The inferior maxillary bone consists of the body, curved somewhat like a horseshoe, and two perpendicular portions called rami, which join the body nearly at a right angle. Springing upward from the junction of the body and rami are the coronoid processes, which give attachment to the powerful temporal muscles. The upper border of the body presents hollows for the lower teeth, and the outer angle of the jaw gives attachment to the powerful muscle of mastication, the masseter. The upper jaw is fixed, the mandible moving only in chewing.

The joint of the jaw is a condyloid articulation and is formed by the reception of the condyle of the inferior maxilla into the glenoid fossa of the temporal bone. Although firmly bound by five ligaments, dislocation forward often occurs from opening the mouth too widely, as in yawning, as well as by violence. The dislocation is easily reduced by grasping the lower jaw with both hands, the thumbs resting on the lower teeth, pressure being made steadily downward and then backward. The jaw may become fixed as the result of ankylosis of the joint, from injury, syphilis, or chronic arthritis, or as the result of muscular spasm, as in tetanus (lockjaw), or the irritation of an erupting wisdom tooth, or, occasionally, in hysteria. The spongy alveolar processes of the jaws are liable to infection from the teeth or gums, giving rise to necrosis, or more often to alveolar abscess. Necrosis of the jaws was common among workers in match factories under the old process of manufacture, which has generally been discontinued (see OCCUPATIONAL DISEASES), this necrosis being due to phosphorus poisoning. Fracture of the lower jaw is a common injury, resulting nearly always from violence. It is treated by reducing the fragments into their normal position, closing the mouth so that the upper teeth act as a splint, placing a pad of gauze over the point of fracture, and applying a four-tailed bandage. (See BANDAGE.) In many cases it is possible, after a few days, to hold the parts in place by wiring the teeth. Diet must be liquid, and the food introduced through an opening in the teeth.

JAXARTES, jäk-sär'těz. The ancient name of the Syr Darya (q.v.).

JAY (OF. *jai*, *gai*, *gay*, Fr. *gai*, from OF. *gai*, *gay*, from OHG. *gāhi*, Ger. *gāhe*, *jāhe*, quick). A popular English name for a considerable number of birds of the family Corvidæ. They are sometimes separated from the crows as a special subfamily, the Garrulinæ, but it is difficult to define the group satisfactorily. The jays have the wings shorter than the tail, which is long and rounded, or even graduated, and they are generally, but not always, brightly colored, some shade of blue being very characteristic. But these characters will not serve to distinguish them from the magpies, which are very near allies, the so-called blue magpies of the Old World forming an evident connecting link. Jays are smaller than crows and are more distinctly arboreal; when on the ground, they hop. The jays of the Old World belong to genera distinct from those of America, with the single exception of *Perisoreus*, which is circumpolar.

The bird to which the name "jay" was originally given is the common jay of Europe (*Garrulus glandarius*), which is somewhat over a foot in length and beautifully colored, being vinaceous gray varied with black and white, with exquisite black, white, and blue markings on the wings; the head is provided with a conspicuous black-marked crest. It is a common British bird, although its numbers have diminished under the persistent attacks of gamekeepers.

Blue Jay. The best-known American bird of this subfamily is the blue jay (*Cyanocitta cristata*), which is somewhat smaller than its European cousin and is provided with equally beautiful plumage. The general color above is purplish blue and beneath dusky white; forehead, and a yoke-shaped band on the sides of the neck and across the upper breast, black; wings and tail blue, beautifully variegated with black and white. The blue jay is found throughout eastern North America, from Newfoundland and Hudson Bay, south to Florida and the Gulf, and west to the Plains. It breeds throughout its range and is only partially migratory. As spring approaches, the blue jay becomes a quieter, more domestic and retiring bird, and prepares for the breeding season. The nest is well built of twigs and roots, lined with rootlets, and usually placed in a tree in the woods or an old orchard, at some distance from a house. The eggs are four or five in number, brownish olive or ashy green, thickly marked with rather indistinct spots of a darker shade. It is during and after the breeding season that the blue jay's worst traits come to light, for then he becomes an inveterate robber of birds' nests and devours both eggs and young with avidity. At such times he is quiet, sly, and cowardly. Later in the summer insects, nuts, fruits, and seeds form the staples of his diet, and in the winter he will eat almost anything. The notes of the blue jay are numerous and variable; he is a mimic and somewhat of a ventriloquist, but he is not a singer, and most of his cries are harsh and discordant. The blue jay delights in attacking owls and squirrels. While not truly gregarious, blue jays often travel about in small companies, especially during the winter.

Other American Jays. Several other species of jay occur in North America, variously subdivided by ornithologists into a dozen or more subspecies. One of the most distinct and easily recognized species is the Canada jay, whisky jack, or moose bird (*Perisoreus canadensis*), one of the best-known birds of Canada and the

North. Utterly unlike the blue jay in appearance (it lacks a crest), its manners and habits are very similar. The plumage is ashy gray, and only the forehead and throat are white. It becomes very tame about the camps of loggers and trappers in the northern woods and is famous for the great variety of its notes. It breeds very early in the spring, while there is still much snow on the ground and the weather is very cold. The nest is not unlike that of the blue jay, but the eggs are white, spotted with olive brown. This species, in one form or another, ranges throughout North America from Labrador to Alaska, south to the northern tier of States, in the Rocky Mountains to New Mexico and Arizona, and on the Pacific coast to Oregon. The Florida jay (*Aphelocoma floridana*, or *cyanea*) is another crestless jay, but the general color is blue, with more or less white and ashy. It is abundant in Florida, but is wholly confined to that State, although closely allied species occur in the Rocky Mountain region and in California. A well-known and widely distributed Western jay is Steller's jay (*Cyanocitta stelleri*), varieties of which are known as the black-headed jay, blue-fronted jay, and long-crested jay. These birds are especially characteristic of the Rocky Mountain and Sierra Nevada regions, while the typical form is seen from Oregon to Alaska, replacing the blue jay of the East. These jays have the whole head, neck, and back sooty blackish or brownish, the remainder of the plumage blue of some shade, with black markings on the wings. Their habits are similar to those of the Eastern bird. One other North American jay deserves mention, not only because of its beauty, but because it represents a group of jays characteristic of the warmer parts of America, notable for brilliancy of plumage. This is the Rio Grande, or green, jay (*Xanthoura luxuosa*), abundant in some parts of the lower Rio Grande valley. It is about the size of the blue jay, but has no crest, and the prevailing colors are green above and greenish yellow below; but the sides of the head, the chin, throat, and breast, and markings on the wings are black, while the top of the head is rich blue and the forehead is white. The nest and eggs are similar to those of the less gorgeous jays.

JAY. A town, including several villages, in Franklin Co., Me., about 38 miles northwest of Augusta, on the Androscoggin River and on the Maine Central Railroad (Map: Maine, B 4). There are pulp and paper mills, large granite quarries, novelty works, a corn-canning factory, and a large electric-power plant. Pop., 1900, 2758; 1910, 2987.

JAY, SIR JAMES (1732-1815). An American physician, brother of John Jay. He was born in New York City, studied medicine, and became a practicing physician. He was instrumental in obtaining the endowments for King's (now Columbia) College, New York, and Benjamin Franklin's projected college (now the University of Pennsylvania) in Philadelphia. For the purpose of soliciting contributions for these colleges, he visited England in 1762, where he was knighted by the King, George III. His writings

JAYS, MAGPIES, ETC.

5. AMERICAN RAVEN (*Corvus corax sinuatus*).

6. LONG-CRESTED JAY (*Cyanocitta stelleri diademata*).

include two pamphlets relating to the collections made for the colleges in America (1771 and 1774) and *Reflections and Observations on the Gout* (1772).

JAY, JOHN (1745–1829). An eminent American statesman and jurist. He was born in New York City, Dec. 12, 1745, of French-Huguenot descent, and was the son of Peter Jay, a wealthy merchant. He passed his childhood at Rye, N. Y.; was educated in New Rochelle, N. Y., and at King's (now Columbia) College, where he graduated in 1764; studied law in the office of Benjamin Kissam in New York City; was admitted to the bar in 1768 and soon attained eminence in his profession. In 1770 he was one of the group of lawyers, several of whom later became famous, who formed the professional club known as The Moot. He was made secretary of the commission appointed to determine the disputed boundary between New York and Connecticut in February, 1773, and in April of the following year married, at Elizabeth, N. J., Sarah Livingston, the daughter of William Livingston (q.v.), thus allying himself with one of the most influential Whig families in the Middle Colonies. In the pre-Revolutionary disturbances, though insistent for what he considered to be the rights of the colonists, he allied himself with the conservative element in New York and deprecated the radicalism of such men as Isaac Sears and John Lamb, the leaders of the Sons of Liberty. In May, 1774, he was made a member of the important Committee of Fifty-One in New York, appointed "to correspond with our sister Colonies on all matters of moment," which was controlled by the conservative element and opposed all acts of violence. The answer sent by it to the communication of May 13 from Boston urging New York to concur in a policy of nonimportation and of a discontinuance of trade with the West Indian Islands is attributed to Jay. Jay was a delegate to the First Continental Congress in 1774, was a member of the committee appointed "to state the rights of the Colonies in general," supported Galloway's celebrated plan for an accommodation with the mother country (see GALLOWAY, JOSEPH), and drafted the address to the people of Great Britain. After his return to New York he was an influential member of the dominating Committee of Inspection and of the Committee of Observation, which succeeded it; was a member of the committee for the relief of Boston, and was also a member of the so-called Provincial Convention, an electoral body, by which he was chosen one of the delegates of New York to the Second Continental Congress. He became a colonel of New York City militia, and in 1776 was chosen a member of the Provincial Congress of New York, by which body he was called away in May from the Continental Congress at Philadelphia, thus failing to become a signer of the Declaration of Independence. Of the Provincial Congress, later called the Convention of the Representatives of the State of New York, which assembled in July, 1776, he was also a member. He drafted the resolution which was passed authorizing the New York delegates in the Continental Congress to sign the Declaration; was chairman of a secret military committee vested with extraordinary powers, which was appointed at the time of Lord Howe's expected passage up the Hudson River; was a member of other important committees; and in December, 1776, was the author of an address issued by the Conven-

tion to the people of the Colony. Early in the following year he had an important share in the drafting of the Constitution and Bill of Rights for the State of New York. Upon the adoption of that instrument he was made a member of a Council of Safety and was appointed Chief Justice pro tempore, being regularly confirmed early in September. Late in 1778 he again became a member of Congress, without vacating his seat on the bench, and on December 10 he was elected President of that body to succeed Henry Laurens, in which position he remained until Sept. 28, 1779, when he was succeeded by Samuel Huntington, having previously, on August 10, resigned the chief-justiceship. In September, 1779, he was appointed United States Minister to Spain, and on October 20 started on his mission. He was never officially received by the Spanish government, which, though allied with France and at war with Great Britain, steadily refused to recognize the independence of the United States. Aside from securing a few small loans, he was able to accomplish nothing, and after an unsatisfactory and in many respects a humiliating sojourn of two years he proceeded to Paris in the early summer of 1782 to join Franklin in negotiating the treaty of peace with Great Britain. The two were later joined by John Adams. In this capacity Jay, along with his fellow commissioners, rendered an invaluable service to his country, and he himself is considered to have had perhaps a predominant share, on the American side, in the delicate negotiations which resulted in the signing of the Treaty of 1783. Jay returned to New York in 1784, refusing appointments both to the English and the French court, and from that time to 1789 was Secretary for Foreign Affairs under the Confederation. He strongly approved of the Federal Constitution drawn up by the Philadelphia Convention of 1787 and coöperated with Alexander Hamilton to secure its ratification by New York, writing some of the papers known collectively as the *Federalist* (q.v.), and taking an active part in the debates in the State Convention at Poughkeepsie. He also published anonymously *An Address to the People of New York in Vindication of the Constitution*. Upon the organization of the Federal government Jay was allowed by Washington his choice of all the public offices to be filled by the President's appointment, and chose that of Chief Justice of the Supreme Court, which position he filled with marked dignity and ability until 1795. In 1794 he was sent to England to negotiate with regard to various matters then in dispute between the two countries and concluded with Lord Grenville what is known in American history as the Jay Treaty (q.v.). From 1795 to 1801, for two terms, he was Governor of the State of New York, and thereafter, refusing an appointment to his old position as Chief Justice, he lived in retirement on his estates at Bedford in Westchester Co., N. Y., until his death, on May 17, 1829. Politically Jay was ranked with Hamilton as one of the ablest and most influential leaders of the Federalist party. Consult: William Jay, *Life of John Jay, with Selections from his Correspondence and Miscellaneous Papers* (2 vols., New York, 1833); Whitelocke, *Life and Times of John Jay* (ib., 1887); H. P. Johnston (ed.), *Correspondence and Public Papers of John Jay* (4 vols., ib., 1890–93); Pellet, *John Jay*, in the "American Statesmen Series" (Boston, 1890).

JAY, JOHN (1817-94). An American lawyer and diplomat, son of William Jay (q.v.) and a grandson of Chief Justice John Jay (q.v.). He was born in New York City, graduated at Columbia College in 1836, and was admitted to the bar three years later. He early became intensely interested in the antislavery movement, and while still in college (1834) was president of the New York Young Men's Antislavery Society. He was active in the Free Soil Party movement, presided at several of its conventions, and was once its candidate for Attorney-General of New York. In 1854 he organized the series of popular meetings in the Broadway Tabernacle and the next year was prominently identified with the founding of the Republican party. From 1869 to 1875 he was United States Minister to Austria-Hungary. In 1877 Secretary Sherman appointed him chairman of the special commission to investigate Chester A. Arthur's administration of the New York Custom House. In 1883 Gov. Grover Cleveland appointed him the Republican member of the New York Civil Service Commission, of which he later became president. He published many books and pamphlets on slavery and other questions and in 1889 was president of the American Historical Association.

JAY, WILLIAM (1769-1853). An English Nonconformist minister, born at Tisbury, Wiltshire. He was apprenticed to his father, a stonecutter and mason; but in 1785 he was sent to school under Cornelius Winter, a dissenting clergyman. He preached at Christian Malford near Chippenham for two years; at Hope Chapel, Clifton, for one year; and in 1791 was ordained pastor of the Argyle Independent Chapel at Bath. He acquired a wide reputation as an eloquent pulpit orator. He published: *The Mutual Duties of Husbands and Wives* (1801; 6 editions); *Sermons* (2 vols., 1802-03); *Short Discourses* (2 vols., 1805); *Morning Exercises in the Closet* (1829; 10 editions); *Evening Exercises* (1831); *Sermons Preached at Cambridge* (5 parts, 1837); a collected edition of his *Works* (12 vols., 1842-48; new ed., 8 vols., 1876); *Autobiography* (1854).

JAY, WILLIAM (1789-1858). An American reformer and jurist, the son of John Jay (1745-1829). He was born in New York City, graduated at Yale in 1808, and then studied law at Albany, though poor eyesight soon compelled him to give up the profession. He early became interested in various philanthropic enterprises and reforms and identified himself especially with the temperance, antislavery, and antiwar movements. He was one of the founders (in 1816) of the American Bible Society, which he defended against the vigorous attacks of the High Church party; was judge of common pleas in New York from 1818 to 1820; and was first judge of Westchester County from 1820 to 1842, when he was removed on account of his antislavery views. An enthusiastic member of the American Antislavery Society, whose constitution he drafted, he stood with Birney at the head of the conservative Abolitionists, and by his calm, logical, and judicial writings exerted for many years a powerful influence. From 1835 to 1837 he was the society's corresponding foreign secretary. As a protagonist of the antiwar theories, he was also conspicuous, and was for many years president of the Peace Society. His most valuable publication was the *Life and Writings of John Jay* (1833), in which the part

played by his father in the diplomacy of the Revolution was first adequately pointed out.

JAYADÉVA, jā'yā-dā'vā (c.1200 A.D.). A Hindu poet, probably a native of Bengal. His only extant Sanskrit work, a lyric drama called *Gītagōvinda* (Song of the Cowherd), treats of the love, estrangement, and reconciliation of Krishna and the milkmaid Rādhā. Though dating from the twelfth century, it is the earliest literary example of a primitive type of play that still survives in Bengal and must have preceded the regular dramas. The poem, which is in 12 cantos of artistically varied metrical structure, was presumably based on Prakrit originals and is notable for its vivid portrayal of the emotions. At a later time it was interpreted as a religious allegory. Lassen (Bonn, 1836) published the text, with Latin translation and notes, and native editions are numerous, as those by Vidyasagara (Calcutta, 1882) and by Telang and Pansikar (Bombay, 1899). Sir William Jones (London, 1799; new ed., Calcutta, 1894) and Sir Edwin Arnold (*The Indian Song of Songs*, London, 1875) have translated the poem into English, the latter from the allegorical point of view. There is also a German version of part of the drama by Rückert (Göttingen, 1837), which approaches as near to the highly artificial beauty of the original as is possible in a translation. Jayadéva likewise wrote a poem in Hindi, which was published, with a translation by Trumpp, in the *Sitzungsberichte der bairischen Akademie der Wissenschaften* (Munich, 1879). His *Chandraloka*, a treatise on rhetoric, has been edited by Vidyasagara (2d ed., Calcutta, 1906). Consult Macdonell, *History of Sanskrit Literature* (London, 1913).

JAY'HAWKER. A name applied in the Southern and Western States of the American Union to an irregular, lawless, freebooting soldier not enlisted or in uniform—a guerrilla or bushranger. The term originated in Kansas during the bloody strife between the slavery and antislavery parties and is said to have been first applied to a few isolated "Free State" men in the southeastern part of the Territory, who organized a system of retaliation against proslavery outrages, but who ultimately became robbers and assassins. The term appeared in a proclamation of Gen. James Lane in October, 1861, in which he declared that the people of Kansas were neither thieves, plunderers, nor jayhawkers. The term was also applied by General Sheridan during the Reconstruction period to certain lawless persons in Louisiana. Its origin is not certainly known. According to one theory, it was first applied to Colonel Jennison, of New York, who was known among his comrades as the "Gay Yorker," a phrase from which "jayhawker" was corrupted. A more probable theory is that the term was derived from "jay" and "hawk" in allusion to the predatory nature of these birds.

JAYME, hī'mā, I AND II. Kings of Aragon. See JAMES.

JAYNE, HORACE (1859-1913). An American zoölogist and educator. He was born in Philadelphia, was educated at the University of Pennsylvania (A.B., 1879; M.D., 1882), and studied biology at the universities of Leipzig and Jena in 1882-83 and at Johns Hopkins for a year. In 1884 he was appointed professor of vertebrate morphology at the Wistar Institute of Anatomy, University of Pennsylvania, and from 1894 to 1905 was professor of zoölogy and

director of the institution; in the university he was secretary of the biological faculty (1884-89) and dean of the college faculty (1889-94). He became a trustee of Drexel Institute and served as coeditor of several scientific journals. His writings include: *Abnormalities Observed in the North American Coleoptera* (1880); *Revision of the Dermestidæ of North America* (1882); *Mammalian Anatomy* (1898).

JAY TREATY. In American history, the name applied to a treaty negotiated in 1794 by John Jay on the part of the United States and Lord Grenville on the part of Great Britain. The refusal of Great Britain to observe several of the obligations imposed by the definitive treaty of peace signed in Paris in 1783, among them the compensation for negroes carried away by the retiring British army and the continuation of garrisons in the forts on the northwestern frontier, had produced a hostile feeling in America that was increased by Great Britain's restrictions on American commerce, her refusal to enter into any commercial treaty with the United States and, beginning in 1793, her insistence on the right of search and impressment. In the winter of 1793-94 war actually threatened. On April 7, 1794, a proposal was made in Congress, in accordance with a recommendation for retaliatory legislation made by the Secretary of State, Jefferson, to prohibit all commercial intercourse with England after Nov. 1, 1794, unless before that date the northwestern forts should be evacuated, and pledges given of a cessation of search and impressment. Before this resolution passed, however, Washington, who feared the result of such an enactment, intervened, and on April 16 sent to the Senate the nomination of Chief Justice John Jay as a special Ambassador to negotiate a treaty adjusting the difficulties. The nomination was immediately confirmed by a vote of 18 to 8, and the House nonintercourse resolution was defeated in the Senate by the casting vote of Vice President Adams. Jay reached London June 15, and on November 19 signed with Lord Grenville a treaty of 28 articles. The evacuation of the forts was the only one of the American claims definitely decided. Nothing whatever was said about either the right of search or impressment, or the question of compensation for the negroes. The settlement of the boundaries on the northeastern and northwestern frontiers was to be decided by a joint commission, as was the question of the collection of British debts. The last 18 articles constituted a treaty of commerce, by the provisions of which, with certain qualifications, trade was to be allowed with Great Britain and the East and West Indies. Further provisions related to the fitting out of privateers, defined contraband goods, and contained a renunciation of all American-European trade in West Indian products, such as sugar, molasses, cocoa, and cotton. One clause, the operation of which was limited to two years from the close of the existing war, provided that American vessels not exceeding 70 tons' burden might trade with the West Indies under certain restrictions. On June 8, 1795, the treaty was laid before the Senate in executive session, and it was ratified June 24 by a vote of 20 to 10, with the exception of the clause relating to trade with the West Indies. On July 2, before the terms of the treaty had been officially made public, its text was published in the *Aurora*, the Anti-Federalist organ in Philadelphia. An

outbreak of public wrath and denunciation followed, such as has seldom occurred in the history of the Republic. Jay was burned in effigy from New England to Georgia, and both he and Washington were declared to have been bought with British gold. Even Washington's impeachment was suggested, and the attacks were of such a character as to draw from him the protest that they were "so exaggerated and indecent as could scarcely be applied to a Nero, a defaulter, or even to a common pickpocket." But the outbreak subsided almost as quickly as it had begun, the defenses and explanations of the treaty in the press, particularly in the famous "Camillus" letters of Hamilton and King, brought about a saner state of public opinion, and on April 30, 1796, the House, after debating the question for several months and listening to the able speeches of Fisher Ames and others in its defense, resolved by a vote of 51 to 48 that the terms of the treaty ought to be carried into effect.

Hart, *Manual of American History, Diplomacy, and Government* (Cambridge, Mass., 1908), contains a bibliography; McLaughlin and Hart (eds.), *Cyclopedia of American Government* (3 vols., New York, 1914). For the text of the treaty, consult *Treaties and Conventions* (Washington, 1889).

JAZYGES, jáz'i-jéz (Lat., from Gk. 'Iaζύγες). One of the numerous tribes which by the ancients were comprehensively named Sarmatians (q.v.). They originally occupied the shores of the Black Sea and the Sea of Azov. Later, part of them moved westward, and a detached body of them even settled as far west as the region between the Theiss and the Danube in the centre of modern Hungary. At first friendly to Rome, they later opposed the Romans, under Domitian, and were subdued by Marcus Aurelius during his war with the Marcomanni. Under the Hungarian kings the inhabitants of a part of this region, who had a special military organization, came to be known as Jászok (bowmen), and the district in which they lived re-

ceived the name of Jászság, which was Latinized into Jazygia. These names have been perpetuated to our times, and at the present day a body of Magyars numbering about 70,000 still figure as Jazygians. See HUNGARY. Consult "Sarmatia," in Lübker, *Reallexikon der klassischen Altertums* (8th ed., Leipzig, 1914).

JEAFFRESON, jěf'ēr-son, JOHN CORDY (1831-1901). An English author. He was born Jan. 14, 1831, at Framlingham, Suffolk, England, where his father was a surgeon. He began the study of medicine, but, changing his intentions, he went to Oxford and from there to Lincoln's Inn, where he was admitted to the bar in 1859. In 1854 he published his first novel, *Crewe Rise*, which was followed by *Live it Down* (1863), *Not Dead Yet* (1864), *A Woman in Spite of Herself* (1872), and several others. In 1858 appeared *Novels and Novelists from Elizabeth to Victoria*. But his most important works are his three books on the three learned professions, *A Book about Doctors* (1860; an Amer. ed., Akron, Ohio, 1904); *A Book about Lawyers* (1866); *A Book about the Clergy* (1869). Other works are the *Annals of Oxford* (1871); *Brides and Bridals* (1872), a history of marriage in England; *A Book about the Table* (1875); *The Real Lord Byron* (1883); *The Real Shelley* (1885); *Lady Hamilton and Lord Nelson* (1888; revised in 1897); *A Book of Recollections* (1894). He was also a frequent contributor to the *Athenæum*, *Fraser's Magazine*, the *Dublin University Magazine*, and to other periodicals as well as to the London daily press.

JEALOUS WIFE, THE. A comedy by George Colman the Elder (1761). The plot is said to have been partly taken from Fielding's *Tom Jones*.

JEAMES, jēmz. A pseudonym used by Thackeray in his *Jeames's Diary*, contributed to *Punch*. From this diary of a footman the name has become a popular term for a flunkey.

JEAN CRAPAUD, zhän krä'pō'. A Frenchman. See NATIONAL NICKNAMES.

JEAN DE PARIS, zhän de pä'rē'. An opera by Boieldieu (q.v.), first produced in Paris, April 4, 1812; in the United States, Sept. 28, 1827 (New York).

JEANES, jēnz, ANNA T. (1822-1907). An American Quaker philanthropist, born in Philadelphia. Her benefactions included \$200,000 to Spring Garden Institute, Philadelphia, a technical school; \$100,000 to the Hicksite Friends; \$200,000 to the Quaker schools of Philadelphia; and \$200,000 to the Home for Aged Friends, an institution where she spent the closing years of her own life. In 1907 she transferred to the trusteeship of Booker T. Washington and Hollis B. Frissell the sum of \$1,000,000 to be known as "The Fund for Rudimentary Schools for Southern Negroes" and to be used exclusively for the benefit of elementary negro schools in the South. Her \$45,000 bequest to Swarthmore College was refused because of the condition that the college give up intercollegiate sports. See JEANES FOUNDATION.

JEANES (ANNA T.) FOUNDATION. In 1907 Miss Anna T. Jeanes, of Philadelphia, left a sum of \$1,000,000 for the purpose of fostering negro education. The board administering the fund aims to secure the coöperation of existing educational authorities to develop improved means of education for the negroes. Its activities, which are confined to the Southern States, are exercised in three directions: (1) securing

the appointment of teachers to direct and supervise industrial education; (2) encouraging through the appointment of teachers the development and supervision of extension work; and (3) appointing county agents to supervise the schools, stimulate public interest in the schools, and to improve home conditions. The board does not seek to assume the burden of expense on this work, but rather to point the way for new educational endeavor. The work is constructed in close coöperation with the General Education Board (q.v.).

JEAN JACQUES (zhän zhák) I. The title given to the negro military leader Jean Jacques Dessalines (q.v.).

JEANNE D'ALBRET, zhän däl'brä'. See ALBRET, JEANNE D'.

JEANNE D'ARC, därk. See JOAN OF ARC.

JEANNE D'ARC. An opera by Gounod (1873).

JEANNETTE, jēn-nět'. A borough in Westmoreland Co., Pa., 27 miles east by south of Pittsburgh, on the Pennsylvania Railroad (Map: Pennsylvania, B 6). It is supplied with natural gas and has important manufactures of window glass, flint glass, tableware, lamps and shades, mine fans, rubber goods, bottles, etc. Oakford is the principal park. Jeannette was settled in 1888 and incorporated in the following year. The government is administered by a burgess, chosen every four years, and a borough council, elected on a general ticket. Pop., 1900, 5865; 1910, 8077; 1914 (U. S. est.), 9020.

JEANNETTE EXPEDITION. See POLAR RESEARCH; DE LONG.

JEANNIN, zhä'nän', PIERRE (1540-1622). A French statesman, born at Autun. He was educated under Cujas, was an advocate at the Parlement of Dijon in 1569, and councilor in 1572, and as advocate of the State of Burgundy (1579) he was unable to prevent the St. Bartholomew Massacre from extending to his district. When councilor to the Duke of Mayenne, he strove to bring about a reconciliation between him and Henry IV, who took him into his own service in 1595, and he was made Intendant of Finances in 1602 and General Comptroller in 1610. A commissioner for the Treaty of Lyons with the Duke of Savoy, he was afterward instrumental in forming the important alliance between France and Holland in 1608, whereby Spain was obliged to acknowledge Dutch independence. Always on the side of conciliation, he tried to make peace between Louis XIII and Maria de' Medici. His *Négociations* were published posthumously in 1656 (2 vols.), in 1659 (3 vols.), in 1819, and in 1837, while they are to be found also in *Nouvelles collections des mémoires pour servir à l'histoire de France*, vol. iv (2d ser., 1887).

JEAN PAUL, zhän pōl. See RICHTER, JOHANN PAUL.

JEAN POTAGE, pō'tāzh' (Fr., John Potage). A nickname of the French, based on their fondness for soups and sauces.

JEANRON, zhän'rôn', PHILIPPE AUGUSTE (1807-77). A French painter, born at Boulogne-sur-Mer. He was a pupil of Sigalon and Souchon and exhibited genre painting from 1831 to 1838, when he took up landscape. Without ceasing to paint he began to write criticisms for the magazines and newspapers and founded a Free Society of Painting. After the events of June 13, 1848, he saved the life of Ledru-Rollin by hiding him in the Louvre for 12 days

and in the same year, on the success of the Revolution, was appointed by Ledru-Rollin director of the national museums, holding office until 1850. He greatly improved the arrangement and classification of the various collections of the Louvre, founded the Luxembourg Museum, and gave many commissions to painters of the modern school, now held in high favor but then despised. Among his best paintings are: "The Isle of Calypso," at Bayeux; "Limoges Peasants," at Lille; "Beheading of John the Baptist," at Rouen; "Mirabeau," at Versailles. He is to be classed with the Barbizon school (see BARBIZON, THE PAINTERS OF), in which he was a painter of some distinction.

JEBAIL. See JEBEIL.

JEBB, JOHN (1775-1833). An Irish theologian, Bishop of Limerick. He was born at Drogheda, graduated M.A. at Trinity College, Dublin, in 1801, and in 1810 became curate at Mogorbane, Tipperary. Twelve years afterward Jebb was made Bishop of Limerick, Ardfert, and Agadhoe as a recognition of his services in the distress and disquiet following the famine of 1822. Jebb's great work in the Church was the reform of theological examinations. He favored High Church ritual, many services and communions, and has been reckoned a forerunner, with his friend Alexander Knox, of the Oxford movement. Jebb wrote several volumes of sermons, and his correspondence with Knox was published in 1836. Consult Charles Foster (ed.), *Thirty Years' Correspondence between John Jebb and Alexander Knox* (2d ed., 2 vols., London, 1836); James Wills, *Lives of Illustrrious Irishmen*, vol. vi (Dublin, 1847).

JEBB, SIR RICHARD CLAVERHOUSE (1841-1905). An eminent Scottish classical scholar. He was born at Dundee, Scotland, and was educated at St. Columba's College, Dublin, the Charterhouse School, London, and Trinity College, Cambridge, where he graduated with the highest honors in 1862. In 1871 he became governor of Charterhouse School and in 1872 was appointed classical examiner in the University of London and tutor of Trinity College. Three years later he was called to the chair of Greek in the University of Glasgow and in 1889 was made regius professor of Greek in the University of Cambridge. Jebb was instrumental in establishing in 1886 the British School of Classical Studies at Athens. He was president of the Society for the Promotion of Hellenic Studies from 1891 to 1905; from 1891 also he was member of Parliament from the University of Cambridge. In 1900 he was knighted. He received honorary degrees from the universities of Edinburgh, Cambridge, Bologna, and Harvard; in 1878, in recognition of his high attainments and his earnest advocacy of the teaching of modern Greek, he was presented with the gold cross of the Order of the Saviour by the King of Greece. His numerous works are all distinguished by great scholarship and brilliant style. Among them the most important are: *The Characters of Theophrastus* (1870; 2d ed. by Sandys, 1909); *Attic Orators* (2 vols., 2d ed., 1893); *Richard Bentley* (English Men of Letters Series, 1882); *Homer* (1887); *A Complete Edition of Sophocles*, with critical notes, commentary, and translation (8 vols., Cambridge, 1883-1903; some plays reached a third edition); an edition of Bacchylides, with text, translation, and notes (ib., 1905); a translation of the *Rhetoric* of Aristotle, published after his death

by Sandys (1909); *Essays and Addresses*, also collected and published after his death (Cambridge, 1907); and many monographs on philological subjects. In 1892 he was Turnbull lecturer at Johns Hopkins University. The lectures there delivered were published under the title *The Growth and Influence of Classical Greek Poetry* (1893). Consult Caroline Jebb, *Life and Letters of Sir Richard Claverhouse Jebb* (Cambridge, 1907), and Sandys, *A History of Classical Scholarship*, vol. iii (ib., 1908).

JEBEIL, je-bil', or **JEBAIL**. A town in Syria, Asiatic Turkey, situated near Mount Lebanon, 18 miles from Beirut. It is believed to occupy the site of the ancient city of Byblos (q.v.). Pop., about 2500.

JE'BEL BARKAL. See BARKAL.

JEBEL ESH SHEIK. See HERMON, MOUNT.

JECKER, zhe-kâr', **JEAN BAPTISTE** (c.1810-71). A Swiss banker, whose difficulties with the Mexican government are said to have been one of the causes which led to the French intervention. He was born at Porrentruy in the Canton of Bern. About 1836 he went to Paris, where he entered the banking house of Hottinguer. His brother, who had achieved considerable fame as a physician in Mexico, persuaded him to emigrate to that country, and there he founded a bank which soon grew to be of the first importance. In 1859 President Miramón confided to it the conversion of the domestic debt, for which Jecker charged an enormous commission; but President Juárez refused to recognize the agreement which had been made by his predecessor. Jecker had further obtained from the government authority to explore Sonora and Lower California; but in spite of this the members of his surveying parties were expelled from the territories. When Napoleon III decided to intervene in Mexican affairs, Jecker ceded to the French government for 10,000,000 francs all his rights in Sonora. In 1861 the Mexican government acknowledged its indebtedness to Jecker, which was fixed at 27,703,770 francs. In order to secure prompt payment he consented that this sum should be reduced to 22,660,000 francs and should be paid in three installments—the first, of 7,660,000 francs, on Oct. 15, 1865; the second, of 5,000,000 francs, on December 15; and the third, of 10,000,000 francs, on Feb. 15, 1866. The first two installments were paid; but Maximilian refused to authorize the third, for this arrangement, besides being disastrous to the Mexican Treasury, was a drain on that of France. Jecker returned to France, was arrested by the Commune in 1871, and shot on May 26.

JEDBURGH, jêd'bûr-û. A royal and police borough, the capital of Roxburghshire, Scotland, on the Jed, 56 miles southeast of Edinburgh (Map: Scotland, F 4). It has the interesting remains of the magnificent abbey of Austin Canons, founded by King David I in 1118, and of a castle where William the Lion, Alexander II, and other Scottish kings frequently resided. It has also a fine modern grammar school, county buildings, and town hall. Industry includes the manufacture of blankets, beer, leather, and iron-work. Pop. (police borough), 1901, 3136; 1911, 2752. Consult Watson, *Jedburgh Abbey* (Edinburgh, 1877).

JED'DAH. A city of Arabia. See JIDDAH.

JEEJEEBHOY, jê'jêb-hoi', **SIR JAMSETJEE** (1783-1859). A Parsi merchant prince and philanthropist, born in Bombay. At an early period he showed a great aptitude for mercan-

tile pursuits, and in consequence his father-in-law, Framjee Pestonjee, a Bombay merchant, took him into partnership. While still young, he visited most of the maritime countries of Asia, besides Egypt, Syria, and England. By the year 1820, when he had completed his twentieth year of business, he had amassed an immense fortune and was universally acknowledged to be the first merchant in the East. He now began to manifest on a magnificent scale his benevolence and between 1822 and 1858 gave upward of \$1,000,000. Parsi and Christian, Hindu and Mussulman, were alike the objects of his beneficence. Queen Victoria conferred on him the honor of knighthood. Other honors followed, and in 1857 he was made a baronet of the United Kingdom. He was succeeded in the baronetcy by his eldest son, Cursetjee Jamssetjee Jeejeebhoy, who, in accordance with his father's will, took his father's name.

JEFFERIES, jěf'ríz, RICHARD (1848-87). An English author, born near Swindon, Wiltshire, Nov. 6, 1848. Being wild and restless, he attempted to run away to America when only 16 years old. Later he began to write for the papers and published novels of no moment. He went to London in 1876 and was soon known by his *Gamekeeper at Home* (1877), a remarkable series of nature studies originally contributed to the *Pall Mall Gazette*. This book was followed by *Wild Life in a Southern County* (1879) and other similar but less artistic books on nature. He now took up the novel again, enduing it with perhaps the most subtle appreciation of nature to be found in the entire range of English fiction. His finest work is represented in *Wood Magic* (1881), depicting the life of animals, *Bevis* (1882), and in *The Story of my Heart* (1883) and *Life of the Fields* (1884), the two last-named works, together with the *Gamekeeper at Home*, being his most popular books. In a different vein is the powerfully conceived *After London*, a romance of England after she shall have lapsed into a wilderness (1885). Jefferies died in poverty at Goring, Essex, Aug. 14, 1887. Consult Besant, *Eulogy of Richard Jefferies* (New York, 1888); A. Rickett, *A Vagabond in Literature* (ib., 1906); E. Thomas, *Richard Jefferies: Life and Work* (Boston, 1909).

JEFFERS, jěf'ěrz, WELLINGTON (1814-96). A Canadian Methodist clergyman and journalist. He was born in Cork, Ireland, and in early youth was brought by his parents to Kingston, Ontario. He studied for the ministry of the Wesleyan Methodist church and was ordained in 1841. During the greater part of his ministerial career (1841-84) he filled prominent pastorates in Ontario. He was for several years chairman of the district, became secretary of the conference (1853), codelegate (1866), and president of the conference (1879). In 1884 he retired from active work. He was editor of the *Christian Guardian*, the official organ of Canadian Methodism, in 1860-69. He was known throughout English-speaking Canada as a pulpit orator, the vigor and effect of his sermons and addresses being due to his command of extempore speech. He was conservative in his theological outlook and in that behalf wielded a strong influence in the councils of his church. In 1863 the degree of D.D. was conferred upon him by Victoria University.

JEFFERSON. A city and the county seat of Marion Co., Tex., 48 miles by rail northwest

of Shreveport, La., on the navigable Cypress Bayou, and on the Missouri, Kansas, and Texas, the Jefferson and Northwestern, and the Texas and Pacific railroads (Map: Texas, E 3). It is in a region rich in iron ore; has extensive foundries, machine shops, and iron furnaces, cottonseed-oil mills, and several saw mills; and is an important shipping point for cotton, produce, live stock, etc. The cultivation of vegetables and fruits is extensively carried on in the vicinity. The county courthouse, Carnegie library, high school, United States government building, and an iron bridge across the Bayou are the leading architectural features of the city. Jefferson was settled in 1850 and first incorporated in 1866. It is governed under a general law of 1875 which provides for a mayor, elected biennially, and a council. The water works are owned by the city. Pop., 1900, 2850; 1910, 2515.

JEFFERSON. A city and the county seat of Jefferson Co., Wis., 49 miles by rail west of Milwaukee, at the junction of the Rock and Crawfish rivers and on the Chicago and Northwestern Railroad (Map: Wisconsin, E 5). It has the county asylum for the insane, St. Colletta Institute for Defective Children, and a Carnegie library. There are breweries, a pork-packing plant, creameries, and manufactures of boots and shoes, furniture, motor cycles, cigars, yarn, condensed milk, agricultural implements, wagons and carriages, brick and tile, sash, doors, blinds, etc. Jefferson, settled in 1837, is governed, under a general State charter, by a mayor, chosen every two years, and a council. The water works and electric-light plant are owned and operated by the municipality. Pop., 1900, 2584; 1910, 2582.

JEFFERSON, CHARLES EDWARD (1860-). An American Congregational clergyman, born at Cambridge, Ohio. He graduated from Ohio Wesleyan University in 1882 and from the theological department of Boston University in 1887. In 1882-84 he was superintendent of public schools at Worthington, Ohio. Ordained to the Congregational ministry in 1887, he was pastor at Chelsea, Mass., until 1898, and thereafter occupied the pulpit of the Broadway Tabernacle, New York City. In 1914 he became chairman of the executive committee of the Church Peace Union, endowed by Andrew Carnegie. He is author of *Quiet Hints to Growing Preachers in my Study* (1891); *Quiet Talks with Earnest People in my Study* (1898); *Doctrine and Deed* (1902); *Things Fundamental* (1903); *The Minister as Prophet* (1905); *Faith and Life* (1905); *The New Crusade* (1907); *The Character of Jesus* (1908); *My Father's Business* (1909); *The Christmas Builders* (1909); *The Building of the Church* (1910, 1913); *Why we may Believe in Life after Death* (1911); *The Minister as Shepherd* (1912).

JEFFERSON, JOSEPH (1829-1905). A distinguished American actor, the fourth of a line of actors, of whom his father and grandfather bore the same name. His mother had been Mrs. Burke, a singer of distinction. He was born in Philadelphia, Feb. 20, 1829, and from infancy was upon the stage, appearing as Cora's child in Kotzebue's *Pizarro* when only three years old, and with Rice as a miniature "Jim Crow" when four years old. In 1838 his father removed to the West, playing in Western and Southern cities. They went in 1842 to Mobile, where his father died of yellow fever, and for

several years after this Joseph went through the hard training of a strolling actor, playing minor parts in many cities of the United States and in Mexico. After his return to the East, in 1849, his circumstances improved, and the next few years were largely spent in various cities of the South. In 1856 he made his first visit to Europe. Returning again to New York, he became a member of Laura Keene's company, and in her newly opened theatre in 1857 appeared as Dr. Pangloss in *The Heir-at-Law*, Caleb Plummer in *The Cricket on the Hearth*, and in several less important rôles. In 1858 he played with E. A. Sothorn in Miss Keene's production of *Our American Cousin*, really creating the part of Asa Trenchard. It was while acting in *Our American Cousin* that he began his search in literature for a character combining both humor and pathos, which he finally found in Irving's *Rip Van Winkle*; but his dramatization of the sketch was so unsatisfactory to himself that it was afterward altered and amplified by Boucicault. In its new form it became Jefferson's most famous rôle. He played it for the first time in London, in 1865, and afterward this character, Dr. Pangloss, Caleb Plummer, and Bob Acres in *The Rivals* (which he revived in Philadelphia in 1880) were the principal ones in his repertory. He also acquired a considerable reputation as a landscape painter in oils. Mr. Jefferson was twice married—to Miss Margaret Lockyer in 1850 and, after her death, to Miss Sarah Warren in 1867. He owned a fine plantation in Louisiana, and when not on the stage spent his winters there. He was a member of the American Academy of Arts and Letters. His *Autobiography* (New York, 1890) is full of interesting allusions to many contemporaneous actors and actresses.

Jefferson, *Intimate Recollections of Joseph Jefferson* (ib., 1909).

JEFFERSON, THOMAS (1743–1826). Author of the Declaration of Independence, and third President of the United States, born at Shadwell in Albemarle Co., Va., April 2, O. S. (April 13, N. S.), 1743. His father was Peter Jefferson, a man of some prominence in his community; his mother was Jane Randolph, a sister of William Randolph, of Tuckahoe. Thomas was educated first in a common school, in the ordinary studies for a boy of seven, and when nine years old the Rev. Mr. Douglas gave him instruction in French and in the classical languages. He prepared for college under the tuition of the Rev. Mr. Maury and at the age of 17 became a student in William and Mary's College. Jefferson did well in the classics, in French, Italian, and Spanish, and acquired an equipment in mathematics and science such as was rarely had save by special students. On leaving college he turned his attention to law and studied for about five years under George Wythe, the head of his profession in Virginia. In 1767, at the age of 24, he was admitted to

the bar; but, although successful, he never took the interest in the practice of his profession that he took in scientific farming and gardening, and he continued it only seven years.

In 1769 Jefferson took his seat in the House of Burgesses, elected on the arrival of the new Governor, Lord Botetourt. A set of too independent resolutions brought about the dissolution of the assembly; but before returning home the Burgesses met at the Raleigh Tavern and adopted a nonimportation agreement, of which Jefferson was one of the signers. The question of emancipating slaves was then being agitated in England, but little had been heard on the subject in the Colonies. Jefferson proposed an act which would give masters the right to free their slaves whenever they thought proper; but the bill failed to pass, and the principle was not established until 17 years later.

His term over, he removed to an unfinished house (subsequently famous as Monticello), and on New Year's Day, 1772, married Martha Skelton, daughter of John Wayles, and widow of Bathurst Skelton.

In March, 1773, when the House of Burgesses came together again, Jefferson, Henry, and others of advanced opinions undertook to form a committee of correspondence for the spread of political intelligence in the Colonies. This scheme had scarcely been adopted and the committee selected when the Governor dissolved the House. In the spring of 1774, however, all of the old members reappeared in their seats, and while this session was in progress news came of the Boston Port Bill. Jefferson, with some of the other leaders, succeeded in having a resolution passed to observe a day of prayer and fasting, and again the Governor resorted to dissolution. The Burgesses in a secret meeting requested the Committee of Correspondence to consult with the other Colonies as to the expediency of a general congress, and then resolved in favor of a meeting of representatives from the counties of Virginia, to be held at Williamsburg on August 1. Jefferson was chosen a representative, but was prevented by illness from attending. He forwarded, however, to Peyton Randolph, the president of the convention, a draft which he hoped to see adopted as instructions to the delegates to be selected for the Colonial Congress. When presented, copies of this document were ordered to be printed, and this first of Jefferson's political writings appeared in pamphlet form as *A Summary View of the Rights of British America*. It spelled virtual independence and was sent to England, where, after receiving some interpolations from the pen of Edmund Burke, it was published and widely circulated—a circumstance which Jefferson regarded as the reason for including his name with others in a bill to punish sedition. In the session of the convention held in the spring of 1775 Jefferson was on the committee to see to the defense of Virginia, and in the expectation that Peyton Randolph might be called home he was elected to the Continental Congress. This vacancy did occur soon; but before he left for Philadelphia he drew up for the Burgesses an answer to the "conciliatory propositions" which the English government had made to the Colonies. This reply, the earliest made by any of the Colonies, was anxiously expected in Congress, and when it was brought by the author it was vigorously indorsed. Jefferson was no debater, for, besides having a

poor voice, he hated contest; but his courtesy, his intellectual keenness, his wide political knowledge, and his power of expression gained him hearty respect, and he soon became the recognized document writer to the assembly. The answer of Congress to Lord North's "conciliatory proposition" was intrusted to Jefferson, who based his paper on the reply he had previously written for Virginia. In the winter of 1775-76 it became so plain that there was no possibility of a reconciliation that Virginia in the following spring instructed her delegates to urge on the final breach. On June 7 Richard Henry Lee presented resolutions to this effect, and before the month was out Jefferson, who was placed first on the drafting committee, presented his report. On July 2 Lee's resolution was passed, and on the same day Jefferson's draft was taken up. The author took no part in the warm discussion over the document, for which, with the exception of a few verbal changes by Franklin and Adams, he was solely responsible. Late in the day of July 4 the Declaration was adopted.

Jefferson did not take his seat at the next session of Congress, because he thought he could best serve his country by preparing the laws of his State for the changed conditions the new government would bring with it. In this task he was not working single-handed, but the initiative was almost entirely his own. In October, 1776, Jefferson took his seat in the Virginia House of Delegates, where for two years he labored incessantly at revising the whole Virginia code, reforming old and proposing new laws. In spite of the opposition of the privileged classes, the old aristocratic framework of Virginia society was in a brief time replaced by a democratic one. In June, 1779, a time when the Revolution looked most hopeless for the Americans, Jefferson was elected Governor of the State where the struggle was to be ended. Virginia had supplied to the Revolution 10,000 men, besides all the horses and arms possible, and Jefferson's first duty was to keep up as well as he could this support. Soon, however, the British pushed the war in the South. In April Cornwallis sent Tarleton to capture the Virginia Legislature, then at Charlottesville, but he succeeded only in dispersing it. Jefferson himself narrowly missed capture at Monticello by a party sent after him. His conduct during this period has been the subject of much thoughtless censure. He was not, indeed, fitted to be a "war Governor," but his course had Washington's substantial approval, for the commander in chief recognized that Virginia was without means of defense and that it was impossible for any one to defend it, and in December, 1781, the Virginia House of Delegates were unanimous in a resolution exonerating him from all censure. Jefferson's wife, to whom he had been singularly devoted, died at this time, and he retired from the Governor's chair to his home, where he remained until called by Congress to be one of the commissioners to arrange the treaty of peace. He left home, but found that matters had gone so far that he could be of no practical service, and he did not sail. In 1783 he took his seat in Congress and did much to strengthen a body fallen into something like contempt for its incompetence. His most important service here was his successful advocacy of the decimal system of coinage, which had been devised by

Gouverneur Morris, and the drawing up a plan for the government of the territory to the northwest of the Ohio River. In the latter plan there was the provision for the prohibition of slavery, which, though rejected at first, finally secured all of the vast domain to freedom.

In May, 1784, Jefferson, Franklin, and Adams were sent to Europe under a general power to make commercial treaties. In 1785 Jefferson succeeded Franklin as American representative to France. The diplomatic fruits of this stay are not specially remarkable, because Europe was much concerned with internal troubles and little interested in the affairs of the new nation across the Atlantic. By his personal charm, however, by his sympathy with French ideas, and by the influence of his *Notes on Virginia*, now published with his consent, Jefferson did much to set the United States in a favorable light in Europe. Having as his official duty to attend to the ignoble tribute by which the commercial nations of the time warded off the Algerian pirates, he protested vigorously that a war would be not only more honorable, but much cheaper. On a brief and unsatisfactory mission to England he got a first-hand confirmation of the insolence with which the Americans were there treated. He traveled in Italy and Germany and in Paris became intimate with D'Alembert, Condorcet, and other extreme liberals, with whom his intellectual affinity was marked. In 1789 he returned to America and under Washington became first Secretary of State. The organization of the government had defined political parties, and hardly was Jefferson in office before he was recognized as the leader of the Democratic Republicans (afterward known first as the Republicans and then as the Democrats), while Alexander Hamilton was the leader of the Federalists. Hamilton favored a strong Federal government and distrusted the people; Jefferson insisted on State sovereignty and regarded the people with the most optimistic faith; Washington held views more moderate than either. Most of Hamilton's definite propositions have been adopted by the government, but Jefferson's spirit has given them life. The two new parties came into sharp contention over the question of neutrality when in 1793 France declared war against England. The followers of Jefferson held that the United States was bound by gratitude and treaty to aid the French Republic; those of Hamilton argued that the treaty was not now in force, and that motives of self-preservation were stronger than the obligation owed for help during the Revolution. Washington finally issued a neutrality proclamation, but at the same time declared that he would receive the Minister of the Republic, Genet. "Citizen Genet," as he was called, acted with what was considered to be outrageous disregard for international etiquette and was recalled, but the bitterness between Hamilton and Jefferson was never removed.

Jefferson's secretaryship had not been congenial to him, and at the call of some private business he retired Dec. 31, 1793. Washington's announcement in September, 1796, that he would not be a candidate for a third term, led to the nomination of Adams, then Vice President, and Jefferson by the Federalists and the Democratic Republicans respectively. Adams, having received the highest vote, was chosen President, and Jefferson, having the next highest, was,

under the law of the time, chosen Vice President. As the duties which Jefferson had now to perform were chiefly secondary, he was able to spend most of his time at home, where, nevertheless, he continued to direct the party of which he was the head. The excesses of the French in the Reign of Terror caused a great reaction in America against Republican doctrines, and the Directory now in control in France seemed bent on having war with the United States. The American envoys were treated with insolence, and later the shameful incident of the "X. Y. Z." letters brought not only the quick-tempered Adams but also all but the most devoted followers of Jefferson to a strong desire for war. This calamity was avoided because the French Minister, Talleyrand, seeing that he had overstepped himself in his knavery, now proclaimed the whole thing a mistake. The war feeling had, however, carried the President and his supporters so far that they felt justified in having the Alien and Sedition Laws passed for the protection of the government—the former making it possible to expel from the country any alien suspected of treason, and the latter making defamation of the government a crime punishable by a heavy fine. Jefferson on this provocation drew up the Kentucky Resolutions, which seemed strongly to manifest his belief in the right of a State to secede, although this is not absolutely implied and at least does not seem to have remained his fixed opinion.

The election of 1800 resulted, after a campaign marked by great bitterness, in the election of the Republican candidates, Jefferson and Burr receiving the same number of votes. The decision fell to Congress, where Jefferson was chosen, chiefly through the influence of his opponent, Hamilton, who was too much of a patriot to desire the success of Burr. Although the Federalists, especially of New England, predicted a revolution, Jefferson made astonishingly few removals from office for purely political reasons, was painstaking in his selections for vacancies, and by his popularity drew from the Federalist party much of its vital energy. The stately formalities that had marked the inauguration of the preceding Presidents were omitted. Jefferson rode horseback, without attendants, tied his horse to the fence, and walked unceremoniously into the Senate chamber. He also sent written messages to Congress, and the practice of the President in addressing Congress in person was not revived until 1913. These changes in official etiquette were paralleled in manners and dress; knee breeches gave way to trousers, and simplicity, for which the President set an unostentatious example, became the order of the day.

The most important event of Jefferson's quiet first term was the purchase of Louisiana from the French. This step was deemed unconstitutional by him, but the necessity of controlling the Mississippi and the obvious need of haste abundantly justified the action. A little war with Tripoli, the first opposition that the Algerine pirates had received, led to the extinction of the tribute paying to which Jefferson had so objected. The exploration of the Far West was undertaken, and settlements across the Mississippi were generously assisted. Four years of prosperity and the almost complete disintegration of the Federalist party led to Jefferson's reelection in 1804 by 162 votes out

of 176. Burr's scheme to invade Mexico to set up an empire brought about his trial for treason, and the prosecution gave Jefferson's enemies the opportunity to accuse him of gross partisanship. Jefferson's second term is remarkable for his consistent and on the whole unsuccessful attempt to apply to foreign affairs principles of action so far in advance of his time that we have not yet arrived at them to-day. The long wars between France and England had made these two nations utterly careless of the rights of neutrals. The United States, as the principal carrier of neutral goods, suffered most, her ships being attacked by both nations and her crews being impressed into British service. This impressment by the British went on in spite of protest until a crisis was reached in June, 1807, when the British ship *Leopard* fired into the American frigate *Chesapeake* (q.v.). Redress was demanded, but the British government refused to touch the fundamental cause of the trouble, impressment. The measures that Jefferson recommended in retaliation were those of commercial restriction such as had been not without effect in the eighteenth century. The Embargo of 1807 forbade American vessels to leave for foreign ports, and the Enforcement Act of 1808 put heavy penalties on the violation of the embargo. These acts proved without effect as far as changing the attitude of the British was concerned and brought great distress on the tobacco industry of Virginia and on the commerce of New England and the Middle States. This policy was abandoned early in 1809. In December, 1806, Jefferson successfully recommended to Congress the prohibition of the slave trade. Following the example of Washington in the refusal to be elected a third time to the presidency, Jefferson, at the close of his second term, took up the care of his plantation at Monticello. Here he ceased entirely from active political life, but by means of his facile pen still exerted an important influence on the government, especially upon his successors and disciples, Madison and Monroe. His house was the Mecca to which all America seemed to turn, his open and generous hospitality finally bringing financial distress upon him—a distress that both the government and private individuals helped to relieve. Jefferson's chief public service during this period was the founding of the University of Virginia, in which he unfolded some highly original ideas regarding higher education by the state, and here, as at Monticello, exhibited remarkable tastes as an architect. Another mark of Jefferson's versatile genius was his proficiency in music, especially in playing the violin. In June, 1826, his health failed rapidly, and he died July 4, the same day that his predecessor in office, John Adams, passed away.

In person Jefferson was tall (6 feet, 2 inches), with a bony but strong frame, angular features, ruddy complexion, sandy or reddish hair, and light hazel eyes. In dress and bearing he was so far removed from the formal as to be almost slovenly. His manners were remarkably winning, and his disposition very kindly, not only to his family and his friends, but to his slaves. While not precisely learned, he probably had the most receptive mind of his generation, and it is by no means certain that, although he was on the whole a far from strong executive, he was not the most influential statesman of his day. In religion it is probable that he was

not far from what was then known and execrated as a freethinker: as an idealist, he did not underestimate the sublimity of Christ's character, but he had no belief in the orthodox theological ideas as to redemption. His views on slavery were far beyond those of his time, but all of his efforts to effect a reform in Virginia were unavailing. The influence that he has had through the Democratic party has been but the most open expression of the deep influence he has had in the democratizing of all American ideas. The unfailing trust which the people of his day put in him was due largely to the deep and steady confidence he had in them.

S. Williams, *Thomas Jefferson: His Permanent Influence on American Institutions* (ib., 1913). On Jefferson as an architect, consult: Lambeth and Manning, *Thomas Jefferson as an Architect and Designer of Landscapes* (Boston, 1913); S. F. Kimball, "Thomas Jefferson as Architect, Monticello and Shadwell," in *Architectural Quarterly*, vol. ii (Cambridge, Mass., 1914). For bibliographies of Jefferson, consult: H. B. Tompkins (comp.), *Bibliotheca Jeffersoniana* (New York, 1887); R. H. Johnston (comp.), "Contribution to a Bibliography," in *Thomas Jefferson, Writings* (Monticello ed., vol. xx, Washington, 1905). The best-known monuments to Jefferson are as follows: by Pierre Jean David (David d'Angers), in the Capitol at Washington, a copy in the City Hall, New York, and one at Angers, France; by Galt, in the Library of the University of Virginia, Richmond, Va.; by Moses Ezekiel, in Louisville, Ky.; by Hiram Powers, in Hall of Representatives, Washington; by W. O. Partridge, at School of Journalism, Columbia University, New York City; by

Thomas Crawford, in Richmond, Va.; by Charles Gaffy, made for St. Louis Exposition; and by E. V. Valentine, in Richmond, Va. A bust by J. A. Houdon is in the New York Historical Society, New York City, and a bas-relief, by George Miller, in the American Philosophical Society, Philadelphia.

JEFFERSON BARRACKS. A United States military reservation and post in Missouri, established in 1826. The reservation, which comprises 1261 acres, is located on the Mississippi, 10 miles below St. Louis. There are a post office, telegraph station, and railroad station at the post, while quarters for 31 officers and 1300 men are provided. Jefferson Barracks was originally a cavalry post equipped with stables. For a number of years it has been known as the Jefferson Barracks Recruit Depot, one of the five large depots at which recruits are received and trained for 36 days before assignment to regiments. It is one of the oldest military posts in the United States, and when it was established St. Louis was merely a trading village. For many years it was the fitting-out rendezvous for important expeditions, and until 1861 hardly a regiment, particularly in the cavalry, could be found which had not at one time been represented in the garrison or made its headquarters at Jefferson Barracks. The St. Louis powder depot and national cemetery are included in the reservation. See DEPOT.

JEFFERSON CITY. The capital of Missouri and county seat of Cole County, near the geographical centre of the State and 125 miles by rail west of St. Louis, on the south bank of the Missouri River, on the Missouri Pacific, the Chicago and Alton, and the Missouri, Kansas, and Texas railroads (Map: Missouri, D 3). Its elevation is more than 600 feet. Among the more notable structures are the Capitol (erected at a cost of \$3,500,000), State penitentiary, State armory, Governor's mansion, Supreme Court building, United States courthouse and post office, the county courthouse, Carnegie library, St. Mary's Hospital, and Lincoln Institute (a normal school for the higher education of negroes). The city has also the State and Supreme Court libraries. A fine steel bridge crosses the Missouri River at this point. Jefferson City has valuable natural advantages as the centre of a fertile agricultural and rich mineral region. Coal and zinc abound in the vicinity. It manufactures agricultural implements, boots and shoes, saddletrees, clothing, binding, twine, flour, beer, brooms, foundry products, bricks, etc. There are also railroad shops and roundhouses of the Missouri Pacific. Settled in 1826, Jefferson City was incorporated first in 1839. Under a general legislative act, approved 1893, governing cities of the third class, the government is administered by a mayor, elected biennially, who has important appointive powers, and a unicameral council. Pop., 1900, 9664; 1910, 11,850; 1914 (U. S. est.), 12,780.

JEFFERSON RIVER. One of the three rivers which unite to form the Missouri River. It is formed by the junction of the Beaver Head and Big Hole rivers, in the southwestern part of Montana, flows in a northeasterly direction, and, after a course of 150 miles, unites with the Madison and Gallatin.

JEFFERSONVILLE. A city and the county seat of Clark Co., Ind., on the Ohio River, opposite Louisville, Ky., with which it is con-

ned by two railroad bridges, and on the Pittsburgh, Cincinnati, Chicago, and St. Louis, the Louisville and Northern, the Baltimore and Ohio Southwestern, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Indiana, F 8). It is situated at the head of the Ohio Falls, which afford good water power; has a United States quartermaster's supply depot, the Indiana Reformatory, an orphans' home, and city and State Reformatory libraries. A considerable amount of strawberries is shipped from here, and there are extensive manufactures of river steamboats and freight and passenger cars, cement, and numerous other industries of less importance. The government is administered, as provided under the Indiana laws, by a mayor, elected quadrennially, and a council, which elects subordinate officials, excepting police commissioners, who are appointed by the mayor. Pop., 1900, 10,774; 1910, 10,412.

JEFFERY, jěf'ēr-ī, EDWARD TURNER (1843-). An American railroad president. He was born at Liverpool, England, and came to the United States in 1850. Entering the employment of the Illinois Central Railroad Company in 1856, he was its superintendent in 1877-85 and general manager in 1885-89. He visited the Paris Exposition to make a report on it for the citizens of Chicago in 1889, and then served as chairman of the building and grounds committee of the Columbian Exposition until 1891. He was president from 1891 to 1912, and thereafter chairman of the board directors, of the Denver and Rio Grande Railroad Company; was receiver in 1893-95, and thereafter president, of the Rio Grande Southern; became chairman of the board of directors of the Western Pacific in 1905; and held also the presidency of the New Orleans and Northwestern and the Rio Grande Junction railways and the Utah Fuel Company and directorships in many other corporations.

JEFFREY, jěf'rī, EDWARD CHARLES (1866-). An American botanist. He was born at St. Catharines, Ontario, Canada; graduated from the Collegiate Institute of that place in 1879 and from the University of Toronto in 1888; and studied at Harvard University (Ph.D., 1898), where he was assistant professor of vegetable histology and general morphology from 1902 to 1907 and thereafter professor of plant morphology. His researches deal particularly with the evolution of fossil plants, the anatomy of plants and the structure of coal and lignites, and the morphology of vascular plants.

JEFFREY, FRANCIS, LORD (1773-1850). A Scottish critic and lawyer, born in Edinburgh, Oct. 23, 1773. He was educated at the Edinburgh high school, the universities of Glasgow and Edinburgh, and at Queen's College, Oxford; and he studied law in Edinburgh. During this early period he read widely and practiced both verse and prose writing. In 1794 he was called to the bar. Two years before this he became a member of the Speculative Society (in connection with the University of Edinburgh). Jeffrey soon became prominent among the members by the keenness and liveliness of his intellect and the eloquence of his style, but his progress at the bar was slow, partly on account of the antipathy which then existed to literary lawyers and partly on account of his political opinions, which were Whig. Meanwhile he and several other young men then in Edinburgh,

ambitious of finding a wider outlet for their talent than the discussion in the Speculative Society or the practice of the bar afforded, planned a critical journal. The first proposer of the scheme was Sydney Smith. The result was the establishment (1802) of the *Edinburgh Review* (q.v.), of which Jeffrey soon became editor, an office he retained till 1829. In politics the *Review* was Whig. Jeffrey, however, confined himself mostly to literary reviews, in which he criticized with great severity the new school of poetry, represented by Coleridge, Wordsworth, Byron, and Shelley. This criticism is now generally discredited; it was perverse and hard, but, nevertheless, shrewd and brilliant. After some years Jeffrey's practice at the bar began to increase; in jury trials he shone to great advantage, particularly in the trials for sedition between 1817 and 1820. In 1830 he became Lord Advocate for Scotland, and after the passing of the Reform Bill he was returned to Parliament for the city of Edinburgh, which he continued to represent till 1834, when he gladly retired to accept a judgeship in the Court of Sessions. During the latter years of his life Jeffrey resided at Craigerook Castle, near Edinburgh, where he died Jan. 26, 1850. He was twice married, his second wife being Charlotte Wilkes of New York. Accessible volumes of selections are *Essays: English Poets and Poetry* (1905) and *Literary Criticism* (1910), edited by D. Nicol Smith. Consult: H. T. Cockburn, *The Life of Lord Jeffrey* (Edinburgh, 1852; reissue, 1872); Thomas Carlyle, *Reminiscences*, vol. ii (London, 1881); John Morley, "Memorials of a Man of Letters," in his *Studies in Literature* (ib., 1897); L. E. Gates, *Three Studies in Literature* (New York, 1899); H. H. Joline, *A Famous Reviewer* (ib., 1910).

JEFFREYS, jěf'rīz, GEORGE, LORD (1648-89). An English judge, born at Acton in Denbighshire, Wales. Though the son of a squire of small means, Jeffreys obtained a fair education at Shrewsbury, at St. Paul's, and at Westminster under Dr. Busby; in 1662 he matriculated at Trinity College, Cambridge, which he left the following year without a degree to enter the Inner Temple, London. Admitted to the bar in 1668, with small legal learning, but with a powerful voice and bold address, he soon gained a large practice. About 1672 he deserted his popular constituency and began to cultivate the court party. His ability, zeal, wit, eloquence, and capacity for making friends among unscrupulous attorneys won him rapid advancement, and he became Chief Justice of Chester in 1680, a baronet in 1681, and Chief Justice of England in 1683. He was foremost in the prosecutions of Archbishop Plunket and Stephen Colledge and aided in destroying popular government in London, pushing on the quo warranto proceedings which deprived London of its charter. Charles II, who despised him, consented to his appointment as Chief Justice, swore him as a Privy Councilor in 1683, and connived at and took advantage of his unscrupulousness. Jeffreys was unfair in his rulings in the trial of Algernon Sidney. He condemned Sir Thomas Armstrong without a trial and sent him to his death loaded with insults. He advised James II to collect the customs revenue and use it without a vote of Parliament. His career seemed to culminate in 1685, when he browbeat Titus Oates at his trial. He was created Baron Jeffreys of Wem and was the virtual ruler of Lon-

don and disburser of all legal patronage. In this year also he traveled the western circuit, his Bloody Assizes condemning hundreds to death, without even the semblance of a fair trial, for their complicity in the insurrection headed by the Duke of Monmouth, among them Alice, Lady Lisle; he assigned over 800 persons to his favorites to be sold as slaves, and imprisoned and maimed hundreds more; yet James II made him Lord Chancellor and Keeper of the Great Seal. He joined with James (if, indeed, he did not advise it) in the arrest and imprisonment of the seven bishops. Frightened at length, in 1688 he attempted to undo some of his autocratic deeds, but the movement came too late. His master James II fled, and he disguised himself in the dress of a common sailor, but was recognized in spite of his disguise and taken to the Tower, where he died April 18, 1689, of a malady from which he had long suffered. In private conversation after his fall he alleged that he lost the favor of James because he would not be still more vindictive in his bloody circuit. Occasionally he did an act that indicated some recognition of the principles of human kindness. In criminal cases he has had, perhaps, no equal among judges for baseness. In civil cases, on the contrary, he is said to have been able and upright and surpassed by few men in the clearness of some of his opinions.

Bibliography. The most complete account of his life is found in Woolrych, *Memoirs of the Life of Judge Jeffreys* (London, 1827). Consult also: North, *Life of Lord Keeper Guilford* (ib., 1826); Roscoe, *Lives of Eminent British Lawyers* (ib., 1830); Burnet, *History of my own Time* (ib., 1838); Roberts, *The Life, Progresses, and Rebellion of James, Duke of Monmouth* (ib., 1844); *Reports of State Trials*; Lord Campbell, *Lives of the Lord Chancellors*, vol. iv (ib., 1849-57); Bent, *The Bloody Assizes* (Edinburgh, 1890); Irving, *Life of Judge Jeffreys* (London, 1898); T. B. Macaulay, *History of England*, vols. i, ii (New York, 1899).

JEFFRIES, jěf'riz, JOHN (1744-1819). An American physician, born in Boston. He graduated at Harvard in 1773, afterward traveled in Europe, and attended classes at the medical colleges in London and Aberdeen. Returning to America, he practiced in Boston until the city was evacuated by the British, when he accompanied the English troops to Halifax. He distinguished himself as an army surgeon, and in 1779 was appointed surgeon major of the British forces in America. He was greatly interested in scientific experiments, more especially in the construction of balloons, with a view to atmospheric experiments, and accompanied François Blanchard in his balloon trip from Dover across the Channel, on which occasion the aeronauts landed in the midst of the Forest of Guienne in France. In 1789 he returned to Boston, where he continued the practice of his profession until his death. A lecture delivered by him in 1789 is said to have been the first public lecture on anatomy given in New England.

JEHAN, SHAH. See SHAH JEHAN.

JEHO'AHAZ (Heb. *Yehō'āhāz*, or *Yō'āhāz*, Yahwe holds fast). 1. King of Israel 814-797 B.C. He succeeded his father, Jehu, and in the eyes of the compiler of the Book of Kings was a wicked and inefficient ruler. During his reign the power of Israel was brought very low by the

Aramæans of Damascus (2 Kings xiii. 1-9). The "saviour" mentioned in verse 5 has been thought by some to be Adadnirari III of Assyria. 2. King of Judah 608 B.C. He succeeded his father, Josiah, and reigned three months. He was captured at Riblah on the Orontes by Pharaoh Necho, sent to Egypt, and died there (2 Kings xxiii. 31-34). In Jeremiah (xxii. 11) he is called Shallum.

JEHO'ASH (pseudonym of SOLOMON BLOOMGARDEN) (1870-). A talented Yiddish poet, born at Verzhbolovo, Province of Suwalki. Beginning to write at an early age, he first attracted attention by his poems, some of which were included in the *Jüdische Bibliothek*. In 1890 he emigrated to the United States, 10 years later becoming a regular contributor to *Die Zukunft*, a Yiddish periodical. His fame in America dates from 1907, when the first volume of his poems appeared. Since then 10 volumes of his writings have been published, including four volumes of translations. In 1911 appeared 1 volume of fables, some prose works, and the *Dictionary of Hebrew Elements in Yiddish*, edited by him and C. J. Spivak.

JEHOASH. See JOASH.

JEHOL, zhā'hōl (Chin. *Jê-ho*, hot river). A large and important city of Inner Mongolia, situated in a finely wooded region north of the Great Wall, near the borders of Manchuria and 140 miles northeast of Peking, with which it is connected by a good road. The town is mostly inhabited by Chinese immigrants from Shansi and Shantung. Population, exclusive of numerous Lamaistic monasteries, about 25,000. It is a trading town and is noted for its inlaid tables and boxes. There are here an Imperial hunting park and a summer palace called in Chinese Pi-shu-shan-chwang (mountain lodge for avoiding the heat). The latter was built in 1703 on the model of the Yuen-ming-yuen, or summer palace near Peking, destroyed by the Anglo-French forces in 1860. In a beautiful valley in the vicinity are several large Lama monasteries, the chief of which are the Potala and the Teshilumbo. Jehol was the refuge of the Imperial court in 1860, when the French and English occupied Peking, and in 1912, when the last Manchu Emperor abdicated. Consult: Edkins, in the *Journal of the North China Branch of the Royal Asiatic Society* (Shanghai, 1865); Williamson, *Journeys in North China, Manchuria, and Mongolia* (2 vols., London, 1870); *Journal of the Royal Geographical Society* (ib., 1874); R. O. Franke, *Beschreibung des Jehol-Gebietes in der Provinz Chihli: Detail Studien in chinesischer Landes- und Volkskunde* (Leipzig, 1902).

JEHOSH'APHAT (Heb. *Yehōshāphāt*, Yahwe judges). The fourth King of Judah (877-848 B.C.). He succeeded his father, Asa, and reigned 25 years. The compiler of the Book of Kings commends him for his piety (1 Kings xxii. 43), and the Chronicler enlarges upon this notice and exalts Jehoshaphat's measures for the defense of his kingdom and his success in war (2 Chron. xvii-xx). During a large part of his reign he was practically a vassal to the kings of Israel, for his visit to Ahab, and his campaigns with the latter (1 Kings xxii. 3-40) and Jehoram (2 Kings iii. 7-27), as well as his going into battle dressed in his full robes, while Ahab went in disguise (1 Kings xxii. 30), were probably enforced by the northern rulers. Jehoshaphat tried to establish communication

with the gold country Ophir, but failed, his ships being destroyed by a storm (1 Kings xxii. 48). He was succeeded by his son Jehoram.

JEHOSHAPHAT, VALLEY OF. A valley which the prophet Joel (iii. 2-12) foretells is to be the scene of the judgment of the heathen after the return of Judah and Israel from captivity. No such valley is mentioned elsewhere in the Bible, and it is doubtful whether the writer had any particular site in mind. It has been thought, however, by some scholars that the prophet referred to the valley of Berachah, in which King Jehoshaphat of Judah is said to have gained a notable victory over the Ammonites, Moabites, and Edomites (2 Chron. xx. 26). Another and more popular view identifies the valley of Jehoshaphat with that commonly called Kidron in the Bible—the deep ravine which separates Jerusalem from the Mount of Olives. This view, which can be traced back to the fourth century, has been adopted by travelers of all ages and faiths. It is noticeable that in a Midrashic work the statement is found, "A valley called Jehoshaphat does not exist." Consult Neubauer, *La géographie du Talmud* (Paris, 1868). See **KIDRON**.

JEHO'VAH. A word used in the Authorized Version of the English Bible as the name of the national deity of the Jews in the designation of certain shrines such as Jehovah-jireh (Gen. xxii. 14), Jehovah-nissi (Ex. xvii. 15), and Jehovah-shalom (Judg. vi. 24). It had already appeared in Tyndale's translation of the Pentateuch (1530) in Ex. vi. 3 under the form Iehouah, and in various other Protestant versions. The Hebrew word in these passages, which occurs in the Bible 5410 times, is generally rendered "the Lord" in the English translations. It was expressed in writing, as was the custom among the Jews in earlier times, without any signs indicating the vowels, simply by four consonants corresponding to our Y H W H—the tetragrammaton, as it has been called. When vowel signs were added to the consonantal text of the Hebrew Bible, in the eighth century A.D., as a means of preserving the traditional pronunciation of the sacred literature, those of Adonai (my lord) were attached to the tetragrammaton as an indication that the name was to be pronounced as though it were Adonai (q.v.), or those of Elohim (God) were attached if an Adonai preceded it; but the Masorites did not intend that it should ever be pronounced either Yehowah or Yehowih. By a misunderstanding mediæval Christian scholars combined the vowels of Adonai with the consonantal frame, thus producing the form Jehova, Iehovah. It is commonly stated that this error was unknown until 1520, or, by those who know when Galatinus published his *De Arcanis Catholicæ Veritatis*, until 1518. Moore, however, has called attention to the testimony of Voisin, the editor of the *Pugio Fidei*, of Raymundus Martini, in 1651, that he found the name Jehova in three manuscripts of this work, one of them written in 1381. While doubting that Raymundus himself wrote the name in 1278, as was maintained by Voisin, he concludes that it must have been familiar to copyists of the *Pugio* in the fourteenth century.

While the hybrid form thus goes back to the error of some Christian scribe in the Middle Ages, the Masoretic direction to pronounce the tetragrammaton Adonai must have been a very old tradition at the time when the vowel

signs were invented, for the custom had already been introduced when the Greek version of the Law was made in the third century B.C. What led to this practice of substituting Adonai (and hence *Kyrios*, *Dominus*, the Lord) is not known with certainty, but various reasons have been suggested, such as the easier and more general observance of the Third Commandment, if the holy name was not pronounced, or the feeling that the genuine personal name of the deity was too sacred and too powerful to be used except on extraordinary occasions and by any one but the high priest, or the preference for a term that should not bring to mind the old tribal deity after a more transcendental conception had been gained. Adonai was probably chosen in the vast majority of cases because it had often been employed in direct address to the deity, had not seldom been connected with the proper name, and as an appellative was translucent, dignified, and appropriate.

The avoidance of the use of the original name led to the gradual loss of the true pronunciation, though the repeated interdictions against uttering it render it probable that it was still known among the Jews as late as the tenth century A.D. The Samaritans seem to have continued longer than the Jews to pronounce the holy name. Theodoret (*Questio xv in Exodum*) declares that they pronounced it *Iαβε*, i.e., Yave; and though *shema* (the Name) has been substituted for it, there is unimpeachable evidence that even the Samaritans of to-day know that Yahwe was the original pronunciation. Pagan magicians, Gnostics, and Christians learned what the name was; hence the Ethiopic Yawe, and the forms *Iαβα* (pronounced Yava) and *Iαωυηε* (Iaoue) in magical papyri. Yahwe was seen to have been the true pronunciation of the tetragrammaton by Générard (in 1567) and others, before it was recognized again by Gesenius and Ewald, as has been shown by Moore. The name goes back at least to the middle of the ninth century B.C., as it is found in the Mesha inscription, and it is, after all, most probable that the Moabitish King pronounced it Yahwe, and not Yaho(h), or Yahwah. As to the meaning of Yahwe, Ex. iii. 14 clearly connects it with the root *haya*, 'to be,' 'to become,' and the phrase has generally been understood to mean 'I am what I am'; but Paul Haupt has recently suggested that it might be read *ahye asher yihye*, 'I call into existence what comes into existence' (*Studien. Wellhausen gewidmet*, p. 211, Giessen, 1914). Wellhausen explains it from a root *hawa*, 'he goes through the air' (*Israelitische und jüdische Geschichte*, p. 23, 7th ed., 1914). Others think of a root suggesting 'he sends down, i.e., lightnings.' The presumption is in favor of the etymology suggested by Ex. iii. 14, 'the Maker.'

But another form of the name than the tetragrammaton once existed. The Jews on Elephantine in the fifth century B.C. wrote the name YHW, but also YHH, which seems to indicate that the pronunciation was either always Yaho, or sometimes Yaho, sometimes Yahu. This Yaho was rendered into Greek *Iaw* (Iao), and frequently found in Greek papyri and among later writers; the *h*, or *spiritus asper*, was generally elided, but in a demotic papyrus (Leyden A 65) the aspirate *h* is still shown, and in the corresponding Greek text its place is taken by an epsilon. Yaho is found frequently in the-

ophorous names shortened to Yeho or Yo, both in the Hebrew Bible and in inscriptions recently discovered at Samaria and at Jericho. Yaho or Yahu also underlies the rendering of Hebrew names in Assyrian. Of this form Yah, found in the phrase *Hallelu Yah* (Praise ye Yah!) and also independently, is no doubt an abbreviation, as is seen in the case of names like Yeshayahu (later Yeshayah), Yirmyahu (later Yirmyah). It is not so easy to decide whether Yahu or Yaho is a shortened form of Yahwe, this a lengthened form of Yahu, or whether both are independent. The analogy of Asur, Asir, Asher, Ashur, and even Anshar (see ASSUR) suggests that the form may have varied in different localities and ages, that Yahwe may be due to a desire to find a meaning in what was not a translucent name, and that there may have been a welding together into one of two entirely distinct divinities. It is possible that the name Yahwe, as well as the etymology of it that suggests a creator, is due to the Levites, whose teachings spread from Kadesh Barnea through the Negeb and Judah to Israel; that a god Yahu was widely worshiped in Syria in earlier days, as it is certain that in the Hammurapi period and in the time of the Kassites Yau was worshiped in Babylonia; and that in course of time the distinction between them was obscured. Concerning the meaning of Yahu nothing is known. It has been held that Yahwe was taken over by Moses from Jethro and his people, the Midianites. But there is nothing in Ex. xviii that forces us to conclude either that Moses had been converted to the god of Jethro or Jethro to the god of Moses. (See MOSES; PENTATEUCH.) Consult: Driver, "The Tetragrammaton," in *Studia Biblica* (Oxford, 1885); Smend, *Alttestamentliche Religionsgeschichte* (Freiburg, 1893); Dalman, *Der Gottesname Adonai* (Leipzig, 1896); G. F. Moore, in *Old Testament and Semitic Studies* (Chicago, 1908); Clay, *Amurru* (Philadelphia, 1909); Sellin, in *Mitteilungen der deutschen Orientgesellschaft*, No. 41 (Berlin, 1909); Lyon, in *Harvard Theological Review* (Cambridge, 1909); Grimme, in *Orientalische Literaturzeitung* (Leipzig, 1912); Leander (ib., 1912); König (ib., 1913); Schmidt, in *Journal of Biblical Literature* (Boston, 1915).

JEHOVIST, jê-hô'vist. See ELOHIST AND YAHWIST.

JE'HU (Heb. *Yêhû*, perhaps from *Yehô-hû*, Yahwe is he). Tenth King of Israel (c.842-815 B.C.), son of Jehoshaphat and grandson of Nimshi. From the position of one of the body guards of Ahab he rose to that of general under Joram. He seized the opportunity of Joram's absence in Jezreel, whither he had gone to seek healing from his wounds received in the battle with the Aramæans of Damascus, to seat himself on the throne. Having control of the army intrusted to him for the protection of the border city Ramoth-Gilead against the Aramæans, Jehu proceeded against his royal master, slew Joram and also Ahaziah, King of Judah, who was on a visit to the King of Israel. He also had Jezebel, the wife of Ahab, put to death and, not content with this, brought about a wholesale massacre of Ahab's (or Joram's) family and also of 42 kinsmen of Ahaziah. This story of Jehu's conspiracy is told (2 Kings ix-x) in connection with the narrative of the prophet Elijah. Jehu's deeds are portrayed as retribution for the judicial murder of Naboth (1 Kings xxi), and he is represented as the instrument of

Yahwe to bring about the destruction of Ahab. Such an interpretation, of course, reflects the later religious point of view; but it would seem that Jehu indeed posed as the devotee of Yahwe, for he follows up his destruction of the house of Ahab by an extermination of the prophets and priests of Baal. By a cunning stratagem he collects them together in the temple court and puts them to death (2 Kings x. 18-28). Whatever his motives may have been, he does not appear in the light of a religious reformer to the later Old Testament writers, who cannot disguise the fact that Jehu was not a Yahwe worshiper according to their ideals. In fact, he maintained the "high places" with the Canaanitish rites and associations, and the triumph of Yahwe simply meant for Jehu an absorption of Baal's rôle by the Hebrew deity. The political activity of Jehu was mainly directed towards the subjugation of Judah, which under Ahab had practically become a vassal of Israel. (See JEHOSEPHAT.) At the close of his reign, however, Judah was in a somewhat more favorable position than at the beginning. In 842 B.C., shortly after mounting the throne, Jehu purchased the favor of Shalmaneser III of Assyria (860-825 B.C.) by rich gifts. The Assyrian king laid siege to Damascus, and on his return from his campaigns erected a monument in Nineveh (the so-called black obelisk of Shalmaneser III, now in the British Museum), on which, among other events, he depicted this tribute of Jehu. The latter, however, gained little by currying favor with Assyria. Damascus again began to stir itself and assumed the offensive against Israel, and before the end of Jehu's reign his kingdom was weakened on various sides, though he was able to hand over the succession to his son Jehoahaz (q.v.).

JEHU. A popular term for a driver, especially for one who drives rapidly, derived from Jehu, the son of Nimshi, mentioned in 2 Kings ix. 20.

JEHU'DA, BEN SAMUEL. See JUDAH, BEN SAMUEL.

JEJU'NUM (Neo-Lat., from Lat. *jejunos*, empty). The middle portion of the small intestine, situated between the duodenum and the ileum and forming about one-third of the length of this portion of the intestinal tract. It derives its name from the fact that in post-mortem examinations it is almost always found empty. The jejunum is wider, more vascular, and of a deeper color than the ileum; its walls are also much thicker, but there is no sharp line of division between the two portions. The surface for absorption is much increased by folds of the mucous membrane and the submucous tissue, the valvulae conniventes, which are also present in the upper half of the ileum.

JE'KYL, DR. See STRANGE CASE OF DR. JEKYL AND MR. HYDE.

JELALABAD, je-lä'lä-bäd', or **JALALABAD**. A town of Afghanistan, 96 miles east of Kabul, on the Kabul River, near the Khyber Pass (Map: Afghanistan, O 5). Its defenses were destroyed at the British evacuation of Afghanistan in 1842. The town occupies a very strong natural position, is of great strategic importance as controlling the entrance to north India through the Khyber Pass, and is the winter residence of the Ameer of Afghanistan. Pop. (est.), 4000. The place was heroically defended by Sir Robert Sale against the Afghans in 1842.

JELF, WILLIAM EDWARD (1811-75). An English divine and classical scholar, son of Sir James Jelf, of Gloucestershire, and brother of Dr. Richard William Jelf. He was born at Gloucester and was educated at Eton and Christ Church, Oxford. From 1846 to 1848 he was one of the Whitehall preachers, and in 1857 gave the Bampton lectures before the university. His most important publication was his *Grammar of the Greek Language*, chiefly from the German of Raphael Kühner (2 vols., Oxford, 1842-45; 4th ed., 1866), which was considered a marked improvement on all earlier Greek grammars in the English language.

JELINEK, yěl'i-nĕk, CARL (1822-76). An Austrian meteorologist, born at Brünn in Moravia. He was educated in Vienna and in 1843 became assistant in the Vienna Observatory. In 1847 he went to the Prague Observatory, where he was associated with Kreil in researches on terrestrial magnetism and meteorology. From 1852 to 1863 he was professor of mathematics in the Prague Polytechnic and then returned to Vienna as director of the Central Meteorological Institute. He was prominent in the meteorological congress at Leipzig in 1872. With Hann he edited the journal of the Austrian Meteorological Society, of which he was a founder. He took a prominent part in the reform of Austrian technical education and published *Anleitung zur Anstellung meteorologischer Beobachtungen* (1869; 4th ed., 1893-95) and *Psychrometertafeln* (5th ed., enlarged by Pernter, 1904).

JELLACHICH DE BUZIM, yěl'lá-chĕch de bōō'tsĕm, JOSEPH, COUNT (1801-59). Ban of Croatia. He was born at Peterwardein in Slavonia, Oct. 16, 1801. His father, the descendant of an old Croatian family, was a general in the Austrian service and attained some distinction in the Turkish and Napoleonic wars. Joseph Jellachich, after several years of service on the Turkish frontier, in which he distinguished himself by his courage and skill, became colonel of the first border regiment of Croatia. In 1848 he was appointed by the Emperor Ferdinand general and Ban or Governor of Croatia, and as such he headed the movement of the Southern Slavs of Hungary against Magyar domination. He was urged on in this course by the court of Vienna, which saw in him a convenient instrument for checking the progress of the revolution in Hungary. In September, 1848, Jellachich invaded Hungary with a powerful army and advanced upon Budapest. He was repulsed at Pákozd (September 29), but effected a junction with Windischgrätz before Vienna and defeated Perczel at Moor (December 29). He suffered a disastrous defeat at Kis-Hegyés, and after the termination of the revolutionary struggle returned to Agram as Ban. He was made a count in 1855 and died at Agram, May 20, 1859. He published a volume of poems, among them military songs which became popular.

JELLYCOE, jĕl'i-kō, SIR JOHN RUSHWORTH (1859-). An English naval officer. Educated at Rottingdean, he entered the navy in 1872; served in the bombardment of Alexandria and in the battle of Tel el-Kebir in 1882; in 1893 as commander was wrecked on the *Victoria*; and in 1898-1901 was in China, where he commanded the naval brigade and was chief of staff to Admiral Seymour in the relief of the Peking legations, being terribly wounded in the lungs. He was director of naval ordnance from 1905

to 1907, then was promoted rear admiral, and in 1908-10 was Lord Commissioner of the Admiralty and Controller of the Navy. He commanded the Atlantic fleet in 1910-11 and the second squadron home fleet in 1911-12, and in December, 1912, became Second Sea Lord of the Admiralty. When war broke out in 1914, he commanded the home fleet. See WAR IN EUROPE.

JELLIFFE, jĕl'if, SMITH ELY (1866-). An American neurologist, born in New York City. After graduating from the Brooklyn Polytechnic Institute in 1886 and from the College of Physicians and Surgeons (Columbia) in 1889, he studied also in Europe. He was professor of pharmacognosy and technical microscopy at the College of Pharmacy (Columbia) (1897-1907) and instructor in materia medica and therapeutics (1903-07) at the College of Physicians and Surgeons (Columbia), clinical professor of mental diseases at Fordham University (1907-12), and adjunct professor of diseases of the mind and nervous system at the New York Post-Graduate Hospital and Medical School after 1911. From 1905 to 1909 he was associate editor of the *New York Medical Journal*; after 1902 managing editor of the *Journal of Nervous and Mental Disease*; editor of the *Medical News* (New York) in 1900-05 and of the *Nervous and Mental Monograph Series* after 1907; and coeditor with Dr. W. A. White of the *Psychoanalytic Review* in 1913. Besides translating and editing many foreign texts he edited, with White, *Modern Treatment of Nervous and Mental Diseases* (2 vols., 1913); revised Butler's *Materia Medica* (1902) and *Shaw on Nervous Diseases* (1903); and is author of *Outlines of Pharmacognosy* (1904).

JELLINEK, yěl'li-nĕk, ADOLF (1821-93). An Austrian Jewish theologian, born in Moravia, and educated at Prague and Leipzig. He was a rabbi in Leipzig and, after 1857, in Vienna, where he founded a school for the study of the Talmud. A famous preacher, he published, besides 200 sermons: *Sefat Chachamhim*, explaining Persian and Arabic words in the Talmud (1846-47); *Beiträge zur Geschichte der Kabbala* (1851-52); *Auswahl kabbalistischer Mystik* (1852); *Thomas von Aquino in der jüdischen Litteratur* (1853); *Philosophie und Kabbala* (1854); *Der jüdische Stamm* (1869); *Der jüdische Stamm in nicht-jüdischen Sprichwörtern* (1881-85); and, in Hebrew, a collection of essays, *Kontresim* (1877-84).

JELLINEK, GEORG (1851-1911). A German jurist, son of Adolf Jellinek. He was born at Leipzig and was educated there, at Vienna, and at Heidelberg. Leaving the employ of the Austrian government in 1879, he became a member of the legal faculty at Vienna, then at Basel (1889), and in 1891 at Heidelberg. Among his works are: *Die socialethische Bedeutung von Recht, Unrecht und Strafe* (1878; 2d ed., 1908); *Die Lehre von den Staatenverbindungen* (1882); *Oesterreich-Ungarn und Rumänien in der Donaufrage* (1884); *System der subjektiven öffentlichen Rechte* (1892; 2d ed., 1905); *Adam in der Staatslehre* (1893); *Das Recht der Minoritäten* (1898); *Das Recht des modernen Staates* (1900; 2d ed., 1905); *Verfassungsänderung und Verfassungswandlung* (1906); *Der Kampf des alten mit dem neuen Recht* (1907).

JEL'LYBY, MRS. A sham philanthropist in Dickens's *Bleak House*.

JEL'LYFISH'. The popular name for any

of the free-swimming medusoid or ctenophoran coelenterata (q.v.). The name is obviously applicable because of the transparent gelatinous material which makes up the bulk of the body. In a stricter sense the name is applied only to the larger medusæ, such as those of the genera *Aurelia*, *Cyanea*, etc., which are frequently cast up on seabeaches. Under such circumstances the external form and beauty are generally obliterated, and the animal is literally only a mass of jelly. This has the general form of a saucer or concave disk, whence the name Discophora has been applied to the group—from the underside of which hang the pendent feeding and reproductive organs. Consult: Alexander Agassiz, "North American Acalephæ" (containing an extensive bibliography), in *Memoir of the Museum of Comparative Zoölogy*, vol. i (Cambridge, 1865); G. J. Romanes, *Jelly-fish, Star-fish, and Sea-urchins: Being a Research on Primitive Nervous Systems* (New York, 1885); Agassiz and Mayer, "Acalephs from the Fiji Islands," in *Bulletin of the Museum of Comparative Zoölogy*, vol. xxxii (Cambridge, 1899); A. G. Mayer, *The Medusæ of the World* (Washington, 1911). See CTENOPHORA; MEDUSA SIPHONOPHORA; and Colored Plate of MEDUSÆ AND SIPHONOPHORA.

JEMAPPES, zhe-máp'. A manufacturing town in the Province of Hainault, Belgium, on the Haine, 5 miles southwest of Mons (Map: Belgium, B 4). It has an industrial school, coal mines, iron, glass, and porcelain factories. It is celebrated for the victory won here by 46,000 French, under Dumouriez and the future King Louis Philippe, over 26,000 Austrians, under the Duke of Saxe-Teschen, Nov. 6, 1792, the former losing 4000 men and the latter 7000. This victory gave the Republic the possession of Belgium. Pop., 1900, 12,778; 1910, 14,270.

JEMEZ, há'más. A Pueblo village of Tanoan stock, situated on Jemez River, a western affluent of the Rio Grande, about 35 miles westward from Santa Fe, New Mexico. The inhabitants are peaceable and selfsupporting, with fine fields and orchards. Few of the native arts are maintained, but interesting dances are still to be seen. Pop., about 500. See PUEBLO; TANOAN STOCK.

JENA, yā'nä. A famous university town in the Grand Duchy of Saxe-Weimar-Eisenach, Germany, situated amid precipitous chalk hills on the left bank of the Saale, 10 miles southeast of Weimar (Map: Germany, D 3). It has two fine churches—the fifteenth-century late-Gothic Michael's Church and the high-vaulted collegiate church. The old moats encircling the town have been replaced by fine promenades with monuments of famous scientists. There are in the city many tablets in honor of men who have been associated with the university—Fichte, Schiller, Arndt, Hegel, Reuter, Schelling. Jena also has memories of Luther in the old Black Bear Inn; but the old castle in which Goethe more than once sojourned was torn down in 1905 to make place for a new university building. Jena is the seat of the famous university, with a library of 270,000 volumes. (See JENA, UNIVERSITY OF.) The educational institutions comprise also a Gymnasium, a number of other secondary schools, and scientific organizations. The chief manufactory is the famous Zeiss Optical Works, where lenses are made from Jena glass. The town also makes bricks, vaseline, pianos, soap, and smoked meats. It does a large

book business. The Lichtenhainer beer, made in the vicinity, is famous. Pop., 1900, 20,686; 1910, 38,487, chiefly Protestant. Jena is noted as the scene of a great battle (Oct. 14, 1806), in which about 65,000 Prussians under Prince Hohenlohe were completely defeated by nearly 100,000 French under Napoleon. Little Jena was included in the city limits in 1909.

JENA, UNIVERSITY OF. A German university which is the outgrowth of a Gymnasium or high school founded by John Frederic, Elector of Saxony, about 1547, as a centre of Protestant teaching. It was authorized by the Emperor Ferdinand I as a university in 1558 and soon became famous. Its most flourishing period was under the patronage of Duke Charles Augustus, from 1787 to 1807. Among the famous names connected with the university are those of Fichte, Schelling, Hegel, and Oken in philosophy, Schiller (who lectured here in history for 10 years), the brothers Schlegel, Voss, Fries, and Krause. The university is associated with the rise of the Burschenschaften in 1815. Much of its distinction in recent times has been in biology, philosophy, and theology, the most noted names connected with these departments being those of Haeckel and Eucken. In theology Jena represents the most liberal tendencies. Through the influence and benefactions of Carl Zeiss the university has developed considerable research in optics. Through its educational courses and its Seminar, or practice school, Jena has exercised great influence on education in England and America. New university buildings were added in 1908. The university had in 1913 some 2187 students. Its budget is about 480,000 marks. The library contains 270,000 volumes, 300,000 dissertations and pamphlets, and 1000 volumes of manuscripts. The influential *Litteraturzeitung für Deutschland* (1785–1874) was issued from Jena for nearly a century. Consult A. Stier, "Jena," in *Die deutschen Hochschulen, Illustrierte Monographien* (Berlin, 1908).

JENATSCH, yā'natch, GEORG, or JÜRG (1596–1639). A Swiss soldier and leader in the party strifes of Switzerland during the period of the Thirty Years' War. He was born at Samaden, studied theology at Zurich, and became a Protestant pastor at Veltlin and leader of the Protestants in Grisons. In 1618 he outlawed the Plantas, leaders of the Spanish and Catholic sympathizers, and so put himself for a time at the head of the Patriotic party. Three years later he killed one of these leaders and had to flee. After the entry of the Austrians he was forced to leave Grisons and served under Mansfeld and under the Duke de Rohan. When Rohan did not fulfill the wishes of the Patriotic party (restoration of the Valtellina to the Grisons), Jenatsch turned Catholic and entered the Austrian and later the Spanish service. He was murdered at a banquet by Planta's followers. Jenatsch is portrayed in K. F. Meyer's historical novel *Georg Jenatsch* (Davos, 1894) and by Dierauer (Saint-Gall, 1896).

JENCKES, jēuks, JOSEPH (1656–1740). A Colonial Governor of Rhode Island, born at Pawtucket. He was a surveyor and acted for Rhode Island in the settlement of the Massachusetts boundary and later served Massachusetts in her disputes with Maine and New Hampshire. In 1721 he went to England to bring the boundary question before the King. After many years in the Legislature and 10 years' service as Deputy Governor, he was elected Governor

(1727). In this capacity he vetoed (in 1731) an act authorizing the issue of paper money. He refused reelection in 1732. According to story, Jenckes was 7 feet, 2 inches tall and of symmetrical figure.

JENCKES, THOMAS ALLEN (1818-75). An American legislator and lawyer, born at Cumberland, R. I. Graduating at Brown University in 1838, he was admitted to the bar in 1840. He was government counsel in the suits against the *Crédit Mobilier* and was engaged in patent cases, especially those on the Sickles and Corliss steam engine and the rubber patents of Day and Goodyear. He was intimately connected with the State government during Dorr's Rebellion (1842); became Secretary of the Governor's Council; served in both bodies of the State Legislature; and practically unaided carried his point (*Peckham v. Burrows*) that the Legislature could order a new trial. He was elected to Congress by the Republican party in 1862 and served until 1871. He introduced the general bankrupt law of 1867, as well as important bills for the revision of copyright and patent statutes. His name is especially identified with efforts for the reform of the civil service. In 1868 he prepared an elaborate report on the civil service of other countries, and by speeches and reports he promoted the passage of the law which lies at the basis of the reform. Consult *First Report of the United States Civil-Service Commission* (Washington, 1884).

JENGHIS KHAN, jën'giz kân. See GENGHIS KHAN.

JEN'KIN, HENRIETTA CAMILLA (JACKSON) (c.1807-85). An English novelist, born in Jamaica. After marrying Charles Jenkin, a British naval officer, in 1832, she lived in Paris, Genoa, and Edinburgh. Her novels include: *Violet Banks, and its Inmates* (1858); *Cousin Stella* (1859); *Who Breaks, Pays* (1861); *Skirmishing* (1862); *Once and Again* (1865); *Two French Marriages* (1868; reprinted in New York as *A Psyche of To-Day*, 1868); *Madame de Beauprés* (1869); *Within an Ace* (1869); *Jupiter's Daughters* (1874).

JENKIN, HENRY CHARLES FLEEMING (1833-85). An English engineer and electrician. He was born at Stowting Court, Kent, England, and, after being instructed at a number of educational institutions, graduated from the University of Genoa as Master of Arts in 1850. While engaged in electrical engineering connected with cable testing and laying, he became acquainted with Sir William Thomson, afterward Lord Kelvin, and later a partnership was established, and many important cables were laid under their direction. In addition to his work in telegraph and cable engineering, Jenkin was also associated with Sir William Thomson and C. F. Varley in the invention and construction of electrical instruments. At Sir William's suggestion he was made a member of the committee appointed by the British Association to consider and determine practical electrical units and prepared a number of important reports on this subject. He also devised the system of telpherage for the transportation of goods from place to place and was interested in questions of mechanical and civil engineering as well as electrical matters. In 1865 he became professor of engineering in University College, London, and in 1868 he accepted a call to a similar chair in the University of Edinburgh, which he held until his death. In 1865 he was elected a fellow of the

Royal Society of London, and in 1879 was elected vice president of the Royal Society of Edinburgh, the larger part of his many scientific papers appearing in the *Transactions* and *Proceedings* of these two societies. He was an LL.D. of Glasgow University and was a man of letters and broad information as well as a successful scientist. He was particularly interested in sanitary reform and organized societies for this purpose in Edinburgh and elsewhere. He was the author of a work on *Electricity and Magnetism* (1873). He contributed to the 9th edition of the *Encyclopædia Britannica*. His *Papers, Literary, Scientific, etc.*, edited by Sidney Colvin and J. A. Ewing, with a memoir by R. L. Stevenson, were published in 1887.

JEN'KINS. A town in Letcher Co., Ky., 139 miles from Ashland, on the Sandy Valley and Elkhorn Railroad. It is situated in a rich bituminous coal field. Jenkins was converted in 1911-12 from a thickly wooded place to a model little mining town by the Consolidation Coal Company. The project involved the expenditure of an enormous sum of money and is considered a most remarkable engineering feat. Pop., 1914 (local est.), 5000.

JENKINS, CHARLES JONES (1805-83). An American statesman and jurist, born in Beaufort District, S. C., and educated at the University of Georgia and Union College. He was elected to the Legislature of Georgia in 1830, served a short term as Attorney-General, and was in the Georgia House from 1836 to 1850 as leader of his party and as Speaker. Although he was a Democrat, he supported Harrison (1840) and Clay (1844). Jenkins was chairman of the State Convention which, in the platform of 1850, threatened secession; in the same year he refused the portfolio of the Interior. He was State Senator from 1856 to 1860 and judge of the Supreme Court from 1860 to 1865; was elected provisional Governor in 1865, served until 1868; and was president of the Constitutional Convention of 1877. Consult C. C. Jones, *Life and Services of C. J. Jenkins* (Atlanta, Ga., 1884).

JENKINS, EDWARD HOPKINS (1850-). An American agricultural chemist. He was born at Falmouth, Mass.; in 1872 graduated from Yale University (Ph.D., 1879) and studied at the University of Leipzig (1875-76). He served as chemist (1877-1900), vice director (1882-1900), director after 1900, and treasurer after 1901 of the Connecticut Agricultural Experiment Station. From 1897 to 1903 he was chairman of the Connecticut Sewage Commission. In 1913 he served as president of the Association of Agricultural Colleges and Stations. He published *The Small Rock Garden* (1913).

JENKINS (JOHN) EDWARD (1838-1910). An Anglo-Indian lawyer, politician, and author, born at Bangalore, India. He was educated at McGill University and at the University of Pennsylvania and studied law at Lincoln's Inn, London, where he was admitted barrister in 1864. He acquired a lucrative colonial practice; was counsel for the coolies on the Demerara Coolie Commission in 1870; was agent general for Canada in 1874-76; and was a member of the Royal Commission on Copyright in 1876-77. After an unsuccessful contest as a Liberal candidate for Truro in 1870, he represented Dundee in Parliament in the Liberal interest from 1874 to 1880; but as an Independent Liberal and Imperialist, and later as a Conserva-

tive, failed in his canvasses for Edinburgh in 1881 and for Dundee in 1885 and in 1896. For 24 years he edited the *Overland Mail* and the *Homeward Mail*. He was a prolific political and miscellaneous essayist, and as a novelist produced several works, of which *Ginx's Baby, His Birth and Misfortunes* (1870), published anonymously, was his first success. Among his later writings are: *Lord Bantam* (2 vols., 1871); *Barney Geoghagan, M.P., and Home Rule at Saint Stephen's* (1872); *Little Hodge* (1872), which had a great vogue; *The Devil's Chain* (1876); *Lutchmee and Dilloo: A Study of West Indian Life* (3 vols., 1877); *The Captain's Cabin: A Christmas Yarn* (1877); *Janus, or the Double-Faced Ministry* (1877); *Jobson's Enemies* (3 vols., 1879-82); *Lisa Lena* (2 vols., 1880); *A Paladin of Finance* (1882); *A Week of Passion, or the Dilemma of Mr. George Barton the Younger* (3 vols., 1884); *A Secret of Two Lives* (1886); *Pantalas* (1897); *A Fantasy of Faith* (1900).

JENKINS, SIR LEOLINE (1623-85). An English judge and diplomat, born at Llantrisant, Glamorganshire. He entered Jesus College, Oxford, in 1641, served in the Royalist army during the Civil War, and fled to the Continent in 1655. After the Restoration he was fellow (1660-61) and head (1661-73) of Jesus College. He was appointed registrar of the consistory court of Westminster in 1661, deputy professor of civil law at Oxford in 1662, deputy judge of the court of the arches in 1664, judge of the admiralty court in 1665, Privy Councilor in 1680, and judge of the prerogative court of Canterbury in 1689. He was knighted for diplomatic services in France by Charles II, represented England at the congresses of Cologne (1673) and Nimeguen (1676-79), and served as Secretary of State in 1680-84.

JENKINS, THORNTON ALEXANDER (1811-93). An American naval officer. He was born in Virginia and entered the United States navy in 1828 as a midshipman. He spent the greater part of his life in the service and rose to be rear admiral in 1870, retiring from active duties in 1873. He served with the Mediterranean, African, and North and South Atlantic squadrons until 1845, when he was deputed to investigate the lighthouse systems of Europe. Out of this investigation grew the Law of 1852, framed by Jenkins, under which the Lighthouse Board was administered until merged into a bureau of the Department of Commerce in 1910. After serving on the coast of South America and in Central America, and in Mexico during the war with that country, Jenkins was promoted to a captaincy in 1862 and did good service during the Civil War. He had command of one of the monitors at the battle of Mobile Bay and was highly commended in the report of Admiral Farragut. In 1865 he was chief of the Bureau of Navigation; 1869-71, naval secretary of the Lighthouse Board; 1871-73, in command of the East India squadron. In 1876 Jenkins had charge of the exhibit of the United States Navy Department in the Centennial Exhibition at Philadelphia.

JEN'KINSON, CHARLES and ROBERT, first and second EARLS OF LIVERPOOL. See LIVERPOOL.

JENKINS'S EAR, WAR OF. The popular name of the war between Spain and Great Britain in 1739, which was occasioned chiefly by the complaint of Robert Jenkins, an English ship captain, that he had lost an ear and had undergone other tortures at the hands of the Span-

iards. This outbreak was swallowed up in the War of the Austrian Succession.

JEN'KINTOWN. A borough in Montgomery Co., Pa., 10 miles north of Philadelphia, on the Philadelphia and Reading Railroad (Map: Pennsylvania, L 7). It is in a fertile agricultural district and has railroad switch works. There is a public library here. Pop., 1900, 2091; 1910, 2968.

JENKS, ARTHUR WHIPPLE (1863-). An American Protestant Episcopal theologian. He was born at Concord, N. H., and graduated from Dartmouth College in 1884 and from the General Theological Seminary in 1896. He was ordained a deacon in 1892 and a priest in 1893 in the Protestant Episcopal church and was rector of St. Luke's Church at Woodsville, N. H., in 1892-95. He served as professor of ecclesiastical history at Nashotah House, Wis. (1895-1901), at Trinity College, Toronto, Canada (1901-10), and at the General Theological Seminary after 1910. He received the degree of D.D. from Dartmouth in 1911. He published *Notes for Meditation on the Beatitudes of the Psalter* (1914) and was a contributor to the NEW INTERNATIONAL ENCYCLOPÆDIA.

JENKS, EDWARD (1861-). An English authority on law, born at Clapham, Surrey. He was educated at Dulwich College and at King's College, Cambridge, of which he was scholar and fellow. For a year (1888-89) he lectured at Pembroke and Jesus colleges, Cambridge, then removing to Australia to be dean of the faculty of law in the University of Melbourne. He returned to England in 1892, was Queen Victoria professor of law in University College, Liverpool (1892-96), reader in English law at Oxford, and tutor and lecturer at Balliol College until 1903, and principal and director of legal studies of the Law Society. In addition he served as examiner in the universities of Oxford, Dublin, Durham, London, and Wales, and for the Civil Service Commission, was made honorary secretary of the Society of Public Teachers of Law, and for some years edited the *Independent Review*. His works include: *Constitutional Experiments of the Commonwealth* (1891); *The Doctrine of Consideration in English Law* (1893); *The Government of Victoria, Australia* (1893); *History of the Australasian Colonies* (1895; 3d ed., rev., 1912); *Outline of English Local Government* (1894; 2d ed., 1907); *Law and Politics in the Middle Ages* (1897); *Modern Land Law* (1899); *A Short History of Politics* (1900; 12th thousand, 1902); *Edward I* (1902); *Parliamentary England* (1903); an exhaustive *Digest of English Civil Law* (1905 et seq.), with others; *Husband and Wife in the Law* (1909); *Short History of English Law* (1912).

JENKS, JEREMIAH WHIPPLE (1856-). An American economist and educator, born at St. Clair, Mich. He graduated at the University of Michigan in 1878, studied for several years in Germany, taking his doctorate at the University of Halle in 1885, and after his return studied law and was admitted to the bar. Previous to his residence abroad, he had taught at Mount Morris College, and in 1886 he returned to educational work as professor of political science and English literature at Knox College. Subsequently he held the chair of political economy and social science at Indiana University (1889-91) and then for 21 years a similar chair at Cornell. In 1912 he was ap-

pointed professor of government and director of the division of public affairs in the School of Commerce, Accounts, and Finance, New York University.

Besides his professorial duties he found time to do much as a government expert. In 1899-1901 he was in Europe as agent of the United States Industrial Commission on Investigation of Trusts and Industrial Combinations in the United States and Europe; for a time he was consulting expert on trusts for the Department of Labor; in 1902 he visited Egypt, India, Burma, the Straits Settlements, Java, and the Philippines as special commissioner of the War Department, investigating questions of currency and internal taxation, labor, and police; in 1903 he was employed by the Mexican government as special expert on currency reform; and in 1903-04 he was a member of the United States Commission on International Exchange, in special charge of the reform of the currency of China. He was appointed in 1907 a member of the United States Immigration Commission. He became director of the Far Eastern Bureau, New York, in 1913. His publications include: *Henry C. Carey als Nationalökonom* (1885); an important discussion of *The Trust Problem* (1900; 6th ed., 1912); *Industrial Combinations in Europe* (1901); *Report on Certain Economic Questions in the English and Dutch Colonies in the Orient* (1902); *Citizenship and the Schools* (1906); *The Political and Social Significance of the Life and Teachings of Jesus* (1906); *Life Questions of High School Boys* (1908); *Principles of Politics* (1909); *Governmental Action for Social Welfare* (1910); *The Immigration Problem* (1913), with W. J. Lauck; *The Making of a Nation* (1913), with Prof. C. F. Kent. In addition he was editor and part author of vols. i and xiii of *Trusts and Industrial Combinations* (1900, 1901), the title of the Industrial Commission's reports; and part author and compiler of *Reports of the Commission on International Exchange* (1904, 1905).

JENKS, JOSEPH (1602-83). An American Colonial inventor, born of Welsh parentage in Hammersmith, London, England. He learned the trade of a founder and machinist, and emigrated to Massachusetts Bay about 1645. In the same year he settled at Lynn, Mass., where a little later he became superintendent of an iron foundry—the first to be established in America. Jenks himself was the first founder in iron and brass of whom there is any record in the Colonies. He had considerable ability as an inventor, and to him, on May 6, 1646, the General Court of Massachusetts granted a patent for "an engine for mills to go by water," the first recorded American patent. Later Jenks was granted patents for scythes, saws, and other edged tools. In 1652 he made the dies for the new Colonial coinage, among the coins struck from his dies being the famous "pine-tree" shilling. In 1654 he contracted with the selectmen of Boston to construct "an engine to carry water in case of fires." Consult Lewis and Newhall, *History of Lynn* (Boston, 1865).

JENKS, TUDOR (1857-). An American writer. He was born in Brooklyn, N. Y., graduated from Yale in 1878 and from Columbia Law School in 1880, and after seven years' law practice in New York was from 1887 to 1903 an editor of the *St. Nicholas Magazine*. His numerous and varied books include: *The Boys' Book of Exploration* (1900); *Galopoff, the Talk-*

ing Pony (1902); *Capt. John Smith* (1904); *In the Days of Chaucer* (1904); *Capt. Myles Standish* (1905); *In the Days of Milton* (1905); *In the Days of Shakespeare* (1904); *In the Days of Scott* (1906); *In the Days of Goldsmith* (1907); *The Book of Famous Sieges* (1909); *When America Became a Nation* (1910); *What Shall I Be?—A Sailor* (1911).

JENKS, WILLIAM (1778-1866). A Congregational clergyman. He was born at Newton, Mass., graduated at Harvard in 1797, and served as pastor at Bath, Me., 1805-17. He was also a chaplain in the War of 1812 and professor of Hebrew and English literature at Bowdoin College. In 1826 he went to Boston and there played a prominent part as pastor, philanthropist (especially as the friend of sailors), and scholar. He was one of the founders of the American Oriental Society and of the American Antiquarian Society of Worcester, Mass. He published *The Comprehensive Commentary of the Holy Bible* (1834), of which it is said 120,000 volumes were sold; also an *Explanatory Bible Atlas and Scripture Gazetteer* (1849).

JENNER, EDWARD (1749-1823). An English physician, the discoverer of vaccination as a preventive of smallpox. He was born at Berkeley in Gloucestershire, where his father was vicar. With a view to his entrance into the medical profession, young Jenner was apprenticed to Daniel Ludlow of Sodbury, to learn surgery and pharmacy. In 1770 he went to London and became a student at St. George's Hospital and was a resident for two years in the family of John Hunter. Under Hunter's recommendation, young Jenner received the appointment to prepare and arrange the specimens of fauna and flora brought home by Captain Cook from his first voyage of discovery in 1771. Jenner's success in this matter led to his being offered the position of naturalist of Cook's second expedition, which he declined. He preferred life in a village and became a country surgeon in Berkeley, devoting the time not required by the practice of his profession to ornithology, botany, and mineralogy. Jenner appears to have been the first to suggest that angina pectoris is due to hardening of the coronary arteries. He also described the implication of the heart in cases of rheumatism, of which he was probably the discoverer. In 1792 he was invested with the degree of M.D. by the University of St. Andrews, Scotland.

The discovery of the prophylactic power of vaccination, on which Jenner's fame chiefly rests, was communicated to Edward Gardner in 1780. Jenner had given much thought and time to the study of smallpox, cowpox, and swinepox, and the development of the two latter diseases when communicated to man. He at first considered cowpox to be caused by the contagion of "grease," a hoof disease of horses. In conversation with Hunter in 1770 he had suggested the possibility of the prophylactic power of cowpox. A dread of disappointment influenced him to spend many years in observation and investigation before promulgating his discovery. He inoculated his son with swinepox and ascertained that the boy was proof against smallpox. Jenner performed his first public inoculation with vaccine on May 14, 1796. After passing through the disease of vaccinia the patient was exposed to smallpox by having its virus introduced into his arms, but without effect. Subsequent experiments yielded similar results. In

1798 he published the paper on vaccination, detailing the whole matter and stating his belief and his proofs. In the same year he visited London in order to demonstrate the truth of his assertions; but he was unable to prevail upon any one to submit to vaccination and was bitterly attacked by both physicians and clergymen. In one year, however, a revulsion of feeling took place, and a large number of leading physicians in the capital city declared, over their signatures, their confidence in vaccination, and the day was won. Jenner's high principle and pure motives were shown in his refusal to accept the suggestion of Cline, of St. Thomas's Hospital, to the effect that he should settle in London, where Cline promised him £10,000 a year as a result of his practice. Jenner gave almost his entire time to the demonstration and defense of his discovery, and his practice was nearly annihilated. A petition to Parliament by his friends resulted in a vote of £10,000 to Jenner in 1802, and he received a second grant of £20,000 in 1807. Yet inoculation, in spite of the fact that many deaths resulted from it, was continued at the Smallpox Hospital in London till 1822. In 1811 Jenner received a diamond ring from the Empress of Russia as a token of her admiration. She had the first child vaccinated in Russia named Vaccinoff and pensioned it for life. Jenner was named the first Honorary Associate of the Physical Society of Guy's; he was elected mayor of his native town; he received the freedom of the city of Dublin and of the city of Edinburgh; he was elected an honorary fellow of the Royal College of Physicians of Edinburgh; Oxford granted him the degree of Doctor in Medicine; the naval physicians and surgeons presented a gold medal to the discoverer, upon the adoption of vaccination in the British army and navy. France, Germany, Italy, Spain, Russia, and the United States adopted the practice of vaccination. The Hindus and the Chinese followed the example. In the East the appreciation of Jenner's labors and achievements was shown in public subscriptions of £4000 from Bengal, £2000 from Bombay, and £1383 from Madras. A statue of Jenner was placed in Gloucester Cathedral as a result of a public subscription, and in 1858 a statue was erected in London. In 1815, upon the death of his wife, Jenner retired to Berkeley, where he died of apoplexy.

Among Jenner's published works are: "On the Natural History of the Cuckoo," in *Philosophical Transactions* (1788); "A Process for Preparing Pure Emetic Tartar," in *Philosophical Transactions* (1793); *Inquiry into the Cause and Effect of the Variolæ Vaccinæ* (1798); *Farther Observations on the Variolæ Vaccinæ* (1799); *A Continuation of Facts and Observations Relative to Variolæ Vaccinæ* (1800); *A Complete Statement of Facts and Observations Relative to the Cow-Pock* (1800); *On the Origin of Vaccine Inoculation* (1801); *On the Varieties and Modifications of the Vaccine Pustule, Occasioned by an Herpetic State of the Skin* (1804); "Observations on the Distemper in Dogs," in *Transactions of the Medico-Chirurgical Society* (1809); "Two Cases of Smallpox Infection, Communicated to the Fœtus in Utero," in *Transactions of the Medico-Chirurgical Society* (1809); *A Letter to C. H. Parry, on the Influence of Artificial Eruptions in Certain Diseases Incidental to the Human Body* (1822). Consult J. Baron, *Life of Jenner* (2 vols., Lon-

don, 1838), and "Edward Jenner: His Life, his Work, and his Writings," in *British Medical Journal*, vol. ii (ib., 1902). See VACCINATION.

JENNER, SIR WILLIAM (1815-98). An English physician and surgeon, born at Chatham. He graduated M.R.C.S. at University College, London, in 1837, and M.D. in 1844, and in 1852 became a fellow of the Royal College of Physicians. In 1847, as a member of the staff of the London Fever Hospital, he commenced his minute observations on 1000 cases of fever, which resulted in the absolute differentiation of "typhus" and "typhoid," an achievement which established his fame. Their dissimilarity as "continued fever" had already been noticed, but was not confirmed until the publication of Jenner's conclusions. From 1849 he was professor of pathological anatomy at University College and assistant physician of the College Hospital, becoming physician in ordinary to the royal family in 1861, and attended the Prince Consort in his last illness. In 1868 he was made Baronet and in 1872 Knight Commander of the Bath for his services during the illness of the Prince of Wales. His publications include: *On the Identity and Non-Identity of Typhoid Fever* (1850); the Gulstonian lectures on *Acute Specific Diseases* (1853); *Diphtheria: Its Symptoms and Treatment* (1861); *Lectures and Essays on Fevers and Diphtheria* (1893); *Clinical Lectures and Essays on Ricketts, Tuberculosis, Abdominal Tumours and Other Subjects* (1895). Consult article, by D'Arcy Power, in *Dictionary of National Biography* (supp., vol. iii, London, 1901).

JEN'NET (OF. *genette*, Sp. *ginete*, nag, horseman, probably from Ar. *Zanāta*, name of a Barbary tribe famed for its cavalry). A breed of Spanish horses, which originated in the Middle Ages from a cross between an Arabian stallion and a native mare. They were widely celebrated for speed and grace, having much of the high-stepping action of the barb, and are believed to have contributed much to improve the stock of northern Europe about the sixteenth century.

JEN'NINGS. A city and the parish seat of Jefferson Davis Parish, La., 40 miles west of Lafayette, on the Southern Pacific Railroad and on the Mermentau River (Map: Louisiana, D 6). It is situated in a rich rice, farming, fruit-growing, and lumbering region, and has machine shops, large rice mills, saw mills, and a screen and pump factory. The city contains a Carnegie library, St. Henry's Academy, an Elks Home, sanitarium, and fine high school and Federal buildings. The water works are owned by the municipality. Jennings adopted the commission form of government in 1913. Pop., 1900, 1539; 1910, 3925.

JENNINGS, HERBERT SPENCER (1868-). An American zoölogist. Born at Tonica, Ill., he was educated at the University of Michigan (B.S., 1893), at Harvard University (Ph.D., 1896), and at Jena, Germany (1896-97). He taught botany at the Montana State Agricultural College in 1897-98 and zoölogy at Dartmouth College in 1898-99 and at the universities of Michigan (1900-03) and Pennsylvania (1903-05). In 1906 he became professor of zoölogy, and in 1910 director of the zoölogical laboratory, at Johns Hopkins University. He directed the United States Fish Commission Biological Survey of the Great Lakes in 1901,

EDWARD JENNER
AFTER A PAINTING BY J. R. SMITH

became associate editor of the *Journal of Experimental Zoölogy* and of the *Journal of Animal Behavior*, and served as president of the American Zoölogical Society (1908-09) and of the American Society of Naturalists (1910-11). He published *Anatomy of the Cat* (1901), with Jacob Reighard; *Behavior of the Lower Organisms* (1906); and other researches on the physiology of microorganisms, on animal behavior, and on philosophical biology. In 1909 Clark University gave him the degree of LL.D.

JENNINGS, LOUIS JOHN (1836-93). An Anglo-American journalist, editor, and author, born in London. In 1860 he joined the staff of the *London Times* and in 1863 went as its special correspondent to India, for a period acting as editor of the *Times of India*. After 1865 he succeeded Dr. Charles Mackay as the *Times* representative in the United States. In 1867 he married Miss Madeline Henriques, of New York, and took up his residence in that city. He was appointed to the editorship of the *New York Times*, and his tenure of that office was marked by his scathing and dauntless exposure of the malpractices in the municipal government of New York, which resulted in the prosecution and condemnation of the chief members of the Tweed Ring. In 1876 he returned to England and engaged in various literary pursuits and in politics, being elected Conservative member for Stockport in 1885 and 1886. His published works include: *Eighty Years of Republican Government in the United States* (1868); *Field Paths and Green Lanes: Being Country Walks Chiefly in Surrey and Sussex* (1877); *Rambles among the Hills in the Peak of Derbyshire and the South Downs* (1880); *The Millionaire: A Novel* (3 vols., 1883); *Mr. Gladstone: A Study* (1887). His last literary work was the editing of Lord Randolph Churchill's *Speeches with Notes and Introduction* (1889).

JENNINGS, SAMUEL (?-1708). An English Quaker, famous as a preacher and legislator in America. He emigrated from Buckinghamshire to Burlington, N. J., in 1680, and three years later, having previously acted as deputy, he was elected Governor of West Jersey, but afterward became a judge in Philadelphia. There he mixed in the controversies of the day, and when George Keith made a schism in the Quaker camp, it was Jennings who denounced him and upheld the action of his American coreligionists at the notable trial in London (1694). Upon his return to America he again made his home in Burlington, N. J., but frequently went on preaching tours through the Quaker districts of the other Colonies. He became Speaker of the local House and was instrumental in obtaining the recall of the unpopular British Governor, Lord Cornbury, and in establishing order in the civil government of West Jersey.

JENNINGS, SARAH, DUCHESS OF MARLBOROUGH (1660-1744). Wife of John Churchill, Duke of Marlborough (q.v.). She was born May 29, 1660, the daughter of Richard Jennings. She entered the household of Mary of Modena, the second Duchess of York, while still young, and became an attendant of the Princess Anne (later Queen Anne). Anne was an amiable but weak woman, and she was soon under the complete control of the beautiful and imperious Sarah Jennings. About 1676 John Churchill fell in love with her, and they were married two years later. By her influence

over Anne she was of great assistance to her husband's career; but this was also cut short by her quarrels with Queen Anne, arising through the favor the latter showed to Mrs. Masham (q.v.). About the beginning of 1711 the Duchess of Marlborough was dismissed from all her offices. Thereafter her life consisted chiefly of a series of quarrels and lawsuits with friends and relatives. She died Oct. 18, 1744. There is an interesting correspondence in existence which she and Queen Anne carried on under the pseudonyms of Mrs. Freeman and Mrs. Morley respectively. Consult: *Private Correspondence of Sarah, Duchess of Marlborough* (2 vols., London, 1838); K. B. Thompson, *Memoirs of Sarah, Duchess of Marlborough* (2 vols., ib., 1839); Murray, *Letters of the Duchess of Marlborough* (ib., 1875); J. F. Molloy, *The Queen's Comrade* (ib., 1901); Mrs. O. S. C. Colville, *Duchess Sarah* (ib., 1904); S. J. Reid, *John, Duke, and Sarah, Duchess, of Marlborough* (New York, 1914).

JENSEN, yën'sën, ADOLF (1837-79). A German song composer, born in Königsberg. He studied a short time under Ehlert and Marburg, but was chiefly self-taught. He traveled and taught in Russia to secure funds for further study, and after his return was conductor at the Posen City Theatre in 1857. He lived in Copenhagen for two years in order to be near Niels Gade, after which he returned to Königsberg. From 1866 to 1868 he taught at Tausig's school in Berlin. While here his health gradually failed, compelling him to retire to Dresden, then to Gratz, and finally to Baden-Baden, where he died of consumption. He was a gifted and poetical writer of *Lieder* in the genre of Schumann and Franz and ranks little below those composers. His published songs number about 160 and include *Der Ungenannten*, six love songs after Geibel; six *Liebeslieder*; *Dolorosa*, six poems by Chamisso; *Gaudeamus*, 12 songs for bass; and some instrumental music, especially for the piano. He also wrote an opera entitled *Turandot*. Consult A. Niggli, *Jensen* (Berlin, 1900).

JENSEN, GUSTAV (1843-95). A German composer and violinist, born at Königsberg. He studied in Berlin under Laub, Dehn, and Joachim. From 1872 till his death he was professor of counterpoint at the Cologne Conservatory. As a composer, he lacks the charm and spontaneity of his brother Adolf (q.v.). Nevertheless his chamber music, choruses, pieces for piano, and songs command respect. His editions of older violin music, published under the title *Klassische Violinmusik*, are of permanent value.

JENSEN, PETER (1861-). A German Assyriologist, born in Bordeaux, France. He studied at the universities of Leipzig and Berlin. Devoting himself to the study of Semitic and Hittite archæology, after 1895 he was professor of Semitic philology, and of Oriental history in the Summer Session, at the University of Marburg. Among his publications are *Kosmologie der Babylonier* (1890); *Die Hittiter und Armenier* (1898); *Die Mythen und Epen der Babylonier* (1900); *Das Gilgameschepos in der Weltliteratur* (1906); *Moses, Jesus, Paulus* (1st and 2d ed., 1909; 3d ed., 1910); *Hat der Jesus der Evangelisten wirklich gelebt?* (1910).

JENSEN, WILHELM (1837-1911). A German novelist, born at Heiligenhafen in Holstein. He studied medicine, later philosophy and litera-

ture, at Kiel, Würzburg, and Breslau, and lived later at Munich and Stuttgart, where he edited, from 1868, the *Schwäbische Volkszeitung*; at Flensburg, where he edited the *Norddeutsche Zeitung* (1869-72); at Kiel, at Freiburg in Breisgau, and, after 1888, in Munich. His earlier stories, under the influence of Storm (q.v.), e.g., *Die braune Erica* (1868) and *Eddy-stone* (1872), were prose idyls admirable in their descriptions. Urban and higher social life then attracted him, and with the novel *In der Fremde* (1887) he seemed to be emulating the French Bourget. Later he returned to his earlier manner, e.g., in *Im Zwing und Bann* (1892), a story of the Black Forest, scenes from which he described admirably in the well-illustrated *Der Schwarzwald* (3d ed., Berlin, 1901). His work is characterized by originality of fancy and emotional scenic description, but lacks clearly drawn characters. His shorter stories surpass his novels. Many of his poems are good. He published a great deal. Jensen published the poems *Vom Morgen zum Abend* and *Gesammelte Gedichte* (1897). His latest work includes the romance *Der Schleier der Maja* (1902); *Gäste auf Hohenaschau* (1904); *In Majorem Dei Gloriam* (1905); *Unter der Tarnkappe* (1907); *König Friedrich* (1908); *Die Nachfahren* (1909); *Deutsche Männer* (1909); *Ausgewählte Gedichte* (1913). Consult: Eadmann, W. *Jensen* (Leipzig, 1907); H. R. Jockisch, "Wilhelm Jensen, ein Widmungsblatt zum siebzigsten Geburtstag des Dichters," in *Westermann's Monatshefte*, vol. li (Brunswick, 1907); Ludwig Fulda, article in the *Berliner Tageblatt*, No. 602 (Berlin, 1912).

JENSON, NICOLAS (c.1400-80). A French stamp cutter and printer, born at Tours. He is supposed to have been sent by Charles VII from Paris to Mainz in 1458 in order to learn the art of printing. In 1470 he went to Venice, where in the following year he printed his first book; and before his death, in 1480, he produced from his presses no less than 155 volumes, including many editions now celebrated. Instead of the Gothic or black letters he introduced the antique or Roman characters in many of his books, and his style of type was soon copied in all Latin countries. Jenson was created Count Palatine by Pope Sixtus IV. Consult T. L. DeVinne, *Notable Printers of Italy during the Fifteenth Century* (New York, 1910).

JENYNS, jën'inz, SOAME (1704-87). An English author. He was born in London and was educated at St. John's College, Cambridge, but left before he had completed his course. He first attracted attention by writing, shortly after leaving Cambridge, a poem entitled *The Art of Dancing* (1727). He sat almost continuously in Parliament from 1742 to 1780 and in 1755 was appointed a Commissioner of the Board of Trade. A man of wealth and leisure, he cultivated the acquaintance of literary people and acquired a reputation, wholly undeserved, as a wit and writer. In thought he was shallow, in style wordy and turgid. His book entitled *A Free Enquiry into the Nature and Origin of Evil* (1757) was the subject of one of Dr. Johnson's most scathing and brilliant criticisms in the *Literary Magazine*. His best-known work was his *View of the Internal Evidence of the Christian Religion* (1776), which reached a tenth edition by 1795 and was translated into several Continental languages. His collected *Works* were published in 1790.

JEOFAILS, STATUTES OF. See STATUTES OF JEOFAILS.

