legislation intervened. The tax is usually levied from the owner in the important case of small house property in England, but in almost all other cases from the occupier of the property. The occupier has no right of deducting rates paid from his rent unless he has so contracted with his landlord, and a contract of this kind is scarcely ever made. There is at present, under the Agricultural Rates Act, a rebate of 50 per cent in favor of agricultural land, and there are some other differentiations in the cities. The "rates" are elastic, certain, cheaply collected, and singularly free from disturbing effects upon production. The fact that they are unpopular is sufficiently accounted for by their enormous yield and their obvious character.

Financial Control.— The finance of the central government, according to the present theory of the British Constitution, is vested in the House of Commons. All financial legislation must originate there, and the Commons will not permit any alteration of their measures by the Lords. But in the House of Commons itself the power of initiation in matters of finance is now entirely in the hands of the Ministry. Estimates of expenses and receipts made up in the government departments are considered or amended by the Ministry in private. The result is then laid before the House of Commons by the Chancellor of the Exchequer in his "Budget Speech." A ministry will rarely submit to modify its proposals in any important respect, so that the House has to choose between acceptance of the budget and a change of government. No ordinary member of the House can directly propose an increase in taxes or expenses, the theory being that it is the King who asks his faithful subjects for money, but anyone may propose reductions. The estimates are put before the House in immense detail, but this very detail defeats its own end, as there is not and cannot be, time to consider the whole to any good purpose. The estimates are consequently passed without material alteration. This absence of real control by the House of

Commons is probably favorable rather than unfavorable to economy. The necessity of finding new taxes or increasing old ones is much more immediately before the eyes of the Ministry than of the House of Commons, and the Ministry has also more reason to fear popular resentment against any increase of taxation. It is, moreover, in immediate and constant association with permanent Treasury officers whose influence is generally cast against temporary expedients for staving off the day of reckoning.

In the councils which conduct the local government of the country there is nothing like the Ministry in Parliament, and the system of control consequently has a nearer resemblance, as has sometimes been observed, to that prevailing in the United States Congress. The committees charged with the various departments of the council's work, with the assistance of their executive officers, each prepare their own estimate of expenses for the coming year. These are then all added up and put before the Finance Committee, which usually hands them on with little or no alteration to the Council, merely adding its own estimate of receipts other than rates and a recommendation to the Council to make a rate of as many pence in the pound as is calculated to make up the balance required. The Council discusses the estimate of receipts and expenses thus put before it, and any member may move alterations in any item. Such motions are frequently made and sometimes, especially, of course, in the smaller councils, carried.

The local authorities have no power to contract debt without special authority. For most purposes this now means that sanction must be obtained either from Parliament by special act or from the department of the central government, called the Local Government Board. Loans must always be accompanied by provisions for repayment within the time for which Parliament or the Local Government Board's inspectors calculate the work on which the money is to be spent will last. That the prescribed sum is being set aside every year for repayment is ascertained by the Local Government Board in each case. Some authorities are forbidden by statute to borrow more than an amount bearing a certain proportion to the annual rateable value of their area, but these enactments are rendered practically inoperative by other legislation, and have no influence whatever.

Out of annual revenue the authorities may generally spend as much as they please, the unpopularity of rates being regarded as a sufficient safeguard against extravagance. In regard to one expenditure only, that for poor relief, the central government attempts to prevent too much being spent, at any rate in one or two directions, such as relief to persons not required to enter the workhouse and relief to the able-bodied. In other matters the influence of the central government, when exercised, is almost always in favor of increased expenditure. The threat of "withdrawal of the grant" in respect of a particular school is used every day by inspectors of the central Board of Education in order to compel a local authority to spend more. The central government appoints officers to audit the accounts of the greater number of local authorities, but the auditors of the municipal boroughs (which include all the great cities) in England are elected, under the Municipal Corporations Act of 1832, by the ratepayers. This election is almost always a farce, and the more important city councils have had to provide a proper audit in addition to the one thus provided by law.

Bibliography.— Information as to the actual position of British finance can only be obtained by piecing the facts together from a large number of parliamentary publications, usually known as "Blue-books." Among the most important of these are the annual returns entitled 'National Debt,' which shows the different kinds of debt existing at the end of each year from 1835 to 1906; 'Government Departments Securities,' which gives the amount of the State's securities held by the State itself; the Finance Accounts of the United Kingdom; the 'Postmaster-General's Report,' the 'Annual Local Taxation Returns for England and Wales,' and the same for Scotland and for Ireland. Besides the above, for historical purposes the following parliamentary papers may be found useful: 'History of the earlier years of the National Debt from 1694 to 1786' (C. 9010), and 'Proceedings of the Commissioners for the Reduction of the National Debt from 1786 to 1890' (C. 6539); Local Authorities Liabilities (No. 306 of 1905); 'Reports of and Evidence taken by the Royal Commission of 1897 on Local Taxation.' Among general works on finance dealing preëminently with British conditions C. F. Bastable's 'Public Finance' (3d ed. 1903), is the most complete and up-to-date and gives plentiful references to earlier works. For the history of taxation, consult Stephen Dowell, 'History of Taxation and Taxes in England' (2d ed. 1888), and Cannan, 'History of Local Rates in England' (1896).

Edwin Cannan,
Appointed Teacher of Economic Theory in the University of London; Author of 'History of Local Rates in England,' etc.

18. **Great Britain — Banking.** Banking in Great Britain as now carried on is the product of a continuous process of evolution; it owes very little to external influences, and can only be properly understood in the light of the study of its earlier developments. Its strength is the strength derived from long tradition founded upon experience, and its weakness is the weakness inherent in a system which has developed with the smallest possible amount of legislative control. This weakness is shown in a lack of logical coherence and in an occasional absence of proper definition.

There are few evidences of banking in the modern sense of the term in England before the 17th century. In the middle ages the bankers were mainly money changers and money lenders; they dealt in coin, not in credit. The Italian colony of the Lombards, however, who gave their name to Lombard street, seem to have been well acquainted with the use of bills of exchange, and the banking business of the country was chiefly in their hands after the expulsion of the Jews at the end of the 13th century. During the 16th century, however, the power of the colonies of foreign merchants in London rapidly declined, ending in the breaking up of the German colony in the Steelyard by Queen Elizabeth. In the 17th century it became customary for the wealthier classes to intrust their spare cash to the keeping of the London goldsmiths, a body of men whose occupation inspired the necessary confidence. The transition from goldsmith to banker was a natural and easy one, and the goldsmiths' "cash notes" gradually acquired a degree of negotiability. Some of the existing London private bankers find their origin in the goldsmiths of the latter half of the 17th century. Outside London the early type of country bankers was evolved from the class of substantial merchants. Thomas Smith of Nottingham, for instance, who is the earliest country banker of whom we have any record, and who certainly carried on business as early as 1688, originally combined the business of a mercer with that of a banker.

Owing to the unsatisfactory condition of the public finances under the Stuarts, there was no opening for a public bank such as existed in Amsterdam and other European centres of industry. But the Revolution of 1688 saw the control of the national expenditure pass from the Crown to Parliament. The national credit became, for the first time, an important factor in our economic development, and showed itself in the growth of a national debt. The use of credit spread rapidly and this led to the development of modern banking. To the efforts of William Paterson was due the establishment in 1694 of the Bank of England, founded under the wing of the Chancellor of the Exchequer, Charles Montague, with the object of lending the whole of its capital, £1,200,000, to the State.

The Bank of England.— The Bank of England is the pivot round which centres the whole of modern banking in the United Kingdom. In no other country, whether in Europe or America, does a bank occupy quite an analogous position. It is not a State bank in the strict sense of the term: its capital is held privately, and its management is not in any way directly or indirectly controlled by the State. On the other hand, during its whole history, it has been more or less under the protection of the State; its operations have been on occasion dictated by the State; its development has been marked by successive loans of its capital to the State in return for the confirmation or extension of its privileges, and it still continues to exercise powers and owe responsibilities delegated by the State.

The Bank of England is controlled by a governor, deputy-governor, and a court of 24 directors who are elected by the proprietors on the nomination of the directors. The selection is generally made from the members of leading mercantile firms, and the tradition is not to elect a member of a banking firm or a director of another joint-stock bank. The operations of the Bank are now regulated by the Bank Charter Act of 1844. This act divides the Bank of England into two departments, the Issue Department and the Banking Department. The former, as will be seen in a later section, is so strictly regulated by the act that its action is automatic. The latter is for all practical purposes as free from legal restrictions as any other joint-stock bank. Yet free as it is from special legal obligations, it has, by its action in the past as well as by its present position, assumed peculiar responsibilities, which, though ill defined, are well understood, and which the Bank does not attempt to disown. These responsibilities are due especially to the Bank's position as the Government banker, the bankers' banker, and the keeper of the country's reserves. The Government accounts are kept by the Bank of England, the national debt is managed, exchequer bonds and treasury bills are issued and paid, and many other incidental services of the kind are rendered by the Bank. With regard to the other banks, all the settlements at the London Bankers' Clearing House are made by transfers at the Bank of England, where each clearing bank is bound to keep an account. Those banks which do not possess a seat in the Clearing House find it necessary to appoint one of the clearing bankers as agent and to keep an account with that agent. Practically every banker in England can, therefore, draw either directly or indirectly upon the Bank of England, and the reserve of the latter has thus to be regarded both as the banking reserve of the country, and also as the gold reserve, that is to say, the reserve to insure the convertibility of the note issue.

Appended is a copy of a weekly return of the Bank of England.

BANK OF ENGLAND.

An Account, pursuant to the Act 7th and 8th Victoria, cap. 32, for the Week ending on Wednesday, the 13th day of June, 1906.

Issue Department.

Notes issued	£51,803,190
	£51,803,190
Government debt	£11,015,100
Other securities	7,434,900
Gold coin and bullion	33,353,190
Silver bullion	....
	£51,803,190

Banking Department.

Proprietors' capital	£14,553,000
Rest	3,251,045
Public deposits (including exchequer, savings banks, commissioners of national debt, and dividend accounts)	9,050,109
Other deposits	42,741,064
Seven-day and other bills	91,544
	£69,686,762
Government securities	£15,977,133
Other securities	29,125,443
Notes	23,169,450
Gold and silver coin	1,414,736
	£69,686,762

Dated the 14th day of June, 1906.

J. G. Nairne, *Chief Cashier.*

The Private Bankers.— During the 18th century, all the banks in England, with the exception of the Bank of England, were private partnerships, the number of partners being limited by an act passed in 1708 to six. Now, however, private banks are very few in number, and their influence is a diminishing one, though at one time that influence throughout the country was great, both socially and politically. The London private bankers ceased to issue notes toward the end of the 18th century, but the country private bankers attached great importance to their note issues up to the time when the Bank Charter Act of 1844 made further extension in this direction impossible. Many of these firms were under-capitalized; the banker was often a tradesman as well, and was too much at the mercy of fluctuations in trade. Consequently in time of monetary stress failures were frequent, especially during the early half of the 19th century. Except that their note issue is limited by the Act of 1844, the law imposes no restrictions upon private bankers, and they are not even compelled to issue balance sheets, though in most cases this has been voluntarily done of recent years. In spite of this absence of control, the existing private banks inspire a confidence which seldom proves misplaced. Most of them have been established for many years, for it has proved increasingly difficult for a new private bank to obtain a footing in the country. All banks possessing more than 10 partners must now register as a company under the Companies Acts.

The Joint-Stock Banks.— Owing to a clause in the Bank Charter Act of 1708, joint-stock banking was not possible during the 18th century, but in 1826 the Bank of England monopoly was so far curtailed as to allow joint-stock banks to be established, with the right of issuing notes, provided they had no office in London or within a radius of 65 miles. By an act passed in 1833, joint-stock banks were permitted within this radius, provided they did not issue notes, and under this act several of the leading joint-stock banks of to-day were founded. The legal disability to issue notes continues until the present day, and has had a marked effect on banking in England. The energies of the joint-stock banks have naturally been centred upon the development of deposit banking, with the result that the habit of keeping a banking account has spread more rapidly and more generally than in most countries, and the use of notes has correspondingly decreased. Practically all the existing joint-stock banks have registered under the Companies Acts with limited liability, and in most cases with a reserve of uncalled capital which cannot be utilized except in case of liquidation. During the last 20 years or so a decided tendency has shown itself, on the one hand, for the amalgamation of the private banks and the smaller joint-stock banks with the more powerful of the latter class, and on the other hand for the spread of branch banking. This has resulted in an increased centralization of the banking system in London, and to a lesser extent, in a few of the leading provincial towns, and in the evolution of a system which is in distinct contrast to that existing in the United States of America. The natural consequence is that the magnitude and importance of the individual bank has very greatly increased. Yet, large as the liabilities of the leading banks to the public are, their capital, both nominal and paid up, and their reserve funds, are sufficiently ample to remove any feeling of distrust which might otherwise be inspired by the volume of their obligations, as will be seen from the accompanying figures taken from the balance sheets of a few of the most important joint-stock banks.

Foreign and colonial banks having London offices are, it should be noted, not included in the above tables.

Note Issues.— The Bank Charter Act of 1844, which governs the note issues of English banks, aimed at the eventual extinction of all note issues except that of the Bank of England. This aim is in a fair way to be realized, for at the end of April 1906, only 31 banks possessed the right of issuing notes, the maximum authorized issues amounting to but £1,628,342, and the actual circulation being £577,864. By this act the Bank of England was authorized to issue from the Issue Department £14,000,000 of notes, covered by Government securities, £11,015,000 of which consisted of the Government debt to the Bank. This fiduciary issue could be increased by the addition of two-thirds of the authorized issue of any other bank which forfeited its right of issue or allowed it to lapse, and it amounts at the present time to £18,450,000. Any notes issued in excess of this total must be secured by the deposit of coin or bullion to an equal amount. Silver may form not more than one-fifth of this deposit, but the Bank has but seldom availed itself of this privilege. As the Issue Department is compelled to buy all standard gold bullion offered to it at the rate of £3 17s 9d an ounce, and always issues notes against the stock in hand, it can be seen that the amount of notes issued is controlled to a very small extent by the bank directors, and that it increases or decreases according to the amount of gold imported or exported. The Bank of England is, however, not prevented from offering a higher price than the above, should it find it advisable to compete for gold in the market; and in selling gold, if the demand is for foreign coin or bars, the Bank can fix its price according to the demand. Any notes not required in active circulation are held in the Banking Department and form the greater part of the Bank of England reserve. The active circulation is in normal times peculiarly steady, averaging from 25,000,000 to 30,000,000 out of a total issue of from 50,000,000 to 55,000,000.

Bank notes have been in England largely superseded by the general use of banking accounts by the public, and the demand for an elastic currency has never assumed such proportions as in the United States. In times of stress, however, the demand for notes has, in a few instances, exceeded the Bank's power of issue, and on three occasions, in 1847, 1857, and 1866, the Government has been compelled to intervene and suspend the clause forbidding the issue of notes beyond the fiduciary limit except against the deposit of gold. Bank of England notes, which it may be noted are legal tender in all payments except by the Bank and its branches, are not issued for any sums below £5, though proposals have frequently been made, notably by Viscount Goschen in 1891, to authorize the issue of £1 notes.

The Clearing System.— The system of collecting checks and settling balances owing between bankers, though to the uninitiated it may appear merely an administrative detail, has, in reality, exercised a very important influence on banking development in England. The problem of clearing checks is comparatively simple compared with the problem as existing in the United States or any other country occupying a large geographical area, because practically every English bank or branch bank is within a day's post of London. Consequently although local checks are cleared through local Clearing Houses in some of the larger towns, the great mass of checks is cleared through the London Clearing House, and this fact has very much accentuated the centralization of banking in London, which is the predominant characteristic of the English system. A seat in the Clearing House is a privilege jealously guarded and difficult to obtain, and it was not until 1854 that any of the joint-stock banks were admitted. Those banks which do not possess this privilege appoint a clearing agent, with whom an account is kept, and who in many cases acts generally as the London agent. By the rules of the Clearing House every clearing bank must keep an account with the Bank of England, and the daily differences are settled by means of transfers to and from these various accounts and a central account called the Clearing Bankers' Account.

The total amount of the checks and other articles cleared through the London Bankers' Clearing House in 1905 was £1,287,935,000, being the highest total recorded in the history of the House, and more than 16 per cent higher than the previous year. The largest weekly total was £345,370,000, and the largest daily amount £102,780,000. The number of banks possessing seats in the Clearing House is now eighteen.

The Money Market.— The London money market is the name given to the miscellaneous body of persons who borrow or lend money for short periods, their operations being roughly grouped around Lombard street, Threadneedle street, and the adjoining parts of the City of London. The money in which they are interested is sometimes described as the Short Loan Fund of the Money Market. On the one hand is the borrowing portion of the market, consisting largely of the bill brokers, the Stock Exchange, and an undefined group of financiers; on the other, the Bank of England, which is closely connected with the Money Market, and which, owing to its position as the guardian of the ultimate cash reserves, is also the ultimate lender when money cannot be easily borrowed elsewhere. In between these two extremes are the clearing banks and other banks having London offices, as well as various financial firms, whose surplus unemployed assets form the principal part of the Short Loan Fund. The British Government also plays a very important part as a borrower in the Money Market, and the Government of India, through the India Council, lends largely to the Market. Beside these, there is a group of foreign banks with London offices which exercise a growing influence in the Market, both as borrowers and lenders.

The index to the general condition of the Market is the Bank Rate, which is the official minimum rate at which the Bank of England discounts first-class bills offered to it. All bills so offered for discount must mature within not more than three months, and must be accepted payable in the United Kingdom and bear one other English signature. The Bank of England is actuated in fixing the amount of the Bank Rate by the state of the reserve and the prospects of an inflow or outflow of gold, and speaking generally, the Bank is interested in keeping the rate as high as expediency will allow. The borrowing portion of the Market is naturally anxious to keep the rate as low as possible. If, however, there is plenty of money to be lent outside the Bank of England, the Bank Rate cannot be effectively maintained at a much higher figure than the market rate, otherwise it would be merely nominal. Therefore, the other London banks to a large extent hold the balance between the Bank of England and the borrowing portion of the Market. They are actuated on the one hand by the necessity of employing as large a proportion of their surplus assets as prudence will allow, and on the other by the responsibility of keeping reserves well above the margin of safety. The relations of the Bank of England to the other banks are of the utmost importance and interest. It is possible that in seasons when money is plentiful, the enormous floating balances available for employment in the Money Market may expose the Bank of England to the danger of a drain of gold. This risk is accentuated by the fact that the funds controlled by the joint-stock banks are far larger than those of the Bank of England. The Bank must, therefore, be able to control the market rate should necessity arise, and it must do this by itself coming forward as a borrower (mostly through a broker) and by offering such a rate as to divert the loanable funds of the other banks away from the market. The latter, thus being denuded of funds, is driven to the Bank of England.

The Gold Reserves.— London is recognized as the only free market for gold in the world, and yet her central stock of the metal is, notwithstanding the enormous volume of her financial dealings, at times actually less than that of her principal rivals. It is one of London's most cherished traditions that she puts no obstacles in the way of the export of gold, except by making it more worth the while of its owners to keep it there. When it is remembered that the British banks owe some £900,000,000 sterling to their depositors, and that chiefly owing to the universal reputation of the London sterling bill of exchange as an international currency, London's obligations to the rest of the world are at all times enormous, it will be realized that her gold reserves have to be vigilantly watched and jealously guarded.

That London can work on such a small basis of gold is due in the first place to the fact that the English system of a single centralized reserve is a more economical one than the system prevailing in countries where centralization is less developed; secondly, to the smooth working and thorough organization of her banking system, and thirdly, to the excellent reputation of English credit among other nations, which enables her to attract gold from abroad with the least possible delay. But there is a growing feeling that there should be more gold held in reserve in the country; not that bankers are thought to be working below the safety limit, but because the necessity for incessant vigilance results in unstable rates of interest with a consequent derangement of the Money Market and an undue accentuation of the speculative element in business generally. This feeling has been especially prominent since other countries have adopted a gold standard, and many schemes for an improvement of these conditions have been brought forward. The settlement of the question is rendered more difficult by the dual nature of the Bank of England reserve, which is at the same time a currency reserve and a banking reserve. It is felt that the responsibility of keeping the former belongs partly to the State; that of the latter to the banking community; and the adjustment of the responsibility has not proved easy.

Banking in Scotland and Ireland.— Both in Scotland and Ireland banking has developed on slightly different lines from those of English banks. In Scotland especially the absence of any joint-stock monopoly like that of the Bank of England resulted in the early evolution of a type of powerful bank which crowded out the private banker. Consequently to-day there are only 10 banks in Scotland, all with a large number of branches, and the establishment of a new bank is practically impossible. The Scotch people were early in recognizing the advantages of a good banking system, and the use of "cash credits" had an important effect upon the industrial development of the country. In Ireland, banking has had a stormier history, but similar results have been reached, and there are now only nine banks of any importance in the country. Both Scotland and Ireland differ from England in enjoying a circulation of £1 notes, which have survived all attempts at extinction.

The note issues of the two countries are governed by Bank Acts passed in 1845, which bear a close resemblance to each other. All the banks in Scotland and six of the Irish banks are banks of issue, and each is allowed to issue an amount equal to the average circulation during the year ending 1 May 1845, together with an amount equal to the amount of gold and silver coin held at the head office or principal places of issue, the silver coin not to exceed one-fifth of the whole. The necessity for keeping coin against excess issues of notes brings the Scotch and Irish banks into close relation with the Bank of England. Neither the Scotch nor Irish banks clear their checks through the London Clearing House, but through the Clearing Houses of Edinburgh, Glasgow, and Dublin, hence the connection between these banks and the Bank of England is not necessarily so direct as in the case of English banks. But there are certain recurrent seasons of the year when an increase of the note issues always occurs in Scotland and Ireland, and this necessitates an increase in the stock of coin. As there is no central reserve of gold in Scotland and Ireland, this coin can only be obtained from the Bank of England, and therefore, at these seasons of the year, notably during what is called the Autumn Drain, the Bank of England reserve is always subject to a demand for coin from these countries, especially from Scotland.

Banking Methods.— British banking methods are distinguished by prudence and caution. The immense amount of their deposits repayable on demand forbids English banks to embark upon the general financial business which forms the principal function of some Continental bankers. English banks do not operate on the Stock Exchange except for purely investment purposes, and then only in what are termed "gilt edged" securities. Neither do banks directly interest themselves in the control or management of commercial or industrial undertakings. Furthermore the management of the large banks is singularly free from political interference of all kinds. On the other hand, English bankers have allowed to slip from their control many branches of business which belong legitimately to a banker. Much of the bill-discounting business is in the hands of the bill broker, who is an expert middleman between the banker and his customer. Again, few of the large London banks deal in foreign bills or interest themselves in foreign exchanges, and this branch of banking has also fallen largely into the hands of specialists, or of the branches of foreign banks established in London.

The liabilities of English banks consist almost entirely, first, of the current account balances in their hands, repayable on demand, on which it is not usual to allow any interest, and secondly, of sums deposited repayable at a fixed notice, usually seven days, on which London bankers allow interest at one and a half per cent below the Bank of England Discount Rate. Certain London bankers also accept, on behalf of their customers, bills drawn from abroad, proper security being deposited to cover the bankers' liability. It is, however, not the practice among English bankers to grant open credits in such cases. Their assets consist of cash on hand and at the Bank of England or their London Agent, money lent at call or short notice to the Money Market against security, bills being the acceptances of other bankers or leading merchants bought in the market investments in first-class Stock Exchange securities, and advances to customers, either in the form of loans, overdrafts upon current account, or bills discounted. It is not usual to make advances without some form of security.

During the middle of the 18th century, England was subjected to a series of acute banking crises, notably in 1847, 1857, and 1866, but if we except the grave situation created in 1890 by the liquidation of Barings, who, it must be noted, were not bankers, the country has been free from such disturbances since 1878. It is reasonable to assume that bankers have profited from the experience gained in such times of stress, and it must be admitted that English bankers as a whole inspire in their creditors the confidence due to sober and prudent management.

Bibliography — History of Banking.— Gilbart's 'History, Principles and Practice of Banking,' (first written in the early half of the 19th century and must, therefore, be read with caution for recent history); Macleod's 'Theory and Practice of Banking,' (good but disfigured by an overemphatic style); Dunbar, 'Theory and History of Banking' (a short American work).

Practice of Banking.— Hutchison, 'Practice of Banking' (4 vols.); Moxon, 'English Practical Banking' (very short and concise, but practical).

FELIX SCHUSTER,
Governor of the Union of London and Smiths' Bank, Limited, Chairman of the Council of the London Chamber of Commerce, Deputy Chairman, London Clearing Banks, Vice-President and Chairman of the Council of the Institute of Bankers, Deputy-Chairman of the Central Association of Bankers; and
ERNEST SYKES,
Secretary of the Institute of Bankers, and of the Central Association of Bankers, and Examiner in Banking to the London Chamber of Commerce.

19 (a). Great Britain — Commerce — Eighteenth Century. English commerce of the 18th century is remarkable for the revolution in the methods by which it was carried on, for its growth under the great Whig system of protection and for its culmination in a tremendous expansion with the coming of machinery. English foreign trade had been largely opened out by merchant companies. The foundation idea was that English goods should be sold at a high price and that there should be no glut of goods, no undercutting, but a "well ordered trade." Hence rules as to quantities to be exported were a great feature of these companies. There was no idea of pushing trade or selling at a low price and getting quick returns. Moreover, the numbers admitted to the companies were limited by the high fees charged for entrance, while no one who did not belong to them could lawfully engage in the trade. The only open trades were those to France, Spain and Portugal. Hence a regular attack on the monopoly of the companies was carried on and this constituted the early free trade movement. It was successful: after the Revolution the entrance fees of the companies were reduced by Acts of Parliament; only the East India Company and the Hudson's Bay Company continued strict monopolies. With the throwing open of trade it was possible for an enterprising man to carry on commerce on any scale, to push his wares and generally increase his sales wherever he could without limitation of any kind. This amounted to a veritable revolution in commerce. Alongside of this opportunity for expansion came the emigration of the Huguenots into England. Besides introducing many new industries such as silk, cotton printing, paper and linen, there was no branch of English trade which they did not improve with their taste and skill. Hence England had a more varied assortment of goods with which to push her trade. Moreover the Huguenots preserved their old business connections, and England inherited in this way a great deal of the French trade.

At the revolution of 1689 the control of economic affairs definitely passed to the House of Commons, and the Whig party became the arbiters of national policy. The Tories were inclined toward "free trade." They believed in favoring the consumer and in removing restrictions on intercourse, especially with France, the chief industrial rival of England. The Whigs on the other hand held very decidedly to a policy of encouraging industry and in so manipulating commerce that it should react on the prosperity of industry. Hence they devised a system of bounties for encouraging the exportation of silk, linen and corn. Bounties were also given to the fishing trades. They tried to stop the growth of competing industries in both Ireland and the colonies, and when Scotland showed signs of becoming a rival the Union was brought about.

In their fiscal policy and in their trade treaties the same Whig ideas were carried out. We first see them applied in the commercial relations between England and France. England's great industrial competitor at the end of the 17th century was France. Colbert had been doing everything in his power to encourage French industry and had gone so far, in 1667, as to put prohibitory rates on English cloth. Englishwomen with (to the masculine mind) an extraordinary perverseness would insist on wearing French goods when they could get them. Hence, according to the opinion of the day, to shut out French goods was to assist English industry in the best possible way. To this the Tories were opposed, but the Whigs were successful, in 1678, in carrying an Act prohibiting trade and commerce with France. A system of high duties was substituted for prohibition under James II., but the Whigs returned to the earlier policy. In 1713 a clause was added to the Treaty of Utrecht to the effect that England should admit French goods as in 1664. This gave rise to a tremendous controversy. Again the Whigs were successful; the commercial clauses of the treaty were not carried out, and the policy of protecting English industry by cutting off trade with France was not reversed till the treaty concluded by Pitt in 1786. By that time England no longer feared French competition and English manufactures were so much sought after in France that there was a tremendous outcry on the part of French manufacturers.

The Whig desire to shut out competitors extended to another department of commerce, namely, the trade with India. The East India Company had been bringing back silks and muslin and cotton goods which were worn by the "greatest gallants" as well as by "the meanest cook maids" instead of good English cloth. Hence employment was being diverted from Englishmen to Hindoos, and in 1700 an Act was passed by which East India goods might be warehoused for re-exportation, but they might not be sold within the country.

But it was not enough to shut out possible competitors. Definite encouragements to English trade were given by the Methuen Treaty negotiated with Portugal in 1703, and by the Asiento Contract obtained from Spain in 1713. The Portuguese had prohibited the importation of English cloth, and in 1703 Mr. Methuen was successful in getting this prohibition removed on condition that Portuguese wines were admitted into England at two-thirds of the duty on French wines. The trade with Portugal thus opened up was reckoned to be a very large one, and was especially cherished since a large part of the returns was paid in Brazilian bullion, with which we could renew our depreciated coinage.

By the Asiento Treaty the Whigs got a large part of the slave trade with Spanish America into their hands. They obtained the right to import 4,800 negroes annually and to send one vessel of 500 tons to import goods into the Spanish colonies. The West Indies became a great depôt for this trade and under the cover of the one ship the English got possession of much of the Spanish-American trade. From every point of view the slave trade commended itself to the general opinion of the time. It encouraged shipping, promoted trade with Africa — which country took English cloth in payment for slaves — it supplied labor to the West Indies and Virginia and helped the agricultural development of the colonies. Moreover the slaves were a means of carrying on trade with Spanish-America. But from the English point of view the economic effects were still more important. As long as the colonies had slaves they would never take to manufacture, the negro being incapable of the necessary training. The colonies would continue therefore to grow the tropical commodities for England to distribute.

Sir Robert Walpole began to reform the fiscal system with the same object of stimulating industry through commerce. Accordingly he overhauled the book of rates between 1721–4 with the object, to use his own words, of making "the exportation of our own manufactures and the importation of the commodities used in the manufacturing of them as practical and easy as may be." He repealed or reduced the import duties on raw materials and arranged for manufactured exports to be duty free. He next began to try and stimulate the warehousing trade which the Navigation Acts (see GREAT BRITAIN — NAVIGATION ACTS) were partly designed to create. He hoped to make England "one general free port and a magazine and common storehouse for all nations."

This system of deliberately building up English industry was continued until the time of the younger Pitt, who, following out the Tory tradition of free intercourse, not merely reopened trade with France but tried to carry free trade between England and Ireland, unsuccessfully however, owing to the hostility of the English manufacturers. He also wished to allow American ships to trade freely with England and the West Indies in spite of the Navigation Acts. But this Tory reversal of the Whig policy was doomed to failure.

The French wars prevented any relaxation of the system for revenue reasons, and it was not until 1822 that the great breach with the Whig policy of the 18th century was definitely made.

During the 18th century English commerce steadily increased in almost every direction, especially with the colonies. In 1699 the exports had been estimated at £7,302,716. By 1720 they were £8,681,200 and by 1740, £11,469,872. In 1760 the figure had reached £15,579,073; in 1771, £17,161,146; while with machine products the total reached £34,381,617, in 1800.

The imports in 1699 were £3,482,586; by 1720 they had nearly doubled, being £6,090,083. In 1760 they were £9,832,802; and in 1771 had reached £12,821,995. In 1800 they were £28,257,781.

It is exceedingly difficult to say whether this increase was a result of the Whig policy or no, but the fact remains that while they held the reins of power English trade extended as they intended it should, and thus prepared the way for the introduction of machinery. It was no accident that the industrial revolution (see Great Britain — Industrial Revolution) occurred in England when it did. At the Restoration English industry was very backward; English agriculture undeveloped; and English commerce small. By the end of the 18th century England, in spite of the loss of her American colonies, was the greatest trading country in the world. Her goods, through sheer cheapness, were forcing their way into every country. She was the great carrier of the world, and the only people that could compete with her were the Americans, whose shipping had grown up under English protection. She was able to withstand, by her wealth, the great financial strain of the French wars, and to control the access of colonial produce to Europe.

That many mistakes were made is no doubt true, and Adam Smith did not hesitate to expose them; but the objects which the Whigs had at heart were attained to an extraordinary degree during their tenure of power.

Appointed Lecturer in Modern Economic History, University of London.

19 (b). **Great Britain — Commerce.** *Volume of Trade.*— It has been estimated that nearly a fifth of the working population of the United Kingdom depends for existence on the sale of its products in foreign markets: add to this the classes engaged in ocean transport, in market organization and financial settlements, and it is possible to arrive at some conception of the magnitude of the interests involved and the importance assigned in the United Kingdom to oversea commerce. Parliament and the Press never tire of the theme. Not merely the Board of Trade, but all other great departments of administration, whether concerned with defence, revenue, foreign and colonial affairs, or education, find themselves involved in one way or another in the consideration of the interest of international commerce. So far, indeed, has been carried this exclusive attention to external relations, that the existence of a home market is not seldom forgotten or ignored. Some ground for this forgetfulness may be found in the great value of the foreign trade — over £920,000,000 sterling in 1904 — in relation to a limited population and area; but its real importance in the economy of the United Kingdom appears only on a further analysis of the figures.

Of the imports, valued at £551,000,000, three-fourths must be credited to food and raw material, the rest to manufactures of various kinds. The exports are made up of £300,000,000 of British produce and £70,000,000 foreign and colonial re-exports. Manufactures constitute the mass of British produce exported, with one important exception — coal. The figures imply much that is interesting both in past history and present organization. A country of restricted area and resources obtained, through various economic and political accidents, a start in the industrial race a century ago. Some of the necessary raw materials of industry it cannot produce, of others the quantity is insufficient for its growing demands. Increasing specialization leads to greater dependence on certain types of foreign imports and greater need for a market abroad for the constantly increasing surplus of manufactures. Food, too, must be brought from more favored regions, and the very success of manufactures breeds a natural tendency to neglect the interest of agriculture; though native resources, utilized to the utmost, would still be insufficient, in the present state of agricultural science, for the needs of the growing industrial population. The basis of the present system, and the only home product, on a large scale, which is more than sufficient for the needs of the moment, is coal. Hence it is exported from those districts where it is not utilized in local industries, and where access to the sea is easy; its ultimate functions being to provide power for British and foreign shipping or for foreign factories.

The entrepôt business, in foreign and colonial produce, again represents a historical advantage. It is a relic of the partial monopoly of the carrying trade, and the control of the supply of tropical, eastern, and colonial commodities to continental markets, long enjoyed by the United Kingdom. Though aided by the principle of inertia, and the facilities of old-established commercial centres, such business has not increased at a rate proportional to the general movement of trade; in fact, for a long period it was stationary at about £60,000,000, though recent years have witnessed a great improvement. This slow rate of growth is due mainly to the development of continental shipping and the establishment of direct relations between the European consumer and distant markets, which have been conspicuous features in the elaboration of international commerce during the last generation.

The last point noteworthy in the general figures, is the vast difference between the value of imports and exports. Apart from minor questions of statistical method, the excess of imports represents two main facts: firstly, returns for the service of some 9,000,000 tons of foreign-going shipping, which carries nearly the whole trade of the United Kingdom and no inconsiderable portion of that of the rest of the world; secondly, payments of interest by debtor nations and foreign industries to the great creditor nation of the 19th century, or in some cases, perhaps, the redemption or creation of capital liabilities.

Classification and Distribution of Imports.— The close relationship between foreign commerce and internal organization is best seen by tracing commodities from their sources or following them to their destination within the country. For this purpose much of the United Kingdom can be removed from the map. A small fragment of Scotland, a single port in Ireland, the north and part of the midland and west of England, with London and its subsidiary ports, cover the whole region of industrial and commercial importance. London, including the minor ports from Harwich to Southampton, receives about 40 per cent of the total imports of the United Kingdom. Of this vast trade, food, in one shape or another, accounts for nearly half; fruit, eggs, vegetables, butter and other minor agricultural products, with large supplies of beet sugar, from the neighboring districts of Europe; grain and meat from more distant countries; tea, coffee, rice, and miscellaneous tropical and sub-tropical products; all are poured in to supply the needs of the dense population of the London area, or to be distributed over the lines of communication radiating northward and westward.

Apart from food, the most important items of note in the statistics of London and its subsidiary ports are the silk, woolens and other textiles consigned from France and other parts of the continent which are valued at over £25,000,000 sterling. In this matter, London appears as the great consumer of luxuries; on the other hand the receipt of raw wool from distant parts of the world to the value of some £17,000,000, and of large quantities of tin from the East, shows her as a controller of markets and distributor of commodities which she does not utilize herself. For the rest, the trade is made up of innumerable minor manufactured articles, chiefly from European countries, and of miscellaneous raw materials from every region of the world, partly for use in the many industries of the London area, partly attracted thither by facilities of transport and marketing.

The only group to compare with London consists of Liverpool, with the Mersey ports, now including Manchester. Together they take another 30 per cent of the total imports of the kingdom. Roughly, a third is staple food stuffs, mainly from across the Atlantic; Liverpool vieing with London as a distributer of these commodities; another third is raw cotton, nearly the whole of the supply needed for native industries; while in the miscellaneous group, the cane sugar and tobacco of the Indies, the palm-oil, nuts and rubber of the African and American tropics are interesting reminders of the intimate connection of Liverpool with the older colonial and plantation trade.

The remainder of the import business is divided between the eastern group of seaports, represented by the Forth, the Tyne with Middlesboro, and the Humber; and the western, represented by the Clyde, the Severn and Belfast. The main intercourse of the east coast is naturally with the continent of Europe, from the Baltic to the Black Sea; and, for the most part, it can be regarded as merely an extension of London for the receipt of continental goods. One commodity alone deserves special remark. Iron, in various elementary stages of manufacture, enters the Humber from abroad, while Middlesboro and the Tyne find it necessary to import more and more foreign iron ore for their smelting industries. The native supplies, for certain purposes, show a distinct and unpleasant tendency to run short. On the west coast, the Clyde and Severn, like Liverpool, need food for the population concentrated on their coal areas, and have a small share in the sugar and tobacco of the plantation trade. Glasgow must look abroad for iron ore, Cardiff and South Wales for iron, copper, and tin, while Belfast needs flax and linen yarn to supplement native supplies.

All ports alike, from London downward, absorb vast quantities of timber in various shapes. The native supply is a thing of the past; so northern Europe, North America and the tropics are called in to provide this necessary material for railways and mining, and above all for one of the greatest home industries,— building — an industry which does not figure in the export list but is none the less of vital importance in the general economy of the country. An annual timber bill of £25,000,000 is a fairly prominent item in the national balance sheet. For food, raw materials, luxuries, for nearly all the needs of civilized existence, the United Kingdom depends partly or wholly on supplies from beyond the seas; it is small matter for surprise that the question of safety of trade routes, on the one hand, and of the economic and political policy of the regions from which the necessary supplies are drawn, on the other, should loom larger and larger in the view of statesmen, as the economic dependence of the country steadily increases.

Classification and Distribution of Exports.— As an outlet for those districts which produce the chief British staples, London cannot compare with Liverpool. Over a third of the total exports of British produce goes by way of the Mersey, only about a quarter by way of the London group. At Liverpool, cotton goods provide half the export, then come iron and steel in all stages of manufacture, large quantities of woolens, with textile machinery, chemicals and earthenware. In fact the main industries of Lancashire, Yorkshire, Cheshire, and the *Midlands* are here represented roughly in order of their relative importance. With one or two qualifications, the foreign trade of Liverpool may be taken as a type of that of the whole Kingdom.

The export business of the London group is less easy to define, partly owing to the many minor industries of London and district, partly owing to the modifying effects of cost of transport from the great producing centres. Textiles still hold the first place in the customs list, but large quantities of leather, millinery and apparel, paper and stationery, provisions, confectionery, pickles, and medicines, suggest rather the minor activities of a great centre of population than the staple industries of modern life. In short, London may be regarded rather as a general store, handling every kind of goods and forwarding to all parts. The main activities are typical of commercial rather than industrial England.

The export trade of the east coast has certain peculiarities worth a moment's attention. Many million tons of coal leave the Tyne and Humber for European ports, while the textile industries are represented by yarns and machinery rather than finished goods. A certain amount of iron and steel, with ships and their machinery, completes the main features of the trade. The European markets, owing to their advance in industrial organization, tend to be accessible only to certain restricted groups of British industries; the changing conditions are reflected in the customs records of the eastern seaports.

On the west coast, a few million pounds worth of cotton, iron and steel, ships and machinery represents the industrial activity of the Glasgow district; while the linens of Belfast, the iron, steel, and tin plate of the Severn ports and £10,000,000 worth of steam coal from Cardiff complete the schedule of the chief British exports.

In the entrepôt business, London and Liverpool alone are worthy of notice. London is still the chief European market for wool, though her position has been affected by the increase of direct relations between Australia and the continent. But the supreme control of the world's tea trade has dropped from her grasp. The teas of China, whether destined for Europe or America, no longer fill her warehouses. In this, as in other less important departments of commerce, the development of commercial policy of the Powers in the Far East and more particularly the activity of their shipping, have gradually undermined those special advantages on which the great entrepôt trade was founded. London still remains a convenient market for miscellaneous tropical and colonial products, and this position she shares with Liverpool. Broadly speaking, the one looks to the east for imports, the other to the west; together they provide a collecting centre for minor commodities of the whole world. So long as British trade and shipping exist on their present scale, and London maintains its reputation in the financial transactions of commerce, this type of commission business is likely to persist, though it may represent a decreasing proportion of the total commercial activity of the country.

Changes in Character and Sources of Imports. — The ultimate destination of exports or the origin of imports may be a matter of indifference to the individual trader; but in a review of the whole movement of commerce, the question of sources of supply and markets for products, is of the highest interest. In recent years there have been great changes both in the distribution of British manufactures exported and in the sources of the national food supply. Raw materials for the great industries have been affected to a less degree. A generation ago, Europe vied with North America as an exporter of wheat and flour to the United Kingdom; at the close of the century her share had fallen from over 40 to less than 10 per cent. North America had annexed the trade, the larger share falling to the United States, though Canada was rapidly improving her position. India, the Argentine Republic, and Australasia merely supplemented the deficiencies of this supply. But the situation has changed radically, in the last three years, through the enormous deficiency in the supply from the United States, coupled with a corresponding rise in that from India, the Argentine and eastern Europe. Moreover, there are elements of permanence in the change. Apart from the fact that the United States may have considerably less to spare, in the near future, after the satisfaction of the needs of her own industrial population, there are evident economic advantages involved in the purchase of food supplies from those regions which, in their turn, provide an equivalent market for British manufactures. The imports of live cattle from Europe have also ceased, while a new trade in fresh meat with the most distant regions has been created under modern conditions of transport.

In spite of these changes, there has not been that decrease in west-European imports into the United Kingdom which might have been anticipated. Though staple foods for export are only available on a large scale in the non-industrial eastern districts of Europe, the neighboring countries of the west still supply, for British consumption, large quantities of the minor perishable food products. Superior organization and better facilities for transport enable the small grower abroad to supply the great consuming centres with much that could readily be produced in agricultural England. Compensation has also been provided by the enormous growth in the import of beet-sugar, stimulated by the bounty system — a growth of many hundred per cent in twenty years. Since the abolition of the bounties by the convention which came into force in 1903 there has been a considerable decrease in the supply of beet-sugar from Europe, with an increase in that of cane-sugar from tropical regions; but it is impossible to forecast the ultimate position of equilibrium. Further compensation is to be found in the increasing volume of the stream of those continental manufactures which find a ready market in the United Kingdom. The net import of foreign manufactured goods, more than half of which are ready for consumption, has doubled in the last generation and is now valued at upwards of £130,000,000 sterling annually. The greater part of this must be credited to the industrial regions of western Europe. Formerly one of the best markets for the British manufacturer, they are now reversing to some extent the earlier movement, and invade with success the British market, either supplementing or competing with the native industries.

In raw material the changes are less conspicuous. American cotton and Australian wool still dominate the market; but the tin for British industries is now largely imported from

Malaya and Australia, while even for iron ore it is found necessary to utilize more and more the Spanish, Scandinavian and other foreign supplies. The import trade in raw material and food has one characteristic common to all its branches, that is the vastly increased distance from which commodities can be gathered and to some extent the multiplication of possible alternative sources. In fact, the need of an alternative, particularly when no native supply is available, has so impressed itself, not merely on the individual importer but on the great manufacturing interests as a whole and on many responsible officials and politicians, that it bids fair to give rise to a new type of commercial policy, in defence of the national economic interests.

Foreign Markets.— The question of a foreign market for British manufactures raises more difficulties than that of the source of imports. As a general rule, the supply of the latter can be safely left to the foreign countries interested in their production; but British exports must seek out their market in the face of the world-wide competition. In this connection it is worth noting that the proportion of manufactures in the total exports of British produce to the chief protected foreign countries, fell in the last twenty years of the 19th century from 85 to 72 per cent. In the same period the total export of coal more than trebled, while the number of the population engaged in mining shows a heavy relative and absolute increase. These two facts, taken together, are not without significance; though a proportion of the coal exported is accounted for by the enormous increase in the tonnage of British steam shipping engaged in the trade of the world.

Apart altogether from the effects of fiscal policy, the development of the industrial activities of western Europe and the United States has necessarily narrowed the market for British manufactured staples. Both regions take a smaller proportionate share of British exports, while in the case of the United States there has been a heavy absolute fall, for which woolens and tinplate are largely responsible. The European trade has maintained its value and in some cases has shown a tendency to increase; but the type seems to be changing steadily; coal, yarn, and machinery for continental industries tend more and more to take the place of finished goods. The census returns provide a valuable comment on the statistics of exports. Among the greater industries, iron and steel and their manufactures alone show an increase in the proportion of the population employed, comparable to that in mining. Woolens and other textiles show a large decrease. Cotton shows a slight increase in the total number but not commensurate with the growth of population. But allowance must be made for more efficient machinery and labor; while the activity of Lancashire during the last two years, as evidenced by the building of new mills and the greatly increased import of raw cotton and export of finished goods, suggests that the next census will tell a very different tale.

The cry for new markets and the «open door» is not without good foundation. In the west, the United States has evident advantages; Germany, owing to her position and her land frontiers, is exceptionally favored for intercourse with the purely agricultural regions of Europe; while, in the Far East, Japan has started on an industrial career which compels her to import food and raw material rather than finished products. There remain as open markets China, nearer Asia, South America, and the British colonial possessions. The fact that staple British exports have found a rapidly expanding market in the self-governing colonies has masked the decline in other directions. How long the expansion will continue it is impossible to say; the colonies are not without their own individual aspirations, but it is likely to be long before their manufacturing capacity overtakes the demand of their vast agricultural populations.

The British exporter has to face a steady contraction of the world-markets freely open to him, with increased competition in these markets from regions formerly his customers, now self-supporting and rivals in his own line of business. He may change gradually the character of the products exported, though always within the limits set by the national resources of the country; he may find better outlets for miscellaneous articles than for the great staples, but export he must unless the whole economic system is to collapse. He is affected, not merely by the economic policy of foreign states, but by the rise of conditions in the world-market for manufactures, which were scarcely contemplated a generation ago; these conditions may concern more vitally a highly specialized industrial country than one which, either by policy or by natural advantage, is enabled to maintain a better balance of its productive energies and a larger independence of foreign supplies.

Hitherto the British producer and merchant have risen superior to difficulties; ground lost in one direction has been gained in another, while competition has served as a stimulus to greater exertion. In spite of fluctuations and temporary depressions, the volume of British trade has steadily increased; and the fact that the value in 1905 was easily the highest on record, gives strong support to the view that the energy and adaptability of the United Kingdom, alike in the spheres of industry and commerce, are as yet far from reaching a limit.

The following statistical tables give a general view of the progress of British trade for 50 years, though the conclusions to be drawn are affected by the great fall in prices in the latter part of the 19th century, and by changes in the statistical definition of the term «manufactures.»

The figures represent £ million and refer to merchandise only.

Annual Average.	Imports (gross).	Re-export.	Imports wholly or mainly manufactured.
1855-9	169	23	21
1860-4	235	42	31
1865-9	286	49	43
1870-4	346	55	55
1875-9	375	55	66
1880-4	408	64	77
1885-9	379	61	82
1890-4	419	62	90
1895-9	453	60	110
1900-4	533	67	132
1905	565	77	142

Annual Average.	Export of British produce.	Exports wholly or mainly manufactured.
1855-9	116	104
1860-4	138	125
1865-9	181	165
1870-4	235	210
1875-9	202	178
1880-4	234	206
1885-9	226	197
1890-4	234	199
1895-9	238	199
1900-4	283	226
1905	324	269

The figures for «manufactures» are in accordance with the revised classification now adopted by the Board of Trade. The differences between the new and old system are explained in the Parliamentary Paper, Ed. 2,337 (1904), page 325.

Bibliography — Volume of Trade.— The source of all ordinary information as to British trade is the 'Annual Statement of Trade with Foreign Countries and British Possessions', supplemented by the 'Annual Statement of Navigation and Shipping'. The chief defect in the series is that until 1904 the figures represented ports from and to which the goods are shipped, and not countries of origin or ultimate destination. In other words, British trade relations, particularly with certain European countries, are entirely misrepresented. A supplementary volume is now issued which attempts to get at the real facts of the case.

Exports and Imports, Distribution and Changes.— Much valuable information as to the historical growth of British trade can be gathered from the 'Report of the Royal Commission in Trade Depression' (1886), supplemented by Parliamentary papers C. 6394 (1891), C. 8211 (1896), and Cd. 1761 (1903), which bring down to date the statistical information as to British trade and production. The Parliamentary paper, 'Food Supplies Imported 1870-1902' (No. 179, 1903), gives in detail the changes in the sources of supplies in the period. The 'Report of the Royal Commission on Food Supply in Time of War' contains much miscellaneous information as to sources of imports, including raw materials. Consult also the Parliamentary paper Cd. 1199 'Memorandum on Comparative Statistics of Population, Industry and Commerce' (1902); Cd. 1761 'Memoranda and Statistical Tables on British and Foreign Trade and Industrial Conditions' (1903), and Cd. 2337 'Second Series of Memoranda', on the same subject, (1904).

These volumes contain a vast amount of miscellaneous information of the latest date on British trade in relation to industry and foreign competition. They are not without serious inaccuracies, but represent the best official information available. The statistics cover a long period of years.

A. J. Sargent,
Appointed Teacher of Foreign Trade in the University of London; Author of 'The Economic Policy of Colbert'.

20 (a). Great Britain — Navigation Acts. In the 17th century the independence of the English nation as a nation had been secured. Spain had been conquered at sea, and henceforth maritime power became more than ever the great national ideal. Comparatively safe from the dominance of a foreign power, and her internal resources in process of rapid development, all the conditions were present for England to expand beyond the seas and to attempt to secure for herself that pre-eminent position in the world's commerce hitherto held by Holland. England's dominating purpose during the 17th century was to build up her foreign commerce, to outrival the Dutch at every point, to constitute herself the great warehousing and distributing depôt of Europe and to induce the colonies to contribute to the power of the mother country by growing commodities for her to re-export. When Scotland or Ireland seemed likely to encroach on the colonial trade they were carefully excluded.

All through the changes of dynasty from Charles I. to the time of the Whig predominance the same idea holds good; and the instrument by which all this was to be effected was the series of Navigation Acts or Acts of Trade.

The Navigation Acts were no new thing in the 17th century. There was one as early as 1381 (5 R. II. St. I. c. 23). It forbade goods to be exported or imported by Englishmen except «in ships of the King's liegance.» This Act was inoperative, however, owing to the lack of English shipping, but the idea of the statute was never lost sight of. A similar Act was passed in 1463 (3 Ed. IV. c. I) but was dropped after three years. Efforts were again made to enforce a monopoly for English ships under Henry VII. (I. H. VII. c. 8 and 4 H. VII. c. 10) and in 1540 the old laws were re-enacted, the freights defined, and inducements offered to aliens to use English ships. Elizabeth gave up the policy of confining English trade generally to English ships and by an Act of 1563 (5 Eliz. c. 5) merely reserved the coasting trade.

In the 17th century the Navigation Acts were revived. In the early part of the century they took the form of royal letters and proclamations, but in the latter part the policy was embodied in the statutes of 1651 and the series of Acts between 1661 and 1696.

From the 17th century till the final repeal of the Acts between 1822 and 1854, the policy of confining English and colonial trade to English ships was consistently pursued.

The novel feature of the 17th century Navigation Acts did not lie so much in their continuous enforcement as in their enlarged scope and their application to the colonial trade. The Dutch being the greatest traders of the time had got the bulk of the English colonial trade into their hands by making advances to the colonists on the security of future crops. These they duly received when grown and distributed from Amsterdam. This conduct the English regarded as directly contrary to the whole object of colonization, the general view at that time being that people should only leave the mother country in order to build up English trade and shipping elsewhere.

The feeling of jealousy with regard to the Scotch was almost as strong. It is true that they were not such formidable rivals, but they were said to sail cheaper than the English, and as they had close trade relations with the Dutch it was feared that the latter might get hold of the English trade through the Scotch.

"The Plantations are His Majesty's Indies" runs a report of the Commissioners of Customs (30 Oct. 1661) "without charge to him secured and supported by the English subjects who employ above 200 saile of good English ships every year, breed abundance of mariners and begin to grow commodities of great value and esteeme." Were the Scotch allowed to trade freely on the same footing as Englishmen it would "in one word overthrow the very essence and design of the Act of Navigation."

The jealousy of both the Dutch and the Scotch was keenly felt in the 17th century. As soon as the plantations showed signs of development measures were taken, primarily against the Dutch, in order to secure the growing trade for England.

In 1621 we get the first of a series of orders and letters sent out by the King to the Colonial Governors with the object of having all colonial goods brought to England and brought in English ships. In 1624 a proclamation ordered that no tobacco should be imported in foreign bottoms. In 1629 another proclamation re-enacted the old Navigation Laws as to English trade generally. In 1633 the question of the colonial trade was referred to a committee who reported strongly in favor of confining such trade to English ships, and an order was accordingly issued to this effect. In 1637 letters were sent out to the governors in America and the West Indies ordering them to "strictly and resolutely" forbid all trade and traffic with the Dutch.

During the civil war the Dutch seem to have got more and more of the trade of the English colonies into their hands, and it became necessary to revive the policy which had been pursued under Charles I. This was done in the Act of 1651. The commonwealth wished to do a popular thing by appealing to the English hatred of the Dutch, and they no doubt also intended to give the ship owners some compensation for the overwhelming misfortunes which the civil war had brought on them. The restrictions of the Act were not new, nor was it enforced any more effectively than previous Acts had been. Cromwell indeed did not believe in the policy, and so great was the danger to English shipping from the Spanish and Royalist privateers that the government were only too glad to see trade kept alive in neutral ships. In the colonies the statute seems to have been generally disregarded. In 1660 (12 C. II. c. 18) the Act of 1651 was re-enacted with certain additions. The Act of 1651 had declared that no goods "of the growth, production or manufacture of Asia, Africa or America" should be imported into England except in English or colonial ships. Goods from Europe might come either in English vessels or in the ships of the country which produced the goods. As Holland was not a producer she would be particularly affected by this provision. In the 1660 Act the various clauses were made more precise. Both the import trade and the export trade of the plantations were to be carried in ships, English built, English owned, and manned by a crew of whom three parts were English. By a later statute (14 C. II. c. 11) colonial shipping was put on the same footing as English for all the purposes of the Navigation Acts. Goods from Europe were subject to the same restrictions as in the Act of 1651, *i. e.*, they might be imported either in English ships or in ships of the country of origin. No attempt was made to restrict the export of English goods to English ships except in so far as the plantation trade was concerned.

The policy of developing the warehousing trade through the Navigation Acts as outlined by Charles I. was again taken up by his son. A number of commodities — sugar, tobacco, cotton, wool, indigo, ginger, fustick and dye-woods — were "enumerated," and could only be exported from the colonies either to England or to another English colony. Rice and naval stores were added to the list in 1706, and copper and beaver skins in 1722.

The Act of 1663 (15 C. II. c. 7) further extended the policy of making England a great entrepôt by enacting that commodities of the growth or manufacture of Europe that were needed by the colonists should be shipped from England in English or colonial vessels.

Thus, according to the Navigation Acts, the bulk of colonial produce had to be brought to the mother country, and the colonists were bound to take their manufactures from her or through her.

It should be observed that by these Acts the Scotch were shut out from the plantation trade and were not even reckoned as English for the purpose of making up a crew (13 & 14 C. II. c. 11) until the Act of Union. They petitioned to be allowed to trade with the colonies, but a Commission reported strongly against it because such liberty would bring infinite loss to His Majesty's customs and "much prejudice" to the English.

As to Ireland, enumerated goods could be imported there, according to the Act of 1660, and it seemed as if an Irish warehousing system might have developed since food was so cheap that many ships engaged in the colonial trade went into Irish ports to victual. English jealousy of Ireland was, however, too strong for her to be allowed to encroach on a province which England regarded as the foundation of her prosperity. An Act was passed in 1670 (22 & 23 C. II. c. 26) by which the staple colonial commodities were henceforth brought to England only. In 1695 Ireland was prohibited from receiving even non-enumerated commodities as the Bristol merchants complained of the injury done to their trade.

After the Restoration, English shipping increased rapidly; but it is not easy to estimate the precise effect of the Acts in building up the maritime power of England. The English mercantile marine doubled between the Restoration and the Revolution and continued to grow all through the 18th century. Petty, writing in 1699 ('Political Arithmetic,' pp. 258–9), said that shipping had increased three or four fold in the last 40 years; and Child ('Discourse of Trade,' 1695), chronicles the great increase of "Wharfs and Keys" to accommodate the growing trade. It is exceedingly difficult to estimate the extent to which this increased prosperity was due to other factors as well as the Navigation Acts. The English had been pushing trade in all directions after 1660; Charles

II. had concluded a series of trade treaties which gave great openings to English merchants; the banking system was developing with increased facilities for traders; the old system of a steady but restricted trade carried on by merchant companies was giving way to the new principles of pushing trade anywhere and by all means. All these things contributed to increase the demand for shipping. But without the Navigation Acts it might have been Dutch shipping that would have profited, since Holland carried at much cheaper rates than any other nation. At any rate the Acts did secure that the increase of trade should benefit national shipping, although in the Baltic trades the results were at first disastrous. The English had not sufficient shipping for the trade, hence they could not get timber, and accordingly English ship building was hampered. It indeed became necessary to relax the restrictions as far as Norway and Sweden were concerned for three years (7 & 8 W. III. c. 22) to get in naval stores.

The policy of the Acts was attacked as tending to increase prices and limit trade. But the answer always was "that this kingdom is an island the defence whereof hath always been our shipping and seamen," and that therefore "profit and power ought jointly to be considered," and Child, who thus anticipated Adam Smith in his doctrine that defence is more than opulence, added "I think none can deny that the Act of Navigation hath and doth occasion building and employing three times the number of ships and seamen that otherwise we should or would do." Decker in 1766 referred to it as "that most glorious bulwark of our trade." ('High Duties,' p. 21.) Lord Sheffield called it in 1783 "the guardian of the prosperity of Britain," and even Adam Smith says "National animosity at that particular time aimed at the very same object which the most deliberate wisdom would have recommended."

Thus contemporaries seem to have believed that the policy of the Navigation Acts was effecting its object and that it did actually build up the maritime power of Great Britain. To that policy Parliament held steadily till the end of the 18th century.

The result of the Acts on the colonial system is also a matter of dispute. They have been unjustly blamed as being the cause of much friction between the colonies and the mother country. Indeed they have been alleged to be one of the primary causes of the loss of the American colonies. It must, however, be remembered that the Acts were by no means strictly adhered to in the 17th century either in England or the colonies. Especially was this true in the case of New England where smuggling seems to have attained the dignity of a profession. In 1696 it accordingly became necessary to reorganize the Board of Trade, and Courts of Admiralty were established in the colonies to see to the more stringent enforcement of the law. A period of lax administration, however, began again with Walpole and lasted till the time of the Seven Years' War, when an attempt was once more made to stop evasions. After 1763 the Acts were to be worked so as to afford a revenue by which the colonies should contribute part of the cost of their own defence. Before that year the Acts do not seem to have inflicted any great hardship on the colonists, and the commercial monopoly the statutes sought to enforce was scarcely resented. "Whenever the Act pressed hard many individuals indeed evaded it," was Burke's dictum, and this was certainly true as regards the trade between New England and the French West Indies and Newfoundland. The colonists obtained from those places the French manufactures which according to law they were bound to get from England, but no serious attempt seems to have been made previous to 1763 to stop this illegal trade.

Again, the bringing of the "enumerated" commodities to England involved no very great hardship. England was the natural market for those goods, she being best able to undertake the distributing business in Europe with her old established connections. Where the "enumerations" worked hardly they could be relaxed, as was done in the case of rice in 1730. Moreover, in return for the restrictions thus imposed bounties were given to the colonists on the production of naval stores and copper. The growth of tobacco was put down in England so as to give the colonists a monopoly of the market. Another compensation was afforded to the colonies in the great development of shipbuilding and the carrying trade due to the protection given by the Acts to colonial shipping. Massachusetts not merely sold ships in Europe, but in England itself. The causes of the loss of the larger part of the first English Empire do not lie in the trade policy of the Navigation Acts.

In the 18th century the Dutch were outdistanced and England at last attained the position at which she had aimed of being the great carrier of the world. There is, however, no evidence to prove that the Dutch were injured vitally by the English Navigation Acts. The English colonial trade even at the end of the 17th century was only a small trade in the aggregate, and could not have been any very great loss to Holland at the time. The ultimate loss to the Dutch was no doubt great, since they were shut out of a branch of commerce which was capable of great development. The Dutch decline did not begin till 75 years after the passing of the Act of 1651. It was the increase in the volume of English trade while the Dutch trade remained stationary that raised England to the predominant mercantile position.

Between 1796 and 1822 many minor relaxations of the Navigation Acts were placed upon the statute book. Between 1822 and 1826 England's policy was materially changed. Reciprocity in matters of navigation took the place of monopoly. This involved also an alteration in the relations between the colonies and the mother country. To retain for the mother country the bulk of the colonial trade a system of preferential duties was established within the Empire. Between 1849 and 1854 the restrictions on foreign shipping and the colonial trade which were embodied in the Navigation Acts were wholly swept away.

Appointed Lecturer in Modern Economic History, University of London.

20 (b). Great Britain — British Shipping. To an island people, and especially to a nation which has necessarily to import four-fifths of the wheat it consumes, and fully one-half of the total amount of its food from countries beyond the sea, a large and efficient mercantile marine is a vital need. To such a nation, from a national point of view, the shipping and shipbuilding trades must be the most important of all trades.

At the present time the shipping trade is not only the most necessary, but in point of magnitude, it is the greatest of British trades. It is impossible to state with precise accuracy its total volume in terms of money, but the Board of Trade, in the careful and cautious calculation they published in 1903 (Cd. 1761) estimated the earnings of British ships in international trades, for the carriage of cargo alone, at $450,000,000 per annum. If to this sum be added the earnings of the passenger and mail services, and of the coasting vessels at home and abroad owned and controlled by British subjects, the total, in the opinion of those best qualified to judge of the question, cannot be less than $550,000,000 — an amount greatly exceeding the entire product of the largest British manufacture, that of cotton, which is estimated at $450,000,000, and is about equal to the total gross revenue of all the British railways. Deducting a small percentage for the port dues and charges of the ships in foreign ports, the whole of this sum is distributed among British industries. Unlike the cotton manufacturer who must pay away half his total receipts for his imported raw material, the British ship and her engines are built of British materials in British shipbuilding yards, the officers, engineers, and more than four-fifths of the sailors are British subjects; the vessel is repaired and provisioned in British ports, is coaled at home, and generally abroad with British coal, and insured by British underwriters. It will be seen that British shipping is emphatically a national industry. About one man in 36 of the population is directly employed in some capacity upon the sea, but those indirectly employed in the trades ancillary to, and created by, the shipping industry are many times greater.

The latest returns issued by the Board of Trade, those of 1904, give the total tonnage of the merchant vessels registered under the British flag as 12,156,101 tons net register, of which 10,554,520 tons belonged to the United Kingdom, and 1,601,581 to the self-governing colonies and other British possessions. Of the British tonnage, 8,751,853 tons consisted of steamships, and 1,802,667 tons of sailing vessels, that is to say five-sixths of the tonnage of the shipping of the United Kingdom is that of steamships, while of the colonial tonnage 674,640 tons was that of steamships, and 926,941 tons that of sailing vessels; that is to say little more than two-fifths was that of steamers. It is impossible correctly to appreciate the value of these figures except by comparison with those relating to other nations, and here the disparity is so great between the magnitude of the shipping tonnage of Great Britain engaged in international trade, and that of any other country, it would appear the only useful comparison is that between the mercantile fleet of the United Kingdom and those of all other nations, of which record exists, put together. These nations are Germany, France, the United States, Russia, Norway, Sweden, Denmark, Holland, Belgium, Portugal, Spain, Italy, Austria, Greece, China, and Japan. The latest published returns for these countries give the tonnage of their combined ocean merchant shipping as 11,894,853, a figure slightly below that of the whole British Empire, but exceeding that of the United Kingdom taken alone by some 12 per cent. A mere statement of total tonnage, however, is an incomplete statement of relative commercial efficiency. The best authorities calculate three tons of sail as being equal to one ton of steam, the latter at the low speed of 10 knots per hour. Of the combined fleets of the other nations of the world, 7,502,156 tons is that of steamships, and 4,392,697 that of sailing vessels. Thus, while five-sixths of the tonnage of British shipping is that of steamers, more than one-third of that of other countries consists of sailing vessels. Further, an analysis of the character and speed of the relative fleets gives still further proof of the superiority of the British marine. A high shipping authority, the editor of the 'Shipping World' (of London), after long and careful research has made and published as accurate and impartial an estimate as it is possible to make of the comparative efficiency of the British and foreign mercantile fleets. Taking a 10-knot steamer as a unit, and adding and deducting from tonnage in proportion to the departure from this standard of speed, to obtain the potential carrying power, he finds that the potential carrying power of British shipping is represented by the figures 16,445,000 against 13,061,000 for that of all other countries combined; while, if steam tonnage alone is taken, the figures for potential efficiency for the United Kingdom, and all other countries taken together, are 15,834,000 and 11,555,000 respectively.

The progress and prospects of this great trade appear to be satisfactory from the British point of view. The last Board of Trade Return, that for 1904, shows an increase of 352,000 tons in the British register, or more than tenfold that of Germany, France, or Norway the nations which rank next in point of increase.

The British demand for new ships is entirely supplied by the shipbuilding establishments of the country, which in addition have built for other nations during the last 10 years an annual average of about 200,000 tons, exclusive of ships of war. The mercantile fleets of other nations also consist, to a considerable extent, of the vessels discarded and sold by the British shipowners. The tonnage of the vessels so sold and transferred to the registers of other European nations has amounted to an annual average of 360,000 tons during the last 10 years.

To this remarkable concentration of a great trade, one of a specially international character, and one greatly desired by all, in the hands of one nation, many causes have contributed. History shows that it cannot be attributed to commanding geographical advantage in the position of the British Islands, nor to any supreme aptitude of the British people for the life of the sea, and for conducting the oversea trade of the world. In the art and the science of shipbuilding the French have always been well to the front. In the Napoleonic wars Nelson's best ships were those he had captured of French build. In our own time the French have more than once given a lead in naval construction; the first armored ship was French; it was the French who introduced the water-tube boilers, and constructed the first submarines. The coasts of Normandy and Brittany have always furnished hardy and courageous sailors and fishermen, and yet to-day France stands low in the scale of mercantile maritime powers, notwithstanding the extravagant subsidies she pays to her shipbuilders and shipowners. America contests with Great Britain the honor of the successfully applying steam to navigation. Fulton's experimental boat in 1798 was four years earlier than Symington's *Clermont* on the Forth and Clyde canal. The *Savannah* in 1819 was the first vessel with auxiliary steam to cross the Atlantic. Both in the construction of sailing ships and in the improvement of the early marine engine America led. Yet her tonnage of ships Registered for Oversea (Foreign Trade) (1904) stands within 1,000 tons of the figure of 1840. The supremacy of the British mercantile marine, therefore, cannot be attributed to the possession of superior inventiveness or aptitude of the British men for the command of the sea. The phenomenon itself is a very modern phenomenon. «It may be assumed,» says Mr. Cunningham, an authority on economic history, «that in the Middle Ages the shipping of the Italian Republics and the Hanse League excelled that of England.» The chance of England did not come in fact until the discoveries of Columbus and Vasco di Gama opened the Western and Eastern Oceans to commerce, which, until that time, had been confined principally to the Mediterranean and other inland seas. In later times we find that Spain and Portugal, and afterward, Holland took the lead in the new ocean traffic, so much so that in 1603 Sir Walter Raleigh wrote, «The merchant ships of England are not to be compared with those of the Dutch.» The English position, however, was improving, and in 1666 Sir Henry Petty estimated that the Dutch shipping tonnage amounted to 900,000 tons, English to 500,000, French to 100,000, Hamburg, Dantzig, Denmark, and Sweden to 250,000, and Spain, Portugal, and Italy to 250,000. At this time English shipping was subject to the celebrated Navigation Act of Oliver Cromwell (1651), the principle of which, broadly speaking, was to confine foreign trade with European countries to the vessels of Great Britain or of the country with which the trade was carried on; and all trade with any of the more distant continents, or with any of the plantations of Great Britain, entirely to British ships. The Navigation Laws of other maritime nations were framed in a similar spirit on similar lines. In the international race all competitors were pretty equally privileged or handicapped. Although the whole system had become riddled with exceptions and exemptions and suspensions, due sometimes to necessity, and sometimes to reciprocal treaties, the principle of the legislation of Cromwell remained in force until the Navigation Acts were finally repealed in 1849. The great expansion of the trade of the world in the first half of the 19th century together with the improvement in the size, speed, and cost of building and operating the new steam fleets, had rendered it generally impossible to maintain the mediæval system of the old Navigation Laws, and although other nations did not, like Great Britain, emancipate themselves from these fetters at a stroke, they have found it impossible to maintain them, and the relics of the ancient system survive in the present day chiefly in the form of the reservation of their coasting trades by many, though not by all, the civilized nations of the world, certain restrictions on their colonial trades, and in addition to this, in the case of the United States, the restriction of the privilege of the American register, with its exclusive right to the coasting trade, to ships built in America of American materials. The mediæval system in its old barbarous form has universally passed away, and for more than half a century Great Britain has carried on her oversea trade in the atmosphere of free competition.

