## WORLD COFFEE PRODUCTION ESTIMATE REDUCED

### Summary

Total 1974-75 coffee production, at 77.4 million bags, will be about 1.6 million bags less than the December estimate. Exportable production currently is forecast at approximately 58.1 million bags (132,276 lb each), down about 700,000 bags from the previous figure. Exportable production represents total harvested production minus domestic consumption in the producing countries. It does not take into account stocks from previous harvests that may still be available in some producing countries.

The new estimates result from adjustments in a number of countries, notably Colombia, based on recent information. Some small revisions have also been made in the estimates for 1973-74, which are now carried as 62.3 million bags total production, of which about 43.5 million bags were available for export from that crop.

### Production

**NORTH AMERICA.** The 1974-75 production is expected to be slightly less than the previous estimate, but will be 3 percent greater than the 1973-74 crop.

Total production for 1974-75 in **Costa Rica** has been revised downward from the January estimate by 3 percent to 1.35 million bags, a 15 percent decline from the 1973-74 production total. The decreased harvest is the result of the natural tendency for a large crop to be followed by a smaller one. Exportable production for 1974-75 has been revised downward to just under 1.2 million bags.

The 1974-75 production estimate for the **Dominican Republic** remains unchanged from the previous estimate of 750,000 bags. Total production for the 1973-74 crop has been revised upward to 845,000 bags as the result of excellent crops in several areas. The decreased production in 1974-75 was blamed on heavy rainfall in the Cibao area at harvesting time and lower production in other areas. Dominican coffee production is expected to remain relatively stable in the near future.

**El Salvador's** 1974-75 coffee crop is expected to be 2.65 million bags, an upward revision of 80,000 bags from the

previous estimate, and an increase of 28 percent over the 1973-74 crop. The increased crop is a result of exceptionally favorable weather conditions that have persisted throughout the growing and harvesting seasons. Exportable production for 1974-75 is expected to be about 2.5 million bags.

The 1974-75 coffee harvest in **Guatemala** was about 2.2 million bags, of which 1.9 million bags will be exportable. The crop was reduced by volcanic eruptions that damaged coffee plantations in some areas. Heavy flowering during the past few months has stimulated optimistic crop expectations for the 1975-76 season among farmers affected by rising costs of production.

**Haiti's** total production for 1974-75 is expected to be about 535,000 bags, a slight downward revision from the last report. Per hectare yields in Haiti are among the lowest in the world, and production will probably remain at its present level in the near future. The Haitian Government hopes that the 5-year program sponsored by the U.S. Agency for International Development will assist small producers in expanding output.

Total production in **Mexico** for 1974-75 is anticipated to be about 3.5 million bags, a 6 percent increase over the 1973-74 harvest of 3.3 million bags.

**Nicaragua's** crop for 1974-75 is expected to be about 650,000 bags, with exportable production of approximately 560,000 bags.

**SOUTH AMERICA.** Production in South America for the 1974-75 crop was about 38.6 million bags, a 2.5 percent downward revision from the January estimate. Exportable production is estimated at 27.3 million bags.

Total production for **Brazil** in 1974-75 is expected to be 27 million bags, of which 18.6 million bags are exportable. Favorable weather conditions in Parana and Minas Gerais, effective control of leaf rust, and adequate fertilizer applications have contributed to the large 1974-75 crop. The Brazilian Coffee Institute (IBC) has made a preliminary estimate of the 1975-76 crop at 21 million bags. The IBC has also reported satisfactory results with the coffee-tree renewal program. During the past 5 crop years, 1969-70 through 1973-74, Brazil has added to or substituted for about one-third of the 2.3 billion coffee trees

existing in 1969 with 730 million new high yielding trees.

The 1974-75 crop estimate in **Colombia** has been revised downward by 10.5 percent to 8.5 million bags on the basis of recent information. Exportable production in 1974-75 has also been revised to 6.9 million bags.

**Peru's** coffee production has been very stable over the past few years, and is expected to reach 900,000 bags for 1974-75. Exportable production is estimated at 640,000 bags. There has been a lack of renewal plantings in recent years as a partial result of increased production costs and the tightness of credit to the coffee-producing sector.

Total production in **Ecuador** for 1974-75 is expected to be just over 1 million bags, an 18 percent increase over the 1973-74 crop. Exportable production for 1974-75 is estimated at 725,000 bags. Favorable weather conditions throughout the growing and harvesting seasons were primarily responsible for the increased crop. Per hectare yields in Ecuador are very low because of minimal cultural practices.

**AFRICA.** Total African production in 1974-75 was 19.3 million bags. The 1974-75 production estimate for **Angola** has been revised downward by 600,000 bags to 3 million bags, based on recent information. Exportable production for 1974-75 is now estimated at 2.9 million bags.

Total production in **Cameroon** for 1974-75 has been revised upward by 250,000 bags to 1.5 million bags, equal to the 1973-74 crop.

**Ethiopia's** 1974-75 coffee crop showed a recovery from the drought in 1973-74, and is expected to be just over 2 million bags, of which 1.3 million bags will be exportable. The Ethiopian Government announced on March 3 a land reform program that included the assignment of a specific area of free land to each farmer and the establishment of collective farms throughout the country. What impact the decree will have on Ethiopian coffee production is uncertain at this time.

Coffee production in the **Ivory Coast** for the 1974-75 crop is expected to be about 4 million bags—a 22 percent increase over the 1973-74 crop, which was adversely affected by drought. Exportable production for 1974-75 is estimated at 3.9 million bags. Ivory Coast officials hope that further development of the Arabusta (an Arabica-Robusta hybrid) variety will result in larger and more stable production in the future.