JEOPARDY, jëp'ar-dī (from OF. *jeu parti*, divided game, even chance, ML. *jocus partitus*, even chance, from Lat. *jocus*, jest, game, and *partitus*, p.p. of *partire*, to divide, from *pars*, part; influenced by popular etymology with OF., Fr. *jeu perdu*, lost game). In law, the peril incurred by a criminal process. The fifth amendment to the Constitution of the United States declares that no person shall be subject for the same offense to be twice put in jeopardy of life or limb. A similar provision is found in various State constitutions. Like most constitutional guarantees of protection to the individual, this is but a reënactment of a common-law rule; one which was enforceable in a criminal proceeding under the plea of *autrefois acquit* (q.v.). It is said that the phrase "jeopardy of life or limb" referred originally to the hazard of a party to a trial by battle (q.v.). At present, however, it denotes the risk imposed upon one who is subjected to a strictly criminal prosecution. The constitutional provision does not apply to a defendant in a civil action.

As to the question, at what stage of a criminal prosecution the accused is put in jeopardy to which he shall not be subjected a second time, the answers are not uniform. The great weight of authority supports the view that "a person is in jeopardy when he is put upon trial, before a court of competent jurisdiction, upon an indictment (q.v.) or information (q.v.) which is sufficient in form and substance to sustain a conviction, and a jury has been impaneled and sworn to try him." He then stands before the jurors as his judges, and, if he is charged with a capital crime, his life is in their hands. Accordingly, if he is acquitted by them, or if they are discharged by the court without his consent, except in cases of extreme necessity, such as the sickness or death of a juror, the constitutional provision applies, and he is not liable to a second prosecution. On the other hand, if the court had no jurisdiction of the case, or the indictment were fatally defective, or if the prisoner after conviction secured its reversal, the provision does not protect him from another trial. Consult Cooley, *General Principles of Constitutional Law* (Boston, 1900).

JEPHSON, jëf'son, ROBERT (1736-1803). An Irish poet and playwright, who was a soldier in early life. He rose to be an infantry captain, but retired on half pay about 1763, and lived for the four following years in England, where he became friendly with Garrick, Goldsmith, Johnson, Burke, Reynolds, Townshend, Burney, and other lights in the literary, dramatic, and artistic firmament. He was always popular because of his Irish wit and social temperament; his plays were successfully produced in London, and after his return to Dublin he was master of the viceregal horse for many years and member of the national Parliament (1793). His tragedies are: *Braganza* (Drury Lane, 1775); *The Law of Lombardy* (1779); *The Count of Narbonne* (Covent Garden, 1781); *Julia, or the Italian Lover* (Drury Lane, 1787); *Conspiracy* (Drury Lane, 1796). In lighter vein he wrote the farce *The Hotel, or the Servant with Two Masters* (1784); *Campaign, or Love in the East Indies*, a comic opera (acted at Covent Garden in 1785, and presented in abbreviated form under the title *Love and War* in 1787); and the farce *Two Strings to your Bow* (Covent Garden,

1791). He published also in verse *Roman Portraits* (1794), and a satire on the French Revolution called *The Confessions of Jacques Baptiste Coutcau* (1794).

JEPHTHA, jěf'thá, Ger. pron. yěf'tä. An oratorio by Handel (q.v.), first produced in London, Feb. 26, 1752; in the United States, Feb. 7, 1867 (Boston).

JEPH'THAH (Heb. *Yiphthāh*, he, i.e., the El, opens). A Gileadite, one of the judges of Israel. The story of his career, according to Judg. xi-xii, is as follows: He was a bastard and, being driven from home by his brothers, became the leader of a band of brigands. When the Ammonites oppressed Israel, the Gileadites appealed to Jephthah for aid. He rebuked them for coming to him only because in distress, but agreed to help them on condition that, if successful, he should remain their leader. Accordingly he went forth to battle against the Ammonites, first vowing to offer to Yahwe in case of success whatever should come to meet him from the door of his house on his return. He overcame the Ammonites, routing them entirely. On his return home his daughter, his only child, came forth out of the house, the first one to meet him. Being told of her father's vow, she agreed to its fulfillment, and Jephthah "did with her according to his vow" (Judg. xi. 39). Her fate was afterward bewailed by the daughters of Israel four days every year (Judg. xi. 39-40). The Ephraimites picked a quarrel with Jephthah because he had not asked them to join in the war against the Ammonites (cf. Judg. viii. 1). A combat ensued, and Jephthah was victorious. The story goes that, with his Gileadite forces, he held the fords against the Ephraimites and put to death every fugitive who betrayed his Ephraimitic origin by his inability to pronounce his *sh* sound, saying "sibboleth" for "shibboleth." Jephthah's judgeship lasted for six years, and he was buried in Gilead.

The story of Jephthah, when critically studied, reveals a curious mixture of myth and uncertain tradition. By general agreement among critics, the interview between Jephthah and the King of the Ammonites (Judg. xi. 12-28) is regarded as unhistorical, for the sufficient reason that the section in question refers to the Moabites. In the above account of Jephthah, therefore, no mention has been made of it. But there are other problems more difficult to solve. The account of the quarrel of the Ephraimites with Jephthah is so similar to an incident in the career of Gideon (Judg. viii. 1-3) that it is difficult to resist the conclusion that the incident has nothing to do with Jephthah. The incident with Jephthah's daughter rests presumably upon some actual occurrence of child sacrifice; and it has been suggested by Duhm that the name Jephthah was originally Jiphthahel, or 'the god who opens (the womb),' and to whom, therefore, the first-born belonged. In the form in which it is told is an attempt to account for a four days' festival celebrated annually in Gilead and elsewhere in Palestine, a feature of which was weeping by women. This festival is, without much question, that of Tammuz (q.v.)—the young god who is slain by a cruel goddess, and for whom the women (as the official mourners in the Orient, ancient and modern) sing dirges. This festival, we know from Ezekiel (viii. 14), was observed by Hebrews till a comparatively late date. There remains Jephthah's conflict with the Ammonites; and since this account

contains an incident, as above pointed out, which confuses Moabites and Ammonites, it is clear that the later Hebrew writers did not have any very definite knowledge of Jephthah's career. His name remained in the memory of his people as a liberator from oppression by an enemy, but who the enemy was—whether Moabites or Ammonites—appears to have been forgotten. Consult commentaries on Judges by Moore and Budde, and the Hebrew histories of Stade, Guthe, Wellhausen, Kittel, etc.

JEPSON, EDGAR (?-). An English novelist. He was born in London, studied at Leamington College and graduated B.A. at Balliol College, Oxford, and lived in Barbados in 1889-93. His books include: *Sibyl Falcon* (1895); *The Passion for Romance* (1896); *The Keepers of the People* (1898); *On the Edge of the Empire* (1900); *The Dictator's Daughter* (1902); *The Admirable Tinker* (1904); *The Lady Noggs, Peeress* (1905); *The Triumphs of Tinker* (1905); *The Four Philanthropists* (1906); *Tangled Wedlock* (1906); *The Mystery of the Myrtles* (1907); *Arsène Lupin* (1908); *No. 19* (1909); *The Girl's Head* (1910); *Captain Sentimental* (1911); *Pollyooly* (1911); *The House on the Mall* (1912); *The Terrible Twins* (1913); *The Intervening Lady* (1914); *Whitaker's Dukedom* (1914).

JEQUITINHONHA, zhā'kê-tě-nyō'nyā, or RIO GRANDE DO BELMONTE. A river on the east coast of Brazil, rising in the Serra do Espinhaço, in the Province of Minas Geraes, southwest of the town of Diamantina. It flows northeast, falling into the Atlantic at Belmonte, 200 miles south of Bahía (Map: Brazil, J 7). Its length is estimated at about 600 miles. The upper course, flowing through a mountainous country, is very rapid and forms a number of cataracts, one of which, the Salto Grande, has been compared with Niagara. Its lower course, in the State of Bahía, is through a flat country, where it is navigable for light vessels for about 60 miles.

JERÁBEK, yěr'zhä-běk, FRANTIŠEK (1836-93). A Bohemian dramatist, born at Sobotka and educated in theology and philology at Leitmeritz and at Prague. He lived in the latter city, where he taught school and was prominent in journalism as editor of *Pokrok*, and in politics as a member of the Bohemian Diet and the Austrian Reichsrat. His dramas, all of unusual technical merit, include: *Hana* (1858); *Svatopluk* (1859); *Veselohra* (1861); *Cesty veřc-ného miněni* (1866); *Služebník svého pána* (Faithful Servant of his Master, 1870; Ger. trans., 1892), a powerful social play dealing with the conflict between intellect and capital; *Syn člověka* (The Son of Man, 1878), an historical play; and *Závist* (1885), portraying Bohemia in the time of Podiebrad. He also wrote a valuable history of early romantic poetry, *Stará doba romantického básnictví* (1884).

JERAHMEEL, jě-rä'mě-ěl or yä-rä'mä-ěl (Heb., El pities). The name of a tribe in the district of southern Syria called the Negeb (q.v.). In 1 Sam. xxvii. 10 David tells Achish that he has made a raid against the Negeb of Judah, the Negeb of the Jerahmeelites, and the Negeb of the Kenites; and in 1 Sam. xxx. 29 he sends of the spoil of Ziklag to the cities of the Jerahmeelites and the cities of the Kenites as well as to various cities of Judah. At that time Jerahmeel seems to have inhabited the centre of the great plateau of the Negeb, east

of the Cherethites, or Cretans, and south of the Calebites, both mentioned in 1 Sam. xxx. 14, west of the Kenites, and north of the Amalekites, whose northern border apparently was the Wadi Kdês. They consequently occupied the part of the Negeb in which the ruins of important Byzantine cities still stand. Like the neighboring tribes, they were incorporated by David in the Kingdom of Judah. Hence their cities are counted as belonging to the tribe of Judah (q.v.), and in 1 Chron. ii. 9 Jerahmeel appears as the son of Hezron, the son of Perez, Judah's son with Tamar. When Jerahmeel is represented as the older brother of Caleb, this may indicate that the Jerahmeelites were considered as a more important people and known to have lived longer in the land than the Calebites. As the Jerahmeelite cities are also ascribed to Simeon, it is possible that this tribe was dispossessed by the Jerahmeelites. They seem to have been of Edomitish origin and were probably related to the Calebites and the Kenites. When the Nabatæans drove the Edomites out from their mountains across the Arabah into the Negeb, the Jerahmeelites and their kindred moved north into Judah, then decimated by the exile; but they seem to have maintained their separate tribal organization. Whether the name of the eponymous ancestor is that of their chief deity, "the pitying El," and identical with the Rahman of the Arabs, cannot be determined with certainty. Their location in earlier times renders it extremely probable that they exercised a considerable influence on the southern tribes, and therefore indirectly on all Israel; but until further testimony is brought forth the precise nature of this influence can only be conjectured. It is Cheyne's merit to have called attention to the importance of this tribe; and the services rendered by this eminent scholar by his attempt to recover its lost history and his demand for a more searching criticism of genealogies and place names should not be overlooked because of the violent textual emendations and the uncontrollable theories, similar to those of other scholars in reference to the Kenites, to which his discovery led him. *The Chronicles of Jerahmeel* is a collection of late Jewish legends of no historical value; this work has been published by M. Gaster (Orient Translation Fund, 1899). Consult: S. A. Cook, in *Encyclopædia Biblica* (4 vols., New York, 1899-1903); T. K. JERBA, jēr'ba, or **GERBI**. An island off the east coast of Tunis, Africa, in the Gulf of Cades. Area, 425 square miles. The surface is level, and the soil fertile. The natives are engaged in the cultivation of dates and olives and the manufacture of silk and woolen fabrics. The town has a sponge market and an export trade in fruits. Pop., about 45,000, consisting largely of Berbers. There are on the island some Roman remains and an old Spanish castle. The chief town is Haut-es-Suk, with a population of 3000. Jerba is the ancient Meninx, the island of the lotus-eaters. It has been occupied by the French since 1881.

JERBO'A, or **GERBOA** (from Ar. *yarbū'*, flesh of the back and loins, oblique descending muscle jerboa; so called from the great muscular development of the hind legs). A small rodent of the genus *Dipus* and family Dipodidæ, related to rats and mice and remarkable for its kangaroo-like characteristics. (See Plate of MICE AND JERBOAS with the article MOUSE.) The forelegs, more used as hands than as feet, are very small and have five toes, while the hind limbs are excessively long and strong and have only three toes, of which the middle (III) is prolonged. The tail is long, cylindrical, covered with short hair, and tufted at the end. The jerboas are inhabitants of sandy deserts and wide grassy plains in Asia and in eastern Europe and north Africa. They are burrowing animals, nocturnal, and feed upon roots, seeds, herbage, insects, birds' eggs, and the like, and where numerous greatly damage the grain crops. Their great legs enable them to flee from danger in enormous leaps, but when undisturbed they walk upright, one foot after the other, and do not hop like a kangaroo. They hibernate in the colder countries, but do not lay up stores as do many mice. The best-known species is *Dipus ægypticus*, of the north African plains. It is from six to eight inches long besides the tail, which is longer than the body.

Another group of jerboas, principally Asiatic, is distinguished by having five toes on the hind feet, and includes the alactaga (*Alactaga decumana*), an animal as large as a rat and one of the most characteristic animals of the Kirghiz steppes. Several lesser species of the same genus exist, and the great Siberian jumping rabbit of the genus *Euchorcutis* is another relative. Finally, the familiar jumping mouse (q.v.) of the United States is one of this family, as also are the ratlike rodents of northern Europe and Asia of the genus *Sminthus*, whose legs are all of nearly equal length, and whose habits are arboreal. These more regular forms are supposed to have least departed from the ancestral type. Consult: W. T. Blanford, *Observations on the Geology and Zoölogy of Abyssinia* (London, 1870); id., "Zoölogy and Geology of Eastern Persia," in his *Eastern Persia*, vol. ii (ib., 1876); id., *Fauna of British India: Mammalia* (ib., 1888-90); M. W. Lyon, *Comparison of the Osteology of the Jerboas and Jumping Mice* (Washington, 1901).

JERDAN, jēr'dan, WILLIAM (1782-1869). A London journalist of Scottish birth. He left Kelso, his native place, for a writer's office in Edinburgh, but by 1806 had gone to the metropolis to engage in newspaper work, and made himself famous, a few years later, as the reporter who laid first hold upon Spencer Perceval's assassin in the lobby of the House of Commons. He was contributor to and editor of various journals, and from 1817 to 1850 was connected with the *Literary Gazette*, first as editor and shareholder, then as sole owner from 1842. His intimate association with the leading literary men of his time makes interesting reading of his reminiscences and *Autobiography* (4 vols., 1852-53), supplemented by *Men I have Known* (1866). Jerdan helped to establish the Royal Society of Literature (1821) and was always popular with his brother authors, who presented him with a testimonial upon his retirement in 1853, when the government gave him a pension of £100.

JER'EMI'AD. An expression, applied, often

derisively, to speeches or writings of a perfervidly denunciatory character or in a strain of both violent and prophetic denunciation. The term is derived from the lamentations of Jeremiah. See JEREMIAH, LAMENTATIONS OF.

JER'EMI'AH (Heb. *Yirmeyāh*, *Yirmeyāhū*, Yahwe casts, hurls). One of the greatest of the Hebrew prophets. He was the son of Hilkiyah and a member of a priestly family dwelling at Anathoth near Jerusalem. While the earliest references to him in the Old Testament are not older than the second century B.C., still it is possible, from a study of his discourses in the book that bears his name, to follow the general course of his career. The date of his birth may be fixed approximately at about 650 B.C., since we know that in 625 B.C. he came forward into public notice. Whether or not there was a local cult at Anathoth, to which Jeremiah may at one time have been attached, it is probable that after 620 B.C. the prophet's home was at Jerusalem, and that he remained there till the capture of the city. What called him to his prophetic ministry was the approach of the Scythians from the north. Having relieved their allies the Assyrians by forcing the Medes to abandon the siege of Nineveh in 625 B.C., the Scythians went forth to attack Psammetichus I of Egypt, who had been besieging Ashdod, a city claimed by Assyria. They were bought off by the Egyptians, but their coming into Syria filled Jeremiah (and also Zephaniah) with a conviction that Yahwe meant to punish through these his people Judah. Jeremiah frequently seems to have transferred to the Chaldæan power this rôle of punisher of Judah. The death of Josiah at Megiddo in 608, which threw the country into confusion, may have led to a reaction against the religious reforms instituted by the King, and which by his tragic death were demonstrated to be futile in averting the displeasure of Yahwe. In Jehoiakim's reign he seems to have protested against this King's guilty conduct in undertaking great building enterprises without paying the laborers engaged (xxii. 13 ff.). Even though his predictions concerning Jehoiakim failed and the King apparently died in peace and was "joined to his fathers," Jeremiah still looked for a Chaldæan army and threatened Jehoiachin and his mother with exile (xxii. 24-27, 29). Jeremiah develops into a prophet of gloom and woe, declaring that neither prayers nor sacrifices will avail to ward off the coming disaster, and that even the temple of Yahwe may be wiped out, as a punishment for the long period of defection on the part of the people. The refrain which sounds throughout his discourse is "too late." When the end came, Jeremiah counseled submission to Chaldæan authority. He deprecated, as did Josiah (q.v.), reliance upon Egypt, and he did not favor the attempt of Zedekiah to throw off the Babylonian yoke. In assuming this attitude Jeremiah was guided by his stern but profound conviction that the people of Yahwe had been guilty and must suffer the consequences. Naturally such a position rendered him exceedingly unpopular. He was denounced as manifesting lack of patriotism and no doubt endured much suffering and persecution, even though the accounts of his martyrdom were subsequently exaggerated. After the destruction of Jerusalem, in 586 B.C., he went to Egypt, if we may rely upon the statement embodied in the editorial revision of his utterances (xliii. 6, 7).

Cheyne, *Jeremiah: His Life and Times* (London, 1888); Marti, *Der Prophet Jeremia von Anatot* (Basel, 1889); Lazarus, *Der Prophet Jeremias* (Breslau, 1894); Schmidt, "Jeremiah," in *Encyclopædia Biblica* (New York, 1901); Erbt, *Jeremia und seine Zeit* (Leipzig, 1902); Gillies, *Jeremiah: The Man and his Message* (London, 1907); Bittenwieser, *The Prophets of Israel* (New York, 1914).

JEREMIAH, BOOK OF. The second of the Latter Prophets in our present editions of the Hebrew Bible, though, according to the order given in the Babylonian Talmud (*Baba bathra* 14 b, 15 a) and followed in many manuscripts, it occupies the first place. In the general superscription the book is designated as "The word of Jeremiah, son of Hilkiyah, who was of the priests in Anathoth in the land of Benjamin" (i. 1); i. 2 states that "the word of Yahwe came to him in the days of Josiah, son of Amon, king of Judah, in the thirteenth year of his reign"; and i. 3, that "it came in the days of Jehoiakim, son of Josiah, king of Judah, unto the end of the eleventh year of Zedekiah, son of Josiah, king of Judah, even to the deportation of Jerusalem in the fifth month." Apparently verse 2 was the heading of a book containing only oracles supposed to have come at the time when the prophet was called to his work; and verse 3 was added subsequently, when the book had come to contain prophecies of a later date, but as yet none that could be supposed to be later than the fall of Jerusalem in 586 B.C. In subheadings there are 27 other time indications, and in most instances there are direct ascriptions to Jeremiah in connection with them. The dates, however, are not in chronological order; prophecies assigned to Jehoiakim's time sometimes follow utterances said to have been made in the days of Zedekiah. Since Baruch is introduced in xxxvi. 4 ff. as the scribe to whom Jeremiah dictates his discourses in the fourth year of Jehoiakim, it has been supposed that the whole book came from him, and that he wrote the superscriptions. But there is no evidence of this, and it cannot even be rendered probable that the roll read by Baruch to Jehoiakim and rewritten by him after its destruction by the King has been preserved in the present volume. The one sentence quoted from that roll (xxxvi. 29) is not found in any oracle said to have been uttered by Jeremiah in the period before 604 B.C. A careful study of the headings tends to show that they were the work of editors and copyists living at different periods subsequent to the time of Jeremiah and Baruch. Their value is very great, however, for the aid they render in recovering earlier collections and in exhibiting the successive stages of redaction. They seem to indicate that the present work is a compilation of seven smaller collections, and that each of these once had an independent existence. These are: (1) i-xx; (2) xxi-xxiv; (3) xxv, xlvi-li; (4) xxvi-xxix; (5) xxx-xxxiii; (6) xxxiv-xxxix, xlv; (7) xl-xliv. Chapter lii is an appendix to the book. That the prophecies in chapters xxv, xlvi-li once circulated as a separate collection is evident from the different places they occupy in the Hebrew text and in the Greek version. While in the latter these oracles against foreign nations occupy a central position in the volume, like the similar prophecies in Isaiah and Ezekiel, they are in the former relegated to the end. More exactly their place is between xxv. 1-13

and 15-38 of the Hebrew text. Chapters xl-xliv cannot have formed a part of the volume when i. 3 was added to the superscription, for they deal entirely with things later than the fall of Jerusalem. Chapters xxx, xxxi are referred to as a book, and chapters xxxii, xxxiii, seem to be expansions of this book. It is probable that chapters i-xx formed the book to which the heading i. 2 was given, the editor supposing that all the prophecies came from the thirteenth year of Josiah. While it is frequently affirmed that the oracles came to Jeremiah, it is only in li. 60 that it is distinctly stated that he wrote the words against Babylon. Strangely enough, there is no prophecy in the whole volume that is more widely regarded as un-Jeremianic by interpreters belonging to different schools. Except in this case, the editors of the various collections apparently looked upon Jeremiah as an oracle giver, a public speaker, a preacher of righteousness and foreteller of coming doom, rather than as a holy penman, a scribe. This may have been due to the casual reference to Baruch.

The aim of the men who made these collections was evidently a twofold one: they were anxious to preserve what they, rightly or wrongly, regarded as genuine utterances of Jeremiah, as oracles of him who had foreseen the future and accurately foretold the destruction of temple, city, and dynasty; and they were desirous to furnish food for religious thought, stimulate holy sentiments, give comfort, encouragement, and hope by depicting the true prophet, uncompromising in his fidelity to Yahwe, full of deep love for his people, yet unsparing in his denunciations, even though he spoke with a bleeding heart. Very few scholars have any doubt that in these collections a number of actual utterances of Jeremiah have come down to us, and some reliable accounts of occurrences in his life. With most confidence such sayings of his are looked for in the first and second of the seven booklets (i.e., chaps. i-xxiv). But even here modern scholars are inclined to consider many passages as doubtful. The strongest evidences against Jeremianic authorship are cited by them in the case of the prophecies against foreign nations (chaps. xlii-li). Though some go so far as to consider no part of chapters xxx-xxxiii as a genuine work of Jeremiah, there is a widespread feeling that some nucleus in chapters xxx-xxxi may have come from him. In the narratives, found in collections (4), (6), and (7), some episodes are very widely regarded as historical, while others are looked upon with suspicion even by the more conservative critics. It is thought probable that chapter lii comes from some good old source also used, though not so fully on some points, in 2 Kings xxv.

Though much excellent work was done by earlier scholars, both Catholic and Protestant, in elucidating the meaning of the various parts of the book, modern critical study may be considered as having begun in earnest with Dahler in 1825 and Movers in 1837. Dahler studied the book as a collection of somewhat independent sections, not coming from Baruch's pen, and divined the poetic character of Jeremiah's oracles, though he did not recognize a definite metre. Movers accepted the view, first propounded by Michaelis, that there were two recensions of the book, but took a long step forward by recognizing the impossibility of as-

cribing the longer text to Jeremiah or Baruch, and by assigning this text to a much later time, in his opinion the age of Nehemiah. More recent phases of criticism are represented by Pierson, Budde, Stade, Schwally, Smend, Davidson, Schmidt, Cornill, Duhm, Cheyne, Peake, and others. Pierson, in 1877, seems to have been the first to question seriously the historical character of some of the stories concerning the prophet. His criticism, though keen, was not always convincing, but where it has been known it has proved stimulating. Budde, in 1878, showed that chapters l-li have peculiarities that seem to preclude a Jeremianic origin, and this view has now been accepted by a very large number of scholars. Stade (1884-92) pointed out what appeared to him to be the secondary character of many psalm fragments and elegies, of the same nature as those in Lamentations (q.v.), interspersed between unquestionably genuine Jeremianic oracles. More or less convincing attempts have since been made, however, to vindicate these for the prophet. Schwally, in 1888, reached the same conclusions as regards chapters xlii-xli that Budde had adopted anent chapters l-li, and his opinion has also been widely accepted, sometimes on different grounds, though there are some independent scholars who maintain that in these oracles remnants have been preserved of actual utterances by Jeremiah. Smend, in 1893, indicated the difficulties with assuming that chapters xxx-xxxii come from Jeremiah, though many scholars have since suggested that here also there may be a Jeremianic nucleus. Davidson, in 1899, distinguished between the stories that seemed to him well informed and trustworthy and those in which "the narrator dramatizes the information at his command" and regarded such a passage as xlii. 7-22 "a free construction from the hand of the historian," and this "both on account of its rather debased style and its other peculiarities." Schmidt, in 1900 and 1901, was led by an examination of the superscriptions to the view that the book has grown up from the earlier collections which have been indicated above, very much after the fashion of the Book of Isaiah. He discarded as fruitless the search for Baruch's roll (mentioned in xxxvi. 29), assigned many more oracles to later times on internal grounds, and questioned the historical character of some of the stories he supposed to have been taken from a biography of the prophet written long after his death. The subsequent discovery of the Elephantine papyri (q.v.) has shown that in one respect his suspicions were not well founded, since there were early settlements of Jews in Egypt and they worshiped other gods as well as Yahwe; but it has otherwise thrown no light on the historicity of the accounts in chapters xl-xli. Cornill, in 1901, recognized a metre in the poetical utterances of Jeremiah, but supposed that many of his sayings were not in poetic form. Duhm, in 1901, independently reached very similar conclusions to those of Schmidt on many points, but he adhered to the theory that Baruch's roll can be recovered in the present book, and he presented as a criterion of genuineness the peculiar metre characteristic of Jeremiah's oracles. His conviction that the prophet spoke exclusively in poetry led him to the position that only 60 short poems of 268 verses belong to Jeremiah, that 220 of the remaining 350 verses come from Baruch, and that 880 are from the hands

of later supplementers. While in general agreement with the type of criticism that deviates most from traditional views, Cheyne, in 1911, was disinclined to assign a date as late as the Hasmonæan period for any part of the book; and Peake, in 1912-13, was inclined to seek for a Jeremianic nucleus wherever recent criticism, with which he dealt very fairly, seemed to yield the promise of such an original element.

Many difficulties worthy of serious consideration have been urged by conservative exegetes, and there can scarcely be said to be the same degree of unanimity among scholars as in the case of the Book of Isaiah (q.v.), though even in reference to that great thesaurus of prophetic oracles new points of view are being urged at the present time. Extraordinarily great problems are offered both by textual and historical criticism. While there is a strong presumption in favor of the view that a certain poetic form, a distinct rhythm and metre such as prophets in their moments of inspired exaltation naturally adopted, characterized the genuine Jeremianic prophecies, it cannot be regarded as absolutely certain that the prophet always employed it. Bittenwieser has recently maintained that Jeremiah did not know how to write, and therefore dictated his words to Baruch. This is difficult to believe, since he belonged to a priestly family. But if for some reason he was unable to put his discourses into writing, or did not care to do so ordinarily, not only Baruch but others who desired to take down his prophecies may have failed to recognize their poetic form or paid no attention to it, writing solely to record the substance, and later copyists may have departed even more radically from the original form. The margin necessarily left to the subjective judgment of the interpreter is very wide. However peculiar a man's style may be, it is subject to change in the course of 40 years; and what to one scholar may appear unmistakably to betray a later origin may to another seem quite in harmony with what is generally admitted as genuine. In such matters only a prolonged coöperation of competent students approaching the text from different points of view can lead to relatively assured results.

Bibliography. Among the commentaries the following deserve special mention; Dahler (Leipzig, 1825), Rosenmüller (Berlin, 1826), Ewald (Stuttgart, 1840; 2d ed., ib., 1868), Hitzig (Leipzig, 1841; 2d ed., ib., 1866), Neumann (ib., 1856-58), Graf (ib., 1862), Keil (ib., 1862), Rowland Williams (London, 1871), R. P. Smith (New York, 1875), Le Hir (Paris, 1877), Scholz (Wurzburg, 1880), Schneedorfer (Prague, 1881), Trochon (Paris, 1883), Cheyne (London, 1883-85), Orelli (New York, 1887; 3d ed., 1905), Knabenbauer (Paris, 1889), Ball, in *Expositor's Bible*, vol. i (London, 1890), Giesebrecht (Göttingen, 1894; 2d ed., ib., 1907), Bennett, in *Expositor's Bible*, vol. ii (ib., 1895), Streane (London, 1895), Myrberg (Upsala, 1896), Duhm (Freiburg, 1901), Cornill (Leipzig, 1905), Driver (London, 1906), Peake (ib., 1912-13); see also Movers, *De Utriusque Recensionis Vaticiniorum Jeremiæ Indole et Origine* (Hamburg, 1837); Pierson, *Israels Profeten* (Leyden, 1877); Budde, in *Jahrbücher für deutsche Theologie* (Gotha, 1878); Stade, in *Zeitschrift für alttestamentliche Wissenschaft* (Giessen, 1884, 1885, 1892); Schwally (ib., 1888); Cheyne, *Jeremiah: His Life and*

Times (London, 1888); Marti, *Der Prophet Jeremia von Anatot* (Basel, 1889); Smend, *Alttestamentliche Religionsgeschichte* (Freiburg, 1893); Nathaniel Schmidt, in *The New World* (Boston, 1900); id., "Jeremiah, Book of," in *Encyclopædia Biblica* (New York, 1901); Cornill, *Die metrischen Stücke des Buches Jeremia reconstruirt* (Leipzig, 1901); Erbt, *Jeremia und seine Zeit* (ib., 1902); Giesebrecht, *Jeremias Metrik am Texte dargestellt* (Göttingen, 1905); Gillies, *Jeremiah: The Man and his Message* (London, 1907); Cheyne, "Jeremiah," in *Encyclopædia Britannica* (11th ed., Cambridge, Eng., 1911); Bittenwieser, *The Prophets of Israel*, vol. i (New York, 1914); Davidson, in *Hastings, Dictionary of the Bible* (ib., 1899).

JEREMIAH, EPISTLE OF. See APOCRYPHA, *Old Testament*.

JEREMIAH, LAMENTATIONS OF. The name given in the English Bible to a short book placed immediately after the Book of the Prophet Jeremiah. In the Hebrew it is called 'Ekāh ('How,' the first word), sometimes also *Kinōth* ('Dirges'), and is placed among the Hagiographa. The title in the Greek version is Θρήνοι, *Thrēnoi*, a translation of *Kinōth*. The book consists of five chapters, which may be designated as so many elegies or dirges over the desolation of the land, the exile of the people, the destruction of the first temple, the fall of the Kingdom of Judah, and the writer's own woes. Properly speaking, only chapters i, ii, and iv are dirges, bewailing the death of the Jewish nation. Chapter iii deals with the affliction of the people, or rather of the pious section of the community. Chapter v is in the form of a prayer. The elegies are in poetical form, the metre of the first four being that commonly employed in dirges in the ancient and modern Orient—the so-called *Kinah* strain. Each verse member is divided by a cæsura into two unequal parts, of which the first is the longer; the second usually presents an enforcement of the thought contained in the first. This unequal proportion between the two parts of a verse member gives to the lines a limping character. In chapters i and ii the verses consist of three members; in chapter iii of one member; in chapter iv of two members. The metre of the fifth poem consists of three-toned lines. The structure of the elegies is very artificial. The first, second, and fourth each contain 22 verses, each verse beginning with a different letter of the Hebrew alphabet arranged in the usual order, except that in i and iv the seventeenth letter of the alphabet, according to the ordinary arrangement (*pe*), precedes the sixteenth (*ayin*). In chapter iii the same order of the letters of the alphabet is followed as in i and iv, but there are three successive lines beginning with the same letter, making 66 verses in all. Chapter v contains 22 verses, but their initial letters are not in alphabetic order.

The contents of the five elegies may be summarized as follows: 1. Lamentation over the state of Jerusalem after the people had been carried captive; its sins acknowledged as the just cause of its misfortunes; Yahwe approached with penitence as the only source of help. 2. The destruction of the city and sufferings of its people lamented; false prophets condemned; Yahwe again invoked as alone able to save. 3. Description of the affliction of the religious community under the type of a single individual, as in the songs of the "servant of Yahwe" in Isaiah (q.v.). The sufferings are regarded as just pun-

ishments, and the speaker expresses confidence in Yahwe's ultimate compassion. 4. Lamentation over present conditions in contrast with former prosperity; all misfortune confessed to be the result of transgression and sin. 5. A final appeal to Yahwe; the calamities of the nation again recited; the sins that caused them penitently confessed; and Yahwe entreated to turn His people back to Himself and to renew the blessings they had formerly enjoyed. The last verse contains a sentiment that was considered to be of ill omen, and hence in reading the book it became customary to repeat the preceding verse, which embodies the appeal for a return of divine grace.

Concerning the authorship and date of the poems, opinions are at variance. The internal evidence is not conclusive. The tradition assigning the entire book to Jeremiah may be traced to the Greek version, but it should be noted that not all manuscripts contain this ascription. The tradition is thought by some to be based upon the late statement in 2 Chron. xxxv. 25 that Jeremiah was the author of an elegy upon King Josiah. On the whole, modern scholars reject Jeremiah's authorship of the book. But it is freely admitted that it shows influences of his style and thought. The compositions are evidently specimens of the elegiac literature of the Jews, suggested by the national catastrophe and the sufferings of the postexilic community, especially during the first century after the return and again under the Seleucid rule. Some critics think that no two poems have the same author, and the most plausible arrangement with respect to date is ii, iv, i, v, iii. Chapters ii and iv have more in common than any of the others. Comparison with sentiments in the Psalms that belong to the later Persian period speaks in favor of placing these two chapters about the middle of the fourth century B.C. There is no reason to assume a long interval between ii and iv on the one side and i and v on the other. Chapter iii may belong to the age of Greek supremacy.

Consult: commentaries of Ewald, Thenius, Nägelsbach, Keil, Payne Smith, Cheyne, Plumptre, Löhr, *Die Klagelieder Jeremias* (Göttingen, 1891-94), and Minocchi, *Le Lamentazioni di Geremia* (Rome, 1897), and the Introductions to the Old Testament by Driver (rev. ed., 1910) and Sellin (1913). For the metre, consult Budde's articles in the *Zeitschrift für alttestamentliche Wissenschaft* (1882-94), and in the *New World* (Boston, March, 1893).

JEREMIAH, SHORT PROPHECY OF. See APOCRYPHA, *Old Testament*.

JÉRÉMIE, zhâ'rá'mě'. A port of the Republic of Haiti, situated on the north shore of the southwest peninsula of the island of Haiti, 120 miles west of Port au Prince (Map: West Indies, D 3). It is celebrated as the birthplace of the elder Dumas. It has a poor harbor. It is the residence of a United States consular agent and exports cacao, coffee, and logwood. Pop., 5000.

JERES, CONDE DE. See CERVERA Y TOPETE, PASCUAL, CONDE DE JEREZ, MARQUÉS DE SANTA ANNA.

JÉREZ DE LA FRONTERA, hâ'râth dâ lâ frôn-tâ'rá, or XÉREZ. A famous city in the Province of Cadiz, Spain, situated near the river Guadalquivir, 33 miles by rail and 14 miles in a straight line northeast of Cadiz (Map: Spain,

B 4). It is surrounded by extensive vineyards, which furnish the world-famous sherry wine. The town is divided into two parts, of which the old one is surrounded by the remains of Moorish walls. There are an old Moorish castle, several theatres, and a bull ring. The educational institutions of the city include a high school, schools of law, medicine, and agriculture, a literary and scientific society, and a municipal library housed in the interesting old consistorial palace. In the neighborhood of the city is the convent of La Cartuja, considered the grandest architectural monument of the province; it is surrounded by fine gardens, the entrance to which is in the form of a large triumphal arch. Among the chief objects of interest in the town are the immense wine cellars, or *bodegas*, in which are stored large casks of sherry and other wines, which are exported mostly to Great Britain, the United States, and France. Pop., 1887, 61,708; 1900, 60,846; 1910, 62,628. Jérez was once a Roman colony and fell into the hands of the Arabs at the beginning of the eighth century. The great battle in which the Saracens overwhelmed the Visigoths was fought here in 711. In 1264 it was taken by Alfonso X of Castile. Peter the Cruel had his young wife, Blanche de Bourbon, murdered here in 1362.

JÉREZ DE LOS CABALLEROS, dâ lôs kâ' bâ-lyâ'rôs. A town of southwest Spain in the Province of Badajoz, 15 miles from the Portuguese frontier (Map: Spain, B 3). It is a handsome town, situated among the mountains, surrounded by gardens and orange groves, and dominated by a fortress with three enormous towers. It has two theatres, two hospitals, and a bull ring. There are several flour mills and manufactures of leather, soap, and pottery. Pop., 1900, 10,095; 1910, 10,940. The town is supposed to have been founded by the Phœnicians. It was captured from the Moors by Alfonso IX of León, who handed it over to the Knights Templars, whence the name Caballeros.

JERFALCON. See GYRFALCON.

JERICHAU, jâ'rê-kou, JENS ADOLF (1816-83). A Danish sculptor, born at Assens (Fünen). He studied in his native country and under Thorvaldsen at Rome. He established a reputation by a frieze, representing the marriage of Alexander the Great and Roxana, for the Royal Palace at Christiansborg, and after his return he was made professor at the Academy of Copenhagen (1849). Among his principal works are "Hercules and Hebe," "Penelope," "The Panther Hunter," "Adam and Eve after the Fall," "Christ," "David," and the monuments to Oersted and Andersen at Copenhagen.—His wife, ELIZABETH BAUMANN (1819-81), born at Warsaw, Poland, was a genre painter of note. She studied at Düsseldorf and devoted herself at first to Slovakian, then to Italian, Greek, and Egyptian subjects. Her paintings are deficient in drawing, but show ability in the use of decorative color.—Their son, HARALD (1851-78), born at Copenhagen, a pupil of his mother and afterward of Bénouville in Rome, was a landscape painter of some distinction. He painted Roman, Greek, and Turkish subjects.

JERICHO, jêr'i-kô. An ancient city of Palestine, about 15 miles east-northeast of Jerusalem, in the Jordan valley, north of the Dead Sea (Map: Palestine, C 4). A Canaanite city existed here before the invasion of Palestine by the Hebrew tribes. Joshua is said to have captured and destroyed it. The story of

the manner in which the wall fell, after the children of Israel had marched around it seven times blowing their trumpets (Josh. ii-viii), is regarded by many students as a legendary embellishment. It seems to have been the inner wall of stone, with its towers and its parallel wall of brick, that stood there in the pre-Israelitish period. Judging from the account of the spoils, the city must have been very rich, and that is borne out by the results of the excavations.

According to Josh. vi. 26 the conqueror pronounced a curse upon any one who should rebuild the city. This is thought by some scholars to be a reflection of the feelings aroused by the rebuilding of the city by Hiel of Bethel. He is said to have laid the foundation thereof with the loss of Abiram his first-born and set up the gates thereof with the loss of his youngest son Segub (1 Kings xvi. 34). The impressive wall uncovered by Sellin and Watzinger shows the extraordinary power and skill of this man. It coils like a gigantic serpent around the whole city, solidly built, though without mortar, with nowhere a corner, a bastion, or a tower. A large structure within this wall has been supposed by the excavators to be Hiel's house. Hiel apparently shunned no sacrifice to carry out his project, and the cost he paid created or strengthened the idea that the city lay under a curse. There is evidence that it was inhabited during the centuries preceding Hiel's enterprise, but on a smaller scale than later.

King Zedekiah was captured in the plain of Jericho (2 Kings xxv. 5). From the fifth to the second century B.C. there was a Jewish settlement in Jericho. Some jar handles have been found on which are written in Aramaic letters the name of the god Yahu or Yah. Down to this time the city was located at the foot of Mount Karantal, at Tell el-Sultan, near the spring called Ain el-Sultan, whose waters are supposed to have been healed by Elisha (2 Kings ii. 19-22). Farther south, at Tell abu-laik, the ruins of the Jericho of the Hellenistic period stand. These have been excavated by Sellin under the auspices of the Deutsche Orient-Gesellschaft in 1909 and 1911. The outlines of a theatre or hippodrome were discerned and aqueducts and cisterns found. This is the Jericho on which Herod lavished his care (Josephus, *Jewish War*, i, 21, 9). Through this city Jesus passed on his last journey to Jerusalem, when Zacchæus climbed into the sycamore tree to see him (Luke xix. 1-8). Vespasian destroyed the city, but it was rebuilt. At the time of Constantine it was the seat of a bishop. Justinian caused a "church of the mother of God" to be restored and a hospice for pilgrims to be erected. The Jericho on the present site, El Riha, grew up in the time of the Crusades. A church and a castle testify to the presence of the Crusaders there. Jericho is situated in an extremely fruitful district, yielding figs, grapes, balsam, honey, etc. Josephus and Strabo speak of it in enthusiastic terms. As late as the seventh century A.D. palm trees were common, but it is not certain that Deut. xxxiv. 3 alludes to it as the city of palm trees. The village is the seat of a mudir and has about 300 inhabitants. Karantal is the traditional place of the temptation of Jesus. There are many hermits' caves and chapels there. Much remains still to be done before Jericho can be said to be completely excavated, but the work carried on by Sellin and Watzinger has been sufficient to indicate

from the remains the general course of the history of the city. Consult: Guérin, *Samarie*, vol. i (Paris, 1874); Vincent, in *Révue Biblique* (ib., 1908-10); G. A. Smith, *Historical Geography of the Holy Land* (16th ed., London, 1910); Thiersch, in *Zeitschrift des deutschen Palästina Vereins* (Leipzig, 1913); Sellin and Watzinger, "Jericho: Die Ergebnisse der Ausgrabungen," in *Wissenschaftliche Veröffentlichung der deutschen Orient-Gesellschaft*, vol. xxii (ib., 1913).

JERICHO, ROSE OF. A Syrian cruciferous plant. See ROSE OF JERICHO.

JERKED MEAT, or JERKEY (Chilean *charqui*, dried beef). Meat preserved by drying in the sun. Hot dry weather is essential to the process. In the case of beef the fat is completely removed, and the lean meat is split into thin flakes, which are slit at irregular intervals in order to facilitate the drying. These thin steaks are spread out, or hung up in the sun, in a spot where there is a free circulation of air. The drying process takes from one to three days, depending upon the climate, and when completed the meat is brown, tough, and leathery, and will keep indefinitely if preserved from moisture and insects.

Venison and mutton are also preserved in the same manner, occasionally being cut into strips instead of flakes, dipped in brine, or smoked slightly.

The Indians of North America used to prepare quantities of buffalo meat in this manner, a portion of which was afterward pounded to make pemmican (q.v.). Good jerkey is eaten either cooked or raw, is exceedingly nourishing, and when raw has a rather pleasant, slightly saline flavor.

JERKER. The river chub. See CHUB.

JERMYN, jēr'mīn. A borough in Lackawanna Co., Pa., 12 miles northeast of Scranton, on the Lackawanna River and on the Delaware and Hudson and the Ontario and Western railroads. It is situated in a productive anthracite coal field, and, besides coal mines, the industrial establishments include cut-glass works, silk, powder, grist, planing, and saw mills, bottling works, and fertilizer factories. Pop., 1900, 2567; 1910, 3158.

JER'OBO'AM I (Heb. *Yārōb'ām*, probably 'Amm fights'). The first King of the Kingdom of Israel (c.953-932 B.C.). He was the son of Nebat of the tribe of Ephraim and had charge, under King Solomon, of the house of Joseph. He conspired against Solomon, but failed in his venture and was compelled to flee to Egypt (1 Kings xi. 26-40). The details of the movement, which was probably instigated by the restless spirit of the north under Judæan rule, are not furnished. The incident of the prophet Ahijah (1 Kings xi. 29-39) is thought by some critics to be a legendary embellishment; but there is nothing improbable in the attitude of Ahijah or the symbolic act, though the original oracle seems to have been expounded in later times. On the death of Solomon Jeroboam returned from Egypt and took the lead in another revolt at Shechem. Formal demands were made of Rehoboam, the son of Solomon, to reduce the taxes and otherwise change the policy adopted by his father. Rehoboam naturally refused, and the northern tribe seceded, Jeroboam becoming King of Israel (1 Kings xii. 2-20). Wars between Jeroboam and Rehoboam and his successor, Abijam, were frequent (1 Kings xiv. 30; xv. 7). The compiler of the Book of Kings,

writing from the exilic point of view, which recognized the temple at Jerusalem as the only legitimate centre of Yahwe worship, represents Jeroboam as fearing defection if the people continued to journey to Jerusalem for worship, and for this reason setting up a cult of his own at Bethel and at Dan (1 Kings xii. 26-33). It is the opinion of scholars at present, however, that, as a matter of fact, the idea of centralization of worship in one place did not exist at this time, and the northern tribes naturally recognized Bethel and Dan (q.v.) as they did other sanctuaries of the north as suitable places of worship. At these places a yearly harvest festival was celebrated on the fifteenth day of the eighth month, and Yahwe was worshiped under the form of a golden or gilded image of a bull. See GOLDEN CALF.

JEROBOAM II. King of Israel (c.782-740 B.C.). He was the son of Joash or Jehoash, third King of the Jehu dynasty. The account of his reign (2 Kings xiv. 23-29) is exceedingly brief, but shows that he was a warrior who succeeded in restoring the prestige of his kingdom and regaining from the ruler of Damascus regions lost by his predecessors. Whether, however, he actually secured control of Damascus and Hamath, as is stated, is doubtful. If he did so, it must have been with the help and connivance of Assyria. The ministry of Amos (q.v.) and Hosea (q.v.) falls in Jeroboam's reign, which must in every respect have been an eventful one. Consult Wellhausen, *Israelitische und jüdische Geschichte* (7th ed., Berlin, 1914).

JEROME, jê-rôm'. A town in Yavapai Co., Ariz., 44 miles by rail northeast of Prescott, on the United Verde Railroad (Map: Arizona, C 3). It is situated in a rich copper country, and there are extensive mines. Gold is also found here. Points of interest in the vicinity are Montezuma Wells, Montezuma Castle, Fort Whipple, and Camp Verde, a government post. Pop., 1900, 2861; 1910, 2393.

JEROME, JEROME KLAPKA (1859-). An English humorist, born at Walsall, Staffordshire, May 2, 1859. He was educated at the Philological School, Marylebone. As a young man, he was for a time a clerk in a railroad office and later an actor at Astley's Theatre, London, and in the provincial cities. Subsequently he became in turn a journalist, a teacher, a shorthand writer, and a lawyer's clerk. A brief account of his experiences on the stage he gave in *On the Stage—and Off* (1888), followed a year later by *Stage Land*, dealing with the conventions of the drama. His connection with the theatre enabled him to write several good comedies and farces: *Barbara* (1886); *Sunset* (1888); *Wood Barrow Farm* (1891); *New Lamps for Old* (1890); *Mac Haggis* (1897); *Miss Hobbs* (1900). Among his clever essays and sketches or short stories are: *Idle Thoughts of an Idle Fellow* (1st ser., 1889; 2d ser., 1898); *Three Men in a Boat*, his most humorous production (1889); *Diary of a Pilgrimage*, sketches of an excursion to the Oberammergau Passion Play (1891); *Novel Notes* (1893); *John Ingerfield, and Other Stories* (1893); *Sketches in Lavender* (1897); *Paul Kolver* (1902); *Tommy & Co.* (1904); *The Passing of the Third Floor Back* (1907), in which Sir Johnston Forbes-Robertson played with great success; *They and I* (1909); *The Master of Mrs. Chilvers* (1911); *Esther Castways* (1913); *Poor Little Thing* (1914). In

1914 he came to America to give readings from his most popular books.

JEROME (Lat. *Hieronymus*, from Gk. Ἱερώνυμος, *Hierōnymos*), SAINT (c.340-420). The most learned of the early fathers of the Latin church. His full name is usually given as Sophronius Eusebius Hieronymus, and he was born in Stridon, a town on the border of Dalmatia and Pannonia. Prosper of Aquitania gives 331 as the year of his birth, but that is probably too early. It may have been 342 or 346. Among his eminent contemporaries were Ambrose and Augustine. His parents were wealthy Christians. Jerome was educated in Rome, under the rhetorician Ælius Donatus, where his tastes foretold the scholar; he began to gather a library by copying manuscripts for himself. Here also he received baptism. His strictly theological studies were begun in Treves and continued in Aquileia, where he had Rufinus as a comrade and friend. Traveling in the East, Jerome fell sick (in Syria) and passed through a religious experience in which he was led to adopt the ascetic life. He saw a vision, and heard a voice saying, "Thou are not a Christian, but a Ciceronian!" This he took as a divine rebuke of his fondness for the classics, and he resolved henceforth to abandon secular literature altogether. But his writings show that he never really shook off the influence of his classical training. Jerome's hermit life began in 374, in the desert of Chalcis (the Syrian Thebais), where he studied Hebrew with a converted Jew. After visiting Antioch and Constantinople, where he met Gregory of Nazianzus, Jerome spent three years in Rome (382-385), in close association with Pope Damasus, at whose wish he commenced his translation of the Scriptures into Latin. His Roman career began with great popularity, but ended with unpopularity and bitter quarrels. During these years he became acquainted with certain noble Christian ladies, especially Marcella and Paula, who were devoted to the Church and aided it with their wealth. Paula and her daughter, Eustochium, accompanied Jerome to the East, where they settled at Bethlehem (386). Here Paula built a monastery for men, over which Jerome presided, and cloisters for women, which were under her own direction. Jerome spent the remaining 35 years of his life here, engaged in study and writing, in the practice of asceticism, and in theological controversies.

Jerome's life and work illustrate the combination and conflict of pagan and ascetic Christian ideas, so common in the fourth century. He has been described as a precursor of the Humanists, but this takes into account only one side of his character. He was also an exponent of the monastic ideal, whose growth he furthered, particularly in the West. His later life was filled with theological controversies in which he sometimes displayed an extreme asperity. For the history of his age, Jerome's numerous writings are of the highest value. His Latin translation of the Bible, far superior to any of the Latin versions which preceded it, lies at the basis of the Vulgate. (See BIBLE.) He also wrote commentaries on several books of the Bible. His work entitled *Illustrious Men* (*De Viris Illustribus*), written in 392, is a series of 135 short biographies of Christian leaders, beginning with St. Peter and ending with Jerome himself. It was largely compiled from the *Ecclesiastical History* of Eusebius. He trans-

lated and continued Eusebius' *Chronicle*. (See EUSEBIUS OF CÆSAREA.) More than 100 of his *Letters* have been preserved, in which many varying topics are discussed in a very interesting and lively way. This collection was much read throughout the Middle Ages. Among his ascetic treatises the *Twenty-second Epistle*, addressed to Eustochium, is one of the most famous. Other similar treatises are the lives of Paul of Thebes, of St. Hilarion, and of Malchus, and the bitter polemics against Jovinian and Vigilantius. Jerome became involved in warm disputes with his old friend Rufinus—over the theology of Origen, which he came to oppose bitterly—and with the Pelagians. The most interesting part of his correspondence is with Augustine, who had great respect for him, but disagreed with some of his positions.

Jerome's works were first edited by Erasmus (9 vols., Basel, 1516–20). The best edition is by Vallarsi (11 vols., Verona, 1734–42; Venice, 1766–72; reprinted by Migne in *Patrol. Lat.*, vols. xxii–xxx). The best edition of the *De Viris Illustribus* is by Richardson, in *Texte und Untersuchungen*, vol. xiv (Leipzig, 1896). An English translation of his principal works is in *The Select Library of Nicene and Post-Nicene Fathers*, edited by Schaff and Wace, vols. iii and vi (New York, 1892 et seq.).

Bibliography. Ebert, *Geschichte der Litteratur des Mittelalters* (Leipzig, 1889); Dill, *Roman Society in the Last Century of the Western Empire* (London, 1899); Glover, *Life and Letters in the Fourth Century* (Cambridge, 1901); Bardenhever, *Patrologie* (Freiburg, 1901). For his life, consult also: Zöckler (Gotha, 1865); Cutts (London, 1878); Martin (ib., 1888); Farrar, *Lives of the Fathers*, vol. ii (Edinburgh, 1889); Grützmacher (Berlin, 1901, 1906, 1908).

JEROME, THOMAS SPENCER (c.1863–1914). An American classical scholar, son of a rich miner and railway man who became Governor of Michigan. He graduated at the University of Michigan in 1884, studied law there and at Harvard, and practiced in Detroit for a few years. Then, with his friend C. W. Freer, he settled in Capri, Italy, where he became consular agent and began a great critical study of Roman history, which was interrupted by his sudden death. His published work, *Roman Memories in the Landscape Seen from Capri* (1914), made up of his miscellaneous notes and brought out at the very time of his death, is a brilliant example of modern psychological analysis of the Latin historians.

JEROME, WILLIAM TRAVERS (1859–). An American lawyer, born in New York City. He received his academic training at Williston Seminary, at a preparatory school in Switzerland, and at Amherst College. On account of ill health he was forced to leave college in the junior year, but in 1892 was given an honorary A.M. degree. In 1884 he graduated from the law school of Columbia University. As assistant district attorney of New York County in 1888–90, and as assistant counsel for the Lexow Committee (see LEXOW, CLARENCE), he gained a first-hand knowledge of criminal conditions in the city. In 1895 he managed the anti-Tammany campaign which brought about the election of Col. A. L. Strong as mayor. Appointed by Strong a judge of the court of special sessions, he served until 1901, when he was elected district attorney on the Democratic

ticket. He proceeded to reorganize the office force and began an energetic prosecution of gambling houses—in order to be in close touch with conditions taking up his residence and opening an auxiliary office on the East Side; and he drew up and advocated before the Assembly a bill which granted immunity to witnesses in the gambling-house cases. The honesty and efficiency with which he conducted his office made him widely popular irrespective of party; and when, in 1905, he ran for reelection on an independent ticket, he received contributions from many States of the Union. He made a vigorous campaign and was elected. In his second administration he conducted the prosecution in both of the trials of Harry K. Thaw for the murder of Stanford White (q.v.). In 1908 he was severely censured by the press for failure to prosecute certain individuals charged with crime. Governor Hughes appointed a commissioner to investigate the charges, and Jerome was entirely exonerated. After Thaw had been sent to Matteawan State Hospital for the Criminal Insane, and a legal fight for his release had been begun, in 1913 Jerome was retained as counsel by the State Attorney-General. His success in this contest was followed by Thaw's sensational escape to Canada. Again the former district attorney's services were secured, but in January, 1915, without public explanation, he was dropped from the case. (See THAW CASE.) Jerome published *Liquor Tax Law in New York* (1905).

JEROME OF PRAGUE (?–1416). The associate of John Huss. He was born at Prague in the latter half of the fourteenth century. After attending the university of his native town, he continued his studies at Oxford, Heidelberg, Cologne, and Paris, where he attracted attention by his defense of Wiclif. He took his master's degree at Paris and taught there and also at Cologne. After a journey to Jerusalem he returned to Prague in 1407 and began to introduce the writings and opinions of Wiclif in his native land. His reputation for learning was so great that his advice was taken by Ladislas II, King of Poland, with respect to the reorganization of the University of Cracow in 1410. He entered into the contest carried on by his friend Huss with more zeal than judgment. He publicly trampled the relics under his feet, committed to prison the monks who did not share his opinions, and even ordered one of them to be thrown into the Moldau. When Huss was arrested at Constance, Jerome hastened to defend him, but not receiving a safe-conduct, for which he had applied, set out to return to Prague. He was arrested at Hirschau, April, 1415, and conveyed in chains to Constance. Here he was cast into a dungeon and placed on trial. After some months' imprisonment he recanted his opinions, September, 1415, but in May, 1416, abjured his recantation with horror, and was burned at the stake, May 30. Consult William Gilpin, *Lives of John Wicliff and of the most Eminent of his Disciples* (New York, 1814), and the life by Heller (Lübeck, 1835) and by Becker (Nördlingen, 1858). See HUSS, JOHN; CONSTANCE, COUNCIL OF.

JERRARD, jër'ärd, GEORGE BIRCH (c.1803–63). A British mathematician, son of a major general. He studied at Trinity College, Dublin, graduating B.A. in 1827. His *Mathematical Treatises* (1832–35) and *Essay on Resolution of Equations* (1859) marked him as the prede-

cessor of Cayley and Cockle among English writers on the theory of equations.

JERROLD, jēr'old, DOUGLAS WILLIAM (1803-57). An English humorist, born in London. Though Douglas was sent to school, he mostly educated himself, reading, as time went on, Latin, French, Italian, and the English dramatists. From time to time as a boy he appeared on the stage. He took a child's part in *The Stranger*, and acted in *The Painter of Ghent* in 1835, and played Master Stephen in *Every Man in his Humour* in 1845; but he disliked acting. In 1813 he was appointed midshipman in the royal navy. After the Napoleonic wars he found employment in London as a printer's apprentice and as compositor. After some success at dramatic criticism he began writing for the stage. His first comedy, *More Frightened than Hurt*, written in 1818, was well received at Sadler's Wells Theatre in 1821. *Beau Nash*, a three-act comedy dealing with the history of the gambler Richard Nash (q.v.), was played at the Haymarket and published in 1825. But his great success was *Black-Eyed Susan*, which ran for 300 nights at the Surrey Theatre in 1829. Thereafter he wrote many comedies and farces, among which are *Time Works Wonders* and *The Bubbles of a Day*. In the meantime he was contributing essays and sketches to the magazines, from which he made a collection, *Men of Character* (1838). In 1841 he joined the staff of *Punch*, where first appeared (1846) the popular *Caudle Lectures*. He became in 1852 editor of *Lloyd's Weekly* newspaper. Among his works are *The Story of a Feather* (1844) and *The Chronicles of Clovernook* (1846). Though not a great writer, Jerrold was one of the most brilliant wits of his time. Consult W. B. Jerrold, *Life and Remains of Douglas Jerrold* (London, 1859), and W. C. Jerrold, *Douglas Jerrold and Punch* (New York, 1911).

JERROLD, WILLIAM BLANCHARD (1826-84). An English journalist and author, eldest son of Douglas Jerrold. He was born in London. He studied art and did some good work in illustration, but defective sight compelled him to abandon his profession for literature. On the death of his father, in 1857, he became editor of *Lloyd's Weekly*, a position that he held till his death. In this paper Jerrold advocated the interests of the working classes. During the Civil War in the United States he took the side of the North. He also had a leading hand in founding the International Copyright Association, of which he was president. He wrote four successful comedies and farces, of which the best known is *Cool as a Cucumber*, produced at the Lyceum Theatre in 1851. Of his several novels, *Up and Down in the World* (1863) was most read. Two solid works from his pen are *Life and Remains of Douglas Jerrold* (1859) and *Life of Napoleon III* (4 vols., 1874-82).

JERSEY. The largest and southernmost of the Channel Islands (q.v.), lying 15 miles north of the French coast, 17 southeast of Guernsey, and 88 southeast of Portland Bill (Map: France, N., C 3). It is of oblong form, 11 miles long, 4 to 6 miles wide, with an area of 45 square miles. It has a bold and lofty northern coast, with picturesque rocky inlets, and slopes to the south, east, and west, where it is indented by large open, sandy bays. The interior is mostly table-land, well wooded, especially in the valleys along the many winding streams which intersect the island. Various fruits, potatoes, and toma-

atoes are important crops. Jersey is divided into 12 parishes. The principal town, Saint Helier (q.v.), is connected by rail with Gorey village and harbor on the east, dominated by the imposing mediæval castle of Mont Orgueil; and on the west with the small, neat town of Saint Aubin, the line also extending to the Corbière, the southwest extremity of the island, where is a notable lighthouse. A fine panoramic view of the island is obtained from La Hogue Bie, or Prince's Tower, a building raised on a prehistoric tumulus. Jersey is famous for its breed of cattle (cattle in 1911 numbered 12,031). The island gave its name to New Jersey in 1664. It is the seat of a United States consular agent. Pop., 1891, 54,518; 1901, 52,576; 1911, 51,898. Consult: Noury, *Géologie de Jersey* (Paris, 1887); Black, *Guide to the Channel Islands* (11th ed., London, 1902); G. F. Carey, *Channel Islands* (New York, 1904); J. E. Morris, *Channel Islands* (ib., 1911).

JERSEY, THE. The hulk of a 64-gun vessel in Wallabout Bay, Brooklyn, used by the British as a prison ship during the Revolution. The ship was never cleaned and for seven years was a centre of disease. It held 1200 prisoners. During her use as a prison ship 11,000 are said to have died and been buried on the Brooklyn shore. In 1902 the sunken hulk was discovered during operations connected with the building of a dock on the spot. Consult T. Andros, *The Old Jersey Captive* (Boston, 1833), and *Recollections of the Jersey Prison-Ship from the Original Manuscript of Captain Thomas Dring, One of the Prisoners*, edited by H. B. Dawson (Morrisania, N. Y., 1865).

JERSEY BLUE. An American breed of large domestic fowls, having a bluish plumage. The breast and fluff are light blue; hackle and sickles, blue black; feet, dark blue. They are not popular, either as table fowls or as egg producers, but are hardy and easily kept.

JERSEY CATTLE. See CATTLE.

JERSEY CITY. The second largest city of New Jersey, and the county seat of Hudson County; an important railroad terminal point and a commercial and manufacturing centre (Map: New Jersey, D 2). It is on the peninsula formed by the Hudson River on the east and the Hackensack River and Newark Bay on the west and is opposite New York City, connected by steam ferries and the passenger tunnels of the Hudson and Manhattan Railroad. The Morris Canal has its eastern terminus in the city. The Central of New Jersey, the Erie, the Pennsylvania, the Lehigh Valley, and the West Shore railroads, whose depots are used by a number of other roads, also terminate here. The steamers of several transatlantic steamship companies sail from this port.

The city occupies an area of 12,288 acres and includes six small parks which comprise about 20 acres, and a new county park of 200 acres. It has good electric-railway service, the lines connecting with Newark, the Oranges, Rutherford, Passaic, Paterson, and towns in Hudson and Bergen counties. There are very few unpaved streets in Jersey City. Many of the avenues on the hill section back of the main portion are noteworthy for beautiful residences. In the western part of the city is the magnificent Hudson Boulevard, which extends through the entire length of Hudson County, 14 miles, and 5 miles into Bergen County. Since the completion of the Hudson tunnels this avenue is being

filled with apartments. Among the more prominent buildings are the city hall, with a soldiers' and sailors' monument; the Fourth Regiment Armory; many new public schools; St. Francis, Christ, and city hospitals; a new post office; the public library, containing over 100,000 volumes; a courthouse erected in 1910 at a cost of \$3,300,000; a historical museum, in which are preserved many Colonial documents of interest; and the People's Palace, a nonsectarian amusement institution built by Joseph Milbank and presented to the First Congregational Church. St. Peter's College (Roman Catholic), opened in 1878 and at present attended by about 450 students, is a well-known institution of learning. Besides 15 parochial schools, which provide for 12,500 pupils, there are in the city 34 public elementary schools and 2 high schools with accommodations for 38,000 pupils and having a property valuation of \$5,800,000. There are several convents and a full equipment of asylums, homes, and other charitable institutions.

Jersey City is almost inclosed by water, thus affording excellent docking facilities, which, with its railroad connections, have aided its development as a shipping and receiving point, though officially it has no identity as a separate port, since its returns are included in those of the customs district of New York. It has also large slaughtering and meat-packing interests and extensive manufactures. The Pennsylvania and Erie railroads have large grain elevators here, and there are plants of the American Sugar Refining Company, Colgate and Company, and the Lorillard tobacco factories, which rank with the largest. Among products of other industrial establishments are candles, crucibles, lead pencils, patent iron dump carts, gas engines, compressed gas, glass, locomotives, railroad cars, iron and steel, zinc, copper, boilers, planing mill, foundry and machine-shop products, chemicals, paints, paper boxes, canned soups, motion-picture films, cordage, oakum, jewelry, and pottery.

Jersey City was the first large city in the East to institute a commission form of government, which in 1913 superseded the former administration. It was adopted in April, 1913, and the first primary election was held in May. The number of persons desiring office was reduced to 10, and in the final election, held in June, five commissioners were chosen. These then assumed the control of the municipal government. They are elected for four years, and one of their number is chosen mayor. He receives a salary of \$5500. The other four members of the commission are paid \$5000 a year. They are known as the commissioners of public safety, of streets and public improvements, of revenue and finance, and of parks and property. These men have legislative as well as executive power, and the laws made by them are known as ordinances. The board of education consists of 13 members, one from each city ward and one at large, appointed by the executive. The city appropriated, in 1914, \$3,707,500, of which \$273,000 went to the department of public affairs, \$82,000 to revenue and finance, \$551,000 to streets and public improvements, \$1,306,000 to public safety, \$183,000 to parks and public property, \$549,907 for schools, and \$19,000 for the municipal law department.

Pop., 1850, 6856; 1900, 206,433; 1905, 232,699; 1910, 267,779; 1914 (U. S. est.), 293,921.

In 1638 Abraham Isaacson Planck, a Dutch-

man, bought the land on which Jersey City stands. Later it passed into the hands of another Dutchman, Michael Pauw, and from him the old name Paulus Hoeck, or Hook, was derived. In 1776 fortifications were thrown up here by the Americans, but were captured later in the year (September) by the British. On Aug. 19, 1779, Lieut. Col. Henry Lee, "Light Horse Harry," with about 200 men, surprised the English garrison, and, with a loss of only two killed and three wounded, secured 159 prisoners, partially destroyed the works, and returned in safety. The exploit is regarded as one of the most brilliant feats of the Revolution. The British retook the place and remained in possession until the close of the war. In 1804 a town was laid out and incorporated as the city of Jersey. In 1820 it was reincorporated, this time as Jersey City, but did not become a distinct municipality until 1838. Bergen and Hudson were annexed in 1869 and Greenville in 1873, and a new charter was secured in 1889. Consult: S. A. Green, "Capture of Paulus Hook," in *Historical Magazine*, vol. iv (2d ser., Morrisania, N. Y., 1868); Alexander McLean, *History of Jersey City* (Jersey City, 1895); H. P. Eaton, *Jersey City and its Historic Sites* (ib., 1899); W. G. Muirheid (ed.), *Jersey City of To-Day* (2d ed., ib., 1910); Daniel Van Winkle, "Powles Hoek and Old Jersey City," in *Historical Society of Hudson County Papers*, No. 9 (ib., 1913).

JERSEY SHORE. A borough in Lycoming Co., Pa., on the Susquehanna River, 15 miles west by south of Williamsport, on the New York Central and Hudson River and the Pennsylvania railroads (Map: Pennsylvania, G 4). It is located in a farming district and has railroad shops, cigar factories, a foundry, and a large silk mill. Pop., 1900, 3070; 1910, 5381.

JERSEYVILLE. A city and the county seat of Jersey Co., Ill., 66 miles southwest of Springfield, on the Chicago, Peoria, and St. Louis and the Chicago and Alton railroads (Map: Illinois, D 7). It has a Carnegie library and a fine courthouse. The county fair grounds are located here. The city is the centre of a fertile agricultural region, carries on a considerable trade in produce, fruit, grain, live stock, etc., and has manufactories of shoes. Settled in 1839, it was first incorporated in 1867. The government is administered under a revised charter of 1897, which provides for a mayor, elected biennially, and a council. Jerseyville owns its water works. Pop., 1900, 3517; 1910, 4113.

JERUSALEM (Heb. *Yērūshālayim*, Gk. *Ἱερουσαλήμ*, *Hierousalēm*, Lat. *Hierosolyma*). The chief city of Palestine (Map: Palestine, C 4). The name is of great antiquity, being found on seven of the Tell el-Amarna letters written by Abdi-chiba, ruler of the city, to his master, Amenophis IV of Egypt, c.1400 B.C. (See AMARNA LETTERS.) The original form as found on these tablets was *Urusalim*. On the inscriptions of the Assyrian kings it is spelled *Urusalimmu*. The meaning of the word is uncertain. In the early period of their occupation of Canaan the Hebrews also called it "the city of the Jebusites" or "Jebus" (Judg. xix. 10-11). The fortified part of the old Jebusite city was also called Zion (cf. 2 Sam. v. 7). The city rebuilt on the old site by the Emperor Hadrian (136 A.D.) was named by him *Ælia Capitolina*, but the ancient name continued in use. The Mo-

ammedans call it el-Kuds (the holy). See special map with PALESTINE.

The Modern City. The dome of the church of the Holy Sepulchre is located in lat. 31° 46' 45" N., long. 35° 13' 25" E. The city is distant 33 miles from the Mediterranean and 15 miles from the northern end of the Dead Sea. It is situated on a spur from the main ridge or watershed of Palestine, which runs out eastward for a mile and a half and then deflects to the south for nearly the same distance. On three sides—east, south, and southwest—the city is bounded by deep ravines. The plateau thus formed was originally broken by minor valleys and hills. The highest summit was at the southwest angle. Between this broad western hill and the eastern part of the spur was a valley—the Tyropœon (i.e., the cheese makers). The eastern hill, with several distinct summits, was somewhat long and narrow, sinking rapidly at its southern end. The three valleys, the Kidron on the east, the Tyropœon in the middle, and that of Hinnom on the south and west of the western hill, unite south of the city. At their junction the elevation is about 2000 feet above the sea. The summit of the western hill is over 2500 feet above sea level, that of the eastern somewhat less. For its water supply Jerusalem depends mainly on artificial pools to which water is brought from a distance or on cisterns which conserve the water of the rainy season. The only perennial spring is the Virgin's Fountain, called Gihon in the Old Testament, located in the Kidron valley about one-third of a mile north of the junction of the three valleys. At the junction there is another spring, Bir Eyub (Job's well), called En Rogel in the Old Testament, which, however, is supplied by the surface drainage of the valleys and fails during the dry season of the year. The upper portion of the Tyropœon and several minor ravines are now almost entirely obliterated by the accumulated rubbish of 3000 years' checkered history. The climate of the city is not unhealthful, but the unsatisfactory sanitary conditions produce frequent outbreaks of fever and other epidemics. The mean annual temperature is about 62°, the extremes being 25° and 112°. The annual rainfall averages a little over 23 inches. The Jerusalem of to-day is surrounded by a long and tortuous wall, built by Soliman the Magnificent in the first half of the sixteenth century and practically coinciding with the fortifications of the city at the time of the Crusades. The wall is surmounted by 38 towers and is pierced by eight gates, of which the most important are the Jaffa Gate on the west, the Damascus Gate on the north, and the newly opened Gate of Abd-ul-Hamid, a short distance north of the Jaffa Gate. The inner city is divided into four parts. The Mohammedans occupy the northeastern and largest portion adjoining the Haram esh-Sherif; the Armenians live in the southwest, the Jews in the southeast, and the Christians in the northwest adjoining the outer city. The town is laid out irregularly, and the space is unqually distributed. The streets are narrow, tortuous, and dirty. The Jerusalem of the present, with its mercantile houses, hotels, stores, various educational and philanthropical institutions, has very little suggesting the city of the past. The historical interest of the city centres around the Haram esh-Sherif (the site of the temple; see TEMPLE AT JERUSALEM; OMAR, MOSQUE OF), the church of

the Holy Sepulchre, and the Via Dolorosa (q.v.). Of the modern religious edifices may be mentioned the Latin patriarchal church, the German church of the Redeemer, the French church of Sainte-Anne, the Coptic and the Franciscan monasteries, and the Armenian patriarchal buildings. The outer town, which has grown up since 1858 to the northwest of the old city, contains many Christian churches and hospices, hospitals, schools, missions, and monasteries, as well as consulates and many private residences. In the neighborhood are a number of Jewish colonies. In regard to sanitary conditions the outer city is not above Jerusalem proper. The city is connected by carriage roads with Jaffa, Bethlehem, Hebron, and Jericho, and by a narrow-gauge railway line (54 miles), operated by a French company, with Jaffa. The chief industry of Jerusalem is the manufacture of articles from olive wood and mother-of-pearl. The trade is chiefly in the hands of the Jews. Administratively the city is the capital of a sanjak and has two councils, in which the recognized religious communities are represented. Jerusalem is the seat of a Roman Catholic, a Greek Catholic, and an Armenian patriarch, an Anglican bishop, and numerous consuls. The permanent population, which has been increasing rapidly during recent years, is estimated at 50,000 to 60,000, of whom the Jews constitute over one-half, the Mohammedans exceeding 7000, and the Christians numbering over 10,000. The annual number of pilgrims and tourists is estimated at an average of 15,000.

The Ancient and Mediæval City. Of the history of Jerusalem up to the time of David very little is known. The notices in the Tell el-Amarna letters and the statement in Gen. xiv. 18 only show that it was a place of some importance long before the Hebrew occupation. The account of the conquest of the region south of Jerusalem by the tribe of Judah (Judg. i. 8, 21, in which verse 8 seems to be a late gloss, and verse 21 is to be corrected according to Josh. xv. 63) shows that the city was too strongly fortified to be taken. With this the other ancient reference (Judg. xix. 10-12) agrees. It remained a Jebusite city until its capture by David. Its King, Adoni Zedek, was captured, it is true, by Joshua at the battle of Makkedah (Josh. x. 5-26), but the city remained in the hands of the Canaanites.

When David became King over all Israel (2 Sam. v. 1 et seq.), he discerned the advantages of Jerusalem and determined to make it his capital and sanctuary. He succeeded in taking it from the Jebusites and at once set about improving and fortifying it as the seat of his kingdom (2 Sam. v. 6-12). Soon after he removed thither the ark of Jehovah from its obscurity at Kirjath-Jearim (2 Sam. vi; 1 Chron. xi. 4-9). On the basis of the description by Josephus (*Jewish War*, v, 4, 1) the long-current opinion has been that the citadel taken by David and the city which he walled and improved occupied the high southwestern hill. But excavations and discoveries of remains of old walls and other ancient structures during the past 40 years have resulted in the accumulation of a body of evidence which necessitates an entirely different view. This newer view alone agrees with the incidental topographical notices in the Old Testament. The citadel of the Jebusites was on Ophel, the southern part of the eastern hill, east of the Tyropœon valley.

JERUSALEM

THE MOSQUE OF OMAR AND THE HARAM ESH-SHERIF

Between it and the other summit to the north, which was later occupied by the temple, but was then used as a threshing floor (cf. 2 Sam. xxiv. 15-25; 1 Chron. xxi. 18-30; xxii. 1; 2 Chron. iii. 1), lay a depression, afterward gradually filled up by later building operations. It was thus isolated on all sides. At the foot of its eastern slope was the only natural spring in the vicinity, anciently called Gihon (1 Kings i. 33, 38, 45; 2 Chron. xxxii. 30; xxxiii. 30), afterward named the Virgin's Fountain, while the surrounding hills and valleys were waterless. The slopes were steep and easily fortified. The exact location of David's palace and other buildings (cf. Neh. iii. 16) is not known, nor the extent of the fortifications built by him. This hill, originally called Zion, now became known also as the City of David. It is probable that the Tyropæon valley to the west and the southern and eastern slopes of the western hill were settled to some extent. David or Solomon may have thrown a wall (the first wall of Josephus' description) about these settlements, though no satisfactory evidence of this is at hand. This wall ran about due west from the southwest corner of the temple hill as far as the northwest corner of the southwestern hill; then, turning southward and swinging around the southern slopes of this hill, it crossed over to the south of Ophel, there joining the fortifications of the City of David. The chief feature of David's fortifications was Millo (literally "filling," probably a rampart or embankment constructed by filling in between retaining walls), often mentioned, but not yet identified.

What David began his son Solomon enlarged. On the hill north of the somewhat small and unpretentious palace of David he built a series of buildings on a scale of magnificence hitherto unknown in Israel. After the necessary leveling of the surface, which involved the partial filling up of the depression between Zion and the northern hill, and the laying of the substructures, especially heavy retaining walls on the south, west, and east faces of the north hill, Solomon built (1) a new royal palace with its adjuncts and (2) a sanctuary or temple. The palace was a complex of buildings consisting of the house of the forest of Lebanon, constructed of cedar pillars and beams, 50 cubits wide, 100 long, and 30 high, a throne hall, 30 × 50 cubits, with porticoes, and the palace proper or royal dwelling; somewhere near were apartments built for his Egyptian queen and also the prison (1 Kings vii. 1-12; Jer. xxxii. 2; Neh. iii. 25-27). These buildings were arranged in the order given from south to north, the house of the forest of Lebanon being nearest David's old palace, the royal dwelling being nearest the temple. They were not all on the same level, but were on successive terraces, the palace occupying the highest. On a still higher elevation than the palace were the courts and buildings of the temple. The temple (see 1 Kings vi and vii. 13-50) was built on the site of the threshing floor of Araunah (1 Chron. xxii. 1). The main building was of great beauty, though comparatively small (20 × 60 cubits, exclusive of the vestibule or porch and the side chambers, 1 Kings vi. 3-6), of stone and cedar. At the entrance stood two large bronze pillars of symbolic significance (1 Kings vii. 15-22). It was surrounded by a court in which were the altar of burnt offerings and the great molten sea or reservoir (1 Kings vii. 9-12, 23-47). A

passageway led from the court to the palace below (2 Kings xi. 13, 16; xvi. 18). At the dedication of the temple the ark was "brought up" from the City of David (1 Kings viii. 1, 3; cf. ix. 24) to the new sanctuary. To the temple mount, now considered the dwelling place of Yahwe, Israel's God, the name Zion was transferred (cf. Amos i. 2; Mic. iv. 2; Isa. viii. 18, etc.). The temple and palace area were encircled by a strong wall. The city of Solomon was thus larger and more magnificent than that of David. The great buildings and main fortifications were still mostly, if not entirely, on the eastern hills. Thence the city gradually spread westward, covering the slopes of the Tyropæon valley and the western hills. With the secession of the northern tribes from the rule of the house of David (c.933 B.C.) Jerusalem's importance was diminished. For nearly two centuries it was barely able to hold its own. It was captured several times, and not until the prosperous reigns of Uzziah and his son Jotham (2 Chron. xxvi, xxvii) were extensive improvements undertaken. They greatly strengthened the fortifications by building strong towers near the gates and at the corners of the wall. Hezekiah (c.720-689 B.C.), having rebelled against Sennacherib, King of Assyria, and realizing that his capital was likely to be besieged by the Assyrian invaders, paid especial attention to the fortifications and the water supply. In place of the extramural surface conduit that conducted the waters of Gihon along the eastern and then across to the western side of Ophel he had an underground conduit tunneled a distance of 1700 feet to convey the water of Gihon to the Pool (or reservoir) of Siloam, on the southwest slope of Ophel, near the mouth of the Tyropæon valley. This conduit was discovered in 1886 by Dr. Schick. An old Hebrew inscription on the wall of the tunnel about 25 feet from the Pool of Siloam tells of the meeting of the two parties of workmen working towards each other in constructing the tunnel. (See SILOAM.) The pool was hewn out of the rock and measured 71 feet north and south by 75 feet east and west. Stone steps led down to it. Lower down the valley Hezekiah constructed a new reservoir to hold the overflow of Siloam. Walls and fortifications for the protection of these works were also erected (cf. Isa. xxii. 7-11; 2 Kings xx. 20; 2 Chron. xxxii. 5; 2 Kings xxv. 4). Doubtless the city by this time contained also numerous cisterns for holding surface water. The surplus waters of Siloam were used for the royal gardens about the southern slope of Ophel. Sennacherib did not lay regular siege to Jerusalem, and for nearly 100 years after Hezekiah the city was in comparative peace. Samaria had been captured in 722 B.C., and Jerusalem was now without a rival in Palestine, though Judah was but a vassal state of the Assyrian Empire. The city grew; in the reign of Josiah (639-608 B.C.) we read of a "second quarter" of the town (2 Kings xxii. 14; Zeph. i. 10), and the mention of numerous gates in Jeremiah and in Nehemiah's account of his reconstruction of the old walls makes it likely that by the time of the capture by Nebuchadnezzar the city wall inclosed the "second quarter" as well as the southwestern and eastern hills. This wall, perhaps begun by Hezekiah (see above), probably extended westward from the temple area, which was already well fortified, along the line of Josephus' second wall

(*Jewish War*, v, 4, 2). After submitting to Nebuchadnezzar (597 B.C.), the city rebelled and in 587-586 sustained a long and terrible siege of one year, five months, and seven days. On its capture the temple was burned, the walls broken down, the city laid in ruins, and the best part of the population deported (2 Kings xxiv and xxv; also Jeremiah and Ezekiel, *passim*).

For 50 years the city was a desolation. In 536 B.C. Cyrus gave permission to the Jews in Babylonia to return to Palestine. Upward of 50,000 availed themselves of the opportunity. But as the royal decree had contained no permission to rebuild the city walls, the second temple, on the same site as the old one, but less pretentious, and completed about 516, was at first without walls (Ezra i-vi; see also Haggai and Zech. i-viii). No permanent success in walling the city that again began to grow up near the temple was achieved until the arrival of Nehemiah (c.445 B.C.) as royal governor. This energetic man retraced and rebuilt the old wall of preëxilic days in the remarkably short time of 52 days, putting the whole available population at work. The description contained in Neh. ii. 12-16 and iii is an invaluable source for the topography of the old city, but details must be omitted here. The city area thus walled in being sparsely inhabited, Nehemiah persuaded many to take up their residence there (xi. 1 et seq.). The adoption of Ezra's "book of the law," corresponding practically to the "priestly" portion of the Pentateuch, as the constitution of the community completed the transition from the old Hebrew religion to Judaism, and of Judaism Jerusalem now became the head. Foreigners were, as far as possible, excluded from citizenship. (See Ezra ix-x and Neh. ix-xiii.) In Nehemiah's restoration the old palaces of the preëxilic city were not rebuilt.

From Nehemiah to Alexander's conquest of the East, Jerusalem enjoyed a century of quiet prosperity under Persian rule. Whether the conqueror visited the city is doubtful. For 100 years after Alexander, Jerusalem was subject to Egypt, and though Ptolemy I is said to have worked some devastation (Josephus, *Ant.*, xii, 1), this century was one of prosperity. The high priest Simon II (c.220-200 B.C.) was an able ruler and did much to improve the city (see *Ecclus.* i. 1-4). In 197 B.C. Jerusalem passed to the control of the Græco-Syrian Kingdom of Antioch. The growth of a liberal Hellenistic party in Jerusalem and the opposition it stirred up led to troublous times. At the accession of Antiochus IV Epiphanes (175 B.C.), Jason, a member of the pro-Greek party, was appointed high priest, and a gymnasium was erected in Jerusalem. These measures enraged the conservative element, and so bitter was the opposition that Antiochus IV in 168 B.C. determined to put an end to the Jewish faith. Great massacres took place in Jerusalem, the walls were broken down, a strong fortress, called the Akra, built on the site of the old City of David, was filled with a Syrian garrison, and finally, in December, 168, the temple was defiled, the altar polluted by sacrifice of swine and by the erection thereon of an altar (or statue) to Jupiter. This was the "abomination of desolation" (cf. Dan. xi. 31; 1 Macc. i; 2 Macc. iii-vii; and Josephus, *Ant.*, xii, 5, 1-4). After the first victories of Judas Maccabæus, a priest of a family called Hasmonæan, and his brothers,

the temple was purified, worship restored (165 B.C.), and the temple hill strongly fortified. In 142 B.C. the Syrian garrison evacuated the Akra, or fortress of the City of David, south of the temple (1 Macc. xiii. 49-53). The Jews, under the leadership of Simon Maccabæus, now restored and greatly strengthened the old walls (1 Macc. xiv. 37). One great change was wrought by Simon in the general appearance of the city. The hill on which the old City of David had stood was leveled and greatly reduced in height so as to make the temple hill command the whole eastern part of the city. The result was that the depression between the two eastern hills was now entirely filled up, and its existence was soon entirely forgotten (Josephus, *Jewish War*, v, 4, 1, according to the correct interpretation).

Under the Hasmonæans Jerusalem entered on an unprecedented era of prosperity. It was now the great pilgrim shrine of the Jewish world. A palace was built on the hills west of the temple mount, the Tyropœon valley being bridged to permit of easy access to the temple. The tower of Hammeah (Neh. iii. 1) northwest of the temple was also greatly strengthened. The capture of the city by Pompey (63 B.C.) entailed no serious disaster. The acme of prosperity was attained under Herod the Great (37 B.C.). Besides a complete reconstruction of the temple on a scale truly magnificent, involving the expenditure of vast sums of money, he built the Xystus, an open place surrounded by a gallery beneath the palace of the Hasmonæans, his own great palace on the western side of the western hill, with its three massive towers Phasaël, Hippicus, and Mariamne, the large reservoir Amygdalon north of the palace, a hippodrome probably south of the temple mount, and a theatre somewhere in the south part of the city. In addition to these great works many minor improvements were made, such as paving, draining, leveling, and the general strengthening of the fortifications. Other improvements were undertaken after Herod's day, such as the palaces built by the royal family of Adiabene on the southern extension of the temple hill (Josephus, *Jewish War*, iv, 9, 11; v, 6, 1; vi, 6, 3), the enlargement of the Hasmonæan palace by Agrippa II in 62 A.D. (Josephus, *Ant.*, xx, 8, 11), and the third wall, begun by Agrippa I (41-44 A.D.), completed shortly before the siege by the Romans, rendered necessary by the growth of the city to the northwest and north. Such was the Jerusalem of New Testament times. According to Josephus, the different quarters of the city were known as (1) the upper city, i.e., the high southwest hill; (2) the temple area; (3) the lower city or Akra, the portion of the eastern hill south of the temple hill; (4) the new city, or Bezetha, i.e., the quarter north of the temple hill; and (5) the northern quarter, i.e., north of the old (first) wall and west of the temple (cf. Josephus, *Jewish War*, v, 4, 1).

This city, with its beautiful palaces and more beautiful temple, was laid in ruins in the terrible siege and capture by the Romans under Titus in 70 A.D. (cf. Josephus, *Jewish War*, books v, vi, and vii, 1, 1). Only a few remnants of the western fortifications were left standing. With this catastrophe the history of ancient Jerusalem came to its close.

The History and Topography of Modern Jerusalem. For 60 years Jerusalem was practically in ruins. About 130 the Emperor Ha-

drian visited it and determined to rebuild it. The desperate rebellion of the Jews under Bar Cochba led him to make it a pagan city and prohibit all Jews from entering it. The new city was called *Ælia Capitolina*. The wall with which Hadrian encircled it was, in general, on the line of the old wall, except on the south, where it left a large portion of the old city, including the whole of the City of David, outside the inclosure. The rebuilding caused a great change in the levels, owing to the vast accumulation of rubbish rendering the whole surface more uniform than that of the old city had been. In some places the former city was buried to a depth of 80 feet, making identifications of many ancient places uncertain, if not impossible.

Nothing is known of the city from Hadrian to Constantine the Great. The pagan population was gradually supplemented by Christians. With the recognition of Christianity as the religion of the Empire, pilgrims began to flock to Jerusalem to visit the holy places. The church of the Holy Sepulchre (see *HOLY SEPULCHRE*) was built by Constantine's orders. Other buildings of like character were added as the centuries went by. Jerusalem became a Christian city, the favorite resort of religious devotees from all quarters of Christendom. Among the noteworthy buildings belonging to this period the church of St. Stephen, north of the city, built by the Empress Eudocia (450-460), who also rebuilt the ancient southern wall, and the great church of St. Mary on the temple hill, built by Justinian c.532, deserve mention.

The Christian city, after being captured by the Persians under Khosru in 614, but recovered by the Emperor Heraclius in 628, was taken by the Moslems in 637 under the Caliph Omar. The Christians were treated leniently. A mosque, The Dome of the Rock, was erected about 691 by the Caliph Abd-al Malik over the rock which, in all probability, was the altar place of Solomon's temple. When in 969 the Egyptian Fatimite caliphs became rulers of Jerusalem, the condition of the Christian population became more serious. The Seljuk Turks conquered the city in 1077, and their maltreatment of Christians was one of the chief causes of the Crusades. In 1099 the Crusaders, under Godfrey of Bouillon and others, gained possession of the city. Moslems and Jews were severely treated. Jerusalem was once more a Christian city. The churchmen of the crusading forces immediately set about the election of a patriarch, probably expecting the temporal dominion to go with the spiritual, but the secular princes insisted on the choice of a king. The crown was declined by Raymond of Toulouse, and possibly also by Robert of Normandy. Godfrey of Bouillon was the final choice, though he refused to wear "a crown of gold in the place where his Saviour had worn a crown of thorns," and called himself simply protector of the Holy Sepulchre. The new state won its first victory at Ascalon a few days later and was soon fully organized with Western laws. Godfrey died in a year and was succeeded by his brother Baldwin, Count of Edessa. He succeeded in enlarging his kingdom by the conquest of Arsuf and Cæsarea in 1101, of Acre (Ptolemais) in 1104, of Tripolis in 1109, and of Berytus and Sidon in 1110. The other Christian lordships of the East acknowledged him definitely as their suzerain. He died on his way back from an expedition

against Egypt in 1118, designating as his successor his brother Eustache, or, failing him, his cousin Baldwin of Edessa. The latter being on the spot, the barons decided to avoid an interregnum by crowning him at once. Baldwin II also extended the boundaries of his kingdom. In 1124, with Venetian aid, he made the important conquest of Tyre. His reign was a constant series of conflicts, but before his death, in 1131, the Kingdom reached the height of its power. None the less its existence was precarious; the feudal system, which had been a help in its establishment, now tended to dissension, and under the next King, Fulk of Anjou (1131-43), the decline began. During the minority of Baldwin III (1143-62) Edessa was conquered and destroyed, 30,000 Christians being slaughtered. The news of this disaster called out the Second Crusade, which did nothing to strengthen the Kingdom. Amalric (1162-73) attempted the conquest of Egypt, but was opposed by Saladin, who was now rising to supreme power among the Moslems. In the reign of Guy of Lusignan, whose title came through his wife, Sibylla, mother of Baldwin V, Saladin defeated the Christian army in the decisive battle of Tiberias and on Oct. 2, 1187, took Jerusalem and cast down the cross from the mosque of Omar. The titular kingship came in 1225 by marriage to the Emperor Frederick II, who secured possession of the city (except two mosques) by a treaty with the Sultan Kameel in 1229; but, owing to his conflict with the holy see, he was obliged to crown himself, not a single ecclesiastic being willing to sanction his title. In 1244 the city was stormed by the Kharezmians and passed finally out of Christian hands, and the fall of Acre in 1291 was the definite close of the real history of the Kingdom. The title of King of Jerusalem, however, was for a long time borne by the kings of Naples and Sicily, from whom it passed to the house of Lorraine and, by the marriage of Maria Theresa (1736), to the Hapsburgs. The Emperor Ferdinand I (1835-48) finally renounced it. For further details on the mediæval history, see *CRUSADES*, and consult the authorities there referred to.

Bibliography. For the antiquities of Jerusalem, consult the standard guidebooks, especially Baedeker's (4th ed., London, 1906) or Murray's (ib., 1892). Of the voluminous literature on the city, only the most recent and reliable is selected. The comprehensive articles by the expert witnesses—Guthe, in the *Hauck-Herzog Realencyclopädie*, vol. viii (3d ed., Leipzig, 1896-1913), G. A. and W. R. Smith, in the *Encyclopædia Biblica* (4 vols., New York, 1899-1903), and Conder, in Hastings, *Dictionary of the Bible* (ib., 1914)—are most excellent. *The Survey of Western Palestine, Jerusalem* (London, 1884), by Warren and Conder, contains the results of surveys and excavations up to 1883. The annual reports of the Palestine Exploration Fund (ib., 1883 to date) are invaluable, also the similar reports of the German Palestinian Society (Leipzig). Other publications of the Palestine Exploration Fund may be consulted, particularly Besant and Palmer, *Jerusalem, the City of Herod and Saladin* (4th ed., London, 1899); Conder, *The Latin Kingdom of Jerusalem, 1099-1291* (ib., 1884); and vol. i of the Palestine Pilgrims' Text Society (ib., 1887). For special monographs, consult: Warren, *Underground Jerusalem* (ib., 1876); Mommert,

Topographie des alten Jerusalem (Leipzig, 1893); Buhl, *Geographie Palestinas* (ib., 1896); Bliss and Dickie, *Excavations at Jerusalem* (London, 1898); Freer, *Inner Jerusalem* (ib., 1904); R. Kittel, *Studien zur hebräischen Archäologie*, Heft 4 (Leipzig, 1908); G. A. Smith, *Jerusalem, from the Earliest Times to A.D. 70* (2 vols., New York, 1908); L. B. Paton, *Jerusalem in Bible Times* (Chicago, 1908); Selah Merrill, *Ancient Jerusalem* (New York, 1908); Vincent Hugues, *Jérusalem: Recherches de topographie, d'archéologie et d'histoire* (2 vols., Paris, 1912); C. M. Watson, *Story of Jerusalem* (London, 1912). The general works on Palestine, such as those of G. A. Smith and Robinson, contain valuable material. For the Mohammedan period, consult Le Strange, *Palestine under the Moslems* (London, 1890). The large map published by the Palestine Exploration Fund is most excellent. See Plate of MOUNT OF OLIVES, with the article OLIVES, MOUNT OF.

JERUSALEM, ASSIZE OF. See ASSIZE OF JERUSALEM.

JERUSALEM, COUNCILS OF. A number of councils were held in Jerusalem, of which the following are the most important: 1. The first Christian council, often called the Apostolic Council (Acts xv. 1-31), was held about 51 A.D., to consider questions raised in the church of Antioch concerning the obligation of Gentile Christians to observe the Jewish law. By the decision of the council it was declared to be necessary for such Christians to abstain from (a) meats which had been offered to idols, (b) blood and strangled things, (c) fornication. This council seems to have comprised only one church, that in Jerusalem, though this church may have embraced several local congregations in that city, organized as a church in common. 2. In 335 a council, formed of the bishops who had assembled for the consecration of the church of the Holy Sepulchre, restored Arius to fellowship and allowed him to return to Alexandria. 3. About 346 Maximus, of Jerusalem, and 60 other bishops, on the return of Athanasius to Alexandria, revoked the decree against him and drew up a letter to his church. 4. In 399 a council held in consequence of a letter from Theophilus of Alexandria on the decree passed against the Origenists assented to it and resolved not to have fellowship with any who denied the equality of the Son with the Father. 5. In 553 the acts of the fifth Ecumenical Council (Constantinople) were received by all the bishops of Palestine assembled at Jerusalem, except Alexander of Abilene, who was consequently deposed. 6. The most important council held in Jerusalem was that of 1672. It was convened by Dositheus, Patriarch of Jerusalem, and was composed of more than 60 bishops and other officers in his diocese. Its object was to oppose Calvinism, which had been introduced into the East by Cyril Lucaris. Its measures led to its being charged with favoring Roman Catholicism and occasioned considerable trouble in the Church. See GREEK CHURCH.

JERUSALEM, LATIN KINGDOM OF. See LATIN KINGDOM OF JERUSALEM.

JERUSALEM, TEMPLE AT. See TEMPLE AT JERUSALEM.

JERUSALEM, yâ-rôô'zá-lêm, WILHELM (1854-). An Austrian philosopher and psychologist. He was born in Drënic, Bohemia, was educated at Prague, specializing first in

classical philology and then in pedagogy, and taught in secondary schools in Nikolsburg (1878-85) and Vienna (1885-1907) and then became lecturer in the University of Vienna. Among his valuable works covering various branches of philosophical study are: *Zur Reform der philosophischen Propädeutik* (1885); *Psychologische Sprachbetrachtung* (1887); *Lehrbuch der empirischen Psychologie* (1888; 5th ed., 1912); *Laura Bridgman* (1890); *Die Urteilsfunktion* (1895), an excellent summary of different theories of the nature of the logical "judgment"; *Einleitung in die Philosophie* (1899; 6th ed., 1913), which has been translated into English (1910), Russian, Polish, and Japanese; *Der kritische Idealismus und die reine Logik* (1905); *Gedanken und Denker* (1905); a translation (1908) of William James's *Pragmatism*; *Die Soziologie des Erkennens in der Zukunft* (1909).

JERUSALEM ARTICHOKE. See ARAUCARIA; ARTICHOKE.

JERUSALEM CHAMBER. A room adjacent to Westminster Abbey, built in 1376-86, so named from tapestries formerly hung there and representing scenes from the history of Jerusalem. It is now the meeting place of the Upper House of Convocation of the Province of Canterbury. The room contains frescoes of the death of Henry IV, who died in it, and of the coronation of Queen Victoria.

JERUSALEM CHERRY. The popular name of an ornamental species of the genus *Solanum*, of which *Solanum pseudocapsicum* and its hybrids are the most important species. As grown under glass for decorative purposes, it ranges from 1 to 3 feet in height, carrying numerous bright-green oblong or oblong short-petioled leaves, small white flowers, and a profusion of bright red or yellow fruits about 1/2 inch in diameter, which constitute the chief beauty of the plant. It is easily propagated either by seeds or cuttings.

JERUSALEM CORN. A variety of non-saccharine sorghum. See ANDROPOGON; SORGHUM, *Nonsaccharine*.

JERUSALEM CREED. A confession of faith taught by Cyril of Jerusalem in his catechetical lectures before 350. It is preserved as follows in Cyril's discourses: "I believe in one God, the Father Almighty, maker of heaven and earth, and of all things visible and invisible; and in one Lord Jesus Christ, the only begotten Son of God, begotten of the Father before all worlds, very God, by whom all things were made, who was incarnate and made man, crucified and buried, and the third day ascended into the heavens, and sat down at the right hand of the Father; and is coming to judge quick and dead. And in the Holy Ghost, the paraclete, who spake by the prophets; and in one baptism for the remission of sins; and in one holy catholic church; and resurrection of the flesh; and in life everlasting." It is of great historical interest, as being the basis of the Constantinopolitan creed of 381. Consult Schaff, *Creeeds of Christendom*, vol. ii (New York, 1878), and Curtis, *History of Creeeds and Confessions* (Edinburgh, 1911). See NICENE CREED; CREEDS AND CONFESSIONS.

JERUSALEM DELIVERED. See GERUSALEMME LIBERATA.

JERUSALEM OAK. An herb of southern Europe. See CHENOPODIUM.

JERVIS, jêr'vîs or jâr'vîs, JOHN, EARL OF ST.

VINCENT (1735–1823). A British admiral. The second son of Swynfen Jervis, barrister, he was born at Meaford, Staffordshire, Jan. 9, 1735. After education at Burton-on-Trent and at Greenwich, he entered the navy in 1749. He obtained a commission as lieutenant in 1755, and during some years was engaged in active service on the North American station. In 1769 he commanded the *Alarm* frigate in the Mediterranean, and when it was paid off made a tour of inspection of the naval arsenals of France and northern Europe. His next command was the *Foudroyant*, of 80 guns, the finest two-deck ship in the British navy. Engaging the *Pégase*, 74 guns, off Brest, in 1782, he took her without the loss of a man. In 1783 he entered Parliament for Launceston. In 1787 he was made rear admiral and in 1793 commanded the naval part of the expedition against the West India Islands, Sir C. Grey commanding the troops. Although the French were well prepared and fought desperately, every island fell in succession into the hands of the British. In 1795 he was made an admiral and given the command of the Mediterranean fleet. On Feb. 14, 1797, with 15 sail of the line, he encountered the Spanish fleet of 27 sail off Cape St. Vincent, and the battle of St. Vincent was fought. The genius of Nelson contributed greatly to the success of the day. For this victory the King created Jervis Earl of St. Vincent, and Parliament settled upon him a pension of £3000 a year. After having by great firmness repressed a mutiny off Cadiz, which threatened the loss of the whole fleet, he was compelled by ill health to return home. He was soon applied to by government to subdue the spirit of sedition which had openly manifested itself in the Channel fleet, and his endeavors were eminently successful. After having held the appointment of First Lord of the Admiralty (1801–03) and at the age of 72 for a second time commanded the Channel fleet, he retired into private life, and died March 13, 1823. A public monument was erected to his memory in St. Paul's Cathedral. St. Vincent ranks among the foremost naval commanders who broke the maritime power of France and Spain and established the naval supremacy of Great Britain. Consult Brenton, *Life and Correspondence of John, Earl of St. Vincent* (London, 1838), and Tucker, *Memoirs of . . . the Earl of St. Vincent* (ib., 1844). But these books have been largely superseded by Laughton, *From Howard to Nelson* (ib., 1899); A. T. Mahan, *Types of Naval Heroes* (Boston, 1901); Anson, *Life of John Jervis, Admiral Lord St. Vincent* (London, 1913).

JERVIS, jēr'vīs, JOHN BLOOMFIELD (1795–1885). An American civil engineer. He was born at Huntington, Long Island, and was brought up at Rome, N. Y. After receiving a common-school education he began work on the Erie Canal, was promoted in two years from axeman to resident engineer in charge of 17 miles of the canal, and in 1824 was in control of one-seventh of the canal. In the following year he became assistant engineer of the Delaware and Hudson Canal Company, in 1830 became chief engineer of the Albany and Schenectady Railroad, and in 1836, after taking a prominent part in the enlargement of the Erie Canal, began the work of constructing the Croton Aqueduct. The Cochituate Aqueduct (Boston) and the Hudson River Railroad be-

tween New York and Albany were constructed largely from his plans and under his supervision. He retired in 1858 from the presidency of the Rock Island, but after three years was chosen superintendent of the Pittsburgh, Fort Wayne, and Chicago Railroad, and in two years brought its stock up from a value of eight cents on the dollar to a point where it paid a dividend of 10 per cent. He received the degree of LL.D. from Hamilton College in 1878. Port Jervis, N. Y., was named in his honor. He wrote: *Railway Property* (1859); *The Construction and Management of Railways* (1861); *Labor and Capital* (1877).

JERVOIS, jēr'vīs, SIR WILLIAM FRANCIS DRUMMOND (1821–97). An English soldier and engineer, born at Cowes, Isle of Wight. After early education at Gosport and Woolwich he entered the Royal Military Academy at Woolwich in 1837 and two years later received a commission in the Royal Engineers. In 1841 he proceeded to the Cape of Good Hope and for seven years was engaged in professional duties, besides being employed in active service against the Boers and Kaffirs. He returned to England in 1848; continued on active engineering duty; received various promotions; and in 1856, when commanding royal engineer of the London Military District, was appointed assistant inspector general of fortifications. In 1857, during the threatened war with France, he was made secretary of the National Defense Committee. His report and recommendations for the defenses of London and the nation were accepted by Parliament and carried into effect. In 1862 he was appointed director of works for fortifications and in 1864 and 1865 inspected the fortifications of Canada and its eastern seaboard, also visiting the principal Eastern forts of the United States during the Civil War. Until 1874 he was actively engaged at home and in the colonies—Halifax, Bermuda, Gibraltar, Malta, and India—superintending the execution of a system of Imperial defense. Jervois saved £40,000 on the sum of £7,460,000 which had been voted for defense. From 1875 to 1877 he was Governor of the Straits Settlements; from 1878, when he was made G.C.M.G., to 1882 he was Governor of South Australia; and from 1882 to 1889 was Governor of New Zealand. In all these positions he distinguished himself by his ability and energy and was notably popular. Some of his papers on the coast defenses of England and the colonies and on England's defensive policy were separately published.

JESH'URUN (Heb. *Yeshurūn*). A poetical or symbolical name for Israel, used three times in Deuteronomy (xxxii. 15; xxxiii. 5, 26) and once in Isaiah (xliv. 2). The underlying root of the word, *yashar*, denotes "straight, upright," and it seems to be a formation designed as a symbolical play upon Israel, artificially separated into two elements, *yshr* (= *yashar*) and *el*.

JESI, yā'zē, or IESI (Lat. *Æsis*, *Æsium*). An episcopal city in the Province of Ancona, Italy, 17 miles by rail southwest of the city of Ancona, on a hill beside the river Esino (Map: Italy, D 3). It has mediæval walls, a cathedral dedicated to the martyr St. Septimius, the first Bishop of Jesi (308), and the twelfth-century church of San Marco. There is a fifteenth-century city hall, once the convent church San Floriano, and a library with paintings by Lorenzo Lotto. Jesi was the birthplace of Emperor Frederick II and of the composer Gio-

vanni Pergolesi. The composer Spontini was born in a neighboring village. There are schools of music and design, a private female normal school, a gymnasium, several technical schools, and a seminary. The city manufactures paper, bricks, silk, wool, soap, matches, hats, and rope. As the city is an important centre of local trade, there are many fairs. Wine and oil are marketed here. The river Æsis (modern Esino) from 250 to 82 B.C. formed the northern boundary of Italy. The town of Æsis was a recruiting station for the Roman army. Pop. (commune), 1901, 22,308; 1911, 24,777.

JESPERSEN, yēs'pēr-sēn, JENS OTTO HARRY (1860-). A Danish philologist, born at Randers. He studied law and languages at the University of Copenhagen, where, after gaining the degree of Ph.D., he became professor of English language and literature (1893). In his books Jespersen treats mainly of phonetics. His principal work is the large *Fonetik, Læren om Sproglyd* (1897-99), which is the first complete presentation of phonetics in Danish. Of the periodical *Dania* he, with Kr. Nyrop, was editor from 1890 to 1903. He wrote: *The Articulation of Speech Sounds* (Marburg, 1889); "Danias Lydskrift," in *Dania* (1890); "Til Spørgsmaalet om Lydlove," in *Nordisk Tidsskrift for Filologi*, vol. vii (1886; in German, in *Internationale Zeitschrift für allgemeine Sprachwissenschaft*, vol. iii); *Chausers Liv og Digtning* (1893); *Progress in Language* (1894); *Sprogundervisning* (1901; Eng. trans., 1904); *Phonetische Grundfragen* (1904); *Growth and Structure of the English Language* (1905); *John Hart's Pronunciation of English* (1907); *Modern English Grammar* (1909); *Lehrbuch der Phonetik* (1913). In 1886 he helped found Quousque Tandem, a Scandinavian society for improved instruction in languages, and through various channels he exerted a large influence upon the teaching of languages in Denmark. Jespersen became vice president of the Association Phonétique Internationale, was elected officer or member of many other societies, Danish and foreign, and in 1906 was awarded the Volncy prize of the French Institute. In 1904 he lectured at St. Louis and in 1909-10 at the University of California and Columbia University, where he was made honorary doctor.

JES'SAMINE. An ornamental shrub which bears fragrant flowers. See JASMINE.

JES'SAMY BRIDE, THE. A name given to Mary Horneck, a relative of the artist Reynolds and supposed to have been the object of Goldsmith's affection. The word "jessamy" probably represents jasmine and is used to indicate the daintiness and grace of her person.

JES'SANT (probably from OF. *issant*, pres. p. of *isser*, *eisser*, *iesser*, to issue, from Lat. *exire*, to go out, from *ex*, out + *ire*, to go). In heraldry, a term frequently used as synonymous with *issant*, rising, as a demilion is often represented doing, from the bottom line of a field or upper line of an ordinary. Jessant is sometimes used improperly for *naissant*, or rising from the middle of an ordinary. See HERALDRY.

JESSE, EDWARD (1780-1868). An English writer on natural history, born at Hutton-Cranswick, Yorkshire. He early showed a love of plants and animals, fostered by his places of residence, Richmond and Bushey parks, and he should be credited with much that was done to beautify Hampton Court. He was made deputy surveyor of royal parks and palaces.

Though he was no great scientist, there is pleasant reading in his *Gleanings in Natural History* (1832-35), *An Angler's Rambles* (1836), *Scenes and Tales of Country Life* (1844), *Anecdotes of Dogs* (1846), and *Lectures on Natural History* (1861), as well as his descriptions of jaunts to Hampton Court, Windsor, and Eton. He edited Walton's *Complcat Angler*, and White's *Selborne*, with a biographical introduction.

JESSE, JOHN HENEAGE (1815-74). An English historical writer. He was educated at Eton and became an Admiralty clerk, but was devoted to literature early in life, and his first poem, "Mary Stuart," was published in 1831. He wrote *London: Its Celebrated Characters and Remarkable Places* (3 vols., 1871), but made a specialty of memoirs, of which *George the Third* (3 vols., 1867) was his best effort. The others include: *The Court of England during the Reign of the Stuarts* (1840); *The Court of England from the Revolution to the Death of George II* (3 vols., 1843); *George Selwyn and his Contemporaries* (4 vols., 1843); *The Pretenders and their Adherents* (2 vols., 1845); *Richard the Third and Some of his Contemporaries* (1862); *Celebrated Etonians* (2 vols., 1875). American editions of most of the above-mentioned memoirs appeared at the close of the last and the opening of the present century.

JESSE, RICHARD HENRY (1853-). An American educator, born in Lancaster Co., Va. He studied at the University of Virginia (1873-75, 1878) and in Europe (1885, 1890, 1905-06). For some years he was connected with secondary schools as teacher or principal, from 1884 to 1891 he was professor of Latin at Tulane University, and thereafter until his retirement in 1908 was president of the University of Missouri, also holding the chair of ancient and mediæval history. At various times he served as president of the Missouri State Teachers' Association, the Southern Association of Colleges and Secondary Schools, the National Association of State Universities, and the Baptist Congress. In 1904 he was awarded a commemorative diploma and medal at the St. Louis Exposition for his services to education. He is author of *Missouri Literature* (1901), with E. A. Allen, and of papers in the transactions of various societies.

JESSEL, jēs'el, SIR GEORGE (1824-83). An English judge, born in London. He was educated at University College, London, becoming a fellow in 1846, and in 1847 was called to the bar at Lincoln's Inn, becoming bencher in 1865. He was returned to Parliament for Dover in 1868, was appointed Solicitor-General in 1871, and in 1873 became Master of the Rolls and Privy Councilor. The second Judicature Act of 1881 relieved him of duty in the rolls court and made him president of the first court of appeal, and there he served until his death. Jessel was the first Jew to participate in the executive government of England, to sit on the judicial bench of Great Britain, and to become Privy Councilor. As a judge, he was noted for his comprehensive and accurate legal knowledge and for his dispatch.

JES'SICA. Shylock's beautiful daughter, in Shakespeare's *Merchant of Venice*.

JESSO, yēs'sō. An island of Japan. See YEZO.

JESSONDA, yē-sōn'dā. An opera by Spohr (q.v.), first produced in Cassel, July 28, 1823.

JES'SOPP, AUGUSTUS (1823-1914). An

English clergyman and author, born at Albury Place, Hertfordshire. He was educated at St. John's College, Cambridge, was select preacher at Oxford in 1896, and held honorary fellowships at both universities. He began his clerical life as curate of Papworth St. Agnes, Cambridgeshire (1848-54), but was head master in Helston Grammar School, Cornwall, for four years, and in a Norwich academy for 20 years, before he was made rector of Scarning, Dereham, Norfolk, in 1879. In charge of this parish he remained until 1911. From 1902 to 1910 Dr. Jessopp was chaplain in ordinary to King Edward VII. His literary work includes an edition, with life, of John Donne's *Essays in Divinity* (1855); *One Generation of a Norfolk House* (1878); *History of the Dioecese of Norwich* (1879); *Arcady for Better for Worse* (1881); *The Coming of the Friars* (1888); *Trials of a Country Parson, Random Roaming, and Frivola* (all 1896); *Before the Great Pillage* (1901); and the biographies of Queen Elizabeth and some of the famous men of her time in the *Dictionary of National Biography*. In 1914 appeared *England's Peasantry, and Other Essays*.

JES'SUP, HENRY HARRIS (1832-1910). An American Presbyterian missionary. He was born at Montrose, Pa., son of the jurist William Jessup (1797-1868); graduated at Yale in 1851 and at Union Theological Seminary in 1855; and immediately entered the foreign-missionary service of the Presbyterian church in Tripoli, Syria. In 1860 he was transferred to Beirut and became prominent at that important station. He wrote, besides various works for the American Mission Press at Beirut: *The Women of the Arabs* (1873); *The Mohammedan Missionary Problem* (1879); *The Greek Church and Protestant Missions* (1884); *Kamil, a Moslem Convert* (1899); *Fifty-Three Years in Syria* (1910).

JEST (OF. *geste*, exploit, tale of adventure, from ML. *gesta*, deed, from Lat. *gestus*, p.p. of *gerere*, to carry on). The word *geste*, meaning originally something done, a deed, an exploit, came to be a name for the record of exploits in history or story. It was so used in Middle English, but gradually came to assume its exclusive modern sense of a joke or piece of fun. A stage in the transition from story to humorous story and trick, and finally to witty saying, is marked by the *geste* of Robin Hood, narrating the shrewd practices of this outlaw and his merry men. Though the word in its modern sense is of comparatively recent date, the jest itself is of ancient origin. Collections of jests passed from the East to the Greeks, then to the Romans, and from classic literature spread throughout Europe in the Renaissance period, uniting with that stream of story and witty remark which flows from men of all races and of all times. The earliest of modern jest books, dating from the fifteenth century, were in Latin and were known as *facetiæ* (q.v.). A notable volume was the *Liber Facetiarum* (1470) of the Florentine Poggio, of which the best stories found their way into the anecdotal literature of Italy, France, Germany, and England. For Italy may be cited Pietro Aretino and the vast body of *novelle*, dealing with the incidents of everyday life; and for France the *eontes* and *joyeux devis* of Rabelais and his school. Among the earliest German jest books were the Latin *Faetiæ* of H. Bebel (1508) and the *Sehimpf und*

Ernst of the monk Johannes Pauli (1519), largely compilations for which Poggio was freely used. Native German humor of the period is perhaps best seen in the Low Saxon *Eulenspiegel* (q.v.) (1515), which in a mutilated form early passed into France and England. *Eulenspiegel* (i.e., owl-glass), from whom the book derives its name, is a knavish peasant who plays his tricks upon his more prosperous countrymen. In England there had long been books sharing in the literature of jest. Such, e.g., was the *De Nugis Curialium* (twelfth century) of Walter Map. But the flourishing period of the jest book in England, as in the rest of Europe, was during the sixteenth and seventeenth centuries. From the press of John Rastell issued two interesting collections—*The Merry Gestes of the Widow Edith*, in verse (1525), and *The Hundred Merry Tales* (1526). The latter volume is mentioned by Beatrice in *Much Ado about Nothing* (II, i, 135). These were succeeded by *Merry Tales and Quick Answers* (about 1535), containing 114 anecdotes. It became customary for compilers to father their collections upon some well-known historical character who might or might not have been a wit. Famous books of this kind were: *The Merry Tales of Skelton* (1566 or 1567), attributed to John Skelton, who after his death gained the reputation of a wag; *The Jestes of Scogan* (1565-66, probably), said to have been gathered by Andrew Boorde (q.v.), a witty physician, from the sayings of a fool at the court of Edward IV; *Tarlton's Jestes* (3 parts, 1592, 1600, 1611), named from the great comedian; and *The Jestes of George Peele* (1607), containing perhaps some escapades of the dramatist. This practice of placing a name on the title-page that would sell the book continued into the nineteenth century, receiving its most abused illustration in the collections purporting to have been "transcribed from the mouth of Joe Miller" (q.v.), an actor of the eighteenth century. *The Merry Tales of the Mad Men of Gotham*, dating from the sixteenth century, were given a habitation in Nottinghamshire. The little pamphlet circulated as a chapbook in England and Scotland well into the nineteenth century. Other collections are *Pasquil's Jestes, Mixed with Mother Bunch's Merriments* (1604); *The Pleasant Conceits of Old Hobson, the Merry Londoner* (1607); and the racy *Wit and Mirth* of John Taylor (q.v.), the water poet. These books are only a small section of a vast literature of jest which pervaded popular tales and prepared the way for the realism of the modern novel. The jest was fused with the novel of manners by Theodore Hook (q.v.) in his *Sayings and Doings* (London, 1824-28). The older English jests were edited by W. C. Hazlitt under the title *Shakespeare Jest-Books* (3 vols., ib., 1864). The interesting jest literature of Germany and its influence is discussed by C. H. Herford in *The Literary Relations of England and Germany in the Sixteenth Century* (Cambridge, England, 1886). Consult Ernst Schulz, *Die englischen Schwankbücher bis herab zu "Dobsons drei Bobs"* (Berlin, 1912). See also the remarks on the Spanish rogue story in the article on the NOVEL.

JESTER. A clownish wit, akin to the court fool (q.v.), often called the jester, or the King's jester, and simply one kind of minstrel. (See MINSTREL.) The jester in the Sanskrit drama

is represented by the *vidusaka*, a character of mingled gluttony, cowardice, and knavery, redeemed only by his unswerving devotion to the King, who is his companion. It is noteworthy that the *vidusaka* is always a Brahman, a fact which is plausibly explained by the supposition that he was a stock character borrowed by the classic Hindu drama from the folk plays. In Latin comedy the intriguing slave Davos is perhaps a prototype for ignoble but amusing characters in modern comedy. During the Middle Ages weirdly dressed and clownish devils either terrified or entertained by their antics the on-lookers at the miracles and mysteries. In Spain the *gracioso*, or jesting buffoon, has the same function in the dramas of Lope de Vega, Calderón, and other dramatists, as Vidusaka had in India. In Italy Pantaleon, an old buffoon in Venetian costume, and Arlecchini were indispensable personages in the *Commedia dell'arte*, and they passed through France into England.

JESUITS, jěz'ū-īts (Fr. *Jésuite*, from Neo-Lat. *Jesuita*, from Lat. *Jesus*), or SOCIETY OF JESUS. A religious order of the Roman Catholic church. The preliminary step to the foundation of the society was taken when, on Aug. 15, 1534, Ignatius of Loyola (see IGNATIUS), with eight associates—Pierre Le Fèvre, a Savoyard; James Laynez, Francis Xavier, Alfonso Salmeron, and Nicholas Bobadilla, Spaniards; a Portuguese, Simon Rodriguez; Claude Lejay and Paschase Brouet—took, in the chapel on Montmartre, Paris, vows to make a pilgrimage to the Holy Land and devote themselves to the conversion of the infidels. Owing to the breaking out of war with the Turks, they could not make the pilgrimage as planned, so they applied themselves to various spiritual works in and around Venice, from which it had been their intention to sail. They lived more or less in common, but were not united in a formal way until 1538, when the first idea of permanent organization came. They went to Rome and laid the preliminary sketch of the constitution of their proposed order before Pope Paul III, who approved it in 1539. The formal creation of the Order of Jesuits was made by bull dated Sept. 27, 1540. In founding the Jesuits, Ignatius is often said to have contemplated repairing the losses occasioned to the church by Luther; but at this time he had scarcely heard of him. His object was the increase of devotion among the adherents of the church. The motto of the new order was *Ad Majorem Dei Gloriam*, often abbreviated A. M. D. G. (to the greater glory of God). The members bound themselves, besides the usual three vows of religious orders—poverty, chastity, and obedience—by a fourth vow to go as missionaries wherever the Pope might send them.

The order was inaugurated in 1541 by the election of Ignatius as general. He wished to refuse this office at first, but was finally prevailed upon to accept it. The name chosen—Society (or more properly Company) of Jesus—was meant to recall that Ignatius' idea in its foundation was that they were to be a band of soldiers in the army of the church. What time he could spare from the government of the society and his many good works the general devoted during the next 10 years to the drawing up of the formal Constitutions and rules of the order. In 1550 these were submitted to the members and received certain modifications in

detail. The revised text, written by Ignatius himself and known as the autograph text, was then sent to all the fathers, even to those in India, and suggestions asked. Such as seemed proper were incorporated in a third text, which forms the Constitutions of the Jesuits now in force. These are essentially from the hand of Ignatius, never having received any important modification. They are considered by Jesuits of the present day as the palladium of their existence as a religious order. The most important parts of the Constitutions are those that prescribe the training to which each member of the order shall be subjected. The formation, as it is called, of the Jesuit for his life work takes about 18 years. As a rule, before entrance into the order he has already pursued studies equivalent to those required for the collegiate degree of A.B. The first two years of novitiate are spent in spiritual exercises, prayer, meditation, and ascetic reading, in the practice of mortification, and in humble occupations of various kinds. During his first year the novice devotes 30 days of retreat, as it is called, in absolute silence, to making the spiritual exercises of St. Ignatius. These consist of meditations on the last four things to be remembered and on the life of Jesus Christ. Every year of his life afterward, no matter what his status in the society, at least eight successive days are devoted to the same purpose. At the end of the second year of novitiate the candidate takes simple vows of poverty, chastity, and obedience. Then two years are devoted to the study of the humanities and the modern languages. After this three years are given to philosophic and scientific studies, during which, though a definite course is marked out for all, opportunities are provided for those who wish to pursue special studies. At the completion of these seven years of study of self, the humanities, philosophy, and science the young Jesuit, usually now about 25 years of age, is sent to teach for five years in a Jesuit college. If he has shown predilection and talent for some special study, he will, as far as circumstances permit, be assigned to teach this branch. He is not confined to one class during his years of teaching, but is supposed to go up with his class during the course, thus providing for his own mental development as well as the consistent progressive formation of his students. After the period of college work the Jesuit studies theology for three years and then is advanced to holy orders. For one year more theological studies are continued, and then opportunities are given the young priest for mission work and spiritual employment of various kinds for a year, after which a final year of novitiate, called the third year of probation, is prescribed. During this year the Jesuit devotes himself exclusively to the study of spiritual things, his own character, the ways and means of the Institute of the society, its rules and Constitutions. During his third year the 30 days' retreat of silence and prayer, according to the method of the spiritual exercises of St. Ignatius, is once more made. After this final year of probation the candidate is admitted to the last solemn vows, now four in number, because they include a special vow of obedience to the Pope. Those who accomplish this full course are called professed fathers.

The rules prescribe in detail the Jesuit's daily occupation, and, as far as circumstances allow,

a definite routine is followed very exactly by all the members of the order. The Jesuit rises at 5 A.M. Half an hour is given to physical preparation for the day. He devotes one hour to mental prayer, for which there has been 15 minutes of preparation the night before. He then hears mass or, if a priest, says mass. About 7 A.M. he breakfasts, and after a few minutes devoted to a review of his morning meditation, and especially the practical resolutions that it has led him to, he begins the day's work, whatever it may be—studying, teaching, preparing sermons, missions or retreats, or writing books or articles. He is advised by his rules not to continue any one form of occupation, whatever it may be, for more than two consecutive hours without a diversion of mind for some minutes at least. About noon he devotes 15 minutes to a review of his morning's work and plans the work of the afternoon, so as to do better. Dinner is taken in common, and then, according to rule, one hour is passed in recreation in common. About 9 P.M. the community assembles for the recital of the litany of the saints and of the Blessed Virgin. This is the only daily spiritual exercise in common enjoined by rule. Even this did not originate with Ignatius himself, but with St. Francis Borgia, the third general of the society. Ignatius wished to leave his order free for work and study, depending on the constant direction of the motives of their work to make them spiritual men. The litanies are followed by 15 minutes devoted to the selection of a passage of the life of Christ for meditation next morning. Then follows the evening examination of conscience. At 10 o'clock all are in bed, unless special permission is given for further work. The *Monita Secreta* (q.v., Secret Admonitions), a masterpiece of craft and duplicity, supposed to have been issued for the private direction of thoroughly initiated members of the order, is now acknowledged by all serious authorities to be an invention of the enemies of the Jesuits.

The government of the Society of Jesus, though often spoken of as autocratic, is a striking example of a limited constitutional authority, practically the first of its kind. The order is governed by a general, whose power, said sometimes to be absolute, is strictly limited by the Constitutions. He is elected by a general congregation and holds his office for life. He may be deposed by a general congregation under certain conditions prescribed by the Constitutions, though such an incident has never happened in the history of the order. A general congregation is composed of the general, or his deputy, and the five assistants who form his council, besides the provincials, or heads of provinces, and two deputies from each province. The provincial deputies are elected by the professed fathers and the rectors of the province. When the general congregation, which has no fixed time, meets, all important concerns come before it. It alone has power to dissolve a college or professed house or a novitiate once established. The general has power to dispense with some provisions of the Constitutions in particular cases, but he cannot alter or annul them. All others in authority hold office for a limited time, usually for three years. The assistants who compose the general's consultors are elected by the general congregation and are chosen from certain groups of provinces. At the present time there are the Italian assistancy;

the French; the Spanish, which includes also missions in South America; the German, which includes the Low Countries and Austria; and finally the English, including England and North America, with missions in South Africa and in India. For the assistance of the general there are also an admonitor and a father confessor. The general's admonitor is bound to inform him of any faults he may commit. While the general consults with his assistants, he is not obliged to follow their advice, even when unanimous.

There are four classes of Jesuits: 1. Professed fathers, who, after their 18 years of preparation, have taken the four solemn vows mentioned above. It is from this class alone that the general and all the higher officials of the society are chosen. 2. Coadjutors, spiritual and temporal. Spiritual coadjutors are priests whose health or talents have not permitted them to reach the standard of knowledge required for professed fathers and who help in preaching, teaching, and the direction of souls. Temporal coadjutors are the lay brothers to whom the menial offices and certain minor duties are assigned. 3. Scholastics, who, having passed through the novitiate, are engaged either in their own studies or in teaching in the colleges. 4. Novices, who, after a short trial as postulants, are engaged for two years exclusively in spiritual exercises, prayer, and ascetic reading and practices.

The administrative and executive government of the society is intrusted under the general to provincials who are named by the general and hold office for three years. In each province the superiors of the colleges, professed houses, and novitiates are appointed by the general, who receives from them at stated intervals—monthly from provinces, quarterly from colleges and novitiates—a detailed report of the character, conduct, and occupation of each member of the society. Far from making a system of espionage, this detailed knowledge only gives superiors such information with regard to subjects as enables them to make the best possible use of them with the least possible danger of failure under trying circumstances. Ignatius gave his order no distinctive dress (though that of the Spanish priests of that time has come to be adopted by Jesuits generally), so that they might be freer for intercourse with the world.

The Jesuits spread rapidly. At the death of Ignatius (1556) there were 1000 members of the order, in 12 provinces. At the end of the century there were over 10,000. When the celebration of the centenary of their foundation came in 1639, they numbered over 13,000. A century and a quarter later, at the time of their suppression, there were 22,600 Jesuits throughout the world. Wherever they were, they were considered as the special upholders of the papacy and the most faithful defenders of the Roman Catholic church. This accounts for most of the opposition to them. When there was difficulty between the Republic of Venice and the Pope, during the first half of the seventeenth century, the Jesuits were excluded from the Venetian states. Their close adhesion to the Pope made their position in France often insecure. Gallicanism saw in them implacable opponents, and Jansenism (q.v.) recognized them as the foes most to be feared. The Sorbonne and the University of Paris opposed the introduction of the society into France and always continued to be

jealous of the educative influence acquired by it. Finally, Mme. de Pompadour became a bitter enemy because the Jesuits refused her the sacraments unless there should be an end of her liaison with the King. The philosophic party was opposed to the Jesuits because it saw in them the most prominent factor in the conservation of Catholic thought and education. This united opposition brought about the exiling of the Jesuits by royal edict throughout the French dominions in 1764. The example was followed in a few years by the other Bourbon courts—Spain, Naples, Parma, and Modena. In 1759, through the machinations of the Prime Minister Pombal, who saw an opportunity of enriching himself at their expense, the Jesuits had been expelled from Portugal. The charges that they were the source of the attempt upon the King's life and were fomenting disaffection among the Indians in the so-called reductions of Paraguay, recently transferred from Spain to Portugal, were evidently trumped up. Pope Clement XIII (1758-69) interposed vainly in their behalf and used every effort to reconcile the governments. Pope Clement XIV (1769-74), pressed by the ambassadors of so many Catholic governments, at length issued, July 21, 1773, the brief *Dominus ac Redemptor Noster*, by which, without adopting the charges made against the society or entering in any way into the question of their justice, acting solely on the motive of "the peace of the church" he suppressed the society in all the states of Christendom. Submission to the brief was immediate and complete. In Spain and Portugal the members of the society were driven into exile. In other Catholic countries they were permitted to remain as individuals, engaged in the ministry or in literary occupations. Two non-Catholic governments, those of Frederick the Great of Prussia and Catharine II of Russia, refused to allow the brief of suppression to be published in their dominions because they could not replace the Jesuits as educators. In these states the Jesuits retained a quasi-corporate existence as a society for education.

What was meant to be the suppression of the society proved but a temporary suspension. In 1792 the Duke of Parma secured a partial reorganization for his dominions. In 1801 Pope Pius VII (1800-23) permitted the formal reestablishment of the Jesuits in Lithuania and White Russia and with still more formality in Naples in 1804. On Aug. 7, 1814, by the bull *Solicitudo Omnium Ecclesiarum*, the complete rehabilitation of the order was made. Since then the Jesuits have continued to spread all over the world.

Among the works of the Jesuits there is none to which they devoted themselves with more zeal or, we may add, with greater success than that of the education of youth. St. Ignatius himself insisted on this and was the first to make education the special ministry of a religious order. The principles to guide the society in its educational work were laid down by Ignatius in the fourth part of the Constitutions. This was, however, only an outline of a system of education. At first the Jesuits adopted the methods of teaching then followed in the various Catholic schools of Europe, drawing chiefly from the traditions of the great University of Paris, the alma mater of St. Ignatius and his first companions, though with due attention also to the developing methods of the humanistic

schools of the Netherlands, then justly celebrated. The theory that the Jesuits' method of education was borrowed largely from the "Plan of Studies" of John Sturm of Strassburg is now admitted to be false. From 1540 to 1599 the society was engaged in forming a complete system of studies. Plans were drawn up and put in practice in various colleges, as, e.g., those of Nadal and Ledesma. The practical system thus created was completed under Acquaviva, the fifth general of the society, who ruled during its most brilliant period (1581-1615). In 1584 a committee of six experienced Jesuit teachers of different nationalities drew up a preliminary plan which was tried in all the colleges of the society. The results of this five-year trial were reported to Rome, and the suggestions made were employed in drawing up a modified plan, which was sent to the various colleges in 1591. After this plan had been tested for over five years, the final plan was drawn up and formally issued in 1599. This is the famous *Ratio Studiorum*, which was the fruit of long and patient efforts and the result of the combined wisdom of the whole society. The system is divided into three parts: (1) *studia inferiora*, inferior studies, which consist chiefly of linguistics, the literary study of the classical languages with history, archæology, etc., as collateral branches; (2) arts, or philosophy, consisting of philosophy, mathematics, and the natural sciences as far as they were known and cultivated in those times; (3) theology. In the lower course, that of humanities, there were ordinarily five classes, in some places six. These were called the grammar classes, first, second, and third, then humanities, or poetry and rhetoric. After the restoration of the society at the beginning of the nineteenth century the needs of the times demanded a change in the educational system. Father Roothaan, then general, proceeded with the same care as Acquaviva in securing the opinions of the best educators in various countries. The revised *Ratio Studiorum* was published in 1832. This was not definitive, but was considered subject to such further changes as might prove advisable in the course of time and the progress of education. The principles of the old *Ratio Studiorum* are preserved, but greater attention is recommended to the natural sciences, and special care is to be devoted to the teaching of the mother tongue. The Jesuits have always been markedly successful in the teaching of Latin and Greek. The essence of their method is the prelection or preliminary explanation of a passage by the teacher, followed by the pupil's study of it and then by recitation, which includes grammatic, historic, and other details. Imitative themes are a prominent feature, and, as far as possible, the pupil is brought to a speaking knowledge of the language studied. Frequent repetitions are recommended. The thoroughness of this system is exemplified by their own mastery of the Latin tongue and the lasting knowledge acquired by their students, especially in the classic languages. How well the recommendation to devote more attention to the sciences has been carried out is shown by the fact that such great astronomers of the nineteenth century as De Vico, Perry, and Secchi were Jesuits.