In all the previous centuries she possessed no marked superiority as a shipowning and seafaring community, and at the time of the Free Trade revolution she might only with some doubt be placed first among the mercantile maritime powers. She was then making no marked progress in comparison with other nations, and in some respects was declining. For example, although, after the great war in 1815, the shipping tonnage of the United States was not half that of the United Kingdom, in 1850 the American mercantile marine had grown to be very nearly equal to that of England in total tonnage, if coast and lake and river steamers be included, and greatly exceeded it in efficiency, for it included more than half a million tons of steam shipping against less than 200,000 tons of British shipping of the same class. Although the tonnage of all American ships registered for oversea (foreign) trade was at that time only about one-third of that of Great Britain, it was superior in quality, and was increasing with greater rapidity. The Americans excelled in the speed, efficiency, and beauty of their sailing ships, and the celebrated «Baltimore Clippers» and «American Liners» almost monopolized the carrying trade between Great Britain and the United States. In the middle of the 19th century it may be said that Great Britain and the United States were worthy and well-matched rivals in the race for leadership upon the ocean.

It is an interesting question to ask what are the causes to which this modern phenomenon, the supremacy of Great Britain in the trades of building, manning, and operating ships, is to be attributed; and especially those which have led to the decline in the mercantile marine of the United States registered for foreign trade, almost to the point of extinction. It would be erroneous to attribute this commercial revolution to any one cause. The substitution of steam for sailing ships does not appear to have been of any particular advantage to Great Britain, for during the first 30 years of the existence of sea-going steamships America kept the lead in this class of shipping, and her engineers contributed largely to the earlier development of the marine engine. The later substitution of iron and steel for wood as the material for the construction of ships undoubtedly gave a great temporary advantage to England, which was at that time and remained for many years the largest and cheapest producing country of iron and steel, but it does not explain the fact that while the production of iron and steel in America now greatly exceeds that of the United Kingdom, this country has not been able to regain any considerable portion of the trade of building and operating ships for international commerce. Undoubtedly the American war had a disastrous temporary effect upon American shipping, shown by the decrease in the tonnage of ships registered for oversea trade from 2,546,237 tons in 1860 to 1,516,800 tons in 1870, but this does not explain the failure of the United States to recover this single trade in succeeding years; still less does it explain the continuous reduction of American tonnage to 898,768 tons in 1904. The principal explanation of this phenomenon is undoubtedly to be found in the opposite fiscal policies pursued by the two countries. It would not be proper in this place to enter into an argument as to the general results of the British policy of Free Trade, and the American policy of Protection upon the two countries, but it is a fact admitted alike by free-traders and protectionists, that the control of this particular trade of international shipowning and shipbuilding has been determined by their mercantile policy (see GREAT BRITAIN — FREE TRADE). The growth of the shipping supremacy of Great Britain, a supremacy becoming more marked each year, dates from the adoption of the policy of free imports in the years 1840–50, coupled with the abolition of the Navigation Laws in 1849. The process of the absorption of international shipping by British shipowners has undoubtedly been assisted by the protection policy of other nations. By restricting their importation of British material goods, the inexorable economic law which compels each trading nation to pay its debts and balance its international accounts, has rendered it more convenient for Great Britain to pay for her great imports of food and raw material to the nations which refused her cotton goods or her iron, in the form of shipping services, which form at the present time the largest of British exports. The result has been that while the total volume of British trade amounts to not more than one-seventh of the trade of the world, British ships carry more than one-half of the trade of the world. The volume of purely foreign trade, that is of trade between foreign port and foreign port — trade which does not touch the ports of the United Kingdom, carried by British ships — largely exceeds that of the direct trade to and from British ports. In contrast, the gradual decline of the American trade is well set out in a statistical table prepared by Mr. Meikle, Secretary of the Seattle Chamber of Commerce, and published in the Report of the Merchant Marine Commission at Washington in 1905. It showed that in the year 1821 the percentage of the import and export trade of the United States carried in American bottoms was 88.7. This proportion, which remained fairly steady until 1850, had shrunk in 1860 to 72.5 per cent. From that year onward the decline became increasingly rapid until in 1900 the percentage carried in American bottoms was only 9.2; and at about this figure it remains to-day.

RUSSELL REA, M. P.

21. Great Britain — Railways. *Comparisons and Contrasts Between the Railway Systems of Great Britain and the United States.*— "The plastic American instinct has introduced the wholesale principle into regions where the slower-witted nations of Europe have never thought of applying it. The factory life of England is new, and British manufacturers fully appreciate the economies to be effected by turning out pins by the million gross, cotton yarn by the million pounds, and steel rails by the tens of thousands of tons. But the Americans have applied the principle to businesses which have existed since the dawn of civilization. Their hotel-keeping is wholesale; their farming is wholesale; and, most of all, their transportation system is wholesale. The English farmer still looks upon the railway train as only a slightly magnified carrier's cart, and persists in sending his basket of eggs or his hamper of vegetables to market, as his grandfather did when George III. was king. The American farmer does his business in carloads."*

The writer, in a book written by him 15 years ago, after his first visit to the United States, pointed out in these words what seemed to him then, as it seems to him now, the essential differentia between English and American railroading, and suggested that the difference is not accidental and specific, but part of the generic difference between the two countries which naturally arises from their different historical and geographical position.

But there are other important differences between the railways of England and the United States. England is an island, and a small one; America is a great continent. The maximum possible haul within the British Isles is just

* "The Railways and the Traders." (London, 1891.)

about as far as from New York to Chicago. In fact there is practically no traffic here requiring to be carried any such distance. If it did, it would probably go by water, for there is no place in Great Britain more than 80 miles from a sea port. Any thing over 100 miles is referred to in England as a long haul; in the United States the average haul of freight is 133 miles. The average passenger journey in the United States is 30 miles; in Great Britain it is probably — accurate statistics do not exist — about 10 miles.

Again, Great Britain is densely populated; the United States is the reverse. On one-thirtieth of the area of the United States, England has half as much population. Naturally, therefore, while the United States has fewer miles of railway per square mile of area, Great Britain has fewer miles per thousand of the population. Roughly, the United States has one mile of railway per 18 square miles of area; Great Britain, one mile for every six square miles. But in Great Britain there is a mile of line for every 2,000 of the population; in the United States a mile of line for every 400. The population of Great Britain, and therefore, its intercourse, per mile being so much greater, it is also natural that a mile of railway is a much more elaborate thing than in the United States. For every route mile in the United States there are one and one third miles of track, while in Great Britain there are well over two miles. In equipment the contrast is even greater. With only one-tenth of mileage of railway in the United States, Great Britain has half the number of locomotives, more passenger cars, and nearly as many freight cars.* Put another way, a mile of English railway represents an expenditure of almost as many pounds as a mile of American railway represents dollars; a mile of English line earns five dollars for every two dollars that an American mile earns.

It must not, however, be assumed that a mile of English railway does work as compared with a mile of American in the same ration in which it earns revenue. How much work American railways do is known. In the year 1905 they carried over 22,000,000,000 passengers and 174,000,000,000 tons of freight one mile. The railways of the United Kingdom in the same period — according to the best estimate that, in the absence of precise statistics, it is possible to make — carried about 14,000,000,000 passengers, and 150,000,000,000 tons one mile. In other words the railways of the United States dealt with over 700,000,000 passengers, carrying them on the average 30 miles each. English railways dealt with double that number, but only carried them on the average of 10 miles each. In freight service the railways of the United States handled thrice the tonnage of English railways — 1,300,000,000 against 450,000,000 tons, and carried it nearly four times as far — 133 miles against an estimated 30 miles. The average mile of railway therefore in America carried in the year (in very round figures) 100,000 passengers and 800,000 tons of freight. For the United Kingdom the estimated figures are 600,000 passengers, and 670,000 tons of freight. Less freight service but six times as intense a passenger service. It would be wearisome to pursue the statistical contrast further. We may sum it up by saying that, whereas in the United States the typical passenger travels for a considerable distance at pretty long intervals, in Great Britain the railway occupies in great measure the place of the street car of the United States, and is the means by which large sections of the population move daily to and from their work and whereas the typical freight consignment in the United States is a "straight" carload of produce carried for a long distance, the typical consignment in Great Britain is a single box, or bag, or bale, or other package of manufactured articles, carried from one town to another closely adjacent.

The service required of the railways by the public of the two countries being so entirely different, it is only natural that the method of performing it, and the charges made for it should show equally wide differences. In the United States the railways receive two cents per mile on the average for every passenger, and at this rate find passenger traffic barely profitable. In Great Britain the railways receive hardly, if at all, more than one cent a mile on the average. Yet they can make a handsome profit, spite of the fact that they give a much more frequent and a faster service, with accommodation certainly not inferior in comfort. The mainstay of railway prosperity in the United States is in the carriage of freight at a rate of, roughly, five miles for four cents. English companies' receipts average, it is estimated, not less than two cents for each mile. Yet the prevailing opinion of those best qualified to judge is that much of the freight traffic in Great Britain is unprofitable, while not a little is done at an actual loss — for the irony of fate has decreed that England, with freight rates undoubtedly on the average the highest in the world, shall also have certain rates undoubtedly the lowest. For instance, for eight cents the Great Eastern Railway Company will bring from any of its country stations, say between 50 and 130 miles off, and deliver to the consumer's door in London a box of farm or garden produce of a gross weight of 20 lbs. See AMERICAN RAILROADS; RAILWAY SYSTEMS OF THE UNITED STATES; RAILWAY CONSOLIDATION.

Similarity.— England and the United States are the only great countries where the railway system has been provided by practically unaided private enterprise, and still remains in the hands of practically independent private companies. In both countries the state has found it necessary to interfere at many points, and an interesting essay might be written comparing the methods of government control adopted in each. But here it can only be very briefly pointed out that in both countries the Anglo-Saxon tradition has prevailed, and such governmental control as exists has taken in the main a legislative and judicial form. Executive interference — which in France descends to the minutest details of every-day operation — is of relatively small importance. On the whole it is safe to say that English railways are and always have been more closely supervised by public authority than the railways of the United States. On paper it is true some States of the

* Of course in Great Britain the locomotives and cars are smaller and freight cars only one-third of the size of those of the United States. The comparison includes freight cars privately owned (believed to be not less than 500,000 in number) which are ignored in English official statistics.

Union — Texas more particularly — appear to interfere more than does the English government. But the operation of the Constitution and the rival state and federal jurisdiction secure even for railway corporations in Texas a considerable degree of practical freedom, while there is no possibility of escape from the supreme and final authority of an English Act of Parliament.

Laws Governing the Railway Systems.— According to the English code of railway law, which took practically its present shape as long ago as 1845, no company can come into existence, no new line can be constructed, no new capital can be raised without the authority of a special Act of Parliament, which lays down with great detail the constitution of the company, the route of the line and its method of construction, the amount of the capital and the purposes to which it shall be applied. Maximum rates and fares for goods and passengers are also prescribed. The authorized railway cannot be opened for passenger traffic until an inspection by public authority has secured that every possible precaution for safety has been taken. Once opened, however, the operation of the company is in the main in its own hands. Not so, however, the commercial management. A special court, the Railway Commission, exists to watch over the observance of the law of undue preference. Its powers are, it is true, seldom invoked, but that is the best proof of their real efficacy. Further, the same tribunal has power to forbid the increase of any existing rate for goods, and does in fact refuse to permit any such increase unless under exceptional circumstances. See Railway Consolidation: *England.*

Finances.— Regarded as financial investments, the relative position of English and American railway stocks has been completely inverted within recent years. Formerly English railways were the most popular investments for English capital. To-day they are quite out of favor. The stock of one leading company, quoted a few years ago at 230, has recently been sold at under 150, though the dividend has remained practically unchanged. In cases, and they are very numerous, where the dividend has fallen, the drop in the capital value has been even more marked. It would probably be safe to say that the market value of English railway securities has fallen by at least a thousand million dollars within the last decade. In the year 1900, for the first time on record, the average earnings of all English railway capital fell below 3½ per cent. And this at a time when trade was booming, and when the valuation of American railway capital was advancing by leaps and bounds. The explanation is simple enough. The cost of working has been steadily rising owing to the more exacting demands of the public, the increased cost of materials, and the higher wages and shorter hours of the railway employees. The operating ratio rose steadily from 52 per cent in 1889, to 63 per cent in 1901. Moreover, with net receipts stationary, the railway capital has grown with alarming rapidity. For, it has been the traditional policy of English railway companies to divide half year by half year the whole of its profits among the shareholders, and to charge all additions and improvements to capital. This has been done perfectly openly and deliberately. But it has proved to be short-sighted finance. For it has resulted in swelling capital accounts to a size on which the earnings of the line can hardly pay more than a very modest dividend. And, in this staid, old-fashioned country, no railway company can hope to wipe out its past and start afresh with a reorganized capital account, as did some of the greatest and most famous railroads of the United States after the financial collapse of 1893.

One other point of contact between England and the United States may be noted in conclusion. Between them they are responsible for the original invention of railways, and for every important improvement in railway methods and practice that has been introduced since. There are some students of railway history who, spite of the fact that the nations of continental Europe are more and more going over to state ownership of railways, believe that this is no accident, but rather a natural result of the Anglo-Saxon habit of leaving to private enterprise the utmost freedom which practical experience shows to be compatible with the welfare of the nation at large.

THE PRODUCTION OF WEALTH.

22 (a). Great Britain — The English Land Law. *Sources and General Characteristics.*— The law of land, or "real estate" bears the traces of the different streams of influence that have made English history. It derives its main characteristics from the feudal organization of society but these characteristics have been superimposed on other systems, or combined with other elements, which may be of early Germanic, Celtic, or in some instances even of Roman origin. Again, the land laws have been the subject of frequent legislation; in the usual English method, particular evils have from time to time been remedied without any logical recasting of the body of the law and without the removal of mere anomalies which could not rank as grievances. But the main principles of the law may still be called feudal.

The modern law may be compared to a chalk cliff in which are many fossils; a cliff pierced by works and tunnels for such useful purposes as railways or mines, but left, where modern necessities have not interfered, to the slow decomposing action of the elements. The chalk is the feudalized common law, the fossils are pre-feudal survivals, such as land of "copyhold" tenure, the works and tunnels are Parliamentary Statutes, and the elements are the forces of public opinion acting by judicial exposition and construction. Compared to the law as it was in the early years of the 19th century, the modern law of real property is simple, but if it be tested by any more severe standard it still retains many intricacies for which it is easier to find a historical than a logical explanation.

Land on feudal principles is the subject of tenure and not ownership. No man owns English land unless he be King of England. Land is always "held of" some one — either the King, or a tenant in some degree of the King. Land was thus originally looked on rather as the means of fulfilling a duty than as so much property, and for the comparatively simple conception of ownership was substituted the more subtle idea of "estates," *i. e.*, parts of and interests in ownership. Some of these interests were not recognized in the Courts of Common Law but only in "Equity," *i. e.* the extraordinary jurisdiction of the Chancellor. In time the feudal idea of tenure ceased to express the real state of things, and a tenant in fee simple became and has for many centuries been an absolute owner. But the inherited complications remained and indeed grew, being constantly developed so as to evade and even counteract Parliamentary Statutes which landowners and the legal profession viewed with disfavor. In 1832 the English land law was a vast metaphysical system requiring and developing great acuteness of intellect among practitioners but utterly unintelligible to a layman.

The feudal theory of tenure gave to English land holding a certain social character which in many country districts has never been lost. To this day land in rural England is looked on less as a means of livelihood or source of income than as giving a certain social status to which rights and obligations are attached. Indeed it would be difficult even now to give a better definition according to received ideas of the English upper social class than to say that it consists of the owners of the country estates of England.

The legal position of the possessor of land may be considered in three main aspects: his relations to his predecessors and successors, including what may be called family law; his economic and social relations, including the law of landlord and tenant; and his relations to the community as a whole, including his liability to taxation and generally the rights and powers of the State.

Family Law: (1) *Settled Land.*— England is a country of large properties, and most large properties are, to use a legal phrase, "Settled Land." The meaning of this is that by the terms of some deed or will (called for this purpose "a settlement") the land is not at the disposition of a living person to sell, mortgage or give away; the apparent owner is only what is called a "tenant for life," and on his death the land will pass to some other person, generally his eldest son, if he has children, but if he has not, then to some collateral relative, without any effort and without any power of interference on his part. A "settlement" of this kind may be looked on as a temporary and conventional "entail"; it originates in the voluntary act of some tenant in fee simple, and its duration is limited by law to the life or lives of some person or persons in being when the settlement is made and a further period of 21 years afterward. The practical effect of an ordinary English settlement is to preserve the land for two or even three generations to the eldest living male of the senior line as head of the family to the exclusion of females and younger sons. In most land-holding families as soon as the person who will succeed to the land not merely as a life tenant but with absolute power of disposition, is next in succession and is 21 years of age, he joins with the existing tenant for life — usually his own father — to resettle the land for another two generations. Thus one settlement succeeds another, and a tenant in fee simple is rarely, if ever, in possession. Provision is usually made for a widow of a tenant for life by giving her an annuity known as a "jointure," and younger children are given comparatively small sums of capital known as "portions" which are made charges on the estate. This practice of settlement is permitted but not enjoined by the law; it came into fashion about the middle of the 17th century. It is thought by some observers that the practice now (1906), shows some signs of being on the wane, but no direct evidence is available; certainly it still affects nearly all large properties, and therefore the greater part of English land. Its result has been to make each eldest son in turn the proprietor of one or more family estates, to prevent the dispersal of land into many hands, and to keep for the head of a family a social prestige and preëminence among both relations and neighbors. If there happens to be a peerage or baronetcy in the family, the land practically always goes with the title. In fact it is not uncommon even in cases where there is no title or honor in the family for the settlement to provide that any person succeeding who does not already bear the family name — *e. g.* a married daughter, or a daughter's son — shall take the name and armorial bearings of the author of the settlement on pain of exclusion from the property. Younger sons, on the other hand, after a boyhood spent on the family property are left with slender portions to make their own careers; thus in their case class distinctions tend to be obliterated; younger sons of the land-holding class may be found in almost every branch of activity, in the navy, the army, in orders in the Anglican Church, in commerce, and in the learned professions.

British colonial development owes much to the adventurous disposition fostered by the outdoor life and the economic necessities of the younger sons of the land-holding classes.

Formerly the main economic objection to the legal fetters imposed on land-holders by settlements, was that during a settlement the land was taken out of commerce as it had no proprietor who could sell. This difficulty has now been removed as the result of an important Act of Parliament (The Settled Land Act

1882). Every English tenant for life may now (1906) be considered as a kind of plenipotentiary agent for the whole family, born and unborn. Subject to certain not onerous restrictions, he can sell or lease for long periods on the recognized terms as he pleases; indeed he can do almost anything which a prudent and honest owner would do, but always on the terms that the property or the proceeds of sale are kept to descend in due course of settlement. But the real fetters on an English tenant for life are not those which the law imposes, but the fetters of tradition and family sentiment which no legal power or ingenuity can remove.

(2) *Land not Settled.*— Apart from this liberty of terminable settlement the English law does not favor restrictions on the powers of a landholder. No entail can by English law be created which cannot be destroyed as soon as some person unborn at the date of its creation attains 21 years of age. In the 15th century English lawyers, more daring than their Scottish brethren, with public feeling behind them, went so far as in substance to defeat the provisions of a Statute of Edward I. (*De Donis Conditionalibus*, A.D. 1285), by which Parliament had sought to make entails perpetual. Where land is not settled, in the case of the death of a landholder without a will, the common law on feudal principles gives his land to his eldest son; prefeudal customs are, however, not left entirely without witnesses; in parts of the county of Kent the older custom of equal division, known as gavel-kind, still prevails, and in a few ancient boroughs under the custom known as "Borough English" the youngest son alone succeeds. But cases of intestacy are not common among the wealthy classes.

Wills.— A tenant in fee simple has, contrary to feudal principles, been gradually empowered by successive Acts of Parliament, culminating in the year 1662, to dispose of his land by will after his death in the same absolute manner as during his life. He can disinherit totally or partially all or any of his children and can at his pleasure give the land to strangers or, since the year 1891, even to charity. But the charity as a rule is bound to sell the land and not retain it.

Landlord and Tenant. (1) *The Town.*— There is a sharp contrast between the land system in the towns and in the country. In and near towns the proportion of settled to unsettled land is probably smaller than in the country; but even in the case of settled land the tie between landlord and tenant is purely economic. A town landlord may often be of inferior social standing to his tenant; further, urban and suburban land is often owned by commercial companies formed for dealings in land. But both in town and country, England is a land of large properties and it is the exception to find that the actual occupier of land is, in the popular phrase, "his own landlord."

On all land in or near towns, building is usually done on the lease-hold system. By this system the land is let, usually to a builder, for a long period, from 80 to 99 years. The lessee contracts to build and keep his building in repair; to pay an annual "ground rent"; to discharge all taxes levied on the land, and in fact to bear all possible burdens connected with it. At the end of the lease the land and the building on it revert to the successors of the original landlord. The long lease thus granted may usually be sold or mortgaged at the pleasure of the lessee, and the building itself is frequently sublet by the lessee as landlord to the actual occupant as tenant, who pays to the original lessee or his successor a full or "rack" rent for building and land together.

Until recent years the whole tendency of the law was to favor the landlord as against the tenant, and even now the law can hardly be said not to lean in the landlord's favor, particularly in allowing him the right of distress for rent. In the exercise of this right, contrary to the general principles of English law, a landlord whose rent is in arrear can without the judgment of any Court seize and sell any chattels of any person, whether his tenant or a stranger, that he can find on the premises, and thus pay himself his rent. Recent legislation (The Conveyancing and Law of Property Act 1881) has, however, interfered against the landlord, who, whatever the terms of the lease, can now no longer forfeit a lease for a casual breach of covenant not deliberately persisted in by the tenant.

This leasehold system in and near towns, though frequent, is not by any means universal, especially in the north of England; there, a common plan is to sell land for building purposes out and out, in consideration of a perpetual rent reserved to the vendor. Further, the simple plan of the sale of building plots for a lump sum is probably growing in favor, particularly in suburban districts developed by land companies. A company of this kind has no family pride in the preservation of its estate, nor does it wish to realize an improved value after three generations.

(2) *Country.*— In the country districts the long leasehold system is unknown. The ordinary English farmer usually does not hold a lease for any fixed term of years, but has merely a tenancy from year to year determinable by 12 months' notice. As a rule all the farm buildings have been supplied by the landlord. The tendency of modern legislation is to give the agricultural tenant security for the value of his improvements, but the old law, which treats whatever is built or planted on land as an accretion to the land, and therefore the property of the landlord, still governs in the main the relationship of landlord and tenant.

The tie of landlord and tenant in the country districts is for good and for evil, not merely economic. The landlords are the social magnates of the countryside. As unpaid magistrates they have had up till now (1906) practically a monopoly of the ordinary dispensation of all minor criminal and some civil justice. On the other hand, in bad years they are expected by the common opinion of the countryside to allow and do allow considerable reductions on the agreed rent. A "good landlord" is the man who is always ready to aid his tenants in sundry ways. On well-managed estates, the system works easily. The system, however, is one which for its success depends on the peculiar social conditions which have hitherto prevailed in rural England, and its transplantation to Ireland, where these conditions did not exist, had results disastrous for both countries.

Sporting Rights.— In England the love of sport has been a prominent characteristic of the landholding class throughout all history; it is practically the universal custom for a landlord to reserve the sporting rights over agricultural land. If he does not exercise them himself, he lets them to some other person. Where sporting rights are reserved the tenant has no right to kill pheasants or partridges, but the Ground Game Act of 1880 empowers the tenant himself, and one other person authorized by him in writing, to shoot hares and rabbits on his land whether sporting rights are reserved or not, and whatever the terms of the tenancy agreement.

Land and The State; Taxation.—The taxation of land is a question that is complicated by some historical anomalies. (1) *Land Tax.*— The burden commonly known as Land Tax represents historically the surviving portion of a general tax in the nature of an income tax imposed both on real and personal estate in the year 1692; but it has for many years been a mere stereotyped incumbrance redeemable by the landholder, and charged on the value of the land as in the year 1692. On most urban land the tax has been redeemed. (2) *Income Tax.* — Incomes derived from land, *i. e.* the net rent of land, are liable to income tax equally with incomes derived from other sources. (3) *Death Duties.*— Before 1894 land escaped the greater part of the death duties imposed on personal property, but since the Finance Act of that year all species of property are in this respect on an equality. (4) *Local Taxation.*— On the other hand a man's liability to local, as distinct from imperial, taxation is estimated by the value of the real property (*i. e.* land and buildings) which he occupies, no account (in spite of some earlier statutory provisions to the contrary) being taken of his personal property. On agricultural land, by an Act of Parliament passed in 1896, only half the ordinary rate is paid. But no contribution is made to local taxation in respect of the capital value of land, or of land which is not occupied, however high may be its value.

Other Rights of the State.—The feudal principle of the ultimate ownership of the King has produced little or no effect in giving to the State which the King personifies, rights over English land. The modern State has practically no mineral rights. The precious metals, gold and silver, which for commercial purposes are practically not found in Great Britain, are in law Crown property and can only be worked under license from the Crown. But all other minerals belong to the tenant in fee simple of the soil who leases or works them for his own private benefit. The Crown lands in England are small in extent; ownership by local authorities is still in its infancy. There is no prairie land to grant to railway pioneers or new settlers. When land is wanted for the purpose of some undertaking of a public nature — such as a railway, waterworks, or the site of a post-office — it has, as a rule, to be purchased by the company, or authority concerned, under statutory machinery, by which the fair value of the land has to be paid, plus 10 per cent. compensation for compulsory sale. In the year 1887 the principle of compulsory acquisition was, subject to many safeguards, extended to the acquisition by a local authority of land to be let in very small quantities, called allotments, to agricultural laborers or others for cultivation. The Irish Land Purchase Act of 1903 proceeded on the principle of a loan by the State to a tenant who wished to purchase his holding from his landlord, and agreed with him as to the price. It did not directly involve either public ownership or compulsory acquisition.

Transfer.— In recent years several attempts, culminating in the Land Transfer Act 1897, have been made to induce English landholders to abandon the present system of private transfer of land for a system based on a Land Registry. Under the present system whenever land is sold or mortgaged, it is necessary for the purchaser or mortgagee to satisfy himself as to the title by going into all dealings with the land for a period which may be as long as 40 years. This is an expensive process, but it has been endeared by centuries of experience to English landholders and lawyers. At the present time, a public Land Registry has been substituted for the old system only in London. The principle of the new system is to enter the name of the proprietor of (or rather the person entitled to sell) every piece of land on a register and to make land transferable by the person registered by means of a fresh entry on the registry, as if it were so much stock in the funds. The extension of this system to the rest of the country is a question of time; but in legal matters time moves slowly.

Trend of the Law.— Recent developments of the law have in nearly all cases tended to restrict the freedom of the individual in relation to land. Neither in town nor country are landlord and tenant allowed to make what bargain they choose; it is assumed that the economic inferiority of the tenant places him at too great a disadvantage for it to be possible for him to make a contract fair to himself, and so beneficial to the community. Men are no longer allowed to settle their land in such a way as to make it unsalable, and the community has asserted the right to dispossess the individual, not only for definite works of a public nature, but in order to provide its poorer members with an interest in the land. It has also compelled land owners in the Metropolis to abandon the old system of private conveyance and mortgage for a system which is in a sense public, as it is worked by public officials, and which may thus be regarded as a kind of reversion to the old method of public transfer. The same system will also in time form — what is badly wanted — a new and more accurate 'Domesday Book.' Finally, modern legislation has put an end to the former advantage of land in respect of taxation and so claimed a larger share in real property directly for the State. The simplification of the land laws may be said to be one aspect of this change; intricacy and subtlety of phrase and interpretation may be tolerated by a private owner as the price of the liberty of complicated dispositions and of secrecy, but these niceties are inconsistent with the uniformity which must accompany public control.

22 (b). **Great Britain — The Eighteenth Century — Agriculture.** Between 1700 and 1815 English agriculture changed its whole character. England became a great corn exporting country and continued so up to 1773. Great agricultural improvements were carried through, stock breeding became scientific, waste land was broken up, large portions of the fens were drained, big farms with enterprising up-to-date farmers became the object of every landlord and the agricultural system which had come down from Anglo-Saxon days, and which still prevailed over large parts of England, was given up. English farming became intensive in character instead of mainly extensive. The social effects of the change involved the disappearance or degradation of the landowning peasantry or yeoman class. On the other hand it was only by means of the great increase in agricultural produce that England was not starved into submission during the Napoleonic wars. The changes in agriculture of that century meant ultimately nothing more nor less than national independence.

One of the main objects of English policy had been for centuries the encouragement of agriculture. A sufficient food supply raised at home deprived the enemy of the power of cutting off supplies from abroad. Moreover agriculture was considered the best breeding ground of good soldiers. Corn also was an excellent commodity for ships to carry, and the encouragement of corn export formed part of the Navigation policy of the realm. The great attention bestowed by successive governments upon agriculture was the most original part of English policy. Her seamanship she copied from Holland, her industrial protection from France; but while every other country aimed at preventing the export of corn so as to have a sufficient food supply, England deliberately stimulated export believing that thereby farming would be best encouraged.

This policy reached its most complete expression in the Corn Bounty Act (I. Wm. and Mary, c.12) of 1689, by which, when the price of wheat was at or below 48 shillings (and proportionately for other grains) a bounty was given on export.

The result of this law was to attract capital into farming. Men who sunk money in improvements were assured of a price which should not fall below 48 shillings and under the stimulus of this certainty a great agricultural revolution began. There grew up gradually a class of capitalist farmers and "spirited landlords" who were willing to carry out experiments. The result was that by 1770 England not only produced food for a population that had doubled itself, but was the granary of Europe.

One of the great improvements of the 18th century was, for example, the manuring of land, by which Arthur Young calculated that three or four hundred thousand acres of waste were turned into gardens. A revolution in fodder was brought about by the introduction of turnips and clover, while careful attention to grass seeds resulted in good hay on which cattle could be kept in condition in winter. Previous to the introduction of winter roots the majority of the beasts had to be killed in the autumn and salted down, while the remainder declined in weight through sheer starvation. This annual loss was now averted and a supply of fresh meat secured all the year round.

It therefore became worth while to improve the breed of the animals themselves. Bakewell of Dishley and Coke of Holkham wrought a revolution in English life with their Leicester and Southdown sheep and Devon cattle. Animals were now raised primarily for food instead of for their wool or hides, they were ready for the market sooner and the average size of cattle doubled and trebled. Thus a larger food supply was secured, and the great stockbreeders wrought a change the effects of which were as far reaching as those of Watt and Arkwright.

Before however this scientific farming could become general it had to become known. Roads were undeveloped, people in one county could not know what was passing in another, there was no agricultural newspaper — no machinery to make this knowledge common property. Moreover with the inherent conservatism of the agricultural class it needs something more than mere knowledge to make a farmer change his ways.

The necessary diffusion of information was carried out largely by Arthur Young and the Board of Agriculture, while the stimulus of the great wars and the shortage in the food supply provided a powerful incentive for improvement by means of high prices. Moreover, the growth of the iron and coal trade had led to the cutting of canals, and internal communications of all kinds were improved. People could get about; great towns began to grow up, providing an ever increasing market for food stuffs. It therefore became more and more worth while to effect improvements, and scientific agriculture became a patriotic hobby. The King himself wrote articles for agricultural newspapers and the great agricultural meetings and cattle shows put a spirit of emulation into farmers.

The chief obstacle to betterment lay however in the fact that much of the land was owned by small farmers who simply had not the capital to get good stock, implements, seeds and manures. Moreover, the system of farming among the peasantry was that of farming in strips, each man having about thirty strips of land but no two lying together. These strips were separated from one another by turf balks, and after the hay and corn harvest had been gathered all the animals were turned indiscriminately over the open fields. The system was most wasteful. It was quite impossible to adopt improved methods of cultivation on half acre strips. No winter crops could be grown because the cattle ranged all over the fields from September to February. No improvements in breed could be carried out when good cattle were exposed to the infection of the mangy village herds with their foot and mouth disease. No drainage could be attempted since the outfall would be on some neighbor's strip. The loss of time involved in going from piece to piece, and in carting little bits of hay and corn from different places, to say nothing of the waste of numerous footpaths and the endless disputes over real or fancied encroachments, made the system one which in the interest of good farming it was highly desirable to displace. It was established by the Board of Agriculture that tenants lived comfortably on enclosed land rented at 10/6 an acre who had starved on open farms at 2/6 an acre and that enclosed land at 20/- an acre was cheaper than open land at 8/-.

The famine years of 1795, 1800 and 1801 made the prosperity of agriculture a pressing national question. Enclosures were pushed on rapidly, partly by the agreement of the parties concerned, but mainly by private Acts of Parliament. The general result was that the scattered strips were given up and each farmer received an equivalent in a compact little holding all in one place.

Between 1770 and 1799, 1,375 enclosure bills were passed, between 1800 and 1819, 1,700. Altogether it has been calculated that over 2,500,000 acres were affected by the Acts prior to 1801.

The result meant better farming, but it also involved great loss to the peasant and the laborer. The fees of the commissioners for redistributing the lands, the legal expenses of getting a private Act, the cost of hedging the new farm, all bore hardly on the yeoman. Even when he had survived the actual enclosure he found it hopeless to compete with the capitalist farmer. The stuff he could raise would not bring a remunerative price in competition with that of the large producers. He was moreover hard hit by the loss of the bye employments of spinning and weaving which were tending to become more and more factory industries. Many of the yeomen sold their little farms to large landowners who were only too anxious to throw them together into big ones in order to realize the high prices during the war period. Moreover the new men who were making their money in cotton were glad to buy land for the sake of social position. With an increasing struggle for existence on the one hand and the prospect of a good sale on the other the small farmers sold their holdings and disappeared. Those that held on were so hard hit by the great depression in agriculture after 1815 that they too were forced to succumb. Hence England between 1770–1815 became predominantly the land of the capitalist farmer.

The laborers, too, suffered considerably, since when the land was enclosed they lost many little perquisites such as turning out a cow on the waste or gathering fuel. But more important than all was the fact that the laborer lost the chance of rising in the world. The small farmer had ceased practically to exist and the laborers never could hope to get together capital enough to take a big farm.

But without the improvements of those years England could not have held out against Napoleon. She would simply have surrendered from famine when the Baltic corn was cut off.

The stimulus of the Corn Bounty Act started the agricultural revolution, the great wars completed it. The result was an enormous advance in farming but great social distress; the extinction of the peasant proprietor, but the ultimate safety of England.

22 (c). **Great Britain — Agriculture.** *History.*— The close of the 18th century saw the English system of farming fully established, with its characteristic division of the landed interest into the three classes of landlord capitalists, tenant farmers, and laborers. Agricultural improvement had indeed made great strides during the 18th century, and in some parts of the country, as in Norfolk and Herts, the change from the old open field system to large enclosed farms had already been accomplished, but it was the high prices for food, prevailing at a time when the rapid growth of a manufacturing population coincided with the Napoleonic wars, which finally swept away the village-community style of farming and replaced it by the large tenant holdings as known to-day. The old system, while it supported a good many poor men on the land, was a very inefficient method of feeding the nation. The first condition of agricultural improvement was the investment of capital in the land, and the most economical way of doing it has proved to be to allow the landlord to use his money on the permanent amelioration of his property, leaving the whole of the tenant's resources free to be employed in his business of farming. It should perhaps be explained that on an ordinary Scotch or English estate, the landlord bears the cost of all the work which may be supposed to permanently increase the letting value of the farm. He, for example, erects all the buildings required by the tenant, and supplies the latter with timber and other materials for their repair; he finds wood and gates for fencing, tiles for draining; in many cases he even provides the fruit trees that are to be planted, and the seed for land that is to be laid down in permanent grass. The advantage of this system lies in the fact that the tenant's capital is kept in a liquid condition; he becomes a manufacturer of meal and corn, who hires land and buildings as tools in his business, and how well it has succeeded may be learned by comparing the results attained by British farming with those of other countries. In Great Britain the average yield of wheat for the last five years has been 31 bushels per acre, as against a world's average of about 12 bushels, a French average of 20, a United States average of 13; the only countries with a similar large yield being Germany and Belgium with 28 bushels per acre. A comparison of other crops would be even more favorable to Great Britain. The development of improved breeds of live stock and superior strains of crops, as will be recounted in a later section, has been made possible by the existence of a race of tenant farmers with both the means and the temperament to speculate in the development of their industry. The system has of course its drawbacks; it demands that the landlord should possess capital and some understanding of the agricultural situation; it lacks flexibility when a great economic change takes place like the fall in prices after 1876; it encourages too conservative a style of farming, for it checks the initiative of tenants by giving small security that they will reap the benefit of any increase in the value of the farm due to their improvements. Its intense individuality, from which so much has been gained in the past, becomes a drawback now that the farmers of a country are no longer competing with one another, but have to be organized to maintain their position in the common market of the world.

The agricultural history of the 19th century in Great Britain may be divided into four epochs, beginning with the period of inflated war prices which lasted up to 1810, during which time the great work of enclosing the common lands and forming large farms was practically completed. This was also a period of great activity in the improvement of farming; the foundations of most of the British breeds of live stock were then laid; machinery began to be applied to agriculture, and the reclamation of the wastes, practically the creation of good arable soil out of barren sands and intractable clays, proceeded with vigor. The value of marl on the light sands, and of chalk and lime upon the clays had long been known, but at this time such ameliorations were being carried out wholesale and with a thoroughness of which the British farmer is still reaping the benefit. There followed a period of 20 years of unexampled depression when the great break in prices, consequent on the end of the war, was aggravated by a succession of bad seasons. Little by little this depression was removed as the obligations incurred during the time of inflation became void, as the weaker farmers and small holders became squeezed out, and particularly as the consuming population in the manufacturing towns grew in number and wealth. The forty years from 1836 to 1876 may be described as the Golden Age of British farming. The making of the soil by marling, claying, chalking, etc., went on apace; something like 3,000,000 acres were tile-drained in England alone between 1830 and 1870; simultaneously also science and the industries put at the service of the farmer nearly all the modern range of fertilizers and feeding stuffs — guano, nitrate of soda, phosphates, and the oil cakes. The modern breeds of live stock became clearly defined, and had their herd and flock books established during this period, and amongst the best practitioners farming became a fine art attaining the polish characteristic of a well-kept garden. Rents rose steadily with the competition for farms among not only the farming classes but also the tradespeople of the country towns, who saw in agriculture the road to wealth and an easy life; indeed, on the great estates where the tradition was against rack-renting the sound farmers were realizing very considerable fortunes.

The crowning period of this prosperity was the time of the Franco-German war of 1870–72. By 1875 the depression was beginning to make itself felt. Freights were low and foreign imports, especially American, of grain, wool, cheese and butter were beginning to grow rapidly. A run of bad harvests had also set in, culminating in the black year of 1879, when the lowest cereal yields on record, due to continuous wet weather, coincided with an enormous crop and corresponding importations from the United States. From this time the yield of corn in England ceased to rule its price, which has in the main been set in Chicago. The great change that then came over agriculture would have been less fatal had its permanent character been recognized earlier; as it was, on very many estates rents were not lowered rapidly enough, with the result that the old tenants were ruined and new ones could only be attracted by comparatively enormous reductions. Up till 1894 the gloom was unrelieved, the prices of corn and wool dropped year by year, although wages were rising, nor were there any new factors in sight which promised a change for the better.

It was the arable land farmers who suffered the most, particularly the cultivators of heavy land in the eastern counties and the midlands, where the land was expensive to work and only profitable when wheat and beans made a good price. This land gradually got laid down to grass; much of it went wholly out of cultivation for a time and was only reclaimed again as grass land by a new race of farmers who got it almost rent free. The western side of the country, which had always been in the main devoted to grazing and dairying and where rents had never been excessive, suffered comparatively little, nor did the highly farmed Lothians show the same fall in rents as the arable lands farther south. The change which came over the farming of the country may be seen in the acreage under wheat, which from 3,600,000 acres in 1874, fell to 2,500,000 acres in 1885, and 1,400,000 in 1904; at the same time the area under permanent grass increased about 4,000,000 acres.

Since 1894 the drop in prices has been arrested, and an upward turn has manifested itself for nearly all the products of the farmer, meat only excepted. At the same time, a new race of farmers has grown up, who have discovered methods and openings by which a living may still be made out of the land. But though the agricultural situation may now be said to be comparatively stable and even improving, it is still full of difficulties. The British farmer is now competing with every country that has any agricultural produce to sell; the British market is the one open market of the world, and the price of any commodity is fixed by whichever country has a great surplus crop in that year. The proximity of the town, while it creates a market for certain products, also increases the farmer's expenses; in the end the manufacturing industries set the standard of wages and draw off the energetic and the able among the laborers. At the same time the farmer has to conform to the urban standard of life; he has to pay for roads, sanitation, and education of a style unknown to his competitors in a primitive country. Again, as a capitalist, he expects a return for the money he has invested in his business, whereas his competitors are, in most cases, content if they extract a living out of their labor, without taking into account the capital they have accumulated on their small holdings. Even the proximity to the great population, which ought to be the saving factor, is nullified by high internal railway rates, which compare unfavorably with the assisted freights of most competing countries.

During the period we have under review the British tenant farmer may be credited with two characteristic steps forward; the perfecting of a system of high farming and the fixing and improvement of a number of races of live stock. As regards the first matter — high farming — three contributing factors may be noticed. Owing to the changeable climate and the diversity of the soils the preparation of the land for crops has always required some nicety in management, and the British farmer in virtue of his long experience became something of an artist in the treatment of his soil. And though since prices have fallen some of his practices are no longer very remunerative, however desirable from the point of view of securing the "best" even if not the most paying crop, yet British farmers are still in the main more skilful than those in any other country, as far as the actual cultivation of the soil goes. Secondly, the British farmer early learnt the value of a good rotation of crops, which should not only provide something to sell, but which would also furnish a continual supply of food for his stock. Though turnips, clovers and other artificial grasses were well known in England before 1700, it was not until the 18th century was nearing its close that their employment had been organized into such rotations as we know to-day. The British farmer was also the first to appreciate the possibilities which artificial manures put at his disposal; and the early exportations of guano, nitrate of soda, bones, etc., were in the main to the United Kingdom: Liebig even denounced England in no measured terms for her greed and wastefulness in drawing bones from all other civilized countries, and then squandering the phosphoric acid thus obtained by letting her sewage run into the sea. With the more intensive farming, due to better cultivation and the addition of manures, came improvements in the varieties of seed sown, mode of progress taken up with great energy both by individuals and certain firms of seedsmen. Though the results are not so noteworthy as in the case of live stock, yet most of the heavier yielding varieties, both of corn and of green crops, are of British origin, *e. g.* the "Squarehead" wheats, the "Chevalier" type of barley, the "drumhead" cabbage, all of which are widely spread over the world. Progress in all these directions made British farming the general model up to 1870 or so, and how real the superiority was, may be judged from the table in which the yields per acre in Great

	Yield per Acre, Mean, 1901-05.			
	Wheat, Bush.	Barley, Bush.	Oats, Bush.	Potatoes, Tons.
Great Britain....	30.7	32.6	39.3	5.9
France	10.4	22.4	27.2	3.2
Germany	28.2	33.2	38.7	5.3
United States....	13.2	26.5	31.2	2.2

Britain are compared with the corresponding figures for France, Germany and the United States. Had the same comparison been made twenty-five or thirty years earlier the superiority of the United Kingdom would have been still more manifest, for while it has been reducing expenses to meet the depression in prices, the other countries have been working up to its level.

Live Stock.— But the special excellence of the British farmer has been his success in improving and fixing certain breeds of live stock, which have now become the standard breeds all the world over. Up to the middle of the 18th century there were a number of types of cattle and sheep to be found in the different districts of the British Isles, as in any other old farming country; but these types were ill-defined and there was no common or conscious action toward fixing them in any desirable direction. Robert Bakewell, of Dishley (1725–1795), working on Leicester sheep and Longhorn cattle, first showed how a breed could be improved and fixed. Bakewell aimed at an animal which would mature earlier and would put on its increase in the most profitable places. Carrying a type in his mind, he selected a number of animals approximating to his ideal and bred only from them; then by a period of close inbreeding among such of the progeny as conformed to the type, he was able both to advance rapidly in the desired direction and also to eliminate a good deal of the tendency to fall back toward the old unimproved class of animal. At the same time it was found that this close inbreeding resulted in sires which had great power of stamping their character on their offspring, even when the dam is of a different or common strain. Thus Bakewell's Leicester sheep have been employed to give quality to almost all the other local races, and there are nowadays few breeds of sheep in existence who do not possess a strain of Leicester blood in them. Bakewell's Longhorns have not had a like success, but the same principles were applied to the native cattle of Teesdale, the Durhams or "Shorthorns" by the brothers Colling, who died in 1820 and 1836, respectively. Their work, continued by the Booths and by Bates, resulted in the modern Shorthorn, the typical beef-producing cattle of the world, with which, in the main, all the newer countries have been stocked.

The same progress was applied to other local breeds of cattle; the Herefords and the Devons in England, and the Aberdeen Angus in Scotland, have in the same way attained to far more than a local reputation, as also have several of the breeds of sheep, like the Southdowns or the Lincolns. Notwithstanding the existence in all old-settled countries of indigenous races, stock of British breeds are to be found all over the continent, either kept pure or more generally used for grading up the local type; while in the newer countries, which have become the great food producers of the world, none but breeds of British origin are to be found, with the exception of the Frisian or Holstein cattle, the Merino sheep and the Percheron horse. And the United Kingdom remains the great fountain from which these countries find it necessary to replenish their breeding stock, so that the production of pedigree animals of high quality continues to be one of the most lucrative items in British farming.

Agricultural Districts.— Farming, at the present time, has become by force of circumstances a highly specialized business, showing great adaptation to the diversities of soil, climate and markets in the British Islands. To review the condition of the industry it will then be necessary to consider the country, district by district. Beginning with the southeastern counties; Kent, Sussex, Surrey, and Hampshire form a fairly defined area, possessing in general a warm and dry climate. Here, but particularly in Kent, may be found the greatest development of market-gardening, fruit growing, hop cultivation, and other similar highly intensive forms of farming. As far as regards the production of very early crops this district cannot compete with the Channel Islands or Cornwall, but as main crops the standard green vegetables are grown in great breadths. This district is also noted for its hardy fruit growing; near Southampton on one hand and later in North Kent the greater part of the strawberries for London are produced. The best cherries have long been a special feature of East Kent, which country is also the largest producer of plums, apples, currants, and nuts. East Kent from Canterbury to Rochester, and the Medway Valley to Tonbridge, show without doubt the best kept orchards in the country. Hop cultivation is also another leading feature of this district; no other farming industry is carried on so intensively or spends more on labor during the growth of the crop. The best of the hops march with the fruit in East and Mid Kent, but Sussex is also a large grower, as also is a belt of rich land stretching from Farnham in Surrey as far as Petersfield in Hampshire. The district under review has not perhaps the same reputation for general farming as it has for fruit and hops; it possesses, however, several distinct and valuable races of stock. The Southdown sheep are natives of the open chalk downs of Sussex; small, fine-wooled, and models of symmetry, they have been extensively used for improving the mutton of other breeds and form a great element in the foundation of such breeds as the Hampshire and Oxford Downs, the Shropshires and the Suffolks. Kent possesses in the "Romney Marsh" sheep one of the older breeds of the country; big, hardy, and long-wooled, which have lately proved valuable for crossbreeding in all parts of the world. The Hampshire Downs constitute a large framed, rapidly-growing breed that has been formed from a local coarse sheep by crossing with the Southdown. It exists in large numbers on the light arable lands of the great chalk area of which Hampshire forms the centre. Sussex also possesses a local breed of cattle; a horned, all-red, typically beef-producing breed, which has not spread greatly beyond its proper borders. Hampshire passes insensibly into the West Country — Wiltshire, Dorset, Somerset, Devon, and Cornwall — a typical stock district, showing less and less arable land toward the west. This is one of the chief dairying countries, milk being sent to London; while Somerset, in particular, is the original home of the "Cheddar" cheese, the typical cheese turned out nowadays on such a large scale in the United States and Canada. The cattle are mainly Shorthorns, though Devon possesses a dairy breed of its own, the South Hams, which have been raised from the true Devons by an infusion of Guernsey blood. The true Devons are an all-red, beef-producing breed, doubtless of common origin with the Sussex, but which has gone all over the world as among the thriftiest and most profitable of grazers. The Dorset horned sheep are characteristic of this area, a short-wooled, horned breed valuable for the production of early lambs. Somerset and Devon are also great apple-growing counties, though the fruit does not receive the care which is to be found in Kent, and much of the product is only useful for cider-making. The southwest of Cornwall possesses an extremely mild climate, frosts being few and of no great severity; it has therefore become an important market-gardening district for the production of the earliest green vegetables and potatoes. The Channel Islands share the same advantages of climate, and, thanks to the skill and industry of their inhabitants, form perhaps the most prosperous agricultural community in the Kingdom. The land is divided into small holdings and is highly rented, but the farming is intensive and the crops valuable. In Jersey early potatoes, followed by green vegetables, form the staple crops: in Guernsey there has been a great development of farming under glass; cucumbers, tomatoes, grapes, early beans and flowers being the chief products. Each island possesses a special, though closely-related, breed of cattle, which by law has been kept pure and unmixed from any foreign blood for more than a century. These Channel Island breeds represent the descendants of an original Celtic race of cattle and are distinguished by the tendency to a yellow skin and black hair; they are small in frame, and produce large quantities of milk far richer in butter than that of any other breed. The Jerseys, in particular, have been largely exported to America as milk and butter producers.

The West Country shades off into the west Midlands — Gloucester, Hereford and Worcester, counties growing much hardy fruit and typical producers of cider. Here also is situated the other hop-growing area in the British Islands, the acreage under hops in the valley of the Teme and its tributaries tending to increase, while it diminishes in the southeast. This district is the original home of the Hereford cattle, red with white faces, which have become one of the great cosmopolitan races, famous all the world over as hardy stock fattening readily upon grass.

The Midlands proper are almost wholly laid down to grass; the broad belt of strong pastures lying on the Lias and other Jurassic clays, and stretching from Devon to Yorkshire, forms the great milk and meat-producing area of England. The cattle are mainly Shorthorns, as being valuable for both meat and milk, but many Herefords, Galloways and Welsh black cattle will also be found fattening on the richer pastures. While these Midland pastures largely send new milk into the great towns, a good deal of cheese is made, the best known variety being the "Stilton," which is as typical of the English soft-curd cheeses as "Cheddar" is of the hard curd. Eastward the land comes more under the plow, Essex, Suffolk, Norfolk and Lincoln being typical arable counties. Lincoln possesses a large area of "warp" land composed entirely of alluvial sediment, and this, of great fertility for all purposes, is very largely given up to the growth of potatoes. On the strong soils of Essex and Suffolk the best English wheat is grown, wheat being still a profitable crop in this district; while Suffolk and Norfolk enjoy a great reputation for the growth of high-class malting barley. These counties are still, though not to the same extent as formerly, great centres of stall-feeding of cattle. Welsh "Runts," Shorthorns, and Aberdeen Angus stores are brought in and rapidly fattened on the turnips drawn from the arable land. Norfolk possesses a native breed in the Red-Polled cattle, valuable for both their flesh and their milk-producing powers, and which are rapidly establishing a reputation outside of England. In Suffolk also is to be found a special breed of heavy horse, the Suffolk Punch, a compact, thick-set animal of great value for farm work. All the low-lying country forms a fine breeding ground for horses, which is one of the staple industries of the eastern counties. The fen country indeed is the original home of the typical English "great" horse, the Shire horse, the most powerful animal of its kind in the world, particularly adapted to heavy work in cities. Bay, brown, and black are the commonest colors, and the feet and legs are heavily feathered with white hair; the breed probably owes its origin to an influx of Flemish blood into the old English draught horse. Lincoln also possesses the chief of the English long-wooled races of sheep; heavy, rapid-growing animals, with a great fleece of long slightly lustrous wool. The Lincolns have been exported in large numbers to Australia, New Zealand and the Argentine for crossing with the Merino to yield a sheep equally valuable for both mutton and wool.

Turning to the west again, Wales is a country almost wholly in permanent grass; dairying and the raising of store cattle to be fattened in the midlands and east of England being the prevailing industries. The Welsh black cattle are good milkers, and, in addition, have long been esteemed, under the name of "Welsh Runts," as hardy, thrifty grazing cattle, producing beef of high quality. Like all mountainous countries, Wales has a race of hill sheep, but on the lower lands, and especially in the border counties, the "Shropshire" breed will most commonly be seen. The Shropshire sheep is a short-wooled, small-framed animal, rather larger and hardier than a Southdown, but otherwise fulfilling the same purposes, as a symmetrical, rapidly growing sheep, producing mutton of the highest quality upon grass land and the lower hill pastures. On the Welsh borders also is to be found one of the native breeds of hill ponies, very slightly different from the two other breeds living upon Exmoor and in the New Forest, but quite distinct from the Shetland ponies, which are doubtless of Scandinavian origin.

Yorkshire provides perhaps the most varied farming in England; on the one hand there is the rich warpland adjoining the Humber, and the elevated arable sheep-farming land of the Wolds, then the highly-farmed general purpose land of the central plain which merges into the upland sheep walks of the limestone country in the northeast. Horse breeding, stock raising and dairying are the mainstays of Yorkshire farming, and though no breeds of great note are associated with Yorkshire, except the white Yorkshire pigs and the Cleveland Bay Coach horse, it should not be forgotten that the original home of the Shorthorn was just as much the North Riding of Yorkshire as the Durham Tees-side, with which their name is always associated.

In the Northern Counties generally may be seen some of the best arable farming in England; a four-course rotation is generally followed, the foundation of the whole system being a good crop of Swede turnips, part of which are fed on the land to sheep, part carted off for fattening stock in the yards. Barley is the money-making crop in the rotation, oats being the other cereal usually grown. The typical cattle of all this district are Shorthorns; in Cumberland, which is more of a grazing country, they are of the milking type, the beef strains predominating in the eastern side. The sheep are the Cheviot breed for the hill pastures, and the Border Leicester, which was originally produced by crossing the Cheviots with Bakewell's Leicester breed.

Scotland and Ireland.— Crossing the border in the Lothians of Scotland will be found the most highly-farmed general-purpose arable land in the British Isles. Here the management of the land, the utilization of labor-saving machinery, and the application of skill to intensive cultivation, reach a higher pitch than anywhere else in the world. The cropping is much the same as that of the other northern counties, but potatoes form the most remunerative crop; in the famous Dunbar district they are often sold standing in the field for £30 per acre.

The southwest of Scotland is preëminently a grazing district; it is the home of two of the most distinct breeds of cattle, the Ayrshire, a typical dairy cow, yielding milk particularly suited for cheesemaking, and the Galloway, a polled black animal, characterized by its great hardiness and the fine quality of its beef. For generations the Galloways, either pure, or in the well-known "blue gray" cross, have been exported to be fattened in the Midlands and east of England. The more northern counties of Scotland naturally, in the main, consist of grazing land. They have their typical race of Highland cattle and also carry the Scotch blackfaced sheep, both slowly-maturing hardy breeds, producing meat of high quality. The eastern counties, particularly Aberdeen, show some highly-farmed arable land, noted for the magnitude and high quality of its turnip crops, on which the cattle are stall-fed through the winter. For this purpose another race of cattle, now of cosmopolitan distribution, has been evolved, the polled black Aberdeen-Angus, massive animals noted for their rapid growth, symmetry, and quality of flesh.

Irish agriculture is of two classes; on the one hand there exists, especially in the west, a great number of small holdings, worked entirely by the single family, producing potatoes for home consumption and a little oats for sale, in addition to the milk or butter from a few cows on the rough grazing attached to the holding. The farming of these peasant proprietors is naturally of a primitive character, but the efforts of the Irish Co-operative Organization Society and later of the Irish Board of Agriculture have, during the last ten years, done much to ameliorate the conditions under which they are working, particularly by the introduction of co-operative creameries. The Irish peasant farmer has quickly learnt to work on co-operative principles, so that the movement toward co-operation, which has been headed by Sir Horace Plunkett, has enormously improved the character of Irish butter, a staple article in the English market, and must have nearly doubled the returns to the producer. On the other hand, Ireland possesses large farms of the richest grazing land on which are bred great numbers of store cattle of the Shorthorn breed for the English market, as well as light horses of the best strain, wholly or nearly thoroughbred. The high quality of the pastures give these animals a foundation of bone and vigor of constitution which makes them respond freely to richer conditions in later life.

Science and Education.—Any survey of British farming for the last century would be incomplete if it did not take some account of the scientific and intellectual resources which have been at the service of the British farmer. Of these the Rothamsted Experiments form the main, practically the only, British contribution to the world's stock of agricultural science. The foundation of these field experiments dates back to 1843, in which year J. B. Lawes, a Hertfordshire landowner, obtained the co-operation of J. H. Gilbert to carry out experiments upon field crops upon his own estate. This partnership in investigation lasted for nearly sixty years, the continuity of the work being secured by a Trust founded and endowed by Lawes. The main feature of the Rothamsted investigations has been field experiments with the various farm crops, conducted on a large scale and over a great period of time, and to them the farming community owes its knowledge of the principles of the nutrition of our domesticated plants. Rothamsted was the forerunner of the many agricultural experimental stations which have been created in other countries; the first German Station at Möckern dates from 1852, the first American station at Middletown, Conn., having been founded in 1875. It is noteworthy that though agricultural research has in every country become the business of the State, Rothamsted remains the only institution of its kind in the British Islands and enjoys no assistance from public funds.

From about the same period as the foundation of the Rothamsted Experiments, dates the establishment of the Royal Agricultural Society, which, by its institution of national agricultural shows held year by year in different parts of the country, has done much to foster the improvement of English live stock. For a long time also this society by its 'Journal,' by its appointment of consulting scientific advisers, by undertaking analyses for its members, was a great educational factor in the country, but the work of the society in this direction has of late years been largely taken over by other and more widespread agencies, while the society has no longer found fresh pioneer work to do but has more and more confined its energies to its annual show.

Agricultural education in Great Britain was for a long time restricted to private enterprise, the Royal Agricultural College at Cirencester being the first, and for a long time, the only institution giving a systematic training in agricultural science. Edinburgh was the first university to give any instruction in agriculture, until in 1890 the allocation of certain excise revenues for technical instruction enabled the country generally to make a start with agricultural education. The last decade has in consequence seen the establishment of a number of schools and colleges for agricultural instruction, so that at the present time practically the whole country is in touch with some institution of secondary or university type, which, as a rule, aims both at educating the future farmer and at providing expert assistance for the current generation.

Summary.— From this brief survey it will be seen that the characteristic feature of British farming has been its individuality; its great advances have been made by individuals; its good qualities and its visible weakness are alike the result of solitary work and internal competition. Despite the apparent diversity of their interests landlord and tenant have, in the main, pulled together; the landlord has always been the spokesman and has represented agriculture in the legislature. But there the farming interest has been wholly ineffective; the State has never recognized any responsibilities toward the industry, either in the way of protection against competition or in the provision of intelligence or education.

Whether this policy will continue to answer in the face of the State-trained and State-directed competition for the English market of all the other agricultural communities, will be settled during the coming generation; it may then turn out that the much belauded "principle" of *laissez faire* is but a cloak for lack of knowledge and slackness in the governing class.

23. Great Britain—Fisheries. The great extent of seaboard in proportion to the area of the United Kingdom combines with the wealth of the surrounding seas in food fishes to render the fisheries a very important branch of British industry, as may be seen from the following table compiled from the returns for 1904.

—	Regular Fishermen Employed			Fishermen Occasionally Employed			Total
	In Trawling (except for Shrimps)	In other modes of Fishing	Total	In Trawling (except for Shrimps)	In other modes of Fishing	Total	
England and Wales	16,499	16,870	33,369	1,396	7,245	8,641	42,010
Scotland	2,379	25,560	27,939	59	10,061	10,120	38,059
Ireland	1,315	7,105	8,420	291	17,770	18,061	26,481
Isle of Man	128	497	625	....	231	231	856
Channel Islands	100	410	510	25	167	192	702
Total	20,421	50,442	70,863	1,771	35,474	37,245	108,108

This table does not include the persons engaged in the secondary occupations connected with fishing, such as boat-builders, coopers, packers, curers, net-makers, etc. These were estimated in 1904 to number 48,562 in Scotland alone; if the ratio may be assumed to be the same in the other parts of the United Kingdom, the total number of persons deriving a livelihood from the sea fishing industry, exclusive of salmon fishing, cannot be far short of a quarter of a million.

The total weight and value of fish (not including salmon) landed in the United Kingdom during 1904 is shown in the following table:

	England and Wales	Scotland	Ireland	United Kingdom
	cwts.	cwts.	cwts.	cwts.
Wet fish { weight	11,3[illegible]5,484	7,947,829	951,836	20,264,749
Wet fish { value	£[illegible]	£2,231,102	£344,154	£9,065,180
Shell fish, value	£[illegible]09,063	£76,800	£49,476	£416,339
Total value	£[illegible]	£2,307,902	£393,63[illegible]	£9,481,519

This result, which may be taken as being above the average of recent years in weight, but considerably below the average aggregate value, was attained by the employment of 26,074 vessels and boats, of which 8,962 were registered in English ports, with an aggregate tonnage of 162,431; 10,891 in Scottish ports, aggregating 140,396 tons; and 6,221 in Irish ports, of which the total tonnage is not recorded.

A notable change in the character of the British fishing fleet has been in progress during recent years, owing to the substitution of steam for sailing power. The result has been a great extension in the fishing grounds. The North Sea, of course, remains a most productive source of supply, and five-sixths of the steam trawlers working there are British. Thus in 1904, while foreign steam trawlers registered at North Sea ports numbered 202, there were 1,282 registered at English and Scottish North Sea ports. But, outside the North Sea, powerful steam trawlers and liners from the east coast of England and Scotland now carry on their operations off Iceland and the Faroe Islands, in the Bay of Biscay, and off the coast of Portugal. In 1904 a new trawling ground in 70 fathoms was opened off the coast of Morocco. Much of the catch in these distant waters never finds its way into the British market, and consequently does not figure in the returns above quoted. "For instance, one English trawler fishing off the French coast, near Brest, in 70 fathoms, too 300 kits of fish, which, in the Lisbon Market, some 600 miles distant, realized £444. On the next day the same vessel commenced fishing off Cape Finisterre, in 120 fathoms, and in four days returned to Lisbon, and sold some 200 kits for £378." *

The rapidity with which steam is taking the place of sails in the larger English and Scottish boats may be seen by comparing the statistics of different years:

England and Wales	1[illegible]		1904	
	Steam	Sailing	Steam	Sailing
First class boats....	564	3,270	1,4[illegible]8	1,755
Second class boats..	2	4,099	1[illegible]	4,2[illegible]5

Scotland	18[illegible]		1904	
	Steam	Sailing	Steam	Sailing
All classes..... ...	158	12,940	474	10,417

* Board of Agriculture and Fisheries: *Report* 1904, p. xxii.

In Ireland, out of a total of 6,221 vessels actually engaged in sea-fishing during 1904, there were only one steam beam trawler, and nine steam otter trawlers against 168 sailing boats employed in the first and 255 in the second method of fishing. There were no steam line fishers.

Steam power, at first employed only in trawling vessels, is becoming annually more common in drift net and long line fishing. Drift nets are employed for the capture of herrings, mackerel and pilchard, of which the relative importance as articles of food and commerce may be inferred from the quantities of each landed in British and Irish ports during the year 1904:

	England and Wales	Scotland	Ireland	United Kingdom	Total value
	cwts.	cwts.	cwts.	cwts.	
Herring	3,196,303	5,4[illegible]2,4[illegible]4	[illegible]86,49[illegible]	8,918,293	£1,870,[illegible]10
Mackerel	518,569	16,49[illegible]	502,501	1,037,563	417,070
Pilchard.	175,552	....	....	175,552	47,450

The development of mackerel fishing on the west coast of Scotland has been retarded hitherto owing to want of curing stations. Thus in September 1904, one boat landed 60 crans of fine mackerel at Kyle of Lochalsh, of which 40 crans were sold fresh at 8s. a cran, and 20 crans had to be thrown overboard because there was no means of curing them. A cran of mackerel contains an average of about 400 fish.

While the local herring fishery is actively pursued from almost every creek approached by the fish, powerful boats from Yarmouth, Lowestoft, Grimsby, and 10 other principal English ports, and from Eyemouth, Leith, Fraserburgh, Buckie, and 14 other Scottish ports seek out the most productive waters irrespective of vicinity or distance. In this respect, men of the east coast are far more enterprising than those of the west, owing, no doubt, in great measure to their proximity to the excellent fishing grounds in the North Sea; but it appears that, of the three main races contributing to British ethnology, men of Anglo-Saxon and Scandinavian descent take more readily to maritime pursuits than do the Celts. A considerable portion of the fish landed on the west coast of Britain and in Ireland are taken by east coast fishermen; and those places on the west coast where the local industry is most active, such as Stornoway in Lewis and Peel in the Isle of Man, and Morecambe Bay in Lancashire, remained long under Norse dominion, and contain a strong Norse element in the population. Roughly speaking, the Saxon and Scandinavian blood is stronger in the east, the Celtic in the west, throughout Great Britain, which may account in some measure, at least, for the great disparity in fishing enterprise among the local population on the respective coasts.

The British export trade in cured herrings is very large, amounting to 2,543,873 barrels in 1904. Germany and Russia have long been the chief customers. Notwithstanding that the German import duty is 3s. per barrel, and the Russian 13s. per barrel, the number of barrels consigned to Germany in 1904 was 1,649,144, valued at £1,656,921, and to Russia 526,050, valued at £547,417, being together upwards of four-fifths of the whole export. About 50 per cent of the herrings landed in Germany are sent over the frontier into Russia. The United States took 57,291 barrels in 1904, valued at £104,883, and that country is the principal importer of pickled mackerel from the Irish fisheries.

Pilchards, which are taken only on the south and southwest coast of England, find their best market in Italy, which in 1904 took 18,381 hogsheads, valued at £53,953, out of a total export of 19,272 hogsheads. It requires from 560 to 600 lbs. of cured pilchards to fill a hogshead.

It is a singular fact that, notwithstanding the large export trade in fish from the United Kingdom, amounting in 1904 to the total value (including salmon) of £3,555,066, the total imports go far to balance it, amounting in the same year to the value of £3,332,656, of which cured and salted fish to the value of £925,793 was re-exported.

Next to drift net and trawl fishing, the chief branch of sea-fishing is conducted by long lines. The relative importance of these different methods varies very much in the three Kingdoms. Thus in England, out of 33,369 *regular* fishermen, 16,499 are employed in trawling (not including shrimp trawlers); whereas in Scotland only 8 per cent. and in Ireland only 15 per cent of regular fishermen were so employed. Considerable friction has arisen in the past between trawlers and line-fishers, owing to the destruction of lines laid upon ground over which trawlers worked. Deeming it undesirable that the more ancient and local industry of line-fishing, often pursued by men of humble means, should be sacrificed to the interest of persons of capital and residing at a distance from the fishing grounds, and also actuated by a desire to prevent the destruction of undersized fish within favorable nursery grounds, Parliament has conferred powers upon the Fishery Boards of the three Kingdoms to schedule certain areas within which trawling is prohibited. But, whereas the territorial waters of Great Britain and Ireland are circumscribed by a line drawn at a distance of three miles from the nearest coast, which line passes within parts of some of the prohibited areas, such as the Moray Firth, the jurisdiction of British courts cannot apply to foreign trawlers working in such areas, provided they keep outside the three-mile limit. Consequently, fish may be and are taken by foreign trawlers upon ground closed to British trawlers by the act of their own legislature; and such fish may be landed in British ports to the natural indignation of those fishermen upon whom the prohibition is effective. Meanwhile, disinterested scientific opinion remains sharply divided upon the question whether the protection of these areas has any appreciable effect upon the general stock of fish in the adjacent seas, though it is undoubtedly in favor of the line fishermen, to whom the prohibition does not apply.

The fish taken by trawl and line are technically divided into round and flat fish: the principal round fish being haddock, cod, ling, whitings, saithe, torsk, conger eels, gurnards, catfish, anglers and hake; the principal flat fish being flounders, plaice, brill, halibut, soles, lemon soles, turbot. The English and Irish fishery returns do not show the amount of the total catch of these fish taken by trawl and line respectively, but the proportion in Scottish waters is indicated in the following table for 1904:

	Line		Trawl		Total	
	cwts.		cwts.		cwts.	
Round fish	628,8[illegible]8	£279,428	1,520,949	£618,687	2,140,847	£8[illegible]8,115
Flat fish	120,211	80,703	130,709	[illegible]21,212	300,920	301,915
Unclassified (skate, squid, etc., the squid being taken in nets)	4,631	1,054	1,910	425	6,541	1,480
	753,741	£370,185	1,703,568	£840,334	2,447,308	£1,201,519

The importance of the fishing industry as a nursery and reserve of practised seamen can hardly be overrated in a maritime nation, nor is it to be feared that the steady displacement of sails by steam in the fishing fleet will impair its value in that respect. The same qualities of mind and body which distinguished seafaring men of the old school are those which best fit their descendants for handling and managing modern warships and trading vessels; and the greater distance from port at which the more powerful class of vessel now employed enables men to follow their calling, requires competent knowledge of navigation as well as skill in seamanship. Upon the social system of regular fishing communities the effect of the change is considerable.

"Fishing," wrote Professor Mackintosh about the Scottish fishers of the east coast, "was to be carried out no longer by more or less independent crews, bound together by blood relationship or other ties, and whose working hours were largely regulated by the weather and tides, or their own convenience and necessities. Yet their whole domestic life was interwoven with the time-honored pursuit. Their wives and daughters laboriously baited the hooks and arranged the lines in the baskets for 'shooting'; they gathered the bent-grass for separating the layers of the line, and, with the sons, dug lob-worms or procured the mussels for bait. . . Now (1883) active and powerful vessels, propelled by steam, and thus more or less independent of weather, manned by a captain responsible to owners or their manager, a crew bound together only by discipline and pay, and whose fishing apparatus required no bait, appeared on the field. . . . Capitalists took up the question, and fitted out powerful ships in both England and Scotland, and sent them into Scottish waters, so that liners met with most formidable rivals." *

The stern realities of their calling have imparted a gravity of demeanor upon the class of sea fishermen on all parts of the coast; statistics, were it possible to obtain them, would probably reveal them as among the most orderly and law-abiding of the community. Among the fish-wives of Newhaven and Musselburgh is preserved almost, if not quite, the sole survival of national costume. The short, heavy-pleated, dark skirt, the woollen hose and serviceable shoes, the striped "bed-gown" or blouse, and the thick pilot coat are probably identical in form and material with those which Queen Mary may have seen on landing at Leith in August 1561. In those days, and for long afterward, the fish-wives used to trudge up to Edinburgh market, with the heavy "creel" on their backs supported by the leathern band across the forehead. They come up by cheap trains nowadays, but their presence in the streets in their picturesque dress and archaic equipment affords a welcome note of local color in the monotonous uniformity of a modern metropolis.