**Kenya's** coffee harvest for 1974-75 is estimated at 1.1 million bags, virtually all of which will be exportable. Weather conditions in Kenya have been somewhat irregular, as good rains persisted through October-November 1974, followed by a severe drought beginning in December. The recent arid conditions will particularly affect the small-holding coffee sector, which has no irrigation facilities and now produces more than half of Kenya's total coffee crop. The drought has, however, stemmed the incidence of coffee berry disease.

**Uganda's** total coffee crop for 1974-75 is estimated at 3.1 million bags, most of which will be exportable. The production estimate for **Zaire** remains unchanged from the January estimate at 1.1 million bags, with exportable production of 975,000 bags.

**ASIA.** Total Asian production in 1974-75 was 5.6 million bags. Total production in **India** for 1974-75 is expected to be approximately 1.7 million bags, a 9 percent increase over the 1973-74 crop. Exportable production for 1974-75 is estimated at 855,000 bags. The Indian Coffee Board is continuing with its plan to plant an additional 40,000 acres with coffee in the next 5 years.

The 1974-75 coffee harvest in **Papua New Guinea** is expected to total 650,000 bags, a 4 percent increase over the 1973-74 crop. The increase in production has been largely the result of favorable weather conditions and the coming into bearing of a greater number of trees.

## Other Developments

Imports of green coffee by the main consuming countries for 1974 showed a decrease from the 1973 level. Trade sources estimate that imports of green coffee by the European Community for 1974 will be about 600,000 bags below the 20.1 million bags imported in 1973, a decrease of about 3 percent.

U.S. imports of green coffee for calendar 1974 totaled 19.2 million bags, a 12 percent decrease from the 21.85 million bags imported in 1973. The decreased volume of U.S. imports was mainly a result of a large drawdown in green coffee inventories. Stocks of green coffee in the United States at the end of December 1974 were approximately 3 million bags, a 42 percent reduction from the 1974 high of 5.2 million bags reached in May. U.S. imports of soluble coffee in 1974 were a record 1.6 million bags, a 5 percent increase over 1973 imports.

Green coffee purchases by the major importing countries have continued to meet only immediately foreseeable needs, and prices in the first quarter of 1975 have softened from end of fourth-quarter 1974 levels.

Central American Milds decreased 19 percent from the average December level, selling for 49.5 cents (New York spot price) on March 25. Colombian Milds decreased 14 percent to 70 cents, and Ambriz BB (African Robustas) showed a decline of 13 percent to 49 cents as of the end of March. Santos 4's (Brazils) increased 5 percent to 72 cents. Brazil continues, however, to make discount sales. The average retail price of regular ground coffee in the United States reached a record \$1.23 per pound in 1974.

Reflecting the inventory drawdown of green coffee in importing countries, total exports in 1973-74 were approximately 55.6 million bags, a 7 percent decrease from the 1972-73 export volume.

Brazil's green coffee exports of 14.1 million bags in 1973-74 were the lowest since the 1964-65 coffee year. In an effort to bolster the sagging volume of Brazilian coffee exports in 1974-75, the IBC has begun an active sales policy, including special contracts with some European countries.

Exports of coffee from Colombia for 1973-74 were 7.4 million bags, an 18 percent increase over the 1972-73 export level.

Total earnings from coffee exports in calendar 1973 were a record \$4.2 billion, a 34 percent increase over 1972. Major producing countries deriving more than 20 percent of their export earnings from coffee included El Salvador, Costa Rica, Colombia, Brazil, and virtually all of the African producers.

Representatives of 38 coffee-producing countries, accounting for about 90 percent of world coffee production, met in San Salvador February 14-16 to discuss producer policies aimed at maintaining world coffee prices.

The Working Group on the Negotiation of a New International Coffee Agreement held a fourth series of meetings in London March 17-22 to continue discussion of proposals for a new Agreement. Much of the discussion thus far has been of a general nature. The final Working Group meeting was scheduled for April. The present Agreement (without economic provisions) is likely to be extended by protocol until September 30, 1976. A negotiating conference will meet this summer in London, June 24-July 11.

<sup>1/</sup> Coffee marketing year begins about July in some countries and in others about October. <sup>2/</sup> Of 60 kilograms each. <sup>3/</sup> As indicated in footnote 1, the coffee marketing year begins in some countries as early as July. Ecuador is one of these countries. Hence, the crop harvested principally during June-October 1971 in that country is shown as production for the 1971-72 marketing year. In Ecuador, however, this is referred to as the 1970-71 crop.

Note: Production estimates for some countries include cross-border movements.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source materials, reports of U. S. Agricultural Attachés and Foreign Service Officers, results of office research, and related information.

<sup>1/</sup> Coffee marketing year begins about July in some countries and in others about October. Exportable production represents total harvested production minus estimated domestic consumption. <sup>2/</sup> Of 60 kilograms each. <sup>3/</sup> Negligible. <sup>4/</sup> As indicated in footnote 1, the coffee marketing year begins in some countries as early as July. Ecuador is one of these countries. Hence, the crop harvested principally during June-October 1971 in that country is shown as production for the 1971-72 marketing year. In Ecuador, however, this is referred to as the 1970-71 crop.

Note: Production estimates for some countries include cross-border movements.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source materials, reports of U.S. Agricultural Attachés and Foreign Service Officers, results of office research, and related information.

GREEN COFFEE: VALUE OF EXPORTS BY SPECIFIED PRODUCING COUNTRIES