The number of the colleges increased very rapidly. Within 50 years after the papal approbation the Jesuits had colleges all over the

world, not only in Europe, but in the Indies, China, Japan, Mexico, and Brazil. At the time of the death of Acquaviva (1615) the society had 372 colleges. Shortly before the suppression of the society, about the middle of the eighteenth century, there were 728 colleges, many of which had an average attendance of 1500 or more, while in some the number of students was from 2000 to 3000, and no college is mentioned with a lower number than 300. Taking the lowest possible average, the 700 Jesuit colleges must have had about the middle of the eighteenth century 300,000 students. This influence was all the more important as they insisted on moral and religious training. Such Protestant writers as Ranke, Paulsen, Quick, and others candidly admit that the Jesuits during these centuries were the best educators, so that many parents not of the Catholic faith intrusted the education of their sons to them. The spread and development of Jesuit colleges during the nineteenth century was slow but steady. The order had to struggle against great difficulties. The colleges which it possessed before the suppression were in the hands of the civil authorities. The persecutions and expulsions of the society from various countries prevented the establishment of new colleges and put an end to those already in being. Notwithstanding this, in the year 1906 the Jesuits had about 220 colleges throughout the world with more than 55,000 students. There were more than 20 new colleges established from 1900 to 1905, but the Associations Law in France caused the suppression of nearly as many others. In the United States they have colleges at Worcester, Mass., Boston, New York City (Fordham University), Georgetown, D. C., Jersey City, N. J., Washington, D. C., Baltimore, Chicago, Cincinnati, Detroit, Milwaukee, Omaha, St. Louis, St. Mary's, Kans., Galveston, Mobile, New Orleans, Denver, San Francisco, Santa Clara, Cal., Buffalo, Cleveland, Spokane, and Manila, P. I. The Jesuits also have charge of the Apostleship of Prayer, or League of the Sacred Heart (q.v.).

The Jesuit missions are the source of the greatest honor to the order. St. Francis Xavier's (q.v.) work in the Indies recalled the apostolic times. He knew how to organize his many missions, so that his numerous converts became faithful Christians in the best sense. His brethren on the missions imitated his example and almost rivaled his success. Venerable Joseph Anchieta, called the Apostle of Brazil, before the end of the sixteenth century organized missions among the natives of that country into settlements of the kind that in Paraguay, later, were called reductions. The first reduction of Paraguay was founded in 1610. For nearly a century and a half the native converts lived in ideal peace and happiness. These native Christian communities have been the admiration of students of social science ever since. At the beginning of the seventeenth century, after 20 years of patient effort, Father Ricci succeeded in getting audience of the Emperor of China. His skill in applied mathematics and mechanics gained him the favor of the Emperor, and he obtained protection for the Christians in China. Scholarly successors, equally able and zealous, Schall, Verbiest, and Bouvet, continued the good influence over the Emperor. Unfortunately, after a time, the controversy over the Chinese rites took place. Certain practices of their former

lives, which, in imitation of the Apostles, the Jesuits allowed their converts still to keep up, seemed to the Dominicans to savor of idolatry. In the midst of the disputes the Imperial favor was lost, and persecutions wiped out the Chinese missions. The Japanese missions were begun in 1549 by St. Francis Xavier, and in 30 years had grown to number 200,000 Christians. Bloody persecutions, continuing for nearly three centuries, made numbers of martyrs; but with a marvelous tenacity, though all their priests had been put to death, the survivors handed down their faith from generation to generation, and when Japan was once more opened to Europeans in the nineteenth century, there were still natives ready to welcome the Catholic missionaries as their long-lost fathers. In India Robert de' Nobili (1605) took up the difficult task of living as a high-caste Brahman, fulfilling rigidly their precepts of abstinence and avoiding all contact with other castes. After years of patience he succeeded in making numerous converts. The careers of Fathers Lallemond, Brebœuf, and Jogues among the Huron and Iroquois Indians were a succession of sufferings and hardships, deliberately undertaken, calmly borne, and heroically persisted in by men of gentle breeding and deep culture. The Jesuit missions were always centres of civilization as well as religion. When the United States government took possession of the Philippines, the Jesuits in charge of the observatory at Manila were asked to collate the information with regard to the archipelago in the possession of members of the order, and this was published in two large volumes with an atlas at the Government Printing Office (*El Archipiélago Filipino*, Washington, 1900). In 1914 the Jesuits numbered 8178 priests, 4400 scholastics, and 4137 lay brothers, making a total of 16,715. There were 28 provinces. The Rev. Francis X. Wernz, a distinguished canonist, the general of the whole society, died in 1914, and on Feb. 11, 1915, Father Wlodimir Ledochowski (q.v.), nephew of the late Cardinal Mieczyslaw Ledochowski, was elected general.

Bibliography. The following periodicals are issued under the direction of the Jesuits and always supply information as to current topics in their regard: *Civiltà Cattolica*, Rome; *The Month*, London; *Etudes Littéraires et Religieuses*, Paris; *Stimmen aus Maria-Laach*, Freiburg; *Zeitschrift für katholische Theologie*, Innsbruck; *Revue des Questions Scientifiques*, Brussels; *The Messenger, America*, and *The Live Issue*, New York; *Messenger of the Sacred Heart*, Innsbruck, Bilbao, Toulouse, Mexico, and other places. Consult, for their Constitutions, *Institutum Societatis Jesu* (Avignon, 1830-38) and *Concerning Jesuits*, a collection of tracts in favor of the Jesuits (London, 1902). The accepted authority for their general history is Crétineau-Joly, *Histoire de la compagnie de Jésus* (6 vols., Paris, 1844-46); in English, Andrew Steinmetz, *History of the Jesuits, their Missions, their Educational System and Literature* (3 vols., London, 1848); G. B. Nicolini, *History of the Jesuits: Origin, Progress, Doctrines, and Designs* (ib., 1873); Daurignac, *History of the Jesuits* (Baltimore, 1878); B. N., *The Jesuits, their Foundation and History* (2 vols., New York, 1879); Heinrich Boehmer, *Les Jésuites, ouvrage traduit de l'allemande* (2d ed., Paris, 1910); Joseph McCabe, *Candid History of the Jesuits* (New York, 1913). JESUIT'S BARK. An old name for cinchona (q.v.).

JESUIT STYLE. The name frequently applied to the baroque style of architecture in its ecclesiastical phases. It is marked by pretentious, theatrical decoration, a flagrant misuse of stucco enrichments, recourse to figure sculpture in extreme and sensational attitudes, and a general disregard of restraint and refinement. Its name is due to the great number of Jesuit churches erected in this style during the seventeenth century in Italy and Germany. Its beginnings are seen in the church of the Gesù at

Rome (1568), and its culmination in that of Santa Maria della Vittoria, by Maderna, and in many German churches. See BAROQUE.

JES'UP, MORRIS KETCHUM (1830-1908). An American merchant and philanthropist. He was born at Westport, Conn., and was educated there and in New York City. In 1843 he entered the employ of a manufacturing firm at Paterson, N. J. In 1852 he went into business on his own account, from which he retired in 1884. He is best known for his philanthropic work and his interest in scientific exploration. He was one of the organizers of the United States Christian Commission during the Civil War, was one of the founders of the Young Men's Christian Association, and its president in 1872, was president after 1860 of the Five Points House of Industry, of which he was one of the founders, and after 1881 was president of the New York City Mission Society, for which he built the De Witt Memorial Church in Rivington Street. In 1881 he became president of the American Museum of Natural History. To this institution he gave much during his life and at his death left over \$1,000,000. He presented Jesup Hall to the Union Theological Seminary, and endowed the Jesup North Pacific Expedition for scientific research. He was chosen president of the New York Chamber of Commerce and was president of the International Congress of Anthropology in 1902. To the subject of Southern education, especially that of the negro, he gave much time and thought. He was treasurer of the Slater Fund at its beginning, and he was also made a member of the Peabody Educational Board and of the General Education Board. In 1905 he was knighted by the Czar for philanthropic work. Consult *Resolutions in Appreciation of Morris Ketchum Jesup*, by Trustees of American Museum of Natural History (New York, 1908), and W. A. Brown, *Morris Ketchum Jesup* (ib., 1910). In 1915 the Metropolitan Museum, New York, received by bequest of Mrs. Jesup a large and valuable collection of paintings.

JESUS CHRIST. In order to appreciate the work of Jesus, it is necessary to understand the political and religious condition of the Jewish people, to whom he belonged and among whom his work was carried out. *Politically.*—The Jews were subjects of the Roman Emperor, the dominion of the Romans having been established by Pompey in 63 B.C. After that time various adjustments of Palestine's relations within the Empire took place, and when Jesus began his public ministry the government of the country was divided as follows: Galilee, with the land to the north, east, and southeast of the Sea of Galilee, was under the rule of Philip and Antipas, sons of Herod the Great, who, as *rex socius*, had had the entire land as his kingdom. Philip's territory was the land north and east of the Sea of Galilee (Ituræa and Trachonitis); the territory of Antipas was Galilee itself and the land southeast of the Sea of Galilee (Peræa). Both regions were ruled as tetrarchies. On the other hand, Judæa, Samaria, and the land of Idumæa, south of Judæa, were more distinctly provinces under the rule of a Roman procurator (Pontius Pilate), who to a certain degree was subordinate to the Governor of the Province

of Syria. This continued to be the political situation throughout the ministry of Jesus. (See HEROD.) *Religiously*.—The Jews had returned from their exile with a new hold upon the monotheism of their religion and a new devotion to Yahwe's law. This spirit had been strengthened by the persecutions which they had undergone under the rule of the Seleucidæ and the revolt by which, under the Maccabees, they had broken from that rule, producing at the time of Jesus' ministry an exaggerated conception of the ceremonial requirements of the Mosaic law, in the interpretation of which had arisen a body of legal refinements that added greatly to the burden of the law and to the power of those who administered it. See MACCABEES; JEWS.

It was a characteristic of Jewish life, however, to combine religion and politics. As a result, there arose in the nation during the time of the Maccabæan revolt, when the religious and political elements in the people's life were brought to accentuation, two great parties, whose significant influence increased as with the religious elements in the national life were mingled with increasing energy the political. These parties were the Pharisees and the Sadducees (qq.v.). The Pharisees (literally *Separatists* or *Purists*) were the party of religion. The characteristic of their creed was the scrupulous observance of the law. They represented the religious idea dominant among the people since the return from Babylon, while, in their devotion to the conception of the theocracy and their expectation of a Messiah who should restore it to its independency, they expressed what in general were the people's political views. They were, in brief, the popular party. The Sadducees (a name derived from Zadok, the priest whom Solomon put in the place of Abiathar, 1 Kings ii. 35) were the party of the priesthood. They represented the priestly nobility, and their object was the retention of priestly power in the state. They were largely indifferent to religion as such, giving their thought rather to politics, in which their aim was to keep in favor with the ruling power.

In addition to these were two minor parties, which more or less added to the politico-religious confusion of the times. Of these parties the political was the party of the Herodians, the religious, the party of the Zealots (qq.v.). The Herodians arose with the introduction into Jewish politics of the family whose name they bore, and were committed to the political interests of that family in its effort to establish a rule in Palestine, the spirit of which would be a union of Judaism and Hellenism. With them the religious element was minimized, if it was present at all, though they did not hesitate to combine with the religious parties when their aims could thus be furthered. The Zealots arose with the recession of the Pharisees from active interest in national affairs. Their principles were those of the Pharisees, only they were ready, as the Pharisees were not, to carry these principles into action to any extent. In this party, consequently, the religious element resulted in a fanaticism which made them the most dangerous factor in the troublous conditions of the times.

Separate from all these parties stood the Essenes (q.v.), who were unique in their absolute removal from all politics and their complete dissociation from the public worship of the temple. They were characterized by the strict-

ness of their community life, their strenuous regard for ceremonial purity, their unselfish practice of the community of goods, and their uprightness of life. Their organization was confined to Palestine, and their main roots were laid in Pharisaic Judaism. Yet they were subject to foreign influences, Oriental rather than Greek, which contributed largely to their isolation among the parties of the land. In fact, they were a sect rather than a party, and as a sect emphasized the idea of an exclusive brotherhood.

Of these parties and sects the people were most influenced by the Pharisees, who best expressed popular ideas, and with whom the people came most vitally in contact, especially through the authoritative channels of the temple, the synagogues, and the schools. In fact, the control of the last two institutions was almost wholly in the hands of the Scribes, who were the expounders and administrators of the law, and who almost exclusively belonged to the Pharisaic party; while in the temple itself their influence and authority was an increasingly important factor. This popular influence of the Pharisees was naturally most felt in Judæa and Jerusalem, where the observance of the national religion was concentrated, and where the religious rulers had their home, but there and elsewhere there were those among the people who, while reverencing the Scribes and following the general line of their directions, still held to a direct fellowship with God in worship and life.

From this survey it is clear that Jesus, while finding a special receptivity among these devout ones of the people, as a religious teacher and worker among the Jews must have come more or less into contact with the sects and parties of the land; that this contact, in proportion as Jesus' position involved opposition to national ideas and customs, must have been one of conflict; and that this conflict, in proportion as the parties combined politics with their religion, must have been one of menace to his work and to his life.

As given in the Gospel history, Jesus' life and work most naturally divides itself into two prominent periods—the *Galilean Period*, which was largely one of construction, centring upon the gathering around himself of a body of disciples; and the *Judæan Period*, which was largely one of instruction, having as its object both the preparation of his disciples for the closing events of his life and the presentation to the Jews of his Messianic claims. Between these two main periods lay the short *Intervening Period* covered by his withdrawal into the regions of northern Galilee; while preceding them was the *Preliminary Period* of his younger years, leading up to his formal induction into his work and his early ministry in Judæa; and following them was the *Culminating Period* of his life, issuing in his betrayal, crucifixion, resurrection, and ascension.

A. The Preliminary Period. (a) *The Period of his Early Life*.—Jesus was born in the sixth or seventh year before the Christian era, towards the close of the reign of Herod the Great. (See NEW TESTAMENT CHRONOLOGY.) It is quite impossible to read the record of his birth as given in the Gospels of Matthew and Luke without realizing that the circumstances preceding and attending it were of such supernatural character as to mark it as miraculous,

Attempts have been made to show that the sources of the record were legendary; but these are confronted with difficulties which compel the conviction that the narrative is trustworthy. (See GOSPEL, *Nativity*.) His birth occurred in the town of Bethlchem in Judæa, where Joseph and Mary had gone for the purpose of registration in connection with one of the Imperial enrollments customary in the provinces. After Herod's death Jesus' home was in Nazareth until the time of his formal entrance upon his public work. Of these early years practically no information has come to us, the Gospels giving, besides the summary statements of Luke (ii. 40, 52), but one event of that time, his visit to the temple (Luke ii. 41-51), while the extra-canonical traditions referring to this period are worthless. (b) *Induction into Public Work*.—Though the Gospels do not give the processes of development by which Jesus came finally to the consciousness of his Messiahship and his Messianic work, yet the disclosure which they make of the relations of the disciples to their Master shows that the way by which they came to realize that he was some one greater than a prophet was the way by which he himself came to the consciousness of his unique spiritual relation to God. They saw and he knew that, unlike all others around him, he had no consciousness of sin in himself. Spiritual communion between himself and his Father was uninterrupted and unclouded, and his life was an unimpaired realization of this fellowship. Conviction of this fact doubtless came to him gradually, as knowledge of self and its relations to God generally comes to the soul; but this consciousness must have pressed upon him the question as to what such a fact involved for him in the work and service of life; for such relationship with God could only mean that there was a work for him to do which would measure up to the unique character of the relationship. Otherwise, what was the reason for the relationship and this conviction of a work his Father had ready for his doing? It was with this consciousness of himself that he heard of the message of the Baptist that the Kingdom of God was at hand, and it must have been with the conviction that the establishment of this Kingdom was the work to be committed to him that he came to the Jordan to be baptized, as a public confession of his consecration to this work. At all events, with the baptism in Jordan at the hands of John the Baptist, it is clear that to Jesus' mind his work was formally undertaken, and that he conceived of his work, not as that of a rabbi, nor even as that of a prophet, but as that of the Messiah foreshadowed and promised to the people of God in the Old Testament Scriptures. Following upon his baptism Jesus retired to the neighboring wilderness. There for a season he was subject to an inward struggle with thoughts which this public consecration to his mission most naturally brought to him—a struggle rightfully termed a temptation; for, having consecrated himself to this great work, the question was now before him, in what spirit and by what means and methods he should carry it out. The more exalted one's mission to the world, the more real are the testings of character in its accomplishment. From this period of inward conflict he returned to the scene of his baptism, where he met certain of the Baptist's disciples, to whom he had been pointed out by their

teacher. They were Andrew and Simon, his brother, Philip and Nathanael, and, apparently, also John, all of them residents of Galilee. This acquaintance proved to be the beginning of their discipleship, and their discipleship formed the nucleus of all of Jesus' subsequent following. (c) *Early Judæan Ministry*.—After a short visit to his home Jesus returned to Judæa to be present at the Feast of the Passover, in the spring of the year (27 A.D.). While there he made a public declaration of his mission of religious reform by driving out of the temple the traders and money changers, who had been gradually permitted by the priests to bring their business within the sacred inclosure.

There was nothing formal about this act. Conscious as he was of his intimate fellowship with his Father and of the deeply spiritual work his Father had given him to do, it was impossible that the commercialized life of the temple should stand before him as anything save a corruption of its worship, whose right to exist he must challenge in this public act. Nor was there anything light-hearted in what he did. He clearly foresaw that the ceremonialism which had made such corruption possible would not accept the spiritual claims with which it was challenged, and that in rejecting these claims he himself would be rejected as making them, and that the rejection of himself would inevitably involve a hostility whose bitterness would have but one fatal end. The experience of the prophets would have justified an ordinary spiritual insight into the religious life of Judaism in coming to such a conclusion, and Jesus' knowledge of the religious forces with which he was confronted was something more than that of an Old Testament seer. At the same time Jesus was not fatalistic in what he did and said on this occasion. His message and mission were to the heart and will of men, and from the beginning to the close of his work he moved with a hope that men would hear the glad tidings of the message he bore them and throw themselves into his mission for the establishment of the Kingdom of God in the world.

But here, in this first act of his ministry, his hope was disappointed. The people felt the power of the conscious authority with which he challenged the corruption of the temple life; they were impressed with the miracles he performed, but they were not brought to any personal commitment of themselves to him—Nicodemus, who, during his stay in the city, sought an interview with him, was a type of this half-way belief in him; so Jesus withdrew from the city and for a while—possibly during the summer and autumn—remained in Judæa, carrying on, with such of his disciples as had accompanied him to the feast or as had attached themselves to him in Jerusalem, a simple work among the people. Upon the imprisonment of the Baptist, however, he withdrew permanently into Galilee, passing through Samaria, in a village of which region, Sychar by name (the modern Askar), he spent a few days in successful work. Coming finally to Galilee, he made Capernaum his home and the centre of his work. Here he called to his more formal following Simon and Andrew and John, who had come to him at the Jordan, and with them James, the brother of John, and in their company he began his stated ministry.

B. The Galilean Period. The heart of Jesus'

mission was to awaken men to the fact of the love which God had for them and through such awakening to relate their living in loving obedience to his will. So he announced to them that the Kingdom of God was at hand, and in order to let them see the reality of its presence wrought before them those wonder deeds which to their minds, trained in the Hebrew religion, must have shown in action the divine forces against the evil influences of sin. The casting out of demons, the cleansing of lepers, the raising of the dead—these were not merely proofs of Jesus' power, but evidences of the fact that the forces of the Messianic age were being released upon the world; for demonic possessions were considered as directly due to Satan, while leprosy was a recognized emblem of the corruption of sin, and death was looked upon as its punishment. In showing himself master of these Jesus not simply aroused attention to himself as a prophet in Israel, but as a prophet who had a direct message to the religious life of the people. This message, however, would not have been understood had his miracles been unaccompanied with instruction. As a matter of fact, it was poorly understood even then; but slow to understand it as were the people to whom it was given and even his chosen disciples, we can comprehend how it came that such portions of it as have been preserved to us in the composite address known as the Sermon on the Mount and in the group of parables delivered by the Sea of Galilee are of the character they are. The atmosphere in which the Jew had been religiously trained being that of ceremonial righteousness, it was necessary, from Jesus' point of view, to emphasize the higher character of the righteousness which his religion required, and yet its essential identity with the real righteousness demanded in the law. It was equally necessary to make clear the divisions and separations which such requirements would bring among men, and the judgment involved in such process. The character of this newer righteousness is brought out in the Sermon on the Mount, delivered towards the beginning of his Galilean work. The judicial results involved in it are portrayed to a large extent in the parables which were uttered towards the close of that work.

With this purpose of announcing by deed and word the advent of God's Kingdom in the world, Jesus carried on his work from Capernaum as a centre. His method was to make stated tours of the neighboring towns and villages, heralding the fact that the Kingdom of God was at hand and proclaiming his authority in this announcement by miraculous deeds. Three of these tours are reported in the Synoptics during this period of his Galilean work: (1) Mark i. 35-39, Matt. iv. 23-25, Luke iv. 42-44; (2) Luke viii. 1-3; (3) Mark vi. 6, Matt. ix. 35-38, xi. 1. These tours in Galilee afforded Jesus the opportunity he desired of coming widely in contact with the people of the country and bringing before them his message. With his presence among them in the streets and market places, teaching and working miracles, there could be no ignorance of the fact that a prophet had arisen in Israel and a new message had come to the people from Yahwe. As a result, Jesus secured to himself a large following among the people, who became increasingly enthusiastic as the conviction that he might possibly be the national Messiah grew upon them. As this following increased in num-

bers, he organized it more formally by the selection of 12 of his disciples to a closer relationship to himself. (See APOSTLE.) To these he increasingly directed his instruction, with a view to the work he looked forward to their doing as his future representatives. We have a formal exhibition of such instruction in the discourse of Matthew x.

But the religious conceptions of the people had been dulled by ceremonial formalism and hardened by political misfortunes; it was inevitable, therefore, that such a teacher and worker as Jesus would not find acceptance with their religious leaders, in whom this condition was most realized, nor with that portion of them most under the influence and control of these leaders. For this reason Jesus had selected Galilee as the place for his constructive work. The people of the north were less ecclesiastical and more receptive to such a message as he had to deliver and such a mission as he had to perform. While, as the Messiah, he must give his message finally to the religious centre of the land, and while the desire of winning that centre to the Kingdom of God must have been great in proportion as the centre held in itself the people's future, yet it was clear that such winning of men to the Kingdom was more probable in Galilee than in Jerusalem and Judæa. On this principle he had done his work and spent his time in the northern portion of the country. At the same time the fact of hostility to Jesus among the Jerusalem leaders not only early manifested itself in that city, but, as their representatives from time to time went into Galilee and came in contact with Jesus' work, it showed itself even there. Indeed, all the political parties were opposed to him and came gradually to combine in persecution of him. The offense which united them was the spiritual character of his mission; though, under the leadership of the Pharisees, the main point of attack, both in Jerusalem and in Galilee, was the free and independent attitude Jesus maintained towards the ceremonial regulations of the law, particularly those which gathered around the observance of the Sabbath.

As his popularity with the multitudes increased, it took upon itself more and more a political character, until, after the feeding of the 5000, the enthusiasm of the people led them to a public effort to force Jesus as the nation's Messiah into a political revolution against Rome. It was clear that the Master could meet this crisis in only one way. He must present to the people in a way they could not misunderstand the essential opposition of his mission to their political hopes. This was the motive of the profoundly spiritual discourse on the Bread of Life (John vi), which was delivered in the synagogue at Capernaum shortly after this feeding of the multitude. But so steeped were the people in their nationalism that its only effect was a confusing of their false views of Jesus and a benumbing of their superficial devotion to his cause. In fact, it broke his influence with them and practically ended his work in Galilee.

C. The Intervening Period. With his work in Galilee brought thus to an end, it was natural that his thoughts should turn to Jerusalem. If the political hopes and passions of the common people had turned them against the spiritual character of his mission, then there was nothing further for him to accomplish among them, and

there remained only the religious centre of the people's life to which he could appeal. His hope that the covenant people would hear him and return to fellowship with God had been again unfulfilled, but it was not to be abandoned until he had delivered his message to the holy city, the heart of the nation's religious life. With this hope he goes up to Jerusalem soon after the Passover referred to in John vi, which, inasmuch as it came at or near this crisis of his Galilean work, he did not attend. He makes the occasion of his visit the unnamed feast mentioned in John v. 1*—most likely the Pentecost following the Passover of chapter vi—and while at the feast performs a notable miracle and in connection with it delivers a searching discourse. But again his hope of the people's receptivity to his message and their acceptance of his mission is disappointed, and he sees instead a hostility develop which is consummated in a determination to put him to death.

Confronted with such a situation, he must leave the city. He must leave it, however, not to return to his Galilean work, for that now was over, but to go into the unjewish regions north and east of Galilee, where organized work could be laid aside and the time given to the thought which must now be pressing upon him as he sees clearly the coming of the long-fore-shadowed closing of his life, and the opportunity embraced of bringing his disciples to such an understanding of the spiritual character of his Messiahship as would carry them through the tragedy of his death and send them out to herald his message of God's love and God's claims to the uttermost parts of the world.

So understood, this time spent in the region of Tyre and Sidon and in the Decapolis is an essential part of Jesus' preparation for his closing ministry in Jerusalem and not another ministry among unjewish folk, undertaken as a judgment upon the unreceptivity of the people of his own land. The public work he does is desultory and in a manner forced upon him, for he could not be hid; but the moving purpose of his retirement, apart from meditation upon the coming crisis in his own life, was the instruction of the disciples in the spiritual character of his Messianic work. That this is so is clear from the disciples' confession of his Messiahship with which this period was closed, the exultant approval with which this confession was received on the Master's part, and the statement that from this time on he began to disclose to the disciple band the inevitable catastrophe which awaited the further progress of his work (Matt. xvi. 13-28 and parallels). The falling away from him which had been occasioned by his recent discourse in Capernaum had depressed them, especially as they came to realize its positive and permanent character. On the other hand, they themselves shared the popular conceptions of the promised Messianic age as an age which would be national as well as religious (see Acts i. 6), so that to their minds the ultimate issue of the Master's mission could not possibly involve his death. They were thus disposed to resent such an outlook on his part. But Jesus was clearly conscious

that it must be met at last in Jerusalem. His final return to Galilee from the north consequently was not to resume there his work among the people, but to pass through that region on his last journey to Jerusalem.

D. Judæan Period. This journey brought him to the city at the Feast of Tabernacles (28 A.D.), not, however, as an attendant upon the feast, but apart from it, arriving after the feast had begun, apparently in order to avoid as far as possible the ceremonial atmosphere, while taking advantage of the presence of the people to get his message to them as a spiritual reality in and of itself. He found the people full of discussion about him, wondering why he had not come up to the feast, and largely divided in their opinions regarding him. To their confusion of mind, he spoke unhesitatingly, criticizing the unbelief which underlay it, and asserted with full frankness of claim his own divine authority. But whatever hope he may have had that these claims would be accepted, the only outcome of his discourse—apart from a passing arousal of a wavering attraction towards him—was such embitterment of feeling against him that his life was endangered and he withdrew from the city. Shortly before the Feast of Dedication, however, he returned, throwing the people anew into discussion and division by a significant miracle upon a man born blind and by further discourses. But these things resulted simply in another threatening of his life, which again compelled him to leave the city. This withdrawal was of longer duration and for the greater part spent at a distance from the city. It was mostly occupied with an instruction of the disciples and the multitudes, having in view the approaching crisis of his work and life. Miracles, however, were performed—among them the remarkable one at the grave of Lazarus, the result of which in its impression upon the people was so compelling as to crystallize the enmity against him among the authorities into a definite determination to put him to death.

E. Closing Period. On the approach of the Passover (29 A.D.) Jesus returned for the last time towards the city, reaching Bethany six days before the event. On the Sunday of Passover week, in the midst of a large concourse of people, attracted to him from among the pilgrims to the feast, he entered the city with a publicity of popular enthusiasm superficial as that in Galilee had been, and yet impressive enough to arouse to renewed bitterness the enmity of both Sadducees and Pharisees. During the rest of that day, as well as on Monday and Tuesday, he remained in the city, withdrawing to Bethany for the night, where he also spent in retirement the whole of Wednesday and most of Thursday. These days in the city were given to an unrestrained presentation of his Messianic claims that brought him into open conflict with Pharisees, Sadducees, and Herodians together. So came to final issue the hostile purpose of his enemies. This issue was reached on the night of Thursday. On that night Jesus ate with his disciples a meal, in connection with which he referred to his approaching death clearly and distinctly as a sacrifice for sin. (See GOSPEL, *Lord's Supper*.) Leaving the house where the supper had been eaten, the Master goes out with his disciples across the Kidron to an olive orchard which had been transformed into a private garden, where with the three disciples with

* A careful study of the events narrated in the Fourth Gospel shows several displacements of the original sequence, the most obvious of which is that of the fifth chapter, which should follow and not precede the sixth. Consult Lewis, *Disarrangements in the Fourth Gospel*. See also JOHN, GOSPEL OF.

whom he had been most intimate he retires for prayer. Facing as he did the nearness of a murderous death, it was but natural that there should have been agony in this prayer; but, with our understanding of Jesus' consciousness of himself and his mission, this could not have been the mere fear of physical dissolution, even with all the certainty of violence which surrounded it, but rather the realizing sense of its significance as the answer of sin to the love of God. That, in obedience to the Father's command, he must let this take its course and through the perfidy of one of his own disciples realize itself—this was the cup which he prayed if possible might not be pressed to his lips. While in this garden, he was apprehended by a band from the chief priests and Pharisees. This band was under the lead of Judas Iscariot, one of the Twelve, who had betrayed him to the authorities. Upon his arrest he was taken before Annas, an ex-high priest, by whom he was examined. He was then led before a hastily gathered meeting of the Sanhedrin, where such process of trial as might be called by that name was gone through with, at the close of which he was subjected to a personal examination by Caiaphas, the high priest. In this examination Jesus is challenged to confess to his Messianic claims. Though he had been silent against all the fabricated charges of the trial, against this challenge—fundamental and essential as it was—he could not hold his peace, and his admission of the claims is his condemnation by the council. As the morning dawned, Jesus is bound as a prisoner and led away to the Governor, Pontius Pilate, with charges which provoked discussion between Pilate and the leaders and induced Pilate to question Jesus as to himself and the charges brought against him. From this questioning Pilate was convinced of Jesus' innocence and resorted to various expedients to save him from the hatred of the rulers. This, however, was a difficult task; for the rulers had gathered to their aid and support the populace, who, disappointed at Jesus' failure to realize their political hopes, had turned revengefully against him and, with the chief priests and elders, were insistent on his death. Finally, through a shrewd presentation of the case as one involving his political attitude to the Emperor, Pilate was induced to yield and give Jesus over for crucifixion. This final act in the great drama of this wonderful life was carried out at a place outside the city, named by the Fourth Evangelist Golgotha (John xix. 17). Its location is impossible of certain identification; but it was evidently an eminence easily in sight of the passing public, in fact prominent enough to be visible from afar. Here Jesus was crucified between two outlaws. Around the crosses were gathered a riotous mob of people and religious officials from the city, a few of the more loyal disciples, and the Roman guard, who watched the agony of the hours till death mercifully intervened. Upon them all the tragedy of this scene wrought a deep impression. Those whose enmity to Jesus had brought the deed about doubtless had not conscience enough to suffer remorse; certain it is that to the Master's disciples it marked the end of all their hopes. On the evening of the day the body was taken by Jesus' friends from the cross, through Pilate's permission, and hastily laid in a sepulchre near at hand. On the first day of the week which followed certain of the women disciples, going

to the tomb for the purpose of completing the burial, found that the stone had been rolled away and the sepulchre itself was empty. Later on that day Jesus himself appeared to the women, and then to other of the disciples in various places and to varying numbers, and these appearances were repeated at intervals during 40 days. There was no doubt in the minds of the disciples to whom these appearances came that they had had intercourse again with the Master whom they had known and followed during his ministry in Galilee and Judæa. In fact, it was upon this conviction alone that they recovered from the hopeless dependency into which his death had thrown them, and it was upon their positive testimony of this personal intercourse with their resurrected Master that the Christian community in Jerusalem was later established and the Christian Church throughout these ages has lived and wrought its mission in the world. During this post-resurrection period Jesus gave himself to interpreting to his disciples the meaning of his death in the light of the Old Testament Scriptures, and to further instructing them in "the things pertaining to the kingdom of God" (Acts i. 3), and at some time within this period he laid upon them the specific commission to go out into all the world as his representatives and bring men into his discipleship (Matt. xxvii. 18-20). Finally, in a company of the disciples whom he had led out from the city to Bethany, he was taken from them into heaven. (See GOSPEL, *Resurrection*.) From Bethany the disciples, returning to Jerusalem, waited until the day of Pentecost, when, under manifestations of special inspiration from heaven, they began their work of the proclamation of Jesus' religion to the world.

It is not possible in the compass of a brief article, if indeed it is necessary, to estimate the character of a personality unique in human history as was this. Varying as are the opinions which have gathered around his life and work, his advent into the world has set in motion a reformation of its thought and living which has not only continued in its development throughout these centuries but is in a more vital realization of itself to-day than it has ever been. And the significant thing about the power of this movement is that it comes, not from the impression created by the wonder deeds which he performed, which, after all, were not so many, nor from the influence wrought by the peculiar teachings which he uttered, which, taken all in all, were not so extensive, but from the influence and the impression of himself. It was this that from the first laid hold of his disciples and in the dark hour of his death would not leave their minds. It was this fact of the experience of Christ that made the fact of his life among them so significant and has convinced the centuries that have followed that this personality is not the creature of a literary imagination nor even of a pious sentiment, but a divine event in the human history of the world.

JESUS CHRIST IN ART. The representations of Jesus Christ are the most important part of Christian iconography (q.v.). In the early period art did not try to embody God the Father or the Holy Ghost in any human form—the former, if attempted at all, was symbolized by a hand appearing out of a cloud; the latter, by the form of a dove. Even in the acts of creation and in the Old Testament events embodying relations between God and man, it is always the Son who is represented by the artist. The early Church possessed no authentic portraits of Jesus. During the first three centuries the traditional opinion was that he was unsightly in appearance, according to the familiar passage, "He hath no form nor comeliness . . . there is no beauty that we should desire him" (Isa. liii. 2). In the early fourth century Eusebius, in the well-known reply to a letter from the Emperor Constantine's sister, who desired a portrait of Christ, stated that no such portraits existed. Not until the eighth century does one of the fathers, John of Damascus, venture to describe Christ's personal appearance, and yet even during the early centuries there were various theories on the subject. Broadly speaking, there were two schools: one, chiefly the African church, maintained that Jesus was ugly, in order to proclaim the tri-

umph of mind over matter, of internal over external beauty, and out of hatred for the Hellenic pagan worship of the beautiful; the other, mainly the Greek fathers, refused to see in him anything but perfection. The Latin church did not intervene forcibly on either side. At all events, the early Church was hostile to any but symbolic representations of the Redeemer, and during the first three centuries his portraiture in art was carefully avoided.

Early and Middle Ages. In early Latin art, represented in the catacomb frescoes (second to fourth centuries) and sculptured sarcophagi (third and fourth), he is a youth, beardless, with long curly hair—so young that by no possibility could it be supposed to be the portrait of a man of 30. Artists evidently wished to avoid being accused of attempting any such thing. But before the close of the fourth century St. Augustine speaks of the different types of portraits of Christ which artists were then attempting. Of these types one survived all others and with modifications was handed down to the Renaissance. It was purely conventional, and only later writers sought to base it upon early tradition, such as the description in the spurious "Letter of Lentulus," and the acheiropoetic images, or miraculous portraits, like the handkerchief of Veronica. This type had an oblong oval face, with broad smooth forehead, straight slender nose, arched brows, hair parted in the middle and falling in long ringlets over the shoulders, a full beard of moderate length, and an expression grave but sweet. This bearded, poetic, and intellectual type originated with Greek Christian art and was brought by it to Italy. Some examples of it appear in the catacombs; imperfectly in the sarcophagi (a fine example in the Lateran Museum); better in the frescoes (at St. Calixtus and St. Pontianus); coarsely at Santa Costanza; more refined in the mosaics of Santa Pudenziana (c.400), Rome, and Sant' Apollinare Nuovo (c.500-550), Ravenna. It is primarily intended to represent the Christ triumphant, transfigured, or in heaven, not the Christ of the earthly miracles. The beardless type became entirely obsolete before the close of the fifth century. Christ was represented bearded and somewhat older, whether on earth or in heaven. In turn, this type was replaced by a third, usually called the Byzantine, because it is the prevailing one in surviving Byzantine churches. It represents the Redeemer as aged, with elongated face, long beard, deep-set eyes, and an expression of lifelessness. The transition to this type appears at the end of the fourth century in the mosaics of St. Paul Without the Walls, and in the fifth century in Sant' Apollinare in Classe Fuori, Ravenna. It dominated the art of the Christian world until the advent of the Gothic period in northern Europe and the beginnings of the Renaissance in Italy. Mention should be made of late nineteenth-century efforts to trace the origin of these Christ types to certain ancient gods: the youthful, beardless type to Apollo, the Good Shepherd type to Dionysus, and the later bearded type to Æsculapius or Jupiter Serapis. The proof advanced for these theories, however, is not sufficient to establish their probability. The changes in the Christ type from the earlier youthful to the later ascetic ideal were more likely conditioned by the increased emphasis upon the dogma of the deity of Christ and the corresponding change in the ideals of the times.

During the second century almost the only way of presenting him in the catacomb frescoes was as the Good Shepherd, either carrying a lamb on his shoulders or in the midst of the sheep; then, in the third century, came the first use of the scene of the Adoration of the Magi, and perhaps even earlier the Baptism, the Samaritan woman at the well, and the Resurrection of Lazarus—subjects used as symbols and not as episodes. The commonest method was to present Christ under symbols that only the faithful would recognize—as the Lamb, the Fish, the Vine, as Orpheus charming with his music. With the triumph of Christianity (312) a new stage opened, in which on the one hand the art of the catacombs is continued in the sculptured sarcophagi, and on the other the monumental art of the basilicas strikes a new note in representations of Christ. Such episodes of the life of Christ as would be suitable were carved on the sarcophagi, but as yet no complete historic series of these episodes were attempted. Christ triumphant was enthroned in the apses of the new churches; enthroned or seated on a globe or standing among the Twelve Apostles, teaching them and giving Paul and Peter authority to preach and govern. The scene is in the heavenly Jerusalem, and from beneath his feet flow the four rivers of Paradise. The spiritualizing of the scenes continued up to the fifth century—the mosaics of Santa Costanza (c.330), Santa Pudenziana (c.400), Santa Maria Maggiore (c.436), and St. Paul (c.450), all in Rome, show how the visions of St. John acquired more and more influence, until the culmination is reached in the 24 elders casting their crowns before a radiant bust of Christ in a medallion, with the four living creatures on either side. While this spiritual element was being developed, art was beginning to construct, also under Greek influence, a complete series of pictures of the life of Christ, in three main groups: (a) Infancy, (b) Miracles, (c) Passion; beginning with (1) the Annunciation, (2) Adoration of the Magi, (3) Massacre of the Innocents, (4) Presentation in the Temple, (5) Flight into Egypt, etc. The collection of sarcophagi in the Lateran Museum in Rome gives the best series of subjects illustrating the miracles—the wooden doors of Santa Sabina (fifth century) and the mosaics of Sant' Apollinare, Ravenna, the most detailed series of the Passion scenes, which were still without any element of suffering. Christ even here was the triumphant King. In the Santa Sabina reliefs is the first known portrayal of the Crucifixion. The Sant' Apollinare series of c.500 admirably illustrate their transitional age. In the 13 scenes from the miracles Christ is the beardless youth of the Christian sarcophagi (fourth century); in the 13 scenes from the Passion he has the later, more majestic, bearded type of the heavenly and triumphant Christ. The favorite scene in the apse of the basilicas is Christ on a throne or a globe, his head surrounded by a nimbus, holding a book in his left hand and blessing with his right, accompanied by angels and saints, who replace the apostles of the fourth century, except occasionally, though Peter and Paul are often retained. Sometimes—as at St. John Lateran, St. Paul, and San Venanzio—only a bust of Christ appears in the clouds. Until the ninth century the popularity of the Apocalypse and the scenes from the heavenly Jerusalem caused the lamb to be retained as an emblem of

Christ, even after a council of the Church had forbidden such pictures. The period from c.500 to 800, therefore, while it witnesses the creation of a positively individual type of Christ and gives artists the liberty of portraying all the events of his life—even those of the Passion—lays but little stress on the humanity and the sufferings, much on the divinity and triumph, of Christ. The Carolingian age (800–1000) inaugurated the idea of the terror-striking Christ. The Apocalyptic scenes were partly replaced by realistic Last Judgments. The story of the painter missionary Methodius terrifying the Bulgarians into conversion by such a painting is typical. At the beginning of the period it is not universally so—witness the beautiful mosaics of Santa Prassede in Rome. The type of Christ, also, still breathes majestic sweetness and calm. Byzantine art probably invented at this time some of its most beautiful types of Christ, handed down since by tradition—Christ winged as the Angel of the Divine Will, or as the High Priest. The illuminated manuscripts of this period, both Byzantine and Carolingian, give the most varied material for study. A favorite new composition is Christ crowning the Emperor (or Empress) of the East or West. In the eleventh and twelfth centuries Christ becomes more and more the severe Judge, with whom the Virgin and John the Baptist act as intercessors, though he is still surrounded by the four cherubim Evangelists, the Twelve Apostles, and sometimes the 24 elders. But he no longer appears seated on a globe or a throne with a few saints in the celestial sphere—he is almost always brought into immediate contact with human affairs. The frescoes of Ferentillo, San Tommaso in Formis, San Pietro in Grado, in Pisa, the mosaics of Torcello, and innumerable other works of the eleventh and twelfth centuries show the increasing emphasis upon the severe side of Christ's character and the theological and dogmatic tendency. The growing asceticism of the type of Christ is shown also in Byzantine art, which, however, retains much beauty and serenity, which it does not lose until the twelfth century. The mosaics of San Marco in Venice, of the cathedral of Cefalù, of Monreale, and the Capella Palatina in Palermo are among the most important series of scenes and types of Christ. The Byzantine conception, as expressed in the Greek *Guide to Painting*, edited and translated by Didron and Durand, should be read in the presence of such mediæval works, to show how traditional and carefully taught were all representations of the Saviour, as to type, age, garments, color, attitude, grouping with other figures, etc.

The devotional idealism and realism of the thirteenth and fourteenth centuries dispute the field with the power to recreate a spiritual type of Christ. In Italy the tendency was to give prominence to the sufferings of Christ. This is painfully evident in those Crucifixions of the Berlinghieri, of Margaritone, Cavallini, Giovanni Pisano, and other painters and sculptors. The emaciated and distorted body, the drawn face, the gaping wounds, are intended to excite a sentimental piety. French Gothic art was more sedate. The Christ carved for the cathedrals was the divine Teacher. The statue of the Beau Christ of Amiens is typical of a large class, to be met with in Chartres, Rheims, Paris, and elsewhere. Comparing the art of the West, both in its works and in such literary treatises as

that of Durand (*Rationale Divinorum Officiorum*), it is evident that the West is comparatively narrow in its range of representations, and that it lays increasing emphasis on the psychological, even the pathological, side of Christ's life—a side very lightly touched upon in the East. At the same time representations of the three persons of the Trinity became common in the West for the first time, often strangely imagined. For the first time, also, the scene of the Virgin and Child is often repeated. Not that it was entirely unknown in earlier times, but its sudden popularity accords with the humanitarian and psychological period. At the close of the Middle Ages we are confronted by two important factors: first, the death of the Christian (Byzantine) art of the East, which removes what was at that time the most original and spiritual element in representations of Christ; second, the revival of painting under Giotto and his successors. Both of these factors had an important bearing on the later development.

Renaissance and Modern Types. During the Renaissance painting became the favorite means of depicting the Christ type—rather than sculpture, which is concerned chiefly with the human body, or mosaics, the chief value of which is decorative. With a marvelous union of wholesome naturalism and classic idealism the Italian painters of this period established an ideal type of Jesus and left representations of his life which became the models of future painting and still dominate our conceptions of the subject. Every significant phase of his existence on earth and in heaven, from the "Annunciation" (q.v.) to the "Last Judgment," was portrayed with loving care and skill. Most frequent of all was the representation of the infant Jesus with his mother; this subject, usually termed "The Madonna," will be found treated under that heading. Among the scenes of his life represented, the following are treated in special articles of this *ENCYCLOPÆDIA*: "The Nativity," usually combined with "The Adoration of the Shepherds"; "The Adoration of the Magi"; "The Massacre of the Innocents"; "The Flight into Egypt"; "The Marriage of Cana"; "The Last Supper"; "Ecce Homo"; "The Crucifixion"; "The Bewailing of Christ," usually called "The Pietà" (q.v.); "The Resurrection"; "Christ's Appearance to the Magdalen," usually called "Noli me Tangere" (q.v.); "The Supper at Emmaus"; "The Last Judgment."

During the late thirteenth and the fourteenth century, although the grandiose, mediæval type of Christ still prevailed, there was increasing freedom in depicting his life. The Sieneese, chief of whom was Duccio, clung to the Byzantine ideal, with an increasing tendency to soften the type, while the Florentines, at whose head stands Giotto, cherished a less conventional and more virile ideal. The union of these two tendencies promoted the type of the mild and suffering Christ, which reached its culmination in the paintings of Fra Angelico. During the fifteenth century the Florentines, from Masaccio on, depicted the strong and virile type, and this was the ideal of the Realists, some of whom, like Andrea del Castagno, represented Christ as little more than a peasant. The Umbrians, on the other hand, continued the Sieneese tradition of the mild and suffering Redeemer, as may best be seen in the works of Perugino. Practically every important painter of the Italian Renais-

sance endeavored to realize the Christ type and depicted scenes from his life. The Christ ideal of the Renaissance was perhaps most perfectly realized by Leonardo in "The Last Supper," by Titian in his "Tribute Money" and other masterpieces, and by Raphael in such paintings as "The Transfiguration" and the cartoons for the Sistine tapestries. Following the ascetic tendencies of the Counter Reformation, Italian painting of the seventeenth century emphasized the suffering Christ, as may especially be seen in the many "Ecce Homo's" by Guido Reni and others.

The portrayal of Jesus and his life was a theme of no less importance in northern painting. In Flanders during the fifteenth century Jan van Eyck established a type which greatly influenced the painting of the succeeding epoch, and such masters as Rogier van der Weyden, Dirck Bouts, and Hans Memling represented scenes of his life with power and pathos. The type culminated in the beautiful and serene Christ of Gerard David. The subject was a favorite one with Quenten Metsys, whose "Ecce Homo's" are well known. Among German painters of the Renaissance Dürer deserves special mention for the powerful yet serene Christ type which he so often painted and engraved. Among the Flemings of the eighteenth century Rubens stands preëminent for his powerful representations, while Van Dyck's Christ type is more refined. Among the Dutch and, indeed, among the painters of all times, Rembrandt stands unrivaled in his presentation of the human side of Christ's nature, particularly in its pathetic phases.

The Spanish school depicted especially Christ's suffering and developed a type in which realism was combined with ascetism and solemnity. The Christ types of El Greco, Vicente Juanes, and Murillo are probably the finest of the school. During the eighteenth century all religious subjects lost their former importance in painting, and even the nineteenth century produced little worthy of comparison with the great works of the past. Mention should be made of the pure Greek conception embodied in Thorvaldsen's marbles. In painting the sincerest work has been done by the Germans and English. Early in the century the German Nazarenes (q.v.) revived religious painting with more piety than artistic ability. At the middle of the century the Pre-Raphaelites, especially Holman Hunt and Burne-Jones, painted the life of the Redeemer with much reverence and infinite detail. In the late nineteenth century Eduard van Gebhardt painted scenes from his life with great power and originality, and Gebhardt's work was continued, with deep pathos, by Fritz von Uhde, who depicts Jesus surrounded by the people of the present day. Far better known in Germany and elsewhere are the paintings of Joseph Hoffmann, but this is due to pleasing illustrative qualities rather than to depth of sentiment or real artistic merit. In France many of the great painters, like Flandrin and Delacroix, represented scenes of Jesus' life, but their paintings are more important from the artistic than from the religious standpoint. But during recent times a few French painters, foremost among whom are Dagnan-Bouveret and L'Hermitte, have painted canvases of profound artistic and religious significance. Mention should also be made of the well-known aquarelles and illustrations of James Tissot, who with infinite care and patience has

depicted Christ and the holy personages as types of present-day Jews of Palestine.

Bibliography. The most scholarly works on the subject have discussed chiefly the iconography of the early period. Among such discussions are Grimm, *Die Sage vom Ursprung der Christusbilder* (Berlin, 1843); Didron, *Histoire de Dieu, iconographie des personnes divines* (Paris, 1843); Wesseley, *Iconographie Gottes und der Heiligen* (Leipzig, 1874); Dietrichson, *Christusbilledet* (Copenhagen, 1880); Hauck, *Die Entstehung des Christustypus in der abendländischen Kunst* (Heidelberg, 1880). A good brief discussion of the subject is in Kraus, *Real-Encyclopädie der christlichen Altertümer*, vol. ii (Freiburg, 1886). No satisfactory account of the Renaissance and modern period has been written. The English works which emphasize this phase are unscholarly and popularly written. They include Henry Van Dyke, *Christ Child in Art* (New York, 1894); E. M. Hurll, *Life of Our Lord in Art* (Boston, 1898); F. W. Farrar, *Life of Christ in Art* (London, 1901); Bayliss, *Rex Regum* (ib., 1905); J. Burns, *The Christ Face in Art* (New York, 1907), probably the best; and for the early period, Thomas Heaphy, *The Likeness of Christ* (London, 1906). The legendary side of the subject is treated in a very popular manner by A. B. M. Jameson, *History of Our Lord as Exemplified in Works of Art* (2 vols., ib., 1864-65); Whiteomb and Grosvenor, *Christ Child in Legend and Art* (New York, 1910).

JESUS COLLEGE, CAMBRIDGE. A college of Cambridge University. It was founded in 1496 by John Alcock, Bishop of Ely, on the site, and in part with the property, of the nunnery of Sts. Mary and Rhadegunde, which dated from 1133 and had become bankrupt in revenues, reputation, and numbers. The buildings of the college, which date from the twelfth to the nineteenth century, are among the most attractive in Cambridge, comprising as they do the old nunnery buildings and church, as well as the later collegiate additions. The almost monastic seclusion of the college and its quiet charm well warrant to-day the title bestowed on it by James I, *Musarum Cantabrigiensium Museum*, the house of the Cambridge muses. The college consisted, in 1913-14, of a master, 12 fellows, and 30 scholars, with college officials and some 212 undergraduates. It presents to 16 livings. Among the worthies of Jesus College are Archbishops Cranmer, Bancroft, and Sterne, Bishops Pearson, Fox, and Fisher, John Strype, John Bale, Laurence Sterne, and S. T. Coleridge. Consult A. Gray, *Jesus College, Cambridge* (London, 1902). See CAMBRIDGE, UNIVERSITY OF.

JESUS COLLEGE, OXFORD. A college of Oxford University. It was the first college founded after the Reformation and owes its establishment to Dr. Hugh ap Rice, or Price, who in 1571 was granted a charter for its foundation by Queen Elizabeth. Later the Queen added a gift of part of the land on which the college now stands and timber from the royal forests and took the title of founder. The college was intended for Welsh students, who still form the largest part of its membership, and it has always been closely associated with Wales and the Welsh marches. The earls of Pembroke are its hereditary visitors. The college developed greatly in the seventeenth century by the benefactions and influence of two of its masters. The first of these, Sir Eubule Thellwall, obtained

a new charter from James I, added in 1621 to the buildings, and doubled the endowment. The second was the distinguished diplomat Sir Leo-line Jenkins, who became master of the college in 1661 and added greatly to its resources by bequest in 1685. Its buildings, chiefly of the sixteenth and seventeenth centuries, have been restored since 1850 and are now very attractive. The library is rich in scarce books and manuscripts, particularly those connected with the history and literature of Wales. In 1913-14 the college consisted of a master, 10 fellows, 34 scholars, and 186 undergraduates. See OXFORD UNIVERSITY. Consult E. G. Hardy, *Jesus College, Oxford* (London, 1899).

JET (OF. *jet, jaet, jayet, gayet*, Fr. *jayct, jais*, from Lat. *gagates*, Gk. *γαγάτης, gagatēs*, jet, from *Γάγης, Gagēs, Γάγαι, Gagai*, a town and river of Lyeia in Asia Minor, where the mineral abounded). A black variety of bituminous coal that is easily cut and carved and takes a high polish. It occurs at various places in Bavaria, Bohemia; Aude, France; Germany; near Villaviciosa, Spain; also in the Tertiary clays along the coast of Yorkshire, England, especially at Whitby, where it is found mixed with fragments of bituminized wood of coniferous trees in the upper lias or alum shale of that district. Owing to the high polish that it takes, it is extensively used as material for dress trimmings and mourning jewelry. Among the Greeks it was considered a remedy for toothache when powdered and mixed with wine, and was applied, with beeswax, to tumors. Popular belief attributed to it a power of revealing faithlessness. See LIGNITE.

JETSAM, jēt'sam (corrupted form of *jetson, jettison*). Goods which go down with the ship on which they are carried, or which are cast overboard from a vessel in peril of storm or capture and then sink and do not come to the surface. Such goods do not come under the description of "wreck," which, by a rule of the common law, under certain conditions, was forfeited to the crown, but continues subject to recovery by the owner. See FLOTSAM; DERELICT; JETTISON; WRECK.

JETTÉ, zhě'tā', SIR LOUIS AMABLE (1836-). A Canadian jurist and statesman. He was born at L'Assomption, Province of Quebec, and was educated at L'Assomption College. He studied law, was called to the Quebec bar in 1857, and practiced his profession in Montreal. He also contributed to the political press and became editor of *L'Ordre* (Montreal). His connection with several noted legal cases gained him prominence, and he decided to enter politics. In 1872-78 he was a Liberal member of the House of Commons for Montreal East. In the latter year he also became professor of civil law in Laval University and later was appointed dean of the law faculty. From 1878 to 1898 he was a puisne judge of the Superior Court of Quebec and for the next 10 years Lieutenant Governor of Quebec. In 1903 he was one of the two Canadian members of the Alaska Boundary Tribunal in London (see ALASKA, *Boundary Dispute*), and in his decision dissented from the majority. In 1901 he was knighted (K.C.M.G.). In 1909 he was appointed Chief Justice of the Court of King's Bench (P. Q.), and in the same year was made Commander of the French Legion of Honor. He was one of the commissioners for the revision of the Civil Code of Quebec and published *Observations relatives au code de procédure civile* (1888).

JETTING. See PILE; FOUNDATION.

JETTISON (OF. *getaison, gettaison*, from Lat. *jactatio*, a throwing, from *jactare*, frequentative of *jacere*, to throw). In maritime law, the throwing overboard of a ship's cargo, either in whole or in part, in cases of necessity, so as to lighten the vessel in a storm, or to prevent capture by pirates or the public enemy, or for other justifiable cause. The power to jettison a cargo is lodged by the law in every master of a ship while upon the high seas and in extremity

JETTY (OF. *jetee, getee*, Fr. *jetée*, p.p. of OF. *jetter, jeter*, Fr. *jeter*, to throw, from Lat. *jactare*, frequentative of *jacere*, to throw). An embankment or pier extending into a lake or ocean for the purpose of controlling sand drift which would otherwise shoal up a channel or encroach on the shore. In strict parlance such embankments for the latter purpose are called groins or groynes (see SHORE PROTECTION), while jetty is reserved for structures built out from the mouth of a river to deepen the channel over

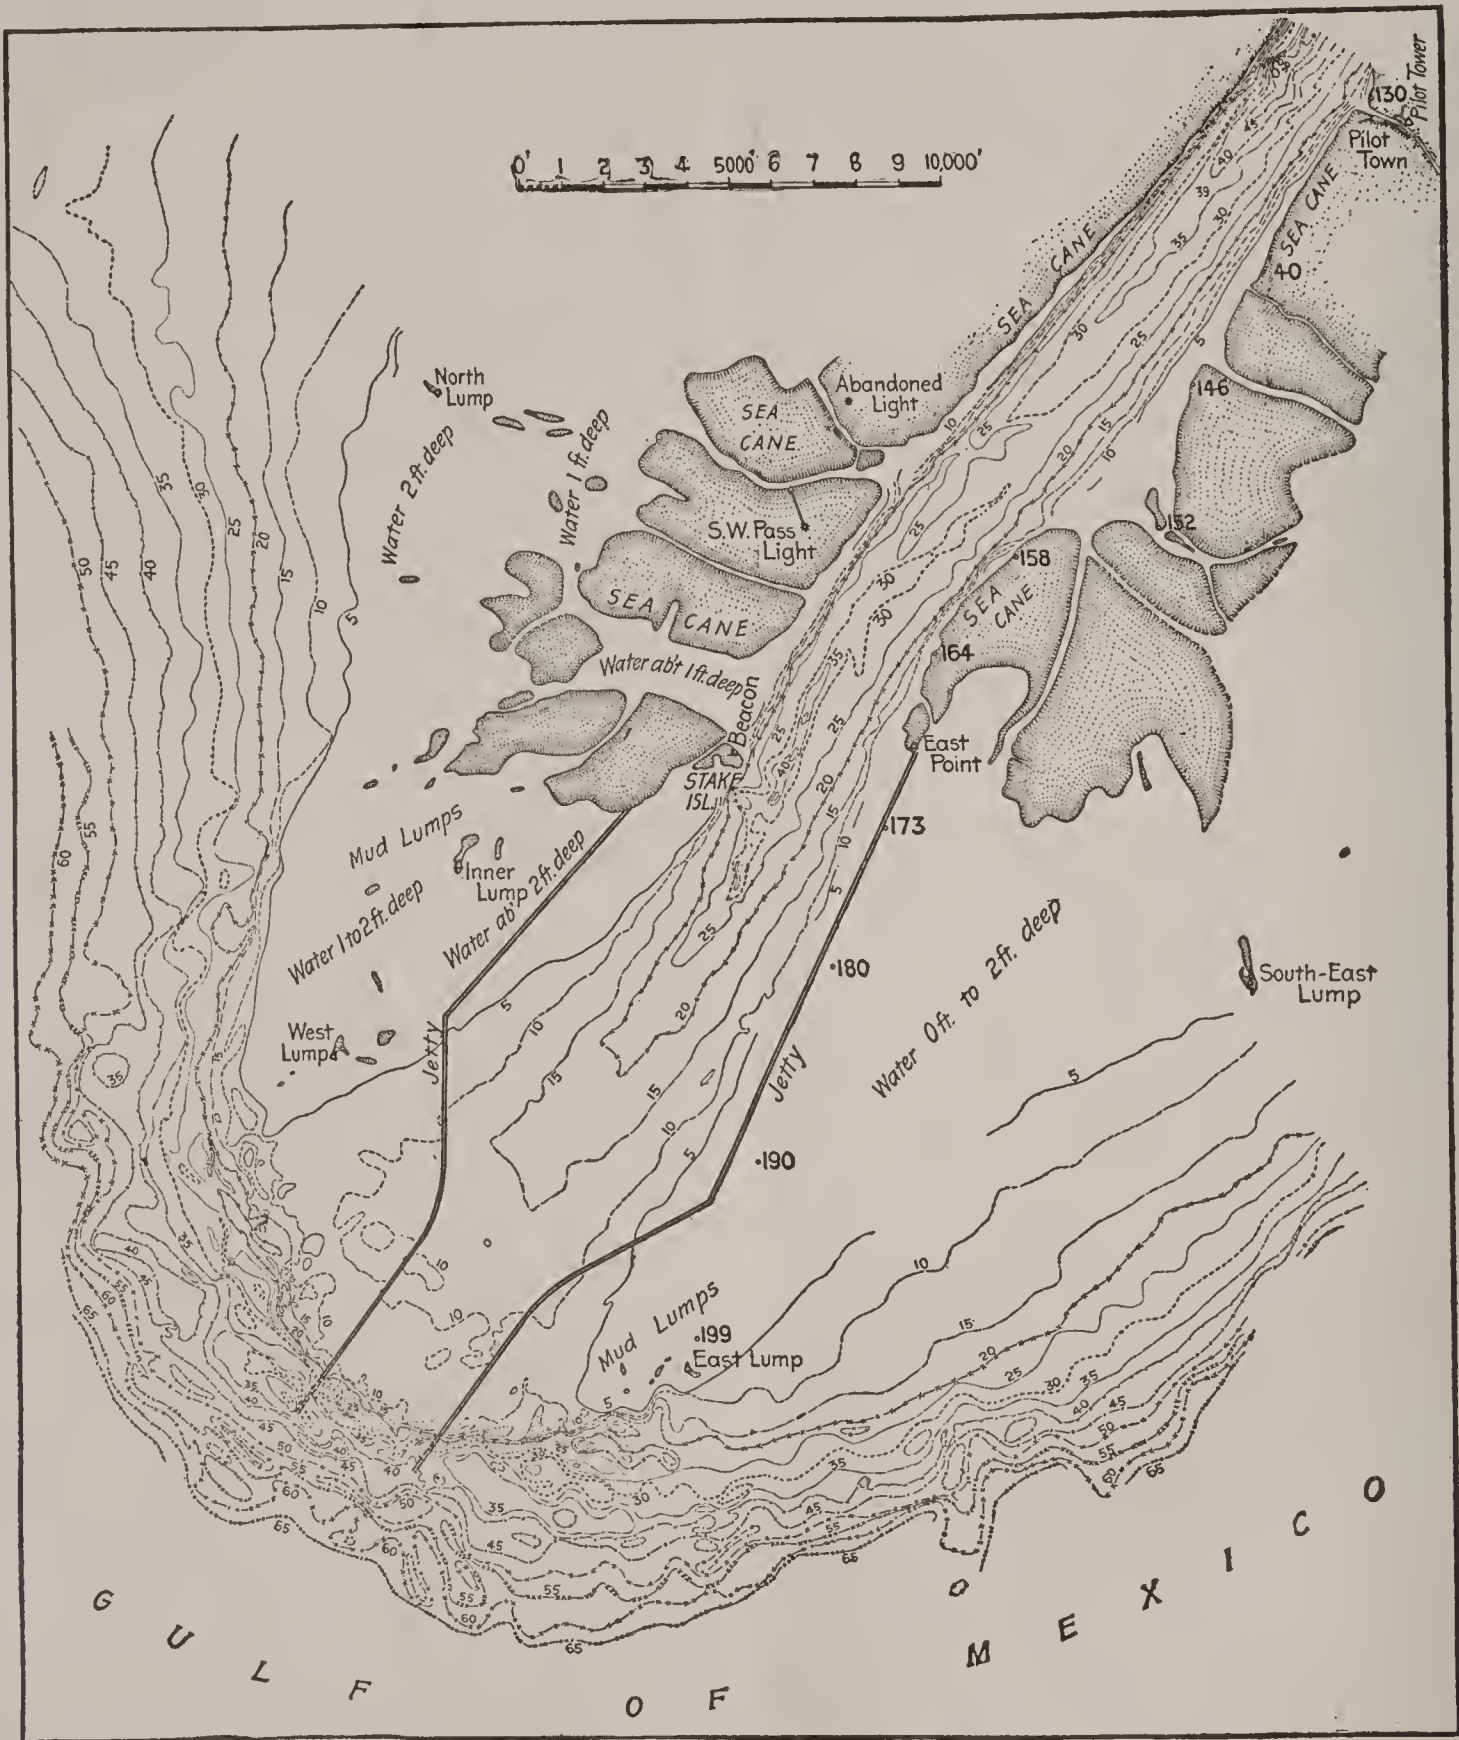

FIG. 1. MAP SHOWING LOCATION OF JETTIES FOR SOUTHWEST PASS OF MISSISSIPPI RIVER.

of danger. The loss sustained by the sacrifice does not fall upon the master or upon the owners of the vessel, but primarily upon the owner of the cargo. But as he is sacrificed for the general good, he is entitled by the doctrine of general average to a pro rata contribution from the several persons interested in the ship, freight, and cargo, though there are exceptions to this rule where the goods were carried on deck. When the goods sacrificed by jettison have been insured, the insurer has the benefit of this contribution or average to the extent of his loss. See AVERAGE, IN MARITIME LAW.

the bars that otherwise would form across the mouth. A jetty is sometimes confused with a breakwater (q.v.). The two may be similar in construction, but the jetty is designed to accelerate a current and thereby cut a deeper channel, whereas a breakwater is merely a protection of a harbor against the severity of the open sea. Quite possibly, however, the same structure may serve both purposes.

On an exposed coast there is generally a considerable drift of sand or shingle along the shore, due either to the prevailing wind or to offshore currents. An alluvial river emptying

into the sea will at the same time carry down with it a great quantity of silt and sand which, coming in contact with the littoral drift and the dead water of the open sea, is deposited as a bar which shoals the channel just beyond the mouth and, in extreme cases, forces the river into one or more other outlets. For purposes of navigation it is necessary to cut through this bar to preserve the channel depth. Dredging is often resorted to for this purpose, but the jetty has been found to be one of the most effective methods inasmuch as it is automatic in its action.

Jetties are built generally of large broken stone which is dumped in a self-shaping mound seaward from shore, either from a trestle, a barge, or the already completed jetty. Other materials which are used are timber, earthwork, cut stone, concrete block, and wood mattresses. The structure is similar to a breakwater, and all of the methods of construction described under BREAKWATER apply equally well to jetties.

Twin jetties are two embankments roughly parallel (though often converging towards the outer end) projecting from either side of the

nel of some old jetties which may or may not be influencing the scour.

Jetties have been constructed at the mouth of too many rivers to note here, but brief description will be given of the notable and typical examples of the Danube and Rhone in Europe and the Mississippi and Columbia in the United States.

Mississippi Jetties. The most famous jetties in the world are those at the mouths of the Mississippi River, although they were built subsequent to, and partly as a result of the lessons from, those at the Rhone and the Danube. It is well known that the Mississippi River makes its way to the Gulf of Mexico through three great branches or passes. On the extreme left to the east lies Pass à l'Outre, about 14 miles in length to land's end. In the middle lies South Pass, which, before its improvement, was about 12 miles long. On the right, to the west, lies Southwest Pass, about 17 miles to land's end. In 1874, after a very bitter controversy, Congress authorized Capt. James B. Eads to improve the South Pass by the construction of two parallel jetties at his own expense, with the provision

FIG. 2. TYPICAL CROSS SECTIONS OF EAST JETTY FOR SOUTHWESTERN PASS OF MISSISSIPPI RIVER.

river mouth and forming a continuation of the river banks, so that by confining the river its current is concentrated and its force increased sufficiently to scour a channel across the bar and to deposit its drift and sediment out in deep water. At the same time the windward jetty keeps the littoral drift from depositing at the river mouth. The obvious difficulty in the method is that in time the deposit beyond the jetty head may tend to form a new shoal, which for a time can be kept clear by dredging, but which eventually may require a lengthening of the jetties.

Practically all jetty construction is of the twin jetty type, but there have been built single jetties, on the leeward side of the channel, with the idea that the sand drift will drive the channel to the jetty and the latter will hold it in one position, with a consequent improvement in depth. As a rule the theory does not work out in practice. At Aransas Pass, Texas, there has been built a special type of single jetty, called by its inventor a "reaction breakwater," which has a specially curved plan designed to force the paralleling current alongside the jetty, where it can scour out a channel. Its principle is very debatable and its success doubtful in the one example because of the presence in the chan-

nel that he was to receive payment therefor when he secured a final permanent depth of 26 feet in the 350-foot channel between the jetties. The east jetty was made 11,800 feet long from land's end to 30 feet of water in the Gulf; the west jetty was 7800 feet long and was built 1000 feet from the east jetty and generally parallel with it. The first work was to drive a row of piles spaced 12 feet apart to mark the inner lines of the two jetties. These piles served to guide the operations of sinking the mattresses and were not intended to give strength to the work.

The jetty structures proper consisted of several layers of willow mattresses, loaded down with stone. The first layer was composed of mattresses 100 feet long and 50 feet wide, and the succeeding layers of mattresses of the same length, but decreasing in width to the top mattress, which was 20 feet wide. Generally four courses or layers of mattresses were sufficient to bring the mattress work to the water surface. Each mattress was composed of four layers of willow brush, which, when compressed, gave it a thickness of about 2 feet. The mattresses were built on launching ways on shore, towed into position behind the guide piles and sunk by loading them with stone. After the mattress work was thoroughly settled, the sea end of each

jetty was surmounted by a capping of concrete blocks. The work was started in June, 1875; by August, 1876, a depth of 20 feet had been secured, by February, 1878, a depth of 22 feet, by July, a depth of 24 feet, and by October, 1878, 30 feet. Captain Eads's theories were thus vindicated, and experience has proved them correct.

In 1899 the United States Army Engineers submitted plans for the construction of jetties at the mouth of the Southwest Pass of the Mississippi River, according to the design shown in the accompanying figures. Construction of the jetties was commenced in December, 1903, and completed January, 1908, at a cost of about \$2,627,000. Extension of the east jetty for 3000 feet and of the west jetty for 3750 feet was commenced in 1909 and completed in 1912. The final depth gained by the jetties with the aid of extensive dredging is 35 feet. A résumé of this improvement and of the previous work on the South Pass by William Starling, United States Engineer Corps, was published in *Engineering News* (New York) of Aug. 23 and Oct. 4, 1900. See MISSISSIPPI RIVER.

Columbia River Jetty. The Columbia River, ever since its discovery in 1792, has been the chief harbor of the Pacific Northwest, but the shifting character and variable depth of the bar channels have always caused its entrance to be held in terror by mariners and shipowners. To improve these conditions a jetty extending out seaward from the south cape was completed in 1895. Its total length was nearly 4½ miles. It was constructed by sinking mattresses of brush 3 feet thick and 40 feet wide and surmounting them by a mound or ridge of rubble stone. From a low-water depth, generally of 19 feet to 22 feet, in shifting and uncertain channels across the bar, the depth was increased to 30 feet in a single channel. The improvement did not prove permanent, as a gradual shoaling set in, and by 1902 the channel had moved to an unstable location and was only 21 feet in depth. In 1903 a plan was begun of making a 2½-mile addition to the south jetty, a 2½-mile north jetty, and an enlargement of the present section. The south jetty and enlargement were about completed in 1913.

Rhone River Jetty. One of the earliest large jetties was built at the eastern outlet of the Rhone River in 1852-57. Here embankments were built along both sides of the channel, closing off five minor outlets and extending out to within half a mile of the offshore bar, thereby concentrating all of the flow in a single outlet. The improvement in channel depth for a time was marked, but soon the bar formed again beyond the jetty head, owing to the shallow offshore depth, absence of littoral current, heavy sediment, and poor wind conditions. A new canal exit for the river had to be built in 1863-73, but the lessons learned from the structure were put to good use in later structures, notably the Danube jetties.

Danube River Jetties. Shortly after the Rhone improvement, work was started on the jetties at the Sulina or central mouth of the Danube. In 1858-61 twin jetties of rubble on piles and later (1866-71) with concrete block topping were carried through a 9-foot depth over the bar to the 18-foot depth offshore. They were about 4600 feet long and 600 feet apart at their extremities. Completed in 1861, they had by 1872 increased the through channel depth to 20½ feet and later to 24 feet.

Haupt, "Jetties for Improving Estuaries," in *Journal of Franklin Institute* (Philadelphia, 1888); papers on "Harbors," presented before the International Engineering Congress, St. Louis, 1904, in *Transactions of the American Society of Civil Engineers*, vol. liv, part A (New York, 1905); Perilli, "Jetties of Armored Concrete," in *Report of International Congress on Navigation* (Brussels, 1905); *Engineering News* (New York, 1874-); *Reports of Chief of Engineers, United States Army* (Washington, D. C.).

JEU DE PAUME, zhē de pōm (Fr., tennis), **HALL OF THE.** A famous building in Versailles, in which the members of the Third Estate in June, 1789, met after finding the assembly room closed against them. The hall contains a great painting by David depicting the taking of the celebrated oath of the Tennis Court.

JEUNE, PAUL LE. See LE JEUNE, PAUL.

JEUNESSE DORÉE, zhě'nēs' dō'rā', LA (Fr., gilded youth). A name given to a political party in Paris during the French Revolution. The term was first used by contemporaneous historians of the Revolution in 1797 by François Xavier Pagès in his *Histoire secrète de la révolution française* and has been frequently used by later writers on the Revolution, like Mignet, Thiers, Thibaudeau, and Prudhomme. It consisted of young men who, under the leadership of Fréron, endeavored to bring about a counter-revolution after the fall of Robespierre. The party was also nicknamed the *Muscadins* (scented darlings) and *Petits Maîtres* (elegants). The term and its English equivalent, "gilded youths," is commonly applied at present to the idle rich young men about town that are found in every great city. See INCROYABLES.

JEV'ONS, FRANK BYRON (1858-). An English educator and religious historian. He was educated at Wadham College, Oxford. In 1882 he joined the faculty of Durham University, where he was tutor in classics until 1910 and also censor of unattached students (1892-96), senior proctor (1896-99), university treasurer (1898-1902), subwarden (1902-09), and principal of Bishop Hatfield's Hall after 1896. In 1910 he was appointed professor of philosophy. He became an alderman of the Durham County Council in 1913. His writings, those treating of religion being especially important, include: *A History of Greek Literature* (3d ed., 1889); *The Prehistoric Antiquities of the Aryan Peoples* (1890); *Plutarch's Roman Questions* (1892); *A Manual of Greek Antiquities* (2d ed., 1895); *An Introduction to the History of Religion* (2d ed., 1896); *Evolution* (1900); *Religion in Evolution* (1906); *Study of Comparative Religion* (1908); *Idea of God in Early Religions* (1910); *Comparative Religion* (1913); *Philosophy: What Is It?* (1914).

JEVONS, WILLIAM STANLEY (1835-82). An English economist, born in Liverpool. He was a grandson of William Roscoe, the eminent historian, educated at University College, London, and made a fellow of his college in 1862. He held a position in the Sydney (Australia) mint (1854-59). In 1866 he received the appointment of professor of logic and mental and moral philosophy, and Cobden lecturer in political economy in Owens College, Manchester; in 1872 he was elected a fellow of the Royal Society, and in 1876 received the honorary degree of LL.D. from the University of Edinburgh.

During the latter year he was appointed professor of political economy in University College, London. Failing health caused him to relinquish his Manchester professorship in 1881. In the following year he was drowned while bathing at Bexhill, Sussex. Few writers of recent years have had a wider influence. His *Treatise on Logic* substitutes for the familiar conceptions a mathematical foundation of the syllogism, which has been widely adopted by later writers. Among theoretical economists he is most widely known by his *Theory of Political Economy*, which develops the theory of final utility which has occupied a conspicuous place in writings of later theorists. He is best known to general readers by his *Investigations in Currency and Finance*, his *Money and the Mechanism of Exchange*, and especially by the *Coal Question*, which at the time of its publication (1865) set all England in a ferment. The thesis of the work was the dependence of England upon coal, the approaching exhaustion of its deposits, and the gradual decline of English preëminence in the industrial world. Jevons had planned to write a systematic treatise on economics, but this work was never finished. The manuscript parts, with a number of essays contributed to periodicals, were published in 1905 under the title of *Principles of Economics*.

JEW'EL. See GEMS; JEWELRY.

JEW, THE WANDERING. See WANDERING JEW, THE.

JEWEL, JOHN (1522-71). A prominent English churchman of the time of Elizabeth. He was born in the Parish of Berimber or Berryn-arbor, Devonshire, May 24, 1522. While a student at Oxford, he was led to favor reformed doctrines, and for openly inculcating them he was deprived of a fellowship at Corpus Christi on Mary's accession in 1553. Later he was induced to sign adherence to a form of doctrine essentially Roman Catholic; but he repented of his act and in 1555 fled to Frankfort, where he abjured his recantation. He lived at Strassburg and Zurich until Elizabeth's accession, when he returned to England (1559), was one of eight Protestant divines appointed by the Queen to dispute with a similar number of Roman Catholics, and in 1560 was made Bishop of Salisbury. In 1562 he published his work in defense of the English church, *Apologia Ecclesiæ Anglicanæ*, which was condemned by the Council of Trent. It was translated into English the same year, and by Elizabeth's order a copy was placed in every parish church. Thomas Harding published *An Answer to Doctor Jewel's Challenge* (1564), to which Jewel replied (1565); then Harding published a *Confutation of an Apology* (1566) and was answered by Jewel in a *Defense of the Apology* (1567). He died at Monkton Farleigh, Sept. 23, 1571. His complete works were issued with memoir, by Featley (London, 1609); by Ayre, with memoir, for the Parker Society (4 vols., Cambridge, 1845-50); and by Jelf (8 vols., Oxford, 1848). Consult his biography by C. W. Le Bas (London, 1835).

JEW'ELL, MARSHALL (1825-83). An American politician, born in Winchester, N. H. After receiving a common-school education, he learned the tanning business in a belting manufactory established by his father at Hartford, Conn., learned telegraphy, and after several years as a telegraph operator in the South and West returned to Hartford in 1850 and became a member of his father's firm. He accumulated a large

fortune, became interested in numerous business enterprises and in Republican State politics, and, after being the unsuccessful candidate for Governor in 1868, was elected in 1869. Defeated for reëlection in 1870, he was again successful in 1871. In 1873 he was sent by President Grant as Minister to Russia, whence he was recalled in the following year to take the portfolio of Postmaster-General in Grant's cabinet. In this capacity he served until July, 1876, when he resigned in consequence of a disagreement with the President over the action of Secretary Benjamin H. Bristow (q.v.) in connection with the "Whisky Ring" frauds. In 1880 he opposed Grant's renomination, and as chairman of the Republican National Committee conducted the Garfield campaign.

JEWELL, THEODORE FRELINGHUYSEN (1844-). An American naval officer, born at Georgetown, D. C. He graduated at the Naval Academy in 1864 and served in defenses of Washington in the summer of 1863. Jewell commanded at the Naval Torpedo Station (1890-93), was superintendent at the naval gun factory up to 1896, and commanded the *Minneapolis* in the war with Spain and the *Brooklyn* in the Philippine Islands. In March, 1904, he was promoted to the grade of rear admiral and shortly afterward was placed in command of the European squadron. He retired in November, 1904. He is the author of numerous articles on professional subjects, especially ordnance and torpedoes, with the development of which he was closely identified.

JEW'ELRY (Eng. *jewel*, a finished gem, Fr. *joyau*, OF. *jouel*, ML. *jocāle*). Ornaments for the person, especially mounted gems or precious stones, and objects made of gold or silver. (See also DIAMOND; ENAMEL; GEMS; PEARL; RING.) Originally jewelry was part of the goldsmith's work—the *minuteria*, or small work, of the Italians, who called plate (q.v.) *grosseria*, or large work. As pointed out by H. Clifford Smith, jewelry naturally divides into five different classes,—objects worn (1) on the head—diadems, tiaras, aigrettes, hairpins, jewels for the hat and cap, earrings; (2) on the neck—necklaces, with their various pendants; (3) on the breast—brooches, clasps, buttons; (4) on the limbs—armlets, anklets, bracelets, rings; (5) at the waist—girdles, with their various attachments and pendants, such as chatelaines, pomanders, scent cases, rosaries. While jewelry to-day is worn principally by women, among savage and barbarous races it is worn principally by men—not only to beautify the body, but also as a mark of rank and dignity, and as charms and religious symbols.

Egypt. Of ancient Egyptian jewelry, rich in colored gems and glazes, much has been preserved in Egyptian tombs. The best collection is in the Museum at Cairo, but there are also important collections in the Louvre, the British Museum and at Berlin and Munich. The Egyptians preferred chasing and engraving to other methods of ornamenting metal, but they were skilled in soldering and repoussé (q.v.), and indeed in all the processes known to-day except enameling. (See ENAMEL.) Extraordinary evidence of what they could do is the jewelry of five princesses of the twelfth dynasty (about 2400 B.C.), discovered in 1894 at Dashur. The most important pieces are three openwork *pectorals*, inlaid with jewels, two gold crowns (one flat openwork with inlay, the other a wealth

of tiny florals mounted on filigree) and a dagger with inlaid handle.

About 1000 years later is the jewelry of Queen Aah-hotp, coarser than that of Dashur, but ingeniously worked. The diadem of gold has a sphinx couchant each side of a box ornamented in checker pattern with red and blue pastes, and bearing an inscription in gold on lapis lazuli. The flexible gold chain of plaited wire terminates in ducks' heads, and carries suspended by a tiny ring a scarab of gold inlaid with lapis lazuli. The flat hinged bracelet, similar to those used to-day, shows repoussé figures on gold ground inlaid with lapis lazuli. As shown by the sculptures and the paintings that represent bracelets by bands of red and blue, many Egyptians wore two on each arm—one on the wrist and one above the elbow. But the commonest ornament, and the most necessary, was the finger ring that served as signet, with the owner's emblem engraved on the metal or on a scarab or other stone set in it. The pectoral, as the name indicates, was worn on the breast suspended by ribbon or chain.

The best Phœnician jewelry has been found in Cyprus, but it also occurs in Phœnician settlements at Sardinia, Crete, and Rhodes. It is a mixture of Egyptian and Assyrian forms, the latter of which are known to us almost exclusively from the bas-reliefs. About Phœnician jewelry much has been learned from sculptured busts like those of Yecla, now in the Madrid Museum, and the "Lady of Elché," in the Louvre, adorned with three necklaces carrying urn-shaped pendants, with elaborate diadem encircling the forehead, and with sumptuous coiffure.

Greece. Prehistoric Greek jewelry is best illustrated by the finds at Mycenæ and Cyprus, the former those of Schliemann now preserved in the Museum at Athens. Spiral patterns almost identical with the Celtic are common, and there are cuttlefish, starfish, butterflies, and other naturalistic forms expressed in repoussé. Especially numerous are the small round gold plates with perforations for attaching to the clothing; and especially noteworthy the gold diadems in the shape of long oval plates covered with rosettes in repoussé. Of later Greek jewelry the most brilliant collections are that in the Hermitage at St. Petersburg, unearthed from the tombs of Kerch and the Crimea, and the one discovered in 1905 under the temple of Artemis at Ephesus—1000 pins, brooches, beads, and stamped disks of gold—part of which is in the British Museum, but most in Constantinople. Exceedingly rich in ancient Greek jewelry has proved to be the part of Italy known as Magna Græcia. A famous burial wreath found at Armento, purchased about 1826 by Ludwig I of Bavaria, and now in the Antiquarium at Munich, is composed of roses, narcissus, myrtle, and oak leaves, enlivened by small figures of genii. Also from Magna Græcia is the extraordinarily and exquisitely beautiful gold crown in the British Museum acquired in 1898 from the collection of Count Tieszkiewicz. In granulated work the Greeks were rivaled only by the Etruscans, but they preferred filigree ornamentation—fine threads of gold delicately twisted upon the surface. Enamel they used sparingly. Gold was their favorite material, and they excelled in repoussé, chasing, engraving, and intaglio cutting, and developed to great perfection the art of soldering small objects to

thin surfaces and joining the thinnest metal plates together. For designs they went straight to nature, associating simple and simplified fruit, flower, and foliage motifs with naturalistic animal and human forms. Their invention was particularly fertile as applied to earrings, both ring-shaped and pendent. See the article **EARRING**.

Etruria. For the Etruscans jewelry had a special charm, and though their later work is coarser, their early goldsmiths excelled in fineness and elaboration and were able to unite metals by solvents unknown to us, so that no traces of solder remained. Especially did they understand and freely employ granulation (*pulvisculus aureus*, as the Romans called it) for the decoration of gold surfaces with grains of gold of microscopic size—an art mentioned by Cellini in his *Trattato dell' Oreficeria*, but not commonly practiced in the Renaissance. In the nineteenth century it was revived by Castellani, of Rome, who discovered among the Abruzzi goldsmiths, to whom the processes had come by inheritance from antiquity. Examples of his work were exhibited at London and at Philadelphia in 1876. Important collections of Etruscan jewelry are those in the Vatican, the Louvre, the British Museum, and at Berlin and Munich.

Rome. From Etruscan and Greek jewelry is derived Roman, which under the Republic was worn modestly, but under the Empire extravagantly and luxuriously. Pliny describes a lady at a betrothal as covered from head to foot with pearls and emeralds. Coiffures were heavy with jewels and precious metals. An ancient Roman hairpin in the British Museum is 8 inches long and crowned with a Corinthian capital on which stands Aphrodite. Pearls were used lavishly, especially on earrings. Seneca complains that: "Two pearls beside each other, with a third above, now go to a single pendant. The extravagant fools probably think their husbands are not sufficiently plagued without their having two or three heritages hanging from their ears." Necklaces were often double or triple, of plaited or linked gold; or richly mounted with precious stones, especially after the Oriental conquests of Pompey, who found in the captured treasury of Mithridates "jewels for the breast and neck all set with gems"; or composed of beads of stone or glass or amber, especially the latter, which was regarded as a talisman against witchcraft and other perils. Amber with a small insect in it was particularly prized, "being valued," says Pliny, "no matter how small, at more than a healthy living slave." Cameos, large intaglios, and Imperial gold coins were popular as pendants, and the coins were also made up into bracelets. Especially extravagant were the Romans with their rings. Martial speaks of a man who wore six on each finger, and advises another who had one of monstrous size to wear it on his leg instead of on his hand. The signet use of the ring continued, and every Roman appears to have chosen his own subject or device—the portrait of a friend or an ancestor, or some symbol from poetry or mythology, serving, like the coat of arms of the Middle Ages, as a mark of identification. Rings as well as bracelets in the form of serpents were much in vogue, and also those shaped like an Herculean knot. Bezels were sometimes hollow and filled with poison for use in case of emergency. Of the officer in charge of the temple of Jupiter Capitoline, Pliny says: "Being arrested, he broke

the stone of his ring between his teeth and expired on the spot."

Byzantium. Byzantine jewelry links the ancient and the modern world, having transmitted antique processes and designs not only to Russia, that still reproduces them, but also to western Europe, that until the twelfth century was decoratively subservient. Byzantine jewelry is, however, a compromise between Orient and Occident. It retains the craftsmanship of the ancient Roman Empire and the dignity of classic traditions modified by Christian ideas, but adds the patient skill of the Oriental in executing exuberant decoration. The style is admirably illustrated by the contemporary mosaic portraits of Justinian and Theodora at San Vitale in Ravenna. The garments of the Empress and her attendants are stiff with gold and richly set with jewels; pearls, rubies, and emeralds enrich her neck and shoulders and cover her head, hanging from her temples in festoons down to her breast. The most usual type of earring from the sixth century on is crescent-shaped, in gold repoussé openwork, showing a cross pattée inside a circle, supported on either side by peacocks confronted. Of course the favorite breast pendant is the cross, but not till after the fifth century. One of the finest examples that have survived is the Beresford-Hope cross in the British Museum, dating from the eighth century. It is made of two plates of gold hinged to form a reliquary, with figures executed in translucent cloisonné enamel—on one side, the crucified Saviour with busts of the Virgin and St. John; on the other, the Virgin full-length with the heads of four saints. Of the many Byzantine finger rings that have survived, most bear Christian symbols, and more are in gilded bronze than in gold.

Germania. The Gothic and other Germanic tribes had jewelry copied from Persia or farther east—colored stones, usually garnets, or cut red glass inserted in thin gold plate or placed side by side with strips of gold between. The treasure of Petrossa in the Bucharest Museum contains some of the earliest examples, dating from the fourth century A.D., among them a bird-shaped breastplate, three bird-shaped brooches, and a crescent-shaped collar rich with precious stones. Of more refined workmanship is the regalia of Childeric I, founder of the Merovingian dynasty, who was buried at Tournai in Languedoc in 481 A.D. His grave was accidentally exposed by a peasant in 1653, and the precious objects it contained—a sword, a bracelet, brooches, buckles, about 300 gold bees that adorned a mantle, and a signet ring with oval engraved gold bezel bearing the inscription *Childirici Regis*—were transferred to the Bibliothèque Nationale in Paris. Most wonderful of all is the treasure of Guarrazar, 11 jeweled gold crowns, found near Toledo in Spain in 1858, and divided between the Cluny Museum at Paris and the Royal Armory at Madrid. The most important of those at Madrid is the crown of King Svinthila (621–631 A.D.), set with large pearls and cabochon sapphires arranged in rose-shaped patterns. Suspended by chains from the lower rim is a fringe of letters set in the cloisonné manner with red-glass paste, and spelling *svintilanus rex offert*. Prolific in Anglo-Saxon jewelry have proved the ancient graves of England, particularly those of Kent, Sussex, and the Isle of Wight. The British Museum has a rich collection of decorated hairpins; beaded necklaces

with pendants; brooches, many of cruciform shape; girdle buckles of gold, silver, or bronze. Of Celtic jewelry, the Dublin Museum has much—perhaps the richest collection in Europe of prehistoric gold ornaments. Among the numerous torques, the largest, over 5 feet long and weighing 27 ounces, is supposed to have been worn over the shoulder and across the breast.

Mediæval. About mediæval jewelry from the ninth century on, graves give us little information, the custom of burying objects with the dead having been forbidden by Charlemagne. But the inventories of the period show an astounding wealth of precious stones and gold and silver ornaments; and the brasses, tombstones, and illuminated manuscripts give us considerable assistance. During the Crusades the Byzantine and Oriental influence was increased by the knights who brought back from Syria, Palestine, and Constantinople (Byzantium) not only impressions of Oriental culture but actual specimens of Oriental jewelry. There began a regular importation of goods and workmen from Asia Minor to Venice, Genoa, and Pisa, who under the banner of the Cross reestablished their trade with the East. By the beginning of the thirteenth century the West appears to have learned its lesson and became practically independent of its former sources of supply. The methods and practices of jewelers then are preserved in the monk Theophilus' famous *Schedula Artium*, in which he describes all minutely. In the monasteries sumptuous objects were made for ecclesiastical use, Limoges becoming the chief centre for enamel work, the process being *champlevé* generally on copper. In the Gothic thirteenth, fourteenth, and fifteenth centuries, shapes became slighter and more elegant, with more detail and delicacy. Gothic architecture and window tracery penetrated the designs, enamels becoming translucent and modeled in low relief, usually on silver. In the fourteenth century the costumes of the laity began to be luxurious with jewelry. The inventories of Charles V of France and his three brothers—the dukes of Anjou, Berry, and Burgundy—are a revelation as regards the possible extent of personal splendor and ostentation. But the culmination was reached in Flanders under the Burgundian dukes of the fifteenth century—Philip the Good and Charles the Bold—whose court was the richest and most fashionable in all Europe. Pearls and precious stones entered from the Orient at the great port of Bruges, and, as is shown by the portrait painters of the period, garments were sewn thick with them. Especially interesting is the painting by Petrus Christus, of Bruges, known as the "Legend of St. Eloi and St. Godeberta," picturing the interior of a Flemish goldsmith's shop.

Italian Renaissance. Italian Renaissance jewelry merits the high reputation it has always had. During the fifteenth century, while the arts in Flanders, France, Germany, and England were still Gothic, the revival of the classic had already taken place in Italy. In this movement Florence led, though rivaled by Venice, the wealthiest city and most important port in Europe. The goldsmiths emerge from the subordinate status occupied in the mediæval guild, and attain fame as free artists. Many of them become painters, sculptors, and architects, and their trade is regarded as the best apprenticeship for the arts of design. Among the great names are those of Ghiberti, Maso di Finiguerra,

Pollaiuolo, Verrocchio, Caradosso, Botticelli, and Ghirlandaio (q.v.). Noteworthy are the intricate settings devised by Botticelli for the neck pendants of the three Graces in his "Primavera." Noteworthy also are the jewels in Ghirlandaio's portrait of Giovanna Tornabuoni, formerly in the Kann and now in the Morgan collection—one worn on the lady's breast, a ruby in claw setting with small beryl above and three pendent pearls below; the other in a recess beside her, a ruby surrounded by two pearls and three beryls, beautifully set and surmounted by a winged dragon with a sapphire over its head.

While the designs of antiquity excel in abstract beauty of form and color, and those of the mediæval craftsmen possess a peculiarly naïve and ingenuous charm, it cannot be denied that the jewels of the Renaissance, enriched with every variety of ornament that the goldsmith could devise, are in their own manner incomparable. Though some by overelaboration may lose balance and dignity, the majority possess qualities rarely found together save at this remarkable period—boldness of conception, richness of form, and extraordinary refinement of technique. Hammering, chasing, casting, and particularly enameling, are all perfectly accomplished. The variety is astonishing. There is none of the monotonous repetition characteristic of most modern jewelry.

The value of Renaissance jewels is independent of their intrinsic worth or the cost of the materials. When the Countess of Châteaubriand was requested to return to Francis I the precious ornaments that were desired by her successor in the royal favor, she sent them to the melting pot first, thus making the gift trivial instead of magnificent. Throughout the best period sculpture is prominent; human and animal figures in relief or in the round find a place on the majority of jeweled compositions; subjects are pictured from history and mythology, religion and romance. Grotesque patterns, like those copied from the unburied frescoes of ancient Rome by Raphael and his pupils for the decoration of the Loggia of the Vatican, are a frequent source of inspiration.

Of sixteenth-century Italian Renaissance jewelry there still exists an abundance, but the sixteenth-century painters, unlike those of the fifteenth century, do not illustrate jewels generously. The foremost name is that of the Florentine goldsmith Benvenuto Cellini (q.v.), whose popularity long caused all the finest examples to be attributed to him, regardless of the facts. If one believes what he himself wrote in the fascinating narrative of his life and adventures, one is tempted to associate him with all the finest creations of his time and to picture his services as competed for by cardinals, popes, and kings. Yet the only quite authenticated example we have of his work as goldsmith is the famous saltcellar at Vienna, the attribution being disputed of jewels such as "Leda and the Swan" at Vienna, the "Chariot of Apollo" at Chantilly, and the mountings of the two cameos, "The Four Cæsars" and "The Centaur and the Bacchic Genii," in the Bibliothèque Nationale at Paris.

Germany. About 1515 the wide circulation of engravings and illustrated books of Italian Renaissance jewelry impelled the German goldsmiths to cultivate Renaissance ornament, and before long the richness of their invention began to overshadow the Italians. Among famous Ger-

man designers of jewelry are Dürer and Holbein, the former the son of a goldsmith. In Germany, Renaissance ornament lost much of its original purity and became a mixed style composed of strap and ribbon work and intricate architectural motifs.

France. France was the first country to adopt the new Italian style, and from the beginning of the reign of Francis I, French jewelry was closely modeled on Italian, and many Italian jewelers settled and worked in Paris—among them Cellini, from 1540 to 1545. As a collector, Francis I surpassed even Henry VIII and Pope Paul III. But actual examples of French Renaissance jewelry are few, almost the only ones being the wonderful mounted cameos in the Bibliothèque Nationale. Among the chief designers who engraved models for jewelry were Jean Duvet (goldsmith to Francis I and Henri II), Jacques Androuet Ducerceau, Etienne Delaune, René Boyvin, and Pierre Woëriot.

One of the acquisitions of Henry VIII just before his death was the great pendant of Charles the Bold, the last Duke of Burgundy, captured by a common Swiss soldier from his tent after the memorable defeat at Granson in 1475 and later sold by the magistrates of Bern to a merchant of Augsburg, who sold it to Henry VIII. In the centre was a splendid pyramidal diamond $\frac{5}{8}$ of an inch square, surrounded by three larger rubies, called the "Three Brothers" from their equality in size and weight, and by four enormous pearls. The last we hear of the famous jewel is in 1623, when James I had it refashioned for the use of Charles and Buckingham on their visit to Spain, the King writing to his son: "I send for your wearing the Three Brethren, that you know full well, but newlie sette."

In the baroque seventeenth century, gorgousness and glitter rather than color and good design were sought. Stones that had formerly been cut *en cabochon*, or in other simple forms, were elaborated with facets like diamonds, and pearls were in immense demand. Flowers painted in natural colors on enamel and sometimes modeled in relief were the principal decoration of pendants.

Modern. As in the other arts (see INTERIOR DECORATION), so in jewelry, rococo naturalistic designs and unsymmetrical outlines dominated during the first half of the eighteenth century, simple classic forms during the last half. The fashionables of the Directoire who could afford it wore ancient Greek and Roman jewels; the rest, facsimiles of ornaments unearthed at Pompeii or pictured on ancient vase and mural paintings and sculptures. The affected classicism of the Empire stimulated the use of engraved gems, and cameos and intaglios often occupied positions of honor beside important diamonds. The metal work of the early nineteenth century was poor—either pinchbeck imitation or thin and light.

The leader in the revival of jewelry as a personal and individual art at the close of the nineteenth century was René Lalique (q.v.), whose exhibits at the Salon of 1895 and the Exposition of 1900 created a sensation. But the permanent reorganization of the industry depends largely upon the enthusiastic though often inefficient work of Arts and Crafts societies and schools, particularly those of England, Germany, Austria, and the United States. While machine-made jewelry is not

necessarily ugly, it is apt to lack the qualities that distinguish good art from bad art. Everything is stereotyped, the different parts being stamped out in quantity by steel dies, especially in imitation jewelry, where stones in paste and glass are mounted on cheap electroplated alloys.

One of the first artistic industries established in the American Colonies was that of the goldsmith, who in every large town produced trinkets for the Indians and popular articles of jewelry, particularly snuffboxes. In 1788 no less than 35 goldsmiths took part in the procession in Philadelphia celebrating the adoption of the Constitution. Providence has long been a jewelry centre. In 1805 four firms there employed 30 men making simple finger rings, gold beads, and silver spoons. Attleboro, Newark, and New York became active a little later, and all four cities produce much cheap jewelry, using alloyed and hammer-plated, and after 1860 electroplated, metals. See PLATED WARE.

United States Statistics. In 1909, according to the thirteenth census of the United States (published 1913), the jewelry industry of the United States was concentrated in the States of Rhode Island, New York, Massachusetts, and New Jersey, and the percentage of the value of the product for that year for the principal centres was as follows: Providence, 25.1 per cent; New York, 23.9; Newark, 16.4; Attleboro, 9.2.

The jewelry industry is one of considerable importance, and the thirteenth census, quoted above, reported that in 1909 there were 1537 establishments engaged in this branch of manufacturing, which includes the working of gold, silver, platinum, gold-filled metals, gold plate, brass, copper, or other metal, with or without precious or semiprecious stones. In addition there were included gold and silver mountings for various articles of more or less utility, and jewelers' findings, as well as statistics of establishments engaged in setting diamonds and other stones and in chasing gold and silver for the trade. The 1537 establishments produced in the year 1909 an output of \$80,349,874, of which the cost of materials amounted to \$36,674,859, so that there was added by manufacture \$43,675,015. The average number of wage earners in the industry was 30,347, and their wages represented a total of \$18,357,950.

JEWELS OF THE MADONNA. See GIOJELLI DELLA MADONNA.

JEW'ETT, CHARLES COFFIN (1816-68). An American librarian. He was born in Lebanon,

Me., graduated at Brown University in 1835 and at Andover Theological Seminary in 1840, where, while a student, he acted as librarian. He became librarian at Brown University in 1841 and from 1843 to 1848 was professor of modern languages there. He then became librarian of the Smithsonian Institution and from 1855 until his death was superintendent of the Boston Public Library. He was the first of the modern school of American librarians, and his *Notices of Public Libraries in the United States of America* (1851) and his *Smithsonian Report of the Construction of Catalogues of Libraries* (1853) were of much value and marked a great advance over earlier writings in this field in America. At Boston he prepared the card catalogue of the public library, one of the first instances of the use of the card catalogue in public libraries. Mr. Jewett was president of the first American convention of librarians—that of 1853, held in New York.

JEWETT, MILO PARKER (1808-82). An American educator, born in St. Johnsbury, Vt. He graduated at Dartmouth College in 1828 and at the Andover Theological Seminary in 1833, became professor of rhetoric and political economy two years later in Marietta College, Ohio, resigned in 1838 after adopting Baptist tenets, and in 1839 founded the Judson Female Institute in Marion, Ala., which he conducted until 1855. He then established a seminary for young ladies at Poughkeepsie, N. Y., where he aided Matthew Vassar in planning Vassar College, of which he became the first president in 1862. He resigned his office in 1864 and in 1867 removed to Milwaukee, Wis. His publications include: *Baptism* (1840); *Education in Europe* (1863); *Relations of Boards of Health and Intemperance* (1874); *The Model Academy* (1875).

JEWETT, SARAH ORNE (1849-1909). A writer of stories of New England life, born in South Berwick, Me., Sept. 3, 1849. Miss Jewett, born of New England stock, made her first serious entry into literature in 1869 by publishing a story in the *Atlantic Monthly*. Her books, mainly consisting of short stories and sketches, include: *Deephaven* (1877); *Play Days* (1878); *Old Friends and New* (1879); *Country By-Ways* (1881); *The Mate of the Daylight* (1883); *A Country Doctor* (1884), a novel; *A Marsh Island* (1885), a novel; *A White Heron, and Other Stories* (1886); *The Story of the Normans* (1887); *The King of Folly Island, and Other People* (1888), which contains some of her best work; *Betty Leicester* (1890); *Tales of New England* (1890); *A Native of Winby* (1893); *The Life of Nancy* (1895); *The Country of the Pointed Firs* (1896); *The Queen's Twin* (1899); *The Tory Lover* (1901), an historical novel. Her stories and sketches are admirable in their simple and intimate portrayal of New England character in its finer and gentler moods. Her work is distinguished for its naturalness and is a valuable contribution to the fiction dealing with American life. Consult C. M. Thompson, "The Art of Miss Jewett," in the *Atlantic Monthly*, vol. xiv (Boston, 1904), and *Letters*, edited by A. Fields (ib., 1911).

JEW'FISH'. Any of several groupers of tropical American waters and the largest of the sea-bass family Serranidæ.

1. A guasa (*Promierops guttatus*), common on both coasts of Mexico and about Florida and the West Indies and known in the vicinity of Pensacola as warsaw (a corruption of guasa,

q.v.). It is a robust species, with a big, flat head and a huge mouth with formidable teeth. It has a voracious appetite. The color of the young is pale olive green, with five crossbars of darker green; but as the fish grows older the general hue becomes dark olive green. It haunts rock places. Ordinary specimens do not often exceed 20 pounds in weight, but one was brought to New York in 1874 which weighed 300 pounds. For illustration, see WARSAW.

2. The black jewfish of Florida, also called warsaw and mero de alto by fishermen, is a related species (*Garrupa nigrita*), which ranges from South Carolina to Brazil, but is not present on the Pacific side of Central America. Few have been examined which weighed less than 100 pounds, and specimens exceeding 500 pounds are recorded. Its color is chocolate brown, varying to blackish gray, without markings, and little paler on the ventral parts, and the fish is a favorite object of sport with rod and line. Consult Holder, *Big Game Fishes* (New York, 1903).

3. On the coast of southern California, an immense fish of the same family and habits (*Stereolepis gigas*), brownish with large greenish-black blotches, and the ventral fins black. It is 5 to 7 feet long, reaches a weight of 500 pounds, and frequents the neighborhood of rocky islands. The flesh of the smaller specimens, often called black sea bass, commands a high price.

JEWISH ART. A term properly applied to art as practiced by the Jews in Palestine before the capture of Jerusalem by Titus, as the conditions of the dispersion afterward did not allow of any independent art. The earliest archæological material known is their pottery, which has been found in considerable quantities, especially at Tell el-Hesy, where Professor Petrie's (q.v.) systematic excavations enabled him to distinguish several periods marked by superimposed strata of ruins. His periods are: (1) An Amorite, (2) a Phœnician, and (3) a Jewish period. Jewish designs seem mainly to be copies of Phœnician models, which were themselves copies of other Oriental arts. In the same way the Jewish glyptics were remotely derived, through the Canaanites and Phœnicians, from the glyptics of Babylonia and Assyria; the Hebrew seals, few of which are earlier than the Maccabæan age, varying only by the predominance of floral and geometric design, owing to the aversion of the Jews to reproducing the human figure. Nothing remains of Jewish metal work; carving in wood and ivory and overlaying with metal were practiced, but no works are extant; nor do we know anything of the artistic character of Jewish pictorial decoration, weaving, or embroidery. The tombs near Jerusalem (Tombs of the Kings, etc.) and scattered throughout Palestine are similar to the late Hellenistic and Roman works of their class throughout Syria (see TOMB), and Herod, when reviving the prosperity of Palestine, rebuilding the temple, and founding Cæsarea, with its magnificent structures, frankly adopted the style of Roman art. To this time and to the succeeding century belong the few remaining ancient synagogues in Galilee.

Bliss, *Tell el-Hesy* (ib., 1894); Benziger, *Hebräische Archäologie* (Freiburg, 1894); Nowack, *Lehrbuch der hebräischen Archäologie* (ib., 1894).

For fine illustrations of Hebrew ornament from ancient manuscripts, see Strassof and Gunzburg, *L'Ornement hebreux* (Berlin, 1905). See SYNAGOGUE.

JEWISH CHAUTAUQUA SOCIETY, THE. (shâ-tâ'kwâ) Conceived and founded in 1893 by its chancellor, Dr. Henry Berkowitz, of Philadelphia, for the "dissemination of a knowledge of the Jewish religion by fostering the study of its history, literature, etc.," this society is modeled on the mother Chautauqua of New York. In 1897 the first assembly was held in Atlantic City, and this focusing of the work has so greatly prospered that the original session of two weeks has now been extended to three. Here the creation of departments for study and entertainment is similar to those of other Chautauquas. More than this, the influence of the society has resulted in the London Jewish Study Society. The official organ was, until 1907, the *Menorah Magazine* of New York, and there is also an *Assembly Record*, published at Philadelphia, besides special series of various publications. The society was incorporated in 1899 and is administered by the following officers: a chancellor, a president, a treasurer, a secretary and director, a field secretary, a board of trustees, and an educational council. The society has a membership of 3000. It conducts a correspondence school and reading circles, for which course books and syllabi are issued dealing with biblical and postbiblical history and literature and the Hebrew language. Consult the *Menorah Magazine* (New York, since 1897); *Special Series No. 7* of the Jewish Publication Society of America (Philadelphia, 1902); *Reports of the United States Commissioner of Education*.

JEWISH EDUCATION. See JEWS.

JEWISH LANGUAGE AND LITERATURE. See JEWS.

JEWISH SECTS. A term applied to certain divergent schools of religious thought and practice, or organized parties, among the Jews.

The *Samaritans* may be regarded as a Jewish sect, inasmuch as they recognized the binding authority of the Law of Moses, but, on the other hand, limited the sacred writings to the Pentateuch, established a cult of their own on Mount Gerizim (see EBAL AND GERIZIM), maintained a certain opposition to the cult in Jerusalem, and took no part in the movements that led to the establishment of rabbinical Judaism. Manasseh, the son of Joiada, is said to have been the first high priest, and the temple to have been built in the days of Alexander; and there is still a small community celebrating every year the Passover on Mount Gerizim. See SAMARITANS.

The *Pharisees* are first heard of in the days of Jonathan (161-143 B.C.), but may have existed for some time then. They were distinguished by their belief in the resurrection and a world to come, intense Messianic expectations, reliance upon angelic ministrations, certain customs of purification, and a tendency to defend apparent deviations from the written Law by an appeal to the "oral Law" claimed to have been transmitted from Moses. In the days of Herod there were 6000 members of this sect. Their views and attitude influenced greatly the later rabbinical development. See PHARISEES.

The *Sadducees* apparently came into existence about the same time as a party banded together to insist upon a literal interpretation of the

Law, to oppose the novel teachings concerning a resurrection from the dead and a world of spirits, to maintain a more conservative type of thought and piety, and to emphasize freedom of the will and moral responsibility. Whether they were called Sadducees because they were "just," organized by one named Zadok, or at first adherents of the Zadokite line of high priests, is uncertain. They ceased to have any influence after the fall of Jerusalem in 70 A.D. See SADDUCEES.

Another sect that probably also grew up in the second century B.C. was the *Essenes*. They formed a kind of brotherhood, chiefly intent upon the exercise of practical virtues and ruled by a severe code of morals. In the time of Philo and Josephus there were several thousand members, some living a stricter monastic life at Engedi, others scattered in various communities, living in matrimony. They believed in a spiritual resurrection, opposed oath taking, the law of retaliation, divorce, and private wealth, and they occupied themselves much with secret books. See ESSENES.

The *Covenanters of Damascus*, a sect arising in the middle of the second century B.C., has been unknown until the publication by Schechter of some of its documents in 1910. He identifies them with the Zadokites described by the Karaite Kirkisani in 637 A.D. It seems to have been after the overthrow of the old high-priestly family that a company of Judæans left their homes and took up their abode in Damascus and the neighboring region. They departed widely from the teaching and practice of the Pharisees, against whom they made many accusations: they forbade divorce; they looked forward to the coming of a Messiah, not from Judah or David's line, but "from Aaron and Israel," consequently a priest; and they regarded it to be wrong to kindle the altar fire and offer sacrifice. They apparently cherished the Book of Hagu and the Book of Jubilees among their scriptures; and the present documents may be as old as the beginning of the first century B.C. See ZADOKITES.

According to Epiphanius, there was a Jewish sect, the *Nasaræans*, living "in Galaaditis, Basanitis, and the region beyond the Jordan," which "existed before Christ and did not know Christ" and differed from other Jews only in regarding the Law of Moses they had as more accurate, refusing to offer sacrifices, and abstaining from animal food. See NASARÆANS.

The *Dositheans* probably go back to pre-Christian times. They show certain similarities to the Zadokites. There is a growing conviction among scholars that *De Vita Contemplativa* is a genuine work of Philo, and consequently the picture of the *Therapeutæ* a description, more or less idealized, of an actual Jewish sect living on the shores of Lake Mareotis, south of Alexandria. It shows marked affinity to the Essenes. See THERAPEUTÆ.

JEWISH YEAR. See CALENDAR.

JEW LIZARD. An agamoid lizard of Australia which, when excited, expands the pouch of its throat into the appearance of a beard; hence often called bearded lizard.

JEW OF MALTA, *mał'tà*, THE. A tragedy by Marlowe, written at a date which is uncertain, but must have been subsequent to 1588. It was acted between 1591 and 1596 and was first published in 1633, edited by Thomas Heywood. Shakespeare was indebted to Marlowe's play for

suggestions in the *Merchant of Venice*, though the plot was mainly taken from other sources.

JEWS (OF. *Geu*, *Jeu*, Fr. *Juif*, It. *Giudeo*, Ger. *Jude*, Lat. *Judæus*, Gk. *Ἰουδαῖος*, *Ioudaios*, from Heb. *Yehudah*, Judah). The name of a people belonging to the Semitic family of nations. (See SEMITES.) Originally it designated the members of the tribe of Judah; then the citizens of the Kingdom of Judah, which included various ethnic elements (see JUDAH); later the inhabitants of Judæa under foreign rule or temporarily independent, as under the Hasmonæans (see MACCABEES); and finally, all followers of the Jewish religion, whether they lived in Palestine or were dispersed among the nations, who were descendants of the ancient occupants of Judæa, traced their lineage to any of the tribes of Israel, or were proselytes to the faith. This later usage made it possible to apply the term to the tribes of Israel in earlier times, all the more readily as, after the fall of the independent kingdoms, Israel came to be employed as a designation of the exiles of both, and of all who regarded themselves as the sons of the patriarch Israel. (See JACOB.) Since the term Hebrew was used in early records of Abraham, Joseph, the people of Goshen, and the Israelites in the period of the Judges, though perhaps exclusively by foreigners (see HEBREWS), this also came into vogue as a name of the descendants par excellence of Abraham. Hence Jew, Israelite, and Hebrew have been used indiscriminately in regard to the same people, and the modern attempts to differentiate between them have never been consistently carried out or found a very general recognition. For the sake of convenience the first of these names may here be adopted in its widest sense.

Ethnology. The Jews were long considered as a striking example of a pure, unmixed race. Historical research, however, has tended to show that this assumption was not well founded. Even the earliest traditions suggest a mixed origin. The patriarchs are represented as marrying Aramæan, Canaanitish, and Hittite wives, and some of the tribes, evidently less closely related to the main body, as being the offspring of concubines. The invaders seem to have mixed freely with the various peoples settled in Palestine during the long period of gradual absorption. The racial distinctions between the former and the Canaanites, the Hittites, and the Philistines (qq.v.) were very marked. A mixture of the blond and the brunette races appears to have taken place, similar, though on a smaller scale, to that between the Northern, the Alpine, and the Mediterranean races in Europe. Even the Semitic element is likely to go back ultimately to a blend of heterogeneous stocks. See ARABIA; SEMITES.

It is difficult to determine how nearly related Israel and Judah were. There was always a consciousness of distinction. The difference is striking between the Judæans represented by Egyptian artists in the time of Sheshonk I and the Israelites represented by Assyrians on the obelisk of Shalmaneser III. The genealogical scheme which made Judah a son of Israel seems to have been preceded by the conception that they were brothers (in 2 Sam. xix. 44 the words, "I am the firstborn," have been preserved in the Greek), but such brotherhood need not involve a common origin or even blood kinship at all, as may be seen from Gen. ix. 25, 26, where Shem, Canaan, and Japheth (qq.v.) are repre-

sented as brothers. The spread of Yahwe worship to the northern tribes and the union of Israel and Judah in the time of David and Solomon brought them together very closely. Many tribes, most of them of Edomitish origin (see CAIN, CALEB, JERAHMEEL, KENITES, KENIZITES), were united in the Kingdom of Judah. There does not appear to have been any ban upon intermarriages with foreigners until comparatively late times. The example set by the kings would naturally be followed by the people. The missionary movement, to which the eloquent descriptions of Israel as the Servant of Yahwe in the last chapters of the Book of Isaiah (q.v.) gave such an impetus, brought numerous proselytes to the Jewish fold. To break down prejudices against intermarriage and cordial relations with foreign peoples the books of Ruth and Jonah were written.

It has been shown that a considerable part of the South Russian Jews are the descendants of the Chazars, a people of Turkish origin, who adopted the Jewish religion towards the end of the seventh century A.D. Hence the extraordinarily divergent physical type prevailing among them in spite of a common dialect, a common religion, and freedom to intermarry with other Jews. Wherever the Jews have settled, and particularly in countries where discriminations against them have never existed or have been removed, there are noteworthy admixtures of other blood and approximation in craniological and other somatic characteristics to those of the peoples of their environment. Nevertheless, religious and social isolation and a remarkable assimilative power have tended to produce a distinct type. The modern Jew may be described as short, with dark hair and eyes, rather swarthy skin, somewhat broad-headed, with a characteristic facial expression, full lips, ample beard, etc. (See the Colored Plate under EUROPE, PEOPLES OF.) The majority of ethnologists are agreed that in early times the predominant Semitic (and Jewish) type was dolichocephalic, a type characteristically Arab and preserved by the Jews of Africa and perhaps most of the so-called Sephardim (q.v.).

Among the distinguishing mental and moral traits of the Jews may be mentioned: distaste for hard or violent physical labor; a strong family sense and philoprogenitiveness; a marked religious instinct; the courage of the prophet and martyr rather than of the pioneer and soldier; remarkable power to survive in adverse environments, combined with great ability to retain racial solidarity; capacity for exploitation, both individual and social; shrewdness and astuteness in speculation and money matters generally; an Oriental love of display and a full appreciation of the power and pleasure of social position; a very high average of intellectual ability.

History. 1. *The Earliest Period* (c.2100–c.1440 B.C.).—Native traditions, preserved in song and story, and some allusions in contemporaneous foreign records are the only sources for our knowledge of this period. They are indeed too uncertain and fragmentary to give us anything like a continuous history, yet they may allow us, when taken together, to catch occasional glimpses of actual occurrences or at least to divine the general trend of development that preceded the first important conquests in Syria. For a summary of the tradi-

tions, see PENTATEUCH, ABRAHAM, ISAAC, JACOB, JOSEPH, MOSES.

Historians are not inclined at the present time to assume that any real traditions underlie the stories of the creation, the garden of Eden, the antediluvians, the deluge, the tower of Babel, the dispersion of mankind, and the patriarchs from Noah to Abraham. Even Terah, the father of Abraham, is generally identified with the divinity bearing the same name. But the historical character of Abraham is still an open question. It has long been recognized that a foreign source is likely to have been used in Genesis xiv. The Elamitish and Babylonian names inspire confidence (see AMRAPHEL, CHEDORLAOMER, ARIOCH, TIDAL); the identification of Amraphel with Hammurapi (2124–2081 B.C.) is highly probable; the names of the kings of the pentapolis have an Amoritish sound; and the reference to Abram the Hebrew would be natural in a Babylonian or Amoritish document, though it may be explained as a clever archaism. The extent of the source used can only be ascertained by future discoveries. But even if Abraham should prove to be the local numen of Hebron, as some scholars think, it is significant that tradition made him a contemporary of Hammurapi. This may show that somehow a memory was preserved of an early immigration at this time of ethnic elements counted as belonging to the Habiri, or Hebrews. Though Chedorlaomer's name has not yet been found in any cuneiform inscription, an expedition into Syria by an Elamitish king, accompanied by his vassals, is no longer thought incredible. (See ELAM.) The occasion may indeed have been the spread of Hittite power in Syria (see HITTITES) and the consequent invasion of Egypt by the Hyksos, and the first appearance of the Habiri in Palestine may have been more easily remembered because it came at this important epoch.

Some of the Hebrews in the widest sense seem to have established themselves in the following centuries east of the Dead Sea and in Mount Seir. The fact that not only a list of eight Edomitish kings earlier than Saul, but also of dukes reigning in Edom before them, has been handed down in Genesis xxxvi, may indicate that some of them were settled east of the Arabah (q.v.) long before the tribes of Israel invaded the East Jordan country. They also seem to have overflowed into the Negeb (q.v.). Tradition likewise ascribed to Moab kings at an early date, and Ammon probably settled its land not much later. None of these peoples, though reckoned as kinsmen, were thought of as having gone down into Goshen. There is nothing improbable in the settlement of a part of the Habiri in Goshen, the land southwest of the Negeb extending towards the Nile (see GOSHEN) during the Hyksos period, possibly as early as in the nineteenth century B.C. That Jacob-her appears as the name of one of the Hyksos kings can scarcely be an accident. It would be natural to suppose that these Habiri were driven east of Goshen when the Hyksos were expelled from Egypt and pursued to Sharuhin in 1575 B.C., even though no reliance be placed upon the traditions recorded by Manetho, and that they continued to lead their nomadic life in the land of Midian, having successfully escaped their pursuers to the other side of the Gulf of Akabah. Towards the end of this period some of them seem to have been settled around Kadesh Barnea (q.v.).

Scholars are divided in their judgment as to the great figure to whom tradition ascribed so important a rôle at this time. While some maintain that Moses was the leader of his people from Egyptian territory first to Sinai, then to Kadesh, and finally to the East Jordan country, and an oracle giver with whom at least the Decalogue (q.v.) in its earliest form originated, others regard him as the mythical ancestor of the Levitic priesthood at Kadesh Barnea. No criterion has yet been found by which any part of the Pentateuchal legislation can be separated from its Palestinian background and vindicated as the product of Moses's pen; the story of his life in Exodus and Deuteronomy shows such manifest mythical motives, later recasting and successive expansions, and is at any rate so overlaid with legendary embellishments, that no conclusive verdict can be reached (see PENTATEUCH), and there exists at present no external testimony worthy of consideration. (See MOSES.) But whatever view is taken of Moses's personality, this phase of the nomadic or seminomadic people's life must, in view of the later development of the Yahwe cult fostered by the Levites, be considered as marking an epoch.

2. *The Invasion of Syria and the Judges* (c.1440-c.1050 B.C.).—It may have been at the time of Egyptian weakness after the death of Thothmes III in 1447 that Israelitish tribes invaded the country occupied by the Amoritish kings Sihon of Heshbon and Og of Edrei in Bashan. The memory of this earliest forcible invasion of Syria was preserved in the Song of the Crossing of Arnon (Num. xxi. 14, 15), the Song of the Capture of Be'er (xxi. 17, 18), and the Song of Sihon's Conquests (xxi. 27-30). There is no evidence that these lyrics reflect later historic situations, and our present knowledge of the Amorites (q.v.) has increased the probability of these kingdoms and their overthrow. Three tribes—Reuben, Gad, and Manasseh—took possession of the country north of the Arnon and east of the Jordan, though subsequently Reuben was driven out of the part of Moab once held by Sihon. Other tribes pushed their way across the Jordan, and towards the end of the fifteenth century B.C. the Habiri began to make themselves felt in Palestine, as the Tell el-Amarna tablets (see AMARNA LETTERS) indicate. From the account in Judges i, it is evident that the Canaanite, Amorite, and Hittite population was by no means exterminated, but that the Israelitish tribes wedged their way into the country and only gradually gained the upper hand and secured possession of the land. Cities were indeed besieged and battles fought, but connubial and commercial relations were also established. The transition to agricultural and urban life was necessarily a slow process. A comparison of the Amarna correspondence with the Book of Joshua suggests that the situation presented in the former is earlier than that in the latter.

The battle of Gibeon referred to in an old song taken from a collection called the Book of Jashar (Josh. x. 13) may have been fought c.1350 B.C. Paul Haupt ("Die Schlacht von Taanach," in *Studien Julius Wellhausen gewidmet*; Giessen, 1914) has plausibly conjectured that the famous battle described in the Song of Deborah (Judg. v) took place in 1250 B.C. towards the end of the reign of Ramses II (1310-1244). Six tribes participated in this

battle: Naphtali, Issachar, Zebulun, Ephraim, Machir, and Benjamin. These, with Reuben, Gilead, Gad, Dan, and Asher, mentioned in the song, evidently formed the confederacy of Israel. Judah, Simeon, and Levi were apparently not counted as a part of Israel. An Egyptian hymn of victory coming from the fifth year of Meren Ptah (c.1240) describes his conquests in Syria over Hittites, Canaanites, and Israelites. The statement, "Israel, his people are few, his seed exists no more," is, of course, an exaggeration, but may indicate a serious defeat for the confederacy, possibly soon after the battle on the Kishon, while Ramses II was still alive. In the reign of Ramses III (1200-1169) the Philistines, whose home was in Caphtor (Crete), attacked Egypt, and being repulsed settled on the coast of Syria. As long as they were occupied with subduing the Canaanites, they were looked upon by the Hebrews as rendering a good service. See JAPHETH.

The tribes of Israel were exposed to raids from the east by Moabites, Ammonites, Midianites, and Minæans. Against them leaders from one tribe or another went forth with such forces as they could gather. When they were successful, they brought deliverance, respite for a while from similar invasions, and prestige for themselves. Such leaders of bands were called *shofetim*, as they were termed *shapiti* by the Assyrians; in Tyre and Carthage the chief magistrates were designated as *shofetim*, *suffetes*, and in course of time the heroes of this period—Ehud, Barak, Gideon, Jephthah, and even Samson—appeared in the light of "judges" of all Israel. One of these warriors, Abimelek, became city king in Shechem, but was not able to maintain himself. Sometimes the tribes that constituted Israel made war upon one another (Judg. xix-xxi). When the Philistines had firmly established themselves in their pentapolis, they set out to conquer the whole land that has been named after them Palestine. Israel was subdued, probably in the first part of the eleventh century B.C.

The transition from seminomadic to agricultural life naturally affected the religious ideas and practices. As the various tribes came into possession of fields and vineyards, they felt the necessity of seeking the favor of those local numina, male and female, who were supposed to have given the rain and the sunshine in the past; and as they took over the sanctuaries, the sacred trees and fountains, and the high places, they worshiped there many "lords" (Baalim) and many goddesses (Ashtaroth) whose individual names have not come down to us. The later historians were well aware of the flourishing polytheism of this period, and from their standpoint regarded the foreign invasions, the oppression by enemies, and the general distress of the time as punishments for this worship of many gods. Some peculiar facts, such as the extreme rarity of names compounded with Yahu (see JEHOVAH), have led scholars to question whether this deity was at all worshiped in Israel during this period. But it is significant that the priesthood at Dan traced its descent to Jonathan, a name compounded with Yahwe, and considered this Levite as the grandson of Moses; that the father of Gideon, Joash, has a name of the same type; and that, if any of the extant witnesses to the text can be trusted, Yahwe was used in the Song of Deborah. Since Dan appears to have been set-

tled "where the stream breaks forth" already at the time of the battle of Taanach, it would seem probable that the Levites had been driven from their homes around Kadesh Barnea, perhaps at the same time when the Simeonites were driven out of their cities in the Negeb by the Jerahmeelites, before the middle of the thirteenth century B.C. With the Levites the Yahwe cult may have spread to Dan, Ophrah, Shiloh, and many other centres. There is indeed nothing to prevent the assumption that, in spite of the worship of a multitude of gods, the Yahwe cult was already at this time felt to some extent to be a bond of union between the tribes of Israel. It may, however, have taken a somewhat deeper root in Judah, though we unfortunately know very little about this tribe before David.

3. *The United Kingdom* (c.1050-953 B.C.).—The deliverance from the Philistine yoke came through Saul, a Benjamite, who was proclaimed King by the prophet Samuel (q.v.), and his valiant son Jonathan. Saul seems to have been the first to unite all the tribes of Israel, and it is probable that what was then the tribe of Judah, south of Jerusalem, also formed a part of his Kingdom. This is indicated both by the fact that there were Judæan warriors, like David and his brothers, with Saul, and by the war he fought with the Amalekites in the Negeb. How long Saul reigned is not known, since the text in 1 Sam. xiii. 1, which now reads "Saul was one year old when he began to reign, and he reigned two years over Israel," is manifestly corrupt. He fell in the battle of Mount Gilboa c.1033 B.C. The Philistines regained control of a large part of the Kingdom, but east of the Jordan, at Mahanaim, Saul's son Ishbaal maintained himself for seven years. Meanwhile David (q.v.) had built for himself a kingdom, with Hebron for its capital, made up of heterogeneous elements—Calebites, Kenites, Kenizzites, Jerahmeelites, and Judæans—known as the Kingdom of Judah. After the murder of Ishbaal (c.1026) he came into possession of Israel. His general, Joab, captured for him Jerusalem from the Jebusites, and from this capital his power spread to the adjoining countries. He conquered the Aramæan states of Zobah, Beth Rehob, Ishtob, and Maacah, held the Amalekites in check, and incorporated Edom, Ammon, and Moab in his empire. He was in league with Hamath, Geshur, and Tyre. His son Solomon (c.993-953 B.C.) divided his kingdom into 12 administrative districts, built a royal temple in Jerusalem and many palaces, caused dissatisfaction and serious insurrections by the heavy taxation necessary to carry out his building enterprises, undertook an expedition to Ophir, and had relations with Hiram of Tyre, the King of Egypt (possibly Pesebkenno II), and the Queen of Sheba, who may have sought an alliance with him against the Minæans. The weakness of the Egyptian, Hittite, Assyrian, and Babylonian kingdoms, and the unusual qualities of Saul, David, and Solomon, made it possible to develop and to maintain for nearly a century this Hebrew power in Syria.

4. *The Kingdom of Israel* (c.953-c.723 B.C.).—Under the leadership of Jeroboam I (c.953-932 B.C.), Israel, forming the bulk of the nation, seceded. Jeroboam made Shechem his capital and showed special favor to the ancient temples at Bethel and Dan. The invasion of Syria by Sheshonk I (c.948 B.C.) seems to have affected

Israel as well as Judah. His son Nadab (c.932-930) was overthrown by Baasha (c.930-906), a strong ruler who fixed the capital at Tirza. Ela (c.906-904) and Zimri (c.904-903) were followed by Omri (c.903-872), a very capable ruler, who made Samaria his capital, waged war with Damascus, and conquered Moab, as the Mesha inscription attests. Ahab (c.872-851) gained a notable victory over Damascus, capturing Bar Hadad I and obtaining valuable commercial advantages for Israel in the Aramæan capital. He took part in the coalition of Syrian states against Shalmaneser III, sending 10,000 men to the battle of Karkar (854). His alliance with Tyre was sealed by a marriage to Jezebel, daughter of Ito Baal. The erection of a Melkart temple in Samaria led to the struggle with Elijah (q.v.). Ahab fell on the battlefield at Ramoth-Gilead. His sons Ahaziah (c.851-849) and Jehoram (c.849-843) succeeded him. Mesha of Moab revolted in the time of Jehoram, and a punitive expedition ended in defeat after Mesha had resorted to the sacrifice of his son to save his capital.

The dynasty was overthrown by Jehu (c.843-814), who murdered the Queen mother and many members of the royal family, established the Yahwe cult by massacre of the priests of Melkart and destruction of their temple, paid tribute to Shalmaneser III of Assyria in 842 B.C., and lost the East Jordan country to Hazael of Damascus. Joahaz (c.814-797) was practically a vassal of Bar Hadad II of Damascus. The later weakness of Bar Hadad II, who was defeated by Adadnirari V (812-783) and by Zakir, King of Hamath, allowed Joash (c.797-782) to reconquer much territory in the east and the north. He also fought with Amaziah, whom he took prisoner, and captured Jerusalem. The long reign of Jeroboam II (c.782-740) witnessed further expansion and a sudden accession of wealth that led to industrial slavery of the lower classes. Prophets like Amos and Hosea appeared urging justice and equity and predicting disaster. Zechariah (740) and Shallum (740) could not maintain themselves, Menahem (740-737) only with the support of Assyria. In the time of Pekahiah's (737-735) successor, Pekah (735-734), a league was formed with Rezin of Damascus, and an attempt was made to force Ahaz of Judah to unite with them. He appealed to Tiglath-pileser IV (745-728), who captured the East Jordan country and a part of Galilee. Hoshea (734-725) revolted and surrendered himself in 725, while his city was probably taken, as the Babylonian Chronicle suggests and the Hebrew records declare, by Shalmaneser V, apparently in the year 723. Sargon II (722-705) carried away about 27,290 people. Yet there was a revolt again in 720.