Notwithstanding this severe competition, the line-fisher's industry continues to be fairly remunerative. In the 'Official Report' of the International Fisheries Exhibition, 1884, the late W. Spencer Walpole, Inspector of Fisheries, combated the idea that the average fisherman's lot is harder or his earnings smaller than that of agricultural laborers. "I do not think," said he, "that anyone who has any acquaintance with the fishing community will endorse that statement. If you examine an ordinary fisherman's dress, you will find it warmer and more costly than the laborer's . . . he consumes a larger proportion of animal food than the laborer. . . . You will find rows of cottages not merely occupied, but owned, by fishermen, built or purchased out of the profits of the fisheries. . . . Many of them own their own nets and lines, and some of them have a share in the boats in which they sail. . . . Many of the masters are boat owners, with £250 to £1,500 of capital, who have begun their lives as ordinary fishermen." If steam has invaded the industry of local fishermen on the one hand, it has extended his opportunities on the other by giving him access to more distant markets.

Commercially the salmon fisheries of the United Kingdom are of considerable value, but the nature of that industry is not such as to affect the character of the population in different localities in such a marked manner as do the seafisheries. Some idea of the extent of the fishery may be had from the consignments of fresh salmon to Billingsgate (London) market. These have averaged annually during the eight seasons, 1896–1903:

English and Welsh	1,435 boxes
Scottish	13,117 "
Irish	4,2[illegible]2 "
Total average	1[illegible],[illegible]14 b[illegible]xes

Each of these boxes weigh about one hundredweight.

There remains to be noticed the institution in British water of a new branch of the fishing industry, technically, so called, although the object of pursuit is not a fish, but a mammal. Previous to the invention some twenty years ago of the bomb-harpoon, the mighty rorqual or finner whale, which abounds in the North Atlantic, was too powerful a quarry for whalers to attack. Now, however, steam whalers armed with this formidable artillery, are sent regularly in pursuit of rorqual, and during the present century three whale fisheries have been established by Norwegian companies in the Shetland Islands.

Bibliography.—'Annual Reports' of the Board of Agriculture and Fisheries (England), the Fishery Board for Scotland, and Department of Agriculture and Technical Instruction for Ireland; 'The Resources of the Sea,' by Prof. W. C. McIntosh, F. R. S. (in which the idea that steam trawling is unduly injurious to the general fishing industry is warmly denied) (1899); 'Official Report,' International Fisheries Exhibition (1884), containing a vast amount of detailed description of the various modes of fishing and kinds of gear; 'British Fisheries, their Administration and Problems,' by James Johnstone (1905); 'Sea and Coast Fishing,' by P. G. Aflalo (1901), dealing with the sporting aspect of sea-fishing; 'Report' of the Royal Commission on trawling (1878).

24. Great Britain — The Mining Industry. When it is considered that mining enterprise in Great Britain and Ireland accounts, at the present time for the employment of no less than 974,634 persons directly engaged in the production of 249,021,651 tons of minerals estimated to be worth, at the mines and quarries from which they are drawn, the sum of £97,477,639, the vastness of the industry, and its effect on the economic life of the country will perhaps be more fully realized than by the recital of detailed descriptions of the various branches of mining. Indeed it may be said that the wealth of Britain is mainly due to the unique position, mineralogically, that it occupies relatively to other nations; for no country contains, proportionately to its area, so great or so varied a store of mineral wealth.

Mining in the United Kingdom is usually treated as coming within one of two categories,* viz.:[1] metalliferous mines, and[2] those which are governed by the Coal Mines Regulation Act, the latter comprising chiefly coal and stratified ironstone mines, and being by far the

* 'The Resources of the Sea,' by Prof. Mackintosh (1899).

* For reference see end of article.

most extensive and important section, though a development of later growth, having expanded through seven centuries to what, as judged by some, is believed to be its zenith.

Of the metalliferous deposits[3] mined in the United Kingdom, the most important are, and have always been, the ores of tin, copper, lead and iron. Native silver has never been worked, and it is doubtful whether it occurs in Britain or Ireland, although Strabo writing about 19 A.D. mentions silver as well as gold as being among its products.[4] Tacitus also makes reference to it indirectly.[5] Gold is very sparsely disseminated, occurring in mineral veins, found chiefly in Merionethshire[6] (North Wales), Lanarkshire (Leadhills, Scotland) and Cornwall; and in some alluvial deposits in Sutherlandshire (Scotland) and Wicklow (Ireland).

Probably the earliest mining on commercial lines in Britain was that of tin. The "cassiterides,"[7] whence the Phœnicians obtained their British tin, were, in all probability what are now known as Scilly, the Channel Islands, and, more particularly, Cornwall. The industry is and always has been restricted to Cornwall and, to a very small extent, to the contiguous part of Devon, and as early as 60 B.C. we find Diodorous Siculus describing the tin trade of these parts. In the early years of the 19th century (1817) Cornwall was the chief source of production of the world's supply of tin, now it stands fifth on the list of tin producing countries, contributing only 4.7 per cent of the total production.

What has been written of tin is also largely true of copper. Carew[8] said, writing about 1600, that he could not find that it was being profitably worked in the west of England, yet nearly two centuries later, the production[9] (during the dicennial period 1766–1775) was abnormally large, and as late as 1888 we find no less an authority than the late Mr. D. C. Davies[10] stating that *for their size* the British Islands constitute the greatest copper producing country of the world, but the production has greatly dwindled since the time he wrote. Cornwall and Anglesea are the chief copper bearing districts in the kingdom, and very remarkable profits have, in times past, been derived from some of the mines.[11]

The production of lead far exceeds that of tin and copper,[12] and as in the case of tin and copper, signs of a revival are not wanting, still, it is very doubtful whether this branch of mining in the United Kingdom will in the near future attain to a similar state of prosperity as that experienced about the year 1877. Lead mining in these islands is of considerable antiquity; we know that lead ore was mined in Shropshire in the days of the Emperor Hadrian from the fact that "pigs" of lead were some years ago discovered in the refuse heaps of the Roman gravel mines in that county, one of which is preserved in the Geological Museum in Jermyn street. It may be mentioned of this district that, though possibly the smallest mineralized area in Europe, it was believed by so great an authority as the late Sir Roderick Murchison[13] to be probably unequalled for its size, in point of wealth in lead ore.

In Shropshire, North Wales, Cornwall, Isle of Man and the Pennine Chain are situate the chief lead mining areas of the kingdom. Lead mining in general, however, is not being very profitably conducted at the present time in the United Kingdom. Though far from being ex-

FIG. 1 SHEWING THE FLUCTUATIONS IN THE PRICES OF COPPER, LEAD, TIN AND ZINC IN THE LONDON MARKET FOR EACH YEAR SINCE 1873.

NOTE: The thick lines shew the highest prices and the thin lines the average prices

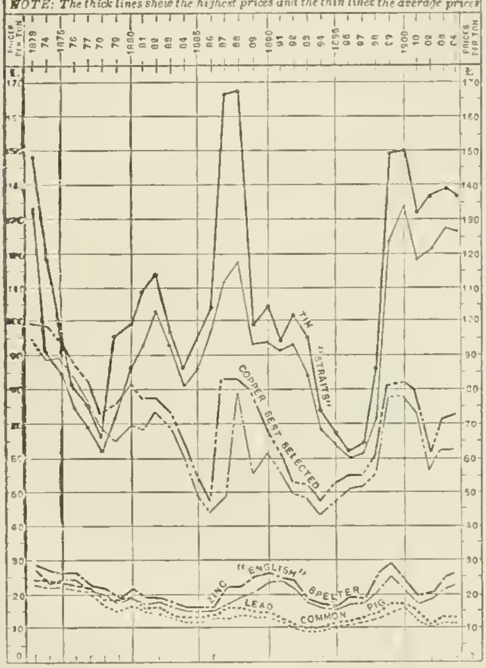

FIG. 2 SHEWING THE FLUCTUATIONS IN THE PRICES OF COAL AND IRON FOR EACH YEAR SINCE 1873

NOTE: The thick lines shew the highest prices and the thin lines the average prices

hausted, except in few instances, the mineral veins are not of such a character as to allow of their being as cheaply exploited as the richer deposits of Spain, Australia, and some other extensive lead-producing countries. As these more bountiful districts become exhausted, prosperity will return to British lead mining.

Fig. 1 shows diagrammatically the fluctuations in the prices of copper, lead and zinc in the London market for each year since 1873 to 1904 inclusive.

The iron ore deposits of Great Britain[14] are of two kinds, viz., stratified iron ore — the mines of which come under the control of the Coal Mines Regulation Act and the "mass" and "veined" deposits of hæmatite which come within the jurisdiction of the Metalliferous Mines Act. Cumberland and North Lancashire which yield an output of nearly one and a half million tons, are the source of the famous red hæmatite which chiefly occurs in the form of huge irregular masses in the carboniferous limestone and is the richest iron ore of the country, yielding

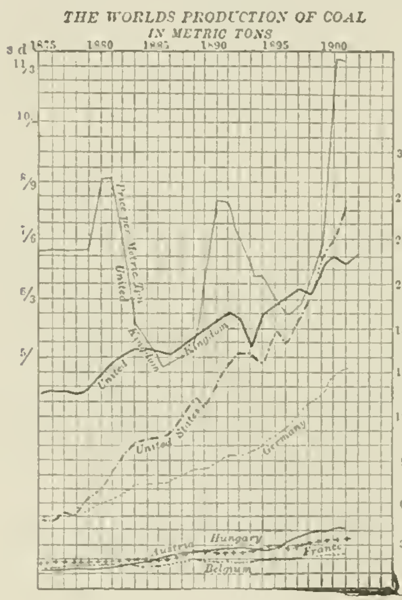

Fig. 3.

on the average over 50 per cent of metal. Working one of these masses is probably the most extensive iron mine in the world — the Hodbarrow mine.[15] The other principal iron producing districts are Cleveland (N. Yorkshire), which accounts for nearly five and three-quarter million tons annually, Lincolnshire, Northamptonshire and Leicestershire together supplying over four and a half million tons, the total production being nearly fourteen million tons annually, valued at over three million sterling.[16] The Cleveland clay ironstone (carbonate of iron) is chiefly worked from a bed about 10 feet thick, in the Middle Lias, containing on the average about 30 per cent of iron. The ore from Lincolnshire, Northamptonshire and Leicestershire is derived from open workings in a bed of brown iron ore in the Inferior Oolite, and averages about 33 per cent of metal. The Scottish ore and that from North Staffordshire is largely worked from the Black Band ironstones (carbonate of iron) in conjunction with the coal in the collieries of those districts and varies considerably in richness of metal.[17] Fig. 2 is a graphic representation of the fluctuations in the price of coal and iron (London market) for each year since 1873 up to last year.

A description of British mining would be incomplete without some reference to the production of slates,[18] as in no country are there yielded slates of a quality equal to those of North Wales. The mines proper are mostly in Merionethshire, whereas the quarries are worked in Carnarvonshire, the Penryhn quarry, near Bangor, being the largest open working in the world, the underground workings of the Oakley Slate Quarry Company, Ltd., at Festiniog, Merionethshire, being the most extensive slate mine. The output of finished products from the individual mines and quarries constitutes only a part of what is drawn from the workings, it being calculated that there is a loss of about two-thirds in the "dressing" (cutting and shaping) of the slates.

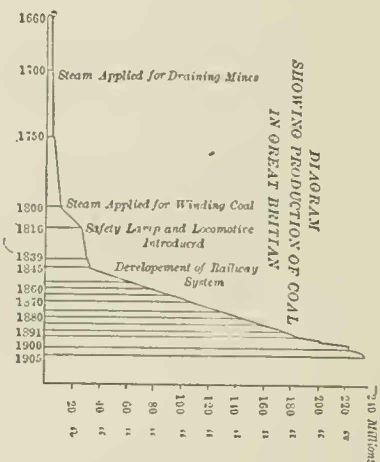

Fig. 4.

No description is given in this review of the production of building and other stones derived chiefly from quarries, as space does not permit of allusion to other than the more purely mining part of this subject.

The chief sources of the mineral wealth of the United Kingdom is in the coal and iron deposits. Of the latter mention has already been made. The former far outweighs in importance all other branches of mining classed together.

Until the year 1899 the United Kingdom was the largest producer of coal in the world (see Fig. 3); it now stands second, the United States having outstripped it in the race for supremacy in this respect.

When coal first came to be worked in this country as a merchantable article, authorities are not agreed. It may have been worked in a desultory and uncertain fashion in very remote times, but the first substantial mention of coal mining is that contained in the records of Holyrood and Newbattle Abbeys,[19] in which it is shown that coal was dug on the south shore of the Firth of Forth in Scotland about 1200 A.D.; further, we know that coal was imported into London from Newcastle about 1257. Indeed, Novacastrians may justly claim the banks of the Tyne as nursery of the coal trade, and to the present day the inhabitants have more than maintained their heritage of skill and foresight, for there is no field in which the mining industry rejoices in better management, both in respect of the mining operations themselves and in the conduct of labor affairs, than the Great Northern coal field. The systems of "joint committees" of representatives of owners and men, and the respective associations of mine owners and of the workmen in Northumberland and Durham constitute a pattern to be studied and an example to be followed by every other mining district wherever it may be, conducing, as they have done in an eminent degree, to the equitable conduct of the trade and the harmonious relations existing between employers and workmen.

There is, perhaps, no trade, excepting the iron-making industry, more subject to variations of prosperity and depression than coal mining. It is often remarked that it is the first to prognosticate a cycle of general depression and the last to recover therefrom. Be that as it may, the words of the old chronicler[20] have a strangely modern ring about them, when read in the light of recent experience. "Many thousands of people," he remarks, "are imployed in this trade of coales: many live by working of them in the pits: many live by conveying them in wagons and waines to the river Tine: many men are employed in conveying coales in keeles from the stathes aboard the ships; one coal merchant imployeth five hundred or a thousand in his works of coals: yet for all his labour, care and cost, can scarce live by his trade. * * * Nay, many of them hath consumed and spent great estates and dyed beggars." The conclusion of the whole matter appeared to him to be that "their Collieries is wasted and their monies is consumed; this is the uncertainty of mines — a great charge, the profit uncertain."

It is not proposed to follow the history of development of the coal trade in detail. The rate of this expansion and how it has been affected by various improvements in mining and facilities of transport are marked in the accompanying diagram, Fig. 4.[21]

One of the most remarkable characteristics of the carbonaceous deposits of this kingdom other than the number of the separate fields and their extensive area is the great variety in the fuel itself. The coal fields may be divided into groups as follows:

I. ENGLISH COAL FIELDS.

Midland Group.— (1) North Staffordshire; (2) South Staffordshire; (3) Leicestershire; (4) Warwickshire.

North Midland Group.— (1) Yorkshire; (2) Derbyshire and Nottinghamshire.

Great Northern Group.— (1) Durham and Northumberland; (2) Cumberland.

Northwestern Group.— (1) Lancashire and East Cheshire; (2) Coalbrookdale (or Shropshire); (3) Forest of Wyre.

Western Group.— (1) Bristol and Somersetshire; (2) Forest of Dean.

II. WELSH COAL FIELDS.

(1) South Wales; (2) Denbighshire and Flintshire.

III. SCOTTISH COAL FIELDS.

(1) The Clyde basin; (2) Midlothian and Haddingtonshire; (3) Fifeshire; (4) Ayrshire; (5) Lesmahagow; (6) Canonbie.

IV. IRISH COAL FIELDS.

(1) Northern Group; (2) Southern Group. These are of small importance and little worked.

The thickness of the seams worked in the fields varies from 11 or 12 inches to 30 feet, but the latter is restricted to South Staffordshire; this seam and the thick coal of Warwickshire being quite exceptionable. Cannel coal in Scotland has been worked, in some instances, when only six inches thick.

The variation in the character and quality of the coals within the different fields themselves is remarkable: for instance, first class coking coal is mined near the banks of the Tyne, yet only a few miles east of Newcastle the world-famed Wallsend household coal is produced, and by far the greater part of the Northumbrian output is exported as steam coal. Again, coke unrivalled in quality, is made from the coal mined in the western and south-western part of Durham, whereas good gas and very superior house coal is raised from the collieries situate in the central and eastern part of the same county.[22] The principal steam coal-producing areas, other than Northumberland, are South Wales (pre-eminently), and parts of the Scottish fields — notably that of Fifeshire — to some extent Lancashire, North Staffordshire and Yorkshire; the other fields chiefly supplying manufacturing, iron smelting, gas and coking coals. Of all the districts, the variation in character of coal is most marked in the great South Wales field, the seams in Monmouthshire being bituminous, but toward the south-west they become less and less so, until in central Glamorganshire the fuel mined is the world-renowned smokeless steam coal so much in request by the navies of this and other nations, and toward the northwest (Carmarthenshire) the seams pass into anthracite.[23]

A factor that must largely affect the future commercial prosperity of the country, indeed is vital to it — is the duration of its iron and coal supplies. The stores of iron ore, owing to the nature of the deposits, cannot be estimated with the same degree of accuracy as is possible in the case of coal, but it may be safely prophesied that their exhaustion will long precede that of coal. Working on the figures arrived at by the late Royal Commission on Coal Supplies, the time which would be taken to exhaust the coal fields at the present rate of output may be taken as about 600 years;[24] whether the present rate of output will be long maintained is, however, somewhat doubtful. For the last 30 years, the average increase in the output has been 2½ per cent per annum, and that of exports (including bunkers) [illegible] per cent per annum, but it is highly improbable, owing to physical reasons, that these rates of increase will be long continued. Some districts, indeed, have already attained their maximum, and decadence has set in, as for instance in the "exposed" part of the South Stafford coal field. The developments in the new coal fields will possibly increase the total output for some years, but the Royal Commission, just alluded to, "look forward to a time, not far distant, when the rate of increase of output will be slower, to be followed by a period of stationary output, and then a gradual decline." Nor do they hold out any hope that the resources may be husbanded by the utilization of any other source of power; they are convinced "that coal is the only reliable source of power and that there is no real substitute, though there are some sources which may slightly relieve the demand for coal." [25]

---

[1] These figures are derived from the 'Mines and Quarries Statistics,' published annually in four parts by the Home Office as a Blue Book, comprising District Statistics, Part I; Labor, Part II; Output, Part III; Colonial and Foreign Statistics, Part IV.

[2] Final 'Report' of the Royal Commission on Coal Supplies. This commission was appointed in 1903, and published its final report in 1905.

[3] The limited extent of metal mining is evidenced by the fact that only 29,504 persons were employed during the year 1904 in producing 3,246,336 tons of metalliferous minerals, *vide* Part IV. of 'Mines and Quarries Statistics.'

[4] Book IV., Cap. 279. Clearly some process of extraction of silver from rich silver-lead ore (galena) must have been in vogue.

[5] In the life of his father-in-law—'Vita Agricolæ.' Agricola in an oration to his soldiers before the battle, near the Grampians (84 A.D.) exclaims: *"Fert Britannia aurum et argentum et alia metalla, pretum victoriæ."*

[6] 'The occurrence of gold in Great Britain and Ireland,' by J. Malcolm Maclaren, B.Sc., F.G.S., in the 'Transactions' of the Institution of Mining Engineers, vol. xxv., pp. 435-508. Hence, "cassiterite," or oxide of tin, the commonest ore of that metal.

[7] 'Tin Deposits of the World,' by Sydney Fawns, F.G.S. For a clear statement of the present position of Cornish tin mining, the articles which appeared in the Engineering Supplement of the 'Times' (Sept. 27, Oct. 18, 1905) should be consulted. Tin *mining*, in the strict sense of the term, probably dates from the 11th century, before that time the whole of the tin being derived from "Stream Works." In 1884 the British output of tin ore amounted to 15,117 tons of tin ore (black tin), worth about £40 a ton; the produce has year by year decreased, until during 1904 the output was only 6,742 tons, worth about £72 a ton. The price has been steadily rising, with occasional fluctuations, during 1905-06, tin being dearer now than ever recorded in the history of the world, and many old mines are being reopened in Cornwall.

[8] Carew, Richard, of Antoine, 'Survey of Cornwall.'

[9] William Pryce in his 'Mineralogia Cornnbiensis' gives the output as 264,273 tons of copper ore during this period, averaging in price £6.14.6 per ton.

[10] 'A Treatise on Metalliferous Mines and Mining,' p. 125. Davies instances the fact, drawing his information from Hunt's 'Mineral Statistics of Great Britain and Ireland,' that in the year 1877 there were 101 copper mines at work in the kingdom, producing an aggregate of 79,252 tons of ore, valued at £317,186 7.7d; of these mines 65 were in Cornwall. The output of copper ore (and copper precipitate) during the year 1904 was only 5,465 tons, valued at the mines at £17,952.

[11] Pennant's 'Tour in North Wales.' The Parys Mine, in the northern corner of Anglesea, worked for a long time and in a century and a quarter returned profits estimated at over £7,000,000. The copper at present derived from the mines in this district is obtained by precipitation of the copper in the waters pumped from the mines.

[12] The output of lead ore for 1877 was 80,850 tons, valued at £1,123,952, whereas during 1904 it amounted to but 26,707 tons, valued at £206,238, to which should be added 36 tons of so-called silver ore, valued at £1,782. Vide 'Mines and Quarries Statistics.'

[13] Sir Roderick Murchison, F.R.S., director of the Geological Survey of Great Britain, 'The Silurian System' (1839, p. 282). He says, "we shall find there are few tracts of given extent in any part of the world which are veined to a greater extent."

[14] 'The Iron Ores of Great Britain and Ireland,' by J. D. Kendall, F.G.S., affords much reliable and valuable information on this subject.

[15] The output of ore from this mine during 1904 was 408,637 tons.

[16] The figures of 1904 give a total production from all classes of mines and quarries of 13,774,282 tons, valued at £3,125,814. 'Mines and Quarries Statistics.'

[17] The output of the various kinds of ore may be roughly proportioned as follows: Clay ironstone, 42 per cent of the output; black band, 12 per cent; hæmatite (red), 11 per cent; brown ore, 29 per cent.

[18] The total production of slates during 1904 was 563,170 tons, valued at £1,678,726. Of this 427,730 tons were contributed by North Wales, in the proportion, roughly speaking, of three-fifths from open workings and two-fifths from mines. The Oakley Coy's mines alone produced 40,192 tons.

[19] For an exhaustive and admirable history of coal mining in Great Britain, the reader cannot be referred to a more interesting and accurate record than the 'Annals of Coal Mining and the Coal Trade' (2 vols.) by R. L. Galloway.

[20] Grey, '*Chorographia, or a Survey of Newcastle-upon-Tine*,' published 1649.

[21] After J. B. Simpson, M.I.C.E., *vide*, Address on the 'Rise and Progress of Coal Mining' (1896), the diagram has been further extended and brought up to date thus:

	Long tons, 2,240 lbs.
In the year 1660, it was estimated by the Royal Commission on coal (reported 1871) that the output of coal was........	2,148,000
And that in 1770 it had risen but little, being but	2,612,000
Between 1770 and 1750, however, steam was applied to draining mines, and gunpowder came to be used at underground operations, so that it was estimated that by 1750 the output had advanced considerably, being for that year	4,773,828
Later steam was applied to hoisting the coal up the shafts, and between 1760 and 1800 the development of the canal system took place, which gave a great impetus to the trade. So that for 1880 the output had increased to	10,080,300
In 1803 coal came to be used for the manufacture of gas, and in 1815 the safety-lamp was invented, which would further assist coal mining. Mr. Samuel Salt computed the output for 1816 to be...	27,020,115
For 1845 Mr. J. R. McCullock puts the output at	34,600,000
The introduction of steam in navigation and the development of the railway system took place shortly before and about this time.	
The (1871) Royal Commission on Coal, sometimes called the Argyll Commmission, the Duke of Argyll being its chairman, calculated that in 1855, the output had risen to the considerable figure of.......	64,307,000

The first year of which we have official returns is 1860. The following figures show the increase:

1860	84,042,698
1865	98,150,587
1870	112,875,575
1880	146,969,409
1890	181,614,288
1900	227,084,871
1905	236,111,150

[22] Professor Hull's 'Coal Fields of Great Britain' (sixth edition) should be consulted by the reader interested in further pursuing this subject.

[23] The extent to which the different fields contribute to the total production may be roughly proportioned as follows:

		Million Tons.
Scotland	East Scotland	17½
	West Scotland	....

[24] The annual output of anthracite is nearly 3,000,000 tons, practically derived entirely from this region.

[25] 'Reports' of Royal Commission on Coal Supplies. Final Report 1905. The Commissioners computed that there were yet remaining to be worked in the "proved" coal fields adopting 4,000 feet as the limit of practical depth in working and 1 foot as the minimum workable thickness, an *available* quantity of coal equal to 100,914,668,167 tons, and that the quantity supposed to exist outside the "proved" areas, *i.e.*, in the "concealed" fields, would amount to 39,483,000,000 tons. In calculating the period of duration there has not been taken into consideration the coal existent at a depth below the 4,000 feet limit, which in the "proved" coal fields alone is placed at 5,239,433,980 tons.

R. A. S. Redmayne,
Professor of Mining in the University of Birmingham; Member of Council, Institute of Mining Engineers; Member of American Institute of Mining Engineers; Institute of Mining and Metallurgy; etc.

25 (a). Great Britain—The Industrial Revolution. Between the years 1770 and 1840 England became the workshop of the world. She changed radically in character; from an agricultural nation she became primarily a manufacturing one. She became dependent for her raw materials on foreign nations and on markets abroad for the sale of her goods. Her international position, therefore, was vastly affected and her prosperity became dependent on the state of trade. No less remarkable was the change in the relations of persons. A new middle class of manufacturers arose and the moneyed interest permanently overtopped the landed interest in social importance. Alongside of the employing class grew up the class of factory hands, and the business relations of the two classes had to be settled afresh and not without considerable friction. The industrial revolution involved, therefore, industrial reconstruction with all the disintegration and suffering that drastic reconstruction always causes.

Not more striking than the alteration in the character of English industry and in English social relations was the remarkable shifting which took place of centres of importance, for suddenly the North sprang into prominence and the South correspondingly declined. In this new industrial region huge masses of people were congregated on certain spots, and the problem of the large towns arose, with all the sanitary housing and other questions connected therewith.

Then came the problem of feeding these agglomerations of people and of getting rid of the goods they made, which questions were answered by the great revolution in the means of transport and the changes in the English fiscal system.

The industrial revolution is generally dated from the coming of machinery and is usually connected with the invention by Arkwright of a cotton-spinning machine in 1775 which was worked by water. It was the application of mechanical power to industry that constituted the novelty, for it was the invention of a substitute for man himself.

But events had been preparing for more than half a century for the introduction of manufacturing on a large scale in England. Inventors had always been numerous, but the conditions were present about 1770 which enabled an inventor to bring his ideas to a successful issue. In the first place there was in the England of that time an abundance of capital, owing to the development of the banking system, so that an enterprising man could get money to try experiments. Arkwright's machine is said to have cost £12,000 before it was perfected. Then, too, there was every prospect of large sales without which machine production would have been unnecessary. England's markets were developing steadily in the 18th century both at home and abroad. At home the revolution caused by smelting iron with coal had given rise to canals to transport the fuel and the result was a general quickening of intercommunications. New centres rose up and a greater demand for goods was created. The export of English goods was steadily rising in value and there was every chance of increasing the sales if goods were cheaper. Moreover in the 18th century the capitalist employer had become prominent. There was, therefore, a class of men trained to production on a large scale. The old mercantile companies with their rules as to limited sales had lost their power to dictate as to quantities and prices and there was no hindrance on that side to the enterprising man.

Yet although these forces were all making for a great change in the methods of industry the England of 1760 was an agricultural country. The leading branch of trade was cloth; cotton goods and muslins were imported from India and re-exported; fine cotton goods could not be made in England as the warp was too weak and linen had to be used. The iron trade had been threatened with extinction owing to the lack of timber and was only just beginning to revive when coal could be utilized for smelting owing to the invention of the Darbys about 1740; but much remained to be done, and it was not until Cort's invention of a means of puddling iron in 1784 that the iron trade made great advances.

In 1760 the Duke of Bridgwater was cutting the first canal and the turnpike roads were beginning to facilitate internal travel.

The majority of the work-people were either small manufacturers who bought the wool, wove it, and disposed of the cloth themselves, or worked on commission for some big dealer. Nearly all of them had a by-employment in the shape of a small farm, while the women and children practically all over England were employed in spinning or carding. The incomes of the day were family earnings. As English cloth had almost a monopoly value the demand was steady; England grew the bulk of her own wool and was not mainly dependent on importation from abroad. The characteristic of the whole period was stability. If the orders for cloth fell off then the man had his bit of farm to fall back on — the one helped the other. Agriculture was not divorced from industry nor the workman from country employment, nor was there any marked distinction between town and country. It is probable that according to our notions the life was sordid and the standard of comfort low, and there is no reason to think that the parents were the easiest of taskmasters for the children. But the problem of the unemployed was absent, and the domestic workmen at all events decidedly preferred the life to that of the factory.

When machinery came it was curiously enough first of all applied to the languishing trade of cotton. The reason seems to have been that the supply of raw cotton was unlimited, while England was already on the verge of a wool famine. Sheep growing had not been started in Australia and there was no reason to anticipate that even if machinery came in the output could be largely increased. Moreover wool being more brittle than cotton it was found at first very difficult to adjust it to the strain of the machine without constant breakages. Hence wool is affected by machinery much later than cotton. Arkwright, a barber, revolutionized the cotton trade by his water frame, patented in 1775, which spun a yarn firm enough for the warp. Crompton followed this up by inventing the mule in 1775 which created the muslin trade; and Cartwright, a clergyman, brought out the power loom for weaving which was first used in 1801. Power spinning in the woollen trade did not become general till the first decade of the 19th century.

The effect of the cotton machines was to create a new trade. The great manufacturing centres had hitherto been Norwich and Devizes, but the new machinery needed water power, and hence the trade settled in the North in country districts where water was available. The first machines were small and simple and were made of wood and necessitated a good deal of bending over by grown-up persons but could easily be worked by children, but such labor was difficult to obtain in the country in large quantities, hence the massing of pauper children in these factories. There seem to have been grave abuses in the system and a new era was inaugurated by Sir Robert Peel's Health and Morals of Apprentices Act of 1802 which limited the working hours of apprentices to 12 per day.

The problem, however, was altered when steam came in owing to Watt's invention. It was only substituted gradually for water power, coming in more and more after 1815 and becoming the prevalent type altogether in 1840. The important thing now was no longer water but coal, and to get coal the factories had to settle in the great centres where coal could easily be brought by canal, as the cost of dragging it over country roads was prohibitive for cheap production. Hence we get a second great migration of industry to the towns near the coal fields. Here child labor was readily available, and a new Act had to be passed in 1819 to meet the case of children who were not apprentices. As steam became more regularly applied the machinery got more complicated and less suitable for children of tender years, and there was a tendency to discontinue them in certain branches. They were still retained in the old water mills and the Factory Acts were never really effective till the invention of the government factory inspector in 1833.

There were practically no people dispossessed by machinery in the cotton trade; instead there were increasing opportunities of employment, but other trades suffered. The demand for both light woollen and linen goods fell off as cotton was substituted. Still the weavers prospered. They continued to work up the yarn in their own homes, and it was not until the dislocation of trade brought about by the Napoleonic wars that they fell upon evil days. Gradually machinery was applied to weaving, and the race of hand-loom weavers died out amid great privations.

It was when machinery was applied to wool, that the real social upheaval came. It destroyed the by-employment of spinning throughout the whole of the country districts, and an elaborate system of relief from the rates had to be devised to assist people over the crisis. This pauperized the whole of the south of England and degraded the agricultural laborers as a class.

The radical change in English life came from the fact that the factory system destroyed the old stability. A man had to follow his work to the towns and lost his little farm. Even when the factories were situated in the country he had to work regularly and could not take time off to attend to the garden as he could when working for himself. The regularity of the life, the tyranny of the factory bell, and the loss of independence were the things of which the worker most complained. The early factories, situated as they were in the country districts, laid the workmen open to an appalling system of payment in kind called "truck," an evil only gradually remedied by a series of Acts of Parliament beginning in 1831.

But more important than his dependence on his treatment by the master was the dependence of the workman on the state of trade. The sufferings during the Industrial Revolution in England were especially violent owing to the Continental System of Napoleon which shut out English goods from Europe except by smuggling between 1806–1812, and which was followed by the rupture with the United States, which cut off another very important market. After the peace of 1815 the utter exhaustion of the continent made Europe a bad customer, and England, equipped as she now was for production in bulk, suffered accordingly. The coming of machinery would have been a difficult time for any country, but the troubles were enormously aggravated owing to the fluctuations of trade and the depression after the war. English exports decreased in value between 1815 and 1825, and only began to recover about 1835, and to make a rapid advance in 1840. Nevertheless the increase in trade when compared with that of 1750 was enormous.

The exports in 1750 were valued at £12,690,081, in 1800 they were £34,381,617, in 1840, £116,479,678. The imports in 1750 were £7,772,039, in 1800, £28,257,781, in 1840, £67,432,964.

The growth in the import of raw cotton is very striking. In 1751, 2,976,610 pounds were imported, in 1815, 99,306,343, in 1830, 259,856,000.

The import of wool could not expand till the Australian wool became available. In 1800 the number of pounds imported was 8,600,000, in 1840, 49,436,000, in 1857, 127,390,000.

Then the English fiscal system had to be overhauled to get in cheap raw material, and the agitation of the manufacturers was successful in bringing about the free trade era.

During the 19th century the English Parliament has been mainly occupied in readjusting the relations of employers and employed, in facilitating the growth of a manufacturing state, and in abandoning the system which was made for an agricultural state; while no attempt has been made to preserve any balance between agriculture and industry.

The result of the industrial revolution in England was, to use the words of an 18th century writer, "to remove multitudes of people from our natural and fixed basis, land, to the artificial and fluctuating basis, trade."

25 (b). **Great Britain—The Industrial Organization.** *The Recent Character of Important Changes.*—The industrial organization of the United Kingdom as it is at the present time is of recent origin so far as some of its most characteristic and important features are concerned. The "industrial revolution," so-called, which took place at the end of the 18th century, important as it was, did not extend very far, but left other countries comparatively untouched. Many British industries continued to be carried on by the old methods. Railways and the means of transport generally were ill-developed, and the old balance between agriculture and manufactures remained on the whole undisturbed. These conditions have all been altered in more recent times, especially during the last 30 years. The machine industry has spread to other countries, and whenever a new manufacture is now founded it is carried on by methods of which Great Britain formerly had the monopoly. Moreover, the relation of manufactures to the rest of the national economy has undergone a great and fundamental change.

The Decline of Agriculture and its Effect. — In the period 1831-5, 96 per cent, or 23.6 millions, of the then population were fed from home-grown corn. In 1841-5, the period immediately preceding the repeal of the Corn Laws, while the percentage of the population fed from home-grown corn had declined to 90 per cent, the actual number had risen to 24 millions. In the period 1901-5, the percentage of the population so supported had fallen to 10.6 and the actual number to 4½ millions. The change so indicated is not confined to wheat, but extends in some degree to every form of agricultural produce, including meat, and these changes have become more marked during the last 30 years. Most of the old economic arguments, which were in fact based upon an assumed balance between agriculture and manufactures and the action and reaction of one upon the other, have ceased to be relevant to the United Kingdom. The export of manufactures is absolutely essential to the maintenance of the United Kingdom.

The Relations between the Home and the Export Trades.—The home market, in the sense in which this expression is used in America and on the Continent of Europe, cannot be said to exist. Calculations, or to speak more accurately, "guesses," are frequently made as to the relations between the home and the export trades. It was calculated for example, a few years ago, that 20 per cent of the total wages in England was earned in productions for the export trade and in much economic reasoning at the present time, there is an implied assumption that the home trade is so much more important than the export trade that a considerable change in the character of the latter would be of no great importance. This reasoning might perhaps apply to a large extent to the United States and to a smaller extent to modern Germany: it certainly would not apply to the United Kingdom. Whatever the exact proportions may be — and until there is an industrial census we have not an adequate basis for calculation — it is certain that the relation between the home and the export trade in the United Kingdom is very different from that which is found in foreign countries and must necessarily affect both the international organization of the trade and business policy adopted. In the actual investigation of trade conditions, it is extraordinarily difficult to obtain from firms engaged in industry materials for any clear-cut distinction between the two branches of national activity, because, even in the case of firms which themselves do directly no export trade, the reaction upon their trade of trades which manufacture for export is both immediate and rapid. We may take one or two examples to show how this works out.

The Cotton Trade in Relation to Other Industries.—The Cotton trade differs from all other British industries in the proportion which the export trade bears to the home trade. More than 80 per cent of the output of the cotton industry is exported. The industry employs more than half a million working people directly in the mills, and they and their families depend directly for their livelihood on their weekly earnings. To these we must add the millions of people dependent upon the railways, the canals, the shipping which bring the raw materials to the mills, and carry away the yarn and manufactured goods; on the engineering industry which provides the machinery required; on the building trades which erect the mills, and house the operatives: on the countless other trades and agencies, state, municipal, and private, which supply the needs of the great industrial population. The result is that the prosperity or the depression of the cotton industry quickly affects other trades throughout the country, whether they do or do not manufacture for export. In the recent cotton boom the improved conditions spread over the country like a great tidal wave. Here then whether the actual proportions between the total export trade and the home trade of the country are as 1 to 5, or 1 to 6, is of trivial importance. If any considerable diminution occurred in the exports of Lancashire, or even if the export trade remained for a long period of time stationary, many other industries would suffer from stagnation.

The Export Trade and Domestic Competition.— Evidence recently obtained brings out another very important condition which is found in British industries at present. Here again we may in the first instance take the cotton industry. While there is no particular reason why Germany and other competing countries should not with ease and success spin coarse and medium counts both for the home and the export trades, Lancashire at the present time has almost the monopoly of fine spinning, and this branch of the spinning industry has beyond all question considerably increased in recent times; but until the boom of the last two years the depression in certain branches of the cotton trade reached alarming proportions. There was a marked tendency under these influences for capital to go into fine spinning and competition has in fact become exceedingly severe in recent years. The McKinley and Dingley tariffs prejudicially affected many important branches of the woolen industry. The result of the loss of these and other markets has been to throw manufacturers back upon the home market to such an extent, that whereas in former times the woolen industry was carried on in localities, each of which was devoted to specialties, the lines of demarkation between one locality and another are gradually being broken down. The West Riding competes with the West of England, and the different parts of the West Riding compete with each other in a far more marked degree than was formerly the case.

Textile Substitutes.— This movement has been accentuated by the invention of substitutes for different textiles. Cotton competes with linen, and in many of the cheaper classes of goods has displaced the linen. Cotton substitutes for wool have played havoc with certain branches of the woolen industry. Mercerised cotton has displaced many goods formerly made of silk. During the high price of wool in recent years cotton benefited considerably by the extended use of cotton substitutes for woolen goods. Generally speaking, three conditions fundamentally affecting the industrial organization of the United Kingdom have become more marked in recent years: (1) the old balance between agriculture and industry has been completely destroyed, with the result that the export of manufactures is of vital importance to the existence of the country; (2) the export trade in manufactures bears a higher proportion to the home trade than that of other industrial countries — in one industry, cotton, that proportion reaching more than 80 per cent of the whole; (3) the loss or relative diminution of some branches of the export trade has greatly increased domestic competition — a competition which has further been rendered more acute by the more extended use of substitutes for the various classes of textile goods.

Size of Firms.— The theoretical lines upon which economic investigation has been carried on in England have popularized a purely academic view of the industrial organization of the United Kingdom, based to a large extent on the conditions which prevail only in certain industries organized on the factory system. The picture is presented of the great factory employing large numbers of pure wage earners, above them the class of the foreman, etc., then the great *entrepreneur* and the capital in the background, the *entrepreneur* sometimes being resolved into a board of directors with one as managing director. Moreover, this idealized factory is becoming larger and larger, swallowing up the smaller works in its progress and ultimately forming part of one great amalgamation controlling a large proportion of the industry in which it is established. This highly-organized business proceeds every year to a higher grade of manufacturing, employing a class of workpeople progressively improving in skill and intelligence, and in the wages they earn. There can be no doubt that illustrations may be found in the industrial system of Great Britain of this type of industrial organization, but it would be a great mistake to suppose that it is normal or usual. Taking the United Kingdom as a whole there are probably not more than 90,000 to 100,000 manufacturing firms, and of these the vast majority are small works. Even in iron and steel and engineering the great firm employing thousands of workpeople is by no means common. Over a great part of the Midlands countless small industries are carried on in which the prevalent type of manufacturer does not differ so widely from his predecessor of two or three generations ago as the economic textbooks would lead one to suppose. To what extent the process of concentration has gone, how far the smaller firms have been eliminated, whether that elimination is proceeding faster or slower than it did 30 years ago, whether the whole of the industrial system is growing by degrees to conform to standards very largely derived from certain industries in the United States, are questions it is impossible to answer. At present, so far from conforming to one particular type, the industries of England as they pass under review present a bewildering complexity of organization.

Tendencies with Regard to Raw and Half-Manufactured Materials.— Some important changes have taken place in regard to the conditions of supply of raw materials. It is of course impossible in this article to review these conditions as they affect all industries, but taking the case of raw cotton, the general opinion in the trade appears to be that conditions have deteriorated, both absolutely and relatively, partly because of the liability to shortage which was illustrated on a great scale in 1903 and 1904, partly because of the competition of foreign countries, and partly because English spinners cannot use all classes of cotton. The last mentioned difficulty is said to be due in a large measure to the objections of the operatives, but the change in the proportion taken by the Continent, the United States and Great Britain respectively has reacted upon general conditions. The following table shows the weekly consumption of cotton in the United Kingdom and on the Continent during this critical period.

	Great Britain. (bales of 500 lbs. each)	*Continent.*
1901–02	62,560	93,000
1902–03	61,250	99,000
1903–04	58,020	99,000

Thus, while Lancashire was working short time, owing to a diminished supply of 3,230 bales per week, the Continent continued with the same supply as in the previous season. The explanations given for this state of things fall into two groups, one attributing it to differences in the method of buying, the other referring it to the general policy of the countries concerned. In regard to wool, the conditions have also altered considerably within recent experience. There has been a steadily-diminishing production of British wool which is probably connected with the agricultural depression, and Continental ools have also declined in use, but there has been an enormously increased use of Australian and other Colonial wools; and in regard to the Australian wool trade in particular great changes have taken place in the organization of the trade. Not only has a direct trade of considerable proportions grown up between the Continent and Australia, displacing much of the indirect trade which formerly took place, but the Continental manufacturers are now strong competitors with the British manufacturers in raw wool at the London wool sales. In no industry is the diminution of England as the emporium for raw materials so marked as in the case of silk, the re-export trade in silk having declined from more than £3,000,000 sterling in the period 1857–64 to merely a nominal sum at the present time. Going carefully into the figures with regard to the supply of raw material for the various English trades at the present time it is not so clear that, on the whole, Great Britain under existing conditions enjoys those marked advantages which she formerly possessed, in the instances above mentioned, and in many others, experience having proved that foreign competing industries can do equally well, and in some instances, in the opinion of manufacturers, even better. Above the stage of raw material also there has been in recent years a decline in the self-sufficiency of British manufacturing industries. Steel blooms and billets formerly obtained exclusively in the United Kingdom are now often imported; in the engineering industry steel castings, forgings, and shaftings are frequently obtained from abroad instead of as in former times giving employment to workpeople in England. Industries like the tinplate trade have grown to depend, as some think, to a somewhat dangerous extent, on imported materials.

Finished Goods.— Competition has also developed in regard to finished goods with reactions of considerable importance on the organization of some British trades. In the woolen trade the home manufacture of foreign countries such as France, Russia, Germany, and the United States, which formerly imported largely from Great Britain, has enormously increased, and there has taken place a decline in those branches. There has thus been a tendency for yarns to displace manufactures, for tops to displace yarns, and for raw wool to be exported in a larger proportion than was formerly the case. This process, if it continues, must have a considerable effect in deteriorating the quality of labor employed in the woolen industry. The highest paid and most efficient labor is in the finishing branches, and if these branches are displaced and inferior grades substituted, there must inevitably take place a gradual degradation both of the quality and the wages of labor.

Tendency to Specialties.— On the whole, however, the effect of the increase of foreign competition on the industries of Great Britain has been to produce a growing tendency toward the manufacture of specialties. Large generalizations in regard to an industry are scarcely ever correct, but if we may make one for the purpose of bringing out this point, we might say that while in the United States and Germany the tendency has been to capture certain staple lines, to rely for the maintenance and growth of production of these lines chiefly upon the home market, and to support the system so established by an export organization for the disposal of surplus products, the tendency in some great English industries, especially the textile, has been more and more in the direction of specialties. This condition affects fundamentally the organization of the British industrial system, because it is less possible to make to stock or to diminish the burdens of fixed charges; greater attention must also be devoted to watching the ever-changing character of the demand; greater expense must be devoted to designing and processes, and it is less easy to scrap old machinery. Thus the industries of England are probably less homogeneous than those of the competing countries. The cotton trade, big as it is, is not one industry, but a vast aggregate of industries in which it is scarcely possible to find two mills which are strictly comparable. There is not merely the distinction between fine, medium, and coarse spinning, but the range of counts produced differs from one mill to another. When we come to the weaving and finishing branches, every mill appears to have its own specialty, the spinning, weaving and finishing are not normally found conducted under the same roof, and manufacturers who cover all the different branches are comparatively rare. This, however, is not true of the linen trade, where the largest firms conduct every operation from the stage of raw material to the finished product.

Variations of Costs.— The problem of comparative costs in the United Kingdom and foreign countries is one of extraordinary difficulty and complexity; even in such grades of manufacture as pig iron and steel billets and blooms the variation in the amount and proportions of the different elements of cost are very great. Taking, for example, the actual figures of an iron and steel firm and comparing their costs in the production of steel for two consecutive periods, the works running three quarter time in the one period while they were running full time in the second period, the saving in the second period as compared with the first worked out at almost 6s. a ton, or in the case of this particular firm about £45,000 a year. Moreover, the saving was effected both on wages, fuel, and general charges, and the proportions of each element varied. Other instances showing even greater variations could be given in the same industries. These figures vitiate comparisons of the productive power of one country with that of another based upon average costs which pay no regard to output, the period during which the works have been running, or the trade policy adopted by manufacturers. But when we come to the different stages of production in the engineering or the textile industries, the problem is infinitely more complicated than in iron and steel because we have to consider not only the element of continuous running — the main factor in the iron and steel variations given above — but the different part played by the cost of materials and the quantity and character of the labor employed. Actual accounts are given by Lancashire manufacturers of the variations in salaries and wages from 14 to 63½ per cent in cotton spinning. Taking two mills spinning the same fine counts of cotton in France and England respectively, we find wages working out at 64 per cent in France against 70 per cent in England; fixed charges at 7½ per cent in France as compared with 4 per cent in England; working expenses at 28½ per cent in France as compared with 26 per cent in England. But this does not altogether show the matter correctly because although in the case of these particular mills the individual wages are smaller in France than in England, yet more workpeople are required in France for the same amount of work, and the wage bill in France is as a total very similar to that in England though the percentages are so different. Taking another instance from worsted manufacture, the analyses of the actual accounts of a large mill come out as follows: In the wool merchanting, wages worked out at .6 per cent of the cost; in the top making 6.9 per cent; in the yarn spinning 13.8 per cent; in the cloth weaving 30 per cent. But the various items, taking the English industry as a whole, vary so considerably that it is quite impossible to reduce the comparison of costs in England and in foreign countries to useful statistical treatment.

Continuous Running.— But in every industry without exception we constantly find the same argument insisted upon as to the importance of continuous running in diminishing costs. Taking this condition of successful competition in conjunction with the tendencies which have been explained toward the loss of staple lines, and the dependence upon specialties, it is at any rate open to discussion how far the changing character of British industry is favorable to the permanent retention of the markets upon which they have hitherto depended, as other countries which have already securely established their staple lines become more and more skilled in the production of articles which compete, directly or indirectly, with the specialties of Great Britain.

The Efficiency of Labor.— Generally speaking, inquiry does not give much support to the belief, which is very widely held, that labor in England is less efficient than that of foreign countries. On the whole the evidence points to the opposite conclusion, but it does appear doubtful whether the progressive increase in wages and the diminution in the hours of labor are, as a matter of fact, followed by a proportionate increase in the productive power of the industries affected. In particular, the relative shortness of the hours in the United Kingdom does appear to handicap British industry by making it extremely difficult or impossible to get so much out of the machinery and plant, and to proportionately reduce the burden of fixed charges. It is not a question of the working capacity or the intelligence of the individual employee or of groups of employees in the same grade, but of the running of the works as an organic whole. Hence, there appears to be, under existing conditions, a growing divergence between the claims of legislation and the interests of the workers as citizens and the need of making full use of modern machinery and plant if costs are to be kept within the limits necessary for successful competition in neutral markets, or even for retaining control of the home market.

Transport and Export Organization in Relation to British Industries.— To this may be added the complications that arise in relation to the organization of British industries through the different relations between each trade and the transport system in England as compared with Germany, the United States, or other foreign countries. The United States is full of examples in which the industry at every stage, from the raw material to the finished product, works in the closest harmony with the transport and general export organization which that industry requires, and the development of the state railways in Germany and the inclusion of transport in the general scheme of national policy, produce similar results. In the United Kingdom on the other hand, railways, steamship companies, commercial organization, and all the other aids to productive enterprise have grown up historically on their own lines, and the whole national system in England is on an "individualist" basis. One of the most interesting problems which the future will perhaps solve is, how far an industry so organized can satisfy the claims of labor at home and at the same time meet on equal terms the disciplined industrial armies of competing countries.

W. A. S. Hewins,

Secretary of the Tariff Commission, formerly Director of the London School of Economics and Political Science.

INDUSTRIAL REORGANIZATION.

26. **Great Britain — Trade Unionism.** English Trade Unionism is an indigenous product, which has remained singularly uninfluenced by any foreign movements or ideas. Disregarding the analogous combinations among journeymen during the Middle Ages, which in England seem to have been usually intermittent and temporary, and also the mediæval guilds of master-craftsmen and merchants — between which and modern Trade Unionism no actual affiliation or connection has yet been traced — we may say that Trade Unionism, in the sense of durable combinations of wage earners for the purpose of maintaining or improving the conditions of

their employment, have existed continuously from the end of the 17th century. The earliest actual records known to us of such a combination is that of the woolen workers of the south-west of England, which is mentioned as existing in 1700, and frequently referred to in Devonshire, Somerset, Wiltshire, and Gloucestershire throughout the 18th century. The London tailors, too, can be shown to have been in continuous combination from at least 1720, when an Act of Parliament was passed to restrain them. Other Trade Unions known to have existed in the first half of the 18th century were those of the woolcombers, woolstaplers and silkweavers. It was, however, apparently during the last quarter of the 18th century, when industrial conditions were being revolutionized in so many trades by the introduction of machinery, the factory system, production for export and the use of water or steam power, that Trade Unionism first became widely prevalent. Since that date, it is notable that the aggregate membership of Trade Unions in the United Kingdom has, with a number of temporary suspensions, persistently increased, until it now (1907) approaches 2,000,000; organized in 1,150 different societies, possessing funds exceeding £5,000,000. As an institution Trade Unionism has, during the whole two centuries, and especially since 1824, when the first legalising statute was passed, steadily increased in solidity, and continuously improved in its temper toward society and in the economic character of the methods employed to gain its end. In all these respects the improvement during the last 30 years has been most marked. Whatever may be the causal connection, if any, the historian cannot but record the fact that the character of English Trade Unionism has varied from decade to decade in close correspondence with the variations of the treatment which the community accorded to it. So rapidly and certainly has an improvement in English Trade Unionism followed upon measures of legalization and tolerance that were it not that it would seem to palliate inexcusable outrages of past times, we should be tempted to the epigram that each generation of citizens and the employers in each trade in each generation have the Trade Unionism that they deserve!

The form which Trade Unionism takes among the English wage earners (and we may ignore for present purposes the Trade Unionism of other classes, such as lawyers, doctors, teachers, etc.), is that of a voluntary association among the persons engaged in a particular trade, based upon the payment of weekly contributions — varying from two pence to eighteen pence — to a common fund which is administered by an elected executive, bound by an elaborate code of rules, and controlled by frequent referendum votes of the entire membership, in such ways as are believed to promote the objects of the members. These objects are, first and foremost, the maintenance and progressive improvement of the conditions of employment of the wage earners in the trade concerned, including not only the amount of wages, but also the method of remuneration, the form of the agreement, the hours of labor, the sanitation, safety and comfort of the operatives, and all the other conditions, explicit or implicit, of the wage-contract. Auxiliary to this fundamental object, and always subordinate to it, are the various "friendly benefits" afforded to members, which may include maintenance payments to members out of work, whether from strikes or lockouts, or merely from slackness of trade; sick pay; medical attendance; funeral benefit on death of member or member's wife; accident benefit; insurance of tools against loss by fire or otherwise; legal assistance to members in litigation, and so forth. It is especially in the durability and financial solidity of the association, the multiplicity and amount of their friendly benefits, and the magnitude of their accumulated funds, that the principal English Trade Unions surpass those of all other countries. There are great Trade Unions (such as the Amalgamated Society of Engineers) which habitually enjoy an annual income of £4 per member; there are others (such as the Amalgamated Cotton Spinners) which possess accumulated funds exceeding £21 per member; there are others, again (such as the Boilermakers), which disburse on sick pay and medical attendance alone, more than £60,000 a year, including no less than £8,000 as salaries to the doctors in their employment. Among them all, the Trade Unions expend more than £250,000 annually in pensions of 5 to 10 shillings a week to their aged members, and nearly £100,000 in payment of their funerals; while £750,000 is annually paid to members out of work, only from one-sixth to two-fifths of this, according to the state of the labor market, being for anything that can be called strikes or industrial disputes. But this strong financial position and these substantial friendly benefits are confined to the well-known leading Trade Unions. Out of the 1,150 separate Trade Unions, there are 20 owning more than £50,000, which together possess one-third of the aggregate total of members and three-fifths of the accumulated funds of the whole movement.

The fundamental principle of English Trade Unionism is the necessity, in modern industrial and social conditions, for the establishment and enforcement of a common rule, with regard to the conditions of employment. Without the enforcement of such a common rule, Trade Unionists assert that the operation of competition is inevitably to degrade the conditions of employment irrespective of the profitableness of the industry or the wealth of the country as a whole; eventually forcing down the remuneration of the lowest and weakest wage earner to the very minimum on which he can manage to exist from day to day (far below the level for healthy subsistence); requiring him to labor for excessive hours, and exposing him to unsanitary, dangerous and brutalizing conditions of employment. Toward such a morass of "sweating," demoralizing to the workers themselves, and economically as well as socially disastrous to the community as a whole, the unrestricted competition of the labor market is always forcing out only the weaker members, but also, through the competition of these, the entire wage earning class. In confirmation of this analysis, the English Trade Unionists point to the state of millions of workers in every industrial country, the United States and Australia affording quite as striking demonstrations as England and the continent of Europe. Its essential accuracy is, indeed, now asserted by the economists of to-day, and mathematically demonstrated (consult 'Industrial Democracy,' by S. and B. Webb, 1902).

Against this persistent tendency of industrial competition in the labor market, the modern economist or statesman establishes, in the interest of the community as a whole, the Common Rule of standard minimum conditions, designed to prevent the wage earner being subjected, even with his own consent, to conditions of employment likely to impair his health, undermine his strength, or demoralize himself or his family. This is the philosophy of Factory Legislation, as yet only imperfectly applied in any country, but advancing in all; as yet restricted in the main to women and children, and to their hours and sanitation, but now slowly extending to wages and other conditions, and to adult men. The maintaining, extending and enforcing of Factory Legislation is one of the principal expedients used by English Trade Unionists (especially the textile operatives, the coal miners, the railway workers and the shop assistants) for obtaining the protection of the Common Rule. Such legislation has been carried to its fullest extent at present in New Zealand and Australia. (Consult 'State Experiments in Australia and New Zealand' by W. P. Reeves).

The second expedient used by English Trade Unionists is that of Collective Bargaining. Instead of each wage earner making his own bargain with the individual employer, the Trade Union aims at making common terms for the operatives as a whole, with the whole of the employers. Examples of such Collective Bargains are the "Working Rules" which govern the building trades in nearly every English city; the elaborate hierarchy of agreements of the iron-shipbuilding trade; or the highly evolved lists of prices of the cotton industry. This does not mean (as often ignorantly asserted) that Trade Unionism implies, or that Trade Unionists desire, that all workers should be paid alike. The mere fact that a large majority of the English Trade Unionists (including the strongest and ablest of them all) absolutely insist on piecework as the very basis of their Collective Bargains, and would instantly strike against any attempt to introduce wages by the hour or by the day, proves that equality of earnings is not their object. What they do aim at is equality in the rate of pay for a given unit of work; though even here their aim is only to secure for every worker the standard rate for the work done as a minimum. No objection is made to more than the minimum rate being given, provided that this is not done in such a way as to bring other workers below the minimum. Collective Bargaining, more or less universal throughout the trade, is now the prevalent practice in all the principal manufacturing industries of Great Britain and it is, to the economist, a notable fact that it prevails most universally and is most strictly enforced, just in those industries, such as cotton spinning and shipbuilding, in which British industrial supremacy is most demonstrable.

The third expedient of English Trade Unionism is Mutual Insurance. By bringing to the support of the individual workman, in any time of economic weakness, the aid of accumulated funds, he is enabled to stand out against the terms offered by the employer, and wait until better terms are conceded. It is with this object, and not primarily from any compassionate or humanitarian feeling, that English Trade Unionists have so generally united the well known "friendly benefits" with their trade combination. The large accumulated funds of some of the English Trade Unions, amounting sometimes to £25 per head of membership, afford valuable assistance in their Collective Bargaining for better conditions, by making possible the final arbitrament of the strike. But they do more than that. In small and closely unit trades, where the operatives are sufficiently self-restrained and intelligent, what we have called the strike in detail may be an effective weapon. There is no overt Trade Unionism. The employer may refuse to recognize the Union, or the law may make corporate action dangerous. There may even be no attempt to prevent the employer filling his vacancies. But if the men in the trade are strongly combined, the employer may find that he cannot keep any man more than a week or two. Each man in succession leaves in silence before he has well settled down to his work, leaving the employer to find out for himself in what way the conditions which he is offering offend against the undivulged Common Rule. Such a strike in detail is out of the power of any but a small, skilled, strongly combined, highly intelligent, and rich Trade Union having an elaborate Mutual Insurance. But with such a Union experience shows it to have often been more efficacious in maintaining the Common Rule, than the most turbulent of strikes.

The English Trade Unions form, with the analogous associations into which the employers in the principal trades are now brigaded, elaborate organizations — based on mutual discussions in joint committees, investigation by neutral accountants and the joint application of principles by the salaried officers of the employers and of the workmen respectively — for Collective Bargaining, the settlement of standard piecework lists, scales of wages, and other general minima of the conditions of employment to be observed throughout the trade; for the application of these formal agreements to the varying circumstances of particular districts, particular establishments, particular branches of work, and even particular jobs; and also for the revision of these general agreements, and the settlement by arbitration of the disputes that from time to time inevitably arise. This elaborate machinery for determining, irrespective of the will or caprice of individual employers or individual operatives, the minimum conditions on which the whole trade shall work, is most highly organized in the cotton manufacturing, coal mining and shipbuilding industries, together with some smaller trades, such as the brassworkers, lacemakers, and compositors.

The Trade Unions have, however, further organizations of their own. The local branches in each town are united for mutual support in Trade Councils, of which there are now over 200. These organizations are of little financial strength, and chiefly of moral support. More substantial are the great federations, of which the principal one, the General Federation of Trade Unions, now includes over 90 large Trade Unions, with 400,000 members, and an accumulated fund of £100,000. This has for its object the mutual support of its constituent unions in industrial disputes. Another federal body, the Federation of Engineering and Shipbuilding Trades, with 350,000 members (including most of those in the General Federation), has for its principal object, the prevention and settlement of the disastrous disputes that occasionally break out between one set of workmen and another as to the "encroachments" by one trade on another, and the proper "demarcation" of their several pieces of work. A third body, the Miners' Federation, is composed of practically all the coal mining Trade Unions, and has, beyond mutual support, principally for its object the obtaining of additional Mines Regulation Acts, especially the enactment of an eight hour law.

The relative proportion which Trade Unionship members in the United Kingdom bears to the wage earners as a whole, is often much misunderstood. The two millions of Trade Unionists amount to only one in seven of the whole. What is, however, obscured by the statement is that the vast mass of the wage earners belong to occupations in which Trade Unionism does not exist, or exists only in rudimentary form — such, for instance, as the agricultural laborers, the unskilled laborers in urban districts and the domestic servants, or the large numbers who work in one or other form as independent producers, such as the jobbing craftsmen, the tin and copper mines, the homeworking seamstresses, etc. Women workers, generally, including all the factory population, count only 125,000 Trade Unionists out of some four millions of women industrially employed. A more correct way to estimate the strength of Trade Unionism is to take the proportion of Trade Union membership to the adult males employed at wages in particular industries. In many cases, such as the boilermakers, the cotton spinners, the lacemakers, and the coal miners, it would be found that over whole districts of England every operative actually employed was a Trade Unionist. In such industries, indeed, Trade Unionism is as universally compulsory as citizenship, and is enforced by as little conscious pressure. It is taken for granted by every workman, as it is by every employer. The whole industrial organization is adjusted to it, with the result that it becomes as imperceptible as the weight of the atmosphere. On the other hand, there are great industries, such as the building and engineering trades, in which, while strong Trade Unions exist, are whole districts in which a majority of the workmen remain outside the unions, not caring to pay the weekly dues; and usually in every town some establishments which employ indifferently both Unionists and non-Unionists. To the economist it is significant that it is precisely in those industries in which Trade Unionism is virtually universal and compulsory — among them being particularly cotton spinning and shipbuilding — that both technical processes and the use of machinery have been most advanced, and both industrial efficiency and financial success have been most conspicuous. In contrast stand the "sweated" industries, low grade in quality in their nature, and curiously unstable in their position in the world-market. In these industries neither Trade Unionism nor effective Factory Legislation exists.

Bibliography.—The principal authorities are the 'Annual Reports' of the Board of Trade (Labor Department) on Trade Union Statistics, and on Strikes and Lockouts. For the history, consult 'The History of Trade Unionism,' by S. and B. Webb (1902 edition), and (as to origins) also 'Industrial Organization in the 16th and 17th Centuries,' by George Unrvin (1904). For an elaborate economic analysis of every form of Trade Union activity, consult 'Industrial Democracy' by S. and B. Webb (edition of 1902); also 'Methods of Industrial Remuneration,' by D. L. Schloss; 'Industrial Peace,' by L. L. F. R. Price; 'The Case for the Factory Acts,' edited by Mrs. Sidney Webb, with preface by Mrs. Humphrey Ward. For the case against Trade Unionism, from the standpoint of the individualist employer, consult 'Trade Unions and Industry,' by E. A. Pratt.

27. Great Britain — The Labor Movement in Politics. The greatest politician of the last century, W. E. Gladstone (q.v.), writing in 1892, expressed the opinion that "The labor question may be said to have come into public view simultaneously with the repeal of the Combination Laws," — that is about 1825.

Accepting this authority, we may divide the 80 years that have since elapsed into three periods, dominated not as might be expected by three but by two ideas. From 1825 to about 1850, labor, when it fought at all, fought under its own flag, and disdained alliance with any other party. From 1850 to 1900, partly owing to the dominating personality of Mr. Gladstone, political labor for the most part joined hands with Liberalism. In 1900 the banner of independence was raised once more, and has already attracted the greater part of the political forces of the proletariat.

The First Period of Revolt.—Up to 1832 the Government of England was an irregular oligarchy rather than a democracy. The House of Commons which then as now exercised supreme control, was elected in a haphazard fashion. A few members represented large democratic constituencies; many were elected by some scores or hundreds of voters; many others were practically nominees of individual landowners or of the Crown. Labor scarcely aspired to political rights; all it asked was relief from coercive legislation and excessive taxation. The populace, of course, supported the reformers of 1820-32, and it was fear of revolution which forced the House of Lords to consent to the passage of the Reform Bill.

Nearly the first work of the reformed Parliament of 1832 was the amendment of the old Poor Law, which had reduced the agricultural laborers of southern England almost to the condition of serfs, owned not by individuals, but by their parishes. The abolition in 1834 of the system of indiscriminate outrelief was intensely unpopular, and this, combined with the memories of the recent reform agitation, and with the teachings of Robert Owen (q.v.), who had promulgated many of the doctrines of modern Socialism, led to the Chartist movement, the first distinctively working class political agitation in modern England. (See CHARTISM.)

"The People's Charter," drafted by Francis Place, the radical tailor, was issued in 1838. Its six points were universal (*i. e.* manhood), suffrage, election by ballot, payment of members, annual parliaments, equal electoral districts, and the abolition of property qualification for members. This purely political programme gathered to itself the whole of the working class discontent which hitherto had taken other forms. In 1839 the north of England was saved from a revolutionary rising by the ability of Sir Charles Napier; and Chartism was crushed by the imprisonment of its leaders. It survived till 1848, when the continental revolutions fanned it again into flame, but it expired after the failure of a monster meeting at Kennington, London, which was to inaugurate the British revolution. Meanwhile the agitation for the abolition of the Corn Laws, which was successful in 1846, had attracted to the Liberal party a great measure of labor support, and with the disappearance of Chartism, the first period of revolt terminated.

Labor in Alliance with Liberalism.— The abolition of the Corn Laws was followed by a series of years of expanding trade and growing wealth; the narrow Whig oligarchy was gradually replaced by a broader Liberalism which conferred the suffrage on the workmen of the towns in 1867, and on those of the rule districts in 1884. John Bright (q.v.), the tribune of the people, and Joseph Chamberlain (q.v.), the idol of radical Birmingham, were the real leaders of the working classes up to 1886, and Gladstone generally held their allegiance from 1868 till his retirement in 1894. The trade unions had during this period established themselves as national institutions, and the standing Parliamentary committee of their annual conference was in constant friendly communication with Sir William Harcourt (q.v.), Sir Henry James (now Lord James) (q.v.), A. J. Mundella, and other leading Liberals. George Odger was one of the first working-class aspirants to Parliament, but he died before the day of victory. In 1874, Thomas Burt (q.v.), the Northumberland miner, was elected for Morpeth, a position he still retains, and his remarkable career has been honored in his old age by the high dignity of a seat in the Privy Council. In the same election another Labor candidate, Alexander Macdonald, was successful. At first the Liberals opposed these upstarts: but their claims were soon admitted, while their harmless respectability and valuable special knowledge were generally acknowledged. In 1880–83 trade unionists were elected; in 1885, 11; in 1886, 9; in 1892, 15; in 1895, 12; while 3 more were successful at bye-elections between this date and 1900. Meanwhile Henry Broadhurst, a stone-mason, was appointed Parliamentary Under-Secretary of State for Home Affairs in 1886, and Thomas Burt, a miner, was Parliamentary Secretary to the Board of Trade from 1892 to 1895.

It may be said that almost all these men were elected as Liberals. The distinction between them and the others of their party was that they had been manual workers, they had entered Parliament as nominees of their fellow workmen, and usually their election expenses were paid and their maintenance was provided by the funds of their trade unions. But in fact the classification, though definite, is not determined by any one factor. Working men were elected during this period in considerable numbers to town councils, school boards, county councils, and other local governing authorities, and many were appointed justices of the peace, that is members of the unpaid courts of first instance.

The New Revolt. — The origin of the revival of independence in politics dates from 1884, when the modern Socialist movement began in England. In this year the Social Democratic Federation, founded a short time before by H. M. Hyndman, became distinctively socialist, and the adhesion to its ranks of William Morris (q.v.), the poet and artist, brought it into immediate prominence. Several Socialist candidates were put in the field at the election of 1885, but they all failed to secure more than a few dozen votes, except John Burns (q.v.), now President of the Local Government Board, who polled 598 votes at Nottingham, but, of course, was defeated.

From this time onwards the Socialist party made slow but steady progress. The Fabian Society, founded also in 1884, devoted itself to adapting the principles of socialism to English political conditions, and in 1893 J. Keir Hardie (q.v.) (Ayrshire Miners), who had been elected to Parliament for West Ham, near London, the year before, founded the Independent Labor Party, a socialist body whose object was to promulgate a form of socialism more acceptable to British trade unionists than the doctrinaire and revolutionary gospel according to Marx, which was then expounded by the Social Democrats.

Here we must turn aside to make one point clear. The Independent Labor Party (commonly called the I. L. P.) is a small, though influential, socialistic body, which has never numbered more than some 15,000 members. It must be carefully distinguished from the Labor Party which is before all things independent, as well as from the Labor Party in its wider sense. This important distinction is constantly neglected even in the best-informed London press.

During the fifteen years prior to 1899 the Socialist societies kept up a constant agitation for the direct and independent representation of labor in Parliament, with a certain measure of success. John Burns was elected in 1892 for Battersea as an independent attached to no party. Keir Hardie, after his election, carried his independence even further, but lost his seat in 1895, and was not re-elected till 1900. Meanwhile the trade unions had been gradually permeated with the new spirit, and in the autumn of 1899 at their Plymouth conference, a resolution was carried instructing their executive to call a conference of trade unions and Socialist societies in order to form a new body for the promotion of labor representation. This conference met in London in February 1900, and the Labor Representation Committee was then founded with a membership (at the close of the first year) of 376,000, of whom less than 23,000 were Socialists and the rest trade unionists.

The new body (which in 1906 altered its name to the Labor Party) consisted of a federation of trade unions, trades councils (that is the local organization of trade unionists in each town), and the three Socialist societies, of which, as previously mentioned, the Independent Labor Party is one. The Social Democrats, however, withdrew a year or two later. At the general election of 1900, the Labor Representation Committee, as it was then called, put 15 candidates into the field, but it was only a few months old; the Conservative Party, asking a vote of confidence from the country while the South African war was in progress, won an overwhelming victory, and the Labor Party was not ill-pleased to score two wins, Keir Hardie at Merthyr and Richard Bell at Derby. During the next five years it won three sensational bye-elections, but Mr. Bell dropped out, and at the dissolution the new party numbered four. Mr. Bell's defection was due to a change in the policy of the body. It was first formed to create a «group»; it was determined that candidates supported by the Labor Representation Committee might ally themselves on other questions with the existing parties; that independence should be limited to labor questions alone. Against this policy a constant internal struggle went on till the Newcastle conference of February 1903, when the extremists won an overwhelming victory, and thenceforward the watchword was complete independence of all other political parties.

There are two chief reasons for this policy. One, of course, is distrust of the Liberal Party which is largely middle-class, controlled by wealth, and in league with a section of the aristocracy. It is not necessary to discuss how far this distrust is well founded, because it is undeniable that the Liberal Party, as at present constituted, must consider other interests as well as those of the workers. The other reason is more cogent. If labor makes any political alliance it must be with the Liberals. Once indeed the secretary of the cotton-operatives was a Tory candidate for Oldham, but he lost the seat for his party, and he is the only exception to the otherwise unbroken rule tnat labor alliance means alliance with Liberalism. But very many trade unionists, especially in Lancashire, are Conservative, or at any rate are strongly anti-Liberal, and they would not be content to see their contributions to their unions invariably used in the interests of their political opponents. In fact it was the accession of 103,000 textile operatives that at the Newcastle conference turned the scale decisively for independence. Five years were spent in active preparation, and the long-expected election of 1906 found the Labor Party ready for the fight. It put 50 candidates into the field, and elected 29 of them. After the election another joined their ranks, and for the first time in British history the workers of the country were represented by a compact independent party in the House of Commons. No aspect of the election attracted more attention at the time, and in the few months since the new party has fully justified itself, by the activity and political ability of its members, and their success in moulding the policy of the Liberal government.

Political Labor in 1906.— Having traced the history of the participation of Labor in politics, we shall conclude with a survey of its present position, which will reveal an extraordinary complexity of organization, and a considerable diversity of ideas.

The most dramatic result of the Liberal victory was the appointment of John Burns, engineer, socialist, and trade unionist, to a seat in the Cabinet as President of the Local Government Board, which carries with it membership of the Privy Council. The appointment was fully expected. John Burns was too powerful a force to be left outside, and he can rightly claim that he entered the Cabinet as a direct representative of labor. He is still a member of his trade union, and until his salary as a minister began to run, he was largely maintained by grants from his own and other unions. As member of Parliament for Battersea Mr. Burns was never distinctly a Liberal: he stood as John Burns. His appointment was the most popular act of the government which took office immediately before the election, and for a time John Burns himself was the most conspicuous man in England.

The representatives of labor in the present parliament belong to three distinct groups: (1) The Labor Party proper, the group of 30 men who sit in opposition to the Government, and act in complete isolation; (2) the Miners, of whom there are 13 (besides one or two in the Labor Party), some of whom were elected as Liberals, some as miners simply, who in a few cases fought and beat the official Liberal; (3) the Liberal-Labor men who numbered 11 at the election, but who have since been reduced to 10 by the retirement of Mr. Broadhurst. The Miners and the Liberal-Labor men form a group within the Liberal Party, and a number of advanced radicals usually co-operate with them.

Outside Parliament there are three great working class organizations: (1) The Parliamentary Committee of the Trade Union Congress, which is the largest and traditionally most important of the three, though its functions have now been largely usurped by the younger bodies; (2) the Federation of Trade Unions, formed to organize a common fund for strike purposes, which takes but little part in politics; and (3) the Labor Party, which exists for politics alone. Joint committees of these three bodies have frequently been formed for special purposes; a joint board now exists to promote co-operation, and the same set of men form the executives, sitting sometimes on one, sometimes on another, and sometimes even on two of the committees.

The Labor Party consists first of the 30 members of Parliament. These men are required by the rules of their party to stand as labor candidates only. In fact about 23 are members of socialist societies, chiefly the Independent Labor Party. The Labor Party organization which finances these candidates consists of 158 trade unions with 904,496 members, two socialist societies with 14,730 members, and 73 trade councils whose membership owing to overlapping cannot be counted. Except for the Miners, who are scarcely represented, the whole of the English trade unions may be said to belong to the party. Its funds are provided by a payment of 15/– per 1,000 members, for working expenses, and one penny a member (likely to be increased to 2d.) for the Parliamentary Fund, out of which the 29 members elected under its auspices are paid £200 a year, with a small contribution toward election expenses.

The body holds an annual conference which has exclusive power to alter rules and determine policy. This conference elects the executive committee of 13, of whom nine are chosen by the trade unions, one by the trade councils, and three by the Socialists. It will be noted that Socialists who only contribute one-sixtieth of the funds and only possess the same proportion of the voting power at the conference are accorded three-thirteenths of the executive committee, while the Secretary, J. Ramsay Macdonald, M.P., also belongs to their party. This arrangement, deliberately maintained at the conference of 1905, after keen debate, is a tribute by the trade unionists to the political importance of Socialism. Every organization affiliated to the Labor Party can put forward its own candidates if it undertakes to provide their election expenses, and, if successful, the member is paid by the party. The 50 candidates who stood in 1906 were put forward partly by the trade unions and partly by the Independent Labor Party; the Fabian Society does not collectively run candidates, though many of its members stood and seven were elected. Of the Social Democrats only one, who stood as a Labor candidate nominated by the dock laborers, was elected.

The Socialist wing of the labor movement is represented by three national societies, the oldest and most orthodox or doctrinaire of which is the Social Democratic Federation. It claims about 10,000 members, and has done much to influence public opinion. The Independent Labor Party claims about 14,000 members and has about 19 members in the House of Commons. It is very influential because it has always striven to work in harmony with the trade unions; its members not only fill trade union Parliamentary seats but all other offices as well, both in voluntary and local governmental organizations. The third socialist society is the Fabian Society, a body with under 1,000 members, mainly middle-class. It may roughly be called an association of leaders. It does not aim at a large membership and devotes itself to education, and the formulation of socialist policy. It has eight members of Parliament, some Liberal, some Liberal-Labor, some Labor, and some both Labor and Independent Labor Party.

The political aims of labor are very indefinite. All are united on demanding such reform of the law relating to trade unions as will undo the recent legal decisions ("Taff Vale" and others) which have destroyed the security of their funds. As their bill will probably soon become law, an exact exposition of their grievances is unnecessary. These hostile legal decisions contributed largely to the success of the movement for political independence amongst trade unionists. Otherwise, the members of the Liberal-Labor section, including the miners, vary in the complexion of their opinions as do the others of their party; a few are individualists, many are Socialists, in their leanings; some are extreme and others are moderate in their radicalism.

The Labor Party itself includes men of divergent opinions, though to a less extent than the others. About three-quarters of its members are Socialists. The remaining quarter declines so to label itself, but it has no definite creed, and constant association with men of strong opinions, who as a rule have studied political and social problems, makes it to say the least, extremely tolerant of socialism.

Because of this divergence the Labor Party has refused to formulate a programme. It has issued official leaflets in favor of Old Age Pensions, and of the nationalization of railways and of land. It has advocated state provision of work for the unemployed and of meals for underfed school children; and it strongly supports free trade, a policy on which all sections of labor are united. The attitude of the Labor Party to the Liberal Government again is conditioned by various factors. The party exists by independence, but none the less it was elected largely by Liberal votes. Only five of the 29 members were opposed by Liberals. In 16 cases the Liberals left them alone to fight the Tories. In eight other cases of two-membered constituencies, the Liberals only put up one candidate. Thus 24 out of the 29 Labor men polled the bulk of the Liberal vote in their constituencies.

The Socialist political policy includes the labor policy above indicated, and goes farther on the same lines. It advocates the municipalization of the liquor trade, and more drastic interference with the evil results of competition, such as long hours and overtime, child labor, and sweating of women's labor; it favors compulsory arbitration to replace strikes and lock-outs; and a more vigorous extension of the sphere of municipal and governmental industry. Some Labor men oppose some of these proposals. Very few would oppose them all.

At present the prospects of the Labor Party are bright. Its leaders are united and harmonious. The party is in a stronger financial position than any other section, since its members are paid a regular salary from a central fund. Moreover the party has made a name for itself; it is a force to be reckoned with; its action is watched, and its intentions discussed in advance. In every respect the Labor Party member has a marked advantage over his Liberal-Labor rival. There is every prospect that the Labor Party will grow stronger and no doubt before long the half million miners with their 11 members of Parliament will join its ranks.

Prophecy in politics is peculiarly risky but it is fairly safe to say that the share of labor in the control of the destinies of the Empire will be larger in the future than it has been in the past.

A Founder and Secretary of the Fabian Society; Trustee and Member of the Executive of the Labor Party.

28. Great Britain — The Co-operative Movement. The earliest examples of co-operative institutions are the corn mills and baking societies started in the closing years of the 18th century and the first decade of the 19th as a relief from the millers' monopoly and the exorbitant price of flour. At Hull, Whitby, Sheerness, Devonport, and sundry places in Scotland, mills and bakeries were worked successfully on a ready-money, cost-price basis, but they had little effect on the subsequent movement, though Sheerness and a few other societies still exist. The co-operative idea, as we know it, was evoked in the mind of Robert Owen by consideration of the antagonism of classes produced by the industrial revolution with its widespread misery among the factory operatives. Failing to persuade his fellow manufacturers to follow his example of humane treatment of his employees, and failing to obtain efficient factory legislation from the government, he devised the plan of organizing the workers into self-sufficient communities, owning and cultivating the land in common and producing commodities for their own use or for exchange with other communities. Two such colonies, at Orbiston in Lanarkshire (1826) and at Ralahine in Ireland (1830–4), nearly succeeded. His followers, who enthusiastically adopted his communist doctrines, started, from 1828 onwards, numerous associations for co-operative trading, which employed their profits in setting their members to work at manufacture on a small scale. To provide a market for the goods so made, Owen in 1832 opened his Equitable Labor Exchange at Gray's Inn in London, where persons leaving goods for sale received in exchange labor-notes based on the average time of production at sixpence per hour. In 1830 there were nearly 300 "Union Shops" with over 20,000 members, and between 1830 and 1835 seven Co-operative Congresses were held. But by 1835 the whole movement collapsed owing to want of legal status, the divergent interests of the members, and the failure of the labor-time principle. The enthusiasm of Owen's followers now overflowed into the Chartist movement.

The second stage in the history of co-operation began in 1844 with the founding of the Rochdale Society of Equitable Pioneers by a group of socialists, chartists, and trade unionists, who found the motive in the failure of a strike among the flannel weavers. Its objects were the sale of provisions, etc., the building and buying of houses for members, the employment of out-of-work members in manufacture, the purchase of an estate to be cultivated by members out of work or underpaid, "to establish a self-supporting home colony of united interests," and to start a temperance hotel. Cash payment and good quality were principles shared with the older movement, but the new departure on which the success of co-operation was to turn was the surrender of the attempt to sell at cost price. In lieu thereof Charles Howarth introduced the system of dividing profits upon purchases, and from that moment co-operation has never ceased to prosper. This system took the government of the society out of the hands of founders or shareholders and transferred it to the customers, that is to the general co-operative community. The rules for the organization of a Co-operative Society have remained substantially the same as those of the original Rochdale Society. To quote one example: "The object of this society is to carry on the trade of dealers in food, fuel, clothes, and other necessaries, and manufacturers of the same; the trade of general dealers (wholesale and retail); including dealings of any description with land, and the trade of builders." Membership is free to all, and each member must hold a fixed minimum of one-pound shares one to five, carrying interest at 4 or 5 per cent. The maximum investment is £200, and each member has one vote only, whatever his holding of shares. The quarterly general meeting of the society is the governing body, but the management is in the hands of the committee, generally elected for a year, half retiring each six months. The secretary is elected for a year by the general meeting, but is the servant of the committee, which appoints all the other officials and workpeople. The shares can be withdrawn but are not transferable and therefore have never more than their face value. The business of the store is transacted in the same way and at the same prices as ordinary shopkeepers, and after interest has been paid the profits are divided among the customer-members in proportion to their purchases. Metal tokens or paper checks registering the value of each purchase are given to the buyer, and are collected periodically and credited to him. Non-members are allowed half dividend. Out of the profits a bonus is sometimes paid to labor (£45,073 in 1905) and grants made for educational and charitable purposes (£120,831 in 1905).

The co-operative movement now grew with exceeding rapidity. In 1862 the total sales of all the societies of all kinds in the United Kingdom amounted to £2,333,523; in 1870 to £8,201,-685; in 1880 to £23,248,314; in 1890 to £43,731,-669; in 1900 to £81,020,428. In 1905 there were 1,457 retail societies with 2,153,185 members, a share capital of £26,077,174, total sales of £61,-086,991, and profits of £9,959,238. Nineteen stores have annual sales exceeding £400,000 each. The obvious advantages of buying in large quantities led to the formation of the North of England Co-operative Wholesale Society in 1864 which in 1874 amalgamated with a similar metropolitan body to form the Co-operative Wholesale Society of England, with headquarters at Manchester. Only societies can be members and each member society must take up one five-pound share for each 10 of its members, such shares being transferable at par. The general committee of 16 sitting at Manchester governs the society with the assistance of two branch committees of eight each at Newcastle and London. The final authority resides in the quarterly meeting, which, for sake of convenience, is held in three parts at Manchester, Newcastle and London, each member-society being entitled to one delegate for each 500 members. Questions are settled by the total votes at the three meetings. Goods are sold at slightly over cost price and the profit divided among the purchasing societies in proportion to their purchases. The Scottish Co-operative Wholesale Society, established in 1868, is similarly managed, but the member-societies have one vote in virtue of their membership, one vote for the first £1,000 of purchases, and one vote for each additional £2,000. A bonus is paid to employees at the rate of twice the purchasers' dividend. The two Wholesale Societies do not compete but act as each other's agents. There are sale depots at Leeds, Nottingham, Blackburn, Huddersfield, Birmingham, Leith, Kilmarnock, and Dundee, and buying agencies in Ireland, Denmark, Germany, Spain, United States, Canada, etc. In 1905, the two societies had 1,419 members with £1,660,072 capital, their sales amounted to £27,-725,207, and their profits to £635,873.

Besides buying and selling at wholesale, the Wholesale Societies carry on a large amount of manufacture — boots and shoes, candles, woollens, clothing, furniture, brushes, upholstery, bedding, butter, flour, lard, jam, tobacco and printing by the English society; flour, tweeds, blankets, tailoring, shirts, mantles, furniture, boots and shoes, hosiery, brushes, preserves, confectionery, tobacco, fish-curing and printing by the Scottish Society. The output of the English Society's productive works in 1905 was valued at £3,543,501, and of the Scottish Society at £1,942,321. The two societies own tea plantations in Ceylon, and the Scottish Society is now considering the purchase of a tract of land in Canada for wheat growing. The English Society conducts a banking department for the distributive stores and its turnover in 1905 was £98,999,831. The Co-operative Newspaper Society is another federal institution owned by co-operative societies. It publishes the *Co-operative News*, the weekly organ of the movement. The Co-operative Insurance Society is another "society of societies" doing mainly fire insurance of society buildings, £22,000,000 of property being so insured. The United Baking Society of Glasgow (capital £130,372, sales £482,544 in 1905) and eight corn mills (capital £347,071, sales £1,364,527 in 1905) are also productive societies, federations of ordinary stores. Production to the amount of several millions sterling is carried on by ordinary distributive societies, mainly in flour and baking, 19,456 persons being employed in production, and much activity is also shown by many societies in building houses to be sold or leased to members. The total investments of the stores in "house property" (including presumably their own buildings) is £6,576,217.

A large section of co-operators has always held that co-operation, which did not include a co-partnership with labor, was only a masquerade. To the Owenite communities succeeded the Redemptionist Societies "for carrying out the practice of associative labor," which had a brief life about 1850. The Christian Socialists—Kingsley, Maurice, Ludlow, Neale—in 1848–52 established some twelve "self-governing workshops" in which the employees were to supply capital, management, and labor. Next in the early sixties came the "Oldham Coops.," joint-stock cotton spinning companies in which the shares were mainly held by operatives, but they degenerated into ordinary companies. Efforts at founding manufacturing societies were persistent, and the wholesale and distributive societies and trade-unions lost large sums of money; 275 societies established before 1880 were extinct in 1882, leaving only eight corn-mills and 25 other societies. In 1884 the Labor Association was founded to promote productive societies on the basis of a co-partnership of labor and capital, the workers being entitled of right to a share of profit and being at liberty to invest their savings in shares. The mortality among societies continued high despite brisk propaganda—139 societies disappearing between 1880 and 1898. In 1905 there were 131 "productive societies" (excluding the federal corn-mills, the United Baking Society of Glasgow, and the Co-operative Newspaper Company) with 27,813 members, £409,054 share capital, £1,316,126 sales, and £68,051 profits. Losses were made by 23 societies, and of 91 making profits, 72 gave part to capital, 35 part to labor, and 37 part to purchasers. The Co-operative Production Federation was started to aid the societies with capital and prevent overlapping. Eighteen textile societies had sales of £456,100 and 22 boot and shoe societies had sales amounting to £272,935; 16 metal working societies had sales of £92,886 and 14 building societies sales of £92,825. A new branch of activity is the "Co-partnership Tenant's Movement" for building and owning houses which has established since 1888 many co-operative colonies; there are now eight societies, of which four are active with £82,600 capital. In agriculture there are now 125 societies with 10,000 members and £250,000 turnover; they consist of farmers and small holders, buy seed and manures and sell produce for their members. On the whole they belong to a different class from the ordinary working-class societies. Finally, there is to be mentioned the Co-operative Union, started in 1869, which carries on propaganda through its district committees and the United Board formed of representatives of the sectional boards. It is also the parliamentary organ of the movement and devotes much labor to organization and education. Under its auspices is held an annual congress of co-operative societies at which matters of interest to the movement are discussed, but the resolutions carried thereat have no mandatory force. The Woman's Co-operative Guild, started in 1883, had, in May 1906, 424 branches and 22,077 members; it has done much education work among woman members of stores and has been specially active in organizing special stores in very poor districts.

29. **Great Britain — Factory Legislation.** In the year 1784, there raged at Radcliffe, near Manchester, an epidemic fever in the cotton spinning works, where long hours of labor and a total absence of sanitation had undermined the strength of the juvenile operatives. The conditions of work in the Radcliffe Mills were not worse than those prevailing throughout the neighboring industrial district, in which the new factories were multiplying fast. The epidemic of fever was but one among many similar epidemics. But when, at the request of the Lancashire Justices of the Peace, this particular outbreak was investigated by a committee of Manchester doctors, and when the leading physician among them, Dr. Thomas Percival, and the Chairman of the Quarter Sessions, Thomas Butterworth Bayley, persuaded their fellow magistrates that the gravity and rapid diffusion of the sickness really arose from the "putrid effluvia" of the "numbers crowded together" in the new mills, and the "injury done to young persons through confinement and too long continued labor," they were close to the discovery of the great device of factory legislation. At once the Manchester Justices, who were not at that date pecuniarily interested in cotton mills, decided henceforth to refuse to allow the "indentures of parish apprentices whereby they shall be bound to owners of cotton mills and other works in which children are obliged to work in the night, or more than 10 hours in the day." In 1796, Dr. Percival and his friends definitely formulated certain resolutions, in which they again drew attention to the physical and moral evils of excessive hours of labor, of the unsanitary conditions of the factories and of night work; and in which they proposed, "if other methods appear not likely to effect the purpose," that Parliament should enact "a general system of laws for the wise, humane and equal government of all such works." Here we have expressly suggested the expediency of factory legislation. Within half a dozen years the first tiny instalment of that legislation—the "Health and Morals of Apprentices Act, 1802"—had, at the instance of the greatest mill owner of the time (Sir Robert Peel), passed into law. This experimental legislation of 1802, expanded by Robert Owen in 1815 into a general principle of industrial government, and applied in tentative instalments by successive generations of unwilling statesmen, has spread to every industrial community in the Old World and the New. Of all the 19th century inventions in social organization, factory legislation is the most widely diffused. The opening of the 20th century finds it prevailing over a larger area than the public library or the savings bank; it is, perhaps, more far reaching if not more ubiquitous, than even the public elementary school or the policeman.

It is sometimes said that England has lost the lead in factory legislation; that New Zealand and several of the Australian states far outstrip her; and that in one respect or another France, Germany, Switzerland, and even Austria, surpass the United Kingdom in the protection of labor. This is not the place to examine into the accuracy of these assertions. It is by no means easy to ascertain, even from the laws of a country, exactly what national minimum it proposes to enforce, in all the varied circumstances of place and process, age and sex. Still less easy is it to discover to what extent the law is really obeyed and enforced. Though the policy of a national minimum is, in the United Kingdom, as yet most inadequately embodied in law, and most imperfectly enforced, yet it may well be that the scope of the factory legislation is, taken as a whole, and as applied in actual practice, more extensive than that of any other state.

What is often overlooked is that the law on the subject is, in the United Kingdom, not contained in any single code, or in any one act of Parliament, but has to be collected from among seven different branches of English law. There is first the law as to sanitation, which applies to factories as to other places, and is administered by the Town Council or other local governing body under the supervision and, more or less, the control of the local Government Board. With this we may name the law as to education, with its incidental restrictions on the employment of children under 14, enforced by the Town and County Council under the supervision of the Board of Education. It is partly in connection with education, too, though partly also in connection with the prevention of cruelty to children, that the Town and County Councils are empowered to make by-laws, subject to the approval of the Home Office, regulating or prohibiting the employment of children and young persons under 16 in certain occupations. The law regulating the conditions of employment as such is itself scattered over five distinct series of acts of Parliament, relating respectively to (a) factories and workshops generally, including all manufacturing industries, laundries, docks and works of engineering; administered partly by the Home Office itself and partly by the local governing bodies under the Local Government Board; (b) mines, administered wholly by the Home Office; (c) retail shops, administered wholly by the local government bodies, under the Local Government Board; (d) ships, and (e) railways, both administered wholly by the Board of Trade.

The principle underlying this mass of complicated and detailed legislation—a principle which was not consciously present to the mind of its early advocates, and one which is still only grudgingly admitted—is the establishment and enforcement of a "national minimum" in the circumstances of employment, below which it is judged to be inexpedient, in the permanent interests of the community as a whole, that any person should be employed. "The ultimate end of factory legislation," approvingly wrote the *Times* of 12 June 1874, "is to *prescribe* conditions of existence below which population shall not decline." This compulsory national minimum is naturally a rising one. "Every society is judged, and survives," aptly said Mr. Asquith in 1901, "according to the material and moral minimum which it *prescribes* to its members."

It would be an interesting and supremely useful subject for graduate study to discover what is the national minimum which the various civilized states of the world, now actually *prescribe*, by compulsory law, to the various grades and classes of citizens, in the different circumstances of their respective employments. To do this even for the United Kingdom would require much more than the space here available. The student would find that the system of regulation which began, in 1802, with the protection of the tiny class of pauper apprentices in textile mills now includes within its scope every manual worker in every manufacturing industry. From sanitation and the duration of labor, the law has extended to the age of commencing work, protection against accidents, the fixing of meal times and holidays, the methods of remuneration — not yet (though this, too, in New Zealand and Australia) the amount of the wages. The prescription of national minima is, however, still very far from being either uniform or systematic. The various requirements in the way of sanitation, duration of labor, hours of beginning and ending, age of commencement, meal times and holidays, methods of remuneration and protection against accidents, often apply, each of them, to particular industries, particular processes, particular ages, particular localities and particular sexes; partly, of course, because the various detailed prescriptions are, in their very nature, applicable only to this limited extent; but, more commonly merely on account of the empirical, and so to speak, accidental character of all our legislation. Speaking generally, we may say that the policy of the national minimum has been most completely and efficiently worked out in the industry to which it was first applied, mainly cotton spinning and cotton weaving; and in which—whether *post hoc* or *propter hoc*—England still leads the world; taking industries generally, it has been far more thoroughly applied to the employment of women and children than to that of men, in respect to whom it is only just beginning; with regard to subjects of prescription, it is most universal in respect of the cleanliness, ventilation, temperature and sanitary accommodations of the work place, and the means of escape from fire; next most in respect of the age of commencement, the maximum working day and protection against accidents; whilst with regard to the enforcement of a national minimum of subsistence, we are in the United Kingdom, still in the stage of wondering how the unlettered rulers of New Zealand and various Australian states can manage actually to accomplish that which the English statesman and captain of industry agree to be demonstrably impossible. The policy of a national minimum secures universal lip homage, so far as it applies to children. Yet our young children may lawfully be industrially employed, or even hired out for wages, in all Ireland outside the few large cities, if in any industry not coming under the Factory Acts, at any age, at all hours, without stint; in Great Britain and the Irish cities (unless new by-laws have recently been made) in any such industry at any age, for any number of hours; under such by-laws, generally only after 11 years of age, and for limited hours, differing from place to place; in factories or workshops, not under 13, and then only halftime unless a minimum educational standard, prescribed by the local education authority, has been attained; generally speaking, full time after 14; but in some specified industries or processes not until 16, or even 18. Still more wanting in universality and uniformity is the enforcement of such national minima as the law does prescribe. The distribution of the task of enforcing the law among over 2,000 independent local governing bodies, in England, Scotland and Ireland; the supervision and imperfect control exercised over these by four different government departments in England, besides several others for Scotland and Ireland; and the very different views which these government departments take of their duties—to say nothing of the very different degrees to which they have consciously adopted the root-idea of factory legislation as above set forth—necessarily makes the enforcement of the law extremely uneven. Only in one branch, indeed, that which deals with "factories" properly so called, in which women and children are employed in connection with mechanical power, can the law be said to be at all successfully and systematically enforced from one end of the Kingdom to the other. This happens to be the branch of the law which is enforced by an official staff, appointed by and solely responsible to, the Home Office in London.

For the enforcement of the policy of the national minimum, so far as this is committed to him, the Home Secretary has at his disposal, in the Factory Department of the Home

Office, a "Chief Inspector," a score of specialist and superintending inspectors, 42 district inspectors, nearly 50 extra inspectors who share the work of heavy districts, and nearly 40 assistant inspectors. This staff of about 150 men, who are paid from £150 to £1,000 a year, is supplemented by 15 lady inspectors, who receive from £200 to £300 a year. All the staff are appointed after examination, without regard to politics, and are permanently employed. These inspectors are perpetually traveling over the United Kingdom, covering among them, nearly a million miles annually, and keeping under inspection more than a quarter of a million distinct factories, workshops, warehouses, laundries, docks and wharves (excluding those employing adult men only, which are ignored in practice), in which nearly five millions of persons are employed. Their efforts are aided by about 2,000 "certifying surgeons," who are paid by fees only. These are doctors in local practice who give the certificates of health without which, in certain cases, children cannot be employed. A similar, but more limited, staff is employed in the inspection of the mines and quarries. The tradition of the Home Office in this department is that it is the business of the inspector, not merely to act on complaints, or to make so many visits, but to get the law enforced. Hence, the inspectors go hither and thither as they think fit, visiting one factory frequently, another not at all; acting on any hint or suggestion that they can get of any illegality being committed, and, not only not refusing to act on anonymous communications, but eagerly welcoming them when nothing better is to be had. Unfortunately, however, the paucity of the staff allowed to it by the treasury, and the curious reluctance of English government departments to see their functions expand, has led the Home Office to forego whole fields of industrial employment in which the enforcement of a national minimum is no less necessary than those which it inspects. It deliberately omits from its regular inspection, not only the workplaces where men only are employed (though these are also subject to the law in various particulars), but also the myriads of "domestic workshops," in which only members of the same family are employed, and in which the worst cases of "sweating" are found. The sanitation, too, of the workshops (not using mechanical power), even where women and children are employed, is, like the whole regulation of the homeworkers, abandoned to the more perfunctory hands of the local authorities. On the other hand, it must be said that the Home Office far surpasses the Board of Trade in the execution of its duty of enforcing the policy of the national minimum. The scanty inspectorial staff of the Board of Trade, on whom we have to rely for the enforcement of the law relating to the conditions of employment in connection with railways and ships, confines itself, practically, to the investigation of cases actually brought to its notice by responsible specific complaints, or by accidents; and takes up the attitude that it is not the business of the office, or of its parliamentary chief, to initiate anything. To the student of the factory system of the 19th century, the reflection will inevitably occur that, if the Home Office had acted on this principle, we should still have with us the "white slavery" of the Lancashire Cotton Mills, denounced by Oastler and Lord Ashley. But there is even a lower depth than the Board of Trade. The Local Government Board, the department to which Parliament has entrusted the enforcement of the national minimum of sanitation takes no action whatever to see that the local governing bodies put into operation the sanitary provisions of the Factory Acts with regard to workshops and the residences of home-workers; and fails even to compel negligent or recalcitrant local government bodies to put in force the Public Health Acts. It does not even make itself aware of the extent to which the national minimum of sanitation is being secured in the different localities.

Thus it is that, after a whole century of experiment in factory legislation—of experiment so demonstrably successful that it has converted the statesmen and the economists of the entire civilized world—the United Kingdom still contains districts, classes, and industries in which there prevail the precise evils from which the cotton operatives of Lancashire and the coal miners of Northumberland suffered a century ago. The so-called "sweated" trades, to which factory legislation has not yet been effectively applied, remain as they were described by the select committee of the House of Lords in 1890, regions of "earnings barely sufficient to sustain existence; hours of labor such as to make the lives of the workers periods of almost ceaseless toil; sanitary conditions injurious to the health of the persons employed and dangerous to the public." What those who believe in factory legislation demand, and what the second century of such legislation may bring to us, is the conscious application of the policy of the national minimum to every branch of industrial employment; the explicit formulation of this policy in a systematic code, applicable, with only the necessary technical variations, to every trade in every part of the Kingdom, and to every worker in such trade, of whatever age or sex; the deliberate prescription, in the interest of the whole community, of the conditions of employment, whether sanitation or hours, education or subsistence, below which no individual can be permitted to be employed; and the vigilant enforcement of this minute universal code by the joint activities of the central departments and local governing authorities, each acting, through its highly organized inspectorate, as a check, not only upon all who break the law, but also upon any who should neglect their own part of its enforcement.

Bibliography.— The best vision of the administration of the Factory Acts in the United Kingdom is afforded by the 'Annual Report' of the Chief Inspector of Factories and Workshops, and the corresponding one of the Chief Inspector of Mines. THE IDEAL LIFE OF THE NATION.

30 (a). Great Britain — The Church of England. It is difficult to define the characteristics of the Church of England so as to enable an outsider to understand it. In much that concerns its external form and traditions it is probably the most mediæval institution in Europe. In much that concerns its religious teaching and life it is more abreast of modern thought than any other religious body. The former characteristic may be illustrated by the fact that its property is held in some cases by direct gift of Anglo-Saxon kings, and that many of its institutions are feudal in their origin. Again it differs from any of the Protestant Churches of the Continent by the fact that it does not express as they do the teaching or influence of one individual reformer. In a very true sense its history has been continuous. It is an institution which has grown and developed with the history of the English people. It has been modified and changed to meet the needs of each age. It is an institution which has created a theology, not one which is the outcome of its theology. It is therefore clear that the Church of England can only be described by its history.

History. — The history of the Church of England dates from the mission of Augustine in 597 A.D. This mission was the direct action of the Church of Rome, but almost from the beginning there were other elements. A large part of England was as a matter of fact converted by missionaries from Scotland and Ireland, representatives of the old Celtic Church. Although the organization introduced by Augustine and Theodore ultimately prevailed through the whole island, yet the Church contained elements and traditions derived from Celtic sources. Gregory the Great had used language in his letters to Augustine which implied that a considerable degree of independent development was to be left to the newly founded Church, and from the first its rites and ceremonies differed from the Roman. During the Anglo-Saxon period there were two elements in its history. The kings and the people of England were full of admiration for the Church of Rome to which they owed Christianity, but, on the other hand, the Church developed more and more as a national institution and its ecclesiastical laws were the work very largely of secular councils, on which the bishops sat. The Norman Conquest brought the British Isles very much into the swim of European life, and gradually two opposing currents of policy asserted themselves strongly. On the one side a series of able ecclesiastics aimed at securing the independence and privileges of the Church and at bringing it into close obedience to the central organization at Rome. On the other side the national development tended to assert the insularity and independence of the English state and sovereigns. There was a strong opposition to foreign ecclesiastics, to payments to foreign courts and to the influence of foreign monastic orders. Legislation such as the Act of Praemunire was introduced, limiting ecclesiastical authority and in the reign of Henry V. the property of alien priories was confiscated. Throughout the Middle Ages there is literary evidence of criticism on much connected with the Church, which reached its head in the work of Wycliffe who combined opposition to the monastic body and the Church of Rome with a good deal which would be called in the present day Radicalism.

Like the Church of England the history of the Reformation (q.v.) is a complicated story. The final result was produced by various influences. There was the old national feeling as opposed to the claims of the papal curia expressed in the Reformation Acts by the statement that the realm of England was and always had been an Empire; there was the influence of the Humanism of Colet, More and Erasmus, which demanded a Conservative Reformation; there was the popular objection to the rights and privileges of the clergy; there was the strong conservative element which has always been characteristic of the English people and which checked any great tendency to change; and especially during the reign of Elizabeth there was the influence of the foreign reformers. The result was a Conservative Reformation. No attempt was made to sweep away the Old Church and reconstruct it, either doctrinally or as regards the constitution *de novo.* Such changes were made as were found necessary to express the different influences which prevailed. This might be shown in various ways and will appear as we proceed with our account. For example by a statute law which has never been repealed, the whole of the canon law which had been accepted in England before the Reformation is still the law of the Church, except in so far as it is contrary to Act of Parliament. By the time of Queen Elizabeth's reign the various parties had become clear. It was clearly the aim of the rulers of the time to unite as many elements as possible in one national Church and the ultimate reform settlement was based therefore on a policy of modelling a national Church which should include very varied elements. The result of the

Reformation was to modify and reform the existing institutions, not to create a new Church in accordance with any system of doctrine. (See GREAT BRITAIN — THE REFORMATION.)

Since that time the Church of England has suffered hardly any change in its formularies or in its constitution; but it has been profoundly changed by the influence of various schools of thought, each of which has interpreted its formularies in accordance with their convictions. The close of the reign of Queen Elizabeth, the writings of Hooker, mark the beginning of a typical theology, and Anglicanism in the modern sense of the term was developed and worked out by the great divines of the 17th century. The result of the Commonwealth and of the Puritan domination was to strengthen the hold of the English Church on the nation, and at the time of the Restoration a vast majority of the people were attached to it. A very little more statesmanship on the part of the restored Cavaliers might have almost wiped out Puritan traditions. At the time of the Restoration the High Church party were the dominant factors in the Church, but the Roman tendencies of Charles II., the Roman Catholic position of James II., the fear of papal influence, and the Non-Jurors schism on the accession of William weakened its influence. Some of the ablest members of the High Church party left the Church at the time of the Non-Jurors' secession. High Churchmen were under suspicion as being opposed to the reigning dynasty, and in the first half of the 18th century the prevailing influence was the latitudinarian movement associated largely with the name of Tillotson. The Whig ascendency, the suppression of convocations and the influence of the deistic literature reduced the spiritual life of the country to the lowest ebb. The movement for religious awakening grew up in the Church of England, but a secularized Church was unable to contain the vigorous spiritual life of Wesleyanism. But though the Wesleyan Society passed outside the Church, its influence lived within it, and at the close of the 18th and the beginning of the 19th century, the evangelical movement was strong. All through this period the High Church party had lived on. The failure of the Stuart succession destroyed all suspicion of disloyalty, and eventually latitudinarianism and evangelicalism lost their hold on the country. High Church influences began to assert themselves again. The religious movement was assisted by a romantic reaction against the commonplace 18th century traditions and by the revival of an idealistic philosophy, and it came to a head in the well-known Oxford Movement, which is usually supposed to date from the year 1833. The Oxford Movement in its double aspect of High Church principles and of ritualism has profoundly changed the religious life of the whole Anglo-Saxon world. It was followed rapidly by a Broad Church reaction, and there has been a tendency of recent years for a new party to arise, combining many of the elements of both the schools. At the present time the theology of the Church of England is influenced by all the different movements we have described. The Church of England is not "Anglicanism," but it has created Anglicanism within the fold of an Establishment. Various different types of thought prevail and the position can only be understood by looking at the Church as the result of the history we have described.

General Principles. — The Church claims to be that portion of the Universal Church of Christ located in England, a "true and apostolical Church teaching the doctrine of the Apostles." It acknowledges that to the Crown "the chief government of all estates of this realm, whether they be ecclesiastical or civil in all cases doth appertain." It is established, *i. e.* it is part of the constitution of the country. It is National; Protestant in so far as denying that the Bishop of Rome has jurisdiction in England and condemning the errors of the Roman Church; Catholic as claiming to be a portion of the Universal Church of Christ. It grounds itself on Scripture and the three creeds. Its ministers are bishops, priests, and deacons. It claims to be continuous with the primitive church.

Constitution and Law. — The constitution of the Church was influenced by two main characteristics. One was a desire to do away with what we believe to be mediæval corruptions; the other to preserve the primitive organization of the Church. Naturally also there was a tendency to preserve all the distinctly national institutions which were inherited from the past. The orders of the Church of England are: bishops, priests, and deacons, and it is definitely laid down that the possession of episcopal ordination is necessary for holding office in the Church. The clergy of the Church meet in their own assemblies in Convocation which were originally the meetings of the clergy for taxing themselves at the time when they were immune from general taxation. At the present day, Convocations have no legislative power except such as is intrusted to them on any special occasion by Parliament, and no change can be made in any law or custom of the Church without the consent of Parliament. But it was the theory, not perhaps always acted upon, of the Reformation and it has been the custom since, that Parliament should not legislate for the Church except with the advice of the clergy. Practically the result of this has been that external changes in either form or constitution of the Church have hardly been made since the Act of Uniformity of the year 1662. By the common law of the country the parson or parish priest has a freehold in his cure, and he can only be removed by very complicated legal processes. The result of this has been to make the English clergy very independent of any authority. The influence of the bishops as men may be very powerful and effective but if they wish to support their opinions or the administration of the law by any appeal to authority they are hampered at every turn by a complicated legal system which makes it exceedingly difficult for them, even in spite of recent changes, to interfere with acrimonious or refractory clerks. The difficulties have been increased by the unsatisfactory character of the Church Courts. It is a fundamental principle of the English law that the Sovereign is in all causes, as well ecclesiastical as civil, supreme. The Church has its own courts and those courts are very largely secular in character and do not command the adherence of the clergy, while the Judicial Committee of Privy Council which is the final court of appeal in matters ecclesiastical, has not confined itself to reviewing judgments of courts on the point of view of justice to the individual, but has attempted to legislate by its judgments, and has not met with anything like universal acceptance. The position then is that the constitution of the Church and the Church Courts has grown up not in obedience to any particular theory, but by modifications from time to time of the traditional system and that it does not at present satisfy the convictions of a large section of the Church.

Establishment.— The position of the Church of England is that it is established by law and it is part of the constitution of the country. What exactly this implies has never been clearly defined and there are different sections of opinion on the subject in the country. The High Church party claim that the position of the Church is continuous with that before the Reformation and that the Church is by constitutional right free to determine its own teaching. A party which would be called by their opponents Erastian would claim that the Church was entirely subject to the Sovereign and to the Houses of Parliament. The former would point out that the Sovereign is rightly supreme in all actions relating to liberty of person and property, that (as shown by many Acts of Parliament, notably the Scottish Church Act of 1905), when questions of property are involved the Civil Courts or Parliament have to deal with the internal matters of the different religious bodies whether they call themselves "Free" or not, and that what the state has done is to accept to a large extent the Church Courts as part of its constitution.

The situation can really be determined only by historical principles. The position of the Church is that it is not in obedience to any theory but in obedience to a number of historical facts. During the Middle Ages the Church had great independence. The clergy had the right of taxing themselves and met for that purpose in their convocations. The bishops and mitred abbots were members of the House of Peers, but there was continued friction between the crown lawyers and ecclesiastical lawyers as to their respective jurisdiction and the secular authorities always resented the right of appeal in ecclesiastical matters to Rome. The present position of the Church and State is determined by the following points: (1) The position of the Sovereign is in a certain sense that of the head of the Church. It is to be noted that the title "Supreme Head" was definitely given up by Queen Elizabeth and the actual position is rather that the Sovereign is head over "all causes, as well ecclesiastical as civil, supreme." (2) The patronage of the Crown. The Crown appoints to all bishoprics and deaneries and to many canonries of the inferior clergy. In most cases the Crown right of patronage is directly inherited from the Middle Ages or taken over from the rights of the Popes. (3) The Church is subject, like every other body in the kingdom, to the laws laid down by Parliament. The Book of Common Prayer has been adopted by Parliament, and by the Act of Uniformity the authority of the State is added to the authority of the Church.

The Property of the Church.— The property of the Church consists of the following: (1) Tithes, which are charges upon the land paid originally to the parochial clergy. The origin of the institution of the tithes is much debated. It appears to have begun as a voluntary custom from charges made upon the land by the owners, and these customs and charges have gradually been recognized by law and become universal. Up to the time of the Tithe Commutation Act in 1836 all these payments were made in kind: by that Act they were commuted into money payments. (2) Landed Property. The Church has inherited a portion of the large estates which were in the possession of the bishops and other ecclesiastical bodies during the Middle Ages. These were ultimately derived in many cases from a grant by the sovereign or of individual land-owners. They include in addition to landed property, manorial rights and in the County Palatine of Durham royalty rights. In many cases they date from a period before the Conquest; for instance, Farnham Castle has been the property of the Bishops of Winchester from the time of a grant made in Anglo-Saxon times. In the great majority of cases now the landed property apart from the Glebe lands of the parochial clergy is managed by the Ecclesiastical Commissioners and the bishops receive fixed stipends. (3) Modern Endowments. These largely consist of money, and are for the most part administered by the Ecclesiastical Commissioners.

Prayer Book.— The character of the Church of England is shown very clearly in the Book of Common Prayer. The Prefaces lay down that the object throughout was to preserve the old form of services but to fit them to the altered needs of the time, and in many cases to return to what were looked upon as more primitive customs. The first edition of the Prayer Book was issued in 1549, the second in 1552, the third in 1559, the fourth in 1604, and the fifth edition in 1662. The services throughout preserve the structure of the pre-Reformation books, but they are shortened and simplified. What was believed to be superstitious was cut out, and, of course, the whole translated into the English language. The Prayer Book was influenced to a certain extent by some of the earlier Lutheran formularies and some of the finest of the collects were the work of Archbishop Cranmer himself.

Doctrinal Formula.— The doctrinal formula of the Church of England is the Thirty-nine Articles and the belief of the Church is also to be gathered in the Homilies and Prayer Book. The production of religious formulæ was the leading feature of all sections of the Christian Church during the Reformation period and amongst all the varied formulæ the Articles of the Church of England are conspicuous for their shortness. During the reign of Henry VIII, various doctrinal documents were issued. The first document we have to consider is the Forty-two Articles issued in 1553. They were not systematic in character, they were mainly directed against the different evils of the time and in their broad outline were concerned with the errors of the Anabaptists on the one side and the Mediæval Schoolmen on the other. These Articles were revised in the reign of Elizabeth and published as in Thirty-eight Articles in 1563. These were made more systematic in character and the relation of the Church of England both to certain Protestant movements on the Continent and to the Church of Rome was more accurately defined. By this time the results of the Reformation had begun to shape themselves more clearly. But throughout they bore the impress of the statesman. They were clearly drawn up with the object of including as large a number as possible of the different sections of opinion which existed at the time within the limits of the national Church. These were further revised and finally issued as the Thirty-nine Articles in 1571. At one time the subscription to these Articles was imposed by the State not only on all the clergy but all sections of the laity as the means of qualifying for office, but the tests for the laity have now been entirely done away with and that of the clergy is limited to a general assent to the teaching of the Articles. The courts have always been very broad in their interpretation of the doctrine of the Church of England. The clergy undertake to use the Prayer Book and no other document in public worship except in so far as allowed by lawful authority and give a general assent to the teaching of the Thirty-nine Articles. Within these limits the fullest freedom of opinion and expression of opinion is allowed.

Anglican Theology.— The theology of the Church of England has had certain special characteristics. (1) Owing to its connection with the universities there has always been a markedly learned character about a section of its clergy. *Clerus Anglicanus stupor mundi* was the verdict of the 17th century, and during that period a number of very learned works were produced by the Church. It suffered like all departments of the country by the intellectual lethargy of the universities in the 18th century. In the 19th century its character to a large extent revived. (2) But though a learned Church there have always been certain characteristics to distinguish it from other religious bodies. Its interest has been very largely in historical and exegetical studies. It has sedulously eschewed systematic theology. There is not at the present day an authoritative work stating the beliefs of the Church of England. It has been largely concerned with questions of ecclesiastical organization and the special features which have distinguished it from the Roman Catholic and Protestant churches. (3) The most prominent product of its activity has been the creation of that school of theology which might be defined as Anglican. Whereas Luther and Calvin created Lutheranism and Calvinism the traditions of Anglicanism, on the contrary, are the product of the position of the Church of England rather than the creator of it. Although certain broad principles underlie the Reformation it would be impossible to say that any one prominent principle prevailed, but the result of a Conservative Reformation, with some reference to primitive truth, was to create a body which preserved historical tradition in the threefold order of bishops, priests, and deacons, and the customs and rites of the primitive Church and at the same time had largely abolished mediæval corruption. The defence of this position created Anglicanism. A knowledge of the Eastern Church provided the exponents of that system with a very strong weapon and the Oxford Movement (q.v.) finally made this the dominant note in Anglican theology. But it must not be thought that it is necessary to hold "Anglican" views to be a member of the Church of England. Within the limits of the Church are many who would strongly object to those views. (4) The opportunities for a liberal position created on the one side by the relations of the Church with the universities and on the other side by the freedom of opinion secured by secular courts created a strong Broad Church movement. As the modern exposition of Anglicanism dates from the 'Tracts of the Times' so the modern exposition of the Broad Church theology dates from 'Essays and Reviews.' The aim of the Broad churchman has always been to keep himself in touch with modern science and modern criticism. But of recent years there has been a considerable rapprochement between these two schools and the appearance of 'Lux Mundi' marked a new departure by which the Anglican school accepted many of the results of modern criticism and thought which their predecessors had condemned. (5) Ever since the Wesleyan movement, and the Evangelical movement which was its accompaniment in the Church of England, there has been a strong Evangelical party within the Church. Its tenets were represented by Simeon and the Cambridge school of the early 19th century and it took for many years a lead in philanthropic work and is especially connected with the abolition of the slave trade. But it has always failed as compared with the other two schools in an intellectual exposition of its system and has never in any great degree influenced the theology of the Church. Outside all these definite schools it is probable that there is a considerable element in the Church consisting of those who are by tradition loyal members of the Church of England, who accept its formularies without attempting to interpret them very definitely, whose interest in religion is practical rather than theoretical, and who are prepared to accept and work from the point of view of common sense rather than of elaborate theological accuracy the system in which they find themselves.

Doctrinal Teaching.— As will appear from what has been said above it is not particularly easy to fix the standard of belief in the Church of England. On the one hand it did not arise from a definite body of teaching, like that of the Lutheran and Calvinistic churches, on the other side its Articles were drawn up with the idea of inclusion rather than exclusion. Moreover its historical position has led to its holding a mediating belief in many respects. A resolution, however, of the Lambeth Conference has laid down the following principles. (1) The acceptance of the Old and New Testaments. The English Church, however, has never accepted the position that the Bible and the Bible only is the authority for its belief. Its definite statement is that whatever is not contained therein or may be proved thereby is not necessary to salvation. But it has always recognized that in interpreting the Bible the traditions of the Church may be used. As regards the canon of Scripture it occupies a middle position between the Protestant and Roman Catholic churches. It accepts the Apocrypha, though not as a standard of belief, or as authority for faith. (2) The acceptance of the two Creeds: The Nicene and the Apostles. This definitely means that its standard of belief is the traditional, orthodox teaching of the Church. It is, however, slow to express a decision, or impose its belief. (3) The acceptance of the two sacraments, of Baptism and the Lord's Supper, as generally necessary to salvation. As regards sacramental teaching it has always been very wide in its limits. It makes its standard the acceptance of the authorized service and it has frankly admitted that while Zwinglianism and the doctrine of transubstantiation are incompatible with its formularies, within these limits any form of eucharistic doctrine is allowed. As regards other rites and ceremonies it has always made a very definite distinction between the two sacraments and others, although its formulas have occasionally used the term sacrament in a wider signification. But it lays great stress on confirmation, orders, and matrimony and allows private absolution and confession, although it does not make them compulsory. (4) The acceptance of the threefold ministry of bishops, priests and deacons. Here again its demands point to a system rather than to a doctrine. All its clergy must be episcopally ordained, but it does not demand any definite theory of ordination apart from what is implied in acceptance of the ordinal. A section of the Church would make the acceptance of the doctrine of apostolic succession necessary, but it has never been the teaching of the Church officially and as a whole.

Negatively the Church condemns emphatically the system and authority of the Roman Catholic Church and the infallibility and supremacy of the Pope. It definitely condemns also certain doctrines of purgatory, the invocation of saints, the sacrifice of the mass, relics, the merits of the saints, and works of supererogation. In relation to the Eastern Church, while differing fundamentally in tone and temper it is very nearly in doctrinal harmony, the chief points of distinction being of course the invocation of saints, the doctrine of t double procession, the use of the term transubstantiation, while there is some general hesitation about the acceptance of all the seven councils or the necessary acceptance of the seven sacraments. As against the Protestant churches as a whole, it would always avoid accepting the extreme forms of predestination or justification by faith; it would lay stress on the need of interpreting the Scriptures in accordance with the traditions of the Church; it would almost universally lay greater stress on the reality of the sacramental system, and it would maintain episcopacy as an institution against every other form of Church government whilst condemning the tendency to disunion which characterizes so many of the Protestant bodies. To some its mediating attitude appears to be a mere political compromise between two incompatible ideals, to its own members it would seem to be the one Church which most clearly holds the balance between the various conflicting aspects of Christianity.

The Church and the Nation.— The relation of the Church of England to the English nation has been modified very considerably in the early part of the last century by a series of enactments. Almost all its exclusive privileges have been gradually taken away. It has no longer a paramount position in the universities, and membership of the Church of England is no longer necessary for any civil position in the state. Side by side with this there has been an enormous increase in the population, which has made the existing ecclesiastical arrangements quite unfit to cope with the immense mass of new work. Many of the dioceses are excessively large and the process of sub-division has not been rapid enough to keep up with the demands. In many districts the clergy and the Church have been quite inadequate to meet the spiritual demands of the people. This fact, combined with the increase in just those sections of the populace which were least touched by the influence of the Church of England, has led to a very great increase in Nonconformity. But this loss of privilege and greater need of work have not been detrimental on the whole to the Church. The various spiritual movements that we have narrated and the demands of the day have stirred up an immense amount of voluntary work on the part of the Church. The old rigid high and dry schools have had to make way for younger men with very varied forms of activity. Methods of religious propaganda have been borrowed, alike from Nonconformist and Roman Catholic sources. The Church has taken a vigorous interest in educational and social topics. Missionary enterprises, always strongly supported by the Low Church party, have been exceedingly vigorous. The exigencies of a Colonial Empire, the spread of commercial activity, have created new demands, and the last hundred years have marked an immense increase in the religious activity and the enterprise of the Church. Including the Anglican Church in America the number of bishops now connected with the Church exceeds 300, and every 10 years the Conference at Lambeth marks the extent and growth of the Anglican Church.

As regards its hold upon the people there are no trustworthy statistics, but on the upper and upper-middle classes its hold is very strong. Amongst the working classes the greater majority are nominally adherents of the Church of England, but a great deal of the religious life is Nonconformist. As against Nonconformity the Church of England is little organized for political activity, and its hold upon the people and its influence are very intangible and indeterminable quantities. Probably, except perhaps in some of the great centres of the populace, its influence is very much greater than is often imagined.

Bibliography — History. — The best continuous history of the Church of England is probably 'A History of the English Church' in eight volumes by various writers, edited by the late Very Rev. W. R. W. Stephens and the Rev. William Hunt. Shorter histories are those by Wakeman, Spencer, Boyd-Carpenter, etc.

Canon Law.— 'Report of the Royal Commission on Ecclesiastical Courts,' published in

1881–3, and Manuals of Church Law, such as Phillimore's 'Ecclesiastical Law.'

Prayer Book.— Proctor and Frere, 'A New History of the Book of Common Prayer' (London).

Doctrinal Formula.— Edgar S. Gibson, 'The Thirty-Nine Articles of the Church of England.'

Much information concerning the Church of England may be found in the 'Report of the Royal Commissioners in Ecclesiastical Discipline,' bulletin c. 1906.

Principal of King's College, London; Dean of the Faculty of Theology, University of London.

30 (b). **Great Britain — English Nonconformity.** *Early History — Death of Queen Elizabeth.*—Nonconformity as a definite ecclesiastical movement in English history may be said to have had its origin in Elizabeth's reign. But regarded as a spiritual force appearing now and again and here and there in the nation, it may be traced back to a much earlier time. All who protested against the prevailing ecclesiastical assumptions of the clergy, and who dared to think and act for themselves in matters spiritual, may be regarded as Nonconformists, and were called to suffer for their faith. From 1401, when the statute for burning heretics came into force, to 1534, the date of the renunciation of Papal supremacy, no fewer than 111 persons were burnt at the stake; and from 1534 to 1558, the year Queen Mary died, 337 more were added to the roll of the protestant martyrs. On the accession of Queen Elizabeth it was hoped that a better day had dawned for those men of Puritan sort who desired to see the Reformation carried still further. But, while breaking with the Papacy as completely as did her father before her, the queen was not prepared to yield to what she regarded as their extreme views in the matter of religious ceremonial. She cared for order, pomp, and appearance in the worship of the Church as in other things, and her princely power combined with her indomitable will made her supreme in ecclesiastical affairs. Several of the bishops and divines in the early years of her reign had been in close friendship with the continental Reformers and were prepared to go far in the Puritan direction. But the queen would not hear of it. Bishop Jewell writing to his friend Bullinger at Zurich in 1566 said: "I wish that all, even the slightest vestiges of Popery might be removed from our Church, and above all from our minds. But the queen at this time is unable to endure the least alteration in matters of religion." Thus began that conflict between the individual conscience and the power of the state church which has continued down to our own time.

The rupture between Elizabeth and the Puritan party first took open shape on the promulgation of the orders known as "Advertisements," which, in 1566, specified the minimum of ceremonial the State was prepared to tolerate in the services of the Church. Uniformity was to begin to be enforced at a given date, and deprivation of benefice was to follow in the case of the clergy after three months' refusal of compliance.

The two sides thus having joined issue the Puritan party became divided, taking different directions. Many of the ministers conformed, using only such ceremonial as they were compelled, submitting to many things they did not approve in the hope of a better time when a simpler and, as they believed, a more scriptural system, might come to prevail. Others, again, while remaining in the Church, sought to bring about a radical change in the direction of Presbyterianism, the discipline of which was elaborately organized both in London and the Midlands, and a literature created which assailed with more and more of vehemence the existing establishment. In 1571 Thomas Cartwright, Lady Margaret Professor of Divinity at Cambridge, issued two addresses to Parliament under the title of "A First" and "A Second Admonition," which were elaborate attacks upon the Episcopal system, and vigorous assertions of the divine right of the Genevan discipline. Having exercised this discipline privately for a time they proceeded to bolder measures, setting up their system openly in the parish churches of Northamptonshire and Warwickshire. Eventually, however, this movement was stamped out by the greater power of the State, and Nonconformity was henceforth to be sought for in other directions. Some of the Puritans became actual Separatists from the episcopal system. Their starting-point in church polity was the existence of spiritual life, the personal relation of the individual soul to God; and a church in their view was a community of spiritual men: "The kingdom of God," said they, "is not to be begun by whole parishes, but rather of the worthiest, were they never so fewe." Taking as their fundamental position that the Church visible consists of a company and fellowship of faithful and holy people gathered in the name of Christ, they went on to maintain that a Church so composed is competent for self-government. This self-governing power they further regarded not so much as a privilege to be enjoyed as a sacred trust to be discharged. The period when these men, who came to be known as Congregationalists or Independents, actively promulgated their views may be roughly stated as between 1570 and 1593. Their leaders during the first half of this period were Richard Fitz, the pastor of a London church, and Robert Browne and Robert Harrison who formed a Congregational church in Norwich in 1580; and the most active promoters of their principles in the second half of this period were Henry Barrowe and John Greenwood, who, together with John Penry, the Welsh martyr, suffered death for their opinions in 1593.

The penal laws against Nonconformity, severe before, were made still more severe by the Conventicle Act of 1593, which provided that all persons above 16 years of age being present at unlawful conventicles, should, on conviction, be committed to prison, there to remain without bail or mainprise until they made open submission and declaration of conformity at some church or chapel, or usual place of common prayer. The offender who refused to make such public submission within three months of conviction should be compelled "to abjure this realm of England, and all other the Queen's Majesty's dominions forever." This sternly repressive Act explains why during the

10 years previous to the accession of James I. so many Nonconformists languished in prison, while many were banished, and many more went into voluntary exile.

From the Accession of James I. to the Revolution of 1688.— With the death of Elizabeth and the accession of James I. the hopes of the Puritan party once more revived. For the King had been brought up among Presbyterians, had been the pupil of George Buchanan, and a frequent hearer of the disciples of John Knox; and had even invited Thomas Cartwright, the leader of the English Presbyterians to a professorship in Scotland. Regarding him, therefore, as at least not unfavorable to Puritan ideas, they met him on his way to London in 1603 and presented the Millenary Petition, so called, as representing the views of a thousand of the clergy. But again their hopes were destined to disappointment. At the Hampton Court Conference, held the following January, the King spoke contemptuously of Presbyterianism and declared he would either make these church reformers conform themselves or he would harry them out of the land. The Conference was followed by the Canons of Convocation which were so constructed as to make it impossible for any man who disagreed with the constitution and articles of the Church, as set forth in them, to remain honestly among its clergy. The immediate result was that some 300 ministers were ejected from their livings. The Nonconformists who had fled to Holland in search of liberty of worship after the Conventicle Act of 1593 were reinforced from time to time by the arrival of others of like mind. Especially memorable among these were the members of the little church at Scrooby in Nottinghamshire, who, under the leadership of William Brewster and John Robinson, fled to Amsterdam in 1608, and subsequently settled in Leyden. This was the church from which, in 1620, the Pilgrim Fathers of New England crossed the Atlantic as the founders of Plymouth Colony, the starting-point of the United States.

The Separatists who remained in England were subjected to perpetual hardships and persecution on account of their faith. James I. was succeeded by Charles I., the new king coming completely under the influence of Archbishop Laud, who proceeded to great lengths in enforcing conformity to Prayer Book, articles and canons. While the two opposing forces of Catholic tradition and Puritan earnestness were thus contending within the arena of church life, the two opposing forces of absolutism and the desire for popular government were at the same time at war within the political sphere. The men who contended for the divine right of bishops maintained also the theory of absolute monarchy and the divine right of kings. The leaders of the Church made the serious mistake of allying its interests with the side hostile to the constitutional liberties of the nation. With a high-spirited people such a course could only have one issue — that of disaster and overthrow. The attempt to base the Church on the subversion of freedom ended in civil war and the temporary overthrow of the very institutions the advocates of absolute government sought to maintain.

After Charles and Laud came the Long Parliament and Cromwell. Two main ideas seem to have guided Cromwell's ecclesiastical policy — first, that there should be an established non-episcopal Church, on a broad basis of evangelical comprehension, to be endowed and controlled by the State; and next, that outside that Church there should be an ample toleration of Dissent, which therefore provided for the existence of separate congregations. The Church, as established, recognized no one form of ecclesiastical organization; it had no church courts, no church laws or ordinances. Nothing was said about rites and ceremonies, nothing even about sacraments. These were left as open questions to be determined by each congregation for itself. All that the commissioners for each county dealt with was the personal piety and intellectual fitness of the minister presented by the patron to the living; and the church buildings were regarded as the property of the several parishes.

This loosely organized system came to an end with the ending of Cromwell's life. When the strong hand which alone was able to control the conflicting forces let loose in a time of civil war, fell powerless, the nation, weary of strife, restored the monarchy, and with the restoration of the monarchy there came back also the episcopal system of government in the Church. In 1662 the Act of Uniformity cast out 2,000 of the ministers as being unable to give unfeigned assent and consent to all and everything contained and prescribed in the Book of Common Prayer. From that hour Nonconformity took definite and permanent shape in English national life. It defied all attempts to crush it out of existence. The Conventicle Acts of 1664 and 1670 sent thousands of godly people to prison where many of them died in the pestilential jails of the time. Others were ruined by heavy fines and the spoiling of their goods, but the more Nonconformity was oppressed the more it grew, and at length by the Declaration of Indulgence of 1672 the government was compelled to admit that no fruit had been gained by these forceful courses. Still after brief respite these forceful courses were resorted to again. Conventicles were again frequented; spies and informers renewed their dishonored calling and persecution went on its cruel and iniquitous way so long as the Stuart kings remained on the English throne. Happily sooner or later tyranny digs its own grave, and when William of Orange landed at Torbay, 5 Nov. 1688, the hour of deliverance had struck. The persecuted Nonconformists felt that the tidings were almost too good to be true. Year by year for a long period they observed the anniversary of their emancipation, exclaiming ever and again: "When the Lord turned again the captivity of Zion we were like them that dream. The Lord hath done great things for us whereof we are glad!"

From 1688 to the Present Time.— The Revolution of 1688 was followed by the Toleration Act of 1689 which repealed the Penal Acts and permitted Nonconformists to erect their own places of worship which were registered, and so placed under the protection of the State. To the providing of local habitation for their communities and their principles they addressed themselves with considerable energy, In the quarter of a century which elapsed between the accession of William III. and the death of Queen Anne, besides many temporary structures, some 1,500 permanent places of worship were opened and maintained. The political history of Nonconformity in the 18th century is largely concerned with the endeavor to set aside certain disabilities to which its adherents were still subjected, the Toleration Act notwithstanding. The Corporation Act of 1661 provided that no person could be elected as mayor, alderman, recorder, bailiff, town clerk, or common-councilman who had not previously taken the sacrament according to the rites of the Church of England. The Test Act of 1673, though aimed mainly at the Roman Catholics, by widening the scope of the Corporation Act told heavily also against Protestant Nonconformists. It forbade any person holding office under the Crown, of any nature whatsoever, who could not produce a certificate to show that he had taken the sacrament at the parish church. Whoever offended against this law was thenceforth disabled from suing in a court of law, acting as guardian or executor, taking any legacy or deed of gift, or bearing any public office, and was further liable to a penalty of £500.

These acts were unaffected by the Act of Toleration and were naturally felt by the Nonconformists to be a serious grievance. The Occasional Conformity Act of 1711 intensified this grievance. It provided that any person holding any civil or military office who should be found in a conventicle, or in any religious meeting of more than 10 persons, other than one conducted according to the rites of the Established Church, should forfeit the sum of £40, and be disabled for the future from holding any public office.

In 1717 an agitation was commenced for the repeal of these three tyrannical and disabling acts. A bill for the purpose was introduced into the House of Lords by Earl Stanhope, and on a second reading was carried by a division of 86 votes against 68; but on going into committee the clauses relating to the Test and Corporation Acts were withdrawn from the bill and it passed without them. Thus it came about that while the Occasional Conformity Act was repealed at that time it was not till 1828 that a bill for the Repeal of the Test and Corporation Acts received the royal assent.

Still in the interval between 1717 and 1828 several distinct steps were taken in the direction of liberty. In 1742 a dissenter was elected to the office of sheriff of the city of London, and on his refusal to qualify by taking the sacrament he was cited to the Court of King's Bench which decided against his claim to exemption. The Corporation then passed a by-law imposing a fine of £400 upon every person who declined to stand for the office after being nominated, and a fine of £600 upon every person who, being elected, refused to serve. Again and again dissenters were nominated, and as they all refused to serve, fines were levied amounting in six years to more than £15,000, which went toward the erection of the new Mansion House. In 1754 it was resolved to make a stand against this oppressive procedure. After a lawsuit which was traversed from court to court, and which lasted for 13 years, Lord Mansfield, by his memorable and scathing judgment of 1767, put an end to the iniquity forever.

This gain in the direction of freedom was followed by another in 1779 when Protestant Dissenting ministers and schoolmasters were no longer required to sign the Thirty-nine Articles. In 1812 the Quakers' Oaths, the Conventicle and Five-Mile Acts, which till then had remained on the statute book, were repealed, and the Free Churches were placed, in respect to legal protection from disturbance during times of public worship, on an equality with the Established Church.

The repeal of the Test and Corporation Acts in 1828 was followed by the great Reform Bill of 1832 which did much to introduce the rule of the middle class in English society. The result was a large accession to the strength of Nonconformity, both political and social. Their influence entered more fully into the stream of the national life. They were found taking active part in Parliament and in municipal councils, the national universities were thrown open to them in 1871, and as the result of a recent religious census it was found that quite half of the worshipping population of the country were in attendance on the Nonconformist churches of various denominations. It may be well to add to this historical sketch of the older Nonconformity a brief reference to the laterborn but powerful religious society known as Wesleyan Methodism, which taking its rise in the 18th century, has gone on developing and consolidating ever since. Its internal history is largely that of a struggle for greater freedom and an increased representation of the laity in the government of the Church. Neither Wesley himself nor the other early leaders in Methodism believed in democratic government in ecclesiastical affairs, and continued resistance on their part to the extension of the lay element in the Conference led to one secession after another, these separating bodies forming sister communities. Still while working with more breadth and democratic freedom they remained loyal to the doctrines held by the great founder of Methodism and to the ecclesiastical system he had elaborated. These various off-shoots are known as the Methodist New Connexion, the Primitive Methodists, the Bible Christians, the Wesleyan Reform Union, the United Methodist Free Church, and the Independent Methodist Church. Notwithstanding these successive secessions and some occasional disasters the original Wesleyan Society has shown marvellous vitality, elasticity and resource. While in 1816 in Great Britain and Ireland there was a membership of 241,319, according to the latest minutes of Conference that membership has risen to 565,088. If we add to this the number of members belonging to the various branches of Methodist outside the main body, to the Foreign Missions, to the French Conference and to the South African Conference we reach a total of 1,217,081. If again to this the membership in Australia, in the United States and in Canada, according to the latest information, we arrive at a grand total of 7,870,730. For the due care of this large body they have an ordained ministry of 49,113, and a band of lay preachers numbering 102,608.

Passing from Wesleyan Methodism to the Free Churches generally it may be mentioned that these various bodies of Christians outside the Established Church have in recent years entered into a sort of federation without sacrificing their separate self-government. This federation is known as the National Council of the Evangelical Free Churches and consists of representatives of the local Councils of the Congregational and Baptist churches, the Methodist Churches, the Presbyterian Church of England, the Free Episcopal churches (including the Moravians), the Society of Friends, and such other evangelical churches as the National Council may at any time admit.

JOHN BROWN,
Formerly Chairman of the Congregational Union of England and Wales, Lyman Beecher Lecturer at Yale University, author of 'Lectures on the Book of Revelation,' etc.

20 (c). **Great Britain — English Roman Catholics.** *History.*— The Roman Catholic Church in England is descended from those who in the reign of Elizabeth refused to accept the Reformation (q.v.) and remained in communion with the see of Rome. Nearly all the English bishops were included in this number, and were deprived of their sees, and stringent laws were made with a view to enforcing conformity with the established religion. Notwithstanding these, however, and the fact that they were frequently put into execution, the number of those who adhered to the Roman Catholic faith was, for a time, very considerable. No form of ecclesiastical government was instituted at first, as hopes were entertained of a national reunion with Rome; but in the meantime, in order to perpetuate a succession of clergy, several colleges were established on the Continent, in which also the laity obtained their education. Chief among these was the college at Douay, in Flanders, founded by Cardinal Allen in 1568. Others were in Rome, Paris, Saint Omer, Seville, Valladolid, Lisbon, etc., several owing their origin to the well known Jesuit, Father Parsons. Most of these still exist, some on their original sites, while others, having come to an end during the French Revolution were re-founded in England, for the laws against Catholic schools had then been relaxed. It was undoubtedly due to the English colleges abroad that the Roman Catholics in England were saved from extinction.

Early in the 17th century, when the hopes of reunion had become remote, an attempt was made to form a proper ecclesiastical government for the Roman Catholics; but it was not until the reign of James II. that affairs were put on a permanent footing. England was then divided into four "districts"— the Northern, Western, Midland and London — each under the government of a bishop called a "Vicar Apostolic." This means that he was, by a kind of legal fiction, bishop of an Asiatic see "*in partibus Infidelium*," and he ruled his actual "district" with authority delegated directly by the Pope. Thus the first "Vicar Apostolic" was nominally Bishop of Chalcedon. A similar arrangement was made a little later in Scotland. And all the colonies having no ecclesiastical government of their own, were considered as belonging to the "London District," so that in early days, the Roman Catholics of North America were under the London "Vicar Apostolic." The beginnings of the present American Roman Catholic hierarchy date from the time of the War of Independence. In England the government by "Vicars Apostolic" continued until the establishment of the hierarchy in 1850; in Scotland it lasted until 1878.

After the brief reign of James II., new penal laws were enacted against Catholics, and the time which followed may be considered the low water mark of Roman Catholicism in England. The hopes they had placed in the Stuarts had failed, and the outlook seemed dark and dreary. There were numerous defections about that time, and hardly any converts were made to replace them. The only centres where the Catholic religion could be regularly practiced were the country seats of the old Catholic families, and in London the chapels of the various Roman Catholic ambassadors.

Towards the end of the 18th century, however, there were signs of better times for them. The penal laws were mitigated by Parliament in 1778, and practically abolished by a second Act in 1791, after which Catholic chapels began to spring up in many of the larger towns, and a certain number of conversions were made. Roman Catholics were still, however, disqualified from sitting in either house of Parliament, and were under many other civil disabilities. These were not formally removed until the Act of "Catholic Emancipation," obtained by the agitation of O'Connell and the Irish in 1829.