The exiled Israelites were placed in various towns in Mesopotamia and Media. The bulk of Israel unquestionably remained in the land. To take the place of the exiles, four Arabic tribes from Hejaz were sent to Samaria in 715. Later Asurbanipal (668-625) sent deportations from Babylon, Kutha, Sippara, Awwa, and Hamath. The mixed population worshiped many gods, but the Yahwe cult continued and gained in strength. This was no new thing, since the worship of other gods had always coexisted with the worship of Yahwe in Israel. If some of the remaining Israelites felt the attraction of the new gods, many of the newcomers were anxious to learn the manner of the

god of the land to whom the sacred places had belonged. Concerning the Assyrian, and later Chaldæan, Province of Samaria we know very little. The raids made upon the sanctuaries at Bethel and in the cities of Samaria by Josiah (2 Kings xxiii. 15-20), if historical, are not likely to have affected profoundly the religious life. It is not improbable that the later cult community at Shechem (see SAMARITANS) was chiefly made up of old Israelitish families who had adhered to a stricter worship of Yahwe. As for the exiles in Mesopotamia and Media, they were probably absorbed in the native population, though there is no reason to doubt that some of them may have continued, even in a foreign land, to worship Yahwe, and their descendants may subsequently have drifted into communities of Judæan exiles. The search for "the lost ten tribes" has been occasioned by the false conception that the entire population was carried away and yet maintained its ethnic peculiarities, and has been encouraged by fanciful combinations that lack all scientific value.

5. *The Kingdom of Judah* (c.953-586 B.C.).—The secession of Jeroboam and the establishment of the Kingdom of Israel left to the house of David little more than the founder of the dynasty had possessed before the death of Ishbaal. The chief additions were Jerusalem, with the adjoining territory of Benjamin and the suzerainty over Edom. But the fine capital with its temples and palaces, the Negeb with its ancient shrines, the alp land beyond the Arabah with its Judæo-Edomitish population, the traditions of the great rulers, David and Solomon, and the attachment to Yahwe, somewhat stronger in Judah than in Israel, were valuable assets. Rehoboam (c.953-937), whose headstrong policy led to the disruption, saw his capital invaded by Sheshonk I (c.948). This raid, however, does not seem to have had any permanent effect. He left his reduced territory to Abijam (c.937-934). Asa (c.934-877) made an alliance with Bar Hadad I of Damascus. Jehoshaphat (c.877-848) allied himself with Jehoram of Israel and attempted to send an Ophir expedition from Ezion Geber. Jehoram (c.848-845) lost Edom, and Ahaziah (c.845-843) was murdered by Jehu. Athaliah, the daughter of Ahab and Jezebel, reigned c.843-836. By a coup d'état of Jehoiada, a powerful priest, Joash came into power (c.836-796). He was assassinated, as was his successor, Amaziah (c.796-777), who reconquered Edom. Uzziah (c.777-737) seems at first to have been a vassal of the King of Israel, Jeroboam II. He became a leper, and Jotham was appointed coregent. After his death Jotham reigned alone (c.737-735). In the time of Ahaz (c.735-715) Pekah and Rezin threatened Judah, to force this state into the union against Assyria, but Ahaz preferred to pay tribute to Tiglath-pileser IV, before whom he appeared in person at Damascus (732 B.C.). His reign probably saw both the humbling of Israel by this Assyrian King and the final capture of Samaria by Shalmaneser V in 723 and Sargon II in 720. Hezekiah (c.715-686) may have been in league with Ashdod against Assyria in 711, and certainly received an embassy from Merodach Baladan (Mardukapaliddin) of Babylon and took part in a general revolt which led to Sennacherib's invasion in 701.

The influence of the prophet Isaiah was strongly felt in the reigns of Ahaz and Heze-

kiah, and Micah also appeared at this time. A reaction against the teaching of these prophets took place in the days of Manasseh (c.686-639). He seems to have adopted a policy of submission to Assyria, favored Assyrian customs, and given much offense to the prophets and their followers by introducing new features into that polytheistic worship which had never been suppressed in Judah. As his reign was long, peaceful, and prosperous in spite of this policy, it was quoted a century later, by those who preferred other gods, as an evidence against the profitableness of worshipping Yahwe. (See JEREMIAH.) His son Amon (c.639-637) was followed by Josiah (c.637-608). In 625 the Scythians, having come to the rescue of their allies, the Assyrians, by relieving the siege of Nineveh, swept on through Syria to punish Psammetichus I, who had invested Ashdod, a city over which Assyria claimed authority. Jeremiah and Zephaniah interpreted their coming as betokening Yahwe's purpose to punish through them the people of Judah for their sins. In 620 a law book was found in the temple (see DEUTERONOMY) which caused Josiah to destroy other sanctuaries and kill their priests, while centralizing the Yahwe cult in Jerusalem. He died in the battle of Megiddo, defending his Assyrian liege lord against the invasion of Necho II of Egypt. His son Jehoahaz (c.608) was made King by the people, but removed by Necho II after three months. The Egyptian King then made another son of Josiah, Jehoiakim, ruler (c.608-597). In collecting the tribute imposed by Necho he had resort to a taxation so heavy as to be oppressive, and yet he undertook to build by forced labor a palace ceiled with cedar and painted with vermilion, for which he was severely censured by Jeremiah. The prophet Uriah was slain for rebuking the King. It may have been after a battle at Carchemish between Necho and Nebuchadnezzar II of Babylon (probably in 605) that Jehoiakim paid tribute for three years to the Chaldæan King; then he revolted, though Nebuchadnezzar did not have opportunity to undertake his punishment until 597. He escaped, however, the fate foretold by Jeremiah and intended by Nebuchadnezzar, as he died in peace at Jerusalem; but Jehoiachin (597) was carried away to Babylonia with 10,000 citizens of Jerusalem (2 Kings xxiv. 14).

Zedekiah was made King. He entered into a league with Apries (Hophra) of Egypt, and there was a strong party in Jerusalem who favored armed opposition to the Chaldæan suzerain. Jeremiah was persecuted for denouncing this policy, but his fears were realized. After an unsuccessful sortie Zedekiah was captured, saw his sons killed before him, and was then blinded. The city was bravely defended, but finally taken in 586; 74 prominent men were put to death by Nebuchadnezzar, 834 were carried away captive from Jerusalem in 586, and possibly 3023 Jews from the surrounding country in the same year, if 7 is an error for 17 in Jer. lii. 28, as Ewald suggested, and finally 745 Jews were carried away by Nebuzaradan in 581, probably after another insurrection (Jer. lii. 29-30). Either in 586 or in 581 the temple was burned with fire. Gedaliah was made Chaldæan governor of the land in 586 and took up his residence at Mizpah, but was slain two months later by Ishmael b. Nethaniah of the seed royal. Under the leadership of Johanan b.

Kareah some Jews fled to Egypt and settled at Tahpanhes for fear of the consequences of this murder. The number is not given, but it can scarcely have included "all the remnant of Judah," as 745 Jews were deported to Babylonia in 581; and it is thought by some scholars that, even after these deportations and emigrations, the bulk of the population of the Kingdom of Judah still remained in the land under Chaldæan rule.

6. *The Chaldæan and Persian Periods (586-332 B.C.)*.—The fall of Jerusalem, the destruction of the temple, the overthrow of the Davidic dynasty, and the deportation or flight of thousands of citizens threatened the Jewish people with extinction. It was saved by the fact that these things had been foreseen by the prophets. Their oracles were proved true by the events, and this enhanced their prestige; their conception of Yahwe, his justice, indifference to the cult, and purely ethical demands, tended to give assurance that their religion could live, even though the temple was gone, and "the remnant" they foresaw might turn to Yahwe, preserve its distinctness, and gain prosperity, even though the independence of the nation was lost.

When Amil Marduk in 561 removed Jehoiachin from his prison and "set his throne above the thrones of the kings that were with him in Babylon" (2 Kings xxv. 28), new hopes were aroused, and it is thought by some scholars that it was the birth of a child to this scion of the long-lived Davidic dynasty that inspired the pictures of the coming monarch in Isa. ix. 1-6; xi. 1-10. Collections of prophecies were made, and to the ancient denunciations many a word of good cheer was added. The Pentateuch in its earliest form, as a connected whole, beginning with the stories of Genesis and ending with the laws and exhortations of Deuteronomy, is likely to have appeared at this time, though many changes and additions may belong to a subsequent period. (See PENTATEUCH.) In Nabunaid's reign (556-539) the career of Cyrus filled the Jews everywhere with lively expectations. These may be seen in Isaiah xiii-xiv, xxi and, in the opinion of many scholars, also in xl-lv, though the references to Cyrus here may possibly be secondary. (See ISAIAH.) In December, 539, Babylon fell into the hands of Cyrus. In 537 he is said to have given permission to the Jews to return to Palestine. Their condition was such (see BABYLONIAN EXILE) that it is extremely doubtful whether a considerable number took advantage of this opportunity. Furthermore, there is no hint of returned exiles in the prophecies of Haggai and Zechariah, and Neh. i. 2, 9 clearly indicate that in the fifth century B.C. the inhabitants of Jerusalem were regarded as "those remaining there after the captives had been carried away."

But in the time of Darius Hystaspis the temple was rebuilt. This sanctuary, which was less magnificent than Solomon's temple, but became the home of a purer worship, was completed in 516. Zerubbabel was then Persian governor, and from Zechariah's prophecies it may be inferred that certain hopes of national independence clustered around this Davidic descendant, so that even a golden crown was sent from Babylonian Jews for the coronation. What became of Zerubbabel is not known. In the twentieth year of Artaxerxes, Nehemiah was sent as governor to Jerusalem with authority to rebuild the walls of the city. The Elephan-

time Papyri (q.v.) have rendered it probable that his sovereign was Artaxerxes I, and consequently the year of his appointment 445 B.C. In spite of many obstacles he succeeded in accomplishing his purpose. Ezra (q.v.) obtained permission from Artaxerxes to return with a company of his countrymen, 1754 in number, in the seventh year of the King's reign. As only the name is given and there were three kings with this name, it is not certain whether Artaxerxes I is meant or Artaxerxes II. Most scholars think of the former, but there is much to be said in favor of the latter. The date would be either 458 or 398. Ezra is described as "the writer of the Law." This may mean anything from a mere copyist to an author; it quite probably indicates that he not only copied the Pentateuch as it was in his time, but also amplified and edited it. This law book seems to have been adopted as the official code. According to Josephus (*Ant.*, xi, 7), the temple was defiled and many Jews enslaved by Bagoses (or Bagoas), probably in 383; and an early chronologist (preserved in Syncellus, i, 486) tells of the participation of the Jews in the insurrection against Artaxerxes III and the exile of many to Hyrcania by the Caspian Sea and to Babylonia (c.350 B.C.). The fortification of the city by Nehemiah and the national feeling engendered by Ezra's measures against mixed marriages prepared the way for this rebellion. Characteristic of the period was the development of a theocratic form of government with the high priest for its head and the Pentateuch as the law of the land. This theocracy was more democratic than the earlier monarchical régime. While the Book of Ezekiel, sections of the Book of Isaiah, and the Memoirs of Nehemiah and Ezra, as well as some cuneiform documents, allow us to catch glimpses of the life of the exiles in Susa, Babylon, and Nippur, on the Chebar and the Ahava, the Elephantine Papyri have given us a more intimate knowledge of a Jewish community at the southern end of Egypt, having its own Yahu temple, its syncretistic form of religion, its peculiar standards and customs, while in contact with both Jerusalem and Samaria and cognizant of what was going on in these places; and these papyri are dated in various years of the fifth century B.C.

7. *The Macedonian Period (332-143 B.C.)*.—Alexander met with serious resistance in Syria only at Tyre and Gaza. The Jews submitted quietly to the new ruler. There is no real evidence that he visited Jerusalem, but it cannot be said to be improbable. His policy resembled that of Cyrus. He was prepared to conciliate the nations he conquered and permitted them to retain as much liberty as was consistent with a recognition of Macedonian supremacy. This liberty was extended to the religious cult, with which Alexander was careful not to interfere. In fact, he seems to have been particularly anxious to visit famous shrines and to gain the favor of influential priesthoods. He may have learned something concerning the Jews through his teacher Aristotle and been curious to see their sanctuary. After Alexander's death his empire went to pieces, and his generals fought for the several parts. Laomedon at first secured the satrapy of Palestine and Phœnicia, but Ptolemy, the son of Lagus, who had become satrap of Egypt, dispossessed him in 320 B.C. Antigonus deprived him of these provinces in

315, but they were restored after the battle of Ipsus in 301 to Ptolemy, who in 305 had assumed the title of King. Many Jews left Palestine for Egypt in the time of Ptolemy I, and soon the Jewish colonies in Egypt far outnumbered those in Babylonia.

The Egyptian dispersion, destined to be of vast importance in the development of Judaism and Christianity, gradually spread from the delta in the north to the boundaries of Ethiopia in the south, over Cyrenaica to the territory of Carthage. The Jews in Alexandria are said by Josephus (*Ant.*, xii, 3, 1) to have enjoyed equal political rights with the Macedonians. Duchesne (*Origines du culte chrétien*, p. 2; Paris, 1889), Willrich (in *Beiträge zur alten Geschichte*, vol. iii, pp. 403 ff.; 1903), and Wellhausen (*Israelitische und jüdische Geschichte*, pp. 225 ff.; 7th ed., Berlin, 1914) maintain that Josephus has used a misleading term to indicate the privileges of religious freedom and separate jurisdiction which they enjoyed, and that they could not have had the citizen's franchise and a share in the government, since they were unwilling to take part in the official cult. On the other hand Schürer (*Geschichte des jüdischen Volkes*, vol. iii; Leipzig, 1909) holds the testimony of Josephus and Philo to be decisive and thinks of the Jews as forming separate *φύλαι*, *phylai*, not bound to observe the official religious ceremonies in exercising their rights as citizens. The decision is difficult. There can be no doubt, however, that they often rose to high positions in the state. Their artisans and workmen were held in esteem. While there is no record of any Jew having occupied a chair in the University of Alexandria, the fact that it was a Museum, a temple to the muses, with an officiating high priest, may have served as a bar. A somewhat extensive literature seems to have been produced, including the Greek translation of the Hebrew Scriptures, begun in the reign of Ptolemy II Philadelphus (285-247), a work of extreme difficulty and of very great importance. This version naturally estranged the people more and more from the language of the fathers; it became a standard of style as well as an authority in matters of faith and gave rise to a large number of religious or philosophical writings. As Palestine was a province of Egypt until 200 B.C. the Hellenizing influence was felt even among the Aramaic-speaking Jews there, especially in Jerusalem. It makes itself noticeable in the wisdom literature. Ptolemy III (247-221) was favorable to the Jews, but Ptolemy IV (221-204) seems to have reversed this policy.

Ptolemy V (204-181) lost Palestine and Cœle-Syria after his general, Scopas, had been defeated by Antiochus III at Panium in 200 B.C. The Jews were treated less generously by the Seleucid rulers than by the Ptolemies. Seleucus IV (187-175) sent Heliodorus to plunder the temple in Jerusalem (2 Macc. iii. 7-40). At this time a priestly family, the Tobiads, rose to power and influence, vying with the high-priestly family of the Oniads. When Antiochus IV Epiphanes (175-164) came upon the throne, Onias III was forced to flee to Antioch, and the Tobiads supported against him his brother Jason, who sought the King's favor by introducing Hellenic customs, but after three years (174-171) was overthrown. Menelaus, a member of the Tobiad family, was then recognized by Antiochus as high priest and continued to

further the Hellenizing process. The aristocracy of Jerusalem fell in with the King's strong desire that Greek customs, and even Greek religion, should everywhere in the empire supplant what appeared to him as barbarous ideas and practices. But the rivalry of the parties for position caused a revolt in favor of Onias. Menelaus, however, was reinstated by Antiochus on his return from his first Egyptian campaign in 169 and remained in office until 162. The King entered the temple and confiscated some of its treasures as punishment for the rebellion. The following year, after he had been humiliated in Egypt by Popilius Lænas, he sent Apollonius to take further measures. His force must have met with opposition, for the walls and some of the houses were torn down, many were put to death, and others fled, leaving only the "apostates," i.e., the Hellenists and the foreigners. The Akra, or citadel, was rebuilt and provided with a garrison. The temple was partly destroyed and then dedicated to Zeus Olympius, whose altar, or image, was placed on the great altar of Yahwe. A royal decree was sent from Antioch ordering the cessation of the Yahwe cult, prohibiting the celebration of sabbaths and festivals, as well as the performance of circumcision, and commanding that all copies of the Law be delivered up and burned. Altars were built in every village, images of the gods erected, and the Jews were forced to offer impure sacrifices and to observe Greek rites. This took place in 168.

But deliverance came through Mattathias, son of Johanan, of the family of the Hasmonæans, and his three sons—Judas, surnamed Maccabæus, Jonathan, and Simon. Mattathias lived at Modein, near Lydda. When called upon to sacrifice to the Greek gods, he refused and slew the first Jew who complied. With a band of followers determined to defend themselves even on the Sabbath, he began a rebellion which was continued, after his death in 166, by Judas. Judas defeated Apollonius, then Seron at Beth-Horon, then Nicanor and Gorgias at Emmaus, and finally Lysias himself in 165. The city of Jerusalem was taken, and the temple rededicated to Yahwe in December, 165, though the citadel remained in the hands of the Seleucids. After the death of Antiochus IV an attempt to capture the Akra itself forced Lysias to action. He defeated Judas at Beth-Zechariah, took Beth-Sura, and besieged the temple mountain in 163. The Jews suffered much, but Lysias treated them generously; Menelaus was deposed, and Alcimus made high priest in 162. This last high priest of the Zadokite line was driven away by the Maccabees; Nicanor was sent with an army to reinstate him, but was defeated in March, 161, at Adasa. It was probably in 160 that Judas fell in a battle with Bacchides at Elasa. Jonathan became the leader. He sided with Alexander Balas (q.v.) and was made high priest in 152 and meridarch at the wedding of Alexander and the Egyptian princess in Ptolemais in 150. He fought for Balas until 145 and then sided with Demetrius, whom he defended with 3000 men in his own capital and who recognized his position. Subsequently he left Balas for Trypho and drove the troops loyal to Demetrius out of Ashkelon, Gaza, and Beth-Sura. Finally, Jonathan was suspected and arrested by Trypho, who later executed him at Baskama. The full independence of Judæa was effected by his successor, Simon.

8. *The Hasmonæan Period* (143–63 B.C.).—On the coins which signalize the sovereignty of the Hasmonæan rulers 170 Sel., i.e., 143/2 B.C., is counted as the first year of Simon. It was not, however, until 141 that the Akra was captured and the Seleucid garrison driven out. But he was the founder of the dynasty, and events were dated in the years of his reign as in ancient times. He made a treaty with the Romans and cared for his people, until he was murdered at Dok by his son-in-law Ptolemy in 135. His son John Hyrcanus (135–104) was attacked by Antiochus VII Sidetes in 130, and Jerusalem was forced to capitulate, the walls were razed, Joppa and Gezer were ceded, and John must take part with Antiochus in the Parthian campaign, from which he probably gained his surname Hyrcanus. But Antiochus lost his life and his eastern provinces in 129, and John Hyrcanus was able not only to recover independence, but also to increase the boundaries. He conquered Medaba and Samaga, subdued Shechem, and is said to have destroyed the temple on Mount Gerizim; and he took possession of Idumæa, i.e., the territory south of Judah, and forced the inhabitants to become circumcised. With the aid of the Romans he also maintained himself against Antiochus IX and conquered the Greek city of Samaria. His son Aristobulus I (103–102), who assumed the title of King, conquered some Ituræans and forced them to adopt the Jewish religion. His brother Alexander Jannæus (102–75) extended the borders of Judah in the Philistine plain and the East Jordan country. His kingdom compared favorably with that of David, for while the ancient territory of Edom was now in the hands of the Nabatæans, the powerful Philistine cities now Hellenized were, with the exception of Ashkelon, conquered or held by him. The Pharisaic party called in Demetrius III Eucerus and with the aid of the Macedonian soldiers defeated their King in battle (88 B.C.), but 6000 men deserted from the camp of the victors and defeated the rest. Alexander crucified 800 Pharisees as a punishment, and then went forth on new campaigns, from which he returned in triumph three years later. He advised his widow, Salma Alexandra (75–67), to live in peace with the Pharisees. This she did and governed prudently for nine years. In her time probably falls the organization of the Sanhedrin (q.v.) as a “collegium” having among its members scribes and Pharisees. Alexandra’s sons Hyrcanus II and Aristobulus II (67–63) became rivals. As Alexandra could not be high priest, Hyrcanus had during her reign occupied this position. Since he was the first-born he became King, but after a few months Aristobulus conquered him with Arab troops and made himself ruler. Hyrcanus, however, at the instigation of Antipater, an Idumæan, the father of Herod, fled to the Nabatæan King Aretas, who was induced by the promise of a cession of the territory that had been acquired by Alexander Jannæus to take up arms on his behalf. This led to the interference of the Romans, who were then fighting both in Syria and Armenia. Jerusalem was captured in 63 B.C. by Pompey, who had decided in favor of Hyrcanus, and Judæa was made dependent on the Roman Province of Syria.

The Maccabæan uprising and the Hasmonæan kingdom were of great importance for the future of the Jews. They awakened a keen national sentiment. Not only freedom had come, but

also power. The little people felt itself to be in the midst of the conquest of the world. In vain would the nations rebel against Yahwe and his anointed, the King in Zion. If he was not of the seed of David, Yahwe had placed him on the throne of David, and the promises to David applied to him; if he was not of the seed of Aaron, he had the zeal of Phinehas; he was a king and priest after the order of Melchizedek. The Psalter reflects the eschatological mood. Out of this grew the hope of a future Messiah, either a king who should be a genuine descendant of David (cf. the Psalms of Solomon), or a priestly ruler, a descendant of Aaron and Israel, as the Covenanters of Damascus desired. (See JEWISH SECTS.) A new zeal for the Law also developed as a consequence of the attempts by enemies of the Jewish religion to destroy this treasure. This created an eagerness to collect and edit all other sacred books. The perils passed of a Hellenization that would have robbed the Jews of their distinctive religious life without enabling them to make any other contribution that could compensate for so serious a loss.

9. *The Roman Period* (63 B.C.–395 A.D.).—Pompey established the Roman power in Syria. Hyrcanus was appointed ethnarch and high priest. Aristobulus, his two sons, Alexander and Antigonus, and two daughters were carried captive to Rome. In 54 B.C. Crassus plundered the temple, which Pompey had piously spared. He fell shortly afterward in the war against the Parthians, and his companion, Cassius Longinus, succeeded in completely routing the army of Aristobulus, who had been released by Cæsar. Meanwhile the war between Cæsar and Pompey broke out. In Syria the partisans of the latter were numerous and contrived to poison Aristobulus and execute his son Alexander, who were Cæsareans (49 B.C.). After the death of Pompey, however, Hyrcanus, or rather Antipater the Idumæan (who was both his minister and master), saw the necessity of securing the favor of Cæsar. With Hyrcanus II ended the line of Hasmonæan princes, who had exercised, at least nominally, supreme authority both in the civil and religious affairs of Palestine, though in the time of Alexandra the real religious authority had passed into the hands of the priesthood, and especially of the Sanhedrin. The Idumæan (Herodian) dynasty, which succeeded the Hasmonæan, virtually commenced with Antipater, who prevailed on Cæsar to restrict Hyrcanus to the high-priesthood and obtained for himself the office of procurator of Judæa, while his eldest son, Phazael, was appointed governor of Jerusalem, and his youngest son Herod governor of Galilee. The Jewish or National party took alarm at this sudden increase of Idumæan power, strife ensued, and ultimately Antipater perished by poison; but Herod, by the assistance of the Romans, finally entered Jerusalem in triumph (37 B.C.) and caused Antigonus, the last male representative of the Hasmonæan line and his most dangerous enemy, to be put to death.

After Herod’s death (4 B.C.) Archelaus, one of his sons, ruled Judæa, Samaria, and Idumæa as ethnarch; Antipas, another son, became tetrarch of Galilee and Peræa; and a third son, Philip, became tetrarch of Trachonitis. But the arbitrariness and cruelty of Archelaus made him hateful to the people, and Augustus, listening to their just complaints, banished him to Vienne in Gaul (6 A.D.). Judæa was now

ruled by Roman procurators. During the government of the first of these, Coponius, the party of the Zealots arose among the Jews, founded by Zadok and Judas of Galilee, who protested against the taxes imposed by the Roman government as a sinful servitude. In 28 A.D. John the Baptist appeared as a prophet. He was suspected of political motives, wrongly no doubt so far as he was himself concerned, though some of his disciples may have cherished ambitions for him, and he was put to death by Herod Antipas in 29 A.D. Already before the death of Herod, probably in 6 B.C., Jesus of Nazareth had been born. After the death of John the Baptist he appeared independently as a prophet, proclaiming the advent of the kingdom of heaven on earth and set forth and illustrated the principles of righteousness implied in God's government over human society. He did not favor rebellion against Roman rule and apparently had no ambition to become a Messiah or King of Israel, but was wrongly charged with this and put to death under Pontius Pilate. The precise year when this event occurred, which has had an incalculable influence on the history of the Jews, is not known, but it must have been between 29 and 36 A.D.

In the year 38 the Emperor Caligula issued an edict ordering divine honors to be paid to himself as Cæsar. Everywhere throughout the Roman dominions the Jews refused to obey. The order was given to Petronius, the Roman governor of Syria, to use violence if necessary in setting up the statue of the Emperor in the temple at Jerusalem. At Alexandria a massacre took place, and for a moment it seemed as if all the inhabitants of Judæa, too, were doomed to perish; but Herod Agrippa I, tetrarch of northern Palestine and a friend of Caligula, dissuaded the Emperor from carrying out his design. Petronius did not enforce the Emperor's order and escaped punishment through the murder of Caligula in 41. The accession of Claudius, on the assassination of Caligula, seemed the dawn of a brighter day. Herod Agrippa, a loyal friend and favorite of the new Emperor, obtained the dominion over all the parts once ruled by his grandfather Herod, and many privileges were through his influence granted to his Jewish subjects and even to foreign Jews. They received the rights of Roman citizenship (41 A.D.), and Herod even tried to conciliate their religious prejudices by the strictness with which he observed their law; yet the National party remained in an almost permanent state of mutiny, while the followers of Jesus suffered persecution at the hands of Herod. After the death of Herod Agrippa I, his son being but a youth of 17, the country was again subjected to Roman governors. The land was overrun by robbers and assassins, some of whom professed to be animated by religious motives, while others were mere ruffianly freebooters and cutthroats; the antipathy between Jews and Samaritans waxed fiercer and fiercer, and the latter waylaid and murdered the orthodox Galileans as they went up to worship at Jerusalem; all sorts of impostors, fanatics, and pretenders to magic made their appearance; the priesthood was riven by dissensions; and the hatred between the populace and the Roman soldiery (mostly of Græco-Syrian origin) increased. In 66, in spite of all the precautionary efforts taken by Agrippa, the party of Zealots burst into open rebellion, which was terminated

(70) by the conquest of Jerusalem by Titus, the destruction of the temple, and the massacre and banishment of thousands of Jews, who were scattered among their brethren in all parts of the world. The defense of Jerusalem, as narrated by Josephus, is a magnificent example of heroism. Considerable numbers were allowed to remain in their native country, and for the next 30 years, although both hated and treated with rigor, they appear, on the whole, to have flourished. The Emperor Nerva was lenient to them as to the rest of his subjects, but as soon as they had attained some measure of political vitality their turbulent spirit broke out anew. Their last attempts to throw off the Roman yoke, at Cyrene (115), Cyprus (116), Mesopotamia (118), and Palestine under Simon Bar Cochba (132-135), were defeated after enormous butchery. The suppression of Bar Cochba's insurrection by the capture of Bethar, the great stronghold of the Jews (135), marks the final desolation of Judæa and the dispersion of its inhabitants. The whole of Judæa was laid waste, and it is said that about 985 towns and villages lay in ashes, and 50 fortresses were razed to the ground; the new city founded by Hadrian on the site of Jerusalem was named *Ælia Capitolina*, and on the site of the temple a sanctuary in honor of Jupiter Capitolinus was erected, containing an equestrian statue of the Emperor Hadrian. The hardships to which Jews were subjected were again alleviated in the reign of Antoninus Pius (138-161), whom the Jewish writers represent as secretly attached to their religion. Heliogabalus (218-222) patronized Jewish practices, such as circumcision and abstinence from swine's flesh. Alexander Severus (222-235) also placed Abraham on the same level as he did Christ and obtained from the grateful people the title of "father of the synagogue." Generally speaking, from the close of the second century till the establishment of Christianity under Constantine, when their hopes were once more dashed to the ground, the Jews of the Roman Empire appear to have prospered. In this period falls the redaction of the chief code and basis of the oral Law, the Mishna, completed by Jehuda Hanasi (the prince), or Hakadosh (the holy), president of the great school at Tiberias (150-210)—upon which code were grafted subsequently the two gigantic commentaries or complements, the Palestinian and Babylonian Gemaras.

The Babylonian Jews were even more fortunate than their western brethren, though they did not perhaps attain the meridian of their prosperity till the establishment of the Persian dynasty of the Sassanids in 226, after the downfall of the Parthian dynasty. Their leader was called the Prince of the Captivity and was chosen from among those held to be descended from the house of David. He lived in great splendor and was even permitted to exercise political functions in the Jewish community. The Jews of Babylonia were wealthy and pursued all sorts of industrial occupations. They were merchants, bankers, artisans, husbandmen, and shepherds and had the reputation of being the best weavers of the famous Babylonian garments. The reputation for learning of the Babylonian schools, Nehardea, Sura, and Pumbeditha, was very great. Their condition at this time farther east is uncertain, but it seems possible that they had obtained a footing in

China at quite an early date. They were discovered there by the Jesuit missionaries of the seventeenth century, especially at Kai-fong-fu, where they had a large synagogue. They followed in their prayers and observances rabbinical Judaism, having remained in close connection with their brethren in Persia. The tablet inscriptions in their synagogues were in the Persian language. In 1901 certain Jews in Shanghai entered into communication with the very few who had preserved their identity. In Europe the ascendancy of Christianity proved baneful to the condition of the Jews. Imperial edicts and ecclesiastical decrees vied with each other in the rigor of their intolerance towards all who did not accept Christianity. The Jews were prohibited from making converts, from invoking (in Spain at least) the divine blessing on the country, from marrying Christian women or holding Christian slaves; they were burdened with heavy taxes; yet despite persecution, they seem to have flourished. They are found in large numbers in Illyria, Italy, Spain, Minorca, Gaul, and the Roman towns on the Rhine; they were agriculturists, traders, and artisans and held land. Constantius, during whose reign a fierce insurrection incited by his Coregent Gallus broke out among the Arians and Jews (353), terms them, in a public document, "that most hateful of all people"; yet in spite of this we find them filling important civil and military positions and exercising the influence that springs from the possession of wealth and knowledge. The brief rule of Julian (361-363) even shed a momentary gleam of splendor over their destinies, and he appears to have favored the rebuilding of the temple at Jerusalem. The death of the Emperor frustrated this plan. The establishment of Christianity as the official religion of the Empire in 378 and the suppression of all other forms of religion exposed the Jews to serious persecutions. When Theodosius died in 395 and divided his empire between his two sons, Arcadius and Honorius, the Jews in the East, except those under Sassanid rule, became subject to the Emperor in Constantinople, those in the West to the Emperor in Rome.

10. *The Byzantine Period* (395-622).—Within the Byzantine Empire the Jews were subject to much restrictive legislation and were frequently harassed by their Christian neighbors. In 418 they were excluded from the military service; in 429 the patriarchate at Tiberias was abolished; in Egypt the Jews as well as the pagans were persecuted by Cyril of Alexandria. In the time of Justinian (527-565) there were constant struggles between Christians and Samaritans as well as between Christians and Jews, and the Emperor issued decrees against both. It is interesting to observe that he recommended the oldest Greek version, permitted the use of Aquila, but forbade the elders to give the haggadic exposition after the reading of the lesson from the Law. In Italy, Sicily, and Sardinia the Jews were for the most part unmolested. In the sixth and seventh centuries the Franks and the Visigoths in Spain inflicted on them frightful persecutions. In Persia the Jews were treated well under Sassanid rule. After the destruction of Jerusalem by Titus many fugitives had settled in Arabia, and by the year 300 they had become quite powerful in Yemen and elsewhere. About 360 the Aksumite King Ela Amida conquered Yemen. When he was driven out in 378, Jewish influence became paramount. The

Himyarite kingdom of Dhu Nuwas was a Jewish kingdom. It was overthrown in 525 by Elesbaha, King of Aksum (see ETHIOPIA), with the aid of the Sabæan and Hadramautian rulers. This gave the Christian religion a firmer hold on South Arabia and probably drove some of the Jewish communities farther north.

11. *The Jews in the Moslem World* (622-).—At first Jewish tribes around Mecca and Medina were favorably regarded by Mohammed, but when it became evident that they would not accept Islam, they had to pay dearly for their loyalty to their own faith. Mohammed subdued the Khaibar tribes in 627, and most of the Arabian Jews removed to Syria and Mesopotamia. The spread of Mohammedanism through western Asia, the Mediterranean regions, Africa, and Spain was, nevertheless, advantageous to the Jews. Excepting incidental persecutions, such as those in Mauritania (790) and in Egypt (1010), they enjoyed under the caliphs and Arabian princes comparative peace. In Moorish Spain their numbers increased greatly, and they became famous for their learning, as well as for commercial and industrial activity. They were husbandmen, landed proprietors, financial administrators, counselors, secretaries, astrologers, or physicians to the rulers, and were untrammelled in the exercise of their religion. This period may well be considered the golden age of Jewish literature. Poets, orators, and philosophers arose among them, and to them and the Arabs is due no small share in the preservation and subsequent spreading of ancient classical literature, more especially philosophy, in Europe. In Babylonia the Jews were also for a long time treated well by the Ommiad and especially the Abbaside caliphs. But as the caliphate passed into the hands of rulers hostile to them, persecution began even there. Before the end of the eleventh century the rabbinical schools were closed, the best of the community had fled to Spain, and those that remained were reduced to an abject condition from which they have never risen. In Italy, where they were settled in large numbers in Bari, Taranto, and Otranto, their position was made tolerable by pecuniary sacrifices.

The spread of the Turkish power came to the Jews in Asia Minor as a relief from the persecutions that had been started by the Byzantine Emperor Basil II (957-1025) and continued by several of his successors. The Crusades brought sufferings not only to the Jews of the Occident, but also to those who were found in the East. After the fall of the Byzantine Empire in 1453 the Jewish communities began to grow in its chief cities, the Osmanli Turks granting them freedom of worship, though often withholding from them other rights, such as that of purchasing and holding real estate. They were allowed to reopen their schools, to establish synagogues, and to settle in all the commercial towns. Among the Jews expelled from Spain at the end of the sixteenth century many found their way to the Levant. There are to-day considerable communities in Constantinople, Adrianople, Smyrna, Aleppo, Damascus, and other cities. In Palestine they are rapidly increasing. Only a minority can now trace their descent to the refugees from Spain in the time of Isabella I; the majority are recent immigrants from eastern Europe, Bohkara, and Yemen. There may be 100,000 Jews in Palestine to-day, more than one-half of them in the city of Jerusalem.

In spite of the efforts of their European and American brothers to ameliorate their condition, most of them are very poor. Much has been done in recent years to furnish educational facilities and opportunities for economic betterment to the rising generation. The number of Jews in Arabia is not very large, yet they enjoy some independence. Those in Persia have in the last centuries sunk into ignorance through oppression and the general sluggishness prevailing in that country. Jews are found in Afghanistan and carry on trade between Kabul and China, and in Bokhara, where they possess equal rights with the other inhabitants and are skilled in the manufacture of silks and metals. They are also found in considerable numbers in Tunis, Algiers, Tripoli, and Morocco, where they have had colonies for perhaps more than 1000 years, which were largely reënforced in consequence of the great Spanish persecutions. They are especially numerous in Fez and Morocco, though they are often shamefully treated. In Egypt they are comparatively few in number at the present time, the only important communities being in Alexandria and Cairo. On the Abyssinian Jews, living in the midst of a Christian population itself surrounded by Moslem neighbors, see FALASHAS.

12. *The Jews in Mediæval and Modern Europe* (622-).—While Mohammed was making his appeal to the Jews of Medina, their brethren were suffering for their faith in Spain, defending it in Italy, and seeking converts for it in Russia. They were destined to be relieved of their sufferings and have a long period of prosperity in Spain through the influence of the faith Mohammed preached, to buy toleration in Italy in an age which saw papacy reach the climax of its power, and to make converts to their own faith of the whole kingdom of the Chazars, the greatest power in Russia. As they pushed their way from land to land in Europe their career was almost everywhere one of alternating prosperity and adversity, toleration and bitter persecution. Their lot in *France* during the eighth and ninth centuries was quite favorable, especially in Paris, Lyons, Languedoc, and Provence. They possessed lands and houses and, in the south, held public offices. Their Talmudic schools flourished. At the court of Louis le Débonnaire (814-840), who maintained as a principle the obligation to protect all his subjects, irrespective of their faith, they acquired great influence. Before long, however, under his successors, kings, bishops, feudal barons, and even the municipalities joined in a carnival of persecution. From the eleventh to the fourteenth century, especially during the religious excitement wrought by the Crusades, their history is a series of massacres. All manner of wild stories were circulated against them; it was said that they were wont to steal the Host and to stick it contemptuously through and through, to inveigle Christian children into their houses and murder them, to poison wells, etc. Occasionally their debtors, high and low, had recourse to what they called Christian religion as a very easy means of getting rid of their obligations. Thus Philip Augustus (1180-1223), under whose rule the Jews seem to have held mortgages of enormous value on the estates of church and state dignitaries, simply confiscated the debts due to them, forced them to surrender the pledges in their possession, seized their goods, and banished them from

France; the decree appears to have taken effect chiefly in the north; yet in less than 20 years the same proud but wasteful monarch was glad to let them come back and take up their abode in Paris. Louis IX, who was a very pious Prince, among other religious acts canceled a third of the claims which the Jews had against his subjects, "for the benefit of his soul." An edict was also issued for the seizure and destruction of their sacred books, and we are told that at Paris (1242) 24 carts filled with copies of the Talmud, etc., were consigned to the flames. In the reign of Philip the Fair they were again expelled from France (1306) with the usual accompaniments of cruelty; but the state of the royal finances rendered it necessary, 10 years later, under Louis X, to recall them; and they were allowed to enforce payment of the debts due to them, on condition that two-thirds of the whole should be given up to the King. The semireligious disorders, known as the rising of the shepherds, which broke out in Languedoc and the central regions of France (1321), were signalized by horrible massacres of the Jews. (See PASTORELS.) In the following year the plague broke out, and the wildest crimes were laid to their charge. They were held responsible, likewise, for the Black Death which appeared in 1348. In whole provinces every Jew was burned. At Chinon a deep ditch was dug, an enormous pile raised, and 160 of both sexes burned together. Yet Christianity never produced more resolute martyrs than these Jews, who met their tortures chanting hymns of rejoicing. Finally, Sept. 17, 1394, they were indefinitely banished from central France.

The first appearance of the Jews as traders in *England* dates from the period of the Saxons. They are mentioned in the ecclesiastical constitutions of Egbert, Archbishop of York, 740. The first real settlement was made under William the Conqueror, who, with his son William Rufus, favored them; the latter, on the occasion of a public debate between them and the Christians, even swore with humorous profanity that if the rabbins beat the bishops, "by the face of St. Luke" he would turn a Jew himself. The same reckless monarch carried his contempt for the religious institutions of his Kingdom so far that he actually farmed out the vacant bishoprics to the Jews; and at Oxford, even then a seat of learning, it has been surmised that they possessed three halls—Lombard Hall, Moses Hall, and Jacob Hall—where Hebrew was taught to Christians as well as to the youths of their own persuasion. As they grew in wealth they grew in unpopularity. On the day of the coronation of Richard the Lion-Hearted (1189) some foreign Jews being perceived to be witnesses of the spectacle, from which their nation had been strictly excluded, a popular commotion against them broke out in London; their houses were pillaged and burned. Sir Richard Glanville, the Chief Justice of the realm, acting under the orders of the indignant King, partially succeeded in arresting the havoc and even in bringing some of the mob to justice (three were hanged). Similar scenes were witnessed at Norwich, Edmundsbury, Stamford, and York; in the last of these towns most of the Jews preferred voluntary martyrdom in the synagogue to forced baptism. When Richard returned from Palestine, though they were still treated with great rigor, their lives and wealth were protected for a consideration. John at first cov-

ered them with honor; but the popular and priestly hatred only became the stronger, and the vacillating King turned on his protégés, after they had accumulated wealth, and imprisoned, maltreated, and plundered them in all parts of the country. Under Henry III, accused of clipping the coin of the realm, they had as a penalty to pay the royal exchequer (1230) a third of their movable property. The unfounded stories of the crucifixion of the Christian boys, William of Norwich (1144) and Hugh of Lincoln (1255), roused the populace against the Jews. Some efforts were made to induce them to give up their profession of usury, as was also done in France and elsewhere during the same period; but they were so heavily taxed by the governments of Christendom, and at the same time so completely debarred from almost every occupation, that they could find no other means of subsistence. The attempt made by the Dominican friars to convert them failed utterly, and in 1253 the Jews—no longer able to withstand the constant hardships to which they were subjected in person and property—begged of their own accord to be allowed to leave the country. Richard of Cornwall, however, persuaded them to stay. Ultimately, under Edward I in 1290, they were driven from England, pursued by the execrations of the infuriated rabble, and leaving in the hands of the King all their property, debts, obligations, and mortgages. They emigrated for the most part to France and Germany, though it has been shown that some remained behind and managed to conceal themselves from the authorities. The number of Jews in England at the time of the expulsion is estimated at about 16,000.

In *Germany* they were looked upon as the special property of the sovereign, who bought and sold them, and they were designated his *Kammerknechte* (chamber servants). About the eighth century they were found in all the Rhenish towns. In the tenth century they were in Saxony and Bohemia; in the eleventh, in Swabia, Franconia, and Vienna; and in the twelfth, in Brandenburg and Silesia. The same sort of treatment befell them in the Empire as elsewhere; they had to pay all manner of taxes and to present gifts, to mollify the avarice or supply the necessities of emperors, princes, and barons. Only here and there did they possess the rights of citizens or were they allowed to hold immovable property. Repeatedly the emperors gratified at once their piety and their greed by canceling the Jews' pecuniary claims. In many places they were compelled to live in a certain part of the town, known as the *Juden-gasse* (Jews' street) or ghetto. As elsewhere in Christendom, so in Germany, the Crusades kindled a spirit hostile to the "enemies of Christ." The word *hep* (said to be the initials of *Hierosolyma est perdita*, Jerusalem is taken) throughout all the cities of the Empire became the signal for massacre, and, if a fanatic monk sounded it along the streets, it threw the rabble into paroxysms of murderous rage. The Jews were expelled, after being plundered and maltreated, from Vienna (1196), Mecklenburg (1225), Breslau (1226), Brandenburg (1243), Frankfort (1241), Munich (1285), Nuremberg (1390), Prague (1391), Mainz (1420), Saxony (1432), Bavaria (1450), and Regensburg (1476).

Switzerland, whither they came at a comparatively late period, began to persecute them

about the middle of the thirteenth century. They were expelled from Bern (1288), Zurich (1436), Geneva (1490), Basel (1576), and Schaffhausen (in the fifteenth century).

In *Spain*, as we have seen, the condition of the Jews was long favorable. During the whole of the brilliant period of Arab and Moorish rule in the peninsula they were almost on terms of equality with their Mohammedan masters, rivaled them in letters, and probably surpassed them in wealth. Nor was this state of things confined to those portions of Spain under the sovereignty of the Moors; the Christian monarchs of the north and interior gradually came to appreciate the value of their services, and we find them for a time protected and encouraged by the rulers of Aragon and Castile. But the extravagance and consequent poverty of the nobles, as well as the increasing power of the priesthood, ultimately brought about a disastrous change. Gradually the Jews were deprived of the privilege of living where they pleased, their rights were diminished, and their taxes augmented. In Seville, Cordova, Toledo, Valencia, Catalonia, and the island of Majorca outbreaks of priestly and popular violence took place (1391-92); immense numbers were murdered, and wholesale theft was perpetrated by the religious rabble. Escape was possible only through flight to Africa or by accepting baptism at the point of the sword. Many thousands became enforced converts to Christianity, though many of these, known as *Maranos*, secretly continued to profess the rites of the Jewish religion. In 1480 the Inquisition was introduced. Hundreds of Jews were burned at the stake. Sometimes the popes, and even the nobles, shuddered at the fiendish zeal of the inquisitors and tried to mitigate it; but in vain. At length the hour of final horror came. In 1492 Ferdinand and Isabella issued an edict for the expulsion, within four months, of all who refused to become Christians, with the strict inhibition to take neither gold nor silver out of the country. The Jews offered an enormous sum for the revocation of the edict and for a moment the sovereigns hesitated, till Torquemada, the Dominican Inquisitor General, dared to compare his royal master and mistress to Judas. To the number of 300,000 (some even give the numbers at 650,000 or 800,000) they resolved to abandon the country, which a residence of seven centuries had made almost a second Judæa to them. Almost every land was shut against them. Some ventured into France; others into Italy, Turkey, and Morocco, in the last of which countries they suffered the most frightful privations. Of the 80,000 who obtained an entrance into *Portugal* on payment of eight gold pennies a head, but only for eight months to enable them to obtain means of departure to other countries, many lingered after the expiration of the appointed time, and the poorer were sold as slaves. In 1496 King Emmanuel commanded them to quit his territories, but he at the same time issued a secret order that all Jewish children under 14 years of age should be torn from their mothers, retained in Portugal, and brought up as Christians. Agony drove the Jewish mothers into madness; they destroyed their children with their own hands and threw them into wells and rivers, to prevent them from falling into the hands of their persecutors. The miseries of those who embraced Christianity, but who for the most part secretly adhered to their old faith,

were hardly less dreadful, and it was far on in the seventeenth century before persecution ceased. Suspected converts were burned as late as 1766 in Portugal and 1821 in South America.

The wanderers appear to have met with better treatment in *Italy* (and *Turkey*) than elsewhere. During the fifteenth and sixteenth centuries they are to be found—except at intervals of persecution—in almost every city in Italy, chiefly engaged in money lending. Abrabanel, perhaps the most eminent Jewish scholar and divine of his day, rose to be confidential adviser to the King of Naples. The invention of printing, the revival of learning, and the Reformation are generally asserted to have been beneficial to the Jews; but this can be regarded as true only in a limited sense. When the Jews began to use the presses at their earliest stage for their own literature, sacred and otherwise, the Emperor Maximilian was urged to order all Hebrew writings to be committed to the flames, and but for the strenuous exertions of Johann Reuchlin (q.v.), ignorance, treachery, and bigotry might have secured a triumph. Luther, in the earlier part of his career, looked with no unfavorable eye on the adoption of violent means for their conversion; but, on the other hand, we find at least one distinguished Roman Catholic, Pope Sixtus V, animated by a far more wise and kindly spirit towards them than any Protestant prince of his time. In 1558 he abolished all the persecuting statutes of his predecessors, allowed the Jews to settle and trade in every city of his dominions and to enjoy the free exercise of their religion, and in the administration of justice and taxation placed them on a footing with the rest of his subjects. That the Reformation itself had nothing to do with subsequent ameliorations in the condition of the Jews is plain from the fact that in many parts of Germany, Protestant as well as Catholic, their lot became actually harder than before. They were driven out of Bavaria (1553), out of Brandenburg (1571), and similar treatment befell them elsewhere. What really caused the change in their favor was the great uprising of human reason that marked the middle of the eighteenth century.

Holland was one of the first countries in modern times to rise out of the barbarism of the Middle Ages. As early as 1593 it permitted Jews to settle and trade, though they did not acquire the rights of citizenship till 1796. *Holland*, therefore, became a refuge in the seventeenth century, of which the Spanish Maranos availed themselves; and by the middle of that century Amsterdam had a considerable Jewish population, renowned for its learning and enterprise. Nor has there been any instance of persecution of Jews in *Holland* from the time of their entrance to the present day, except such as orthodox Jews themselves indulged in against "heretics," e.g., the cases of Gabriel Acosta and Spinoza (qq.v.).

In *England* the edict of Edward I remained in force for more than 300 years, though Jews are known to have lived secretly in London and to have had a synagogue there during the whole of this period. The first attempt made by the Jews to obtain a legal recognition in England was during the Protectorate of Cromwell in 1655. (See MANASSEH BEN ISRAEL.) Cromwell himself was favorable to their admission; so were the lawyers; but the nation generally, and particularly the emphatically religious por-

tion of it, were strongly hostile to such a proceeding; and the wearisome, controversial jangling of the divines appointed to consider the question prevented anything from being done till the reign of Charles II, who, standing much and frequently in need of their services, permitted them quietly to settle in the land. In 1723 they were permitted to give evidence in courts of justice; in 1753 they obtained the right of naturalization. Since 1830 civic corporations, since 1833 the profession of advocate, and since 1845 the offices of alderman and of Lord Mayor have been opened to them. The last triumph of the principle of toleration was achieved in 1858 by the admission of Jews into Parliament. In the year 1885 Lord Rothschild took his seat as a member of the House of Lords, and in 1914 Sir Rufus Isaacs became Lord Chief Justice of England.

Some of the exiles from Spain and Portugal found their way into *France*, where they long lingered in a miserable condition. In 1550 they were received into Bayonne and Bordeaux; they were also to be found in considerable numbers in Avignon, Lorraine, and Alsace. In 1784 the capitation tax was abolished. In 1790, in the early period of the French Revolution, the Jews presented a petition to the national representatives, claiming full rights as citizens. Mirabeau was among their advocates, and their cause was not unsuccessful. From this time their technical designation in France has been *Israélites*. In 1806 the Emperor Napoleon summoned a Sanhedrin of Jews to meet in Paris, to whom a variety of questions were put, mainly with a view to test their fitness for citizenship. Their answers were satisfactory, and they were allowed to reorganize their religious institutions in the most elaborate manner. No material change has since taken place in the laws regarding them, though since 1895 anti-Semitism has been very virulent in France and was especially noteworthy in connection with the case of Alfred Dreyfus (q.v.).

Jews appeared in *Russia* at an early date; in the seventh century the ruler of the Chazars and part of his people were converted to Judaism. During the Middle Ages, as in most countries of Christendom, they were received, persecuted, and banished. Admitted into Russia proper by Peter the Great, they were expelled—to the number of 35,000—by the Empress Elizabeth in 1742. The partition of Poland (1772–95) brought a large Jewish population under Russian sway. Readmitted by Catharine II into Russia proper, they were further protected by Alexander I, who in 1805 and 1809 issued decrees insuring them full liberty of trade and commerce; but of the liberties which he conferred upon them they were deprived by the Emperor Nicholas. After 1835 a scheme of gradual emancipation was entertained by the government and was partially carried out by Nicholas I and Alexander II. But the reaction under Alexander III, due to the influence of Pobiedonostseff, procurator of the Holy Synod, was of the direst consequences to the Jews. From the year 1881 and the promulgation of the Ignatieff Law of 1882, the most restrictive measures have been piled up against them. They have been confined to one huge ghetto—the Pale of Settlement—and since 1891 the laws have been applied with the utmost severity. The Jews have been forced out of all offices of trust and from nearly all the professions, restricted in the

use of schools and universities, and have been forced to live in the direst poverty and neglect. Their only hope lies in conversion to the Orthodox faith or in emigration. Fully 800,000 have sought safety in flight and have settled in various parts of Europe and America. Many have benefited by the munificence of the late Baron Maurice de Hirsch (q.v.), from whom the Jewish Colonization Association received many millions of dollars. The Jews are more numerous in Russia than in any other part of the world, being found mainly in those portions of the Empire which formed part of the ancient Kingdom of Poland, and the governments nearest to these territories. As early as 1264 the Jews enjoyed in Poland and in Lithuania certain important privileges. They were favored by Casimir the Great of Poland (1330-70), because of the love he bore to a Jewish mistress. After 1348 their numbers were swelled by fugitives from Germany and Switzerland. For many years the whole trade of the country was in their hands. During the seventeenth century and the greater part of the eighteenth, however, they were much persecuted and sank into a state of great ignorance and poverty; but education—in spite of the severity and barbarism of Russian intolerance—has, since the French Revolution, made great progress among them.

Frederick the Great of *Prussia* showed himself singularly harsh towards the Jews. All manner of taxes were laid upon them, only a certain number were allowed to reside in the country, and these were excluded both from the most honorable and the most lucrative employments. This condition was ended by the Prussian edict of toleration (1812), by which the Jews were placed almost in an equal position as citizens with other Prussians. Thereafter the tendency was to enlarge their liberties, and the revolution of 1848 finally gained them full emancipation, although, owing to the subsequent reaction, it was slowly carried out. But a few years after the formation of the German Empire a new kind of anti-Jewish persecution took its rise, under the name of anti-Semitism (q.v.), and from Germany it spread to Austria, Belgium, Switzerland, and France. It was started as a political move, the promoters desiring to discredit the Liberals and Socialists through the Jews. The old blood accusation has often been revived, and the Jews have been gradually forced out of all offices of public trust and of government appointment. In the smaller German states full rights were likewise legally conceded to the Jews. The first German national assembly, held in Frankfort in 1848, contained many prominent Jewish members. In *Austria* the Emperor Joseph II distinguished himself by passing an act of toleration (1782). This act was extraordinarily liberal in its provisions for the Jews. Not till 1867, however, did they acquire the right to possess land. The anti-Semitic agitation has been exceedingly strong in Austria, and attempts have been made (1890-96) to reenact former restrictive measures, especially in Vienna, where an anti-Semitic board of aldermen existed for many years. In *Hungary* the Jews, who had long enjoyed important privileges and who had been protected by the nobility, were emancipated at the time of the revolution of 1848, in which they were patriotic to a man. In that Kingdom they are on an absolute equality with the Christians. The Jews have lived in *Rumania* (Moldavia, Wallachia) since the

thirteenth century. They have not fared better there than in other parts of Europe. The severest persecution came over them during the last quarter of the nineteenth century. In spite of the Treaty of Berlin (1878) the government refused to naturalize the Jews and has gradually forced them out of all but a few employments and driven them altogether from the schools. The financial and economic crisis of 1899 and 1900 made the lot of Rumanian Jews unbearable, and they have been forced to leave the country in large numbers. *Spain* began to tolerate the Jews again in 1837, and they can follow trade or agriculture like other Spaniards; but few Jews have as yet cared to venture back to a land that is filled with mournful recollections. *Portugal* has about 400 Jews, and the Jewish religion is legally tolerated there. *Switzerland* long treated them harshly, but while they now enjoy full personal liberty in all cantons, popular ill will has interfered with the exercise of some of their religious observances. In *Denmark*, since 1814, they have been on a footing of equality as citizens with native Danes. In *Sweden* they obtained admission into Stockholm and three other cities in 1776 and have since been admitted to citizenship on the same basis as native Swedes. In *Norway* they were not admitted until 1860, but now enjoy all the rights of citizenship.

Jews at an early date settled on the *American* continent, exiled from Spain and Portugal, or taking part in the Dutch and English enterprises in the New World. In the sixteenth century we find some in Brazil, whither they had been sent in company with convicts. In 1642 a large number of Portuguese Jews came from Amsterdam and settled in Pernambuco and Surinam. From here they spread to Guadeloupe, Cayenne, and Curaçao. The strong arm of the Inquisition was felt also in Brazil, and many were compelled to comport themselves as Christians (Maranos) or to emigrate to the West Indies. There were Jews in New Amsterdam as early as 1652; others came from Brazil in 1654. They were not heartily welcomed, and therefore betook themselves to Newport and Providence, R. I. The Newport congregation was strengthened by fresh arrivals from Lisbon (1755) and Curaçao. The old synagogue there is still standing. At the end of the seventeenth century there were some Jews in Maryland, Pennsylvania, Georgia, and the Carolinas were the next places of settlement. This was during the first half of the eighteenth century. During the struggle for independence the Jews attached themselves to the nation under whose wing they had thus found protection. There were nine Jewish signers of the nonimportation resolution drawn up in Philadelphia in 1768. Jews were in the Charleston regiment of militia, and three Jews served on the staff of De Kalb. Haym Solomon enjoyed an enviable reputation as one who aided the Continental Congress with his money. Forty-four Jews figured in the War of 1812, 58 in the Mexican War, and in the War of the Rebellion they were to be found in large numbers both on the Northern and Southern sides. During the nineteenth century the Jews spread over the whole extent of the United States, and important congregations have also grown up in the larger cities of Canada. From 1830 to 1870 the immigration came largely from the southern states of Germany and from Hungary. The riots and persecutions

in Russia have driven hundreds of thousands of Jews to the United States. To these have been added large numbers from Galicia and Rumania, who have for the most part settled in the large business centres; though efforts have been made to found agricultural colonies for them in Delaware, New Jersey, the Dakotas, Pennsylvania, Connecticut, and also in Argentina.

Judaism at the Present Time. In taking a rapid survey of the Jews as they exist to-day, we see at one and the same time a great diversity coupled with a fundamental conformity. This diversity has arisen from the attempt which the Jew is bound to make to fit his ancient beliefs and ceremonies into modern ways of thinking and modern conditions. Outwardly the Jews may be divided into two distinctive classes, the so-called *Ashkenazim*, or the descendants of the Jews of middle and eastern Europe, and the *Sephardim*, or descendants of the Jews who lived formerly in Spain and Portugal. Brought up under different conditions, the Sephardim had the benefit of a general culture earlier than had the Ashkenazim, and so imbued were they with the Spanish and Portuguese civilization that they carried it with them wherever they went after the expulsions of 1492 and 1496. To this day, whether in Europe, Asia, North Africa, or America, Sephardim are apt to congregate among themselves, having their own synagogues and their own ecclesiastical authorities. They are readily distinguished from the Ashkenazim by their names and in the synagogue by their more Oriental pronunciation of the Hebrew and certain peculiarities in their ritual. They are, however, few in number and by intermarriage with Ashkenazim are gradually losing their identity. Judaism was never a favorable ground for the growth of sects. The enmity of the outside world produced a solidarity which triumphed over all attempts at division. The only sect that may be said to exist to-day is that of the Karaites, who probably do not number more than 15 or 20 thousand and are to be found in southern Russia, in various parts of the Turkish Empire, and in Egypt. The Samaritans, of whom about 200 souls still live in Nablus, the ancient Shechem, can hardly be counted as among the Jews, since they live a life entirely apart from the rest of the community and seek to preserve their ancient schismatic condition. Among the Ashkenazic Jews there are in reality only two divisions, the orthodox and the reform, and even here these divisions are by no means clearly cut. There being no Jewish church as such, and each community, and even each congregation, being a law unto itself, the greatest variety is found, starting with the ultraorthodox and reaching down to the most radical reform. For purposes of distinction we may speak of the three following divisions: orthodox, conservative, and reform Jews. The orthodox Jew believes in the absolute authority, not only of the Bible as the Word of God, but also of the traditional body of laws, statutes, and observances which have grown up around the written Law in course of time and which form the oral Law. After passing through various codifications, from the time of the two Talmuds (fourth to sixth century), this Law was put into some sort of final shape by Joseph Caro (sixteenth century). His *Shulhan Aruk* is considered the norm by which the orthodox Jew regulates both his religious and his everyday life. He believes

that a strict performance of all its minor regulations is obligatory upon him on all occasions and at all times. The conservative Jew holds in practice also to the validity of both the oral and the written Law, but is a little less rigid in his observances and believes that some concession ought to be made to the spirit of the times and the conditions of modern life. Reform Judaism takes quite a different attitude respecting both the written and the oral Law. It professes to see a regular development in both and believes that Jewish belief and Jewish practice are supple enough to adapt themselves to all changes of environment and to all phases of human thought. Commencing with Moses Mendelssohn, towards the end of the eighteenth century, this reform has made greatest progress in Germany and the United States. Starting as an attempt to modernize the public worship of the synagogue, it has gradually so developed as to become a sort of Unitarianism modified by peculiar Jewish observances. It has more or less radical ideas in regard to the inspiration of the Bible; it has largely introduced the vernacular into the synagogue service, from which it seeks to remove all traces of its Oriental origin; and discards the separation of the sexes, the covering of the head, and the observance of the second-day festivals. In some places Sunday services have been introduced, in addition to those on the historical Sabbath (in Berlin as early as 1840, in the United States during the last quarter of the nineteenth century). In only one place (Chicago) has the Saturday service been entirely discarded in favor of the Sunday. Between these divisions, however, there are many subdivisions, and the words "orthodox" and "reform," as regards the Jews, are loosely and variously applied.

It is impossible to give a single description of the Jewish rites and ceremonies of to-day, because of the diversity which exists. Nominally, the seventh day is the day of the Jewish Sabbath; the demands made by modern commercial life render an observance of the day extremely difficult, and, except a small number of the orthodox, most Jews to-day keep their places of business open on the Sabbath. The festival of the New Year and the Fast of the Day of Atonement, both of which occur in the months of September and October, are perhaps the two festivals which are most rigidly observed. The Passover festival, which falls usually in the month of March or April, is still observed by most Jews, who abstain for a week from eating leaven. The celebration of the Pentecost festival (end of May or beginning of June), which commemorates the giving of the Law on Mount Sinai, has been made more solemn by the reform Jews, among whom it is the day of confirmation. Formerly (and this is the rule to-day in orthodox Jewish congregations) boys were confirmed at the age of 13, in whatever month they reached that period of life. Reform Judaism has substituted for this the annual day of confirmation, in which the girls participate together with the boys. The Feast of Tabernacles (celebrated in the autumn), which commemorates the dwelling of the Israelites in booths during the passage through the wilderness, is still universally observed in some manner or other. The minor festivals, such as the Ninth of Ab, the day upon which the temple in Jerusalem was destroyed; Purim, the commemoration of the deeds of Esther and Mordecai; as

well as other minor festivals, are to-day observed only by the orthodox; though there is a tendency, even among reform Jews, to lay more than ordinary weight upon the celebration of the *Chanukkah*, which recalls the national regeneration under the Maccabæan heroes. The dietary laws, as laid down in the Bible and interpreted by the rabbinical authorities, are universally held to be binding among the orthodox Jews, while only a few of the reform Jews observe them through ancient habit or through veneration of the past.

The use of the Hebrew language among the Jews has generally given way to the vernacular of the countries in which they live. Of late, however, there has been a certain revival in the use of Hebrew, due to the more national Jewish sentiments which have inspired large numbers of the Jews. In the Jewish colonies in Palestine, Hebrew is the vernacular, and a number of Jewish journals and reviews are published in Hebrew, not only in the East, but in various parts of Europe. The Judæo-German, or Yiddish, has also experienced a revival. This language, which has as its base a dialect of German spoken in the Rhine regions during the Middle Ages, has become, through the expansion of the German Jews eastward, the common tongue of several millions of Jews living in Russia, Austria, and the Balkan Peninsula. When these Jews were again driven westward, during the closing quarter of the nineteenth century, they carried this Yiddish with them into the new ghettos of western Europe and northern America. In the large cities of these countries many Yiddish daily and weekly papers are published. Because of contact with many other languages and civilizations, this Yiddish has become variously modified by the introduction of Russian, Polish, High German, and English terms and forms.

The training of men for the Jewish ministry was in former times peculiarly one-sided. The seminaries, or *yeshibas*, devoted their time exclusively to rabbinical jurisprudence and Talmudic law; secular learning was looked at askance, as the rabbi was not a minister in the modern sense of the word, but a legal adviser and a judge in matters of religious dispute. Very early in the nineteenth century the need for some more modern course of instruction was felt. A seminary for the training of teachers was founded as early as 1809 in Cassel, Germany. The first regular seminary for the training of rabbis, however, was founded in Padua in 1829. In 1854 the conservative seminary was established in Breslau; this was followed by similar institutions in Berlin, London, Paris, Budapest, and Vienna. In the United States, after some abortive attempts in the sixties and seventies of the nineteenth century, the Hebrew Union College was founded in 1875 at Cincinnati, by the Union of American Hebrew Congregations, under the presidency of Isaac M. Wise. Dr. K. Kohler was elected its president in 1903. This Union, founded in 1873, comprised all the important congregations of the United States which had a leaning towards reform. It consisted in 1914 of 189 congregations. The college is generally recognized as the training place of ministers for this wing of the synagogue. It attempts to give its students an historical knowledge of the development of Jewish history and the Jewish religion and to fit them for active preachers and communal workers. As its graduates cannot serve in orthodox con-

gregations, the Jewish Theological Seminary was established in 1886 in the city of New York for the purpose of training rabbis who shall understand the principles of Jewish law and be able to interpret it practically to the congregations whom they are to serve. In the year 1902 the Jewish Theological Seminary of America was enlarged, and Prof. S. Schechter, of Cambridge, England, was called to be the president of its faculty. In the year 1893 a training school for religious school-teachers was founded at Philadelphia, with the money left to the Mikwe Israel Congregation, of that city, by Hyman Gratz. It is called Gratz College. In 1908 the Dropsie College for Hebrew and Cognate Learning was opened in Philadelphia, as a postgraduate institution leading to the degree of doctor of philosophy. Dr. Cyrus Adler, of Washington, D. C., was called as president of this college. In 1893 the Jewish Chautauqua Society (q.v.) was founded by Dr. Henry Berkowitz, of Philadelphia, which carries on a sort of Jewish university extension work, by means of Chautauquan circles in various States and a summer meeting at Atlantic City. This gave rise in 1899 to the Jewish Study Society in London. Work on these lines is also done by the Young Men's Hebrew Associations, the first of which was founded in New York in 1874, and which are now to be found in nearly all the larger cities in the United States. A Jewish publication society was founded in Philadelphia in 1845, and a second one in New York in 1873, but both of these were short-lived. In 1888 the Jewish Publication Society of America was organized in Philadelphia and has since then published a number of works dealing with Jewish history and Jewish life. The only Jewish learned society in the United States is the American Jewish Historical Society, founded in 1892. In 1893 the Jewish Historical Society of England was founded. A similar society (*Société des Etudes Juives*) exists in France, and its interests cover the whole of Jewish history; while in Germany there are over 100 Jewish literary societies which give courses of lectures on Jewish subjects and publish a yearbook. The National Council of Jewish Women, an American organization established in 1893, has endeavored to foster the religious spirit in the home by the personal influence of its members and by organized philanthropic effort. The Intercollegiate Menorah Association was organized in 1913. Its purpose is the study and advancement of Jewish culture and ideals among college men. It has at present over 20 societies.

One of the peculiar features of American Judaism is the large development of the Sabbath schools attached to the congregations. As early as 1838 a general Sabbath school was organized in Philadelphia for Jews of all shades of belief. In 1845 the movement spread to New York, in 1848 the Hebrew Educational Society was founded in Philadelphia, and in 1864 the Hebrew Free School Association was incorporated in New York.

The arrival of large numbers of Jews from Russia and Rumania has made necessary the founding of manual training and technical schools, in which the rising generation may be taught handicrafts, from which they have largely been excluded by legislation in eastern Europe. Such schools exist in New York, Philadelphia, Chicago, and other cities and have been fostered especially by the Baron de Hirsch Fund.

A remarkable development in modern Jewish life is that of the Zionist movement. In a measure it is the continuation of the old Jewish hope of restoration to the land of Palestine. It is also the Jewish answer to anti-Semitism. Starting with a pamphlet by Dr. Theodor Herzl of Vienna (*A Jewish State: An Attempt at a Modern Solution of the Jewish Question*, Vienna, 1896; Eng. trans. by D'Avigdor, London, 1896), it soon took hold of the Jewish people, and Zionist societies and clubs are now to be found wherever Jews exist. The object of the Zionist movement is to found a secure and legal home for the oppressed Jews in Palestine. The Federation of American Zionists was organized in 1897 and has held 17 annual conventions. It has 14,000 shekel payers and 102 societies. The Jewish Colonial Trust has been organized by the International Congress and has its head offices in London. See ZIONIST MOVEMENT.

There being no international Jewish organization, except that of the Zionist congresses, the Jews in each country have been forced to band themselves together in various ways in order to subserve interests, social and economic, which they have in common. In France the Alliance Israélite Universelle (q.v.), founded in Paris in 1860, has not only looked after the interests of Jews in Mohammedan countries supposed to be in the sphere of French influence, but has also on several occasions used its good offices to procure the amelioration of the condition of the Jews wherever its influence could be brought to bear. In England the Board of Jewish Delegates has attempted to do the same thing. Austria has its Israelitish Alliance, and Germany its Union of Congregations (*Deutsch-israelitische Gemeinde-Bund*). In the United States no such single union has been possible. The Union of the American Hebrew Congregations comprises those bodies which belong to the reform wing of the synagogue, and a union of orthodox Hebrew congregations was founded in New York in 1886. About the middle of the nineteenth century, when Jews were scattered in out-of-the-way places, a number of orders similar to that of the Freemasons were called into being. The B'nai B'rith (Sons of the Covenant), founded in the United States in 1843, in 1913 had 412 lodges and 38,447 members in America and a few in Germany, Rumania, Austria, Algeria, Bulgaria, and Egypt. Other similar societies are the Sons of Benjamin, the Free Sons of Israel, and the Free Sons of Judah. As the number of Jews in the United States increased, extensive calls were made upon the Jews already domiciled there to provide adequately for their more unfortunate brethren. Many homes for orphans have been established, also homes for the aged, and hospitals. A Jewish Agricultural and Industrial Aid Society was organized in 1900, which assists Jewish immigrants to become farmers by helping them to find suitable farms, loaning them money on favorable terms, and maintaining a Farm Labor Bureau. A Jewish Agricultural Experiment Station was organized in 1910. The National Jewish Fraternal Congress, organized in 1911, has 600,000 members in constituent orders. A National Jewish Immigration Council was organized in 1911, and in the same year a National Union of Jewish Sheltering Societies. In 1889 Rabbi Gustav Gottheil organized the first Sisterhood for Personal Service, in connection with the Temple Emanu-El in New York City. Since

then such societies, in which the work is done by the women of the congregation, have become attached to nearly every important synagogue in the land. The National Federation of Temple Sisterhoods was organized in 1913 and now consists of 71 societies. In most of the cities the work of the Jewish charities has been organized, so that one central body directs it in a large measure—the United Hebrew Charities of the City of New York. On Dec. 1, 1899, a national conference of Jewish charities in the United States was held at Cincinnati, with the end in view of bringing about a greater coöperation among the relief societies situated in the various parts of the country. Of more recent date is the attempt by the Jews to do settlement work in the congested districts of the large cities where the poorer Jews live—a work until

now undertaken almost exclusively by Christian organizations. The Educational Institute, in New York, is a sort of people's palace, and a regular Jewish settlement exists in Chicago. No account of Jewish charitable endeavor during the nineteenth century would be complete without the particular mention of Baron and Baroness de Hirsch, who bequeathed 300,000,000 francs for the purpose of aiding the oppressed Jews of eastern Europe. This fund is in the hands of a private corporation composed of a few trustees and has its seat in Paris. It has spent vast sums in colonizing some 5000 Jews in the Argentine Republic; it assists colonization in Canada and has recently taken over the Jewish colonies established by Edmund de Rothschild in Palestine; it also maintains schools and homes in several American cities to which the Russian Jews have emigrated. See HIRSCH, MAURICE, BARON DE.

Statistics. According to the latest issue of

the American Jewish Year Book (1913), "the total number of Jews in the world may be estimated at 12,000,000," of whom, in round numbers, 9,125,000 are assigned to Europe, 2,043,000 to North America, 62,000 to South America, 355,000 to Asia, 395,000 to Africa, and 20,000 to Australasia. This estimate is very conservative. The figures actually given amount to about 90,000 more; the latest of them come from the year 1911; the largest figure, that for Russia, is based on the census of 1897. In spite of emigration, persecution, and unfavorable conditions, it may be questioned whether the Jewish population in Russia has remained stationary since 1897; but there are no reliable data for the increase, if there has been a growth.

In view of the increase through immigration and excess of births over deaths, it may be regarded as certain that there were on Jan. 1, 1915, more than 2,500,000 Jews in the United States and more than 1,000,000 in New York City. More than 10 per cent of the population of New York State is Jews; it has been estimated that the Jewish population exceeds 100,000 also in Pennsylvania, Illinois, Massachusetts, Ohio, New Jersey, Missouri, and California, and there is no State or Territory in the United States in which there are not some Jews.

Language. By the Hebrew language is usually meant the language in which all the books of the Old Testament are written except parts of Daniel (q.v.) and Ezra (q.v.). The expression "Hebrew language" is not found in the Old Testament. In its place we have "speech of Canaan" (Isa. xix. 18) and "Jews' language" (2 Kings xviii. 26, 28; Neh. xiii. 24), corresponding to the general use of the term "Jew," i.e., Judæan, for the entire nation in the later books. This "language of Canaan" belongs to the northern branch of the Semitic family of languages. It is practically identical with the Phœnician, with the speech of the Syrian correspondents of Amenhotep III and IV, as occasional lapses into the vernacular in the Amarna letters (q.v.) show, and with the Moabitish, as the Mesha inscription shows. Some traces of dialects appear in the Old Testament (cf. Judg. xii. 5, 6), and it is not improbable that there were characteristic differences of pronunciation and expression between Judah and Israel, Galilean and Ephraimitish, East and West Jordan tribes, just as at a later time there were dialectical differences between Judæan, Samaritan, and Galilean Aramaic. In writing Hebrew the alphabet employed was the old North Semitic (see ALPHABET; BIBLE, *Text of the Old Testament*), and this was still used for official purposes (e.g., on coins) as late as in the time of Simon Bar Cochba (132-135 A.D.). In writing the Aramaic vernacular, however, a more cursive hand was introduced, with a tendency towards more square characters. This was particularly the case when the writing material was papyrus, and may be seen in one of the Elephantine Papyri (q.v.) from the year 484 B.C. In Palestine the Jews employed, when writing their Aramaic dialects, the modification of the North Semitic alphabet used in Syria by Palmyrenes, Nabatæans, and other Aramaic-speaking peoples. It was called the "Assyrian" script (Assyrian being used in the sense of Syrian) or the "square" writing. The earliest examples in Palestine are found in two inscriptions at Arak al-Amir, probably written

by Hyrcanus, grandson of Tobias, between 183 and 175 B.C. This square Aramaic script was adopted by the Jewish scribes in copying the Holy Scriptures, probably in the first century B.C., since Yodh could be familiarly referred to in the following century as the smallest letter (Matt. v. 18), while the Samaritans continued to copy the Law in the Hebrew, i.e., the old North Semitic characters. (Cf. Driver; *Notes on the Hebrew Text and the Topography of the Books of Samuel, with an Introduction on Hebrew Palæography and the Ancient Versions*, 2d ed., Oxford, 1913.) For the grammatical structure and general characteristics of the Hebrew language, see SEMITIC LANGUAGES. On other languages spoken by the Jews, see ARAMAIC; LADINO; YIDDISH.

A grammatical treatment of the Hebrew first commenced after the language ceased to be spoken by the people. The vocalization and accentuation of the text originated in the sixth and seventh centuries after the time of Christ. (See MASORA.) The Jews made the first attempt at a system of grammar about the dawn of the tenth century, after the example of the Arabians, and originally even in the Arabic language. Rabbis Saadia Gaon (Saadia ben Joseph, died 942), Jehuda Hayyug (c.1030), Jonah (Ibn Janach, c.1030), Abraham ben Ezra (died 1167), and David Kimchi (died 1235) were the first grammarians. The dictionary of the last was long considered the best. The founder of the study of Hebrew among Christians was Johann Reuchlin (died 1522), who, however, like the grammarians of the next age, Buxtorf and others, strictly adhered to Jewish tradition and method. A new era began when the study of other members of the Semitic family of languages, Syriac, Arabic, and Ethiopic, enlarged the field of view. Albert Schultens (died 1750) and Nikolaus Wilhelm Schröder (died 1798) are noteworthy in this work. The development of Assyriological research during the nineteenth century has added much to our knowledge of the relation of Hebrew to the other Semitic dialects. Wilhelm Gesenius (died 1842) was by far the greatest of Hebraists up to his time. His *Hebräische Grammatik* (Halle, 1813; 27th ed. by Kautzsch, Leipzig, 1902; several Eng. trans., including one by the Americans Mitchell and Price, 2d ed., from the 25th German ed., Boston, 1894), *Thesaurus Linguae Hebraicæ* (Leipzig, 1829-42), completed by Rödiger, and shorter *Hebräisches und chaldäisches Handwörterbuch* (2 vols., Leipzig, 1810-12; 14th ed. by Buhl, 1905; Eng. trans. by Tregelles, Robinson, and others) were not only better than any previously produced, but are still those in most general use. Since Gesenius noteworthy grammars have been written in German by Ewald (Leipzig, 1827), Olshausen (Brunswick, 1861), Stade (Leipzig, 1879), and König (ib., 1881-97), and dictionaries by Fürst (ib., 1837-40) and by Siegfried and Stade (ib., 1873). The grammatical and lexicographical researches of Lagarde (died 1891) and Barth deserve special mention. The Hebrew-English dictionary by Brown, Driver, and Briggs (Boston, 1906) gives the results of the latest scholarship and research.

Literature. Only a scanty portion of ancient Jewish literature has come down to the present day. The Tell el-Amarna tablets show that writing on clay was known in Palestine as early as 1400 B.C. Whether the "journals of his

fathers" which Zakar Baal, of Byblos, ordered to be read to Wen Amon in the reign of Ramses XII (c.1118 B.C.), according to the Golénischeff Papyrus, were written in cuneiform characters is not certain, but probable. Yet it is not altogether impossible, if they came from Zakar Baal's father and grandfather, that they were written in the North Semitic alphabet, since this method of writing may have been invented before the first half of the twelfth century. (See ALPHABET.) There is no reason to doubt that the Habiri, or Hebrews, referred to in the Tell el-Amarna tablets, knew how to use the cuneiform script, but they probably adopted the Semitic alphabet soon after its invention. Some of the songs and stories of earlier ages may never have been written down at all before they were recorded in the new alphabetic script a century or more before David, and some that had been known through cuneiform inscriptions may at that time have been written down in the alphabetic script. The bulk of the remains of ancient Jewish literature is to be found in the Old Testament, and since the latest portions of the Old Testament bring us down to the Hasmonæan age, it embraces a period of more than 1000 years. To the Old Testament, however, as preserved in the Jewish canon of scriptures, must be added as properly belonging to ancient Jewish literature, not only the deuterocanonical books (q.v.), but also a large number of apocryphal books, originally written in Hebrew or Aramaic. (See APOCRYPHA.) With reference to form and contents this literature may be divided into poetry (lyric, didactic, and religious), history (including legends, traditions, and myths in historical garb), legal codes, religious discourses, romances, apocalyptic works, and philosophical disquisitions. The oldest specimens are probably found in the lyric poems, e.g., the Song of the Crossing of Arnon (Num. xxi. 14 f.), the Song of the Capture of Be'er (Num. xxi. 17 f.), the Song of the Conquests of Sihon (Num. xxi. 27-30), the Song of Deborah (Judg. v), and the Fable of Jotham (Judg. ix. 7 ff.). The earliest collections of traditions, historical reminiscences, stories, songs, legends, and laws (like the Covenant Code, Ex. xxi. 23-xxiii) may have been made towards the end of the period of the Judges. Among the remnants that seem to indicate a wealth of lyric poetry in the age of David and Solomon are David's Elegy on Saul and Jonathan (2 Sam. i. 17 ff.), the Blessing of Jacob (Gen. xlix), the Prophecies of Balaam (Num. xxii-xxiv), and the Blessing of Moses (Deut. xxxiii). A number of oracles, in poetic form, uttered by prophets in the eighth, seventh, and sixth centuries B.C. have come down to us, though in collections of a much more recent date. It is possible that the period of the exile saw the addition of Deuteronomy (q.v.) to the Story of Origins and the Story of Moses and the Legislation, by which the earliest form of the Pentateuch as a whole seems to have been constituted, though it was afterward greatly expanded. Characteristic of the Chaldæan and Persian periods was the attention bestowed on the Law and the prophetic collections. Much new material, legislative, narrative, and prophetic, seems to have been added to earlier works and collections. Still later apparently, and belonging chiefly to the Græco-Macedonian period, are philosophical productions, as Job, Proverbs, Ecclesiasticus, Ecclesiastes; the great body of

the religious poetry (the Psalter), though some of the psalms in a theologically less developed form may have originated in the præxilic epoch; and the romances, such as Ruth, Esther, Judith, and Tobit. For details, see the articles on the separate books of the Hebrew canon; also BIBLE; DEUTEROCANONICAL BOOKS; APOCRYPHA; PENTATEUCH; PROPHECY; APOCALYPTIC LITERATURE.

Though the uncertainty concerning the dates of the numerous works that make up Jewish biblical literature renders it difficult to divide its contents into definite periods, it is generally admitted that periods may be fixed, having certain literary characteristics, even if there is no agreement among scholars as to the number of productions that properly belong to this or that period. There is a *first* period, ending with the disruption of the Kingdom in c.953 B.C., to which, as is generally recognized, some of the finest of Hebrew lyrics belong, and, in the judgment of many scholars, a not inconsiderable portion of story and legislation as well. The characteristic of the *second* period (c.953-586 B.C.) is unquestionably the appearance of the oracles of the great præxilic prophets and the records of the reigns of the Israelitish and Judæan kings, whatever other literary products may likewise be regarded as belonging to it. That a gathering together of old material into larger collections is one of the chief marks of the *third* period (586-332 B.C.) will be widely acknowledged, even if the extent of editorial freedom and activity in bringing out larger volumes of history, legislation, and poetry may be differently defined.

A *fourth* period (332-165 B.C.) is characterized by one work that can be dated with certainty, Ecclesiasticus i-xliii, as the grandfather of the translator, who came to Egypt in 132 B.C., must have written about 180 B.C. A comparison of this work with other specimens of the wisdom literature has convinced many scholars that such products of the same spirit and intellectual milieu as Job, Proverbs, and possibly Ecclesiastes, belong to the same period. To this age belongs also essentially that great achievement of the Jews of Egypt, the translation of the Hebrew scriptures into Greek, though we know from the prefaces to Esther and Ecclesiasticus that this activity continued into the following period.

The *fifth* period (165 B.C.-135 A.D.) is characterized by several tendencies. One was legalistic, having to do with the interpretation of the Law. The *Midrash* (q.v.), or the inquiry into the meaning of the sacred text, was divided into *Halacha*, which considered the exegesis and completion of the written code through the oral Law, with a view to practical results, and *Haggada*, which sought the essence of the religious and historical interpretations. At first both were the oral deliverances of the Sopherim, or scribes, but gradually written memorials made their appearance. The public interpretation of the scriptures in schools and synagogues, the independence of the Sanhedrin, the strife of sects, and the influences of Alexandrian culture furthered this development. We possess in the Pirke Aboth and other tractates of the Mishna, and also in the texts of the Covenanters of Damascus, written c.100 B.C., evidences of this activity; but the written targums, or Aramaic versions of the Bible, belong to a later period. (See TARGUM.) Another tendency was apoc-

alyptic. While none of the great apocalyptic works is dated, the false ascription to some ancient seer making this impossible, internal evidence often points with apparent conclusiveness to the time of composition, and it may be regarded as certain that a number of apocalypses ascribed to Daniel, Enoch, Moses, Baruch, and Ezra come from this period. Less conclusive is the evidence that the period saw a great development of psalmody. But there can be little doubt that the Psalter of Solomon (q.v.) was written in the middle of the first century B.C., and many scholars maintain that the bulk of the Psalms in the Hebrew canon were written in the Maccabæan and Hasmonæan periods. The development of Hellenistic literature in Egypt, culminating in Philo, not only affected Palestinians like Josephus and showed itself in many of the deuterocanonical and apocryphal works, but also influenced Saul of Tarsus, the author of the Fourth Gospel, and other Christian writers who, nurtured in the principles of Judaism, retained many traces of their ancestral culture, feeling, and faith. The reaction against Hellenism, which saved the synagogue from being absorbed by the church, was led by such doctors of the oral Law as Hillel, Shammai, Johanan ben-Zakkai, the Gamaliels, Eleazar ben-Hyrcanus, Joshua ben-Hananya, Ishmael, Akiba, and others, to whom the honorary title of rabbi (master) or talmid hakam (disciple of the wise) was given. Besides the Hasmonæan and Bar Cochba coins, Greek and Latin inscriptions of this period are extant.

The *sixth* period reaches from 135 to 475. Instruction in the Halacha and Haggada now became the principal employment of the flourishing schools in Galilee, Syria, Rome, and, after 219, in Babylonia; the most distinguished men were the masters of the Mishna (q.v.) and the Talmud (q.v.)—viz., Eleazar ben-Jacob, Jehuda, Jose, Meir, Simeon ben-Yohai, Jehuda the Holy, Nathan, Hiyya, Rab, Samuel, Johanan, Hunna, Rabba, Rava, Papa, Ashe, and Abina. Besides expositions, ethical treatises, stories, fables, and history were also composed; the liturgy began to assume larger dimensions, the targum to the Pentateuch and the Prophets was completed, and the calendar fixed by Hillel the Second, 340. After the suppression of the academies in Palestine, those of Mesopotamia—viz., at Sura, Pumbeditha, and Nehardea—became the centres of Jewish literary activity. On Sabbaths and festal days the people heard, in the schools and places for prayer, instructive and edifying discourses. Of the biblical literature of the Greek Jews we have only fragments, such as those of the versions of Aquila (q.v.) and Symmachus (q.v.).

The *seventh* period was from 475 to 740. By this time the Jews had adopted the language of the country they happened to dwell in. During the sixth century the Babylonian Talmud was concluded, the Palestinian Talmud having been edited about 100 years before. Little remains of the labors of Jewish physicians of the seventh century or of the first *geonim*, or presidents, of the Babylonian schools, who first appear in 589. On the other hand, from the sixth to the eighth century, the Masora was developed in Palestine (at Tiberias), and besides a collection of the earlier haggadas (e.g., *Bereshith rabba*), independent commentaries were likewise executed, as the *Pesikta*, the *Pirke of Eliezer* (700), etc. See MIDRASH; HAGGADA.

In the *eighth* period (from 740 to 1040) the Arabs, energetic, brilliant, and victorious in literature as in war, had appropriated to themselves the learning of Hindus, Persians, and Greeks, and thus stimulated the Oriental Jews, among whom now sprang up physicians, astronomers, grammarians, commentators, and chroniclers. Religious and historical haggadas, books of morality, and expositions of the Talmud were likewise composed. The oldest Talmudic compends belong to the age of Anan (c.750), the earliest writer of the Karaite Jews. The oldest prayer book was drawn up about 880, and the first Talmudic dictionary about 900. The most illustrious *geonim* of a later time were Saadia (died 942), equally famous as a commentator and translator of Scripture into Arabic, a doctor of law, a grammarian, philosopher, and poet; Sherira (died 998), and his son Hai (died 1038), who was the author, among other works, of a dictionary. From Palestine came the completion of the Masora and of the vowel system; numerous *midrashim*, the hagiographical targums, and the first writings on theological cosmogony were also executed there. From the ninth to the eleventh century Kairawan and Fez in Africa produced several celebrated Jewish doctors and authors. Learned rabbis are likewise found in Italy after the eighth century, e.g., Julius in Pavia, etc. Bari and Otranto were at this time the great seats of Jewish learning in Italy. After the suppression of the Babylonian academies (1040) Spain and Egypt became chief seats of Jewish literature. To this period belong the oldest Hebrew codices, which go back to the ninth century. Hebrew rhyme is a product of the eighth, and modern Hebrew prosody of the tenth century.

The *ninth* period (from 1040 to 1204) is the most splendid era of Jewish mediæval literature. The Spanish Jews busied themselves about theology, exegetics, grammar, poetry, the science of law, astronomy, mathematics, philosophy, rhetoric, and medicine. They wrote sermons and ethical and historical works. The languages employed were Arabic, rabbinical Hebrew, and ancient or classical Hebrew. We can only mention here the great doctor, Samuel Halevi (died 1055), and the renowned Maimonides, whose death closes this epoch. The literature of the French rabbis was more national in its character and kept more strictly within the limits of the Halacha and Haggada. In Languedoc, which combined the literary characteristics of France and Spain, there were celebrated Jewish academies at Lunel, Narbonne, and Nîmes, and we find Talmudists, such as Berchia Halevi, Abraham ben-David, etc. The fame of the Talmudists of Germany, especially those of Mainz and Regensburg, was very great. Among the most illustrious Jewish writers of this period belonging to that country are Simeon, the compiler of the Midrashic collection known as the *Yalkut*, Joseph Kara, and Petahya. Only a few names belong to Greece and Asia; still the Karaite Jews had a very able writer in Juda Hadassi (1148).

The *tenth* period (from 1204 to 1492) bears manifest traces of the influence exercised by Maimonides. Literary activity showed itself partly in the sphere of theologicoexegetic philosophy, partly in the elaboration of the national law. With the growth of a religious mysticism there also sprang up a war of opinions between Talmudists, philosophers, and cabalists. The

most celebrated Jews of this period lived in Spain, later in Portugal, Provence, and Italy. To Spain belong (in the thirteenth century) the poet Jehuda al-Hanzi, etc. In the fifteenth century a decline is noticeable. Books written in Hebrew were printed at Ixar in Aragon (1485), at Zamora (1487), and at Lisbon (1489). During this epoch the chief ornaments of Jewish literature in Languedoc were Moses ben-Abraham, David Kimchi, Jeruham, Farissol, Isaac Nathan, the author of the Hebrew Concordance. In Italy, Jewish scholars employed themselves with the translation of Arabic and Latin works. Works of an æsthetic character were written by Immanuel ben-Solomon, the author of the first Hebrew sonnets, and by Moses de Rieti (born 1389), who wrote a Hebrew imitation of the *Divina Commedia*. It was here that the first Hebrew books were printed, at Reggio, 1475; Pieve di Sacco, 1475; Mantua, 1476; Ferrara, 1477. In France mention may be made of the collectors of the Tosaphot, Moses de Coucy and Jehiel ben-Joseph. Germany produced a multitude of writers on the Law, such as Eleazar Halevi, Meyer of Rothenburg, Asher, Isserlin, Lippmann. Most of the extant Hebrew manuscripts belong to this period, but a great part of mediæval Jewish literature lies still unprinted in the libraries of Europe.

The *eleventh* period (1492 to 1755) is marked by erudition in many fields and some noteworthy advances by radical thinkers. In Italy and the East (1492), in Germany and Poland (1550), as well as in Holland (1620), Jewish scholars worked printing presses, while numerous authors wrote in Hebrew, Latin, Spanish, Portuguese, Italian, and Judæo-German. Some of the most eminent theologians, philosophers, jurists, historians, mathematicians, poets, commentators, lexicographers and grammarians of this period among the orthodox Jews were Isaac Abrabanel, Elia Miahrahi, I. Arama, J. Habib, Elias Levita, Obadiah Sforno, Joseph Cohen, Gedalia ibn-Yahya, Sal. Usque, Asaria de Rossi, David de Pomis, David Gans, Isaac Troki, I. Luria, J. Caro, M. Alshech, M. Jafé, J. Heller, I. Aboab, Manasseh ben-Israel, Dávid Conforte, Leo de Modena, B. Musaphia, J. Eybeschütz, D. Oppenheimer, J. Emden, and M. C. Luzzatto. A bold thinker, who met with a sad fate because of his opposition to accepted beliefs, was Uriel da Costa, and the greatest philosopher the Jewish people has produced was Baruch Spinoza, whose influence for a long time was felt more strongly in the Christian world than in Jewry.

The *twelfth* period extends from 1755 to the present time. Encouraged by the spirit of the eighteenth century, Moses Mendelssohn opened to his coreligionists a new era which, as in the Middle Ages, first manifested itself in the national literature. Its character, contents, expression, and even its phraseology, were changed. Poetry, language, philology, criticism, education, history, and literature have been earnestly cultivated. Among the illustrious names of the early part of this period may be mentioned Ezekiel Landau, Elias Wilna, J. Berlin, Mendelssohn, Maimon, Bendavid, Beer, Euchel, Benzehb, S. Dubno; but the real foundation for the work of the modern critical school was laid by L. Zunz, whose *Gottesdienstliche Vorträge der Juden* (Berlin, 1832; 2d ed., Frankfurt, 1892) brought light for the first time into the history of the Midrashic literature, and whose works

on the religious poetry of the Jews have served as a basis for all later scholars. He was ably seconded by S. L. Rapoport, N. Krochmal, M. Jost, S. D. Luzzatto, and M. Steinschneider. Among those who have continued the work done by Zunz may be mentioned A. Geiger, L. Dukes, M. Sachs, S. Munk, Reggio, Z. Frankel, L. Löw, H. Graetz, D. Rosin, M. Joel, A. Jellinek, W. Bacher, J. Derenbourg, S. Buber, M. Kayserling, M. Güdemann, D. Kaufmann, A. Neubauer, A. Berliner, D. Chowlson, A. Harkavy, S. Schechter, Isidor Loeb, Marcus Jastrow, Morris Jastrow, Gustav Gottheil, J. R. Gottheil, Kaufmann Kohler, Emil Hirsch, and C. G. Montefiore.

A great influence has also been exerted by the journals and periodicals which in part are devoted to purely literary questions and in part treat of religious and practical affairs. One of the first of these was the *Meassef* (Collector) published by the circle which gathered around Mendelssohn. L. Philippson in Bonn, A. Geiger in Berlin, Szanto in Vienna, Lehmann in Mainz, Fürst in Leipzig, and I. M. Wise in Cincinnati were among the pioneers in modern Jewish journalism. They have been followed by a host of others. The leading periodicals are Z. Frankel's *Monatsschrift für die Geschichte der Juden* (Breslau, 1851 et seq.); *Monatsschrift für die Wissenschaft des Judenthums* (Berlin, 1883 et seq.); *Revue des Etudes Juives* (Paris, 1879 et seq.); *Jewish Quarterly Review* (London, 1888 et seq.), new series (Philadelphia, 1910 et seq.); *Jewish Review* (London, 1910 et seq.). Besides these periodicals mention should also be made of the powerful influence exerted by the *Jewish Encyclopædia* edited by Isidore Singer (New York, 1901-06).

There is no country in Europe which does not count Jews among the foremost representatives of its intellectual progress. In Germany some of the greatest professors at the universities and academies have been Jews. The list includes the names of Gans, Benary, Weil, Benfey, Bernays, Stahl, Derenbourg, Valentin, J. Kaufmann, Spitzer, Lazarus, Herz, Steinthal, and Barth. To these may be added Bréal, Oppert, H. Weil, Salomon Reinach, Th. Reinach, S. Munk, and H. Derenbourg in France, Sylvester in England, G. Brandes in Denmark, D. H. Müller in Austria, S. D. Luzzatto in Italy, and I. Goldziher in Hungary. Conspicuous in literature and the various fine arts are the names of Heinrich Heine, Ludwig Börne, Rahel Levin (Varnhagen), Berthold Auerbach, Marcus Herz, Jules Janin, Max Nordau, Israel Zangwill, Mark Antokolski, James Darmesteter, Catulle Mendés, Felix Mendelssohn-Bartholdy, Halévy, Waldteufel, Meyerbeer, Moscheles, Joachim, Rubinstein, Wieniawski, Grisi, Costa, Rachel, Dawison, Dessoir, Bernhardt.

Bibliography. For anthropological and ethnographical information, the following works may be mentioned, some of which also contain valuable material upon other topics: the general works of Brinton, Lombroso, and Ripley; Fligier, "Zur Anthropologie der Semiten," in the *Mitteilungen der anthropologischen Gesellschaft in Wien* (Vienna, 1880); Andree, *Zur Volkskunde der Juden* (Bielefeld, 1881); Blechmann, *Ein Beiträge zur Anthropologie der Juden* (Dorpat, 1882); Wolf, *Die Juden* (Vienna, 1883); Goldstein, "Introduction à l'étude anthropologique des Juifs," in the *Revue d'Anthropologie* (Paris, 1885); Jacobs, "On the Racial Charac-

teristics of Modern Jews" and "The Comparative Distribution of Jewish Ability," in the *Journal of the Anthropological Institute of Great Britain and Ireland* (London, 1886); id., *Studies in Jewish Statistics* (ib., 1891); Alsberg, *Rassenmischung im Judentum* (Berlin, 1891); Luschán, "Die anthropologische Stellung der Juden," in the *Correspondenzblatt der deutschen anthropologischen Gesellschaft* (Brunswick, 1882); Jacques, "Types juifs," in the *Revue des Etudes Juives* (Paris, 1893). For Hebrew history and religion and the postbiblical period to the destruction of Jerusalem, the histories of Stade, Kittel (2d ed., Gotha, 1909-12), Guthe, Buhl, Cornill, Köhler, Klostermann, Wellhausen (7th ed., Berlin, 1914), Renan, Piepenbring, and Kent represent modern scholarship. Eduard Meyer, in *Entstehung des Judentums* (Halle, 1896) and *Die Israeliten* (ib., 1906), deals with two important periods; for a later period cf. Schlatter, *Geschichte Israels von Alexander dem Grossen bis Hadrian* (2d ed., Leipzig, 1906). For the general history of the Jews, but chiefly for the period after 70 A.D., the most comprehensive work is Graetz, *Geschichte der Juden von den ältesten Zeiten bis auf die Gegenwart* (11 vols., Berlin, 1854-75; abridged Eng. ed., 5 vols., Philadelphia, 1873), but Jost, *Geschichte der Israeliten seit der Zeit der Makkabäer bis auf unsere Zeit* (10 vols., Berlin, 1820-47), still possesses independent value. Other general histories are Heinrich Ewald, *Geschichte des Volkes Israel*, to the time of Bar Cochba (7 vols., 3d ed., Göttingen, 1864-78; Eng. trans., 5 vols., London, 1869-74), and H. H. Milman, *The History of the Jews* (rev. ed., 2 vols., New York, 1909). There are briefer histories by Geiger, Cassel, and Graetz. Useful compends are Lady Magnus, *Outlines of Jewish History* (Philadelphia, 1890), and Reinach, *Histoire des Israélites*, with bibliography (2d ed., Paris, 1902). The best sketches are by James Darmesteter, *Coup d'œil sur l'histoire du peuple juif* (Paris, 1881; Eng. trans. in *Selected Essays of James Darmesteter*, Boston, 1895), Dubnow, *Die jüdische Geschichte* (Berlin, 1898), and Philippson, *Neueste Geschichte des jüdischen Volkes* (ib., 1908). Consult also the Hebrew archæologies of Nowack and Benzinger (3d ed., Tübingen, 1907); A. P. Stanley, *Lectures on the History of the Jewish Church* (3 vols., London, 1864-76; 3 vols., New York, 1901-02); Goldziher, *Der Mythos bei den Hebräern* (Leipzig, 1876); Hommel, *Die Semiten und ihre Bedeutung für Kulturgeschichte* (ib., 1881); id., *Die vorsemitischen Kulturen in Aegypten und Babylonien* (ib., 1882); Renan, *Le judaisme comme race et comme religion* (Paris, 1883); Montefiore, *Lectures on the Origin and Growth of Religion as Illustrated by the Religion of the Ancient Hebrews*, Hibbert Lectures (London, 1893); Leroy Beaulieu, *Israël chez les nations* (2d ed., Paris, 1893; trans., New York, 1895); Edersheim, *History of the Jewish Nation* (London, 1896); Barton, *A Sketch of Semitic Origins* (New York, 1902); Schürer, *Geschichte des jüdischen Volkes in Zeitalter Jesu Christi* (4th ed., Leipzig, 1901-11; Eng. trans., 5 vols., New York, 1896); I. Abrahams, *Jewish Life in the Middle Ages* (London, 1896). For special periods and places the works are exceedingly numerous. The following may be mentioned: Wertheimer, *Geschichte der Juden in Oesterreich* (Leipzig, 1842); Lindo, *History of the Jews of Spain and Portugal* (London, 1848); Derenbourg, *Essai*

sur l'histoire et la géographie de la Palestine (Paris, 1867); Bédarride, *Les Juifs en France, en Italie et en Espagne* (3d ed., ib., 1867); Güdemann, *Geschichte des Erziehungswesens und der Cultur der abendländischen Juden* (5 vols., Vienna, 1873-91); Goldschmidt, *Geschichte der Juden in England*, part i (Berlin, 1886); Scherer, *Beiträge zur Geschichte des Judenrechtes im Mittelalter*, vol. i (Leipzig, 1901); Abbott, *Israel in Europe* (London, 1905). For the United States the publications of the American Jewish Historical Society (Baltimore, 1893 et seq.) may be consulted, and for Germany those of the Gesellschaft für die Geschichte der Juden in Deutschland (Berlin, 1886 et seq.). Anti-Semitism has produced a voluminous literature. A bibliography to 1885 will be found in Jacobs, *The Jewish Question* (London, 1885). The *Mitteilungen aus dem Vercin zur Abwehr des Antisemitismus* (weekly, Berlin, 1891 et seq.) is a contemporary history of the movement. Consult, for the anti-Jewish side: Rohling, *Der Talmudjude* (Münster, 1871); Heinrich Von Treitschke, *Ein Wort über unser Judentum* (2d ed., Berlin, 1880); Stöcker, *Das moderne Judentum* (ib., 1880); Von Hartmann, *Das Judentum in Gegenwart und Zukunft* (Leipzig, 1885); Drumont, *La France juive* (Paris, 1886); Burton, *The Jew, the Gypsy, and el-Islam* (New York, 1898). In defense of the Jews: Mommsen, *Auch ein Wort über unser Judentum* (Berlin, 1880); Franz Delitzsch, *Schachmatt den Blutlügen Rohling und Justus* (Erlangen, 1883); Lazan, *Contre l'antisémitisme* (Paris, 1896); Leroy-Beaulieu, *Les doctrines de haine* (ib., 1902). For Jewish literature, consult: Steinschneider, *Jewish Literature* (London, 1857); Zunz, *Die synagogale Poesie des Mittelalters* (Berlin, 1855-59), which combines with the treatment of the poetry a history of the cruelties of the Middle Ages; the other writings of Zunz are also of much value; Karpeles, *Geschichte der jüdischen Litteratur* (Berlin, 1886); id., *Jewish Literature and Other Essays* (Philadelphia, 1895); Deutsch, *The Talmud* (ib., 1895); Arsène Darmesteter, *The Talmud* (ib., 1897); Abrahams, *Chapters on Jewish Literature* (ib., 1899); Lazarus, *The Ethics of Judaism*, English translation by Henriette Szold (ib., 1900). The *American Jewish Year Book*, edited by Cyrus Adler (ib., 1899 et seq.), gives much valuable information, and the great *Jewish Encyclopædia* (12 vols., New York, 1901-06) is a comprehensive work.

JEWS, EXCHEQUER OF THE. In early English history the Jews did not form an integral part of the body politic, but constituted a special status, dependent directly upon the crown and subject to any restrictions and exactions the King might impose upon them. In 1194 proctors or judges were appointed to deal with cases in which Jews were concerned. In the thirteenth century these officials presided over the exchequer chamber set apart for Jewish revenue and accounts and were sometimes known as "justiciars deputed to the charge of the Jews," sometimes as "justiciars of the exchequer of the Jewry." In their judicial capacity these officials tried offenses in which non-Jews would have had to appear before the King's ordinary justices; they also decided civil suits between Jews, or between Jews on the one hand and Christians on the other. As fiscal officials, they presided over the exchequer chamber of the Jews and saw that all claims which the King

had against Jews, or arising out of transactions in which Jews were involved, were presented and enforced. They provided the sheriff of each county with lists of the sums which he was expected to collect from the Jews; they kept records of royal claims on the Jews and their debtors and administered property that came into the King's hands on account of the Jews. In the first instance the Jewish revenue was paid into the great exchequer, whence it was transferred to the exchequer of the Jews, to be kept until the King needed it. The institution disappeared with the expulsion of the Jews under Edward I.

JEW'S BURY, GERALDINE ENDSOR (1812-80). An English novelist. She was born at Measham, Derbyshire, and was the daughter of a Manchester merchant. She was left motherless at an early age and was educated by her sister Maria Jane (afterward Mrs. Fletcher), a popular author. An early acquaintance with Thomas Carlyle and his wife and other literary and artistic celebrities helped to develop her powers, and her first novel, *Zoe, the History of Two Lives* (1845), was the forerunner of a succession of works, which include: *The Half Sisters* (1848); *Marian Withers* (1851); *The History of an Adopted Child* (1852); *Angelo, or the Pine Forest in the Alps* (1855); *Constance Herbert* (1855); *The Sorrows of Gentility* (1856); *Right or Wrong* (1859).

JEW'S BURY, MARIA JANE (1800-33). An English author, born at Measham, Derbyshire, sister of the preceding. At the age of 18 she began to write poetry for the newspapers of Manchester, where she lived. Her first prose work, *Phantasmagoria, or Sketches of Life and Character*, was published in Leeds (1824). It was followed by *Letters to the Young* (1828); *Lays of Leisure Hours* (1829); *The Three Histories—of an Enthusiast, a Nonchalant, and a Realist* (1830). She married the Rev. William K. Fletcher (1832), chaplain to the East India Company, and died of cholera in a little more than a year after she had gone with him to India.

JEW'S-HARP (*Jew* + *harp*, in allusion to the use of the harp, as David's harp, among the Jews). A simple musical instrument, made of metal. It is held between the teeth, and the sound is produced by the inhaling and ejecting of the air from the lungs, while at the same time an elastic tongue or spring, which is fixed in the middle of the frame, is set into vibration by being twitched by the finger. It is an old invention, being mentioned by Prætorius in his *Organographia* (1619) under the name of *crembalum*.

JEW'S MALLOW. An annual potherb. See CORCHORUS.

JEW'S-THORN. A spiny Old World shrub which bears an edible fruit. See JUJUBE.

JEX-BLAKE, SOPHIA (1840-1912). An English physician, born at Brighton. She was a tutor in mathematics at Queen's College, London, in 1858-61. She then traveled in Europe and America, became interested in the medical education of women, and in 1866 began the study of medicine under Dr. Lucy Sewall in Boston. Returning to England in 1868, she matriculated in medicine at the University of Edinburgh in the following year, but was not permitted to finish the course, although she contested the action of the university authorities in the law courts. She was a leader in

opening the London School of Medicine for Women in 1874. Her own medical education she completed at the University of Bonn, receiving the degree of M.D. in 1877. At Edinburgh she opened a Dispensary for Women and Children in 1878, the Cottage Hospital in 1885, and in 1886 the Edinburgh School of Medicine for Women, of which she was dean until her retirement in 1899. She is author of *American Schools and Colleges* (1866); *Medical Women* (1872; 2d ed., 1886); *Care of Infants* (1884; 2d ed., 1903).

JEYPORE, jî-pōr'. Another spelling for the name of a native State of India, and its capital. See JAIPUR.

JEZ'EBEL (Heb. 'Izebel). The daughter of Ethbaal, King of Tyre, and wife of Ahab, King of Israel. Ahab's marriage with a Tyrian princess (1 Kings xvi. 31) was a political device to insure the alliance with Tyre. As a symbol of the alliance, a temple to Baal Melkart, the god of Tyre, seems to have been built. The worship of this god was probably very similar to the Baal cult that already flourished in Israel and not very different from the Yahwe cult as it was then practiced. To a later age the act of Ahab in marrying a "Canaanitish" woman appeared as a heinous offense, and accordingly both Ahab and Jezebel are represented in Kings and Chronicles in the most unfavorable light. In Ahab's reign a strong movement led by Elijah (q.v.) against the Baal cult set in, and Jezebel is represented as having been one of the strongest and bitterest opponents of Elijah. Hence the later biblical writers cannot find enough to say against her. She is represented as cruel, intent upon exterminating the prophets of Yahwe, and is made responsible for the murder of Naboth (q.v.). These charges can scarcely be regarded as borne out by the evidence when a careful textual and historical criticism has been applied. She survived her husband for 14 years and was murdered (2 Kings ix. 30-37) by Jehu (q.v.) at the time that he seized the throne of the northern kingdom (c.843 B.C.). Consult the histories of Israel, and Schmidt, "The Sins of Jezebel," in *Journal of Biblical Literature* (Boston, 1915). See AHAB.

JEZI'RAH (Heb. *sēfer yeširāh*), or BOOK OF CREATION. One of the chief cabalistic books of the Jews, containing a mystical account of the creation of the universe. See CABBALA.

JEZREEL, jēz'rē-ēl (Heb. *yizre'el*, God sows). A town of ancient Palestine in the territory of Issachar (Josh. xix. 18) (Map: Palestine, C 2). Near by was fought the battle in which Saul fell (1 Sam. xxix. 1 et seq.). The town contained a palace, which was the residence of Ahab and Jezebel (1 Kings xviii. 45-46; 2 Kings ix. 30). After their time it was deserted. In the time of Eusebius and Jerome it was known under the names Esdraela and Stradela, and in the history of the Crusades we meet with it as Parvum Gerinum. The modern Arabic name of the place is Zerín; it contains only slight ruins, of little interest.

JHANSI, jän'sē. The headquarters of a district of the same name, United Provinces, India, 60 miles northeast of the city of Gwalior (Map: India, D 4). It is surrounded by a wall from 18 to 30 feet high, 6 to 12 feet thick, and 4½ miles in circuit. The town is important as the central junction of four lines of the Indian Midland Railway system. It has manufactures of silk, rugs, and brassware. The large rail-

way shops employ more than 2000 hands. It is the centre for agricultural products of the district. Pop., 1901, 55,724; 1911, 70,208. The formidable fort on an elevated rock, commanding the city and surrounding country, belongs to the British government.—JHANSI NAOABAD, with the civil station and military cantonment (pop., 3000), adjoins the city and is the capital of the British District of Jhansi in the Allahabad division, Northwest Provinces. The European garrison was massacred during the mutiny of 1857, and Jhansi was only recovered the following year after a siege of 12 days and a large loss of life.

JHELAM, jē'lūm, or **JHELUM**. The ancient Hydaspes, the westernmost of the five rivers of the Punjab, India. Its source is at Vernag in Kashmir, 12 miles east of Shahabad, where it issues from an octagonal tank in a garden fed by springs from the Bunihal Pass in the Western Himalayas (Map: India, B 2). Its course is northwest past Islamabad and Srinagar to the Wulur Lake, whence it flows southwest through the Barambula Pass and again northwest to Mazufurabad. Here it bends directly southward and forms the boundary of Kashmir and the Punjab to Jhelam, where it assumes a southwesterly trend and, continuing past Jalalpur, Pind Dadan Khan, Bhera, Shahpur, and Shahiwal, joins the Chenab below Kadirpur after a course of 490 miles. It is navigable by river craft for the greater part of its course and abounds in fish. On its banks Alexander the Great built a war fleet and fought a battle with Porus. It is an important Himalayan example, in its pathway through Kashmir, of a wide and fertile plain made by a locally aggrading stream which has caused a vast deposit of alluvium and much meandering.

JHERING, yā'ring, HERMANN VON (1850–). A German naturalist in Brazil. A son of the jurist, Rudolf von Jhering, he was born in Kiel and was educated at Giessen, Leipzig, Berlin, and Göttingen. He was privatdocent at Erlangen and Leipzig until 1880, when he went to Brazil. There he became naturalist of the Museu Nacional in Rio de Janeiro and later director of the Museu Paulista in São Paulo. The name *Amphineura* and the grouping of the *Neomenia*, *Chaetoderma*, etc., under this name were due to him (1876), though he erroneously included them in a division of worms; and his work in zoölogy, paleontology, and anthropology has a particular value because of his knowledge of South America. He edited the *Revista do Museu Paulista* (1895 et seq.) and wrote: *Vergleichende Anatomie des Nervensystems und Phylogenie der Mollusken* (1877); *Rio Grande do Sul* (1885); *Anthropology of the State of São Paulo* (2d ed., 1906).

JHERING, RUDOLF VON (1818–92). A German legal scholar, born at Aurich, Hanover, and educated at Heidelberg, Munich, Göttingen, and Berlin. He became instructor at Berlin (1843) and professor at Basel (1845), Rostock (1846), Kiel (1849), Giessen (1852), Vienna (1868), and Göttingen (1872). He was made a noble by the Emperor of Austria in 1872. Trained in the historical school, Jhering forsook it for a philosophical method which aimed to show the psychological development of law by examples drawn from the national character of the Romans. This was in direct contravention to Savigny's method. Jhering's great work (unfinished), which brought him rank as one of the

foremost of nineteenth-century authorities on jurisprudence, was *Geist des römischen Rechts auf den verschiedenen Stufen seiner Entwicklung* (1852–65; 6th ed., 1907 et seq.; It. trans. by Bellavite). He published also: *Zivilrechtsfälle ohne Entscheidungen* (1847; 11th ed., 1909); *Die Jurisprudenz des täglichen Lebens* (1870; 13th ed., 1909; Eng. trans. by H. Goudy, *Law in Daily Life*, 1904); *Der Kampf ums Recht* (1872; 17th ed., 1910); *Der Zweck im Recht* (2 vols., 1877–83; 4th ed., 1904–05; Eng. trans. of vol. i by I. Husik, *Law as a Means to an End*, 1914); *Scherz und Ernst in der Jurisprudenz* (1885; 10th ed., 1909); and the posthumous *Entwicklungsgeschichte des römischen Rechts* (1894), and *Vorgeschichte der Indoeuropäer* (1894). With Karl Gerber he founded in 1856, and thereafter edited, the *Jahrbücher für die Dogmatik des heutigen römischen und deutschen Privatrechts*. Consult: A Merkel, *R. von Jhering* (Jena, 1893); E. Hurwicz, *Rudolf von Jhering und die deutsche Rechtswissenschaft* (Berlin, 1911), with bibliography; Gustav de Szászy-Schwarz, "Rudolf Jhering et son œuvre," in *Revue de Hongroie*, vol. xii (Budapest, 1913).

JIB (from Dan. *gibbe*, Swed. *gippa*, Dutch *gippen*, to turn suddenly, jibe). A triangular sail which is set on the *jib stay*, a rope extending from the jib boom or extremity of the bowsprit to the fore-topmast head. Nearly all sailing vessels larger than a catboat have jibs, the exceptions being mostly vessels with a lateen rig. The forward and upper side of a jib lies along the stay, to which it is secured by *hanks* or *travelers*, and is inclined to the horizon at an angle varying from 30 to 60 degrees. The after edge or leech is more nearly vertical, and the foot is almost horizontal. The jib serves to balance the effect of the after sails and keep the ship's head from coming up to the wind. The *jib boom* is a spar projecting from the bow of a vessel over which the jib is set. In large sailing ships the jib boom projects through a hole in the bowsprit cap, and its inner end or heel is secured on top of the bowsprit. Sometimes there is a *flying jib boom*, a light spar lying partly on the jib boom, to which it is secured, and projecting beyond it to give a lead to the flying jib and foreroyal stays. The *flying jib* is a sail similar to the jib, but smaller, and is set on the flying jib stay. The *jib foresail* is the forestaysail of a sloop. The *jib guy* is a rope giving lateral support to the jib boom. It leads from the head of the latter to the end of the whisker boom and then to the fore-castle rail. When two sails are set between the fore-topmast stay and jib stay, they are called *inner* and *outer jibs*.

The *jib netting* is a network with meshes 4 to 6 inches across, which is placed under the jib boom and seized to the whisker booms and jib guys. It serves to keep the jib from hanging down into the water when hauled down and is a safeguard to the men furling it in heavy weather. The *jib stay* is a rope forming part of the standard rigging of a ship and serves to set the jib upon. It leads from the fore-topmast head to a sheave or hole in the outer end of the jib boom, thence under a cleat on the dolphin striker and in to the bow. The *flying jib stay* is a rope similar to the jib stay, but leading from the fore-topgallant masthead to the end of the flying jib boom, thence to the dolphin striker and to the bow. The *jib topsail* is a light sail on

the topmast stay of a small schooner or sloop. See SAIL.

JIBE. To shift over a boom mainsail or spanker when the wind is aft, or nearly aft, so that the wind will fill it on the other side. When the sail is a large one, the sudden change of the wind pressure from one side to the other usually causes the vessel to heel over at a considerable angle, and if the operation is carelessly done in a strong breeze the vessel may capsize. The operation of wearing in a small fore-and-aft rigged vessel is usually called *jibing*, on account of the jibing of the mainsail. Jibing the spanker is of rare occurrence, as it is usually taken in when the wind is very far abaft the beam.

JIBO'A, or JIBO'YA. A native name in Brazil for a boa—more particularly, on the Amazon, the thick-necked boa. See BOA.

JICARILLA, hē'ká-rē'lyá. A tribe of Athapascan stock formerly occupying parts of Arizona and New Mexico. They were composed of two bands—the Llanero ranging east of the Rio Grande, the Ollero to the west. Both bands are now living on a reservation in northern New Mexico and number 694. They are generally considered a division of the Apache (q.v.), because of similarity in language, but have always been politically independent. Their culture bears some resemblance to that of the Plains Indians. Consult P. E. Goddard, "Jicarilla Apache Texts," in *American Museum of Natural History, Anthropological Papers*, vol. viii (New York, 1911), and id., *Indians of the Southwest*, in *American Museum of Natural History, "Handbook Series,"* No. 2 (ib., 1913). See INDIANS.

JICIN, yē'chēn. A town of Bohemia. See GITSCHIN.

JID'DAH, or JEDDAH (Ar. Juddah). The most important trading port on the Red Sea, situated on the coast of the Hejaz, Arabia, about 60 miles west of Mecca (Map: Turkey in Asia, D 7). It is a well-built, prosperous-looking walled city, with wide streets and fine buildings, the chief of which are the Governor's residence, the customhouse, the mosques, and the fort. The climate is exceedingly hot and the water supply defective. Jiddah was formerly the trading centre between Arabia and Africa, and its annual commerce amounted to about \$4,500,000, but now is less than one-quarter of that amount. The city is more important as a landing place for pilgrims to Mecca than a trading centre, though it is still the chief market for pearls, mother-of-pearl, black coral, coffee, balsam, aromatic herbs, horses and donkeys, and a depot for Oriental carpets and other goods. Two lines of steamers connect it with Suez, the Suez-Aden boats touch here, and consulates of most of the powers are maintained. More than 60,000 pilgrims pass through the city yearly, and outside the city is one of the holy places of the Moslem world, the tomb of Eve. During the Wahhabite wars Jiddah was taken by the Egyptians. Since 1840 it has belonged to Turkey. On June 15, 1858, Christian missionaries were murdered in the city, and a month later it was besieged for three days by an English man-of-war. The population is estimated at 30,000 and is exceedingly heterogeneous.

JIG, or GIGUE, zhêg (OF., Fr. gigue, jig, OSp., OIt. giga, fiddle, from MHG. gige, Ger. Geige, Icel. gígja, fiddle). The name of a short piece of music much in vogue in olden times,

of a joyful and lively character, and in $\frac{3}{8}$ or $\frac{3}{4}$, also in compound time ($\frac{6}{8}$, $\frac{9}{8}$, etc.); used formerly as a dance tune. It consists of two parts of eight bars each, and the shortest notes are quavers. When it became a regular part of the suite (q.v.), its dimensions were extended. It was customary to close all suites or partitas with a *gigue*. The dance is rapid and irregular, and, although originally a form of country-dance, has been modified by its introduction into various countries until scarcely anything of its early character remains.

JIG. A device for separating heavy minerals of an ore from the barren gangue rock, or for separating two or more minerals varying considerably in specific gravity. Hand jigs are used on small operations or by prospectors, and mechanical jigs for larger operations. The hand jig consists of a square box having a screen for the bottom; this box is suspended from a spring pole or lever in a larger box containing water; a charge of ore is shoveled into the suspended box, and an up-and-down or jiggling motion imparted to it through the spring pole. The heavy ore or mineral settles to the bottom, and lighter rock which rises to the surface is removed by hand. Mechanical jigs consist of a series of boxes or one long box separated into from three to six independent compartments by cross vertical partitions; each compartment is then divided into two sections by a longitudinal vertical partition which extends from the top of the box to a depth of about one-third of the height of the box; this longitudinal partition permits the passage of water between the two sections. One side of each compartment is then fitted with a fine screen or grating, and the other side is fitted with a plunger. The plunger is suspended by a steel rod, or support, from an eccentric which revolves around a central longitudinal shaft. Each compartment is then filled with water; sized ore is fed to the screen with a stream of water to wash the surface of the material to succeeding boxes; and the central shaft is then revolved, causing the plungers to move up and down, resulting in the water first being forced into the section containing the ore and then being sucked back. The crushed ore is raised en masse from the screen bottom by the force of the water, thereby permitting the heavy minerals to fall back to the screen in advance of the lighter ore or waste rock. This continued action of the plunger results in layers being formed of heavy minerals next to the screen and the lighter minerals and waste on the surface; the surface material is washed by the surface current of water to the second and succeeding compartments. The minerals which have settled are drawn from each compartment through an automatic gate. With lead-zinc sulphide ores in a siliceous gangue the first compartment will collect and discharge practically pure galena (lead sulphide), which is the heaviest mineral; the second compartment will discharge a middlings product consisting of galena attached to silica and galena attached to blende (zinc sulphide); the third compartment will discharge practically pure blende; the fourth compartment will discharge a middlings product of blende attached to silica; and the fifth compartment, a very low-grade middlings product. All of the middlings product must be re-crushed, sized, and re-treated. From the tail end of the compartments the waste rock is

washed away by the surface current of water. A small amount of water is fed constantly to the plunger side of each compartment. This type is known as the Hartz jig.

The size of each section or screen area varies greatly; usually it is 10 to 12 inches wide by 20 to 24 inches long; the Cooley jig, used in Joplin, Mo., is 18 to 24 inches wide by 24 to 36 inches long. The Hancock jig differs from the Hartz jig in that the screen forms the bottom of a movable box suspended in water which is raised and lowered mechanically by supports connected to an eccentric. The action of this jig is identical to that of the Hartz jig, gives very satisfactory results, and has a large capacity. Various types of jigs are manufactured, differing in methods of drawing off the products and in design of eccentric, but the principle of separation is the same in all types.

With heavy ores it is customary to feed nothing over about $\frac{1}{2}$ inch or under $\frac{1}{10}$ inch; there are a few exceptions to this. With coal mixed with slate the largest size is usually about $1\frac{1}{2}$ inches. The preliminary sizing for the most efficient work consists of separating into such sizes that the smallest grain of heavy material will settle with the same velocity as the largest grain of light mineral. In the separation of blende (zinc sulphide) from quartz gangue the most efficient results are obtained by sizing into the following products: coarse, $\frac{1}{2}$ to $\frac{1}{4}$ inch; medium, $\frac{1}{4}$ to $\frac{1}{8}$ inch; and fine size, $\frac{1}{8}$ to $1/16$ inch; the fine size is often fed to concentrating tables. See ORE DRESSING.

JIGGER, jĭg'ēr (corruption of *chigoe*, the native name), or RED BUG. See CHIGOE, 2.

JILL. See JACK AND JILL.

JIM CROW. A negro song (1835) introduced by T. D. Rice in Louisville, Ky., and at the Adelphi in London.

JIMÉNES, hê-mā'nās. See XIMÉNES.

JIMÉNES DE CISNEROS, FRANCISCO. See XIMÉNEZ DE CISNEROS, FRANCISCO.

JIMÉNES DE QUESEDA. See XIMÉNEZ DE QUESADA.

JIMÉNEZ DE RADA, dâ rā'dà, RODRIGO (c.1170-1247). A Spanish historian, born probably in Navarra. He was educated in Paris, entered the Franciscan Order, and became Archbishop of Toledo in 1208. Afterward he was made Cardinal. His contemporaries considered him the most scholarly cleric in the world. He wrote at the bidding of St. Ferdinand of Castile his *Historia Gothica* (so named by him, but more commonly called *Chronica Rerum Gestarum in Hispania*), which he himself translated into Castilian as the *Historia de los Godos* (c.1241). It covers the time from the invasion of the Goths to the year 1243 and was exceedingly influential in the world of letters.

JIM'MU TEN'NO (Sinico-Japanese, Jimmu the Emperor). The first ruler of Japan, and the reputed founder of the line of mikados that has continued to the present time, Yoshihito, the Mikado now (1915) on the throne, being the hundred and twenty-second or, according to some, the hundred and twenty-third. He was said to have been a descendant in the fifth degree of Ten-sho Dai-jin, or Amaterasu, the sun goddess. His reign is said to have begun in the year 660 B.C. and to have ended in 581 B.C., after having conquered all his enemies in the south and west and established his throne in Yamato, the central part of the main island

of Japan. There he married a lady named Hime-tatara-isuzu-himeno-mikoto, daughter of one of the rulers of the country. He is said to have died at the age of 137. His burial place is situated on an isolated hill on the northeast side of Mount Unebi in Yamato. His anniversary is February 11, when salutes are fired in his honor. The era of Jimmu Tenno is that from which the Japanese reckon. If he ever existed, he was probably one of the early—or perhaps the earliest—invaders of Japan, entering the country from the southwest.

JIMSON WEED. A weed of the nightshade family. See STRAMONIUM.

JINGAL, jĭn'gāl (Hind. *jangāl*, Marathi, *jejāl*, swivel gun). A long, heavy musket or small gun, using a ball weighing a quarter of a pound or more, formerly much used in China and Korea and still employed to some extent. It is supported when being aimed by an iron crutch pivoted about the middle of the barrel. It is usually breech-loading, and fitted to be charged by a separate brass chamber inserted into the bore and held in place by a wedge-shaped key.

JINGLE, ALFRED. See PICKWICK CLUB.

JINGLE SHELL. A species of *Anomia*, a bivalve shell related to the oyster, in which the upper valve is convex, smooth or rough, while the lower valve is concave, with a deep rounded notch in front of the cartilage process; the animal is anchored by a plug passing through the notch in the lower valve. It lives attached to oysters and other shells, and these are modified so as to acquire the irregular form of the surface on which they rest. One species lives on the coast of northeastern America; but the jingle shell proper is a larger golden-yellow species from the tropics.

JIN'GOISM (from *jingo*, perhaps a corruption of St. *Gingulphus*, or a corruption of Basque *Jinkoa*, *Jainkoa*, *Jeinkoa*, contracted from *Jaungoicoa*, *Jangoicoa*, lord of the high, God). A term coined from the ancient slang expression "by Jingo," owing to an incident of British politics in 1877, when England was undecided whether to interfere forcibly in the war between Russia and Turkey. The Liberals, led by Gladstone, were in favor of leaving Turkey to itself, while the Conservatives, under Lord Beaconsfield, the Premier, were determined to protect Turkey from Russia. During the winter of 1877-78 the excitement in London became intense, and wherever the fighting spirit prevailed it freely found vent in a doggerel first sung at a music hall:

"We don't want to fight, but by Jingo, if we do,
We've got the ships, we've got the men, we've got the
money too."

"Jingo!" shouted with a significant emphasis, was derisively cast as a nickname at the warlike party. The term, corresponding to "spread-eagleism" in America and *chauvinisme* in France, has ever since been applied to the warlike advocates of British Imperial sway and has been taken up with a similar meaning in the United States. Consult J. A. Hobson, *The Psychology of Jingoism* (London, 1901), and F. H. S. Escott, "The Analysis of Jingo," in the *Fortnightly Review*, vol. lxxvii (ib., 1902).

JINGO-KOGO, jĭn'gō-kō'gō (Sinico-Japanese, Jingo the Empress). A legendary ruler of Japan, named Okinaga-Tarashi-Hime, wife of Chuai Tenno, the fourteenth Mikado (191-200

A.D.). A rebellion having broken out in Kiushu, he set out to suppress it, accompanied by his wife, then with child. He died in camp, a fact which she suppressed, and, having appointed a general to continue the war there, she assumed the regency, assembled another great army, and fitted out a fleet to invade Korea. She led the expedition in person, and so formidable was the armada that the King of Shiraki became terror-stricken on its approach and immediately submitted, swearing to pay tribute to Japan forever. The kings of Kōma and Kudara also submitted on the same terms; and, laden with gifts and bringing many hostages, the warlike Regent returned after an absence of nearly three years to Japan and gave birth to a child, who afterward became Ojin Tenno, the fifteenth Mikado, and later was canonized as Hachiman, the god of war. As Regent, his mother ruled Japan until 270 A.D. She is worshiped to this day under the name of Kashi Dai Myojin. On her legendary conquest of Korea are based the traditional claims of Japan upon that country.

JINIGARÁN, hē'nē-gā-rān', or **GINIGARÁN**. A town of the Province of Negros Occidental, Philippines, situated on the west coast of the island of Negros, on the Guimras Strait, 29 miles south of Bacólod. Pop., 1903, 14,256.

JINN (Ar., from *janna*, to be veiled, be dark), often written **GENIL**. Supernatural beings of Arabic folklore and religion. Mohammed believed in their existence, and the seventy-second sura of the Koran is named after them. According to tradition, the Prophet recognized five orders of such creatures. They are both male and female; eat, drink, and propagate their kind, and die, though they generally live very long. Some are good, some bad; some are Mohammedans, some infidels. They were created 2000 years before Adam, of smokeless fire, and in the early time were ruled by a race of kings each named Solomon. Their home is the mountain called Kaf, supposed to encompass the earth; but they haunt all sorts of places, rivers, ruined buildings, ovens, baths, etc. They are in the sea, on land, and in the air. They assume what form they choose, and appear to men as dogs, cats, serpents, and in other animal forms, as human beings, and in the whirlwinds, dust clouds, and the like. They are the authors of many of the ills to which men are subject, but also confer benefits, and, in general, whatever the mind of the untutored cannot conceive of as done by human means is ascribed to them. It was they who built the pyramids. Solomon, son of David, acquired great power over them, and innumerable stories are told of the great things he accomplished with their help. They are identical with the spirits and demons that play so large a part in the religious literature of the Babylonians and Assyrians. Consult: Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898); Fossey, *La magie assyrienne* (Paris, 1902); and, for the Arabian demons, Lane, *Manners and Customs of the Modern Egyptians* (London, 1837); id., *The Thousand and One Nights*, notes (ib., 1838-40).

JINNISTAN. See **DJINNESTAN**.

JINRIKISHA, jīn-rīk'ē-shā (Sinico-Japanese, man-power vehicle). A light two-wheeled hooded carriage, much resembling a miniature hansom cab without the driver's seat at the back. It is drawn by a man, however, instead of a horse. Near the outer end of the shafts is

a crosspiece used by the runner in pulling the carriage. With a cord attached to the crossbar, one or two or more outrunners can assist when extra speed is needed or the burden is especially heavy, though ordinarily the jinrikisha is almost wholly a single or double passenger vehicle only. The *hiki*, or puller, is not usually troubled with very much clothing in summer time. He can go at a great pace for long distances, frequently from 30 to 40 miles a day, arriving at his destination apparently as fresh as when he started. An American Baptist missionary named Goble claimed the invention of the jinrikisha, in 1869; but Takayama Kosuka, of Tokyo, was the first to obtain government permission to run the new vehicles, early in the same year, and another Japanese improved the rude original by supplying springs and designing the hood or calash top, adding wheel guards. Then followed a period of lavish decoration. The change from the *kago*, or palanquin, was easily made, the bearers becoming pullers. At present the decoration is very simple, generally confined to the family crest or to a single symbol. The jinrikisha has been introduced into several Asiatic countries and in India is vulgarly called ricksha and has even found a place in literature. Useful applications of this vehicle have been made in the army.