Three events of later time must be briefly alluded to, as having had a permanent effect on the state of English Catholics. One was the French Revolution, which had a double effect. In the first place, it drove back to England the numerous communities of English monks and nuns, who had settled abroad during penal times, and by accustoming the people in England to their presence amongst them, prepared the way for the rapid multiplication of such institutions in later times. In the second place, it caused some thousands of French priests to take refuge in England, where they were received with marked hospitality, and considerable sums both of private and public money were apportioned to their relief. Most of them indeed returned to France on the signature of the concordat between Napoleon and the Pope in 1801; but a certain number remained in England, and founded missions or other Catholic works, some of which still continue. The second event to be alluded to was the great immigration of the Irish after the potato famine in 1845–9, which was the chief cause of the rapid increase of the Catholic congregations at that time and later. The third was the Oxford Movement (q.v.), which though it did not have such a great effect numerically speaking, nevertheless brought over men of standing and influence who have left a lasting mark on the Church. The names of Newman, Manning, Faber, Ward, Oakeley are only some of many that might be mentioned in this connection.

Present Ecclesiastical Organization.—At the present day the Roman Catholic Church in England is ruled by an archbishop of Westminster, and 15 suffragan bishops; and Scotland by two archbishops and four suffragans. The titles of the English sees were expressly chosen to be different from those of the Established Church, though the latter have since adopted three of the Roman Catholic titles — Liverpool, Birmingham and Southwark. Each diocese has a chapter, though there are no resident canons: they are chosen from among the senior clergy of the diocese, and meet at stated intervals. There have been four archbishops of Westminster — Cardinal Wiseman (1850–1865); Cardinal Manning (1865–1892); Cardinal Vaughan (1892–1903); and Archbishop Bourne since 1903. The new cathedral at Westminster was begun under the direction of Cardinal Vaughan in 1895. It is in the Byzantine style, the architect being the late Mr. J. F. Bentley, who died during its construction in 1902. Although yet far from finished, it has already cost over £200,000.

Since the abrogation of the penal laws more than a century ago, mission churches have rapidly multiplied throughout the country, and few towns of any importance are now without one. Some have been built by individual rich Catholics, and are good specimens of architecture: for example, the church at Arundel, built by the Duke of Norfolk in 1873, or that at Cambridge, built by Mrs. Lyne Stephens in 1890; and a certain number of handsome churches have been built by subscription, a prominent instance being the Oratory at Brompton, opened in 1884. Moreover, the influence of the elder Pugin, who was a Roman Catholic, is largely visible in the churches set up during the early days of the Gothic revival. Nevertheless, the large majority of Catholic churches bear evidence of the poverty of that community as a whole, and have been built with the sole view of securing a maximum amount of accommodation at a minimum of cost.

In their practical working the missions do not differ much from parishes, though they are not canonically constituted as such. The clergy, being unmarried, live together in a house or "Presbytery." They are supported entirely by voluntary contributions. For the most part they lead laborious lives, ministering to the wants of their people, most of whom belong to the poorest classes. There is also a large section of the clergy known as "Regulars," including Jesuits, Benedictines, Dominicans, Franciscans, as well as the modern Redemptorists, Passionists, and other similar congregations. They commonly live in monasteries or large houses; but in the present state of England they often find themselves obliged to undertake the care of missionary churches, like the secular clergy. The total number of priests in England is about 3,400, serving 1,600 churches, chapels or stations.

The Laity.— From what has been said, it will be seen that the Roman Catholic laity belong to three very heterogeneous groups: (1) The hereditary English Catholics, consisting of a number of county families, and in some few districts, such as Lancashire and parts of Yorkshire, and elsewhere, some of the working classes; (2) Converts, or children of converts, of whom there are usually a certain number in most town missions; and (3) those who are Irish, or partly Irish, by descent, who form the majority of the congregations, many of them belonging to the poorer classes of the population. At the present time there are 41 Roman Catholic peers, and 49 baronets, many of them of course being Irish. The total number of Catholics in England and Scotland is said to be about two millions. The prejudices of former times are steadily dying away, and Roman Catholics in general live on good terms with their neighbors. They intermarry to a certain extent, but such "mixed marriages," as they are called, are discouraged by the ecclesiastical authorities and a special permission is requisite for each. Many Roman Catholics may now be found occupying prominent positions on county councils, boards of guardians, or other public bodies. In politics, owing to the composite nature of the body, they are divided, almost every shade of political opinion being represented amongst them; but in general it may be said that while the majority, including almost all the Irish, sympathize with the Liberal party, many of the upper class hereditary Catholics have in recent years become strong Conservatives. When Catholic interests are at stake, however, those of all political views unite on a common platform.

Education.—Very remarkable energy and perseverance has been shown in providing elementary schools for Catholic children, and there is one attached to almost every mission. In spite of past difficulty and poverty, they have usually been carried on very efficiently. Training colleges for the supply of Catholic teachers, both male and female, exist in various parts of the country. There are numerous poor law, reformatory and industrial schools. In the provision of secondary day schools Catholics are less well off, though there are a certain number of efficient ones in some of the chief towns; but the boarding schools for the upper classes are on a very large scale in proportion to their numbers. The chief ones — Stonyhurst, Ushaw, Beaumont, Downside, Ampleforth, Old Hall, and others, are all equipped fully up to the standard of modern requirements. Some of them are descended from the English colleges on the Continent which were broken up during the French Revolution; others, as for example Cardinal Newman's school at the Birmingham Oratory, have been founded in more recent times.

Until a few years ago, Roman Catholics were forbidden to attend the National universities; but in 1895, in response to a petition from the laity, the law of the Church was relaxed, and there are now over a hundred Catholic undergraduates at Oxford and Cambridge. They are scattered in the various colleges, and mix freely in the general life of the university; but there is in each case a centre, where lectures on Catholic subjects are given periodically, and there is a Catholic Debating Society both at Oxford and at Cambridge.

Convents, Charities, etc.— One of the features of Roman Catholic life in England during the last 50 years has been the rapid multiplication of convents, which now number over 700. In a large number of cases the nuns devote themselves to the work of education, either in the parish (primary) schools, or by conducting a secondary school of their own, either for boarders, or day scholars, or both. Others work among the poor, or undertake the care of the sick or the aged, or the unfortunate, while a certain number belong to "enclosed" orders, and give themselves to a life of prayer. Many other homes, orphanages and "rescue" societies deserve to be enumerated; nor ought we to omit at least a mention of the Catholic Truth Society, for printing and distributing cheap Catholic literature among the poor, in these days an essential provision for Catholic life.

Bibliography.— For details of the present state of Roman Catholics, see 'Catholic Directory,' published annually under authority.

The following books may be consulted on the history of the Roman Catholics in England, from their point of view: Dodd's 'Church History of England' (Dodd's real name was Rev. Hugh Tootell. His history was published 1737–42); Tierney's 'Dodd' (The notes of Canon Tierney form a very valuable addition, and make this practically a new book; but it breaks off at about 1640, and was never finished. It was published in 1839–43. Both editions of Dodd are often met with in second-hand catalogues); Lingard's 'History of England'; Sander's 'Rise and Growth of the Anglican Schism' (Lewis's translation [1877], the Latin original [1585] having run to over 30 editions); Challoner's 'Memoirs of Missionary Priests, 1577 to 1664' (1st ed. 1741–2; many times republished); Berington's 'State and Behaviour of the English Catholics from the Reformation to the year 1780' (London 1781); Butler's 'Historical Memoirs of English and Scottish Catholics'; Milner's 'Supplementary Memoirs.' (These two books formed part of a long and acrimonious controversy on Catholic affairs between Bishop Milner, Vicar Apostolic of the Midland District, and Charles Butler, the distinguished lawyer, who on the passing of the Emancipation Act in 1829 became the first Roman Catholic K. C. Butler's Memoirs appeared in 1819, and Bishop Milner wrote to correct what he considered misrepresentations of Butler. Both books are still fairly commonly to be found); Husenbeth's 'Life of Milner' (1862); Flanagan's 'History of the Church in England' (1857); Olliver's 'Collectanea' (1857); Ullathorne's 'History of the Restoration of the Catholic Hierarchy' (1871); Mazière Brady's 'Annals of the Catholic Hierarchy' (1877); Foley's 'Records of the English Province S. J.' (8 vols. 1877); 'Records of English Catholics' (edited by Knox); vol. I., 'Douay Diaries'; II., 'Letters and Memorials of Cardinal Allen' (1878–82); Amherst's 'History of Catholic Emancipation' (1886); Morris' 'Catholic England in Modern Times' (1892); 'The Catholic Church During the Last Two Centuries' (Lord Braye's Prize Essay 1892); Bernard Ward's 'Catholic London a Century Ago' (1905); Gillow's 'Biographical Dictionary of English Catholics'; Wilfrid Ward's 'Life and Times of Cardinal Wiseman' (1897); Purcell's 'Life of Cardinal Manning' (1896; a book full of inaccuracies, but containing much valuable documentary matter).

Bernard Ward,
President of St. Edmund's College, Domestic Prelate to the Pope, and Roman Catholic Canon of Westminster.

30 (d). Great Britain — Judaism. *Historical Summary.*—Though the statements as to the presence of Jews in Roman and Saxon England are more or less legendary, it is tolerably certain that William I. brought a number of Jews with him from Rouen to England. Under the Normans, the Jews enjoyed some privileges; they developed a communal life of culture and distinction; but they were practically restricted to financial pursuits as a means of livelihood. Henry I. granted them a charter, but at the coronation of Richard I. serious massacres occurred in London and elsewhere, especially at York, where the ordeal of martyrdom was heroically endured. The "Exchequer of the Jews" was then founded to preserve the Jews from some of the effects of such riots and to enable the Crown, as chief partner in the Jewish money-lending business, to secure its share of the gains. By the middle of the 13th century the Jews were chattels of the king, and their unpopularity on religious grounds was increased by the power they gave the king to obtain a revenue independently of barons and people. In 1275 the *Statutum de Judaismo* forbade the Jews to lend money, and as there was no other function for them in feudal England, their expulsion followed as a matter of course in 1290.

For the next three and one-half centuries a few Jews visited England from time to time; Queen Elizabeth had a Jewish physician. Toward the middle of the 17th century a number of Marano merchants came to the front in English colonies and in England itself. These men, who had escaped the Spanish Inquisition by assuming an outward garb of Roman Catholicism, now boldly asserted themselves as Jews, and in 1655 Cromwell, as a result of the Whitehall Conference of that year, connived at the open resettlement of a Jewish community in England. But two centuries more were to pass before the English Jews obtained full civil and political emancipation. In 1753, Pelham prematurely passed a naturalization bill, which he was forced to repeal next year. The struggle recommenced in 1830. In the years 1828–9 Protestant Dissenters and Roman Catholics were relieved of most of their disabilities. But the Jews were still excluded from Parliament, from membership of the University of Oxford, and from degrees and posts of emolument in the University of Cambridge. Nor could they occupy high posts in the army or navy. Political emancipation was won in 1858. In 1870, following on the senior wranglership of a Jew, the University Tests Act conferred full scholastic rights on the English Jews. In 1858 Baron Lionel de Rothschild took his seat as a Member of the House of Commons, and in 1885, his son, Sir Nathaniel de Rothschild was raised to the peerage — the first Jew so distinguished. Since 1858, many English Jews have sat in Parliament; there has been a Jewish Master of the Rolls; and in the Civil, Military and Diplomatic services a goodly array of Jews has become prominent.

Statistics.— In 1290 the number of Jews who left England amounted to 16,000. At the Restoration of Charles II. there were about 40 Jewish families in London. The increase was slow in the 17th century, but toward the end of the 18th century there was a larger immigration. Colquhoun estimated the Jewish population of London as 20,000 at the beginning of the 19th century, which would bring the total for the British Isles to about 25,000. This estimate is probably too high, for it is doubtful whether there were more than 60,000 Jews in the country before the Russian immigration of 1881. Mr. Jacobs calculated that in 1901 there were nearly a quarter of a million Jews in the British Empire, of which number 160,000 were in the British Isles. Mr. Isidore Harris conjectured ('Jewish Year Book,' X, 229) that in 1905 the total Jewish population of the United Kingdom amounted to 227,000 (of whom 140,000 were resident in London); and for the whole of the British Empire he assigned a total of 350,000. For the United Kingdom, this estimate makes the Jewish population 5 per cent. of the total population. All these estimates are conjectural.

Organization.— Since the dispersal of the Jews from Palestine in the first centuries of the Christian era, the organization of Jewish communities has been almost invariably on an independent congregational basis. Each congregation in the mediæval period constituted an independent unit. Sometimes there would be a combination of these units for certain purposes, as in the famous Council of Four Lands in Poland (c. 1550–1750). In the pre-expulsion period in England, there were officials who bore the title "Presbyter Judæorum" and who were the acknowledged leaders of the whole Anglo-Jewish community. Such officials were closely connected with the royal finances in so far as they affected the Jews, and were more or less responsible for assessments of talliages. When the Jewish community was re-established in the 17th century, the old congregational system was restored. There was first the Sephardim or "Spanish and Portuguese" Congregation which for long took the first place in the guidance of the whole Jewish life of London. Founded by a body of men distinguished alike fo culture and commercial capacity, this congregation gave to English public life many a noble son. They bore a considerable part in developing Colonial trade. This congregation, whose present Bevis Marks Synagogue was consecrated in 1701, was governed by a Mahamad or Council of Elders with an ecclesiastical head or Haham. The Mahamad claimed and exercised considerable power over all the individual members. Gradually, however, the leadership passed into the hands of the Ashkenazim or "German" Jews. At first each German congregation was completely independent, and this condition continued with more or less completeness till 1870 when the United Synagogue was founded. A large number of Metropolitan Jewish congregations are constituents of this united body, but the Sephardim have maintained their complete independence, and besides a few German congregations of old foundation which have remained outside the Union, there was established in 1841 a West London Synagogue of British Jews which introduced some ritual reforms and placed itself (as it still remains) in an independent position. The increase of foreign Jews had, however, led to the formation, especially since 1880, of a considerable number of smaller East End congregations outside the Metropolitan Union. These were "federated" in 1887. It is difficult to define the exact condition of the Jewish communal organization at the present time. The Chief Rabbi is the official head of the great bulk of the congregations of the British Empire, but except for statutory powers conferred over the constituent Synagogues of the United Synagogue by the Act of 1870, the influence of the Chief Rabbi depends on the voluntary acceptance of his jurisdiction by the various congregations. As to the rest of the communal organization, it does not differ from that found in other Jewish centres all the world over. The distinctive mark of Anglo-Jewish arrangements is perhaps the tendency to centralization. In Germany and in America there are Rabbis for every separate congregation; in England there are "Ministers" who preach and teach rather than Rabbis who exercise judicial functions. But there are many indications that the centralization is in process of breaking down. Certainly the organization of the English Jews on its religious side is now in a transitional phase. On the other hand, charitable and philanthropic organization is in a condition of first-rate efficiency, and men of such ability, public spirit, and philanthropic nature as Lord Rothschild are readily acknowledged as lay heads of the community.

The Communal Life.— Cromwell re-admitted the Jews unconditionally, and though the acquisition of political rights was a slow process, the English Jews were never subjected to restrictions of the Ghetto type. On the other hand, the fact that emancipation in England was gradual and not sudden gave the English Jews a training in civic adaptability which had rather exceptional consequences. The Jew easily assimilates, but in England assimilation was not accompanied with any wide-felt desire to forsake Judaism. The English Jews who have taken the lead in serving the state have on the whole been identical with the English Jews who have served the synagogue. The Disraeli family was an exception that proves the rule. But while English Judaism thus gained in coherence and stability by the fact that the leadership of the community was in the hands of its chief men of affairs, the communal life suffered some loss of idealism. English Jews have, indeed, consistently taken the lead in dealing with crises in the fate of the Jews of the world, but on the whole, communal life was respectable rather than brilliant. The institutions which resulted were, however, striking examples of practical philanthropy. The Board of Guardians for the relief of the Jewish poor (founded in 1859) occupies a high place among institutions of its class. It not only prevents the Jewish poor from falling on the rates, but it takes an enlightened view of the aims of poor-relief, fostering self-help by a carefully organized system of loans and emigration. Another characteristic institution is the Jews' Free School (founded 1817). This is probably the largest school in England, and it has served the cause of education while at the same time providing a friendly atmosphere for the children of alien parents. Considerable changes have followed on the increase of foreign Jews. The whole communal life has been vivified. In the first place, the presence of these Jews for the first time made evident a passing wave of anti-Semitism which culminated in the futile Alien Bill. Anti-Semitism has no deep roots in England, but the anti-Alien agitation did undoubtedly rouse the Jews of England to a sense of their responsibilities. Again, the Zionist and Territorial schemes introduced some of the previously lacking idealism. The absence of Jewish Mission deprives the Jews of a powerful driving force. But there is one important Jewish missionary society — a society of Jews with a mission to Jews. The Anglo-Jewish Association (founded 1871) has, under the enlightened presidency of Mr. C. G. Montefiore, had its horizon widened partly by the Hirsch Colonization Scheme which is directed in part by the Anglo-Jewish Association, and partly by the revived interest felt in the Jews of the world in consequence of the propaganda of Dr. Herzl and Mr. Zangwill. The Russian persecutions had considerable influence in the same direction. The general result has been that the leadership of the community is passing from the men of affairs to the idealists, and though there would be serious danger were this process carried too far, there can be little doubt that the change is on the whole fraught with advantage. As another token of present-day idealism may be instanced the initiation of a literary revival. English Jews have not played a foremost role in the promotion of Jewish learning. While the 'Dictionary of National Biography' was edited for the larger part by a Jew (Sidney Lee), and the British Academy was founded by another Jew (Israel Gollancz), though Jews have filled professorial chairs at the Universities and though there have been two Jewish R. A.'s, the literary performances of Jews in the field of specifically Jewish learning have been insignificant. But a new spirit is now discernible, or rather the old Jewish spirit has invaded the English Jewry. Thus, without enumerating the many institutions which are the just pride of the community, without detailing the eminent service to the State rendered by English Jews, it may be said generally that the practical spirit which has so long directed the current of Jewish life is now receiving a long-needed infiltration of idealism. In no part of the world is there greater hope for Judaism. Fullest toleration is enjoyed and more than toleration, sympathy. Fullest civic and political rights are the possession of English Jews. And above all there is undoubtedly a genuine affection for Judaism. Official Judaism is not in a thoroughly healthy condition, but there is in the general mass of Jews a sturdy confidence in the religion and an immovable hope in its power to civilize and save. Sobriety, good citizenship, devotion to the state, and a practical appreciation of all humane virtues are being once more touched by the fire of enthusiasm. Judaism is not only a creed and a code, it is a life. In England this principle seems likely to reassert itself. The English Jew is pre-eminently an Englishman, and he may become at one and the same time pre-eminently a Jew.

Reader in Talmudic and Rabbinic Literature, University of Cambridge.

31. **Great Britain — Education.** *Introductory.*— For a history of the early days of British Education the hour has not yet come. Much of the spadework of research has yet to be undertaken. Even the origin of the two ancient universities remains obscure. The records of secondary schools, with very few exceptions, do not begin before the Reformation, though the claim of King Edward VI. to be a patron of education has been shown to rest rather on having attached his name to a portion of the older foundations, of which a considerable number were destroyed under the Chantry Act of 1547. Elementary education was a matter too humble to receive much definite permanent

record, and probably, as in Scotland till recent years, it was frequently given in the same schools in which the elder children were being prepared for the universities. Neither taxes nor rates were levied for education before the 19th century (to speak in general terms), and the only method of maintaining any permanent educational institution was by means of endowment. Considerable sums were devoted to this end in the reign of Elizabeth, and, after the troubles of the Civil Wars were over, there was an outburst of endowment in the end of the 17th and beginning of the 18th centuries.

ENGLAND.

Elementary Education.— Two important factors in spreading elementary education were the Society for Promoting Christian Knowledge, founded in 1698, and the Sunday School movement, crystalized in the foundation of the Sunday School Society in 1785, and representing largely the Evangelical Revival of the 18th century.

The educational work of the Society for Promoting Christian Knowledge was in 1811 transferred to the "National" Society (The Society for Promoting the Education of the Poor in the Principles of the Established Church), which for the time being was devoted to carrying on Schools on the "Madras" monitorial system, as organized by Dr. Andrew Bell. In 1808 a Society, known subsequently as the British and Foreign School Society, was founded, chiefly by Nonconformists, to establish schools on an almost identical system which had been developed by Joseph Lancaster. The provision of Elementary Schools in England and Wales was thus in the beginning almost entirely the work of those connected with religious bodies, of which the Church of England was numerically and financially by far the most important. These Voluntary Schools, aided since 1833 by gradually increasing grants from government, continued to hold the field alone until 1870. Since the introduction of Board Schools, supported by rates, at that date, and even since 1902, the Voluntary Managers have gone on raising considerable sums of money, which, however, of late years, have been devoted chiefly to building and maintaining the fabric of their schools.

The religious difficulty in English elementary schools has thus been involved in their very origin.

It was not till 1833 in the first Reform Parliament that the State came to their aid. In that year the House of Commons made a money grant of $100.000, which was apportioned between the two Societies, and it was not till 1839 that the Government Education Department for directing the administration of the grant was established. The grant was gradually increased, and between 1850 and 1860 rose from $725.000 to $4.000.000 for Great Britain. In 188?, it was $12.500,000 for England and Wales only, and now is over $55.000.000 for elementary education. The years between 1840 and 1860 were years of great expansion. The population, which in 1801 had been under nine millions in England and Wales, by 1861 numbered twenty millions. The Government Education Grants greatly encouraged the clergy of all denominations, and schools sprang up in all directions. In 1861 the economists took fright, and severe mechanical tests were applied to the system of grants by the "Revised Code." Payment was to be made only on the results of individual examination of every pupil, in reading, writing, and arithmetic. Undoubtedly some check was needed on a system advancing so rapidly and with teachers so ill prepared as many were for their profession. But the method adopted was disastrous, and its cramping influence is felt in the traditions which exist to-day, years after the last relics of this method of payment by results have been abolished.

By 1870 it was quite plain that, magnificent as the efforts of the Churches had been, nothing short of a national local system could provide the necessary schools, especially in the large towns. The Elementary Education Act of that year enabled boroughs and parishes to form School Boards, with powers (if necessary) to levy a rate for building and maintaining Schools in addition to the building grants and other grants from the State. The Central Education Department had after due investigation to declare what school accommodation was needed in each district. If in any case it were not duly supplied, they might order the formation of a School Board; and in case of further default appoint such a School Board themselves. Existing Voluntary Schools were to receive the Government Grant, but no aid from rates. They might still give such religious instruction as they thought fit. In the Board Schools no religious catechism or religious formulary distinctive of any particular denomination was to be taught. This regulation is known as the Cowper-Temple Clause, from the name of the member who introduced it as an amendment. Subject to this a School Board might give in its schools such religious instruction as it thought fit, or might abstain from giving any. As a matter of fact, except in some places in Wales, where the religious instruction is given in Sunday Schools, plain Bible lessons are given by the ordinary teachers in all these schools with very few exceptions. Any School Board might make by-laws enforcing the compulsory attendance of children between five and thirteen, subject to a conscience clause, and a number of School Boards were established for this purpose only. In 1876 attendance was made compulsory in *all* districts by the establishment of School Attendance Committees where no School Boards existed. The provisions for compulsory attendance have been strengthened and diversified by four subsequent Acts, and are further complicated by conflicting Factory and Workshop Acts, so that the whole now urgently need consolidation. In 1891 fees were abolished in most schools, a process nearly completed since 1902.

The Act of 1870 aroused the most intense opposition at once from the Church party and the extreme Nonconformists. The latter were disappointed of their hopes of a uniform national system, the former found themselves in competition with a rival subsidized by the State. The greatest activity prevailed on both sides in providing additional schools. Between 1860 and 1876 provision was made in elementary schools for 1,600,000 additional children, and of these two-thirds were in voluntary schools, toward the cost of which only one-fifteenth was paid in Government building grants. Educational enthusiasm was not, however, the sole factor; in many cases the chief ratepayers realized that they could build and maintain the schools far more cheaply by voluntary subscriptions than under the administration of a School Board, and large corporations such as railway companies, were willing to contribute to voluntary schools for similar reasons. And in point of fact, the annual cost of education per child in Voluntary Schools in 1902 amounted to $11.50, and in Council Schools to $15. By 1902 the number of Board Schools was 5,878, as against 14,275 Voluntary, but they were educating 2,344,000 children, as against 2,546,217 in Voluntary Schools. These figures sufficiently indicate that the voluntary system had proved wholly inadequate in the large centres of population, but still prevailed in the majority of country villages.

By the end of the century the time was ripe for further legislation. Secondary education was in chaos, and it was imperative that it should be coördinated with the elementary system. The development of the latter moreover was in many places completely at a standstill and unlikely to be further improved under existing conditions. The tendency to local self government had rapidly increased during the past few years. In 1888 the Local Government Act established County Councils, and in 1894, by another Act, District and Parish Councils were constituted. In 1889 the Technical Instruction Acts had authorized the County and Borough Councils to supply technical instruction, and the vast majority of them were spending for this purpose the large sums of money handed over to them in 1890 by the Local Taxation (Customs and Excise) Act. They had thus already some experience as education authorities. On the other hand, the requirements of the Education Department (which in 1899 had been reorganized as the Board of Education) had been steadily growing, in accordance with modern ideas of education, so that the Voluntary Schools began to find it impossible in most cases to obtain the money requisite to keep them efficient.

Accordingly in 1902 a fresh Education Act was passed. By this every County, every County Borough (*i. e.* to speak roughly, city of more than 50,000 inhabitants), and (for elementary education) every urban district of over 20,000 inhabitants and every non-county borough of over 10,000 became local Education Authorities, and all School Boards were abolished. Each new authority must appoint, according to a scheme approved by the Board of Education, an Education Committee, which they are bound to consult, and to which they may delegate all powers for education except that of raising money. The Voluntary Schools must give their religious teaching in accordance with the terms of their trust deed (if any), and it is under the control of their managers. They appoint and dismiss their own teachers, subject to the consent of the local authority which pays them. The voluntary managers are responsible for the upkeep of their buildings, subject to an allowance from the authority for internal fair wear and tear, but the local authority is bound to maintain and keep the schools efficient otherwise, at its own expense. Each Voluntary School is managed by a body of managers, usually six, of whom two-thirds are appointed under the trust deed, amended by Order if necessary, and one-third by the local authorities. Board Schools are now known as Council Schools. The managers are appointed by the local authorities. In counties two-thirds are appointed by the County Council, and one-third by the local District or Parish Council. To the managers such powers are at present delegated as the central local authority thinks fit. London was excepted from this measure but received an analogous Act in the following year.

Unsatisfactory as many of the provisions of this Act are to the politician and to the religious controversialist, there can be no doubt that from the point of educational administration over the country as a whole, it has brought about great progress, an advance proportionately almost as great as the Act of 1870. Even in those cities where there was already a strong progressive School Board, it has concentrated the powers for higher as well as for elementary education in the hands of one authority, has materially increased the grant, and has given considerable powers over the standard of accommodation and of staffing in the elementary schools. In the Counties moreover it has abolished the small rural School Boards, whose sole object was to reduce expenditure, and has placed in charge an authority which can apply a reasonably high and uniform standard of efficiency in staffing, in school accommodation, in hygiene, in school material, in school attendance, and even in the small, but important matters of school cleaning and offices.

It is not yet possible to obtain statistics for the whole country which are up to date, but, to take a typical large county, the following figures relating to Staffordshire speak for themselves:

STAFFORDSHIRE EDUCATION COMMITTEE.

Number of Elementary Teachers:	1902	1906
Certificated	789	954
Uncertified	581	722
Average Attendance	85.5	90.9
Number of Departments in which was taught:		
Cookery	28	62
Manual Instruction or Handicraft	14	33
School Gardens	4	89

In 1902 in 79 departments in Staffordshire the principal grant was paid on the lower scale on account of some lack of efficiency; by the end of 1906 it is reduced in only one case.

Notice has been given of the intention to provide 6,575 additional places in elementary schools in this county, and steps are being taken to carry out the whole of this work as quickly as possible. In most cases the new accommodation is to replace schools which are wholly unsuitable.

Of these items, the increase in School Gardens is the only abnormal figure; the remainder are fairly typical of what has been done in ordinary progressive counties. They are far from reaching the ideal, but they mark a very real progress. They represent moreover the first fruits of a new movement whose efforts have not yet had time to reach their full effect. Of the three years during which this advance has been made, at least a year and a half had to be devoted to preliminary organization.

On the other hand the Act of 1902 has met with the most violent antagonism from the enemies of the Voluntary School system. It is urged with good reason that complete maintenance from the public funds should be accompanied by full public control, that no denomination should be allowed to have instruction in its tenets given at the public cost, and that in any parish where there is only one school, the children of the minority, who have no alternative but to attend it, are liable to suffer from a stigma attached to the exercise of the conscience clause. Nonconformist teachers moreover find it difficult to obtain engagements in Church Schools or places in training colleges of which very few are undenominational. The Church party on the other hand are not unreasonably unwilling to allow only undenominational religious instruction to be given in schools which they have built, largely at their own expense, for denominational instruction, and claim a right to have such instruction for their children.

At the moment this is written the news comes that the negotiations for a compromise over the Bill of 1906 have broken down. That measure aimed at complete popular control of the school, and the abolition of tests for teachers. The provisions to secure freedom for religious instruction were extremely complicated and teachers were forbidden to give denominational instruction, even if they desired to do so. A long controversy is evidently before us, in which very little will be heard of true education. The more simple the ultimate measure is, the more permanent is the settlement likely to be. But the general feeling of the country is against a secular solution.

Probably the large bulk of the people, apart from the Roman Catholics, would be quite ready to accept religious instruction under the Cowper-Temple clause. Meanwhile there is among politicians a growing weariness of the whole squabble, and among enthusiasts for education an entire distrust for politicians as educational reformers.

Training of Elementary Teachers.— In England and Wales the reform probably most needed is to improve the general education and the professional training of teachers in elementary schools. Out of 165,000 teachers employed in 1904–5, only 78,000 were fully certificated, and of these less than 43,000 had been to a training college. Of the residential training colleges in 1905, four-fifths were denominational, but this does not apply to the day training colleges. The total number of teachers in training was only 7,522. Pressure is being brought to bear on local authorities to improve their staffing, and to provide more training accommodation. Perhaps, however, the best work done as yet has been in laying the foundation of this reform by re-organizing the education of pupil teachers. Formerly a child in an elementary school was allowed to act as probationer, then became a pupil teacher in the same school, receiving instruction before and after ordinary school hours from the head teacher only. The pupil teacher then passed or failed to pass, examinations for which it was difficult to obtain any special preparation. The teacher so trained might then well spend the rest of his or her life in the same school. The board now refuses to recognize pupil teachers under 16 (in rural districts 15, with a three years' apprenticeship), requires at least half time attendance (where it is possible) during the apprenticeship of two years at a centre, which in most cases forms part of a secondary school. Previous attendance at a secondary school is encouraged as far as possible, and all the larger authorities are giving special scholarships for this purpose. The barrier between elementary and secondary schools is thus being broken down to an unhoped for extent, and pupil teachers so educated will be better able and far more likely to go on to the training colleges. Of 140,216 adult teachers in public elementary schools in 1905, 33,855 or 24 per cent were men.

English Secondary Education.— The best defence of English secondary schools at any rate during the past century, is that they have successfully educated a large number of men of high character and ability who have served the nation well in political and administrative life, not only in England, but all over the world. There was, however, till quite recently, nothing that could be called a system. Each school utilized or abused its endowments and its opportunities, and the abuses were very slowly revealed by the inquiry of royal commissions, and still more slowly corrected. Although inquiries began in 1818 under Brougham, it was only in the "sixties" that the reports of the commissions on the great "Public Schools" (nine in number) and on the endowed schools led to two acts of reform, the Public Schools and the Endowed Schools Acts, and under these most of the abuses of endowments have been brought to an end.

But in the leading English "Public Schools" (*i. e.* the leading secondary schools for boys, and principally for boarders), a considerable measure of reform had come in early days from within. The twin names of Arnold and Rugby are best known, but the Rugby reform was in part inspired by Winchester, and great names are not wanting to Eton and Harrow which with the many glaring defects they possessed at that period were relatively efficient. From Arnold and his successors, Temple and Percival, influence radiated and few schools failed to become different, whether by attraction or repulsion. Thring at Uppingham, Vaughan at Harrow, Cotton and Bradley at Marlborough, Bradby at Haileybury, were mighty instruments in "changing the face of education all through the public schools of England."

Not only have science and modern languages been introduced, as well as opportunities for the arts and manual instruction, but the teaching of Greek and Latin has to a great extent been remodelled. Physical development, which was always encouraged in those schools by games, has been pushed to a degree which now makes against intellectual interests. Nearly all the so-called first grade schools are boarding schools, and consequently the corporate life gives far greater scope to the influence of masters and of boys, and thus to education in the widest sense, than is possible in day schools. For good or evil, the effects are more marked, and on the credit side must be set that independence and self reliance which the best schools produce. On the other hand over-organization and "spoon-feeding" seem at the present time to be a real danger.

The first chief influence of modern science on the schools' curricula came from a separate government department founded in 1836 as a school of design. In 1853 this was reconstituted as the Department of Science and Art, largely by the influence of Prince Albert, and partly as a consequence of the first international exhibition held in London in 1851. This department began to hold examinations and make grants for teaching of science and art, and ultimately extended its subsidies to schools recognized by it as "Organized Science Schools," in which regular courses of instruction in science were given. In 1900 the new Board of Education absorbed the Department of Science and Art, and also the Education Department dealing with elementary schools. It thus became the sole central authority, and in 1901 began to give grants to approved secondary day schools with regular courses. It has also in connection with these grants developed a very full and valuable system of inspection conducted by its own staff. In 1902, as already mentioned, the county and country boroughs became education authorities, the minor localities possessing only concurrent jurisdiction with the counties in higher education. Since 1902 these authorities almost without exception have made considerable annual grants to the secondary schools in their areas, and a marked improvement is already visible in the efficiency of the schools, and the length of attendance of the pupils. These grants of course are given almost entirely to the smaller schools. The endowments and fees of the first grade "Public Schools" render them independent of such assistance and consequently of the Board of Education.

But if there has been great development in boys' schools, what is to be said of the education of girls? With the awakening of the middle of the century to the defects of the teaching of girls, came the establishment of numerous high schools, and were it not from the lack of endowments, and the relics of a tradition against spending much on girls' education, their secondary schools in receipt of State and local grants would soon be as numerous and fully as efficient as those for boys.

Mixed Schools.— There has been a certain amount of experiment in this direction, and prejudice has to a large extent been dispelled, but on the whole the best English opinion seems inclined to the view that, other things being equal, it is preferable to educate girls and boys in separate schools. There are, however, many places unable to support two separate schools, and in these co-education is being tried with some success. But there is no likelihood of its ever being tried in the older public schools, where the school age does not end before 18 or 19, and this precedent will probably always militate against it in smaller schools.

Curriculum of Secondary Schools.— So far as boys' schools are concerned, not very much liberty is really left to initiate startling reforms. Pupils are prepared for the universities, for civil service, or for army and professional examinations, and it is these which really prescribe the subjects. In addition to the actual university courses most of the universities have followed the example of Oxford and Cambridge in establishing "Local Examinations" and the "Examinations of the Joint Board" for the benefit of pupils still at school. These tests, especially when joined with inspection, have done most valuable service. The chief difficulty, however, is that there is no correlation of these examining bodies, and there are no definite principles upon which they are agreed, more especially with regard to the examinations to qualify for admission to professions.

Other Secondary and Technical Education.— The Science and Art Department, already mentioned, held various examinations and gave grants to classes and prizes to pupils. But it was the Technical Instruction Act of 1889, and still more the Local Taxation (Customs and Excise) Act of 1890 which encouraged local authorities to spend money on so-called "technical" subjects. The list of these subjects finally included, I believe, everything secondary except the classics. Even Shakespeare is said to have been taught under the head of "Commercial English." These powers brought the councils of counties and boroughs and urban districts into the field as education authorities, and in addition to their grants to secondary schools and their scholarship schemes, they did much to prepare for their future work in secondary education proper. The chief effect of the limitation to "technical" instruction was to encourage the teaching of science subjects, which had never before received proper recognition. This limitation to "technical" instruction was entirely swept away in 1902, when the local authorities received power to administer all higher education as well as elementary. In the last 15 years a large number of "Institutes," "Schools of Art," and "Technical Schools" have been built or enlarged. Marked progress has been made in the education of those persons who during the day are engaged in trades and professions. The quality and scope of the teaching have been considerably improved, and the chief need at present is to secure the attendance of lads and girls who are leaving the elementary schools and to induce them to complete well-arranged courses of not less than three or four years' duration.

Board of Education.— Much of this progress both in elementary and secondary education is undoubtedly due to the increased enlightenment and energy of the Board since its re-organization and above all to the present permanent secretary, Mr. R. L. Morant, who was specially promoted to this post in 1903, and has shown himself to be in the first rank of educational administrators. Not only have the different departments been re-arranged on wise and appropriate lines, but the whole of the codes and regulations have been entirely rewritten from an educational standpoint. A Board of Education Library was started in 1895 under the charge of a director of special inquiries. The series of invaluable special reports issued by Dr. M. E. Sadler, and his successor Dr. Heath, have been of first rate importance, not only to British education, but to students all over the world.

English Universities may perhaps most conveniently be divided into two classes, the old and the new. In no branch of education has there been a more rapid or startling development than here. In 1826 there were only Oxford and Cambridge, the traces of whose origin are lost in the early Middle Ages. In 1906 no less than six new universities enjoy a prosperous existence, while there are other university colleges which may hereafter develop into universities themselves.

The New.— Manchester, Liverpool and Leeds, federated in 1880 as Victoria University, have recently acquired separate charters. Birmingham, established in 1880 as Mason College, became a university in 1900. Durham, founded in 1832, has been constituted more on the lines of Oxford and Cambridge, except for its association with the college at Newcastle. London, which received its first charter in 1836, was afterward for many years merely an examining body, but at last in 1898 received a new constitution enabling it to embrace all the chief institutions for higher teaching situated in and near the capital, and to distinguish between its internal (or taught) and external (or merely examined) students. It is difficult to do justice to the splendid energy and the magnificent generosity which has founded and worked most of these institutions — qualities which can be more easily paralleled among the universities of America. These institutions are new, they are efficient, they do well a work which needed doing. But as the object of educational study, they are less interesting than the universities of Oxford and Cambridge.

The Old.— It would be hard to explain to a stranger the way in which Oxford and Cambridge have in the past entered into the life of the whole country, attracting to themselves not only the sons of men of rank, position and leisure, but also poor and able lads likely hereafter to make their way both at home and in the world at large. It is probable that no Cabinet will ever again be composed almost exclusively of men drawn from these two universities, but it is equally improbable that any Cabinet will ever lack them altogether. Oxford and Cambridge supply a very large part of that executive civil service to which England owes so much, and of which so little is heard. In nearly every country parish the squire and the parson can still exchange reminiscences of a university common to them both, for in the past the size of the country and of the population rendered it possible for two universities to gather together, widely speaking, the representatives of the governing and teaching classes. If these young men did not always get much learning, at least they grew from boyhood to manhood in an atmosphere of discipline and among their equals. The influence moreover of the beautiful buildings set in an environment of groves and lawns and quiet streams, and the association of national history and literature, were a factor in their education which nothing else could supply. Oxford "as she lies in the moonlight, spreading from her towers the enchantments of the Middle Ages," and Cambridge, her equal and rival, have an influence still reaching deep and wide into the character of the nation.

It must not, however, be supposed that cautious reforms have not adapted these universities to the changing needs of the time. By the beginning of the 19th century examinations were instituted, the best of which have probably done the work possible to examinations as well as it has ever been done. Royal commissions in the middle of the century, and again in 1877 led to the revision of the mediæval statutes and to the abolition of many obsolete restrictions and privileges. All religious tests were finally abolished in 1873. The time has perhaps come round for a new inquiry, but the particular methods of teaching by lectures and by tutorial work are carried out with a thoroughness and care which it would be difficult to surpass. In the past 50 years nine distinct new courses have been added to the curricula both for Oxford and Cambridge graduation, besides new subjects for which diplomas are granted. Museums and libraries, laboratories, institutes and workshops have been freely erected, and only a lack of money prevents further developments. For it is a curious feature of their constitution that in both places eight-ninths of the property belongs to the individual colleges in which the men reside and one-ninth only to the universities themselves.

The Rhodes Bequest.— The most striking departure of recent years has, however, been due to a son of Oriel College, Cecil Rhodes, who bequeathed an income of some $170,000 a year to be given in 60 scholarships to the Colonies, 102 to the United States, and 15 to Germany, all tenable only at Oxford. The result of this policy it is premature to forecast, but the experiment so far has met with success. Oxford has welcomed the scholars, and they have at once found their feet and seem cordially to recognize the distinctive character of the benefits which the university has to offer without being blind to its limitations.

University Extension.— Besides the direct work of the universities, old and new, notice should be taken of their pioneer efforts in developing education by means of lectures. This has proved specially valuable in the development of some half dozen university colleges, of which Reading is the most conspicuous example.

Higher Education of Women.— The education of women has met with many difficulties in England, but except for the refusal of degrees at Oxford and Cambridge, practically all desired privileges are now everywhere open to them. In the newer colleges and universities they are received on the same terms as men, except in certain medical courses. In Cambridge they have two colleges, in Oxford four and they are admitted to all such teaching as they require and to all examinations. Degrees alone are withheld and actual membership of the universities which would involve a share in their government.

WALES.

Introductory.— Of the four quarters of the United Kingdom, Wales has made the most rapid progress. In the middle of the 19th century her elementary education had probably the worst equipment; her secondary schools were inadequate and inefficient; while in higher education she possessed only the recent foundation of Lampeter, which was then little more than a theological college.

Elementary.— The Welsh elementary schools have always been under the administration of the English Board, and, considering the inaccessibility of the wilder parts of the country, have made at least a proportionate progress. Nowhere has more difficulty arisen in the administration of the Education Act of 1902, and a section in the Bill of 1906 provided for the establishment of a separate Education Department for Wales. Teachers and schools probably suffered to some extent, but the future progress of Welsh education is in any case assured. Wales has the educational advantage of being a bilingual country to a greater extent even than Ireland, and this has long been fully recognized in her schools.

Secondary.— Wales, while sharing in the educational inquiries and reforms of England, made in 1889 an enormous step in advance. In that year she obtained the Welsh Intermediate Education Act, under which small joint education committees were established in all the counties and county boroughs, and by this means an admirable system of county secondary schools for boys and girls was established. In 1897 a Central Welsh board was created to provide for examination and inspection of the different schools which had been created and organized out of the rates and grants placed at the disposal of the joint education committees. Of these county schools, 93 obtained a grant in 1905.

Universities.— In university teaching Wales in a single generation has rivalled the provision of Scotland. A training college was founded in 1862, and the first university college at Aberystwyth in 1872. In 1883-4 university colleges were established at Cardiff and Bangor, and the annual grant they received from Government was before long extended to Aberystwyth. In 1893 they were incorporated in the University of Wales, which has since been extended so as to include Lampeter, which, however, has the power of giving separate degrees. Women have been admitted from the beginning to the Welsh university colleges and the university.

SCOTLAND.

Preliminary.— A love of education is in the blood of the Scot. He will get his education and profit by it, and he will utilize any existing means to this end. This is the history of education in Scotland, and accounts for the virtues and most of the defects in the Scottish system. In the old days the elementary school led direct to the universities, and the universities were hampered by doing the work of secondary schools. On the other hand there were few boys of ability and character who could not get the best education in the country, and the sacrifices they made had a large share in the success so many of them ultimately achieved. To-day the path is easier, the opportunities greater, and the instruction has progressed with the times.

Elementary.—John Knox laid down a scheme for the establishment of a grammar school in every town, but most of the funds intended for the endowment passed into other hands. In 1696, however, a system of schools was established by statute, the landowners being bound to provide a school-house, and a salary for the teacher, in every parish. The salary was small, and the exceptions numerous, but a rate-aided system was actually organized, and owing to the cheapness of the university system, and the frugality of the country, much excellent work was done. The conditions of the teacher and the method of his appointment were gradually improved by statute, though no State aid was forthcoming till 1833. The first Parliamentary Grants for elementary education applied equally to Scotland, which was under the English Board of Education until 1872. In that year the first education act for Scotland was passed. In spite of the multiplicity of her religious denominations, Scotland was ready to accept a universal system of school boards, who were left entirely free to teach what religious formulæ they pleased in their schools. Compulsory attendance between five and thirteen was enforced throughout the country under a maximum penalty amounting to as much as five dollars, a sum not reached in England until 1900. A special committee for education for Scotland was now created, which in 1885 was given a separate secretary.

In a general sketch it is impossible to point out the numerous small differences between the Scottish and English systems. Scotland was earliest to escape from the revised code and payments by results, uniform curricula and mechanical inspection; first to provide special treatment for blind and deaf children; first to secure free education, and to improve her physical training. A Scot may be pardoned if he sums up the main results by saying that the outlook is generally more from the education standpoint, the teacher more fervid and better educated, and the children more eager for knowledge. The religious difficulty has been entirely avoided, and that in the chief home of religious controversy. A mention should be made of the celebrated Dick bequest which in the northern counties has done much to improve the quality of the teaching by subsidies to better qualified teachers. This also has materially assisted children from elementary schools ultimately to fit themselves for a university education. A bill to introduce certain reforms into the organization of the system and increase the powers of the school boards, has twice been introduced into Parliament, but has not yet been passed, though Scotch members now appear fairly agreed on its merits.

Secondary and Higher Education.— In spite of Knox's comparative failure there were burgh schools and academies established in nearly all the burghs by 1866, and the existing endowments, though capable of better use, had never been greatly abused or misappropriated. A leaving certificate has been organized with much success by the Education Department, which holds the necessary examinations, as well as inspecting higher class schools.

The science and art teaching formerly conducted under the auspices of South Kensington was in 1897 transferred to the charge of the Scotch Education Department. Technical Instruction in the United Kingdom may be said to have had its rise at Glasgow in Anderson's Institute, but the cheapness of the universities and greater facilities for general education has always prevented much specialization on purely technical subjects.

Universities.—In no respect has Scotland fared better than in the number and accessibility of her universities. Saint Andrews (1411) with three colleges, Glasgow (1450), Aberdeen (1494) with two colleges, and Edinburgh (1582) afforded every opportunity that the poorest student could wish. It was necessary to attend lectures, but there was no residence in college, and the long summer vacations were used by poor students to earn their fees for the winter. The chief reforms which have been carried have been to raise the minimum requirements for graduation, to make fees uniform, to admit women, to provide adequate buildings, and to endow new subjects of instruction. The greatest liberality has been shown in providing funds for the last two of these purposes, and the universities are now well housed and well staffed. Mr. Andrew Carnegie has given $10,000,000, the income of which is to be spent equally between the endowment of certain branches of study and research, and paying the fees of poor students. The latter half of the bequest seems unlikely to benefit the character of a class which would formerly have found such assistance unnecessary, but the value of the portion applied to the endowment it would be difficult to exaggerate.

IRELAND.

Introductory.—In Ireland the state of education has been most deplorable, and is still far behind the rest of the kingdom. This is due to poverty, to politics, and to religious bigotry. The difficulties caused by bigotry and politics when a Protestant minority was in power in the earlier half of the 19th century caused those who were responsible for elementary education to steer a cautious and ineffectual course; a different set of difficulties due to the same causes, working through the priesthood and the politicians, prevent any thorough reform to-day. And always the grinding poverty of the nation as a whole has hindered the schools and the teachers from being brought up at any given time to the standard which prevailed in English or in Scottish education.

Elementary Education.— Till the end of the 18th century Catholic schools were illegal, and existed chiefly as "Hedge Schools." Considerable funds were spent, chiefly in encouraging proselytising institutions. In 1831, however, the present system administered by the Board of Commissioners of National Education in Ireland was introduced, and has continued without any sweeping changes to this day. These schools are supported almost entirely by Government Grants, and are placed each under a patron, who appoints a local manager. There is no rate raised for elementary education, the whole grant coming from Imperial funds. All schools are open nominally to all denominations, and religious instruction must be given separately, but practically all but a very small proportion of the schools are attended solely by Catholics or by Protestants respectively. Compulsory attendance is still extremely limited in its scope, and the percentage of average attendance in 1904 was only 65.7 throughout the country, as against 85.98 for Scotland and 85.70 in England and Wales. The standard of school accommodation is very low, and an amount of discomfort and squalor exists in the elementary schools which it would have been impossible to find anywhere in England for many years past. Thus in 1904, one thousand schools stood in need of having out-offices provided. The number of teachers who had been trained was 7,210, as against 5,071 untrained, or 58.7 per cent. The quality of the less capable teachers, however, compares very unfavorably with the standard in England.

The most hopeful feature in Irish education in recent years has been the establishment of the Department of Agriculture and Technical Instruction, created in 1899, which, beside administering technical instruction, has acted as the adviser of the National Commissioners with regard to teaching agriculture and elementary science in the elementary schools, and in enabling the teachers to obtain instruction in these and kindred subjects. The report of the Belmore Commission, in 1898, showed the most deplorable backwardness in all modern developments of primary instruction. Progress *is* being made, though it will naturally take years to overcome the neglect and ignorance of ages, and it is to be hoped that the managers of the schools will co-operate with the teachers and the central board, and that a healthy feeling as to school attendance will gradually spread throughout the country.

Secondary Education.— The chief agent in secondary education in Ireland, apart from the board which administers the endowments, and before the establishment of the Technical Instruction Board, has been the Commissioners of Intermediate Education. In 1878 this board was founded and endowed with five million dollars from the funds of the disestablished Church of Ireland. In 1890, $250,000 a year were added to this income. The money, however, has been awarded on the results of examinations, and before the system was reorganized in 1902 the whole scheme was one of payment-by-results run mad. The reform is still far from satisfactory, but a change at any rate has been made in the right direction. The Technical Instruction Board is, however, doing most admirable work and is being well seconded by the county councils.

University Education.— The Elizabethan foundation of the University of Dublin and Trinity College, which practically form one body, has throughout its career had a marked success as a Protestant university on the lines of Oxford and Cambridge. Tests were abolished to a great extent in 1793, and finally in 1873, but the Catholics have never as a body accepted Trinity as a national institution. The three Queen's colleges, founded in 1845, have had even less success in this respect, and the Queen's University, in which they were amalgamated, was replaced in 1879 by the Royal University of Ireland, which is in itself merely an examining body. At the same time it is true that the fellowships of the Royal University are used practically as a means of endowing the Catholic University College in Dublin, as well as the Queen's colleges. The question of establishing and endowing a Catholic university or of creating a National university, of which Trinity College should or should not form an integral part, has been debated again and again. Catholics refuse to be content with less than a Catholic university; English Liberals and Nonconformists cannot see their way to spend public money on endowing a denominational institution. It is difficult to see how this deadlock can be overcome under existing conditions, but in the meantime the country is suffering severely.

Higher Education of Women.—Women have been admitted to the examinations and degrees of the Royal University from its foundation, and have since been allowed to attend the lectures of the Queen's colleges. For a long time Trinity College and the University of Dublin would not admit them either to lectures, examinations, or degrees. The examinations were conceded first, the lectures followed; and now women who have been at Oxford and Cambridge, and require a degree for teaching or other purposes, obtain it freely at Dublin, which thus drives a flourishing business at the expense of its less progressive rivals.

Director of Education to the Staffordshire County Council: Author of 'Educational Systems,' 'The Life of R. L. Stevenson.'

31 (b). Great Britain — Medicine. *Registration.*— With few exceptions medical practitioners in Great Britain are registered by law. This legal recognition, and this alone, allows them to recover their charges in a court of law; to practise medicine, surgery, and midwifery under recognized titles in the United Kingdom, and (subject to local law) throughout the Empire; to hold medical appointments in the government services, in emigrant and other vessels, in asylums, hospitals, and other institutions and capacities under local authorities, and in benevolent and similar societies. This registration alone qualifies them to sign certificates of birth and death. Here is the dividing line. Unregistered medical men may practise, and they may hold appointments in hospitals entirely supported by voluntary contributions. But they cannot recover charges in courts of law; they are debarred from public appointments; they may not wilfully and falsely use the title of physician, surgeon, apothecary, doctor of medicine, or any description implying legal registration; above all, they may not sign death certificates.

Anyone may *claim to be registered* after a minimum course of five years' study on payment of $25 (£5) after passing a written and oral examination of high standard qualifying for one of the recognized diplomas, and taking out one such either in medicine, surgery, or midwifery. The qualifying examinations must be in all three subjects. There is no state examination. The lowest actual standard in England is probably that of the Society of Apothecaries, which is about equal to certain Irish and Scotch diplomas; and even this minimum is a high all-round practical test, rarely, if ever, maintained in other countries. American and other foreign and colonial graduates in medicine are usually admitted to the final examination for the diplomas of the Royal Colleges and Society of Apothecaries, on showing that they have obtained degrees from universities recognized by these boards and have passed a preliminary examination in general education equal to that required in England. Particulars may be obtained of the Secretary to the Examining Board, Examination Hall, Victoria Embankment, London, W. C.

Value of English Diplomas.—The commonest is the combined license and membership, respectively, of the Royal Colleges of Physicians and Surgeons, given after a series of examinations by a conjoint board of the two colleges. With or without this diploma or that of the Apothecaries' Society, distinction in England is obtained by taking out a degree at one of the universities, Oxford or Cambridge, London or Durham, Manchester (The Victoria), Sheffield, Liverpool, Birmingham, Leeds. The highest distinctions are the Doctorate in Medicine and Mastership in Surgery of Oxford, Cambridge, and London universities, the Membership of the Royal College of Physicians of London, and the Fellowship of the Royal College of Surgeons of England. For each of these a further examination, considerable fees and certain other evidence of professional position and training are required, beyond the original qualifying test; and the Fellowship of the Physicians' College is elective and in a high degree exclusive, with a view of maintaining the highest ideal standard, both professional and general, amongst the body of consulting physicians. *In Scotland.*—By one series of examinations held both in Glasgow and Edinburgh, a student obtains the licenses of the Royal Colleges of Physicians and Surgeons of Edinburgh and of the Faculty of Physicians and Surgeons of Glasgow. With or without this qualification, distinction is obtained by taking out a degree at one of the universities,— Saint Andrew's, Glasgow, Aberdeen, Edinburgh, — or the Fellowship of the Edinburgh Royal Colleges or Glasgow Faculty. *In Ireland.*— The Royal Colleges of Physicians and Surgeons of Dublin hold conjoint examinations for their licenses, the Apothecaries' Hall of Ireland holds a separate series of examinations, and distinction is obtained by taking out a degree at the older university of Dublin (Trinity College), or at the Royal University of Ireland, or the Fellowship of the Dublin Royal Colleges.

Professional Titles.—The relative attainments of any practitioner at the outset of his professional career may therefore be to some extent gauged by the letters after his name. University qualifications, M.B., M.D., B.Ch., (or B.C., or B.S.), M.Ch., (or M.C., or M.S.), besides the social and general education they have involved, count as a rule for more than the conjoint qualifications, M.R.C.S., L.R.C.P. in England, L.R.C.S., L.R.C.P. (Edin.), L.F.P.S. (Glasg.) in Scotland, L.R.C.P.I., L.R.C.S.I. in Ireland; and these again for more than the English and Irish apothecaries' licenses, L.S.A., L.A.H. English qualifications are commonly reckoned of a higher standard than Scotch or Irish. Besides the initials already given are those for midwifery, viz., at the Irish universities, B.A.Oh., M.A.Oh., and Irish Royal Colleges, L.M., and those for public health (Hygiene or State Medicine), and tropical medicine, viz., D.P.H. (Diplomate), D.S.Sc. (Sanitary Science), D.Hy., and B.Hy. (Hygiene), M.D. Stat. Med. (State Medicine), and D.T.M. (Diplomate). Dental degrees are independent of the medical profession. There are no degrees in other special subjects, although special subjects are allowed to be taken in the thesis or examination for certain M.D. degrees.

Councils.—The General Medical Council (address 299 Oxford St., London, W.) is constituted under Act of Parliament. It consists of 34 medical men of eminence, holding office each for five years, five nominated by the Crown with the advice of the Privy Council, 12 by the Universities, Royal Colleges and Apothecaries' Hall in England, 7 by those of Scotland, 5 by those of Ireland, and 5 by direct vote of all registered medical practitioners in the United Kingdom. There are Branch Councils for England, Scotland, and Ireland. The duties of the council are to establish and preserve the roll of registered practitioners. They have to regulate by deputed inspectors the standard of examination and other tests required for the qualifying diplomas; but direct pressure can only be exerted on examining bodies through the Privy Council. It is theirs to publish the register every year; and to hear penal cases, with a view to removing from the register the name of any man judged "guilty of infamous conduct in any professional respect." Such cases are first investigated by the Branch and then by the General Council, which is for this purpose practically a court of law, its decisions not being open, however, to revision in any other court. Infamous conduct includes "covering" or the employment of unqualified assistants; it does not include the adoption of any theory of medicine or surgery.

Professional Training.—Education for admission to the register is largely in the hands of the Universities and other examining bodies already mentioned. But in London medical education is carried out entirely in connection with the large general hospitals supported by endowment or voluntary subscriptions, included only recently and as yet only formally as constituent colleges in the remodelled London University, which, until 1900, was but an examining body. The colleges of medicine in London, 12 in number, are the schools of the following hospitals: Guy's, Saint Bartholomew's, London, Saint Thomas's, Saint Mary's, Saint George's, Middlesex, Charing Cross, Westminster — with University College and King's College, both having hospitals attached, and the London School of Medicine for Women, attached in 1877 to the Royal Free Hospital in Gray's Inn Road. These hospitals contain from 165 beds (Royal Free), to 927 beds (the London), with large out-patient departments. Most of the medical, surgical, and pathological work is carried out by students under the supervision of a visiting staff; the resident appointments are held for short periods only, by recently qualified students, who are the best men of their year and are given much responsibility and actual major surgical practice. It is this practical experience under supervision, this training by responsibility, that gives a special value to the English training, as compared for instance with that in Scotland or on the Continent. Each medical school is a separate organization, to which students look as their professional home usually from the beginning to end of their professional lives, the organization in many instances being completed by a residential college, clubs' union, athletic ground, and periodical gazette or journal. This system involves a subdivision of the otherwise unique clinical material of London; but it leads to a healthy rivalry, closer contact of students with their responsible work, and greater individual attention to their needs by the lecturers and visiting staff. An attempt is at present being made to concentrate the teaching of elementary medical studies in London *in that part of the Imperial Institute now given over to the London University;* but University College, King's College, and the larger London Schools are unlikely in the near future to curtail their own spheres of educational activity, even for the sake of an Imperial ideal in medical education. In the provinces education is conducted by university schools of medicine in connection with some large local general hospital, that of Durham University, for instance, being at Newcastle. But Oxford and Cambridge Universities, being situated in small towns, encourage their students to do their clinical work at the London hospitals. They are content with having given them as thorough and liberal an education as possible in all the medical sciences, including laboratory pathology, and they trust, by a final examination in which they can impose their own tests of efficiency, after two or three years in a London hospital, to ensure the proper development of sound professional ability from the groundwork of principles which they have laid. This mixed university and London training, a system of only 20 years' growth, is being gradually developed by Prof. Clifford Allbutt at Cambridge and Prof. Osler in succession to Sir John Burdon-Sanderson at Oxford, and is already recognized as providing an exceptionally sound education. All the other schools give an almost complete course of medical education. This, however, may be supplemented by private schools and special hospitals; and a course of instruction in infectious diseases at the large fever hospitals of the Metropolitan Asylums' Board or elsewhere is obligatory for all diplomas. It is a subject of regret to many in the present day that the old system of training by apprenticeship is dead, the law allowing no qualified practitioner to employ unqualified assistants, and the General Medical Council not reckoning any period into the requisite time of study unless spent at a medical school. After passing the examination in general knowledge, the minimum length of the course of training is five years; the average is over seven. The fees for the course of teaching, examinations and final diploma vary in general from $1,000 to $1,500 (£200 to £300).

Medical education in Scotland and Ireland is on similar lines, the extra-mural school of the Royal Colleges at Edinburgh and the Rotunda Hospital for Midwifery at Dublin having exceptional influence.

Post-graduate study is arranged for separately in each hospital; but in London a combined hospital ticket is now obtainable, from the London Post-graduate Association, Examination Hall, Victoria Embankment, London, W. C. ($42½ for 3 months, $75 for 6), giving admission to the clinical practice of the chief hospitals. Comprehensive courses of post-graduate study are well organized in London at the West London Hospital, and at the Polyclinic; special courses are arranged for at the London and Liverpool Schools of Tropical Medicine and at most of the special hospitals. Research work, and bacteriological and chemical analysis are carried out at all the above institutions, and virtually at all fever hospitals. Research and supply of vaccines and antitoxins are the sole aim of the Lister Institute of Preventive Medicine in Chelsea, with its fine farm at Elstree, Herts. Bacteriological and chemical analysis are efficiently organized as a commercial concern by the Clinical Research Association, and in certain private laboratories.

Voluntary Organization in Practice.—A considerable fraction of the best students in every year secure junior positions in their hospitals or in the medical schools attached to them, and work their way up by degrees to consulting practice, mainly with the help of their student-friends and pupils in general practice. The majority of those qualified find their way into the provinces, often after spending a few years in junior positions at London or provincial hospitals, in trips abroad as ship's surgeon or otherwise, in assistantships to practitioners; and they in most cases buy the good-will of an established practice or partnership at one to two years' purchase. In such positions they are isolated, attached by little more than sentiment and a dining club to their old hospital, officially organized only in their occasional vote for a direct representative on the General Medical Council. Voluntarily, however, they organize themselves to a considerable extent for relief and for protection, as in the British Medical Benevolent and Lancet Relief Funds, The Society for the Relief of their Widows and Orphans, the benevolent and educational work of Epsom College, and various associations for medical defence. Still more, a thorough scheme of organization has been established by the British Medical Association, with its 20,000 members, grouped systematically into geographic divisions throughout the Empire, each with its divisional council and its delegates to the Annual Representative Meeting, which recommends the policy to be carried out by the partly co-opted, partly nominated Central Council, during the ensuing year. This council works largely through committees, of which the chief are the medico-political, the ethical, and that which conducts the well-known weekly journal. Apart from the protection of professional interests, the association exercises considerable influence by memorials and deputations to government, which otherwise relies for medical advice on the Royal Society, the Royal Colleges of Physicians and Surgeons, and the few medical advisers to government departments.

Women mostly take the license of the Apothecaries' Society in England, the Scotch or Irish conjoint qualification or the degrees of the London and the other newer universities. They are debarred from the English conjoint qualification, and from the degrees of the universities of Oxford and Cambridge. They take little part in the professional organizations, and as yet they practice but little in the United Kingdom, many being trained for the mission field.

Homœopathy.—In England Homœopathy is a specialty practiced without exception by men who possess a legal qualification to practice. They receive their special training, if at all, by post-graduate lectures and resident appointments at the homœopathic hospitals. Of these there are a fine example of 100 beds in London, and 9 in the provinces. Most homœopaths belong to the British Homœopathic Society, founded in 1844, which publishes a quarterly journal. There are also two monthly journals of the cult and a new "British Homœopathic Association" of practitioners and laymen.

Medical Societies, Libraries, Journals, and the Annual Congress form a considerable bond of union. Apart from branches of the British Medical Association, there are 100 such societies in London alone and corresponding numbers in the other chief towns, many being associated with a central body in London, some for general, many for special professional objects. Societies in London mostly meet at 8 p. m. The best medical libraries in London are those of the Royal Colleges, of the Medico-Chirurgical Society, and of the British Medical Association. The chief periodicals are the 'Lancet' and 'British Medical Journal' (weekly); the 'Annals of Surgery,' 'Practitioner,' 'Journal of the Royal Army Medical Corps,' and 'Public Health' (monthly); 'Brain' and 'The Journal of Hygiene' (quarterly); annual report-volumes of the various chief London hospitals; and the annual 'Medical Register' and 'Medical Directory.' The 'Pharmacopœia' is revised from time to time and published by the General Medical Council. An opportunity for the interchange of ideas on all subjects is afforded every year by the Congress of the British Medical Association, held usually in the United Kingdom, but in 1906 in Toronto, Canada.

The Government Medical Services are each separately organized under the corresponding Government Office. The Naval Medical Service includes 520 active and 240 retired medical officers, with its chief hospital and college at Haslar, near Portsmouth; the Royal Army Medical Corps, 1,031 active and 533 retired medical officers, with the new Army Medical College opened in 1907 at Millbank, Westminster; the Indian Medical Service, 747 active and 546 retired medical officers, sharing in the Army Medical College; the Colonial Office employs in Crown colonies several hundred medical officers, who do not hold commissions, but undergo extra training at the School of Tropical Medicine; and the Foreign Office has also a staff of medical men in its service abroad.

Under the Local Government Board, for purposes of *the poor law*, district and workhouse medical officers and public vaccinators are appointed in every parish and union for the most part in conjunction with their general practice, usually in return for very small salaries, to attend to paupers in need of medical attention. The workhouse infirmaries in the large cities are of great size and importance. Under the Local Government Board, too, is organized *the sanitary medical service*. The head of this service is the political President, advised by his medical officer, and by his legal adviser, with the assistance of a staff of legal secretaries and engineering and medical inspectors of the highest experience and ability. Local Government throughout the country is in the hands of borough and district councils, each of whom has a sanitary inspector and a medical officer of health, and many of whom maintain isolation hospitals for cases of infectious disease. Powers of supervision are given to County Councils, who, with the advice of County Medical Officers of Health, may report default of District Councils to the Local Government Board. The chain of authority is therefore through the lay authorities, each advised by its medical officer. Some of these sanitary appointments are of little pecuniary value; others of considerable value, demanding the whole attention of the holders; and they are increasing markedly in number, value, and importance. In practice the sanitary service largely depends on the unofficial Royal Sanitary Institute with its annual congress and monthly journal, its courses of instruction, its examinations and its diplomas for school teachers and sanitary inspectors, a body of non-medical men who are the foundation of British sanitary administration. Among other government appointments are those of police surgeon, prison surgeon, factories' surgeon, and inspector of factories and workshops under the Home Office, those of Medical Officer to Schools under County Councils and the Education Office; those to lunatic asylums and fever hospitals under the Metropolitan Asylums' Board and other local authorities.

With these offices and work for insurance and friendly societies, sick-clubs and private nursing homes, the practitioner ekes out his slender earnings.

The numbers on the British Medical Register in 1906 were roughly as follows: London, 6,400; Provincial England, 17,000; Wales, 1,200; Scotland, 3,800; Ireland, 2,700; Foreign and Colonial, 4,700; Naval, Military, and Indian Services, 3,200. Total, 39,000.

Francis Fremantle,
Herts County Medical Officer of Health.

31 (c). Great Britain—Engineering. Engineering as a profession is only partially organized in Great Britain. To understand the present state of development a brief historical statement is necessary.

Historical.— On the military side engineering is and has been thoroughly organized. Fortification and the art of constructing defences are probably as old as society. The Babylonians, Greeks, and Romans showed skill and originality in design and construction which has nowhere been surpassed. From the introduction of the catapult, ballista, and other engines of war amongst the Greeks and Romans mechanical skill likewise received wide and steady development.

Into Great Britain engineering was probably first introduced by the Roman invasion and then languished until William the Conqueror brought with him a large body of engineers.

As gunpowder, cannon, and later muskets replaced catapult, arquebus and crossbow, mechanical skill and ingenuity made steady advance until at the present day the manufacture of war implements and their invention and design have passed to a considerable extent into the hands of civilians. Military engineers are organized as the Corps of Royal Engineers with their headquarters at Chatham, although it has recently been proposed to remove them elsewhere.

The Artillery is organized in several corps, according as service in the fortress, field, mounted, or on foot, is required. Knowledge and training in a specialized branch of engineering is needed for these services.

Guns and military equipment are manufactured at the Royal Arsenal at Woolwich and at the Royal Small Arms Factories at Enfield and Birmingham, under Army control, and in various factories belonging to civilian firms.

In the Navy engineers have steadily increased in importance as the construction of ships and their working depended more and more upon machinery until under the recently modified regulations it has been arranged that all naval officers whether navigating, gunnery, torpedo, or engineering shall for the first years of their training be educated together, specialization being left to the later years of their course. Engineer officers will therefore rank with other officers of equal standing and be capable of executive command.

On the Civil Side.— The foundation of English Civil Engineering may be said to have been laid by Smeaton (1724–1792). He was the son of an attorney, became a philosophical instrument maker, and subsequently devoted his attention to a study of windmills, canals (for which he made a tour of the low countries in 1754), and lighthouses. He reconstructed the Eddystone Lighthouse in 1756. He was therefore "much consulted in regard to engineering projects, including river navigation, the drainage of the Fens, design of harbors, and the repair and construction of bridges."

Smeaton founded in 1771 the "Society of Civil Engineers," the members of which dined together once a month during the parliamentary session and discussed subjects of professional interest. It still exists under the name of "The Smeatonian Society of Civil Engineers." No records of its discussions have been kept nor published but its foundation shows the earliest step in the direction of organizing the non-military engineers into a profession in Great Britain.

Partly contemporary with Smeaton was James Watt (1735 to 1829). He was trained as a mathematical instrument maker, but was prevented from practicing by the trade as not being fully qualified, and therefore he was granted three rooms in the University of Glasgow where he carried on experiments resulting in the creation of the modern steam engine out of the crude pumps of the Marquis of Worcester, Newcomen, Cawley, and Savory. His improvements demanded for their perfect fulfillment mechanical skill and workmanship far in advance of the work of the millwrights of his earlier youth. Out of the millwright he therefore created the manufacturing engineer, and did for the *mechanical* side of the profession what Smeaton had done for the *constructive* side, and like Smeaton on the constructive side Watt on the mechanical side was consulted as an authority of the first rank on all important matters.

Watt moreover had, about 1767–1770, a large practice as a constructive engineer and surveyor, and prepared plans for a number of canals and harbors, chiefly in Scotland.

As manufactures increased, partly owing to the impetus given to them by Watt's inventions, partly as a result of the industrial development at the termination of the Napoleonic wars, the improvement of means of communication and greater rapidity of transit became of first class importance, and as the roads throughout Great Britain were at the end of the 18th century in an execrable condition we find attention more and more concentrated upon the construction of inland canals and new and improved roads.

The man who more than any other aided in this improvement was Thomas Telford (1757–1834), the son of a Dumfriesshire shepherd and in early life trained as a stone mason. After the construction of a house for the Commissioner of Portsmouth Dockyard he became Surveyor of Public Works for Shropshire and constructed a bridge over the Severn at Montford in 1792. The construction of the Elsemere canal in 1793 lead to his being employed in the construction of most of the chief canals in Great Britain, from the Caledonian in 1804 to the Birmingham and Liverpool junction in 1825 as well as the Gotha canal in Sweden in 1810. He constructed and perfected most of the main roads in Scotland, the North of England, and Wales, involving the erection of the Menai and Conway bridges, besides numerous others of less magnitude. He also made many continental roads in Austria, and was also employed in harbor construction.

He lived a bachelor in London at the Salopian Coffee House, afterward the Ship Restaurant, and two years after the establishment of the Institution of Civil Engineers in 1818 he was elected president for life. The meetings were thereafter held in the Ship Restaurant, whither the institution removed from the Kendal Coffee House in Fleet street, its earliest home.

Meanwhile, mechanical road traction, steam barge, and ship propulsion had advanced with the advance of the steam engine and with George Stephenson's triumph at Rainhill in 1829, railway construction had commenced and was fast monopolizing attention as the most efficient and rapid means of communication. The names of Brunel, Clarke Russell, Whitworth and a host of others claim recognition in the rapid advance of engineering both at sea and on land which now followed, but enough has been said to enable a grasp of the rise of the profession and the lines of its gradual development to be realized.

The progress in organization of the profession which has since taken place has been due firstly to the commanding position in the profession attained by the Institution of Civil Engineers and secondly to the development and organization of engineering scientific education which has taken place in the Technical and University Colleges and Universities throughout the kingdom.

Institution of Civil Engineers.— This institution founded, as already said, in 1818, obtained a Royal Charter of Incorporation in 1828, its objects being — as described by Tredgold in a statement prepared for the Council in applying for a Charter — "For the general advancement of mechanical science, and more particularly for promoting the acquisition of that species of knowledge which constitutes the profession of a civil engineer, being the art of directing the great sources of power in Nature for the use and convenience of man as the means of production and of traffic in states both for internal and external trade as applied in the construction of roads, bridges, aqueducts, canals, river navigation, and docks for internal intercourse and exchange, and in the construction of ports, harbors, moles, breakwaters and lighthouses, and in the art of navigation by artificial power for the purposes of commerce, and in the construction and adaptation of machinery and in the drainage of cities and towns."

This is the earliest definition of civil engineering and the profession of the civil engineer therefore embraces all non-military engineers who are laboring to "direct the great sources of power in Nature to the use and convenience of man" whatever be the special corner of this wide field of operations to which any individual member may be devoting himself.

During the earlier years of the institution's corporate existence the enormous development in the construction of railways, roads, harbors, docks, drainage, and waterworks lead to the not unnatural predominance of discussion on questions of special moment to these branches of the profession in the institution proceedings. The Council was consequently largely recruited from the men of eminence on the predominating side and the civil engineer became in public estimation more and more exclusively identified with the designer and constructor of such works.

With the rapid improvements which have since taken place in machinery and machine processes and with the revolution which has been effected in commerce and in the requirements and mode of life of the people, by the less prominent but equally remarkable achievements of such men as Stephenson, Armstrong, Whitworth, Bessemer, and Siemens, the demands for a greater outlet for the discussion of the mechanical problems of interest on this side of the profession of the civil engineer became more and more insistent and the opportunities available in the existing institution being by many felt to be inadequate, the Institution of Mechanical Engineers was founded in 1847 and was constituted in 1878 as a registered association under the Companies Acts.

With the discovery of the means of practically utilizing electricity for producing light and transmitting power and the consequent extension of its use in all departments of mechanical work a third development took place in 1889, when the Society of Telegraph-Engineers and Electricians which had been incorporated under the Companies Acts in 1883 and from its establishment in 1871 had until 1881 been called the Society of Telegraph Engineers again changed its name to the Institution of Electrical Engineers. Various other societies and institutions have been formed at various dates amongst which may be mentioned the Civil and Mechanical Engineers' Society, the name of which the membership is confined to junior founded on a misconception, the Society of Engineers, and the Institution of Junior Engineers, a very active and progressive institution of which the membership is confined to Junior members of the profession.

The Institution of Civil Engineers is thus the parent institution, embracing by its constitution and membership all branches of the profession demanding for entry to its roll (a) practical professional training in works or as an assistant to an engineer; (b) theoretical training as evidenced by the passing of its own examinations held twice a year or by the holding of the degree or diploma of a recognized university or technical college; (c) suitable and strictly defined qualifications for each of its classes of membership or studentship.

It is recognized as the leading professional body and membership of its Council and occupation of its presidential chair to which there is annual election are the most valued of professional distinctions. It can to a certain extent guide and control professional conduct within its own membership but does so with an all-too-sparing hand. To many it appears that the time is ripe for further extension of professional organization and for the application of stricter discipline in regard to what may be called, generally, professional etiquette, and it is the Institution of Civil Engineers which alone has the constitution and prestige which would enable it to successfully deal with such a development.

Beside this great leading institution are the Institution of Mechanical Engineers and the Institution of Electrical Engineers, each representing one branch of the profession only, and demanding professional but not examination qualifications for membership. Most of the members of each of these belong also to the premier institution.

To complete the organization of the profession much remains to be done. There is as yet no state registration enabling the assumption of the name civil engineer (embracing, as has been shown above, engineers of all branches) by unqualified and untrained persons, to be checked and fees and professional conduct to be regulated by a governing body, such as the Institution of Civil Engineers, with the help of the other professional institutions, might organize if they had the necessary statutory powers. The public thus lack the protection to which they are entitled against the employment of unqualified advisers whom they have no sure means of distinguishing from competent engineers. One difficulty in the way of this necessary step being taken would probably be removed if the popular misconception of the functions of a civil engineer were eradicated.

This perhaps is more strongly the case in the United Kingdom than elsewhere, for there it has been the custom, where work involving machinery or engineering construction of any magnitude was required by those who were not themselves engineers, to obtain advice as to the best way to obtain the ends in view, and the best engineering designs to employ, from leading members of the appropriate branch of the profession practicing as consultants. There has thus grown up a body of engineers whose function is to give this advice and draw up the instructions upon which tenders can be obtained from engineers who undertake the construction of the works or machinery involved. Much misconception has arisen in America and elsewhere as to the foundation and value of this method. The consultant is in a position of trust between his non-engineering client and the manufacturer. By clearly defining the requirements of his client, after investigating all the conditions of the problem, he enables competing contractors to estimate their prices upon a fair and uniform basis. On the one hand his duty is to see that his client obtains the best installation and that which most satisfactorily fulfills the conditions of the problem on reasonable terms; on the other he sees that no competing manufacturing or contracting firm is unfairly handicapped by a misunderstanding of the problem and by the unfair competition of a rival. Further, his duty is to see that the chosen contractor is not unfairly dealt with owing to the ignorance of engineering possibilities or limitations on the part of his client.

In this capacity, as arbitrator and adviser, the highest qualifications of judgment, independence, integrity, and justice are required of the engineer, and it is of the highest importance that the ranks should be kept purged of any who may usurp these functions without the necessary qualifications and bring discredit upon the profession as a whole. Here statutory powers of control and regulation by a professional body are pre-eminently needed.

Educational Organization.— On this question a brief word must suffice. Engineering schools were first established in London at King's College and University College in the first half of the 19th century. These have been followed by the establishment of other schools in the provinces and in London until a large number now exist in which the scientific bases of engineering are taught in an organized course lasting in general for three years. During that course Engineering Laboratory training at most schools occupies a large portion of the time. Experimental determinations of the efficiencies of various machines and prime movers working under varying conditions, the strength and properties of materials, flow of liquids, etc., are undertaken by the students, and the underlying scientific laws deduced and exemplified.

In some schools engineering manufacturing processes are also taught and workshop training undertaken, but in the United Kingdom it has generally been held that this branch of training is best obtained in the factories of manufacturing firms, and this is the method advocated by the Institution of Civil Engineers.

The University of London has an Engineering Faculty and grants degrees in Science (Engineering), and the University of Cambridge has a Mechanical Science tripos as an avenue to its degrees in arts.

The provincial universities all grant degrees in science on the engineering side. Dublin and Liverpool alone grant a degree in engineering.

The principle upon which such "engineering" as distinct from "science" degrees are generally held to be unsound in Great Britain is that the practical, which is an essential portion of an engineer's training, can not be rightly regulated or judged by an academic body. A professional body such as the Institution of Civil Engineers is alone competent to co-ordinate the two portions of the professional education.

David Sing Capper,
Professor of Engineering, King's College, London; Appointed Teacher in Civil and Mechanical Engineering, University of London.

32. Great Britain — English Society. This paper does not purpose to deal with the history of society in England, or to compare the customs, clothes, and conventions of different centuries;— still less to compile personal anecdotes and present sketches of various social celebrities. To do any of these things adequately would fill a volume. The article therefore merely attempts to give an impression of English society as it exists in the year 1906, and some account of its chief characteristics, influences, and pursuits.

Society in England is very difficult of definition. There are no rules of admission, no graded qualifications, no inevitable exclusions. It is not essential to be well born, or rich — it is not necessary to be refined or clever. The enclosure is a very large one and there are many entrances and many tickets of admission. Certainly the fame of its easy hospitality attracts undesirables from all over the world, and people, who in spite of their vast wealth, have proved too stupid or too vulgar for Paris and Rome, often find a happy home in London; but it is to the credit of society in England that it tries to be appreciative and will always welcome anyone who can amuse or interest or stir it — brains, talent, fame, are keys which unlock every gate, and this hospitality, combined with certain national characteristics, helps to make social life in England, notwithstanding its obvious faults, on the whole vital and interesting.

A clever German woman said once that in her own country she would rather belong to the middle-class, for it contained almost all the people with brains and talent, but that in England there was only one thing to do if you wished to pass your life among interesting people — and that was to get into society. She should have added, from her point of view, that unless she had been gifted with certain qualities, she might have been born a member of one of the greatest families, without attaining this result. Mere rank or birth is not enough — both undoubtedly help, but it is no use being born within the enclosure unless you are able to walk about in it.

Unlike the custom of many foreign capitals it is not really necessary to be received at Court before admittance, nor on the other hand is the presentation to the King and Queen a sufficient introduction. The presentation is an honor but not a necessity, and except in rare cases, where the reception at court practically intimates to society that some scandal is to be ignored or condoned, carries with it, so far as England is concerned, no social privileges. The influence of the Court is, however, very considerable and confers a certain social position even though it cannot always secure admittance into some coveted circles. For in a sense it may be said that the Royal family is apart, having a circle round it drawn from society, but not itself forming a part of the general throng.

Roughly speaking, English society has always concerned itself with Government and with politics, from the days when the great nobles of the State took sides and fought for rival Kings, to the present time, when the sons of great houses join one or other political party, and when to be a prominent politician is to be a prominent social figure.

In the nearer past, society was divided into hostile camps, following the cleavage of party. Whigs met, talked, played, and danced with other Whigs; Tories with Tories, and the orbits of the two planetary systems rarely crossed. In the year 1906, these divisions hardly exist, and it may often happen that a Minister will find himself at the same table with a Member of Parliament who an hour before was denouncing him as a dangerous enemy to the best interests of his country.

There is a rule that no Member of Parliament when speaking in the House, shall step beyond a certain line drawn parallel to the benches; a necessary precaution once, when passions ran high, and swords might be whipped out at any moment. But now that there is more control, and men do not wear swords, the rule is only a survival whose origin is forgotten. The line beyond which no man may step has been transferred from the floor to the tongue. Even in the days of swords duelists before beginning to fight used to greet each other with elaborate bows and courtesies and, in the same spirit, two men engaged in a bitter struggle can now exchange smiles and laughter at dinner.

These conventions are reflected in the society of to-day, where no difference of opinion, no rivalry, hardly any dislike, is allowed to hamper social intercourse — the bitterest public opponents in politics and letters, the criticized, and the critics meet amiably round tables, and all goes well.

Two characteristics which during the last few years have affected the pace and the color of social life, are restlessness, and love of riches.

The first is fostered by the greater facilities of transit and of communication, which urge even the most quiet people into movement. Routine is almost unknown. The busier a man or woman, the more imperative becomes the weekly change of air, the journey to waters, the visits in Scotland — while life in London itself is forced to an ever-increasing pace by the telegram and telephone.

The second characteristic, the worship of riches, is the effect of a growing taste for expensive pleasures and displays. London even suffers sometimes from the particular type of American millionaire, who will spend thousands of pounds upon transforming the courtyard of his hotel into a lake, and feeding his friends in gondolas,— but these visitations are rare and hardly ruffle the surface of social life. There are however, permanently in its midst, men who possess special commercial aptitude, but who have no peculiar social qualifications. Their wealth enables them to erect palaces, dine delicately and expensively inside them, whirl about in magnificent motor cars, hire splendid moors and forests, and these people, though they could not have done so fifty years ago, palpably influence modern social life. A standard of luxury and pleasure is set up, far beyond the power of ordinary well-to-do people to attain — some struggle to compete, some acquiesce and give up the effort, but all enjoy what they can of the rich man's table. Every door is open to him; his character, his conversation, his manners are seen through a golden haze — he is asked everywhere — he is flattered and imitated. It may possibly occur to him at depressed moments that he is not quite inside the inner circle; that certain great houses only remember his existence once a year, and that there are always some people, not devoid of influence, who prefer simpler friends, and simpler modes of life. But he will be easily consoled; there will always be the many others, his children will marry what is called the best in the land, and he himself will finally, if his ambition so prompt him, take his seat proudly as a peer of the realm.

Keeping in mind then, these two characteristics,— restlessness and love of riches, a description of the methods of intercourse, and incidentally the pursuits adopted by the pleasure seekers will help to give a more complete picture.

The practice of eating together, it need hardly be said, still obtains, and on the whole, the amount consumed in spite of much that is said and written, varies very little in quantity. It certainly does in quality — French cooks and French dishes have invaded London and the consequent expense and variety make it difficult for small households to compete with the restaurants. The habit therefore of eating simple food at home, and of entertaining friends at the Carlton or the Ritz has taken strong hold. Not so very long ago it was difficult to get a really good and choice dinner except at a private club — now a sovereign or two in the pocket will secure it on any evening of the year. The enormous increase in theatres is a subsidiary effect — a party cannot sit forever round a table, and they drift to some place of amusement. The habit of sitting together and talking is on the wane, «causerie» is becoming a lost art, and in private houses the theatre is replaced by bridge tables, and occasionally by music.

Letters have altered in much the same way as conversation. The old fashioned correspondences, the full, leisurely chronicling of great and small events, has given place to telegraphic and telephonic communication. Those people who are not in the telephone book inevitably drop out of the busiest ranks of the pleasure seekers, just as those who do not possess motor cars have to abandon the chase after distant golf links and country luncheon parties.

A week's visit in a country house is now a rarity — the longest shooting parties begin on Tuesday and end Saturday, and the throng hurries back to London, or goes on to one of the usual Saturday to Monday hospitalities. But in spite of this curtailment, and in spite of the rush of a week-end party — the country visit remains the best method of intercourse. There is a greater freedom — youths and maidens walk, ride, play games, and in the intervals talk together, and their elders when released from their own athletics and cards can also exchange ideas. Marriages are promoted far better in this way than in the mazes of the dance, and many of the best marriages have been made by girls who are little known in London. This is greatly due to the decay of town life which is gradually setting in — out of door pursuits and games absorb people more and more, and the ease of transit make them able to combine a certain amount of town dissipation with country life. The girls are tall, strong, well-developed, they hunt and play golf and bicycle — they join in whatever may be the game of the moment, with the keenest zest, and improve their figures and their general health, and indirectly the whole physique of the race by this custom. The part which girls and women thus take in the amusements of the other sex, is only one of the many invasions which women have practised. They share to the fullest extent in the work and struggle of their husbands — in politics they take an increasing part, many of them now speaking on political platforms, besides doing humbler work in constituencies. Women, with their gift for detail and their organizing power exert great political influence on all kinds of subjects — an influence which is too impersonal and diffused to be ascribed only to the usual cause. The old Aspasian influence, however, always has existed, and always will, for no change in social methods will diminish or increase the eternal power of sex. The political salon has disappeared, chiefly because of the vast size of political and social circles, but the women who make the right men meet at the right hour, who place the derogatory or the praising word at the auspicious moment, who avert unpopularity or create it, are as powerful as they have ever been. Therefore while women leading social lives certainly read, think, and even work more than they used to, there is no falling off in the efforts after personal adornment. On the contrary, the same thing has happened with dresses as with dishes — both are now made expensively by the French. Probably a smart lady of our day spends three times as much upon her clothes as her mother or grandmother did. This is not only because she lives in a more extravagant age — it is also because she does many more things for which she has to be appropriately dressed, and because the standard of technique in this difficult art has been gradually rising. A smart English woman will often spend from £2,000 to £3,000 a year on her outfit, which has to contain for town life, morning gowns, afternoon gowns, dinner and ball gowns — even House of Commons gowns, and for country life, golfing, shooting, and walking skirts, driving coats, motor coats, furs, tea gowns and evening gowns. To all these must be added the endless supernumaries of veils, gloves, handkerchiefs, scarves, umbrellas, parasols, walking sticks, hats, shoes, boots. Every new pursuit in a social woman's life means a new dress. Skirts hamper athletics in any case, therefore they must be specially made—the gown in which it is fitting to open a bazaar looks vulgar in a drawing-room, the evening gown is not quite in tune with the House of Commons, and so on. The men are spared the greater part of these trammels, but they would not be pleased to see their wives lacking in any of the so-called essentials.

People often wonder whether smart society is more or less immoral than it was — an obviously hopeless comparison to attempt, for the facts are not adequately known or recorded. If a set of very rich people who have not got enough to do, spend their lives in various frivolities, this description undeniably applies to a section, though a small one, in England — it is only to be expected that some fall into follies, and some get caught in the grip of passions with which they have been playing. But on the whole the tone is good, the decencies are observed, and the unfaithful wife or the complaisant husband are not admired. It is considered more intelligent to get on together as man and wife, and if a harmony is sometimes preserved only by an organized tolerance or blindness, it is at least a tribute to the prevailing fashion.

Insensibly an article about Society in London becomes an article about women,— and with reason — for women make it, guide it, sustain it. It is they who organize many of the pleasures for the other sex, it is they who arrange parties for the most brilliant of their acquaintance, male or female, it is they who select and discard the members of their circle. A dull man is often accepted by hostesses for the sake of his clever wife — but a clever man is rarely able to successfully float a dull or tactless woman. He must either go out without her, or drop from the ranks, for a dull woman is far more difficult to swamp or absorb owing to the social custom of deference to women, than is a dull man. Natural selection is as ruthless here as in other matters. There is a greater number of pretty and intelligent, leisured and therefore charming women in London than there is of clever, interesting men. It is one of the disabilities of Empire, that the outlying possessions claim year by year many of the more adventurous, thoughtful, and ambitious of England's youth. If a man is not the eldest son of a great house, and has no desire to go to the Bar, or enter politics, he is almost certain to get to India — or to one of the great colonies. After governing kingdoms, after fighting savage tribes or building railways which change the destinies of continents, these men come back to London as strangers — they are often run after, flattered, and feasted, but they do not stay — they return to their distant and strenuous lives and leave society very much as they found it. They rarely have the opportunity of marrying into it, which may or may not be a loss for them, but is undeniably one for the girl who would have found in her husband's career a fitting outlet for her own energy, enthusiasm and ambition. The growing interest in the problems of empire which make women admire men of this calibre, the greater freedom of intercourse allowed, and above all the habit of constant and extended travel, will alter these conditions, and there may in time be far more intermarriage between England and her colonies than now exists between England and America. American women have started the fashion of travelling — and incidentally that of marrying out of their own land. Their English sisters being able to satisfy hankerings after titles and other social amenities at home, will probably extend their choice almost entirely to men of their own race.

No description of social life would be complete without some mention of its duties and claims. The feudal dependence upon great families, the claims of poor relations, the patronage of struggling authors and artists, these things exist no longer as institutions to which all must submit, whether they wish to or not. Instead has come a far wider sense of responsibility, including these claims, and many others as well. Hardly a social man or woman exists who does not give time and work to his or her particular charity or league. Many great reforms have been initiated in this way — the attempt to redress coming from the very class carelessly dubbed as heartless. The efforts are sometimes futile and unfruitful, but a surprising amount of devotion and ability exists, and in times of national crisis, like the Boer War, social men and women come to the front, and reveal powers of organization and work little suspected. Many women spend all their leisure in promoting various causes — many men rob themselves of well-earned rest to help in definite philanthropic work.

In attempting to give any picture of Society as a whole it must always be borne in mind that there are circles within circles in London: there are houses where you can get brilliant talk, political and social; there are houses where people who belong to various choirs and choral societies meet to sing through old madrigals and part-songs; there are hostesses who provide perfect concerts, who give balls, who arrange card parties, and there are others who attract round them the literary flavor of the moment.

Large, flashing, many-sided, English Society of to-day deserves much adverse criticism, but it is also worthy of study and of admiration. From its ranks are drawn many of the nation's most famous men and women — and to its ranks are welcomed every day all and any who have distinguished themselves. The bright gaudy pattern is woven on a plain and sober ground of solid work and achievement. Society in England is adapting, expanding, altering with the general state, and is therefore not a mere excrescence on the national life, but an integral part of its organism.

Edith Lyttelton.

33. Great Britain — Sport. Sport occupies at the present time, as indeed in all periods of English history, a space in social organization which those who would understand national life and character cannot possibly ignore. Speaking generally, in most of the forms which it has assumed, sport represents the survival of those instincts and aptitudes developed by primitive man to cope with the two imperious necessities of his existence; defence against his fellows and the quest for animal food; and war and the chase, which were the expression of these necessities, demanded qualities of very similar character. Both necessities exist at the present time, but war is of far less frequent occurrence and the pursuit of wild animals is rare in old and civilized countries. But in the less advanced provinces of the Empire adventurous Britons find the older conditions still prevalent, and there, as in times of war nearer home, large opportunity and recognition is accorded to those qualities which are characteristic of the best sportsmen — courage, cheerfulness, discipline, the faculty of command, the corporate sense, the spirit which, forgetful of self, rejoices in the power and cohesion of the crew, the regiment and the team. A school of reformers whose eyes are bent at the present time on national efficiency in war are disposed to deny the value of sporting qualities in modern warfare, and preach with conviction the necessity of the training of our youth in drill, rifle-shooting and other exercises more closely related to military science. It is doubtful whether these views are harmonious to the national tastes, and whether if they prevailed, the training suggested would ultimately produce better material than the less organized physical discipline of field sports and games. Be that as it may, sports and games have a great, perhaps too great, a vogue in England. Not unfrequently they have become an end in themselves, and as perhaps is natural in a period of ever increasing wealth and leisure, men pass from cricket, tennis and polo in the summer to hunting, shooting and golf in the winter, believing that they are attaining, as doubtless they are pursuing, pleasure; but they carry on their countenances the negation of their expectancy and furnish living proofs of the existence of the law of contrast prescribing that pleasure must take its roots in foundations of strenuous and often irksome industry. Recreation, which sport in its true sense represents, is that which refits and recuperates man and renders him more capable to do his work, and the nation which has seized this conception of sport, lives up to it and narrowly observes its tests, has little to fear from the joyless exaggerations of pleasure, or the nervous morbidities of industrial excess. But when the basis of industry is firmly established, those gain most from recreative sport, and get most efficiency from its pursuit, who are the most absorbed and strenuous, put forth for the time being every faculty and energy into the affair of pleasure, and whose ardor for success is limited only by the canons of the highest chivalry, and by the resolve that while every nerve must be strained to defeat him, an antagonist, whether man or beast, must have all the courtesy and honor of war.

The seriousness of Britons at play is often the wonder of amused and tolerant foreigners, but much can be urged to justify it; if realities have for a time to be banished, the phantoms pursued in their place must have their semblance and fashion; the problems of politics, law and business, the cares of every day life absorb and wear the brain; to exclude them there is need of substitutes which will really engross other faculties than those normally in use.

Few will dispute that the Britons have carried sport further and cultivated the sporting spirit more assiduously than any other civilized race. This energy is in part accounted for not by the greater prevalence in ancient days of war and the chase in England, but by the peculiar social conditions absent elsewhere, but which obtained in earlier days in England. Looking backwards only so far as the days of the Stuarts, before Puritanism had set its ban on many of the pastimes of our forefathers, we find that while in France the Court encouraged the noble to assert his plea in society by living in Paris or Versailles, the Stuarts regarded the status of country gentlemen as a profession in itself. The squire was expected to keep open house, administer local justice, relieve want and furnish employment. These functions, enforced by a shrewd purpose from above, confirmed a not unwilling class in those duties which were not so onerous as to prove any serious bar to much sporting. The deer in the enclosed parks were deliberately chased to the cry of hounds "slow in pursuit but matched in mouth like bells" hunting 'at force' ranged over wider spaces — the otter was speared, the badger trapped, the hare coursed and the fox hunted by the squire who owned his own hounds. But if these sports were the peculiar domain of the well-to-do, the less wealthy enjoyed with a whole heart fishing, then open to nearly all, and games of all sorts. The country lay ever at the townsman's doors, and wrestling, where life and limb were in jeopardy, jumping, pitching the bar, dancing and nine pins were native customs, while football enjoyed a popularity which emulates that of the present time. The husbandman, when the fat swine were killed on the approach of winter, got the bladder and blew it out great and thin, and "tried it out at football with the shins." The simplest of all games, it was played with local rules suited to the nature of the ground, often across the stream and up the length of the village. King James forbade it at Court as "meeter for the laming than the making able of his liege subjects," but all classes commonly joined in the scrimmage to the good old cry of "all fellows at football." The causes, partly economic and partly political, which attached the rural gentry to the land received renewed impetus from the Napoleonic wars and the great appreciation of prices of agricultural produce of that period; and the honorable opinion that obligations should accompany social privileges in rural life, is happily to this day widely felt throughout the land. Local government and administration and minor judicial work still remain, and the police, notwithstanding the activity of County Councils, are largely controlled by the experience of country gentlemen, and so long as there is this solid background of usefulness for them, field sports will continue to be enjoyed by the gentry, but for whose presence in rural England they would soon perish. But it is natural and inevitable that with the growth of population, and above all of the perpetually increasing facilities of locomotion which make that population so mobile, hunting, fowling, stalking, and shooting, owing to the competition for them, tend to be the sports of a relatively diminishing portion of the population. Fox hunting does indeed (wild stag hunting is now so rare as to be almost a curiosity) despite the inroads of civilized life still retain a leading position in England sports, but railways and motors are making and will make its pursuit more and more difficult by temporarily concentrating into particular places most adapted for the sport such large numbers of people living at a distance that the agriculturists, who formerly never repelled and often welcomed the advent of hounds, now require large compensation for the kindly hospitality which they extend to their passage over the land. This is not surprising when a field of 500 horsemen, many of them strangers to the district, accompany the hunt whose progress ravages both crops and fences in spite of a dictator's authority freely accorded to the master and exercised to the general good. The attachment of Britons to the greatest of all sports is attested by the expenditure, cheerfully borne by men often not rich, which of necessity follows on the track of such damage, but it is to be feared that in the coming years other obstacles to hunting more difficult to overcome will follow in the wake of more specialized and scientific agriculture.

Shooting is enjoyed under more advantageous conditions as the great natural wheat lands and pastures of the world come more completely into use. Deer forests and moorlands are less likely to be required in the future than now for the purposes of pastoral or agricultural industry. The driving of both grouse and partridge has, contrary to expectations, resulted in a wonderful improvement in the health and reproductive power of these birds. The Battue of pheasants, though probably requiring greater skill from the individual in the technique of actual "gunnery," is by reason of its artificiality lacking in the highest interest and excitement of sport, but for that very reason it can be conducted in places where nature has been most obviously civilized. Partridges, though wilder than pheasants, if let alone will seldom go beyond the limits of two or three fields, they need not the silence and the calm of the moors, and are not averse to the frequent presence of man; thus partridge shooting is a popular sport and on the first of September, the echoes are answering a dropping fire from John O'Groats to Lands End.

Driving, usually postponed till three or four weeks later, requires large estates and much organization, drilling of beaters, etc., but there remain many lively days of more desultory sport widely enjoyed by modest folk, sometimes advancing in line over the fields, sometimes using the dogs who were formerly indispensable. Geese, snipe, duck and woodcock are rare in any considerable numbers, but the rabbit's white tail vanishing into the burrow is one of the most familiar spectacles of the rougher and less highly cultivated countries. Fishing is even more democratic and is pursued by great varieties of men of all conditions and all ages, but salmon and good trout fishing are already beyond the reach of modest incomes, even in Scotland. This sport, which in the opinion of many great judges, is second to none, is connected with many disappointments and has infinite varieties. The element of uncertainty and risk enter into it to a degree sufficient to answer the expectancy of the most exacting, but like hunting it is greatly to be feared that the enjoyment of its exquisite pleasures must be more and more restricted, and the pursuit more and more detached from universal national life. In truth those causes against which no expert can be of any avail and to which reference has already been made, the fast filling up of the island, the limited area unoccupied by the presence of man, machinery and locomotive facilities of all kinds are slowly tending to draw the vast majority of the people from the chase to those games whose enjoyment is independent of the existence of wild nature, and whose arena is accessible to all. Cricket, football, racing and golf occupy a truly astonishing position in the public mind. Even in Scotland, where cricket is, comparatively speaking, little in vogue, the leading newspapers devote daily, five or six columns to accounts of these pastimes, while it is noticeable that English journals whose leading articles contain austere exhortations against gambling, and denunciation of the undue dominance of sport, are forced by the struggle for existence to chronicle at wearisome length the very subjects whose popularity they deplore. Racing has become so commercial and statistical that it may be said to have, for many of those who are prominently engaged in it, many of the characteristics of business, and it affords great pleasure and excitement to innumerable speculators who without seeing the races, or knowing anything of horses, hazard sums of money varying in amount under the guidance of "tipsters" in newspapers on the issues of remote contests. In the north of England and sporadically in the Midlands and South there exist many genuine lovers of horses deeply interested in the science of breeding for speed, and enjoying without pecuniary stimulant the glorious sensation of pride and admiration which the victory of a horse bred at home and reared with affectionate and anxious solicitude inspires.

Gambling has not entered to so considerable an extent into cricket or golf, though it is said to be making its way into the wide regions where football holds sway. But the commercial spirit is tending to invade the arena of popular games. Cheap excursion trains concentrate vast crowds of spectators in the large cities; so many as 100,000 gather to see the most important football engagements; and during the three days occupied by a cricket match 50,000 or 60,000 frequently pay sixpence or a shilling for a pleasure which to men engaged in hard manual toil throughout five days of the week has the deepest attraction. The press is compelled to give large spaces to description of contests which arouse such widespread interest and stimulate such extensive circulation among a public who but for the sporting cohesion would never dream of purchasing the cheapest journal. The opportunity of a good livelihood pleasantly earned is, as a result, extending itself to a larger and larger number of professional players, and if the worthiness of an occupation is to be measured by the different pleasures which it conveys, a professional cricketer or footballer is earning his bread in at least as meritorious a manner as many other craftsmen against whose calling no criticism has ever been made. But irritation is aroused at the disproportionate celebrity which is attached to skill in these pursuits, and to the ambitions which they excite among amateurs, and to the place given in national life to things which should be the variants and not the principal motives of energy. A powerful temptation is continually presenting itself to young men just at the time when the real business of life should begin to earn popular applause and distinction by making a game the staple occupation of their time. The result often is that at the age of 35, when physical powers for these purposes begin to lose their first bloom, men who have had much excitement and have awakened much popular notice fall into an enforced and unwilling idleness which is often difficult, after so long a delay, to disperse by the practice of a profession or entrance into business. Criticism is heard far and wide of this exaggeration of a natural and manly taste, but no remedy will ever be of the slightest avail unless it be accompanied by an alteration in public opinion and estimate of the value of proficiency in games.

At present no evidence of such a change is perceptible in the Anglo Saxon race. In America, though less widely diffused, games are prosecuted with an intensity characteristic of an energetic people. Australia, New Zealand and South Africa are more deeply inoculated with their attraction than the mother country. In one province leading statesmen vie with civic dignitaries in applauding and welcoming with honors the dashing batsman or the "demon" bowler; in another the expenses of the all-conquering football team are placed on the estimates and cheerfully voted by an enthusiastic Parliament. Few anticipate a diminution, many expect an increase in the popularity of sport, and the historian of the future will probably be able to institute an interesting comparison between those nations who are trained more consciously for war and those who are learning some of its lessons in sport. The phrase "play the game" has passed into the language as a symbol of honor, unselfishness and veracity; we may hope that the sources of these virtues will be untainted by commercial standards and will refresh and preserve national manliness.

Alfred Lyttelton.

Formerly Secretary of State for the Colonies.

34. **Great Britain — The Fine Arts.** The earliest records of British art are concerned with the decoration of palaces, churches, costumes, arms, furniture, and domestic utensils. But we find the point of transition from the useful to the fine arts in the shrines, such as those erected by Edward I. to the memory of Queen Eleanor, the monuments, tombs, painted tablets and portraits on glass and in illuminated MSS. of the 15th century. From the 15th century onwards oil painting became the chief medium in which the memory of important persons and events was recorded. All the important work of this kind was, however, till the 18th century, in the hands of foreign artists, who were attracted to England by the munificence of the kings and nobles; hence, with the possible exception of Holbein's and the best of Van Dyck's portraits, it reflects the national instincts and sentiments only from an external and superficial point of view. But the distinctively British school of painting, which sprang into existence during the 18th century, owed much to the influence of these foreign artists and their works, and to the numerous collections of pictures by celebrated continental artists which collectors like the Earl of Arundel and Charles I. had formed. These provided a kind of university in which native-born artists could educate their taste and master the manual secrets of their art. The English artists had only to assimilate the traditions of the great foreign schools and to use the technical skill thus acquired for the expression of those more intimate nuances of the national character which foreign artists—whatever their artistic gifts — were incapable of sharing. Hence, the astonishing rapidity with which the English school of painting developed, the absence of technical experiments which marked its first stages, and the very high standard of executive ability which the earlier men possessed.

PORTRAIT PAINTING.

The first English portrait painters seem to have seen their sitters through the eyes of the foreign masters under whom they had studied or on whose works they had formed themselves. The very skilful miniatures of Nicholas Hilliard (1537–1619) and Isaac Oliver (1564–1617) show the influence of Holbein and the French miniaturists. Robert Streater (1624–1680) was a pupil and imitator of Dumoulin, William Dobson (1610–1646) and John Haylis. (—— 1679) of Van Dyck. John Greenhill of Salisbury, (1649–1676) of Sir Peter Lely. Samuel Cooper (1609–1672), whose fine portrait of Cromwell is well known, and John Riley (1646–1691) were the first to express a more distinctively national point of view in their portraits. Jonathan Richardson (1665–1745), Riley's pupil, had great influence in directing attention to the intellectual and imaginative aims of paintings.

William Hogarth (1697–1764) is the first great English artist. In a series of paintings like 'The Harlot's Progress,' 'The Rake's Progress,' and 'The Marriage à la Mode' (National Gallery), he brought the whole drama of contemporary life into pictorial art. Such pictures contain abundant evidence of the artist's powers of observation and memory, but Hogarth was not content to observe life merely from the outside. He does not choose a series of situations and proceed to visualize them as they would appear to an indifferent spectator, but, as Charles Lamb has pointed out, he seizes his subjects with such an extraordinary power of imaginative intuition that they seem to direct him, and his paintings, instead of confining themselves to external matters, become a revelation of and a commentary on the unseen qualities—the moral and intellectual attributes—of his characters. To do this the whole of the artist's personality has to be engaged in his work of dramatization, and it is inevitable that the result should bear the impress of his temperament and convictions. Hogarth has been censured, especially by continental theoricians, for allowing his moral emotions to appear in his work; but the place his art has taken in the life of the English people depends almost entirely upon the warmth and thoroughness with which he made himself an exponent of their instincts, sentiments, and aspirations. There can be no doubt that Hogarth is as thoroughly national in what have been called his moralistic prejudices as in the completeness and sharpness of his observation, his rollicking humor, and the animation, vigor, and bitterness of his satire. With such gifts it is not surprising that Hogarth has left us some excellent portraits. His own portrait, in the National Gallery, and that of Captain Coram, in the Foundling Hospital, are generally considered his most successful efforts in this branch of art.

Thomas Hudson (1701-1779), a pupil of Richardson, was a successful rival of Hogarth as a portrait painter. His merits have, however, been obscured by the achievements of his pupil, Sir Joshua Reynolds (1723-1792). Certainly no painter has ever entered so subtly as Reynolds into all varieties of the English heart and mind. His portraits have such a striking air of individuality that they carry instant conviction of their veracity. This commanding quality is largely due to the completeness with which he identified himself with the aspirations and instincts of his countrymen, as this determined the principles of selection and rejection in his observation. We have Northcote's authority for saying that lovers "used to tell him (Reynolds) that after seeing his portraits of their ladies, they thought the originals handsomer than before; the reason of this was," he adds, "Sir Joshua seized upon some particular quality that he liked and made it more palpable than it was in nature, and which afterward served as an index to point it out to them." But while differentiating the essentially poetic or imaginative intuitions of the artist from the exhaustive and impartial observation of the man of science, we must be careful to point out that Reynolds's felicity of perception is just as clearly distinguished from the arbitrary constructions of fancy. They are real men, women, and children that he gives us, not mere figments of his imagination.

With such gifts, sedulously cultivated by unremitting practice and an exhaustive study of the works of the Italian and Dutch painters, Reynolds has taken his place amongst the greatest artists of modern times. Among the finest of his portraits of children we may mention 'The Age of Innocence,' 'Heads of Angels,' 'The Infant Samuel,' and 'Robinetta' (all in the National Gallery), and 'The Strawberry Girl' of the Wallace Collection. The 'Portrait of Nelly O'Brien' (Wallace) and 'Mrs. Siddons as the Tragic Muse' (Duke of Westminster) are among the best of his portraits of women. The superb 'Portrait of Lord Heathfield' (National Gallery), together with those of Dr. Johnson, Goldsmith, Burke, and himself are all fine examples of his grasp of men's character.

Thomas Gainsborough (1727-1788), the great rival and contemporary of Reynolds, was less varied in his portraits than that master. He approached his sitters with a stronger subjective bias and he was not so profound an observer. The charm of pathetic tenderness and melancholy which he gives to all his sitters belongs rather to the painter's own character than to theirs. His instinct for physical grace and beauty was probably keener than Reynolds's, but there were certain aspects of life in which he was little interested. Hence, his portraits convey a less concrete idea of his sitters than those of Reynolds. But this tendency toward abstraction enables him to express the qualities he is interested in with great clearness and emphasis, so that his pictures often give more intense and immediate pleasure than those of Reynolds. Among his most remarkable portraits are the 'Mrs. Siddons' (National Gallery), 'Mrs. Sheridan and Mrs. Tickell' (Dulwich Gallery), the 'Blue Boy' (Duke of Westminster), and the 'Hon. Mrs. Graham' (Edinburgh). Gainsborough's landscapes are at least as fine as his portraits, but we will defer speaking of them till we come to deal with landscape painting.

The tendency toward one-sided and arbitrary abstraction which we notice in Gainsborough is still more pronounced in the works of his contemporaries and immediate successors. George Romney (1734-1802) was so much impressed with the examples of Græco-Roman sculpture he saw in Rome that he took them as models for his own work. He betrays a constant striving to make the women and children who sat to him look like animated statues. This predominant concern with the external side of art led to the neglect of the intellectual and emotional sides of life. The idea of the sitter conveyed in Romney's portraits is therefore less capable of taking its place in any fully articulated conception of reality than is the case with Reynolds. But within his own limits Romney's works have a vivid consistency which gives them high rank as works of art. The very popular 'Parson's Daughter' (National Gallery) is freer than usual from the painter's besetting tendency to impose a pre-conceived ideal on his sitters; his own portrait (National Portrait Gallery), though unfinished, is a most interesting and characteristic work. Sir Henry Raeburn (1756-1823), a brilliant and successful artist, who worked principally in Edinburgh, painted nearly all the celebrated Scotch men and women of his time, with the exception of Burns. John Hoppner (1759-1810) was chiefly concerned to make the faces of his portraits pretty, and only as a secondary consideration to make them like his sitters. Sir Thomas Lawrence (1769-1830), with whom the great school of British portraiture may be said to have come to an end, used his great mechanical cleverness in the service of the false elegance and false sentiment fashionable in his day at the court and among the associates of the Prince Regent. There is less metricious affectation in his male portraits.

The school of humorous genre, founded by Hogarth, was developed in the direction of caricature by the water colors and engravings of Thomas Rowlandson (1756-1827), Gillray (1757-1815), the two Cruikshanks, Isaac (1756-1811) and George (1792-1878), John Leech (1817-1864), etc.; in the direction of prettiness and domestic sentiment by painters like Wilkie (1785-1841), Mulready (1786-1863), Webster, Newton, William Collins, Frith, etc.

LANDSCAPE PAINTING.

It is, however, in the domain of landscape painting that English artists have won their chief triumphs. If the English school of portraiture was the only great school of painting in Europe in the 18th century, the English school of landscape painting, which culminated in the works of Turner and Constable, may be said to have enriched poetic art with a new form of expression and to have revolutionized every form of modern art.

Richard Wilson (1713–1782) is generally regarded as the first of the great English landscape painters. His fame still suffers from the large number of canvases by pupils and imitators which are passed off under his name in most of the public and private collections. When at his best his feeling for breadth and quality, for tone and light and color, has been rarely equaled. He was one of the first painters of delicate morning effects of misty blue and silver. His designs have a freshness and beauty, and a majesty or serenity of atmospheric effect which even Corot and Turner have equaled but rarely. No other artist influenced Turner so much. In Gainsborough's (1727–1788) landscapes we find the same tendency toward abstraction which we noticed in his portraits, but here his sense of physical beauty and the peculiar charm and tenderness of his temperment find freer play. Of his four important landscapes in the National Gallery, 'The Watering Place' is the most celebrated. In such pictures Gainsborough struck an intimate personal note which was new in landscape art, but which had much in common with the note of lyrical Nature-worship, which was beginning to make itself heard in such poems as Thomson's 'Seasons.' No less essentially poetic is the art of John Cozens (1752–1799), the first great English water color painter. He is a poet of a more austere stamp than Gainsborough. His drawings are generally low in tone and subdued in color. He preferred Nature's "most silent eloquence."

J. M. W. Turner (1775-1851) began his career as a topographical draughtsman and water color painter. But soon after he was 20, under the influence of Wilson's and Cozens's work, he repudiated topographical art altogether in favor of a more poetical treatment of landscape. It became a principle with him that mere imitative landscape, painted as it might be photographed nowadays from a fixed point of view and embracing all that could be seen from that point of view, and no more, did not even represent the place so fully as a more general treatment would do. He therefore made a point of bringing any buildings and objects into his pictures, which from their importance or singularity were especial features of the place, even though they were hidden from his point of view or out of the field of his picture. Thus, Redgrave tells us, "he would say that no one should paint London without Saint Paul's, or Oxford without the dome of the Bodleian"; and constantly in his pictures he would move a building of importance considerably to the right or left, to bring it into what he considered its best place in the picture. "And this," Redgrave adds, "is quite consistent with reason, for no one but an artist views a town or any scene from a rigidly fixed point of view." We may add that this is merely the application to landscape painting of the principles upon which Reynolds invariably worked, and which he has formulated in his 'Discourses.' In the fourth Discourse he states that "even in portraits * * * the likeness consists more in taking the general air than in observing the exact similitude of every feature." This is because art addresses itself to the imagination; and this end is best secured when the artist makes all the details of his picture subordinate to his own imaginative intuition of his subject.

In the whole of his long career, during which his style underwent a series of startling transformations, Turner remained inflexibly faithful to Reynolds's conception of poetic art. His work is always an attempt to express a poetic conception or intuition, never an inarticulated collection of dispassionate observations. The differences in his style are the result of the changes which took place in his attitude toward life. Between 1800 to 1820 he gives us works which suggest comparisons between the dominant moods of Milton's and Wordsworth's poetry, after 1820 his works become possessed of a Byronic recklessness and sensuousness, with vague aspirations toward the unlimited. As typical examples of the earlier period we may mention 'The Frosty Morning,' 'Abingdon,' and 'Windsor' (National Gallery). These incomparable works show us that Turner could, as Prof. Raleigh has said of Wordsworth, "feel deeply and sanely and wisely in the presence of things seen." Though dealing with ordinary aspects of English life they have an unforced beauty of design and color which has few equals in the artist's work, and a tenderness and sincerity of feeling which makes the beautiful Gainsborough, which hangs opposite to two of them, seem almost rhetorical. In the later period the artist's chief aim seems to have been to astonish and dazzle the public. The restraint of the earlier works is abandoned for a loose suggestiveness, sincerity to a strange mixture of gorgeous rhetoric and childish naïvety.

The most characteristic works of John Constable (1776–1837) form a striking contrast to Turner's later pictures. Constable's subjects are conspicuous for their simplicity; they generally consist of a farm, a few picturesque cottages, a village church or green, or peaceful rivers wandering through luxuriant meadows. He treats such subjects with rare intimacy and sincerity. His pictures are characteristic of lowland England, and of "English homes" with "dewy pastures, dewy trees." Though Constable had not Turner's range or exquisite sensibility of temperament, he infused such a wealth of genuine affection into pictures like 'The Corn Field,' 'The Hay-Wain,' and 'The Valley Farm' (all in National Gallery), that they have long taken their place among the masterpieces of the English school. With Constable and Turner must be classed Crome (1769–1821), Cotman (1782–1842), Cox (1783–1859) and De Wint (1784–1849).

With these landscape painters what may be called the classical period of English art came to an end. In portraiture, landscape and genre-painting it had succeeded in expressing the best qualities of the English race; its high seriousness and imaginative force, its healthfulness and strong simplicity. But while universal in its substance it had remained individual in its form. The artists, while animating their work with their own personal convictions and emotions were yet so happily characterized as to stand as types of their fellow-countrymen. Their individual modes of impression and conception were those of all their countrymen, only freed more completely from the bias of exclusively selfish interests. There was no specially artistic point of view. The chief characteristic of most subsequent art — of Academic, Pre-Raphaelite, Realistic and Impressionistic art — is that it is the expression of a specially and artificially developed manner of perception. Modern English art is therefore less national than the art of Reynolds, Gainsborough, Turner and Constable; it makes a narrower appeal, is more of an exotic, a thing of coteries and faddists, requiring a specially developed system of apperception for its enjoyment.

ACADEMIC ART.

The distinguishing characteristic of Academic painters like Benjamin West (1738–1820), Barry (1741–1806), Herbert, Horsley, Long, Ward, Armitage, etc., is the substitution of intelligent plagiarism for spontaneity and creative force. Technical accomplishment takes the place of personal emotion. Such artists' works are generally arrangements after celebrated models; simplicity, directness of feeling, and all peculiar national stamp give way to an empty rhetorical manner and a blind worship of routine and processes.

THE PRE-RAPHAELITE SCHOOL.

The Pre-Raphaelite movement, which began about in 1848, was a well-meant and in some respects successful protest against Academic plagiarism. A band of young artists, of whom Holman Hunt and Millais were among the most prominent, resolved to do their uttermost to root out of their practice the influence of their teachers and of all the approved examples of their art, and to base their work on a fresh and personal study of Nature. The change thus inaugurated was primarily a technical one. The subject-matter of their pictures differed little from that of their older and Academic rivals. The difference was to be found in their methods of exact and elaborate representation. When the arrangement of the picture was settled every object to be represented was studied separately and painted direct from Nature. As Mr. Hunt has told us, "direct application to Nature" was made "for each feature, however humble a part of foreground or background this might be. I justified the doing of this thoroughly as the only sure means of eradicating the stereotyped tricks of decadent schools." Typical pictures of this kind are Hunt's 'Light of the World,' 'Jesus in the Midst of the Doctors,' and Millais's 'Ophelia.' Pre-Raphaelite theories also exercised a powerful influence on the black and white work produced between 1850 and 1870, notably in the wood-engravings designed by Rossetti, Sandys, Millais, Houghton and Pinwell.

REALISTIC SCHOOL.

It is not at first sight easy to distinguish the Realistic school of painters from the Pre-Raphaelites, of which they are strictly speaking an off-shoot. With Hunt and Millais the principle of direct and elaborate representation was always intended to be kept in subordination to the interests of imaginative art ("— it cannot be too clearly reasserted that Pre-Raphaelitism in its priority was the frank worship of Nature, kept in check by selection and directed by the spirit of imaginative purpose.") (H. Hunt, 'Pre-Raphaelitism' II. p. 452). In the works of realists like Thomas Seddon (1821–1857) and John Brett (1832–1902) this "frank worship of Nature" became an end in itself. The chief aim of Seddon's 'Jerusalem and the Valley of Jehoshaphat' (National Gallery), and of all Brett's pictures, is to give trustworthy information about the scenes represented.

IMPRESSIONISTIC PAINTERS.

This attempt to abstract physical reality from its setting in human consciousness was carried still farther by the Impressionists. The naïve vision of the Pre-Raphaelites had drawn attention to the importance of local colors in nature, the later works of Turner had directed attention to the transformations which atmospheric conditions exercise upon these colors. Impressionism makes the study of the atmosphere the main object of each picture. The Pre-Raphaelites had eliminated black and brown from their palettes; the Impressionists, partly owing to their example, partly out of deference to some questionable optical theories, have deliberately confined themselves to the use of the seven colors of the spectrum. The chief Impressionistic painters have been Frenchmen, but they have exercised considerable influence on recent English art. Among the more prominent Impressionistic painters in England are Mr. P. Wilson Steer and Mr. Wynford Dewhurst.

It has already been remarked that all these artistic sects are concerned mainly with technical questions, so that though each had had and still has its coterie of enthusiasts and initiated, none has enjoyed the whole-hearted support of the mass of the educated public. Each sect has no doubt voiced certain aspirations common to a large number of their fellow-countrymen, but as a whole their works reflect the national mind and temper in a fitful, fragmentary, and more or less arbitrary fashion. There are, however, three artists belonging to the latter half of the 19th century, who stand outside this war of artistic sectaries.

G. F. Watts (1817–1904), an artist of lofty ambitions, deliberately appointed himself the exponent in imaginative art-forms of all that seemed to him noblest and most worthy of admiration in his age. What he might have done had his great gifts of grandiose and monumental design had free play can be seen from his magnificent fresco in the hall of Lincoln's Inn, and from such paintings as 'Love and Death,' 'Hope,' 'Eve,' etc. As a portrait painter he belongs to the great school of Reynolds; portraits like those of 'Lord Shrewsbury' and 'Joachim' show the same greatness of conception and the same supreme gifts of imaginative intuition. His statues, like 'Clytie' and 'Vital Energy', have given him a great reputation as a sculptor.

D. G. Rossetti (1828–1882), though associated with the Pre-Raphaelites in the earlier stages of their movement, was essentially an emotional or romantic painter. Among his more important works are 'Beata Beatrix' (National Gallery), 'Dante's Dream' (Liverpool Corporation Gallery) and 'The Bride' or 'The Beloved.'

F. Madox Brown (1821–1893) was also at one time a member of the Pre-Raphaelite group. In his designs for the decoration of the Manchester Town Hall, and in such pictures as 'Work' (Manchester Corporation Gallery) and 'The Last of England' (Birmingham Corporation Gallery) he proves himself an artist of sincere and unbending talent, passionate in conception, impressive and convincing in execution.

With our limited space we cannot speak in detail of the beautiful and expressive work of the English Water Color painters, like Sandby, Hearne, Rooker, Cozens, Turner, Girtin, Cotman, Cox and De Wint.

SCULPTURE.

Sculpture has never flourished in England owing, it has been said, to adverse climatic conditions. The only really great sculptor England has produced is Alfred Stevens (1817–1875). Among other distinguished sculptors the names of Flaxman, Armstead, Thornycroft, Brock and Gilbert may be mentioned.

ARCHITECTURE.

It has often been questioned whether Architecture should be ranked among the fine arts, which are concerned primarily with the expression of intellectual and imaginative ideas, not with the production of objects of utility. The present tendency among architects to reduce architecture to a matter of good, sound, and convenient building emphasizes this objection. But there can be no question of the supreme artistic beauty of the Gothic cathedrals of England. As examples of the early English style (1189–1307) Salisbury Cathedral and the Nave of Lincoln may be cited; the choir of Lincoln is a typical example of the decorated style. The reigns of Henry VIII. and Edward VI. (1536–1540) saw the erection of a large number of grammar schools and colleges; that of Elizabeth the inauguration of the era of the erection of the great domestic mansions. In these buildings the late Gothic style was modified and gradually developed under the influence of the old classical architecture into the Anglo-Classic of Inigo Jones (1572–1652). In the buildings of Wren (1632–1723), such as Saint Paul's Cathedral and the Sheldonian Theatre, Oxford, French influence is more apparent. The 19th century saw a battle for pre-eminence between the Classic and Gothic styles. The restoration of a large number of cathedrals and churches and the erection of an immense number of new churches greatly aided the Gothic revival, but for public buildings the classical style, modified by modern French and Italian ideas of the Renaissance, has generally been adopted. In the latter part of the century the works of Norman Shaw, Nesfield, and Philip Webb initiated a movement in favor of the Queen Anne style, or Free Classic as it is sometimes called. As examples of this style we may mention Mr. Shaw's 'New Zealand Chambers' in Leadenhall street, and a number of country houses. Mr. Shaw's influence on the design of the smaller buildings in the suburbs and country by the erection of houses, etc., at Bedford Park, Chiswick, has been considerable.

ART INSTITUTIONS.

The establishment of the Royal Academy of Arts and state and municipal schools of design and art galleries, has undoubtedly exercised considerable influence on the later developments of British arts; whether this influence has been on the whole beneficial has sometimes been questioned.

The Royal Academy of Arts in London, as it was at first called, was established in 1768. It was an offshoot of an older professional society known as the Incorporated Society of Artists in Great Britain, which had come into existence as the result of the first public exhibition held in London (in 1760) of works by contemporary artists. The constitution of this society was of too democratic a character to suit some of the members. They therefore set about the establishment of a new society of a less representative character, and, as they were fortunate enough to secure the patronage and financial assistance of George III. and were thus enabled to obtain the co-operation of Sir Joshua Reynolds, their exhibitions gradually ousted those of the older society in the favor of the public. The Royal Academy has since maintained itself as the most wealthy and powerful art society of Great Britain; its influence among the better educated of the public has, however, been steadily diminishing of late, and it cannot be said at the present time to be really representative of the body of art workers in this country.

It consists of 40 academicians, mostly painters, with a few sculptors and architects. There is a second order of probationers, called associates, whose numbers vary from time to time, from whom alone the vacancies that occur among the academicians can be supplied. It supports and manages schools for the training of painters, sculptors and architects, the instruction in which is gratuitous. The cost of these schools during the last 30 or 40 years has averaged from £5,000 to £6,000 a year. The total number of students admitted between 1769 and 1900 was 4,697, giving an average of about 36 a year. The distribution of charitable funds is confined to its own members or to exhibitors at its annual summer exhibitions. The average annual amount distributed among its members "has been latterly," to quote a semi-official statement made in 1900, "about £2,000"; the donations to distressed artists who have been exhibitors at the Academy, their wives, and children under the age of 21, has averaged from £1,200 to £1,500. The whole of the funds at the disposal of the Academy are derived from the profits on the annual exhibitions, to which about 1,200 non-members contribute works and about 65 members and associates. The fact that the Academy is thus forced to put the making of a large profit out of their exhibition in the forefront of their activity may possibly account for the disfavor into which they have fallen with a number of the more serious of the younger artists.

The neglect of the art of engraving and of what are often called "the minor arts" of design by the Academy induced the government to open a school of design at Somerset House, London, in 1837, and in 1840 grants were made to establish similar schools in five of the more important provincial towns. In 1852 a Department of Practical Art was instituted, and the formation of a museum was begun which developed into the present Victoria and Albert Museum at South Kensington. About 1880 a growing conviction of the inadequacy of the governmental schools led to the establishment of new technical schools in the principal towns. The municipality of Birmingham established a singularly well-equipped and organized school, as did also the municipalities of Manchester, Glasgow and Leicester.

The British National Gallery, though the collection is small and modern, is among the most representative of European state galleries. It was founded in 1824, by the acquisition of the Angerstein collection. Its accessions are governed by a parliamentary grant of £5,000 to £10,000 a year, but it benefits by a large number of gifts and legacies, the most important of which have been the Vernon gift in 1847, the Turner bequest in 1856, and the Wynn-Ellis legacy in 1876. The galleries contain few poor works and all schools are well represented, with the single exception of the French school.

The National Gallery of British Art (known as the Tate Gallery) is devoted to modern British pictures. The Victoria and Albert Museum has also a number of British pictures, especially in water color. The National Portrait Gallery was founded in 1856, the National Gallery of Scotland in 1850, and the National Gallery of Ireland in 1854. There are also important municipal galleries at Birmingham, Glasgow, Liverpool, etc., and few large towns are without a permanent gallery of some description.

Bibliography.— A history of British Art showing the place it has occupied in the life of the people is a work which has not yet been undertaken, at least with any considerable degree of success; the details of the private lives of the artists have generally attracted more attention than the effects of their works. The only moderately successful attempt to present a reasoned account of the vital influence exerted by the national art is to be found in Richard Muther's 'Geschichte der Malerei im XIX. Jahrhundert' (3 Bde., München, 1893–4), of which an English translation has been published (London 1895–6); the parts dealing with British art have also been brought together and slightly amplified and published separately under the title 'Geschichte der Englischen Malerei' (Berlin 1903). Much valuable information is to be found in Ernest Chesneau's 'The English School of Painting' (Eng. Tr. 1885), R. and S. Redgrave's 'A Century of Painters of the English School' (London 1866), and D. S. McColl's 'Nineteenth Century Art' (Glasgow 1902).

A large number of volumes dealing separately with the works of all the more prominent artists, or with particular schools or periods have, however, been published. The most penetrating criticisms of Reynolds's work are to be found in Northcote's 'Memoirs of Sir Joshua Reynolds' (London 1813–15); 'Conversations of James Northcote' by William Hazlitt (London 1830), and 'Conversations of James Northcote, R. A., with James Ward,' ed. by Ernest Fletcher (London 1901); for details of the artist's life, the 'Life and Times of Sir Joshua Reynolds,' by C. R. Leslie and Tom Taylor (London 1865), should be consulted.

The standard work for the earlier periods of British Art is Horace Walpole's 'Anecdotes of Painting in England' (1st ed., 1762–71, 5 vols.) For the lives and works of the principal artists the following volumes will be found useful: 'William Hogarth' by H. Austin Dobson (London 1902); 'Gainsborough and His Place in English Art' by Sir Walter Armstrong (London 1898); 'Romney' by Humphrey Ward and W. Roberts (London 1904); 'Sir Henry Raeburn' by Sir W. Armstrong, with Introduction by R. A. M. Stevenson (London 1901); 'Sir Thomas Lawrence' by Lord Ronald Gower, with Catalogue of the artist's works, compiled by A. Graves (London 1900); 'The Life of J. M. W. Turner, R. A.' by W. G. Thornbury (London 1862), and 'Turner' by W. Cosmo Monkhouse (London 1879); 'Constable and His Influence on Landscape Painting,' by Prof. C. J. Holmes (London 1902), and 'Memoirs of the Life of John Constable,' ed. by C. R. Leslie (London 1843); 'Dante Gabriel Rossetti as Designer and Writer,' by W. M. Rossetti (London 1899), and 'Rossetti Papers, 1862 to 1870,' compiled by W. M. Rossetti (London 1903); 'Memoir of Madox Brown' by F. M. Hueffer (London 1896); 'Pre-Raphaelitism and the Pre-Raphaelite Brotherhood,' by W. Holman Hunt (London 1905); etc.

Black and White Work.— J. W. Gleeson White, 'English Illustration' (London 1897).

Water Color.— J. L. Roget, 'A History of the Old Water-Color Society (London 1891); W. Cosmo Monkhouse, 'The Earlier English Water-Color Painters' (2nd ed. London 1897); A. J. Finberg, 'The English Water Color Painters' (London 1896).

Sculpture.— Sir Walter Armstrong, 'Alfred Stevens' (London 1881); M. H. Spielmann, 'British Sculpture and Sculptors of To-day' (London 1901).

Architecture.— James Ferguson 'Illustrated Handbook of Architecture' (1855), and 'A History of Architecture' (London 1865); B. and B. F. Fletcher, 'History of Architecture' (London 1896); R. Blomfield, 'A History of Renaissance Architecture in England'; F. Bond, 'Gothic Art in England' (1,254 illustrations) (London 1905); T. G. Jackson, 'Reason in Architecture' (London 1906).

Art Institutions.— Report from the Select Committee on Arts and their connection with manufactures (1836); Report of the Commissioners appointed to inquire into the present position of the Royal Academy in relation to the Fine Arts (1863); Report from the Select Committee of the House of Lords on the Chantrey Trust (1904). Official catalogues and reports of the various galleries, etc.

Author of 'English Water Color Painters.'

35. **Great Britain — English Newspapers.** The English newspaper has scarcely so long a pedigree as some others in Europe. Several German towns had their news-sheets or news-letters in the 15th century, and the Venetian Republic started its official gazette in the middle of the 16th century. There are legends of an 'English Mercurie' published in 1588 under Queen Elizabeth's patronage, but the 'Weekly News' and the 'London Weekly Courant,' both produced in 1622, and after these the numerous 'Mercuries' published by various parties during the civil war are the real beginnings. The censorship of the Restoration killed independent journalism for the next 30 years, and left the field clear to the official 'London Gazette.' A crop of new journals arose on the abolition of the Press Licensing Law in 1695, and in 1702 the first daily newspaper, the 'Daily Courant,' a small sheet printed on one side, made its appearance. But, though the censorship was withdrawn, governments retained the weapon of taxation, and for the next 130 years the history of English journalism is that of a perpetual struggle against heavy and arbitrary imposts. At the beginning of the 18th century, many news-sheets were sold for a halfpenny; in the year of Waterloo (1815) and for nearly 20 years afterward the taxation was four pence a copy, and the usual price to the public six pence or seven pence. Newspapers in those days had a great many readers per copy. News agents let them out for a penny an hour, and sold them in the provinces at a reduced price, when a few days old. In 1836 the stamp-duty was reduced to one penny the sheet, and in 1855 it was abolished, together with the advertisement tax, which was scarcely less oppressive. The paper duty was also diminished during these years, and its final repeal was achieved by Mr. Gladstone in 1861 after a memorable struggle with the House of Lords. It was this complete relief from taxation which in Mr. Gladstone's words "called into vivid, energetic, permanent, and successful action the cheap press of this country."

Certain of the great English newspapers, notably the 'Times' (1778) and the 'Morning Post' (1772) have been continuously in existence since the last years of the 18th century, and their proprietors, especially Mr. John Walter of the 'Times,' rank high among the pioneers of modern journalism. The 'Times' was first printed by steam as early as 1814, and greatly improved its position by its enterprise in this respect. Happily the abolition of the "taxes on knowledge" came in the nick of time to enable the English press to take full advantage of the development of railways and telegraphs. In later days the organization of the press has followed much the same lines in England as in America, a leading feature in both countries being the establishment of agencies for the joint collection of general news. The leading English newspapers have, however, shown great enterprise in foreign, special, and war correspondence. No English journalists have made a more conspicuous mark or are better remembered than the chief correspondents in these various departments, such as Sir William Russell and M. de Blowitz of the 'Times'; Mr. Archibald Forbes, Mr. Laurence Oliphant, and Mrs. Crawford of the 'Daily News.' The English newspapers, like the American, have been able to spend lavishly on their news and correspondence by reason of the large revenues which they have drawn from advertisements. Herein they have the advantage of French, Italian, and even German newspapers, which have not succeeded in developing that side of their business to anything like the same extent. For this reason British and American newspapers greatly resemble each other and differ from all others in their large sheets, numerous pages, and heavy proportion of telegraphed matter.

English newspapers are accustomed to describe themselves as "organs of opinion" and have always taken pride in their power of influencing opinion through their leading articles. Men of great ability and literary accomplishment were employed on this part of their work during the last half of the 19th century, and the chief morning papers regularly presented their readers with three or four leading articles, each a column long and in the conventional form of three paragraphs to each article. The centre page containing these articles was perhaps the most characteristic feature of Victorian journalism. The principle of anonymity was jealously guarded during this period. No one knew the names of the leader-writers, and it was contrary to the etiquette of the profession for any writer to claim the authorship of his article. The opinions expressed were accepted by the public as the opinions of the journal and not the opinions of any individual member of the staff. The aim of the writer under these conditions was to be grave and well-informed, rather than lively or brilliant. The exclusion of the personal element and the constant use of the editorial "we" compelled a rather ponderous pose, and the rigidity of the form and length for all subjects, whatever their importance, led to a certain diffuseness and monotony of treatment. In spite of these defects, the journalism of opinion was never more powerful than in this period and no newspapers ever had a steadier or more continuous influence on public affairs than the 'Times,' the 'Morning Chronicle,' the 'Standard,' and the 'Daily News' during the middle years of the last century. The leader-writing tradition is still powerful, but the old hard and fast conditions have been relaxed. In the last 30 years of the last century, two or three powerful individuals, notably Mr. Frederick Greenwood, first editor of the 'Pall Mall Gazette,' and subsequently editor of the 'Saint James's Gazette,' Mr. John Morley, who followed him as editor of the 'Pall Mall Gazette,' and Mr. Stead, who followed Mr. Morley on the same journal, obtained a personal influence which broke through the anonymous tradition. These writers still used the anonymous form, but there was a quality in their writing which revealed them and gave new life and color to the leading article. At the same time the 'Daily Telegraph' was breaking through the solemnity of morning journalism and bringing a great many subjects, previously thought too trivial for treatment by responsible newspapers, within its range. Mr. L. A. Sala invented a new kind of leading article to which nothing human was alien, while Mr. Andrew Lang (in the 'Daily News') wrote of books and literature with a delicacy and skill which quickly took the public fancy. In the early 80's Mr. Stead came on the scene as editor of the 'Pall Mall Gazette' and introduced many new features, including "the interview," which were regarded at the time as daring innovations from American journalism but most of which have since been adopted by the older established newspapers.

In the 10 years from 1890 to 1900 the changes in the English press were many and rapid. The cheapening of paper, the introduction of typesetting machines, and the improvements in printing machinery — many of them introduced by American firms — led to the starting of many new journals and the enlargement of most existing journals. The 'Daily Mail,' established in 1896, set a new fashion in halfpenny morning journalism which was quickly followed in London and the provinces. Two of the old-established morning papers, the 'Daily News' and the 'Daily Chronicle' subsequently reduced their price from a penny to a halfpenny, and there are now no less than six halfpenny morning journals published in London. In the provinces the penny morning papers still hold the chief position and are conducted with great skill and enterprise, but the halfpenny evening paper has an immense vogue with all classes.

The new conditions have to some extent changed the character of the English press. Sport, fashion, and business as well as amusements and entertainments of all kinds compete powerfully with politics for the attention of the reader. The old verbatim reports of Parliament and public speeches give way to short summaries and descriptive sketches. The Parliamentary sketch-writer is a regular and most important member of the staff. Editors of the old school, like Barnes and Delane of the 'Times,' who directed their journals primarily with a view to influencing public affairs, have grown scarcer in these days, and their successors are more often than not described as "editor-managers." They are expected to cultivate a great variety of interests and to be constantly in touch with the business departments of their journals. The question whether the influence of the press is not seriously diminishing has been much debated in England during recent years, but it is scarcely possible to answer it in general terms. The word "press" covers a great many types of journals and periodicals. There are newspapers conducted with the greatest skill and enterprise which aim rather at reflecting than at influencing opinion and which have great power in emphasizing the prevailing sentiment in times of excitement. But there are still a great many others which directly influence statesmanship and administrative policy by serious, independent, and expert criticism on public affairs. In its literary style the English press stands midway between the American and the French press. The English journalist stops short of the vigorous popular manner of the American, and he scarcely achieves the deftness and subtlety of the French. But on the whole the standard of writing has improved in spite of the introduction of popular features. The newspapers tend to widen the circle of their contributors and to rely less exclusively on their own staffs. There is scarcely any eminent man or woman of letters who is not an occasional writer for the press, and signed articles by experts fill a large space in the daily newspapers. There follows a certain competition of interests which somewhat detracts from the old editorial unity of the English journal, but a greater variety of clever writing is now possible than in the old days when an anonymous staff did all the work.

At the present time (1906) 18 morning and six evening papers are published daily in London, the former including three financial and two sporting journals. In addition to these 76 morning and 138 evening papers are published in the provinces of the United Kingdom. The daily newspapers do not appear on Sundays, their place being taken by special Sunday journals.

Editor of 'The Westminster Gazette.'

36. Great Britain — The Trend of Thought and Literature in the 19th Century. *General Characteristics.*— An almost unprecedented development or expansion of intellectual energy characterized the opening years of the 19th century in Great Britain. The emancipating influences, which had produced the French revolution, were then working in England at their acme of strength, and were generating an intellectual as well as a political and social reformation, which steadily gathered force as the century grew older. The new tide of thought found at the outset its loftiest manifestation in purely imaginative literature. The mighty revival of imaginative literature, amid which the century opened, is only comparable with that of the age of Shakespeare. The highest intellectual energy of the nation seemed to find, at the beginning of the epoch, its complete and most congenial expression in the departments of poetry and fiction. Between the years 1800 and 1825 the works of Wordsworth, Shelley, Byron, Coleridge, Keats, Jane Austen and Sir Walter Scott were the chief triumphs of the intellectual movement which was clarifying man's mental vision and remodelling his aspirations.

After the first quarter of the century the creative literary activity of England showed some signs of exhaustion. But the ebbing was then of short duration. The tide of intellectual energy in the sphere of literary endeavor quickly rose again. The torch that had been lighted by

Wordsworth and Shelley, Byron and Scott, Lamb and Coleridge, soon flamed anew in the hands of Tennyson and Browning, of Dickens and Thackeray, of Macaulay and Carlyle, of Ruskin and Matthew Arnold.

With the sixth decade of the century, a radical change came over the intellectual horizon of the nation. The intellectual spirit no longer contributed the whole of its richest sustenance to the field of great imaginative writing. It long continued to nourish splendid imaginative effort; only when the century closed did the purely imaginative energy, which had flowed on almost continuously from the first, grow sluggish and tame. But midway through the century the intellectual spirit proved fertile enough to produce in new glory and luxuriance a second and a very different type of intellectual fruit. During the last five decades, the intellectual spirit gave a fresh and unexampled impetus to scientific inquiry and to speculation concerning the character and capacity of all animate and inanimate nature. For a generation the poets and novelists, the critics and historians, divided the honors of intellectual exertion with scientific investigators like Darwin, Wallace, Huxley and Tyndall, and with philosophers like John Stuart Mill, Herbert Spencer, Thomas Hill Green, and Leslie Stephen.