JIRÁSEK, yě'rā-shěk, ALOIS (1851-). A popular Bohemian historical novelist and dramatist, born at Hronov. In 1888 he became professor in a Gymnasium at Prague. His numerous novels, covering Bohemian history from the earliest times, evince great faithfulness to historical truth. They include: *Nevolnice*, on the heathen period; a trilogy *Mezi proudy* (Between the Streams), on the times of Huss; and *Maryla* and *V eizích službách* (In the Foreign Service), dealing with the period after Huss. His collected works, including several dramas, were published at Prague (1899 et seq.).

JIREČEK, yě'rā-chěk, HERMENEGILD (1827-). A Bohemian writer on Slavic law, born at Hohenmauth (Vysoké Mýto) in Bohemia and educated at Prague. He became an official in the Department of Public Education when he was 27. His earliest literary activity was in the field of fiction, and he published a collection of tales, *Novely*, in 1853. His writings on Slavic history, law, and literature include: *Ueber Eigentumsverletzungen und deren Rechtsfolgen nach dem altböhmischem Rechte* (1855); *Die Echtheit der Königinhofer Handschrift* (1862), with his brother Josef, in which he defended the authenticity of a document now generally admitted to be spurious; in Bohemian, a work on Slavic law up to the thirteenth century (1863-73); a collection of Slavic folk laws (1880); *Codex Juris Bohemici* (1867-98); *Antiqua Boemiae Topographia Historica* (1892); and *Unser Reich vor 2000 Jahren* (1893), continued by *Unser Reich zur Zeit der Geburt Christi* (1896).

JIREČEK, JOSEF (1825-88). A Bohemian educator, scholar, and critic, brother of the preceding, born at Hohenmauth and educated at Prague. In 1871 he was made Minister of Public Instruction in Hohenwart's cabinet, from which he was forced by German opposition. A faithful subject of the Emperor, he entered the Austrian Reichsrat in 1879. His earlier literary work was mainly educational, including the valuable manual *Anthologie z literatury české* (1858-61). Besides his work in Old Czech gram-

mar, and an essay written together with his brother, Hermenegild Jireček, entitled *Die Echtheit der Königinhofer Handschrift* (1862), mention should be made of his valuable reprints from Bohemian literature, including works of Koldin (1876) and Dalimil's chronicles (1878); of the two histories of literature, general and encyclopædic, to the close of the eighteenth century, *Rukověť k dějinám literatury české* (1874-75), his most important work, and the other dealing with Bohemian hymnology, *Dějiny církevního básnictví českého* (1878); of an anthology (1858-61) and biographical dictionary (1875-76) of Czech literature; of his contributions to *Slovník naučný*, the Bohemian encyclopædia; and of his edition of the collected works of his father-in-law, Paul Safařík (q.v.). Consult Helfert, *Joseph Jireček* (Vienna, 1890).

JIREČEK, KONSTANTIN JOSEF (1854-). A Bohemian writer on Slavic history, son of Josef Jireček, who had married a daughter of Safařík. He was born in Vienna and was educated at Prague, was appointed docent of history at the University of Prague (1877), and after traveling in the South Slavic countries was made secretary (1879) and chief (1881) of the Bulgarian Ministry of Education. Having resigned, he became President of the Council of Public Instruction and director of the museum and library of Sofia. He returned to Prague in 1884, to teach universal history in the Bohemian University, and in 1893 was appointed professor of Slavic history at Vienna. In 1898 he was made a member of the Vienna Academy of Sciences. His works, mostly on the Balkan Slavs, include, among others: *Geschichte der Bulgaren* (1876; also in Czech and Russian); in Bulgarian, a bibliography of that literature (1872); *Die Heerstrasse von Belgrad nach Konstantinopel und die Balkanpässe* (1877); *Die Handelsstrassen und Bergwerke von Serbien und Bosnien im Mittelalter* (1879); in Czech, *Excursions in Bulgarien* (1880); *Das Fürstentum Bulgarien* (1891); *Die Romanen in den Städten Dalmatiens während des Mittelalters* (1901-04); *Geschichte der Serben*, vol. i (1911), the standard history of Servia. A bibliography of Jireček was published in the *Transactions of the Society of Sciences of Sofia* (1905).

JIRÓN, hê-rôn'. A town of the Department of Santander, Colombia, on the Río de Oro, 6 miles southwest of Bucaramanga. There are gold washings in the river. The surrounding region produces cacao, coffee, quinine, and tobacco. Its industries are the manufacture of hats and cigars, and it has trade in tobacco, hats, and cattle. It was founded in 1631. Pop., 1912, 5898.

JITOMIR, zhī-tō-mêr'. A city of Russia. See ZHITOMIR.

JIUJITSU. See WRESTLING.

JIVARO, hê-vä'rô. An important confederacy or group of tribes apparently constituting a distinct stock, scattered in the forests along the Marañon (Amazon), chiefly on the north or Ecuador side, about the confluence of the Pastaza and Santiago. They are a vigorous, wild, and warlike people, but at the same time honorable and faithful, and were never subjugated by the Incas (see QUICHUA), and only temporarily brought under the dominion of the Spaniards, whom they expelled in a general revolt in 1599. Their general appearance indicates muscular strength and activity and quick intelligence. They live in well-built wooden

houses, with platform beds instead of hammocks; cultivate corn, beans, and bananas, and weave cotton cloth. They use the blowgun, bow, lance, and shield, and wear their hair long and flowing, with headdresses of bright feathers. Their ordinary dress is a shirt without sleeves and a pair of short trousers, but in war they are stripped and painted. They are noted for preserving the dried heads of enemies slain in battle (see HEAD HUNTING) and for the practice of taking a strong emetic every morning as a preparation for the day's work. They have developed a system of signaling by means of large drums kept in every village, by which the approach and strength of an enemy can be made known, or the warriors called to battle. Consult Rivet, *Les indiens jibaros* (Paris, 1908), and Beuchat and Rivet, in *Anthropos*, vols. iv, v (Salzburg, 1909-10).

JO'AB (Heb. *Yō'ab*, Yahwe is father). Son of Zeruah and nephew of King David, as well as commander of David's army (2 Sam. ii. 13; 1 Chron. xi. 6). He performed valuable services for David, his chief achievements being the overthrow of the army of Saul's son, Ishbosheth, led by Abner (2 Sam. ii. 12-31), his wars against the Ammonites (xi; xii. 26-31), and his overthrow of the conspiracy of Absalom (chap. xviii). For killing Absalom contrary to orders David deposed him in favor of Amasa (2 Sam. xix. 14), and soon after he treacherously slew his rival (xx. 8-10). At the close of David's life Joab joined Adonijah in his attempt to secure the succession to the throne and was executed by Solomon's order after David's death (1 Kings ii. 28-34).

JOACHIM, yō'ä-kêm, JOSEPH (1831-1907). A distinguished Hungarian violinist. He was born at Kittsee, near Pressburg, Hungary, of Jewish parents. His father was engaged in commercial pursuits, but discovered his son's musical proclivities, and at the age of five years placed him under Szervaczinsky, the celebrated concert master of Budapest. After two years' study he made his first public appearance, playing duets with his master, after which he studied under Böhm at Vienna. In 1841 he was a pupil at the Vienna Conservatory, studying counterpoint under Hauptmann, and in 1843, when only 12 years of age, distinguished himself at a concert of Madame Viardot-Garcia in Leipzig. In the spring of 1844 he visited England, where he was enthusiastically received, returning to Leipzig in November of the same year to play at one of the Gewandhaus concerts. Adopting the advice of his friends David and Mendelssohn, he determined to continue his studies at Leipzig. He made visits to England at intervals until 1862, after which his appearance in London became an annual event. He was appointed concert master in 1849 of the orchestra at Weimar during the régime of Liszt, whose views were so diametrically opposed to his own ideals that a disagreement was inevitable. He left Weimar in 1854 to accept the post of concert conductor and solo violinist at the court of Hanover, where he married Amalie Weiss, a well-known contralto singer. In 1868 he was appointed head of the Hochschule für ausübende Tonkunst. His most important work is the Hungarian Concerto in D minor. His other compositions include overtures and incidental music to various plays; several marches and trios; ballads, and various forms of chamber music. His most salient characteristics as a player are reflected in the gen-

eral character of his written work, which is marked by sincerity, depth, and tenderness. It was as a quartet player, however, that his intellectual superiority over contemporary violinists was most marked; his quartet party, consisting of himself, as first violin, De Ahna, second violin, Hausmann, 'cello, and Wirth, viola, have never been excelled. As a soloist, he earned for himself the title of king of violinists. He was known as the greatest master of style, repose, and tone of his day. Consult: A. Moser, *Joseph Joachim* (Berlin, 1904); J. A. Fuller-Maitland, *J. Joachim* (London, 1905); *Letters from and to Joseph Joachim*, selected and translated by Nora Bickley (ib., 1914).

JOACHIM, ORDER OF SAINT. A secular order founded in 1755 by the Duke of Saxe-Coburg-Saalfeld and other nobles and originally called the Order of Jonathan. The device of the order was: *Deo, Principi, Legi*. Its objects were benevolent. It had three classes, and its membership was restricted to the nobility. The order disappeared about 1840.

JOACHIM FREDERICK (1546-1608). A German bishop and Elector of Brandenburg, son of the Elector John George. He was made Bishop of Brandenburg and Havelberg, and Archbishop of Magdeburg. In 1570 he married and so forfeited his archiepiscopal seat in the German Diet. In 1598 he succeeded to the electorate and made his son, Christian William, Bishop of Magdeburg. He founded the Joachimsthal Gymnasium of Berlin.

JOACHIM (jō'ā-kīm) **OF FLO'RIS** (c.1145-c.1202). A monk of the twelfth century, revered as a prophet by many in his own time and for two centuries later. He was born at Celico, near Cosenza, Calabria, about 1145, became a Cistercian monk, and in 1177 is mentioned as abbot of Coraca. After some years he resigned and betook himself to the wilderness near Cosenza for study. There he founded a monastery, San Giovanni in Fiore, 25 miles east of Cosenza, and a new order (Ordo Florensis). His order was absorbed by the Cistercians in 1505. Joachim divided all time into three dispensations: (1) that of the Father from the creation to the birth of Christ; (2) that of the Son, from the birth of Christ to 1260; (3) that of the Spirit, from 1260 to the end. His three principal writings are: *Liber Concordiæ Novi ac Veteris Testamenti* (printed at Venice, 1519); *Psalterium Decem Chordarum* (1527); *Expositio Apocalypsis* (1527). Some of his opinions concerning the Trinity were condemned by the Lateran Council of 1215. In 1254 a Minorite, Gherardino, of Borgo, San Donnino, who considered Joachim's works inspired, brought them out with an introduction, in which he described them as the "Everlasting Gospel" (*Evangelium æterne*). He made a sensation and led to their condemnation by the University of Paris on 31 propositions taken from his introduction and the writings of Joachim. Pope Alexander IV in 1255 examined by commission these alleged heretical statements, with the result that Gherardino was censured, but Joachim was not.

Bibliography. The earliest lives extant are published by the Bollandists in *Acta Sanctorum* (Antwerp, 1643-86). Consult: Xavier Roussetat, *Etude d'histoire religieuse aux 12e et 13e siècles, Joachim de Florcs, Jean de Parma et la doctrine de l'évangile éternel* (2d ed., Paris, 1867); Döllinger, *Fables Respecting the Popes of the Middle Ages* (Eng. trans., New York,

1872); Schneider, *Joachim und die Apokalyptiker des Mittelalters* (Dillingen, 1873); Wilhelm Preger, "Das Evangelium Æternum und Joachim von Floris," in *Munich Akademie der Wissenschaften, historische Classe, Abhandlungen*, vol. xii (Munich, 1874); Haupt, *Zur Geschichte des Joachimismus* (Gotha, 1885); J. E. Renan, "Joachim de Flore et l'évangile éternel," in his *Nouvelles études d'histoire religieuse* (Paris, 1899); P. E. L. Fournier, *Etudes sur Joachim de Flore* (ib., 1909).

JOACHIMSTHAL, yō'ā-kēms-tāl'. An ancient town in Bohemia, Austria, situated in the Erzgebirge at an elevation of 2365 feet, 12 miles north of Karlsbad (Map: Austria, C 1). It has a fine modern church and a sixteenth-century Rathaus with a library. In ancient times Joachimsthal was famous for its silver mines, and the Joachimsthaler, coined from native silver by the counts of Schlick after 1517, had a very wide circulation. The name was subsequently abbreviated to the modern German thaler. (See DOLLAR.) The present silver output is only nominal. Uranium is worked in quantities (there is a plant for its commercial production), also bismuth and nickel. The government has bought the pitchblende mines here and produces radium. A tobacco factory employs 1200 hands; there are manufactures of gloves, paper, lace, corks, and dolls. Pop., 1900 (commune), 7378; 1910, about 8000.

JOAN, jō-ān' or jōn, POPE. The name of a supposed female occupant of the papal chair following Leo IV (died 855) and preceding Benedict III (died 858). The story represents her as born in Germany of English parentage. Assuming the dress and character of a man, she went to Athens and thence to Rome, where, under the name of Johannes Anglicus (John of England), she is alleged to have gained distinction as a scholar, entered holy orders, and risen through various gradations to the papal sovereignty itself. The story goes on that she was seized with the pains of childbirth on the occasion of a public procession and died in delivery. The legend takes various forms in different writers. The story of a female pope is told by a French Dominican, Steven of Bourbon (died c.1261), in his work upon the *Seven Gifts of the Holy Spirit*. He is thought to have copied from an earlier Dominican, John of Mailly. A third Dominican, Martin Polonus or Martin of Troppau (died 1278), helped to spread the story. Its unhistoric character was first shown by the French Calvinist David Blondel, *Eclaircissement de la question si une femme a été assise au siège papal de Rome* (Amsterdam, 1647); *De Joanna Papissa* (ib., 1657), and is now universally admitted. It probably grew up from the survivals of local folk tales and the explanations of certain antiquities and Roman customs. Consult: Friedrich Spanheim, *Histoire de la papesse Jeanne* (2 vols., The Hague, 1736); Alexander Cocke, *Present for a Papist; or, The History of the Life of Pope Joan* (London, 1740); Wensing, *Over de Pansin Johanna* (The Hague, 1845); Döllinger, *Fables Respecting the Popes of the Middle Ages* (Eng. trans., New York, 1872); E. D. Rhoides, *Pope Joan* (Eng. trans., London, 1886).

JOAN'NA (1479-1554). Queen of Castile. She was the second daughter of Ferdinand the Catholic of Aragon and Isabella of Castile. She married Philip, son of Emperor Maximilian I, and by the death of her brother and her elder

sister and the latter's infant son she became heiress to the crowns of Castile and Aragon. On the death of Isabella, in 1504, Joanna succeeded as Queen of Castile, but, as she was partially insane, she did not actually rule. On the death of her husband (1506) she became wholly insane and passed the rest of her life in the castle of Tordesillas. Her son Charles became King of Spain in 1516 and Holy Roman Emperor, as Charles V, in 1519. Her younger son, Ferdinand, became Roman Emperor in 1556. Consult W. H. Prescott, *History of Ferdinand and Isabella* (many editions).

JOANNA I (c.1327-82). Queen of Naples from 1343 to 1382, Queen of Sicily after 1356, and Countess of Provence. She was the daughter of Charles, Duke of Calabria, and of Marie of Valois, and became Queen on the death of her grandfather, Robert the Wise. She was already married to her cousin Andrew, brother of Louis the Great, King of Hungary. This marriage had been made when they were mere children, in order to conciliate the rival claims to the throne of the two branches of the house of Anjou. By the will of Robert Joanna was proclaimed his heiress; Andrew was to be only Coregent and Duke of Calabria. Moreover, Joanna was to become Queen only when 25 years of age. This will was unsatisfactory to all parties. Joanna succeeded in having herself crowned at once by the authority of the Pope; by the influence of Louis the Great Andrew was also crowned. In 1345 the latter was murdered by conspirators, who, it was generally believed, were instigated by Joanna. Louis of Hungary declared war to avenge his brother's murder. In 1347 Joanna married Louis of Taranto, but both were soon driven out by Louis the Great, who captured Naples and had himself crowned King. He was soon compelled to return home, as his army was decimated by the plague. In the meantime Joanna and her husband had taken refuge with the Pope at Avignon. They secured money by selling to the latter Avignon, which was a fief held by Joanna. They returned to Naples and drove out the Hungarian garrisons. Louis the Great made another expedition in which he was at first successful. Then he met with reverses which led to a treaty suspending hostilities on condition that Joanna should be tried for the murder of Andrew and if found guilty should forfeit the kingdom to Louis. She was adjudged innocent in 1352 by the papal court, and she and Louis of Taranto were crowned. The latter died in 1362, and Joanna married, about a year later, James of Aragon, titular King of Majorca. She allowed him no share in the government, and he spent his life in quest of adventure, generally outside the Kingdom of Naples. After he died, in 1375, Joanna married Otho of Brunswick, who received the title of Prince of Tarantó. When Urban VI and Clement VII were elected to the papacy by the rival factions of cardinals (1378), Joanna favored the latter. Urban thereupon crowned Charles of Durazzo King of Naples, which he claimed to control as a papal fief. Charles, who was a cousin of Joanna, had been named by her as her successor before her last marriage. Later she had changed her will and named as her heir Louis of Anjou, brother of Charles V, King of France. Charles of Durazzo, with the aid of the Pope and of Louis the Great, succeeded in capturing Joanna and had her put to death, May 22, 1382. She had two children

who died in infancy. Joanna was a wise ruler, capable and generous. Her court was renowned for its magnificence. Consult: Battaglia, *Giovanna prima, regina di Napoli* (Padua, 1835); Baddeley, *Queen Joanna I of Naples, Sicily, and Jerusalem* (London, 1893); Scarpetta, *Giovanna I di Napoli* (Naples, 1903); Francesca M. Steele, *The Beautiful Queen Joanna I of Naples* (London, 1910).

JOANNA II (1371-1435). Queen of Naples from 1414 to 1435. She was a daughter of Charles III of Durazzo and was the successor of her brother Ladislas. Her first husband was William of Austria, her second James of Bourbon, Count of La Marche. She was of a very dissolute character, and her government was disturbed by constant feuds and insurrections. Her second husband at one time imprisoned her, only to be himself finally driven from the country. Louis of Anjou sought to deprive Joanna of the throne of Naples, but she called to her aid Alfonso V of Aragon and adopted him. Soon, however, she tired of Alfonso and used the powerful house of Anjou thereafter as a counterpoise to the claims of Aragon. Consult Crivelli, *Della prima e secunda Giovanna, regine di Napoli* (Padua, 1830).

JOANNE, zhō'án', PAUL BÉNIGNE (1847-). A French geographer, born in Paris. He studied at the lyceums of Saint-Louis and Louis-le-Grand, but after being admitted to the bar he left the law to become assistant and successor to his father, who was editor of the *Guides Joanne* for the Hachette Library. His own greatest achievement is the *Dictionnaire géographique et administratif de la France et de ses colonies* (7 vols., 1889-1905).

JOANNES, jō-ān'nēz, ISLAND OF. See MARAJÓ.

JOAN (jōn or jō-ān') **OF ARC** (Fr. *Jeanne d'Arc*), THE MAID OF ORLÉANS (c.1412-31). She was born between 1410 and 1412, in the village of Domremy, near Vaucouleurs, France. She was the daughter of well-to-do peasants and was taught the duties of a girl in her station. When about 13 years of age, she believed that she heard an angel's voice, saying, "I come from God to help thee to live a good and holy life. Be good, Jeannette, and God will aid thee." Gradually "the voices" talked to her more frequently, and she believed them to belong to St. Michael, St. Catharine, and St. Margaret. St. Michael gave to her directions which finally became very definite: "Daughter of God, thou shalt lead the Dauphin to Rheims, that he may there receive worthily his anointing." For four years the "voices" continued to speak to Joan, and the condition of France in the meanwhile became more and more desperate. Henry VI of England had been crowned, at Paris, King of France (1422). The Regent, the Duke of Bedford, was victorious almost everywhere. The Dauphin, Charles VII, weak and vacillating, held little territory and was called in derision, by the English and the Burgundians, "the King of Bourges." Towards the close of 1428 the English laid siege to Orléans, and, although the city was well garrisoned, its defenders finally lost heart and at the beginning of 1429 the place seemed destined soon to be captured. Joan's "voices" had become more distinct and more imperative, until finally she obeyed, and sought the French commander at Vaucouleurs. Her story was at first rejected as that of one insane, but she went a second time and suc-

ceeded in getting an escort to Charles VII, to whom she rode in male attire (February, 1429). By his command Joan was admitted to an examination by learned theologians, from which she emerged triumphant. The Dauphin thereupon resolved to employ her. A suit of armor was prepared for her, and she had a white banner made, representing God blessing the fleurs-de-lis. This she herself carried into the front of every battle.

In April preparations were being made to send a convoy with provisions to Orléans. Joan led the troops, and on April 29, 1429, reached the city, still closely besieged by the English. From May 4 to 8 she made successful sallies upon the English, which resulted in their being compelled to raise the siege. Joan was wounded, but not severely. From this time she was known as "the Maid of Orléans." The national ardor of the French was rekindled to the utmost, and Joan became the dread of the previously triumphant English. Between June 12 and 18 the French won notable victories under Joan's leadership. By her own people she was beloved and revered as God's agent; by the English she was believed to be a witch. After some delays she persuaded the Dauphin to allow himself to be conducted to Rheims, where he was crowned (July 17, 1429). From this time her fortune changed, and she failed in several undertakings, notably the capture of Paris. The popular explanation of her failure was that she had broken her sword. It was one which she had miraculously discovered at Fierbois. One day, the story goes, she struck with the flat of this sword some common women whom she found in the camp. The sword broke, and the pieces could not be welded together. Joan took part in many conflicts, until, on May 23, 1430, she succeeded in entering with a few troops into Compiègne, which Burgundian forces were besieging. On the same day, in a sally which she led from the town, she became isolated from her followers and was taken prisoner. Her captors sold her, six months later, to the English. She was taken to Rouen and confined in chains. She was urged to put on female attire, but refused, because she was forbidden by her "voices." Wearing men's clothes and cutting off her hair were two of the main charges against her when she was brought before the Inquisition. She was tried in the ecclesiastical court, as a sorceress, by the Bishop of Beauvais, assisted by members of the University of Paris, which was under English control, and a specially delegated inquisitor. The trial dragged on for months, and Joan faced her judges boldly. One of the judges disguised himself and, pretending to be a fellow-prisoner, won her confidence and secured a great deal of information about "the voices," which was used in the trial. She was threatened with torture to no effect. Finally, on 12 charges which were drawn up by the judges, she was condemned to be burned to death, but she recanted her alleged errors and expressed penitence. Her punishment was then commuted by the ecclesiastical authorities into perpetual imprisonment. The English, however, felt it necessary to have Joan put to death. The events of the next few days are obscure; but it is certain that Joan again put on the male attire which she had abjured. The resumption of these garments and expressions of regret for her recantation were made grounds for concluding that she had relapsed. She was con-

demned and burned at the stake (May 30, 1431).

After the execution attempts were made to blacken her character in the popular French opinion, but with little success. Her family, by King Charles's influence, obtained in 1450 a revision of her trial, and in 1455 she was formally pronounced to have been innocent.

The memory of the Maid of Orléans during the centuries succeeding the Hundred Years' War never probably enjoyed that general reverence among the French people which her services to her country would seem to have merited. Voltaire's *La Pucelle* expresses the views of the eighteenth-century philosophers regarding the Maid. In the nineteenth century, however, her fame underwent rehabilitation. In 1875 the question of her canonization came up before the Roman Curia, and she was beatified by Pius X, the reigning Pope, April 11, 1909. In literature the character of Joan of Arc has been variously treated. Shakespeare's *Henry VI* reflects the contemporary English opinion, which regarded Joan as a sorceress in league with the devil. In Schiller's beautiful *Jungfrau von Orléans* she is depicted, on the contrary, as a virgin mystic, who, in fulfillment of her heaven-appointed mission, spurns all earthly love and dies in the moment of victory with the banner of the Christ child in her arms.

JO'ASH, or **JEHO'ASH** (Heb. *Yehōāsh*).
1. King of Judah, son of Ahaziah (c.836-796 B.C.). On the death of Ahaziah, Athaliah, his mother, massacred all the royal children except Joash, an infant of one year, who was saved by his aunt, Jehosheba, and kept in hiding by her for six years, during which time Athaliah governed the land (2 Kings xi. 1-3). In the seventh year Joash, by the help of Jehoiada, the high priest, was put upon the throne (2 Kings xi. 4-16). Joash reigned 40 years (2 Kings xii. 1). We know but little of his long reign. The most noteworthy event recorded was his conflict with Hazael, King of Syria (2 Kings xii. 18-19). Joash was murdered by his servants (2 Kings xii. 20-21) and was succeeded by his son Amaziah. It has been suggested that the assassination of the King may have been an act of private vengeance for his murder of Zechariah, the son of Jehoiada the priest (2 Chron. xxiv. 21). The references to religious conditions under Joash in Kings and Chronicles, where the King is represented as instituting religious reforms at the beginning of his reign and reverting to "idolatry" subsequently, are believed by some not to rest upon genuine tradition. 2. King of Israel, son and successor of

Jehoahaz (c.797-782 B.C.). He was one of the most warlike kings of the north (2 Kings xiii. 12, 25), and during his reign of 17 years (2 Kings xiii. 1) he brought the Kingdom of Judah to a position of vassalage. His victory over Amaziah was followed by his breaking down of the wall of Jerusalem (2 Kings xiv. 9-14).

JOB (Heb. *Iyyōb*). The hero of the Book of Job, which in the Jewish canon follows the Psalter and Proverbs in the third division of the Old Testament, known as *Kethubhim* or *Hagiographa*. The Book of Job in its present form belongs to that part of ancient Jewish literature which is commonly designated Wisdom Literature, and which, including such books as Proverbs, Ecclesiastes, Ecclesiasticus, and the Wisdom of Solomon, is didactic in purpose and concerned with discussions or considerations of the problems of life. In the Book of Job the problem is the cause of suffering. As a setting for the philosophical discussions on this problem, the following situation is set forth. A pious man by the name of Job, whose home is in the land of Uz and who is blessed with wealth and children, is put to a severe test by God at the instance of Satan, who raises the suspicion that Job's piety is connected with his prosperity. Job is deprived of his possessions and of his children, but remains pious and God-fearing. Satan, not yet satisfied, proposes as a severer test striking Job with a painful and loathsome disease. Job endures in silence and resignation, resisting the temptation suggested by his wife to "curse God" and make an end of his sufferings. Three friends come to visit him—Eliphaz the Temanite, Bildad the Shuhite, and Zophar the Naamathite (chaps. i-ii, containing the prologue). There now begins a series of discourses (iii-xxxi) between Job and his three friends, Job bewailing his sufferings and declaring that he does not merit the punishment heaped upon him, his friends answering in turn and trying to prove, each in his way, that suffering is due to guilt. There are three cycles of speeches and replies. Following Job's lament in chapter iii, the first of these cycles occupies chapters iv-xiv, the second xv-xxi, and the third xxii-xxxi. Chapters xxxii-xxxvii introduce a fourth personage, Elihu, who endeavors to convince Job of his error in questioning the justice of divine government. In xxxviii-xlii. 6 Yahwe Himself is brought in as the speaker, rebuking Job for his presumption in attempting to fathom the secrets of God and demonstrating the limitations of human power. Job in reply confesses his ignorance and his error in giving utterance to words without insight. The book closes (xlii. 7-17) with an epilogue in which the three friends are rebuked by Yahwe; they are ordered to bring an offering of seven bullocks and seven rams in the presence of Job, who is to intercede with Yahwe on their behalf. As for Job, his property is restored to him and increased two-fold, and seven sons and three daughters are born to him: he dies happy and full of years.

There are two features of the book that strike one at the first glance: (1) that the story of Job has nothing to do with the religious problem that forms the kernel of the book; (2) that the close of the story, in which Job is justified and rewarded, hardly accords with the light in which he appears in the course of the discussion of the problem. It is probable that chapters i, ii, xlii. 7-17, represent what has survived of a popular story, written in prose, in which a pious

man endured severe tests without ever losing his patience or sincere resignation to the divine will. This attitude he apparently maintained throughout in the prose story, in speeches now lost, since Yahwe refers to him (xlii. 7) as having spoken the right thing concerning Him, while the friends so utterly failed to say the right thing that Yahwe is angry with them, and their lives are in danger and can be saved only through Job's intercession. Job is then rewarded for his steadfastness and unswerving piety. The moral was that a just man may suffer as though he were unjust incidentally, as a trial of his loyalty, but that before the end comes he will, if truly righteous, be restored to prosperity and rewarded in addition for the sufferings he has endured. It may be supposed that this folk story fell into the hands of a great poet, who substituted for the speeches of Job and his friends the series of poetic dialogues in which he considers, in a highly artistic and profoundly thoughtful manner, the question whether the suffering that man endures is in all cases due to his own guilt, or, in other words, whether God, the author of everything, acts according to recognized standards of justice. That He does so is the ordinary view of religious people represented by the three friends. Job, acknowledged to be a good and pious man, seems to prove the contrary; and the arguments against the conventional views come therefore with great force from his mouth. Incidentally a second question is raised and by implication answered: Is the popular story correct in assuming that a pious man will endure suffering that he considers unjust in silence and resignation? The discourses of Job in which he curses the day of his birth (iii), declares that his sufferings are out of all proportion to any possible wrongs that he may have committed (vi), takes a most gloomy view of human life (vii), bitterly accuses God of not acting fairly, of not permitting one to plead his case (ix), boldly asserts that he is in the right, and that no one can answer the arguments he presents (xiii), and charges God with persecuting him (xiii. 20-22; xvi; xix. 22)—show that even a truly righteous person, for such Job is assumed to be, may in the agony of his soul cry out in protest against what he deems an undeserved fate. It is particularly noteworthy that the poet puts upon the lips of Job a protest against the kind of apologetics that is nothing but special pleading, partisan advocacy, implying suppression of the truth and affirmation of what is obviously false, in the supposed interest of God (xiii. 7, 8), and a confident assertion that a bold, sincere, and manly scrutiny of the facts is more welcome on high than the hypocrisy that dares not raise its voice except in terms of flattery. The author, indeed, seems to raise the question as to the seat of authority, Eliphaz making his appeal to revelation and inspiration, Bildad to tradition, and Zophar to the majority, while Job appeals to the facts and to his private judgment. Having rejected the theory of the friends that adversity is an unfailing sign of divine anger, provoked by human sin, and prosperity a sign of divine favor, rewarding human righteousness, Job is forced to face the problem of God's nature, a problem which does not exist to the friends, and makes his appeal from a God who may inspire fear, but not respect, to a God in whom power and wisdom wait on justice and love—a great Avenger who will vindicate his

character, even though to a mistaken human judgment death may set upon it the final stamp of guilt (xix. 26 ff.). The friends never mention the possibility of a squaring of accounts in a future life; Job refers to this "hope of man" most sympathetically where he pictures himself as waiting on his sentinel's post in the nether world until God should call him back to life, filled with longing for the work of his hands (xiv. 13 ff.), but only to reject it as a fancy and without ever allowing it to influence his argument.

The Book of Job in the new form, it may well be supposed, would have been offensive to religious circles. This appears indeed to have been the case; and, as a consequence, a number of interpolations were made in the speeches of Job, calculated to remove their sting, just as in the Book of Ecclesiastes words and phrases are added here and there which give a different turn to the thought. That the entire book was not rejected was due to the weight attached to the speeches of the three friends. Here were three men noted for their wisdom—friends, moreover, of Job—who all agreed that God was just and that Job was wrong in questioning the divine justice. Three against one represents a powerful majority. Moreover, their arguments seemed forcible. Eliphaz is certainly right in declaring (v) that no mortal is righteous before God; nor can any one gainsay Bildad when he declares (viii) that we are not wiser in penetrating the divine will than our ancestors were; and Job himself declares his acquiescence in Zophar's panegyric on divine wisdom (xi), which is so far superior to human knowledge and power. It might easily seem, therefore, despite the cruel charges brought by the friends against Job that he must have committed some awful crime, that Job's charges against God were not justified, and merited the rebuke they received at the hands of his friends. All, therefore, that was needed to make the Book of Job acceptable and teach just the contrary lesson that God was just and that Job deserved the test, was to take the edge off some of Job's utterances. This was not difficult, for even in the boldest passages of the book the expression is somewhat veiled.

It must not be supposed that the Book of Job as we have it was produced "at one sitting," as it were; it is a growth, and the very popularity which it appears to have enjoyed was a factor in accounting for modifications to which it was submitted. The introduction of Elihu is an illustration of the thesis regarding the gradual formation of the present book. There is no reference to Elihu in the prologue. His speeches are not essential either to the story or to the moral of the book. They are simply a reiteration of the whole problem—the reason and object of suffering, the righteousness of God, the value of faith, and the beneficence of divine government. How and when the speeches of Elihu came to be united with the Book of Job are questions in regard to which scholars have not yet reached general agreement. It is plausible to suppose that the Book of Job found imitators. The problem was attractive, and other writers tried their hand at presenting the arguments in favor of the current religious attitude. The speeches of Elihu impress one in this way as another Book of Job in epitome. Lastly, the speeches of Yahwe (xxxviii–xlii. 6), forming a separate part, while they do not offer a solution of the problem of suffering, still reinforce the

attitude of the pious—that man, not having been present at creation and not being admitted into the counsels of the Almighty, dare not and must not question divine justice. These speeches again add nothing to the situation nor to the moral; but they add another witness against Job, and so powerful a one that Job must needs confess his error. The introduction of Yahwe, who severely rebukes Job, contradicts the epilogue in which Yahwe turns with favor to Job and rebukes Job's friends, although the latter have all throughout pleaded Yahwe's cause. The speeches of Yahwe out of the storm are likely to have taken the place of some words of Yahwe in the prose story of a different tenor which the author of our present dialogues did not care to change. That Job's confession of his error is a later addition seems to be evident from xxxi. 40, where it is said, "Here end the words of Job."

The Book of Job in its present form is probably postexilic, and the tendency at present among scholars is to bring the date down towards the third century B.C. One reason for the favor which the book attained in pious circles was the similarity between Job and Israel which naturally suggested itself. Job's sufferings typified Israel's fate. His resignation in the popular story served as an example to the postexilic Jewish community to endure in faith and patience, while the justification of Job by Yahwe Himself is one form of the presentation of the problem, and his restored happiness and prosperity were interpreted as an assurance of the glory that was destined to be again Israel's lot.

Bibliography. Consult the Old Testament introductions, and the commentaries of Ewald, Delitzsch, Dillmann, Duhm, Merx, Hitzig, Davidson, Budde, Siefried, Zöckler; also Budde, *Beiträge zur Kritik des Buches Hiob* (Bonn, 1876). On the text, consult: Bicknell, "Kritische Bearbeitung des Job-Dialogs," in *Wiener Zeitschrift für die Kunde des Morgenlandes* (Vienna, 1892–93); id., *Das Buch Hiob nach Anleitung der Strophik und der Septuaginta* (ib., 1894). On the growth and purport, consult: Renan, *Le livre de Job* (Paris, 1859); Green, *The Argument of the Book of Job Unfolded* (New York, 1873); Fairbairn, "The Problem of Job," in *The City of God* (London, 1886); Cheyne, *Job and Solomon* (ib., 1887); Bradley, *Lectures on the Book of Job* (Oxford, 1887); Meinhold, "Das Problem des Buches Hiob," in *Neue Jahrbücher für deutsche Theologie* (Bonn, 1892); Laue, *Die Composition des Buches Hiob* (1896); Castelli, *Il poema Semitico del Pessimismo* (Milan, 1897); Schmidt, *The Messages of the Poets* (New York, 1911), where an extensive bibliography is also given; Barton, *The Book of Job* (ib., 1912).

JOB, TESTAMENT OF. A Jewish apocryphal book. It is mentioned in an edict on canonical and spurious books issued by Pope Gelasius I (c.496) as an apocryphon. The Greek text was published by Angelo Mai in his *Scriptorum Veterum Nova Collectio*, vii (Rome, 1833), reedited by James from a Paris manuscript, in *Apoerypha Anecdota* (Cambridge, 1897), and published again, with an introduction and an English translation by K. Kohler, in *Semitic Studies in Memory of Rev. Dr. Alexander Kohut* (Berlin, 1897). That it is a Jewish midrash, and not a Christian story, is evident from the absence of any distinctive Christian doctrine, and the prohibition "Take not unto yourselves wives from

strangers." Kohler thinks that it came from Essene circles, and the conception of immortality is in favor of this assumption. The children of Job were seen, adorned with crowns, standing near the glory of God; the three daughters, when they put on the three-stringed girdles, were transfigured; and He who sat upon the Great Chariot came and took the soul of Job away with a kiss and carried it to the east, where the heavenly throne stood. The book reveals the same kind of traditions concerning Job that are met in the Greek translation and in the Targum on Job. Consult, in addition to the works quoted above, Kohler's article in *The Jewish Encyclopædia*, vol. vii (New York, 1904).

JOBERT DE LAMBALLE, zhō'bâr' de län'bâl', ANTOINE JOSEPH (1799-1867). A French surgeon. He was born at Matignon, studied medicine at Paris, and in 1830 became surgeon at the Hospital Saint-Louis. He was elected to the Academy of Medicine in 1840 and to the Academy of Sciences in 1856. Jobert was a brilliant and resourceful operator, best known for his masterly use of *autoplastie*, the repair of diseased parts by healthy neighboring tissue, and especially for the operation which he styled *élitroplastie*, an autoplasmic cure of vaginal fistula. He wrote: *Traité théorique et pratique des maladies chirurgicales du canal intestinal* (1829); *Etudes sur le système nerveux* (1838); *Traité de chirurgie plastique* (1849); *De la réunion en chirurgie* (1864).

JOB'S COMFORTER. A popular expression for one who, like Job's friends, while pretending sympathy in times of distress, presents the most hopeless side of the trouble and attributes it to the sufferer's shortcomings. The term is also used of boils, which formed part of Job's afflictions.

JOBSON, jōb'son, FREDERICK JAMES (1812-81). A Wesleyan clergyman. He was born at Northwich, Cheshire, became an architect, but in 1834 a minister, and rose to great eminence. His early studies are shown in his *Chapel and School Architecture* (1850), which had considerable influence in improving such structures of his denomination. His travels as a representative of the British Conference produced *America and American Methodism* (1857) and *Australia, with Notes by Way of Egypt, Ceylon, Bombay, and the Holy Land* (1862). Consult his life by Gregory (London, 1884).

JOB'S TEARS, *Coix lachryma-jobi*. An East Indian cereal of stout habit, botanically allied to maize, which sometimes reaches a height of 8 feet. It derives its name from the tearlike form of the hard, shining, bluish-white seeds, which are sometimes made into bracelets, necklaces, and rosaries, and are also used for food in India, where it is somewhat cultivated. It has become naturalized in Spain and Portugal, where flour is occasionally made from it. It is cultivated as a curiosity in the United States and elsewhere. See **CHRYSOLITE**; **PERIDOT**.

JOB'S WIFE, LAMENTATION OF. See **APOC-RYPHA**, *Old Testament*.

JOCAS'TA. In Greek legend, the mother and wife of Œdipus (q.v.).

JOCELIN DE BRAKELOND, jōs'lin de brāk'lōnd. An English monk who flourished 1200 A.D. He was trained as a novice under Samson of Tottington, in 1182 became chaplain to Samson, was elected abbot in that year, and was later successively guest master (1196-1200) and almoner (1212). He is characterized as

extremely devout. He wrote a chronicle of St. Edmunds Abbey from 1173 to 1202, which was carefully edited by J. G. Rokewood for the Camden Society (London, 1840; new ed., 1905), and of which striking use has been made by Carlyle in *Past and Present* (1843; book ii, "The Ancient Monk").

JOCHMUS, yōg'mōōs, AUGUST GIACOMO, BARON DE COTIGNOLA (1808-81). A German soldier of fortune and Imperial Minister, born at Hamburg. He was engaged in business, then studied military science in Paris, and in 1827 went to Greece, where he served as adjutant under General Church and in 1832 became Minister of War. But the National party forced him to leave three years afterward. He went to England and from there with the Foreign Legion to Spain; in 1838 he was back in England, and Palmerston sent him to Constantinople to plan the Syrian campaign with Ponsonby. In 1840 he went to Syria, was promoted to division commander in the Turkish army, and was chief of staff in the allied army which captured Acre. After that battle he became commander in chief of the Turkish army of occupation and later Minister of War. He returned to Germany in 1848, and in March of the next year was appointed by the Vicar of Germany, Archduke John, Imperial Minister of the Navy and of Foreign Affairs, a post which he held until December, 1849, when he retired. He was made lieutenant field marshal commanding a division in the Austrian army in 1859; but did no further fighting. In 1870-71 he made a trip around the world. He wrote *Der syrische Krieg und der Verfall des Osmanenreichs seit 1840* (1856). His collected works, edited by Thomas (1883-84), contain his correspondence with Archduke John of Austria.

JOCRISSE, zhō'krīs'. A character in French popular comedy, first seen towards the end of the sixteenth century. He usually represents a stupid countryman and became well known in the eighteenth century through Dorvigny's *Le désespoir de Jocrisse*. The name is popularly used also of a married man too much concerned with domestic matters.

JODELLE, zhō'dël', ETIENNE, SIEUR DE LY-MODIN (1532-73). A French dramatic poet, painter, sculptor, engraver, and architect, and member of the Pléiade (q.v.), sometimes called, though with insufficient reason, the founder of French tragedy and comedy—the former by his *Cléopâtre captive* (1552) and *Didon se sacrifiant* (before 1558), the latter by *Eugène*. In a sense these were the first "regular" French dramas, though they were so solely through imitation of Latin dramatists in work that appealed only to scholarly imagination. However industriously imitated, they had no hold on the popular stage, which till the time of Alexandre Hardy (q.v.) was untouched by the scholastic spirit. There is a modern edition of Jodelle's *Works* by Marty-Laveaux (Paris, 1868-70). Consult Faguet, *La tragédie française au XVIème siècle* (Paris, 1883), and Rigal, *De Jodelle à Molière* (ib., 1905).

JODELN, yō'deln (dialectic Ger.). A peculiar manner of singing by using the falsetto voice in harmonic progressions, with sudden and unexpected changes to notes of the chest register. It exists chiefly among the Tyrolese and the Swiss.

JODHPUR, jōd-pōōr', or **MAR'WAR**. The largest of the native Rajputana States, India

(Map: India, B 3). It is bounded on the north by Bikanir and Jaipur, on the east by Ajmere-Merwara and Kishangarh, on the south by Palanpur and Sirohi, and on the west by Sind and the Rann of Cutch. Area, 34,963 square miles. It is traversed by the Luni, which divides the state into unequal portions. The soil is almost entirely sandy and sterile; only the valley of the river and the southeast are fertile, where cotton and wheat are largely grown. Camels, cattle, and sheep are bred. Iron, zinc, and salt are the chief minerals; marble is quarried and woollens are manufactured. Capital, Jodhpur. Pop., 1901, 1,935,565; 1911, 2,057,553.

JODHPUR. The capital of the native Rajputana State of Jodhpur, or Marwar, India, 98 miles west of Ajmere, with which it is connected by rail (Map: India, B 3). It is situated on the south slope of a range of red sandstone hills and is surrounded by a wall 6 miles in circuit and pierced by six gates. It is dominated by an imposing fortress, 400 feet above the plain. Within the massive walls of the fortress are ancient palaces and the Maharajah's treasury. Several magnificent tanks supply it with water by means of pipes; the town also has elaborately constructed and deep wells. Richly carved temples and houses, hospitals, a college, a wheat market, and public gardens adorn its streets. The Darbar High School (occupying the Talati Mal, an old palace), the arts college, a boarding school, and special schools to teach Sanskrit, telegraphy, and surveying, form the chief educational institutions. The palaces of the present Maharajah and his predecessor are on the southeast; the town is electrically lighted. The Jubilee buildings, the public offices of the British Agent, are fine modern buildings in the native style. Jodhpur has well-established institutions and is a flourishing commercial centre. It has manufactures of ivory, lacquer ware, brass and iron utensils, and dyestuffs. The Maha Mandir (great temple), $\frac{1}{2}$ mile to the northeast, occupies a wall-enclosed suburb of 800 houses, to which it gives its name. Jodhpur was founded in 1459, the prior capital having been Mandor, 3 miles north, which has interesting ruins of temples, palaces, and tombs. Pop., 1901, 60,437; 1911, 59,262.

JODL, yō'd'l, FRIEDRICH (1849-1914). A German philosopher, born and educated at Munich. He was docent there for five years, professor at Prague in the German university from 1885 to 1896, and then took a chair (1896) in philosophy at Vienna. During his stay in Prague Jodl was prominent in the work of the association for the advancement of things German in Bohemia. In 1890 he became an editor of the *International Journal of Ethics*. He is the master of a remarkably clear style and wrote, besides several monographs on ethical subjects: *Leben und Philosophie David Humes* (1872); *Kulturgeschichte* (1878); *Geschichte der Ethik in der neueren Philosophie* (vol. i, 1882, 2d ed. 1906; vol. ii, 1889, 2d ed. 1912); *Moral, Religion, und Schule* (1892); *Lehrbuch der Psychologie* (1899; 3d ed., 2 vols., 1908); *Ludwig Feuerbach* (1908).

JODO, jō'dō. See TS'ING-TU.

JO'EL (Heb. Yō'el, Yahwe is God). The son of Pethuel and second (or, according to the order in the Greek version, the fourth) of the twelve Minor Prophets. Concerning the life of Joel absolutely nothing is known, except the fact, gathered from his work, that he prophesied in Judah.

The occasion for his prophecy was a destructive plague of locusts, accompanied by a severe drought. The prophecy consists of two parts: (1) (i. 2-ii. 17) A vivid description of the devastation that the plague is causing in the land and a call for repentance, to be manifested by fasting, solemn assemblies, and mourning; this is accompanied by an assurance that repentance will bring forgiveness and renewed prosperity, and will keep off the "day of Yahwe," which, however, is sure to come. (2) (ii. 18-iii. 21) The statement, evidently following repentance on the part of the people, that the plague has departed, and that Yahwe will bless the land with material prosperity and ultimately with a gift of prophecy for all flesh. A description follows of the day when Yahwe will gather the nations together in the valley of Jehoshaphat (q.v.) and judge them for their wrongs against Israel. There are two different problems connected with the book, viz., the meaning of the locusts spoken of and the date of the prophecy. Some critics take the locusts allegorically, as a figure for the enemies of Jerusalem; others take the locusts literally, a plague of locusts being no unusual thing for Palestine. The date must be fixed entirely by internal evidence, and this has produced two widely different views—(a) one favoring a pre-exilic date, preferably in the days of Joash, (b) another in favor of a post-exilic date. The main criterion is the list of nations mentioned as enemies of Judah—the Phœnicians, Philistines, Egyptians, and Edomites. The reference to the Greeks (iii. 6) and the fact that there is no mention of the Aramæans, Assyrians, or Chaldæans among the enemies, are potent reasons in favor of the later date, after the return of the exiles, in the days of Ezra and Nehemiah. The trend of opinion is now quite general towards this date.

Joel is full of lofty imagery, and his language is pure and eloquent. The book presents many parallels with other Old Testament books—e.g., Isaiah (cf. Joel i. 15; ii. 10; iii. 10, respectively, with Isa. xiii. 6, 10; ii. 4), Ezekiel (cf. Joel ii. 28; i. 15; ii. 1, 2, respectively, with Ezek. xxxix. 29; xxx. 2, 3), and Amos (cf. Joel iii. 16; iii. 18, respectively, with Amos i. 2; ix. 13). It has been attempted to settle the vexed question of the date by means of these parallels; but naturally there is great difference of opinion as to which prophet is borrowing. Consult: Credner, *Der Prophet Joel übersetzt und erklärt* (Halle, 1831); Wünsche, *Die Weissagung des Propheten Joel übersetzt und erklärt* (Leipzig, 1872); Merx, *Die Prophezeiung des Joel und ihre Ausleger* (Halle, 1879); and the authorities referred to under MINOR PROPHETS.

JOE MILLER'S JESTS. See MILLER, JOSEPH.

JOE'-PYE' WEED. A North American medicinal plant. See EUPATORIUM.

JOFFRE, zhō'fr', JOSEPH JACQUES CÉSAIRE (1852-). A French general, born in Rivesaltes, Pyrénées. In 1868 he entered the Ecole Polytechnique to study military engineering. He entered active service in September, 1870, in an artillery battery in the Franco-Prussian War, after which he returned to the Polytechnique. He became a captain in 1874 and helped plan the defenses of Pontarlier. In 1883-84 he fought under Courbet in Tongking, and in 1893 under Dodds in Dahomey. He was prominent in the French occupation of Timbuktu in 1894 and in the fortification of Diego Suarez in Mada-

gaspar in 1897. After his return to France he was a professor in the Higher War School for a time and was promoted brigadier general of a division. In July, 1911, while he was commanding the Second Army Corps at Amiens, he was appointed chief of the general staff. The three years' military service law for the French army was largely due to Joffre's efforts. For his services in the earlier part of the European War President Poincaré conferred on him a military medal in November, 1914. The article **WAR IN EUROPE** contains a discussion of his work as head of the French army.

JOGGS. See **JOUGS**.

JOGUES, zhōg, ISAAC (1607-46). A Jesuit missionary to the North American Indians, born in France. He joined the Society of Jesus in 1624 and in 1636 was ordained and sent to the Huron mission, then the most dangerous of all which the society maintained in the New World. There he labored until 1639, when he was chosen for the new and even more perilous mission among the Tobacco Nation. Two years later he made the long and arduous journey to Sault Ste. Marie, where he preached to an assemblage of 2000 Algonquins, and soon after his return he set out for Three Rivers to procure supplies for the Huron mission. As he was crossing the Lake of St. Peter on his return, he and his companion, Goupil, were captured by the Iroquois. The prisoners were taken to the Mohawk villages and fearfully tortured. Goupil was finally killed, but Jogues was kept as a slave. His pitiable condition excited the compassion of Dominie Megapolensis and other Dutchmen at Rensselaerswyck, who finally succeeded in smuggling him aboard a vessel, which conveyed him down to New Amsterdam, where Director General Kieft received him kindly and sent him to France. The story of his sufferings had preceded him, and on his arrival he was received as a hero; even the Queen showed him marked attention, and the Pope gave him a special dispensation which enabled him to say mass despite the mutilated condition of his hands. He soon returned to Canada, however, and two years afterward again went to the Mohawk villages; but this time as an ambassador from the Canadian government and as the founder of a new mission, the Mission of the Martyrs. Having accomplished his political object, which was to confirm the Mohawks in their adhesion to a recently signed treaty of peace, he returned to Quebec, but went back once more to work among the Mohawks. There having been a change in the feelings of the Indians, he was soon subjected to torture, and finally one night as he entered a lodge to which he had been invited for a feast a savage sprang from the darkness and struck him dead. The place of his martyrdom, Ossernenon, near Auriesville, N. Y., has become a place of pilgrimage to Roman Catholics. Thwaites (ed.), *The Jesuit Relations* (73 vols., Cleveland, 1896-1901); Martin, *Father Isaac Jogues*, translated by Shea (New York, 1896).

JOHAN'NA. One of the Comoro Islands (q.v.).

JOHANNESBURG, yō-hän'nes-bürg. The largest and most advanced city in South Africa, situated in the Transvaal Province, at an altitude of 5735 feet, in the midst of the gold district,

35 miles south of Pretoria (Map: Africa, G 7). It is connected with Pretoria, Delagoa Bay, Cape Town, and Port Elizabeth by rail, and is a modern city, intersected by parks and broad thoroughfares, lined with fine buildings, including theatres, clubs, and a stock exchange; it is electrically lighted. In 1906 the installation of electric street railways was begun, and, by 1913, 63 miles of track had been laid. It has the Transvaal University College (founded in 1903), a good art gallery, a library of 32,000 volumes, and an observatory. An imposing fortress erected by the Boers, but now dismantled, commands the town. Johannesburg was founded in 1886 and grew rapidly, owing to its location on the Witwatersrand gold fields, one of the richest gold-mining districts in South Africa. It was the seat of the Uitlander disaffection which led to the war with Great Britain (1899-1902). Pop., 1896, 99,800 (including 8000 Boers, 43,000 natives, and 34,000 British); 1904, 158,580 (83,902 whites, 62,524 natives, and 12,154 other colored); 1911, 237,104 (Europeans, 119,953; natives, 117,151). Johannesburg was captured, without opposition, by the British under Lord Roberts on May 29, 1900. A notable feature in the neighborhood is the national Boer monument commemorating the declaration of independence in 1880, which stands on the open veldt near the suburb of Krugersdorp.

JOHANNES CLERICUS. See **LE CLERC, JEAN**.

JOHANNESSEN, yō-hän'ne-sen, EDVARD HOLM (1844-1901). A Norwegian Arctic navigator and hunter, born in Balsfjorden. His successful ice navigation of Barents and Kara seas in 1869 gained for him a medal from the Swedish Academy of Sciences. In 1870 he circumnavigated Nova Zembla, the first so to do. In 1878, rounding Nova Zembla to the north, he discovered and circumnavigated in Kara Sea, in 77° 31' N., 86° E., Ensomheden (Einsamkeit or Lonely) Island, snow free and a resort of sea game. In 1887 he discovered to the east of Northeast Land a high, snow-covered island in 80° 10' N., 30° 32' E., called New Iceland, possibly the same as White Island. These discoveries brought him the gold medal of the Swedish Academy of Sciences.

JOHANNES SECUNDUS, jō-hän'nēz sē-kūn'dūs (1511-36). A Latin poet, born at The Hague. His true name was Jan Nicolai Everaerts. He studied law at Bourges, but early devoted himself to the fine arts, but more especially to poetry. He traveled in Italy and Spain, became secretary to Cardinal Tavera, Archbishop of Toledo, and accompanied Charles V on his expedition to Tunis. His poems are admired for their classical purity, delicate sentiment, and graceful imagery, and have been translated into several foreign languages. The best known among them are the *Basia* (1539). A complete edition of his *Opera Poetica* was published by his brothers in 1541.

JOHANNES VAN DEWALL, yō-hän'nās vān dā'vāl. The pseudonym of the German novelist August Kühne (q.v.).

JOHANNOT, zhō'ā'nō', CHARLES (1793-1825), ALFRED (1800-37), TONY (1803-52). Three brothers, all engravers, the younger two also historical painters, born in Germany of French parents—Charles at Frankfort, Alfred and Tony at Offenbach. Their father, François, was a silk manufacturer in Offenbach until 1806, when financial reverses obliged him to emigrate.

He was also a painter of flowers and is said to have been the first to print music from stone, introducing the art of lithography into France. Charles engraved illustrations, after Desenne, for Tasso's *Aminta* and Voltaire's *Paul et Virginie*. Alfred learned engraving from his brother Charles, and collaborated with his brother Tony in illustrations for the French translation of the works of Byron, Cooper, and Scott. Many engravings by Alfred and Tony are signed *Johannot frères*. Alfred exhibited with great success at the Salon and was decorated by the King. Three of his paintings are at Versailles. Tony was a vignettist of the first order, and his illustrations rank with the best of the eighteenth century. He is credited with more than 3000 engravings, besides illustrations for over 500 books and pamphlets. He exhibited at the Salon regularly after 1831, was decorated in 1840, and two of his paintings are at Versailles.

JOHANNSDORF, yō'hāns-dōrf, ALBRECHT VON. A German minnesinger from Bavaria, who flourished between 1185 and 1209 and probably took part in the Crusade of 1190. His love songs are full of natural feeling, mingled with a current of religious enthusiasm. Consult Lachmann and Haupt, *Des Minnesangs Frühling* (Leipzig, 1888), and Bartsch, *Liederdichter*, xxxv.

JOHANSEN, JEAN McLANE (1878-). An American portrait painter, wife of John C. Johansen. She was born in Chicago and studied at the Chicago Art Institute and under Duveneck and Chase in New York. Her art is unaffected in conception and bold in treatment. Her first picture to attract attention was a "Girl in Gray," now in the Art Museum of Toledo. Among other noteworthy works are: "On a Hill Top" (Salon, 1908); "Mother and Babe" (1911); "Girl in Green" (1912); the portrait of Mrs. Henry Hammond and daughter, awarded the Shaw prize, National Academy of Design, in 1912; "Brother and Sister" (1913). She won the Elling prize in 1906 and the Burgess prize in 1907 (both awarded by the New York Art Club), and first prize at the International Art League of Paris in 1907. She was elected an associate of the National Academy of Design.

JOHANSEN, JOHN CHRISTEN (1876-). An American portrait, figure, and landscape painter. He was born in Copenhagen, Denmark, was brought to America in infancy, and studied at the Art Institute, Chicago, then under Duveneck, and also in Paris under Constant Laurens and Whistler. In 1901 he removed to Chicago, but returned in 1906 to spend several years in France and Italy. A master of technique and possessor of a strong romantic individuality, he is especially clever in working out novel problems of color and in handling light. His portraits are sincerely fresh and personal renderings; among his sitters are many persons prominent in the academic, scientific, and social worlds. His architectural views of Venice, exhibitions of which have been held in London and New York, have achieved especial success on account of the novelty of color scheme and treatment. Among his best-known paintings are: "October, Sear and Gold," purchased by the Chicago Municipal Art League in 1903; "Piazza San Marco," Art Institute, Chicago; "Fiesole," Richmond Gallery; portraits of Professors Daniels and McLaughlin and "Sunrise in Venice" (1911); portrait of J. H. Kehler (1911); "In the Sewing Room" and "Approaching Storm" (1912). He received the Young prize at Chi-

cago in 1903, a gold medal at Buenos Aires in 1910, and the Saltus gold medal, National Academy of Design, in 1911. He became an associate of the National Academy and made his residence in New York. He married Jean McLane. (See JOHANSEN, JEAN McLANE.)

JOHANSSON, yō-hāns'sōn, KARL FERDINAND (1860-). A Swedish philologist, born at Misterhult and educated at Upsala, where he became docent and afterward professor of Sanskrit and of comparative philology (1893). Besides some 70 articles in *Bezenbergers Beiträge*, *Kuhns Zeitschrift*, *Indogermanische Forschungen*, *Nordisk Tidskrift for Filologi*, etc., contributed to those journals especially after 1900, he wrote: *De Derivatis Verbis Contractis Linguae Graecae Quaestiones* (1886); *Några ord om dialekter, Speciellt de Grekiska* (1888); *Beiträge zur griechischen Sprachkunde* (1890); *Indiska sagor, översatta från sydbuddhistiska originaltexter* (1907). In 1906 he became coeditor of *Le Monde Oriental*.

JOHN, THE APOSTLE. One of the Twelve Apostles, commonly believed to have been the "beloved disciple" and the author of the New Testament books known as the Gospel of John, the three Epistles of John, and the Revelation. This traditional view is involved almost necessarily with the supposition that the Apostle John lived to a great age, that the last period of his life was spent in Asia Minor, and that the New Testament books written by him were all the product of his later years. As nearly every point of the traditional view is now disputed by many of the foremost New Testament scholars, it will be necessary to review the ancient evidence regarding the life of the Apostle John and try to ascertain its actual significance and value.

1. *The Earliest Evidence, that of the Synoptic Gospels, the Acts, and the Pauline Epistles, all well within the Limits of the First Century A.D.* The first notice of John in the Synoptic Gospels is in Mark i. 19-20 = Matt. iv. 21-22. Here we find that early in Jesus' ministry John, with his brother James and his father Zebedee, was engaged in the fishing business on the Sea of Galilee. They had boats, nets, and hired servants. Jesus, passing by, summoned the two brothers to leave their occupation and follow him. They obeyed and along with another pair of brothers, Peter and Andrew, similarly summoned, they constituted the first group of followers or disciples of Jesus (cf. Mark i. 29). Luke's account of the same incident (Luke v. 1-11) differs somewhat from that in Mark and Matthew, though agreeing as to the main points noted above, while adding the statement that Peter was in partnership with James and John. Later, when Jesus selected 12 of his followers to be more closely and permanently associated with him, John with his brother James was one of the 12 who were later known as the Apostles (Mark iii. 14 ff. = Luke vi. 13 ff.; cf. Matt. x. 2-4). In all three lists the four names of the two pairs of brothers stand at the head. At the raising of Jairus's daughter Peter, James, and John were the only disciples Jesus allowed to enter the house with him (Mark v. 37 = Luke viii. 51). Similarly these three alone were privileged to witness the transfiguration scene (Mark ix. 2 ff. = Matt. xvii. 1 ff. = Luke ix. 28 ff.). On one occasion John (probably in conjunction with his fellow disciples), seeing a certain one casting out demons in Jesus' name,

although not one of Jesus' disciples, forbade him to do so, as he was not a disciple. For this he was rebuked by Jesus (Mark ix. 38-41 = Luke ix. 49-50). It may be that this zeal for his Master and the incisive, uncompromising disposition it evidenced, in which his brother shared, led Jesus to give them the surname Boanerges (sons of thunder, Mark iii. 17). The same trait of character is disclosed in the incident, related only by Luke (ix. 51-56), when James and John wished to call down fire from heaven on the inhospitable Samaritans. On this occasion also Jesus rebuked them. As Jesus and his disciples were drawing near the city of Jerusalem on his last journey thither, James and John, apparently through their mother, made the request that in the coming Kingdom they might have the seats of honor at his right and left hand. The answer of Jesus indicated to them that their devotion to him would involve suffering and death similar to his own, but contained no promise of special honors (Mark x. 35 ff. = Matt. xx. 20 ff.). According to Mark (xiii. 3), it was to the four—Peter, Andrew, James, and John—that Jesus privately made known the course of future events. According to Luke (xxii. 8), Peter and John were the ones to whom Jesus intrusted the preparations for the Last Supper, and on these two with James the brother of John he leaned for comfort and sympathy in his hour of trial and agony in Gethsemane (Mark xiv. 33 = Matt. xxvi. 37).

The impression produced by the Synoptic narrative is that John was a Galilean, of a family possessed of at least moderate means. As Galilee was largely a bilingual country, it is easily credible that John could speak and possibly write Greek, though his mother tongue was Aramaic. When a boy, he might have learned Hebrew in the synagogue school. He gave a whole-hearted response to Jesus' summons and with his brother James and his friends Peter and Andrew soon belonged to the circle of followers with whom Jesus was most intimate.

In the record of the very early years of the Church as given in Acts, John holds a prominent place, as the Synoptic record would lead us to expect. He is usually associated with Peter, who seems to have been the chief speaker, and no word of John's is recorded (Acts i. 13; iii. 1, 3, 4, 11; iv. 1-32; viii. 14 ff.). The last notice of John in Acts does not necessarily refer to a date later than about 35 or 36 A.D., about the time of the persecution that followed the martyrdom of Stephen, when many of the Christians fled from Jerusalem. His brother James was put to death by Herod, certainly not later than 44 A.D. (Acts xii. 2). That John was in Jerusalem after this, and considered one of the three "pillars" of the Palestinian church, is practically certain from Paul's account of the Council in Jerusalem (c.49 A.D.), at which John, Peter, and James (the Lord's brother) gave formal sanction to Paul's apostolic status (Gal. ii. 1-10, the only reference to John in Paul's letters). All this, our earliest and most undisputed information regarding John, carries us no farther than c.50 A.D., but may be said fairly to imply that he was one of the three or four most prominent Apostles and to prepare us for other traditional information to the same effect.

2. *The Tradition Concerning a John in Asia Minor.* We may begin with the Book of Revelation. This book claims to have been written by some one named John (Rev. i. 1, 4, 9;

xxii. 8). Assuming that the work is a unity and is not pseudonymous, questions that do not concern us here, it is certain that the book witnesses to the fact or tradition that a certain John was a man of the greatest influence in the Christian communities of the Province of Asia in early times. As the date of Revelation cannot be placed later than c.90 or 95 A.D. (it may have been earlier), it makes certain that before the end of the first century A.D. a John was a prominent figure in the Christian circles of Asia. Who was this John? Justin Martyr, who was converted c.130 A.D. in Ephesus, believed that the author was John the Apostle (*Dial.*, 81). All early Christian tradition after Justin is practically unanimous on this point. By writers near the end of the second century a number of interesting details are supplied regarding the Apostle's stay in Ephesus—that once he refused to remain in the same bath with the heretic Cerinthus, and that he lived until the times of Trajan (from Irenæus); that his grave was at Ephesus (from Polycrates); of his wonderful success in reclaiming a young convert from a brigand's life (from Clement of Alexandria); to say nothing of the countless miracles attributed to him in the apocryphal *Acts of John* written between 130 and 180 A.D.

But when we go back earlier than Justin Martyr the evidence becomes more uncertain. The two most important Asia Minor witnesses are Polycarp of Smyrna and Papias of Hierapolis, both of whom lived in the first half of the second century A.D. Irenæus, who heard Polycarp in his early youth, says that he distinctly remembered how Polycarp used to tell of his intercourse with John and others who had seen the Lord (*Ep. ad Flor.*). Papias, however, in the fragments of his work that remain, does not say that he had heard or seen John the Apostle, but does speak of a John "the Elder," who was apparently a prominent Christian, who had seen the Lord and from whom Papias had learned, directly or indirectly, certain things Jesus had said.

These testimonies, it will be observed, cease to be clear and convincing just at the important point, and perplexities now begin. For Papias not only seems to speak of John "the Elder," although early writers who had read his entire work supposed he meant thereby John the Apostle, but in a fragment of his work that has recently come to light says that not only James but his brother John also was slain by the Jews, presumably in Palestine and before the fall of Jerusalem (70 A.D.). If this was so, then the John of Asia Minor who wrote the Revelation must have been some other John than the Apostle, and the known facts of the Apostle's life would be confined to those noted above under section 1. In this case, also, we might assume that a certain John, possibly a disciple of Jesus, found his way in the later years of the first century to Ephesus and there became an influential teacher and was the author of the New Testament books assigned to "John" or "the Elder" (2 and 3 John). In the course of time tradition confused him with the Apostle. Such is the general view, with variations in detail, now favored by many leading scholars.

Its acceptance, however, presents serious difficulties: as (1) the difficulty of explaining how the confusion of persons could have taken place in the very region where the supposed "Elder" was so well known; (2) the fragments of Papias

are not free from suspicion both as to genuineness and exact meaning; (3) the witness of Irenæus as to what Polycarp said, being personal testimony as to what, he himself heard Polycarp say, is not to be easily cast aside.

3. *The Fourth Gospel and the Apostle John.* Whether the Fourth Gospel can tell us anything of the Apostle John depends upon what is the true answer to the question raised in section 2 above. If the tradition as we know it from c.130 on is true, the Fourth Gospel is the work of John the Apostle, and, in addition to its own testimony to the literary powers and activity of John in his later years, it adds many details as to his experiences with Jesus to the account given in the Synoptics. For, on this view, there can be little doubt that the unnamed disciple "whom Jesus loved," about whom so much is said, was John himself. But if John was martyred by the Jews before 70 A.D., the Fourth Gospel and the Epistles were by some other author and tell us nothing certain of John the Apostle.

Bibliography. The ablest presentation of the traditional view will perhaps be found in James Drummond, *The Character and Authorship of the Fourth Gospel* (London, 1903); V. H. Stanton, *The Gospels as Historical Documents* (Cambridge, 1903); William Sanday, *The Criticism of the Fourth Gospel* (New York, 1905); Theodor Zahn, *Introduction to the New Testament* (Edinburgh, 1909). The case for the opposing view is ably presented by B. W. Bacon, *The Fourth Gospel in Research and Debate* (New York, 1910), and J. Moffatt, *Introduction to the Literature of the New Testament* (ib., 1911).

JOHN THE BAPTIST. The forerunner of Jesus Christ. The sources on which we depend for our knowledge of the man and his work are: 1. The sections of the Gospels especially devoted to a description of him and his ministry. Of these the accounts in the Synoptic Gospels relate chiefly to his career up to the baptism of Jesus, while the account of the Fourth Gospel is concerned mainly with John's relation to Jesus after the baptism of the latter. 2. The incidental notices of the Baptist in the Gospels, either by the Evangelists themselves or in their reports of Jesus' words. 3. The account of Josephus (*Ant.*, xviii, 5, 2). From these various sources we learn that John the Baptist was born about six months before Jesus, in a town in the hill country of Judæa. The name of the town is not given. The parents were of priestly stock and full of anxious thought and earnest expectation concerning the future of Israel. To this only child, born in their old age and looked upon as a gift of Jehovah, they gave the name John (Hebrew *Johanan*, 'Jehovah is gracious'). Naturally he was well instructed in the religious literature of Israel. To what extent, if at all, he was initiated into the priestly life we are not told. It is noteworthy that the messengers sent to him by the Jerusalem authorities were certain priests and Levites, as though these were best fitted to examine him (John i. 19). The greater part of his early manhood was spent in retirement, in the quiet of the wilderness. But at last, as in the case of the prophets of old, the "word of the Lord" (Luke iii. 2) came to him, and he issued from his retirement with a message such as Israel had not heard for centuries. (For the date, see NEW TESTAMENT CHRONOLOGY.) The scene of his first public appearance was in the lower Jordan valley and the wild slopes of northeastern Judæa (Matt. iii. 1; Mark

i. 4; Luke iii. 3). Here, clad in homely garb, eating the simplest diet, he began his public ministry, crying, "Prepare ye the way of the Lord" (Mark i. 2). Hearers soon began to throng about him, the whole country was agitated, and even from Galilee the crowds gathered to hear the great preacher.

The message of the preacher was not a honey-eyed one. Like the prophets of old, his summons was "Repent!" Righteousness was the one thing needful. For it was a time of crisis; the axe was already laid to the tree; the chaff of the threshing floor was about to be burned; "the day of Jehovah," foretold by the prophets, was at hand (Matt. iii. 2, 7, 10; Mark i. 4; Luke iii. 3, 7-9). Nothing but a thorough repentance, a new moral condition, could save Israel from doom. What made this message so startling was its stern application to Israel, the chosen people. The Messianic age was not painted in glowing colors, as a glorious triumph of Israel over her enemies. No false trust in the boasted descent from Abraham was permitted to blind the eyes or dull the conscience. The Messianic age was to be ushered in by judgment, a judgment that was to sift Israel herself first of all. Only a new, purified, righteous Israel could hope to meet and greet that age with confidence. This coming dispensation held a large place in John's thought. To the many inquiries as to who he claimed to be, his reply was: "I am only the herald, only the voice that prepares the way; the greater one is to follow; one for whom I am unworthy even to do a slave's service" (Matt. iii. 11, 12; Mark i. 7; Luke iii. 15-18). And it was doubtless with reference to this impending age that John instituted the rite of baptism. As a symbol, it was somewhat common in Jewish circles. Ceremonial lustrations with water were frequently practiced. But John's baptism was no ordinary lustration. The requisite to receiving it was a confession of sin, and the baptized one arose from the water, as a member of the new Israel, repentant, and thus ready to meet the Messianic age, which to such would be an age of blessing, not of judgment.

The multitudes that came to hear the Baptist were of two opinions. Some refused to admit the reality of his mission and would have nothing to do with his baptism. Of such a mind were the higher classes. The humbler classes, on the other hand, welcomed him as a true prophet; and many of them, even those most despised and sinful, took his message to heart and were baptized (Luke vii. 29, 30; Matt. xxi. 32). For months, possibly a year, John continued his work—not always in the same place, but never far from the Jordan. He organized a body of disciples and prescribed for them certain regulations touching prayer and fasting (Matt. xi. 2; Luke v. 33, xi. 1; Mark ii. 18 ff., vi. 29). In the course of his ministry—under what circumstances it is not stated—he rebuked Herod Antipas, Tetrarch of Galilee and Peræa, for his adulterous marriage with Herodias, the wife of his brother Philip. This seems to have aroused Herodias, rather than Herod, to anger; for Herod's imprisonment of John which followed was not so much a personal revenge upon his boldness; it was really because Herod feared John's growing influence with the people; in fact, it is not at all impossible that he wished by this imprisonment to save him from the murderous hostility of Herodias, which, if it were realized, he felt might rouse the people

in revolt against him. During his captivity, therefore, his disciples had free access to him, and Herod even delighted to hear his teachings (Mark vi. 14-20; Matt. xiv. 1-5). Finally, however, in the drunken revelry of a birthday feast Herod was trapped by Herodias into ordering his execution, and he was beheaded at the castle of Machærus (Mark vi. 21-29; Matt. xiv. 6-12; cf. the account of Josephus). It seems likely that John's disciples continued their organization for some time afterward. In fact, 20 or more years later followers of the Baptist were found in Alexandria and in Ephesus who had been baptized according to John's rite, but had not seemed to appreciate the presence of the spiritual age for which it was intended to prepare (Acts xviii. 24-xix. 7). In other words, they had been baptized simply in reference to repentance from sin, but not with the emphasis on the Messianic era as already ushered in and partly realized in the Messianic work of Jesus (cf. Acts i. 5; xi. 16). Such a following, existing apart from the Christian communities, may have arisen from that spirit of aloofness from Jesus' work which seems to have developed in the latter part of the Baptist's life, and which afterward may have been emphasized by his disciples into a claim of Messiahship for him (cf. Luke iii. 15; also 1 John v. 6). This following seems to have resolved itself into several definitely heretical sects, some of which persisted into the latter part of the second century.

As to the relation of John to Jesus, it is not likely that there was any intimate acquaintance between them before their public work began (John i. 31), though their mothers were related (Luke i. 36). But the report of the great excitement in the lower Jordan valley reached Nazareth, and in due time among those presenting themselves for baptism was Jesus of Nazareth. The message of John had summoned him to the establishment of this new age as the work which, in the consciousness of his unique relations to God, he realized was the work he was intended to do; for to Jesus this rite was as really a symbol of his moral attitude of consecration to his work as it was to the people a symbol of their moral attitude of repentance in preparation for this work. In its administration both John and Jesus were fulfilling its expression of their right relations to this Messianic work which was to be accomplished. The Baptist discerned that there stood before him no ordinary person, and he was unwilling to baptize the candidate, but yielded at Jesus' reasoning that "so it cometh us to fulfill all righteousness" (Matt. iii. 14, 15). Most likely only John and Jesus were conscious of the confirmation of Jesus' consecration to his work which followed in the special endowment of Jesus with the Spirit of his work and in the divine acknowledgment of his act through the voice from heaven (Mark i. 10, 11; Matt. iii. 16, 17; Luke iii. 21, 22; cf. John i. 32-34). Though thus ushered into his public ministry by John, Jesus seems to have had little converse with him subsequently (yet cf. John iii. 26). Nevertheless, Jesus ever recognized the greatness of John's work and character. In his opinion John was no "reed shaken with the wind," but a prophet, the last in the great succession. He was the greatest of mortals (Matt. xi. 7-15; Luke vii. 24-28, xvi. 16). He came in "the way of righteousness" (Matt. xxi. 32), and the result of his work was that many were seeking to enter into

the kingdom of heaven as by force. His witness was a witness to the truth, for he was a "burning and shining light" (John v. 33-35). More than all this, he was the one definitely predicted in Mal. iii. 1 as the Elijah who was to come (Mark ix. 13; Matt. xvii. 12). These statements show conclusively that Jesus recognized in John his forerunner, whose duty it was to prepare for his greater ministry. Such preparation was accomplished in two ways. On the one hand, the general awakening of the moral sense of Israel by the Baptist's preaching made Jesus' profounder and higher message more readily and easily apprehended. On the other hand, the definite designation of Jesus as the one who was to come, to a few choice spirits among his followers, led these to Jesus as the first and truest of his disciples (John i. 29 ff.). Notwithstanding, however, Jesus' testimony to John's greatness and recognition of him as his forerunner, he taught that John's conception of his mission was not altogether adequate. The "least in the kingdom"—i.e., the humblest one of those who entered the kingdom along the lines of Jesus' message of the Heavenly Father and His love—was on a higher plane than John the Baptist (Matt. xi. 11; Luke vii. 28). John's prophetic gift and calling did not make him infallible. His view of the Messianic age saw it mainly as one of judgment, sifting, and punishment. Jesus, with just as great an insistence on righteousness, proclaimed it in a gospel of glad tidings as an epoch of release from bondage, an era of comfort to the weary, a welcome to the Father's house. To John the judgment was in the foreground; to Jesus forgiveness was in the foreground, and forgiveness through the service he was to render for its realization. John did not advance beyond the old idea of repentance in order to the escape of judgment; Jesus called for repentance, but in order to a personal relation to himself (Matt. ix. 11-17; Mark ii. 21, 22). With this emphasis upon the judgment character of the coming age, John looked upon Jesus as one who would assert it in the spirit of a Judge. He could not appreciate Jesus as the suffering Servant of the prophets (Isa. liii). He was so thoroughly conscious of his own relations of servitude to Jesus that he could not understand the elements of self-sacrificing service in the ministry which Jesus was carrying out. And so he sent to him his message of confused inquiry, "Art thou he that cometh, or look we for another?" (Matt. xi. 3). It was in the hope that nevertheless the spiritual discernment of John would discover the spirit of his mission that Jesus sent back his messengers with his reply to their master in prison (Matt. xi. 4-6). John, however, most likely carried his confusion with him to his death, and his disciple following confirmed it in the separate organization which they continued to maintain. Consult the various lives of Christ, and H. Köhler, *Johannes der Täufer* (Halle, 1884); H. R. Reynolds, *John the Baptist* (London, 1888); James Stalker, *Two St. Johns of the New Testament* (ib., 1905); A. T. Robertson, *John the Loyal: Studies in the Ministry of the Baptist* (New York, 1911); Blakiston, *John Baptist and his Relations to Jesus* (London, 1912).

JOHN. The name of 23 popes.—JOHN I (Pope, 523-526), a native of Tuscany. Nothing is known of his pontificate except his heading an embassy to the Emperor Justin II at Constanti-

nople, at the request of Theodoric, the Arian King of Italy, in regard to the execution of an Imperial edict against the Arians. On his return he was imprisoned by Theodoric, who was dissatisfied with the result of his mission, and died in captivity. His day is May 27.—JOHN II (Pope, 532–535), a Roman, Mercurius by name. He appealed to Athalaric, King of the Goths, for aid in putting down simony, which was fearfully prevalent. His letters are in Migne, *Patrologia Latina*, vol. lxxvi.—JOHN III (Pope, 560–573).—JOHN IV (Pope, 640–642), a Dalmatian by birth. He condemned the Monothelites and insisted that Honorius I had not sanctioned their doctrine.—JOHN V (Pope, 685–686), a Syrian, the first of several popes of Eastern birth, who owed their election to the influence of the exarchs. He had been sent by Pope Agatho as his legate to the sixth general council.—JOHN VI (Pope, 701–705), a Greek. He decided the prolonged conflict between St. Wilfrid of York and the see of Canterbury in the former's favor. His letters are in Migne, *Patrologia Latina*, vol. lxxxix (Paris, 1844–64).—JOHN VII (Pope, 705–707), a Greek, the immediate successor of the preceding. He is said to have persuaded the Anglo-Saxon clergy to abandon their secular dress. Consult, for John IV, V, VI, VII, H. K. Mann, *Lives of the Popes* (London, 1902–06).—JOHN VIII (Pope, 872–882), a Roman by birth and Archdeacon of Rome before his elevation. He supported the claim of Charles the Bald to the Empire and crowned him in 875; two years later he upheld his disputed right in a great synod at Ravenna. The incursions of the Saracens in Lower Italy gave him much trouble, and after strenuously opposing any compromise with them he was obliged to purchase exemption from their attacks by a yearly tribute. He made a determined attempt to reunite the Eastern church with Rome, but was defeated by the crafty stubbornness of Photius (q.v.). His numerous letters are in Migne, *Patrologia Latina*, vol. cxxvi (Paris, 1844–64). Consult, for the Eastern negotiations, Hergenröther, *Photius, Patriarch von Constantinopel* (Regensburg, 1867).

JOHN IX (Pope, 898–900), a Benedictine, the candidate of the Frankish party. His position amid the troubles of the time was very insecure, and, though a zealous man, he accomplished little except the rehabilitation of his predecessor Formosus.—JOHN X (Pope, 914–928), a native of Romagna. He became Archbishop of Ravenna in 905 and was raised to the papacy by the influence of Theodora's faction. But he disappointed their expectations by striving to render his temporal power independent of any party. He defeated the Saracens in person and attempted a reconciliation with the Eastern church. He was imprisoned, and perhaps murdered by Marozia, daughter of Theodora, whose ambitions he opposed. His letters are in Migne, *Patrologia Latina*, vol. cxxxii (Paris, 1844–64).—JOHN XI (Pope, 931–936), the son of Marozia by her first husband, Alberic. She and her other son, Alberic II, practically ruled, leaving none but purely sacerdotal functions to the Pope.—JOHN XII (Pope, 955–964), the son of Alberic II, elected at the age of 18. His name was Octavian; he was the first to introduce the practice of adopting a new name. He gained the support of Otho I, whom he crowned Emperor in 962, but fell out with him afterward and, in consequence of many grievous accusa-

tions, was threatened with deposition. He conquered his opponents, but died soon afterward.—JOHN XIII (Pope, 965–972). He was Bishop of Narni before his choice as the candidate of Otho I for the papacy. By his influence with the Emperor John recovered Ravenna and the rest of the *patrimonium Petri*. He crowned Otho's young son as associate in the Empire and aided in procuring for him the hand of the Greek Princess Theophano. His letters are in Migne, *Patrologia Latina*, vol. cxxxv (Paris, 1844–64).—JOHN XIV (Pope, 983–984), previously Bishop of Pavia and Chancellor of Otho II. When the Emperor died and his wife, Theophano, left Rome, John was helpless. Boniface VII, who had seized the papacy on the death of Otho I and had then fled to Constantinople in fear of the counts of Tusculum, now returned and imprisoned him in the castle of Sant' Angelo, where he was done to death four months later. Consult Floss, *Die Papstwahl unter den Ottonen* (Freiburg, 1858). Another John is included in some lists of the popes as the immediate successor of Boniface, but according to modern investigations he has no claim to the title. His inclusion has introduced a confusion into the numbering of the later Johns.

JOHN XV (Pope, 985–996), elevated by Crescentius and his party, and completely under their influence. After his death, Otho III caused the election of his own kinsman Bruno, as Gregory V, but on the Emperor's departure he was driven out by Crescentius, who in 997 set up John Philagathus, a native of the Greek Province of Calabria, as JOHN XVI. He was overthrown by the return of the Emperor and treated with a cruelty which he did not long survive.—JOHN XVII (Pope for a few months in 1003).—JOHN XVIII (1003–09). He effected a temporary reconciliation with the Church of Constantinople and left the name of a learned and pious man. He is said to have retired to a monastery to end his days, but it is not improbable that he was driven out by the son of Crescentius.—JOHN XIX (Pope, 1024–33), a Roman of the family of the counts of Tusculum. He succeeded his brother, Benedict VIII. He attempted to consolidate the renewed union with the East by conceding to the Patriarch of Constantinople, in a sense, the title of Ecumenical; but the feeling of Western Christendom was so strong against the concession that he was obliged to withdraw it, and the breach became wider than ever. He crowned the Emperor Conrad II in the presence of the English King Canute. His letters are in Migne, *Patrologia Latina*, vol. cxi (Paris, 1844–64).—JOHN XX, often called JOHN XXI (Pope, 1276–77), a Spaniard, Peter by name, made Cardinal Bishop of Frascati in 1273. He was a man of great learning, especially in philosophy and medicine. He left some treatises which are interesting contributions to the history of mediæval medicine. His enemies accused him of dealing in magic arts and considered his death by the fall of a ceiling as a judgment.

JOHN XXII (Pope, 1316–34), Jacques d'Èuse, a native of Cahors, made Bishop of Fréjus in 1300 and Cardinal Bishop of Porto in 1312. He was chosen Pope after a vacancy of two years and fixed his residence at Avignon. Attempting to carry out in very altered circumstances the vast and comprehensive policy of Gregory VII and Innocent III, he interposed in the contest for the Imperial crown between Louis of Bavaria and Frederick of Austria, in favor of the latter.

He was involved in several other controversies of a more theological nature; that on the poverty of Christ, which sprang up among the Franciscans (see FRATICELLIANS), was partly connected with support given by the recalcitrant members of the order to Louis. His opinion that the just would not be admitted to the beatific vision until the general resurrection was vigorously opposed by many theologians, and he retracted it before his death. He endeavored to propagate the Christian faith in the most distant lands and to promote a crusade, in which he was hindered by the constantly divided state of Christendom. He collected large sums for the treasury of the Church, but his own life was simple and ascetic. Consult: Friedensburg, *Ludwig der Bayer und Friedrich von Oesterreich* (Göttingen, 1877); Verlaque, *Jean XXII, sa vie et ses œuvres* (Paris, 1883); Souchon, *Die Papstwahlen von Bonifaz VIII. bis Urban VI.* (Brunswick, 1888). —JOHN XXIII (Pope, 1410–15), Baldassarre Cossa, of a noble Neapolitan family. He was made Cardinal in 1402. He took a prominent part in the Council of Pisa and in the effort to terminate the great schism by the elevation of Pietro Philargi as Alexander V. On Alexander's death he was chosen by the same dubious authority. He called the Council of Constance (q.v.), by which he was deposed. He fled, but was captured and imprisoned for four years, until he was released by the intervention of his successor, Martin V, who made him dean of the Sacred College. He died and was buried in Florence. Consult, for John XXII, XXIII, Pastor, *History of the Popes*, vols. i–xii (St. Louis, 1898–1913), and Mandell Creighton, *History of the Papacy* (6 vols., New York, 1899–1901).

JOHN I, ZIMISCES (925–976). A Byzantine Emperor (969–976). Nicephorus Phocas, who had mounted the throne by his aid, gave him the chief military command in the Empire. He ably seconded the Emperor in his victorious campaigns against the Saracens, but through jealousy he was deprived of his command. At the same time the Emperor was unpopular, and John was in love with the Empress; consequently he murdered the Emperor and himself mounted the throne. During his reign war was waged successfully against the Russians, whom he drove out of Thrace in 970–973, the Saracens, from whom he recovered part of Syria, and the Bulgarians. He is supposed to have been poisoned while on his return from the campaign in Syria. Consult: Schlumberger, *L'Épopée Byzantine*, vol. i (Paris, 1896), and Edward Gibbon, *Decline and Fall of the Roman Empire* (2d ed., by J. B. Bury, vol. v, London, 1901).

JOHN II, COMNENUS or **KALOJOANNES** (1088–1143). A Byzantine Emperor, called "The Good." He succeeded his father, Alexius, on the throne in 1118. Although himself a man of high character, and a winner of many victories in his wars against the Turks in Asia and against the Serbians and the Hungarians in Europe, yet his administration was weak, and his whole government enfeebled by corruption. Consult Edward Gibbon, *Decline and Fall of the Roman Empire* (2d ed., by Bury, vol. v, London, 1901), and Chalandon, *Les Comnènes*, vol. i (Paris, 1912).

JOHN V. Byzantine Emperor. See PALÆOLOGUS.

JOHN VI. Byzantine Emperor. See CANTACUZENUS.

JOHN VII, VIII. Byzantine emperors. See PALÆOLOGUS.

JOHN I (1350–95). King of Aragon and son of Peter IV, whom he succeeded on the throne in 1387. He maintained a school of troubadours at his court.

JOHN (1513–71). Margrave of Brandenburg-Küstrin, second son of the Elector Joachim I of Brandenburg, born at Tangermünde. He was better known as Hans of Küstrin, from one of the possessions which he secured upon the death of his father in 1535. Although brought up a Catholic, he introduced the Protestant religion into his dominions in 1537 and the next year joined the Schmalkaldic League, though with the express stipulation that it should be for the purpose of protecting religious belief and not for political reasons. Consequently, on the outbreak of the Schmalkaldic War, he joined the Emperor Charles V and took an important part in the battle of Mühlberg, where the Imperial forces gained a decisive victory over the Protestant princes (1547). At length realizing the mistake he had made, he went over to the Elector Maurice of Saxony and exerted himself on the Protestant side during the treaty making at Passau (1552). Internal peace once more restored to Germany, he accompanied the Emperor Charles V in his French campaign and took part in the unsuccessful siege of Metz. His chief title to fame, however, rests in the ability with which he governed his lands. He restrained the nobility, cleared the country of highway robbers, extended its frontiers, and encouraged agriculture, commerce, and industries.

JOHN I (1358–90). King of Castile from 1379 to 1390. He succeeded to the throne on the death of his father, Henry II. To defeat the schemes of John of Gaunt (q.v.), Duke of Lancaster, who had assumed the title of King of Castile, and of Ferdinand of Portugal, he attacked Portugal. Ferdinand submitted in 1382 and made peace by giving his daughter Beatrice, the heiress of Portugal, to John. On Ferdinand's death, in 1383, John again made war upon Portugal in support of the claims of Beatrice, and later fought against John I, who had been elected King of that country, but failed the first time on account of a pestilence and the second time was defeated at Aljubarotta in 1385. See SPAIN, *History*.

JOHN II OF CASTILE (1405–54). Despite the mutually antagonistic opinions of two prominent historians (Menéndez y Pelayo and Burke), the reign of John II of Castile must still be considered of prime importance for the political and literary history of the end of the Spanish Middle Ages. John II, born in 1405, was but two years old at the time of his father's death. Castile again went into the hands of a Regent—Ferdinand, the brother of the late King (Henry III of Castile), who shared the regency with the widowed Queen Katherine (daughter of John of Gaunt and Constance of Castile). Fortunately for Spain, he was the best Regent Castile had yet had. In 1416 Ferdinand (who had become King of Aragon in 1412) died, and two years later Katherine died also, leaving an inexperienced boy of 13 to the tender mercies of dissolute favorites. In 1419, shortly after his marriage (1418) to Mary, the daughter of his uncle Ferdinand, he took the reins of government. From the death of Ferdinand, however, the real ruler of Castile was the celebrated Alvaro de Luna, a relative of the indomitable Antipope Benedict XIII. Accordingly the reign might more appropriately be called the reign

of Alvaro de Luna. Plots and counterplots, revolutions and counter-revolutions, were the order of the day throughout the whole of the long reign. After the death of Queen Mary (1445), Don Alvaro brought about the King's marriage (1450) with Isabel of Portugal, who promptly broke the favorite's power by encouraging the King to assert his independence. In 1453 Don Alvaro was executed. A year after the marriage the Princess, later (after the death of her half brother Henry IV) Queen, Isabella was born.

A period so tumultuous as this would hardly seem propitious for literary productivity, and it is true that the great lights in it are not very numerous; but the sum total of lesser lights makes a galaxy only less brilliant than that of the great *siglo de oro*. John II has many points in common with his great ancestor Alfonso X (the Wise), but those very points in common accentuate the essential differences: John II was literary rather than scientific, pedantic rather than scholarly, formal rather than substantial, graceful rather than profound. Still he gave a not unintelligent protection to literary men and their works and did much for the universities and scholars. Consult: Comte de Puymaigre, *La cour littéraire de Don Juan II, roi de Castille* (2 vols., Paris, 1873); Fernán Pérez de Guzmán, "Generaciones y semblanzas," in *Biblioteca de autores españoles*, vol. lxxviii (Madrid, 1877); Marcelino Menéndez y Pelayo, *Antología de poetas líricos castellanos*, vols. iv-v (ib., 1893-94); Emilio Cotarelo y Mori, *D. Enrique de Villena* (ib., 1896); Alonso de Palencia, *Crónica de Enrique IV: traducción castellana por Antonio Paz y Melia*, vol. i, books i and ii (ib., 1904).

JOHN (1167-1216). King of England from 1199 to 1216. He was the youngest son of Henry II by his wife, Eleanor of Aquitaine, and was born on Dec. 24, 1167. His father called him Lackland, probably because Henry had divided his dominions among his elder sons and thus left John without a portion. John was given, in 1177, the lordship of Ireland, and in April, 1185, he went over to take the reins of government, but ruled so badly that he was recalled the following September. John united with his brothers in their repeated rebellions against their father, and it was the sudden communication of the news of his having joined his brother Richard's uprising that caused the death of Henry. When Richard I succeeded to the crown, he conferred upon his young brother earldoms which amounted to nearly one-third of the Kingdom. This did not, however, prevent John from endeavoring to seize the crown during Richard's captivity. John was, nevertheless, pardoned on Richard's return and treated with great clemency and is said to have been designated by his brother on his deathbed as his successor. John hastened, at his brother's death, to obtain the support of the continental barons and then returned to England, being crowned at Westminster May 27, 1199. Arthur (q.v.), the son of his elder brother, Geoffrey, was, according to modern laws of heredity, the lawful heir to the crown, but at this time the rules of succession to the crown were still imperfect. The claims of Arthur were supported by the King of France, but John bought off the latter's influence. In 1200 he obtained a divorce from his first wife, Isabella or Avice of Gloucester, and married Isabella of Angoulême, who was betrothed to Hugh

le Brun, son of Hugh, Count of La Marche, one of his vassals. In revenge Le Brun stirred up the nobles of Poitou against him and embraced the cause of young Arthur. In the war which ensued, Arthur, who was again assisted by France, was taken prisoner and confined in the castle of Rouen, where, according to tradition, he was put to death. As a result of the war, the English monarch lost to Philip Augustus of France Normandy, Touraine, Maine, Anjou, and Poitou. In 1207 John quarreled with the Pope concerning the appointment of a new Archbishop of Canterbury, and, as a result, the Kingdom was placed under an interdict in 1208; John in return confiscated the property of the clergy who obeyed the interdict and banished the bishops. He also compelled William, King of Scotland, who had joined his enemies, to do him homage (1209), put down a rebellion in Ireland (1210), and subdued Llewellyn, the independent Prince of Wales (1211). The Pope, in 1212, solemnly deposed John, absolved his subjects from their allegiance, and commissioned Philip Augustus of France to execute his sentence. John, denounced by the Church and hated for his cruelty and tyranny by his subjects, found his position untenable and was compelled, in 1213, to make abject submission to Rome and to hold his kingdom as a fief of the papacy. Philip Augustus, nevertheless, proceeded with his scheme of invasion, though no longer approved by Rome; but the French fleet was totally defeated in the harbor of Damme. Subsequent events, however, proved more favorable to France, and John's strength was crushed in 1214 by the defeat at Bouvines (q.v.). At length the English barons saw the opportunity to end the tyranny of John; they drew up a petition demanding the redress of abuses in the government and the administration of justice and the issuance of a charter of liberties modeled on that of Henry I. This was rejected by the King and became the signal for war. The army of the barons assembled at Stamford and marched to London; they met the King at Runnymede and on June 15, 1215, was signed the great charter, Magna Charta (q.v.). The Pope soon after annulled the charter, and the war broke out again. The barons now called over the Dauphin of France to be their leader, and Louis landed near Sandwich, May 21, 1216, and gained control over a large part of England. John attempted to regain this territory, but in crossing the Welland lost his regalia and treasures and part of his baggage and army. He was taken ill, and died at Newark Castle Oct. 19, 1216. John had five legitimate children: Henry III; Richard, Earl of Cornwall; Joan, Queen of Scotland; Isabella, Empress of the Holy Roman Empire; and Eleanor, whose second husband was Simon de Montfort. One of his illegitimate children married Llewellyn I, Prince of North Wales.

H. Vickers, "England in the Later Middle Ages," in his *History of England*,

vol. iii (ib., 1913); S. K. Mitchell, "Studies in Taxation under John and Richard III," in *Yale Historical Publications, Studies 2* (New Haven, 1914).

JOHN II (1319-64). King of France from 1350 to 1364, surnamed "The Good." He succeeded his father, Philip VI of Valois, in 1350, and commenced his reign by acts of despotism and cruelty. The English invaded France, and John was defeated by Edward the Black Prince at Poitiers (q.v.) in 1356. John himself was taken prisoner, carried to Bordeaux and then to London, where he was detained until Oct. 25, 1360. His ransom was fixed by a treaty with Edward III at Brétigny (q.v.). In 1363 he secured for his son Philip the Duchy of Burgundy, which was destined to become a danger to France. His son, the Duke of Anjou, who had been in London as a hostage for the payment of John's ransom, escaped in violation of his parole, and thereupon John voluntarily returned in 1364 as a prisoner to London, where he suddenly died. Consult Lavissee, *Histoire de France*, vol. iv, part i (Paris, 1902).

JOHN III, VATATZES, or DUCAS (1193-1254). Emperor of Nicæa. His skill as a soldier led to his being chosen to succeed Theodore I in 1222. He reorganized the remaining portions of the East Roman Empire, extended his boundaries to Rhodes, defeated the Latin Emperor, and the final recapture of Constantinople was largely due to his efforts, although his own siege of that city in 1235 did not succeed. Consult Pears, *Destruction of the Greek Empire* (London, 1903).

JOHN IV, LASCARIS (c.1250-c.1300). Emperor of Nicæa. He succeeded his father, Theodore II, in 1258, when he was scarcely 10 years old. Three years afterward he was deposed and blinded by Michael Palæologus. Consult Pears, *Destruction of the Greek Empire* (London, 1903).

JOHN II, CASIMIR (1609-72). King of Poland from 1648 to 1668. He was the youngest son of Sigismund III and on his father's death, in 1632, became lord of an extensive appanage in Poland. In 1640, however, he entered the Jesuit Order at Rome and was made Cardinal by Pope Innocent X. Returning to Poland, he was elected to succeed his brother, Ladislaus IV, as King in 1648, and married his widow, Maria Luisa Gonzaga, receiving from the Pope absolution from his vows. The first part of his reign was disturbed by the revolt of the Cossacks under Chmielnicki. In 1655 Charles X of Sweden made war upon Poland and in 1656 was joined by Frederick William, Elector of Brandenburg. In 1657 the Elector went over to the side of Poland, which in return formally renounced its suzerainty over East Prussia. Peace was made with Sweden at Oliva in 1660. By the Treaty of Andrussovo (1667) the Polish King ceded White and Red Russia and the Ukraine east of the Dnieper to Russia. Broken by misfortune, John abdicated at the Diet of Warsaw, Sept. 16, 1668, and retired to France. He died at Nevers, Dec. 16, 1672. See POLAND.

JOHN III, SOBIESKI (1624-96). King of Poland from 1674 to 1696 and one of the greatest warriors of the seventeenth century. He was born at Olesko, Galicia, June 2, 1624, and was educated with great care, together with his brother Mark, by his father, James Sobieski, Castellan of Cracow, a man distinguished in the civil and military life of Poland. The brothers

traveled in France, England, Italy, and Germany, until their father's death recalled them home in 1648. Poland was then on the decline and involved in constant wars with Sweden, Brandenburg, Russia, the Tatars, the Turks, and the Cossacks. The Sobieskis, as became their rank and training, entered the military service. Mark fell in battle against the Cossacks; John distinguished himself by his valor and became the most efficient Polish leader of his time. He became grand marshal in 1665 and commander in chief of the Polish forces and Waywode of Cracow in 1667. On Nov. 11, 1673, he defeated the Turks in the great battle of Khotin in Bessarabia. After the death of King Michael Wisniowiecki (1673) he was unanimously elected King of Poland (May 21, 1674). He turned from the French alliance, which seemed cemented by his election, to that of Austria because of a pique on the part of his wife, and when the Turks besieged Vienna in 1683 John hastened to its relief with 20,000 Polish troops. Near Vienna he was joined by the Duke of Lorraine and the Imperial troops, and on September 12 the combined army of 70,000 assailed the Turkish forces under Kara Mustapha in their camp around Vienna. The enemy, whose numbers are estimated at 275,000 men, were overwhelmingly defeated and driven back to the Raab. Sobieski was received with acclaim by the Viennese, but the Emperor Leopold showed strange ingratitude in his treatment of the deliverer and of the Polish army. Sobieski became the hero of Christendom, but this was the climax of his career. He was hampered by the wretched politics of the aristocratic Polish Republic and by the intrigues of foreign parties in his court, and the later years of his life were full of disappointment. He died of apoplexy, June 17, 1696. John Sobieski was not only a statesman and warrior, but a patron of science and literature. His constant wars, however, prevented that attention to the internal condition of Poland which its critical situation urgently required. He had, too, many of the faults of the high Polish nobility, and he was too much under the influence of his wife, an intriguing and frivolous woman. The family of Sobieski was extinguished with the death of the last descendant, in 1875. Consult: Tatham, *John Sobieski* (Oxford, 1881), the Lothian prize essay at Oxford in that year; Dupont, *Mémoires pour servir à l'histoire de Sobieski* (Warsaw, 1885), by a French officer in the Polish service under Sobieski; Salvandy, *Histoire de Pologne avant et sous le roi Jean Sobieski* (2 vols., new ed., Paris, 1855); Coyer, *Histoire de Jean Sobieski* (Amsterdam, 1761 and 1783); Waliszewski, *Acta* (3 vols., Cracow, 1684), extracts from the foreign archives of France in regard to the relations of Sobieski with that country; Rieder, *Johann III., König von Polen* (Vienna, 1883); Chelmecki, *König J. Sobieski und die Befreiung Wiens* (ib., 1883); Du Hamel de Breuil, *Sobieski et sa politique de 1674 à 1683* (Paris, 1894).

JOHN I, THE GREAT (1357-1433). King of Portugal from 1385 to 1433, sometimes known as "The Bastard." He was the founder of the illegitimate Burgundian line and was born at Lisbon (being a natural son of Peter I). In 1364 he was created Grand Master of Aviz. After the death of his half brother, Ferdinand, in 1383, he became Regent and Protector of the Kingdom, and in April, 1385, was chosen King by the Portuguese in violation of the rights of

the Infanta Beatrice, who had married John I, King of Castile. A war followed, resulting in favor of the Portuguese, who won the battle of Aljubarrota, in 1385. In 1415 John took Ceuta from the Moors. The island of Madeira was discovered in his reign largely through the efforts of his son, Prince Henry the Navigator (q.v.). The reign of John I, whose conquests and good government earned him the title of "The Great," marks the beginning of the heroic age in Portuguese history. He died, after a long and glorious reign of 48 years, in August, 1433, and was succeeded by Edward, the eldest of his six sons by his wife, Philippa of Lancaster. Consult H. M. Stephens, *Portugal* (New York, 1893), and V. de Bragança Cunha, *Eight Centuries of Portuguese Monarchy* (ib., 1911).

JOHN II, THE PERFECT (1455-95). King of Portugal from 1481 to 1495. He was born at Lisbon, being the son of King Alfonso V. In his youth he showed himself possessed of high courage and attainments. In 1471 he married Leonora of Lancaster and succeeded his father in 1481. He put to death for conspiracy the dukes of Braganza and Viseu in 1483. During his reign the African coasts were thoroughly explored by Portuguese navigators, and Bartholomeu Dias discovered the Cape of Good Hope (1488). By the Convention of Tordesillas (1494) Portugal divided with Spain the newly discovered world in the Western Ocean. (See DEMARCATION, LINE OF.) John II was a monarch of remarkable political sagacity and broad views and sought in every way to promote commerce, art, and industry in his Kingdom. His premature death (Oct. 25, 1495) has been attributed to slow poisoning. His only son, Alfonso, having died in 1491, he was succeeded on the throne by Emmanuel, Duke of Beja, his brother-in-law. Consult J. P. Oliveira Martins, *O principe perfeito* (Lisbon, 1895).

JOHN III (1502-57). King of Portugal from 1521 to 1557. He was the son of Emmanuel the Great, whom he succeeded in 1521. He found Portugal at the very height of its power, but during his reign its influence began to wane, and it lost much of the prestige which it had formerly enjoyed. The Inquisition was introduced, and the control of the University of Coimbra was placed in the hands of the Jesuits. Colonial enterprise, however, continued under his reign. As a result of the Congress of Badajoz (1524), Portugal's title to Brazil was conceded by Spain, and a beginning was made towards the colonization of the country by its division into captaincies which were granted out to the great nobles to be held in feudal tenure. In the East Indies, too, the Portuguese power was greatly extended. Consult V. de Bragança Cunha, *Eight Centuries of Portuguese Monarchy* (New York, 1911).

JOHN IV, THE FORTUNATE (1605-56). King of Portugal from 1640 to 1656 and the founder of the Braganza dynasty. He was born at Villaviciosa in 1604, being descended from both the legitimate and illegitimate royal families of Portugal. Before an almost bloodless revolution raised him to the Portuguese throne in 1640, John IV was Duke of Braganza, which title he had inherited in 1630. In 1633 he married Luisa de Guzmán, oldest daughter of the Duke of Medina Sidonia and a woman of energetic personality. As leader of the patriotic party, he succeeded in 1640 in expelling the Spanish usurpers and making himself King, after the country had

been 60 years under the yoke of Spain. His election was ratified by the Cortes in January, 1641. For 15 years John IV ruled Portugal with energy and ability, restoring the finances and promoting commerce and agriculture. The Spaniards were completely defeated early in his reign at the battle of Montijo (1644) and gave no further trouble. In 1649 and 1654 the Portuguese won important naval victories over the Dutch off the coast of Brazil. At the time of his death (Nov. 6, 1656) John had succeeded in restoring Portugal to her place among the nations and establishing his family firmly on the throne. Two of his sons succeeded him in turn, as Alfonso VI and Pedro II respectively, and his daughter, Catharine of Braganza, became the wife of Charles II of England, bringing Bombay as her dowry. Consult: J. Pinto Ribeiro, *Usurpação, retenção, restauração de Portugal, 1642* (Lisbon, 1642); J. de Vasconcellos, *Restauração de Portugal, 1643* (ib., 1643-44); E. de Faria y Sousa, *History of Portugal (down to 1640), Translated and Continued down to this Present Year, 1698, by Capt. John Stevens* (London, 1698).

JOHN V (1689-1750). King of Portugal from 1706 to 1750. He was the son of Peter II, whom he succeeded in 1706 in the midst of the War of the Spanish Succession, in which Portugal was involved as an ally of Great Britain and the Emperor. By the Treaty of Utrecht (1713) Portugal was confirmed in its possession of both banks of the Amazon. The King was a man of strong religious tendencies and devoted much attention to ecclesiastical affairs. Numerous churches and convents were erected, and to this end the army and the navy were allowed to sink into complete inefficiency. For thus turning the entire government of the Kingdom into the hands of the clerics, Pope Benedict XIV in 1748 bestowed upon him and his successors the title "Most Faithful King."

JOHN VI (1767 or 1769-1826). King of Portugal from 1816 to 1826. He was the son of Peter III and of Queen Maria I, who succeeded her father, Joseph I, in 1777. In 1792 Queen Maria became insane, and John took the reins of government into his own hands. In 1799 he was formally declared Prince Regent of the Kingdom. In 1807 Napoleon attempted to force upon the Regent the acceptance of the Continental System (q.v.), and on the latter's hesitation a French army under Junot entered the country. On November 27 the Prince Regent and the court sailed for Brazil, leaving the government in charge of a council of regency under the Marquis of Abrantes. On the death of his mother, in 1816, John became King. In Portugal, where the government after the expulsion of the French was carried on by Marshal Beresford, great dissatisfaction prevailed over the arbitrary character of the latter's rule, as well as over the continued absence of the court. In 1820 the troops at Oporto and Lisbon rose in insurrection and proclaimed a liberal constitution closely modeled on the Spanish constitution of 1812. King John returned to Portugal in 1821, leaving his eldest son, Dom Pedro, as Regent of Brazil, and gave his adhesion to the new constitution. The party of reaction, however, was strong, and headed by Queen Carlotta and her younger son, Dom Miguel, took courage from the presence of the army of the Holy Alliance in Spain to stir up an insurrection in northern Portugal (May,

1823) and succeeded in obtaining control of the King's person. The Cortes was dissolved, a new ministry was appointed, and an absolutist régime established. Alarmed by the liberal leanings of certain members of the new government, Dom Miguel resolved on a coup d'état, which was carried out April 29, 1824. On May 9 King John took refuge on board an English man-of-war and proclaimed his son a traitor. Dom Miguel was forced to yield to the pressure of the Powers and left the country. John was reinstated in power and restored the liberal constitution. He died March 10, 1826. Brazil in 1822 had declared itself independent under Dom Pedro as Emperor, and its independence was acknowledged by Portugal in 1825. On the death of John VI the crown of Portugal also fell to Dom Pedro, who resigned it in favor of his daughter, Dona Maria da Gloria. Consult V. de Bragança Cunha, *Eight Centuries of Portuguese Monarchy* (New York, 1911).

JOHN (1801-73). King of Saxony from 1854 to 1873. He was the youngest son of Prince Maximilian of Saxony and was born at Dresden, Dec. 12, 1801. In his youth he traveled in Italy, where he became an ardent student of Italian literature and a devotee of Dante. In 1830 he became commander of the local militia and was made a member of the Privy Council, taking his seat subsequently in the Council of State. As a member of the Upper Chamber, he exerted a very powerful influence on legislation. On the death of his brother, Frederick Augustus II, Aug. 9, 1854, he became King. In spite of his great attainments his statesmanship was not equal to meeting the crucial problems presented by the progressive rôle of Prussia in German affairs. In the War of 1866, acting upon the advice of his Prime Minister, Count Beust (q.v.), and hoping to strengthen Saxony, he embraced the cause of Austria. Saxony was invaded by Prussian troops, and after the defeat at Sadowa the King was forced to enter into the North German Confederation. He was loyal to the German cause during the Franco-German War of 1870-71 and played his part in the founding of the German Empire. He died at Pillnitz, Oct. 29, 1873. He published an excellent metrical translation of the *Divina Commedia*, with valuable notes (1839-49), under the pseudonym Philalethes. He also left manuscript translations of 70 English poems. He married, in 1822, Amalia Augusta, daughter of Maximilian Joseph, King of Bavaria, by whom he had nine children, of whom his eldest son, Albert, succeeded him.

JOHN OF AUSTRIA (1545-78). A Spanish general, commonly known as Don John (Juan) of Austria. He was the illegitimate son of the Emperor Charles V by Barbara Blomberg, the then unmarried daughter of a citizen of Ratisbon, and was born Feb. 24, 1545. He was not at first acknowledged by his father, who nevertheless provided for his bringing up. In 1550 he was taken to Spain and until 1559 remained under the care of Don Luis de Quijada at the latter's castle of Villagarcía, near Valladolid. In his will Charles V recognized him as his son and intrusted him to the care of his successor, Philip II, who in 1559 granted him the rank of a prince of the house of Austria and an establishment at Madrid. He was educated together with the Infante Don Carlos and Alexander Farnese, Prince of Parma. In 1568 he was given the command of a squadron which operated against the Barbary pirates and in the follow-

ing year was intrusted with the task of suppressing the Morisco rebellion in Andalusia. Though he was far from cruel by nature and protested earnestly against his instructions, Don John none the less carried them out relentlessly, displaying great military skill in the campaign. By November, 1570, all of the Moriscos had either been killed or made their submission. Upon the formation of the Holy League by Spain, the Pope, and Venice against the Turks in 1571, Don John was given the supreme command of a fleet of more than 200 galleys, with which he won a splendid victory over the superior forces of the Turks at Lepanto, Oct. 7, 1571, killing or taking more than 30,000 of the enemy and releasing more than 12,000 Christian galley slaves. His ambition to establish an independent kingdom for himself in Greece was frustrated by the opposition of the Spanish King. In October, 1573, he took Tunis from the Turks, hoping to make himself ruler of the city; but here, too, his plans shattered against the jealous refusal of Philip II. In 1576 he was appointed Governor of the Netherlands, to succeed Don Luis de Requesens. The Pacification of Ghent, signed in the same year, had united all of the provinces, except Luxemburg, against Spanish misrule, and Don John was forced to make the journey to the north disguised as a slave in the train of Ottavio Gonzaga. From Luxemburg he carried on negotiations with the Estates and was able to enter Brussels (May, 1577) only after he had issued his Perpetual Edict, reaffirming the immunities granted the Protestants by the Pacification of Ghent, and promising in addition the removal of the hated Spanish soldiery from the country. William of Orange, however, continued in his policy of opposition, out of distrust in the promises of the Spanish party, although Don John seems to have carried out the terms of the edict in sending the Spanish soldiers out of the country and delivering a number of castles into the hands of Flemish commanders. In December, 1577, Don John was deposed by the Estates, and William, as Protector of Brabant, took the field against him. With the aid of a Spanish army, brought to the Netherlands by Alexander Farnese, his old schoolmate, Don John won the victory of Gembloux, Jan. 31, 1578, but, for lack of support, was unable to prosecute the campaign. Philip II, who saw in Don John's success a possible danger to himself, delayed in sending him reënforcements, and this enabled the party of Orange to make headway against the Governor. He died suddenly at his camp near Namur, Oct. 1, 1578, his death being attributed to poison administered by order of Philip II. For such a conjecture, however, there is no basis of fact. Consult: Montplainchamp, *Histoire de Don Jean d'Autriche* (Amsterdam, 1690); Sir William Stirling-Maxwell, *Don John of Austria* (2 vols., London, 1883); J. L. Motley, *History of the United Netherlands* (4 vols., New York, 1900); Luis Coloma, *Story of Don John of Austria* (London, 1912).

JOHN OF BRIENNE (?1148-1237). King of Jerusalem from 1210 to 1225 and Latin Emperor of Constantinople after 1229. When Mary became Queen of Jerusalem, the barons sent to Philip Augustus, asking him to choose a husband for her. He named John, who went to the Holy Land and married Mary in 1210. In 1212, on the death of the Queen, he became Regent for his daughter, who inherited the crown. He took an important part in the Crusade of 1218-21.

In 1225 the Emperor Frederick II, who had married John's daughter, forced him to resign the title of King. Soon after John took command of the papal troops in the attack upon Frederick's possessions. In 1229 he was chosen Emperor of the Latin Empire and spent the remaining years of his life in its service. Consult Georges, *Jean de Brienne* (Troyes, 1858). See BALDWIN II.

JOHN OF CAPPADOCIA. Logothete and later prætorian prefect under the Emperor Justinian, after 530 A.D. He filled the Imperial treasury by taxation, but was noted for his dishonesty, cruelty, gluttony, and debauchery. In 541, by a stratagem of Theodora, he was detected in a crime and was exiled. After Theodora's death, in 548, he was recalled to Constantinople, and again reinstated in favor. But he is said to have died in poverty. Consult Edward Gibbon, *Decline and Fall of the Roman Empire* (ed. by J. B. Bury, vol. iv, London, 1898).

JOHN OF DAMASCUS, SAINT (c.700-754). The author of the standard textbook of dogmatic theology in the Greek church. He was born at Damascus about 700 A.D. Like his father, he was a financial officer of high rank under the Caliph of Damascus. Much excited over the Imperial order forbidding the ecclesiastical use of images, he issued three letters, about 730, in behalf of image worship. Being outside of the Greek Emperor's authority, he escaped his wrath; but ultimately his position was made uncomfortable, and soon afterward he became a monk in the convent of Mar Saba, near the western shore of the Dead Sea and some 18 miles southeast of Jerusalem, where he spent the rest of his days in the composition of theological works and was ordained a priest. He died about 754 A.D. and had the honor of being canonized by both the Latin and Greek churches; in the former his day is May 6, in the latter December 4. He is one of the doctors of the Latin church. On account of his eloquence he has received the epithet Chrysorroas (the stream of gold). He was a man of extensive erudition and was considered the ablest philosopher of his time; but by some his writings are considered to show weakness of judgment and of critical power. His fame rests upon his three *Operations*, or letters upon image worship (trans. by Allies, *John Damascene's Treatise on Holy Images and Sermons on the Assumption*, London, 1899); and on his *Fount of Knowledge*, in three parts: (1) "Heads of Philosophy," (2) "Compendium of Heresies," and (3) "An Exact Exposition of the Orthodox Faith" (Eng. trans. of the third part by Salmond, in *Nicene and Post-Nicene Fathers*, 2d ser., vol. iv, pp. 1-106). He is also the reputed author of the tale of *Barlaam and Ioasaph*, in which Buddha becomes a Christian saint (Eng. trans. by Woodward and Mattingly, in the Loeb Library, New York, 1914). His complete works are in Migne, *Patrologia Græca*, vols. xciv-xcvi (Paris, 1854-66). Consult, for his biography, Langen (Gotha, 1879); J. H. Lupton (London, 1882); Alexander Whyte, *Father John of the Greek Church* (New York, 1898); Adolf Harnack, *History of Dogma*, vols. iii, iv (Boston, 1897-99); K. I. Burkhard, *Johannes von Damaskus Auszüge aus Nemesius* (Vienna, 1909). Douglas (London, 1901) has made him the subject of a poem.

JOHN OF GAUNT, DUKE OF LANCASTER (1340-99). The fourth son of Edward III of England. He was born at Ghent, whence his name

(Gaunt). In the English wars with France and Spain he served with great bravery. He succeeded in 1361 to the Earldom of Lancaster in the name of his wife, Blanche, who was the daughter of Henry, Duke of Lancaster, and whom he had married in 1359. In 1369 his wife died; but two years later John married Constance, daughter of Peter the Cruel, King of Castile, whom the English had been aiding against his rival, Henry of Trastamare (q.v.). Peter the Cruel having been killed in 1369, John claimed the crown of Castile, but was never able to make any headway against Henry. The contest was ended upon the marriage of his daughter to the heir to the throne, in 1388. Meanwhile war had broken out with France also, and as the Black Prince was ill, John took command of the army, but was singularly unsuccessful, and the English lost nearly all of their conquests in France. The domestic affairs of England were also approaching a crisis, for Parliament objected to the corrupt practices of Lord Latimer and Richard Lyons, whom John protected, and to the influence of King Edward's mistress, Alice Perrers. In 1376 the so-called Good Parliament banished her, but, after it was dissolved and the Black Prince had died, John of Gaunt returned to power. He became involved, on account of his hostility to Bishop Wykeham, in a long contest with the clergy, in which he became allied with Wiclif (q.v.). His second wife died in 1394, and in 1396 he married his mistress, Catharine Swynford, whose children, the Beauforts, were declared legitimate by Parliament in 1397. He died Feb. 3, 1399, at Ely House in Holborn. He was the foremost patron of art and literature of his day, among his protégés being the poet Chaucer, whose material fortunes were dependent upon the Duke's career. His son, surnamed Bolingbroke, became in 1399 King of England under the title of Henry IV (q.v.). Consult: William Stubbs, *Constitutional History of England*, vol. ii (Oxford, 1896); Sydney Armitage Smith, *John of Gaunt* (London, 1904); G. M. Trevelyan, *England in the Age of Wycliffe* (New York, 1909); Sydney Armitage Smith (ed.), *John of Gaunt's Register* (2 vols., London, 1911); K. H. Vickers, "England in the Later Middle Ages," in his *History of England*, vol. iii (ib., 1913).

JOHN OF HALIFAX, or HOLYWOOD. See SACROBOSCO.

JOHN OF LEYDEN, properly JAN BEUKELSZOON, BOCKELSON, or BOCKOLD (c.1510-36). An Anabaptist fanatic. He was born in Leyden about 1510. For a time he wandered about as a journeyman tailor and then settled in his native city. Adopting the opinions of the Anabaptists (q.v.), he became one of their wandering prophets. In 1533 he went to Münster with Jan Matthys (Matthiesen), and when the latter lost his life in 1534 became his successor. He set aside the ancient constitution of the city, set up in Münster "the kingdom of Zion," appointed judges, and applied in an extravagant manner the principles of the Old Testament theocracy. He himself became "King of Zion." He introduced polygamy and displayed a great love of kingly pomp. In June, 1535, the town was taken by the Bishop of Münster. John and his chief accomplices suffered death under circumstances of fearful cruelty (Jan. 23, 1536), and his body was suspended in a cage from a church tower. He attempted to save his life by

confession and submission. Consult E. B. Bax, *Rise and Fall of the Anabaptists* (New York, 1903). See ANABAPTISTS.

JOHN OF LUNA. See JOHN OF SEVILLE.

JOHN OF LUXEMBURG (1296–1346). King of Bohemia. His father, the German Emperor Henry VII (Count of Luxemburg), secured for him the hand of Elizabeth, daughter of Wenceslas of Bohemia, and in 1310 he was chosen King of that country. After his father's death, which occurred three years later, he hoped to be elected Emperor, but, finding that his youth was regarded as an insuperable obstacle, he threw all his influence on the side of Louis the Bavarian and against the Hapsburg candidate. Through the favor of the new Emperor he was able to add considerably to his kingdom, and so laid the foundations of that great German-Slavic dominion over which his son, Emperor Charles IV, was to rule. His reign began auspiciously, but was soon disturbed by internal discord, which had its origin in the race hatred of the Germans and the Czechs; and as John, not a great ruler in any case, spent most of his time away from Bohemia waging wars in the interest of Louis, of his native Luxemburg, and of the Teutonic knights, or squandering his kingdom's revenues at the gay court of France, affairs at home, left to the management of deputies, went from bad to worse. So greatly did the feeling of his subjects towards him change during these years that when, in 1339, he became totally blind, the same Bohemians who had welcomed his accession with extravagant demonstrations of joy now felt he was justly punished by God. Other misfortunes overtook him also. His second son, John Frederick, who had married Margaret, famous as Margaret Maultasch, Countess of Tirol, was discarded by his wife, who married the Emperor's son. This and John's growing intimacy with the King of France, whose papal protégé at Avignon had always opposed Louis's claims, led to a rupture between him and the Emperor. In July, 1346, he secured the election of his own son as King of the Romans in place of Louis, who was formally deposed. In the same year he accompanied Philip VI of France in his disastrous campaign against the English, and at the battle of Crécy, guided by a knight on either side, forced his way into the thick of the fight and there was killed. It was at this battle that Edward the Black Prince won his spurs, and, according to Camden, he adopted the Bohemian King's insignia, three ostrich plumes, and the motto "Ich dien," which ever since have been borne by the princes of Wales; but there is no proof for this statement. Consult Weech, *Kaiser Ludwig der Bayer und König Johann von Böhmen* (Munich, 1860), and Schötter, *Johann, Graf von Luxemburg und König von Böhmen* (2 vols., Luxembourg, 1865).

JOHN OF NEPOMUK, or POMUK (?–1393). A popular Bohemian saint of the Catholic church. The history of his life is very uncertain. He is said to have been born at Nepomuk between 1330 and 1340. Having entered into orders, he rose rapidly to distinction, being created a canon of the cathedral of Prague and eventually a vicar-general of the diocese. The legend is that, the Queen of Wenceslas IV having selected him for her confessor, Wenceslas, himself a man of dissolute life, conceiving suspicions of her virtue, required of John to reveal to him what

he knew of her life from the confessions which she had made to him. John steadfastly refused, and the King, having first put John to the torture, at which he himself personally presided, had him tied hand and foot and flung, already half dead from the rack, into the Moldau (March, 1393). His memory was cherished with peculiar affection in his native country, and he was eventually canonized as a saint of the Roman Catholic church, his feast being fixed for May 16. By some historians two distinct personages of the same name are mentioned—one the martyr of the confessional zeal, the other of his resistance to the simoniacal tyranny of Wenceslas; but the two are probably identical. The historical John of Pomuk was not the Queen's confessor, but vicar-general of the Archbishop of Prague. The King wished to violate canon law in order to found a new bishopric for one of his favorites, but John refused to accede, and his torture and death followed as in the legend. Consult his life by Wratislaw (London, 1873) and by Frind (Prague, 1879); also August Amrheim, *Historisch-chronologische Untersuchungen über das Todesjahr des heiligen Johannes von Nepomuk* (Würzburg, 1884).

JOHN OF PROCIDA. See PROCIDA, JOHN OF.

JOHN OF SALISBURY (c.1120–80). An English scholar and churchman, for 30 years the central figure of English learning. He was born between 1115 and 1120 at or near Old Sarum. In 1136 he went to France, attended the lectures of Peter Abélard and other famous masters, and remained there for several years, studying logic, grammar, the classics, and theology. He was sent on important missions to Popes Eugenius III and Adrian IV, by whom he was received with great honor. When Thomas à Becket became Archbishop of Canterbury, he was made his secretary, was with him in his exile in France, returned with him to England, and witnessed his martyrdom. In 1176 he was appointed Bishop of Chartres. His greatest works are: *Policraticus sive de Nugis Curialium et Vestigiis Philosophorum* (first printed, 1476), in eight books, a work of great erudition, dealing with government, philosophy, and various learning; and *Metalogicus*, in four books, a defense of the studies of the schools against the sneers of the ignorant. His *Vita et Passio Sancti Thomæ* and his letters, numbering about 300, are of the highest interest. Other works are: *Entheticus*, an elegiac poem containing 1852 lines, which deals with the same subject as *Policraticus*; *Vita Sancti Anselmi*; *Historia Pontificalis*. He died at Chartres, Oct. 25, 1180. John of Salisbury is described as a graceful Latin poet, an impressive orator, and by far the most learned man of his age. Consult his *Opera*, edited by Giles (5 vols., Oxford, 1848); Schaarschmidt, *Johannes Saresberiensis nach Leben und Studien, Schriften und Philosophie* (Leipzig, 1862); William Stubbs, *Seventeen Lectures on the Study of Mediæval and Modern History* (3d ed., Oxford, 1900).

JOHN OF SEVILLE, also called JOHN OF LUNA and JOHANNES HISPALENSIS (Hispalis, Seville). A Jewish scholar of the twelfth century. He was engaged by Raimond, Archbishop of Toledo, in the translation of various Arabic works on philosophy and mathematics. He made at least some of his translations in Spanish, and these were put into Latin by Domenico Gondisalvi. Boncompagni published the text of one of his

works, *Alghoarismi de Practica Arismetrice* (Rome, 1857). This is one of the oldest treatises concerning calculations with our numerals and zero. In spite of the title the original Arabic was probably not that of Mohammed ibn Musa (see AL-KHUWARIZMI), since it is much more developed than the arithmetical treatise of the latter.

JOHN OF SWABIA. See JOHN THE PARRICIDE.

JOHN OF WESEL. A German religious reformer who flourished about the middle of the fifteenth century. He was rector of the University of Erfurt (1456-57). He came under the ban of the Church by publishing an article against indulgences and escaped death at the stake only by recanting. He then entered a monastery, where he died in 1481. Of his writings there remain only *De Potestate Ecclesiastica* and *De Indulgentiis*. Consult Ullmann, *Reformatoren vor der Reformation* (2d ed., Gotha, 1866), and Clemen, "Ueber Leben und Schriften Johannis von Wesel," in *Deutsche Zeitschrift für Geschichtswissenschaften*, vol. ii (new ser., Freiburg, 1897).

JOHN THE CONSTANT (1468-1532). Elector of Saxony, son of the Elector Ernest, born in Schweidnitz. He succeeded his brother, Frederick the Wise, in 1525, and soon declared for the Reformation. The next year he entered into the Torgau Union with Philip I of Hesse and attended the Diet of Speyer. In 1528 he ordered a general parochial visitation in his dominions and in 1529 protested against a decision of the Diet of Speyer which was unfavorable to the Reformation. He was a bitter opponent of the Emperor Charles V at the Diet of Augsburg (1530). During the closing years of his life he devoted himself to organizing the Schmalkaldic League (q.v.).

JOHN THE FEARLESS (1371-1419). Duke of Burgundy from 1404 to 1419. He was the son of Philip the Bold. At the age of 25 he joined the King of Hungary against the Turks and was made prisoner at the battle of Nicopolis (1396). After nine months he was ransomed. He succeeded his father in 1404 as Duke of Burgundy, and on the death of his mother in 1405 became Count of Flanders. He was opposed by the French Queen and the Duke of Orléans, his rival. In 1407 he instigated the assassination of the Duke and soon obtained almost supreme power in France. (See CABOCHIENS.) This was followed by a civil war, in which John was aided by Henry IV of England. In 1414 and 1416 he formed alliances with Henry V of England and captured Paris in 1418, but was murdered on Sept. 10, 1419, at the instigation of the Dauphin, son of Charles VI, on the bridge of Monttereau, where he had gone to meet the Dauphin. Consult Lavissee, *Histoire de France*, vol. iv, part i (Paris, 1902).

JOHN THE PARRICIDE (1290-?). The assassin of the German Emperor Albert I (of Austria), often known as John of Swabia. He was the son of Rudolph, Albert's brother. John, when he attained his majority, demanded from his uncle the whole or a part of his patrimony, but was met with a curt refusal. After a number of abortive attempts to gain his end, John, with others who had cause to complain of Albert's rapacity, formed a conspiracy against the life of the Emperor. While Albert was crossing the Reuss, near the castle of Hapsburg, on May 1, 1308, he was murdered by the conspirators. John disappeared, and nothing defi-

nite is known of his later life, though various accounts represent him as repenting of his deed and expiating his crime in a cloister. He is one of the characters in Schiller's *Wilhelm Tell*. Consult Mücke, *Albrecht I. von Habsburg* (Gotha, 1866).

JOHN, AUGUSTUS EDWIN (1879-). A British painter, draftsman, and etcher, one of the principal leaders of Impression in England. He was born in Wales and studied at the Slade Art School, London, and afterward independently in Paris, where he seems to have been influenced by Puvis de Chavannes. But he learned most from his study of the old masters and was himself wont to say that his earliest masters were Rembrandt and Piero della Francesca. His work, however, is strikingly original. As compared with some Impressionists, he is conservative in methods, especially in the matter of form. This is evident in his admirable drawings, which aroused such favorable criticism at the International Exhibition held in New York in 1913. His favorite subjects are small figures alone or in landscape; these are often types of repulsive ugliness, which at times approach caricature, yet, again, are subtle and naïve. His able portraits are somewhat decorative in treatment, with emphasis upon the salient characteristics of the sitter. In his paintings the line is flowing and easy, the color bright and attractive, the handling free and powerful. Among his best-known paintings are the "Spanish Flower Girl," "Mother and Child," "Seraphita," and several fine scenes from gypsy life. Among his best-known portraits are those of Professor Mackay and the mayor of Liverpool. In the technique of his powerful etchings the influence of Rembrandt is apparent; the best of his plates include several portraits of himself, the "Coster Girl," "Profile of Bella," "Maggie and Lucy," "Quarry Folk," and "The Valley of Time." Although John never gained recognition from the Royal Academy, he exercised a wide influence upon recent British art through his numerous pupils. He became a leader of the New English Art Club, where he chiefly exhibited.

JOHN, BAPTIST JOSEPH FABIAN SEBASTIAN, ARCHDUKE OF AUSTRIA (1782-1859). An Austrian prince and general. He was born at Florence, the son of Leopold I, Grand Duke of Tuscany, afterward the Emperor Leopold II. At an early age John showed considerable military talent, and in the wars with France he played an important part. As commander, he was extremely unfortunate. His army was crushed by Moreau at Hohenlinden (1801); he was defeated at Salzburg soon afterward; shared in the disaster of Austerlitz in 1805; was overthrown at Raab, June 14, 1809; and was unsuccessful in an attempt to join the army of his brother, Archduke Charles, at Wagram. He was popular, however, on account of his amiability, the interest he took in the sciences and public improvements, and above all his favorable attitude towards German unity, in which he stood alone among those who represented the Austrian policy. When the German National Assembly met at Frankfort, after the commotions of 1848, he was called by a great majority, on June 29 of that year, to be Vicar (Reichsverweser) of Germany. The progress of events being unfavorable to the Austrian interests, he resigned his office Dec. 20, 1849.

JOHN, EPISTLES OF. Three of the canonical Epistles of the New Testament. The First

Epistle. The literary form of 1 John is peculiar, and some have considered it a tract rather than an epistle. Yet it seems clear that the writer has a quite definite circle of readers in mind, whom he addresses in a tone of loving but authoritative familiarity; and although without definite address or signature, it is properly designated an epistle. In an introduction (i. 1-4), which reminds one of the Prologue to the Gospel of John, the writer states that the Word, who was manifested, with whom he and others had had personal experience, is the Word of life, to know whom is to have fellowship with the Father and the Son. To assist the readers to realize this truth and experience its joy is the purpose of the message that follows. Since God is light, emphasis is laid upon the necessity and possibility of separation from sin in order to fellowship with the light (i. 5-ii. 6). The result and evidence of fellowship with God is mutual love, the supreme duty of each towards the other (ii. 7-12), while the world with its attractions is to be shunned (ii. 12-17). The readers are then warned against those who deny Jesus to be the Christ (ii. 18-29). The full significance of being children of God is then unfolded (iii. 1-17), the realization of which, through faith, is equivalent to vital union with the truth (iii. 18-24). Once more (iv. 1-6) the false views, the spirit of Antichrist, are mentioned. One must oppose these, holding fast to the manifestation of love in the mission of Jesus, God's Son, and exemplifying it in his life of righteousness, faith, and love of the brethren (iv. 7-21). This gives the victory over the world (v. 1-5). Such is the unimpeachable testimony to Jesus, the Son, in whom is life (v. 6-12). With hints of the practical purpose of the Epistle (v. 13-17), a summary restatement of fundamentals (v. 18-20), and a final exhortation (v. 21), the Epistle closes, somewhat abruptly.

The Epistle itself contains no direct information as to its author, date, and place of writing, or persons addressed. The "we" (i. 1 et seq.) gives place to the singular (ii. 1, 7, 8, 12-14, 26; v. 13). The author thus indicates that he is one with others in his fundamental position, but is personally responsible for the Epistle as a whole. It was a time when new views, especially those of Gnostic tendency, were in the air. The view most repugnant to the author was probably a form of Docetic dualism which denied that Jesus was truly the Son of God and therefore the Christ (ii. 18-25, cf. iv. 1-3; v. 1-13). As this view does not appear to have been elaborated to any great extent when the Epistle was written, as it afterward was, a date somewhere near the beginning of the second century is most probable. The internal evidence being so insufficient, we must fall back (1) on traces of the work in early Christian literature, and (2) on comparison with the Gospel of John for facts touching its origin and destination.

The notices of 1 John in ancient literature are singularly full and direct. From the quotation and allusions in Polycarp's letter to the Philipians (c.115 A.D.), and the use of the Epistle by Papias (according to Eusebius' express statement), its circulation and high standing in Asia Minor soon after 100 A.D. cannot be doubted. It was known in the West as John's before the writing of the Muratorian canon (c.170 A.D.), which quotes its first verse. Irenæus, Clement of Alexandria, and Tertullian all speak of it as

by John. That Marcion and possibly the Alogi did not accept it was due to dogmatic, not historical, reasons. If this strong chain of ancient testimony is to be accepted, we are brought to the same general date and situation as that with which the Fourth Gospel (see JOHN, GOSPEL OF) is concerned. A comparison of the vocabulary, leading ideas, and other characteristics of the Epistle with the Gospel has led the majority of scholars (H. J. Holtzmann, P. W. Schmiedel, and a few others are exceptions) to conclude that the two are products of the same mind and hand. A more difficult question is that of the respective dates of the two writings. There are no data at hand to decide this, but most scholars think that the Epistle is later than the Gospel. All that can be said with confidence is that during his sojourn in Asia the writer of the Fourth Gospel sent this message to a circle of believers (not necessarily to the church in Ephesus), with many of whom he was well acquainted, and by whom he was looked up to as a spiritual father, to warn them against dangerous views concerning Christ, and to impress upon them that faith in Christ must manifest itself in love and in a life separate from sin. Around those fundamental thoughts the whole Epistle revolves in a peculiar epigrammatic style, of great external simplicity, yet singularly rich and comprehensive in thought. The teachings antagonized contradicted the most important elements of Christian doctrine taught by the apostolic church. Whether they can be assigned to Cerinthus, the Ephesian heretic, we cannot decide.

The Second and Third Epistles. Unlike 1 John, the Second and Third Epistles have the formal address and signature of ordinary letters. The second is addressed to the "elect lady and her children." It is a question whether this designation indicates a person or a church. If the statement in 3 John 9, "I have written something to the church," refers to 2 John, it is decisive in favor of the former interpretation. On this hypothesis the relation between the two Epistles would be that of a general message to a church (2 John) supplemented by a more private note to an influential member, Gaius (3 John). The contents of the two accord well with this view. The letter to the church praises it for its faithfulness, exhorts to the exercise of mutual love in obedience to the command, warns against those who deny Jesus, the incarnate Messiah, and urges that they have no fellowship with such. It closes with a notice of the writer's intention to visit them soon, and a salutation from the sister church with which the writer was at the time. In the Epistle to Gaius, the elder commends his hospitality to missionary preachers, takes notice of the self-assertion of a certain Diotrephes whom he will bring to terms when he comes, recommends the imitation of the good, praises one Demetrius, and closes with a notice of his expected visit and the usual salutations.

The two Epistles thus seem to be companion letters. Should the address "elect lady" in 2 John 1 be taken to mean an individual, no connection between the two can be posited, except on the basis of a general similarity of style, and the fact that they have been associated in Christian tradition from ancient times, though their early history is obscure. Irenæus (c.180 A.D.) quotes 2 John 11 as a statement by John the disciple of the Lord. The Muratorian canon

(c.170 A.D.) speaks of two Epistles of John after mentioning 1 John; but whether the reference is to 2 and 3 John or to 1 and 2 John is somewhat uncertain. Apparently Clement of Alexandria (c.200 A.D.) was acquainted with 3 John as well as with 1 and 2 John. Origen (c.225 A.D.) says that in his day doubts were expressed regarding their authorship. These doubts persisted, though their cause is not exactly known. Jerome assigned the Epistles positively to the Presbyter John, not to the Apostle. No quotation from 3 John has been discovered in the most ancient Christian writers, and external evidence for it before Origen is lacking. The tradition that the two Epistles were written by the Apostle is supported by the similarity in style, vocabulary, and thought to 1 John. The title Presbyter or Elder in 2 and 3 John is not inconsistent with authorship by the Apostle John, since Peter (1 Peter v. 1) speaks of himself as a "fellow elder." If the "Elder" or "Presbyter" John, mentioned by Papias, was some other one than the Apostle, it is, of course, possible that the letters were written by him, though many scholars continue to identify him as the Apostle. In the nature of the case the date, place of writing, and destination cannot be fixed.

Bibliography. In addition to the works cited under the article JOHN, GOSPEL OF, consult the commentaries of William Alexander (New York, 1881), Alfred Plummer (Cambridge, 1886), B. F. Westcott (3d ed., London, 1892); and especially the full discussions by M. W. Jacobus, in the *Standard Bible Dictionary* (New York, 1909), James Moffat, in his *Introduction to the Literature of the New Testament* (ib., 1911), and A. E. Brooke, in the *International Critical Commentary* (ib., 1912).

JOHN, yōn, EUGENIE. The name of the German author who wrote under the pseudonym E. Marlitt (q.v.).

JOHN, GOSPEL OF. The Fourth Gospel, according to the usual arrangement of the New Testament books. In some ancient manuscripts, such as the *Codex Beza*, it stands in the second place, in others in the third, while in some circles it heads the list. Its usual position in ancient times was, however, the same as the present. The general character of this Gospel and the influence it has had upon the Christian thought render it perhaps the most conspicuous book of the Bible and have naturally attracted to it the supreme attention of critical scholarship.

Contents of the Gospel. In striking contrast to the first three (or Synoptic) Gospels, the Fourth Gospel states explicitly the apologetic motive controlling its author in writing it (cf. xx. 30-31). It is in the light of this statement that the outline of its contents should be constructed. Understanding, then, that the author intended so to depict the person and work of Jesus that saving faith in him as the Son of God would result to his readers, the contents may be outlined as follows: *The Prologue* (i. 1-18), in which the profound significance of the historic Christ is set forth: he was the divine Logos incarnate, the life and light of man, who alone has revealed God, but who, when he came to "his own," was not received, though to receive him makes one a child of God. In the Prologue we find the fundamental ideas which the history following is intended to illustrate and prove—the divine glory of Jesus, the

nature of the reception accorded him, faith on the part of some with its necessary results and unbelief on the part of others, and the significance of it all for the world.

The Main Narrative, which extends from i. 19 to xx. 29, opens with the events at the Jordan (i. 19-51), where the Baptist makes his confession to the Jerusalem delegation (i. 19-28) and bears his testimony to Jesus before his own disciples (i. 29-36), resulting in the gathering around Jesus of the beginning of a discipleship based on the attractions of a personal acquaintance with him (i. 37-51). This is followed by Jesus' return to Galilee, including the incident of the marriage at Cana, where his glory is displayed and his disciples' faith in him is deepened (ii. 1-12). There is then begun the record of a series of visits to Jerusalem, with the miracles and discourses accompanying them, which appears to form the general scheme on which the narrative is framed.

The first visit occurs at the Passover following the above return to Galilee (chap. ii). During the feast Jesus discloses himself to the Jerusalem populace as a reformer zealous for the purity of the temple worship by driving out the traders from its courts. The result of this action is an official inquiry as to his authority for such boldness, to which Jesus replies with a challenge to the materialism exhibited in this commercializing of the house of God, predicting a spiritual religion in place of that which they have so grossly degraded (ii. 13-22). The result of his stay in the city is a sort of halfway belief in him on the part of many (ii. 23), of whom Nicodemus is presented as a type, and Jesus' conference with him as representing the noncommittal attitude which Jesus assumed in response to it (ii. 24-iii. 21). Jesus then withdraws into Judæa to a region in the neighborhood of the Baptist's work and carries on a ministry which attracts many to his following, resulting in jealous queries on the part of John's disciples, which were answered with a renewed testimony of John to Jesus (iii. 22-30). The attention of the Pharisees being drawn to the extension of Jesus' work among the people, Jesus returns to Galilee, passing through Samaria, where he has his interview with the woman at the well and wins a general faith from the people of her village (iv. 1-42). On his arrival in Galilee he finds the people receptive to him, because of what they had witnessed of his works during his stay in Jerusalem (iv. 43-45). Coming again to Cana, he heals there the nobleman's son in response to a definite and distinctive faith on the father's part, which was deepened by the miracle and participated in by the entire household (iv. 46-53).

There then follows the second visit to Jerusalem, with its healing of the impotent man at the Pool of Bethesda and its following discourse to the people, who, however, are not only no more receptive to him than at the first visit, but, under the influence of their religious leaders, develop a hostility towards him that seeks his death (chap. v). Jesus is then represented as again in Galilee, where he feeds the multitude by the sea and, declining their enthusiastic effort to commit him to a programme of political revolution, returns to Capernaum, where, in a discourse that searches their religious materialism, he presents to the people his spiritual claims for himself and his work. The result of this discourse is depressing—many of

the people falling away from his following, and the disciples themselves renewing their allegiance in a spirit lacking all enthusiasm (chap. vi).

This experience in Galilee is followed by a *third visit* to Jerusalem, at the Feast of the Tabernacles, during which Jesus again discourses to the people, however, practically without any receptive response on their part, but with renewed hostility from the Pharisees and chief priests, culminating in an unsuccessful effort to arrest him (chap. vii). Omitting the incident of the woman taken in adultery (viii. 1-11), which has evidently been interpolated from outside sources, Jesus' teaching is continued. It results, however, in an increasing irritation on the part of the people, ending in an attempt to stone him, from which, however, Jesus escapes (viii. 12-59). In the following chapter there is a *further visit* to Jerusalem, where Jesus restores sight to the man born blind—the miracle developing a controversy between the man and the Pharisees which results in the ecclesiastical disowning of the man and the personal expression to Jesus of his worshipful belief in him (ix. 1-40). Whether the discourse given in the first 18 verses of the tenth chapter belongs to this incident or to a *later visit* at the Feast of Dedication (x. 22, 23), or whether the healing of the blind man took place at this later feast, may be open to debate; but Jesus' teaching, as given in this tenth chapter, rouses the people to added hostility and a renewed effort on their part to lay hands upon him (x. 1-39). Upon this, Jesus withdraws from the city to the other side of the Jordan, where he subsequently receives word of the illness of Lazarus and, *returning to Bethany* and finding him already dead and laid away in the sepulchre, brings him back to life (x. 40-xi. 44).

The result of this astounding miracle is a conviction of faith on the part of many and at the same time a council of the Pharisees to decide upon what was to be done to counteract the increased reputation which it had brought to Jesus (xi. 45-52). The issue of their deliberation is a determination to put Jesus to death (xi. 53). In consequence of this official resolve, Jesus withdraws to a small town a short distance from Jerusalem, where he tarries with his disciples until the time of the Passover Feast (xi. 54-57). Shortly before the feast he *comes back to Bethany*, where a supper is made for him in Lazarus' home. During the supper Mary anoints his feet with costly ointment, and, upon Judas' criticism of the extravagance of the act, he commends her for what she has done (xii. 1-8). On the following day he makes his public entry into the city, accompanied by a following whose enthusiasm depresses with a new irritation the hostile Pharisees (xii. 12-19). There is then narrated the incident of the Greeks at the feast, their desire to see Jesus, and the discourse to the multitude which their request prompts him to deliver—a discourse full of significant allusions to the fatal ending of his work which he already sees approaching (xii. 20-50).

In the narrative scheme of the Gospel this ends his public ministry. The remaining portion of the record is devoted to a disclosure of the intimate fellowship between Jesus and his disciples in the closing hours before his arrest. To this are devoted five chapters (xiii-xvii), the first describing the Last Supper—a meal

which, according to this Gospel, preceded the Passover Meal. During this Supper Jesus makes announcement of the coming betrayal of himself by one of the disciple band and singles out Judas as the betrayer, though apparently without bringing the other disciples to a realizing sense of what he meant. Chapters xiv-xvi are then devoted to a record of Jesus' farewell words to the disciples. These are followed by an intercessory prayer, with which the meal is apparently closed. Then comes the narrative of Jesus' arrest by the band led by Judas and the taking of him away to Annas and the high priest Caiaphas for examination, along with which is given the story of Peter's denial (xviii. 1-27). The remainder of this and the first part of the following chapter record the arraignment of Jesus before Pilate, his examination by the Governor, that official's effort to free the Prisoner, and his final surrender to the insistent demand of the chief priests, supported by the now hostile multitude, that Jesus be put to death (xviii. 28-xix. 16). Then follows the narrative of the crucifixion and the hasty entombment (xix. 17-42). The closing chapter gives the visit of Mary Magdalene to the tomb on the first day of the week, her discovery that it was empty, and her hasty report of the fact to Peter, with the hurried repairing of that and "the other disciple whom Jesus loved" to the sepulchre and their return to the city, mystified at the fact which they could not but believe, the appearance of Jesus to Mary after they had left, and his subsequent disclosure of himself to two gatherings of the disciples as they were met together secretly in the city for fear of the Jews (xx. 1-29). The last two verses of this chapter (30 and 31), giving as they do the motive for the preceding narrative of the Gospel, show that the following chapter, with its narrative of the meeting of Jesus with the disciples at the Sea of Tiberias, is an appendage to the Gospel (xxi. 1-23). This added chapter itself is closed with an assurance on the part of those who published the Gospel as to the reliability of the record, with the impression of the writer representing them as to its relation in extent to the whole of Jesus' ministry (xii. 24-25).

This is the arrangement of the contents as we have them in the Gospel before us. That this arrangement is not the original one, however, is evident from some obvious misplacements of the material, whether due to accident or to faulty editorial work—e.g., chapter v is properly to be inserted before vii. 15; vii. 1-14 and viii. 12-20 before vii. 25; vii. 37-44 after vii. 52; xii. 36b-43 after xii. 50; chapters xv and xvi either after xiii. 20 or after the introductory words of xiii. 31, bringing chapter xiv at the close of the valedictory remarks and immediately preceding the intercessory prayer of chapter xvii; xviii. 19-24 after xviii. 13.

The narrative, however, whether in its present or its original arrangement, is in marked contrast with what we find in the first three Gospels and, apart from the character of the contents, naturally arouses the attention of scholarship.

Criticism of the Fourth Gospel. The main question to which this Gospel gives rise is, Can it be considered an historical source for our knowledge of Jesus Christ? The Gospel gives no indication of its authorship, beyond some veiled allusions to one of the disciples, which, however, are of a significant character. They

occur at xiii. 23, xix. 26, xx. 2, xxi. 7, 20, and refer to the disciple as "the disciple whom Jesus loved." This phrase is either the author's way of referring to himself or the editor's way of describing him; in either case, as it is generally conceded, it is intended to identify to the readers the writer of the narrative. Such a phrase naturally could be used only of one of the three disciples whom Jesus had taken into his intimate companionship—Peter, James, or John. Of these, however, Peter is excluded, because of his definite naming in some of these passages along with this peculiarly described disciple (xiii. 23 f.; xx. 2-10; xxi. 7, 20-23; cf. also xviii. 15 f.). James also is excluded because of his early martyrdom (Acts xii. 2, 44 A.D.), which occurred before there was any possibility of this Gospel having been written. John alone remains, and, while he is nowhere else referred to by this description, it is significant that he is found in such companionship with Peter in the life of the Jerusalem church (Acts iii. 1-11, iv. 1-22, viii. 14; cf. also Gal. ii. 9) as would correspond with the companionship of Peter and this described disciple in our Gospel (see above passages; cf. also Luke xxii. 8). The question becomes, therefore, whether the Apostle John could have written this Gospel. In a careful study of the narrative several things become evident. Among the most obvious is that the writer's knowledge of contemporary Judaism and of Palestine is remarkable. He shows himself perfectly at home in regard to numerous details of Jewish national affairs (xviii. 19, 24, 31; xix. 7), Jewish parties (vii. 45-52; xi. 49), Jewish customs (x. 22 [cf. 1 Macc. iv. 59]; vii. 2-13; iv. 45; vii. 37; xix. 31, 42; xviii. 28; xi. 55-57, ii. 1 ff. [cf. iii. 39]; xi. 44; xix. 39 f.), Jewish prejudices (iv. 9, 27; vii. 15, 49), and Jewish Messianic hopes (chap. vii). He has also an intimate knowledge of the topography of Palestine (e.g., i. 28; ii. 1, 11; iii. 23; xi. 54; iv. 5 f., 11, 20; vi. 19, 22-25) and of Jerusalem (e.g., iii. 20; v. 2; viii. 20; x. 23; xviii. 1; xix. 13, 41). Besides this, he is sufficiently acquainted with the Hebrew text to correct the Septuagint rendering of his quotations by the original reading, e.g., the citation from Zech. xii. 10 (xix. 37) and that from Ps. xli. 9 (xiii. 18); while his style bears throughout the Hebrew stamp and betrays a Hebrew influence. These facts can only be accounted for on the supposition that the writer was a Jew of Palestine by birth and education. It is almost inconceivable that a Gentile could have written as he did. At the same time he was a Jew whose break with formal Judaism was complete. He was no longer a Jew at heart. It may be said further that the Gospel seems to have been written by one who was an eyewitness of many of the events he recorded. Attention has often been called to the fact that the references to persons, such as Peter, Philip, Thomas, Judas Iscariot, Pilate, Mary, Martha, and others, brief as they are, betray the impressions made by such persons on one who had seen or heard them. They are remarkably lifelike and tally exactly with what is known of them from other sources. Many incidental touches in the narrative, such as "Jesus sat thus on the well," "it was about the sixth hour" (iv. 6), are best explained as due to personal experience. In addition to such incidental indications of authorship by an eyewitness, there are express statements to the same effect. In i. 14 it is said, "and we

beheld his glory." This "we" seems to mean the author addressing his readers. We also at xix. 35 find brief notices by another hand, "he that hath seen hath borne witness and his witness is true, and he knoweth that he saith true, that ye also may believe," and at xxi. 24 that "this is the disciple that beareth witness of these things and wrote these things, and we know that his witness is true." It appears, then, that the work claims to be derived either wholly or in part from written records of an eyewitness. From the last citation it is evident that the claim is that the disciple mentioned in the immediately preceding section (xii. 15 ff.), i.e., the disciple whom Jesus loved, is the witness and recorder referred to. That is, the Gospel proper, which closes with xx. 31, and possibly the additional narrative of xxi. 1-23, were derived from the written and oral testimony of this disciple. As to the *date* of the Gospel, apart from whether the last chapter was written by the author or by another hand or hands, the maturity of the Gospel's thoughts, as seen in the selection of its material, is evidence of the lateness of the writing. For it is difficult to account for such selection, except in the author's times; while the advance which the Gospel's thought shows upon that of the Synoptics finds its natural explanation in the advance of the thought of the Church, which must have progressed with an advance in the age.

There is nothing to determine the *place* of the Gospel's writing, except in so far as the lateness of its date would indicate most probably a place outside of Palestine. As to the *purpose* of the writing, it is clear that the author had no intention of producing a history—for the narrative is too meagre for that—nor of presenting a biography—for all we get is but occasional glimpses of Jesus' life. The closing verses of chapter xx show us that the author's purpose was purely religious—to bring out the personality of Christ as it had impressed itself upon the author's own spiritual life. From all this study of the Gospel's contents it is clear that they confirm rather than contradict an authorship by the Apostle John.

Turning now from the Gospel to the records of the early Church, the facts are these: Writers of the period 170-200 show great familiarity with the Gospel, quoting it frequently and often speaking of John the Apostle as the author. In addition to this there are several explicit statements of importance. Irenæus (c.130-200), whose early home was in Asia Minor, declares that it was by John the Apostle, who spent his last years in Ephesus and there wrote the Gospel to counteract the teachings of Cerinthus (q.v.) (*Adv. Hær.*, ii, 22, 5; iii, 1, 1; iii. 4; xi. 1). Polycrates, Bishop of Ephesus, in a letter to Victor of Rome (c.190), speaks of John, "who reclined on the breast of the Lord," as buried in Ephesus. Polycarp (born or converted about 69 A.D., martyred 155), Bishop of Smyrna, was known to Irenæus, who as a youth heard him tell of his intercourse with John and others who had seen Jesus (Eusebius, *Hist. Eccles.*, v, 20). In such statements we have the testimony of personal experiences carrying us back to John himself. Justin Martyr, writing c.150, who had already spent some time in Ephesus, uses the Gospel as one of the apostolic memoirs, but says nothing about it in particular. Evidence for the existence and use of the Gospel before Justin is not entirely lacking, though not

altogether certain. It is likely that it was known to Ignatius of Antioch (c.110-115), to the writer of the Epistle to Barnabas (c.125), and to the early Gnostic Basilides (c.125). External evidence, then, quite clearly points to the existence of the Gospel soon after 100 A.D., assigns it to John, and indicates Ephesus as the place where it was written. The general bearing of the external testimony is therefore confirmatory of the favorable bearing of the internal evidence to the effect that the Fourth Gospel was written by the Apostle John, late in life, at Ephesus in Asia Minor.

Nevertheless, by some modern critics this view is pronounced untenable. The more important reasons for such an opinion are: 1. The character of the teachings in the Fourth Gospel and the representation there given of Jesus' life and words are, on the one hand, so different from what we have in the first three Gospels, and, on the other hand, fit in so well with the doctrinal developments of the first half of the second century, that it seems necessary, apart from the question of authorship, to consider it a product of early second-century thought. Such a position practically necessitates giving up the Johannine authorship. 2. The evident use made of the Synoptic Gospels by the Fourth Gospel does not accord with apostolic authorship of the latter. 3. The vagueness in the recorded tradition of Asia Minor makes it possible that it was John "the Elder," rather than John the Apostle, who worked there, and that soon after his death, by an easy confusion, much of his activity was ascribed to John the Apostle, who may not have lived in Ephesus at all. 4. Certain particulars in the history of Christianity in Asia Minor, especially the appeal of Polycarp to the authority of John in the quartodeciman controversy, which is said to contradict the statements in the Gospel, show that early in the second century the Gospel was not recognized in that region as of apostolic origin.

The latter two of these arguments rest on such uncertain grounds that much weight should not be attached to them. The quartodeciman controversy in its early stages was concerned with the question of the proper time to begin the observance of Easter, the Christian Passover, and did not touch the question of the particular day of the month when Jesus ate the Last Supper. Polycarp claimed that John had taught them to celebrate the Passover regularly on the 14th of Nisan, the usual Jewish day. Even if, with many, we should hold that the Fourth Gospel places the Last Supper on the 13th of Nisan, Polycarp might easily have made his appeal to John and also considered him the author of the Gospel. The third argument presents a possibility, but not a probability. It may be said with confidence that such a confusion of ideas among men who had personal knowledge of the facts is altogether unlikely. It does not appear to have been noticed by the advocates of this theory that the confusion of John the Presbyter and John the Apostle must have antedated the Gospel itself; for not only xxi. 1-23, but the whole book, rests on the supposition or claim that the Apostle John is its authority. But this involves improbabilities that are fatal to the supposition. There must have been substantial reasons for the claim of the Gospel to be Johannine and for the ready acceptance of it as such by the leaders of the church in Asia Minor. In fact, for the residence

in Asia of another so-called Presbyter John we have really no proof whatever.

There remain, however, the first two objections noted above. What is to be said regarding them? That the discourses of the Fourth Gospel are different from those of the Synoptics is not to be denied. Not only do they substitute an allegorical form of statement for the parabolic form so characteristic of Jesus' teachings in the Synoptics, but they almost exclusively substitute Jesus himself as the subject of the discourse in place of the varied and practical topics of the Synoptic talks, while they treat this self subject almost exclusively at the point of Jesus' divinity and his relation to the unseen world (cf. chaps. i-iii, v-viii, x-xvi). In the consideration of these facts it seems as though there should not be ignored the difference in the surroundings in which these two sets of discourses were delivered, the difference in the audiences to which they were spoken, and the difference in the narrators by whom they were reported. There can be no question that there was a development in Jesus' ministry, both in the conditions to which it was subjected and its adjustment to those conditions. It would hardly seem possible that over against this Jesus' teachings should be the same in content and form throughout his ministry. In fact, had the Synoptics represented him as delivering to the peasants of Galilee, who were largely loyal to him, and during the early practical period of his work, the same sorts of discourses on the same sorts of themes as the Fourth Gospel represents him as delivering to the speculative scribes and Pharisees of Jerusalem, who were largely hostile to him, and during the later controversial period of his work, the credibility of the Synoptics would have been justly called in question. And the same suspicion would have been aroused against the Fourth Gospel had it represented Jesus as delivering to the religious leaders of Jerusalem, at the close of his ministry, the same sorts of discourses as the Synoptics represent him as delivering to the country folk of Galilee at its beginning. As a matter of fact, to the extent that the Synoptic discourses are suited to the Galilean crowds and the circumstances of the Galilean work, and the Fourth Gospel discourses to the people and leaders of Jerusalem and the circumstances of the Jerusalem work, to that extent are both sets of discourses supposable.

It is significant that the only discourse which Jesus is represented by the Fourth Gospel as delivering outside of Jerusalem and to a Galilean audience so effectually confused and confounded those who heard it that it practically ended Jesus' successful work in that region. It is quite likely that had Jesus delivered to his Jerusalem audiences a discourse characterized with the beatitudes and the homely phrases of the Sermon on the Mount, it would have been as lost upon their ears as the discourse of the sixth chapter of John was upon those of the Capernaum people. It is no objection to this line of argument to say that the discourse of chapter v was delivered in Jerusalem during the early part of his ministry; for with the right placing of the chapter after the sixth chapter it takes its place with the other discourses of his later Jerusalem work.

And, further, there is the question of the personal qualifications and capacities of John—what he was able to produce. To say that the

theology or philosophy of the book is such that John could not have written it, is to take a purely hypothetical and even arbitrary position. We do not know, and have no means of knowing, what John could have produced. Some one wrote the book, and he was a gifted man. He may as well have been John as any other Christian Jew. That the book marks a stage of thought supplementary to the primitive apostolic and Pauline developments is frankly admitted. If it was by John, it simply reflects the growth of his own religious experience. He had lived close to the Master, he had seen the origin and progress of the Church, he had known Paul, and at last he had lived for some time in the speculative atmosphere of Ephesus. This book gives his final judgments, his memory of Jesus, his impressions of him after these years of experience.

Finally, there is the question of the narrative relation of the Fourth Gospel to the first three. This demands very careful consideration. There can be no doubt of the fact that it was written on the supposition that its readers were acquainted with a Gospel history substantially identical with that in the Synoptics. Its own record is fragmentary and presupposes many things as well known. At the same time its attitude towards this already current history is one of independence. In fact, it is being discovered that at several important points the Fourth Gospel supplies data by which alone the Synoptics can be rightly understood. There is, e.g., in the Synoptics no explanation of why Jesus suddenly gave up his successful work in Galilee to draw aside into that period of retirement in the regions of Tyre and Sidon and the Decapolis. It is a puzzle, apart from the information given us by the Fourth Gospel of the collapse of his Galilean work (chap. vi) and the murderous hostility of the religious leaders in Jerusalem (chap. v). More than this, the Synoptics are not always historically reliable. It is the Fourth Gospel, and not the Synoptics, which gives us the correct statement as to when the Last Supper was had with the disciples. The old contention that either the Synoptics or the Fourth Gospel must be taken as genuine is being abandoned by scholars today, and the conviction is growing that with proper allowances both may be historically accepted.

General Conclusions. In view of all the facts of the case, the Fourth Gospel may be said to be the work, in substance at least, of the Apostle John, written towards the end of his life at Ephesus primarily for Christian circles, to give them an adequate conception of Jesus. The work was written when speculation was rife. Gnosticism was beginning to manifest itself. Terms such as "Logos," adapted from Alexandrian Jewish philosophy, were being used in Christian circles. The central truths of Jesus' unique personal significance were in danger of being obscured. To counteract such teachings John wrote his Gospel, prefacing it with the Prologue, in which he stated his conviction that the one truth that gave life and reality to ideas and speculation concerning the Logos was this, that Jesus Christ was the Logos incarnate, in whom grace and truth, the fullness of the knowledge of God, was manifest and placed within man's reach. The Gospel so written concluded with xx. 31 and may have been known for a time to a limited circle without the con-

cluding chapter. But later, possibly not long before John's death or very soon after the work was published, and in order to correct a wrong impression concerning Jesus' words to Peter in reference to John, the last chapter was added, concluding with the guaranty of the Apostle's authorship of the entire work. No sooner was the work known than it met with acceptance, copies quickly finding their way all over the Christian world. A small sect, later called the Alogi, objected to it, not because they had any more correct knowledge of its origin, but because of its teachings, ascribing it to Cerinthus, according to tradition a bitter opponent of John in Ephesus. By 160-170 it was known and used along with the earlier three Gospels throughout the Christian Church.

Bibliography. The literature of the Fourth Gospel is very extensive. Fairly complete lists will be found in Luthardt, *Saint John, the Author of the Fourth Gospel*, translated by Gregory (Edinburgh, 1875), and in Watkins, *Modern Criticism Considered in its Relation to the Fourth Gospel* (Bampton Lectures, London, 1890). Besides the *New Testament Theologies* of Weiss, Beyschlag, Holtzmann, Stevens, and Feine; the works on the apostolic age by Lechler, Hausrath, Weizsäcker, Bartlett, McGiffert, and Ropes; the *Commentaries* of Meyer, Weiss, Godet, H. Holtzmann, O. Holtzmann, Westcott and Zahn; the various *Lives of Christ*, and the larger *Introductions* to the New Testament, especially those by Weiss, H. Holtzmann, Salmon, Jülicher, Zahn and Moffatt, attention may be called to J. B. Lightfoot, *Essays on Supernatural Religion* (London, 1889); Ezra Abbot, *External Evidence of the Fourth Gospel* (New York, 1891); J. B. Lightfoot, *Biblical Essays* (London, 1893); Lowrie, *Doctrine of Saint John* (ib., 1899); Wendt, *Gospel According to John* (trans., New York, 1902); Stanton, *The Gospels as Historical Documents*, part i (Cambridge, 1903); Drummond, *Character and Authorship of the Fourth Gospel* (New York, 1904); Sanday, *The Criticism of the Fourth Gospel* (Oxford, 1905); Scott, *The Fourth Gospel: Its Purpose and Theology*, in "The Literature of the New Testament Series" (Edinburgh, 1906); Bacon, *The Fourth Gospel in Research and Debate* (New York, 1910); Lewis, *Disarrangements in the Fourth Gospel* (Cambridge, 1910); with articles by Inge and Brooke in *Cambridge Biblical Essays* (London, 1909). See DE BOOR

FRAGMENT.

JOHN, GRIFFITH (1831-1912). A Welsh missionary, born at Swansea and educated at Brecon College, Bedford. He began preaching when only 14 years old, volunteered to serve as a missionary under the London Missionary Society in 1853, and two years later arrived in China. The first five years were spent in evangelical work around Shanghai; he then traveled extensively in central China and went to Hankow in 1861. With his associates he established more than 100 missionary stations in Hupeh and Hunan provinces. His most important work, however, was the translation of the New Testament and the greater part of the Old Testament into Chinese in what is known as the *Wen-li Version*. He established the first Protestant missions in the Yang-tse valley and the theological college that bears his name and published many books and tracts in Chinese. Consult William Robson, *Griffith John, Founder of the Hankow Mission, Central China* (London, 1888).

JOHN, REVELATION OF SAINT. See REVELATION OF SAINT JOHN.

JOHN, SIR WILLIAM GOSCOMBE (1860-). A Welsh sculptor. He was born at Cardiff and as a youth assisted his father, a wood carver, in the restoration of Cardiff Castle. He went to London in 1882 and studied at the Lambeth Art Schools under Dalou and Frith and afterward at the Academy schools, where he won the gold medal and a traveling scholarship in 1887. In 1890-91 he studied in Paris. His art usually strives to reproduce the severe dignity of the Gothic style and excels in skillful and delicate modeling. Among the best of his ideal works are "Morpheus" and "St. John the Baptist" (Cardiff Gallery); "The Elf" (Glasgow Gallery); "Boy at Play" (Tate Gallery); "Study of a Head" (Liverpool Gallery). His portraits, which are faithful likenesses, include the seated statue of the Duke of Devonshire, at Eastbourne; King Edward VII, at Cape Town; Prince Christian Victor, at Windsor; the historian Lecky, at Trinity College, Dublin, and an equestrian statue of the Earl of Minto, at Calcutta. Among his memorial monuments are those to the Marquis of Salisbury, in Westminster Abbey and Hatfield Church; to Sir Arthur Sullivan, in St. Paul's Cathedral, and to the Coldstream Guards and War Correspondents, also in St. Paul's. John received a gold medal in Paris in 1901, was made a Royal Academician in 1909, was knighted in 1911, and became corresponding member of the French Institute.

JOHN A. GRINDLE, or JOHNNY GRINDLE. A quaint name in the Mississippi valley for the curious fish the bowfin (*Amia calva*), also called lawyer. See BOWFIN.

JOHN ANDERSON, MY JO. 1. A touching ballad by Robert Burns. 2. An old Scottish song, a dialogue between a man and his wife ridiculing popery.

JOHN BROWN'S BODY. One of the most frequently sung marching songs of the Civil War. The melody is said to have been heard in a Southern colored church and fitted to the words, "Say, brothers, will you meet us?" at a meeting of the Young Men's Christian Association held at Albany about 1860. The music was set to the words of the first stanza by James E. Greenleaf, and the other stanzas were written by C. S. Hall, of Charlestown, Mass., in 1861. Consult H. K. Johnson, *Our Familiar Songs and Those who Made Them* (New York, 1881).

JOHN B. STETSON UNIVERSITY. A coeducational institution founded at De Land, Fla., in 1887. It has a preparatory department, a college of liberal arts, schools of law, technology, music, and art, a normal school, and a business college. It confers the degrees of bachelor of arts, philosophy, science, and laws, and of mechanical, civil, and electrical engineer. The university has a campus of 35 acres and well-equipped modern buildings, in large part the gifts of John B. Stetson, valued at \$300,000. Its endowment funds amounted in 1914 to over \$1,000,000, and its income to \$40,000. It has a library of more than 24,000 volumes. In 1913-14 its students numbered 469, of whom 224 were enrolled in the collegiate department. The number of professors and instructors was 37. The president in 1914 was Lincoln Hulley, Ph.D., LL.D.

JOHN BULL. See NATIONAL NICKNAMES.

JOHN BULL; OR, THE ENGLISHMAN'S FIRE-SIDE. A comedy by the younger Colman (1805).

JOHN CAS'IMIR (1543-92). Count Palatine of the Rhine, the fourth son of Elector Palatine Frederick III, born in Simmern. He was reared at the French and Lotharingian courts, and joined the Calvinist church at the same time as his father. He at various times (1575-78) led troops into France to aid the Huguenots and into the Netherlands to aid the Dutch, but achieved little fame as a soldier. On the death of his brother he became Regent of the Palatinate during his nephew's minority and made his Protestant subjects adopt the Calvinist creed—the third time in 10 years they had been forced to change.

JOHN CHINAMAN. See NATIONAL NICKNAMES.

JOHN COMPANY. A nickname for the East India Company, originating probably in India, in the eighteenth century.

JOHN CRESCENTIUS. See CRESCENTIUS, JOHN.

JOHN CROW. The name in Jamaica and the British Antilles for the turkey buzzard vulture (*Cathartes aura*).

JOHN DAMASCENE. See JOHN OF DAMASCUS.

JOHN DORY. The English name of a small group of singular fishes found in the warm seas of the Old World. One species (*Zeus faber*) is well known in the Mediterranean as a food fish, but is uncommon in the Atlantic. Its ugly and extraordinary form is shown in the accompanying illustration. The body is greatly compressed, and the total length rarely exceeds 20 inches. The bony jaws can be widely opened, so that surprisingly large objects may be swallowed, and the fish is active in pursuit of its prey (other fishes), though sluggish at other times. Its body scales are very small, but it is armed with strong fin spines and has a row of large spinous scales along the base of the dorsal fin and in front of the pectorals. The color is usually a pale olive brown, with a large circular spot

JOHN DORY.

nearly black on the middle of the side. Various legends account for this spot. One declares this to be the fish which St. Peter caught in the Lake of Gennesaret and marked with his thumb and finger while taking the tribute money from its mouth; another that the mark was similarly made by St. Christopher, who seized one of these fishes while carrying Jesus through an

arm of the sea. Its flesh is highly esteemed in Europe. Several related species occur in the deeper tropical seas, and all constitute a group of very uncertain affinities.

JOHN FREDERICK I, THE MAGNANIMOUS (1503-54). Elector of Saxony from 1532 to 1547. He was the son of the Elector John the Constant and was born at Torgau, June 30, 1503. In 1532 he succeeded his father in the government conjointly with his brother Ernest, with whom, however, he concluded a partition settlement in 1542, ceding to him the Principality of Coburg. He was from the first an ardent champion of the Reformed faith. With Philip of Hesse he became one of the leaders of the Schmalkaldic League (q.v.), and as such was placed by Charles V under the ban of the Empire in 1546. He successfully defended his territories against an invasion by his cousin, Maurice of Saxony, in the same year; but on April 24, 1547, the army of the Schmalkaldic League was defeated at Mühlberg, and John Frederick fell into the hands of the Emperor. Sentence of death was pronounced on the prisoner, and he was compelled to cede his possessions, together with the electoral title, to Maurice. For five years John Frederick remained in captivity, until, together with Philip of Hesse, he was liberated by the sudden uprising of Maurice against Charles V. The death of his brother Ernest in the same year (1552) placed him in possession of Coburg. He died in 1554. The foundation of the University of Jena was largely due to his patronage.

JOHN FREDERICK II (1529-95). Duke of Saxony, eldest son of John Frederick I. After his father's imprisonment, in 1547, he undertook, in conjunction with his brother John William and in the name of their younger brother John Frederick III, the administration of what remained of the territories of the Ernestine line. Soon after, in accordance with his father's wish, he founded the University of Jena. Upon the death of John Frederick III, in 1565, the two brothers divided their dominions, John Frederick taking Weimar and Gotha, and John William Coburg, who, in 1567, became sole ruler. In 1566, because of the protection which he had afforded the outlaw Wilhelm von Grumbach, he was himself outlawed by the Emperor, was captured in 1567, and was imprisoned until his death. His wife, Elizabeth of the Palatinate, lived with him during 22 years of his imprisonment. Consult Beck, *Johann Friedrich der Mittlere* (Weimar, 1858).

JOHN GEORGE I (1585-1656). Elector of Saxony from 1611 to 1656. He was born March 5, 1585; married Magdalene Sibylle, daughter of Duke Albert Frederick of Prussia, in 1607; and succeeded his brother Christian II as Elector of Saxony, June 23, 1611. The attitude of Saxony, as one of the most powerful of the Protestant states of Germany, was of great importance in the Thirty Years' War; but the course of John George was vacillating, and when he was giving nominal support to one side, he was generally negotiating with the other. When Gustavus Adolphus entered Germany, John George refused him passage across Saxony, and thus prevented the relief of Magdeburg, which was taken by Tilly, whose infuriated troops put most of the inhabitants to the sword. A little later, when Saxony was about to suffer from the advance of the Imperialists, John George concluded a hasty alliance with Sweden, and his troops

were on the field of Leipzig or Breitenfeld (September, 1631), but fled early in the day. The Elector sought continually to bring about a peace advantageous to Saxony. In 1632, when Gustavus was in Bavaria, he sought to detach Brandenburg from the Swedish cause, and in 1635 he concluded the Peace of Prague with the Emperor, yielding practically all that the German Protestants had fought for and agreeing to endeavor to secure the general acceptance of the terms. His reward was the hereditary possession of Lusatia. Only Brandenburg and some of the minor states acceded. In 1636 the Saxons were defeated by Banér at Wittstock, and in 1645 the Elector was obliged to conclude an armistice with Sweden. By the Peace of Westphalia he was confirmed in the possession of Lusatia and the bishoprics of Meissen, Merseburg, and Naumburg. John George died Oct. 8, 1656. How much of his changeable and treacherous policy was due to himself, and how much to the intrigues of his most trusted counselor, Von Arnim, it is difficult to determine. His will established three ruling Saxon lines for his sons, in addition to electoral Saxony—Saxe-Weissenfels, Saxe-Merseburg, and Saxe-Weitz. See ARNIM; GUSTAVUS ADOLPHUS; SAXONY; THIRTY YEARS' WAR.

JOHN GEORGE II (1613-80). Elector of Saxony from 1656 to 1680. He was the son of John George I and was born in 1613. Subsidies received from France in the early years of his reign (against the will of a majority of his subjects) enabled him to gratify his tastes, which were more to him than his crown, and to make Dresden one of the most beautiful cities and art centres of Europe.

JOHN GEORGE III (1647-91). Elector of Saxony from 1680 to 1691, only son and successor of John George II. He took a prominent part in the war between the Empire and Louis XIV of France, which broke out in 1688, and in 1690 was made commander of the Imperial army. One of his sons became King of Poland.

JOHN GEORGE IV (1668-94). Elector of Saxony from 1691 to 1694, son and successor of John George III. He continued the policy of his father during his short reign of three years, maintaining an alliance with Brandenburg and the Emperor, although he maintained an independent attitude towards the latter, which frequently resulted in trouble. As a matter of state policy he married Eleonore, Margravine of Brandenburg-Anspach, but his life is chiefly interesting for the story of his romantic attachment for Magdalene Sibylle von Neitschütz, who was created Countess of Rochlitz by the Emperor.

JOHN GILPIN. The hero of a famous humorous ballad of the same title by William Cowper (1782).

JOHN HALIFAX, GENTLEMAN. A novel by Dinah Mulock Craik (1856).

JOHN HYRCANUS. See HYRCANUS.

JOHNITE. See EXPLOSIVES.

JOHN MARCH, SOUTHERNER. A novel by G. W. Cable (1894). It appeared as a serial in *Scribner's Magazine*.

JOHN NEPOMUK SALVATOR, ARCHDUKE OF AUSTRIA (1852-?1891). He was born in Florence, the youngest son of the Grand Duke Leopold II of Tuscany. He entered the Austrian military service and rose through the various ranks to that of major general commanding a division. In 1883 he was transferred to Linz as a punishment for having published a pamphlet

entitled *Drill oder Erziehung?* in which he expressed himself too sharply in opposition to the commander in chief, Archduke Albert. The government was still more irritated when he, as it was asserted, intrigued to have himself appointed successor to Prince Alexander of Bulgaria, on the latter's enforced abdication. Soon after this he was deprived of his military command and left the army. He then studied navigation, passed the examination for ship's captain, and in October, 1889, after having renounced all his titles, rights, and privileges as an archduke, took the name of Johann Orth (from the name of his castle). The next summer he left Hamburg for Buenos Aires, on board his newly purchased sailing ship *Sankt Margaretha*. After touching at Buenos Aires, he continued his voyage in the direction of Valparaiso and never was heard from again. Numerous romantic stories have been told in connection with his strange disappearance, but the probability is that the *Sankt Margaretha* was wrecked on the coast of South America, and that all hands were lost. Besides his pamphlet already mentioned, he left two others on military subjects, *Betrachtungen über die Organisation der österreichischen Artillerie* (1875) and *Geschichte des kaiserlich-königlichen Linien-Infanterieregiments Erzherzog Wilhelm Nr. 12* (1877-80), and a third on spiritualism, entitled *Einblicke in den Spiritismus* (5th ed., 1885). In addition to these he wrote the text of the ballet *Die Assassinen*.

JOHN'NY (JEAN) CRAPAUD, krä'pō'. A Frenchman. See NATIONAL NICKNAMES.

JOHNNY DARTER. A fish. See DARTER.

JOHNNY GROAT'S HOUSE. See JOHN O' GROAT'S HOUSE.

JOHNNY REB. A nickname used of the Southern soldiers by the Federal troops during the Civil War.

JOHNNY VERDE, or JUAN VERDE. A numerous and excellent food fish (*Paralabrax nebulifer*) of the southern California coast. It is one of the cabrillas, about 18 inches long, mottled greenish in color, and has the general characteristics of a rock bass.

JOHN O' GROAT'S HOUSE (more correctly, JOHNNY GROAT'S HOUSE). A spot on Duncansby Head, the northeastern extremity of the mainland of Scotland, marking one of the limits of that country. Commemorated in Burns's line, "Frae Maidenkirke to Johnny Groat's," it is also widely known as the terminus of cycling and automobile record rides from Land's End, the southwestern extremity of England, a distance of 994 miles. The house stood on the beach at the mouth of the Pentland Firth and was probably built for the reception of travelers crossing the ferry to the Orkneys. Tradition gives a romantic origin. In the reign of King James IV (1488-1513) two or three brothers—Dutchmen named Groot or Scotch Lowlanders named Groat—settled in Caithness and acquired the lands of Warse and Duncansby. When their descendants had multiplied to eight families, disputes arose as to precedence at a yearly festival reunion. John Groat, one of the brothers, settled the controversy by building an eight-sided house, with a door and a window in each side, and an eight-sided table within, so that the head of each of the eight families of Groats might enter by his own door and sit at his own head of the table. The family of Groats still exists, but a small green knoll marked with the foundation lines is

all that remains of John o' Groat's house. A neighboring hotel with an appropriate octagonal tower bears the name since 1876. The beautiful shell *Cypraea europaea*, which abounds in the neighborhood, is known as John o' Groat's bucky.

JOHNS, CLAUDE HERMANN WALTER (1857-). An English Assyriologist, born in Banwell, Somersetshire. He was educated at Queens' College, Cambridge; was ordained in 1887 after being a secondary-school teacher for seven years; was tutor at St. Peter's, Peterborough, in 1887-92; held the post of lecturer in Assyriology at Queens' College, Cambridge (1895-1909), and at King's College, London (1904-10); and in 1909 became master of St. Catharine's, Cambridge, and canon of Norwich. In his special field of Babylonian law he published: *Assyrian Deeds and Documents of the Seventh Century B.C.* (1898-1902); *The Oldest Code of Laws* (1903); *Babylonian and Assyrian Laws, Contracts, and Letters* (1904).

JOHNS HOPKINS UNIVERSITY. An institution of higher learning in Baltimore, Md., founded by Johns Hopkins (q.v.), who bequeathed over \$7,000,000 for the establishment of a university and a hospital. The two institutions are closely affiliated, but each has its own funds and is controlled by a distinct board of trustees. The university was incorporated Aug. 24, 1867, several years before the founder's death, and in 1870 the first board of trustees was created. Early in 1874 the trustees began the work of organization and at the end of that year elected, as president, Dr. Daniel Coit Gilman, who entered upon his duties in February, 1876. Instruction in the department of philosophy began in October of the same year. Temporary buildings were provided in the heart of the city, and the location proved to be so convenient that the university has remained there. In May, 1889, the Johns Hopkins Hospital was opened, and the work of the Johns Hopkins Medical School was inaugurated in 1893. In 1902 a gift of an eligible site in the suburbs of Baltimore was made, and an endowment of \$1,000,000 was presented to the university by the citizens of Baltimore. The development of this site was at once undertaken. A botanical laboratory and a greenhouse have been erected, and a fine athletic field is in use by the students. A general scheme of arrangement of the future buildings was adopted by the trustees as the result of a competition by selected architects, and the plans of the important structures were in 1914 either completed or in course of preparation. The academic building and a mechanical and electrical engineering building were occupied in 1914.

The university offers instruction to students of the following classes: 1. Under the faculty of philosophy: (a) college graduates and other advanced scholars (men and women) who may proceed to the degree of doctor of philosophy or of master of arts in literature or science, or pursue their studies for any length of time at their own discretion; (b) undergraduate students (men only) who are candidates for the degree of bachelor of arts: these may pursue one of five parallel groups of studies; (c) students who have taken no degree and who desire to pursue work in the university without aiming at academic honors. 2. Under the faculty of medicine: (a) candidates for the degree of doctor of medicine (men and women) for whom a four years' course is provided; (b) doctors of

medicine desiring to pursue special graduate courses. 3. In the department of engineering: graduates or undergraduates (men only) looking forward to the profession of engineer. The undergraduate college was organized to meet the needs of those desiring "a systematic discipline in liberal studies," and since 1876 over 2300 students have received the collegiate training. The undergraduate work is rendered effective by certain features of organization not found to the same degree elsewhere. These conditions include the sharp distinction drawn between the disciplinary methods appropriate for undergraduate instruction and the freer methods of advanced study; the group arrangement of studies; the opportunities offered to students of exceptional attainments for carrying on work beyond that required for any degree; and the influence upon younger pupils of the presence of a large body of graduate scholars engaged in specialized work in the various branches of learning. The most striking characteristics of the Johns Hopkins University, however, are the attractions offered to advanced students and the instruction given to them in seminaries and laboratories. These features were made the prime consideration at the inception of the university, at a time when the importance of university work did not receive its full measure of recognition in the United States. The first president succeeded in associating with him a small number of eminent specialists whose high standards and enthusiasm carried the new institution successfully through its experimental period and earned for it primacy in its field. For the encouragement of research among American students, the university annually awards a large number of fellowships and scholarships. Under the auspices of the university are published the *American Journal of Philology*, the *American Journal of Mathematics*, *Memoirs from the Biological Laboratory*, the *Studies in Historical and Political Science*, *Modern Language Notes*, *Hesperia* (devoted to Germanic philology), *Contributions to Assyriology and Comparative Semitic Philology*, and *Terrestrial Magnetism and Atmospheric Electricity*.

The government of the university is vested in a board of 12 trustees, with the president as an ex-officio member. In the philosophical department an academic council, consisting of the president and 10 professors, is in charge of the various departments of study and exercises the right of nominating the instructors and fellows. A board of university studies, consisting of the president, 37 professors, and 14 associate professors, has charge of the instruction of graduate students and of the examination of candidates for the degree of doctor of philosophy or of master of arts. A board of collegiate studies, consisting of the president, the dean of the college, and representatives from each of the chief departments of undergraduate study, directs the college work and conducts examinations for the baccalaureate degree. The Medical School, which is a department of the university and is at the same time closely connected with the Johns Hopkins Hospital, has had a most important influence on the recent advances made in medical education. The course extends through four years. For admission the bachelor's degree is required, or an equivalent course of preliminary training in the liberal arts, and especially in three branches of science—physics,

chemistry, and biology. The principal buildings of the philosophical department are McCoy Hall, which contains the library, the chief assembly room, and numerous apartments for literary and historical studies; Levering Hall, devoted to the work of the Young Men's Christian Association; Hopkins Hall, devoted to geology and mineralogy; the Chemical Laboratory; the Biological Laboratory; the Physical Laboratory; the Gymnasium; and the Administration Building. The medical department is provided with five well-equipped laboratories: the Anatomical (known as the Women's Fund Memorial Building), the Physiological, the Pathological, the Clinical, and the Hunterian (for animal surgery). In 1913 the total value of the property under control of the university was \$2,312,108, the endowment \$5,969,000, and the gross income \$377,689. The university has at various times received generous gifts, including one of \$307,000 from Miss Mary E. Garrett, of Baltimore, supplementing a previous gift of \$112,000 from women in different parts of the country, which enabled the trustees to open the Medical School (1893). Two general subscriptions for the benefit of the university have been made in Baltimore, amounting to nearly \$350,000, in addition to the million-dollar endowment fund above referred to. In 1910 the General Education Board offered the sum of \$250,000 if the university would secure an additional \$750,000 within a specified period—half of the total to be available for buildings on the new site. The sum was oversubscribed within a few months by citizens of Baltimore and other friends. In 1912 the Legislature of Maryland appropriated \$600,000 to establish a department of engineering, this sum to be used for buildings and equipment, and by the same Act an annual grant of \$50,000 for maintenance was made. For two years the Legislature gave \$50,000 per annum, \$24,000 annually for the next two years, and \$25,000 annually for the past 12 years, for current expenses.

The library contained, in 1914, 182,000 volumes, and more than 2300 periodicals are regularly received. The library supplements the valuable collections of the Peabody Institute, containing 211,000 volumes. The Maryland Geological Survey and the Maryland Weather Bureau are closely connected with the university, occupying rooms in the university buildings. In 1913-14 the faculty included 240 professors, associates, instructors, assistants, and lecturers. In the same year there were 870 students in the regular session, of whom 213 pursued graduate courses under the philosophical faculty, 378 under the medical faculty, and 16 in the department of engineering, and 263 were enrolled in the undergraduate courses, including those expecting to study engineering. In addition 167 teachers and others attended specially arranged afternoon courses of collegiate grade, 70 physicians pursued special courses in medicine and surgery, and 277 were enrolled in college courses during six weeks of summer. The total enrollment, excluding duplicates, was 1325. Dr. Gilman resigned the presidency in 1900, the resignation taking effect at the end of the academic year. Professor Ira Remsen was chosen to succeed him, and he was inaugurated Feb. 22, 1902; in January, 1913, he retired from office. On Feb. 23, 1914, the trustees announced the election of Dr. Frank Johnson Goodnow, of Colum-

bia University, as president, and he assumed his duties Oct. 1, 1914. Consult: *Johns Hopkins University: The Foundation and the Founder* (Baltimore, n. d.); *Retrospect of Twenty Years, 1876-1896* (ib., n. d.); *Statements Respecting the University Presented to the Public on the 20th Anniversary* (ib., n. d.); D. C. Gilman, *Launching of a University and Other Papers* (New York, 1906); E. E. Slosson, *Great American Universities* (ib., 1910).

JOHN SIGISMUND, sĭj'is-mũnd, *Ger. pron.* zĕ'gĭs-mũnt (1572-1620). Elector of Brandenburg, son of the Elector Joachim Frederick. During his reign the dominions of the electors of Brandenburg were increased by the acquisition of Cleves, Mark, Ravensberg, Ravenstein, and the Duchy of Prussia (East Prussia). The first four districts were part of the dominions of the dukes of Cleves, Jülich, and Berg, all of which the Elector claimed as grandson of the eldest daughter of Duke William the Rich. Count Palatine of Neuberg, the husband of a younger daughter, also claimed the territories. After years of dispute the matter was finally arranged in 1630 by an amicable division of the districts. The acquisition of East Prussia was also accompanied by difficulties, notwithstanding the Polish King's promise that the Brandenburg Hohenzollerns should be the heirs of the Prussian dukes. The Prussian nobles preferred the freedom enjoyed by their Slavic neighbors to what they called "the Brandenburg tyranny," and the King of Poland was not unwilling to listen to their petition, so that it was only by giving the greatest concessions that the Elector finally persuaded the King to stand by his promise.

JOHN'SON, ALEXANDER (1835-1913). A Canadian educator and scientist. He was born in Ireland and was educated at Trinity College, Dublin. He came to Canada in 1857 and was appointed professor of mathematics and natural philosophy, and later Peter Redpath professor of pure mathematics, in McGill University, Montreal. In 1867 he became vice dean and, later, dean of the faculty of arts and vice principal of the university. He was acting principal for three years and in 1903-13 was vice principal emeritus. Johnson contributed valuable papers to the *Transactions* of the Royal Society of Canada, of which he was president in 1905, and he also read papers before the British Association for the Advancement of Science. In 1897 he was vice president of the mathematical and physical section of the latter association. He was chairman and secretary of its committee which established a tidal survey for Canada and later was prominent in securing the commencement of a general hydrographic survey of the Atlantic and Pacific coasts. Besides many pamphlets and papers he published *Science and Religion* (1876).

JOHNSON, ALVIN JEWETT (1827-84). An American publisher, born at Wallingford, Vt. He spent his early years on a farm, then went to Virginia, where he taught school for a time, and finally removed to New York in 1853. The most important of his publications was *Johnson's Universal Cyclopædia*, the publication of which involved him in a bitter dispute with D. Appleton & Co., who afterward bought it and published it as the *Universal Cyclopædia*.

JOHNSON, ALVIN SAUNDERS (1874-). An American economist. Born near Homer,

Neb., he graduated in 1897 from the university of that State, and in 1902 from Columbia University (Ph.D.), where he was tutor, instructor, and adjunct professor of economics until 1906. He served as professor of economics at the University of Nebraska in 1906-08 and at the University of Texas in 1908-10; was acting associate professor in 1909, and associate professor in 1910-11, at the University of Chicago; and held the chair of economics at Leland Stanford in 1911-12 and at Cornell after 1913. He was assistant editor of the *Political Science Quarterly* in 1902-06 and had charge of the department of economics in the NEW INTERNATIONAL ENCYCLOPÆDIA, and is author of *Rent in Modern Economic Theory* (1903), *Introduction to Economics* (1909), and *The Professor and the Petticoat* (1914), a novel.

JOHNSON, ANDREW (1808-75). The seventeenth President of the United States of America. He was born at Raleigh, N. C., Dec. 29, 1808. His father lived only four years after Andrew's birth and left no funds for the education of the boy, who at the age of 10 was bound out to a tailor. Lack of education was a great grievance to Andrew, and he resolved to learn to read by himself. For this purpose he passed much of the time between labor and sleep in study. Just before his term of service was out, he went to work on his own account as a journeyman tailor at Laurens Court House, S. C. In 1826 he removed to Greeneville in east Tennessee, where he worked at his trade for about a year and married Eliza McCardle, who taught him writing and arithmetic.

When only 20 years old, Johnson organized a party of workingmen in opposition to the planters. The workingmen chose him alderman that year and reelected him in the two succeeding years. In 1830 Johnson was elected mayor, serving for three years. To qualify himself for public undertakings, he joined a debating society, most of whose members were students of Greeneville College. In 1834 Johnson took an active part in advocating a new constitution for the State greatly limiting the power of the large landholders; in 1835 he nominated himself for the Assembly, declaring himself a Democrat. He was successful in the ensuing election, but in 1837 failed of reelection because of his opposition to a financial measure which, as was later proved, he rightly judged to be bad. In 1839 he was again chosen a member of the Legislature. In 1840 he was on the Democratic electoral ticket and made many speeches for Van Buren. The next year he was elected to the State Senate, and in 1843 he was elected a member of Congress, to which he secured four consecutive reelections. While in the House he supported the annexation of Texas, the Mexican War, the Tariff of 1846, and the Compromise of 1850. He favored the acceptance of the forty-ninth degree of latitude to settle the Oregon boundary dispute and was one of the foremost of the advocates of a homestead law. He was also a firm supporter of the President's veto power and on all occasions was in favor of the greatest economy in public expenditure. Having been gerrymandered out of a seat, he left Congress in March, 1853; but the same year he was chosen Governor of his State, and two years afterward was reelected after a very turbulent canvass.

In 1857 he was elected to the United States Senate, where he opposed the increase of the

army and the legislation for the Pacific Railroad. He spoke little on slavery except to discourage all agitation of the question, his main interest being centred on the preservation of the Union. In the campaign of 1860, after being himself mentioned for the nomination, he supported Breckenridge until he found that secession was contemplated, when he repudiated him. When he went home in 1861, after opposing secession in the Senate, he was in great danger of his life. He worked hard for the Union cause, and at one time the secessionists turned his family out of their home. Early in March, 1862, Johnson was made military Governor of Tennessee. For a long time he labored earnestly to bring his State back into the Union. Near the beginning of March, 1864, under Johnson's special orders, Tennessee elected officers, both State and local. Three months afterward he was nominated for Vice President on the ticket with Lincoln. Six weeks after the inauguration Lincoln was shot, and Johnson became President. On taking the executive chair he made a brief speech, which was understood to mean that he would deal with the utmost severity with the leading secessionists. Instead of following this policy, his course, after he came under the influence of Secretary Seward, was the very opposite. He hastened to bring Virginia back to the Union, and near the close of June he brushed aside all regulations with regard to trade with the seceding States. He proclaimed general amnesty to all (except a few special classes) who would swear to be loyal to the Union. Under his proclamation provincial governments were set up in a number of the States but a few weeks before in rebellion, and he prepared the way for them to send members to Congress. These acts put him in opposition to the majority of the Republicans in Congress. Congress appointed a committee on reconstruction and on the admission of Southern members to the House, and adopted the Civil Rights Act, adding an act to increase the power and efficiency of the Freedmen's Bureau. These last two bills were vetoed by President Johnson, but they were readopted and passed. This action was severely denounced by the President, who characterized the course of Congress as another rebellion. Disaffection began to work in the cabinet, and three members resigned in consequence of differences with the President.

When Congress declared that the Fourteenth Amendment, giving the negroes citizenship, should be ratified by every seceding State as a preliminary to readmission to the Union, the President vetoed the resolution. During the next session acts were passed requiring the right of voting to be granted without regard to color in Territories applying for admission as States. These, too, were vetoed; but in all cases the bills were repassed and became laws. In March, 1867, in spite of the veto, an Act was passed dividing the Southern States, save Tennessee, into military districts, and trouble immediately arose over the appointments of the generals to command and their functions, Johnson's cabinet, with the exception of Secretary Stanton, supporting him in his obstruction of the legislation of the radicals in Congress. In August Stanton was displaced as Secretary of War, and General Grant was given the position. Stanton protested that his removal was in violation of the Tenure of Office Law which Congress had passed over Johnson's veto in March, 1867; and

at the meeting of Congress in September the Senate refused to ratify the suspension, whereupon Grant resigned, and Stanton resumed his post. Five months afterward Johnson again removed Stanton, and put Gen. Lorenzo Thomas in his place. But Congress had taken from the President practically all power, and the Senate now resolved that "the President has no power to remove the Secretary of War and designate any other person to perform the duties of that office." The day after the adoption of the resolutions of the Senate, the House of Representatives determined upon the President's impeachment. The articles of impeachment recited many offenses, the principal of which were the removal of the Secretary of War; the public expression of disregard of and contempt for the legislative branch of the government; the declaration that the one in session was not a constitutional Congress; and particularly his obstruction to the execution of congressional acts. The main point of the defense was that Johnson's course in the work of reconstruction was merely the continuation of a plan resolved upon by President Lincoln and the members of his cabinet. In the Senate, sitting as the court of impeachment, the test vote was: guilty, 35; not guilty, 19. The requisite two-thirds vote not having been obtained, Johnson was acquitted—a result which is now considered just and fortunate by temperate historians. As soon as the trial was over Stanton voluntarily gave up his office and was succeeded by General Schofield.

At the Democratic National Convention in New York, July 4, 1868, Mr. Johnson's name was among the list of candidates for President. On the first ballot he had 65 votes, standing second on the list, George H. Pendleton having 105; but Johnson's vote diminished rapidly until on the nineteenth ballot his name did not appear. On Christmas Day, 1868, he proclaimed complete pardon to all who had been directly or indirectly concerned in secession. This was his last important official act. He was succeeded, March 4, 1869, by General Grant and at once repaired to his home in Greeneville. He was not satisfied with retirement and sought unsuccessfully to be sent to the Senate and also failed as an independent candidate for Congress. At last, in January, 1875, he was chosen United States Senator and was in his seat during the short extra session in March. But his triumph was short, for he died on July 31, 1875. Johnson showed great ability, courage, and political acumen. His messages, which represent his views, whether or not he was their author in the fullest sense, are powerful documents. His bust is in the Senate gallery in the Capitol at Washington.

Dunning, *Essays on the Civil War and Reconstruction* (ib., 1898); J. S. Jones, *Life of Andrew Johnson* (Greenville, Tenn., 1901); D. M. Dewitt, *Impeachment and Trial of Andrew Johnson* (New York, 1903); F. T. Hill, *Decisive Battles of the Law* (ib., 1907); W. A. Dunning,

Reconstruction, Political and Economic (ib., 1907); id., "A Little More Light on Andrew Johnson," in the *Proceedings of the Massachusetts Historical Society* (Boston, 1905), in which the author maintains that Johnson's first inaugural address was written by the historian George Bancroft.

JOHNSON, BRADLEY TYLER (1829-1903). An American soldier and lawyer, born at Frederick City, Md. He graduated at Princeton in 1849, studied law at Harvard, and was admitted to the bar in 1851. He was a delegate to the National Democratic Convention at Baltimore in 1860 and joined the majority of his delegation when they withdrew from the convention and united with the Southern wing of the party, which supported Breckenridge and Lane. When the Civil War began, Johnson organized and equipped a company at his own expense, and he took an active part in forming the First Maryland Regiment, of which he became major and subsequently colonel, meanwhile declining a lieutenant colonel's commission in a Virginia regiment because of his belief that his strongest obligation was to his own State. He saw service in the seven days' battles around Richmond in 1862 and was advanced to the rank of brigadier general of cavalry in 1864. As commander of the post at Salisbury, N. C., he used his influence to lessen the suffering among the prisoners and finally obtained their parole. At the close of the war he practiced law in Richmond until 1879, when he removed to Baltimore. His writings include: *Reports of Chase's Decisions on the Fourth Circuit* (1875); *Memoir of Joseph E. Johnston* (1891); an examination of the *Foundation of Maryland and the Maryland Act Concerning Religion* (1883); *Life of General Washington*, in "Great Commanders Series" (1894); and the volume *Maryland in Confederate Military History* (Atlanta, 1899). Consult vol. ii of this *History* for Johnson himself.

JOHNSON, BURGESS (1877-). An American author, editor, and publisher, born at Rutland, Vt. Graduating from Amherst College in 1899, he served as a reporter for the *New York Commercial Advertiser* and the *Evening Post* in the same year; was literary adviser to G. P. Putnam's Sons in 1900-02 and a member of the literary staff of Harper & Bros. in 1903-06; and then held an assistant editorship on *Everybody's Magazine* for a year and the managing editorship of *Outing* until in 1908 he became president of the publishing house of Thompson, Brown Co. After 1913 he was manager of the educational department of E. P. Dutton & Co. He is author of *Rhymes of Little Boys* (1905); *Pleasant Tragedies of Childhood* (1905); *Beastly Rhymes* (1906); *Rhymes of Home* (1909); *Yearbook of Humor* (1910); *Bashful Ballads* (1911); *Rhymes of Little Folks* (1915).

JOHNSON, BUSHROD RUST (1817-80). An American soldier in the Confederate service, born in Belmont Co., Ohio. He graduated at West Point in 1840 and served in the Seminole War and in the war with Mexico. He resigned from the service in 1847, was professor of natural philosophy and chemistry at the Western Military Institute, Georgetown, Ky., in 1848-51, and then for four years superintendent of the institution. In 1855 he became superintendent of the Military College of the University of Nashville. He entered the Confederate Army as a colonel of engineers in 1861 and was made a

brigadier general in January, 1862. He was chief of staff at the defense of Fort Donelson and two months later commanded a brigade at Shiloh (April 6 and 7, 1862). At Perryville and at Murfreesboro his brigade was engaged in some of the most desperate fighting, while at Chickamauga, according to Gen. D. H. Hill, it was due to Johnson's initiative that the Confederates swept the Federal right wing from the field. He was commissioned a major general in May, 1864. Towards the close of the war his force joined Lee's army and took part in the actions at Drewry's Bluff and around Petersburg. After the surrender he returned to the Western Military Institute, where he was professor of engineering, mechanics, and natural philosophy during the remainder of his life.

JOHNSON, CAVE (1793-1866). An American politician. He was born in Robertson Co., Tenn., received an academic education, studied law, was admitted to the bar, and practiced successfully at Clarksville until his appointment to the bench of the State Circuit Court in 1820. He resigned his judgeship in 1829, upon his election as a Democrat to the Twenty-first Congress. By successive reelections he served until 1837, when he was defeated by the Whig candidate, but was again elected in 1839 and continued to serve until 1845. He was a ready debater and a staunch supporter of Jackson and opposed with spirit the nullification movement and the United States Bank. In 1845 he entered the cabinet of President Polk as Postmaster-General, serving throughout the administration and favoring the President's Mexican policy, though with little enthusiasm. From 1850 to 1859 he was president of the State Bank of Tennessee and on the outbreak of the Civil War, although an old man, threw himself with energy into the movement to keep Tennessee in the Union, spoke frequently in opposition to secession, and supported and advised Andrew Johnson. In 1863 he was elected as a Unionist to the State Senate of Tennessee, but ill health prevented his taking any part in legislation.

JOHNSON, CHARLES (1679-1748). An English dramatist, born probably in London. He first studied for the bar, but afterward gave himself to authorship and produced 19 mediocre plays. Pope satirized him in the *Dunciad*. His works include: *The Wife's Relief, or the Husband's Cure* (1711); *Country Lassies, or the Custom of the Manor* (1715); *The Sultanness* (1717), a tragedy taken from the *Bajazet* of Racine; *Cælia, or the Perjured Lover* (1733).

JOHNSON, CHARLES FLETCHER (1859-). An American legislator. He was born at Winslow, Me., and received the degrees of A.M. in 1879 and LL.D. in 1911 from Bowdoin College. He was principal of schools at Machias, Me., in 1881-86, was then admitted to the Maine bar, and thereafter practiced law at Waterville, Me., where he served for a time as mayor. In 1892 and 1894 he was the Democratic candidate for Governor of Maine, attended the Democratic National Convention in 1904, and served in the Maine House of Representatives in 1905 and 1907. He was chosen United States Senator for the term 1911-17.

JOHNSON, DANIEL (1629-75). An English buccaneer, born at Bristol. When 25 years old, he was sold as a slave in the West Indies by the Spaniards, who had taken the merchant vessel in which he was a sailor, but escaped in

1657 and became a rover of the high seas, revenging his wrongs wherever possible upon Spanish shipping and towns. His depredations were upon such a gigantic scale that \$25,000 were offered for his capture, and it was at length accomplished by four ships to one. Johnson's wounds were many and dangerous, but the Spaniards waited till they were healed before executing him at Panama.

JOHNSON, DUNCAN STARR (1867-). An American botanist. He was born at Cromwell, Conn., and was educated at Wesleyan University (B.S., 1892), at Yale, at Johns Hopkins (Ph.D., 1897), and in Munich (1901). At Johns Hopkins he was assistant in botany (1898-99), associate (1899-1901), associate professor (1901-06), and professor after 1906; and he had charge of the work in botany from 1896 to 1900 and of cryptogamic botany from 1901 to 1911 at the Carnegie Institution station for experimental evolution, Cold Spring Harbor, Long Island. His investigations deal with the morphology of various groups, notably of the Marsiliaceæ (water ferns), Hepaticæ (liverworts), and dicotyledons. In the last-named group he gave special attention to the more primitive families, especially the Piperaceæ.

JOHNSON, EASTMAN (1824-1906). An American genre and portrait painter, born at Lovell, Me., July 29, 1824, and educated in the public schools of Augusta. When 18 years of age, he made several portraits in black and white. In 1845 he spent one year in Washington, D. C., painting the portraits of Daniel Webster and John Quincy Adams. In the three following years, during his residence in Boston, he painted the portraits of Longfellow and his family, of Emerson, and Hawthorne. In 1849 he went abroad, studying with Leutze and at the Royal Academy, Düsseldorf; then in Paris, Italy, and Holland. He spent five years at The Hague, painting with such success that he was offered the position of court painter to remain. His work there included the well-known pictures, "The Savoyard" and "The Card Players." He returned to the United States in 1856, spending one year in the Indian country on the shores of Lake Superior. In 1860 he settled in New York and was elected a member of the National Academy of Design in the same year. He appealed to popular taste, painting simple themes of real life with a sound and thorough technique, little influenced by the Düsseldorf school. His portraits are dignified and fine in characterization; his genre pictures are better than anything done before in the United States—the subjects are treated with a wholesome naturalism and a breadth of handling lacking in his portraits. Many of his works have been lithographed and engraved. Among his chief works are: "Spanish Woman" (1862); "Old Stage Coach" (1871); "Milton Dictating to his Daughters" (1875); "Cranberry Harvest" (1880); portraits of Presidents Cleveland and Harrison, of Theodore D. Woolsey, John D. Rockefeller, William H. Vanderbilt, Cornelius Vanderbilt, William Waldorf Astor, Mrs. Alexander Hamilton, Mrs. Augustus Belmont, and Mrs. Hamilton Fish. The Metropolitan Museum, New York, possesses two portraits by him ("Two Men" and Sanford R. Gifford) and "Corn Husking at Nantucket"; the New York Historical Society, his portrait of Augustus Schell; and the Public Library, New York, his famous "Old Kentucky Home" and two others.

JOHNSON, EDWARD (1599-1672). An American Colonial official and historical writer, born in Kent, England. He came to Massachusetts Bay with the party of Governor Winthrop in 1630 and engaged in trade with the Indians. In 1642 he was recorder of the meeting which organized the town and church of Woburn, Mass., and he served as recorder of the town until his death. With the exception of 1648, he yearly represented the town in the General Court from 1643 to 1671, being Speaker in 1655 and serving upon many important committees. He published anonymously a *History of New England from the English Planting in the Yeere 1628 Untill the Yeere 1652* (London, 1654), which is better known by the subtitle *The Wonder-working Providence of Zion's Saviour*. Much of the book was copied in the so-called *Gorges Tracts*. It is valuable for the minute account of civil and ecclesiastical procedure in the Bay Colony and was reprinted in *Massachusetts Historical Collection*, 2d series, vols. i, ii, iii, iv, vii, viii. There is also a facsimile edition, with an elaborate introduction by W. F. Poole (Andover, 1867).

JOHNSON, E(MILY) PAULINE (1862-1913). A Canadian poet. She was born at Chiefwood, on the Grand River Reserve, in Ontario. Her father was George Henry M. Johnson, chief of the Mohawk Indians; her mother, Emily S. Howells, a native of Bristol, England. She was educated by private tutors and at the Brantford Model School. In 1894 she visited England, where she published a collection of poems under the title *The White Wampum*. The volume gained wide attention because of the author's Indian blood and fresh passionate themes. Her later volumes of poems were *Canadian Born* (1903) and *Flint and Feathers* (1912). She also published *Legends of Vancouver* (1911) and two books of fiction, *The Moccasin Maker* (1912) and *Shagganappi* (1913). She died at Vancouver, B. C.

JOHNSON, EMORY RICHARD (1864-). An American economist, born at Waupun, Wis. He graduated from the University of Wisconsin (1888) and in 1893 took his Ph.D. from the University of Pennsylvania, where, after teaching economics for three years at Haverford College, he became professor of transportation and commerce. As an expert on transportation problems, his services were obtained by the United States Industrial Commission (1899), the Census Bureau (1904-05), and the National Waterways Commission (1909). He was a member of the Isthmian Canal Commission (1899-1904) and in 1911 made a report to President Taft on the Panama Canal. In 1907 he arbitrated a dispute between the Southern Pacific and the Order of Railroad Telegraphers. He became director of the Philadelphia Bureau of Municipal Research. Besides editing the *Annals of the American Academy of Political and Social Science* after 1901, he collaborated in the preparation of an economic history of the United States for the Carnegie Institution and published: *Inland Waterways: Their Relation to Transportation* (1893); *American Railway Transportation* (1903; rev. ed., 1908); *Ocean and Inland Water Transportation* (1906); *Elements of Transportation* (1909); *Railroad Traffic and Rates* (2 vols., 1911); *Panama Canal Traffic and Tolls* (1912); *Measurement of Vessels for the Panama Canal* (1913); *The Panama Canal*, with others (1915).

JOHNSON, GISLE (CHRISTIAN) (1822-94). A noted Norwegian Lutheran theologian and author, born at Fredrikshald. A descendant of two of Iceland's most esteemed families, he was educated at Christianssand and Christiania, continued his studies in Berlin, Leipzig, Erlangen, and Paris, and became docent in theology at the University of Christiania in 1849 and was professor from 1860 to his death. Notable for his wide experience and great learning, he exerted a far-reaching influence upon his students and upon the Lutheran church of Norway throughout his long life. He founded many benevolent and educational institutions, as Den norske Lutherstiftelse (1867); was (1847-90) coeditor of *Theologisk Tidsskrift*, founder and (1863-75) editor of *Luthersk Kirketidende*; and wrote many books and articles. Consult: Th. G. B. Odland, "Biografi af Gisle Johnson," in *79de Beretning om det norske Bibelselskab* (Christiania, 1894), and *Norsk Forfatter-Leksikon*, vol. iii (ib., 1892).

JOHNSON, GUY (c.1740-88). An English soldier, famous as an American Royalist. He was born in Ireland and saw service during the French and Indian War, first with the American provincials and later as a cavalry commander under General Amherst. He succeeded his uncle, Sir William Johnson, as Superintendent of Indian Affairs at the latter's death in 1774. At the outbreak of the Revolution his estates in central New York were confiscated by the Americans, and he was obliged to flee to Canada. There he interested himself in inciting the Mohawk Indians, under Joseph Brant, to attack the colonists. In 1783 he was dismissed from the service and five years later died in poverty in London.

JOHNSON, HERMAN MERRILL (1815-68). An American educator. He was born at Butter-nuts, Otsego Co., N. Y., graduated at Wesleyan University in 1839, and entered the Methodist ministry in 1845. He was professor of ancient languages at St. Charles College, Missouri, from 1839 to 1842, when he was called to a similar position at Augusta College, Kentucky. In 1844 he became a professor in Ohio Wesleyan University and remained there for six years. He accepted the professorship of philosophy and English literature in Dickinson College in 1850 and in 1860 became its president. Dr. Johnson was a contributor to the *Methodist Quarterly Review*, but is best known by his edition of the *Clio* of Herodotus (1850) and his *Orientalia Antiquaria Herodoti*.

JOHNSON, HERRICK (1832-1913). An American Presbyterian clergyman and educator. He was born near Fonda, N. Y., and graduated at Hamilton College in 1857 and at Auburn Theological Seminary in 1860. He was pastor of churches in Troy, N. Y., Pittsburgh, Philadelphia, and Chicago; was professor of homiletics and pastoral theology at Auburn Theological Seminary (1874-80); and from 1880 to 1905 was professor of homiletics in McCormick Theological Seminary. He was moderator of the General Assembly of the Presbyterian church in 1882 and became president of the Presbyterian Board of Education and Board of College Aid. His publications include: *Christianity's Challenge* (1881); *Plain Talks about the Theater* (1882); *Revivals* (1883); *Presbyterian Book of Forms* (1889); *From Love to Praise* (1903); *The Ideal Ministry* (1908).

JOHNSON, HERSCHEL VESPASIAN (1812-80).

An American jurist and political leader, born in Burke Co., Ga. He graduated at Franklin College in 1834, studied law and practiced at Augusta, and finally settled at Milledgeville in 1844. In 1843 he was nominated for Congress, but was defeated, and in the campaign of 1844 was a presidential elector. In 1848 he was appointed by the Governor to the seat in the United States Senate made vacant by the resignation of W. T. Colquitt, and in that body he strongly supported the administration's Mexican policy. From his entry into political life he had been a strong States' rights advocate, and in 1849 he was one of the signers of the "Southern Address." His views, however, underwent a radical change at this time, and he became one of the warmest supporters of Clay's scheme of compromise and thereafter allied himself with the Unionist element in the South. He was a judge of the Superior Court of Georgia from November, 1849, to 1853, and was Governor of the State from 1853 until 1857. His well-known conservatism led to his nomination in 1860 as the candidate of the Northern Democrats for Vice President on the ticket with Stephen A. Douglas. With Alexander H. Stephens (q.v.) he did his utmost to check the secession movement in Georgia, but he abided by the decision of the secession convention and threw in his fortune with the Confederacy. He was elected one of the senators from Georgia in the Second Confederate Congress in November, 1862, but early despaired of the cause of the South. He openly advocated peace in 1864, hailed the cessation of hostilities with delight, and in October, 1865, was president of the Georgia convention which repealed the ordinance of secession. On the readmission of Georgia he was, in January, 1866, elected United States Senator, but was not allowed to take his seat on account of war disabilities. In 1873 he was appointed to the bench of the State Superior Court, where he remained until his death.

JOHNSON, HIRAM WARREN (1866-). An American lawyer and public official, born at Sacramento, Cal. He received his academic and legal education at the University of California and was admitted to the bar in 1887. Although regarded as an able and efficient attorney, he did not become generally known to the people of the State until he participated in the trial of the San Francisco graft and boodling cases in 1906 and 1907. When Francis J. Heney was shot down in the court room, Johnson, as the assistant prosecuting attorney who was most familiar with the case, took his place and conducted the prosecution with great ability and success. The result was that Abe Ruef and his associates were convicted and sentenced to a term of imprisonment, and Johnson was regarded as one who had freed the city and the State of their power. He was selected in 1910 by the progressive element of the Republican party for the nomination for Governor. A bitter campaign of five months followed, but Johnson, employing as his chief political doctrine the sentence "The Southern Pacific Railroad must be kicked out of State politics," won the nomination, and after a severe contest he was elected over the Democratic nominee. He began his administration with the avowed intention of cleaning up the State and turning out officeholders who were inefficient and who were controlled by private interest. His first

message to the Legislature urged many radical reforms, including the establishment of a railroad commission, the adoption of the short ballot, and the direct nomination of United States Senators so as to bind the choice of the Legislature to the nominee. He spoke throughout the State in favor of the adoption of an amendment to the State constitution providing for the initiative and referendum in matters of legislation and for the recall of elective officers, including judges. In 1912, at the Republican Convention in Chicago, he was a conspicuous figure. He opposed the candidacy of President Taft, condemned the admission of certain contested delegates, and, leaving the party with the other followers of Roosevelt, was named for the vice-presidency on the ticket of the new Progressive party. In 1913 he signed the Webb Anti-Alien Land Bill, which was passed by the California Legislature to restrict the rights of aliens, particularly Japanese, in that State, and during the controversy which the bill provoked between the United States and Japan he remained firm. Though criticized as insincere in his adherence to the principles of the Progressive party, and in spite of the fact that this party's hold on the country at large had greatly weakened, Johnson was reelected Governor in 1914 by 188,500 plurality. See CALIFORNIA, *History*; and, for constitutional amendments during his first term, *Government*.

JOHNSON, SIR JOHN (1742-1830). An American Tory leader, the son of Sir William Johnson (q.v.), upon whose estate on the Mohawk River in New York he was born. He was educated at Albany and at New York and took part with his father in the French and Indian War. He was knighted in 1765 and in 1774 succeeded to the baronetcy which had been granted to his father. He retained a great deal of his father's remarkable influence over the Indians, and it was due to this and to the exertions of Joseph Brant (q.v.), Sir William's protégé, that the tribes of the Iroquois Nation, with the exception of the Oneidas and the Tuscaroras, allied themselves with the British at the outbreak of the Revolution. There was a strong Tory element in central New York, and this element Sir John undertook to rally about the standard of Great Britain, organizing the famous loyalist corps known as the Queen's Own American Regiment, or, more familiarly, as the Royal Greens, of which he himself became colonel. With these troops in July, 1777, he joined St. Leger at Oswego and took part in the siege of Fort Stanwix (q.v.) and the battle of Oriskany (q.v.) on August 6 following. Later in the same day on which Herkimer was repulsed in his attempt to raise the siege, a brilliant sortie of the fort's garrison under Marinus Willett compelled Johnson to withdraw across the Mohawk, leaving his camp and equipment in the hands of the Americans. The advance of Arnold to the relief of the fort and the defection of a large part of their Indian allies caused St. Leger and Johnson to abandon the siege on August 22 and retreat northward towards Oswego, thus rendering impossible the proposed coöperation with Burgoyne. During the next two years Johnson continued to direct operations in northern and central New York, and the succession of raids of the Butlers and Brant with their bands of Indians and Tories, resulting in the massacres in the Wyoming and Cherry valleys, forms one of the most unpleas-

ant chapters of the American Revolution. When in the summer of 1779 Washington determined to put a stop to these outrages, he sent General Sullivan at the head of 5000 troops into the region. This force met Sir John Johnson and the Butlers at Newtown (now Elmira) on Aug. 29, 1779, and decisively defeated them. This defeat and the devastation of the Iroquois towns that followed put a stop to the Tory régime in the district, and Sir John retired to Montreal. At the close of the war his large estates were confiscated. He lived the rest of his life in Canada, where for many years he was superintendent general of Indian affairs in British North America. Consult Stone, *Life of Brant* (New York, 1838; Albany, 1865).

JOHNSON, JOHN ALBERT (1861-1909). An American public official, born near St. Peter, Minn. When Johnson was only 13 years old, his father died in the county poorhouse of alcoholic dementia, and he was forced to leave school in order to support his mother. He was employed by various mercantile establishments and for a time was connected with a railroad-construction gang. During all of this time, however, he continued to educate himself by private study. His success in this respect was demonstrated in 1886 when he was made editor of the *St. Peter Herald*. He was active in bringing about civic improvements, providing free public lectures, and establishing playgrounds. His attractive personality and geniality made him extremely popular. In 1894 he entered politics as Democratic candidate for the State Senate; though then unsuccessful, in 1898 he was elected and served in three successive legislatures. He became known for his independence of party partisanship when he opposed Governor Lind (q.v.) on the question of withdrawing Minnesota troops from the Philippines. Johnson was a bold advocate of tariff reform and economy in the administration of the government. In 1904 he was nominated and elected Governor. The campaign was extremely bitter, and personalities entered largely into the speeches. The public issue concerned the merging of the Great Northern and the Northern Pacific railroads (see **NORTHERN SECURITIES CASE**), but Johnson was taunted with references to his family. His popularity with the Scandinavian element, his public record, and the assaults on his family turned public sentiment in his favor, and he was elected by a plurality of 6000 at a time when Roosevelt carried the State for the Republican national ticket by 146,000. As Governor, he achieved immense success, and through his influence legislation was enacted providing for employers' liability, the abolition of railroad passes, schools for delinquent girls, and a reformation of the civil service; he was also instrumental in effecting local and national reforms in insurance laws. He was reelected Governor in 1906 by a plurality of 76,000, and again in 1908 by 20,000, although Taft carried the State by 85,000 votes. In the presidential campaign of 1908 Johnson was frequently mentioned for the Democratic nomination, and he received 46 votes in the Denver Convention. His prestige and success as Governor were not diminished by the quiet (though determined) method employed by him in dealing with the miners' strike of 1908. He had long suffered from appendicitis, and in 1909 an operation was performed, but failed to save his life.

JOHNSON, JOHN BUTLER (1850–1902). An American civil engineer and educator. He was born at Marlboro, Ohio, and graduated at the University of Michigan in 1878. He was a member of the United States Lake and Mississippi River Surveys until 1883; professor of civil engineering at Washington University, St. Louis, Mo., from that date until 1898, and dean of the department of mechanics and engineering at the University of Wisconsin from 1898 until his death. The parabolic column formula, which he proposed, bears his name; his name is also connected with the roller extensometer, an instrument used in measuring the stretch in materials under test. In 1884 he assumed charge of the index department of the *Journal of the Association of Engineering Societies*, and in 1891 was put in charge of the timber-testing laboratory at St. Louis by the United States Forestry Bureau. His publications include *The Materials of Construction*, first published in 1897; *Theory and Practice of Surveying* (8th ed., 1904); *Engineering Contracts and Specifications* (3d ed., 1904); and he was joint author of *Modern Framed Structures* (1893).

JOHNSON, JOSEPH FRENCH (1853–). An American economist, born at Hardwick, Mass. He graduated from Harvard University in 1878; studied in Germany for one year; joined the staff of the *Springfield Republican*; was financial editor of the *Chicago Tribune*; and from 1890 to 1893 was proprietor of the *Spokane (Wash.) Spokesman*, which he had established. Thereafter until 1901 he was professor in the Wharton School of Commerce, University of Pennsylvania, and from 1899 to 1903 he lectured also on finance at Columbia University. In 1901 he became professor of political economy in, and in 1903 dean of, the School of Commerce, Finance, and Accounts at New York University. He reported on the national banking system of Canada for the National Monetary Commission and was a member of the commission on new sources of revenue for New York City in 1912 and of the commission to revise the banking laws of the State of New York in 1913. He edited the *Modern Business Series* and the *Journal of Accountancy*, contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA, and published *Syllabus of Money and Banking* (1899), *Money and Currency* (1905; rev. ed., 1914), and *The Canadian Banking System* (1910).

JOHNSON, LIONEL (1867–1902). A British poet and critic, of Irish descent, born at Broadstairs, Kent, and educated at Winchester and at Oxford. In his university days he was much under Walter Pater's influence. Though of a line of soldiers and Protestants, he chose literature for his profession and Catholicism for his creed, and much of his poetry took tone and color from his religion. He was active in the Irish Literary Society of London, founded in the 1890's, and, indeed, should be associated with the movement known as the Irish Literary Revival. (See IRISH LITERATURE, II.) Most of his life was passed in London, where he lived, a bachelor and a scholar, with his many books. For relaxation, he took long country rambles that tried his fragile health. He died on Oct. 4, 1902, in St. Bartholomew's Hospital, of a fractured skull caused by a fall while he was walking in Fleet Street on the night of September 29. "In the bitter pathos of his end he was not with Keats, but with Poe." He produced little,

but what he wrote was of fine quality. The range of his scholarship, his taste, and his insight combined to make him an excellent critic, in which capacity he is represented by *The Art of Thomas Hardy* (London, 1894) and *Post Liminium: Essays and Critical Papers* (New York, 1911), edited by Thomas Whittemore. His poetry is marked by depth and restrained intensity of feeling, by refined beauty of form, and by a certain lucidity, wholesome soundness, and ordered firmness of structure that indicate his kinship with the classic spirit. His poems are collected in *Poems* (London, 1895) and in *Ireland, with Other Poems* (ib., 1897). Consult: W. B. Yeats's introduction to selections from Johnson in *A Treasury of Irish Poetry* (ib., 1900); L. I. Gurney, "Of Lionel Johnson, 1867–1902," in *Atlantic Monthly*, vol. xe (Boston, 1902).

JOHNSON, MANUEL JOHN (1805–59). An English astronomer, born in Macao, China, and educated at Addiscombe Military College. He took service in the St. Helena artillery; and, in an observatory built by the East India Company, he made a *Catalogue of 606 Principal Fixed Stars in the Southern Hemisphere* (1835), which won for him the gold medal of the Royal Astronomical Society. He entered Magdalen College, Oxford, in 1835, and on graduation, in 1839, succeeded Rigaud as director of the Radcliffe Observatory, which under his care became not merely a scientific centre, but a gathering place for the leaders of the Oxford High Church party. He published 18 volumes of *Radcliffe Observations* and wrote a catalogue of circumpolar stars, edited by Main in 1860. Johnson was president of the Royal Astronomical Society in 1857.

JOHNSON, OLIVER (1809–89). An American Abolitionist and editor, born at Peacham, Vt. He entered the office of the *Vermont Watchman* at Montpelier as an apprentice, and as early as July 4, 1828, showed his sympathy with the Abolition movement by delivering a speech against slavery. In January, 1831, he began to publish the *Christian Soldier*, and soon afterward became intimate with William Lloyd Garrison. He was one of the founders of the New England Antislavery Society and edited the *Liberator* during Garrison's absence in Europe in 1833. Among the other papers of which he was an editor were the *National Antislavery Standard*, the *Antislavery Bugle*, and the *Pennsylvania Freedman*. He was an associate editor of the *Independent* when Garrison became a contributor in 1868. Later he occupied editorial positions on the *Weekly Tribune* and the *Christian Union*, and after 1881 was connected with the *New York Evening Post*. He published *William Lloyd Garrison and his Times, or Sketches of the Antislavery Movement in America* (1880).

JOHNSON, OWEN (1878–). An American novelist, son of Robert Underwood Johnson, born in New York City and educated at the Lawrenceville (N. J.) School and at Yale University. His story of school life, *The Varmin* (1910), with its boyish high spirits, cleverness, and wholesomeness, is perhaps his best book. His *Stover at Yale* (1911), a college story, frank in its criticisms of certain phases of life in the author's alma mater, aroused a little storm of controversy. Other books of his are: *Arrows of the Almighty* (1901); *In the Name of Liberty* (1905); *Max Fergus* (1906); *The Eternal Boy* (1909); *The Humming Bird*

(1910); *Tennessee Shad* (1911); *The Sixty-first Second* (1912); *The Salamander* (1914; and dramatized). He also wrote the plays *The Comet* (1908), *Comedy for Wives* (1912), and an adaptation from the French, *The Return from Jerusalem* (1912).

JOHNSON, PERCIVAL NORTON (c.1793–1866). An English metallurgist. He was much employed in consultation at important English mines, was the first to establish rules for accurately determining the composition of bullion, and introduced into England the alloy known as German silver (q.v.). He improved the mechanical plant in some of the Cornish mines and made several important inventions in mining and metallurgy.

JOHNSON, REVERDY (1796–1876). An American jurist, born at Annapolis, Md., May 21, 1796. He was a son of John Johnson, himself an eminent lawyer, who became Chancellor of Maryland. Reverdy was educated at St. John's College at Annapolis, studied law in his father's office, and in 1815 was admitted to the Maryland bar. In 1817 he removed to Baltimore and was successively Deputy Attorney-General of Maryland and for four years a State Senator (1821–25). With Mr. Thomas Harris, he edited the reports of the Maryland Court of Appeals from 1820 to 1826. He gained a high reputation as a profound lawyer and was frequently employed in arguing important cases before the Supreme Court of the United States. He represented his native State in the United States Senate from 1845 to 1849, when he resigned his seat to enter President Taylor's cabinet as Attorney-General. After the death of General Taylor in 1850 Mr. Johnson continued to practice law in Baltimore. In 1863 he was again elected to the United States Senate, but before the expiration of his term was appointed Minister to England in 1868. His negotiations for a settlement of the disputed *Alabama* claims having proved unsatisfactory to the American government, and his convention with Great Britain being rejected by the Senate of the United States, Mr. Johnson was recalled in 1869. During the trial of the assassins and conspirators concerned in the murder of Abraham Lincoln, Mr. Johnson prepared an argument in behalf of Mrs. Surratt (afterward executed for complicity in the assassination) which the military court that tried the case refused to hear. Though not a master of statecraft nor a great politician, Reverdy Johnson was a man of great courage and independence of judgment as well as a consummate lawyer and earned a place of great distinction in the roll of the American bar. He died at Annapolis, Feb. 10, 1876.

JOHNSON, RICHARD MENTOR (1780–1850). An American legislator and politician, Vice President of the United States in 1837–41. He was born at Bryant's Station, Ky., was educated at Transylvania University, studied law and began practice at Grand Crossings in that State. His political career began in 1805 with his election to the Lower House of the Kentucky Legislature. In 1806 he was elected to the Tenth Congress and was reelected to the Eleventh and Twelfth, serving from 1807 until 1813. At the outbreak of the War of 1812 he returned to Kentucky, where he recruited a regiment of mounted riflemen, serving during the recesses of Congress and occupying his seat during the sessions. In 1813 he raised a second regiment, of which he became colonel and which he com-

manded in Gen. William Henry Harrison's Canadian campaign. At the battle of the Thames, Oct. 5, 1813, according to tradition, he shot and killed Tecumseh (q.v.). He was not a member of the Thirteenth Congress, but was returned to the House by his constituents in 1814 and served until 1818. In 1819 he was elected to the United States Senate to fill the vacancy caused by the resignation of John J. Crittenden and was later reelected, remaining in that body until 1829. In the Senate and in the House, of which he was again a member from 1829 to 1837, he was a strong supporter of Jackson, who in 1835 designated him as his personal choice for Vice President. In the Baltimore Convention in May of that year he was placed in nomination, his principal opponent being William C. Rives (q.v.) of Virginia. Opposition to his candidacy continued throughout the campaign, and when the electoral votes were counted it was found that, although Van Buren was elected, Virginia by casting her votes for William Smith of Alabama had prevented the choice of a Vice President. The election was therefore thrown into the Senate, where Johnson was promptly elected, receiving 33 votes to 16 for Francis Granger (q.v.) of New York. Opposition to Johnson having increased, at the Baltimore Convention in May, 1840, after the President had been indorsed and renominated, a resolution was passed declaring "that the Convention deem it expedient at the present time not to choose between the individuals in nomination" for the vice presidency, all of whom, it declared, were worthy of the office. In the electoral college, however, the Democratic electors voted generally for Johnson, giving him 48 votes, L. W. Tazewell of Virginia 11, and James K. Polk 1. In 1844 Johnson entered into the Democratic canvass for the presidential nomination, but was defeated.

JOHNSON, RICHARD W. (1827–97). An American soldier, born in Kentucky. He graduated at West Point in 1849 and up to the time of the Civil War was employed chiefly on frontier service. In 1861 he was commissioned colonel of the Third Kentucky Cavalry and soon afterward was made a brigadier general of volunteers. He took part as a cavalry commander in the western campaigns of 1861 and 1862 and on August 21 of the latter year was defeated and captured by Col. John H. Morgan, whom he had been sent to drive out of Tennessee. In the battle of Murfreesboro he commanded a division. At Chickamauga his division formed part of the command of General Thomas, and it was one of those which during the battle of Chattanooga charged up the heights of Missionary Ridge. The next year he commanded a division in the Army of the Cumberland during the invasion of Georgia and was severely wounded at the battle of New Hope Church (May 28, 1864). On August 22 of that year he was made chief of cavalry of the Military Division of the Mississippi. He commanded a cavalry division at the battle of Nashville, and on the second day was given the brevet rank of major general of volunteers, supplemented on March 13, 1865, by the brevet rank of brigadier general in the regular army, and on the same day he was brevetted major general in the regular army for "gallant and meritorious services during the war." He was mustered out of the volunteer service on Jan. 15, 1866, and became provost marshal general of the Military Division of the Tennessee, and later acting judge advocate in various mili-

tary departments. He resigned in 1867 with the rank of major, which grade by an Act of Congress (March 3, 1875) was changed to that of brigadier general. He published *A Soldier's Reminiscences in Peace and War* (1866) and a *Memoir of Major General George H. Thomas* (1881).

JOHNSON, ROBERT UNDERWOOD (1853–). An American poet and editor, born at Washington, D. C., Jan. 12, 1853. He joined the staff of the *Century Magazine* in 1873, became associate editor in 1881, and in 1909, on the death of Richard Watson Gilder, succeeded to the editorial chair, which he occupied until May, 1913. He early became noted for his services in behalf of international copyright, as secretary of the American Copyright League doing much to secure the passage of the Law of 1891, for which he was decorated by the French and Italian governments. He had a hand in many important publishing undertakings, and it was on his persuasion that Gen. U. S. Grant wrote his *Memoirs*. He became permanent secretary of the American Academy of Arts and Letters. His writings include *The Winter Hare and Other Poems* (1891) and *Songs of Liberty and Other Poems* (1897). His *Saint Gaudens: An Ode* (third edition of poems) appeared in 1910, and the fourth edition was published under the same title in 1914. With C. C. Buel he edited the well-known *Century* articles relating to the Civil War, afterward published as *Battles and Leaders of the Civil War* (1887–88)—one of the most valuable compilations dealing with the subject.

JOHNSON, ROSSITER (1840–). An American editor and author, born at Rochester, N. Y. In 1863 he graduated from the University of Rochester, which gave him the degree of LL.D. 30 years later. He married a daughter of Asahel C. Kendrick, and his sister was the wife of Joseph O'Connor (qq.v.). From 1864 to 1869 he was assistant editor of the *Rochester Democrat* (later *Democrat and Chronicle*), and in 1869–72 he edited the *Concord* (N. H.) *Statesman*. In 1873–77 he was an associate editor in the revision of the *American Cyclopædia*. He became editor of the *Annual Cyclopædia* in 1883, from 1886 to 1888 was managing editor of the *Cyclopædia of American Biography*, and in 1900–04 was editor in chief of the *Universal Cyclopædia*. Among other compilations edited by him are: *The British Poets* (3 vols., 1876); *Famous Single and Fugitive Poems* (1877); *Play-Day Poems* (1878), an anthology of humorous verse in English; *Fifty Perfect Poems* (1882), with C. A. Dana; the *Little Classics Series* of prose selections (16 vols., 1874–75; two additional vols., 1880; new ed., 1900); *The World's Great Books* (1898–1901); *Twentieth Century Biographical Dictionary of Notable Americans* (1904); the sumptuous and unique *Liber Scriptorum* (1893), in collaboration with J. D. Champlin and G. C. Eggleston; *Anthology of Italian Authors* (1907); *The War in Europe: Its Causes and Consequences* (1914). His original publications include: *Phaeton Rogers* (1881), a boy's story; *Idler and Poet* (1883), poems; *A History of the French War* (1882); *A History of the War between the United States and Great Britain* (1882); *A History of the War of Secession* (1888); *A Short History of the War between the United States and Spain* (1899); *The Story of the Constitution of the United States* (1906); *The Hero of Manila* (1912), a story for boys.

JOHNSON, SAMUEL (1696–1772). An American educator, born at Guilford, Conn. He graduated at Yale in 1714, became a tutor there in 1716, and in 1720 was ordained pastor at West Haven. Two years afterward he was converted to Episcopacy. From 1754 to 1763 he was president of King's College (later Columbia University), the first to hold that office. Johnson was an ardent polemic and carried on long controversies in behalf of apostolic succession and divine sovereignty. He wrote: *A System of Morality* (1746; reprinted by Franklin as *Elementa Philosophica* in 1752); *Three Letters from a Minister of the Church of England to his Dissenting Parishioners* (1733–37); and an *English and Hebrew Grammar* (1767; 2d ed., 1771). Consult Chandler, *Life* (London, 1824), and Beardsley, *Life and Correspondence of Samuel Johnson* (New York, 1874).

JOHNSON, SAMUEL (1709–84). An English lexicographer, essayist, and critic. He was born at Lichfield, Sept. 18, 1709, the son of Michael Johnson, a bookseller. He was sent to a dame school, from which he passed to the Lichfield grammar school, where he learned Latin, and then attended for a few months a school at Stourbridge. The years 1727–29 he spent at home in "lounging." Though indolent and desultory, he read widely and wrote some verse. In 1728 he entered Pembroke College, Oxford, where he became known for his various knowledge and a Latin translation of Pope's *Messiah*. At Oxford he learned Greek and read metaphysics. Melancholy by nature, he became a hypochondriac under the pressure of poverty. In October, 1731, he left Oxford without a degree, and two months later his father died, leaving him only £20. In 1732 he was usher in a school at Market Bosworth—a position for which he was particularly unsuited, owing to his extreme nervousness, which manifested itself in facial contortions. Aware of his failure and detesting the employment, he gave up school-teaching and went to live with a school friend in Birmingham. He probably contributed to the *Birmingham Journal*, for the publisher of which he made an abridged translation (1735) of Lobo's *Voyage to Abyssinia*. On July 9, 1735, he married the widow of a Birmingham mercer, his senior by 20 years. His wife's small fortune, about £800, enabled him to open a boarding school for young gentlemen at Edial Hall, near Lichfield. Few pupils attended, but among them was David Garrick. Johnson had for some time been thinking of London, as may be inferred from a letter he sent in 1734 to Edward Cave, proprietor of the *Gentleman's Magazine*, proposing to become a contributor. On March 3, 1737, he and Garrick, each having a few pence in his pocket, went to London. Later in the same year Johnson returned to Birmingham and brought his wife to London. Poor as Johnson had been hitherto, he had now to pass through a severe ordeal. For a period he went about ill clothed and ill fed, and, it is said, sometimes walked the streets with his friend Savage "for want of a lodging." In 1738 he became a regular contributor to the *Gentleman's Magazine*. At first he was employed to edit for Cave the parliamentary debates reported by William Guthrie, and then from July, 1741, to March, 1744, he wrote them himself, sometimes from notes furnished him and at other times from only the names of the speakers, always taking care that the "Whig dogs should not have the

best of it." In the meantime he had published *London* (1738), an adaptation to London life of Juvenal's third satire. It was immediately successful and placed Johnson among the best followers of Pope. In 1744 appeared his *Life of Richard Savage*, which, in depicting the terrible career of this unfortunate poet, throws indirectly much light on Johnson's own hardships. In 1749 he published another adaptation of Juvenal, *The Vanity of Human Wishes*, the finest of his poems. Johnson had long before written a tragedy called *Irene*. In February, 1749, Garrick brought it out at Drury Lane. Though Johnson received from the author's three nights and the copyright nearly £300, it was only a moderate success. The next year he began—writing most of the essays himself—the *Rambler*, a semiweekly in imitation of the *Spectator*, which ran for two years (March 20, 1750, to March 14, 1752). To Johnson, already known as a poet, this periodical gave rank as an impressive moralist. Three days after the last issue of the *Rambler* Johnson's wife died. At this time Johnson was in the midst of his labors on a new *Dictionary of the English Language*. The *Plan* for it, published in 1747, was inscribed to Lord Chesterfield, evidently with a view to that nobleman's patronage. Chesterfield, however, approved of the work in no public manner until December, 1754, when it was near completion. In a memorable letter Johnson then spurned the overtures of the noble lord (Feb. 7, 1755). In the following April the *Dictionary* appeared. For this undertaking Johnson was not fully equipped. He had no knowledge of the English language and literature in its earlier periods; consequently the dictionary was untrustworthy in its etymologies. On the other hand, he had read widely in the seventeenth century and was thus able to illustrate the use of words by admirable quotations. He at once became known as the great lexicographer. His splendid struggle with adversity, however, was not quite over. The next year he was arrested for debt. In 1758 he began a series of essays called the *Idler*, not so good as the *Rambler*, which he carried on for two years. Now occurred one of the most touching episodes in his heroic life, the writing of *Rasselas* (1759), "in the evenings of a week," to pay the expenses of his mother's funeral. It is hardly a novel, but rather a magnificent moral tract, into which are compressed *The Vanity of Human Wishes* and the best of the *Rambler*. In 1762 he accepted, after some hesitancy, a government pension of £300. It was probably in 1763 that Johnson founded his famous Literary Club, which held its meetings at the Turk's Head tavern, and which included the best talkers of the day and the men most distinguished in the arts, among them Goldsmith, Boswell, Burke, Sir Joshua Reynolds, and Garrick. Thereafter his life was passed in comparative ease. In 1763 he had made the acquaintance of James Boswell, his future biographer; and in 1765 he began his intimacy with the Thrales, who received him into their home at Southwark and took him with them to Streatham for the summer months. For 16 years they ministered to his comfort. Composition now becoming very onerous for him, he found an outlet for his thoughts in brilliant conversation. To this period, however, belongs some notable work. In 1765 he brought out an edition of Shakespeare, proposals for which had

been issued eight years before. The record of a visit to Scotland and the Hebrides with Boswell in 1773 he published under the title *A Journey to the Western Isles of Scotland* (1775). His literary career closed with the *Lives of the Poets* (1779–81), the most admirable of his essays both in thought and in style. He died in London Dec. 13, 1784, and was buried in Westminster Abbey. The degree of LL.D. he had received both from Dublin (1765) and from Oxford (1775), but he himself rarely used the title. Johnson was the central figure in English literature for a quarter of a century. Time, however, has taken away much of his prestige. As a critic, he is narrow; and his style is ponderous. On the other hand, his opinions show independent and robust thinking; and his style, even in the *Rambler*, has at times a delightful rhythm. Of the charm of his conversations there can never be any question, and, among English conversationalists, the palm by general consent must go to him. Of Johnson as a man the record is complete. Though Boswell noted his sayings and doings in a great variety of situations, nothing was ever said or done to lessen one's respect for his noble qualities of mind and heart.

Bibliography. His *Works*, ed. by Walesby (11 vols., Oxford, 1825); *Lives of the Poets*, with notes and introduction by Waugh (6 vols., London, 1896); *Johnson Club Papers* (ib., 1899); R. B. Hill, *Dr. Johnson: His Friends and his Critics* (ib., 1878); id., *Boswell's Life of Johnson* (6 vols., Oxford, 1887); id., *Letters* (London, 1892); *Johnsonian Miscellanies* (New York, 1897); the lives of Johnson by Leslie Stephen, in "English Men of Letters Series" (London, 1878); F. R. C. Grant, in "Great Writers Series" (ib., 1887), with a bibliography; John Dennis, *Dr. Johnson* (New York, 1905); W. A. Raleigh, *Samuel Johnson* (Oxford, 1907); C. K. Shorter, *Immortal Memories* (New York, 1907); W. A. Raleigh, *Six Essays on Johnson* (Oxford, 1910); H. L. T. Piozzi, *Dr. Johnson's Mrs. Thrale* (New York, 1910); A. M. Broadley, *Doctor Johnson and Mrs. Thrale* (ib., 1910); F. Burney, *Dr. Johnson and Fanny Burney* (ib., 1911); J. C. Bailey, *Dr. Johnson and his Circle* (ib., 1913); and the famous essays by Macaulay and Carlyle. Roger Ingpen's edition of *Boswell's Life* (2 vols., New York and London, 1909), with some two or three hundred illustrations, constitutes a well-nigh complete picture gallery of all Johnson's friends and haunts. See also BOSWELL, JAMES; PIOZZI, MRS.

JOHNSON, SAMUEL (1822–82). An American clergyman and reformer. He was born at North Andover, Mass., and graduated at Harvard in 1842 and at the Harvard Divinity School in 1846. He preached for some time at Dorchester, but displeased his congregation there by his opposition to slavery. In 1851 he became pastor of a "free church" in Lynn, Mass., being independent in his religious opinions. He edited, jointly with Samuel Longfellow, a collection of sacred poetry entitled *Hymns for Public and Private Devotion* (1846), and was author of *The Worship of Jesus* (1868) and of *Oriental Religions—India* (1872), *China* (1877), *Persia* (1885). Consult Longfellow, *Memoir of Samuel Johnson* (Boston, 1883).

JOHNSON, SAMUEL WILLIAM (1830–1909). An American agricultural chemist, born at Kingsboro, N. Y. He was educated at the Scientific School of Yale College and studied at

the universities of Leipzig and Munich. He was made professor of analytical chemistry at the Yale Scientific School in 1856, taught agricultural chemistry there from 1857 to 1875, and from 1875 to 1896 served as professor of theoretical and agricultural chemistry. From 1877 to 1899 he was also director of the Connecticut Agricultural Experiment Station. In 1858 he was appointed chemist to the State Agricultural Society and began the publication of a series of notable reports upon commercial fertilizers and on other agricultural subjects. These continued after the society was replaced by the Connecticut State Board of Agriculture. He was a member of the National Academy of Sciences and in 1878 was president of the American Chemical Society. His publications include: *Essays on Peat, Muck, and Commercial Manures* (1859); *Peat and its Uses* (1866); *How Crops Grow* (1868); *How Crops Feed* (1870). He edited Fresenius' *Manual of Quantitative Chemical Analysis* (1st, 2d, and 3d eds., 1864, 1875, 1883).

JOHNSON, THOMAS (1732-1819). An American statesman, born at St. Leonard, Md. He studied law in Annapolis; was a leader of the pre-Revolutionary agitation in Maryland; became a prominent member of the First Continental Congress, to which he was reelected in 1776; moved the appointment of Washington as commander in chief (June, 1775); and in 1776 was made brigadier general of the militia of the province, going to Washington's relief in the winter of that year. Early in 1777 he was elected Governor of Maryland and held that office through 1779, acting with much energy and vigor in behalf of the Continental Congress and its forces. He was returned to the Provincial Congress in 1780 and became a member of the House of Delegates in the same year. From 1781 to 1787 he sat in the Continental Congress; he became a supporter of the Constitution and was a member of the Maryland convention which ratified that instrument in 1789. He became associate in the United States Supreme Court (1791), refused to succeed John Rutledge as Chief Justice, and refused the portfolio of State (1795). He was a member of the commission which laid out the city of Washington.

JOHNSON, THOMAS CARY (1859-). An American Presbyterian theologian. He was born in Monroe Co., Va. (afterward part of W. Va.), and studied at Hampden Sidney College (A.B., 1882), at the Union Theological Seminary in Virginia, and at Yale. He was professor of Old and New Testament exegesis in the Austin (Tex.) Theological Seminary from 1888 to 1890 and thereafter was a member of the faculty of the Virginia Union Seminary—professor of the English Bible and pastoral theology (1891-92), of ecclesiastical history and polity (1892-1913), and then of systematic theology. He wrote: *A History of the Southern Presbyterian Church* (1894); *John Calvin and the Genevan Reformation* (1900); *The Life and Letters of Robert Lewis Dabney* (1903); *The Life and Letters of Benjamin Morgan Palmer* (1906); *Virginia Presbyterianism and Religious Liberty* (1907); *Introduction to Christian Missions* (1909); *Baptism in the Apostolic Age* (1912).

JOHNSON, THOMAS LOFTIN (usually known as Tom L. Johnson) (1854-1911). An American mayor and municipal reformer, born at

Georgetown, Ky. His family having suffered heavy financial losses in the Civil War, in early youth he obtained employment in a street-railway office. He rose rapidly to positions of responsibility and became interested in city transportation problems, inventing several devices, among which were a fare box and the Johnson rail, which he sold for large sums. In 1876 he purchased part interest in a street railway of Indianapolis and later acquired large holdings in Cleveland (where he encountered the fierce opposition of Marcus A. Hanna), in Detroit, and in Brooklyn. All of his lines were made popular and profitable by the introduction of through fares and transfers. In Cleveland he became known also as an iron manufacturer. After disposing of his street-railway interests, Johnson, then a wealthy man, entered politics. In 1898 he was unsuccessful as Democratic candidate for Congress, being defeated by T. E. Burton (q.v.); in 1890 and 1892 he was successful. In his campaigns Johnson announced his adherence to and advocacy of the single-tax ideas of Henry George and of public ownership of utilities, and in Congress he urged especially the adoption of the single tax for the District of Columbia. He attracted national attention by his plans of municipal ownership. Elected mayor of Cleveland in 1901 and thrice reelected, during this period of eight years Johnson transformed the city government. His persistence and success in introducing radical reforms, and especially his bitter fight to secure three-cent fares over all street-car lines in the city, were matters of country-wide interest. In 1903 he was an unsuccessful candidate for the governorship. His public service ended in 1910. Consult his autobiography, *My Story*, edited by E. J. Hauser (New York, 1911).

JOHNSON, VIRGINIA WALES (1849-). An American author, born in Brooklyn, N. Y. After 1875 she resided in Europe. Her publications, mainly for young people, include: *The Kettle Club Series* (1870); *Joseph the Jew* (1873); *A Sack of Gold* (1874); *The Catskill Fairies* (1875); *The Calderwood Secret* (1875); *The Neptune Vase* (1881); *Tulip Place* (1886); *The House of the Musician* (1887); *The World's Shrine* (1902); *Many Years of a Florence Balcony* (1911); *A Lift on the Road* (1913), short stories.

JOHNSON, WALTER ROGERS (1794-1852). An American chemist, born at Leominster, Mass. He graduated from Harvard in 1819. From 1839 to 1843 he was professor of physics and chemistry in the University of Pennsylvania. He devoted himself to studying the strength of materials and mechanical construction and wrote: *Use of Anthracite in the Manufacture of Coal* (1841); *Report on Coals* (1844); *Coal Trade of British America* (1850); and several scientific textbooks.

JOHNSON, SIR WILLIAM (1715-74). A British soldier and superintendent of Indian affairs in America, born in Smithtown, County Meath, Ireland. He was educated for mercantile pursuits, but in 1738 assumed the management of the landed estates of his uncle, Sir Peter Warren, in the Colony of New York. In that year he settled on a tract of land in the Mohawk valley, about 25 miles west of the present town of Schenectady, and at once undertook the improvement and colonization of his uncle's lands. His relations with the Indians, with whom he was soon engaged in trade, were characterized

by honesty and fair dealing. He soon acquired a knowledge of their language, familiarized himself with their customs, and cultivated their friendship. In 1744 Governor Clinton appointed him superintendent of the affairs of the Six Nations, and two years later he was made Indian commissioner of New York. In 1748 he was charged by the government with the defense of the New York frontier, and on one occasion by his tact and personal influence was able to effect the settlement of a difficulty between the Indians and the colonists. In the meantime he had received a royal commission as a member of the Governor's Council, and in 1754 was one of the commissioners to the Albany Convention (q.v.) called to treat with the Indians and at the same time to prepare a plan of union for the Colonies. Upon the outbreak of the French and Indian War (q.v.) he was given sole charge of Indian affairs in New York, was commissioned a major general of Colonial forces, and was charged with the conduct of the expedition against Crown Point. In this capacity he performed valuable service to the Colonial cause by defeating and capturing Baron Dieskau at Lake George. It was largely through his influence that the Six Nations were kept from joining the French in this struggle. For this service he received the thanks of Parliament, accompanied by a grant of £5000, and at the same time was created a baronet, and in the following year was made superintendent of all affairs of the Six Nations and other Northern Indians. He subsequently took part in the futile attempts to relieve Oswego and Fort William Henry and was present at the battles of Ticonderoga and Fort Niagara. In the latter engagement, after the death of General Prideaux, he assumed the chief command, cut to pieces the French army, and compelled the surrender of the fort. Later he led the Indians in an expedition to Canada and was present at the surrender of Montreal. Through his influence the Six Nations, as a whole, were prevented from joining the Pontiac conspiracy, although he was unable to secure the absolute neutrality of the Senecas. In addition to the reward which he had already received, the King granted him a tract of nearly 100,000 acres of land in the Mohawk valley, where he built Johnson Hall, which is still standing and which became the nucleus of Johnstown, N. Y. Here Sir William lived for the remainder of his life in baronial fashion. His last public service was the conclusion of the Treaty of Fort Stanwix in 1768. (See FORT STANWIX.) He died July 11, 1774, in his fifty-ninth year. In 1739 Johnson married the daughter of a neighboring German settler, and by her had three children. After her death he had several mistresses, both Indian and white, one of whom was "Molly" Brant, a sister of the Mohawk chief, Joseph Brant or Thayendanegea. By her he had eight children. Sir William prepared a paper of some value on "The Language, Customs, and Manners of the Six Nations," published in the *Transactions of the Philosophical Society* of Philadelphia for November, 1772, and he wrote a great number of letters of historical value. Consult: *Calendar of the Sir William Johnson Manuscripts*, compiled by Day (Albany, 1909); Stone, *Life of Sir William Johnson* (2 vols., ib., 1865); Griffis, *Sir William Johnson and the Six Nations* (New York, 1891); Buell, *Sir William Johnson* (ib., 1903).

JOHNSON, WILLIAM (1771-1834). An American jurist, born at Charleston, S. C. He graduated at Princeton in 1790; studied law under C. C. Pinckney; was admitted to the bar in 1793; and represented Charleston in the State Legislature from 1794 to 1798, when he received the appointment to the Court of Common Pleas. In 1804 he was appointed to the United States Supreme Court, where his course was marked by great independence, especially in a case based on the Embargo Act, the legality of which he denied. His opposition to nullification was so strong that in 1833 he had to leave his own State. He spent a few months in western Pennsylvania and in 1834 removed to Brooklyn, N. Y. He wrote *Life and Correspondence of Major-General Nathanael Greene* (1822).

JOHNSON, WILLIAM. See CORY, WILLIAM JOHNSON.

JOHNSON, WILLIAM SAMUEL (1727-1819). An American jurist and educator, born at Stratford, Conn. He was the son of the Rev. Samuel Johnson (q.v.), who became the first president of King's College (now Columbia University). He graduated at Yale in 1744 and in 1747 received the degree of A.M. from Harvard. After graduation he planned to enter the Church and worked for a time for the Society for the Propagation of the Gospel, but changed his plans, studied law, and practiced in the courts of Connecticut and New York. In 1761 and 1765 he was a member of the Lower House of the Connecticut Legislature and then was made a member of the Upper House or Governor's Council. In 1765 he was a delegate from Connecticut to the meeting at New York known as the Stamp Act Congress. From 1766 to 1771 he was in London as counsel for the Colony in litigation concerning the title to land secured from the Mohegan Indians. On his return he was again a member of the Governor's Council and in 1772 was made judge of the Superior Court. After the battle of Lexington he was one of a committee sent to General Gage to consider the possibility of peace. He was opposed to the war and during its progress remained quietly at home practicing his profession, though he contributed money to the American cause. From 1784 to 1787 he was a member of the Continental Congress and in 1787 was at the head of the Connecticut delegation to the convention to form the Federal Constitution. He was again made a member of the Governor's Council and also in this year (1787) the first president of Columbia College after its reorganization. In 1789 he was elected the first Senator of the United States from Connecticut. When the seat of government was removed to Philadelphia, he attended one session of Congress, but in 1793 resigned in order to devote his whole time to the college. In 1800, on account of failing health, he resigned the presidency and retired to Stratford, where he lived quietly until his death. He received the degree of D.C.L. from Oxford in 1766 and later LL.D. from Yale. While in London he made many friends, among them being Dr. Samuel Johnson, with whom he corresponded. His letters to the governors of Connecticut during this period, giving his view upon the Colonial situation, are printed in the *Massachusetts Historical Collection*, 5th series, vol. ix. Consult Beardsley, *Life of William Samuel Johnson* (Boston, 1876).

JOHNSON, WILLIAM WOOLSEY (1841-). An American mathematician, born at Owego,

N. Y. In 1862 he graduated from Yale University (A.M., 1868). He served in the United States Nautical Almanac Office in 1862-64; taught mathematics in the United States Naval Academy (1864-70), at Kenyon College, Ohio (1870-72), and at St. John's College, Mo. (1872-81); and in 1881 returned to Annapolis as professor of mathematics. In 1913 he accepted in addition a professorship in the navy. He is author of: *An Elementary Treatise on the Integral Calculus* (1881); *Curve Tracing in Cartesian Co-ordinates* (1884); *The Theory of Errors and Methods of Least Squares* (1890); *A Treatise on Ordinary and Partial Differential Equations* (1889); *An Elementary Treatise on Theoretical Mechanics* (1901); *Treatise on Differential Calculus* (1904); *Differential Equations* (1906); *Treatise on Integral Calculus* (1907); *An Elementary Treatise on the Differential Calculus* (1908).

JOHN'SONBURG. A borough in Elk Co., Pa., 164 miles northeast of Pittsburgh, on the Buffalo, Rochester, and Pittsburgh, the Erie, and the Pennsylvania railroads (Map: Pennsylvania, D 3). It is in a productive farming and lumbering region and has extensive paper mills. There are some deposits of coal, clay, oil, and natural gas. Pop., 1910, 4334.

JOHNSON CITY. A city in Washington Co., Tenn., 106 miles east by north of Knoxville, on the Southern, the Carolina, Clinchfield, and Ohio, and the East Tennessee and Western North Carolina railroads (Map: Tennessee, H 2). It is known as a summer resort, having an elevated site and picturesque mountain scenery. The mountain branch of the United States Soldiers Home and the East Tennessee State Normal School are situated here. There is also a public library. The city is also a manufacturing centre, with woodworking establishments, an iron furnace, rolling mills, cigar, box, table, and furniture factories, a foundry and machine shops, a tannery, and several brick plants. Johnson City is governed under a charter of 1897, which provides for a mayor, elected biennially, and a unicameral council. The water works are owned by the municipality. Pop., 1900, 4645; 1910, 8502; 1914 (U. S. est.), 10,143.

JOHNSON GRASS. A fodder grass of the southern United States. See **ANDROPOGON**.

JOHN'STON. A town in Providence Co., R. I., adjoining Providence, on the New York, New Haven, and Hartford Railroad. It has worsted mills, wool sorting and scouring works, and a soap factory. Pop., 1900, 4305; 1910, 5935.

JOHNSTON, ALBERT SIDNEY (1803-62). An American soldier, prominent on the Confederate side in the Civil War. He was born at Washington, Ky., Feb. 3, 1803, graduated at West Point in 1826, and was assigned to the Second United States Infantry. He fought in the Black Hawk War, but resigned from the army, April 24, 1834, and emigrated to Texas. In 1836 he joined in the struggle for Texan independence, enlisting as a trooper, but was soon made adjutant general and then commander of the Texan army. In 1838 he was appointed Secretary of War of the young Republic and displayed political wisdom and military ability in dealing with Mexican and Indian encroachments. He resigned his office early in 1840 and became a planter.

When the Mexican War broke out, he became

colonel of the First Regiment of Foot Riflemen of Texas, six months' volunteers, and was present at the siege of Monterey as inspector general on the staff of Gen. W. O. Butler. After some years of retirement he was appointed paymaster, in 1849, and colonel of the Second (since Fifth) United States Cavalry, in which his lieutenant colonel was Robert E. Lee, in 1855. In 1857, the Mormons having defied the United States authority, a military expedition was sent against them. At a late period in the summer the Mormons began actual hostilities against the government, destroying its supply train and threatening its troops. In an emergency the command was transferred to Colonel Johnston, whose march to Utah was conducted with rare judgment and courage. He converted an impending calamity into a solution without bloodshed of a serious military and political problem. For these services he was brevetted brigadier general, remaining in command in Utah until Feb. 29, 1860. At the outbreak of the Civil War General Johnston was in command of the Department of the Pacific, with headquarters at San Francisco, but April 10, 1861, he resigned his commission and, proceeding to Richmond, entered the service of the Confederacy, being appointed general and placed in command of the Confederate forces in the West. He held the line of Bowling Green, Ky., from September, 1861, to February, 1862, against greatly superior forces. On the fall of Fort Henry and Fort Donelson (q.v.) in February he effected his retreat through middle Tennessee to Corinth, Miss., where he assembled the entire force under his command east of the Mississippi. Advancing with his army, 40,000 strong, he attacked Grant's army at Shiloh Church unexpectedly on April 6, 1862, and drove him to the cover of his gunboats at Pittsburg Landing, capturing more than 3000 prisoners. At this critical point General Johnston was killed while leading a charge, and a lull ensued in the battle. A few hours later General Beauregard, who succeeded to the command, withdrew the Confederate troops from their advanced position, and Generals Buell and Lew Wallace coming up with reinforcements for Grant during the night, the battle was renewed the next day, and Beauregard was forced to fall back to Corinth. General Johnston was regarded by prominent officers of both armies as one of the most aggressive and brilliant of the Confederate leaders and at the time of his death as unsurpassed in handling large bodies of men in action. In his message to the Confederate Congress President Davis said: "Without doing injustice to the living, it may safely be said that our loss is irreparable." The subsequent history of the war in the West abundantly confirmed this tribute. Consult the exhaustive and valuable biography, *Life of Albert Sidney Johnston* (New York, 1878), by his son, W. P. Johnston.

JOHNSTON, ALEXANDER (1849-89). A political and constitutional historian, born in Brooklyn, N. Y. From 1883 to 1889 he was professor of political economy at Princeton. He wrote a useful and popular *History of American Politics* (1879); *Genesis of a New England State: Connecticut* (1884); *History of the United States for Schools* (1886); *History of Connecticut* (1887); *American Political History, 1763-1876. Part I: The Revolution, and the Growth of Nationality* (1905); *Part II:*

Slavery Controversy, Civil War, and Reconstruction (1906), posthumous. He edited *Representative American Orations* (1885). His article on the history of the United States in the *Encyclopædia Britannica* was later published as a volume. He also contributed to Lalor's *Cyclopædia of Political Science* (1881-84).

JOHNSTON, ALEXANDER KEITH (1804-71). A Scottish cartographer, born near Edinburgh and educated at Edinburgh University. His first important work, the *National Atlas*, was published in 1843. Its merits received immediate recognition, and Johnston was appointed Royal Geographer for Scotland. Five years later appeared his *Physical Atlas of Natural Phenomena*, the publication of which was the signal for a shower of honors from the geographical societies of Europe. A second edition, greatly improved, was issued in 1856. In 1850 appeared a very useful *Dictionary of Geography*, better known as *Johnston's Gazetteer* (5th ed., 1877). His *Royal Atlas of Geography* (1861) is probably the most beautiful and minutely accurate ever executed in the English language. He was the draftsman of a vast number of maps which were published separately and in series.

JOHNSTON, CHRISTOPHER (1856-1914). An American Assyriologist. He was born at Baltimore, Md., graduated from the University of Virginia in 1876 and from the medical department of the University of Maryland in 1880, and practiced medicine until 1888. He then entered Johns Hopkins as a student of Semitics and taught at that university before and after taking the degree of Ph.D. in 1894—as instructor (1891-94), associate (1894-99), associate professor of Oriental history and archæology (1899-1908), and professor. He edited *Ancient Empires of the East* (1906), contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA, and published *Epistolary Literature of the Assyrians and Babylonians* (1896).

JOHNSTON, GABRIEL (1699-1752). A Colonial Governor of North Carolina. He was born in Scotland and was at one time professor of Oriental languages in the University of St. Andrews, where he had received his education. In 1734 he was appointed Governor of North Carolina, through the influence of the Earl of Wilmington, in whose honor he renamed the town of Newton, calling it Wilmington. Though he was often at odds with the people, he showed himself a man of liberal views, with an earnest desire to promote the welfare of the people. During his administration, which lasted until his death in 1752, the population of the Colony increased about threefold. For an account of his administration, consult Ashe, *History of North Carolina*, vol. i, chap. xix (Greensboro, N. C., 1908).