When the century was reaching its end, the spirit of scientific inquiry was producing no triumphs so heroic as those associated in the middle years with the names of Darwin and his disciples. But scientific energy was at the close of the epoch still giving notable proofs of activity, while literary energy was comparatively torpid. In the last half of the period science and pure literature may fairly be credited with having slowly changed their relative places in the empire of the British intellect. Pure literature which held the place of predominance at the beginning of the era yielded it to science before the end. The mass of available intellectual energy which had gone at the outset to the making of poetry and fiction, of history and criticism, was ultimately diverted to the cause of science. In general terms, the gradual and peaceable succession of science to the throne which had been occupied by imaginative literature may be said to mark the trend of British thought and literature in the 19th century.

Homogeneity of the Imaginative Effort.— For the purpose of detailed study of the literature of the century it might be convenient to divide it into four chronological sections — each corresponding with one quarter of the period. But there is an essential homogeneity about the whole of the century's literary effort, which renders chronological division undesirable in a brief survey. Specious grounds may be urged for separating the century, in however rapid a general view of its thought and literature, into at least two periods, the one ending and the other beginning at the accession of Queen Victoria in 1837. In 1837 the literary giants of the opening years of the century either were dead or had ceased to write. Among poets, Byron (1788-1824), Shelley (1792-1822), and Keats (1795-1821) had passed away. Wordsworth (1770-1850) had ceased to be a poetic force, save in the sight of admirers more zealous than discreet. Of writers of fiction, Jane Austen had been dead 20 years and Sir Walter Scott five. Among essayists whose work conferred on the literature of the century one of its most distinctive charms, Charles Lamb, the genial king among such literary artificers, did not survive beyond 1834; Hazlitt died in 1830, and although De Quincey and Leigh Hunt lived more than 20 years longer, their best work was done in the pre-Victorian Epoch.

But there is no genuine philosophic ground for detaching the work of these heroes from that of their successors. The writers of eminence, who have exclusive right to the epithet Nineteenth Century or Victorian, prove after allowance has been made for individual idiosyncrasies which in great literature count for much, to belong in spirit to the age of their immediate predecessors. They sought expression for their thought in forms not essentially different from those to which their predecessors devoted their energies, and their thought showed no new departure. It still breathed that faith in the dignity of mankind, in its inalienable right of rational liberty and in the greatness of the human destiny which was the outcome of the French Revolutionary spirit, at the same time as it paid respectful homage to surviving tradition of the great art and literature of a more distant past.

Tennyson (1809-92) who shares with Robert Browning (1812-89) the first place in the poetry of Victorian England, is nearly at all points Wordsworth's successor. Like Wordsworth he was in sympathy, through his prime, with the political and philosophic enlightenment of his era. It was this which he sought to interpret in his verse. He was a careful observer and a sympathetic expositor of inanimate nature. He had Wordsworth's command of poetic diction and melody, and also, it is to be admitted, Wordsworth's tendency to bathos and commonplace, in spite of his keen ear and sense of form. Browning — the twin-peak with Tennyson in the range of Victorian poetry — presents a stronger individuality. He is less closely allied to the writers who flourished in his early youth. But in many of his most striking characteristics,— in the subtlety of his power of psychological analysis, in his robust optimism, in the universality and activity of his interest in current life and literature, in his predilection for study of past history and biography, and even in his indifference to the graces of form which degenerated with him at times into a barbarous grotesqueness — in one or other of these regards Browning betrayed kinship with Coleridge, Byron, Landor and Scott.

Third in the list of those Victorian writers of the imagination, whose lives wholly belonged to the 19th century, stands Matthew Arnold (1822-88). As a poet Arnold marched under the banners of Wordsworth and Shelley; as a critic in prose he was at some points more subtle and less sympathetic, and at other points clearer-eyed and less prejudiced than Lamb or Hazlitt. But the distinctions between Arnold and the earlier essayists of the century are due not so much to difference of epoch or of innate temperament. They are attributable rather to the idiosyncrasies that come of accidental divergences in youthful training and environment. Arnold's native heritage of genius bore an academic impress owing to his association with

Rugby, a great public school of which his father was a distinguished headmaster, and with Oxford, the University whose traditions and temper he permanently assimilated as a young man. Had Lamb and Hazlitt enjoyed Arnold's youthful experiences, their style and sentiment are likely to have worn Arnold's colors. They were at one with each other in their ultimate conception that the æsthetic sense was the sense best worth developing in human life and thought.

The three poets whose genius first blossomed midway through Queen Victoria's reign, Dante Gabriel Rossetti (1828–1882), William Morris (1834–1896) and Algernon Charles Swinburne (b. 1837), all to some extent inherited and developed the tradition of Keats. Rossetti and Morris were painters as well as poets. The former was a leader of the pre-Raphaelite movement, which sought to reproduce in art the simple beauty which distinguished pictorial effort of the early middle ages. As poets, Rossetti and his friend Morris sought their affinity in the sphere of mediæval romance, whence both Keats and Sir Walter Scott had drawn with differing motives much inspiration. Rossetti was almost as great a master of the sonnet as his teachers Wordsworth and Keats, and he and Mr. Swinburne improved on Keats's and Tennyson's aptitude to suggest in metre new and subtle harmonies of music. Swinburne, at the opening of his career, seemed to graft on the sensuous influences of Keats the voluptuous temper of Byron. He cherished the wild aspirations which were bred of the French Revolution. The poetry of Mr. Swinburne's youth ranks among the century's literary glories. He alone of his poetic school still survives. But his late work has hardly sustained the promise of his rebellious early years. The unimaginative spirit of the second half of the century would seem to have discouraged and repressed his poetic development.

The seventh great master of Victorian literature, whose work in spite of the varied aim may best be classed with literary products of the imagination, was John Ruskin (1819–1900), who in that field survived all masters of his generation, save Mr. Swinburne. Ruskin has, like Rossetti and his friends, some claim to be numbered with the disciples of Keats. He devoted himself to expounding an æsthetic philosophy, the germ of which is discernible in Keats's poetry. He gave a very wide interpretation to the attributes of beauty, which he identified with excellence in every kind of human endeavor. In his voluminous writings he sought to define the place that beauty and its manifestation in art ought to fill in human economy. His clarity of style, imaginative insight, and assertive personality invested all his literary work with fascination. But he owes his chief importance in the history of 19th century thought and literature to his masterly interpretation, analysis and application of the æsthetic principles which underlie the most characteristic achievements of the great writers belonging to the generation that preceded or was coincident with the date of his own birth.

Fiction and Drama.— In fiction it might appear as if the spirit which colored manifestations in the early years of the century perished before the later or even the middle years were reached. The centre of gravity may seem at any rate to have shifted somewhat violently between the dates of 'Sense and Sensibility,' 'Waverley' and 'Vivian Grey' on the one hand, and of 'David Copperfield,' 'Adam Bede' or 'Vanity Fair' on the other. Still wider may seem the interval between 'Romola,' 'Esmond,' and 'Barnaby Rudge,' and 'Harry Richmond,' 'Jude the Obscure,' and 'Dr. Jekyll and Mr. Hyde.' But all the masterly fiction of the century aims, through different avenues, at a like goal. It seeks the exact, the vivid, the sympathetic and for the most part the optimistic representation in narrative of the complexities and perplexities of human life and feeling. Whether the novelist rear his structure on historical research or on autobiographical experience, on careful observation of contemporary society, or on imaginative speculation into human potentialities, his success is due to his power of combining in his chronicle artistic presentment of facts of experience with sane and practical interpretation of thought and impulse.

None of the great novelists of the 19th century failed at one or other period of their careers to emulate Sir Walter Scott's method of seeking in history material through which to work out their ambitions. Scott concentrated on the historical novel a mass of learning and a wealth of intuition which no successor inherited. But the spirit which animated his achievements in the art of fiction lived, albeit in attenuated condition, in the labors of Charles Dickens (1812-70) and William Makepeace Thackeray (1811–63), of George Eliot (1819–80) and Robert Louis Stevenson (1850–94). Thackeray reached the highest point of his career as an artist in fiction when he produced 'Esmond,' a story of the time of Queen Anne. Dickens in 'The Tale of Two Cities' and in 'Barnaby Rudge' brought all the vigor of his genius to vivify historic episodes of the century preceding his own. George Eliot proved herself more scholarly and more laborious, and therefore less successful than Dickens or Thackeray, when she sought in Romola to evolve a romance out of the history of the Florentine reformation. Robert Louis Stevenson, master of the most picturesque style among novelists since Laurence Sterne, made his most sustained bid for reputation by pursuing in the chronicles of Scotland the historical trail. The same category embraces the most notable work of lesser luminaries like Bulwer-Lytton, Charles Kingsley and Charles Reade, with each of whose names an historical novel of eminence has to be associated.

Not that the novel of current experience failed to flourish in increasing luxuriance as the years of the century grew. The cultivation of fiction, which reflected the foibles and aspirations of contemporary society, absorbed throughout the epoch literary genius of the most varied and conflicting types. The most conspicuous laborers in this field of endeavor were, during the early years, Jane Austen and Disraeli, while their successors included Charlotte Brontë, Dickens, Thackeray, Trollope and Charles Reade during the middle years of the century and George Meredith and Thomas Hardy during the last years. The century's yield of fiction in all its forms far exceeded in quality and quantity that of any earlier epoch. The stream was continuously replenished and it maintained till near the end a level approximating to that of the first days. But even in fiction the creative energy failed in intensity as the epoch closed.

The drama was the only field of imaginative literature in which England of the 19th century failed to secure conspicuous and lasting triumphs. The standard of excellence which Shakespeare set in the 16th and early 17th centuries was not likely to be reached again. But the dramatic productions of the 19th century proved of smaller value than the efforts of the 17th or 18th century, which, despite their inferiority to Shakespearean drama, maintained a level of permanent interest. No writer of comedy in the 19th century is comparable with Sheridan, not any writer of tragedies with Dryden or Otway. Writers like Browning and Mr. Swinburne, who devoted poetic genius to tragic or romantic drama, never acquired mastery of the true dramatic temper which belongs to the art of the theatre. They proved themselves capable of fine poetic declamation and were skilled in the use of poetic language, but their efforts resulted in the production of dramatic literature for the study rather than of drama for the stage. Bulwer-Lytton, Sheridan Knowles, Tom Taylor and T. W. Robertson are the only English playwrights of the early or central years of the 19th century any portion of whose work lived after its original production in the theatre. Taylor and Knowles essayed romantic drama. Lytton and the rest won their chief fame in the comedy of manners. But immortality was denied them. None of these men courted with any effect the muse of tragedy. Such plays of theirs in the vein of comedy or romance as retained their vogue in a succeeding generation quickly lost the savor of freshness and seemed to breathe in a very short space of time an antiquated or a faded atmosphere. Their fame soon flickered. A chief cause of the failure of drama to attract during the 19th century any substantial or efficient part of the literary genius of the era doubtless lay in the competing claims of the novel. The growing complexity of life and thought rendered it increasingly difficult to give, in the brief and graphic terms of drama, permanently satisfying expression to the complexity of current aspiration and speculation. The art of fiction is freer of conventional restrictions than dramatic art, and gives fuller scope to endeavor, which seeks to interpret variegated experience and manifold human effort.

Carlyle and Macaulay.— The 18th century not only won its literary triumphs by virtue of the exercise of the imagination in poetry and romance. Throughout the century history and criticism, in which the imagination plays a more limited part, were flourishing conspicuously. Henry Hallam (1777-1859) produced between 1818 and 1837 three solid historical works, which anticipated many of the characteristics of the new historical school in England. They were for the most part genuine studies of original authorities and although they betrayed a whig political bias were conscientious endeavors to present the facts fairly. A robust common sense atoned for the lack of sympathetic imagination or broad philosophical temper. But Hallam's labors stand apart and lay for the most part outside the main contemporary currents of intellectual effort. The two representative practicers of the arts of history and criticism in the 19th century — Carlyle and Macaulay — were possessed of far greater literary genius than Hallam and exerted a wider influence. Both were long lived. Their work was well begun before Queen Victoria commenced to reign; it continued long after. Carlyle was born five years before the end of the 18th century and died in 1881. Macaulay was born in the first year of the last century and died in 1859.

Carlyle is one of the most distinctive figures in the whole range of literary activity in the 19th century with which his life was almost coterminous. He was thoroughly imbued with the large ideas of man's social perfectibility to which the leaders of the French Revolution gave expression in their cry for liberty and fraternity. But he was at the same time a potent and censorious foe of many of the social tendencies which the French Revolution set in motion. He warned his contemporaries of the dangers inseparable from the levelling spirit of a democratic age, with a greater practical effect than any man of letters has compassed before by dint of mere passive penmanship. To Carlyle's essays and lectures may in part be attributed that definite recognition of the limitations inherent in a purely democratic ideal, to which, in the earlier decades of the century, the eyes of the mass of Englishmen seemed closed.

Carlyle's finest literary work was done in the fields of history. He toiled complainingly in the dry-as-dust repositories of historical learning, but he did not take so wide a view of the historian's fiction as the greatest of the British historians, Gibbon, nor were his researches so exhaustive or so multifarious as the more recent scientific standard of historical investigation prescribes. But by force of a rare imaginative insight into human action and character, Carlyle recalled to life a series of episodes of the past, with a truth and realism which no poet or novelist, working with unlimited right and power of invention, has excelled in pith and moment. Carlyle's 'French Revolution' (1837) and portions of his 'Frederick the Great' (1858-65) set before the reader historic episodes with something of the dramatic intensity of the historical plays of Shakespeare.

At the same time as Carlyle was working out his destiny, Macaulay was also making masterly contributions, of not altogether dissimilar calibre, to the literature of the century. Macaulay's knowledge of books and records was as great as Carlyle's, if not greater, but his historical achievement remains on a lower plane. He possessed far less imaginative intuition. His mental horizon was limited by temporary conditions of current political conflict. His conception of historic fact was colored by partisan prepossessions, which, viewed in relation to the great destinies of the human race, seem puny, and in a historian, tend to unveracity. Carlyle and even Gibbon had strong prejudices, but their native sentiment was cast in a larger mould. Their preconceptions left the historical spirit in the main unclouded.

In style Carlyle and Macaulay were as the poles asunder. The spasmodic irregularity of the one has nothing in common with the disciplined orderliness of the other. Macaulay's influence on the English prose style of the century has been far greater and on the whole more beneficial than Carlyle's. Carlyle's style was a bow of Ulysses, which none but himself could bend. In other hands it became an implement of burlesque. Macaulay's style which was less impracticable, inherited and developed many of the best features of the prose of the 18th century. It was mainly characterized by a directness and an emphasis which often grew into brilliant and stirring eloquence, although it inclined at times to monotonous rigidity, and at times to declamatory violence. It proved a dangerous style for purposes of servile imitation. The habit of insistent emphasis is apt to degenerate among the incompetent into bombast. At the same time the discreet and intelligent assimilation of Macaulay's prose tends to clearness and point without appreciable sacrifice of grace. Toward the end of the century a passing reaction set in against the metallic clearness of Macaulay's diction, and efforts were made to invest English prose with a subtle elegance and cloudy preciosity to which it was not naturally adapted. The most remarkable of such filigree workers in prose was Walter Pater (1839–94). Another conscious artist in prose was Robert Louis Stevenson but he was endowed with a fertile imaginative power which preserved his style from the vices of pedantry and kept its lucidity intact. Pater devoted himself to æsthetic criticism which he clothed in a delicate and ornate verbal garb. Pater often achieved beautiful effects. But the methods were inseparable from affectations and conceits, which often render his prose difficult to read with understanding. The irresistible vogue of Macaulay's prose style ordained that none should be widely acceptable which failed at any point in perspicuity. John Ruskin, whose æsthetic criticism covered a wider field than Pater's, proved, too, that perspicuity in English prose was not incompatible with artistic beauty and pliancy. Affected prose consequently met with small encouragement; it was cherished by coteries and did not color the broad currents of the century's literature.

The Scientific Tendency.— The trend of English literature and thought was profoundly affected by the scientific and philosophic spirit of inquiry which received a triumphant impulse from the publication of Charles Darwin's 'Origin of Species by Means of Natural Selection' in 1859, and from the inception of Herbert Spencer's 'System of Synthetic Philosophy,' in 1862. The earlier literary work of the utilitarians, Jeremy Bentham (1748–1832), David Ricardo (1772–1823), James Mill (1773–1836), and above all, John Stuart Mill (1806–73), only indirectly touched the imaginative temper of the times. The topics which the utilitarians handled were practical matters of social and political reform, some of which had been suggested by the French Revolutionary movement. The larger conceptions of man's physical or spiritual destiny were for the most part overlooked. The statute book of the realm between 1840 and 1874 reflected the economic principles which the Mills and their disciples disseminated, but neither the great poetry nor indeed the great fiction, bore, in any appreciable degree, trace of the reforming activities or enthusiasm of the utilitarians. Dickens occasionally expanded in his novels the practical suggestions of the utilitarians, but it was elsewhere, it was in the literary presentation of universal features of human nature, that he rendered his most memorable service to literature. The scientific and philosophic movement gathered its greatest force in the years which followed the revelations of Darwin and Spencer. Then at length the scientific spirit spread to the nation's literature and affected the matter as well as the manner. On prose style it exerted an immediate influence. It insisted with a greater force than Macaulay's example commanded on perspicuity as the main virtue of expression, and effectually discountenanced whatever was subtle, obscure or deliberately affected. One scientific writer, Thomas Henry Huxley, who championed and developed the Darwinian doctrine, lived on till 1895. Huxley was gifted with an exceptional clarity of thought and expression, and his range of interest in current affairs secured for his writings a wide general audience. Huxley's labors may be regarded as an efficient agent in the national development of plain-speaking prose.

As far as the new scientific spirit affected pure literature, it may be said to have exerted a hampering effect on imaginative effort. Both George Eliot and Tennyson in their later work showed proclivities to philosophic or scientific speculation, which encumbered their imaginative deliverances with scientific terminology. Till the end of the epoch scientific or philosophic speculation inclined to divide the allegiance of men who were endowed with poetic genius and to dissipate their energies. William Morris, whose poetic gifts enabled him to conquer rich fields of pure romance, devoted most of the energy of his late life to developing theories of social regeneration which had their root in current scientific and philosophic inquiry.

Not that the scientific tendencies of the century went forward without check. Religion at times called literature to her aid in order to rally her forces for conflict with science. A specially vigorous attempt was made in religious circles by the Oxford movement, of which John Henry Newman (1801–90) was the chief literary leader, to stem at the outset the tide of the scientific advance. Newman was a great man of letters whose imaginative powers were combined with great delicacy of style in both poetry and prose. He made contributions of lasting value to the literature of the century. But his reactionary efforts failed to restrain the scientific and philosophic impulse of his era, if they did not by their open defiance of scientific progress consolidate the champions of free scientific speculation, and accelerate their victorious march. An endeavor to effect, on more pacific lines, a compromise between the opposing forces of science and of the imaginative sentiment of religion was made by leaders of another school of thought which was known as the Broad-Church. That school of thought had no greater sympathy with Newman's unbending conservatism than with the revolutionary independence of scientific and philosophic inquiry. The Broad Church leaders, Frederick D. Maurice and Charles Kingsley, were ready and voluminous writers. But their theological or philosophic position was logically unsound, and they failed permanently to affect the trend of contemporary thought, which finally accepted the scientific sway beyond risk of relapse.

It was in the field of history, of all departments of literature, that the scientific spirit most resolutely planted its standard. Workers in history grew in number as the century closed. But only one English historian of the period deliberately persisted in the literary tradition, which Carlyle and Macaulay had dignified. James Anthony Froude, who died in 1894, alone practiced history as a branch of great literature. In his historical work he gave free play to a natural gift of style and a sense of the picturesque. He treated accuracy of detail or judicial impartiality as comparatively of small account. For the time being, Froude is the last representative of the great literary school of historians.

It was in the middle of the century that the scientific spirit invaded the province of history and developed a new view of its aims. Facts were to be accumulated and arranged so as to illustrate and explain the evolution of civilized progress. The scientific method of historical inquiry was first put in practice by Henry Thomas Buckle (1821–62), whose unfinished 'History of Civilization' excited great public interest. The first volume appeared in 1857, the second and last in 1861.

The substantive value of Buckle's labors proved less than he or his admirers anticipated. The field of observation, which he sought to survey, proved too wide for any one man's capacity. His method depended for its success on mastery of minute detail touching every department of human endeavor. The quest of omniscience proved fatal. Many of the generalizations, in which Buckle's scheme compelled him to take refuge, were either disputable or were confuted by more specialized research. But though Buckle's historical work failed long to sustain its authority, its influence was permanent. It encouraged the application of scientific method to historical investigation. It raised the standard of historical accuracy. It promoted specialized research. It encouraged concentration of industry in narrow fields of historical inquiry.

Six men, Seeley (1834–95), Lecky (1838–1903), Freeman (1823–92), Stubbs (1825–1901), Creighton (1843–1901), and Gardiner (1829–1902), were the most conspicuous representatives of the tendency to pursue in history the methods of scientific accuracy. The order in which the names are placed here indicates the progressive ascendancy of specialization in historical research. The six men's modes of work differed in detail among themselves. Seeley and Lecky sought to graft a broad philosophic tone on their historical investigations. Freeman, Stubbs, Creighton, and Gardiner rarely suffered their minds to stray from their endeavors to accumulate and to test the facts which illustrated the evolution of politics or political institutions. As a consequence the writings of Seeley and Lecky assimilated a finer literary spirit than those of their associates. While the permanent value of the scientific treatment of history is now admitted, there is risk of repelling students by too severe a presentation of the results of research, and it may be that the new method stands in need of a greater infusion of literary art before its credentials will be accepted universally. Gardiner, the latest of the 19th century historians to pass away (d. 23 Feb. 1902), labored with rare self-denial within a narrow range of English political history, the early and middle years of the 17th century. He made small endeavor to cultivate the literary graces.

Another indication of the progress of scientific method in the province of literature is found in the energy which has of late years been applied to textual criticism of standard authors and to the publication of historic documents. The British government has undertaken the issue of state papers, of the muniments of great families and of official records. Private voluntary societies have coöperated in such endeavors, and with their aid local archæology has especially been investigated with an unexampled thoroughness. Other private literary societies, like the Early English Text Society, and numerous private publishing firms, following the examples set by the presses of the great universities of Oxford and Cambridge, have placed at the disposal of the public, accurate texts of the great literary monuments of the country. In undertakings like the Dictionary of National Biography and the Oxford English Dictionary, efforts have been made to coördinate and codify on a large scale the hitherto scattered fruits of historical, literary and philological research. All these enterprises are tributes to the ascendancy of scientific method. They bear testimony to the trend of 19th century thought and literature, which shows during the last half, decay of the purely imaginative impulse, and advance of the purely scientific. But there is nothing in the nature of the present situation to preclude the revival in due time of such imaginative energy, as distinguished the first half of the century. Scientific and imaginative achievements are complementary fruits of the intellect. They need not be mutually exclusive. The future is likely to bring to light an accommodation of their respective pretensions to mastery in the realms of thought. There is small reason why science and pure literature should not flourish in perfect development side by side.

Bibliography.— 'The English Poets,' edited by T. H. Ward (vol. IV.); Prof. Saintsbury's 'History of 19th Century Literature' (1905); Essays by George Brimley (1858); Leslie Stephen's 'Hours in a Library' (1874–79); and 'The English Utilitarians' (3 vols., 1900); Prof. Dowden's 'Studies in Literature, 1789–1877' (1878); Forster's 'Life of Dickens'; Prof. Saintsbury's 'Corrected Impressions,' 'Essays on Victorian Writers' (1895), and 'History of 19th Century Literature' (1896); Macready's Reminiscence and Diaries' edited by Sir F. Pollock (1875); Sir G. O. Trevelyan's 'Life and Letters of Macaulay'; Cotter Morrison's 'Macaulay' in English Men of Letters Series (1882); J. A. Froude's 'Life of Carlyle' (4 vols., 1882–84); A. W. Benn's 'History of English Rationalism in the 19th Century' (1906); J. H. Newman's 'Apologropro Vita Sua' (1864); Dr. John Hunt's 'Religious Thoughts in England in the 19th Century' (1896); A. R. Wallace's 'Wonderful Century' (1898), and 'My

Life' (1905); Herbert Spencer's 'Autobiography' (1904); Darwin's 'Life of Charles Darwin'; Herbert Paul's 'Life of Froude' (1905); 'A Bibliography of the Historical Works of Dr. Creighton, Dr. Stubbs, Dr. S. R. Gardiner, and Lord Acton,' edited for the Royal Historical Society by W. A. Shaw, Litt.D. (1903); Lord Acton's 'Lectures on Modern History' (1906).

Editor of the 'Dictionary of National Biography'; Formerly Clark Lecturer in English Literature, Trinity College, Cambridge; Lecturer at the Lowell Institute, Boston; Donovan Lecturer at Johns Hopkins University, Baltimore; Trask Lecturer at Princeton University; Author of 'Stratford-on-Avon,' 'Life of William Shakespeare,' 'Life of Queen Victoria,' 'Great Englishmen of the Sixteenth Century,' 'Shakespeare and the Modern Stage,' etc.

EXTERNAL RELATIONS.

37. **Great Britain — The British Navy.** In one of his essays Emerson drew a vivid picture of the historic association of the English people with the sea, an association which falsified Virgil's famous line about the poor Britons being cut off from the world, by proving the sea to be the ring of marriage with all the nations. "England," he said, "resembles a ship in its shape, and, if it were one, its best admiral could not have worked it, or anchored it in a more judicious or effective position. . . . The shop-keeping nation, to use a shop word, has a *good stand*." Then, with true symbolism, he declared that the white path of an Atlantic liner was the avenue to the king of England's palace front. The king would consult his dignity if he gave audience to foreign ambassadors in the cabin of a man-of-war. That the British people have occasionally lost sight of this identity of their destiny with the sea is sufficiently shown by quite recent periods of their history and instances such as when in the reign of Charles II. the Dutch fleet sailed up the Thames. Byron's lines in Don Juan describe a similar state of affairs:

> Nelson was once Britannia's god of war,
> And still should be so but the tide is turned;
> There's no more to be said of Trafalgar
> 'Tis with our hero quietly inurned;
> Besides the Prince is all for the land service
> Forgetting Duncan, Nelson, Howe and Jervis.

There has, however, never been such distrust of the navy as exists in the case of the land forces, which is the origin of the fact that the Army Act has to be passed through Parliament each year in succession so that theoretically no standing Army can be said to be maintained.

Periods of maritime apathy on the part of the people have always synchronized with naval inefficiency afloat, a coincidence lending some countenance to a saying of the late Lord Salisbury which excited ridicule at the time, to the effect that the people and not the government are responsible for military efficiency. The education of the people is therefore a factor in the continued naval supremacy of Great Britain, for the reason of this occasional straying from the path of safety is probably to be sought in the fact that of all civilized nations the English are the least imbued with history. Again and again the sailor has been at issue with the statesman as when Torrington made his prophetic protest that the government would be afraid when the danger was past remedy. Hood was superseded for the vigor of his protests concerning the Mediterranean Fleet in 1793. Half a century later Rear-Admiral Berkeley threw up his post at the Admiralty as a protest. In 1867 two Lords of the Admiralty resigned. Again, in 1888, a Lord of the Admiralty resigned; and in 1893 abdication on the part of the Board of Admiralty was threatened; all these cases being caused by penurious treatment of the Navy by the government of the day. Gladstone penned truer words than he knew in the Edinburgh Review in 1870 when he wrote of the vast advantages the English people derived "from consummate means of naval defense" and how when exceptional and peculiar advantages are the lot of a nation there is often a counterpoise in insensibility to their value. In this connection it is significant that historians, beginning with Raleigh and ending with Mahan, have been the best advisers. Raleigh it was who first preached what is now known as the blue water school doctrine in the following words: "He who rules the sea rules the commerce of the world, and to him that rules the commerce of the world belong all the treasure of the world, and indeed, the world itself." Take again his appeal to His Majesty "to employ his good ships on the sea, and not trust in any entrenchment on shore." Kinglake in a fine passage of his work on 'The Invasion of the Crimea' cites the unsuccessful bombardment of Sebastopol as an instance of how so unspeakably precious a heritage as the renown of the Royal Navy can be made "second to an ephemeral policy." As a historian he recognized the necessity for regarding the navy as too sacred to be experimented upon or sacrificed to mere expediency. The fact that the country since the battle of Worcester in 1651, has for so long been free from such internal dissensions as cause eyes to be turned inwards instead of outwards over the surrounding sea, or to a land frontier instead of the probable enemy's coast-line, has been an enormous advantage in enabling a fairly consistent naval policy to be pursued.

For some time the policy took the form of laying down two battleships for every one laid down by France. It was clearly shown by the Treasury Committee of 1859 that the result of their inquiries into the relative state of the navies of England and France was to show that England had nearly always been twice as strong in battleships and more than twice as strong in frigates. Subsequently, with the Naval Defence Act of 1889, there came into vogue the two-power standard of equality with the two leading European maritime powers combined with a margin of safety for contingencies such as the intervention of a neutral power. In 1899 the First Lord of the Admiralty after specifically stating that British naval expenditures simply rose and fell *pari passu* with the new ships laid down by the European powers, offered on behalf of Great Britain to reduce our programme if the other powers would do the same. Since the recent war there has arisen a school which claims, that as policy determines armaments, the Russian navy having for the time being vanished, and relations with France being friendly, the British Cabinet need only consider Germany. Against this it is urged with some force that as it takes two years to build a battleship and four to six years to build a number of them, it would be folly to neglect the possibility of Franco-German combination. History is replete with instances of the greatest enemies making common cause, as in the partition of Poland or the coercion of Japan by Germany, France and Russia in 1894. As regards the United States the best indication that British naval preparations are not made with any thought of war with that country is to be found in the fact that she does not maintain any squadron on either coast of North America, and has abandoned her naval dockyards in Canada.

Relative Strength.— The old doubling the chief-rival standard and the two-power standard, both appear simple enough, but the bitter controversies in the English press prove the problem of relative strength to be one of some complexity. This will be appreciated still more if ever the details of a disarmament scheme come to be examined. Thus the British official return of the fleets classes both the Dreadnought of 1906 and the Rodney of 1883 as first-class battleships. Count of heads unchecked by age is therefore clearly misleading. Tonnage comparisons are equally so from every point of view. The wood-sheathed bottoms of many British ships adding say, five hundred tons to the displacement, the extra quantity of coal carried for the purpose of keeping the seas do not add in the slightest degree to the fighting power on the day of battle. It is absurd on the face of it to allow as much fighting value to a ton of compound armor in the Royal Sovereign as a ton of the latest Krupp armor when the latter has over twice the stopping power. How misleading is a tonnage comparison can be seen by contrasting the Japanese Asama, which did so well in the war, with the British Kent of 100 tons more displacement. The Asama has two inches more armor, has the same battery of six-inch guns, two additional eight-inch guns, and has equal speed. The Rurik of 10,923 tons was easily defeated by two vessels whose aggregate tonnage was 7,350 tons.

The following is a complete statement as to the strength of three nations in vessels being maintained, and ships building and projected, adopting the classification of the British Admiralty's official return:

	Great Britain.		*France.*		*Germany.*	
Battleships:						
First class.......	57	57.	31	41.	26	39.
Second class....	0		9		4	
Third class	0		1		9	
Large coast defence vessels...	0.		3.		0.	
Armored cruisers.	38.		23.		9.	
Other cruisers excluding unprotected cruisers.	71.		37.		34.	

Taking the first-class battleships which will be built or building according to the programmes by Jan. 1908, we can divide them into five categories and include the United States for comparative purposes.

All first-class battleships built or building on first of Jan., 1908, less than

Nation or Combination.	23 years old.	18 years old.	13 years old.	8 yrs. old.	Laid down or projected 1905-7.
Britain	58.	52.	37.	19.	6.
France	23.	22.	17.	12.	6.
Germany	28.	27.	24.	16.	6.
United States (a)	28.	28.	24.	16.	4a.
France and Germany ...	51.	49.	41.	28.	12.
Germany and United States (a)	56.	55.	48.	32.	10.
British force as a percentage of the 3 Powers	p. c. 73.4	p. c. 67.5	p. c. 56.9	p. c. 43.2	p. c. 37.5

(a) Does not include any programme for the United States in 1907. The Navy Department proposed in November, 1906, an immediate addition of two more battleships.

The cause of the steady decrease in the relative British strength as old ships are discarded lies in the great building efforts of the maritime powers since 1895, as disclosed by the following table dealing only with first-class battleships laid down in the years named:

	1885–9	1890–4	1895–9	1900–4	1905–7
Great Britain..	6.	15.	18a	13.	6.
France	1.	5.	5.	6.	0.
Germany	1.	3.	8.	10.	6.
United States..	0.	4.	8.	12.	4b

(a) Excludes Montagu.
(b) Does not include programme for 1907.

It should be noted that of the 58 British battleships enumerated in the above list, only the most modern 16 have complete armor protection for their water line, whereas all the French and German ships have complete belts. In a seaway the British ships would derive an advantage from their deeper belts amidships. Setting aside the cruisers which have their special functions in war, we may next compare the gun equipments.

It is obvious when a 12-inch gun of a few years ago is out-classed by a modern 9.2-inch gun of to-day, that the total guns according to size or calibre is no measure of strength. The theoretical perforation of the guns using capped projectiles against the latest Krupp armors at 5,000 yards is the best indication of their relative value. Excluding the armored cruisers which have their special functions to fulfill in war, the guns mounted in armored vessels by Great Britain, France and Germany may be classified as follows:

	Capable of piercing strongest armor	Belts of most battleships	A great number of defended positions	Armor belts of most cruisers
Theoretical penetration	17.5″ to 18″	14″ to 1[illegible]″	11″ to 13″	7″ to 10.5″
Great Britain.....	48	84	68	92
France...........	40	[illegible]	110	64
Germany..........	64	..	40	40
France & Germany	104	16	150	104

It is quite clear from the comparison that Great Britain is completely out-classed by 1910 in the best guns for long range. In the table it has been assumed that the press reports as to the armaments of the new German battleships being sixteen 11-inch guns is correct. In 1908 Great Britain will probably lay down at least two battleships or the equivalent of 20 guns, but Germany will also lay down two, with say, 32 guns, and it is an open question whether France will add to her programme.

In the case of cruisers Great Britain is building three 'armored cruisers' each carrying eight 12-inch guns, or guns capable of piercing the heaviest armor afloat; and Germany will lay down similar vessels at the rate of one a year. Setting aside these cruiser-battleships Great Britain has 35 armored cruisers carrying 56 guns capable of attacking any armor in any cruisers afloat, while France and Germany have 31 cruisers with 6 guns equal to those in the British cruisers and 52 but slightly inferior. The British Admiralty have expressed the opinion that the best of the 71 protected cruisers which are still retained must die out in the course of the next few years. It is difficult to see how the seas are to be effectively policed in face of determined attacks by unarmored vessels on the trade routes if reliance is only to be placed on 35 armored cruisers.

Natural Resources.—The introduction of steam and iron ships led to Great Britain becoming the great shipbuilding and shipowning nation and so strengthened her maritime position. Almost everything from the material for the hull to that for the motive power was formerly imported. Even the rapid introduction of oil fuel, for which Great Britain at present only possesses the Burmese supply, is no disadvantage to a power whose dual policy is to command the sea, so insuring safe communications to her oil-fuel steamers, and to keep on good terms with the United States which possesses the only other known oil-fuel supply outside Russia. In addition oil fuel, unlike coal, can be stored without deterioration. The natural tendency of the human mind is to be pessimistic in its outlook as to the effect of change of inventions in the future. It is not surprising, therefore, that in 1830 the Lords of the Admiralty should have issued a circular placing on record that they "felt it their bounden duty to discourage the introduction of steam, as calculated to strike a fatal blow to the naval supremacy of the empire," and in 1850 a Royal Commission should have prophesied that future wars would still be fought under masts and sails. The tendency of invention, as for instance in wireless telegraphy, is to increased reliability and certainty. Such a tendency must necessarily operate more powerfully in favor of the strong rather than the weak. The sea, it has been said, will only tolerate one mistress. While the weapons of war and their adjuncts were uncertain and fitful in their operation, it was, however, the case that a weak power resorting to the tactics of evading direct conflict could prolong an irritating struggle on the sea even as the Boers did on the land in South Africa. The old difficulties in obtaining and transmitting information have, however, practically vanished on the sea. The monopoly of both submarine cables and shipping practically lies in the hands of Great Britain and with them she has a great addition to the power of her navy to control the sea in war.

The Distribution of Naval Force.—If invention has been of main assistance to Great Britain in the provision of naval force it has also aided her in its economical distribution. It was impossible for sailing-ships able to move directly over only five-eighths of a circle at a speed varying with the direction and the force of the wind, and reduced to helplessness on a lee shore, it was impossible for such ships to control a great area of water with the facility of steamships aided by wireless and other forms of telegraphy. To take a simple instance, a sailing vessel endeavoring to make Gibraltar Harbor might be delayed off the Straits for as long as six weeks.

The complications formerly introduced into the distribution of naval force by the fact of small neutral powers possessing fleets, have vanished as the expense has become prohibitive. A Dreadnought costs eighteen times as much as a line of battleship such as Nelson's *Victory* a century ago, and eight times as much as the *Duke of Wellington* fifty years ago. The result has been to confine the business of naval war to seven great maritime powers and has led to the remarkable state of affairs at this moment by which the European powers limit their battleships solely to European waters. The difficulty of maintaining the British policy of sea supremacy in view of heavy expenditure and the relative increase of wealth and population in rival countries, must depend in the not distant future on how far the British colonies, on emerging as nations, are disposed to make common cause with the mother country in the maintenance of the navy.

The distribution of the British fleets, in spite of the relief obtained on the China station in consequence of the destruction of the Russian fleet, vividly illustrates the responsibilities falling to it from an Empire of 12,000,000 square miles with 43,000 miles of coast line. Only 1.1 per cent of the Empire is at the seat of government in Europe. Throughout 1906, the distribution of the Navy was as follows:

	At home in commission or in reserve.	Abroad,	Cruising
Battleships	29.	16.	
Armored cruisers including Diadem and Powerful classes	20.	15.	
Large protected cruisers	10.	8.	10.
Small cruisers.....	18.	15.	
Destroyers	95.	47.	

The German fleet on the other hand, like the German Empire, is to all intents and purposes, concentrated. Having regard to the increasing demands made on the British Navy, the extraordinary stringency of which will become obvious in war when British fleets endeavor to keep the sea while important units incur the ordinary accidents of navigation or are away coaling and refitting, it is very much open to question whether adequate provision is being made for the future. A combination of France and Germany would place 516 torpedo craft and 91 submarines on the sea, or over double what is possessed by Great Britain, and some successes on the part of these craft as well as the dangerous floating mines must be provided for. Taken in conjunction with the dispersion of the British force and the disquieting tables given above, the success of Great Britain in face of a combination is by no means as certain as ought to be the case in view of her military policy. That policy in 1901 provided 435,000 men to defend the country against invasion. In 1905 it was altered to a force to defend against a smaller invasion of 70,000 men. In 1906 the Army was organized for service abroad, its passage to be safeguarded by the Navy, while the Navy was to defend the country against everything but minor raids of a few thousands of men. In other words, the Government while cutting down the relative naval strength, demands from the Navy the absolute certainty of successful defence in war.

Personnel.— In 1903, with some subsequent modifications, a system of providing officers was introduced by which there was established a common system of entry and training for the three great branches of executive officers, marines and engineers commencing at 13 years of age. Specialization for the different branches of engineering, marines, gunnery, navigation and torpedo was to commence at about the age of 22 to 23. It is still in some doubt whether the separation of the three great branches will then be permanent or temporary. At one time in 1905 it was decided that complete amalgamation should take place as is the case in the American Navy in regard to the line and engineer officers, but the new Board of Admiralty, with the change of government in 1906, claimed a free hand to defer any decision. Complete amalgamation was urged by the old Board on the ground that otherwise no volunteers would be forthcoming for the engineer branch, as none of the young officers would forego the chance of commanding fleets and ships. The original scheme of common entry and training was held to be justified in practice by the belief that it had succeeded in America, but serious doubts were thrown on this by later information and by the reports of Admirals Melville and Rae, who succeeded each other as head of the American naval engineering department. Historically it was held that the military officer had always combined his work with that of handling the motive power. This is too sweeping a statement, for the sailing period in history was relatively brief, and in a previous period, when the motive power as to-day was internal to the ship instead of external, the oarsmen were separated from the military element. There were the strongest reasons in the period of sailing ships for combining the two functions. The whole art of fighting consisted in bringing guns to bear with the greatest effect, and this entirely depended on watching the sails, taking advantage of shifts of wind, while the men at the guns, who were necessarily under the control of the combatant officer, had also to be used to work the sails. To disable the motive power of an enemy was equivalent to crippling his gun power. Things are absolutely reversed to-day. The motive power is purely mechanical, is completely protected below the armored deck, and is out of sight of the seaman. The latter cannot follow his calling as a combatant and be in the engine-room at the same time. In addition it was contended that to allow the ordinary officer to take charge of marines would result in the ultimate extinction of the marine whose cost was one-third of that of a seaman, whose discipline was much more reliable, and who, as the annual prize firing returns proved, was the better man at the gun. These in brief were some of the arguments presented by men of such standing and influence that there did not seem to be any likelihood of permanence about the new system of providing officers.

As regards the men, for 50 years they had been entered under a long service system of 12 years. The system has lately been tempered by entering a certain number for shorter periods with subsequent service in the Royal Fleet Reserve, and the latter is also recruited from pensioners who had served their full time in the navy. In 1906 this force numbered 19,500 men. The old pensioner reserve which is to be allowed to die out numbered nearly 6,000 in 1906. In addition there is formed out of the merchant service and fishermen the Royal Naval Reserve of about 28,000 men. Allowing for the Royal Naval Volunteers 3,800 men, and Colonial Reserves in Newfoundland and Australia 1,400 men, we obtain a total of 58,528 in reserve and 129,000 serving in the navy. The tendency is, however, to discourage the Royal Naval Reserve on the ground that it would deplete the merchant service of British seamen during war and that with the large permanent force and Royal Fleet Reserve the country has ample men. It is held that the waste of war is rather one of material than men, and that the result is that if the supply of men in proportion to ships is adequate at the beginning of war it is in excess of requirements after a short period of hostilities, the conclusion being the reverse of that universally acknowledged in the case of land war. Certainly in 1906, following on a policy of rooting out all obsolete vessels the permanent force of 129,000 men was capable of manning all the ships with but slight reinforcement from the reserves. This marks a notable change from the beginning of the 18th century when the manning difficulty was Great Britain's chief concern, so much so as to lead her into a war with the United States rather than sacrifice her system of impressing those who were believed to be British seamen wherever found. At that time enough officers and men were employed on the impress service alone to have formed the crews of half a dozen line of battleships while vessels remained out of commission in war for want of men. The habit of looking to the seafaring profession to man the navy on the outbreak of war resulted in large fluctuations. Thus in 1762 85,000 men were borne, whereas in 1773 when England was at peace less than 22,000 were borne. The next year war broke out and the number rose in 1781 to over 99,000. In 1792 or a few months before the French Revolutionary War it was just over 17,000 men and by 1814 it rose to over 126,000. As a contrast it may be mentioned that at the present time while the regular fleets are concentrated and ready to strike an immediate blow, many of the remaining ships of fighting value have a nucleus crew of all their officers and skilled ratings. To commission such ships for war is a mere matter of a few hours involved in marching the seamen, stokers and marines from the barracks. The skilled ratings being kept in contact with the ships they have to serve in, break-downs should be less frequent if repairs are attended to, whereas formerly these delays were a feature with newly commissioned ships. The progress in training is equally remarkable, the year 1906 being one of what are popularly called "records" in gunnery as well as coaling. It is interesting to note that in this respect there is a friendly rivalry between the British and American navies, the record for the former with the six-inch gun being 12 rounds in 60 seconds with 11 hits, and for the latter the Pennsylvania's achievement of 17 rounds in 90 seconds with 17 hits. The British record with the 9.2-inch gun is the remarkable one of 10 hits in 11 rounds fired in 90 seconds.

The Admiralty.— It only remains in the short space at our disposal to say a few words as to administration. The Board of Admiralty is organized on a constitutional basis, giving complete cabinet control. The First Lord of the Admiralty decides the duties of the different members. As the board never votes, if there is a disputed point, the First Lord decides, and he can lean on the junior Sea Lord as much as the senior, for constitutionally all are of equal status. The arrangement has worked so well that a recent change by which the junior Sea Lords are ordered to consult and report on all important questions with the First Sea Lord has been sharply attacked. This view of Admiralty procedure was well described by a former First Lord of the Admiralty, Lord George Hamilton, in the House of Commons in 1905:

> The Board of Admiralty met for general consultative and advisory purposes, and every Naval Lord was in a position of perfect equality. He attached great importance to that equality of *status*. It had made the Admiralty efficient, and the want of it had made the War Office inefficient. There were always in the Navy two schools—the young school and the old school—and the probability was that the old school would be more represented by the Senior Naval Lord. If the First Lord was a sensible man and had free access to the inner minds of the Junior Lords, he very often got hold of some idea of the new school, which he put forward in his name and which the Senior Naval Lord accepted, though he might not have been inclined to do so had it originated entirely with the new school.

The drawback is that Parliament has no cognizance of the views of the experts as Congress has through the admirable reports of the chiefs of the various naval departments. A commission under the present Duke of Devonshire 16 years ago urged that the American practice should be followed, but nothing has been done. As Parliament has no expert guidance and the navy estimates can be readjusted between the Treasury and the Admiralty after they have been voted, while no particulars are given of the construction programme, which does not even indicate whether the ships are to be battleships or armored cruisers, it is clear that Parliament has been deprived of all effective control. The tendency that results is for individual members to object to the magnitude of the naval estimates rather than to discuss the reasons which have guided the government in presenting them.

Bibliography.— Of late years there has been a great improvement in works dealing with the British Navy. Former histories were mere chronicles of events. The following works may be consulted with advantage: Colomb's 'Naval Warfare'; Mahan's 'The Influence of Sea Power upon History,' 'The Influence of Sea Power upon French Revolution'; White's Cantor Lectures at the Society of Arts on 'Modern War Ships'; 'The Naval Annual' (1886 to the present day); 'Journals of the Royal United Service Institution'; 'Transactions of the Institutions and Admiralty Instructions' (1906); 'The Navy Records Society'; Clowes', 'The Royal Navy' (5 vols.); White's 'Naval Architecture'; The Royal Navy List (quarterly).

Official Publications.— 'The King's Regulations and Admiralty Instructions' (1906); 'The Navy Estimates' (annual); 'Statement of the First Lord of the Admiralty explanatory of the Navy Estimates' (annual 1887 to the present day); 'Report of a Treasury Committee on the Relative State of the Navies of England and France, 1852-58,' No. 182 of 1859; Return No. 168 of 1860, statistics of ships, men and money voted for each year from 1736 to 1859; Returns dealing with relative naval strength No. 218 of 1888, No. 90 of 1889, No. 465 of 1893, and Return of Fleets (Great Britain and Foreign Countries) for 1897 and subsequent years; the Statistical Reports of the Health of the Navy (annual); Cd. (2416) of 1905 showing distribution of work among the Lords of the Admiralty; annual returns are also published as to court-martial and summary punishments, the gunlayers' competitions, and Hydrographer's report as to Admiralty surveys.

CARLYON BELLAIRS,
Lieutenant Royal Navy, M. P.

38. Great Britain — The British Army. *The Regular Army.*—The British Army is in many respects like the British Constitution. It has grown, it has not been made. No single idea has dominated its history, no directing mind has prescribed its form or defined its functions. But while the forces, which formed and moulded the British Constitution, and made it from time to time the reflex of the prevailing opinion of the British people, have exercised a constant pressure—a pressure which has never been relaxed—the forces which have produced the British Army of to-day have been intermittent and irregular. The history of the British Army is a long record of the vicissitudes of public favor and public neglect. To a nation in whose long history the gates of the Temple of Janus have rarely been closed for a decade, each new war has come as a surprise. Every war, whether it has ended in victory or defeat, has furnished the British people with lessons which they have vowed to learn and never to forget, and which they have invariably forgotten before the ink has dried on the peace preliminaries. Every war has brought with it good resolutions born of anxiety and alarm, and every peace has produced the apathy, the neglect and the self-confidence which are the outcome of real or fancied security.

It would be unjust, and untrue to historical teaching, to infer from these facts that the British are an unwarlike, or, in all their public concerns, an improvident people. The population of the United Kingdom is composed of warlike races, and in regard to the conduct of public affairs it cannot be said that England has been behind the rest of the world. But it is possible to be a warlike without being a military nation, and there can be no doubt that the scientific evolution of a consistent military policy in the United Kingdom has not kept pace with other branches of national development.

The reason is not far to seek. An insular position and the immense protection afforded by a powerful navy have relieved the inhabitants of the British Islands from the dangers which ever threaten the great nations of Continental Europe whose long land frontiers expose them to attack by an ambitious and unfriendly neighbor. For nearly 300 years the people of England have been spared the knowledge of what war on their own soil actually means. While from Brest to Moscow, from Bergen to Gibraltar, every part of Europe has rung to the tramp of hostile soldiery, and has been the suffering witness of the tragedy of war, the dwellers in English counties carry back their immemorial tradition of undisturbed peace to the day when Oliver Cromwell won the last great battle fought on English soil on the field of Worcester.

Once, and once only since the creation of modern firearms did the people of England come in contact with the realities of war. In 1645 Parliament in conflict with the king found itself confronted by the necessity of fighting, or surrendering to an implacable enemy. Following the custom of the country, the House of Commons sought at first to meet the emergency by the aid of amateur soldiers, maintained by voluntary contributions. But the logic of facts soon convinced them that war cannot be trifled with. The "New Model" Army was called into existence by Act of Parliament, funds were provided by vote of the House of Commons, compulsory service was imposed when volunteering failed to produce the required number of men; and the recalcitrant were hanged. A Regular Army was called into existence, and that Regular Army almost immediately became a "Standing Army." It is from the days of the "New Model" that the history of the Standing Army of England really dates. War on English soil taught its lessons to a practical people. To the Commonwealth England owes, not only the establishment of her Standing Army, but the actual groundwork of the military institutions of the present day. One of the most famous regiments of the British Army, the Coldstream Guards, came into existence at this time; and the very establishment of the modern British Cavalry and Infantry regiment is practically what it was made by Oliver Cromwell and the soldiers of his day.

In 1651 the Civil War ended. In 1658 Oliver Cromwell died, and a military *Coup d'etat* placed Charles II. on the throne. Never since that day has a British Parliament legislated for the army with a knowledge of war borne of experience. A generation grew up which had forgotten the lessons of Marston Moor and Worcester. The reaction was prompt, and its effects far reaching. The army soon came to be regarded as an evil, scarcely a necessary evil. The soldier soon learnt that the utmost he could expect was toleration. The accession of a foreign king surrounded by Dutch guards increased that antipathy to the army, which for the next two centuries marked the proceedings of Parliament. In 1689 was passed the first Mutiny Act. The primary object of the Act was to confer upon the sovereign the right to punish certain military offences not dealt with by the ordinary law; but the Act contained a section of a totally different purport. The words which have become famous run as follows: "The raising or keeping of a Standing Army within the United Kingdom of Great Britain and Ireland in time of peace, unless it be with the consent of Parliament, is against law."

The law as passed in the time of King William III. is to this day solemnly re-enacted every year by Parliament, and the illegality of maintaining a Standing Army is palliated by a special Act of Dispensation for one year only. This annual performance has become a meaningless anachronism. The necessity for maintaining a Standing Army in time of peace is no longer questioned or questionable, and the army itself has long ceased to be the instrument of a sovereign, and has become the servant of the nation. But the original passage of the Act and its renewal by many succeeding Parliaments is typical of the tone and temper of the Legislature toward an institution which is as essential to the safety and welfare of the State as Parliament itself.

The result of this want of sympathy between Parliament and the army is very noticeable. The favor of the Legislature, and the funds which that favor can alone provide, have been available during periods of crisis and national danger: They have been grudgingly given or withheld in those intervals of peace which ought also to be intervals of preparation. As a result there has been an absence of continuity, and of deliberate adaptation of means to ends, which has greatly interfered with the proper development of the military power of Great Britain, and have provided her with military institutions which bear upon them the unmistakable evidence of their having been created at haphazard, altered to meet political rather than military exigencies, and adapted to meet a single emergency rather than to deal scientifically with the work of a world-wide empire.

Under these circumstances the services which the Regular Army of Britain has rendered are indeed a marvel. In every land and under every sky, against the highly trained armies of Europe, against the half disciplined hosts of Oriental princes, against savage tribes, formidable by reason of their fanaticism, courage and numbers, the Regular Army of Britain has fought with varying fortunes but with never failing tenacity and devotion. There is no soil which does not cover the grave of the British soldier. In the broad valley of the Danube, on the plains of Belgium, on the shores of the Black Sea, in the passes of Spain, among the vineyards of France they are to be found. The "Redcoats" have fought and died on the plains of India, under the walls of the imperial cities of China; on the heights of the Saint Lawrence; in the valley of the Hudson; under the ramparts of New Orleans; in South American cities; before the stockades of the Maori in

New Zealand and in innumerable islands in every sea. On the great African Continent, North and South, East and West, from the Pyramids to Table Mountain; from the blazing shores of the Red Sea, to the swamps of the Gold Coast and the Niger, they have obeyed orders, and laid down their lives for "the safety, honor and welfare of their Sovereign and his Dominions." But they have not died in vain. If it be true that the tap of the British drum follows the rising sun round the world, it is true also that the planting of the British flag in five continents is largely due to the patient heroism of the British soldier. Rarely commanded by generals of exceptional genius; almost invariably suffering from the apathy and neglect of Parliament in peace time, and from the faulty administration in war which is the certain result of neglect in time of peace; the British soldier by dint of certain great qualities which he possesses has held his own. To the Regimental Officers and to the Non-Commissioned Officers credit is above all due. They have been, and still are, the true strength of the British Army.

What is the nature of this Army which has suffered and accomplished so much? In its character and composition it is as unique as the circumstances which have created it. There may be better armies than the British, there are undoubtedly worse armies, but there is no army like it. It shares with the Army of the United States the peculiarity of being recruited by voluntary enlistment and not by compulsion in any form. It has a further peculiarity which, until recent foreign conquests planted the Stars and Stripes in the China Seas, distinguished it even from the Army of the United States. Nearly half of the Regular Army of Britain is maintained on a war footing in time of peace, is maintained in distant lands, and to a large extent in tropical or sub-tropical countries. The population of India is 300,000,000 and the military force which defends the great Peninsula and keeps the peace from Quetta to Cape Camorin does not exceed 231,000 all told. Of these 78,000 are British soldiers enlisted within the United Kingdom; the remainder are the troops of the Indian Army, 152,825 natives commanded by British Officers. There are also 14,917 "Imperial Service" troops raised by Native States and held at the disposal of the government; 20,731 Reserves of the Native Army, and 31,966 white volunteers. South Africa, the Mediterranean fortresses of Gibraltar and Malta, the distant Eastern Ports of Singapore and Hong Kong, make further demands upon the Regular Army. On 1 Oct. 1905, there were 142,203 British troops serving abroad. It is the necessity for maintaining this great force abroad that makes the British Army essentially a voluntary Army. Conscription for service abroad in time of peace is impossible. The young soldier cannot endure the climate of India, and a youth enlisted at eighteen, must perforce remain for two years at home before he becomes physically qualified for foreign service. This fact not only makes it necessary that the service should be voluntary, but that it should be long and that it should greatly exceed the limit of two years which is the term now accepted in the principal conscript armies of the world.

For this voluntary Army there are enlisted on an average 38,000 men a year. The total is sometimes exceeded; there is rarely any difficulty in reaching it. There is no reason why there should be a difficulty. The old prejudice against military service due to the savage conditions of the soldier's life, his scanty pay, his squalid surroundings, lived long and died hard; indeed it is not altogether dead yet. But the life, pay, and prospects of the British soldier at the present day are such as may reasonably attract young men of spirit and ambition. The pay itself, though not excessive, is good. An Infantry private of 20 years of age serving at home receives on an average, week in and week out throughout the year, 11/7d. ($2.50) in cash after every deduction has been made for "stoppages" compulsory and voluntary. When the soldier receives his pay every need has already been provided for. He has been clothed, fed, housed, doctored, and educated; his general health has been looked after, his amusements furnished. If he chooses to remain in the Service his pay increases with every step in rank; and, if his conduct be good, he may look forward with certainty to retirement at the age of 39 with a life pension. It is not true to say that all the recruits who enter the Army are good, or that they all become useful soldiers. Many are not good, and never become so. But the unfit are soon eliminated and the quality of the special branches, the Royal Engineers, the Royal Artillery, the Cavalry and the Guards is very high. A British regiment returning from India after a long tour of service in that country, will bear comparison with any body of fighting men of equal numbers in the world.

The composition of the Regular Army at the close of the year 1905 was as follows:

STRENGTH AND COMPOSITION OF THE REGULAR ARMY (ALL RANKS), WITH THE COLORS ON OCTOBER 1, 1905.

	All Ranks.
Household Cavalry	1,360
Cavalry of the Line	19,149
Royal Horse and Field Artillery	30,550
Royal Garrison Artillery	24,174
Royal Engineers	10,718
Foot Guards	8,055
Infantry of the Line	150,955
Colonial Corps (on Brit. Estab.)	6,220
Army Service Corps	6,944
Royal Army Medical Corps	5,049
Army Ordnance Corps	2,423
Army Pay Corps	856
Army Veterinary Corps	*149
Total	†266,658

*There were in addition 6,475 officers and men borrowed from India for garrison and expeditionary purposes, borne on the British Establishment at the date named.

†The Secretary of State for War has recently announced (July, 1906), that he proposes to reduce the regular army by 10 battalions of infantry and nearly 4,000 officers and men of the Royal Artillery, making 20,000 men in all, exclusive of reserves.

STRENGTH OF THE ARMY RESERVE ON OCT. 1, 1905, *94,770.

DISTRIBUTION OF THE REGULAR ARMY, OCT. 1905.

United Kingdom	129,930
India	78,061
Colonies and Egypt	63,185
Crete (temporary)	977
Total	272,153

*Since increased to over 120,000. This increase is temporary only, and due to exceptional causes.

The ordinary period of Color Service in the British Army varies from six to nine years, but the Brigade of Guards are enlisted for three years with the Colors, the men having the right to prolong their service to eight years. Soldiers are generally permitted, if their conduct has been good, to extend their first term of service and to remain with the Colors for 12, and in some cases, for 21 years. In addition to the men with the Colors there are the men forming the Army Reserve. The Army Reserve is an outcome of the great reform accomplished by Lord Cardwell in 1870. That distinguished War Minister was the first to divide the soldiers' service into two periods, the first with the Colors, the second in the Reserve. The Reservist is liable to be recalled to his Regiment in case of war or national emergency only.

The recruits for the Regular Army are drawn from all parts of the United Kingdom, the figures for 1905 being as follows:

	Total number of recruits approved.
England and Wales	27,314
Scotland	3,842
Ireland	3,166
Total	34,322

It must not be forgotten, however, that many Scotsmen and Irishmen enlist in England. In theory and to a considerable extent in practice the Army is "territorialized." Each Infantry Regiment is associated with a particular County or district, and the recruits in many cases, though not in all, are drawn mainly from that district.

The Auxiliary Forces.— It must not be supposed, however, that the Regular Army exhausts the number of soldiers available for the service of the nation in time of war. The "Auxiliary Forces" largely outnumber the Regular Army. They are composed of the "Militia," the "Imperial Yeomanry" and the "Volunteers."

One great line of demarcation separates the Regular from the Auxiliary Army. The officers and men of the former are liable by the terms of their engagement to serve abroad both in peace and in war. The officers and men of the latter are under no such liability, either in peace or in war. The distinction is important. The protection afforded by the sea and by a powerful navy suffices in the opinion of many authorities to secure the British Islands against any serious invasion. If this view be correct, and it is the view which has been officially accepted by both political parties in the State, the value of the Regular Army is greatly enhanced. An army whose functions are limited by law to the performance of duties which will never be imposed upon it, has evidently not attained its full sphere of usefulness. It is the perception of this fact which has led to the acceptance of the view that the Militia should in future be made liable to serve abroad in time of war, and that the Volunteers should be encouraged to regard themselves more as a reservoir from which the Regular Army can be replenished in time of war, than as a force capable of operating independently, or of taking the field with the units of which it is composed in time of peace.

It is evident that the policy by which a nation which admittedly requires its army for service outside its own territorial limits, has allowed two-thirds of its force to be tied to the soil, is not a scientific one, or one which would have been sanctioned if the situation, as it ultimately developed, had been dealt with as a whole, and provision made for it on business principles. But, as has been pointed out, the spirit of scientific organization has never directed the military policy of Great Britain; and the development of the Army has been due more to chance and to the incidents of successive campaigns, than to any recognized and guiding principle.

The Militia.— The Militia, the oldest force in the realm, was called into being at a time when the danger of invasion was real and pressing, and when the building up of the British Empire had scarcely begun. The organization was appropriate to its original purpose, the service in the Militia was local, and was, or at any time might be rendered, compulsory by the enforcement of the ballot. The old law, though in abeyance, still exists, and can be put into operation at any time at the will of Parliament; it embodies the principle of compulsory service, but in a form which makes it unsuitable to modern conditions. The Militia at the present day is raised and maintained under later statutes in which the principle of compulsion does not appear. Service in the Militia is voluntary; the training of the recruit is for 49 days, and the annual training is for 28 days. In the year 1905 the strength of the Militia was as follows:

STRENGTH OF THE MILITIA (BY ARMS) IN THE YEAR 1905.

Royal Field Artillery	428
Royal Garrison Artillery	14,909
Royal Engineers	2,504
Infantry	77,881
Royal Army Medical Corps	881
Total	96,603

The Militia is dwindling under the pressure of adverse conditions which will continue to operate until a change is made in the constitution of the force. Free Trade, and the perpetual and increasing burdens laid upon landed property, have done much to cripple the landowners who were at one time the mainstay of the Militia, and to reduce the number of farm laborers who provided its best recruits. Changes in the organization of the Army have brought the Regular regiments into sharp competition with the Militia, and thousands of recruits for the former are drawn from the ranks of the latter; the Militia is "bled" for the benefit of the Line. By universal admission some change must be made in the organization of the Militia if it is to be preserved as an effective force. The tendency of the present time is to effect this change by bringing the Militia into closer relation with the Regular Army, and by enforcing upon recruits, and upon all men in the ranks, who will accept the obligation, the duty of serving abroad in time of war.

The Imperial Yeomanry.— The Yeomanry is a force of mounted men, raised under the same statutes as the Militia but on different conditions of service. The force rendered good service during the South African War, for which several thousand men volunteered. The value of the Yeomanry was fully recognized, its numbers were increased, and it received the title "Imperial" thus connecting it with the contingents furnished by other parts of the Empire. The Yeomanry is well officered and efficient, the annual training in camp is 10 days, the weapon of the Yeomanry is the rifle. The strength of the force in 1905 was 25,341.

The Volunteers.— The Volunteers are the largest section of the Auxiliary Forces; their numbers and constitution on Nov. 1, 1905, were as follows:

STRENGTH OF THE VOLUNTEER FORCE. NOV. 1, 1905.

Royal Garrison Artillery	39,882
Royal Engineers	17,736
Infantry	184,627
Royal Army Medical Corps	3,417
Bearer Companies	1,839
Motor Volunteer Corps	147
Total	247,648
Permanent Staff	2,023
Honorable Artillery Company	483

Service in the Volunteers is voluntary; a specified number of drills must be performed by each man — 30 drills in his first year, 10 in subsequent years. A large proportion of the force attend camp for a week or a fortnight each year.

The origin of the force is remarkable, it was raised in 1859 when the nation was alarmed by threats of invasion by the French under Napoleon the Third. It was recognized that the Fleet was insufficient and ill-equipped, and that the British Army compared with that of France was a negligible quantity. The country was thoroughly alarmed, a number of patriotic and energetic men appealed to the manhood of the nation to "volunteer" for military service to resist the threatened invasion. The Government approved and endorsed the appeal. There was an immediate and adequate response; corps were formed throughout the length and breadth of Great Britain, and the force thus created has continued to attract the interest and command the confidence of the public until the present day. Important changes have taken place in its character and organization. On the whole the changes have been in the direction of increased efficiency. The Volunteer Force undoubtedly contains some of the best military material in the United Kingdom. At the present time it suffers somewhat from the lack of trained officers, and from the absence of any precise function in time of war. That if the task of organizing the armed forces of the United Kingdom in the most effective manner were now to be undertaken for the first time the Volunteers would exist in their present form is not probable. But, having been created in the absence of any directing policy, they nevertheless form an integral part of the national forces, too important to be disregarded and of too great potential value to be omitted from any scheme of organization for war upon which the military authorities may decide, and of which Parliament may approve.

Bibliography.— The literature dealing with the British Army in all its aspects is very voluminous. The following works which bear upon and illustrate the subjects referred to in the preceding article may be consulted with advantage. Fortescue, 'A History of the British Army' (London): Scott, 'The British Army, its Origin, Progress and Equipment' (London); May, 'Imperial Defence' (London); Ross, 'Representative Government and War'; Constable Wilkinson, 'The Brain of the Army' (Edinburgh); Arnold-Forster, 'The Army in 1906' (London): 'The Journal of Royal United Service Institution' (London).

Official Publications.—'The Army Annual Act'; 'The Army Estimates' (annual); 'Army Orders'; 'General Annual Return of the British Army'; 'Annual Report of the Inspector of Recruiting'; 'King's Regulations and Orders for the Army'; 'The Militia and Yeomanry Act'; 'Regulations for the Militia'; 'The Reserve Forces Act'; 'The Reserve Force and Militia Act'; 'Regulations for the Volunteer Force' (1904); 'Report of the War Offices Reconstruction Committee' (1905); 'Report of the Royal Commission on the War in South Africa' (The Elgin Commission).

H. O. Arnold-Forster,
Formerly Secretary to the Admiralty and Secretary of State for War; Author of 'The Citizen Reader,' 'A History of England,' 'In a Conning Tower,' 'Our Home Army,' etc.

39 (a). Great Britain — England and Europe. It is the purpose of these observations to explain, as clearly and as briefly as possible, the policy of England in Europe as it has been, as it is, and as, most probably, it will be. In order to elucidate the problem, it is necessary to look, in the first place, exclusively at Europe, and then to turn our eyes to England.

For about five centuries after the fall of the Roman Empire, that is, from the 5th up to the opening of the 11th century, there was one absorbing issue before Europe. That issue was whether European civilization was to continue to exist or not. During that time the Moslems on the South, the Danes, Swedes, Goths, and Norwegians from the Cattegat, and eastward the Slavs and Hungarians swarmed round the dissolving limbs of Christendom, so that Christendom bade fair to disappear. As Baronius said, "it was as if Christ slept in the vessel that bore mankind." The 10th century brought Europe nearest to destruction. But about the year 1000 an almost magical change began to operate. Invasion ceased. Europe was saved. Since that time external barbarism has often threatened, but never with overwhelming force.

The next epoch of Europe has lasted from the 11th century up to our own day and is not yet concluded. Europeans are busy finding a solution for a problem which has haunted them for eight centuries. That problem is the reorganization of Europe after its almost complete destruction by the barbarians. To the most profound minds two ways of reconstructing Europe have presented themselves. The first was to amalgamate this small continent under one supreme authority, and to do what the statesmen of China and of America have achieved so admirably for China and the United States. Great prestige has attached to that solution because the Romans had carried it out to a large extent already with fair political results. But the solution has derived its fundamental authority from the fact that there is a certain amount of reasonableness and utility in the idea of having one sovereignty to control the peninsula which Europe is.

The chief exponents of this great idea can easily be named. First, there was the mediæval Papacy which, springing up in the 11th century, claimed universal sovereignty as a right. As Pope Gregory VII. said at that date, the Papacy is the Master of Emperors. Then in the 13th century, when the mediæval Papacy had fallen, the French monarchy made a similar attempt. Mathew Pavis, Peter Dubois, and Jandun all agreed that France was the new claimant to universal power. Later Pope Urban, in 1382, pointed out that "France desires the universal monarchy of the world."

The next successor in the field was the House of Hapsburg. That family fought for this idea during two centuries, from the middle of the 15th to the middle of the 17th century. "Austria's mission is to rule the world," was their motto, and their greatest prince was Charles V. They came in course of time to rule both at Vienna and at Madrid. The two branches of the house were intertwined together. Together they fell. The decline of the German branch was registered by the peace of Westphalia in 1648, and that of the Spanish branch by the peace of the Pyrenees in 1659.

The next power which strove to raise from the ground the broken sceptre of the Cæsars was France again, under Louis XIV. Louis inaugurated their policy in 1661. This dream of French supremacy in Europe was consistently pursued by France up to 1815. Its consummate exponent was Napoleon, who claimed to be the heir of the Cæsars. In the summer of 1808 he attained the nearest to his ambition when he told Talleyrand that he was now "master of Europe."

After Napoleon had fallen in 1815, Russia succeeded to his aspirations. In 1812 she had extinguished the ambitions of Napoleon in the Russian snow. The last two centuries had been a route march for her, East as well as West, South as well as North. Her day had come she thought. But that is not so certain. The Crimean War showed her to be not so strong as she imagined, and since that date, Germany, under Prince Bismark, has arisen to dispute the title. Michelet once described Germany as the India of Europe, vast, vague and unsettled. All that was ended by the man of blood and iron. We will not pronounce whether European supremacy rests at this moment with Russia, at the head of the Dual Alliance, or with Germany at the head of the Triple Alliance. Probably it inclines toward Germany. However that may be, the struggle for the supremacy lies at present between these two powerful champions. Of the two, Germany appears to claim it with more zest and resolution.

But in spite of all these constantly renewed ambitions to grip the supremacy of Europe, all aspirants to supreme dominion have failed. No one has been strong enough to reconstitute the empire of Rome. What force has thwarted this consummation? It is the force of nationality. The issue before Europe has been the issue between despotism and freedom. Freedom has won. Europe has chosen to organize herself into a number of mutually independent nations, some 20 in number, rather than to place herself in subjection to one supreme authority, whether of Pope or of Emperor.