JOHNSTON, GEORGE (1797-1855). A British naturalist, born at Simprin, Scotland. He studied medicine with Dr. Abercrombie, graduated at the University of Edinburgh in 1819, and practiced his profession at Berwick-on-Tweed until 1853. He was thrice mayor of Berwick. Besides numerous contributions to the *Edinburgh Philosophical Journal* and other scientific periodicals, he published: *History of British Zoöphytes* (1838); *History of British Sponges and Lythophytes* (1842); *Introduction to Conchology* (1850); *Terra Lindisfarnensis: The Natural History of the Eastern Borders* (1854).

JOHNSTON, GEORGE BEN (1853-). An

American surgeon. He was born at Tazewell, Va., studied in the university of that State in 1870-75, and graduated from University Medical College (New York University) in 1876. He became professor of surgery at the Medical College of Virginia and surgeon of the Memorial Hospital, Richmond, Va., of the Johnston-Willis Sanatorium, and of the Abingdon (Va.) Hospital. He served as president of the Southern Surgical and Gynæcological Association (1887), of the Medical Society of Virginia (1897), and of the American Surgical Association (1904-05). Many of his papers were published in the *Medical Register*.

JOHNSTON, SIR HARRY HAMILTON (1858-). An African explorer, born in London. He was educated at Stockwell Grammar School and at King's College, London, and also studied at the Royal Academy of Arts (1876-80). In 1879-80 he traveled in north Africa and in 1882-83, with the Earl of Mayo, explored Portuguese West Africa and the river Congo. In 1884 he was at the head of a scientific expedition to Mount Kilimanjaro. He explored Lakes Nyassa and Tanganyika in 1889, and in 1900 climbed Mount Ruwenzori. At various times he held consular positions in Africa, from 1899 to 1901 being special commissioner, commander in chief, and Consul General for Uganda Protectorate. He received gold medals from the Zoölogical, Royal Geographical, and Royal Scottish Geographical societies. His works, besides contributions on African ethnology, geography, and zoölogy to scientific and popular periodicals, especially the *Proceedings of the Royal Geographical Society* (1883-90), are: *Essays on the Tunisian Question* (1880-81); *The River Congo* (1884); *Kilimanjaro* (1885); *The History of a Slave* (1889); *Life of Livingstone* (1891); *British Central Africa* (1897); *A History of the Colonization of Africa by Alien Races* (1899); *The Uganda Protectorate* (1902); *British Mammals* (1903); *The Nile Quest* (1903); *Liberia* (1906); *George Grenfell and the Congo* (1908); *A History of the British Empire in Africa* (1910); *The Negro in the New World* (1910); *The Opening-up of Africa* (1911); *Views and Reviews* (1912); *Common Sense in Foreign Policy* (1913); *Phonetic Spelling* (1913).

JOHNSTON, JAMES FINLEY WEIR (1796-1855). An English chemist, born at Paisley. He was educated at the University of Glasgow and later studied chemistry under Berzelius. From 1833 until his death he was reader in chemistry and mineralogy at the University of Durham. In 1849-50 he spent several months in the United States, studying the agricultural conditions of the sections he visited. His writings on scientific agriculture, agricultural chemistry, and allied subjects comprise many volumes, and some of them have passed through a very large number of editions. We may mention here his *Catechism of Agricultural Chemistry and Geology* (1844, and more than 50 subsequent editions in English, as well as translations into several foreign languages); *Notes on North America, Agricultural, Economical, and Social* (1851); *The Chemistry of Common Life* (2 vols.), originally published in 1853-55.

JOHNSTON, JOHN HUMPHREYS (1857-). An American portrait and landscape painter. He was born in New York and studied there under La Farge and in Paris under Lefebvre and Doucet. Although La Farge's influence is

visible in Johnston's methods, color scheme, and sympathetic conception of his subject, his work has a distinctly individual note. For his "Pink Domino" he received the Temple gold medal in Philadelphia in 1896; the "Portrait of the Artist's Mother" is in the Luxembourg Museum; "Moonlight, Finisterre," is in the Carnegie Institute, Pittsburgh. Among the best known of his other paintings are "Sarah Bernhardt as Lorenzaccio" and "Mystery of the Night." He made his home chiefly in Venice, was appointed Chevalier of the Legion of Honor in 1901, and received a gold medal at Munich in 1902.

JOHNSTON, JOSEPH EGGLESTON (1807-91). An eminent American soldier, prominent on the Confederate side during the Civil War. He was born near Farmville, Prince Edward Co., Va., Feb. 3, 1807; graduated at West Point in 1829, being a classmate of Robert E. Lee; was made brevet second lieutenant, Fourth Artillery; was engaged for a time in garrison duty; took part in the Black Hawk War; and served in the Seminole War, for part of the time as aid to General Scott, until 1837, when he resigned his commission and became a civil engineer. He reentered the army on July 7, 1838, as first lieutenant of topographical engineers and was brevetted captain on the same date for gallantry in the Seminole War. In September, 1846, he was promoted to be captain. In the Mexican War he served with distinction throughout the Southern campaign, was appointed lieutenant colonel of voltigeurs in April, 1847, and was brevetted major and colonel, United States Army, for his conduct at Cerro Gordo, where he was severely wounded. At the head of the voltigeurs Colonel Johnston took part in the storming of Chapultepec and for gallantry was brevetted lieutenant colonel. In 1853-55 he had charge of Western river improvements and in March, 1855, was appointed lieutenant colonel, First United States Cavalry, after which he was engaged in various duties in Utah, Kansas, and elsewhere. In June, 1860, he was appointed quartermaster general of the army, with the rank of brigadier general. On April 20, 1861, he resigned his commission and was appointed one of the first five brigadier generals in the Confederate service. These five were soon afterward made full generals. Johnston with about 9000 men joined Beauregard at Manassas, and they defeated the Federal army under General McDowell at the first battle of Bull Run, July 21, 1861. In the early part of the campaign of 1862 Johnston had command of all the Confederate forces in Virginia and as such was in charge of the early operations against McClellan in the Peninsular campaign. At the battle of Fair Oaks, May 31, 1862, he was severely wounded and for several months was disabled for service. On reporting for duty in November, he was assigned, notwithstanding the hostility of President Jefferson Davis, to the Military Department of Tennessee. In April, 1863, he reported himself still unfit for active service. Some weeks later, however, he made an attempt to relieve Vicksburg, then besieged by Grant, but was defeated at Jackson on May 14. After the defeat of Bragg by General Grant at Chattanooga, Nov. 24-25, 1863, Johnston was put in command of all the forces of the Southwest. With 55,000 men he first occupied the fortified position of Dalton, Ga. General Sherman attacked him (May, 1864) with a superior force and compelled him to fall back to Resaca;

thence, after a severe battle, to Allatoona Pass, to Kenesaw Mountain, where Johnston beat back his assailants, and across the Chattahoochee. General Sherman then threatened his line of communication with Atlanta, his base of supplies and a place of great military importance. Johnston reached that city in July, 1864, and determined to hold it to the last; but the authorities at Richmond were dissatisfied with his Fabian policy and on July 17 ordered him to turn over his command to General Hood. Near the close of February, 1865, after Sherman had captured Atlanta and marched without opposition to Savannah and into South Carolina, Johnston, at the earnest request of General Lee, was assigned to the command of the remnant of the Army of the Tennessee and of all the troops in South Carolina, Georgia, and Florida and was ordered to "concentrate all available forces and drive back Sherman." But his force being inferior to that of Sherman, he was several times defeated, and on April 26, 1865, having learned of Lee's surrender of the Army of Northern Virginia, and after consultation with President Davis and members of the Confederate cabinet, he capitulated to Sherman at Durham's Station, N. C., upon terms similar to those agreed upon at Appomattox. The testimony of Johnston's principal opponents and of an able and impartial British military critic must be taken as a fair estimate as to his merits as a soldier. General Grant said: "I have had nearly all the Southern generals in high command in front of me, and Joe Johnston gave me more anxiety than any of the others." Sherman said he was "equal in all the elements of generalship to Lee." Colonel Chesney wrote: "If men were to be judged of solely by the difficulties they overcame, independently of the direct results achieved, then General Johnston might fitly head the list of great American commanders; for on his side was neither the supreme military power wielded by Grant, nor the prestige which made Lee almost independent of those who nominally controlled him; much less the harmony of thought and action with his superior which assisted Sherman from first to last. . . . In all these points, therefore, he was at a striking disadvantage as regarded his opponent; yet with these against him, and with but one-half the number of the Federals, he contrived to hold them back, led though they were with such versatile skill and unwearied energy as the records of modern war can hardly match, for nearly two months and a half, . . . a feat that should leave his name in the annals of defensive war at least as high as that of Fabius or Turenne or Moreau." After the war Johnston resided for several years in the South, holding offices in railroad, express, and insurance companies. He was elected to Congress from the Richmond district of Virginia in 1876 and was appointed United States Commissioner of Railroads in 1885 by President Cleveland. He was a pallbearer at the funerals of Grant and Sherman. He published a *Narrative of Military Operations during the Late War* (1874). Consult Hughes, *General Johnston* (New York, 1893), in the "Great Commanders Series."

JOHNSTON, MARY (1870-). An American novelist, born at Buchanan, Botetourt Co., Va. She was educated at home and began authorship with *Prisoners of Hope* (1898), which was followed by *To Have and to Hold* (1899) and *Audrey* (1902), all stories of Colonial Vir-

ginia, which had, each, a good reception. Her novels include also: *Sir Mortimer* (1904); *The Goddess of Reason* (1907); *Lewis Rand* (1908); *The Long Roll* (1911); *Cease Firing* (1912); *Hagar* (1913); *The Witch* (1914). *Audrey* and *Sir Mortimer* were dramatized.

JOHNSTON, RICHARD MALCOLM (1822-98). An American author, born in Hancock Co., Ga., March 8, 1822. He graduated at Mereer University, Georgia (1841), taught for a year, was admitted to the bar, practiced successfully, became professor of literature in the University of Georgia (1857), left this post at the outbreak of the Civil War, opened a boarding school for boys at Sparta, Ga., removed this institution in 1867 to Baltimore Co., Md., and maintained it there many years. Towards the end of his life he resided in Baltimore. He gained literary mark by sketches of rural Georgia, *Dukesborough Tales*, first printed in the *Southern Magazine* and collected in 1883. He contributed frequently to magazines and published: *A History of English Literature* (1879), with W. H. Browne; *Old Mark Langston* (1884); *Two Grey Tourists* (1885); *Mr. Absalom Bilingslea and Other Georgia Folk* (1887); *The Primes and their Neighbors* (1891). *Dukesborough Tales* contains his best work. He wrote a *Biography of Alexander H. Stephens* (1883), with W. H. Browne.

JOHNSTON, ROBERT MATTESON (1867-). An American historian. Born in Paris, he was educated in France, England, and Germany, graduated from Cambridge University (M.A.) in 1889, and became a barrister at law of the Inner Temple. In 1904 he lectured at Harvard University and Mt. Holyoke College, in 1907-08 was professor of history at Bryn Mawr College, and after 1908 was assistant professor of history at Harvard. He is author of *The Roman Theocracy and the Republic, 1846-49* (1901); *Napoleon: A Short Biography* (1904); *The Napoleonic Empire in Southern Italy and the Rise of the Secret Societies* (1904); *The Memoirs of Malakoff* (1907); *American Soldiers* (1907); *The French Revolution* (1909); *The Corsican* (1910); *The Holy Christian Church* (1912); *Mémoire de Marie Caroline, reine de Naples* (1912); *Bull Run* (1913).

JOHNSTON, SAMUEL (1733-1816). An American jurist, born at Dundee, Scotland, nephew of Gabriel Johnston. His parents emigrated to Chowan Co., N. C., when he was three years old. He was admitted to the bar and was elected to four provincial congresses, over the last two of which he presided. He was moderator of the General Meeting at Newbern in 1775 and by virtue of this office was chief magistrate of North Carolina between the abdication of the last royal Governor and the accession of the first State Governor. From 1780 to 1782 he was a member of the Continental Congress, in 1788 was president of the State convention which rejected the Federal Constitution, and in 1789 was president also of that which ratified it. From 1787 to 1789 he was Governor of North Carolina, and on the expiration of his term of office he was chosen by the Federalists a United States Senator, in which capacity he served from 1790 to 1793. He was appointed judge of the Superior Court in 1800, but resigned three years later and passed the remainder of his life in retirement.

JOHNSTON, WILLIAM DAWSON (1871-). An American librarian. He was born

at Essex Center, Vt., graduated from Brown University in 1893, and studied at the University of Chicago (1893-94) and at Harvard University (A.M., 1898). He was an instructor in history at the University of Michigan (1894-97) and at Brown (1899-1900), an assistant in the Library of Congress (1900-07), lecturer at Simmons College (1905-07), and served as librarian of the Bureau of Education, Washington (1907-09), of Columbia University (1909-14), and of the Public Library at St. Paul, Minn., after 1914. He is author of *History of the Library of Congress* (1904) and *Special Collections in Libraries in the United States* (1912), with I. G. Mudge.

JOHNSTON, WILLIAM PRESTON (1831-99). An American educator, son of Albert Sidney Johnston. He was born in Louisville, Ky., was educated at Centre College, at Georgetown, Ky., and at Yale (1852), and was admitted to the Kentucky bar in 1853. He was commissioned as major in the Confederate army in 1861, served as Jefferson Davis's aid-de-camp, and was captured with him. In 1867 he was chosen professor of history and literature in Washington and Lee University, became president of Louisiana State University in 1880, and first president of Tulane in 1884. He was a regent of the Smithsonian Institution. He wrote a valuable *Life of Albert Sidney Johnston* (1877); several volumes of verse; a genealogy of the Johnstons; *The Prototype of Hamlet* (1890).

JOHNSTON CITY. A city in Williamson Co., Ill., 5 miles north of Marion, on the Illinois Central and the Chicago and Eastern Illinois railroads (Map: Illinois, G 10). It is in a productive coal, fruit, and grain country, and has 17 coal mines within a radius of 4 miles. Pop., 1900, 787; 1910, 3248.

JOHNSTONE. A manufacturing town and police burgh in Renfrewshire, Scotland, on the Black Cart, 11 miles west of Glasgow (Map: Scotland, D 4). It has large manufactories of paper, shoes, iron, brass, machinery, and textiles. Elderslie, the traditional birthplace of Wallace, is a mile to the east. Pop., 1901, 11,155; 1911, 12,045.

JOHNSTOWN. A city and the county seat of Fulton Co., N. Y., 50 miles by rail northwest of Albany, on Cayadutta Creek, and on the Fonda, Johnstown, and Gloversville Railroad (Map: New York, F 4). It was settled about 1760, was named, in 1771, after Sir William Johnson (whose mansion, erected in 1761-62, is still standing), was incorporated as a village in 1808, and was chartered as a city in 1895. It was the scene of many important councils with the Indians, and in the fall of 1781 a small American force under Col. Marinus Willett defeated here a small British force under Major Rose, the latter losing about 60 in killed, wounded, or captured. Besides Johnson Hall, there are two buildings of historic interest—the courthouse and the jail, both built in 1772. A public-library building has been presented to the city by Andrew Carnegie, and there is an old ladies' home. Johnstown has extensive manufactures of gloves and mittens, leather, knit underwear, baseballs, glove-makers' tools, gelatin, fur coats, shirts, etc. As provided under the original city charter, the government is vested in a mayor, elected every two years, who appoints the chief of police and chief of fire department, and a uni-

cameral council, of which the executive is a member. The school and water boards are independently elected by the people. The city owns its water works. Pop., 1900, 10,130; 1910, 10,447; 1914 (U. S. est.), 10,582. Consult Frothingham, *History of Fulton County* (Syracuse, 1892).

JOHNSTOWN. A city in Cambria Co., Pa., 78 miles east of Pittsburgh, on the Pennsylvania and at the terminus of a branch of the Baltimore and Ohio Railroad (Map: Pennsylvania, D 7). It occupies, at an elevation of about 1300 feet, an area of 7 square miles, being situated in the irregular and narrow valley formed by the confluence of Stony Creek and the Conemaugh River. Among public buildings of note are the Conemaugh Valley Memorial and two other hospitals, the high school, Carnegie library, and the city hall. There are 23 acres of public parks, and Grand View Cemetery is of special interest as the burial place of 800 unidentified victims of the disastrous flood of 1889. The city is well known as the centre of an extensive iron and steel industry, the Cambria Steel Company alone employing some 22,000 men. There are also another large iron and steel plant here, and planing mills, brickyards, fire-clay-products works, breweries, furniture factories, and extensive manufactures of radiators. Coal is mined and shipped in large quantities, and iron ore, fire clay, and limestone are found in the vicinity. Founded in 1791, Johnstown was incorporated in 1889 and adopted the commission form of government in 1914. On May 31, 1889, as a result of heavy rains, the dam across the South Fork, a branch of the Conemaugh River, 12 miles directly east of the city, but more than 18 miles along the stream bed, was carried away, thus releasing Conemaugh Lake, a body of water 2½ miles long, 1½ miles wide at its greatest width, and in many places as much as 100 feet deep. The valley was quickly engulfed, Johnstown and surrounding villages were submerged, 2235 lives were lost, and property worth, according to some estimates, as much as \$10,000,000 was destroyed. (See DAMS AND RESERVOIRS.) Aid poured in from all parts of the country, fully \$3,000,000 in cash and material being contributed, and the city was quickly rebuilt and has grown steadily. Pop., 1900, 35,936; 1910, 55,482; 1914 (U. S. est.), 64,642.

JOHN WARD, PREACHER. A novel by Margaret Deland (1888), similar in character to *Robert Elsmere*.

JO'HORE. An independent native state, occupying the southern extremity of the Malay Peninsula and embracing an area of about 9000 square miles. It is a progressive state under a sultan, whose foreign relations are controlled by Great Britain. The revenue, derived chiefly from customs dues, exceeds the expenditure by about \$1,000,000. The chief products of Johore are rubber, coffee, pepper, gambier, gutta-percha, and sago. Pop., 1912, 180,412, chiefly Moslems.

JOIE DE VIVRE, zhvä de vë'vr', LA (Fr., The Joy of Living). A sombre romance by Emile Zola (1884).

JOIGNEAUX, zhvä'nyö', PIERRE (1815-92). A French journalist, agronomist, and politician, born at Ruffey-lès-Beaune. He was educated at the Parisian Central School of Arts and Manufactures and entered into political journalism in opposition to the government of Louis

Philippe as an editor of the *Journal du Peuple*. For his connection with *L'Homme Libre*, he was put in jail for four years (1838-42) and thus gained the material for *Les prisons de Paris* (1841). Joigneaux became a member of the Constituent Assembly and edited the *Feuille du Village* (1849-51), but was banished to Belgium (1851-59) and on his return occupied himself with writing, chiefly upon agricultural subjects. In 1871 he was elected to the National Assembly, holding his seat until 1889, when he was elected to the Senate. His books include: *Histoire anecdotique des professions en France* (1843); *Les paysans sous la royauté* (1850-51); *Dictionnaire d'agriculture pratique* (1835); *L'Agriculture dans la Campine* (1859); *Légumes et fruits* (1860); *Conseils à la jeune fermière* (1861); *Culture de la vigne et fabrication des vins en Belgique* (1862); *Pisciculture et culture des eaux* (1864); *Nouvelles lettres aux paysans* (1871); *Les éphémérides Joigneaux* (1878); *Monographie de la commune de Ruffey-lès-Beaune* (1888).

JOIN'DER (Fr. *joindre*, OF. *joindre*, *juindre*, from Lat. *jungere*, to join; connected with Gk. *ζευγνύειν*, *zeugnynai*, Skt. *yuj*, to join, and ultimately with OChurch Slav. *igo*, Lith. *jūngus*, Goth. *juk*, OHG. *joh*, Ger. *Joch*, AS. *geoc*, Eng. *yoke*). In pleading and practice, the joining or uniting together of parties, issues, or causes of action for the purpose of securing a convenient and complete determination of an entire matter in controversy in a single action.

To entitle persons to be joined as parties plaintiff or defendant in an action, there must be some privity or mutuality of interest between them in respect to the claim or defense. The joining of causes of action in one suit is permitted as a matter of convenience and to save multiplicity of actions. The chief requisite is that they shall be of the same general nature and not be inconsistent.

The phrase *joinder of issue* is also employed to denote the final phase in the process of pleading, when the matter or matters in dispute between the parties to an action have been sifted out from their allegations and admissions and clearly defined. The parties are then said to "be at issue." See ACTION; ISSUE; PLEADING; PRACTICE.

JOIN'ERY. The art of joining or framing together the wooden interior finishings of buildings, such as the doors, windows, shutters, stairs, etc. It is, however, usually confined to dadoes, door trims, and cabinetwork. The term is becoming obsolete. See BUILDING; CABINETWORK; CARPENTRY.

JOINT (OF. *joint*, *joinct*, from Lat. *junctus*, joint, from *jungere*, to join; connected with Gk. *ζευγνύειν*, *zeugnynai*, Skt. *yuj*, to join, and ultimately with Eng. *yoke*), or ARTICULATION. In anatomy, the connection existing between any of the denser component parts of the skeleton, whether bone or cartilage. The structures which enter into the formation of the more complex joints are bone, ligament, cartilage, fibrocartilage, and synovial membrane. Bone is the fundamental part of all joints. Ligament is very generally the bond of union between bony segments. Cartilage (either articular, costal, or membraniform) is found as a layer between surfaces or an incrustation upon the opposing ends of bones or as an extension of a bone to reach a given point. Fibrocartilage is either disposed about the circumference of an articular

cavity in order to deepen it or is connective or separative. Synovial membranes, when articular, exist as thin sacs containing a little fluid wherewith the joints are lubricated from their position between the opposing bones. Joints vary in their degree of motion. They are arranged in three classes: 1. *Synarthrosis*, or immovable joint, of which there are three varieties. 2. *Amphiarthrosis*, or joint of limited motion, also called "synchondrosis," or "symphysis," of which there are three types. 3. *Diarthrosis*, or freely movable joint, of which there are three varieties.

Synarthrosis is divided into: (a) *Sutura*, in which there is a union of bone by a series of processes and indentations which fit closely together. There are three types of sutura, viz., *sutura dentata*, where the indentations are large and extensive, as in the joints between the parietal bones of the skull; *sutura serrata*, where the dovetailing is smaller and more regular, as in the suture between the frontal bones in youth; *sutura limbosa*, where there are beveled margins and dentated processes, as in the joint between the frontal bone and the parietal; *harmonia*, in which there is a mere coaptation of two rough bony surfaces, as between the two halves of the upper jaw; and *squamosa*, formed by thin, beveled margins overlapping each other, as in the squamoparietal suture. (b) *Schindylesis*, in which a thin plate of bone is inserted into a cleft, as where the rostrum of the sphenoid articulates with the vomer. (c) *Gomphosis*, in which a bone is implanted firmly into a socket of another bone, as where the teeth are inserted into the alveolar processes of the jaw.

The three main varieties of diarthrosis are: (a) *Enarthrosis*, or ball-and-socket joint, as in the case of the head of the humerus in the glenoid cavity of the scapula; (b) *Arthrodia*, including all articulations of flat or nearly flat surfaces, as in the joint between the acromion process of the scapula and the clavicle; and (c) *Ginglymus*, or hinge joint, as in the articulation of the bones of the knee, elbow, and ankle. The joints admitting of angular, lateral, or rotary motion are all called *ginglymus*. Some anatomists call articulation that admits of rotary motion *diarthrosis rotatorius*.

Amphiarthrosis includes *synchondrosis*, or union by cartilage, *syndesmosis*, or union by ligament, and *syssarcosis*, or union by muscular tissue. As an example of *synchondrosis*, the union between the two bones of the pelvis, in front, is excellent. This is generally termed the *symphysis pubis*. Joints admit of the following varieties of motion: flexion, extension, adduction, abduction, rotation, circumduction, and gliding movement. The hinge joints and ball-and-socket joints are most useful in securing flexion and extension; the ball-and-socket joints in securing adduction, abduction, circumduction, and rotation; while arthrodiar joints alone secure gliding movement. Consult Cunningham, *Textbook of Anatomy* (New York, 1913).

JOINT. In mechanics and building, a device for, or method of, attaching together two or more pieces of a machine or structure; also the place of such union. Joints are movable or fixed. To the first class belong the hinge (q.v.), pivot, and swivel, the compass joint and rule joint, the knee or toggle joint, ball-and-socket and universal joint, all of which permit a partial rotation in one or more directions of one

of the members. A swivel is a link with a stem pivoted into a ring or seat; a rule joint and compass joint are designed to secure great rigidity of rotation in the plane of the two members, the first by multiple small knuckles and a long pin, the second by a short pin and broad, flat knuckles.

Pipes are joined end to end in various ways: by flanges bolted together (flange joint), by the insertion of the tapered end of one into the flared bore of the other, by screw-threaded couplings and unions, by wiped joints of melted solder (for lead pipes only), and, where the direction of the pipes changes at the joint, by one-eighth turns, quarter turns, etc. A tee joins two pipes in a line to a third at right angles.

In carpentry a butt joint, or abutment joint, is one where the end of one piece abuts against the end or side of another; a mitre joint unites two pieces at an angle, the ends being cut to meet in a plane which bisects that angle. When a round or square projection (tenon) on the end of one piece fits into a corresponding hole (mortise) in the other, the joint is a mortise and tenon. When one-half the thickness of each piece is cut away so that at their junction the two pieces are flush, they are said to be halved into each other. A halved joint between two pieces in the same straight line is a lap joint. If the meeting surfaces are cut to a slight angle with the axis of the timbers and provided with projections or serrations that engage into each other, they form a scarf joint, which is generally locked by a wedge or key. In masonry, in floor laying, and in lathing, to break joints is to arrange the vertical or the end joints so that no two (or in lathing no more than five or six) in consecutive courses shall be in a continuous line.

In steel construction, columns, beams, etc., are secured at the joints either by fishplates, angles, or specially shaped pieces, riveted to each of the meeting pieces, or, in the case of bridge trusses and roof trusses, sometimes by pin joints. See BUILDING; CARPENTRY; MASONRY.

JOINT ADVENTURE, ENTERPRISE, or TRADE. A phrase sometimes applied to a business undertaking by two or more persons, in the nature of a partnership, but which is limited to a single transaction or set of transactions. The expression is more commonly used, however, of joint undertakings in which the essential element of partnership—a business carried on in common with a view to profit—is wanting. An example of this use is afforded by an agreement between the owner of an invention and another to take out a patent in their joint names and sell the right to use it, dividing the profits. Such persons are not carrying on a business, but are engaged in a joint adventure. Pooling arrangements between competitors in business are ordinarily joint enterprises and not partnerships. Each competitor remains sole owner and manager of his separate business, while all are jointly interested in the pool made up of their various earnings. Consult the authorities referred to under PARTNERSHIP; CONTRACT.

JOINT ILL, or OMPHALOPHLEBITIS. An acute infectious disease of newborn animals, principally colts and calves, occurring in the first few days of life and not later than the first four weeks. The symptoms consist in swelling of one or more joints and of the navel. The animals are stiff and lie down the greater part

of the time. High fever and rapid pulse and breathing are characteristic. The disease arises from infection in the navel at the time of birth or soon after, and a purulent discharge from the navel is seen in all advanced cases. The infection spreads through the umbilical vein, and abscesses may ultimately be formed in the muscles near the navel or even in the lungs and liver. The majority of such cases end in death. In order to prevent the occurrence of the disease the stables should be kept clean and the navel should be treated with an antiseptic solution immediately after birth. Swollen joints may be daily painted with tincture of iodine; internal doses of quinine and hyposulphite of soda three times a day sometimes give good results. Consult F. Hutyra and J. Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals*, vol. i (Chicago, 1912), and E. W. Hoare, *A System of Veterinary Medicine*, vol. i (ib., 1913).

JOINT LIABILITY. A mutual or common responsibility of two or more persons for some act or duty, which so binds them all that one cannot be held or released without the others. It is the direct opposite of "several liability," where an individual is bound personally, irrespective of his relations to others. Persons more frequently become jointly and severally liable on a bond or other obligation. In such cases the obligee or owner of the bond or obligation can sue either separately or both together at his option. Where judgment is recovered against persons jointly, and not severally, liable, the judgment creditor can levy execution against the goods of either or both of them at his option, but can have only one satisfaction. In either of the above cases, if the judgment is satisfied out of the goods of one, that one is entitled to contribution (q.v.) from the other, i.e., to be reimbursed the proportionate share the other should have paid; and this right he can enforce by action.

At common law the death of one joint obligor terminated his liability, and the survivor or survivors continued solely liable; but this rule is now changed in most jurisdictions by statute, and the estate of the deceased is liable for his share. In the absence of statutes to the contrary the discharge of one person jointly liable by operation of law, as by bankruptcy, does not release the others even for the proportionate share of the bankrupt. See **CONTRACT**; **BOND**.

JOINT OWNERSHIP. A general expression for the ownership by two or more persons, in common, of one and the same piece of property. The ownership of any property, real or personal, may be thus shared. The expression is not of precise legal signification, but is generally employed to include such various forms of common ownership as joint tenancy, tenancy in common, parcenary, and tenancy by entireties, and sometimes, also, the ownership of property by partnerships and unincorporated joint-stock associations. These differ greatly in their characteristics and in the nature of the rights which they confer, but they all have the common characteristic that each individual owner's interest is an undivided share of the entire property affected and not a definite part or parcel of the whole. The various forms of joint ownership are considered under their appropriate titles. See also **OWNERSHIP**; **PROPERTY**.

JOINTS. A name given to the divisional planes which traverse rocks, separating them

into irregular prismatic blocks. All consolidated strata, whether of igneous or sedimentary character, are broken by joints, although some variations are observable depending upon the different rock materials. In sedimentary rocks the joints are usually arranged in two series that intersect each other at a high angle and are approximately perpendicular to the bedding planes. When the strata are inclined, one series in most cases trends with the dip, while the other follows the direction of the strike, thus giving rise to the classification of dip joints and strike joints. In igneous rocks there is a wider range in the number and direction of the joint planes. Granite and other coarse-grained rocks of igneous nature are often traversed by two sets of perpendicular joints forming columns and by a third set intersecting the other two and articulating the columns into segments. The finer crystalline masses such as basalt exhibit a great number of joints so arranged as to form complex polygonal prisms of remarkable regularity. This is well shown in the illustrations of Fingal's Cave (see **STAFFA**) and Giant's Causeway (q.v.). Jointing is of great assistance to quarrying operations; the rock is readily removed in blocks, which could be obtained by sawing or blasting only with difficulty. The cause of joints is variously explained as the result of contraction of rocks upon cooling or drying, of earthquake shocks, and of compression strains. See **GEOLOGY**.

JOINTS, COMPARATIVE ANATOMY OF. Among invertebrate animals there are many cases of articulation which indicate the presence of joints, but they are mostly confined to that type which is characterized by the presence of jointed appendages, the arthropods. Among the worms we find nothing to which the word "joint" can properly be applied, the relation of the successive segments to each other not justifying the term. It is even open to question whether the relationship of the segments in the arms of crinoids and brittle stars is such that the word "joint" ought to be used. The joints are generally very simple, consisting merely of the connecting of successive skeletal pieces by strips of connective tissue or muscle. In crinoids we find a very peculiar joint, the syzygy, which occurs at more or less regular intervals throughout the length of the arm and may also occur in the stalk. A syzygy has been defined as a joint in which the two skeletal pieces "are closely and immovably fitted together, though they can be separated by alkalies." If the union is still more complete, so that alkalies will not separate the pieces, the result is called ankylosis. In sea urchins we find excellent examples of true joints, in the attachment of the spines to the test by means of ball-and-socket joints, the base of the spine being hollowed out to fit smoothly over a polished tubercle and held in position by a band of muscular and connective tissue. Although the spines of many starfishes show considerable mobility, there is seldom any well-marked joint. The only example of joints among mollusks would seem to be in the connection between the eight pieces of the chiton's shell or in the hinge of a bivalve shell, but these are hardly worthy the designation. Among arthropods (insects, arachnoids, and crustaceans) joints abound, for not only are the antennæ and feet jointed appendages, but even the mouth parts and the wings work upon joints. In all these cases, however, there are no skeletal ossicles, the seg-

ments being merely sections of the uniformly inclosing exoskeleton, with the muscle or connective tissue strands within themselves. The freedom of movement is rendered possible by the marked thinning of the exoskeleton at the joints into a delicate, flexible membrane, while muscles pass from each joint into the next one.

Among vertebrates the various joints are of the same general structure and plan as in man, varying with the degree of ossification and the complexity of the organs concerned.

JOINTS, DISEASES OF THE. Attempts have been made to classify these diseases according to the anatomical condition, as diseases of the cartilage (*chondritis*), the articular capsule (*synovitis*), or of the bone (*osteitis*); but practically the surgeon views inflammation of the joint as a whole, and uses the term *arthritis* oftener than the others. Diseases of the joints are caused by cold, injuries, gout, syphilis, tubercle necrosis, or caries. Water on the knee is the popular name for chronic synovitis of the knee joint, in which there is an effusion of fluid into the synovial cavity. White swelling is the popular name for tubercular arthritis. Dislocation may follow some joint diseases; suppuration may accompany some; while in other cases adhesions growing in the joints may cause fibrous ankylosis, or stiffened joint, or in still other cases denuded articular ends of bones may join together forming bony ankylosis with permanent immovable joint. Rest is the first treatment for a diseased joint, pain being a danger signal that counterindicates activity. Hot and cold affusions to the joint, alternately, with evaporating lotions, are useful in some cases; but domestic treatment of a joint, in ignorance of the conditions, is always hazardous. Even in the hands of competent surgeons many joint diseases are very slow in resolving. See KNEE JOINT; ARTHRITIS; GOUT; RHEUMATISM; SYNOVITIS.

JOINT-STOCK COMPANY, or ASSOCIATION. An association of individuals who unite to carry on business for gain, each taking and holding shares in the common stock. At common law it is a partnership (q.v.) and is subject to the rules of partnership law, and especially to the rule which binds each partner individually to liability for the debts of the firm. It differs from the ordinary partnership, however, in three important respects: 1. Its capital stock is divided into transmissible shares; i.e., any shareholder can sell his shares to a third person, who becomes at once a member of the association, without the assent of the seller's partners. 2. The death of a shareholder does not dissolve the company. 3. The conduct of a joint-stock company's business is always limited to a few persons. A shareholder has, as such, no implied authority to act for the company. In order to bind it he must be designated as a manager, or in some other way receive authority to act for it.

At present, both in England and in the United States, joint-stock companies are generally organized under statutory provisions. The tendency of such statutes is to assimilate these companies to corporations, without really transforming them into artificial persons. In England legislation has gone further in this direction than in the United States. By the Companies Act of 1862 (25 and 26 Vict., c. 89) and acts amendatory thereof it is provided that "any seven or more persons associated for any lawful purpose may, by subscribing their names to a memorandum of association, and otherwise complying

with the requisition of the act in respect to registration, form an incorporated company with or without limited liability." If the proposed company is to be an association of limited liability, the word "Limited" must be added to its title. Since the enactment of this legislation joint-stock companies have multiplied and flourished remarkably in England.

They have not gained equal popularity in the United States partly because the organization of corporations under general laws is much easier than in Great Britain, and partly because of the introduction of limited partnerships during the last century. While State legislation varies in matters of detail, it generally provides for the organization of joint-stock companies by the execution of certain written articles of association by the shareholders, and the filing of these articles in designated public offices. Their business is managed by directors and officers duly elected and announced. Actions may be maintained by the company in the name of some designated officer or officers and against the company in such name. When a judgment is obtained against the company in a suit of this kind, execution is issued against the company's property, and not against the officer named as the representative of the company, nor against the property of shareholders. Oftentimes the company is allowed to sue its members, as though they were strangers. But, as a rule, the partnership liability of each shareholder for all the debts and liabilities of the company has not been modified by our legislation. They may be dissolved by the mutual consent of all the shareholders, as in the case of an ordinary partnership, or by a decree of a court in a proper proceeding brought for that purpose. Consult: Lindley, *The Law of Companies* (London, 1889); Hurrell and Hyde, *Law of Joint Stock Companies* (ib., 1898); Birdseye, *New York Statutes*, title "Joint Stock Associations" (New York, 1901); Heinrich Lomnitz, *Die systematische Bearbeitung der Veröffentlichungen von Aktiengesellschaften* (Leipzig, 1908); W. R. Scott, *The Constitution and Finance of English, Scottish, and Irish Joint-Stock Companies to 1720*, vols. i-iii (Cambridge, 1910-12).

JOINT TENANCY. A form of common ownership of real or personal property, in which each owner is conceived of as owning the whole as well as an undivided and proportional share of the property. This is described by the quaint and untranslatable expression that the ownership is *per my et per tout*. It is of a curiously limited character and can exist only when there is a unity of interest, time, title, and possession; i.e., when the owners have identical interests, accruing by one and the same conveyance, commencing at one and the same time, and held by one and the same undivided possession. They must all hold upon one and the same conditions in every respect, each of them being regarded as having possession of every parcel and of the whole estate, not indeed for every purpose, but in respect of tenure and survivorship. For the purpose of alienation each joint tenant has a right only to his undivided relative share of the property, and the purchaser of such right does not succeed to the position of the seller as a joint tenant, but becomes a tenant in common with the survivors of the joint tenancy who have not alienated their shares. If there are two tenants, each may dispose of an undivided half; if four,

an undivided quarter, and so on; but the purchaser cannot enter upon the exclusive possession of his share, for the estate must remain undivided, subject to an entirety of interest on the part of each of the remaining joint tenants, and to what is called the principle of survivorship, by which is meant the right of the last survivor to the whole property. In other words, when one of several joint tenants dies, his share passes to the survivors, and so on until the last survivor takes the whole interest, whatever it may be, and upon his death it will pass to his heirs. This right of survivorship—or *jus accrescendi*, as it is called—is the principal and characteristic incident of a joint tenancy.

An estate in joint tenancy cannot arise by descent or operation of law, but only by purchase or acquisition, as a grant, a devise, or a disseisin. In America such tenancy is comparatively uncommon, the law presuming nothing in its favor, but inclining rather towards tenancy in common, which excludes the principle of survivorship and implies that the estate may be divided and each tenant take his proportionate share. By the common law, indeed, any conveyance to two or more persons without qualification was presumed to be in joint tenancy; but by statute in many American States this presumption has been reversed, and such a conveyance declared to be a tenancy in common unless the deed creating it contains an express statement to the contrary. An exception is, however, generally made in favor of conveyances to executors or trustees, which are still deemed to be in joint tenancy. Joint tenants are regarded in law as a single owner as respects third parties, and they must therefore all be joined in any suits that concern their joint estate. Possession by one tenant is deemed the possession of all, and a conveyance to one a conveyance to all. Consult: James Kent, *Commentary on American Law* (14th ed., 4 vols., Boston, 1896); Sir William Blackstone, *Commentaries* (4th ed., 2 vols., Chicago, 1899); Tiffany, *The Modern Law of Real Property* (St. Paul, 1903). See ENTIRETY, TENANCY BY; JOINT OWNERSHIP; COMMON, TENANCY IN; PARCENARY.

JOIN'TURE (OF., Fr. *jointure*, from Lat. *junctiona*, a joining, from *jungere*, to join). A settlement made on a wife or on the husband and wife jointly, to be taken by her in lieu of dower (q.v.) if she survive her husband. It arose during the period of English history when the dower right of the married woman was in abeyance owing to the prevalence of the practice of conveying lands to the use of persons who were not the legal owners. (See DOWER.) Jointure derived its name from the fact that it was a conveyance to the husband and wife as joint tenants with the benefit of survivorship. When the Statute of Uses (27 Hen. VIII, c. 10) transferred the legal title in lands to all who had the use or beneficial ownership, its immediate effect was to revive the dower right of the wife in all such lands. As this would have resulted in giving her a double provision, the same statute compelled her to choose between her jointure and her dower. She could not have both. In this form the jointure has survived in England and in many of the United States, though the practice of settling a jointure upon married women is less common in America than in England.

The expression *equitable jointure* is applied to a similar provision made for the wife under cir-

cumstances which do not entitle her to legal jointure as described above. It is, in effect, an extension of the doctrine of jointure effected from motives of humanity and justice by courts of equity. Equitable jointure does not require so many formalities as legal jointure, but in a court of equity any provision made for the wife before the marriage, and then assented to and accepted by her as a jointure, may effectually bar her dower. In that court proof of her assent given before the marriage obviates the necessity of showing that the formalities prescribed by the Statute of Jointures have been complied with. If she be a minor, such assent may be properly given by herself and her guardian or parent. If the jointure, whether legal or equitable in its nature, be not settled upon the wife until after the marriage, it is no further binding upon her than that she must elect at the husband's death to take it in lieu of dower or to take her dower. In some of the United States she is required by statute to make such election within a prescribed time—usually one year—after the husband's death, or, if she do not so elect, she is conclusively presumed to have accepted the jointure. In some States also legal jointure is abolished, and only such as is equitable, i.e., made with her consent before marriage, can absolutely bar her dower. Substantially the same causes may operate to bar jointure as those which may defeat dower; but at law a wife does not lose her jointure, as she would her dower, by eloping and living in adultery, since it is not a mere incident of the marriage relation, but is an interest in land, vested in the woman as her sole and separate property. Consult Sir William Blackstone, *Commentaries on the Laws of England* (4th ed., 2 vols., Chicago, 1899). See DOWER; HUSBAND AND WIFE; MARRIAGE.

JOINT'WORM. Any of several hymenopterous insects of the family Chalcididæ and genus *Isosoma*, and particularly the wheat jointworm (*Isosoma tritici*) and the jointworm of barley (*Isosoma hordei*). The jointworms, although belonging to a family of parasitic insects, are true gall makers, and their larvæ make oblong swellings or enlargements in the stems of wheat, barley, and other small grains or grasses. The galls are commonly found at or near the joints and more frequently in the second joint. The adult insects are small, black, four-winged flies, averaging about $\frac{1}{8}$ of an inch in length. The galls usually occur in groups of three or four or more, distorting and greatly weakening the stem. About 40 species are known in the United States. The best remedy consists in burning the stubble after harvest. Cf. GALL INSECTS.

JOINVILLE, zhwǎn'vêl', FRANÇOIS FERDINAND D'ORLÉANS, PRINCE DE (1818–1900). Third son of Louis Philippe, King of France (1830–48). He was born at Neuilly, Aug. 14, 1818, was educated at the naval school at Brest, and was made a naval lieutenant in 1838. In 1840 he commanded the frigate *La Belle Poule*, which bore the body of Napoleon from St. Helena to France. In 1843, at Rio de Janeiro, he married Francesca, sister of the Brazilian Emperor, Pedro II. In the same year he was made rear admiral. In 1844, in the war with Morocco, he commanded the French squadron at the bombardment of Tangier and the taking of Mogador and was made a vice admiral. With the other members of the royal family, he took refuge in England after the revolution of 1848. In 1861, with his son, the Duc de Penthièvre, and his

nephews, the Comte de Paris and the Duc de Chartres, he went to the United States, where they joined the staff of General McClellan. The course of France in Mexico, however, made Frenchmen unpopular, and the Prince returned to England in 1862. In 1870 he returned to France and, being forbidden to remain in the country, served under the name of Colonel Lutherod in the fighting about Orléans. He was arrested by order of Gambetta, confined five days in the fortress of Mans, and then sent to England. Being relieved of his political disabilities, he entered the Assembly as a Deputy from Haute-Marne in 1871. He retired from public life in 1876 because of growing deafness and was again sent into exile by the Law of 1886 against the royalist families. He returned to France in 1895 and died June 16, 1900. He was a man of considerable and varied talent, a capable military and naval officer, and a writer of ability. Most of his essays in the *Revue des Deux Mondes* appeared in book form as *Essais sur la marine française: L'Escadre de la Méditerranée* (Paris, 1853) and *Etudes sur la marine et récits de guerre* (1859; 2d ed., 1870). He also published a book on his experiences in the Civil War, *La guerre d'Amérique, campagne du Potomac* (1872). Of interest especially as to the French revolution of 1848 are his recollections published in 1894 under the title *Vieux souvenirs, 1818 à 1848*.

JOINVILLE, JEAN, SIRE DE (1224-1317). A great French chronicler, hereditary seneschal of Champagne, and Governor thereof during the minority of Jeanne de Navarre, at whose request he wrote or completed his *Histoire de Saint Louis*. He was of a family illustrious in the second, third, and fifth crusades. Reared at the literary court of Thibaut of Champagne, he was already married and father of two children when at 24 he joined at Cyprus Louis IX on his first (the Egyptian) crusade (September, 1248). Joinville was wounded at Mansurah in 1250 and taken prisoner, but after a month he was ransomed. He remained in Egypt and Syria till 1254. The experience satisfied him, and he declined to accompany the King on his crusade to Tunis in 1267. In 1283 Philip III made him Governor of Champagne. His *Histoire*, though made at the request of Jeanne, then Queen, was presented four years after her death (1309) to her son, the future Louis X. There is a letter of 1315 in which Joinville, then over 90, offers to join that King in a campaign against Flanders. He died on Christmas Eve, 1317. At Saint-Jean d'Acre Joinville wrote his *Credo* (1251), a sort of commentary on the Creed, and he recast it in 1287. He was also fond of annotating autographically the papers of his chancellery; and it is now thought, contrary to earlier opinion, that the kernel of his *Histoire* consists, not of the recollections of an old man, but of notes taken during the Egyptian crusade or of personal memoirs written probably soon after 1272. To these memoirs, retouched and expanded, the anecdotal history of the already venerated King was added by the aged Joinville at royal request, probably in 1305. In the later parts there are traces of senility; the memoirs are the work of a keen observer and a born narrator. Here, says Langlois, Joinville reveals himself fundamentally good, straightforward, cautious, filled with an ideal of duty, brave though not fond of blows, careful of his interests and his ease, a jealous conserver of tradition, with just a trace

of aristocratic pride and personal vanity, but yet full of good sense, good humor, and dry wit. If Joinville had not written, the classic, popular figure of St. Louis would not be what it is, and there would be something lacking in the history of France. Yet there are but these manuscript copies of the *Histoire*, which for two centuries seems to have been quite forgotten. The works of Joinville were first edited by Antoine de Risux in 1547, and best by Natalis de Wailly in *Jean de Joinville: Histoire de Saint Louis, Credo et Lettre à Louis X*, with a modernized version (Paris, 1874).

T. Marzials, ib., 1908); *Memoirs of the Lord of Joinville* (new Eng. version by E. Wedgwood, New York, 1906).

JÓKAI, yō'kō-ī, MAURUS (Hung. *Mór*) (1825-1904). A famous Hungarian writer of fiction, born at Komorn (Komárom) Feb. 19, 1825. At Pápa he made the acquaintance of Petőfi (q.v.), with whom he entered into a lasting friendship, the two being the leaders of the young Nationalist party during the revolutionary days of 1848. On March 15 they fought for the "twelve articles" (freedom of the press, etc.). Though admitted to the bar in 1846, he never took up law practice, but devoted himself to literary pursuits. As early as 1842 he composed his first drama, *A Zsidó fiú* (*The Jew Boy*), and published in 1846 his first novel, *Hétköznapiok* (*Working Days*), which at once became popular. In 1847 he assumed the editorship of the weekly *Eletképek* (*Pictures from Life*), which molded public opinion and guided the minds during those days of social ferment. Two volumes of his tales, *Vadon virágai* (*Wilderness Flowers*), appeared during the same year and attracted general attention to the rising author. After the revolution was crushed out, he was imprisoned at Világos (in 1849), whence after many hairbreadth escapes he was safely brought to Pest by his devoted young wife, later the famous tragic actress Rosa Laborfalvy. These troublous days he described in his *Forradalmi és esataképek* (1849, *Revolutionary Battle Pictures*), followed by a series of novels dealing with the history of Hungary. Of these works the following are best known: *Erdély arany kora* (1851; trans. by Nisbet Bain as *The Golden Era of Transylvania*); *A két szarvu ember* (1852, *The Two-Horned Man*); *Török világ Magyarországon* (1852; Eng. trans., *The Turks in Hungary*); *Egy magyar nábob* (*An Hungarian Nabob*), one of his best novels, describing the life of wealthy Hungarians, "who lived like little potentates in prerevolutionary times"; its sequel, *Kárpáthy Zoltán* (1854, *The Carpathian Sultan*), full of pathos and humor; *A köszivü ember fia* (*The Sons of a Heartless Man*); *Politikai divatok* (*Political Fashions*); *Mégis mozog a föld* (1866, *And Yet the Earth Moves*); *Az új földesúr* (*The New Landlord*, trans. by A. Patterson, London, 1865), admittedly his masterpiece as regards form and structure; *A jövő század regénye* (1874, *The Romance of the Next Century*); *A ma* (1881, *Our Days*); *Fekete gyémántok* (*Black Diamonds*, trans. into Eng-

lish); *Mire megvénülünk* (*What we are Growing Old for*); *Szerelm bolondjai* (*Love's Fools*); *Nincsen ördög* (*There is No Devil*, trans., New York, 1891); *Rákóczy fia* (*The Son of Rákóczy*); *Az arany ember* (*The Man of Gold*, trans. as *A Modern Midas*, New York, 1886); *Kétszer kettő négy* (*Twice Two is Four*); *A Tengersizemü hölgy* (1890, *Eyes Like the Sea*). Of his numerous dramas, *King Kolomán* (1855), *Manlius Sinister* (1856), *George Dózsa* (1858), *The Martyrs of Szigetvár* (1859), and *Milton* (1878) met with the greatest favor. Jókai's *History of Hungary* (1884) is held in high repute. From 1858 till 1881 he was contributor to and editor of the leading humorous weekly, *Ustökös* (*Comet*), at Budapest; founded the political daily *Hon* (*Fatherland*) in 1863, and became editor in chief of *Nemzet* (*The Nation*) in 1894.

He was elected to the Hungarian Academy in 1858, became a member of the Kisfaludy Society in 1860, and was president of the Petöfi Society after 1878. The fiftieth anniversary of his literary activity was celebrated throughout Hungary in 1894, and an *édition de luxe* of his works was issued in 100 volumes; this edition is, however, far from including all Jókai's literary productions. A supporter of Tisza, Jókai was many times reelected to the Lower House of the Hungarian Parliament until January, 1897, when he was called by Emperor Francis Joseph to the House of Magnates.

Alert and keen to what was going on in the world, he reflected in his methods the various literary currents prevailing in European literature. Thus, avowedly a pupil of the French Romanticists, particularly Victor Hugo and Alexandre Dumas, at the beginning of his literary career, he became a strong champion of the Realistic school during the last two decades of the nineteenth century. Written in a rich and racy language, vivid in fancy, rich in humor, absorbing in plot, his works are often open to criticism owing to the special nature of his gifts and the rather crude psychology of his heroes; but his writings present a splendid panorama of the political and social life of Hungary, particularly during the nineteenth century, and more especially the period of his country's regeneration (1825-48), the revolution, and the epoch of reaction. Consult L. Névy, *M. Jókai* (Budapest, 1894); R. N. Bain, "Maurus Jókai," in the *Monthly Review*, vol. iv (London, 1901); Temperley, "Jókai and the Historical Novel," in the *Contemporary Review*, vol. lxxxvi (ib., 1904); Emile Horn, "Maurice Jókai," in *Le Carnet*, vol. xix (Paris, 1904); M. Kalmán, *Jókai Már Elete és kora*, part i (Budapest, 1907).

JOKJAKARTA, jök'já-kär'tá, or DJOCJAKARTA. The capital of a native vassal state on the island of Java, Dutch East Indies, pleasantly situated a short distance from the south coast, 260 miles by rail east-southeast of Batavia (Map: East Indies, D 7). It is a regularly built and fortified town, and the seat of the native Sultan and of the Dutch Resident. Pop., 1900, 72,235; 1905, 79,567. In the vicinity is a magnificent water palace, constructed about 1750. Its paradise gardens and beautiful lakes with luxurious water chambers were the resort of the former sultans in their leisure hours. It is now decayed and visited only by tourists.

JOK'TAN (Heb. *Yoktân*). According to Gen. x. 25-30, son of Eber, a descendant of Shem, and

progenitor of the older Arabian tribes. In the tradition of the Arabs, Joktan is identified with Kahtan, the ancestor of the South Arabian clans. The traditions are not thought to have historical value.

JO'LA, or **FEL'LUP**. Negroes along the Gambia River, on the extreme west coast of Africa. They belong to the Mande, Mandingan, or Mandenke linguistic group. They are true negroes, tall (67 inches in stature), dolichocephalic, and not at all attractive. Both sexes wear little or no clothing. They are the principal tribe in the region and have imposed their dialect upon other Mandingan tribes in the neighborhood. In some locations they are spoken of as gentle, frank, and honest; in others they are said to be cruel and always at war with their neighbors. In their own country there is neither law nor government, nor any formality in marriage. Consult Madrolla, *En Guinée* (Paris, 1895). See also MANDINGO.

JO'LIBA. A river of Africa. See NIGER.

JOLIBOIS, zhò'lè'bwä', CLAUDE EMILE (1813-?). A French archæologist, born in Chaumont-en-Bassigny and educated there. In 1845 he was made professor of history in the Colmar Lyceum, but was dismissed four years later on account of his political views, which involved him in further trouble through the promulgation of them in his newspaper, *Le Républicain du Rhin*, which was suppressed. He was imprisoned (1851-53), upon his release took up his abode in Paris, and in 1859 was made archivist of the Department of Tarn, where he gained medals and honors for the literary work done in connection therewith. His publications include: a translation of *Chroniques de l'évêché de Langres* (1843); *L'Histoire de la ville de Rethel* (1846); *L'Histoire de la ville de Chaumont* (1856); *La roue de fortune* (1857), which is the translation of the fourteenth-century genealogical romance; *La Haute-Marne ancienne et moderne* (1861); *L'Histoire des consuls de la ville d'Albi* (1865); *Albi au moyen âge* (1871); *Dévastation de l'Albigeois par les compagnons de Montluc* (1872).

JO'LIET. A city and the county seat of Will Co., Ill., 37 miles by rail southwest of Chicago, on the Des Plaines River and the Illinois and Michigan Canal, and on the Chicago and Alton, the Atchison, Topeka, and Santa Fe, the Chicago, Rock Island, and Pacific, the Elgin, Joliet, and Eastern, the Chicago, Milwaukee, and Gary, the Chicago, Ottawa, and Peoria, and the Michigan Central railroads (Map: Illinois, H 2). Four miles from the city is the new Illinois State Penitentiary, covering 4000 acres, and there are a public library, St. Joseph's and Silver Cross hospitals, the Illinois Steel Company's Athenæum, a clubhouse for working men, and St. Francis and St. Mary academies. The township high school, which cost about \$250,000, is a large building, splendidly equipped. The city contains also Bush and Dellwood parks. Industrial interests are represented by plants of the Illinois Steel Company, American Steel and Wire Company, and the American Sheet and Tin Plate Company, and by stove and boiler works, machine shops, agricultural-implement works, engine, match, box, pottery, brick, and chemical factories, etc. Several of the largest limestone quarries in the United States are here. The manufacturing is largely promoted by power from the river and canal. Joliet is governed by the commission form of government, with a

mayor and four commissioners, elected every four years. The town, named after the famous explorer, was settled about 1831 and was organized as a city in 1852. It owns the water works. Pop., 1900, 29,353; 1910, 34,670; 1914 (U. S. est.), 36,934.

JOLIET, zhô'lyâ', CHARLES (1832-1910). A French journalist and author. He was born at Saint-Hippolyte-sur-le-Doubs in the Department of Doubs and was educated at the College of Chartres and the Lyceum of Versailles. In 1854 he entered the civil service. He varied his official labors by dilettante journalism and in 1859 published *L'Esprit de Diderot*. His anagrammatic pseudonym, J. Telio, became well known, and in 1864 he abandoned his official position and thenceforward devoted himself to journalism and miscellaneous literature. His early successes were *Le roman de deux jeunes mariés* (1866) and *Mademoiselle Chérubin* (1870). His fame was enhanced during the Franco-German War (1870-71), and subsequently, by his novels treating of incidents during that turbulent period. Among the more important of these are: *Les romans patriotiques* (1871); *Le train des maris* (1872); *Trois uhlands* (1872); *La foire aux chagrins* (1873). His later works include: *Carmagnol* (1876); *La vipère* (1880), a study of a woman; *Le crime du pont de Chatou* (1882); *Le médecin des dames* (1885); *Violette* (1890), portraying the miseries and splendors of an actress; *Nouveaux jeux d'esprit* (1892).

JOLIET, LOUIS (1645-1700). An explorer of the Mississippi valley. He was a Canadian by birth and was educated for the priesthood in the Jesuits' College at Quebec. His inclination drew him towards the woods, and he soon became known as a voyageur. In 1669 he went with a party to search for copper on the shores of Lake Superior and to discover a more direct route from the upper lakes to Montreal. He penetrated as far west as Sault Ste. Marie. In 1672 Joliet was selected by Frontenac, then newly appointed Governor of Canada, to explore the course of the Mississippi, which was supposed to flow into the "Sea" of California. In December he reached Mackinaw, where he found Père Marquette (q.v.), and remained during the winter. The voyage of exploration was continued in the following May. Seven men in two birch-bark canoes ascended the Fox River, crossed the portage to the Wisconsin, and, sailing down that stream, on June 17 entered the Mississippi, which they descended as far as the Arkansas River. Satisfied that the Mississippi flowed into the Gulf of Mexico and not into the Pacific Ocean, they returned to Quebec by way of the Illinois River and Lake Michigan. Joliet's canoe had been overset in the Lachine Rapids, and all his maps and papers lost, but from memory he drew a map of the discoveries he had made, of which a facsimile is given in Winsor's *Narrative and Critical History*, vol. iv, pp. 208, 210. He was presented with the island of Anticosti and built a fort there. In 1693 he was appointed Royal Hydrographer and in 1697 was granted the seigniory of Joliet, south of Quebec, which is still in the possession of his descendants. Consult: Shea, *Discovery and Exploration of the Mississippi Valley* (New York, 1852); Parkman, *La Salle, or the Discovery of the Great West* (Boston, 1879); Gagnon, *Louis Joliet* (Quebec, 1902); and for a consideration of the first discovery of the Mississippi, Winsor, *Cartier to Frontenac* (Boston, 1894).

JOLIETTE, zhô-lyët'. The capital of Joliette Co., Quebec, on L'Assomption River, 36 miles north by east of Montreal, on the Canadian Northern and the Canadian Pacific railways (Map: Quebec, E 4). It has a Roman Catholic cathedral, a classical college, academies for boys and girls, a hospital, and two orphan asylums. Among its manufacturing establishments are saw, lumber, and grist mills, a biscuit factory, five tobacco factories, two woolen mills, a chemical factory, two paper mills, a sash and door factory, a brewery, and steel and iron foundries. Pop., 1901, 4220; 1911, 6346.

JOLIN, yô-lên', JOHAN KRISTOFER (1818-84). A Swedish dramatist born in Stockholm. From 1845 to 1868 he was an actor in the Stockholm Theatre and during the latter part of this time was reader and director of the dramatic school. He adapted and translated a number of plays, besides writing several himself, such as the dramas *Mäster Smith* (1847), *Barnhusbarnen* (1849), and *Mjölmarfröken* (1865) and the comedies *En man af verld och en man af värde* (1846), *Min hustru vill ha roligt* (1868), and *Smålands-Petter* (1883), noted for their wit, vivacity, and clever stagecraft. He was also the author of some novels and sketches and a prize poem (1845). His complete works were published in three series, the first in 1872-81, six volumes; the second in 1882-83, five volumes; and the third in 1888.

JOLINE, jô-lên', ADRIAN HOFFMAN (1850-1912). An American lawyer and writer, born at Ossining, N. Y. He graduated from Princeton University in 1870, studied at Columbia Law School, and was a member successively of various law firms. He became a leader at the bar in questions relating to railroad litigation, trusts, mortgages, and reorganizations, served as general counsel and director of many railroad and other corporate interests, and was receiver of the Metropolitan Street Railway Company of New York City. Joline attracted attention just previous to the presidential campaign of 1912 by the publication of a letter received by him from Woodrow Wilson in 1905, in which Wilson had said, "Would that we could do something at once dignified and effective to knock Mr. Bryan into a cocked hat." An enthusiastic book and autograph collector, Joline published: *Meditations of an Autograph Collector* (1902); *Diversions of a Book Lover* (1903); *At the Library Table* (1910); *Edgehill Essays* (1911); *Rambles in Autograph Land* (1913). His library and autograph collections were sold at auction in 1914.

JOLLY, yô'lê, FRIEDRICH (1844-1904). A German physician, born at Heidelberg, son of Philipp von Jolly. He studied at Munich and Göttingen. In 1871 he became privatdocent at Würzburg, and in 1873 he went to Strassburg as professor of psychiatry and director of the psychiatric clinic. There he remained until 1890, when he accepted a similar position at the University of Berlin. Among his publications are: *Bericht über die Irrenabteilung des Juliuspitals* (1873); *Untersuchungen über den elektrischen Leitungswiderstand des menschlichen Körpers* (1884); *Ueber Irrtum und Irrsinn* (1893). For several years after 1890 he was editor of the *Archiv für Psychiatrie und Nervenkrankheiten*, and his later writings were largely in collaboration. Consult Siewerling, *Zur Erinnerung an Friedrich Jolly* (Berlin, 1904).

JOLLY, JULIUS (1849-). A German

philologist and Sanskrit scholar, an authority on Hindu jurisprudence, son of Philipp von Jolly. Born at Heidelberg and educated at Munich, Berlin, and Leipzig, he, in 1872, became docent and, five years later, professor of Sanskrit and comparative philology at the University of Würzburg. He traveled two years (1882-83) in India. The most important of his works are: *Ein Kapitel vergleichender Syntax* (1872); *Geschichte des Infinitivs im Indogermanischen* (1873); *Naradiya Dharmasastra* (1876); *The Institutes of Vishnu* (1880; vol. vii of *Sacred Books of the East*); *Tagore Law Lectures* (1885); *A History of the Hindu Law of Partition, Inheritance, and Adoption* (1885); *Manutikāśāgraha* (1885-90); *Institutes of Nāradaśmṛiti* (1885-86); *Mānava Dharmasāstra* (1887); *Minor Law Books* (1889; vol. xxxiii of *Sacred Books of the East*). To the *Grundriss der Indoarischen Philologie* he contributed the sections *Recht und Sitte* (1896) and *Indische Medizin* (1901). His biography of *Georg Bühler* appeared in 1899.

JOLLY, PHILIPP VON (1809-84). A German physicist. He was born at Mannheim and studied at the universities of Heidelberg, Vienna, and Berlin. He became connected with the University of Heidelberg in 1834, as privat-docent, and in 1839 was appointed professor, serving until 1854, when he was called to the University of Munich. He was the inventor of many pieces of useful physical apparatus, which, originally designed for his researches, soon found a more general application. Among these are the air thermometer, the Jolly or spring balance for specific-gravity determinations, the copper eudiometer, and the mercury air pump. He also studied various osmotic phenomena, the expansion of gases, and the mass and density of the earth. He was the author of *Anleitung zur Differential- und Integralrechnung* (1846), *Die Principien der Mechanik* (1852), and *Die Physik der Molekularkräfte* (1857). A biography by Böhm was published at Munich in 1886.

JOLLY BALANCE. A piece of physical apparatus used in determining the specific gravity of small objects, especially minerals. It consists of a vertical standard from the upper end of which is suspended a spiral spring of fine wire. To the lower end of this spring are attached small pans, in each of which consecutively is placed the object whose specific gravity is to be determined. A scale—usually a mirror on which equal divisions are etched—is placed behind the spring, and the position of some fixed point, such as a bead, is noted on the scale. The object is then placed in the upper pan, and the spring being extended, the fixed point will be opposite some lower division on the scale. The amount that the spring is extended is noted, and after removing the object, weights enough to produce an equal extension are put in its place. The object is then placed in the lower pan, which is immersed in a vessel of water, and as the buoyant effort of the latter acts on the object the amount the spring is extended is diminished and the fixed point will be opposite some higher division on the scale, which, of course, is noted. Weights are then added to stretch the spring the same amount. The difference between the weights required to stretch the spring from its zero point to where it rests when the body is weighed in the air, and the amount required to bring it to the position it assumes when the pan and body are in the

water, divided into the total weight, gives the specific gravity.

The usual arrangement of the apparatus is to have two pans, the lower of which is kept submerged in the water so that the conditions re-

main constant whether the body is placed in the upper or lower pan. The etched mirror usually employed forms an admirable scale, inasmuch as it enables the observer to avoid parallax and determine accurately the position of the fixed point, as when the bead or other point on the spring is seen with the eye, reflected together in the mirror, it implies that the eye, the fixed point, and the scale division are all in a straight line perpendicular to the surface of the mirror. In an accurate determination correction should be made for the temperature of the water, as explained under SPECIFIC GRAVITY, and the wire which carries the lower pan should be as fine as possible to eliminate the effects of capillarity between the water and the wire.

The Jolly balance is used mostly for rapid determination of specific gravity of such objects as mineralogical specimens and does not admit of as great precision as an analytical balance arranged for specific-gravity determinations. The spring must be suited to the weights of the objects which are to be used, so that the extensions will not be produced over too long or too short a range of scale. In the latter case a small error of observation will seriously affect the result. See SPECIFIC GRAVITY.

JOLLY BALANCE.

JOLLY-BOAT' (*jolly*, from Dan. *jolle*, Swed. *julle*, Dutch *jol*, Eng. *yawl* + *boat*). A small boat similar to a working dingy (see **BOAT**), but generally smaller and broader. It is of cutter model, with a square stern, and usually clinker-built. The term is now little used, but a boat of this character is nearly always carried by merchant vessels.

JOLO. See **SULU**.

JOLOF. See **YOLOF**.

JOLY, zhò'lé', **HENRI** (1839-). A French philosopher. He was born at Auxerre, studied at the Ecole Normale Supérieure, and taught at Douai until 1871, and then at Dijon, where he was made dean in 1878. He was assistant at the Sorbonne (1881-83) and taught for a year (1886-87) at the Collège de France. After the suppression of his chair there he returned to Dijon. In 1903 he was elected a member of the Academy of Moral and Political Sciences. His works include: *Eléments de morale* (1880); *Psychologie comparée: L'homme et l'animal* (1877; 5th ed., 1911); *Psychologie des grands hommes* (1883; 3d ed., 1912); *Le crime* (1888); *La France criminelle* (1889); *Cours de philosophie* (9th ed., 1891); *Socialisme chrétien* (1892); *A travers l'Europe* (1898); *Malebranche* (1901); *Sainte Theresa* (1901; Eng.

trans., 1906); *De la corruption de nos institutions* (1903); *La Belgique criminelle* (1907); *La Hollande sociale* (1908); *La Suisse politique et sociale* (1909); *Problèmes de science criminelle* (1910); *L'Italie contemporaine* (1911); *L'Enfant* (1912); *Histoire de la civilisation* (1913).

JOLY, JACQUES CRÉTINEAU. See CRÉTINEAU-JOLY, JACQUES.

JOLY, jō'li, JOHN (1857-). An Irish physicist. He was educated at Trinity College, Dublin, was demonstrator of civil engineering there in 1882-91 and of experimental physics in 1893-97, and in 1897 became professor of geology and mineralogy. Joly devised a diffusion photometer known by his name; made valuable experiments in the early nineties on color photography, perfecting a system of trichromatic ruled screens and a method which was used (1897) for lantern slides; and determined with great accuracy the melting points of many minerals, inventing a melometer for this purpose. He estimated the age of the earth from the quantity of sodium in the ocean. Besides many contributions to the *Proceedings*, etc., of the Royal Society and the Royal Dublin Society, he wrote an important book on *Radioactivity and Geology* (1909).

JOLY DE LOTBINIÈRE, zhō'lē' de lōt'bē'-nyâr', SIR HENRI GUSTAVE (1829-1908). A Canadian statesman. He was born at Epernay, France, was educated in Paris, studied law, and was called to the Lower Canada bar in 1855. He practiced his profession in the city and district of Quebec. Entering politics, he was elected a Liberal member of the Canada Legislative Assembly and was prominent in the debates preceding confederation, which he opposed, maintaining that French-Canadian rights would not be adequately protected. After confederation he became a member of the House of Commons and also of the Quebec Provincial Assembly, retaining his seat in both Houses until the abolition of dual representation in 1874. He elected to remain in the Quebec Assembly, where he became leader of the Liberal Opposition. In 1878 he became Premier of Quebec and pursued a vigorous policy of retrenchment, also striving to abolish the Provincial Legislative Council. He resigned in 1879, was again Opposition leader in 1879-83, and in 1885 retired from public life. After 10 years of comparative political inactivity he reëntered politics in 1895 and actively promoted the return of the Liberals to power under Sir Wilfrid Laurier in 1896. In 1897-1900 he was Minister of Inland Revenue in the Laurier administration and in 1900-06 Lieutenant Governor of British Columbia. He was made K.C.M.G. in 1895.

JOMARD, zhō'mär', EDMÉ FRANÇOIS (1777-1862). A French Egyptologist, born at Versailles. He studied at the Ecole Polytechnique and accompanied the French army to Egypt in 1798 as a member of the scientific commission. Returning in 1802, he was appointed secretary to the commission, and in this capacity he edited the great *Description de l'Égypte*, contributing many essays, which were later published separately, and directing the printing for 20 years. In 1821 he took part in founding the Geographical Society of Paris, and in 1828 he became *conservateur administrateur* in the Royal Library. He suggested to Mehemet Ali to send a number of young Egyptians to be educated in Paris under his direction, thus form-

ing the so-called Institut des Egyptiens. The next Viceroy conferred upon him the title of Bey. He wrote, among other works, *Voyage à l'Oasis de Syouah* (1823) and *Remarques sur les rapports de l'Éthiopie et l'Égypte* (1822).

JOMINI, zhō'mé'nè', ANTOINE HENRI, BARON (1779-1869). A French general and writer on military topics. He was born at Payerne in the Canton of Vaud, Switzerland, and began his military career in a Swiss regiment in the French service, becoming Secretary of the Department of War under Masséna in 1799. He left the army in 1801, in 1805 began the publication of his *Traité des grandes opérations militaires*, and in the same year entered the French army, as aid-de-camp on the staff of Marshal Ney. He was present at Ulm (1805) and at Jena (1806), participated in the Prussian campaign of 1807, and was sent to Spain in the following year as chief of staff to Marshal Ney. He served in the Russian campaign of 1812 under Berthier and did good service during the retreat. In 1813 he helped win the battle of Bautzen; but, offended at the treatment which he received from Napoleon, he passed over to the allies and entered the service of Alexander of Russia, to whom he had offered his services some years before while in Switzerland. He refused, however, to fight against France or to divulge the military plans of Napoleon, which were well known to him. Napoleon said of him in St. Helena, "Jomini has not betrayed his colors, he had to complain of great injustice, he was blinded by an honorable sentiment, he was not French, the love of his country did not hold him back." In 1828 he took an active part in the military operations at Varna and in 1829 settled at Brussels. In 1853 he acted as military adviser to the Czar in the Crimean War and returned to Paris after the conclusion of peace in 1856. In 1859 his advice was sought by Napoleon III on the Italian campaign. Jomini was a magnificent tactician and strategist on the field as well as in council. Besides the work already mentioned, his *Histoire critique et militaire des campagnes de la Révolution* (Paris, 1820-24), his *Vie politique et militaire de Napoléon* (ib., 1827), his *Tableau analytique des principales combinaisons de la guerre* (St. Petersburg, 1830), and especially his *Précis de l'art de la guerre* (1836), are of great value to the military student. Consult Lecomte, *Le général Jomini* (3d ed., Lausanne, 1888).

JOMMELLI, yō-mē'lè', NICOLÒ (1714-74). A famous Neapolitan composer and one of the most celebrated masters of his time. He was born at Aversa, near Naples, and was educated under Canon Mozzillo, Durante, Feo, Leo, Prato, and Mancini. Previous to his appointment as kapellmeister to the Duke of Württemberg in 1754, his music had been marked by every characteristic of his national school and as such was very popular with his countrymen; but the influence of German ideals during his stay in that country, from 1753 to 1769, had so thoroughly entered into his work that, notwithstanding its increased richness and power in orchestration, it was no longer acceptable to his own Naples, and this neglect is said to have hastened his death. His first serious opera was *Odoardo* (1738), and although *Merope* (1747) was the most popular, his best were *Armida* (1770) and *Ifigenia in Aulide* (1773). Of his sacred compositions, the oratorio *La passione* (1748) is the most important. In 1749 he was chapel-

master of St. Peter's, and the period of his activity there marks the zenith of his power as a Church composer, although by many his *Miserere* is considered his masterwork. His known compositions are 50 operas, five cantatas, four oratorios, and 34 Church compositions. His death occurred at Naples. Consult H. Abert, *Niccolo Jommelli als Opernkomponist* (Halle, 1908).

JO'NAH (Heb. *Yōnāh*, dove). A Hebrew prophet. According to 2 Kings xiv. 25, he was the son of Amittai, a native of Gath-hepher in Zebulun, and prophesied during the reign of Jeroboam II, King of Israel (782-740 B.C.). The subject of his prophecy was the deliverance of Israel from the oppression of the Aramæans of Damascus. (See JEHOAHAZ; JEROBOAM II.) These prophecies must have been delivered early in Jeroboam's reign. They have not been preserved. The fifth book of the Minor Prophets is ascribed to Jonah, but there are serious objections to assigning a preëxilic date to this production. (See JONAH, BOOK OF.) Isaiah xv-xvi. 12 has been attributed to Jonah, but the view is improbable and cannot be proved.

JONAH, BOOK OF. The fifth book of the Minor Prophets. In the superscription the authorship of the book is ascribed to Jonah, the son of Amittai. Considerations of language and style, however, the general thought and point of view, and the psalm in chapter ii, which closely resembles other psalms of late date, make it difficult to believe that the book was written as early as the time of Jeroboam II. It can hardly date before the time of Ezra and is more likely to belong to the Greek period. The psalm in chapter ii may be much later than the rest of the work. The book consists of two sections: (1) the episode of Jonah and the fish (chaps. i, ii); (2) the account of the repentance of Nineveh, Jonah's chagrin at finding his prophecies unfulfilled, and the divine rebuke in consequence (chaps. iii, iv). Chapter i begins with God's command to Jonah to go to Nineveh and proclaim its destruction. Jonah attempts to evade the duty and takes passage on a ship going to Tarshish. A great storm arises on the voyage, interpreted by the sailors as a sign of divine displeasure. Jonah is chosen by lot as the guilty one, confesses, and is cast into the sea and swallowed by a great fish. After three days he is cast forth alive on the shore. Chapter ii is a psalm of thanksgiving for deliverance from the perils of the sea. In chapter iii Jonah obeys the divine command and preaches at Nineveh. In consequence the people of the city, at the command of the King, repent and observe a fast in sign of contrition. God then changes His purpose, and Jonah in consequence is greatly displeased. God rebukes him in an emblematic way by means of a gourd which He causes to grow and furnish shade to Jonah against the heat of the sun for one day. When the gourd perishes, Jonah is in despair because of the discomfort he feels. Thereupon the lesson is made clear that, if he experiences such deep regret for a mere gourd, which, moreover, he had no share in producing, God may have pity on a city like Nineveh, containing such a vast population, many of them innocent and all God's creatures.

Many modern scholars think that the Book of Jonah is to be classed with the homiletic literature of the Jews, along with such books as Tobit and Susannah, which contain a narrative told for religious edification and in illustration of religious doctrines. From this point of view

the book emanates from those Jewish circles which did not altogether sympathize with the exclusive conceptions developed by the doctrine of Israel's election, which, besides bringing about a total separation of the Hebrews from the "nations," placed the latter in the light of wicked people, merely because they were not Israelites. The Book of Jonah protests against this view and teaches, by means of a story of a prophet sent against Assyria, that even such a wicked heathen nation as Assyria, the old archenemy of Israel and Judah, could obtain the favor of God. The prophet himself is held up in the light of one who was more concerned with maintaining his prestige than to have his lessons followed. He urges upon God the destruction of Nineveh, despite the repentance shown by the latter. It is also the aim of the author, incidental to his main purpose, to hold the prophets up to ridicule by representing Jonah, the servant of God, as the one really disobedient to divine command. He is the one held responsible for the terrific storm which expresses the divine displeasure, as he is the one who needs the lesson of chapter iv. That the book maintained its place among the prophetic writings publicly read in the synagogue and formed a part of the final canon of Scripture is explained partly by its ascription to a preëxilic prophet mentioned elsewhere and partly by the symbolical interpretation to which it easily lent itself. Jonah as the dove—the favorite bird of sacrifice—symbolized Israel (cf. Ps. lxxviii. 13). Nineveh was a disguise for Jerusalem, and the lesson of the city's repentance was intended for the Jews. In this way an interpretation of the book grew up which obscured its real and original purport.

Concerning the historicity of the book opinions have varied widely. But whatever opinion may be held on this point, there can be little doubt that its main purpose and aim was didactic. There is an old story of a man swallowed by a fish which appears in numerous forms among ancient nations—as, e.g., Bel and the dragon, Marduk and Tiamat. A story of a remarkable sea monster also appears to have some connection with the port of Joppa. The most complete discussion of these mythological motives will be found in the recent work of Hans Schmidt. Those who deny the historical character of the book, and regard the story of the prophet and the fish as a work of fiction as much as the parables of Jesus, emphasize, as a rule, more strongly than those who accept it as literal fact, the broad sympathy, the catholicity of sentiment, and the high conception of the divinity which this book reveals.

Consult: the general commentaries on the Minor Prophets (q.v.); Simpson, *The Jonah Legend* (London, 1899); Cheyne, "Jonah: A Study in Jewish Folk-Lore and Religion," in the *Theological Review* (1877); Kalisch, *Bible Studies*, vol. ii (London, 1877-78); Wright, *Biblical Essays* (ib., 1886); Hans Schmidt, *Jona* (Göttingen, 1910).

JONAH CRAB. The name in southern Massachusetts of a crab (*Cancer borealis*) differing from the common rock crab (q.v.) in being heavier, more massive, and in living at low water on exposed and rocky shores, being by its stronger, more solid shell better calculated to withstand the action of the waves; it also occurs as far down as 10 fathoms. It is supplied to the Newport markets in small quantities during the summer season, being considered by

many as preferable to the blue or lady crab (q.v.).

JONAH MARINUS. See IBN JANACH.

JONAS, hō-nās', ALBERTO (1868-). A Spanish pianoforte virtuoso, born in Madrid. He studied first at the conservatory at Madrid and from 1886 to 1890 at the Brussels Conservatory. During the winter of 1890-91 he completed his piano studies under Rubinstein at St. Petersburg (Petrograd) and in 1891 made his début in Berlin. From 1894 to 1905 he was professor of music at the University of Michigan. In 1906 he settled in Berlin, where he gained great success as a teacher.

JONAS, yō'nās, JUSTUS (1493-1555). A German theologian and reformer (originally JOBST KOCH), born at Nordhausen, Saxony. He studied at Erfurt, became professor of law, and in 1521 professor of theology at Wittenberg, where he had studied for a time in 1511. He was ordained priest about 1515 and became pastor at Halle in 1541-46, court preacher at Coburg in 1551, pastor at Ratisbon in 1552, and in the following year became superintendent at Eisfeld. He was an intimate friend of Luther, whom he accompanied to the diets of Worms and Augsburg and assisted in his translation of the Old Testament. He also preached his funeral sermon. By his preaching and his translation into German of the Latin writings of Melancthon and Luther, beginning with the theses of the latter, he did much to promote the Reformation. Consult Pressel, *Justus Jonas* (Elberfeld, 1862), and Lindsay, *History of the Reformation in Germany* (New York, 1906).

JON'ATHAN (Heb. Yéhōnāthān, Yahwe gives). Eldest son of King Saul and friend of David. He was a valiant warrior, smote a garrison of the Philistines at Geba (1 Sam. xiii. 3), and a little later, assisted by his armor-bearer alone, attacked a Philistine garrison and threw the enemy into confusion (xiv. 1-18). Saul thereupon brought up his forces and completed the rout (vs. 19-23). In connection with this victory it is related that Jonathan, ignorant of a prohibition issued by his father not to partake of food until evening, ate some wild honey and as a consequence, but for the interference of the people, who ransomed their hero, would have been killed (vs. 24-46). The fast, for such it appears to have been, was probably ordained by Saul as a means of securing the assistance and favor of Yahwe in the fight. Noteworthy as Jonathan's achievements in war were, his fame rests upon the friendship between him and David. This, one of the most romantic and attractive narratives of the Old Testament, as related in 1 Sam. xviii-xx, is believed by scholars to be based on facts. Jonathan, together with his father and two of his brothers, fell at Mount Gilboa in a battle against the Philistines (1 Sam. xxxi. 2-6), and David gave a touching expression to his love for Jonathan in his beautiful elegy over Saul and Jonathan (2 Sam. i. 18-27). Consult Schmidt, *Messages of the Poets* (New York, 1911).

JON'ATHAN. The Hasmonæan, brother of Judas Maccabæus (q.v.). On the death of Judas in battle against the Syrians (161 B.C.) the leadership of the struggle of the Jews for national independence devolved upon Jonathan. The odds against him seemed at first overwhelming. The discontented elements of the population, abetted by the Syrians and the renegade high priest Alcimus, a puppet of the Syrians,

attempted to crush out the patriotic party. For some time Jonathan maintained himself in the regions east of the Jordan. At length, after the death of Alcimus (May, 160 B.C.), Bacchides, the Syrian governor, having fortified and garrisoned a number of towns in Judæa, returned to Syria. This was Jonathan's opportunity. In a quiet way he managed to increase his influence and more thoroughly organize his party, with the result that after two years the pro-Syrian party became alarmed and sent to Antioch for assistance. Bacchides returned, but found Jonathan so strong that he was compelled to recognize him, and determined to make peace with him. Jonathan took up his residence at Michmash, a few miles north of Jerusalem, and for five years so guided the affairs of the patriots that, notwithstanding the existence of the council at Jerusalem and the Syrian garrisons in the country, he succeeded in uniting the mass of the population under his leadership. The wars of contestants for the throne of Syria proved advantageous to the patriots. Demetrius I was opposed by the pretender to the throne, Alexander Balas. Each of the rivals courted Jonathan's assistance, making him liberal offers both for himself and his country. Jonathan, seeing that Alexander was destined to win, accepted the insignia of princely rank sent him and espoused his cause. In the same year (153 B.C.) he assumed the duties of high priest, which office had been vacant since the death of Alcimus. Alexander, aided by Ptolemy of Egypt, was victorious, and at the celebration of his marriage to Cleopatra, Ptolemy's daughter, Jonathan was an honored guest and was publicly confirmed in his rank and privileges. He was recognized as the military, civil, and religious head of Judæa, subject to the overlordship of Syria. This remarkable success was due to Jonathan's political shrewdness as much as to his military abilities. It was not long, however, before Syrian politics were again disturbed by the appearance of Demetrius II as a rival of Alexander Balas. Demetrius was assisted by Ptolemy and won the day, but Jonathan was strong enough not only to repel an attempted invasion of Judæa, but to gain important military successes in the old Philistine territory. He even advanced a step farther and laid siege to the citadel of Jerusalem, occupied by the Syrian garrison, the symbol of Syrian sovereignty. Jonathan's aim was now evidently complete independence of Syria. Demetrius heard of this and summoned Jonathan before him. Jonathan obeyed the summons without raising the siege. The result of his interview with Demetrius was that, while a considerable tract of territory was added to Judæa's domain, the taxes were materially reduced, and Jonathan was confirmed in his various offices, still the Syrian claim of overlordship was maintained, and the garrison remained in Jerusalem. Soon after this Demetrius, who was unpopular, was forced to meet a rebellion headed by a certain Trypho, who claimed to be espousing the cause of Antiochus, son of Alexander Balas. Though Jonathan assisted Demetrius in suppressing the revolt in Antioch, the King failed to show any gratitude, and in the civil war that followed the Jews favored Trypho. Jonathan now engaged in many active and successful campaigns against the forces of Demetrius, conquered much adjacent territory to the east and south, fortified Joppa, and finally renewed his efforts to reduce the Syrian garrison in the

strong fortress of Jerusalem. He was now a powerful prince with a well-disciplined army of over 40,000 men, and Trypho saw that he must be crushed if his own ambitious designs were to succeed. He entrapped Jonathan by artful means and at first held him for a ransom, but after the ransom was paid foully murdered him (143 B.C.). Jonathan was eminently the politician of the three brothers whose careers were so glorious. His administration of 18 years was a conspicuous success. It was comparatively easy for his brother Simon, who succeeded him, to reap the benefits of Jonathan's policy and secure, in the following year (142 B.C.), complete independence for the Jews. Consult 1 Maccabees, chaps. ix-xiii, and Emil Schürer, *History of the Jewish People in the Time of Christ*, vol. i (New York, 1896).

JONATHAN BEN UZZIEL, ūz-zī'ēl or ūz'zī-ēl. A Jewish scholar, disciple of Hillel (q.v.), who lived about the time of Jesus. He is the traditional author of the Targum, or Aramaic translation of the prophets, but proof of his authorship is entirely lacking; the Targum Pseudo-Jonathan also formerly passed as his work. No details of Jonathan's life are known. See TARGUM.

JONATHAN OLDSTYLE. See OLDSTYLE, JONATHAN.

JONATHAN WILD, THE HISTORY OF. A novel by Fielding (1743).

JONCKBLOET, yōnk'blōōt, WILLEM JOZEF ANDRIES (1817-85). A Dutch critic and historian of literature, born at The Hague. In the University of Leyden he studied medicine, then jurisprudence, and finally literature. He was professor at the Athenæum of Deventer (1847) and at the University of Groningen (1854). In 1864 he was elected to the Lower House of the States-General, but in 1877 returned to literary work, as professor of the literature of the Netherlands, at Leyden. He gave up his professorship in 1883. He edited many mediæval works, both Dutch and French, but his more important publications are: *Geschiedenis der middennederlandsche dichtkunst* (1851-54); *Etude sur le roman de Renart* (1863); *Geschiedenis der Nederlandsche letterkunde* (last ed., 1890).

JONCTIJS, or **JONCTYS**, yōnk'tis, DANIEL (1600-?). A Dutch poet, born at Dort. He studied medicine, and began to practice at Dort, but the theological party caused him to leave the city on account of a satirical poem, *De Hedendaagsche Venus en Minerva* (1643), directed against them. He afterward became a judge at Rotterdam. His *Rozelyns Oogjes ontleed* (1620-23), a series of love poems, was at one time much admired.

JONES, ALEXANDER (c.1802-63). An American inventor, journalist, and author, born in North Carolina, of Welsh descent. After studying medicine in Philadelphia he went to practice it in Mississippi, but while there undertook to invent an improved cotton gin, which ultimately replaced the old, and made himself so famous that he received an offer to superintend the introduction of his improvements into Hindustan cotton fields. This he declined, but his ingenuity found further outlet in a street sweeper, which he invented while engaged in journalistic work in New York, and in the formulation of a code of ciphers, the first employed by the Associated Press, of which he was agent (1850). For several years he was the writer on commercial topics for the New York *Herald*,

contributed to other American and English papers, and wrote: *Cuba in 1851* (1851); *Historical Sketch of the Electric Telegraph* (1852); *The Cymri of Seventy-Six* (1855).

JONES, ALFRED (1819-1900). An American engraver, born in Liverpool, England. He was apprenticed in 1834 to an engraving firm in Albany, N. Y., and later studied at the National Academy of Design, where he received first prize in 1839. He was made a member of the National Academy in 1851. In 1846-47 he worked in England under some of the best London masters of the art of engraving. After 1851 he confined himself chiefly to bank-note engraving. His large plate, "The Image Breaker" (1850), is considered one of the best line engravings produced in the United States. Other fine examples of his work are: "Mexican News" (1851); "The New Scholar" (1850); "The Capture of Major André." His portraits of George Washington, A. B. Durand, and Thomas Carlyle combine line work with etching admirably.

JONES, ALFRED GILPIN (1824-1906). A Canadian statesman, born in Weymouth, Nova Scotia, and educated at the Yarmouth Academy. His active interest in politics did not begin until 1865, when the movement for Canadian confederation brought him out as one of its opponents, and, after the death of the Hon. Joseph Howe, he became the leader of the Nova Scotia opposition to that plan. In 1867 he was elected a member of the Dominion Parliament for Halifax and, joining the Liberal party in federal politics, was made Minister of Militia in the cabinet of Alexander Mackenzie, an office which he held in 1874-78. He served an additional term as member of the Dominion Parliament during 1887-91. In 1900-06 he was Lieutenant Governor of Nova Scotia. Jones, though a United Empire Loyalist by descent and during his earlier career a Conservative, later became a warm supporter of commercial union with the United States and in general was opposed to schemes of Imperial consolidation, whether in trade or politics.

JONES, ANSON (1798-1858). A President of the Republic of Texas, born at Great Barrington, Mass. He studied medicine and, after living for short periods in Philadelphia, New Orleans, and South America, finally, in 1833, settled in Brazoria Co., Tex. He was a surgeon in the Texan army during the war between that country and Mexico and after the cessation of active hostilities was elected a member of the Second Texan Congress (1834). The next year he was appointed Minister to the United States. After his return from Washington he was elected from Brazoria County to the Texan Senate, and in 1841 President Houston appointed him Secretary of State. In 1844 he was elected President of Texas, an office which he held until Feb. 19, 1846, when he turned over the government to J. Pinckney Henderson, the first Governor under the Constitution of the United States. His journal and autobiography were published in 1858. Jones County, and its county seat, Anson, in Texas, were named in his honor.

JONES, CHARLES COLCOCK (1831-93). An American lawyer, born at Savannah, Ga. He graduated at Princeton in 1852 and at the Harvard Law School in 1855, was admitted to the bar in Savannah in the same year, and soon took high rank in his profession. He was elected mayor of the city in 1860. On the passage of the ordinance of secession in 1861, he entered

the Confederate army and served as lieutenant colonel of artillery under Gen. J. E. Johnston until the close of the war. He then removed to New York, where he practiced law until his return to Georgia in 1877. His publications include: *Historical Sketch of the Chatham Artillery during the Confederate Struggle for Independence* (1867); *Reminiscences of the Last Days of Gen. Harry Lee* (1870); *Antiquities of the Southern Indians* (1873); *Life of Commodore Josiah Tatnall* (1878); *History of Georgia* (2 vols., 1883); *English Colonization of Georgia* (1887).

JONES, DAVID PHILLIPS (1841-1903). An American naval engineer, born in Philadelphia, Pa. After serving as resident engineer in the office of the Surveyor-General of Utah Territory, he entered the navy in 1862 as third assistant engineer and in 1862-63, on board the *Cimerone* and later the *Sangamon*, participated in the operations on the James River, Va., and the St. John's River, Fla. In 1864 he was promoted to be second assistant engineer, and on board the *Mendota*, of the James River division of the North Atlantic squadron, was present at the battle of Bermuda Hundred. In 1867 he attained the rank of passed assistant engineer and in 1889 that of chief engineer. During a leave of absence he was constructing engineer of the St. Louis and Southeastern Railway, in 1874-79 was instructor in steam engineering at the United States Naval Academy, in which capacity he organized the department of mechanical drawing for cadet engineers, and from 1885 to 1888 was on duty as professor of mechanical engineering at the Kansas Normal College. From 1889 until his retirement in 1892 he was at the United States navy training station at Newport, R. I. During the Spanish-American War (1898) he was ordered to Pittsburgh, Pa., as chief inspector of steel for that district, and at the close of the war became a consulting engineer at Pittsburgh.

JONES, EBENEZER (1820-60). An English poet. Born in London, of poor parents, he escaped from their rigid Calvinism under the leadership of Robert Owen, Shelley, and Carlyle, and turned to verse making as a relief from office toil. At the age of 23 he published his first volume of poems, *Studies of Sensation and Event*, which met even a worse reception than it deserved. The poet was soured in consequence and took up radical journalism. He returned to the muse only when chastened by domestic unhappiness and sick unto death, and gave evidence by his "Winter Hymn to the Snow," "When the World is Burning," and "To Death," of what he might have done had longer life been granted him. Consult the 1879 edition of *Studies of Sensation and Event*, with a memoir by his brother, Sumner, and corrections and new poems by the poet himself.

JONES, EDWARD ("BARDY BRENIN") (1752-1824). A Welsh harpist and author, born at Llanderfel in Merionethshire. He was an important factor in the encouragement and development of Welsh minstrelsy and devoted his entire life to the study of the harp. He first appeared in London in 1775 and eight years later received the royal appointment of bard to the Prince of Wales. His works include: *Musical and Poetic Relics of the Welsh Bards* (1784 and 1794); *The Bardic Museum of Primitive British Literature*, which contains over 200 Gaelic melodies (1802); *Lyric Airs, Consisting of Specimens of Melodies of Greek, Albanian, Wallachian, Turkish, Persian, Chinese, and Moorish*

Melodies (1804); *Cheshire Melodies* (1803); *The Musieal Bouquet* (1799). Other publications for which no definite dates can be assigned are: *The Musieal Miscellany*; *Terpsichore's Banquet*; *The Minstrel's Serenade*; *Maltese Melodies*; *The Musical Portfolio*; *Musieal Remains of Handel, Baeh, Abel, etc.*; *A Collection of Melodies for Beginners on the Harp*. He died in London.

JONES, E(MILY) E(LIZABETH) CONSTANCE (c.1857-). An English educator and writer on logic and ethics. She was educated at Girton College, Cambridge, taking a first class in the Moral Sciences Tripos in 1880; was resident lecturer on moral sciences (1884-1903) at Girton, vice mistress (1896-1903), and after 1903 mistress. She translated, with Miss Hamilton, Lotze's *Mikrokosmos* (1888); edited Sidgwick's *Methods of Ethies* (1901) and his *Ethies of Green, Speneer, and Martineau* (1902); and wrote *Elements of Logie* (1890); *A Primer of Logie* (1905); *A Primer of Ethies* (1909); *A New Law of Thought and its Logieal Bearing* (1911); *Girton College* (1913).

JONES, ERNEST CHARLES (1819-68). An English orator, poet, and politician. He was born in Berlin and studied at Luneburg and Göttingen. He was called to the bar in 1844 and two years afterward became deeply interested in the Chartist programme. He edited the *Laborer* and the *Northern Star*, defended O'Connor, and soon after broke with him, as his own plans became more radical and revolutionary. Jones urged a provisional government and was elected as one of its members by the Chartists. His speeches in May, 1848, counseled forcible attack on the established order, and he was imprisoned for two years. He adhered to Chartism after all others had forsaken it. Jones was a persuasive and brilliant orator. His prose had little worth, but his verse was marked by a true lyric gift. His varied literary activity included the writing of sensational novels and stories, published in the fifties and now forgotten; *The Battle Day and Other Poems* (1855), highly praised by Landor; *Evenings with the People* (1856), a series of political addresses.

JONES, FRANCIS COATES (1851-). An American figure painter. He was born in Baltimore and studied at the Ecole des Beaux-Arts, Paris, under Boulanger and Lefebvre. A resident of New York after 1882, in 1894 he was elected to the National Academy of Design. He is fond of painting children or young girls in charming surroundings and shows cleverness in the handling of detail. His drawing is accurate, his color delicate, but his works are too detailed in finish and lack inspiration. Among his paintings are: "A Perplexing Move" (1909); "A Cup of Tea" (1910); "Nymphs Bathing" and "The Letter" (1911); "The Sisters" and "Wooded Hillside" (1912); "The Trout Pool" (1913). He was awarded the Clarke prize by the Academy in 1885, and the Shaw purchase by the Society of American Artists in 1904.

JONES, FREDERICK SCHEETZ (1862-). An American physicist and university dean. He was born at Palmyra, Mo., and was educated at Yale University (A.B., 1884; A.M., 1891), Berlin (1887-88), and the Polytechnic School at Zurich, Switzerland (1888-89). He was professor of physics from 1889 to 1909, and dean of the College of Engineering from 1902 to 1909,

at the University of Minnesota, and thereafter he served as dean of Yale College. His investigations in physics deal with primary cells and Röntgen rays.

JONES, GEORGE HEBER (1867-). An American Methodist Episcopal missionary, born at Mohawk, N. Y. In 1887 he went as a missionary to Korea, where he was in educational work at Scoul (1888-93), was presiding elder of the Chemulpo District (1895-1903), and served as superintendent of the Korea Mission of his denomination (1897-99). He returned to the United States in 1903 to be field secretary of the Methodist Board of Missions, but four years later again went to the East as president of the Biblical Institute of Korea. He lectured on missions at Boston University in 1910, was executive secretary of the Korean Quarter Centennial Movement of the Methodist Episcopal church in 1910-12, and in 1913 became editorial secretary of the Methodist Board of Foreign Missions. An authority on the history, language, literature, and religion of the Koreans, he wrote *Korea: The Land, People, and Customs* (1907) and *An English-Korean Dictionary of Scientific and Technical Terms* (1910).

JONES, HARRY CLARY (1865-1916). An American chemist, born at New London, Md. He graduated from Johns Hopkins University (A.B., 1889; Ph.D., 1892); studied for two years at Leipzig, Amsterdam, and Stockholm; and then, returning to Johns Hopkins as an instructor in physical chemistry, later became associate (1898), associate professor (1900), and professor (1904). He became associate editor of the *Journal de Chimie Physique*, of the *Zeitschrift für physikalische Chemie*, and of the *Journal of Franklin Institute*, whose Langstreth medal he was awarded in 1913. Besides translating Biltz's *Practical Method of Determining Molecular Weights* (1899), he wrote: *Freezing Point, Boiling Point, and Conductivity Methods* (1897); *Theory of Electrolytic Dissoeiation* (1900); *Elements of Physical Chemistry* (1902; in Russian, 1911; in Italian, 1912); *Elements of Inorganic Chemistry* (1903); *Electrical Nature of Matter and Radioactivity* (1906); *Hydrates in Aqueous Solutions* (1907); *The Absorption Spectra of Solutions* (1909); *Introduction to Physical Chemistry* (1910); *Electrical Conductivity of Salts and Organic Acids* (1912); *A New Era in Chemistry* (1913); and many contributions to European and American journals.

JONES, HENRY (1721-70). An Irish poet and dramatist, born at Beaulieu, near Drogheda, County Louth. He was a bricklayer by trade, but he pushed his way into literary circles through his flattery of influential men, while his ability to write complimentary verses stood him in good stead with the landladies who accepted them in lieu of board money. Lord Chesterfield became his patron when Lord Lieutenant of Ireland and afterward in London helped him to publish his *Poems on Several Occasions* (1749) and to get his tragedy, *The Earl of Essex*, put on at Covent Garden (1753). Other plays and poems of his have fallen into oblivion. An inordinate devotion to drink brought him under the wheels of a coach in St. Martin's Lane and terminated an unedifying career.

JONES, HENRY (1831-99). An English writer on whist, born in London. He will be

more generally recognized by his pen name, Cavendish. Bred to the game on which he became an authority by his father, Dr. Henry D. Jones, he codified its laws and wrote a work in many ways invaluable to card players, *Principles of Whist, Stated and Explained by "Cavendish"* (1862). Somewhat the same service he rendered in books on piquet and écarté. Of other games, outdoor and indoor, he also wrote, and notably of billiards, tennis, and croquet. In 1852 he began the practice of medicine in London and continued active in this profession for some 15 years.

JONES, SIR HENRY (1852-). A British philosopher, born at Llangernyw, North Wales. He was educated at the University of Glasgow, was made professor of philosophy and political economy at the University College of North Wales and professor of logic and metaphysics at St. Andrews, whence in 1894 he went to Glasgow as professor of moral philosophy. He was given the LL.D. by St. Andrews (1895) and the D.Litt. by the University of Wales (1905) and in 1912 was knighted. He wrote: *Browning as a Religious and Philosophical Teacher* (1891; 6th ed., 1912); *The Philosophy of Lotze* (1895), a valuable piece of criticism; *The Immortality of the Soul in the Poems of Tennyson and Browning* (1905); *Idealism as a Practical Creed* (1909); *The Working Faith of the Social Reformer* (1910); *Social Powers* (1913).

JONES, HENRY ARTHUR (1851-). An English playwright, born at Grandborough, Buckinghamshire, and educated at Winslow School. When only 13 years old, he left school and was thrown upon his own resources. He first became known in London as the author of *Clerical Error*, performed by Wilson Barrett at the Court Theatre (1879). This play was followed in 1882 by *The Silver King* at the Princess's Theatre, which ran for over a year. In 1884 Jones began a series of social dramas, mostly comedies. They met with extraordinary success, as played in English-speaking countries in both hemispheres, and some of them were translated and produced in continental cities. Among them are: *Saints and Sinners* (1884); *The Middleman* (1889); *Judah* (1890); *The Dancing Girl* (1891); *The Tempter* (1893), a tragedy; *Michael and his Lost Angel* (1896); *The Rogue's Comedy* (1896); *The Liars* (1897); *The Manœuvres of Jane* (1898); *Carnae Sahib* (1899); *Mrs. Dane's Defence* (1900); *The Princess's Nose* (1902); *Whitewashing Julia* (1903); *Joseph Entangled* (1904); *The Heroic Stubbs* (1906); *The Hypocrites* (1906); *We Can't be as Bad as All That* (1910); *Mary Goes First* (1913), in which Marie Tempest had notable success in London and New York; and *The Lie* (1914), in which Margaret Illington appeared. Jones visited the United States in 1914. He wrote also *The Renaissance of the English Drama* (1896); *The Foundations of a National Drama* (1913); *The Theatre of Ideas*, three plays (1915).

JONES, HENRY BENICE (1814-73). An English physician and chemist, born at Thornington Hall, Suffolk. He was educated at Harrow and at Trinity College, Cambridge (B.A., 1836), and later studied chemistry at University College, London, and in Giessen under Liebig. Trinity College gave him the degrees of M.A. (1842) and M.D. (1849). From 1845 to 1862 he was connected with St. George's Hospital in London. Jones was an authority on diseases of the stomach and kidneys. He wrote: *Gravel*,

Calculus, and Gout (1842); *Animal Electricity* (1852); *Lectures on the Application of Chemistry and Mechanics to Pathology and Therapeutics* (1867); *Croonian Lectures on Matter and Force* (1868); *Life and Letters of Faraday* (1870); as well as many scientific memoirs in chemical, medical, and physical journals.

JONES, HUGH BOLTON (1848-). An American painter, born at Baltimore, Md. He studied in his native city and then went abroad, where he remained for several years, sketching in Spain and France. He was elected an academician in 1883. Typical examples of his work, which is correct in line and delicate in color, but overdetailed in finish and lacking in inspiration, are "Spring" and "Autumn," in the Metropolitan Museum, New York.

JONES, INIGO (1573-1652). An English architect, born in London. Of his early history little is known till the time when the Earl of Pembroke, attracted by his great aptitude for drawing, sent him abroad for four years to study the masterpieces of architecture in France, Germany, and Italy. He spent most of his time in Venice, paying particular attention to the works of Palladio, whose style he introduced into England, whence we sometimes hear Jones designated as the "English Palladio." After a visit to Denmark he returned to England before 1605, when he was employed by James I in arranging the scenery and properties for the masques of Ben Jonson, which were at that time the chief amusement of the court. Jonson afterward satirized his fellow laborer in *Bartholomew Fair*. In 1613 and 1614 Jones revisited Italy, still further to improve his style, and on his return to England was appointed surveyor-general of the royal buildings (1615). Jones was at this time accounted the first architect of England and according to some the first of the age. His great reputation is, however, due less to the intrinsic merit of his works, which was often mediocre, than to his introduction of what was for England a new and monumental style of design. In 1618 he planned the palace of Whitehall (950 × 1280 feet), of which only the famous banqueting hall, considered to be his masterpiece, was carried out. Other works of his are Chiswick Villa, in close imitation of Palladio's Villa Capra, the church of St. Paul in Covent Garden, Ashburnham House, and Surgeons' Hall. Most of his important works, such as the renovations of the façade of Old St. Paul's, Shaftesbury House, Physicians' College, etc., have been destroyed. His *Designs*, consisting of plans for public and private buildings, was published by W. Kent at London, 1727. Consult: R. T. Blomfield, "Inigo Jones," in the *Portfolio* (London, 1889); W. J. Loftie, *Inigo Jones and Wren* (New York, 1893); Peter Cunningham, *Life of Inigo Jones* (London, 1898); Ernest Rhys, "The Masques of Inigo Jones," in *The Nineteenth Century and After*, vol. liv (ib., 1903); A. T. Bolton, *Jacobean Architecture and the Work of Inigo Jones in the Earlier Style* (ib., 1911).

JONES, JACOB (1768-1850). An American naval officer, born in Kent County, near Smyrna, Del. He studied medicine at the University of Pennsylvania, but soon after graduation gave up his practice to accept the position of clerk of the Supreme Court of Delaware. In 1799 he entered the United States navy as a midshipman and during the war against the Barbary corsairs was captured with the *Philadelphia* in

1803. He was liberated after a year and a half of captivity and in 1810 was promoted to the rank of commander. On Oct. 18, 1812, his vessel, the 18-gun sloop of war *Wasp*, captured the British 18-gun *Frolic*; but scarcely had he put a crew aboard his prize when the *Poictiers*, a British 74, appeared and captured them both. On his return to the United States Jones received a vote of thanks and a gold medal from Congress, which also voted \$25,000 prize money to be distributed among the officers and crew of the *Wasp*. Jones was promoted to the rank of captain and was placed in command of the captured frigate *Macedonian*. After the return of peace he commanded squadrons in the Pacific and in the Mediterranean, where he vanquished the Algerian pirates. For several years he was a commissioner of the naval board, and governor of the naval asylum at Philadelphia.

JONES, JAMES KIMBROUGH (1839-1908). An American lawyer and politician, born at Love, Marshall Co., Miss. Educated by private tutors, at 20 he entered an Arkansas mercantile firm, and during the Civil War, despite physical weakness, he served with credit in the Confederate army. Afterward he engaged in agriculture and, having just been admitted to the Arkansas bar, was elected State Senator in 1873. He was reelected in 1875 and 1877 and during his last term was President of the Senate. A leader of the Democrats, Jones participated in the Brooks-Baxter war, which resulted in ousting the Republican party from control. He was elected to Congress in 1880, was twice reelected, and from 1885 to 1903 was United States Senator. In the Senate Jones was an important figure, being chairman of the Democratic caucus and a member of the Finance Committee. He fought for the passage of the Wilson Tariff Bill, but opposed the Cleveland administration on the silver question. In 1896 he was chairman of the Democratic Convention at Chicago, and after Bryan's nomination he was manager of the campaign. Again in 1900 he was chairman of the Democratic Convention and also headed the National Committee. Defeated in his candidacy for a fourth term in the Senate, he retired to the practice of law in Washington.

JONES, JENKIN LLOYD (1843-). An American Unitarian clergyman and author, born at Llandyssil, Cardiganshire, Wales, but brought to Wisconsin when a year old. He served in the Civil War; graduated from Meadville (Pa.) Theological Seminary in 1870; for nine years had a charge at Janesville, Wis.; and in 1882 organized All Souls' Church, Chicago, of which he was thereafter pastor. He held various high offices in his church and was instrumental in organizing the Congress of Religion. *Unity*, the journal which became the organ of the congress, he edited after 1879. In 1909 he was given the degree of LL.D. by the University of Wisconsin. The founder and first president of the Chicago Browning Society, he lectured on literature at Chicago University and published: *The Faith that Makes Faithful* (1885), with W. C. Gannett (q.v.); *Practical Piety* (1890); *Word of the Spirit* (1897); *Jess: Bits of Wayside Gospel* (1897; and 2d series, 1901, as *A Search for an Infidel*); *Nuggets from a Welsh Mine* (1902); *Reinforcement of Faith* (1905); *Conscience Calls* (1906); *On the Firing Line in the Battle for Sobriety* (1910).

JONES, JOHN (1729-91). An American surgeon, born at Jamaica, N. Y., of Welsh descent.

He studied medicine at Paris, Leyden, London, and Edinburgh; practiced in New York; was professor of surgery in King's College (now Columbia University) for nine years; and, with Dr. S. Bard, founded the New York Hospital (1771). When New York was occupied by the British, he went to Philadelphia, where he was elected one of the physicians of the Pennsylvania Hospital, and in 1787, on the institution of the College of Physicians of Philadelphia, he was elected vice president. He was Washington's family physician in Philadelphia and the intimate friend and physician of Franklin, whom he attended in his last illness. He published *Plain Remarks upon Wounds and Fractures* (1775), republished with a memoir, by Dr. Mease (1795). Jones was a skillful operator and especially well known for his success in lithotomy.

JONES, JOHN PAUL (1747-92). A famous naval officer in the American Revolution, born in Kirkcudbrightshire, Scotland, July 6, 1747. His name was originally John Paul, "Jones" being subsequently added for reasons unknown. In his twelfth year he was apprenticed to a merchant of Whitehaven, who was actively engaged in the American trade, and shortly thereafter sailed for Virginia, where his brother was settled as a planter. For a time he lived at Fredericksburg with his brother, devoting his leisure to the study of nautical affairs. In 1766, his indentures being canceled, he made a voyage to Jamaica as chief mate on a slaver. He soon abandoned this business, however, and in 1768 took passage in a brigantine for Scotland. The master and mate dying in the course of the voyage, Paul assumed command and carried the vessel safely into port. For this service the owners appointed him captain and supercargo and sent him on a voyage to the West Indies. He continued this trade and accumulated a fortune by commercial speculation. In 1773, his brother having died childless and intestate, he returned to Virginia to settle the affairs of the estate which had fallen to him, and for a time gave his attention to planting. It was then that he assumed the name of Jones, by which he was subsequently known. Upon the outbreak of the Revolution he offered his services on behalf of the Colonies and was early invited to aid the Naval Committee of Congress with information and advice. He also served on a commission for the purchase of vessels for the new navy, and on Dec. 22, 1775, was commissioned senior first lieutenant of the flagship *Alfred*. After a short cruise, during which a successful attack was made on New Providence and a squadron was captured, he was transferred to the *Providence* with the rank of captain. He then made a cruise in the West Indies and in 47 days captured 16 prizes and destroyed a number of small vessels together with the fishery at Isle Madame. He then resumed command of the *Alfred*, and in November, 1776, sailed from Newport to Nova Scotia, where he captured a number of British coal transports, liberated 100 Americans confined at hard labor in the mines, destroyed the Cape Breton fishery, and returned to Boston with several prizes. In June, 1777, Jones was transferred to the command of the *Ranger*, one of the newly built vessels of the navy, and the one upon which the stars and stripes are said to have been hoisted for the first time. On November 1 Jones sailed from Portsmouth, N. H., with instructions to hover about the coast of Great Britain and destroy the English

shipping. Before entering the Channel he stopped in France to deliver to the American commissioners the official dispatches announcing the surrender of Burgoyne and to confer with them in regard to his mission in European waters. He then sailed to the north coast of England, seized the port of Whitehaven, spiked its guns, and burned some of the shipping. It was then that he conceived the project of capturing the Earl of Selkirk on his fine estate near Kirkcudbright and of holding him as a hostage. The project miscarried on account of the absence of the Earl, whose plate, however, was appropriated by the crew of the *Ranger* and was sold, but was subsequently purchased by Jones and restored to the rightful owner. In the summer of 1778 Jones captured near the English coast the *Drake*, a 20-gun warship of superior build, and carried it into Brest with 160 prisoners. His exploits won him great renown in America, and he was placed in command of the ship *Duras*, furnished by the French government, the name of which he changed to the *Bon Homme Richard*, and in August, 1779, he sailed with a squadron of five vessels, three American and two French, for the coast of Scotland, creating even greater alarm among the inhabitants than before. Off Flamborough he fell in with a fleet of 41 British merchantmen returning from the Baltic and convoyed by two powerful men-of-war, the *Serapis*, carrying 40 guns, and the *Countess of Scarborough*, with 20 guns. On the evening of Sept. 23, 1779, Jones engaged the *Serapis* in battle, and after three hours' desperate fighting, during the course of which the *Serapis* and the *Bon Homme Richard* were lashed together, the *Serapis* surrendered. The *Bon Homme Richard*, however, was so badly damaged that it sank two days later, the crew in the meantime being transferred to the *Serapis*.

For this victory Jones was, upon his arrival in Paris, presented by Louis XVI with a gold-mounted sword and was decorated with the cross of the Order of Military Merit. Upon his return to America in February, 1781, Congress voted him a gold medal, passed a resolution commending his "zeal, prudence, and intrepidity," assigned him to the command of a new ship of the line then building, and proposed to create for him the rank of rear admiral. The British, however, regarded Jones as a pirate and refused to recognize the validity of his captures. At the close of the war he went to Paris as American agent for prize money. In 1788 he entered the Russian service against the Turks, with the rank of rear admiral, but on account of the jealousies and intrigues of the Russian officers he resigned. In 1790 he retired to Paris, where he remained in retirement for the rest of his life. In 1792 he was appointed United States Consul at Algiers, but died before his commission arrived. A long search, instituted by Gen. Horace Porter, Ambassador to France, resulted in the discovery of his body in the old St. Louis Cemetery, in Paris, on April 14, 1905. The following July a United States squadron conveyed the body to Annapolis, Md., where it was buried, with the usual naval ceremonies.

Barnes (ed.), *Logs of the Serapis, Alliance, Ariel, under the Command of John Paul Jones, 1779-1780*, printed for the Naval History Society (ib., 1911); R. M. Crawford, *The Sailor whom England Feared* (London, 1913); Nathaniel Fanning, *Fanning's Narrative, the Memoirs of Nathaniel Fanning, an Officer of the American Navy, 1778-1783* (ib., 1913).

JONES, JOHN PERCIVAL (1829-1912). An American legislator and politician, born in Herefordshire, England. When a year old, he was brought to the United States by his parents, who settled in northern Ohio. He received his education in the public schools of Cleveland. Shortly after the discovery of gold in California he crossed the plains to the Pacific coast, where he became successful as a mine owner and operator. He was sheriff of Tuolumne County and from 1863 to 1867 served as a member of the California State Senate, removing in the latter year to Nevada. There he became superintendent and part owner of the famous Crown Point silver mine, the subsequent development of which brought him a large fortune. In State politics, he gained great influence with the miners, by whom he was known as the Nevada Commoner. Elected by the Nevada Legislature (1873) to succeed James Nye in the United States Senate, he was reelected as a Republican in 1879, 1885, and 1891, and as a Silverite in 1897. In the Senate he was long a member of the Committee on Post Roads, where he was an indefatigable worker in behalf of the extension of the system in the Pacific States, and of the Committee on Mines and Mining, to which his practical knowledge proved of the greatest value. His identification with the silver movement dates from August, 1875, when he became chairman of the monetary commission to examine and report upon the question of bimetallism. After that date he stood consistently as one of the foremost champions of bimetallism in the country, favored the free coinage of silver without regard to the rest of the world, and on that issue left the Republican party and supported Bryan in 1896. During the campaign of 1900 he returned to the Republican party, though without giving up his free-silver theories. He retired in 1903.

JONES, JOHN WINTER (1805-81). An English librarian, of Welsh descent, born in London. After education at St. Paul's School he studied law, but had to abandon the profession owing to an illness which affected his voice. When 18 years old, he had published a translation of the polyglot quotations in Blackstone's *Commentaries*, and he now devoted himself to the acquisition of foreign languages and the study of literature. In 1835 he became connected with the civil service and, as secretary to the charity commissioners, during two years traveled over the greater part of England. In 1837 the commissioners recommended him as an assistant in the British Museum Library, with which institution he was thenceforth identified. He was associated with Panizzi and Richard Garnett in the remodeling of that great institution, and the catalogue commenced in 1839, for which he, with others, framed scientific rules, and of which he was the general reviser, is a monument to his indefatigable industry, erudition, and judgment. On Panizzi's strong recommendation, when the latter resigned in 1866, Jones was appointed

principal librarian and held that position till 1878, when ill health necessitated his retirement. Numerous interesting catalogues and other works were published under his direction; he translated and edited several valuable works of early travels, notably *Divers Voyages Touching the Discovery of America*, issued by the Hakluyt Society (1850), and was a prolific contributor to the *New Biographical Dictionary* of the Society for the Diffusion of Useful Knowledge.

JONES, LEONARD AUGUSTUS (1832-1909). An American jurist and writer on legal topics. He graduated from Harvard College in 1855 and from Harvard Law School in 1858 and then practiced law until 1874. Thereafter he was associate editor (1874-1904) and editor in chief (1904-07) of the *American Law Review*. He became judge of the land court in 1898 and thereafter until his death was chief judge of that court. His writings include: *An Index to Legal Periodical Literature* (2 vols., 1888-89); *Legal Forms* (6th ed., rev., 1909); and treatises on the law of *Real Property* (2 vols., 1896); *Collateral Securities and Pledges* (3d ed., 1912); *Corporate Bonds and Mortgages* (3d ed., 1907); *Landlord and Tenant* (1906); *Mortgages of Real Property* (6th ed., 1904); *Mortgages on Personal Property* (5th ed., 1908).

JONES, LEWIS RALPH (1864-). An American botanist, born at Brandon, Wis. He was educated at Ripon College (1883-86) and at the University of Michigan (Ph.B., 1889; Ph.D., 1904). From 1889 to 1910 he taught natural science at the University of Vermont and was botanist of the Vermont Experiment Station, and thereafter he was professor of plant pathology at the University of Wisconsin. He was special agent of the United States Bureau of Plant Industry in 1904, served as president of the Botanical Society of America (1912) and of the Phytopathological Society of America (1909), became one of the editors of the *American Journal of Botany*, contributed to *Webster's New International Dictionary*, and published several contributions on the diseases of plants.

JONES, OWEN (1809-74). An English architect and designer, born in London, the son of Owen Jones, the Welsh antiquary. He studied six years in the office of the architect Vulliamy and at the Royal Academy. He traveled in the East and Europe and in 1834 went to Granada, which he revisited in 1837 for material for his *Plans, Elevations, Sections, and Details of the Alhambra* (1842-45, with 101 plates in color). He was one of the superintendents of works at the exhibition of 1851 and a year later had charge of the decorations of the Egyptian, Greek, Roman, and Alhambra courts at the Crystal Palace, Sydenham. The casts decorating the palace were also collected by him and Sir Digby Wyatt. As an architect, he built St. James's Hall, London. He was particularly successful with interior decoration, in which he was influenced by his love of Arabic ornamentation and color. He was vice president of the Royal Institute of British Architects and was the winner of various medals for designs. His works include: *Designs for Mosaic Tessellated Pavements* (1842); *The Illuminated Books of the Middle Ages* (1844), with Humphreys; *The Polychromatic Ornament of Italy* (1846); *An Attempt to Define the Principles which should Regulate the Employment of Color in the Decorative Arts* (1852); his famous *Grammar of Ornament*

(1856, 100 plates); *One Thousand and One Initial Letters* (1864); *Seven Hundred and Two Monograms* (1864); *Examples of Chinese Ornament* (1867).

JONES, PETER (1802–56). A Canadian Indian missionary and educator. He was born at Burlington Heights, Upper Canada, a member of the tribe of Ojibway Indians. Through the aid of influential friends he obtained an excellent education. In 1833 he was ordained a Wesleyan Methodist minister and from that time until his death was a zealous and influential missionary. He traveled much and preached in the United States and Great Britain. When in the latter country he did much to inform and rightly guide opinion in political and religious circles as to the position and treatment of the various Indian tribes in North America. He prepared several educational books for the use of the Ojibways, translated the Gospels of Matthew and John into their language, and published *My Life and Journals* (1860) and *History of the Ojibway Indians, with Special Reference to their Conversion to Christianity* (1861).

JONES, SAMUEL (1734–1819). An American jurist. He studied law with William Smith, the New York historian; was a Tory throughout the Revolution, but not an active one; and became a leader of the Federalist party and a member of the State Convention of 1788 which adopted the Constitution. He became recorder of the city of New York in 1789 and in the same year revised the State statutes with Richard Varick. In 1796 he was made State comptroller, the functions of which office he had legally prescribed at the request of John Jay. He was a brilliant jurist and wrote many papers for the New York Historical Society.

JONES, SAMUEL PORTER (1847–1906), commonly known as Sam Jones and often styled the Mountain Evangelist. An American evangelist of the Methodist Episcopal Church South, born in Chambers Co., Ala. He was admitted to the bar in 1869 and for a time practiced successfully. His professional life was ruined by his passion for drink, but after his father's death, in 1872, he was converted, in the same year was ordained a clergyman of the Methodist Episcopal Church South, and at once began preaching. His success from the first was remarkable, and he became widely known as a speaker on evangelistic, revival, and Chautauqua platforms. Many of his sermons, discourses peculiar to themselves in their unconventionality, have been published. These include: *Famous Stories of Sam P. Jones* (1908); *Popular Lectures of Sam P. Jones* (1909); *Sam Jones's Revival Sermons*, compiled by his daughter, Annie Jones Pyron (1912); *Lightning Flashes and Thunderbolts*, compiled by J. S. Shingler (1912).

JONES, THOMAS (1731–92). An American lawyer and Tory, born at Fort Neck, Long Island. He graduated from Yale in 1750, studied law, was admitted to the bar in 1755, became city attorney and recorder, and in 1773 succeeded his father, David Jones (1699–1775), as judge of the Supreme Court, an office which he held under the crown. He was twice captured by the Revolutionary forces and twice paroled; in 1779 he was captured in spite of his parole and exchanged (1780) for Gen. Gold Selleck Silliman. A year afterward he removed to England and was attainted in 1782 by the New York Legislature. Jones wrote a *History*

of New York during the Revolutionary War, published by the Historical Society in 1879. The work has the value of a sole contemporary document and is Loyalist in sympathies.

JONES, THOMAS AP CATESBY (1787–1858). An American naval officer, born in Virginia. He entered the navy in 1805 and three years later was sent to the Gulf of Mexico, where he was engaged until the outbreak of the War of 1812 in suppressing piracy, smuggling, and the slave trade. He saw no active service against the British until near the end of the war, when he attempted with his squadron of five gunboats manned by 182 men to bar the passage across Lake Borgne to the fleet under Vice Admiral Cochrane, which was transporting General Packenham's army to New Orleans. He anchored his squadron in such a position that the deep-draft vessels of the British could not approach it and so forced the latter to attack in their tenders. After an obstinate resistance, in which he inflicted severe loss upon his assailants, but during which he was himself badly wounded, his vessels were captured. In 1820 Jones was promoted to the rank of commander and in 1829 to that of captain. At this time conditions in the Hawaiian Islands were attracting attention in the United States and in England. The missionaries, most of whom were Americans, had secured practical control of the government; but opposed to them was an aggressive party, composed of sailors and merchants, which was headed by the British Consul, Richard Charlton, who wished to secure the cession of the islands to Great Britain. Commander Jones in the sloop of war *Peacock* was sent out in 1826 to secure payment of debts claimed by American citizens and to endeavor to restore peace between the warring factions. He remained almost three months, collected the debts, denied publicly Charlton's assertion that the islands were a British dependency, and presided over a meeting at which the missionaries met the charges of their adversaries. In 1842, while commanding the Pacific squadron, he heard that war had been declared against Mexico, and, believing from the actions of the British warship *Dublin* that that government intended to annex California, he landed a force at Monterey and took possession in the name of the United States. For this indiscretion he was temporarily removed from his command.

JONES, THOMAS RUPERT (1819–1911). An English geologist, born in London. He was sent to school at Taunton and Ilminster and afterward studied medicine, but in 1850 became assistant secretary to the London Geological Society. He was professor of geology at the Royal Military and Staff Colleges, Sandhurst, from 1862 till superannuated in 1880. His works include: *Monograph of the Cretaceous Entomostraca* (1849); *The Tertiary Entomostraca in England* (1856); *Monograph of the Fossil Estheria* (1862); *Monograph of the Arctic and North Atlantic Foraminifera* (1865); *Foraminifera of the Crag* (1866); *Monograph of the Carboniferous Cypridinidæ* (1874); *Palæozoic Phyllopora* (1888). He edited numerous books on natural science and contributed extensively to scientific periodicals.

JONES, WALTER (1865–). An American physiological chemist, born at Baltimore, Md. He graduated from the Baltimore City College in 1884 and from Johns Hopkins Uni-

versity in 1888 (Ph.D., 1891). He served as professor of chemistry at Wittenberg College, Springfield, Ohio, in 1891-92, and as professor of analytical chemistry at Purdue University in 1892-95. He then returned to Johns Hopkins, where he was an assistant in physiological chemistry (1895-98), associate (1898-1902), associate professor (1902-08), and professor after 1908. The results of his many investigations in his field were published in various technical journals and in *Nucleic Acids* (1914).

JONES, WESLEY LIVSEY (1863-). An American legislator. Born near Bethany, Ill., he graduated from Southern Illinois College in 1886 and was admitted to the bar in the same year. He moved to the Territory of Washington in 1889 and there began the practice of law in 1890. He participated in the Blaine campaign of 1884 and the Harrison campaign of 1888 in Illinois and in all subsequent campaigns in the State of Washington. He was a Republican member of the Fifty-sixth to the Sixtieth Congress (1899-1909), was elected United States Senator for Washington for the term of 1909-15, and in 1914 was reelected.

JONES, SIR WILLIAM (1746-94). A famous English Orientalist, Indian jurist, and littérateur. He was born in London, Sept. 28, 1746, and was sent to Harrow in 1753. In 1764 he was entered at University College, Oxford, where he was enabled to gratify his desire for a knowledge of the Oriental languages. In 1765 he left Oxford, to become tutor to Earl Spencer's eldest son, with whom he remained five years. In 1770 he published, at the request of the King of Denmark, a *Life of Nadir Shah*, translated into French from the Persian; in the following year, a *Persian Grammar* (1772; several times republished); and in 1774 his *Poeseos Asiaticæ Commentariorum Libri Sex*, republished by Eichhorn at Leipzig in 1776. In 1780 he completed a translation of the seven Arabic poems known as the *Moallakāt*, which obtain their collective name from being suspended in the temple at Mecca; wrote an essay *On the Legal Mode of Suppressing Riots*, and another, entitled *Essay on the Law of Bailments* (1781), and two or three odes. In March, 1783, Jones was knighted and obtained a judgeship in the Supreme Court of Judicature in Bengal, and landed at Calcutta in September. He at once set about the acquisition and promulgation of the knowledge of Oriental languages, literature, and customs. He established the Royal Asiatic Society, of which he was the first president. To the volumes of the *Asiatic Researches* Sir William contributed largely. Besides these, he wrote and published a story in verse, called *The Enchanted Fruit, or the Hindu Wife*, and a translation of an ancient Indian drama, called *Sakuntala, or the Fatal Ring* (1789), which aroused widespread interest in the literary circles of Europe. A translation by him of the *Ordinances of Manu* (q.v.) appeared in 1794. He was busily employed on a digest of the Hindu and Mohammedan laws at the time of his death (April 27, 1794). Jones was one of the greatest linguists and Oriental scholars that England has produced, and his enthusiasm and literary ability did much to arouse general interest in the subject. The East India Company erected a monument to his memory in St. Paul's Cathedral and a statue in Bengal. A complete edition of his works in six volumes was published by Lady

Jones in 1799, and another appeared in 13 volumes (London, 1804-07), with a life of the author by Lord Teignmouth (republished, London, 1835). His translation of Jayadéva's *Gita-gōvinda* was republished in 1894 (Calcutta). Consult the article by H. M. Stephens in the *Dictionary of National Biography*, vol. xxx (London, 1892).

JONES, WILLIAM (1871-1909). An American scholar, anthropologist, and writer, of Welsh, English, and Indian descent, born in Indian Territory and reared, on the Sauk and Fox Reservation, by his grandmother, the daughter of Wa-shi-ho-wa, a Fox chief. He attended Hampton Institute and Phillips Andover Academy, graduated at Harvard in 1900, received the Ph.D. degree at Columbia, and collected Sauk, Fox, and Ojibwa ethnological specimens for the American Museum of Natural History, New York. An Algonquian linguist, he prepared field notes and Indian texts. While in the Philippines, sending material to the Field Museum, Chicago, he was fatally wounded by traitorous natives. Among his writings are: *The Algonkin Manitou; Kickapoo Texts; Fox Texts; Some Principles of Algonquian Word-Formation* (1904); *Mortuary Observances and the Adoption Rites of the Algonquin Foxes of Iowa*.

JONES, WILLIAM, OF NAYLAND (1726-1800). An English divine. He was born at Lowick, Northamptonshire; educated at the Charterhouse and University College, Oxford; ordained priest (1751); became successively curate of Finedon, vicar of Bethersden, rector of Pluckley, Paston, and perpetual curate of Nayland (1777). He adopted, while at Oxford, the philosophy of Hutchinson, as opposed to that of Sir Isaac Newton, and subsequently advocated it with great erudition and ingenuity. He was a man of vast learning, an able theologian, and proficient in music, and one of the most prominent in the High Church party of his day. He wrote with vigor against the principles disseminated during the French Revolution and illustrated by it. He wrote treatises on music and composed anthems, and founded the *British Critic* (1793). A complete collection of his works was published in 12 volumes in 1801, with a short life by W. Stevens (new ed. in 6 vols., 1810). His life forms part v of the *Biography of English Divines* (London, 1849). Consult also article by J. H. Overton in *Dictionary of National Biography*, vol. xxx (ib., 1892).

JONESBORO, jōnz'būr-ō. A city and the county seat of Craighead Co., Ark., 67 miles by rail northwest of Memphis, Tenn., on the St. Louis and San Francisco, the St. Louis Southwestern, and the Jonesboro, Lake City, and Eastern railroads (Map: Arkansas, E 2). It is a manufacturing centre of some importance, having flouring and lumber mills, peanut-hulling factory, cotton-oil mill, basket and handle factories, brickworks, cotton gins, machine shops. Jonesboro is also the distributing centre for a wide agricultural region. The city contains a State agricultural school, Elks Home, Federal building, and the St. Bernards Hospital. Settled in 1870 and incorporated in 1882, Jonesboro is governed under a charter of 1892 which provides for a mayor, elected biennially, and a unicameral council. The water works, electric-light plant, and sewer system are owned by the city. Pop., 1900, 4508; 1910, 7123.

JONESBORO. A city and the county seat of Clayton Co., Ga., 20 miles south of Atlanta, on the Central of Georgia Railroad (Map: Georgia, B 2). It has a tire factory. Pop., 1900, 877; 1910, 970. Here in August, 1864, was fought a stubborn battle between the Federal General Howard, at the head of a portion of General Sherman's army then besieging Atlanta, and the Confederate General Hardee, commanding about half of the army which, under General Hood, was endeavoring to hold that city. Howard had been sent to destroy the railroad at this point, and Hardee at 2 P.M. on the 31st made an attempt to drive him across Flint River, but was repulsed with considerable loss and forced to retreat. This victory placed the Federals in control of the Macon road and compelled General Hood hurriedly to evacuate Atlanta. The loss of the Federals in killed, wounded, and missing was about 300; that of the Confederates, while never actually ascertained, was probably about 2000. Consult Sherman, *Memoirs* (2 vols., New York, 1875), and Cox, *Atlanta*, in the "Campaigns of the Civil War Series" (ib., 1882).

JONGE, yǒng'e, JOHANNES CORNELIS DE (1793-1853). A Dutch historian, born at Zierikzee and educated at Leyden. There he became acquainted with Van Wijn, whose assistant he was until 1831, when he succeeded his master as keeper of the Dutch archives. Jonge had shown his patriotism by volunteering for the Hundred Days, and in his later years he held various representative offices. His historical works form the actual basis of Dutch history; they include: *Verhandeling over den oorsprong der hoeksche en kabeljaauwsche twisten* (1817); *Het derde stand in de staatsvergaderingen* (1824); the great work, *Geschiedenis van het Nederlandsche zeezezen* (1833-48; 2d ed., 1858); and a biography of Van Wijn (1832).

JONGKIND, yǒng'kint, JOHANN BARTHOLD (1819-91). A Dutch landscape painter and etcher. He was born at Latrop, near Rotterdam, went to Paris while quite young, and studied chiefly with Isabey. There remain but scant details of his life at Paris, despite the fact that he numbered Baudelaire, Théophile Gautier, and Zola among his friends. Corot, Daubigny, and Monet were also of the number—fervent admirers of his work. None the less his life was passed in poverty, wandering from place to place, forever at work, but finding little sale for his beautiful productions. His privations and the bitterness they brought ended in mental collapse. From 1860 to his death, at La Côte Saint-André in 1891, Jongkind, like his great compatriot, Van Gogh, was insane.

Jongkind belongs to the Dutch school in the character of his outlook on nature and to the French in technique—it has been well said that he is the artistic descendant of Van Goyen, Ruysdael, and Van de Velde. He carried the naturalism of the men of 1830 to a point unattained by any of them and is the link between their art and that of the Impressionists. Jongkind's ceaseless industry made him a master of any medium he cared to work in—oils, water colors, pencil, etching, or lithography. He excelled especially in the handling of water color, and in etching he is one of the greatest masters of the nineteenth century. With a sure draftsmanship and with unsurpassed freedom and economy of means, he jotted down his impressions of nature directly on the copper. Both in

painting and etching he succeeded especially with the canals and skies of his native land, but his French subjects are scarcely less attractive. His painting is well represented at Amsterdam in the Rijks-Museum and the Municipal Gallery, and in the Moreau-Nelaton collection of the Louvre; also in several French provincial museums and at Brussels and Amsterdam. Consult Frantz, "Johann Barthold Jongkind," in the *International Studio*, vol. xxxvi (New York, 1908-09).

JONGLEUR, zhōn'glēr' (OF., from ML. *joculator*, jester, juggler, from Lat. *joculari*, to jest, juggle, from *joculus*, dim. of *jocus*, jest, joke). A title given in France during the Middle Ages to members of a class of public entertainers or minstrels, who wandered from place to place singing, as a rule, the compositions of others, though some confusion is occasionally found between the functions of the jongleur and the troubadour (q.v.). The jongleur, however, was of a lower and purely mercenary class. See also FRENCH LITERATURE.

JONGLEUR DE NOTRE DAME, de nô'tr' dām, LE (Fr., The Juggler of Our Lady). An opera by Massenet (q.v.), first produced in Monte Carlo, Feb. 18, 1902; in the United States, Nov. 27, 1908 (New York).

JÖNKÖPING, yēn'chē-pīng. Capital of the län of the same name, Sweden, at the south extremity of Lake Wetter, 85 miles east of Göttenberg. It is regularly and well built, and is situated among lakes and pine-clad hills, but is somewhat low and unhealthy. Its suburbs on surrounding hills are better placed (Map: Sweden, E 8). It is one of the most important industrial towns of Sweden and is famous for its manufactures of matches, founded in 1844 by John Eduard Lundström. Other important products are paper and wood pulp, arms, castings, carpets, tobacco, and machinery. The maritime trade is considerable. It is the seat of a court of appeal. Jönköping is an ancient town dating from legendary times; it received its town charter in 1284. Pop., 1901, 23,143; 1911, 26,969.

JONOPUS, an epiphyte. See Plate of EPIPHYTES.

JONQUIÈRES, zhōn'kyâr'. A town in Chicoutimi Co., Quebec, Canada, on the Quebec and Lake St. John Railway, 10 miles east of Chicoutimi (Map: Quebec, G 2). Among its industrial establishments are pulp and paper mills, a sash and door factory, planing mill, furniture factory, and foundry. Pop., 1911, 2354.

JON'QUIL (Fr. *jonquille*, from Lat. *juncus*, reed). A name given to certain species of *Narcissus* (q.v.) with rushlike leaves. The common jonquil (*Narcissus jonquilla*), a native of the south of Europe, is one of the most common bulbous-rooted plants in flower borders. It has from two to six yellow flowers at the summit of its scape (leafless stem). The sweet-scented jonquil (*Narcissus odoratus*), also a native of the south of Europe, is another species very generally cultivated. Like other species of *Narcissus*, these are readily grown in forcing houses. The flowers are used in the manufacture of perfumes. All varieties are ordinarily propagated by bulbs. New varieties are obtained from seeds.

JON'SON, BEN (BENJAMIN) (?1573-1637). An English dramatist, born probably at Westminster in 1573. His grandfather belonged to one of the Johnstone families of Annandale.

His father, who was a "minister," died a month before the dramatist's birth; and his mother soon married a "master bricklayer" living near Charing Cross. Ben was sent to Westminster School at the expense of William Camden, then second master there, and a famous scholar, to whom he was surely indebted for the beginnings of his solid learning. It is commonly stated, on the authority of Fuller, that from Westminster he proceeded to St. John's College, Cambridge. For the assertion there is, however, no real evidence. After he had won a name in letters, Jonson received from each university the degree of M.A., but—in his own words—"by their favour, not his studie." He was taken from school and put to the craft of his stepfather. Disliking this occupation, he went to the Low Countries, where he joined the English troops against Spain. While there, he killed one of the enemy in view of both armies. He returned to England about 1592 and "betook himself to his wonted studies." Near this time he also married a "wife who was a shrew yet honest." Precisely when he began writing for the stage is not known; but the date is probably not earlier than 1595. Two years later he was both actor and playwright in Henslowe's company. In 1598 he wrote a tragedy for this company and was mentioned by Meres as one of "the best for tragedy." These plays are lost. His first extant play is the famous *Every Man in his Humour*, performed by the lord chamberlain's servants, at the Globe Theatre, in September, 1598. Shakespeare himself played a part in this first noteworthy English comedy of character. While the play was on the stage, Jonson quarreled with an actor in Henslowe's company named Gabriel Spenser and killed him in a duel (September

adaptation of Plautus. During the next 15 years he brought out *Cynthia's Revels* (1600), *The Poetaster* (1601), *Sejanus*, a tragedy (1603), *Catiline*, a tragedy (1611); and his greatest comedies, *Volpone* (1605), *Epicæne, or the Silent Woman*, best of all (1609), *The Alchemist* (1610), and *Bartholomew Fair* (1614). In 1616 came a poorer comedy, *The Devil is an Ass*. The regular stage Jonson now forsook for 10 years, and his later comedies have little interest. At his death he left fragments of a beautiful pastoral, *The Sad Shepherd, or a Tale of Robin Hood*.

With the accession of James he had begun for the court a series of festive performances which he classed as entertainments, barriers, and masques. They had respectively, as the centre of interest, a complimentary speech, a mock tournament, and a masqued dance. They were presented with elaborate machinery furnished by Inigo Jones (q.v.). But the general plan and the verse, often exquisite, were Jonson's. Besides masques, Jonson also composed many poems. Scattered through his comedies, written mostly in prose, are well-known songs, as "Still to be neat, still to be drest." But his larger poetic fame rests upon his charming epigrams (short poems embodying one idea), and the collections entitled *The Forest* and *Underwoods*. Unsurpassed of their kind are the lines "On Lucy, Countess of Bedford," and the "Epitaph on the Countess of Pembroke." And in a series of essays called *Discoveries* he displayed his solid character and ripe wisdom.

During these years Jonson lived a varied life. His combativeness led to "many quarrels" with Marston, one of his collaborators, whom he "beat," and satirized, in conjunction with Dekker in the *Poetaster*. When, in 1604, Chapman and Marston were sent to prison for certain passages in their *Eastward Ho*, offensive to the court, Jonson, who had a slight hand in the play, voluntarily joined them (1605). The next year he was also imprisoned with Chapman. But for the most part he enjoyed the favor of the King, whom he pleased by his masques and in other ways. In 1616 he was granted a royal pension of 100 marks, afterward raised to £200, and might have been knighted, it is said, had he wished. In 1613 he was abroad with the son of Sir Walter Raleigh, to whose *History of the World* he contributed the account of the Punie wars. In the summer of 1618 he traveled on foot to Scotland, returning the next year. He visited the poet Drummond at Hawthornden, about 11 miles from Edinburgh, in conversations with whom he spoke very freely of his contemporaries and of his own early life. His friends among the aristocracy were many, especially among the Sidneys. From the Earl of Pembroke he received every year £20 to buy books. Convivial by nature, he ruled as monarch at the hostelrys where gathered poets and dramatists, first at the Mermaid and then at the Devil Tavern. Of Shakespeare, who no doubt was one of his early associates, he said late in life: "I loved the man and do honour his memory, on this side idolatry, as much as any." He died Aug. 6, 1637, and was buried in Westminster Abbey, where his tombstone bears the inscription, "O rare Ben Jonson." Jonson's work is the best representation of classic ideals in the English drama, adapting to contemporary life the spirit of ancient comedy. His aim was

A CULTIVATED JONQUIL.

22). He was imprisoned for a short time; but, by pleading benefit of clergy, he escaped with branding on the left thumb and loss of goods and chattels. The next year Jonson produced *Every Man Out of his Humour* and perhaps had already written *The Case is Altered*, an

to depict for ridicule and satire the "humours" of society, i.e., affectations in conduct, dress, and speech. His comedies he aptly described as "comical satires."

The first volume of the first folio edition of Jonson's *Works*, as revised by himself, was published in 1616. *Every Man in his Humour*, as published in 1601, was Italian in setting. In the folio of 1616 it first appeared as now generally known, with its scene shifted to London and the names of the characters in English. The second volume of the first folio appeared in installments between 1630 and 1641. The only critical edition in the nineteenth century was that of Gifford (9 vols., London, 1816; revised by Cunningham, 1875). It is not a careful piece of work. A convenient edition of the plays is *Complete Plays* (2 vols., New York and London, 1910), with introduction by F. E. Schelling. Selected plays, edited by B. Nicholson, with an introduction by C. H. Herford, were published in the *Mermaid Series* (3 vols., London and New York, 1894 and 1903).

Bibliography. The main source for Jonson's life is *Conversations with Drummond*, edited by Laing, Shakespeare Society (London, 1842). Consult also: John Dryden, *Essay on Dramatic Poesy* (ib., 1668); W. Gifford, "Memoirs of Ben Jonson," in his *Works*, vol. i (ib., 1872); Soergel, *Die englischen Maskenspiele* (Halle, 1882); J. A. Symonds, *Life of Johnson*, in "English Worthies Series" (London, 1886); A. C. Swinburne, *Study of Johnson* (ib., 1889); Fleay, *English Drama* (ib., 1891); Koepfel, *Quellen-Studien zu den Dramen Ben Jonsons* (Leipzig, 1895); F. E. Schelling, *Ben Jonson and the Classical School* (New York, 1898); Ward, *History of English Dramatic Literature* (London, 1899); A. H. Thorndike, "Ben Jonson," in *Cambridge History of English Literature*, vol. vi (Cambridge, 1907-10); Paul Birck, *Literarische Anspielungen in den Werken Ben Jonson's* (Strassburg, 1908), containing a bibliography; C. R. Baskerville, "English Elements in Jonson's Early Comedy," in University of Texas, *Bulletin*, "Humanistic Series," No. 178 (Austin, Tex., 1911); Mina Kerr, *Influence of Ben Jonson on English Comedy, 1598-1642* (Philadelphia, 1912), containing a bibliography.

JONSON, CORNELIUS. See JANSSEN.

JÓNSSON, yóns'són, FINNUR (1704-89). An Icelandic bishop and historian. He was born at Hitardal, was educated at the University of Copenhagen, and was appointed Bishop of Skálholt in 1754. The public instruction in the island was greatly improved under his direction. Of his numerous works in Latin and Icelandic the most valuable is *Historia Ecclesiastica Islandiæ* (4 vols., Copenhagen, 1772-78). This is really the entire history of Iceland from earliest times to Jónsson's day, a learned work and important as a source of Icelandic history and literature.

JÓNSSON, yóns'són, FINNUR (1858-). A noted Icelandic philologist and historian of literature, born at Akureyri. He was educated at Reykjavik and at the University of Copenhagen, where he became docent in northern philology in 1887 and professor in 1898. Learned and energetic, he published many critical editions of Old Norse texts, the most important being *Den norsk-islandske Skjaldedigtning* (1908; new ed., 1914). But his greatest work is *Den oldnorske og oldislandske Literaturs His-*

torie (3 vols., 1894-1902; abbreviated ed. in Icelandic, 1904-05, in Danish, 1907), the most detailed of all works on this subject, and a standard. His foremost linguistic works are *Det norsk-islandske Skjaldesprog* (1901) and *Islandsk Sproglære* (1905).

JOP'LIN. A city and one of the county seats of Jasper Co., Mo., 155 miles south of Kansas City, on the Kansas City Southern, the Missouri Pacific, the St. Louis and San Francisco, the Missouri, Kansas, and Texas, and three other railroads (Map: Missouri, B 4). It is of considerable commercial importance as the distributing point for a large agricultural district, but is known principally for its extensive mining interests, being the trade centre of the vast zinc and lead fields of southwestern Missouri. The industrial establishments include smelting, paint, and white-lead works, large foundries and machine shops, a wagon factory, a cooperage, ironworks, a candy factory, and flouring mills. Among the more notable structures are the courthouse, the opera house, several hotels, the Young Men's Christian Association building, a Federal government building (\$155,000), the Frisco Lines station, and a Carnegie library. Joplin adopted the commission form of government in 1914. One of the light plants is owned by the municipality. The city has an assessed valuation of \$10,042,000, while its debt is less than 4 per cent of this amount. The receipts for the year 1912 were \$555,000, while its expenditures amounted to \$530,000. Settled about 1870, Joplin was first incorporated in 1873. Since 1890 it has grown rapidly. Pop., 1900, 26,023; 1910, 32,073; 1914 (U. S. est.), 32,848.

JOP'PA (Heb. *Yāphō*, beauty). The biblical name of the seaport of Jerusalem, the modern Jaffa (Map: Turkey in Asia, C 4). It was a very ancient Phœnician town and was fabled to be the place where Andromeda (q.v.) was chained to the rock. It is mentioned in Egyptian and Assyrian inscriptions. In the Old Testament it is referred to as part of the lot of Dan (Josh. xix. 46), as the place where timber from Lebanon was landed for transportation to Jerusalem (2 Chron. ii. 16; Ezra iii. 7), and the port at which Jonah took passage for Tarshish (Jonah i. 3). It was the home of Dorcas (Acts ix. 36-42), and at the house of Simon the tanner Peter received the vision which he interpreted to mean that Gentiles as well as Jews were to be admitted to the Christian Church (Acts x. 1-23). Joppa was a point of importance and suffered much in the Maccabean and Roman wars. It was made a bishop's see under Constantine and attained great prosperity in the time of the Crusades, when it became one of the landing places of the warriors of Christendom. It was stormed by the French in 1799, and a shameful massacre of Turkish prisoners was then perpetrated. See JAFFA.

JORDAENS, yōr'däns, JACOB (1593-1678). A Flemish historical, genre, and portrait painter, one of the chief masters of the school. He was born at Antwerp, May 19, 1593, the son of a cloth merchant. He was a pupil of Adam van Noort, the master of Rubens, and remained with that master when his other pupils left him, finally marrying his daughter. In 1615 he was admitted to the Guild of St. Luke as a painter in water colors, though most of his work was in oils. He never studied in Italy as did the other principal Flemish painters of his day, but this had the

advantage of making him more essentially Flemish. He was influenced by Rubens and associated with him in work, but there is no evidence to show that he was his pupil. Rubens gave him a commission for a series of cartoons for tapestry which he had received from the King of Spain. Jordaens also painted "Vertumnus and Pomona" for this monarch, as well as a picture for Charles I of England (1640) and a passion suite for Charles Gustavus of Sweden (1665). In 1652 he decorated the palace of the widow of Frederick Henry of Orange, Stadtholder of Holland, near Scheveningen. These mural paintings are his best works. The principal one represents the "Triumph of the Stadtholder," who is seated in a triumphal car drawn by four white horses. It is imposing in effect and masterly in treatment. Jordaens had a large number of pupils, who assisted him in his work, and on the death of Rubens he was considered the chief painter of his time. He acquired wealth and erected a patrician house at Antwerp, filled with works of art. Notwithstanding his numerous commissions for the Catholic clergy, he was an ardent Calvinist and suffered some persecution for his faith. He died in Antwerp, Oct. 18, 1678.

The characteristics of the Flemish school, its exaggerated treatment of form and crude humor, are more evident in Jordaens than in any other painter. Like Rubens, he painted in full light red healthy faces and figures inclined to corpulency. His color was even warmer than that of his great contemporary, and his best pictures possess a peculiar and effective golden glow. His excessive realism, however, often descends into coarseness. He was a most prolific painter, whose works abound in all the principal European galleries.

Among his chief religious and mythological paintings are "Christ Driving the Money Lenders from the Temple" and the "Four Evangelists," in the Louvre; the "Entombment of Christ," the "Last Supper," "Commerce and Industry Protecting the Arts," "Pegasus," the "Divine Law Protecting Human Law," in the Museum of Antwerp; the "Martyrdom of St. Apollonia," "St. Charles Borromeus Praying for the Pest-Stricken at Milan," and "St. James," in the church of the Augustinians, Antwerp. Others are in the Museum of Brussels, The Hague, Brunswick, Cassel (which possesses, among other canvases, a remarkable "Triumph of Bacchus"), and Madrid. In the Gallery of Dresden there are a "Presentation in the Temple" and "Diogenes Seeking an Honest Man"; at Vienna, "Jupiter and Mercury," with "Philemon and Baucis," one of his best mythological pictures. The Metropolitan Museum in New York possesses "The Philosophers," a "Holy Family," and a fine sketch.

His genre pieces fall mainly into two classes: the first, entitled "The King Drinks" or "Epiphany," are scenes showing the Flemish celebration of the festival. Of this group the best examples are at Cassel, Valenciennes, in the Louvre, Brussels, and in the Academy Museum, St. Petersburg. Others illustrate the Flemish proverb "As the old sing, so the young peep," or, as we should say, "Like parent, like child." Of this subject there are versions in Antwerp, the Louvre, Dresden, and Würzburg. He painted also a few portraits, some of great power, such as "Van Surpale and his Wife" (Duke of Devonshire, London); "Jan Wierts,

his Wife," at Cologne; the admirable "Unknown Man," formerly thought to be Jordaens, in the Uffizi; a family group, at Cassel; the "Lady with the Locket," Vienna Academy; the supposed portrait of De Ruyter, in the Louvre; and the fine portrait of an old man, at Budapest.

Bibliography. The chief authority on Jordaens is Max Rooses, an English translation of whose extensive monograph was published at London in 1908. Briefer monographs are by Génard (Ghent, 1852), by Paul Buschmann (Brussels, 1905), by Fierens-Gevaert, in *Les grands artistes* (Paris, n. d.), and by Aric van Veen, "Jacob Jordaens," in *Elseviers Geillustreerd Maandschr.*, vol. xv (Amsterdam, 1905). An album of reproductions of his works was published at Antwerp in 1905.

JORDAN (Heb. *Yardēn*; probably connected with Syr. *yardā*, lake, Ar. *wird*, watering place). The principal river of Palestine, called Esh-Sheriah or Esh-Sheriah el-Kebir by the Arabs (Map: Palestine, D 3). Starting from the mountains in the north of Palestine, it flows southerly, passes through the small lake Huleh (the biblical waters of Merom, q.v.) and the Lake of Tiberias or of Gennesaret (Sea of Galilee), and enters the north end of the Dead Sea. The main sources of the Jordan are three in number: the largest, Nahr Leddan, issues from the mound called Tell el-Kadi (hill of the judge) near ancient Dan; the second, the Nahr Banais, springs from crevices between and from under rocks that choke the mouth of a cave near Banias (the ancient Paneas, Cæsarea Philippi, q.v.); and the third, smallest and most remote, the Nahr Hasbani, rises near Mount Hermon. Uniting their waters above Lake Huleh, these streams give rise to the Jordan. Above Lake Huleh the river is 30 to 100 feet in width, just below the lake about 60 feet, and in the valley between the Lake of Tiberias and the Dead Sea from 90 to 250 feet, and is 540 feet wide at its mouth. In the flood season it reaches a breadth of even 2 miles. At ordinary times it is fordable in a great many places—in some places even when the river is in flood. Its usual depth between the Lake of Tiberias and the Dead Sea is 2 to 3 feet; just below Lake Huleh it is about 15 feet deep; the depth of course increases in the flood season. The river is not navigable. In the flood season dangerous rapids are found. In its course the river makes a steep descent. Lake Huleh is about 7 feet above the level of the Mediterranean, while the Lake of Tiberias is about 680 feet, and the Dead Sea about 1300 feet below that level; so that between Huleh and the Lake of Tiberias the river falls about 69 feet to the mile, between the Lake of Tiberias and the Dead Sea about 9 feet to the mile. The valley is a portion of the great rift valley, or depression which extends nearly across Africa. It has four main affluents: the Sheriat el-Menadireh (Hieromax, Yarmuk) and Zerka (Jabbok) on the east; the Jalud and Faria on the west. A little below Huleh the river is crossed by a bridge, the Jisr Benat Yakob, over which the road from Damascus to Galilee passes, and a few miles below the Lake of Tiberias is another bridge, the Jisr Mujamia. Below the Lake of Tiberias the valley of the Jordan presents a most remarkable formation. Within a larger valley called the Ghor is a smaller valley called the Zor, and through this the Jordan flows. The precipitous ridges which

inclose the valley rise in some places to the height of 3000 or 4000 feet. The width of the Ghor is from somewhat over 1 mile to 16 miles, of the Zor from $\frac{1}{2}$ mile to 2 miles. The river runs through the Zor in such a tortuous course that its total length is more than 200 miles, although the distance in a straight line is but 65 miles. Near the Dead Sea vegetation does not exist; but the valley above is covered with grass in the rainy season, and tamarisks, acacias, oleanders, etc., abound. Cereals are raised in various parts of the territory traversed by the river, especially barley. The Jordan was first thoroughly explored by Molyneux and Lynch—by the former in 1847 in the dry season, by the latter in 1848 when the river was in flood. The climate in the Jordan valley is tropical, and it has been well described as "a tropical oasis sunk in the temperate zone." The name Jordan was regarded by the Hebrews as suggesting the "swiftly flowing" stream (from *yarad*, to descend) and hence is always used in Hebrew with the article. Consult: Molyneux, in the *Journal of the Royal Geographical Society*, vol. xviii (London, 1848); W. F. Lynch, *Official Report of the United States Expedition to Explore the Dead Sea and the River Jordan* (Baltimore, 1852); Libby and Hoskins, *The Jordan Valley and Petra* (2 vols., New York, 1905); G. A. Smith, *Historical Geography of the Holy Land* (16th ed., London, 1910); and the travels in Palestine of Robinson, Porter, Tristram, Huntington, and others.

JORDAN, zhôr'dän', CAMILLE (1771-1821). A French politician, born at Lyons. He became interested in public affairs at a very early age and developed into an active opponent of the French Revolution. He published, in 1792, a satire on the church of the new constitution, cleverly entitled *Histoire de la conversion d'une dame parisienne*. Proscribed by the Directory for his participation in the insurrection of Lyons, he fled to Switzerland and London. Returning to Lyons in 1796, he was chosen in 1797 to the Council of Five Hundred, where he advocated the principles of religious liberty, of which he was one of the chief supporters until his death, gaining the nickname of Jordan les Cloches (church-bell Jordan). After the revolution of the 18th Fructidor he went to Germany. In 1800 he was recalled, and opposed the measures of Bonaparte, exposing the frauds in the election of 1802 in a pamphlet, *Vrai sens du vote national sur le consulat à vie*. He lived in retirement, devoted to literature, until the accession of Louis XVIII. He was elected in 1816 to the Chamber of Deputies and sided with the opposition. His writings were published in Paris in 1818. Consult C. A. Sainte-Beuve, "Jordan et Mme. de Staël," in *Revue des Deux Mondes* (Paris, 1868).

JORDAN, jôr'dan, CONRAD N. (1830-1903). An American banker, born in New York City. He learned the printing trade (1843), became a compositor, and in 1852 was appointed to the staff of a New York bank. From 1864 to 1880 he was cashier of another banking establishment there, and in 1880-84 was treasurer of the New York, Ontario, and Western Railway Company. In 1885 he was appointed Treasurer of the United States, from which post he resigned in 1887, upon the resignation of Daniel Manning from the secretaryship of the Treasury. During his administration he introduced a new system of public reports by means of which the

precise condition of the Treasury was made readily ascertainable. He was again active in banking, as vice president of a New York banking house in 1887 and subsequently its president. From 1893 until his death he was Assistant Treasurer of the United States in New York City, in which capacity he rendered efficient service during the financial difficulties of 1893-95.

JORDAN, DAVID STARR (1851-). An American ichthyologist, educator, and writer, born at Gainesville, N. Y. He entered Cornell University at its opening session in 1868, was appointed an instructor in botany there in 1871, and a year later took the degree of M.S. In 1875 he received an M.D. from Indiana Medical College and in 1878 a Ph.D. from Butler University, where he was professor of biology from 1875 to 1879. He had already become an assistant to the United States Fish Commission and had begun under the direction of Agassiz the studies which eventually made him one of the foremost of ichthyologists. After six years as professor of zoölogy at Indiana University, he became president of that institution, serving from 1885 to 1891. His summers were spent in investigations and researches for the Fish Commission, with which his connection continued up to 1891 and from 1894 to 1909. In 1879-81 he was a special agent for the United States census and in that capacity made a report of great value on the marine industries of the Pacific coast. In 1891, on the founding of Leland Stanford Junior University, he became its president. Under his able supervision the university was successfully organized and was developed along original lines. (See LELAND STANFORD JUNIOR UNIVERSITY.) He remained president until his retirement in 1913, when he was chosen to the honorary post of chancellor. Dr. Jordan served as special United States Commissioner to investigate the fur-seal fisheries in Alaska (1897) and later to investigate salmon fisheries and in 1908-10 was international commissioner of fisheries. In 1910 he became chief director of the World Peace Foundation. He received the degree of LL.D. from several universities and in 1909 was president of the American Association for the Advancement of Science. In addition to papers in the proceedings of scientific societies, and in the reports of the United States Fish Commission and the Census Bureau, he published *A Manual of Vertebrate Animals of the Northern United States* (1876); *Science Sketches* (1887); *The Care and Culture of Men* (1896; new ed., 1910); *Fishes of North and Middle America* (4 vols., 1896-1900), with B. W. Evermann; *To Barbara* (1897), verse; *Matka and Kotik* (1897; new ed., as *The Story of Matka*, 1910); *Footnotes to Evolution* (1898); *Imperial Democracy* (1899); *Food and Game Fishes of North America* (1902), with B. W. Evermann; *Guide to the Study of Fishes* (New York, 1905); *The Human Harvest* (1907); *Fishes* (1907); *Life's Enthusiasms* (1907); *College and the Man* (1907); *The Religion of a Sensible American* (1909); *The Stability of Truth* (1909); *The Fate of Iciodoram* (1909); *War and Waste* (1913); *War's Aftermath* (1914), with H. E. Jordan.

JORDAN, DOROTHY, or DOROTHEA (1762-1816). An Irish actress. She was born near Waterford, Ireland, and was the daughter of Grace Phillips, an actress, whose husband was a reputed Captain Bland. Dorothy made her dé-

THE RIVER JORDAN

but in Crow Street Theatre, Dublin, in 1777, as Phoebe in *As You Like It*, and, after various vicissitudes as an English provincial actress and the adoption of the name of Mrs. Dora Jordan, she appeared in 1785 at Drury Lane, London, in the character of Peggy in *The Country Girl*. She speedily won great popularity, exhibiting decided talent in comedy and musical farce. Lady Teazle, Rosalind, and Viola were her chief successes, and her acting was extravagantly praised—among others by Lamb, Leigh Hunt, Hazlitt, Byron, and Campbell. As Mrs. Ford, she was for some years the mistress of Mr., afterward Sir, Richard Ford, by whom she had four children. In 1790 her beauty captivated the Duke of Clarence, afterward William IV, and her intimacy with him lasted until 1811, when it was terminated by the Duke, an ample provision being made for her and the 10 children she had borne him. The eldest of these children, George Augustus Frederick Fitz Clarence, was created Earl of Munster in 1830, and the brothers and sisters were also ennobled. In 1814 Mrs. Jordan retired to France and is said to have died of a broken heart at Saint-Cloud, July 3, 1816; but there is a suspicion that she lived for seven years afterward in England under an assumed name. A statue of her, by Chantry, was erected by William IV after his accession. Consult Boaden, *The Life of Mrs. Jordan* (London, 2 vols., 1831).

JORDAN, yôr'dän, HENRI (1833-86). A German archæologist, born at Berlin and educated at Bonn and at Berlin, where he became instructor. From 1867 to 1886 he was professor at Königsberg. He made many journeys to Italy, his especial study being Roman religion and topography. Among his works are the excellent editions of Cato Censor and Sallust, *Catonis præter Librum de Re Rustica quæ Exstant*, with elaborate Prolegomena (1860), and *Sallusti Catilina, Jugurtha, Historiarum Reliquiæ* (1866; 2d ed., 1876); *Topographie der Stadt Rom im Altertum* (1871-85); *Forma Urbis Romæ* (1874); *Kritische Beiträge zur Geschichte der lateinischen Sprache* (1879); *Der Tempel der Vesta und das Haus der Vestalinnen* (1886); and the third edition of Preller, *Römische Mythologie* (1881-83).

JORDAN, jôr'dän, JOHN WOOLF (1840-). An American antiquary, born in Philadelphia and educated at Nazareth Hall. He became assistant librarian of the Pennsylvania Historical Society in 1885 and in 1888 editor of the *Pennsylvania Magazine of History and Biography*. Lafayette College gave him the degree of LL.D. in 1902. His writings include: *Occupation of New York by the British* (1889); *Moravian Immigration to Pennsylvania 1734-67* (1896); *Franklin as a Genealogist* (1899); *A Century and a Half of Pittsburgh and her People* (1909), with J. N. Boucher; *A History of Delaware County, Pa., and its People* (1914).

JORDAN, LOUIS HENRY (1855-). A British theologian and authority on comparative religion. He was born in Halifax, studied at Dalhousie University, Edinburgh, Princeton, Oxford, Marburg, Leipzig, and Berlin. He was minister of churches in Halifax (1882-85), Montreal (1885-90), and Toronto (1894-1900), and lectured on Church polity at Montreal Theological College in 1887-89 and on comparative religion at the University of Chicago (1902). After 1900 he resided largely in England, spending much time in travel and study. He wrote:

Comparative Religion: Its Genesis and Growth (1905); *Comparative Religion: A Survey of Recent Religion* (1906, 1909, 1912); *Comparative Religion: Its Method and Scope* (1902); *Modernism in Italy* (1909); *Comparative Religion: Its Meaning and Value* (1913).

JORDAN, zhôr'dän', MARIE ENNEMOND CAMILLE (1838-). A French mathematician, born at Lyons. He entered the Paris School of Mines in 1857 and received the degree of doctor of sciences in 1860, his theses being: (1) *Sur le nombre des valeurs des fonctions*; (2) *Sur les périodes des fonctions inverses des intégrales des différentielles algébriques* (1860). The next year he was made engineer of mines, and in 1885 he was promoted to the rank of chief engineer. After 1872 he devoted himself to the teaching of mathematics. In 1876 he was made professor of analysis at the Polytechnic School, and in 1883 he succeeded Liouville in the chair of mathematics at the Collège de France. In 1881 he was elected a member of the Academy of Sciences, in the place of Michel Chasles. One of the most noted of French mathematicians, Jordan gained a wide reputation through his discoveries in geometry and analysis. He applied himself especially to the theory of substitutions and made important applications of this theory to algebraic and linear differential equations. In France he came to be recognized as one of the greatest teachers of the *n*-dimensional geometry. The results of his investigations appeared in the form of memoirs to the number of more than 100, published chiefly in the *Journal für Mathematik*, *Annali di Matematica*, *Liouville's Journal*, *Mathematische Annalen*, *Comptes Rendus*, and the *Journal de l'Ecole Polytechnique*. Besides these contributions he published: *Théorie des substitutions et des équations algébriques* (1870), which received the Poncelet prize; *Cours d'analyse de l'Ecole Polytechnique* (3 vols., 1882-87; 3d ed., 1909).

JORDAN, yôr'dän, RUDOLF (1810-87). A German genre painter. He was born in Berlin, studied there under Wach and afterward, at Düsseldorf, he studied under Schadow and Karl Sohn. Frequent journeys to the coasts of Holland, Belgium, and France furnished him with the subjects for the clever delineations from the life of fishermen and sailors, to which he devoted his brush almost exclusively. Of his many works, which became widely known through reproductions, the most familiar are "An Offer of Marriage in Heligoland," "Return of the Pilots" (1836), "Boat-Hawsing in Normandy" (1843), "The Pilot's Death" (1856), "Old Men's Home on the Coast of Holland" (1864), and "The Widow's Comfort" (1866), all in the National Gallery, Berlin; "Shipwreck on the Coast of Normandy" (1848), Dresden Gallery; "Soup for the Sick" and "The First Child" (1862), Düsseldorf Gallery; "First Visit after the Wedding" (1861) and "Soup-Day at a French Convent" (1868), Leipzig Museum. He did good work in water colors and was also favorably known as an illustrator and etcher. He was professor at the Düsseldorf Academy and received the great gold medal at the Berlin Exhibition in 1886.

JORDAN, jôr'dän, THOMAS (1819-95). An American soldier and journalist, born in the Luray valley in Virginia. He graduated at West Point in 1840 in the same class with Sherman and Thomas, served in the Seminole and Mexican wars, and in 1861 resigned to enter

the Confederate army. He commanded the forces at the first battle of Bull Run until the arrival of Beauregard, whose chief of staff he became. After Shiloh he was promoted to the rank of brigadier general (April 14, 1862) and after service with Bragg returned to Beauregard's staff and was active in the defense of Charleston. In 1869 he joined the Cuban revolutionists, was made their chief commander, and won the battle of Guaimaro, but resigned soon afterward. He edited the *Memphis Appeal* (1866-69), and wrote, with J. B. Pryor, *The Campaigns of Lieutenant-General Forrest* (1868). Upon his return to New York he became editor of the *Financial and Mining Record*. He wrote a valuable criticism of the Confederate war policy for *Harper's Magazine* (1865).

JORDAN, yôr'dän, WILHELM (1819-1904). A German poet. He was born at Insterburg, East Prussia, and studied at Königsberg (1838-42) and in Berlin (1842-43). He became an exponent of liberalism and of the Young Hegelian philosophy and published two books of poems, *Irdische Phantasien* (1842) and *Schaum* (1846). Banished from Saxony by reason of his radical tendencies in politics and religion, he went to Bremen and in 1848 was elected a member of the National Assembly at Frankfort. He was subsequently secretary of the naval board in the short-lived Imperial ministry (1848) and held other offices. His best-known works are his two epics—*Demiurgos* (3 vols., 1852-54), deeply metaphysical and rather an exposition of the Young Hegelian philosophic system than a true epic, and *Nibelunge* (1867-74), in which he unsuccessfully sought to revive both the matter and manner of ancient Germanic poetry. But, as a wandering rhapsodist, Jordan recited this epic with great success in Europe and America (1871). His best work is contained in the three light dramas in verse, *Die Liebesleugner* (1855), *Tausch enttäuscht* (1856), and *Durchs Ohr* (1870). He wrote some other volumes—criticism, poetry, and prose fiction. Consult Schiffner, *Wilhelm Jordan* (Frankfort, 1889); Roepe, *Die moderne Nibelungendichtung* (1869); Von Stern, *Wilhelm Jordan* (1910).

JORDAN, WILLIAM GEORGE (1864-). An American author, editor, and lecturer. He was born in New York and was educated there in the City College. At 20 he became editor of *Book Chat*. He was subsequently editor of *Current Literature*; managing editor of the *Ladies' Home Journal* (1897); editor of the *Saturday Evening Post* (1898-99); for six years editor and vice president of the Continental Publishing Co.; and for one year editor of the *Search Light*. His educational views, formulated as "Mental Training by Analysis, Law, and Analogy," he spread through lectures. It was at his suggestion (made in 1907) that the State executives organized as the House of Governors. Jordan published: *Mental Training, a Remedy for Education* (1896); *The Kingship of Self Control* (1899); *The Majesty of Calmness* (1900); *The Power of Truth* (1902); *The House of Governors* (1907); *The Crown of Individuality* (1909); *The Power of Purpose* (1910); *Little Problems of Married Life* (1910).

JORDANES, jôr-dä'nēz. A historian of the sixth century, formerly erroneously called Jordanes. He was probably an Alan and a native of Lower Mœsia. In his early years he was secretary to one of the rulers of the Alans; later he became a monk and possibly a bishop.

The work by which he has become famous is his *De Rebus Geticis*, usually called *Getica*, written about the year 552, while he was living in or near Ravenna. This is very little more than a condensation of the Gothic History of Cassiodorus (q.v.). But, as the latter has been lost, the *Getica* of Jordanes is of prime importance for the early history of the Goths. Moreover, his work has preserved many German legends and is also of some importance for philologists. The second work which he wrote, a summary of Roman history, named *De Summa Temporum vel Origine Actibusque Gentis Romanæ*, usually called *Romana*, is of little value. Of the numerous editions of both works the best is by Mommsen, in the *Monumenta Germanicæ Historica, Auctores Antiquissimi*, vol. v (Berlin, 1882). Consult: Thomas Hodgkin, *Italy and her Invaders*, vol. i (Oxford, 1892); Potthast, *Bibliotheca Historica Medii Ævi* (2d ed., Berlin, 1896); Wattenbach, *Deutschlands Geschichtsquellen im Mittelalter*, vol. i (7th ed., Stuttgart, 1904).

JORDAN (jôr'dän) **RIVER**. A river of the United States which heads at the northern end of Utah Lake and flows northward in a winding course of about 40 miles to Great Salt Lake. It drains an area of north-central Utah in the extreme eastern part of the Great Basin. The main stream and its tributaries are extensively used for irrigation.

JORDANUS, NEMORARTUS, possibly identical with JORDANUS DE SAXONIA (?-1236). A mathematician of the thirteenth century, born at Borgentreich, Diocese of Paderborn. He studied at Paris, where he gained a great reputation, and it is possible that he is the Jordanus who in 1220 was elected to succeed St. Dominic. With the exception of Leonardo of Pisa, Jordanus is the only learned man of the Latin West in the Middle Ages who deserved the name of mathematician, and his immediate influence was much greater than that of his Italian contemporary. His mathematical writings served as a basis for teaching in the various universities of the Middle Ages and Renaissance. The most important of his published writings are: *Arithmetica Demonstrata* (1496); *De Ponderibus* (1533); *Jordani Opusculum de Ponderositate* (1565); *De Numeris Datis* (published by Treutlein in the *Abhandlungen zur Geschichte der Mathematik*, 1879); *Jordani Nemorarii Geometria vel de Triangulis Libri IV* (Thorn, 1887); *Tractatus de Sphæra*.

JOREE. See CHEWINK.

JÖRG, yêrk, JOHANN CHRISTIAN GOTTFRIED (1779-1856). A German physician, born at Predel, and educated at Leipzig, where in 1810 he was made professor of midwifery. As director of the charity hospital at Leipzig, he gained much practice in his special field. His notable contributions were the invention of mechanical aids and the introduction of a new system of Cæsarean section, gastrolytrotomy. In general he sought milder methods, both in obstetrics and orthopedy. Jörg wrote: *Handbuch der Krankheiten des Weibes* (3d ed., 1831); *Handbuch der Geburtshilfe* (3d ed., 1833); *Handbuch zum Erkennen und Heilen der Kinderkrankheiten* (2d ed., 1836); *Lehrbuch der Hebammenkunst* (5th ed., 1855).

JÖRG, JOSEPH EDMUND (1819-1901). A Bavarian Ultramontane politician. He was born at Immenstadt; studied law, history, and the-

ology at Munich; entered the Bureau of Archives in 1847; became in 1852 editor of the *Historischpolitische Blätter*, and in 1865 a member of the Second Bavarian Chamber. He published: *Deutschland in der Revolutionsperiode 1522-26* (1850); *Geschichte des Protestantismus in seiner neuesten Entwicklung* (1857); *Geschichte der socialpolitischen Parteien in Deutschland* (1867).

JÖRGENSEN, jēr'gen-sen, ADOLF DITLEV (1840-97). A Danish historian and archivist, born at Graasten, Sønderjylland. Of an old Danish family he felt deeply the loss to Denmark of his native province (1864). Having studied history, in 1869 he became assistant in the royal archives, and in 1889 keeper of the public records. In the latter office he rearranged with much ability all the archives of the kingdom. He published works on the earliest Danish history and Danish popular songs (1868-71), *Om Danebrogens Oprindelse* (1876), *Det gamle danske Kongevaaben* (1879), *Den nordiske Kirkes Grundloggelse og første Udvikling* (2 vols., 1874-78), *Udsigt over de danske Rigsarkivers Historie* (1884), *Kongeloven og dens Forhistorie* (1886); many biographies, notably *Peter Schumacher Griffenfeld* (2 vols., 1893-94); also *40 Fortællinger af Fædrelandets Historie* (1882; 5th ed., 1908), *Fortællinger af Nordens Historie* (2 vols., 1892-93; 2d ed., 1901), *Bidrag til Oplysning af Middelalderens Love og Samfundsforhold* (4 vols., 1872-76), and *Danmarks Riges Historie, 1814-52* (1896-97). Posthumously appeared (in three languages) the weighty treatise *Det dansk-tyske Spørgsmaal* (1900), his collected works (4 vols., 1898-1900), and his autobiography, *En Redegjørelse for min Udvikling og mit Forfatterskab* (1901).

JÖRGENSEN, JÖRGEN (1779-1845). A Danish adventurer, the son of a Copenhagen watchmaker. In 1809 he audaciously seized upon the government of Iceland, looted the treasury, and with an "army of eight men" ruled the island for six weeks, until driven out by the captain of an English sloop of war. He went to England, was tried and found guilty on a charge of robbery, and was sent to Botany Bay, where he died. For his adventure he became known as the Hundadagarkonungur, i.e., the Dog-Days King. Consult J. F. Hogan, *The Convict King* (London, 1891; Dan. trans. by U. von Ripperda, Copenhagen, 1892).

JÖRGENSEN, jēr'gen-sen, SOPHUS MADSEN (1837-1914). A Danish chemist and author, born at Slagelse and educated at the University of Copenhagen. In 1867 he was made director of the chemical laboratory of the Polytechnic College in Copenhagen, in 1871 lecturer in chemistry in the university there, and from 1887 to 1908 was professor. As teacher and scientist, he did much important work, his advice being much sought by scientific associations and practical enterprises. He wrote 1900 pages of the celebrated Gmelin-Kraut *Handbuch der Chemie; Overjodider af Alkaloiderne* (1869); and widely used textbooks, such as *Lærebog i kvantitativ uorganisk Analyse* (1869), *Lærebog i organisk Kemi* (1880), and *Kemiens Grundbegreber* (1902), besides numerous articles in scientific periodicals. In 1906 he was awarded the Lavoisier gold medal and the Berthelot bronze medal by the Académie des Sciences, Paris.

JORIS, yō'rīs, or **JORISZON**, yō'rīs-zōn,

DAVID (c.1501-56). An Anabaptist leader, whose real name was Hans Jorisz, born either at Ghent or Bruges. He was apprenticed to a glass painter and soon displayed great aptitude in the work. To perfect himself in the art, he visited Belgium, France, and England. Returning to Holland, he settled at Delft, practicing his trade (1524); but in 1528 he began to display unusual religious zeal against Roman Catholicism, and, while a procession on Ascension Day was passing in Delft, he stopped the priests, accused them of deceiving the people by false teachings, and reproached them for worshipping images and pictures. He was arrested and banished for three years. Abandoning the common principles of the Reformation, he became an adherent of Anabaptist views. At first he did not identify himself with the sect on account of their disorderly conduct and their doctrine of using the sword to establish their authority; but in 1534 he fully joined them by rebaptism. He was consecrated as Bishop of Delft by Dammas, Ubbo, and others. His influence was very great and his followers numerous. The Anabaptist leaders, jealous of his success, openly disavowed him. But at the convocation of Anabaptists in 1536 Joris fearlessly declared himself a divinely appointed leader and soon afterward issued a pamphlet calling all parties to a peaceful union. The leaders were still more provoked, and most of the Anabaptists forsook him. Those who adhered to him took the name of Jorists or Davidists. He professed to have visions and revelations and interpreted the persecutions to which his followers were subjected as proofs of the divine favor. At Delft, Haarlem, Amsterdam, Rotterdam, Leyden, and other cities, many suffered death for their adherence to him. His own mother died on the scaffold, a martyr to the doctrines which her son was propagating (February, 1538). He kept up his wandering life till 1544, when, the voluntary gifts of his followers rendering him independent, he altered his life completely. In Basel in August of that year appeared a man by the name of John of Bruges. He was wealthy, a communicant in the Reformed church, and had come there with his family. He was highly esteemed for his wealth and his virtues and died peacefully, Aug. 25, 1556. This was David Joris. For three years his secret was kept. Then his son-in-law, Nicholas Blesdyk—a reformed preacher, but an avaricious and unprincipled man, who had been his disciple—revealed the identity of John of Bruges with David Joris. The clergy and university declared his opinions heretical, and his body was dug up and burned. The sect, which Joris had secretly communicated with while living in Basel, survived his death half a century and circulated his writings. Joris was a thorough mystic and believed that he had divine visions. He rejected the doctrine of the Trinity and held strange views concerning Christ. He believed that he was to establish internally and externally the eternal kingdom of Christ, which before was the kingdom of Christ only internally. He denied the doctrine of future judgment and the existence of angels. He held that the body only was defiled by sin. Of his 250 books and 1000 letters, the most important is the *Book of Miracles*, under the title of *Wonderboeck*, two editions of which were printed (1542, 1551), both anonymous. In it he adopts the idea of Joachim of Floris (q.v.), of three dispensations. Consult, for a complete

account of his life and works, Nippold's articles in *Zeitschrift für die historische Theologie* (Leipzig, 1863, 1864, 1868); for a bibliography of his writings, Van der Linde, *David Joris: Bibliographie* (The Hague, 1867). See DAVIDISTS.

JORIS, yō'rēs, PLO (1843-). An Italian genre and landscape painter, born in Rome, where he studied at St. Luke's Academy from 1856 to 1864, and later under Fortuny, to whose influence he owes much. He traveled extensively in Germany, France, England, and Spain, and depicts life and nature with felicity of conception and coloristic splendor. Notable specimens of his art are: "Sunday Morning before the Porta del Popolo in Rome" (1869); "Baptism in Ischia" (1878); "Flight of Pope Eugene IV" (1883), in the National Gallery, Rome; and "Church Festival in St. Peter's" (1901). He also achieved distinction as a painter of water colors, being made president of the Società d'Acquarellisti in Rome and honorary member of the Société Belge des Acquarellistes.

JORISTS, jō'rīsts. See DAVIDISTS.

JORISZON, DAVID. See JORIS, DAVID.

JORKINS. In Dickens's *David Copperfield*, the soft-hearted partner of Mr. Spenlow. The latter, in his intercourse with clients, paints Jorkins as a rigid taskmaster and so throws the responsibility for the firm's acts on him.

JÖRN, yērn, KARL (1876-). A Russian tenor, born at Riga. When he was about 18 years of age, Otto Lohse (q.v.), at that time the conductor of the Riga Opera, discovered his voice and induced him to study with Schutte-Harmsen, a baritone at the opera. After one year of study he went to Berlin to Röss. In 1895 he made his début at Freiburg, which resulted in an engagement at Zurich. Here Ludwig Barnay (q.v.) was greatly impressed by him and in 1899 secured him a contract with the Hamburg Opera, where he laid the foundation of his fame. In 1902-03 he was connected with the Berlin Royal Opera, but with generous leave for extended guest tours, which took him all over Europe and to South America. In 1908 he joined the Metropolitan Opera, where in his first season he established himself as a prime favorite. His repertory includes 100 operas in German, Italian, French, English, Russian, Spanish, and Portuguese.

JORNANDES. See JORDANES.

JORTIN, JOHN (1698-1770). A Church of England prelate. He was born in London, Oct. 23, 1698. His father was a French Protestant of Brittany who had come to England on the revocation of the Edict of Nantes. The son was educated at Charterhouse and at Jesus College, Cambridge, taking his first degree in 1719; soon became a fellow of the college; and graduated as M.A. in 1722. While at Cambridge, he published a small volume of Latin poems, entitled *Lusus Poetici*, regarded as worthy of a high place among modern Latin verses. He was presented with a living in Cambridgeshire (1727), but removed to London (1730), where he became an admired preacher. He was rector of Eastwell in Kent (1737) and St. Dunstan's-in-the-East (1751); became in 1762 the domestic chaplain of the Bishop of London, rector of Kensington, London, and prebend in the cathedral of St. Paul's. In 1764 he was made Archdeacon of London. He died Sept. 5, 1770. His most important works were: *Remarks on Ecclesiastical History*

(1751-54; new ed. by Trollope, 1846); *Life of Erasmus* (1758-60; new ed. 1868); *Tracts, Philological, Critical, and Miscellaneous* (1790). He wrote also criticisms on Spenser, Milton, Tillotson, Cardinal Pole, Seneca, and others. His *Various Works* appeared in 1805-10, and his *Memoirs*, by Disney, in 1792. Consult his *Life*, by Trollope (London, 1846).

JORULLO, hō-rōō'lyō. A volcanic mountain in the State of Michoacan, Mexico, situated 70 miles southwest of Morelia, the capital of the state. It is of comparatively recent origin, having risen from the surrounding plain as a result of the earthquake of Sept. 29, 1759. Besides Jorullo, there sprang up five other volcanic cones and a large number of small cones, which were still active at the time of the visit of Humboldt in 1803. The surrounding region is covered with lava fields and scattered volcanic rocks, showing evidence of the extent of the eruption, and near the cone are a number of hot springs. The height of Jorullo above the sea is 4265 feet; it is now inactive.

JOSAPHAT. See BARLAAM AND JOSAPHAT.

JOSÉ, hō-sā', POEMA DE (Sp., Poem of Joseph). A Spanish poem belonging to the class of documents called *aljamiados*, i.e., works written in the Spanish language, but with Arabic characters. Through a hieratical impulse, or merely as a result of a rooted attachment to the alphabetical signs of their ancestral speech, certain of the Moors, when composing in Spanish, adapted the Arabic signs to the purpose and avoided the use of the Roman characters. The *José* is the most interesting work of the kind. It seems to have been written in the sixteenth century and possibly on Aragonese territory if we may judge by some dialect forms found in it. It tells the story of the selling of Joseph by his brethren and of his life in Egypt, intermingling with the narrative elements of Mohammedan tradition. In form it is modeled upon the old Spanish poems which were written in what Gonzalo de Berceo called the *Cuaderna Via*, i.e., it is in quatrains of 12-syllabled or 14-syllabled lines, with a single rhyme in the quatrain. From the phonetic point of view this work, like others of its kind, has a certain value, since the adaptation of the Arabic alphabet to Spanish sounds affords a possible clue to the real nature of those sounds at the time in question. Consult: Morf's ed. of the *José* (Leipzig, 1883); *Biblioteca de autores españoles*, vol. lvii (Madrid, 1864); F. G. Robles, *Leyendas de José, Hijo de Jacob y de Alejandro Magno* (Saragossa, 1888); Ford, "The Old Spanish Sibilants," in *Harvard University Studies and Notes in Philology and Literature* (Boston, 1900); M. Schmitz, "Ueber das altspanische Poema de José," in *Romanische Forschungen*, vol. xi (Erlangen, 1901); Grünbaum, *Gesammelte Aufsätze zur Sprach- und Sagenkunde* (Berlin, 1901); Menéndez Pidal, *Poema de Yúçuf* (Madrid, 1902); Saroihandy, "Remarques sur le poème de Yúçuf," in *Bulletin hispanique*, vol. vi (Paris, 1904).

JOSEF'FY, yō-zěf'i, RAFAEL (1852-1915). An Hungarian-American pianist, composer, and teacher, born at Miskolez, Hungary. He was educated mainly under Moscheles at the Leipzig Conservatory, but studied subsequently under Tausig at Berlin. About 1880 he established himself in New York and afterward came to be recognized as one of the leading teachers and concert virtuosos in his adopted country. Be-

fore coming to America he had won for himself a high reputation as an interpreter of Chopin and, after some very successful concert tours throughout Germany and Austria, had made a place for himself in the musical life of Vienna, in which city he had taken up his residence. He published upward of a score of piano compositions, which are marked by delicacy and charm of musical phrasing. From 1885 to 1906 Joseffy was a member of the faculty of the National Conservatory of Music, New York. His playing has been characterized as possessing great delicacy, charm of touch, facility of execution, and exquisite finish. He is the author of an excellent *School of Advanced Piano Playing* (1892; also in German).

JOSEPH (Heb. *Yōsēph*, he increases; perhaps an abbreviation of *Yōsēph 'El*, God increases). The son of Jacob and Rachel (Gen. xxx. 22-24), eponym of the tribe of Joseph. The story of Joseph is given with much detail in the last 14 chapters of the Book of Genesis. He is represented as the favored son of his father; for this reason and because of his own boyish arrogance in consequence of it, he gains the ill will of his brethren. Taking advantage of a favorable opportunity, they decide to kill him, but ultimately think better of their purpose and sell him into slavery instead. He is taken to Egypt and becomes the slave of Potiphar, an officer of Pharaoh. Resisting the advances of Potiphar's wife, he gains her enmity and is put in prison on a false accusation by her. His skill in interpreting dreams secures his release and brings him into favor with Pharaoh. He saves Egypt in a time of famine and becomes the highest official in the land. He marries the daughter of the high priest of Heliopolis. Through his wise administration he not only maintains the people of Egypt alive, but also secures for the crown possession of the soil and 20 per cent of all income from the land, and for the priesthood exemption from taxation. The famine extends to Palestine, and Joseph's brethren come to Egypt for provisions. A reconciliation follows, and Jacob and all his family remove to Egypt and take up their residence in the land of Goshen.

Many modern scholars think that the story of Joseph, like those of Abraham, Isaac, and Jacob, is a combination of two sources, the Yahwistic and Elohist narratives. (See PENTATEUCH.) The combination represents, in their judgment, the welding together of a much larger number of elements than in any of the other narratives in Genesis. In the minds of both writers Joseph is supposed to be the representative of the Northern Kingdom of Israel, and the importance assigned to him is taken to indicate a northern origin of these stories. It is held, however, that this is particularly evident in those portions of the composite narrative which belong to E (a northern writer), and that, while J (a Judæan writer) also must admit the superiority to be accorded to Joseph over other tribes represented as his brethren, he saves his national pride by according to his own tribe as favorable a position as possible by the side of Joseph, by maintaining that it was Judah who proposed to save Joseph from the jealousy of his brothers, whereas according to the northern writer it was Reuben who intervened. But other scholars consider this conjectural division of the story into Yahwistic and Elohist elements as unproved and im-

probable. In view of the uncertainty as to the use of the divine names in the original text, indicated by manuscripts and versions, they attach little importance to the sporadic use in two chapters of the name Yahwe. They find no difficulty in assuming more than one cause for the jealousy of the brethren or in supposing that two brothers were thought to be more friendly than the rest. Since both of these brothers speak of the Ishmaelites, and the Greek version suggests that the "Midianites" is a corruption of the "Ishmaelites," they find no contradiction in this respect. The keeper of the harem was often a married man in ancient Egypt, and with his office that of chief executioner is naturally connected; the term *saris* seems to designate not only an "eunuch," but also such an official as elsewhere was frequently an actual eunuch.

Various elements are distinguished in the story of Joseph: (1) northern traditions, reflecting the rivalry between various tribes which (or some of which) formed parts of the later Hebrew confederation; (2) recollections of the sojourn of certain Hebrew clans in the land of Goshen (q.v.), subsequently enlarged into the tradition which brought all the 12 clans into Egypt; (3) an Egyptian folk tale of a faithful servant wrongfully accused by his master; (4) a story of a Hebrew who rose to a high official position in Egypt; and (5) certain peculiarities of Egyptian life, such as the heavy taxation and the exemption of the priests, for which an explanation was sought. Approaching the story of Joseph from this point of view, its component parts become tolerably clear. Joseph is the favorite son of Jacob, the eldest son of the patriarch's favorite wife, Rachel. He belongs to Shechem (the chief sanctuary in the Northern Kingdom) in the same sense in which Jacob belongs to Bethel, Isaac to Beersheba, and Abraham to Hebron. He rouses the jealousy of his brothers because of a garment with sleeves (befitting one of superior rank) given to him by Jacob; and because of his dreams, which bethokened future greatness and superiority over his brothers. The result is that the brothers decide to kill him, but are persuaded by Reuben and by Judah to spare his life. He is cast into a cistern and is sold by his brothers to Ishmaelites and in this way is carried down to Egypt. In this incident two factors are distinguished: (a) the story of Joseph's superiority, and (b) the story of his humiliation by his brothers. The former reflects the natural pride of the northern writer, the latter embraces a recollection of a combination of a number of tribes against one which had become too powerful. In actual Hebrew history there is no tribe of Joseph, but instead we have two clans, Ephraim and Manasseh (qq.v.), who are the main props of the Northern Kingdom and who are represented in tradition as the sons of Joseph. It would seem, therefore, that a Joseph tribe, after being large enough to produce two offshoots, aroused such opposition and fear because of growing power as to lead to a combination which succeeded in driving this dangerous tribe from its territory. Such an event is just what we encounter among Arabic clans. The story of Joseph in Egypt contains, again, two elements: (a) tradition of the sojourn of some of the Hebrew tribes in Goshen (q.v.), combined with (b) two stories that have nothing to do with the Hebrews. That some of the tribes

afterward forming part of the confederation of the Bene Israel came at one time to the land of Goshen adjoining Egypt proper on the northeast and counted as belonging to Egyptian territory, in connection either with the Hyksos invasion or in connection with that steady process leading Semitic nomads to make more or less permanent settlements on the frontier districts of Egypt, is hardly open to doubt, as, on the other hand, it is equally certain that not all of the tribes came into this region. The pragmatic method of history writing which prevails in Genesis (as in the whole Pentateuch) represents the Bene Israel as forming a unit from time immemorial, and hence the popular tradition is so modified as to bring all the Hebrew tribes into Egypt and to bring them out again in a body under the leadership of Moses. Joseph may have been the name of the tribe (and possibly also of its numen) which first pushed its way into the western part of Goshen (q.v.). Of the two Egyptian stories told of Joseph, one is a folk tale, probably of Egyptian origin; the other embodies a reminiscence based upon an actual occurrence. The folk tale is that of a faithful servant intrusted by his master with the care of his household, and who resists the temptations offered by the faithless wife of the master. The servant is wrongfully accused and thrown into prison. The sequel of the story in its original form no doubt told of the proof that was forthcoming, establishing the innocence of the servant, his reward for his fidelity and honesty, and the punishment of the bad wife. This story, the Egyptian parallel to which exists in the so-called *Tale of Two Brothers* (consult Petrie, *Egyptian Tales*, London, 1895-99; Ranke, in Gressmann, *Altorientalische Texte und Bilder*, pp. 223 ff., Tübingen, 1909), is attached to Joseph as a favorite character of northern Hebrew legend. It is a species of Midrash very much of the order of the stories found in the Jewish Midrashim to illustrate Abraham's piety or Moses' faith. Instead, however, of presenting the story with its original sequel, it is attached to another tale about a foreigner who rose to a position of great eminence at the Egyptian court, and who manifested his wisdom and devotion to the interest of his royal master in various ways. The period to which this incident belongs can no longer be determined. From the Tell el-Amarna tablets we learn that in the fifteenth century B.C. it was not uncommon for Semites to hold high positions in Egyptian domains; and it has therefore been supposed that at the period of Egyptian supremacy over Palestine, when the relations between Egyptians and Semites were naturally quite close, a Hebrew vizier lived, the memory of whose remarkable career was thus preserved. It should be borne in mind, however, that there is as yet no positive evidence of such a person. This story, too, is then supposed to have been attached to Joseph as a familiar subject of legend and an appropriate personage of whom it could be told, and, having been combined with the folklore tale, to have become another incident in the life of one and the same person.

The visit of Joseph's brothers, with its dramatic incidents, and the emigration of Jacob and his sons and their families into Egypt, may be due to the pragmatic historical scheme of the Old Testament writers; while the meeting between Jacob and Joseph, and Jacob's interview with Pharaoh, from this point of view, are an-

other specimen of early Jewish Midrash. There remains the scene at the death of Jacob (xlvi. 15-20) when Joseph brings his two sons to his father, who in blessing them gives Ephraim, although the younger, the preference over Manasseh. This touch is due to the pride of the Ephraimitic writer, who in this way justifies the greater prominence which, as a matter of fact, the tribe of Ephraim obtained. Joseph dies in Egypt, which may be taken perhaps as another indication that the tribe actually never left Egypt, or the land of Goshen, which was counted as a part of the territory of Egypt. The name of Joseph, however, survives largely through the northern clans, Ephraim and Manasseh, and in the local legendary tales gradually assumes almost the same position as Israel until, with the prophets, "house of Joseph" becomes synonymous with the "house of Israel," and the terms "house of Joseph" and "house of Jacob" embrace the Hebrews as a body. For the results of critical investigation regarding Joseph, consult the commentaries on Genesis of Dillmann, Holzinger, Gunkel (3d ed., 1910), Driver, and Skinner, and the Hebrew histories of Stade, Guthe, Piepenbring, Kent, Kittel, and Wellhausen (7th ed., Berlin, 1914).

JOSEPH. Husband of Mary, and the reputed father of Jesus (Luke iii. 23, iv. 22; John i. 45, vi. 42). He was probably a carpenter (Matt. xiii. 55), although Matthew's designation of Jesus as "the son of the carpenter" may mean no more than that he was a "carpenter," as he is termed in Mark vi. 3. Joseph is not alluded to in the New Testament outside of the Gospels of Matthew, Luke, and John. The earliest Gospel (Mark) is silent about him. The chief sources of information (apart from the Apocryphal Gospels) are the two narratives of the infancy of Jesus, prefixed respectively to the first and third Gospel. In addition to the well-known material there preserved, Luke alone records that "Joseph and his mother" brought the child Jesus to Jerusalem to present him to the Lord, in accordance with the Law of Moses (ii. 22, 23); and that, when Jesus was a boy of 12, his parents following their annual custom, went with him to the Passover feast in Jerusalem (ii. 41). From this point on, Joseph passes out of the clear light of history. That he died before the public ministry of Jesus began is only an inference, though a strongly justified one, from Mark iii. 20 with 31, vi. 3; John xix. 26, 27.

JOSEPH. 1. An oratorio by Handel (q.v.), first produced in London, March 2, 1744. 2. An opera by Méhul (q.v.), first produced in Paris, Feb. 17, 1807.

JOSEPH THE CARPENTER, HISTORY OF. See APOCRYPHA, *New Testament*.

JOSEPH (*Ger. pron. yō'zēf*) I (1678-1711). Holy Roman Emperor from 1705 to 1711. He was the eldest son of Emperor Leopold I and was born at Vienna, July 26, 1678. He was crowned King of Hungary in 1687 and King of the Romans in 1690. He succeeded his father as Emperor and ruler of the Hapsburg dominions on May 5, 1705. His accession infused new energy into the prosecution of the war against France, which on the part of the Imperialists had been carried on with some dilatoriness. (See SUCCESSION WARS, *War of the Spanish Succession*.) His ambition was directed towards the extension of the Austrian power in Italy and Bavaria; of the latter the victories

of Marlborough and Eugene made him the master, but his plan to bring the Electorate of Bavaria under the Austrian crown failed on account of the opposition of the other German sovereigns. He was engaged in a long war with his Hungarian subjects, led by Rákóczy, which was terminated immediately after the death of the Emperor. Joseph was powerful enough to impose his will upon the Pope, whom he forced in 1709 to acknowledge his brother Charles as King of Spain. The influence of the Prince of Salm, who had the charge of his education, and his subsequent connection with Prince Eugene, led Joseph to embrace opinions much more liberal than those which had generally prevailed in his family, and he granted privileges to the Protestants of Hungary and Bohemia which had been refused by his predecessors. He also concluded a treaty in 1706 with Charles XII of Sweden, by which he granted religious liberty to the Protestants of Silesia and restored to them over 200 churches which had been taken from them by the Jesuits. He was fond of courtly ceremonial, but in his personal relation was mild and affable. He sought to improve the condition of the peasantry in his dominions by relieving them from some of their feudal burdens. Consult Herchenhahn, *Geschichte der Regierung Kaiser Josephs I.* (2 vols., Leipzig, 1786-89), and Robinson and Beard, *Development of Modern Europe*, vol. i (Boston, 1907).

JOSEPH II (1741-90). Holy Roman Emperor from 1765 to 1790. He was the son of the Emperor Francis I, of the house of Lorraine, and Maria Theresa, sovereign of the Austrian dominions and Queen of Hungary, and was born at Vienna, March 13, 1741, at a time when his mother's fortunes were in their lowest state of depression. He early gave proof of excellent abilities. He was elected King of the Romans in 1764, and Maria Theresa associated him with herself in the government of the Austrian states; but for some time his actual share in it amounted to little more than the chief command of the army. In 1765 he succeeded his father as Holy Roman Emperor. On the death of Maria Theresa, in 1780, he inherited all her dignities and power. Joseph II was a zealous reformer, having imbibed, like Frederick the Great, the principles of philosophy which prevailed in that age; but he worked unwisely, depending too much upon the exercise of authority and having too much faith in the intelligence of the average man in his day. Deeply concerned for the welfare of his subjects, the Emperor set to work to abolish privilege and oppression throughout his dominions. He was the typical "benevolent despot" of the age, and he sought to impose his reforms by force of his autocratic will, without considering the expediency of many of his radical measures and in total disregard of the sentiments of those whom supposedly his reforms were to benefit. As it was, he succeeded for the greater part in antagonizing his subjects in Hungary, in Bohemia, and in the Netherlands, and was compelled repeatedly to revoke many of his important measures of reform. Not the least of his blunders was his attempt to merge the heterogeneous nationalities of his realms into a centralized state. Nevertheless he contributed immensely to the permanent improvement of the administration and the system of taxation and did much to develop commerce and industry.

His liberal views in matters ecclesiastical aroused the bitter hostility of the clergy. As soon as he found himself in full possession of the government of Austria, he proceeded to declare himself independent of the Pope and to prohibit the publication of any new papal bulls in his dominions without his *placet regium*. The further publication of the bulls *Unigenitus* and *In Cæna Domini* was also prohibited. Besides this he suppressed no fewer than 700 convents, reduced the number of the regular clergy from 63,000 to 27,000, prohibited papal dispensations as to marriage, and on Oct. 13, 1781, published the celebrated Edict of Toleration, by which he allowed the free exercise of their religion to the Protestants and the adherents of the Greek faith in his dominions. Pope Pius VI thought to change this policy by a personal interview with the Emperor, and for that purpose made a visit to Vienna in 1782; but, although he was quite unsuccessful in his object, he carried away with him the conviction that the people were utterly unprepared for the reforms which their sovereign sought to accomplish. Many of the reforms instituted by this enlightened monarch were later undone. In 1788-89 Joseph II, in alliance with Russia, engaged in a war with Turkey, in which he was unsuccessful; the vexation caused by this and by the revolt in the Netherlands (1789-90), occasioned by the abolition of the ancient constitution of Brabant, hastened his death, which took place Feb. 20, 1790. Joseph II had the ideals and the will, but he lacked the temperament, of a constructive reformer. He believed that despotic authority was all-sufficient to make any desirable change and so failed to see that democracy was necessary in order to give stability and permanence to reforms. Juste, *Histoire du règne de l'empereur Joseph II et de la révolution belge de 1790* (2 vols., Brussels, 1845-46); Arneth, *Joseph II. und Leopold von Toscana: ihr Briefwechsel, 1781-90* (Vienna, 1870); Brunner, *Joseph II.* (Freiburg, 1885); Schlitter, *Pius VI. und Joseph II.* (Vienna, 1894); Robinson and Beard, *Development of Modern Europe*, vol. i (Boston, 1907).

JOSEPH, AARON BEN. See AARON BEN JOSEPH.

JOSEPH, FATHER. A popular name for François Leclerc du Tremblay (1577-1638), the private secretary and confidant of Cardinal Richelieu. He was born in Paris of a distinguished family and was originally a soldier, but left the army in 1599 and became a Capuchin friar. After some time Father Joseph, as he was called, attracted the attention of Richelieu and in 1611 became his secretary. He was intrusted by Richelieu with the management of his secret diplomacy and was frequently sent on important missions abroad. So great was his influence with the Cardinal and so well recognized his power that he was known by the sobriquet of His Gray Eminence, in contradistinction to the title of Cardinal Richelieu. (See EMINENCE GRISE; EMINENCE ROUGE.) Religious zeal actuated his entire official life, and the conversion and dissemination of the principles of the Church were the objects most dear to him. In pursuance of these objects he lent his aid to the forcible conversion of French Protestants and also sent missionaries to India and Canada, while he earnestly advocated a

Crusade against the Turks. A priest of ascetic habits, but of fiery enthusiasm, he was also a statesman of broad views and comprehensive knowledge, and one of the shrewdest and most able diplomats of his time. His death took place at Ruel, Dec. 18, 1638. A series of memoirs of his time of which he is the author is deposited in the Bibliothèque Nationale in Paris, but the volumes have never been published, though supposed to contain important matter for the history of Louis XIII's reign. He was also the author of *Le Turciad*, a Latin poem, and of several political and religious tracts. Consult: Richard, *Vie du père Joseph* (Paris, 1702); Fagniez, *Le père Joseph et Richelieu, 1597-1638* (ib., 1894); R. F. O'Connor, *His Grey Eminence, the True Friar Joseph of Bulwer Lytton's "Richelieu": An Historical Study* (Philadelphia, 1912).

JOSEPH, PRAYER OF. An apocryphal work belonging to the Old Testament Pseudepigrapha, now known only from old lists of apocryphal books and some quotations in Origen, who seems to have esteemed it highly. The work was of Jewish origin. Why it was called the Prayer of Joseph is uncertain, since in Origen's quotations Jacob, not Joseph, is the speaker. It was apparently of pseudoprophetic or apocalyptic character, dealing largely with matters concerning angels and their respective ranks and the secrets of the future. Since Jacob speaks of himself as the first born of all living creatures, some have supposed that the book originated in the desire to counteract the claims of Christians in reference to Jesus, by representing the patriarchs as of equal honor and rank. Consult Emil Schürer, *History of the Jewish People in the Time of Jesus Christ*, vol. ii (New York, 1896).

JOSEPH AN'DREWS. A novel by Henry Fielding (1742). Begun as a satire on Richardson's *Pamela*, whose brother the hero is, it turned out an excellent story.

JOSEPH BAR'SABBAS. The unsuccessful candidate for the place among the Twelve made vacant by the death of Judas Iscariot. He is mentioned in the New Testament only in Acts i. 23. His Roman name, Justus, is clear; but his Jewish name, Barsabbas, perhaps son of Sheba or son of the Sabbath, is of doubtful etymology. Beyond the fact that he must have been a disciple of Jesus from the Baptism to the Ascension, in order to be eligible to a place among the Twelve (Acts i. 21-22), we know nothing. A later but untrustworthy tradition makes him one of the Seventy or Seventy-two (Luke x. 1).

JOSEPH FRIEDRICH WILHELM, yō'zēf frē'drīk vīl'hēlm, PRINCE OF SAXE-HILDBURGHAUSEN (1702-87). An Austrian general. He entered the service in 1719, became a colonel in 1732, and fought bravely in Italy and on the Rhine (1734-35). In 1736 he put down an insurrection of the Croats, and he served against the Turks as master general of the ordnance until 1739. During the War of the Austrian Succession (1740-48) he had charge of the defensive forces in the interior of the Empire. In 1757 he was put in command to act with the French under Soubise, was defeated at Rossbach, and retired from the service.

JOSEPHI, jō-zēf'ī, ISAAC A. (1859-). An American miniature painter. He was born in New York and studied at the Art Students' League, and under Bonnât in Paris. An ex-

president of the American Society of Miniature Painters and a member of the Royal Society of Miniature Painters, London, he exhibited frequently in America and abroad and received honorable mention in Paris in 1900 and a medal at Charleston in 1902.

JOSEPHINE, zhō'zā'fèn' (Fr. *Joséphine*), MARIE ROSE TASCHER DE LA PAGERIE (1763-1814). First wife of Napoleon Bonaparte and first Empress of France. Josephine was born of a Creole family on the island of Martinique, June 23, 1763. Poorly educated, though carefully trained in the social formalities of the period, she was taken to France (Dec. 13, 1779) at the age of 16 to be married under the auspices of her aunt, Madame de Renaudin, to Alexandre, Vicomte de Beauharnais, also of a Martinique family. Of this union, which soon proved unhappy, were born two children—on Sept. 3, 1780, a son who became later, by the favor of Napoleon, Prince Eugene, Viceroy of Italy, and on April 10, 1783, a daughter, Hortense, who later was married to Napoleon's brother Louis and became Queen of Holland and mother of Napoleon III. Beauharnais played a considerable rôle in the political and military circles of the early period of the French Revolution. Assisted by the popularity of the salôn of Josephine, he became commander of the Army of the Rhine in 1793. Both fell under suspicion, however, in 1794 during the Terror, and Josephine barely escaped through the efforts of Madame Tallien, while her husband was executed. Left a widow, apparently with considerable means, Josephine became conspicuous in the society of the salôns, which included also such well-known figures as Madame Récamier and Madame Tallien, and enjoyed the special protection of Barras—for personal reasons, it has been alleged. Somewhat reluctantly she was induced to marry (March 9, 1796) the rising young commander Bonaparte, who was placed through the influence of Barras in command of the Italian campaign of 1796. Josephine accompanied him during part of his victorious campaign. During the Egyptian campaign, however, she remained in Paris and conducted herself in such a way that Napoleon on his return is said to have threatened a separation. During the four years of the Consulate Josephine reigned as queen of society and was able to add to the social prestige of Napoleon's position, though his numerous infidelities were a source of chagrin and apprehension. Josephine was crowned Empress beside Napoleon in Notre Dame on December 2 and remarried to him with a religious ceremony. (See Plate of DAVID.) Her son was soon after made Viceroy of Italy and married the daughter of the King of Bavaria, while her daughter, Hortense, who had been married to Louis Bonaparte in 1802, became Queen of Holland in 1806. The childless union of Napoleon and Josephine was becoming increasingly unsatisfactory to Napoleon as his ideas of founding a dynasty developed, and in 1809, after his successful Austrian campaign, he definitely decided upon a divorce, to which Josephine was induced to give her mournful compliance. On the following day the Senate sanctioned the divorce and bestowed upon Josephine Imperial honors and a large annuity. She retired to Malmaison, where she led a lonely and unhappy life. Napoleon paid her frequent friendly visits and after his marriage with the Archduchess Marie-Louise

brought his son, the small King of Rome, to see her. She died at Malmaison, May 29, 1814.

Her character resembled that of other women of her time who had had the same education and environment. Frivolous and extravagant and of mediocre intelligence, she was also kind and affectionate, and her charm of manner, which combined the dignity of the old régime with the ease of the new, fitted her to reign in the society of the Empire.

JOSEPH OF AR'IMATHÆ'A. The disciple of Jesus who provided for His burial. Arimathæa was probably the village of Ramah, or Ramathaim-zophim, of the hill country of Ephraim, the birthplace of Samuel (1 Sam. i. 1 with 19), a few miles north of Jerusalem, near Lydda (cf. 1 Macc. xi. 34). Joseph is mentioned in the New Testament only in connection with the entombment of Jesus (Mark xv. 43-46; Matt. xxvii. 57-60; Luke xxiii. 50-53; John xix. 38-42). The four Evangelists record in general agreement that Joseph came to Pilate and asked for the body of Jesus, and that the body, after a hasty preparation for burial, was placed in a new tomb. Mark calls Joseph a "councilor of honorable estate," which doubtless implies that he was a wealthy man of the better class and a member of the Council, or Sanhedrin; suggests his courage in making the daring request of the Procurator; and states that he was "looking for the kingdom of God," i.e., that he was one of the "pious" like Simeon (Luke ii. 25), who hoped for a coming of the Messiah which would be a religious blessing to the people of God. Matthew does not call him a councilor, but designates him as a "rich man" and a "disciple" of Jesus. Luke also calls him a "councilor" and a "good and righteous man" and states specifically that he had not assented to the action of the Sanhedrin in its condemnation of Jesus. John qualifies Mat-

thew's remark about discipleship by observing that he was a disciple in secret only, for fear of the Jews, and then adds significantly that it was Nicodemus who brought the myrrh and aloes, and that he assisted Joseph in the preparations for the entombment. These differences in the accounts have been thought to indicate that John combines two originally different traditions—one that Jesus was buried by Joseph, a man of noble rank, wealthy, and the owner of a tomb near Jerusalem; the other that it was Nicodemus, a well-known Pharisee, friendly, however, to Jesus, a member of the Sanhedrin, who buried him. The differences, however, do not definitely prove the hypothesis. According to tradition, which is of no historical worth, Joseph went as missionary to Gaul and Britain and built the first Christian oratory in the latter country on the site of Glastonbury.

JOSEPHUS, FLAVIUS (37-?). A celebrated Jewish historian. He was born at Jerusalem in the year 37 A.D., of both royal and sacerdotal lineage, being descended, on the mother's side, from the line of Hasmonæan princes, while his father, Matthias, officiated as a priest in the first of the 24 courses. He received a good education and became familiar with both Hebrew and Greek literature. Having attended the lectures of the paramount religious schools of his time—"sects," as he terms them—he withdrew into the desert, to a man whom he calls Banos, probably an Essene. Three years later he returned to Jerusalem and henceforth belonged to the Pharisees. At the age of 26 he was chosen delegate to Nero. At the outbreak of the great war between the Jews and Romans, Josephus was appointed Governor of Galilee. Here he displayed valor and prudence; but the advance of the Roman general Vespasian (67) made resistance hopeless. The city of Jotapata, into which Josephus had thrown himself, was taken after a desperate resistance of 47 days. Along with some others he concealed himself in a cavern; but his hiding place was discovered, and, being brought before Vespasian, he would have been sent to Nero, had he not—according to his own account, for Josephus is his own and his sole biographer—prophesied that his captor would yet become Emperor of Rome. Nevertheless, he was kept in a sort of easy imprisonment for about three years. It was then that he adopted the Latinized name by which he is known. Josephus was present in the Roman army at the siege of Jerusalem by Titus and after the fall of the city (70) was instrumental in saving the lives of some of his relatives. After this he appears to have resided in Rome and to have devoted himself to literary studies. The exact period of his death is not ascertained. All we know is that he survived Herod Agrippa II, who died in 100. His works are: *History of the Jewish War*, in seven books, written both in Hebrew and Greek (the Hebrew version no longer extant); *Jewish Antiquities*, in 20 books, containing the history of his countrymen from the earliest times down to the end of the reign of Nero; an *Apology* of the Jews against Apion, valuable chiefly for its extracts from old historical writers; and an *Autobiography*, which may be considered supplementary to the *Antiquities*. The other works attributed to him are not believed to be genuine. Josephus in the main was honest and veracious; he had a sincere liking for his countrymen and much pride in the old national history; but the hopelessness

of attempting to withstand the enormous power of the Romans, and an aversion to martyrdom, caused him to side with the enemy—perhaps in the faint hope of being thus of some use to the national cause. The influence of Greek philosophy and learning is visible in all his writings and, as far as biblical history is concerned, infused into it a tone of rationalism. He speaks of Moses as a human rather than a divinely inspired lawgiver; he rationalizes the miracles of the Old Testament, such as the crossing of the Red Sea and the healing of the waters of Marah. His style is easy and elegant, and Josephus has often been called the Greek Livy. A description of Christ (*Ant.*, xviii, 63 f.) has caused much discussion, but is not regarded as genuine. The editio princeps of the Greek text appeared at Basel (Froben) in 1544. Since then the most important edition (with notes) is that of B. Niese (7 vols., Berlin, 1885–95; the text alone, 6 vols., 1885–95). Consult: Bärwald, *Topographisch-historisches Lexicon zu den Schriften des Josephus* (Leipzig, 1879); Destinon, *Die Quellen des Flavius Josephus* (Kiel, 1882); Olitzki, *Flavius Josephus und die Halacha* (Leipzig, 1886); Krenkel, *Josephus und Lukas* (ib., 1894); Schmidt, *De Flavii Josephi Elocutione* (ib., 1894); Emil Schürer, *History of the Jewish People in the Time of Christ* (5 vols., New York, 1896); Drüner, *Untersuchungen über Josephus* (Marburg, 1897). The best-known version in English is by W. Whiston (London, 1737), revised by A. R. Shilleto, in *Bohn's Library* (5 vols., 1888–89); especially valuable is the translation of the *Jewish War* and the *Autobiography* by R. Traill (ib., 1862).

JOSH BILLINGS. The nom de plume of the American humorist Henry W. Shaw (q.v.).

JOSH'UA (Heb. *Yēhōshu'a*, Yahwe is deliverance). The leader of Israel in the conquest of the land of Canaan. According to the Pentateuch, he was the son of Nun, of the tribe of Ephraim (Num. xi. 28; xiii. 8), led the fight against the Amalekites in the desert (Ex. xvii. 8–13), was sent by Moses among the spies that went into Canaan (Num. xiii. 8), and was appointed by Moses to be his successor (Deut. xxxi. 23). In the Book of Joshua he is represented as leading Israel in the crossing of the Jordan and the conquest of Palestine and as assigning the territories to the various tribes (Josh. i–xxiv). He is said to have died at the age of 110 (Josh. xxiv. 29).

This account of Joshua, according to the critics, is written from the point of view which regards the conquest of Canaan as the fulfillment of a promise made by Yahwe in the days of Moses. Many scholars have questioned the historical character of Joshua and regarded him as a mythical hero venerated in the cult at Timnath-serah (Josh. xxiv. 30). The name, when compared with the names used in Israel in the period of the Judges, is such as to awaken suspicions. Others consider it probable that an Ephraimitish leader took an active part in the first struggles for the possession of the land to the west of the Jordan and in the organization of the confederacy of the tribes that formed Israel. A slight transformation of the name is not impossible. Legend and dimmed tradition may have dealt generously with the historical element in the Joshua story. The long process involved in the conquest is pictured as though it took place in the days of Joshua and through

the efforts of the popular hero. It is likely that many deeds ascribed to him belong to later periods. The supposed distribution of the lands among the tribes merely reflects the geographical position of the clans at a certain period after the conquest, probably subsequent to the reign of David.

JOSHUA. An oratorio by Handel (q.v.), first produced in London, March 9, 1748; in the United States, April 16, 1876 (Boston).

JOSHUA, BOOK OF. The first of the four historical books in the Hebrew Bible, forming with Judges, Samuel, and Kings the division known in the Jewish canon as the Former Prophets. The Book of Joshua is mainly occupied with the narrative of the conquest of Canaan and with the settlement of the Hebrew clans in the newly gained territory.

Its contents may be summarized as follows: (a) Chaps. i–xii, crossing of the Jordan; capture of Jericho; advance to Ai; the ruse of the Gibeonites to save themselves from destruction; the subjugation of the south; campaign against the King of Hazor and allies; conquest of the north; list of victories. (b) Chaps. xiii–xxiv, distribution of the land to the trans-Jordanic tribes—to Caleb, Judah, Ephraim, and Manasseh; survey and allotment to the remaining tribes; Joshua's inheritance; designation of cities of refuge; Levitical cities; dismissal of trans-Jordanic tribes; final exhortations of Joshua; assembly and covenant at Shechem; death and burial of Joshua.

The authorship of the book is ascribed to Joshua in the Babylonian Talmud (*Baba bathra*, 14 a). Already Calvin questioned the accuracy of this ascription, and in modern times it has very generally been abandoned by scholars. It has been pointed out that the conception of the conquest of Canaan in certain parts of the book is in the strongest contrast with the more credible representation in the first chapter of the Book of Judges and in other parts of the Book of Joshua itself. While, according to the latter, the Israelitish tribes failed to dispossess the natives in large sections of the territory ideally assigned to them, so that many of the most important cities remained in the hands of the Canaanites for a long time, the former leaves the impression that the whole population was destroyed by the invaders, who had only to decide between themselves by lot what portion each tribe was to have. The quotation from the Book of Jasher (q.v.) in Josh. x. 12 has also been adduced against the traditional view, inasmuch as Joshua would not be likely to back up his account of his own victory by the testimony of a song already found in a book, and because this book is also said in 2 Sam. i. 18 to contain David's elegy over Saul and Jonathan. The passage (xxiv. 26) in which Joshua is claimed as the author seems very clearly to refer only to his farewell address, and the words "Joshua wrote in the book of the law of God" appear to indicate that this address was once found in a law book. The high eulogy passed on Joshua (iv. 4, vi. 27) and the account of his death and burial likewise seem to preclude a Joshuanic authorship. According to the generally prevailing view among Protestant scholars, the same sources that are supposed to have been used in the composition of the Pentateuch were also drawn upon in the Book of Joshua—the Yahwist and the Elohist particularly in the first half of the book and

the so-called Priests' Code in the second. Some independent scholars who reject the current analysis of the Pentateuch still maintain that different sources were used, or that there has been a gradual expansion of the original text. (See PENTATEUCH.) It is generally admitted that the memory of some incidents in the early period of the invasion has been preserved in the book, such as the capture of Jericho, Ai, and Bethel, the battle of Gibeah, and others, though, in the judgment of many scholars, the genuine tradition has often been overlaid with legendary embellishments. The second part of the book is extremely valuable because of the information it gives concerning the boundaries of the different tribes and the chief cities and towns in each, even though occasionally cities are included which only ideally, and not actually, belonged to one or another of these tribes. In connection with the modern analytic theory the term Hexateuch (q.v.) has sometimes been used to designate the Pentateuch and the Book of Joshua.

Consult chapters on the conquest in the Hebrew histories of Kittel, Stade, Wellhausen, Guthe, Renan, and Piepenbring; the commentaries to the Book of Joshua by Keil, Dillmann, Oettli, Steuernagel, and Bennett; also Budde, *Richter und Josua* (Giessen, 1888); Albers, *Die Quellenberichte in Josua I.-XXI.* (Bonn, 1891); Addis, *Documents of the Hexateuch* (London, 1898); Carpenter and Battersby, *The Hexateuch* (ib., 1900); and the introductions to the Old Testament by Driver, Kuenen, Kautzsch, König, and Cornill.

JOSIAH (Heb. *Yō'shiyyāhū*, Yahwe supports) (c.637-608 B.C.). King of Judah. He was the son of Amon and Jedidah and is said to have succeeded his father at the age of eight years (2 Kings xxii. 1). It is hard to believe that this figure can be correct. Of the early years of his reign we hear nothing. The compiler of Kings is chiefly interested in an important event that happened in the eighteenth year of the King's reign. According to chaps. xxii-xxiii, the priest Hilkiah found in the temple a book of the Law which he sent to the King through Shaphan, the scribe. The King, upon learning of the contents of the book, is in deep distress at the religious practices of the country, which are in flagrant contradiction to the ordinances in the Law book. He orders an assembly of the elders, and in solemn convocation it is agreed to abide in the future by the laws prescribed in the new book. The narrative then goes on to give an account of the radical religious reforms instituted by Josiah in destroying all Baal cults, in removing the priests from the high places, and establishing the worship of Yahwe in its pure form, freed from all foreign elements. There is no longer any question among scholars that the Law book "found" by Hilkiah was the legal portion of the present book of Deuteronomy (q.v.). This religious code was probably compiled either by Hilkiah or during the reign of Josiah's predecessor. Josiah's religious reform marks the end of an important epoch in the religious history of Israel. As a result of the efforts of Elijah, Elisha, and of such prophets as Amos and Hosea, two principles became established: (1) the worship of Yahwe to the exclusion of the Canaanitish Baalim; (2) the centralization of Yahwe worship in the sanctuary at Jerusalem. The times seemed ripe for

taking a decisive step in the new direction, and Josiah favored the movement. A reaction set in after Josiah's death, but the zealous Yahwe worshipers had gained their point, and a new direction was given to religious development among the Hebrews. The reign of Josiah seems to have been a peaceful one until the close, when Necho II, King of Egypt, thought the time opportune, since Assyria's fall was imminent, to attempt to regain control of Syria and Palestine. Josiah encountered the Egyptian forces and met his death on the plain of Megiddo (2 Kings xxiii. 29-30). His death was regarded as a national calamity and must have been particularly startling to the pious, who felt that so zealous a follower of Yahwe was certain of divine favor and help. The religious reaction after Josiah's death against the Deuteronomic reforms may have been a direct consequence of the consternation that his tragic fate aroused, which naturally raised a doubt as to the correctness of the step taken by him. Consult Wellhausen, *Israelitische und jüdische Geschichte* (7th ed., Berlin, 1914).

JOSIAH ALLEN'S WIFE. The nom de plume of Marietta Holley (q.v.) and the title of one of her humorous sketches.

JOSIAS, *yō-zē'ās*, FRIEDRICH, PRINCE OF SAXE-COBURG (1737-1815). An Austrian general, son of Duke Franz Josias of Coburg. Entering the Austrian army in 1756, he served in the Seven Years' War as a colonel and against the Turks (1788-91), commanding a battalion and winning the battle of Martinestye. He was made field marshal lieutenant for his services in this campaign and in 1793 was put at the head of the army in the Netherlands. Here he was remarkably successful for a short time and brought Belgium once again into Austria's power. The French victory at Fleurus forced him to retire (1794). He left the army soon afterward and lived in quiet at Coburg. Consult Witzleben, *Prinz Friedrich Josias von Coburg-Saalfeld* (Berlin, 1859).

JÓSIKA, *yō'shī-kō*, MIKLÓS, BARON (1794-1865). An Hungarian novelist, born of a noble and distinguished family, April 28, 1794, at Torda in Transylvania. In his youth he served for some time in the Austrian army and then for many years devoted himself to agriculture and study. He was a member of the Transylvanian Diet in 1834 and again in 1847. His first works appeared in 1834 under the title of *Irány* (*Tendency*) and *Vázolatok* (*Sketches*) and were exceedingly popular. From that period till the revolution in 1848 he wrote about 60 novels, all of which were published at Budapest, and most of which have been translated into German. The most important are: *Abafi* (1836); *Az utolsó Batory* (*The Last Batory*, 1838); *Zrinyi a költő* (*The Poet Zrinyi*, 1840); *A Csehek Magyarországon* (*The Bohemians in Hungary*, dealing with the Hussites, 1840); and *Jósika István* (*Stephen Jósika*, one of the author's ancestors, 1847). Involved in the Hungarian revolution, he had to leave his native country, and afterward he resided at Brussels, where he continued his literary work. In 1864 he removed to Dresden, where he died in 1865. Among his productions written in exile are: *Egy Magyar család a forradalom alatt* (*A Hungarian Family during the Revolution*); *Die Familie Mailly*, like the foregoing first in German; *Eszter* (*Esther*); *A Szegedi boszorkányok* (*The Witches of Szegedin*). Jósika

was a thoroughly natural novelist and drew his materials almost wholly from the history of his own land. He has been called the Walter Scott of Hungary, being the real founder of the historical novel of that country. His heroines are especially remarkable. Consult his *Memoirs, Emlékirat* (Budapest, 1865), which he was writing at the time of his death.

JOSIP'PON, Book of. A Hebrew chronicle, written in Italy in the tenth century and giving a history of the world from the Creation until the overthrow of the second temple by Titus. It claims to be a translation of Josephus, but the author employs the works of other writers, some of them very late. Lucian, Strabo, and St. Jerome were among his sources, and the book contains much extravagant legend. The author calls himself Joseph ben Gorion. The Jewish historian Graetz (*History of the Jews*, vol. iii, p. 180) holds that the work was originally written in Arabic, but this view has not been accepted. The book was first published in 1476 at Mantua and during the following centuries enjoyed great popularity, several editions appearing besides translations into Latin and German.

JOSQUIN, zhôs'kân', DEPRÈS. See DEPRÈS, JOSQUIN.

JOSS (a pidgin-Eng. corruption of Portug. *deos*, from Lat. *deus*, god). A pidgin-English term which is sometimes found in modern books of travel, in newspapers, etc., as well as colloquially in connection with Chinese matters. It is used for God and is also applied to Chinese idols (joss), temples, and churches (joss houses), the gilt paper on which charms and amulets are printed or in which they are neatly wrapped up (joss paper), and also the fragrant incense sticks (joss sticks) burned before the idols. The so-called "stick" is a paste made of the dust of various scented woods held together with clay, which in its combustion serves as a rude measure of time at night. The paste is rolled around the upper part of a stick of bamboo and in that form is commonly known. *Joss pidgin* means "religious ceremony," and clergymen and priests are spoken of as "joss-pidgin men." Joss paper to represent money is especially used at funerals or at the front doors of shops and houses. When incinerated, the Chinese idea is that this paper changes into real money in the spirit world.

JOSSELYN, jôs'lîn, JOHN (seventeenth century). The author of one of the earliest accounts of the English settlements in New England. He was the son of Sir Thomas Josselyn, a knight of Essex, England, where he was born probably early in the seventeenth century. His brother Henry had sailed for New England as the agent for John Mason, the patentee of New Hampshire, in 1634, and had continued in the service of Mason's successor, Sir Ferdinando Gorges. It was at his brother's solicitation that John Josselyn visited New England in 1638, sailing from England late in April of that year and arriving in Boston on July 2. Thence, after calling upon John Winthrop and John Cotton, to whom he had letters, he proceeded to Black Point, Scarborough (Me.), where his brother Henry was stationed. He returned to England in October, 1639. It was not until 1663 that he returned to New England. He remained in America until December, 1671, traveling extensively through the other settlements in New England and noting facts as to

their government, history, social life, and products. Upon his return to England he published his observations in two books. The first was entitled *New England's Rarities Discovered in Birds, Beasts, Fishes, Serpents, and Plants of that Country* (1672; reprinted in Boston, 1865). His second and more valuable book from the historical point of view is *An Account of Two Voyages to New England* (London, 1674; reprinted, Boston, 1869; also in *Collections of the Massachusetts Historical Society* for 1834).

JOST, yöst, ISAAK MARKUS (1793-1860). A German-Hebrew historian, born in Bernburg. He studied philology at Göttingen and Berlin and was principal of a school in the latter city in 1826-35 and subsequently of the Jewish Realschule at Frankfort. His principal works are: *Geschichte der Israeliten* (9 vols., 1820-29; to which was added a tenth volume in 1849, entitled *Neuere Geschichte der Israeliten von 1815-45*); *Allgemeine Geschichte des israelitischen Volkes* (2 vols., 1831-32); a translation (into German) of the *Mishna*, with text and commentary (6 vols., 1832-34); and *Geschichte des Judentums und seiner Sekten* (3 vols., 1857-59). He also edited a journal entitled *Israelitische Annalen* (1839-41). Consult Zerndorf, *Isaak Markus Jost und seine Freunde* (Cincinnati, 1886).

JOTA, hō'tá. A Spanish dance in $\frac{3}{4}$ time, especially popular in Aragon. It is danced by couples and somewhat resembles a waltz, though there are many extempore variations of step. Its rapid, striking music is furnished by mandolins, castanets, and a song, whose couplets are often extemporized and are of a satirical or romantic character. The jota is sometimes danced as a solemn rite at funerals.

JOTUNHEIM, yō'tun-hām (Icel., giants' home). In Norse mythology, a region of cold and darkness, extending around the rim of the earth, the abode of the frost giants.

JOTUNN, yō'tun (Icel., giant, devourer). In Norse mythology, a race of giants and magicians, generally hostile to human beings, dwelling in caves in Jotunheim, and carrying on constant warfare with the powers of light. Originally giants of the storm, they are pictured as having power over the forces of nature. They are the enemies of Thor, who prevents their attempt to storm heaven.

JOUBERT, zhōō'bâr', BARTHÉLEMY CATHERINE (1769-99). A French Revolutionary general, born at Pont-de-Vaux, Ain. Though educated for the career of an advocate, Joubert showed early his preference for a military career, and enlisted as a volunteer in 1791, served in the Army of the Rhine, and, four years later, was made a general of brigade for brilliant service. In the Italian campaign of 1796-97 he acted as second in command to Bonaparte, being made general of division. He distinguished himself at the siege of Mantua and in the battle of Rivoli, in January, 1797; took Trent in the following year and led a French army of invasion into Tirol, effecting a junction with Napoleon. He subsequently commanded in Holland and on the Rhine and in 1798 was made head of the Army of Italy. He overran Piedmont and forced King Charles Emmanuel to abdicate. In June, 1799, he was made commandant of Paris, but soon after was sent to replace Moreau in Italy, where he gained slight advantages over the combined Russian and Austrian forces, but

was defeated by Suvaroff at Novi, where he fell mortally wounded, August 15, at too early an age to have won the military reputation to which his talents entitled him. A monument raised to his memory was demolished by order of Louis XVIII, but another was erected later in his birthplace. His biography has been written by Chevrier (2d ed., Paris, 1884).

JOUBERT, JOSEPH (1754-1824). A noteworthy French philosopher, born at Montignac (Périgord). He studied at the College of Toulouse, at that time conducted by the Jesuits, and was subsequently assistant master in the institution, but had to resign because of failing health. In 1778 he went to Paris, where he became the friend of Chateaubriand and Fontanes. In 1790-92 he was justice of the peace at Montignac and in 1809, at the instance of Fontanes, the grand master, was appointed by Napoleon a councilor of the newly organized University of Paris. Of frail health, he lived at Paris and at Villeneuve in Burgundy, where he was greatly inspired by Madame de Beaumont. He was constantly reading and taking notes, writing letters, and receiving the inevitable throng of friends who came to hear his extraordinary conversation, much, Matthew Arnold observes, as Englishmen flocked to hear that of Coleridge. In 1838 Chateaubriand edited a privately printed volume of fragments, which was reviewed by Sainte-Beuve in the *Revue des Deux Mondes*, and which established Joubert's fame. The best edition is that by P. de Raynal, entitled *Pensées; précédées de sa correspondance, d'une notice sur sa vie, son caractère et ses travaux* (Paris, 1864). Selections from his writings have appeared in Charles Dudley Warner, *Library of the World's Best Literature* (New York, 1896-97), and in a volume of translations by Katharine Lyttleton (ib., 1899). Consult: Condamin, *Essai sur les pensées et la correspondance de Joubert* (Paris, 1877); E. M. Caro, *Mélanges et portraits* (ib., 1888); and the fine appreciation in Matthew Arnold, *Essays in Criticism* (London, 1907).

JOUBERT, PETRUS JACOBUS (1831-1900). A Boer general and politician. He was born in the Oudsthoorn District of Cape Colony, of Dutch-Huguenot parents, his French ancestor, Joubert, having emigrated to South Africa in 1687 to escape religious persecution in France. After an elementary education and a youth spent in trading expeditions throughout South Africa, Piet Joubert, as he was called, settled in the Wakkerstroom District of the South African Republic and became a prosperous farmer and cattleman. In the early sixties he was elected a member of the Volksraad, and in 1870, having already had some experience in legal work, he was made Attorney-General of the Republic and became prominent politically. From that time on he was more or less the political rival of Kruger (q.v.). In 1874 Joubert acted as President during the visit of President Burgers to Europe, and his political opportunism earned him the name of Slim (or crafty) Piet. In 1880, on the outbreak of war with England, Joubert became commandant general of the forces and won the battles of Laing's Nek, Ingogo, and Majuba Hill (q.v.), the last of which closed the war in favor of the Boers in 1881. In 1883-84 he was acting President during Kruger's absence in Europe, and in the latter year he opposed the plan of annexing Bechuanaland to the Transvaal. Later he

avored a liberal policy towards the Uitlanders in the country. He was defeated by only 800 votes in the contest against Kruger for the presidency in 1893, but he became Vice President and general commander of the army and frustrated the attempted raid by the forces of Dr. Jameson near Krugersdorp in January, 1896. When the relations between the Transvaal and England had become strained, in 1899, Joubert wrote an appeal to Queen Victoria in which he stated the case of the Boers. Joubert was the ablest of the Boer military men, and to his efforts in great measure was due the fact that the Transvaal was prepared with arms and munitions of war when the Republic declared war against Great Britain in October, 1899. As commandant general of the Boer forces, he began the campaign in Natal and laid siege to the town of Ladysmith, showing remarkable generalship as long as he remained in the field. But early in 1900 his health broke down, and he was forced to retire to Pretoria, where he died (March 27, 1900). Joubert commanded the profound respect of his enemies for his ability and honor, but his liberal views on many points did not commend him to the mass of the Transvaal Boers, who preferred Kruger's conservatism. See TRANSVAAL; SOUTH AFRICAN WAR.

JOUETT, jou'ët, JAMES EDWARD (1828-1902). An American naval officer, son of the artist Matthew Harris Jouett. He was born at Lexington, Ky., was appointed a midshipman in the navy at the age of 13, and served on the *Independence*, and against slavers on the *Decatur*. During the Mexican War he was stationed in southeastern Texas. In 1861, soon after the outbreak of the Civil War, he entered Galveston Bay with a small detachment of marines and destroyed the *Royal Yacht* after a fierce fight. He was equally prominent in the operations in Mobile Bay under Farragut in 1864, and his promotion of 30 numbers, for his services in the capture of the *Selma*, was recommended by Farragut. Jouett became captain in 1866 and commodore in 1883, and in 1885 he commanded the North Atlantic squadron and opened the Isthmus of Panama. He became a rear admiral in 1886 and soon afterward was made president of the board of inspection and survey. He retired in 1890, and in 1893 Congress voted him full pay for life.

JOUETT, MATTHEW HARRIS (1783-1827). An American painter, born in Mercer Co., Ky. He was the pupil for a short time of Gilbert Stuart in Boston, painted all through the country from Kentucky to the Gulf, and was recognized as the best painter "west of the Mountains." Although weak in drawing, his paintings please by reason of their rich, harmonious color. His portrait of John Grimes is in the Metropolitan Museum, New York, and his full-length of Lafayette is in the capitol at Frankfort, Ky.

JOUFFROY, zhōō'frwä', FRANÇOIS (1806-82). A French sculptor, born in Dijon. He was a pupil of the younger Ramey and at the Ecole des Beaux-Arts, and won the Prix de Rome in 1832. He became a member of the Institute in 1857, Officer of the Legion of Honor in 1861, and professor at the Beaux-Arts in 1863. He was par excellence the official sculptor of his period, and commissions were heaped upon him. Among his works are the marble statue of St. Bernard, at the Panthéon in Paris; the monument to St. Bernard, at Dijon; Napoleon, at Auxonne; Pierre de France, the Duc

de Longueville, the Duc d'Alençon, Marie Leczinska, at Versailles; "Young Girl Telling her Secret to Venus," at the Louvre, which almost justifies the high regard in which Jouffroy was held by his contemporaries. His works are characterized by grace and delicacy.

JOUFFROY, THÉODORE SIMON (1796-1842). A French philosopher. He was born at Pontets, Doubs, and studied philosophy at Dijon and under Cousin at the Ecole Normale, Paris, where at 21 years of age he began to teach. After many changes he became in 1838 librarian to the University of Paris, which position he filled till his death on Feb. 4, 1842. He published translations of the works of Reid and translated also some of the works of Dugald Stewart, with notes and introductions, besides writing *Cours de droit naturel* (Paris, 1834-35) and *Mélanges philosophiques* (ib., 1833; selected translations by George Ripley, Boston, 1838). Some of his works appeared posthumously. He opposed the sensualism of Condillac and all tendencies to identify psychology with physiology; in general, his position was similar to that of Cousin (q.v.). Consult Tissot, "Théodore Jouffroy, sa vie et ses écrits," in *Mémoires de l'Académie de Dijon*, vol. iii (Dijon, 1875-76).

JOUFFROY D'ABBANS, dā'bāN', CLAUDE FRANÇOIS DOROTHÉE, MARQUIS DE (1751-1832). An inventor and engineer. He was born in France in 1751 and spent the early portion of his life in the army. Witnessing the operation of a fire engine, he believed that steam could be used for vessels on water. He made his first attempt with a boat equipped with a Watt engine and "duck-foot" paddles mounted on a chain on the river Doubs in 1776, but the experiment was a failure. In 1780 he built a novel form of engine for a boat 150 feet long, and in 1783 he made another experiment on the Saône, with more success. Owing to various technicalities, the Academy refused to indorse the experiments, and the government declined to grant a promised monopoly. Impoverished and discouraged, Jouffroy went to England and was active in political plots, siding with the Bourbons. Returning to France, he became acquainted with Fulton, who admitted the merit of the experiments. He received permission in 1816 to form a company, and put his first steamer, called *Charles Philippe*, on the Seine; but the attempt was unsuccessful. He withdrew to the Hôtel des Invalides and died there of cholera. His claim was acknowledged by Arago and in 1840 by the French Academy. Jouffroy published *Les bateaux à vapeur* and wrote for the Academy *Mémoires sur les pompes à feu*.

JOUGS, jōgz (OF. *joug*, yoke, from Lat. *jugum*, yoke; connected with Gk. *ζυγόν*, *zygon*, Skt. *yuga*, Goth. *juk*, OHG. *joh*, Ger. *Joch*, AS. *geoc*, Eng. *yoke*, from Lat. *jungere*, Gk. *ζεγγύναι*, *zeugnynai*, Skt. *yuj*, to join), **JUGGS**, or **JOGGS**. A form of pillory used in Scotland as well as in the Low Countries. It consisted of an iron ring, or collar, fastened by a chain of two or three links to a pillar or wall in some public place, such as a market cross, a prison door, a church door, a churchyard gate, a tree beneath whose branches courts and the like were held. The ring or collar opened by a hinge or joint, so as to inclose the culprit's neck, when it was secured by a loop, or staple, and a padlock. Jogs were employed as a punishment for ecclesiastical as well as for minor civil offenses in the fifteenth to the eighteenth centuries. Al-

though they have not been in use for the last 100 years, they may still be found hanging at a few country churches. Branks (see BRANK) were occasionally hung on the same pillar with the jogs. See PILLORY; STOCKS.

JOULE, joul (named in honor of James P. Joule). The joule is the practical unit of energy or work. It is 10⁷ ergs. See C. G. S. SYSTEM OF UNITS; MECHANICAL UNITS; MECHANICS, *Work and Energy*.

JOULE, JAMES PRESCOTT (1818-89). An English physicist. He was born at Salford, near Manchester, England. His father was the proprietor of a large brewery, and he took advantage of the opportunities offered by the equipment of such a plant to perform many of his best-known investigations. He was an invalid all his life, owing to a spinal trouble. His early education was secured at home, the chemist Dalton being the young man's instructor, and at the age of 19 he published in the *Annals of Electricity* a description of an electromagnetic engine which he had himself invented. In the course of researches on electricity he was able to show that in electric conduction the amount of heat absorbed was equivalent to the heat produced during the original combination of the elements in the cell which produced the current. Joule was the first Englishman to ascertain the mechanical equivalent of heat (see HEAT), and in an address delivered in 1847 at Manchester he stated the doctrine of the conservation of energy. The paper was hardly noticed by press or scientists, and a similar paper presented to the British Association would also have been passed over had its merits not been seen by William Thomson, afterward Lord Kelvin. Joule worked for 40 years to determine the mechanical equivalent of heat, using both electric currents and the mechanical friction of water, and obtained a number of values for this quantity. Many researches on electricity and thermodynamics are to be credited to him, and his name is given to the unit of work, while Joule's law for determining the amount of energy in an electric circuit has become fundamental in electrical science. Dr. Joule received the Copley and other medals and numerous honors from the leading universities and scientific societies throughout the world. His *Scientific Papers*, in two volumes, were published in 1885 and 1887, and numerous valuable communications from him are to be found in the various English journals and in the proceedings of societies. Consult Osborne Reynolds, *Memoir of James Prescott Joule* (Manchester, 1892).

JOURDAIN, zhōōr'dāN', MONSIEUR. The leading character in Molière's *Bourgeois gentilhomme*.

JOURDAN, zhōōr'dāN', JEAN BAPTISTE, COUNT (1762-1833). A French marshal. He was born April 29, 1762, at Limoges, where his father was a surgeon. He entered the army in 1778 and served under Count d'Estaing in the War of American independence. On returning to France in 1784 Jourdan married and opened a milliner's shop at Limoges. On the breaking out of the Revolution he abandoned trade and became the captain of the company of National Guards raised in Limoges. Under Dumouriez he rose to be chief of battalion, and in 1793 was made successively general of brigade and general of division. Finally in the autumn of that year he obtained the command of the Army of the North and gained an important victory at

Wattignies against the Austrians (Oct. 15-16, 1793). In 1794, as head of the Army of the Sambre and Meuse, he defeated the Austrians again at Fleurus and overran Belgium, forcing the enemy back across the Rhine. In 1795 he was less successful in his campaigns; for, having crossed the Rhine at Düsseldorf, he was defeated by the Austrians at Höchst (Oct. 11, 1795). In 1796 he pushed his way far into Germany, but was driven back by the Archduke Charles at Wetzlar (June 15), Amberg (August 24), and Würzburg (September 3). This discomfiture, for which the plan of campaign as worked out in Paris was responsible more than he, led him to resign his command and to devote himself to politics. In 1799 the Directory intrusted him with the command of the Army of the Danube; but he was defeated by the Archduke Charles at Ostrach and at Stockach in March of the same year and was superseded. Although he opposed the coup d'état of the Eighteenth Brumaire, the First Consul employed him in 1800 in the reorganization and administration of Piedmont; and on the establishment of the Empire in 1804, he was made a marshal. In 1803 he had been given the command in Italy, but in 1805 he was replaced by Masséna. He was sent with King Joseph to Naples (1806), and in 1808 he went with him to Spain as chief of staff. Louis XVIII appointed him commander of the seventh military division and made him a peer of France; but his Republican principles led him to enter heartily into the revolutionary movement of 1830, and for a short time after the July revolution he acted as Minister of Foreign Affairs. His last years were spent as governor of the Hôtel des Invalides, and there he died (Nov. 23, 1833). As member and president of the Council of Five Hundred (1797-99), Jourdan was instrumental in planning and establishing the system of military conscription throughout France. Unlike many of Napoleon's marshals, Jourdan lived and died poor. He was the author of *Opérations de l'armée du Danube* (Paris, 1799) and *Mémoires pour servir à l'histoire de la campagne de 1796* (ib., 1819). His *Mémoires militaires, guerre d'Espagne* was published in 1899.

JOURNAL. See BEARING.

JOURNAL DE SAINT-PÉTERSBOURG, zhōōr'nāl' de sãn'pã'tërz'bōōr' (Fr., Journal of St. Petersburg). A political daily paper, at St. Petersburg, founded in 1825. It is issued in French and is the organ of the Ministry of Foreign Affairs.

JOURNAL DES DÉBATS, dã dã'bã' (Fr., Journal of the Debates). A Paris daily paper, founded in 1789 to report the sessions of the National Assembly. Since 1800 it has been owned by members of the Bertin family. In politics it pursues a moderate Republican course.

JOURNALISM. See NEWSPAPER; PERIODICAL.

JOURNALISM, COLLEGE. Like the system of Greek-letter fraternities, college journalism, embracing those periodicals edited and published wholly or partly by undergraduates and devoted to student interests, is a form of student activity which is almost entirely restricted to American institutions. It is differentiated from the departmental and official publications of the university by the fact that its sphere embraces all the varied interests of the student body and not alone the educational, and that it provides

the channel for the expression of student opinion, formerly voiced through the oration and the debating society. Students in the English universities have from time to time attempted to establish publications similar to college papers in the United States, the most notable of which, *The Snob*, was edited by Thackeray while at Cambridge in 1829. While other efforts in the direction of college journalism in England were made sporadically, in the initial stage many of the journals rarely lasted longer than the college life of their original projectors. At Oxford and Cambridge weekly magazines are issued dealing largely with events of current interest in the respective universities, but include also reports of more important lectures and general articles by undergraduates and dons. In addition to these general university magazines a number of the colleges issue their own journals, and there are, besides, university magazines of lighter character. It may be said that all universities and colleges in the British Isles now have their students' magazines, which appear, as a rule, once a month. Such magazines are published by a student editorial board and are self-supporting. No college daily has yet appeared. The secondary schools also issue school journals of a general character. In the United States the college paper originally took the form of a periodical devoted to the publication of essays, serious poems, and criticisms, and often supplemented the literary societies. With the broadening of the student life there came a change in the character of the periodicals until to-day the students of nearly every American college support from one to a dozen periodicals. In recent years the institution has worked downward to the preparatory schools as well, and many of these maintain successful school papers modeled on the college publications.

The first American college periodical was the *Gazette*, published at Dartmouth in the year 1800. Daniel Webster, of the class of 1801, was its editor. The *Yale Literary Cabinet* was published in 1806 by the senior class of that year, and this was followed by the *Harvard Lampoon* in 1812. The oldest college paper now in existence is the *Yale Literary Magazine*, which dates from 1836. In the 20 years preceding that date there were born and died at Yale, besides the *Literary Cabinet*, the *Athenæum*, *Crayon*, *Sitting-Room*, *Students' Companion*, *Gridiron*, and *Medley*. Next to the Yale "*Lit.*," the paper which has had the longest existence is the *Nassau Literary Magazine*, founded in Princeton in 1842. The number of publications which have enjoyed only a temporary existence during the 100 years of college journalism is unknown, but it must have been very large. According to the best information obtainable, Amherst now supports 3 college papers, Brown 3, Leland Stanford 4, California 3, Columbia 5, Cornell 6, Harvard 7, Michigan 5, Minnesota 4, Pennsylvania 5, Princeton 4, Yale 6, Kansas 4, Wisconsin 4, and Tulane, Williams, Wellesley, Dartmouth, Missouri, Chicago, 2 each.

College journalism is represented by periodicals devoted to (1) literary matter exclusively; (2) news and some literary matter; (3) news and comment; (4) the comic and burlesque; (5) historical record; (6) the interests of certain departments or professional schools; and (7) the interests of the alumni. The typical forms are the daily, weekly, monthly, and annual, though there are many intermediate forms,

like the semiweekly, biweekly, or quarterly. The most popular forms of the college paper to-day are the daily and weekly, the weekly performing the same service in the smaller college that the daily does in the university, that of a newspaper pure and simple. The first ventures in the field of daily journalism appear to have been made in the universities of the Middle West; thus, the *Daily Illini* was issued at the University of Illinois in 1871 and the *Daily Student* at the University of Indiana in 1874. Of the better-known college dailies, however, the precedence in point of time is taken by the *Daily Princetonian*, which was established in 1876 and was soon followed by the *Yale News* (1878), the *Harvard Echo*, now the *Crimson* (1879), the *Cornell Daily Sun* (1880), and the *Pennsylvanian* (1884). Tradition takes the *Columbia Spectator* back to 1877, but its existence in its present form has only been continuous since 1902, when it replaced the *Acta Columbiana*. A college daily is now published in about 20 universities in the country, including, in addition to the above, the following: *Daily Palo Alto* (Leland Stanford, 1892), *Daily Californian* (California, 1893), *Maroon* (Chicago, 1892), *Purdue Exponent*, the *Daily Iowan* (Iowa, 1901), *University of Michigan Daily* (1890), *Minnesota Daily* (1900), *University Missourian* (1908), *Daily Nebraskan* (1901), *Daily Orange* (Syracuse, 1903), *Brown Herald* (Brown, 1891), *University of Washington Daily*, *Wisconsin Cardinal* (1892). A number of triweeklies are maintained, e.g., the *Northwestern* (Northwestern University, 1871) and the *Tech* (Massachusetts Institute of Technology, 1883); while in a few other institutions semiweekly papers are issued, e.g., *Scarlet and Black* (Grinnell, 1894), *Students' Herald* (Kansas A. and M. College, 1895), *I. S. C. Student* (Iowa State Agricultural College, 1890), *Williams Record* (Williams, 1874), *Denison Collegian*, and the *Brown and White* (Lehigh, 1894). Many of the latter class are probably on the way to becoming dailies. The typical daily is a four to eight page paper, devoted entirely to news and items of current student interest, and forms an important factor in student affairs. So much is this the case that the *Yale News* is commonly said at New Haven to "run the college."

The weekly college paper has increased in proportion more rapidly than the dailies. There are now about 92 weeklies in circulation in the leading institutions of college rank. It is to be noticed that historically the weekly is prior to the daily. The following college weeklies may be mentioned: *Amherst Student* (1867), *Dartmouth Weekly* (1867), *Scholastic* (Notre Dame, 1867), *Wesleyan Argus* (1868), *Rutgers Targum* (1869), *Campus* (Rochester, 1874), *The Fayette* (Lafayette, 1875), *Colby Echo* (1876), *California Occident* (1881), *Delphic* (Drake University, 1884), *Silver and Gold* (University of Colorado, 1892), *Knox Student* (1894), *Tufts Weekly* (1895), the *Triangle* (New York University, 1895), *Hamilton Life* (1898), *Syracuse Weekly* (1900), *Barnard Bulletin* (1901), the *Texan* (University of Texas), and *Olive and Blue* (Tulane). Most of these are devoted almost wholly to news, although a number are entirely literary in character, whilst several others include both news and literary matter.

The monthly magazines now make up the majority of college journals, more than 280 being issued. They include the *Amherst Literary*

Monthly (1886), the *Brunonian* (Brown University, 1829), the *California Magazine* (1895), the *Columbia Monthly* (1893), the *Cornell Era* (1868), which absorbed the *Cornell Magazine* in 1900, the *Dartmouth Magazine* (1892), the *Hamilton Literary Monthly* (1866), the *Harvard Monthly* (1885), the *Lafayette Touchstone* (1896), the *Michigan Inlander*, the *Minnesota Magazine* (1895), the *Red and Blue* (University of Pennsylvania, 1886), the *Nassau Literary Magazine* (1842), the *Syracuse Herald* (1872), the *University of Virginia Magazine* (1840), and the *Williams Literary Monthly* (1885). In addition to the *Hamilton Life*, the official publication of the fraternities, the non-fraternity men at Hamilton publish about six times a year the *Review*. The *Harvard Illustrated Magazine*, established as a monthly in 1899, still stands in a class by itself. Among the more important papers published at women's colleges are the *Barnard Bear*, *Mount Holyoke*, *Wellesley Magazine*, *Radcliffe Magazine*, *Wells College Chronicle*, *Smith College Monthly*, and *Vassar Miscellany*.

While the dailies, weeklies, and monthlies form the largest class, these must be supplemented by the biweeklies and bimonthlies, and a number that are published at irregular intervals. There are about 30 journals that appear fortnightly, including the *Yale Courant* (1865), the *Yale Record* (1871), the *Harvard Advocate* (1866), the *Earlhamite*, the *Wrinkle* (University of Michigan), the *Oracle* (Hamline, 1888), the *State* (Stevens Institute of Technology), *Chapparral* (1900) and *Sequoia* (1891), both of Leland Stanford Junior University. The 14 bimonthlies include the *Coe College Cosmos* (1890), the *Worcester Polytechnic Journal*, the *Bacon* (Boston University), and the *Sibyl* (Elmira, 1871). The *Trinity Tablet* (Trinity College, 1868) is issued every three weeks.

The humorous college papers are few in number and generally conducted on the lines of the *New York Life* rather than of *Puck* or *Judge*. In fact, *Life* may be said to be the outgrowth of the college humorous magazines, since it was actually established by former editors of the *Harvard Lampoon*, and its success was due to *Lampoon* men and former editors of the *Columbia Spectator* and *Acta Columbiana*. Besides the *Harvard Lampoon*, established in 1876, the most important humorous college papers are the *Cornell Widow*, the *University of Michigan Wrinkle*, the *Yale Record*, all biweekly; the *Princeton Tiger*, monthly, and the *Columbia Jester*, a biweekly. In 1900 the *Punch Bowl* was started at the University of Pennsylvania as a monthly humorous magazine. At the University of California the literary monthly publishes a humorous illustrated supplement called the *Axe*.

Alumni news is sent out in some form from many colleges, often by the faculty in the form of a weekly, monthly, or quarterly magazine. An alumni newspaper published by a joint board of alumni and undergraduates is a less common form, but in those cases in which it exists the results are highly satisfactory and present perhaps the most successful examples of college journalism. The *Yale Alumni Weekly*, the *Cornell Alumni News*, *Columbia Alumni News*, and the *Princeton Alumni Weekly* are among the best-conducted college papers of any kind. Harvard publishes the *Harvard Bulletin*, weekly, and the *Harvard Graduate Magazine*, established

as a quarterly in 1893. Some other colleges maintain alumni papers, but those already quoted are representative of the class.

Many of the professional schools publish magazines of a serious nature, devoted to particular interests. Examples are the *Harvard Law Review* (weekly), the *Pennsylvania Dental Journal* (monthly), the *American Law Register* (University of Pennsylvania, monthly), the *Phagocyte* (Tulane Medical School), the *Yale Medical Journal*, the *Sibley Journal* (Sibley College, Cornell), the *Columbia School of Mines Quarterly*, and the *Columbia Law Review*. Some of these professional journals take high rank in the outside world. In some cases, as in the *Sibley Journal*, they are managed entirely by undergraduates; in others there are associate or advisory faculty or alumni editors.

The college annual gives a survey of the year's collegiate history. It contains statistics and records of the fraternities, clubs, societies, athletic events, and other matters of interest to students, and includes daring attempts at humor aimed at the students and the faculty. The cost of preparing one of these yearbooks already mounts into the thousands of dollars. They are yearly growing in size, and more and more attention is paid to art work in their preparation. Some of the college annuals are the *Amherst Olio*, the *Brown Lieber*, the *California Blue and Gold*, the *Chicago Cap and Gown*, the *Columbian* (formerly the *Columbiad*), the *Cornellian*, the *Dartmouth Ægis*, the *Harvard Register*, the *Hullabaloo* of Johns Hopkins, the *Lafayette Mélange*, the *Lehigh Epitome*, the *Michiganensian*, the *Minnesota Gopher*, the *Pennsylvania Record*, the *Princeton Bric-à-Brac*, the *Stanford Quad*, the *Syracuse Onondaguan*, the *Texas Cactus*, the *Trinity Ivy*, the *Tulane Jambalayo*, the *Vermont Ariel*, the *Virginia Corks and Curls*, the *Williams Giulielmensian*, the *Yale Banner* and *Potpourri*.

The peculiar system of management by which the college paper is perpetuated from year to year also involves a periodical fluctuation in the literary value of the contributions. Each year as a portion of the board of editors are graduated or pass to a higher class, an equal number of new classmen are elected to take their places. By this means the publication is kept alive, and its general tone and policy are preserved, while its literary standard is raised or lowered as the new editors are more or less clever than their predecessors. The college paper is generally recognized and encouraged by the faculty of the institution, and in some cases substantial acknowledgment is made for work done by the editors. In the majority of institutions the college papers, in common with other student organizations, are provided with office room, heat, light, and service.

Competition for places on the editorial boards of college papers is often very keen. The method of selecting editors varies considerably, vacancies being filled on the basis of literary competition, class election, editorial or faculty appointment, excellence in class work, fraternity or society representation, and various other ways. When editors are elected by the student body, they are held responsible to it, while they are left free in the internal management of the paper. The *Cornell Sun* is chartered by the whole student body; other papers are official society organs, close corporations, or stock companies. The evil effects of college politics are often apparent

in the selection of editors, leading sometimes to the establishment of rival papers and to an injurious form of competition. Cases of the abuse of editorial positions for personal ends or animosities are noticeably rare, although no checks except student sentiment exist to prevent it.

A diversity of opinion exists as to the influence of the college paper in developing literary talent among the undergraduates. It seems probable that the general training in the various features of journalism now acquired by editors of college papers is at least equivalent to the purely literary training given by the old literary periodicals. It is a fact that numbers of the most successful of our younger writers have served their apprenticeship on the editorial board of college publications, which are increasingly recognized as valuable training schools for journalistic work. A college editor has much to unlearn when he takes a place on the daily paper, but he has at the same time acquired much valuable experience in editorial and business management and in reportorial work. The college paper, as now conducted, affords an agreeable and profitable employment and gives to friends of an institution an actual insight into the life of the college that cannot be gained from any official catalogue or report. Like general newspapers, the college paper has its exchange list, and its editors and readers are thus kept in touch with the doings and sentiments of all other colleges. To the instructors the college press affords the surest indication of student sentiment, and is helpful in the solution of educational problems affecting the institution. There are now in the United States and Canada, according to the best newspaper directories, about 500 undergraduate publications, not including alumni and professional school magazines and the official publications of the Greek-letter societies. See FRATERNITIES, AMERICAN COLLEGE.

JOURNALISTEN, zhur'ná-lis'ten, DIE (Ger., The Journalists). A comedy by Gustav Freytag (1853), which deals with the influence of the press on German political and social life.

JOUR'NEYMAN (from *journey*, day's work, from *journee*, Fr. *journée*, from ML. *diurnata*, day's work, day's journey, from Lat. *diurnus*, daily, from *dies*, day + *man*). A term originally applied to laborers working by the day, but in the late Middle Ages applied to the laborers in the guilds who had completed their apprenticeship, but who had not attained the position of master. In contrast with the modern workman, the journeyman in the most flourishing period of the guilds was not a wage earner for life, but could look forward to the independent position of master. As industry became more complex and required a greater outlay for the necessary tools and materials, the possibility of attaining mastership practically ended, and journeymen became a permanent class of skilled wage earners. See GUILD.

JOUSTS, júst (OF. *joste*, *jouste*, It. *giostra*, from OF. *juster*, *joster*, *jouster*, It. *giostrare*, to joust, from ML. *juxtare*, to approach, tilt, from Lat. *juxta*, near). Contests on horseback, engaged in as trials of strength in the Middle Ages by knights and nobles. In the jousts the combatants engaged one another singly, each against his antagonist, and not in a troop, as in the tournament (q.v.). The lance was the weapon chiefly used.

JOUTEL, zhōō'tél', HENRI (c.1650-?). A French explorer, born in Rouen, the son of a gardener in the employ of Henri Cavelier, an uncle of La Salle (q.v.). He joined La Salle's expedition, which left France in 1684 to found a colony at the mouth of the Mississippi. When La Salle started through the wilderness for Canada, where he hoped to secure aid, he left Joutel in command of the post, St. Louis, which he had established on what proved to be an estuary on the coast of Texas. Joutel's administration was disturbed by plots and intrigues, the colonists being thoroughly disheartened. After La Salle's return the discontent increased, and finally in 1687 La Salle made a second and more determined attempt to reach Canada. Accompanied by his brother Jean, his two nephews Moranget and Cavelier, Joutel, and about 15 others, he again started from the little colony; but scarcely two months later, while encamped on a branch of the Trinity River in Texas, La Salle, Moranget, and two others were assassinated by four or five malcontents. Joutel and those of his companions who were loyal to La Salle were forced to conceal their horror at this deed, fearing a like fate for themselves; and the whole party pushed on to the Cenis villages, which had been the farthest point reached by La Salle in his first attempt. Here they remained for some time, the murderers not caring to enter Canada, where justice awaited them, and being equally unwilling to allow the others, who might become witnesses against them, to proceed on their journey. At last, however, the assassins quarreled among themselves, and this afforded the others a chance to escape. After more than two months of travel through the wilderness, Joutel and his companions finally reached the Mississippi, which they ascended to the Illinois, where they spent the winter at Fort St. Louis. The next spring they pushed on to Canada and took ship to France. Joutel wrote a *Journal historique du dernier voyage que feu M. de la Salle fit dans le Golfe de Mexique*, trans. by H. R. Stiles (Albany, 1906), which is probably the most trustworthy account of the expedition.

JOUVENET, zhōō'v'-nâ', JEAN (1644-1717). A French painter, born at Rouen. He was the

most celebrated of a family of painter sculptors and was the son and pupil of Laurent Jouvenet, called The Younger (1609-81). He afterward studied at the Royal Academy in Paris and worked with Charles Lebrun, whom he assisted with the decorations of Versailles from 1661 to 1680. He soon became well known and was successively member (1675), professor (1687), and perpetual rector of the Royal Academy of Painting and Sculpture (1707). The death of Lebrun placed him at the head of the French school. There are examples of his work in many French museums. Among his mural paintings are those on the ceiling of the Hall of Mars at Versailles, and the "Apotheosis of the Apostles," a fresco at the Invalides. His four paintings at the Louvre—"Jesus and the Pharisee," "The Merchants Driven from the Temple," "The Resurrection of Lazarus," "The Miraculous Draft of Fish"—were reproduced in tapestries by order of Louis XIV and later presented to the Czar Peter the Great on the occasion of his visit to France. His paintings are in the style of Louis XIV, with rather more of the Italian influence showing than in Lebrun.

JOUY, zhōō'é', VICTOR JOSEPH ETIENNE DE (1764-1846). A French author, born at Jouy, near Versailles. In early life he served in the army and afterward took an active part in the troubles of the Revolution. In 1815 he was made a member of the Academy and in 1830 librarian of the Louvre. After 1797 he devoted himself to literature. His works include the opera texts, *La vestale* (1807), music by Spontini, *Les abencérages* (1813), music by Cherubini, and *Guillaume Tell* (1829), music by Rossini; two tragedies, *Tippo Saïb* (1812) and *Sylla* (1822); and his most important writings, several series of sketches, which first appeared in the *Gazette de France*. These were collected under the following titles: *L'Hermite de la Chaussée d'Antin* (1812-14), *Le franc-parleur* (1814), *L'Hermite de la Guyane* (1816), *L'Hermite en province* (1818-27), and, with Antoine Jouy, *Les hermites en prison* (1823) and *Les hermites en liberté* (1824). He was also the editor of several journals. He published an edition of his own *Œuvres complètes* in the years 1823-28.