The definite appearance of the national spirit, and therefore of nations, may be dated from the 13th century. At that time a whole cluster of young nations appeared on the horizon, like a group of islands, Hawaiian or Philippine, descried far out at sea. Some were powerful, such as France, or insignificant, such as Austria; some monarchial, such as Castile, or republican, such as Florence; some Slavonic, such as Poland, or Romance, such as Aragon; or Teutonic, such as Holland; some dying like the Arelate, or full of the germs of progress, like Brandenburg, or precarious, like Hungary. What a bewildering scene! What an inextricable task to follow the dance of these atoms for seven centuries up to our own day, as they coalesce and disperse and again amalgamate into the nations which we know so well!

Enough has been said to make quite plain what the main history of European politics really is. It consists of a conflict between two theories of government embodied in men's passions. One theory proclaims the advantage of unity under one authority. The other theory announces the goodliness of nationality of freedom, of a Europe split into many independent sovereignties. Since the 11th century Europe has been rent by this question. Wars innumerable have been fought over it. Such has been the fearful legacy of ambition left by the Cæsars to the barbarians.

Having now indicated the nature of the politics of Europe, let us turn to England, this minute speck of an islet off the European coast. What has been her policy as regards this continent? Japan, an island similarly situated, has enjoyed an easy time, because China, on the coast opposite, has been the most peaceable neighbor in the world. But, as for us, we have been faced by the most savage and quarrelsome races, the scum of Asia, almost always at war. Therefore, we have had perforce to take our part. We have had imperatively to say whether we should side with autocracy, as represented by the Pope, by the Spanish Armada, by Louis XIV., by Napoleon, by the Czar Nicholas, and by Bismark; or whether we should side with the force of freedom ever ready to resist these powers. It has been somewhat a hard choice. We have often tried to shut our eyes and take no part. We have sometimes taken the side of power and authority, as James I. did in siding with Spain, or as Charles II. did in siding with France. But, on the whole, since the days of William the Conqueror we have sided with freedom. For the liberties of Europe ever coincide with the interests of England.

Our reason for siding with the liberties of the Continent has been a practical business reason. We know perfectly well that the day of the amalgamation of Europe under one authority is the day of our destruction. We are not strong enough to maintain ourselves against a whole hostile continent. We fell inevitably before Rome, as soon as Rome had mastered the West. It was only by the most strenuous effort that we saved ourselves from the latest heir of the Cæsars,— Napoleon. Hence it is that we have opposed the Papacy, and Spain, and Louis XIV., and Napoleon, and the Czar. Hence to-day our profound anxiety at the progress of

German ambition toward Austria and toward Holland. Hence our love of the balance of power in Europe which is a conception rooted in our history, and was as familiar to Henry VIII. and Wolsey as it is in our own hour to any of our foreign ministers. Hence our instinctive love of small states, of Holland and Belgium and Portugal, and Switzerland, each of which is a bar against autocracy and a pledge of European freedom. Hence our "perfidiousness," that is, our aptitude ever to abandon the company of a too dominant star. Hence at this moment our love of France whom we disliked ever since the rise of Louis XIV., but whose successive falls in 1815 and 1870 have brought us at last to her side. Hence our profound and fundamental indifference to European politics, so long as no power is visibly in the ascendant across the Channel. Hence, too, the predominant part which, in all the real crises of European history, England has played. Who but they thwarted the Pope, and the Hapsburgs, and Louis XIV., and Napoleon? Who but they have proved the ultimate obstacle to Czars and Kaisers?

For Americans all this has a good deal of significance. What is to be the policy of the United States in Europe? The interests of the United States in Europe are nothing like so vital and immediate as those of England; but subject to that consideration, they run on parallel lines. It can never be the interest of the United States to be faced across the Atlantic by an united and amalgamated Europe. For, first, that would mean the conquest of England; and next, the power thus organized would be a menace to the greatness of the United States. Just as the United States desires the open door and the balance of power in the Far East, so, and for the same reason, she needs a Europe in which national freedom prevails, rather than a Europe armed under one authority and dictatress of the world. That consideration is not yet materialized in the American mind. But the day will come when it will be materialized and then it will be seen that the identity of the European policy of England and of the United States constitute yet another link between the two nations.

The future of Europe and of England's policy in Europe remains to be considered. At first sight it would seem that never before has the principle of nationality, of freedom, been so firmly established in Europe, or so much revered. There seem so many nations, and all so strong. The project of universal dominion would at first sight appear hopeless. Where Napoleon failed, is it likely that anyone can succeed? If all this be so, then England may rest at peace as regards Europe and devote herself wholly to her duties oversea. Is it so? It is not so. The old problem of eight centuries is still with us, and still must regulate our policy.

First, though nationality has won, Europe is paying a fearful price for this victory. The nations have had to arm to the teeth. They are groaning under their armaments, necessitated by the ambitions still glowing in the soil of our volcanic continent. Hence, on all sides, there is observable beneath the surface a profound reaction against nationality. Those who thus react are called Socialists. Socialism is the reaction against nationality. It proclaims the brotherhood of man, the disarmament of nations, the unification of labor, and universal peace. The socialist is not a patriot of France, or Germany, or Italy. He is, or thinks he is, a patriot of the world. Such men are the precise stuff of which revolutions are made. They beat down the barriers of Nations. But in so doing they commit a revolutionary act, and clear the ground not for a Mirabeau, but for a Napoleon. This is the foremost danger of which England has to beware in Europe.

Let me put the same fact in a somewhat different light. The pace in Europe is terrific at the present time. The stress of rivalry in armaments is too much for some nations to bear. A progressive nation like Germany can hold out longer than a stationary nation like France, or than an undeveloped nation like Russia, or than a disorganized nation like Austria. Here are the seeds of a European cataclysm. Some nation, fainting in the race for life, may become the footstool of its neighbors and in a moment the balance of power may be upset. Then again will come the call for the power of England.

Against this bad outlook there are two powerful considerations to be set. Socialism, if guided by statesmanship, may, in its detestation of armaments and their evil consequences, achieve a great good. The nations may be induced to draw back in time from their insensate haste to arm. Perhaps the hour of mutual limitation of fleets and armies is nearer than may be supposed. For if things go on in Europe without check as they are now going, men will come to loathe nationality as much as they once came to loathe feudalism. They will tear up its title deeds even as they tore up those of the barons. But it is quite likely that nationality will not thus perish, and that suicide is not to be the sole end of Europe. To arrive at some such happy solution should be a part of our policy in Europe, for, indeed, upon its achievement our ultimate safety depends.

There is a second consideration, pointing the same way. Most of the great nations of Europe and several of the small ones have acquired empire over sea. These empires are inhabited by alien races who, as time goes on, will be found to grow more and more impatient of their foreign masters. Even were it otherwise, and even were the natives to be forever docile and obedient, here is a vast and adequate scope for the energies of Europe which would be thus far better occupied than in the domestic broils which occupied Holy Roman Emperors and most Christian Kings. Besides, the whole wide world east and west, in regions never known by Cæsar, will laugh us out of court for wrangling over the legacy of the Cæsars, now that it is grown so small by comparison. Thus perhaps the new world is solving, slowly but effectually, by distracting our attention to greater issues, the problem of how we Europeans can live together in amity, and how nations may combine peace with freedom. Thus nations will continue to exist and will justify the policy of England in defending them. For humanity, divided by reason of its very greatness, will not soon find its unity once more.

George Peel.

Author of 'The Enemies of England'; 'The Friends of England'; etc.

39 (b). Great Britain — Foreign Policy in India. In writing about India one is too apt to presuppose a certain amount of knowledge of the historical, geographical and ethnographical facts of that vast continent, but in the space allotted to this article a large presumption of familiarity with the main circumstances of the British occupation of India is inevitable. There is no time for even a brief sketch of the marvellous story of the British wooing and winning of the great peninsula, which contains nearly one-fifth of the human race. A glance at the map of India will show that others also wooed, but did not win, and will indicate that all paid their addresses at three important points on the long coast line, so singularly lacking in harbors. Near Bombay on the West, the Portuguese still hold the beautiful land of Goa; near Madras on the East, the French retain Pondicherry, and up the Hooghly river above Calcutta, the tri-color still flies over the little settlement of Chandernagore. Dutch and Danes no longer have settlements in India, but these, too, have left their traces. From Madras, Bombay and Calcutta — isolated and unconscious — strenuous traders generated the force, which was in the course of time to create and consolidate one of the most remarkable Empires which the world has ever seen.

There is no time to dwell on the romantic deeds of Clive and Warren Hastings, nor to second the achievements of the various Governor-Generals, who seemed compelled, in spite of themselves, and in spite of their merchant-masters in London City, to advance and advance. Warren Hastings, Lord Wellesley and Lord Dalhousie were the great builders of the huge fabric, known as British India.

Another glance at the map will show that only three-fifths of the Indian continent are colored red. The remaining two-fifths belong to the Indian Princes and are not British territory. If the policy so keenly followed by Lord Dalhousie had not been arrested by the convulsion, known as the Indian Mutiny, it is possible that a considerable portion of the territory now belonging to the Indian Feudatories would have passed by lapse or other causes into British possession. But happily by the wise grant of the right of adoption to the Indian Princes the danger of further annexation disappeared. It will be noticed, if reference again be made to the map of India, that the territories of the Indian Princes are widely scattered. There are large countries belonging to Princes, such as the Nizam of Hyderabad and the Maharaja of Mysore in the South, and there are vast areas held by groups of chiefs such as the congeries of states known as central India; where the great Mahratta dynasties hold sway — Rajputana where the Rajput Princes rule, and the large tract in the Punjab where the Sikh states lie. It is difficult to define the exact relation of the Indian Princes to the crown, but the King of England and Emperor of India may in a sense be styled a "Ruler of Princes." The ties which bind the Indian Princes to the British crown have been described by Lord Curzon:

"They are peculiar and significant, and, so far as I know, they have no parallel in any other country of the world. The political system of India is neither Feudalism nor Federation; it is contained in no constitution; it does not always rest on a treaty and it bears no resemblance to a league. It represents a series of relationships that have grown up between the Crown and the Indian Princes under widely differing historical conditions but which in process of time have gradually conformed to a single type. The sovereignty of the Crown is everywhere unchallenged. It has itself laid down the limitations of its own prerogative. Conversely, the duties and the service of the states are implicitly recognized, and as a rule, faithfully discharged."

With Lord Dalhousie passed away the policy, and, indeed, the necessity for annexation. The conquest of Upper Burmah, postponed by him and carried out by Lord Dufferin, was under the circumstances unavoidable. There have also been changes in Baluchistan of a political rather than a territorial nature. But with these exceptions, India, from the time when it passed out of the hands of the company of merchants into the keeping of the Crown, has remained content with the frontiers which nature had suggested and Lord Dalhousie had secured. They are good frontiers, and enable a comparatively small force of some 230,000 men to keep the peace, internal and external, of some 300,000,000 people. India has been likened to a "fortress with the vast moat of the sea on two of her faces and with mountains for her walls on the remainder." For the Hindus the "black water," as they call the ocean, was protection enough until the navies came out of the west, while to the north stood the stupendous mountains of the Himalaya. But to the northwest, the frontier, difficult and dangerous though it was, admits of passage, and through the defiles which occur in the marches between Peshawar and Quetta the waves of invasion have often found their way. And so long as Great Britain holds command of the sea, it is only through the northwestern frontier that India can be threatened.

Since 1857, the year of the Indian Mutiny, the chief preoccupation of the Viceroys has been the internal development of the vast and varied continent, split up into so many distinct countries and peopled by races of extraordinary diversity. The terms "India" and "Indian" are too often used with most misleading results, and it would be as safe to predicate anything of "India" and the "Indians" on any subject ranging from politics to weather, as it would be to generalize on Europe and the Europeans. The only thing in India which is the same and universal is the system of Government, and many are of opinion that in this sameness and uniformity there is danger. But uniformity on the whole tends to efficiency and is economical, and since India passed under the direct control of the Crown the exigencies of finances have rendered strict economy essential. It would be difficult to find any part of the world, where government is carried on so cheaply as in India. Some 1,000 officers of the Indian Civil Service manage the affairs of some 230,000,000 people in British India, and have occasionally an indirect influence on the welfare of the remaining 70,000,000 who live in the territories of the Indian Princes. British India is divided into large administrative areas known as Districts, and in the whole world there is no such work as that of the District Officer. Often isolated from his countrymen he toils day and night for the people committed to his charge. They look to him for everything and in their own language he is their Mabáp — their Mother and Father. His one idea is that they should not be harassed or worried whether it be by tyrannous neighbors, by exacting underlings, or by an over-zealous Government. He is usually conservative in his views, and his one hope is the hope of his clients that the rain shall fall in due season, and that there shall be a bumper harvest. The District Officer at his best is rarely seen except by the people away in the villages. Viceroys and distinguished travellers cannot see him at his real work, but for all that they quickly learn that the good Government of India ultimately depends on the good District Officer. Perhaps the best critics of English administration in India are the French, and they have borne generous testimony to the system, and wonder at the fewness of the Civil servants. As it is in the Civil Service, so it is in the other many efficient departments of official work: the British officers are few,* and their work and responsibilities are enormous. It is due perhaps to the responsible nature of the work that the strenuous life prevails in spite of climate and solitude.

Far away from the Districts, from the canals, railways and forests, where men live their solitary lives on salaries none too generous, there is a military cantonment with a mixed Brigade of British and Indian troops. Strong as may be the District Officer, and unquestioned as may be his authority among the people, the knowledge that there are soldiers of the fair faces and guns within a few hundred miles undoubtedly acts as a sanction, and a steadying influence on the unruly spirits and latent forces of disorder, ready in every District to spring if there be the least sign of weakness.

The Oriental respects most of the respectable qualities, but to him the great quality is strength. And though we pride ourselves on justice, though we labor to make the Indians more prosperous, though as trustees we spend India's money on railways, irrigation, canals and education, though we toil to remove all real grievances, and tax our brains to defeat famine and plague, it all goes for nothing unless there be strength — power manifest and actual. There is a word in use throughout India — Ikbál. If the Ikbál of the Sirkar is good, that is if the prestige of Government stands high, all is well. But if it is shaken all the splendid structure which the British have raised in India will also be sorely shaken. It is the knowledge of this prestige and its power, and the sense that it must be inviolate, that brings anxiety and pause to a Viceroy and his Government, when some reform really touching the people or some military operation to quell a turbulent clan on the frontiers is under discussion. In India risks must be run, but caution is the characteristic of the Indian bureaucracy. It is this same knowledge of prestige and of what is connoted by the loss of it, which has hitherto made for continuity of policy, and has kept India out of the arena of party strife in England. For, once belittle a Viceroy, a Lieutenant Governor, or even a District Officer, and a blow is struck at authority which reverberates through the astonished minds of millions. Authority, power, prestige are all summed up in the word Ikbal. That is the word on which the astonishing miracle — the rule of 300,000,000 by a mere handful of men — rests. Justice, benevolence, an almost missionary zeal to improve the condition of the people are mere incidental attributes.

It is a commonplace to say that the average Englishman knows nothing of India and its problems, and it is rare to find a man who can visualize the Indian people unless he has visited the East. The statesman with the poetic imagination and the literary gift may sometimes project himself into the jungle of India religions, tribes, castes, languages and customs, but the Burkes, the Max Müllers, and the John Morleys occur but seldom. And yet no Government is richer in official literature than the Government of India. There are mines of information awaiting the student, for every official is perforce a writer of reports. There will shortly be published a work known as the Gazetteer of India which will give to the world the conditions and vital statistics of the most remote parts of the Continent. Every ten years there is published the report of the Census of India, and a very cursory reading of that most interesting work will reveal the curious and complex charge which devolves on the Viceroy and his Government. The student will be staggered when he learns the number of religions, languages, tribes and castes which exist in India. He will recognize that India is a vast conglomeration of innumerable differences. But he must see the people before he can realize the gulf which lies between the Sikh and Pathan, the Mahratta and the Bengali. Lord Curzon explained it in his speech at the Guild-Hall in 1904: "We have to deal in India with races that are as different from each other as the Esquimau is from the Spaniard or the Irishman from the Turk; with creeds that range between the extreme points of the barest animalism on the one hand and the most exalted metaphysics on the other, and with standards of life that cover the whole space between barbarism and civilization."

It is no easy task to give equal justice to all these varieties of the human race, but the task is fairly faced, and the wise rule of religious tolerance, and the scrupulous respect which is paid to Indian customs, make possible the Government of India. But though the differences are great there are solvent forces at work which may at no very distant date make for homogeneity in certain localities, and the close of one century and the beginning of another seems by some curious reason to be the signal for change. Some few years ago it was the fashion to suppose that the people of the two great religions of India — the Hindus and the Mussulmans — would never work in harmony. It was similarly supposed that the manly races of the Punjab would never co-operate with the unwarlike people of lower Bengal. Undoubtedly many of the propositions which used to be accepted without challenge must be modified. Railways, travel in

* The work of the Civil administration of India is carried on by [illegible] British, either brought from abroad or recruited in India, and by 21,800 Indians. These figures leave out all on lower pay than £60 per annum.

Europe, education and a free press have worked important changes, and it is plain to the writer, who has had opportunities of revisiting India after periods of absence sufficiently long to enable him to notice changes, that the Government of the future will have to reckon not with an homogeneous India, but with an increasing number of educated Indians scattered over the continent who are groping after ideals. It will be the problem of the Indian statesman to find them these ideals, and to give them some safe scope for their activities. The progressive Indian realizes that India depends on the British connection. He wishes to take part in the Government of India, and to enable India to take her place among the self-respecting nations of the world. He points to Japan, and the defeat of Russia and the Anglo-Japanese alliance have naturally caused a ferment in India. But the progressive Indian — like the ordinary Englishman — will not grasp the radical point, that there is no India and no nation of Indians. If political power is to come to the educated classes — the microscopic minority of the millions, it must first come from small beginnings, from the village and the town. They cannot jump at once into the control of an Empire. The progressive Indian is, so far as he can be judged by his conversation and his public speeches, loyal to the Crown, but unfortunately his organ — practically the whole of the native press — is undoubtedly preaching sedition and poisoning the mind of the rising generation against the Government. With some honorable exceptions, there is no sense of responsibility, and still less of dignity in the native press, and though the editors are in some cases merely making believe and ploughing the sands, their teaching tends to conflagration, and they must know that they are playing with fire. Yet the leaders of the progressive party would deplore a conflagration, for they and theirs would be the first to be overwhelmed. It needed no prophet to point out as did Mountstuart Elpinstone years ago that bureaucracy and a free press were incompatible, but the problems of finding the ideal for the intellect of India must now be grappled with and the good humored indifference of a strong Government toward a virulent and hostile press is no longer safe. This somewhat lengthy but still incomplete preface to the subject of my article, «Foreign Policy in India» is necessary since it is impossible to deal with the Foreign Policy of India as a thing separate and apart from India. Up to the end of the 19th century Indian foreign policy was treated with great reticence. There may have been some policy, but it was known to few. But at the beginning of the present century Lord Curzon, Viceroy of India, who believed in taking the people into his confidence, departed from the old-fashioned reticence, and in several memorable speeches formulated the problems of the defence of India. No one was ever more qualified to expound these problems. He had made them his life study, and his intimate knowledge of the countries beyond the frontier, acquired by travel, coupled with his wonderful grasp of every detail of Indian affairs, enabled him to co-ordinate isolated facts and events, and to establish India's position on the board of British foreign policy. He pointed out that up to the last 15 years the foreign relations of India were practically confined to her dealings with Afghanistan and to the designs or movements of the great Power beyond, and the foreign policy of India had little to do with any other foreign nation. «Now all that is changed and events are passing which are gradually drawing this country, once so isolated and remote, into the vortex of the world's policy, and that will materially affect its future.» Consolidation on the frontiers involved more direct relations with the countries beyond, but more than that. «Europe has waken up, and is beginning to take a revived interest in Asia. Russia with her vast territories, her great ambitions, and her unarrested advance, has been the pioneer in this movement, and with her or after her have come her competitors, rivals and allies. Thus, as all those foreigners arrive upon the scene and push forward into the vacant spots, we are slowly having a European situation recreated in Asia, with the same figures upon the stage. The great European Powers are also becoming the great Asiatic Powers. Already we have Great Britain, Russia, France, Germany, and Turkey; and then, in place of all the smaller European kingdoms, and principalities, we have the Empires and States of the East, Japan, China, Thibet, Siam, Afghanistan, Persia, — only a few of them strong and robust, the majority containing the seeds of inevitable decay. There lie in these events and in this renewed contact or collision, as the case may be, between the East and the West, omens of the greatest significance to this country.» Again, «A land frontier 5,700 miles in length, peopled by hundreds of different tribes, most of them inured to religious fanaticism and hereditary rapine,— a single outbreak at a single point may set entire sections of that frontier ablaze. Then, beyond it, we are brought into direct contact with the picturesque but perilous debility of independent, or quasi-independent, Asiatic States, some of them incurably diseased and hastening to their fall; and behind them, again, are the muffled figures of great European Powers, advancing nearer and nearer and sometimes finding in these conditions temptations to action that is not in strict accordance with the interests which we are bound to defend.»

But after all English foreign policy in India is largely a matter of finance, for it must be based on the contentment of the people. It can be asserted with deliberation that the system of taxation in India is fair and considerate, but there are millions who live on a very slender margin. In normal years when the rains are favorable there is rude plenty in the land; but when the rain fails, and when, later, famine is declared, the numbers who flock to the famine camps are proof that among the poorer classes there is little or no reserve. It is, therefore, incumbent on the Viceroy — whose duty is to keep India safe and contented — to ensure peace on his long land frontier of 5,700 miles. He can engage in no policy of adventure and he cannot lightly undertake even a small expedition, for he never knows whether a local disturbance may not set the frontier in a blaze for hundreds of miles. He has to consider the revenues and the economic requirements of India, the policing of the Provinces, and the obligatory garrisons, and he knows that if his calculations are correct that he has only a certain amount of force for the extended defence of the Indian Empire. Those fierce critics of Government — the editors of the native press — who write at the safe harbors where shots have not been fired for generations, maintain that the military forces of India are excessive, and they point with some justice to the fact that during the war in South Africa and the operations in China the garrison of India was seriously depleted. It was a risk, but no Viceroy can hesitate when the British Empire calls, and the splendid conduct of the people and Princes of India justified the confidence reposed in them. But the army, judged by whatever standard,—by the size of the continent, by the population, or by the trade and wealth of India,— is none too large, and if operations of magnitude ever take place on the Northwestern frontier, the forces which can be spared from the obligatory garrisons will merely be able to hold on for a limited period until reinforcements arrive from over sea. The Army of India is composed of British and native troops. Experience demands that the proportion shall be one British soldier to two Indian sepoys, and that the artillery shall be entirely British. The British soldier in India is expensive, the Indian sepoy cheap, perhaps the cheapest and for his pay the best and most efficient soldier in the world. Life in the army has hitherto appealed to the manly tribes. It was an honorable career, it was possible to save, and there is a pension at the end of the service. But the general rise in wages throughout India, the comparatively speaking lucrative employment which is offered in various directions, and the certain chances presented by agriculture in the canal colonies have somewhat changed the prospects of service in the Army. Simultaneously the great efforts which have been made of late to obtain a high standard of efficiency have diminished the amenities of the sepoy's existence, and it is possible that the difficulties of recruiting which beset the authorities in England will ere long appear in a modified form in India. At any rate, in spite of the fact that India is still, notwithstanding the changes wrought by civilization, and the *Pax Britanica*, rich in man power, the sepoy will become more expensive, and however menacing the situation on the frontiers may be, it will be difficult on India's present financial basis to increase the standing army. There are, however, other forces than those of the Regular Army in India. On the frontier Lord Curzon, chiefly from political reasons,— the policy of conciliation instead of exasperation,— has offered to the wild youth of the frontier service in Militia Regiments, while many of the greater Princes have voluntarily contributed highly trained troops for the defence of the Empire. These forces are trained by British officers, and have won high praise on service. They are known as the Imperial Service Troops, and are quite as efficient as the regiments of the Regular Army. But in spite of India's resources in man power, in spite of the loyal co-operation of the great Feudatories, the Indian Government cannot be expected, single-handed, to provide for the defence of what has been truly called the "strategical frontier" of the British Empire. India must look to Great Britain in times of supreme danger, and in the matter of foreign policy India is merely an agent of the British Government. The Viceroy and his Government are responsible as local agents for Indian territory where it marches with Turkey, Russia, China and France, for the Persian Gulf, and for relations with Afghanistan. The ideal is that the glacis of the fortress should be sterilized or neutralized, but with European powers pushing East, and with decaying and moribund Asiatic States as our neighbors, this ideal will not be realized save by armed preparation and a resolute front. Opinions differ as to the policy on the Northwestern frontier. The scientific soldier is in favor of daring measures and would occupy advanced posts in Afghanistan to check a Russian invasion, and apart from military consideration there is an obligation to defend the Amir of Kabul from attack, and there is the belief that the advance of Russia to the near neighborhood of India would injure the prestige of Government in the eyes of the Indians. Against this policy is the awkward fact that as things are at present the advance of British troops into Afghanistan would be regarded with hostility by the subjects of our ally, the Amir, and that it would be the signal for the rising of the independent tribes who hold the hills between India and Afghanistan. But above all is the question whether the Army of India is fitted, either by its size or its nature, to undertake protracted campaigns at great distances from the present frontier. It is always difficult for men who have been brought up in a school of great tradition to abandon the faith, and among the traditions which have made this splendid Indian Empire have been courage, a belief in the British mission in the East, and undaunted advance. For generations Afghanistan has been a will-o'-the-wisp, and for the purpose of keeping that miserable abode of robbers from extinction, we have spent blood and money and are still spending money with very little return. Few would like to throw up the Afghan policy, yet few are satisfied with it. The abandonment of our relations with the Amir of Kabul would mean the absorption of Afghanistan by Russia. Her railways have reached the Afghan frontiers and she can penetrate more easily than England can. But the policy of sterilizing the glacis does not end with Afghanistan, or Thibet, where the policy was recently applied. We have to consider Persia and Seistan, and later there may be a dangerous glacis to be provided for at the head of the Persian Gulf. Where is it all to end? Nature has indicated a very respectable frontier — our present frontier. No frontier is now impregnable, but with railways and ample supplies, with military works, and an army well fed and unexhausted by marches through hostile country, the existing Indian frontier would serve. While there is no question of the enormous importance of prestige in India, the advance of a European force to the frontiers of India would perhaps not weaken our prestige as much as a protracted and uncertain campaign out in the treacherous mountains of Afghanistan.

Bibliography.—Of the two important sections of the Indian frontier we hear less of the

Burman borders than we do of the Northwestern frontier. India marches with China (Yunnan) on the Northeast, with Siam on the Southeast. For about 100 miles between the point where the Anglo-China boundary ends, and the Anglo-Siamese boundary begins, the British border along the Mekong river touches French Indo-China. The Government of India has relations with the local authorities of these three Governments.

The boundary with China was settled by the conventions of 1894 and 1897 from the Mekong river in the South to latitude 25-40° n., and the greater part has since been demarcated. The Mekong boundary with French Indo-China was settled by the Anglo-French convention of 1896. North of latitude 25-40° we have always claimed that the basins of the Irrawaddy belongs to Burma and that the boundary with China up to the confines of Thibet should be the watershed between the Irrawaddy and the Salween. And this northern part of Burma from the watershed to the borders of Assam is inhabited by wild Kachin tribes, British relations with whom, outside of administrative territory, is managed by the Indian Government through the local government. So also with the semi-independent tribes—Chins and Lushais, who inhabit the hilly tracks between Burma and Assam, and Chittagong. Among works which contain information regarding the frontiers of Burma may be mentioned: John Nisbet, 'Burma Under British Rule and Before'; Shway Yoe (Sir G. Scott), 'Burma as It Was, as It Is, and as It Will Be,' and 'The Burman, His Life and Notions'; Sir Arthur Phayre, 'History of Burma'; A. R. Colquhun, 'Among the Shans'; E. G. Harmer, 'The Story of Burma' ('Stories of the Empire Series').

The literature on the Northwestern frontier of India is large and increasing. The following books may be consulted: R. I. Bruce, 'The Forward Policy and Its Results'; Valentine Chirol, 'The Middle Eastern Question'; Lord Curzon, 'Russia in Central Asia,' 'Persia and the Persian Question,' 'The Pamirs and the Sources of the Oxus'; Wm. K. Daly, 'Eight Years Among the Afghans'; Sir Herbert Edwardes, 'A Year on the Punjab Frontier'; Dr. Gray, 'My Residence at the Court of the Amir'; Colonel Sir T. Holdich, 'The Indian Border-land'; A. H. Keane, 'Asia'; H. Lansdell, 'Russia in Central Asia'; O. Olafsen, 'Through the Unknown Pamirs'; Sir Henry Rawlinson, 'England and Russia in the East'; F. M. Lord Roberts, 'Forty-One Years in India'; Earl of Ronaldshay, 'Sport and Politics Under an Eastern Sky,' and 'On the Outskirts of Empire in Asia'; M. M. Shoemaker, 'The Heart of the Orient'; F. H. Skrine and E. D. Ross, 'The Heart of Asia'; Sultan Mahomed Khan, 'Laws and Constitution of Afghanistan,' and 'The Life of Abdul Rahman, Amir of Afghanistan'; A. C. Yate, 'England and Russia Face to Face'; C. E. Yate, 'Kurasan and Seistan,' and 'Northern Afghanistan.'

Walter Roper Lawrence.

Formerly Private Secretary to Lord Curzon of Kidleston, Viceroy of India; and Head of the Staff of the Prince of Wales during his Indian tour.

40. Great Britain — The Free Trade Movement. *Introduction.*— I desire to put shortly before the American people why the British are Free Traders, and why they hold it vital to their interests to maintain Free Trade. Before considering their reasons for favoring such a policy, it is necessary to ask what an Englishman means by Free Trade. He does not, of course, mean that the government ought never to take any toll from traders or lay any taxation whatever upon imported goods. In a modern state it would be absolutely impossible to support any such contention. The enormous revenues which have to be raised to carry on the work of government make indirect taxation an absolute necessity. The principle upon which the British Free Trader insists is that any tariff imposed upon goods entering his country shall be imposed for revenue purposes only. That he holds is the sole object which the Government must entertain in levying its customs. But it follows from this that duties ought not to be levied at the ports on goods produced abroad which are also produced in England. To levy such duties encourages the consumer to buy the home and untaxed goods rather than the foreign and taxed goods, and so diminishes the yield of the tax. Needless to say, this principle is not adopted out of any hostility to home-made products, or from any desire to favor the foreigner. If he thought he could do so without injury to himself, without loss of revenue or without diminishing trade generally, the Englishman would of course prefer that the goods made by his fellow citizens should sell better than those made by foreigners. One of his objections to protective duties (that is, to import duties on articles which are also made at home) is that such duties are not good "drawing" taxes. Unless the State levies excise duties equal in amount to the customs duties, and such excise duties can only be levied profitably in a few instances, the home manufactured goods which escape taxation are, speaking in a strictly fiscal sense, defrauding the revenue. In other words, what ought to go into the public purse is going into the pockets of the protected manufacturers. The more efficiently a tax protects, the worse tax it is for the purpose of filling the treasury — the true purpose of all taxation. It is then, in the opinion of English Free Traders, neither wise nor in the true interests of the State to interfere with the course of trade on any other ground than that of producing revenue.

The Economic Argument.— It must next be explained that the Englishman objects to interference with the course of trade, not out of any pedantic feeling in regard to the abstract "rights" of the trading part of the community, but because he believes that such interference must involve economic waste and so cause material loss to the nation. He believes that to forbid or interfere with exchanges between man and man always results in a diminution of national wealth. The Englishman adopts, and has adopted during the past 50 years and more, the principle that all exchanges are and must be a *mutual* benefit. They are transactions which are twice blest. They bless him that buys as well as him that sells, and benefit the man who exchanges gold for corn as much as the man who gives corn for gold. Hence it has become an essential, nay, an almost instinctive, belief on the part of the great majority of Englishmen that it is to their interest to stimulate and encourage exchanges in every possible way. They hold that to reduce the volume of exchanges must necessarily cause waste. But Government interference with trade by means of customs duties is bound to reduce the number of exchanges. Therefore they will only allow that interference in obedience to the imperative needs of the treasury. They realize that foreign exchanges benefit the individuals of a nation, and so the nation, quite as much as home exchanges, and feel that as long as exchanges are being made freely and are increasing, that there can be nothing wrong, at any rate in the commercial condition of a nation. Only allow free commercial intercourse, free buying and free selling and free access to the ports of a country, and its trade, and so its prosperity, will take care of itself. To allow the maximum of exchanges is to increase the wealth of a nation. To prevent or lessen exchanges is to waste its wealth.

The "Bleeding to Death" Hypothesis.— Further, English Free Traders hold that there is no necessity to be anxious as to whether the imports into a country are greater in value than the exports out of it. They hold that the relations between the imports and exports must necessarily adjust and equalize themselves. Human nature, they contend, has passed an ordinance to the effect that "he that will not buy, neither shall he sell." Thus, instead of fearing that imports, even of goods which can be made in England, will reduce the amount of labor, and so injure home trade, they regard all imports into Britain as orders for British goods to be produced and paid in exchange for those imports. Imports are physical orders for goods, and so for the labor that is employed to make the goods. And they have this advantage: the payment arrives with the order.

At one time the British public, it must be admitted, was not so confident as it is now in regard to the propositions just set forth. The opponents of Free Trade declared that Englishmen were living in a fool's paradise when they supposed that trade could look after itself, and that imports and exports must really be balancing though the statistics *seemed* to show that many millions' worth more goods came into England every year than went out of it. Nobody, they argued, will give something for nothing, and therefore if your imports exceed your exports by, say, a hundred millions a year, you must be paying the difference in some way or other. "There is only one way in which you can be paying it," ran the argument, "and that is by sending away the capital accumulated in years of better trade. In fact you are living on your capital and bleeding to death. Because you have been very rich in the past, the process may take a long time to work out, but some day you will find that you have no more blood left in your veins, and that you have reached the point of economic extinction." That line of argument was first used in the "Fair Trade" agitation in the years 1882–1885, and was revived some three years ago. The simplest answer is found in the fact that if exchanges do not balance and if the British people have been in truth living on their capital and bleeding to death, they ought by now to be a trebly ruined nation. In the course of the last 25 years imports have *apparently* been so much in excess of exports that the loss in that period must have been nearly £2,000,000,000 of capital. But it is notorious that we have suffered no such loss. Though statistics as regards the accumulation of capital, both in home and foreign investments, are by no means complete or satisfactory, it is manifest that instead of bleeding to death the nation has become more, not less, full blooded from the capitalist point of view and that the total capital, instead of diminishing, has vastly increased in the course of the last quarter of a century. Instead of having £2,000,000,000 less capital, we have many hundreds of millions more and are a very much richer people. In other words, experience has shown that the bleeding to death theory will not bear examination, and that whether on other grounds or not protection may be a good thing, free trade is certainly not driving Britain to bankruptcy or reducing her capital resources. In fact, regarded as a means for increasing and maintaining the material wealth of the nation, Free Trade must be admitted to hold the field.

The Imperial Argument.— Though there is no doubt a great deal of difference of opinion in regard to the best way in which to maintain and develop the British Empire, the nation is virtually unanimous on one point. It is for the benefit — moral, political and economic — of the peoples who compose it that the British Empire shall be maintained. It is asserted on the Protectionist side, however, that the Empire cannot be maintained under a Free Trade system, and that unless that system is changed the Empire will fall. That argument has hitherto not made any impression upon the masses of the British people. Instead of accepting the formula "No Preference, no Empire" they are much more inclined to accept the opposite dictum, "No Free Trade, no Empire" and to hold the opinion that the Empire as it exists to-day is the gift of Free Trade. Up to 60 years ago there was a system of preferential trade within the Empire almost exactly like that which it is now proposed to re-establish. On the one hand the British Colonies were required to give a preference to British manufactured goods and to supply their needs in the British market, and on the other, the British people gave a very large advantage to the products of the various parts of the British Empire in their markets. Yet, strange as it may seem, the result of these attempts to interfere with exchanges on political grounds did not produce a sense of loyalty in the inhabitants of the Colonies or of good feeling toward the scattered parts of the Empire in the United Kingdom. The epoch of Colonial preference was the epoch in which there grew up in England a school of thought and a political party which believed that the connection between the outlying parts of the Empire and the United Kingdom was injurious to both and that it would be to her advantage if Britain got rid of her Colonies and dependencies as rapidly as possible. Even so imperialistic a statesman as Lord Beaconsfield was affected by these views in middle life. He actually described the Colonies as "millstones round our neck" and looked forward to the time when they would all be independent. The abolition of Colonial preference and the adoption of the principle of "tariff for revenue only" may be said to have been accomplished by the end of the first half of the 19th century. It was after 1850 and so in the Free Trade epoch that the strong sentiment in regard to the Empire now existing, both in the Colonies and at home grew up. No one now looks forward, as men constantly looked forward during the preferential epoch, to the time when the Colonies would one by one leave the Empire. This being so, many of the most far-seeing and the most steadfast Imperialists in England regard Free Trade as essential to the maintenance of the Empire.

A further argument for Free Trade as an essential condition of empire is to be found in the fact that from the strategic and military point of view the Empire rests upon sea power, and that sea power in the true sense cannot be possessed by a nation which does not also possess supremacy or something approaching supremacy in the matter of its mercantile marine. A great national navy depends upon a great commercial navy. But a commercial navy cannot exist without Free Trade. It is the nations which encourage all who have anything to sell to come freely to their ports and sell it there without let or hindrance, which most easily develop a large mercantile marine. Britain stands first in the world of shipping, not because she has better resources for shipbuilding, and not because her population is by nature more inclined to sea-faring than others, but because she is a Free Trade nation. Englishmen feel that if they are to keep their empire they must remain a great shipping power, and to be a great shipping power they must maintain Free Trade.

Monopoly and Corruption.— There are two other factors which operate to make Englishmen maintain their present fiscal system. The first is the dread of monopoly which is to be found in the British democracy. They are intensely suspicious of anything in the nature of Trusts or Combines, or of allowing any body of commercial men to be in a position in which they can say "You must either buy the goods we make, or accept the services which we offer, or go without." Dreading intensely the creation of monopolies, they cling to Free Trade, for they realize that it is almost impossible to establish a complete monopoly under their present system. As long as the doors are open, and the traders of every nation in the world are allowed to send what they will to Britain and dispose of it there freely, the task of creating a monopoly in any of the essential needs of mankind is almost impossible of accomplishment. Another reason which weighs not less strongly with the British nation is the dread of political corruption. Rightly or wrongly they believe that there is always a danger under Protection of corruption entering political life. If vast fortunes can be made by the addition of a word or two to the schedule of a tariff bill, they argue that people will take too fierce an interest in politics and that the desire to get those words inserted or to keep them there after insertion will deflect men's minds from what should be their true concern in dealing with public affairs,— the good of the nation as a whole. Politics, in a word, under Protection, become too personal. The British people do not want any man to find himself in the position of saying "I can't listen to what you say about the interests of the people. All I know is that if the words in the tariff Act which protect the industry in which I work, or in which my money is invested, do not remain in that Act, my wife and children may come to starvation. Therefore I mean to work with anybody or any party which will give me the assurance that my livelihood shall not be placed in danger. I am a man and the father of a family first of all." It must not be inferred that the British people consider that a proper regard for national interests can never be found in protectionist states. The history of America shows that in spite of the dangers to which I have alluded, plenty of unselfish patriotism is to be found in countries where protection prevails. The fact, however, remains that the British people do dread very greatly the introduction of protectionist conditions into their political life. Further, they dread the direct corruption of the Legislature by the great commercial interests. They may trust their Members of Parliament in the abstract but they do not wish to see them exposed to the temptations which unquestionably exist when enormous pecuniary interests depend upon the maintenance of a Protectionist tariff. If once a Legislature becomes corrupt, the chief safeguards of liberty are destroyed. Hence, the British democracy feel that with the maintenance of Free Trade is bound up a great deal of what they value most in the political system under which they live. See GREAT BRITAIN — THE BRITISH TARIFF MOVEMENT.

General Conclusions.— To sum up, the British people have established the policy of Free Trade and wish to maintain it on the following grounds: (1) They believe that the abandonment of Free Trade would cause economic waste and so tend to national impoverishment. (2) They believe that Free Trade secures the Empire of which they are so proud, and also gives them that naval strength upon which in the last resort that Empire rests. (3) They believe that Free Trade prevents the growth and spread of political corruption,— the chief danger of modern democracies.

Bibliography.— The main outlines of the early free trade movement can be found in general histories, such as 'The growth of English Industry and Commerce,' vol. II, by W. Cunningham; 'History of British Commerce,' by Leon Levi. But the real relation of the movement to English life and progress is best seen in the speeches of the politicians mainly responsible for the carrying out of ideas into practice. There is ample material of this kind in the 'Speeches' of W. Huskisson (1831); of Sir Robert Peel (1853); in the 'Free Trade Speeches' of Charles Villiers (1883); in the 'Life and Speeches of John Bright,' by G. B. Smith (1881); and in the 'Life of Richard Cobden,' by J. Morley (1881); the 'History of the Anti-Corn-Law League,' by H. Prentice (1853), and the 'History of the Free Trade Movement in England,' by A. Mongredien, also contain much information as to the earlier period.

The revival of interest in the question in the early eighties, the controversy as to the results of English policy and the influence of the example of foreign countries, are illustrated in 'Free Trade and Protection,' by H. Fawcett (1878); and 'Free Trade v. Fair Trade,' by Sir T. Farrer (1885); 'The Free Trade Movement and its Results,' by G. Armitage-Smith (1903); 'Elements of the Fiscal Problem,' by L. G. Chiozza Morey (1903); 'The Tariff Problem,' by W. J. Ashley (1903); 'The Rise and Decline of the Free Trade Movement,' by W. Cunningham (1903); 'The Return to Protection,' by W. Smart (1903); represent from various points of view, the reviewed controversy of the present day. An interesting general view by a disinterested observer is given in C. J. Fachs' 'The Trade Policy of Great Britain and her Colonies,' translated by H. M. Archibald (1905).

JOHN ST. LOE STRACHEY,
Editor of 'The Spectator.'

41. Great Britain — The British Tariff Movement: Its Origin, Theory and Prospects. "For more penetrating observers," writes Dr. Schulze-Galvernitz in the latest and ablest study of the British economic situation, "the overwhelming success of the Liberals in the elections of January 1906, was less surprising than the number of votes given against Free Trade." This is the verdict of the searching and candid writer whose prepossessions are all in favor of Free Trade. The remark shows a genuine anatomical knowledge of British politics and may be commended to Americans who wish to penetrate surface impressions on this subject and desire to grasp the underlying facts. My purpose, so far as the brief space permits, is to state the facts, to explain their causes, and to indicate what seems to be their tendency.

The main fact is that England has ceased to be a solidly Free Trade nation, though possessing at the present moment a Free Trade majority of an insecure character. The state of Parliamentary representation does not truly reflect the balance of national opinion. In England and in the United States a small majority of the nation may secure a disproportionate power in the Legislature. Any party which could obtain a one per cent plurality everywhere would obtain an absolute monopoly of representation, although it had secured only a little more than half the votes. Thus, as a result of the recent General Election, the Unionists, or Fiscal Reformers, were reduced in the House of Commons to an unprecedented minority. In Great Britain they secured less than a quarter of the seats; but the important point is that they obtained nearly 44 per cent of the National vote. The balance of opinion disclosed at the polls may be shown in round numbers as follows:

BRITISH NATIONAL VOTING JANUARY, 1906.

		Per cent.
For Liberals (Free Traders)	2,600,000, or	48.2
For Unionists (Fiscal Reformers)	2,350,000, or	43.5
For Labor Party (Independents)	450,000, or	8.3
	5,400,000	

(1) The Labor party is chiefly a Socialist party, though for reasons of policy it declines that title. It is independent in its parliamentary position and independent in its economic opinions. Its support of Free Trade is tactical, perhaps temporary. It assures the masses that Free Trade alone is a failure; that the tariff alone is no remedy; that both are unimportant by comparison with the policy of Socialism; that either may be used to promote Socialist purposes. The truth is, that in a period of trade depression the tariff movement would try to capture the Labor party while the Labor party would try to capture the tariff movement. In any case independent labor is not a fixed Free Trade force; and this being so, a glance at the figures just given will show that Great Britain no longer possesses anything like a fixed Free Trade majority.

(2) The aggregate Liberal vote was less than 50 per cent of the whole, though the pendulum was swinging with very exceptional violence against the late Government for reasons largely unconnected with the Free Trade issue.

(3) The Unionist, or fiscal reform party, secured at the first trial of strength, within less than three years from the beginning of Mr. Chamberlain's tariff campaign, the support of more than two-fifths of the nation. This is the surprising fact, as Professor Schulze-Galvernitz perceives. Seventy years after Adam Smith's 'Wealth of Nations' had appeared; nearly a quarter of a century after Huskinson had commenced to reduce the obsolete tariffs raised to an exorbitant height by the desperate revenue necessities of the Napoleonic wars; seven years after Cobden had started his violent and masterly agitation against the corn duties, the country was still unconverted to the Free Trade principle. It was suddenly moved to throw open its ports by the Irish famine and the crop failure of a disastrous season. "It was the rain," as Mr. John Morley remarks, "that rained away the Corn Laws in 1846."

By these comparisons the rapidity and extent of the progress made by the new movement in Great Britain are to be measured. We have a strong Free Trade party which is at present in power. We have ceased to be a Free Trade nation. That policy formerly depended upon unanimous national support. It now depends upon the odd man. Holding the casting vote under the party system, the odd man is no doubt omnipotent while he remains of the same mind. But he determines the rise and fall of Governments by changing his mind.

The predominant fact, then, of present English politics is the rise of the tariff movement. The history of this fact may be briefly sketched. Its origins were slow and subconscious. Mr. Cobden had always dwelt upon the advantage of an unfettered exchange of cotton for corn. England would manufacture the cotton and other things; America and other countries would grow the corn; there would be an ideal division of labor from the British point of view. Mr. Cobden promised that if England abolished her tariffs there would not be a country in the world within five years but would have followed her example. Sixty years have elapsed; no country has followed her example. A steady rise of national tariffs, as elaborate and powerful as the fortifications of Vauban, has dominated the intervening period. The Far East is about to repeat the example of the United States and the European Continent. Great Britain is only one open island amid the closing markets of the world. Free Trade, therefore,— exchange equally unrestricted on one side and the other as between two nations transacting — has never yet prevailed anywhere. It is an unknown condition. Even England has not had it. She has instead the system of free imports by which foreign competition is admitted without interference to her market, while her own competition is as far as possible suppressed in foreign markets. That is not a satisfactory comparison.

Foreign protective tariffs are a disadvantage to British trade. British free imports are relatively an advantage to foreign trade. The conditions are unequal. Unequal conditions in commerce are not good. Free Trade writers cannot be induced to examine the practical effect of the inequality — pivot-point nevertheless of the British economic controversy. They simply restate, without modification of any kind, the traditional arguments which would apply to a genuine international system of free exchange, but cannot apply in the same measure — and, to a large extent, do not apply at all — to the state of things prevailing in the total absence of that system.

For a prolonged period (1846–1875), British trade expanded with unexampled energy. Agriculture flourished. The economic conditions of the world were transformed by the Californian and Australian gold discoveries; by railway construction in the United States and upon the European Continent; by steam shipping. But America and Europe alike were convulsed by great wars. Their state systems were refunded. Their tariffs were readjusted in the spirit of Alexander Hamilton rather than of Adam Smith. They were equipped with railways and prepared for manufacture. England had remained at peace and her workshops dominated all markets. But her memorable period of uncontested supremacy was over.

In 1878 — exactly a generation after Mr. Cobden's triumph — a period of commercial depression reached its depth. Crowds of industrial workers were unemployed in the cities. The old prosperity of British agriculture was broken and the rural population began rapidly to diminish. From that moment through another quarter of a century of trade fluctuations, the truth of the free import theory was questioned by an increasing number of English thinkers. Popular distrust, however, preceded scientific opposition. The "National Fair Trade League" was started in July 1881, and carried on for more than a decade a formidable political agitation, stimulated by some able controversial literature and a vigorous weekly paper. This protectionist movement, however, failed to find a great leader and died out in the early nineties. Its only chance of success lay in converting one of the great political parties. The Conservative rank and file were generally predisposed to protection. The Conservative leaders patronized the Fair Trade movement while the Liberals were in power, and stifled it when they had obtained office themselves. Nevertheless, other influences continued almost imperceptibly to dissolve Free Trade conviction throughout the country. The British 'Trade Consular Reports' became a serial narrative of the advance of protectionist competition, American and German, in markets where British manufactured exports had recently been supreme. The immense progress of the United States and the new German empire showed at last that free imports, or half-free trade, was not a certain recipe, assuredly not the sole recipe, for commercial success, and that protection was not necessarily a prevention of progress. There was a general mood of profound anxiety as to the position and prospects of British commerce, and a widespread scepticism as to the theoretical truth of Free Trade and the practical advantage of free imports.

All the previous scepticism and mistrust which had existed upon the question of Free Trade were crystallized in 1903 when Mr. Chamberlain created the new fiscal reform movement. His Birmingham speech on May 15 in that year was one of the dominating events of English politics. In the limits of this article it is impossible to trace the history of his agitation. The result has been noticed. There has been a small schism of very distinguished persons. There is some difference between Mr. Chamberlain and Mr. Balfour as to the sort of commercial system to be substituted for the existing one. But the Unionist (or "Conservative" or "Imperialist") party is committed to some form of tariff policy. The Liberal - Irish Nationalist - Independent Labor Coalition which conquered at the last General Election is not morally solid against the tariff. The present writer believes that Mr. Chamberlain's policy is the policy of the future. England, let us repeat the fact, has ceased as a whole to be a Free Trade nation though still containing a great free trade party whose parliamentary predominance rests upon a comparatively slight majority of popular votes.

We now pass from the history to the theory of the movement. Free Traders say: (a) *that tariffs restrict trade.* The reply is that exports and imports alike are increasing in every considerable protectionist country. Germany's break with the Cobdenite system in 1879 — America's adoption of what Englishmen call McKinleyism — have been followed not by commercial restriction, but by a greater expansion of production, foreign exchanges, employment, population, and wealth than has taken place in Great Britain during the parallel period. No Free Trade writers grapple with the fact — few ever notice the fact — that the fundamental principle of a scientific tariff is the free importation of raw material, side by side with the taxation of foreign competitive manufacture. The tariff idea aims at restricting the least advantageous kind of imports in order to develop the most profitable kind. So far from implying restricted trade, it means, when competently adjusted, the largest volume of the best exchanges.

(b) *That imports must be balanced by exports — that goods received must be paid for by goods returned — and that as all inter-*

national exchange will arrange itself in an ideal manner, if you let it alone, the State ought not to interfere with it. The reply to these statements is that they are to a large extent altogether inaccurate, and for the rest are superficial half-truths of a singularly deceptive character. Imports may or may not be completely paid for by exports (including shipping freights and foreign investments). The account may be cancelled by the transfer of securities. An excess of imports may remain as invested capital, the interest only being returned, and the complete "balancing" being indefinitely deferred. England, for instance, formerly sent a steady excess of imports into the United States. The excess remained for the most part as British capital invested in America. America ceasing to be a debtor nation has cancelled a good deal of that British capital by the excess of her own exports in recent years. Thus while imports and exports may appear to balance more or less all the time, according to the conventional Free Trade theory, a movement may be gradually going on under the surface which actually reverses the position of the two countries concerned; and transfers the commanding advantage of economic relations from one country to another. Again, no Free Trader asserts that like is paid for by like — that the import of foreign *manufacture* produces an equivalent export of home *manufacture.* A country which formerly exported raw produce in exchange for finished manufacture may rise in the social scale and export in its turn finished goods to pay for crude material. So far as the maxim tells upon the practical controversy, it tells both ways. Imports and exports do not balance better under free imports than under the tariff. America pays for her imports with her exports and has a probable margin to spare! America entrenches her own trade in its position and makes it as difficult as possible for foreign competition to displace it. The English system makes it as easy as possible for foreign manufacture to displace home industry. Under Free Trade the products of certain industries may pay for the competitive imports which are steadily weakening other industries. To sum up, the tendency of isolated free imports is to undermine the national defensive position in trade after trade. America and Germany under the tariff are making new conquests in trade after trade. "Where organization becomes necessary," said Brunel, "*laissez faire* becomes impossible."

The British tariff movement, however, lays more stress upon its constructive principles than upon its replies to the sophistry of Cobdenite syllogisms. It is maintained that the tariff under British conditions would mean the maximum increase and the best distribution of wealth. An isolated free import system implies the narrowest and least secure market. A competitive import only enters by displacing the home supply against which it had competed. There is a gain to some home consumers but a loss to some producers. The nominally counterbalancing export follows at the second remove, though meanwhile a net injury to the productive power of the importing country may have been inflicted. Home capital may have been sterilized; home labor displaced. How different under the American or German national systems. There, imports are mainly non-competitive; they must either stimulate home production or supplement it. The possibility of loss at this first stage is reduced to a minimum: the return export follows in the ordinary course, and benefit accrues at each stage of the transaction. The percentage of unemployed persons (skilled artisans and laborers) is considerably greater in England than in the United States or Germany. For in the former case the Cobdenite system facilitates slow but steady displacement of home labor and arrests the development of all trades against which foreign finished goods compete. Again, under the present conditions free imports actually restrict British industry to the smallest market and secure foreign competition in the possession of the largest market. America has free sale within her own market and ours, among 125,000,000 of people; Germany has free sale in her own territory and equally in the United Kingdom — a similar double-market of over 100,000,000 of people. England has no free sale for her goods outside her own home market of 40,000,000 of inhabitants, and does not reserve any advantage to herself even upon her own soil. The conditions are not equal; the inequality means a steady discount upon British national prosperity.

The argument may be reviewed succinctly. For the island and the empire fiscal *laissez faire* is now a principle of *minimum* development. We must seek in another policy the principle of *maximum* development. The principle of maximum development in economics demands the maximum efficiency of capital. In every country which admits the raw material of industry free, but discriminates against foreign finished goods, the activity of capital is more decisively encouraged than under Cobdenite conditions, where the British manufacturer is excluded by foreign tariffs abroad, and attacked at his own home base by protected competition. Cobdenism gives away the whole case when it declares that capital under the tariff is stimulated. We are told, it is true, that the stimulus is secured by pillaging the consumer. That is rather demagogically stated than commercially reasoned. For if capital is stimulated at all, its operations must be extended; its efforts in developing the productive capacity of a country must be more powerful; it must create the maximum amount of employment; it must tend to raise wages by the most certain of all methods — that of increasing the demand for labor; and it is not possible, if the chain of reasoning be sound, that the consumer can lose in the long run by the policy of maximum development.

Finally, there is a moral question rather unpleasantly introduced in a manner which can only be called a little insular. It is said that the tariff would introduce corruption. I do not believe it. In economic controversy it is especially desirable to "clear our minds of cant." In spite of free imports, gross frauds are perpetrated in English finance and a considerable amount of petty dishonesty prevails in business. Human nature is tinctured in the ordinary way, and to revive the old pose of superior virtue is a proceeding which appears to be a little deficient in humor. Corruption in America, if I judge aright, is due to the concentrated passion of the money-hunt, to the vehemence of the desire to succeed, and the sheer difficulty of bringing public opinion steadily to bear upon any one aspect of this evil amid a heterogeneous society in a state of violent material development. Corruption rages in every phase of expansion and exploitation. It will be eliminated as the conditions of American society become more settled. Where it prevails it is apt to taint everything. It will taint the tariff if it touches the tariff; but nothing could be more unhistorical or less imaginative than to represent whatever commercial and political corruption there is in America as due to the national economic policy founded under Alexander Hamilton and restored under Lincoln. For the rest the American habit of making public confession under a sounding board creates an exaggerated impression in Europe where the admitted evil is popularly believed to be far worse than it is. Shipping and revenue will be more properly dealt with in another section. The aim here has been to show that the tariff movement in England depends upon a theory of development, not of restriction; that the political prospects of that movement are good; and that the real strength of the foundation of the free-import system, national unanimity in support of it, has irrevocably disappeared.

Author of 'Economics of Empire.'

42. **Great Britain — Reaction of British Imperialism Upon the Mother Country.** The maintenance of the British Empire is not merely the great problem of the King's dominions as a whole. It is the vital problem of British domestic politics. We shall proceed to regard it under this latter aspect. What the shores of the Baltic were after the fall of Rome, the United Kingdom has been in the last few centuries — a nursery of nations. The area under the flag is about 12,000,000 square miles, or not much less than a quarter of the earth's land surface. Two-thirds of this area consists of territory more or less suitable for white settlement and more or less occupied by white races. These are the "Colonies." The other third includes India, always to be regarded as a world within a world, and the undeveloped tropical possessions. These are the "dependencies." The dependencies present a strict *Imperial* problem. The colonies, on the other hand, present a *Federal* problem. That distinction should be clearly grasped and borne always in mind. These two very different sets of facts have exerted a double and parallel reaction upon insular conditions, mental, moral and material. Great Britain cannot continue to exist as a great power unless she can induce the colonies to enter with her into a political or a commercial partnership; or into a Defence Union and a Customs Union combined, such as the thirteen colonies formed when they adopted the American constitution and became the United States. It is improbable, however, that the British dominion can be consolidated and preserved unless the mother country resorts to an extensive reorganization of her traditional arrangements.

The growth of what is called the Imperial idea in British politics may be rapidly sketched. After the American War of Independence the credit of the old Colonial theories was destroyed in Europe. "Colonies are fruits that cling till they ripen," said Turgot. That a country should facilitate the emigration of vigorous citizens, extend its responsibilities and increase its burthens, in order to create new States certain (as it was thought) to separate when they were strong enough, seemed a proposition of which the folly had been demonstrated once for all at Yorktown. This feeling was naturally most intense in England and continued well nigh unchanged for nearly three generations. By the complete conquest of India trade was increased; national imagination was stimulated; the adventurous and administrative vigor of the race was kept in play. But India remained remote and alien. The English people had no ideal sense of connection with it, although the conviction that mercantile supremacy depended upon the possession of it was widely spread.

The victorious sequel of the struggle against Napoleon was a triumph of the national power contained within the four seas of the British islands. In spite of the loss of the thirteen colonies, England seemed stronger than ever, and toward the close of that era had occurred the war of 1812. After Waterloo, Englishmen with leisure to reflect upon the tremendous vicissitudes of events in the previous half century, felt not unnaturally that colonial enterprise meant a loss of national force and created new perils. This mood deepened throughout the years of the Great Peace. It was now clearly expressed by the father of the free-import system — Mr. Cobden. To him the separation of America seemed not only a necessary political experiment in itself, but a precedent which not only would be, but ought to be repeated in the future. Trade with the United States had much increased and there was no longer any obligation to defend them. That seemed to be an ideal result. Canada, Australia and South Africa were vast wildernesses, supporting little commerce at that time but aggravating military charges. There was a preference under the old protectionist tariffs for West Indian sugar and Canadian corn and timber. The higher duties upon the corresponding foreign products were represented as having been imposed in order to favor the colonies (though it may be doubted whether any duties would have been lower had the colonies not existed) and this was represented as another artificial burden laid upon the consumer. Cobden thought the colonies were useless and dangerous possessions. He thought India was an immoral possession, and that matters would never be well with England until she stripped herself of all these appendages and returned to a strict national basis. His belief is summed up in the well known letter of 1842:

"The colonial system with all its dazzling appeals to the passions of the people could never be got rid of except by the indirect process of Free Trade which will gradually and imperceptibly loosen the bonds which unite the colonies to us."

As to the whole spirit of British history:

"Unlike every other people, we have during seven centuries been fighting everywhere except upon our own soil. Need another word be said to prove us the most aggressive race under the sun?"

In India the position was iniquitous and the prospect hopeless:

"There is no future but trouble and loss and disappointment and I fear crime in India; and they are doing this country the greatest service who tell them the honest truth according to their convictions and prepare them for abandoning at some future time the thankless and impossible task."

Upon the project of Canadian Confederation Mr. Cobden expressed his views with his accustomed plainness and vigor:

"In my opinion it is for the interest of both that we shall as speedily as possible sever the political thread by which we have been connected. I have felt an interest in this Confederation scheme because I thought it was a step in the direction of an amicable separation."

Cobden's opinions were shared in essence even by the majority of the cultivated and aristocratic classes who disliked his unvarnished language. The extracts given illustrate the mood which prevailed almost universally until late in the sixties of the 19th century.

Then the tide began to turn. The reaction was deeply connected with the events of contemporary history and the change in the spirit of international politics. Since the American and French revolutions the ideas of liberty and independence had dominated and inspired men's minds. Henceforth, the idea of *unity* was to direct politics and to penetrate into the sphere of commerce. Italy reconquered her unity after the disintegration and enslavement of centuries. American unity was vindicated in the mighty grapple of the Civil War. The imperial unity of the German race was magnificently restored. Under the British flag the Canadian Confederation, like the Australian Commonwealth later, had been born in peace. Steam had diminished all distances and the unity of the British dominions had become for the first time a physical possibility, bound to become more and more feasible as the rapidity of modern communication developed. But above all, Lincoln's and Bismark's victories (with intent we name statesmen rather than soldiers) had caused people in Great Britain to reflect that the American power and the German power of the future would dwarf Great Britain in the end, politically and commercially, unless the zone of a Britannic Federation could be made to span the world. Australia after the gold discoveries promised to fill up more rapidly than it has done. Russia was now drawing nearer to the Indian frontier; England began to realize that the result of bleeding to death at the extremities might be the same as a thrust in the heart. Imaginations awakened under the apprehension of future necessity. Queen Victoria was proclaimed Empress of India by the policy of Lord Beaconsfield, who knew that democracy only understands the simple and grandiose forms of symbolism. The Prince of Wales (now King Edward) visited India, and his tour, followed with intense interest at home, became a popular education. Next South Africa was the scene of fierce and exciting little wars. Professor Seeley's brilliant little study 'The Expansion of England' had, it is not too much to say, a greater influence upon British political thought than any other book of the same size published in the last two generations. Lord Cromer's masterly administration of Egypt followed and was rightly regarded as a great moral vindication of the history and genius of Imperial Britain. Cobden's view of the ethical aspects of Imperialism was replaced by the opinion best expressed in the late Professor Pearson's 'National Life and Character,' "In India for one war that we have waged we have prevented twenty." Mr. Gladstone's Home Rule policy was regarded as a policy of disruption. Hence his defeat. The Conservative-Liberal coalition which overthrew him and formed the Unionist party emphasized the idea of National and Imperial unity through the 20 years of its almost unbroken rule (1886–1892 and 1895–1906).

All these influences were gathered to a focus in the Jubilees of 1887 and 1897 — memorable celebrations of the fiftieth and sixtieth years of Queen Victoria's reign. Mr. Chamberlain as Colonial Secretary was the strongest and most conspicuous personality in the Ministry. Then came the crucial test of the recent South African War. It was felt that the fate of South Africa and the ultimate existence of the Empire depended upon the issue. When the mother country and the colonies marched together the war was fought as a war for unity. The movement of national sentiment in favor of Imperialism appeared decisive; the ideal remained vague.

In 1903 Mr. Chamberlain resolved to attempt the first constructive steps, by proposing a closer union with the colonies upon a commercial basis. He had hoped in the first instance to create a central Imperial Council to organize Imperial defence. The colonies perceived that representation with that object would ultimately mean taxation for it. For this they were not prepared. But they offered to conclude treaties admitting British goods to their markets upon preferential terms. Canada had already made a beginning in that direction. Other colonies have followed. But the reciprocal condition necessary to a powerful extension of the system has not yet been given—a corresponding preference in the British market for colonial produce.

This would necessitate the introduction of a British tariff. The more the problem was examined the more deeply Mr. Chamberlain became convinced that it must be attacked upon the commercial side, if progress toward its solution was to be made. There we should follow the American precedent and the German precedent. "The Constitution" said Daniel

Webster, "was the child of pressing commercial necessity." And of the resolution upon which the Philadelphia Convention was called the same orator says: "Look at the resolution itself. There is not an idea in it but trade. Commerce, commerce is the beginning and end of it." The North German Zollverein preceded German political unity. It seems fairly clear in the British case that some form of Imperial Zollverein must be established before any form of Imperial Kriegsverein can be created. But Mr. Chamberlain was met, both in his own and the opposite camp, by the contention that the traditional policy of free trade forbade any attempt to enter into preferential commercial relations with the colonies. Mr. Chamberlain then decided that the traditional policy of free trade must go. But it was mainly for political reasons that he assailed the theory of Cobdenism upon the field of national production as well as in the sphere of Imperial trade. A British national tariff upon foreign manufacture would assuredly accompany a system of preferential commercial treaties with the colonies; and this would be an extraordinary result of Imperial influence working back upon insular organization.

The immediate effect of Mr. Chamberlain's agitation has been to give a wholly new direction to a great body of national thought. To repeat here words that the writer has previously used, the security of the King's dominions would be best based upon the power of a white population proportionate in number, vigor and cohesion to the vast territories which the British democracies in the mother country and the colonies control. That surest of all guarantees is obviously lacking to British power. Although we have a quarter of the world under our flag, we are much less numerous than Americans or Germans. We cannot safely believe that we are more efficient. We are not. The home populations of the three great countries chiefly concerned in the future of trade and seapower compare as follows: United States 81,000,000 of people; Germany 61,000,000; and the United Kingdom 43,000,000. So much for the present. What of the future? The Kaiser's subjects increase twice as fast as King Edward's subjects in the mother country. The white population under the American flag increases three times as fast as the white population under ours. By 1920 the United States ought to count considerably more than 100,000,000 of people. The German Empire within its present limits should count 75,000,000. The United Kingdom at the present rate of increase (and that rate slackens rather than accelerates) would number in 1920 only about 48,000,000 of people. The British nation cannot limit its view of economic policy by the insular horizon. Were we compelled once more to lead an isolated life we should realize the disadvantages of being an island,— and a small one! Nature has fixed our bounds. We have no *hinterland.* Railways through Europe and direct shipping services are diminishing our importance to the nearest continent as a warehousing centre and place of transhipment. Were Europe involved in a great war from any cause whatever, a perfectly possible reconstruction might create a pan-German empire with a population as large as that of the United States, stretching from the North Sea to the Mediterranean and perhaps across the Bosphorus (for the Turkish dominions even if remaining unconquered might very well be drawn into a Central European Zollverein) and occupying a political and strategical position unrivalled in the world. Such a development of European politics is no less and no more possible than the events from 1864 to 1871 which led to the hegemony of Prussia in the restored German Empire. Upon the other hand the British self-governing colonies taken together have an area more than twice as large as the United States— but they contain a white population estimated at 11,000,000, or very considerably less than the population of New York State and Pennsylvania taken together. If England desires a more rapid increase of white population in her colonies, she must take some special steps to promote that result. Otherwise even a complete federation with her daughter-states would not enable her to maintain her present relative political and commercial power or to guarantee their safety.

Unless Great Britain can fill up her colonies and form a union with them, her prospects of maintaining the command of the sea by the use of her insular resources will become hopeless. Maritime supremacy, and with it her present imperial and commercial position, would pass away perhaps before the end of another generation under conditions of peace and through the natural operation of economic and social forces. Take the comparison with Germany alone. For armaments and interest on debt, the United Kingdom pays nearly £90,000,000 annually. Germany pays less than £50,000,000 upon the same accounts. The reason is that her national debt is exceedingly small by comparison with England's; her vaster national army is no more expensive; her navy at present no more than one third, at the most, in size and cost. Yes; but look at the figures just given and you will observe the fact that Germany could ultimately maintain a fleet as large as the British while paying less than the United Kingdom pays now for the triple financial services — National Debt, Army and Navy. It is tolerably plain then that the only hope for the island, from a revenue point of view, lies in union and development of the Empire. This view has been authoritatively expressed by Sir Michael Hicks-Beach and Lord St. Aldwyn. He was chancellor of the Exchequer during the South African War, is a firm opponent of Mr. Chamberlain's commercial plans and advocates the impracticable alternative of large direct colonial contributions to the support of the British Navy. In heading a deputation upon this subject to the Prime Minister Sir Michael Hicks-Beach spoke as follows on 10 Dec. 1904:

"It is my deliberate conviction, looking at the enormous efforts now being made in all parts of the world by great powers in increasing their naval strength, that without recourse to a system of borrowing for current expenditure, which would be deeply injurious to the credit of this country, and which would deprive us of the resources necessary for carrying on any great war — without such recourse *it would be impossible for taxpayers of the United Kingdom to continue to bear alone the vast and ever increasing burdens of the naval defense of the Empire.*"

It is often said that a tariff which protects shuts out the goods and produces no revenue; and that a tariff to produce revenue must let in the goods and cannot protect. This is a purely verbal difficulty. Every well-adjusted tariff is partly a protective and partly a revenue-producing instrument. It serves both ends in sufficient measure while serving neither exclusively. Free Traders point to the fact that Great Britain still possesses half the mercantile shipping tonnage of the world, as though in that fact rested naval security and a decisive argument against change. England's advantage in the carrying trade is no larger than it was a generation ago in the iron trade. Americans and Germans were only beginning to compete in iron then, and both have beaten English iron; they are only beginning to compete in shipping now. But sea-power has become a highly specialized form of force, far less intimately connected than in Nelson's days with the mercantile marine, and depending more generally upon the whole financial and technical resources of the nation behind it. Great Britain has half the merchant shipping of the world. In that respect, she has reached the maximum, and the percentage is beginning to show a slight but unmistakable tendency to recede. Under protection her chief commercial competitors have developed a financial and taxable capacity which enables Germany and the United States for the first time to challenge British naval supremacy in earnest. It is perfectly conceivable that England might retain her present proportion of the world's mercantile tonnage and might nevertheless lose her naval supremacy through the eventual ability of some power to bear a far larger naval budget than England as an island could afford.

The United States could dispense in a crisis with the whole of its foreign trade. Germany beaten at sea would still produce the great bulk of her food supplies upon her own territory. France, with her wonderfully compact economy, is practically self-contained. But England is more dependent upon exterior forces for her means of existence — her agricultural imports and her raw material; the food for her people and the food for her machines — than any other society history has known. Great Britain, in other words, cannot continue to be a great power upon an insular basis and the failure to unite her Empire would be followed by the decay of her present national status. The fate of Holland is her danger. The application of the spirit of the Philadelphia Convention to the circumstances of her vast and heterogeneous dominion — that is her hope.
